

IP EIGRP Route Authentication

The IP Enhanced IGRP Route Authentication feature provides MD5 authentication of routing updates from the EIGRP routing protocol. The MD5 keyed digest in each EIGRP packet prevents the introduction of unauthorized or false routing messages from unapproved sources.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see [Bug Search Tool](#) and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About IP EIGRP Route Authentication

EIGRP Route Authentication

EIGRP route authentication provides MD5 authentication of routing updates from the EIGRP routing protocol. The MD5 keyed digest in each EIGRP packet prevents the introduction of unauthorized or false routing messages from unapproved sources.

Each key has its own key identifier (specified with the **key number** key chain configuration command), which is stored locally. The combination of the key identifier and the interface associated with the message uniquely identifies the authentication algorithm and the MD5 authentication key in use.

You can configure multiple keys with specific lifetimes. Only one authentication packet is sent, regardless of how many valid keys exist. The software examines the key numbers in the order from lowest to highest, and

uses the first valid key that it encounters. Note that the device needs to know the time to configure keys with lifetimes.

How to Configure IP EIGRP Route Authentication

Defining an Autonomous System for EIGRP Route Authentication

Before you begin

Before you configure EIGRP route authentication, you must enable EIGRP. In this task, EIGRP is defined with an autonomous system number.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface type number**
4. **no switchport**
5. **ip authentication mode eigrp autonomous-system md5**
6. **ip authentication key-chain eigrp autonomous-system key-chain**
7. **exit**
8. **key chain name-of-chain**
9. **key key-id**
10. **key-string text**
11. **accept-lifetime start-time {infinite | end-time | duration seconds}**
12. **send-lifetime start-time {infinite | end-time | duration seconds}**
13. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	interface type number Example: Device(config)# interface Gigabitethernet 1/0/9	Configures an interface type and enters interface configuration mode.

	Command or Action	Purpose
Step 4	no switchport Example: Device(config-if)# no switchport	Puts an interface into Layer 3 mode
Step 5	ip authentication mode eigrp autonomous-system md5 Example: Device(config-if)# ip authentication mode eigrp 1 md5	Enables MD5 authentication in EIGRP packets.
Step 6	ip authentication key-chain eigrp autonomous-system key-chain Example: Device(config-if)# ip authentication key-chain eigrp 1 keychain1	Enables authentication of EIGRP packets.
Step 7	exit Example: Device(config-if)# exit	Exits to global configuration mode.
Step 8	key chain name-of-chain Example: Device(config)# key chain keychain1	Identifies a key chain and enters key chain configuration mode.
Step 9	key key-id Example: Device(config-keychain)# key 1	Identifies the key number and enters key chain key configuration mode.
Step 10	key-string text Example: Device(config-keychain-key)# key-string 0987654321	Identifies the key string.
Step 11	accept-lifetime start-time {infinite end-time duration seconds} Example: Device(config-keychain-key)# accept-lifetime 04:00:00 Jan 4 2007 infinite	(Optional) Specifies the time period during which the key can be received.
Step 12	send-lifetime start-time {infinite end-time duration seconds} Example:	(Optional) Specifies the time period during which the key can be sent.

Defining a Named Configuration for EIGRP Route Authentication

	Command or Action	Purpose
	Device(config-keychain-key)# send-lifetime 04:00:00 Dec 4 2006 infinite	
Step 13	end Example: <pre>Device(config-keychain-key)# end</pre>	Exits key chain key configuration mode and returns to privileged EXEC mode.

Defining a Named Configuration for EIGRP Route Authentication

Before you begin

Before you configure EIGRP route authentication, you must enable EIGRP. In this task, EIGRP is defined with a virtual instance name.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **router eigrp *virtual-instance-name***
4. Enter one of the following:
 - **address-family ipv4 [multicast] [unicast] [vrf *vrf-name*] autonomous-system *autonomous-system-number***
 - **address-family ipv6 [unicast] [vrf *vrf-name*] autonomous-system *autonomous-system-number***
5. **network *ip-address* [*wildcard-mask*]**
6. **af-interface {default | interface-type *interface-number*}**
7. **authentication key-chain *name-of-chain***
8. **authentication mode {hmac-sha-256 *encryption-type password* | md5}**
9. **exit-af-interface**
10. **exit-address-family**
11. **exit**
12. **key chain *name-of-chain***
13. **key *key-id***
14. **key-string *text***
15. **accept-lifetime *start-time* {infinite | *end-time* | duration *seconds*}**
16. **send-lifetime *start-time* {infinite | *end-time* | duration *seconds*}**
17. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example:	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.

	Command or Action	Purpose
	Device> enable	
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	router eigrp virtual-instance-name Example: Device(config)# router eigrp virtual-name1	Enables an EIGRP routing process and enters router configuration mode.
Step 4	Enter one of the following: <ul style="list-style-type: none"> • address-family ipv4 [multicast] [unicast] [vrf vrf-name] autonomous-system autonomous-system-number • address-family ipv6 [unicast] [vrf vrf-name] autonomous-system autonomous-system-number Example: Device(config-router)# address-family ipv4 autonomous-system 45000 Device(config-router)# address-family ipv6 autonomous-system 45000	Enters address family configuration mode to configure an EIGRP IPv4 or IPv6 routing instance.
Step 5	network ip-address [wildcard-mask] Example: Device(config-router-af)# network 172.16.0.0	Associates networks with an EIGRP routing process.
Step 6	af-interface {default interface-type interface-number} Example:	Enters address family interface configuration mode and configures interface-specific EIGRP commands.
Step 7	authentication key-chain name-of-chain Example: Device(config-router-af-interface)# authentication key-chain SITE1	Specifies an authentication key chain for EIGRP.
Step 8	authentication mode {hmac-sha-256 encryption-type password md5} Example: Device(config-router-af-interface)# authentication mode md5	Specifies the type of authentication used in an EIGRP address family for the EIGRP instance.

Defining a Named Configuration for EIGRP Route Authentication

	Command or Action	Purpose
Step 9	exit-af-interface Example: Device(config-router-af-interface)# exit-af-interface	Exits address family interface configuration mode.
Step 10	exit-address-family Example: Device(config-router-af)# exit-address-family	Exits address family configuration mode.
Step 11	exit Example: Device(config-router)# exit	Exits router configuration mode and returns to global configuration mode.
Step 12	key chain name-of-chain Example: Device(config)# key chain keychain1	Identifies a key chain and enters key chain configuration mode.
Step 13	key key-id Example: Device(config-keychain)# key 1	Identifies the key number and enters key chain key configuration mode.
Step 14	key-string text Example: Device(config-keychain-key)# key-string 0987654321	Identifies the key string.
Step 15	accept-lifetime start-time {infinite end-time duration seconds} Example: Device(config-keychain-key)# accept-lifetime 04:00:00 Jan 4 2007 infinite	(Optional) Specifies the time period during which the key can be received.
Step 16	send-lifetime start-time {infinite end-time duration seconds} Example: Device(config-keychain-key)# send-lifetime 04:00:00 Dec 4 2006 infinite	(Optional) Specifies the time period during which the key can be sent.
Step 17	end Example:	Exits key chain key configuration mode and returns to privileged EXEC mode.

	Command or Action	Purpose
	Device(config-keychain-key)# end	

Configuration Examples for IP EIGRP Route Authentication

Example: EIGRP Route Authentication—Autonomous System Definition

The following example shows how to enable MD5 authentication on EIGRP packets in autonomous system 1.

Device A will accept and attempt to verify the MD5 digest of any EIGRP packet with a key equal to 1. It will also accept a packet with a key equal to 2. All other MD5 packets will be dropped. Device A will send all EIGRP packets with key 2.

Device B will accept key 1 or key 2 and will use key 1 to send MD5 authentication because key 1 is the first valid key of the key chain. Key 1 is not valid after December 4, 2006. After this date, key 2 is used to send MD5 authentication, and this key is valid until January 4, 2007.

The figure below shows the scenario.

Device A Configuration

```
Device> enable
Device(config)# configure terminal
Device(config)# router eigrp 1
Device(config-router)# exit
Device(config)# interface Gigabitethernet 1/0/9
Device(config-if)# no switchport
Device(config-if)# ip authentication mode eigrp 1 md5
Device(config-if)# ip authentication key-chain eigrp 1 key1
Device(config-if)# exit
Device(config)# key chain key1
Device(config-keychain)# key 1
Device(config-keychain-key)# key-string 0987654321
Device(config-keychain-key)# accept-lifetime 04:00:00 Dec 4 2006 infinite
Device(config-keychain-key)# send-lifetime 04:00:00 Dec 4 2006 04:48:00 Dec 4 1996
Device(config-keychain-key)# exit
Device(config-keychain)# key 2
Device(config-keychain-key)# key-string 1234567890
Device(config-keychain-key)# accept-lifetime 04:00:00 Jan 4 2007 infinite
Device(config-keychain-key)# send-lifetime 04:45:00 Jan 4 2007 infinite
```

Device B Configuration

```
Device> enable
Device(config)# configure terminal
Device(config)# router eigrp 1
Device(config-router)# exit
Device(config)# interface Gigabitethernet 1/0/9
Device(config-if)# no switchport
Device(config-if)# ip authentication mode eigrp 1 md5
Device(config-if)# ip authentication key-chain eigrp 1 key2
```

Example: EIGRP Route Authentication—Named Configuration

```

Device(config-if)# exit
Device(config)# key chain key2
Device(config-keychain)# key 1
Device(config-keychain-key)# key-string 0987654321
Device(config-keychain-key)# accept-lifetime 04:00:00 Dec 4 2006 infinite
Device(config-keychain-key)# send-lifetime 04:00:00 Dec 4 2006 infinite
Device(config-keychain-key)# exit
Device(config-keychain)# key 2
Device(config-keychain-key)# key-string 1234567890
Device(config-keychain-key)# accept-lifetime 04:00:00 Jan 4 2007 infinite
Device(config-keychain-key)# send-lifetime 04:45:00 Jan 4 2007 infinite

```

Example: EIGRP Route Authentication—Named Configuration

The following example shows how to enable MD5 authentication on EIGRP packets in a named configuration.

Device A will accept and attempt to verify the MD5 digest of any EIGRP packet with a key equal to 1. It will also accept a packet with a key equal to 2. All other MD5 packets will be dropped. Device A will send all EIGRP packets with key 2.

Device B will accept key 1 or key 2 and will use key 1 to send MD5 authentication because key 1 is the first valid key of the key chain. Key 1 is not valid after December 4, 2006. After this date, key 2 will be used to send MD5 authentication because it is valid until January 4, 2007.

Device A Configuration

```

Device> enable
Device# configure terminal
Device(config)# router eigrp virtual-name1
Device(config-router)# address-family ipv4 autonomous-system 45000
Device(config-router-af)# network 172.16.0.0
Device(config-router-af)# af-interface Gigabitethernet 1/0/1
Device(config-router-af-interface)# authentication key-chain SITE1
Device(config-router-af-interface)# authentication mode md5
Device(config-router-af-interface)# exit-af-interface
Device(config-router-af)# exit-address-family
Device(config-router)# exit
Device(config)# key chain SITE1
Device(config-keychain)# key 1
Device(config-keychain-key)# key-string 0987654321
Device(config-keychain-key)# accept-lifetime 04:00:00 Dec 4 2006 infinite
Device(config-keychain-key)# send-lifetime 04:00:00 Dec 4 2006 infinite
Device(config-keychain-key)# exit
Device(config-keychain)# key 2
Device(config-keychain-key)# key-string 1234567890
Device(config-keychain-key)# accept-lifetime 04:00:00 Jan 4 2007 infinite
Device(config-keychain-key)# send-lifetime 04:45:00 Jan 4 2007 infinite

```

Device B Configuration

```

Device> enable
Device# configure terminal
Device(config)# router eigrp virtual-name2
Device(config-router)# address-family ipv4 autonomous-system 45000
Device(config-router-af)# network 172.16.0.0
Device(config-router-af)# af-interface ethernet 0/0
Device(config-router-af-interface)# authentication key-chain SITE2
Device(config-router-af-interface)# authentication mode md5

```

```

Device(config-router-af-interface)# exit-af-interface
Device(config-router-af)# exit-address-family
Device(config-router)# exit
Device(config)# key chain SITE2
Device(config-keychain)# key 1
Device(config-keychain-key)# key-string 0987654321
Device(config-keychain-key)# accept-lifetime 04:00:00 Jan 4 2007 infinite
Device(config-keychain-key)# send-lifetime 04:00:00 Dec 4 2006 infinite

```

The following example shows how to configure advanced SHA authentication with password password1 and several key strings that will be rotated as time passes:

```

!
key chain chain1
key 1
  key-string securetraffic
  accept-lifetime 04:00:00 Dec 4 2006 infinite
  send-lifetime 04:00:00 Dec 4 2010 04:48:00 Dec 4 2008
!
key 2
  key-string newertraffic
  accept-lifetime 01:00:00 Dec 4 2010 infinite
  send-lifetime 03:00:00 Dec 4 2010 infinite
exit
!
router eigrp virtual-name
  address-family ipv6 autonomous-system 4453
    af-interface ethernet 0
      authentication mode hmac-sha-256 0 password1
      authentication key-chain key1
!
!
```

Feature Information for Overview of Cisco TrustSec

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 1: Feature Information for Overview of Cisco TrustSec

Feature Name	Releases	Feature Information
IPv6 enablement - Inline Tagging	Cisco IOS XE Fuji 16.8.1	The support for IPv6 is introduced.
