Accumulates value starting with the last element and applying [operation] from right to left to each element and current accumulator value.

* Returns `null` if the list is empty.

* @param [operation] function that takes an element and current accumulator value, and calculates the next accumulator value.

* @sample

```

Returns a list containing successive accumulation values generated by applying [operation] from left to right to each element and current accumulator value that starts with [initial] value.

* Note that `acc` value passed to [operation] function should not be mutated; otherwise it would affect the previous value in resulting list.

* @param [operation] function that takes current accumulator value and an element, and calculates the next accumulator value.

@SinceKotlin("1.3")@InlineOnly
public actual inline fun <T> (suspend () ->
T).startCoroutineUninterceptedOrReturn(
    completion: Continuation<T>): Any? =
this.asDynamic()(completion, false)

```

Starts an unintercepted coroutine with receiver type [R] and result type [T] and executes it until its first suspension. Returns the result of the coroutine or throws its exception if it does not suspend or [COROUTINE_SUSPENDED] if it suspends. In the latter case, the [completion] continuation is invoked when the coroutine completes with a result or an exception.

The coroutine is started directly in the invoker's thread without going through the [ContinuationInterceptor] that might be present in the completion's [CoroutineContext]. It is the invoker's responsibility to ensure that a proper invocation context is established.

This function is designed to be used from inside of [suspendCoroutineUninterceptedOrReturn] to resume the execution of the suspended coroutine using a reference to the suspending function.

```

Creates unintercepted coroutine without receiver and with result type [T]. This function creates a new, fresh instance of suspendable computation every time it is invoked. To start executing the created coroutine, invoke `resume(Unit)` on the returned [Continuation] instance. The [completion] continuation is invoked when coroutine completes with result or exception. This function returns unintercepted continuation. Invocation of `resume(Unit)` starts coroutine immediately in the invoker's call stack without going through the [ContinuationInterceptor] that might be present in the completion's [CoroutineContext]. It is the invoker's responsibility to ensure that a proper invocation context is established. Note that [completion] of this function may get invoked in an arbitrary context. [Continuation.intercepted] can be used to acquire the intercepted continuation. Invocation of `resume(Unit)` on intercepted continuation guarantees that execution of both the coroutine and [completion] happens in the invocation context established by [ContinuationInterceptor]. Repeated invocation of any resume function on the resulting continuation corrupts the state machine of the coroutine and may result in arbitrary behaviour or exception.

```

The compiler produces mangled names\n * for functions with parameters, which is unnatural for usual JavaScript developer.\n * \n * You can put `@JsName(...)`\n * on functions you want to be available from JavaScript.\n * \n * * For some reason you want to rename declaration, e.g.\n * there's common term in JavaScript\n * for a concept provided by the declaration, which is uncommon in Kotlin.\n * \n * Example:\n * \n * ``` kotlin\n * class Person(val name: String) {\n *   fun hello() {\n *     println("Hello\n * $name!")\n *   }\n * }\n * \n * @JsName("helloWithGreeting")\n * fun hello(greeting: String) {\n *   println("$greeting $name!")\n * }\n * }\n * \n * \n * \n * @property name the name which compiler uses both for\n * declaration itself and for all references to the declaration.\n * \n * It's required to denote a valid JavaScript\n * identifier.\n * \n * @Retention(AnnotationRetention.BINARY)\n * @Target(CLASS, FUNCTION, PROPERTY,\n * CONSTRUCTOR, PROPERTY_GETTER, PROPERTY_SETTER)\n * public actual annotation class\n * JsName(actual\n * val name: String)\n * \n * \n * Denotes an `external` declaration that must be imported from native JavaScript\n * library.\n * \n * The compiler produces the code relevant for the target module system, for example, in case of\n * CommonJS,\n * it will import the declaration via the `require(...)` function.\n * \n * The annotation can be used on\n * top-level external declarations (classes, properties, functions) and files.\n * \n * In case of file (which can't be `external`)\n * the following rule applies: all the declarations in\n * the file must be `external`. By applying `@JsModule(...)` on a

```

file you tell the compiler to import a JavaScript object that contain all the declarations from the file.

Example:

```

kotlin @JsModule("jquery") external abstract class JQuery() {
    // some declarations here
}
kotlin @JsModule("jquery") external fun JQuery(element: Element): JQuery
@property import name of a module to import declaration from. It is not interpreted by the Kotlin compiler, it's passed as is directly to the target module system.
@see JsNonModule
@Retention(AnnotationRetention.BINARY) @Target(CLASS, PROPERTY, FUNCTION, FILE) public annotation class JsModule(val import: String) {
    Denotes an `external` declaration that can be used without module system.
    By default, an `external` declaration is available regardless your target module system.
    However, by applying [JsModule] annotation you can make a declaration unavailable to `plain` module system.
    Some JavaScript libraries are distributed both as a standalone downloadable piece of JavaScript and as a module available as an npm package.
    To tell the Kotlin compiler to accept both cases, you can augment [JsModule] with the `@JsNonModule` annotation.
    For example:
kotlin @JsModule("jquery") @JsNonModule @JsName("$") external abstract class JQuery() {
    // some declarations here
}
kotlin @JsModule("jquery") @JsNonModule @JsName("$") external fun JQuery(element: Element): JQuery
@see JsModule
@Retention(AnnotationRetention.BINARY) @Target(CLASS, PROPERTY, FUNCTION, FILE) public annotation class JsNonModule {
    Adds prefix to `external` declarations in a source file.
    JavaScript does not have concept of packages (namespaces). They are usually emulated by nested objects.
    The compiler turns references to `external` declarations either to plain unprefix names (in case of `plain` modules) or to plain imports.
    However, if a JavaScript library provides its declarations in packages, you won't be satisfied with this.
    You can tell the compiler to generate additional prefix before references to `external` declarations using the `@JsQualifier(...)` annotation.
    Note that a file marked with the `@JsQualifier(...)` annotation can't contain non-`external` declarations.
    Example:
kotlin @file:JsQualifier("my.jsPackageName") package some.kotlinPackage external fun foo(x: Int)
kotlin external fun bar(): String
@property value the qualifier to add to the declarations in the generated code.
    It must be a sequence of valid JavaScript identifiers separated by the `.` character.
    Examples of valid qualifiers are: `foo`, `bar.Baz`, `_.$.f`.
@see JsModule
@Retention(AnnotationRetention.BINARY) @Target(AnnotationTarget.FILE) public annotation class JsQualifier(val value: String) {
    Exports top-level declaration on JS platform.
    Compiled module exposes declarations that are marked with this annotation without name mangling.
    This annotation can be applied to either files or top-level declarations.
    It is currently prohibited to export the following kinds of declarations:
    * `expect` declarations
    * inline functions with reified type parameters
    * suspend functions
    * secondary constructors without `@JsName`
    * extension properties
    * enum classes
    * annotation classes
    Signatures of exported declarations must only contain `exportable` types:
    * `dynamic`, `Any`, `String`, `Boolean`, `Byte`, `Short`, `Int`, `Float`, `Double`
    * `BooleanArray`, `ByteArray`, `ShortArray`, `IntArray`, `FloatArray`, `DoubleArray`
    * `Array<exportable-type>`
    * Function types with exportable parameters and return types
    * `external` or `@JsExport` classes and interfaces
    * Nullable counterparts of types above
    * Unit return type. Must not be nullable
    This annotation is experimental, meaning that restrictions mentioned above are subject to change.

 Divides this value by the other value, flooring the result to an integer that is closer to negative infinity.

`Short.floorDiv(other: Byte): Int =` `this.toInt().floorDiv(other.toInt())`  
 Calculates the remainder of flooring division of this value by the other value. The result is either zero or has the same sign as the `_divisor_` and has the absolute value less than the absolute value of the divisor.

`Short.mod(other: Byte): Byte =` `this.toInt().mod(other.toInt()).toByte()`  
 Divides this value by the other value, flooring the result to an integer that is closer to negative infinity.

`Short.floorDiv(other: Short): Int =` `this.toInt().floorDiv(other.toInt())`  
 Calculates the remainder of flooring division of this value by the other value. The result is either zero or has the same sign as the `_divisor_` and has the absolute value less than the absolute value of the divisor.

`Short.mod(other: Short): Short =` `this.toInt().mod(other.toInt()).toShort()`  
 Divides this value by the other value, flooring the result to an integer that is closer to negative infinity.

`Short.floorDiv(other: Int): Int =` `this.toInt().floorDiv(other)`  
 Calculates the remainder of flooring division of this value by the other value. The result is either zero or has the same sign as the `_divisor_` and has the absolute value less than the absolute value of the divisor.
