## Einleitung

In diesem Dokument wird beschrieben, wie die Layer-2-Hardwareprogrammierung und -weiterleitung für Catalyst Switches der Serie 9400 validiert wird.

# Voraussetzungen

## Anforderungen

Es gibt keine spezifischen Anforderungen für dieses Dokument.

## Verwendete Komponenten

Die Informationen in diesem Dokument basieren auf Switches der Catalyst Serie 9400 (UADP 2.0).

---

 Hinweis: In diesem Dokument wird die Softwareversion 16.6.1 verwendet. Dies gilt jedoch weiterhin für neuere Versionen von Cisco IOS®.

---

 Hinweis: Sie können dieses Dokument für andere Arten von Catalyst 9000-Switches verwenden, ignorieren jedoch alle Befehle, die auf eine Linecard verweisen.

---

Die Informationen in diesem Dokument beziehen sich auf Geräte in einer speziell eingerichteten Testumgebung. Alle Geräte, die in diesem Dokument benutzt wurden, begannen mit einer gelöschten (Nichterfüllungs) Konfiguration. Wenn Ihr Netzwerk in Betrieb ist, stellen Sie sicher, dass Sie die möglichen Auswirkungen aller Befehle kennen.

## Hintergrundinformationen

Der Catalyst 9400 Supervisor1 (C9400-SUP-1) verfügt über drei UADP 2.0 Forwarding ASICs (0, 1, 2).

Jeder UADP 2.0 Forwarding-ASIC verfügt über:

- Ein Dual-Core (0, 1) - dies gab es in früheren Generationen von UADP 2.0 ASICs nicht.
- SIFs (Stack Interfaces) - werden verwendet, um über einen internen Stack-Ring eine Verbindung zu den anderen beiden UADP 2.0 ASICs herzustellen.
- NIFs (Network Interfaces) - werden für die Verbindung mit einer oder mehreren Linecards über die Backplane verwendet.
- Alle Entscheidungen bezüglich der Paketweiterleitung für die Linecards und die Supervisor-Uplink-Schnittstellen werden von den drei UADP 2.0-Weiterleitungs-ASICs auf dem aktiven Supervisor getroffen.
- Die in diesem Beispiel verwendeten Linecards verfügen über einen Single-Core-Stub-ASIC mit 1 Linecard, der nicht an Entscheidungen zur Paketweiterleitung beteiligt ist.
- Der Linecard-Stub-ASIC auf der Linecard ist über die Rückwandplatine mit mindestens einem der drei UADP 2.0-Weiterleitungs-ASICs auf dem Supervisor verbunden.
- Die drei UADP 2.0-Weiterleitungs-ASICs auf dem Supervisor treffen alle Entscheidungen bezüglich der Paketweiterleitung.

# Terminologie

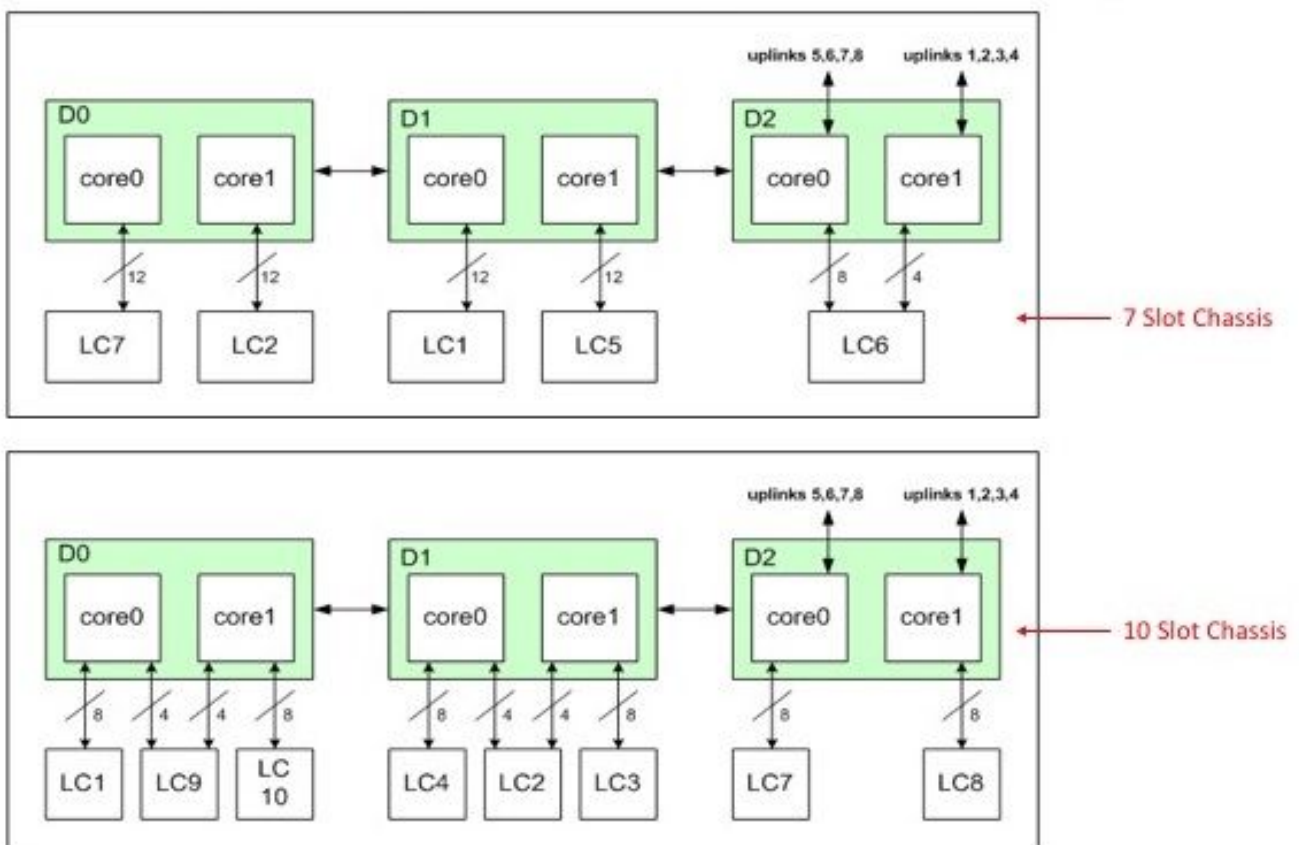

| Abkürzung      | Definition   |
|----------------|--|
| RP             | Routingprozessor   |
| FP             | Weiterleitungsprozessor  |
| FED            | Forwarding-Engine-Treiber. Der Softwareprozess, der den Supervisor Forwarding ASIC programmiert.   |
| Objekt-Manager | FP-Software-MAC-Einträge, die als asynchrone Objekte in der Objektdatenbank gespeichert werden.  |
| MPI            | Punt-Schnittstelle für gemeinsamen Linux-Speicher. Der Transport zwischen Datenebene (Hardware-UADP 2.0) und Kontrollebene (Software-CPU).                                       |
| IFM            | Interface Manager-Softwareprozess.   |
| IF-ID          | Interface IDentifier ist ein eindeutiger Wert, der eine bestimmte Schnittstelle darstellt. Es wird während der internen Programmierung im Switch verwendet.                      |
| Einlegen       | Instanz Gibt an, dass die UADP 2.0 ASIC/Core an einer Schnittstelle angeschlossen ist: 0=ASIC0/Core0, 1=ASIC0/Core1, 2=ASIC1/Core0, 3=ASIC1/Core1, 4=ASIC2/Core0, 5=ASIC2/Core1. |
| Asic           | Gibt an, welchem UADP 2.0 eine Schnittstelle zugeordnet ist: 0=UADP 2.0 #0, 1=UADP 2.0 #1, 2= UADP 2.0 #2.   |
| Kern           | Gibt an, welcher Kern der UADP 2.0-Schnittstelle zugeordnet ist: 0=core0, 1=core1.   |
| Anschluss      | Ordinale Instanznummer eines Ports innerhalb eines Steckplatzes. Innerhalb desselben Steckplatzes sind alle Portnummern eindeutig.   |

|          |  |
|----------|--|
| Sub-Port | Identifiziert einen Port innerhalb einer Portgruppe (Cntx) für Ports an der Vorderseite, die unterportiert sind (Cntx und SubPort zusammen identifizieren einen eindeutigen Port, der unterportiert ist).  |
| Mac      | Schnittstellenkennung, die verwendet wird, wenn eine Schnittstelle MACsec ausführt (Sicherheitsauthentifizierung und Verschlüsselung).   |
| CNTX     | Kontext. Eine Gruppennummer, zu der ein Port gehört, wenn eine Schnittstelle an der Vorderseite unterstützt wird (Cntx und SubPort zusammen identifizieren einen eindeutigen Port, der unterportiert ist). |
| VPN      | Logische Portnummer, die einer Schnittstelle zugeordnet ist.   |
| GPN      | Globale Portnummer, die einer Schnittstelle zugeordnet ist   |
| NIF-Typ  | Netzwerkschnittstelle; NRU = Network Redundant Uplink  |
| IF_IS    | Interface Identifier: Dies ist ein eindeutiger Wert, der eine bestimmte Schnittstelle darstellt. Es wird während verschiedener Programmiervorgänge intern im Switch verwendet.                             |
| Port_LE  | Logische Einheit des Ports. Dies ist die Schnittstellenkonfiguration.  |
| AOM      | Asynchroner Objektmanager. Das FP programmiert Informationen in die Objektdatenbank als Objekt.  |
| VP       | Virtueller Port  |
| MATM     | MAC-Adresstabellen-Manager   |
| RP       | Routingprozessor   |
| OM_PTR   | Objekt-Manager-Zeiger  |
| TBL-ID   | Table Identifier = VLAN  |
| CMAN     | Chassis-Manager  |

|         |   |
|---------|---|
| FP      | Weiterleitungsprozessor   |
| fp_port | Die Anschlüsse auf der Vorderseite.   |
| Sif     | Stack-Schnittstelle (zu den anderen beiden UADP 2.0 Forwarding-ASICs auf dem Supervisor). |
| Nif     | Netzwerkschnittstelle (zur Schnittstelle an der Vorderseite)                              |
| IGR/EGR | Eingang/Ausgang   |
| IQS     | Scheduler für Eingangswarteschlange   |
| SQS     | Stack Queue Scheduler   |
| PBC     | Paket-Puffer-Komplex  |
| AQM     | Aktive Warteschlangenverwaltung. Dadurch werden Engpassmanagementprüfungen durchgeführt.  |
| AQMRed  | Aktives Warteschlangenmanagement Zufällige Früherkennung.                                 |
| EQC     | Ausgangs-Warteschlangencontroller   |
| ESM     | Scheduler-Ausgangsverwaltung  |
| RWE     | Engine für Umschreiben. Fügt Header-Informationen zum Paket hinzu oder löscht sie.        |
| IOMD    | Treiber für das Eingangs-Ausgangsmodul  |
| fp_port | Der Port an der Vorderseite   |
| Nif     | Netzwerkschnittstelle (zur Schnittstelle an der Vorderseite)                              |
| SLI     | System Link Interface (zum Supervisor)  |

|                         |   |
|-------------------------|---|
| IGR/EGR =               | Eingang/Ausgang   |
| AQMRed                  | Aktives Warteschlangenmanagement Zufällige Früherkennung.   |
| OCI                     | Out-of-Band-Steuerungsschnittstelle = interner Kommunikationskanal zwischen Linecard und aktivem Supervisor   |
| MATM                    | MAC-Adresstabellen-Manager  |
| MAC-Verschiebungsanzahl | Dies ist die Zählung, die durchgeführt wird, wenn eine MAC-Adresse auf eine neue Schnittstelle verschoben wird. Die Verschiebungsanzahl kann auftreten, wenn ein End-Host physisch von einer Schnittstelle zu einer anderen verschoben wird, ein Wireless-Host von einem Access Point (AP) zu einem anderen AP wechselt, der an einer anderen Schnittstelle angeschlossen ist, oder sich der Spanning-Tree-Pfad ändert oder Schleifen durchläuft. |

## Etherchannel-Programmierung

In diesen Beispielausgaben für Etherchannel-Programmierung programmiert der RP den FP, der FP den FED und der FED dann die ASIC-Hardware für die Supervisor-Weiterleitung. RP-Softwareeinträge werden als Objekte in der Objektdatenbank und die FP-Softwareeinträge als asynchrone Objekte in der Objektdatenbank gespeichert.

## Software-Programmierung

In den nächsten Ausgabebeispielen programmiert der RP den FP, der FP den FED, der FED programmiert dann schließlich die Supervisor Forwarding ASIC-Hardware. RP softwareMAC-Einträge werden als Objekte in der Objektdatenbank und die FP softwareMAC-Einträge als asynchrone Objekte in der Objektdatenbank gespeichert.

## Hardwareprogrammierung - Methode 2

| Abkürzung/Begriff | Definition   |
|-------------------|--|
| VLAN:10           | MVID 10 VLAN 100 verwendet intern im Switch die zugeordnete VLAN-ID (MVID) 10. |
| gpn:1104          | Globale Portnummer von Port-Channel 1.   |
| Mac:0x20bc05e5351 | MAC-Adresse 20bb.c05e.5351   |

Hardware-Programmiermethode 2 Beispielausgabe:

```
<#root>
```

```
C9400#
```

```
show platform hardware fed active matm macTable vlan 100
```

```
--snip--
```

```
Type ..... [L2-Ethchannel]
Identifier ..... [0x2ec]
Unit ..... [1]
Port Logical Subblock
L3IF_LE handle .... [0x0]
Num physical port . [2]
GPN Base ..... [1104]
--snip--
```

---

 Hinweis: Wenn die Schnittstelle, von der der MAC Kenntnis erlangt hat, eine einzelne Schnittstelle anstelle eines Port-Channels war, wird der nächste Befehl verwendet, um die Zuordnung von gpn zu Schnittstelle zu bestimmen:

---

```
<#root>
```

```
C9400#
```

```
show platform software fed active ifm mappings gpn
```

```
Mappings Table
```

| GPN | Interface            | IF_ID      |
|-----|----------------------|------------|
| 101 | GigabitEthernet1/0/1 | 0x00000007 |
| 102 | GigabitEthernet1/0/2 | 0x00000008 |
| 103 | GigabitEthernet1/0/3 | 0x00000009 |

```
--snip--
```

## TCAM-Nutzung

Überprüfen Sie die TCAM-Nutzung für die MAC-Adresseinträge auf jeder Supervisor ASIC-Instanz, um sicherzustellen, dass dem Switch nicht der TCAM-Speicherplatz ausgeht, um Einträge in der Hardware zu speichern.

## Erfolgreiche Hardwareprogrammierung

Alle Funktionen (ob MAC-Adresse, Schnittstelle, VLAN usw.) werden in der Objektdatenbank gespeichert und als Objekte in die Hardware programmiert.

Der RP programmiert das FP, das FP programmiert das FED und das FED programmiert dann schließlich die Supervisor Forwarding ASIC-Hardware. RP-Softwareeinträge werden als Objekte in der Objektdatenbank und die FP-Softwareeinträge als asynchrone Objekte in der Objektdatenbank gespeichert.

Wenn das FED das FED programmiert (das wiederum den Supervisor Forwarding ASIC programmiert), sendet das FED eine Bestätigung zurück an das FP. Das FP leitet es dann an den RP weiter, um anzugeben, dass die Hardwareprogrammierung erfolgreich abgeschlossen wurde. Wenn die Programmierung der FED-Hardware fehlt oder falsch ist, können Sie mit diesem nächsten Befehl auf Probleme und/oder Bestätigungen überprüfen.

<#root>

C9400#

```
show platform software object-manager fp active statistics
```

## Forwarding Manager Asynchronous Object Manager Statistics

Object update: Pending-issue: 0, Pending-acknowledgement: 0  
Batch begin: Pending-issue: 0, Pending-acknowledgement: 0  
Batch end: Pending-issue: 0, Pending-acknowledgement: 0  
Command: Pending-acknowledgement: 0  
Total-objects: 3269  
Stale-objects: 0  
Resolve-objects: 0  
Error-objects: 0  
Paused-types: 0

Wenn der vorherige Befehl Objekte anzeigt, die nicht null sind und sich im Zustand "Ausstehend" befinden, suchen Sie mit diesem Befehl nach der betreffenden Objektnummer:

```
<#root>
```

```
C9400#
```

```
show platform software object-manager fp active pending-issue-update
```

Verwenden Sie dann diesen Befehl, um den fixierten Prozess zu bestimmen, der mit der Objektnummer verknüpft ist:

```
<#root>
```

```
C9400#
```

```
show platform software object-manager fp active object {object#}
```

Verwenden Sie auf RP-Seite diesen Befehl, um ausstehende Löschvorgänge (Del Pend) für ein Objekt zu überprüfen, das vom RP nicht bestätigt wurde.

```
<#root>
```

```
C9400#
```

```
show platform software object-manager rp active object-type-info
```

| Object type   | Name          | Count | Del Pend | Layer |
|---------------|---------------|-------|----------|-------|
| CC            | cc            | 5     | 0        | 2     |
| SPA           | spa           | 0     | 0        | 4     |
| PORT_DPIDB    | port_dpidx    | 164   | 0        | 10    |
| CHANNEL_DPIDB | channel_dpidx | 0     | 0        | 12    |
| VIRTUAL_DPIDB | virtual_dpidx | 503   | 0        | 13    |
| SW_DPIDB      | sw_dpidx      | 0     | 0        | 17    |
| VLAN          | vlan          | 0     | 0        | 19    |

--snip--

# Integritätsprüfung

## Kontrollebenen-Datenverkehr und Richtlinien

Überprüfen Sie, ob in Hardware-UADP 2.0 CoPP-Drops (Control Plane Policy) für Datenverkehr an die Software-CPU vorhanden sind. Dies kann sich auf das MAC Learning und die Spanning-Tree-Stabilität auswirken.

```
<#root>
```

```
C9400#
```

```
show policy-map control-plane
```

```
Control Plane
```

```
Service-policy input: system-cpp-policy
```

```
--snip--
```

```
Class-map: system-cpp-police-sw-forward (match-any)
  0 packets, 0 bytes
  5 minute offered rate 0000 bps, drop rate 0000 bps
  Match: none
  police:
    rate 1000 pps, burst 244 packets
    conformed 1298 bytes; actions:
      transmit
    exceeded 0 bytes; actions:
      drop
```

```
--snip--
```

```
Class-map: system-cpp-police-l2-control (match-any)
  0 packets, 0 bytes
  5 minute offered rate 0000 bps, drop rate 0000 bps
  Match: none
  police:
    rate 500 pps, burst 122 packets
    conformed 239197001 bytes; actions:
      transmit
    exceeded 0 bytes; actions:
      drop
```

```
--snip--
```

```
Class-map: system-cpp-default (match-any)
  0 packets, 0 bytes
  5 minute offered rate 0000 bps, drop rate 0000 bps
  Match: none
  police:
    rate 1000 pps, burst 244 packets
    conformed 0 bytes; actions:
      transmit
    exceeded 0 bytes; actions:
      drop
```

```

Class-map: class-default (match-any)
  0 packets, 0 bytes
  5 minute offered rate 0000 bps, drop rate 0000 bps
Match: any

```

Die gleiche CoPP-Ausgabe wie im vorherigen Beispiel wird hier in einem detaillierteren und einfacher zu lesenden (komprimierten) Format dargestellt.

```
<#root>
```

```
C9400#
```

```
show platform hardware fed active qos queue stats internal cpu policer
```

#### CPU Queue Statistics

## Supervisor-Statistik - Datenpfad zwischen Supervisor und Line Card

Überprüfen Sie die aktiven Supervisor UADP 2.0 Forwarding ASIC-Statistiken, die einer bestimmten Frontblendenschnittstelle zugeordnet sind. In diesem Beispiel wird die Schnittstelle Gig1/0/13 verwendet.

Ausgabebeispiel:

- Prüfen Sie, welche Schnittstellen der Linecard zur gleichen Portgruppe gehören.
- Jede Portgruppe nutzt 8 Gbit/s an Bandbreite vom Linecard-Stub-ASIC zum Supervisor Forwarding-ASIC.
- Jede Portgruppe ist mit einem SLI (System Link Interface) auf dem Line Card Stub-ASIC verbunden, der zum Supervisor Forwarding-ASIC führt.

Linecard-Statistik - Datenpfad zwischen Supervisor und Linecard

Überprüfen Sie die Line Card Line Card Stub-ASIC-Statistiken, die einer bestimmten Frontblendenschnittstelle zugeordnet sind. In diesem Beispiel steht die Schnittstelle Gig1/0/13 im Mittelpunkt.

Ausgabebeispiel:

- Pakete, die von Gig 1/0/13 empfangen werden, gelangen in den Empfangsport der Netzwerkschnittstelle und gelangen über IQS zur Stack-Schnittstelle.
- Von dort geht ein Paket entweder über die Stack-Schnittstelle an einen anderen Supervisor ASIC oder über den SQS, AQM, EQC, ESM, RWE zurück und geht dann über die Netzwerkschnittstellen-Übertragung von Gig 1/0/13.
- Pakete, die von anderen Supervisor-ASICs-Schnittstellen gesendet werden, die aus Gig 1/0/13 ausgehen, gelangen in Sif und passieren dann SQS, AQM, EQC, ESM, RWE und gehen dann die NifTx von Gig 1/0/13 aus.
- Für AQM gibt es 8 Tx-Warteschlangen. Wenn Sie Drops aus diesen Warteschlangen sehen, können Sie diesen Befehl verwenden, um festzustellen, welche Warteschlange ein Drops aufweist: `show platform hardware fed active goes queue stats interface Gig 1/0/13`

  rxBytes          0

```

Überprüfen Sie den Status der Flusssteuerung aus der Line Card-Perspektive für die Frontblendschnittstelle. So können Überlastungen an der Schnittstelle leichter erkannt werden.

- Werte sind "-", wenn keine Flusssteuerung vorhanden ist, andernfalls wird die Warteschlangennummer mit Flusssteuerung (Überlastung) angezeigt.
- Die von der Schnittstelle empfangene Flusskontrolle wird vom Linecard-ASIC auf der Linecard an den Supervisor-ASIC auf dem Supervisor weitergeleitet, wo AQM-Drops typischerweise auf dem Supervisor-ASIC zu sehen sind. Die OCI (Out-of-Band Control Interface) ist der interne Kommunikationskanal zwischen der Linecard und dem aktiven Supervisor, der zur Signalisierung der Flusssteuerung von der Linecard zum Supervisor verwendet wird.
