

BGP AS-Override Split-Horizon

The BGP AS-Override Split-Horizon feature enables a Provider Edge (PE) device using split-horizon to avoid advertisement of routes propagated by a Customer Edge (CE) device to the same CE device. The BGP AS-Override Split-Horizon feature also enables a PE or CE device to send route updates to a specific PE or CE device in the same replication group.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see [Bug Search Tool](#) and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About BGP AS-Override Split-Horizon

BGP AS-Override Split-Horizon Overview

When you configure split-horizon on a device, the Provider Edge (PE) device may advertise routes propagated from a Customer Edge (CE) device to the same CE device. The BGP AS-Override Split Horizon feature groups all the BGP neighbors into separate replication-groups, even when they are in the same update-group, and ensures that the route updates propagated from a CE device are not sent to the same CE device.

The BGP AS-Override Split Horizon feature enables a PE or CE device to selectively send and block updates to one or more neighboring PE or CE devices in the same update-group. The PE or CE device sends or blocks

a message to a neighboring PE or CE device based on the type of the message and on whether the originator of the message matches the router ID of the PE or CE device.

How to Configure BGP AS-Override Split-Horizon

Configuring BGP AS-Override Split-Horizon

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **router bgp** *autonomous-system-number*
4. **address family ipv4 vrf** *vrf-name*
5. **neighbor** *ip-address* **remote-as** *autonomous-system-number*
6. **neighbor** *ip-address* **activate**
7. **neighbor** *ip-address* **as-override split-horizon**
8. Repeat Step 5 to Step 7 to enable split-horizon for different neighbors in a virtual routing and forwarding (VRF) instance.
9. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	router bgp <i>autonomous-system-number</i> Example: Device(config)# router bgp 21	Configures the Border Gateway Protocol (BGP) routing process and enters router configuration mode.
Step 4	address family ipv4 vrf <i>vrf-name</i> Example: Device(config-router)# address-family ipv4 vrf vrf1	Specifies the name of the VPN routing and forwarding (VRF) instance to associate with subsequent IPv4 address family configuration mode commands and enters address-family configuration mode.

	Command or Action	Purpose
Step 5	neighbor <i>ip-address</i> remote-as <i>autonomous-system-number</i> Example: <pre>Device(config-router-af)# neighbor 192.0.2.1 remote-as 1</pre>	Configures peering with a BGP neighbor in the specified autonomous system.
Step 6	neighbor <i>ip-address</i> activate Example: <pre>Device(config-router-af)# neighbor 192.0.2.1 activate</pre>	Enables the neighbor to exchange prefixes for the IPv4 address family with the local device.
Step 7	neighbor <i>ip-address</i> as-override split-horizon Example: <pre>Device(config-router-af)# neighbor 192.0.2.1 as-override split-horizon</pre>	Enables split-horizon per neighbor in a VRF instance.
Step 8	Repeat Step 5 to Step 7 to enable split-horizon for different neighbors in a virtual routing and forwarding (VRF) instance.	—
Step 9	end Example: <pre>Device(config-router-af)# end</pre>	Exits router address-family configuration mode and enters privileged EXEC mode.

Verifying BGP AS-Override Split-Horizon

SUMMARY STEPS

1. enable
2. show ip bgp vpn4 all update-group
3. show ip bgp vpnv4 all neighbors *ip-address*
4. show ip bgp vpnv4 all neighbors *ip-address* policy

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: <pre>Device> enable</pre>	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.

```

Minimum time between advertisement runs is 0 seconds
Has 2 members:
 192.0.2.1          198.51.100.1

```

Sample output for the `show ip bgp vpnv4 all neighbors ip-address` command

To display details about neighbor connections, use the `show ip bgp vpnv4 all neighbors ip-address` command in privileged EXEC mode.

```

Device> enable
Device# show ip bgp vpnv4 all neighbors 209.165.200.228
BGP neighbor is 209.165.200.228, vrf vrf1, remote AS 1, external link
  BGP version 4, remote router ID 209.165.201.28
  BGP state = Established, up for 00:01:26
  Last read 00:00:35, last write 00:00:28, hold time is 180, keepalive interval is 60 seconds

Neighbor sessions:
  1 active, is not multisession capable (disabled)
Neighbor capabilities:
  Route refresh: advertised and received(new)
  Four-octets ASN Capability: advertised and received
  Address family IPv4 Unicast: advertised and received
  Enhanced Refresh Capability: advertised and received
  Multisession Capability:
  Stateful switchover support enabled: NO for session 1
Message statistics:
  InQ depth is 0
  OutQ depth is 0

          Sent          Rcvd
Opens:           1           1
Notifications:   0           0
Updates:         6           2
Keepalives:      3           3
Route Refresh:   0           0
Total:           12          6
Default minimum time between advertisement runs is 0 seconds

For address family: VPNv4 Unicast
Translates address family IPv4 Unicast for VRF vrf1
Session: 209.165.200.228
BGP table version 40, neighbor version 40/0
Output queue size : 0
Index 1, Advertise bit 1
1 update-group member
Overrides the neighbor AS with my AS before sending updates
Split horizon processing before sending updates
Slow-peer detection is disabled
Slow-peer split-update-group dynamic is disabled

Feature Information for BGP AS-Override Split-Horizon

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 1: Feature Information for BGP AS-Override Split-Horizon

Feature Name	Releases	Feature Information
BGP AS-Override Split-Horizon		<p>The BGP AS-Override Split-Horizon feature enables a Provider Edge (PE) device using split-horizon to avoid advertisement of routes propagated by a Customer Edge (CE) device to the same CE device. The BGP AS-Override Split-Horizon feature also enables a PE or CE device to send route updates to specific PE or CE device in the same replication group.</p> <p>The following command was introduced or modified: neighbor ip-address as-override split-horizon.</p>
