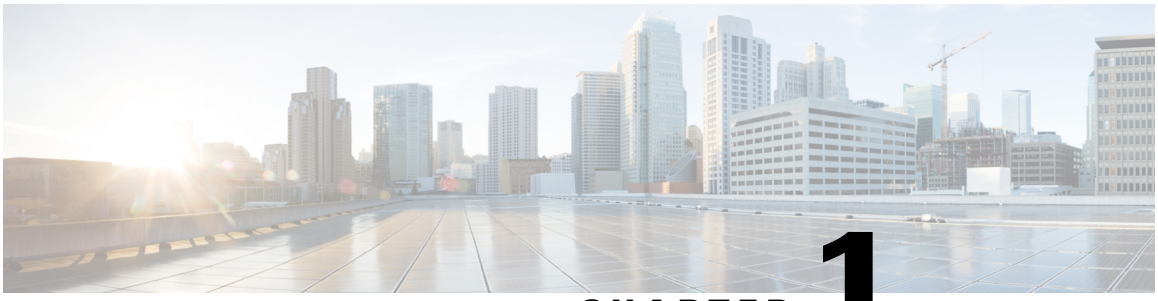
CONTENTS



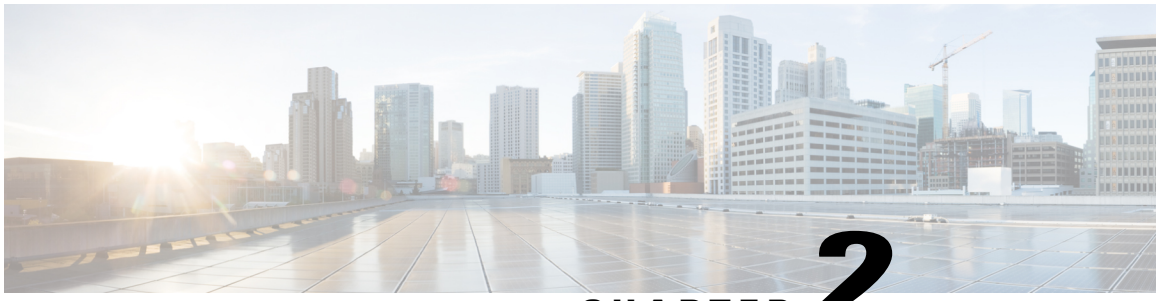
CHAPTER 1

Read Me First

Important Information about Cisco IOS XE 16

Effective Cisco IOS XE Release 3.7.0E (for Catalyst Switching) and Cisco IOS XE Release 3.17S (for Access and Edge Routing) the two releases evolve (merge) into a single version of converged release—the Cisco IOS XE 16—providing one release covering the extensive range of access and edge products in the Switching and Routing portfolio.

Note The Feature Information table in the technology configuration guide mentions when a feature was introduced. It might or might not mention when other platforms were supported for that feature. To determine if a particular feature is supported on your platform, look at the technology configuration guides posted on your product landing page. When a technology configuration guide is displayed on your product landing page, it indicates that the feature is supported on that platform.



CHAPTER 2

Easy VPN Server

The Easy VPN Server feature introduces server support for the Cisco VPN Client Release 3.x and later software clients and Cisco VPN hardware clients (such as the Cisco ASR 1000 Series Aggregation Services Routers). This feature allows a remote end user to communicate using IPsec with any Cisco IOS XE VPN gateway. Centrally managed IPsec policies are “pushed” to the client device by the server, minimizing configuration by the end user.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Restrictions for Easy VPN Server

Unsupported Protocols

The table below outlines IPsec protocol options and attributes that are not supported by Cisco VPN clients. These options and attributes should not be configured on the device for these clients.

Table 1: Unsupported IPsec Protocol Options and Attributes

Options	Attributes
Authentication types	• Authentication with public key encryption • Digital Signature Standard (DSS)
Diffie-Hellman (DH) groups	1
IPsec protocol identifier	IPSEC_AH
IPsec protocol mode	Transport mode
Miscellaneous	• Manual keys • Perfect Forward Secrecy (PFS)

Cisco Secure VPN Client 1.x Restrictions

When used with the Easy VPN Server feature, the Cisco Secure VPN Client 1.x has the following restrictions:

- It does not support dead peer detection (DPD) or any other keepalive scheme.
- It does not support initial contact.
- This feature cannot use per-group attribute policy profiles such as IP addresses and Domain Name Service (DNS). Thus, customers must continue to use the existing, globally defined parameters for the IP address assignment, Windows Internet Naming Service (WINS), DNS, and preshared keys.

Multicast and Static NAT

Multicast and static Network Address Translation (NAT) are supported only for Easy VPN servers using dynamic virtual tunnel interfaces (DVTIs).

Virtual IPsec Interface Restrictions

The Virtual IPsec Interface Support feature works only with a Cisco software VPN Client version 4.x or later and an Easy VPN remote device that is configured to use a virtual interface.

Cisco Tunnel Control Protocol Restrictions

- If a port is being used for Cisco Tunnel Control Protocol, the port cannot be used for other applications.
- Cisco Tunnel Control Protocol can be used on only ten ports at a time.
- Cisco Tunnel Control Protocol is supported on only Easy VPN servers.
- If a Cisco Tunnel Control Protocol connection is set up on a port, Cisco Tunnel Control Protocol cannot be disabled on that port because doing so causes the existing connection to stop receiving traffic.
- High Availability of Cisco Tunnel Control Protocol is not supported on the Easy VPN server.

Universal Client Mode

The Easy VPN Server feature does not support universal client mode using Dynamic Host Configuration Protocol (DHCP).

Information About Easy VPN Server

How It Works

When the client initiates a connection with a Cisco IOS XE VPN device, the "conversation" that occurs between the peers consists of device authentication via Internet Key Exchange (IKE), followed by user authentication using IKE Extended Authentication (Xauth), VPN policy push (using Mode Configuration), and IPsec security association (SA) creation. An overview of this process is as follows:

- The client initiates IKE Phase 1 via aggressive mode (AM) if a preshared key is used for authentication. If the client identifies itself with a preshared key, the accompanying group name entered in the configuration GUI (ID_KEY_ID) is used to identify the group profile associated with this client. If digital certificates are used the client initiates main mode (MM). The organizational unit (OU) field of a distinguished name (DN) is used to identify the group profile when digital certificates are used.

Note Because the client may be configured for preshared key authentication, which initiates IKE AM, it is recommended that the administrator change the identity of the VPN device via the **crypto isakmp identity hostname** command. This will not affect certificate authentication via IKE MM.

- The client attempts to establish an IKE SA between its public IP address and the public IP address of the VPN device. To reduce the amount of manual configuration on the client, every combination of encryption and hash algorithms, in addition to authentication methods and DH group sizes, is proposed.
- Depending on its IKE policy configuration, the VPN device will determine which proposal is acceptable to continue negotiating Phase 1.

Tip IKE policy is global for the VPN device and can consist of several proposals. In the case of multiple proposals, the VPN device uses the first match, so you should always list your most secure policies first.

Note Device authentication ends and user authentication begins at this point.

- After the IKE SA is successfully established, and if the VPN device is configured for Xauth, the client waits for a "username/password" challenge and then responds to the challenge of the peer. The information that is entered is checked against authentication entities using authentication, authorization, and accounting (AAA) protocols such as RADIUS and TACACS+. Token cards may also be used via AAA proxy. During Xauth, it is also possible for a user-specific attribute to be retrieved if the credentials of that user are validated via RADIUS.

Note VPN devices that are configured to handle remote clients should always be configured to enforce user authentication.

- If the VPN device indicates that authentication was successful, the client requests further configuration parameters from the peer. The remaining system parameters (for example, IP address, DNS, and split tunnel attributes) are pushed to the client at this time using Mode Configuration.

Note The IP address pool and group preshared key (if Rivest, Shamir, and Adelman [RSA] signatures are not being used) are the only required parameter in a group profile, all other parameters are optional.

- After each client is assigned an internal IP address via Mode Configuration, it is important that the VPN device knows how to route packets through the appropriate VPN tunnel. Reverse route injection (RRI) ensures that a static route is created on the VPN device for each client internal IP address.

Note It is recommended that you enable RRI on the crypto map (static or dynamic) for the support of VPN clients unless the crypto map is being applied to a Generic Routing Encapsulation (GRE) tunnel that is already being used to distribute routing information.

- After the configuration parameters have been successfully received by the client, IKE quick mode is initiated to negotiate IPsec SA establishment.
- After IPsec SAs are created, the connection is complete.

RADIUS Support for Group Profiles

Group policy information is stored in a profile that can be defined locally in the router configuration or on a RADIUS server that is accessible by the VPN device. If RADIUS is used, you must configure access to the server and allow the VPN device to send requests to the server.

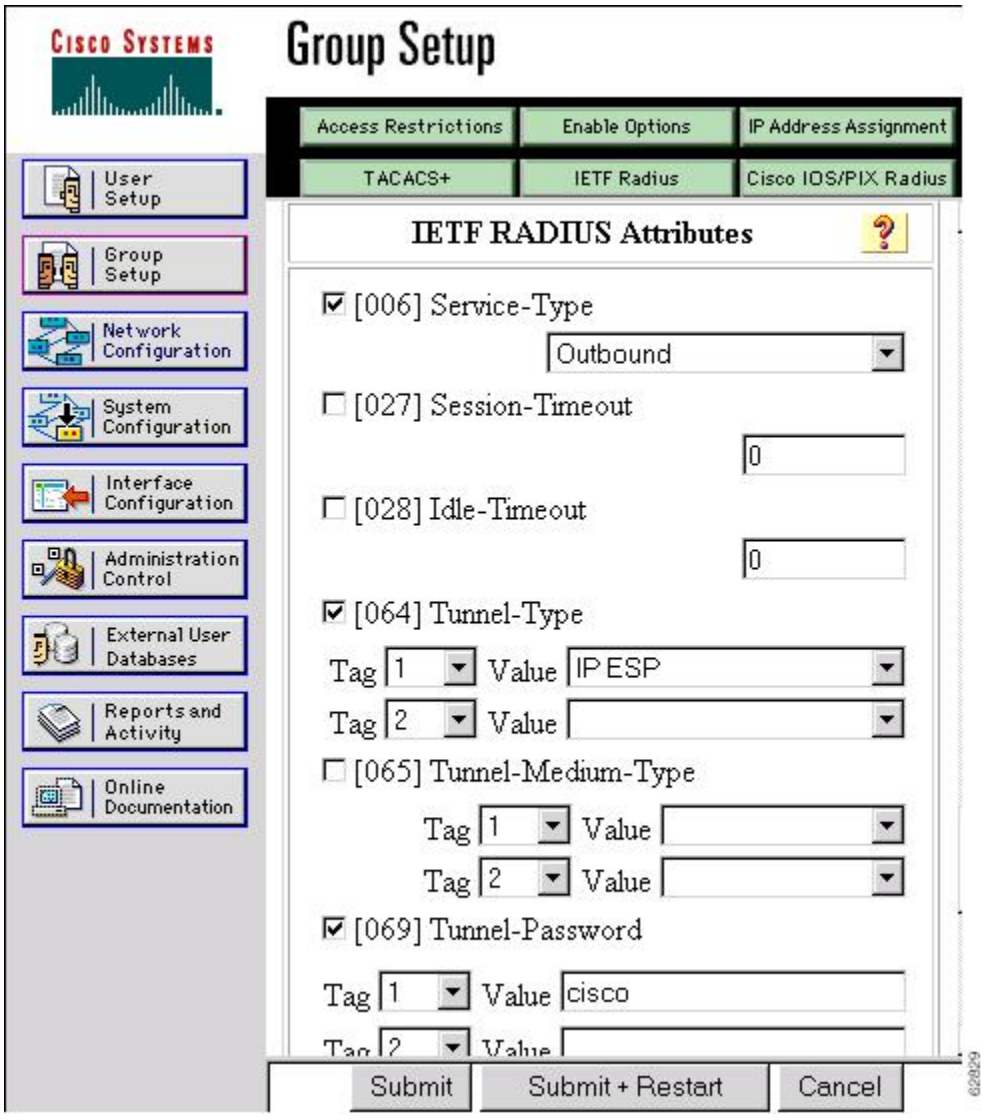
To define group policy attributes for RADIUS, you must do the following task on your RADIUS server:

- Define a user that has a name equal to the group name as defined in the client GUI. For example, if users are connecting to the VPN device using the group name “sales,” you need a user whose name is “sales.” The password for this user is “cisco,” which is a special identifier that is used by the router for RADIUS purposes. The username must then be made a member of a group in which the correct policy is defined. For simplicity, it is recommended that the group name be the same as the username. Use the **radius-server host** *ip-address* [**auth-port** *port-number*] [**acct-port** *port-number*] [**key** *string*] command to configure access to the RADIUS server and allow the VPN device to send requests to the server. You need to configure this command only if you choose to store group policy information in a RADIUS server.

For a Cisco Secure Access Control Server

If you are using a Cisco secure access control server (ACS), you may configure your remote access VPN group profiles on this server. To perform this task, you must ensure that IETF RADIUS attributes are selected for group configuration as shown in the figure below. (This figure also shows the compulsory attributes required for a remote access VPN group.) All values must be entered except the Tunnel-Password attribute, which is actually the preshared key for IKE purposes; if digital certificates are preferred, this attribute may be omitted.

Figure 1: IETF RADIUS Attributes Selection for Group Configuration



In addition to the compulsory attributes shown in the figure above, other values can be entered that represent the group policy that is pushed to the remote client via Mode Configuration. The figure below shows an example of a group policy. All attributes are optional except the addr-pool, key-exchange=preshared-key, and key-exchange=ike attributes. The values of the attributes are the same as the setting that is used if the policy

is defined locally on the router rather than in a RADIUS server. These values are explained in the section "Defining Group Policy Information for Mode Configuration Push, on page 24".

After the group profile is created, a user who is a member of the group should be added. (Remember that the username that is defined maps to the group name as defined on the remote client, and the password defined for the username in the RADIUS database must be “cisco.”) If digital certificates are the preferred method of IKE authentication, the username should reflect the OU field in the certificate presented by the remote client.

For All Other RADIUS Servers

Ensure that your RADIUS server allows you to define attribute-value (AV) pairs. For an example, see the section “Example Configuring Cisco IOS XE for Easy VPN Server, on page 50”.

Note If digital certificates are used, the username defined in RADIUS must be equal to the OU field of the DN of the certificate of the client.

RADIUS Support for User Profiles

Attributes may also be applied on a per-user basis. If you apply attributes on a per-user basis, you can override a group attribute value with an individual user attribute. The attributes are retrieved at the time the user authentication via Xauth occurs. The attributes are then combined with group attributes and applied during Mode Configuration.

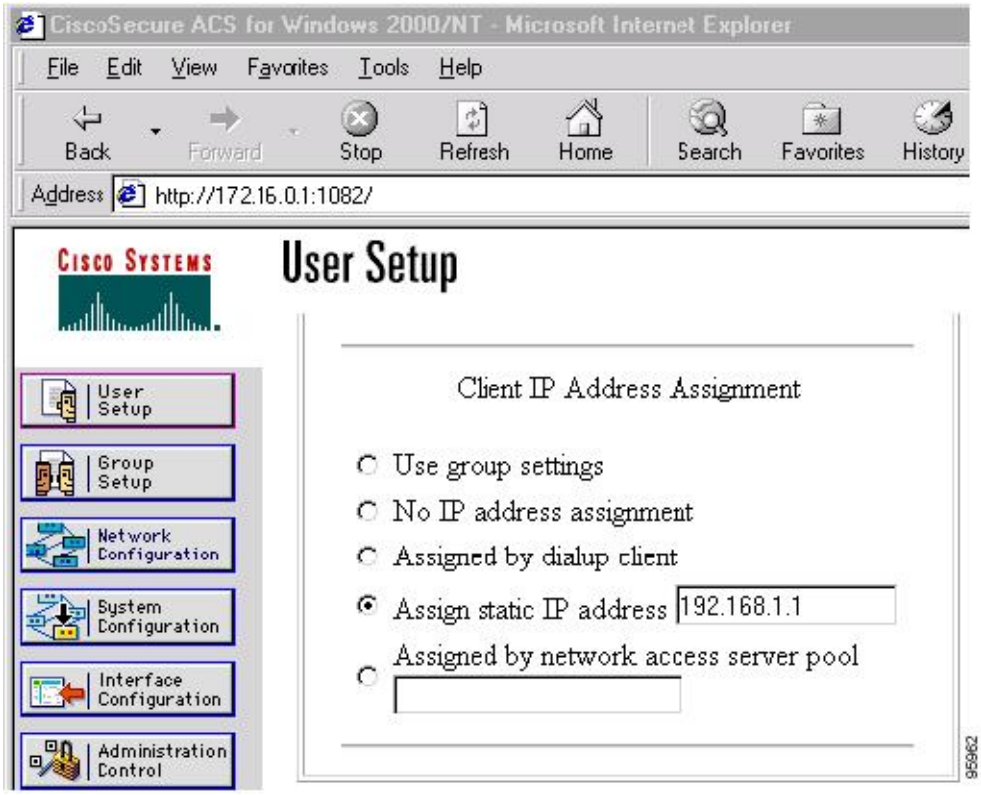
User-based attributes are available only if RADIUS is being used for user authentication.

To define user policy attributes for RADIUS, you must do the following task on your RADIUS server:

- Define a user or add attributes to the existing profile of a user in your RADIUS database. The password for the user will be used during Xauth user authentication, or you may proxy to a third-party server, such as a token card server.

The figure below shows how CiscoSecure ACS may be used for user authentication and for the assignment of a Framed-IP-Address attribute that may be pushed to the client. The presence of this attribute means that the local address pool defined for the group to which that user belongs will be overridden.

Figure 3: CiscoSecure ACS User Profile Setup



For All Other RADIUS Servers

Ensure that your RADIUS server allows you to define AV pairs. For an example, see the "Example Configuring Cisco IOS XE for Easy VPN Server, on page 50" section.

Easy VPN Server Supported Protocols

The table below outlines supported IPsec protocol options and attributes that can be configured for this feature. (See the Unsupported Protocols section in the *Restrictions for Easy VPN Server* for unsupported options and attributes.)

Table 2: Supported IPsec Protocol Options and Attributes

Options	Attributes
Authentication algorithms	• Hashed Message Authentication Codes with message digest algorithm 5 (HMAC-MD5) • HMAC-Secure Hash Algorithm 1 (HMAC-SHA1)
Authentication types	• Preshared keys • RSA digital signatures
D-H groups	• 2 • 5
Encryption algorithms (IKE)	• Data Encryption Standard (DES) • Triple Data Encryption Standard (3DES)
Encryption algorithms (IPsec)	• DES • 3DES • NULL
IPsec protocol identifiers	• Encapsulating Security Payload (ESP) • IP Lempel-Ziv-Stac compression (IPCOMP-LZS)
IPsec protocol mode	Tunnel mode

Table 3: AAA protocols and services supported by Easy VPN Server

AAA Service	Database Type		
	RADIUS	TACACS+	Local
Authentication	Yes	Yes	Yes
Authorization	Yes	Yes	Yes
Accounting	Yes	Yes	No

We recommend choosing RADIUS over TACACS+. Easy VPN does not support other AAA protocols such as LDAP and Kerberos.

Functions Supported by Easy VPN Server

Mode Configuration Version 6 Support

Mode Configuration version 6 is supported for more attributes (as described in an IETF draft submission).

Xauth Version 6 Support

Cisco IOS XE software has been enhanced to support version 6 of Xauth. Xauth for user authentication is based on an IETF draft submission.

IKE Dead Peer Detect

The client implements a new keepalives scheme--IKE DPD.

DPD allows two IPsec peers to determine whether the other is still “alive” during the lifetime of a VPN connection. DPD is useful because a host may reboot, or the dialup link of a remote user may disconnect without notifying the peer that the VPN connection is terminated. When an IPsec host determines that a VPN connection no longer exists, the host can notify a user, attempt to switch to another IPsec host, or clean up valuable resources that were allocated for the peer that no longer exists.

A VPN device can be configured to send and reply to DPD messages. DPD messages are sent if no other traffic is being passed through the VPN tunnel. If a configured amount of time has lapsed since the last inbound data was received, DPD will send a message (“DPD R-U-THERE”) the next time it sends outbound IPsec data to the peer. DPD messages are unidirectional and are automatically sent by Cisco VPN clients. DPD must be configured on the router only if there is a need to send DPD messages to the VPN client to determine the health of the client.

The **crypto isakmp keepalive** *seconds* [*retries*] command allows the gateway to send DPD messages to the router. The *seconds* argument specifies the number of seconds between DPD messages (the range is from 1 to 3600 seconds); the *retries* argument specifies the number of seconds between retries if DPD messages fail (the range is from 2 to 60 seconds).

Split Tunneling Control

Remote clients can support split tunneling, which enables a client to have intranet and Internet access at the same time. If split tunneling is not configured, the client will direct all traffic through the tunnel, even traffic destined for the Internet.

Note The split tunnel access control list (ACL) has a limit of 50 access control entries (ACEs). If more than 50 ACEs are configured in a split tunnel ACL, only the first 50 ACEs are considered. These ACEs are sent to the client during Mode Configuration.

Note For network extension mode, the dynamic NAT rule is not inserted by EZVPN client when a duplicate split tunnel (ACE has same source address but different destination address) entry is pushed from EZVPN server for network extension mode.

Initial Contact

If a client is suddenly disconnected, the gateway may not be notified. Consequently, removal of connection information (IKE and IPsec SAs) for that client will not immediately occur. If the client attempts to reconnect to the gateway again, the gateway will refuse the connection because the previous connection information is still valid.

To avoid such a scenario, a new capability called initial contact has been introduced; it is supported by all Cisco VPN products. If a client or router is connecting to another Cisco gateway for the first time, an initial contact message is sent that tells the receiver to ignore and delete any old connection information that has been maintained for the newly connecting peer. Initial contact ensures that connection attempts are not refused because of SA synchronization problems, which are often identified via invalid security parameter index (SPI) messages and which require devices to have their connections cleared.

Group-Based Policy Control

Policy attributes such as IP addresses, DNS, and split tunnel access can be provided on a per-group or per-user basis.

User-Based Policy Control

Attributes may also be applied on a per-user basis. You can override a group attribute value with an individual user attribute. The attributes are retrieved at the time when user authentication via Xauth occurs. They are then combined with group attributes and applied during Mode Configuration.

Attributes can be applied on a per-user basis after the user has been authenticated. These attributes can override any similar group attributes. User-based attributes are available only if RADIUS is used as the database.

Framed-IP-Address

To select the Framed-IP-Address attribute for CiscoSecure for NT, do the following:

- Under the user profile, choose the "use this IP address" option under addressing and manually enter the address. (You should check the method of configuring a framed IP address with your own RADIUS server because this procedure will vary.)

Note If a framed IP address is present, and there is also a local pool address configured for the group that the user belongs to, the framed IP address will override the local pool setting.

DHCP Client Proxy

Easy VPN servers currently assign an IP address to a remote device using either a local pool that is configured on the router or the framed IP address attribute that is defined in RADIUS. The DHCP Client Proxy feature provides the option of configuring an Easy VPN server to obtain an IP address from a DHCP server. The IP address is pushed to the remote device using Mode Configuration.

Note This feature does not include the functionality for the DHCP server to push the DNS, WINS server, or domain name to the remote client.

To configure DHCP Client Proxy, see the section "Configuring an Easy VPN Server to Obtain an IP Address from a DHCP Server, on page 47."

Benefits of DHCP Client Proxy

- The functionality provided with this feature helps in the creation of dynamic Domain Name System (DDNS) entries when a DNS server exists in conjunction with the DHCP server.
- The user is not restricted to IP address pools.

User-Save-Password

As per the group description, the User-Save-Password attribute can be received in addition to the group variant (Save-Password), but if it is received, it will override the value asserted by the group.

The following is sample output of a RADIUS AV pair for the User-Save-Password attribute:

```
ipsec:user-save-password=1
```

User-Include-Local-LAN

As per the group description, the User-Include-Local-LAN attribute can be received in addition to the group variant (Include-Local-LAN), but if it is received, it will override the value asserted by the group.

The following is sample output of a RADIUS AV pair for the User-Include-Local LAN attribute:

```
ipsec:user-include-local-lan=1
```

User-VPN-Group

The User-VPN-Group attribute is a replacement for the Group-Lock, on page 16 attribute. It allows support for both preshared key and RSA signature authentication mechanisms such as certificates.

If you need to check that the group a user is attempting to connect to is indeed the group the user belongs to, use the User-VPN-Group attribute. The administrator sets this attribute to a string, which is the group that the user belongs to. The group the user belongs to is matched against the VPN group as defined by group name (ID_KEY_ID) for preshared keys or by the OU field of a certificate. If the groups do not match, the client connection is terminated.

This feature works only with AAA RADIUS. Local Xauth authentication must still use the Group-Lock attribute.

The following is sample output of a RADIUS AV pair for the Use-VPN-Group attribute:

```
ipsec:user-vpn-group=cisco
```

Group-Lock

If you are only using preshared keys (no certificates or other RSA signature authentication mechanisms) with RADIUS or local AAA, you can continue to use the Group-Lock attribute. If you are only using preshared keys (no certificates or other RSA signature authentication mechanisms) with RADIUS, you can either continue to use the Group-Lock attribute or you can use the new User-VPN-Group, on page 15 attribute.

How It works

The group lock feature allows you to perform an extra authentication check during Xauth. With this feature enabled, the user must enter a username, group name, and user password during Xauth to authenticate. The username and group name can be entered in any of the following formats: “username/group name,” “username\group name,” “username%group name,” or “username group name.” The group name entered during Xauth is compared by the server with the group name sent for the preshared key device authentication. If they do not match, the server denies the connection. To enable this feature, use the **group-lock** command for the group.

Cisco IOS XE software does not strip the @group from the Xauth username, so the username user@group must exist in the local or external AAA database pointed to by the Internet Security Association Key Management Protocol (ISAKMP) profile selected at Phase 1 (machine group authentication).

Caution Do not use the Group-Lock attribute if you are using RSA signature authentication mechanisms such as certificates. Use the User-VPN-Group attribute instead. The User-VPN-Group attribute is recommended regardless of whether preshared keys or RSA signature is used as the method of authentication when an external AAA database is used.

Session Monitoring for VPN Group Access

It is possible to mimic the functionality provided by some RADIUS servers for limiting the maximum number of connections to a specific server group and also for limiting the number of simultaneous logins for users in that group. After user-defined thresholds are defined in each VPN group, connections will be denied until counts drop below these thresholds.

If you use a RADIUS server, such as CiscoSecure ACS, it is recommended that you enable this session control on the RADIUS server if the functionality is provided. In this way, usage can be controlled across a number of servers by one central repository. When enabling this feature on the router itself, only connections to groups on that specific device are monitored. Load-sharing scenarios are not accurately accounted for.

To configure session monitoring, use the **crypto isakmp client configuration group**command in global configuration mode and the **max-users** and **max-logins** commands in crypto ISAKMP group configuration mode.

The following is sample output of RADIUS AV pairs that have been added to the relevant group:

```
ipsec:max-users=1000
ipsec:max-logins=1
```

Virtual IPsec Interface Support on a Server

Virtual IPsec Interface Support on a Server allows you to selectively send traffic to different Easy VPN concentrators (servers) as well as to the Internet.

With the Virtual IPsec Interface Support on a Server feature, the tunnel-up configuration can be applied to separate interfaces, making it easier to support separate features at tunnel-up. Features that are applied to the traffic going into the tunnel can be separate from the features that are applied to traffic that is not going through the tunnel (for example, split-tunnel traffic and traffic leaving the device when the tunnel is not up). When the Easy VPN negotiation is successful, the line protocol state of the virtual-access interface gets changed to up. When the Easy VPN tunnel goes down because the SA expires or is deleted, the line protocol state of the virtual-access interfaces changes to down.

Note This feature does not support multicast.

Virtual Tunnel Interface Per-User Attribute Support

The Virtual Tunnel Interface provides per-user attribute support for Easy VPN servers.

For more information about this feature, see the IPsec Virtual Tunnel Interface feature.

Attributes To Support Management of Easy VPN Remote Devices

The following features provide support for attributes that aid in the management of the Cisco Easy VPN remote device.

Banner

An Easy VPN server can be configured to push the banner to the Easy VPN remote device. A banner is needed for the web-based activation feature. The banner is displayed when the Easy VPN tunnel is up on the Easy VPN remote console or as an HTML page in the case of web-based activation.

Auto-Update

You can configure an Easy VPN server to provide an automated mechanism for software and firmware upgrades on an Easy VPN remote device. Use the **crypto isakmp client configuration group**command to specify the group to which a policy profile should be defined and to enter crypto ISAKMP group configuration mode. To configure auto-update parameters for an Easy VPN remote device, use the **auto-update client** command in crypto ISAKMP group configuration mode.

Browser Proxy

You can configure an Easy VPN server so that an Easy VPN remote device can access resources on the corporate network. Using this feature, you do not have to manually modify the proxy settings of the web browser when connecting to the corporate network using Cisco VPN Client or manually revert the proxy settings upon disconnecting.

Use the **crypto isakmp client configuration browser-proxy** command in global configuration mode to configure browser-proxy parameters for an Easy VPN remote device. Use the **proxy** command in ISAKMP browser proxy configuration mode to configure proxy parameters for an Easy VPN remote device.

Configuration Management Enhancements

Pushing a Configuration URL Through a Mode-Configuration Exchange

When remote devices connect to a corporate gateway for creating an IPsec VPN tunnel, some policy and configuration information has to be applied to the remote device when the VPN tunnel is active to allow the remote device to become a part of the corporate VPN.

The Pushing a Configuration URL Through a Mode-Configuration Exchange feature provides for a mode-configuration attribute that "pushes" a URL from the concentrator (server) to the Easy VPN remote device. The URL contains the configuration information that the remote device has to download and apply to the running configuration, and it contains the Cisco IOS XE CLI listing. (For more information about a Cisco IOS XE CLI listing, see Cisco IOS XE documentation for the **configuration url** command.) The CLI for this feature is configured on the concentrator.

The configuration that is pushed to the remote device is persistent by default. That is, the configuration is applied when the IPsec tunnel is "up," but it is not withdrawn when the IPsec tunnel goes "down." However, it is possible to write a section of the configuration that is transient in nature, in which case the configuration of the section is reverted when the tunnel is disconnected.

There are no restrictions on where the configuration distribution server is physically located. However, Cisco recommends that you use a secure protocol such as Secure HTTP (HTTPS) to retrieve the configuration. The configuration server can be located in the corporate network and because the transfer happens through the IPsec tunnel, insecure access protocols (HTTP) can be used.

Regarding backward compatibility--the remote device asks for the CONFIGURATION-URL and CONFIGURATION-VERSION attributes. Because the CONFIGURATION-URL and CONFIGURATION-VERSION attributes are not mandatory attributes, the server sends them only if these attributes are configured for the group. There is no built-in restriction to push the configuration. However, bootstrap configurations (such as, for the IP address) cannot be sent because those configurations are required to set up the Easy VPN tunnel, and the CONFIGURATION-URL comes into effect only after the Easy VPN tunnel comes up.

After the Configuration Has Been Acquired by the Easy VPN Remote Device

After the configuration has been acquired by the Easy VPN remote device, the remote device sends a new ISAKMP notification to the Easy VPN server. The notification contains several manageability information messages about the client (remote device). The Easy VPN server takes two actions when this information is received:

- The Easy VPN server caches the information in its peer database. The information can be displayed by using the **show crypto isakmp peer config** command. This command output displays all manageability information that is sent by the client (remote device).
- If accounting is enabled, the Easy VPN server sends an accounting update record that contains the manageability information messages about the remote device to the accounting RADIUS server. This accounting update is later available in the accounting log of the RADIUS server.

How to Configure This Feature

The commands that are used to configure this feature and the attributes, CONFIGURATION-URL and CONFIGURATION-VERSION are described in the **crypto isakmp client configuration group** command documentation.

Per User AAA Download with PKI

With the Support of Per User AAA Download with public key infrastructure (PKI) feature, user attributes are obtained from the AAA server and pushed to the remote device through Mode Configuration. The username that is used to get the attributes is retrieved from the remote device certificate.

Per-User Attribute Support for Easy VPN Servers

The Per-User Attribute Support for Easy VPN Servers feature provides users with the ability to support per-user attributes on Easy VPN servers. These attributes are applied on the virtual access interface.

Local Easy VPN AAA Server

For a local Easy VPN AAA server, the per-user attributes can be applied at the group level or at the user level using the CLI.

To configure per-user attributes for a local Easy VPN server, see "Configuring Per-User Attributes on a Local Easy VPN AAA Server, on page 37" section.

Remote Easy VPN AAA Server

AV pairs can be defined on a remote Easy VPN AAA server as shown in this example:

```
cisco-avpair = "ip:outacl#101=permit tcp any any established
```

Per-User Attributes

The following per-user attributes are defined in the AAA server and are applicable to IPsec:

- inacl
- interface-config
- outacl
- policy-route
- prefix
- route
- rte-fltr-in
- rte-fltr-out
- sub-policy-In
- sub-policy-Out

Easy VPN Syslog Messages

Along with the ezvpn_connection_up and ezvpn_connection_down syslog messages, the following syslog messages are supported:

- Authentication Passed
- Authentication Rejected
    - Group Lock Enabled
    - Incorrect Username or Password
    - Max Users exceeded/Max Logins exceeded
    - No. of Retries exceeded
- Authentication Failed (AAA Not Contactable)
- IP Pool Not present/No Free IP Address available in the pool
- ACL associated with Ezvpn policy but NOT defined (hence, no split tunneling possible)
- Save password Turned ON
- Incorrect firewall record being sent by Client (incorrect vendor | product | capability)
- Authentication Rejected
    - Access restricted via incoming interface
    - Group does not exist

To enable Easy VPN syslog messages on a server, use the **crypto logging ezvpn** [**group** *group-name*]command. If a group name is not provided, syslog messages are enabled for all Easy VPN connections to the server. If a group name is provided, syslog messages are enabled for that particular group only.

Network Admission Control Support for Easy VPN

Network Admission Control provides a way to determine whether a PC client should be allowed to connect to the LAN. Network Admission Control uses Extensible Authentication Protocol over UDP (EAPoUDP) to query the Cisco trust agent on the PC and allows a PC to access the network if the client status is healthy. Different policies can be applied on the server to deny or limit access of PCs that are infected.

Network Admission Control can be used to monitor the status of remote PC clients as well. After the Easy VPN tunnel comes up and the PC starts to send traffic, the traffic is intercepted at the Easy VPN server, and the posture validation process starts. The posture validation process consists of sending an EAPoUDP request over the Easy VPN tunnel and querying the Cisco trust agent. The authentication server is configured inside the trusted network, behind the IPsec aggregation.

The configuration of an Easy VPN server that has Network Admission Control enabled is shown in the Example Network Admission Control, on page 59.

Central Policy Push Firewall Policy Push

The Easy VPN server supports Central Policy Push (CPP) Firewall Policy Push. This feature allows administrators to push policies that enforce security to the Cisco Easy VPN (software) client and related firewall software.

A split tunnel enables access to corporate networks, but it also allows a remote device to be exposed to attacks from the Internet. This feature enables the server to determine whether to allow or deny a tunnel if the remote device does not have a required firewall, thereby reducing exposure to attacks.

The following firewall types are supported:

- Cisco-Integrated-firewall (central-policy-push)
- Cisco-Security-Agent (check-presence)
- Zonelabs-Zonealarm (both)
- Zonelabs-ZonealarmPro (both)

The server can be used either to check the presence of a firewall on the client (remote device) using the check-presence option or to specify the specifics of the firewall policies that must be applied by the client using the central-policy-push.

To enable this feature, see the section Configuring a Central Policy Push Firewall, on page 38.

Syslog Support for CPP Firewall Policy Push

Syslog support can be enabled by using the **crypto logging ezvpn** command on your router. CPP syslog messages will be printed for the following error conditions:

- If a policy is configured on a group configuration (using the **firewall policy** command), but a global policy with the same name is not defined (using the **crypto isakmp client firewall** command). The syslog message is as follows:

```
Policy enabled on group configuration but not defined
```

Tunnel setup proceeds as normal (with the firewall).

- If an incorrect firewall request (vendor/product/cap incorrect order) is received, the syslog message is as follows:

```
Incorrect firewall record received from client
```

- If a policy mismatch occurs between the Cisco VPN client and the server, the syslog is as follows:

```
CPP policy mismatch between client and headend
```

Password Aging

If you have configured the Password Aging feature, the Easy VPN client is notified when a password has expired, and you are prompted to enter a new password. To configure the Password Aging feature, see the section "Configuring Password Aging, on page 42."

For more information about Password Aging, see the reference for “Password Aging” in the section Related Documents, on page 65.

Split DNS

The Split DNS feature enables the Easy VPN hardware client to use primary and secondary DNS values to resolve DNS queries. These values are pushed by the Easy VPN server to the Easy VPN remote device. To configure this feature on your server, use the **split-dns** command (see the section “ Defining Group Policy Information for Mode Configuration Push, on page 24 ”). Configuring this command adds the split-dns attribute to the policy group. The attribute will include the list of domain names that you configured. All other names will be resolved using the public DNS server.

For more information about configuring split DNS, see “*Configuring Split and Dynamic DNS on the Cisco VPN 3000* ” at the following URL: http://www.cisco.com/warp/public/471/dns_split_dynam.pdf.

VRF Assignment by a AAA Server

To assign VPN Routing and Forwarding (VRF) to Easy VPN users, enable the following attributes on a AAA server:

```
Cisco-avpair “ip:interface-config=ip vrf forwarding example1”
Cisco-avpair “ip:interface-config=ip unnumbered loopback10”
```

How to Configure Easy VPN Server

Enabling Policy Lookup via AAA

To enable policy lookup via AAA, perform the following task.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **aaa new-model**
4. **aaa authentication password-prompt** *text-string*
5. **aaa authentication username-prompt** *text-string*
6. **aaa authentication login** *list-name method1* [*method2...*]
7. **aaa authorization network** *list-name* **local** [**group radius**]
8. **username** *name* [**password** *encryption-type encrypted-password*]

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable**	Enables privileged EXEC mode.

	Command or Action	Purpose
	Example: `Router> enable`	• Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Router# configure terminal`	Enters global configuration mode.
Step 3	**aaa new-model** **Example:** `Router(config)# aaa new-model`	Enables AAA.
Step 4	**aaa authentication password-prompt** *text-string* **Example:** `Router(config)# aaa authentication password-prompt "Enter your password now:"`	(Optional) Changes the text displayed when users are prompted for a password.
Step 5	**aaa authentication username-prompt** *text-string* **Example:** `Router(config)# aaa authentication username-prompt "Enter your name here:"`	(Optional) Changes the text displayed when users are prompted to enter a username.
Step 6	**aaa authentication login** *list-name method1* [*method2...*] **Example:** `Router(config)# aaa authentication login userlist local group radius`	Sets AAA authentication at login. • A local and RADIUS server may be used together. **Note** This command must be enabled to enforce Xauth.
Step 7	**aaa authorization network** *list-name* **local** [**group radius**] **Example:** `Router(config)# aaa authorization network grouplist local group radius`	Enables group policy lookup. • A local and RADIUS server may be used together.
Step 8	**username** *name* [**password** *encryption-type encrypted-password*] **Example:** `Router(config)# username server-r password 7 121F0A18`	(Optional) Defines local users for Xauth if RADIUS or TACACS+ is not used. **Note** Use this command only if no external validation repository will be used.

Defining Group Policy Information for Mode Configuration Push

Although users can belong to only one group per connection, they may belong to specific groups with different policy requirements. Thus, users may decide to connect to the client using a different group ID by changing their client profile on the VPN device. To define the policy attributes that are pushed to the client via Mode Configuration, perform the following task.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto isakmp client configuration group** {*group-name* | **default**}
4. **key** *name*
5. **dns** *primary-server* [*secondary-server*]
6. **wins** *primary-server* [*secondary-server*]
7. **domain** *name*
8. **pool** *name*
9. **netmask** *name*
10. **acl** *number*
11. **access-restrict** {*interface-name*}
12. **firewall policy** *policy-name*
13. **group-lock**
14. **include-local-lan**
15. **save-password**
16. **backup-gateway** *ipaddress*
17. **pfs**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Router> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Router# configure terminal`	Enters global configuration mode.

	Command or Action	Purpose
Step 3	**crypto isakmp client configuration group** {*group-name* | **default**} **Example:** `Router(config)# crypto isakmp client configuration group group1`	Specifies the policy profile of the group that will be defined and enters ISAKMP group configuration mode. • If no specific group matches and a default group is defined, users will automatically be given the policy of a default group.
Step 4	**key** *name* **Example:** `Router(config-isakmp-group)# key group1`	Specifies the IKE preshared key for group policy attribute definition. **Note** This command must be enabled if the client identifies itself with a preshared key.
Step 5	**dns** *primary-server* [*secondary-server*] **Example:** `Router(config-isakmp-group)# dns 10.2.2.2 10.3.3.3`	(Optional) Specifies the primary and secondary DNS servers for the group.
Step 6	**wins** *primary-server* [*secondary-server*] **Example:** `Router(config-isakmp-group)# wins 10.10.10.10 10.12.12.12`	(Optional) Specifies the primary and secondary WINS servers for the group.
Step 7	**domain** *name* **Example:** `Router(config-isakmp-group)# domain domain.com`	(Optional) Specifies the DNS domain to which a group belongs.
Step 8	**pool** *name* **Example:** `Router(config-isakmp-group)# pool pool1`	Defines a local pool address. • Although a user must define at least one pool name, a separate pool may be defined for each group policy. **Note** This command must be defined and refer to a valid IP local pool address or the client connection will fail.
Step 9	**netmask** *name* **Example:** `Router(config-isakmp-group)# netmask 255.255.255.255`	(Optional) Specifies the subnet mask to be downloaded to the client for local connectivity. **Note** Some VPN clients use the default mask for their particular classes of address. However, for a router, the host-based mask is typically used (/32). If you want to override the default mask, use the **netmask** command.
Step 10	**acl** *number*	(Optional) Configures split tunneling.

	Command or Action	Purpose
	Example: `Router(config-isakmp-group)# acl 199`	• The *number* argument specifies a group of ACL rules that represent protected subnets for split tunneling purposes.
Step 11	**access-restrict** {*interface-name*} **Example:** `Router(config-isakmp-group)# access-restrict fastethernet0/0`	Restricts clients in a group to an interface.
Step 12	**firewall policy** *policy-name* **Example:** `Router(config-isakmp-group)# firewall policy policy1`	(Optional) Specifies a firewall policy.
Step 13	**group-lock** **Example:** `Router(config-isakmp-group)# group-lock`	Enforces the group lock feature.
Step 14	**include-local-lan** **Example:** `Router(config-isakmp-group)# include-local-lan`	(Optional) Configures the Include-Local-LAN attribute to allow a nonsplit-tunneling connection to access the local subnetwork at the same time as the client.
Step 15	**save-password** **Example:** `Router(config-isakmp-group)# save-password`	(Optional) Saves your Xauth password locally on your PC.
Step 16	**backup-gateway** *ipaddress* **Example:** `Router(config-isakmp-group)# backup-gateway 10.1.1.1`	(Optional) Rather than have backup gateways added to client configurations manually, it is possible to have the server "push down" a list of backup gateways to the client device. • These gateways are tried sequentially when a previous gateway fails. You can specify the gateways using IP addresses or host names.
Step 17	**pfs** **Example:** `Router(config-isakmp-group)# pfs`	(Optional) Notifies the client of the central-site policy regarding whether PFS is required for any IPsec SA. • Because the client device does not have a user interface option to enable or disable PFS negotiation, the server will notify the client device of the central site policy using this parameter. The

	Command or Action	Purpose
		DH group that is proposed for PFS will be the same that was negotiated in Phase 1 of the IKE negotiation.

Enabling VPN Session Monitoring

Perfom the following task to set restrictions on the maximum number of connections to the router per VPN group and the maximum number of simultaneous logins per user.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto isakmp client configuration group** *group-name*
4. **max-logins** *number-of-logins*
5. **max-users** *number-of-users*
6. **end**
7. **show crypto session group**
8. **show crypto session summary**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Router> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Router# configure terminal`	Enters global configuration mode.
Step 3	**crypto isakmp client configuration group** *group-name* **Example:** `Router(config)# crypto isakmp client configuration group group1`	Specifies the policy profile of the group that will be defined and enters ISAKMP group configuration mode. • *group-name* --Group definition that identifies which policy is enforced for users.

	Command or Action	Purpose
Step 4	**max-logins** *number-of-logins* **Example:** `Router(config-isakmp-group)# max-logins 10`	(Optional) Limits the number of simultaneous logins for users in a specific server group.
Step 5	**max-users** *number-of-users* **Example:** `Router(config-isakmp-group)# max-users 1000`	(Optional) Limits the number of connections to a specific server group.
Step 6	**end** **Example:** `Router(config-isakmp-group)# end`	Exits ISAKMP group configuration mode and enters privileged EXEC mode.
Step 7	**show crypto session group** **Example:** `Router# show crypto session group`	(Optional) Displays groups that are currently active on the VPN device.
Step 8	**show crypto session summary** **Example:** `Router# show crypto session summary`	(Optional) Displays groups that are currently active on the VPN device and the users that are connected for each of those groups.

Applying Mode Configuration and Xauth

Mode Configuration and Xauth must be applied to a crypto map to be enforced. To apply Mode Configuration and Xauth to a crypto map, perform the following task.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto map** *tag* **client configuration address** {**initiate** | **respond**}
4. **crypto map** *map-name* **isakmp authorization list** *list-name*
5. **crypto map** *map-name* **client authentication list** *list-name*

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Router> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Router# configure terminal`	Enters global configuration mode.
Step 3	**crypto map** *tag* **client configuration address** {**initiate** | **respond**} **Example:** `Router(config)# crypto map dyn client configuration address initiate`	Configures the router to initiate or reply to Mode Configuration requests. **Note** Cisco clients require the **respond** keyword to be used; however, if the Cisco Secure VPN Client 1.x is used, the **initiate** keyword must be used; **initiate** and **respond** keywords may be used simultaneously.
Step 4	**crypto map** *map-name* **isakmp authorization list** *list-name* **Example:** `Router(config)# crypto map map1 isakmp authorization list list1`	Enables IKE querying for a group policy when requested by the client. • The *list-name* argument is used by AAA to determine which storage source is used to find the policy (local or RADIUS) as defined in the **aaa authorization network** command.
Step 5	**crypto map** *map-name* **client authentication list** *list-name* **Example:** `Router(config)# crypto map xauthmap client authentication list xauthlist`	Enforces Xauth. • The *list-name* argument is used to determine the appropriate username and password storage location (local or RADIUS) as defined in the **aaa authentication login** command.

Enabling Reverse Route Injection for the Client

To enable RRI on the crypto map (static or dynamic) for VPN client support, perform the following task.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. Do one of the following:
   - **crypto dynamic-map** *map-name seq-num*
   -
   -
   - **crypto map** *map-name seq-num* **ipsec-isakmp**
4. **set peer** *ip-address*
5. **set transform-set** *transform-set-name*
6. **reverse-route**
7. **match address** *extended-access-list*

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Router> enable`	Enables privileged EXEC mode • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Router# configure terminal`	Enters global configuration mode.
Step 3	Do one of the following: • **crypto dynamic-map** *map-name seq-num* • • • **crypto map** *map-name seq-num* **ipsec-isakmp** **Example:** `Router(config)# crypto dynamic-map mymap 10` **Example:**	Creates a dynamic crypto map entry and enters crypto map configuration mode. or Adds a dynamic crypto map set to a static crypto map set and enters crypto map configuration mode.

	Command or Action	Purpose
	Example: **Example:** `Router(config)# crypto map yourmap 15 ipsec-isakmp`	
Step 4	**set peer** *ip-address* **Example:** `Router(config-crypto-map)# set peer 10.20.20.20`	Specifies an IPsec peer IP address in a crypto map entry. • This step is optional when configuring dynamic crypto map entries.
Step 5	**set transform-set** *transform-set-name* **Example:** `Router(config-crypto-map)# set transform-set set1`	Specifies which transform sets are allowed for the crypto map entry. • Lists multiple transform sets in order of priority (highest priority first). **Note** This list is the only configuration statement required in dynamic crypto map entries.
Step 6	**reverse-route** **Example:** `Router(config-crypto-map)# reverse-route`	Creates source proxy information.
Step 7	**match address** *extended-access-list* **Example:** `Router(config-crypto-map)# match address 2001`	Specifies an extended access list for a crypto map entry. • This step is optional when configuring dynamic crypto map entries.

Configuring the Pushing of a Configuration URL Through aMode-Configuration Exchange

To configure an Easy VPN server to push a configuration URL through a Mode-Configuration Exchange, perform the following task.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto isakmp client configuration group** *group-name*
4. **configuration url** *url*
5. **configuration version** *version-number*

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Router> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Router# configure terminal`	Enters global configuration mode.
Step 3	**crypto isakmp client configuration group** *group-name* **Example:** `Router(config)# crypto isakmp client configuration group Group1`	Specifies to which group a policy profile will be defined and enters crypto ISAKMP group configuration mode.
Step 4	**configuration url** *url* **Example:** `Router(config-isakmp-group)# configuration url http://10.10.88.8/easy.cfg`	Specifies the URL the remote device must use to get the configuration from the server. • The URL must be a non-NULL terminated ASCII string that specifies the complete path of the configuration file.
Step 5	**configuration version** *version-number* **Example:** `Router(config-isakmp-group)# configuration version 10`	Specifies the version of the configuration. • The version number will be an unsigned integer in the range from 1 to 32767.

Configuring Per User AAA Download with PKI--Configuring the Crypto PKI Trustpoint

To configure a AAA server to push user attributes to a remote device, perform the following task.

Before You Begin

Before configuring a AAA server to push user attributes to a remote device, you must have configured AAA. The crypto PKI trustpoint must also be configured (see the first configuration task below). It is preferable that the trustpoint configuration contain the **authorization username** command.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto pki trustpoint** *name*
4. **enrollment url** *url*
5. **revocation-check none**
6. **rsakeypair** *key-label*
7. **authorization username subjectname commonname**
8. **exit**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Router> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Router# configure terminal`	Enters global configuration mode.
Step 3	**crypto pki trustpoint** *name* **Example:** `Router(config)# crypto pki trustpoint ca-server`	Declares the trustpoint that your router should use and enters ca-trustpoint configuration mode.

	Command or Action	Purpose
Step 4	**enrollment url** *url* **Example:** `Router(config-ca-trustpoint)# enrollment url http://10.7.7.2:80`	Specifies the URL of the certification authority (CA) server to which to send enrollment requests.
Step 5	**revocation-check none** **Example:** `Router(config-ca-trustpoint)# revocation-check none`	Checks the revocation status of a certificate.
Step 6	**rsakeypair** *key-label* **Example:** `Router(config-ca-trustpoint)# rsakeypair rsa-pair`	Specifies which key pair to associate with the certificate.
Step 7	**authorization username subjectname commonname** **Example:** `Router(config-ca-trustpoint)# authorization username subjectname commonname`	Specifies the parameters for the different certificate fields that are used to build the AAA username.
Step 8	**exit** **Example:** `Router(config-ca-trustpoint)# exit`	Exits ca-trustpoint configuration mode.

Configuring the Actual Per User AAA Download with PKI

To configure the actual per-user download with PKI, perform the following task.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto isakmp policy** *priority*
4. **group** {**1** | **2**}
5. **exit**
6. **crypto isakmp profile** *profile-name*
7. **match certificate** *certificate-map*
8. **client pki authorization list** *listname*
9. **client configuration address** {**initiate** | **respond**}
10. **virtual-template** *template-number*
11. **exit**
12. **crypto ipsec transform-set** *transform-set-name transform1* [*transform2*] [*transform3*] [*transform4*]
13. **exit**
14. **crypto ipsec profile** *name*
15. **set transform-set** *transform-set-name*

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Router> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Router# configure terminal`	Enters global configuration mode.
Step 3	**crypto isakmp policy** *priority* **Example:** `Router(config)# crypto isakmp policy 10`	Defines an IKE policy and enters ISAKMP policy configuration mode.
Step 4	**group** {**1**	**2**} **Example:** `Router(config-isakmp)# group 2`	Specifies the DH group identifier within an IKE policy.

	Command or Action	Purpose
Step 5	**exit** **Example:** `Router(config-isakmp)# exit`	Exits ISAKMP policy configuration mode and enters global configuration mode.
Step 6	**crypto isakmp profile** *profile-name* **Example:** `Router(config)# crypto isakmp profile ISA-PROF`	Defines an ISAKMP profile and audits IPsec user sessions and enters crypto ISAKMP profile configuration mode.
Step 7	**match certificate** *certificate-map* **Example:** `Router(config-isa-prof)# match certificate cert-map`	Assigns an ISAKMP profile to a peer on the basis of the contents of arbitrary fields in the certificate.
Step 8	**client pki authorization list** *listname* **Example:** `Router(config-isa-prof)# client pki authorization list usrgrp`	Specifies the authorization list of AAA servers that will be used for obtaining per-user AAA attributes on the basis of the username constructed from the certificate.
Step 9	**client configuration address** {**initiate** | **respond**} **Example:** `Router(config-isa-prof)# client configuration address respond`	Configures IKE configuration mode in the ISAKMP profile.
Step 10	**virtual-template** *template-number* **Example:** `Router(config-isa-prof)# virtual-template 2`	Specifies which virtual template will be used to clone virtual access interfaces.
Step 11	**exit** **Example:** `Router(config-isa-prof)# exit`	Exits crypto ISAKMP profile configuration mode and enters global configuration mode.
Step 12	**crypto ipsec transform-set** *transform-set-name transform1* [*transform2*] [*transform3*] [*transform4*] **Example:** `Router(config)# crypto ipsec transform-set trans2 esp-3des esp-sha-hmac`	Defines a transform set--an acceptable combination of security protocols and algorithms and enters crypto transform configuration mode.

	Command or Action	Purpose
Step 13	**exit** **Example:** `Router(cfg-crypto-trans)# exit`	Exits crypto transform configuration mode and enters global configuration mode.
Step 14	**crypto ipsec profile** *name* **Example:** `Router(config)# crypto ipsec profile IPSEC-PROF`	Defines the IPsec parameters that are to be used for IPsec encryption between two IPsec routers and enters IPsec profile configuration mode.
Step 15	**set transform-set** *transform-set-name* **Example:** `Router(ipsec-profile)# set transform-set trans2`	Specifies which transform sets can be used with the crypto map entry.

Configuring Per-User Attributes on a Local Easy VPN AAA Server

To configure per-user attributes on a local Easy VPN AAA server, perform the following task.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **aaa attribute list** *list-name*
4. **attribute type** *name value* [**service** *service*] [**protocol** *protocol*]
5. **exit**
6. **crypto isakmp client configuration group** *group-name*
7. **crypto aaa attribute list** *list-name*

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Router> enable`	Enables privileged EXEC mode. • Enter your password if prompted.

	Command or Action	Purpose
Step 2	**configure terminal** **Example:** `Router# configure terminal`	Enters global configuration mode.
Step 3	**aaa attribute list** *list-name* **Example:** `Router(config)# aaa attribute list list1`	Defines a AAA attribute list locally on a router and enters attribute list configuration mode.
Step 4	**attribute type** *name value* [**service** *service*] [**protocol** *protocol*] **Example:** `Router(config-attr-list)# attribute type attribute attribute-name service ike protocol ip`	Defines an attribute type that is to be added to an attribute list locally on a router. • You can choose the attribute type that should be added from the list of given attributes.
Step 5	**exit** **Example:** `Router(config-attr-list)# exit`	Exits attribute list configuration mode.
Step 6	**crypto isakmp client configuration group** *group-name* **Example:** `Router (config)# crypto isakmp client configuration group group1`	Specifies to which group a policy profile will be defined and enters ISAKMP group configuration mode.
Step 7	**crypto aaa attribute list** *list-name* **Example:** `Router (config-isakmp-group)# crypto aaa attribute list listname1`	Defines a AAA attribute list locally on a router.

Configuring a Central Policy Push Firewall

You can configure a CPP firewall, using a local AAA server or using a remote AAA server.

Configuring a CPP Firewall Policy Push Using a Local AAA Server

Perform the following task to configure a CPP firewall policy push using a local AAA server.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto isakmp client firewall** *policy-name* {**required** | **optional**} *firewall-type*
4. **policy check-presence**
5. **exit**
6. **crypto isakmp client configuration group** *group-name*
7. **firewall policy** *policy-name*
8. **end**
9. **debug crypto isakmp**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Router> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Router# configure terminal`	Enters global configuration mode.
Step 3	**crypto isakmp client firewall** *policy-name* {**required** | **optional**} *firewall-type* **Example:** `Router(config)# crypto isakmp client firewall hw-client-g-cpp required cisco-security-agent`	Defines the CPP firewall push policy on a server and enters ISAKMP client firewall configuration mode. • *policy-name* --Uniquely identifies a policy. A policy name can be associated with the Easy VPN client group configuration of the server (local group configuration) or on the AAA server. • **required** --Policy is mandatory. If the CPP policy is defined as mandatory and is included in the Easy VPN server configuration, the tunnel setup is allowed only if the client confirms to this policy. Otherwise, the tunnel is terminated. • **optional** --Policy is optional. If the CPP policy is defined as optional, and is included in the Easy VPN server configuration, the tunnel setup is continued even if the client does not confirm the defined policy. • *firewall-type* --Type of firewall (see the **crypto isakmp client firewall** command for a list of firewall types).
Step 4	**policy check-presence**	Defines the CPP firewall policy push.

	Command or Action	Purpose
	Example: `Router(config-ikmp-client-fw)# policy check-presence`	• **check-presence** --Denotes that the server should check for the presence of the specified firewall as shown by the value of the *firewall-type* argument on the client.
Step 5	**exit** **Example:** `Router(config-ikmp-client-fw)# exit`	Exits ISAKMP client firewall configuration mode and enters global configuration mode.
Step 6	**crypto isakmp client configuration group** *group-name* **Example:** `Router(config)# crypto isakmp client configuration group hw-client-g`	Specifies to which group a policy profile will be defined and enters ISAKMP group configuration mode.
Step 7	**firewall policy** *policy-name* **Example:** `Router(crypto-isakmp-group)# firewall policy hw-client-g-cpp`	Specifies the CPP firewall push policy name for the crypto ISAKMP client configuration group on a local authentication, AAA server.
Step 8	**end** **Example:** `Router(crypto-isakmp-group)# end`	Exits ISAKMP group configuration mode and enters privileged EXEC mode.
Step 9	**debug crypto isakmp** **Example:** `Router# debug crypto isakmp`	(Optional) Displays messages about IKE events.

Configuring a CPP Firewall Policy Push Using a Remote AAA Server

Perform the following task to configure a CPP firewall policy push using a remote AAA server.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto isakmp client firewall** *policy-name* {**required** | **optional**} *firewall-type*
4. **policy check-presence**
5. **exit**
6. Add the VSA "cpp-policy" under the group definition that is defined in RADIUS.
7. **exit**
8. **debug crypto isakmp**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Router> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Router# configure terminal`	Enters global configuration mode.
Step 3	**crypto isakmp client firewall** *policy-name* {**required** | **optional**} *firewall-type* **Example:** `Router(config)# crypto isakmp client firewall hw-client-g-cpp required Cisco-Security-Agent`	Defines the CPP firewall push policy on a server and enters ISAKMP client firewall configuration mode. • *policy-name* --Uniquely identifies a policy. A policy name can be associated with the Easy VPN client group configuration of the server (local group configuration) or on the AAA server. • **required** --Policy is mandatory. If the CPP policy is defined as mandatory and is included in the Easy VPN server configuration, the tunnel setup is allowed only if the client confirms to this policy. Otherwise, the tunnel is terminated. • **optional** --Policy is optional. If the CPP policy is defined as optional, and is included in the Easy VPN server configuration, the tunnel setup is continued even if the client does not confirm the defined policy. • *firewall-type* --Type of firewall (see the **crypto isakmp client firewall** command for a list of firewall types).
Step 4	**policy check-presence**	Defines the CPP firewall policy push.

	Command or Action	Purpose
	Example: `Router(config-ikmp-client-fw)# policy check-presence`	• **check-presence** --Denotes that the server should check for the presence of the specified firewall as shown by the value of the *firewall-type* argument on the client.
Step 5	**exit** **Example:** `Router(config-ikmp-client-fw)# exit`	Exits ISAKMP client firewall configuration mode and enters global configuration mode.
Step 6	Add the VSA “cpp-policy” under the group definition that is defined in RADIUS. **Example:** `ipsec:cpp-policy=”Enterprise Firewall”`	Defines the CPP firewall push policy for a remote server.
Step 7	**exit** **Example:** `Router(config)# exit`	Exits global configuration mode and enters privileged EXEC mode.
Step 8	**debug crypto isakmp** **Example:** `Router# debug crypto isakmp`	(Optional) Displays messages about IKE events.

Configuring Password Aging

To configure Password Aging so that the Easy VPN client is notified if the password has expired, perform the following task.

Note The following restrictions apply to the Password Aging feature:

- It works only with VPN software clients. It does not work with VPN client hardware.
- It works only with RADIUS servers.

>

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **aaa new-model**
4. **aaa authentication login** *list-name* **passwd-expiry group radius**
5. **radius-server host** *ip-address* [**auth-port** *port-number*] [**acct-port** *port-number*] [**key** *string*]
6. **crypto isakmp profile** *profile-name*
7. **match certificate** *certificate-map*
8. **client authentication list** *list-name*

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Router> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Router# configure terminal`	Enters global configuration mode.
Step 3	**aaa new-model** **Example:** `Router(config)# aaa new-model`	Enables AAA.
Step 4	**aaa authentication login** *list-name* **passwd-expiry group radius** **Example:** `Router(config)# aaa authentication login userauth paswd-expiry group radius`	Configures the authentication list so that the Password Aging feature is enabled.
Step 5	**radius-server host** *ip-address* [**auth-port** *port-number*] [**acct-port** *port-number*] [**key** *string*] **Example:** `Router(config)# radius-server host 172.19.217.96 auth-port 1645 acct-port 1646 key cisco radius-server vsa send authentication`	Configures the RADIUS server.

	Command or Action	Purpose
Step 6	**crypto isakmp profile** *profile-name* **Example:** `Router(config)# crypto isakmp profile profile2`	Defines an ISAKMP profile and audits IPsec user sessions and enters crypto ISAKMP profile configuration mode.
Step 7	**match certificate** *certificate-map* **Example:** `Router(config-isa-prof)# match identity group branch`	Assigns an ISAKMP profile to a peer on the basis of the contents of arbitrary fields in the certificate.
Step 8	**client authentication list** *list-name* **Example:** `Router(config-isa-prof)# client authentication list userauth`	Configures IKE extended authentication (Xauth) in an ISAKMP profile and includes the authentication list that was defined above.

Configuring Split DNS

To configure Split DNS, perform the following task. The task also provides information on how to verify and monitor the Spilt DNS configuration.

Before You Begin

Before the Split DNS feature can work, the following commands should have been configured on the Easy VPN remote:

- **ip dns server**
- **ip domain-lookup**

Note You can use the **show** and **debug**commands in any order.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto isakmp client configuration group** {*group-name* | **default**}
4. **dns** *primary-server secondary-server*
5. **split-dns** *domain-name*
6. **end**
7. **show ip dns name-list** [*name-list-number*]
8. **show ip dns view** [**vrf** *vrf-name*] [**default** | *view-name*]
9. **show ip dns view-list** [*view-list-name*]
10. **debug ip dns name-list**
11. **debug ip dns view**
12. **debug ip dns view-list**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Router> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Router# configure terminal`	Enters global configuration mode.
Step 3	**crypto isakmp client configuration group** {*group-name* | **default**} **Example:** `Router(config)# crypto isakmp client configuration group group1`	Specifies the policy profile of the group that will be defined and enters ISAKMP group configuration mode. • If no specific group matches and a default group is defined, users will automatically be given the policy of a default group.
Step 4	**dns** *primary-server secondary-server* **Example:** `Router(config-isakmp-group)# dns 10.2.2.2 10.3.3.3`	Specifies the primary and secondary DNS servers for the group.

	Command or Action	Purpose
Step 5	**split-dns** *domain-name* **Example:** `Router(config-isakmp-group)# split-dns domain.com`	Specifies a domain name that must be tunneled or resolved to the private network.
Step 6	**end** **Example:** `Router(config-isakmp-group)# end`	Exits ISAKMP group configuration mode and enters privileged EXEC mode.
Step 7	**show ip dns name-list** [*name-list-number*] **Example:** `Router# show ip dns name-list 1`	Displays information about DNS name lists.
Step 8	**show ip dns view** [**vrf** *vrf-name*] [**default** | *view-name*] **Example:** `Router# show ip dns view default`	Displays information about DNS views.
Step 9	**show ip dns view-list** [*view-list-name*] **Example:** `Router# show ip dns view-list ezvpn-internal-viewlist`	Displays information about DNS view lists.
Step 10	**debug ip dns name-list** **Example:** `Router# debug ip dns name-list`	Enables debugging output for DNS name-list events.
Step 11	**debug ip dns view** **Example:** `Router# debug ip dns view`	Enables debugging output for DNS view events.
Step 12	**debug ip dns view-list** **Example:** `Router# debug ip dns view-list`	Enables debugging output for DNS view-list events.

Configuring an Easy VPN Server to Obtain an IP Address from a DHCP Server

When the Easy VPN server selects the method for address assignment, it does so in the following order of precedence:

1. Selects the framed IP address.
2. Uses the IP address from the authentication server (group/user).
3. Uses the global IKE address pools.
4. Uses DHCP.

Note To enable the Easy VPN server to obtain an IP address from a DHCP server, remove other address assignments.

To configure an Easy VPN server to obtain an IP address from a DHCP server, perform the following task.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **crypto isakmp client configuration group** *group-name*
4. **dhcp server** {*ip-address* | *hostname*}
5. **dhcp timeout** *time*
6. **dhcp giaddr** *ip-address*

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Router> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**configure terminal** **Example:** `Router# configure terminal`	Enters global configuration mode.
Step 3	**crypto isakmp client configuration group** *group-name*	Specifies to which group a policy profile will be defined. **Note** Entering this command places the CLI in ISAKMP group configuration mode. From this mode, you can use subcommands to specify characteristics for the group policy.

	Command or Action	Purpose
	Example: `Router(config)# crypto isakmp client configuration group group1`	
Step 4	**dhcp server** {*ip-address* | *hostname*} **Example:** `Router(config-isakmp-group)# dhcp server 10.10.1.2`	Specifies a primary (and backup) DHCP server to allocate IP addresses to users entering a particular public data network (PDN) access point.
Step 5	**dhcp timeout** *time* **Example:** `Router(config-isakmp-group)# dhcp timeout 6`	Sets the wait time in seconds before the next DHCP server on the list is tried.
Step 6	**dhcp giaddr** *ip-address* **Example:** `Router (config-isakmp-group)# dhcp giaddr 10.1.1.4`	Specifies the giaddr for the DHCP scope.

Verifying and Monitoring DHCP Client Proxy

Verifying and Monitoring DHCP Client Proxy

To verify and monitor your DHCP client proxy configuration, perform the following task.

Note You can use the **show** and **debug**commands in any order.

SUMMARY STEPS

1. **enable**
2. **show dhcp lease**
3. **show ip dhcp pool**
4. **show ip dhcp binding**
5. **debug crypto isakmp**
6. **debug dhcp**
7. **debug dhcp detail**
8. **debug ip dhcp server events**

DETAILED STEPS

	Command or Action	Purpose
Step 1	**enable** **Example:** `Router> enable`	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	**show dhcp lease** **Example:** `Router# show dhcp lease`	Displays information about the DHCP address pools. **Note** Use this command when an external DHCP is used.
Step 3	**show ip dhcp pool** **Example:** `Router# show ip dhcp pool`	Displays information about the DHCP address pools. **Note** This command is applicable only when the Easy VPN server is also the DHCP server (generally not the case because in most cases, the DHCP server is an external server).
Step 4	**show ip dhcp binding** **Example:** `Router# show ip dhcp binding`	Displays address bindings on the DHCP server. **Note** This command is applicable only when the Easy VPN server is also the DHCP server (generally not the case because in most cases, the DHCP server is an external server).
Step 5	**debug crypto isakmp** **Example:** `Router# debug crypto isakmp`	Displays messages about IKE events.
Step 6	**debug dhcp** **Example:** `Router# debug dhcp`	Reports server events, like address assignments and database updates.

	Command or Action	Purpose
Step 7	**debug dhcp detail** **Example:** `Router# debug dhcp detail`	Displays detailed DHCP debugging information.
Step 8	**debug ip dhcp server events** **Example:** `Router# debug ip dhcp server events`	Reports server events, like address assignments and database updates. **Note** This command is applicable only when the Easy VPN server is also the DHCP server (generally not the case because in most cases, the DHCP server is an external server).

Configuration Examples for Easy VPN Server

Example Configuring Cisco IOS XE for Easy VPN Server

The following example shows how to define group policy information locally for Mode Configuration. In this example, a group is named “cisco” and another group is named “default.” The policy is enforced for all users who do not offer a group name that matches “cisco.”

```
! Enable policy look-up via AAA. For authentication and authorization, send requests to
! RADIUS first, then try local policy.
aaa new-model
aaa authentication login userlist group radius local
aaa authorization network grouplist group radius local
enable password XXXX
!
username cisco password 0 cisco
clock timezone PST -8
ip subnet-zero
! Configure IKE policies, which are assessed in order so that the first policy that
matches the proposal of the client will be used.
crypto isakmp policy 1
 group 2
!
crypto isakmp policy 3
 hash md5
 authentication pre-share
 group 2
crypto isakmp identity hostname
!
! Define “cisco” group policy information for mode config push.
crypto isakmp client configuration group cisco
 key cisco
 dns 10.2.2.2 10.2.2.3
 wins 10.6.6.6
 domain cisco.com
 pool pool1
 acl 199
! Define default group policy for mode config push.
crypto isakmp client configuration group default
 key cisco
 dns 10.2.2.2 10.3.2.3
```

```
 pool pool1
 acl 199
!
!
crypto ipsec transform-set set1 esp-des esp-sha-hmac
!
crypto dynamic-map mode 1
 set transform-set set1
!
! Apply mode config and xauth to crypto map “mode.” The list names that are defined here
! must match the list names that are defined in the AAA section of the config.
crypto map mode client authentication list userlist
crypto map mode isakmp authorization list grouplist
crypto map mode client configuration address respond
crypto map mode 1 ipsec-isakmp dynamic mode
!
!
controller ISA 1/1
!
!

 transport input none
line aux 0
line vty 5 15
!
```

Example RADIUS Group Profile with IPsec AV Pairs

The following example shows a standard RADIUS group profile that includes RADIUS IPsec AV pairs. To get the group authorization attributes, “cisco” must be used as the password.

```
client_r Password = "cisco"
 Service-Type = Outbound

 cisco-avpair = "ipsec:tunnel-type*ESP"
 cisco-avpair = "ipsec:key-exchange=ike"
 cisco-avpair = "ipsec:tunnel-password=lab"
 cisco-avpair = "ipsec:addr-pool=pool1"
```

```
 cisco-avpair = "ipsec:default-domain=cisco"
 cisco-avpair = "ipsec:inacl=101"
 cisco-avpair = "ipsec:access-restrict=fastethernet 0/0"
 cisco-avpair = "ipsec:group-lock=1"
 cisco-avpair = "ipsec:dns-servers=10.1.1.1 10.2.2.2"
 cisco-avpair = "ipsec:firewall=1"
 cisco-avpair = "ipsec:include-local-lan=1"
 cisco-avpair = "ipsec:save-password=1"
 cisco-avpair = "ipsec:wins-servers=10.3.3.3 10.4.4.4"
 cisco-avpair = "ipsec:split-dns=green.com"
 cisoc-avpair = "ipsec:ipsec-backup-gateway=10.1.1.1"
 cisoc-av5pair = "ipsec:ipsec-backup-gateway=10.1.1.2"
 cisoc-avpair = "ipsec:pfs=1"
 cisco-avpair = "ipsec:cpp-policy="Enterprise Firewall"
 cisco-avpair = “ipsec:auto-update=”Win http://example.com 4.0.1”
 cisco-avpair = “ipsec:browser-proxy=bproxy_profile_A”
 cisco-avpair = "ipsec:banner=Xauth banner text here"
```

The following example shows a RADIUS user profile that is set up for a group that has group-lock configured. The user name is entered in the same format as the user@domain format.

```
abc@example.com Password = "abcll1111"
cisco-avpair = "ipsec:user-include-local-lan=1"
cisco-avpair = "ipsec:user-save-password=1"
Framed-IP-Address = 10.10.10.10
```

Example RADIUS User Profile with IPsec AV Pairs

The following example shows a standard RADIUS user profile that includes RADIUS IPsec AV pairs. These user attributes will be obtained during Xauth.

```
ualluall Password = "uall1234"
        cisco-avpair = "ipsec:user-vpn-group=unity"
        cisco-avpair = "ipsec:user-include-local-lan=1"
        cisco-avpair = "ipsec:user-save-password=1"
        Framed-IP-Address = 10.10.10.10
```

Example Backup Gateway with Maximum Logins and Maximum Users

The following example shows that five backup gateways have been configured, that the maximum users have been set to 250, and that maximum logins have been set to 2:

```
crypto isakmp client configuration group sdm
 key 6 RMZPPMRQMSdiZNJg`EBbCWTKSTi\d[
 pool POOL1
 acl 150
 backup-gateway 172.16.12.12
 backup-gateway 172.16.12.13
 backup-gateway 172.16.12.14
 backup-gateway 172.16.12.130
 backup-gateway 172.16.12.131
 max-users 250
 max-logins 2
```

ExamplesPushingaConfigurationURLThroughaMode-ConfigurationExchange

The following **show crypto ipsec client ezvpn** command output displays the Mode Configuration URL location and version:

```
Router# show crypto ipsec client ezvpn
Easy VPN Remote Phase: 5
Tunnel name : branch
Inside interface list: Vlan1
Outside interface: FastEthernet0
Current State: IPSEC_ACTIVE
Last Event: SOCKET_UP
Address: 172.16.1.209
Mask: 255.255.255.255
Default Domain: cisco.com
Save Password: Allowed
Configuration URL [version]: tftp://172.16.30.2/branch.cfg [11]
Config status: applied, Last successfully applied version: 11
Current EzVPN Peer: 192.168.10.1
```

The following **show crypto isakmp peers config** command output displays all manageability information that is sent by the remote device.

```
Router# show crypto isakmp peers config
Client-Public-Addr=192.168.10.2:500; Client-Assigned-Addr=172.16.1.209; Client-Group=branch;

Example Network Admission Control

The following example shows that an Easy VPN server that has been enabled with Network Admission Control.

Note Network Admission Control is supported on an Easy VPN server only when the server uses IPsec virtual interfaces. Network Admission Control is enabled on the virtual template interface and applies to all PC clients that use this virtual template interface.

```
Router# show running-config
Building configuration...
Current configuration : 5091 bytes
!
version 15.0
!
hostname Router
!
aaa new-model
!
!
aaa authentication login userlist local

aaa accounting update newinfo
aaa accounting network acclist start-stop broadcast group radius
aaa session-id common
!
!
! Note 1: EAPoUDP packets will use the IP address of the loopback interface when sending
```

```
the EAPoUDP hello to the Easy VPN client. Using the IP address ensures that the returning
EAPoUDP packets come back encrypted and are associated with the correct virtual access
interface. The ip admission (ip admission source-interface Loopback10) command is optional.
 Instead of using this command, you can specify the IP address of the virtual template to
be an address in the inside network space as shown in the configuration of the virtual
template below in Note 2.
ip admission source-interface Loopback10
ip admission name test eapoudp inactivity-time 60

```

Example Split DNS

In the following example, the split tunnel list named “101” contains the 10.168.0.0/16 network. It is necessary to include this network information so that the DNS requests to the internal DNS server of 10.168.1.1 are encrypted.

```
crypto isakmp client configuration group home
  key abcd
  acl 101
  dns 10.168.1.1. 10.168.1.2
```

show Output

The following exampleshows that www.ciscoexample1.com and www.ciscoexample2.com have been added to the policy group:

```
Router# show running-config
 | security group
 crypto isakmp client configuration group 831server
 key abcd
 dns 10.104.128.248
 split-dns www.ciscoexample1.com
```

```
 split-dns www.ciscoexample2.com
 group home2 key abcd
```

The following sample output from the **show ip dns view** command displays currently configured DNS views:

```
Router# show ip dns view
DNS View default parameters:
Logging is off
DNS Resolver settings:
  Domain lookup is enabled
  Default domain name: cisco.com
  Domain search list:
  Lookup timeout: 3 seconds
  Lookup retries: 2
  Domain name-servers:
    172.16.168.183
DNS Server settings:
  Forwarding of queries is enabled
  Forwarder addresses:
DNS View ezvpn-internal-view parameters:
Logging is off
DNS Resolver settings:
  Domain lookup is enabled
  Default domain name:
  Domain search list:
  Lookup timeout: 3 seconds
  Lookup retries: 2
  Domain name-servers:
    10.104.128.248
DNS Server settings:
  Forwarding of queries is enabled
  Forwarder addresses:
```

The following sample output from the **show ip dns view-list** command displays currently configured DNS view lists.

```
Router# show ip dns view-list
View-list ezvpn-internal-viewlist:
  View ezvpn-internal-view:
    Evaluation order: 10
    Restrict to ip dns name-list: 1
  View default:
    Evaluation order: 20
```

The following sample output from the **show ip dns name-list** command displays DNS name lists.

```
Router# show ip dns name-list
ip dns name-list 1
    permit www.ciscoexample1.com
    permit www.ciscoexample2.com
```

Example DHCP Client Proxy

The following examples display DHCP client proxy output information using **show** and **debug** commands.

show Output

Note To use the **show ip dhcp**command, the DHCP server must be a Cisco IOS XE server.

The following sample output from the **show ip dhcp pool**command provides information about the DHCP parameters:

```
Router# show ip dhcp pool
```

```
Pool dynpool :
 Utilization mark (high/low)    : 100 / 0
 Subnet size (first/next)       : 0 / 0
 Total addresses                : 254
 Leased addresses               : 1
 Pending event                  : none
 1 subnet is currently in the pool:
 Current index    IP address range          Leased addresses
                  10.3.3.1 - 10.3.3.254     1
 No relay targets associated with class aclass
```

The following sample output from the **show ip dhcp** command provides information about the DHCP bindings:

```
Router# show ip dhcp binding
Bindings from all pools not associated with VRF:
IP address          Client-ID/                        Lease expiration      Type
                    Hardware address/User name
                    10.3.3.5  0065.7a76.706e.2d63.   Apr 04 2006 06:01 AM  Automatic
               6c69.656e.74
```

debug Output

The following example shows how the **debug crypto isakmp** and **debug ip dhcp server events** commands can be used to troubleshoot your DHCP client proxy support configuration:

```

The Cisco Support and Documentation website provides online resources to download documentation, software, and tools. Use these resources to install and configure the software and to troubleshoot and resolve technical issues with Cisco products and technologies. Access to most tools on the Cisco Support and Documentation website requires a Cisco.com user ID and password.	http://www.cisco.com/cisco/web/support/index.html

Feature Information for Easy VPN Server

Table 4: Feature Information for Easy VPN Server

Feature Name	Releases	Feature Information
Central Policy Push Firewall Policy Push feature	Cisco IOS XE Release 2.1	The Central Policy Push Firewall Policy Push feature was integrated for use on the Easy VPN Server.
Easy VPN Server	Cisco IOS XE Release 2.1	The Easy VPN Server feature introduces server support for the Cisco VPN Client Release 3.x and later software clients and Cisco VPN hardware clients (such as the Cisco ASR 1000 Series Routers). This feature allows a remote end user to communicate using IPsec with any Cisco IOS XE VPN gateway. Centrally managed IPsec policies are “pushed” to the client device by the server, minimizing configuration by the end user.
	Cisco IOS XE Release 2.1	RADIUS support for user profiles, user-based policy control, session monitoring for VPN group access, backup-gateway list, and PFS were added.
	Cisco IOS XE Release 2.1	The **netmask** command was integrated for use on the Easy VPN server.
	Cisco IOS XE Release 2.1	The following feature was integrated for use on the Easy VPN Server:

Feature Name	Releases	Feature Information
	Cisco IOS XE Release 2.1	The following features were integrated for use on the Easy VPN Server: • Configuration Management Enhancements (Pushing a Configuration URL Through a Mode-Configuration Exchange) • Per User AAA Download with PKI • Syslog Message Enhancements • Network Admission Control for Easy VPN • Password Aging • Virtual IPsec Interface Support
	Cisco IOS XE Release 2.1	The following features were integrated for use on the Easy VPN Server: • DHCP Client Proxy • Virtual Tunnel Interface Per-User Attribute Support for Easy VPN Servers. • Split DNS • Per-User Attribute Support for Easy VPN Servers • VRF Assignment by a AAA Server The following commands were introduced: **crypto aaa attribute list**, **debug ip dns**, **dhcp-server (isakmp)**, **dhcp-timeout**, **show ip dns name-list, show ip dns view,**and **show ip dns view-list**
		The following command was modified: **crypto isakmp client configuration group**

Feature Name	Releases	Feature Information
	Cisco IOS XE Release 2.1	The DHCP Client Proxy feature was updated to include manageability enhancements for remote access VPNs. The following commands were modified: **clear crypto session, crypto isakmp client configuration group, debug crypto condition, show crypto debug-condition, show crypto isakmp peers, show crypto isakmp profile, show crypto isakmp sa, show crypto session**

Glossary

AAA--authentication, authorization, and accounting. Framework of security services that provides the method for identifying users (authentication), for remote access control (authorization), and for collecting and sending security server information used for billing, auditing, and reporting (accounting).

aggressive mode (AM)--Mode during Internet Key Exchange negotiation. Compared to main mode (MM), AM eliminates several steps, which makes it faster but less secure than MM. Cisco IOS XE software will respond in aggressive mode to an IKE peer that initiates aggressive mode.

AV pair--attribute-value pair. Additional authentication and authorization information in the following format: Cisco:AVPair="protocol:attribute=value".

IKE--Internet Key Exchange. Hybrid protocol that implements Oakley key exchange and Skeme key exchange inside the ISAKMP framework. Although IKE can be used with other protocols, its initial implementation is with IPsec. IKE provides authentication of the IPsec peers, negotiates IPsec keys, and negotiates IPsec security associations.

IPsec--IP Security Protocol. Framework of open standards that provides data confidentiality, data integrity, and data authentication between participating peers. IPsec provides these security services at the IP layer. IPsec uses IKE to handle negotiation of protocols and algorithms based on local policy and to generate the encryption and authentication keys to be used by IPsec. IPsec can be used to protect one or more data flows between a pair of hosts, between a pair of security gateways, or between a security gateway and a host.

ISAKMP--Internet Security Association Key Management Protocol. Protocol framework that defines payload formats, the mechanics of implementing a key exchange protocol, and the negotiation of a security association.

MM--main mode. Mode that is slower than aggressive mode but more secure and more flexible than aggressive mode because it can offer an IKE peer more security proposals. The default action for IKE authentication (Rivest, Shamir, and Adelman signature (rsa-sig), RSA encryption (rsa-encr), or preshared) is to initiate main mode.

policy push --Allows administrators to push policies that enforce security to the Cisco Easy VPN (software) Client and related firewall software.

reverse route injection (RRI)--Simplified network design for VPNs on which there is a requirement for redundancy or load balancing. RRI works with both dynamic and static crypto maps.

In the dynamic case, as remote peers establish IPsec security associations with an RRI enabled router, a static route is created for each subnet or host protected by that remote peer. For static crypto maps, a static route is created for each destination of an extended access-list rule.

SA--security association. Description of how two or more entities will utilize security services to communicate securely. For example, an IPsec SA defines the encryption algorithm (if used), the authentication algorithm, and the shared session key to be used during the IPsec connection.

Both IPsec and IKE require and use SAs to identify the parameters of their connections. IKE can negotiate and establish its own SA. The IPsec SA is established either by IKE or by manual user configuration.

VPN --Virtual Private Network. Framework that consists of multiple peers transmitting private data securely to one another over an otherwise public infrastructure. In this framework, inbound and outbound network traffic is protected using protocols that tunnel and encrypt all data. This framework permits networks to extend beyond their local topology, while remote users are provided with the appearance and functionality of a direct network connection.
