Introduction

This document describes how to verify and troubleshoot EIGRP configuration on FTD devices using an FMC as manager.

Prerequisites

Requirements

Cisco recommends that you have knowledge of these topics:

- Enhanced Interior Gateway Routing Protocol (EIGRP) concepts and functionality
- Cisco Secure Firewall Management Center (FMC)
- Cisco Secure Firewall Threat Defense (FTD)

Components Used

The information in this document is based on these software and hardware versions:

- FTDv for VMWare in version 7.2.8.
- FMC for VMWare in version 7.2.8.

The information in this document was created from the devices in a specific lab environment. All of the

devices used in this document started with a cleared (default) configuration. If your network is live, ensure that you understand the potential impact of any command.

EIGRP Background

EIGRP can be configured on an FMC to use dynamic routing between FTD devices and other EIGRP capable devices.

The FMC only allows to configuration of one EIGRP Autonomous System (AS) in single mode.

The next parameters must match the EIGRP neighbors to form the EIGRP adjacency.

- An interface that belongs to the same IP subnet.
- EIGRP AS
- Hello and Hold intervals
- MTU
- Interface Authentication.

Basic Configuration

This section describes the needed parameters to configure EIGRP.

1. Navigate to **Devices > Device Management > Edit device**
2. Click the **Routing** tab.
3. Click on **EIGRP** in the left menu bar.
4. Mark the checkbox **Enable EIGRP**, to enable the protocol, and assign a value between 1-65535 to AS number.
5. Note that the **Auto Summary** option is disabled by default
6. Select one **network/host**, you can use an object previously created or add a new one by clicking on the add button (+)
7. (Optional) Mark the checkbox **Passive interface**, to select the interfaces that do not redistribute the traffic.
8. Click on Save, to store the changes.

Filter rules

The FTD allows the user to configure a distribution list to control the inbound and outbound routes.

1. Navigate to **Devices > Device Management > Edit device**
2. Click the **Routing** tab.
3. Click on **EIGRP**.
4. Click on **Filtering Rules > Add**.
5. Select the corresponding information for the filtering fields.
 - Filter direction
 - Select Interface
 - Select Access List
6. Move to steps, if there is a Standard Access List configured.

If the user needs to configure a Standard Access List, click on the plus button or create it from **Objects > Object Management > Access List > Standard > Add Standard Access List**.

7. Assign a name to the list

8. Click the plus (+) button

- Select an **Action**
- Add the network or host from the **Available Network** to the **Selected Network**.

9. Click on **Add** at the bottom to save the access list entry.

10. Click on **Save**, to save the standard access list.

11. Click on **Ok**.

12. Click on **Save** to validate the changes.

Redistribution

The FTD has the capability to redistribute the routes generated from BGP, RIP, and OSPF protocols, or from the static and connected routes into the EIGRP.

1. Navigate to **Devices > Device Management > Edit** device
2. Click the **Routing** tab.
3. Click on **EIGRP**.
4. Click on **Redistribution**.
5. Enter the information in the redistribution fields.

- Protocol
 - RIP
 - OSPF
 - BGP
 - Connected
 - Static

For OSPF is necessary to specify the Process ID, and for BGP the AS number on the filed **Process ID***.

If the configuration requires redistribution of the information generated by the OSPF protocol, the user can select the OSPF type of Redistribution.

Optional Metrics refer to the EIGRP metrics and Route Map.

Interface

Hello and Hold timers

The Hello Packets are used for neighbor discovery and to detect the neighbor available. These packets are sent out in intervals, by default the value of this timer is 5 seconds.

Hold timer, determines the amount of time EIGRP deems a route is reachable and functional. By default, the hold time value is 3 times the hello interval.

Authentication

The FTD supports MD5 hash Algorithm to authenticate the EIGRP packets. By default, the authentication is disabled.

Mark the checkbox MD5 Authentication, to enable the MD5 hash algorithm.

Key

Unencrypted - plain text.

Encrypted

Troubleshooting and Validation commands

- **show run router eigrp**. Displays the EIGRP configuration
- **show run interface [interface]**. Displays the EIGRP interface authentication and timers information.
- **show eigrp events [{ start end} | type]**. Displays the EIGRP event log.
- **show eigrp interfaces [if-name] [detail]**. Displays the interfaces participating in EIGRP routing.
- **show eigrp neighbors [detail | static] [if-name]**. Displays the EIGRP neighbor table.
- **show eigrp topology [ip-addr [mask] | active | all-links | pending | summary | zero-successors]**. Displays the EIGRP topology table.
- **show eigrp traffic**. Displays EIGRP traffic statistics.

Verification

Consider the next topology, this section uses the commands previously described to validate the EIGRP configuration applied to the FTD.
