compiler gives same name in JavaScript, you can\n * mark one with `@JsName(...)` to prevent the compiler from
reporting error.\n * * You are writing a JavaScript library in Kotlin. The compiler produces mangled names\n *
for functions with parameters, which is unnatural for usual JavaScript developer.\n * You can put `@JsName(...)`
on functions you want to be available from JavaScript.\n * * For some reason you want to rename declaration, e.g.
there's common term in JavaScript\n * for a concept provided by the declaration, which is uncommon in Kotlin.\n
*\n * Example:\n * ``` kotlin\n * class Person(val name: String) {\n *     fun hello() {\n *         println("Hello
$name!")\n *     }\n *     @JsName("helloWithGreeting")\n *     fun hello(greeting: String) {\n *
println("$greeting $name!")\n *     }\n * }\n * ```\n * @property name the name which compiler uses both for
declaration itself and for all references to the declaration.\n * It's required to denote a valid JavaScript
identifier.\n * *\n * @Retention(AnnotationRetention.BINARY)\n * @Target(CLASS, FUNCTION, PROPERTY,
CONSTRUCTOR, PROPERTY_GETTER, PROPERTY_SETTER)\n * public actual annotation class JsName(actual
val name: String)\n * *\n * Denotes an `external` declaration that must be imported from native JavaScript
library.\n * The compiler produces the code relevant for the target module system, for example, in case of
CommonJS,\n * it will import the declaration via the `require(...)` function.\n * The annotation can be used on
top-level external declarations (classes, properties, functions) and files.\n * In case of file (which can't be `external`)
the following rule applies: all the declarations in\n * the file must be `external`. By applying `@JsModule(...)`
on a file you tell the compiler to import a JavaScript object\n * that contain all the declarations from the file.\n
*\n * Example:\n * ``` kotlin\n * @JsModule("jquery")\n * external abstract class JQuery() {\n *     // some
declarations here\n * }\n * @JsModule("jquery")\n * external fun JQuery(element: Element): JQuery\n * ```\n
*\n * @property import name of a module to import declaration from.\n * It is not interpreted by the Kotlin
compiler, it's passed as is directly to the target module system.\n * *\n * @see JsNonModule\n
*\n * @Retention(AnnotationRetention.BINARY)\n * @Target(CLASS, PROPERTY, FUNCTION, FILE)\n * public
annotation class JsModule(val import: String)\n * *\n * Denotes an `external` declaration that can be used without
module system.\n * By default, an `external` declaration is available regardless your target module system.\n *
However, by applying [JsModule] annotation you can make a declaration unavailable to *plain* module system.\n *
Some JavaScript libraries are distributed both as a standalone downloadable piece of JavaScript and as a module
available\n * as an npm package.\n * To tell the Kotlin compiler to accept both cases, you can augment [JsModule]
with the `@JsNonModule` annotation.\n * For example:\n * ``` kotlin\n * @JsModule("jquery")\n *
*\n * @JsNonModule\n * @JsName("$")\n * external abstract class JQuery() {\n *     // some declarations here\n * }\n
*\n * @JsModule("jquery")\n * @JsNonModule\n * @JsName("$")\n * external fun JQuery(element: Element):
JQuery\n * ```\n * *\n * @see JsModule\n * *\n * @Retention(AnnotationRetention.BINARY)\n * @Target(CLASS,
PROPERTY, FUNCTION, FILE)\n * public annotation class JsNonModule\n * *\n * Adds prefix to `external`
declarations in a source file.\n * JavaScript does not have concept of packages (namespaces). They are usually

```

emulated by nested objects.
 * The compiler turns references to `external` declarations either to plain unprefix names (in case of `*plain*` modules) or to plain imports.
 * However, if a JavaScript library provides its declarations in packages, you won't be satisfied with this.
 * You can tell the compiler to generate additional prefix before references to `external` declarations using the `@JsQualifier(...)` annotation.
 * Note that a file marked with the `@JsQualifier(...)` annotation can't contain non-`external` declarations.
 * Example:
 * `@file:JsQualifier("my.jsPackageName") package some.kotlinPackage external fun foo(x: Int) external fun bar(): String`
 * `````
 * `@property value the qualifier to add to the declarations in the generated code.`
 * It must be a sequence of valid JavaScript identifiers separated by the ``.` character.

Examples of valid qualifiers are: ``foo``, ``bar.Baz``, ``_.$0.f``
 * `@see JsModule`
 * `@Retention(AnnotationRetention.BINARY)`
 * `@Target(AnnotationTarget.FILE)`
 * `public annotation class JsQualifier(val value: String)`
 * `````
 * Exports top-level declaration on JS platform.
 * Compiled module exposes declarations that are marked with this annotation without name mangling.
 * This annotation can be applied to either files or top-level declarations.
 * It is currently prohibited to export the following kinds of declarations:
 * ``expect`` declarations
 * inline functions with reified type parameters
 * suspend functions
 * secondary constructors without `@JsName``
 * extension properties
 * enum classes
 * annotation classes
 * Signatures of exported declarations must only contain `"exportable"` types:
 * ``dynamic``, ``Any``, ``String``, ``Boolean``, ``Byte``, ``Short``, ``Int``, ``Float``, ``Double``
 * ``BooleanArray``, ``ByteArray``, ``ShortArray``, ``IntArray``, ``FloatArray``, ``DoubleArray``
 * ``Array<exportable-type>``
 * Function types with exportable parameters and return types
 * ``external`` or `@JsExport`` classes and interfaces
 * Nullable counterparts of types above
 * Unit return type. Must not be nullable
 * This annotation is experimental, meaning that restrictions mentioned above are subject to change.

* `@ExperimentalJsExport`
 * `@Retention(AnnotationRetention.BINARY)`
 * `@Target(CLASS, PROPERTY, FUNCTION, FILE)`
 * `@SinceKotlin("1.3")`
 * `public actual annotation class JsExport`
 * `````
 * Forces a top-level property to be initialized eagerly, opposed to lazily on the first access to file and/or property.

* `@ExperimentalStdlibApi`
 * `@Retention(AnnotationRetention.BINARY)`
 * `@Target(AnnotationTarget.PROPERTY)`
 * `@SinceKotlin("1.6")`
 * `@Deprecated("This annotation is a temporal migration assistance and may be removed in the future releases, please consider filing an issue about the case where it is needed")`

    generic function parameter of a function,\n * it enables to infer the type arguments of that generic function from the
    lambda body passed to that parameter.\n *\n * The calls that affect inference are either members of the receiver type
    of an annotated function parameter or\n * extensions for that type. The extensions must be themselves annotated
    with `@BuilderInference`.\n *\n * Example: we declare\n * ```\n * fun <T> sequence(@BuilderInference block:
    suspend SequenceScope<T>().-> Unit): Sequence<T>\n * ```\n * and use it like\n * ```\n * val result = sequence {
    yield("result") }\n * ```\n * Here the type argument of the resulting sequence is inferred to `String` from\n * the
    argument of the [SequenceScope.yield] function, that is called inside the lambda passed to [sequence].\n *\n * Note:
    this annotation is experimental, see [ExperimentalTypeInference] on how to opt-in for it.\n

    lists that differ only in the return type\n * of a functional parameter, this annotation enables overload selection by the
    type of the value returned from\n * the lambda function passed to this functional parameter.\n *\n * Example:\n *
    ```\n * @OverloadResolutionByLambdaReturnType\n * fun create(intProducer: () -> Int): Int\n * fun
 create(doubleProducer: () -> Double): Double\n * val newValue = create { 3.14 }\n * ```\n *\n * The annotation
 being applied to one of overloads allows to resolve this ambiguity by analyzing what value is returned\n * from the
 lambda function.\n *\n * This annotation is also used to discriminate the annotated overloads in case if overload
 selection still cannot\n * choose one of them even taking in account the result of lambda parameter analysis. In that

this deep recursive function use its [invoke] function.\n * As a rule of thumb, it should be used if recursion goes
deeper than a thousand calls.\n *\n * The [DeepRecursiveFunction] takes one parameter of type [T] and returns a
result of type [R].\n * The [block] of code defines the body of a recursive function. In this block\n *

```

[callRecursive][DeepRecursiveScope.callRecursive] function can be used to make a recursive call to the declared function. Other instances of [DeepRecursiveFunction] can be called in this scope with `callRecursive` extension, too.

For example, take a look at the following recursive tree class and a deeply recursive instance of this tree with 100K nodes:

```

class Tree(val left: Tree? = null, val right: Tree? = null) {
 val deepTree = generateSequence(Tree()) { Tree(it) }.take(100_000).last()
}

```

A regular recursive function can be defined to compute a depth of a tree:

```

fun depth(t: Tree?): Int = if (t == null) 0 else
 max(depth(t.left), depth(t.right)) + 1
println(depth(deepTree)) // StackOverflowError

```

If this `depth` function is called for a `deepTree` it produces [StackOverflowError] because of deep recursion.

However, the `depth` function can be rewritten using `DeepRecursiveFunction` in the following way, and then it successfully computes [depth(deepTree)][DeepRecursiveFunction.invoke] expression:

```

val depth =
 DeepRecursiveFunction<Tree?, Int> { t -> if (t == null) 0 else max(callRecursive(t.left),
 callRecursive(t.right)) + 1 }
println(depth(deepTree)) // Ok

```

Deep recursive functions can also mutually call each other using a heap for the stack via [callRecursive][DeepRecursiveScope.callRecursive] extension. For example, the following pair of mutually recursive functions computes the number of tree nodes at even depth in the tree.

```

val mutualRecursion = object {
 val even: DeepRecursiveFunction<Tree?, Int> = DeepRecursiveFunction { t -> if (t == null) 0 else
 odd.callRecursive(t.left) + odd.callRecursive(t.right) + 1 }
 val odd: DeepRecursiveFunction<Tree?, Int> = DeepRecursiveFunction { t -> if (t == null) 0 else even.callRecursive(t.left) +
 even.callRecursive(t.right) }
}

```

`round(x)` is `x` where `x` is `NaN` or `+Inf` or `-Inf` or already a mathematical integer.  
@SinceKotlin("1.2")\npublic expect fun round(x: Float): Float  
Returns the absolute value of the given value [x].  
Special cases:  
`abs(NaN)` is `NaN`  
@see `absoluteValue` extension property for `[Float]`  
@SinceKotlin("1.2")\npublic expect fun abs(x: Float): Float  
Returns the sign of the given value [x]:  
`-1.0` if the value is negative,  
zero if the value is zero,  
`1.0` if the value is positive  
Special case:  
`sign(NaN)` is `NaN`  
@SinceKotlin("1.2")\npublic expect fun sign(x: Float): Float  
Returns the smaller of two values.  
If either value is `NaN`, then the result is `NaN`.  
@SinceKotlin("1.2")\npublic expect fun min(a: Float, b: Float): Float  
Returns the greater of two values.  
If either value is `NaN`, then the result is `NaN`.  
@SinceKotlin("1.2")\npublic expect fun max(a: Float, b: Float): Float  
// extensions  
Raises this value to the power [x].  
Special cases:  
`b.pow(0.0)` is `1.0`  
`b.pow(1.0) == b`  
`b.pow(NaN)` is `NaN`  
`NaN.pow(x)` is `NaN` for `x != 0.0`  
`b.pow(Inf)` is `NaN` for `abs(b) == 1.0`  
`b.pow(x)` is `NaN` for `b < 0` and `x` is finite and not an integer  
@SinceKotlin("1.2")\npublic expect fun Float.pow(x: Float): Float  
Raises this value to the integer power [n].  
See the other overload of `[pow]` for details.  
@SinceKotlin("1.2")\npublic expect fun Float.pow(n: Int): Float  
Returns the absolute value of this value.  
Special cases:  
`NaN.absoluteValue` is `NaN`  
@see `abs` function  
@SinceKotlin("1.2")\npublic expect val Float.absoluteValue: Float  
Returns the sign of this value:  
`-1.0` if the value is negative,  
zero if the value is zero,  
`1.0` if the value is positive  
Special case:  
`NaN.sign` is `NaN`  
@SinceKotlin("1.2")\npublic expect val Float.sign: Float  
Returns this value with the sign bit same as of the `[sign]` value.  
If `[sign]` is `NaN` the sign of the result is undefined.  
@SinceKotlin("1.2")\npublic expect fun Float.withSign(sign: Float): Float  
Returns this value with the sign bit same as of the `[sign]` value.  
@SinceKotlin("1.2")\npublic expect fun Float.withSign(sign: Int): Float  
Rounds this `[Float]` value to the nearest integer and converts the result to `[Int]`.  
Ties are rounded towards positive infinity.  
Special cases:  
`x.roundToInt() == Int.MAX_VALUE` when `x > Int.MAX_VALUE`  
`x.roundToInt() == Int.MIN_VALUE` when `x < Int.MIN_VALUE`  
@throws `IllegalArgumentException` when this value is `NaN`  
@SinceKotlin("1.2")\npublic expect fun Float.roundToInt(): Int  
Rounds this `[Float]` value to the nearest integer and converts the result to `[Long]`.  
Ties are rounded towards positive infinity.  
Special cases:  
`x.roundToLong() == Long.MAX_VALUE` when `x > Long.MAX_VALUE`  
`x.roundToLong() == Long.MIN_VALUE` when `x < Long.MIN_VALUE`  
@throws `IllegalArgumentException` when this value is `NaN`  
@SinceKotlin("1.2")\npublic expect fun Float.roundToLong(): Long  
// endregion  
// region Integer Math  
Returns the absolute value of the given value [n].  
Special cases:  
`abs(Int.MIN_VALUE)` is `Int.MIN_VALUE` due to an overflow  
@see `absoluteValue` extension property for `[Int]`
