

CHAPTER 3

Common APIs

This chapter describes the Cisco Prime Fulfillment APIs for operations that are common to all Prime Fulfillment services. These operations include; creating inventory in the Prime Fulfillment respository, session login, auditing, deployment and collection tasks, database event notifications, and general purpose XML requests.

This chapter contains the following sections:

- Inventory, page 3-1
- Devices, page 3-2
- Session, page 3-7
- Tasks, page 3-8
- General Purpose APIs, page 3-13
- Date/Time Format in API Requests, page 3-14

Inventory

You can create, modify, delete, or view any inventory object in the Prime Fulfillment repository. Use the following API operations to:

- Create an object—createInstance
- Modify an object—modifyInstance (Resource pools do not support the *Modify* operation.)
- Delete an object—deleteInstance
- View an object—enumerateInstances

Note

When you send a view request (**enumerateInstances**) for an object, the response returns the *create* and *modify* date information.

Inventory APIs are divided into the following categories:

- Devices—Physical devices in the network
- Resource Pools—IP address pools, VLAN pools, route target, route distinguisher
- Topology—CE routing communities (CERCs), virtual private networks (VPNs), and named physical circuits (NPCs)
- Groupings—Access domains, device groups, collection zones.

XML examples for all APIs are available at: Cisco Prime Fulfillment API Programmer Reference 6.2

Devices

The inventory APIs for devices allow you to define a physical device in the Prime Fulfillment repository. Every network element that Prime Fulfillment manages must be defined as a device in the system. An element is any device from which Prime Fulfillment can collect configuration information.

Table 3-1 shows the devices available as inventory objects.

Table 3-1 Inventory Objects – Devices

className	Required Parameters	XML Examples	
AAAServer	Number of Retries	CreateAAServer.xml	
	• Address	• CreateAAServerNTDOMAIN.xml	
	• AuthServerType=	• CreateAAServerRADIUS.xml	
	- RADIUS	• CreateAAServerSDI.xml	
	- NTDOMAIN	• CreateAAServerTACACS.xml	
	- SDI		
	- TACACS+		
	• Role=		
	- AUTHENTICATION		
	- ACCOUNTING		
	- BOTH		
CatOs	One or more of the following:	CreateCat.xml	
(Cat OS operating system)	ManagementIPAddress		
	• HostName		
	• DomainName		
CatIOS	One or more of the following:	CreateCatIOS.xml	
(Cisco IOS operating	 ManagementIPAddress 		
system)	• HostName		
	• DomainName		
CiscoRouter	One or more of the following:	CreateCiscoRouter.xml	
	 ManagementIPAddress 		
	• HostName		
	• DomainName		
Сре	• Site	CreateCpe.xml	
	• Device		
	• Name		

Table 3-1 Inventory Objects – Devices (continued)

className	Required Parameters	XML Examples
PE	Device	CreatePE.xml
	• Region	
PIX	One or more of the following:	CreatePIX.xml
	ManagementIPAddress	
	HostName	
	DomainName	
TerminalServer	One or more of the following:	CreateTerminalServer.xml
	ManagementIPAddress	
	HostName	
	DomainName	
VPNServicesModule	• Parent	CreateVPNSM.xml
	• SlotNumber	
IE2100	One or more of the following:	CreateIE2100.xml
	• IPAddress	
	HostName	
	DomainName	
NonCiscoDevice	One or more of the following:	CreateNonCiscoDevice.xml
	ManagementIPAddress	
	HostName	
	• DomainName	

Resource Pools

Resource pools allow you to manage various pool types and to associate a pool with any service model object in the Prime Fulfillment repository. Pools help to automate service deployment.

Prime Fulfillment supports the following resource pools:

- IP address pools—Defined and assigned to regions.
- Multicast pools—Used for multicast MPLS VPNs.
- Route Distinguisher (RD) pool—The IP subnets advertised by the CPE devices to the PE devices are augmented with a 64-bit prefix, which is the route distinguisher.
- Route Target (RT) pool—The MPLS mechanism that informs PEs which routes to insert into the appropriate VPN routing and forwarding table (VRF). Every VPN route is tagged with one or more route targets when it is exported from a VRF and offered to other VRFs.
- Site-of-origin pool—The pool of values for the site-of-origin attribute. The site-of-origin attribute prevents routing loops when a site has multiple connections to the MPLS VPN backbone.
- VLAN ID pool—VLAN ID pools are attached to an access domain. To have Prime Fulfillment automatically assign VLANs to end-to-end wire links (for L2VPN provisioning), you can specify the **AutoPickVlanId** option.

• VC ID pool—A 32-bit identifier that is shared between the two PEs. The VC ID is a globally unique value.

The *Modify* operation is not supported with resource pools.

Table 3-2 shows the resource pools available as inventory objects.

Table 3-2 Inventory Objects—Resource Pools

className	Required Parameters	XML Examples
IPAddressPool	• IPAddressPool	CreateIPAddressPool.xml
	• SubnetMask	
	• AssocClassType=	
	- Region	
	- VPN	
MulticastAddrPool	MulticastAddress	CreateMulticastAddrPool.xml
RouteDistinguisher	• Start	CreateRouteDistinguisher.xml
	• Size	
	• AssocClassType=Provider	
	AssocClassId	
RouteTarget	• Start	CreateRouteTarget.xml
	• Size	
	• AssocClassType=Provider	
	• AssocClassId	
SiteOfOrigin	• Start	CreateSiteOfOrigin.xml
	• Size	
	• AssocClassType=Provider	
	AssocClassId	
VcIdPool	• Start	CreateVcIdPool.xml
	• Size	
VlanIdPool	• Start	CreateVlanIdPool.xml
	• Size	
	• AssocClassType=Provider	
	AssocClassId	

Topology

In complex topologies, it is sometimes necessary to further define the connectivity between CE and PE devices into groups, such as CE routing communities (CERCs), virtual private networks (VPNs), and named physical circuits (NPCs).

Use the Topology tool in the GUI to check CERC memberships and the resulting VPNs.

Table 3-3 shows the topology elements available as Prime Fulfillment inventory objects.

Table 3-3 Inventory Objects — Topology

className Required Parameters		XML Examples	
CERC	• Provider	CreateCERC.xml	
		Note The CreateCERC.xml appends the route target values, if a CERC already exists with the same name. To ensure uniqueness of CERC names, use ViewCERC.xml to verify that a CERC with the same name does not exist.	
		CreateVPN_DefaultCERC.xml	
VPN	• Name	CreateVPN.xml	
	Organization		
NamedPhysicalCircuit	PhysicalLink	CreateNamedPhysicalCircuit.xml	
	- SrcDevice		
	- DestDevice		
	- SrcIfName		
	 DestIfName 		
NamedPhysicalCircutRing	• LocatorId	CreateNamedPhysicalCircuitRing.xml	
		CreateNamed PhysicalCircuitRingExisting.xml	

Use ViewVRF.xml to view the VRF routing tables.

Groupings

Prime Fulfillment is designed to provision a large number of devices through its distributed architecture. Groupings are provided to simplify management tasks of devices for administrative or geographical reasons or for scalability.

- Access domain—The access domain object is associated with the provider access domain (PAD).
 Each PE-POP is assigned to an access domain.
- Device groups—Devices that are organized for collection and management purposes.
- Organization (Customer)— A requestor of VPN services from an Internet service provider (ISP).
- Site—A set of IP systems with mutual IP connectivity between them without the use of a VPN.
- Provider— An enterprise that provides internet services for customers.

- Region—A group of PE devices within a single border gateway protocol autonomous system (BGP AS).
- Collection zones—Collection servers are used to off load the work of the master server when the number of devices in the network increases. Network devices are associated with these collection servers using collection zones.

Table 3-4 shows the groupings as inventory objects.

Table 3-4 Inventory Objects – Groupings

className	Required Parameters	XML Examples	
AccessDomain	• Provider	CreateAccessDomain.xml	
	• ReservedVlanPool		
	- Start		
	- Size		
	- Managed		
DeviceGroup	• Name	CreateDeviceGroup.xml	
	• Devices		
Organization	• Name	CreateOrganization.xml	
	• ContactInfo		
	• SiteOfOrigin=enabled (use for multiple connections to the MPLS backbone)		
Site	• Name	CreateSite.xml	
	• Customer		
Provider	• Name	CreateProvider.xml	
	• AsNumber		
Region	• Name	CreateRegion.xml	
	• Provider		

Table 3-4 Inventory Objects—Groupings (continued)

className	Required Parameters	XML Examples
CollectionZone	• Name	CreateCollectionZone.xml
	• VPNSCHost	
NetworkObject	• Name	CreateNetworkObject.xml
	• Type=	
	- STRING	
	- NETWORK	
	- HOST	
	• Values	
	ContainerId	
	• FQCN (container type)	
	- Global	
	- Customer	
	- Site	
	- Cpe	

Session

Sessions are specialized API operations. Prime Fulfillment supports the following session operations:

- createSession—Login
- deleteSession—Logout

The first XML request sent by the client is a login request. The login request generates a session ID, which is used each time you access the system. The session ID is valid for a configurable period of time. During this time, you can make an indefinite amount of calls to the server, using the session ID for authentication. Each call to the server resets the time-to-live (ttl) time back to the original period of time. The default session time is 20 minutes.

The API license is global to the installation and is checked at the start of each session. If the API license does not exist, the session is not granted. During the session, if a user attempts to provision a service that is not licensed, an error is returned.

Table 3-5 User Login

className	Required Parameters	XML Examples	
Session	LoginName LoginPassword	Login.xml (\$PRIMEF_HOME/resources/n bi/xml/examples/Session/Login. xml)	

The following example shows the XML response to a login request. The **SessionId** is indicated in **bold**.

```
<?xml version="1.0" encoding="UTF-8"?>
<soapenv:Envelope xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/"</pre>
xmlns:soapenc="http://schemas.xmlsoap.org/soap/encoding/"
xmlns:xsd="http://www.w3.org/2001/XMLSchema"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xmlns:ns0="http://www.cisco.com/cim-cx/2.0" xmlns:ns1="urn:CIM">
  <soapenv:Header>
    <ns0:message id="87855" timestamp="2003-10-10T19:43:16.380Z"</pre>
sessiontoken="93E0A400406693604270C6B6A07731A4" />
  </soapenv:Header>
  <soapenv:Body>
    <ns1:createSessionResponse>
      <returns xsi:type="ns1:CIMPropertyList" soapenc:arrayType="ns1:CIMProperty[]">
        <item xsi:type="ns1:CIMProperty">
          <name xsi:type="xsd:string">SessionId</name>
          <value xsi:type="xsd:string">93E0A400406693604270C6B6A07731A4
        </item>
      </returns>
    </ns1:createSessionResponse>
  </soapenv:Bodv>
</soapenv:Envelope>
```

Tasks

Task APIs are used for auditing, deployment, and collection activities. Tasks follow the same service order/service request structure as other Prime Fulfillment services, where the service request is executed as part of a service order.

- For device-related tasks (Collection and SLA Collection), you must enter the device or device group.
- For service request-related tasks (Certificate Enrollment Audit, Configuration Audit, Service Deployment, and MPLS Functional Audits), you must enter the service request Locator ID.

Tasks are scheduled using the **DesiredDueDate** field in the service request or service order. A task with a **DesiredDueDate** that is in the past, or within 5 minutes of the current time, is executed immediately. Tasks with due dates in the future are scheduled.

Prime Fulfillment uses the following guidelines for DesiredDueDate

- If there is no due date in the service request, the task uses the service order due date.
- If there is a date in the service request, the service request due date overrides the service order due date for that particular task.
- If there is no due date specified in the service order or the service request, the service is not deployed.

Tasks can be created, deleted, and viewed using the API. However, you can only modify the **DesiredDueDate** field in a Task.

All Tasks are deployed using a service order that specifies a service request with **Type=Task**.

Viewing a Task

To obtain information about task service requests, run a view of the task (ViewTask.xml), using the **TaskLocatorId**.

Use this process to retrieve the **TaskLocatorId**:

Step 1 Record the service order **LocatorId** that is returned in the XML response.

When you submit a service order XML request for any task, Prime Fulfillment returns a **LocatorId** in the XML response. This Locator ID is associated with the service order or request **Name**.

- **Step 2** Run a view of the service order using ViewServiceOrder.xml, and the **LocatorId** from Step 1.
- **Step 3** Record the **TaskLocatorId** that is returned in the XML response.
- Step 4 Run a view of the Task using ViewTask.xml. Specify className=PersistentTask and use the TaskLocatorId from Step 3.

The API supports the following tasks:

- Certificate Enrollment Audit
- Collection
- Service Decommission
- Configuration Audit
- Service Deployment
- MPLS Functional Audit
- MPLS Functional Audit
- SLA Collection

Certificate Enrollment Audit

A certificate enrollment audit is performed on devices to verify the certificates issued to them by a certificate authority (CA).

A certificate enrollment audit does the following:

- Verifies the certificates issued by the CA to a device or device groups.
- Confirms the presence of the root certificate and device certificate for the certificate chain of the specified trust point.
- Returns a summary that indicates the certificate enrollment status and expiration status on the audited devices.

Table 3-6 Certificate Enrollment Task

className	Required Parameters	XML Examples
ServiceRequestDetails	• SubType= CERT_ENROLLMENTAUDIT	CreateTaskServiceOrderCertAudit.xml
	• Device (or DeviceGroup)	
	• TrustedPort	
	IncludeRootCert	

Collection

A collection operation collects configuration information from network devices and serves the following purposes:

- It loads the current configuration information for the devices that populate many of the configuration cells.
- It verifies reachability and passwords for the devices from which it collects configuration files.

Table 3-7 Collection Task

className	Required Parameters	XML Examples
ServiceRequestDetails	 SubType=COLLECTION Device (or DeviceGroup) Note You must select at least one device or device group. 	Create TaskServiceOrderCollection.xml
	RetreiveVersion=trueRetreiveDeviceInterface=true	

Performing a device collection on your network is more accurate and efficient than manually entering individual device information.

Service Decommission

Decommissioning a service request removes a service from all devices associated with the service request.

To decommission a service request that includes templates, you must first negate the template information on the device. See the "Removing Template Configurations" section on page 4-22 for more information.

During the decommission process, Prime Fulfillment creates the necessary removal configuration to delete the service from each device and automatically audits the configuration to ensure that the service is completely removed. Once audited, the service request changes to a *Closed* state.

Table 3-8 Decommission Task

className	Requi	red Parameters	XML Examples
ServiceRequestDetails	SubType=DECOMMISSIONLocatorId		CreateTask ServiceOrderDecommission.xml
	Note	The LocatorId of the service request to decommission.	

If you do not want the configuration audit to occur, change the value for the **Audit** parameter. The **Audit** parameter supports these values:

- Audit—This is the default. A successfully deployed decommission service request is automatically audited unless this flag is changed.
- NoAudit—Do not perform a configuration audit when the decommission service request is deployed.
- **ForceAudit**—Perform a configuration audit even if the deployment of the decommission service request is not successful.

Configuration Audit

A configuration audit is executed as part of a service request deployment. During a configuration audit, Prime Fulfillment verifies that all Cisco IOS commands are present and that they have the correct syntax. A configuration audit also verifies that there were no errors during service deployment.

Table 3-9 Configuration Audit Task

className	Required Parameters • SubType=CONFIG_AUDIT • LocatorId		XML Examples CreateTask ServiceOrderConfigAudit.xml
ServiceRequestDetails			
	Note	The LocatorId of the service request used to deploy the configlets.	

Service Deployment

A service deployment downloads the Prime Fulfillment-generated configlet, created for a service order, to the device configuration file.

You can specify the following options for service deployment:

ForceDeploy—Takes a configlet for a service request that is already in the *Deployed* state and
downloads it to the network device. Use ForceDeploy when a device configuration is lost or when
you replace or change equipment.

Table 3-10 Deployment Task

className	Required Parameters	XML Examples
ServiceRequestDetails	SubType=DEPLOYMENTProvisionLocatorId	Create TaskServiceOrderDeployment.xml
	Note The LocatorId of the service request used to deploy the configlets.	

MPLS Functional Audit

An MPLS functional audit verifies that the links in a service request or VPN are working correctly. The audit checks the routes to remote CPE devices in the VRF route tables on the PE devices.

Table 3-11 MPLS Functional Audit Task

className	Required Parameters	XML Example
ServiceRequestDetails	SubType= MPLS_FUNCTIONALAUDITLocatorId	CreateTask ServiceOrderMPLSFuncAudit.xml
	Note The LocatorId of the service request used to deploy the configlets.	
	• VPN	
	• MPLSMirrorPing	

SLA Collection

Prime Fulfillment uses the Cisco SA Agent MIB to monitor service level agreement (SLA) metrics. SLAs monitor the network performance by measuring response time, jitter, connect time, throughput, and packet loss. The SA Agent allows you to configure probes for performance measurements and uses a router monitor (RTRMON) MIB for access through SNMP. The MIB also supports SNMP notifications.

An SLA collection task collects all SLA data from SLA-enabled devices. Prime Fulfillment collects the relevant performance data and stores it persistently in the database. To view the data, you must execute a task to aggregate the data and run the SLA Report.

To collect SLA data from a device, it must have SA Agent and SNMP enabled, and SNMP parameters must already be set.

SLA collection includes performance data on Jitter (voice jitter) and the following protocols:

- Dynamic Host Configuration Protocol (DHCP)
- Domain Name System (DNS)

- File Transfer Protocol (FTP)
- Internet Control Message Protocol Echo (ICMP Echo)
- Transmission Control Protocol Connect (TCP Connect)
- User Datagram Protocol Echo (UDP Echo)
- Hypertext Transfer Protocol (HTTP)

Table 3-12 SLA Collection Task

className	Required Parameters	XML Example
ServiceRequestDetails	SubType=SLA_COLLECTION	CreateTask
	Device (or DeviceGroup)	ServiceOrderSLACollection.xml
	Note You must select at least one device or device group.	

General Purpose APIs

The following general purpose API XML examples are provided with Prime Fulfillment:

- CreateConfigServiceOrderDownload—Creates a service order to download an inline configuration to a device.
- Create Inventory—Can be used to populate a database with sample inventory and is commonly used for testing or demonstration. The service order adds one type of each inventory element to the repository and enters the host name, domain name, management IP address, and the login and password for each device.
- CreateNPCInventory—Creates several physical links in a network, including the source and destination devices and relevant interfaces.
- CreateExecCommandServiceOrder—Creates a service order to execute a command on a device or device group. You can execute any command allowed by the device console.
- CreateServiceOrderResponse—Returns the following values for a service order:
 - ServiceName (for the service order)
 - ServiceRequestName
 - LocatorId (for the service request)
- CreateSLAInventory—Can be used to populate a database with sample inventory and is commonly
 used for testing. The service order adds the host name, domain name, and SLA data to devices in
 device groups.
- CreateResourceLock_Device, CreateResourceLock_Device_Batch,
 CreateResourceUnlock_Device, ViewResourceLock_Device—See the "Device Locking" section on page 5-22.
- DeleteServiceOrder—Deletes a service order.
- DeleteServiceOrder_purge—Deletes a service request of a specified subtype (**Type = L2VPN**, **Mpls**), with a given Locator ID and **Force=true**.
- ViewConfiglet—View the Prime Fulfillment generated configlet for a specified service request. Returns the ViewConfigletResponse.
- ViewConfigletResponse—Returns the following values:

- ConfigletClob
- LocatorId
- Device
- ConfigletText—Contains the configlet.
- ViewConfiguration—View the configuration of a specified device. Returns the ViewConfigurationResponse.
- ViewConfigurationResponse—Returns the following values:
 - LocatorId
 - Device
 - **DeviceConfig**—Contains the device configuration.
- ViewCpe_propList_level—Provides a sample of a properties list and level usage. Returns the ViewCpe_propList_level_Response.
- ViewCpe_propList_level_Response—Returns the following values:
 - LocatorId
 - Site
 - Device
- ViewMPLSServiceRequest_propList_level—Provides a sample of a properties list and level usage. Returns the ViewMPLSServiceRequest_propList_level_Response.
- ViewMPLSServiceRequest_propList_level_Response—Returns the following values:
 - **OpType** (operation type; ADD or DELETE)
 - LocatorId
 - MplsVpnLink (and link attributes)
 - CERCMembership
- ViewServiceOrder—View the status of any service order, with a given service order name or Locator ID. If the service order employs a task, the task locator ID is returned. The **TaskLocatorId** is required to view a task service order (**ViewTask**).

Date/Time Format in API Requests

For all API requests where the date and time needs to be specified, the zulu format is used. Zulu is the military designation for "Greenwich Mean Time."

Use the following format: 2011-03-17T15:05:38.885Z

Local time cannot be specified. Therefore, outside the UK any time difference has to be taken into consideration.

In the current format, the desired due date has to be followed by "Z", which means that the task will be executed one hour after the specified date.

So for example, when the clock is moved back one hour in the UK in October, the Zulu time will be equal to the UK time.
