## Introduction

This document describes that in phase 1 of the multicast implementation over Locator/ID Separation Protocol (LISP), ingress replication is used. It means that unicast Routing Locator (RLOC) core is used to transport identity information (EID) multicast.

## Prerequisites

### Requirements

Cisco recommends that you have knowledge of LISP and multicast.

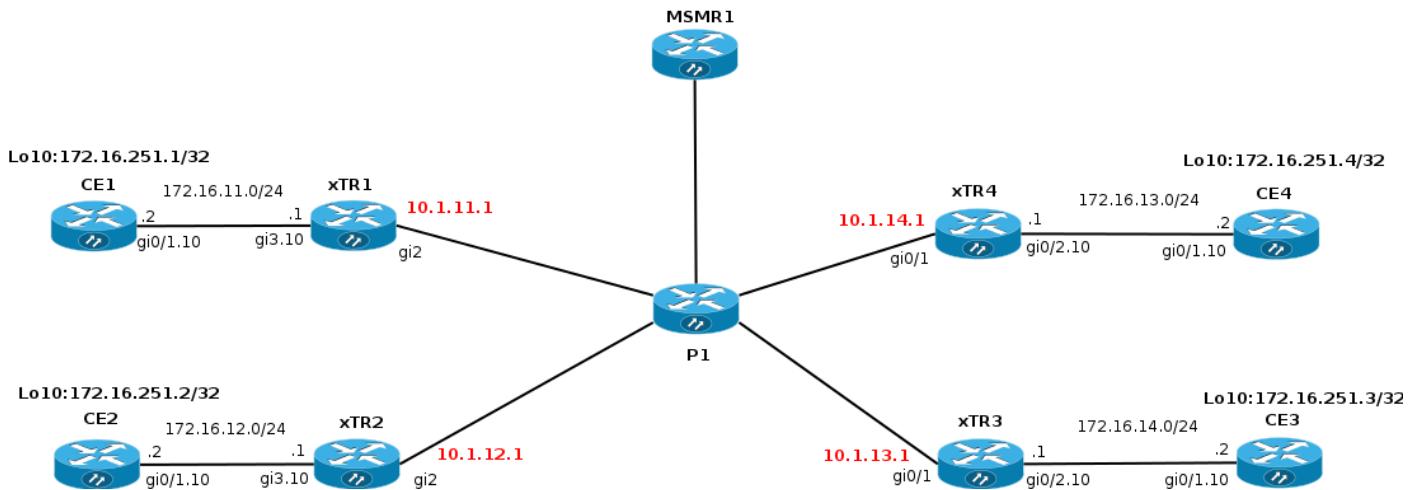

### Components Used

This document is not restricted to specific software and hardware versions.

The information in this document was created from the devices in a specific lab environment. All of the devices used in this document started with a cleared (default) configuration. If your network is live, make sure that you understand the potential impact of any command.

## Configure

### Network Diagram

## Configurations

Phase 1 supports unicast head-end replication of multicast packets.

- Phase 1 support begins in XE 3.13 and Cisco IOS® 15.4(2)T.
  - Phase 1 supports IPv4 EIDs over IPv4 RLOCs (transport) begins in XE 3.13 and Cisco IOS® 15.4(2)T.
  - Phase 1 supports IPv6 EIDs over IPv4 RLOCs (transport) begins in Polaris 16.6.1 in default vrf only for LISP with VXLAN encapsulation for Software-Defined Access (SDA).
  - Phase 1 supports EID Virtual Routing and Forwarding (VRFs) (segmentation) with IIDs (via PIM VRF support).
  - Phase 1 supports Any Source Multicast (ASM) and Source Specific Multicast (SSM) models.
  - Phase 1 supports static Route Processor (RP) configuration only.
  - Phase 1 does not support RP redundancy.
  - Phase 1 supports various combinations of LISP and non-LISP capable source and receiver sites.
  - LISP Multicast is NOT supported as a LISP Mobility Data Center Interconnect (DCI) solution.
- It is assumed, that multicast is already configured on the network (pim sparse-mode/rp).

In order to enable multicast over LISP you have to add “ip pim sparse-mode” under a LISP0 or a LISP0.xx interface. By enabling PIM on a LISP interface, it is included in RPF. The RPF information for prefixes reachable via LISP sites consists of a LISP tunnel and a neighbor represented by a RLOC address of an upstream site.

Only join/prune messages are allowed to be sent over LISP tunnels. PIM Hello messages are not exchanged between sites. PIM join/prune messages are unicast-encapsulated to an upstream xTR (RP or Source). Join/prune messages are not seen by other xTRs/PxTRs. There is no analog of Default MDT in MVPN.

PIM must be enabled under a LISP tunnel interfaces for multicast processing.

EID virtualization uses LISP Instance-IDs in conjunction with EID VRFs. An interface LISP0.x where x=IID is created for each EID VRF/LISP Instance ID.

```
xTR1#sh run
!
interface LISP0
```

```

ip pim sparse-mode <<< PIM under the LIISP interface
!
interface LISPO.20
  ip pim sparse-mode <<< PIM under the LIISP interface
end

```

**xTR1#sh ip pim int**

Address	Interface	Ver/ Mode	Nbr Count	Query Intvl	DR Prior	DR
172.16.11.1	GigabitEthernet3.10	v2/S	1	30	1	172.16.11.2
10.1.255.1	LISPO	v2/S	0	30	1	10.1.255.1

No neighbors via a LIISP interface are seen because there are no active sources/receivers and PIM Hello's are not exchanged between peers.

**xTR1#sh ip pim nei**

PIM Neighbor Table

Mode: B - Bidir Capable, DR - Designated Router, N - Default DR Priority,  
 P - Proxy Capable, S - State Refresh Capable, G - GenID Capable,  
 L - DR Load-balancing Capable

Neighbor Address	Interface	Uptime/Expires	Ver	DR Prio/Mode
172.16.11.2	GigabitEthernet3.10	01:43:52/00:01:34	v2	1 / DR S P G

## SSM

Let's configure the interface lo10 on the CE2 to join a group. It triggers a (S,G) Join because a group and a source are specified.

**CE2#conf t**

Enter configuration commands, one per line. End with CNTL/Z.

**CE2(config)#int lo10**

**CE2(config-if)#ip igmp join-group 232.1.1.10 source 172.16.251.1**

```

*Nov 26 18:28:55.471: PIM(0): Insert (172.16.251.1,232.1.1.10) join in nbr 172.16.12.1's queue
*Nov 26 18:28:55.491: PIM(0): Building Join/Prune packet for nbr 172.16.12.1
*Nov 26 18:28:55.491: PIM(0): Adding v2 (172.16.251.1/32, 232.1.1.10), S-bit Join
*Nov 26 18:28:55.492: PIM(0): Send v2 join/prune to 172.16.12.1 (GigabitEthernet0/1.10)
*Nov 26 18:28:56.856: PIM(0): Send v2 join/prune to 172.16.12.1 (GigabitEthernet0/1.1)

```

The (S,G) mroute is created on CE2.

**CE2#sh ip mro 232.1.1.10**

```

<...skip...
(172.16.251.1, 232.1.1.10), 00:00:16/00:02:45, flags: sLTI
  Incoming interface: GigabitEthernet0/1.10, RPF nbr 172.16.12.1
  Outgoing interface list:
    Loopback10, Forward/Sparse, 00:00:14/00:02:45

```

Let's check what happens on xTR2.

**Debug ip pim** is enabled on xTR2.

The (S,G) Join from CE2 is received.

```

CE2#sh ip mro 232.1.1.10
<...skip...
(172.16.251.1, 232.1.1.10), 00:00:16/00:02:45, flags: sLTI
  Incoming interface: GigabitEthernet0/1.10, RPF nbr 172.16.12.1
  Outgoing interface list:
    Loopback10, Forward/Sparse, 00:00:14/00:02:45

```

172.16.251.1 is the EID from xTR1 and not present in the RIB yet. Because of that, the RPF lookup is failed for the source IP 172.16.251.1. It triggers the LISP lookup. So the RPF interface is the LISP tunnel.

```

*Nov 26 18:38:19.641: PIM(0): RPF Lookup failed for 172.16.251.1
*Nov 26 18:38:19.643: PIM(0): Add GigabitEthernet3.10/172.16.12.2 to (172.16.251.1, 232.1.1.10),
Forward state, by PIM SG Join
*Nov 26 18:38:19.650: PIM(0): Insert (172.16.251.1,232.1.1.10) join in nbr 10.1.11.1's queue

```

```

xTR2#sh ip rpf 172.16.251.1
RPF information for ? (172.16.251.1)
  RPF interface: LISPO
  RPF neighbor: ? (10.1.11.1)
  RPF route/mask: 172.16.251.1/32
  RPF type: unicast ()
  Doing distance-preferred lookups across tables
  RPF topology: ipv4 multicast base

```

After that, a (S,G) Join is built and sent out via the LISP interface to the source via the RLOC 10.1.11.1.

```

*Nov 26 18:38:19.641: PIM(0): RPF Lookup failed for 172.16.251.1
*Nov 26 18:38:19.643: PIM(0): Add GigabitEthernet3.10/172.16.12.2 to (172.16.251.1, 232.1.1.10),
Forward state, by PIM SG Join
*Nov 26 18:38:19.650: PIM(0): Insert (172.16.251.1,232.1.1.10) join in nbr 10.1.11.1's queue

```

```

xTR2#sh ip rpf 172.16.251.1
RPF information for ? (172.16.251.1)
  RPF interface: LISPO
  RPF neighbor: ? (10.1.11.1)
  RPF route/mask: 172.16.251.1/32
  RPF type: unicast ()
  Doing distance-preferred lookups across tables
  RPF topology: ipv4 multicast base

```

A Join is encapsulated into the unicast LISP header. The source IP of the encapsulated packet is a RLOC of the interface via which the packet is sent out. The destination IP is the RLOC address of the xTR which has reachability to the EID of the multicast source.

```

xTR2#sh ip lisp map-cache 172.16.251.1
LISP IPv4 Mapping Cache for EID-table default (IID 0), 4 entries

172.16.251.1/32, uptime: 02:18:16, expires: 21:41:44, via map-reply, complete
  Sources: map-reply
  State: complete, last modified: 02:18:16, map-source: 10.1.11.1
  Idle, Packets out: 41(4838 bytes) (~ 01:21:15 ago)
  Locator      Uptime      State      Pri/Wgt
  10.1.11.1    02:18:16   up          100/100
    Last up-down state change:        02:18:16, state change count: 1
    Last route reachability change:  02:18:16, state change count: 1

```

```
Last priority / weight change: never/never
RLOC-probing loc-status algorithm:
Last RLOC-probe sent: never
```

In order to be able to send a Join you need to have a PIM neighbor. Once RPF information has been obtained, PIM explicitly creates a neighbor to the corresponding RLOC. The neighbor is not created in the usual way because PIM Hello's are not going through the LISP tunnel.

```
xTR2#sh ip pim nei
```

PIM Neighbor Table

The outer Source and Destination IP are local and remote RLOCs. It is expected as you use unicast replication.

The inner Source IP was taken from the LISP0 interface.

```
xTR2#sh int LISP0 | i unn
Interface is unnumbered. Using address of Loopback0 (10.1.255.2)
```

The inner destination IP is multicast address 224.0.0.13 which is used for PIM messages.

On xTR2 for the (172.16.251.1, 232.1.1.10) mroute an IIL is the LISP0 interface and an OIL points to CE2.

```

xTR2#show ip mroute
<...skip...
(172.16.251.1, 232.1.1.10), 00:00:36/00:02:55, flags: sT
  Incoming interface: LISPO, RPF nbr 10.1.11.1
  Outgoing interface list:
    GigabitEthernet3.10, Forward/Sparse, 00:00:36/00:02:55

xTR2#sh ip mfib
<...skip...
(172.16.251.1,232.1.1.10) Flags: HW
  SW Forwarding: 0/0/0/0, Other: 0/0/0
  HW Forwarding: 0/0/0/0, Other: 0/0/0
  LISPO Flags: A
  GigabitEthernet3.10 Flags: F NS
  Pkts: 0/0

```

On xTR1, a Join from xTR2 was received and a (S,G) mroute was created.

```

*Nov 26 18:38:19.464: PIM(0): Received v2 Join/Prune on LISPO from 10.1.255.2
*Nov 26 18:38:19.464: PIM(0): J/P Transport Attribute, Transport Type: Unicast, to us
*Nov 26 18:38:19.464: PIM(0): Join-list: (172.16.251.1/32, 232.1.1.10), S-bit set
*Nov 26 18:38:19.467: PIM(0): Add LISPO/10.1.12.1 to (172.16.251.1, 232.1.1.10), Forward state,
by PIM SG Join
*Nov 26 18:38:19.467: PIM(0): Insert (172.16.251.1,232.1.1.10) join in nbr 172.16.11.2's queue
*Nov 26 18:38:19.467: PIM(0): Building Join/Prune packet for nbr 172.16.11.2
*Nov 26 18:38:19.467: PIM(0): Adding v2 (172.16.251.1/32, 232.1.1.10), S-bit Join
*Nov 26 18:38:19.467: PIM(0): Send v2 join/prune to 172.16.11.2 (GigabitEthernet3.10)

```

```

xTR1#sh ip mroute
<...skip...
(172.16.251.1, 232.1.1.10), 00:01:00/00:03:28, flags: sT
  Incoming interface: GigabitEthernet3.10, RPF nbr 172.16.11.2
  Outgoing interface list:
    LISPO, 10.1.12.1, Forward/Sparse, 00:01:00/00:03:28 <<< LISP in OIL

```

Upstream xTR1 must track every downstream RLOC for which a Join message has been received.

The xTR must remember the set of RLOCs to replicate packets to.

An ( $EID_s, G$ ) entry at the upstream xTR therefore looks as follows for unicast encapsulation:

**( $EID_s, G$ )**

**A Eth0/0**

**F LISPO, nexthop = RLOC1**

**F LISPO, nexthop = RLOC2**

```

xTR1#sh ip mfib
<...skip...
(172.16.251.1,232.1.1.10) Flags: HW
  SW Forwarding: 0/0/0/0, Other: 0/0/0
  HW Forwarding: 0/0/0/0, Other: 0/0/0

```

```
GigabitEthernet3.10 Flags: A
LISP0, 10.1.12.1 Flags: F NS <<<
Pkts: 0/0
```

**Note:** xTR1 doesn't have a PIM neighbor via the interface LISP0.

```
xTR1# sh ip pim nei
PIM Neighbor Table
Mode: B - Bidir Capable, DR - Designated Router, N - Default DR Priority,
      P - Proxy Capable, S - State Refresh Capable, G - GenID Capable,
      L - DR Load-balancing Capable

The destination IP for the packet is the RLOC of xTR3.

Multicast flow is replicated into two unicast streams and is sent out over the core.

## ASM

**Note:** A Static-RP only is supported. A RP redundancy is not supported.

## Source Registers First

Let's sent multicast from CE1 to the group 225.1.1.10. CE1 is the First Hop Router (FHR) so it will trigger an unicast register message to the RP (CE4). As you don't have any receivers, CE1 received a Register-Stop and creates mroute entries.

```
CE1#ping 225.1.1.10 so lo10
Type escape sequence to abort.
Sending 1, 100-byte ICMP Echos to 225.1.1.10, timeout is 2 seconds:
Packet sent with a source address of 172.16.251.1

*Nov 27 14:29:04.083: PIM(0): Check RP 172.16.251.4 into the (*, 225.1.1.10) entry
*Nov 27 14:29:04.084: PIM(0): Building Triggered (*,G) Join / (S,G,RP-bit) Prune message for
225.1.1.10
*Nov 27 14:29:04.089: PIM(0): Adding register encapsulation tunnel (Tunnel0) as forwarding interface of
(172.16.251.1, 225.1.1.10).
*Nov 27 14:29:04.112: PIM(0): Received v2 Register-Stop on GigabitEthernet0/1.10 from
172.16.251.4
*Nov 27 14:29:04.112: PIM(0): for source 172.16.251.1, group 225.1.1.10
*Nov 27 14:29:04.113: PIM(0): Removing register encapsulation tunnel (Tunnel0) as forwarding interface
of (172.16.251.1, 225.1.1.10).
*Nov 27 14:29:04.113: PIM(0): Clear Registering flag to 172.16.251.4 for (172.16.251.1/32,
225.1.1.10).
```

```

CE1#sh ip mro 225.1.1.10
<...skip...
(*, 225.1.1.10), 00:02:16/stopped, RP 172.16.251.4, flags: SPF
  Incoming interface: GigabitEthernet0/1.10, RPF nbr 172.16.11.1
  Outgoing interface list: Null

225.1.1.10
CE4#
*Nov 27 14:24:11.207: PIM(0): Building Periodic (*,G) Join / (S,G,RP-bit) Prune message for
224.0.1.40

```

```

CE4#sh ip mro 225.1.1.10
<...skip...
(*, 225.1.1.10), 00:00:31/stopped, RP 172.16.251.4, flags: SP
  Incoming interface: Null, RPF nbr 0.0.0.0
  Outgoing interface list: Null

(172.16.251.1, 225.1.1.10), 00:00:31/00:02:28, flags: P
  Incoming interface: GigabitEthernet0/1.10, RPF nbr 172.16.14.1
  Outgoing interface list: Null

```

Take into account that a Register-source interface should be in the EID range otherwise LISP won't be triggered. By default, it would be the IP address from the outgoing interface.

```

CE1#sh run | i source
ip pim register-source Loopback10

```

For xTR1 and xTR4, nothing changed because multicast traffic has not being received yet.

## Receiver Comes First

Let's configure a receiver on the interface Lo10 on the device CE3.

```

CE1#sh run | i source
ip pim register-source Loopback10

```

A (\*,Join) is triggered and a mroute is created. Everything is expected.

```

```

A (\*,225.1.1.10) Join is received by xTR3. A (\*,G) Join is sent to the RP. xTR3 checks the RLOC for the RP (172.16.251.4). As it is reachable via the LISP, PIM neighbor to the appropriate RLOC is created. In this case it is 10.1.14.1.

```

```

## Shortest Path Tree (SPT) Switchover

It is assumed that the shared-tree is already built.

CE1 starts to send traffic to the 225.1.1.10 from the source Lo10 (172.16.251.1).

```

CE1#ping 225.1.1.10 so lo10
Type escape sequence to abort.
Sending 1, 100-byte ICMP Echos to 225.1.1.10, timeout is 2 seconds:
Packet sent with a source address of 172.16.251.1
Reply to request 0 from 172.16.251.3, 77 ms

```

The first multicast packet is encapsulated into the unicast Register message and is sent to the RP.

```

CE1#ping 225.1.1.10 so lo10
Type escape sequence to abort.
Sending 1, 100-byte ICMP Echos to 225.1.1.10, timeout is 2 seconds:
Packet sent with a source address of 172.16.251.1
Reply to request 0 from 172.16.251.3, 77 ms

```

The register packet is decapsulated on the RP and sent over the shared tree to the Receiver.

```

CE1#ping 225.1.1.10 so lo10
Type escape sequence to abort.
Sending 1, 100-byte ICMP Echos to 225.1.1.10, timeout is 2 seconds:
Packet sent with a source address of 172.16.251.1
Reply to request 0 from 172.16.251.3, 77 ms

```

Because of match between outgoing interface for a (\*,G) and an incoming interface for a (S,G), a proxy join timer is started for a (S,G), the flag X is set. It is a topology specific situation (RP-on-a-stick).

```

CE4#sh ip mro
<...skip...
(*, 225.1.1.10), 00:00:37/stopped, RP 172.16.251.4, flags: S
  Incoming interface: Null, RPF nbr 0.0.0.0
  Outgoing interface list:
    GigabitEthernet0/1.10, Forward/Sparse, 00:00:37/00:02:52

(172.16.251.1, 225.1.1.10), 00:00:26/00:02:33, flags: PX Incoming interface:
  GigabitEthernet0/1.10, RPF nbr 172.16.14.1 Outgoing interface list: Null

```

So CE4 sends a (S,G) Join to the Source and does not send a (S,G) Prune.

```

CE4#sh ip mro
<...skip...
(*, 225.1.1.10), 00:00:37/stopped, RP 172.16.251.4, flags: S
  Incoming interface: Null, RPF nbr 0.0.0.0
  Outgoing interface list:
    GigabitEthernet0/1.10, Forward/Sparse, 00:00:37/00:02:52

(172.16.251.1, 225.1.1.10), 00:00:26/00:02:33, flags: PX Incoming interface:
  GigabitEthernet0/1.10, RPF nbr 172.16.14.1 Outgoing interface list: Null

```

At the same time, decapsulated multicast traffic is sent over a shared tree to receivers as shown in the images.

Sniffer capture showing network traffic between two hosts connected via a switch.

**Host 1 (Outer IP):** 10.1.11.1 (SRC), 10.1.14.1 (DST)

**Host 2 (Inner IP):** 10.1.14.1 (SRC), 10.1.13.1 (DST)

**Protocol Analysis:**

- Ethernet II frames (SRC: fa:16:3e:9b:b3:ff, Dst: fa:16:3e:ab:98:7e) indicate traffic on interface xTR4.
- Internet Protocol Version 4 (IP) frames show traffic between 10.1.11.1 and 10.1.14.1.
- User Datagram Protocol (UDP) port 4341 is used.
- Locator/ID Separation Protocol (LISP) Data frames are present.
- Internet Protocol Version 4 (IP) frames show traffic between 10.1.11.1 and 10.1.13.1.
- Internet Control Message Protocol (ICMP) Echo (ping) requests are exchanged between the two hosts.

The packet capture was taken on the xTR4 g0/1 interface.

In the first packet, the outer IP SRC and DST are 10.1.11.1 and 10.1.14.1.

In the second packet, the outer IP SRC and DST are 10.1.14.1 and 10.1.13.1 respectively.

After receiving multicast packets LHR CE3 is initiating SPT switchover. A Mroute for (S,G) is created and flags J and T are set. A (S,G) Join is sent towards the Source.

```
.Nov 30 00:00:51.765: MRT(0): Set 'L' flag for (172.16.251.1, 225.1.1.10)

.Nov 30 00:01:34.818: MRT(0): Set the T-flag for (172.16.251.1, 225.1.1.10)
.Nov 30 00:01:34.818: PIM(0): Removing register decap tunnel (Tunnel0) as accepting interface of (172.16.251.1, 225.1.1.10).
.Nov 30 00:01:34.819: PIM(0): Installing GigabitEthernet0/1.10 as accepting interface for (172.16.251.1, 225.1.1.10).
.Nov 30 00:01:34.899: PIM(0): Insert (172.16.251.1,225.1.1.10) join in nbr 172.16.14.1's queue
.Nov 30 00:01:34.902: PIM(0): Building Join/Prune packet for nbr 172.16.14.1
.Nov 30 00:01:34.903: PIM(0): Adding v2 (172.16.251.1/32, 225.1.1.10), S-bit Join
.Nov 30 00:01:34.903: PIM(0): Send v2 join/prune to 172.16.14.1 (GigabitEthernet0/1.10)
.Nov 30 00:01:39.398: PIM(0): Insert (172.16.251.1,225.1.1.10) prune in nbr 172.16.14.1's queue
.Nov 30 00:01:39.399: PIM(0): Building Join/Prune packet for nbr 172.16.14.1
.Nov 30 00:01:39.401: PIM(0): Adding v2 (172.16.251.1/32, 225.1.1.10), S-bit Prune
.Nov 30 00:01:39.402: PIM(0): Send v2 join/prune to 172.16.14.1 (GigabitEthernet0/1.10)
```

```
CE4#sh ip mro
<...skip...
(172.16.251.1, 225.1.1.10), 00:00:57/00:02:45, flags: PT
  Incoming interface: GigabitEthernet0/1.10, RPF nbr 172.16.14.1
  Outgoing interface list: Null
```

xTR4 receives a (S,G) Prune initiated by the RP and sends it to the FHR (CE1). Gi0/2.10 is excluded from an OIL.

```
Nov 30 00:01:38.620: PIM(0): Received v2 Join/Prune on GigabitEthernet0/2.10 from 172.16.14.2, to us
Nov 30 00:01:38.621: PIM(0): Prune-list: (172.16.251.1/32, 225.1.1.10)
Nov 30 00:01:38.622: PIM(0): Prune GigabitEthernet0/2.10/225.1.1.10 from (172.16.251.1/32, 225.1.1.10)
Nov 30 00:01:38.622: MRT(0): Delete GigabitEthernet0/2.10/225.1.1.10 from the olist of (172.16.251.1, 225.1.1.10)
Nov 30 00:01:38.624: MRT(0): Reset the PIM interest flag for (172.16.251.1, 225.1.1.10)
Nov 30 00:01:38.625: MRT(0): set min mtu for (172.16.251.1, 225.1.1.10) 1500->18010
Nov 30 00:01:38.626: PIM(0): Insert (172.16.251.1,225.1.1.10) prune in nbr 10.1.11.1's queue - deleted
Nov 30 00:01:38.628: PIM(0): Building Join/Prune packet for nbr 10.1.11.1
Nov 30 00:01:38.629: PIM(0): Adding v2 (172.16.251.1/32, 225.1.1.10), S-bit Prune
Nov 30 00:01:38.630: PIM(0): Send v2 join/prune to 10.1.11.1 (LISP0)
```

```
xTR4#sh ip mro
<...skip...
(*, 225.1.1.10), 00:08:19/00:02:32, RP 172.16.251.4, flags: S
  Incoming interface: GigabitEthernet0/2.10, RPF nbr 172.16.14.2
  Outgoing interface list:
    LISPO, 10.1.13.1, Forward/Sparse, 00:08:19/00:02:32
(172.16.251.1, 225.1.1.10), 00:00:57/00:02:02, flags: PT
  Incoming interface: LISPO, RPF nbr 10.1.11.1
  Outgoing interface list: Null
```

xTR1 receives a (S,G) Prune from xTR4 and remove the LISPO via the RLOC 10.1.14.1 from the OIL.

```

.Nov 30 00:01:47.450: PIM(0): Received v2 Join/Prune on LISPO from 172.16.251.14
.Nov 30 00:01:47.450: PIM(0): J/P Transport Attribute, Transport Type: Unicast, to us
.Nov 30 00:01:47.450: PIM(0): Prune-list: (172.16.251.1/32, 225.1.1.10)
.Nov 30 00:01:47.451: PIM(0): Prune LISPO/10.1.14.1 from (172.16.251.1/32, 225.1.1.10)
.Nov 30 00:01:47.451: MRT(0): Delete LISPO/10.1.14.1 from the olist of (172.16.251.1,
225.1.1.10) - deleted

```

```

xTR1#sh ip mro
<...skip...
(*, 225.1.1.10), 00:01:02/stopped, RP 172.16.251.4, flags: SP
  Incoming interface: LISPO, RPF nbr 10.1.14.1
  Outgoing interface list: Null

(172.16.251.1, 225.1.1.10), 00:01:02/00:01:57, flags: T
  Incoming interface: GigabitEthernet3.10, RPF nbr 172.16.11.2
  Outgoing interface list:
    LISPO, 10.1.13.1, Forward/Sparse, 00:01:02/00:02:27

```

Now you have a final state.

## FHR (CE1)
