What's New in Cisco IOS XR Release 7.5.3

Software Features Introduced and Enhanced

To learn about features introduced in other Cisco IOS XR releases, select the release from the [Documentation Landing Page](#).

Feature	Description
IP Addresses and Services	
Optimizing ACL Level 3 compression	This feature allows you to change the TCAM (ternary content-addressable memory) size that is allowed for ACL level 3 compression from 70 to 76 bytes and conversely. The option to increase TCAM space by 6 bytes for the compression fields enables you to avoid ACL L3 compression failures when the compression field configurations exceed 70 bytes. This feature introduces the hardware access-list l3-compression-optimisation command.
MPLS	
Self-Ping Probe for Reoptimized LSP	You can now prevent traffic drops on a reoptimized label switch path (LSP) by timely confirmation that it's ready to handle the traffic. This confirmation is made possible by enabling the label edge router (LER) to send self-ping probes over the reoptimized LSP to the ingress LER. As soon the probe reaches the LER, there's confirmation that the RSVP programming is complete along the path. Post this confirmation, the LER switches traffic to the reoptimized LSP with no drop in traffic. This feature introduces the self-ping keyword in the named-tunnels tunnel-te command.
System Security	

Feature	Description
Automatic renewal of Public Key Infrastructure (PKI) certificate	<p>You can now enable the router to renew the PKI certificate from the Certificate Authority (CA) by configuring the percentage of the certificate validity, after which the router requests a new certificate from the CA, and the CA authorizes it before certification expiration. This feature eliminates the previously needed manual efforts of certification renewal and avoids interruptions such as MACsec session flaps due to certificate expiry and so on.</p> <p>This feature introduces the following commands:</p> <ul style="list-style-type: none"> • auto-enroll • renewal-message-type
MACsec SNMP MIB (IEEE8021-SECY-MIB) support on A99-10X400GE-X-SE	<p>With this feature, we have enabled IEEE8021-SECY-MIB capabilities on the A99-10X400GE-X-SE line card. The IEEE8021-SECY-MIB enables the user to query on the SecY (Security Entity) data, encryption, decryption, and hardware statistics.</p>
OpenSSH Certificate based Authentication for Router	<p>You can now use OpenSSH certificates to authenticate to the remote routers from a client machine. This feature uses the ssh-keygen utility, a standard SSH component to generate and manage authentication keys, available in OpenSSH to create a CA (Certificate Authority) like infrastructure for logging into the router.</p> <p>In this feature, the certificates that are used to authenticate router and client are both signed by the same CA. This automatically establishes trust between router and client, and eliminates the need to establish trust, while using the client for remote logging to router for the first time.</p>

Programmability Data Models Introduced and Enhanced

This release introduces or enhances the following data models. For detailed information about the supported and unsupported sensor paths of all the data models, see the [Github](#) repository. To get a comprehensive list of the data models supported in a release, navigate to the [Available-Content.md](#) file for the release in the Github repository. The unsupported sensor paths are documented as deviations. For example, openconfig-acl.yang provides details about the supported sensor paths, whereas cisco-xr-openconfig-acl-deviations.yang provides the unsupported sensor paths for openconfig-acl.yang on Cisco IOS XR routers.

Using the NETCONF RPC or CLI you can specify these user-defined values. The following leaves support user-defined values for the LLDP TLVs:</p> <ul style="list-style-type: none"> • OC-lldp:lldp/config/system-name • OC-lldp:lldp/config/system-description • OC-lldp:lldp/config/chassis-id-type • OC-lldp:lldp/config/chassis-id <p>The data model also supports the following sensor paths to retrieve the operational state of LLDP packets that are sent and received by a specified interface:</p> <ul style="list-style-type: none"> • OC-lldp:lldp/state/counters/last-clear • OC-lldp:lldp/state/counters/tlv-accepted • OC-lldp:lldp/interfaces/interface/state/counters • OC-lldp:lldp/interfaces/interface/neighbors/neighbor/state/age • OC-lldp:lldp/interfaces/interface/neighbors/neighbor/state/last-update
openconfig-isis Version 0.6.0	<p>With the revised version of this model, you can now monitor the system performance by checking the packet counter statistics and bandwidth, time, length, and values (TLVs) of IS-IS database.</p> <p>The revised model updates the leaf nodes in the following paths:</p> <ul style="list-style-type: none"> • Configuration • Global Mode • System-level • Interface

Feature	Description

Important Notes

- Repetitive Smart Licensing evaluation expired warning messages are displayed on the console every hour, but no functionality impact is observed on the device. To stop these repetitive messages, you should register the device again with a new registration token.
- From IOS XR Release 7.0, 1st and 2nd generation of Ethernet ASR 9000 line cards are not supported.
- Country-specific laws, regulations, and licenses—In certain countries, use of these products may be prohibited and subject to laws, regulations, or licenses, including requirements applicable to the use of the products under telecommunications and other laws and regulations; customers must comply with all such applicable laws in the countries in which they intend to use the products.
- Exceeding Cisco testing—if you intend to test beyond the combined maximum configuration tested and published by Cisco, contact your Cisco Account Team or Technical Support representative to discuss how to engineer a large-scale configuration for your purpose.
- For ZTP, In Cisco IOS XR Release 7.3.1 and earlier, the system accepts the device sending **user-class = "exr-config"**; however starting Cisco IOS XR Release 7.3.2 and later, you must use only **user-class = "xr-config"**.

In Cisco IOS XR Release 7.3.2 and later, use:

```
host cisco-rp0 {  
    hardware ethernet e4:c7:22:be:10:ba;  
    fixed-address 172.30.12.54;  
    if exists user-class and option user-class = "iPXE" {  
        filename = "http://172.30.0.22/boot.ipxe";  
    } elsif exists user-class and option user-class = "xr-config" {  
        filename = "http://172.30.0.22/scripts/cisco-rp0_ztp.sh";  
    }  
}
```

Supported Transceiver Modules

To determine the transceivers that Cisco hardware device supports, refer to the [Transceiver Module Group \(TMG\) Compatibility Matrix](#) tool.

Supported Modular Port Adapters

For the compatibility details of Modular Port Adapters (MPAs) on the line cards, see the [datasheet](#) of that specific line card.

Cisco IOS XR Error messages

To view, search, compare, and download Cisco IOS XR Error Messages, refer to the [Cisco IOS XR Error messages](#) tool.

Cisco IOS XR MIBs

To determine the MIBs supported by platform and release, refer to the [Cisco IOS XR MIBs](#) tool.

Production Software Maintenance Updates (SMUs)

A production SMU is a SMU that is formally requested, developed, tested, and released. Production SMUs are intended for use in a live network environment and are formally supported by the Cisco TAC and the relevant development teams. Software bugs identified through software recommendations or Bug Search Tools are not a basis for production SMU requests.

For information on production SMU types, refer the [Production SMU Types](#) section of the *IOS XR Software Maintenance Updates (SMUs)* guide.

Upgrading Cisco IOS XR Software

Cisco IOS XR Software is installed and activated from modular packages, allowing specific features or software patches to be installed, upgraded, or downgraded without affecting unrelated processes. Software packages can be upgraded or downgraded on all supported card types, or on a single card (node).

Software packages are installed from Route Processor Module (RPM) files that contain one or more software components.

The upgrade document is available along with the software images.

Note If you have mLACP/ICCP Redundancy Model setup, ensure that you upgrade the active and standby nodes to the same IOS XR version while upgrading to a newer version of the ASR 9000 router.
