

# Cisco Connected Mass Transit Reference Architecture

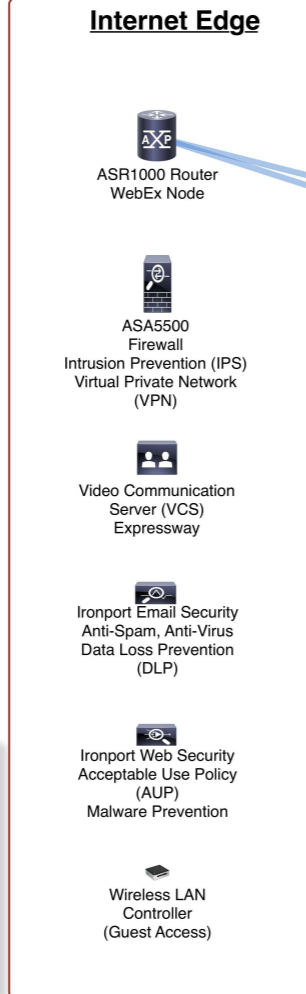

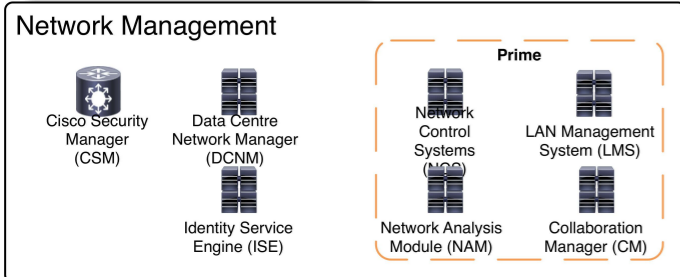

The Mobile TeleWorker gains flexibility and productivity. Cisco delivers a suite of teleworking solutions with a cost-effective approach that preserves business security and agility, increases productivity, and reduce costs by continuously connecting the TeleWorker, anytime, from every location at home or on the road.

Cisco Security solutions protect assets and empowers the workforce. Context-aware security provides high level intelligence, policy governance, and enforcement capabilities. Significantly enhancing the accuracy, effectiveness, and timeliness of any organisation's security implementation.

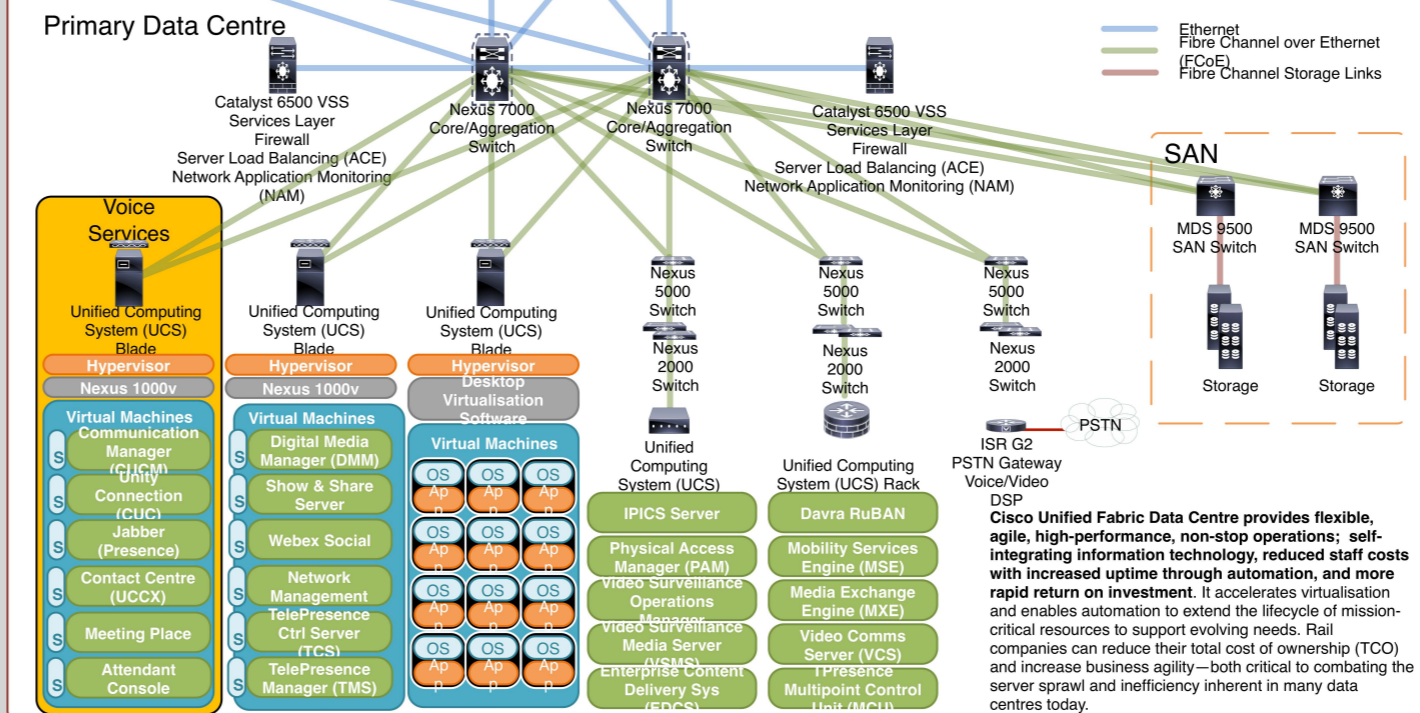

Cloud Services can offer savings in IT resources such as computing storage and application services. "The Cloud" can provide these services as elastic resources that are suitable for use in existing or new applications without a large investment in capital resources and ongoing maintenance costs. WebEx delivers online meetings and easy-to-use web collaboration tools to the entire workforce. Scansafe keeps malware off the corporate network and more effectively controls and secures web usage.

Wide Area Application Services (WAAS) is a comprehensive WAN optimization solution that accelerates applications over the WAN, delivers video to the branch office, and provides local hosting of branch-office IT services. Cisco WAAS allows IT departments to centralize applications and storage in the Data Centre while maintaining LAN-like application performance.

IP/MPLS in the WAN enables converged secure link virtualisation. It reduces overall costs by supporting multiple logical networks across a single physical infrastructure.

Cisco Unified Fabric Data Centre provides flexible, agile, high-performance, non-stop operations; self-integrating information technology, reduced staff costs with increased uptime through automation, and more rapid return on investment. It accelerates virtualisation and enables automation to extend the lifecycle of mission-critical resources to support evolving needs. Rail companies can reduce their total cost of ownership (TCO) and increase business agility—both critical to combating the server sprawl and inefficiency inherent in many data centres today.
