## Einführung

In diesem Dokument wird die **set path-selection**-Anweisung in einer Routenrichtlinie für Border Gateway Protocol (BGP) in Cisco IOS®-XR beschrieben.

## Hintergrundinformationen

Viele Designs streben an, dass BGP mehrere Pfade für ein Präfix auswählt und ankündigt.

Standardmäßig wird nur ein BGP-Pfad als bestmöglicher Pfad ausgewählt, und es wird nur dieser beste Pfad angekündigt. Der BGP-Algorithmus für die beste Pfadauswahl entscheidet:

[BGP – Algorithmus für die Auswahl des besten Pfads](#)

Neben dem besten Pfad kann ein zweitbesten Pfad als Backup-Pfad ausgewählt werden. Dieser Sicherungspfad kann in Designs mit BGP PIC (Prefix Independent Convergence) verwendet

werden.

Das BGP kann mehrere Pfade installieren, um einen Lastenausgleich zu erreichen. Dabei kann es sich um ECMP-Lastenausgleich (Equal Cost Multipath) oder UCMP (Unqual Cost Multipath) handeln. Diese Multipath-Routing-Tabellen (RIB) und die Daten- oder FIB-Tabelle (Forwarding Instance Base) werden installiert, um einen Lastenausgleich zu erreichen. Die FIB-Tabelle wird auch als CEF-Tabelle (Cisco Express Forwarding) bezeichnet.

Der Schwerpunkt dieses Artikels liegt auf zwei Zielen:

- Wie kann BGP mehrere Pfade für die Installation auswählen?
- Wie kann BGP mehrere Pfade ankündigen?

BGP verwendet außerdem zusätzliche Pfade (ADD-Pfade). Mit dieser Funktion kann BGP mehr als einen Pfad über eine BGP-Sitzung angeben.

## Zusammenfassung

- Der beste Pfad wird immer vom BGP ausgewählt. Wenn nicht, ist etwas falsch. Dieser Artikel behandelt diese Szenarien nicht.
- Ein Sicherungspfad kann ausgewählt werden, wenn die jeweilige Funktion konfiguriert ist (z. B. BGP PIC).
- Eine Routing-Richtlinie kann unter einer bestimmten Adressfamilie konfiguriert werden, damit BGP die zu installierenden und/oder anzukündigenden Pfade auswählt.
- Vor Cisco IOS®-XR 7.3.1 wird nur eine **festgelegte Pfadauswahlweisung** in der Routenrichtlinie zur Auswahl von Pfaden für ein bestimmtes Präfix unterstützt.
- Zu Beginn mit Cisco IOS®-XR 7.3.1 werden mehrere **festgelegte Pfadauswahlweisungen** in der Routenrichtlinie zur Auswahl von Pfaden für ein bestimmtes Präfix unterstützt.
- Ab Cisco IOS®-XR 7.3.1 wurde eine Funktion hinzugefügt, mit der eine Routingrichtlinie verwendet werden kann, um einem BGP-Nachbarn bestimmte Pfade für ein BGP-Präfix anzukündigen.

Die Auswahl von Multipath-Pfaden durch BGP erfolgt in der Reihenfolge des Empfangs der Pfade. Die Befehle **show bgp** zeigen jedoch die BGP-Pfade in lexikografischer Reihenfolge an.

Mit einem neuen Befehl, der in Cisco IOS®-XR 7.3.1 eingeführt wurde, können die BGP-Pfade in der Reihenfolge angezeigt werden, in der sie empfangen wurden:

```
show bgp <afi> rd <rd> <path_details>
```

Dies erleichtert die Überprüfung und Fehlerbehebung von Multipath. Es löst die Hauptfrage, warum ein Pfad als Multipfad und nicht als ein anderer gewählt wird.

Ein Multipath-Protect-Pfad ist ein Backup-Pfad, der kein Multipath-Pfad ist, aber alle anderen Multipath-Pfade schützt.

Beginnend mit Cisco IOS®-XR 7.3.1 gibt es dieses neue Schlüsselwort **multipath-protect-notify** für die **set path-selection**-Anweisung. Sie kann verwendet werden, um den Multi-Path-geschützten

Pfad neben dem Backup-Pfad oder neben den Multipath-Pfaden anzukündigen. Die vollständigen Befehle, die in der Routingrichtlinie verwendet werden, sind:

```
set path-selection backup 1 install multipath-protect advertise multipath-protect-advertise
set path-selection multipath advertise multipath-protect multipath-protect-advertise
```

Dies ist eine Übersicht über den Befehl **set path-selection** mit allen seinen Schlüsselwortkombinationen. Eine ausführlichere Erläuterung und Beispiele finden Sie im nächsten Abschnitt.

In allen folgenden Fällen wird der beste Pfad installiert. Ist dies nicht der Fall, ist irgendetwas falsch (z. B. der nächste Hop ist ungültig), aber dies bezieht sich nicht auf den Befehl **set path-selection**.

Damit der Sicherungspfad ausgewählt werden kann, muss für BGP eine Funktion aktiviert sein, die die Auswahl eines BGP-Sicherungspfads ermöglicht: z. B. BGP PIC.

Multipath-Pfade werden im BGP durch den Befehl **maximum-path** der Adressfamilie aktiviert:

```
maximum-paths {ebgp | eibgp | ibgp} <2-32> (unequal-cost)
```

Der beste Pfad ist definitionsgemäß ein Multipath-Pfad. Der beste Pfad ist der einzige in der Routing-Tabelle installierte Pfad, wenn Multipath für BGP nicht aktiviert ist. Mit dem Befehl **maximum-path {ebgp}** können Sie steuern, wie viele BGP-Pfade in der Routing-Tabelle installiert sind. | **eibgp | ibgp} <2-32> (ungleiche Kosten)**.

Diese Tabelle bietet eine Übersicht über alle Optionen mit dem Befehl **set path-selection**. Weitere Details und Beispiele finden Sie im nächsten Abschnitt für jeden Fall, der hier vorgestellt wird.

Fall	Command	Installieren	Werbung
1	set path select backup 1 install	1 Backup-Pfad installiert.	Es wird nur der beste angegeben.
2	Festlegen von Pfad- Auswahl-Backup 1 kündigen	Der Sicherungspfad ist nicht installiert.	Der Sicherungspfad v angekündigt.
3	set path-selection backup 1 kündigt Installation an	Der Sicherungspfad ist installiert.	Der Sicherungspfad v angekündigt.
4	Pfadauswahl aller Anzeigen festlegen	Der Sicherungspfad ist nicht installiert. Die Multipath-Pfade werden installiert.	Alle Pfade werden angekündigt (bester P Sicherungspfad, Mult Non-Multipath-Pfad).
5	Festlegen des besten Pfads für die Pfadauswahl	Die Multipath-Pfade werden installiert.	Es wird nur der beste angegeben.
6	Einstellen von Pfadauswahl-Multipath- Werbung	Die Multipath-Pfade werden installiert.	Die Multipath-Pfade werden angekündigt.
7	set path-selection backup	Die Multipath-Pfade	Es wird nur der beste

		werden installiert. Ein anderer Pfad wird als Backup-Pfad installiert (der Pfad "backup(protect multipath)", wenn es immer noch Pfade neben den Multipath-Pfaden gibt.	
8	1 install multipath-protect  set path-selection backup 1 install multipath-protect-andame	Die Multipath-Pfade werden installiert. Ein anderer Pfad wird als Backup-Pfad installiert (der Pfad "backup(protect multipath)", wenn es immer noch Pfade neben den Multipath-Pfaden gibt.	Der beste Pfad und d Sicherungspfad werd angekündigt. Der Backup-Pfad (Multipath schützen) v nicht angekündigt.
9	Festlegen von Pfad-Auswahl Gruppe Best Advertisement	Die Auswahl der besten Gruppen ist der beste Pfad pro AS und auch pro Next-Hop. Die Multipath-Pfade werden installiert.	Alle gruppenbesten P werden angekündigt.
10	set path-selection backup 1 install multipath-protect andood-protect multipath- protect-protect-inerate	Die Multipath-Pfade werden installiert. Ein anderer Pfad wird als Backup-Pfad installiert (der Pfad "backup(protect multipath)", wenn es immer noch Pfade neben den Multipath-Pfaden gibt.	Der beste Pfad, der Sicherungspfad und d Backup-Pfad (Protect multipath) werden angekündigt.
11	Einrichtung von Pfad-Auswahl Multipath kündigen Multipath-Schutz an	Die Multipath-Pfade werden installiert.	Die Multipath-Pfade werden angekündigt. Der Backup-Pfad (Multipath schützen) v nicht angekündigt.
12	Einrichtung von Pfad-Auswahl Multipath kündigen Multipath-Protect Multipath-Protect- Advertisement	Die Multipath-Pfade werden installiert. Ein anderer Pfad wird als Backup-Pfad installiert (der Pfad "backup(protect multipath)", wenn es immer noch Pfade neben den Multipath-Pfaden gibt.	Die Multipath-Pfade werden angekündigt. Der Pfad für die Siche (Multipath schützen) v angekündigt.

Dies ist die in diesem Dokument verwendete Topologie.

In allen Fällen ist ADD-PATH zwischen RR (Route-Reflector) und PE6 aktiviert.

PE1, PE2, PE3, PE4, PE5 und PE6 weisen alle dasselbe Präfix wie die Vpnv4-Unicast-Route zum RR aus.

PE6 ist der Eingangs-PE, der dieses Präfix vom RR erhält.

Sofern nicht anders angegeben, ist ADD-PATH für jede BGP-Sitzung aktiviert, und auf dem RR wird "maximum-path ibgp 3" für "address-family vpnv4 unicast" konfiguriert.

**Hinweis:** In den RIB- und CEF-Tabellen ist maximal ein Backup-Pfad installiert. Es ist nicht mehr als eine möglich/unterstützt. Der Pfad wird in der BGP-Tabelle, der RIB-Tabelle und der CEF-Tabelle als Backup markiert.

Die Backup-Route wird in diesem Artikel immer vom BGP gewählt. Eine Backup-Route kann von einer anderen Funktion ausgewählt werden, aber hier ist sie immer BGP.

Wenn Multipath für BGP konfiguriert ist, können in der BGP-Tabelle Multipath-Pfade (ECMP oder UCMP) installiert werden. Sie sind mit **Multipath** markiert. Der Sicherungspfad ist der zweitbeste Pfad, daher sollte er einer der Multipath-Pfade sein, falls vorhanden. Dies bedeutet, dass bei einer Konfiguration dieser Funktion (dem **Multipath-Protect**-Schlüsselwort in der **Anweisung set path-selection route-policy**) vom BGP eine Sicherung(Protect multipath) ausgewählt werden kann. In diesem Fall ist dieser **Backup-Pfad (Multipath schützen)** der Backup-Pfad in der RIB- und CEF-Tabelle. Der **Backup-Pfad**, der vom BGP ausgewählt und vom BGP als solcher gekennzeichnet wurde, ist dann kein Backup-Pfad, sondern lediglich ein Multipath-Pfad.

Eine Backup-Route auf einem RR ist nicht sinnvoll, wenn dieser RR nur die Rolle eines RR übernimmt.

In diesem Artikel wird davon ausgegangen, dass der RR auch ein PE-Router ist. In diesem Fall ist es sinnvoll, eine Backup-Route auszuwählen und zu installieren. Die Backup-Route könnte für BGP PIC verwendet werden.

Eine Backup-Route wird bei Angabe des jeweiligen Präfix mit **Backup** in der RIB markiert oder mit "!", wenn das Präfix nicht angegeben wird.

## Festlegen von Pfadauswahlbefehlen in Routingrichtlinien

In diesem Abschnitt werden alle in der Routenrichtlinie für die spezifische Adressfamilie unter Router BGP verwendeten **Set-Path-Selektionsanweisungen** behandelt.

Dies gilt unabhängig von der Cisco IOS®-XR-Version vor oder nach Cisco IOS®-XR 7.3.1.

Konfiguration:

```
router bgp 65000
  address-family ipv4 unicast
```

```
!  
address-family vpnv4 unicast  
additional-paths receive  
additional-paths send  
additional-paths selection route-policy BGP-Path-Selection  
!  
neighbor 10.0.0.1  
remote-as 65000  
update-source Loopback0  
address-family ipv4 unicast  
route-reflector-client  
!  
address-family vpnv4 unicast  
route-reflector-client  
!  
!  
neighbor 10.0.0.2  
remote-as 65000  
update-source Loopback0  
address-family ipv4 unicast  
route-reflector-client  
!  
address-family vpnv4 unicast

update-source Loopback0  
address-family ipv4 unicast  
route-reflector-client  
!  
address-family vpnv4 unicast  
route-reflector-client  
!  
!  
neighbor 10.0.0.6  
remote-as 65000  
update-source Loopback0  
address-family ipv4 unicast  
route-reflector-client  
!  
address-family vpnv4 unicast  
route-reflector-client
```

```

!
!
vrf one
rd 1:1
address-family ipv4 unicast
  maximum-paths ibgp 3
  additional-paths selection route-policy BGP-Path-Selection
  redistribute connected
!
!
!

```

Die Routingrichtlinie mit den festgelegten Pfadauswahl-Anweisungen wird unter der address-family-VPNv4-Unicast angewendet.

Die Routingrichtlinie mit den Statements zur Pfadauswahl wird auch auf die VRF-Instanz angewendet. Dies ist erforderlich, wenn eine Backup-Route in der VRF-RIB/CEF-Tabelle installiert (oder über die PE-CE-Verbindung über die BGP-Sitzung angekündigt) werden muss.

Hier sind beide Routenrichtlinien identisch, aber unter der Adressfamilie können verschiedene Richtlinien angewendet werden, im Gegensatz zur VRF-Instanz.

**Maximum-path** *ibgp 3* wird unter VRF one verwendet, wobei angegeben wird, dass in der RIB/CEF-Tabelle bis zu drei ECMP-Pfade vorhanden sein können.

Diese Fälle zeigen alle Möglichkeiten für die Routenrichtlinie mit **festgelegter Pfadauswahl**.

## 1. set path select backup 1 install

## 6. Einstellen von Pfadauswahl-Multipath-Werbung

Werbung ist ein Pflichtschlüsselwort.

```
route-policy BGP-Path-Selection
  set path-selection multipath advertise
end-policy
```

Damit dies funktioniert, muss für BGP für die spezifische Adressfamilie Multipath aktiviert sein.

Hier ist der Multipath für ipv4-Unicast in VRF One aktiviert.

```
router bgp 65000
  vrf one
  rd 1:1
  address-family ipv4 unicast
    maximum-paths ibgp 3
    additional-paths selection route-policy BGP-Path-Selection
  redistribute connected
```

```
RP/0/RP0/CPU0:RR#show bgp vpnv4 unicast rd 1:1 10.1.1.1/32
```

Möglicherweise gibt es keinen **Backup-Pfad (Multipath schützen)**. Wenn beispielsweise **BGP-Pfade für maximal 2** konfiguriert sind und nur 2 Pfade empfangen werden, sind zwei Pfade Multipath und es gibt keinen **Backup-(Multipath schützen)** Pfad.

Fazit: Alle Multipath-Pfade werden in der RIB installiert. Ein anderer Pfad wird als Backup-Pfad installiert (der **Backup-Pfad (Multipath schützen)**). Es wird nur der beste Pfad angegeben.

- Es gibt drei Multipath-Pfade.
- Es gibt einen Backup-Pfad (MultiPath schützen). Dies ist der installierte Sicherungspfad in der RIB/CEF-Tabelle.
- Der fünfte Pfad ist nicht markiert.
- Der beste Pfad und der Sicherungspfad werden angekündigt.

Möglicherweise gibt es keinen **Backup-Pfad (MultiPath schützen)**. Wenn z. B. **BGP-Pfade 2** konfiguriert sind und nur zwei Pfade empfangen werden, sind zwei Pfade Multipath und es gibt keinen **Backup-Pfad (MultiPath schützen)**.

Dieser angekündigte Sicherungspfad ist einer der Multipfad-Pfade (in der BGP-Tabelle als Backup markiert).

Dies ist bei **ibgp 1** mit maximalen Pfaden:

```

- Es gibt keinen ECMP auf RR.
- Der zweitbeste Pfad ist der Sicherungspfad. Sie wird in der RIB/CEF-Tabelle installiert.
- Der beste Pfad und der beste Sicherungspfad werden angegeben.

- Es gibt keinen **Backup-Pfad (Multipath schützen)**.

Fazit: Alle Multipath-Pfade werden in der RIB installiert. Ein anderer Pfad wird als Backup-Pfad installiert. Der beste Pfad und der Sicherungspfad werden angekündigt.

## 9. Festlegen von Pfad-Auswahl Gruppe Best Advertisement

- Gruppen-Best können nur mit **Werbung** verwendet werden.
- Die Auswahl der besten Gruppen ist der beste Pfad pro AS (Autonomous System) und auch pro Next-Hop.
- Das Präfix stammt von verschiedenen autonomen Systemen.

In diesem Fall wird eine andere Topologie verwendet. Router sind identisch mit Bild 1, PE4 ist jedoch jetzt in AS 65004 und PE5 in AS 65005. Alle anderen Router befinden sich weiterhin im AS 65000.

Bild 2

Dies bedeutet, dass nun eine eBGP-Sitzung zwischen RR und PE4 sowie zwischen RR und PE5 besteht.

RR kündigt den besten Pfad der Gruppe aus den drei Pfaden an, die vom AS 65000 empfangen wurden. Neben diesem Pfad gibt der RR auch den gruppenbesten Pfad an, der von AS 65004 und dem von AS 65005 empfangen wurde.

Es gibt drei Gruppen-beste Pfade, da die drei Pfade ein anderes Nachbarn-AS haben. Alle diese Pfade werden angekündigt. Die Multipath-Pfade werden nicht angekündigt.

Fazit: Alle gruppenbesten Pfade werden angekündigt.

## 10. set path-selection backup 1 install multipath-protect andood-protect multipath-protect-protect-inserate

Diese Option ist nur ab Cisco IOS®-XR 7.3.1 verfügbar.

Zu Beginn von Cisco IOS®-XR 7.3.1 gibt es ein neues Schlüsselwort **multipath-protect-inserse**.

Dadurch kann der **Multi-Path-Protect-Pfad neben dem Backup-Pfad** angekündigt werden. Vor Cisco IOS®-XR 7.3.1 wurde der **Multi-Path-Protect-Pfad** installiert, aber nicht angekündigt. (Siehe Fall 8.)

## Fazit:

- Alle drei Pfade sind im BGP als Multipath markiert.
- In der RIB/CEF-Tabelle sind drei ECMP-Pfade installiert.
- Der zweite Pfad ist der Sicherungspfad. Als Backup (Protect Multipath) im BGP gekennzeichnet und als Backup-Pfad in der RIB/CEF-Tabelle installiert.
- Der beste Pfad und die Multipath-Pfade sowie die Pfade "backup(protect multipath)" werden angekündigt.

# Neues Pfadauswahlverhalten von Cisco IOS®-XR 7.3.1

Seit Cisco IOS®-XR 7.3.1 hat sich Folgendes geändert:

- Die Pfadauswahl nach Nachbarn ist möglich. Vor Cisco IOS®-XR 7.3.1 war dies nur pro Adressfamilie möglich.
- Mehrere festgelegte Pfadauswahlweisungen sind in einer Routenrichtlinie zulässig.
- Die BGP-Pfade können in der Reihenfolge angezeigt werden, in der sie empfangen werden.

## Per Neighbor-Pfadauswahl möglich

Dies ist die Pfadauswahl, die in einer Routenrichtlinie verfügbar ist:

```
RP/0/RP0/CPU0:RR(config-rpl)#set path-selection ?
all          BGP all paths
backup      BGP backup path
best-path   BGP best path
group-best  BGP group best path
multipath   BGP multipath
```

Der **beste Pfad** ist der Standardwert.

Dies wird auf der Ebene der Adressfamilie unterstützt.

Konfigurationsbeispiel:

```
router bgp 65000
address-family ipv4 unicast
!
address-family vpnv4 unicast
additional-paths receive
additional-paths send
  additional-paths selection route-policy BGP-Path-Selection
!
neighbor 10.0.0.1
remote-as 65000
update-source Loopback0
address-family ipv4 unicast
  route-reflector-client
!
address-family vpnv4 unicast
  route-reflector-client
!
!
vrf one
rd 1:1
address-family ipv4 unicast
  maximum-paths ibgp 2
  additional-paths selection route-policy BGP-Path-Selection
  redistribute connected
!
!
!
```

Zu Beginn mit Cisco IOS®-XR 7.3.1 werden einige Pfadauswahloptionen in einer Routenrichtlinie auch auf Nachbar-Ebene unterstützt. Dies führt zu einer präziseren Kontrolle, welche Pfade für

welche BGP-Nachbarn angekündigt werden. Beispielsweise kündigt ein BGP-Sprecher einem BGP-Nachbarn den besten Pfad und einen Backup-Pfad an, meldet aber den Multipath an und schützt den Multipath-Pfad vor einem anderen Nachbarn.

Auf Nachbarebene gibt es:

```
RP/0/RP0/CPU0:RR(config-rpl)#if destination ?
in                               Member of a set
  is-all                         Check for additional paths selected by all path-selection
  is-backup-path                 Checks for backup path
is-best-external                 Checks for best external route
  is-best-path                   Checks for best path
  is-multi-path                  Checks for multiple paths
  is-multipath-protect           Checks for multipath-protect path
longer-than                       Prefix-length greater than the route's prefix length
or-longer                         Prefix-length equal to or greater than the route's prefix length
```

**Warnung:** Der beste Pfad ist Multipath, wenn der BGP-Befehl **maximum-path** konfiguriert ist. Wenn jedoch die einzige Bedingung, die in der Route-Policy konfiguriert ist, **Multipath ist**, werden nur die Multipath-Pfade angekündigt, die nicht der beste Pfad sind! Dies hängt vom BGP-Design ab, aber es ist wahrscheinlich, dass, wenn die Multipath-Pfade angekündigt werden, auch der beste Pfad angekündigt werden sollte.

Der **All-** und **Multipath-Schutz** sind neu in Cisco IOS®-XR 7.3.1 integriert.

**Mehrere Pfadauswahlweisungen sind in einer Route-Policy zulässig.**

Ab Cisco IOS®-XR 7.3.1 können Sie in einer Routingrichtlinie für ein Präfix **mehrere** Pfadauswahlweisungen festlegen. Vor Cisco IOS®-XR 7.3.1 war dies nicht zulässig und führte zu unvorhersehbarem BGP-Pfadverhalten.

Die Auswahl von mehr als einem Pfad wird pro Präfix überprüft.

Beispielsweise wird **vor** Cisco IOS®-XR 7.3.1 Folgendes nicht unterstützt:

```
route-policy add-path-to-ibgp
set weight 65000
  set path-selection backup 1 install
set metric-type type-1
set extcommunity rt RT BUSINESS additive
  set path-selection all advertise
set rib-metric 100
end-policy
```

Sie haben zwei **festgelegte Pfadauswahlweisungen** in einer Routingrichtlinie, die auf dieselben Präfixe angewendet werden.

**Vor Cisco IOS®-XR 7.3.1** wird jedoch Folgendes unterstützt. Der Grund hierfür ist, dass die verschiedenen Pfadauswahlweisungen für verschiedene Präfixe gelten, da **wenn** Anweisungen mit einer Auswahl (Ziel, Community, ...) verwendet werden.

Beispiel 1:

```

route-policy ADDPATH
  if destination in TRAFFIC_1 then
    set path-selection backup 1 install
  endif
  if destination in TRAFFIC_2 then
    set path-selection multipath advertise
  endif
end-policy

```

Dies ist gut, da sich die **set-path-Auswahlweisungen** auf verschiedene Präfixe beziehen (sie sind in zwei verschiedenen **if**-Anweisungen vorhanden).

Beispiel 2:

```

route-policy ADDPATH-2
  if community matches-any COMM_ADD-PATH then
    set path-selection backup 1 install multipath-protect advertise
  else
    set path-selection best-path
  endif
end-policy

```

Dies ist gut, da sich die Anweisungen zur Pfadauswahl auf verschiedene Präfixe beziehen (sie befinden sich in zwei verschiedenen Teilen der **if**-Anweisung).

Ab Cisco IOS®-XR 7.3.1 wird dies unterstützt.

Dies ist ein Beispiel für eine Routenrichtlinie mit mehr als einer **festgelegten Pfadauswahlweisung**:

```

route-policy BGP-Path-Selection
  set path-selection multipath advertise
  set path-selection backup 1 install multipath-protect advertise multipath-protect-advertise
end-policy
!

```

Die Route-Policy für jeden Nachbarn legt fest, welche Pfade diesem Nachbarn angekündigt werden. Jeder Pfad kann nur aus den bereits markierten Pfaden auf der Ebene der Adressfamilie ausgewählt werden.

Auf der Ebene der Adressfamilie wird der Pfad ausgewählt:

```

RP/0/RP0/CPU0:RR(config-rpl)#set path-selection ?
  all          BGP all paths
  backup       BGP backup path
  best-path    BGP best path
  group-best   BGP group best path
  multipath    BGP multipath

```

Auf Nachbarebene gibt es:

```

RP/0/RP0/CPU0:RR(config-rpl)#if destination ?
  in          Member of a set
  is-all      Check for additional paths selected by all path-selection
  is-backup-path Checks for backup path
  is-best-external Checks for best external route
  is-best-path Checks for best path
  is-multi-path Checks for multiple paths

```

```
is-multipath-protect Checks for multipath-protect path
longer-than          Prefix-length greater than the route's prefix length
or-longer            Prefix-length equal to or greater than the route's prefix length
```

**Warnung:** Der beste Pfad ist Multipath, wenn der BGP-Befehl **maximum-path** konfiguriert ist. Wenn jedoch die einzige Bedingung, die in der Route-Policy konfiguriert ist, **Multipath ist**, werden nur die Multipath-Pfade angekündigt, die nicht der beste Pfad sind! Dies hängt vom BGP-Design ab, aber es ist wahrscheinlich, dass, wenn die Multipath-Pfade angekündigt werden, auch der beste Pfad angekündigt werden sollte.

Der **All-** und **Multipath-Schutz** sind neu in Cisco IOS®-XR 7.3.1 integriert.

Bei diesem Ansatz kann die **Markierung** der Pfadauswahl eine Mischung der Pfadauswahlmodi sein, die Sie haben (z. B. alle, Backup-, Multipath-, Multipath-Protect- usw.).

Die Nachbarrichtlinie steuert die **Werbung** anhand der Pfadmarkierung.

Für den Markierungsteil: Beispielsweise können Backup und Multipath in der Routingrichtlinie auf der Ebene der Adressfamilie gemeinsam konfiguriert werden:

```
route-policy BGP-Path-Selection
  set path-selection multipath advertise (1)
  set path-selection backup 1 install multipath-protect advertise multipath-protect-advertise
(2)
end-policy
!
```

Die beiden obigen Pfadauswahlweisungen werden ab Cisco IOS®-XR 7.3.1 neu unterstützt. Auch wenn im Beispiel "maximum path ibgp 3" konfiguriert ist, gibt es Folgendes:

- Ermöglicht die Anzeige des besten Pfads und aller Multipath-Pfade.
- Ermöglicht die Anzeige des besten Pfads und des Sicherungspfads (Multipath schützen).

Diese Kombination war vor Cisco IOS®-XR 7.3.1 nicht möglich. Dies bedeutet, dass entweder (1) oder (2) in Kraft wäre.

Dies ist das Ergebnis:

```

Es ist jetzt möglich, einem Nachbarn den primären (besten Pfad) und Backup-Pfade anzukündigen, basierend auf *dem besten Pfad oder dem Backup-Pfad*.

Für einen anderen Nachbarn kann der Multipfad mit **is-multi-path** angekündigt werden.

Beispiel für eine benachbarte Routenrichtlinie (verwendet mit der Routingrichtlinie auf der Ebene der Adressfamilie):

```

route-policy BGP-neighbor-1
  if community matches-any COMM-LIST-1 then
    if destination is-best-path or destination is-backup-path then
      pass
    else
      drop
    endif
  elseif community matches-any COMM-LIST-2 then
    if destination is-multi-path or destination is-multipath-protect then
      pass
    else
      drop
    endif
  else
    drop
  endif
end-policy
!

```

Diese Pfade sind die Multipath-Pfade (aber **nicht** den besten Pfad!) und der Backup-Pfad (Multipath schützen).

## Anzeigen der BGP-Pfade in der Reihenfolge, in der sie empfangen wurden

Die BGP-Pfade werden in lexikografischer Reihenfolge angezeigt.

Mit einem neuen Befehl, der in Cisco IOS®-XR 7.3.1 eingeführt wurde, können die BGP-Pfade in der Reihenfolge angezeigt werden, in der sie empfangen wurden:

```
show bgp <afi> rd <rd> <path_details> <age-order>
```

Dieser Befehl ist hilfreich, um zu sehen, warum Pfade als Multipath markiert wurden. Die zuvor empfangenen Pfade sind als Multipath markiert und werden im RIB als Maximum-Path-Routen installiert. Der Befehl **show route** zeigt das **BGP Multi-Path**-Schlüsselwort für die als solche installierten Routen.

Um zu überprüfen, welcher Pfad als multipath markiert ist, kann der neue Befehl verwendet werden, um die Reihenfolge zu überprüfen, in der alle Pfade empfangen wurden. Die neueren Pfade befinden sich oben in der Ausgabe.

Beispiel:

```
route-policy BGP-Path-Selection
  set path-selection multipath advertise
  set path-selection backup 1 install multipath-protect advertise multipath-protect-advertise
end-policy
!
```

Es gibt keine Änderungen im Prozess für die Entscheidung für den besten Pfad, und die Pfade haben keine Attribute (z. B. lokale Präferenz), die den Entscheidungsprozess für den besten Pfad beeinflussen.

Der RR hat die folgende BGP-Pfadauswahl:

```
RP/0/RP0/CPU0:RR#show bgp vpnv4 unicast rd 1:1 10.1.1.1/32
```

BGP routing table entry for 10.1.1.1/32, Route Distinguisher: 1:1

Versions:

```
Process          bRIB/RIB  SendTblVer
Speaker          5         5
```

Warum ist der Pfad von 10.0.0.1 der beste Weg? Warum ist der Pfad von 10.0.0.2 der Sicherungspfad? Warum ist der Pfad von 10.0.0.3 Multipath? Warum ist der Pfad von 10.0.0.4 die Sicherung (Multipath schützen)? Warum ist der Pfad von 10.0.0.5, nicht der beste Pfad, nicht der Multipath, und nicht der Backup-Pfad (Multipath schützen)?

Sie können dies mit demselben Befehl am Ende mit der **Änderungsreihenfolge** sehen. Die neueren Pfade befinden sich oben in der Ausgabe.

```

```

Da die meisten Attribute in den BGP-Pfaden zwischen den Pfaden übereinstimmen, wurde der beste Pfad zur niedrigsten Router-ID des BGP-Sprechers gewählt. Dies ist der BGP-Sprecher 10.0.0.1. Der Sicherungspfad ist der zweitbeste Pfad, daher die zweitniedrigste Router-ID des BGP-Sprechers. Hier ist 10.0.0.2.

Die Pfade von 10.0.0.4 und 10.0.0.5 sind keine Multipath-Pfade, da sie später als die Pfade von 10.0.0.1, 10.0.0.2 und 10.0.0.3 installiert wurden.

## Backup und Sicherung (Multipath schützen)

```

route-policy BGP-Path-Selection
  set path-selection multipath advertise
  set path-selection backup 1 install multipath-protect advertise multipath-protect-advertise
end-policy
!
```

Maximum-path ibgp 3 ist konfiguriert.

Die Sicherung ist der zweitbeste Pfad. Hier wurden die Multipath-Pfade vor dem Backup-Pfad

empfangen. Es gibt also drei Multipath-Pfade, und ein anderer ist ein Backup-Pfad.

```

An den 4 Pfaden, die zuvor installiert wurden, wurde nichts geändert. Nur der Pfad von 10.0.0.5 wurde hinzugefügt. Es sitzt oben, weil es neuer ist. Es handelt sich nicht um einen Multipath-Pfad oder eine Art Backup-Pfad.

Der Pfad von 10.0.0.5 hat sich nach einer Statusänderung im Pfad von multipath zu non-multipath geändert!

Fazit:

- Die Reihenfolge, in der Pfade empfangen werden, spielt eine Rolle bei der Bestimmung, welche Pfade Multipath sind.
- Die Reihenfolge, in der Pfade empfangen werden, spielt eine Rolle, wenn es einen Backup-Pfad (Multipath schützen) gibt oder nicht.
- Die Reihenfolge, in der Pfade empfangen werden, spielt keine Rolle, in der der Pfad als der beste Pfad oder Sicherungspfad ausgewählt wird.

## Bestellung nach IGP-Metrik

Es besteht die Möglichkeit, die Multipath-Pfade gemäß der IGP-Metrik (Interior Gateway Protocol) zu bestellen.

```

RP/0/RP0/CPU0:RR#conf t
RP/0/RP0/CPU0:RR(config)#router bgp 65000
RP/0/RP0/CPU0:RR(config-bgp)#vrf one
RP/0/RP0/CPU0:RR(config-bgp-vrf)#address-family ipv4 unicast
RP/0/RP0/CPU0:RR(config-bgp-vrf-af)#maximum-paths ibgp 3 ?

```

```

order          Order candidate multipaths for selection as per configured number(cisco-support)
selective     Allow multipaths only from marked neighbors
unequal-cost  Allow multipaths to have different BGP nexthop IGP metrics
<cr>
RP/0/RP0/CPU0:RR(config-bgp-vrf-af)#maximum-paths ibgp 3 unequal-cost ?
order          Order candidate multipaths for selection as per configured number(cisco-support)
selective     Allow multipaths only from marked neighbors
<cr>
RP/0/RP0/CPU0:RR(config-bgp-vrf-af)#maximum-paths ibgp 3 unequal-cost order ?
  igp-metric  Order by IGP metric (cisco-support)
RP/0/RP0/CPU0:RR(config-bgp-vrf-af)#maximum-paths ibgp 3 unequal-cost order igp-metric ?
<cr>
RP/0/RP0/CPU0:RR(config-bgp-vrf-af)#maximum-paths ibgp 3 unequal-cost order igp-metric
RP/0/RP0/CPU0:RR(config-bgp-vrf-af)#commit
RP/0/RP0/CPU0:RR(config-bgp-vrf-af)#end
RP/0/RP0/CPU0:RR#

```

Die ungleichen Kosten sind erforderlich, da ansonsten nur der beste Pfad, ein Backup-Pfad, aber kein Multipath-Routing erforderlich ist, da die gleichen IGP-Kosten als Multipath angesehen werden müssen.

Die IGP-Kosten von RR zu den PE-Routern werden in der Topologie geändert. Die IGP-Kosten werden wie folgt konfiguriert:

- RR zu PE1: 5
- RR zu PE2: 4
- RR zu PE3: 3
- RR zu PE4: 2
- RR zu PE5: 1

Es gibt noch folgende:

```

route-policy BGP-Path-Selection
  set path-selection multipath advertise
  set path-selection backup 1 install multipath-protect advertise multipath-protect-advertise
end-policy
!

```

Vor der IGP-Metrik (die Kosten sind für alle Links gleich) werden folgende Änderungen vorgenommen:

```

RP/0/RP0/CPU0:RR#show bgp vpnv4 unicast rd 1:1 10.1.1.1/32

- Der beste Pfad ist jetzt der Pfad von 10.0.0.5 aufgrund der niedrigeren IGP-Metrik (Metrik 2).
- Der Sicherungspfad ist jetzt der Pfad mit der zweitbesten IGP-Metrik, dem Pfad von 10.0.0.4 (Metrik 3).
- Der beste Pfad und der beste Sicherungspfad sind auch Multipath, daher bleibt ein Multipath-Pfad zu wählen. Dies ist der Pfad von 10.0.0.3 (Metrik 4).
- Der Sicherungspfad (Protect multipath) ist der Pfad von 10.0.0.2 (Metrik 5).
- Schließlich ist der Pfad von 10.0.0.1 (Metrik 6) überhaupt nicht markiert, da er die schlechteste Metrik hat.
