Introduction

This document describes how to configure the ASA to posture VPN users against the ISE.

Prerequisites

Requirements

Cisco recommends that you have knowledge of these topics:

- Basic knowledge of ASA CLI configuration and Secure Socket Layer (SSL) VPN configuration
- Basic knowledge of remote access VPN configuration on the ASA
- Basic knowledge of ISE and posture services

Components Used

The information in this document is based on these software versions:

- Cisco ASA software Versions 9.16 and later
- Microsoft Windows Version 7 with Cisco AnyConnect Secure Mobility Client Version 4.10
- Cisco ISE Version 3.0

The information in this document was created from the devices in a specific lab environment. All of the devices used in this document started with a cleared (default) configuration. If your network is live, ensure

that you understand the potential impact of any command.

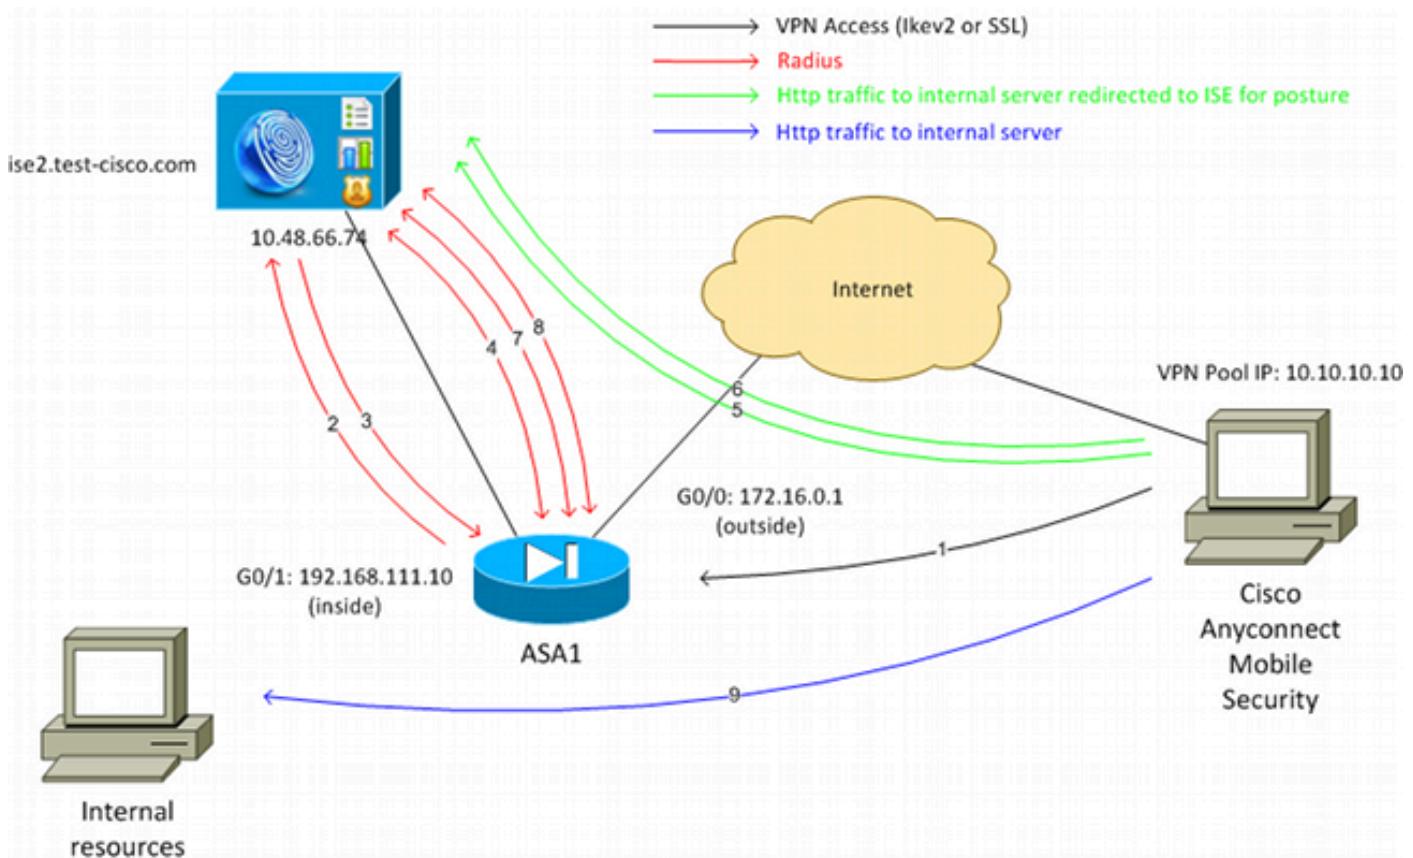

Background Information

The Cisco ASA Version 9.16 supports RADIUS Change of Authorization (CoA) (RFC 5176). This allows for posturing of VPN users against the Cisco ISE. After a VPN user logs in, the ASA redirects web traffic to the ISE, where the user is provisioned with a Network Admission Control (NAC) Agent or Web Agent. The agent performs specific checks on the user machine in order to determine its compliance against a configured set of posture rules, such as Operating System (OS), patches, AntiVirus, Service, Application or Registry rules.

The results of the posture validation are then sent to the ISE. If the machine is deemed complaint, then the ISE can send a RADIUS CoA to the ASA with the new set of authorization policies. After successful posture validation and CoA, the user is allowed access to the internal resources.

Configure

Network Diagram and Traffic Flow

Here is the traffic flow, as illustrated in the network diagram:

1. The remote user uses Cisco Anyconnect for VPN access to the ASA.
2. The ASA sends a RADIUS Access-Request for that user to the ISE.
3. That request hits the policy named **ASA916-posture** on the ISE. As a result, the **ASA916-posture** authorization profile is returned. The ISE sends a RADIUS Access-Accept with two Cisco Attribute-Value pairs:

- **url-redirect-acl=redirect** - this is the Access Control List (ACL) name that is defined locally on the ASA, which decides the traffic that must be redirected.
- **url-redirect** - this is the URL to which the remote user must be redirected.

 **Tip:** The Domain Name System (DNS) servers that are assigned to the VPN clients must be able to resolve the Fully Qualified Domain Name (FQDN) that is returned in the redirect URL. If the VPN filters are configured in order to restrict access at the tunnel-group level, ensure that the client pool is able to access the ISE server on the configured port (**TCP 8443** in this example).

4. The ASA sends a RADIUS Accounting-Request start packet and receives a response. This is needed in order to send all of the details in regards to the session to the ISE. These details include the session_id, external IP address of the VPN client, and the IP address of the ASA. The ISE uses the session_id in order to identify that session. The ASA also sends periodic interim account information, where the most important attribute is the Framed-IP-Address with the IP that is assigned to the client by the ASA (**10.10.10.10** in this example).
5. When the traffic from the VPN user matches the locally-defined ACL (redirect). Dependent upon the configuration, the ISE provisions the NAC Agent or the Web Agent.
6. After the agent is installed on the client machine, it automatically performs specific checks. In this example, it searches for the **c:\test.txt** file. It also sends a posture report to the ISE, which can include multiple exchanges with the use of SWISS protocol and ports TCP/UDP 8905 in order to access the ISE.
7. When the ISE receives the posture report from the agent, it processes the authorization rules once again. This time, the posture result is known and another rule is hit. It sends a RADIUS CoA packet:
 - If the user is compliant, then a Downloadable ACL (DACL) name that permits full access is sent (AuthZ rule ASA916-compliant).
 - If the user is non-compliant, then a DACL name that permits limited access is sent (AuthZ rule ASA916-noncompliant).

 **Note:** The RADIUS CoA is always confirmed; that is, the ASA sends a response to the ISE in order to confirm.

8. The ASA removes the redirection. If it does not have the DACLs cached, it must send an Access-Request in order to download them from the ISE. The specific DACL is attached to the VPN session.
9. The next time that the VPN user tries to access the web page, it can access all of the resources that are permitted by the DACL that is installed on the ASA.
If the user is not compliant, only limited access is granted.

 **Note:** This flow model differs from most scenarios that use RADIUS CoA. For wired/wireless 802.1x authentications, RADIUS CoA does not include any attributes. It only triggers the second authentication in which all attributes, such as DACL, are attached. For the ASA VPN posture, there is no second authentication. All of the the attributes are returned in the RADIUS CoA. The VPN session is active and it is not possible to change most of the VPN user settings.

Configurations

Use this section in order to configure the ASA and the ISE.

ASA

Here is the basic ASA configuration for Cisco AnyConnect access:

```
<#root>

ip local pool
POOL 10.10.10.10-10.10.10.100
mask 255.255.255.0

interface GigabitEthernet0/0
nameif outside
security-level 0
ip address xxxx 255.255.255.0

!
interface GigabitEthernet0/1
nameif inside
security-level 100
ip address 162.168.111.10 255.255.255.0

aaa-server ISE protocol radius
aaa-server ISE (inside) host 10.48.66.74

key cisco

webvpn
enable outside

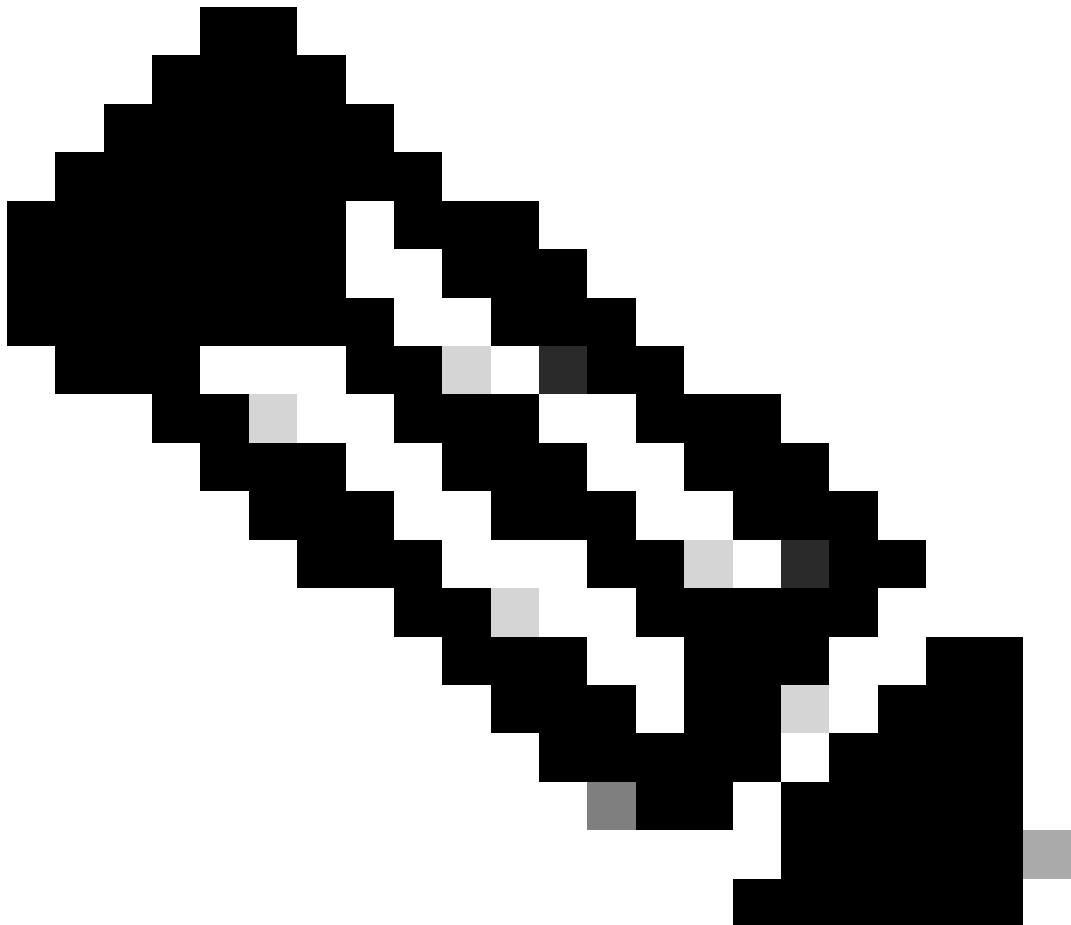

anyconnect image disk0:/anyconnect-win-arm64-4.10.06079-webdeploy-k9.pkg 1
anyconnect enable
tunnel-group-list enable

group-policy GP-SSL internal
group-policy GP-SSL attributes
vpn-tunnel-protocol ikev1 ikev2 ssl-client ssl-clientless

tunnel-group RA type remote-access
tunnel-group RA general-attributes
address-pool POOL
authentication-server-group ISE
default-group-policy GP-SSL
tunnel-group RA webvpn-attributes
group-alias RA enable
```

For ASA integration with the ISE posture, ensure that you:

- Configure the Authentication, Authorization, and Accounting (AAA) server for dynamic authorization in order to accept CoA.
 - Configure the accounting as a tunnel-group in order to send VPN session details towards the ISE.
 - Configure the interim accounting which sends IP address assigned to the user and periodically update the session status on ISE
 - Configure the redirect ACL, which decides if the DNS and the ISE traffic are allowed. All other HTTP traffic is redirected to the ISE for posture.
-

Note: Only registered Cisco users can access internal Cisco tools and information.

Here is the configuration example:

```
<#root>  
access-list
```

```
redirect
  extended deny udp any any eq domain
access-list

redirect
  extended deny ip any host 10.48.66.74
access-list

redirect
  extended deny icmp any any
access-list

redirect
  extended permit tcp any any eq www

aaa-server ISE protocol radius

authorize-only

interim-accounting-update periodic 1

dynamic-authorization

aaa-server ISE (inside) host 10.48.66.74
key cisco

tunnel-group RA general-attributes
address-pool POOL
authentication-server-group ISE

accounting-server-group ISE

default-group-policy GP-SSL
```

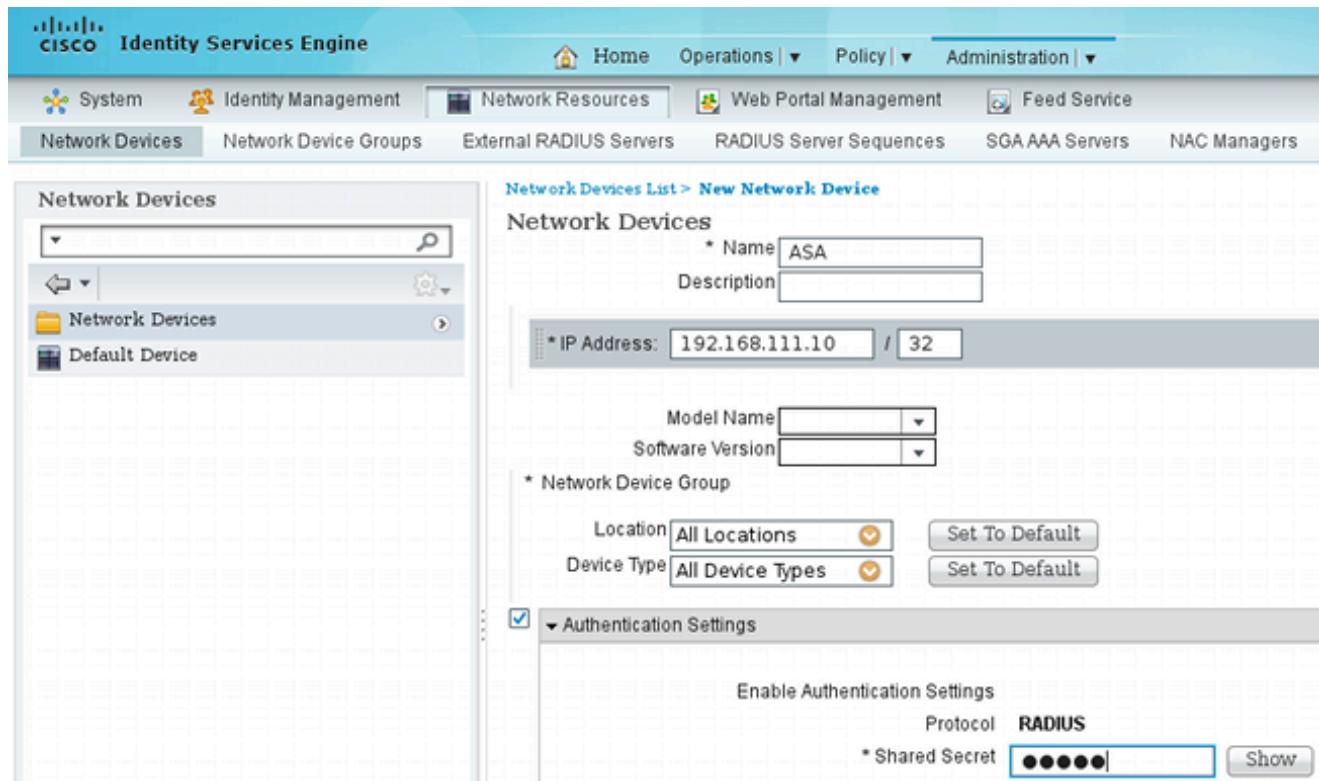

ASA accounting mode:

The accounting mode on ASA needs to be single (default) otherwise ASA is not able to correctly process ISE sessions; that is, ASA rejects the CoA request with “Action not supported”.

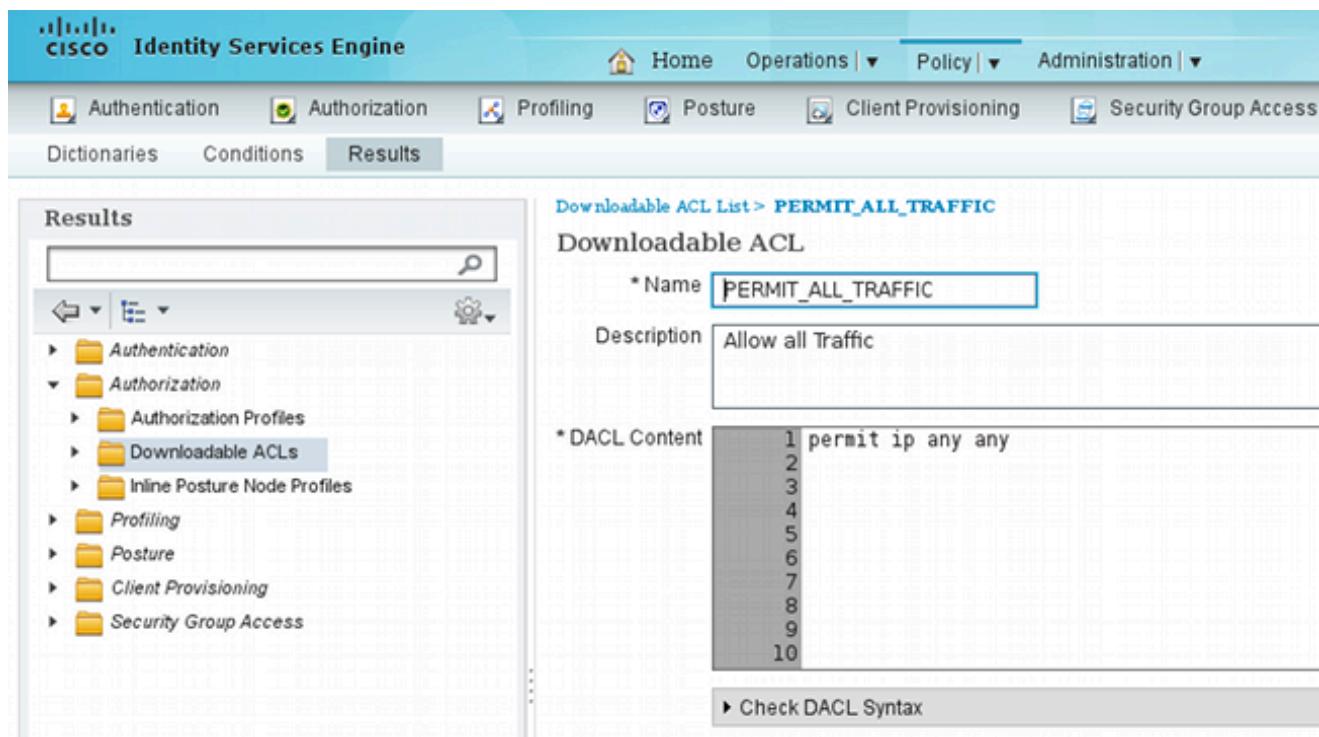

ISE

Complete these steps in order to configure the ISE:

1. Navigate to **Administration > Network Resources > Network Devices** and add the ASA as a network device:

2. Navigate to **Policy > Results > Authorization > Downloadable ACL** and configure the DACL so that it permits full access. The default ACL configuration permits all IP traffic on the ISE:

3. Configure a similar ACL that provides limited access (for non-compliant users).
4. Navigate to **Policy > Results > Authorization > Authorization Profiles** and configure the Authorization Profile named **ASA92-posture**, which redirects users for posture. Check the **Web Redirection** check box, select **Client Provisioning** from the drop-down list, and ensure that **redirect** appears in the ACL field (that ACL is defined locally on the ASA):

The screenshot shows the Cisco Identity Services Engine interface. The left sidebar has a tree view with nodes like Authentication, Authorization, Authorization Profiles, Downloadable ACLs, etc. The main panel shows the configuration for an Authorization Profile named "ASA92-posture". The profile has an "Access Type" of "ACCESS_ACCEPT". Under "Common Tasks", the "Web Redirection" checkbox is checked. Below the profile configuration, there are dropdown menus for "Client Provisioning (Posture)" set to "redirect" and "ACL" set to "redirect".

- Configure the Authorization Profile named **ASA92-compliant**, which must only return the DACL named **PERMIT_ALL_TRAFFIC** that provides full access for the compliant users:

The screenshot shows the Cisco Identity Services Engine interface. The left sidebar has a tree view with nodes like Authentication, Authorization, Authorization Profiles, Downloadable ACLs, etc. The main panel shows the configuration for an Authorization Profile named "ASA92-compliant". The profile has an "Access Type" of "ACCESS_ACCEPT". Under "Common Tasks", the "DACL Name" checkbox is checked, and the dropdown menu shows "PERMIT_ALL_TRAFFIC" selected.

- Configure a similar Authorization Profile named **ASA916-noncompliant**, which must return the DACL with limited access (for non compliant users).
- Navigate to **Policy > Authorization** and configure the Authorization Rules:

- Create a rule that allows full access if the posture results are compliant. The result is the authorization policy **ASA916-compliant**.
- Create a rule that allows limited access if the posture results are non-compliant. The result is the authorization policy **ASA916-noncompliant**.
- Ensure that if neither of the previous two rules are hit, then the default rule returns the **ASA916-posture**, which forces a redirection on the ASA.

| | | | |
|-------------------------------------|---------------------|--|-------------------------|
| <input checked="" type="checkbox"/> | ASA92 complaint | if Session:PostureStatus EQUALS Compliant | then ASA92-compliant |
| <input checked="" type="checkbox"/> | ASA92 non complaint | if Session:PostureStatus EQUALS NonCompliant | then ASA92-noncompliant |
| <input checked="" type="checkbox"/> | ASA92 redirect | if Radius:NAS-IP-Address EQUALS 192.168.111.10 | then ASA92-posture |

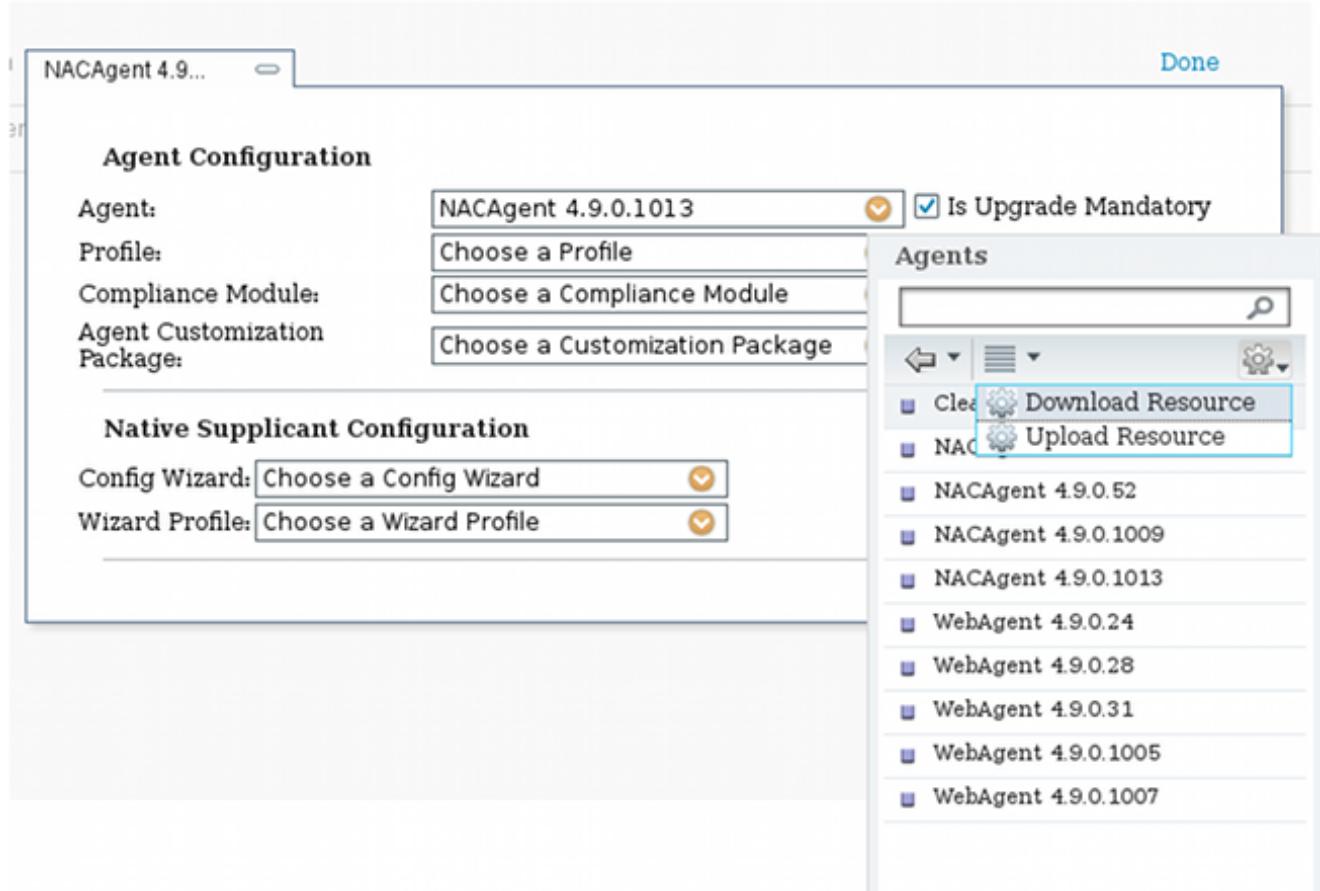

8. The default authentication rules check the user name in the internal identity store. If this must be changed (checked in the Active Directory (AD), for example), then navigate to **Policy > Authentication** and make the change:

| Protocol | Condition | Allow Protocols |
|----------------------------|--|--------------------------|
| MAB | If Wired_MAB OR Wireless_MAB | Default Network Access |
| Dot1X | If Wired_802.1X OR Wireless_802.1X | Default Network Access |
| Default Rule (If no match) | Allow Protocols : Default Network Access | and use : Internal Users |

9. Navigate to **Policy > Client Provisioning** and configure the provisioning rules. These are the rules that decide the type of Agent that must be provisioned. In this example, only one simple rule exists, and the ISE selects the NAC Agent for all Microsoft Windows systems:

| Rule Name | Identity Groups | Operating Systems | Other Conditions | Results |
|---------------|-----------------|-------------------|------------------|--------------------------|
| ASA92-posture | If Any | Windows All | and Condition(s) | then NACAgent 4.9.0.1013 |

When the Agents are not on the ISE, it is possible to download them:

10. If necessary, you can navigate to **Administration > System > Settings > Proxy** and configure the proxy for the ISE (to access the Internet).
11. Configure the posture rules, which verify the client configuration. You can configure rules that check:
 - **files** - existence, version, date
 - **registry** - key, value, existence
 - **application** - process name, running, not running
 - **service** - service name, running, not running
 - **antivirus** - more than 100 vendors supported, version, when definitions are updated
 - **antispyware** - more than 100 vendors supported, version, when definitions are updated
 - **compound condition** - mixture of all
 - **custom dictionary conditions** - usage of most of the ISE dictionaries
12. In this example, only a simple file existence check is performed. If the **c:\test.txt** file is present on the client machine, it is compliant and allowed full access. Navigate to **Policy > Conditions > File Conditions** and configure the file condition:

13. Navigate to **Policy > Results > Posture > Requirements** and create a requirement. This requirement must be met when the previous condition is satisfied. If it is not, then remediation action is executed. There can be many types of remediation actions available, but in this example, the simplest one is used: a specific message is displayed.

| Name | Operating Systems | Conditions | Remediation Actions |
|-------------------------|-------------------|------------------------|-----------------------------|
| file_requirement | for Windows All | met if file_condition | else Message Text Only |
| Any_AV_Installation_Win | for Windows All | met if ANY_av_win_inst | else Message Text Only |
| Any_AV_Definition_Win | for Windows All | met if ANY_av_win_def | else AnyAVDefRemediationWin |
| Any_AS_Installation_Win | for Windows All | met if ANY_as_win_inst | else Message Text Only |
| Any_AS_Definition_Win | for Windows All | met if ANY_as_win_def | else AnyASDefRemediationWin |
| Any_AV_Installation_Mac | for Mac OSX | met if ANY_av_mac_inst | else Message Text Only |
| Any_AV_Definition_Mac | for Mac OSX | met if ANY_av_mac_def | else AnyAVDefRemediationMac |
| Any_AS_Installation_Mac | for Mac OSX | met if ANY_as_mac_inst | else Message Text Only |
| Any_AS_Definition_Mac | for Mac OSX | met if ANY_as_mac_def | else Message Text Only |

Note: In a normal scenario, the File Remediation action can be used (the ISE provides the downloadable file).

14. Navigate to **Policy > Posture** and use the requirement that you created in the previous step (named **file_requirement**) in the posture rules. The only posture rule requires that all Microsoft Windows systems meet the **file_requirement**. If this requirement is met, then the station is compliant; if it is not met, then the station is non-compliant.

| Status | Rule Name | Identity Groups | Operating Systems | Other Conditions | Requirements |
|-------------------------------------|-----------|-----------------|-------------------|------------------|-----------------------|
| <input checked="" type="checkbox"/> | posture | If Any | and Windows All | | then file_requirement |

Periodic Reassessment

By default, posture is a one-time event. However, there is sometimes a need to periodically check the user compliance and adjust the access to the resources based on the results. This information is pushed via SWISS protocol (NAC Agent) or encoded within the application (Web Agent).

Complete these steps in order to check the user compliance:

1. Navigate to **Administration > Settings > Posture > Reassessments** and enable reassessment globally (per identity group configuration):

Reassessment Configuration List - New Reassessment Configuration

Reassessment Configuration

* Configuration Name:

Configuration Description:

Use Reassessment Enforcement:

Enforcement Type: continuous

Interval: minutes

Grace Time: minutes

1. Each configuration must have a unique group or a unique combination of groups.
2. No two configurations may have any group in common.
3. If a config already exists with a group of 'Any', then no other configs can be created unless -
 I. the existing config with a group of 'Any' is updated to reflect a group (or groups) other than 'Any', or
 II. the existing config with a group of 'Any' is deleted.
4. If a config with a group of 'Any' must be created, delete all other configs first.

* Select User Identity Groups:

2. Create a posture condition that matches all reassessments:

The screenshot shows the 'Conditions' tab selected in the navigation bar. On the left, a sidebar lists various condition types: File Condition, Registry Condition, Application Condition, Service Condition, Compound Condition, AV Compound Condition, AS Compound Condition, Dictionary Simple Condition (which is selected and highlighted in blue), and Dictionary Compound Condition.

The main form is titled 'Dictionary Conditions List > New Dictionary Condition'. It contains fields for 'Name' (set to 'reassessment'), 'Description' (empty), 'Attribute' (set to 'Session:Agent-Request-Type'), 'Operator' (set to 'Equals'), and 'Value' (set to 'Periodic Reassessment').

3. Create a similar condition that matches only the initial assessments:

The screenshot shows the 'Conditions' tab selected in the navigation bar. On the left, a sidebar lists various condition types, with 'Dictionary Simple Condition' selected.

The main form is titled 'Dictionary Conditions List > New Dictionary Condition'. It contains fields for 'Name' (set to 'initial'), 'Description' (empty), 'Attribute' (set to 'Session:Agent-Request-Type'), 'Operator' (set to 'Equals'), and 'Value' (set to 'Initial').

Both of these conditions can be used in the posture rules. The first rule matches only the initial assessments and the second one matches all of the subsequent assessments:

The screenshot shows the 'Posture Policy' section. It defines rules based on operating system and other conditions. Two rules are listed:

- posture_initial**: If Any and Windows All, then file_requirement. This rule is associated with the 'initial' condition.
- posture_reassessment**: If Any and Windows All, then file_requirement. This rule is associated with the 'reassessment' condition.

Verify

In order to confirm that your configuration works correctly, ensure that these steps are completed as described:

1. The VPN user connects to the ASA.
2. The ASA sends a RADIUS-Request and receives a response with the **url-redirect** and the **url-redirect-acl** attributes:

```

Frame 1: 270 bytes on wire (2160 bits), 270 bytes captured (2160 bits)
> Ethernet II, Src: VMware_c0:00:03 (00:50:56:c0:00:03), Dst: VMware_e8:ef:25 (00:0c:29:e8:ef:25)
> Internet Protocol Version 4, Src: 10.48.66.74 (10.48.66.74), Dst: 192.168.111.10 (192.168.111.10)
> User Datagram Protocol, Src Port: sightline (1645), Dst Port: 54459 (54459)
Radius Protocol
  Code: Access-Request (2)
  Packet identifier: 0x2e (46)
  Length: 269
  Authenticator: bef22fb479a10c1e2dea50937882e0d4
  This is a response to a request in frame 1
  [Time from request: 0.059399000 seconds]
Attribute Value Pairs
  AVP: l=7 t=User-Name(1): cisco
  AVP: l=40 t=State(24): 52656175746853657373696f6e3a6330613837303061303...
  AVP: l=50 t=Class(25): 434143533a6330613837303061303064303030353262...
  AVP: l=33 t=Vendor-Specific(26) v=ciscoSystems(9)
    VSA: l=27 t=Cisco-AVPair(1): url-redirect-acl=redirect
  AVP: l=119 t=Vendor-Specific(26) v=ciscoSystems(9)
    VSA: l=113 t=Cisco-AVPair(1): url-redirect=https://ise2.test-cisco.com:8443/guestportal/gateway?sessionId=c0a8700a0000900052b1b1bc&action=cpp
  
```

3. The ISE logs indicate that the authorization matches the posture profile (the first log entry):

| | #ACSACL#-IP-P | ASA9-2 | Compliant | Ise2 |
|---|-----------------------|--------|-----------------|-----------------------------------|
| ✓ | 192.168.10.67 | ASA9-2 | ASA92-compliant | Compliant Ise2 |
| ● | 0 cisco 192.168.10.67 | ASA9-2 | | Compliant Ise2 |
| ✓ | cisco 192.168.10.67 | ASA9-2 | ASA92 posture | User Identity Gro... Pending Ise2 |

4. The ASA adds a redirect to the VPN session:

```

<#root>

aaa_url_redirect

: Added url redirect:https://ise2.test-cisco.com:8443/
guestportal/gateway?sessionId=c0a8700a0000900052b840e6&action=cpp
acl:redirect for

10.10.10.10
  
```

5. The status of the VPN session on the ASA shows that the posture is required and redirects the HTTP traffic:

```

<#root>

ASA#
show vpn-sessiondb detail anyconnect
  
```

ISE Posture:

```
Redirect URL : https://ise2.test-cisco.com:8443/guestportal/gateway?
sessionId=c0a8700a0000900052b840e6&action=cpp
```

Redirect ACL : redirect

6. The client that initiates the HTTP traffic that matches the redirect ACL is redirected to the ISE:

```
<#root>

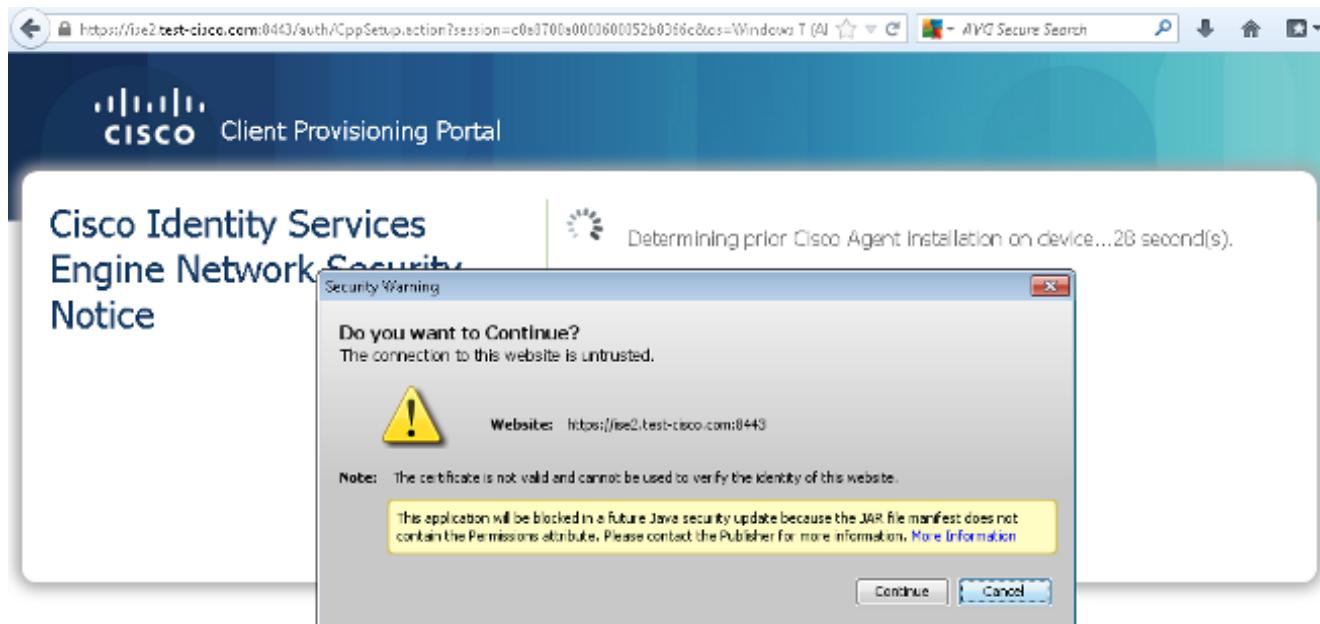

aaa_url_redirect: Created proxy for 10.10.10.10
aaa_url_redirect:

Sending url redirect

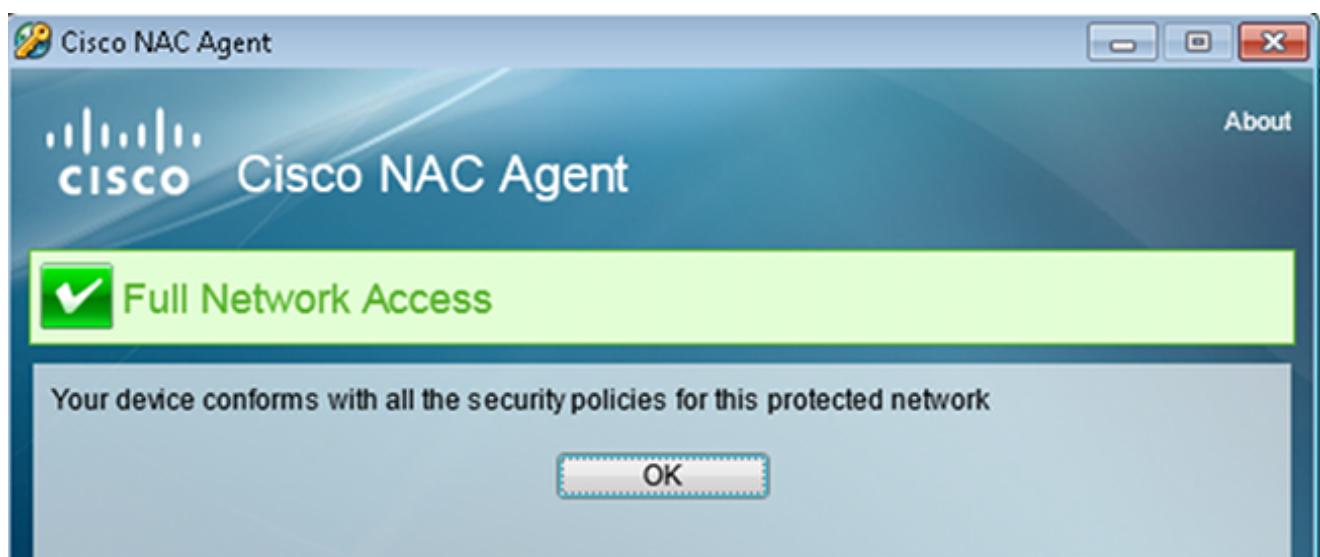

:https://ise2.test-cisco.com:8443/
guestportal/gateway?sessionId=c0a8700a0000900052b840e6&action=cpp
for

10.10.10.10
```

7. The client is redirected to the ISE for posture:

8. The NAC Agent is installed. After the NAC Agent is installed, it downloads the posture rules via SWISS protocol and performs checks in order to determine compliance. The posture report is then sent to the ISE.

9. The ISE receives the posture report, reevaluates the authorization rules, and (if needed) changes the authorization status and sends a CoA. This can be verified in the **ise-psc.log**:

```
<#root>

cisco.cpm.posture.runtime.PostureHandlerImpl -:cisco:c0a8700a0000900052b840e6

This is reflected in the ISE logs:

- The first log entry is for the initial authentication that returns the posture profile (with redirection).
- The second log entry is populated after the compliant SWISS report is received.
- The third log entry is populated when the CoA is sent, along with the confirmation (described as Dynamic Authorization Succeeded).
- The final log entry is created when the ASA downloads the DACL.

#ACSAACL#-IP-PERMIT_ALL_TRAFFIC-51ef7db1

 **Note:** The ASA always removes the redirect rules, even when the CoA does not have any DACL attached.

Troubleshoot

This section provides information you can use in order to troubleshoot your configuration.

Debugs on the ISE

Navigate to **Administration > Logging > Debug Log Configuration** in order to enable debugs. Cisco recommends that you enable temporary debugs for:

- SWISS
- Nonstop Forwarding (NSF)
- NSF-Session
- Provision
- Posture

Enter this command in the CLI in order to view the debugs:

```

<#root>
ise2/admin#
show logging application ise-psc.log tail count 100

```

Navigate to **Operations > Reports > ISE Reports > Endpoints and Users > Posture Details Assessment**

in order to view the posture reports:

The screenshot shows the Cisco Identity Services Engine (ISE) web interface. The top navigation bar includes links for Home, Operations, Policies, Administration, and Setup Assistant. Below the navigation is a menu bar with options like Authentication, Reports, Endpoint Protection Service, and Troubleshoot. On the left, a sidebar titled 'Report Selector' contains sections for Favorites, ISE Reports, and Posture Detail Assessment. Under Posture Detail Assessment, there is a 'Time Range' dropdown set to 'Today' and a 'Run' button. The main content area displays a table titled 'Posture Detail Assessment' with the following data:

| Logged At | Status | Detail | PMA | Identity | Endpoint ID | IP Address | Endpoint OS | Agent | Message |
|-----------------------|--------------------------------------|--------------------------------------|----------|----------|------------------|--------------|-----------------------------|----------------|--|
| 2013-12-23 15:21:34.9 | ✓ | ○ | continue | cisco | 08:01:27:CD:BA | 10.147.24.92 | Windows 7 Enterprise 64-bit | Cisco NAC A... | Received a posture report from an endpoint |
| 2013-12-23 15:08:58.3 | ✓ | ○ | continue | cisco | 08:01:27:CD:BA | 10.147.24.92 | Windows 7 Enterprise 64-bit | Cisco NAC A... | Received a posture report from an endpoint |
| 2013-12-23 14:59:34.3 | ✓ | ○ | continue | cisco | 08:01:27:CD:BA | 10.147.24.92 | Windows 7 Enterprise 64-bit | Cisco NAC A... | Received a posture report from an endpoint |
| 2013-12-23 14:55:26.6 | ● | ○ | N/A | cisco | 08:01:27:CD:BA | 10.147.24.92 | Windows 7 Enterprise 64-bit | Cisco NAC A... | Received a posture report from an endpoint |
| 2013-12-23 14:44:45.0 | ● | ○ | N/A | cisco | 08:01:27:CD:BA | 10.147.24.92 | Windows 7 Enterprise 64-bit | Cisco NAC A... | Received a posture report from an endpoint |
| 2013-12-23 13:34:30.3 | ● | ○ | N/A | cisco | 08:01:27:7F:5F:9 | 10.147.24.92 | Windows 7 Ultimate 64-bit | Cisco NAC A... | Received a posture report from an endpoint |
| 2013-12-23 13:27:10.3 | ● | ○ | N/A | cisco | 08:01:27:7F:5F:9 | 10.147.24.92 | Windows 7 Ultimate 64-bit | Cisco NAC A... | Received a posture report from an endpoint |

At the bottom right of the table, it says 'Generated at 2013-12-23'. There are also 'Page' and 'Print' buttons.

On the Posture More Detail Assessment page, there is policy name with a requirement name that is displayed, along with the results:

Debugs on the ASA

You can enable these debugs on the ASA:

- **debug aaa url-redirect**
- **debug aaa authorization**
- **debug radius dynamic-authorization**
- **debug radius decode**
- **debug radius user cisco**

Debugs for the Agent

For the NAC Agent, it is possible to gather the debugs with the Cisco Log Packager, which is initiated from the GUI or with the CLI; use CCAgentLogPackager.app.

 **Tip:** You can decode the results with the Technical Assistance Center (TAC) tool.

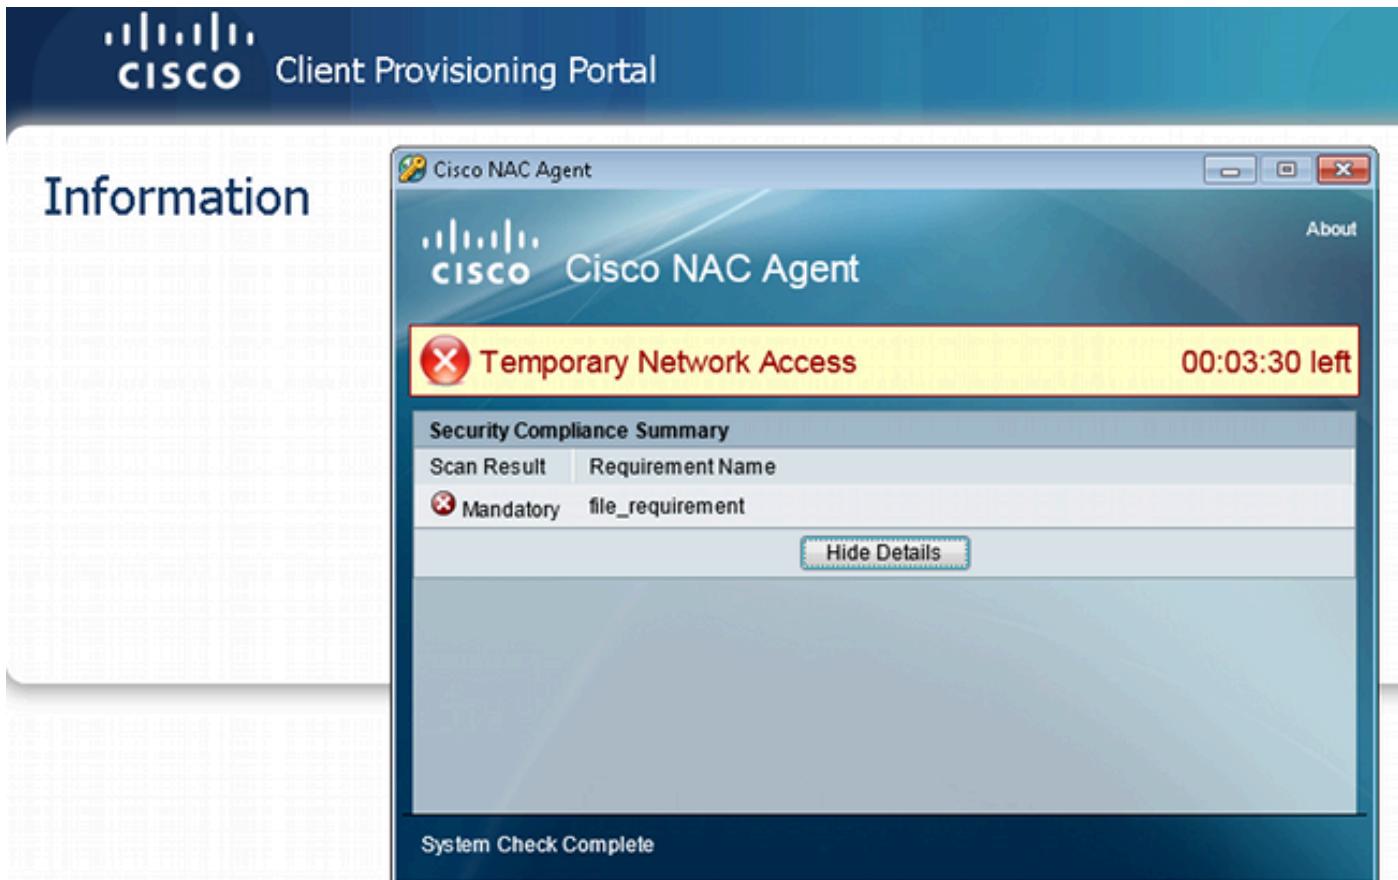

In order to retrieve the logs for the Web Agent, navigate to these locations:

- C: > Document and Settings > <user> > Local Settings > Temp > webagent.log (decoded with the TAC tool)
- C: > Document and Settings > <user> > Local Settings > Temp > webagentsetup.log

 **Note:** If the logs are not in these locations, then verify the **TEMP Environment** variable.

NAC Agent Posture failure

If the posture fails, the user is presented with the reason:

The user is then allowed remediation actions if they are configured:
