integrity

To specify the ESP integrity algorithm in an IKEv2 security association (SA) for AnyConnect IPsec connections, use the integrity command in IKEv2 policy configuration mode. To remove the command and use the default setting, use the **no** form of this command:

```
integrity { md5 | sha | sha256 | sha384 | sha512 | null }
no integrity { md5 | sha | sha256 | sha384 | sha512 | null }
```

Syntax Description

md5	Specifies the MD5 algorithm for the ESP integrity protection.
null	Allows an administrator to choose null as the IKEv2 integrity algorithm when AES-GCM is specified as the encryption algorithm.
sha	(Default) Specifies the Secure Hash Algorithm (SHA) SHA 1, defined in the U.S. Federal Information Processing Standard (FIPS), for ESP integrity protection.
sha256	Specifies the Secure Hash Algorithm SHA 2 with the 256-bit digest.
sha384	Specifies the Secure Hash Algorithm SHA 2 with the 384-bit digest.
sha512	Specifies the Secure Hash Algorithm SHA 2 with the 512-bit digest.

Command Default

The default is **sha** (SHA 1 algorithm).

Usage Guidelines

An IKEv2 SA is a key used in phase 1 to enable IKEv2 peers to communicate securely in phase 2. After entering the crypto ikev2 policy command, use the **integrity** command to set the integrity algorithm for the ESP protocol.

Command Modes

The following table shows the modes in which you can enter the command:

Command Mode	Firewall Mode		Security Context		
	Routed	Transparent	Single	Multiple	
				Context	System
Global Configuration	• Yes	—	• Yes	—	—

Command History

Release Modification

- | | |
|--------|---|
| 8.4(1) | This command was added. |
| 8.4(2) | The sha256, sha384, and sha512 keywords were added for SHA 2 support. |
| 9.0(1) | The null option as an IKEv2 integrity algorithm was added. |

Examples

The following example enters IKEv2 policy configuration mode and sets the integrity algorithm to MD5:

```
ciscoasa(config)# crypto ikev2 policy 1
ciscoasa(config-ikev2-policy)# integrity md5
```

Related Commands

Command	Description
encryption	Specifies the encryption algorithm in an IKEv2 SA for AnyConnect IPsec connections.
group	Specifies the Diffie-Hellman group in an IKEv2 SA for AnyConnect IPsec connections.
lifetime	Specifies the SA lifetime for the IKEv2 SA for AnyConnect IPsec connections.
prf	Specifies the pseudo-random function in an IKEv2 SA for AnyConnect IPsec connections.

intercept-dhcp

To enable DHCP Intercept, use the **intercept-dhcp enable** command in group-policy configuration mode. To remove the **intercept-dhcp** attribute from the running configuration and allow the users to inherit a DHCP Intercept configuration from the default or other group policy, use the **no** form of this command.

```
intercept-dhcp netmask { enable | disable }  
no intercept-dhcp
```

Syntax Description

disable Disables DHCP Intercept.

enable Enables DHCP Intercept.

netmask Provides the subnet mask for the tunnel IP address.

Command Default

DHCP Intercept is disabled.

Command Modes

The following table shows the modes in which you can enter the command:

Command Mode	Firewall Mode		Security Context		
	Routed	Transparent	Single	Multiple	
				Context	System
Global-policy configuration	• Yes	—	• Yes	—	—

Command History

Release Modification

7.0(1) This command was added.

Usage Guidelines

To disable DHCP Intercept, use the **intercept-dhcp disable** command.

A Microsoft XP anomaly results in the corruption of domain names if split tunnel options exceed 255 bytes. To avoid this problem, the ASA limits the number of routes it sends to 27 to 40 routes, with the number of routes dependent on the classes of the routes.

DHCP Intercept lets Microsoft XP clients use split-tunneling with the ASA. The ASA replies directly to the Microsoft Windows XP client DHCP Inform message, providing that client with the subnet mask, domain name, and classless static routes for the tunnel IP address. For Windows clients prior to XP, DHCP Intercept provides the domain name and subnet mask. This is useful in environments in which using a DHCP server is not advantageous.

Examples

The following example shows how to set DHCP Intercepts for the group policy named FirstGroup:

```
ciscoasa(config)# group-policy FirstGroup attributes  
ciscoasa(config-group-policy)# intercept-dhcp enable
```

interface (global)

To configure an interface and enter interface configuration mode, use the **interface** command in global configuration mode. To remove a subinterface, use the **no** form of this command; you cannot remove a physical interface or a mapped interface.

For physical interfaces (for all models except the ASASM):

interface *physical_interface*

For subinterfaces (not available for the ASA 5505 or the ASASM, or for the Management interface on the ASA 5506-X through ASA 5555-X):

interface { *physical_interface* | **redundant number** | **port-channel number** } . *subinterface*

no interface { *physical_interface* | **redundant number** | **port-channel number** } . *subinterface*

For multiple context mode when a mapped name is assigned:

interface *mapped_name*

Syntax Description

mapped_name In multiple context mode, specifies the mapped name if it was assigned using the **allocate-interface** command.

physical_interface Specifies the physical interface type, slot, and port number as *type[slot/port]*. A space between the type and slot/port is optional.

The physical interface types include the following:

- **ethernet**
- **gigabitethernet**
- **tengigabitethernet**
- **management**

Enter the type followed by slot/port, for example, **gigabitethernet 0/1**.

The management interface is meant for management traffic only. You can, however, use it for through traffic if desired, depending on your model (see the **management-only** command).

See the hardware documentation that came with your model to identify the interface type, slot, and port number.

subinterface Specifies an integer between 1 and 4294967293 designating a logical subinterface. The maximum number of subinterfaces varies depending on your ASA model. Subinterfaces are not available for the ASA 5505, ASASM, or for the management interface on the ASA 5512-X through ASA 5555-X. See the configuration guide for the maximum subinterfaces (or VLANs) per platform. An interface with one or more VLAN subinterfaces is automatically configured as an 802.1Q trunk.

Command Default

By default, the ASA automatically generates **interface** commands for all physical interfaces.

In multiple context mode, the ASA automatically generates **interface** commands for all interfaces allocated to the context using the **allocate-interface** command.

The default state of an interface depends on the type and the context mode:

- Multiple context mode, context—All allocated interfaces are enabled by default, no matter what the state of the interface is in the system execution space. However, for traffic to pass through the interface, the interface also has to be enabled in the system execution space. If you shut down an interface in the system execution space, then that interface is down in all contexts that share it.
- Single mode or multiple context mode, system—Interfaces have the following default states:
 - Physical interfaces—Disabled.
 - Subinterfaces—Enabled. However, for traffic to pass through the subinterface, the physical interface must also be enabled.

Command Modes

The following table shows the modes in which you can enter the command:

Command Mode	Firewall Mode		Security Context		
	Routed	Transparent	Single	Multiple	
				Context	System
Global Configuration	• Yes	• Yes	• Yes	• Yes	• Yes

Command History

Release Modification

7.0(1) This command was modified to allow for new subinterface naming conventions and to change arguments to be separate commands under interface configuration mode.

Usage Guidelines

In interface configuration mode, you can configure hardware settings (for physical interfaces), assign a name, assign a VLAN, assign an IP address, and configure many other settings, depending on the type of interface and the security context mode.

For an enabled interface to pass traffic, configure the following interface configuration mode commands: **nameif**, and, for routed mode, **ip address**. For subinterfaces, also configure the **vlan** command.

If you change interface settings, and you do not want to wait for existing connections to time out before the new security information is used, you can clear the connections using the **clear local-host** command.

The Management 0/0 interface on the ASA 5512-X through ASA 5555-X has the following characteristics:

- No through traffic support
- No subinterface support
- No priority queue support
- No multicast MAC support
- The IPS SSP software module shares the Management 0/0 interface. Separate MAC addresses and IP addresses are supported for the ASA and IPS module. You must perform configuration of the IPS IP

address within the IPS operating system. However, physical characteristics (such as enabling the interface) are configured on the ASA.

Examples

The following example configures parameters for the physical interface in single mode:

```
ciscoasa(config)# interface gigabitethernet0/1
ciscoasa(config-if)# speed 1000
ciscoasa(config-if)# duplex full
ciscoasa(config-if)# nameif inside
ciscoasa(config-if)# security-level 100
ciscoasa(config-if)# ip address 10.1.1.1 255.255.255.0
ciscoasa(config-if)# no shutdown
```

The following example configures parameters for a subinterface in single mode:

```
ciscoasa(config)# interface gigabitethernet0/1.1
ciscoasa(config-subif)# vlan 101
ciscoasa(config-subif)# nameif dmz1
ciscoasa(config-subif)# security-level 50
ciscoasa(config-subif)# ip address 10.1.2.1 255.255.255.0
ciscoasa(config-subif)# no shutdown
```

The following example configures interface parameters in multiple context mode for the system configuration, and allocates the gigabitethernet 0/1.1 subinterface to contextA:

```
ciscoasa(config)# interface gigabitethernet0/1
ciscoasa(config-if)# speed 1000
ciscoasa(config-if)# duplex full
ciscoasa(config-if)# no
shutdown
ciscoasa(config-if)# interface gigabitethernet0/1.1
ciscoasa(config-subif)# vlan 101
ciscoasa(config-subif)# no shutdown
ciscoasa(config-subif)# context contextA
ciscoasa(config-ctx)# ...
ciscoasa(config-ctx)# allocate-interface gigabitethernet0/1.1
```

The following example configures parameters in multiple context mode for the context configuration:

```
ciscoasa/contextA(config)# interface gigabitethernet0/1.1
ciscoasa/contextA(config-if)# nameif inside
ciscoasa/contextA(config-if)# security-level 100
ciscoasa/contextA(config-if)# ip address 10.1.2.1 255.255.255.0
ciscoasa/contextA(config-if)# no shutdown
```

Related Commands

Command	Description
allocate-interface	Assigns interfaces and subinterfaces to a security context.
member-interface	Assigns interfaces to a redundant interface.
clear interface	Clears counters for the show interface command.
show interface	Displays the runtime status and statistics of interfaces.
vlan	Assigns a VLAN to a subinterface.

interface (vpn load-balancing)

To specify a non-default public or private interface for VPN load-balancing in the VPN load-balancing virtual cluster, use the **interface** command in vpn load-balancing mode. To remove the interface specification and revert to the default interface, use the **no** form of this command.

```
interface { lbprivate | lbpublic } interface-name
interface { lbprivate | lbpublic }
```

Syntax Description

interface-name The name of the interface to be configured as the public or private interface for the VPN load-balancing cluster.

lbprivate Specifies that this command configures the private interface for VPN load-balancing.

lbpublic Specifies that this command configures the public interface for VPN load-balancing.

Command Default

If you omit the **interface** command, the **lbprivate** interface defaults to **inside**, and the **lbpublic** interface defaults to **outside**.

Command Modes

The following table shows the modes in which you can enter the command:

Command Mode	Firewall Mode		Security Context		
	Routed	Transparent	Single	Multiple	
				Context	System
vpn load-balancing	• Yes	—	• Yes	—	—

Command History

Release Modification

7.0(1) This command was added.

Usage Guidelines

You must have first used the **vpn load-balancing** command to enter vpn load-balancing configuration mode.

You must also have previously used the **interface**, **ip address** and **nameif** commands to configure and assign a name to the interface that you are specifying in this command.

Examples

The following is an example of a **vpn load-balancing** command sequence that includes an **interface** command that specifies the public interface of the cluster as “test” one that reverts the private interface of the cluster to the default (inside):

```
ciscoasa(config)# interface GigabitEthernet 0/1
ciscoasa(config-if)# ip address 209.165.202.159 255.255.255.0
ciscoasa(config)# nameif test
ciscoasa(config)# interface GigabitEthernet 0/2
ciscoasa(config-if)# ip address 209.165.201.30 255.255.255.0
```

```
ciscoasa(config)# nameif foo
ciscoasa(config)# vpn load-balancing
ciscoasa(config-load-balancing)# interface lbpublic test
ciscoasa(config-load-balancing)# no
  interface lbprivate
ciscoasa(config-load-balancing)# cluster ip address 209.165.202.224
ciscoasa(config-load-balancing)# participate

ciscoasa(config-load-balancing)# participate
```

Related Commands

Command	Description
vpn load-balancing	Enters vpn load-balancing configuration mode.

interface bvi

To configure the bridge virtual interface (BVI) for a bridge group, use the **interface bvi** command in global configuration mode. To remove the BVI configuration, use the **no** form of this command.

```
interface bvi bridge_group_number
no interface bvi bridge_group_number
```

Syntax Description

bridge_group_number Specifies the bridge group number as an integer between 1 and 100; for 9.3(1) and later, the range is increased to between 1 and 250.

Command Default

No default behavior or values.

Command Modes

The following table shows the modes in which you can enter the command:

Command Mode	Firewall Mode		Security Context		
	Routed	Transparent	Single	Multiple	
				Context	System
Global Configuration	—	• Yes	• Yes	• Yes	—

Command History

Release Modification

8.4(1) This command was added.

9.3(1) The number range was increased to between 1 and 250 to support 250 BVIs.

9.6(2) The maximum interfaces per bridge group was increased from 4 to 64.

Usage Guidelines

Use this command to enter interface configuration mode so you can configure a management IP address for the bridge group. If you do not want the overhead of security contexts, or want to maximize your use of security contexts, you can group interfaces together in a bridge group, and then configure multiple bridge groups, one for each network. Bridge group traffic is isolated from other bridge groups; traffic is not routed to another bridge group within the ASA, and traffic must exit the ASA before it is routed by an external router back to another bridge group in the ASA. Although the bridging functions are separate for each bridge group, many other functions are shared between all bridge groups. For example, all bridge groups share a syslog server or AAA server configuration. For complete security policy separation, use security contexts with one bridge group in each context. At least one bridge group is required per context or in single mode.

Each bridge group requires a management IP address. The ASA uses this IP address as the source address for packets originating from the bridge group. The management IP address must be on the same subnet as the connected network. For IPv4 traffic, the management IP address is required to pass any traffic. For IPv6 traffic, you must, at a minimum, configure the link-local addresses to pass traffic, but a global management address is recommended for full functionality, including remote management and other management operations.

For another method of management, you can configure the Management interface, separate from any bridge groups.

For 9.2 and earlier, You can configure up to 8 bridge groups in single mode or per context in multiple mode; for 9.3(1) and later, you can configure up to 250 bridge groups. Each bridge group can include up to 4 interfaces. In 9.6(2) and later, you can add up to 64 interfaces to a bridge group. You cannot assign the same interface to more than one bridge group. Note that you must use at least 1 bridge group; data interfaces must belong to a bridge group.

Note Although you can configure multiple bridge groups on the ASA 5505, the restriction of 2 data interfaces in transparent mode on the ASA 5505 means you can only effectively use 1 bridge group.

Note For a separate management interface, a non-configurable bridge group (ID 301) is automatically added to your configuration. This bridge group is not included in the bridge group limit.

Note The ASA does not support traffic on secondary networks; only traffic on the same network as the management IP address is supported.

Examples

The following example includes two bridge groups of three interfaces each, plus a management-only interface:

```
interface gigabitethernet 0/0
nameif inside
security-level 100
bridge-group 1
no shutdown
interface gigabitethernet 0/1
nameif outside
security-level 0
bridge-group 1
no shutdown
interface gigabitethernet 0/2
nameif dmz
security-level 50
bridge-group 1
no shutdown
interface bvi 1
ip address 10.1.3.1 255.255.255.0 standby 10.1.3.2
interface gigabitethernet 1/0
nameif inside
security-level 100
bridge-group 2
no shutdown
interface gigabitethernet 1/1
nameif outside
security-level 0
bridge-group 2
no shutdown
interface gigabitethernet 1/2
nameif dmz
```

```

security-level 50
bridge-group 2
no shutdown
interface bvi 2
ip address 10.3.5.8 255.255.255.0 standby 10.3.5.9
interface management 0/0
nameif mgmt
security-level 100
ip address 10.2.1.1 255.255.255.0 standby 10.2.1.2
no shutdown

```

Related Commands

Command	Description
ace/bvi	Clears the bridge virtual interface configuration.
bridge-group	Groups transparent firewall interfaces into a bridge group.
interface	Configures an interface.
ip address	Sets the management IP address for a bridge group.
show bridge-group	Shows bridge group information, including member interfaces and IP addresses.
show running-config interface bvi	Shows the bridge group interface configuration.

interface loopback

To create a loopback interface, use the **interface loopback** command in the global configuration mode. Use the **no** form of the command to remove the loopback interface.

interface loopback *number*
no interface loopback *number*

Command Default

No default behavior or values.

Command Modes

The following table shows the modes in which you can enter the command.

Command Mode	Firewall Mode		Security Context		
	Routed	Transparent	Single	Multiple	
				Context	System
Global configuration	• Yes	• Yes	• Yes	• Yes	—

Usage Guidelines

A loopback interface is software-only interface that emulates a physical interface. The loopback interface is reachable through multiple physical interfaces. You can only use a loopback interface for to/from the device traffic.

The following features support the loopback interface:

- AAA
- BGP
- DNS
- HTTP
- ICMP
- SNMP
- SSH
- Syslog
- Telnet
- VTI source interface

Command History

Release Modification

9.18(2) This command was added.

9.19(1) Support for VTI was added.

Release Modification

9.20(1) Support for DNS, HTTP, and ICMP was added.

Examples

The following example creates a new loopback interface:

```
ciscoasa(config)# interface loopback 10
```

Related Commands

Command	Description
tunnel source interface	Specifies the source interface to create a VTI tunnel.
ssh	Configures SSH for an interface.
logging host	Specifies the syslog host.
neighbor update-source	Configures an interface as the source for a BGP-speaking neighbor.
snmp-server host	Specifies the SNMP server.
telnet	Configures Telnet for an interface.

interface-policy

To specify the policy for failover when monitoring detects an interface failure, use the **interface-policy** command in failover group configuration mode. To restore the default values, use the **no** form of this command.

interface-policy *num* [%]
no interface-policy *num* [%]

Syntax Description

num Specifies a number from 1 to 100 when used as a percentage, or 1 to the maximum number of interfaces.

% (Optional) Specifies that the number *num* is a percentage of the monitored interfaces.

Command Default

If the **failover interface-policy** command is configured for the unit, then the default for the **interface-policy failover group** command assumes that value. If not, then *num* is 1.

Command Modes

The following table shows the modes in which you can enter the command:

Command Mode	Firewall Mode		Security Context		
	Routed	Transparent	Single	Multiple	
				Context	System
Failover group Configuration	• Yes	• Yes	—	—	• Yes

Command History

Release Modification

7.0(1) This command was added.

Usage Guidelines

There is no space between the *num* argument and the optional % keyword.

If the number of failed interfaces meets the configured policy and the other ASA is functioning correctly, the ASA will mark itself as failed and a failover may occur (if the active ASA is the one that fails). Only interfaces that are designated as monitored by the **monitor-interface** command count towards the policy.

Examples

The following partial example shows a possible configuration for a failover group:

```
ciscoasa(config)# failover group 1

ciscoasa(config-fover-group)# primary
ciscoasa(config-fover-group)# preempt 100
ciscoasa(config-fover-group)# interface-policy 25%
ciscoasa(config-fover-group)# exit
ciscoasa(config)#
```

Related Commands

Command	Description
failover group	Defines a failover group for Active/Active failover.
failover interface-policy	Configures the interface monitoring policy.
monitor-interface	Specifies the interfaces being monitored for failover.

interface port-channel

To configure an EtherChannel interface and enter interface configuration mode, use the **interface port-channel** command in global configuration mode. To remove an EtherChannel interface, use the **no** form of this command.

interface port-channel *number*
no interface port-channel *number*

Syntax Description

number Specifies the EtherChannel channel group ID, between 1 and 48. This interface was created automatically when you added an interface to the channel group. If you have not yet added an interface, then this command creates the port-channel interface.

Note You need to add at least one member interface to the port-channel interface before you can configure logical parameters for it, such as a name.

Command Default

By default, port-channel interfaces are enabled. However, for traffic to pass through the EtherChannel, the channel group physical interfaces must also be enabled.

Command Modes

The following table shows the modes in which you can enter the command:

Command Mode	Firewall Mode		Security Context		
	Routed	Transparent	Single	Multiple	
				Context	System
Global Configuration	• Yes	• Yes	• Yes	• Yes	• Yes

Command History

Release Modification

8.4(1) This command was added.

Usage Guidelines

In interface configuration mode, you can assign a name, assign an IP address, and configure many other settings.

For an enabled interface to pass traffic, configure the following interface configuration mode commands: **nameif**, and, for routed mode, **ip address**.

If you change interface settings, and you do not want to wait for existing connections to time out before the new security information is used, you can clear the connections using the **clear local-host** command.

Note This command is not supported on the ASA 5505 or the ASASM. You cannot use interfaces on the 4GE SSM, including the integrated 4GE SSM in slot 1 on the ASA 5550, as part of an EtherChannel.

For more information about interfaces, see the CLI configuration guide.

Examples

The following example configures three interfaces as part of an EtherChannel. It also sets the system priority to be a higher priority, and GigabitEthernet 0/2 to be a higher priority than the other interfaces in case more than eight interfaces are assigned to the EtherChannel.

```
ciscoasa(config)# lACP system-priority 1234
ciscoasa(config-if)# interface GigabitEthernet0/0
ciscoasa(config-if)# channel-group 1 mode active
ciscoasa(config-if)# interface GigabitEthernet0/1
ciscoasa(config-if)# channel-group 1 mode active
ciscoasa(config-if)# interface GigabitEthernet0/2
ciscoasa(config-if)# lACP port-priority 1234
ciscoasa(config-if)# channel-group 1 mode passive
ciscoasa(config-if)# interface Port-channel1
ciscoasa(config-if)# lACP max-bundle 4
ciscoasa(config-if)# port-channel min-bundle 2
ciscoasa(config-if)# port-channel load-balance dst-ip
```

Related Commands

Command	Description
channel-group	Adds an interface to an EtherChannel.
interface port-channel	Configures an EtherChannel.
lACP max-bundle	Specifies the maximum number of active interfaces allowed in the channel group.
lACP port-priority	Sets the priority for a physical interface in the channel group.
lACP system-priority	Sets the LACP system priority.
port-channel load-balance	Configures the load-balancing algorithm.
port-channel min-bundle	Specifies the minimum number of active interfaces required for the port-channel interface to become active.
show lACP	Displays LACP information such as traffic statistics, system identifier and neighbor details.
show port-channel	Displays EtherChannel information in a detailed and one-line summary form. This command also displays the port and port-channel information.
show port-channel load-balance	Displays port-channel load-balance information along with the hash result and member interface selected for a given set of parameters.

interface redundant

To configure a redundant interface and enter interface configuration mode, use the **interface redundant** command in global configuration mode. To remove a redundant interface, use the **no** form of this command.

interface redundant *number*
no interface redundant *number*

Syntax Description

number Specifies a logical redundant interface ID, between 1 and 8. A space between **redundant** and the ID is optional.

Command Default

By default, redundant interfaces are enabled. However, for traffic to pass through the redundant interface, the member physical interfaces must also be enabled.

Command Modes

The following table shows the modes in which you can enter the command:

Command Mode	Firewall Mode		Security Context		
	Routed	Transparent	Single	Multiple	
				Context	System
Global Configuration	• Yes	• Yes	• Yes	• Yes	• Yes

Command History

Release Modification

8.0(2) This command was added.

Usage Guidelines

A redundant interface pairs an active and a standby physical interface (see the **member-interface** command). When the active interface fails, the standby interface becomes active and starts passing traffic.

All ASA configuration refers to the logical redundant interface instead of the member physical interfaces.

In interface configuration mode, you can assign a name, assign an IP address, and configure many other settings.

For an enabled interface to pass traffic, configure the following interface configuration mode commands: **nameif**, and, for routed mode, **ip address**.

If you change interface settings, and you do not want to wait for existing connections to time out before the new security information is used, you can clear the connections using the **clear local-host** command.

Note This command is not supported on the ASA 5505 or the ASASM.

For more information about interfaces, see the CLI configuration guide.

Examples

The following example creates two redundant interfaces:

```
ciscoasa(config)# interface redundant 1
ciscoasa(config-if)# member-interface gigabitethernet 0/0
ciscoasa(config-if)# member-interface gigabitethernet 0/1
ciscoasa(config-if)# interface redundant 2
ciscoasa(config-if)# member-interface gigabitethernet 0/2
ciscoasa(config-if)# member-interface gigabitethernet 0/3
```

Related Commands

Command	Description
clear interface	Clears counters for the show interface command.
debug redundant-interface	Displays debug messages related to redundant interface events or errors.
interface redundant	Creates a redundant interface.
member-interface	Assigns a physical interface to a redundant interface.
redundant-interface	Changes the active member interface.
show interface	Displays the runtime status and statistics of interfaces.

interface tunnel

To create a new VTI tunnel interface, use the **interface tunnel** command in the Global Configuration mode. Use the no form of the command to remove the VTI tunnel interface.

interface tunnel *number*
no interface tunnel *number*

Syntax Description

number Assigns a number to the tunnel interface. This can be any value between 0-1024.

Command Default

No default behavior or values.

Command Modes

The following table shows the modes in which you can enter the command.

Command Mode	Firewall Mode		Security Context		
	Routed	Transparent	Single	Multiple	
				Context	System
Global Configuration	• Yes	• No	• Yes	• No	• -

Command History

Release Modification

9.7(1) We introduced this command and its submodes.

9.16(1) The number of tunnel interfaces supported was increased from 100 to 1024 per device.

Examples

The following example creates a new tunnel interface:

```
ciscoasa(config)# interface tunnel 10
```

Related Commands

Command	Description
tunnel source interface	Specifies the source interface to create a VTI tunnel.
tunnel destination	Specifies the IP address of the VTI tunnel's destination.
tunnel mode	Specifies that IPsec is used for tunnel protection.
tunnel protection ipsec	Specifies the IPsec profile that will be used for tunnel protection.

interface vlan

For the ASA 5505 and ASASM, to configure a VLAN interface and enter interface configuration mode, use the **interface vlan** command in global configuration mode. To remove a VLAN interface, use the **no** form of this command.

interface vlan *number*
no interface vlan *number*

Syntax Description

number Specifies a VLAN ID.

For the ASA 5505, use an ID between 1 and 4090. The VLAN interface ID is enabled by default on VLAN 1.

For the ASASM, use an ID between 2 to 1000 and from 1025 to 4094.

Command Default

By default, VLAN interfaces are enabled.

Command Modes

The following table shows the modes in which you can enter the command:

Command Mode	Firewall Mode		Security Context		
	Routed	Transparent	Single	Multiple	
				Context	System
Global Configuration	• Yes	• Yes	• Yes	• Yes	• Yes

Command History

Release Modification

7.2(1) This command was added.

8.4(1) ASASM support was added.

Usage Guidelines

For the ASASM, you can add any VLAN ID to the configuration, but only VLANs that are assigned to the ASA by the switch can pass traffic. To view all VLANs assigned to the ASA, use the **show vlan** command. If you add an interface for a VLAN that is not yet assigned to the ASA by the switch, the interface will be in the down state. When you assign the VLAN to the ASA, the interface changes to an up state. See the **show interface** command for more information about interface states.

In interface configuration mode, you can assign a name, assign an IP address, and configure many other settings.

For an enabled interface to pass traffic, configure the following interface configuration mode commands: **nameif**, and, for routed mode, **ip address**. For the ASA 5505 switch physical interfaces, assign the physical interface to the VLAN interface using the **switchport access vlan** command.

If you change interface settings, and you do not want to wait for existing connections to time out before the new security information is used, you can clear the connections using the **clear local-host** command.

For more information about interfaces, see the CLI configuration guide.

Examples

The following example configures three VLAN interfaces. The third home interface cannot forward traffic to the work interface.

```
ciscoasa(config)# interface vlan 100
ciscoasa(config-if)# nameif outside
ciscoasa(config-if)# security-level 0
ciscoasa(config-if)# ip address dhcp
ciscoasa(config-if)# no shutdown
ciscoasa(config-if)# interface vlan 200
ciscoasa(config-if)# nameif work
ciscoasa(config-if)# security-level 100
ciscoasa(config-if)# ip address 10.1.1.1 255.255.255.0
ciscoasa(config-if)# no shutdown
ciscoasa(config-if)# interface vlan 300
ciscoasa(config-if)# no forward interface vlan 200
ciscoasa(config-if)# nameif home
ciscoasa(config-if)# security-level 50
ciscoasa(config-if)# ip address 10.2.1.1 255.255.255.0
ciscoasa(config-if)# no shutdown
ciscoasa(config-if)# interface ethernet 0/0
ciscoasa(config-if)# switchport access vlan 100
ciscoasa(config-if)# no shutdown
ciscoasa(config-if)# interface ethernet 0/1
ciscoasa(config-if)# switchport access vlan 200
ciscoasa(config-if)# no shutdown
ciscoasa(config-if)# interface ethernet 0/2
ciscoasa(config-if)# switchport access vlan 200
ciscoasa(config-if)# no shutdown
ciscoasa(config-if)# interface ethernet 0/3
ciscoasa(config-if)# switchport access vlan 200
ciscoasa(config-if)# no shutdown
ciscoasa(config-if)# interface ethernet 0/4
ciscoasa(config-if)# switchport access vlan 300
ciscoasa(config-if)# no shutdown
```

The following example configures five VLAN interfaces, including the failover interface, which is configured separately using the **failover lan** command:

```
ciscoasa(config)# interface vlan 100
ciscoasa(config-if)# nameif outside
ciscoasa(config-if)# security-level 0
ciscoasa(config-if)# ip address 10.1.1.1 255.255.255.0
ciscoasa(config-if)# no shutdown
ciscoasa(config-if)# interface vlan 200
ciscoasa(config-if)# nameif inside
ciscoasa(config-if)# security-level 100
ciscoasa(config-if)# ip address 10.2.1.1 255.255.255.0
ciscoasa(config-if)# no shutdown
ciscoasa(config-if)# interface vlan 300
ciscoasa(config-if)# nameif dmz
ciscoasa(config-if)# security-level 50
ciscoasa(config-if)# ip address 10.3.1.1 255.255.255.0
ciscoasa(config-if)# no shutdown
ciscoasa(config-if)# interface vlan 400
ciscoasa(config-if)# nameif backup-isp
ciscoasa(config-if)# security-level 50
ciscoasa(config-if)# ip address 10.1.2.1 255.255.255.0
```

```

ciscoasa(config-if)# no shutdown
ciscoasa(config-if)# failover lan faillink vlan500
ciscoasa(config)# failover interface ip faillink 10.4.1.1 255.255.255.0 standby 10.4.1.2
255.255.255.0
ciscoasa(config)# interface ethernet 0/0
ciscoasa(config-if)# switchport access vlan 100
ciscoasa(config-if)# no shutdown
ciscoasa(config-if)# interface ethernet 0/1
ciscoasa(config-if)# switchport access vlan 200
ciscoasa(config-if)# no shutdown
ciscoasa(config-if)# interface ethernet 0/2
ciscoasa(config-if)# switchport access vlan 300
ciscoasa(config-if)# no shutdown
ciscoasa(config-if)# interface ethernet 0/3
ciscoasa(config-if)# switchport access vlan 400
ciscoasa(config-if)# no shutdown
ciscoasa(config-if)# interface ethernet 0/4
ciscoasa(config-if)# switchport access vlan 500
ciscoasa(config-if)# no shutdown

```

Related Commands

Command	Description
allocate-interface	Assigns interfaces and subinterfaces to a security context.
clear interface	Clears counters for the show interface command.
show interface	Displays the runtime status and statistics of interfaces.

interface vni

To configure a VXLAN Network Identifier (VNI) interface and enter interface configuration mode, use the **interface vni** command in global configuration mode. To remove a VNI interface, use the **no** form of this command.

interface vni *number*
no interface vni *number*

Syntax Description

number Sets the ID between 1 and 10000. This ID is only an internal interface identifier.

Command Default

No default behavior or values.

Command Modes

The following table shows the modes in which you can enter the command:

Command Mode	Firewall Mode		Security Context		
	Routed	Transparent	Single	Multiple	
				Context	System
Global Configuration	• Yes	• Yes	• Yes	• Yes	—

Command History

Release Modification

9.4(1) This command was added.

Usage Guidelines

You must associate a VNI interface with a VTEP source interface using the **vtep-nve** command. You must also set the VXLAN **segment-id**.

Examples

The following example configures the GigabitEthernet 1/1 interface as the VTEP source interface, and associates the VNI 1 interface with it:

```
ciscoasa(config)# interface gigabitethernet 1/1
ciscoasa(config-if)# nameif outside
ciscoasa(config-if)# ip address 10.1.1.1 255.255.255.0
ciscoasa(config)# nve 1
ciscoasa(cfg-nve)# source-interface outside
ciscoasa(config)# interface vni 1
ciscoasa(config-if)# segment-id 1000
ciscoasa(config-if)# vtep-nve 1
ciscoasa(config-if)# nameif vxlan1000
ciscoasa(config-if)# ip address 10.1.1.1 255.255.255.0 standby 10.1.1.2
ciscoasa(config-if)# ipv6 address 2001:0DB8::BA98:0:3210/48
ciscoasa(config-if)# security-level 50
ciscoasa(config-if)# mcast-group 236.0.0.100
```

Related Commands	Command	Description
	debug vxlan	Debugs VXLAN traffic.
	default-mcast-group	Specifies a default multicast group for all VNI interfaces associated with the VTEP source interface.
	encapsulation vxlan	Sets the NVE instance to VXLAN encapsulation.
	inspect vxlan	Enforces compliance with the standard VXLAN header format.
	interface vni	Creates the VNI interface for VXLAN tagging.
	mcast-group	Sets the multicast group address for the VNI interface.
	nve	Specifies the Network Virtualization Endpoint instance.
	nve-only	Specifies that the VXLAN source interface is NVE-only.
	peer ip	Manually specifies the peer VTEP IP address.
	segment-id	Specifies the VXLAN segment ID for a VNI interface.
	show arp vtep-mapping	Displays MAC addresses cached on the VNI interface for IP addresses located in the remote segment domain and the remote VTEP IP addresses.
	show interface vni	Shows the parameters, status and statistics of a VNI interface, status of its bridged interface (if configured), and NVE interface it is associated with.
	show mac-address-table vtep-mapping	Displays the Layer 2 forwarding table (MAC address table) on the VNI interface with the remote VTEP IP addresses.
	show nve	Shows the parameters, status and statistics of a NVE interface, status of its carrier interface (source interface), IP address of the carrier interface, VNIs that use this NVE as the VXLAN VTEP, and peer VTEP IP addresses associated with this NVE interface.
	show vni vlan-mapping	Shows the mapping between VNI segment IDs and VLAN interfaces or physical interfaces in transparent mode.
	source-interface	Specifies the VTEP source interface.
	vtep-nve	Associates a VNI interface with the VTEP source interface.
	vxlan port	Sets the VXLAN UDP port. By default, the VTEP source interface accepts VXLAN traffic to UDP port 4789.

interim-accounting-update

To enable the generation of RADIUS interim-accounting-update messages for the AAA server group, use the **interim-accounting-update** command in aaa-server group configuration mode. To disable interim-accounting-update messages, use the **no** form of this command.

interim-accounting-update [**periodic** [*hours*]]

no interim-accounting-update [**periodic** [*hours*]]

Syntax Description

periodic [*hours*] (Optional) Enables the periodic generation and transmission of accounting records for every VPN session that is configured to send accounting records to the server group in question. You can optionally include the interval, in hours, for sending these updates. The default is 24 hours, the range is 1 to 120.

Use this option for a server group configured for ISE Change of Authentication.

Command Default

By default interim-accounting-update is not enabled.

Command Modes

The following table shows the modes in which you can enter the command:

Command Mode	Firewall Mode		Security Context		
	Routed	Transparent	Single	Multiple	
				Context	System
aaa-server group configuration	• Yes	• Yes	• Yes	• Yes	—

Command History

Release Modification

9.2(1) The **periodic** keyword was added.

Usage Guidelines

If you use this command without the **periodic** keyword, the ASA sends interim-accounting-update messages only when a VPN tunnel connection is added to a clientless VPN session. When this happens the accounting update is generated in order to inform the RADIUS server of the newly assigned IP address.

If you are using the server group to configure ISE Change of Authorization for a remote access VPN, add the **periodic** keyword. Period reporting includes AnyConnect connections as well as clientless sessions.

ISE maintains a directory of active sessions based on the accounting records that it receives from NAS devices like the ASA. However, if ISE does not receive any indication that the session is still active (accounting message or posture transactions) for a period of 5 days, it will remove the session record from its database. To ensure that long-lived VPN connections are not removed, configure the group to send periodic interim-accounting-update messages to ISE for all active sessions.

Examples

The following example shows how to configure an ISE server group for dynamic authorization (CoA) updates and hourly periodic accounting. Included is the tunnel group configuration that configures password authentication with ISE.

```
ciscoasa(config)# aaa-server ise protocol radius
ciscoasa(config-aaa-server-group)# interim-accounting-update periodic 1
ciscoasa(config-aaa-server-group)# dynamic-authorization
ciscoasa(config-aaa-server-group)# exit
ciscoasa(config)# aaa-server ise (inside) host 10.1.1.3
ciscoasa(config-aaa-server-host)# key sharedsecret
ciscoasa(config-aaa-server-host)# exit
ciscoasa(config)# tunnel-group aaa-coa general-attributes
ciscoasa(config-tunnel-general)# address-pool vpn
ciscoasa(config-tunnel-general)# authentication-server-group ise
ciscoasa(config-tunnel-general)# accounting-server-group ise
ciscoasa(config-tunnel-general)# exit
```

The following example shows how to configure a tunnel group for local certificate validation and authorization with ISE. In this case, you include the **authorize-only** command in the server group configuration, because the server group will not be used for authentication.

```
ciscoasa(config)# aaa-server ise protocol radius
ciscoasa(config-aaa-server-group)# authorize-only
ciscoasa(config-aaa-server-group)# interim-accounting-update periodic 1
ciscoasa(config-aaa-server-group)# dynamic-authorization
ciscoasa(config-aaa-server-group)# exit
ciscoasa(config)# aaa-server ise (inside) host 10.1.1.3
ciscoasa(config-aaa-server-host)# key sharedsecret
ciscoasa(config-aaa-server-host)# exit
ciscoasa(config)# tunnel-group aaa-coa general-attributes
ciscoasa(config-tunnel-general)# address-pool vpn
ciscoasa(config-tunnel-general)# authentication certificate
ciscoasa(config-tunnel-general)# authorization-server-group ise
ciscoasa(config-tunnel-general)# accounting-server-group ise
ciscoasa(config-tunnel-general)# exit
```

Related Commands

Command	Description
authorize-only	Enables authorize-only mode for the RADIUS server group.
dynamic-authorization	Enables dynamic authorization for the RADIUS server group.

internal-password

To display an additional password field on the clientless SSL VPN portal page, use the **internal-password** command in webvpn configuration mode. This additional password is used by the ASA to authenticate users to file servers for whom SSO is allowed.

To disable the ability to use an internal password, use the **no** version of the command.

internal-passwordenable
no internal password

Syntax Description

enable Enables use of an internal password.

Command Default

The default is disabled.

Command Modes

The following table shows the modes in which you can enter the command:

Command Mode	Firewall Mode		Security Context		
	Routed	Transparent	Single	Multiple	
				Context	System
Webvpn configuration	• Yes	—	• Yes	—	—

Command History

Release	Modification
8.0(2)	This command was added.

Usage Guidelines

If enabled, end users type a second password when logging in to a clientless SSL VPN session. The clientless SSL VPN server sends an SSO authentication request, including the username and password, to the authenticating server using HTTPS. If the authenticating server approves the authentication request, it returns an SSO authentication cookie to the clientless SSL VPN server. This cookie is kept on the ASA on behalf of the user and used to authenticate the user to secure websites within the domain protected by the SSO server.

The internal password feature is useful if you require that the internal password be different from the SSL VPN password. In particular, you can use one-time passwords for authentication to the ASA, and another password for internal sites.

Examples

The following example shows how to enable the internal password:

```
ciscoasa
(config)#
webvpn
ciscoasa
(config-webvpn)#
  internal password enable
ciscoasa (config-webvpn)#
```

Related Commands

Command	Description
webvpn	Enters webvpn configuration mode, which lets you configure attributes for clientless SSL VPN connections.

internal-port

To specify the VXLAN internal port for a VNI interface for the ASA virtual on Azure for the Azure Gateway Load Balancer (GWLB), use the **internal-port** command in interface configuration mode. To remove the port, use the **no** form of this command.

internal-port *port*
no internal-port *port*

Syntax Description *port* Sets the port between 1024 and 65535.

Command Default No default behavior or values.

Command Modes The following table shows the modes in which you can enter the command:

Command Mode	Firewall Mode		Security Context		
	Routed	Transparent	Single	Multiple	
				Context	System
Interface configuration	• Yes	—	• Yes	—	—

Command History

Release	Modification
9.19(1)	This command was added.

Usage Guidelines In an Azure service chain, ASA virtuals act as a transparent gateway that can intercept packets between the internet and the customer service. The ASA virtual defines an external interface and an internal interface on a single NIC by utilizing VXLAN segments in a paired proxy.

Examples The following example configures the VNI 1 interface for Azure GWLB:

```
ciscoasa(config)# interface vni 1
ciscoasa(config-if)# proxy paired
ciscoasa(config-if)# internal-segment-id 1000
ciscoasa(config-if)# external-segment-id 1001
ciscoasa(config-if)# internal-port 101
ciscoasa(config-if)# external-port 102
ciscoasa(config-if)# vtep-nve 1
ciscoasa(config-if)# nameif vxlan1000
ciscoasa(config-if)# ip address 10.1.1.1 255.255.255.0 standby 10.1.1.2
ciscoasa(config-if)# ipv6 address 2001:0DB8::BA98:0:3210/48
ciscoasa(config-if)# security-level 50
```

Related Commands	Command	Description
	debug vxlan	Debugs VXLAN traffic.
	encapsulation vxlan	Sets the NVE instance to VXLAN encapsulation.
	external-port	Sets the external VXLAN port.
	external-segment-id	Specifies the VXLAN external segment ID for a VNI interface.
	inspect vxlan	Enforces compliance with the standard VXLAN header format.
	interface vni	Creates the VNI interface for VXLAN tagging.
	internal-segment-id	Specifies the VXLAN internal segment ID for a VNI interface.
	nve	Specifies the Network Virtualization Endpoint instance.
	peer ip	Manually specifies the peer VTEP IP address.
	proxy paired	Sets the interface to paired proxy mode.
	show interface vni	Shows the parameters, status and statistics of a VNI interface, status of its bridged interface (if configured), and NVE interface it is associated with.
	show nve	Shows the parameters, status and statistics of a NVE interface, status of its carrier interface (source interface), IP address of the carrier interface, VNIs that use this NVE as the VXLAN VTEP, and peer VTEP IP addresses associated with this NVE interface.
	source-interface	Specifies the VTEP source interface.
	vtep-nve	Associates a VNI interface with the VTEP source interface.
	vxlan port	Sets the VXLAN UDP port. By default, the VTEP source interface accepts VXLAN traffic to UDP port 4789.

internal-segment-id

To specify the VXLAN internal segment ID for a VNI interface for the ASA virtual on Azure for the Azure Gateway Load Balancer (GWLB), use the **internal-segment-id** command in interface configuration mode. To remove the ID, use the **no** form of this command.

internal-segment-id *id*
no internal-segment-id *id*

Syntax Description *id* Sets the ID between 1 and 16777215.

Command Default No default behavior or values.

Command Modes The following table shows the modes in which you can enter the command:

Command Mode	Firewall Mode		Security Context		
	Routed	Transparent	Single	Multiple	
				Context	System
Interface configuration	• Yes	—	• Yes	—	—

Command History

Release	Modification
9.19(1)	This command was added.

Usage Guidelines In an Azure service chain, ASA virtuals act as a transparent gateway that can intercept packets between the internet and the customer service. The ASA virtual defines an external interface and an internal interface on a single NIC by utilizing VXLAN segments in a paired proxy.

Examples The following example configures the VNI 1 interface for Azure GWLB:

```
ciscoasa(config)# interface vni 1
ciscoasa(config-if)# proxy paired
ciscoasa(config-if)# internal-segment-id 1000
ciscoasa(config-if)# external-segment-id 1001
ciscoasa(config-if)# internal-port 101
ciscoasa(config-if)# external-port 102
ciscoasa(config-if)# vtep-nve 1
ciscoasa(config-if)# nameif vxlan1000
ciscoasa(config-if)# ip address 10.1.1.1 255.255.255.0 standby 10.1.1.2
ciscoasa(config-if)# ipv6 address 2001:0DB8::BA98:0:3210/48
ciscoasa(config-if)# security-level 50
```

Related Commands	Command	Description
	debug vxlan	Debugs VXLAN traffic.
	encapsulation vxlan	Sets the NVE instance to VXLAN encapsulation.
	external-port	Sets the external VXLAN port.
	external-segment-id	Specifies the VXLAN external segment ID for a VNI interface.
	inspect vxlan	Enforces compliance with the standard VXLAN header format.
	interface vni	Creates the VNI interface for VXLAN tagging.
	internal-port	Sets the internal VXLAN port.
	nve	Specifies the Network Virtualization Endpoint instance.

	proxy paired	Sets the interface to paired proxy mode.
	show interface vni	Shows the parameters, status and statistics of a VNI interface, status of its bridged interface (if configured), and NVE interface it is associated with.
	show nve	Shows the parameters, status and statistics of a NVE interface, status of its carrier interface (source interface), IP address of the carrier interface, VNIs that use this NVE as the VXLAN VTEP, and peer VTEP IP addresses associated with this NVE interface.
	source-interface	Specifies the VTEP source interface.
	vtep-nve	Associates a VNI interface with the VTEP source interface.
	vxlan port	Sets the VXLAN UDP port. By default, the VTEP source interface accepts VXLAN traffic to UDP port 4789.

interval maximum

To configure the maximum interval between update attempts by a DDNS update method, use the **interval** command in DDNS-update-method mode. To remove an interval for a DDNS update method from the running configuration, use the **no** form of this command.

interval maximum *days hours minutes seconds*

no interval maximum *days hours minutes seconds*

Syntax Description

days Specifies the number of days between update attempts with a range of 0 to 364.

hours Specifies the number of hours between update attempts with a range of 0 to 23.

minutes Specifies the number of minutes between update attempts with a range of 0 to 59.

seconds Specifies the number of seconds between update attempts with a range of 0 to 59.

Command Default

No default behavior or values.

Command Modes

The following table shows the modes in which you can enter the command:

Command Mode	Firewall Mode		Security Context		
	Routed	Transparent	Single	Multiple	
				Context	System
Ddns-update-method configuration	• Yes	—	• Yes	• Yes	—

Command History

Release Modification

7.2(1) This command was added.

Usage Guidelines

The days, hours, minutes, and seconds are added together to arrive at the total interval.

Examples

The following example configures a method called ddns-2 to attempt an update every 3 minutes and 15 seconds:

```
ciscoasa(config)# ddns update method ddns-2
ciscoasa(DDNS-update-method)# interval maximum 0 0 3 15
```

Related Commands

Command	Description
ddns	Specifies a DDNS update method type for a created DDNS method.

Command	Description
ddns update	Associates a DDNS update method with an ASA interface or a DDNS update hostname.
ddns update method	Creates a method for dynamically updating DNS resource records.
dhcp-client update dns	Configures the update parameters that the DHCP client passes to the DHCP server.
dhcpd update dns	Enables a DHCP server to perform DDNS updates.

invalid-ack

To set the action for packets with an invalid ACK, use the **invalid-ack** command in tcp-map configuration mode. To set the value back to the default, use the **no** form of this command. This command is part of the TCP normalization policy enabled using the **set connection advanced-options** command.

```
invalid-ack { allow | drop }
no invalid-ack
```

Syntax Description

allow Allows packets with an invalid ACK.

drop Drops packets with an invalid ACK.

Command Default

The default action is to drop packets with an invalid ACK.

Command Modes

The following table shows the modes in which you can enter the command:

Command Mode	Firewall Mode		Security Context		
	Routed	Transparent	Single	Multiple	
				Context	System
Tcp-map configuration	• Yes	• Yes	• Yes	• Yes	—

Command History

Release	Modification
7.2(4)/8.0(4)	This command was added.

Usage Guidelines

To enable TCP normalization, use the Modular Policy Framework:

- tcp-map**—Identifies the TCP normalization actions.
 - invalid-ack**—In tcp-map configuration mode, you can enter the **invalid-ack** command and many others.
- class-map**—Identify the traffic on which you want to perform TCP normalization.
- policy-map**—Identify the actions associated with each class map.
 - class**—Identify the class map on which you want to perform actions.
 - set connection advanced-options**—Identify the TCP map you created.
- service-policy**—Assigns the policy map to an interface or globally.

You might see invalid ACKs in the following instances:

- In the TCP connection SYN-ACK-received status, if the ACK number of a received TCP packet is not exactly the same as the sequence number of the next TCP packet sending out, it is an invalid ACK.
- Whenever the ACK number of a received TCP packet is greater than the sequence number of the next TCP packet sending out, it is an invalid ACK.

Note TCP packets with an invalid ACK are automatically allowed for WAAS connections.

Examples

The following example sets the ASA to allow packets with an invalid ACK:

```
ciscoasa(config)# tcp-map tmap
ciscoasa(config-tcp-map)# invalid-ack allow
ciscoasa(config)# class-map cmap
ciscoasa(config-cmap)# match any
ciscoasa(config)# policy-map pmap
ciscoasa(config-pmap)# class cmap
ciscoasa(config-pmap)# set connection advanced-options tmap
ciscoasa(config)# service-policy pmap global
ciscoasa(config)#
```

Related Commands

Command	Description
class-map	Identifies traffic for a service policy.
policy-map	Identifies actions to apply to traffic in a service policy.
set connection advanced-options	Enables TCP normalization.
service-policy	Applies a service policy to interface(s).
show running-config tcp-map	Shows the TCP map configuration.
tcp-map	Creates a TCP map and allows access to tcp-map configuration mode.

ip address

To set the IP address for an interface (in routed mode) or for the bridge virtual interface (BVI) (routed or transparent mode), use the **ip address** command in interface configuration mode. To remove the IP address, use the **no** form of this command.

```
ip address ip_address [ mask ] standby ip_address | cluster-pool poolname ]
no ip address [ ip_address ]
```

Syntax Description

cluster-pool *poolname* (Optional) For ASA clustering, sets the cluster pool of addresses defined by the **ip local pool** command. The main cluster IP address defined by the *ip_address* argument belongs to the current master unit only. Each cluster member receives a local IP address from this pool.

You cannot determine the exact address assigned to each unit in advance; to see the address used on each unit, enter the **show ip local pool** *poolname* command. Each cluster member is assigned a member ID when it joins the cluster. The ID determines the local IP used from the pool.

ip_address The IP address for the interface.

mask (Optional) The subnet mask for the IP address. If you do not set the mask, the ASA uses the default mask for the IP address class.

standby *ip_address* (Optional) For failover, sets the IP address for the standby unit.

Command Default

No default behavior or values.

Command Modes

The following table shows the modes in which you can enter the command:

Command Mode	Firewall Mode		Security Context		
	Routed	Transparent	Single	Multiple	
				Context	System
Interface Configuration	• Yes	• Yes	• Yes	• Yes	—

Command History

Release Modification

7.0(1) For routed mode, this command was changed from a global configuration command to an interface configuration mode command.

8.4(1) For transparent mode, bridge groups were added. You now set the IP address for the BVI, and not globally.

9.0(1) The **cluster-pool** keyword was added to support ASA clustering.

Release Modification

9.7(1) For routed interfaces, you can configure an IP address on a 31-bit subnet for point-to-point connections.

Usage Guidelines

This command also sets the standby address for failover.

Multiple Context Mode Guidelines

In single context routed firewall mode, each interface address must be on a unique subnet. In multiple context mode, if this interface is on a shared interface, then each IP address must be unique but on the same subnet. If the interface is unique, this IP address can be used by other contexts if desired.

Transparent Firewall Guidelines

A transparent firewall does not participate in IP routing. The only IP configuration required for the ASA is to set the BVI address. This address is required because the ASA uses this address as the source address for traffic originating on the ASA, such as system messages or communications with AAA servers. You can also use this address for remote management access. This address must be on the same subnet as the upstream and downstream routers. For multiple context mode, set the management IP address within each context. For models that include a Management interface, you can also set an IP address for this interface for management purposes.

Failover Guidelines

The standby IP address must be on the same subnet as the main IP address.

ASA Clustering Guidelines

You can only set the cluster pool for an individual interface after you configure the cluster interface mode to be individual (**cluster-interface mode individual** command). The only exception is for the management-only interface(s):

- You can always configure the management-only interface as an individual interface, even in spanned EtherChannel mode. The management interface can be an individual interface even in transparent firewall mode.
- In spanned EtherChannel mode, if you configure the management interface as an individual interface, you cannot enable dynamic routing for the management interface. You must use a static route.

/31 Subnet Guidelines

For routed interfaces, you can configure an IP address on a 31-bit subnet for point-to-point connections. The 31-bit subnet includes only 2 addresses; normally, the first and last address in the subnet is reserved for the network and broadcast, so a 2-address subnet is not usable. However, if you have a point-to-point connection and do not need network or broadcast addresses, a 31-bit subnet is a useful way to preserve addresses in IPv4. For example, the failover link between 2 ASAs only requires 2 addresses; any packet that is transmitted by one end of the link is always received by the other, and broadcasting is unnecessary. You can also have a directly-connected management station running SNMP or Syslog.

- 31-Bit Subnet and Clustering—You can use a 31-bit subnet mask for Spanned EtherChannels. Individual interfaces (including the Management IP address in Spanned EtherChannel mode) do not support a 31-bit subnet. You also cannot use the 31-bit subnet for the Cluster Control Link.
- 31-Bit Subnet and Failover—For failover, when you use a 31-bit subnet for the ASA interface IP address, you cannot configure a standby IP address for the interface because there are not enough addresses. Normally, an interface for failover should have a standby IP address so the active unit can perform

interface tests to ensure standby interface health. Without a standby IP address, the ASA cannot perform any network tests; only the link state can be tracked. For the failover and optional separate state link, which are point-to-point connections, you can also use a 31-bit subnet.

- 31-Bit Subnet and Management—If you have a directly-connected management station, you can use a point-to-point connection for SSH or HTTP on the ASA, or for SNMP or Syslog on the management station.
- 31-Bit Subnet Unsupported Features—The following features do not support the 31-bit subnet:
 - BVI interfaces for bridge groups— The bridge group requires at least 3 host addresses: the BVI, and two hosts connected to two bridge group member interfaces. you must use a /29 subnet or smaller.
 - Multicast Routing

Examples

The following example sets the IP addresses and standby addresses of two interfaces:

```
ciscoasa(config)# interface gigabitethernet0/2
ciscoasa(config-if)# nameif inside
ciscoasa(config-if)# security-level 100
ciscoasa(config-if)# ip address 10.1.1.1 255.255.255.0 standby 10.1.1.2
ciscoasa(config-if)# no shutdown
ciscoasa(config-if)# interface gigabitethernet0/3
ciscoasa(config-if)# nameif outside
ciscoasa(config-if)# security-level 0
ciscoasa(config-if)# ip address 10.1.2.1 255.255.255.0 standby 10.1.2.2
ciscoasa(config-if)# no shutdown
```

The following example sets the management address and standby address of bridge group 1:

```
ciscoasa(config)# interface bvi 1
ciscoasa(config-if)# ip address 10.1.3.1 255.255.255.0 standby 10.1.3.2
```

Related Commands

Command	Description
interface	Configures an interface and enters interface configuration mode.
ip address dhcp	Sets the interface to obtain an IP address from a DHCP server.
show ip address	Shows the IP address assigned to an interface.

ip address dhcp

To use DHCP to obtain an IP address for an interface, use the **ip address dhcp** command in interface configuration mode. To disable the DHCP client for this interface, use the **no** form of this command.

ip address dhcp [**setroute**]
no ip address dhcp

Syntax Description

setroute (Optional) Allows the ASA to use the default route supplied by the DHCP server.

Command Default

No default behavior or values.

Command Modes

The following table shows the modes in which you can enter the command:

Command Mode	Firewall Mode		Security Context		
	Routed	Transparent	Single	Multiple	
				Context	System
Interface configuration	• Yes	—	• Yes	• Yes	—

Command History

Release Modification

7.0(1) This command was changed from a global configuration command to an interface configuration mode command. You can also enable this command on any interface, instead of only the outside interface.

Usage Guidelines

Reenter this command to reset the DHCP lease and request a new lease.

If you do not enable the interface using the **no shutdown** command before you enter the **ip address dhcp** command, some DHCP requests might not be sent.

Note The ASA rejects any leases that have a timeout of less than 32 seconds.

Examples

The following example enables DHCP on the GigabitEthernet0/1 interface:

```
ciscoasa(config)# interface gigabitEthernet0/1
ciscoasa(config-if)# nameif inside
ciscoasa(config-if)# security-level 100
ciscoasa(config-if)# no shutdown
ciscoasa(config-if)# ip address dhcp
```

Related Commands

Command	Description
interface	Configures an interface and enters interface configuration mode.
ip address	Sets the IP address for the interface or sets the management IP address for a transparent firewall.
show ip address dhcp	Shows the IP address obtained from the DHCP server.

ip address pppoe

To enable PPPoE, use the **ip address pppoe** command in interface configuration mode. To disable PPPoE, use the **no** form of this command.

```
ip address [ ip_address [ mask ] ] pppoe [ setroute ]
no ip address [ ip_address [ mask ] ] pppoe
```

Syntax Description

ip_address Manually sets the IP address instead of receiving an address from the PPPoE server.

mask Specifies the subnet mask for the IP address. If you do not set the mask, the ASA uses the default mask for the IP address class.

setroute Lets the ASA use the default route supplied by the PPPoE server. If the PPPoE server does not send a default route, the ASA creates a default route with the address of the access concentrator as the gateway.

Command Default

No default behavior or values.

Command Modes

The following table shows the modes in which you can enter the command:

Command Mode	Firewall Mode		Security Context		
	Routed	Transparent	Single	Multiple	
				Context	System
Interface configuration	• Yes	—	• Yes	—	—

Command History

Release Modification

7.2(1) This command was added.

Usage Guidelines

PPPoE combines two widely accepted standards, Ethernet and PPP, to provide an authenticated method of assigning IP addresses to client systems. ISPs deploy PPPoE because it supports high-speed broadband access using their existing remote access infrastructure and because it is easier for customers to use.

Before you set the IP address using PPPoE, configure the **vpdn** commands to set the username, password, and authentication protocol. If you enable this command on more than one interface, for example for a backup link to your ISP, then you can assign each interface to a different VPDN group if necessary using the **pppoe client vpdn group** command.

The maximum transmission unit (MTU) size is automatically set to 1492 bytes, which is the correct value to allow PPPoE transmission within an Ethernet frame.

Reenter this command to reset and restart the PPPoE session.

You cannot set this command at the same time as the **ip address** command or the **ip address dhcp** command.

Examples

The following example enables PPPoE on the GigabitEthernet 0/1 interface:

```
ciscoasa(config)# interface gigabitethernet0/1
ciscoasa(config-if)# nameif outside
ciscoasa(config-if)# security-level 0
ciscoasa(config-if)# ip address pppoe
ciscoasa(config-if)# no shutdown
```

The following example manually sets the IP address for a PPPoE interface:

```
ciscoasa(config)# interface gigabitethernet0/1
ciscoasa(config-if)# nameif outside
ciscoasa(config-if)# security-level 0
ciscoasa(config-if)# ip address 10.1.1.1 255.255.255.0 pppoe
ciscoasa(config-if)# no shutdown
```

Related Commands

Command	Description
interface	Configures an interface and enters interface configuration mode.
ip address	Sets the IP address for an interface.
pppoe client vpdn group	Assigns this interface to a particular VPDN group.
show ip address pppoe	Shows the IP address obtained from the PPPoE server.
vpdn group	Creates a vpdn group and configures PPPoE client settings.

ip-address-privacy

To enable IP address privacy, use the **ip-address-privacy** command in parameters configuration mode. Parameters configuration mode is accessible from policy map configuration mode. To disable this feature, use the **no** form of this command.

ip-address-privacy
no ip-address-privacy

Syntax Description This command has no arguments or keywords.

Command Default This command is disabled by default.

Command Modes The following table shows the modes in which you can enter the command:

Command Mode	Firewall Mode		Security Context		
	Routed	Transparent	Single	Multiple	
				Context	System
Parameters Configuration	• Yes	• Yes	• Yes	• Yes	—

Command History **Release Modification**
 7.2(1) This command was added.

Examples The following example shows how to enable IP address privacy over SIP in a SIP inspection policy map:

```
ciscoasa(config)# policy-map type inspect sip sip_map
ciscoasa(config-pmap)# parameters
ciscoasa(config-pmap-p)# ip-address-privacy
```

Related Commands	Command	Description
	policy-map type inspect	Creates an inspection policy map.
	show running-config policy-map	Display all current policy map configurations.

ip audit attack

To set the default actions for packets that match an attack signature, use the **ip audit attack** command in global configuration mode. To restore the default action (to reset the connection), use the **no** form of this command.

ip audit attack [**action** [**alarm**] [**drop**] [**reset**]]
no ip audit attack

Syntax Description

action (Optional) Specifies that you are defining a set of default actions. If you do not follow this keyword with any actions, then the ASA takes no action. If you do not enter the **action** keyword, the ASA assumes you entered it, and the **action** keyword appears in the configuration.

alarm (Default) Generates a system message showing that a packet matched a signature.

drop (Optional) Drops the packet.

reset (Optional) Drops the packet and closes the connection.

Command Default

The default action is to send and alarm.

Command Modes

The following table shows the modes in which you can enter the command:

Command Mode	Firewall Mode		Security Context		
	Routed	Transparent	Single	Multiple	
				Context	System
Global Configuration	• Yes	• Yes	• Yes	• Yes	—

Command History

Release Modification

7.0(1) This command was added.

Usage Guidelines

You can specify multiple actions, or no actions. You can override the action you set with this command when you configure an audit policy using the **ip audit name** command. If you do not specify the action in the **ip audit name** command, then the action you set with this command is used.

For a list of signatures, see the **ip audit signature** command.

Examples

The following example sets the default action to alarm and reset for packets that match an attack signature. The audit policy for the inside interface overrides this default to be alarm only, while the policy for the outside interface uses the default setting set with the **ip audit attack** command.

```
ciscoasa(config)# ip audit attack action alarm reset
ciscoasa(config)# ip audit name insidepolicy attack action alarm
```

```
ciscoasa(config)# ip audit name outsidepolicy attack
ciscoasa(config)# ip audit interface inside insidepolicy
ciscoasa(config)# ip audit interface outside outsidepolicy
```

Related Commands

Command	Description
ip audit info	Sets the default actions for packets that match an informational signature.
ip audit interface	Assigns an audit policy to an interface.
ip audit name	Creates a named audit policy that identifies the actions to take when a packet matches an attack signature or an informational signature.
ip audit signature	Disables a signature.
show running-config ip audit attack	Shows the configuration for the ip audit attack command.

ip audit info

To set the default actions for packets that match an informational signature, use the **ip audit info** command in global configuration mode. To restore the default action (to generate an alarm), use the **no** form of this command. You can specify multiple actions, or no actions.

ip audit info [**action** [**alarm**] [**drop**] [**reset**]]
no ip audit info

Syntax Description

action (Optional) Specifies that you are defining a set of default actions. If you do not follow this keyword with any actions, then the ASA takes no action. If you do not enter the **action** keyword, the ASA assumes you entered it, and the **action** keyword appears in the configuration.

alarm (Default) Generates a system message showing that a packet matched a signature.

drop (Optional) Drops the packet.

reset (Optional) Drops the packet and closes the connection.

Command Default

The default action is to generate an alarm.

Command Modes

The following table shows the modes in which you can enter the command:

Command Mode	Firewall Mode		Security Context		
	Routed	Transparent	Single	Multiple	
				Context	System
Global Configuration	• Yes	• Yes	• Yes	• Yes	—

Command History

Release Modification

7.0(1) This command was added.

Usage Guidelines

You can override the action you set with this command when you configure an audit policy using the **ip audit name** command. If you do not specify the action in the **ip audit name** command, then the action you set with this command is used.

For a list of signatures, see the **ip audit signature** command.

Examples

The following example sets the default action to alarm and reset for packets that match an informational signature. The audit policy for the inside interface overrides this default to be alarm and drop, while the policy for the outside interface uses the default setting set with the **ip audit info** command.

```
ciscoasa(config)# ip audit info action alarm reset
```

```

ciscoasa(config)# ip audit name insidepolicy info action alarm drop
ciscoasa(config)# ip audit name outsidepolicy info
ciscoasa(config)# ip audit interface inside insidepolicy
ciscoasa(config)# ip audit interface outside outsidepolicy

```

Related Commands

Command	Description
ip audit attack	Sets the default actions for packets that match an attack signature.
ip audit interface	Assigns an audit policy to an interface.
ip audit name	Creates a named audit policy that identifies the actions to take when a packet matches an attack signature or an informational signature.
ip audit signature	Disables a signature.
show running-config ip audit info	Shows the configuration for the ip audit info command.

ip audit interface

To assign an audit policy to an interface, use the **ip audit interface** command in global configuration mode. To remove the policy from the interface, use the **no** form of this command.

ip audit interface *interface_name* *policy_name*
no ip audit interface *interface_name* *policy_name*

Syntax Description

interface_name Specifies the interface name.

policy_name The name of the policy you added with the **ip audit name** command. You can assign an info policy and an attack policy to each interface.

Command Default

No default behavior or values.

Command Modes

The following table shows the modes in which you can enter the command:

Command Mode	Firewall Mode		Security Context		
	Routed	Transparent	Single	Multiple	
				Context	System
Global Configuration	• Yes	• Yes	• Yes	• Yes	—

Command History

Release Modification

7.0(1) This command was added.

Examples

The following example applies audit policies to the inside and outside interfaces:

```
ciscoasa(config)# ip audit name insidepolicy1 attack action alarm
ciscoasa(config)# ip audit name insidepolicy2 info action alarm
ciscoasa(config)# ip audit name outsidepolicy1 attack action reset
ciscoasa(config)# ip audit name outsidepolicy2 info action alarm
ciscoasa(config)# ip audit interface inside insidepolicy1
ciscoasa(config)# ip audit interface inside insidepolicy2
ciscoasa(config)# ip audit interface outside outsidepolicy1
ciscoasa(config)# ip audit interface outside outsidepolicy2
```

Related Commands

Command	Description
ip audit attack	Sets the default actions for packets that match an attack signature.
ip audit info	Sets the default actions for packets that match an informational signature.

Command	Description
ip audit name	Creates a named audit policy that identifies the actions to take when a packet matches an attack signature or an informational signature.
ip audit signature	Disables a signature.
show running-config ip audit interface	Shows the configuration for the ip audit interface command.

ip audit name

To create a named audit policy that identifies the actions to take when a packet matches a predefined attack signature or informational signature, use the **ip audit name** command in global configuration mode. To remove the policy, use the **no** form of this command.

```
ip audit name name { info | attack } [ action [ alarm ] [ drop ] [ reset ] ]
no ip audit name name { info | attack } [ action [ alarm ] [ drop ] [ reset ] ]
```

Syntax Description

action (Optional) Specifies that you are defining a set of actions. If you do not follow this keyword with any actions, then the ASA takes no action. If you do not enter the **action** keyword, then the ASA uses the default action set by the **ip audit attack** and **ip audit info** commands.

alarm (Optional) Generates a system message showing that a packet matched a signature.

attack Creates an audit policy for attack signatures; the packet might be part of an attack on your network, such as a DoS attack or illegal FTP commands.

drop (Optional) Drops the packet.

info Creates an audit policy for informational signatures; the packet is not currently attacking your network, but could be part of an information-gathering activity, such as a port sweep.

name Sets the name of the policy.

reset (Optional) Drops the packet and closes the connection.

Command Default

If you do not change the default actions using the **ip audit attack** and **ip audit info** commands, then the default action for attack signatures and informational signatures is to generate an alarm.

Command Modes

The following table shows the modes in which you can enter the command:

Command Mode	Firewall Mode		Security Context		
	Routed	Transparent	Single	Multiple	
				Context	System
Global Configuration	• Yes	• Yes	• Yes	• Yes	—

Command History

Release Modification

7.0(1) This command was added.

Usage Guidelines

Signatures are activities that match known attack patterns. For example, there are signatures that match DoS attacks. To apply the policy, assign it to an interface using the **ip audit interface** command. You can assign an info policy and an attack policy to each interface.

For a list of signatures, see the **ip audit signature** command.

If traffic matches a signature, and you want to take action against that traffic, use the **shun** command to prevent new connections from the offending host and to disallow packets from any existing connection.

Examples

The following example sets an audit policy for the inside interface to generate an alarm for attack and informational signatures, while the policy for the outside interface resets the connection for attacks:

```
ciscoasa(config)# ip audit name insidepolicy1 attack action alarm
ciscoasa(config)# ip audit name insidepolicy2 info action alarm
ciscoasa(config)# ip audit name outsidepolicy1 attack action reset
ciscoasa(config)# ip audit name outsidepolicy2 info action alarm
ciscoasa(config)# ip audit interface inside insidepolicy1
ciscoasa(config)# ip audit interface inside insidepolicy2
ciscoasa(config)# ip audit interface outside outsidepolicy1
ciscoasa(config)# ip audit interface outside outsidepolicy2
```

Related Commands

Command	Description
ip audit attack	Sets the default actions for packets that match an attack signature.
ip audit info	Sets the default actions for packets that match an informational signature.
ip audit interface	Assigns an audit policy to an interface.
ip audit signature	Disables a signature.
shun	Blocks packets with a specific source and destination address.

ip audit signature

To disable a signature for an audit policy, use the **ip audit signature** command in global configuration mode. To reenabe the signature, use the **no** form of this command.

ip audit signature *signature_number* **disable**
no ip audit signature *signature_number*

Syntax Description

disable Disables the signature.

signature_number Specifies the signature number to disable. See [Table 1: Signature IDs and System Message Numbers](#) for a list of supported signatures.

Command Default

No default behavior or values.

Command Modes

The following table shows the modes in which you can enter the command:

Command Mode	Firewall Mode		Security Context		
	Routed	Transparent	Single	Multiple	
				Context	System
Global Configuration	• Yes	• Yes	• Yes	• Yes	—

Command History

Release Modification

7.0(1) This command was added.

Usage Guidelines

You might want to disable a signature if legitimate traffic continually matches a signature, and you are willing to risk disabling the signature to avoid large numbers of alarms. [Table 1: Signature IDs and System Message Numbers](#) lists supported signatures and system message numbers.

Table 1: Signature IDs and System Message Numbers

Signature ID	Message Number	Signature Title	Signature Type	Description
1000	400000	IP options-Bad Option List	Informational	Triggers on receipt of an IP datagram where the list of IP options in the IP datagram header is incomplete or malformed. The IP options list contains one or more options that perform various network management or debugging tasks.
1001	400001	IP options-Record Packet Route	Informational	Triggers on receipt of an IP datagram where the IP option list for the datagram includes option 7 (Record Packet Route).

Signature ID	Message Number	Signature Title	Signature Type	Description
1002	400002	IP options-Timestamp	Informational	Triggers on receipt of an IP datagram where the IP option list for the datagram includes option 4 (Timestamp).
1003	400003	IP options-Security	Informational	Triggers on receipt of an IP datagram where the IP option list for the datagram includes option 2 (Security options).
1004	400004	IP options-Loose Source Route	Informational	Triggers on receipt of an IP datagram where the IP option list for the datagram includes option 3 (Loose Source Route).
1005	400005	IP options-SATNET ID	Informational	Triggers on receipt of an IP datagram where the IP option list for the datagram includes option 8 (SATNET stream identifier).
1006	400006	IP options-Strict Source Route	Informational	Triggers on receipt of an IP datagram in which the IP option list for the datagram includes option 2 (Strict Source Routing).
1100	400007	IP Fragment Attack	Attack	Triggers when any IP datagram is received with an offset value less than 5 but greater than 0 indicated in the offset field.
1102	400008	IP Impossible Packet	Attack	Triggers when an IP packet arrives with source equal to destination address. This signature will catch the so-called Land Attack.
1103	400009	IP Overlapping Fragments (Teardrop)	Attack	Triggers when two fragments contained within the same IP datagram have offsets that indicate that they share positioning within the datagram. This could mean that fragment A is being completely overwritten by fragment B, or that fragment A is partially being overwritten by fragment B. Some operating systems do not properly handle fragments that overlap in this manner and may throw exceptions or behave in other undesirable ways upon receipt of overlapping fragments, which is how the Teardrop attack works to create a DoS.
2000	400010	ICMP Echo Reply	Informational	Triggers when a IP datagram is received with the protocol field of the IP header set to 1 (ICMP) and the type field in the ICMP header set to 0 (Echo Reply).
2001	400011	ICMP Host Unreachable	Informational	Triggers when an IP datagram is received with the protocol field of the IP header set to 1 (ICMP) and the type field in the ICMP header set to 3 (Host Unreachable).
2002	400012	ICMP Source Quench	Informational	Triggers when an IP datagram is received with the protocol field of the IP header set to 1 (ICMP) and the type field in the ICMP header set to 4 (Source Quench).

Signature ID	Message Number	Signature Title	Signature Type	Description
2003	400013	ICMP Redirect	Informational	Triggers when a IP datagram is received with the protocol field of the IP header set to 1 (ICMP) and the type field in the ICMP header set to 5 (Redirect).
2004	400014	ICMP Echo Request	Informational	Triggers when a IP datagram is received with the protocol field of the IP header set to 1 (ICMP) and the type field in the ICMP header set to 8 (Echo Request).
2005	400015	ICMP Time Exceeded for a Datagram	Informational	Triggers when a IP datagram is received with the protocol field of the IP header set to 1 (ICMP) and the type field in the ICMP header set to 11 (Time Exceeded for a Datagram).
2006	400016	ICMP Parameter Problem on Datagram	Informational	Triggers when a IP datagram is received with the protocol field of the IP header set to 1 (ICMP) and the type field in the ICMP header set to 12 (Parameter Problem on Datagram).
2007	400017	ICMP Timestamp Request	Informational	Triggers when a IP datagram is received with the protocol field of the IP header set to 1 (ICMP) and the type field in the ICMP header set to 13 (Timestamp Request).
2008	400018	ICMP Timestamp Reply	Informational	Triggers when a IP datagram is received with the protocol field of the IP header set to 1 (ICMP) and the type field in the ICMP header set to 14 (Timestamp Reply).
2009	400019	ICMP Information Request	Informational	Triggers when a IP datagram is received with the protocol field of the IP header set to 1 (ICMP) and the type field in the ICMP header set to 15 (Information Request).
2010	400020	ICMP Information Reply	Informational	Triggers when a IP datagram is received with the protocol field of the IP header set to 1 (ICMP) and the type field in the ICMP header set to 16 (ICMP Information Reply).
2011	400021	ICMP Address Mask Request	Informational	Triggers when a IP datagram is received with the protocol field of the IP header set to 1 (ICMP) and the type field in the ICMP header set to 17 (Address Mask Request).
2012	400022	ICMP Address Mask Reply	Informational	Triggers when a IP datagram is received with the protocol field of the IP header set to 1 (ICMP) and the type field in the ICMP header set to 18 (Address Mask Reply).
2150	400023	Fragmented ICMP Traffic	Attack	Triggers when a IP datagram is received with the protocol field of the IP header set to 1 (ICMP) and either the more fragments flag is set to 1 (ICMP) or there is an offset indicated in the offset field.
2151	400024	Large ICMP Traffic	Attack	Triggers when a IP datagram is received with the protocol field of the IP header set to 1 (ICMP) and the IP length > 1024.

Signature ID	Message Number	Signature Title	Signature Type	Description
2154	400025	Ping of Death Attack	Attack	Triggers when a IP datagram is received with the protocol field of the IP header set to 1(ICMP), the Last Fragment bit is set, and $(IP\ offset * 8) + (IP\ data\ length) > 65535$ that is to say, the IP offset (which represents the starting position of this fragment in the original packet, and which is in 8 byte units) plus the rest of the packet is greater than the maximum size for an IP packet.
3040	400026	TCP NULL flags	Attack	Triggers when a single TCP packet with none of the SYN, FIN, ACK, or RST flags set has been sent to a specific host.
3041	400027	TCP SYN+FIN flags	Attack	Triggers when a single TCP packet with the SYN and FIN flags are set and is sent to a specific host.
3042	400028	TCP FIN only flags	Attack	Triggers when a single orphaned TCP FIN packet is sent to a privileged port (having port number less than 1024) on a specific host.
3153	400029	FTP Improper Address Specified	Informational	Triggers if a port command is issued with an address that is not the same as the requesting host.
3154	400030	FTP Improper Port Specified	Informational	Triggers if a port command is issued with a data port specified that is <1024 or >65535 .
4050	400031	UDP Bomb attack	Attack	Triggers when the UDP length specified is less than the IP length specified. This malformed packet type is associated with a denial of service attempt.
4051	400032	UDP Snork attack	Attack	Triggers when a UDP packet with a source port of either 135, 7, or 19 and a destination port of 135 is detected.
4052	400033	UDP Chargen DoS attack	Attack	This signature triggers when a UDP packet is detected with a source port of 7 and a destination port of 19.
6050	400034	DNS HINFO Request	Informational	Triggers on an attempt to access HINFO records from a DNS server.
6051	400035	DNS Zone Transfer	Informational	Triggers on normal DNS zone transfers, in which the source port is 53.
6052	400036	DNS Zone Transfer from High Port	Informational	Triggers on an illegitimate DNS zone transfer, in which the source port is not equal to 53.
6053	400037	DNS Request for All Records	Informational	Triggers on a DNS request for all records.
6100	400038	RPC Port Registration	Informational	Triggers when attempts are made to register new RPC services on a target host.
6101	400039	RPC Port Unregistration	Informational	Triggers when attempts are made to unregister existing RPC services on a target host.

Signature ID	Message Number	Signature Title	Signature Type	Description
6102	400040	RPC Dump	Informational	Triggers when an RPC dump request is issued to a target host.
6103	400041	Proxied RPC Request	Attack	Triggers when a proxied RPC request is sent to the portmapper of a target host.
6150	400042	ypserv (YP server daemon) Portmap Request	Informational	Triggers when a request is made to the portmapper for the YP server daemon (ypserv) port.
6151	400043	ypbind (YP bind daemon) Portmap Request	Informational	Triggers when a request is made to the portmapper for the YP bind daemon (ypbind) port.
6152	400044	yppasswdd (YP password daemon) Portmap Request	Informational	Triggers when a request is made to the portmapper for the YP password daemon (yppasswdd) port.
6153	400045	ypupdated (YP update daemon) Portmap Request	Informational	Triggers when a request is made to the portmapper for the YP update daemon (ypupdated) port.
6154	400046	ypxfrd (YP transfer daemon) Portmap Request	Informational	Triggers when a request is made to the portmapper for the YP transfer daemon (ypxfrd) port.
6155	400047	mountd (mount daemon) Portmap Request	Informational	Triggers when a request is made to the portmapper for the mount daemon (mountd) port.
6175	400048	rex (remote execution daemon) Portmap Request	Informational	Triggers when a request is made to the portmapper for the remote execution daemon (rex) port.
6180	400049	rex (remote execution daemon) Attempt	Informational	Triggers when a call to the rex program is made. The remote execution daemon is the server responsible for remote program execution. This may be indicative of an attempt to gain unauthorized access to system resources.
6190	400050	statd Buffer Overflow	Attack	Triggers when a large statd request is sent. This could be an attempt to overflow a buffer and gain access to system resources.

Examples

The following example disables signature 6100:

```
ciscoasa(config)# ip audit signature 6100 disable
```

Related Commands

Command	Description
ip audit attack	Sets the default actions for packets that match an attack signature.
ip audit info	Sets the default actions for packets that match an informational signature.
ip audit interface	Assigns an audit policy to an interface.

Command	Description
ip audit name	Creates a named audit policy that identifies the actions to take when a packet matches an attack signature or an informational signature.
show running-config ip audit signature	Shows the configuration for the ip audit signature command.

ip-client

To allow FXOS to initiate management traffic and send it out of a Firepower 2100 ASA data interface, use the **ip-client** command in global configuration mode. To disable traffic initiation, use the **no** form of this command.

ip-client *interface_name*
no ip-client *interface_name*

Syntax Description *interface_name* Specifies the interface name through which FXOS can send management traffic.

Command Default No default behavior or values.

Command Modes

The following table shows the modes in which you can enter the command:

Command Mode	Firewall Mode		Security Context		
	Routed	Transparent	Single	Multiple	
				Context	System
Global Configuration	• Yes	• Yes	• Yes	—	—

Command History

Release Modification

9.8(2) We added this command.

Usage Guidelines

You can enable FXOS management traffic initiation on ASA data interfaces, which is required for SNMP traps, or NTP and DNS server access, for example. For incoming management traffic, see the **fxos permit** command.

In the FXOS configuration, make sure the default gateway is set to 0.0.0.0, which sets the ASA as the gateway. See the FXOS **set out-of-band** command.

Examples

The following allows FXOS traffic initiation through the outside interface:

```
ciscoasa(config)# ip-client outside
```

Related Commands

Command	Description
connect fxos	From the ASA CLI, connects to the FXOS CLI.
fxos permit	Allows FXOS management access on ASA data interfaces.
fxos port	Sets the FXOS management access port.

ip-comp

To enable LZS IP compression, use the **ip-comp enable** command in group-policy configuration mode. To disable IP compression, use the **ip-comp disable** command. To remove the **ip-comp** attribute from the running configuration, use the **no** form of this command.

```
ip-comp { enable | disable }
no ip-comp
```

Syntax Description	disable Disables IP compression.
	enable Enables IP compression.

Command Default IP compression is disabled.

Command Modes The following table shows the modes in which you can enter the command:

Command Mode	Firewall Mode		Security Context		
	Routed	Transparent	Single	Multiple	
				Context	System
Group-policy configuratio	• Yes	—	• Yes	—	—

Command History	Release Modification
	7.0(1) This command was added.

Usage Guidelines The **no** form of this command enables inheritance of a value from another group policy. Enabling data compression might speed up data transmission rates for remote dial-in users connecting with modems.

Caution Data compression increases the memory requirement and CPU utilization for each user session and consequently decreases the overall throughput of the ASA. For this reason, we recommend that you enable data compression only for remote users connecting with a modem. Design a group policy specific to modem users, and enable compression only for them.

If the endpoints generate IP compression traffic, you should disable IP compression to prevent improper decompression of the packets. If IP compression is enabled on a particular LAN to LAN tunnel, host A cannot communicate with host B when trying to pass IP compression data from one side of the tunnel to other side.

Note When the **ip-comp** command is enabled and IPsec fragmentation is configured for “before-encryption,” you cannot have IPsec compression (ip-comp_option and pre-encryption). The IP header sent to the crypto chip becomes obfuscated (because of the compression), causing the crypto chip to generate an error when processing the supplied outbound packet. You might also check your MTU level to ensure that it is a small amount (such as 600 bytes).

Examples

The following example shows how to enable IP compression for the group policy named “FirstGroup”:

```
ciscoasa(config)# group-policy FirstGroup attributes  
ciscoasa(config-group-policy)# ip-comp enable
```

ip local pool

To configure IP address pools, use the **ip local pool** command in global configuration mode. To delete the address pool, use the **no** form of this command.

ip local pool *poolname* *first-address-last-address* [**mask** *mask*]
no ip local pool *poolname*

Syntax Description

first-address Specifies the starting address in the range of IP addresses.

last-address Specifies the final address in the range of IP addresses.

mask *mask* (Optional) Specifies a subnet mask for the pool of addresses. You cannot use a 255.255.255.254 (/31) or 255.255.255.255 (/32) subnet mask.

poolname Specifies the name of the IP address pool.

Command Default

No default behavior or values.

Command Modes

The following table shows the modes in which you can enter the command:

Command Mode	Firewall Mode		Security Context		
	Routed	Transparent	Single	Multiple	
				Context	System
Global Configuration	• Yes	• Yes	• Yes	• Yes	—

Command History

Release Modification

7.0(1) This command was added.

9.0(1) IP local pool for the cluster pool in the **ip address** command to support ASA clustering was added.

Usage Guidelines

You must supply the mask value when the IP addresses assigned to VPN clients belonging to a non-standard network and the data could be routed incorrectly if you use the default mask. A typical example is when the IP local pool contains 10.10.10.0/255.255.255.0 addresses, since this is a Class A network by default. This could cause some routing issues when the VPN client needs to access different subnets within the 10 network over different interfaces. For example, if a printer, address 10.10.100.1/255.255.255.0 is available via interface 2, but the 10.10.10.0 network is available over the VPN tunnel and therefore interface 1, the VPN client would be confused as to where to route data destined for the printer. Both the 10.10.10.0 and 10.10.100.0 subnets fall under the 10.0.0.0 Class A network so the printer data may be sent over the VPN tunnel.

Examples

The following example configures an IP address pool named firstpool. The starting address is 10.20.30.40 and the ending address is 10.20.30.50. The network mask is 255.255.255.0.

```
ciscoasa(config)# ip local pool firstpool 10.20.30.40-10.20.30.50 mask 255.255.255.0
```

Related Commands

Command	Description
clear configure ip local pool	Removes all IP local pools.
show running-config ip local pool	Displays the IP pool configuration. To specify a specific IP address pool, include the name in the command.

ip unnumbered

To borrow or inherit an IP address from an interface (for example, a loopback interface), use the **ip unnumbered** command in the interface configuration mode. To stop inheriting an ip address from an interface, use the **no** form of this command.

ip unnumbered *interface-name*
no ip unnumbered

Syntax Description

interface-name Specifies the name of an interface to inherit the IP address..

Command Default

No default behavior or values.

Command Modes

The following table shows the modes in which you can enter the command:

Command Mode	Firewall Mode		Security Context		
	Routed	Transparent	Single	Multiple	
				Context	System
Interface Configuration	• Yes	• Yes	• Yes	• Yes	—

Command History

Release Modification

9.19(1) This command was added.

Usage Guidelines

The **ip unnumbered** command is used to inherit the IP address of the selected interface as the address for the current interface.

Examples

The following example borrows the IP address from the loopback interface:

```
ciscoasa(config)# interface tunnel 1
ciscoasa(conf-if)# ip unnumbered loopback1
```

Related Commands

Command	Description
ipv6 unnumbered <i>interface-name</i>	Inherits the IPv6 address of the specified interface.
interface loopback <i>loopback-number</i>	Creates a loopback interface.

ip-phone-bypass

To enable IP Phone Bypass, use the **ip-phone-bypass enable** command in group-policy configuration mode. To remove the IP phone Bypass attribute from the running configuration, use the **no** form of this command.

```
ip-phone-bypass { enable | disable }
no ip-phone-bypass
```

Syntax Description **disable** Disables IP Phone Bypass.

enable Enables IP Phone Bypass.

Command Default IP Phone Bypass is disabled.

Command Modes

The following table shows the modes in which you can enter the command:

Command Mode	Firewall Mode		Security Context		
	Routed	Transparent	Single	Multiple	
				Context	System
Group-policy configuration	• Yes	—	• Yes	—	—

Command History

Release Modification

7.0(1) This command was added.

Usage Guidelines

To disable IP Phone Bypass, use the **ip-phone-bypass disable** command. The **no** form of this command option allows inheritance of a value for IP Phone Bypass from another group policy.

IP Phone Bypass lets IP phones behind hardware clients connect without undergoing user authentication processes. If enabled, secure unit authentication remains in effect.

You need to configure IP Phone Bypass only if you have enabled user authentication.

You also need to configure the **mac-exempt** option to exempt the clients from authentication. See the **vpnclient mac-exempt** command for more information.

Examples

The following example shows how to enable IP Phone Bypass for the group policy named FirstGroup:

```
ciscoasa(config)# group-policy FirstGroup attributes
ciscoasa(config-group-policy)# ip-phone-bypass enable
```

Related Commands

Command	Description
user-authentication	Requires users behind a hardware client to identify themselves to the ASA before connecting.

ips

To divert traffic from the ASA to the AIP SSM for inspection, use the **ips** command in class configuration mode. To remove this command, use the **no** form of this command.

```
ips { inline | promiscuous } { fail-close | fail-open } [ sensor { sensor_name | mapped_name } ]
no ips { inline | promiscuous } { fail-close | fail-open } [ sensor { sensor_name | mapped_name } ]
```

Syntax Description

fail-close	Blocks traffic if the AIP SSM fails.
fail-open	Permits traffic if the AIP SSM fails.
inline	Directs packets to the AIP SSM; the packet might be dropped as a result of IPS operation.
promiscuous	Duplicates packets for the AIP SSM; the original packet cannot be dropped by the AIP SSM.
sensor { <i>sensor_name</i> <i>mapped_name</i> }	<p>Sets the virtual sensor name for this traffic. If you use virtual sensors on the AIP SSM (using Version 6.0 or above), you can specify a sensor name using this argument. To see available sensor names, enter the ips ... sensor ? command. Available sensors are listed. You can also use the show ips command.</p> <p>If you use multiple context mode on the ASA, you can only specify sensors that you assigned to the context (see the allocate-ips command). Use the <i>mapped_name</i> argument if configured in the context.</p> <p>If you do not specify a sensor name, then the traffic uses the default sensor. In multiple context mode, you can specify a default sensor for the context. In single mode or if you do not specify a default sensor in multiple mode, the traffic uses the default sensor that is set on the AIP SSM.</p> <p>If you enter a name that does not yet exist on the AIP SSM, you get an error, and the command is rejected.</p>

Command Default

No default behavior or values.

Command Modes

The following table shows the modes in which you can enter the command:

Command Mode	Firewall Mode		Security Context		
	Routed	Transparent	Single	Multiple	
				Context	System
Class configuration	• Yes	• Yes	• Yes	• Yes	—

Command History**Release Modification**

- | | |
|--------|-----------------------------------|
| 7.0(1) | This command was added. |
| 8.0(2) | Virtual sensor support was added. |

Usage Guidelines

The ASA 5500 series supports the AIP SSM, which runs advanced IPS software that provides proactive, full-featured intrusion prevention services to stop malicious traffic, including worms and network viruses, before they can affect your network. Before or after you configure the **ips** command on the ASA, configure the security policy on the AIP SSM. You can either session to the AIP SSM from the ASA (the **session** command) or you can connect directly to the AIP SSM using SSH or Telnet on its management interface. Alternatively, you can use ASDM. For more information about configuring the AIP SSM, see Configuring the Cisco Intrusion Prevention System Sensor Using the Command Line Interface.

To configure the **ips** command, you must first configure the **class-map** command, **policy-map** command, and the **class** command.

The AIP SSM runs a separate application from the ASA. It is, however, integrated into the ASA traffic flow. The AIP SSM does not contain any external interfaces itself, other than a management interface. When you apply the **ips** command for a class of traffic on the ASA, traffic flows through the ASA and the AIP SSM in the following way:

1. Traffic enters the ASA.
2. Firewall policies are applied.
3. Traffic is sent to the AIP SSM over the backplane (using the **inline** keyword; See the **promiscuous** keyword for information about only sending a copy of the traffic to the AIP SSM).
4. The AIP SSM applies its security policy to the traffic, and takes appropriate actions.
5. Valid traffic is sent back to the ASA over the backplane; the AIP SSM might block some traffic according to its security policy, and that traffic is not passed on.
6. VPN policies are applied (if configured).
7. Traffic exits the ASA.

Examples

The following example diverts all IP traffic to the AIP SSM in promiscuous mode, and blocks all IP traffic if the AIP SSM card fails for any reason:

```
ciscoasa(config)# access-list IPS permit ip any any
ciscoasa(config)# class-map my-ips-class
ciscoasa(config-cmap)# match access-list IPS
ciscoasa(config-cmap)# policy-map my-ips-policy
ciscoasa(config-pmap)# class my-ips-class
ciscoasa(config-pmap-c)# ips promiscuous fail-close
ciscoasa(config-pmap-c)# service-policy my-ips-policy global
```

The following example diverts all IP traffic destined for the 10.1.1.0 network and the 10.2.1.0 network to the AIP SSM in inline mode, and allows all traffic through if the AIP SSM card fails for any reason. For the my-ips-class traffic, sensor1 is used; for the my-ips-class2 traffic, sensor2 is used.

```
ciscoasa(config)# access-list my-ips-acl permit ip any 10.1.1.0 255.255.255.0
ciscoasa(config)# access-list my-ips-acl2 permit ip any 10.2.1.0 255.255.255.0
```

```

ciscoasa(config)# class-map my-ips-class
ciscoasa(config-cmap)# match access-list my-ips-acl
ciscoasa(config)# class-map my-ips-class2
ciscoasa(config-cmap)# match access-list my-ips-acl2
ciscoasa(config-cmap)# policy-map my-ips-policy
ciscoasa(config-pmap)# class my-ips-class
ciscoasa(config-pmap-c)# ips inline fail-open sensor sensor1
ciscoasa(config-pmap)# class my-ips-class2
ciscoasa(config-pmap-c)# ips inline fail-open sensor sensor2
ciscoasa(config-pmap-c)# service-policy my-ips-policy interface outside

```

Related Commands

Command	Description
allocate-ips	Assigns a virtual sensor to a security context.
class	Specifies a class map to use for traffic classification.
class-map	Identifies traffic for use in a policy map.
policy-map	Configures a policy; that is, an association of a traffic class and one or more actions.
show running-config policy-map	Displays all current policy map configurations.

ipsec-udp

To enable IPsec over UDP, use the **ipsec-udp enable** command in group-policy configuration mode. To remove the IPsec over UDP attribute from the current group policy, use the **no** form of this command.

```
ipsec-udp { enable | disable }
no ipsec-udp
```

Syntax Description

disable Disables IPsec over UDP.

enable Enables IPsec over UDP.

Command Default

IPsec over UDP is disabled.

Command Modes

The following table shows the modes in which you can enter the command:

Command Mode	Firewall Mode		Security Context		
	Routed	Transparent	Single	Multiple	
				Context	System
Group-policy configuration	• Yes	—	• Yes	—	—

Command History

Release Modification

7.0(1) This command was added.

Usage Guidelines

The **no** form of this command enables inheritance of a value for IPsec over UDP from another group policy. IPsec over UDP, sometimes called IPsec through NAT, lets a Cisco VPN Client or hardware client connect via UDP to an ASA that is running NAT.

To disable IPsec over UDP, use the **ipsec-udp disable** command.

To use IPsec over UDP, you must also configure the **ipsec-udp-port** command.

The Cisco VPN Client must also be configured to use IPsec over UDP (it is configured to use it by default). The VPN 3002 requires no configuration to use IPsec over UDP.

IPsec over UDP is proprietary, applies only to remote access connections, and requires mode configuration, which means that the ASA exchanges configuration parameters with the client while negotiating SAs.

Using IPsec over UDP may slightly degrade system performance.

The ipsec-udp-port command is not supported on an ASA5505 operating as a VPN client. The ASA 5505 in client mode can initiate IPsec sessions on UDP ports 500 and/or 4500.

Examples

The following example shows how to configure IPsec over UDP for the group policy named FirstGroup:

```
ciscoasa(config)# group-policy FirstGroup attributes
ciscoasa(config-group-policy)# ipsec-udp enable
```

Related Commands

Command	Description
ipsec-udp-port	Specifies the port on which the ASA listens for UDP traffic.

ipsec-udp-port

To set a UDP port number for IPsec over UDP, use the **ipsec-udp-port** command in group-policy configuration mode. To disable the UDP port, use the **no** form of this command.

ipsec-udp-port *port*
noipsec-udp-port

Syntax Description

port Identifies the UDP port number using an integer in the range of 4001 through 49151.

Command Default

The default port is 10000.

Command Modes

The following table shows the modes in which you can enter the command:

Command Mode	Firewall Mode		Security Context		
	Routed	Transparent	Single	Multiple	
				Context	System
Group-policy configuratio	• Yes	—	• Yes	—	—

Command History

Release Modification

7.0(1) This command was added.

Usage Guidelines

The **no** form of this command enables inheritance of a value for the IPsec over UDP port from another group policy.

In IPsec negotiations, the ASA listens on the configured port and forwards UDP traffic for that port even if other filter rules drop UDP traffic.

You can configure multiple group policies with this feature enabled, and each group policy can use a different port number.

Examples

The following example shows how to set an IPsec UDP port to port 4025 for the group policy named FirstGroup:

```
ciscoasa(config)# group-policy FirstGroup attributes
ciscoasa(config-group-policy)# ipsec-udp-port 4025
```

Related Commands

Command	Description
ipsec-udp	Lets a Cisco VPN Client or hardware client connect via UDP to an ASA that is running NAT.
