

MPLS LDP Inbound Label Binding Filtering

Last Updated: November 29, 2011

Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP) supports inbound label binding filtering. You can use the MPLS LDP Inbound Label Binding Filtering feature to configure access control lists (ACLs) for controlling the label bindings a label switch router (LSR) accepts from its peer LSRs.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the Feature Information Table at the end of this document.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Restrictions

Inbound label binding filtering does not support extended ACLs; it only supports standard ACLs.

Information about MPLS LDP Inbound Label Binding Filtering

The MPLS LDP Inbound Label Binding Filtering feature may be used to control the amount of memory used to store LDP label bindings advertised by other routers. For example, in a simple MPLS Virtual

Americas Headquarters:
Cisco Systems, Inc., 170 West Tasman Drive, San Jose, CA 95134-1706 USA

Private Network (VPN) environment, the VPN provider edge (PE) routers may require LSPs only to their peer PE routers (that is, they do not need LSPs to core routers). Inbound label binding filtering enables a PE router to accept labels only from other PE routers.

How to Configure MPLS LDP Inbound Label Binding Filtering

- [Configuring MPLS LDP Inbound Label Binding Filtering, page 2](#)
- [Verifying that MPLS LDP Inbound Label Bindings are Filtered, page 4](#)

Configuring MPLS LDP Inbound Label Binding Filtering

Perform this task to configure a router for inbound label filtering. The following configuration allows the router to accept only the label for prefix 25.0.0.2 from LDP neighbor router 10.12.12.12.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip access-list standard** *access-list-number*
4. **permit** {*source* [*source-wildcard*] | **any**} [**log**]
5. **exit**
6. **mpls ldp neighbor** [**vrf** *vpn-name*] *nbr-address* **labels accept** *acl*
7. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Example: Router# configure terminal	Enters global configuration mode.

Command or Action	Purpose
<p>Step 3 <code>ip access-list standard <i>access-list-number</i></code></p> <p>Example:</p> <p>Example:</p> <pre>Router(config)# ip access-list standard 1</pre>	<p>Defines a standard IP access list with a number.</p>
<p>Step 4 <code>permit {<i>source</i> [<i>source-wildcard</i>] any} [log]</code></p> <p>Example:</p> <p>Example:</p> <pre>Router(config-std-nacl)# permit 10.0.0.0</pre>	<p>Specifies one or more prefixes permitted by the access list.</p>
<p>Step 5 <code>exit</code></p> <p>Example:</p> <p>Example:</p> <pre>Router(config-std-nacl)# exit</pre>	<p>Exits the current mode and goes to the next higher level.</p>
<p>Step 6 <code>mpls ldp neighbor [<i>vrf vpn-name</i>] <i>nbr-address</i> labels accept <i>acl</i></code></p> <p>Example:</p> <pre>Router(config)# mpls ldp neighbor 10.12.12.12 labels accept 1</pre>	<p>Specifies the ACL to be used to filter label bindings for the specified LDP neighbor.</p>
<p>Step 7 <code>end</code></p> <p>Example:</p> <p>Example:</p> <pre>Router(config)# end</pre>	<p>Exits the current mode and enters privileged Exec mode.</p>

Verifying that MPLS LDP Inbound Label Bindings are Filtered

If inbound filtering is enabled, perform the following steps to verify that inbound label bindings are filtered:

SUMMARY STEPS

1. Enter the **show mpls ldp neighbor** command to show the status of the LDP session, including the name or number of the ACL configured for inbound filtering.
2. Enter the **show ip access-list** command to display the contents of all current IP access lists or of a specified access list.
3. Enter the **show mpls ldp bindings** command to verify that the LSR has remote bindings only from a specified peer for prefixes permitted by the access list.

DETAILED STEPS

Step 1 Enter the **show mpls ldp neighbor** command to show the status of the LDP session, including the name or number of the ACL configured for inbound filtering.

Example:

```
show mpls ldp neighbor
 [vrf

vpn-name
][
address
 |
interface
] [detail
```

Note To display information about inbound label binding filtering, you must enter the **detail** keyword.

Following is sample output from the **show mpls ldp neighbor** command.

Example:

```
Router# show mpls ldp neighbor 10.12.12.12 detail
Peer LDP Ident: 10.12.12.12:0; Local LDP Ident 10.13.13.13:0
TCP connection: 10.12.12.12.646 - 10.13.13.13.12592
State: Oper; Msgs sent/rcvd: 49/45; Downstream; Last TIB rev sent 1257
Up time: 00:32:41; UID: 1015; Peer Id 0;
LDP discovery sources:
Serial1/0; Src IP addr: 25.0.0.2
holdtime: 15000 ms, hello interval: 5000 ms
Addresses bound to peer LDP Ident:
10.0.0.129 10.12.12.12 10.0.0.2
Peer holdtime: 180000 ms; KA interval: 60000 ms; Peer state: estab
LDP inbound filtering accept acl: 1
```

Step 2 Enter the **show ip access-list** command to display the contents of all current IP access lists or of a specified access list.

Example:

```
show ip access-list
[
```

```
access-list-number
|
access-list-name
]
```

Note It is important that you enter this command to see how the access list is defined; otherwise, you cannot verify inbound label binding filtering.

The following command output shows the contents of IP access list 1:

Example:

```
Router# show ip access 1
Standard IP access list 1
 permit 10.0.0.0, wildcard bits 0.0.0.255 (1 match)
```

Step 3

Enter the **show mpls ldp bindings** command to verify that the LSR has remote bindings only from a specified peer for prefixes permitted by the access list.

Example:

```
Router# show mpls ldp bindings
tib entry: 10.0.0.0/8, rev 4
  local binding: tag: imp-null
tib entry: 10.2.0.0/16, rev 1137
  local binding: tag: 16
tib entry: 10.2.0.0/16, rev 1139
  local binding: tag: 17
tib entry: 10.12.12.12/32, rev 1257
  local binding: tag: 18
tib entry: 10.13.13.13/32, rev 14
  local binding: tag: imp-null
tib entry: 10.10.0.0/16, rev 711
  local binding: tag: imp-null
tib entry: 10.0.0.0/8, rev 1135
  local binding: tag: imp-null
  remote binding: tsr: 12.12.12.12:0, tag: imp-null
tib entry: 10.0.0.0/8, rev 8
  local binding: tag: imp-null
Router#
```

Configuration Examples for MPLS LDP Inbound Label Binding Filtering

In the following example, the `mpls ldp neighbor labels accept` command is configured with an access control list to filter label bindings received on sessions with the neighbor 10.110.0.10.

Label bindings for prefixes that match 10.b.c.d are accepted, where b is less than or equal to 63, and c and d can be any integer between 0 and 128. Other label bindings received from 10.110.0.10 are rejected.

```
Router# configure terminal
Router(config)# access-list 1 permit 10.63.0.0 0.63.255.255

Router(config)# mpls ldp neighbor 10.110.0.10 labels accept 1

Router(config)# end
```

In the following example, the **show mpls ldp bindings neighbor** command displays label bindings that were learned from 10.110.0.10. This example verifies that the LIB does not contain label bindings for prefixes that have been excluded.

```
Router# show mpls ldp bindings neighbor 10.110.0.10
tib entry: 10.2.0.0/16, rev 4
    remote binding: tsr: 10.110.0.10:0, tag: imp-null
tib entry: 10.43.0.0/16, rev 6
    remote binding: tsr: 10.110.0.10:0, tag: 16
tib entry: 10.52.0.0/16, rev 8
    remote binding: tsr: 10.110.0.10:0, tag: imp-null
```

Feature Information for MPLS LDP Inbound Label Binding Filtering Feature

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Glossary

carrier supporting carrier --A situation where one service provider allows another service provider to use a segment of its backbone network. The service provider that provides the segment of the backbone network to the other provider is called the backbone carrier. The service provider that uses the segment of the backbone network is called the customer carrier.

CE router --customer edge router. A router that is part of a customer network and that interfaces to a provider edge (PE) router.

inbound label binding filtering --Allows LSRs to control which label bindings it will accept from its neighboring LSRs. Consequently, an LSR does not accept or store some label bindings that its neighbors advertise.

label --A short fixed-length identifier that tells switching nodes how to forward data (packets or cells).

label binding --An association between a destination prefix and a label.
