Introduction

This document illustrates an IP Security (IPSec) configuration using a generic routing encapsulation (GRE) tunnel between two routers. IPSec can be used to encrypt GRE tunnels to provide network layer security for non-IP traffic, such as Novell Internetwork Packet Exchange (IPX), AppleTalk, and so forth. The GRE tunnel in this example is purely used for transporting non-IP traffic. Hence, the tunnel does not have any IP address configured. Here are some configuration considerations:

- With IOS 12.2(13)T software and later (higher numbered T-train software, 12.3 and later), the configured IPSec crypto map only needs to be applied to the physical interface and is no longer required to be applied on the GRE tunnel interface. In software versions prior to this release, IPSec crypto maps need to be applied to both the tunnel interface and the physical interface. Having the crypto map on the physical and tunnel interface when using the 12.2.(13)T software and later should still work; however, Cisco highly recommends that you apply it just on the physical interface.
- Make sure that the GRE tunnel works before applying the crypto maps.
- The crypto access control list (ACL) should have GRE as the permitted protocol. For example, **access-list 101 permit gre host #.#.# host #.#.#** (where the first host number is the IP address of the tunnel source of the GRE tunnel and the second host number is the IP address of the tunnel destination).
- Use the physical interface (or the loopback interface) IP addresses to identify Internet Key Exchange (IKE) peers.
- In certain earlier versions of Cisco IOS release, fast switching on the tunnel interface has to be disabled for it to work, due to a bug. Turn off fast switching on the tunnel interface. You can view the bug details for this issue at CSCdm10376 (registered customers only) .

Before You Begin

Prerequisites

Before attempting this configuration, please ensure that you meet the following prerequisites:

- knowledge of IPX configuration and routing
- knowledge and configuration of GRE tunnels
- working knowledge and configuration of IPSec

Components Used

The information in this document is based on the software and hardware versions below.

- Cisco IOS® Software Release 12.2(7)
- Cisco 3600 Series Routers

The information presented in this document was created from devices in a specific lab environment. All of the devices used in this document started with a cleared (default) configuration. If you are working in a live network, ensure that you understand the potential impact of any command before using it.

Conventions

Refer to Cisco Technical Tips Conventions for more information on document conventions.

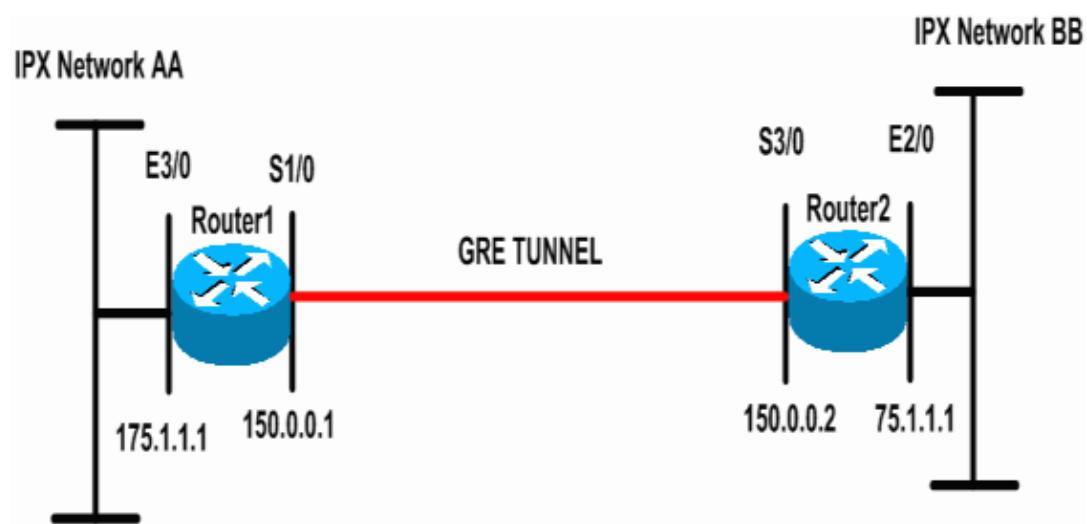

Configure

In this section, you are presented with the information to configure the features described in this document.

Note: To find additional information on the commands used in this document, use the Command Lookup Tool (registered customers only).

Network Diagram

This document uses the network setup shown in the diagram below.

Configurations

This document uses the configurations shown below.

Router 1
Current configuration: 1300 bytes

```

Verify

This section provides information you can use to confirm your configuration is working properly.

Certain **show** commands are supported by the Output Interpreter Tool (registered customers only) , which allows you to view an analysis of **show** command output.

- **show ipx interface** Displays the status and parameters of the IPX interfaces configured on the device such as the IPX network and node address.
- **show ipx route** Displays the contents of the IPX routing table.
- **show crypto isakmp sa** Shows the phase 1 security associations by displaying the router's IKE SA. The state displayed should be QM_IDLE for an IKE SA to be considered up and functioning.
- **show crypto ipsec sa** Shows the phase 2 security associations by displaying a detailed list of the router's active IPSec SAs.
- **show crypto map** Displays the crypto maps configured on the router along with its details such as crypto access lists, transform sets, peers etc.
- **show crypto engine connections active** Displays a list of active SAs with their associated interfaces, transforms and counters.

Sample Show Output

This section captures the **show** command outputs on the device Router1 when the IPX **ping** command is executed on Router1 destined for Router2. The outputs on Router2 are similar. The key parameters in the output are indicated in **bold**. For explanation on the command outputs, refer to the IP Security Troubleshooting – Understanding and Using debug Commands document.

```
Router1#show ipx interface ethernet 3/0
Ethernet3/0 is up, line protocol is up
  IPX address is AA.00b0.64cb.eab1, NOVELL-ETHER [up]
    Delay of this IPX network, in ticks is 1 throughput 0 link delay 0
    IPXWAN processing not enabled on this interface.

!--- Output suppressed.
```

```
Router2#show ipx interface ethernet 2/0
Ethernet2/0 is up, line protocol is up
  IPX address is BB.0002.16ae.c161, NOVELL-ETHER [up]
    Delay of this IPX network, in ticks is 1 throughput 0 link delay 0
    IPXWAN processing not enabled on this interface.

!--- Output suppressed.
```

```
Router1#show ipx route
Codes: C - Connected primary network,      c - Connected secondary network
       S - Static, F - Floating static, L - Local (internal), W - IPXWAN
       R - RIP, E - EIGRP, N - NLSP, X - External, A - Aggregate
       s - seconds, u - uses, U - Per-user static/Unknown, H - Hold-down

3 Total IPX routes. Up to 1 parallel paths and 16 hops allowed.

No default route known.

C          AA (NOVELL-ETHER),   Et3/0
C          CC (TUNNEL),        Tu0
R          BB [151/01] via     CC.0010.7b37.c8ae,   56s, Tu0
```

```

Router2#show ipx route
Codes: C - Connected primary network,      c - Connected secondary network

Troubleshoot

This section provides information you can use to troubleshoot your configuration.

Troubleshooting Commands

Note: Before issuing **debug** commands, please see Important Information on Debug Commands.

- **debug crypto engine** Shows information about the crypto engine performing encryption and decryption process.
- **debug crypto ipsec** View the IPSec negotiations of phase 2.
- **debug crypto isakmp** View the IKE negotiations of phase 1.

Sample Debug Output

This section captures the debug command outputs on the routers configured with IPSec. The IPX ping command is executed on router1 destined for router2.

- Router1
- Router2

Router1

```
Router1#show debug
Cryptographic Subsystem:
    Crypto ISAKMP debugging is on
    Crypto Engine debugging is on
    Crypto IPSEC debugging is on
Router1#
