

## VLAN Subinterfaces

This chapter tells how to configure VLAN subinterfaces.

**Note** For multiple context mode, complete all tasks in this section in the system execution space. If you are not already in the system execution space, in the Configuration > Device List pane, double-click **System** under the active device IP address.

## About VLAN Subinterfaces

VLAN subinterfaces let you divide a physical, redundant, or EtherChannel interface into multiple logical interfaces that are tagged with different VLAN IDs. An interface with one or more VLAN subinterfaces is automatically configured as an 802.1Q trunk. Because VLANs allow you to keep traffic separate on a given physical interface, you can increase the number of interfaces available to your network without adding additional physical interfaces or ASAs. This feature is particularly useful in multiple context mode so that you can assign unique interfaces to each context.

## Licensing for VLAN Subinterfaces

Model	License Requirement
Firepower 9300	Standard License: 1024
ASAv5	Standard License: 25
ASAv10	Standard License: 50

Model	License Requirement
ASAv30	Standard License: 200
ASA 5506-X	Base License: 5
ASA 5506W-X	Security Plus License: 30
ASA 5506H-X	
ASA 5508-X	Base License: 50
ASA 5512-X	Base License: 50 Security Plus License: 100
ASA 5515-X	Base License: 100
ASA 5516-X	Base License: 50
ASA 5525-X	Base License: 200
ASA 5545-X	Base License: 300
ASA 5555-X	Base License: 500
ASA 5585-X	Base and Security Plus License: 1024
ASASM	No support.
ISA 3000	Base License: 5 Security Plus License: 25

**Note** For an interface to count against the VLAN limit, you must assign a VLAN to it.

## Guidelines and Limitations for VLAN Subinterfaces

### Model Support

- ASASM—VLAN subinterfaces are not supported on the ASASM; ASASM interfaces are already VLAN interfaces assigned from the switch.
- For most ASA models, you cannot configure subinterfaces on the Management interface. See [Management Slot/Port Interface](#) for subinterface support.

### Additional Guidelines

- Preventing untagged packets on the physical interface—If you use subinterfaces, you typically do not also want the physical interface to pass traffic, because the physical interface passes untagged packets. This property is also true for the active physical interface in a redundant interface pair and for EtherChannel

links. Because the physical, redundant, or EtherChannel interface must be enabled for the subinterface to pass traffic, ensure that the physical, redundant, or EtherChannel interface does not pass traffic by not configuring a name for the interface. If you want to let the physical, redundant, or EtherChannel interface pass untagged packets, you can configure the name as usual.

- The ASA does not support the Dynamic Trunking Protocol (DTP), so you must configure the connected switch port to trunk unconditionally.
- You might want to assign unique MAC addresses to subinterfaces defined on the ASA, because they use the same burned-in MAC address of the parent interface. For example, your service provider might perform access control based on the MAC address. Also, because IPv6 link-local addresses are generated based on the MAC address, assigning unique MAC addresses to subinterfaces allows for unique IPv6 link-local addresses, which can avoid traffic disruption in certain instances on the ASA.

## Default Settings for VLAN Subinterfaces

This section lists default settings for interfaces if you do not have a factory default configuration.

### Default State of Interfaces

The default state of an interface depends on the type and the context mode.

In multiple context mode, all allocated interfaces are enabled by default, no matter what the state of the interface is in the system execution space. However, for traffic to pass through the interface, the interface also has to be enabled in the system execution space. If you shut down an interface in the system execution space, then that interface is down in all contexts that share it.

In single mode or in the system execution space, interfaces have the following default states:

- Physical interfaces—Disabled.
- VLAN subinterfaces—Enabled. However, for traffic to pass through the subinterface, the physical interface must also be enabled.

## Configure VLAN Subinterfaces and 802.1Q Trunking

Add a VLAN subinterface to a physical, redundant, or EtherChannel interface.

### Before you begin

For multiple context mode, complete this procedure in the system execution space. If you are not already in the System configuration mode, in the **Configuration > Device List** pane, double-click **System** under the active device IP address.

### Procedure

**Step 1** Depending on your context mode:

- For single mode, choose the **Configuration > Device Setup > Interface Settings > Interfaces** pane.

- For multiple mode in the System execution space, choose the **Configuration > Context Management > Interfaces** pane.

**Step 2** Choose **Add > Interface**.

The **Add Interface** dialog box appears.

**Note** In single mode, this procedure only covers a subset of the parameters on the Edit Interface dialog box; to configure other parameters, see [Routed and Transparent Mode Interfaces](#). Note that in multiple context mode, before you complete your interface configuration, you need to allocate interfaces to contexts. See [Configure Multiple Contexts](#).

**Step 3** From the **Hardware Port** drop-down list, choose the physical, redundant, or port-channel interface to which you want to add the subinterface.

**Step 4** If the interface is not already enabled, check the **Enable Interface** check box.

The interface is enabled by default.

**Step 5** In the **VLAN ID** field, enter the VLAN ID between 1 and 4094.

Some VLAN IDs might be reserved on connected switches, so check the switch documentation for more information. For multiple context mode, you can only set the VLAN in the system configuration.

**Step 6** In the **Subinterface ID** field, enter the subinterface ID as an integer between 1 and 4294967293.

The number of subinterfaces allowed depends on your platform. You cannot change the ID after you set it.

**Step 7** (Optional) In the **Description** field, enter a description for this interface.

The description can be up to 240 characters on a single line, without carriage returns. For multiple context mode, the system description is independent of the context description. In the case of a failover or state link, the description is fixed as “LAN Failover Interface,” “STATE Failover Interface,” or “LAN/STATE Failover Interface,” for example. You cannot edit this description. The fixed description overwrites any description you enter here if you make this interface a failover or state link.

**Step 8** Click **OK**.

You return to the **Interfaces** pane.

## Examples for VLAN Subinterfaces

The following example configures parameters for a subinterface in single mode:

```
interface gigabitethernet 0/1
  no nameif
  no security-level
  no ip address
  no shutdown
interface gigabitethernet 0/1.1
  vlan 101
  nameif inside
```

```

security-level 100
ip address 192.168.6.6 255.255.255.0
no shutdown

```

## History for VLAN Subinterfaces

*Table 1: History for VLAN Subinterfaces*

Feature Name	Version	Feature Information
Increased VLANs	7.0(5)	Increased the following limits: <ul style="list-style-type: none"> <li>• ASA5510 Base license VLANs from 0 to 10.</li> <li>• ASA5510 Security Plus license VLANs from 10 to 25.</li> <li>• ASA5520 VLANs from 25 to 100.</li> <li>• ASA5540 VLANs from 100 to 200.</li> </ul>
Increased VLANs	7.2(2)	VLAN limits were increased for the ASA 5510 (from 10 to 50 for the Base license, and from 25 to 100 for the Security Plus license), the ASA 5520 (from 100 to 150), the ASA 5550 (from 200 to 250).
Increased VLANs for the ASA 5580	8.1(2)	The number of VLANs supported on the ASA 5580 are increased from 100 to 250.
