```
/**
 * Adapts focus styles based on the user's active input modality (i.e., how
 * they are interacting with the UI right now).
 *
 * Focus styles are only relevant when using the keyboard to interact with the
 * page. If we only show the focus ring when relevant, we can avoid user
 * confusion without compromising accessibility.
 *
 * The script uses two heuristics to determine whether the keyboard is being used:
 *
 * 1. a keydown event occurred immediately before a focus event;
 * 2. a focus event happened on an element which requires keyboard interaction (e.g., a text field);
 *

/**
 * PAN RESPONDER
 *
 * `PanResponder` uses the Responder System to reconcile several touches into
```

- \* a single gesture. It makes single-touch gestures resilient to extra touches,
- \* and can be used to recognize simple multi-touch gestures. For each handler,
- \* it provides a `gestureState` object alongside the ResponderEvent object.
- \*
- \* By default, `PanResponder` holds an `InteractionManager` handle to block
- \* long-running JS events from interrupting active gestures.
- \*

\* A graphical explanation of the touch data flow:

'use strict';

```

import type {PressEvent} from '../vendor/react-native/Types/CoreEventTypes';
import InteractionManager from '../InteractionManager';
import TouchHistoryMath from '../vendor/react-native/TouchHistoryMath';
export type GestureState = {
  // ID of the gestureState; persisted as long as there's a pointer on screen
  stateID: number,
  // The latest screen coordinates of the gesture
  x: number,
  // The latest screen coordinates of the gesture
  y: number,

```

```

// The screen coordinates of the responder grant
initialX: number,
// The screen coordinates of the responder grant
initialY: number,
// Accumulated distance of the gesture since it started
deltaX: number,
// Accumulated distance of the gesture since it started
deltaY: number,
// Current velocity of the gesture
velocityX: number,
// Current velocity of the gesture
velocityY: number,
// Number of touches currently on screen
numberActiveTouches: number,
_accountsForMovesUpTo: number,
};

const {
  currentCentroidX,
  currentCentroidY,
  currentCentroidXOfTouchesChangedAfter,
  currentCentroidYOfTouchesChangedAfter,
  previousCentroidXOfTouchesChangedAfter,
  previousCentroidYOfTouchesChangedAfter
} = TouchHistoryMath;

```

```

const PanResponder = {
  _initializeGestureState(gestureState: GestureState) {
    gestureState.x = 0;
    gestureState.y = 0;
    gestureState.initialX = 0;
    gestureState.initialY = 0;
    gestureState.deltaX = 0;
    gestureState.deltaY = 0;
    gestureState.velocityX = 0;
    gestureState.velocityY = 0;
    gestureState.numberActiveTouches = 0; // All `gestureState` accounts for timeStamps up until:

    gestureState._accountsForMovesUpTo = 0;
  },

  /**
   * Take all recently moved touches, calculate how the centroid has changed just for those
   * recently moved touches, and append that change to an accumulator. This is
   * to (at least) handle the case where the user is moving three fingers, and
   * then one of the fingers stops but the other two continue.
   *
   * This is very different than taking all of the recently moved touches and
   * storing their centroid as `dx/dy`. For correctness, we must *accumulate
   * changes* in the centroid of recently moved touches.
   *
   * There is also some nuance with how we handle multiple moved touches in a
   * single event. Multiple touches generate two 'move' events, each of
   * them triggering `onResponderMove`. But with the way `PanResponder` works,
   * all of the gesture inference is performed on the first dispatch, since it
   * looks at all of the touches. Therefore, `PanResponder` does not call
   * `onResponderMove` passed the first dispatch. This diverges from the
   * typical responder callback pattern (without using `PanResponder`), but
   * avoids more dispatches than necessary.
   *
   * When moving two touches in opposite directions, the cumulative
   * distance is zero in each dimension. When two touches move in parallel five
   * pixels in the same direction, the cumulative distance is five, not ten. If
   * two touches start, one moves five in a direction, then stops and the other
   * touch moves fives in the same direction, the cumulative distance is ten.
   *
   * This logic requires a kind of processing of time "clusters" of touch events
   * so that two touch moves that essentially occur in parallel but move every
   * other frame respectively, are considered part of the same movement.
   *
   * x/y: If a move event has been observed, `(x, y)` is the centroid of the most
   * recently moved "cluster" of active touches.
   * deltaX/deltaY: Cumulative touch distance. Accounts for touch moves that are
   * clustered together in time, moving the same direction. Only valid when

```

```

* currently responder (otherwise, it only represents the drag distance below
* the threshold).
*/

/**
 * ===== PressResponder Tutorial =====
 *
 * The `PressResponder` class helps you create press interactions by analyzing the
 * geometry of elements and observing when another responder (e.g. ScrollView)
 * has stolen the touch lock. It offers hooks for your component to provide
 * interaction feedback to the user:
 *
 * - When a press has activated (e.g. highlight an element)
 * - When a press has deactivated (e.g. un-highlight an element)
 * - When a press should trigger an action, meaning it activated and deactivated
 *   while within the geometry of the element without the lock being stolen.
 *
 * A high quality interaction isn't as simple as you might think. There should
 * be a slight delay before activation. Moving your finger beyond an element's
 * bounds should trigger deactivation, but moving the same finger back within an
 * element's bounds should trigger reactivation.
 *
 * In order to use `PressResponder`, do the following:
 *

```

```

*   const pressResponder = new PressResponder(config);
*
* 2. Choose the rendered component who should collect the press events. On that
*   element, spread `pressability.getEventHandlers()` into its props.
*
*   return (
*     <View {...this.state.pressResponder.getEventHandlers()} />
*   );
*
* 3. Reset `PressResponder` when your component unmounts.
*
*   componentWillUnmount() {
*     this.state.pressResponder.reset();
*   }
*
* ===== Implementation Details =====
*
* `PressResponder` only assumes that there exists a `HitRect` node. The `PressRect`
* is an abstract box that is extended beyond the `HitRect`.
*
* # Geometry
*
* - Presses start anywhere within `HitRect`.
*
* VisualRect
*   - When pressed down for sufficient amount of time
*   HitRect   before letting up, `VisualRect` activates.
*
* Out Region  o
*
*           When the press is released outside the `HitRect`,
*           the responder is NOT eligible for a "press".
*
* # State Machine
*
* RESPONDER_RELEASE
* NOT_RESPONDER
* RESPONDER_TERMINATED
*
* RESPONDER_GRANT (HitRect)
*
*
* RESPONDER_INACTIVE_ DELAY RESPONDER_ACTIVE_ T + DELAY RESPONDER_ACTIVE_
* PRESS_START PRESS_START LONG_PRESS_START
*
*

```

```
* T + DELAY => LONG_PRESS_DELAY + DELAY
```

```
*
```

```
* Not drawn are the side effects of each transition. The most important side  
* effect is the invocation of `onLongPress`. Only when the browser produces a  
* `click` event is `onPress` invoked.
```

```
*/

/\*\*

\* Adapts focus styles based on the user's active input modality (i.e., how they are interacting with the UI right now).  
\*  
\* Focus styles are only relevant when using the keyboard to interact with the page. If we only show the focus ring when relevant, we can avoid user confusion without compromising accessibility.  
\*  
\* The script uses two heuristics to determine whether the keyboard is being used:  
\*  
\* 1. a keydown event occurred immediately before a focus event;  
\* 2. a focus event happened on an element which requires keyboard interaction (e.g., a text field);  
\*

/**  
* NOTE: This is React Native specific export type.  
*  
* RCTExport is an interface type that allows native code generation for React  
* Native native modules. It exists as a hint to the codegen tool that any  
* interface that extends it needs to be codegen'ed. Example usage:  
*  
* export interface RCTFoobar extends RCTExport<void> {}  
*  
* Native definition for RCTFoobar will then be generated.  
*  
* The type param T is a placeholder for future codegen hinting, like versioning  
* information, native base classes, etc. For now, simply use `void` type as  
* there's nothing to give hint about.  
*/  
// eslint-disable-next-line no-unused-vars  
  
export interface RCTExport<T: void = void> {  
  +getConstants?: () => {}  
} // eslint-disable-next-line lint/react-native-modules  
  
export interface TurboModule extends RCTExport<void> {}

/\*\*

\* RESPONDER EVENT SYSTEM

\*

\* A single, global "interaction lock" on views. For a view to be the "responder" means

\* that pointer interactions are exclusive to that view and none other. The "interaction

\* lock" can be transferred (only) to ancestors of the current "responder" as long as

\* pointers continue to be active.

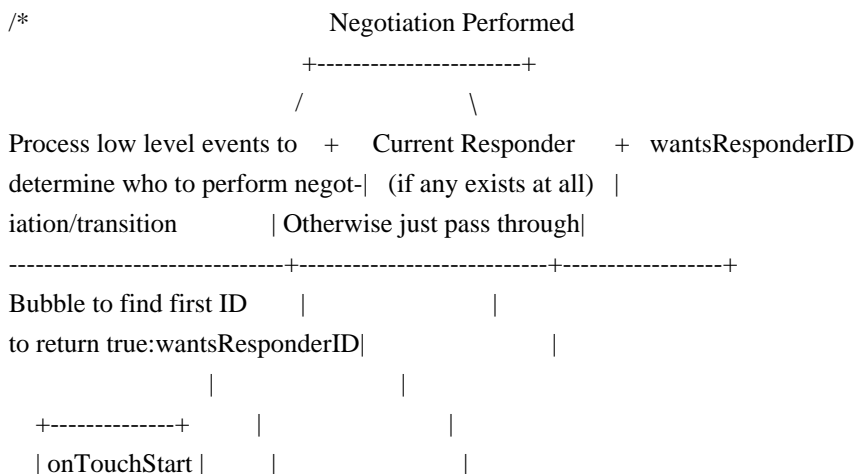

\*

\* Responder being granted:

```

*
* A view can become the "responder" after the following events:
* * "pointerdown" (implemented using "touchstart", "mousedown")
* * "pointermove" (implemented using "touchmove", "mousemove")
* * "scroll" (while a pointer is down)
* * "selectionchange" (while a pointer is down)
*
* If nothing is already the "responder", the event propagates to (capture) and from
* (bubble) the event target until a view returns `true` for
* `on*ShouldSetResponder(Capture)`.
*
* If something is already the responder, the event propagates to (capture) and from
* (bubble) the lowest common ancestor of the event target and the current "responder".
* Then negotiation happens between the current "responder" and a view that wants to
* become the "responder": see the timing diagram below.
*
* (NOTE: Scrolled views either automatically become the "responder" or release the
* "interaction lock". A native scroll view that isn't built on top of the responder
* system must result in the current "responder" being notified that it no longer has
* the "interaction lock" - the native system has taken over.
*
* Responder being released:
*
* As soon as there are no more active pointers that *started* inside descendants
* of the *current* "responder", an `onResponderRelease` event is dispatched to the
* current "responder", and the responder lock is released.
*
* Typical sequence of events:
* * startShouldSetResponder
* * responderGrant/Reject
* * responderStart
* * responderMove
* * responderEnd
* * responderRelease
*/

# 1.56 util-deprecate 1.0.2

## 1.56.1 Available under license :

No license file was found, but licenses were detected in source scan.

```
util-deprecate
```

```
=====
```

```
### The Node.js `util.deprecate()` function with browser support
```

In Node.js, this module simply re-exports the `util.deprecate()` function.

In the web browser (i.e. via browserify), a browser-specific implementation of the `util.deprecate()` function is used.

```
## API
```

A `deprecate()` function is the only thing exposed by this module.

```
``` javascript
```

```
// setup:
```

```
exports.foo = deprecate(foo, 'foo() is deprecated, use bar() instead');
```

```
// users see:
```

```
foo();
```

```
// foo() is deprecated, use bar() instead
```

```
foo();
```

```
foo();
```

```
```
```

```
## License
```

PostCSS will use that method\n * as

```

described in #2. Another `{@link Processor}` instance. `PostCSS` will copy plugins from that instance into this one. Plugins can also be added by passing them as arguments when creating a `postcss` instance (see `[postcss(plugins)]`). Asynchronous plugins should return a `Promise` instance.

`@param {Plugin|pluginFunction|Processor} plugin` - `PostCSS` plugin or `{@link Processor}` with plugins

`@example` `const processor = postcss().use(autoprefixer).use(precss);`

`@return` `{Processes}` current processor to make methods chain

`use(plugin)` `{this.plugins = this.plugins.concat(this.normalize([plugin]); return this;}`

Parses source CSS and returns a `{@link LazyResult}` Promise proxy. Because some plugins can be asynchronous it doesn't make any transformations. Transformations will be applied in the `{@link LazyResult}` methods.

`@param {string|toString|Result} css` - String with input CSS or any object with a `toString()` method, like a `Buffer`.

Optionally, send a `{@link Result}` instance and the processor will take the `{@link Root}` from it.

`@param {processOptions} [opts]` - options

`@return` `{LazyResult}` Promise proxy

`@example` `processor.process(css, { from: 'a.css', to: 'a.out.css' }).then(result => { console.log(result.css); });`

`process(css, opts = {})` `{return new LazyResult(this, css, opts);}`

`normalize(plugings)` `{let normalized = []; plugings.forEach(i => { if (i.postcss) i = i.postcss; if (typeof i === 'object' && Array.isArray(i.plugins)) { normalized = normalized.concat(i.plugins); } else if (typeof i === 'function') { normalized.push(i); } else { throw new Error(`${i} is not a PostCSS plugin`); } }); return normalized;}`

`export default Processor;`

`import './rule';` // break cyclical dependency deadlock – #87

`import Container from './container';`

`import LazyResult from './lazy-result';`

`import Processor from './processor';`

`import warnOnce from './warn-once';`

Represents a CSS file and contains all its parsed nodes.

`@extends` `Container`

`@example` `const root = postcss.parse('a{color:black} b{z-index:2}');` `root.type // => 'root'`

`root.nodes.length // => 2`

`class Root extends Container` `{constructor(defaults) {super(defaults); this.type = 'root'; if (!this.nodes) this.nodes = [];}`

`removeChild(child)` `{child = this.index(child); if (child === 0 && this.nodes.length > 1) { this.nodes[1].raws.before = this.nodes[child].raws.before; } return super.removeChild(child);}`

`normalize(child, sample, type)` `{const nodes = super.normalize(child); if (sample) { if (type === 'prepend') { if (this.nodes.length > 1) { sample.raws.before = this.nodes[1].raws.before; } else { delete sample.raws.before; } } else if (this.first !== sample) { nodes.forEach(node => { node.raws.before = sample.raws.before; }); } } return nodes;}`

Returns a `{@link Result}` instance representing the root's CSS.

`@param {processOptions} [opts]` - options with only ``to`` and ``map`` keys

`@return` `{Result}` result with current root's CSS

`@example` `const root1 = postcss.parse(css1, { from: 'a.css' });`

`const root2 = postcss.parse(css2, { from: 'b.css' });`

`root1.append(root2);`

`const result = root1.toResult({ to: 'all.css', map: true });`

`toResult(opts = {})` `{const lazy = new LazyResult(new Processor(), this, opts); return lazy.stringify();}`

`remove(child)` `{warnOnce('Root#remove is deprecated. Use Root#removeChild'); this.removeChild(child);}`

`prevMap()` `{warnOnce('Root#prevMap is deprecated. Use Root#source.input.map'); return this.source.input.map;}`

`@memberof` `Root#`

`@member` `{object}` `raws` - Information to generate byte-to-byte equal node string as it was in the origin input.

Every parser saves its own properties, but the default CSS parser uses:

- `after`: the space symbols after the last child to the end of file
- `semicolon`: is the last child has an (optional) semicolon

`@example` `postcss.parse('a {}').raws // => { after: '\n' }`

`postcss.parse('a { }').raws // => { after: " } \n" }`

`export default Root;`

`import './root';` // break cyclical dependency deadlock – #87

`import CssSyntaxError from './css-syntax-error';`

`import PreviousMap from './previous-map';`

`let sequence = 0;`

`@typedef` `{object}` `filePosition`

`@property` `{string}` `file` - path to file

`@property` `{number}` `line` - source line in file

`@property` `{number}` `column` - source column in file

Represents the source CSS.

`@example` `const root = postcss.parse(css, { from: file });`

`const input = root.source.input;`

`class Input` `{`

/**
 * @memberof Node#
 * @member {string} type - String representing the node's type.
 * Possible values are `root`,
`atrule`, `rule`,
 * `decl`, or `comment`.
 * @example
 * postcss.decl({ prop: 'color',
value: 'black' }).type // => 'decl'
 * @memberof Node#
 * @member {Container} parent - the
node's parent node.
 * @example
 * root.nodes[0].parent === root;
 * @memberof
Node#
 * @member {source} source - the input source of the node
 * The property is used in source map
generation.
 * If you create a node manually (e.g., with `postcss.decl()`),
 * that node will not have a
`source` property and will be absent
 * from the source map. For this reason, the plugin developer should
 * consider cloning nodes to create new ones (in which case the new node's
 * source will reference the original,
cloned node) or setting
 * the `source` property manually.
 * // Bad
 * const prefixed =
postcss.decl({
 * prop: '-moz-' + decl.prop,
 * value: decl.value
 * });
 * // Good
 * const prefixed
= decl.clone({ prop: '-moz-' + decl.prop });
 * // Bad
 * if ( atrule.name === 'add-link' ) {
 * const
rule = postcss.rule({ selector: 'a', source: atrule.source });
 * atrule.parent.insertBefore(atrule, rule);
 * }
 * // Bad
 * @example
 * decl.source.input.from // => '/home/ai/a.sass'
 * decl.source.start // => { line: 10,
column: 2 }
 * decl.source.end // => { line: 10, column: 12 }
 * @memberof Node#
 * @member {object} raws - Information to generate byte-to-byte equal
node string as it was in the
origin input.
 * Every parser saves its own properties,
 * but the default CSS parser uses:
 * `before`: the space symbols before the node. It also stores ` ` and ` _ ` symbols before the declaration (IE
hack).
 * `after`: the space symbols after the last child of the node
 * to the end of the node.
 * `between`: the symbols between the property and value
 * for declarations, selector and `{` for rules, or last
parameter
 * and `{` for at-rules.
 * `semicolon`: contains true if the last child has
 * an (optional)
semicolon.
 * `afterName`: the space between the at-rule name and its parameters.
 * `left`: the space
symbols between `/*` and the comment's text.
 * `right`: the space symbols between the comment's text
 * and <code>*&#47;</code>.
 * `important`: the content of the important statement,
 * if it is not just
`important`.
 * PostCSS cleans selectors, declaration values and at-rule parameters
 * from comments and
extra spaces, but it stores origin content in raws
 * properties. As such, if you don't change a declaration's
value,
 * PostCSS will use the raw value with comments.
 * @example
 * const root = postcss.parse('a
{
 * color:black
}')
```

root.first.first.raws // => { before: '\n ', between: ':' }

```

}

  before the node. It also stores ` ` \n   * and ` _ ` symbols before the declaration (IE hack).\n   * * `after`: the space
  
```

symbols after the last child of the node  
\* to the end of the node.  
\* \* `between`: the symbols between the property and value  
\* for declarations, selector and `{` for rules, or last parameter  
\* and `{` for at-rules.  
\* `semicolon`: contains true if the last child has an (optional) semicolon.  
\* `afterName`: the space between the at-rule name and its parameters.  
\* \* PostCSS cleans at-rule parameters from comments and extra spaces,  
\* but it stores origin content in raws properties.  
\* As such, if you don't change a declaration's value,  
\* PostCSS will use the raw value with comments.  
\* @example  
\* const root = postcss.parse('@media\nprint {\n})  
\* root.first.first.raws // => { before: ' ',  
\* // between: ' ',  
\* // afterName: '\n',  
\* // after: '\n'}  
\* \n\nexport default AtRule;  
\* @flow  
\* \*\*\n \* Contains helpers for safely splitting lists of CSS values,  
\* preserving parentheses and quotes.  
\* @example  
\* const list = postcss.list;  
\* @namespace list  
\* \n\nconst list = {\n \* split(string, separators, last) {\n \* const array = [];  
\* let current = '';  
\* let split = false;  
\* let func = 0;  
\* let quote = false;  
\* let escape = false;  
\* for (let i = 0; i < string.length; i++) {\n \* const letter = string[i];  
\* if (quote) {\n \* if (escape) {\n \* escape = false;  
\* } else if (letter === '\\') {\n \* escape = true;  
\* } else if (letter === quote) {\n \* quote = false;  
\* }  
\* } else if (letter === '\"' || letter === '\'') {\n \* quote = letter;  
\* } else if (letter === '(') {\n \* func += 1;  
\* } else if (letter === ')') {\n \* if (func > 0) func -= 1;  
\* } else if (func === 0) {\n \* if (separators.indexOf(letter) !== -1) split = true;  
\* }  
\* if (split) {\n \* if (current !== '')  
\* array.push(current.trim());  
\* current = '';  
\* split = false;  
\* } else {\n \* current += letter;  
\* }  
\* }  
\* if (last || current !== '') array.push(current.trim());  
\* return array;  
\* }  
\* \n\n \* }  
\* \*\*\n \* Safely splits space-separated values (such as those for `background`, `border-radius`, and other shorthand properties).  
\* @param {string} string - space-separated values  
\* @return {string[]} splitted values  
\* @example  
\* postcss.list.space('1px calc(10% + 1px)') // => ['1px', 'calc(10% + 1px)']  
\* \n\n \* space(string) {\n \* const spaces = [' ', '\n', '\t'];  
\* return list.split(string, spaces);  
\* }  
\* \n\n \* }  
\* \*\*\n \* Safely splits comma-separated values (such as those for `transition-\*` and `background` properties).  
\* @param {string} string - comma-separated values  
\* @return {string[]} splitted values  
\* @example  
\* postcss.list.comma('black, linear-gradient(white, black)')  
\* // => ['black', 'linear-gradient(white, black)']  
\* \n\n \* comma(string) {\n \* const comma = ',';  
\* return list.split(string, [comma], true);

CSS through synchronous plugins and returns `{ @link Result#map }`. This property will only work with synchronous plugins. If the processor contains any asynchronous plugins it will throw an error. This is why this method is only for debug purpose, you should always use `{ @link LazyResult#then }`.

`@type {SourceMapGenerator}` `@see Result#map` `get map()` `{ return this.stringify().map; }`

Processes input CSS through synchronous plugins and returns `{ @link Result#root }`. This property will only work with synchronous plugins. If the processor contains any asynchronous plugins it will throw an error. This is why this method is only for debug purpose, you should always use `{ @link LazyResult#then }`.

`@type {Root}` `@see Result#root` `get root()` `{ return this.sync().root; }`

Processes input CSS through synchronous plugins and returns `{ @link Result#messages }`. This property will only work with synchronous plugins. If the processor contains any asynchronous plugins it will throw an error. This is why this method is only for debug purpose, you should always use `{ @link LazyResult#then }`.

`@type {Message[]}` `@see Result#messages` `get messages()` `{ return this.sync().messages; }`

Processes input CSS through synchronous plugins and calls `{ @link Result#warnings }`.

`@return {Warning[]}` warnings from plugins `warnings()` `{ return this.sync().warnings; }`

Alias for the `{ @link LazyResult#css }` property. `@example` `lazy + " === lazy.css;` `@return {string}` output CSS `toString()` `{ return this.css; }`

Processes input CSS through synchronous and asynchronous plugins and calls `onFulfilled` with a Result instance. If a plugin throws an error, the `onRejected` callback will be executed. It implements standard Promise API.

`@param {onFulfilled}` `onFulfilled` - callback will be executed when all plugins will finish work

`@param {onRejected}` `onRejected` - callback will be executed on any error

`@return {Promise}` Promise API to make queue `@example`

```

postcss([cssnext]).process(css).then(result => { console.log(result.css); });
.then(onFulfilled, onRejected) { return this.async().then(onFulfilled, onRejected); }
Processes input CSS through synchronous and asynchronous plugins and calls onRejected for each error thrown in any plugin. It implements standard Promise API.
@param {onRejected} onRejected - callback will be executed on any error
@return {Promise} Promise API to make queue
@example
postcss([cssnext]).process(css).then(result => { console.log(result.css); }).catch(error => { console.error(error); });
.catch(onRejected) { return this.async().catch(onRejected); }
handleError(error, plugin) { try { this.error = error; if (error.name === 'CssSyntaxError' && !error.plugin) { error.plugin = plugin.postcssPlugin; error.setMessage(); } else if (plugin.postcssVersion) { const pluginName = plugin.postcssPlugin; const pluginVer = plugin.postcssVersion; const runtimeVer = this.result.processor.version; const a = pluginVer.split('.'); const b = runtimeVer.split('.'); if (a[0] !== b[0] || parseInt(a[1]) > parseInt(b[1])) { warnOnce(`Your current PostCSS version ' + is ' ${runtimeVer}, but ${pluginName} ` + uses ${pluginVer}. ```

function. PostCSS will pass the function a `@{link Root}` as the first argument and current `{@link Result}` instance as the second. An object with a ``postcss`` method. PostCSS will use that method as described in #2. Another `{@link Processor}` instance. PostCSS will copy plugins from that instance into this one. Plugins can also be added by passing them as arguments when creating a ``postcss`` instance (see `[`postcss(plugins)`]`). Asynchronous plugins should return a ``Promise`` instance.

`@param {Plugin|pluginFunction|Processor} plugin` - PostCSS plugin or `{@link Processor}` with plugins

`@example` `const processor = postcss().use(autoprefixer).use(processing);`

`@return {Processes}` current processor to make methods chain

```
use(plugin) {
  this.plugins = this.plugins.concat(this.normalize([plugin]));
  return this;
}
```

Parses source CSS and returns a `{@link LazyResult}` Promise proxy. Because some plugins can be asynchronous it doesn't make any transformations. Transformations will be applied in the `{@link LazyResult}` methods.

`@param {string|toString|Result} css` - String with input CSS or any object with a ``toString`` method, like a Buffer.

Optionally, send a `{@link Result}` instance and the processor will take the `{@link Root}` from it.

`@param {processOptions} [opts]` - options

`@return {LazyResult}` Promise proxy

`@example` `processor.process(css, { from: 'a.css', to: 'a.out.css' })`

```
.then(result => {
  console.log(result.css);
});
```

```
process(css, opts = {}) {
  return new LazyResult(this, css, opts);
}
```

```
normalize(plugs) {
  let normalized = [];
  plugs.forEach(i => {
    if (i.postcss) i = i.postcss;
    if (typeof i === 'object' && Array.isArray(i.plugins)) {
      normalized = normalized.concat(i.plugins);
    } else if (typeof i === 'function') {
      normalized.push(i);
    } else {
      throw new Error(`${i} is not a PostCSS plugin`);
    }
  });
  return normalized;
}
```

export default Processor;

```
import './rule'; // break cyclical dependency deadlock - #87
import Container from './container';
import LazyResult from './lazy-result';
import Processor from './processor';
import warnOnce from './warn-once';
```

Represents a CSS file and contains all its parsed nodes.

`@extends Container`

`@example` `const root = postcss.parse('a{color:black} b{z-index:2}');` `root.type` `//=> 'root'` `root.nodes.length` `//=> 2`

```
class Root extends Container {
  constructor(defaults) {
    super(defaults);
    this.type = 'root';
    if (!this.nodes) this.nodes = [];
  }
  removeChild(child) {
    child = this.index(child);
    if (child === 0 && this.nodes.length > 1) {
      this.nodes[1].raws.before = this.nodes[child].raws.before;
    }
    return super.removeChild(child);
  }
  normalize(child, sample, type) {
    const nodes = super.normalize(child);
    if (sample) {
      if (type === 'prepend') {
        if (this.nodes.length > 1) {
          sample.raws.before = this.nodes[1].raws.before;
        } else {
          delete sample.raws.before;
        }
      } else if (this.first !== sample) {
        nodes.forEach(node => {
          node.raws.before = sample.raws.before;
        });
      }
    }
    return nodes;
  }
}
```

Returns a `{@link Result}` instance representing the root's CSS.

`@param {processOptions} [opts]` - options with only ``to`` and ``map`` keys

`@return {Result}` result with current root's CSS

`@example` `const root1 = postcss.parse(css1, { from: 'a.css' });` `const root2 = postcss.parse(css2, { from: 'b.css' });` `root1.append(root2);` `const result = root1.toResult({ to: 'all.css', map: true });`

```
toResult(opts = {}) {
  const lazy = new LazyResult(new Processor(), this, opts);
  return lazy.stringify();
}
```

```
remove(child) {
  warnOnce('Root#remove is deprecated. Use Root#removeChild');
  this.removeChild(child);
}
```

```
prevMap() {
  warnOnce('Root#prevMap is deprecated. Use Root#source.input.map');
  return this.source.input.map;
}
```

`@memberof Root#` `@member {object} raws` - Information to generate byte-to-byte equal node string as it was in the origin input.

Every parser saves its own properties, but the default CSS parser uses:

- ``after``: the space symbols after the last child to the end of file
- ``semicolon``: is the last child has an (optional) semicolon

`@example` `postcss.parse('a {}').raws` `//=> { after: '\n' }` `postcss.parse('a { }').raws` `//=> { after: " }\n" }`

```
export default Root;
```

```
import './root'; // break cyclical dependency deadlock - #87
import CssSyntaxError from './css-syntax-error';
import PreviousMap from './previous-map';
let sequence = 0;
```

`@typedef {object} filePosition`

`@property {string} file` - path to file

`@property {number} line` - source line in file

`@property {number}`

```

 \* root.nodes[0].parent == root;  
 \*\n \* @memberof Node#\n \* @member {source} source - the input source of the node.  
 \*\n \* The property is used in source map generation.  
 \*\n \* If you create a node manually (e.g., with `postcss.decl()`),  
 \* that node will not have a `source` property and will be absent  
 \* from the source map. For this reason, the plugin developer should  
 \* consider cloning nodes to create new ones (in which case the new node's  
 \* source will reference the original, cloned node) or setting  
 \* the `source` property manually.  
 \*\n \* `js` // Bad  
 \* const prefixed = postcss.decl({\n \* prop: '-moz-' + decl.prop,  
 \* value: decl.value  
 \* });  
 \*\n \* // Good  
 \* const prefixed = decl.clone({\n \* prop: '-moz-' + decl.prop  
 \* });  
 \*\n \* `js` if ( atrule.name === 'add-link' ) {\n \* const rule = postcss.rule({\n \* selector: 'a',\n \* source: atrule.source\n \* });  
 \* atrule.parent.insertBefore(atrule, rule);\n \* }\n \*\n \* @example  
 \* decl.source.input.from //=> '/home/ai/a.sass'\n \* decl.source.start //=> { line: 10, column: 2 }\n \* decl.source.end //=> { line: 10, column: 12 }\n \* ^\n \* @memberof Node#\n \* @member {object} raws - Information to generate byte-to-byte equal  
 \* node string as it was in the origin input.  
 \*\n \* Every parser saves its own properties,  
 \* but the default CSS parser uses:  
 \*\n \* \* `before`: the space symbols before the node. It also stores ` ` and ` ` symbols before the declaration (IE hack).  
 \* \* `after`: the space symbols after the last child of the node  
 \* to the end of the node.  
 \* \* `between`: the symbols between the property and value  
 \* for declarations, selector and `{` for rules, or last parameter  
 \* and `{` for at-rules.  
 \* \* `semicolon`: contains true if the last child has  
 \* an (optional) semicolon.  
 \* \* `afterName`: the space between the at-rule name and its parameters.  
 \* \* `left`: the space symbols between `/\*` and the comment's text.  
 \* \* `right`: the space symbols between the comment's text  
 \* and `<code>\*&#47;</code>`.  
 \* \* `important`: the content of the important statement,  
 \* if it is not just `!important`.  
 \*\n \* PostCSS cleans selectors, declaration values and at-rule parameters  
 \* from comments and

extra spaces, but it stores origin content in `raws` properties. As such, if you don't change a declaration's value, PostCSS will use the raw value with comments.

```

@example
const root = postcss.parse('a { color:black}');
root.first.first.raws // => { before: '\n ', between: ':' }

```

Represents a CSS declaration.

```

@extends Node
@example
const root = postcss.parse('a { color: black }');
const decl = root.first.first;
decl.type // => 'decl'
decl.toString() // => 'color: black'

```

Extends `Node`

```

  this.raws.important = val;
}

```

Member of `Declaration`

```

@member {string} prop - the declaration's property name
@example
const root = postcss.parse('a { color: black }');
const decl = root.first.first;
decl.prop // => 'color'

```

Member of `Declaration`

```

@member {string} value - the declaration's value
@example
const root = postcss.parse('a { color: black }');
const decl = root.first.first;
decl.value // => 'black'

```

Member of `Declaration`

```

@member {boolean} important - `true` if the declaration has an !important annotation.
@example
const root = postcss.parse('a { color: black !important; color: red }');
root.first.first.important // => true
root.first.last.important // => undefined

```

Member of `Declaration`

```

@member {object} raws - Information to generate byte-to-byte equal node string as it was in the origin input.
Every parser saves its own properties, but the default CSS parser uses:
- `before`: the space symbols before the node. It also stores ` ` and ` ` symbols before the declaration (IE hack).
- `between`: the symbols between the property and value for declarations, selector and ` ` for rules, or last parameter and ` ` for at-rules.
- `important`: the content of the important statement, if it is not just `!important`.
PostCSS cleans declaration from comments and extra spaces, but it stores origin content in raws properties.
As such, if you don't change a declaration's value, PostCSS will use the raw value with comments.
@example
const root = postcss.parse('a {\n color:black\n}');
root.first.first.raws // => { before: '\n ', between: ':' }

```

Represents a comment between declarations or statements (rule and at-rules).

```

Comments inside selectors, at-rule parameters, or declaration values will be stored in the `raws` properties explained above.
@extends Node

```

Contains plugins to process CSS. Create one `Processor` instance, initialize its plugins, and then use that instance on numerous CSS files.

```

const processor = postcss([autoprefixer, precss]);
processor.process(css1).then(result => console.log(result.css));
processor.process(css2).then(result => console.log(result.css));

```

**class Processor** {  
**plugins** - PostCSS plugins. See [Processor#use](#) for plugin format.  
**constructor**(plugins = [])  
**string** - Current PostCSS version.  
**example**  
 if (result.processor.version.split('.')[0] !== '5') {  
 throw new Error('This plugin works only with PostCSS 5');  
 }  
 this.version = '5.2.0';  
**pluginFunction[]** - Plugins added to this processor.  
**example**  
 const processor = postcss([autoprefixer, precss]);  
 processor.plugins.length // => 2  
 this.plugins = this.normalize(plugins);  
 }  
**pluginFunction[]** - Adds a plugin to be used as a CSS processor.  
**PostCSS plugin can be in 4 formats:**  
**A plugin created by [postcss.plugin](#) method.**  
**A function.** PostCSS will pass the function a [Root](#) as the first argument and current [Result](#) instance as the second.  
**An object with a `postcss` method.** PostCSS will use that method as described in #2.  
**Another [Processor](#) instance.** PostCSS will copy plugins from that instance into this one.  
**Plugins can also be added by passing them as arguments when creating a `postcss` instance (see `postcss(plugins)`).**  
**Asynchronous plugins should return a `Promise` instance.**  
**plugin** - PostCSS plugin or [Processor](#) with plugins  
**example**  
 const processor = postcss()  
 .use(autoprefixer)  
 .use(precss);  
**return** {Processes} current processor to make methods chain  
 use(plugin) {  
 this.plugins = this.plugins.concat(this.normalize([plugin]));  
 return this;  
 }  
**Parses source CSS and returns a [LazyResult](#) Promise proxy.** Because some plugins can be asynchronous it doesn't make any transformations. Transformations will be applied in the [LazyResult](#) methods.  
**css** - String with input CSS or any object with a `toString()` method, like a Buffer.  
**Optional, send a [Result](#) instance and the processor will take the [Root](#) from it.**  
**processOptions** [opts] - options  
**example**  
 processor.process(css, { from: 'a.css', to: 'a.out.css' })  
 .then(result => {  
 console.log(result.css);  
 });  
 process(css, opts = {}) {  
 return new LazyResult(this, css, opts);  
 }  
**normalize(plugins)** {  
 let normalized = [];  
 plugins.forEach(i => {  
 if (i.postcss) i = i.postcss;  
 if (typeof i === 'object' && Array.isArray(i.plugins)) {  
 normalized = normalized.concat(i.plugins);  
 } else if (typeof i === 'function') {  
 normalized.push(i);  
 } else {  
 throw new Error(`\${i} is not a PostCSS plugin`);  
 }  
 });  
 return normalized;  
 }  
**export default Processor;**  
**rule;** // break cyclical dependency deadlock – #87  
**Container** from './container';  
**LazyResult** from './lazy-result';  
**Processor** from './processor';  
**warnOnce** from './warn-once';  
**Represents a CSS file and contains all its parsed nodes.**  
**extends Container**  
**example**  
 const root = postcss.parse('a{color:black} b{z-index:2}');  
 root.type // => 'root'  
 root.nodes.length // => 2  
**class Root extends Container** {  
 constructor(defaults) {  
 super(defaults);  
 this.type = 'root';  
 if (!this.nodes) this.nodes = [];  
 }  
 removeChild(child) {  
 child = this.index(child);  
 if (child === 0 && this.nodes.length > 1) {  
 this.nodes[1].raws.before = this.nodes[child].raws.before;  
 }  
 return super.removeChild(child);  
 }  
 normalize(child, sample, type) {  
 const nodes = super.normalize(child);  
 if (sample) {  
 if (type === 'prepend') {  
 if (this.nodes.length > 1) {  
 sample.raws.before = this.nodes[1].raws.before;  
 } else {  
 delete sample.raws.before;  
 }  
 } else if (this.first !== sample) {  
 nodes.forEach(node => {  
 node.raws.before = sample.raws.before;  
 });  
 }  
 }  
 return nodes;  
 }  
 }  
**Returns a [Result](#) instance representing the root's CSS.**  
**processOptions** [opts] - options with only `to` and `map` keys  
**return** {Result} result with current root's CSS  
**example**  
 const root1 = postcss.parse(css1, { from: 'a.css' });  
 const root2 = postcss.parse(css2, { from: 'b.css' });  
 root1.append(root2);  
 const result = root1.toResult({ to: 'all.css', map: true });  
 toResult(opts = {}) {  
 const lazy = new LazyResult(new

components/styled-components/issues/1941#issuecomment-417862021

"11": "\_This error was replaced with a dev-time warning, it will be deleted for v4 final. [createGlobalStyle] received children which will not be rendered. Please use the component without passing children elements."

"12": "It seems you are interpolating a keyframe declaration (%s) into an untagged string. This was supported in styled-components v3, but is not longer supported in v4 as keyframes are now injected on-demand. Please wrap your string in the css` helper which ensures the styles are injected correctly. See <https://www.styled-components.com/docs/api#css>"

"13": "%s is not a styled component and cannot be referred to via component selector. See <https://www.styled-components.com/docs/advanced#referring-to-other-components> for more details."

"14": "ThemeProvider: `theme` prop is required."

"15": "A stylis plugin has been supplied that is not named. We need a name for each plugin to be able to prevent styling collisions between different stylis configurations within the same app. Before you pass your plugin to `<StyleSheetManager stylisPlugins={[]}>`, please make sure each plugin is uniquely-named, e.g. `js\nObject.defineProperty(importedPlugin, 'name', { value: 'some-unique-name' });`"

"16": "Reached the limit of how many styled components may be created at group %s. You may only create up to 1,073,741,824 components. If you're creating components dynamically, for instance in your render method then you may be running into this limitation."

"17": "CSSStyleSheet could not be found on HTMLStyleElement. Has styled-components' style tag been unmounted or altered by another script?"

```

```

`maps`.  
`@property {parser} parser` - function to generate AST by string  
`@property {stringifier} stringifier` - class to generate string by AST  
`@property {syntax} syntax` - object with ``parse`` and ``stringify``  
`@property {object} map` - source map options  
`@property {boolean} map.inline` - does source map should be embedded in the output  
`CSS as a base64-encoded`  
`@property comment`  
`{string|object|false|function} map.prev` - source map content from a previous  
processing step  
(for example, Sass).  
`PostCSS will try to find`  
previous map  
automatically, so you could disable it by  
``false` value.`  
`@property {boolean} map.sourcesContent` - does PostCSS should set  
the origin content to map  
`@property {string|false} map.annotation` - does  
PostCSS should set  
annotation comment to map  
`@property {string} map.from` - override ``from`` in map's  
``sources``  
Contains plugins to process CSS. Create one ``Processor`` instance,  
initialize its plugins, and then use that instance on numerous CSS files.  
`@example` `const processor = postcss([autoprefixer, precss]);`  
`processor.process(css1).then(result => console.log(result.css));`  
`processor.process(css2).then(result => console.log(result.css));`  
`class Processor {`  
 `constructor(plugins = [])`  
 `plugins - PostCSS plugins. See Processor#use for plugin format.`  
 `version` - Current PostCSS version.  
`@example` `if (result.processor.version.split('.')[0] !== '5')`  
 `throw new Error('This plugin works only with PostCSS 5');`  
`this.version = '5.2.0';`  
 `plugins` - Plugins added to this processor.  
`@example` `const processor = postcss([autoprefixer, precss]);`  
`processor.plugins.length //> 2`  
`this.plugins = this.normalize(plugins);`  
 `} Adds a plugin to be used as a CSS processor.`  
PostCSS plugin can be in 4 formats:  
\*\* A plugin created by `postcss.plugin()` method.  
\*\* A function. PostCSS will pass the function a `Root` as the first argument and current `Result` instance as the second.  
\*\* An object with a ``postcss`` method. PostCSS will use that method as described in #2.  
\*\* Another `Processor` instance. PostCSS will copy plugins from that instance into this one.  
Plugins can also be added by passing them as arguments when creating a ``postcss`` instance (see `postcss(plugins)`).  
Asynchronous plugins should return a ``Promise`` instance.  
`@param {Plugin|pluginFunction|Processor} plugin` - PostCSS plugin or `Processor`  
with plugins  
`@example` `const processor = postcss().use(autoprefixer).use(precss);`  
`@return {Processes}` current processor to make methods chain  
`use(plugin)` `this.plugins = this.plugins.concat(this.normalize([plugin]));`  
`return this;`  
Parses source CSS and returns a `LazyResult` Promise proxy.  
Because some plugins can be asynchronous it doesn't make any transformations. Transformations will be applied in the `LazyResult` methods.  
`@param {string|toString|Result} css` - String with input CSS or any object with a ``toString`` method, like a `Buffer`.  
Optionally, send a `Result` instance and the processor will take the `Root` from it.  
`@param {processOptions} [opts]` - options  
`@return {LazyResult}` Promise proxy  
`@example` `processor.process(css, { from: 'a.css', to: 'a.out.css' })`  
`.then(result => console.log(result.css));`  
`process(css, opts = {})` `return new LazyResult(this, css, opts);`  
`normalize(plugins)` `let normalized = [];`  
`plugins.forEach(i => if (i.postcss) i = i.postcss;`  
`if (typeof i === 'object' && Array.isArray(i.plugins))`  
`normalized = normalized.concat(i.plugins);`  
`else if (typeof i === 'function')`  
`normalized.push(i);`  
`else`  
`throw new Error(`${i} is not a PostCSS plugin`);`  
`return normalized;`  
`export default Processor;`  
`import rule from './rule';`  
`import Container from './container';`  
`import LazyResult from './lazy-result';`  
`import Processor from './processor';`  
`import warnOnce from './warn-once';`  
`Represents a CSS file and contains all its parsed nodes.`  
`@extends Container`

```

with a dev-time warning, it will be deleted for v4 final. `[createGlobalStyle]` received children which will not be rendered. Please use the component without passing children elements.

"It seems you are interpolating a keyframe declaration (%s) into an untagged string. This was supported in styled-components v3, but is not longer supported in v4 as keyframes are now injected on-demand. Please wrap your string in the `css`` helper which ensures the styles are injected correctly. See <https://www.styled-components.com/docs/api#css> is not a styled component and cannot be referred to via component selector. See <https://www.styled-components.com/docs/advanced#referring-to-other-components> for more details.

"ThemeProvider: `theme` prop is required.

"A stylis plugin has been supplied that is not named. We need a name for each plugin to be able to prevent styling collisions between different stylis configurations within the same app. Before you pass your plugin to `<StyleSheetManager stylisPlugins={[]}>`, please make sure each plugin is uniquely-named, e.g. `jsObject.defineProperty(importedPlugin, 'name', { value: 'some-unique-name' });`

"Reached the limit of how many styled components may be created at group %s. You may only create up to 1,073,741,824 components. If you're creating components dynamically, as for instance in your render method then you may be running into this limitation.

"CSSStyleSheet could not be found on HTMLStyleElement.

Has styled-components' style tag been unmounted or altered by another script?
