General Troubleshooting

This chapter provides procedures for troubleshooting the most common problems encountered when operating the NCS 1004 chassis. To troubleshoot specific alarms, see the *Alarm Troubleshooting* chapter. If you cannot find what you are looking for, contact Cisco Technical Support (1 800 553-2447).

Validate and Troubleshoot Installation of Software Packages

Procedure

Step 1   **show version**

Displays the software version and details such as system uptime.

Example:

```
RP/0/RP0/CPU0:ios# show version
Mon Nov 22 22:50:09.240 IST
Cisco IOS XR Software, Version 7.5.1
Copyright (c) 2013-2021 by Cisco Systems, Inc.
```

```
Build Information:
Built By     : xxxxxxxxx
Built On     : Sun Nov 21 23:25:35 PST 2021
Built Host   : iox-lnx-054
Workspace    : /auto/srcarchive15/prod/7.5.1/ncs1004/ws
Version      : 7.5.1
Location     : /opt/cisco/XR/packages/
Label        : 7.5.1

cisco NCS-1004 () processor
System uptime is 2 minutes
```

Step 2   **show install repository**

Displays a list of all the installed software packages on NCS 1004.

Example:

```
RP/0/RP0/CPU0:ios# show install repository
Wed Oct 13 20:14:15.984 IST
6 package(s) in XR repository:
    ncs1004-mini-x-7.5.1
    ncs1004-mpls-2.0.0.0-r751
    ncs1004-k9sec-2.1.0.0-r751.x86_64
    ncs1004-xr-7.5.1
    ncs1004-mpls-te-rsvp-2.1.0.0-r751
```

Step 3   **show install active**

Displays a list of all the installed and active software packages on NCS 1004.

The following sample output displays active software packages.

Example:

```
RP/0/RP0/CPU0:ios# show install active      Mon Mar 11 07:31:12.302 UTC
Wed Oct 13 20:14:15.984 IST
Node 0/RP0/CPU0 [RP]
  Boot Partition: xr_lv19
  Active Packages: 5
    ncs1004-mini-x-7.5.1
    ncs1004-mpls-2.0.0.0-r751
    ncs1004-k9sec-2.1.0.0-r751.x86_64
    ncs1004-xr-7.5.1
    ncs1004-mpls-te-rsvp-2.1.0.0-r751
```

Step 4   **show install committed**

Displays a list of all committed software packages on NCS 1004.

The committed software packages are the software packages that are booted on an NCS 1004 reload. Committed packages are the packages that are persistent across reloads. If you install and activate a package, it remains active until the next reload. If you commit a package set, all packages in that set remain active across reloads until the package set is replaced with another committed package set.

The following sample output displays the committed software packages.

Example:

```
RP/0/RP0/CPU0:ios# show install committed
Wed Oct 13 20:14:15.984 IST
Node 0/RP0/CPU0 [RP]
  Boot Partition: xr_lv19
  Committed Packages: 5
    ncs1004-mini-x-7.5.1
```

```
        ncs1004-mpls-2.0.0.0-r751
        ncs1004-k9sec-2.1.0.0-r751.x86_64
        ncs1004-xr-7.5.1
        ncs1004-mpls-te-rsvp-2.1.0.0-r751
```

Step 5   **show install log**

Displays information on the history of the installation operations. This command provides information about both successful and failed installation operations on NCS 1004. You can also verify a Service Maintenance Update (SMU) installation using this command.

Example:

```
RP/0/RP0/CPU0:ios# show install log 49 detail
Wed Dec  9 01:19:18.680 UTC
Dec 09 01:19:07 Install operation 49 started by root:
 install add source tftp://10.105.236.167 ncs1004-k9sec.rpm
Dec 09 01:19:08 Action 1: install add action started
Dec 09 01:19:08 ERROR! Either file is not proper or error in getting rpm metadata from rpm
 file

Dec 09 01:19:08 ERROR!! failed to complete install add precheck

Dec 09 01:19:09 Install operation 49 aborted
Dec 09 01:19:10 Ending operation 49
```

In the above example, either a wrong rpm package is used or the rpm package is corrupted.

For failure on install add source, check that the package is correctly named and is available at the location.

What to do next

If the expected active software packages are not displayed, install the packages (if required) and activate the packages using the **install activate** *package_name* command.

Troubleshoot the Management Interface

Before you begin

Management interface should be configured.

Procedure

Step 1   **show interfaces mgmtEth** *instance*

Displays the management interface configuration.

Example:

```
RP/0/RP0/CPU0:ios# show interfaces MgmtEth 0/RP0/CPU0/0
Fri Nov 13 19:42:29.716 UTC
MgmtEth0/RP0/CPU0/0 is administratively down, line protocol is administratively down
  Interface state transitions: 0
  Hardware is Management Ethernet, address is badb.adba.d098 (bia badb.adba.d098)
```

```
Internet address is 10.58.227.183/24
MTU 1514 bytes, BW 100000 Kbit (Max: 100000 Kbit)
   reliability 255/255, txload 0/255, rxload 0/255
Encapsulation ARPA,
Full-duplex, 100Mb/s, CX, link type is autonegotiation
loopback not set,
ARP type ARPA, ARP timeout 04:00:00
Last input never, output never
Last clearing of "show interface" counters never
5 minute input rate 0 bits/sec, 0 packets/sec
5 minute output rate 0 bits/sec, 0 packets/sec
   0 packets input, 0 bytes, 0 total input drops
   0 drops for unrecognized upper-level protocol
   Received 0 broadcast packets, 0 multicast packets
          0 runts, 0 giants, 0 throttles, 0 parity
   0 input errors, 0 CRC, 0 frame, 0 overrun, 0 ignored, 0 abort
   0 packets output, 0 bytes, 0 total output drops
   Output 0 broadcast packets, 0 multicast packets
   0 output errors, 0 underruns, 0 applique, 0 resets
   0 output buffer failures, 0 output buffers swapped out
   0 carrier transitions
```

a) In the above result, the management interface is administratively down. Use the **no shut** command to enable the management interface.

The following example shows sample output from the **show running-config interface mgmtEth** command when the management interface is in the no shut state.

```
RP/0/RP0/CPU0:ios#show running-config interface mgmtEth 0/RP0/CPU0/0
Fri Nov 13 19:42:54.368 UTC
interface MgmtEth0/RP0/CPU0/0
 ipv4 address dhcp
!
```

You can also use the **show interfaces summary** and **show interfaces brief** commands in the Cisco IOS XR EXEC mode to verify the management interface status.

- The following example shows sample output from the **show interfaces summary** command.

```
RP/0/RP0/CPU0:ios# show interfaces summary
Wed Mar  4 06:14:52.995 UTC
Interface Type       Total    UP      Down     Admin Down
--------------       -----    --      ----     ----------
ALL TYPES            4        2       0        2
--------------
IFT_ETHERNET         3        1       0        2
IFT_NULL             1        1       0        0
```

- The following example shows sample output from the **show interfaces brief** command.

```
RP/0/RP0/CPU0:ios# show interfaces brief
Wed Mar  4 06:15:51.689 UTC

              Intf       Intf      LineP   Encap  MTU       BW
              Name       State     State   Type   (byte)    (Kbps)
-----------------------------------------------------------------------------
               Nu0        up         up    Null   1500          0
     Mg0/RP0/CPU0/0       up         up    ARPA   1514    1000000
     Mg0/RP0/CPU0/1  admin-down admin-down ARPA   1514    1000000
     Mg0/RP0/CPU0/2  admin-down admin-down ARPA   1514    1000000
```

Step 2   When the line protocol is down, you must verify the Layer 3 connectivity. You can perform the following steps.

a) Check the Ethernet cable connection and physical connectivity of NCS 1004 to get the line protocol up.

b) Ensure ARP connectivity.

c) Use the **ping** command to check reachability and network connectivity on the IP network.

d) Verify the static IP and default gateway configuration.

Troubleshoot Environmental Parameters

Some of the common environmental problems are listed below.

- Fan failure

- Fan not detected

- Fan speed problem

- Power module fails

- Power module not detected

- Temperature of the device exceeds a threshold value

- Voltage of the device exceeds a threshold value

Procedure

Step 1   **admin**

Enters system admin EXEC mode.

Example:

```
RP/0/RP0/CPU0:ios# admin
```

Step 2   **show environment** [**all** | **fan** | **power** | **voltages** | **current** | **temperatures**] [**location** | *location*]

Displays the environmental parameters of NCS 1004.

Example:

The following example shows sample output from the **show environment** command with the **fan** keyword.

```
sysadmin-vm:0_RP0# show environment fanWed Mar  4  05:36:33.678 UTC+00:00
===============================================
                    Fan speed (rpm)
Location     FRU Type         FAN_0   FAN_1
-----------------------------------------------
0/FT0        NCS1K4-FAN        7020    6930
0/FT1        NCS1K4-FAN        6780    6690
0/FT2        NCS1K4-FAN        6810    6720
0/PM0        NCS1K4-AC-PSU    25376   24352
0/PM1        NCS1K4-AC-PSU    11200   11232
```

The following example shows sample output from the **show environment** command with the **temperatures** keyword.

```
sysadmin-vm:0_RP0# show environment temperatures location 0/RP0
Wed Mar  4  05:44:51.221 UTC+00:00
================================================================================
Location  TEMPERATURE                  Value   Crit Major Minor Minor Major  Crit
          Sensor                       (deg C) (Lo) (Lo)  (Lo)  (Hi)  (Hi)  (Hi)
--------------------------------------------------------------------------------
0/RP0
          TEMP_LOCAL                      32    -10   -5    0    55    65    70
          TEMP_REMOTE1                    32    -10   -5    0    55    65    70

          ADM1293_MB_2V5_PLL          2483   2300  2375  2625  2700
```

Step 3   **show inventory**

Displays inventory information for all the physical entities of NCS 1004.

```
RP/0/RP0/CPU0:ios# show inventory

What to do next

Environment parameter anomalies are logged in the syslog. Hence, if an environment parameter displayed in the **show environment** command output is not as expected, check the syslog using the **show logging** command. The syslog provides details on any logged problems.

Verify Firmware Version

The firmware on various hardware components of NCS 1004 must be compatible with the installed Cisco IOS XR image. Incompatibility may cause the NCS 1004 to malfunction.

To verify the firmware version, perform the following procedure.

Procedure

Step 1 **show hw-module fpd**

```
RP/0/RP0/CPU0:ios# show hw-module fpd
Fri Nov 26 14:53:27.188 UTC

Auto-upgrade:Disabled
                                                          FPD Versions

```

Displays firmware information of various hardware components of NCS 1004 in the Cisco IOS XR EXEC mode.

In the previous output, some of the significant fields are:

- FPD Device—Name of the hardware component such as FPD, CFP, and so on.

- ATR—Attribute of the hardware component. Some of the attributes are:

  - B—Backup Image

  - S—Secure Image

  - P—Protected Image

- Status—Upgrade status of the firmware. The different states are:

  - CURRENT—The firmware version is the latest version.

  - NOT READY—The firmware of the FPD is not ready for upgrade.

  - NEED UPGD—A newer firmware version is available in the installed image. We recommended that upgrade be performed.

  - UPGD PREP—The firmware of the FPD is preparing for upgrade.

  - RLOAD REQ—The upgrade is completed, and the card requires a reload.

  - UPGD DONE—The firmware upgrade is successful.

  - UPGD FAIL—The firmware upgrade has failed.

  - UPGD SKIP—The upgrade is skipped because the installed firmware version is higher than the version available in the image.

  - Running—Current version of the firmware running on the FPD.

Step 2   **show fpd package**

Use the **show fpd package** command to display the FPD image version available with this software release for each hardware component.

```
RP/0/RP0/CPU0:ios# show fpd package
Fri May  8 05:11:47.819 UTC

```

What to do next

Upgrade all the FPDs using the **upgrade hw-module location all fpd all** command in the Cisco IOS XR
EXEC mode. After upgrade is completed, the Status column shows RLOAD REQ if the software requires
reload.

If Reload is required

If the FPGA location is 0/RP0, use the **admin hw-module location 0/RP0 reload** command. This command
reboots only the CPU. As a result, traffic is not impacted. If the FPGA location is 0/0, use the **admin hw-module
location all reload** command. This command reboots the chassis. As a result, traffic is impacted. After the
reload is completed, the new FPGA runs the current version.

⚠️

Caution   The upgrade of OTNXP LC_DP_MOD_FW and LC_OPT_MOD_FW FPDs affect traffic. Hence, you must perform this upgrade during a maintenance window.

If Firmware Upgrade Fails

If firmware upgrade fails, use the **show logging** command to view the details and upgrade the firmware again using the above commands.

✎

Note   You can upgrade the firmware version of power modules, only when both the power modules are present and powered on.

Loopback

Table 1: Feature History

Feature Name	Release Information	Description
Configuration Alarms for Loopback	Cisco IOS XR Release 7.8.1	A configuration alarm is now triggered whenever there is a change in the loopback configuration. This alarm helps in improving loopback status monitoring. You can now view the alarm details such as, the configuration time and date, description, severity, and location using the **show alarms brief system active** command.

You can configure the loopback on the CoherentDSP, FC, OTU, and Ethernet controllers to identify connection problems. The loopback can be configured only in the maintenance mode. Use the **controller** *controller-type* and the **secondary-admin-state maintenance** commands to place the controllers in the maintenance mode.

From R7.8.1, loopback configuration alarm details for each controller are triggered whenever there is a change in the loopback configuration. Details such as, location of the controller, severity, configuration date and time, and description are available in the output of the **show alarms brief system active** and **show alarms brief history** commands.

✎

Note   Internal and line loopbacks are supported on the FC, OTU, and Ethernet controllers whereas only internal loopbacks are supported on the CoherentDSP controllers.

Configuring Loopback on the 1.2T Card

To configure the loopback, use the following commands:

configure

controller *controllertype Rack/Slot/Instance/Port*

sec-admin-state maintenance

loopback [**line** | **internal**]

commit

Example 1

The following example shows how a line loopback is configured on the Ethernet controller.

```
RP/0/RP0/CPU0:ios#configure
RP/0/RP0/CPU0:ios(config)#controller HundredGigECtrlr 1/0/1/10 secondary-admin-state
maintenance
RP/0/RP0/CPU0:ios(config)#commit
Fri Feb 22 19:49:46.504 UTC
RP/0/RP0/CPU0:ios(config)#exit
```

The following example shows how to verify a line loopback configured on the Ethernet controller.

```
RP/0/RP0/CPU0:ios#show controller HundredGigECtrlr 0/1/0/10
Fri Feb 22 19:50:08.328 UTC

Configuring Loopback on OTN-XP Card

From R7.2.1 onwards, OTN-XP card supports loopback on the OTU2, OTU2e, OTU4, 10GE, and CoherentDSP controllers.

From R7.3.2 onwards, OTN-XP card supports loopback on the 100GE and 400GE controllers.

From R7.5.2 onwards, OTN-XP card supports loopback on the 16G FC and 32G FC controllers.

The CoherentDSP controller supports both line and internal.

To configure the loopback on the controllers, use the following commands:

configure

controller *controller type Rack/Slot/Instance/Port/Lane number*

sec-admin-state maintenance

loopback [**line** | **internal**]

commit

The range of *Lane number* is 1–4.

☞

Restriction From R7.10.1, OTN-XP card supports loopback on STM64 and OC192 controllers. You must use **no sec-admin-state** command instead of **sec-admin-state normal**.

Example 1

The following example shows how an internal loopback is configured on the 10GE controller.

```
RP/0/RP0/CPU0:ios#configure
RP/0/RP0/CPU0:ios(config)#controller tenGigECtrlr 0/0/0/5/2
RP/0/RP0/CPU0:ios(config-eth-ctrlr)#sec-admin-state maintenance
RP/0/RP0/CPU0:ios(config-eth-ctrlr)#loopback internal
RP/0/RP0/CPU0:ios(config-eth-ctrlr)#commit
```

The following example shows how to verify an internal loopback configured on the 10GE controller.

```
RP/0/RP0/CPU0:ios#show controllers tenGigECtrlr 0/0/0/5/2
Thu Apr 23 10:47:48.020 UTC

Example: Loopback Configuration in 4X100G MXP on 100GE Controller

The following example shows how the client internal loopback is configured on the 100GE controller:

```
RP/0/RP0/CPU0:ios#configure
RP/0/RP0/CPU0:ios(config)#controller HundredGigECtrlr 0/2/0/1
RP/0/RP0/CPU0:ios(config-eth-ctrlr)#sec-admin-state maintenance
RP/0/RP0/CPU0:ios(config-eth-ctrlr)#loopback internal
RP/0/RP0/CPU0:ios(config-otu4)#commit
Thu Sep 23 11:05:22.429 UTC
RP/0/RP0/CPU0:ios(config-otu4)#end
```

The following example shows how the client line loopback is configured on the 100GE controller:

```
RP/0/RP0/CPU0:ios#configure
RP/0/RP0/CPU0:ios(config)#controller HundredGigECtrlr 0/2/0/1
RP/0/RP0/CPU0:ios(config-eth-ctrlr)#sec-admin-state maintenance
RP/0/RP0/CPU0:ios(config-eth-ctrlr)#loopback line
RP/0/RP0/CPU0:ios(config-otu4)#commit
Thu Sep 23 11:05:22.429 UTC
RP/0/RP0/CPU0:ios(config-otu4)#end
```

The following example shows how the trunk internal is configured on the coherentDSP controller:

```
RP/0/RP0/CPU0:ios#configure
RP/0/RP0/CPU0:ios(config)#controller coherentDSP 0/2/0/11
RP/0/RP0/CPU0:ios(config-CoDSP)#secondary-admin-state maintenance
RP/0/RP0/CPU0:ios(config-CoDSP)#loopback internal
RP/0/RP0/CPU0:ios(config-otu4)#commit
Thu Sep 23 11:05:22.429 UTC
RP/0/RP0/CPU0:ios(config-otu4)#end
```

The following example shows how the trunk line is configured on the coherentDSP controller:

```
RP/0/RP0/CPU0:ios#configure
RP/0/RP0/CPU0:ios(config)#controller coherentDSP 0/2/0/11
RP/0/RP0/CPU0:ios(config-CoDSP)#secondary-admin-state maintenance
RP/0/RP0/CPU0:ios(config-CoDSP)#loopback line
RP/0/RP0/CPU0:ios(config-otu4)#commit
Thu Sep 23 11:05:22.429 UTC
RP/0/RP0/CPU0:ios(config-otu4)#end
```

Example: Loopback Configuration in 400G-TXP on 400GE Controller

The following example shows how the client internal loopback is configured on the 400GE controller:

```
RP/0/RP0/CPU0:ios#configure
RP/0/RP0/CPU0:ios(config)#controller FourHundredGigECtrlr 0/2/0/10
RP/0/RP0/CPU0:ios(config-eth-ctrlr)#sec-admin-state maintenance
RP/0/RP0/CPU0:ios(config-eth-ctrlr)#loopback internal
RP/0/RP0/CPU0:ios(config-otu4)#commit
Thu Sep 23 11:05:22.429 UTC
RP/0/RP0/CPU0:ios(config-otu4)#end
```

The following example shows how the client line loopback is configured on the 100GE controller:

```
RP/0/RP0/CPU0:ios#configure
RP/0/RP0/CPU0:ios(config)#controller FourHundredGigECtrlr 0/2/0/10
RP/0/RP0/CPU0:ios(config-eth-ctrlr)#sec-admin-state maintenance
RP/0/RP0/CPU0:ios(config-eth-ctrlr)#loopback line
```

```

```

The following example shows how the trunk internal is configured on the coherentDSP controller:

```
RP/0/RP0/CPU0:ios#configure
RP/0/RP0/CPU0:ios(config)#controller coherentDSP 0/2/0/10
RP/0/RP0/CPU0:ios(config-CoDSP)#secondary-admin-state maintenance
RP/0/RP0/CPU0:ios(config-CoDSP)#loopback internal
RP/0/RP0/CPU0:ios(config-otu4)#commit
Thu Sep 23 11:05:22.429 UTC
RP/0/RP0/CPU0:ios(config-otu4)#end
```

The following example shows how the trunk line is configured on the coherentDSP controller:

```
RP/0/RP0/CPU0:ios#configure
RP/0/RP0/CPU0:ios(config)#controller coherentDSP 0/2/0/10
RP/0/RP0/CPU0:ios(config-CoDSP)#secondary-admin-state maintenance
RP/0/RP0/CPU0:ios(config-CoDSP)#loopback line
RP/0/RP0/CPU0:ios(config-otu4)#commit
Thu Sep 23 11:05:22.429 UTC
RP/0/RP0/CPU0:ios(config-otu4)#end
```

Configure Loopback in Inverse Muxponder Configured on the OTN-XP Card

You can configure loopback on the coherentDSP controllers in the inverse muxponder configuration.

Note You must configure loopback on both trunk ports 12 and 13, otherwise traffic goes down.

The following example shows how loopback is configured on both the trunk ports:

```
RP/0/RP0/CPU0:ios#configure
Thu Sep 30 14:16:04.678 UTC
RP/0/RP0/CPU0:ios(config)#controller coherentDSP 0/2/0/12
RP/0/RP0/CPU0:ios(config-CoDSP)#secondary-admin-state maintenance
RP/0/RP0/CPU0:ios(config-CoDSP)#loopback internal
RP/0/RP0/CPU0:ios(config-CoDSP)#commit
Thu Sep 30 14:16:19.594 UTC
RP/0/RP0/CPU0:ios(config-CoDSP)#controller coherentDSP 0/2/0/13
RP/0/RP0/CPU0:ios(config-CoDSP)#secondary-admin-state maintenance
RP/0/RP0/CPU0:ios(config-CoDSP)#loopback internal
RP/0/RP0/CPU0:ios(config-CoDSP)#commit
Thu Sep 30 14:16:32.390 UTC
RP/0/RP0/CPU0:ios(config-CoDSP)#
```

The following examples shows how to verify loopback configured on the OTN-XP card in the inverse muxponder configuration:

```
RP/0/RP0/CPU0:ios#show controllers coherentDSP 0/2/0/12

Configuring Loopback on 2-QDD-C Card

From R7.3.1 onwards, 2-QDD-C card supports loopback on the 100 and 400GE controllers.

✎ **Note**   On applying client-side loopbacks, traffic is looped and does not continue in the 2-QDD-C card. QSFP squelching happens on applying internal loopback.

To configure the loopback on the controllers, use the following commands.

configure

controller *controllertype Rack/Slot/Instance/Port/Lanenumber*

sec-admin-state maintenance

loopback [**line** | **internal**]

commit

Example

The following example shows how an internal loopback is configured on a 100GE controller.

```
RP/0/RP0/CPU0:ios#configure
RP/0/RP0/CPU0:ios(config)#controller hundredGigECtrlr 0/0/0/5
RP/0/RP0/CPU0:ios(config-eth-ctrlr)#sec-admin-state maintenance
RP/0/RP0/CPU0:ios(config-eth-ctrlr)#loopback internal
RP/0/RP0/CPU0:ios(config-eth-ctrlr)#commit
```

The following example shows how to verify the internal loopback configured on a 100GE controller.

```
RP/0/RP0/CPU0:ios#show controllers hundredGigECtrlr 0/0/0/5
Thu Apr 23 10:47:48.020 UTC
Operational data for interface hundredGigECtrlr0/0/0/5:

LLDP Drop

Link Layer Discovery Protocol (LLDP) Snooping is enabled by default on all ethernet controllers.

To verify the LLDP neighbors, use the following commands:

```
RP/0/RP0/CPU0:ios#show lldp neighbors detail
Tue Mar 12 11:49:20.819 IST
Capability codes:
        (R) Router, (B) Bridge, (T) Telephone, (C) DOCSIS Cable Device
        (W) WLAN Access Point, (P) Repeater, (S) Station, (O) Other

```

When you enable LLDP drop on the client controller ports of the muxponder or muxponder slice, the LLDP frames drop on the ports without forwarding.

Note   LLDP on 400GE is not supported on the OTN-XP card.

Configuring LLDP Drop

You can configure the LLDP drop for a muxponder or muxponder slice. By default, the LLDP drop status is set to False. On enabling the LLDP Drop, the status is set to True.

To configure LLDP drop on a muxponder use the following command:

configure

hw-module location *location* **mxponder drop-lldp**

Note   Use the **no** form of the command to disable LLDP drop.

commit

Limitation

  • When you disable LLDP globally, the LLDP gets disabled on all the interfaces.

Note   By default, LLDP is enabled for NCS 1004. But when you enable and disable LLDP in the global configuration mode, LLDP gets disabled on all the interfaces.

Workaround: You must enable LLDP globally or reload the Router.

```
RP/0/RP0/CPU0:ios#configure
RP/0/RP0/CPU0:ios#hw-module location 0/1 mxponder drop-lldp
RP/0/RP0/CPU0:ios#commit
```

configure

hw-module location *location* **mxponder-slice** *slice-number* **drop-lldp**

Note   Use the **no** form of the command to disable LLDP drop.

To configure LLDP drop on a muxponder slice, use the following command:

commit

The following is a sample in which slice 0 client ports are enabled with LLDP drop.

```
RP/0/RP0/CPU0:ios#configure
RP/0/RP0/CPU0:ios(config)#hw-module location 0/1 mxponder-slice 0 drop-lldp
RP/0/RP0/CPU0:ios(config)#commit
```

Verifying the Status of LLDP Drop

To verify the LLDP drop enabled status, use the following command.

```
RP/0/RP0/CPU0:ios#show hw-module location all mxponder

```

Trail Trace Identifier

The Trail trace identifier (TTI) feature helps you to identify the signal from the source to the destination within the network. You can configure the TTI sent or expected string only in ASCII string format. When the expected TTI string does not match the received TTI trace string, the controller goes down and the OTUK-TIM alarm is raised. To configure TTI on the coherent DSP controllers, use the following commands:

configure

controller coherentDSP *R/S/I/P* **tti** {**sent | expected**} **ascii** *tti-string*

commit

Note   The *tti-string* can have a maximum of 64 characters.

The following sample displays how to configure TTI on a coherent DSP controller with the sent and expected strings set to the same ASCII string. The state of the controller is up.

```

Configure TTI on OTN-XP Card

You can configure the TTI sent or expected string in the full ASCII format, or Source Access Point Identifier (SAPI)/Destination Access Point Identifier (DAPI) format on OTU, ODU, ODU-flex, ODUCn, and coherentDSP controllers for the OTN-XP card.

From R7.3.1 onwards, coherentDSP controller supports only the full ASCII string format.

From R7.3.2 onwards, coherentDSP controller supports SAPI/DAPI string format in addition to the full ASCII string format.

You can configure TTI for the following muxponder modes:

- 10G-Grey-MXP

- 4x100G-MXP-400G-TXP

The following table lists the ASCII format that is supported on each muxponder mode for TTI:

Table 2: ASCII Format Supported on Each Muxponder Mode

Muxponder Mode	ASCII with Character String	Controller
10G Grey	Full ASCII 64-character	OTU2, OTU2E, OTU4, ODU4, ODU2E (10G mapper)
	SAPI ASCII 15-character	OTU2, OTU2E, OTU4, ODU4, ODU2E (10G mapper)
	DAPI ASCII 15-character	OTU2, OTU2E, OTU4, ODU4, ODU2E (10G mapper)
	Operator-specific ASCII 32-character	OTU2, OTU2E, OTU4, ODU4, ODU2E (10G mapper)
4x100G-MXP-400G-TXP	Full ASCII 64-character	OTU4, coherentDSP, ODUC4, ODU4 (100G mapper), and ODU-FLEX (400G mapper)
	SAPI ASCII 15-character	OTU4, coherentDSP, ODUC4, ODU4 (100G mapper), and ODU-FLEX (400G mapper)
	DAPI ASCII 15-character	OTU4, coherentDSP, ODUC4, ODU4 (100G mapper), and ODU-FLEX (400G mapper)
	Operator-specific ASCII 32-character	OTU4, coherentDSP, ODUC4, ODU4 (100G mapper), and ODU-FLEX (400G mapper)

To configure TTI, use the following commands:

configure

controller *controller-type R/S/I/P* **tti** {**sent** | **expected**} {**ascii** | **sapi ascii** | **dapi ascii** | **operator-specific ascii** } *tti-string*

commit

Note We recommend that you configure TTI in the SAPI/DAPI ASCII format.

Restriction
- For OC192 and STM 64 payloads, configure both sides for ASCII and hex on mapper ODU2.
- For OC192 and STM 64 payloads, do not edit operator specific hex on mapper ODU2. Instead, delete and create the operator specific hex.

The following is a sample configuration on ODU4 controller:

```
RP/0/RP0/CPU0:ios#configure
Thu Sep 30 17:19:11.804 UTC

Enable TIM CA on Path Monitoring Layer

You can enable Trace Identifier Mismatch (TIM) consequent action (CA) on the Path Monitoring (PM) layer using the **pm-tim-ca** command on mapper ODUs for Ethernet controller. The TTI transmit string in the SAPI/DAPI format is not configurable on ODUs that are transparent.

For example, the clients that are supported are ODU4, ODU2, and ODU2E, and lower-order ODUs such as ODU2 or ODU2E.

You can configure **pm-tim-ca** only on mapper ODUs such as ODU2E (10G mapper), ODU4 (100G mapper), and ODU-FLEX (400G mapper).

To configure **pm-tim-ca** on mapper ODU in the 4x100G-MXP-400G-TXP muxponder mode, use the following commands

configure

controller *controller-type R/S/I/P*

pm-tim-ca

commit

Troubleshoot the Trunk Port

Procedure

Step 1   **show controller coherentDSP** *R/S/I/P*

Displays details of the coherent DSP controller.

Example:

```
RP/0/RP0/CPU0:ios# show controller coherentDSP 0/0/0/0
Tue Feb 25 11:26:08.235 UTC

Port                                            : CoherentDSP 0/0/0/0

AINS Timer                                      : 0h, 0m
AINS remaining time                             : 0 seconds
```

In the above output, you can verify the state of the controller and also verify the alarms related to the trunk port.

Step 2   **show controller optics** *R/S/I/P*

Displays details of the optics controller.

Example:

```
RP/0/RP0/CPU0:ios# show controller optics  0/1/0/3
 Thu Feb 21 19:45:41.088 UTC

 Controller State: Up

 Transport Admin State: Automatic In Service

 Laser State: On

 LED State: Green

 Optics Status

         Optics Type:  Grey optics

         Alarm Status:

 Transceiver Vendor Details

         Form Factor          : QSFP28
         Name                 : CISCO-FINISAR
         Part Number          : FTLC1152RGPL-C2
         Rev Number           : CISCO-FINISAR
```

```
                    Serial Number          : FNS22150LEC
                    PID                    : QSFP-100G-CWDM4-S
                    VID                    : V02
                    CISCO-FINISAR
                    Date Code(yy/mm/dd)    : 18/04/11
                    Fiber Connector Type: LC
                    Sonet Application Code: Not Set
                    Ethernet Compliance Code: 100GBASE-CWDM4

 Transceiver Temperature : 32 Celsius

 AINS Soak               : Running
 AINS Timer              : 0h, 15m
 AINS remaining time     : 771 seconds
```

In the above output, you can verify the state of the controller, LED state, TX power, RX power, OSNR, and the alarms.

Step 3   If there is an LOS alarm on the trunk port, verify the fiber continuity to the port of NCS 1004 and fix the fiber connection.

What to do next

Verify the performance monitoring parameters of the Optics, Ethernet, and coherent DSP controllers. For more information, see #unique_13.

Troubleshoot a Failed Commit Configuration

Use the **show configuration failed** command to get information on why the configuration failed.

```
RP/0/RP0/CPU0:ios(config-hwmod-mxp)#show configuration failed
Fri Nov 26 15:27:22.629 UTC
!! SEMANTIC ERRORS: This configuration was rejected by
!! the system due to semantic errors. The individual
!! errors with each failed configuration command can be
!! found below.

hw-module location 0/0
 mxponder-slice 0
  client-port-rate 1 client-type 400GE
!!% Total group bandwidth exceeds the limit: Total group bandwidth exceeds the limit
 !
!
end
```

Verify the Performance Monitoring Parameters of Controllers

Performance monitoring (PM) parameters are used by service providers to gather, store, set thresholds for, and report performance data for early detection of problems. The user can retrieve both current and historical PM counters for the various controllers in 10 seconds, 15 minutes and 1 day intervals.

Procedure

show controllers *controllertype R/S/I/P* **{ pm { current | history } { 30 sec | 15-min | 24-hour } { optics | ether | fec | otn }** *linenumber* }

The following sample output displays the current performance monitoring parameters of the Optics controller in 15-minute intervals. Client optics have four lanes.

```
RP/0/RP0/CPU0:ios#show controller optics 0/1/0/3 pm current 15-min optics 3

Sat Feb  9 19:33:42.480 UTC

Using SNMP for Troubleshooting

The supported MIBs in NCS 1004 are documented in the *SNMP* chapter of *Configuration Guide for Cisco NCS 1004*.

Procedure

Use the following commands in EXEC mode to verify and monitor the SNMP for network monitoring and management.

- show snmp — Displays the status of SNMP communications.

- show snmp mib access — Displays the counters per OID that indicate the number of times an operation was done on an OID.

- show snmp mib access time — Displays the timestamp of the last operation on an OID.

- show snmp trace requests — Displays a log of the high level PDU processing trace points.

- debug snmp packet — Displays information about every SNMP packet sent or received by NCS 1004.

- debug snmp requests — Displays information about every SNMP request made by the SNMP manager.

Using Netconf for Troubleshooting

Netconf provides mechanisms to install, manipulate, and delete the configuration of network devices. The Netconf protocol provides a set of operations to manage device configurations and retrieve device state information.

Use the following commands in EXEC mode to retrieve device state information.

Before you begin

- Verify the installation of k9sec package.

- Generate the crypto key for SSH using the **crypto key generate dsa** command.

> ✎
>
> **Note**   If you access NCS 1004 after regenerating the crypto key, you must remove the **~/.ssh/known_hosts** file as there will be a key mismatch between the host and NCS 1004.

- Configure SSH.

```
RP/0/RP0/CPU0:ios# configure
RP/0/RP0/CPU0(config)# ssh server v2
RP/0/RP0/CPU0(config)# ssh server netconf port 830
RP/0/RP0/CPU0(config)# ssh server netconf  vrf default
```

> ✎
>
> **Note**   Port 830 is the default Netconf port.

- Configure Netconf.

```
RP/0/RP0/CPU0:ios# configure
RP/0/RP0/CPU0(config)# netconf-yang agent ssh
```

Procedure

Step 1   **show netconf-yang clients**

Displays the client details for netconf-yang.

Example:
```
RP/0/RP0/CPU0:ios# show netconf-yang clients
Fri Nov 26 15:28:50.942 UTC
No active netconf sessions found.
```

Step 2   **show netconf-yang statistics**

Displays the statistical details for netconf-yang.

Example:

```
RP/0/RP0/CPU0:ios# show netconf-yang statistics
Fri Nov 26 15:24:06.612 UTC
Summary statistics

Verify Alarms

You can view the alarm information using the **show alarms** command.

Procedure

show alarms [**brief** [**card** | **rack** | **system**] [**location** *location*] [**active** | **history**] | **detail**
[**card** | **rack** | **system**] [**location** *location*] [**active** | **clients** | **history** | **stats**]]

Displays alarms in brief or detail.

Example:

```
RP/0/RP0/CPU0:ios# show alarms brief card location 0/RP0/CPU0 active

Wed Mar  4 06:10:55.959 UTC

------------------------------------------------------------------------------------------
Active Alarms
------------------------------------------------------------------------------------------
Location        Severity    Group           Set Time                  Description

0/3             NotReported  OTN             05/07/2020 14:24:41 UTC   ODU2E0/3/0/0/2/4
- Path Monitoring Alarm Indication Signal

0/1             Major        Ethernet        05/07/2020 14:24:41 UTC   TenGigECtrlr0/1/0/4/1
 - Remote Fault
```

Note

In the maintenance mode, all the alarms are suppressed and the **show alarms** command will not show the alarms details. Use the **show controllers** *controllertype R/S/I/P* command to view the client and trunk alarms.

Using Onboard Failure Logging

Onboard Failure Logging (OBFL) collects and stores boot, environmental, and critical hardware data in the nonvolatile flash memory of the CPU controller card. This information is used for troubleshooting, testing, and diagnosis if a failure or other error occurs. This data provides improved accuracy in hardware troubleshooting and root cause isolation analysis. The data collected includes field-replaceable unit (FRU) serial number, OS version, total run time, boot status, temperature and voltage at boot, temperature and voltage history, and other board specific errors.

Procedure

show logging onboard {**fmea** | **inventory** | **temperature** | **uptime** | **voltage**}

Displays OBFL data.

Example:

The following example shows the *uptime* information.

```
sysadmin-vm:0_RP0# show logging onboard uptime

OBFL Uptime Information For : 0/RP0
      * indicates incomplete time-sync while record was written
      ! indicates time reset backwards while system was running

Capture Logs

Procedure

Step 1 **show logging**

Displays the contents of the logging buffers. You can also view details of FPD upgrade failures.

Example:

```
RP/0/RP0/CPU0:ios# show logging
Fri Nov 26 15:03:48.886 UTC
Syslog logging: enabled (0 messages dropped, 0 flushes, 0 overruns)
    Console logging: Disabled
    Monitor logging: level debugging, 0 messages logged
    Trap logging: level informational, 0 messages logged
    Buffer logging: level debugging, 1025 messages logged

Log Buffer (2097152 bytes):

RP/0/RP0/CPU0:Nov 25 16:40:28.533 UTC: syslogd[155]: %SECURITY-XR_SSL-6-INFO : XR SSL info:

RP/0/RP0/CPU0:Nov 25 16:40:36.457 UTC: aib[291]: Registering with IM
RP/0/RP0/CPU0:Nov 25 16:40:36.661 UTC: cma_partner[350]: Packet received on undiscovered
module 160
RP/0/RP0/CPU0:Nov 25 16:40:37.113 UTC: ifmgr[142]: platform_pfi_ifh_get_if_alloc_info:
Setting pic
.............
.............
```

a) **logging buffered** *size*

Configures the size of the logging buffer. The range is from 2097152 to 125000000 bytes.

Example:

```
RP/0/RP0/CPU0:ios(config)#logging buffered 3000000
```

Step 2 **show tech-support ncs1004**

Creates a .tgz file that contains the dump of the configuration and show command outputs. This file provides system information for the Cisco Technical Support.

Example:

```
RP/0/RP0/CPU0:ios# show tech-support ncs1004
Fri Nov 26 15:05:28.996 UTC
++ Show tech start time: 2021-Nov-26.150529.UTC ++
Fri Nov 26 15:05:30 UTC 2021 Waiting for gathering to complete
..............................................................................................
Fri Nov 26 15:10:38 UTC 2021 Compressing show tech output
Show tech output available at 0/RP0/CPU0 :
/harddisk:/showtech/showtech-ncs1004-2021-Nov-26.150529.UTC.tgz
++ Show tech end time: 2021-Nov-26.151040.UTC ++
```

Step 3   **show tech-support alarm-mgr**

Collects the Cisco support file for the alarm manager component.

Example:

```
RP/0/RP0/CPU0:ios#show tech-support alarm-mgr
Fri Nov 26 15:06:06.916 UTC
++ Show tech start time: 2021-Nov-26.150607.UTC ++
Fri Nov 26 15:06:08 UTC 2021 Waiting for gathering to complete
.....
Fri Nov 26 15:06:23 UTC 2021 Compressing show tech output
Show tech output available at 0/RP0/CPU0 :
/harddisk:/showtech/showtech-alarm_mgr-2021-Nov-26.150607.UTC.tgz
++ Show tech end time: 2021-Nov-26.150624.UTC ++
```

Step 4   **admin**

Enters system admin EXEC mode.

Example:

RP/0/RP0/CPU0:ios#**admin**

Step 5   **show tech ncs1004-admin**

Collects show tech logs that can be copied to IOS XR hard disk.

Example:

```
sysadmin-vm:0_RP0# show tech ncs1004-admin
Thu May  5  15:22:08.520 UTC+00:00
++ Show tech start time: 2022-May-05.152208.UTC ++
Waiting for gathering to complete
......
Compressing show tech output
Show tech output available at
/misc/disk1//showtech/showtech-ncs1004-admin-2022-May-05.152208.UTC.tgz
Please collect show tech-support ctrace in addition to any sysadmin show-tech-support
collection

sysadmin-vm:0_RP0# run
Thu May  5  15:31:54.352 UTC+00:00
[sysadmin-vm:0_RP0:~]$scp
/misc/disk1/showtech/showtech-ncs1004-admin-2022-May-05.152208.UTC.tgz
209.165.200.227:/misc/disk1/
showtech-ncs1004-admin-2022-May-05.152208.UTC.tgz                          100%   13MB
 12.8MB/s   00:00
[sysadmin-vm:0_RP0:~]$exit
```

What to do next

You should gather the above information before calling the Cisco Technical Assistance Center (TAC).

Verify Process Details and Crash Dump

Procedure

Step 1 **show processes**

Displays information about active processes.

Example:

The following example shows the output of the **show processes** command in the EXEC mode.

```
RP/0/RP0/CPU0:ios# show processes
Fri Nov 26 14:59:31.671 UTC
JID    TID  Stack  pri  state       NAME            rt_pri
1      1      0K   20   Sleeping    init            0
66895  1359   0K   20   Sleeping    oom.sh          0
66911  1375   0K   20   Sleeping    cgroup_oom.sh   0
66912  1376   0K   20   Sleeping    oom.sh          0
66932  1396   0K   0    Sleeping    cgroup_oom      0
67172  1636   0K   20   Sleeping    app_config_back 0
67176  1640   0K   20   Sleeping    bash            0
67203  1667   0K   20   Sleeping    inotifywait     0
67205  1669   0K   20   Sleeping    bash            0
67242  1706   0K   20   Sleeping    dbus-daemon     0
67242  1707   0K   20   Sleeping    dbus-daemon     0
67260  1724   0K   20   Sleeping    sshd            0
67271  1735   0K   20   Sleeping    rpcbind         0
......................................
......................................
```

The following example shows the output of the **show processes** command in the system admin EXEC mode.

```
sysadmin-vm:0_RP0# show processes all location 0/rp0
Fri Nov  26 15:01:44.450 UTC+00:00

```

Step 2   **show processes** *process-name*

Displays detailed information about a process.

Example:

```
RP/0/RP0/CPU0:ios#show processes dsr
Fri Nov 26 15:02:55.728 UTC
                Job Id: 53
                   PID: 2246
          Process name: dsr
       Executable path: /opt/cisco/XR/packages/ncs1004-iosxr-os-1.0.0.0-r751/all/bin/dsr
            Instance #: 1
            Version ID: 00.00.0000
               Respawn: ON
         Respawn count: 1
          Last started: Thu Nov 25 16:40:26 2021
         Process state: Run
         Package state: Normal
                  core: DUMPFALLBACK
             Max. core: 0
                 Level: 11
             Mandatory: ON
          MaintModeProc: ON
             Placement: None
          startup_path:
/opt/cisco/XR/packages/ncs1004-iosxr-os-1.0.0.0-r751/all/init.d/dsr.init
                 Ready: 0.375s
       Process cpu time: 2.050 user, 0.930 kernel, 2.980 total
JID    TID  Stack  pri  state       NAME            rt_pri
```

```
53    2246    0K  20    Sleeping    dsr                0

53    2380    0K  20    Sleeping    dsr                0
--------------------------------------------------------------------------------
```

Step 3   **show context**

Displays information about process crashes.

Example:

```
RP/0/RP0/CPU0:ios# show context
Fri Nov 26 15:03:26.008 UTC

node: node0_RP0_CPU0
----------------------------------------------------------------
No context
```

The command output is empty during system upgrade.
