Introduction

This document describes how to configure Cisco Identity Service Engine 3.3 pxGrid Context-in using Open API.

Prerequisites

Requirements

Cisco recommends that you have knowledge of these topics:

- Cisco Identity Service Engine (ISE) 3.3
- Advance REST API

Components Used

The information in this document is based on these software and hardware versions:

- Cisco ISE 3.3
- Insomnia REST API client

The information in this document was created from the devices in a specific lab environment. All of the devices used in this document started with a cleared (default) configuration. If your network is live, ensure that you understand the potential impact of any command.

Background Information

pxGrid Context-In solution through REST APIs. This is because the Context-In pubsub model has some limitations with respect to using custom attributes in profiling and authorization policies.

Custom attributes are user-defined attributes that do not come in as endpoint data through regular network probes. Prior to ISE 3.3, there were mainly two ways to input custom attribute values as endpoint data.

- pxGrid Context-In asset topic, where ISE acts as a consumer and consumes endpoint data published by an external third-party product.
- Endpoint Extensible RESTful Services (ERS) Create/Update APIs.

Both these channels have limitations for using custom attributes in profiling and authorization policies.

Initial Steps

Enable Open API on ISE

Open API is disabled by default on ISE. In order to enable it, navigate to Administration > System > API Settings > API Service Settings. Toggle the Open API options and click **Save**.

API Settings

API Service Settings

API Service Settings for Primary Administration Node

ERS (Read/Write)

Open API (Read/Write)

API Service Setting for All Other Nodes

ERS (Read)

Open API (Read)

CSRF Check (only for ERS Settings)

Enable CSRF Check for Enhanced Security (Not compatible with pre ISE 2.3 Clients)

Disable CSRF For ERS Request (compatible with ERS clients older than ISE 2.3)

Buttons: Reset | Save

Enable Open API

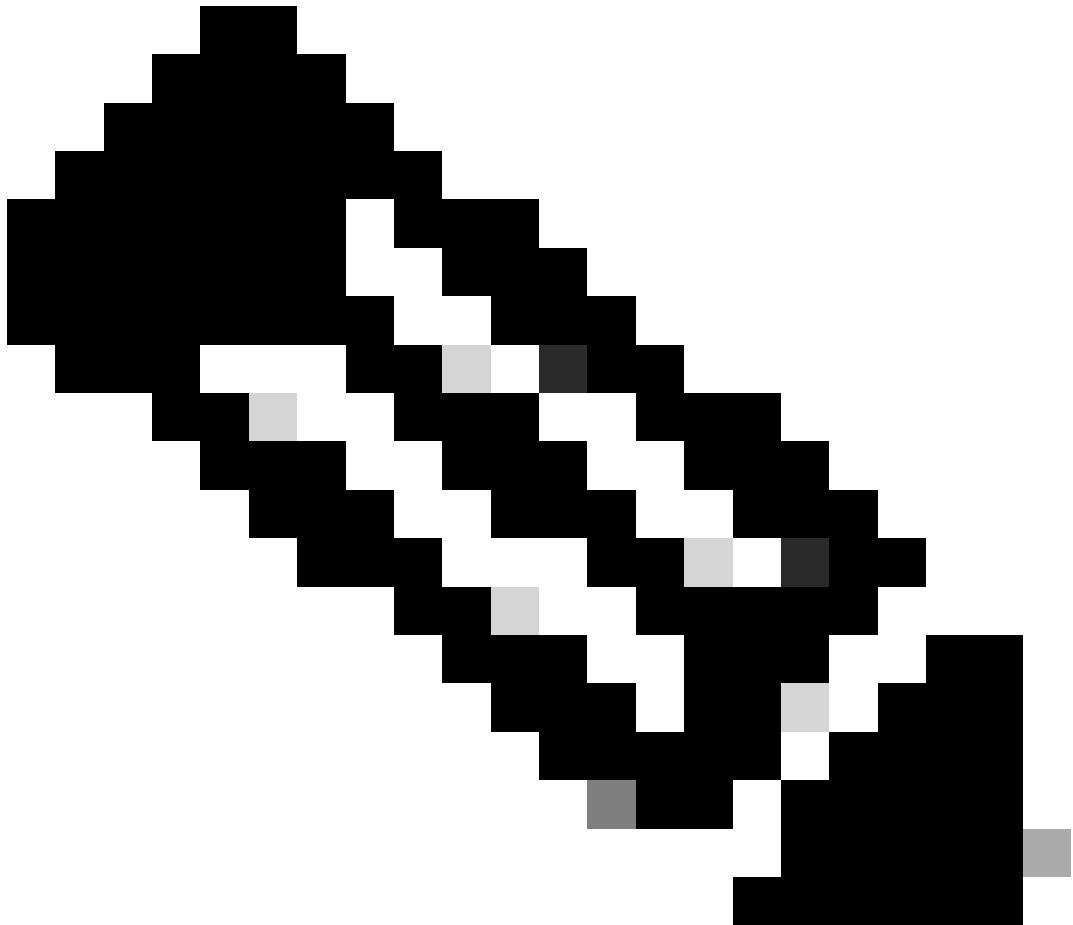

Enable Custom Attribute for Profiling Enforcement on ISE

Custom Attribute for Profiling Enforcement is disabled by default on ISE. In order to enable it, navigate to

Work Centers > Profiler > Settings > Profiler Settings. Enable Custom Attribute for Profiling Enforcement. Click Save.

The screenshot shows the 'Profiler Settings' page under the 'Work Centers / Profiler' tab. On the left sidebar, there are icons for Overview, Ext Id Sources, Network Devices, Endpoint Classification, Node Config, Feeds, Manual Scans, Policy Elements, Profiling Policies, and More. The 'More' icon is highlighted with a blue bar. The main content area has a title 'Profiling' and a section titled 'Profiler Settings'. It includes fields for 'CoA Type*' (set to 'No CoA'), 'Overlapping Classification Priority' (set to 'Admin First'), and 'Current custom SNMP community strings' (set to '*****'). There is a 'Show' link next to the community strings field. Below these are several checkboxes: 'EndPoint Attribute Filter', 'Anomalous Behaviour Detection', 'Anomalous Behaviour Enforcement' (unchecked), 'Custom Attribute for Profiling Enforcement' (checked), 'Profiling for MUD', 'Profiler Forwarder Persistence Queue' (checked), and 'XSS Security Scan Enforcement for EndPoint Probe Data' (unchecked). A 'Save' button is located at the bottom right of the form.

Enable Custom Attribute for Profiling Enforcement

Note: The Custom Attribute for Profiling Enforcement flag indicates that an automatic re-profiling action takes place if any custom attribute is modified.

Swagger UI

In order to access all Open API definitions on ISE, navigate to Administration > System > Settings > API Settings and click 'For more information on ISE Open API, please visit:'.

The URLs for the definitions used in this document are:

- Custom Attribute: <https://<ISE-PAN-IP>/api/swagger-ui/index.html?urls.primaryName=CustomAttributes>
- Endpoint: <https://<ISE-PAN-IP>/api/swagger-ui/index.html?urls.primaryName=Endpoints>

Swagger UI

Configure Endpoint Custom Attributes using Open API

Create Endpoint Custom Attribute

In order to create an endpoint custom attribute, it is mandatory to give it a name and type.

The types that can be used are:

- String
- Int
- Boolean
- Float
- Long
- IP
- Date

Method	POST
URL	<a href="https://<ISE-PAN-IP>:443/api/v1/endpoint-custom-attribute">https://<ISE-PAN-IP>:443/api/v1/endpoint-custom-attribute
Authentication Type	Basic

Reset Save

Endpoint Custom Attribute GUI

Note: The Endpoint Custom Attributes can be added manually. From ISE, navigate to Administration > Identity Management > Settings > Endpoint Custom Attributes. Click +, then enter the **Attribute Name**, and choose the **Type**.

Context-In API for Single Endpoint

Profiling Policy for Custom Attribute

From ISE, navigate to Work Centers > Profiler > Profiling Policies. Click Add.

Enter Name of the profiling policy.

Under Rules, navigate to Attributes > Create New Condition > CUSTOMATTRIBUTE. Choose the custom attribute created, choose Operator, and enter the value to be matched. Click Submit.

In this example, the DevicTypeA profiling policy is defined with CUSTOMATTRIBUTE_DeviceType.

Profiler Policy

Create Endpoint

In this example, an endpoint with the mac address 94:DA:5F:96:74:63 and DeviceType set to A is created.

Verify Endpoint Creation

From ISE, navigate to Context Visibility > Endpoints. Filter with the name of the profiling policy created under **Endpoint Profile** column.

Context Visibility DeviceTypeA

Update Endpoint

In order to update endpoints via Open API, the URL path requires the parameter **value**. This parameter can be the **ID** or **MAC address** of the endpoint.

In this example, a new profiling policy DeviceTypeB was defined in order to update the custom attribute **DeviceType** set to **B** and the **value** is set as the **MAC address**.

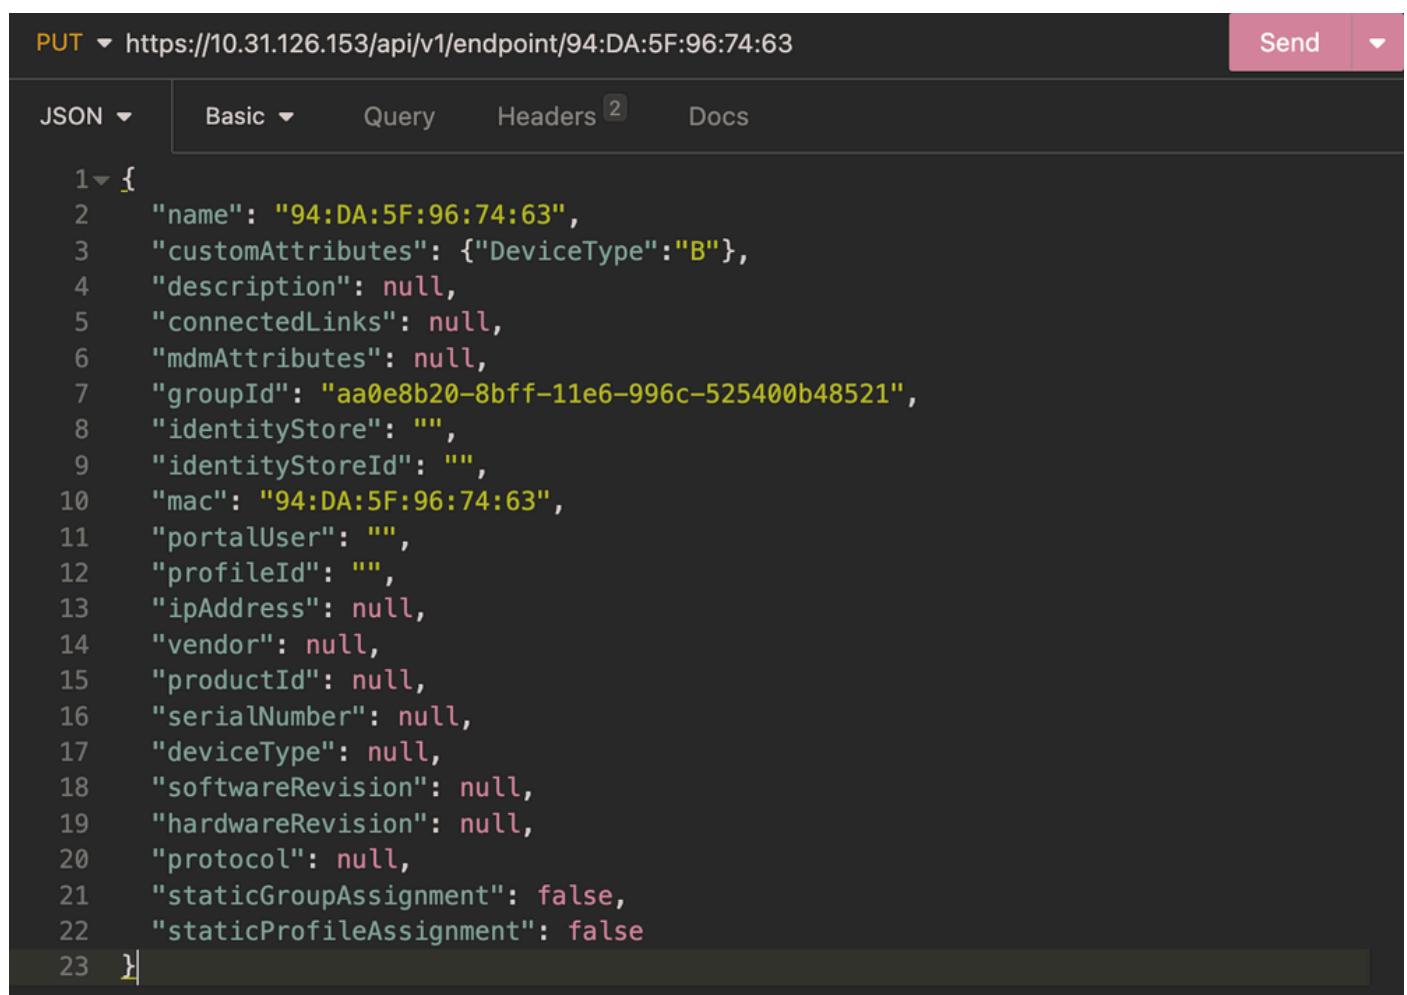

Method	PUT
URL	https://<ISE-PAN-IP>:443/api/v1/endpoint/{value}

Expected output Update Endpoint

Verify Endpoint Update

From ISE, navigate to Context Visibility > Endpoints. Filter with the name of the profiling policy created under Endpoint Profile column.

Context Visibility DeviceTypeB

Context-In API Bulk

Authorization Policy Configuration with Endpoint Identity Group

From ISE, navigate to Policy > Policy Sets > Select a Policy Set > Authorization Policy. Click the gear icon in any of the Authorization Policies and choose **Insert**.

Give a name to the rule and add a new condition in order to open the Condition Studio.

Add a new attribute and navigate to Identity Group > Name > CONTAINS > Select the Endpoint Profile > USE.

Choose the profile as the result of the condition. Click **Save**.

In this example, the **DeviceTypeA** is the name of the rule.

The screenshot shows the Cisco Identity Services Engine (ISE) Policy / Policy Sets interface. The left sidebar lists policy sets:

- > Authorization Policy - Global Exceptions
- ✓ Authorization Policy(15)

 The main area displays a table of authorization policies:

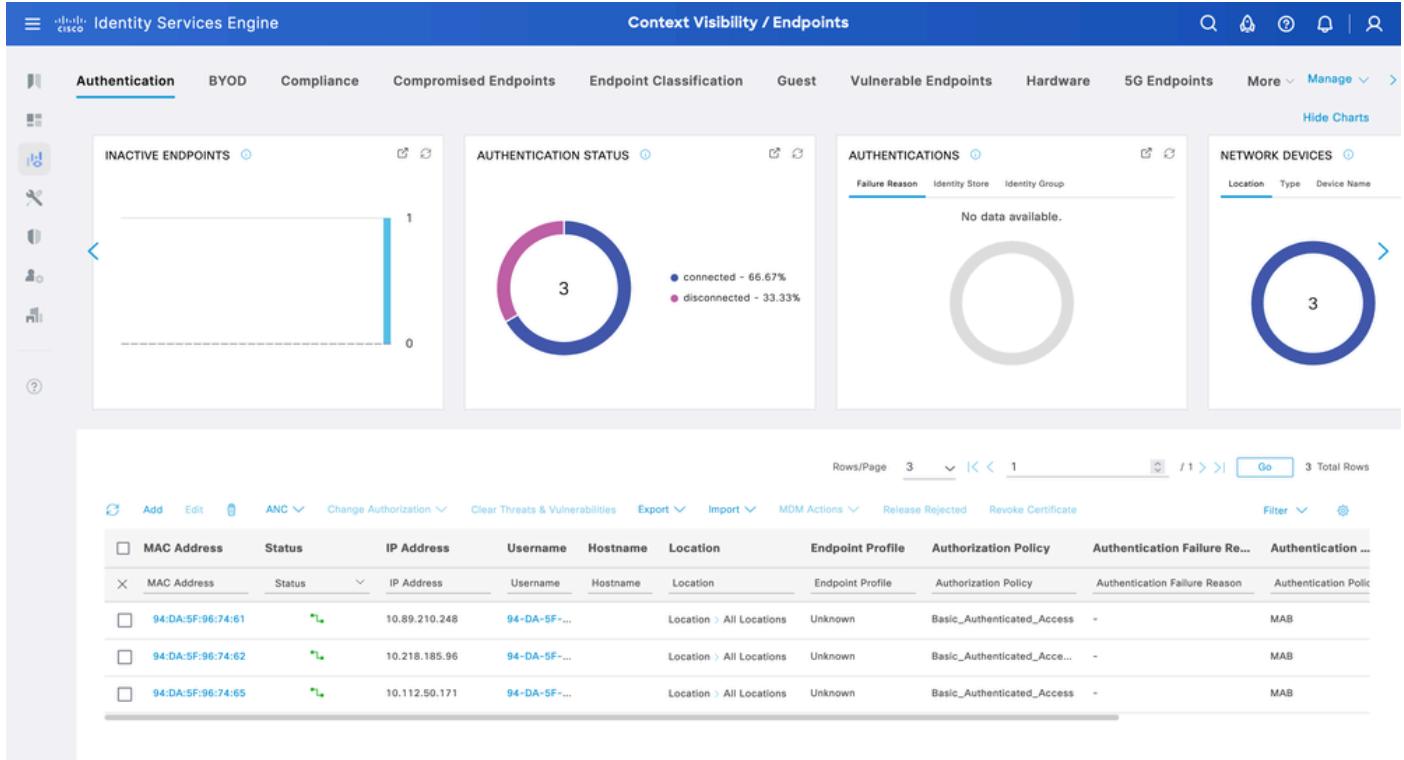

Status	Rule Name	Conditions	Results	Profiles	Security Groups	Hits	Actions
Green checkmark	Wireless Black List Default	AND IdentityGroup-Name EQUALS Endpoint Identity Groups:Blacklist	Block_Wireless_Access	Select from list		0	⚙️

Policy Sets

Update Endpoint in Bulk

In order to change the attribute for different endpoints, the bulk API call is needed.

In this example, the Radius request from different endpoints does not have any custom attribute, and the **Endpoint Profile** is set as **Unknown**.

Context Visibility Unknown Profile

Context Visibility DevcieTypeA Endpoint Profile

For the endpoint, in order to use the correct Authorization Policy **DeviceTypeA**, the endpoint must re-authenticate.

The screenshot shows the Cisco ISE Context Visibility / Endpoints dashboard. It includes four main sections:

- INACTIVE ENDPOINTS:** A bar chart showing 1 inactive endpoint.
- AUTHENTICATION STATUS:** A donut chart showing 3 endpoints. Legend: connected - 66.67% (blue), disconnected - 33.33% (purple).
- AUTHENTIFICATIONS:** A section stating "No data available." with a large grey circle icon.
- NETWORK DEVICES:** A donut chart showing 3 network devices.

 Below these is a table titled "Context Visibility DevcieTypeA Authorization Policy" listing three endpoints with MAC addresses 94:DA:5F:96:74:61, 94:DA:5F:96:74:62, and 94:DA:5F:96:74:65, all assigned to DeviceTypeA and MAB authentication.

Context Visibility DevcieTypeA Authorization Policy

Troubleshoot

This section provides information that you can use in order to troubleshoot your configuration.

From ISE, navigate to Operation > Troubleshoot > Debug Wizard > Debug Log Configuration. Choose your Primary Admin Node (PAN) and click **Edit**.

Filter the **Component Name** by API service and choose the Log Level needed. Click **Save**.

The screenshot shows the Cisco ISE Operations / Troubleshoot Debug Wizard interface. The left sidebar shows "Operations" selected. In the center, under "Debug Wizard", the "Debug Log Configuration" tab is active. It displays a table for "Debug Level Configuration" with one entry for "apiservice" set to "DEBUG". Buttons for "Edit", "Reset to Default", "Log Filter Enable", and "Log Filter Disable" are at the top. A "Save | Cancel" button is at the bottom right.

Component Name	Log Level	Description	Log file Name	Log Filter
apiservice	DEBUG	ISE API Service logs	api-service.log	Disabled

Debug Level Configuration Open API

- On ISE PAN CLI the logs are found at:

```
admin#show logging application api-service.log
```

- On ISE GUI navigate to Operations > Troubleshoot > Download Logs > Select ISE PAN > Debug log > Debug Log Type > Application Logs. Download the zip files for api-service.log.
- API response codes and their possible meanings:
 - 200 (OK): Indicates the Open API successfully carried out the desired action.
 - 201 (Created): Indicates the resource was created and the request was successful.
 - 400 (Bad Request): The server is unable to process the request. Recognize client errors due to malformed request syntax, invalid parameters, and so on. Read the message details if available.
 - 401 (Unauthorised): This indicates that the action was undertaken with the wrong credentials or no credentials, or the account is not authorized to perform this action.
 - 403 (Forbidden): This indicates the server is capable of understanding the request but is not authorized.
 - 404 (Not Found): This indicates the server is unable to find the requested resource.
 - 500 (Internal Server Error): Indicates an issue on the server side. Logs on ISE can help understand the cause.
