CONTENTS

CHAPTER 1

Overview of Cisco Cloud Native Broadband Router 1

- Transformation of the Cable Network 1
- Features and Benefits of Cisco cnBR 2
- Cisco cnBR Product Components 2
 - Cisco Operations Hub 3
 - cnBR Manager 3
 - cnBR Core 3
 - Remote PHY Device 4
- Cisco cnBR Deployment 4
 - Kubernetes Platform 6
- Cisco cnBR Network Topology 8
 - Core Components of Cisco cnBR Network Topology 8
 - Cisco cnBR Expansion Servers 8
 - Inter-Connections Between Core Components 9
 - Downstream and Upstream Data Flow 9
 - Control Flow 9

CHAPTER 2

Set Up Cisco Cloud Native Broadband Router Components 11

- cnBR Prerequisites 11
- Prepare Supporting Software Components 19
 - Cisco cnBR Server Installation and Configuration 19
 - Cisco UCS Server Installation 19
 - Update Firmware 20
 - Load Cisco cnBR Optimized BIOS Configuration 20
 - Configure Boot Drives 20
 - Configure Data Drives 21

Install VMware ESXi	21
Reboot VMware ESXi Host and Set Boot Device	21
Add Cisco cnBR ESXi Hosts to vSphere Virtual Infrastructure	21
Configure VMware ESXi Host Management Networking	22
Add ESXi Hosts to VMware vCenter Server	22
Configure and Enable Required ESXi Host Features	22
Configure Virtual Machine Networking	23
Deployment of cnBR and Operations Hub	23
Prepare the Staging Server	23
Create the Configuration File	25
Deploy the Cluster	27
Deployment Example Configurations	28
Deployment Limitations	32
Configure Operations Hub	32
Access Operations Hub	32
Create New Users	33
API User Roles	33
Configure Local Users	33
Configure LDAP	33
Using REST APIs	34
Configure TLS Certificate	35
Configure Cisco cnBR Using Autodeployer	35
Autodeployer Examples	40
Autodeployer Limitations	51
Configure cnBR using cnBR Manager	52
Add Cisco cnBR to cnBR Manager	52
Apply Global Configuration to cnBR	52
Add Service Group Configuration to cnBR	55
View RPD and Modem Status	67

Configure SNMP	274
SNMP Support Scope	275
SNMP Limitations	277

CHAPTER 1

Overview of Cisco Cloud Native Broadband Router

This chapter provides an overview of Cisco Cloud Native Broadband Router (cnBR) and its key features and benefits. It also describes the key components of the Cisco cnBR and how the router is deployed in a network.

- [Transformation of the Cable Network, on page 1](#)
- [Features and Benefits of Cisco cnBR, on page 2](#)
- [Cisco cnBR Product Components, on page 2](#)
- [Cisco cnBR Deployment, on page 4](#)
- [Cisco cnBR Network Topology, on page 8](#)

Transformation of the Cable Network

To support the increasing needs of the customers, cable networks are undergoing major transformations. They are:

- migrating from analog to digital systems
- adding capacity and scale
- deploying new and improved service features

Replacing analog systems with digital devices, such as Remote PHY and Converged Interconnect Network (CIN) routers and switches, is preparation for what is to come: the transformation of the cable headend. With a digital access network, cable services that are reliant on headend hardware are no longer tied to physical hardware-based solutions.

The Cisco Cloud Native Broadband Router (cnBR) is a fundamental rewrite of the CCAP, virtualizing the earlier hardware-based services with a truly cloud-native design, thus offering unprecedented service velocity, highly simplified operations, and economic scalability for profitably operating your network. The Cisco cnBR is built from the ground up, taking decades of experience and expertise in networking technologies and completely rewriting the hardware-based Converged Cable Access Platform (CCAP) code to be cloud native. Instead of lifting and shifting existing code from legacy hardware and placing it in the cloud to run as a virtual machine, the Cloud Native Broadband Router is a full software rewrite for CCAP-enabled services, built as a composable set of microservices that utilize standard tools, such as Kubernetes for container orchestration and Docker for creating, deploying, and running containerized applications.

Features and Benefits of Cisco cnBR

The previous generations of Cable Modem Termination Systems (CMTS) products integrated cable modem RF connectivity, Data-over-Cable Service Interface Specifications (DOCSIS) control plane signaling, data forwarding, platform monitoring, and back office reporting into a single purpose-built hardware platform. The Cisco cnBR is a containerized, virtual CCAP solution, which is designed to take the service capabilities of physical hardware and virtualize them into a customizable, scalable, and resilient set of microservices.

The Cisco cnBR offers the following features and benefits:

- **Increased feature velocity:** The increased feature velocity is achieved by hosting the functionality on more generic hardware platforms, making it easier to develop and test features as well as leverage Open Source Software and continuous integration technologies.
- **Flexible placement of CMTS Core and PHY:** With the Cisco cnBR on general-purpose hardware and physically not containing the PHY interface, the CMTS Core can be deployed anywhere there is network connectivity to the RPDs and service provider IP network.
- **Enhanced monitoring:** With the Cisco cnBR and Operations Hub deployed on a container platform, industry leading monitoring technologies like Prometheus and ELK are readily accessible and easy to deploy.
- **Easier scaling:** Scaling up the Cisco cnBR in a datacenter is as easy as adding new cnBR service containers on existing or new clusters.
- **Rapid feature and configuration deployment:** By employing CI/CD tools in combination with a container platform, new features can be quickly tested and deployed in the service provider network.
- **DevOps support:** Increased monitoring visibility, CI/CD capabilities, use of industry-standard container platforms, and the need to keep the deployment updated, paves the way for DevOps support and tools. The product is more visible and technologically understandable by the service provider, thus allowing for a partnered support model.
- **Increased automation:** The kubernetes (K8S) platform has been designed to make automation easier, further reducing operational cost.

Cisco cnBR Product Components

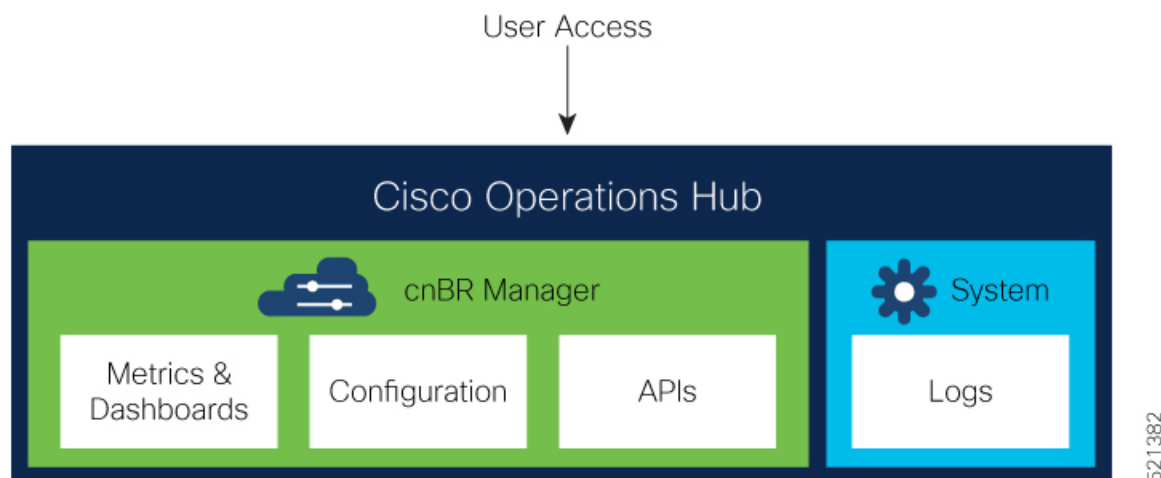

The key components of the Cisco cnBR are:

- Cisco Operations Hub
- Cisco cnBR Manager application
- cnBR Core
- Remote PHY Device

Cisco Operations Hub

Cisco Operations Hub is an application and service hosting platform tailored for the cloud-native era. Cisco Operations Hub hosts applications and services essential to managing the Cisco cnBR, including real-time telemetry, statistics, and log collection as well as providing centralized external management access to IPDR and SNMP data.

Figure 1: Cisco Operations Hub Framework

See [Configure Operations Hub](#), on page 32 for information on accessing and configuring Cisco Operations Hub.

In addition to application hosting, Cisco Operations Hub provides these interfaces for Customer OSS or Third-Party Vendor tool integration:

- [IP Detail Record Service](#)
- [Simple Network Management Protocol](#)

cnBR Manager

Cisco cnBR Manager provides essential tools for managing a Cisco cnBR:

- **Metrics & Dashboards:** Provides real-time visualizations of service & health metrics along with other information about Cisco cnBR, and DOCSIS network elements.
- **Configuration:** Provides a collection of management tools to view, import, export, and modify Cisco cnBR and RPD configurations.
- **APIs:** Provides a programmatic interface to retrieve configuration, metrics, and other information about Cisco cnBR and DOCSIS network elements.

cnBR Core

The cnBR Core interacts with RPDs to:

- receive cable modem (CM) data.

- process CM control plane messages to establish and maintain modem sessions.
- forward upstream and downstream data between the modem and IP network.

It also captures the KPI health of the modem and RPD network, and provides a management interface for DOCSIS features and telemetry data, including service flows.

Remote PHY Device

The Remote PHY Device (RPD) provides analogue RF connectivity to the cable modems and digital connectivity to the CMTS Core (cnBR).

Cisco cnBR Deployment

The following figure depicts a typical Cisco cnBR deployment that separates management plane, control plane, and data plane components.

Figure 2: Typical cnBR Deployment

The management plane components, which include Operations Hub, are centralized within a central data center.

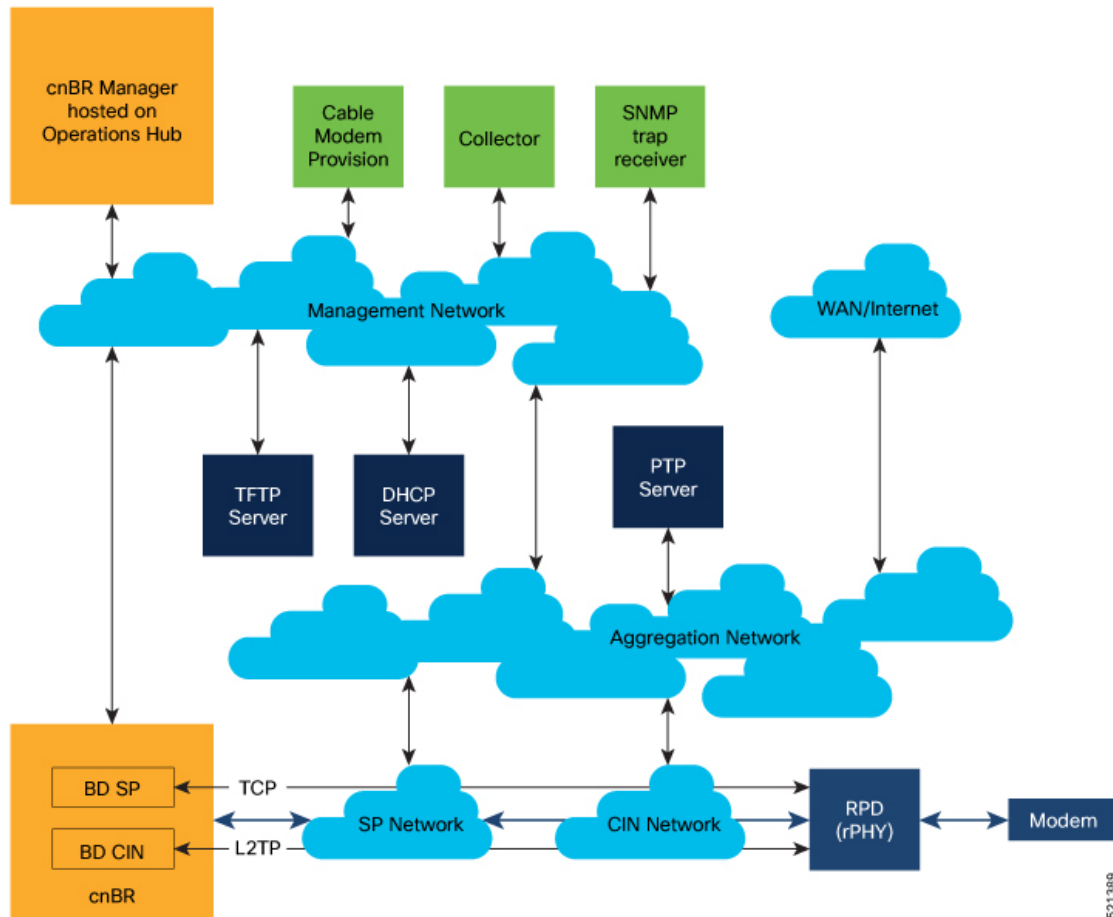

The Cisco cnBR, which contains the control plane components and routing for the data plane, is hosted within regional data centers.

The RPDs within hubs around the hub may connect to these regional data centers.

Because the entire solution has high availability, there can be no single point of failure, especially in the data plane.

The following diagram shows the components and networks that are configured when a Cisco cnBR is deployed in a typical service provider network.

Figure 3: Network Components

Network	Purpose
Aggregation	The aggregation network provides a nexus where necessary network paths converge to provide access to all necessary services.
Converged Interconnect Network (CIN)	The CIN network is well defined in the Cisco cable architecture and brings the cable modem traffic that has been converted to IP traffic into the digital DOCSIS network. The CIN network connects to the aggregation network for non-CMTS data traffic, such as PTP timing and RPD provisioning.
Management Network	The management network provides management-level interaction between the Cisco cnBR components and back-office services, such as IPDR collectors, SNMP trap, receivers, and cable modem provisioning and monitoring.
SP Network	The service provider networks provide a path for the cable modem traffic that is processed by the CMTS to reach the internet from the service provider side of the network.

Network	Purpose
WAN/Internet	The WAN/Internet network provides a path for the cable modems to send traffic to and receive traffic from the public internet.

These networks may be realized using one or more routers configured for each network.

The TFTP, DHCP, and PTP capabilities are required to be part of the solution and may be connected to different networks than those depicted in the figure. The PTP, DHCP, and TFTP address are configured within the Cisco cnBR.

The green boxes represent common service provider management features. In the past, cable modem provisioning and monitoring used information from the CMTS collected through SNMP MIBs. However, going forward, the preference is to move to REST APIs.

In the Cisco cnBR, the CIN and SP bridge domains must be configured. The CIN and SP bridge domain configurations provide first hop routing information to correspondingly named networks.

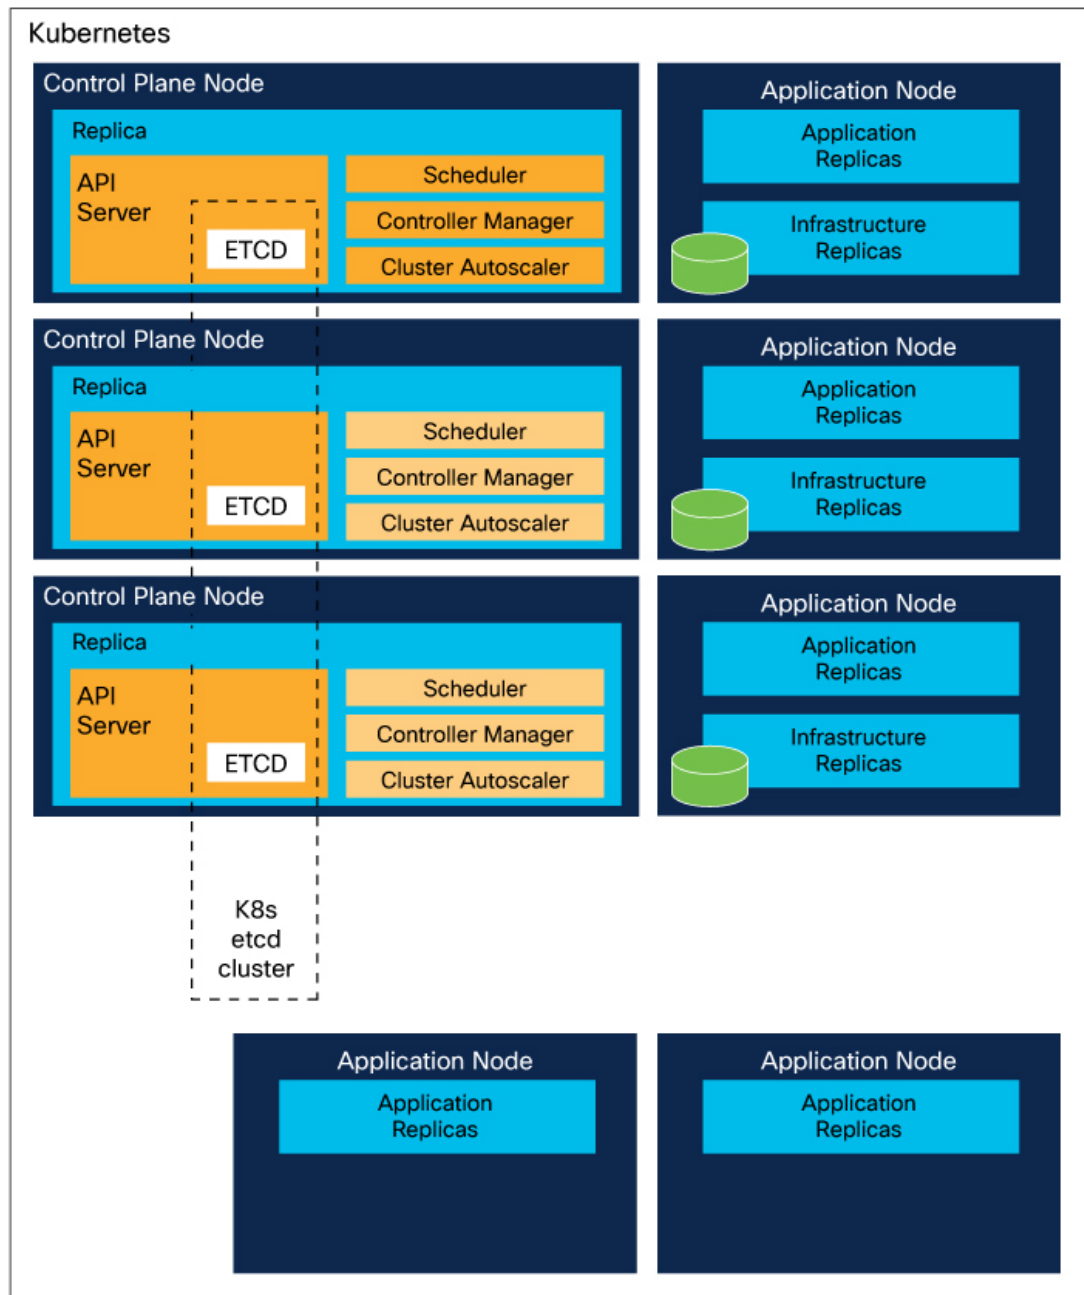

Kubernetes Platform

The Kubernetes (K8S) platform is deployed on VMs. In the future, bare metal deployment may be supported to maximize throughput.

The Cisco cnBR and management plane services are deployed as microservices within kubernetes (K8S) container orchestration clusters. Kubernetes platform supports deployment of replicated restartable microservices, where requests are routed and processed. Services are therefore highly available and scalable through redundancy.

To be hardware redundant, the K8S management functionality must be spread across separate nodes, either as bare metal servers or VMs hosted on separate servers as shown in the following figure.

Figure 4: Kubernetes Platform

521249

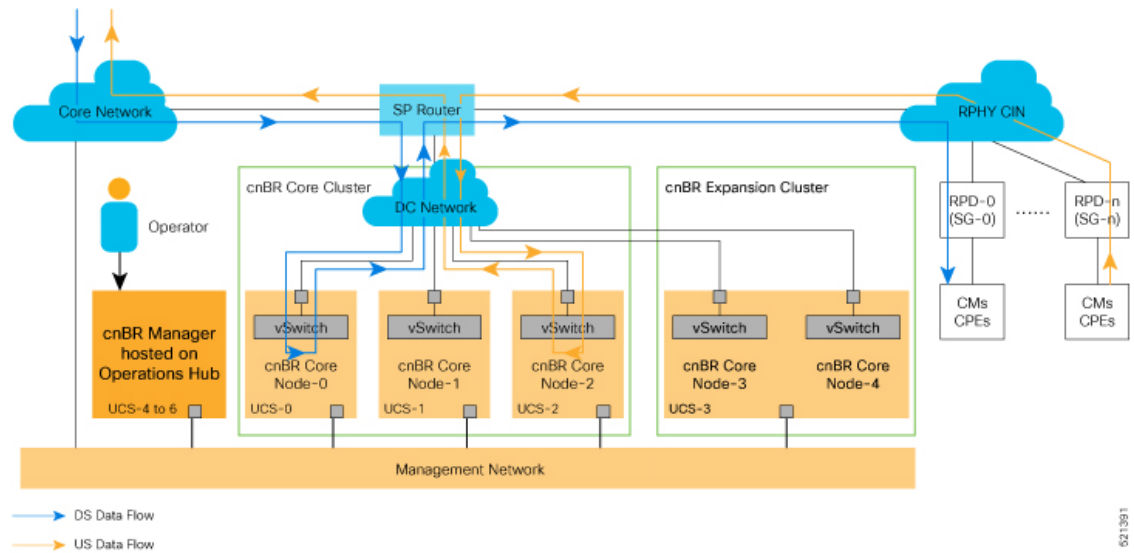

Similarly, the application load must be spread across worker nodes that are independent of the K8S control plane nodes. Separating the application workload from K8S control plane nodes protects the K8S management services from being impacted by the application workload.

The Cisco cnBR functionality and Cisco Operations Hub are hosted in a common cloud platform.

Cisco cnBR Network Topology

A typical Cisco cnBR network consists of Cisco cnBR core clusters, a SP router network, and Cisco Operations Hub, which hosts the cnBR Manager application. The following figure shows the core components and their inter-connections.

Figure 5: Cisco cnBR Inter-Connections and Data Flow

Core Components of Cisco cnBR Network Topology

- A highly available Cisco cnBR core cluster consists of three or more worker nodes, which provide core functionality of traditional CMTS: for example, DOCSIS control plane, data plane, and DOCSIS applications.
- SP Router forwards L3 packets between the uplink core network, RPHY CIN, and cnBR core services.
- Cisco Operations Hub is built in its own cluster and provides operation and management-related functionality in the Cisco cnBR system: for example, configuration, monitoring, and alert management.

Cisco cnBR Expansion Servers

Table 1: Feature History

Feature Name	Release Information	Feature Description
Multiserver support	Cisco cnBR 20.3	You can install a Cisco cnBR cluster that includes 2 expansion servers, which is a 5-server cluster.

A Multi-Node cnBR can be deployed with increased compute capacity to accommodate larger scale deployments. Additional Cisco C220 M5 UCS Servers, which are called Expansion Servers, can be added to

the Core 3 Node UCS Server Cluster to run additional DOCSIS Nodes. Cisco cnBR currently supports Static Expansion deployment. The Expansion Servers must be prepared and connected per the [Prepare Supporting Software Components, on page 19](#) procedure in the [Set Up Cisco Cloud Native Broadband Router Components, on page 11](#) section together with the Core 3 Node UCS Server Cluster before the initial cnBR cluster deployment.

Inter-Connections Between Core Components

- The SP router connects directly with the data center (DC) network to access multiple Cisco cnBR core nodes. The configuration is based on network virtualization technology that the UCS vSwitch uses, such as VLAN or VXLAN.
- Cisco Operations Hub communicates with the Cisco cnBR core clusters through internal RESTful messaging, which in turn is through the high-speed Management Network. The Management Network also transmits real-time telemetry data exported from Cisco cnBR core clusters to Cisco Operations Hub.

Downstream and Upstream Data Flow

[Figure 5: Cisco cnBR Inter-Connections and Data Flow, on page 8](#) illustrates the downstream and upstream data flows with arrows shown in different colors.

- All data traffic goes in and out of the Cisco cnBR core cluster for corresponding processing. The SP router acts as a hub.
- Different service groups (SG) are managed by different Cisco cnBR core nodes. For example, in [Figure 5: Cisco cnBR Inter-Connections and Data Flow, on page 8](#), SG-0 is managed by cnBR-Core Node-0, while SG-n is managed by cnBR-Core Node-2.

Control Flow

As shown in the following figure, network data flows between the subscriber devices and the Cisco cnBR core for control and data. It also flows between the Cisco cnBR core and the Cisco Operations Hub for management.

Figure 6: Cisco cnBR Control and Management Flows

The major Cisco cnBR control and management flows are:

- Cable modem control flow—between DOCSIS service and cable modems, for cable modem provisioning and management
- RPD control flow—between RPD service and RPD nodes, for RPD node provisioning and management
- Control flow—for PTP and DHCP relay service
- Cisco Operations Hub management flow—between Cisco Operations Hub and Cisco cnBR core services, for telemetry data export and RESTful interface messaging

06E1730

CHAPTER 2

Set Up Cisco Cloud Native Broadband Router Components

This chapter provides information about the required prerequisite hardware and software, describes key components of Cisco cnBR, its topology, and how the router is deployed in a network. This chapter also provides information about how you can set up the Cisco cnBR core and the Cisco Operations Hub, and how you configure Cisco cnBR for service resiliency.

- [cnBR Prerequisites, on page 11](#)
- [Prepare Supporting Software Components, on page 19](#)
- [Deployment of cnBR and Operations Hub, on page 23](#)
- [Configure Operations Hub, on page 32](#)
- [Configure Cisco cnBR Using Autodeployer, on page 35](#)
- [Configure cnBR using cnBR Manager, on page 52](#)
- [Cisco cnBR Service Resiliency, on page 68](#)
- [Cisco cnBR Link Redundancy, on page 72](#)
- [Cisco cnBR SP Router Redundancy, on page 75](#)
- [Smart Licensing, on page 78](#)

cnBR Prerequisites

The following prerequisite components are required to install, operate, and manage a Cisco cnBR. The prerequisites are:

- The Cisco cnBR server
- The Cisco Operations Hub server
- The Cisco cnBR topology
- VMware vSphere virtualization platform

Prerequisites required for the Cisco cnBR server

The Cisco cnBR runs exclusively on a Unified Computing System (UCS) server that is imaged with an VMware ESXi hypervisor.

- Cisco UCS server requirement

Three Cisco UCS C220 M5 servers are required to run Cisco cnBR. The supported Cisco UCS servers are UCSC-C220-M5SX.

The minimum compute, storage, and networking requirements for the Cisco UCS server are listed in the following table.

Table 2: Minimum Requirements Cisco UCS Server

Component	Specification
Chassis	UCSC-C220-M5SX
Processor	2 x Intel 6248 2.5GHz/150W 20C/27.5MB DCP DDR4 2933 MHz
Memory	384GB DDR4-2933-MHz RDIMM
Storage	2 x 240 GB SATA M.2 4 x 800GB SSD
Storage Controller	Cisco Boot optimized M.2 RAID Controller Cisco 12G Modular RAID controller with 2GB cache
NIC	2 x Intel XL710-QDA2 (40G)

- VMware requirements
 - Hypervisor - VMware ESXi 6.5, minimum recommended patch release for security updates ESXi650-202006001, or VMware ESXi 6.7, minimum recommended patch release for security updates ESXi670-202006001
 - Host Management - VMware vCenter Server 6.5 or VMware vCenter Server 6.7

If the VMware ESXi 6.7 is installed on host, ensure that the vCenter version is VMware vCenter Server 6.7.

Prerequisites required for the Cisco Operations Hub server

- Cisco UCS server requirement

Three Cisco UCS C220 M5 servers are required to run Cisco cnBR. The supported Cisco UCS servers are UCSC-C220-M5SX.

The minimum compute, storage, and networking requirements for the Cisco UCS server are listed in the following table.

Table 3: Minimum Requirements Cisco UCS Server

Component	Specification
Chassis	UCSC-C220-M5SX

Component	Specification
Processor	2 x Intel 6248 2.5GHz/150W 20C/27.5MB DCP DDR4 2933 MHz
Memory	384 GB DDR4-2933-MHz RDIMM
Storage	2 x 240 GB SATA M.2 4 x 800GB SSD
Storage Controller	Cisco Boot optimized M.2 RAID Controller Cisco 12G Modular RAID controller with 2GB cache
NIC	2 x Intel XL710-QDA2 (40G)

- VMware requirements
 - Hypervisor - VMware ESXi 6.5, minimum recommended patch release for security updates ESXi650-202006001, or VMware ESXi 6.7, minimum recommended patch release for security updates ESXi670-202006001
 - Host Management - VMware vCenter Server 6.5 or VMware vCenter Server 6.7

If the VMware ESXi 6.7 is installed on host, ensure that the vCenter version is VMware vCenter Server 6.7.

- Browser support

For the Cisco cnBR, the Cisco Operations Hub functionality is supported for the following browser versions:

- Mozilla Firefox 78.0 and later
- Google Chrome 83 and later or Google Chrome 84 and later
- Microsoft Edge 44 and later

Prerequisites required for the Cisco cnBR topology

- Cisco cnBR Data Switch

You must use a data center switch with the requisite 40G port density between the Cisco cnBR servers and the service provider router to aggregate the Cisco cnBR data path links.

- Management Switch

A dedicated data center switch can be used for Cisco cnBR and Cisco Operations Hub management traffic. The Cisco cnBR and Cisco cnBR servers provide 1G, 10G, and 40G network interface connectivity options for the different management networks that are used in the system. The management networks can be VMware ESXi host management, Cisco cnBR and Cisco Operations Hub virtual machine cluster management, and the Cisco Integrated Management Controller (IMC) Lights-Out-Management.

- Service Provider Router

The SP Router is responsible for forwarding L3 packets between the core network, RPHY CIN, and Cisco cnBR. The SP Router and Cisco cnBR establishes connections through BGP, SG, RPHY-core for RPD session setup and traffic forwarding.

We recommend the following Cisco Network Convergence System 5500 Series models:

- NCS-55A1-36H-S
- NCS-55A1-24H

The required software version must be Cisco IOS XR 6.5.3 or later.

- DHCP Server

A standard Dynamic Host Configuration Protocol (DHCP) server is required, and typically included in an existing DOCSIS infrastructure. For example, the DHCP server included is the Cisco Network Registrar (CNR).

- PTP Server Configuration

A Precision Time Protocol (PTP) server is required and typically included in an existing DOCSIS infrastructure. For example, an OSA 5420.

- TFTP Server

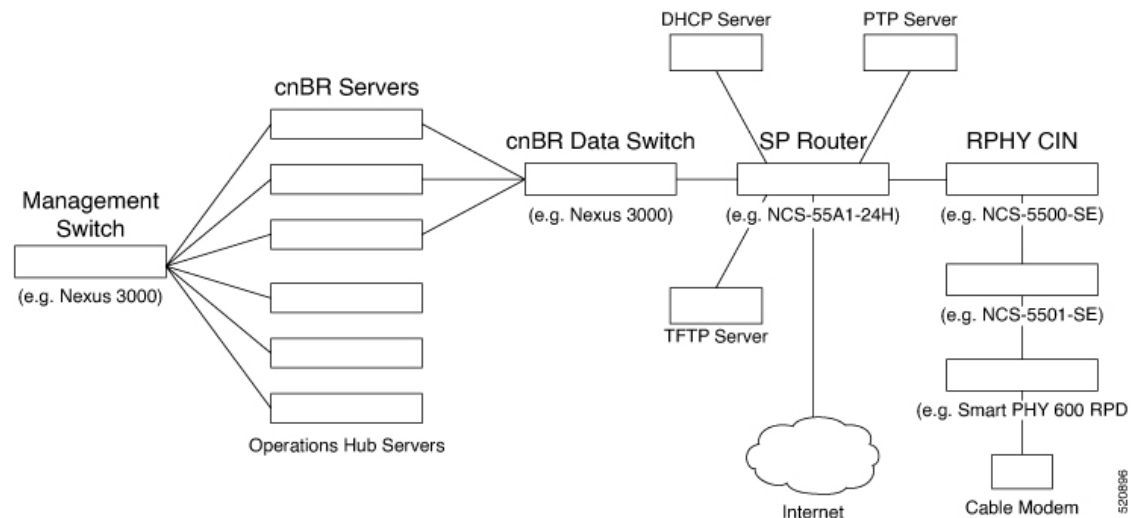

A standard Trivial File Transfer Protocol (TFTP) server is required and typically included in an existing DOCSIS infrastructure.

- RPHY CIN

A Remote PHY Converged Interconnect Network (CIN) is required. A Remote PHY Device, and Cable Modems are also required. For example, Cisco Smart PHY 600 Shelf.

The following image is a simplified, high-level overview of an end-to-end system and shows how these Cisco cnBR components are connected in the topology with provisioning systems and a Remote PHY CIN:

Figure 7: Simplified cnBR Topology

Prerequisites required for the VMware vSphere virtualization platform

VMware is a mandatory component for the Cisco Operations Hub server, and is necessary for the deployment topology. An ESXi host is required to run the cnBR Deployer VM.

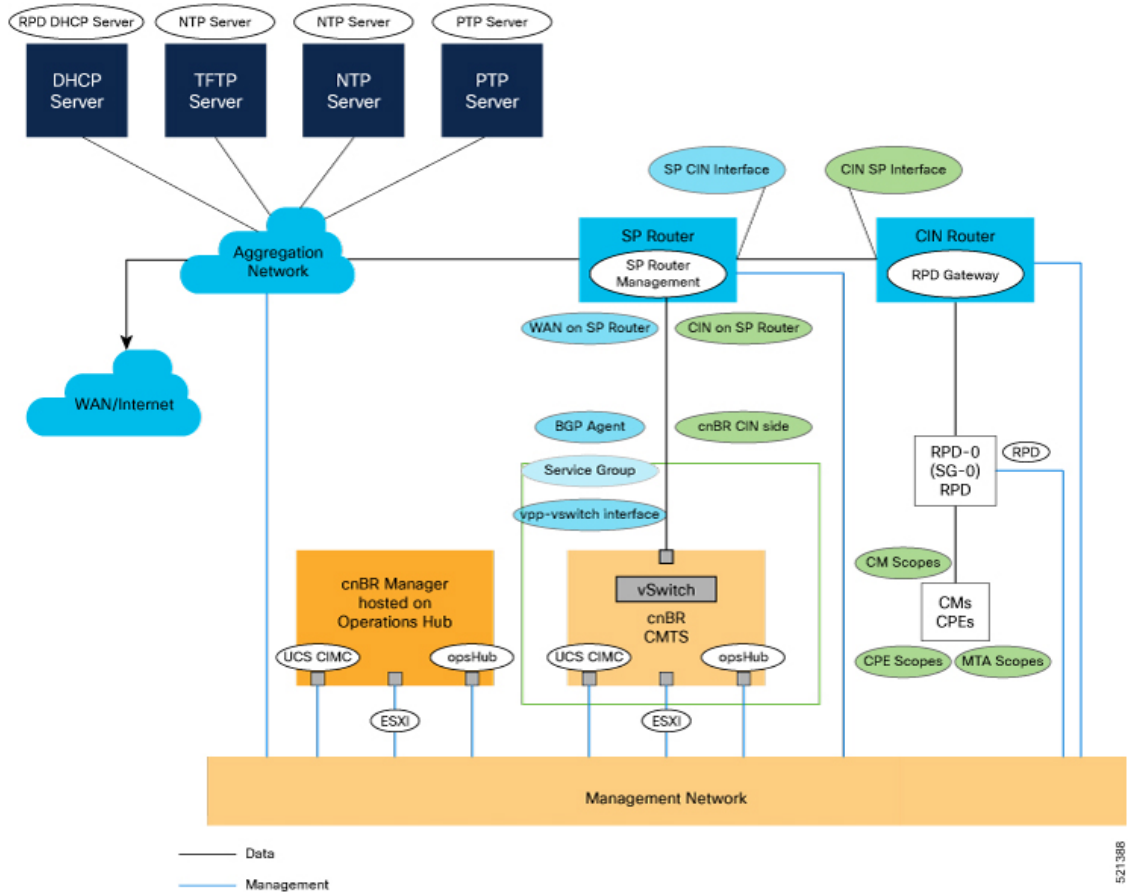

A generalized Cisco cnBR deployment with the Cisco Operations Hub and Cisco cnBR core hosted in VMware clusters is depicted in the following image:

Figure 8: cnBR Deployment in a VMware Cluster

The VMware network topology in the following image is for a VLAN configuration:

Figure 9: VLAN Configuration with VMware Network Topology

The necessary IP addresses and networks that are mapped in the diagram are described in the following sections:

• Networks

The following table provides guidance for the networks that are needed in the management, WAN, and CIN routing domains:

Table 4: Network Information for Routing Domains

Name	Subnet Mask	Function
Management	<ul style="list-style-type: none"> • 2 addresses for each cluster • Operations Hub/cnBR UCS • 1 for each cluster • 1 for each service device 	Management
CIN	Network requirements for each customer	Connection RPD and CCAP core customer

Name	Subnet Mask	Function
WAN	Network requirements for each customer	Internet access for CPE
cnBR CIN side	Network requirements for each customer	-
BGP network to SP router	Network requirements for each customer	Management
Network for data	Network requirements for each customer	-
SG IP cnBR side	Network requirements for each customer	The peer IP for Service Group on cnBR
RPD address pool	Customer selected	DHCP scope for RPD sized to cover total number of RPDs
DHCP scope for CM	Customer selected	-
DHCP scope for CPE	Customer selected	-
DHCP scope for MTA	Customer selected	-

You must provide domain and DNS name for the management network.

• Device Addresses

The following tables provide information on the IP address that is needed for device and router interfaces.

- **Management IP Address:** Each management interface that is listed in the following table requires 1 IP address:

Table 5: Management Interface and Associated IP Addresses

Device name	Number of Addresses
CIMC cnBR	1 per cnBR UCS
ESXi cnBR	1 per cnBR UCS
CIMC Operations Hub	1 per Operations Hub UCS
ESXi Operations Hub	1 per Operations Hub UCS
cnBR	1 per cnBR Cluster
Operations Hub	1 per Operations Hub Cluster
Deployer	1
vCenter	1
SP router	1

Device name	Number of Addresses
CIN router	1

- **DOCSIS Network Addresses:** The following table lists the DOCSIS network-related information:

Table 6: DOCSIS Network-Related Information

Device Name	Network Name	Description	Number of Addresses
SP router to CIN	CIN	SP connection to CIN router	1
CIN router to SP	CIN	CIN connection to SP router	1
SP router to WAN	WAN	SP connection to WAN/Internet	1
RPD Gateway	CIN	RPD gateway router Address	1
cnBR CIN side	CIN	cnBR connection to CIN	Customer specific
BGP Agent	WAN	WAN router BGP Agent IP	Customer specific
Service Group	WAN	Service Group WAN IP	Customer specific
WAN on SP Router	WAN	SP connection to WAN network	Customer specific

- **Customer Provisioned Services:** The following table lists the various customer services:

Table 7: Customer Provisioned Services

Service	Notes
DHCP	Needed for both RPD and subscriber devices
TFTP	RPD only uses it during software upgrade
TOD	Time of day clock
PTP	One connection that is required for the cnBR and for each RPD
NTP	Network Time Protocol Server
DNS	Domain Name Server

Prepare Supporting Software Components

To prepare the Cisco Unified Computing System (UCS) servers for software installation, you must do the following.

- Configure the servers using [Cisco Integrated Management Controller \(CIMC\)](#)
- Install VMware ESXi
- Add VMware ESXi Hosts to a VMware vSphere cluster using VMware vCenter

Note Cisco UCS Servers ordered using the Cisco cnBR PID are preconfigured, imaged, and ready for installation. For Cisco cnBR PID-specific servers, execute the steps in [Cisco UCS Server Installation](#) and continue to [Add Cisco cnBR ESXi Hosts to vSphere Virtual Infrastructure](#), on page 21.

Cisco cnBR Server Installation and Configuration

-
- Step 1** [Cisco UCS Server Installation](#), on page 19
 - Step 2** [Update Firmware](#), on page 20
 - Step 3** [Load Cisco cnBR Optimized BIOS Configuration](#), on page 20
 - Step 4** [Configure Boot Drives](#), on page 20
 - Step 5** [Configure Data Drives](#), on page 21
 - Step 6** [Install VMware ESXi](#), on page 21
 - Step 7** [Reboot VMware ESXi Host and Set Boot Device](#), on page 21
-

Cisco UCS Server Installation

-
- Step 1** Rack mount the servers. See [Cisco UCS C220 M5 Server Installation and Service Guide](#).
 - Step 2** Ensure both power supplies are connected on each server, and power on the servers.
 - Step 3** Connect the following network cables:
 - For Cisco Integrated Management Controller (CIMC), use the 1Gb Ethernet dedicated management port.
 - For VMware ESXi Host Management, use Ethernet port 1 of the Dual 1Gb/10Gb Intel X550T on board NIC.
 - For Cisco cnBR Data, connect port 1 of the Intel XL710 40G NIC in PCIe Slot 1 to the SP Router/Leaf Switch using Cisco QSFP-40G-SR4.
 - Step 4** Connect the UCS Kernel-based Virtual Machine (KVM) console adapter or connect a keyboard and monitor directly to the server.

Step 5 Configure CIMC through the KVM console and update the [Network Settings](#).

Update Firmware

Download the latest Hardware Update Utility for the UCS C220 M5 Server from [Cisco's Software Download](#) site and use it to update the CIMC, BIOS, and Device Firmware for Storage Controllers, Network Adapters, SSDs, and other components.

Load Cisco cnBR Optimized BIOS Configuration

Step 1 Create a new json file "cnbr_perf.json" and add the following structure.

Cisco cnBR Optimized BIOS profile config for C220 M5 Servers

```
{
  "name": "Perf_M5",
  "description": "",
  "tokens": {
    "EnhancedIntelSpeedStep": "Enabled",
    "IntelTurboBoostTech": "Enabled",
    "IntelHyperThread": "Disabled",
    "CPUPerformance": "Enterprise",
    "ExecuteDisable": "Enabled",
    "IntelVTD": "Enabled",
    "ProcessorC1E": "Disabled",
    "ProcessorC6Report": "Disabled",
    "PsdCoordType": "HW ALL",
    "CpuEngPerfBias": "Performance",
    "PwrPerfTuning": "BIOS",
    "CpuHWPM": "HWPM Native Mode",
    "WorkLdConfig": "IO Sensitive",
    "SelectMemoryRAS": "Maximum Performance",
    "SNC": "Disabled",
    "XPTPrefetch": "Enabled",
    "DcuIpPrefetch": "Enabled",
    "PatrolScrub": "Disabled"
  }
}
```

Step 2 Load the optimized Cisco cnBR BIOS configuration into the system using "cnbr_perf.json".

Step 3 Save a backup of the current BIOS settings.

Step 4 Select the new profile "Perf_M5" and activate it.

Configure Boot Drives

Step 1 Enable the Cisco MSTOR Boot Optimized M.2 RAID Controller.

- Step 2** Create a RAID 1 virtual drive from 2 x M.2 SSD Drives.
 - Step 3** Set Stripe Size to 64KB
-

Configure Data Drives

- Step 1** Enable Cisco 12G SAS Modular RAID Controller.
 - Step 2** Create a RAID 5 enabled virtual drive using 4 x SSDs.
 - Step 3** Set Stripe Size to 64KB.
 - Step 4** Set Write Cache Policy to *Write Back with Good BBU*.
-

Install VMware ESXi

- Step 1** Download the Cisco custom image for ESXi 6.5 U3 GA Install CD ISO from VMware.
 - Step 2** Install VMware ESXi 6.5 Update 3 on the M.2 RAID 1 Virtual Drive (Boot Drive).
 - Step 3** Use the Cisco Custom ISO - `VMware_ESXi_6.5.0_13932383_Custom_Cisco_6.5.3.1.iso`
 - Step 4** Set a password for the root user following the installation process.
 - Step 5** Reboot the VMware ESXi host following the installation process and execute the steps in [Reboot VMware ESXi Host and Set Boot Device](#), on page 21.
-

Reboot VMware ESXi Host and Set Boot Device

- Step 1** Interrupt the boot process with the F2 key after the host resets and boot into the BIOS.
 - Step 2** Under the Boot Options tab, set Boot Option #1 to the UEFI target - *VMware ESXi*.
 - Step 3** Disable all other boot options.
 - Step 4** Save changes and exit.
 - Step 5** Confirm the host boots directly into VMware ESXi.
-

Add Cisco cnBR ESXi Hosts to vSphere Virtual Infrastructure

- Step 1** [Configure VMware ESXi Host Management Networking](#), on page 22
- Step 2** [Add ESXi Hosts to VMware vCenter Server](#), on page 22
- Step 3** [Configure and Enable Required ESXi Host Features](#), on page 22

Step 4 [Configure Virtual Machine Networking, on page 23](#)

Configure VMware ESXi Host Management Networking

Step 1 Log into the VMware ESXi host through the Direct Console User Interface (DCUI) with the root account.

Note For Cisco cnBR PID Servers, use the password received from your Cisco representative as part of your Cisco cnBR order.

Step 2 Configure the management network.

- a) Update IP configuration.
 - b) Update DNS configuration.
 - c) Update custom DNS suffixes.
 - d) Update VLAN ID if required.
-

Add ESXi Hosts to VMware vCenter Server

In VMware vCenter:

Step 1 Create a new, dedicated cluster for Cisco cnBR.

Note Do not enable DRS or any HA features.

Step 2 Add each new Cisco cnBR ESXi Host to the new Cisco cnBR cluster.

Configure and Enable Required ESXi Host Features

Step 1 Configure time on the host.

- a) Enable NTP.

Step 2 Apply ESXi host licenses.

Step 3 Enable PCI Pass-through on all four Intel XL710 40G QSFP+ ports(requires host reboot).

Step 4 Create a new datastore on the data drive storage device.

Note By default, Cisco cnBR PID servers have a datastore created and PCI Pass-through enabled.

Configure Virtual Machine Networking

- Step 1** Ensure VMware vSwitch connectivity to the physical switch.
- Step 2** Create a PortGroup and a VMware vSwitch for the Kubernetes Cluster Node VM MGMT Network.
-

Deployment of cnBR and Operations Hub

Cisco cnBR supports offline installation of the SMI Cluster Manager, Cisco Operations Hub, and Cisco cnBR clusters.

All required installation packages are available from the SMI Cluster Deployer in an offline deployment scenario. The packages include Helm charts, Docker images used by the Cisco cnBR, and Cisco Operations Hub cluster nodes. Note that cluster nodes do not pull software or images directly from Cisco Artifactory. Product tar files containing all necessary Helm charts and container images are separate. The tar files are imported into the SMI Deployer during the deployer creation process.

The installation of the SMI Deployer Virtual Manager is from a working directory on a staging server. The staging server can be any host - physical server, virtual machine, or an administrator's laptop. However, you must ensure that you can connect to the target vSphere Infrastructure, vCenter Server, and cluster nodes with the proper credentials.

The Autodeploy utility creates the deployer, and deploys the Cisco Operations Hub and Cisco cnBR clusters. The Autodeploy utility is part of the Cisco cnBR release bundle.

Prepare the Staging Server

Complete the following steps to prepare the staging server:

Before you begin

Ensure that you have a staging server setup with the following prerequisites:

- Python 3: See <https://www.python.org/> for more information.
- OpenSSL: See <https://www.openssl.org/> for more information.
- Docker: See <https://docs.docker.com/get-docker/> for more information.
- The staging server must have network connectivity to the VMware nodes.

-
- Step 1** Verify the image signature.

In an offline deployment scenario, you must verify the authenticity and integrity of the image before the installation and deployment. You can choose to verify the image signatures online or offline.

We recommend online verification. Offline verification can be used when there is no network access to perform online verification.

A corrupted or tampered image can lead to an image verification failure. Discard the image and contact the Cisco Customer Support to get the authentic image.

- a) Extract the Cisco cnBR release bundle. Untar the `cnbr-installer-<release-version-tag>.SPA.tgz` signed release bundle as shown:

```
~/staging$ tar xvzf cnbr-installer-<release-version-tag>.SPA.tgz
cnbr-installer-<release-version-tag>.tgz # cnBR release bundle
isign/ # folder with image verification content
isign/cnbr-installer-<release-version-tag>.tgz.signature
isign/CNBR-BUNDLE_pubkey.der
isign/cisco_x509_verify_release.py3
isign/CNBR_IMAGE_SIGN-CCO_RELEASE.cer
verify_signature_offline # script to be used to verify the image signature
offline
verify_signature_online # script to be used to verify the image signature
online
```

- b) Verify the image by choosing either of the following methods. We recommend the online verification.

- Online image verification. Run the following script to verify the image. A successful verification is as follows:

```
~/staging$ ./verify_signature_online
Downloading CA certificate from http://www.cisco.com/security/pki/certs/crcam2.cer ...
Successfully downloaded and verified crcam2.cer.
Downloading SubCA certificate from http://www.cisco.com/security/pki/certs/innerspace.cer ...
Successfully downloaded and verified innerspace.cer.
Successfully verified root, subca and end-entity certificate chain.
Successfully fetched a public key from isign/CNBR_IMAGE_SIGN-CCO_RELEASE.cer.
Successfully verified the signature of cnbr-installer-<release-version-tag>.tgz using
isign/CNBR_IMAGE_SIGN-CCO_RELEASE.cer
```

- Offline image verification. Run the following script to verify the image. A successful verification is as follows:

```
~/staging$ ./verify_signature_offline
Verified OK
```

Step 2 Untar the Cisco cnBR release bundle:

```
> tar xvzf cnbr-installer-<release-version-tag>.tgz
> cd cnbr-installer-<release-version-tag>
```

The directory, `staging/cnbr-installer-<release-version-tag>`, is referred to as staging or install directory. The directory has the following content:

```
~/staging/cnbr-installer-<version-tag>$ tree
.

Create the Configuration File

The configuration file is in the standard YAML descriptive language format.

Use the following steps to create the configuration file:

Step 1 **Configuring the environment:** The environment configuration provides the vCenter access and network access details used to create and provision the deployers and cluster virtual machines (VM). The deployer and clusters need environments to be defined before their creation and deployment.

The deployer contains all the defined environments that can be reused by clusters. The deployer refers to the corresponding vCenter environment by name.

```

environments:
  "<<vcenter-env>>":
    # vCenter environment name
    server: "<<XX.XX.XX.XX>>"
    # vCenter Server IP address
    username: "<<user-name>>"
    # vCenter username. The user is prompted for
    the password
    datacenter: "<<vmware datacenter>>"
    # DataCenter name
    cluster: "<<vcenter cluster>>"
    # vCenter cluster name
    nics: [ "<<VM Network>>", "<<VM Network1>>" ]
    # vCenter NICs (port groups)
    nameservers: [ "<<YY.YY.YY.YY>>" ]
    # DNS servers
    search-domains: [ "<<yourdomain>>" ]
    # Search domains
    ntp: "<<yourclock.domain>>"
    # NTP server
    https-proxy: "<<http://proxyhost.domain:port>>"
    no-proxy: "<<127.0.0.1,localhost>>"

```

Step 2 **Configuring the deployer:** Ensure that you have at least one environment defined, before a deployer is created for deployment. The deployer holds all the defined environments which can be reused by clusters when referred to by name.

```

deployers:
  "<<deployer3-test>>":
    # Deployer VM name
    environment: "<<vcenter-env>>"
    # Reference to the vCenter environment
    address: "<<XX.XX.XX.XX/prefix_len>>"
    # SSH-IP of the VM in CIDR format
    gateway: "<<XX.XX.XX.XX>>"
    # Gateway for the VM
    ingress-hostname: "<<host.domain>>"
    # Custom ingress hostname for the deployer -
    FQDN (Optional)
    username: "<<user-name>>"
    # Deployer VM username. The user is prompted
    for the password
    # SSH private-key-file with path relative to
    the staging directory
    # Key is auto-generated, if one is not provided
    private-key-file: "<<cmts.pem>>"
    host: "<<XX.XX.XX.XX>>"
    # Server IP address where the deployer VM is
    hosted
    datastore: "<<datastore1>>"
    # Datastore for the deployer VM

```

When you configure a custom ingress hostname for the deployer, ensure that the following entries are in the DNS:

```
<host.domain>
charts.<host.domain>
files-offline.smi-cluster-deployer.<host.domain>
deployer-ui.smi-cluster-deployer.<host.domain>
cli.smi-cluster-deployer.<host.domain>
restconf.smi-cluster-deployer.<host.domain>
docker.<host.domain>
```

Step 3 **Configuring the cluster:** A cluster (Cisco cnBR/Cisco Operations Hub Multi-Node) needs at least one environment and deployer to be defined before its creation and deployment. A cluster also needs references to the corresponding environment and deployer.

A cluster can be one of the following types:

- Multi-Node Cisco cnBR
- Multi-Node Cisco Operations Hub

Note

- Single-Node Cisco Operations Hub is supported for Lab or Demo purpose only.
- Single-Node Cisco cnBR clusters are not supported.

Multi-Node Configuration

- The following reference configuration distributes the cluster node VMs evenly across three ESXi Hosts with proper NUMA alignment and computes the resource reservation.
- 13 Management IP addresses in total = 12 for the cluster nodes + 1 primary virtual IP.
- For each of the following node, update the `k8s ssh-ip`, `VMware datastore`, and `VMware host` accordingly.
- For the DOCSIS nodes, the PCI device must be identified and available.

```
clusters:
  # Name of the cluster
  "<<cnbr-multi>>":
    type: "<<cnbr>>"
    environment: "<<vcenter-env>>"
    # cnBR cluster name
    # Cluster type 'cnbr' or 'opshub'
    # Reference to vCenter environment
    # PCI passthrough, used only for docsis nodes
    # Specify this variable only to enable PCI

passthrough
  pci_device: "<<0000:5e:00.0>>"
  gateway: XX.XX.XX.XX
  ingress-hostname: "<<host.domain>>"
  # Gateway for the cluster
  # Custom ingress hostname for the cluster - FQDN
  (Optional)
  username: "<<user-name>>"
  the cluster password
  # Cluster username. You are prompted to enter
  # SSH private-key-file with path relative to
  the staging directory
  # Key is auto-generated, if not provided
  private-key-file: "<<cmts.pem>>"
  master-vip: "<<XX.XX.XX.XX/prefix_len>>"
  # Master vip in CIDR format only for multi-node

  # For Multi-Node only
  nodes:
    - host: "<<XX.XX.XX.182>>"
    # Server IP address where the deployer VM is
  hosted
  # IP addresses assigned to master, etcd, infra, and docsis/ops nodes respectively
```

```

addresses: [ "<<XX.XX.XX.187>>", "<<XX.XX.XX.172>>", "<<XX.XX.XX.169>>", "<<XX.XX.XX.190>>" ]

  datastore: "<<XX.XX.XX.182-datastore1>>"
- host: "<<XX.XX.XX.176>>"
  addresses: [ "<<XX.XX.XX.188>>", "<<XX.XX.XX.173>>", "<<XX.XX.XX.170>>", "<<XX.XX.XX.191>>" ]

  datastore: "<<XX.XX.XX.176-datastore1>>"
- host: "<<XX.XX.XX.184>>"
  addresses: [ "<<XX.XX.XX.189>>", "<<XX.XX.XX.174>>", "<<XX.XX.XX.171>>", "<<XX.XX.XX.192>>" ]

  datastore: "<<XX.XX.XX.184-DataStore1>>"
  # specify pci_device ID if different from the global pci_device ID
  pci_device: "<<0000:5e:00.1>>"

# For Single-Node cluster [ Only supported, for Lab/Demo purpose for Operations HUB ]
nodes:
- host: "<<XX.XX.XX.182>>" # Server IP address where the deployer VM is
hosted
  addresses: [ "<<XX.XX.XX.187/prefix_len>>" ]
  datastore: "<<XX.XX.XX.182-datastore1>>"

```

When you configure a custom ingress hostname for a cluster, ensure that the following entries are in the DNS:

For Cisco cnBR:

```

<host.domain>
cli.ccmts-infra-ops-center.<host.domain>
documentation.ccmts-infra-ops-center.<host.domain>
restconf.ccmts-infra-ops-center.<host.domain>
docs.cee-data-product-documentation.<host.domain>
cli.cee-data-ops-center.<host.domain>
documentation.cee-data-ops-center.<host.domain>
prometheus-hi-res.cee-data-cnat-monitoring.<host.domain>
restconf.cee-data-ops-center.<host.domain>
show-tac-manager.cee-data-smi-show-tac.<host.domain>
grafana.<host.domain>

```

For Cisco Operations Hub:

```

<host.domain>
cli.opshub-data-ops-center.<host.domain>
documentation.opshub-data-ops-center.<host.domain>
restconf.opshub-data-ops-center.<host.domain>
docs.cee-data-product-documentation.<host.domain>
cli.cee-data-ops-center.<host.domain>
documentation.cee-data-ops-center.<host.domain>
prometheus-hi-res.cee-data-cnat-monitoring.<host.domain>
restconf.cee-data-ops-center.<host.domain>
show-tac-manager.cee-data-smi-show-tac.<host.domain>
restconf.cnbrmanager-data-ops-center.<host.domain>

```

Deploy the Cluster

Deploy the cluster by using the following command:

```
~/cnbr-installer-<release-version-tag>$ ./deploy -c <config_file>
```

The Cluster Manager is deployed first, before deploying any cluster. To deploy more clusters, run the command with the corresponding configuration files.

Deployment Example Configurations

Table 8: Feature History

Feature Name	Release Information	Feature Description
Second NIC configuration on the Cisco Operations Hub for cable modem data	Cisco cnBR 20.3	You can configure second NIC on the Cisco Operations Hub cluster that connects to CIN network, allowing the Cisco Operations Hub to poll cable modem data such as SNR and TX/RX power.

Example configuration files are available in the staging or examples directory. You can copy, modify, and use the appropriate example configuration file.

Ensure that you have gone through [Step 1](#) and [Step 2](#) topics.

• Sample Deployer Configuration

The following is a sample configuration to deploy the cluster manager. The sample has two mandatory sections for all cluster configurations.

```
environments:
  "vcenter-env":
    server: "XX.XX.XX.XX"
    username: "vCenter username"
    datacenter: "vmware datacenter"
    cluster: "vmware cluster"
    nics: [ "VM Network" ]
    nameservers: [ "DNS1", "DNS2" ]
    search-domains: [ "yourdomain" ]
    ntp: "yourclock.yourdomain"
    https-proxy: "http://proxyhost.domain:port"
    no-proxy: "127.0.0.1,localhost"

deployers:
  "deployer3-test":
    environment: "vcenter-env"
    address: "XX.XX.XX.194/prefix_len"
    gateway: "XX.XX.XX.129"
    username: "cloud-user"
    private-key-file: "cmts.pem"
    host: "XX.XX.XX.184"
    datastore: "XX.XX.XX.184-DataStore1"
```

• Multi-Node cnBR Configuration

Define the cluster configuration as shown:

```
clusters:
  "cnbr-mnode":
    type: "cnbr"
    environment: "vcenter-env"
```

```
# comment out pci_device to disable PCI
pci_device: "0000:5e:00.0"
master-vip: "XX.XX.XX.193/prefix_len"
username: "cloud-user"
private-key-file: "cmts.pem"
gateway: XX.XX.XX.129
nodes:
  - host: "XX.XX.XX.182"
    datastore: "XX.XX.XX.182-datastore1"
    addresses: [ "XX.XX.XX.187", "XX.XX.XX.172", "XX.XX.XX.169", "XX.XX.XX.190" ]

  - host: "XX.XX.XX.176"
    datastore: "XX.XX.XX.176-datastore1"
    addresses: [ "XX.XX.XX.188", "XX.XX.XX.173", "XX.XX.XX.170", "XX.XX.XX.191" ]

  - host: "XX.XX.XX.184"
    datastore: "XX.XX.XX.184-DataStore1"
    addresses: [ "XX.XX.XX.189", "XX.XX.XX.174", "XX.XX.XX.171", "XX.XX.XX.192" ]
```

• Multi-Node cnBR Configuration with Custom Ingress Hostname and Expansion Servers

Define the cluster configuration as shown:

```
clusters:
  "cnbr-mnode":
    type: "cnbr"
    environment: "vcenter-env"
    master-vip: "XX.XX.XX.193/prefix_len"
    username: "cloud-user"
    private-key-file: "cmts.pem"
    gateway: XX.XX.XX.129
    ingress-hostname: "cnbr1.cisco.com"
    nodes:
      - host: "XX.XX.XX.182"
        datastore: "XX.XX.XX.182-datastore1"
        addresses: [ "XX.XX.XX.187", "XX.XX.XX.172", "XX.XX.XX.169", "XX.XX.XX.190" ]

        pci_device: [ "0000:5e:00.0" ]

      - host: "XX.XX.XX.176"
        datastore: "XX.XX.XX.176-datastore1"
        addresses: [ "XX.XX.XX.188", "XX.XX.XX.173", "XX.XX.XX.170", "XX.XX.XX.191" ]

        pci_device: [ "0000:5e:00.0" ]

      - host: "XX.XX.XX.184"
        datastore: "XX.XX.XX.184-DataStore1"
        addresses: [ "XX.XX.XX.189", "XX.XX.XX.174", "XX.XX.XX.171", "XX.XX.XX.192" ]

        pci_device: [ "0000:5e:00.0" ]

      - host: "XX.XX.XX.185"
        datastore: "XX.XX.XX.185-DataStore1"
        addresses: [ "XX.XX.XX.194", "XX.XX.XX.195" ]
        pci_device: [ ["0000:5e:00.0"], ["0000:d8:00.1" ] ]

      - host: "XX.XX.XX.186"
        datastore: "XX.XX.XX.186-DataStore1"
        addresses: [ "XX.XX.XX.196", "XX.XX.XX.197" ]
        pci_device: [ ["0000:5e:00.0"], ["0000:d8:00.1" ] ]
```

Note For Link Redundancy, add 2 PCI device IDs per DOCSIS node as follows:

```
nodes:
  - host: "XX.XX.XX.182"
    datastore: "XX.XX.XX.182-datastore1"
    addresses: [ "XX.XX.XX.187", "XX.XX.XX.172",
"XX.XX.XX.169", "XX.XX.XX.190" ]
    pci_device: [ ["0000:5e:00.0", "0000:5e:00.1"] ]
  - host: "XX.XX.XX.176"
    datastore: "XX.XX.XX.176-datastore1"
    addresses: [ "XX.XX.XX.188", "XX.XX.XX.173",
"XX.XX.XX.170", "XX.XX.XX.191" ]
    pci_device: [ ["0000:5e:00.0", "0000:5e:00.1"] ]
  - host: "XX.XX.XX.184"
    datastore: "XX.XX.XX.184-DataStore1"
    addresses: [ "XX.XX.XX.189", "XX.XX.XX.174",
"XX.XX.XX.171", "XX.XX.XX.192" ]
    pci_device: [ ["0000:5e:00.0", "0000:5e:00.1"] ]
  - host: "XX.XX.XX.185"
    datastore: "XX.XX.XX.185-DataStore1"
    addresses: [ "XX.XX.XX.194", "XX.XX.XX.195" ]
    pci_device: [ ["0000:5e:00.0", "0000:5e:00.1"], [
"0000:d8:00.0", "0000:d8:00.1" ] ]
  - host: "XX.XX.XX.186"
    datastore: "XX.XX.XX.186-DataStore1"
    addresses: [ "XX.XX.XX.196", "XX.XX.XX.197" ]
    pci_device: [ ["0000:5e:00.0", "0000:5e:00.1"], [
"0000:d8:00.0", "0000:d8:00.1" ] ]
```

• Multi-Node Operations Hub Configuration

Define the cluster configuration as shown:

```
clusters:
  "opshub-mnode":
    type: "opshub"
    environment: "vcenter-env"
    master-vip: "XX.XX.XX.193/prefix_len"
    gateway: XX.XX.XX.129
    username: "cloud-user"
    private-key-file: "cmts.pem"
    nodes:
      - host: "XX.XX.XX.182"
        datastore: "XX.XX.XX.182-datastore1"
        addresses: [ "XX.XX.XX.187", "XX.XX.XX.172", "XX.XX.XX.169", "XX.XX.XX.190" ]
      - host: "XX.XX.XX.176"
        datastore: "XX.XX.XX.176-datastore1"
        addresses: [ "XX.XX.XX.188", "XX.XX.XX.173", "XX.XX.XX.170", "XX.XX.XX.191" ]
      - host: "XX.XX.XX.184"
        datastore: "XX.XX.XX.184-DataStore1"
        addresses: [ "XX.XX.XX.189", "XX.XX.XX.174", "XX.XX.XX.171", "XX.XX.XX.192" ]
```

• Multi-Node Operations Hub Configuration with Custom Ingress Hostname and 2nd Network Interface on Ops Nodes

Define the cluster configuration as shown:

```

clusters:
  "opshub-mnode":
    type: "opshub"
    environment: "vcenter-env"
    master-vip: "XX.XX.XX.193/prefix_len"
    gateway: XX.XX.XX.129
    ingress-hostname: "opshub1.cisco.com"
    username: "cloud-user"
    private-key-file: "cmts.pem"
    nodes:
      - host: "XX.XX.XX.182"
        datastore: "XX.XX.XX.182-datastore1"
        addresses: [ "XX.XX.XX.187", "XX.XX.XX.172", "XX.XX.XX.169", "XX.XX.XX.190" ]

        nics: [ "OpsHub7-Remote-Query" ]
        ops:
          interfaces:
            - addresses: [ "5.202.0.40/24" ]
              routes:
                - {dest: [ "5.225.0.0/16" ], nhop: "5.202.0.1" }
      - host: "XX.XX.XX.176"
        datastore: "XX.XX.XX.176-datastore1"
        addresses: [ "XX.XX.XX.188", "XX.XX.XX.173", "XX.XX.XX.170", "XX.XX.XX.191" ]

        nics: [ "OpsHub7-Remote-Query" ]
        ops:
          interfaces:
            - addresses: [ "5.202.0.41/24" ]
              routes:
                - {dest: [ "5.225.0.0/16" ], nhop: "5.202.0.1" }
      - host: "XX.XX.XX.184"
        datastore: "XX.XX.XX.184-DataStore1"
        addresses: [ "XX.XX.XX.189", "XX.XX.XX.174", "XX.XX.XX.171", "XX.XX.XX.192" ]

        nics: [ "OpsHub7-Remote-Query" ]
        ops:
          interfaces:
            - addresses: [ "5.202.0.42/24" ]
              routes:
                - {dest: [ "5.225.0.0/16" ], nhop: "5.202.0.1" }

```

• Single-Node Operations Hub Configuration

The Single Node Cluster is not supported for production. It is restricted for use at the Lab.

Define the cluster configuration as shown:

```

clusters:
  "opshub-snode":
    type: "opshub"
    environment: "vcenter-env"
    gateway: XX.XX.XX.129
    username: "cloud-user"
    private-key-file: "cmts.pem"
    nodes:
      - host: "XX.XX.XX.139"
        datastore: "XX.XX.XX.139-datastore1"
        addresses: [ "XX.XX.XX.159/prefix_len" ]

```

Deployment Limitations

The following are the deployment limitations in this release:

- IPv6 addressing is not supported.
- The config file must comply to YAML syntax. Not conforming to the syntax might cause crash dumps.
- The configuration file must comply to all mandatory sections and attributes. You might see the autodeploy exit without warnings and errors when mandatory attributes are missing in the configuration file.
- Limited error and exception handling. When an exception or error occurs, you might see detailed crash dumps.
- Single node cluster for Cisco Operations Hub is not supported in production. Single Node Cisco Operations Hub clusters are meant for use at the Lab.

Configure Operations Hub

The Cisco Operations Hub allows you to create and configure users.

This section provides details of how to configure the Cisco Operations Hub and to use the UI and APIs.

Access Operations Hub

You can access the **Operations Hub** home page using the following URL:

`https://{Hostname}`

`Hostname` is the Fully Qualified Domain Name (FQDN) of the Cisco Operations Hub cluster, which is configured using the `ingress-hostname` key of the deployer configuration. When the Cisco Operations Hub cluster is deployed without the `ingress-hostname` key, the format of the `Hostname` is `{vip}.nip.io`, where `vip` is the virtual IP address of the Cisco Operations Hub cluster. You can see a home page similar to the following after you log in.

Create New Users

You can create local users and configure LDAP for external authentication with Active Directory (AD).

API User Roles

Operations Hub supports three user roles based on the HTTP actions:

- api-admin: Allowed http method: GET, POST, PUT, DELETE
- api-editor: Allowed http method: GET, POST, PUT
- api-viewer: Allowed http method: GET

By default, the user, `admin` is already under these three groups.

Configure Local Users

Operations Hub **ops-center** CLI allows an administrator to create new users. Use the following procedure to create a user:

Step 1

Log in to the Operations Hub **ops-center** CLI using the admin user credentials created during the Operations Hub deployment.

The Operations Hub **ops-center** URL is: `https://cli.opshub-data-ops-center.{Hostname}/`

```
product opshub# smiuser show-user username admin
User: admin, Group(s): admin api-admin api-editor api-viewer li-admin, Password Expiration days: 86
```

Step 2

Run the following command to define a new user:

```
smiuser add-user username <username> password <password>
```

Example:

```
product opshub# smiuser add-user username opshubuserA password Abcd123@
message User added
```

```
product opshub# smiuser show-user username opshubuserA
User: opshubuserA, Group(s): opshubuserA, Password Expiration days: -1
```

Step 3

Run the following command to add the new user to one of the API groups:

```
smiuser assign-user-group username <username> groupname <API group name>
```

Example:

```
product opshub# smiuser assign-user-group username testuser groupname api-admin
message User assigned to group successfully
product opshub
```

Configure LDAP

Operations Hub **ops-center** CLI allows the administrator to configure LDAP settings for external authentication with AD (Active Directory).

Step 1 Log into the Operations Hub ops-center CLI using the admin user credentials created during the Operations Hub deployment.

The Operations Hub ops-center URL is: `https://cli.opshub-data-ops-center.{Hostname}/`

Step 2 Configure the LDAP server using the following commands:

```
product opshub# config terminal
Entering configuration mode terminal
product opshub(config)# ldap-security ldap-server-url <URL>
product opshub(config)# ldap-security ldap-username-domain <domain>
product opshub(config)# ldap-security base-dn DC=<example>,DC=com
product opshub(config)# ldap-security ldap-filter userPrincipalName=%s@<domain>.com
product opshub(config)# ldap-security group-attr memberOf
product opshub(config)# end
Uncommitted changes found, commit them? [yes/no/CANCEL] yes
Commit complete.
```

Step 3 Configure the mapping between LDAP groups and API groups:

```
product opshub# config terminal
Entering configuration mode terminal
product opshub(config)# ldap-security group-mapping {ldap group} api-admin
product opshub(config-group-mapping-crdc-docsis/api-admin)# end
Uncommitted changes found, commit them? [yes/no/CANCEL] yes
Commit complete.
```

Using REST APIs

This section explains how you can use REST APIs.

Step 1 Create a user.

Use the procedure from the [Create New Users, on page 33](#) section.

Step 2 Call auth REST API to create token.

Encode the username and password with base 64. Fill the encode output into the Authentication Header.

Example:

```
User: admin
Password: bell
```

```
Get the Base64 under Linux: echo -n 'admin:lab' | base64
Base64 encode output: YWRtaW46bGFi
```

```
curl -X POST "https://{Hostname}/api/auth/v1/token" -H "accept: application/json" -H "authorization:
Basic YWRtaW46bGFi"
```

```
Response code: 201
```

```
Response body
```

```
{
"access_token": "eyJhbGciOiJIUzI1NiIsInR5cCI6IkpXVCJ9.eyJyYb2x1IjoiYXBPWFkKWluIiwic2FsdCI6IiI1ViQ2daamt
IWhd6RUNzS1EiLCJleHAiOiJlNjQ2NTA2MTd9.x7ccHcOn6fLvHc_ajLJxQEY1ftvR1ZaJH9K_YZx1lues",
"refresh_token": "1YYtZqgVhnsnBJgSHbigRzeEaLnWziMpHJKVzghA",
"refresh_token_expire": 1567221017,
```

```
"token_type": "jwt"
}
```

Step 3 With this token, call other REST APIs.

Example:

Call REST API to get the Cisco cnBR list:

```
curl -X GET "https://opshub1.cisco.com/api/manager/v1/cmts" -H "accept: application/json" -H
  "Authorization: Bearer eyJhbGciOiJIUzI1NiIsInR5cCI6IkpXVCJ9.eyJyY2x1IjoiYXBpLWVkbWluIiwic2FsdCI6I1V
  iQ2daamtIWhd6RUNzSlEiLCJleHAiOiJlNjQ2NTA2MTd9.x7ccHcOn6fLvHc_ajLJxQEYlftvR1ZaJH9K_YZx1ues"
```

```
Response code:200
Response body
{
  "cluster_list": [
    {
      "cluster-id": "cnbr1.cisco.com",
      "cmts-name": "test",
      "namespace": "ccmts-infra",
      "ingress-host-name": "cnbr1.cisco.com"
    }
  ]
}
```

Configure TLS Certificate

When Cisco Operations Hub cluster is deployed, self-signed certificate is configured by default. You can replace self-signed certificate with CA signed certificate from Deployer CLI. Use the following commands in the example to configure a CA signed TLS certificate.

```
product opshub# config terminal
Entering configuration mode terminal
product example deployer(config)# clusters {k8s-cluster-name}
product example deployer(config-clusters-*****)# secrets tls opshub-data cert-api-ingress
?
Possible completions:
  certificate  Path to PEM encoded public key certificate.
  private-key  Private key associated with given certificate.
  <cr>
product example deployer(config-clusters-*****)# secrets tls cnbrmanager-data
cert-api-ingress ?
Possible completions:
  certificate  Path to PEM encoded public key certificate.
  private-key  Private key associated with given certificate.
  <cr>
product example deployer(config-clusters-*****)#commit
product example deployer(config-clusters-*****)#exit
```

Configure Cisco cnBR Using Autodeployer

You can complete the Cisco cnBR configuration using the Autodeployer.

Complete the following steps:

Step 1 Prepare Cisco cnBR configuration.

There are three categories of configuration:

- **General Configuration**

The general configuration specifies details of the Cisco cnBR and Cisco Operations Hub clusters.

```
opshub :
  ip : 'xx.xx.xx.xx'           # Operations Hub IP address
  ingress-hostname: '<host.domain>' # Operations Hub ingress hostname - FQDN (Optional: If
the <host.domain> is not available, the default cluster ingress <IPAddress>.nip.io is used.)
  cnbr :
    name : '<name_of_cnbr>'      # Name of the Cisco cnBR cluster to be added to the Operations
Hub
    type : 'MUL_NODES'          # cnBR cluster Type : 'MUL_NODES' Multi-Node cluster is only
option supported.
    ip : 'xx.xx.xx.xx'         # cnBR IP address
    ingress-hostname: '<host.domain>' # cnBR Ingress Hostname - FQDN (Optional: If the
<host.domain> is not available, the default cluster ingress <IPAddress>.nip.io is used.)
    number-of-docsis-node: <x> # Total Number of DOCSIS nodes (Required when Expansion Servers
are used)
```

- **Mandatory Configuration**

The mandatory configuration specifies details for the PTP, BGP, CIN, Wiring, templates (SG and L3) and RPD-list.

Complete the following mandatory configurations:

- **PTP Configuration**

```
ptp :
  v4 :
    domain : <clock-domain>
    master: {'ip':'xx.xx.xx.xx', 'gw':'xx.xx.xx.xx'}
```

- **BGP Agent Configuration**

```
bgpagent :
  asn : <asn>
  max_hops : <max_hops>
  restart-time : <restart_time>
  stale-path-time: <stale_path_time>
  # list of neighbors ( IPv4 and IPv6 )
  neighbors :
    - {'address' : 'xx.xx.xx.xx', 'asn':<asn>}
```

- **CIN Configuration**

```
# Lists of IPv4 and IPv6 gateways. IPv6 is not supported in this release.
cin :
  v4 : [ "xx.xx.xx.xx"
```

- **Wiring Configuration**

```
wiring :
  # Starting IP address for the range to be used by cnBR internal interfaces
  # Make sure the range does not clash with IP addresses of RPD, COPS, and CCAPCORE
  # IP addresses that will be carved out from this pool to assign to the below interfaces
  # PTP, VPP-DP and other interface
```

```

cin-start-ip:
  v4 : 'xx.xx.xx.xx'

# SG peer IP, typically its bgp-neighbor IP address but it could be different
#   dmic-if and relayproxy-if addresses are carved out from the same network
sg-peer:
  v4 : 'xx.xx.xx.xx'
  v6 : 'xxxx::nnn' #Needs dummy value even if IPv6 is not enabled. nnn is <0-255>

# ccapcore IP, specified in the DHCP config, where RPD learn ccapcore from
rphmgr-if:
  v4 : "xx.xx.xx.xx"

# Packet cable interface IP
cmts-cops-if:
  v4 : "xx.xx.xx.xx"

# IP addresses to be used by BGP agents running in cnBR
# AIO needs one and MultiNode needs two as that many instances of bgp agents would be
running in the cluster
bgp-agent-if:
  v4 : ["xx.xx.xx.xx", "xx.xx.xx.xx"]
  v6 : ["xxxx::xxxx", "xxxx::xxxx"] #Needs dummy values even if IPv6 is not enabled.

# CIN Prefix
cin-prefix:
  v4 : <prefix_len>
  v6 : <prefix_len> #Needs dummy value even if IPv6 is not enabled due to known issue

# DC link prefix to be used by CIMC interfaces within cnBR
# v4 and v6 prefixes are mandatory for now due to an internal issue, even if v6 is not
enabled.
#   will have a fix in the next release.
dc-link-prefix:
  v4 : <prefix_len>
  v6 : <prefix_len> #Needs dummy value even if IPv6 is not enabled due to known issue

# VLAN or VXLAN config, whichever is applicable
vlan :
  cnbr-wan-ifname: "<name>/<bay>/<slot>"
  overlay-wan-vlan: <xxxx>
  overlay-cin-vlan: <xxxx>
  overlay-l2vpn-vlan-vlan: <xxxx>
  overlay-l2vpn-mpls-vlan: <xxxx>
vxlan :
  sp-router-wan-ip: "xx.xx.xx.xx"
  cnbr-wan-prefix: <prefix_len>
  cnbr-wan-ip: "xx.xx.xx.xx"
  cnbr-wan-ifname: "<name>/<bay>/<slot>"
  cnbr-loopback-ip: "xx.xx.xx.xx"
  sp-router-loopback-ip: "xx.xx.xx.xx"
  overlay-cin-vni: <cin-vni>
  overlay-l2vpn-mpls-vni: <mpls-vni>
  overlay-l2vpn-vlan-vni: <vlan-vni>
  overlay-wan-vni: <wan-vni>
# MTU used by cnBR SG
mtu : "2450"

```

- VLAN section of the wiring configuration with Link Redundancy enabled:

```

# VLAN config, whichever is applicable
vlan :
  cnbr-wan-ifname: "<name>" # Bond Interface Name
-"BondEthernet0"
  cnbr-wan-bonded-interface1: "<name>/<bay>/<slot>" # 1st Interface Name -

```

```
"FortyGigabitEthernetb/0/0"
  cnbr-wan-bonded-interface2: "<name>/<bay>/<slot>" # 2nd Interface Name -
"FortyGigabitEthernetb/0/1"
  cnbr-wan-bond-mode: "<mode>" # Mode - lacp, roundrobin,
activebackup, xor, broadcast
  cnbr-wan-bond-loadbalance: "<type>" # Load Balance - L2, L34, L23,
RR, BC
  overlay-wan-vlan: <xxxx>
  overlay-cin-vlan: <xxxx>
  overlay-l2vpn-vlan-vlan: <xxxx>
  overlay-l2vpn-mps-vlan: <xxxx>
```

- **Service Group (SG) and RPD List:** Specify the list of RPDs that the Cisco cnBR has to load as RPD-list. File paths are relative to the staging directory or the directory from where you are running autodeploy. Go through [Autodeployer Examples, on page 40](#) for examples on L3 Template, SG Template, and Video Template.

```
templates:
  # List of L3 templates in the {<name>:<file_path>} format
  L3 :
    'L3-1' : '<L3 template1 file>'
    'L3-2' : '<L3 template2 file>'

  # List of SG templates in the {<name>:<file_path>} format
  SG :
    '4x4_SG_Config' : '<SG template1 file>'
    '33x8_SG_Config' : '<SG template2 file>'

  # List of Video Downstream SC QAM templates in the {<name>:<file_path>}
format.
  # Optional parameters: specify only while configuring Video DS SC QAM Service

  Video :
    'NC_Video_Config' : '<Video QAM template1 file>'
    'BC_Video_Config' : '<Video QAM template2 file>'

  # Video QAM Template to Downstream Port Association.
  # Optional parameters: specify only while configuring Video DS SC QAM Service
  video-configs:
    VT0:
      - port: "DS-0"
        groups: ["NC_Video_Config", "BC_Video_Config"]

  # RPD location
  RPD-loc1: &loc1
    region: "<region>"
    city: "<city>"
    neighborhood: "<neighborhood>"
    address: "<address>"
    latitude: <latitude>
    longitude: <longitude>

  # List of RPDs, 'Video_tmpl' is an optional parameter: specify only while
configuring Video DS SC QAM Service
  rpd-list:
    # [ 'rpd-name', 'rpd-mac', 'SG_name', 'SG_tmpl', 'L3_tmpl', 'RPD_location',
'Video_tmpl' ]
    - [ 'RPD-00', 'xx:xx:xx:xx:xx:xx', 'SG00', '33x8_SG_Config', 'L3-1', *loc1,
'VT0' ]
    - [ 'RPD-01', 'xx:xx:xx:xx:xx:xx', 'SG01', '33x8_SG_Config', 'L3-1', *loc1 ]
    - [ 'RPD-02', 'xx:xx:xx:xx:xx:xx', 'SG02', '4x4_SG_Config', 'L3-2', *loc1 ]
```

• Optional Configuration

Choose the optional configurations required. The configuration specifies details for L2VPN, L3VPN, TFTP, PacketCable, RIP, SAV, and PFG:

```
# Specify, if tftpProxy is different from CIN gateway
tftpProxy:
  v4 : ["xx.xx.xx.xx"]
  v6 : ["xx:xx:xx:xx:xx:xx:xx:xx"] #specify, if IPv6 is enabled

# cops interface in wiring config needs to be set to enable this feature.
packetcable :
  enable: 'true'
  max-gate: <value>
  t0: <value>
  t1: <value>
  subscriber: 'false'

l2vpn :
  dot1qvc :
    - {'mac':"xxxx.xxxx.xxxx", 'vlan':<vlan>, 'vpn':"<name>"}
  mplsvc :
    - {'mac':"xxxx.xxxx.xxxx", 'peerip':<peerip>, 'vc': 1, 'vpn':"<name>", 'experimental':0}
  mplsvlansg :
    - {'sg':"xxxx.xxxx.xxxx", 'vlan_max':<vlan_max>, 'vlan_min':0}
  sprstat :
    - {'id':"xxxx.xxxx.xxxx", 'asn':<asn>, 'state':'Up'}

l3vpn:
  - {"name" : "<name>", "vlan" : <vlan>, "vpn" : "<name>"}

rip :
  enable : 'false'
  update-timer : <time in seconds>
  invalid-timer : <time in seconds>
  holddown-timer : <time in seconds>
  passive-mode' : 'false'

sav:
  enable : 'true'
  entries:
    - grp-name : "testSAV"
      prefixes : [ "xx.xx.xx.xx/<prefix_len>" , "xx:xx:xx:xx:xx:xx:<prefix_len>" ]

pfgactive:
{"cm_ds":-1,"cm_us":-1,"host_ds":-1,"host_us":-1,"mta_ds":-1,"mts_us":-1,"stb_ds":-1,"stb_us":-1,"ps_ds":-1,"ps_us":-1}

pfg:
  - id : 1
    rules :
      - {"isPermit":0, "isIpv6":0, "srcIp":"'xx.xx.xx.xx/<prefix_len>',
        "dstIp":"'xx.xxx.xx.xx/<prefix_len>"}
```

Step 2 Apply the configuration.

Run the deploy command to apply the configuration and monitor the status through the Cisco Operations Hub or CLI. You can update the configuration file to add, delete, or update the SGs or RPDs and rerun the command to apply the updated configuration.

```
$ ./deploy -c cnbr_config.yaml
```

The configuration file must strictly conform to YAML syntax, to avoid any crash dumps.

Note To remove Video Downstream SC QAM Service ('Video_tmpl') from specific RPDs, use the -f option to force the update. Without the -f option, the Cisco cnBR ignores this change. The -f option forces the Cisco cnBR to delete and radd the RPD.

Autodeployer Examples

- Configuration file

```

opshub : 'xx.xx.xx.xx'
cnbr :
  name : 'cnbr001'
  type : 'MUL_NODES'
  ip   : 'xx.xx.xx.xx'

Autodeployer Limitations

The Autodeployer has the following limitations:

- Rerunning the deploy command reapplies all configurations, except the wiring configuration. The wiring configuration update is not supported.
- When updating the SG or RPD, the existing service groups are deleted and the SG or RPD is then added back with the updated configuration.
- Placeholder values for IPv6 must be provided, even if IPv6 is not supported. Values for `sg-peer`, `bgp-agent-if`, `cin-prefix`, and `dc-link-prefix` must be as specified in the given example.
- The configuration file must specify all mandatory sections and attributes. You may see the autodeploy exit without warnings and errors when mandatory attributes are missing in the configuration file.

- Cisco cnBR has limited error and exception handling. Review the detailed crash dumps when an exception or error occurs.

Configure cnBR using cnBR Manager

You can complete the Cisco cnBR configuration using the cnBR Manager application in Cisco Operations Hub.

Add Cisco cnBR to cnBR Manager

To add Cisco cnBR cores using the cnBR Manager application in Cisco Operations Hub, complete the following steps:

-
- Step 1** From the Cisco Operations Hub, click the Cisco Operations Hub main menu button (.
- Step 2** Choose **cnBR Manager > Core Management** to open the **cnBR Clusters** page.
- Step 3** Click **ADD** to open the **Add cnBR Cluster** page.
- Step 4** Provide a unique name to the Cisco cnBR cluster, a namespace, and the ingress-host-name.
For example:
- ```
cnBR Cluster Name: cnbr-demo
Namespace: ccmts-infra
Ingress-host-name: cnbr1.cisco.com
```
- Step 5** Enter the Cisco cnBR username and password.
- Step 6** Click **ADD**.
- 

### Apply Global Configuration to cnBR

Complete the following steps to configure Wiring, BGP Agent, PTP, and CIN:

- 
- Step 1** Configure Wiring.
- On the Cisco Operations Hub, click the Cisco Operations Hub main menu button.
  - Choose **cnBR Manager > Core Management** to open the **cnBR Clusters** page.
  - Select a Cisco cnBR cluster.

We recommend that you use the `Code` mode to configure wiring.

Figure 10: cnBR Cluster Configuration Page

521364

- d) Click **SAVE** to apply configuration to Cisco cnBR.

For example:

```
{
 "cluster-type": "MUL_NODES",
 "l3-info": {
 "bgp-agent-if-ipv4": [
 "208.208.208.102", <---bgp address
 "208.208.208.103"
],
 "bgp-agent-if-ipv6": [

 "3.208.1.20",
 "3.208.1.21",
 "3.208.1.22",
 "3.208.1.23",
 "3.208.1.24"
],
],
 "vpp-dp-rpd-if-ipv6": []
},
"mtu": 2450, <---Recommend value is 2450
"overlay-info": {
 "overlay-type": "vlan",
 "vlan-info": {
 "cnbr-wan-ifname": "FortyGigabitEthernetb/0/0",
 "overlay-cin-vlan": 1182, <---This vlan id should be same as vlan id in SP router

 "overlay-l2vpn-mpls-vlan": 1183,
 "overlay-l2vpn-vlan-vlan": 1184,
 "overlay-wan-vlan": 1181 <---This vlan id should be same as vlan id in SP router
 }
}
}
}

```

**Step 2** Configure BGP Agent.

- a) Use the `Code` mode to configure BGP Agent.
- b) Click **SAVE** to apply configuration to Cisco cnBR.

For example:

```

{
 "asNumber": 65001,
 "ebgpMultihop": 255,
 "gracefulRestart": {
 "enable": true,
 "restartTime": 120,
 "stalePathTime": 360
 },
 "ifname": "bgp",
 "neighbors": [
 {
 "address": "208.208.208.1", <----IP in SP Router. Same IP with SG Peer.
 "asNumber": 65000
 },
 {
 "address": "2001:208:208:208::1",
 "asNumber": 65000
 }
]
}

```

**Step 3** Configure PTP.

- a) Use the `Code` mode to configure PTP.
- b) Click **SAVE** to apply configuration to Cisco cnBR.

For example:

```

PTP:
{
 "PtpDomain": 44,
 "PtpGwIp": "3.208.1.2",
 "PtpMasterIp": "3.158.185.51"
}

```

**Step 4** Configure CIN.

If RPD and RPHYMAN are in different networks, you must configure CIN. Otherwise, choose to ignore this step.

- a) Use the `Code` mode to configure CIN.

For example:

```

{
 "CinGwIp": "3.208.1.2"
}

```

## Add Service Group Configuration to cnBR

Complete the following steps to add Service Group (SG) template and L3 template:

- Step 1** On the Cisco Operations Hub, click the Cisco Operations Hub main menu button.
- Step 2** Choose **cnBR Manager** > **Profiles & Templates** to open the **Templates and Profiles** page.
- Step 3** Click **Add Template** on the left pane and choose **SG Template** as the template type.

**Step 4** Provide an appropriate template Name and Description. Click **Next**.

**Step 5** On the **Add SG Template** page, choose to ignore the profile changes. Click **EXPERT**.

**Figure 11: Add Service Group Template Page**

The screenshot shows the 'Add SG Template' page in the Cisco Operations Hub. The page title is 'Add SG Template' and the breadcrumb is 'cnBR Manager - Profiles & Templates'. The left sidebar has 'Add Template' selected. The main form has the following fields:

- Name: TEST
- Description: TEST
- DS Profile: ds\_profile
- US Profile: (empty)
- MAC Domain Profile: (empty)
- Modulation Profile: (empty)
- RPD Profile: (empty)
- RPD PTP Profile: rpd ptp pr

At the bottom, there are three buttons: 'ADD PROFILE', 'EXPERT', and 'SAVE'. The 'EXPERT' button is highlighted in blue.

521366

**Step 6** Provide the SG related configuration and click **SAVE**.

For example:

```
{

 "sgPeerIpv6": "2001:208:208:208::1/64"
}

```

is same <-----IP in SP Router. SG Peer IP and BGP Peer IP

**Step 11** Click the Cisco Operations Hub main menu button.

**Step 12** Choose **cnBR Manager > Remote PHY Device Management** to open the **RPD Overview** page.

**Step 13** Execute **RPD Add** auto-mop to add RPD one by one.

- a) Click **Add RPD**. Add the RPDs, one by one.
- b) Set the target by providing all RPD related information.
- c) Ensure that all **Pre-RPD-Add Checklist** conditions are ticked. Check the **Please confirm RPD has been connected physically and start RPD config adding** checkbox.
- d) Click **Next Step**.

Wait for the RPD Add progress wizard to complete.

- e) To save time, you can alternatively choose to add another RPD during the **Post-check Progress**.

## Step 14

Add consecutive RPDs to Cisco cnBR.

## View RPD and Modem Status

You can view the RPD and modem status using Grafana.

To check the status of RPDs and CMs, complete the following step:

### Step 1

From the Cisco Operations Hub, click the Cisco Operations Hub main menu button.

### Step 2

Choose **cnBR Manager > Metrics & Dashboards** to open the **Metrics** home page.

### Step 3

Click **Home** on the top left of the **Metrics** home page to bring up the dashboard search box.

### Step 4

Search for cnBR Cluster by typing **cnBR Cluster** in the **Search dashboards by name** field.

**Figure 12: RPD and Modem Status Dashboard**

# Cisco cnBR Service Resiliency

The Cisco cnBR supports service resiliency that tolerates software and hardware failures. It can dynamically balance DOCSIS service workloads among the micro service instances and DOCSIS nodes in the Cisco cnBR cluster. When a single micro service instance or node fails, to minimize service interruption, the system reassigns the affected workloads to suitable resources automatically.

## Node Failure Recovery

Table 9: Feature History

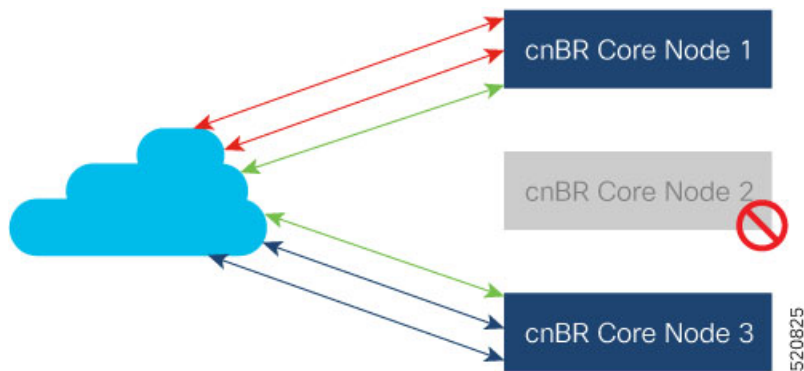

| Feature Name                            | Release Information | Feature Description                                                                                                                                                                                                                                                                     |
|-----------------------------------------|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Resiliency Support on Expansion Servers | Cisco cnBR 21.1     | This feature supports service resiliency on two expansion servers. Thus, all five servers, that is three core servers and two expansion servers, are covered by service resiliency functionality. With this feature enabled, less DOCSIS services are affected in case of node failure. |

In Cisco cnBR, all micro service instances, which provide DOCSIS services, are organized into a global resource pool. The system manages this resource pool and assigns workloads to micro service instances. When you add a new RPD into the cluster, the system chooses a proper node and assigns the newly increased workloads to the micro service instances running on the chosen node. In the following example, the system assigns the workloads of multiple RPDs to multiple nodes evenly.

When a node fails, the system moves the workloads from the failed node to healthy nodes that have sufficient capacity to accept more workloads.

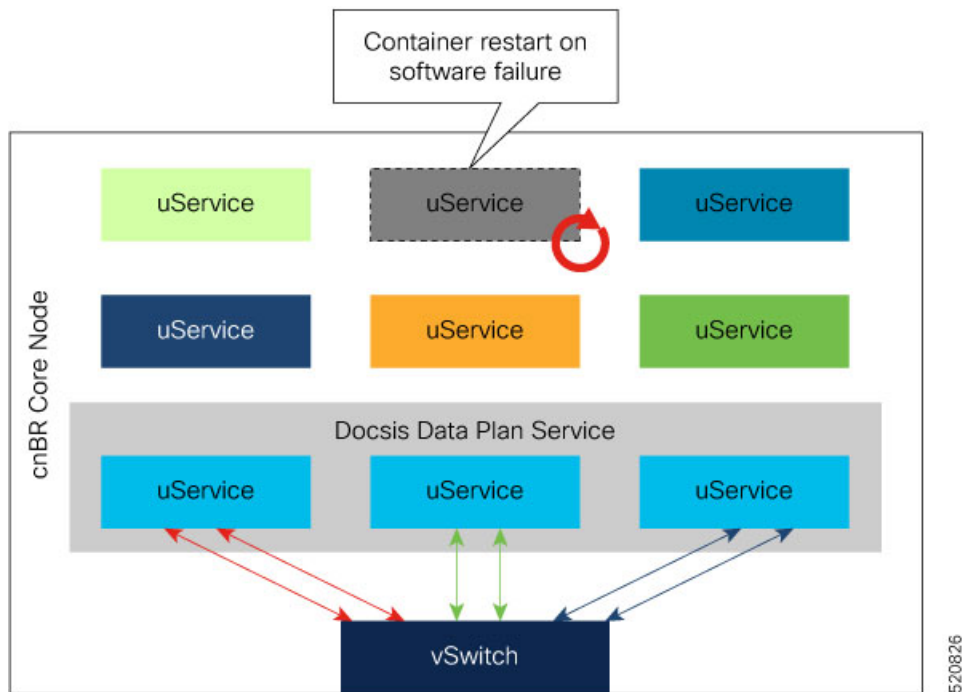

Therefore, the healthy nodes in the cluster take over the workloads from the failed node. After the failed node recovers, it returns to the resource pool and the system can assign new workloads to it. If the available capacity on the healthy node is not enough, the system moves as many workloads as possible until all resources are exhausted. The remaining workloads stay on the failed node; they are recovered after the node is recovered.

**Node Failure Recovery with Expansion Servers**

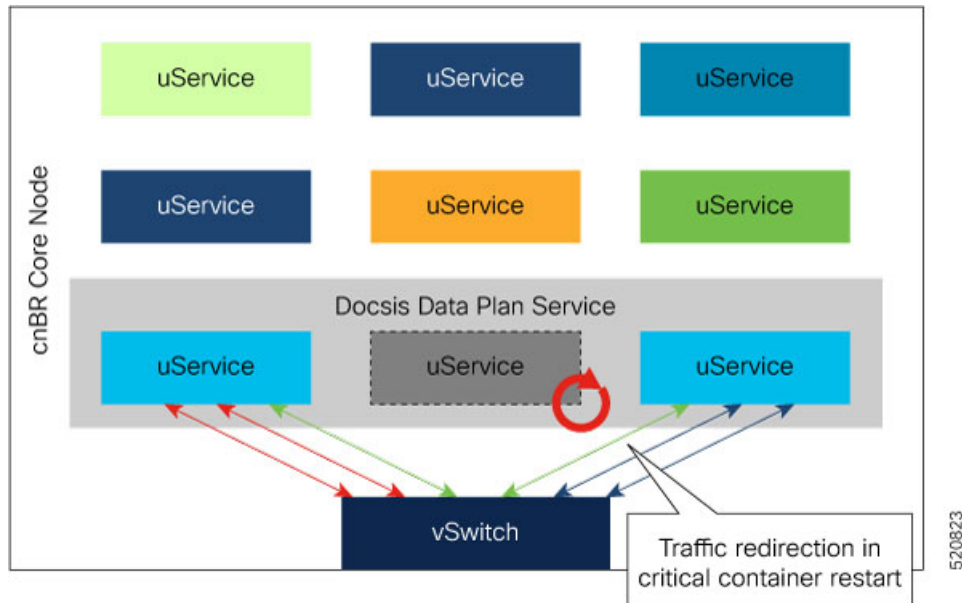

Cisco cnBR supports node failure recovery with the deployment of expansion servers. All service instances, which provide DOCSIS services, including service instances running on expansion servers, are treated in the same way. This allows for ease of scale without loss of node resiliency functionality.

**Software Failure Recovery**

In addition to node resiliency, the containerized micro services are inherently tolerant to service software failures. If a micro service instance fails, it can restart itself quickly without interrupting the overall service.

Container restart may take a few seconds; it is good enough for control plane and management services. When a container in critical services such as data plane fails to minimize the traffic interruption time, the system redirects DOCSIS traffic to other instances with free service group capacity within the same node.

## Configure Service Resiliency

Service resiliency is always enabled in Cisco cnBR cluster.

The system constantly monitors the resource (nodes and service instances) status. When there is a failure, the system automatically triggers workload reassignment. This process is transparent to the subscribers.

Workload in Cisco cnBR is measured in the unit of service group. Service groups are load balanced across DOCSIS nodes when you add them into a Cisco cnBR cluster. Make sure that there are enough capacities reserved in a Cisco cnBR cluster for resiliency.

In 20.2 release, each DOCSIS node can support up to 20 service groups. In order to tolerate one node failure without service interruption, we recommend that you do not provision more than 40 service groups for a three DOCSIS node Cisco cnBR cluster. Then, when a single DOCSIS node fails, there are enough capacities reserved for service resiliency.

## Monitor and Troubleshoot

In cnBR HA Overview dashboard, you can check the overall High Availability (HA) state of the cluster.

The SG Switchovers chart displays the total DOCSIS service switchover event count in the Cisco cnBR cluster. The counters increase when new service switchover occurs. In this chart:

- Success: The service switchover is complete without any issues.
- Failed: Some or all of the services failed to move workload during the service switchover. If this counter increases, click the number to check the error in the Service Group Switchover History dashboard.

Cisco cnBR Applications table lists the HA state of all the Cisco cnBR application services.

If a new switchover event occurred, access the Service Group Resiliency History dashboard to review detailed information for troubleshooting.

The SG Resiliency History diagram visualizes all historical DOCSIS service switchovers and SG mapping changes.

Click an event in the timeline to display the event details in the SG Resiliency Detail panel.

## Cisco cnBR Link Redundancy

**Table 10: Feature History**

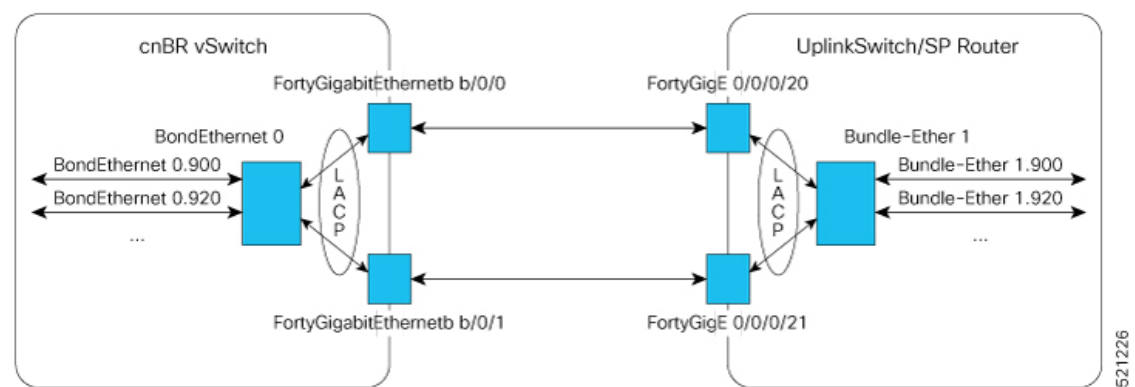

| Feature Name               | Release Information | Feature Description                                                                                                                                                                                                                                                                                                                  |
|----------------------------|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Cisco cnBR link redundancy | Cisco cnBR 20.3     | Link redundancy protects the connection between a Cisco cnBR and a Service Provider (SP) router. When you connect a Cisco cnBR to an SP router (or uplink switch) using a 40G interface, a single link failure causes the whole service to fail. With this feature, you can enable another 40G interface to provide link redundancy. |

Link redundancy protects the connection between a Cisco cnBR and a Service Provider (SP) router. When you connect a Cisco cnBR to an SP router (or uplink switch) using a 40G interface, a single link failure causes the whole service to fail. With this feature, you can enable another 40G interface to provide link-redundancy.

Link redundancy is based on the Link Aggregation Control Protocol (LACP). LACP is an 802.3ad standard. The vSwitch/Vector Packet Processor (VPP) in the Cisco cnBR provides the LACP function. The VPP has the bond interface to support link-redundancy. Bonding combines or joins two or more network interfaces together into a single logical interface. The Cisco cnBR forwards traffic over all available network interfaces of the aggregated link. Therefore, traffic can flow on the available links if one of the links within an aggregated link fails.

The following figure shows an example of a link redundancy setup between a Cisco cnBR and an SP router (or uplink switch)

**Figure 13: Link Redundancy Wiring Topology in VLAN Mode**

#### Note

- "bundle-ether" on router, "port-channel" on switch, and "bond-ether" are all terms to describe the bundling of two or more ports to form one logical Ethernet link.
- Create all subinterfaces on the bond interface.
- On the Cisco cnBR, an LACP bonding group supports a maximum of 2 members. The two members must come from the same Ethernet network-adapter card. The officially supported adapter card is Intel X710 dual-port 40G QSPF+ NIC. The Cisco product ID for this adapter card is UCSC-PCIE-ID40GF.

## Configure Link Redundancy

On Cisco cnBR, use Day0 and Day1 configuration to enable link-redundancy.

### Day0 Configuration

Add a second PCI device in the Day0 deployment configuration. You can configure the "pci\_device" parameter as one or more PCI device entries.

See [Deployment Example Configurations, on page 28](#) for sample configurations.

### Day1 Configuration

Use the Day1 deployment configuration to configure the bond interface.

Use the following five parameters to configure the bond interface for link-redundancy.

- cnbr-wan-ifname
- cnbr-wan-bonded-interface1
- cnbr-wan-bonded-interface2
- cnbr-wan-bond-mode
- cnbr-wan-bond-loadbalance

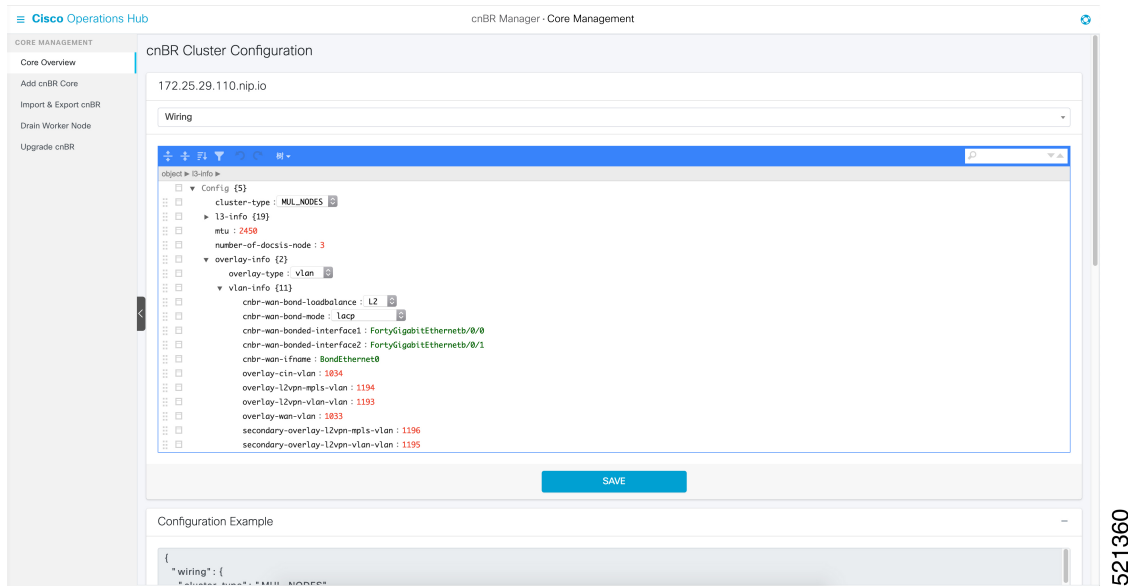

These parameters are under the **wiring > overlay-info > vlan-info/vxlan-info**. "cnbr-wan-ifname" is a mandatory parameter in the wiring overlay configuration. The four bond-parameters are optional. To configure link-redundancy, define the "cnbr-wan-ifname" as "BondEthernet0" and configure the four bond-parameters. The following example shows a typical configuration:

```
wiring:
...
vlan :
 cnbr-wan-ifname: "BondEthernet0"
 cnbr-wan-bonded-interface1: "FortyGigabitEthernetb/0/0"
 cnbr-wan-bonded-interface2: "FortyGigabitEthernetb/0/1"
 cnbr-wan-bond-mode: "lacp"
 cnbr-wan-bond-loadbalance: "L2"
 overlay-cin-vlan: 920
 overlay-l2vpn-mpls-vlan: 2003
 overlay-l2vpn-vlan-vlan: 2202
 overlay-wan-vlan: 900
mtu : "2450"
```

## Cisco cnBR Configuration

To add the bond interface, Use the cnBR Manager to configure the wiring.

- 
- Step 1** From the Cisco Operations Hub, click the Cisco Operations Hub main menu button.
  - Step 2** Choose **cnBR Manager > Core Management** to open the **cnBR Clusters** page.
  - Step 3** Choose the target Cisco cnBR Cluster.
  - Step 4** Choose Wiring from the drop-down list.

**Step 5** Update the configuration and click **SAVE**.

## Cisco cnBR SP Router Redundancy

**Table 11: Feature History**

| Feature Name                    | Release Information | Feature Description                                                                                                                                                                                         |
|---------------------------------|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Cisco cnBR SP Router Redundancy | Cisco cnBR 20.4     | Enables the Cisco cnBR to set up redundant connections to different SP routers. This redundancy ensures that a single link or SP router failure does not disrupt traffic flow for the CIN and WAN networks. |

Cisco cnBR bridges its internal network to the WAN and CIN networks. This bridging uses various data channels running through the provider network via the SP router. To enable high availability, the Cisco cnBR can set up redundant connections to different SP routers. This redundancy ensures that a single link or SP router failure does not disrupt the network traffic flow for the CIN and WAN networks.

You can configure redundant SP routers that the Cisco cnBR connects to, to operate in active/active or active/standby mode.

The following figure shows an example of SP router redundancy setup:

Figure 14: SP Router Redundancy Setup

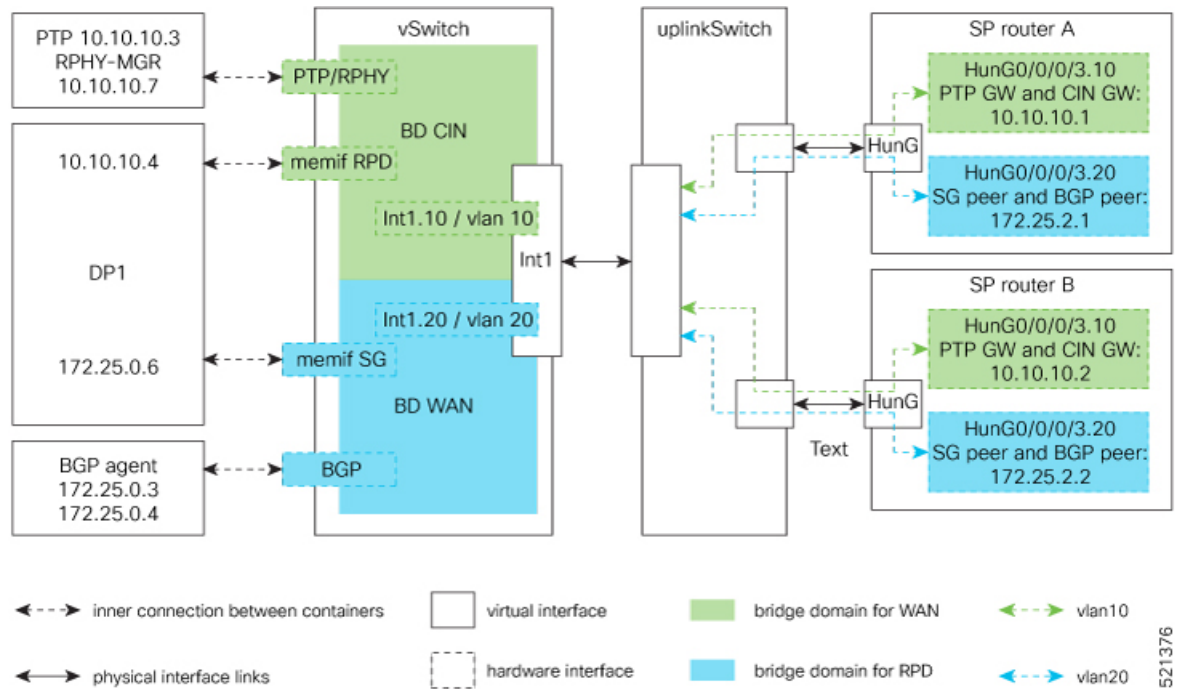

Figure 15:

**Note** In VLAN mode, SP router A and SP router B are in the same VLAN. In the vln10 for CIN and vln20 for WAN in the preceding figure.

**Note** Connect each UCS server to an uplink switch.

## Configure SP Router Redundancy

The BGP agent and SP Router redundancy mode configurations are necessary to enable SP Router redundancy. The following configuration examples show sample BGP agent, SP Router redundancy configurations. Typically, these configurations are part of the Day1 operation.

### BGP Agent Configuration

For bgpagent neighbors, configure BGP peers of both SP routers. The following example shows a typical configuration:

```
bgpagent:
 asn: 65001
 max_hops: 1
 restart-time: 120
 stale-path-time: 360
 neighbors:
```

```

- {'address': '172.25.200.1', 'asn':65000}
- {'address': '2001:DB8:200:200:200::1', 'asn':65000}
- {'address': '172.25.200.254', 'asn':65000}
- {'address': '2001:DB8:200:200:200::254', 'asn':65000}

```

### SP Router Redundancy Configuration

The following example shows a typical configuration. "spr" in the following configuration refers to SP router.

```

spr:
 sp-router-redundancy-mode : "active-active"
 sp-routers :
 - {'bgp-peer' : '172.25.200.1', "sg-peer": "172.25.200.1", "router-id": "10.1.1.1",
 "cin-gateway": "10.40.14.3", "ptp-gateway": "10.40.14.3"}
 - {'bgp-peer' : '2001:DB8:200:200:200::1', "sg-peer": "2001:DB8:200:200:200::1", "router-id":
 "10.1.1.1", "cin-gateway": "2001:DB8:10:40:14::3", "ptp-gateway": "2001:DB8:10:40:14::3"}
 - {'bgp-peer' : '172.25.200.254', "sg-peer": "172.25.200.254", "router-id": "20.2.2.2",
 "cin-gateway": "10.40.14.254", "ptp-gateway": "10.40.14.254"}
 - {'bgp-peer' : '2001:DB8:200:200:200::254', "sg-peer": "2001:DB8:200:200:200::254",
 "router-id": "20.2.2.2", "cin-gateway": "2001:DB8:10:40:14::254", "ptp-gateway":
 "2001:DB8:10:40:14::254"}

```

To configure SP router redundancy for l2vpn, define the "secondary-overlay-l2vpn-vlan-vlan" and "secondary-overlay-l2vpn-mpls-vlan" for the second SP router. The following example shows a typical configuration:

```

wiring :
 .
 .
 .
 vlan :
 cnbr-wan-ifname: "FortyGigabitEthernetb/0/0"
 overlay-wan-vlan: 20
 overlay-cin-vlan: 10
 overlay-l2vpn-vlan-vlan: 202
 overlay-l2vpn-mpls-vlan: 203
 secondary-overlay-l2vpn-vlan-vlan: 204
 secondary-overlay-l2vpn-mpls-vlan: 205

```

## Configure Cisco cnBR SP Router Redundancy Using cnBR Manager

Use the cnBR Manager to configure the bgpagent, spr, and wiring.

- 
- Step 1** Log in to the Cisco Operations Hub.
  - Step 2** From the Cisco Operations Hub main menu, choose **cnBR Manager > Core Management**.
  - Step 3** Select the target cnBR Cluster.
  - Step 4** Select **BGP Agent** from the drop-down list.
  - Step 5** Update the configuration and click **SAVE**.
  - Step 6** Select **SP Router** from the drop-down list.
  - Step 7** Update the configuration and click **SAVE**.
  - Step 8** Select **Wiring** from the drop-down list.
  - Step 9** Update the configuration and click **SAVE**.
-

# Smart Licensing

Table 12: Feature History

| Feature Name    | Release Information | Feature Description                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------------|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Smart Licensing | Cisco cnBR 21.1     | The Smart Licensing feature is a standardized licensing platform that simplifies the Cisco software experience. Cisco Smart Licensing is a new, flexible way of licensing to buy, deploy, track, and renew Cisco software. With Smart Licensing, you can configure, activate, and register your device. Smart Licensing establishes a pool of software licenses or entitlements that are used across your entire enterprise in a flexible and automated manner. |

Cisco Smart Licensing is a new, flexible way of licensing to buy, deploy, track, and renew Cisco software. With Smart Licensing, you can configure, activate, and register your device. Smart Licensing establishes a pool of software licenses or entitlements that are used across your entire enterprise in a flexible and automated manner.

The following topics provides an overview of the Cisco Smart Licensing client feature. You can also go through the several utilities and processes that are required to complete the registration and authorization.

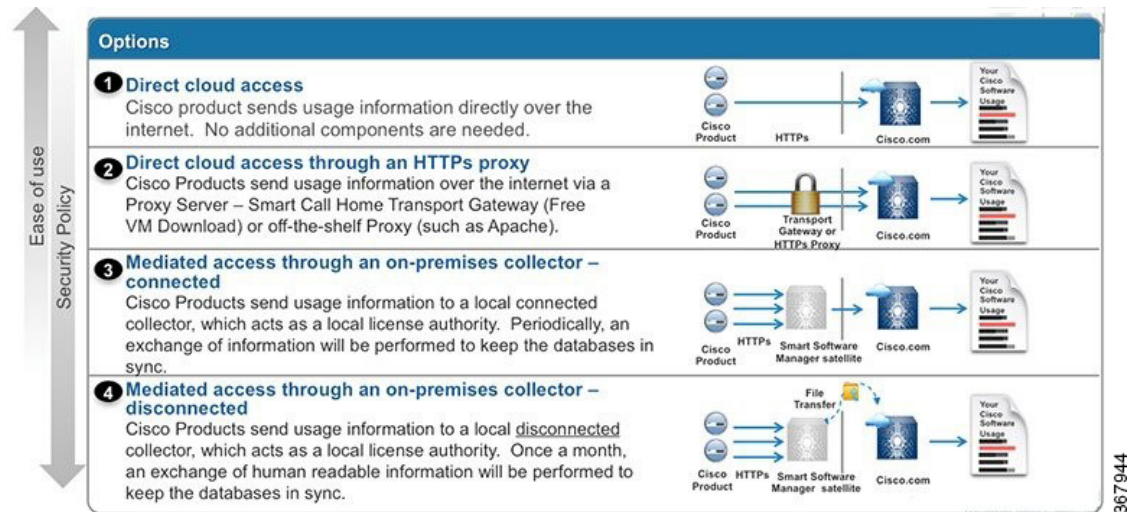

## Prerequisites for Smart Licensing

To enable Smart Licensing on Cisco cnBR, ensure that you have the following components in place:

- Access to Cisco Smart Software Manager (CSSM)
- Smart Account (SA) and Virtual Account (VA). Go through the [Create a Smart Account](#) step.
- Smart Agent running on the device (cnBR)
- Smart Call Home (Optional)
- Smart Software Satellite (Optional)

## Smart Licensing Deployment Models

You have choice of four options that are available for deploying the Smart Licensing.

The deployment options are listed from the easiest, to the most secure one:

- 1. Direct cloud access:** This deployment option allows you to transfer usage over the internet to the cloud server, directly from the devices to the cloud via HTTPs.
- 2. Direct cloud access through a HTTPs proxy:** This option allows you to transfer files directly over the internet to the cloud server through a HTTPs proxy. You can either use the *Smart Call Home Transport Gateway* or use a HTTPs proxy such as Apache.
- 3. Mediated access through an on-premises collector-connected:** This deployment option uses the *Cisco Smart Software Satellite* as an internal collection device. The Cisco Smart Software Satellite is available at the customer end, and periodically transmits the information to the cloud using periodic network synchronization. In this deployment option, the only system or database transferring information to the cloud is the Satellite. You can thus control what is included in the collector database, which provides greater security.
- 4. Mediated access through an on-premises collector-disconnected:** This is the most secure deployment option, and uses the *Cisco Smart Software Satellite*. The Cisco Smart Software Satellite only transfers the collected files using manual synchronization (at least once a month). In this option, the system is not directly connected to the cloud. An *air gap* exists between your network and the Cisco cloud.

## cnBR License Model

Cisco cnBR offers a three-tier license model that is based on the usage number of channels that are configured per Service Group (SG). You need at least one of these three licenses to run Cisco cnBR beyond the evaluation period of 90 days. You also need one basic SMI license to run the basic software infrastructure per cluster.

Cisco cnBR offers a three-tier license model:

- **Essential:** Essential is the lowest tier license which enables Cisco cnBR. Essential is used when the number of channels per Service Group is less than or equal to 48, and number of Service Groups with channels greater than 48 does not exceed 5% of total Service Groups.
- **Advantage:** Advantage is the middle tier license which enables Cisco cnBR. Advantage is used when the number of channels per Service Group is less than or equal to 80, and the number of Service Groups with channels greater than 80 does not exceed 5% of total Service Groups.

- **Primier:** Premier is the highest tier license which enables Cisco cnBR with no restrictions.

Every license has two entitlements. The entitlement types are the right-to-use (RTU) and Software Innovation Access (SIA). You must have an equal number of licenses in both RTU and SIA. Entitlements are configured automatically by Cisco cnBR as per the criteria show in the following table:

**Table 13: Cisco cnBR Entitlements and Required Licenses**

| Entitlement Type | Entitlement Name | Channels/SG(N)   | Criteria                          | Licenses Required |
|------------------|------------------|------------------|-----------------------------------|-------------------|
| Essential RTU    | CNBR_ESS_RTU     | $N \leq 48$      | Less than 5% of SGs have $N < 80$ | 1 per Subscriber  |
| Essential SIA    | CNBR_ESS_SIA     | $N \leq 48$      | Less than 5% of SGs have $N < 80$ | 1 per Subscriber  |
| Advantage RTU    | CNBR_ADV_RTU     | $48 < N \leq 80$ | Less than 5% of SGs have $N > 80$ | 1 per Subscriber  |
| Advantage SIA    | CNBR_ADV_SIA     | $48 < N \leq 80$ | Less than 5% of SGs have $N > 80$ | 1 per Subscriber  |
| Premier RTU      | CNBR_PRE_RTU     | $N > 80$         | More than 5% of SGs have $N > 80$ | 1 per Subscriber  |
| Premier SIA      | CNBR_PRE_SIA     | $N > 80$         | More than 5% of SGs have $N > 80$ | 1 per Subscriber  |
| Basic SMI RTU    | CNBR_SMI_BS_RTU  | NA               | 1 per Cluster                     | 1 per Cluster     |
| Basic SMI SIA    | CNBR_SMI_BS_SIA  | NA               | 1 per Cluster                     | 1 per Cluster     |

When you exceed the usage of lower tier licenses, Cisco Smart Software Manager (CSSM) tries to borrow and consume license from the higher tier to keep Cisco cnBR in compliance mode. Noncompliance is reported if there is no license available in the higher tiers.

Cisco cnBR license requirements are based on the usage of channels per Service Groups and the number of subscribers.

## Configure Smart License

Go through the following topics to configure the Smart License with Cisco cnBR.

### Configure cnBR Entitlement

Cisco cnBR entitlement is configured to Essential by default.

---

Cisco cnBR provides a config CLI to manually configure the entitlements. Use the following CLI:

```
Router# conf
Entering configuration mode terminal
Router# cmts-entitlements
Possible completions:
```

```
count Entitlement/Subscriber Count
name Entitlement Name
Router# cmts-entitlements name CNBR_
Possible completions:
 CNBR_ADVANTAGE cnBR Advantage, allows upto 80 channels per SG
 CNBR_ESSENTIAL cnBR Essential, allows upto 48 channels per SG
 CNBR_PREMIER cnBR Premier, allows unlimited channels per SG
Router# cmts-entitlements name CNBR_ADVANTAGE count 54
```

---

## Configure CSSM URL on Device

You must configure Cisco Smart Software Manager (CSSM) URL on the device before configuring Smart Licensing.

Complete the following step to configure CSSM:

---

Run the following CLI

```
Router# conf
Entering configuration mode terminal
cmts(config)# license smart url <CSSM URL>
```

---

## Enable Smart License

Smart Licensing is enabled by default on Cisco cnBR.

Complete the following steps to get started with Smart Licensing:

- 
- Step 1** Ensure that the [Prerequisites for Smart Licensing](#) are met.
  - Step 2** [Configure Call Home](#).
  - Step 3** [Generate a New Token from CSSM, on page 81](#).
  - Step 4** [Register a Device Using Token, on page 82](#).
  - Step 5** In case of Satellite deployments under call-home profile, remove the default destination CSSM production URL and configure the satellite destination URL.
- 

## Device Registration

Go through the following topics to generate a token from the Cisco Smart Software Manager (CSSM) and register your device.

### Generate a New Token from CSSM

Tokens are generated to register a new product instance to the virtual account. Go through the following steps to generate a new token from the Cisco Smart Software Manager (CSSM).

- Step 1** Log in to CSSM at <https://software.cisco.com/>. Ensure that you use a username and password that is provided by Cisco.
- Step 2** Click **Inventory**.
- Step 3** Select your virtual account from the Virtual Account drop-down list.
- Step 4** Click **General > New Token**.

The screenshot shows the Cisco Software Central interface for Smart Software Licensing. The page title is 'Smart Software Licensing'. The navigation menu includes Alerts, Inventory, License Conversion, Reports, Preferences, Satellites, and Activity. The current virtual account is 'Virtual Account 1'. The 'General' tab is selected, showing details for the virtual account and a section for 'Product Instance Registration Tokens'. A 'New Token...' button is visible, and a table lists two existing tokens, both of which are expired.

| Token                        | Expiration Date | Description | Export-Controlled | Created By | Actions |
|------------------------------|-----------------|-------------|-------------------|------------|---------|
| ZjgxNzdjYjctOVRhMC00M2I0L... | Expired         | Token 1     | Allowed           | User 1     | Actions |
| ZTg2MjBjMzUIN2U0Ni00NDkL...  | Expired         |             | Allowed           | User 1     | Actions |

521547

- Step 5** Create a registration token. Provide a token description. Specify the number of days that the token must be active.
- Step 6** Switch the Export-Controlled functionality to *Allow* for the products registered with this token.
- Step 7** Click **Create Token**. After the token is creation, click **Copy** to copy the newly created token.
- Step 8** [Register a Device Using Token, on page 82](#).

## Register a Device Using Token

Complete the following step to register the device using the token.

Run the following command to complete the Smart License configuration:

```
#license smart register idtoken
```

You must use the token value you have got from step [Generate a New Token from CSSM, on page 81](#) for *idtoken*.

On successful registration, the device displays the *Registered* status and receives an identity certificate. The certificate is saved to your device, and is automatically used for all future communication with Cisco.

An error log is generated if the registration fails. Following is an example of a preregistered instance:

```
Router# show license all

Router#
```

## Specific License Reservation

Specific License Reservation (SLR) is a Smart Licensing functionality that enables you to deploy a software license on a device without communicating usage information to Cisco. SLR allows you to reserve a license for your product instance from the Cisco Smart Software Manager (CSSM). This feature is used in secure networks.

To create an SLR, complete the following steps:

---

**Step 1** Generate the reservation request code on the device:

```
Router# license smart reservation request
reservation-request-code CB-ZCNBR:IP4D62A-HRFCTOY-BfCjVThKq-03
Router#
Message from confd-api-manager at 2021-03-25 03:44:13...
Global license change NotifyReservationInProgress reason code Success - Successful.

Router# show license reservation

Smart Licensing is ENABLED
License Reservation is ENABLED
RESERVATION IN PROGRESS
Request Code:CB-ZCNBR:IP4D62A-HRFCTOY-BfCjVThKq-03
```

- Step 2** Log in to Cisco Smart Software Manager at <https://software.cisco.com/>. You must log into the portal using a username and password that is provided by Cisco.
- Step 3** Click **Inventory**.
- Step 4** Select your virtual account from the Virtual Account drop-down list.
- Step 5** Select SLR entitlement.
- Step 6** Click **Licenses > License Reservation**.
- Step 7** Provide a token description. Specify the number of licenses to be reserved for every entitlement.
- Step 8** Click **Create Token**. After the token is created, click **Copy** to copy the newly created token.
- Step 9** Install the reservation key on the device to enable SLR as shown:

```

Router# license smart reservation install key "<key>"
Router#
Message from confd-api-manager at 2021-03-25 04:26:18...

## CHAPTER 3

# Cisco Cloud Native Broadband Router Service Configuration and Monitoring

---

Cisco cnBR virtualizes all hardware-based services, provides a cloud-native design, and offers a variety of features as microservices. You can quickly develop, test, and deploy new services or update features and functions without any downtime.

- [Network Services, on page 91](#)
- [DOCSIS, on page 126](#)
- [Voice, on page 153](#)
- [Video Services, on page 163](#)
- [Traffic Management, on page 166](#)
- [Enabling Security, on page 180](#)

## Network Services

Cisco cnBR empowers you to create a number of easily composable, scalable, and resilient network services.

### DHCP Relay Service

Cisco cnBR acts as a Dynamic Host Configuration Protocol (DHCP) relay agent to implement features such as DHCP relay, Lease Query (LQ), IPv6 Prefix Delegation (PD), and to provision static IP addresses for subscribers by using source address verification (SAV).

#### DHCP Relay

When the Cisco cnBR acts as a relay agent, it forwards requests and replies between clients and servers when they are not on the same physical subnet. Relay agent forwarding is different from normal IP router forwarding. In normal IP router forwarding, IP datagrams are forwarded between networks transparently. However, in relay agent forwarding, relay agent receives a DHCP message and then generates a new DHCP message to send through another interface.

When a DHCP client requests an IP address from a DHCP server, for instance DHCPv4, the client sends a DHCPDISCOVER broadcast message to locate the DHCP server. Relay agent forwards the packets between the DHCP client and the DHCP server. The DHCP server provides configuration parameters, such as IP address, MAC address, domain name, and a lease for the IP address, to the client in a DHCPOFFER unicast message.

User Guidelines:

- By default, DHCP relay is enabled on Cisco cnBR. DHCP relay depends on two Cisco cnBR services in the multiple instances environment - BGP agent and Relay proxy.
- DHCP relay agent configuration is based on service group.
- DHCP server receives DHCP request. If multiple DHCP servers are configured, all these servers receive relay packets.
- The v4Net/v6Net defines all the IP scopes for the subscriber's DHCP destination IP address. This configuration must be consistent with the configuration of the DHCP server. If multiple subscriber nets are configured, use the first scope as the default scope.
- Cisco cnBR can also assign a specific server or IP scope for a subscriber. For more information, see [Policy Based Relay, on page 92](#).

## Policy Based Relay

Policy Based Relay allows subscribers with different device classes to be classified into different IP ranges.

When the relay agent handles subscriber DHCP packets, Cisco cnBR can identify its device class based on the TLV (Tag, Length, Value) in the DHCP packets. Then the Cisco cnBR uses a predefined relay policy to assign a specific server to get DHCP address, or notify the server to assign its DHCP address in a specific IP range.

User Guidelines:

- Define the v4serverip/v6serverip in the dhcpServers.
- Define the giaddr/linkaddr with associated v4Nets and/or v6Nets. The address is the prefix of the v4Nets/v6Nets.
- If there is no specific v4serverip/v6serverip for the device class, the subscriber requests are forwarded to all the servers defined.
- If there is no specific giaddr/linkaddr for the device class, the subscribers get the IP from the first default range.

## DHCPv6 Prefix Delegation

In the IPv6 networking, you can use the DHCPv6 prefix delegation (PD) to assign network address prefix, automate configuration, and provision the public routable addresses for the network. For example, in home networks, home routers use the DHCPv6 protocol to request a network prefix from the ISP's DHCPv6 server. After you assign the network prefix, the ISP routes this network prefix to your home router. Then the home router starts displaying the new addresses to hosts on the network.

After the PD router comes online, it gets the assigned network prefix from the DHCP server.

## ARP/NDP Glean and Lease Query

As a relay agent, Cisco cnBR stores all subscriber DHCP information after DHCP is completed. Based on this information, routing is established for subscribers. However, there are several cases when subscriber information is unavailable, such as a modem reset, resulting in routing being no longer available for subscribers. When these subscribers access the network, Cisco cnBR rebuilds the data path by using ARP/NDP glean or lease query.

When using ARP/NDP Glean, Cisco cnBR can trust the packets that come from the cable side network. After the ARP/NS is received and the source IP is updated in the configured IP ranges, Cisco cnBR rebuilds a data path for the source MAC. This method is open to MAC spoofing.

In contrast, when using Lease Query, Cisco cnBR doesn't trust the cable side network. When Cisco cnBR receives the upstream packet with no data path route, it sends a LEASEQUERY request to DHCP server. After DHCP server gets the request and confirms that the RESPONSE, the MAC and IP are released from DHCP server, Cisco cnBR rebuilds the data path. Otherwise, Cisco cnBR drops the packets.

User guidelines:

- Enable or disable ARP/NDP Glean and Lease Query on demand.
- Lease Query checks the source IP with the v4Nets/v6Nets configuration. If the source IP of the packets isn't in the range, then Lease Query discards the packet.
- Use ARP/NDP Glean and Lease Query with Source Address Verification (SAV).

## Source Address Verification (SAV)

In addition to DHCP leased IP address, Cisco cnBR allows static IP address by provisioning SAV group.

A SAV group is a group of IPv4 or IPv6 prefixes. Cisco cnBR uses these prefixes to authenticate a cable modem (CM). You can configure a CM with an IPv4 or IPv6 prefix that belongs to a particular SAV group. The time, length, and the value (TLV) 43.7.1 specify the group name to which a given CM belongs. If the source IP address of a packet from a CM belongs to the configured prefix in a SAV group, the Cisco CMTS considers it as an authorized packet.

You can configure a maximum of 255 SAV groups on a Cisco cnBR. Each SAV group contains up to four IPv4s, IPv6s, or a combination of both prefixes. The total number of the prefixes is not more than four.

During registration, CMs communicate their configured static prefixes to the CMTS using TLV 43.7.1 and TLV 43.7.2. The TLV 43.7.1 specifies the SAV prefix group name that the CM belongs to, and TLV 43.7.2 specifies the actual IPv4 or IPv6 prefix. Each CM can have a maximum of four prefixes configured. When the Cisco CMTS receives these TLVs, it identifies whether the specified SAV group and the prefixes are already configured on the Cisco CMTS. If these are configured, the Cisco CMTS associates them to the registering CM. However if these are not configured, the Cisco CMTS automatically creates the specified SAV group and prefixes before associating them to the registering CM.

The Cisco CMTS considers the SAV group name and the prefixes that are provided by these TLVs to be valid. The packets received from the CM, with the source IP address belonging to the prefix specified by the TLV, are authorized packets. For example, if a given CM has an SAV prefix of 10.10.10.0/24, and the source IP address of a packet received from this CM (or CPE behind the CM) is in the subnet 10.10.10.0/24, then it is an authorized packet.

User guidelines:

- SAV configuration is global and not for each service group.
- SAV doesn't check the MAC/IP binding. You can assign the static IP to any MAC.
- By default, SAV is disabled. You can enable it on demand.

## ARP/NDP Proxy

All cable modems and subscribers are behind the HFC network. As a proxy, Cisco cnBR relays the ARP/NDP requests to the CM.

With ARP/NDP proxy enabled, Cisco cnBR can respond the ARP/NDP, and the DS lease query is not to be triggered.

## Mobility Scopes

If the subscribers are allowed to roam between different IPv4 and IPv6 scopes, the mobility scopes contain all the IPv4 and IPv6 scopes granted to the subscribers. This configuration is optional.

## Configure DHCP Relay Service

The DHCP relay service operates in a similar way as other Cisco CMTS products. You can configure it with Autodeployer Script, or by importing the whole Cisco cnBR configuration YAML file to the desired Cisco cnBR using Cisco Operations Hub. The imported configuration file overwrites the existing configuration and activates the new configuration.

### Update the DHCP Relay configuration using Autodeployer reconfig (Preferred)

After configuring the DHCP Relay using the Autodeployer during deployment, you can modify the dhcp block in the L3 profile file and run the AutoDeployer configuration script again to update the configuration.

---

**Note** Rerunning AutoDeployer configuration script causes all the RPDs/SGs to be deleted and added.

---

### Update DHCP Relay Configuration Using cnBR Manager

After configuring the DHCP Relay using the Autodeployer during deployment, you can also update the configuration using the cnBR Manager UI.

Use the following steps to update the DHCP Relay configuration:

- 
- Step 1** Click the Cisco Operations Hub main menu button on the top left corner, choose **cnBR Manager > Core Management**, and click **Import & Export cnBR**.  
The **Export/Import** page opens.
  - Step 2** In the **Export cnBR Configuration** section, from the drop-down list, choose the required Cisco cnBR to update.
  - Step 3** Click **Export** to get the current SG configuration of the selected Cisco cnBR.
  - Step 4** In the `.json` file, update one or more parameters in the `dhcp` section of the SG configuration.
  - Step 5** Save the updated configuration file on the local disk.
  - Step 6** In the **Import cnBR Configuration File** pane, from the drop-down list, choose the Cisco cnBR to update.
  - Step 7** Click **Browse** to locate the file which you updated (saved at Step 5).
  - Step 8** Click **Import** to upload the updated SG configuration to the selected Cisco cnBR.
- 

### Configure DHCP Relay using Autodeployer Script

In the AutoDeployer script L3 profile file, the DHCP Relay configuration is saved in the `dhcp` section. It is applied to all Service Groups on the Cisco cnBR. The following is an example configuration:

```
"Dhcp":
{
```

```

 "ArpGlean":true,
 "ArpProxy":true,

]
 }
}

```

See [Configure Cisco cnBR Using Autodeployer](#), on page 35 for additional information.

## Configure DHCP Relay

| Field Name  | Description                                               | Type                                  | Enforcement |
|-------------|-----------------------------------------------------------|---------------------------------------|-------------|
| dhcpServers | DHCP server IPv4 and IPv6 addresses                       | IPv4 or IPv6                          | Required    |
| v4Nets      | IPv4 range to which the subscriber's DHCP address belongs | CIDR (Classless Inter-Domain Routing) | Required    |
| v6Nets      | IPv6 range to which the subscriber's DHCP address belongs | CIDR (Classless Inter-Domain Routing) | Required    |

```

"Dhcp":
{
 // all the DHCP servers IP, V4 and V6
 "dhcpServers": [
 "81.81.81.3",
 "24.24.24.3",
 "2001:81:81:81::3",
 "2001:24:24:24::3"
],
 // all the V4 subnets for the subscribers in this SG
 "v4Nets": [
 "90.90.90.1/24",
 "91.91.91.1/24",
 "92.92.92.1/24",
 "93.93.93.1/24",
 "94.94.94.1/24",
 "95.95.95.1/24",
 "96.96.96.1/24",
 "97.97.97.1/24",
],
 // all the V6 subnets for the subscribers in this SG
 "v6Nets": [
 "2001:90:90:90::1/64",
 "2001:91:91:91::1/64",
 "2001:92:92:92::1/64",
 "2001:93:93:93::1/64",
 "2001:94:94:94::1/64",
 "2001:95:95:95::1/64",
 "2001:96:96:96::1/64",
 "2001:97:97:97::1/64"
],
}

```

## Configure DHCP Relay Policy

| Field Name  | Description                                                                                    | Type   | Enforcement |
|-------------|------------------------------------------------------------------------------------------------|--------|-------------|
| deviceClass | The device class for each subscriber                                                           | String | Required    |
| v4serverip  | The server to which the DHCP request is forwarded                                              | IPv4   | Optional    |
| v6serverip  | The server to which the DHCPv6 request is forwarded                                            | IPv6   | Optional    |
| giaddr      | The IP range to which the DHCPv4 address belongs; the giaddr is the IP address in the v4Nets   | IPv4   | Optional    |
| linkaddr    | The IP range to which the DHCPv6 address belongs; the linkaddr is the IP address in the v6Nets | IPv6   | Optional    |

```

"Dhcp":
{
 "RelayPolicies":[
{"deviceClass": "HOST",
"giaddr": "92.92.92.1",
"v4serverip": "24.24.24.3",

}
]}
}

```

### Configure ARP/NDP Glean and Lease Query

| Field Name | Description    | Type    | Enforcement                |
|------------|----------------|---------|----------------------------|
| arpGlean   | Enable/Disable | Boolean | Required; default is false |
| ndGlean    | Enable/Disable | Boolean | Required; default is false |
| ipv4Lq     | Enable/Disable | Boolean | Required; default is false |
| ipv6Lq     | Enable/Disable | Boolean | Required; default is false |

```

"Dhcp":
{
 "arpGlean":true,
 "ipv4Lq": false,
 "ndGlean":false,
 "ipv6Lq": false,
}

```

*Configure SAV*

| Field Name | Description         | Type                                       | Enforcement |
|------------|---------------------|--------------------------------------------|-------------|
| savEnable  | Enable/Disable      | Boolean                                    | Required    |
| savEntires | SAV group structure | savGroup                                   | Optional    |
| grpName    | SAV group name      | String                                     | Optional    |
| prefixes   | The SAV prefixes    | CIDR (Classless Inter-Domain Routing) list | Optional    |

```

"sav"
{
 "savEnable": true,
 "savEntries": [{
 "grpName": "testSAVV",
 "prefixes": ["93.93.93.100/28",
 "2001:93:93:93100::0/72"]
 }]
}

```

*Configure ARP/NDP Proxy*

| Field Name | Description    | Type    | Enforcement             |
|------------|----------------|---------|-------------------------|
| ArpProxy   | Enable/Disable | Boolean | Required; default false |
| NdProxy    | Enable/Disable | Boolean | Required; default false |

```

"ArpProxy":true,
"NdProxy":true,

```

*Configure Mobility Scopes*

| Field Name     | Description             | Type   | Enforcement |
|----------------|-------------------------|--------|-------------|
| mobilityScopes | Scopes of ipv4 and ipv6 | String | Optional    |

```

"mobilityScopes":["90.90.90.1/24",
 "91.91.91.1/24",
 "92.92.92.1/24",
 "2001:90:90:90::1/64",
 "2001:91:91:91::1/64",
 "2001:92:92:92::1/64"
]

```

## Monitor DHCP Relay Service

### DHCP IPv4 Statistics

Figure 16: DHCPv4 panel in cnBR Manager Metrics

This dashboard panel (DHCPv4) in cnBR Manager Metrics is displaying statistics of the DHCP relay of IPv4. In all, there are 16 dashboards. The preceding picture shows only half the number of dashboards. Each dashboard represents the count of different states for different packet over time. There are four packet types for DHCPv4: Discover, Offer, Request, and Acknowledgment (Ack). The system processes each type of packet differently: Received, Dropped, Handled, and Injected. You can change the time span at the top-right corner. Currently, they show the count for the last six hours.

### DHCP IPv6 Statistics

Figure 17: Screenshot of DHCPv6 panel in cnBR Manager Metrics

This dashboard panel (DHCPv6) in cnBR Manager Metrics displays statistics of the DHCP relay of IPv6. In all, there are 16 dashboards. The preceding picture shows only half the number of dashboards. Each dashboard

represents the count of different states for different packet over time. There are four packet types for DHCPv4: Renew, Advertise, Request, and Reply. The system processes each type of packet differently: Received, Dropped, Handled, and Injected. You can change the time span at the top-right corner. Currently, they show the count for the last six hours.

## PTP

Precision Time Protocol (PTP) is used to synchronize clocks throughout all cable networks. The Cisco cnBR cores and RPDs are managed by the Cisco cnBR, and runs an instance of the PTP client. To achieve time synchronization, the PTP client in Cisco cnBR and the PTP client in RPDs must synchronize their clocks to the same PTP primary clock. The Cable Modems (CMs) then synchronize their clock to the Cisco cnBR (and eventually to the PTP primary clock) through the DOCSIS timestamps provided by the RPD.

PTP allows creation of individual profiles for different scenarios. A profile is a specific selection of PTP configuration options that are selected to meet the requirements of a particular application. Cisco cnBR supports the PTP default profile.

To provide a high availability precision clock in the Cisco cnBR, two PTP primary clock sources can be configured in cnBR - a main PTP primary clock server and an alternate PTP primary clock server. Cisco cnBR synchronizes its clock to the best available PTP primary clock.

Some of the key parameters that are configured, or configurable, in the Cisco cnBR and RPD PTP client include:

- PTP Domain

A PTP domain is a logical grouping of clocks that communicate with each other using the PTP protocol. A single computer network can have multiple PTP domains operating separately. For example, one set of clocks synchronized to one time scale and another set of clocks synchronized to another time scale. PTP can run over either Ethernet or IP, so a domain can correspond to a Local Area Network, or it can extend across a Wide Area Network.

In Cisco cnBR and RPD PTP client, the PTP domain is set during initial Cisco cnBR deployment. The PTP domain can be updated after deployment.

- PTP Transport

In Cisco cnBR and RPD, the PTP transport is configured to use PTP over IPv4 in unicast mode. The PTP Transport mode is not configurable in Cisco cnBR PTP client. The PTP Transport mode is configurable in the RPD PTP client.

- PTP Ports

A port can be configured to perform either fixed primary or secondary role, or can be configured to change its role dynamically. If no role is assigned to a port, it can dynamically assume a primary, passive, or secondary role, based on the Best Master Clock Algorithm (BMCA).

Cisco cnBR and RPD support the PTP port secondary role. The Cisco cnBR PTP port role is not configurable. However, the RPD PTP port role is configurable, but it must be set to secondary role.

- PTP Clock Mode

PTP Clock Mode can be configured as either of the following modes:

- **1-step clock mode:** The PTP primary clock includes its timestamp in the synchronization message when the synchronization message is sent by the hardware. This mode requires hardware to insert the clock timestamp right before the synchronization message is sent through the wire.

- **2-step clock mode:** The PTP primary clock sends its timestamp in a separate message after sending the synchronization message. This mode does not require hardware support, but the timestamp messages and the synchronization messages may arrive at the PTP clients out of order in some scenarios.

Cisco cnBR and RPD support the 1-step clock mode. The PTP Clock mode is not configurable.

## Configure PTP

The PTP client in Cisco cnBR and RPD can be configured during the initial Cisco cnBR configuration using Autodeployer.

- Step 1** The top-level Autodeployer configuration file used in the deployment of Cisco cnBR must include the configuration for the PTP client in the Cisco cnBR.

**Table 14:**

| Field Name    | Description                                                                   | Mandatory |
|---------------|-------------------------------------------------------------------------------|-----------|
| ptp:v4:       | PTP IPv4 related parameters for the Cisco cnBR PTP container                  | Yes       |
| domain        | Clock domain of the PTP primary server                                        | Yes       |
| master:ip     | IPv4 address of the PTP clock primary server                                  | Yes       |
| master:gw     | IPv4 address of the Gateway to access the PTP clock primary server            | Yes       |
| alt-master:ip | IPv4 address of the PTP alternate clock primary server                        | No        |
| alt-master:gw | IPv4 address of the gateway to access the PTP alternate clock primary server  | No        |
| dscp          | Differentiated Services Codepoint.<br>Default: 46                             | No        |
| SG_template   | Go through the SG template listed in step <a href="#">Step 2, on page 101</a> | Yes       |

- Step 2** The reference Service Group template should include the configuration of the PTP client in the RPD. Go through the following table for the detailed values.

**Table 15:**

| Field Name | Description                                              | Mandatory |
|------------|----------------------------------------------------------|-----------|
| rpdpTpcfg: | < PTP related parameters for the PTP client in the RPD > | Yes       |

| Field Name                      | Description                                                            | Mandatory |
|---------------------------------|------------------------------------------------------------------------|-----------|
| domain                          | Clock domain of the PTP primary server                                 | Yes       |
| dtiMode                         | DOCSIS Time Interface Mode                                             | Yes       |
| priority1                       | Priority1                                                              | No        |
| priority2                       | Priority2                                                              | No        |
| ptpClkProfileId                 | PTP clock profile ID in PTP primary server                             | Yes       |
| ptpPortCfg: adminState          | PTP port administration state                                          | Yes       |
| ptpPortCfg: anncReceiptTimeout  | Announcement Receipt Timeout interval                                  | No        |
| ptpPortCfg: cos                 | COS of 802.1Q                                                          | No        |
| ptpPortCfg: dscp                | DSCP of IP Differentiated Services                                     | No        |
| ptpPortCfg: enetPortIndex       | Ethernet port index for the clock port                                 | No        |
| ptpPortCfg: gateway             | IPv4 address of the gateway to access the PTP primary clock server     | Yes       |
| ptpPortCfg: gatewayAlt          | IPv4 address of the Alt gateway to access the PTP primary clock server | No        |
| ptpPortCfg: masterAddr          | IPv4 address of the PTP primary clock server                           | Yes       |
| ptpPortCfg: masterAddrAlt       | IPv4 address of the Alt PTP primary clock server                       | No        |
| ptpPortCfg: localPriority       | Local Priority                                                         | No        |
| ptpPortCfg: logDelayReqInterval | Interval for PTP delay-req packets0-7(-7 -0)                           | Yes       |
| ptpPortCfg: logSyncInterval     | Interval for Sync packets                                              | Yes       |
| ptpPortCfg: masterAdminState    | PTP Primary Administration State                                       | Yes       |
| ptpPortCfg: ptpPortIndex        | PTP Port Index                                                         | Yes       |
| ptpPortCfg: unicastDuration     | The grant duration time in seconds for unicast                         | No        |

For more information on the listed parameters, go through the RPD documentation at [https://www.cisco.com/c/en/us/td/docs/cable/cbr/configuration/guide/b-rpd-full-book-11/b-rpd-full-book-11\\_chapter\\_011.pdf](https://www.cisco.com/c/en/us/td/docs/cable/cbr/configuration/guide/b-rpd-full-book-11/b-rpd-full-book-11_chapter_011.pdf).

**Example**

- Cisco cnBR PTP client-related parameters in Autodeployer top-level configuration file:

```
// IPv4 address of PTP Master Clock and alternate Master clock servers,
// and their respective Gateway server, in the top level config file.
ptp :
 v4 :
 domain : 0
 master: {'ip':"100.158.158.158", 'gw':"10.70.78.1"}
 alt-master: {'ip':"100.158.158.159", 'gw':"10.70.78.1"}

// Specify the "SG template" that contains the RPD PTP CLient parameters.
SG :
 'SG_4x4': 'sg_template.json'
```

- RPD PTP client-related parameters in the SG\_template:

```
"rpdPtpCfg": {
 "dtiMode": "SlaveDtiMode",
 "domain": 44,
 "priority1": 128,
 "priority2": 255,
 "ptpClkProfileId": "00:00:00:00:00:00",
 "ptpPortCfg": [
 {
 "adminState": "Up",
 "annReceiptTimeout": 11,
 "cos": 6,
 "dscp": 47,
 "enetPortIndex": 1,
 "gateway": "10.70.78.1",
 "gatewayAlt": "10.70.78.xxx",
 "localPriority": 128,
 "logDelayReqInterval": -4,
 "logSyncInterval": -4,
 "masterAddr": "100.158.158.158",
 "masterAddrAlt": "100.158.158.xxx",
 "masterAdminState": "Up",
 "ptpPortIndex": 22,
 "unicastDuration": 300
 }
]
}
```

**Update cnBR PTP Configuration using Autodeployer**

You can update the Cisco cnBR PTP configuration using the Autodeployer.

Ensure that you have configured the Cisco cnBR PTP client during deployment, and the Cisco cnBR using the Autodeployer.

See [Configure Cisco cnBR Using Autodeployer, on page 35](#) for more information.

Go through the following steps to update the PTP configuration:

- 
- Step 1** Locate the Autodeployer configuration files used for the initial deployment and configuration of cnBR. This includes:
- Top-level Autodeployer configuration file

- SG template
- L3 template

**Step 2** Update the PTP section of the top-level Autodeployer configuration file.

**Step 3** Run the Autodeployer configuration script.

**Note** All RPDs or SGs (including unchanged SGs), are first deleted and added when you rerun the Autodeployer configuration.

---

## Update cnBR PTP Configuration using cnBR Manager

You can update the Cisco cnBR PTP configuration using the cnBR Manager.

Ensure that you have configured the Cisco cnBR PTP client during deployment and the Cisco cnBR using the Autodeployer. Also, ensure that the Cisco cnBR is added to the cnBR Manager.

To view and update the PTP configuration parameters, use the following procedure:

---

**Step 1** Click the Cisco Operations Hub main menu button on the top left corner, choose **cnBR Manager > Core Management**, and click **Core Overview**.

**Step 2** Choose a Cisco cnBR core from the list.

**Step 3** Choose PTP from the drop-down list and edit the configuration using one of the following modes:

- Tree mode: Select **Tree** mode to edit each field.
- Code mode: Select **Code** mode to edit the configuration in plain text.

**Step 4** Configure the Cisco cnBR PTP client with either a single primary clock or with dual primary clocks.

The following image shows the Cisco cnBR PTP client with a single primary clock.

**Figure 18: Configuring cnBR PTP Client with a Single Primary Clock**

## Update RPD PTP Configuration using Autodeployer

You can update the RPD PTP configuration using the Autodeployer. We recommend this method of updating the RPD PTP.

Ensure that you have configured the RPD PTP client during the deployment, and have configured Cisco cnBR using the Autodeployer.

See [Configure Cisco cnBR Using Autodeployer, on page 35](#) for more information.

- 
- Step 1** Locate the complete set of Autodeployer configuration files used in the initial deployment and configuration of cnBR. This includes:
- Top-level Autodeployer configuration file
  - SG template
  - L3 template
- Step 2** Update the `rpdpTtpCfg` section of the Service Group template.
- Step 3** Run the Autodeployer configuration script.
- Note** Rerunning the Autodeployer configuration causes all the RPDs or SGs, including unchanged SGs, to be first deleted and added.
- 

## Update RPD PTP Configuration using cnBR Manager

You can update the RPD PTP configuration using the cnBR Manager.

Ensure that you have configured the RPD PTP client during deployment, and have configured Cisco cnBR using the Autodeployer.

To view and update the RPD PTP configuration parameters, use the following procedure:

- 
- Step 1** Click the Cisco Operations Hub main menu button on the top left corner, choose **cnBR Manager > Core Management**, and click **Import & Export cnBR**.
- The **Export/Import** page opens.
- Step 2** On the **Export cnBR Configuration** pane, choose the Cisco cnBR that you want to update.
- Step 3** Click **Export** to retrieve the current SG configuration of the selected Cisco cnBR.
- Step 4** In the `<filename>-configuration.txt` file, update the parameters in the `rpdpTtpCfg` section of the SG configuration.
- Step 5** Save the updated file to the local disk.
- Step 6** Update the SG configuration.
- a) In the **Import cnBR Configuration File** pane, choose the file that you updated.
  - b) Click **Import** to update the SG configuration to the RPD.
- Step 7** Delete the RPD and add the RPD again for the updated SG configuration to take effect.
- 

## Monitor and Troubleshoot PTP

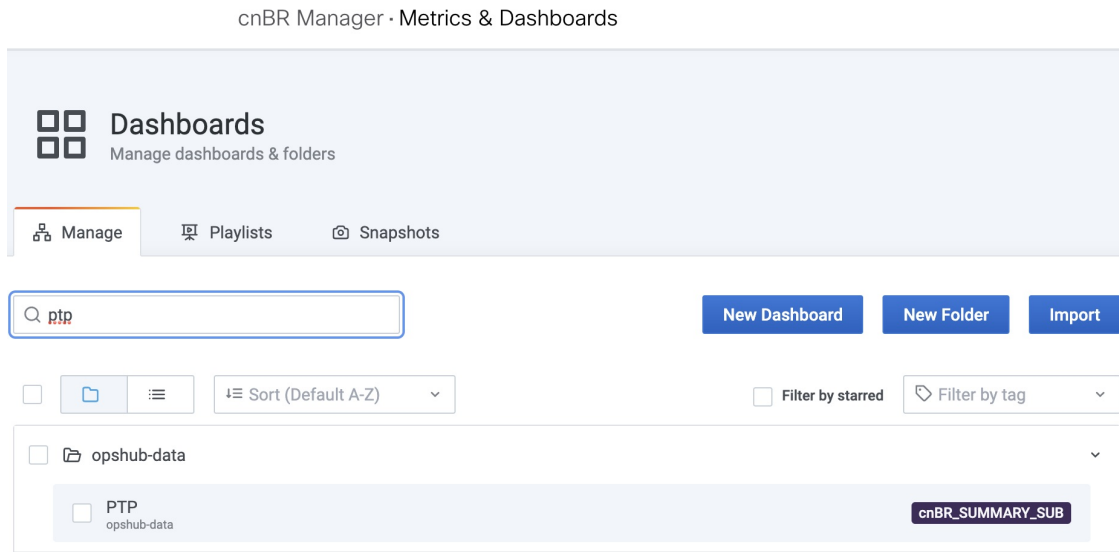

You can view the PTP status and its details on the PTP panel of the **Metrics & Dashboards** dashboard.

To view the **Metrics & Dashboards** dashboard, use the following procedure:

- Step 1** Enter the Cisco Operations Hub URL `https://{Hostname}` in the web browser.
- Step 2** Click the Cisco Operations Hub main menu button on the top left corner, choose **cnBR Manager > Metrics & Dashboard**, and click **Manage**.
- Step 3** Enter PTP in the search box and click the **PTP** row.

The PTP dashboard appears.

**Figure 20: PTP Dashboard**

**Note** The `OffsetFromMaster` must be within `[-1ms, 1ms]`.

## BGP Agent

The BGP Agent is a service in Cisco cnBR. It sets up BGP sessions with the SP router and installs or withdraws subscribed routes on the SP router while the subscribed devices (e.g. CM/CPE) are online.

The Cisco cnBR BGP Agent supports BGP version 4, includes address family IPv4 unicast, address family IPv6 unicast, and supports [Graceful Restart, on page 109](#).

### Configure BGP Agent

You can perform the BGP Agent initial configurations through the Autodeployer Config file. See [Configure Cisco cnBR Using Autodeployer, on page 35](#) for additional information.

After the initial setup, you can access BGP Agent configuration through the cnBR Manager. See instructions for [Access BGP Agent Configuration, on page 109](#).

520757

## Configuration Parameters

| Field Name      | Description                                                                                                                                                | Type                   | Enforcement |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------|-------------|
| asNumber        | BGP supports 2-byte AS numbers                                                                                                                             | 1 ~ 65535              | Required    |
| ebgpMultihop    | The maximum number of eBGP hops allowed                                                                                                                    | 0 ~ 255                | Required    |
| ifname          | BGP Agent interface name                                                                                                                                   | String, length 1 ~ 255 | Required    |
| neighbors       | BGP peer; BGP uses TCP port 179 to create a TCP session with a peer                                                                                        |                        | Required    |
| weight          | Weight of BGP peers; if you configure two BGP IPv4/IPv6 peers, the upstream routes sent from these peers are accepted in the order of weight. Default: 100 | Unsigned integer       | Optional    |
| address         | BGP peer IP/IPv6 address                                                                                                                                   | String                 | Required    |
| gateway         | The gateway IP address if the BGP messages are transmitted to loopback interface on the SP router                                                          | String                 | Optional    |
| gracefulRestart | BGP graceful restart parameters                                                                                                                            |                        | Required    |
| enable          | True, to enable the graceful restart BGP option and False, to disable it                                                                                   | Bool                   | Required    |
| restartTime     | Determines how long the peer routers wait to delete stale routes before a BGP open message is received                                                     | 1 ~ 3600 seconds       | Required    |
| stalePathTime   | Determines how long a router waits before deleting stale routes after receiving an end of record (EOR) message from the restarting router                  | 1 ~ 3600 seconds       | Required    |

## Delete BGP Neighbors

cnBR Cluster Configuration

172.25.29.110.nip.io

BGP Agent

object ▶ neighbors ▶ 2

- Config {5}
  - asNumber : 65009
  - ebgpMultihop : 255
  - gracefulRestart {3}
  - ifname : bgp
  - neighbors [3]
    - 0 {2}
    - 1 {2}

Append { }

(empty object)

SAVE

**Step 5** In the first field, enter `address`, and in the second field, enter the IP address of the new neighbor.

cnBR Cluster Configuration

172.25.29.110.nip.io

BGP Agent

object ▶ neighbors ▶ 2 ▶ address

- Config {5}
  - asNumber : 65009
  - ebgpMultihop : 255
  - gracefulRestart {3}
  - ifname : bgp
  - neighbors [3]
    - 0 {2}
    - 1 {2}
    - 2 {1}
      - address : 200.200.200.3

SAVE

**Step 6** Click the edit box of the `Address` field and choose **Append** from the drop-down list to create an object with two fields.

**Step 7** In the first field, enter `asNumber` and in the second field, enter the AS number of the new neighbor.

**Step 8** Click **Save**.

## Delete BGP Neighbors

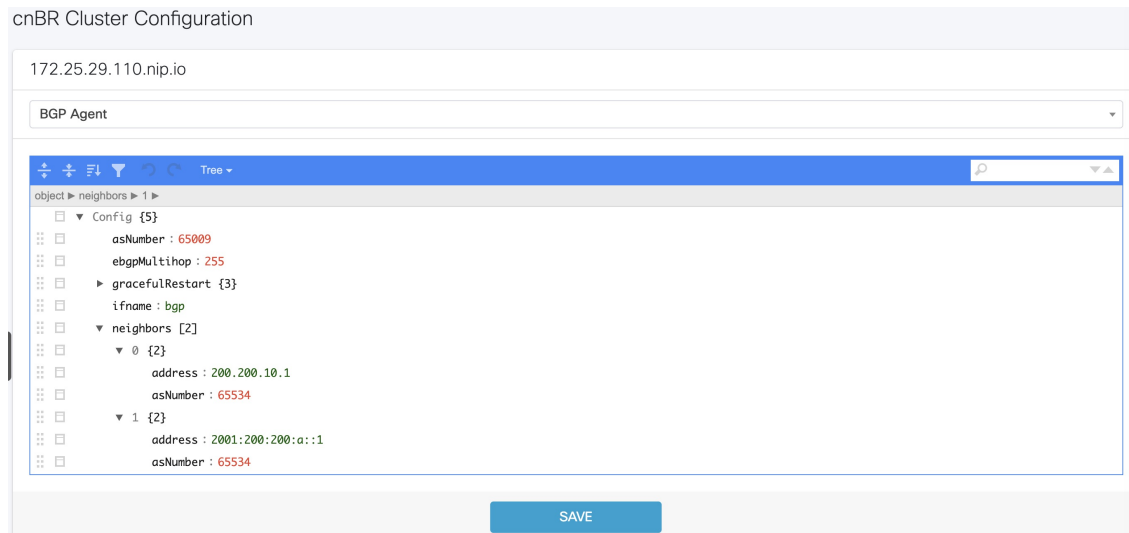

**Step 1** In the BGP Agent configuration, expand all neighbor objects to locate the neighbor to delete.

**Step 2** Select the edit box of the neighbor object to delete, then select **Remove**.

**Step 3** Click **Save**.

## Get BGP Neighbors

BGP neighbor information is stored in the `neighbors` field in the BGP configurator.

## BGP Agent Dashboard

The Cisco cnBR BGP Agent Dashboard provides visibility into the BGP IPv4 and IPv6 routes and operation.

### Access BGP Agent Dashboard

- Step 1** Log in to the Cisco Operations Hub.
- Step 2** Click the Cisco Operations Hub main menu button on the top left corner, choose **cnBR Manager > Metrics & Dashboard**, and click **Manage**.
- Step 3** Enter **bgp** in the search box and click the **BGP Agent** row.
- Step 4** Choose the desired Cisco cnBR from the **cnBR Name** drop-down list.  
The BGP Agent Dashboard of the desired Cisco cnBR appears.

WAN Route Table

The screenshot shows the monitoring interface for 'opshub-data / BGP Agent'. It displays two sections for WAN Route Tables:

- SP Router v6 Route:** A table with columns 'Neighbor', 'Prefix', 'NextHop', and 'Weight'. It lists various IPv6 routes with their respective next hops and weights.
- SP Router v4 Route:** A table with columns 'Neighbor', 'Prefix', 'NextHop', and 'Weight'. It lists various IPv4 routes with their respective next hops and weights.

Each route table is accompanied by an 'SP Router State Table' (showing 'No data to show') and an 'SP Router BGP Route Number' graph. The v6 graph shows route counts for 'sprouter-1-count' and 'sprouter-2-count' over time, with peaks around 23:40, 00:00, 00:10, 00:20, and 00:30. The v4 graph shows similar data with peaks around 00:00, 00:10, 00:20, and 00:30.

WAN Route Table

WAN Route Table displays the default routes generated by BGP Agent, and BGP routes received by the SP Router.

This block provides a detailed view of the WAN Route Tables for SP Router v6 and v4. The v6 table shows a static route for 'Static V6' with a prefix of '::/0' and a next hop of '2001:100:100::1'. The v4 table shows a static route for 'Static V4' with a prefix of '0.0.0.0/0' and a next hop of '100.100.0.1'. Both tables include a 'Weight' column with a value of 100.

Table 16: Parameters

| Name     | Description              |
|----------|--------------------------|
| Neighbor | Neighbor IP address      |
| Prefix   | Network segment of route |

| Name    | Description                                                                         |
|---------|-------------------------------------------------------------------------------------|
| Nexthop | IP address of next hop to get to destination                                        |
| Weight  | Weight parameter described in <a href="#">Configuration Parameters, on page 108</a> |

### SP Router State Table

SP Router State Table displays the connection state between the BGP Agent and the SP router. The UP state indicates that the connection is established, and the DOWN state indicates the connection is not established.

| SP Router State Table |                     |       |
|-----------------------|---------------------|-------|
| Index ▲               | SP Router           | State |
| 1                     | 2001:200:200:200::1 | UP    |

| SP Router State Table |               |       |
|-----------------------|---------------|-------|
| Index ▲               | SP Router     | State |
| 1                     | 200.200.200.1 | UP    |

**Table 17: Parameters**

| Name      | Description                                             |
|-----------|---------------------------------------------------------|
| SP Router | The IP address of the SP Router                         |
| State     | State of the connection between BGP Agent and SP Router |

### BGP Route Table

BGP Route Table displays the BGP routes that is sent to the SP router to route packets from CM to the correct DP.

▼ Bgp v4 Route

Bgp v4 Route Table

| SG Name | SG ID | IPv4 Route     | Nexthop       |
|---------|-------|----------------|---------------|
| SG1     | 1     | 122.122.0.1/16 | 200.200.204.3 |
| SG0     | 0     | 90.90.90.37/32 | 100.100.0.2   |

520760

Table 18: Parameters

| Name     | Description                                   |
|----------|-----------------------------------------------|
| SG Name  | Service Group name corresponding to the route |
| SG ID    | Service Group ID corresponding to the route   |
| IP Route | Destination IP address                        |
| NextHop  | Next IP address hop to get to destination     |

**BGP Route Number**

BGP Route Number displays the number of BGP routes installed into the SP router over time.

- X-axis: Time
- Y-axis: Number of BGP routes

### BGP Route Rate

BGP Route Rate displays the rate of change of BGP routes over time.

- X-axis: Time

- Y-axis: Change rate of BGP routes

## L2VPN

The Cisco cnBR application emulates the Layer 2 virtual private network (L2VPN), when L2VPN devices across shared or public networks appear as computing devices that are directly connected to a switch device. Therefore, Layer 2 packets from one device can reach the other device without changes to the Layer 2 packet header, similar to the traditional Layer 2 Forwarding method.

Several tunneling protocols are used to implement L2VPN. Cisco cnBR supports the point-to-point mode L2VPN for the IEEE 802.1Q (dot1q) protocol.

For the dot1q L2VPN, Cisco cnBR adds one layer dot1q tag for the upstream packet and removes the tag at the receiving end.

Cisco cnBR supports both cable modem (CM) based L2VPN and service flow (SF) based L2VPN.

- CM-based L2VPN: One CM can configure one L2VPN service. Primary upstream and primary downstream packets are encapsulated into a L2VPN tunnel.
- Service flow-based L2VPN: One CM can configure up to four L2VPN services using the CM configure file TLV. A maximum of eight upstream SFs and eight downstream SFs are supported for each L2VPN service. The upstream classifier on the CM and downstream classifier on the Cisco cnBR router are used to classify different packets into L2VPN service flows.

Cisco cnBR supports the following types of L2VPN tunnel:

| Tunnel Type | CM-based                                                                                                                      | SF-based                                                                                                                                            |
|-------------|-------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| dot1q       | <ul style="list-style-type: none"> <li>• dot1q tunnel</li> <li>• Configure by Rest API</li> <li>• One L2VPN per CM</li> </ul> | <ul style="list-style-type: none"> <li>• dot1q tunnel</li> <li>• Configured by CM configuration file TLV</li> <li>• Up to 4 L2VPN per CM</li> </ul> |

## Configure L2VPN

The dot1q L2VPN is implemented using the Cisco cnBR router with a Service Provider (SP) router.

SP routers are Cisco ASR 9000, Cisco ASR 1000, or Cisco Network Convergence System 5501.

The connection between the Cisco cnBR router and the SP router is supported by either the VxLAN mode or the VLAN mode.

### VxLan Mode

The following image shows the dot1q L2VPN packet flow from CPE to the dot1q tunnel.

The following table summarizes the configuration that is required for the supported L2VPN types:

| Tunnel Type | CM-based                                                                                                                                                                                                        | SF-based                                                                                                                                                                                                      |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dot1q       | <ul style="list-style-type: none"> <li>• Cisco cnBR configuration: static dot1q L2VPN</li> <li>• Cisco cnBR configuration: dot1q VxLAN wiring</li> <li>• SP router configuration: dot1q VxLAN wiring</li> </ul> | <ul style="list-style-type: none"> <li>• CM configure file: dot1q L2VPN related TLV</li> <li>• Cisco cnBR configuration: dot1q VxLAN wiring</li> <li>• SP router configuration: dot1q VxLAN wiring</li> </ul> |

### VLAN Mode

The following image shows the dot1q L2VPN packet flow from CPE to the dot1q tunnel.

The following table summarizes the configuration that is required for the supported L2VPN types:

| Tunnel Type | CM-based                                                                                                                                                                                                        | SF-based                                                                                                                                                                                                      |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dot1q       | <ul style="list-style-type: none"> <li>• Cisco cnBR configuration: static dot1q L2VPN</li> <li>• Cisco cnBR configuration: dot1q VxLan wiring</li> <li>• SP router configuration: dot1q VxLan wiring</li> </ul> | <ul style="list-style-type: none"> <li>• CM configure file: dot1q L2VPN related TLV</li> <li>• Cisco cnBR configuration: dot1q VxLan wiring</li> <li>• SP router configuration: dot1q VxLan wiring</li> </ul> |

## Cisco cnBR L2VPN Configuration

For both CM-based and SF-based L2VPN, configure the L2VPN related VLAN or VxLAN that connects to the SP router. Use the **cnBR Cluster Configuration** window to configure the wiring.

For CM-based L2VPN, configure the static L2VPN map by using the REST API.

- 
- Step 1** Click the Cisco Operations Hub main menu button on the top-left corner, choose **cnBR Manager > Core Management**, and click **Core Overview**.
- Step 2** Choose the required Cisco cnBR core from the list.
- Step 3** Select **Wiring** from the drop-down list.
- Step 4** Update the configuration as required and click **SAVE**.
- 

## Static Dot1q L2VPN

To configure a cable modem (CM) as dot1q CM-based L2VPN, upstream traffic (primary service flow) adds one-level dot1q tag. Each L2VPN must have a different `vLanId`.

- 
- Step 1** Click the Cisco Operations Hub main menu button on the top-left corner, choose **cnBR Manager > Core Management**, and click **Core Overview**.
- Step 2** Choose the required Cisco cnBR core from the list.
- Step 3** Choose **Layer 2 VPN** from the drop-down list.
- Step 4** Update the configuration as required and click **SAVE**.
- 

## CM Configuration File TLV Definition

SF-based L2VPN depends on the CM configuration file TLV to set up L2VPN service, L2VPN service flow, and L2VPN classifier. For more details, see the CableLabs document: *Business Services over DOCSIS Layer 2 Virtual Private Networks*.

## IPv6

| Feature Name       | Release         | Feature Description                                                                                                                     |
|--------------------|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| IPv6 WAN Protocols | Cisco cnBR 21.1 | Allows you to use WAN protocols over IPv6. The WAN protocols consist of IPv6 BGP Agent, IPv6 DHCP Relay Agent and Proxy, and IPv6 DMIC. |

Cisco cnBR supports IPv6 protocol when communicating with the following network devices:

- Cable Modem (CM)
- Customer Premise Equipment (CPE)-Equipment that is connected to the CM at the customer premise.

**Note** Cisco cnBR supports dual-stack IPv4 and IPv6 protocols (It supports both IPv4 and IPv6 addresses at the same time).

Cisco cnBR supports WAN protocols over IPv6, along with CIN protocols. The WAN protocols consist of IPv6 BGP Agent, IPv6 DHCP Relay Agent and Proxy, and IPv6 DMIC. In the current network topology, both CIN and WAN networks are connected to the SP router through a layer 2 switch.

## Configure IPv6 WAN

Configure Service Provider router BGP WAN, which includes BGP routing display, Wiring configuration, layer 3 (L3) configuration, SG template configuration, and DMIC configuration.

Following are a few sample configurations, which may be different for each vendor router. The current topology must have a Layer 2 switch between the SP router and Cisco cnBR.

### Configure BGP WAN

```

...
interface Bundle-Ether1.1001
 description WAN-for-cnbr-mn
 mtu 9216

 "ptp-mac-addr": "20:19:06:13:15:43"
}

```

### Configure SG Template

The `ipInit` can be dual-stack, IPv6 only, or IPv4 only. The following is an example of the relevant subsection of the SG template:

```

"md": [
 {
 "adminState": "Up",
 "cmInitChanTimeout": 60,
 "dataBackoff": {
 "end": 5,
 "start": 3
 },
 "disableDocsis31": false,
 "idInSg": 0,
 "ipInit": "dual-stack",
 "mac": "00:23:09:73:47:a5",
 }
]

```

### Configure DMIC

Dynamic Shared Secret that enables service providers to provide higher levels of security for their data-over-cable service interface specifications (DOCSIS) cable networks. This feature uses randomized, single-use shared secrets to verify the DOCSIS configuration files, which are downloaded to each cable modem.

Following is the L3 configuration for Dynamic Message Integrity Check (DMIC):

```

{
 "dhcp": {
 "arpGlean": true,
 "arpProxy": true,
 "dhcpIfname": "cnr",
 "dhcpServers": [
 "1.2.2.91",
 "fd26:ba99:aae:102::2:91"
],
 "dynamicSecret": true,
 "ipv6Lq": true,
 }
}

```

## Cisco cnBR as DHCP Relay Agent

In a Cisco cnBR system, cable modems and some of the associated CPEs acquire IP addresses from a DHCP server in the network. These cable modems, their associated CPEs, and the DHCP server are not on the same

physical network. In this scenario, Cisco cnBR acts as a DHCP relay agent to relay all requests and replies between the clients (CM and CPE) and the DHCP server. The DHCP relay agent in Cisco cnBR supports both IPv4 and IPv6 addressing.

Cisco cnBR supports CMs and CPEs operating in IPv4, IPv6, and dual-stack modes.

When CMs operate in the IPv6 mode, especially only in the IPv6 mode, configure the TFTP server and operate it in the IPv6 mode. This configuration allows the CMs to connect to the TFTP server in IPv6 mode and download their CM configuration file.

**Note** DHCP messages from RPDs does not reach the DHCP relay agent in the Cisco cnBR router. These DHCP messages from RPDs can reach the DHCP server in the CIN without using the DHCP relay agent in Cisco cnBR.

## Configure DHCP Services

Initially, you can configure the DHCP relay services using the Autodeployer script, or by importing the Cisco cnBR configuration YAML file to the desired Cisco cnBR through the Cisco Operations Hub. The imported configuration file overwrites the existing configuration and activates the new configuration. Following is an example of the DHCP relay service configuration:

```
...
"Dhcp":
 {
 "ArpGlean":true,
 "ArpProxy":true,
 "ipv4Lq": false,
 "NdGlean":true,
 "NdProxy":true,
 "ipv6Lq":false,
 "dhcpServers":["80.80.80.3",
 "81.81.81.3",
 "2001:80:80:80::3",
 "2001:81:81:81::3"
],
 "V4Nets":["90.90.90.1/24",
 "91.91.91.1/24",
 "92.92.92.1/24"
],
 "V6Nets":["2001:90:90:90::1/64",
 "2001:91:91:91::1/64",
 "2001:92:92:92::1/64"
],
 "RelayPolicies":[
 {"deviceClass": "HOST",
 "v4serverip": "80.80.80.3",
 "v6serverip": "2001:80:80:80::3",
 "giaddr": "90.90.90.1",
 "linkaddr": "2001:90:90:90::1"
 },
 {"deviceClass": "STB",
 "v4serverip": "81.81.81.3",
 "v6serverip": "2001:81:81:81::3",
 "giaddr": "91.91.91.1",
 "linkaddr": "2001:91:91:91::1"
 },
 {"deviceClass": "PS",
 "giaddr": "92.92.92.1",

```

```

 "linkaddr": "2001:92:92:92::1"
 },
 {
 "deviceClass": "EROUTER",
 "v4serverip": "80.80.80.3",
 "v6serverip": "2001:80:80:80::3",
 },
 {
 "deviceClass": "DVA",
 "giaddr": "90.90.90.1",
 "linkaddr": "2001:90:90:90::1"
 },
 {
 "deviceClass": "MTA",
 "giaddr": "91.91.91.1",
 "linkaddr": "2001:91:91:91::1"
 }
],
 "mobilityScopes": ["90.90.90.1/24",
 "91.91.91.1/24",
 "92.92.92.1/24",
 "2001:90:90:90::1/64",
 "2001:91:91:91::1/64",
 "2001:92:92:92::1/64"
]
 }
}

```

For more details, see [DHCP Relay Service, on page 91](#).

## Cisco cnBR IPv6 CIN

From Cisco cnBR 20.4 onwards, Converged Interconnect Network (CIN) is supported over IPv6. CIN enables you to build a robust, flexible, and scalable network to interconnect the CCAP-Core and RPDs in a solution topology. You can provision RPD with IPv6 to communicate with cnBR ccap-core through IPv6.

The GCP, PTP, and L2TP protocol will be running over IPv6. You need to configure end-to-end CIN network from RPDs to SPR, and Cisco cnBR must be configured to support it. You also need to provision the RPDs to support IPv6.

### Configure cnBR IPv6 CIN

Complete the following steps to configure Cisco cnBR IPv6 CIN:

**Step 1** Configure the SP router CIN network interface with IPv6 address.

```

...
interface Bundle-Ether24.1002
ipv4 address 5.230.203.1 255.255.255.0
ipv6 nd prefix default no-adv
ipv6 nd ra-interval 4
ipv6 nd suppress-ra
ipv6 address fc00::5e6:cb01/120
load-interval 30
encapsulation dot1q 1002
!
...

```

- a) Day1 configuration: Add v6 support for `rphmgr-if`, `cin-start-ip` in wiring part. The `rphmgr-if` v6 address is `ccap-cores` for RPDs in DHCPv6 option 17.61.

```
```yaml
```

```
wiring :
  bgp-agent-if:
    v4 : ['200.200.203.201', '200.200.203.202']
    v6 : ['2001:200:200:203::201', '2001:200:200:203::202']
  cin-prefix: {'v4':24, 'v6':120}
  rphmgr-if: {'v4':'5.230.203.3', 'v6':'fc00::5e6:cb03'}
  cmts-cops-if: { 'v4':'5.230.203.9'}
  cin-start-ip: { 'v4':'5.230.203.10', 'v6':'fc00::5e6:cb0a'}
  sg-peer: {'v4':'200.200.203.1', 'v6':'2001:200:200:203::1'}
  dc-link-prefix: {'v4':24, 'v6':64}
  vlan :
    cnbr-wan-ifname: 'BondEthernet0'
    cnbr-wan-bonded-interface1: 'FortyGigabitEthernetb/0/0'
    cnbr-wan-bonded-interface2: 'FortyGigabitEthernetb/0/1'
    cnbr-wan-bond-mode: 'lacp'
    cnbr-wan-bond-loadbalance: 'L2'
    overlay-wan-vlan: 1001
    overlay-cin-vlan: 1002
    overlay-l2vpn-vlan-vlan: 1003
    overlay-l2vpn-mpls-vlan: 1004
    secondary-overlay-l2vpn-vlan-vlan: 1103
    secondary-overlay-l2vpn-mpls-vlan: 1104
  mtu : '2450'
  ...
```

b) Add PTP and CIN IPv6 configuration:

```
```yaml
ptp :
 v6:
 domain : 44
 master: {'ip': '2001:420:4:ef00::50a:2f9', 'gw': 'fc00::5e6:cb01'}
 cin :
 v4 : ['5.230.203.1']
 v6 : ['fc00::5e6:cb01']
 ...
```

c) Add ipv6 cin-gateway and ptp-gateway if SP router redundancy is configured:

```
```yaml
spr :
  sp-router-redundancy-mode : 'active-active'
  sp-routers :
    - {'bgp-peer' : '200.200.203.1', 'sg-peer': '200.200.203.1', 'router-id': '5.230.0.5',
      'cin-gateway': '5.230.203.1', 'ptp-gateway': '5.230.203.1'}
    - {'bgp-peer' : '2001:200:200:203::1', 'sg-peer': '2001:200:200:203::1', 'router-id':
      '5.230.0.5', 'cin-gateway': 'fc00::5e6:cb01', 'ptp-gateway': 'fc00::5e6:cb01'}
    - {'bgp-peer' : '200.200.203.254', 'sg-peer': '200.200.203.254', 'router-id':
      '5.230.0.17', 'cin-gateway': '5.230.203.254', 'ptp-gateway': '5.230.203.254'}
    - {'bgp-peer' : '2001:200:200:203::254', 'sg-peer': '2001:200:200:203::254', 'router-id':
      '5.230.0.17', 'cin-gateway': 'fc00::5e6:cbff', 'ptp-gateway': 'fc00::5e6:cbff'}
  ...
```

Step 2 SG template configuration

Configure the masterAddr to PTP master v6 address in rpdPtpCfgy section of SG template:

```
```json
"rpdPtpCfgy": {
 "domain": 44,
 "dtiMode": "SlaveDtiMode",
 "priority1": 128,
```

```

"priority2": 255,
"ptpClkProfileId": "00:00:00:00:00:00",
"ptpPortCfg": [
 {
 "adminState": "Up",
 "anncReceiptTimeout": 11,
 "cos": 6,
 "dscp": 40,
 "enetPortIndex": 1,
 "localPriority": 128,
 "logDelayReqInterval": -4,
 "logSyncInterval": -4,
 "masterAddr": "2001:420:4:ef00::50a:2f9",
 "masterAdminState": "Up",
 "ptpPortIndex": 22,
 "unicastDuration": 300
 }
]
}
}
...

```

## DOCSIS

Cisco cnBR provides Data-Over-Cable Service Interface Specifications (DOCSIS) functionality, enabling next generation broadband capability for your Distributed Access Architecture.

### Upstream Resiliency

A DOCSIS 3.0+ cable modem (CM) operating in upstream channel bonding mode, or Multiple Transmit Channels (MTC) mode, utilizes its assigned upstream channels, or Transmit Channel Set (TCS), to transmit data packets when Cisco cnBR grants transmission opportunities on those channels.

The Upstream (US) Resiliency feature provides the capability to automatically suspend granting transmission opportunities for a CM on one or more certain upstream channels when the Cisco cnBR determines that those upstream channels are no longer usable for the CM.

Cisco cnBR determines the usability of the upstream channel by polling the CM with Station Maintenance (SM) Ranging opportunities every 20 seconds on each of the upstream channels in the CM TCS, and waits for the Range Request from the CM on those upstream channels. If Cisco cnBR does not receive the Range Request message from the CM after granting an SM Ranging opportunity, the Cisco cnBR reduces the SM grant interval from 20 seconds to 1 second for the CM on the affected upstream channel. If the Cisco cnBR still can not receive the Ranging Request from the CM for the next 25 times, the Cisco cnBR then considers the upstream channel to be impaired for that CM.

The CM is then classified as operating in the Upstream Partial Service state. The RPTS, nRTPS service flows used by the CM, if any, will be moved to another upstream channel in the updated TCS of the CM. After the CM is able to range on all its TCS channels again, the CM exits the Partial Service state.

**Note** Other non-Best Effort Service Flows, such as UGS, UGS-AD, will not be moved away from the impaired upstream channel. Future Cisco cnBR releases will address this issue.

By default, upstream resiliency is enabled. It does not require any configuration; that is, you do not need to set US Resiliency parameters in the Autodeployer configuration file.

## Monitor Upstream Resiliency

The Upstream Resiliency Dashboard displays the statistics of the cable modems that are in upstream partial service state, and the status of the upstream channels in the Cisco cnBR. You can use the Dashboard to identify impaired upstream channels, and help to narrow down part of the cable plant that needs servicing.

### US Resiliency cnBR Manager Dashboard

Enter the Cisco Operations Hub URL `https://{FQDN}` in the web browser.

Click the Cisco Operations Hub main menu button on the top left corner, choose **cnBR Manager > Metrics & Dashboard**, and click **Manage**. Then, search for the US Resiliency dashboard by entering `us resiliency`, and click the matching result that appears in the result panel.

In the **US Resiliency** dashboard, click the **cnBR ID** drop-down list to choose the Cisco cnBR to monitor. You must add Cisco cnBR to the Cisco Operations Hub to see it in the drop-down list.

After you choose the Cisco cnBR, select the desired Service Group by clicking the **SG ID** drop-down list. Similarly, you must first fill and configure the Service Group to select it in the **SG ID** drop-down list.

### Cluster Statistic

The Cisco cnBR Cluster US Resiliency statistic panel provides the current and historical statistics for the selected Cisco cnBR and Service Group, which includes:

- The current number of cable modems that are in partial service mode in the selected Cisco cnBR cluster.
- The current total number of cable modems detected by the selected Cisco cnBR cluster.
- The historical count of the cable modems that are in upstream partial service mode and the total number of cable modems over time.
- The current list of the cable modems in upstream partial service mode.

### Service Group Statistic

The Service Group Statistic panel provides the current and historical statistics for the selected Service Group, which includes:

- The current number of cable modems that are in partial service mode in a specific Service Group.
- The historical count of the cable modems that are in upstream partial service mode in a specific service group.

520805

## Upstream Channel Statistic

The US Channel Statistic panel provides the current and historical statistics for each upstream channel in the selected Service Group, which includes:

- The current number of cable modems that are in partial service mode for each upstream channel in the selected Service Group.
- The historical count of the cable modems that are in upstream partial service mode in each upstream channel in the selected Service Group.

520805

When a significant number of CMs have a problem on a specific channel, there may be channel frequency interference in a certain segment of the cable plant or service neighborhood.

When a few CMs have a problem on all channels, it may indicate that there is a loose connector or deteriorating cable on certain segment of the service neighborhood, or those CMs may be close to the boundary of the supported service area. It may also indicate a cabling problem of those CMs at the customer homes.

In the preceding cases, you may need more investigation to better understand and troubleshoot the problem, and proactively implement remedies if needed (before you call the service center).

## Downstream Resiliency

DOCSIS 3.0+ Cable Modems (CMs) use downstream bonding groups to receive data. In this scenario, when one or more downstream channels get impaired, it causes packet drops in that particular channel. Furthermore, as the packets need to be reordered, packet drop in one channel can cause reorder timeout and large packet delay, in a continuous manner. Therefore, detecting channel impairment and mitigating this type of condition is important for proper downstream channel bonding operation.

DOCSIS provides a mechanism that let modems detect this condition and report the issue through a CM-STATUS MAC Management Message (MMM). Therefore, CMTS can stay informed about one or more channels that are impaired. However, the DOCSIS specification does not specify how the CMTS should handle the impaired channel conditions. The implementation is up to CMTS vendor.

Upon receiving a CM-STATUS MMM indicating DS channel impairment, the Cisco cnBR temporarily removes the impaired DS channel from the bonded DS Receive Channel Set (RCS). From the CM's perspective, its current RCS persists during impairment. It allows the CM to monitor all DS channels and detect when the impairment is gone from the impacted DS channel. After the Cisco cnBR receives a CM-STATUS MMM indicating that the DS channel impairment is gone, the previously impaired DS channel is added back to the RCS.

**Note** DS resiliency applies to only nonprimary DS channels. DS impairment of a CM's primary channel is an event that cannot be mitigated and results in a CM dropping offline.

Current DS Resiliency Feature handles three failure modes:

- MDD timeout
- QAM lock failure
- OFDM profile failure

Four types of CM-STATUS messages are handled for supporting DOCSIS 3.0 DS resiliency:

- MDD timeout (Event Code 1)
- QAM lock failure (Event Code 2)
- MDD recovery (Event Code 4)
- QAM lock recovery (Event Code 5)

Two types of CM-STATUS message are handled for supporting DOCSIS 3.1 DS resiliency:

- DS OFDM Profile Failure (Event Code 16)
- DS OFDM Profile Recovery (Event Code 24)

## Configure DS Resiliency

The DS Resiliency configuration is a sub-configuration of the service group configuration. To enable the DS resiliency feature, add the following sub-configuration to all SG configurations.

```
"DsResilCfg":
 {
 "DampenTime":30,
 "ResilEn":"true"
 },
```

To disable the DS resiliency feature, change the "ResilEn":"true" to "ResilEn":"false" in all SG configurations.

**Note** Even with DS Resiliency disabled, logs and dashboards show all events and impaired CMs, and don't change the service flow.

---

**Note** The unit of dampen time is seconds.

---

## Update the DS Resiliency Configuration Using cnBR Manager

After the initial configuration of DS Resiliency during deployment using the Autodeployer, you can also update the configuration through the cnBR Manager using the following steps:

- 
- Step 1** Click the Cisco Operations Hub main menu button on the top left corner, choose **cnBR Manager > Core Management**, and click **Import & Export cnBR**.  
The **Export/Import** page opens.
  - Step 2** In the **Export cnBR Configuration** section, from the drop-down list, choose the required Cisco cnBR to update.
  - Step 3** Click **Export** to get the current SG configuration of the selected Cisco cnBR.
  - Step 4** Update the configuration in the `dsResilCfg` section of the SG configuration.
  - Step 5** Save the updated file on the local disk.
  - Step 6** In the **Import cnBR Configuration File** pane, from the drop-down list, choose the Cisco cnBR to update.
  - Step 7** Click **Browse** to locate the file which you updated (saved at Step 5).
  - Step 8** Click **Import** to upload the updated SG configuration to the selected Cisco cnBR.
- 

## DS Resiliency Monitor Statistics

- 
- Step 1** Log in to Cisco Operations Hub.
  - Step 2** Click the Cisco Operations Hub main menu button on the top left corner, choose **cnBR Manager > Metrics & Dashboard**, and click **Manage**.
  - Step 3** Enter `resil` in the search bar and click **DS Resil Dashboard**.
  - Step 4** Select the desired Cisco cnBR from the **cnBR Name** drop-down list.
- 

## OFDM Container

Cisco cnBR provides DOCSIS 3.1 support by introducing Orthogonal Frequency-Division Multiplexing (OFDM) channels in the downstream direction, and Orthogonal Frequency-Division Multiple Access (OFDMA) channels in the upstream direction. OFDM allows for higher throughput and higher spectral efficiency, while still allowing backward compatibility to DOCSIS 3.0.

The OFDM Channel support includes 1 OFDM channel per Service Group (SG) with a channel bandwidth from 24 - 192 MHz wide. Currently, Cisco cnBR supports OFDM channel as a non-primary channel, and the OFDM container is used within a downstream bonding group with up to 32 SC QAM channels.

Each OFDM channel supports the following:

- **Control profile:** The control profile is known in [CM-SP-MULTIv3.1](#) as Profile A, using profile ID 0. This denotes the common profile that all modems can receive and decode. A modem uses Profile A when it first initializes.
- **NCP profile:** There is a dedicated NCP profile, the Next Codeword Pointer. The NCP profile indicates which subcarriers are usable for NCP and what modulation is to be used on each subcarrier.
- **Data profile:** An OFDM channel supports a maximum of five data profiles. The data profiles are referred to as profile B, C, D, and so on, in [CM-SP-MULTIv3.1](#).

## Configure OFDM Port

Complete the following steps to configure the OFDM port:

### Step 1

Configure the OFDM Frequency Exclusion band. The OFDM Frequency exclusion band configuration is supported at the DS port level. The OFDM configuration parameters are listed in the following table:

*Table 19: OFDM Port Configuration Parameters*

OFDM Frequency Exclusion Band Parameter	Minimum (MHz)	Maximum (MHz)	Default
Channel ID in SG	158	162	N/A
Start frequency	108	1217	N/A
Width	1	1110	N/A

### Step 2

Configure OFDM channel in SG. OFDM channels are numbered from 158 to 162. An OFDM channel number must be present in the channel set under a dsPort for its configuration to take effect.

**Note** Only a single OFDM channel for each SG is supported.

See the following DS port configuration example:

```
"rpdCfg":
 [
 {
 "rpdIp": "$RPD0_IP",
 "rpdMac": "$RPD0_MAC",
 "entries":
 [
 {
 "dsPort":
 [
 {
 "portId": 0,
 "basePower": 21,
 "rfMute": false,
 "adminState": "Up",
 "ofdmFreqExclBand": [{"startFreq": 900000000, "width": 10000000}],
 "channel": [0, 1, 2, 3, 158]
 }
],
 "usPort":
 [
 {
 "portId": 0,
 "channel": [0, 1, 2, 3]
 }
],
 "fiberNode":
```

```

 [{"Id":0,
 "DsPort":0,
 "UsPort":0
 }],
 }
}],

```

## Configure OFDM Channel

Complete the following steps to configure the OFDM channel:

Go through the OFDM channel-level configuration parameters listed in the following table:

**Table 20: OFDM Channel Configuration Parameters**

OFDM Frequency Exclusion Band Parameter	Minimum (MHz)	Maximum (MHz)	Default
Channel ID in SG	158	162	N/A
Start frequency	108	1218	N/A
Width	24	192	N/A
PLC start frequency	108	1218	N/A
Cyclic prefix	192, 256, 512, 768, 1024		1024
Interleaver depth	1	32	16
Pilot scaling	48	120	48
Roll-off	64, 128, 192, 256		128
Subcarrier spacing	25 KHz, 50 KHz		50 KHz
Guard band override (optional)	0 Hz	4000000 Hz	Disabled

**Note** As a Cisco cnBR convention, OFDM channels use DOCSIS Channel ID (DCID) of 158, or higher.

See the following DS channel configuration example. The OFDM channel configuration is in the `ofdmDs` block at the SG level. The following block configures OFDM channel #158:

```

i
"ofdmDs":
[
 {
 "cyclicPrefix": 512,
 "idInSg": 158,
 "interleaverDepth": 16,
 "pilotScaling": 48,
 "plc": 873000000,
 }
]

```

```

"profileControl": "QAM64",
"profileData": [
 {
 "id": 1,
 "modulationDefault": "QAM1024"
 },
 {
 "id": 2,
 "modulationDefault": "QAM2048"
 },
 {
 "id": 3,
 "modulationProfile": 9
 }
],
"profileNcp": "QAM16",
"rollOff": 128,
"startFrequency": 867000000,
"subcarrierSpacing": "50KHZ",
"width": 192000000
}
],

```

## OFDM Channel Guard Band

**Table 21: Feature History**

Feature Name	Release Information	Feature Description
OFDM Channel Guard Band	Cisco cnBR 21.1	You can override the default OFDM guard band configuration and configure it based on your requirement, for example, you could potentially trade off some performance margin for additional usable OFDM channel bandwidth.

Guard band is an excluded subcarrier band on both the lower and upper edges of the OFDM channel spectrum. The lower and upper guard band sizes are always identical. You can configure the size of the guard band by setting **guardbandOverride** under the **ofdmDs** block at the SG level. By default, the Cisco cnBR uses the roll-off and subcarrier spacing configuration of the OFDM channel to calculate the guard band. See the following table for the default guard band values.

Roll-off	Subcarrier Spacing: 25 kHz (freq: sc)	Subcarrier Spacing: 50 kHz (freq: sc)
64	3,350,000 Hz: 134	3,600,000 Hz: 72
128	1,725,000 Hz: 69	1,900,000 Hz: 38
192	1,175,000 Hz: 47	1,350,000 Hz: 27
256	1,000,000 Hz: 40	1,000,000 Hz: 20

Use the **guardbandOverride** parameter to configure the guard band size to any value 0–4000000 Hz. Align the guard band size with the subcarrier spacing configuration. The Cisco cnBR uses the configured guard

band value for both the lower guard band and upper guard band of the OFDM channel. The following block configures OFDM channel 158 to use a guard band of 1 MHz:

```
"ofdmDs":
[
 {
 "cyclicPrefix": 512,
 "idInSg": 158,
 "interleaverDepth": 16,
 "pilotScaling": 48,
 "plc": 873000000,
 "profileControl": "QAM64",
 "profileData": [
 {
 "id": 1,
 "modulationDefault": "QAM1024"
 },
 {
 "id": 2,
 "modulationDefault": "QAM2048"
 },
 {
 "id": 3,
 "modulationProfile": 9
 }
],
 "profileNcp": "QAM16",
 "rollOff": 128,
 "startFrequency": 867000000,
 "subcarrierSpacing": "50KHZ",
 "width": 192000000,
 "guardbandOverride": 1000000
 }
],
```

## Configure Downstream Modulation Profile

Table 22: Feature History

Feature Name	Release Information	Feature Description
Configure OFDM Subcarriers Using Frequency Offset	Cisco cnBR 21.1	You can configure sub carrier ranges using the frequency offset ( <code>freqOffset</code> ) attribute in <code>ofdmModProfs</code> group.

A profile is a list of modulation orders which are defined for each subcarrier within an OFDM channel. The Cisco cnBR can define multiple profiles for use in an OFDM channel. The profiles may differ in the modulation orders that are assigned to each subcarrier.

Choose one of the supported modulation orders:

- Constant Modulation Orders

When a profile has the same QAM modulation for all subcarriers, it is specified by the keyword `modulationDefault` and a modulation value (for example - `QAM256`) inside the `profileData` block for the OFDM channel configuration. See the example available in the section, [Configure OFDM Channel, on page 132](#).

- Variable Modulation Orders

When a profile has Variable QAM modulations for the subcarriers, it is specified using a different block within `ofdmModProfs` at the SG level. The following example defines the data-profile ID 9, named 512-1k-4k. The profile has a modulation order of 4096 QAM for all subcarriers except two ranges, where a different modulation order is defined.

You can configure the ranges using either absolute frequency or frequency offset. When you use the frequency offset, the range begins at the frequency (startFrequency + freqOffset). In the following example, the first range begins at the absolute frequency of 935000000 Hz with a width of 7405000 Hz and has a modulation order of 512 QAM. The second range begins at a frequency offset of 12000000 Hz with a width of 6000000 Hz, and has a modulation order of 1024 QAM.

```
"ofdmModProfs":
 [
 {
 "assigns": [
 {
 "modulation": "QAM512",
 "rangeSubcarriers": {
 "freqAbs": 935000000,
 "width": 7405000
 }
 },
 {
 "modulation": "QAM1024",
 "rangeSubcarriers": {
 "freqOffset": 12000000,
 "width": 6000000
 }
 }
],
 "description": "512-1k-4k",
 "idInSg": 9,
 "modulationDefault": "QAM4096"
 }
]
```

## Configure Modulation Profile Display

The profile list that is used by an OFDM channel is displayed in the OFDM Channel Profile Data dashboard in the cnBR Manager.

To view the OFDM profile data, perform either of the following steps:

- To load the OFDM Channel Profile Data dashboard:

Click the Cisco Operations Hub main menu button on the top left corner, choose **cnBR Manager > Metrics & Dashboard**, and click **Manage**. Search for **OFDM Channel Profile Data**.

- To load the OFDM Modulation Profile Data dashboard:

Click the Cisco Operations Hub main menu button on the top left corner, choose **cnBR Manager > Metrics & Dashboard**, and click **Manage**. Search for **OFDM Modulations Profile Data**.

The data profile that is defined for variable modulation orders is displayed in the **OFDM Modulation Profile Data** page in the Cisco Operations Hub.

## Update Configuration Using cnBR Manager

The configuration of the DS port, OFDM channel, and OFDM Modulation Profile can all be updated using the cnBR Manager. After the initial configuration during deployment using the Autodeployer, the configuration can be updated through the cnBR Manager.

Use the following procedure to update the configuration:

- 
- Step 1** Click the Cisco Operations Hub main menu button on the top left corner, choose **cnBR Manager > Core Management**, and click **Import & Export cnBR**.  
The **Export/Import** page opens.
- Step 2** In the **Export cnBR Configuration** section, from the drop-down list, choose the required to cnBR cluster to update.
- Step 3** Click **Export** to get the current SG configuration of the selected cnBR cluster.  
The file is downloaded in JSON format. You can choose to update the following parameters in the downloaded JSON file.
- To update the OFDM Modulation Profile, edit the values in the `ofdmModProfs` section of the SG configuration.
  - To update the DS port, edit the values in the `rpdcfg` section of the SG configuration.
  - To update the OFDM channel, edit the values in the `ofdmDs` section of the SG configuration.
- Step 4** Save the updated file.
- Step 5** In the **Import cnBR Configuration File** pane, from the drop-down list, choose the Cisco cnBR to update.
- Step 6** Click **Browse** to locate the file which you updated (saved at Step 4).
- Step 7** Click **Import** to push the updated SG configuration.
- 

## Downstream Modulation Profile Selection

Cisco cnBR has the following DS modulation profiles:

- Default Data Profile

When a CM registers, it is assigned a default data profile. The default data profile is `profile-data 1`. If `profile-data 1` is not configured, `profile-control` is assigned to the CM.

- Recommended Profile

The Cisco cnBR chooses a profile from existing configured modulation profiles having the highest speed and sufficient Signal to Noise Ratio (SNR) margin. The profile selection is based on the Receive Modulation Error Ratio (RxMER) values collected from a modem.

This allows optimum use of the OFDM channel while allowing the modem to receive codewords with acceptable error rate. The selected profile is the *recommended profile* for that modem.

To compute the recommended profile, the modem's RxMER values are first mapped to desired bit loading values. The desired bit loading values are compared to those in the configured profiles. Ideally, the desired bit loading value must be higher than that in the profile for the same subcarrier.

However, due to the error correction capabilities provided by the channel coding and interleaving, this rule allows certain exceptions. The exemptions are made a configurable value, and is called *exempt subcarrier percentage*.

### Recommended Profile Age

All recommended profiles have a configurable age that is associated with it. If the recommended profile exceeds this age, it is no longer valid for that modem.

### RxMER to Bit Loading Mapping

There are various methods to map the Receive Modulation Error Ratio (RxMER) values to a modem's desired bit loading values. Cisco cnBR recommends the following mapping, which is listed in [CM-SP-CCAP-OSSIv3.1](#), as the baseline mapping:

**Table 23: RxMER to Bit Loading Values**

RxMER (¼ DB)	QAM	Bit Loading
60	16	4
84	64	6
96	128	7
108	256	8
136	1024	10
148	2048	11
164	4096	12
184	8192	13
208	16384	14

### Margin Adjustment

A margin value may be configured for each cnBR to adjust the RxMER to the Bit loading mapping listed in the table. This configured value (in quarter-DB) is added to the RxMER values collected by cnBR before using the above mapping table. This gives you more control in selecting the recommended profiles.

### Exempt Subcarrier Percentage

An exempt subcarrier percentage may be configured for each cnBR. When computing the recommended profile for a modem, this threshold percentage of subcarriers may be ignored when comparing the modem's desired bit loading values to those in each configured profile.

### RxMER Poll Interval

cnBR uses OPT message with bit-0 option to collect RxMER data from CMs, after the initial modem registration and periodically thereafter. The collected RxMER data is used to compute the recommended profile for each modem.

### Unfit Profile

The profile indicates that the CM-STATUS message is marked as *unfit profile* if the CMTS receives CM-STATUS Event 16 (DS OFDM Profile Failure).

A configurable maximum age is associated with each unfit profile for a given modem. If the unfit profile for a modem exceeds this age, it is no longer considered *Unfit* for that modem.

### Profile Selection Parameter Configuration

The following table lists the parameter range for the profile selections:

**Table 24: Parameter Ranges for Profile Selections**

Profile Selection Parameter	Minimum	Maximum	Default
rxmer-poll-interval	1 minute	1440 minutes	60 minutes
exempt-sc-pct	1	100	2
mer-margin-qdb	0 qdB	40 qdB	0
recm-prof-age	1 minute	1440 minutes	120 minutes
unfit-prof-age	1 minute	1440 minutes	120 minutes

An example of the parameter configuration is as follows:

```
"ofdmProfMgmt":
{
 "rxmer-poll-interval": 180,
 "exempt-sc-pct": 20,
 "mer-margin-qdb": 16,
 "recm-prof-age": 360,
 "unfit-prof-age": 360
}
```

## View OFDM Channel and Profile Statistics

You can choose to view the OFDM channel and profile statistics information on the Cisco cnBR dashboard.

You can view the OFDM channel and profile statistics through the **Metrics & Dashboard** page. You can choose to view the following:

- Downstream Channel Statistics

View the DS channel (SC QAM and OFDM channel) byte and packet counters for a given SG on the **Downstream Channel Rate** dashboard of the Cisco Operations Hub.

To load this dashboard, click the Cisco Operations Hub main menu button on the top-left corner, choose **cnBR Manager > Metrics & Dashboard**, and click **Manage**. Search for **DS Channel Rate**.

The **Downstream Channel Rate** dashboard also shows the historical data of the downstream channel (SC QAM and OFDM channel) bit and packet rates for a given SG, along with the historical data of the downstream channel (SC QAM and OFDM channel) utilizations.

- OFDM Modulation Profile Statistics

View the OFDM modulation per-channel-per-profile byte and packet counters on the **OFDM Channel Profile Stats** dashboard in the Cisco Operations Hub.

To load this dashboard, click the Cisco Operations Hub main menu button on the top-left corner, choose **cnBR Manager > Metrics & Dashboard**, and click **Manage**. Search for **OFDM Channel Profile Stats**.

- OFDM OCD and DPD Information

View the OFDM channel OCD and DPD configuration sent through MAC Management Message to CMs on the **OFDM Channel OCD and DPD Information** dashboard.

To load this dashboard, click the Cisco Operations Hub main menu button on the top-left corner, choose **cnBR Manager > Metrics & Dashboard**, and click **Manage**. Search for **OFDM Channel OCD DPD Info**.

---

## View DOCSIS 3.1 Modem Data

You can view the DOCSIS 3.1 modem data through the Cisco cnBR dashboard.

---

You can use the dashboard to view information on the following:

- **D3.1 Modem Information display**

Click the Cisco Operations Hub main menu button on the top-left corner, choose **cnBR Manager > Metrics & Dashboard**, and click **Manage**. Search for **Cable Modem Verbose**.

The **Modem Other Info** and **Modem OFDM Info** tables display information specific to D3.1.

- **OFDM Profile Stats**

Click the Cisco Operations Hub main menu button on the top-left corner, choose **cnBR Manager > Metrics & Dashboard**, and click **Manage**. Search for **CM OFDM Profile Stats**.

The profile stats information from each D3.1 modem is available.

---

## DEPI Latency Measurement

DEPI Latency Measurement (DLM) measures the delay and latency of the packets traversing through the Converged Interconnect Network (CIN) from Cisco cnBR to the RPD.

DLM configuration has three parameters: `staticDelay`, `interval`, and `updateMap`. Without any DLM configuration, the network delay uses 500 microseconds ( $\mu$ s) as default value for the calculation of Map Advance Time. When you configure `staticDelay` with nonzero value, it replaces the default network delay in

Map Advance Time. When you configure the interval with nonzero value, DLM starts to send the packets from Cisco cnBR to RPD and calculate the downstream path CIN delay. You can use the CIN delay measurements from DLM to display or debug. When you set updateMap to true, and statiDelay configuration is absent or 0, you can also use the CIN delay measurements to replace the network delay time and adjust the DOCSIS MAP Advance Time. When the DLM is disabled, the network delay restores to the default value of 500  $\mu$ s.

The DLM calculated delay is valid if it falls in the range of 30  $\mu$ s and 100 ms. The valid DLM delay replaces the network delay when it is enabled. Subsequent ongoing update to the network delay happens only when the difference between the old and new value is larger than 75  $\mu$ s. The following table summarizes how the map advance time can be affected based on the parameters in the table.

DLM staticDelay	DLM interval	DLM updateMap	DLM measuring CIN delay	Map Advance Network Delay
Absent or zero	Absent or zero	true or false	No	500 $\mu$ s (default)
Nonzero	Absent or zero	true or false	No	staticDelay (configured)
Nonzero	Nonzero	true or false	Yes	staticDelay (configured)
Absent or zero	Nonzero	false (display only)	Yes	500 $\mu$ s (default)
Absent or zero	Nonzero	true	Yes	DLM calculated delay

## Configure DLM

DLM is configured in the Service Group configuration. Because DLM measures CIN delay to RPD, it is set for each RPD.

### Configure DLM using AutoDeployer script

In the AutoDeployer script SG template file, you can add `netDelayCfg` block to `rpdcfg` block to enable DLM. The SG template configuration applies to all service groups on the Cisco cnBR. See [Configure Cisco cnBR Using Autodeployer, on page 35](#) for additional information.

```

"rpdcfg": {
 "rfTopology": {

 },
 "netDelayCfg": {
 "staticDelay": 1000,
 "dlmCfg": {
 "interval": 10,
 "updateMap": true
 }
 }
}

```

### Update the DLM Configuration using AutoDeployer Reconfigure (Preferred)

After the initial DLM configuration during the deployment using the AutoDeployer, you can update the configuration by modifying the `netDelayCfg` block in the SG template and running the AutoDeployer configuration script again.

**Note** The system first deletes all the RPDs/SGs and then adds them back when you rerun AutoDeployer configuration.

### Update DLM configuration using cnBR Manager

After the initial DLM configuration during the deployment using the AutoDeployer, you can also update the configuration through the cnBR Manager **Core Management** window.

**Step 1** Click the Cisco Operations Hub main menu button on the top-left corner, choose **cnBR Manager > Core Management**, and click **Import & Export cnBR**.

The **Export/Import** page opens.

**Step 2** In the **Export cnBR Configuration** section, from the drop-down list, choose the Cisco cnBR that manages the RPD.

**Step 3** Click the **Export** button to retrieve the current SG configuration of the selected Cisco cnBR.

**Step 4** Update one or more parameters in the `netDelayCfg` section of the SG configuration to the desired configuration.

**Step 5** Save the updated file on the local disk.

**Step 6** In the **Import cnBR Configuration File** pane, from the drop-down list, choose the Cisco cnBR to update.

**Step 7** Click **Browse** to locate the file which you updated (saved at Step 5).

**Step 8** Click **Import** to push the updated SG configuration to the RPD.

**Step 9** Delete the RPD and add the RPD again for the updated SG configuration to take effect.

For more details, see [RPD Operations, on page 260](#).

### Configuration Parameters

Field Name	Description	Type	Enforcement
Interval	The interval of sending request packets to RPD and performing the delay calculation by DLM	Integer, 1 ~ 420, in second	Default is 0 and it means that DLM is disabled by default
UpdateMap	If the StaticDelay value is not set, determine if DLM calculated delay is used to update network delay portion of Map Advance.	Bool	Default is false and it means that DLM does not update Map Advance. Set it to true, and clear the StaticDelay, for DLM to update Map Advance after DLM delay calculation
StaticDelay	Use static delay to set the network delay portion of the MAP advance. If set, the dynamically calculated delay value is not used even if the UpdateMap flag is set to true.	Integer, 30 ~ 100000, in $\mu$ s	Default is 0 and it means that there is no static delay to update map advance

## Monitor DLM Information

You can find the DLM summary and related plots in two DLM display panels in cnBR Manager.

opshub-data > DLM Summary

DLM Info Summary

cnBR Name	cnBR ID	SG Name	SG ID	RPD ID	Interval	Channel	Delay	Jitter	Transaction	Refresh Count
mn-dev	10.86.2.30.nip.io	SG00	0	a0:f8:49:6f:c0:ff	10	0	16	-1	187	0
mn-dev	10.86.2.30.nip.io	SG01	1	a0:f8:49:6f:ad:9c	10	0	24	-96	144	0

520795

Field Name	Description	Type
cnBR Name	Cisco cnBR cluster name.	Name string
cnBR ID	Cisco cnBR cluster address.	IPv4/IPv6 address
SG Name	The name of the service group for the RPD.	Name string
SG ID	The Service Group identifier.	Integer
RPD ID	The MAC address of the RPD. This RPD is part of the Service Group with the preceding SG ID.	MAC address
Interval	Configured DLM interval.	Integer, in seconds
Channel	DS channel ID where DLM packet is sent.	Integer, index
Delay	The most recent time delay calculated by DLM.	Integer, in $\mu$ s
Jitter	The most recent time jitter calculated by DLM.	Integer, in $\mu$ s
Transaction	The transaction ID of the most recent DLM request packet sent from Cisco cnBR.	Integer, index
Refresh Count	The number of times the DLM updates Map Advance network delay.	Integer, Counter

Click RPD ID to enter the DLM verbose display panel.

520797

- Jitter Health: Jitter graph and histogram are in the top of the DLM verbose display panel.
- Latency History Statistics
  - Delay/Jitter

Field Name	Description	Type
Actual Delay	The actual delay calculated by DLM over time	Integer, in $\mu$ s
Actual Jitter	The actual jitter calculated by DLM over time	Integer, in $\mu$ s
Used Delay	The average delay used to update map advance	Integer, in $\mu$ s

- Rate

Field Name	Description	Type
Sending Rate	Sending rate of the DLM request packets from cnBR	Rate, unit is pps.
Receiving Rate	Receiving rate of the DLM response packets from RPD	Rate, unit is pps.
Err Delay Rate	Receiving rate of the DLM response packets with abnormal timestamp from RPD	Rate, unit is pps.
TID Mismatching Rate	Receiving rate of the DLM response packets with abnormal transaction id from RPD	Rate, unit is pps.

- DLM Event: The warning events from DLM are listed in the bottom of the DLM verbose display panel.

## DOCSIS Set-Top Gateway

Table 25: Feature History

Feature Name	Release Information	Feature Description
DOCSIS Set-Top Gateway	Cisco cnBR 20.3	DOCSIS Set-top Gateway (DSG) allows the configuration and transport of out-of-band (OOB) messaging. OOB messaging occurs between a set-top controller (or application server) and the customer premise equipment (CPE).

DOCSIS Set-top Gateway (DSG) allows the configuration and transport of **out-of-band (OOB) messaging**. OOB messaging takes place between a set-top controller (or application servers) and the customer premise equipment (CPE). DSG is not intended for the delivery of programming content.

The following figure depicts a typical DSG topology over a Cisco cnBR system.

Figure 21: Typical DSG Topology over a Cisco cnBR System

DSG has the following components:

- **DSG Server:** DSG Server is any server (such as an application server or other network attached device) that provides content that is transported through the DSG Tunnel to the DSG Client.
- **DSG Agent:** The DSG Agent is the implementation of the DSG protocol within the Cisco cnBR. DSG Agent creates the DSG Tunnel, places content from the DSG Server into the DSG Tunnel, and sends the DSG Tunnel to the DSG Client.
- **DSG eCM (Embedded Cable Modem):** A DSG eCM is a DOCSIS cable modem that is embedded into a set-top device and includes DSG functionality.
- **DSG Client Controller:** DSG Client controller is the component of a set-top device that handles the processing of Downstream Channel Descriptor (DCD) messages and decides the forwarding of DSG tunnels within the set-top device.
- **DSG Client:** The DSG Client terminates the DSG Tunnel and receives content from the DSG Server. There may be more than one DSG client within a set-top device.

## Configure DSG

You can configure DSG using the Day1 deploy script. You can also configure DSG by importing the Cisco cnBR configuration YAML file to the target Cisco cnBR using cnBR Manager. Using this configuration method overwrites the existing configuration and activates the new configuration. The following is an example configuration for DSG. Add separate DSG configuration entries in the MAC Domain (MD) configuration. See [DSG Configuration in MAC Domain \(MD\)](#), on page 151.

The following example is a sample DSG Configuration.

```
"dsg":

## Configure DSG from Autodeployer

In the Autodeployer script SG template file, the DSG configuration is in the "dsg" section. Some DSG configuration is also present in the "md" section. See example configurations in the preceding section. See [Configure Cisco cnBR Using Autodeployer](#) for additional information.

## Update DSG Configuration Using Autodeployer Re-Configuration (Preferred)

You can update the DSG configuration by modifying the DSG-related blocks in the SG template and rerunning the autodeployer configuration script. Use this method to update the configuration after the initial configuration of DSG during the deployment using autodeployer.

**Note** Rerunning autodeployer configuration deletes and readds all the RPDs/SGs.

## Update DSG Configuration Using cnBR Manager

After the initial configuration of DSG made during the deployment using autodeployer, you can update the configuration using the cnBR Manager **Core Management** interface.

- 
- Step 1** Click the Cisco Operations Hub main menu button on the top-left corner, choose **cnBR Manager > Core Management**, and click **Import & Export cnBR**.  
The **Export/Import** page opens.
- Step 2** In the **Export cnBR Configuration** section, from the drop-down list, choose the required Cisco cnBR to update.
- Step 3** Click **Export** to get the current SG configuration of the selected Cisco cnBR.
- Step 4** Update the parameters in the **dsg** and **md** sections of the SG configuration.
- Step 5** Save the updated configuration file on the local disk.
- Step 6** In the **Import cnBR Configuration File** pane, from the drop-down list, choose the Cisco cnBR to update.
- Step 7** Click **Browse** to locate the file which you updated (saved at Step 5).
- Step 8** Click **Import** to upload the updated SG configuration to the selected Cisco cnBR.
- 

## Configuration Parameters

All configurations of DSG are not mandatory. The mandatory configurations are `dsg client-list`, `dsg classifier`, `dsg tunnel`, and `dsg tunnel-group`. The optional configuration details include timer, vendor parameters, DSG channel lists, DSEH, and name-update-interval.

### DSG Clients

Use `dsg client-list` to configure the DSG downstream channel list on a Cisco cnBR. This configuration is mandatory.

Field Name	Description	Type	Enforcement
id	DSG client list ID	Integer	Required
clients	DSG client entry	Array	Required
clients.id	DSG client ID index for the client list	Integer	Required
clients.caSystemId	DSG client type CA system ID	String	Optional
clients.macAddr	DSG client type MAC address	string[]	Optional
clients.applicationId	DSG client type Application ID	String	Optional

Field Name	Description	Type	Enforcement
clients.broadcast	DSG client type broadcast	String	Optional
clients.vendorParam	DSG vendor parameters group ID	Integer	Optional

```
"clientList": [
 {
 "id": 0,
 "clients": [
 {
 "id": 0,
 "caSystemId": "701",
 "macAddr": [
 "00:53:00:00:00:02"
],
 "applicationId": "0",
 "broadcast": "2",
 "vendorParam": 0
 }
]
 }
]
```

### DSG Classifier

Add the DSG classifiers, with optional support for the DCD parameter. This configuration is mandatory.

Field Name	Description	Type	Enforcement
id	DSG classifier ID	Integer	Required
enable	Enable DSG classifier	Boolean	Required
destIp	Destination IP address	String	Required
srcIp	Source IP address	String	Optional
srcIpMask	Source IP mask	String	Optional
destPortStart	Destination TCP/UDP port start	String	Optional
destPortEnd	Destination TCP/UDP port end	Integer	Optional
srcPortStart	Source TCP/UDP port start	String	Optional
srcPortEnd	Source TCP/UDP port end	Integer	Optional
priority	Classifier priority	Integer	Optional

```
"cfr": [
 {
 "id": 0,
 "enable": true,
 "destIp": "203.0.113.2",
 "srcIp": "192.0.2.12",
 "srcIpMask": "255.255.255.0",
 "destPortStart": 0,
 "destPortEnd": 0,
 "srcPortStart": 0,
 "srcPortEnd": 0,
 "priority": 0
 }
]
```

```
 }
]
}
```

### Tunnel

Add DSG tunnel and associate a client-list ID to it. This configuration is mandatory.

Field Name	Description	Type	Enforcement
id	DSG tunnel ID	Integer	Required
macAddr	DSG tunnel MAC address	String	Required
clientList	DSG client list ID	Integer	Required
cfr	DSG classifier	integer[]	Required

```
"tunnel": [
 {
 "id": 0,
 "macAddr": "00:53:00:00:00:02",
 "clientList": 0,
 "cfr": [
 0
]
 }
]
```

### Tunnel Group

Add a DSG tunnel group and associate a tunnel to it. This configuration is mandatory.

Field Name	Description	Type	Enforcement
id	User-defined DSG tunnel group ID	Integer	Required
tunnel	DSG tunnel IDs defined in the "tunnel group" API	integer[]	Required

```
"tg": [
 {
 "id": 0,
 "tunnel": [
 0
]
 }
]
```

### Timer

Configure a DSG timer if necessary. Define different timeouts in seconds for Init, Operational, Two-Way, and One-Way. The timer configuration is optional. However, if you define a DSG timer, all the fields are mandatory.

Field Name	Description	Type	Enforcement
id	User-defined DSG timer ID	Integer	Required
timeout	DSG timeout in seconds[Init,Operational,Two-Way,One-Way]	integer[]	Required

```
"timer": [
 {
 "id": 0,
 "timeout": [
 2,
 30,
 35,
 60
]
 }
]
```

### Vendor Parameters

Configure the DSG vendor-specific parameters if necessary. This configuration is optional. However, if you define vendor-specific parameters, all the fields are mandatory.

Field Name	Description	Type	Enforcement
id	DSG vendor parameters ID	Integer	Required
vendor	DSG vendor parameters entry	Array	Required
vendor.id	DSG vendor parameters vendor index	Integer	Required
vendor.oui	DSG vendor parameters vendor OUI	String	Required
vendor.value	DSG vendor parameters vendor value	String	Required

```
"vendorParam": [
 {
 "id": 0,
 "vendor": [
 {
 "id": 0,
 "oui": "ce",
 "value": "0"
 }
]
 }
]
```

### DSG Channel List

Configure a DSG channel list if necessary. This configuration is optional. However, if you define a DSG channel list, all the fields are mandatory.

Field Name	Description	Type	Enforcement
id	DSG channel list ID	Integer	Required
chans	DSG channel frequency entry	Array	Required
chans.id	DSG channel frequency entry index	Integer	Required
chans.freq	DSG channel frequency	Integer	Required

```
"chanList": [
 {
 "id": 0,
 "chans": [
 {
 "id": 0,
 "freq": 0
 }
]
 }
]
```

### Other Parameters

**NameUpdateInterval:** This parameter is the interval in minutes to update the fully-qualified domain name (FQDN) classifiers on a Cisco cnBR based on the DNS server record. The valid range is 1–60.

**Dseh:** Downstream Service Extended Header: This parameter is a boolean value indicating whether the DSG tunnels use DS-EH.

Field Name	Description	Type	Enforcement
NameUpdateInterval	Interval in minutes to check the DNS server for any FQDN classifier changes	Integer	Optional
Dseh	Boolean value indicating if DSG tunnels use the DS-EH (Downstream Service Extended Header)	Boolean	Optional

### DSG Configuration in MAC Domain (MD)

Add DSG configuration to the MD configuration. The tunnel-group (tg) parameter is mandatory. Other values in the DSG field are optional. Associate the DSG tunnel group to the mac-domain.

Field Name	Description	Type	Enforcement
channelList	DSG channel list ID defined in the 'channel list' API	Integer	Optional
dcdDisable	Disable DSG DCD	integer[]	Optional
tg	DSG tunnel groups in the 'tunnel group' API	integer[]	Required
timer	DSG timer ID in the 'DSG timer' API	Integer	Optional
vendorParam	DSG vendor parameters ID in the 'channel list' API	Integer	Optional

```
"dsg": {
 "channelList": 0,
 "dcdDisable": [
```

```

 0
],
 "tg": [
 0
],
 "timer": 0,
 "vendorParam": 0
}

```

## SP Router Configuration

To set up an SP router, perform the following steps:

- 
- Step 1** Enable ip multicast-routing distributed.
  - Step 2** Enable **ip pim sparse-dense-mode** and **ip igmp version 3** on the BVI Interface for Multinode cnBR.
  - Step 3** Configure static IGMP corresponding to DSG **cf**r groups and sources, on the BVI Interface for Multinode cnBR.
- 

### Example

The following example is a sample configuration. The actual configuration may vary depending on the type and version of the router.

```

multicast-routing
address-family ipv4
interface BVI1005
 enable
!
interface Loopback0
 enable
!
!
!
router igmp
interface BVI1005
static-group 233.1.1.1
version 3
!
!
router pim
address-family ipv4
interface BVI1005
 enable
!
interface Loopback0
 enable
!
!
!

```

## Policy-based Load Balancing

Table 26: Feature History

Feature Name	Release Information	Feature Description
Policy-based Load Balancing	Cisco cnBR 20.4	Enables each service group (SG) to manage traffic based on the weight assigned to the SG.

Policy-based load balancing enables each service group (SG) to manage traffic based on the weight assigned in the configuration file. Policy-based load balancing assigns a weight to the SG to determine how much network traffic it can handle.

By default, the service groups are given a static traffic rate for both downstream and upstream traffic. The weight is an integer between 1 and 4 with the default value of 1. An SG with weight 4 can handle 4 times the traffic of the default load. Each data-plane pod can hold up to 4 total weight.

### Configure Policy-Based Load Balancing Using Operations Hub

Different SG templates are required for configuring different weights on SGs.

**Step 1** To enable policy-based load balancing, add `sgWeight` key to a new or existing template in the Cisco Operations Hub.

```
"sgWeight": 2,
```

For information on how to add SG configuration, see [Add Service Group Configuration to cnBR, on page 55](#).

**Step 2** Create a new SG and apply the appropriate SG template.

When updating an existing SG, delete the existing SG first and then add the SG with the new template.

For information on how to add or delete SGs, see [RPD Operations, on page 260](#).

### Configure Policy-based Load Balancing Using AutoDeployer

To enable policy-based load balancing, add `sgWeight` key in the AutoDeployer script SG template file.

```
"sgWeight": 2,
```

Different SG templates are required for configuring different weights on SGs. When updating the weight for an existing SG, the AutoDeployer script deletes and adds the SG.

For more details, see [Configure Cisco cnBR Using Autodeployer, on page 35](#).

## Voice

Cisco cnBR provides voice communication capabilities over cable networks.

## Packetcable

Packetcable is a set of protocols developed to deliver Quality of Service (QoS) enhanced communications services using packetized data transmission technology to your home over the cable network.

Packetcable 1.5 is an enhanced version of packetcable protocols from Packetcable 1.0. The following figure shows the basic network topology.

**Figure 22: Topology for Packetcable 1.5**

## Packetcable Configuration Parameters

Parameter	Values	Description	Default Value
pcEnable	True, False	True = Enabled, False = Disabled	True
pcMaxGate	Integer	Maximum gate number allowed in Cisco cnBR	51200
t0Timer	Integer in milliseconds	The period that an allocated gate exists without having the gate parameter set	30000
t1Timer	Integer in milliseconds	The period that an authorized gate exists without having the gate parameter set	200000
sendSubscriberEnable	True, False	If it is True, GateClose and GateSetAck messages include Subscriber ID	False
copsAddrIp	IP address	IP address of CMS	None
copsGwIp	IP address	First hop gateway IP to CMS	None

By default, Packetcable 1.5 is enabled. The following configuration is used to disable the feature or change the timers. Usually, the default configuration is sufficient. For more details of timer parameters, see [DQoS1.5 SPEC](#).

You can configure the Packetcable 1.5 by using the Cisco cnBR Autodeployer YAML file.

```
packetcable :
 {enable:'true', 'max-gate':51200, 't0':30000, 't1':200000, 'subscriber':'false',
 'ip':'5.230.205.10', 'gw':'5.230.205.1'}
```

You can also configure the Packetcable 1.5 by using the Configurator as depicted in the following figure:

**Figure 23: Configure Packetcable 1.5 using cnBR Manager**

cnBR Cluster Configuration

## Cisco Operations Hub Voice Dashboard

The cnBR Manager Voice Dashboards monitor Cisco cnBR Packetcable 1.5 voice features.

### Voice Main page

As shown in the following figure, the first part of Voice Main page displays the Packetcable feature enable/disable status, COPS connection status, established call status, and the alerts that are reported by system.

Figure 25: Voice Main Dashboard Part 1

520834

Detailed explanation for components in the preceding figure.

- Pie chart for CMS Connection.
  - active - The counter for CMS connections which are in active status.
  - timeout - The counter for CMS connections which are timeout.
- Pie chart for Call Established.
  - active - The counter for Established Calls which are in active status.
  - failure - The counter for Established Calls which are failure.
- Pie chart for Alert.
  - fatal - Fatal event counter.
  - error - Error event counter.
  - warning - Warning event counter.
- Table for CMS Servers.
  - CMS - Server IP address.
  - Port - Server port.
  - State - Server connection states.
  - Keepalive - Keepalive timer between CMS and Cisco cnBR.
  - Client Type - The client type value (32776 for Packetcable and 32778 for Packetcable Multimedia).
  - You can use **Search...** text box to do fuzzy search in the entire table.

As shown in the following figure, the second part of Voice Main page displays overall call statistics and error logs reported by cmts-app-packetcable container in Cisco cnBR side.

**Figure 26: Voice Main Dashboard Part 2**

520836

Legends for each column of tables in the preceding figure.

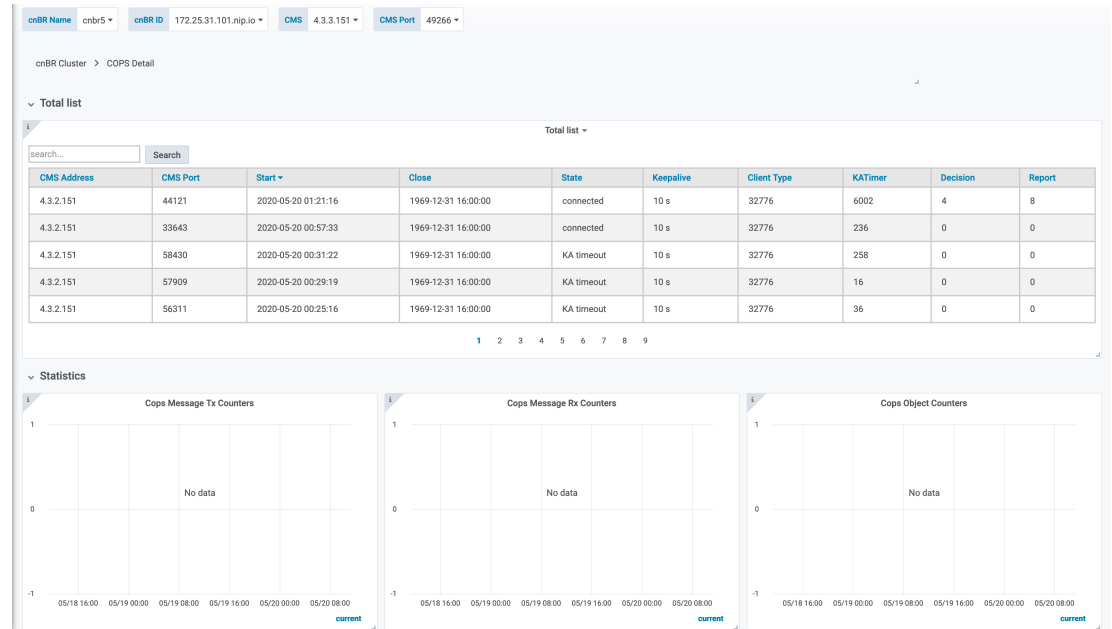

- Table for Ongoing Call Status
  - Modem - Modem MAC address.
  - Subscriber - Subscriber's MTA IP address.
  - Start time - The start time for the call.
  - Duration - Call duration.
  - CMS - Call Management Server IP address.
  - Gate ID - Gate identifier.
  - SFID(US) - Service flow ID for upstream.
  - SFID(DS) - Service flow ID for downstream.
- Table for Completed Call Status
  - Modem - Modem MAC address.
  - Subscriber - MTA IP address.
  - Start time - The start time for the call.
  - Stop time - The stop time for the call.
  - Duration - Call duration.
  - CMS - Call Management Server IP address.
  - Gate ID - Gate identifier.
  - SFID(US) - Service flow ID for upstream.

- SFID(DS) - Service flow ID for downstream.

## COPS Status Page

The COPS Status page shows the COPS connection status as shown in the following figure:

**Figure 28: COPS Status Page**

Legends for each table in the preceding figure.

- Table for Total list
  - CMS Address - Call Management Server IP address.
  - CMS Port - Port of the Call Management Server IP address.
  - Start - The start time for CMS connection.
  - Close - The close time for CMS connection.
  - State - The server connection states.
  - Keepalive - The keepalive time for CMS and Cisco cnBR.
  - Client Type - The client type (32776 for Packetcable and 32778 for Packetcable Multimedia).
  - KATimer - The counter for keepalive message.
  - Decision - The counter for COPS decision message.
  - Report - The counter for COPS report-type message.
  - You can use **Search...** text box to do fuzzy search in the entire table.
- COPS Message Tx Counters

- X-axis - Time.
- Y-axis - The counter for each type of COPS Tx Message.
- COPS Message Rx Counters
  - X-axis - Time.
  - Y-axis - The counter for each type of COPS Rx Message.
- COPS Object
  - X-axis - Time.
  - Y-axis - The counter for each type of COPS Object.

## Service Flow Information

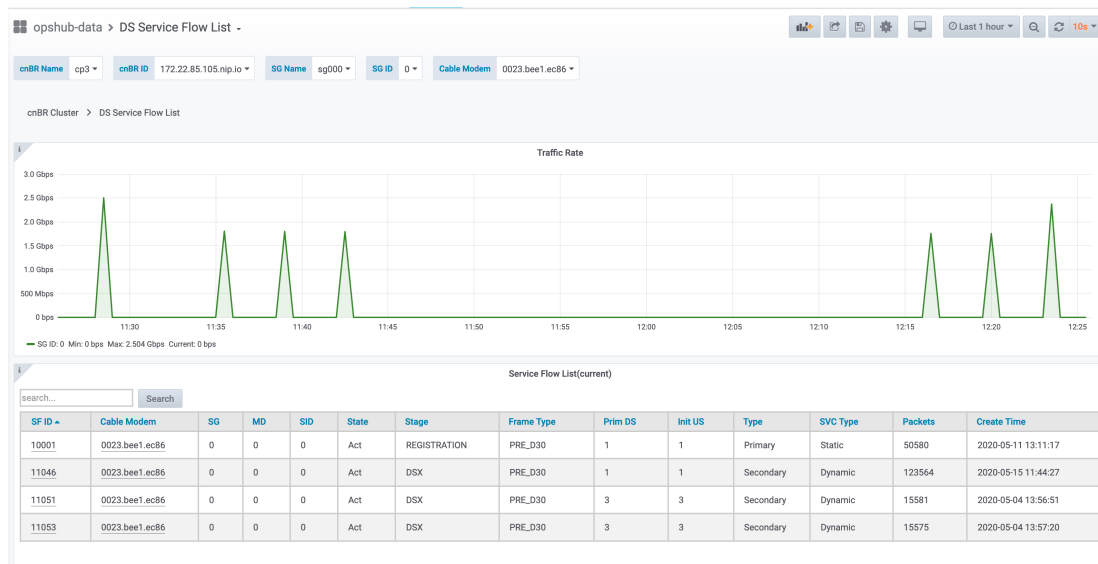

Four dynamic service flows are created to set up a voice path for each two-way call.

One upstream and one downstream service flow are created for each modem in the call.

You can find Service Flow Information for each modem in Downstream Service Flow List or Upstream Service Flow List dashboard.

The Downstream Service Flow List is used as an example in the following figure:

**Figure 29: Service Flow List For Specific Modem**

The downstream dynamic service flow created for voice call is listed under Service Flow List table.

Detailed explanations of each column in Downstream Service Flow List table in the preceding figure.

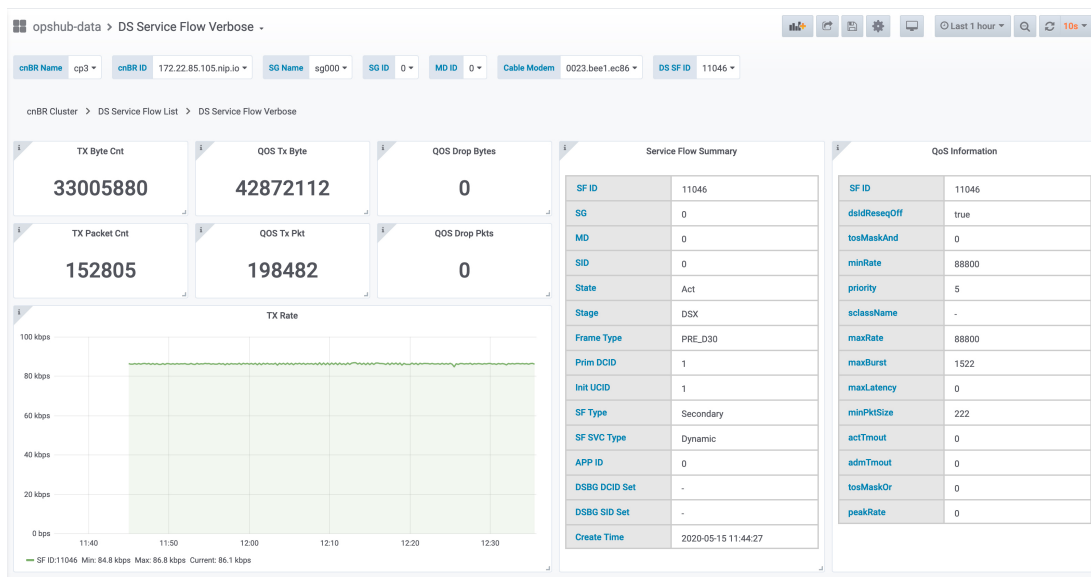

- Table for Downstream Service Flow List
  - SF ID - Service Flow ID.
  - Cable Modem - MAC Address of the modem.

- SG - Service Group of the modem.
- MD - MAC Domain of the modem.
- State - State of service flow [Prov, Adm, Act].
  - Prov - Service flow is in provision state.
  - Adm - Service flow is in admit state.
  - Active - Service flow is active state.
- Stage - Stage of service flow [PRE\_REGISTRATION, REGISTRATION, DSX].
  - PRE\_REGISTRATION - Service flow is provisioned before REGISTRATION.
  - REGISTRATION - Service flow is provisioned in REGISTRATION.
  - DSX - Service flow is dynamically provisioned for voice.
- Frame Type - [PRE\_D30, CCF\_ON, CCF\_OFF].
  - PRE\_D30 - Pre-3.0 DOCSIS concatenation and fragmentation.
  - CCF\_ON - Continuous Concatenation and Fragmentation is enabled.
  - CCF\_OFF - Continuous Concatenation and Fragmentation is disabled.
- Prim DS - Primary downstream channel ID.
- Init US - Init upstream channel ID.
- Type - [Primary, Secondary].
- SVC Type - [Dynamic, Static].
  - Dynamic - Service flow is dynamically provisioned.
  - Static - Service flow is statically provisioned.
- Packets - Number of packets.
- Create Timestamp - When the service flow created.

Clicking on the SFID of dynamic flow in above table to redirect to the Downstream Service Flow Verbose page.

The voice traffic throughput data is available in that page, as shown in the following figure:

Figure 30: Downstream Service Flow Verbose Page

520839

The TX Rate table in the preceding figure shows the downstream traffic throughput for voice.

Legends of relevant tables and counters in the preceding figure.

- Service Flow Traffic Rate
  - X-axis - Time
  - Y-axis - Throughput in kilobit per second
- TX byte cnt is the count of total bytes received by policer.
  - "TX Byte cnt" = "QOS Tx Byte" - "QOS Drop Bytes"
- TX packet cnt is the count of total packets received by policer.
  - "TX Packet Cnt" = "QOS Tx Pkt" - "QOS Drop Pkts"
- QOS TX byte is the count of total bytes sent to policer.
  - "QOS Tx Byte" = "TX Byte cnt" + "QOS Drop Bytes"
- QOS TX pkt is the count of total packets sent to policer.
  - "QOS Tx Pkt" = "TX Packet Cnt" + "QOS Drop Pkts"
- QOS drop bytes are the drop bytes count of policer, includes policer drops, queue full drops, and approximate Fair Drop drops.
  - "QOS Drop Bytes" = "QOS Tx Byte" - "TX Byte cnt"
- QOS drop pkts are the drop packets count of policer, includes policer drops, queue full drops, and approximate Fair Drop drops.
  - "QOS Drop Pkts" = "QOS Tx Pkt" - "TX Packet Cnt"

# Video Services

Cisco cnBR provides the control plane to enable Video Services between RPDs and Traffic Engines. Traffic Engines are legacy devices that support only data plane functions. Traffic Engines do not support the L2TPv3 control plane protocol or the GCP protocol. The Cisco cnBR configures static L2TPv3 pseudowires on RPDs so that they can communicate with Traffic Engines. You must configure matching static pseudowires on the Traffic Engines. The Cisco cnBR does not configure the Traffic Engines.

To support Traffic Engines, Cisco cnBR supports the Downstream Video SC QAM channel and pseudowire configuration on RPD.

## Video Downstream SC QAM

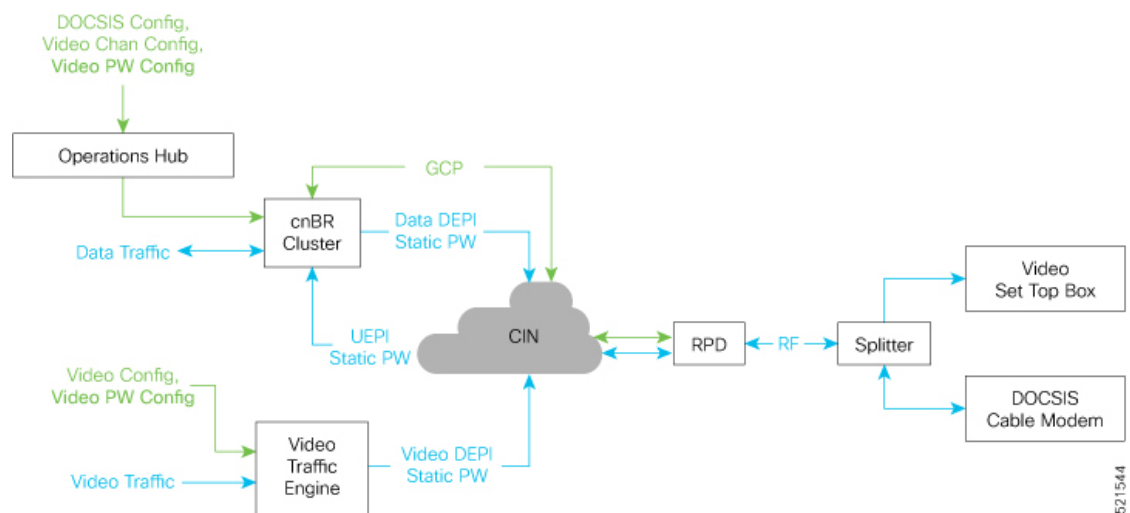

**Table 27: Feature History**

Feature Name	Release Information	Feature Description
Video Downstream SC QAM	Cisco cnBR 21.1	You can configure RPD video QAM and OOB sources (multicast IPv4 or IPv6) without using a cBR-8 or other external video core. This feature allows deployments of Cisco cnBR with RPDs without any third-party devices.

The Cisco cnBR is the DOCSIS principal CCAP core for RPDs. It provides DOCSIS services, but it does not provide video services. There are two ways to support the video services:

- Use a Video Auxiliary CCAP core
- Use Video Traffic Engines

**Figure 31: Video Downstream SC QAM Overview**

521544

In the preceding diagram, the Video Traffic Engine provides the video service but only supports the data plane function. It encapsulates the downstream MPEG video traffic in a DEPI static pseudowire (PW). Video Traffic Engines do not support Generic Control Protocol (GCP) communication with RPDs.

To support Video Traffic Engines, the Cisco cnBR communicates with RPDs using GCP to configure video Downstream SC QAM channels and associated multicast forward static pseudowires. The Cisco cnBR communicates to the RPD about:

- The static pseudowires that carry a video stream
- The Downstream SC QAM channel that transmits the video stream

The cnBR RPD configuration must be consistent with the Video Traffic Engine configuration:

- The cnBR RPD static pseudowires configuration must match the source IP address, group IP address, and sessionID used by the Video Traffic Engine.
- The cnBR RPD Downstream SC QAM configuration (annex, modulation, and symbol-rate) must be consistent with the bit-rate of the associated video stream from the Video Traffic Engine.
- Configure the cnBR RPD Downstream SC QAM for asynchronous video if the Cisco cnBR and the video Traffic Engine are in different timing domains.

The Cisco cnBR supports the following video services:

- Narrowcast – set of channels that apply to one RPD downstream port or a small group of RPD downstream ports.
  - Video on Demand (VoD)
  - Switched Digital Video
- Broadcast – set of channels that apply to a large group of RPD downstream ports across a geographic area.

An explicit configuration of the type of service is not necessary. You can group a set of channels and assign them to groups of RPD downstream ports. You may have to set a broadcast channel group flag for channels that are associated with multiple downstream ports on an RPD node or shelf.

## Configure Video Downstream SC QAM

Configure Video Downstream SC QAM using the cnBR Manager. The configuration involves instantiation of Video Downstream Profile, Video Channel Profile, and Video QAM Template from the cnBR Manager. After defining the Video QAM Template, use the template in the Add RPD operation to configure the Cisco cnBR and RPDs. Perform the following steps to configure Video Downstream SC QAM:

**Step 1** On the Cisco Operations Hub main menu, click **cnBR Manager > Profiles and Templates > Add Profile** and create a **Video DS Profile**.

**Video DS Profile** supports the following configuration parameters for DS SC QAM channels:

Field Name	Description	Type
annex	RF Channel Annex Type. Possible values: AnnexA, AnnexB, or AnnexC	String

Field Name	Description	Type
interleaver	Interleaver depth of a channel. Possible values: fecI8J16, fecI12J17, fecI16J8, fecI32J4, fecI64J2, fecI128J1, fecI128J2, fecI128J3, fecI128J4, fecI128J5, fecI128J6, fecI128J7, or fecI128J8	String
modulation	QAM modulation for the channel. Possible values: qam256, qam64	String
powerAdjust	Power level adjustment for the channel from base power of the RF downstream port. Value range: -8 to 6 in dB	Integer
channelWidth	RF Channel Width in Hz. Mandatory field for annex value: AnnexA Possible values: 6000000, 7000000, 8000000. Optional field for annex values: AnnexB and AnnexC. AnnexB and AnnexC default to and only support 6000000	Integer
symbolRate	Number of symbol changes for each unit of time in kilo-symbols/second. Value range: 3500-7000. Mandatory for 'annex' values, AnnexA and AnnexC. Optional and ignored for AnnexB. AnnexB symbol rate is fixed based on QAM modulation.	Integer
spectrumInversion	RF signal spectrum inversion. True: Channel Spectrum is inverted False: Channel Spectrum is not inverted.	Boolean
rfChanType	Mode in which a QAM channel is operating. Possible values: sync, async. The value, sync indicates that channel operates as a synchronous MPEG video channel. The value async, indicates that channel operates as an asynchronous MPEG video channel. Configure the channel for asynchronous video if the cnBR and video Traffic Engine are in different timing domains.	String

**Step 2**

On the Cisco Operations Hub main menu, click **cnBR Manager > Profiles and Templates > Add Profile** and create a **Video Channel Profile**.

Video Channel Profile represents a group of channels that are connected to specific Video Traffic Engine. Video Channel Profile supports following configuration parameters for DS SC QAM channels.

Field Name	Description	Type
broadCastChanGroup	Instruct RPD to include the channel in a Broadcast Channel Group (BCG). When true, RPD adds the channels to a BCG. A BCG group downstream SC-QAM channels from all Downstream RF Ports identified by the same ID in an SG that has broadcastChanGroup set to true. In this case, the channel is associated with multiple downstream ports on an RPD node or shelf. The same content goes to the same channel on each Downstream port for the BCG	Boolean
idInSGRange	IDs of channels specified as a range. For example: 30-40. Value of channel IDs should be in range 0-157, 163.	String
startSessionId	Unique PW Session Identifier represented in Hexadecimal. The startSessionId value is used as SessionId of first channel in idInSGRange. For subsequent channels, SessionId is incremented by 1. Value range: <b>0x80000001 to 0x8000FFFF</b>	String
startFrequency	The startFrequency is the center frequency of the first channel in idInSGRange. For subsequent channels, frequency value is incremented based on value of annex and channelWidth of channel.	Integer
groupAddress	Group Address of Video Traffic Engine in IPv4 or IPv6	String
sourceAddress	Source Address of Video Traffic Engine in IPv4 or IPv6	String

**Step 3** On the Cisco Operations Hub main menu, click **cnBR Manager > Profile and Templates > Add Template**, and create a **Video QAM Template** by selecting the **Video DS Profile** and the **Video Channel Profile** created in the previous steps.

**Step 4** Perform the [Add RPDs](#) operation using Video QAM Template created in the previous step.

**Note** Only one group of channels can be in a Video Channel Profile. For video services that require multiple channel groups, you must create **Video Channel Profiles** and **Video QAM Templates** for each channel group. For example, discontinuous channel with separate frequency range or sessionID range. While performing **Add RPD** operation, you can select multiple **Video QAM Templates** for each downstream port, allowing you to configure the entire video services in one attempt.

---

### Configure Video Downstream SC QAM Using Autodeployer Script

You can also configure Video Downstream SC QAM using Autodeployer script. See [Configure Cisco cnBR Using Autodeployer, on page 35](#) for additional information.

## Traffic Management

Cisco cnBR provides traffic management functionalities to prevent data loss in important business applications, and to ensure that mission-critical applications take priority over other traffic.

## DOCSIS Downstream QoS

DOCSIS downstream QoS consists of classifying packets into service flows for downstream and providing QoS at the service flow level.

### Packet Classification

The packet classification supports the following packet header fields, as specified in the DOCSIS specification.

IPv4 fields:

- IPv4 TOS values
- IP protocol
- IP source address and mask
- IP destination address and mask

IPv6 fields:

- IPv6 traffic class values
- IPv6 flow label
- IPv6 next header type
- IPv6 source address and prefix length (bits)
- IPv6 destination address and prefix length (bits)

TCP or UDP fields:

- TCP/UDP source port start and end
- TCP/UDP destination port start and end

The packet classifiers are specified in cable modem configuration files. These configuration files are sent to Cisco cnBR either when registering the modem (for static service flows) or later through DSX messages (for dynamic service flows).

## Downstream Service Flow

The basic unit of downstream QoS is the downstream service flow, which is a unidirectional sequence of packets transported across RF channels between Cisco cnBR and cable modems. The following parameters define the QoS of service flows in DOCSIS:

- Maximum sustained traffic rate
- Minimum sustained traffic rate
- Peak traffic rate
- DOCSIS traffic priority
- Maximum traffic burst size
- Maximum DS latency, used to indicate only the absolute priority

A service flow can be in one of the following three states:

- Provisioned
- Admitted
- Active

Only active flows are used to carry traffic and subject to the QoS treatment.

You can specify the service flow parameters directly in the individual modem configuration files or indirectly through the service classes on Cisco cnBR.

## Service Class

Service providers can use service classes to manage QoS parameters. For example, the provider can add QoS parameters to each tier of service it offers in a service class. Use the service class names to match a modem's service flows to a service class, as defined by DOCSIS.

## Downstream QoS Configuration

You can configure all packet classification parameters and the downstream service flow QoS parameters in the modem configuration files. If you want to use the service class feature, configure Cisco cnBR accordingly.

When you use a service class, the modem configuration files should have the service class names that match the ones configured in the service class.

---

**Note** QoS parameters for a service flow are decided when creating the service flow, either during modem registration or its dynamic creation.

---

## Initial Configuration from Autodeployer Script

Configure service classes in the `svcds` block in the SG configuration `json` file. The following traffic parameters are supported.

**Note** The maximum values provided in the following table indicate the valid parameter range. Provide the actual parametric values that are based on the actual system capacity and traffic planning.

Parameter Name	Description	Minimum	Maximum	Unit
maxSustTrafRate	Maximum Sustained Traffic Rate	0	4G	bps
minRsvdTrafRate	Minimum Reserved Traffic Rate	0	4G	bps
peakTrafRate	Peak Traffic Rate	0	4G	bps
trafPrio	Traffic priority used to indicate traffic ratio under congestion	0	7	N/A
maxTrafBurst	Maximum traffic burst	1522	4G	Byte
maxDsLatcy	Indication for High Priority	0	>0	N/A
servClassName	Service Class Name	N/A	N/A	a string

### Example

```

## View Downstream QoS Configuration

---

- Step 1** On the Cisco Operations Hub, click the Cisco Operations Hub main menu button.
- Step 2** Choose **cnBR Manager > Core Management** to open the **cnBR Clusters** page.
- Step 3** Click **Export & Import cnBR** from the vertical navigation tab to access the **Export/Import** page.
- Step 4** In the **Export cnBR Configuration** section, select the target Cisco cnBR from the drop-down list.
- Step 5** Click **Export** to retrieve the SG configuration of the selected Cisco cnBR.
- 

A `.json` file containing the full configuration is saved to your machine. Service class settings are available in the `svcds` block.

## Update Downstream QoS Configuration

You can update the configuration using the following two methods:

- cnBR Manager
- Autodeployer re-configuration

In both these options, the full configuration is sent to the CMTS. The existing configuration is overwritten and the new configuration is activated. For more details, see [Autodeployer Limitations, on page 51](#).

### Using Operations Hub Configurator

---

- Step 1** Click the Cisco Operations Hub main menu button on the top left corner, choose **cnBR Manager > Core Management**, and click **Import & Export cnBR**.
- The **Export/Import** page opens.

Export/Import

Import cnBR Configuration File

cnBR Name

Configuration File

Export cnBR Configuration

cnBR Name

Help

**Import**

1. Select one of cnbr cluster in the list which you'd like to import its configuration.
2. Select configuration file which exported previously.
3. Click Import button.

**Export**

1. Select one of cnbr cluster in the list which you'd like to export its configuration.
2. Click Export button.
3. Rename the filename and store to a proper place.

- Step 2** In the **Export cnBR Configuration** section, choose the Cisco cnBR router address from the drop-down list.
- Step 3** Click **Export** to retrieve the current SG configuration of the selected Cisco cnBR.
- Step 4** Open the file and update the configuration in the `svcds` block of the SG configuration.
- Step 5** Save the updated file on the local disk.
- Step 6** In the **Import cnBR Configuration File** pane, choose the Cisco cnBR address from the drop-down list.
- Step 7** Click **Browse** to locate the saved configuration file.
- Step 8** Click **Import** to upload the updated SG configuration.

---

This updated file overwrites the existing configuration file and activates the new configuration.

### Using Autodeployer Reconfiguration

After the initial configuration of the Source-Verify using the Autodeployer, update the configuration by modifying the appropriate blocks and rerunning the Autodeployer. This process overwrites the existing configuration and activates the new configuration.

For more details on the Autodeployer, see [Configure Cisco cnBR Using Autodeployer, on page 35](#).

### Default Configuration

If the service class configuration does not exist, specify the service flow QoS parameters in the cable modem configuration file.

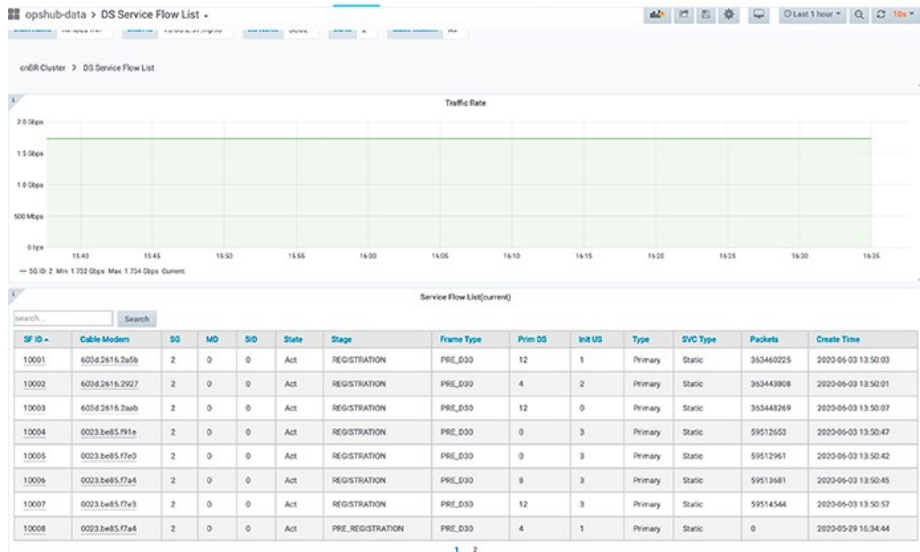

### Downstream QoS Statistics

In cnBR Manager, under **opshub-data** menu, you can see the following service flow details:

- Downstream Service Flow List
- Downstream Service Flow Verbose
- Downstream Service Flows for a Modem

## Downstream Service Flow List

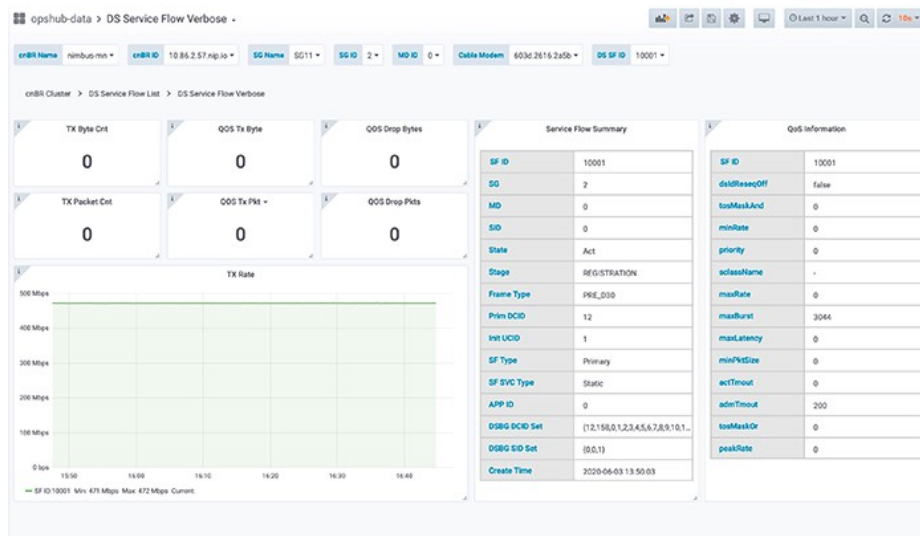

The **Downstream Service Flow List** window provides the details of downstream service flows for each service group. The window displays a live graph of the traffic rate and a table listing all service flows of the selected service group.

520879

## Downstream Service Flow Verbose

This window provides detailed information of an individual downstream service flow, including its transmission rate.

520880

## Downstream Service Flows for Cable Modem

The **Cable Modem Verbose** window provides the downstream service flow rate for all the flows on that modem.

## Punt Path Rate Limiting in Data Plane

The Cisco cnBR *punts* packets that the Data Plane (DP) cannot process to application services (for example, DHCP relay service) through **to-app-svc** queues. For example, ARP packets, DHCP packets, IP packets destined to unresolved adjacency, and so on.

The DP *punt-path* assigns a punt-cause to each punted packet, and prepares the packet for entry into **to-app-svc** queues.

**Figure 32: Punt path rate-limiting**

Denial of Service occurs when a service starts tail-dropping legitimate packets as a result of the queues becoming congested. To prevent this congestion, punt-path rate limiting (PPRL) operates in the punt-path to drop packets selectively. The Cisco cnBR identifies malicious actors and drops corresponding packets, while punting legitimate packets.

Cisco cnBR rate limiting operates on two levels:

- Source-Based Rate Limiting (SBRL) combines the subscriber MAC-address and the punt-cause to create an index for rate-limiting.
- Punt-Policer uses the punt-cause as the index for rate-limiting.

SBRL operates first. The Cisco cnBR combines MAC-address and punt-cause to create an index for rate-limiting. The Cisco cnBR rate-limits this MAC/punt stream according to the configured rate. The Cisco cnBR drops nonconforming packets. SBRL uses the source MAC address in the upstream direction and the destination MAC address in the downstream direction.

Next, the Punt-Policer aggregates packets with the same punt-cause, and rate-limits each punt-cause according to the configured rate. The Cisco cnBR drops nonconforming packets.

The following table lists the supported punt-causes:

Cause Id	Cause Name	Cause Description
6	dhcpv4_us	DHCP IPv4 upstream
14	dhcpv6_us	DHCP IPv6 upstream
10	cable_arp	ARP request and reply
11	ndp	Neighbor discovery protocol
20	svfy_v4	Source-verify IPv4
21	svfy_v6	Source-verify IPv6
22	ds_lq_v4	Lease query downstream IPv4
23	ds_lq_v6	Lease query downstream IPv6
25	mobility_v4	IPv4 CPE mobility
26	mobility_v6	IPv6 CPE mobility
7	tftp_req	TFTP request
32	ds_no_adj_v4	No adjacency downstream IPv4
33	ds_no_adj_v6	No adjacency downstream IPv6

## Configure Punt Path Rate Limiting

Both SBRL and Punt-Policer configurations are on a per-punt-cause basis.

### Initial Configuration of Punt Path Rate Limiting From Autodeployer Script

In the Autodeployer script SG template file, the PPRL configuration is in the *punt* block. Configure SBRL using the *subMacAddrSbrlList* block. Configure Punt-Policer using the *icpiPerCausePuntCfgList* block.

```
"sgs": [
 ...
 "sg-config": {
 ...
 "punt": {
 "subMacAddrSbrlList": [
 {
```

```

 "PuntCause":cable_arp,
 "RateLimitCfg": {
 "RatePer4Sec":1000,
 "BurstTimeMs":7000
 }
 },
 {
 "PuntCause":ndp,
 "RateLimitCfg": {
 "RatePer4Sec":6000,
 "BurstTimeMs":6000
 }
 }
]
 "icpiPerCausePuntCfgList": [
 {
 "CauseId": 20,
 "icpiPerCausePuntCfg": {
 "MaxRate": 20
 }
 },
 {
 "CauseId": 21,
 "icpiPerCausePuntCfg": {
 "MaxRate": 20
 }
 },
 {
 "CauseId": 22,
 "icpiPerCausePuntCfg": {
 "MaxRate": 20
 }
 },
 {
 "CauseId": 23,
 "icpiPerCausePuntCfg": {
 "MaxRate": 20
 }
 }
]
}
...
}
]

```

## View Punt Path Rate Limiting Configuration

- 
- Step 1** On the Cisco Operations Hub, click the Cisco Operations Hub main menu button.
  - Step 2** Choose **cnBR Manager > Core Management** to open the **cnBR Clusters** page.
  - Step 3** Click **Export & Import cnBR** from the vertical navigation tab to access the **Export/Import** page.
  - Step 4** In the **Export cnBR Configuration** section, select the target Cisco cnBR from the drop-down list.
  - Step 5** Click **Export** to retrieve the SG configuration of the selected Cisco cnBR.
- 

A .json file containing the full configuration is saved to your machine. PPRL settings are available in the *punt* block.

## Update Punt Path Rate Limiting Configuration

You can update the configuration using the following methods:

- cnBR Manager
- Autodeployer reconfiguration

Both options send the full configuration to the CMTS. The Cisco cnBR overwrites the existing configuration and activates the new configuration. For more details, see [Autodeployer Limitations, on page 51](#).

### Update Configuration Using cnBR Manager

- 
- Step 1** On the Cisco Operations Hub, click the Cisco Operations Hub main menu button.
- Step 2** Choose **cnBR Manager > Core Management** to open the **cnBR Clusters** page.
- Step 3** Click **Export & Import cnBR** from the vertical navigation tab to access the **Export/Import** page.
- Step 4** In the **Export cnBR Configuration** section, select the target Cisco cnBR from the drop down list.
- Step 5** Click **Export** to retrieve the SG configuration of the selected Cisco cnBR.
- Step 6** Update the configuration in the *punt* block of the SG configuration and save the file.
- Step 7** In the **Import cnBR Configuration File** section, select the target Cisco cnBR from the drop down list.
- Step 8** Click **Browse** and select the saved configuration file.
- Step 9** Click **Import** to push the updated SG configuration.
- 

This import overwrites the existing configuration and activates the new configuration.

### Update Configuration Using Autodeployer Reconfiguration

After the initial configuration of SBRL and Punt-Policer using the Autodeployer, update the configuration by modifying the corresponding blocks in the Autodeployer script and rerunning the Autodeployer. This process overwrites the existing configuration and activates the new configuration.

## Configuration Parameters

*Table 28: SBRL Configuration Parameters*

Field Name	Description	Type	Units	Value	Enforcement
PuntCause	Punt cause ID to be rate limited	string	—	dhcpv4_us, dhcpv6_us, cable_arp, ndp, svfy_v4, svfy_v6, ds_lq_v4, ds_lq_v6, mobility_v4, mobility_v6, tftp_req, ds_no_adj_v4, ds_no_adj_v6	Required

Field Name	Description	Type	Units	Value	Enforcement
RatePer4Sec	Max rate in pkts-per-4-sec	integer	pkts-per-4-sec	1-255	Required
BurstTimeMs	For burst packets handling	integer	microseconds	1000-8000	Optional

Table 29: Punt-Policer Configuration Parameters

Field Name	Description	Type	Units	Value	Enforcement
CauseId	Punt cause ID to be rate limited	integer	—	6, 14, 10, 11, 20-23, 25, 26, 7, 32, 33	Required
MaxRate	Max rate in pkts-per-sec	integer	pkts-per-sec	10-300000	Required

## Default Configuration of Punt Path Rate Limiting

Table 30: SBRL Default Configuration

PuntCause	RatePer4Sec(pkts/4-sec)	BurstTime(msec)
dhcpv4_us	16	4000
dhcpv6_us	16	4000
cable_arp	16	4000
ndp	16	4000
svfy_v4	4	4000
svfy_v6	4	4000
ds_lq_v4	4	4000
ds_lq_v6	4	4000
mobility_v4	16	4000
mobility_v6	16	4000
tftp_req	16	4000
ds_no_adj_v4	4	4000
ds_no_adj_v6	4	4000

Table 31: Punt-Policer Default Configuration

CauseId	Cause Description	MaxRate(pkts/sec)
6	DHCP IPv4 upstream	1200
14	DHCP IPv6 upstream	1200

CauseId	Cause Description	MaxRate(pkts/sec)
10	ARP request and reply	1200
11	Neighbor Discovery Protocol	1200
20	Source-verify IPv4	1200
21	Source-verify IPv6	1200
22	Lease query downstream IPv4	400
23	Lease query downstream IPv6	400
25	IPv4 CPE mobility	1200
26	IPv6 CPE mobility	1200
7	TFTP request	1200
32	No adjacency downstream IPv4	400
33	No adjacency downstream IPv6	400

## Monitor Punt Path Rate Limiting

In the cnBR Manager Metrics home page, click **Home** on the top left of the **Metrics** home page to bring up the dashboard search box. Search for Punt Inject Stats page by typing **Punt Inject Stats** in the **Search dashboards by name** field.

Punt Inject Stats page contains the PPRL statistics. Overall punt statistics are also available, along with SBRL and Punt-Policer statistics.

**Figure 33: Overall Punt Statistics**

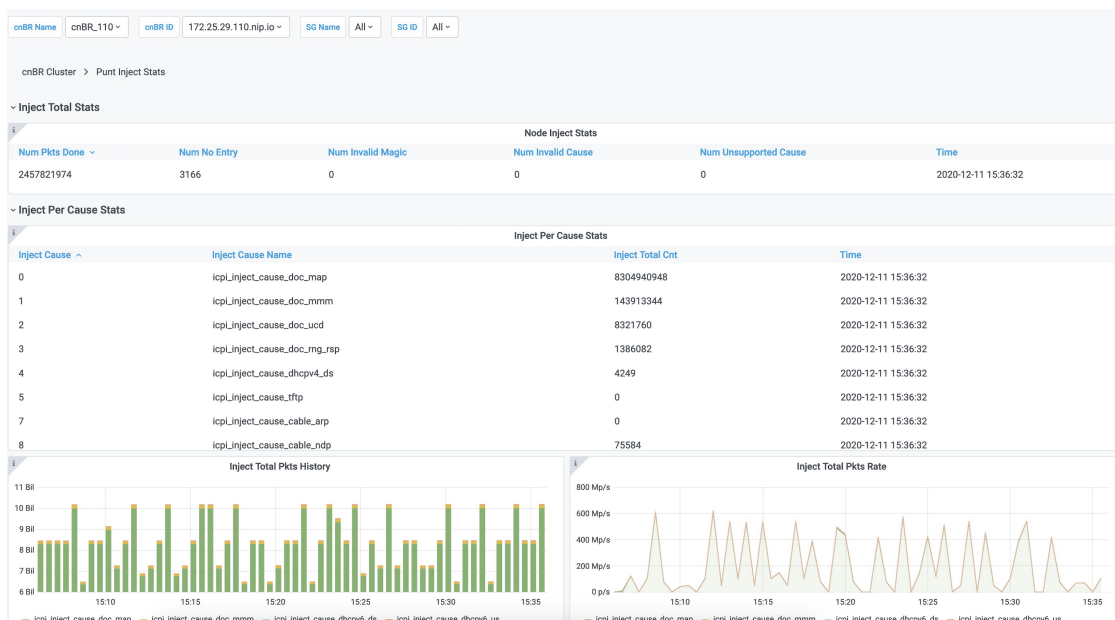

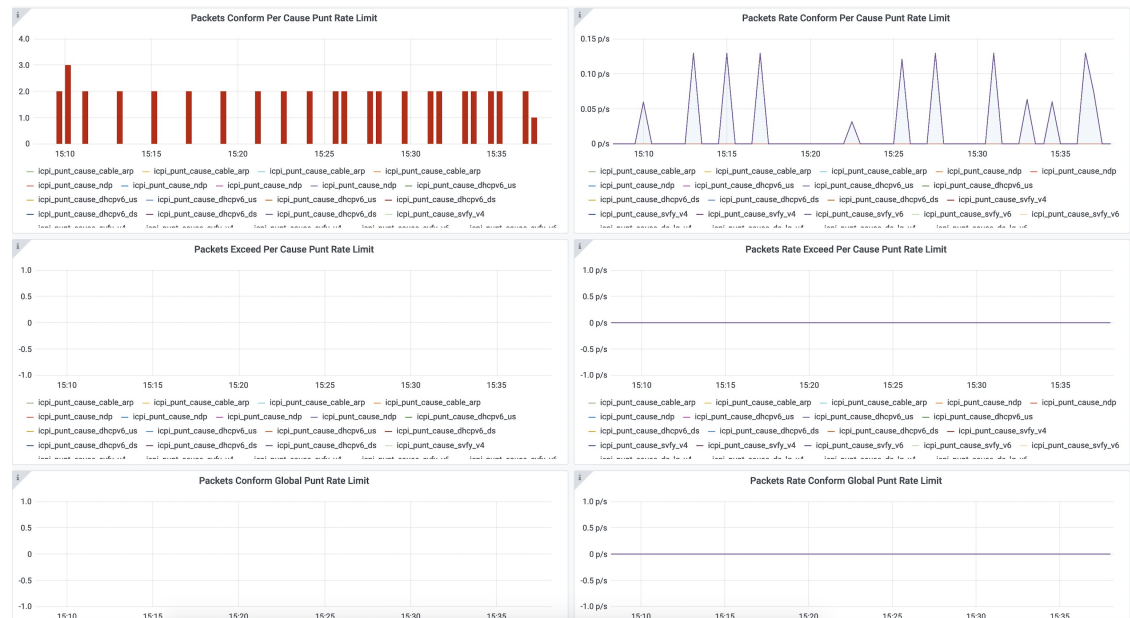

Figure 34: SBRL Statistics

Figure 35: Punt-Policer Statistics

## Upstream Type-of-Service (ToS) Overwrite

The Cisco cnBR can overwrite the DSCP/ToS field of packets associated with the DOCSIS Service Flow.

### Configure ToS

Currently, you can configure ToS Overwrite through only the DOCSIS configuration file.

### DOCSIS Configuration File

The DOCSIS service flow parameter *IP Type of Service (DSCP) Overwrite* contains two bytes, one for the **tos-and-mask** and one for the **tos-or-mask**. According to DOCSIS requirements, when you configure a

Service Flow with an *IP Type of Service (DSCP) Overwrite* parameter, the CMTS overwrites the DSCP/ToS value in the IP packets as follows:

```
new-ip-tos = ((orig-ip-tos AND tos-and-mask) OR tos-or-mask)
```

DOCSIS cable-modem configuration file uses *IP Type of Service Flow* under *Upstream Service Flow Encodings* to configure the upstream service flow parameter *IP Type of Service (DSCP) Overwrite*.

SubType	Length	Value
23	2	[and-mask, or-mask]

A configuration example is following:

```
24 (Upstream Service Flow Encoding)
 S01 (Service Flow Reference) = 4
 S06 (QoS Parameter Set Type) = 7
 S023 (IpTosOverwrite) = 00 FF
```

More information on the DOCSIS parameters is available in DOCSIS 3.0 MAC and Upper Layer Protocols Interface Specification.

## Default Configuration of ToS

By default ToS Overwrite is disabled; so the Cisco cnBR does not overwrite the DSCP/ToS field in the packet.

## Enabling Security

Cisco cnBR provides security functionalities to defend against outside attacks.

## Packet Filtering

Packet Filtering provides the ability to configure device-specific filters in the upstream and downstream directions.

- Devices are assigned with upstream and downstream filter groups through the DOCSIS configuration file.
- Different groups can be assigned for the upstream and downstream directions.
- If no filter group is specified in the DOCSIS configuration file, devices receive the default group configured on Cisco cnBR.
- If no default filter group is specified on Cisco cnBR, then no filtering is applied and the default action is FORWARD.

The rules for filter groups are configured on Cisco cnBR. Matching rules and actions (FORWARD or DROP) are specified in priority order. Rules are based on layer 2, layer 3, and layer 4 packet fields.

By default, Packet Filtering is disabled.

## Configure Packet Filtering

**Note** Cable modems use the settings that are active during CM registration. If the default Packet Filtering groups are changed, you must reset cable modems to use the updated settings.

### Initial Configuration using AutoDeployer Script

- In the Optional Configuration section of [Configure Cisco cnBR Using Autodeployer, on page 35](#), Packet Filtering configuration is in the `pfgActive` and `pfgGroup` blocks.
- Default Packet Filtering groups are specified in the `pfgActive` block.
- Rules for the groups are specified in the `pfgGroup` block.

The following is a sample configuration along with some explanation.

- The default filter group for downstream packets to a cable modem (`cm_ds`) is Group 10.
- Group 1 defines a filter that permits 90.90.90.2 ICMP packets, while denying other 90.90.90.0/24 ICMP packets. Groups 1 and 2 are not default groups. Therefore assign devices to these groups via the DOCSIS configuration file.

```

## Display Current Configuration using cnBR Manager

- Step 1** On the Cisco Operations Hub, click the Cisco Operations Hub main menu button.
- Step 2** Choose **cnBR Manager > Core Management** to open the **cnBR Clusters** page.
- Step 3** Navigate to **cnBR-Core Manage > cnBR Cores**.
- Step 4** Click on Cisco cnBR name in the table to open the **cnBR Cluster Configuration** page.
- Step 5** Click on drop-down menu and select **PFG Active** or **PFG Group** to display the corresponding configuration.

**Figure 36: PFG Active Configuration**

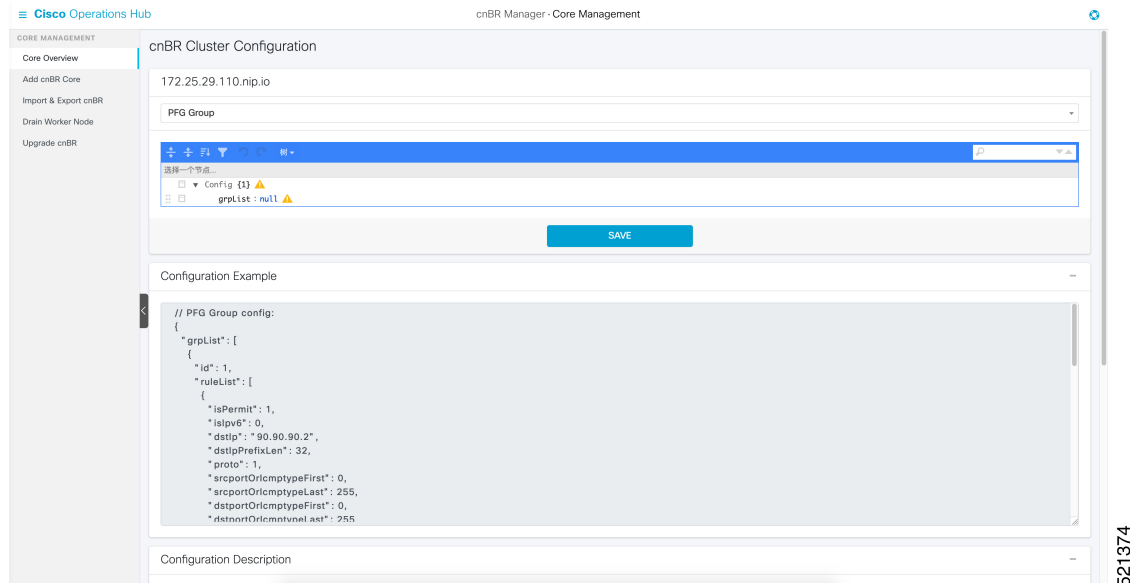

Figure 37: PFG Group Configuration

521374

## Update Configuration using cnBR Manager

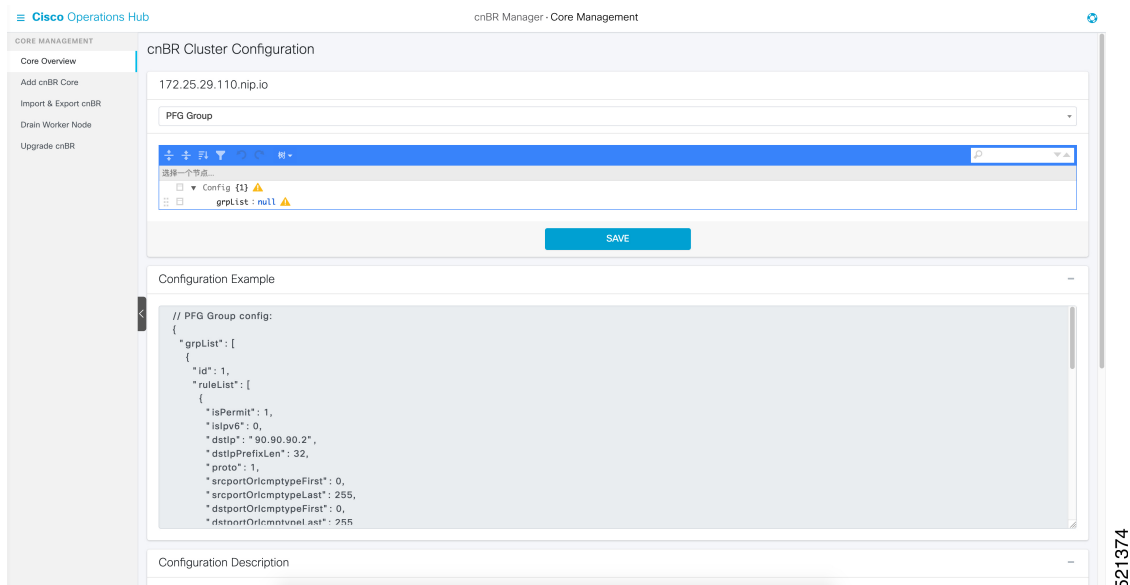

- Step 1** On the Cisco Operations Hub, click the Cisco Operations Hub main menu button.
- Step 2** Choose **cnBR Manager** > **Core Management** to open the **cnBR Clusters** page.
- Step 3** Navigate to **cnBR-Core Manage** > **cnBR Cores**.
- Step 4** Click on Cisco cnBR name in the table to open the **cnBR Cluster Configuration** page.
- Step 5** Click on drop-down menu and select **PFG Active** or **PFG Group** to display the corresponding configuration.

Figure 38: PFG Active Configuration

521373

Figure 39: PFG Group Configuration

521374

**Step 6** Modify the configuration.

**Step 7** Click **SAVE** to push the updated configuration to the Cisco cnBR.

## Update Configuration using Autodeployer Reconfiguration

After the initial configuration of Packet Filtering following the [Configure Cisco cnBR Using Autodeployer, on page 35](#), you can update the configuration by modifying the appropriate blocks and rerunning the AutoDeployer. It fully overwrites the existing configuration and activates the new configuration. See [Autodeployer Limitations, on page 51](#).

## Configuration Parameters

- A group can have multiple rules. Rules are processed in the listed order.
- If a packet matches a rule, the specified action is performed and filtering is complete.
- If a packet does not match any rule in the group, the packet is forwarded.

**Table 32: PFG Active: Default Packet Filtering Groups**

Field Name	Description	Type	Range	Enforcement
cm_ds	Cable Modem downstream default group	integer	-1 means no group, otherwise [1, 254]	required
cm_us	Cable Modem upstream default group	integer	-1 means no group, otherwise [1, 254]	required
host_ds	Host (ie. CPE) downstream default group	integer	-1 means no group, otherwise [1, 254]	required
host_us	Host (ie. CPE) upstream default group	integer	-1 means no group, otherwise [1, 254]	required
mta_ds	Multimedia Terminal Adaptor downstream default group	integer	-1 means no group, otherwise [1, 254]	required
mta_us	Multimedia Terminal Adaptor upstream default group	integer	-1 means no group, otherwise [1, 254]	required
ps_ds	Portal Server downstream default group	integer	-1 means no group, otherwise [1, 254]	required
ps_us	Portal Server upstream default group	integer	-1 means no group, otherwise [1, 254]	required
stb_ds	Set-Top Box downstream default group	integer	-1 means no group, otherwise [1, 254]	required
stb_us	Set-Top Box upstream default group	integer	-1 means no group, otherwise [1, 254]	required

**Table 33: PFG Group: Rule Definition**

Field Name	Description	Type	Enforcement
isPermit	0 means deny, 1 means permit	Integer	required
isIpv6	0 means IPv4, 1 means IPv6	Integer	required
srcIp	Source IP value	IPv4 or IPv6	required
srcIpPrefixLen	Source IP prefix length	Integer	required
dstIp	Destination IP value	IPv4 or IPv6	required
dstIpPrefixLen	Destination IP prefix length	Integer	required

Field Name	Description	Type	Enforcement
tosValue	ToS/traffic class value	Integer	required
tosMask	ToS/traffic class mask	Integer	required
proto	Layer 4 protocol	Integer	required
srcportOrIcmptypeFirst	Start of source port or ICMP4/6 type range	Integer	required
srcportOrIcmptypeLast	End of source port or ICMP4/6 type range	Integer	required
dstportOrIcmpcodeFirst	Start of destination port or ICMP4/6 code range	Integer	required
dstportOrIcmpcodeLast	End of destination port or ICMP4/6 code range	Integer	required
tcpFlagsValue	TCP flags value	Integer	required
tcpFlagsMask	TCP flags mask	Integer	required

## Source-Verify

Source-Verify inhibits certain types of Denial of Service attacks based on IP address spoofing and IP address theft. When you enable Source-Verify, Cisco cnBR verifies the validity of IP packets received from CMs and CPEs. This verification is based on layer 2 and layer 3 addresses known to Cisco cnBR. Cisco cnBR learns the layer 2 and layer 3 addresses when DHCP assigns IP addresses to CM and CPE clients. If Cisco cnBR cannot determine the validity of a packet, it generates a lease-query in order to verify the packet. Source-Verify supports CPE IPv6 Prefix Delegation.

## Source-Verify Logic

The following flowchart describes the Source-Verify logic in Cisco cnBR.

Figure 40: Source-verify logic

### Bypass Logic

Cisco cnBR forwards packets that match any of the following criteria. These packets pass Source-Verify.

- IPv4 packets with src address 0.0.0.0
- IPv6 packets with multicast link local destination address

- IPv6 packets with unicast link local source or destination address
- IPv6 packets with unspecified source address

### Invalid src Logic

Cisco cnBR drops packets that match the following criteria. These packets fail Source-Verify.

- IPv4 packets with source address 255.255.255.255

## Configure Source-Verify

### Initial Configuration of Source Verify From Autodeployer Script

In the Autodeployer script L3 template file, the Source-Verify configuration is in the *dhcp* block. To enable IPv4 Source-Verify, set *ipv4Lq* to true. To enable IPv6 Source-Verify, set *ipv6Lq* to true. To enable mobility, align CM/CPE scope with *mobilityScopes*.

```
"sgs": [
 ...
 "sg-config": {
 ...
 "dhcp": {
 "arpGlean": true,
 "arpProxy": true,
 "dhcpIfname": "cnr",
 "dhcpServers": [
 "10.2.2.91"
],
 "ipv4Lq": true,
 "ipv6Lq": true,
 "mobilityScopes": [
 "10.1.1.1/24",
 "2001::a/88"
],
 "ndProxy": true,
 "relayModeV4": 0,
 "relayModeV6": 0,
 "relayPolicies": [
 {
 "deviceClass": "HOST",
 "giAddr": "24.44.9.2",
 "linkAddr": "2010::1",
 "v4ServerIp": "1.2.2.91"
 }
],
 "v4Nets": [
 "9.44.9.2/24",
 "24.44.9.2/24"
],
 "v6Nets": null
 },
 ...
]
}
```

## View Source Verify Configuration

**Step 1** On the Cisco Operations Hub, click the Cisco Operations Hub main menu button.

- Step 2** Choose **cnBR Manager > Core Management** to open the **cnBR Clusters** page.
- Step 3** Click **Export & Import cnBR** from the vertical navigation tab to access the **Export/Import** page.
- Step 4** In the **Export cnBR Configuration** section, select the target Cisco cnBR from the drop-down list.
- Step 5** Click **Export** to retrieve the SG configuration of the selected Cisco cnBR.

---

A .json file containing the full configuration is saved to your machine. Source-Verify settings are available in the *dhcp* block.

## Update Source-Verify Configuration

You can update the configuration using the following methods:

- cnBR Manager Configurator
- Autodeployer reconfiguration

Both options send the full configuration to the CMTS. Cisco cnBR overwrites the existing configuration and activates the new configuration. For more details, see [Autodeployer Limitations, on page 51](#).

### Update Configuration using cnBR Manager

- 
- Step 1** From the Cisco Operations Hub, click the Cisco Operations Hub main menu button.
- Step 2** Choose **cnBR Manager > Core Management** to open the **cnBR Clusters** page.
- Step 3** Click **Export & Import cnBR** from the vertical navigation tab to access the **Export/Import** page.
- Step 4** In the **Export cnBR Configuration** section, select the target Cisco cnBR from the drop down list.
- Step 5** Click **Export** to retrieve the SG configuration of the selected Cisco cnBR.
- Step 6** Update the configuration in the *dhcp* block of the SG configuration and save the file.
- Step 7** In the **Import cnBR Configuration File** section, select the target Cisco cnBR from the drop down list.
- Step 8** Click **Browse** and select the saved configuration file.
- Step 9** Click **Import** to push the updated SG configuration.

---

This import overwrites the existing configuration and activates the new configuration.

### Update Configuration Using Autodeployer Reconfiguration

After the initial configuration of Source-Verify using the Autodeployer, update the configuration by modifying the corresponding blocks in the Autodeployer script and rerunning the Autodeployer. This process overwrites the existing configuration and activates the new configuration.

## Default Source-Verify Configuration

By default, Source-Verify for both IPv4 and IPv6 is disabled.

## Monitor Source-Verify

When the Cisco cnBR is unable to determine packet validity in the dataplane, it punts the packet for lease-query generation. Only punt statistics are available for Source-Verify.

- Mobility packets get the *mobility\_v4* or *mobility\_v6* punt-cause.
- All other Source-Verify punts get the *svfy\_v4* or *svfy\_v6* punt-cause.

In the cnBR Manager **Metrics** home page, click **Home** on the top left of the Metrics home page to bring up the dashboard search box. Search for Punt Inject Stats page by typing **Punt Inject Stats** in the **Search dashboards by name** field.

The Punt Inject Stats page contains the punt statistics for Source-Verify and Mobility. Punted packets are subject to Punt-Rate-Limit processing. See [Punt Path Rate Limiting in Data Plane, on page 173](#) for more information on these statistics.

**Figure 41: Punt Inject Stats Page**

## CHAPTER 4

# Cisco Cloud Native Broadband Router Maintenance

---

Cisco cnBR enables you to perform software upgrades seamlessly, and without disrupting any of the services. You can continuously deploy new services and features with minimal downtime.

- [RPD Secure Software Download, on page 193](#)
- [Offline Image Upgrade, on page 197](#)
- [Service Group Operations, on page 200](#)
- [Export and Import Configuration, on page 202](#)

## RPD Secure Software Download

The cnBR Manager provides automated ways to securely download and activate software images to RPDs.

The secure software download (SSD) feature helps you to authenticate the source of a file and verify the integrity of the downloaded code before you use it in your system. The SSD feature is applicable to Remote PHY (R-PHY) devices installed in unsecure locations.

## Prerequisites

To use SSD, the following prerequisites must be met:

- For Non-Express mode: The RPD software image is available at an external TFTP or HTTP image server. The image server is where the software image is stored, and can be accessed by RPD.
- For Express mode: The RPD software image is available in the Cisco Operations Hub. Ensure that RPD has connectivity to the management IP of Cisco Operations Hub.
- Ensure that code validation certificates are available. For more information, go through the [Add Code Validation Certificates](#) topic.

## Upload Software Image for RPD

For Express-mode of SSD, upload the software image to the cnBR Manager. Complete the following steps:

- 
- Step 1** Log in to the Cisco Operations Hub.
- Step 2** Choose **cnBR Manager > Remote PHY Device Management** from the Cisco Operations Hub main menu and click **Image Management**.
- Step 3** Click **Choose file** to select the RPD software image file that you want to upload.
- Step 4** Click **Upload**.

To delete any of the listed software image files, click the **X** icon that appears against the image name.

---

## Download Software Image for RPD

Download the software image from the specified server. The software image is available on an external TFTP or HTTP image server.

To download an RPD software image using SSD, complete the following steps:

---

- Step 1** Manually upload the software image to the external image server.
- Step 2** Add code validation certificates.
- Step 3** Upgrade the software image.

**Note** You need to download the software image for RPD only for Non-Express mode. For Express mode, the image is available in the Operations Hub.

---

## Add Code Validation Certificates

To authenticate the source and verify the integrity of the software image, Cisco cnBR uses the following two types of RPD code validation certificates (CVC).

- **M-CVC:** The type of CVC released along with the Cisco RPD software image. Contact Cisco Support to get the M-CVC.
  - **C-CVC:** The type of CVC created and signed through Manufacturer's Statement of Origin (MSO). When CVCs are available, upload them using the following procedure:
- 

- Step 1** Log in to the Cisco Operations Hub.
- Step 2** Choose **cnBR Manager > Remote PHY Device Management** from the Cisco Operations Hub main menu and click **Code Validation Check**.
- Step 3** Copy the contents from the CVC file to the appropriate text box and click **Add**.
-

## Upgrade the Software Image

To upgrade the software, complete the following steps:

- 
- Step 1** Log in to the Cisco Operations Hub.
- Step 2** Choose **cnBR Manager > Remote PHY Device Management** from the Cisco Operations Hub main menu and click **Secure Software Download**.
- Step 3** Scroll down the page and use the toggle button to choose to upgrade using either of the following options:
- Express Mode
  - Non-Express Mode
- 

### Upgrade RPD in Express Mode

Complete the following steps to upgrade the RPD software in Express mode:

**Note** Express mode works only with HTTP on PORT 80.

---

- 
- Step 1** Log in to the Cisco Operations Hub.
- Step 2** Choose **cnBR Manager > Remote PHY Device Management** from the Cisco Operations Hub main menu and click **Secure Software Download**.
- Step 3** Click **On** in the toggle button to choose the Express Mode option.  
This step enables the Express mode, and the corresponding text fields are visible.
- Step 4** Enter the following details in the appropriate text fields:
- | Field     | Description                                                               |
|-----------|---------------------------------------------------------------------------|
| RPD Image | Choose the image from the list of available images in the drop-down list. |
- Ensure that the RPD is able to reach the Cisco Operations Hub management IP.
- Step 5** Filter out the required RPDs by using the search field in the **RPD Summary** section. The list depicts the target RPDs for upgrade.
- Step 6** Click **Upgrade Now** to upgrade the image without a reboot. Alternatively, you can also choose to upgrade during the next reboot by clicking **Save Configuration**.
- 

### Upgrade RPD in Non-Express Mode

Complete the following steps to upgrade the RPD software in Non-Express mode:

- Step 1** Log in to the Cisco Operations Hub.
- Step 2** Choose **cnBR Manager > Remote PHY Device Management** from the Cisco Operations Hub main menu and click **Secure Software Download**.
- Step 3** Click **Off** in the Express Mode toggle button to choose the non-Express Mode option. This step enables the Non-Express mode.
- Step 4** Enter the following details in the appropriate text fields:

Field	Description
Image Server	Address of the server that stores the software image, and from where RPDs can access the software images.
Image Path	The relative path of the RPD software image on the server. The file is available in the default directory of the image server.
Method	HTTP or TFTP for RPD download SSD image.
M-CVC	Indicator showing whether the certificate is valid or not.
C-CVC	Indicator showing whether the certificate is valid or not.

Ensure that the RPD is able to reach the Cisco Operations Hub management IP.

- Step 5** Filter out the target RPDs by using the search field in the **RPD Summary** section. The RPDs in this list of RPDs are the target RPDs for upgrade.
- Step 6** Click **Upgrade Now** to upgrade the image without a reboot. Alternatively, you can also choose to upgrade during the next reboot, by clicking **Save Configuration**.

## Monitor RPD and SSD State

The RPD SSD window provides options to monitor and trigger SSD operations. A dashboard, displaying three pie charts, provides details of the RPD status and metrics. Access this dashboard under the **Cisco Operations Hub > cnBR Manager > Remote PHY Device Management > Secure Software Download**.

- **RPD State:** Displays the states of RPDs that are upgraded. During the upgrade process, the RPD becomes offline and then returns online.
- **Software Version:** Shows the number of RPDs for each RPD software version.
- **SSD State:** Shows various phases of the SSD progress of RPDs.

### RPD Summary

The **RPD Summary** table provides details of RPDs which can be upgraded. You can also search for a specific RPD or set of RPDs that can be upgraded. The following table explains the fields in the **RPD Summary** pane.

Field	Description
Name	Name of the RPD.

Field	Description
MAC Address	MAC address of the RPD.
Service Group	Service group ID of the RPD.
IPv4 Address	IPv4 address of the RPD.
IPv6 Address	IPv6 address of the RPD.
State	Status of the RPD: <ul style="list-style-type: none"> <li>• online</li> <li>• offline</li> </ul>
CCMTS ID	Host name of the Cisco cnBR application. Example: cnbr1.cisco.com
SSD State	Phase of the SSD progress.
Software Version	Version of the software running on the RPD.
Online Timestamp	Time when the RPD became online.

## Offline Image Upgrade

Cisco cnBR supports offline image upgrade. The image upgrade workflow provides a dashboard that simplifies the image upgrade for both Cisco cnBR and Cisco Operations Hub.

**Note** The image upgrade workflow supports only the upgrade of the `cmts-app`, `opshub-app`, and `cloud-infra-app` charts.

## Image Upgrade Preparation

Use the following steps to prepare an image for upgrade:

- 
- Step 1** Log in to the Cisco Operations Hub.
- Step 2** Choose **cnBR Manager > Core Management** from the Cisco Operations Hub main menu and click **Add cnBR Core**.
- Step 3** Provide a unique name to the Cisco cnBR core, a namespace, and Core Ingress-host-name.  
See the following example:
- ```
cnBR-Core Name: Upgrader-demo
Core Namespace: cmts-infra
Core Ingress-host-name: cnbr1.cisco.com
```
- Step 4** Enter the Cisco cnBR username and password.

- Step 5** Click **ADD**.
- Step 6** Copy the `cnbr-installer-v20.2-06042020.tar.gz` installer bundle image to a staging server.
The installer bundle name `<06042020>` denotes the date MMDDYYYY.
- Step 7** Decompress the image into the directory.
- Step 8** Set up the configuration file by following the steps at [Step 1](#) and [Step 2](#).
- Step 9** Run the following autodeploy command to update the image on the deployer:

```
./deploy -c <day0 config file> -u
```

The image update process takes 30–45 minutes on the deployer.

The new image URL format is as follows:

```
http://chart.<deployer's ip>.nip.io/<image name>/
```

Based on the product type, the `<image name>` is either `cnbr-master` or `opshub-master`.

Image Upgrade

Complete the following steps to upgrade the image:

- Step 1** Log in to the Cisco Operations Hub.
- Step 2** Choose **cnBR Manager > Core Management** from the Cisco Operations Hub main menu and click **Upgrade cnBR**.
- Step 3** Select the Cisco cnBR cluster that you want to upgrade.
- Step 4** Enter the username and password.
- Step 5** Click **Connect**.
- You can upgrade only the Cisco Operations Hub that is currently in use. You cannot choose a cluster when you want to upgrade the Cisco Operations Hub.
- Step 6** Enter the image that you want to upgrade. Provide the target URL obtained from [Image Upgrade Preparation, on page 197](#).
- Step 7** Click **Next**.
- Step 8** Check the following before performing image upgrade:
- Helm status: Ensure that the Helm releases status is **DEPLOYED**. To recover failed images, go through the steps that from [Image Recovery, on page 199](#).
 - Updates of the new image: Lists the differences between the current and target versions.
 - Target cluster pod status: Lists the status of all Pods.
- Step 9** Click **Upgrade**. During the Cisco Operations Hub upgrade, the page may redirect you to the Cisco Operations Hub login page. The redirect can happen due to any back-end service downtime. To resolve the issue, log in to the Cisco Operations Hub and go through step [#unique_255 unique_255_Connect_42_step1](#). The workflow jumps to step [Step 4, on page 198](#) and continues the monitoring progress.
- The Cisco Operations Hub displays the Image upgrade report.

Step 10 Click **SHOW** to view detailed differences of image and pod statuses before and after upgrade.

Image Recovery

To recover from an environment failure during the upgrade process, go through the following steps:

Step 1 Label all the DOCSIS worker node with the following label using deployer CLI:

```
config terminal
cluster <cluster-name>
nodes docsis-1
no k8s node-labels type_cmts no
k8s node-labels smi.cisco.com/node-type docsis
exit
exit
nodes docsis-2
no k8s node-labels type_cmts no
k8s node-labels smi.cisco.com/node-type docsis
exit
exit
nodes docsis-3
no k8s node-labels type_cmts no
k8s node-labels smi.cisco.com/node-type docsis
exit
exit
```

Note The value <docsis-n> denotes a number of K8s nodes. If there are more UCS servers or nodes in the system, you must repeat the steps for every worker node.

Step 2 Clean up environment. To clean up the ops-center in deployer:

```
config terminal
cluster <cluster-name>
no ops-centers cnBR infra
commit
end
clusters <cluster-name> actions sync run
```

You can check the synchronization progress by using the following CLI:

```
clusters <cluster-name> actions sync status
```

Step 3 Reconfigure the ops-centers image with the new image:

```
conf t
cluster <cluster-name>
ops-centers cnBR infra
  repository <image url>
  initial-boot-parameters use-volume-claims true
  initial-boot-parameters first-boot-password <password>
  initial-boot-parameters auto-deploy true
  initial-boot-parameters single-node false
commit
```

```
end
clusters <cluster-name> actions sync run
```

Service Group Operations

Table 34: Feature History

| Feature Name | Release Information | Feature Description |
|--------------------------|---------------------|---|
| Service Group Operations | Cisco cnBR 21.1 | You can view the worker-node each service group is running on and move service groups from one worker-node to another. This allows you to balance workloads across worker-nodes. You have better visibility and management on the service groups and the worker-nodes that they are running on. |

Cisco cnBR enables you to move Data-over-Cable Systems Interface Standard (DOCSIS) service group workloads to other Cisco cnBR nodes during maintenance and troubleshooting activities. The Service Group related operations help avoid service interruptions during maintenance activities and help balance workloads across nodes.

Move Service Groups

You can move DOCSIS service groups across nodes. Moving Service Groups allows nodes to balance the Service Group workloads effectively. You can move one or multiple Service Groups using the cnBR Manager.

Perform the following steps to move Service Groups.

- Step 1** On the Cisco Operations Hub main menu, click **cnBR Manager > Core Management > Service Group Operations**.
- Step 2** Select an available Cisco cnBR cluster from the drop-down list. The table displays the nodes for the selected cluster.
- Step 3** Select a node, click **Move Service Groups**. The right panel lists down the available Service Groups for that node.
- Step 4** Click the plus icon next to the Service Group to select the target Service groups.
- Step 5** Select the destination node from the drop-down list.
- Step 6** Click **Move** to trigger the move operation. The status of the host and destination nodes changes to **SG Moving**. On completion of the operation, the Cisco Operations Hub updates Service Group information in the table.

Drain the Node

You can drain a node by moving all the DOCSIS service group workloads from the node. Draining allows you to safely remove the node from the cluster, allowing other nodes to take up workloads.

Perform the following steps to drain a node.

-
- Step 1** On the Cisco Operations Hub main menu, click **cnBR Manager > Core Management > Service Group Operations** to launch the Service Group Operations panel.
- Step 2** Select an available Cisco cnBR cluster from the drop-down list.
The table displays the nodes for the selected cluster.
- Step 3** Select a node, click **More Action > Drain & Deactivate**, and confirm the drain operation.
On confirmation, the status of the node changes to **SG Moving**. On completion, the status changes to **Inactive**. A drained node has no associated Service Groups.
-

Activate the Node

A drained node appears as Inactive in the **Service Group Operations** dashboard (**cnBR Manager > Core Management > Service Group Operations**). To move a drained node back to the working pool after maintenance, perform the following steps:

-
- Step 1** Select an available Cisco cnBR cluster from the drop-down list.
The table displays the nodes for the selected cluster.
- Step 2** Select an Inactive Node and click ****More Action > Activate****.
On successful activation, the selected node appears as ***Active*** in the Service Group Operations dashboard.
-

Audit of Service Group Operations

The Cisco Operations Hub records all Service Group related moves in the cnBR Manager for auditing.

To view the service group move, drain or activation history, perform the following step:

Navigate to **cnBR Manager > Core Management > Service Group Operations** and click **Operations History**. The **Operations History** table provides the following information:

- Task ID
- Action undertaken
- Status of the operation
- Cluster ID
- Source and Destination Node
- Service Groups that moved successfully

- Service Groups that failed during movement (if any)
- The initiation time of the operation

Service Group Operations Errors and Warnings

Service Group Operations have the following errors and warnings:

Error

Error: Failed to drain node *<node-name>*, reason: job failed. Please try again later.

Diagnosis: The common cause for a draining job failure is a timeout occurring while waiting for responses from other microservices.

Solution: Attempt the operation later and see whether the issue is resolved.

Warning

Warning: Unable to drain *<node-name>*, reason: Insufficient SG capacity in other worker node.

Diagnosis: When draining a DOCSIS node, the Cisco cnBR moves the service groups to other DOCSIS nodes to keep the services running. Sometimes, the other DOCSIS nodes do not have the capacity to hold all service groups. In such cases, an error-dialog warns of the insufficient capacity.

Solution: To resolve the issue, click **Cancel** and stop the drain operation. You can alternatively drain the node with **Force Drain**.

Note

We do not recommend the **Force Drain** method. This method may cause the clusters to become unable to service several service groups. These unserved service groups may increase service downtime.

Export and Import Configuration

The system administrator perform import and export Cisco cnBR and Cisco Operations Hub configurations using the Cisco Operations Hub UI or RESTful APIs. The system administrator can store the exported configuration at a secure location. For Disaster Recovery, the system administrator performs the import operation, to restore the Cisco cnBR, the Cisco Operations Hub, or both to their original configurations.

Export Cisco cnBR Configuration using cnBR Manager

To export the Cisco cnBR configuration, complete the following steps:

- Step 1** Click **Cisco Operations Hub > cnBR Manager > Core Management > Import & Export cnBR**.
- Step 2** Select the target Cisco cnBR from the drop-down list in the **Export cnBR Configuration** section.
- Step 3** Click **Export**.

Step 4 Rename the file and save it at a secure location.

Export Cisco cnBR Configuration using RESTful API

Run the following command in a UNIX shell to export the Cisco cnBR configuration:

```
curl -k -X GET 'https://{opshubHost}/api/configurator/v1/cmts/config/{cmts-id}' -H 'Accept: application/json' -H 'Authorization: Bearer <token>' | tee path/to/backup/config
```

Example

```
hostname#curl -k -X GET 'https://opshub1.cisco.com/api/configurator/v1/cmts/config/cnbr1.cisco.com' -H 'Accept: application/json' -H 'Authorization: Bearer <token>' | tee cnbr-10.79.193.236-configuration.json
```

Export Cisco Operations Hub Configuration using Cisco Operations Hub

To export the Cisco Operations Hub configuration, complete the following steps:

Step 1 Click **Cisco Operations Hub > System > Configurations & Upgrade**.

The **Cisco Operations Hub** Export/Import pane is displayed.

Step 2 On the **Export Operations Hub Configuration** section, click **Export**.

Step 3 Rename the file and save it to a secure location.

Export Cisco Operations Hub Configuration using RESTful API

Run the following command in a UNIX shell to export the Cisco Operations Hub configuration:

```
curl -k -X GET 'https://{opshubHost}/configurator/opshub/export' -H 'Accept: application/json' -H 'Authorization: Bearer <token>' | tee path/to/backup/config
```

Example

```
hostname#curl -k -X GET 'https://opshub1.cisco.com/configurator/opshub/expor' -H 'Accept: application/json' -H 'Authorization: Bearer <token>' | tee opshub-172.22.29.221-configuration.json
```

Import Cisco cnBR Configuration using cnBR Manager

To import the Cisco cnBR configuration, complete the following steps:

-
- Step 1** Click **Cisco Operations Hub > cnBR Manager > Core Management > Import & Export cnBR**.
 - Step 2** Select the target Cisco cnBR Name from the drop-down list in the **Import cnBR Configuration File** section.
 - Step 3** Select the configuration file.
 - Step 4** Click **Import**.
 - Step 5** Rename the file and save it at a secure location.
-

Import Cisco cnBR Configuration using RESTful API

Run the following command in a UNIX shell to import the Cisco cnBR configuration:

```
curl -k -X PUT 'https://{opsHUBHost}/api/configurator/v1/cmts/config/{cmts-id}' -H 'Accept: application/json' -H 'Content-Type: application/json' -H 'Authorization: Bearer <token>' -d '@path/to/backed/up/config'
```

Example

```
hostname#curl -k -X PUT
'https://opshub1.cisco.com/api/configurator/v1/cmts/config/cnbr1.cisco.com' -H 'Accept: application/json' -H 'Content-Type: application/json' -H 'Authorization: Bearer <token>' -d '@cnbr-10.79.193.236-configuration.json'
```

Import Cisco Operations Hub Configuration using Cisco Operations Hub

To import the Cisco Operations Hub configuration, complete the following steps:

-
- Step 1** Click **Cisco Operations Hub > System > Configurations & Upgrade**.
The **Cisco Operations Hub** Export/Import pane is displayed.
 - Step 2** On the **Import Operations Hub Configuration File** section, browse and choose an Operations Hub configuration file.
 - Step 3** Click **Import**.
-

Import Cisco Operations Hub Configuration using RESTful API

Run the following command in a UNIX shell to import the Cisco Operations Hub configuration:

```
curl -k -X PUT "https://{opshubHost}/configurator/opshub/import" -H "accept: application/json" -H  
"Content-Type: application/json" -H 'Authorization: Bearer <token>' -d "@path/to/backed/up/config"
```

Example

```
hostname#curl -k -X PUT 'https://opshub1.cisco.com/configurator/opshub/import' -H 'Accept:  
application/json' -H 'Content-Type: application/json' -H 'Authorization: Bearer <token>'  
-d '@opshub-172.22.29.221-configuration.json'
```

CHAPTER 5

Cisco Cloud Native Broadband Router Diagnosis

The Cisco cnBR provides a suite of in-built tools to diagnose and resolve common issues.

- [Cable Modem Diagnosis Tool, on page 207](#)
- [Cable Modem Troubleshooting, on page 209](#)
- [Cisco cnBR Metrics, on page 214](#)
- [KPI Alert Management, on page 245](#)
- [Log Aggregation and Management, on page 253](#)

Cable Modem Diagnosis Tool

In a Data-over-Cable Systems Interface Standard (DOCSIS) environment, various elements can affect a modem's ability to maintain a connection and remain online. When a cable modem goes offline, it is difficult to diagnose the cause and identify the issues.

The Cisco cnBR includes a Cable Modem Diagnosis Tool to enable easy diagnosis of such issues. Checkpoints are created periodically for online modems, where information such as system logs, configuration details, and system statistics are saved. When a cable modem goes offline, this system information is analyzed from the saved checkpoints.

The Cable Modem Diagnosis Tool supports the following modes:

- **On-demand mode:** System logs related to a modem is collected with a single click, when needed.
- **Background mode:** Logs, health metrics and performance metrics are actively analyzed in the background to detect, diagnose, and report modem issues.

The Cable Modem Diagnosis Tool provides the following utilities:

- Detect malfunctioning modems.
- Enable debugging for malfunctioning modems and disable debugging when modems are recovered.
- Supports interactive enabling or disabling of per modem debugging.
- Display modem logs and telemetry on the Grafana dashboard.
- Download of modem logs containing modem log messages.

Configure Cable Modem Diagnosis Tool for On-Demand Diagnosis

On-Demand diagnosis allows debugging a cable modem from the **cnBR Manager Metrics & Dashboards** dashboard. On-Demand diagnosis does not require any configuration changes. You can run the On-Demand diagnosis from the **cnBR Manager Metrics & Dashboards** dashboard.

Complete the following steps to enable On-Demand Diagnosis:

-
- Step 1** On the Cisco Operations Hub, click **cnBR Manager > Metrics & Dashboards > Home**.
 - Step 2** On the Dashboards pane, search and click **Cable Modem Verbose** option.
 - Step 3** Select the Cisco cnBR name and modem that you want to debug from the **cnBR Name** and **Cable Modem** drop-down lists.
 - Step 4** Click **Cable Modem Log From cnBR**.
 - Step 5** Click **Debug**.
 - Step 6** Click **Disable** to disable debugging.
-

Configure Cable Modem Diagnosis Tool for Background Diagnosis

The Background diagnosis utility runs periodically, and detects malfunctioning modems. The utility runs automatically in the background, and is enabled by default.

Using the Background diagnosis method, debug functions that collect modem logs are enabled. Complete the following steps to view the logs:

-
- Step 1** On the Cisco Operations Hub, click **cnBR Manager > Metrics & Dashboard**.
 - Step 2** Click the name of the dashboard to bring up the search box.
Note You can find the name of the dashboard in the top left of the screen. In the **Metrics & Dashboard** home page, the dashboard name is **Home**.
 - Step 3** Choose **cnBR Manager > Diagnosis**.
The debugging information is available in the **Diagnosis Job Summary**, **cnBR Debug CMD Control**, and **Cable Modem Online Anomaly Detection Job** tables.
 - Step 4** To view detailed information about these tables, expand the tables and click the **i** icon at the top-left corner.
-

Cable Modem Troubleshooting

Table 35: Feature History

| Feature Name | Release Information | Feature Description |
|--|---------------------|--|
| Cable modem troubleshooting | Cisco cnBR 20.3 | The Cisco Operations Hub allows you to collect troubleshooting information for cable modems on-demand. You can also retrieve troubleshooting information that the Cisco Operations Hub automatically collects when it detects L3 ping failure. |
| Per-CM debugging through a single location | Cisco cnBR 20.4 | The Cisco Operations Hub allows you to get more cable modem debug information from Cisco cnBR. |

This section describes how to:

- Collect troubleshooting information for cable modems on-demand.
- Retrieve troubleshooting information that the Cisco Operations Hub automatically collects when it detects L3 ping failure.

The cnBR Manager gathers troubleshooting information from the Cisco cnBR on-demand and automatically. L3 ping failure detection triggers automatic gathering of troubleshooting information. The troubleshooting information includes a task ID, the cable modem MAC address, and results. Results include troubleshooting information that the cnBR Manager collects from different cnBR services. Troubleshooting information is saved in the debug_info field of the logs. Currently you can receive troubleshooting information for Ranging, Vector Packet Processor (VPP), Baseline Privacy Interface (BPI), Ping, and Data Plane Vector Packet Processor (DP-VPP).

On-Demand Generation of Troubleshooting Information

To generate on-demand troubleshooting information, complete the following steps:

-
- Step 1** Click **Cisco Operations Hub > cnBR Manager > Metrics & Dashboard**.
 - Step 2** On the Dashboards pane, click **Cable Modem Verbose**.
 - Step 3** Click **Troubleshoot**.

The screenshot shows the configuration page for a Cable Modem. At the top, there are input fields for 'cnBR Name' (cmts-209), 'cnBR ID' (172.22.64.209.nip.io), and 'Cable Modem'. Below these are navigation links: 'cnBR Cluster > Service Group > Cable Modem Verbose'. A row of buttons includes 'Reset', 'Delete', and 'Troubleshoot', with the 'Troubleshoot' button circled in red. Below the buttons are four data tables:

| Cable Modem Basic Info | | Cable Modem RNG Info | | Cable Modem OFDM Info | | Cable Modem Other Info | |
|------------------------|------------|----------------------|---|-----------------------|---|------------------------|-------|
| MAC | [Redacted] | MaxCMPwr(1/100 ... | - | OFDM Prof | - | DOCSIS Version | DO... |
| State | o... | MaxCMPwr(Norm) | - | OFDM Unfit Prof(s) | - | Operational Version | DO... |
| SG Name | SG... | MaxChPwr(1/100 d... | - | OFDM MRC | - | QoS Version | DO... |
| SG | 0 | MaxChPwr(Norm) | - | OFDMA MTC | - | Sys Desc | - |
| MD | 1 | Neq(1.6MHz TxCh) | - | OFDM Prof Supp | - | Net Access Disable | f... |
| IP | [Redacted] | MinPwrLoad(1/100 ... | - | OFDM QAM Mod | - | DBC Req Count | {...} |

Wait for the **Troubleshoot** button to turn from **In Progress..** to **Save**.

Step 4 Click **Save** to save the **TroubleshootingLogs-<mac-address>.txt** file.

Example:

The following example is a sample output file: **troubleshootingLogs-0053.5577.190c.txt**

Automatic Generation of Troubleshooting Information

When the cnBR Manager detects a cable modem ping failure, the cnBR Manager generates a request to get troubleshooting information from the Cisco cnBR. cnBR Manager stores the troubleshooting information responses that it receives from the Cisco cnBR.

- Step 1** Click **Cisco Operations Hub > cnBR Manager > Metrics & Dashboard**.
- Step 2** On the Dashboards pane, search and click **Cable Modem Verbose** option.
- Step 3** In the **Cable Modem** drop-down list, select the target cable modem MAC address.
- This page lists the occurrences of L3 ping loss with timestamp.

Modem IP Ping-Loss History

| Time ▾ | RTT | IP Loss |
|---------------------|-----|---------|
| 2020-10-16 18:14:29 | - | 100.0% |
| 2020-10-16 18:12:29 | - | 100.0% |
| 2020-10-16 18:11:29 | - | 100.0% |
| 2020-10-16 18:09:29 | - | 100.0% |

1 2 3 4 5 6 7 8 9

521235

Note You can view the top ten modems with IPv4 ping-loss from the **Top 10 IPv4 Ping-Loss Modems** panel in the **Service Group** dashboard. To view the **Service Group** dashboard, click **cnBR Manager > Service Group**.

- Step 4** Open the following link in a browser, or use the curl command to send a GET request.

```
https://<hostname>/opshub-data/api/idocsis/v1/idm/cm-debug/tasks
```

Find the target cable modem using the MAC address to get the troubleshooting information.

Example:

```
https://opshub1.cisco.com/opshub-data/api/idocsis/v1/idm/cm-debug/tasks
```

Or

```
hostname#curl -k -L -X GET 'https://opshub1.cisco.com/opshub-data/api/idocsis/v1/idm/cm-debug/tasks'
```

See example in Step 3 for a sample response.

Step 5 Find the target cable modem MAC address, and ping failure timestamp from the information to get troubleshooting information for the ping failure.

Example:

In the following example, we can see the debug result for the cable modem 0053.2ed0.84a6.

```

Note If time zone settings are different, the time that is displayed in the cnBR Manager interface and the time in the Cisco cnBR response are different. The time stamp in the Cisco cnBR response is always in Greenwich Mean Time (GMT).

Cisco cnBR Metrics

The **Metrics** tab in the cnBR Manager application allows you to monitor the status of the Cisco cnBR router. The cnBR Manager receives metrics and telemetry data from Cisco cnBR. Based on the type of data, the data is saved in the Postgres or Prometheus databases. The Metrics dashboard later retrieves the data and displays it on the dashboard.

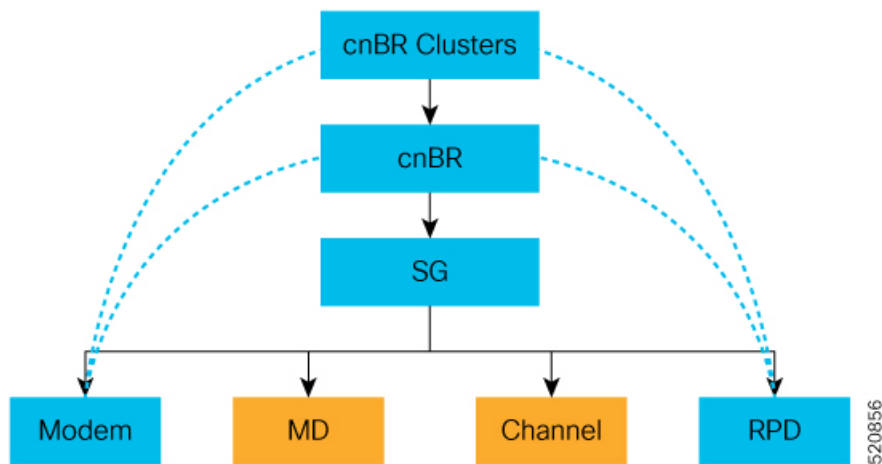

The following illustration shows the Metrics framework.

Cisco cnBR Metrics Dashboards

The Metrics Grafana dashboard displays metrics and status of the DOCSIS network, DOCSIS devices, and CMTS performance status. The Metrics dashboard is based on a hierarchical structure, which matches the Cisco cnBR system deployment exactly.

The following illustration shows the hierarchical layout:

The Metrics Dashboard user interface (UI) has the following components:

Breadcrumbs Bar

The breadcrumbs bar is available on each dashboard. It shows the dashboard pages just visited. You click each link in the breadcrumbs and go to that specific dashboard.

520870

Links

Links are marked using an underline. You click the underlined text and open the related page.

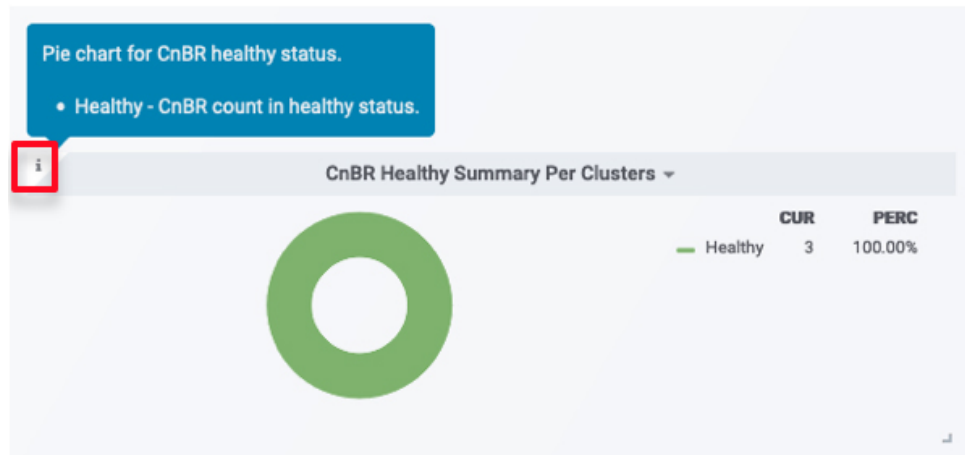

Search...

| Cable Modem ▾ | IPv4 | IPv6 | State |

520868

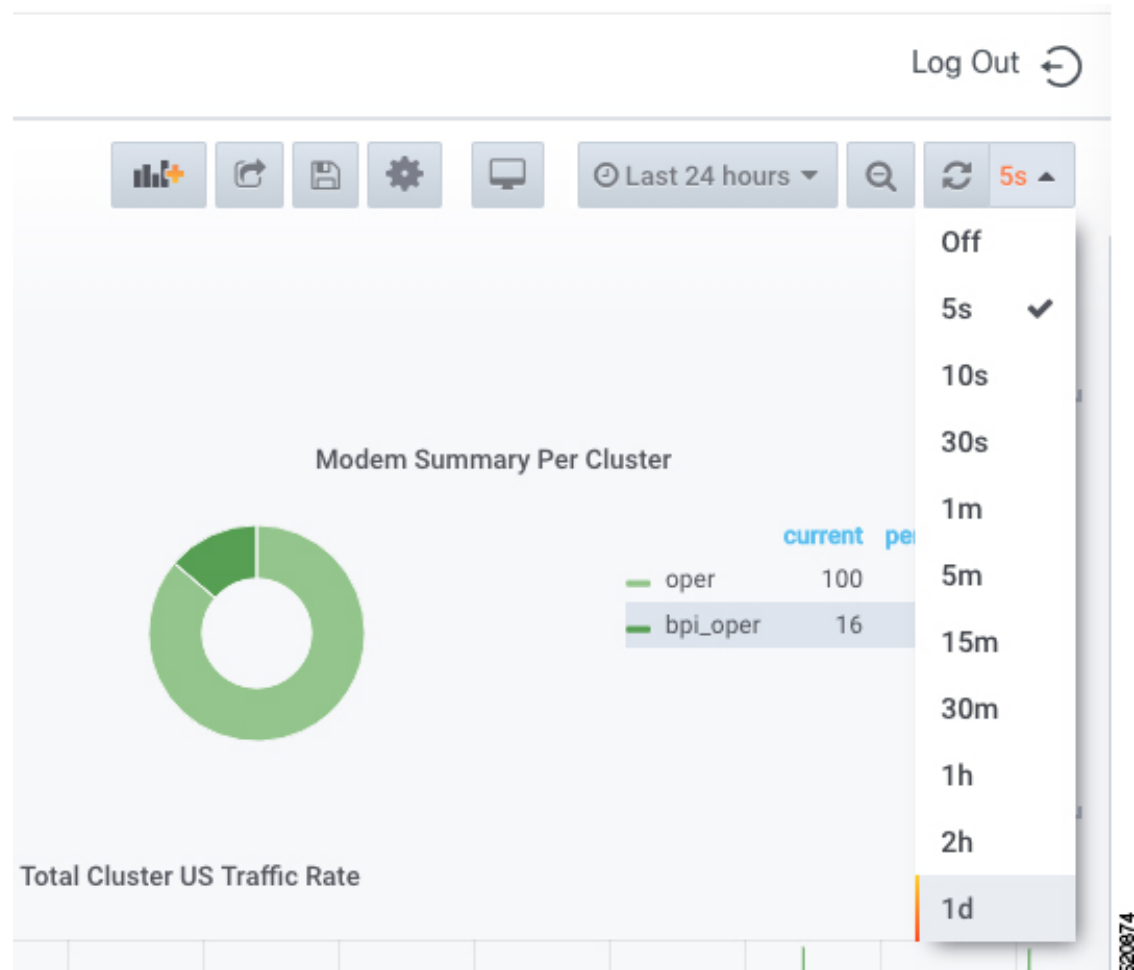

Tooltips

Tooltips are available on the dashboard to display information for each panel on the Grafana dashboard. To view a tooltip, hover your mouse over the  on the top-left corner of the panel.

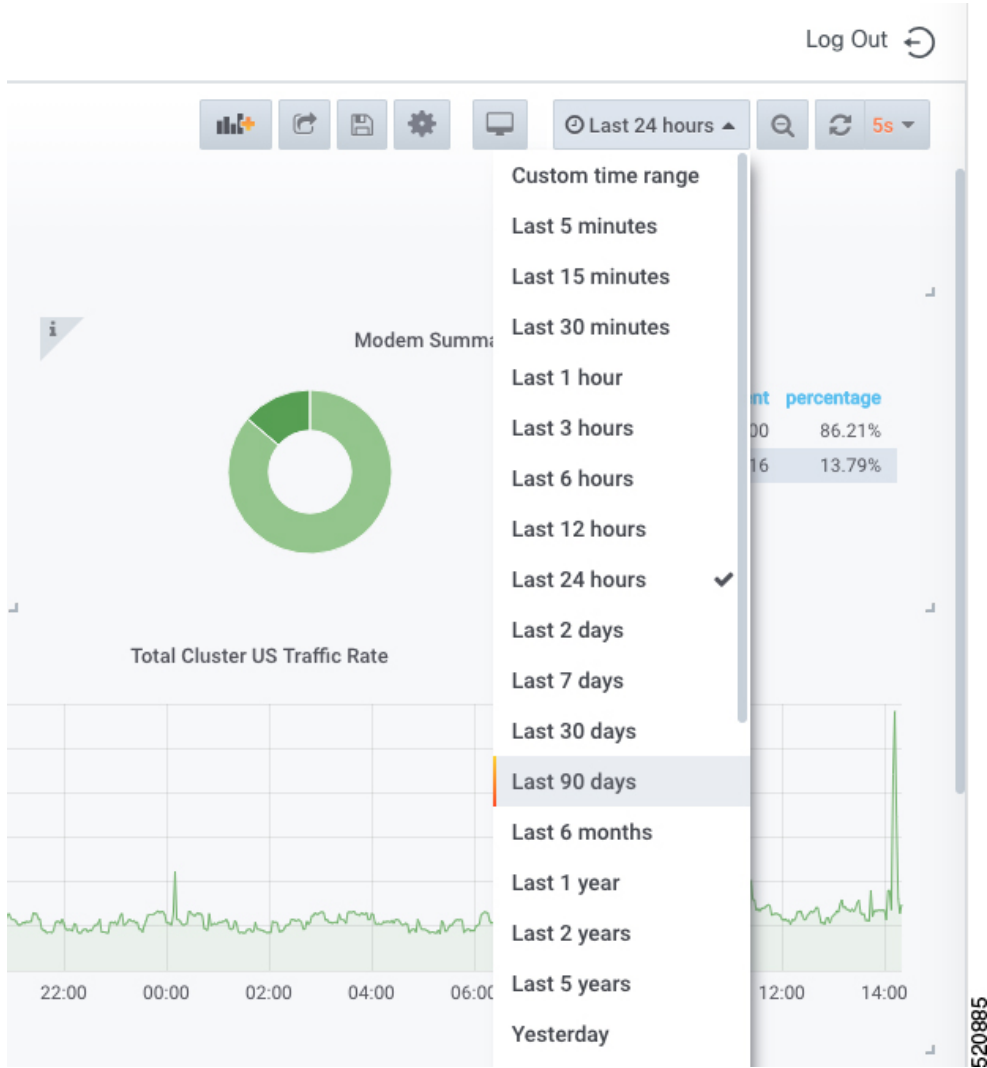

Dashboard Refresh and Time Range

To set the refresh time for each dashboard, choose the time from the drop-down list on the top-right corner of the dashboard. The default refresh time for the dashboard is 10 seconds.

If data is retrieved from the Prometheus database, choose the required value from the **Custom time range** drop-down list as shown in the following image.

Data Display on Dashboard

For all dashboards available in the Cisco cnBR Manager application, data is represented using pie charts, tables, and live graphs.

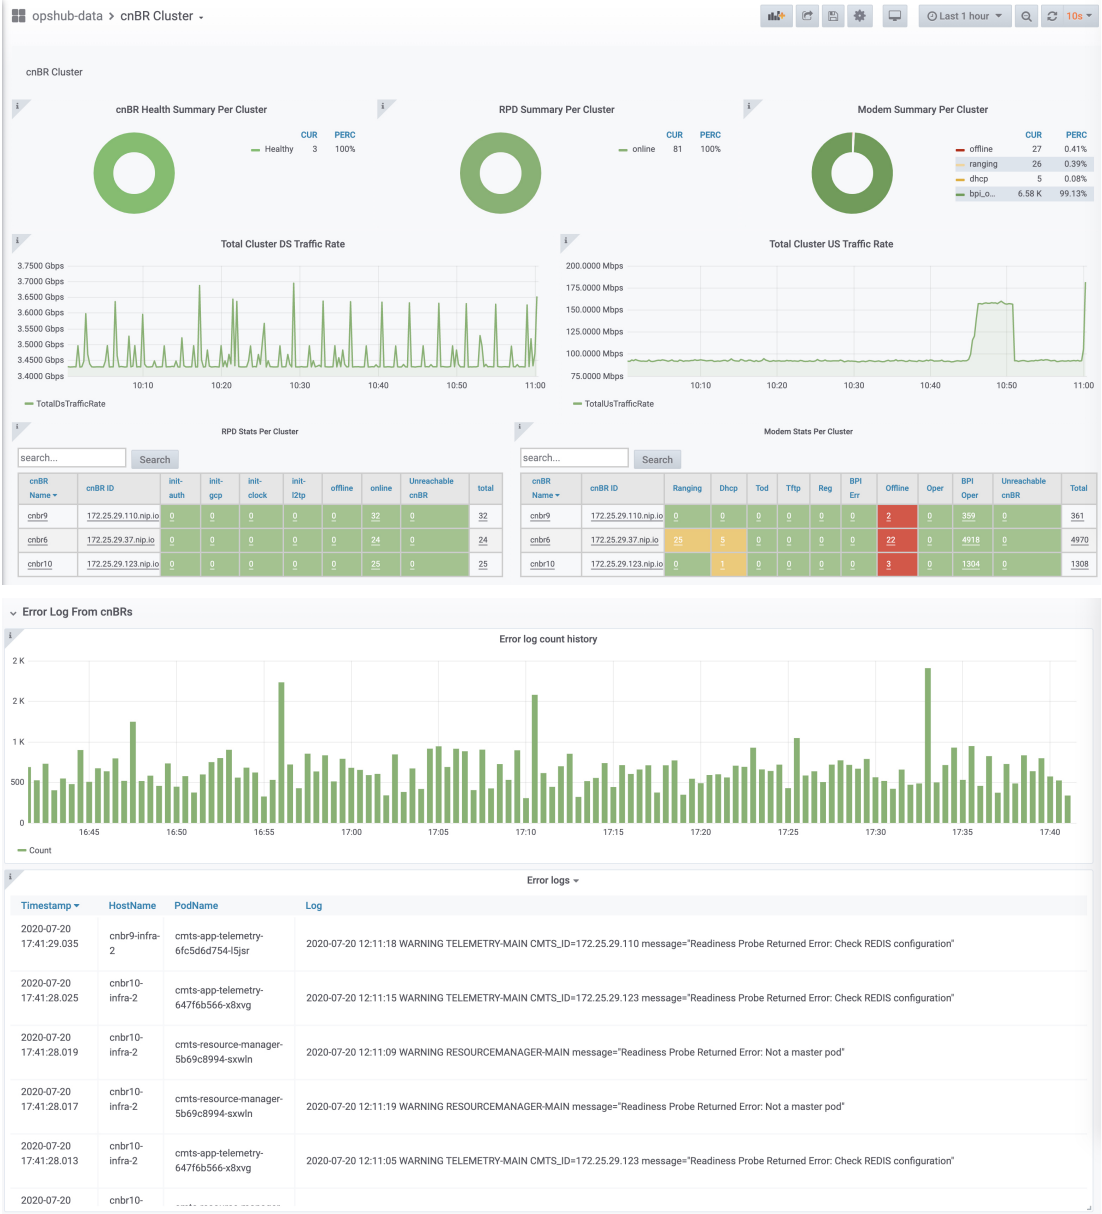

cnBR Cluster

This Dashboard displays the following information:

| Panel Name | Description |
|--------------------|--|
| cnBR health status | The pie chart shows Cisco cnBR performance status for each Cisco cnBR cluster. |

| Panel Name | Description |
|--|--|
| Remote-PHY device (RPD) status | The pie chart shows the status of RPDs in each Cisco cnBR cluster. |
| Cable Modem status | The pie chart shows the status of cable modems in the Cisco cnBR cluster. |
| Summary of downstream traffic rate for all cnBR clusters | The graph shows how much download happened in the set time. |
| Summary of upstream traffic rate for all cnBR clusters | The graph shows how much upstream traffic happened in the set time. |
| Summary of RPDs in different states per cnBR cluster | The table shows how many RPDs are offline or online, and the following details: <ul style="list-style-type: none"> • cnBR Name: Name of the cluster • cnBR ID: The IP address to reach the Cisco cnBR router. • init-auth: Authorization status of the RPD • init-gcp: GCP provision status • init-clock: Clock synchronization status • init-l2tp: L2VPN provisioning status • total: Total number of RPDs in the cluster |
| Summary of modems in different states per cnBR cluster | The table shows a summary of the status of cable modems in the cluster, including the following details: <ul style="list-style-type: none"> • Ranging: Number of ranging requests received. • DHCP: Number of DHCP requests received. • ToD: Time-of-Day (ToD) requests received. • TFTP: Number of TFTP requests received. • Reg: Number of registration requests (REG-REQ) or multipart registration request (REG-REQ-MP) received. • BPI Err: Number of Baseline Privacy Interface (BPI) errors even if the cable modem is registered. • Offline: Number of modems which are offline. • Oper: Number of cable modems which are registered without enabling BPI. • BPI Oper: Number of cable modems with BPI. |
| Error log count history for all cnBR clusters | The live graph shows the history of the number of error logs generated for all Cisco cnBR clusters. |

| Panel Name | Description |
|-----------------------------------|--|
| Error logs from all cnBR clusters | The live graph shows the error logs generated for all Cisco cnBR clusters. |

| Panel Name | Description |
|--------------------|---|
| US channel configs | <p>Upstream channel configuration.</p> <ul style="list-style-type: none"> • upstream channel id: Upstream channel ID • slotsize: Minislot size • frequency: Frequency • docsismode: DOCSIS Mode • modulation: Modulation profile • powerlevel: Power level • channelwidth: Channel width • sgid: Service group ID |

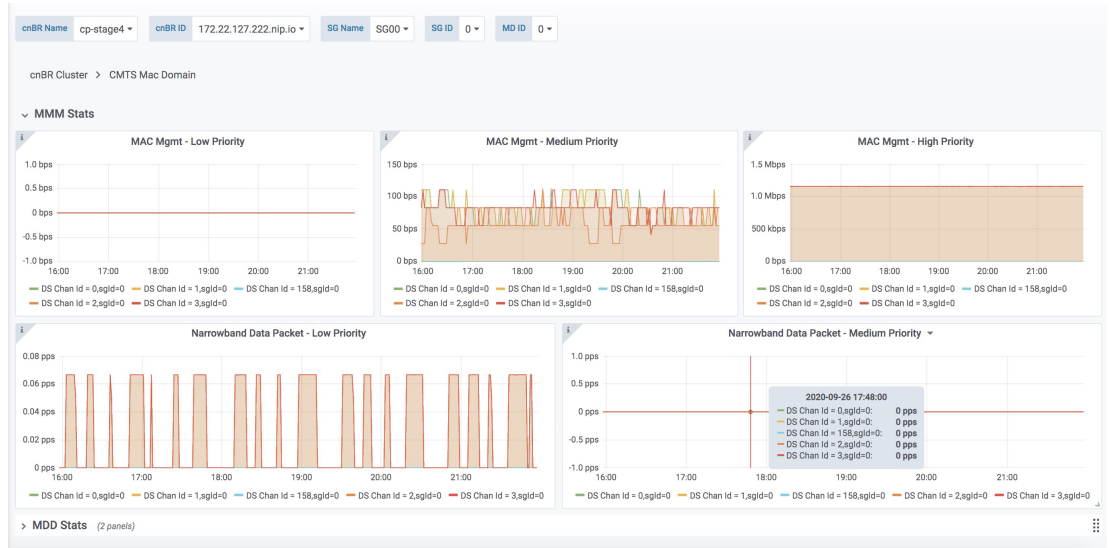

520877

CMTS MAC Domain

The Dashboard displays the following information:

| Panel Name | Description |
|------------|--|
| MMM stats | Rate history of MAC management messages. |
| MDD stats | Rate history of MDD. |

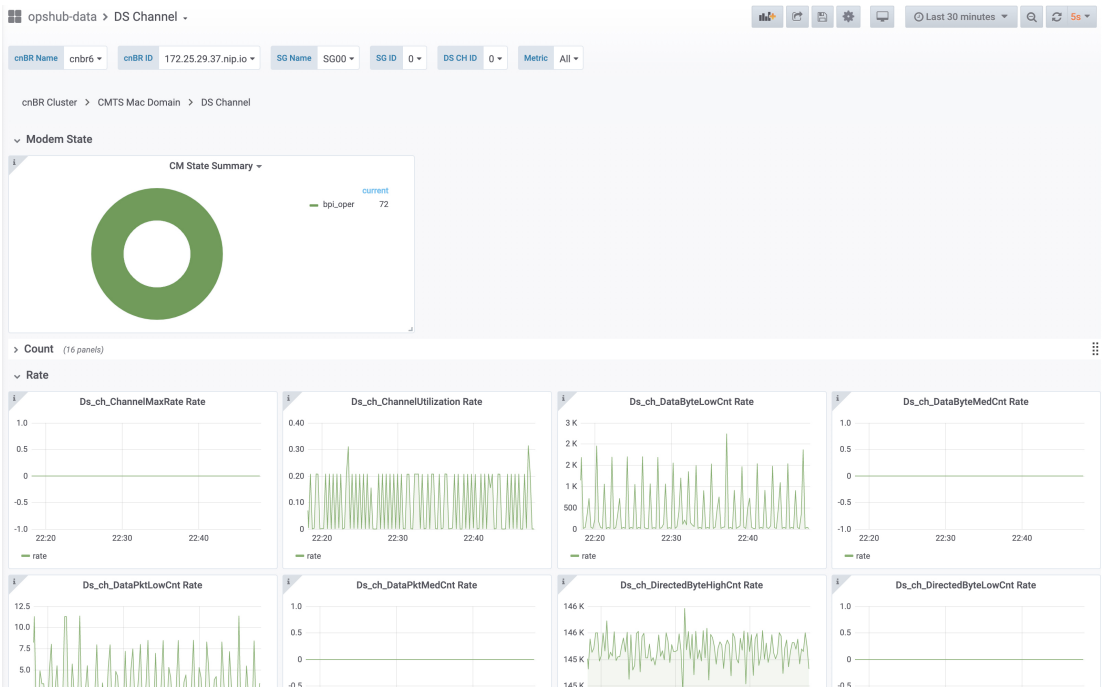

520867

DS Channel

The Downstream (DS) Channel dashboard displays the following information:

| Panel Name | Description |
|-------------|--|
| Modem state | Summary of modems in different states for the specific Cisco cnBR cluster. |
| Count | Downstream channel count of the cable modem. |
| Rate | Downstream traffic rate for the Cisco cnBR cluster. |

Modem US Channel

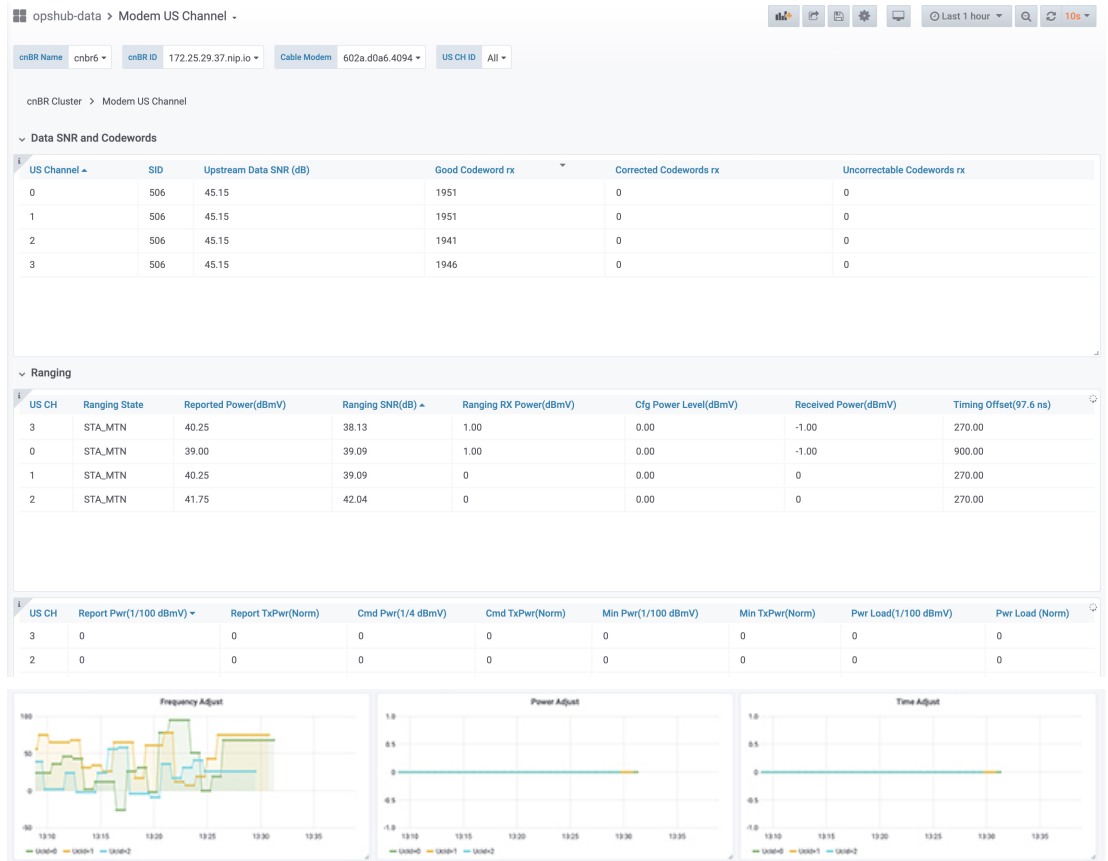

520859

Modem US Channel

The Dashboard displays the following information:

| Panel Name | Description |
|------------------------|---|
| Data SNR and Codewords | SNR and Codeword information of the upstream channel for the cable modem. |
| Ranging | Ranging information of cable modems. |

Modems List

The Dashboard displays all CMs in a list, based on the cluster, SG ID, MD, and the status:

| Panel Name | Description |
|--------------|---|
| Download CSV | Download CSV for online and offline modems. You can download the CSV for one Cisco cnBR cluster at a time. A single CSV file for all clusters is not available for downloading. |

| Panel Name | Description |
|------------|---|
| Modem List | <p>Detailed modem state information list. Use the Search text box to filter modems by MAC address, IPv4 address, or IPv6 address. The number of rows in the Modem List table is limited to 256. Total is the total number of modems that are filtered by clusterIp and the search text.</p> <ul style="list-style-type: none"> • Cable Modem: MAC address of the cable modem • IPv4: IPv4 address of the cable modem • IPv6: IPv6 address of the cable modem • State: State of the cable modem • SG Name: Service group name of the cable modem • SG: Service group ID of the cable modem • MD: MAC domain ID of the cable modem • cnBR ID: Cloud CMTS ID • SID: Service ID of the cable modem • DS Count: Downstream channel count of the cable modem • US Count: Upstream channel count of the cable modem • CPE Count: CPE count of the cable modem • Online Time: Time stamp when the modem became online • Offline Time: Timestamp when the cable modem transitioned to offline • Last Update: Last time when the entry was updated |

Search for Dashboards

Follow this procedure to search for dashboards:

Step 1 Choose **cnBR Manager > Metrics & Dashboards** from the Cisco Operations Hub main menu.

Step 2 Click the name of the dashboard to bring up the search box.

Note You can find the name of the dashboard in the top left of the screen. In the **Metrics & Dashboards** home page, the dashboard name is **Home**.

Step 3 Enter the dashboard name in the **Search dashboards by name** text field.

Or alternatively, you can click the **cnBR Manager** folder or **cee-data** folder and browse through it.

KPI Alert Management

Table 36: Feature History

| Feature Name | Release Information | Feature Description |
|----------------------|---------------------|---|
| KPI Alert Management | Cisco cnBR 20.4 | Expands the alerts in Subscriber, RF Plant, and Infra KPI Alert categories. |

KPIs (Key Performance Indicator) of Cisco cnBR clusters help in getting information on the overall system stability and on the components that are not functioning normally and are impacting the system stability.

The cnBR Manager supports the following KPI Alert categories:

- Subscriber
- RF Plant
- Infra

Subscriber

This KPI Alert category provides an overview of the subscriber health status of the Cisco cnBR cluster. The following parameters are available in this KPI:

- **CMNotHealthyCMState**: If the percentage of online modems is higher than the configured threshold(95%), we can consider this parameter as healthy, otherwise, unhealthy.
- **CMNotHealthyPartialUS**: If the percentage of modems in upstream partial-service mode is less than the configured threshold(10%), we can consider this parameter as healthy, otherwise, unhealthy.
- **CMNotHealthyPartialDS**: If the percentage of modems in downstream partial-service mode is less than the configured threshold(10%), we can consider this parameter as healthy, otherwise, unhealthy.
- **CMNotHealthyPingLoss**: If the ping loss rate is less than the configured percentage threshold(20%), we can consider this parameter as healthy, otherwise, unhealthy.
- **CMNotHealthyPingLatency**: If the ping latency is less than the configured threshold(200 ms), we can consider this parameter as healthy, otherwise, unhealthy.
- **RPDNotHealthy**: If all the RPDs are online, we can consider this parameter as healthy, otherwise, unhealthy.

RF Plant

This KPI Alert category provides an overview of the RF plant health status of the Cisco cnBR cluster. The following parameters are available in this KPI:

- **DSCHNotHealthyMER**: If the primary downstream channel has a Modulation Error Ratio higher than the configured threshold(30 dB), we can consider the channel as healthy, otherwise, unhealthy.
- **USCHNotHealthySNRRanging**: If the primary upstream channel has an upstream ranging Signal to Noise Ratio (SNR) higher than the configured threshold(20 dB), we can consider the channel as healthy, otherwise, unhealthy.
- **USCHNotHealthySNRData**: If the primary upstream channel has a data-SNR higher than the configured threshold(30 dB), we can consider the channel as healthy, otherwise, unhealthy.
- **DSCHPartialNotHealthy**: If the percentage of modems in downstream partial-service mode is less than the configured threshold(10%), we can consider the channel as healthy, otherwise, unhealthy.
- **USCHPartialNotHealthy**: If the percentage of modems in upstream partial-service mode is less than the configured threshold(10%), we can consider the channel as healthy, otherwise, unhealthy.

Infra

This KPI Alert category provides the following information:

- An overview of the pod CPU, memory, and file descriptor usage status of the Cisco cnBR and the Cisco Operations Hub clusters.
- An overview of the node CPU, memory, and disk usage of the Cisco cnBR cluster.
- Cisco cnBR reachability and token refresh status.

The following parameters are available in this KPI:

- **NodeNotHealthyMEMIssue**: If the available memory of a node is higher than the configured threshold(10%), we can consider the node as healthy, otherwise, unhealthy. Available memory is an estimate of the memory available for starting new applications without swapping.
- **NodeNotHealthyCPUIssue**: If the 1-minute CPU load of a node is lower than the configured threshold(90%), we can consider the node as healthy, otherwise, unhealthy.
- **NodeNotHealthyDiskIssue**: If the disk usage of a node is less than the configured threshold(80%), we consider the node as healthy, otherwise, unhealthy.
- **PodNotHealthy**: If all pods of a node are ready, we consider the node as healthy, otherwise, unhealthy.
- **CriticalPodNotHealthy**: If all critical pods(configured in the config map) of a node are ready, we can consider the node as healthy, otherwise, unhealthy.
- **PodNotHealthyHighCPU**: If a pod is consuming fewer CPU cores than the configured limit, we can consider the pod as healthy, otherwise, unhealthy.
- **PodNotHealthyHighMEM**: If a pod is consuming less memory than the configured limit, we can consider the pod as healthy, otherwise, unhealthy.
- **PodNotHealthyTooManyOpenFileDescriptor**: If a pod has less open file descriptors than the configured limit(2048), we can consider the pod as healthy, otherwise, unhealthy.
- **cnBRNotReachable**: If the cnBR host is reachable from the Cisco Operations Hub, we can consider the Cisco cnBR as healthy, otherwise, unhealthy.
- **cnBRRefreshTokenFailure**: If the token refresh is working for a Cisco cnBR host, consider the host as healthy, otherwise, unhealthy.

Alert Management

The cnBR Manager Alert Management is based on the KPIs. Cisco cnBR records all alerts for users to view. You can configure the alert-manager to manage alerts.

Follow this procedure to view the KPI Alert Management page:

Choose **cnBR Manager > API Summary** from the Cisco Operations Hub main menu and click **KPI Alert Management** from the left side bar.

Alert Definition

All alerts are built based on the KPI metrics and divided into several alert groups. Each KPI metric generates one alert that belongs to a predefined alert group. For example, KPI metrics: CM state (Summary of CM online state) generates one alert that is named CMNotHealthy, which is part of the Subscriber alert group. The Alert Management supports the following alerts and alert groups.

| Group | Alert |
|------------|--|
| Subscriber | <ul style="list-style-type: none"> • CMNotHealthy • RPDNotHealthy |
| RF | <ul style="list-style-type: none"> • USCHNotHealthy • DSCHNotHealthy |
| Infra | <ul style="list-style-type: none"> • NodeNotHealthy • PodNotHealthy |

Alert Record

Alert Management records all alerts that are generated in the Cisco cnBR router. The dashboards display an alert summary and detailed information about those alerts.

KPI Alert Summary

Alert summary dashboards show the number of current alerts and total resolved alerts. In addition, the dashboards display the distribution of alerts based on severity. Cisco cnBR supports two levels of alerts:

- critical
- warning

You can view this pane on the Cisco cnBR cluster dashboard under **Dashboards > Manage > cnBR Manager**.

KPI Alert Information

The dashboard shows two lists of Firing Alerts and Resolved Alerts. The following details are available in these tables:

| Panel Name | Description |
|-------------|-------------------|
| Firing Time | Alert fired time. |

| Panel Name | Description |
|--------------------|---|
| Name | Alert name. |
| Severity | Critical or warning. |
| cnBR ID | Cisco cnBR where the alert is fired. |
| Alert Group | Category of the KPI alert. |
| Acknowledge status | Shows whether acknowledged or not. |
| Action | Acknowledge or view an alert.

Click the View link. The Alert Action pane on the right side shows the details of the alert. |

You can view details and acknowledge firing alerts. For the resolved alerts, you can view the details of each alert.

▼ KPI Alert Information

Firing List (current)

| Firing Time ▼ | Name | Severity | cnBR ID | Group | Acked | Action |
|---------------------|--------------|----------|----------------------|------------|-------|--------|
| 2019-09-19 16:08:19 | CMNotHealthy | critical | 10.124.211.23.nip.io | Subscriber | false | ack |

E20907

Acknowledge KPI Alert

You can acknowledge the firing alerts. By default, every three hours, you are notified about the firing alerts by email. You can stop receiving the alert emails by setting the silence time, creator, and comments.

Configure Alerts

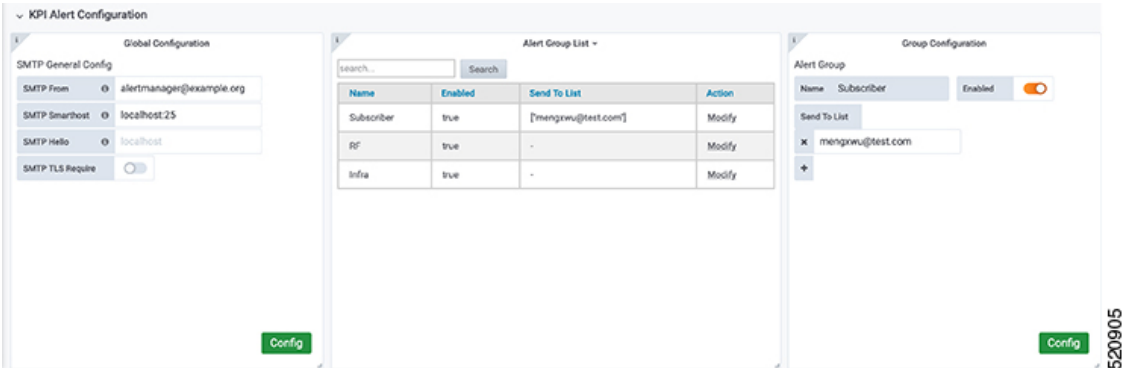

You can configure global alerts through Alert Management. For global configuration, update the SMTP (Simple Mail Transfer Protocol) settings. By default, this option is disabled.

On the **Global Configuration** pane, configure the notification channel. The **SMTP General Config** pane is available under the **KPI Global Configuration** pane of the **KPI Alert Configuration** dashboard.

| Field | Description |
|------------------|---|
| SMTP From | The default SMTP From header field. |
| SMTP Smarthost | The default SMTP smarthost used for sending emails, including the port number. The port number is 25 or 587 for SMTP over TLS (STARTTLS). Example: smtp.example.org:587 |
| SMTP Hello | The default hostname to identify to the SMTP server. |
| SMTP TLS Require | The default SMTP TLS requirement (Default: false). |

KPI Alert Configuration

You can enable or disable an alert group and add or delete email addresses of receivers for each alert group. When you enable an alert group and add email addresses, those users are notified when an alert is generated in the respective group.

Log Aggregation and Management

Table 37: Feature History

| Feature Name | Release Information | Feature Description |
|--------------------------------|---------------------|--|
| Log Aggregation and Management | Cisco cnBR 21.1 | The Cisco Operations Hub provides multiple log aggregation tools, various visualization techniques, and customizations that help you to view, debug, visualize, and customize your log information. The Cisco Operations Hub enables Log Aggregation and Management through the Audit Dashboard, Debug Dashboard, and a host of other utilities. |

The Cisco Operations Hub provides the Audit Dashboard, Debug Dashboard, and a host of other utilities for log aggregation and management activities.

By using the various visualization techniques and customizations, you can search, visualize, and create dashboards to have macro and micro views.

Configure Operations Hub for Log Management

The following configuration steps are needed only when the Cisco cnBR is added in Cisco Operations Hub using Cisco Operations Hub UI or API. You can skip this section if you added the Cisco cnBR using Autodeployer.

During deployment, the Cisco Operations Hub is preconfigured to forward logs from all the components to Operations Hub. However, to get the logs forwarded, you must manually configure Cisco cnBR..

To manually configure the Audit Dashboard to receive the Cisco Operations Hub logs, complete the following steps:

Step 1 Log in to the CEE Data OpsCenter CLI. Ensure that you provide a valid Cisco cnBR user ID and password.

```
https://cli.cee-data-ops-center.<cnBRIP>.nip.io
```

Step 2 Key in these commands at the prompt:

```
logging fluent host fluentd.ccmts-infra
logging fluent port 24224
logging fluent disable-tls true
commit
end
```

Step 3 Log in to Cisco cnBR OpsCenter. Ensure that you provide a valid user ID and password.

```
https://cli.<cnBR Namespace>-ops-center.<cnBRIP>.nip.io
```

Step 4 Key in these commands at the prompt:

```
logging forward kafka-blockers <OpsHub_IP>
```

```
commit  
end
```

Working with Logs

The Cisco Operations Hub provides you with a host of utilities that helps you to view, debug, visualize, and customise your log information.

View Audit Logs

The Audit dashboard leverages Kibana to provide meaningful visualization and a search interface for the raw log data.

You can view the Audit Logs dashboard by completing these steps:

Step 1 Click **Cisco Operations Hub > System > Logs**.

Step 2 Click **Audit Dashboard**.

The Audit Dashboard provides the following information:

- A visualization of the count of audit logs against time. You can view this as a histogram.
- All user initiated events from UI or using API interface are logged and available as audit logs.
- For every log file, the Audit Dashboard provides the following facets of information:
 - **Time**: The time of logging the event.
 - **User**: The user initiating the event.
 - **API**: The API call used.
 - **Status**: The HTTP response status code that returns when API was called.
 - **Response Time**: The time taken by the API to execute.
 - **Method**: The HTTP method the API used.
 - **Service Host**: The application that served the request.

View Debug Logs

You can view the Debug logs dashboard by completing these steps:

Step 1 Click **Cisco Operations Hub > System > Logs**.

Step 2 Click **Debug Dashboard**.

The Debug Dashboard provides the following information:

- A visualisation of the count of logs from different components against time is provided as a histogram.

- All internal application events logged by respective services or software components are captured as debug logs.
 - For every log file, the Debug Dashboard provides the following facets of information:
 - **Time:** The time of logging the event.
 - **Source:** The application where the event happened.
 - **ContainerName:** The applications microservice that generated the event.
 - **LogLevel:** The log level.
 - **Message:** The entire log content.
-

Discover Logs

The Discover option allows you to search and find logs based on custom search definitions.

You can view the Discover option by completing these steps:

Step 1 Click **Cisco Operations Hub > System > Logs**.

Step 2 Click **Discover**.

Step 3 Search for the log files.

You can perform basic text search, or advanced search by using KQL (Kibana Query Language) or Lucene search. Alternatively, you can also customize your search query based on time, debug-log type, selected fields, inspect option, and so on.

You can choose to save the search for later use from the dashboard.

Visualize Logs

You can create intuitive visualizations for your log data.

To create a visualization, complete these steps:

Step 1 Click **Cisco Operations Hub > System > Logs**.

Step 2 Click **Visualize > Create visualisation**.

Step 3 Choose one of these visualization type:

- Area
- Control
- Coordinate Map
- Data Table
- Gauge

- Goal
- Heat Map
- Horizontal Bar
- Line
- Markdown
- Metric
- Pie
- Region Map
- TSVB
- Tag Cloud
- Timelion
- Vega
- Vertical Bar

Step 4 Choose a source type. You can choose from `audit-log`, `debug-log`, or `logstash` objects. You can choose to save the visualizations to generate panels when you [Create Dashboards](#) , on page 256.

Create Dashboards

The Dashboard option allows you to create a new dashboard by adding panels from the saved [Discover Logs](#) option or [Visualize Logs](#) option. You can also create a new Dashboard from scratch.

Complete these steps to create a Dashboard:

- Step 1** Click **Cisco Operations Hub > System > Logs**.
- Step 2** Click **Dashboard > Create dashboard**.
- Step 3** Click **Add**.
- Step 4** On the Add panels menu, select the required searched and saved logs and visualizations.
- Step 5** You can choose to change existing filters or add filters.
- Step 6** Click **Create new** to choose a visualization type. You can choose from these visualization types:
- Area
 - Control
 - Coordinate Map
 - Data Table
 - Gauge
 - Goal

- Heat Map
- Horizontal Bar
- Line
- Markdown
- Metric
- Pie
- Region Map
- TSVB
- Tag Cloud
- Timelion
- Vega
- Vertical Bar

Step 7 Choose a source type. You can choose from `audit-log`, `debug-log`, or `logstash` objects. You can view the saved dashboards on the dashboard list.

Query on Data Store

The Dev Tools option allows you to query the data store.

Complete these steps to use the Dev Tools option:

Step 1 Click **Cisco Operations Hub > System > Logs**.

Step 2 Click **Dev Tools**.

Manage Indices and Objects

The Management option allows you to manage your indices and index patterns, list your saved objects, and enables you to customize the logs with advanced options.

Complete these steps to use the Management option:

Step 1 Click **Cisco Operations Hub > System > Logs**.

Step 2 Click **Management**.

You can choose from these tools:

- **Index Patterns:** Lists all available patterns. The list includes all fields for the selected pattern and the field's associated core type as recorded by Elasticsearch.

- **Saved Objects:** Lists all saved objects. You can choose to delete saved objects and saved searches. You can also edit the raw data of saved objects.
 - **Advanced Settings:** These are advanced settings, and must be handled with caution. For more detailed information, go through [Kibana Advanced Settings](#).
-

CHAPTER 6

Operations of Cisco Cloud Native Broadband Router

Cisco cnBR supports day-to-day operations of the Data-over-Cable Service Interface Specifications (DOCSIS) system from the deployment to the monitoring for optimal operations. This chapter describes utilities to facilitate typical workflows during such operations.

- [RPD Cutover, on page 259](#)
- [RPD Operations, on page 260](#)

RPD Cutover

Cisco cnBR Manager supports the Remote PHY Device (RPD) Cutover process through a GUI-based step-by-step wizard to move the RPDs from an existing cBR-8 system to a Cisco cnBR. RPD cutover assumes the Cisco cnBR is operational and the related service group (SG) configuration is ready before running this wizard. The wizard focuses on step-by-step instructions, preparation, and post verification including cable modem, CPE, and RF signal.

Prerequisites for RPD Cutover

- Target RPD is online and connected to cBR-8 system.
- Cisco cnBR is operational and healthy.
- Target SG is configured and verified on Cisco cnBR.
- SG configuration has the correct Secure Software Download (SSD) configuration.
- The SSD Image is in the TFTP or HTTP server.
- Network connectivity between Cisco cnBR and target cutover RPD is available.

Perform RPD Cutover from cBR-8 to Cisco cnBR

Choose **cnBR Manager > Remote PHY Device Management** from the Cisco Operations Hub main menu and click **Cutover RPD** to start RPD Cutover. The wizard presents fields for entry in sets on a progressive series of interface pages.

-
- Step 1** Set target details at the Connection page.
- Select or input original cBR-8 Access Protocol, IP Address, Username, Password, and Enable Password.
 - Click **Connect to cBR-8** to see all RPDs on the cBR-8 available for selection.
 - Select the target RPD to cutover and target Cisco cnBR.
 - Fill in expected values for the `CM online ratio threshold after cutover:` (for example: 95) and `Max wait-time after cutover init:` (for example: 40) fields.
 - Click **Next Step**.
- Step 2** Get prechecks done at the Pre-Check page.
- This step automatically performs prechecks. If a check fails, correct the failure, and click the rerun icon to rerun the precheck.
 - After all prechecks are complete, manually update the RPD CCAP-CORE-List from cBR-8 to Cisco cnBR at the DHCP server.
 - If the same CM/CPE IP scopes must move from the original cBR-8 to Cisco cnBR on DHCP server, move it.
 - Check the confirm check box when it is complete.
 - Click **Start Cutover** to start the RPD cutover process.
- Step 3** View progress and summary information at the Cutover page.
- Click **Next Step** when the RPD successfully comes online on Cisco cnBR and the target Cable Modem comes online within the time that is specified in the MAX wait-time field.
- Step 4** Get postchecks done at the Post-Check page.
- After these checks are complete, click **Next Step**.
- Step 5** View the Summary Report at the Report page. If there is any issue during this task, click **View Details** to get more information. Rollback tips are available in case you want to rollback when the cutover is not successful.
-

RPD Operations

cnBR Manager allows you to add, edit, delete, and replace RPDs serviced by a Cisco cnBR using the Configurator interface. This section provides step-by-step instructions to add, edit, delete, and replace RPDs.

Add RPDs

Before you begin

- Use an existing template or create new SG and L3 templates. See [Configure cnBR using cnBR Manager, on page 52](#) for steps to create new SG templates and L3 templates.
- Have the MAC address of the target RPD at hand.

-
- Step 1** Log in to the Cisco Operations Hub.
- Step 2** Choose **cnBR Manager > Remote PHY Device Management** from the Cisco Operations Hub main menu and click **Add RPD**.

Step 3 Select the Cisco cnBR and enter the target RPD information.

cnBR, RPD MAC, RPD Name, SG Name, SG Template, and L3 Template are required fields.

Step 4 To configure Video Services, check the **Configure Video Services** check box.

- a) Click **Add Template**.
- b) Select the Downstream port and Video QAM Template from the drop-down lists.

On selection of a Video QAM Template, the Cisco Operations Hub populates the default values of startSessionId, groupAddress, sourceAddress, and idInSg. You can edit the values as necessary.

Note Video QAM is only applicable to Downstream ports.

- c) Click the **Save** icon after providing all the inputs.

You can add multiple Video QAM Templates per Downstream port.

Step 5 Click **Next Step**.

Step 6 Wait for the cnBR Manager to complete the automated prechecks. Check the box at the bottom of the checklist to confirm that RPD is physically connected. Click **Next Step**.

The cnBR Manager starts to add the RPD. The progress is displayed in this page.

Step 7 If the operation is successful, click **Next Step**.

If it fails, the cnBR Manager displays a message to let you know that this step has failed.

Step 8 Wait for the cnBR Manager to perform the automated postchecks. Click **Next Step**.

The cnBR Manager displays a summary report that has the results of the operation.

What to do next

If adding the RPD fails during Steps 6 or 7, the cnBR Manager displays the error information. Use this information to diagnose and correct the problem. After you fix the problem, restart the **Add RPD** operation from Step 1. If the problem resolution requires a change in the configuration, delete and add the RPD again with the updated configuration.

Edit RPDs

Table 38: Feature History

| Feature Name | Release Information | Feature Description |
|----------------------------------|---------------------|---|
| Simplified RPD Parameter Editing | Cisco cnBR 21.1 | You can use the Configurator interface to edit SG/L3 template and other parameters of online RPDs instead of deleting and readding the RPD with new parameters. |

Before you begin

- Have the MAC address of the target RPD at hand.

-
- Step 1** Log in to the Cisco Operations Hub.
- Step 2** Choose **cnBR Manager > Remote PHY Device Management** from the Cisco Operations Hub main menu and click **Edit RPD**.
- Step 3** Select the Cisco cnBR Cluster, RPD MAC address, SG Template and/or L3 Template. You can also update RPD Location attributes in this step. Click **Next Step**.
- Note** If you updated the parameters of an existing SG / L3 template or created a new template, to apply this particular template to the RPD, select it in this step. The new parameters will be applied after the RPD edit operation is successful.
- Step 4** Wait for the cnBR Manager to complete the RPD edit operation. This may take a few minutes. Click **Next Step**.
- Step 5** Wait for the cnBR Manager to perform the automated post checks. Click **Next Step**
- Note** This step will be skipped if there is error in the previous step.
- Step 6** The cnBR Manager displays a detailed summary report at the end of the RPD edit operation.
-

Delete RPDs

Before you begin

- Have the MAC address of the target RPD at hand.

-
- Step 1** Log in to the Cisco Operations Hub.
- Step 2** Choose **cnBR Manager > Remote PHY Device Management** from the Cisco Operations Hub main menu and click **Delete RPD**.
- Step 3** Select the Cisco cnBR and the target RPD and click **Next Step**.
- Step 4** Wait for the cnBR Manager to check if the target cnBR is ready. Check the box to confirm you want to delete the RPD and click **Start Delete**.

The cnBR Manager starts to delete RPD. The progress is displayed in this page.

- Step 5** If the operation is successful, click **Next Step**. If it fails, the cnBR Manager displays a message to inform you that this step has failed; skip to Step 8.
- Step 6** Wait for the cnBR Manager to perform the automated postchecks. Click **Next Step**. (If Step 6 fails, the cnBR Manager skips this step.)
- Step 7** The cnBR Manager displays a summary report that has the results of the operation.
-

What to do next

If deleting the RPD fails at Steps 6 or 7, the cnBR Manager displays the error information. Use this information to diagnose and correct the problem. After you fix the problem, restart the **Delete RPD** operation from Step 1.

Replace RPDs

Before you begin

- Have the MAC addresses of the target RPD and the new RPD at hand.
-

- Step 1** Log in to the Cisco Operations Hub.
- Step 2** Choose **cnBR Manager > Remote PHY Device Management** from the Cisco Operations Hub main menu and click **Replace RPD**.
- Step 3** Select the Cisco cnBR and the existing RPD you want to replace. Enter the MAC address of the new RPD and the maximum wait time for the new RPD to be online. Click **Next Step**.
- Note** New RPDs need at least 12 minutes to come online.
- Step 4** Wait for the cnBR Manager to complete automated prechecks. Check the box at the bottom of the checklist to confirm that the RPD is physically connected. Click **Start Replace**.
The cnBR Manager starts to replace RPD. The progress is displayed in this page.
- Step 5** If the operation is successful, click **Next Step**. If it fails, the cnBR Manager displays a message to inform you that this step has failed; skip to Step 8.
- Step 6** Wait for the cnBR Manager to perform the automated postchecks. Click **Next Step**. (If Step 6 fails, the cnBR Manager skips this step.)
- Step 7** The cnBR Manager displays a summary report that has the results of the operation.
-

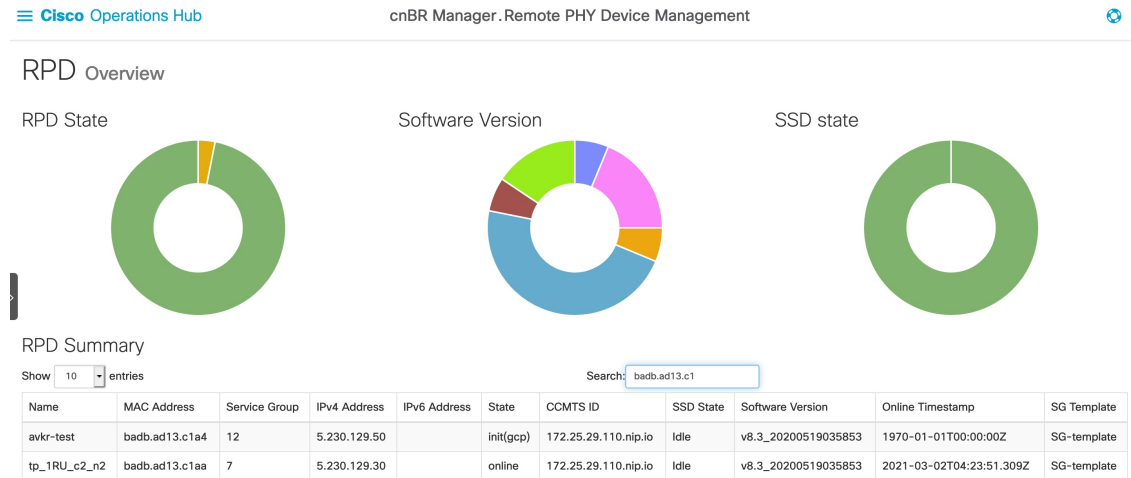

What to do next

If replacing the RPD failed at Steps 6 or 7, the cnBR Manager displays the error information. Use this information to diagnose and correct the problem. After you fix the problem, restart the **Replace RPD** operation from Step 1.

Monitor RPDs

After you add or replace an RPD serviced by Cisco cnBR, you can use the **RPD Overview** of the **cnBR Manager - Remote PHY Device Management** window to monitor the status of the RPD. The **RPD List Summary** page in Grafana also has the same details.

Figure 43: RPD List Summary Dashboard

CHAPTER 7

External Interfaces Support for Cisco Cloud Native Broadband Router

Cisco cnBR supports legacy interface translation, general network management, and monitoring information.

Cisco cnBR supports the following external interfaces:

- [IP Detail Record Service, on page 265](#)
- [Simple Network Management Protocol, on page 273](#)

IP Detail Record Service

The Cisco Operations Hub hosted IP Detail Record (IPDR) service provides the mechanisms to export IP detailed records to IPDR collectors and the ability to configure the IPDR service.

The Cisco Operations Hub IPDR service operates in a similar way as other Cisco Cable Modem Termination Systems (CMTS) products. You can configure it through the REST interface. See [IPDR Streaming Protocol on the Cisco CMTS Routers](#) for reference.

The URL `https://{Hostname}/api/ipdr` is created for the IPDR service, which is used for the REST configuration and status requests. The collector connects to the IPDR service on default port 4737 to establish a TCP session. Then, IPDR records are streamed from the IPDR service to the collector over this TCP session.

For the IPDR service to deliver records, the IP address of the collector that receives the records is required. An ordered list of collectors is contained in a session. Only one collector in a session receives the records, the

others are available as backup. The session describes the delivery mechanism and record format. You can define multiple sessions so that more than one collector can receive IPDR records from Operations Hub.

Terminology

| Term | Description |
|-----------|--|
| Collector | The host that receives (collects) the IPDR records. |
| Exporter | The IPDR service includes an exporter service that generates the IPDR records. |
| Session | Describes the set of collectors and templates that are used to send IPDR records. At a time, only one collector in a session gets IPDR data at a time based on a priority order. If a collector is unavailable, the collector with the next highest priority gets the records. |
| Template | Identifies the record format for sending the records. |

Configure IPDR Service

To configure the IPDR service, use a single command to set all configuration parameters in JSON format in one single action. This configuration method overwrites the existing configuration and activates the new configuration.

```
/v1/config
```

Note /ipdr/config is deprecated but usable.

To set the configuration, use the **PUT** HTTP method as shown in the following example.

```
curl -k -X PUT -H "Content-Type: application/json" -d @- << EOF
https://{Hostname}/api/ipdr/v1/config
{json_string}
EOF
```

Note Parameter -k allows insecure server connections when using SSL.

Example: Add or change IPDR configuration.

```
curl -k -X PUT -H "Content-Type: application/json" -d @- << EOF
https://opshub1.cisco.com/api/ipdr/v1/config
{
  "sessions": [
    {
      "id": 1,
      "name": "session_1",
      "description": "IPDR Session 1",
      "type": {
        "type": "time-interval",
        "interval": 15
      },
    },
    "templates": [
      {
        "template-type": "SAMIS-TYPE1"
      }
    ]
  }
}
```

```

    }
  ],
  "associated-collectors": [
    {
      "collector-name": "Collector1",
      "priority": 1
    }
  ]
},
{
  "id": 2,
  "name": "session_2",
  "description": "IPDR Session 2",
  "type": {
    "type": "event",
    "interval": 0
  },
  "templates": [
    {
      "template-type": "DS-UTIL"
    }
  ],
  "associated-collectors": [
    {
      "collector-name": "Collector1",
      "priority": 1
    }
  ]
},
{
  "id": 3,
  "name": "session_3",
  "description": "IPDR Session 3",
  "type": {
    "type": "event",
    "interval": 0
  },
  "templates": [
    {
      "template-type": "US-UTIL"
    }
  ],
  "associated-collectors": [
    {
      "collector-name": "Collector1",
      "priority": 1
    }
  ]
}
],
"collectors": [
  {
    "name": "Collector1",
    "address": "10.0.0.1",
    "nat-address": "0.0.0.0",
    "port": 0
  }
],
"exporter": {
  "ack-timeout": 60,
  "keep-alive": 300,
  "max-unacked": 200,
  "started": true
},

```

```

    "utilization": {
      "interval": 300
    }
  }
EOF

```

After setting the configuration, you can use the **GET** HTTP method as shown in the following example to display the consolidated configuration:

```
curl -H 'Content-Type: application/json' -X GET https://{Hostname}/api/ipdr/v1/config
```

Example: Display the existing IPDR configuration

```

curl -k -H 'Content-Type: application/json' -X GET
https://opshub1.cisco.com/api/ipdr/v1/config
{
  "sessions": [
    {
      "id": 1,
      "name": "session_1",
      "description": "IPDR Session 1",
      "type": {
        "type": "time-interval",
        "interval": 2
      },
      "templates": [
        {
          "template-type": "SAMIS-TYPE1"
        }
      ],
      "associated-collectors": [
        {
          "collector-name": "Collector1",
          "priority": 1
        }
      ]
    },
    {
      "id": 2,
      "name": "session_2",
      "description": "IPDR Session 2",
      "type": {
        "type": "event",
        "interval": 0
      },
      "templates": [
        {
          "template-type": "DS-UTIL"
        }
      ],
      "associated-collectors": [
        {
          "collector-name": "Collector1",
          "priority": 1
        }
      ]
    },
    {
      "id": 3,
      "name": "session_3",
      "description": "IPDR Session 3",
      "type": {
        "type": "event",
        "interval": 0
      },
    },
  ]
}

```

```

    "templates": [
      {
        "template-type": "US-UTIL"
      }
    ],
    "associated-collectors": [
      {
        "collector-name": "Collector1",
        "priority": 1
      }
    ]
  },
  "collectors": [
    {
      "name": "Collector1",
      "address": "10.0.0.1",
      "nat-address": "0.0.0.0",
      "port": 0
    }
  ],
  "exporter": {
    "ack-timeout": 60,
    "keep-alive": 300,
    "max-unacked": 200,
    "started": true
  },
  "utilization": {
    "interval": 240
  }
}

```

Example: Remove IPDR configuration

```
curl -X PUT -H "Content-Type: application/json" https://opshub1.cisco.com/api/ipdr/v1/config
```

Note The `opshub1.cisco.com` is only for illustrative purposes. Use the Fully Qualified Domain Name (FQDN) of the Cisco Operations Hub deployed at your site.

Fields In JSON

This table lists the fields used in JSON and their description.

| Field Name | Description | Type | Enforcement |
|-----------------|---|--|-------------|
| ack-timeout | Exporter timeout, after which an acknowledgement is received from the collector before retry. | Number. 5–60 seconds; the default value is 60. | Optional |
| address | The IP address of the collector, which is used to receive the IPDR records. | IP Address | Required |
| collector-name | A specific collector definition for collectors. | String | Required |
| collectors:name | Unique name used to identify a collector. | String | Required |
| description | Long descriptive text. | String | Required |

| Field Name | Description | Type | Enforcement |
|---------------|--|--|---|
| id | A unique session number for the purpose of reference. | Number | Required |
| interval | The interval used to send DS-UTIL and US-UTIL data. | Number in seconds, 0 means disabled. | Optional |
| keep-alive | The keepalive time after which the collector is considered unavailable. | Number. 5–300 seconds; the default value is 300. | Optional |
| max-unacked | The maximum number of unacknowledged records. | Number. 5–200; the default value is 200. | Optional |
| name | Descriptive name for reference purposes. | String | Required |
| nat-address | The NAT IP address of the collector. | IP Address | Optional |
| port | The port of the collector. | Number | Optional |
| priority | The order to use the collector. Use the collector with the lowest priority number first. | > 0 | Required |
| started | Start the IPDR service or not. | Boolean | Required |
| type:type | The method used to request data from the service. | String. Possible values: adhoc, event, time-interval | Required |
| type:interval | The frequency of sending the data for a session. | 2–1440 minutes. | Required only if "type:type" field is set to "time-interval". |
| template-type | Identifies the records format. | String. Possible values: SAMIS-TYPE1, US-UTIL, DS-UTIL, TOPOLOGY | Required |

REST Return Codes

You can use the status codes listed in the following table to convey the results of a request.

| Code | Short Description | Response Text | Actions |
|------|-------------------|---|---|
| 400 | HTTP_BAD_REQUEST | <ul style="list-style-type: none"> Failure: request format error. Failed to configure session when exporter starts, stop it at first. | Confirm that the format of the request is valid or restart the IPDR service to apply new sessions. |
| 404 | HTTP_NOT_FOUND | <ul style="list-style-type: none"> Failure: collector doesn't exist. | Return this code when adding a session referring to a collector that does not exist. If it is a consolidated configuration request, correct the request to include a valid collector. |

| Code | Short Description | Response Text | Actions |
|------|-------------------|--|--|
| 500 | HTTP_BAD_REQUEST | <ul style="list-style-type: none"> Failed to add new session to cache. Failed to apply IPDR configuration. Failed to config ipdr session to exporter. Failed to get ipdr sessions with internal error. Failed to recover configurations. Failed to remove session in cache. Failed to revert session in cache when db failed. Failed to update IPDR configuration. Failure: allocate JSON object error. Failure: get ipdr config information error. Failure: not enough memory. Failure: save global cfg error. IPDR configuration not updated, restored to original. | Internal error that requires engineering team engagement. |
| 503 | HTTP_SER_UNAVAIL | <ul style="list-style-type: none"> not ready | Use this code only in response to readiness check. If the service is not ready, confirm that the Cassandra database is ready. Otherwise, get the database ready. If the Cassandra database is ready and operational, ask for customer support. |

Monitor

Use the **GET** HTTP method of the following REST APIs to monitor the status of the IPDR session, collector, and exporter.

Monitor Session Status

- Get the status of all sessions.

```
/v1/sessions
```

- Get the status of a specific session.

```
/v1/sessions/{id}
```

Note /ipdr/session/status is deprecated but usable.

Example:

```
curl -k -H 'Content-Type: application/json' -X GET
https://opshub1.cisco.com/api/ipdr/v1/sessions
Session ID: 1, Name: samis, Descr: samis, Started: True
Session Type: Time Interval (15 minutes).
Expires in 81 seconds.
Exporting not started.
2019-05-29T05:08:14 Statistics:
  Transmitted 0 Acknowledged 0 Enqueued 0 Lost 0
  queuedOutstanding 0 queuedUnacknowledged 0
1 Collectors in the session:
  Name: collector1, IPAddr: 10.0.0.1, Port: N/A, Priority: 1[DISCONNECTED]
Templates in the session:
  Template ID: 2, Name:
http://www.cablelabs.com/namespaces/DOCSIS/3.0/xsd/ipdr/DOCSIS-SAMIS-TYPE-1/DOCSIS-SAMIS-TYPE-1_3.5.1-A.1.xsd,
  Type: SAMIS-TYPE-1, KeyNumber: 28
Session 1 has a total of 1 templates.
Session ID: 2, Name: cmts-ds-util-stats, Descr: cmts-ds-util-stats, Started: True
Session Type: Event Based.
2019-05-29T05:08:14 Statistics:
  Transmitted 0 Acknowledged 0 Enqueued 0 Lost 0
  queuedOutstanding 0 queuedUnacknowledged 0
1 Collectors in the session:
  Name: collector1, IPAddr: 10.0.0.1, Port: N/A, Priority: 0[DISCONNECTED]
Templates in the session:
  Template ID: 13, Name:
http://www.cablelabs.com/namespaces/DOCSIS/3.0/xsd/ipdr/DOCSIS-CMIS-DS-UTIL-STATS-TYPE/DOCSIS-CMIS-DS-UTIL-STATS-TYPE_3.5.1-A.3.xsd,
  Type:
http://www.cablelabs.com/namespaces/DOCSIS/3.0/xsd/ipdr/DOCSIS-CMIS-DS-UTIL-STATS-TYPE/DOCSIS-CMIS-DS-UTIL-STATS-TYPE_3.5.1-A.3.xsd,
  KeyNumber: 11
Session 2 has a total of 1 templates.
Session ID: 3, Name: cm-status, Descr: cm-status, Started: True
Session Type: Ad-hoc.
Exporting not started.
2019-05-29T05:08:14 Statistics:
  Transmitted 0 Acknowledged 0 Enqueued 0 Lost 0
  queuedOutstanding 0 queuedUnacknowledged 0
1 Collectors in the session:
  Name: collector1, IPAddr: 10.0.0.1, Port: N/A, Priority: 1[DISCONNECTED]
Templates in the session:
  Template ID: 8, Name:
http://www.cablelabs.com/namespaces/DOCSIS/3.0/xsd/ipdr/DOCSIS-CMIS-CM-FEG-STATUS-TYPE/DOCSIS-CMIS-CM-FEG-STATUS-TYPE_3.5.1-A.1.xsd,
  Type:
http://www.cablelabs.com/namespaces/DOCSIS/3.0/xsd/ipdr/DOCSIS-CMIS-CM-FEG-STATUS-TYPE/DOCSIS-CMIS-CM-FEG-STATUS-TYPE_3.5.1-A.1.xsd,
  KeyNumber: 18
Session 3 has a total of 1 templates.

curl -k -H 'Content-Type: application/json' -X GET
https://opshub1.cisco.com/api/ipdr/v1/sessions/1
Session ID: 1, Name: samis, Descr: samis, Started: True
Session Type: Time Interval (15 minutes).
Expires in 81 seconds.
Exporting not started.
2019-05-29T05:08:14 Statistics:
  Transmitted 0 Acknowledged 0 Enqueued 0 Lost 0
  queuedOutstanding 0 queuedUnacknowledged 0
1 Collectors in the session:
  Name: collector1, IPAddr: 10.0.0.1, Port: N/A, Priority: 1[DISCONNECTED]
```

```

Templates in the session:
Template ID: 2, Name:
http://www.cablelabs.com/namespaces/DOCSIS/3.0/xsd/ipdr/DOCSIS-SAMIS-TYPE-1/DOCSIS-SAMIS-TYPE-1_3.5.1-A.1.xsd,
Type: SAMIS-TYPE-1, KeyNumber: 28
Session 1 has a total of 1 templates.

```

Monitor Collector Status

/v1/collectors

Note /ipdr/collectors/status is deprecated but usable.

Example:

```

curl -k -H 'Content-Type: application/json' -X GET
https://opshub1.cisco.com/api/ipdr/v1/collectors
Collector name collector1, ip addr 10.0.0.1, port 0

```

Monitor Exporter Status

/v1/exporter

Note /ipdr/exporter/status is deprecated but usable.

Example:

```

curl -k -H 'Content-Type: application/json' -X GET
https://opshub1.cisco.com/api/ipdr/v1/exporter
IPDR exporter is started.
Current parameters:
  KeepAliveInterval: 300
  AckTimeInterval: 60
  AckSequenceInterval: 200

```

Simple Network Management Protocol

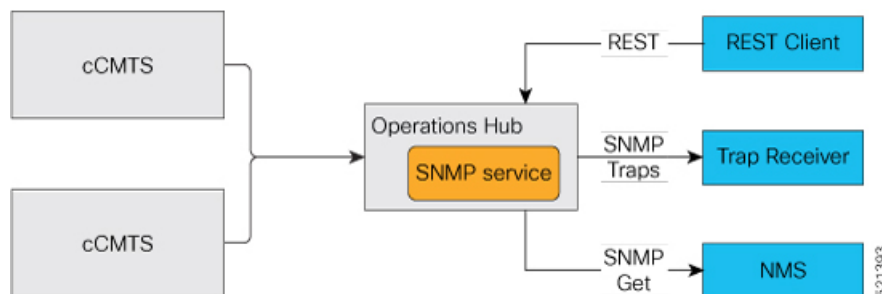

The Simple Network Management Protocol (SNMP) allows you to monitor the DOCSIS elements of Cisco cnBR.

The REST API is the recommended method to configure and operate Cisco cnBR. However, partial SNMP functionality is provided for compatibility with legacy SNMP applications. The Cisco cnBR SNMP Agent is located on the Cisco Operations Hub, and not on individual Cisco cnBRs.

SNMP aggregates information from multiple Cisco cnBR cores that are managed by Cisco Operations Hub.

From an application perspective, you must consider the Cisco Operations Hub as a *large* Cisco cnBR.

The following image provides you an overview of how the SNMP works in the Cisco cnBR.

Configure SNMP

Follow these steps to configure SNMP for Cisco cnBR:

Use the REST API to configure the SNMPv2 community string or Trap Receivers.

```
curl -X {GET|PUT|DELETE} https://{hostname}/api/snmp/v1/config
```

Use one of the following options:

- **SNMPv2 Community**

To configure SNMPv2 Community, replace <opshub-ip> with the Cisco Operations Hub IP. The following example is only indicative. See the [Cisco Cloud Native Broadband Router Operations Hub REST API Guide](#) for the authentication and encryption format.

```
curl -X GET https://{hostname}/api/snmp/v1/config
{"community-list": [], "v3user-list": [], "trap-receivers": [], "trap-enabled-list": []}
```

```
curl -X PUT -d @- << EOF https://{hostname}/api/snmp/v1/config
{
  "community-list": [
    {
      "community": "public",
      "access": "ro",
      "source": "",
      "oid": ""
    }
  ]
}
EOF
```

```
curl -X GET https://{hostname}/api/snmp/v1/config
{"community-list": [{"community": "public", "access": "ro", "source": "", "oid": ""}],
"v3user-list": [], "trap-receivers": [], "trap-enabled-list": []}
```

```
curl -X DELETE -d @- << EOF https://{hostname}/api/snmp/v1/config
{
  "community-list": [
    {
      "community": "public",
      "access": "ro",
      "source": "",
      "oid": ""
    }
  ]
}
EOF
```

• SNMPv1/v2 Trap

The Trap Receiver is a server listening to a specific UDP port for SNMP Trap events. Use the following REST API to configure the Trap Receiver IP address, port, and other information in the Cisco cnBR SNMP agent. The REST API enables the agent to send traps to the trap receiver.

```
curl -X PUT -d @- << EOF https://{hostname}/api/snmp/v1/config
{
  "trap-receivers": [
    {
      "host": "10.1.1.2",
      "port": 12348,
      "version": 2,
      "community": "private"
    }
  ]
}
EOF

curl -X GET https://{hostname}/api/snmp/v1/config
{"community-list":[], "v3user-list":[], "trap-receivers":
[{"host":"1.1.2.2", "port":12345, "version":1, "community":"public"},
{"host":"10.1.1.2", "port":12348, "version":2, "community":"private"}]}

curl -X DELETE -d @- << EOF https://{hostname}/api/snmp/v1/config
{
  "trap-receivers": [
    {
      "host": "1.1.2.2"
    }
  ]
}
EOF
```

- Note**
- *host*: Trap Receiver's IP address. For DELETE action, *host* is the key, and the other fields are not necessary.
 - *port*: Trap Receiver listens on this port. The Trap Receiver uses the default port **162**, if the *port* is not specified.
 - *version*: 1 for SNMPv1, 2 for SNMPv2.
 - *community*: Specify the community string to send or receive trap. At the receiver side, there is a configuration file to specify the *community*.

SNMP Support Scope

MIB

The following tables are supported.

```
docsIf31CmtsDsOfdmChanTable
docsIf31DocsisBaseCapability
docsIf3CmtsCmRegStatusTable
docsIf3CmtsCmUsStatusTable
docsIf3DsChSetTable
```

```

docsRphyRpdIfRpdToCoreMapTable
docsRphyStatsRpdUsOfdmaChanPerfStatsTable
docsRphyStatsRpdUsScQamChanPerfStatsTable
ifTable

```

**Note**

- Only a subset of OIDs required for the third-party tools integration is supported.
- Only the following MIBs supports SNMP Write:

```

docsPnmBulkDestIpAddr
docsPnmBulkDestIpAddrType
docsPnmCmtsUtscCfgTable
docsPnmCmtsUtscCtrlTable

```

- Cisco cnBR does not support NDF/NDR. The following MIBs only conform to prerequisites of third-party tools to capture upstream spectrum:

```

docsRphyRpdDevNdfCfgTable
docsRphyRpdDevNdrCfgTable

```

- For the following MIB, the table returns value zero (0) for all rows until OFDMA is supported by Cisco cnBR.

```

docsRphyStatsRpdUsOfdmaChanPerfStatsTable

```

Trap

Only CM online and offline events are supported.

Reference

[DOCSIS MIBs](#)

SNMP Limitations

Cisco cnBR SNMP has the following limitations:

- SNMP write is supported only for the MIB object or table that is listed in the MIB section. For more information, see [OIDs of MIB tables supported by Cisco Operations Hub](#).
- Only a limited set of DOCSIS MIB OIDs and traps is supported. For more information, see [OIDs of MIB tables supported by Cisco Operations Hub](#).
