The bridge to possible
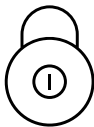

Cisco Spaces for Healthcare

The bridge between the data available in your physical space and insights that data provides.

Product overview

Cisco Spaces is an integral part of Cisco's comprehensive portfolio of products, services, and solutions that securely connect and enable healthcare organizations to power inclusive care, no matter what is happening in the world and without compromising security.

With Cisco Spaces, you can leverage your existing access network to glean insights into the location of users, connected medical equipment, and IoT devices, allowing you to deliver data-driven care and improved clinician workflow. With our rich ecosystem of partner apps and devices, you can transform your facilities to offer patients an enhanced experience and provide clinicians and staff instant access to records and equipment.
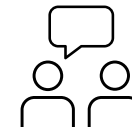

Benefits

Safe

Enable a safe workplace with indoor location services that provide meaningful, real-time data about who is in your workplace and where they go.

Smart

IoT services for smart buildings let your switches and access points act as a unifying layer between different wired and wireless IoT solutions. That way, you can deliver on a multitude of use cases and optimize your services and operations.

Seamless

Offer seamless wireless access with Wi-Fi and Bluetooth Low Energy (BLE) device onboarding that simplifies connections and opens new opportunities for engagement and revenue.

Be ready for scale with an open platform

Most location-based solutions in the market today require proprietary, vendor-specific hardware and software. This limits the variety of use cases they can serve and creates management complexity.

By contrast, Cisco Spaces is an open platform that sits at the nexus of a broad ecosystem of device and software partners, channel partners, and industry associations.

Our ability to unify management in a multivendor, multitechnology environment using the existing wireless and switching infrastructure is the reason our platform can address more use cases, scale more easily, and deliver better business outcomes for our customers.

Healthcare use cases

Smart hospitals

Securely connect clinical, operational, and business systems, applications, users, and data across physical healthcare facilities for a more automated and sustainable experience.

- Patient tracking
- Behavioral insights
- Room availability and utilization
- IoT services

Location services for clinical environments

Leverage location data to enable clinical operational efficiency, respond to staff duress, improve patient throughput capabilities, and monitor asset utilization.

- Density monitoring
- Occupancy threshold alerts
- Environmental monitoring
- Asset tracking

Mobile experiences and wayfinding

Make it easier for patients to use their own devices to find what they need, get where they're going, and check in easily with wayfinding and digital intake.

- Captive portals
- OpenRoaming
- Wayfinding
- Room availability
