Certificate Regeneration for Tokenless CTL Solution

Introduction

This document describes differences between Cisco Unified Communications Manager (CUCM) security with / without the use of hardware USB eTokens.

Prerequisites

Requirements

Cisco recommends that you have knowledge of CUCM Version 10.0(1) or later. Additionally, ensure that:

• Your license server for CUCM version 11.5.1SU3 and higher must be Cisco Prime License Manager (PLM) 11.5.1SU2 or higher. This is because CUCM version 11.5.1SU3 requires the Encryption License to enable mixed mode and PLM does not support the Encryption License until 11.5.1SU2.

For more information reference the Release Notes for Cisco Prime License Manager, Release 11.5(1)SU2.

- You have Administrative access to the Command Line Interface (CLI) of the CUCM Publisher node.
- You have access to the hardware USB eTokens and that the CTL Client Plugin is installed on your PC for scenarios that require you to migrate back to the use of hardware eTokens.

For additional clarity, this requirement is only if you, at any point, have a scenario where the USB eTokens are needed. The chances are very small that USB eTokens are needed for most people.

- There is full connectivity between all of the CUCM nodes in the cluster. This is very important because the CTL file is copied to all of the nodes in the cluster via SSH File Transfer Protocol (SFTP).
- The Database (DB) Replication in the cluster works properly and that the servers replicate the data in real-time.
- The devices in your deployment support Security by Default (TVS). You can use the *Unified CM Phone Feature List* from the Cisco Unified Reporting webpage (https://<CUCM IP or FQDN>/cucreports/) in order to determine the devices that support Security by Default.
- Note: Cisco Jabber and many Cisco TelePresence or Cisco 7940/7960 Series IP phones do not

currently support Security by Default. If you deploy Tokenless CTL with devices that do not support Security by Default, any update to your system that changes the CallManager certificate on the publisher then prevents normal functionality of those devices until the CTL is manually deleted. Devices that support Security by Default, such as 7945 and 7965 phones or newer, are able to install CTL files when the CallManager certificate on the publisher is updated because they can use the Trust Verification Service (TVS).

Components Used

The information in this document is based on these software and hardware versions:

- CUCM Version 10.5.1.10000-7 (cluster of two nodes)
- Cisco 7975 Series IP Phones registered via Skinny Client Control Protocol (SCCP) with Firmware Version SCCP75.9-3-1SR4-1S
- Two Cisco Security Tokens that are used in order to set the cluster to Mixed mode with the use of CTL Client software

The information in this document was created from the devices in a specific lab environment. All of the devices used in this document started with a cleared (default) configuration. If your network is live, ensure that you understand the potential impact of any command.

Background Information

This document describes the difference between Cisco Unified Communications Manager (CUCM) security with and without the use of hardware USB eTokens.

This document also describes the basic implementation scenarios that involve Tokenless Certificate Trust List (CTL) and the process that is used in order to ensure that the system functions properly after the changes.

Tokenless CTL is a new feature in CUCM Versions 10.0(1) and later that allows the encryption of call signaling and media for IP Phones without the need to use hardware USB eTokens and the CTL Client plugin, which was the requirement in previous CUCM releases.

When the cluster is placed into Mixed mode with the use of the CLI command, the CTL file is signed with the CCM+TFTP (server) certificate of the Publisher node, and there are no eToken certificates present in the CTL file.

Note: When you regenerate the CallManager (CCM+TFTP) certificate on the publisher, it changes the signer of the file. The phones and devices that do not support Security by Default also do not accept the new CTL file unless CTL files are manually deleted from each device. Refer to the last requirement that is listed the Requirements section of this document for more information.

From Non-Secure Mode to Mixed Mode (Tokenless CTL)

This section describes the process that is used in order to move the CUCM cluster security into Mixed mode via the CLI.

Prior to this scenario, the CUCM was in Non-Secure mode, which means that there was no CTL file present on any of the nodes and that the registered IP Phones had only an Identity Trust List (ITL) file installed, as shown in these outputs:

```
<#root>
admin:
show ctl
Length of CTL file: 0
CTL File not found
. Please run CTLClient plugin or run the CLI - utils ctl.. to
 generate the CTL file.
Error parsing the CTL File.
admin:
```

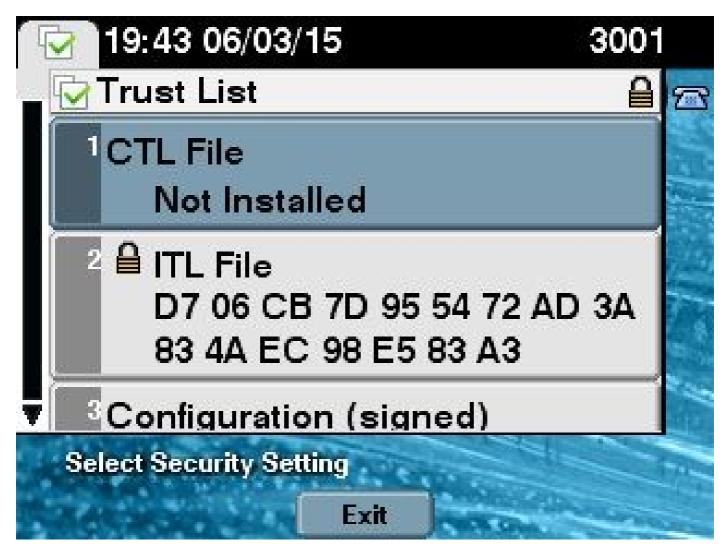

Note: If there is a CTL file found on the server while the cluster is not in mixed mode, this means the cluster was once in mixed mode then moved back to non-mixed mode and the CTL file was not deleted from the cluster.

The command file delete activelog cm/tftpdata/CTLFile.tlv deletes the CTL file from nodes in the CUCM cluster; however, the command needs to be entered on each node. To be clear, only use this command if your servers have a CTL file and the cluster is not in mixed mode.

An easy way to confirm if a cluster is in mixed mode is to use the command run sql select paramname, paramvalue from process config where paramname='ClusterSecurityMode'. If the param value is 0, then the cluster is not in mixed mode.

run sql select paramname, paramvalue from process config where paramname='ClusterSecurityMode' paramname paramvalue _____ ___ ClusterSecurityMode 0

In order to move the CUCM cluster security into Mixed mode with the use of the new Tokenless CTL feature, complete these steps:

- 1. Obtain Administrative access to the CUCM Publisher node CLI.
- 2. Enter the **utils ctl set-cluster mixed-mode** command into the CLI:

<#root>
admin:
utils ctl set-cluster mixed-mode
This operation sets the cluster to Mixed mode. Do you want to continue? (y/n):y
Moving Cluster to Mixed Mode
Cluster set to Mixed Mode
Please Restart the TFTP and Cisco CallManager services on all nodes in the cluster
that run these services
admin:

3. Navigate to **CUCM Admin Page > System > Enterprise Parameters** and verify whether the cluster was set to Mixed mode (a value of **1** indicates Mixed mode):

Security Parameters	
Cluster Security Mode *	1
LBM Security Mode_*	Insecure 🔻
CAPF Phone Port *	3804
CAPF Operation Expires in (days) *	10
Enable Caching *	True 🔻

- 4. Restart the TFTP and Cisco CallManager services on all of the nodes in the cluster that run these services.
- 5. Restart all of the IP Phones so that they can obtain the CTL file from the CUCM TFTP service.
- 6. In order to verify the content of the CTL file, enter the **show ctl** command into the CLI.
- 7. In the CTL file you can see that the CCM+TFTP (server) certificate for the CUCM Publisher node is used in order to sign the CTL file (this file is the same on all servers in the cluster). Here is a sample output:

<#root>

admin:

show ctl

The checksum value of the CTL file:

```
0c05655de63fe2a042cf252d96c6d609(MD5)
```

```
8c92d1a569f7263cf4485812366e66e3b503a2f5(SHA1)
```

Length of CTL file: 4947 The CTL File was last modified on Fri Mar 06 19:45:13 CET 2015

[...]

[]						

The CTL file was verified successfully.

8. On the IP Phone side, you can verify that after the service is restarted, it downloads the CTL file, which is now present on the TFTP server (the MD5 checksum matches when compared to the output from the CUCM):

Note: When you verify the checksum on the phone, you see either **MD5** or **SHA1**, dependent upon the phone type.

From Hardware eTokens to Tokenless Solution

This section describes how to migrate the CUCM cluster security from hardware eTokens to the use of the new Tokenless solution.

In some situations, mixed mode is already configured on the CUCM with the use of the CTL Client, and the IP Phones use CTL files that contain the certificates from the hardware USB eTokens.

With this scenario, the CTL file is signed by a certificate from one of the USB eTokens and is installed on the IP Phones. Here in an example:

<#root>
admin:
show ct1
The checksum value of the CTL file:
256a661f4630cd86ef460db5aad4e91c(MD5)
3d56cc01476000686f007aac6c278ed9059fc124(SHA1)
Longth of CTL file: 5728

Length of CTL file: 5728 The CTL File was last modified on Fri Mar 06 21:48:48 CET 2015 [...]

	CTL Record #:5		
BYTEPOS	TAG	LENGTH	VALUE
1 2 3 4 5 6	RECORDLENGTH DNSNAME SUBJECTNAME FUNCTION ISSUERNAME SERIALNUMBER	2 1 56 2 42 10	1186 cn="SAST-ADN008580ef ";ou=IPCBU;o="Cisco Systems System Administrator Security Token cn=Cisco Manufacturing CA;o=Cisco Systems

9	CERTIFICATE	902	85 CD 5D AD EA FC 34 B8 3E 2F F2 CB 9C 76 B0 93 3E 8B 3A 4F (SHA1 Hash HEX)
10	IPADDRESS	4	
This et	oken was used to	sign th	e CTL file.

The CTL file was verified successfully.

Complete these steps in order to move the CUCM cluster security to the use of Tokenless CTLs:

- 1. Obtain Administrative access to the CUCM Publisher node CLI.
- 2. Enter the utils ctl update CTLFile CLI command:

<#root>
admin:
utils ctl update CTLFile
This operation updates the CTLFile. Do you want to continue? (y/n):y
Updating CTL file
CTL file Updated
Please Restart the TFTP and Cisco CallManager services on all nodes in
the cluster that run these services

- 3. Restart the TFTP and CallManager services on all of the nodes in the cluster that run these services.
- 4. Restart all of the IP Phones so that they can obtain the CTL file from the CUCM TFTP service.
- 5. Enter the **show ctl** command into the CLI in order to verify the content of the CTL file. In the CTL file, you can see that the CCM+TFTP (server) certificate of the CUCM Publisher node is used in order to sign the CTL file instead of the certificate from the hardware USB eTokens.
- 6. One more important difference in this case is that the certificates from all of the hardware USB

eTokens are removed from the CTL file. Here is a sample output:

<#root> admin: show ctl The checksum value of the CTL file: 1d97d9089dd558a062cccfcb1dc4c57f(MD5) 3b452f9ec9d6543df80e50f8b850cddc92fcf847(SHA1) Length of CTL file: 4947 The CTL File was last modified on Fri Mar 06 21:56:07 CET 2015 [...] CTL Record #:1 ____ LENGTH VALUE BYTEPOS TAG _____ ___ -----RECORDLENGTH 2 1156 1 DNSNAME 16 SUBJECTNAME 62 cucm-1051-a-pub CN=cucm-1051-a-pub;OU=TAC;O=Cisco;L=Krakow; 2 3 ST=Malopolska;C=PL 4 FUNCTION 2 System Administrator Security Token 5 62 ISSUERNAME CN=cucm-1051-a-pub;OU=TAC;O=Cisco;L=Krakow; ST=Malopolska;C=PL 6 SERIALNUMBER 16 70:CA:F6:4E:09:07:51:B9:DF:22:F4:9F:75:4F:C5:BB PUBLICKEY 7 140 8 SIGNATURE 128 9 CERTIFICATE 694 E9 D4 33 64 5B C8 8C ED 51 4D 8F E5 EA 5B 6D 21 A5 A3 8C 9C (SHA1 Hash HEX) 10 IPADDRESS 4 This etoken was used to sign the CTL file. 10	IPADDRESS	4			
[]					

The CTL file was verified successfully.

Note: In the output,If CCM+TFTP (server) certificate of the CUCM Publisher is not signer, then move back to Hardware etoken based cluster security mode and repeat the changes again for tokenless solution.

7. On the IP Phone side, you can verify that after the IP Phones were restarted, they downloaded the updated CTL file version (the MD5 checksum matches when compared to the output from the CUCM):

From Tokenless Solution to Hardware eTokens

This section describes how to migrate the CUCM cluster security away from the new Tokenless solution and back to the use of hardware eTokens.

When the CUCM cluster security is set to Mixed mode with the use of the CLI commands, and the CTL file is signed with the CCM+TFTP (server) certificate for the CUCM Publisher node, there are no certificates from the hardware USB eTokens present in the CTL file.

For this reason, when you run the CTL Client in order to update the CTL file (move back to the use of hardware eTokens), this error message appears:

```
The Security Token you have inserted does not exist in the CTL File
Please remove any Security Tokens already inserted and insert another
Security Token. Click Ok when done.
```

This is particularly important in scenarios that include a downgrade (when the version is switched back) of the system to a pre-10.x version that does not include the **utils ctl** commands.

The previous CTL file is migrated (without changes in its content) in the process of a refresh or a Linux to Linux (L2) upgrade, and it does not contain the eToken certificates, as previously mentioned. Here is a sample output:

<#root> admin: show ctl The checksum value of the CTL file: 1d97d9089dd558a062cccfcb1dc4c57f(MD5) 3b452f9ec9d6543df80e50f8b850cddc92fcf847(SHA1) Length of CTL file: 4947 The CTL File was last modified on Fri Mar 06 21:56:07 CET 2015 Parse CTL File -----Version: 1.2 HeaderLength: 336 (BYTES) BYTEPOS TAG LENGTH VALUE -----_____ ___ 3 SIGNERID 2 149 SIGNERNAME 62 4 CN=cucm-1051-a-pub;OU=TAC;O=Cisco;L=Krakow; ST=Malopolska;C=PL 70:CA:F6:4E:09:07:51:B9:DF:22:F4:9F:75:4F:C5:BB CN=cucm-1051-a-mub:0U=TAC:0.25 SERIALNUMBER 16 5 6 CANAME 62 CN=cucm-1051-a-pub;OU=TAC;O=Cisco;L=Krakow; ST=Malopolska;C=PL 7 SIGNATUREINFO 2 15 8 DIGESTALGORTITHM 1 9 8 SIGNATUREALGOINFO 2 10 SIGNATUREALGORTITHM 1 11 SIGNATUREMODULUS 1 SIGNATURE 128 12 65 ba 26 b4 ba de 2b 13 b8 18 2 4a 2b 6c 2d 20 7d e7 2f bd 6d b3 84 c5 bf 5 f2 74 cb f2 59 bc b5 c1 9f cd 4d 97 3a dd 7c 75 19 a2 59 66 49 6e b7 64 e8 9a 25 7f 5a c8 56 bb ed 6f 96 95 c3 b3 72 7 91 10 6b f1 12 f4 d5 72 e 8f 30 21 fa 80 bc 5d f6 c5 fb 6a 82 ec f1 6d 40 17 1b 7d 63 7b 52 f7 7a 39 67 e1 1d 45 b6 fe 82 0 62 e3 db 57 8c 31 2 56 66 c8 91 c8 d8 10 cb 5e c3 1f ef a 14 FILENAME 12 15 TIMESTAMP 4 CTL Record #:1 ____ BYTEPOS TAG LENGTH VALUE _____ ___ _____ ____ 2 1 RECORDLENGTH 1156 2 DNSNAME 16 cucm-1051-a-pub 3 SUBJECTNAME 62 CN=cucm-1051-a-pub;OU=TAC;O=Cisco;L=Krakow;

The CTL	file was verifi	ed succe	ssfully.				
admin:							

For this scenario, complete these steps in order to securely update the CTL files without the need to use the procedure for lost eTokens, which ends up in manual deletion of the CTL file from all of the IP Phones:

- 1. Obtain Administrative access to the CUCM Publisher node CLI.
- 2. Enter the **file delete tftp CTLFile.tlv** command into the Publisher node CLI in order to delete the CTL file:

<#root>
admin:
file delete tftp CTLFile.tlv
Delete the File CTLFile.tlv?
Enter "y" followed by return to continue: y
files: found = 1, deleted = 1

3. Open **SafeNet Authentication Client** on the Microsoft Windows machine that has the CTL Client installed (it is installed automatically with CTL Client):

SafeNet Authenticatio	on Client Tools			
SafeNe	st.			
Safe	eNet Authentication Cl	ient	0 05	i ? 🟦
eToken	PRO	1	Rename Token	
		****	Change Token Password	
			Unlock Token	
		\times	Delete Token Content	
		2	View Token Information	
		Dis	connect SafeNet eToken Virtual	
			w	ww.safenet-inc.com

4. In SafeNet Authentication Client, navigate to the Advanced View:

SafeNet Authentication Client Tools	- 31.00		
8			
SafeNet.			
SafeNet Authentication Client			
	Advanced View	1 3	

- 5. Insert the first hardware USB eToken.
- 6. Select the certificate under the *User certificates* folder and export it to the folder on the PC. When prompted for a password, use the default password of **Cisco123**:

SafeNet Authentication Client Too	uthentication Client			
	Certificate Data			
SafeNet Authentication Client Tools	Serial number	45 da a2 af 00 00 00 27 f9 3c		
E- 🙊 eToken PRO	Issued to	SAST-ADN0054f509

	Martin Lana	06/09/2010		
- III Settings	Delete Certificate	06/09/2020		
💑 Client Settings	Export Certificate	Client Authentication		
	Private Key Data			
	Key size	1024 bits		
	Container name	01502a75-c04b-4b87-b4ec-f7abc2e5efeb		
	Modulus	81 5b ee 24 d0 7e b9 0c de 05 a1 02 77 d7 44 24 dc 94 08 3c 09		
	Key specification	AT_KEYSIGNATURE		
	Default key container	Yes		
	Auxiliary key container	Yes		
		www.safenet-inc.com		

7. Repeat these steps for the second hardware USB eToken so that both certificates are exported to the PC:

Name	Date modified	Туре	Size	
🔄 SAST-ADN0054f509	06-03-2015 22:32	Security Certificate		1 KB
SAST-ADN008580ef	06-03-2015 22:33	Security Certificate		1 KB

8. Log into the Cisco Unified Operating System (OS) Administration and navigate to Security > Certificate Management > Upload Certificate:

9. The Upload Certificate page then appears. Choose **Phone-SAST-trust** from the Certificate Purpose drop down menu and select the certificate that you exported from the first eToken:

👑 Upload Certificate/Certificate chain - Google Chrome					
🖹 https://10.48.47.155/c	Lttps://10.48.47.155/cmplatform/certificateUpload.do				
Upload Certificate/Certific	ate chain				
Upload Close					
Upload Certificate/Certifi		this cluster			
Certificate Purpose*					
Description(friendly name) 1st eToken Cert Upload File Wybierz plik SAST-ADN0054f509.cer					
Upload Close					
indicates required item.					

10. Complete the previous steps in order to upload the certificate that you exported from the second eToken:

upload Certificate/Certificate	chain - Google Chrome			
🖹 https://10.48.47.155/c	mplatform/certificateUpload.do			
Upload Certificate/Certific	ate chain			
Dipload 🖳 Close				
Status Success: Certificate Uploaded				
Upload Certificate/Certificate chain				
Certificate Purpose*	Phone-SAST-trust	T		
Description(friendly name)	2nd eToken Cert			
Upload File	Wybierz plik SAST-ADN008580ef.cer			
Upload Close				

11. Run the CTL Client, provide the IP address/hostname of the CUCM Publisher node, and enter the CCM Administrator credentials:

CTL Client v5.0			
Cisco CTL Cl For IP Telephony Solution		ahaha cisco	
Cisco Unified Communicatio	ns Manager Server		
Hostname or IP Address:	10.48.47.155	Port:	2444
Username:	admin		
Password:	Jacacatata		
<u>H</u> elp		<u>C</u> ancel	<u>N</u> ext

12. Since the cluster is in mixed mode already, but no CTL file exists on the Publisher node, this warning message appears (click **OK** in order to ignore it):

No CTL File exists on the server but the Call Manager Cluster Security Mode is in Secure Mode. For the system to function, you must create the CTL File and set Call Manager Cluster the Secure Mode.

13. From the CTL Client, click the Update CTL File radio button, then click Next:

CTL Client v5.0

The CTL file was verified successfully.

23. On the IP Phone side, you can verify that after the IP Phones were restarted, they downloaded the updated CTL file version (the MD5 checksum matches when compared to the output from the CUCM):

This change is possible because you previously exported and uploaded the eToken certificates to the CUCM Certificate Trust Store, and the IP Phones are able to verify this unknown certificate that was used in order to sign the CTL file against the Trust Verification Service (TVS) that runs on the CUCM.

This log snippit illustrates how the IP Phone contacts the CUCM TVS with a request to verify the unknown eToken certificate, which is uploaded as **Phone-SAST-trust** and is trusted:

<#root>

//

In the Phone Console Logs we can see a request sent to TVS server to verify unknown certificate

8074: NOT 23:00:22.335499 SECD: setupSocketToTvsProxy: Connected to TVS proxy server 8075: NOT 23:00:22.336918 SECD: tvsReqFlushTvsCertCache: Sent Request to TVS proxy, len: 3708

//

In the TVS logs on CUCM we can see the request coming from an IP Phone which is being successfully verified

Certificate Regeneration for Tokenless CTL Solution

This section describes how to regenerate a CUCM cluster security certificate when the Tokenless CTL solution is used.

In the process of CUCM maintenance, sometimes the CUCM Publisher node CallManager certificate changes.

The scenarios in which this can happen include the change of hostname, the change of domain, or simply a certificate regeneration (due to close certificate expiration date).

After the CTL file is updated, it is signed with a different certificate than those that exist in the CTL file that is installed on the IP Phones.

Normally, this new CTL file is not accepted; however, after the IP Phone finds the unknown certificate that is used in order to sign the CTL file, it contacts the TVS service on the CUCM.

Note: The TVS server list is in the IP Phone configuration file and is mapped in the CUCM servers from the IP Phone **Device Pool > CallManager Group**.

Upon successful verification against the TVS server, the IP Phone updates its CTL file with the new version. These events occur in such a scenario:

1. The CTL file exists on the CUCM and on the IP Phone. The CCM+TFT (server) certificate for the CUCM Publisher node is used in order to sign the CTL file:

The CTL file was verified successfully.

- 6. From the Unified Serviceability page, the TFTP and Cisco CallManager services are restarted on all of the nodes in the cluster that run these services.
- 7. The IP Phones are restarted, and they contact the TVS server in order to verify the unknown certificate that is now used in order to sign the new version of the CTL file:

<#root>

//

In the Phone Console Logs we can see a request sent to TVS server to verify unknown certificate

2782: NOT 17:21:51.794615 SECD: setupSocketToTvsProxy: Connected to TVS proxy server 2783: NOT 17:21:51.796021 SECD: tvsReqFlushTvsCertCache: Sent Request to TVS proxy, len: 3708

//

In the TVS logs on CUCM we can see the request coming from an IP Phone which is being successfully verified

```
17:21:51.831 |
                debug tvsHandleQueryCertReq
17:21:51.832 |
                debug tvsHandleQueryCertReq : Subject Name is: CN=cucm-1051-a-pub;
OU=TAC;O=Cisco;L=Krakow;ST=Malopolska
17:21:51.832 |
                debug tvsHandleQueryCertReq : Issuer Name is: CN=cucm-1051-a-pub;
OU=TAC;O=Cisco;L=Krakow;ST=Malopolska;
17:21:51.832 |
                debug tvsHandleQueryCertReq : Serial Number is:
6B1D357B6841740B078FEE4A1813D5D6
17:21:51.832 |
                debug CertificateDBCache::getCertificateInformation - Looking up the
certificate cache using Unique MAPco;L=Krakow;ST=Malopolska;C=PL
17:21:51.832 |
                debug CertificateDBCache::getCertificateInformation - Found entry
{rolecount : 2}
17:21:51.832 |
                debug CertificateDBCache::getCertificateInformation - {role : 0}
17:21:51.832 |
                 debug CertificateDBCache::getCertificateInformation - {role : 2}
17:21:51.832 |
                 debug convertX509ToDER -x509cert : 0xf6099df8
17:21:51.832
                 debug tvsHandleQueryCertReg: Timer started from
tvsHandleNewPhConnection
```

11

In the Phone Console Logs we can see reply from TVS server to trust the new certificate (new CCM Server Certificate which was used to sign the CTL file)

2797: NOT 17:21:52.057442 SECD: clpTvsInit: Client message received on TVS proxy socket

2798: NOT 17:21:52.058874 SECD: processTvsClntReq: Success reading the client TVS request, len : 3708

2799: NOT 17:21:52.059987 SECD: processTvsClntReq: TVS Certificate cache flush request received

2800: NOT 17:21:52.062873 SECD: tvsFlushCertCache: Completed TVS Certificate cache flush request

8. Finally, on the IP Phones, you can verify that the CTL file is updated with the new version and that the MD5 checksum of the new CTL file matches with that of the CUCM:
