

RADIUS for Multiple UDP Ports

RADIUS security servers are identified on the basis of their hostname or IP address, hostname and specific UDP port numbers, or IP address and specific UDP port numbers. The combination of the IP address and UDP port number creates a unique identifier, allowing different ports to be individually defined as RADIUS hosts providing a specific authentication, authorization, and accounting (AAA) service. This unique identifier enables RADIUS requests to be sent to multiple UDP ports on a server at the same IP address. If two different host entries on the same RADIUS server are configured for the same service—for example, accounting—the second host entry configured acts as a failover backup to the first one. If the first host entry fails to provide accounting services, the network access server tries the second host entry configured on the same device for accounting services.

Prerequisites for RADIUS for Multiple UDP Ports

To configure RADIUS on your Cisco device or access server, you must perform these tasks:

- Use the **aaa new-model** global configuration command to enable AAA. AAA must be configured if you plan to use RADIUS.
- Use the **aaa authentication** global configuration command to define method lists for RADIUS authentication.
- Use line and interface commands to enable the defined method lists to be used.

Information About RADIUS for Multiple UDP Ports

Device-to-RADIUS Server Communication

The RADIUS host is normally a multiuser system running RADIUS server software from Cisco (CiscoSecure ACS), Livingston, Merit, Microsoft, or another software provider. Configuring device to RADIUS server communication can have several components:

- · Hostname or IP address
- Authentication destination port
- Accounting destination port
- Timeout period
- · Retransmission value
- Key string

RADIUS security servers are identified on the basis of their hostname or IP address, hostname and specific UDP port numbers, or IP address and specific UDP port numbers. The combination of the IP address and UDP port number creates a unique identifier, allowing different ports to be individually defined as RADIUS hosts providing a specific AAA service. This unique identifier enables RADIUS requests to be sent to multiple UDP ports on a server at the same IP address. If two different host entries on the same RADIUS server are configured for the same service—for example, accounting—the second host entry configured acts as a failover backup to the first one. If the first host entry fails to provide accounting services, the network access server tries the second host entry configured on the same device for accounting services. (The RADIUS host entries are tried in the order they are configured.)

A RADIUS server and a Cisco device use a shared secret text string to encrypt passwords and exchange responses. To configure RADIUS to use the AAA security commands, you must specify the host running the RADIUS server daemon and a secret text (key) string that it shares with the device.

The timeout, retransmission, and encryption key values are configurable globally for all RADIUS servers, on a per-server basis or in some combination of global and per-server settings. To apply these settings globally to all RADIUS servers communicating with the device, use the three unique global commands: **radius-server timeout**, **radius-server retransmit**, and **radius-server key**. To apply these values on a specific RADIUS server, use the **radius-server host** command.

Note

You can configure both global and per-server timeout, retransmission, and key value commands simultaneously on the same Cisco network access server. If both global and per-server functions are configured on a device, the per-server timer, retransmission, and key value commands override global timer, retransmission, and key value commands.

How to Configure RADIUS for Multiple UDP Ports

Configuring Device-to-RADIUS Server Communication

SUMMARY STEPS

- 1. enable
- 2. configure terminal
- 3. radius server server-name
- 4. address ipv4 ip-address
- **5.** key {0 string | 7 string | string}
- 6. retransmit retries
- 7. timeout seconds
- 8. exit

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example:	• Enter your password if prompted.
	Device> enable	
Step 2	configure terminal	Enters global configuration mode.
	Example:	
	Device# configure terminal	
Step 3	radius server server-name	Specifies the name for the RADIUS server.
	Example:	
	Device(config)# radius server rad1	
Step 4	address ipv4 ip-address	Assigns an IP address to the RADIUS server.
	Example:	
	Device(config-radius-server)# address ipv4 10.45.1.2	
Step 5	key {0 string 7 string string}	Specifies the shared secret text string used between the
	Example:	device and a RADIUS server.
	Device(config-radius-server)# key myRaDIUSpassword	Note In this step, the encryption key value is configured globally for all RADIUS servers.

	Command or Action	Purpose
		• Use the 0 <i>string</i> option to configure an unencrypted shared secret. Use the 7 <i>string</i> option to configure an encrypted shared secret.
Step 6	retransmit retries	Specifies how many times the device transmits each RADIUS request to the server before giving up (the default is 3).
	Example:	
	Device(config-radius-server)# retransmit 25	Note In this step, the retransmission value is configured globally for all RADIUS servers.
Step 7	timeout seconds	 Specifies for how many seconds a device waits for a reply to a RADIUS request before retransmitting the request. Note In this step, the timeout value is configured globally for all RADIUS servers.
	Example:	
	Device(config-radius-server)# timeout 6	
Step 8	exit	Returns to privileged EXEC mode.
	Example:	
	Device(config)# exit	

Configuration Examples for RADIUS for Multiple UDP Ports

Example: Device-to-RADIUS Server Communication

The following example shows how to configure two RADIUS servers with specific timeout, retransmit, and key values. In this example, the **aaa new-model** command enables AAA services on the device, and specific AAA commands define the AAA services. The **retransmit** command changes the global retransmission value to 4 for all RADIUS servers. The **host** command configures specific timeout, retransmission, and key values for the RADIUS server hosts with IP addresses 172.16.1.1 and 172.29.39.46.

```
! Enable AAA services on the device and define those services.
aaa new-model
aaa authentication login default group radius
aaa authentication ppp default group radius
aaa authentication network default group radius
aaa accounting exec default start-stop group radius
aaa accounting network default start-stop group radius
enable password tryit1
!
Device (config) # radius server rad1
Device (config-radius-server) # address ipv4 10.45.1.2
Device (config-radius-server) # key myRaDIUSpassword
Device (config-radius-server) # retransmit 25
Device (config-radius-server) # timeout 6
Device (config) # exit
```

Example: RADIUS Server with Server-Specific Values

The following example shows how to configure server-specific timeout, retransmit, and key values for the RADIUS server with IP address 172.31.39.46:

radius-server host 172.31.39.46 timeout 6 retransmit 5 key rad123

Feature Information for RADIUS for Multiple UDP Ports

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.
