# A through action snmp Commands

## action add

To specify the action of adding values of two variables when an Embedded Event Manager (EEM) applet is triggered, use the **action add** command in applet configuration mode. To undo the add action, use the **no** form of this command.

```
action label add {long-integervariable-name} {long-integervariable-name}
no action label add
```

Syntax Description		
<i>label</i>	Unique identifier that can be any string value. Actions are sorted and run in ascending alphanumeric key sequence using the label as the sort key. If the string contains embedded blanks, enclose it in double quotation marks.	
<b>add</b>	Adds the values of two variables.	
<i>variable-name</i>	String value to be placed as the variable name.	
<i>long-integer</i>	Long integer value to be added to a variable.	

**Command Default** By default, there is no change in the value of variables configured within an EEM applet.

**Command Modes** Applet configuration (config-applet)

Command History	Release	Modification
	12.4(22)T	This command was introduced.
	12.2(33)SRE	This command was integrated into Cisco IOS Release 12.2(33)SRE.

**Usage Guidelines** You can use this command to add the values of two variables. The result is stored in the variable named `$_result`. The value of the variable must be a long integer, else the action will fail.

**Examples** The following example shows how to configure an EEM applet to add the values of two variables:

```
Router(config)#event manager applet one
Router(config-applet)#action 1.0 set $var1 10
Router(config-applet)#action 1.0 set $var2 20
Router(config-applet)#action 1.0 add $var1 $var2
Router(config-applet)#
```

Related Commands	Command	Description
	<b>event manager applet</b>	Registers an event applet with the Embedded Event Manager and enters applet configuration mode.

## action append

To specify the action of appending the given string value to the current value of a variable when an Embedded Event Manager (EEM) applet is triggered, use the **action append** command in applet configuration mode. To undo the append action, use the **no** form of this command.

**action** *label* **append** *variable-name* [*variable-value*]  
**no action** *label* **add**

### Syntax Description

<i>label</i>	Unique identifier that can be any string value. Actions are sorted and run in ascending alphanumeric key sequence using the label as the sort key. If the string contains embedded blanks, enclose it in double quotation marks.
<b>append</b>	Appends the given string value to the current value of the variable specified.
<i>variable-name</i>	String value to be placed as the variable name.
<i>variable-value</i>	(Optional) Long integer value to be appended to the value of the variable name specified.

### Command Default

By default, there is no change in the value of variables configured within an EEM applet.

### Command Modes

Applet configuration (config-applet)

### Command History

Release	Modification
12.4(22)T	This command was introduced.
12.2(33)SRE	This command was integrated into Cisco IOS Release 12.2(33)SRE.

### Usage Guidelines

You can use this command to append the given string value to the current value of variable. If the variable does not exist, it will be created and set to the given value.

### Examples

The following example shows how to configure an EEM applet to append given string value to the current value of the variable specified:

```
Router(config)#event manager applet one
Router(config-applet)#action 1.0 set $var1 10
Router(config-applet)#action 1.0 append $var1 12
Router(config-applet)#
```

### Related Commands

Command	Description
<b>event manager applet</b>	Registers an event applet with the Embedded Event Manager and enters applet configuration mode.

## action break

To specify the action of exiting from a loop of actions when an Embedded Event Manager (EEM) applet is triggered, use the **action break** command in applet configuration mode. To disable the break action, use the **no** form of this command.

**action label break**

**no action label break**

### Syntax Description

<i>label</i>	Unique identifier that can be any string value. Actions are sorted and run in ascending alphanumeric key sequence using the label as the sort key. If the string contains embedded blanks, enclose it in double quotation marks.
<b>break</b>	Causes an immediate exit from a loop of actions.

### Command Default

By default, there is no exit from a loop of actions configured within an EEM applet.

### Command Modes

Applet configuration (config-applet)

### Command History

Release	Modification
12.4(22)T	This command was introduced.
12.2(33)SRE	This command was integrated into Cisco IOS Release 12.2(33)SRE.

### Usage Guidelines

You can use this command to skip all the actions down to the related end action.

### Examples

The following example shows how to configure an EEM applet to break from a loop of actions:

```
Router(config)# event manager applet loop
Router(config-applet)# event none
Router(config-applet)# action 1 while 1 eq 1
Router(config-applet)# action 2 break
Router(config-applet)# action 3 end
```

### Related Commands

Command	Description
<b>event manager applet</b>	Registers an event applet with the Embedded Event Manager and enters applet configuration mode.

## action cli

To specify the action of executing a Cisco IOS command-line interface (CLI) command when an Embedded Event Manager (EEM) applet is triggered, use the **action cli** command in applet configuration mode. To remove the action of executing a CLI command, use the **no** form of this command.

**action label cli command cli-string [pattern pattern-string]**

**no action** *label* **cli command** *cli-string*

<b>Syntax Description</b>	<i>label</i>	Unique identifier that can be any string value. Actions are sorted and run in ascending alphanumeric key sequence using the label as the sort key. If the string contains embedded blanks, enclose it in double quotation marks.
	<b>command</b>	Specifies the message to be sent to the Cisco IOS CLI.
	<i>cli-string</i>	CLI command to be executed. If the string contains embedded blanks, enclose it in double quotation marks.
	<b>pattern</b>	(Optional) Specifies the regular expression response pattern for the <b>command</b> <i>cli-string</i> only when the command string solicits input.
	<i>pattern-string</i>	(Optional) Specifies the action to be specified with the <b>pattern</b> keyword. You are required to specify a regular expression <i>pattern-string</i> that will match the next solicited prompt.

**Command Default** No CLI commands are executed when an EEM applet is triggered.

**Command Modes** Applet configuration (config-applet)

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	12.3(14)T	This command was introduced.
	12.2(28)SB	This command was integrated into Cisco IOS Release 12.2(28)SB.
	12.2(18)SXF4	This command was integrated into Cisco IOS Release 12.2(18)SXF4 to support Software Modularity images only.
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
	12.2(18)SXF5	This command was integrated into Cisco IOS Release 12.2(18)SXF5.
	12.2(33)SXH	The <b>pattern</b> keyword was added.

**Usage Guidelines** Use the **action cli** command to specify the action of executing a Cisco IOS CLI command when an EEM applet is triggered. The **pattern** keyword is optional and is used only when the command string solicits input.

There are two types of Cisco IOS CLI commands:

- Normal--Those Cisco IOS CLI commands that produce output followed by a display of the normal router prompt. The **action cli** command ends when the normal router prompt is received.
- Solicited--Those Cisco IOS CLI commands that ask one or more questions before the normal router prompt is displayed, such as “confirm,” which has to be completed with a “yes” or a “no” input.

The **action cli** command ends when the solicited prompt as specified in the optional **pattern** keyword is received. You are required to specify a regular expression pattern that will match the next solicited prompt. Specifying an incorrect pattern will cause the **action cli** command to wait forever until the applet execution times out due to the maxrun timer expiration.

The vty lines are allocated from the pool of vty lines that are configured using the **line vty** CLI configuration command. EEM will use a vty line when a vty line is not being used by EEM and there are available vty lines. EEM will also use a vty line when EEM is already using a vty line and there are three or more vty lines available. Be aware that the connection will fail when fewer than three vty lines are available, preserving the remaining vty lines for Telnet use.

The table below shows the built-in variable that is set when the **action cli** command is run.

**Table 1: EEM Built-in Variables for action cli Command**

Built-in Variable	Description
<code>\$_cli_result</code>	The result of the execution of the CLI command.

## Examples

The following example shows how to specify an EEM applet to run when the Cisco IOS **interface loopback** CLI command is configured three times. The applet executes the **no shutdown** command to ensure that the loopback interfaces are operational.

```
Router(config)# event manager applet cli-match
Router(config-applet)# event cli command {.*interface loopback*} sync yes occurs 3
Router(config-applet)# action 1.0 cli command "no shutdown"
```

The following example shows how to specify an EEM applet to run when the **pattern** keyword specifies the *confirm* argument for the **clear counters Ethernet0/1** command.

```
Router(config)# event manager applet cli-match
Router(config-applet)# action 1.0 cli command "enable"
Router(config-applet)# action 2.0 cli command "clear counters Ethernet0/1" pattern "confirm"
Router(config-applet)# action 3.0 cli command "y"
!
```

## Related Commands

Command	Description
<b>event manager applet</b>	Registers an event applet with the Embedded Event Manager and enters applet configuration mode.

## action cns-event

To specify the action of sending a message to the CNS Event Bus when an Embedded Event Manager (EEM) applet is triggered, use the **action cns-event** command in applet configuration mode. To remove the action of sending a message to the CNS Event Bus, use the **no** form of this command.

```
action label cns-event msg msg-text
no action label cns-event msg msg-text
```

## Syntax Description

<i>label</i>	Unique identifier that can be any string value. Actions are sorted and run in ascending alphanumeric key sequence using the label as the sort key. If the string contains embedded blanks, enclose it in double quotation marks.
<b>msg</b>	Specifies the message to be sent to the CNS Event Bus.

<i>msg-text</i>	Character text, an environment variable, or a combination of the two. If the string contains embedded blanks, enclose it in double quotation marks.
-----------------	---

**Command Default** No messages are sent to the CNS Event Bus.

**Command Modes** Applet configuration

Release	Modification
12.0(26)S	This command was introduced.
12.3(4)T	This command was integrated into Cisco IOS Release 12.3(4)T.
12.3(2)XE	This command was integrated into Cisco IOS Release 12.3(2)XE.
12.2(25)S	This command was integrated into Cisco IOS Release 12.2(25)S.
12.2(28)SB	This command was integrated into Cisco IOS Release 12.2(28)SB.
12.2(18)SXF4	This command was integrated into Cisco IOS Release 12.2(18)SXF4 to support Software Modularity images only.
12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
12.2(18)SXF5	This command was integrated into Cisco IOS Release 12.2(18)SXF5.

## Examples

The following example shows how to specify a message to be sent to the CNS Event Bus when the memory-fail applet is triggered:

```
Router(config)# event manager applet memory-fail
Router(config-applet)# event snmp oid 1.3.6.1.4.1.9.9.48.1.1.1.6.1 get-type exact entry-op
lt entry-val 5120000 poll-interval 10
Router(config-applet)# action 1.0 cns-event msg "Memory exhausted; current available memory
is $_snmp_oid_val bytes"
```

Related Commands	Command	Description
	<b>event manager applet</b>	Registers an event applet with the Embedded Event Manager and enters applet configuration mode.

## action comment

To specify the action of adding comments to an applet when an Embedded Event Manager (EEM) applet is triggered, use the **action comment** command in applet configuration mode. To disable the comment, use the **no** form of this command.

```
action label comment string
no action label comment
```

**Syntax Description**

<i>label</i>	Unique identifier that can be any string value. Actions are sorted and run in ascending alphanumeric key sequence using the label as the sort key. If the string contains embedded blanks, enclose it in double quotation marks.
<b>comment</b>	Adds comments to an applet.
<i>string</i>	Series of characters, including embedded spaces, to be placed as the comment.

**Command Default**

By default, there are no comments added to an applet.

**Command Modes**

Applet configuration (config-applet)

**Command History**

Release	Modification
12.4(22)T	This command was introduced.
12.2(33)SRE	This command was integrated into Cisco IOS Release 12.2(33)SRE.

**Usage Guidelines**

You can use this command to add comments to applets. This results in a no-op when the applet is run.

**Examples**

The following example shows how to add comments to an applet:

```
Router (config) #event manager applet one
Router (config-applet) #action 1.0 comment keyvalue
Router (config-applet) #
```

**Related Commands**

Command	Description
<b>event manager applet</b>	Registers an event applet with the Embedded Event Manager and enters applet configuration mode.

## action context retrieve

To specify the action of retrieving variables identified by a given set of context name keys, when an Embedded Event Manager (EEM) applet is triggered, use the **action context retrieve** command in applet configuration mode. To undo the retrieve action, use the **no** form of this command.

```
action label context retrieve key key-name variable variable-name-pattern
no action label context retrieve
```

**Syntax Description**

<i>label</i>	Unique identifier that can be any string value. Actions are sorted and run in ascending alphanumeric key sequence using the label as the sort key. If the string contains embedded blanks, enclose it in double quotation marks.
<b>context retrieve</b>	Used to retrieve variables identified by the given context name keys.

<b>key</b> <i>key-name</i>	Provides the context name key.
<b>variable</b> <i>variable-name-pattern</i>	Provides description of the variable.

**Command Default**

By default, no variables specified by a given set of context name keys are retrieved.

**Command Modes**

Applet configuration (config-applet)

**Command History**

Release	Modification
12.4(22)T	This command was introduced.
12.2(33)SRE	This command was integrated into Cisco IOS Release 12.2(33)SRE.

**Usage Guidelines**

You can use this command to retrieve the variable(s) identified by a given set of context name keys. Information that is retrieved is automatically deleted from the context database.

The information for the variable specified in the command is retrieved, only if a variable with the same name was saved in the corresponding context save call, using the **action context save** command.

**Examples**

The following example shows how to configure an EEM applet to retrieve variables identified by a given set of context name keys:

```
Router(config)#event manager applet one
Router(config-applet)#action 1.0 context retrieve key pki-72a variable var1
Router(config-applet)#
```

**Related Commands**

Command	Description
<b>event manager applet</b>	Registers an event applet with the Embedded Event Manager and enters applet configuration mode.
<b>action context save</b>	This command is used to save information across multiple policy triggers.

## action context save

To specify the action of saving information across multiple policy triggers, when an Embedded Event Manager (EEM) applet is triggered, use the **action context save** command in applet configuration mode. To remove the saved the information, use the **no** form of this command.

**action** *label* **context save** **key** *key-name* **variable** *variable-name-pattern*  
**no action** *label* **context save**

**Syntax Description**

<i>label</i>	Unique identifier that can be any string value. Actions are sorted and run in ascending alphanumeric key sequence using the label as the sort key. If the string contains embedded blanks, enclose it in double quotation marks.
--------------	--

<b>context save</b>	Used to save information across multiple policy triggers.
<b>key</b> <i>key-name</i>	Provides the context name key.
<b>variable</b> <i>variable-name-pattern</i>	Provides description of the variable.

**Command Default**

By default, no information is saved across multiple policy triggers.

**Command Modes**

Applet configuration (config-applet)

**Command History**

Release	Modification
12.4(22)T	This command was introduced.

**Usage Guidelines**

You can use the **action context save** command to save information across multiple policy triggers. The command saves variables that match the given pattern with the context name key as identification. Saved information can be retrieved by a different applet using the **action context retrieve** command.

Once the saved information is retrieved, it is automatically deleted from the context database. To save the same information from the applet that retrieved it, you must run the **action context save** command on that applet again.

**Examples**

The following example shows how to configure an EEM applet to save information across multiple policy triggers:

```
Router(config)#event manager applet one
Router(config-applet)#action 1.0 context save key pki-72a variable var1
Router(config-applet)#
```

**Related Commands**

Command	Description
<b>event manager applet</b>	Registers an event applet with the Embedded Event Manager and enters applet configuration mode.
<b>action context retrieve</b>	Retrieves variables identified by the given context name keys.

**action continue**

To specify the action of continuing with a loop of actions, when an Embedded Event Manager (EEM) applet is triggered, use the **action continue** command in applet configuration mode. To stop the continue action, use the **no** form of this command.

**action** *label* **continue**  
**no action** *label* **continue**

**Syntax Description**

<i>label</i>	Unique identifier that can be any string value. Actions are sorted and run in ascending alphanumeric key sequence using the label as the sort key. If the string contains embedded blanks, enclose it in double quotation marks.
--------------	--

<b>continue</b>	Causes the loop to continue with the next iteration.
-----------------	--

**Command Default** By default, there is no loop of actions configured within an EEM applet.

**Command Modes** Applet configuration (config-applet)

Release	Modification
12.4(22)T	This command was introduced.
12.2(33)SRE	This command was integrated into Cisco IOS Release 12.2(33)SRE.

**Usage Guidelines** You can use this command to continue with a loop of actions.

**Examples** The following example shows how to configure an EEM applet to continue with a loop of actions:

```
Router(config)# event manager applet loop
Router(config-applet)# event none
Router(config-applet)# action 1 while 1 eq 1
Router(config-applet)# action 2 continue
Router(config-applet)# action 3 end
```

Command	Description
<b>event manager applet</b>	Registers an event applet with the Embedded Event Manager and enters applet configuration mode.

## action counter

To specify the action of setting or modifying a named counter when an Embedded Event Manager (EEM) applet is triggered, use the **action counter** command in applet configuration mode. To restore the default value to the counter, use the **no** form of this command.

**action** *label* **counter name** *counter-name* **value** *counter-value* **op** {**dec** | **inc** | **nop** | **set**}  
**no action** *label* **counter name** *counter-name* **value** *counter-value* **op** {**dec** | **inc** | **nop** | **set**}

Syntax Description	
<i>label</i>	Unique identifier that can be any string value. Actions are sorted and run in ascending alphanumeric key sequence using the label as the sort key. If the string contains embedded blanks, enclose it in double quotation marks.
<b>name</b>	Specifies the name of the counter to be set or modified.
<i>counter-name</i>	Name of the counter to be set or modified. The counter name is referenced in a registered counter type policy.
<b>value</b>	Specifies the value to be used to set or modify the counter.
<i>counter-value</i>	Number in the range from -2147483648 to 2147483647, inclusive.

<b>op</b>	Indicates the operator to be used with the <i>counter-value</i> to set or modify the specified counter.
<b>dec</b>	Specifies that the counter is decreased in value by the amount specified in the <i>counter-value</i> argument.
<b>inc</b>	Specifies that the counter is increased in value by the amount specified in the <i>counter-value</i> argument.
<b>nop</b>	Specifies that the counter value is read from the environment variable <code>\$_counter_value_remain</code> .
<b>set</b>	Specifies that the counter is set to the value specified in the <i>counter-value</i> argument.

**Command Default**

No counter values are set or modified.

**Command Modes**

Applet configuration

**Command History**

Release	Modification
12.2(25)S	This command was introduced.
12.3(14)T	This command was integrated into Cisco IOS Release 12.3(14)T.
12.2(28)SB	This command was integrated into Cisco IOS Release 12.2(28)SB.
12.2(18)SXF4	This command was integrated into Cisco IOS Release 12.2(18)SXF4 to support Software Modularity images only.
12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
12.2(18)SXF5	This command was integrated into Cisco IOS Release 12.2(18)SXF5.

**Usage Guidelines**

Use the **action counter** command when an event occurs periodically and you want an action to be implemented after a specified number of occurrences of that event. When the **action counter** command completes, an environment variable is updated as shown in the table below.

The table below shows the built-in variable that is set when the **action counter** command is run.

**Table 2: EEM Built-in Variables for action counter Command**

Built-in Variable	Description
<code>\$_counter_value_remain</code>	The value of the counter after the execution of the <b>action counter</b> command.

Use the **event counter** command with the **action counter** command when an event occurs periodically and you want an action to be implemented after a specified number of occurrences of the event.

**Examples**

The following example shows an EEM applet called IPSLAping1 being registered to run when there is an exact match on the value of a specified SNMP object ID that represents a successful IP SLA ICMP echo operation (this is equivalent to a **ping** command). Four actions are triggered when the

echo operation fails, and event monitoring is disabled until after the second failure. A message saying that the ICMP echo operation to a server failed is sent to syslog, an SNMP trap is generated, EEM publishes an application-specific event, and a counter called IPSLA1F is incremented by a value of one.

```
Router(config)# event manager applet IPSLAping1
Router(config-applet)# event snmp oid 1.3.6.1.4.1.9.9.42.1.2.9.1.6.4 get-type exact
entry-op eq entry-val 1 exit-op eq exit-val 2 poll-interval 5
Router(config-applet)# action 1.0 syslog priority critical msg "Server IP echo failed:
OID=$_snmp_oid_val"
Router(config-applet)# action 1.1 snmp-trap strdata "EEM detected server reachability
failure to 10.1.88.9"
Router(config-applet)# action 1.2 publish-event sub-system 88000101 type 1 arg1 10.1.88.9
arg2 IPSLAEcho arg3 fail
Router(config-applet)# action 1.3 counter name _IPSLA1F value 1 op inc
```

The following example shows a policy--EventCounter\_A--that is configured to run once a minute and to increment a well-known counter called critical\_errors. A second policy--EventCounter\_B--is registered to be triggered when the well-known counter called critical\_errors exceeds a threshold of 3. When policy EventCounter\_B runs, it resets the counter back to 0.

```
Router(config)# event manager applet EventCounter_A
Router(config-applet)# event timer watchdog time 60.0
Router(config-applet)# action 1.0 syslog msg "EventCounter_A"
Router(config-applet)# action 2.0 counter name critical_errors value 1 op inc
Router(config-applet)# exit
```

## action decrement

To specify the action of decrementing the value of a variable, when an Embedded Event Manager (EEM) applet is triggered, use the **action decrement** command in applet configuration mode. To remove the action from the applet, use the **no action** form of this command.

**action** *label* **decrement** *variable-name* *long-integer*  
**no action** *label* **decrement**

Syntax Description	
<i>label</i>	Unique identifier that can be any string value. Actions are sorted and run in ascending alphanumeric key sequence using the label as the sort key. If the string contains embedded blanks, enclose it in double quotation marks.
<b>decrement</b>	Decrements the value of the variable with the integer specified.
<i>variable-name</i>	String value to be placed as the variable name.
<i>long-integer</i>	Long integer value by which the variable gets decremented.

**Command Default** By default, there is no change in the value of variables configured within an EEM applet.

**Command Modes** Applet configuration (config-applet)

**Command History**

Release	Modification
12.4(22)T	This command was introduced.
12.2(33)SRE	This command was integrated into Cisco IOS Release 12.2(33)SRE.

**Usage Guidelines**

You can use this command to decrement the value of a variable.

**Examples**

The following example shows how to configure an EEM applet to decrement the value of a variable:

```
Router(config)#event manager applet one
Router(config-applet)#action 1.0 set varname 20
Router(config-applet)#action 1.0 decrement varname 12
Router(config-applet)#
```

**Related Commands**

Command	Description
<b>event manager applet</b>	Registers an event applet with the Embedded Event Manager and enters applet configuration mode.

## action divide

To divide the dividend value by the given divisor value when an Embedded Event Manager (EEM) applet is triggered, use the **action divide** command in applet configuration mode. To remove the calculation process, use the **no** form of this command.

**action** *label* **divide** [*long-integer-1*variable-name-1] [*long-integer-2*variable-name-2]  
**no action** *label* **divide**

**Syntax Description**

<i>label</i>	Unique identifier that can be any string value. Actions are sorted and run in ascending alphanumeric key sequence using the label as the sort key. If the string contains embedded blanks, enclose it in double quotation marks.
<i>long-integer-1</i>	(Optional) First dividend integer value for the division.
<i>variable-name-1</i>	(Optional) First dividend variable name for the division. The value stored in the dividend variable name must be a long integer value or else the action will fail.
<i>long-integer-2</i>	(Optional) Second divisor integer value for the division.
<i>variable-name-2</i>	(Optional) Second divisor variable name for the division. The value stored in the divisor variable name must be a long integer value or else the action will fail.

**Command Default**

If the command is not entered within applet configuration mode, the respective applet is not registered when you exit the configuration.

**Command Modes**

Applet configuration (config-applet)

**Command History**

Release	Modification
12.4(22)T	This command was introduced.
12.2(33)SRE	This command was integrated into Cisco IOS Release 12.2(33)SRE.

**Usage Guidelines**

Use the **action divide** command to divide the dividend value with a given divisor value. All arithmetic calculations are performed as long integers without any checks for overflow. If a statement is not associated with this applet, events are still triggered without any action or result. A warning message stating that no statements are associated with this applet is displayed at the exit time of the configuration. All the results of the divide action command except the remainder value are saved in `$_result`. The remainder value of the divided integer is saved in `$_remainder`. Floating points (decimal) are not supported.

To provide a consistent user interface for the customers between the Tool Command Language (Tcl) and the CLI applet-based EEM policies, the following criteria are followed:

- Event specification criteria are written in Tcl in the Tcl-based implementation.
- Event specification data are written using the CLI applet submenu configuration statements in the applet-based implementation.

Some of the keywords appear to be longer than necessary or hyphenated in the applet-based implementation because the Tcl-based implementation was developed and deployed first.

To enter applet configuration mode, use the **event manager applet** *applet-name* command after entering global configuration mode. In applet configuration mode, the config prompt changes to (config-applet)#. The applet configuration mode supports three types of configuration statements:

- **event** --Specifies the event criteria that causes this applet to run.
- **action** --Performs a built-in action.
- **set** --Sets an applet variable (currently `_exit_status` is the only variable supported).

**Examples**

The following example shows how to divide the value of the dividend by the value of the divisor.

```
Router(config)# event manager applet action
Router(config-applet)# action label2 divide 45 15
```

**Related Commands**

Command	Description
<b>action add</b>	Adds the value of the variable by the given value when an EEM applet is triggered.
<b>action multiply</b>	Multiplies the value of the variable by the given value when an EEM applet is triggered.
<b>action subtract</b>	Subtracts the value of the variable by the given value when an EEM applet is triggered.

**action else**

To identify the beginning of an else conditional action block in an if/else conditional action block when an Embedded Event Manager (EEM) applet is triggered, use the **action else** command in applet configuration mode. To remove the else conditional action block, use the **no** form of this command.

**action** *label* **else**  
**no action** *label* **else**

**Syntax Description**

<i>label</i>	Unique identifier that can be any string value. Actions are sorted and run in ascending alphanumeric key sequence using the label as the sort key. If the string contains embedded blanks, enclose it in double quotation marks.
--------------	--

**Command Default**

If the command is not entered within applet configuration mode, the respective applet is not registered when you exit the configuration.

**Command Modes**

Applet configuration (config-applet)

**Command History**

Release	Modification
12.4(22)T	This command was introduced.
12.2(33)SRE	This command was integrated into Cisco IOS Release 12.2(33)SRE.

**Usage Guidelines**

Use the **action else** command to identify the else conditional action block. If a statement is not associated with this applet, events are still triggered without any action or result. A warning message stating that no statements are associated with this applet is displayed at the exit time of the configuration.

To provide a consistent user interface for the customers between the Tool Command Language (Tcl) and the CLI applet-based EEM policies, the following criteria are followed:

- Event specification criteria are written in Tcl in the Tcl-based implementation.
- Event specification data are written using the CLI applet-submode configuration statements in the applet-based implementation.

Some of the keywords appear to be longer than necessary or hyphenated in the applet-based implementation because the Tcl-based implementation was developed and deployed first.

To enter applet configuration mode, use the **event manager applet** *applet-name* command after entering global configuration mode. In applet configuration mode the config prompt changes to (config-applet)#. The applet configuration mode supports three types of configuration statements:

- **event** --Specifies the event criteria that causes this applet to run.
- **action** --Performs a built-in action.
- **set** --Sets an applet variable (currently `_exit_status` is the only variable supported).

**Examples**

The following example shows how to identify the beginning of an else action block:

```
Router(config)# event manager applet action
Router(config-applet)# action label if $var eq 0
Router(config-applet)# action label2 else
Router(config-applet)# end
```

Related Commands	Command	Description
	<b>action elseif</b>	Identifies the beginning of an elseif conditional action block when an EEM applet is triggered.
	<b>action if</b>	Identifies the beginning of an if conditional action block when an EEM applet is triggered.

## action elseif

To identify the beginning of the elseif conditional action block in the else/if conditional action block when an Embedded Event Manager (EEM) applet is triggered, use the **action elseif** command in applet configuration mode. To remove the elseif conditional action block, use the **no** form of this command.

**action** *label* **elseif** [*string-op-1*] {**eq** | **gt** | **ge** | **lt** | **le** | **ne**} [*string-op-2*]  
**no action** *label* **elseif**

Syntax Description		
	<i>label</i>	Unique identifier that can be any string value. Actions are sorted and run in ascending alphanumeric key sequence using the label as the sort key. If the string contains embedded blanks, enclose it in double quotation marks.
	<i>string-op-1</i>	(Optional) Sequence of characters that will replace the range of characters in the string.
	<b>eq</b>	Equal To keyword used for comparing two strings.
	<b>gt</b>	Greater Than keyword used for comparing two strings.
	<b>ge</b>	Greater Than or Equal To keyword used for comparing two strings.
	<b>lt</b>	Less Than keyword used for comparing two strings.
	<b>le</b>	Less Than or Equal To keyword used for comparing two strings.
	<b>ne</b>	Not Equal To keyword used for comparing two strings.
	<i>string-op-2</i>	(Optional) Sequence of characters that will replace the range of characters in the string.

**Command Default** If the command is not specified within applet configuration mode, the respective applet is not registered when you exit the configuration.

**Command Modes** Applet configuration (config-applet)

Command History	Release	Modification
	12.4(22)T	This command was introduced.
	12.2(33)SRE	This command was integrated into Cisco IOS Release 12.2(33)SRE.

**Usage Guidelines** Use the **action elseif** command to identify the beginning of the else conditional action block in the else/if conditional action block. All arithmetic calculations are performed as long integers without any checks for overflow. If a statement is not associated with this applet, events are still triggered without any action or result.

A warning message stating that no statements are associated with this applet is displayed at the exit time of the configuration.

To provide a consistent user interface for the customers between the Tool Command Language (Tcl) and the CLI applet-based EEM policies, the following criteria are followed:

- Event specification criteria are written in Tcl in the Tcl-based implementation.
- Event specification data is written using the CLI applet-submode configuration statements in the applet-based implementation.

Some of the keywords appear to be longer than necessary or hyphenated in the applet-based implementation because the Tcl-based implementation was developed and deployed first.

To enter applet configuration mode, use the **event manager applet** *applet-name* command in global configuration mode. In applet configuration mode, the config prompt changes to (config-applet)#. Applet configuration mode supports three types of configuration statements:

- **event** --Specifies the event criteria that cause this applet to run.
- **action** --Performs a built-in action.
- **set** --Sets an applet variable (currently `_exit_status` is the only variable supported).

## Examples

The following example shows how to identify the beginning of the elseif conditional action block.

```
Router(config)# event manager applet action
Router(config-applet)# event none
Router(config-applet)# action 1.0 set x "5"
Router(config-applet)# action 2.0 if $x lt 3
Router(config-applet)# action 3.0 puts "$x is less than 3"
Router(config-applet)# action 4.0 elseif $x lt 10

Router(config-applet)# action 5.0 puts "$x is less than 10"

Router(config-applet)# action 6.0 end
Router# event manager run action
5 is less than 10
Router#
```

## Related Commands

Command	Description
<b>action else</b>	Identifies the beginning of the else conditional action block when an EEM applet is triggered.
<b>action if</b>	Identifies the beginning of an if conditional action block when an EEM applet is triggered.
<b>action ifgoto</b>	Signifies the applet to jump to the given label if the condition is true when an EEM applet is triggered.

## action end

To identify the end of a conditional action block in the if/else and while conditional action block when an Embedded Event Manager (EEM) applet is triggered, use the **action end** command in applet configuration mode. To remove the end conditional action block, use the **no** form of this command.

**action** *label* **end**  
**no action** *label* **end**

**Syntax Description**

<i>label</i>	Unique identifier that can be any string value. Actions are sorted and run in ascending alphanumeric key sequence using the label as the sort key. If the string contains embedded blanks, enclose it in double quotation marks.

- **action** --Performs a built-in action.
- **set** --Sets an applet variable (currently `_exit_status` is the only variable supported).

**Examples**

The following example shows how to identify the end of a conditional action block:

```
Router(config)# event manager applet action
Router(config-applet)# event none
Router(config-applet)# action 1.0 set x "5"
Router(config-applet)# action 2.0 if $x lt 10
Router(config-applet)# action 3.0 puts "$x is less than 10"
Router(config-applet)# action 4.0 end
```

**Related Commands**

Command	Description
<b>action else</b>	Identifies the beginning of the else conditional action block when an EEM applet is triggered.
<b>action if</b>	Identifies the beginning of an if conditional action block when an EEM applet is triggered.

**action exit**

To immediately exit from the running applet configuration when an Embedded Event Manager (EEM) applet is triggered, use the **action exit** command in applet configuration mode. To cancel the process of immediate exit from the running applet, use the **no** form of this command.

**action** *label* **exit** [*result*]

**no action** *label* **exit**

**Syntax Description**

<i>label</i>	Unique identifier that can be any string value. Actions are sorted and run in ascending alphanumeric key sequence using the label as the sort key. If the string contains embedded blanks, enclose it in double quotation marks.
<i>result</i>	(Optional) Parameter word for the exit result.

**Command Default**

If the commands are not specified within applet configuration mode, the respective applet is removed when you exit the configuration.

**Command Modes**

Applet configuration (config-applet)

**Command History**

Release	Modification
12.4(22)T	This command was introduced.
12.2(33)SRE	This command was integrated into Cisco IOS Release 12.2(33)SRE.

**Usage Guidelines**

Use the **action exit** command to immediately exit from the running applet configuration. All arithmetic calculations are performed as long integers without any checks for overflow. If a statement is not associated with this applet, events are still triggered without any action or result. A warning message stating that no statements are associated with this applet is displayed at the exit time of the configuration.

To provide a consistent user interface for the customers between the Tool Command Language (Tcl) and the CLI applet-based EEM policies, the following criteria are followed:

- The event specification criteria are written in Tcl in the Tcl-based implementation.
- The event specification data are written using the CLI applet submode configuration statements in the applet-based implementation.

Some of the keywords appear to be longer than necessary or hyphenated in the applet-based implementation because the Tcl-based implementation was developed and deployed first.

To enter applet configuration mode, use the **event manager applet** *applet-name* command after entering global configuration mode. In applet configuration mode the config prompt changes to (config-applet)#. The applet configuration mode supports three types of configuration statements:

- **event** --Specifies the event criteria that causes this applet to run.
- **action** --Performs a built-in action.
- **set** --Sets an applet variable (currently `_exit_status` is the only variable supported).

## Examples

The following example shows how to exit the applet configuration:

```
Router(config)# event manager applet action
Router(config-applet)# action label2 exit 25
```

## action file

To configure the Embedded Event Manager (EEM) applet file operations, use the **action file** command in applet configuration mode. To disable the configuration, use the **no** form of this command.

```
action label file{close file-descriptor | delete file-descriptor | gets file-descriptor variable-name | open
file-descriptor file-name access-permission | puts file-descriptor {string | newline string} | read
file-descriptor variable-name number | write file-descriptor string number}
no action label file
```

### Syntax Description

<i>label</i>	Unique identifier that can be any string value. Actions are sorted and run in ascending alphanumeric key sequence using the label as the sort key. If the string contains embedded blanks, enclose it in double quotation marks.
<b>close</b>	Specifies the file to close.
<i>filename</i>	Name of the file.
<b>delete</b>	Specifies the file to delete.
<b>gets</b>	Specifies the information or file to get.
<i>variable-name</i>	Variable name to store the get result.
<b>open</b>	Specifies the file to open
<i>file-access</i>	File access. Valid values are
<b>puts</b>	
<i>string</i>	
<b>newline</b>	Specifies that no new line should be added.
<b>read</b>	Specifies the file to read.
<i>number</i>	Specifies the file to write information.

Command	Description
<b>event manager applet</b>	Registers an event applet with EEM and enters applet configuration mode.

## action force-switchover

To specify the action of switching to a secondary processor in a fully redundant environment when an Embedded Event Manager (EEM) applet is triggered, use the **action force-switchover** command in applet configuration mode. To remove the action of switching to a secondary processor, use the **no** form of this command.

**action** *label* **force-switchover**

**no action** *label* **force-switchover**

**Syntax Description**

<i>label</i>	Unique identifier that can be any string value. Actions are sorted and run in ascending alphanumeric key sequence using the label as the sort key. If the string contains embedded blanks, enclose it in double quotation marks.
--------------	--

**Command Default**

A switch to a secondary processor is not made.

**Command Modes**

Applet configuration

**Command History**

Release	Modification
12.0(26)S	This command was introduced.
12.3(4)T	This command was integrated into Cisco IOS Release 12.3(4)T.
12.3(2)XE	This command was integrated into Cisco IOS Release 12.3(2)XE.
12.2(25)S	This command was integrated into Cisco IOS Release 12.2(25)S.

Release	Modification
12.2(28)SB	This command was integrated into Cisco IOS Release 12.2(28)SB.
12.2(18)SXF4	This command was integrated into Cisco IOS Release 12.2(18)SXF4 to support Software Modularity images only.
12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
12.2(18)SXF5	This command was integrated into Cisco IOS Release 12.2(18)SXF5.

### Usage Guidelines

Before using the **action force-switchover** command, you must install a backup processor in the device. If the hardware is not fully redundant, the switchover action will not be performed.

### Examples

The following example shows how to specify a switch to the secondary Route Processor (RP) when the memory-fail applet is triggered:

```
Router(config)# event manager applet memory-fail
Router(config-applet)# event snmp oid 1.3.6.1.4.1.9.9.48.1.1.1.6.1 get-type exact entry-op
lt entry-val 5120000 poll-interval 10
Router(config-applet)# action 2.0 force-switchover
```

### Related Commands

Command	Description
<b>event manager applet</b>	Registers an event applet with the Embedded Event Manager and enters applet configuration mode.

## action foreach

To specify the iteration of an input string using the delimiter as a tokenizing pattern, use the **action foreach** command in applet configuration mode. To remove iteration of the input string, use the **no** form of this command.

```
action label foreach [string-iterator] [string-input] [string-delimiter]
no action label foreach
```

### Syntax Description

<i>label</i>	Unique identifier that can be any string value. Actions are sorted and run in ascending alphanumeric key sequence using the label as the sort key. If the string contains embedded blanks, enclose it in double quotation marks.
<i>string-iterator</i>	(Optional) Series of characters that acts as an iterator. If the string contains embedded blanks, enclose it in double quotation marks.
<i>string-input</i>	(Optional) Series of characters that acts as an input. If the string contains embedded blanks, enclose it in double quotation marks.
<i>string-delimiter</i>	(Optional) Series of characters that acts as a delimiter. If the string contains embedded blanks, enclose it in double quotation marks. The default delimiter is whitespace.

**Command Default**

If the commands are not specified within applet configuration mode, the respective applet is removed when you exit the configuration.

**Command Modes**

Applet configuration (config-applet)

**Command History**

Release	Modification
12.4(22)T	This command was introduced.
12.2(33)SRE	This command was integrated into Cisco IOS Release 12.2(33)SRE.

**Usage Guidelines**

Use the **action foreach** command to iterate an input string using the delimiter as a tokenizing pattern. The delimiter is a regular expression pattern string. The token found in each iteration is assigned to the given iterator variable. All arithmetic calculations are performed as long integers without any checks for overflow. If a statement is not associated with this applet, events are still triggered without any action or result. A warning message stating that no statements are associated with this applet is displayed at the exit time of the configuration.

To provide a consistent user interface for the customers between the Tool Command Language (Tcl) and the CLI applet-based EEM policies, the following criteria are followed:

- The event specification criteria are written in Tcl in the Tcl-based implementation.
- The event specification data are written using the CLI applet submenu configuration statements in the applet-based implementation.

Some of the keywords appear to be longer than necessary or hyphenated in the applet-based implementation because the Tcl-based implementation was developed and deployed first.

To enter applet configuration mode, use the **event manager applet** *applet-name* command after entering global configuration mode. In applet configuration mode the config prompt changes to (config-applet)#. The applet configuration mode supports three types of configuration statements:

- **event** --Specifies the event criteria that causes this applet to run.
- **action** --Performs a built-in action.
- **set** --Sets an applet variable (currently `_exit_status` is the only variable supported).

**Examples**

The following example shows how to iterate an input string using the delimiter as a tokenizing pattern:

```
Router(config)# event manager applet action
Router(config-applet)# event none
Router(config-applet)# action 1 foreach _iterator "red blue green orange"
Router(config-applet)# action 2 puts "iterator is $_iterator"
Router(config-applet)# action 3 end
Router# event manager run action
iterator is red
iterator is blue
iterator is green
iterator is orange
Router#
```

## action gets

To get an input from the local tty in a synchronous applet and store the value in the given variable when an Embedded Event Manager (EEM) applet is triggered, use the **action gets** command in applet configuration mode. To cancel the process of receiving an input from the local tty, use the **no** form of this command.

**action** *label* **gets** *variable*

**no action** *label* **gets**

### Syntax Description

<i>label</i>	Unique identifier that can be any string value. Actions are sorted and run in ascending alphanumeric key sequence using the label as the sort key. If the string contains embedded blanks, enclose it in double quotation marks.
<i>variable</i>	Variable word that stores the input value from the synchronous applet.

### Command Default

If the commands are not specified within applet configuration mode, the respective applet is removed when you exit the configuration.

### Command Modes

Applet configuration (config-applet)

### Command History

Release	Modification
12.4(22)T	This command was introduced.
12.2(33)SRE	This command was integrated into Cisco IOS Release 12.2(33)SRE.

### Usage Guidelines

Use the **action gets** command to get an input from the local tty in a synchronous applet and store the value in the given variable. This command is not operational for asynchronous applets. The applet continues without any error but does not set the variable. All arithmetic calculations are performed as long integers without any checks for overflow. If a statement is not associated with this applet, events are still triggered without any action or result. A warning message stating that no statements are associated with this applet is displayed at the exit time of the configuration.

To provide a consistent user interface for the customers between the Tool Command Language (Tcl) and the CLI applet-based EEM policies, the following criteria are followed:

- Event specification criteria are written in Tcl in the Tcl-based implementation.
- Event specification data are written using the CLI applet submode configuration statements in the applet-based implementation.

Some of the keywords appear to be longer than necessary or hyphenated in the applet based implementation because the Tcl-based implementation was developed and deployed first.

To enter applet configuration mode, use the **event manager applet** *applet-name* command after entering the global configuration mode. In applet configuration mode the config prompt changes to (config-applet)#. The applet configuration mode supports three types of configuration statements:

- **event** --Specifies the event criteria that causes this applet to run.
- **action** --Performs a built-in action.

- **set** --Sets an applet variable (currently `_exit_status` is the only variable supported).

## Examples

The following example shows how to get the input from the local tty in a synchronous applet and store the value:

```
Router(config)# event manager applet action
Router(config-applet)# event none
Router(config-applet)# action label2 gets input
Router(config-applet)# action label3 syslog msg "Input entered was \"${input}\""
```

## Related Commands

Command	Description
<b>action puts</b>	Prints data directly to the local tty in a synchronous applet when an EEM applet is triggered.

## action if

To identify the beginning of an if conditional block when an Embedded Event Manager (EEM) applet is triggered, use the **action if** command in applet configuration mode. To remove the if conditional action block, use the **no** form of this command.

```
action label if [string-op-1] {eq | gt | ge | lt | le | ne} [string-op-2]
no action label if
```

## Syntax Description

<i>label</i>	Unique identifier that can be any string value. Actions are sorted and run in ascending alphanumeric key sequence using the label as the sort key. If the string contains embedded blanks, enclose it in double quotation marks.
<i>string-op-1</i>	(Optional) Sequence of characters that will replace the range of characters in the string.
<b>eq</b>	Equal To keyword used for comparing two strings.
<b>gt</b>	Greater Than keyword used for comparing two strings.
<b>ge</b>	Greater Than or Equal To keyword used for comparing two strings.
<b>lt</b>	Less Than keyword used for comparing two strings.
<b>le</b>	Less Than or Equal To keyword used for comparing two strings.
<b>ne</b>	Not Equal To keyword used for comparing two strings.
<i>string-op-2</i>	(Optional) Sequence of characters that will replace the range of characters in the string.

## Command Default

If the commands are not specified within applet configuration mode, the respective applet is removed when you exit the configuration.

## Command Modes

Applet configuration (config-applet)

**Command History**

Release	Modification
12.4(22)T	This command was introduced.
12.2(33)SRE	This command was integrated into Cisco IOS Release 12.2(33)SRE.

**Usage Guidelines**

Use the **action if** command to identify the beginning of the if conditional action block. All arithmetic calculations are performed as long integers without any checks for overflow. If the *goto label* option is used, the if functionality will not identify the beginning of a action block, but will signify the applet to jump to the given label if the condition is true.

If a statement is not associated with this applet, events are still triggered without any action or result. A warning message stating that no statements are associated with this applet is displayed at the exit time of the configuration.

To provide a consistent user interface for the customers between the Tool Command Language (Tcl) and the CLI applet-based EEM policies, the following criteria are followed:

- Event specification criteria are written in Tcl in the Tcl-based implementation.
- Event specification data are written using the CLI applet submenu configuration statements in the applet-based implementation.

Some of the keywords appear to be longer than necessary or hyphenated in the applet based implementation because the Tcl based implementation was developed and deployed first.

To enter applet configuration mode, use the **event manager applet** *applet-name* command after entering global configuration mode. In applet configuration mode the config prompt changes to (config-applet)#. The applet configuration mode supports three types of configuration statements:

- **event** --Specifies the event criteria that causes this applet to run.
- **action** --Performs a built-in action.
- **set** --Sets an applet variable (currently `_exit_status` is the only variable supported).

**Examples**

The following example shows how to identify the beginning of an if conditional block:

```
Router(config)# event manager applet action
Router(config-applet)# event none
Router(config-applet)# action 1.0 set x "5"
Router(config-applet)# action 2.0 if $x lt 10
Router(config-applet)# action 3.0 puts "$x is less than 10"
Router(config-applet)# action 4.0 end
Router# event manager run action
5 is less than 10
Router#
```

**Related Commands**

Command	Description
<b>action elseif</b>	Identifies the beginning of the else conditional action block in the else/if conditional block when an EEM applet is triggered.

Command	Description
<b>action ifgoto</b>	Signifies the applet to jump to the given label if the condition is true when an EEM applet is triggered.

## action ifgoto

To instruct the applet to jump to a given label if the specified condition is true when an Embedded Event Manager (EEM) applet is triggered, use the **action ifgoto** command in applet configuration mode. To cancel the process of applet jump, use the **no** form of this command.

**action** *label-1* **if** [*string-op-1*] {**eq** | **gt** | **ge** | **lt** | **le** | **ne**} [*string-op-2*] **goto** *label-2*  
**no action** *label* **ifgoto**

### Syntax Description

<i>label-1</i>	Unique identifier that can be any string value. Actions are sorted and run in ascending alphanumeric key sequence using the label as the sort key. If the string contains embedded blanks, enclose it in double quotation marks.
<i>string-op-1</i>	(Optional) Sequence of characters that will replace the range of characters in the string.
<b>eq</b>	Equal To keyword used for comparing two strings.
<b>gt</b>	Greater Than keyword used for comparing two strings.
<b>ge</b>	Greater Than Or Equal To keyword used for comparing two strings.
<b>lt</b>	Less Than keyword used for comparing two strings.
<b>le</b>	Less Than Or Equal To keyword used for comparing two strings.
<b>ne</b>	Not Equal To keyword used for comparing two strings.
<i>string-op-2</i>	(Optional) Sequence of characters that will replace the range of characters in the string.
<i>label-2</i>	Unique identifier that can be any string value. Actions are sorted and run in ascending alphanumeric key sequence using the label as the sort key. If the string contains embedded blanks, enclose it in double quotation marks.
<i>label</i>	Unique identifier that can be any string value. Actions are sorted and run in ascending alphanumeric key sequence using the label as the sort key. If the string contains embedded blanks, enclose it in double quotation marks.

### Command Default

If the command is not specified within applet configuration mode, the respective applet is removed when you exit the configuration.

### Command Modes

Applet configuration (config-applet)

### Command History

Release	Modification
12.4(22)T	This command was introduced.

Release	Modification
12.2(33)SRE	This command was integrated into Cisco IOS Release 12.2(33)SRE.

### Usage Guidelines

Use the **action ifgoto** command to signify the applet to jump to a given label if the specified condition is true. If the **goto label** option is used, the **action if** command will not identify the beginning of an action block. Goto actions are supported only within the if/goto format. To simulate a goto without if, use a test that is always true. All arithmetic calculations are performed as long integers without any checks for overflow. If a statement is not associated with this applet, events are still triggered without any action or result. A warning message stating that no statements are associated with this applet is displayed at the exit time of the configuration.

To provide a consistent user interface for the customers between the Tool Command Language (Tcl) and the CLI applet-based EEM policies, the following criteria are followed:

- Event specification criteria are written in Tcl in the Tcl-based implementation.
- Event specification data is written using the CLI applet submode configuration statements in the applet-based implementation.

Some of the keywords appear to be longer than necessary or hyphenated in the applet-based implementation because the Tcl-based implementation was developed and deployed first.

To enter applet configuration mode, use the **event manager applet** *applet-name* command in the global configuration mode. In applet configuration mode, the config prompt changes to (config-applet)#. Applet configuration mode supports three types of configuration statements:

- **event** --Specifies the event criteria that cause this applet to run.
- **action** --Performs a built-in action.
- **set** --Sets an applet variable (currently `_exit_status` is the only variable supported).

### Examples

The following example shows how to instruct the applet to jump to a given label:

```
Router(config)# event manager applet action
Router(config-applet)# event none
Router(config-applet)# action 1 set x "5"
Router(config-applet)# action 2 if $x lt 10 goto 4
Router(config-applet)# action 3 puts "skipping this"
Router(config-applet)# action 4 puts "jumped to action 4"
Router(config-applet)# action 5 end
Router# event manager run action
jumped to action 4
```

### Related Commands

Command	Description
<b>action else</b>	Identifies the beginning of the else conditional action block when an EEM applet is triggered.
<b>action if</b>	Identifies the beginning of an if conditional action block when an EEM applet is triggered.

## action increment

To specify the action of incrementing the value of a variable, when an Embedded Event Manager (EEM) applet is triggered, use the **action increment** command in applet configuration mode. To remove the action from the applet, use the **no** form of this command.

**action** *label* **increment** *variable-name* *long-integer*  
**no action** *label* **increment**

### Syntax Description

<i>label</i>	Unique identifier that can be any string value. Actions are sorted and run in ascending alphanumeric key sequence using the label as the sort key. If the string contains embedded blanks, enclose it in double quotation marks.
<b>increment</b>	Increments the value of the variable with the long integer specified.
<i>variable-name</i>	String value to be placed as the variable name.
<i>long-integer</i>	Long integer value by which the variable is incremented.

### Command Default

By default, there is no change in the value of variables configured within an EEM applet.

### Command Modes

Applet configuration (config-applet)

### Command History

Release	Modification
12.4(22)T	This command was introduced.
12.2(33)SRE	This command was integrated into Cisco IOS Release 12.2(33)SRE.

### Usage Guidelines

You can use this command to increment the value of a variable. The value of the variable must be a long integer, else the action will fail.

### Examples

The following example shows how to configure an EEM applet to increment the value of a variable:

```
Router(config)#event manager applet one
Router(config-applet)#action 1.0 set varname 20
Router(config-applet)#action 1.0 increment varname 12
Router(config-applet)#
```

### Related Commands

Command	Description
<b>event manager applet</b>	Registers an event applet with the Embedded Event Manager and enters applet configuration mode.

## action info

To specify the action of obtaining system information when an Embedded Event Manager (EEM) applet is triggered, use the **action info** command in applet configuration mode. To remove the **action info** command from the configuration, use the **no** form of this command.

```
action label info type {cli frequency | cli history | syslog frequency | syslog history | routename
| snmp oid oid-value get-type {exact | next}}
no action label info type {cli frequency | cli history | syslog frequency | syslog history | routename
| snmp oid oid-value get-type {exact | next}}
```

### Syntax Description

<i>label</i>	Unique identifier that can be any string value. Actions are sorted and run in ascending alphanumeric key sequence using the label as the sort key. If the string contains embedded blanks, enclose it in double quotation marks.
<b>type</b>	Specifies the type of information requested.
<b>cli frequency</b>	Requests information about the frequency of recent command-line interface (CLI) commands.
<b>cli history</b>	Requests information about the history of recent CLI commands.
<b>syslog frequency</b>	Requests information about the frequency of syslog messages.
<b>syslog history</b>	Requests information about the history of recent syslog messages.
<b>routename</b>	Requests the name of the specified router.
<b>snmp oid</b>	Requests the value of the SNMP object as specified by the SNMP object identifier (object ID).
<i>oid-value</i>	Object ID (OID) value of the data element, in Simple Network Management Protocol (SNMP) dotted notation. An OID is defined as a type in the associated MIB, CISCO-EMBEDDED-EVENT-MGR-MIB, and each type has an object value. Monitoring of some OID types is supported. The following types are valid: <ul style="list-style-type: none"> <li>• INTEGER_TYPE</li> <li>• COUNTER_TYPE</li> <li>• GAUGE_TYPE</li> <li>• TIME_TICKS_TYPE</li> <li>• COUNTER_64_TYPE</li> <li>• OCTET_PRIM_TYPE</li> <li>• OPAQUE_PRIM_TYPE</li> </ul>

<b>get-type</b>	<p>Specifies that a type of SNMP get operation is to be applied to the object ID specified by the <i>oid-value</i> argument.</p> <ul style="list-style-type: none"> <li>• <b>exact</b> --Retrieves the object ID specified by the <i>oid-value</i> argument.</li> <li>• <b>next</b> --Retrieves the object ID that is the alphanumeric successor to the object ID specified by the <i>oid-value</i> argument.</li> </ul>
-----------------	--

**Command Default**

No system information is requested.

**Command Modes**

Applet configuration

**Command History**

Release	Modification
12.3(14)T	This command was introduced.
12.2(28)SB	This command was integrated into Cisco IOS Release 12.2(28)SB.
12.2(18)SXF4	This command was integrated into Cisco IOS Release 12.2(18)SXF4 to support Software Modularity images only.
12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
12.2(18)SXF5	This command was integrated into Cisco IOS Release 12.2(18)SXF5.

**Usage Guidelines**

Use the **action info** command when an event occurs and you want to request some system information. When the **snmp oid** keyword is used, an error message is returned when the OID is not one of the defined types.

The table below shows the built-in variables that are set for the various **action info** keywords. The notation [1-N] represents that the built-in variable ends in a sequential number starting at 1 up to the maximum number of entries returned.

**Table 3: EEM Built-in Variables for action info Command**

Built-in Variable	Description
action info cli frequency	
\$_info_cli_freq_num_entries	The number of CLI event entries.
\$_info_cli_freq_pattern_[1-N]	A regular expression used to perform CLI command pattern matching.
\$_info_cli_freq_time_sec_[1-N]	The seconds in Posix timer units since January 1, 1970, which represents the time the last CLI event was raised.
\$_info_cli_freq_time_msec_[1-N]	The milliseconds in Posix timer units since January 1, 1970, which represents the time the last CLI event was raised.
\$_info_cli_freq_match_count_[1-N]	The number of times that a CLI command matches the pattern specified by this CLI event specification.

Built-in Variable	Description
\$_info_cli_freq_raise_count_[1-N]	The number of times that this CLI event was raised.
\$_info_cli_freq_sync_[1-N]	A “yes” means that event publish should be performed synchronously. The event detector will be notified when the Event Manager Server has completed publishing the event. The Event Manager Server will return a code that indicates whether or not the CLI command should be executed.
\$_info_cli_freq_skip_[1-N]	A “yes” means that the CLI command should not be executed if the sync flag is not set.
\$_info_cli_freq_occurs_[1-N]	Number of occurrences before an event is raised; if this argument is not specified an event is raised on the first occurrence.
\$_info_cli_freq_period_sec_[1-N]	Number of occurrences must occur within this number of seconds in order to raise event; if not specified, does not apply.
\$_info_cli_freq_period_msec_[1-N]	The number of occurrences must occur within this number of milliseconds in order to raise the event; if not specified, the period check does not apply.
action info cli history	
\$_info_cli_hist_num_entries	The number of cli history entries.
\$_info_cli_hist_cmd_[1-N]	The text of the CLI command.
\$_info_cli_hist_time_sec_[1-N]	The time, in seconds, when the CLI command occurred.
\$_info_cli_hist_time_msec_[1-N]	The time, in milliseconds, when the CLI command occurred.
action info routername	
\$_info_routername	The name of the router.
action info snmp	
\$_info_snmp_oid	The SNMP object ID.
\$_info_snmp_value	The value string of the associated SNMP data element.
action info syslog frequency	
\$_info_syslog_freq_num_entries	The number of syslog entries.
\$_info_syslog_freq_pattern_[1-N]	A regular expression used to perform syslog message pattern matching.
\$_info_syslog_freq_time_sec_[1-N]	The seconds in Posix timer units since January 1, 1970, which represents the time the last event was raised.
\$_info_syslog_freq_time_msec_[1-N]	The milliseconds in Posix timer units since January 1, 1970, which represents the time the last event was raised.

Built-in Variable	Description
<code>\$_info_syslog_freq_match_count_[1-N]</code>	The number of times that a syslog message matches the pattern specified by this syslog event specification since event registration.
<code>\$_info_syslog_freq_raise_count_[1-N]</code>	The number of times that this syslog event was raised.
<code>\$_info_syslog_freq_occurs_[1-N]</code>	The number of occurrences needed in order to raise the event; if not specified, the event is raised on the first occurrence.
<code>\$_info_syslog_freq_period_sec_[1-N]</code>	The number of occurrences must occur within this number of Posix timer units in order to raise the event; if not specified, the period check does not apply.
<code>\$_info_syslog_freq_period_msec_[1-N]</code>	The number of occurrences must occur within this number of Posix timer units in order to raise the event; if not specified, the period check does not apply.
action info syslog history	
<code>\$_info_syslog_hist_num_entries</code>	The number of syslog history entries.
<code>\$_info_syslog_hist_msg_[1-N]</code>	The text of the syslog message.
<code>\$_info_syslog_hist_time_sec_[1-N]</code>	The seconds since January 1, 1970 which represent the time the syslog message was logged.
<code>\$_info_syslog_hist_time_msec_[1-N]</code>	The milliseconds since January 1, 1970 which represent the time the syslog message was logged.

## Examples

The following example shows how to configure an EEM applet to intercept configuration commands that attempt to access any loopback interface. The applet also performs a **no shutdown** command on the interface that is selected, and logs a message with the number of times that any “interface loopback” has been attempted. The console output is shown with the configuration because the final line displays the log message.

**Note** CLI commands that are issued from within a policy do not participate in CLI event pattern matching, and this prevents recursion.

```
Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# event manager applet cli-match
Router(config-applet)# event cli pattern ".*interface Loopback.*" sync yes
Router(config-applet)# action 1.0 cli command "enable"
Router(config-applet)# action 1.1 cli command "$_cli_msg"
Router(config-applet)# action 1.2 cli command "no shutdown"
Router(config-applet)# action 1.3 info type cli frequency
Router(config-applet)# action 1.4 syslog msg "There have been
$_info_cli_freq_match_count_1 '$_info_cli_freq_pattern_1' matches."

Router(config-applet)# set 1.5 _exit_status 0
Router(config-applet)# end
```

```

Router#
00:37:30: %SYS-5-CONFIG_I: Configured from console by console
Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# interface loopback0
Router(config)#
00:37:43: %HA_EM-6-LOG: cli-match: There have been 27 '.*interface Loopback.*' matches.

```

**Related Commands**

Command	Description
<b>event manager applet</b>	Registers an event applet with the Embedded Event Manager and enters applet configuration mode.

**action info type interface-names**

To obtain interface names when an Embedded Event Manager (EEM) applet is triggered, use the **action info type interface-names** command in applet configuration mode. To disable the action of obtaining interface names, use the **no** form of this command.

**action label info type interface-names** [**include** *string-operator* | **exclude** *string-operator* | **regexp** *regular-expression*]  
**no action label info type**

**Syntax Description**

<i>label</i>	Unique identifier that can be any string value. Actions are sorted and run in ascending alphanumeric key sequence using the label as the sort key. If the string contains embedded blanks, enclose it in double quotation marks.
<b>include</b>	(Optional) Includes all interface names that contain the string pattern.
<b>exclude</b>	(Optional) Excludes all interface names that contain the string pattern.
<i>string-operator</i>	(Optional) String pattern for including or excluding the interface names.
<b>regexp</b>	(Optional) Obtains all the interfaces that match the specified regular expression.
<i>regular-expression</i>	(Optional) Regular expression pattern. For example, [^abc].

**Command Default**

All the current interface names are obtained from the database.

**Command Modes**

Applet configuration (config-applet)

**Command History**

Release	Modification
12.4(22)T	This command was introduced.
12.2(33)SRE	This command was integrated into Cisco IOS Release 12.2(33)SRE.

**Usage Guidelines**

The **action info type interface-names** command obtains the current interface names and stores them as a space-separated list in the `$_info_interface_names` built-in variable.

**Examples**

The following example shows how to specify that interface names that include “eth” are obtained:

```
Router# configure terminal
Router(config)# event manager applet interface-app
Router(config-applet)# action 1.2 info type interface-names include eth
```

**Related Commands**

Command	Description
<b>event manager applet</b>	Registers an event applet with the EEM and enters applet configuration mode.

**action info type snmp getid**

To retrieve the individual variables from a Simple Network Management Protocol (SNMP) entity during the SNMP get operation, use the **action info type snmp getid** command in applet configuration mode. To disable the retrieving of individual variables from SNMP, use the **no** form of this command.

```
action label info type snmp getid oid-value [community community-string] [ipaddr ip-address]
no action label info type
```

**Syntax Description**

<i>label</i>	Unique identifier that can be any string value. Actions are sorted and run in ascending alphanumeric key sequence using the label as the sort key. If the string contains embedded blanks, enclose it in double quotation marks.
<b>getid</b>	Retrieves SNMP variables.
<i>oid-value</i>	Object ID value of the data element, in SNMP dotted notation. An object identifier is expressed as a series of integers or text strings. For example, the object name for the interfaces MIB can be expressed as 1.3.6.1.2.1.2 or iso.internet.mgmt.mib-2.interfaces.  An OID is defined as a type in the associated MIB, CISCO-EMBEDDED-EVENT-MGR-MIB, and each type has an object value. Monitoring of some OID types is supported. The following types are valid: <ul style="list-style-type: none"> <li>• INTEGER_TYPE</li> <li>• COUNTER_TYPE</li> <li>• GAUGE_TYPE</li> <li>• TIME_TICKS_TYPE</li> <li>• COUNTER_64_TYPE</li> <li>• OCTET_PRIM_TYPE</li> <li>• OPAQUE_PRIM_TYPE</li> </ul>
<b>community</b>	(Optional) Specifies the community string to access the SNMP entity.

<i>community-string</i>	(Optional) SNMP community string. Community string functions like passwords to access the SNMP entity. The string can consist of 1 to 32 alphanumeric characters and can be set to any of the following types of community strings: <ul style="list-style-type: none"> <li>• <b>ro</b> --Sets the read-only access to the SNMP entity. The default value for this community string is <b>public</b>.</li> <li>• <b>rw</b> --Sets read-write access to the SNMP entity. The default value for this community string is <b>private</b>.</li> </ul>
<b>ipaddr</b>	(Optional) Specifies the IP address of the SNMP entity.
<i>ip-address</i>	(Optional) IP address of Network Management System (NMS) from which the objects are retrieved for SNMP get and set operations.

**Command History**

<b>Release</b>	<b>Modification</b>
12.4(22)T	This command was introduced.
12.2(33)SRE	This command was integrated into Cisco IOS Release 12.2(33)SRE.

**Usage Guidelines**

The table below shows the built-in variables in which the variables retrieved from the SNMP get operation are stored.

**Table 4: EEM Built-in Variables for action info Command**

<b>Built-in Variable</b>	<b>Description</b>
<code>\$_info_snmp_sysname_oid</code>	The OID value of the sysName variable.
<code>\$_info_snmp_sysname_value</code>	The value string for the sysName variable.
<code>\$_info_snmp_syslocation_oid</code>	The OID value of the sysLocation variable.
<code>\$_info_snmp_syslocation_value</code>	The value string for the sysLocation variable.
<code>\$_info_snmp_sysdescr_oid</code>	The OID value of the sysDescr variable.
<code>\$_info_snmp_sysdescr_value</code>	The value string for the sysDescr variable.
<code>\$_info_snmp_sysobjectid_oid</code>	The OID value of the sysObjectID variable.
<code>\$_info_snmp_sysobjectid_value</code>	The value string for the sysObjectID variable.
<code>\$_info_snmp_sysuptime_oid</code>	The OID value of the sysUptime variable.
<code>\$_info_snmp_sysuptime_value</code>	The value string for the sysUptime variable.
<code>\$_info_snmp_syscontact_oid</code>	The OID value of the sysContact variable.
<code>\$_info_snmp_syscontact_value</code>	The value string for the sysContact variable.

**Examples**

The following example shows how to retrieve the sysDescr.0 variable from an SNMP entity:

```
Router(config)# event manager applet
Router(config-applet)# action 1.3 info type snmp getid 1.3.6.1.2.1.1.1.0 community public
ipaddr 172.17.16.69
Router(config-applet)#
```

**Related Commands**

Command	Description
<b>event manager applet</b>	Registers an event applet with the EEM and enters applet configuration mode.
<b>snmp-server community</b>	Sets the community access string to enable access to the SNMP entity.

**action info type snmp inform**

To send Simple Network Management Protocol (SNMP) inform requests when an Embedded Event Manager (EEM) applet is triggered, use the **action info type snmp inform** command in applet configuration mode. To disable the sending of SNMP inform requests, use the **no** form of this command.

**action** *label* **info type snmp inform** *trap-oid* *trap-oid-value* **trap-var** *trap-variable* **community** *community-string* **ipaddr** *ip-address*  
**no action** *label* **info type**

**Syntax Description**

<i>label</i>	Unique identifier that can be any string value. Actions are sorted and run in ascending alphanumeric key sequence using the label as the sort key. If the string contains embedded blanks, enclose it in double quotation marks.
<i>trap-oid</i>	Specifies the object identifier of the object generating the SNMP trap.
<i>trap-oid-value</i>	The OID value of the object generating the SNMP trap.
<i>trap-var</i>	Specifies the variable associated with the instance of the object generating the trap.
<i>trap-variable</i>	The variable value of the object generating SNMP trap.
<b>community</b>	Specifies the community string to access the SNMP entity.
<i>community-string</i>	SNMP community string. Community string functions like passwords to access the SNMP entity. The string can consist of 1 to 32 alphanumeric characters and can be set to any of the following: <ul style="list-style-type: none"> <li>• <b>ro</b> --Sets the read-only access to the SNMP entity. The default value for this community string is <b>public</b>.</li> <li>• <b>rw</b> --Sets read-write access to the SNMP entity. The default value for this community string is <b>private</b>.</li> </ul>
<b>ipaddr</b>	Specifies the IP address of the SNMP entity.
<i>ip-address</i>	IP address of Network Management System (NMS) from which the objects are retrieved for SNMP get and set operations.

**Command Default**

No SNMP inform requests are sent by default.

**Command Modes**

Applet configuration (config-applet)

**Command History**

Release	Modification
12.4(22)T	This command was introduced.
12.2(33)SRE	This command was integrated into Cisco IOS Release 12.2(33)SRE.

**Usage Guidelines**

SNMP inform requests are the SNMP notifications that alert the SNMP manager to a network condition and request for confirmation of receipt from the SNMP manager.

**Examples**

The following example shows how to send an SNMP inform request:

```
Router(config)# event manager applet
Router(config-applet)# action 1.4 info type snmp inform trap-oid 1.3.6.1.4.1.1.226.0.2.1
trap-var sysUpTime community public ipaddr 172.69.16.2
Router(config-applet)#
```

**Related Commands**

Command	Description
<b>event manager applet</b>	Registers an event applet with the EEM and enters applet configuration mode.
<b>snmp-server community</b>	Sets the community access string to enable access to the SNMP entity.
<b>snmp-server enable traps</b>	Enables all SNMP notification types available on your system.

## action info type snmp oid

To specify the type of Simple Network Management Protocol (SNMP) get operation and the object to retrieve during the SNMP set operation, when an Embedded Event Manager (EEM) applet is triggered, use the **action info type snmp oid** command in applet configuration mode. To disable this function, use the **no** form of this command.

```
action label info type snmp oid oid-value {get-type {exact | next} [community community-string]
| set-type oid-type oid-type-value community community-string} [ipaddr ip-address]
no action label info type
```

**Syntax Description**

<i>label</i>	Unique identifier that can be any string value. Actions are sorted and run in ascending alphanumeric key sequence using the label as the sort key. If the string contains embedded blanks, enclose it in double quotation marks.
<b>oid</b>	Requests the value of the SNMP object as specified by the SNMP object identifier (OID).

<i>oid-value</i>	<p>Object ID value of the data element, in SNMP dotted notation. An object identifier is expressed as a series of integers or text strings. For example, the object name for the interfaces MIB can be expressed as 1.3.6.1.2.1.2 or iso.internet.mgmt.mib-2.interfaces.</p> <p>An OID is defined as a type in the associated MIB, CISCO-EMBEDDED-EVENT-MGR-MIB, and each type has an object value. Monitoring of some OID types is supported. The following types are valid:</p> <ul style="list-style-type: none"> <li>• INTEGER_TYPE</li> <li>• COUNTER_TYPE</li> <li>• GAUGE_TYPE</li> <li>• TIME_TICKS_TYPE</li> <li>• COUNTER_64_TYPE</li> <li>• OCTET_PRIM_TYPE</li> <li>• OPAQUE_PRIM_TYPE</li> </ul>
<b>get-type</b>	<p>Specifies the type of SNMP get operation to apply to the object ID specified by the <i>oid-value</i> argument.</p> <ul style="list-style-type: none"> <li>• <b>exact</b> --(Optional) Retrieves the object ID specified by the <i>oid-value</i> argument.</li> <li>• <b>next</b> --(Optional) Retrieves the object ID that is the alphanumeric successor to the object ID specified by the <i>oid-value</i> argument.</li> </ul>
<b>community</b>	<p>Specifies the community string to access the SNMP entity.</p>
<i>community-string</i>	<p>SNMP community string. Community string functions like passwords to access the SNMP entity. The string can consist of 1 to 32 alphanumeric characters and can be set to any of the following:</p> <ul style="list-style-type: none"> <li>• <b>ro</b> --Sets the read-only access to the SNMP entity. The default value for this community string is <b>public</b>.</li> <li>• <b>rw</b> --Sets read-write access to the SNMP entity. The default value for this community string is <b>private</b>.</li> </ul>
<b>set-type</b>	<p>Specifies the type of object to retrieve during the SNMP set operation. To perform a set operation, you need to specify the OID, OID type, and value.</p>

<i>oid-type</i>	<p>The type of OID. The following values are valid:</p> <ul style="list-style-type: none"> <li>• <b>counter32</b> --A 32-bit number with a minimum value of 0. When the maximum value is reached, the counter resets to 0.</li> <li>• <b>gauge</b> --A 32-bit number with a minimum value of 0. For example, the interface speed on a router is measured using a gauge object type.</li> <li>• <b>integer</b> --A 32-bit number used to specify a numbered type within the context of a managed object. For example, to set the operational status of a router interface, 1 represents up and 2 represents down.</li> <li>• <b>ipv4</b> --IP version 4 address.</li> <li>• <b>octet string</b> --An octet string in hexadecimal notation used to represent physical addresses.</li> <li>• <b>string</b> --An octet string in text notation used to represent text strings.</li> <li>• <b>unsigned32</b> --A 32-bit number used to represent decimal value.</li> </ul>
<i>oid-type-value</i>	<p>Integer or text string value of the OID type specified for the SNMP set operation. The valid values for each OID type are:</p> <ul style="list-style-type: none"> <li>• <b>counter</b> --Integer value in the range from 0 to 4294967295.</li> <li>• <b>gauge</b>-- Integer value in the range from 0 to 4294967295.</li> <li>• <b>integer</b>-- Integer value in the range from 0 to 4294967295.</li> <li>• <b>ipv4</b>-- IPv4 address in dotted decimal notation.</li> <li>• <b>octet string</b> --Text string.</li> <li>• <b>string</b>-- Text string.</li> <li>• <b>unassigned32</b>-- Unsigned integer value in the range from 0 to 4294967295.</li> </ul>
<b>ipaddr</b>	(Optional) Specifies the IP address of the SNMP entity.
<i>ip-address</i>	(Optional) IP address of Network Management System (NMS) from which the objects are retrieved for SNMP get and set operations.

**Command Default**

No requests for SNMP set or get operations are sent when the EEM applet is triggered.

**Command Modes**

Applet configuration (config-applet)

**Command History**

Release	Modification
12.3(14)T	This command was introduced.
12.2(28)SB	This command was integrated into Cisco IOS Release 12.2(28)SB.
12.2(18)SXF4	This command was integrated into Cisco IOS Release 12.2(18)SXF4 to support Software Modularity images only.

Release	Modification
12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
12.2(18)SXF5	This command was integrated into Cisco IOS Release 12.2(18)SXF5.
12.4(22)T	The <b>set-type</b> , <b>community</b> , and <b>ipaddr</b> keywords were added.

### Usage Guidelines

The SNMP set operation sets individual variables in the SNMP entity, whereas the SNMP get operation retrieves individual variables from the SNMP entity.

The table below shows the built-in variables in which the results of SNMP get and set operations are stored.

**Table 5: EEM Built-in Variables for action info Command**

Built-in Variable	Description
<code>\$_info_snmp_oid</code>	The SNMP object ID.
<code>\$_info_snmp_value</code>	The value string of the associated SNMP data element.

### Examples

The following example shows how to retrieve individual variables of an object from the SNMP entity:

```
Router(config)# event manager applet
Router(config-applet)# action 1.3 info type snmp oid 1.3.6.1.4.1.9.9.48.1.1.1.6.1 get-type
exact community public ipaddr 172.17.16.69
Router(config-applet)#
```

The following example shows how to set an individual variable in the SNMP entity:

```
Router(config)# event manager applet
Router(config-applet)# action 1.4 info type snmp oid 1.3.6.1.4.1.9.9.48.1.1.1.6.1 set-type
integer 42220 sysName.0 community public ipaddr 172.17.16.69
Router(config-applet)#
```

### Related Commands

Command	Description
<b>event manager applet</b>	Registers an event applet with the EEM and enters applet configuration mode.
<b>snmp-server community</b>	Sets the community access string to enable access to the SNMP entity.

## action info type snmp trap

To send Simple Network Management Protocol (SNMP) trap requests when an Embedded Event Manager (EEM) applet is triggered, use the **action info type snmp trap** command in applet configuration mode. To disable the sending of SNMP trap requests, use the **no** form of this command.

**action** *label* **info type snmp trap** *enterprise-oid* *enterprise-oid-value* **generic-trapnum** *generic-trap-number* **specific-trapnum** *specific-trap-number* **trap-oid** *trap-oid-value* **trap-var** *trap-variable*

**no action label info type**

Syntax Description		
<i>label</i>		Unique identifier that can be any string value. Actions are sorted and run in ascending alphanumeric key sequence using the label as the sort key. If the string contains embedded blanks, enclose it in double quotation marks.
<b>trap</b>		Sends SNMP trap requests.
<b>enterprise-oid</b>		Specifies the enterprise OID value of the object.
<i>enterprise-oid-value</i>		Enterprise OID value of the object generating the SNMP trap. The OID value is enterprise specific and is expressed as a series of integers or text strings.
<b>generic-trapnum</b>		Specifies the generic SNMP trap number.
<i>generic-trap-number</i>		The generic trap number. The following generic traps and trap numbers are valid: <ul style="list-style-type: none"> <li>• coldStart (0)</li> <li>• warmStart (1)</li> <li>• linkDown (2)</li> <li>• linkUp (3)</li> <li>• authenticationFaliure(4)</li> <li>• egpNeighborLoss(5)</li> <li>• enterpriseSpecific (6)</li> </ul>
<b>specific-trapnum</b>		Specifies the enterprise-specific trap if the generic trap number is not set to 6.
<i>specific-trap-number</i>		The number associated with the trap specific to an enterprise event.
<b>trap-oid</b>		Specifies the object identifier of the object generating the SNMP trap.
<i>trap-oid-value</i>		The OID value of the object generating the SNMP trap.
<b>trap-var</b>		Specifies the variable associated with the instance of the object generating the trap.
<i>trap-variable</i>		The variable value of the object generating SNMP trap.

**Command Default** No SNMP trap requests are sent by default.

**Command Modes** Applet configuration (config-applet)

Command History	Release	Modification
	12.4(22)T	This command was introduced.
	12.2(33)SRE	This command was integrated into Cisco IOS Release 12.2(33)SRE.

**Usage Guidelines**

Traps are SNMP notifications that alert the SNMP manager or the NMS to a network condition. Unlike SNMP inform requests, traps do not request the receipt from the SNMP manager.

**Examples**

The following example shows how to send an SNMP trap request:

```
Router(config)# event manager applet
Router(config-applet)# action 1.4 info type snmp trap enterprise-oid 1.3.6.1.4.1.1
generic-trapnum 4 specific-trapnum 7 trap-oid 1.3.6.1.4.1.1.226.0.2.1 trap-var sysUpTime
Router(config-applet)#
```

**Related Commands**

Command	Description
<b>event manager applet</b>	Registers an event applet with the EEM and enters applet configuration mode.
<b>snmp-server enable traps</b>	Enables all SNMP notification types available on your system.

**action info type snmp var**

To create a variable for a Simple Network Management Protocol (SNMP) object identifier (OID) and its value from an Embedded Event Manager (EEM) applet, use the **action info type snmp var** command in applet configuration mode. To remove the variable, use the **no** form of this command.

**action** *label* **info type snmp var** *variable-name oid oid-value oid-type oid-type-value*  
**no action** *label info type*

**Syntax Description**

<i>label</i>	Unique identifier that can be any string value. Actions are sorted and run in ascending alphanumeric key sequence using the label as the sort key. If the string contains embedded blanks, enclose it in double quotation marks.
<b>var</b>	Specifies the SNMP variable or the object instance of the SNMP MIB object.
<i>variable-name</i>	Name of the SNMP variable. For example, sysDescr.0.
<b>oid</b>	Requests the value of the SNMP object as specified by the SNMP OID.

<i>oid-value</i>	<p>Object ID value of the data element, in SNMP dotted notation. An object identifier is expressed as a series of integers or text strings. For example, the object name for the interfaces MIB can be expressed as 1.3.6.1.2.1.2 or iso.internet.mgmt.mib-2.interfaces.</p> <p>An OID is defined as a type in the associated MIB, CISCO-EMBEDDED-EVENT-MGR-MIB, and each type has an object value. Monitoring of some OID types is supported. The following types are valid:</p> <ul style="list-style-type: none"> <li>• INTEGER_TYPE</li> <li>• COUNTER_TYPE</li> <li>• GAUGE_TYPE</li> <li>• TIME_TICKS_TYPE</li> <li>• COUNTER_64_TYPE</li> <li>• OCTET_PRIM_TYPE</li> <li>• OPAQUE_PRIM_TYPE</li> </ul>
<i>oid-type</i>	<p>The type of OID. The following values are valid:</p> <ul style="list-style-type: none"> <li>• <b>counter32</b> --A 32-bit number with a minimum value of 0. When the maximum value is reached, the counter resets to 0.</li> <li>• <b>gauge</b> --A 32-bit number with a minimum value of 0. For example, the interface speed on a router is measured using a gauge object type.</li> <li>• <b>integer</b> --A 32-bit number used to specify a numbered type within the context of a managed object. For example, to set the operational status of a router interface, 1 represents up and 2 represents down.</li> <li>• <b>ipv4</b> --IP version 4 address.</li> <li>• <b>octet string</b> --An octet string in hex notation used to represent physical addresses.</li> <li>• <b>string</b> --An octet string in text notation used to represent text strings.</li> <li>• <b>unsigned32</b> --A 32-bit number used to represent decimal value.</li> </ul>
<i>oid-type-value</i>	<p>Integer or text string value of the OID type specified for creating a variable. The valid values for each OID type are:</p> <ul style="list-style-type: none"> <li>• <b>counter</b> --Integer value in the range from 0 to 4294967295.</li> <li>• <b>gauge</b>-- Integer value in the range from 0 to 4294967295.</li> <li>• <b>integer</b>-- Integer value in the range from 0 to 4294967295.</li> <li>• <b>ipv4</b>-- IPv4 address in dotted decimal notation.</li> <li>• <b>octet string</b> --Text string.</li> <li>• <b>string</b>-- Text string.</li> <li>• <b>unassigned32</b>-- Unsigned integer value in the range from 0 to 4294967295.</li> </ul>

**Command Default** No variables are created by default when an EEM applet is triggered.

**Command Modes** Applet configuration (config-applet)

Release	Modification
12.4(22)T	This command was introduced.
12.2(33)SRE	This command was integrated into Cisco IOS Release 12.2(33)SRE.

**Usage Guidelines** A variable is identified by its OID and its instance. The instance is generally specified by appending a .0 to its OID. For example, sysDescr.0.

**Examples** The following example shows how to create a variable for an object identifier:

```
Router(config)# event manager applet
Router(config-applet)# action 1.3 info type snmp var sysDescr.0 oid
1.3.6.1.4.1.9.9.48.1.1.1.6.1 integer 4220
Router(config-applet)#
```

Command	Description
<b>event manager applet</b>	Registers an event applet with the EEM and enters applet configuration mode.

## action mail

To specify the action of sending a short e-mail when an Embedded Event Manager (EEM) applet is triggered, use the **action mail** command in applet configuration mode. To remove the **action mail** command from the configuration, use the **no** form of this command.

**action** *label* **mail server** *server-address* **to** *to-address* **from** *from-address* [**cc** *cc-address*] **subject** *subject* **body** *body-text* **port** *port-number* **secure** {**none** | **tls**} **source-address** {*ipv4-address* | *ipv6-address*} **source-interface** *interface-type interface-number* **vrf** *vrf-name*  
**no action** *label* **mail server** *server-address* **to** *to-address* **from** *from-address* [**cc** *cc-address*] **subject** *subject* **body** *body-text* **port** *port-number* **secure** {**none** | **tls**} **source-address** {*ipv4-address* | *ipv6-address*} **source-interface** *interface-type interface-number* **vrf** *vrf-name*

### Syntax Description

<i>label</i>	Unique identifier that can be any string value. Actions are sorted and run in ascending alphanumeric key sequence using the label as the sort key. If the string contains embedded blanks, enclose it in double quotation marks.
<b>server</b>	Specifies the e-mail server to be used for forwarding the e-mail. The e-mail server address can be any one of the following template formats: <ul style="list-style-type: none"> <li>• <code>username:password@host</code></li> <li>• <code>username@host</code></li> <li>• <code>host</code></li> </ul>

<i>server-address</i>	An optional username and password with the fully qualified domain name of the e-mail server to be used to forward the e-mail.
<b>to</b>	Indicates that a recipient e-mail address is specified.
<i>to-address</i>	E-mail address where the e-mail is to be sent.
<b>from</b>	Indicates that the originating e-mail address is specified.
<i>from-address</i>	E-mail address from which the e-mail is sent.
<b>cc</b>	(Optional) Indicates that a copy e-mail address is specified.
<i>cc-address</i>	(Optional) E-mail address additional to the recipient listed in the <i>to-address</i> where the message is to be sent.
<b>subject</b>	Specifies the subject line content of the e-mail.
<i>subject</i>	Alphanumeric string. If the string contains embedded blanks, enclose it in double quotation marks.
<b>body</b>	Specifies the text content of the e-mail.
<i>body-text</i>	Alphanumeric string. If the string contains embedded blanks, enclose it in double quotation marks.
<b>port</b> <i>port-number</i>	Specifies the Simple Mail Transfer Protocol (SMTP) port number. Range for the <i>port-number</i> argument is from 1 to 65535.
<b>secure</b>	Specifies the SMTP security settings.
<b>none</b>	Specifies that no SMTP security settings are needed.
<b>tls</b>	Species the SMTP transport layer security (TLS) settings.
<b>source-address</b> <i>ipv4-address</i> <i>ipv6-address</i>	Specifies the IPv4 or IPv6 address of the source.
<b>source-interface</b>	Specifies the source interface.
<i>interface-type</i>	Interface type. For more information, use the question mark (?) online help function.
<i>interface-number</i>	Interface or subinterface number. For more information about the numbering syntax for your networking device, use the question mark (?) online help function.
<b>vrf</b> <i>vrf-name</i>	Specifies a VPN routing and forwarding (VRF) instance.

**Command Default**

No e-mails are sent.

**Command Modes**

Applet configuration (config-applet)

**Command History**

Release	Modification
12.3(14)T	This command was introduced.
12.2(28)SB	This command was integrated into Cisco IOS Release 12.2(28)SB.
12.2(18)SXF4	This command was integrated into Cisco IOS Release 12.2(18)SXF4 to support Software Modularity images only.
12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
12.2(18)SXF5	This command was integrated into Cisco IOS Release 12.2(18)SXF5.
12.4(22)T	This command was modified. The <i>server-address</i> argument was modified to include an optional username and password.
15.2(2)T	This command was modified. The <b>port</b> , <b>secure</b> , <b>none</b> , <b>tls</b> , and <b>vrf</b> keywords were added.
15.1(1)SY	This command was integrated into Cisco IOS Release 15.1(1)SY.

**Usage Guidelines**

Use the **action mail** command when an event occurs about which you want to send an e-mail message, such as informing an administrator about the event.

In EEM 3.0 for Cisco IOS Release 12.4(22)T, the *server-address* argument includes an optional username and password along with the fully qualified domain name of the e-mail server to be used to forward the e-mail. The e-mail server name can be in any one of the following template formats:

- username:password@host
- username@host
- host

For example, username:123456@mailserver.cisco.com, or username@mailserver.cisco.com, or mailserver.cisco.com. If a username is supplied, the router will attempt to authenticate using the LOGIN AUTH dialog. If no username is supplied, no authentication is performed.

**Examples**

The following example shows how to send an e-mail when an EEM applet executes. The applet named EventInterface is triggered every time the receive\_throttle counter for Fast Ethernet interface 0/0 is incremented by 5. The polling interval to check the counter is specified to run once every 90 seconds. When the applet is triggered, a syslog message and an e-mail are sent.

```
Router(config)# event manager applet EventInterface
Router(config-applet)# event interface name FastEthernet0/0 parameter receive_throttle
entry-op ge entry-val 5 entry-val-is-increment true poll-interval 90
Router(config-applet)# action 1.0 syslog msg "Applet EventInterface"
Router(config-applet)# action 1.1 mail server mailserver.example.com to example1@example.com

from example2@example.com cc example-manager@example.com
subject "Receive_throttle counter incremented" body "Receive_throttle counter for
FastEthernet0/0 interface has incremented by 5"
```

The following example shows how to configure SMTP secure TLS settings:

```

Router# configure terminal
Router(config)# event manager applet TEST
Router(config-applet)# event none
Router(config-applet)# action 1.0 mail from example1@example.com to example2@example.com
subject "Hello EEM World" body "I am a Router" server root:example@smtp-server.example.com
port 587 secure tls
Router(config-applet)# end

```

The following example shows how to configure SMTP custom port settings:

```

Router(config)#event manager applet TEST
Router(config-applet)#event none
Router(config-applet)#action 1.0 mail from Router@cisco.com to user@cisco.com
subject "Hello EEM World" body "I am Router" server root:lab@smtp-server.cisco.com port 465

Router(config-applet)#end

```

### Related Commands

Command	Description
<b>event interface</b>	Specifies the event criteria for an EEM applet that is run on the basis of a generic interface counter crossing a threshold or reaching exit criteria.
<b>event manager applet</b>	Registers an event applet with the Embedded Event Manager and enters applet configuration mode.

## action multiply

To specify the action of multiplying the variable value with a specified given integer value when an Embedded Event Manager (EEM) applet is triggered, use the **action multiply** command in applet configuration mode. To remove the calculation process, use the **no** form of this command.

```

action label multiply [{long-integer-1variable-name-1}] [{long-integer-2variable-name-2}]
no action label multiply

```

### Syntax Description

<i>label</i>	Unique identifier that can be any string value. Actions are sorted and run in ascending alphanumeric key sequence using the label as the sort key. If the string contains embedded blanks, enclose it in double quotation marks.
<i>long-integer-1</i>	(Optional) First integer value for the multiplication.
<i>variable-name-1</i>	(Optional) First variable name for the multiplication. The value stored in the multiplier variable-name must be a long integer value or else the action will fail.
<i>long-integer-2</i>	(Optional) Second integer value for the multiplication.
<i>variable-name-2</i>	(Optional) Second variable name for the multiplication. The value stored in the multiplier variable-name must be a long integer value or else the action will fail.

### Command Default

If the command is not entered within applet configuration mode, the respective applet is not registered when you exit the configuration.

**Command Modes**

Applet configuration (config-applet)

**Command History**

Release	Modification
12.4(22)T	This command was introduced.
12.2(33)SRE	This command was integrated into Cisco IOS Release 12.2(33)SRE.

**Usage Guidelines**

Use the **action multiply** command to multiply the value of the variable with a given integer value. All arithmetic calculations are performed as long integers without any checks for overflow. If a statement is not associated with this applet, events are still triggered without any action or result. A warning message stating that no statements are associated with this applet is displayed at the exit time of the configuration. All the results of the **action multiply** command are stored in `$_result`.

To provide a consistent user interface for the customers between the Tool Command Language (Tcl) and the CLI applet-based EEM policies, the following criteria are followed:

- Event specification criteria are written in Tcl in the Tcl-based implementation.
- Event specification data are written using the CLI applet submode configuration statements in the applet-based implementation.

Some of the keywords appear to be longer than necessary or hyphenated in the applet-based implementation because the Tcl-based implementation was developed and deployed first.

To enter applet configuration mode, use the **event manager applet** *applet-name* command after entering global configuration mode. In applet configuration mode the config prompt changes to (config-applet)#. Applet configuration mode supports three types of configuration statements:

- **event** --Specifies the event criteria that causes this applet to run.
- **action** --Performs a built-in action.
- **set** --Sets an applet variable (currently `_exit_status` is the only variable supported).

**Examples**

The following example shows how to multiply the stored variable value.

```
Router(config)# event manager applet action
Router(config-applet)# action label2 multiply 23 25
```

**Related Commands**

Command	Description
<b>action add</b>	Adds the value of the variable by the given value when an EEM applet is triggered.
<b>action divide</b>	Divides the value of the variable by the given value when an EEM applet is triggered.
<b>action subtract</b>	Subtracts the value of the variable by the given value when an EEM applet is triggered.

## action policy

To specify the action of manually running an Embedded Event Manager (EEM) policy when an EEM applet is triggered, use the **action policy** command in applet configuration mode. To remove the **action policy** command from the configuration, use the **no** form of this command.

**action** *label* **policy** *policy-filename*  
**no action** *label* **policy** *policy-filename*

Syntax Description		
	<i>label</i>	Unique identifier that can be any string value. Actions are sorted and run in ascending alphanumeric key sequence using the label as the sort key. If the string contains embedded blanks, enclose it in double quotation marks.
	<i>policy-filename</i>	Name of the EEM policy to be run manually. The policy must be previously registered using the <b>event none</b> command and must not be the same as the current policy.

**Command Default** No EEM policies are run.

**Command Modes** Applet configuration

Command History	Release	Modification
	12.3(14)T	This command was introduced.
	12.2(28)SB	This command was integrated into Cisco IOS Release 12.2(28)SB.
	12.2(18)SXF4	This command was integrated into Cisco IOS Release 12.2(18)SXF4 to support Software Modularity images only.
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
	12.2(18)SXF5	This command was integrated into Cisco IOS Release 12.2(18)SXF5.

**Usage Guidelines** EEM usually schedules and runs policies on the basis of an event specification that is contained within the policy itself. The **event none** command allows EEM to identify an EEM policy that can be run manually or when an EEM applet is triggered. To run the policy, use either the **action policy** command in applet configuration mode or the **event manager run** command in global configuration mode.

**Examples** The following example shows how to register a policy named policy-manual to be run manually and then to execute the policy:

```
Router(config)# event manager applet policy-manual
Router(config-applet)# event none policy-manual
Router(config-applet)# action labe11 policy policy-manual
```

Related Commands	Command	Description
	<b>event manager run</b>	Manually runs a registered EEM policy.

Command	Description
<b>event none</b>	Registers an EEM applet that is to be run manually.
<b>show event manager policy registered</b>	Displays registered EEM policies.

## action publish-event

To specify the action of publishing an application-specific event when the event specified for an Embedded Event Manager (EEM) applet is triggered, use the **action publish-event** command in applet configuration mode. To remove the action of publishing an application-specific event, use the **no** form of this command.

**action** *label* **publish-event** **sub-system** *sub-system-id* **type** *event-type* **arg1** *argument-data* [**arg2** *argument-data*] [**arg3** *argument-data*] [**arg4** *argument-data*]  
**no action** *label* **publish-event**

### Syntax Description

<i>label</i>	Unique identifier that can be any string value. Actions are sorted and run in ascending alphanumeric key sequence using the label as the sort key. If the string contains embedded blanks, enclose it in double quotation marks.
<b>sub-system</b>	Specifies an identifier for the subsystem named in the <i>sub-system-id</i> argument that will publish the application event.
<i>sub-system-id</i>	Identifier of the subsystem. Number in the range from 1 to 4294967295. If the event is to be published by an EEM policy, the <i>sub-system-id</i> reserved for a customer policy is 798.
<b>type</b>	Specifies the value of an event type within the specified event.
<i>event-type</i>	Event type value. Number in the range from 1 to 4294967295.
<b>arg1</b>	Specifies that argument data is to be passed to the application-specific event when the event is published.
<i>argument-data</i>	Character text, an environment variable, or a combination of the two. Optional when used with the <b>arg2</b> , <b>arg3</b> , or <b>arg4</b> keywords.
<b>arg2 arg3 arg4</b>	(Optional) Specifies that argument data is to be passed to the application-specific event when the event is published.

### Command Default

No application-specific events are published.

### Command Modes

Applet configuration

### Command History

Release	Modification
12.2(25)S	This command was introduced.
12.3(14)T	This command was integrated into Cisco IOS Release 12.3(14)T.

Release	Modification
12.2(28)SB	This command was integrated into Cisco IOS Release 12.2(28)SB.
12.2(18)SXF4	This command was integrated into Cisco IOS Release 12.2(18)SXF4 to support Software Modularity images only.
12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
12.2(18)SXF5	This command was integrated into Cisco IOS Release 12.2(18)SXF5.

## Examples

The following example shows how a policy named EventPublish\_A runs every 20 seconds and publishes an event to a well-known EEM event type numbered 1. A second policy named EventPublish\_B is registered to run when the well-known EEM event type of 1 occurs. When policy EventPublish\_B runs, it outputs a message to syslog containing the argument 1 argument data passed from EventPublish\_A.

```
Router(config)# event manager applet EventPublish_A
Router(config-applet)# event timer watchdog time 20.0
Router(config-applet)# action 1.0 syslog msg "Applet EventPublish_A"
Router(config-applet)# action 2.0 publish-event sub-system 798 type 1 arg1 twenty
Router(config-applet)# exit
Router(config)# event manager applet EventPublish_B
Router(config-applet)# event application sub-system 798 type 1
Router(config-applet)# action 1.0 syslog msg "Applet EventPublish_B arg1
$_application_data1"
```

## Related Commands

Command	Description
<b>event manager applet</b>	Registers an event applet with the Embedded Event Manager and enters applet configuration mode.

## action puts

To enable the action of printing data directly to the local tty when an Embedded Event Manager (EEM) applet is triggered, use the **action puts** command in applet configuration mode. To disable this function, use the **no** form of this command.

```
action label puts [nonewline] string
no action label puts
```

## Syntax Description

<i>label</i>	Unique identifier that can be any string value. Actions are sorted and run in ascending alphanumeric key sequence using the label as the sort key. If the string contains embedded blanks, enclose it in double quotation marks.
<b>nonewline</b>	(Optional) Suppresses the display of the new line character.
<i>string</i>	Sequence of characters. If the string contains embedded blanks, enclose it in double quotation marks.

**Command Default** Data is not printed to the local tty.

**Command Modes** Applet configuration (config-applet)

Release	Modification
12.4(22)T	This command was introduced.
12.2(33)SRE	This command was integrated into Cisco IOS Release 12.2(33)SRE.

**Usage Guidelines** The **action puts** command applies to synchronous events. The output of this command for a synchronous applet is directly displayed to the tty, bypassing the syslog. This command defaults to the syslog for asynchronous events. The **nonewline** keyword suppresses the display of the new line character. The output of the **action puts** command for an asynchronous applet is directed to the logger.

**Examples** The following example shows how to print data directly to the local tty:

```
Router(config-applet)# event manager applet puts
Router(config-applet)# event none
Router(config-applet)# action 1 regexp "(.*) (.*) (.*)" "one two three" _match _sub1
Router(config-applet)# action 2 puts "match is $_match"
Router(config-applet)# action 3 puts "submatch 1 is $_sub1"
Router# event manager run puts
match is one two three
submatch 1 is one
Router#
```

Command	Description
<b>action gets</b>	Gets input from the local tty and stores the value in the given variable.
<b>event manager applet</b>	Registers an event applet with the EEM and enters applet configuration mode.

## action regexp

To match a regular expression pattern on an input string when an Embedded Event Manager (EEM) applet is triggered, use the **action regexp** command in applet configuration mode. To disable this function, use the **no** form of this command.

**action** *label* **regexp** *string-pattern* *string-input* [*string-match* [*string-submatch1*] [*string-submatch2*] [*string-submatch3*]]  
**no** **action** *label* **regexp**

Syntax Description	
<i>label</i>	Unique identifier that can be any string value. Actions are sorted and run in ascending alphanumeric key sequence using the label as the sort key. If the string contains embedded blanks, enclose it in double quotation marks.
<i>string-pattern</i>	The sequence of characters to be used for regular expression pattern matching.

<i>string-input</i>	The sequence of characters to be used as input.
<i>string-match</i>	(Optional) The variable name to store the entire match.
<i>string-submatch</i>	(Optional) The variable name to store any submatches that are present. A maximum of three submatch strings can be specified.

**Command Default**

No regular expression patterns are matched.

**Command Modes**

Applet configuration (config-applet)

**Command History**

Release	Modification
12.4(22)T	This command was introduced.
12.2(33)SRE	This command was integrated into Cisco IOS Release 12.2(33)SRE.

**Usage Guidelines**

The *string-pattern* argument is a regular expression. If some part of the string matches the pattern, it returns 1; otherwise it returns 0. The optional *string-match* and *string-submatch* arguments store the results of the match.

The table below shows the built-in variable in which the results of the **action regexp** command are stored.

**Table 6: EEM Built-in Variables for action regexp Command**

Built-in Variable	Description
\$_regexp_result	The result of the regular expression pattern matching is stored in this variable.

**Examples**

The following example shows how to define a regular expression match:

```
Router(config-applet)# event manager applet regexp
Router(config-applet)# event none
Router(config-applet)# action 1 regexp "(.*) (.*) (.*)" "one two three" _match _sub1
Router(config-applet)# action 2 puts "match is $_match"
Router(config-applet)# action 3 puts "submatch 1 is $_sub1"
Router# event manager run regexp
match is one two three
submatch 1 is one
Router#
```

**Related Commands**

Command	Description
<b>event manager applet</b>	Registers an event applet with the EEM and enters applet configuration mode.

## action reload

To specify the action of reloading the Cisco IOS software when an Embedded Event Manager (EEM) applet is triggered, use the **action reload** command in applet configuration mode. To remove the action of reloading the Cisco IOS software, use the **no** form of this command.

**action label reload**

**no action label reload**

### Syntax Description

<i>label</i>	Unique identifier that can be any string value. Actions are sorted and run in ascending alphanumeric key sequence using the label as the sort key. If the string contains embedded blanks, enclose it in double quotation marks.
--------------	--

### Command Default

No reload of the Cisco IOS software is performed.

### Command Modes

Applet configuration

### Command History

Release	Modification
12.0(26)S	This command was introduced.
12.3(4)T	This command was integrated into Cisco IOS Release 12.3(4)T.
12.3(2)XE	This command was integrated into Cisco IOS Release 12.3(2)XE.
12.2(25)S	This command was integrated into Cisco IOS Release 12.2(25)S.
12.2(28)SB	This command was integrated into Cisco IOS Release 12.2(28)SB.
12.2(18)SXF4	This command was integrated into Cisco IOS Release 12.2(18)SXF4 to support Software Modularity images only.
12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
12.2(18)SXF5	This command was integrated into Cisco IOS Release 12.2(18)SXF5.

### Usage Guidelines

Before configuring the **action reload** command, you should ensure that the device is configured to reboot the software version that you are expecting. Use the **show startup-config** command and look for any **boot system** commands.

### Examples

The following example shows how to reload the Cisco IOS software when the memory-fail applet is triggered:

```
Router(config)# event manager applet memory-fail
Router(config-applet)# event snmp oid 1.3.6.1.4.1.9.9.48.1.1.1.6.1 get-type exact entry-op
  lt entry-val 5120000 poll-interval 10
Router(config-applet)# action 3.0 reload
```

Related Commands	Command	Description
	<b>boot system</b>	Configures the locations from which the router loads software when the router reboots.
	<b>event manager applet</b>	Registers an event applet with the Embedded Event Manager and enters applet configuration mode.
	<b>show startup-config</b>	Displays the configuration to be run when the router reboots.

## action set (EEM)

To set the value of a variable when an Embedded Event Manager (EEM) applet is triggered, use the **action set** command in applet configuration mode. To remove the value of an EEM applet variable, use the **no** form of this command.

**action label set** *variable-name* *variable-value*

**no action label set**

Syntax Description		
	<i>label</i>	Unique identifier that can be any string value. Actions are sorted and run in ascending alphanumeric key sequence using the label as the sort key. If the string contains embedded blanks, enclose it in double quotation marks.
	<i>variable-name</i>	Name assigned to the variable to be set.
	<i>variable-value</i>	Value of the variable.

**Command Default** No variable value is set.

**Command Modes** Applet configuration (config-applet)

Command History	Release	Modification
	12.4(22)T	This command was introduced. This command replaces the <b>set (EEM)</b> command.
	12.2(33)SRE	This command was integrated into Cisco IOS Release 12.2(33)SRE.

**Usage Guidelines** Use the **action set** command to set the value of a variable when an EEM applet is triggered.

**Examples** The following example shows how to set the value of a variable:

```
Router(config-applet)# event manager applet set
Router(config-applet)# event none
Router(config-applet)# action 1 set str "this is some text"
Router(config-applet)# action 2 string range "$str" 0 6

Router# event manager run set
"this is"
Router#
```

Related Commands	Command	Description
	<b>event manager applet</b>	Registers an event applet with the EEM and enters applet configuration mode.

## action snmp-object-value

To set the object ID and value to be returned by the Simple Network Management Protocol (SNMP) get request when an Embedded Event Manager (EEM) applet is triggered, use the **action snmp-object-value** command in applet configuration mode. To disable this function, use the **no** form of this command.

**action** *label* **snmp-object-value** *oid-type oid-type-value* **next-oid** *oid-value*  
**no action** *label*

### Syntax Description

<i>label</i>	Unique identifier that can be any string value. Actions are sorted and run in ascending alphanumeric key sequence using the label as the sort key. If the string contains embedded blanks, enclose it in double quotation marks.
<i>oid-type</i>	<p>The type of OID. The following values are valid:</p> <ul style="list-style-type: none"> <li>• <b>counter</b> --A 32-bit number with a minimum value of 0. When the maximum value is reached, the counter resets to 0.</li> <li>• <b>counter64</b> --A 64-bit number with a minimum value of 0.</li> <li>• <b>gauge</b> --A 32-bit number with a minimum value of 0. A gauge object type is used, for example, to measure the interface speed on a router.</li> <li>• <b>int</b> --A 32-bit number used to specify a numbered type within the context of a managed object. For example, to set the operational status of a router interface, use 1 for “up” and 2 for “down”.</li> <li>• <b>ipv4</b> --IP version 4 address.</li> <li>• <b>octet</b> --An octet string in hex notation used to represent physical addresses.</li> <li>• <b>oid</b> --SNMP object identifier (object ID) in dotted notation.</li> <li>• <b>string</b> --An octet string in text notation used to represent text strings.</li> <li>• <b>uint</b> --A 32-bit number used to represent decimal value.</li> </ul>

<i>oid-type-value</i>	<p>Integer or text string value of the OID type specified for the SNMP set operation. The valid values for each OID type are:</p> <ul style="list-style-type: none"> <li>• <b>counter</b> --Integer value in the range from 0 to 4294967295.</li> <li>• <b>counter64</b> --Text string.</li> <li>• <b>gauge</b> --Integer value in the range from 0 to 4294967295.</li> <li>• <b>int</b> --Integer value in the range from 0 to 4294967295.</li> <li>• <b>ipv4</b> --IPv4 address in dotted decimal notation.</li> <li>• <b>octet</b> --Text string.</li> <li>• <b>oid</b> --Text string.</li> <li>• <b>string</b> --Text string.</li> <li>• <b>uint</b> --Unsigned integer value in the range from 0 to 4294967295.</li> </ul>
<b>next-oid</b>	Requests the value of the next SNMP object as specified by the SNMP OID.
<i>oid-value</i>	<p>Object ID value of the data element, in SNMP dotted notation. An object identifier is expressed as a series of integers or text strings. For example, the object name for the interfaces MIB can be expressed as 1.3.6.1.2.1.2 or iso.internet.mgmt.mib-2.interfaces.</p> <p>An OID is defined as a type in the associated MIB, CISCO-EMBEDDED-EVENT-MGR-MIB, and each type has an object value. Monitoring of some OID types is supported. The following types are valid:</p> <ul style="list-style-type: none"> <li>• COUNTER_64_TYPE</li> <li>• COUNTER_TYPE</li> <li>• GAUGE_TYPE</li> <li>• INTEGER_TYPE</li> <li>• OCTET_PRIM_TYPE</li> <li>• OPAQUE_PRIM_TYPE</li> <li>• TIME_TICKS_TYPE</li> </ul>

**Command Default**

By default, no object ID or value is specified.

**Command Modes**

Applet configuration (config-applet)

**Command History**

Release	Modification
15.0(1)M	This command was introduced.
15.1(3)T	This command was modified. The <b>oid</b> keyword was added.

**Usage Guidelines**

Use the **action snmp-object-value** command to set the object ID and value to be returned for the SNMP get request.

**Examples**

The following example shows how to set the object ID and value to be returned by the SNMP get request.

```
Router# configure terminal
Router(config)# event manager applet action
Router(config-applet)# event snmp-object oid 1.9.9.9 type gauge sync yes
Router(config-applet)# action 1 syslog msg "oid = $_snmp_oid"
Router(config-applet)# action 2 syslog msg "request = $_snmp_request"
Router(config-applet)# action 3 syslog msg "request_type = $_snmp_request_type"
Router(config-applet)# action 4 syslog msg "value = $_snmp_value"
Router(config-applet)# action 5 snmp-object-value gauge 1111 next-oid 1.2.3.4
Router(config-applet)# action 6 exit 1
```

**Related Commands**

Command	Description
<b>event manager applet</b>	Registers an event applet with the EEM and enters applet configuration mode.

**action snmp-trap**

To specify the action of generating a Simple Network Management Protocol (SNMP) trap when an Embedded Event Manager (EEM) applet is triggered, use the **action snmp-trap** command in applet configuration mode. To remove the action of generating an SNMP trap, use the **no** form of this command.

```
action label snmp-trap [intdata1 integer] [intdata2 integer] [strdata string]
no action label snmp-trap
```

**Syntax Description**

<i>label</i>	Unique identifier that can be any string value. Actions are sorted and run in ascending alphanumeric key sequence using the label as the sort key. If the string contains embedded blanks, enclose it in double quotation marks.
<b>intdata1</b>	(Optional) Specifies an integer to be sent in the SNMP trap message to the SNMP agent.
<b>intdata2</b>	(Optional) Specifies a second integer to be sent in the SNMP trap message to the SNMP agent.
<i>integer</i>	(Optional) Integer value.
<b>strdata</b>	(Optional) Specifies a string to be sent in the SNMP trap message to the SNMP agent.
<i>string</i>	(Optional) Sequence of up to 256 characters. If the string contains embedded blanks, enclose it in double quotation marks.

**Command Default**

No SNMP traps are generated when an EEM applet is triggered.

**Command Modes**

Applet configuration

Command History	Release	Modification
	12.2(25)S	This command was introduced.
	12.3(14)T	This command was integrated into Cisco IOS Release 12.3(14)T.
	12.2(28)SB	This command was integrated into Cisco IOS Release 12.2(28)SB.
	12.2(18)SXF4	This command was integrated into Cisco IOS Release 12.2(18)SXF4 to support Software Modularity images only.
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
	12.2(18)SXF5	This command was integrated into Cisco IOS Release 12.2(18)SXF5.

### Usage Guidelines

Before configuring this command, you must enable the **snmp-server enable traps event-manager** command to permit SNMP traps to be sent from the Cisco IOS device to the SNMP server. Other relevant **snmp-server** commands must also be configured.

This command generates an asynchronous message that is sent from the Cisco IOS device to the SNMP agent. The SNMP agent can be coded to understand customized data such as the optional integer and string data that can be sent in the SNMP trap message.

The SNMP trap that is generated uses the EEM MIB, CISCO-EMBEDDED-EVENT-MGR-MIB.my. Details about the MIB can be found using Cisco MIB Locator at the following URL:

<http://www.cisco.com/go/mibs>

### Examples

The following example shows an EEM applet called IPSLAping1 being registered to run when there is an exact match on the value of a specified SNMP object ID that represents a successful IP SLA ICMP echo operation (this is equivalent to a **ping** command). Four actions are triggered when the echo operation fails, and event monitoring is disabled until after the second failure. A message that the ICMP echo operation to a server failed is sent to syslog, an SNMP trap is generated, EEM publishes an application-specific event, and a counter called IPSLA1F is incremented by a value of one.

```
Router(config)# event manager applet IPSLAping1
Router(config-applet)# event snmp oid 1.3.6.1.4.1.9.9.42.1.2.9.1.6.4 get-type exact
entry-op eq entry-val 1 exit-op eq exit-val 2 poll-interval 5
Router(config-applet)# action 1.0 syslog priority critical msg "Server IP echo failed:
OID=$_snmp_oid_val"
Router(config-applet)# action 1.1 snmp-trap strdata "EEM detected server reachability
failure to 10.1.88.9"
Router(config-applet)# action 1.2 publish-event sub-system 88000101 type 1 arg1 10.1.88.9
arg2 IPSLAEcho arg3 fail
Router(config-applet)# action 1.3 counter name _IPSLA1F value 1 op inc
```
