<b>CHAPTER 2</b>	<b>Cisco AI Assistant User Guide</b>	<b>5</b>
	Onboard with Cisco AI Assistant	<b>5</b>
	Prompt Guide for Cisco AI Assistant	<b>8</b>
	Online Help Documentation	<b>11</b>
	Policy Insights	<b>11</b>
	Policy Analyzer and Optimizer	<b>12</b>
	Automate Policy Rule Creation	<b>13</b>
	Contact Support	<b>17</b>
	Notifications Center	<b>20</b>
	Cisco AI Assistant Frequently Asked Questions (FAQ)	<b>21</b>

---

<b>PART II</b>	<b>Onboard Devices to Cloud-delivered Firewall Management Center</b>	<b>25</b>
----------------	--	-----------

---

<b>CHAPTER 3</b>	<b>Onboard an FTD to the Cloud-delivered Firewall Management Center</b>	<b>27</b>
	Onboarding Overview	<b>27</b>
	Prerequisites to Onboard a Device to Cloud-delivered Firewall Management Center	<b>28</b>
	Onboard a Device with a CLI Registration Key	<b>30</b>
	Onboard a Threat Defense Device to Cloud-delivered Firewall Management Center using Zero-Touch Provisioning	<b>32</b>

Onboard a Threat Defense Device to On-Prem Firewall Management Center using Zero-Touch Provisioning	33
Onboard Threat Defense Devices using Device Templates to Cloud-delivered Firewall Management Center using Zero-Touch Provisioning	34
Deploy a Threat Defense Device with AWS	36
Deploy a Threat Defense Device in Azure	37
Onboard an Azure VNet Environment	38
Deploy a Threat Defense Virtual in Azure	40
Deploy a Threat Defense Device to Google Cloud Platform	41
Create VPC Networks for GCP	41
Deploy a Threat Defense Device on Google Cloud Platform	42
Onboard a Secure Firewall Threat Defense Cluster	44
Onboard a Chassis	45
Delete Devices from Cloud-delivered Firewall Management Center	47
About Device Interfaces	47
Management Interfaces	47
About Data Interfaces	48
Network Routes on Device Management Interfaces	48
Log Into the Command Line Interface on the Device	49
Troubleshooting	50
Troubleshoot Cloud-delivered Firewall Management Center Connectivity with TCP	50
Troubleshoot Threat Defense Device Connectivity	51
Troubleshoot Device Connectivity Loss After Cloud-delivered Firewall Management Center Update	52
Troubleshoot Onboarding a Device to the Cloud-delivered Firewall Management Center Using the CLI Registration Key	53
Error: Device Remains in Pending Setup State After Onboarding	53
Troubleshoot Onboarding a Device to Cloud-delivered Firewall Management Center Using the Serial Number	53
Device is Offline or Unreachable	53
Error: Serial Number Already Claimed	54
Error: Claim Error	55
Error: Failed to Claim	56
Error: Provisional Error	57

**CHAPTER 4****Migrate On-Premises Management Center Managed Secure Firewall Threat Defense to Cloud-delivered Firewall Management Center 59**

- About Migrating Threat Defense to Cloud-delivered Firewall Management Center 59
- Supported On-Premises Firewall Management Center and Threat Defense Software for Migration 60
- Licensing 61
- Supported Features 61
- Unsupported Features 64
- User Identity Migration Guidelines and Limitations for Threat Defense Devices 65
- Migration Guidelines and Limitations for VPN Configuration 66
- Managing Threat Defense Events and Analytics 67
- Before You Begin Migration 68
- Migrate Threat Defense to Cloud-delivered Firewall Management Center 70
- View a Threat Defense Migration Job 72
  - Proceed Migration Process 74
  - Commit Migration Changes Manually to Cloud-delivered Firewall Management Center 75
  - Revert the Threat Defense Management to On-Premises Firewall Management Center 76
  - View Migrated Devices 76
  - Generate a Threat Defense Migration Report 78
  - Delete a Migration Job 78
- Enable Notification Settings 78
- Troubleshoot Threat Defense Migration to Cloud 79
  - Verify Threat Defense Connectivity with Cloud-delivered Firewall Management Center 81

**CHAPTER 5****Device Management 85**

- Log Into the Command Line Interface on the Device 85
- Manage Devices 87
  - Add a Device Group 88
  - Register With a New Management Center 88
  - Shut Down or Restart the Device 89
  - Download the Managed Device List 90
  - Migrate the Configuration to a New Model 91
    - Supported Devices for Migration 91
    - License for Migration 91

- Prerequisites for Migration 92
- What Configurations Does the Wizard Migrate? 92
- Limitations for Migration 94
- Migrate the Secure Firewall Threat Defense 94
- Best Practices for Migration 95
- Hot Swap an SSD on the Secure Firewall 3100/4200 96
- Disable the USB Port 98
  - Disable the USB Port on a Device 98
  - Disable the USB Port in Multi-Instance Mode 99

**CHAPTER 6**

**Device Management Using Device Templates 101**

- About Device Management using Device Templates 101
  - Variables and Network Object Overrides 102
  - Model Mapping 102
- Requirements and Prerequisites for Device Management using Device Templates 102
- Licenses for Device Management using Device Templates 103
- Guidelines and Limitations for Device Management using Device Templates 104
- Template Management 107
  - Add a Device Template 107
    - Create a New Device Template 108
    - Generate a New Device Template from an Existing Device 108
    - Import a Device Template 109
  - Configure a Device Template 110
    - Add a Physical Interface 110
    - Add a Logical Interface 110
    - Edit an Interface 111
  - Configure Other Device Settings 111
  - Configure Template Settings 112
    - Edit General Settings 112
    - Edit Licenses 113
    - Edit Applied Policies 113
    - Edit Advanced Settings 114
    - Edit Deployment Settings 115
    - Configure Template Parameters 116

Add Model Mapping	118
Configure Site-to-Site VPN Connections in a Device Template	119
Configure an SD-WAN VPN Connection	119
Configure a Route-Based Site-to-Site VPN Connection	120
Configure a Policy-Based Site-to-Site VPN Connection	121
Add a Device to an SD-WAN Topology in a Dual ISP Deployment	123
Apply Templates to Existing Devices	124
Apply a Template	124
Reapply a Template	125
Validation of Template Configuration Before and After Application of Template on Device	126
Monitoring Device Templates	126
View Associated Devices	126
Generate a Template Apply Report	127
Delete Device Template	128
Configure a Template for Threat Defense Devices Managed Using the Data Interface	128
Device Template Operations on Threat Defense High Availability Devices	130
Audit Logs	130
Device Templates in Domains	131
Troubleshooting Device Templates	132
History for Device Management using Device Templates	135

---

**CHAPTER 7**
**Device Settings 137**

Edit General Settings	137
Copy a Configuration to Another Device	139
Export and Import the Device Configuration	140
Edit License Settings	144
View System Information	145
View the Inspection Engine	145
View Health Information	145
Edit Management Settings	146
Update the Hostname or IP Address in the Management Center	146
Change Both Management Center and Threat Defense IP Addresses	148
Change the Manager Access Interface from Management to Data	152
Change the Manager Access Interface from Data to Management	156

Change the Manager Access Interface from Management to Data in a High Availability Pair	158
Change the Manager Access Interface from Data to Management in a High Availability Pair	162
Configure a Redundant Manager Access Data Interface	164
Modify Threat Defense Management Interfaces at the CLI	169
Modify the Threat Defense Data Interface Used for Management at the CLI	175
Edit the Management Center IP Address/Hostname on the Device	177
Manually Roll Back the Configuration if the Management Center Loses Connectivity	178
Troubleshoot Management Connectivity on a Data Interface	180
Troubleshoot Management Connectivity on a Data Interface in a High Availability Pair	185
View Inventory Details	190
Edit Applied Policies	190
Edit Advanced Settings	192
Configure Automatic Application Bypass	193
Configure Object Group Search	193
Configure Interface Object Optimization	195
Edit Deployment Settings	195
Edit Cluster Health Monitor Settings	198
History for Device Settings	204

---

**CHAPTER 8**
**Change Management 207**

About Change Management	207
How to Configure Devices in the Change Management Workflow	208
Creating Separate Approver and Configuration Roles	208
Policies and Objects that Support Change Management	209
Requirements and Prerequisites for Change Management	211
Guidelines and Limitations for Change Management	211
Enabling or Disabling Change Management	212
Managing Tickets	213
Creating Change Management Tickets	214
Opening a Ticket for Configuration Changes	215
Previewing a Ticket	215
Submitting a Ticket	216
Discarding a Ticket	216
Approving or Rejecting a Ticket	217

Taking Over or Reassigning Tickets	217
History for Change Management	218

**CHAPTER 9****Users 219**

About Users	219
Internal and External Users	219
CLI Access	219
CLI User Roles	220
Requirements and Prerequisites for User Accounts for Devices	220
Guidelines and Limitations for User Accounts for Devices	221
Add an Internal User at the CLI	221
Troubleshooting LDAP Authentication Connections	223

**CHAPTER 10****Configuration Deployment 227**

About Configuration Deployment	227
Configuration Changes that Require Deployment	227
Deployment Preview	228
Selective Policy Deployment	229
System Username	231
Auto-Enabling of Application Detectors	231
Asset Rediscovery with Network Discovery Policy Changes	232
Snort Restart Scenarios	232
Restart Warnings for Devices	232
Inspect Traffic During Policy Apply	233
Snort Restart Traffic Behavior	234
Configurations that Restart the Snort Process When Deployed or Activated	236
Changes that Immediately Restart the Snort Process	237
Requirements and Prerequisites for Policy Management	238
Best Practices for Deploying Configuration Changes	238
Deploy the Configuration	239
Deploy Configuration Changes	240
Redeploy Existing Configurations to a Device	245
Manage Deployments	247
View Deployment Status	247

- View Deployment History 247
- Download Policy Changes Report for Multiple Devices 251
- Compare Policies 252
- Generate Current Policy Reports 253
- History for Configuration Deployment 254

---

**PART III**

**System Settings 255**

---

**CHAPTER 11**

**System Configuration 257**

- Requirements and Prerequisites for the System Configuration 257
- Manage the Secure Firewall Management Center System Configuration 257
- Access Control Preferences 258
- Change Reconciliation 259
  - Configuring Change Reconciliation 259
  - Change Reconciliation Options 260
- Change Management 260
- Email Notification 261
- Intrusion Policy Preferences 261
  - Set Intrusion Policy Preferences 261
- Manager Remote Access 262
- Network Analysis Policy Preferences 262

---

**CHAPTER 12**

**Users 263**

- About Users 263
  - Internal and External Users 263
  - User Roles 263
- Create a User Record with Your Security Cloud Control Username 266
- Troubleshooting LDAP Authentication Connections 267

---

**CHAPTER 13**

**Updates 269**

- About System Updates 269
- Guidelines and Limitations for System Updates 271
- Update the Vulnerability Database (VDB) 271
  - Schedule VDB Updates 272

Manually Update the VDB	272
Update the Geolocation Database (GeoDB)	273
Schedule GeoDB Updates	274
Manually Update the GeoDB	274
Update Intrusion Rules	275
Schedule Intrusion Rule Updates	276
Manually Update Intrusion Rules	277
Import Local Intrusion Rules	278
Best Practices for Importing Local Intrusion Rules	278
View Intrusion Rule Update Logs	279
Intrusion Rule Update Log Details	280

---

**CHAPTER 14**
**Licenses 283**

About Licenses	283
Smart Software Manager and Accounts	284
How Licensing Works for the Management Center and Devices	284
Periodic Communication with the Smart Software Manager	284
Evaluation Mode	284
Out-of-Compliance State	285
Unregistered State	285
End-User License Agreement	285
License Types and Restrictions	286
Essentials Licenses	287
Malware Defense Licenses	288
IPS Licenses	288
Carrier License	289
URL Filtering Licenses	290
Secure Client Licenses	291
Licensing for Export-Controlled Functionality	291
Threat Defense Virtual Licenses	292
License PIDs	294
Requirements and Prerequisites for Licensing	300
Requirements and Prerequisites for Licensing for High Availability, Clustering, and Multi-Instance	301

- Licensing for Device High-Availability 301
- Licensing for Device Clusters 301
- Create a Cisco Account 301
- Create a Smart Account and Add Licenses 302
- Configure Smart Licensing 304
  - Register the Management Center for Smart Licensing 304
    - Register the Management Center with the Smart Software Manager 304
  - Assign Licenses to Devices 306
    - Assign Licenses to a Single Device 306
    - Assign Licenses to Multiple Managed Devices 307
- Manage Smart Licensing 308
  - Deregister the Management Center 308
  - Monitoring Smart License Status 309
  - Monitoring Smart Licenses 309
  - Troubleshooting Smart Licensing 310
- Configure Legacy Management Center PAK-Based Licenses 311
- Additional Information about Licensing 312

---

**CHAPTER 15**

- Security Certifications Compliance 313**
  - Security Certifications Compliance Modes 313
  - Security Certifications Compliance Characteristics 314
  - Security Certifications Compliance Recommendations 315
    - Appliance Hardening 316
    - Protecting Your Network 317

---

**PART IV**

- Optimize Firewall Performance with AIOps 319**

---

**CHAPTER 16**

- Introduction to AIOps Insights 321**
  - About AIOps Insights 321
    - AIOps Licensing Requirements 322
    - Prerequisites to Use AIOps 322
  - Enable AIOps Insights 322
  - View Summary Insights 323
  - Assess and Improve Feature Adoption 324

Configure Settings for AIOps	325
Enable Traffic and Capacity Insights	325
Enable Feature Adoption Insights	326
Enable Health and Operations Insights	327
Frequently Asked Questions About AIOps	328
Additional Resources	328

---

**PART V**
**Health and Monitoring 331**

---

**CHAPTER 17**
**Health 333**

Requirements and Prerequisites for Health Monitoring	333
About Health Monitoring	333
Health Modules	335
Configuring Health Monitoring	345
Health Policies	346
Default Health Policy	346
Creating Health Policies	347
Apply a Health Policy	347
Edit a Health Policy	348
Set a Default Health Policy	349
Delete a Health Policy	350
Send Vendor-Neutral Telemetry Streams Using OpenConfig	350
Generate Certificates and Private Keys	351
Configure OpenConfig Streaming Telemetry	353
Troubleshoot OpenConfig Streaming Telemetry	354
Device Exclusion in Health Monitoring	356
Excluding Appliances from Health Monitoring	356
Excluding Health Policy Modules	357
Expired Health Monitor Exclusions	358
Health Monitor Alerts	358
Health Monitor Alert Information	358
Creating Health Monitor Alerts	359
Editing Health Monitor Alerts	360
Deleting Health Monitor Alerts	360

About the Health Monitor	360
Using Management Center Health Monitor	362
Running All Modules for an Appliance	363
Running a Specific Health Module	363
Generating Health Module Alert Graphs	364
Hardware Statistics on Management Center	364
Device Health Monitors	365
Viewing System Details and Troubleshooting	366
Viewing the Device Health Monitor	366
Cluster Health Monitor	369
Viewing the Cluster Health Monitor	370
Health Monitor Status Categories	371
Health Event Views	372
Viewing Health Events	372
Viewing the Health Events Table	373
The Health Events Table	374
About System Auditing	375
Audit Records	375
Audit Log Workflow Fields	375
The Audit Events Table View	376

---

**CHAPTER 18**
**Troubleshooting 377**

Best Practices for Troubleshooting	377
System Messages	377
Message Types	378
Message Management	380
View Basic System Information	380
View Appliance Information	380
Manage System Messages	381
View Deployment Messages	381
View Upgrade Messages	382
View Health Messages	383
View Task Messages	383
Manage Task Messages	384

Memory Usage Thresholds for Health Monitor Alerts	384
Disk Usage and Drain of Events Health Monitor Alerts	385
Health Monitor Reports for Troubleshooting	389
Generate Troubleshooting Files for Specific System Functions	389
Download Advanced Troubleshooting Files	390
General Troubleshooting	391
Connection-Based Troubleshooting	391
Troubleshoot a Connection	391
Advanced Troubleshooting for the Secure Firewall Threat Defense Device	392
Packet Capture Overview	392
Use the Capture Trace	394
Packet Tracer Overview	396
Use the Packet Tracer	396
CPU Profiler Overview	398
Use the CPU Profiler	399
Rule Profiler Overview	400
Use the Rule Profiler	400
How to use the Threat Defense Diagnostic CLI from the Web Interface	401
Feature-Specific Troubleshooting	402
<hr/>	
<b>PART VI</b>	<b>Tools 405</b>
<hr/>	
<b>CHAPTER 19</b>	<b>Backup/Restore 407</b>
About Backup and Restore	407
Requirements for Backup and Restore	408
Guidelines and Limitations for Backup and Restore	409
Best Practices for Backup and Restore	409
Back Up Managed Devices	412
Back Up a Threat Defense Device from Cloud-delivered Firewall Management Center	412
Restore Security Cloud Control-Managed Devices	413
Restore a Threat Defense Device	413
Restore Threat Defense from Backup: Threat Defense Virtual	416
<hr/>	
<b>CHAPTER 20</b>	<b>Scheduling 419</b>

- About Task Scheduling 419
- Requirements and Prerequisites for Task Scheduling 420
- Configuring a Recurring Task 420
  - Scheduled Backups 421
    - Schedule Remote Device Backups 421
  - Automating Policy Deployment 422
  - Software Upgrade Automation 423
    - Automating Software Downloads 423
    - Automating Software Pushes 424
    - Automating Software Installs 424
  - Vulnerability Database Update Automation 425
    - Automating VDB Update Downloads 425
    - Automating VDB Update Installs 426
  - Automating URL Filtering Updates Using a Scheduled Task 427
- Scheduled Task Review 428
  - Task List Details 428
  - Viewing Scheduled Tasks on the Calendar 429
  - Editing Scheduled Tasks 429
  - Deleting Scheduled Tasks 430

---

**CHAPTER 21**

**Import/Export 431**

- About Configuration Import/Export 431
  - Configurations that Support Import/Export 431
  - Special Considerations for Configuration Import/Export 432
- Requirements and Prerequisites for Configuration Import/Export 433
- Exporting Configurations 433
- Importing Configurations 434
  - Import Conflict Resolution 435

---

**PART VII**

**Reporting and Alerting 439**

---

**CHAPTER 22**

**External Alerting with Alert Responses 441**

- Secure Firewall Management Center Alert Responses 441
  - Configurations Supporting Alert Responses 442

Requirements and Prerequisites for Alert Responses	442
Creating an SNMP Alert Response	442
Creating a Syslog Alert Response	444
Syslog Alert Facilities	445
Syslog Severity Levels	446
Creating an Email Alert Response	446

---

<b>CHAPTER 23</b>	<b>External Alerting for Intrusion Events</b>	<b>449</b>
	About External Alerting for Intrusion Events	449
	License Requirements for External Alerting for Intrusion Events	450
	Requirements and Prerequisites for External Alerting for Intrusion Events	450
	Configuring SNMP Alerting for Intrusion Events	450
	Intrusion SNMP Alert Options	451
	Configuring Syslog Alerting for Intrusion Events	452
	Facilities and Severities for Intrusion Syslog Alerts	453
	Configuring Email Alerting for Intrusion Events	454
	Intrusion Email Alert Options	454

---

<b>PART VIII</b>	<b>Events and Assets</b>	<b>457</b>
------------------	--------------------------	------------

---

<b>CHAPTER 24</b>	<b>Cisco Security Analytics and Logging</b>	<b>459</b>
	About Security Analytics and Logging	459
	Comparison of SAL Remote Event Storage and Monitoring Options	460
	About SAL (OnPrem)	460
	Licensing for SAL (OnPrem)	461
	Manage SAL (OnPrem) for Security Cloud Control-Managed Threat Defense Devices	461
	Configure SAL (OnPrem) Integration	463
	Configure a Secure Network Analytics Manager	463
	Configure a Secure Network Analytics Data Store	464
	About SAL (SaaS)	466
	Licensing for SAL (SaaS)	466

---

<b>CHAPTER 25</b>	<b>FTD Dashboard</b>	<b>467</b>
	About the FTD Dashboard	467

- View the FTD Dashboard **468**
- FTD Dashboard Widgets **469**
  - Top Intrusion Rules Widget **469**
  - Top Intrusion Attackers Widget **469**
  - Top Intrusion Targets Widget **470**
  - Top Malware Signatures Widget **470**
  - Top Malware Senders Widget **470**
  - Top Malware Receivers Widget **470**
  - Malware Events by Disposition Widget **470**
  - Network Activity Widget **470**
  - Event Activity Widget **470**
  - Access Control Actions Widget **470**
  - Top Access Control Policies Widget **470**
  - Top Access Control Rules Widget **471**
  - Top Devices Widget **471**
  - Top Users Widget **471**
  - Top Users by Blocked Connections Widget **471**
  - Top Devices with Health Alerts Widget **471**
  - Top Loaded Devices Widget **471**
  - Top Web Applications Widget **471**
  - Top Client Applications Widget **471**
  - Top Blocked Web Applications Widget **471**
- Modify Time Settings for the FTD Dashboard **472**

---

**CHAPTER 26**

**Connection Logging 473**

- About Connection Logging **473**
  - Connections That Are Always Logged **474**
  - Other Connections You Can Log **474**
- How Rules and Policy Actions Affect Logging **475**
  - Logging for Fastpathed Connections **476**
  - Logging for Monitored Connections **476**
  - Logging for Trusted Connections **476**
  - Logging for Blocked Connections **476**
  - Logging for Allowed Connections **478**

Beginning vs End-of-Connection Logging	479
Limitations of Connection Logging	480
Best Practices for Connection Logging	480
Requirements and Prerequisites for Connection Logging	482
Configure Connection Logging	483
Logging Connections with Tunnel and Prefilter Rules	483
Logging Decryptable Connections with TLS/SSLDecryption Rules	484
Logging Connections with Security Intelligence	484
Logging Connections with Access Control Rules	485
Logging Connections with a Policy Default Action	486
Limiting Logging of Long URLs	487

---

**PART IX**
**Device Operations 489**

---

**CHAPTER 27**
**Transparent or Routed Firewall Mode 491**

About the Firewall Mode	491
About Routed Firewall Mode	491
About Transparent Firewall Mode	492
Using the Transparent Firewall in Your Network	492
Passing Traffic For Routed-Mode Features	492
About Bridge Groups	493
Bridge Virtual Interface (BVI)	493
Bridge Groups in Transparent Firewall Mode	493
Bridge Groups in Routed Firewall Mode	494
Allowing Layer 3 Traffic	495
Allowed MAC Addresses	495
BPDU Handling	495
MAC Address vs. Route Lookups	496
Unsupported Features for Bridge Groups in Transparent Mode	497
Unsupported Features for Bridge Groups in Routed Mode	498
Default Settings	499
Guidelines for Firewall Mode	499
Set the Firewall Mode	500

---

<b>CHAPTER 28</b>	<b>Logical Devices on the Firepower 4100/9300</b>	<b>503</b>
	About Interfaces	503
	Chassis Management Interface	503
	Interface Types	504
	FXOS Interfaces vs. Application Interfaces	506
	Shared Interface Scalability	508
	Shared Interface Best Practices	508
	Shared Interface Usage Examples	510
	Viewing Shared Interface Resources	516
	Inline Set Link State Propagation for the Threat Defense	516
	About Logical Devices	517
	Standalone and Clustered Logical Devices	517
	Logical Device Application Instances: Container and Native	517
	Container Instance Interfaces	518
	How the Chassis Classifies Packets	518
	Classification Examples	519
	Cascading Container Instances	522
	Typical Multi-Instance Deployment	523
	Automatic MAC Addresses for Container Instance Interfaces	524
	Container Instance Resource Management	525
	Performance Scaling Factor for Multi-Instance Capability	525
	Container Instances and High Availability	525
	Container Instances and Clustering	525
	Licenses for Container Instances	525
	Requirements and Prerequisites for Logical Devices	526
	Requirements and Prerequisites for Hardware and Software Combinations	526
	Requirements and Prerequisites for Container Instances	528
	Requirements and Prerequisites for High Availability	529
	Requirements and Prerequisites for Clustering	529
	Guidelines and Limitations for Logical Devices	533
	Guidelines and Limitations for Interfaces	533
	General Guidelines and Limitations	536
	Configure Interfaces	536

Configure a Physical Interface	536
Add an EtherChannel (Port Channel)	537
Add a VLAN Subinterface for Container Instances	537
Configure Logical Devices	538
Add a Resource Profile for Container Instances	538
Add a Standalone Threat Defense	539
Add a Standalone Threat Defense for the Cisco Security Cloud Control	540
Add a High Availability Pair	541
Change an Interface on a Threat Defense Logical Device	542
Connect to the Console of the Application	543

---

**CHAPTER 29**

<b>Multi-Instance Mode for the Secure Firewall 3100</b>	<b>545</b>
About Multi-Instance Mode	545
Multi-Instance Mode vs. Appliance Mode	545
Chassis Management Interface	546
Instance Interfaces	546
Interface Types	546
Chassis Interfaces vs. Instance Interfaces	547
Shared Interface Scalability	549
Shared Interface Best Practices	549
How the Chassis Classifies Packets	551
Classification Examples	552
Cascading Instances	555
Typical Multi-Instance Deployment	556
Automatic MAC Addresses for Instance Interfaces	557
Performance Scaling Factor for Multi-Instance Mode	558
Instances and High Availability	558
Licenses for Instances	558
Requirements and Prerequisites for Instances	558
Guidelines and Limitations for Instances	560
Configure Instances	562
562	
562	
Onboard the Multi-Instance Chassis	562

Configure Chassis Interfaces	566
Configure a Physical Interface	566
Configure an EtherChannel	569
Configure a Subinterface	573
Add an Instance	575
Customize the System Configuration	582
Configure SNMP	582
Import or Export the Chassis Configuration	583
Configure Chassis Platform Settings	585
Create a Chassis Platform Settings Policy	585
Configure DNS	586
Configure SSH and SSH Access List	587
Configure Syslog	592
Configure Time Synchronization	597
Configure Time Zones	599
Manage Multi-Instance Mode	600
Change Interfaces Assigned to an Instance	600
Change Chassis Management Settings at the FXOS CLI	602
Monitoring Multi-Instance Mode	605
Monitoring Multi-Instance Setup	605
Monitoring Instance Interfaces	606
History for Multi-Instance Mode	608
<hr/>	
<b>CHAPTER 30</b>	<b>High Availability 609</b>
About Secure Firewall Threat Defense High Availability	609
High Availability Support on Threat Defense Devices in a Remote Branch Office Deployment	610
High Availability System Requirements	610
Hardware Requirements	610
Software Requirements	611
License Requirements for Threat Defense Devices in a High Availability Pair	611
Failover and Stateful Failover Links	611
Failover Link	611
Stateful Failover Link	613
Avoiding Interrupted Failover and Data Links	613

MAC Addresses and IP Addresses in High Availability	614
Stateful Failover	616
Supported Features	616
Unsupported Features	617
Bridge Group Requirements for High Availability	618
Failover Health Monitoring	618
Unit Health Monitoring	618
Heartbeat Module Redundancy	619
Interface Monitoring	619
Failover Triggers and Detection Timing	621
About Active/Standby Failover	622
Primary/Secondary Roles and Active/Standby Status	622
Active Unit Determination at Startup	622
Failover Events	622
Config-Sync Optimization	623
Requirements and Prerequisites for High Availability	624
Guidelines for High Availability	624
Add a High Availability Pair	627
Configure Optional High Availability Parameters	630
Configure Standby IP Addresses and Interface Monitoring	630
Edit High Availability Failover Criteria	631
Configure Virtual MAC Addresses	631
Manage High Availability	632
Switch the Active Peer in the Threat Defense High Availability Pair	632
Refresh Node Status for a Single Threat Defense High Availability Pair	633
Suspend and Resume High Availability	633
Replace a Unit in Threat Defense High Availability Pair	634
Replace a Primary Threat Defense HA Unit with no Backup	634
Replace a Secondary Threat Defense HA Unit with no Backup	635
Break a High Availability Pair	636
Remove a High Availability Pair	637
Monitoring High Availability	638
View Failover History	638
View Stateful Failover Statistics	638

Troubleshooting High Availability Break in a Remote Branch Deployment	639
How to Break a High Availability Pair in Active-Active State	639
How to Break a High Availability Pair when Active or Standby Unit has Lost Connectivity	641
How to a Break High Availability Pair when the Secondary Device is in a Failed or Disabled State	642
History for High Availability	644

## CHAPTER 33

**Clustering for Threat Defense Virtual in a Public Cloud 761**

About Threat Defense Virtual Clustering in the Public Cloud	762
How the Cluster Fits into Your Network	762
Individual Interfaces	762
Control and Data Node Roles	763
Cluster Control Link	763
Cluster Control Link Traffic Overview	764
Configuration Replication	764
Management Network	764
Licenses for Threat Defense Virtual Clustering	764
Requirements and Prerequisites for Threat Defense Virtual Clustering	765
Guidelines for Threat Defense Virtual Clustering	766
Deploy the Cluster in AWS	768
AWS Gateway Load Balancer and Geneve Single-Arm Proxy	768
Sample Topology	769
End-to-End Process for Deploying Threat Defense Virtual Cluster on AWS	769
Templates	771
Deploy the Stack in AWS Using a CloudFormation Template	772
Deploy the Cluster in AWS Manually	783
Create the Day0 Configuration for AWS	783
Deploy Cluster Nodes	784
Deploy the Cluster in Azure	785
Sample Topology for GWLB-based Cluster Deployment	785
Azure Gateway Load Balancer and Paired Proxy	786
End-to-End Process for Deploying Threat Defense Virtual Cluster in Azure with GWLB	787
Templates	789
Prerequisites	789
Deploy Cluster on Azure with GWLB Using an Azure Resource Manager Template	789
Sample Topology for NLB-based Cluster Deployment	792
End-to-End Process for Deploying Threat Defense Virtual Cluster in Azure with NLB	793

Templates	794
Prerequisites	795
Deploy Cluster on Azure with NLB Using an Azure Resource Manager Template	795
Deploy the Cluster in Azure Manually	797
Create the Day0 Configuration for Azure	797
Deploy Cluster Nodes Manually - GWLB-based Deployment	802
Deploy Cluster Nodes Manually - NLB-based Deployment	802
Troubleshooting Cluster Deployment in Azure	803
Deploy the Cluster in GCP	804
Sample Topology	804
End-to-End Process for Deploying Threat Defense Virtual Cluster in GCP	805
Templates	806
Deploy the Instance Group in GCP Using an Instance Template	806
Deploy the Cluster in GCP Manually	808
Create the Day0 Configuration for GCP	808
Deploy Cluster Nodes Manually	810
Allow Health Checks for GCP Network Load Balancers	811
Add the Cluster to the Management Center (Manual Deployment)	812
Configure Cluster Health Monitor Settings	818
Manage Cluster Nodes	823
Disable Clustering	823
Rejoin the Cluster	824
Reconcile Cluster Nodes	824
Unregister the Cluster or Nodes and Register to a New Management Center	825
Monitoring the Cluster	826
Cluster Health Monitor Dashboard	829
Viewing Cluster Health	830
Cluster Metrics	831
Upgrading the Cluster	832
Reference for Clustering	832
Threat Defense Features and Clustering	833
Unsupported Features and Clustering	833
Centralized Features for Clustering	833
Cisco Trustsec and Clustering	834

Connection Settings and Clustering	834
Dynamic Routing and Clustering	834
FTP and Clustering	835
NAT and Clustering	835
SIP Inspection and Clustering	837
SNMP and Clustering	837
Syslog and Clustering	837
VPN and Clustering	837
Performance Scaling Factor	838
Control Node Election	838
High Availability within the Cluster	838
Node Health Monitoring	839
Interface Monitoring	839
Status After Failure	839
Rejoining the Cluster	839
Data Path Connection State Replication	840
How the Cluster Manages Connections	840
Connection Roles	840
New Connection Ownership	842
Sample Data Flow for TCP	842
Sample Data Flow for ICMP and UDP	843
History for Threat Defense Virtual Clustering in the Public Cloud	844

---

**CHAPTER 34**
**Clustering for the Firepower 4100/9300 845**

About Clustering on the Firepower 4100/9300 Chassis	845
Bootstrap Configuration	846
Cluster Members	846
Cluster Control Link	846
Size the Cluster Control Link	847
Cluster Control Link Redundancy	847
Cluster Control Link Reliability for Inter-Chassis Clustering	848
Cluster Control Link Network	848
Management Network	848
Management Interface	848

Cluster Interfaces	848
Spanned EtherChannels	848
Configuration Replication	849
Licenses for Clustering	849
Requirements and Prerequisites for Clustering	850
Clustering Guidelines and Limitations	853
Configure Clustering	857
FXOS: Add a Threat Defense Cluster	857
Create a Threat Defense Cluster	857
Add More Cluster Nodes	859
Management Center: Add a Cluster	860
Management Center: Configure Cluster, Data Interfaces	866
Management Center: Configure Cluster Health Monitor Settings	868
FXOS: Remove a Cluster Node	872
Management Center: Manage Cluster Members	874
Add a New Cluster Member	874
Replace a Cluster Member	874
Deactivate a Member	875
Rejoin the Cluster	876
Unregister a Data Node	877
Change the Control Unit	878
Reconcile Cluster Members	878
Management Center: Monitoring the Cluster	879
Cluster Health Monitor Dashboard	880
Viewing Cluster Health	881
Cluster Metrics	883
Examples for Clustering	883
Firewall on a Stick	884
Traffic Segregation	885
Reference for Clustering	885
Threat Defense Features and Clustering	885
Unsupported Features with Clustering	885
Centralized Features for Clustering	886
Connection Settings	887

Dynamic Routing and Clustering	887
FTP and Clustering	888
Multicast Routing and Clustering	888
NAT and Clustering	888
SIP Inspection and Clustering	889
SNMP and Clustering	889
Syslog and Clustering	890
TLS/SSL Connections and Clustering	890
Cisco TrustSec and Clustering	890
VPN and Clustering	890
Performance Scaling Factor	890
Control Unit Election	890
High Availability Within the Cluster	891
Chassis-Application Monitoring	891
Unit Health Monitoring	891
Interface Monitoring	892
Decorator Application Monitoring	892
Status After Failure	892
Rejoining the Cluster	892
Data Path Connection State Replication	893
How the Cluster Manages Connections	894
Connection Roles	894
New Connection Ownership	895
Sample Data Flow for TCP	895
Sample Data Flow for ICMP and UDP	896
History for Clustering	897

---

**PART X****Interfaces and Device Settings 903**

---

**CHAPTER 35****Interface Overview 905**

Management Interface	905
Management Interface	905
Diagnostic Interface	906
Interface Mode and Types	906

Security Zones and Interface Groups	908
Auto-MDI/MDIX Feature	909
Default Settings for Interfaces	910
Create Security Zone and Interface Group Objects	910
Enable the Physical Interface and Configure Ethernet Settings	911
Configure EtherChannel Interfaces	914
About EtherChannels	914
About EtherChannels	914
Guidelines for EtherChannels	917
Configure an EtherChannel	918
Sync Interface Changes with the Management Center	922
Manage the Network Module for the Secure Firewall 3100/4200	925
Configure Breakout Ports	926
Add a Network Module	929
Hot Swap the Network Module	931
Replace the Network Module with a Different Type	933
Remove the Network Module	936
Merge the Management and Diagnostic Interfaces	939
Unmerge the Management Interface	945
History for Interfaces	946

**CHAPTER 36****Regular Firewall Interfaces 949**

Requirements and Prerequisites for Regular Firewall Interfaces	949
Configure Firepower 1010 and Secure Firewall 1210/1220 Switch Ports	950
About Firepower 1010 and Secure Firewall 1210/1220 Switch Ports	950
Understanding Switch Ports and Interfaces	950
Auto-MDI/MDIX Feature	951
Guidelines and Limitations for Switch Ports	951
Configure Switch Ports and Power Over Ethernet	952
Enable or Disable Switch Port Mode	952
Configure a VLAN Interface	953
Configure Switch Ports as Access Ports	955
Configure Switch Ports as Trunk Ports	957
Configure Power Over Ethernet	959

Configure Loopback Interfaces	960
About Loopback Interfaces	961
Guidelines and Limitations for Loopback Interfaces	961
Configure a Loopback Interface	962
Rate-Limit Traffic to the Loopback Interface	962
Configure VLAN Subinterfaces and 802.1Q Trunking	966
Guidelines and Limitations for VLAN Subinterfaces	966
Maximum Number of VLAN Subinterfaces by Device Model	966
Add a Subinterface	967
Configure VXLAN Interfaces	969
About VXLAN Interfaces	969
Encapsulation	969
VXLAN Tunnel Endpoint	969
VTEP Source Interface	970
VNI Interfaces	970
VXLAN Packet Processing	971
Peer VTEPs	971
VXLAN Use Cases	972
Requirements and Prerequisites for VXLAN Interfaces	976
Guidelines for VXLAN Interfaces	976
Configure VXLAN or Geneve Interfaces	977
Configure VXLAN Interfaces	977
Configure Geneve Interfaces	980
Allow Gateway Load Balancer Health Checks	981
Configure Routed and Transparent Mode Interfaces	982
About Routed and Transparent Mode Interfaces	982
Dual IP Stack (IPv4 and IPv6)	983
31-Bit Subnet Mask	983
Guidelines and Limitations for Routed and Transparent Mode Interfaces	984
Configure Routed Mode Interfaces	985
Configure Bridge Group Interfaces	990
Configure General Bridge Group Member Interface Parameters	990
Configure the Bridge Virtual Interface (BVI)	992
Configure IPv6 Addressing	994

About IPv6	994
Configure the IPv6 Prefix Delegation Client	995
Configure a Global IPv6 Address	998
Configure IPv6 Neighbor Discovery	1003
Configure Advanced Interface Settings	1005
About Advanced Interface Configuration	1005
About MAC Addresses	1005
About the MTU	1007
About the TCP MSS	1008
ARP Inspection for Bridge Group Traffic	1009
MAC Address Table	1009
Default Settings	1010
Guidelines for ARP Inspection and the MAC Address Table	1010
Configure the MTU	1010
Configure the MAC Address	1011
Add a Static ARP Entry	1012
Add a Static MAC Address and Disable MAC Learning for a Bridge Group	1013
Set Security Configuration Parameters	1014
History for Regular Firewall Interfaces for Secure Firewall Threat Defense	1015

**CHAPTER 37****Inline Sets and Passive Interfaces 1023**

About IPS Interfaces	1023
IPS Interface Types	1023
About Hardware Bypass for Inline Sets	1024
Hardware Bypass Triggers	1024
Hardware Bypass Switchover	1025
Snort Fail Open vs. Hardware Bypass	1025
Hardware Bypass Status	1025
Requirements and Prerequisites for Inline Sets	1025
Guidelines for Inline Sets and Passive Interfaces	1027
Configure a Passive Interface	1029
Configure an Inline Set	1030

**CHAPTER 38****DHCP and DDNS 1035**

About DHCP and DDNS Services	1035
About the DHCPv4 Server	1035
DHCP Options	1035
About the DHCPv6 Stateless Server	1036
About the DHCP Relay Agent	1036
Requirements and Prerequisites for DHCP and DDNS	1037
Guidelines for DHCP and DDNS Services	1037
Configure the DHCPv4 Server	1038
Configure the DHCPv6 Stateless Server	1040
Create the DHCP IPv6 Pool	1040
Enable the DHCPv6 Stateless Server	1043
Configure the DHCP Relay Agent	1044
Configure Dynamic DNS	1045
History for DHCP and DDNS	1051

**CHAPTER 39****SNMP for the Firepower 1000 1053**

About SNMP for the Firepower 1000	1053
Enabling SNMP and Configuring SNMP Properties for Firepower 1000	1053
Creating an SNMP Trap for Firepower 1000	1055
Creating an SNMP User for Firepower 1000	1056

**CHAPTER 40****Quality of Service 1059**

Introduction to QoS	1059
About QoS Policies	1059
Requirements and Prerequisites for QoS	1060
Rate Limiting with QoS Policies	1060
Creating a QoS Policy	1061
Setting Target Devices for a QoS Policy	1062
Configuring QoS Rules	1062
QoS Rule Components	1063
QoS Rule Conditions	1064
Interface Rule Conditions	1064
Network Rule Conditions	1065
User Rule Conditions	1065

Application Rule Conditions	1065
Port Rule Conditions	1067
URL Rule Conditions	1068
Custom SGT Rule Conditions	1068
ISE SGT vs Custom SGT Rule Conditions	1068
Autotransition from Custom SGTs to ISE SGTs	1069

**CHAPTER 41****Platform Settings 1071**

Introduction to Platform Settings	1072
Requirements and Prerequisites for Platform Settings Policies	1072
Manage Platform Settings Policies	1072
ARP Inspection	1073
Banner	1074
DNS	1075
External Authentication	1078
Enable Virtual-Router-Aware Interface for External Authentication of Platform	1083
Fragment Settings	1084
HTTP Access	1085
ICMP Access	1086
NetFlow	1087
Add Collector in NetFlow	1088
Add Traffic Class to NetFlow	1089
SSH Access	1089
SMTP Server	1091
SNMP	1092
About SNMP	1093
SNMP Terminology	1093
MIBs and Traps	1094
Supported Tables and Objects in MIBs	1094
Add SNMPv3 Users	1098
Add SNMP Hosts	1101
Configure SNMP Traps	1102
Configure SSL Settings	1105
About SSL Settings	1105

Syslog	1109
About Syslog	1109
Severity Levels	1110
Syslog Message Filtering	1110
Syslog Message Classes	1111
Guidelines for Logging	1114
Configure Syslog Logging for Threat Defense Devices	1115
Threat Defense Platform Settings That Apply to Security Event Syslog Messages	1116
Enable Logging and Configure Basic Settings	1116
Enable Logging Destinations	1118
Send Syslog Messages to an E-mail Address	1119
Create a Custom Event List	1120
Limit the Rate of Syslog Message Generation	1121
Configure Syslog Settings	1121
Configure a Syslog Server	1123
Timeouts	1125
Time Synchronization	1127
Time Zone	1128
UCAPL/CC Compliance	1129
Performance Profile	1130

---

**CHAPTER 42**

<b>Network Address Translation</b>	<b>1133</b>
Why Use NAT?	1133
NAT Basics	1134
NAT Terminology	1134
NAT Types	1134
NAT in Routed and Transparent Mode	1135
NAT in Routed Mode	1135
NAT in Transparent Mode or Within a Bridge Group	1136
Auto NAT and Manual NAT	1137
Auto NAT	1137
Manual NAT	1137
Comparing Auto NAT and Manual NAT	1138
NAT Rule Order	1138

NAT Interfaces	1140
NAT Exemption	1141
Configuring Routing for NAT	1141
Addresses on the Same Network as the Mapped Interface	1141
Addresses on a Unique Network	1142
The Same Address as the Real Address (Identity NAT)	1142
Requirements and Prerequisites for NAT Policies	1142
Guidelines for NAT	1143
Firewall Mode Guidelines for NAT	1143
IPv6 NAT Guidelines	1143
IPv6 NAT Best Practices	1144
NAT Support for Inspected Protocols	1144
FQDN Destination Guidelines	1146
Additional Guidelines for NAT	1147
Manage NAT Policies	1149
Creating NAT Policies	1149
Configuring NAT Policy Targets	1150
Configure NAT for Threat Defense	1151
Customizing NAT Rules for Multiple Devices	1152
Searching and Filtering the NAT Rule Table	1154
Enabling, Disabling, or Deleting Multiple Rules	1155
Dynamic NAT	1156
About Dynamic NAT	1156
Dynamic NAT Disadvantages and Advantages	1157
Configure Dynamic Auto NAT	1158
Configure Dynamic Manual NAT	1159
Dynamic PAT	1161
About Dynamic PAT	1161
Dynamic PAT Disadvantages and Advantages	1162
PAT Pool Object Guidelines	1162
Configure Dynamic Auto PAT	1163
Configure Dynamic Manual PAT	1166
Configure PAT with Port Block Allocation	1169
Static NAT	1171

- About Static NAT **1171**
- Configure Static Auto NAT **1175**
- Configure Static Manual NAT **1176**
- Identity NAT **1179**
  - Configure Identity Auto NAT **1180**
  - Configure Identity Manual NAT **1181**
- NAT Rule Properties for Threat Defense **1184**
  - Interface Objects NAT Properties **1184**
  - Translation Properties for Auto NAT **1185**
  - Translation Properties for Manual NAT **1186**
  - PAT Pool NAT Properties **1187**
  - Advanced NAT Properties **1188**
- Translating IPv6 Networks **1189**
  - NAT64/46: Translating IPv6 Addresses to IPv4 **1190**
    - NAT64/46 Example: Inside IPv6 Network with Outside IPv4 Internet **1190**
    - NAT64/46 Example: Inside IPv6 Network with Outside IPv4 Internet and DNS Translation **1192**
  - NAT66: Translating IPv6 Addresses to Different IPv6 Addresses **1196**
    - NAT66 Example, Static Translation between Networks **1196**
    - NAT66 Example, Simple IPv6 Interface PAT **1199**
- Monitoring NAT **1202**
- Examples for NAT **1203**
  - Providing Access to an Inside Web Server (Static Auto NAT) **1203**
  - Dynamic Auto NAT for Inside Hosts and Static NAT for an Outside Web Server **1206**
  - Inside Load Balancer with Multiple Mapped Addresses (Static Auto NAT, One-to-Many) **1210**
  - Single Address for FTP, HTTP, and SMTP (Static Auto NAT-with-Port-Translation) **1213**
  - Different Translation Depending on the Destination (Dynamic Manual PAT) **1219**
  - Different Translation Depending on the Destination Address and Port (Dynamic Manual PAT) **1224**
  - NAT and Site-to-Site VPN **1229**
  - Rewriting DNS Queries and Responses Using NAT **1233**
    - DNS64 Reply Modification **1234**
    - DNS Reply Modification, DNS Server on Outside **1241**
    - DNS Reply Modification, DNS Server on Host Network **1244**

About Alarms	1249
Alarm Input Interfaces	1250
Alarm Output Interface	1250
Syslog Alarms	1251
SNMP Alarms	1251
Defaults for Alarms	1251
Requirements and Prerequisites for Alarms	1252
Configure the Alarms for the ISA 3000	1252
Configure Alarm Input Contacts	1252
Configure Power Supply Alarms	1255
Configure Temperature Alarms	1257
Monitoring Alarms	1260
Monitoring Alarm Status	1260
Monitoring Syslog Messages for Alarms	1260
Turning Off the External Alarm	1261

---

**PART XI**
**Routing 1263**

---

**CHAPTER 44**
**Static and Default Routes 1265**

About Static and Default Routes	1265
Default Route	1265
Static Routes	1266
Route to null0 Interface to Drop Unwanted Traffic	1266
Route Priorities	1266
Transparent Firewall Mode and Bridge Group Routes	1266
Static Route Tracking	1267
Requirements and Prerequisites for Static Routes	1267
Guidelines for Static and Default Routes	1268
Add a Static Route	1268
Reference for Routing	1270
Path Determination	1270
Supported Route Types	1270
Static Versus Dynamic	1270
Single-Path Versus Multipath	1271

Flat Versus Hierarchical	1271
Link-State Versus Distance Vector	1271
Supported Internet Protocols for Routing	1271
Routing Table	1272
How the Routing Table Is Populated	1272
How Forwarding Decisions Are Made	1274
Dynamic Routing and High Availability	1275
Dynamic Routing in Clustering	1275
Dynamic Routing in Individual Interface Mode	1276
Routing Table for Management Traffic	1277
Equal-Cost Multi-Path (ECMP) Routing	1277
About Route Maps	1278
Permit and Deny Clauses	1278
Match and Set Clause Values	1278

---

**CHAPTER 45**
**Virtual Routers 1281**

About Virtual Routers and Virtual Routing and Forwarding (VRF)	1281
About Virtual Routers and Dynamic VTI	1282
How to Configure a Virtual Router with Dynamic VTI	1282
Applications of Virtual Routers	1282
Global and User-Defined Virtual Routers	1283
Configuring Policies to be Virtual-Router-Aware	1284
Interconnecting Virtual Routers	1285
Overlapping IP Addresses	1286
Configuring SNMP on User-Defined Virtual Routers	1287
Maximum Number of Virtual Routers By Device Model	1288
Requirements and Prerequisites for Virtual Routers	1289
Guidelines and Limitations for Virtual Routers	1289
Modifications to the Management Center Web Interface - Routing Page	1291
Manage Virtual Routers	1292
Create a Virtual Router	1292
Configure a Virtual Router	1293
Modify a Virtual Router	1294
Remove Virtual Routers	1295

Monitoring Virtual Routers	1295
Configuration Examples for Virtual Routers	1296
How to Route to a Distant Server through Virtual Routers	1296
How to Provide Internet Access with Overlapping Address Spaces	1301
How to Allow RA VPN Access to Internal Networks in Virtual Routing	1308
How to Secure Traffic from Networks in Multiple Virtual Routers over a Site-to-Site VPN	1311
How to Secure Traffic from Networks with Multiple Virtual Routers over a Site-to-Site VPN with Dynamic VTI	1314
How to Route Traffic between Two Overlapping Network Host in Virtual Routing	1316
How to Manage Overlapping Segments in Routed Firewall Mode with BVI Interfaces	1319
How to Configure User Authentication with Overlapping Networks	1323
How to Interconnect Virtual Routers using BGP	1329

---

**CHAPTER 46**
**ECMP 1335**

About ECMP	1335
Guidelines and Limitations for ECMP	1335
Manage ECMP Page	1336
Create an ECMP Zone	1337
Configure an Equal Cost Static Route	1338
Modify an ECMP Zone	1339
Remove an ECMP Zone	1339
Configuration Example for ECMP	1340

---

**CHAPTER 47**
**Bidirectional Forwarding Detection Routing 1343**

About BFD Routing	1343
Guidelines for BFD Routing	1343
Configure BFD	1344
Configure BFD Policies	1345
Configure Single-Hop BFD Policies	1345
Configure Multi-Hop BFD Policies	1346
History for BFD Routing	1347

---

**CHAPTER 48**
**OSPF 1349**

OSPF	1349
------	------

About OSPF	1349
OSPF Support for Fast Hello Packets	1351
Prerequisites for OSPF Support for Fast Hello Packets	1351
OSPF Hello Interval and Dead Interval	1351
OSPF Fast Hello Packets	1351
Benefits of OSPF Fast Hello Packets	1351
Implementation Differences Between OSPFv2 and OSPFv3	1352
Requirements and Prerequisites for OSPF	1352
Guidelines for OSPF	1352
Configure OSPFv2	1355
Configure OSPF Areas, Ranges, and Virtual Links	1355
Configure OSPF Redistribution	1358
Configure OSPF Inter-Area Filtering	1359
Configure OSPF Filter Rules	1360
Configure OSPF Summary Addresses	1361
Configure OSPF Interfaces and Neighbors	1362
Configure OSPF Advanced Properties	1364
Configure OSPFv3	1367
Configure OSPFv3 Areas, Route Summaries, and Virtual Links	1367
Configure OSPFv3 Redistribution	1369
Configure OSPFv3 Summary Prefixes	1370
Configure OSPFv3 Interfaces, Authentication, and Neighbors	1371
Configure OSPFv3 Advanced Properties	1374
History for OSPF	1376

---

**CHAPTER 49**
**EIGRP 1377**

About EIGRP Routing	1377
Requirements and Prerequisites for EIGRP	1378
Guidelines and Limitations of EIGRP Routing	1378
Configure EIGRP	1380
Configure EIGRP Settings	1380
Configure EIGRP Neighbors Settings	1381
Configure EIGRP Filter Rules Settings	1381
Configure EIGRP Redistribution Settings	1382

Configure EIGRP Summary Address Settings	1383
Configure EIGRP Interfaces Settings	1383
Configure EIGRP Advanced Settings	1384

---

**CHAPTER 50****BGP 1387**

About BGP	1387
Routing Table Changes	1387
When to Use BGP	1388
BGP Path Selection	1389
BGP Multipath	1389
Requirements and Prerequisites for BGP	1390
Guidelines for BGP	1390
Configure BGP	1391
Configure BGP Basic Settings	1392
Configure BGP General Settings	1394
Configure BGP Neighbor Settings	1395
Configure BGP Aggregate Address Settings	1399
Configure BGPv4 Filtering Settings	1400
Configure BGP Network Settings	1400
Configure BGP Redistribution Settings	1401
Configure BGP Route Injection Settings	1402
Configure BGP Route Import/Export Settings	1402

---

**CHAPTER 51****RIP 1405**

About RIP	1405
Routing Update Process	1405
RIP Routing Metric	1406
RIP Stability Features	1406
RIP Timers	1406
Requirements and Prerequisites for RIP	1407
Guidelines for RIP	1407
Configure RIP	1408

---

**CHAPTER 52****Multicast 1411**

About Multicast Routing	1411
IGMP Protocol	1411
Stub Multicast Routing	1412
PIM Multicast Routing	1412
PIM Source Specific Multicast Support	1413
Multicast Bidirectional PIM	1413
PIM Bootstrap Router (BSR)	1414
PIM Bootstrap Router (BSR) Terminology	1414
Multicast Group Concept	1415
Multicast Addresses	1415
Clustering	1415
Requirements and Prerequisites for Multicast Routing	1415
Guidelines for Multicast Routing	1415
Configure IGMP Features	1416
Enable Multicast Routing	1417
Configure IGMP Protocol	1417
Configure IGMP Access Groups	1419
Configure IGMP Static Groups	1419
Configure IGMP Join Groups	1420
Configure PIM Features	1421
Configure PIM Protocol	1421
Configure PIM Neighbor Filters	1422
Configure PIM Bidirectional Neighbor Filters	1423
Configure PIM Rendezvous Points	1424
Configure PIM Route Trees	1425
Configure PIM Request Filters	1425
Configure the Secure Firewall Threat Defense Device as a Candidate Bootstrap Router	1426
Configure Multicast Routes	1427
Configure Multicast Boundary Filters	1428

---

**CHAPTER 53****Policy Based Routing 1431**

About Policy Based Routing	1431
Guidelines and Limitations for Policy Based Routing	1433
Path Monitoring	1434

Configure Path Monitoring Settings	1436
Configure Policy-Based Routing Policy	1437
Add Path Monitoring Dashboard	1440
Configuration Example for Policy Based Routing	1440
Configuration Example for PBR with Path Monitoring	1445

---

**PART XII**
**Objects and Certificates 1449**

---

**CHAPTER 54**
**Object Management 1451**

Introduction to Objects	1452
The Object Manager	1454
Importing Objects	1454
Editing Objects	1457
Viewing Objects and Their Usage	1457
Filtering Objects or Object Groups	1458
Object Groups	1459
Grouping Reusable Objects	1459
Object Overrides	1460
Managing Object Overrides	1461
Allowing Object Overrides	1462
Adding Object Overrides	1462
Editing Object Overrides	1463
AAA Server	1463
Add a RADIUS Server Group	1463
RADIUS Server Group Options	1464
RADIUS Server Options	1465
Add a Single Sign-on Server	1466
Access List	1468
Configure Extended ACL Objects	1468
Configure Standard ACL Objects	1471
Address Pools	1472
Application Filters	1473
AS Path	1473
BFD Template	1474

- Cipher Suite List **1475**
  - Creating Cipher Suite Lists **1476**
- Community List **1476**
  - Extended Community **1477**
- DHCP IPv6 Pool **1479**
- Distinguished Name **1479**
  - Creating Distinguished Name Objects **1481**
- DNS Server Group **1482**
  - Creating DNS Server Group Objects **1482**
- External Attributes **1482**
  - Dynamic Objects **1482**
    - Create Dynamic Objects with Cloud-delivered Firewall Management Center **1483**
    - Create Dynamic Objects with Cloud-delivered Firewall Management Center and On-Premises Cisco Secure Dynamic Attributes Connector **1485**
    - Work With Dynamic Objects **1486**
    - Dynamic Object Mappings **1486**
    - About API-Created Dynamic Objects **1487**
  - Security Group Tag **1488**
    - Creating Security Group Tag Objects **1488**
- File List **1488**
  - Source Files for File Lists **1489**
  - Adding Individual SHA-256 Values to File Lists **1490**
  - Uploading Individual Files to File Lists **1490**
  - Uploading Source Files to File Lists **1491**
  - Editing SHA-256 Values in File Lists **1492**
  - Downloading Source Files from File Lists **1493**
- FlexConfig **1493**
- Geolocation **1494**
  - Creating Geolocation Objects **1494**
- Interface **1494**
- Key Chain **1495**
  - Creating Key Chain Objects **1496**
- Network **1497**
  - Network Wildcard Mask **1498**

Creating Network Objects	1499
Importing Network Objects	1500
Editing and Deleting Network Objects and Groups	1500
PKI	1500
Internal Certificate Authority Objects	1501
CA Certificate and Private Key Import	1502
Importing a CA Certificate and Private Key	1502
Generating a New CA Certificate and Private Key	1503
New Signed Certificates	1503
Creating an Unsigned CA Certificate and CSR	1503
Uploading a Signed Certificate Issued in Response to a CSR	1504
CA Certificate and Private Key Downloads	1504
Downloading a CA Certificate and Private Key	1505
Trusted Certificate Authority Objects	1505
Trusted CA Object	1506
Adding a Trusted CA Object	1506
Certificate Revocation Lists in Trusted CA Objects	1506
Adding a Certificate Revocation List to a Trusted CA Object	1507
External Certificate Objects	1507
Adding External Certificate Objects	1508
Internal Certificate Objects	1508
Adding Internal Certificate Objects	1509
Certificate Enrollment Objects	1509
Adding Certificate Enrollment Objects	1511
Add Certificate Enrollment	1512
Certificate Enrollment Object EST Options	1512
Certificate Enrollment Object SCEP Options	1513
Certificate Enrollment Object Certificate Parameters	1514
Certificate Enrollment Object Key Options	1515
Certificate Enrollment Object Revocation Options	1517
Policy List	1517
Port	1519
Creating Port Objects	1520
Importing Port Objects	1520

- Prefix List **1520**
  - Configure IPv6 Prefix List **1520**
  - Configure IPv4 Prefix List **1521**
- Route Map **1522**
- Security Intelligence **1526**
  - How to Modify Security Intelligence Objects **1527**
  - Global and Domain Security Intelligence Lists **1527**
    - Security Intelligence Lists and Multitenancy **1528**
    - Delete Entries from Global Security Intelligence Lists **1529**
  - List and Feed Updates for Security Intelligence **1529**
    - Changing the Update Frequency for Security Intelligence Feeds **1529**
  - Custom Security Intelligence Lists and Feeds **1530**
    - Custom Lists and Feeds: Requirements **1530**
    - URL Lists and Feeds: URL Syntax and Matching Criteria **1531**
    - Custom Security Intelligence Feeds **1532**
    - Custom Security Intelligence Lists **1533**
- Sinkhole **1535**
  - Creating Sinkhole Objects **1535**
- SLA Monitor **1536**
- Time Range **1537**
  - Creating Time Range Objects **1538**
- Time Zone **1539**
- Tunnel Zone **1539**
- URL **1539**
  - Creating URL Objects **1541**
- Variable Set **1541**
  - Variable Sets in Intrusion Policies **1542**
- Variables **1543**
  - Predefined Default Variables **1543**
  - Network Variables **1545**
  - Port Variables **1547**
  - Advanced Variables **1548**
  - Variable Reset **1548**
  - Adding Variables to Sets **1549**

Nesting Variables	1550
Managing Variable Sets	1552
Creating Variable Sets	1553
Managing Variables	1553
Adding Variables	1554
Editing Variables	1555
VLAN Tag	1556
Creating VLAN Tag Objects	1556
VPN	1557
Certificate Map Objects	1557
Secure Client Custom Attributes Objects	1558
Add Secure Client Custom Attributes Objects	1558
Add Custom Attributes to a Group Policy	1560
Threat Defense Group Policy Objects	1560
Configure Group Policy Objects	1561
Group Policy General Options	1561
Group Policy Secure Client Options	1563
Group Policy Advanced Options	1567
Threat Defense IPsec Proposals	1568
Configure IKEv1 IPsec Proposal Objects	1568
Configure IKEv2 IPsec Proposal Objects	1569
Threat Defense IKE Policies	1569
Configure IKEv1 Policy Objects	1570
Configure IKEv2 Policy Objects	1571
Secure Client Customization	1572
File Objects	1573

---

**CHAPTER 55**
**Certificates 1575**

Requirements and Prerequisites for Certificates	1575
Secure Firewall Threat Defense VPN Certificate Guidelines and Limitations	1575
Managing Threat Defense Certificates	1576
Automatically Update CA Bundles	1577
Installing a Certificate Using Self-Signed Enrollment	1579
Installing a Certificate using EST Enrollment	1580

Installing a Certificate Using SCEP Enrollment 1581  
 Installing a Certificate Using Manual Enrollment 1581  
 Installing a Certificate Using a PKCS12 File 1582  
 Troubleshooting Threat Defense Certificates 1583  
 History for Certificates 1584

---

PART XIII

**SD-WAN 1585**

---

CHAPTER 56

**SD-WAN Capabilities 1587**

Overview of SD-WAN Capabilities 1587  
 Using SD-WAN Wizard for Secure Branch Network Deployment 1588  
     Guidelines and Limitations for Using SD-WAN Wizard 1589  
     Prerequisites for Using the SD-WAN Wizard 1590  
     Configure an SD-WAN Topology Using the SD-WAN Wizard 1590  
         Add a Dynamic Virtual Tunnel Interface for a Hub 1594  
     Sample Configurations for Dual ISP Deployment Using SD-WAN Wizard 1594  
         Dual ISP Deployment: Two Hubs and Four Spokes in the Same Region 1594  
         Dual ISP Deployment: Two Hubs and Four Spokes in Different Regions 1596  
     Verify Tunnel Statuses of an SD-WAN Topology 1599

---

PART XIV

**VPN 1603**

---

CHAPTER 57

**VPN Overview 1605**

VPN Types 1605  
 VPN Basics 1606  
     Internet Key Exchange (IKE) 1606  
     IPsec 1607  
 VPN Packet Flow 1608  
 IPsec Flow Offload 1608  
 VPN Licensing 1609  
 How Secure Should a VPN Connection Be? 1609  
     Complying with Security Certification Requirements 1610  
     Deciding Which Encryption Algorithm to Use 1610  
     Deciding Which Hash Algorithms to Use 1611

Deciding Which Diffie-Hellman Modulus Group to Use	1611
Deciding Which Authentication Method to Use	1612
Pre-shared Keys	1612
PKI Infrastructure and Digital Certificates	1612
Removed or Deprecated Hash Algorithms, Encryption Algorithms, and Diffie-Hellman Modulus Groups	1614
VPN Topology Options	1614
Point-to-Point VPN Topology	1615
Hub and Spoke VPN Topology	1615
Full Mesh VPN Topology	1616
Implicit Topologies	1617

---

**CHAPTER 58**
**Site-to-Site VPNs 1619**

About Site-to-Site VPN	1619
Secure Firewall Threat Defense Site-to-site VPN Guidelines and Limitations	1621
Types of Site-to-Site VPN Topologies	1622
Requirements and Prerequisites for Site-to-Site VPN	1622
Manage Site-to-Site VPNs	1623
Configure a Policy-based Site-to-Site VPN	1624
Threat Defense VPN Endpoint Options	1625
Threat Defense VPN IKE Options	1629
Threat Defense VPN IPsec Options	1631
Threat Defense Advanced Site-to-site VPN Deployment Options	1633
Threat Defense VPN Advanced IKE Options	1633
Threat Defense VPN Advanced IPsec Options	1635
Threat Defense Advanced Site-to-site VPN Tunnel Options	1635
About Virtual Tunnel Interfaces	1636
Static VTI	1637
Dynamic VTI	1638
Guidelines and Limitations for Virtual Tunnel Interfaces	1640
Add a VTI Interface	1644
Create a Route-based Site-to-Site VPN	1645
Configure Endpoints for a Point to Point Topology	1646
Advanced Configurations for a Point to Point Topology in a Route-based VPN	1648

Configure Endpoints for a Hub and Spoke Topology	1648
Advanced Configurations for Hub and Spokes in a Route-based VPN	1651
Configure Multiple Hubs in a Route-based VPN	1652
Configure Routing for Multiple Hubs in a Route-based VPN	1654
Verify the Multiple Hubs Configuration in a Route-based VPN	1655
Route Traffic Through a Backup VTI Tunnel	1655
Configure Dynamic VTI for a Route-based Site-to-Site VPN	1657
How to Configure a Virtual Router with Dynamic VTI	1658
Configure Routing and AC Policies for VTI	1658
Deploy a SASE Tunnel on Umbrella	1661
Guidelines and Limitations for Configuring SASE Tunnels on Umbrella	1662
How to Deploy a SASE Tunnel on Umbrella	1663
Prerequisites for Configuring Umbrella SASE Tunnels	1663
Map Management Center Umbrella Parameters and Cisco Umbrella API Keys	1664
Configure a SASE Tunnel for Umbrella	1665
View SASE Tunnel Status	1667
Monitoring the Site-to-Site VPNs	1668
History for Site-to-Site VPN	1674
<hr/>	
<b>CHAPTER 59</b>	<b>Remote Access VPN 1675</b>
Remote Access VPN Overview	1675
Remote Access VPN Features	1676
Secure Client Components	1678
Remote Access VPN Authentication	1678
Understanding Policy Enforcement of Permissions and Attributes	1680
Understanding AAA Server Connectivity	1680
License Requirements for Remote Access VPN	1681
Requirements and Prerequisites for Remote Access VPN	1681
Remote Access VPN Guidelines and Limitations	1682
Configuring a New Remote Access VPN Connection	1685
Prerequisites for Configuring Remote Access VPN	1685
Create a New Remote Access VPN Policy	1686
Update the Access Control Policy on the Secure Firewall Threat Defense Device	1689
(Optional) Configure NAT Exemption	1689

Configure DNS	1691
Add Secure Client Profile XML File	1691
(Optional) Configure Split Tunneling	1692
(Optional) Configure Dynamic Split Tunneling	1692
Verify Dynamic Split Tunneling Configuration	1694
Verify the Configuration	1694
Create a Copy of an Existing Remote Access VPN Policy	1694
Set Target Devices for a Remote Access VPN Policy	1695
Associate Local Realm with Remote Access VPN Policy	1695
Additional Remote Access VPN Configurations	1696
Configure Connection Profile Settings	1696
Configure IP Addresses for VPN Clients	1697
Configure AAA Settings for Remote Access VPN	1698
Create or Update Aliases for a Connection Profile	1713
Configure Access Interfaces for Remote Access VPN	1714
Configure Advanced Options for Remote Access VPN	1716
Cisco Secure Client Image	1716
Remote Access VPN Address Assignment Policy	1718
Configure Certificate to Connection Profile Mapping	1719
Configure Group Policies	1720
Configuring LDAP Attribute Mapping	1720
Configuring VPN Load Balancing	1722
Configure IPsec Settings	1725
Customize Cisco Secure Client	1730
Configure Secure Client Management VPN Tunnel	1740
Requirements and Prerequisites for Secure Client Management VPN Tunnel	1741
Limitations of Secure Client Management VPN Tunnel	1741
Configuring Secure Client Management VPN Tunnel on Threat Defense	1742
Multiple Certificate Authentication	1744
Guidelines and Limitations of Multiple Certificate Authentication	1744
Configuring Multiple Certificate Authentication	1744
Customizing Remote Access VPN AAA Settings	1745
Authenticate VPN Users via Client Certificates	1746
Configure VPN User Authentication via Client Certificate and AAA Server	1747

Manage Password Changes over VPN Sessions	1749
Send Accounting Records to the RADIUS Server	1749
Delegating Group Policy Selection to Authorization Server	1750
Override the Selection of Group Policy or Other Attributes by the Authorization Server	1751
Deny VPN Access to a User Group	1752
Restrict Connection Profile Selection for a User Group	1753
Update the Secure Client Profile for Remote Access VPN Clients	1753
RADIUS Dynamic Authorization	1754
Configuring RADIUS Dynamic Authorization	1755
Two-Factor Authentication	1756
Configuring RSA Two-Factor Authentication	1756
Configuring Duo Two-Factor Authentication	1757
Secondary Authentication	1759
Configure Remote Access VPN Secondary Authentication	1759
Single Sign-On Authentication with SAML 2.0	1761
Guidelines and Limitations for SAML 2.0	1762
Configuring a SAML Single Sign-On Authentication	1763
Configuring SAML Authorization	1764
Advanced Secure Client Configurations	1766
Configure Secure Client Modules on a Threat Defense	1766
Types of Secure Client Modules	1766
Prerequisites for Configuring Secure Client Modules	1767
Guidelines for Configuring Secure Client Modules	1768
Install Secure Client Modules using a Threat Defense	1769
Configure a Remote Access VPN Group Policy with Secure Client Modules	1769
Verify Secure Client Modules Configuration	1770
Configure Application-Based (Per App VPN) Remote Access VPN on Mobile Devices	1771
Prerequisites and Licensing for Configuring Per App VPN Tunnels	1771
Determine the Application IDs for Mobile Applications	1772
Configure Application-Based VPN Tunnels	1772
Verify Per App Configuration	1774
Remote Access VPN Examples	1774
How to Limit Secure Client Bandwidth Per User	1774
How to Use VPN Identity for User-Id Based Access Control Rules	1775

Configure Threat Defense Multiple Certificate Authentication 1775

---

**CHAPTER 60**

**Dynamic Access Policies 1781**

About Secure Firewall Threat Defense Dynamic Access Policy 1781

Hierarchy of Policy Enforcement of Permissions and Attributes in Threat Defense 1781

Prerequisites for Dynamic Access Policy 1783

Guidelines and Limitations for Dynamic Access Policies 1783

Configure a Dynamic Access Policy (DAP) 1783

Create a Dynamic Access Policy 1783

Create a Dynamic Access Policy Record 1784

Configure AAA Criteria Settings for DAP 1784

Configure Endpoint Attribute Selection Criteria in DAP 1785

Add an Anti-Malware Endpoint Attribute to a DAP 1786

Add a Device Endpoint Attribute to a DAP 1787

Add Secure Client Endpoint Attributes to a DAP 1787

Add NAC Endpoint Attributes to a DAP 1788

Add an Application Attribute to a DAP 1788

Add a Personal Firewall Endpoint Attribute to a DAP 1788

Add an Operating System Endpoint Attribute to a DAP 1789

Add a Process Endpoint Attribute to a DAP 1789

Add a Registry Endpoint Attribute to a DAP 1789

Add a File Endpoint Attribute to a DAP 1790

Add Certificate Authentication Attributes to a DAP 1790

Configure Advanced Settings for DAP 1791

Associate Dynamic Access Policy with Remote Access VPN 1791

History for Dynamic Access Policy 1792

---

**CHAPTER 61**

**VPN Monitoring and Troubleshooting in Security Cloud Control 1793**

VPN Summary Dashboard 1793

Monitor Remote Access VPN Sessions 1793

SD-WAN Summary Dashboard 1794

Prerequisites for Using SD-WAN Summary Dashboard 1794

Monitor WAN Devices and Interfaces Using the SD-WAN Summary Dashboard 1795

- Monitor Application Performance Metrics of WAN Interfaces Using the SD-WAN Summary
  - Dashboard 1797
- System Messages 1797
- Debug Commands 1797
  - debug aaa 1799
  - debug crypto 1799
    - debug crypto ca 1800
    - debug crypto ikev1 1801
    - debug crypto ikev2 1801
    - debug crypto ipsec 1802
  - debug ldap 1802
  - debug ssl 1803
  - debug webvpn 1803

---

**PART XV**

**Access Control 1807**

---

**CHAPTER 62**

**Access Control Overview 1809**

- Introduction to Access Control 1809
- Introduction to Rules 1810
  - Filtering Rules by Device 1810
  - Rule and Other Policy Warnings 1811
- Access Control Policy Default Action 1812
- Deep Inspection Using File and Intrusion Policies 1814
  - Access Control Traffic Handling with Intrusion and File Policies 1815
  - File and Intrusion Inspection Order 1816
- Access Control Policy Inheritance 1817
- Best Practices for Application Control 1818
  - Recommendations for Application Control 1818
  - Best Practices for Configuring Application Control 1820
  - Application Characteristics 1821
  - Application-Specific Notes and Limitations 1822
- Best Practices for Access Control Rules 1823
  - General Best Practices for Access Control 1823
  - Best Practices for Ordering Rules 1824

Rule Preemption	1825
Rule Actions and Rule Order	1826
Application Rule Order	1826
URL Rule Order	1827
Best Practices for Simplifying and Focusing Rules	1827
Maximum Number of Access Control Rules and Intrusion Policies	1828

---

**CHAPTER 63**
**Access Control Policies 1829**

Access Control Policy Components	1829
System-Created Access Control Policies	1830
Requirements and Prerequisites for Access Control Policies	1830
Managing Access Control Policies	1831
Creating a Basic Access Control Policy	1832
Editing an Access Control Policy	1833
Locking an Access Control Policy	1834
Managing Access Control Policy Inheritance	1836
Choosing a Base Access Control Policy	1836
Inheriting Access Control Policy Settings from the Base Policy	1837
Locking Settings in Descendant Access Control Policies	1837
Requiring an Access Control Policy in a Domain	1838
Setting Target Devices for an Access Control Policy	1838
Logging Settings for Access Control Policies	1839
Access Control Policy Advanced Settings	1840
Associating Other Policies with Access Control	1844
Viewing Rule Hit Counts	1845
Analyzing Rule Conflicts and Warnings	1847
Searching for Rules	1848
History for Access Control Policies	1850

---

**CHAPTER 64**
**Access Control Rules 1853**

Introduction to Access Control Rules	1853
Access Control Rule Management	1855
Access Control Rule Components	1856
Access Control Rule Order	1857

Access Control Rule Actions	1858
Access Control Rule Monitor Action	1858
Access Control Rule Trust Action	1858

- Troubleshoot URL Filtering 1941

About Security Intelligence	1945
Best Practices for Security Intelligence	1946
License Requirements for Security Intelligence	1946
Requirements and Prerequisites for Security Intelligence	1947
Security Intelligence Sources	1947
Configure Security Intelligence	1948
Security Intelligence Options	1950
Security Intelligence Categories	1951
Block List Icons	1953
Configuration Example: Security Intelligence Blocking	1953
Security Intelligence Monitoring	1954
Override Security Intelligence Blocking	1954
Troubleshooting Security Intelligence	1955
Security Intelligence Categories Are Missing from the Available Options List	1955

**CHAPTER 68****DNS Policies 1957**

DNS Policy Overview	1957
Cisco Umbrella DNS Policies	1958
DNS Policy Components	1958
License Requirements for DNS Policies	1959
Requirements and Prerequisites for DNS Policies	1959
Managing DNS and Umbrella DNS Policies	1960
Creating Basic DNS Policies	1960
Editing DNS Policies	1961
DNS Rules	1962
Creating and Editing DNS Rules	1962
DNS Rule Management	1963
Enabling and Disabling DNS Rules	1963
DNS Rule Order Evaluation	1964
DNS Rule Actions	1964
DNS Rule Conditions	1965
Security Zone Rule Conditions	1965
Network Rule Conditions	1966
VLAN Tags Rule Conditions	1966

- DNS Rule Conditions 1967
- How to Create DNS Rules 1967
  - Controlling Traffic Based on DNS and Security Zone 1967
  - Controlling Traffic Based on DNS and Network 1968
  - Controlling Traffic Based on DNS and VLAN 1968
  - Controlling Traffic Based on DNS List or Feed 1969
- DNS Policy Deploy 1969
- Cisco Umbrella DNS Policies 1970
  - How to Redirect DNS Requests to Cisco Umbrella 1970
  - Prerequisites for Configuring the Umbrella DNS Connector 1971
  - Configure Cisco Umbrella Connection Settings 1972
  - Create an Umbrella DNS Policy 1973
  - Edit Umbrella DNS Policies and Rules 1973
  - Associate the Umbrella DNS Policy with an Access Control Policy 1974

---

**CHAPTER 69**

**Prefiltering and Prefilter Policies 1975**

- About Prefiltering 1975
  - About Prefilter Policies 1975
  - Tunnel vs Prefilter Rules 1976
  - Prefiltering vs Access Control 1977
  - Passthrough Tunnels and Access Control 1979
- Best Practices for Fastpath Prefiltering 1980
- Best Practices for Encapsulated Traffic Handling 1980
- Requirements and Prerequisites for Prefilter Policies 1981
- Configure Prefiltering 1982
  - Tunnel and Prefilter Rule Components 1983
  - Prefilter Rule Conditions 1985
    - Interface Rule Conditions 1985
    - Network Rule Conditions 1985
    - VLAN Tags Rule Conditions 1986
    - Port Rule Conditions for Prefilter Rules 1986
    - Time and Day Rule Conditions 1987
  - Tunnel Rule Conditions 1987
    - Encapsulation Rule Conditions 1987

Tunnel Zones and Prefiltering	1988
Using Tunnel Zones	1988
Creating Tunnel Zones	1990
Moving Prefilter Rules to an Access Control Policy	1991
Prefilter Policy Hit Counts	1993
Large Flow Offloads	1993
Flow Offload Limitations	1994

---

**CHAPTER 70****Service Policies** 1997

About Threat Defense Service Policies	1997
How Service Policies Relate to FlexConfig and Other Features	1998
What Are Connection Settings?	1998
Requirements and Prerequisites for Service Policies	1999
Guidelines and Limitations for Service Policies	1999
Configure Threat Defense Service Policies	2000
Configure a Service Policy Rule	2000
Bypass TCP State Checks for Asymmetrical Routing (TCP State Bypass)	2003
The Asymmetrical Routing Problem	2003
Guidelines and Limitations for TCP State Bypass	2004
Configure TCP State Bypass	2005
Disable TCP Sequence Randomization	2007
Examples for Service Policy Rules	2008
Protect Servers from a SYN Flood DoS Attack (TCP Intercept)	2008
Make the Threat Defense Device Appear on Traceroutes	2011
Monitoring Service Policies	2012

---

**CHAPTER 71****Intelligent Application Bypass** 2015

Introduction to IAB	2015
IAB Options	2016
Requirements and Prerequisites for Intelligent Application Bypass	2018
Configuring Intelligent Application Bypass	2018
IAB Logging and Analysis	2019

---

**CHAPTER 72****Content Restriction** 2023

About Content Restriction 2023

Requirements and Prerequisites for Content Restriction 2024

Guidelines and Limitations for Content Restriction 2025

Using Access Control Rules to Enforce Content Restriction 2025

    Safe Search Options for Access Control Rules 2026

Using a DNS Sinkhole to Enforce Content Restriction 2026

---

**CHAPTER 73**

**Zero Trust Access 2029**

About Zero Trust Access 2029

How Threat Defense Works with Zero Trust Access 2030

Why Use Zero Trust Access? 2031

Components of a Zero Trust Access Configuration 2031

Zero Trust Access Workflow 2032

Limitations for Zero Trust Access 2033

Prerequisites for Zero Trust Application Policy 2034

Manage Zero Trust Application Policies 2034

Create a Zero Trust Application Policy 2035

Create an Application Group 2036

Create an Application 2037

Set Targeted Devices for Zero Trust Access Policy 2039

Edit a Zero Trust Application Policy 2040

Monitor Zero Trust Sessions 2041

History for Zero Trust Access 2042

---

**PART XVI**

**Intrusion Detection and Prevention 2043**

---

**CHAPTER 74**

**Network Analysis and Intrusion Policies Overview 2045**

Network Analysis and Intrusion Policy Basics 2045

How Policies Examine Traffic For Intrusions 2046

    Decoding, Normalizing, and Preprocessing: Network Analysis Policies 2047

    Access Control Rules: Intrusion Policy Selection 2048

    Intrusion Inspection: Intrusion Policies, Rules, and Variable Sets 2049

    Intrusion Event Generation 2050

System-Provided and Custom Network Analysis and Intrusion Policies 2051

System-Provided Network Analysis and Intrusion Policies	2051
Benefits of Custom Network Analysis and Intrusion Policies	2053
Benefits of Custom Network Analysis Policies	2053
Benefits of Custom Intrusion Policies	2054
Limitations of Custom Policies	2055
License Requirements for Network Analysis and Intrusion Policies	2057
Requirements and Prerequisites for Network Analysis and Intrusion Policies	2057
The Navigation Panel: Network Analysis and Intrusion Policies	2057
Conflicts and Changes: Network Analysis and Intrusion Policies	2059
Exiting a Network Analysis or Intrusion Policy	2060

**CHAPTER 75****Getting Started with Intrusion Policies 2061**

Intrusion Policy Basics	2061
License Requirements for Intrusion Policies	2062
Requirements and Prerequisites for Intrusion Policies	2063
Managing Intrusion Policies	2063
Custom Intrusion Policy Creation	2064
Creating a Custom Snort 2 Intrusion Policy	2064
Editing Snort 2 Intrusion Policies	2065
Intrusion Policy Changes	2066
Access Control Rule Configuration to Perform Intrusion Prevention	2066
Access Control Rule Configuration and Intrusion Policies	2067
Configuring an Access Control Rule to Perform Intrusion Prevention	2067
Drop Behavior in an Inline Deployment	2067
Setting Drop Behavior in an Inline Deployment	2068
Drop Behavior in a Dual System Deployment	2069
Intrusion Policy Advanced Settings	2069
Optimizing Performance for Intrusion Detection and Prevention	2070

**CHAPTER 76****Tuning Intrusion Policies Using Rules 2071**

Intrusion Rule Tuning Basics	2071
Intrusion Rule Types	2071
License Requirements for Intrusion Rules	2072
Requirements and Prerequisites for Intrusion Rules	2073

Viewing Intrusion Rules in an Intrusion Policy	2073
Intrusion Rules Page Columns	2073
Intrusion Rule Details	2074
Viewing Intrusion Rule Details	2075
Setting a Threshold for an Intrusion Rule	2076
Setting Suppression for an Intrusion Rule	2076
Setting a Dynamic Rule State from the Rule Details Page	2077
Setting an SNMP Alert for an Intrusion Rule	2078
Adding a Comment to an Intrusion Rule	2078
Intrusion Rule Filters in an Intrusion Policy	2078
Intrusion Rule Filters Notes	2079
Intrusion Policy Rule Filters Construction Guidelines	2079
Intrusion Rule Configuration Filters	2081
Intrusion Rule Content Filters	2082
Intrusion Rule Categories	2083
Intrusion Rule Filter Components	2083
Intrusion Rule Filter Usage	2084
Setting a Rule Filter in an Intrusion Policy	2084
Intrusion Rule States	2085
Intrusion Rule State Options	2085
Setting Intrusion Rule States	2086
Intrusion Event Notification Filters in an Intrusion Policy	2087
Intrusion Event Thresholds	2087
Intrusion Event Thresholds Configuration	2087
Adding and Modifying Intrusion Event Thresholds	2088
Viewing and Deleting Intrusion Event Thresholds	2089
Intrusion Policy Suppression Configuration	2090
Intrusion Policy Suppression Types	2090
Suppressing Intrusion Events for a Specific Rule	2091
Viewing and Deleting Suppression Conditions	2091
Dynamic Intrusion Rule States	2092
Dynamic Intrusion Rule State Configuration	2093
Setting a Dynamic Rule State from the Rules Page	2094
Adding Intrusion Rule Comments	2095

---

**CHAPTER 77****Custom Intrusion Rules 2097**

- Custom Intrusion Rules Overview 2097
- License Requirements for the Intrusion Rule Editor 2098
- Requirements and Prerequisites for the Intrusion Rule Editor 2098
- Rule Anatomy 2098
  - The Intrusion Rule Header 2099
    - Intrusion Rule Header Action 2100
    - Intrusion Rule Header Protocol 2100
    - Intrusion Rule Header Direction 2101
    - Intrusion Rule Header Source and Destination IP Addresses 2101
    - Intrusion Rule Header Source and Destination Ports 2104
  - Intrusion Event Details 2105
    - Adding a Custom Classification 2108
    - Defining an Event Priority 2109
    - Defining an Event Reference 2109
- Custom Rule Creation 2109
  - Writing New Rules 2110
  - Modifying Existing Rules 2111
  - Adding Comments to Intrusion Rules 2112
  - Deleting Custom Rules 2113
- Searching for Rules 2113
  - Search Criteria for Intrusion Rules 2114
- Rule Filtering on the Intrusion Rules Editor Page 2115
  - Filtering Guidelines 2115
  - Keyword Filtering 2116
  - Character String Filtering 2117
  - Combination Keyword and Character String Filtering 2117
  - Filtering Rules 2117
- Keywords and Arguments in Intrusion Rules 2118
  - The content and protected\_content Keywords 2118
    - Basic content and protected\_content Keyword Arguments 2120
    - content and protected\_content Keyword Search Locations 2121
    - Overview: HTTP content and protected\_content Keyword Arguments 2123

Overview: content Keyword Fast Pattern Matcher	2127
The replace Keyword	2129
The byte_jump Keyword	2130
The byte_test Keyword	2133
The byte_extract Keyword	2135
The byte_math Keyword	2138
Overview: The pcre Keyword	2140
pcre Syntax	2141
pcre Modifier Options	2143
pcre Example Keyword Values	2146
The metadata Keyword	2148
Service Metadata	2149
Metadata Search Guidelines	2154
IP Header Values	2155
ICMP Header Values	2157
TCP Header Values and Stream Size	2158
The stream_reassembly Keyword	2162
SSL Keywords	2162
The appid Keyword	2164
Application Layer Protocol Values	2165
The RPC Keyword	2165
The ASN.1 Keyword	2165
The urilen Keyword	2166
DCE/RPC Keywords	2167
SIP Keywords	2170
GTP Keywords	2172
SCADA Keywords	2184
Modbus Keywords	2184
DNP3 Keywords	2185
CIP and ENIP Keywords	2188
S7Commplus Keywords	2189
Packet Characteristics	2190
Active Response Keywords	2192
The resp Keyword	2192

The react Keyword	2193
The detection_filter Keyword	2194
The tag Keyword	2195
The flowbits Keyword	2196
flowbits Keyword Options	2196
Guidelines for Using the flowbits Keyword	2198
flowbits Keyword Examples	2198
The http_encode Keyword	2203
http_encode Keyword Syntax	2204
http_encode Keyword example: Using Two http_encode Keywords to Search for Two Encodings	2204
Overview: The file_type and file_group Keywords	2204
The file_type and file_group Keywords	2205
The file_data Keyword	2206
The pkt_data Keyword	2207
The base64_decode and base64_data Keywords	2207

**CHAPTER 78****Layers in Intrusion and Network Analysis Policies 2209**

Layer Basics	2209
License Requirements for Network Analysis and Intrusion Policy Layers	2209
Requirements and Prerequisites for Network Analysis and Intrusion Policy Layers	2210
The Layer Stack	2210
The Base Layer	2211
System-Provided Base Policies	2211
Custom Base Policies	2211
The Effect of Rule Updates on Base Policies	2212
Changing the Base Policy	2213
The Cisco Recommendations Layer	2213
Layer Management	2214
Shared Layers	2215
Managing Layers	2216
Navigating Layers	2217
Intrusion Rules in Layers	2217
Configuring Intrusion Rules in Layers	2218

Removing Rule Settings from Multiple Layers 2219

Accepting Rule Changes from a Custom Base Policy 2220

Preprocessors and Advanced Settings in Layers 2221

Configuring Preprocessors and Advanced Settings in Layers 2222

---

CHAPTER 79

**Tailoring Intrusion Protection to Your Network Assets 2225**

About Cisco Recommended Rules 2225

Default Settings for Cisco Recommendations 2226

Advanced Settings for Cisco Recommendations 2227

Generating and Applying Cisco Recommendations 2228

Script Detection 2229

---

CHAPTER 80

**Sensitive Data Detection 2231**

Sensitive Data Detection Basics 2231

Global Sensitive Data Detection Options 2232

Individual Sensitive Data Type Options 2233

System-Provided Sensitive Data Types 2234

License Requirements for Sensitive Data Detection 2234

Requirements and Prerequisites for Sensitive Data Detection 2235

Configuring Sensitive Data Detection 2235

Monitored Application Protocols and Sensitive Data 2236

Special Case: Sensitive Data Detection in FTP Traffic 2237

Custom Sensitive Data Types 2237

    Data Patterns in Custom Sensitive Data Types 2238

    Configuring Custom Sensitive Data Types 2240

    Editing Custom Sensitive Data Types 2241

**PART XX**

**User Identity 2421**

---

**CHAPTER 89**

- User Identity Overview 2423**
  - About User Identity 2423
    - Identity Terminology 2424
  - About User Identity Sources 2424
  - Best Practices for User Identity 2426
  - Identity Deployments 2428

How to Set Up an Identity Policy	2431
The User Activity Database	2435
The Users Database	2436
Cloud-delivered Firewall Management Center Host and User Limits	2437
Cloud-delivered Firewall Management Center Host Limit	2437
Cloud-delivered Firewall Management Center User Limit	2437
User Limits for Microsoft Azure Active Directory Realms	2438

**CHAPTER 90****Realms 2441**

About Realms and Realm Sequences	2441
Realms and Trusted Domains	2443
Supported Servers for Realms	2446
Supported Server Object Class and Attribute Names	2447
License Requirements for Realms	2448
Requirements and Prerequisites for Realms	2448
Create a Proxy Sequence	2448
Create a Microsoft Azure AD (SAML) Realm	2450
How to Create a Microsoft Azure AD Realm for Passive Authentication	2450
About Azure AD and Cisco ISE with Resource Owned Password Credentials	2451
About Azure AD and Cisco ISE with TEAP/EAP-TLS	2452
How to Configure ISE for Microsoft Azure AD (SAML)Microsoft Azure AD	2453
Configure Microsoft Azure Active Directory for Passive Authentication	2453
Configure Azure AD Basic Settings	2454
Get Required Information For Your Microsoft Azure AD Realm	2455
Create a Microsoft Azure AD (SAML) Realm for Passive Authentication	2457
How to Create a Microsoft Azure AD (SAML) Realm for Active Authentication (Captive Portal)	2461
Configure Azure AD Basic Settings	2463
Configure a Single Sign-On (SSO) App in Azure AD	2464
Create a Decryption Rule with Decrypt - Resign Action	2466
Get Required Information For Your Microsoft Azure AD Realm (Active Authentication Only)	2467
Create a Microsoft Azure AD (SAML) Realm for Active Authentication (Captive Portal)	2470
Create an LDAP Realm or an Active Directory Realm and Realm Directory	2475
Prerequisites for Kerberos Authentication	2477
Realm Fields	2478

- Realm Directory and Synchronize fields 2482
- Connect Securely to Active Directory 2484
  - Find the Active Directory Server's Name 2485
  - Export the Active Directory Server's Root Certificate 2485
- Synchronize Users and Groups 2487
- Create a Realm Sequence 2488
- Configure the Management Center for Cross-Domain-Trust: The Setup 2489
  - Configure the Secure Firewall Management Center for Cross-Domain-Trust Step 1: Configure Realms and Directories 2490
  - Configure the management center for Cross-Domain-Trust Step 2: Synchronize Users and Groups 2495
  - Configure the management center for Cross-Domain-Trust Step 3: Resolve Issues 2496
- Manage a Realm 2497
- Compare Realms 2498
- Troubleshoot Realms and User Downloads 2498
  - Troubleshoot Cross-Domain Trust 2501
- History for Realms 2504

**CHAPTER 91**

- User Control with the Passive Identity Agent 2507**
  - The Passive Identity Agent Identity Source 2507
  - Deploy the Passive Identity Agent 2508
    - Simple Passive Identity Agent Deployment 2509
    - Single Passive Identity Agent Monitoring Multiple Domain Controllers 2510
    - Multiple Passive Identity Agents Monitoring Multiple Domain Controllers 2510
    - Passive Identity Agent Primary/Secondary Agent Deployments 2512
  - How to Create a Passive Identity Agent Identity Source 2513
  - Configure the Passive Identity Agent 2515
    - Create a Microsoft Active Directory Realm 2515
    - Create a Passive Identity Agent Identity Source 2515
      - Create a Standalone Passive Identity Agent Identity Source 2516
      - Create a Primary or Secondary Passive Identity Agent Identity Source 2518
    - About Passive Identity Agent Roles 2520
  - Create a Cisco Security Cloud Control User for the Passive Identity Agent 2521
  - Troubleshoot the Passive Identity Agent 2523
  - Get an API Token for the Passive Identity Agent 2523

Install the Passive Identity Agent Software	2524
Uninstall the Passive Identity Agent Software	2526
Monitor the Passive Identity Agent	2527
Manage the Passive Identity Agent	2528
Edit Passive Identity Agents	2529
Delete a Standalone Passive Identity Agent	2529
Delete Primary and Secondary Passive Identity Agents	2529
Troubleshoot the Passive Identity Agent	2530
Security Requirements for the Passive Identity Agent	2531
Internet Access Requirements for the Passive Identity Agent	2531
History for the Passive Identity Agent	2532

**CHAPTER 92**

<b>User Control with ISE/ISE-PIC</b>	<b>2533</b>
The ISE/ISE-PIC Identity Source	2533
Source and Destination Security Group Tag (SGT) Matching	2534
License Requirements for ISE/ISE-PIC	2535
Requirements and Prerequisites for ISE/ISE-PIC	2535
ISE/ISE-PIC Guidelines and Limitations	2535
How to Configure ISE/ISE-PIC for User Control	2538
How to Configure ISE/ISE-PIC Without a Realm	2538
How to Configure ISE/ISE-PIC for User Control Using a Realm	2539
Configure ISE/ISE-PIC	2541
Configure Security Groups and SXP Publishing in ISE	2542
Export Certificates from the ISE/ISE-PIC Server for Use in the Management Center	2544
Export a System Certificate	2545
Generate a Self-Signed Certificate	2546
Import ISE/ISE-PIC Certificates	2546
Configure ISE for User Control	2547
ISE/ISE-PIC Configuration Fields	2549
Ways to Configure the Cisco Identity Services Engine (Cisco ISE) Identity Source	2550
About Cisco ISE Quick Configuration	2551
Prerequisites for ISE Quick Configuration	2551
Quick Configuration	2552
ISE Quick Configuration Results	2554

Cisco ISE Advanced Configuration	2556
ISE/ISE-PIC Configuration Fields	2558
Troubleshoot the ISE/ISE-PIC or Cisco TrustSec Issues	2559
History for ISE/ISE-PIC	2561

**CHAPTER 93****User Control with Captive Portal 2563**

The Captive Portal Identity Source	2563
About Hostname Redirect	2564
License Requirements for Captive Portal	2564
Requirements and Prerequisites for Captive Portal	2564
Captive Portal Guidelines and Limitations	2564
How to Configure the Captive Portal for User Control	2567
Configure the Captive Portal Part 1: Create a Network Object	2569
Configure the Captive Portal Part 2: Create an Identity Policy and Active Authentication Rule	2570
Update a Custom Authentication Form	2572
Configure the Captive Portal Part 3: Create a TCP Port Access Control Rule	2572
Configure the Captive Portal Part 4: Create a User Access Control Rule	2573
Captive Portal Example: Create a Decryption Policy with an Outbound Rule	2574
Configure Captive Portal Part 6: Associate Identity and Decryption Policies with the Access Control Policy	2576
Captive Portal Fields	2577
Exclude Applications from Captive Portal	2578
Troubleshoot the Captive Portal Identity Source	2579
History for Captive Portal	2580

**CHAPTER 94****User Control with the pxGrid Cloud Identity Source 2581**

About the pxGrid Cloud Identity Source	2581
Limitations of the pxGrid Cloud Identity Source	2582
How the pxGrid Cloud Identity Source Identity Source Works	2582
How to Configure a pxGrid Cloud Identity Source	2583
Enable pxGrid Cloud Service in Cisco ISE	2586
Register Cisco ISE with the Cisco DNA Portal	2586
Register the pxGrid Cloud Connection with Cisco ISE	2588
Create and Subscribe to the Firewall Management Center Application	2590

Create a pxGrid Cloud Identity Source	2591
Create an App Instance	2591
Create the Identity Source	2592
Activate the App Instance	2593
Verify It's Working	2594
Create Dynamic Attributes Filters for the pxGrid Cloud Identity Source	2595
Create Access Control Rules Using Dynamic Attributes Filters	2597
History for the pxGrid Cloud Identity Source	2599

---

**CHAPTER 95****User Control with Remote Access VPN 2601**

The Remote Access VPN Identity Source	2601
Configure RA VPN for User Control	2602
Troubleshoot the Remote Access VPN Identity Source	2602
Not Observing Correct Settings for VPN Statistics	2603

---

- [Cisco AI Assistant User Guide, on page 5](#)

## CHAPTER 1

# Managing Cisco Secure Firewall Threat Defense Devices with Cloud-delivered Firewall Management Center

---

The cloud-delivered Firewall Management Center is a software-as-a-service (SaaS) product that manages Secure Firewall Threat Defense devices and is delivered via Security Cloud Control. The cloud-delivered Firewall Management Center offers many of the same functions as an on-premises Secure Firewall Management Center.

The cloud-delivered Firewall Management Center has the same appearance and behavior as an on-premises Secure Firewall Management Center and uses the same FMC API.

As a SaaS product, the Security Cloud Control operations team is responsible for deploying and maintaining cloud-delivered Firewall Management Center software. As new features are introduced, the Security Cloud Control operations team updates your Security Cloud Control tenant's cloud-delivered Firewall Management Center for you.

A migration wizard is available to help you migrate your Secure Firewall Threat Defense devices from your on-premises Secure Firewall Management Center to the cloud-delivered Firewall Management Center. The devices must have Threat Defense software Version 7.0.3 or a later 7.0.x release, or Version 7.2 or later installed to be migrated. Threat Defense 7.1 releases are not supported.

Onboarding Secure Firewall Threat Defense devices is carried out in Security Cloud Control using familiar processes such as onboarding a device with its serial number or using a CLI command that includes a registration key. Once the device is onboarded, it is visible both in Security Cloud Control and in the cloud-delivered Firewall Management Center, however, you configure the device in the cloud-delivered Firewall Management Center. In Security Cloud Control, you can view device-specific information such as version, configuration status, connectivity, health status, and node status. When you click on the health status from Security Cloud Control, you are taken to the respective device's health monitoring page in the cloud-delivered Firewall Management Center user interface.

Security Cloud Control provides high availability support for the threat defense devices that it manages through the data interface. This feature is supported for devices running software version 7.2 or later.

You can analyze syslog events generated by your onboarded threat defense devices using Security Analytics and Logging (SaaS) or Security Analytics and Logging (On-Premises). The SaaS version stores events in the cloud and you view the events in Security Cloud Control. The on-premises version stores events in an on-premises Secure Network Analytics appliance and analysis is done in the on-premises Secure Firewall Management Center. In both cases, just as with an on-premises FMC today, you can still send logs to a log collector of your choice directly from the sensors.

The license for cloud-delivered Firewall Management Center is a per-device-managed license and there is no license required for the cloud-delivered Firewall Management Center itself. Existing Secure Firewall Threat Defense devices re-use their existing smart licenses and new Secure Firewall Threat Defense devices provision new smart licenses for each feature implemented on the FTD.

Existing customers can continue to use Security Cloud Control for managing other device types like, the Secure Firewall ASA, Meraki, Cisco IOS devices, Umbrella, and AWS virtual private clouds. If you use Security Cloud Control to manage a Secure Firewall Threat Defense device configured for local management with Firepower Device Manager, you can continue to manage them with Security Cloud Control as well.

To learn how to have a cloud-delivered Firewall Management Center provisioned on your tenant, see [Enable Cloud-delivered Firewall Management Center on Your Security Cloud Control Tenant, on page 3](#).

## Enable Cloud-delivered Firewall Management Center on Your Security Cloud Control Tenant

If you want to manage your Secure Firewall Threat Defense devices, you can enable the cloud-delivered Firewall Management Center on your tenant. You need to have an admin or a super admin user role to perform this task.

### Procedure

- 
- Step 1** From the Security Cloud Control menu, click **Administration > Firewall Management Center** and click **Enable Cloud-Delivered FMC**.
- Step 2** Security Cloud Control starts provisioning a cloud-delivered Firewall Management Center instance in the background; it typically takes 15 to 30 minutes for this to be complete. You can track the provisioning progress on the **Status** column of **Cloud-Delivered FMC**.

After the provisioning is complete, the status changes to **Active**. In addition, you get a **Cloud-delivered Firewall Management Center is Ready** notification on the Security Cloud Control notifications panel and on the applications on which you have configured incoming webhooks. See [Notification Settings](#) for more information.

**Note** After you receive the **Cloud-delivered Firewall Management Center is Ready** notification, ensure that you log out of and log in back to your tenant once, to see the **Cloud-Delivered FMC** right pane options, such as **Actions**, **Management**, and **System**.

You can then onboard your threat defense devices to the cloud-delivered Firewall Management Center and manage them.

---

## Hardware and Software Support

Cloud-delivered Firewall Management Center supports these Secure Firewall Threat Defense software versions when they are installed on any supported hardware or virtual device:

- Verion 7.0.3 or later 7.0.x versions.
- Version 7.2 and later versions.

---

**Note** Software Version 7.1 is not supported.

---

See [Firepower Threat Defense Support Specifics](#) for more information.

## Security Cloud Control Platform Maintenance Schedule

Security Cloud Control updates its platform every week with new features and quality improvements. Updates are made during a 3 hour period according to this schedule:

Day of the Week	Time of Day (24-hour time, UTC)
Thursday	09:00 UTC - 12:00 UTC

During this maintenance period, you can still access your tenant and if you have a cloud-delivered Firewall Management Center or Multicloud Defense Controller, you can access those portals as well. Additionally, the devices you have onboarded to Security Cloud Control continue to enforce their security policies.

---

### Note

- We advise against using Security Cloud Control to deploy configuration changes on the devices it manages during maintenance periods.
  - If there is any issue that stops Security Cloud Control from communicating, we address that failure on all affected tenants as quickly as possible, even if it is outside the maintenance window.
-

## Onboard with Cisco AI Assistant

### Overview

Firewall administrators often encounter challenges in managing firewall policies and accessing related documentation. The AI Assistant with Security Cloud Control, cloud-delivered Firewall Management Center and on-prem Firewall Management Center streamlines these tasks, making it more efficient to manage firewall devices, policies, and reference documentation when needed.

### Prerequisites

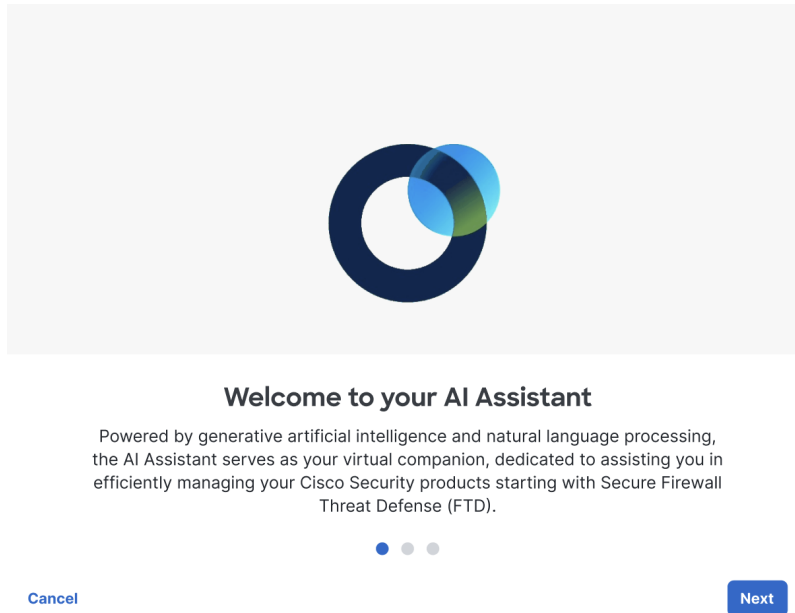

Administrators need to ensure they have met the following prerequisites to use the AI Assistant:

- User roles:
  - Security Cloud Control and cloud-delivered Firewall Management Center- Super Administrators or Administrators.
  - On-prem Firewall Management Center - Global Domain Admin.

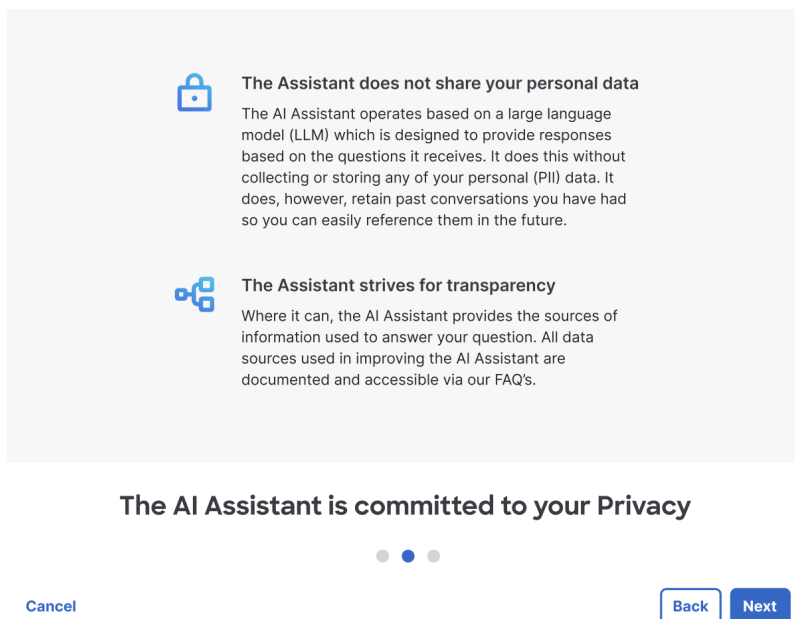

Upon successful login into your tenant, you will notice an AI Assistant widget positioned in the top menu bar of the dashboard (  ), click on the widget to launch the AI Assistant.

### Onboarding First-Time User

After opening the AI Assistant for the first time, a carousel window opens and you are introduced to the AI Assistant. You are presented with information on how the AI Assistant protects the privacy of your data, and a few tips on how to best use it.

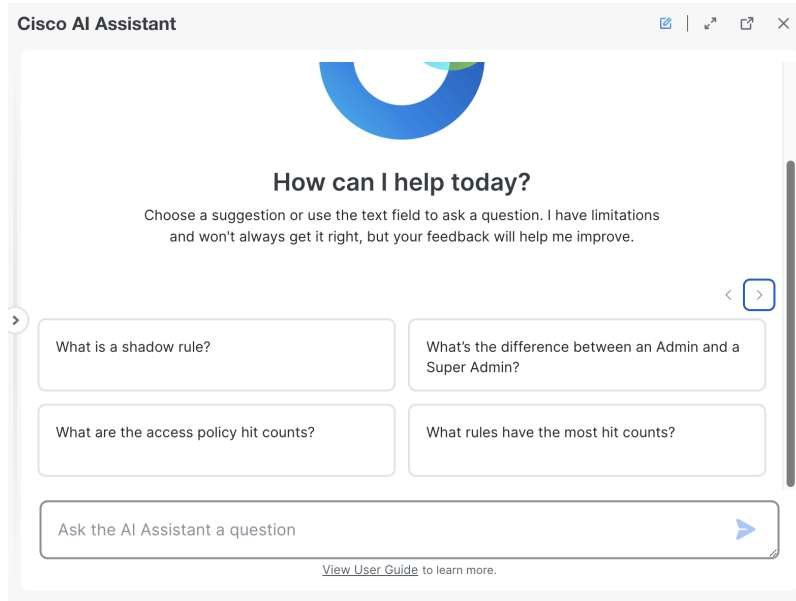

In the carousel window, Click **Next** to learn how the AI Assistant works with your data. We recommend that you read through this to understand how the AI Assistant treats your data and strives for transparency.

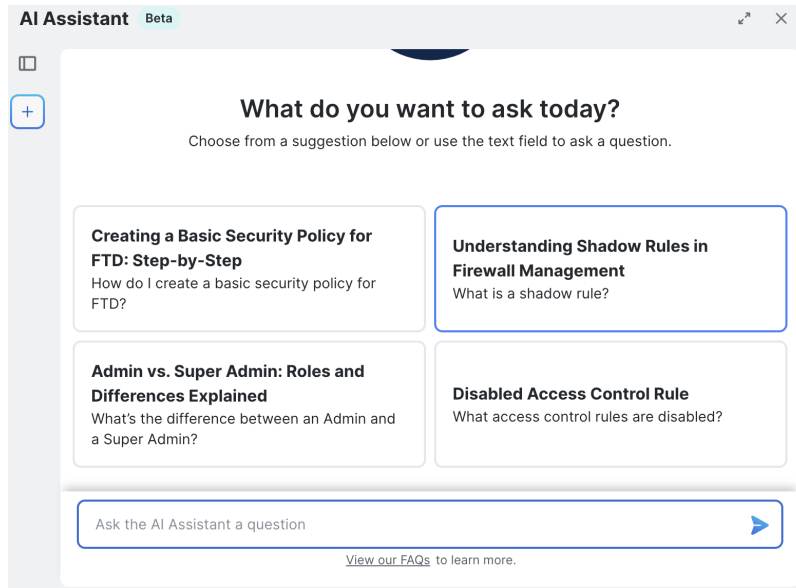

At any point, if you click **Cancel** the AI Assistant carousel closes.

**Note** You will not be able to use the AI Assistant until you have navigated through all the screens in the carousel. This and any other action you take with the AI Assistant is specific to your user account. Your actions do not affect other authorized administrators of your tenant.

Clicking **Launch AI Assistant** opens the AI Assistant in a floating conversation window; You can select a response from one of our suggestion tiles or type in a question in the text box.

**Note** The AI Assistant comes pre-enabled on every tenant. If you prefer to disable the AI Assistant navigate go to the **Settings** page and [switch off the AI Assistant toggle](#) to disable it.

## Prompt Guide for Cisco AI Assistant

The Cisco AI Assistant’s Prompt Guide is designed to help you interact more effectively with our AI Assistant, ensuring you get accurate, relevant, and helpful responses to your queries and commands. Your experience with Cisco AI Assistant can be greatly enhanced by how effectively you communicate with it.

### Understanding a Prompt

A prompt is a question or any text input that you provide to the Cisco AI Assistant to initiate a conversation or request information. Essentially, it's the question you pose to the AI Assistant. The way you format and construct your prompt plays a crucial role in determining the response from the AI Assistant.

### Key Components of a prompt:

- **Clarity:** Be clear and specific about what you're asking for.
- **Context:** Provide necessary background information.
- **Purpose:** State what you want to achieve with your prompt.

### Examples of Effective Prompts

General Prompt	Effective Prompt	What’s the difference?
What are the IP addresses and ports currently being blocked?	Can you provide me with the distinct IP addresses that are currently blocked by our firewall policies?	<p><b>General prompt</b> - Without indicating the need for "both" or "all" attributes explicitly, the assistant might provide default information on either IPs or ports, not both.</p> <p><b>Effective prompt</b> - This prompt is clear and uses the keyword "distinct" to specify the need for unique values, which aligns with the AI Assistant capabilities.</p>

General Prompt	Effective Prompt	What's the difference?
<p>Tell me the firewall rules, who set them, and all the changes made last month.</p>	<p>I need both the names and descriptions of all active firewall rules. Please include both attributes in the output.</p>	<p><b>General prompt</b> - This is overloaded with requests and lacks clarity on whether all attributes are needed together, leading to potential confusion for the AI Assistant.</p> <p><b>Effective prompt</b> - This clearly states the requirement for multiple attributes by using "both," ensuring the assistant understands to include all requested information.</p>
<p>What are the firewall rules for IP addresses X and Y, and how do I update them?</p>	<p>Show me a list of all firewall rules along with their corresponding actions for the past week.</p>	<p><b>General prompt</b> - This combines questions about rules and updating procedures, which can lead to incomplete or inaccurate responses due to lack of context or specificity.</p> <p><b>Effective prompt</b> - This is specific about the need for a list of rules and their actions, making it a straightforward request for the AI Assistant.</p>
<p>Give me everything but only the names.</p>	<p>Initial Question: What are the current firewall rules?</p> <p>Follow-Up Question: Can you also provide the actions associated with these rules?</p>	<p><b>General prompt</b> - This is ambiguous and does not use the provided keywords in a manner that the AI Assistant can effectively interpret.</p> <p><b>Effective prompt</b> - This approach helps maintain context and ensures each question is addressed accurately.</p>
<p>Tell me everything about the policies on my account.</p>	<p>I want to understand my Edge ACP access control policy, can you tell me more about it?</p>	<p><b>General prompt</b> - This is too vague and lacks detail. The AI Assistant is unable to determine which specific policy the user is requesting information about.</p> <p><b>Effective prompt</b> - This informs the AI Assistant the user needs details for Edge ACP access policy. The AI Assistant will respond with all the relevant details.</p>

General Prompt	Effective Prompt	What's the difference?
Show me ports, protocols, and rule counts in Edge ACP policy, biggest to smallest.	In Edge ACP policy, what ports and protocols are configured in the rules? Include the counts of the number of rules using it and sort largest to smallest.	<p><b>General prompt</b> - This lacks specificity, combining multiple complex requests without clear instructions, and assuming the AI Assistant has implicit knowledge of how to aggregate and present the data. This leads to potential misunderstandings and responses that may not meet user expectations.</p> <p><b>Effective prompt</b> - This approach helps maintain context and provides the assistant with clear instructions.</p>

### Guidelines for Crafting Effective Prompts

By providing precise input and context, you significantly increase the chances of receiving a targeted, relevant, and useful answer from the AI Assistant

- **Be Specific and provide context:** Draft your with relevant information, use the correct device names, policy names, etc. that could help the AI Assistant understand your request better.
- **Use Proper Syntax:** While AI Assistant can understand colloquial language, clear and grammatically correct sentences can improve response accuracy.
- **Clarify the Desired Output:** If you have a preference for the response format (e.g., a list, a detailed explanation, tables), mention it.
- **Correction and Feedback:** If the response doesn't meet your expectations, you can provide feedback or ask for clarification within your next .
- **Direct Naming Requests:** Use the phrase "give me only the names" to instruct the AI Assistant to provide solely names in its response. For example, if a user wants to know the names of firewall rules or policy names without additional details, they can use the phrase 'give me only the names of firewall rules' to instruct the AI Assistant to provide solely the names in its response.
- **Unique Values:** Employ the keyword "unique" to request unique values from the AI Assistant.
- **Rules and Actions:** When requesting information about rules, users can specify which attributes they want to include in the response for comprehensive insights. For example, if a user wants to know about firewall rules allowing access to a specific zone, they can specify additional attributes such as the action (e.g., allow or deny) and any relevant source zones. By providing specific instructions, users can tailor the response to their exact requirements and gain deeper insights into the configuration. This approach allows users to obtain more relevant and actionable information from the AI Assistant.
- **Sequential Questioning:** For multiple inquiries, pose them as separate, follow-up questions to enhance clarity and context, rather than combining them into a single complex .
- **Explicit Multi-Attribute Queries:** Clearly state "Both" or "all of the following" when seeking multiple attributes; otherwise, the AI Assistant might select an attribute at random to respond to. For example, when querying about firewall rules, attributes could include details such as the rule name, description, action (e.g., allow or deny), source IP addresses, destination IP addresses, ports, protocols, etc.

In the context of multi-attribute queries, it means requesting information about multiple characteristics or properties simultaneously. For instance, a user might want to know both the names and descriptions of firewall rules, or they might be interested in the source IP addresses and destination ports of network traffic.

## Online Help Documentation

The AI Assistant grants administrators full access to the entire knowledge base, allowing them to ask any query and receive precise, accurate responses. This streamlines the process, saving both time and effort. Additionally, the AI Assistant enhances the user experience by offering relevant citations and reference links to help documents, guiding administrators toward the intended outcome with ease.

Administrators can simply type their query into the AI Assistant's chat interface. The Assistant will respond with a clear answer, along with citations and reference links to help documents for additional guidance.

---

### Tip Sample prompts:

- *What are the steps to configure a new firewall policy?*
  - *Where can I find documentation on rule optimization?*
  - *How do I renew an expired rule in my firewall settings?*
- 

## Policy Insights

Administrators can ask questions to gain insights into policy configurations, including rule details, status, and compliance alignment. AI Assistant scans and analyses policies to provide details of potential gaps and overlaps that need to be resolved resulting in better performance and efficiency.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	Navigate to your tenant's dashboard and click on the AI Assistant icon located in the right top corner.	
<b>Step 2</b>	Use a simple prompt to inquire about existing policy rules (e.g., " <i>Show all access control rules</i> ").	
<b>Step 3</b>	The AI Assistant retrieves a comprehensive list of policies relevant to your query.	
<b>Step 4</b>	Review the details provided by the AI Assistant, including rule configurations, rule status, and key attributes such as allowed traffic, blocked ports, or IP addresses.	

**Example****Tip Sample Prompts**

- *What rules are using http://github.com ?*
- *What rules are using this IP 100.20.10.1?*
- *What policies are blocking the Webex application and webex.com URL?*
- *Which rules allow inbound traffic?*
- *Show rules with expired conditions.*

## Policy Analyzer and Optimizer

The AI Assistant identifies gaps and inconsistencies within firewall rules, providing administrators with detailed insights into anomalies or potential issues. This allows administrators to quickly address security vulnerabilities, ensure compliance, and optimize the overall effectiveness of their firewall policies. The rules can be:

- **Mergable Rule:** Rules that can be combined or consolidated because they share similar criteria or actions. For example, if two or more rules apply to the same source, destination, or protocol, but have redundant or overlapping conditions, they can be merged to reduce complexity and improve the overall efficiency.
  - **Expired Rule:** Rules that are no longer active because they have passed a predefined expiration date or time limit.
  - **Object Overlap:** An element in a field of a rule is a subset of one or more elements in the same field of the rule. *For example, the source field might include a network object for 10.1.1.0/24, and another object for the host 10.1.1.1. Because 10.1.1.1 is within the network covered by 10.1.1.0/24, the object for 10.1.1.1 is redundant and can be deleted, simplifying the rule and saving device memory.*
  - **Duplicate/Redundant Rule:** Two rules apply the same action to the same type of traffic and removing the base rule would not change the ultimate result. *For example, if a rule permitting FTP traffic for a particular network were followed by a rule allowing IP traffic for that same network, and there were no rules in between denying access, then the first rule is redundant, and you can delete it.*
  - **Shadowed Rule:** This is the reverse of a redundant rule. In this case, one rule will match the same traffic as another rule such that the second rule will never be applied to any traffic because it comes later in the access list. If the action for both rules is the same, you can delete the shadowed rule. If the two rules specify different actions for traffic, you might need to move the shadowed rule or edit one of the two rules to implement your desired policy. *For example, the base rule might deny IP traffic, and the shadowed rule might permit FTP traffic, for a given source or destination.*
1. The AI Assistant continuously monitors and analyzes your firewall rules. You can prompt the Assistant to analyze current policies for gaps or inefficiencies (e.g., "Analyze rules for redundant configurations").
  2. The AI Assistant flags any redundant, duplicate, or conflicting rules that could be optimized. It provides suggestions on merging or updating rules to streamline firewall performance.

3. Based on the analysis, the **AI Assistant** recommends optimizations, such as removing obsolete rules, adjusting configurations, or tightening access control for better security.

---

**Note** If the **AI Assistant** detects expiring rules or performance issues within a policy, it automatically generates alerts to prompt timely actions from the administrator.

---

**Tip** **Sample Prompts**

- Identify any inconsistencies in my firewall rules.
  - Show me gaps in current firewall policy configurations.
  - Are there any redundant or conflicting rules in my firewall setup?
- 

**Resolve Policy Abnormalities**

Administrators can address policy rule gaps efficiently using the AI Assistant. With its help, they are able to:

- Disable all the policy rules that are redundant, shadow rules, and expired.
- Remove all the policy rules that are redundant, shadow rules, and expired.
- Merge all the policy rules that are redundant.

---

**Note** In case performing any of these actions does not resolve the issue, you can [create a support ticket](#) to contact Cisco Support Team.

---

## Automate Policy Rule Creation

The AI Assistant simplifies policy rule creation process for the Secure Firewall Threat Defense managed by cloud-delivered Firewall Management Center and minimizes the need for extensive technical knowledge or manual configuration. By leveraging [Prompt Guide for Cisco AI Assistant](#), administrators can quickly establish robust security measures, enhancing the overall efficiency and security of their network. These rules once created are listed under the policies section in your tenant.

### Example Scenario

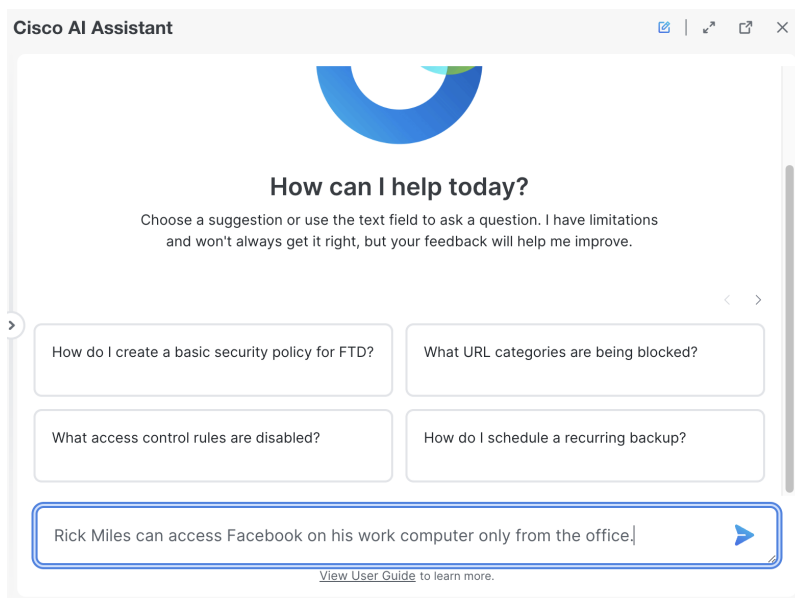

Consider a scenario where an administrator receives the following request:

*Rick Miles can access Facebook on his work computer only from the office.*

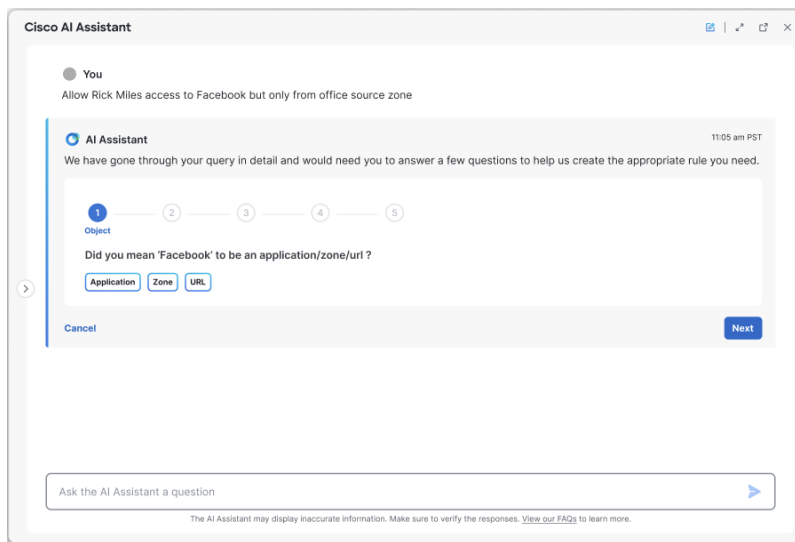

This would be the process the administrator would follow to create the rule:

Procedure

**Step 1** The administrator needs to create a new rule to accommodate this request. They put this request to the AI Assistant:

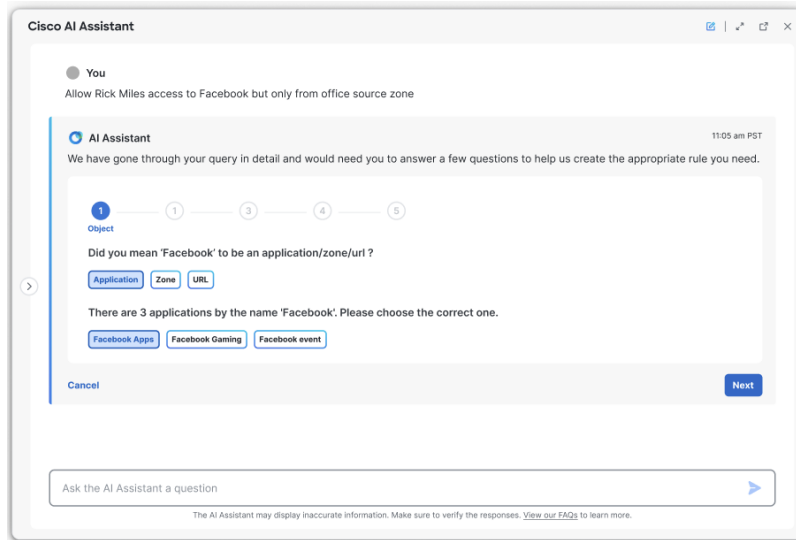

**Step 2** The AI Assistant asks a question to better understand the administrator’s requirement, and then guides them through a selection of options to create the rule:

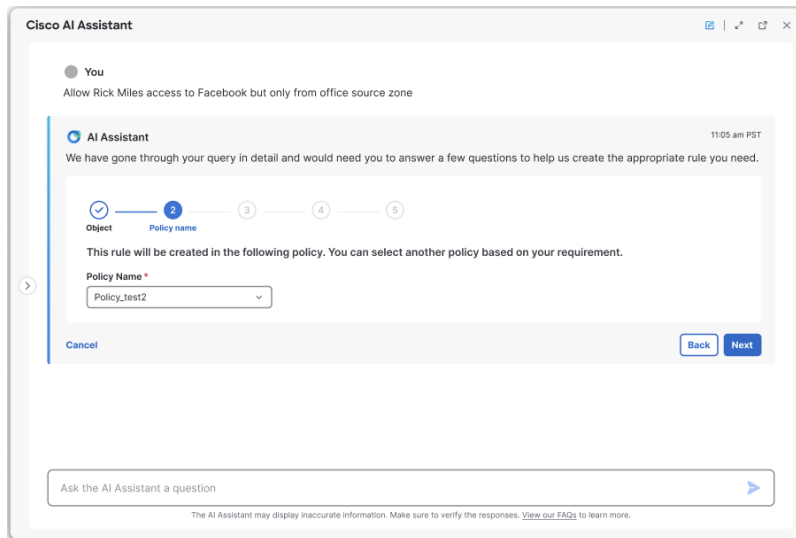

**Step 3** The AI Assistant finds multiple results for Facebook, and asks the administrator to clarify if they are referring to Facebook as an application, URL or a Zone:

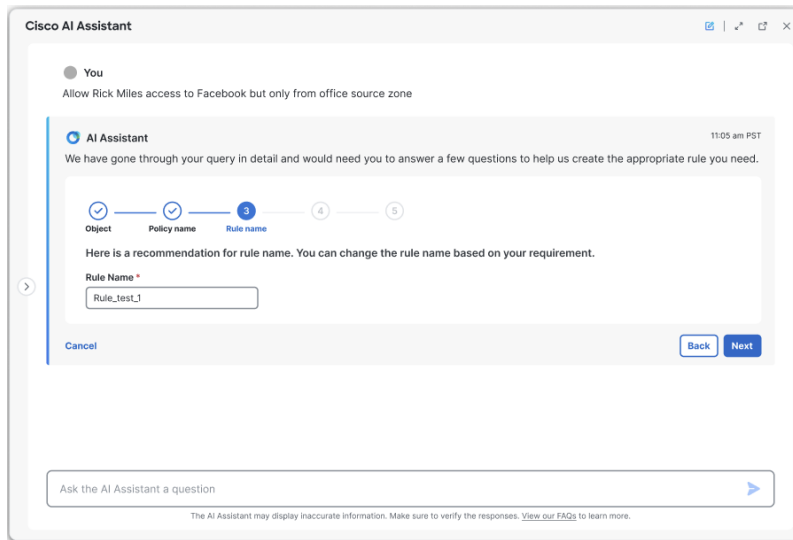

**Step 4** The AI Assistant prompts the administrator to select the policy to which the rule will be added:

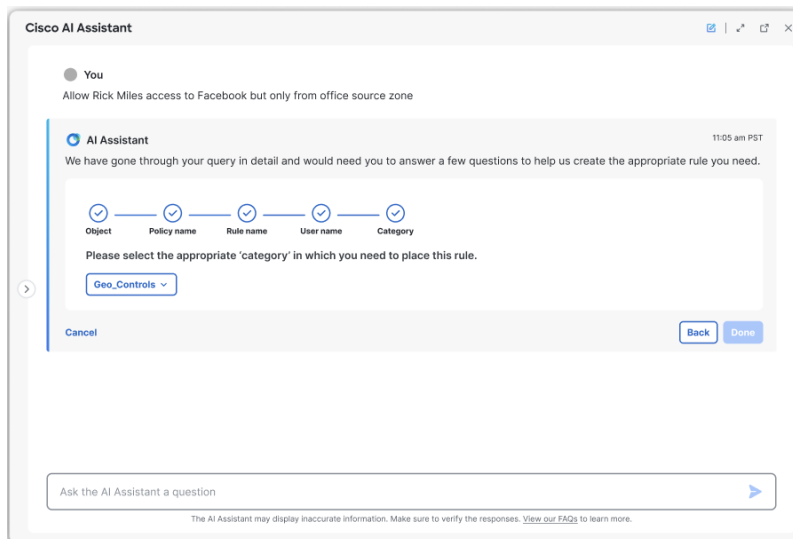

**Step 5** The AI Assistant suggests a "Rule Name", which the administrator can modify if needed:

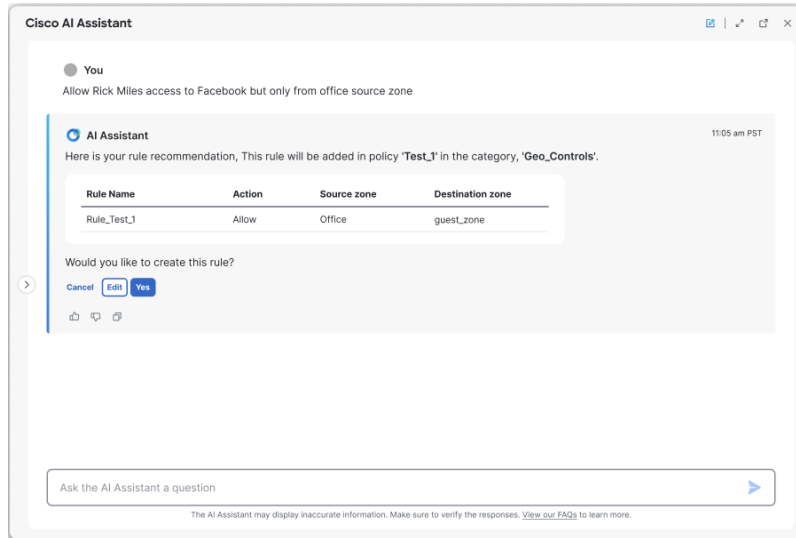

**Note** If the administrator chooses a “Rule Name” that already exists in a policy, the assistant displays an error prompting the administrator to enter a new name.

**Step 6** The AI Assistant prompts the administrator to select a “User name” and a “Category” for the rule:

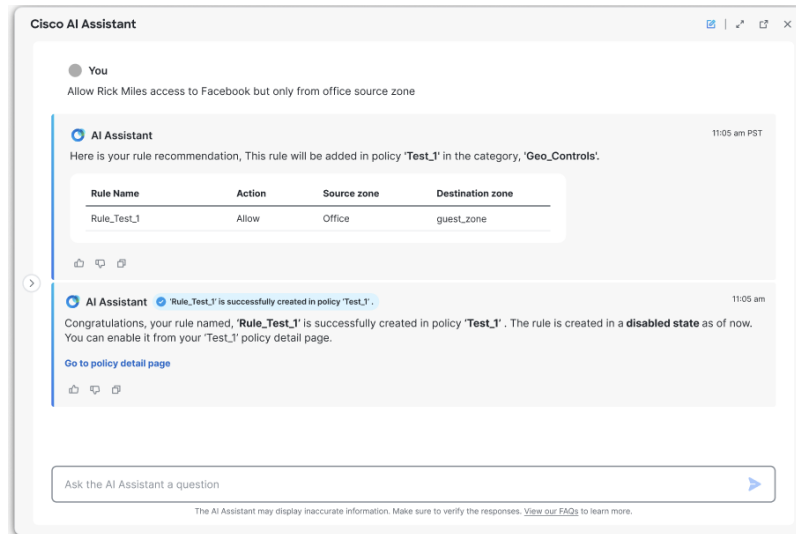

**Step 7** The AI Assistant requests confirmation for rule creation and provides a summary of the administrator's request along with the inputs for the rule:

**Note** The administrator can edit the rule information by clicking **Edit** and cancel the process of rule creation by clicking **Cancel**.

**Step 8** Assuming that the administrator confirms “Yes” for rule creation, the rule is created and will be reflected in the policy the administrator chose:

**Note** If you are unable to create a policy rule, refer to [Cisco AI Assistant Frequently Asked Questions \(FAQ\)](#), on page 21.

## Contact Support

The AI Assistant streamlines the process of ticket creation and management, enabling administrators to handle support requests efficiently and effectively. With this integration, administrators can generate support cases

directly through the AI Assistant when they encounter unresolved issues or require additional assistance beyond the AI's recommendations.

Key capabilities include:

- **Automated Ticket Creation:** The AI Assistant automatically suggests creating a support ticket if its solutions don't resolve the issue. Administrators can also manually create tickets with a simple prompt.
- **Manage Tickets:** Administrators can track and update the status of their tickets to "Close" within the AI Assistant.

By incorporating ticket creation and management into the AI Assistant, organizations can reduce delays in troubleshooting, help create a support case with support teams, and enhance the overall efficiency of issue resolution.

---

Only customers using Security Cloud Control and Cloud-delivered Firewall Management Center can contact support through the AI Assistant.

---

### Open Support Case

The AI Assistant creates a support ticket based on the context of the conversation. This support case is created in the **Support Case Manager** and the ticket details are shared with the user.

By following the steps below, administrators can quickly and seamlessly create a support ticket through the AI Assistant.

1. Navigate to your tenant's dashboard and click on the AI Assistant icon located in the right top corner.
2. Initiate a conversation by typing your query/issue in the text box.
3. The AI Assistant will suggest troubleshooting steps or solutions based on the issue presented.
4. If the AI Assistant's recommended solutions do not resolve the issue or if further help is needed, the Assistant will prompt you to **Open a Case**.

You can also manually request the creation of a support case by typing "create a support case".

5. The AI Assistant will generate the case and provide you with a case summary.
6. The AI Assistant will prompt you to review and confirm the details of the case, you can make any necessary modifications and confirm the information to proceed with opening the support case.
7. After reviewing the case summary, click **Open Case**.

---

**Note** A confirmation email will be sent, including a case number for reference.

---

### Case Summary

A case summary (or ticket summary) is a brief overview of the issue or request that has been submitted to Cisco Support. It typically includes key details such as:

- **Firewall:** Select the firewall that you need help with.
- **Priority:** Indicates the criticality of the issue and its impact on business operations.
- **Description of the issue:** A brief summary explaining the problem or request.

- Case number: A unique identifier assigned to each support case for tracking purposes.
- Problem code: A specific code that categorizes the issue type or technical problem.
- Request type:
- Status: The current state of the support case, such as open, in progress, or close.

---

**Tip Sample Prompts:**

- *I need to report an issue with my firewall.*
- *Can you help me open a support ticket?*
- *Please escalate this problem to your support team.*
- *How do I file a complaint about this product?*
- *I need to speak to someone about a malfunctioning firewall.*
- *This product is giving me trouble, I need to open a case.*

---

**Manage Support Case**

Administrators can quickly view and update a support case through the AI Assistant. The status of a support ticket can be:

- **List cases:** The AI Assistant can list all the open and closed cases for the tenant.
- **Close:** Mark the support case as resolved once the issue has been addressed.
- **Retrieve:** Access the details of an existing support case for review or reference.

**Support Case List**

Administrators can easily access a comprehensive list of all previously created support cases within their tenant using the AI Assistant. By simply asking the assistant to retrieve past cases, they can view case numbers, statuses, descriptions, and other essential details for each case.

To retrieve cases:

1. Navigate to the AI Assistant, in the text box, ask the AI Assistant to **retrieve the list of support cases**.
2. Alternatively, you can retrieve the list of cases directly in the **Support Case Manager** section.

---

**Tip Sample prompts:**

- *I want to know my support case history.*
- *How many support cases we have?*

---

**Support Case Status**

Administrators can check the status of their support case via the AI Assistant.

1. Navigate to the AI Assistant, in the text box, ask the AI Assistant to **retrieve the status of support cases**.
2. Alternatively, you can track the progress of the ticket directly in the **Support Case Manager** section.

---

**Tip Sample prompts:**

- *I want to know my support case status.*
  - *What is the status of my case?*
- 

**Support Case Close**

Administrators can close their support cases via the AI Assistant.

To close a case:

1. Navigate to the AI Assistant, in the text box, ask the AI Assistant to close the case.
2. Alternatively, you can close the ticket directly in the **Support Case Manager** section.

---

**Tip Sample prompts:**

- *I want to close my case.*
  - *How do I close my ticket?*
- 

## Notifications Center

The Cisco AI Assistant's alert and notification system is designed to keep administrators informed of critical actions, updates, and changes within their security environment. By leveraging real-time alerts and scheduled notifications, users can manage security incidents and optimize policies proactively.

The alerts and notifications are accessed via the AI Assistant icon located in the top-right corner of your tenant dashboard. When new alerts or notifications are available, a number indicator will appear on the icon, displaying the total count of unread items.

Clicking the icon opens the **Notification Center**, where you can view a comprehensive list of all alerts and notifications. The list can be easily filtered by status, including **Read**, **Unread**, and by **Severity**, allowing you to prioritize critical actions and stay informed.

The default status of the notifications are unread. The administrators can mark the notifications as read and delete the notifications as required.

The notifications are triggered for:

- **Policy analyzer and optimizer:** The AI Assistant routinely scans policies within your tenant and provides recommendations for optimization. Once the scan results are available, the Assistant will notify the user through a system-generated notification, ensuring timely awareness and action.

- **Policy rule creation:** Upon initiating policy rule creation, the rule is initially set to "disabled" by default, requiring you to manually enable it. The AI Assistant will then notify you once the rule is successfully enabled.

## Cisco AI Assistant Frequently Asked Questions (FAQ)

- Q.** What is the Cisco AI Assistant?
- A.** The Cisco AI Assistant is an application that answers questions about existing configurations on your Secure Firewall Threat Defense device and how to manage those devices in the Secure Firewall Management Center and cloud-delivered Firewall Management Center.
- Q.** What can the AI Assistant help you with?
- A.**
- The AI Assistant answers questions about how to configure your Secure Firewall Threat Defense devices.
  - The AI Assistant answers questions about how to configure access control and other security policies.
  - The AI Assistant simplifies the configuration for a quicker, easier policy rule building.
  - The AI Assistant helps diagnose and troubleshoot firewall-related issues.
- Q.** How do you access the AI Assistant?
- A.** The AI Assistant is integrated with Security Cloud Control and cloud-delivered Firewall Management Center. To access the AI Assistant click the AI Assistant button (  ) on the Security Cloud Control or cloud-delivered Firewall Management Center home page.
- Q.** What do I do if a response is wrong?
- A.** Click the feedback option to report incorrect information.
- Q.** How do I ask the AI Assistant a question?
- A.** Click the AI Assistant button (  ) on Security Cloud Control or cloud-delivered Firewall Management Center home page and type your question text box.
- Q.** What subjects can I ask about?
- A.** You can ask the AI Assistant about your configured firewall devices, policies, and settings; and ask questions about how to configure your firewall.
- Q.** Is the Cisco AI Assistant Secure?
- A.** Yes. The Cisco AI Assistant implemented on your Security Cloud Control tenant only has access to the information and security policies on your tenant and your cloud-delivered Firewall Management Center, if you have implemented that feature. The AI Assistant cannot “learn” about policies on other Security

Cloud Control tenants and so, can't answer questions about other Security Cloud Control tenants or integrate information from them.

- Q.** What is Cisco's data privacy policy?
- A.** This is [Cisco's Online Privacy Statement](#) in the Cisco's Trust Center.
- Q.** Can I use the AI Assistant to create rules?
- A.** Yes, you can use the AI Assistant to create rules. The AI Assistant provides a user-friendly interface with simple prompts that guide you through the rule creation process. It ensures accuracy and efficiency, allowing you to seamlessly integrate and manage policy rules within your workflow.
- Q.** What types of rules are supported by the AI Assistant?
- A.** Currently, the AI Assistant supports the Access Control Policy Rules. You can create rule to `allow`, `block`, `BLOCK_RESET`. Administrators can request specific details about Access Rule policies for their tenant.
- Q.** The AI Assistant is unable to create a rule, how do I fix this?
- A.** The AI Assistant is unable to create a policy rule:
  - **Object not found:** If the AI Assistant cannot find the specified object name within the tenant, it will prompt the admin to verify the object name and try again. We recommend providing the assistant with an updated prompt that includes the correct object name.
  - **Incomplete Request:** The AI Assistant requires complete and accurate information to create a rule. For a better understanding, please refer to the table below:

Object provided by the user	Required Object <i>(The user must provide at least one of these objects to give the AI Assistant better context for rule creation.)</i>
A. <ul style="list-style-type: none"> <li>• Source Zone</li> <li>• Source Network</li> <li>• Source Dynamic Attribute</li> </ul>	<ul style="list-style-type: none"> <li>• Destination Zone</li> <li>• Destination Network</li> <li>• Destination Port</li> <li>• Destination Dynamic Attribute</li> <li>• Application</li> <li>• URL</li> </ul>
User	<ul style="list-style-type: none"> <li>• Destination Zone</li> <li>• Destination Network</li> <li>• Destination Port</li> <li>• Destination Dynamic Attribute</li> <li>• Application</li> <li>• URL</li> </ul>

Object provided by the user	Required Object <i>(The user must provide at least one of these objects to give the AI Assistant better context for rule creation.)</i>
<ul style="list-style-type: none"> <li>• Destination Zone</li> <li>• Destination Network</li> <li>• Destination Port</li> <li>• Destination Dynamic Attribute</li> </ul>	<ul style="list-style-type: none"> <li>• Source Zone</li> <li>• Source Network</li> <li>• Source Dynamic Attribute</li> <li>• User</li> <li>• Application</li> <li>• URL</li> </ul>
<ul style="list-style-type: none"> <li>• Application</li> <li>• URL</li> </ul>	<ul style="list-style-type: none"> <li>• Source Zone</li> <li>• Source Network</li> <li>• Source Dynamic Attribute</li> <li>• User</li> <li>• Destination Zone</li> <li>• Destination Network</li> <li>• Destination Port</li> <li>• Destination Dynamic Attribute</li> </ul>

- Q.** Do I need to pay to use the Cisco AI Assistant for Firewall?
- A.** The Cisco AI Assistant is currently available for early customer evaluation at no cost. During this rollout phase, usage is free of charge. However, Cisco plans to include the product in the General Price List (GPL) in the future. After general availability, Cisco reserves the right to require customers to purchase a subscription to continue using the product.
- Q.** Are there any limitations on features and functionality during the above -mentioned initial customer evaluation period?
- A.** No, there are no planned limitations on the usage of available functionality. During the early availability period, you will have full access to all features and functionalities of the product. However, Cisco will monitor usage levels and may, at its sole discretion, restrict or limit usage, as well as add or remove features and functionalities during this evaluation phase.
- Q.** What happens if I choose not to subscribe and/or do not pay for the product after the above-mentioned period?
- A.** If you choose not to subscribe, your access to the Cisco AI Assistant for Firewall will be limited or discontinued in accordance with our policy. You will have the option to reactivate your subscription at any time.
- Q.** When was the last time the Cisco AI Assistant was updated?
- A.** The AI Assistant is updated weekly with documentation changes.

In Security Cloud Control, the AI Assistant is updated every 24 hours with the policy and configuration changes you made to your devices and tenant.

In cloud-delivered Firewall Management Center, the AI Assistant is also updated every 24 hours with the policy and configurations changes you made to your devices and tenant, and in addition, responses to those questions include when the last data sync occurred.

## PART II

# Onboard Devices to Cloud-delivered Firewall Management Center

- [Device Settings, on page 137](#)
- [Change Management, on page 207](#)
- [Users, on page 219](#)
- [Configuration Deployment, on page 227](#)

## CHAPTER 3

# Onboard an FTD to the Cloud-delivered Firewall Management Center

---

Read the following information for onboarding prerequisites and procedures.

- [Onboarding Overview](#), on page 27
- [Prerequisites to Onboard a Device to Cloud-delivered Firewall Management Center](#), on page 28
- [Onboard a Device with a CLI Registration Key](#), on page 30
- [Onboard a Threat Defense Device to Cloud-delivered Firewall Management Center using Zero-Touch Provisioning](#), on page 32
- [Onboard a Threat Defense Device to On-Prem Firewall Management Center using Zero-Touch Provisioning](#), on page 33
- [Onboard Threat Defense Devices using Device Templates to Cloud-delivered Firewall Management Center using Zero-Touch Provisioning](#), on page 34
- [Deploy a Threat Defense Device with AWS](#), on page 36
- [Deploy a Threat Defense Device in Azure](#), on page 37
- [Deploy a Threat Defense Device to Google Cloud Platform](#), on page 41
- [Onboard a Secure Firewall Threat Defense Cluster](#), on page 44
- [Onboard a Chassis](#), on page 45
- [Delete Devices from Cloud-delivered Firewall Management Center](#), on page 47
- [About Device Interfaces](#), on page 47
- [Troubleshooting](#), on page 50

## Onboarding Overview

Review the following use cases and supported software versions that are compatible with cloud-delivered Firewall Management Center management.

---

**Note** You must ensure that the threat defense device ports have external and outbound access for the cloud-delivered Firewall Management Center to onboard them. There is no requirement for an on-premises or cloud-based Security Device Controller (SDC) for this operation. For more information, see [Network Requirements](#).

To send threat defense Syslog events to the Cisco cloud, you can set up the Secure Event Connector (SEC). For more information, see [Installing Secure Event Connectors](#).

---

### Threat Defense Devices Currently Managed by Cloud-delivered Firewall Management Center

The following scenarios occur when you either move or migrate a device to the cloud-delivered Firewall Management Center:

- If you delete a device from an on-premises management center or Secure Firewall Threat Defense device manager to onboard to the cloud-delivered Firewall Management Center, the change of managers wipes any policies configured through the on-premises management center.
- If you **migrate** a device from an on-premises management center to the cloud-delivered Firewall Management Center, the device retains the majority of your previously configured policies.

---

**Note** If you do not know if your device is already managed by an alternative manager, use the `show managers` command in the device's CLI.

---

### Onboarding Methods

Cloud-delivered Firewall Management Center supports the following onboarding methods:

- [Onboard a Device with a CLI Registration Key](#) - Onboard a device with a registration key. The initial device setup wizard is complete on the device.
- [Onboard a Threat Defense Device to Cloud-delivered Firewall Management Center using Zero-Touch Provisioning](#) - Onboard a new factory-shipped device with its serial number. Note that this method only supports Firepower 1000, Firepower 2100, or Secure Firewall 3100 devices.

---

**Note** Version 7.0.3 does not support zero-touch provisioning.

---

- [Onboard a Threat Defense Device to Cloud-delivered Firewall Management Center using Zero-Touch Provisioning](#) using a device template - Onboard new factory-shipped devices using serial numbers and a device template. Note that this method only supports Firepower 1000, Firepower 2100, Secure Firewall 1200 or Secure Firewall 3100 devices.

# Prerequisites to Onboard a Device to Cloud-delivered Firewall Management Center

### Onboard Limitations and Requirements

Be aware of the following limitations when onboarding a device to the cloud-delivered Firewall Management Center:

- Devices **must** be running version 7.0.3, or version 7.2 and later. We **strongly** recommend version 7.2 or later.
- You can migrate an HA pair that is managed by an On-Premises Firewall Management Center by following the [Migrate FTD to Cloud-Delivered Firewall Management Center](#) process. Confirm both peers are in a healthy state prior to migrating.

- Only devices that are configured for local management and are managed by a device manager can be onboarded with the serial number and zero-touch provisioning methods.
- If the device is managed by an on-premises management center, you can either onboard the device to cloud-delivered Firewall Management Center or migrate the device. Migrating retains any existing policies and objects, whereas onboarding the device removes most policies and all objects. See [Migrate FTD to Cloud-Delivered Firewall Management Center](#) for more information.
- If your device is currently managed by a device manager, unregister all your smart licenses before you onboard the device. Even if you switch device management, the Cisco Smart Software Manager will retain the smart licenses.
- If you have previously onboarded a device that was managed by a device manager and deleted the device from Security Cloud Control with the intention of re-onboarding for cloud management, you **must** register the device manager to the Security Services Exchange cloud after deleting the device. See the "Access Security Services Exchange" chapter in the *Firepower and Cisco SecureX Threat Response Integration Guide*.

**Tip** Onboarding a device to the cloud-delivered Firewall Management Center removes any policies and most objects configured through the previous manager. If your device is currently managed by an on-premises management center, it is possible to migrate the device and retain your policies and objects. See [Migrate FTD to Cloud-Delivered Firewall Management Center](#) for more information.

### Network Requirements

Before you onboard a device, ensure the following ports have external and outbound access. Confirm the following ports on the device are allowed. If communication ports are blocked behind a firewall, onboarding the device may fail.

**Note** You cannot configure these ports in the Security Cloud Control UI. You must enable these ports through the device's SSH.

**Table 1: Device Port Requirements**

Port	Protocol / Feature	Details
443/tcp	HTTPS	Send and receive data from the internet.
443	HTTPS	Communicate with the AMP cloud (public or private)
8305/tcp	Appliance communications	Securely communicate between appliances in a deployment.

### Management and Data Interfaces

Make sure your device is correctly configured with either a management or data interface.

To configure a management or data interface on your device, see [Complete the Initial Configuration of a Secure Firewall Threat Defense Device Using the CLI, on page 2953](#).

## Onboard a Device with a CLI Registration Key

Use the procedure below to onboard a device for cloud-delivered Firewall Management Center with a CLI registration key.

---

**Note** If your device is currently managed by an on-premises management center, onboarding the device will fail. You can either delete the device from the on-premises management center and onboard as a fresh, new device with no policies or objects, or you can migrate the device and retain the existing policies and objects. See [Migrate FTD to Cloud-Delivered Firewall Management Center](#) for more information.

---

---

**Important** You can create a Security Cloud Control-managed, standalone logical threat defense device using the Secure Firewall chassis manager or the FXOS CLI.

---

### Before you begin

Before you onboard a device, be sure to complete the following tasks:

- Cloud-delivered Firewall Management Center is enabled for your tenant.
- Confirm the device's CLI configuration is successfully completed. See [Complete the Initial Configuration of a Secure Firewall Threat Defense Device Using the CLI, on page 2953](#) for more information.
- Review the prerequisites and limitations before you onboard the device. See "Prerequisites to Onboard a Device to Cloud-delivered Firewall Management Center" in [Managing Firewall Threat Defense with Cloud-Delivered Firewall Management Center in Cisco Security Cloud Control](#) for more information.
- The device can be configured for either local management with Secure Firewall device manager or remote management with Secure Firewall Management Center.

---

**Note** If you want the device to maintain management from the Secure Firewall device manager, select **FDM** and see [Onboard an FDM-Managed Device Running Software Version 6.6+ Using a Registration Key](#) for more information.

---

- Device must be running version 7.0.3, or 7.2.0 and later.
- You have reset the device's SSH password as part of the bootstrap process. If you have not reset the SSH password, Security Cloud Control recommends using the [Onboard a Threat Defense Device to Cloud-delivered Firewall Management Center using Zero-Touch Provisioning, on page 32](#) method

## Procedure

- 
- Step 1** Log in to Security Cloud Control.
- Step 2** In the left pane, click **Security Devices**.
- Step 3** In the top-right corner, click **Onboard** ()
- Step 4** Click the **FTD** tile.
- Step 5** Under **Management Mode**, ensure you select **FTD**. By selecting **FTD** under **Management Mode**, you will not be able to manage the device using the previous management platform. All existing policy configurations except for interface configurations will be reset. You must re-configure policies after you onboard the device.
- Step 6** Select **Use CLI Registration Key** as the onboarding method.
- Step 7** Enter the device name in the **Device Name** field and click **Next**.
- Step 8** In the **Policy Assignment** step, use the drop-down menu to select an access control policy to deploy once the device is onboarded. If you have no policies configured, select the **Default Access Control Policy**.
- Step 9** Specify whether the device you are onboarding is a physical or virtual device. If you are onboarding a virtual device, you must select the device's performance tier from the drop-down menu.
- Step 10** Select the subscription licenses you want to apply to the device. Click **Next**.
- Step 11** Security Cloud Control generates a command with the registration key. Connect to the device you are onboarding using SSH. Log in as "admin" or a user with equivalent admin privileges and paste the entire registration key as is into the device's CLI.
- Note:** For Firepower 1000, Firepower 2100, ISA 3000, and threat defense virtual devices, open an SSH connection to the device and log in as `admin`. Copy the entire registration command and paste it into the device's CLI interface at the prompt. In the CLI, enter **Y** to complete the registration. If your device was previously managed by device manager, enter **Yes** to confirm the submission.
- Step 12** Click **Next** in the Security Cloud Control onboarding wizard.
- Step 13** (Optional) Add labels to your device to help sort and filter the **Inventory** page. Enter a label and select the blue plus button. Labels are applied to the device after it's onboarded to Security Cloud Control.
- 

### What to do next

Once the device is synchronized, select the device you just onboarded from the **Inventory** page and select any of the options listed under the **Device Management** pane located to the right. We strongly recommend the following actions:

- If you did not already, create a custom access control policy to customize the security for your environment. See [Access Control Overview](#) in *Managing Firewall Threat Defense with Cloud-Delivered Firewall Management Center in Cisco Security Cloud Control* for more information.
- Enable Cisco Security Analytics and Logging (SAL) to view events in the Security Cloud Control dashboard or register the device to an Secure Firewall Management Center for security analytics. See [Cisco Security Analytics and Logging](#) in *Managing Firewall Threat Defense with Cloud-Delivered Firewall Management Center in Cisco Security Cloud Control* for more information.

# Onboard a Threat Defense Device to Cloud-delivered Firewall Management Center using Zero-Touch Provisioning

Only the Firepower 1000, Firepower 2100, and Secure Firewall 3100 devices can be onboarded with the zero-touch provisioning method.

## Before you begin

Confirm that the following is completed before onboarding:

- You have a Security Cloud Control tenant. If you do not, see [Request a Security Cloud Control Tenant](#) for more information.
- Cloud-delivered Firewall Management Center is enabled for your tenant.
- The device is freshly installed but has never been logged into by either the device CLI, a management center, or the device manager.
- The device is running version 7.2 or later. Version 7.0.3 does **not** support zero-touch provisioning.

## Procedure

- 
- Step 1** Log in to Security Cloud Control.
- Step 2** In the left pane, click **Security Devices**.
- Step 3** In the top-right corner, click **Onboard** ()
- Step 4** Click the **FTD** tile.
- Step 5** Under **Management Mode**, ensure you select **FTD**. By selecting **FTD** under **Management Mode**, you will not be able to manage the device using the previous management platform. All existing policy configurations except for interface configurations will be reset. You must re-configure policies after you onboard the device.
- Step 6** Click the **Use Serial Number** tile.
- Step 7** Select cloud-delivered Firewall Management Center from the drop-down list. Click **Next**.
- Step 8** Enter the **Device Serial Number** and the **Device Name**. Select **Next**.
- Step 9** Choose an option depending on whether the device is logged into and configured for a manager:
- If your device is brand new and has never been configured for a manager, click **Yes, this new device has never been logged into or configured for a manager**.
  - If your device has been previously registered for a manager or is **still** registered to a manager, click **No, this device has been logged into and configured for a manager**.
- Step 10** Click **Next**.
- Step 11** In the **Policy Assignment** step, use the drop-down menu to select an access control policy to deploy once the device is onboarded. If you have no policies configured, select the **Default Access Control Policy**.
- Step 12** Select the subscription licenses you want to apply to the device. Click **Next**.
-

### What to do next

Once the device is synchronized, select the device you just onboarded from the **Inventory** page and select any of the options listed under the **Device Management** pane located to the right. We strongly recommend the following actions:

- If you did not already, create a custom access control policy to customize the security for your environment. See [Access Control Overview](#) in *Managing Firewall Threat Defense with Cloud-Delivered Firewall Management Center in Cisco Security Cloud Control* for more information.
- Enable Cisco Security Analytics and Logging (SAL) to view events in the Security Cloud Control dashboard **or** register the device to an Secure Firewall Management Center for security analytics. See [Cisco Security Analytics and Logging](#) in *Managing Firewall Threat Defense with Cloud-Delivered Firewall Management Center in Cisco Security Cloud Control* for more information.

## Onboard a Threat Defense Device to On-Prem Firewall Management Center using Zero-Touch Provisioning

Only the Firepower 1000, Firepower 2100, and Secure Firewall 3100 devices can be onboarded with the zero-touch provisioning method.

### Before you begin

Confirm the following is completed prior to onboarding:

- You have a Security Cloud Control tenant. If you do not, see [Request a Security Cloud Control Tenant](#) for more information.
- An on-prem FMC must be fully set up, configured, and already recognized as a management center within your Security Cloud Control tenant before onboarding any new devices.
- The device is freshly installed but has never been logged into by either the device CLI, a management center, or the device manager.
- The device is running version 7.2 or later. Version 7.0.3 does **not** support zero-touch provisioning.

### Procedure

- 
- |               |   |
|---------------|---|
| <b>Step 1</b> | Log in to Security Cloud Control.   |
| <b>Step 2</b> | In the left pane, click <b>Security Devices</b> .   |
| <b>Step 3</b> | In the top-right corner, click <b>Onboard</b> (  )   |
| <b>Step 4</b> | Click the <b>FTD</b> tile.  |
| <b>Step 5</b> | Under <b>Management Mode</b> , ensure you select <b>FTD</b> . By selecting <b>FTD</b> under <b>Management Mode</b> , you will not be able to manage the device using the previous management platform. All existing policy configurations except for interface configurations will be reset. You must re-configure policies after you onboard the device. |
| <b>Step 6</b> | Click <b>Use Serial Number</b> .  |
| <b>Step 7</b> | Select an available on-prem FMC from the drop-down list. Click <b>Next</b> .  |

- Note**
- On-prem FMCs running version 7.4 or later and onboarded with Cisco Security Cloud are displayed in the drop-down.
  - Provide the **Public IP address** or **FQDN** value of the selected on-prem FMC unless
    - The FTD is publicly reachable
    - The FTD is running a version earlier than 7.4
    - The connection is being made through the data interface

**Step 8** Enter the **Device Serial Number** and the **Device Name**. Click **Next**.

**Step 9** Choose an option depending on whether the device is logged into and configured for a manager:

- If your device is brand new and has never been configured for a manager, click **Yes, this new device has never been logged into or configured for a manager**.
- If your device has been previously registered for a manager or is **still** registered to a manager, click **No, this device has been logged into and configured for a manager**.

**Step 10** Click **Next**.

**Step 11** In the **Policy Assignment** step, use the drop-down menu to select an access control policy to deploy once the device is onboarded. If you have no policies configured, select the **Default Access Control Policy**.

**Step 12** Select the subscription licenses you want to apply to the device. Click **Next**.

---

### What to do next

Once the device is synchronized, select the device you just onboarded from the **Inventory** page and select any of the options listed under the **Device Management** pane located to the right. We strongly recommend the following actions:

- If you did not already, create a custom access control policy to customize the security for your environment. For more information, see [Access Control Overview](#).
- Enable Cisco Security Analytics and Logging (SAL) to view events in the Security Cloud Control dashboard or register the device to an Secure Firewall Management Center for security analytics. For more information, see [Cisco Security Analytics and Logging](#).

# Onboard Threat Defense Devices using Device Templates to Cloud-delivered Firewall Management Center using Zero-Touch Provisioning

Only the Firepower 1000, Firepower 2100, Secure Firewall 1200, and Secure Firewall 3100 devices can be onboarded with the zero-touch provisioning method.

## Before you begin

Confirm that the following is completed before onboarding:

- You have a Security Cloud Control tenant. If you do not, see [Request a Security Cloud Control Tenant](#) for more information.
- Cloud-delivered Firewall Management Center is enabled for your tenant.
- The device is freshly installed but has never been logged into by either the device CLI, a management center, or the device manager.
- The device is running version 7.4 or later.

## Procedure

- 
- Step 1** Log in to Security Cloud Control.
- Step 2** In the left pane, click **Security Devices**.
- Step 3** In the top-right corner, click **Onboard** ()
- Step 4** Click the **FTD** tile.
- Step 5** Click the **Bulk Onboard using CSV File** tile.
- Step 6** In the **Template Assignment** field, select a template from the drop-down list. The access control policy associated with the template and the supported device models for the selected template are then displayed. Click **Next**.
- Step 7** In the **Upload CSV File** field, **Drag & drop** your CSV template file or **Click** to select the CSV template file that you want to upload.

You can download a **CSV Sample Template File** to have a look at the required header details that have to be used in the template. The CSV template file must be less than 2 MB in size. The filename must satisfy the following criteria:

- Can have a maximum of 64 characters.
- Only alphanumeric characters and special characters such as dash (-), period (.), and underscore (\_) are allowed.
- Must not contain any spaces.

A properly formatted .csv file has the following fields:

- Mandatory fields
  - Display Name - Name of the device. Type: string. Example: test1
  - Serial Number - Serial number of the device. Type: string, Example: JADX345670EG
- Optional fields
  - Device Group - Name of the device group, Type: string, Example: testgroup
  - Admin Password - Password for admin access, Type: string, Example: E28@20iUrhx

- Variables - Use the following format: `$(varName)`. Sample variable: `$(LAN-Devices-IPv4Address)` - IPv4 address of the LAN device. Type: string. Example: 1.2.3.4.
- Network object overrides - Use the following format: `<objType>:<objName>`. Sample network object override: `Network:LAN-Devices-Network` - IP address of the network of LAN devices. Type: string. Example: 1.2.3.4.

A sample CSV template file containing configuration for two devices is as given below.

DisplayName	SerialNumber	AdminPassword	\$WANLinkIP	Host:gateway
Branch A FTD	JADX345410AB	C15c05n0rt#	10.20.30.1	10.2.3.1
Branch B FTD	JADX345670CE	Admin123!	10.20.30.5	10.2.3.1

**Step 8** Click **Next**.

**Step 9** A statement mentioning that the devices are being onboarded is displayed. You can check the onboarding status of the devices in the **Security Devices** window.

### What to do next

Once the device is synchronized, select the device you just onboarded from the **Inventory** page and select any of the options listed under the **Device Management** pane located to the right. We strongly recommend the following actions:

- If you did not already, create a custom access control policy to customize the security for your environment. See [Access Control Overview](#) in *Managing Firewall Threat Defense with Cloud-Delivered Firewall Management Center in Cisco Security Cloud Control* for more information.
- Enable Cisco Security Analytics and Logging (SAL) to view events in the Security Cloud Control dashboard **or** register the device to an Secure Firewall Management Center for security analytics. See [Cisco Security Analytics and Logging](#) in *Managing Firewall Threat Defense with Cloud-Delivered Firewall Management Center in Cisco Security Cloud Control* for more information.

## Deploy a Threat Defense Device with AWS

Use the following procedure to onboard and preliminarily provision the firewall of a threat defense device that is associated with an AWS VPC to be managed by cloud-delivered Firewall Management Center.

### Before you begin

Confirm the following prerequisites are fulfilled prior to generating a virtual threat defense and deploying to an AWS environment:

- You must have the cloud-delivered Firewall Management Center feature enabled and associated with your tenant.

## Procedure

- 
- Step 1** Log in to Security Cloud Control.
- Step 2** In the navigation pane, click **Inventory** and click the blue plus button.
- Step 3** Select the **FTD** tile.
- Step 4** Under **Management Mode**, be sure **FTD** is selected.
- Step 5** Select **Use AWS VPC** as the onboarding method. If there is no AWS VPC already onboarded, you can click the provided link from this step and onboard the virtual environment.
- Step 6** Select the **availability zone** from the drop-down menu. Select the zone where the cloud threat defense is located, and not where your local computer is located.
- Step 7** Select the management interface subnet with either of the following options:
- **Use existing subnets** - Expand the drop-down menus and select the appropriate subnets for the management interface, inside interface, and outside interface subnets.
  - **Create new subnets** - Add a set of subnet interfaces for the device to use once onboarded. Security Cloud Control automatically creates these subnets and applies them to the AWS VPC as part of the onboarding procedure.
- Note that the diagnostic interface will use the same interface as the management interface.
- Step 8** Click **Select** to assign the subnets. Click **Next**.
- Step 9** Enter the device name in the **Device Name** field and click **Next**.
- Step 10** In the Policy Assignment step, use the drop-down menu to select an access control policy to deploy once the device is onboarded. If you have no policies configured, select the **Default Access Control Policy**.
- Step 11** Select the **Subscription Licenses** you want applied to the device. You must have at least the URL license selected for virtual threat defense devices.
- 

### What to do next

It may take a few minutes for the device to appear in Security Cloud Control's **Inventory** page as it cannot synchronize until Security Cloud Control has successfully deployed the cloud formation, initialized the device connections, and established communication with both the virtual device and the AWS VPC environment.

If necessary, you can modify the virtual threat defense device performance tier selection after onboarding through the cloud-delivered Firewall Management Center UI.

## Deploy a Threat Defense Device in Azure

This is a two-part process that involves onboarding an Azure account to Security Cloud Control as well as generating a virtual threat defense and simultaneously deploying it to your Azure instance.

## Onboard an Azure VNet Environment

Use the following procedure to onboard an Azure VNet for cloud-delivered Firewall Management Center management:

### Before you begin

You must have the following completed prior to this onboarding procedure:

- Cloud-delivered Firewall Management Center is enabled for your tenant.
- You must have at least one resource group available in your Azure account with an empty Azure VNet instance. If you do not have a resource group to host the virtual device, create one with the Azure portal. See Microsoft Azure's [Manage Azure resource groups by using the Azure portal](#) guide for more information.
- Your resource group in the Azure portal must have a virtual network created for the virtual device. If you do not have one, create one in the Azure portal. See Microsoft Azure's [Create a virtual network using the Azure portal](#) quickstart guide for more information.
- You **must** register Cisco Security Cloud Control to your Microsoft account to ensure successful communication between Azure and Security Cloud Control. See the "Quickstart: Register an application with the Microsoft identity platform" section of the Azure product documentation for more information.
- You **must** assign a built-in role, or create a custom role, within the Azure environment and assign it a member or group that will access both Azure and Security Cloud Control. See the "Azure custom role" section or the "Azure custom roles" of the Azure product documentation for more information.
- You **must** enable all of the following permissions in the Azure environment in order to successfully communicate with and onboard to Security Cloud Control:

```
"Microsoft.Network/virtualNetworks/write"
"Microsoft.Network/virtualNetworks/join/action"
"Microsoft.Network/virtualNetworks/subnets/read"
"Microsoft.Network/virtualNetworks/subnets/write"
"Microsoft.Network/virtualNetworks/subnets/prepareNetworkPolicies/action"
"Microsoft.Network/networkSecurityGroups/read"
"Microsoft.Network/networkSecurityGroups/write"
"Microsoft.Network/networkSecurityGroups/join/action"
"Microsoft.Network/networkSecurityGroups/securityRules/write"
"Microsoft.Network/networkSecurityGroups/securityRules/read"
"Microsoft.Network/networkSecurityGroups/securityRules/delete"
"Microsoft.Storage/storageAccounts/write"
"Microsoft.Storage/storageAccounts/read"
"Microsoft.Resources/deployments/write"
"Microsoft.Resources/deployments/read"
"Microsoft.Network/publicIPAddresses/read"
"Microsoft.Network/publicIPAddresses/write"
"Microsoft.Network/routeTables/read"
"Microsoft.Network/routeTables/write"
"Microsoft.Network/networkInterfaces/read"
"Microsoft.Network/networkInterfaces/write"
"Microsoft.Compute/virtualMachines/write"
"Microsoft.Resources/deployments/operationstatuses/read"
"Microsoft.Resources/subscriptions/resourcegroups/deployments/operationstatuses/read"
```

```
"Microsoft.Network/routeTables/join/action"  
"Microsoft.Network/virtualNetworks/subnets/join/action"  
"Microsoft.Network/publicIPAddresses/join/action"  
"Microsoft.Network/networkInterfaces/join/action"  
"Microsoft.Compute/virtualMachines/read"  
"Microsoft.Resources/subscriptions/resourceGroups/write"  
"Microsoft.Resources/subscriptions/resourceGroups/delete"
```

## Procedure

- 
- Step 1** Review the prerequisites listed above. You must register Security Cloud Control to your Microsoft account, create a user role, and enable all the applicable permissions prior to onboarding a virtual environment.
- Step 2** Log in to Security Cloud Control.
- Step 3** In the navigation pane, click **Inventory** and click the blue plus button.
- Step 4** Select the **Azure VNet** tile.
- Step 5** Enter the following credentials to continue with the onboarding wizard, then click **Next**:
- **Azure Tenant ID (Directory ID)** - A directory ID is a unique identifier for the tenant in the world of Microsoft cloud services. There is only one directory ID per tenant. To locate it, log into the Azure portal and navigate to **Azure Services > Azure Active Directory** and locate the Tenant ID listed on that page.
  - **Client ID (Application ID)** - An application ID is a unique identifier assigned to Security Cloud Control by Azure AD when the app was registered. To locate it, log into the Azure portal and navigate to **Azure Services > Azure Active Directory > App Registrations** and view the application ID in the list of apps. If there is no application ID for Security Cloud Control, click **New Registrations** to create one for this onboarding procedure.
  - **Client Secret** - You must manually request a client secret, although the Azure portal auto-generates a unique string to protect your tenant. To locate it, log into the Azure portal and navigate to **Azure Services > Azure Active Directory > App Registrations**, then expand the application for Security Cloud Control. In the panel on the left, click **Certificates & secrets**. If there is no secret, click **New client secret** to create one. Copy the **Value** entry for this onboarding procedure, not the Secret ID entry.
  - **Subscription ID** - A subscription is a tenant-based agreement to use Microsoft cloud services; in this case, Azure VNet. The subscription ID is the unique code associated between the tenant and this particular cloud service. To locate it, log into the Azure portal and navigate to **Azure Services > Subscriptions**. If there are no subscriptions available for Security Cloud Control, click **Add** to create one.
- Step 6** In the Security Cloud Control onboarding wizard, use the drop-down menu to select the **Azure VNet** you want to onboard.
- Step 7** Enter the **Device Name** and select **Next**. This device name is what the Azure VNet is displayed as in the Inventory page.
- Step 8** (Optional) Add labels to your device to help sort and filter the **Inventory** page. Enter a label and select the blue plus button. Labels are applied to the device after it's onboarded to Security Cloud Control.
-

**What to do next**

Onboard a virtual device in Security Cloud Control with this instance of Azure VNet as the manager. See [Deploy a Threat Defense Virtual in Azure, on page 40](#) for more information.

## Deploy a Threat Defense Virtual in Azure

Onboard a threat defense virtual for Azure that is managed by cloud-delivered Firewall Management Center. The Azure environment can only support one threat defense virtual. To onboard multiple devices, you must have a separate Azure instance for each of those devices.

**Before you begin**

Ensure that you have an active Azure subscription.

**Procedure**

- 
- Step 1** Log into Security Cloud Control.
- Step 2** In the left pane, click **Inventory** and click the plus icon.
- Step 3** Under **Select a Device or Service Type**, click the **FTD** tile.
- Step 4** Under **Management Mode**, ensure that **FTD** is selected.
- Warning** By selecting **FTD** under **Management Mode**, the device is reconfigured to use the cloud-delivered Firewall Management Center as the manager.
- Step 5** Click **Deploy an FTD to a cloud environment** as the onboarding method.
- Step 6** Choose **Azure** as your cloud provider from the drop-down list.
- Step 7** (Optional) If you have not registered your Security Cloud Control account to an Azure subscription, you can do so now. Click **Azure Cloud Shell** to launch the Azure cloud shell and paste the script that is provided. If you have registered your account or if you have completed executing the script, click **Next**.
- Step 8** Choose a **Region** to deploy the Azure subscription from the drop-down list.
- Step 9** Enter the **FTD Password** that you wish to use for SSH console access.
- Step 10** Enter a **Device Name**. This name is applied to the threat defense virtual in the Inventory page and Azure resource group.
- Step 11** In the **Policy Assignment** step, use the drop-down menu to select an access control policy to deploy once the device is onboarded. If you have no policies configured, select the **Default Access Control Policy**.
- Step 12** Select the licenses you want to apply to the device. You must select at least the essential license as the base license for this device. Click **Next**.
- Step 13** Click **Complete onboarding**.
- This completes the onboarding wizard. It may take up to 20 minutes for the device to fully onboard and synchronize. To monitor the creation process, expand the **Workflows** option of the Azure subscription that is hosting the device.
-

### What to do next

Once the device is synchronized, select the device you just onboarded from the **Inventory** page and select any of the options listed under the **Device Management** pane located to the right. We strongly recommend the following actions:

- If you did not already, create a custom access control policy to customize the security for your environment. See [Access Control Overview](#) in *Managing Firewall Threat Defense with Cloud-Delivered Firewall Management Center in Cisco Security Cloud Control* for more information.
- Enable Cisco Security Analytics and Logging (SAL) to view events in the Security Cloud Control dashboard **or** register the device to an Secure Firewall Management Center for security analytics. See [Cisco Security Analytics and Logging](#) in *Managing Firewall Threat Defense with Cloud-Delivered Firewall Management Center in Cisco Security Cloud Control* for more information.

## Deploy a Threat Defense Device to Google Cloud Platform

Deploy a threat defense device on your Google Cloud Platform (GCP) account to protect your Google Cloud workloads. The security policy for this device will be managed on your cloud-delivered Firewall Management Center.

You must first have a GCP account, a GCP project created, and several networks established for effective communication between cloud-delivered Firewall Management Center and GCP. Once you have established the GCP settings, onboard a threat defense device to be deployed to the GCP.

Use the following procedures to onboard and deploy a threat defense device to GCP.

### Create VPC Networks for GCP

The threat defense virtual deployment requires four networks which you must create prior to deploying the threat defense virtual. The networks are as follows:

- Management VPC for the management subnet.
- Diagnostic VPC or the diagnostic subnet.
- Inside VPC for the inside subnet.
- Outside VPC for the outside subnet.

Additionally, you may have to set up the route tables and GCP firewall rules to allow traffic flow through the threat defense virtual. The route tables and firewall rules are separate from those that are configured on the threat defense virtual itself. Name the GCP route tables and firewall rules according to associated network and functionality

#### Procedure

- 
- Step 1** In the GCP console, choose **VPC networks**, then click **Create VPC Network**.
  - Step 2** In the **Name** field, enter the desired name.
  - Step 3** From the Subnet creation mode, click **Custom**.

- Step 4** In the **Name** field under **New subnet**, enter the desired name.
- Step 5** From the **Region** drop-down list, select the region appropriate for your deployment. All four networks must be in the same region.
- Step 6** From the **IP address range** field, enter the first network's subnet in CIDR format, such as 10.10.0.0/24.
- Step 7** Accept the defaults for all other settings, then click **Create**.
- Step 8** Repeat steps 1-7 to create the remaining three VPC networks.

---

### What to do next

You may have to create firewall rules to apply to your newly created VPC networks. Go to the GCP console and navigate to **Networking > VPC network > Firewall** and then click **Create Firewall Rule**. See [GCP documentation](#) for more information.

Once your GCP VPC networks have been finalized, continue on to deploy the threat defense virtual.

## Deploy a Threat Defense Device on Google Cloud Platform

### Before you begin

When you perform this procedure, Security Cloud Control creates the threat defense virtual as part of the onboarding wizard. You cannot use this procedure with physical threat defense device or a device that is already onboarded to Security Cloud Control.

The following prerequisites must be met prior to onboarding a threat defense that is currently associated with a Google Cloud Platform (GCP) environment:

- You must have cloud-delivered Firewall Management Center enabled for your tenant.
- You must have a GCP account and already have a project created. See [GCP documentation](#) for more information.
- Management interfaces (2) — One used to connect the threat defense virtual to the management center, second used for diagnostics; cannot be used for through traffic.  
Traffic interfaces (2) — Used to connect the threat defense virtual to inside hosts and to the public network. See [Create VPC Networks for GCP, on page 41](#) for more information.
- You **must** enable all of the following permissions in the GCP environment in order to successfully communicate with and onboard to Security Cloud Control:

```
deploymentmanager.deployments.create
deploymentmanager.deployments.get
compute.networks.list
```

### Procedure

---

- Step 1** Log in to Security Cloud Control.
- Step 2** In the navigation pane, click **Inventory** and click the blue plus button (+) to add a new device.

- Step 3** Select the **FTD** tile.
- Step 4** Under **Management Mode**, select **FTD**.
- Step 5** Select **Use GCP VPC** as the onboarding method.
- Step 6** **IF** you have not authenticated your GCP environment with Security Cloud Control before this point, copy the bash command that Security Cloud Control generates and run it on your bash environment or on the Google Cloud Shell to authenticate your GCP account and allow communication between the applications. **IF** you have already authenticated your GCP account prior, ignore the account integration steps and click **Next**.
- Step 7** Use the drop-down menu to select the GCP project you want to associate with the device you are going to onboard. If there are no projects immediately available, click + **Link New Project**. If you click + **Link New Project**, follow these steps:
- Enter the GCP project ID when prompted. Locate this value in the GCP UI. To locate the project ID, see [GCP documentation](#).
  - Upload Credentials File.** Click **Browse** and navigate to where the the .JSON file generated from the script in Step 1 of the onboarding wizard is locally stored. Select it and click **Save**.
- Step 8** Click **Next**.
- Step 9** Use the drop-down menus to select the following parameters and click **Next**:
- **Inside VPC**
  - **Inside Sub Network**
  - **Outside VPC**
  - **Outside Sub Network**
  - **Management VPC**
  - **Management Sub Network**
  - **Diagnostic Network**
  - **Diagnostic Sub Network**
- Step 10** Enter a name for the threat defense device in the **Device Name** field and click **Next**.
- Step 11** In the Policy Assignment step, use the drop-down menu to select an access control policy to deploy once the device is onboarded. If you have no policies configured in the cloud-delivered Firewall Management Center associated with your Security Cloud Control tenant, select the **Default Access Control Policy**.
- Step 12** Select the **Subscription Licenses** you want applied to the device. You must have at least the URL license selected for virtual threat defense devices.
- Step 13** Click **Complete Onboarding**.

---

### What to do next

Navigate to the **Inventory** page to view the progress of the device registration there. Once the device is synchronized, we strongly recommend cross-launching to cloud-delivered Firewall Management Center and customize your access control policy and device status.

# Onboard a Secure Firewall Threat Defense Cluster

**Note** If you must delete a cluster, delete the cluster from the Security Cloud Control Inventory page. See [Delete Devices from Cloud-delivered Firewall Management Center, on page 47](#) for more information.

The following table provides information about device models that support cluster onboarding and creation on the cloud-delivered Firewall Management Center:

Secure Firewall Threat Defense Platforms	Minimum Secure Firewall Threat Defense Version for Cluster Management	Support cluster creation from cloud-delivered Firewall Management Center?
VMware, KVM	7.2.1	Yes
AWS, GCP	7.2.1	No
Azure	7.3	No
Secure Firewall 3100	7.2.1	Yes
Firepower 4100	7.0.6	No
Secure Firewall 4200	7.4	Yes
Firepower 9300	7.0.6	No

## Before you begin

Read through the following limitations:

- Firepower 4100 and Firepower 9300 devices must be clustered through the device's chassis manager.
- Secure Firewall 3100 devices, Secure Firewall 4200 devices, KVM, and VMware environments must be clustered through the Secure Firewall Management Center UI.
- Azure, AWS, and GCP environment clusters must be created through their own environment and onboarded to Secure Firewall Management Center.

## Procedure

- 
- Step 1** Log in to Security Cloud Control.
  - Step 2** In the left pane, click **Security Devices**.
  - Step 3** Click the **FTD** tile.
  - Step 4** Under **Management Mode**, ensure you select **FTD**. By selecting **FTD** under **Management Mode**, you will not be able to manage the device using the previous management platform. All existing policy configurations except for interface configurations will be reset. You must re-configure policies after you onboard the device.
  - Step 5** Select **Use CLI Registration Key**.

- Step 6** Enter the device name in the **Device Name** field and click **Next**.
- Step 7** In the **Policy Assignment** step, use the drop-down menu to select an access control policy to deploy once the device is onboarded. If you have no policies configured, select the **Default Access Control Policy**.
- Step 8** Specify whether the device you are onboarding is a physical or virtual device. If you are onboarding a virtual device, you must select the device's performance tier from the drop-down menu.
- Step 9** Select the subscription licenses you want to apply to the device. Click **Next**.
- Step 10** Security Cloud Control generates a command with the registration key. Paste the entire registration key as is into the device's CLI.
- Step 11** (Optional) Add labels to your device to help sort and filter the **Inventory** page. Enter a label and select the blue plus button. Labels are applied to the device after it's onboarded to Security Cloud Control.

---

### What to do next

Once the device is synchronized, select the device you just onboarded from the **Inventory** page and select any of the options listed under the **Device Management** pane located to the right. We strongly recommend the following actions:

- If you did not already, create a custom access control policy to customize the security for your environment. See [Access Control Overview](#) in *Managing Firewall Threat Defense with Cloud-Delivered Firewall Management Center in Cisco Security Cloud Control* for more information.
- Enable Cisco Security Analytics and Logging (SAL) to view events in the Security Cloud Control dashboard **or** register the device to an Secure Firewall Management Center for security analytics. See [Cisco Security Analytics and Logging](#) in *Managing Firewall Threat Defense with Cloud-Delivered Firewall Management Center in Cisco Security Cloud Control* for more information.

## Onboard a Chassis

You can add a Firepower 4100/9300 chassis to the cloud-delivered Firewall Management Center. The management center and the chassis share a separate management connection using the chassis MGMT interface. The management center offers chassis-level health alerts. For configuration, you still need to use the chassis manager or FXOS CLI.

Security Cloud Control does not record the processes on the **Workflow** page when you onboard a chassis or provision a multi-instance management center threat defense device from the cloud-delivered Firewall Management Center chassis manager page.

---

**Note** For the Secure Firewall 3100/4200, you need to first convert to multi-instance mode. See [Onboard the Multi-Instance Chassis, on page 562](#).

---

### Procedure

- 
- Step 1** Connect to the chassis FXOS CLI, either using the console port or SSH.

**Step 2** In the Security Cloud Control navigation pane, click **Inventory**, then click the blue plus button (  ) to **Onboard** a device.

**Step 3** Click the **FTD Chassis** tile to open the **Add Chassis** dialog box.

*Figure 1: FTD Chassis Tile*

*Figure 2: Add Chassis*

Add Chassis ×

ⓘ This operation is only supported on 3100, 4100 & 9300 chassis

Copy the CLI key below and paste it into the FXOS CLI of the chassis

```
create device-manager localhost hostname localhost nat-id PA5dsUm55M1pHVJjoGweXNfXWmjJzZi9
```

Paste the following string when prompted for the "Registration Key"

```
4tqmzu8Qs04Pk9IyQQPiGofgvhmrWRqb
```

Chassis name\*

Device Group

**Step 4** Click **Copy** (  ) to copy the top generated command, then paste it at the FXOS CLI of your chassis.

**Step 5** When prompted for the Registration Key at the FXOS CLI, click **Copy** (  ) on the **Add Chassis** dialog box for the generated registration key and paste it at the FXOS CLI.

You can disconnect from the FXOS CLI at this point.

**Step 6** In the cloud-delivered Firewall Management Center **Chassis Name** field, enter a name for the chassis as you want it to display in the management center.

**Step 7** (Optional) Add the chassis to a **Device Group**.

**Step 8** Click **Submit**.

The chassis is added to the **Device > Device Management** page.

# Delete Devices from Cloud-delivered Firewall Management Center

Though devices may be registered to cloud-delivered Firewall Management Center, Security Cloud Control still manages device enrollment. You must delete the device from the Security Cloud Control dashboard to remove a device from cloud-delivered Firewall Management Center.

---

**Note** Security Cloud Control does not synchronize the deletion of devices that are associated with an AWS VPC environment. You must delete a device directly from the AWS VPC UI. See AWS documentation for more information.

---

## Procedure

- 
- Step 1** Log into Security Cloud Control and click **Inventory**.
  - Step 2** Locate the device you want to delete by using the filters or search bar. Select it so the device row is highlighted. If your device is part of a high availability pair, locate and select the active device.
  - Step 3** In the Device Actions pane located to the right, click **Remove**.
  - Step 4** When prompted, select **OK** to confirm the removal of the selected device. Click **Cancel** to keep the device onboarded.
- 

## About Device Interfaces

### Management Interfaces

When you set up your device, you specify the IP address that you want to connect to. Both management and event traffic go to this address at initial registration.

---

**Note** In some situations, the device might establish the *initial* connection on a different management interface; subsequent connections should use the management interface with the specified IP address.

---

If the device has a separate event-only interface, the managed device sends subsequent event traffic is sent to the event-only interface if the network allows. In addition, some managed-device models include an additional management interface that you can configure for event-only traffic.

---

**Note** Note that if you configure a data interface for management, you cannot use separate management and event interfaces.

---

If the event network goes down, then event traffic reverts to the regular management interfaces on the managed device.

## About Data Interfaces

You can use either the dedicated management interface or a regular data interface for communication with the device. Security Cloud Control access on a data interface is useful if you want to manage the FTD remotely from the outside interface, or you do not have a separate management network. Security Cloud Control supports high availability on the FTD managed remotely from the data interface.

FTD management access from a data interface has the following limitations:

- You can only enable manager access on one physical, data interface. You cannot use a subinterface or EtherChannel.
- Routed firewall mode only, using a routed interface.
- PPPoE is not supported. If your ISP requires PPPoE, you will have to put a router with PPPoE support between the FTD and the WAN modem.
- The interface must be in the global VRF only.
- SSH is not enabled by default for data interfaces, so you will have to enable SSH later using Security Cloud Control. Because the management interface gateway will be changed to be the data interfaces, you also cannot SSH to the management interface from a remote network unless you add a static route for the management interface using the **configure network static-routes** command. For FTDv on Amazon Web Services, a console port is not available, so you should maintain your SSH access to the management interface: add a static route for Management before you continue with your configuration. Alternatively, be sure to finish all CLI configuration (including the **configure manager add** command) before you configure the data interface.

## Network Routes on Device Management Interfaces

Management interfaces (including event-only interfaces) support only static routes to reach remote networks. When you set up your managed device, the setup process creates a default route to the gateway IP address that you specify. You cannot delete this route; you can only modify the gateway address.

---

**Note** If you configure a data interface for management instead of using the dedicated Management interface, traffic is routed over the backplane to use the data routing table. The information in this section does not apply.

---

At least one static route is recommended per management interface to access remote networks. We recommend placing each interface on a separate network to avoid potential routing problems, including routing problems from other devices to the device. If you do not experience problems with interfaces on the same network, then be sure to configure static routes correctly. For example, both management0 and management1 are on the same network, but the FTD management and event interfaces are on different networks. The gateway is 192.168.45.1. If you want management1 to connect to the management's event-only interface at 10.6.6.1/24, you can create a static route for 10.6.6.0/24 through management1 with the same gateway of 192.168.45.1. Traffic to 10.6.6.0/24 will hit this route before it hits the default route, so management1 will be used as expected.

## Log Into the Command Line Interface on the Device

You can log directly into the command line interface on threat defense devices. If this is your first time logging in, complete the initial setup process using the default **admin** user; see [Complete the Initial Configuration of a Secure Firewall Threat Defense Device Using the CLI, on page 2953](#).

---

**Note** If a user makes three consecutive failed attempts to log into the CLI via SSH, the system terminates the SSH connection.

---

### Before you begin

Create additional user accounts that can log into the CLI using the **configure user add** command.

### Procedure

---

**Step 1** Connect to the threat defense CLI, either from the console port or using SSH.

You can SSH to the management interface of the threat defense device. You can also connect to the address on a data interface if you open the interface for SSH connections. SSH access to data interfaces is disabled by default. See [SSH Access, on page 1089](#) to allow SSH connections to specific data interfaces.

For physical devices, you can directly connect to the console port on the device. See the hardware guide for your device for more information about the console cable. Use the following serial settings:

- 9600 baud
- 8 data bits
- No parity
- 1 stop bit

The CLI on the console port is FXOS (with the exception of the ISA 3000, where it is the regular threat defense CLI). Use the threat defense CLI for basic configuration, monitoring, and normal system troubleshooting. See the FXOS documentation for information on FXOS commands.

**Step 2** Log in with the **admin** username and password.

#### Example:

```
firepower login: admin
Password:
Last login: Thu May 16 14:01:03 UTC 2019 on ttyS0
Successful login attempts for user 'admin' : 1

firepower#
```

**Step 3** If you used the console port, access the threat defense CLI.

#### connect ftd

**Note** This step does not apply to the ISA 3000.

**Example:**

```
firepower# connect ftd
>
```

**Step 4** At the CLI prompt (>), use any of the commands allowed by your level of command line access. To return to FXOS on the console port, enter **exit**.

**Step 5** (Optional) If you used SSH, you can connect to FXOS.  
**connect fxos**

To return to the threat defense CLI, enter **exit**.

**Step 6** (Optional) Access the diagnostic CLI:

**system support diagnostic-cli**

Use this CLI for advanced troubleshooting. This CLI includes additional **show** and other commands.

This CLI has two sub-modes: user EXEC and privileged EXEC mode. More commands are available in privileged EXEC mode. To enter privileged EXEC mode, enter the **enable** command; press enter without entering a password when prompted.

**Example:**

```
> system support diagnostic-cli
firepower> enable
Password:
firepower#
```

To return to the regular CLI, type **Ctrl-a, d**.

## Troubleshooting

Use the following scenarios to troubleshoot any onboarding issues.

### Troubleshoot Cloud-delivered Firewall Management Center Connectivity with TCP

Use the following procedure to troubleshoot connectivity between the cloud-delivered Firewall Management Center and a threat defense device with TCP port 8305.

#### Procedure

**Step 1** Log into Security Cloud Control.

- Step 2** Navigate to **Tools & Services** in the left panel and select **Firewall Management Center** to open the **Services** page. Choose **Cloud-Delivered FMC** and locate the cloud-delivered Firewall Management Center's FQDN in the top righthand corner.
- Step 3** Make sure the threat defense device's state in Security Cloud Control is currently **Onboarding**. Cloud-delivered Firewall Management Center will not respond if the device is not in an onboarding state. If onboarding has failed, click **Retry Onboarding**.
- Step 4** Log into the threat defense device with SSH.
- Step 5** Enter into Expert mode with the following command:
- ```
> expert
admin@devicename:~$
```
- Step 6** Execute a TCP handshake:
- ```
admin@devicename:~$ nc -v xxxxxx.cdo.cisco.com 8305
Connection to xxxxxx.cdo.cisco.com 8305 port [tcp/*] succeeded!
^C (CTRL-C to exit netcat)
admin@devicename:~$.
```

### What to do next

If there is still no response from the cloud-delivered Firewall Management Center, then there is a chance that outbound port TCP 8305 may be blocked upstream from your threat defense device and that network path will need to be assured before your threat defense will be able to connect to cloud-delivered Firewall Management Center.

## Troubleshoot Threat Defense Device Connectivity

Test connectivity to the Internet from the management-plane of the threat defense device:

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	Log into the threat defense device with SSH.	
<b>Step 2</b>	Ping one or both of the following:	<ul style="list-style-type: none"> <li>• system 208.67.222.222</li> <li>• system cisco.com</li> </ul>

### What to do next

If either of these tests fail, there is likely an L1-L3 issue and you will need to check your management networking configuration (`show network`) and/or a DNS issue.

## Troubleshoot Device Connectivity Loss After Cloud-delivered Firewall Management Center Update

A cloud-delivered Firewall Management Center is assigned a dynamic IP address when it is added to a Security Cloud Control tenant. When the management center is updated, the management center receives a new dynamic IP address.

If you have a firewall inspecting the outbound traffic from your threat defense device to the cloud-delivered Firewall Management Center, your firewall rules must allow the threat defense traffic to flow to the FQDN and port of the management center rather than its IP address, or the management center will not be able to manage your threat defense device.

For example, if your network traffic rule allowing management traffic from your threat defense device to the cloud-delivered Firewall Management Center looks like this:

```
allow all traffic <my-threat-defense-ip-src> to 200.165.200.225
```

where 200.165.200.225 is the management address of the cloud-delivered Firewall Management Center, change the one allow rule to these two allow rules as both ports 443 and 8305 need to be open:

```
allow all traffic <my-threat-defense-ip-src > to <my-cdfFMC-FQDN>:443
```

```
allow all traffic <my-threat-defense-ip-src > to <my-cdfFMC-FQDN>:8305
```

See “Network Requirements” in [Prerequisites to Onboard a Device to Cloud-delivered Firewall Management Center](#) for more port information.

### Where do I find the domain name of my cloud-delivered Firewall Management Center?

Where do I find the domain name of my cloud-delivered Firewall Management Center?

1. Log in to Security Cloud Control.
2. In the left pane, click **Administration** > **Firewall Management Center**
3. Select **Cloud-Delivered FMC** in the FMC table.
4. In the top-right corner of the screen, you will see the Hostname of the management center. This is the FQDN.

**Figure 3: Cloud-delivered FMC FQDN**

# Troubleshoot Onboarding a Device to the Cloud-delivered Firewall Management Center Using the CLI Registration Key

## Error: Device Remains in Pending Setup State After Onboarding

When a device fails to register, the device's connectivity status is displayed as **Pending Setup**. In the panel located to the right, Security Cloud Control displays a **Registration Failed** message as well as a **Retry Onboarding** button to immediately allow you to reattempt onboarding the device.

If you fail to execute the `configuration manager` command in the device CLI within 3 mins after onboarding it to Security Cloud Control, the device's registration attempt expires and results in a registration failure. Use the following procedure to resolve the issue:

### Procedure

- 
- Step 1** Log into Security Cloud Control and navigate to the **Inventory** page. Locate the device that failed to register.
  - Step 2** In the panel located to the right, locate the **Registration Failed** window. Beside the device's CLI registration key, click **Copy**. This action copies the CLI key to a local clipboard.
  - Step 3** Open an SSH connection to the device and log in as `admin`.
  - Step 4** Paste the CLI registration key into the device's CLI interface. In the CLI, enter **Y** to complete the registration. If your device was previously managed by device manager, enter **Yes** to confirm the submission.
- 

# Troubleshoot Onboarding a Device to Cloud-delivered Firewall Management Center Using the Serial Number

## Device is Offline or Unreachable

If the device is unreachable during the onboarding process, or at any point post-onboarding, Security Cloud Control displays an **Unreachable** connectivity status. The device will not be able to fully onboard to Security Cloud Control until the device is able to connect. The following scenarios might be the cause:

- The device is cabled incorrectly.
- Your network may require a static IP address for the device.
- Your network uses custom DNS, or there is external DNS blocking the network.
- If your device is associated with the European region (<https://defenseorchestrator.eu/>), you may need to enable PPPoE authentication. For other domains, review the [domain requirements](#).
- The device may be blocked by a firewall, or is incorrectly blocking a port for connectivity. Review the device [Network Requirements, on page 29](#) and confirm the correct outgoing ports are enabled.

## Error: Serial Number Already Claimed

### The Device was Purchased From an External Vendor

If the device was purchased from an external vendor and fails to onboard with a **Serial Number Already Claimed** error, it's possible the device is still associated to the vendor's tenant. Use the following steps to claim the device and its serial number:

1. Delete the device from your Security Cloud Control tenant.
2. Install the FXOS image on the device. For more information, see the "Reimage Procedures" chapter of the Cisco [FXOS Troubleshooting Guide for the Firepower 1000/21000 and Secure Firewall 3100 Firepower Threat Defense](#) guide.
3. Connect a laptop to the device's console port.
4. Connect to the FXOS CLI and log in as **admin**.
5. In the FXOS CLI, connect to **local-mgmt** with the `firepower # connect local-mgmt` command.
6. Execute the `firepower(local-mgmt) # cloud deregister` command to deregister the device from the cloud tenancy.
7. Once the device is successfully unregistered, the CLI interface returns a success message. An example of the message:

```
Example: firepower(local-mgmt) # cloud deregister Release Image Detected RESULT=success
MESSAGE=SUCCESS 10, X-Flow-Id: 2b3c9e8b-76c3-4764-91e4-cfd9828e73f9
```

---

**Note** If the device was never registered to another Security Cloud Control tenant, the message above states `RESULT=success MESSAGE=DEVICE_NOT_FOUND`.

---

8. Onboard the device to your Security Cloud Control tenant with its serial number. See [Onboard a Threat Defense Device to Cloud-delivered Firewall Management Center using Zero-Touch Provisioning, on page 32](#) for more information.

### The Device is Claimed By a Security Cloud Control Tenant in Another Region

The device may have been previously managed by another Security Cloud Control instance in a different region and is still registered to that tenant.

If you **do** have access to the tenant the device is currently registered to, use the following procedure:

1. Delete the device from the incorrect Security Cloud Control tenant.
2. Log into the device's device manager UI.
3. Navigate to **System Settings > Cloud Services**.
4. Click **Cloud Services** and select **Unregister Cloud Services** from the drop-down list.
5. Confirm the action and click **Unregister**. This action generates a warning to indicate that the device has been removed from Security Cloud Control. This is expected behavior.

6. Log into Security Cloud Control tenant in the correct region and onboard the device. See [Onboard a Threat Defense Device to Cloud-delivered Firewall Management Center using Zero-Touch Provisioning](#), on page 32 for more information.
7. Navigate to **System Settings > Cloud Services**.
8. Click **Cloud Services** and select **Unregister Cloud Services** from the drop-down list.
9. Select the **Auto-enroll with Tenancy from Security Cloud Control** and click **Register**. The device maps to the new tenant that belongs to the new region and Security Cloud Control onboards the device.

If you **do not** have access to the tenant, use the procedure below:

1. Connect to the FXOS CLI from the console port and log in as **admin**. For information on how to log into the FXOS CLI, see [Accessing the FXOS CLI](#).
2. In the FXOS CLI, connect to **local-mgmt** with the `firepower # connect local-mgmt` command.
3. Execute the `firepower(local-mgmt) # cloud deregister` command to deregister the device from the cloud tenancy.
4. Once the device is successfully unregistered, the CLI interface returns a success message. An example of the message:

```
Example: firepower(local-mgmt) # cloud deregister Release Image Detected RESULT=success
MESSAGE=SUCCESS 10, X-Flow-Id: 2b3c9e8b-76c3-4764-91e4-cfd9828e73f9
```

---

**Note** If the device was never registered to another Security Cloud Control tenant, the message above states `RESULT=success MESSAGE=DEVICE_NOT_FOUND`.

---

5. In your Security Cloud Control tenant in the correct domain, onboard the device. See [Onboard a Threat Defense Device to Cloud-delivered Firewall Management Center using Zero-Touch Provisioning](#), on page 32 for more information.
6. In the device's device manager UI, navigate to **System Settings > Cloud Services**.
7. Select the **Auto-enroll with Tenancy from Security Cloud Control** and click **Register**. The device maps to the new tenant that belongs to the new region and Security Cloud Control onboards the device.

## Error: Claim Error

If you enter the wrong serial number when onboarding a device, Security Cloud Control generates a **Claim Error** status.

---

**Note** Confirm that the device is claimed in the correct region within Security Cloud Control.

---

Resolve this issue with the procedure below:

## Procedure

- 
- Step 1** Log into Security Cloud Control and navigate to the **Inventory** page. Locate the device with the error.
- Step 2** Select the device so it is highlighted and **Remove** the device from Security Cloud Control.
- Step 3** Confirm the following:
- The device is online and can reach the internet.
  - The device has not already been onboarded to your Security Cloud Control instance or claimed by a Security Cloud Control tenant in another region.
- Step 4** Locate the device's serial number. You can use one of the following methods:
- For the 1000, 2100 and 3100 series model, locate the serial number on the physical device.
  - Open an SSH connection to the device and issue the `show serial-number` command.
- Step 5** In Security Cloud Control, onboard the device with the correct serial number. See [Onboard a Threat Defense Device to Cloud-delivered Firewall Management Center using Zero-Touch Provisioning, on page 32](#) for more information.
- 

## Error: Failed to Claim

If you see an **Error: Failed to Claim** connectivity status or error message after attempting to onboard a device, the following might be the cause:

- The Security Services Exchange platform may have temporary issues that result in no connectivity.
- The Security Cloud Control server may be down.

Follow the procedure below to resolve this issue:

## Procedure

- 
- Step 1** Log into Security Cloud Control and navigate to the **Inventory** page. Locate the device that failed to register.
- Step 2** Select the device so it is highlighted and **Remove** the device from your Security Cloud Control tenant.
- Step 3** Wait at least 10 minutes before attempting to onboard the device back to your Security Cloud Control tenant. See [Onboard a Threat Defense Device to Cloud-delivered Firewall Management Center using Zero-Touch Provisioning, on page 32](#) for more information.
- 

### What to do next

If you are still unable to claim the device, review the device's workflow to see if there is an error message. If there is, [Export the Workflow](#) and [open a support case](#) to further troubleshoot the issue.

## Error: Provisional Error

### Device Password Has Not Been Changed

If you did not change the default password of the device when configuring the device for remote management and selected the **No, this device has been logged into and configured for a manager** option when onboarding the device to Security Cloud Control, the device will generate an **UnProvisioned** connectivity status in the **Inventory** page.

Use the following procedure to resolve this issue:

1. Log into Security Cloud Control and navigate to the **Inventory** page.
2. Locate and select the device with the **UnProvisioned** connectivity status so it is highlighted.
3. In the pane located to the right, locate the **Change Password** window.
4. Click **Change Password** and enter a new password for your device. This overwrites the default password.

It may take a few minutes for the device to onboard and fully synchronize to Security Cloud Control.

### Device Password Has Already Been Changed

If you **did** change the default password of the device when configuring the device for remote management and selected the **Is this a new device that has never been logged into or configured before?** option when onboarding the device to Security Cloud Control, Security Cloud Control generates an **UnProvisioned** connectivity status in the **Inventory** page.

Use the following procedure to resolve this issue:

1. Log into Security Cloud Control and navigate to the **Inventory** page.
2. Locate and select the device with the **UnProvisioned** connectivity status so it is highlighted.
3. In the pane located to the right, locate the **Confirm and Proceed** window.
4. Click **Confirm and Proceed**. This action ignores the password that was provided in the onboarding wizard and reinstates the default password for the device. Security Cloud Control then continues to onboard the device.

### Other Provisional Error Scenarios

Regardless of the default password configuration of the device, it is still possible for a device to result in an **UnProvisioned** connectivity status during the onboarding process. If you confirm the password selection in the onboarding wizard is accurate for the state of the device, consider the following options to resolve the issue:

- Select the device so it is highlighted. In the window located on the right pane of the screen, click **Retry** to force Security Cloud Control to re-onboard the device with existing provisional parameters.
- Delete the device from the **Inventory** page and attempt to re-onboard the device.
- In the device's device manager UI, navigate to **System Settings > Cloud Services**. Select the **Auto-enroll with Tenancy from Security Cloud Control** and click **Register**.

If you are still unable to claim the device, review the device's workflow to see if there is an error message. If there is, [Export the Workflow](#) and [open a support case](#) to further troubleshoot the issue.

**Error: Provisional Error**

## CHAPTER 4

# Migrate On-Premises Management Center Managed Secure Firewall Threat Defense to Cloud-delivered Firewall Management Center

---

- [About Migrating Threat Defense to Cloud-delivered Firewall Management Center, on page 59](#)

- [Migrate Threat Defense to Cloud-delivered Firewall Management Center, on page 70](#)
- [View a Threat Defense Migration Job, on page 72](#)
- [Enable Notification Settings, on page 78](#)
- [Troubleshoot Threat Defense Migration to Cloud, on page 79](#)

## About Migrating Threat Defense to Cloud-delivered Firewall Management Center

Security Cloud Control admin users can migrate threat defense devices to the cloud-delivered Firewall Management Center from on-premises management centers. For supported versions, see [Supported On-Premises Firewall Management Center and Threat Defense Software for Migration, on page 60](#).

Before initiating the migration process, it is important to upgrade the on-premises management center models to a Security Cloud Control-supported version and onboard it to Security Cloud Control. Only after this step, you can proceed with migrating the devices that are associated with the on-premises management center.

You have a 14-day evaluation period to review and assess the migration changes that are made to the threat defense devices before Security Cloud Control automatically commits them. During this evaluation period, if you are not satisfied with the changes, you can either undo the changes and continue managing the device with the on-premises management center or commit the migration changes. It's important to note that after

the evaluation period expires, Security Cloud Control will automatically commit the changes, and it will no longer be possible to undo them.

After migrating the devices, the cloud-delivered Firewall Management Center onboards the threat defense devices and imports all shared policies and associated objects, device-specific policies, and device configuration from the on-premises management center to the cloud-delivered Firewall Management Center. In addition, the devices can be found in Security Cloud Control's **Inventory** page.

---

**Note** Cloud-delivered Firewall Management Center handles all duplicate policy and object names that are identified during the on-premises management center migration process. This behavior is explained in detail later in this document.

---

### User Roles

The user roles of the on-premises management center are no longer applicable in Security Cloud Control after migration. Your authorization to perform tasks on the migrated device is based on your user role in Security Cloud Control. See the [Users](#) topic to understand the on-premises management center and cloud-delivered Firewall Management Center user role mapping.

### Pause Migration to Review Imported Shared Policies

Security Cloud Control provides an option that allows the migration to be paused once the shared access policies, including Access Control and NAT policies, have been prepared within the cloud-delivered Firewall Management Center. This strategic pause prevents the start of the 14-day evaluation period, ensuring the device's current state or the device's manager is affected during the review phase. This window provides an opportunity for a thorough evaluation of the staged configuration.

Upon a satisfactory review of the configuration within the planned migration window, the process can be resumed. Resuming migration will import the device-specific settings, such as routing and interfaces, and will register the threat defenses with the cloud-delivered Firewall Management Center. Note that this action starts the 14-day evaluation period. Post-migration, it is mandatory to execute deployment from the cloud-delivered Firewall Management Center to finalize the migration successfully.

## Supported On-Premises Firewall Management Center and Threat Defense Software for Migration

### Supported Virtual On-Premises Firewall Management Center and Threat Defense

This section describes the minimum software requirements for migrating threat defense devices from the following on-premises management center version:

- Minimum on-premises management center: 7.2
- Minimum threat defense: 7.0.3 or 7.2 (not supported for Version 7.1)

### Supported Physical On-Premises Management Center 1000/2500/4500 Model-Managed Threat Defense

You can migrate threat defense devices to the cloud-delivered Firewall Management Center from a physical on-premises management center 1000/2500/4500 model. We support a *temporary* upgrade from Version 7.0 to Version 7.4. You can download the upgrade package [here](#).

**Note** The physical on-premises management center 1000/2500/4500, you would have migrated devices from Version 7.4, which is unsupported for general operations but serves as an interim solution until the migration is complete. To return the on-premises management center to a supported version you must remove the re-migrated devices, reimage back to Version 7.0.x, restore from backup, and re-register the devices.

Unzip (but do not untar) the upgrade package before uploading it to the on-premises management center. To upgrade to Version 7.4, see [Cisco Secure Firewall Management Center Upgrade Guide, Version 6.0-7.0](#).

We recommend upgrading the devices to Version 7.0.x before upgrading the on-premises management center to Version 7.4.

**Important** An upgrade is required because Version 7.0 on-premises management centers do not support device migration to the cloud. Version 7.4 is only supported during the device migration and evaluation process. These on-premises management centers will not run any intermediate versions. Only standalone and high availability threat defense devices running Version 7.0.3+ (7.0.5 recommended) are eligible for migration.

## Licensing

- When the threat defense is migrated to the cloud, all feature licenses associated with the device are transferred to Security Cloud Control and released from the management center to the Smart License pool. The device reclaims the device-specific licenses during its registration with Security Cloud Control. You need not apply license on the device again.
- The device-specific licenses are not required if you want to keep devices in the management center for analytics.
- Ensure you have registered the cloud-delivered Firewall Management Center with a smart license.

## Supported Features

### Handling Shared Policies and Objects

When the migration process begins, the shared policies and associated objects that are associated with the threat defense devices are imported first and then followed by the device configuration.

The following shared policies are imported to Security Cloud Control after changing the manager on threat defense devices:

- Access control
- IPS

- SSL
- Prefilter
- NAT
- QoS
- Identity
- Platform settings
- Flex config
- Network analysis
- DNS
- Malware & file
- Health
- Remote Access VPN
- Site-to-Site VPN

If a policy or object in Security Cloud Control has the same name as the policy or object that is imported from the on-premises management center, Security Cloud Control takes the following actions after changing the management successfully.

<b>Policies, Objects</b>	<b>Condition</b>	<b>Action</b>
Access control, SSL, IPS, Prefilter, NAT, QoS, Identity, Platform settings, Network analysis, DNS, Malware & File policies.	Name of the cloud-delivered Firewall Management Center policy matches the on-premises management center policy.	The cloud-delivered Firewall Management Center policy is used instead of the imported policy from the on-premises management center.
RA VPN Default group policy <b>DfltGrpPolicy</b>	The default group policy <b>DfltGrpPolicy</b> from the on-premises management center is ignored.	The existing cloud-delivered Firewall Management Center default group policy <b>DfltGrpPolicy</b> is used instead.
Network, Port objects	Name and content of network and port objects in the cloud-delivered Firewall Management Center match the ones in the on-premises management center.	The existing cloud-delivered Firewall Management Center network and port objects with the same name and content are used instead of imported objects from the on-premises management center.  If the object has the same name but different content, an object override is created.

Policies, Objects	Condition	Action
All other objects		The existing cloud-delivered Firewall Management Center object is used instead of the imported object from the on-premises management center.

Any Syslog alert object that is associated with the access control policy is imported into Security Cloud Control.

### Migration Support for Threat Defense in a High-Availability Pair

You can migrate a device in a high-availability pair to the cloud-delivered Firewall Management Center. The device management of both active and standby devices shifts to the cloud-delivered Firewall Management Center.

#### Important

We strongly recommend committing the manager changes before performing any advanced operations, such as creating high-availability configurations or breaking high-availability configurations from the management center on the devices that are being migrated.

Performing such tasks during the evaluation period is not supported and may result in migration commit failure.

### Migration Support for Management Center in a High Availability Pair

You can migrate the threat defense devices in a high availability from on-premises management center to the cloud.

The on-premises management center can be onboarded using the auto-onboarding of on-premises management center method or credentials method. Always onboard the active management center and not the standby.

#### Note

If you have already onboarded a standalone management center and later configured it as a standby, delete the standby management center and onboard the active one.

#### Points to Remember:

- **Auto-onboarding On-Premises Management Center Method**

- High availability break is not supported during the 14 days evaluation period. You can break high availability after committing the changes manually or automatically after the evaluation period.
- High availability switchover is supported during the 14 days evaluation period.

- **Onboarding On-Premises Management Center Method Using SDC**

- High availability break or high availability switchover is not supported during the 14 days evaluation period. You can perform these operations after committing the changes manually or automatically after the evaluation period.

- After a switchover, onboard the new active unit, which was previously in standby mode, and then start a migration job on the devices.

### Migration Support for Threat Defense Cluster

Migration of the threat defense cluster from the on-premises management center to the cloud-delivered Firewall Management Center is supported as long as the minimum supported versions of the threat defense on the following platforms are met.

Secure Firewall Threat Defense Platforms	Minimum Secure Firewall Threat Defense Version for Cluster Migration	Minimum On-Premises Management Center Version for Cluster Migration
VMware, KVM	7.2.1	7.4.1
AWS, GCP	7.2.1	7.4.1
Azure	7.3	7.4.1
Secure Firewall 3100	7.2.1	7.4.1
Firepower 4100	7.0.6	7.4.1
Secure Firewall 4200	7.4	7.4.1
Firepower 9300	7.0.6	7.4.1

**Important** Before migrating the threat defense cluster, it is important to keep in mind the following points:

- Do not attempt to migrate the threat defense cluster during any clustering-related operations initiated from the on-premises management center.
- After the cluster migration, it is recommended to commit the manager changes manually before carrying out any advanced operations, such as adding a node, breaking a node, or breaking a cluster from the on-premises management center on the clusters. This is because performing such tasks during the evaluation period is not supported and may result in migration commit failure.

## Unsupported Features

Migration of a threat defense device registered only for analytics-only with the management center feature is not currently supported.

The following configuration are not imported from the management center to Security Cloud Control as part of migration:

- Custom Widgets, Application Detectors, Correlation, SNMP and Email Alerts, Scanners, Groups, Dynamic Access Policy, Custom AMP Configuration, Users, Domains, Scheduled Deployment Tasks, ISE configuration, Scheduled GeoDB Updates, Threat Intelligence Director configuration, Dynamic Analysis Connections.

- ISE internal certificate object is not imported as part of the migration. You must export a new system certificate or a certificate and its associated private key from ISE and import it into Security Cloud Control.

### Secure Firewall Recommended Rules

Migrating threat defense to the cloud mirrors the rule recommendations that are already associated with any of the intrusion policies. However, the cloud-delivered Firewall Management Center does not allow the generation of new rule recommendations or auto-update the already migrated recommendations post migration. This is because the cloud-delivered Firewall Management Center does not support rule recommendations. See [Auto Cisco Recommended Rules](#).

### Custom Network Analysis

If the device is associated with a custom network analysis policy, you must remove all references to this policy from the on premise before migration.

1. Log on to the on-premises management center.
2. Choose **Policies > Access Control**.
3. Click the edit icon on the access control policy you want to disassociate the custom NAP and then click the **Advanced** tab.
4. In the **Network Analysis and Intrusion Policies** area, click the edit icon.
5. In the **Default Network Analysis Policy** list, select a system-provided policy.
6. Click **OK**.
7. Click **Save** to save the changes and then click **Deploy** to download the changes to the device.

After migration, you can manually create the Network Analysis Policy in Security Cloud Control.

## User Identity Migration Guidelines and Limitations for Threat Defense Devices

Before you migrate an on-premises Threat Defense to Cloud-delivered Firewall Management Center, you must prepare and also deploy as soon as possible after the migration if any access control policies reference identity objects discussed in this topic. To confirm, click **Policies > Access Control** and examine your access control policies and rules.

If none of your access control policies reference identity objects (in particular, users and groups), you can ignore these guidelines.

### Before migrating

Before migrating, on the On-Prem Firewall Management Center, click **Integration > Other Integrations > Identity Sources** and see if you have any Cisco ISE/ISE-PIC or Passive Identity Agent identity sources defined.

- If you have Cisco ISE/ISE-PIC or Passive Identity Agent identity sources defined, create the Cisco ISE/ISE-PIC identity sources on Cloud-delivered Firewall Management Center then migrate the device as discussed in the following paragraphs.
- If no Cisco ISE/ISE-PIC or Passive Identity Agent identity sources are defined, migrate the device as discussed in the following paragraphs.

### Migrate the device

Migration is discussed in [About Migrating Threat Defense to Cloud-delivered Firewall Management Center, on page 59](#). To avoid traffic disruption, when you migrate the device, we strongly recommend you either:

- Check the **Auto deploy to FTDs after successful migration** check box.
- Deploy policies immediately after migration is complete.

## Migration Guidelines and Limitations for VPN Configuration

Keep the following in mind when you migrate a device with VPN configuration.

### Migration Support for Remote Access VPN Policy

Security Cloud Control imports all remote access VPN policy settings, with the following exceptions:

- Object overrides.

If overrides are used in the address pool object, you must manually add them to the imported object using Security Cloud Control, after migration.

- Local users.

If the authentication server is configured to a local database for user authentication, the associated local realm object is imported into Security Cloud Control. However, you must manually add the local users to the imported local realm object using Security Cloud Control, after migration. See [Create a Realm and Realm Directory](#).

- Remote Access VPN load-balancing configuration.
- Remote Access VPN certificate enrollment with domain configuration.

Perform the following after migration to enroll the certificate with domain configuration:

1. In Security Cloud Control, click **Security Devices**.
2. Select the migrated FTD and in the **Device Management** on the right, click **Device Overview**.
3. Choose **Devices > Certificates**.

Perform one of the following tasks:

- If the certificates are imported in an **Error** state, click the **Refresh certificate status** icon to synchronize the certificate status with the device. The certificate status turns green.
- If the certificates are not imported, you must manually add the certificates defined in the Remote Access VPN policy that is configured in the management center.

### Migration Support for Site-to-Site VPN Policy

After you've selected a threat defense device with a site-to-site VPN configuration, Security Cloud Control will automatically select all its peers from different topologies. This is because devices in the site-to-site VPN topology must be migrated together to ensure a migration to succeed.

---

**Note** Although the migration wizard doesn't list the extranet devices that are associated with them, they will still be included automatically during the migration process.

---

Security Cloud Control imports all the settings of a site-to-site VPN policy, with the following exceptions:

- If object overrides are used in the network object, you must manually add them to the imported object using Security Cloud Control, after migration.
- If the authentication type is configured as "Preshared Automatic Key" in the on-premises management center, Security Cloud Control defines a new pre-shared key for the VPN postmigration deployment. The updated pre-shared key does not break existing tunnels, and the new tunnels start using the new pre-shared key.
- When the devices are moved to Security Cloud Control, and the changes have yet to be committed, the site-to-site VPN policy that is associated with those devices can be edited using the on-premises management center, however, it doesn't update the device configuration in Security Cloud Control.
- If devices are configured for SASE tunnels on Cisco Umbrella, refrain from migrating such devices.

## Managing Threat Defense Events and Analytics

The events and analytics management can be retained in the on-premises management center or transferred to Security Cloud Control, where the devices must be configured to send events to Security Cloud Control. While initiating the migration process, you are allowed to choose the manager to which the device events must be sent for analytics.

---

**Attention** If you are migrating devices from on-premises management center 1000/2500/4500, it is not possible to use the on-premises management center for managing events due to limited availability. Therefore, you must use Security Analytics and Logging (OnPrem) or Security Analytics and Logging (SAAS) for devices to send events for analytics. See [Cisco Security Analytics and Logging](#).

---

If you select the on-premises management center for analytics, Security Cloud Control becomes the manager for selected devices but retains a copy of those devices on the on-premises management center in analytics-only mode. The devices continue to send events to the on-premises management center, and Security Cloud Control manages the configuration changes.

If you select Security Cloud Control for analytics, Security Cloud Control becomes the manager for the selected devices and deletes these devices from the on-premises management center. Security Cloud Control manages both configuration changes and events and analytics management. You must configure threat defense devices to send events to the Cisco cloud. You can use either Security Services Exchange or the Secure Event Connector (SEC) to send events from the devices to the Cisco Secure Analytics and Logging (SAL) in the cloud.

### eStreamer Server Streaming

When you manage a threat defense device with cloud-delivered Firewall Management Center, the device supports sending only fully-qualified events (FQE) to eStreamer clients. If you have configured eStreamer clients in the on-prem management center, ensure that the clients support the detailed data formats used by FQE when you migrate the device management to cloud-delivered Firewall Management Center. Any legacy clients, security information and event management (SIEM) systems, or log management solutions that do not support the data format of FQE or lack the necessary storage to handle the larger volume of FQE data will not work when you migrate.

## Before You Begin Migration

Before you begin the process, ensure that the following prerequisites are met:

- A provisioned Security Cloud Control tenant is registered with a Smart License.

- **DNS Server Configuration:**

The threat defenses must have correct DNS server configuration to resolve cloud-delivered Firewall Management Center hostnames. To check device connectivity with cloud-delivered Firewall Management Center, see [Verify Threat Defense Connectivity with Cloud-delivered Firewall Management Center](#).

- **Network Access:**

The required network access is enabled for threat defenses to reach cloud-delivered Firewall Management Center through the TCP port 8305. Note that outbound connectivity from the threat defenses to cloud-delivered Firewall Management Center is sufficient.

- **Threat Defense Outbound Port 443:**

The threat defenses must have outbound port 443 open to access cloud to use Security Cloud Control event viewer.

- **On-Premises Management Center Outbound Port 443:**

The on-premises management center must have outbound port 443 open to access the “\*.cdo.cisco.com” domain.

- The on-premises management center is onboarded to Security Cloud Control. Onboarding the on-premises management center also onboards all the threat defense devices registered to that on-premises management center. See [Onboard an On-Prem FMC](#).

---

**Note** Create a new user in the on-premises management center with Administrator role or a custom user role with "Devices" and "System" permissions for onboarding purposes.

---

---

**Caution** If you onboard an on-premises management center to Security Cloud Control and simultaneously sign in to that on-premises management center with the same user name, the onboarding fails.

---

- For the on-premises management center 1000/2500/4500 migration:

- Run Version 7.4 (available for these models on a temporary basis). We recommend devices be running Version 7.0.5.
- We recommend that you create a backup of on-premises management center.

For versions on-premises management center Version 6.5 to 7.1, see the *Back up the FMC* topic in the [Firepower Management Center Configuration Guide](#).

For on-premises management center Version 7.2 and later, see the *Back up the Management Center* topic in the [Cisco Secure Firewall Management Center Administration Guide](#).

- The threat defense devices must be synchronized and not have pending changes on them. The migration fails on a device if Security Cloud Control identifies pending changes on that device.
- All peer devices in a site-to-site VPN topology must be online and have no pending deployment.
- On-Premises Management Center should allow outbound HTTP/HTTPS to upload configurations to Amazon S3.
- Security Cloud Control imports Syslog alert object used in the access control policy from the on-premises management center. If Security Cloud Control already contains an alert object with the same name but a different type (SNMP, Email), it is reused during configuration import.

The user must check whether the Syslog object name matches the existing SNMP or Email alert object in Security Cloud Control. If the name matches, you must rename the Syslog object in the on-premises management center before starting the migration process.

- If you attempt to migrate firewalls with modified system defined FlexConfig text objects from an on-premises management center to the cloud-delivered Firewall Management Center, the values of the modified system defined FlexConfig text objects are not migrated to the cloud-delivered Firewall Management Center, and the deployment will fail.

To avoid this, perform these tasks before you start the migration:

- Copy the modified system defined FlexConfig text object values from the on-premises management center to cloud-delivered Firewall Management Center before migration.
- Initiate migration from on-premises management center to cloud-delivered Firewall Management Center after verifying the predefined FlexConfig text objects.

### High Availability Failover Link Must Be Up

The high availability failover link should be up for a successful migration. Before initiating the migration process on Security Cloud Control, determine the health status of the failover link on the on-premises management center.

1. Identify the failover interfaces of all HA pairs you want to migrate to cloud-delivered Firewall Management Center.
  - a. Choose **Devices > Device Management**.
  - b. Next to the device high-availability pair you want to edit, click **Edit** (✎).
  - c. Click the **High Availability** tab.
  - d. In the **High Availability Link** area, the **Interface** field shows the failover interface used in the pair.

- e. Identify the interfaces used for failover communication if there are multiple HA pairs for migration.
2. Check the health status of the failover interfaces.
    - a. Choose **Devices > Device Management**.
    - b. Next to the device high-availability pair you want, click **Health Monitor**.
    - c. In the left pane, expand the high availability pair to see the threat defense devices.
    - d. Click the device indicated in the exclamation mark ().
    - e. Click the **Critical** button at the top.  
The **Interface Status** shows the errors associated with interfaces.
    - f. If the failover interface is down, the **Interface 'failover\_interfacename' has no link** message is displayed.

---

**Note** However, you can migrate the HA pair to cloud-delivered Firewall Management Center if you see any other data interface issues except for the failover interface.

---

- g. Rectify the issue and click **Sync from onprem fmc now** to obtain the latest changes on the device.

# Migrate Threat Defense to Cloud-delivered Firewall Management Center

## Procedure

---

**Step 1** In the navigation bar on the left, click **Administration > Migrate FTD to cdFMC**.

**Step 2** Click  and choose **On-Prem FMC-managed FTD to cdFMC**.

**Note** You can initiate only one migration job at one time.

**Step 3** In the **Select OnPrem FMC** area, perform the following:

- a. You can click the **Onboard an FMC** link to onboard the on-premises management center if you have not done already. See [Onboard an FMC](#).
- b. Select the on-premises management center from the available list and click **Next**.

In the **Select Devices** step, you will see the threat defense devices that the selected on-premises management center manages. If a high-availability pair is set up on the on-premise on-premises management center, the high availability node will be shown instead of the active and standby devices.

The **Last Synced time** field indicates the time that is elapsed since the device configuration is synchronized into the on-premises management center. You can click **Sync from OnPrem FMC Now** to fetch the latest device changes.

**Step 4** In the **Select Devices** step, perform the following:

a) Select the devices that you want to migrate.

These devices can include standalone, high-availability pairs, or clusters. If you have a high-availability pair or a cluster, select the node that represents it. Also, you can hover your mouse pointer over the cluster to view more details about the control node.

**Migrate FTD to Cloud**  
Migrate FTD Manager from Firewall Management Center to CDO

**1** Select OnPrem FMC      **OnPrem FMC: FMC\_OnPrem**

**2** Select Devices      Select FTD devices to migrate to cloud from OnPrem FMC to CDO and specify an action in bulk or per device.

1 device(s) selected      Multi-Device Action      Retain on OnPrem FMC for Analytics

	Name	Domain	Action
<input type="checkbox"/>	FMC_OnPrem_192.168.0.31	Global	Retain on OnPrem FMC for Analytics
<input checked="" type="checkbox"/>	FMC_OnPrem_192.168.0.32	Global	Retain on OnPrem FMC for Analytics

Displaying 2 of 2 results

**Migrate FTD to Cloud**

- Note**
- The devices running on unsupported versions are not available for selection.
  - The devices that are registered for analytics only with the on-premises management center or have pending changes to be deployed are not eligible for migration.
  - When you select a device that is associated with a site-to-site VPN topology, Security Cloud Control automatically selects its peer devices belonging to either the same topology or a different topology, because all devices in the site-to-site VPN topology must be migrated together for a successful migration to take place. The wizard does not list the extranet devices, if any. However, Security Cloud Control migrates extranet devices.

The **S2S VPN Topology** column indicates the number of site-to-site VPN topologies in which a selected device participates. You click the topology link to view the topologies and devices that are migrated along with the selected device. This field is not applicable to devices that are not part of the site-to-site VPN topology.

- A high availability pair is presented as a single node. You must select this node to include active and standby devices in the migration.

b) In the **Multi-Device Action** list, you can choose a common action to apply on all devices.

- c) In the **Commit Action** column, you can choose one of the following actions for the selected device:
- **Retain on OnPrem FMC for Analytics:** After the migration process is completed, the analytics management for selected threat defense devices is retained on the on-premises management center.
  - **Delete FTD from OnPrem FMC:** After the migration process is completed, the selected devices are removed from the on-premises management center and are available for Security Cloud Control to handle the analytics. You must configure the devices to send events to Security Cloud Control for managing analytics. When the devices are deleted from the on-premises management center, they cannot be revoked.

**Important** For the on-premises management center 1000/2500/4500, when you select devices to migrate, make sure you choose **Delete FTD from OnPrem FMC**. Note that the device is not fully deleted unless you commit the changes or 14 days pass.

**Note** The actions that are specified here are committed automatically after the 14 days evaluation period or after the changes are committed manually.

**Step 5** (Optional) Check the **Pause migration to review imported shared policies** check box.

When you enable this option, the migration process will pause after the shared access policies like Access Control and NAT policies are staged in the cloud-delivered Firewall Management Center. This pause ensures that the evaluation doesn't start and that the device's current state and manager remain unaffected. It gives you ample time to review the imported configuration for accuracy. After you've assessed everything, you can resume the migration during the planned migration interval, which will then kick off the 15-day evaluation period.

**Step 6** Check the **Auto deploy to FTDs after successful migration** check box to deploy the migrated configuration automatically to the device after successfully migrating and registering the device with the cloud-delivered Firewall Management Center.

However, if you prefer to review and manually deploy the configuration from the cloud-delivered Firewall Management Center after successful migration, you can uncheck this option and proceed to the next step.

**Step 7** Click **Migrate FTD to cdFMC**.

**Step 8** Click **View Migration to Cloud Progress** to see the progress.

---

### What to do next

If you have paused the migration for review, you must manually click **Proceed Migration** to import the remaining configuration. See [Proceed Migration Process, on page 74](#).

You can view the overall and individual status of migration jobs and generate a report when a job is completed successfully. See [View a Threat Defense Migration Job, on page 72](#).

## View a Threat Defense Migration Job

The migration dashboard provides the status of all migration jobs initiated from the Security Cloud Control. You can expand a specific job to see the status of individual devices associated with that tenant. This helps you keep track of the progress of your migration and identify issues, if any, that need to be addressed.

If you have set up alerts for device workflows, click the notifications icon  to see the alerts that have been triggered during the migration process. Additionally, if you have opted to receive email notifications from Security Cloud Control, you will also receive an email notification regarding alerts, if any.

### About the 14-day Evaluation Period

When a migration job is successful, you have 14 days to test and assess migration changes using cloud-delivered Firewall Management Center. If you are convinced about the migration changes, we recommend that you commit the devices manually, and not wait for Security Cloud Control to automatically commit the migration changes. See [Commit Migration Changes Manually to Cloud-delivered Firewall Management Center](#).

Note that for the on-premises management center 1000/2500/4500, you would have migrated devices from Version 7.4, which is unsupported for general operations. To return the on-premises management center to a supported version you must remove the re-migrated devices, reimage back to Version 7.0.x, restore from backup, and re-register the devices.

#### Note

- You cannot revoke the actions that are specified in the migration commit window after committing the changes.
- You can cancel the migration during the evaluation period and return the device to the on-premises management center.
- You cannot delete a device from either the on-premises management center or cloud-delivered Firewall Management Center during the evaluation period.

#### Important

Changes can be made and deployed to the device using Security Cloud Control during the evaluation period. If you switch device management back to the on-premises management center, Security Cloud Control-specific changes made during the evaluation period is not saved on the device once it is reverted to the source Security Cloud Control tenant. You must deploy the changes from the on-premises management center to the device after reverting the device's manager.

- **Name:** Represents the job name that shows the on-premises management center name and the date and time when the job was initiated.
- **Number of FTDs:** Shows the total number of devices that are being migrated to the cloud.
- **Status:** Shows the status of the job. Expand the job to see the status of individual devices.

When a job is completed successfully, the **FTD Migration job is successful message** appears in the **Status** column. You can click the tooltip to see the number of days remaining for evaluating the manager.

You can click [Commit Migration Changes Manually to Cloud-delivered Firewall Management Center](#) to commit the changes manually before the 14 days evaluation period ends.

- **Last Update:** Shows the date and time that are updated only when a change is made to the device.

- **Actions:** Click  to execute the following actions:

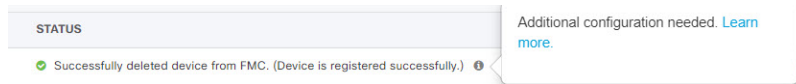

- **Workflows:** Takes you to the **Workflows** to monitor the job.
- **Download Report:** Allows you to generate and download a report of every job that is completed successfully. See [Generate a Threat Defense Migration Report, on page 78](#).
- **Commit Manager Changes:** Allows you to apply the changes manually to devices before the evaluation period ends. See [Commit Migration Changes Manually to Cloud-delivered Firewall Management Center, on page 75](#).
- **Remove Migration Job:** Allows you to remove a completed job. Link is available only for completed jobs. See [Delete a Migration Job, on page 78](#).

After a successful migration, Security Cloud Control deploys the configuration to the device. If the system identifies errors or warnings in the changes to be deployed, it displays them in the **Validation Messages** window. To view complete details, click the arrow icon before the warnings or errors. If the deployment fails, see the *Best Practices for Deploying Configuration Changes* section of [Firepower Management Center Device Configuration Guide X.Y](#).

### Configure Realm Sequence for Identity Policy

If the device contains an identity policy with a Realm or ISE configuration, configure your device as a proxy for Security Cloud Control to communicate with the identity source. The identity policies don't function if Security Cloud Control fails to connect to the Identity Realms.

A tooltip appears in the **Status** column for a device that requires additional configuration.

1. Click the tooltip icon and then click **Learn more**.
2. In the **Configure Proxy** window, click **Configure my realms**.

To add a proxy sequence, see the *Create a Proxy Sequence* section in the [Firepower Management Center Device Configuration Guide, 7.2](#).

## Proceed Migration Process

If the **Pause migration to review imported shared policies** option was checked during the migration setup, the migration process will pause after the shared access policies were staged in the cloud-delivered Firewall Management Center. After you've reviewed the staged configurations, you must manually instruct Security Cloud Control to resume the migration, which will then import device-specific configurations such as routing and interfaces, as well as register the threat defense with the cloud-delivered Firewall Management Center. Completion of the migration triggers a 14-day evaluation period.

To proceed, go to the migration job page and click **Proceed with migration** for the relevant job.

Remember that deployment from the cloud-delivered Firewall Management Center must be done after a successful migration.

# Commit Migration Changes Manually to Cloud-delivered Firewall Management Center

We recommend that you commit migration changes manually if you are convinced with your changes and not waiting for Security Cloud Control to auto commit changes. The **Commit Migration Changes** window shows the remaining days to commit the migration to cloud-delivered Firewall Management Center or revert the device to on-premises management center. During the evaluation period, you can modify the actions for selected threat defense devices before committing the changes. Once the changes are committed, you can't revoke the actions.

**Note** The commit manager changes actions are disabled in the following conditions:

- The 14-day evaluation period has passed.
- The threat defense devices have either been reverted to the on-premises management center or deleted from on-premises management center, in which case, no further actions can be taken.

## Procedure

- 
- Step 1** In the migration jobs page, click the  under the **Actions** column of a completed job.
- Step 2** Click **Commit Migration Changes**. (This link is available only after a job is completed successfully.)
- Step 3** Select a device and in the **Commit Actions** list, choose one of the following actions:
- **Retain on OnPrem FMC for Analytics**: After committing the changes, analytics management for selected threat defense devices is retained on the management center.
  - **Delete Threat Defense from OnPrem FMC**: After committing the changes, the selected devices are removed from the on-premises management center and are available for Security Cloud Control to handle the analytics. You must configure the threat defense to send events to Security Cloud Control for managing analytics. After the threat defense devices are deleted from the on-premises management center, they cannot be revoked.
- Note** If you want to revert the device management to on-premises management center, refer to [Revert the Threat Defense Management to On-Premises Firewall Management Center, on page 76](#).
- Step 4** Click **Commit** executes your specified actions immediately without further confirmation.
- On the migration jobs screen, you can expand the job to check the progress of the actions specified.
- The migrated devices appear on Security Cloud Control's **Inventory** page. These devices can be managed using the cloud-delivered Firewall Management Center portal that is linked to Security Cloud Control. Ensure you deploy the changes to the devices from cloud-delivered Firewall Management Center.
-

## Revert the Threat Defense Management to On-Premises Firewall Management Center

You can revert the device management to the on-premises management center during the evaluation period. This means that the devices will no longer be managed through the Security Cloud Control platform. However, it is important to note that any changes made during the migration process in the Security Cloud Control will not be reflected in the on-premises management center after reverting threat defense management.

---

**Note** When the threat defense management has been returned to the on-premises management center, you can begin the migration job again to switch the threat defense management to Security Cloud Control.

---

### Procedure

- 
- Step 1** In the migration jobs page, click the  under the **Actions** column of a completed job.
  - Step 2** Click **Commit Migration Changes**. (This link is available only after a job is completed successfully.)
  - Step 3** Select a device and in the **Commit Actions** list, choose **Revert Manager to OnPrem FMC**.
  - Step 4** Click **Commit** executes your specified actions immediately without further confirmation.
  - Step 5** Deploy the changes to the device from the on-premises management center.
- 

## View Migrated Devices

The migrated devices appear on the **Inventory** page in Security Cloud Control. You can cross-launch and configure the required feature on the cloud-delivered Firewall Management Center.

---

**Note** The devices on the cloud-delivered Firewall Management Center device listing page may show `NO-IP` instead of the device's management IP address. Because the device registration uses the NAT ID, the device initiates the process, and therefore, the management IPs aren't discovered or used for the connection. Note that this applies to newly onboarded devices and devices migrated from the on-premises management center.

---

### Analytics Only Threat Defense Device Example

Security Cloud Control creates two instances of the same device that is configured to retain on the management center for analytics.

Inventory

Search by Device Name, IP Address, or Serial Number

Displaying 5 of 6 results

Name	Version	Location	Access Policy	Last Deploy	Configuration Status	Connectivity
10.10.16.13 FTD	7.2.0	-	test-policy-1855	-	Synced	Online
FMC_Beta2_OnPremFTD-141 FMC FTD	7.2.0	...		-	Synced	Online
FMC_Beta2_OnPremFTD-146 FMC FTD	7.2.0	...		-	Synced	Online
FMC_Beta2_OnPremFTD136 FMC FTD	7.2.0	...		-	Synced	Online
FMC_Beta2_eventsFtd-16-83 FMC FTD - Analytics Only	7.2.0	...		-	Synced	Online
eventsFtd-16-83 FTD	7.2.0	-	OnPremACPolicy	-	Synced	Online

The device instance with **FMC FTD** and **Analytics Only** labels shows that the management center handles the analytics. The device instance with the **FTD** label indicates that Security Cloud Control manages its configuration.

You can manage the configuration of the device using Security Cloud Control. To see the device in the cloud-delivered Firewall Management Center, do the following:

Select the device having **FTD** label and in the **Management** pane on the right, click **Device Summary**.

Defense Orchestrator

Monitoring Policies Devices Objects Integration

Return to Inventory Deploy

View By: Group

All (1) Error (0) Warning (0) Offline (0) Normal (1) Deployment Pending (0) Upgrade (0) Snort 3 (1)

eventsFtd-16-83 N/A - Routed	FTDv for VMware	7.2.0	N/A	N/A - Routed	Base, Threat (2 more...)	OnPremACPolicy

You can view the events from the device in the management center. To see the events, do the following:

1. Select the device having **FMC FTD** and **Analytics Only** labels and on the right, click the **Manage Devices** link.
2. Log on to the on premise management center.
3. Click **Device > Device Management**.

Firewall Management Center

Overview Analysis Policies Devices Objects Integration

Deploy

View By: Group

All (4) Error (0) Warning (0) Offline (0) Normal (4) Deployment Pending (1) Upgrade (0) Snort 3 (4) CDO (1)

Name	Model	Version	Chassis	Licenses	Access Control Policy	Auto RollBack
Ungrouped (4)						
eventsFtd-16-83 10.10.16.83 - Routed	FTDv for VMware	7.2.0	N/A	CDO Managed	CDO Managed	
OnPremFTD-141 10.10.14.141 - Routed	FTDv for VMware	7.2.0	N/A	Base, Threat (2 more...)	OnPremACPolicy	

You can't select this device as Security Cloud Control manages the configuration. The management center shows the **Security Cloud Control Managed** label for this device.

To see the live events in the management center, click **Analysis > Events**.

## Generate a Threat Defense Migration Report

When a migration job is successful, you can generate and download a report in PDF format to analyze every parameter imported from the on-premises management center to cloud-delivered Firewall Management Center. The report provides details of each device associated with the job. Details include information about devices, values of shared policies, objects, routing details, interfaces, network settings, and more.

On the migration jobs page, click the  under the **Actions** column of a completed job and then click **Download Report**. You must download a report within a year of the job being triggered.

## Delete a Migration Job

If you have completed a migration job and no longer need it to be displayed on the migration page, you can easily remove it by deleting it. This cleans up the migration page and make it easier to navigate.

### Attention

If you want to delete a migration job during the evaluation period, you must first commit the migration changes or revert the manager to the on-prem management center. Failing to do so may result in an inconsistent state of the on-prem management center, which could be unrecoverable. See [Commit Migration Changes Manually to Cloud-delivered Firewall Management Center](#).

If you don't have access to your on-premises management center or if it is no longer available and you are blocked from performing a commit or revert, you can delete the job.

### Procedure

- 
- Step 1** Click **Administration > Migrate FTD to cdFMC**.
- Step 2** Click the  under the **Actions** column and then click **Remove Migration Job**.
- Step 3** Click **Delete** to confirm your action.
- 

## Enable Notification Settings

You can subscribe to get email notifications from Security Cloud Control whenever a device associated with your tenant experiences a specific action when migrating a threat defense device to Security Cloud Control.

Security Cloud Control sends an email if you enable to receive a notification for the following states during migration:

- **Failed:** When a migration job fails.

- **Started:** When a migration job is initiated.
- **Succeeded:** When a migration job is completed successfully.
- **Commit Pending:** When the manager changes have to be committed.

To enable notification settings, see [Notification Settings](#).

## Troubleshoot Threat Defense Migration to Cloud

This section provides information to troubleshoot specific errors that may occur when migrating threat defense to the cloud.

### HTTP Status Code 201 (Created) Found in FMC Response

Security Cloud Control shows this error at the device level.

#### Issue:

The Secure Device Connector (SDC) version is not compatible.

Number of FTDs	Status
1 devices	🚫 ⓘ Change FTD Manager job failed
IP ADDRESS	STATUS
10.10.90.32	🚫 Device Connectivity with CDO failed. (HTTP status code 201 (Created) found in FMC response.)

#### Resolution:

Ensure that the SDC is upgraded to version "202205191350" or later.

1. Navigate to **Admin > Secure Connectors**.
2. Click the SDC to see the existing SDC version in the **Details** pane on the right.
3. [Update your Secure Device Connector](#).

### Device Connectivity to Security Cloud Control Failed

Name	Number of FTDs	Status	Last Updated	Actions
1771Fmc_change-management_2022-02-28-104213	2 devices	🚫 ⓘ Change FTD Manager job failed	Feb 28, 2022, 4:14:12 PM	⋮
DEVICE NAME	IP ADDRESS	STATUS	LAST UPDATED	
1771Fmc_10.10.16.84	10.10.16.84	🚫 Device Connectivity with CDO failed	Feb 28, 2022, 4:12:53 PM	

The device is unable to reach Security Cloud Control for one of the following reasons:

- The device is cabled incorrectly.
- Your network may require a static IP address for the device.
- Your network uses custom DNS, or there is external DNS blocking on the customer network.
- PPPoE authentication is needed.
- The device is behind a proxy.

**Resolution:**

- Check the cabling and network connectivity.
- Ensure that your firewall is not blocking any traffic.
- [Verify Threat Defense Connectivity with Cloud-delivered Firewall Management Center.](#)

**Failed to Configure Security Cloud Control as Configuration Manager**

When Security Cloud Control cannot communicate with the device due to network loss, it fails to execute the configure manager command with the cloud-delivered Firewall Management Center.

Name	Number of FTDs	Status	Last Updated	Actions
1771Fmc_change-management_2022-03-04-055700	2 devices	Change FTD Manager job is in progress	Mar 4, 2022, 11:33:07 AM	...
DEVICE NAME	IP ADDRESS	STATUS	LAST UPDATED	
1771Fmc_10.10.16.86	10.10.16.86	Syncing	Mar 4, 2022, 11:29:03 AM	
1771Fmc_10.10.16.84	10.10.16.84	Failed to configure CDO as Configuration Manager	Mar 4, 2022, 11:28:16 AM	

**Resolution:**

1. Check the cabling and network connectivity.
2. Ensure that your firewall is not blocking any traffic.
3. Ensure that threat defense has internet connectivity and the DNS address is resolved to an IP address. See [Verify Threat Defense Connectivity with Cloud-delivered Firewall Management Center, on page 81.](#)
4. Retry migration for this threat defense from Security Cloud Control in a new change manager job.

**Change Manager Already Exists or in Progress for Source Manager**

You can create a threat defense migration job for a on-premises management center only when the previous job is completed.

This error occurs when you create a new job when the previous job is in progress.

**Migrate FTD to Cloud**  
Change FTD Manager from Firewall Management Center to CDO

1 Select OnPrem FMC **OnPrem FMC: fmc-beta2-18-3**

2 Select Devices **change ftd management already exists or in progress for source manager fmc-beta2-18-3**

Select FTD devices to migrate to cloud from OnPrem FMC to CDO and specify an action in bulk or per device.

1 device(s) selected Multi-Device Action Retain on OnPrem FMC for Analytics

Name	Domain	Action
<input type="checkbox"/> fmc-beta2-18-3_10.10.16.20	Global	Retain on OnPrem FMC for Analytics
<input checked="" type="checkbox"/> fmc-beta2-18-3_10.10.16.25	Global	Retain on OnPrem FMC for Analytics
<input type="checkbox"/> fmc-beta2-18-3_10.10.16.9	Global	Retain on OnPrem FMC for Analytics

Displaying 3 of 3 results

Migrate FTD to Cloud

3 Finish

**Resolution:**

1. Navigate to the migration table to see if another job is in progress for a particular source on premise management center.
2. Wait for the current migration job to complete.
3. Initiate the next migration job.

## Verify Threat Defense Connectivity with Cloud-delivered Firewall Management Center

This section provides the commands to determine the threat defense connectivity with the cloud-delivered Firewall Management Center.

### Check internet connectivity on the device

Execute the **ping system** *<any OpenDNS server address>* command to check whether the device can reach the internet.

1. Connect to the CLI of the device, either from the console port or using SSH.
2. Log in with the Admin username and password.
3. Enter **ping system** *<OpenDNS IPAddress>*.

```
ping system 208.67.222.222
PING 208.67.222.222 (208.67.222.222) 56(84) bytes of data.
64 bytes from 208.67.222.222: icmp_seq=1 ttl=48 time=22.10 ms
```

```
64 bytes from 208.67.222.222: icmp_seq=2 ttl=48 time=22.10 ms
64 bytes from 208.67.222.222: icmp_seq=3 ttl=48 time=22.8 ms
64 bytes from 208.67.222.222: icmp_seq=4 ttl=48 time=22.6 ms
^C
--- 208.67.222.222 ping statistics ---
4 packets transmitted, 4 received, 0% packet loss, time 7ms
rtt min/avg/max/mdev = 22.588/22.841/22.995/0.223 ms
```

The above example shows that the device can connect to the internet using the OpenDNS Server IP address. Also, the number of packets transmitted is the same as received, indicating that internet connectivity is available on the device. This shows that the device can reach the internet.

**Note** If your results don't match, check the internet connection manually.

### Check device connectivity with Cloud-delivered Firewall Management Center

1. Obtain the host name of the cloud-delivered Firewall Management Center.
  - a. In the Security Cloud Control left pane, click **Administration > Firewall Management Center**.
  - b. Choose **Cloud-Delivered FMC** to see the cloud-delivered Firewall Management Center details on the right pane.
  - c. In the **Hostname** field, copy only the hostname shown in the following example image.

The screenshot shows the Cisco Defense Orchestrator (CDO) interface. The main window displays a table of Secure Connectors. The first row is highlighted, showing 'Cloud-Delivered FMC' with a version of '20230809' and a status of 'Active'. On the right side, a sidebar shows the 'Firewall Management Center' details, with the 'Hostname' field highlighted in red, containing the text 'cisco-ama10-app-staging.cdo.cisco.com'.

In the above figure, the highlighted text is the hostname (*Security Cloud Control-acc10.app.us.Security Cloud Control.cisco.com*) of the FMC to be copied.

2. Connect to the CLI of the device, either from the console port or using SSH.
3. Enter **ping system <hostname of the FMC>**.

```
ping system cdo-acc10.app.us.cdo.cisco.com
PING cdo-acc10.app.us.cdo.cisco.com (54.187.125.161) 56(84) bytes of data.
^C
```

```
--- cdo-acc10.app.us.cdo.cisco.com ping statistics ---  
2 packets transmitted, 0 received, 100% packet loss, time 64ms
```

In the above example, the hostname is resolved with the IP address, indicating your connection is successful. Ignore the "100% packet loss" message shown in the response.

---

**Note** If you can't connect to the host, you can rectify the DNS configuration in the CLI using **configure network dns <address>**.

---

## CHAPTER 5

# Device Management

---

This guide applies to an *on-premises* Secure Firewall Management Center, either as your primary manager or as an analytics-only manager. When using the Cisco Security Cloud Control (Security Cloud Control) cloud-delivered Firewall Management Center as your primary manager, you can use an on-prem management center for analytics. Do not use this guide for cloud-delivered Firewall Management Center management; see [Managing Firewall Threat Defense with Cloud-Delivered Firewall Management Center in Cisco Security Cloud Control](#).

You can manage devices in the Secure Firewall Management Center.

- [Log Into the Command Line Interface on the Device, on page 85](#)
- [Manage Devices, on page 87](#)
- [Hot Swap an SSD on the Secure Firewall 3100/4200, on page 96](#)
- [Disable the USB Port, on page 98](#)

## Log Into the Command Line Interface on the Device

You can log directly into the command line interface on threat defense devices. If this is your first time logging in, complete the initial setup process using the default **admin** user; see [Complete the Initial Configuration of a Secure Firewall Threat Defense Device Using the CLI, on page 2953](#).

---

**Note** If a user makes three consecutive failed attempts to log into the CLI via SSH, the system terminates the SSH connection.

---

### Before you begin

Create additional user accounts that can log into the CLI using the **configure user add** command.

### Procedure

- 
- Step 1** Connect to the threat defense CLI, either from the console port or using SSH.

You can SSH to the management interface of the threat defense device. You can also connect to the address on a data interface if you open the interface for SSH connections. SSH access to data interfaces is disabled by default. See [SSH Access, on page 1089](#) to allow SSH connections to specific data interfaces.

For physical devices, you can directly connect to the console port on the device. See the hardware guide for your device for more information about the console cable. Use the following serial settings:

- 9600 baud
- 8 data bits
- No parity
- 1 stop bit

The CLI on the console port is FXOS (with the exception of the ISA 3000, where it is the regular threat defense CLI). Use the threat defense CLI for basic configuration, monitoring, and normal system troubleshooting. See the FXOS documentation for information on FXOS commands.

**Step 2** Log in with the **admin** username and password.

**Example:**

```
firepower login: admin
Password:
Last login: Thu May 16 14:01:03 UTC 2019 on ttyS0
Successful login attempts for user 'admin' : 1

firepower#
```

**Step 3** If you used the console port, access the threat defense CLI.

**connect ftd**

**Note** This step does not apply to the ISA 3000.

**Example:**

```
firepower# connect ftd
>
```

**Step 4** At the CLI prompt (>), use any of the commands allowed by your level of command line access.

To return to FXOS on the console port, enter **exit**.

**Step 5** (Optional) If you used SSH, you can connect to FXOS.

**connect fxos**

To return to the threat defense CLI, enter **exit**.

**Step 6** (Optional) Access the diagnostic CLI:

**system support diagnostic-cli**

Use this CLI for advanced troubleshooting. This CLI includes additional **show** and other commands.

This CLI has two sub-modes: user EXEC and privileged EXEC mode. More commands are available in privileged EXEC mode. To enter privileged EXEC mode, enter the **enable** command; press enter without entering a password when prompted.

**Example:**

```
> system support diagnostic-cli
firepower> enable
Password:
firepower#
```

To return to the regular CLI, type **Ctrl-a, d**.

---

## Manage Devices

The **Devices > Device Management** page provides you with range of information and options.

- **View By**—View devices based on group, licenses, model, version, or access control policy.
- **Device State**—View devices based on state (**Error**, **Warning**, etc.). You can click on a state icon to view the devices belonging to it. The number of devices belonging to the states are provided within brackets.
- **Search Device**—Search for a device by device name, host name, or IP address.
- **Add**—Add devices and other manageable components.
- **Columns**—Click the column head to sort by that column.
  - **Name**
  - **Model**
  - **Version**
  - **Chassis**—For supported models, click **Manage** to bring up the integrated Chassis Manager. For the Firepower 4100/9300, the link cross-launches the chassis manager.
  - **Licenses**
  - **Access Control Policy**—Click on the link in the Access Control Policy column to view the policy that is deployed to the device.
  - **Auto-Rollback**—Shows whether auto-rollback of the configuration is enabled or disabled if the deployment causes the management connection to go down. See [Edit Deployment Settings, on page 195](#).
- **Edit**—For each device, use the **Edit** (✎) icon to edit the device settings.  
You can also just click on the device name or IP address.
- **More**—For each device, click the **More** (⋮) icon to execute other actions:
  - **Packet Tracer**—To navigate to the packet tracer page for examining policy configuration on the device by injecting a model packet into the system.
  - **Packet Capture**—To navigate to the packet capture page, where, you can view the verdicts and actions the system takes while processing a packet.

- **Revert Upgrade**—To revert the upgrade and configuration changes that were made after the last upgrade. This action results in restoring the device to the version that was before the upgrade.
- **Health Monitor**—To navigate to the device's health monitoring page.
- **Troubleshoot Files**—Generate troubleshooting files, where you can choose the type of data to be included in the report.
- **Generate Template from Device**—

## Add a Device Group

The management center allows you to group devices so you can easily deploy policies and install updates on multiple devices. You can expand and collapse the list of devices in the group.

If you add the primary device in a high-availability pair to a group, both devices are added to the group. If you break the high-availability pair, both devices remain in that group.

### Procedure

- 
- Step 1** Choose **Devices > Device Management**.
- Step 2** From the **Add** drop-down menu, choose **Add Group**.
- To edit an existing group, click **Edit** (✎) for the group you want to edit.
- Step 3** Enter a **Name**.
- Step 4** Under **Available Devices**, choose one or more devices to add to the device group. Use Ctrl or Shift while clicking to choose multiple devices.
- Step 5** Click **Add** to include the devices you chose in the device group.
- Step 6** Optionally, to remove a device from the device group, click **Delete** (🗑) next to the device you want to remove.
- Step 7** Click **OK** to add the device group.
- 

## Register With a New Management Center

This procedure shows how to register with a new management center. You should perform these steps even if the new management center uses the old management center's IP address.

### Procedure

- 
- Step 1** On the old management center, if present, delete the managed device.
- You cannot change the management center IP address if you have an active connection with the management center.
- Step 2** Connect to the device CLI, for example using SSH.

**Step 3** Configure the new management center.

```
configure manager add {hostname | IPv4_address | IPv6_address } DONTRESOLVE } regkey [nat_id]
[display_name]
```

- {*hostname* | *IPv4\_address* | *IPv6\_address*}—Sets the management center hostname, IPv4 address, or IPv6 address.
- **DONTRESOLVE**—If the management center is not directly addressable, use **DONTRESOLVE** instead of a hostname or IP address. If you use **DONTRESOLVE**, then a *nat\_id* is required. When you add this device to the management center, make sure that you specify both the device IP address and the *nat\_id*; one side of the connection needs to specify an IP address, and both sides need to specify the same, unique NAT ID.
- *regkey*—Make up a registration key to be shared between the management center and the device during registration. You can choose any text string for this key between 1 and 37 characters; you will enter the same key on the management center when you add the threat defense.
- *nat\_id*—Make up an alphanumeric string from 1 to 37 characters used only during the registration process between the management center and the device when one side does not specify an IP address. This NAT ID is a one-time password used only during registration. Make sure the NAT ID is unique, and not used by any other devices awaiting registration. Specify the same NAT ID on the management center when you add the threat defense.
- *display\_name*—Provide a display name for showing this manager with the **show managers** command. This option is useful if you are identifying CDO as the primary manager and an on-prem management center for analytics only. If you don't specify this argument, the firewall auto-generates a display name using one of the following methods:
  - *hostname* | *IP\_address* (if you don't use the **DONTRESOLVE** keyword)
  - **manager-timestamp**

**Example:**

```
> configure manager add DONTRESOLVE abc123 efg456
Manager successfully configured.
Please make note of reg_key as this will be required while adding Device in FMC.
>
```

**Step 4** Add the device to the management center.

## Shut Down or Restart the Device

It's important that you shut down your system properly. Simply unplugging the power or pressing the power switch can cause serious file system damage. Remember that there are many processes running in the background all the time, and unplugging or shutting off the power does not allow the graceful shutdown of your firewall.

See the following task to shut down or restart your system properly.

---

**Note** After restarting your device, you may see an error that the management connection could not be reestablished. In some cases, the connection is attempted before the Management interface on the device is ready. The connection will be retried automatically and should come up within 15 minutes.

---

## Procedure

- 
- Step 1** Choose **Devices > Device Management**.
- Step 2** Next to the device that you want to restart, click **Edit** (✎).
- Step 3** Click **Device**.
- Step 4** To restart the device:
- Click **Restart Device** (↻).
  - When prompted, confirm that you want to restart the device.
- Step 5** To shut down the device:
- Click **Shut Down Device** (⊗) in the **System** section.
  - When prompted, confirm that you want to shut down the device.
  - If you have a console connection to the firewall, monitor the system prompts as the firewall shuts down. You will see the following prompt:

```
System is stopped.
It is safe to power off now.
Do you want to reboot instead? [y/N]
```

If you do not have a console connection, wait approximately 3 minutes to ensure the system has shut down.

For the ISA 3000, when shutdown is complete, the System LED will turn off. Wait at least 10 seconds before you remove the power.

---

## Download the Managed Device List

You can download a report of all the managed devices.

### Before you begin

To perform the following task, you must be an Admin user.

## Procedure

- 
- Step 1** Choose **Devices > Device Management**.
- Step 2** Click the **Download Device List Report** link.

- Step 3** You can download the device list in CSV or PDF format. Choose **Download CSV** or **Download PDF** to download the report.
- 

## Migrate the Configuration to a New Model

The Secure Firewall Threat Defense model migration wizard enables you to migrate configurations from an old model to a new model. You can map source device interfaces to target device interfaces. Before the migration, the source and target devices are locked.

### Supported Devices for Migration

#### Supported Source Devices

- Cisco Firepower 1120
- Cisco Firepower 1140
- Cisco Firepower 1150
- Cisco Firepower 2110
- Cisco Firepower 2120
- Cisco Firepower 2130
- Cisco Firepower 2140

---

**Note** The source devices must be version 7.0 or later.

---

#### Supported Target Devices

- Cisco Secure Firewall 3105
- Cisco Secure Firewall 3110
- Cisco Secure Firewall 3120
- Cisco Secure Firewall 3130
- Cisco Secure Firewall 3140

---

**Note** The Cisco Secure Firewall 3110, 3120, 3130, and 3140 devices must be version 7.1 or later. Cisco Secure Firewall 3105 must be version 7.3 or later.

---

### License for Migration

You must register and enroll the device with the smart licensing account. The migration copies the source device licenses to the target device.

## Prerequisites for Migration

- You must register the source and the target devices to the management center.
- Your Smart Licensing account must have the license entitlements for the target device.
- We recommend that the target device is a freshly registered device without any configurations.
- Source and target devices must be in the same:
  - Domain
  - Firewall mode: Routed or Transparent
  - Compliance mode
- The target device must not be:
  - In a multi-instance mode
  - Part of a cluster
- The user must have modify permissions on the device.
- The configurations on the source device must be valid and have no errors.
- The source device can have pending deployments. However, deployment, import, or export tasks must not run on either of the devices during the migration.
- If the source device is part of an HA pair, the target device need not be part of an HA pair and vice versa. The migration does not form or break the HA pair.

## What Configurations Does the Wizard Migrate?

The migration wizard copies the following configurations from the source device to the target device:

- Licenses
- Interface configurations
- Inline sets configurations
- Routing configurations
- DHCP and DDNS configurations
- Virtual router configurations
- Policies
- Associated objects and object overrides
- Platform settings
- Remote branch deployment configurations

The migration wizard copies the following policy configurations from the source device to the target device:

- Health policies

- NAT policies
- QoS policies
- Remote access VPN policies
- FlexConfig policies
- Access control policies
- Prefilter policies
- IPS policies
- DNS policies
- SSL policies
- Malware and File policies
- Identity policies

The migration wizard copies the following routing configurations from the source device to the target device:

- ECMP
- BFD
- OSPFv2/v3
- EIGRP
- RIP
- BGP
- Policy Based Routing
- Static Route
- Multicast Routing
- Virtual Router

The migration wizard copies the following interfaces from the source device to the target device:

- Physical interfaces
- Sub-interfaces
- Etherchannel interfaces
- Bridge group interfaces
- VTI interfaces
- VNI interfaces
- Loopback interfaces

## Limitations for Migration

- The wizard does not migrate:
  - Site-to-site VPN policies
  - SNMP configurations
    - After the migration, you can configure SNMP using the platform settings for the device.
- You can perform only one migration at a time.
- If the speed, auto-negotiation, and duplex settings of the source interface are valid for the mapped interface of the target device, the values are copied. If not, these parameters are set to the default values.
- Remote access VPN trustpoint certificates are not enrolled. You must manually enroll these certificates before the deployment.
- After migration, by default, the target device uses Snort 3 and not Snort 2, even if the source device uses Snort 2.
- For HA devices:
  - Target Device: You cannot map the interfaces that are part of the failover configuration. These interfaces are disabled in the wizard.
  - Source and Target Devices: The wizard does not migrate HA configurations such as monitored interfaces, failover trigger criteria, and interface MAC addresses. You must manually configure these parameters after the migration if required.

## Migrate the Secure Firewall Threat Defense

### Before you begin

Review the prerequisites and limitations for the migration.

### Procedure

- 
- Step 1** Choose **Devices > Device Management**.
  - Step 2** Click **Migrate** on the top-right of the page.
  - Step 3** Click **Start** on the welcome screen.
  - Step 4** From the **Source Device** drop-down list, choose a device.  
If the device is part of an HA pair, only the container name of the HA pair appears.
  - Step 5** Click **Next**.
  - Step 6** From the **Target Device** drop-down list, choose a device.  
If the device is part of an HA pair, only the container name of the HA pair appears.
  - Step 7** Click **Next**.

- Step 8** In the **Configure Interfaces** step, map the physical interfaces of the source device with those of the target device.
- Mapping of all interfaces is not mandatory. You must map all named interfaces and interfaces that are part of other interfaces. You cannot map interfaces that are part of an HA failover configuration. These interfaces are disabled in the wizard. The wizard creates the logical interfaces according to the interface mapping provided by the user.
- Click **Map Default** to configure default interface mappings.  
For example, Ethernet1/1 in the source device will be mapped to Ethernet1/1 in the target device.
  - Click **Clear All** to clear all the mappings.
- Step 9** Click **Next**.
- Step 10** Click **View Mappings** to verify the interface mappings.
- Step 11** Click **Submit** to start the migration.
- Step 12** View the migration status in the **Notifications > Tasks** page.
- 

### What to do next

After a successful migration, you can deploy the device.

Deployment is not mandatory, you can validate the configurations and deploy as required. However, before the deployment ensure that you perform the actions mentioned in [Best Practices for Migration, on page 95](#).

## Best Practices for Migration

After a successful migration, we recommend that you perform the following actions before the deployment:

- Change the IP addresses of the interfaces if the source device is live, as they are copied to the target device from the source device.
- Ensure that you update your NAT policies with the modified IP addresses.
- Configure the interface speeds if they are set to default values after migration.
- Re-enroll the device certificates, if any, on the target device.
- If you have a HA setup, configure HA parameters such as monitored interfaces, failover trigger criteria, and interface MAC addresses.
- Configure the diagnostic interface as it gets reset after migration.
- (Optional) Configure SNMP using the platform settings for the device.
- (Optional) Configure remote branch deployment configurations.

If the source or target device had manager access through a data interface, after the migration, the manager access will be lost. Update the manager access configuration on the target device. For more information, see the *Change the Manager Access Interface from Management to Data* topic in the Cisco Secure Firewall Management Center Device Configuration Guide or the Online Help.

- (Optional) Configure site-to-site VPN if required. These configurations are not migrated from the source device.

- View the deployment preview before the deployment. Choose **Deploy > Advanced Deploy** and click the **Preview** (📄) icon for the device.

## Hot Swap an SSD on the Secure Firewall 3100/4200

If you have two SSDs, they form a RAID when you boot up. You can perform the following tasks at the threat defense CLI while the firewall is powered up:

- Hot swap one of the SSDs—If an SSD is faulty, you can replace it. Note that if you only have one SSD, you cannot remove it while the firewall is powered on.
- Remove one of the SSDs—If you have two SSDs, you can remove one.
- Add a second SSD—If you have one SSD, you can add a second SSD and form a RAID.

---

**Caution** Do not remove an SSD without first removing it from the RAID using this procedure. You can cause data loss.

---

### Procedure

---

**Step 1** Remove one of the SSDs.

- a) Remove the SSD from the RAID.

**configure raid remove-secure local-disk {1 | 2}**

The **remove-secure** keyword removes the SSD from the RAID, disables the self-encrypting disk feature, and performs a secure erase of the SSD. If you only want to remove the SSD from the RAID and want to keep the data intact, you can use the **remove** keyword.

**Example:**

```
> configure raid remove-secure local-disk 2
```

- b) Monitor the RAID status until the SSD no longer shows in the inventory.

**show raid**

After the SSD is removed from the RAID, the **Operability** and **Drive State** will show as **degraded**. The second drive will no longer be listed as a member disk.

**Example:**

```
> show raid
Virtual Drive
ID:                1
Size (MB):         858306
Operability:       operable
Presence:          equipped
Lifecycle:         available
Drive State:       optimal
```

```

Type:                raid
Level:               raid1
Max Disks:           2
Meta Version:        1.0
Array State:         active
Sync Action:         idle
Sync Completed:      unknown
Degraded:            0
Sync Speed:          none

RAID member Disk:
Device Name:         nvme0n1
Disk State:          in-sync
Disk Slot:           1
Read Errors:         0
Recovery Start:      none
Bad Blocks:
Unacknowledged Bad Blocks:

Device Name:         nvme1n1
Disk State:          in-sync
Disk Slot:           2
Read Errors:         0
Recovery Start:      none
Bad Blocks:
Unacknowledged Bad Blocks:

> show raid
Virtual Drive
ID:                  1
Size (MB):           858306
Operability:         degraded
Presence:            equipped
Lifecycle:           available
Drive State:         degraded
Type:                raid
Level:               raid1
Max Disks:           2
Meta Version:        1.0
Array State:         active
Sync Action:         idle
Sync Completed:      unknown
Degraded:            1
Sync Speed:          none

RAID member Disk:
Device Name:         nvme0n1
Disk State:          in-sync
Disk Slot:           1
Read Errors:         0
Recovery Start:      none
Bad Blocks:
Unacknowledged Bad Blocks:

```

- c) Physically remove the SSD from the chassis.

## Step 2 Add an SSD.

- a) Physically add the SSD to the empty slot.  
b) Add the SSD to the RAID.

```
configure raid add local-disk {1 | 2}
```

It can take several hours to complete syncing the new SSD to the RAID, during which the firewall is completely operational. You can even reboot, and the sync will continue after it powers up. Use the **show raid** command to show the status.

If you install an SSD that was previously used on another system, and is still locked, enter the following command:

```
configure raid add local-disk {1 | 2} psid
```

The *psid* is printed on the label attached to the back of the SSD. Alternatively, you can reboot the system, and the SSD will be reformatted and added to the RAID.

## Disable the USB Port

By default, the type-A USB port is enabled. You might want to disable USB port access for security purposes. Disabling USB is supported on the following models:

- Firepower 1000 Series
- Secure Firewall 3100
- Secure Firewall 4200

### Guidelines

- Enabling or disabling the USB port requires a reboot.
- If the USB port is disabled and you downgrade to a version that does not support this feature, the port will remain disabled, and you cannot re-enable it without erasing the NVRAM (the FXOS local-mgmt **erase secure all** command).
- If you perform a ROMMON **factory-reset** or FXOS local-mgmt **erase secure**, the USB port will be re-enabled.
- For high availability or clustering, you must disable or re-enable the port individually on each unit.

**Note** This feature does not affect the USB console port, if present.

## Disable the USB Port on a Device

To disable the USB port on a device, you can do so at the threat defense CLI.

### Procedure

- Step 1** Disable the USB port.
- ```
system support usb configure disable
```

**reboot**

To re-enable the USB port, enter **system support usb configure enable**.

**Example:**

```
>system support usb configure disable
USB Port Admin State set to 'disabled'.
Please reboot the system to apply any control state changes.

>reboot
This command will reboot the system. Continue?
Please enter 'YES' or 'NO': YES
```

**Step 2** View the port status.

**system support usb show**

The Admin State shows the USB port configuration. The Oper State shows the current operation. For example, if you disable the USB port but do not reload, the Admin State will show disabled while the Oper State would be enabled.

**Example:**

```
>system support usb show
USB Port Info
-----
Admin State: disabled
Oper State: disabled
```

## Disable the USB Port in Multi-Instance Mode

To disable the USB port in multi-instance mode, you can do so at the FXOS CLI.

### Procedure

**Step 1** Disable the USB port and reboot for the change to take effect.

a) Disable the USB port.

```
scope fabric-interconnect
```

```
disable usb-port
```

```
commit buffer
```

b) Reboot the chassis.

```
connect local-mgmt
```

```
reboot
```

**Example:**

```
firepower-4245 /fabric-interconnect # disable usb-port
Note: USB enablement or disablement changes are effected only after FXOS reboot.
```

```

Confirm change? (yes/no) [yes]:
device /fabric-interconnect* # commit buffer
Note: USB enablement or disablement changes are effected only after FXOS reboot.
Confirm change? (yes/no) [yes]:yes
firepower-4245 /fabric-interconnect # connect local-mgmt
firepower-4245(local-mgmt)# reboot
Before rebooting, please take a configuration backup.
Do you still want to reboot? (yes/no):yes
Broadcast message from admin@firepower-4245 (Wed Feb 21 05:59:55 2024):
All shells being terminated due to system /sbin/reboot

```

**Step 2** Enable the USB port and reboot for the change to take effect.

a) Enable the USB port.

```
scope fabric-interconnect
```

```
enable usb-port
```

```
commit buffer
```

b) Reboot the chassis.

```
connect local-mgmt
```

```
reboot
```

**Example:**

```

firepower-4245 /fabric-interconnect # enable usb-port
Note: USB enablement or disablement changes are effected only after FXOS reboot.
Confirm change? (yes/no) [yes]:
device /fabric-interconnect* # commit buffer
Note: USB enablement or disablement changes are effected only after FXOS reboot.
Confirm change? (yes/no) [yes]:yes
firepower-4245 /fabric-interconnect # connect local-mgmt
firepower-4245(local-mgmt)# reboot
Before rebooting, please take a configuration backup.
Do you still want to reboot? (yes/no):yes
Broadcast message from admin@firepower-4245 (Wed Feb 21 05:59:55 2024):
All shells being terminated due to system /sbin/reboot

```

**Step 3** View the USB port status.

```
scope fabric-interconnect
```

```
show usb-port
```

The Admin State shows the USB port configuration. The Oper State shows the current operation. For example, if you disable the USB port but do not reload, the Admin State will show Disabled while the Oper State would will Enabled.

**Example:**

```

firepower-4245# scope fabric-interconnect
firepower-4245 /fabric-interconnect # show usb-port
Usb Port:
Equipment      Admin State Oper State
-----
A               Disabled   Disabled

```

## CHAPTER 6

# Device Management Using Device Templates

You can add devices to the management center using device templates.

- [About Device Management using Device Templates, on page 101](#)
- [Requirements and Prerequisites for Device Management using Device Templates, on page 102](#)
- [Licenses for Device Management using Device Templates, on page 103](#)
- [Guidelines and Limitations for Device Management using Device Templates, on page 104](#)

## About Device Management using Device Templates

You can use device templates to apply configuration changes to multiple devices with different interface configurations, and clone configuration parameters from existing devices.

When you register a device using basic initial configuration, you can apply limited configurations such as the access control policy and licenses. You must then configure other device settings such as interfaces, routing, and site-to-site VPN configurations individually after device registration. Device templates let you pre-configure these settings and more so you can apply them at the time of registration. Values that need to be unique per device, such as IP addresses, can be defined using variables and network object overrides that you define at registration.

You can also configure site-to-site VPN connections in a device template. These configurations define the site-to-site VPN topologies that a device should be a part of. The VPN configurations along with the other device template policies and configurations enable easy deployment of the branch device to your network.

Device templates support the configuration of a device only as a spoke. A device can be part of multiple hub and spoke site-to-site VPN topologies.

After the configured device template is applied to a device, the variables are resolved, the protected network overrides are configured, and the device is added as a spoke in the specified VPN topology.

## Variables and Network Object Overrides

You can parameterize template configurations using variables and network object overrides.

A variable is an object type that is supported for template configurations. A variable in a template defines specific configuration values for a device. You can define values for these variables during application of the template on the device. You can see the variable icon (x) for the fields that use a variable. The variables are displayed with a \$ prefix to distinguish these values from the other values.

For information on supported variable types and creating variables, see [Supported Variables](#) and [Add a Variable](#).

Network object overrides are similar to variables. But, these are used to provide override values for a network object. You can declare a list of network objects in the template and create network object overrides for these objects. You can then provide values for these network object overrides during the application of the template on the device. For example, if you define a host network object in a template, you can add a network object override before the application of the template on the device and then provide a relevant value during the application of the template on the device.

For more information on supported network objects and adding a network object override, see [Supported Network Object Overrides](#) and [Add a Network Object Override](#).

## Model Mapping

As interface configurations vary for different device models, the interface configurations in the template have to be copied to the target interfaces on the device. Model mapping enables you to define mapping of interfaces defined in the template to the interfaces of the required threat defense model. During application of the template on the device, the variables in the interface configurations are replaced with the values that you provide and copied to the mapped interfaces on the device. Note that you have to create the model mappings in the template before initiating application of the template on the device. For more information on setting up model mapping, see [Add Model Mapping](#).

# Requirements and Prerequisites for Device Management using Device Templates

### Model Support

Device templates are supported on On-Prem Management Center, cloud-delivered Firewall Management Center(cdFMC), with the following models running Secure Firewall version 7.4.1 and later versions:

- Firepower 1000 series
- Secure Firewall 1200 series
- Firepower 2100 series (7.4.x only)

- Secure Firewall 3100 series

### Supported Domains

Any

### User Roles

- To create, modify, or delete templates:
  - Admin
  - Network Admin
- To view the created templates:
  - Any

### Prerequisites for VPN Connections in Device Templates

- Configure site-to-site VPN topologies that must be used in the device template.
- Ensure that you have configured all hub and VPN topology-related configurations such as authentication methods, IKE and IPsec policies.
- Supported types of VPN hub and spoke topologies are:
  - Policy-based
  - Route-based
  - SD-WAN
- Assign appropriate logical names and IP addresses to the interfaces of the threat defense devices. For example, use *inside* for the interface connected to the LAN, and *outside* for the interface connected to the internet or WAN.
- Spoke devices must be version 7.4.1 and later.

## Licenses for Device Management using Device Templates

- Device templates does not have any specific license requirements.
- License entitlements for the target device must be present in the Smart Licensing account.
- To configure VPN connections in the template, the Essentials license must allow export-controlled functionality. Choose **System > Licenses > Smart Licenses** to verify this functionality in the management center.
- When you apply a template on a device, note the following conditions for Secure Client licensing:

| Device with Secure Client License | Template with Secure Client License | Secure Client License after Device Template Application |
|-----------------------------------|-------------------------------------|---------------------------------------------------------|
| Yes                               | Yes                                 | Template License                                        |
| Yes                               | No                                  | Device License                                          |
| No                                | Yes                                 | Template License                                        |

## Guidelines and Limitations for Device Management using Device Templates

### General Guidelines for Device Templates

- All device configurations other than VNI and VTEP are supported.
- You can attach shared policies and S2S VPN policies to a template. These policies are assigned during template application.
- Templates can be applied on HA devices. However, application of device templates during HA device pair registration is not supported. You also cannot manage HA-related configurations such as failover links, standby IP addresses, and so on. For more information, see [Device Template Operations on Threat Defense High Availability Devices](#).
- Device template operations are supported only on the active management center. The standby peer does not support device template operations.
- Ensure that the template names and device display names are not the same.
- Ensure that you do not create or delete a template during device backup or restore operations.
- After application of the template on the device, if the manager access is changed from management to data interface or vice-versa, you must re-establish the management connection with the device. Note that you cannot change the manager access interface during template application.
- You can add a maximum of 250 device templates to the management center.
- Templates that are created and configured for devices that are managed through the data interface cannot be used to register and apply to devices that are managed through the management interface.
- Device registration and application of template does not come under the Change Management workflow. Only approved data, such as access policies, templates, template variables, network overrides declared in template, and template configurations used in the template application operation are used.
- Device registration with serial number and access control policy is supported for only one device at a time.
- When you apply a template to a device that is already registered, the configuration in the template is only copied to the target device. You can then choose to manually deploy the configuration on the device or let the copied configuration stay on the device and deploy later. However, if you apply the template during device onboarding, the configuration in the template is copied to the target device and, as per existing behavior, automatically deployed on the device after device registration.

- Any change in model mapping causes the device to be marked as 'Out of Sync'. Consider reapplying the template to the devices if you have made changes to the interface mapping in the corresponding model mapping or if you have made any configuration changes after the previous application of the template.
- Device templates are only supported on merged management and diagnostic interfaces. For more information, see [Merge the Management and Diagnostic Interfaces](#).
- Template configuration updates are supported by change management. Creation and application of device templates is not supported by change management.
- You cannot sync configuration changes from a device to the template. A few sample scenarios during which you may want to make changes to the device configuration using a template along with recommended solutions are given below:
  - If you want to test the new configuration changes on one device before propagating the changes to multiple devices, we recommend that you make the changes in the template and apply the template to one device. Validate the changes on that device and then apply the template to the other devices.
  - If you want to make a large number of changes resulting in a significant deviation from the current configuration on a device, and then propagate those changes to other devices, you may choose one of the following options:
    - Export the current template to get a copy of the template. You can then make the required changes in the template and apply to a single device. Validate the changes on that device and then apply the template to the other devices.
    - You can also make the required changes on the device and create a template from that device. You can then apply and validate the changes on the other devices. However, we do not recommend this as template parameters such as variables and network object overrides will not be present in the created template.
  - If the configuration on a particular device starts to differ significantly from the configuration in the template, you may also choose to not use the template for this device and delete the device-template association from the **Associated Devices** window.

### Guidelines for VPN Connections in Device Templates

- Supported interfaces for VPN topologies are:

| Topology Type           | Interface Type                                                                                                                                                                                                                                                                                                                           |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Policy-Based and SD-WAN | <ul style="list-style-type: none"> <li>• Physical interfaces               <ul style="list-style-type: none"> <li>• Non-management</li> <li>• Interface Mode must be either Routed or None</li> </ul> </li> <li>• Subinterfaces</li> <li>• Redundant interfaces</li> <li>• Etherchannel interfaces</li> <li>• VLAN interfaces</li> </ul> |

| Topology Type | Interface Type                   |
|---------------|----------------------------------|
| Route-Based   | Static Virtual Tunnel Interfaces |

- When you apply a template on a device that is part of a VPN topology, you must ensure that the template includes interface configurations for all interfaces used in the topology.
- When you apply a template with VPN connections to multiple devices, note the following:  
A template is applied to multiple devices in the order in which you have selected the devices. If the template has VPN connections, the corresponding VPN topology is locked.
- For SD-WAN topology VPN connections: Ensure that IP address subnet of the interface does not conflict with the subnet of the IP address pool of the SD-WAN hub.
- Domain:
  - You can define a template in a global or leaf domain. However, you can define a VPN topology only in a leaf domain.
  - You can configure VPN connections in a template for all domains. During template application, VPN connections are applied to the device only if the device is in the same domain as the VPN topology.

For more information, see [Device Templates in Domains, on page 131](#).

- Change management: Before you apply a device template to a device, ensure that the VPN topology is not locked by a Change management ticket.

### Limitations for Device Templates

- The following features and configurations are not supported using device templates:
  - Multi-instance mode
  - Clustering
  - Non-converged management interface
  - Transparent mode
  - HA failover configurations
  - Chassis configurations
  - Logical devices
  - Variables for nested objects
  - Override support for network groups and other object types

### Limitations for VPN Connections

- When you create a template from a device that is part of a VPN topology (**Devices > Device Management > More (⋮) > Generate Template from Device**), VPN configurations are not part of the template. You must reconfigure the VPN configurations on the template.

- When you export a device template with one or more VPN connections (**Template Settings > General > General** pane > **Export**), the VPN connections are not exported. You must reconfigure the VPN connections on the imported template.
- Certificate-based authentication:
  - Device templates do not support automatic certificate enrolment of a device.
  - When you onboard a device using a template with VPN configurations, if the VPN topology uses certificate-based authentication, the first deployment to the device will fail. Ensure that you manually enroll the device certificate after the device registration and deploy the configurations on the device again.

## Template Management

Choose **Devices > Template Management** to bring up the **Template Management** window. This window provides you with a range of information and options to manage templates. All the created device templates are listed on this window.

Information on each template is provided under the following columns:

- **Name** - Displays the name of the template.
- **Domain** - Displays the domain in which the template is present.
- **Variables** - Displays the variables and network object overrides in the template.
- **Access Control Policy** - Click the link in the Access Control Policy column to view the policy that is deployed on the device.
- **Model Interface Mapping** – Displays the device model interfaces that are mapped to the template interfaces.

Against each template, there is an **Edit** (✎) icon and a **More** (⋮) icon. When you click the **Edit** (✎) icon, the **Device Management** window appears with several tabs. You can use the tabs to configure interfaces, inline sets, routing, DHCP, VPN, and template settings.

Click the **More** (⋮) icon for the following options:

- **Apply**: To apply the template on a device. See [Apply a Template](#).
- **Delete**: To delete a template. See [Delete Device Template](#).
- **Export** and **Import**: To import or export a template. See [Import a Device Template](#).

## Add a Device Template

You can add a new device template with the required configuration or generate a device template from an existing device.

## Create a New Device Template

You can specify the device template name, description, access control policy, and routing mode. You can add more configurations after the template has been created. Perform the procedure given below to create a device template.

### Procedure

---

- Step 1** Choose **Devices > Template Management**.
  - Step 2** Click **Add Device Template**.
  - Step 3** In the **Add Device Template** window, enter a **Name** for the template.
  - Step 4** (Optional) Enter a **Description** for the template.
  - Step 5** Choose an **Access Control Policy** from the drop-down list.
  - Step 6** Choose a **Mode** from the drop-down list.
  - Step 7** Click **OK**.
- 

## Generate a New Device Template from an Existing Device

You can generate a new device template from a device that is registered with the management center. The new template has the same configuration as the device from which it is generated. You can generate a new device template from standalone and HA devices. However, if you generate a template from HA devices, the new template will not contain the failover configurations.

Perform the procedure given below to generate a new device template from an existing device.

### Procedure

---

- Step 1** Choose **Devices > Device Management**.
  - Step 2** Click the **More** (⋮) icon, and click **Generate Template from Device**.
  - Step 3** In the **Generate template from device** window, enter a **Name** for the template.
  - Step 4** (Optional) Enter a **Description** for the template.
  - Step 5** Choose an **Access Control Policy** from the drop-down list.
    - Note** This policy is assigned to the generated template. Any other shared policies that are associated with the device from which the template is generated are assigned to the generated template only if these policies are visible in the domain in which the template is being generated.
  - Step 6** Click **OK**. You can view the status of template creation in the **Notifications > Tasks** window.
  - Step 7** Choose **Devices > Template Management** to view the newly created template.
-

## Import a Device Template

You can import a template into the management center or export a template to your local system. This feature is useful in the following scenarios:

- Generate a copy of the template from a device, export it, and import that template into another management center or cloud-delivered Firewall Management Center.
- Generate a copy of the template, export it, modify as required to create a variation of the existing template, and import the template into the management center.
- Generate a copy of the template, export it, and import that template into another domain in which the source template is not visible.

When you import a template into a domain, any objects that are part of the configuration are either newly created or reused if the objects with the same name are visible in the domain into which the template is imported. Any object with matching names that is not visible, due to domain hierarchy, is imported as a new object with the name suffixed with a `_x`.

If there is a mismatch in the variable names when you want to onboard devices in a domain using the cloned template from another domain, you must specify the new variable names in the `.csv` file to onboard the devices.

Perform the procedure given below to import a device template into the management center from your local system.

### Procedure

- 
- Step 1** Choose **Devices > Template Management**.
  - Step 2** Click the **More** (⋮) icon for the template that you want to replace with an imported template.
  - Step 3** Click **Import** and click **Import** again.  
If you want to export a template, click **Export** and click **OK**.
  - Step 4** View the status of the import task in the **Notifications > Tasks** window.
  - Step 5** Choose the template SFO file on your local system and click **Open**. This template SFO file that you import can be newly created, generated from a device, or cloned from an existing template.
  - Step 6** View the status of the import task in the **Notifications > Tasks** window. You will see a notification informing you that the import or export task is successfully completed. If you are exporting a template, click **Download Export Package** in the **Notifications > Tasks** window to download the template configuration as an SFO file.
- Note** Alternatively, you can also go to the **Template Management** window and click the **Edit** (✎) icon of the template. Then, go to **Template Settings > General**, and click **Import** or **Export** in the **General** tile to import or export the template.
-

# Configure a Device Template

After creating the template, you can set up device configurations and configure settings that you want to apply on the device by editing the template.

## Add a Physical Interface

By default, a device template will enable the device to come up with the following physical interfaces:

- Management interface
- Inside interface
- Outside interface

Perform the procedure given below to create a physical interface.

### Procedure

---

- Step 1** Choose **Devices > Template Management**.
  - Step 2** Click the **Edit** (✎) icon of the template in which you want to add the physical interface.
  - Step 3** In the **Interfaces** tab, click **Add Physical Interface**.
  - Step 4** Choose a **Slot** and **Port Index** number from the drop-down list.
  - Step 5** Click **Create Interface**.
- 

## Add a Logical Interface

You can create a logical interface in the same way as you do on the management center without using the template. Perform the procedure given below to create a logical interface.

### Procedure

---

- Step 1** Choose **Devices > Template Management**.
- Step 2** Click the **Edit** (✎) icon of the template in which you want to add the logical interface.
- Step 3** In the **Interfaces** tab, click **Add Interface**, and choose the type of interface that you want to create from the drop-down list. You can create the following types of interfaces:
  - Sub-interface
  - Ether channel interface
  - Bridge group interface
  - VLAN interface

- Virtual tunnel interface
- Loopback interface

For more information, see [Interface overview](#) and [Regular Firewall Interfaces](#).

---

## Edit an Interface

You can edit an interface in the same way as you do on the management center without using the template. Use template variables to set up the IPv4 and IPv6 addresses. The device template supports the configurations that are supported on Firepower 1000, Secure Firewall 1200, Firepower 2100, and Secure Firewall 3100 Threat Defense devices. Perform the procedure given below to edit an interface.

### Procedure

---

- Step 1** Choose **Devices > Template Management**.
- Step 2** Click the **Edit** (✎) icon of the template in which you want to edit the physical interface.
- Step 3** In the **Interfaces** tab, click the **Edit** icon for the interface that you want to edit.
- Step 4** In the **Edit Physical Interface** window, you can edit any of the following settings:
- General
  - PoE
  - IPv4
  - IPv6
  - Path Monitoring
  - Hardware Configuration
  - Manager Access
  - Advanced

**Note** Use variables to configure IPv4 and IPv6 addresses. For more information on templating variables, see [Configure Template Parameters](#).

For more information on editing the settings mentioned above, see [Interface overview](#) and [Regular Firewall Interfaces](#).

---

## Configure Other Device Settings

Configure the other device settings in the same way as you do on the management center without using the template.

## Procedure

- 
- Step 1** Choose **Devices > Template Management**.
- Step 2** Click the **Edit** (✎) icon for the template in which you want to configure the settings.
- Step 3** Click the tabs at the top of the window to configure any of the following settings:
- Inline Sets
  - Routing
  - DHCP
  - VPN
  - Template Settings
- 

## Configure Template Settings

These are template-specific settings that are copied to the device when the template is applied on the device. In the **Template Settings** window, you can configure the following template settings:

- General
  - [Edit General Settings](#)
  - [Edit Licenses](#)
  - [Edit Applied Policies](#)
  - [Edit Advanced Settings](#)
  - [Edit Deployment Settings](#)
- Template Parameters
  - [Add a Variable](#)
  - [Add a Network Object Override](#)
- [Add Model Mapping](#)

## Edit General Settings

In the **General** tile, you see the following fields:

- **Template Name** – The name of the template.
- **Transfer Packets** – Displays whether or not the managed device sends packet data with the events to the management center.
- **Mode** – Displays the mode of the management interface for the device: routed.

- **Configuration** – Click **Export** to export the template configurations as an SFO file. Click **Import** to import an SFO file that has the template configurations that you require.
- **Manage device by Data Interface** – Toggle the button to enable or disable management of the device using the data interface.

Perform the procedure given below to edit the name of the device, and to enable or disable packet transfer.

### Procedure

---

- Step 1** Click the **Edit** (✎) icon in the **General** tile.
  - Step 2** Change the **Template Name** as per your requirement.
  - Step 3** Check the **Transfer Packets** checkbox to allow packet data to be stored with events on the management center.
  - Step 4** Click **Save**.
- 

## Edit Licenses

In the **License** tile, you can see the **License types** that are required based on the configurations used in the template. Choosing a license here does not consume that license on the device. The license is consumed only when you apply the template to a device.

Perform the procedure given below to edit the license types as per your requirement.

### Procedure

---

- Step 1** Click the **Edit** (✎) icon in the **License** tile.
  - Step 2** Check or clear the check box next to the license you want to enable or disable for the managed device.
  - Step 3** Click **Save**.
- 

## Edit Applied Policies

In the **Applied Policies** tile, you can see the access control policies that are associated with the template.

For policies with links, you can click the link to view the policy.

Perform the procedure given below to edit the policy assignments as per your requirement.

### Procedure

---

- Step 1** Click the **Edit** (✎) icon in the **Applied Policies** tile.
- Step 2** For each policy type, choose a policy from the drop-down list. Only existing policies are listed.

**Step 3** Click **Save**.

## Edit Advanced Settings

The **Advanced Settings** tile displays the advanced configuration settings, as described below. You can edit any of these settings.

**Table 2: Advanced Section Table Fields**

| Field                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Application Bypass            | The state of Automatic Application Bypass on the device.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Bypass Threshold              | The Automatic Application Bypass threshold, in milliseconds.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Object Group Search           | <p>The state of object group search on the device. While operating, the threat defense device expands access control rules into multiple access control list entries based on the contents of any network or interface objects used in the access rule. You can reduce the memory required to search access control rules by enabling object group search. With object group search enabled, the system does not expand network or interface objects, but instead searches access rules for matches based on those group definitions. Object group search does not impact how your access rules are defined or how they appear in the management center. It impacts only how the device interprets and processes them while matching connections to access control rules.</p> <p><b>Note</b> By default, the <b>Object Group Search</b> is enabled when you add threat defense for the first time in the management center.</p> |
| Interface Object Optimization | <p>The state of interface object optimization on the device. During deployment, interface groups and security zones used in the access control and prefilter policies generate separate rules for each source/destination interface pair. If you enable interface object optimization, the system will instead deploy a single rule per access control/prefilter rule, which can simplify the device configuration and improve deployment performance. If you select this option, also select the <b>Object Group Search</b> option to reduce memory usage on the device.</p>                                                                                                                                                                                                                                                                                                                                                   |

Perform the procedure given below to edit the advanced settings.

### Procedure

**Step 1** Click the **Edit** (✎) icon in the **Advanced Settings** tile.

**Step 2** You can change the settings as per your requirement. For more information, see the following sections:

- [Configure Automatic Application Bypass](#)
- [Configure Object Group Search](#)

- [Configure Interface Object Optimization](#)

**Step 3** Click **Save**.

## Edit Deployment Settings

The **Deployment Settings** tile displays the information described in the table below.

*Table 3: Deployment Settings*

| Field                                          | Description                                                                                                                                                                                                                     |
|------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Auto Rollback Deployment if Connectivity Fails | Enabled or Disabled.<br>You can enable auto rollback if the management connection fails as a result of the deployment; specifically if you use data for management center access, and then you misconfigure the data interface. |
| Connectivity Monitor Interval (in Minutes)     | Shows the amount of time to wait before rolling back the configuration.                                                                                                                                                         |

Deployment settings include enabling auto rollback of the deployment if the management connection fails as a result of the deployment; specifically if you use data for management center access, and then you misconfigure the data interface. You can alternatively manually roll back the configuration using the **configure policy rollback** command.

Perform the procedure given below to edit the deployment settings.

### Procedure

**Step 1** Click the **Edit** icon in the **Deployment Settings** tile.

**Step 2** Set the **Connectivity Monitor Interval (in Minutes)** to set the amount of time to wait before rolling back the configuration. The default is 20 minutes.

**Step 3** If a rollback occurs, see the following for next steps.

- If the auto rollback was successful, you see a success message instructing you to do a full deployment.
- You can also go to the **Deploy > Advanced Deploy** screen and click the **Preview** icon to view the parts of the configuration that were rolled back (see [Deploy Configuration Changes](#)). Click **Show Rollback Changes** to view the changes, and **Hide Rollback Changes** to hide the changes.
- In the Deployment History Preview, you can view the rollback changes.

**Step 4** Check that the management connection was reestablished.

In management center, check the management connection status on the **Devices > Device Management > Device > Management > FMC Access Details > Connection Status** page.

At the threat defense CLI, enter the **sftunnel-status-brief** command to view the management connection status.

If it takes more than 10 minutes to reestablish the connection, you should troubleshoot the connection. See [Troubleshoot Management Connectivity on a Data Interface](#).

## Configure Template Parameters

You can templize configurations using template parameters such as variables and network object overrides.

### Supported Variables

The following variable types are supported in device templates.

| Variable Name | Description                                          | Type                                                  |
|---------------|------------------------------------------------------|-------------------------------------------------------|
| AS Number     | Defines the unique Autonomous System (AS) number.    | Integer<br>Example: 2                                 |
| FQDN          | Defines a single Fully Qualified Domain Name (FQDN). | String<br>Example: abc.example.com                    |
| IPv4 Host     | Defines the IPv4 address of the host.                | String<br>Example: 209.165.201.8                      |
| IPv4 Network  | Defines the IPv4 network address block.              | String<br>Example: 209.165.200.224/27                 |
| IPv4 Range    | Defines the range of IPv4 addresses.                 | String<br>Example:<br>209.165.200.225-209.165.200.250 |
| IPv6 Host     | Defines the IPv6 address of the host.                | String<br>Example: 2001:DB8::1                        |
| IPv6 Network  | Defines the IPv6 network address block.              | String<br>Example: 2001:DB8:0:CD30::/60               |
| Password      | Defines a password string.                           | String<br>Example: E28@2OiUrhx!                       |
| Router ID     | Defines an identifier for the router.                | Integer<br>Example: 21                                |
| String        | Defines a custom string.                             | String<br>Example: testvalue2                         |

### Add a Variable

Perform the procedure given below to add a variable.

## Procedure

- Step 1** Choose **Objects > Object Management**.
- Step 2** Choose **Variable** from the list of object types.
- Step 3** Click **Add Variable**.
- Step 4** Enter a **Name**.

In a multi-domain deployment, object names must be unique within the domain hierarchy. The system may identify a conflict with the name of an object you cannot view in your current domain.

- Step 5** Choose a **Variable Type** from the drop-down list.
- Step 6** (Optional) Enter a **Description**.
- Step 7** Click **Save**.

## Supported Network Object Overrides

The following network objects are supported.

| Network Object Name | Description                                  | Type                                                                                                                         |
|---------------------|----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------|
| Network             | An address block, also known as a subnet.    | String<br>Example:<br>IPv4 - 209.165.200.224/27<br>IPv6 - 2001:DB8::/48                                                      |
| Host                | The IP address of the host.                  | String<br>Example:<br>IPv4 - 209.165.200.225<br>IPv6 - 2001:DB8:1::1                                                         |
| Range               | A range of IP addresses.                     | String<br>Example:<br>IPv4 -<br>209.165.200.225-209.165.200.250<br>IPv6 - 2001:DB8::1 -<br>2001:DB8:FFFFFFFFFFFFFFFFFFFFFFFF |
| FQDN                | A single fully-qualified domain name (FQDN). | String<br>Example: abc.example.com                                                                                           |

## Add a Network Object Override

Perform the procedure given below to add a network object override.

## Procedure

- 
- Step 1** Choose **Devices > Template Management**.
  - Step 2** Click the **Edit** (✎) icon of the template in which you want to add the network object override.
  - Step 3** Choose **Template Settings > Template Parameters**.
  - Step 4** In the **Network Object Overrides** section, click **Add or Remove Network Object Overrides**.
  - Step 5** In the **Add or Remove Network Object Overrides** window, choose the network objects for which you want to create network object overrides from the **Available Networks** window and click the > button.
  - Step 6** Click **Save**.
- 

## Add Model Mapping

For each model, you can specify which template interface corresponds with which model interface. You can map a template to one or more models as long as the interface configurations are valid for all mapped models. For example, if the template includes switch ports and VLAN interfaces, then that template can only be applied to a Firepower 1010 or Secure Firewall 1210/1220.

Perform the procedure given below to add model mapping.

## Procedure

- 
- Step 1** Choose **Devices > Template Management**.
  - Step 2** Click **Add Model Mapping** for the template in which you want to create the model mapping. Alternatively, you can click the **Edit** (✎) icon of the template and choose **Template Settings > Model Mapping**.
  - Step 3** Click **Add Model Mapping**.
  - Step 4** Choose the **Device Model** from the drop-down list.
  - Step 5** Map the template interfaces to the device model interfaces by choosing the interface from the **Model Interface** drop-down list.

**Note** You can click **Clear Mapping** to remove the defined model mapping. Click **Reset Mappings** for default interface mapping in which the mapping is done based on the slot and port index order of the interface names.

- Step 6** Click **Save**. The interface mappings are listed along with the device model and mapping status on the **Model Mapping** window.

**Note** Some configurations in the template may not be supported on all device models. Unsupported configurations, if any, are not applied to the device. The Device Template Apply Report provides details about such configurations.

---

## Invalid Model Mappings

Some configurations in the template may not be supported on all device models. Unsupported configurations, if any, are not applied to the device. Valid model mappings can also become invalid when you modify template configurations. For example, when you add a new interface on the template and assign a name to it, the new interface must be mapped to the appropriate interface on the device model.

Model mapping can also be invalidated due to any of the following reasons:

- Number of configured VRF instances exceeds the limit for a specific model.
- Interfaces mapped to incompatible models, versions, or interfaces. See [Requirements and Prerequisites for Device Management using Device Templates](#) for more information.
- Number of interfaces exceeds the model limit.
- Deleted an interface that was mapped.
- Newly added physical interfaces are not mapped to a compatible model interface.
- Model mapping is not done for a named interface.
- Model mapping is not done for an interface related to other logical interfaces, such as sub-interfaces, PC interfaces, and so on.
- Making policy or configuration changes that are unsupported on some device models. For example, enabling switch port configuration on interfaces.

You can also save a template with invalid model mappings. However, you must review and fix the model mapping before initiating application of the template on the device.

You can hover over **Invalid** under **Mapping Status** to view the errors that caused the invalid mapping status. Fix the errors before initiating application of the template on the device.

# Configure Site-to-Site VPN Connections in a Device Template

## Configure an SD-WAN VPN Connection

You can configure an SD-WAN VPN connection to add spokes to SD-WAN topologies using the device template.

### Before you begin

- Configure a minimum of one SD-WAN topology (**Devices > VPN > Site To Site**).
- Review [Requirements and Prerequisites for Device Management using Device Templates](#) and [Guidelines and Limitations for Device Management using Device Templates](#).

### Procedure

- 
- Step 1** Choose **Devices > Template Management**.

**Step 2** Click the edit icon adjacent to the device template that you want to edit.

**Step 3** Click the **VPN** tab.

**Step 4** Click **Add VPN Connection**.

**Step 5** Choose an SD-WAN topology from the **VPN Topology** drop-down list.

The **Add VPN Connection** dialog box expands and you can configure the following parameters:

- a) From the **VPN Interface** drop-down list, choose a WAN-facing or internet-facing physical interface to establish a VPN connection with the hub.  
This list contains all the interfaces configured on the device template.
- b) **Use IP Address from the VPN Interface**—This drop-down list is auto populated with the IP address variable. For IPv6 addresses, choose an IPv6 address from the drop-down list.
- c) Check the **Local Tunnel (IKE) Identity** check box to enable a unique and configurable identity for the VPN tunnel from the spoke to a remote peer.
- d) **Identity Type**—Key ID is the only supported identity type. Choose a key ID variable from the drop-down list or click (+) to create a new key ID variable.
- e) Click **OK**.

You can view the VPN connection in the **Site-to-Site VPN Connections** table.

**Step 6** Click **Save**.

---

### What to do next

1. Configure the routing policy for the spoke in the device template.
2. Map the device interfaces to the template interfaces (Model Mapping).
3. Apply the template to a device.

## Configure a Route-Based Site-to-Site VPN Connection

You can configure a route-based site-to-site VPN connection to add spokes to route-based site-to-site VPN topologies using the device template.

### Before you begin

- Configure a minimum of one route-based site-to-site VPN topology (**Devices > VPN > Site To Site**).
- Review [Requirements and Prerequisites for Device Management using Device Templates](#) and [Guidelines and Limitations for Device Management using Device Templates](#).

### Procedure

---

**Step 1** Choose **Devices > Template Management**.

**Step 2** Click the edit icon adjacent to the device template that you want to edit.

- Step 3** Click the **VPN** tab.
- Step 4** Click **Add VPN Connection**.
- Step 5** Choose a route-based site-to-site VPN topology from the **VPN Topology** drop-down list.

The **Add VPN Connection** dialog box expands and you can configure the following parameters:

- a) From the **Virtual Tunnel Interface (VTI)** drop-down list, choose a VTI interface or click (+) to create a new VTI.

VTI is a virtual interface used to establish a route-based VPN tunnel. You must configure routing policies for a VTI to set up a VPN tunnel. This list contains all the VTIs configured on the device template. For more information on creating a VTI, see [Add a VTI Interface, on page 1644](#).

- b) Check the **Use Public IP Address** check box to override the tunnel source IP address and configure a public IP address variable for the VTI. Click (+) to create a new public IP address variable.

This IP address is the source IP address for the VPN tunnel. By default, this is the IP address of the VPN interface. However, if the device is behind NAT, the VPN interface has a private address, but the post-NAT public IP address should be configured.

- c) Check the **Local Tunnel (IKE) Identity** check box to enable a unique and configurable identity for the VPN tunnel from the spoke to a remote peer.
- d) **Identity Type**: Key ID is the only supported identity type. Choose a key ID variable from the drop-down list or click (+) to create a new key ID variable.
- e) (Optional) Check the **Enable Secondary VPN Tunnel** check box to configure the parameters for the secondary VPN tunnel.
- f) Click **OK**.

You can view the VPN connection in the **Site-to-Site VPN Connections** table.

- Step 6** Click **Save**.

---

### What to do next

1. Configure the routing policy for the spoke in the device template.
2. Map the device interfaces to the template interfaces (Model Mapping).
3. Apply the template to a device.

## Configure a Policy-Based Site-to-Site VPN Connection

You can configure a policy-based site-to-site VPN connection to add spokes to policy-based site-to-site VPN topologies using the device template.

### Before you begin

- Configure a minimum of one policy-based site-to-site VPN (**Devices > VPN > Site To Site**).
- Review [Requirements and Prerequisites for Device Management using Device Templates](#) and [Guidelines and Limitations for Device Management using Device Templates](#).

## Procedure

- 
- Step 1** Choose **Devices > Template Management**.
- Step 2** Click the edit icon adjacent to the device template that you want to edit.
- Step 3** Click the **VPN** tab.
- Step 4** Click **Add VPN Connection**.
- Step 5** Choose a policy-based site-to-site VPN topology from the **VPN Topology** drop-down list.
- The **Add VPN Connection** dialog box expands and you can configure the following parameters:
- From the **VPN Interface** drop-down list, choose a WAN-facing or internet-facing physical interface to establish a VPN connection with the hub.
 

This list contains all the interfaces configured on the device template.

Do one of the following to configure the IP address of the VPN interface:

    - Click the **Use IP Address from the VPN Interface** radio button to use the IP address of the VPN interface.
 

This IP address is auto populated. For IPv6 addresses, choose an IPv6 address from the drop-down list.
    - Click the **Use Public IP Address** radio button to configure a public IP address for the VPN interface.
 

Choose an IP address variable from the drop-down list or click (+) to add an IP address variable.
  - Check the **Local Tunnel (IKE) Identity** check box to enable a unique and configurable identity for the VPN tunnel from the spoke to a remote peer.
  - Identity Type:** Key ID is the only supported identity type. Choose a key ID variable from the drop-down list or click (+) to add a new key ID variable.
  - Protected Networks:** Click (+) to configure a protected network for the VPN connection.
 

Do one of the following:

    - Choose a protected network and click **OK**.
    - Click **Add** to configure a network object and click **Save**.

When you create a protected network object, note the following:

    - Click either the **Host** or the **Network** radio button.
    - Check the **Allow Overrides** check box.
  - Click **OK**.
 

You can view the VPN connection in the **Site-to-Site VPN Connections** table.
- Step 6** Click **Save**.
-

**What to do next**

1. Note that before you apply a template to a device, to configure device-specific values for the protected networks, add these objects in **Template Settings > Template Parameters > Add Network Objects Overrides**.
2. Map the device interfaces to the template interfaces (Model Mapping).
3. Apply the template to a device.

## Add a Device to an SD-WAN Topology in a Dual ISP Deployment

This section provides instructions to add a device to an SD-WAN topology in a dual ISP deployment using a device template.

**Before you begin**

Ensure that you have two SD-WAN VPN topologies with the same hub. For more information about configuring SD-WAN topologies, see [Configure an SD-WAN Topology Using the SD-WAN Wizard, on page 1590](#).

| Step | Task                                                                                                                                                        | GUI Path                                                                            | More Information                                                |
|------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------|-----------------------------------------------------------------|
| 1    | Create a device template.                                                                                                                                   | <b>Devices &gt; Template Management &gt; Add Device Template</b>                    | <a href="#">Create a New Device Template, on page 108</a>       |
| 2    | Add a physical interface in the template.<br>By default, a template has only one outside interface. Rename the outside interfaces, for example, ISP1, ISP2. | <b>Devices &gt; Template Management &gt; Interfaces &gt; Add Physical Interface</b> | <a href="#">Add a Physical Interface, on page 110</a>           |
| 3    | Configure an SD-WAN VPN connection using ISP1 interface.                                                                                                    | <b>Devices &gt; Template Management &gt; VPN &gt; Add VPN Connection</b>            | <a href="#">Configure an SD-WAN VPN Connection, on page 119</a> |
| 4    | Configure an SD-WAN VPN connection using ISP2 interface.                                                                                                    |                                                                                     |                                                                 |
| 5    | Add static routes from ISP1 and ISP2 interfaces to the SD-WAN hub network.                                                                                  | <b>Devices &gt; Template Management &gt; Routing &gt; Static Route</b>              | -                                                               |
| 6    | Add the ISP1 and ISP2 interfaces to an ECMP zone.                                                                                                           | <b>Devices &gt; Template Management &gt; Routing &gt; ECMP</b>                      | -                                                               |

| Step | Task                                                                        | GUI Path                                                                                                                   | More Information                                           |
|------|-----------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------|
| 7    | Configure the network object overrides.                                     | <b>Devices &gt; Template Management &gt; Template Settings &gt; Template Parameters &gt; Add Network Objects Overrides</b> | <a href="#">Add a Network Object Override, on page 117</a> |
| 8    | Map the template interfaces to the device model interfaces (Model Mapping). | <b>Devices &gt; Template Management &gt; Template Settings &gt; Model Mapping</b>                                          | <a href="#">Add Model Mapping, on page 118</a>             |

| 10   | Deploy configurations on the device.                                        | <b>Deploy</b>                                                                                                              | —                                                          |
| 11   | Deploy configurations on the hubs of the SD-WAN topologies.                 | <b>Deploy</b>                                                                                                              | —                                                          |

For more information about dual ISP deployment using the SD-WAN wizard, see [Sample Configurations for Dual ISP Deployment Using SD-WAN Wizard, on page 1594](#).

## Apply Templates to Existing Devices

You can apply or reapply a template to existing devices.

### Apply a Template

You can apply a template to devices that are already registered with the management center. Application of a template on a device clears existing configurations and applies configurations from the template. However, the threat defense HA failover configurations are not cleared.

Application of a template changes device configurations only on the management center. You must explicitly deploy these device configuration changes to the threat defense device. You cannot roll back the applied configuration changes. However, you can apply another template with the required configurations.

**Note** Any change management tickets related to template configurations must be approved for the corresponding changes to be incorporated into the template application workflow. Only approved template configurations are used during template application.

Perform the procedure given below to apply the template on existing devices.

## Procedure

- 
- Step 1** To apply the template from the **Template Management** window, choose **Devices > Template Management**.
- Click the **More** (ⓘ) icon next to the template that you want to apply, and click **Apply**.
  - From the **Device** dropdown list, choose the **Device** on which you want to apply the template.
  - Click **Confirm** to initiate application of template on the device.
- Step 2** (Optional) To apply the template from the **Associated Devices** window, choose **Devices > Template Management**.
- Click the **Edit** (✎) icon of the template that you want to apply to a device.
  - Click **Associated Devices**.
  - In the **Associated Devices** window, click **Apply Template**.
  - From the **Device** drop-down list, choose the **Device** on which you want to apply the template.
  - Enter values for the **Variables** and **Network object overrides** fields.
  - Click **Apply** to initiate application of template on the device.
- 

## Reapply a Template

If you make any changes to the device or template that results in the configuration being out-of-sync, you can reapply the template to make the configuration in sync with the template.

Perform the procedure given below to reapply the template on a device.

## Procedure

- 
- Step 1** Choose **Devices > Template Management**.
- Step 2** Click the **Edit** (✎) icon of the template that you want to reapply to a device.
- Step 3** Click **Associated Devices**.
- Step 4** In the **Associated Devices** window, click **Reapply Template** for the device on which you want to reapply the template.
- Note** If you want to reapply the template on all the associated devices in the template, click **Bulk Reapply** and click **Confirm**.
- Step 5** On the **Reapply template** window, you can reuse the autopopulated **Variables** and **Network object overrides** values or enter new values.
- Step 6** Click **Confirm** to initiate reapplication of the template on the device.
-

# Validation of Template Configuration Before and After Application of Template on Device

Validation of template configuration is done before and after application of the template on the device.

The following validation checks are performed at the start of the task to apply the template on the device:

- Ensure that the target device model and version are supported.
- Cluster and container checks -The device must not be part of a cluster or multi-instance.
- Model mapping validation - Model mapping for the target device model exists and is valid.
- Sanity check of template parameter values. For example, two variables used as IP addresses of interfaces must not have the same value.

The following validation checks are performed at the end of the task to apply the template on the device to ensure that the applied configurations are valid:

- Interface configuration validation. For example, variables used for the IP address fields of two or more interfaces must not have the same IP address values.
- Routing policy validation. For example, the IPv4 address in BGP neighbor configurations must not overlap with the IP address of any interface.

If the validation checks that are done at the end of the task to apply the template on the device fail, any applied configurations are rolled back and the device is restored to its original state.

## Monitoring Device Templates

You can monitor and verify the application of templates by viewing the devices listed in the **Associated Devices** window and by viewing the **Template Apply Report**.

### View Associated Devices

The devices that are associated with the templates are listed in the **Associated Devices** window. Each device row displays the **Device Name**, **Sync Status**, **Template Application Status**, and **Applied Date**. You can also click **Reapply template** to reapply the template. Click the **Variable Summary** icon to display a summary of the variables in the template and the **Report** (📄) icon to download the Device Template Apply report.

Click the **Delete** (🗑️) icon to remove the template from the device.

Click **Apply Template** if you want to apply a template on a device from the **Associated Devices** window. If you want to reapply the template on all the associated devices in the template, click **Bulk Reapply** and click **Confirm**.

The **Sync Status** can be either **Sync** or **Out-of-Sync**. If the status is displayed as **Sync**, it indicates that the template and device configurations are the same or in sync. If the status is displayed as **Out-of-Sync**, it indicates that there has been a change in configuration either on the device or in the template since the last time that the template was applied..

The association of the device with the template is not altered by the following conditions:

- Pending configuration changes on the device – The **Sync Status** does not change if there are pending configuration changes that have to be applied on the device.
- Deployment of pending configuration changes on the device – The **Sync Status** does not change after deployment of pending configuration changes on the device.

The table below shows the **Sync** and **Out-of-Sync** scenarios that may occur.

| Device Configurations Modified After Application of Template on Device | Template Configurations Modified After Application of Template on Device | Association Status |
|------------------------------------------------------------------------|--------------------------------------------------------------------------|--------------------|
| No                                                                     | No                                                                       | In Sync            |
| Yes                                                                    | No                                                                       | Out of Sync        |
| No                                                                     | Yes                                                                      | Out of Sync        |
| Yes                                                                    | Yes                                                                      | Out of Sync        |

## Generate a Template Apply Report

A **Template Apply Report** PDF is generated after the task to apply the template is completed. This report is generated on both successful and unsuccessful application of the template on the device. You will see a link to this report in the **Notifications > Tasks** window.

The **Template Apply Report** contains the following details:

- Template name
- Device model name
- Domain from which the template was applied
- Start and end time
- Status of the application of the template on the device
- Interface mapping information
- Variable values

There may be some configurations on the template that are not applied to the device due to incompatible device model or version. The report also contains details about such configurations. The report also contains any errors that are encountered when the application of the template fails. Application of a template on a device may fail due to any of the following reasons:

- Model mapping does not exist for the device model that is used.
- Values used for variables and network object overrides do not conform to routing policy or interface configuration rules. For example, the same IPv4 address has been used for two IPv4 address interface variables.
- Device or template is locked due to some other task that is being executed, such as application or modification of the template.

## Delete Device Template

Note that you cannot recover a template after deleting it. To backup template configurations, use the **Export** option explained in the [Import a Device Template, on page 109](#) section. To delete a device template, perform the procedure given below.

### Procedure

- 
- Step 1** Choose **Devices > Template Management**.
  - Step 2** Click the **More** (⋮) icon of the template that you want to delete.
  - Step 3** Click **Delete**.
  - Step 4** Click **Delete** again in the **Confirm Deletion** window.
- 

## Configure a Template for Threat Defense Devices Managed Using the Data Interface

To configure a template that you want to apply to a threat defense device that is managed using a data interface for management center connectivity, ensure that the connectivity parameters of the device match the template. This ensures that the Threat Defense device does not lose connectivity with the management center after application of the template. A template that you configure for threat defense devices managed using the data interface cannot be applied on devices that are not managed by the data interface.

The following is a list of connectivity parameters:

- Data interface used to manage the threat defense device. For example, **Ethernet1/1**.
- Name of the interface. For example, **outside**.
- IP address configured on the data interface. For example, DHCP or static IP.
- Route configured for the data interface. This can be a default or specific route defined on the data interface used for connectivity between the threat defense device and the management center.
- DDNS hostname configuration on the data interface.

If the connectivity parameters on the template do not match with the ones on the device, the template validation checks that are done to ensure that the template is successfully applied on the device will fail. The template is then not applied on the device. The template validation checks do not enforce an exact match for some parameters such as IP address or DDNS hostname. However, ensure that you configure such parameters to maintain connectivity between the threat defense device and the management center after deployment.

The following is a list of template validation checks done to ensure sanity of configurations that are required to manage the threat defense device using the data interface:

- You cannot apply a template in which manager access to the device is configured with the management interface to a device in which manager access to the device is configured with the data interface.

- You cannot apply a template in which manager access to the device is configured with the data interface to a device in which manager access to the device is configured with the management interface.
- You cannot apply a template in which manager access to the device is configured with the single WAN data interface to a device in which manager access to the device is configured with the dual WAN data interface.
- If any of the connectivity parameters do not match, you cannot apply a template in which manager access to the device is configured with the data interface to a device in which manager access to the device is configured with the data interface.

Perform the procedure given below to configure the template to manage threat defense devices using the data interface.

## Procedure

- 
- Step 1** Choose **Devices > Template Management**.
- Step 2** Click the **Edit** (✎) icon of the template that you want to configure to manage threat defense devices using the data interface.
- Step 3** Click the **Template Settings** tab.
- Step 4** In the **General** tile, toggle the **Manage device by Data Interface** button.
- Step 5** You will see a popup asking you to pick a data interface for manager access. Click **OK**.
- Step 6** Click the **Interfaces** tab.
- Step 7** Click the **Edit** icon of the data interface that you want to use for manager access. The first data interface – Ethernet1/1 (outside interface), is the data interface that is most commonly used for manager access.
- Step 8** In the **Edit Physical Interface** window, click the **Manager Access** tab.
- Step 9** Check the **Enable management access** checkbox.
- Step 10** Click **OK**. You will see that the interface that you selected for manager access has been marked with **Manager Access**.
- Step 11** Click the **DHCP** tab.
- Step 12** Click the **DDNS Update Methods** tab.
- Step 13** Click **+Add** to add a DDNS update method.
- Step 14** In the **Add DDNS Update Method** window, enter a **Method Name** and choose **FMC only**.
- Step 15** Set the **Update Interval** as per your requirement.
- Step 16** Click **OK**. You will see the method that you created in the **DDNS Update Methods** table.
- Step 17** Click the **DDNS Interface Settings** tab.
- Step 18** Click **+Add** to add dynamic DNS configuration.
- Step 19** In the **Add Dynamic DNS** configuration window, choose values for the following fields:
- **Interface** – Choose the interface enabled for manager access
  - **Method Name** – Choose the method that you created.
  - **Host Name** – Choose a variable for the hostname.

Do not edit the rest of the fields in this window.

- Step 20** Click **OK**. The **DDNS Interface Settings** table is populated with the entry that you created.
- Step 21** To configure the model mapping to ensure that the data interface set for manager access in the template matches the data interface selected for manager access on the device, click the **Template Settings** tab and click **Model Mapping**.
- Step 22** Click **Add Model Mapping**.
- Step 23** Choose the **Device Model** from the drop-down list.
- Step 24** Map the data interface that is set for manager access in the template to the appropriate data interface on the device by choosing the interface from the **Model Interface** drop-down list.
- Step 25** Click **Save**. The interface mappings are listed along with the device model and mapping status on the **Model Mapping** window. You can now apply the template on a device that is managed using the data interface.
- 

## Device Template Operations on Threat Defense High Availability Devices

You can apply device templates on threat defense High Availability (HA) devices after device registration. Failover configurations are not supported in device templates. Any failover configurations and monitored interfaces that are already part of the target HA device pair configurations are not modified. You cannot map any template interfaces to failover interfaces.

You can generate a device template from an HA device pair. Template operations such as application of template on device, template generation, import, and export of template, can be performed only on primary or active HA devices. You cannot perform these operations on secondary or standby devices.

## Audit Logs

Logs related to application of the device template, configuration updates, device template creation, and deletion, are logged under audit logs. The device template audit logs are added to the log both at the start and at the end of the task to apply the template on the device.

An audit diff file is also generated that enables you to view configuration changes that have been done during application of the template on the device. Perform the procedure given below to view the diff file.

### Procedure

---

- Step 1** Choose **System > Monitoring > Audit**.
- Step 2** The device template logs are logged under the subsystem **Devices > Template Management**. Click the **diff** icon to open a new window that displays the configuration changes that have been done during the application of the template on the device.
-

## Device Templates in Domains

Device templates can exist in any domain. If you are in the child domain, you have read-only access to the templates above you in the domain hierarchy. You can apply a template to a device from its domain or its parent domains. You can generate a template from a device and apply that template to a device in any domain in the domain hierarchy.

A domain hierarchy sample is given below along with a table displaying the supported device template application and generation scenarios.

Consider the following scenario:

- Domain A and B are child domains of the Global domain.
- Domain A1 is the child domain of Domain A.

| Template Domain | Device Domain | Device Template Application/Generation Supported |
|-----------------|---------------|--------------------------------------------------|
| Global          | A1            | Yes                                              |
| Global          | B             | Yes                                              |
| A               | A1            | Yes                                              |
| A               | B             | No                                               |
| B               | A1            | No                                               |
| B               | B             | Yes                                              |
| A1              | A1            | Yes                                              |
| A1              | B             | No                                               |

### Domains and VPN Connections

- You can define a template in a global or child/leaf domain. However, you can define a VPN topology only in a leaf domain.
- You can configure VPN connections in a template for all domains. During template application, VPN connections are applied to the device only if the device is in the same domain as the VPN topology.

A domain hierarchy sample is given below along with a table displaying the supported device template application and generation scenarios.

Consider the following scenario:

- Domain A and B are child domains of the Global domain.
- Domain A1 is the child domain of Domain A.
- VPN A is part of Domain A1.
- VPN B is part of Domain B.

| Template Domain | VPN Topology in the Template | Device Domain | Device Template Application/Generation Supported |
|-----------------|------------------------------|---------------|--------------------------------------------------|
| Global          | VPN A<br>VPN B               | A1            | No                                               |
| Global          | VPN B                        | B             | Yes                                              |
| A               | VPN A                        | A1            | Yes                                              |
| B               | VPN B                        | A1            | No                                               |
| B               | VPN B                        | B             | Yes                                              |
| A1              | VPN A                        | A1            | Yes                                              |

## Troubleshooting Device Templates

### Initial Troubleshooting

For initial troubleshooting, we recommend looking at the information in the Template Apply Report and notifications that come up on the Management Center UI when you run into an error. The management center log files also contain detailed debugging and troubleshooting info.

Follow the procedure given below for initial troubleshooting.

1. Check the errors mentioned in the **Template Apply Report**. For more information, see [Generate a Template Apply Report](#).
2. Review variable values and check for overlaps and incompatibilities.
3. Check model mappings to ensure if the correct model mappings exist. Delete or add mappings accordingly.
4. See the management center audit logs to find any other issues and resolve them.

Consider the following error scenario. In a device template, the inside interface is configured with a static IPv4 variable - *\$insideIPv4*.

The BGP IPv4 address is configured with an IPv4 BGP neighbor.

An overlapping IPv4 address is configured for the BGP neighbor and an interface.

Due to the issues mentioned above, the application of the device template fails and an error is displayed.

To troubleshoot this error, identify the error from the notification displayed on the UI.

```
IP Address 192.168.10.1 same as ip address of interface - 'inside' (Ethernet1/1)
```

Check the **Template Apply Report** for more information.

Enter correct values for the variables and apply the template again to ensure successful application of the template on the device.

### Troubleshoot Device Registration

- Issue: Admin Password is incorrect or not provided during registration

Scenario: If the admin password is not set on the device and if you have not provided the admin password during registration, the threat defense device provisioning will fail. In such a scenario, a *Provision Error* along with an **Enter Password** link is displayed.

Workaround: Click **Enter Password** to enter a new password and click **Save**. Click **Confirm and Proceed** to trigger the onboarding again.

- If the admin password is already set on the device and you provide another admin password during registration, device provisioning will fail.
- Issue: Device registration in management center fails

Workaround: Follow existing device registration troubleshooting steps. For more information, see [Configure, Verify, and Troubleshoot Firepower Device Registration](#).

- Issue: Bulk Registration Request Fails in management center

Scenario: The bulk registration request can fail due to a few scenarios:

- You do not have the required permissions to perform template-related operations
- Template is not visible from the request domain
- Invalid CSV file provided

Workaround: You can see logs for these errors in the VMS Shared and USM Shared log files. Fix the errors and initiate registration again.

- Issue: Device provisioning fails in CDO due to some generic errors, such as communication with the device fails

Workaround: Click **Retry** in the Provision Error to trigger the onboarding in CDO again. You can also see the CDO workflows for more information on the error and troubleshooting information.

### Troubleshoot Cisco Security Cloud Integration

Issue: Cisco Security cloud integration not successful

Workaround: Follow Cisco Security Cloud integration troubleshooting steps. For more information, see [Cisco Security Cloud Integration](#).

### Troubleshoot Device Template Configuration Issues

Issue: Device template misconfigurations causing deployment failures after registration

Workaround: Follow the steps given below for initial troubleshooting.

1. Check the errors mentioned in the Template Apply Report.
2. Review variable values and check for overlaps and incompatibilities.
3. Check model mappings to ensure if the correct model mappings exist. Delete or add mappings accordingly.
4. See the management center audit logs to find any other issues and resolve them.

### Troubleshoot CDO Issues

- Issue: Device with serial number already claimed

Workaround: Verify serial number and reinitiate onboarding.

- Issue: CDO fails to claim devices

Workaround: Select the device in the CDO Inventory window for more details on the error. You can see logs related to device claim issues in the VMS Shared and USM Shared log files. Click **Retry** to initiate registration again.

- Issue: Communication failures between management center and Security Cloud Control

Scenario: Communication failures between management center and Security Cloud Control can cause failures during the Zero-Touch Provisioning (ZTP) device registration request.

Workaround: Refresh the ZTP device status, retry ZTP registration, and delete the ZTP device. You can see logs regarding communication failure between the management center and Security Cloud Control in the Auth Daemon logs. For operational failures related to ZTP, you can see the logs in the VMS Shared and USM Shared log files.

## History for Device Management using Device Templates

| Feature                                  | Minimum Management Center | Minimum Threat Defense | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|------------------------------------------|---------------------------|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## CHAPTER 7

# Device Settings

---

After you add a device, you can edit device-related settings on the **Device** page.

1. Choose **Devices** > **Device Management**.
2. Next to the device you want to modify, click **Edit** (✎).
3. Click **Device**.
  - [Edit General Settings, on page 137](#)
  - [Edit License Settings, on page 144](#)
  - [View System Information, on page 145](#)
  - [View the Inspection Engine, on page 145](#)
  - [View Health Information, on page 145](#)
  - [Edit Management Settings, on page 146](#)
  - [View Inventory Details, on page 190](#)
  - [Edit Applied Policies, on page 190](#)
  - [Edit Advanced Settings, on page 192](#)
  - [Edit Deployment Settings, on page 195](#)
  - [Edit Cluster Health Monitor Settings, on page 198](#)
  - [History for Device Settings, on page 204](#)

## Edit General Settings

The **General** section of the **Device** page displays the settings described in the table below.

Figure 4: General

| General                  |                                                                                                                     |
|--------------------------|---------------------------------------------------------------------------------------------------------------------|
| Name:                    | Thing 1                                                                                                             |
| Transfer Packets:        | Yes                                                                                                                 |
| Mode:                    | Routed                                                                                                              |
| Compliance Mode:         | None                                                                                                                |
| Performance Profile:     | Default                                                                                                             |
| TLS Crypto Acceleration: | Disabled                                                                                                            |
| Device Configuration:    | <input type="button" value="Import"/> <input type="button" value="Export"/> <input type="button" value="Download"/> |

Table 4: General Section Table Fields

| Field                    | Description                                                                                                                                                                                             |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name                     | The display name of the device on the management center.                                                                                                                                                |
| Transfer Packets         | This displays whether or not the managed device sends packet data with the events to the management center.                                                                                             |
| Mode                     | The displays the mode of the management interface for the device: <b>routed</b> or <b>transparent</b> .                                                                                                 |
| Compliance Mode          | This displays the security certifications compliance for a device. Valid values are CC, UCAPL and None.                                                                                                 |
| Performance Profile      | This displays the core allocation performance profile for the device, as configured in the platform settings policy.                                                                                    |
| TLS Crypto Acceleration: | Shows whether TLS crypto acceleration is enabled or disabled.                                                                                                                                           |
| Device Configuration     | Lets you copy, export, or import a configuration. See <a href="#">Copy a Configuration to Another Device, on page 139</a> and <a href="#">Export and Import the Device Configuration, on page 140</a> . |
| OnBoarding Method        | Shows whether the device was registered using a registration key or using the serial number (zero-touch provisioning).                                                                                  |

You can edit some of these settings from this section.

## Procedure

- 
- Step 1** Choose **Devices > Device Management**.
- Step 2** Next to the device you want to modify, click **Edit** (✎).

- Step 3** Click **Device**.
- Step 4** In the **General** section, click **Edit** (✎).
- Enter a **Name** for the managed device.
  - Check **Transfer Packets** to allow packet data to be stored with events on the management center.
  - Click **Force Deploy** to force deployment of current policies and device configuration to the device.
- Note** Force-deploy consumes more time than the regular deployment since it involves the complete generation of the policy rules to be deployed on the threat defense.
- Step 5** For **Device Configuration** actions, see [Copy a Configuration to Another Device, on page 139](#) and [Export and Import the Device Configuration, on page 140](#).
- Step 6** Click **Deploy**.
- 

#### What to do next

- Deploy configuration changes.

## Copy a Configuration to Another Device

When a new device is deployed in the network you can easily copy configurations and policies from a pre-configured device, instead of manually reconfiguring the new device.

#### Before you begin

Confirm that:

- The source and destination threat defense devices are the same model and are running the same version of the software.
- The source is either a standalone Secure Firewall Threat Defense device or a Secure Firewall Threat Defense high availability pair.
- The destination device is a standalone threat defense device.
- The source and destination threat defense devices have the same number of physical interfaces.
- The source and destination threat defense devices are in the same firewall mode - routed or transparent.
- The source and destination threat defense devices are in the same security certifications compliance mode.
- The source and destination threat defense devices are in the same domain.
- Configuration deployment is not in progress on either the source or the destination threat defense devices.

#### Procedure

---

- Step 1** Choose **Devices > Device Management**.

**Step 2** Next to the device you want to modify, click **Edit** (✎).

**Step 3** Click **Device**.

**Step 4** In the **General** section, do one of the following:

- Click **Get Device Configuration** (↓) to copy device configuration from another device to the new device. On the **Get Device Configuration** page, select the source device in the **Select Device** drop-down list.
- Click **Push Device Configuration** (↑) to copy device configuration from the current device to the new device. On the **Push Device Configuration** page, select the destination to which configuration is to be copied in the **Target Device** drop-down list.

**Step 5** (Optional) Check **Include shared policies configuration** check box to copy policies.

Shared policies like AC policy, NAT, Platform Settings and FlexConfig policies can be shared across multiple devices.

**Step 6** Click **OK**.

You can monitor the status of the copy device configuration task on **Tasks** in the Message Center.

---

When the copy device configuration task is initiated, it erases the configuration on the target device and copies the configuration of the source device to the destination device.

---

**Warning** When you have completed the copy device configuration task, you cannot revert the target device to its original configuration.

---

## Export and Import the Device Configuration

You can export all of the the device-specific configuration configurable on the Device pages, including:

- Interfaces
- Inline Sets
- Routing
- DHCP
- VTEP
- Associated objects

You can then import the saved configuration for the same device in the following use cases:

- Moving the device to a different management center—First unregister the device from the original management center, then add the device to the new management center. Then you can import the saved configuration.
- Restore an old configuration—If you deployed changes that negatively impacted the operation of the device, you can import a backup copy of a known working configuration to restore a previous operational state.

- Reregistering a device—If you unregister a device from the management center, but then want to add it back, you can import the saved configuration.

See the following guidelines:

- You can only import the configuration to the same device (the UUID must match). You cannot import a configuration to a different device, even if it is the same model.
- Do not change the version running on the device between exporting and importing; the version must match.
- If an object doesn't exist, it will be created. If an object exists, but the value is different, see below:

**Table 5: Object Import Action**

| Scenario                                              | Import Action                                                                                                                                                                                                                                                                                                                                                                                                              |
|-------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Object exists with the same name and value.           | Reuse existing objects.                                                                                                                                                                                                                                                                                                                                                                                                    |
| Object exists with the same name but different value. | Network and Port objects: Create object overrides for this device. See <a href="#">Object Overrides, on page 1460</a> .<br>Interface objects: Create new objects. For example, if both the type (security zone or interface group) and the interface type (routed or switched, for example) do not match, then a new object is created.<br>All other objects: Reuse existing objects even though the values are different. |
| Object doesn't exist.                                 | Create new object.s                                                                                                                                                                                                                                                                                                                                                                                                        |

## Procedure

- 
- Step 1** Choose **Devices > Device Management**.
  - Step 2** Next to the device you want to edit, click **Edit** (✎).
  - Step 3** Click **Device**.
  - Step 4** Export the configuration.
    - a) In the **General** area, click **Export**.

Figure 5: Export Device Configuration

| General                  |                                                                                                                     |
|--------------------------|---------------------------------------------------------------------------------------------------------------------|
| Name:                    | 192.168.0.197 FTDv                                                                                                  |
| Transfer Packets:        | Yes                                                                                                                 |
| Mode:                    | Routed                                                                                                              |
| Compliance Mode:         | None                                                                                                                |
| TLS Crypto Acceleration: | Disabled                                                                                                            |
| Device Configuration:    | <input type="button" value="Import"/> <input type="button" value="Export"/> <input type="button" value="Download"/> |

You are prompted to acknowledge the export; click **OK**.

Figure 6: Acknowledge Export

Device Configuration Export

---

Device configuration export task initiated. View the progress of task from Tasks view.

You can view the export progress in the **Tasks** page.

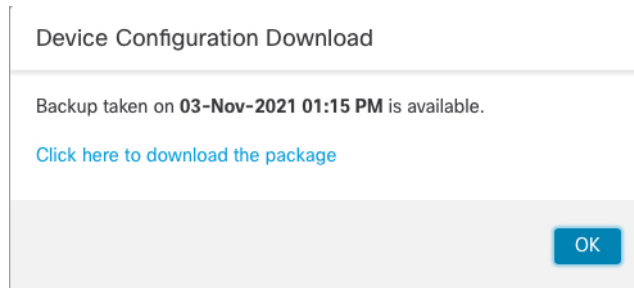

- b) On the **Notifications > Tasks** page, ensure that the export has completed; click **Download Export Package**. Alternatively, you can click the **Download** button in the **General** area.

Figure 7: Export Task

| Deployments                                                                                                                                                                                                                                                                | Upgrades  | Health    | Tasks                  |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------|-----------|------------------------|
| 20+ total                                                                                                                                                                                                                                                                  | 0 waiting | 0 running | 0 retrying 20+ success |
| <div style="display: flex; align-items: center;"> <span style="color: green; font-weight: bold; margin-right: 5px;">✓</span> <div> <p>Device Configuration Export</p> <p>Export file created successfully</p> <p><a href="#">Download Export Package</a></p> </div> </div> |           |           |                        |

You are prompted to download the package; click **Click here to download the package** to save the file locally, and then click **OK** to exit the dialog box.

**Figure 8: Download Package**

**Step 5** Import the configuration.

a) In the **General** area, click **Import**.

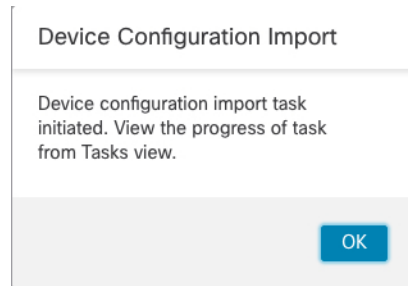

**Figure 9: Import Device Configuration**

You are prompted to acknowledge that the current configuration will be replaced. Click **Yes**, and then navigate to the configuration package (with the suffix `.sfo`; note that this file is different from the Backup/Restore files).

**Figure 10: Import Package****Figure 11: Navigate to Package**

You are prompted to acknowledge the import; click **OK**.

Figure 12: Acknowledge Import

You can view the import progress in the **Tasks** page.

- b) View the import reports so you can see what was imported. On the **Notifications > Tasks** page for the import task, click **View Import Report**.

Figure 13: View Import Report

The **Device Configuration Import Reports** page provides links to available reports.

## Cisco Firepower Management Center

### Device Configuration Import Reports

| Device                               | Shared Policies       | Device Configurations                               |
|--------------------------------------|-----------------------|-----------------------------------------------------|
| 0434ef00-15bb-11ec-bb94-93bdde3ad19d | Report does not exist | <a href="#">Device configurations import report</a> |

## Edit License Settings

The **License** section of the **Device** page displays the licenses enabled for the device.

You can enable licenses on your device if you have available licenses on your management center.

### Procedure

- Step 1** Choose **Devices > Device Management**.
- Step 2** Next to the device where you want to enable or disable licenses, click **Edit** (✎).

- Step 3** Click **Device**.
- Step 4** In the **License** section, click **Edit** (✎).
- Step 5** Check or clear the check box next to the license you want to enable or disable for the managed device.
- Step 6** Click **Save**.

#### What to do next

- Deploy configuration changes.

## View System Information

The System section of the **Device** page displays a read-only table of system information, as described in the following table.

You can also shut down or restart the device.

**Table 6: System Section Table Fields**

| Field                                  | Description                                                                                    |
|----------------------------------------|------------------------------------------------------------------------------------------------|
| Model                                  | The model name and number for the managed device.                                              |
| Serial                                 | The serial number of the chassis of the managed device.                                        |
| Time                                   | The current system time of the device.                                                         |
| Time Zone                              | Shows the time zone.                                                                           |
| Version                                | The version of the software currently installed on the managed device.                         |
| Time Zone setting for time-based rules | The current system time of the device, in the time zone specified in device platform settings. |

## View the Inspection Engine

The Inspection Engine section of the **Device** page shows whether your device uses Snort2 or Snort3. To switch the inspection engine, see *Enable Snort 3 on an Individual Device* in the [Cisco Secure Firewall Management Center Snort 3 Configuration Guide](#).

## View Health Information

The **Health** section of the **Device** page displays the information described in the table below.

Table 7: Health Section Table Fields

| Field    | Description                                                                                                                       |
|----------|-----------------------------------------------------------------------------------------------------------------------------------|
| Status   | An icon that represents the current health status of the device. Clicking the icon displays the Health Monitor for the appliance. |
| Policy   | A link to a read-only version of the health policy currently deployed at the device.                                              |
| Excluded | A link to the Health Exclude page, where you can enable and disable health exclusion modules.                                     |

## Edit Management Settings

You can edit management settings in the **Management** area.

### Update the Hostname or IP Address in the Management Center

If you edit the hostname or IP address of a device after you added it to the management center (using the device's CLI, for example), you need to use the procedure below to manually update the hostname or IP address on the managing management center.

To change the device management IP address on the device, see [Modify Threat Defense Management Interfaces at the CLI, on page 169](#).

If you used only the NAT ID when registering the device, then the IP shows as **NO-IP** on this page, and you do not need to update the IP address/hostname.

If you used zero-touch provisioning to register the device on the outside interface, the hostname is automatically generated along with a matching DDNS configuration; you cannot edit the hostname in this case.

#### Procedure

- 
- Step 1** Choose **Devices > Device Management**.
  - Step 2** Next to the device where you want to modify management options, click **Edit** (✎).
  - Step 3** Click **Device**, and view the **Management** area.
  - Step 4** Disable management temporarily by clicking the slider so it is disabled **Slider disabled** ().

**Figure 14: Disable Management**

| Management  |                                                                                     |
|------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------|
| Remote Host Address:                                                                           | 10.89.5.29                                                                          |
| Secondary Address:                                                                             |                                                                                     |
| Status:                                                                                        |  |
| Manager Access Interface:                                                                      | <a href="#">Data Interface</a>                                                      |
| Manager Access Details:                                                                        | <a href="#">Configuration</a>                                                       |

You are prompted to proceed with disabling management; click **Yes**.

**Disable Management**

Managing this device will not be possible if its Management IP is disabled. Do you want to proceed? You can enable it later.

Disabling management blocks the connection between the management center and the device, but does **not** unregister the device from the management center.

- Step 5** Edit the **Remote Host Address** IP address and optional **Secondary Address** (when using a redundant data interface) or hostname by clicking **Edit** ()

**Figure 15: Edit Management Address**

| Management  |                                                                                       |
|--------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------|
| Remote Host Address:                                                                             | 10.89.5.29                                                                            |
| Secondary Address:                                                                               |                                                                                       |
| Status:                                                                                          |  |
| Manager Access Interface:                                                                        | <a href="#">Data Interface</a>                                                        |
| Manager Access Details:                                                                          | <a href="#">Configuration</a>                                                         |

- Step 6** In the **Management** dialog box, modify the name or IP address in the **Remote Host Address** field and the optional **Secondary Address** field, and click **Save**.

For information about using a secondary manager access data interface, see [Configure a Redundant Manager Access Data Interface, on page 164](#).

Figure 16: Management IP Address

**Step 7** Reenable management by clicking the slider so it is enabled **Slider enabled** ()

Figure 17: Enable Management Connection

## Change Both Management Center and Threat Defense IP Addresses

You might want to change both management center and threat defense IP addresses if you need to move them to a new network.

### Procedure

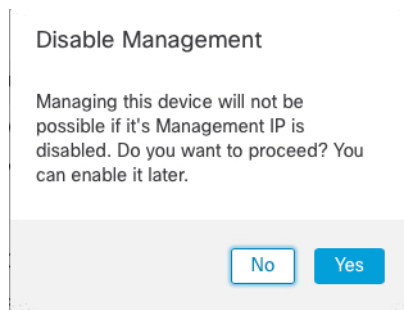

**Step 1** Disable the management connection.

For a high-availability pair or cluster, perform these steps on all units.

- a) Choose **Devices > Device Management**.
- b) Next to the device, click **Edit** ()
- c) Click **Device**, and view the **Management** area.
- d) Disable management temporarily by clicking the slider so it is disabled ()

**Figure 18: Disable Management**

You are prompted to proceed with disabling management; click **Yes**.

**Step 2** Change the device IP address in the management center to the new device IP address.

You will change the IP address on the device later.

For a high-availability pair or cluster, perform these steps on all units.

- Edit the **Remote Host Address** IP address and optional **Secondary Address** (when using a redundant data interface) or hostname by clicking **Edit** (✎).

**Figure 19: Edit Management Address**

- In the **Management** dialog box, modify the name or IP address in the **Remote Host Address** field and the optional **Secondary Address** field, and click **Save**.

Figure 20: Management IP Address

**Step 3** Change the management center IP address.

**Caution** Be careful when making changes to the management center interface to which you are connected; if you cannot re-connect because of a configuration error, you need to access the management center console port to re-configure the network settings in the Linux shell. You must contact Cisco TAC to guide you in this operation.

- a) Choose **System** (⚙) > **Configuration**, and then choose **Management Interfaces**.
- b) In the **Interfaces** area, click **Edit** next to the interface that you want to configure.
- c) Change the IP address, and click **Save**.

**Step 4** Change the manager IP address on the device.

For a high-availability pair or cluster, perform these steps on all units.

- a) At the threat defense CLI, view the management center identifier.

**show managers**

**Example:**

```
> show managers
Type                : Manager
Host                : 10.10.1.4
Display name       : 10.10.1.4
Identifier          : f7ffad78-bf16-11ec-a737-baa2f76ef602
Registration       : Completed
Management type    : Configuration
```

- b) Edit the management center IP address or hostname.

**configure manager edit** *identifier* {**hostname** *{ip\_address | hostname}* | **displayname** *display\_name*}

If the management center was originally identified by **DONTRESOLVE** and a NAT ID, you can change the value to a hostname or IP address using this command. You cannot change an IP address or hostname to **DONTRESOLVE**.

**Example:**

```
> configure manager edit f7ffad78-bf16-11ec-a737-baa2f76ef602 hostname 10.10.5.1
```

**Step 5** Change the IP address of the manager access interface at the console port.

For a high-availability pair or cluster, perform these steps on all units.

If you use the dedicated Management interface:

**configure network ipv4**

**configure network ipv6**

If you use the dedicated Management interface:

**configure network management-data-interface disable**

**configure network management-data-interface**

**Step 6** Reenable management by clicking the slider so it is enabled (.

For a high-availability pair or cluster, perform these steps on all units.

**Figure 21: Enable Management Connection**

**Step 7** (If using a data interface for manager access) Refresh the data interface settings in the management center.

For a high-availability pair, perform this step on both units.

- Choose **Devices > Device Management > Device > Management > Manager Access - Configuration Details**, and click **Refresh**.
- Choose **Devices > Device Management > Interfaces**, and set the IP address to match the new address.
- Return to the **Manager Access - Configuration Details** dialog box, and click **Acknowledge** to remove the deployment block.

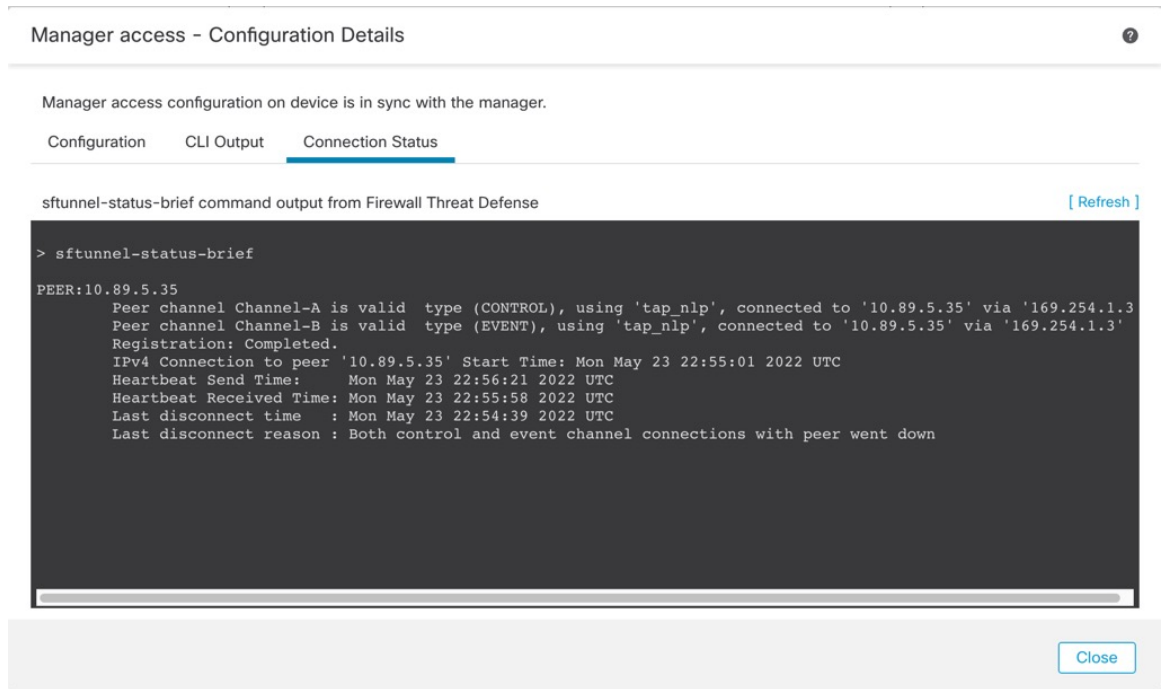

**Step 8** Ensure the management connection is reestablished.

In the management center, check the management connection status on the **Devices > Device Management > Device > Management > Manager Access - Configuration Details > Connection Status** page.

At the threat defense CLI, enter the **sftunnel-status-brief** command to view the management connection status.

The following status shows a successful connection for a data interface, showing the internal "tap\_nlp" interface.

Figure 22: Connection Status

- Step 9** (For a high-availability management center pair) Repeat configuration changes on the secondary management center.
- Change the secondary management center IP address.
  - Specify the new peer addresses on both units.
  - Make the secondary unit the active unit.
  - Disable the device management connection.
  - Change the device IP address in the management center.
  - Reenable the management connection.

## Change the Manager Access Interface from Management to Data

You can manage the threat defense from either the dedicated Management interface, or from a data interface. If you want to change the manager access interface after you added the device to the management center, follow these steps to migrate from the Management interface to a data interface. To migrate the other direction, see [Change the Manager Access Interface from Data to Management, on page 156](#).

Initiating the manager access migration from Management to data causes the management center to apply a block on deployment to the threat defense. To remove the block, enable manager access on the data interface.

See the following steps to enable manager access on a data interface, and also configure other required settings.

## Before you begin

For high-availability pairs, unless stated otherwise, perform all steps only on the active unit. Once the configuration changes are deployed, the standby unit synchronizes configuration and other state information from the active unit.

## Procedure

### Step 1

Initiate the interface migration.

- a) On the **Devices > Device Management** page, click **Edit** (✎) for the device.
- b) Go to the **Device > Management** section, and click the link for **Manager Access Interface**.

The **Manager Access Interface** field shows the current Management interface. When you click the link, choose the new interface type, **Data Interface**, in the **Manage device by** drop-down list.

*Figure 23: Manager Access Interface*

Manager Access Interface

This is an advanced setting and need to be configured only if needed.  
See the [online help](#) for detailed steps.

Manage device by

Data Interface

Switching the manager access interface from Management to Data interface causes the deployment to be blocked. To unblock the deploy, pick a data interface and enable it for manager Access. See the [online help](#) for detailed steps.

Close Save

- c) Click **Save**.

You must now complete the remaining steps in this procedure to enable manager access on the data interface. The **Management** area now shows **Manager Access Interface: Data Interface**, and **Manager Access Details: Configuration**.

Figure 24: Manager Access

If you click **Configuration**, the **Manager Access - Configuration Details** dialog box opens. The **Manager Access Mode** shows a Deploy pending state.

**Step 2** Enable manager access on a data interface on the **Devices > Device Management > Interfaces > Edit Physical Interface > Manager Access** page.

See [Configure Routed Mode Interfaces, on page 985](#). You can enable manager access on one routed data interface, plus an optional secondary interface. Make sure these interfaces are fully configured with a name and IP address and that they are enabled.

If you use a secondary interface for redundancy, see [Configure a Redundant Manager Access Data Interface, on page 164](#) for additional required configuration.

**Step 3** (Optional) If you use DHCP for the interface, enable the web type DDNS method on the **Devices > Device Management > DHCP > DDNS** page.

See [Configure Dynamic DNS, on page 1045](#). DDNS ensures the management center can reach the threat defense at its Fully-Qualified Domain Name (FQDN) if the FTD's IP address changes.

**Step 4** Make sure the threat defense can route to the management center through the data interface; add a static route if necessary on **Devices > Device Management > Routing > Static Route**.

See [Add a Static Route, on page 1268](#).

**Step 5** (Optional) Configure DNS in a Platform Settings policy, and apply it to this device at **Devices > Platform Settings > DNS**.

See [DNS, on page 1075](#). DNS is required if you use DDNS. You may also use DNS for FQDNs in your security policies.

**Step 6** (Optional) Enable SSH for the data interface in a Platform Settings policy, and apply it to this device at **Devices > Platform Settings > Secure Shell**.

See [SSH Access, on page 1089](#). SSH is not enabled by default on the data interfaces, so if you want to manage the threat defense using SSH, you need to explicitly allow it.

**Step 7** Deploy configuration changes.

The management center will deploy the configuration changes over the current Management interface. After the deployment, the data interface is now ready for use, but the original management connection to Management is still active.

**Step 8** At the threat defense CLI (preferably from the console port), set the Management interface to use a static IP address and set the gateway to use the data interfaces. For high availability, perform this step on both units.

```
configure network {ipv4 | ipv6} manual ip_address netmask data-interfaces
```

- *ip\_address netmask*—Although you do not plan to use the Management interface, you must set a static IP address, for example, a private address so that you can set the gateway to **data-interfaces** (see the next bullet). You cannot use DHCP because the default route, which must be **data-interfaces**, might be overwritten with one received from the DHCP server.
- **data-interfaces**—This setting forwards management traffic over the backplane so it can be routed through the manager access data interface.

We recommend that you use the console port instead of an SSH connection because when you change the Management interface network settings, your SSH session will be disconnected.

- Step 9** If necessary, re-cable the threat defense so it can reach the management center on the data interface. For high availability, perform this step on both units.
- Step 10** In the cloud-delivered Firewall Management Center, disable the management connection for the threat defense in the **Devices > Device Management > Device > Management** section, and then reenables the connection.
- Step 11** Ensure the management connection is reestablished.

In the management center, check the management connection status on the **Devices > Device Management > Device > Management > Manager Access - Configuration Details > Connection Status** page.

At the threat defense CLI, enter the **sftunnel-status-brief** command to view the management connection status.

The following status shows a successful connection for a data interface, showing the internal "tap\_nlp" interface.

**Figure 25: Connection Status**

Manager access - Configuration Details

Manager access configuration on device is in sync with the manager.

Configuration CLI Output **Connection Status**

sftunnel-status-brief command output from Firewall Threat Defense [ Refresh ]

```
> sftunnel-status-brief
PEER:10.89.5.35
Peer channel Channel-A is valid type (CONTROL), using 'tap_nlp', connected to '10.89.5.35' via '169.254.1.3'
Peer channel Channel-B is valid type (EVENT), using 'tap_nlp', connected to '10.89.5.35' via '169.254.1.3'
Registration: Completed.
IPv4 Connection to peer '10.89.5.35' Start Time: Mon May 23 22:55:01 2022 UTC
Heartbeat Send Time: Mon May 23 22:56:21 2022 UTC
Heartbeat Received Time: Mon May 23 22:55:58 2022 UTC
Last disconnect time : Mon May 23 22:54:39 2022 UTC
Last disconnect reason : Both control and event channel connections with peer went down
```

Close

If it takes more than 10 minutes to reestablish the connection, you should troubleshoot the connection. See [Troubleshoot Management Connectivity on a Data Interface, on page 180](#).

---

## Change the Manager Access Interface from Data to Management

You can manage the threat defense from either the dedicated Management interface, or from a data interface. If you want to change the manager access interface after you added the device to the management center, follow these steps to migrate from a data interface to the Management interface. To migrate the other direction, see [Change the Manager Access Interface from Management to Data, on page 152](#).

Initiating the manager access migration from data to Management causes the management center to apply a block on deployment to the threat defense. You must disable manager access on the data interface to remove the block.

See the following steps to disable manager access on a data interface, and also configure other required settings.

### Before you begin

For high-availability pairs, unless stated otherwise, perform all steps only on the active unit. Once the configuration changes are deployed, the standby unit synchronizes configuration and other state information from the active unit.

### Procedure

---

**Step 1** Initiate the interface migration.

- a) On the **Devices > Device Management** page, click **Edit** (✎) for the device.
- b) Go to the **Device > Management** section, and click the link for **Manager Access Interface**.

The **Manager Access Interface** field shows the current management interface as data. When you click the link, choose the new interface type, **Management Interface**, in the **Manage device by** drop-down list.

Figure 26: Manager Access Interface

Manager Access Interface

This is an advanced setting and need to be configured only if needed. See the [online help](#) for detailed steps.

Manage device by  
Management Interface

Switching the manager access interface from Data to Management causes the deployment to be blocked. To unblock the deployment, ensure none of the data interfaces are set for manager access. See the [online help](#) for detailed steps.

Close Save

c) Click **Save**.

You must now complete the remaining steps in this procedure to enable manager access on the Management interface. The **Management** area now shows the **Manager Access Interface: Management Interface**, and **Manager Access Details: Configuration**.

Figure 27: Manager Access

Management

Remote Host Address: 10.10.1.12

Secondary Address:

Status: ✔

Manager Access Interface: Management Interface

If you click **Configuration**, the **Manager Access - Configuration Details** dialog box opens. The **Manager Access Mode** shows a Deploy pending state.

**Step 2** Disable manager access on the data interface(s) on the **Devices > Device Management > Interfaces > Edit Physical Interface > Manager Access** page.

See [Configure Routed Mode Interfaces, on page 985](#). This step removes the block on deployment.

**Step 3** If you have not already done so, configure DNS settings for the data interface in a Platform Setting policy, and apply it to this device at **Devices > Platform Settings > DNS**.

See [DNS, on page 1075](#). The management center deployment that disables manager access on the data interface will remove any local DNS configuration. If that DNS server is used in any security policy, such as an FQDN in an Access Rule, then you must re-apply the DNS configuration using the management center.

**Step 4** Deploy configuration changes.

The management center will deploy the configuration changes over the current data interface.

**Step 5** If necessary, re-cable the threat defense so it can reach the management center on the Management interface. For High Availability, perform this step on both units.

**Step 6** At the threat defense CLI, configure the Management interface IP address and gateway using a static IP address or DHCP. For high availability, perform this step on both units.

When you originally configured the data interface for manager access, the Management gateway was set to data-interfaces, which forwarded management traffic over the backplane so it could be routed through the manager access data interface. You now need to set an IP address for the gateway on the management network.

**Static IP address:**

```
configure network {ipv4 | ipv6} manual ip_address netmask gateway_ip
```

**DHCP:**

```
configure network {ipv4 | ipv6} dhcp
```

**Step 7** In the cloud-delivered Firewall Management Center, disable the management connection for the threat defense in the **Devices > Device Management > Device > Management** section, and then reenables the connection.

**Step 8** Ensure the management connection is reestablished.

In the management center, check the management connection status on the **Devices > Device Management > Device > Management > Status** field or view notifications in the management center.

At the threat defense CLI, enter the `sftunnel-status-brief` command to view the management connection status.

If it takes more than 10 minutes to reestablish the connection, you should troubleshoot the connection. See [Troubleshoot Management Connectivity on a Data Interface, on page 180](#).

---

## Change the Manager Access Interface from Management to Data in a High Availability Pair

You can manage the FTD from either the dedicated Management interface, or from a data interface. If you want to change the Cisco Security Cloud Control access interface after you added the device to Security Cloud Control, follow these steps to migrate from the Management interface to a data interface. To migrate the other direction, see [Change the Manager Access Interface from Data to Management in a High Availability Pair, on page 162](#).

Initiating the Security Cloud Control access migration from Management to data causes the Security Cloud Control to apply a block on deployment to the FTD. To remove the block, enable Security Cloud Control access on the data interface.

**Note** Unless stated otherwise, perform all steps mentioned in this section only on the active unit. Once the configuration changes are deployed, the standby unit synchronizes configuration and other state information from the active unit.

See the following steps to enable Security Cloud Control access on a data interface, and also configure other required settings.

### Before you begin

Model Support—Threat Defense

## Procedure

**Step 1** Initiate the interface migration.

- a) In the navigation bar, click **Inventory**.
- b) Click the **FTD** tab.
- c) Select the active device and in the **Management** pane on the right, click **Device Summary**.
- d) Under the **Management** area, click the link for **Manager Access Interface**.

The **Manager Access Interface** field shows the current management interface. When you click the link, choose the new interface type, **Data Interface**, in the **Manage device by** drop-down list.

**Note** The link is unavailable for the standby unit as the access interface can be changed on the active unit.

- e) Click **Save**.

You must now complete the remaining steps in this procedure to enable Security Cloud Control access on the data interface. The **Management** area now shows **Manager Access Interface: Data Interface**, and **Manager Access Details: Configuration**.

Figure 28: Manager Access

If you click **Configuration**, the **Manager Access - Configuration Details** dialog box opens. The **Manager Access Mode** shows a Deploy pending state.

**Step 2** Enable Security Cloud Control access on a data interface on the **Devices > Device Management > Interfaces > Edit Physical Interface > Manager Access** page.

See [Configure Routed Mode Interfaces](#). You can enable Security Cloud Control access on one routed data interface. Make sure this interface is fully configured with a name and IP address and that it is enabled.

**Step 3** Make sure the FTD can route to the Security Cloud Control through the data interface; add a static route if necessary on **Devices > Device Management > Routing > Static Route**.

See [Add a Static Route, on page 1268](#).

**Step 4** (Optional) Configure DNS in a Platform Settings policy, and apply it to this device at **Devices > Platform Settings > DNS**.

[DNS, on page 1075](#). DNS is required if you use DDNS. You may also use DNS for FQDNs in your security policies.

**Step 5** (Optional) Enable SSH for the data interface in a Platform Settings policy, and apply it to this device at **Devices > Platform Settings > Secure Shell**.

See [SSH Access, on page 1089](#). SSH is not enabled by default on the data interfaces, so if you want to manage the FTD using SSH, you need to explicitly allow it.

**Step 6** Deploy configuration changes.

The Security Cloud Control will deploy the configuration changes over the current Management interface. After the deployment, the data interface is now ready for use, but the original management connection to Management is still active.

**Step 7** At the FTD CLI (preferably from the console port), set the Management interface to use a static IP address and set the gateway to use the data interfaces.

**configure network {ipv4 | ipv6} manual ip\_address netmask data-interfaces**

- **ip\_address netmask**—Although you do not plan to use the Management interface, you must set a static IP address, for example, a private address so that you can set the gateway to **data-interfaces** (see the next bullet).
- **data-interfaces**—This setting forwards management traffic over the backplane so it can be routed through the Security Cloud Control access data interface.

We recommend that you use the console port instead of an SSH connection because when you change the Management interface network settings, your SSH session will be disconnected.

**Note** Repeat this step on the standby unit.

**Step 8** When the deployment completes around 90 percent, the new management interface takes effect. At this stage, you must re-cable the FTD so that the Security Cloud Control reaches FTD on the data interface and completes the deployment successfully.

After you re-cable, the deployment may fail if it timed out before re-establishing the management connection to the new interface. In that case, you must reinitiate the deployment after re-cabling for a successful deployment.

**Note** Repeat this step on the standby unit.

**Step 9** Ensure the management connection is reestablished.

In Security Cloud Control, check the management connection status on the **Devices > Device Management > Device > Management > Manager Access - Configuration Details > Connection Status** page.

At the FTD CLI, enter the `sftunnel-status-brief` command to view the management connection status.

The following status shows a successful connection for a data interface, showing the internal "tap\_nlp" interface.

**Figure 29: Connection Status**

Manager access - Configuration Details

Manager access configuration on device is in sync with the manager.

Configuration CLI Output **Connection Status**

sftunnel-status-brief command output from Firewall Threat Defense [Refresh]

```
> sftunnel-status-brief
PEER:10.89.5.35
Peer channel Channel-A is valid type (CONTROL), using 'tap_nlp', connected to '10.89.5.35' via '169.254.1.3'
Peer channel Channel-B is valid type (EVENT), using 'tap_nlp', connected to '10.89.5.35' via '169.254.1.3'
Registration: Completed.
IPv4 Connection to peer '10.89.5.35' Start Time: Mon May 23 22:55:01 2022 UTC
Heartbeat Send Time: Mon May 23 22:56:21 2022 UTC
Heartbeat Received Time: Mon May 23 22:55:58 2022 UTC
Last disconnect time : Mon May 23 22:54:39 2022 UTC
Last disconnect reason : Both control and event channel connections with peer went down
```

Close

If it takes more than 10 minutes to reestablish the connection, you should troubleshoot the connection. See [Troubleshoot Management Connectivity on a Data Interface](#), on page 180.

## Change the Manager Access Interface from Data to Management in a High Availability Pair

You can manage the FTD from either the dedicated Management interface, or from a data interface. If you want to change the Cisco Security Cloud Control access interface after you added the device to Security Cloud Control, follow these steps to migrate from a Data interface to the Management interface. To migrate the other direction, see [Change the Manager Access Interface from Management to Data in a High Availability Pair, on page 158](#).

Initiating the Security Cloud Control access migration from data to Management causes the Security Cloud Control to apply a block on deployment to the FTD. You must disable Security Cloud Control access on the data interface to remove the block.

**Note** Unless stated otherwise, perform all steps mentioned in this section only on the active unit. Once the configuration changes are deployed, the standby unit synchronizes configuration and other state information from the active unit.

See the following steps to disable Security Cloud Control access on a data interface, and also configure other required settings.

### Procedure

**Step 1** Initiate the interface migration.

- a) In the navigation bar, click **Inventory**.
- b) Click the **FTD** tab.
- c) Select the active device and in the **Management** pane on the right, click **Device Summary**.
- d) Under the **Management** area, click the link for **Manager Access Interface**.

The **Manager Access Interface** field shows the current management interface as data. When you click the link, choose the new interface type, **Management Interface**, in the **Manage device by** drop-down list.

**Note** The link is unavailable for the standby unit as the access interface can be changed on the active unit.

- e) Click **Save**.

You must now complete the remaining steps in this procedure to enable Security Cloud Control access on the data interface. The **Management** area now shows the **Manager Access Interface: Management Interface**, and **Manager Access Details: Configuration**.

*Figure 30: Manager Access*

If you click **Configuration**, the **Manager Access - Configuration Details** dialog box opens. The **Manager Access Mode** shows a Deploy pending state.

**Step 2** Disable Security Cloud Control access on a data interface on the **Devices > Device Management > Interfaces > Edit Physical Interface > FMC Access** page.

See [Configure Routed Mode Interfaces](#). This step removes the block on deployment.

**Step 3** If you have not already done so, configure DNS settings for the data interface in a Platform Setting policy, and apply it to this device at **Devices > Platform Settings > DNS**.

See [DNS, on page 1075](#). The Security Cloud Control deployment that disables Security Cloud Control access on the data interface will remove any local DNS configuration. If that DNS server is used in any security policy, such as an FQDN in an Access Rule, then you must re-apply the DNS configuration using Security Cloud Control.

**Step 4** Deploy configuration changes.

The Security Cloud Control will deploy the configuration changes over the current data interface.

**Step 5** When the deployment completes around 90 percent, the new management interface takes effect. At this stage, you must re-cable the FTD so that the Security Cloud Control reaches FTD on the Management interface and completes the deployment successfully.

After you re-cable, the deployment may fail if it timed out before re-establishing the management connection to the new interface. In that case, you must reinitiate the deployment after re-cabling for a successful deployment.

**Note** Repeat this step on the standby unit.

**Step 6** At the FTD CLI, configure the Management interface IP address and gateway using a static IP address or DHCP.

When you originally configured the data interface for Security Cloud Control access, the Management gateway was set to data-interfaces, which forwarded management traffic over the backplane so it could be routed through the Security Cloud Control access data interface. You now need to set an IP address for the gateway on the management network.

**Static IP address:**

```
configure network {ipv4 | ipv6} manual ip_address netmask gateway_ip
```

**DHCP:**

```
configure network {ipv4 | ipv6} dhcp
```

**Note** Repeat this step on the standby unit.

**Step 7** Ensure the management connection is reestablished.

In Security Cloud Control, check the management connection status on the **Devices > Device Management > Device > Management > Status** field or view notifications in Security Cloud Control.

At the FTD CLI, enter the **sftunnel-status-brief** command to view the management connection status.

If it takes more than 10 minutes to reestablish the connection, you should troubleshoot the connection. See [Troubleshoot Management Connectivity on a Data Interface, on page 180](#).

## Configure a Redundant Manager Access Data Interface

When you use a data interface for manager access, you can configure a secondary data interface to take over management functions if the primary interface goes down. You can configure only one secondary interface. The device uses SLA monitoring to track the viability of the static routes and an ECMP zone that contains both interfaces so management traffic can use both interfaces.

High availability is not supported.

**Before you begin**

- The secondary interface needs to be in a separate security zone from the primary interface.
- All of the same requirements apply to the secondary interface as apply to the primary interface. See [Using the Threat Defense Data Interface for Management](#).

**Procedure**

**Step 1** On the **Devices > Device Management** page, click **Edit** (✎) for the device.

**Step 2** Enable manager access for the secondary interface.

This setting is in addition to standard interface settings such as enabling the interface, setting the name, setting the security zone, and setting a static IPv4 address.

- Choose **Interfaces > Edit Physical Interface > Manager Access**.
- Check **Enable management on this interface for the Manager**.
- Click **OK**.

Both interfaces show (**Manager Access**) in the interface listing.

**Figure 31: Interface Listing**

| Interface                    | Logical Name | Type     | Security Zones |
|------------------------------|--------------|----------|----------------|
| Diagnostic1/1                | diagnostic   | Physical |                |
| Ethernet1/1 (Manager Access) | outside      | Physical | outside        |
| Ethernet1/2                  |              | Physical |                |
| Ethernet1/3                  |              | Physical |                |
| Ethernet1/4                  |              | Physical |                |
| Ethernet1/5                  |              | Physical |                |
| Ethernet1/6                  |              | Physical |                |
| Ethernet1/7                  |              | Physical |                |
| Ethernet1/8 (Manager Access) | redundant    | Physical | mgmt           |

- Step 3** Add the secondary address to the **Management** settings.
- Click **Device**, and view the **Management** area.
  - Click **Edit** (✎).

**Figure 32: Edit Management Address**

- In the **Management** dialog box, modify the name or IP address in the **Secondary Address** field

**Figure 33: Management IP Address**

- Click **Save**.

- Step 4** Create an ECMP zone with both interfaces.

- a) Click **Routing**.
- b) From the virtual router drop-down, choose the virtual router in which the primary and secondary interfaces reside.
- c) Click **ECMP**, and then click **Add**.
- d) Enter a **Name** for the ECMP zone.
- e) Select the primary and secondary interfaces under the **Available Interfaces** box, and then click **Add**.

*Figure 34: Add an ECMP Zone*

The screenshot shows a dialog box titled "Add ECMP". At the top right of the dialog are a help icon (question mark) and a close icon (X). Below the title bar is a text input field labeled "Name" containing the text "redundant-mgmt". The main area of the dialog is divided into two columns. The left column is titled "Available Interfaces" and is currently empty. The right column is titled "Selected Interfaces" and contains two entries: "outside" and "redundant", each with a trash can icon to its right. A blue "Add" button is located between the two columns. At the bottom of the dialog are two buttons: "Cancel" and "OK".

- f) Click **OK**, and then **Save**.

### Step 5

Add equal-cost default static routes for both interfaces and enable SLA tracking on both.

The routes should be identical except for the gateway and should both have metric 1. The primary interface should already have a default route that you can edit.

Figure 35: Add/Edit Static Route

Edit Static Route Configuration ?

Type:  IPv4  IPv6

Interface\*

 10.89.5.1 +

Metric:  
 1  
 (1 - 254)

Tunneled:  (Used only for default Route)

Route Tracking:  
+

Cancel OK

- a) Click **Static Route**.
- b) Either click **Add Route** to add a new route, or click **Edit** () for an existing route.
- c) From the **Interface** drop-down, choose the interface.
- d) For the destination network, select **any-ipv4** from the **Available Networks** box and click **Add**.
- e) Enter the default **Gateway**.
- f) For **Route Tracking**, click **Add** () to add a new SLA monitor object.
- g) Enter the required parameters including the following:
  - The **Monitor Address** as the management center IP address.
  - The zone for the primary or secondary management interface in **Available Zones**; for example, choose the outside zone for the primary interface object, and the mgmt zone for the secondary interface object.

See [SLA Monitor](#), on page 1536 for more information.

Cancel Save

- Click **Save**, then choose the SLA object you just created in the **Route Tracking** drop-down list.
- Click **OK**, and then **Save**.
- Repeat for the default route for the other management interface.

#### Step 6 Deploy configuration changes.

As part of the deployment for this feature, the management center enables the secondary interface for management traffic, including auto-generated policy-based routing configuration for management traffic to get to the right data interface. The management center also deploys a second instance of the **configure network management-data-interface** command. Note that if you edit the secondary interface at the CLI, you cannot configure the gateway or otherwise alter the default route, because the static route for this interface can only be edited in the management center.

## Modify Threat Defense Management Interfaces at the CLI

Modify the management interface settings on the managed device using the CLI. Many of these settings are ones that you set when you performed the initial setup; this procedure lets you change those settings, and set additional settings such as enabling an event interface if your model supports it, or adding static routes.

---

**Note** This topic applies to the dedicated Management interface. You can alternatively configure a data interface for management. If you want to change network settings for that interface, you should do so within management center and not at the CLI. If you need to troubleshoot a disrupted management connection, and need to make changes directly on the threat defense, see [Modify the Threat Defense Data Interface Used for Management at the CLI, on page 175](#).

---

For information about the threat defense CLI, see the [Cisco Secure Firewall Threat Defense Command Reference](#).

---

**Note** When using SSH, be careful when making changes to the management interface; if you cannot re-connect because of a configuration error, you will need to access the device console port.

---

---

**Note** If you change the device management IP address, then see the following tasks for management center connectivity depending on how you identified the management center during initial device setup using the **configure manager add** command:

- **IP address—No action.** If you identified the management center using a reachable IP address, then the management connection will be reestablished automatically after several minutes. We recommend that you also change the device IP address shown in management center to keep the information in sync; see [Update the Hostname or IP Address in the Management Center, on page 146](#). This action can help the connection reestablish faster. **Note:** If you specified an unreachable management center IP address, then see the procedure for NAT ID below.
- **NAT ID only—Manually reestablish the connection.** If you identified the management center using only the NAT ID, then the connection cannot be automatically reestablished. In this case, change the device management IP address in management center according to [Update the Hostname or IP Address in the Management Center, on page 146](#).

---

---

**Note** In a High Availability management center configuration, when you modify the management IP address from the device CLI or from the management center, the secondary management center does not reflect the changes even after an HA synchronization. To ensure that the secondary management center is also updated, switch roles between the two management centers, making the secondary management center the active unit. Modify the management IP address of the registered device on the device management page of the now active management center.

---

**Before you begin**

- You can create user accounts that can log into the CLI using the **configure user add** command; see [Add an Internal User at the CLI, on page 221](#). You can also configure AAA users according to [External Authentication, on page 1078](#).

**Procedure**

- 
- Step 1** Connect to the device CLI, either from the console port or using SSH.
- Step 2** Log in with the Admin username and password.
- Step 3** (Firepower 4100/9300/Secure Firewall 4200 only) Enable the second management interface as an event-only interface.

**configure network management-interface enable management1**

**configure network management-interface disable-management-channel management1**

You always need a management interface for management traffic. If your device has a second management interface, you can enable it for event-only traffic.

You can optionally disable events for the main management interface using the **configure network management-interface disable-events-channel** command. In either case, the device will try to send events on the event-only interface, and if that interface is down, it will send events on the management interface even if you disable the event channel.

You cannot disable both event and management channels on an interface.

To use a separate event interface, you also need to enable an event interface on the management center. See the [Cisco Secure Firewall Management Center Administration Guide](#).

**Example:**

```
> configure network management-interface enable management1
Configuration updated successfully

> configure network management-interface disable-management-channel management1
Configuration updated successfully

>
```

- Step 4** Configure the IP address of the management interface and/or event interface:

If you do not specify the *management\_interface* argument, then you change the network settings for the default management interface. When configuring an event interface, be sure to specify the *management\_interface* argument. The event interface can be on a separate network from the management interface, or on the same network. If you are connected to the interface you are configuring, you will be disconnected. You can re-connect to the new IP address.

- a) Configure the IPv4 address:

- Manual configuration:

**configure network ipv4 manual ip\_address netmask gateway\_ip [management\_interface]**

Note that the *gateway\_ip* in this command is used to create the default route for the device. If you configure an event-only interface, then you must enter the *gateway\_ip* as part of the command;

however, this entry just configures the default route to the value you specify and does not create a separate static route for the eventing interface. If you are using an event-only interface on a different network from the management interface, we recommend that you set the *gateway\_ip* for use with the management interface, and then create a static route separately for the event-only interface using the **configure network static-routes** command.

**Example:**

```
> configure network ipv4 manual 10.10.10.45 255.255.255.0 10.10.10.1 management1
Setting IPv4 network configuration.
Network settings changed.
```

```
>
```

- DHCP (supported on the default management interface only):

```
configure network ipv4 dhcp
```

- b) Configure the IPv6 address:

- Stateless autoconfiguration:

```
configure network ipv6 router [management_interface]
```

**Example:**

```
> configure network ipv6 router management0
Setting IPv6 network configuration.
Network settings changed.
```

```
>
```

- Manual configuration:

```
configure network ipv6 manual ip6_address ip6_prefix_length [ip6_gateway_ip]
[management_interface]
```

Note that the *ipv6\_gateway\_ip* in this command is used to create the default route for the device. If you configure an event-only interface, then you must enter the *ipv6\_gateway\_ip* as part of the command; however, this entry just configures the default route to the value you specify and does not create a separate static route for the eventing interface. If you are using an event-only interface on a different network from the management interface, we recommend that you set the *ipv6\_gateway\_ip* for use with the management interface, and then create a static route separately for the event-only interface using the **configure network static-routes** command.

**Example:**

```
> configure network ipv6 manual 2001:0DB8:BA98::3210 64 management1
Setting IPv6 network configuration.
Network settings changed.
```

```
>
```

- DHCPv6 (supported on the default management interface only):

```
configure network ipv6 dhcp
```

**Step 5** For IPv6, enable or disable ICMPv6 Echo Replies and Destination Unreachable messages. These messages are enabled by default.

```
configure network ipv6 destination-unreachable {enable | disable}
```

```
configure network ipv6 echo-reply {enable | disable}
```

You might want to disable these packets to guard against potential denial of service attacks. Disabling Echo Reply packets means you cannot use IPv6 ping to the device management interfaces for testing purposes.

**Example:**

```
> configure network ipv6 destination-unreachable disable
> configure network ipv6 echo-reply disable
```

**Step 6** Enable a DHCP server on the default management interface to provide IP addresses to connected hosts:

```
configure network ipv4 dhcp-server-enable start_ip_address end_ip_address
```

**Example:**

```
> configure network ipv4 dhcp-server-enable 10.10.10.200 10.10.10.254
DHCP Server Enabled
>
```

You can only configure a DHCP server when you set the management interface IP address manually. This command is not supported on the management center virtual. To display the status of the DHCP server, enter **show network-dhcp-server**:

```
> show network-dhcp-server
DHCP Server Enabled
10.10.10.200-10.10.10.254
```

**Step 7** Add a static route for the event-only interface if the management center is on a remote network; otherwise, all traffic will match the default route through the management interface.

```
configure network static-routes {ipv4 | ipv6} add management_interface destination_ip netmask_or_prefix gateway_ip
```

For the *default* route, do not use this command; you can only change the default route gateway IP address when you use the **configure network ipv4** or **ipv6** commands (see [Step 4, on page 170](#)).

**Example:**

```
> configure network static-routes ipv4 add management1 192.168.6.0 255.255.255.0 10.10.10.1
Configuration updated successfully

> configure network static-routes ipv6 add management1 2001:0DB8:AA89::5110 64
2001:0DB8:BA98::3211
Configuration updated successfully

>
```

To display static routes, enter **show network-static-routes** (the default route is not shown):

```
> show network-static-routes
-----[ IPv4 Static Routes ]-----
Interface           : management1
Destination          : 192.168.6.0
Gateway              : 10.10.10.1
Netmask              : 255.255.255.0
[...]
```

**Step 8** Set the hostname:

**configure network hostname** *name*

**Example:**

```
> configure network hostname farscape1.cisco.com
```

Syslog messages do not reflect a new hostname until after a reboot.

**Step 9** Set the search domains:

**configure network dns searchdomains** *domain\_list*

**Example:**

```
> configure network dns searchdomains example.com,cisco.com
```

Set the search domain(s) for the device, separated by commas. These domains are added to hostnames when you do not specify a fully-qualified domain name in a command, for example, **ping system**. The domains are used only on the management interface, or for commands that go through the management interface.

**Step 10** Set up to 3 DNS servers, separated by commas:

**configure network dns servers** *dns\_ip\_list*

**Example:**

```
> configure network dns servers 10.10.6.5,10.20.89.2,10.80.54.3
```

**Step 11** Set the remote management port for communication with the management center:

**configure network management-interface tcpport** *number*

**Example:**

```
> configure network management-interface tcpport 8555
```

The management center and managed devices communicate using a two-way, TLS-1.3-encrypted communication channel, which by default is on port 8305.

**Note** Cisco **strongly** recommends that you keep the default settings for the remote management port, but if the management port conflicts with other communications on your network, you can choose a different port. If you change the management port, you must change it for **all** devices in your deployment that need to communicate with each other.

**Step 12** (Threat Defense only) Set the management or eventing interface MTU. The MTU is 1500 bytes by default.

**configure network mtu** [*bytes*] [*interface\_id*]

- *bytes*—Sets the MTU in bytes. For the management interface, the value can be between 64 and 1500 if you enable IPv4, and 1280 to 1500 if you enable IPv6. For the eventing interface, the value can be between 64 and 9000 if you enable IPv4, and 1280 to 9000 if you enable IPv6. If you enable both IPv4 and IPv6, then the minimum is 1280. If you do not enter the *bytes*, you are prompted for a value.
- *interface\_id*—Specifies the interface ID on which to set the MTU. Use the **show network** command to see available interface IDs, for example management0, management1, br1, and eth0, depending on the platform. If you do not specify an interface, then the management interface is used.

**Example:**

```
> configure network mtu 8192 management1
MTU set successfully to 1500 from 8192 for management1
Refreshing Network Config...
NetworkSettings::refreshNetworkConfig MTU value at start 8192

Interface management1 speed is set to '10000baseT/Full'
NetworkSettings::refreshNetworkConfig MTU value at end 8192
>
```

**Step 13**

Configure an HTTP proxy. The device is configured to directly-connect to the internet on ports TCP/443 (HTTPS) and TCP/80 (HTTP). You can use a proxy server, to which you can authenticate via HTTP Digest. After issuing the command, you are prompted for the HTTP proxy address and port, whether proxy authentication is required, and if it is required, the proxy username, proxy password, and confirmation of the proxy password.

**Note** For proxy password on threat defense, you can use A-Z, a-z, and 0-9 characters only.

**configure network http-proxy****Example:**

```
> configure network http-proxy
Manual proxy configuration
Enter HTTP Proxy address: 10.100.10.10
Enter HTTP Proxy Port: 80
Use Proxy Authentication? (y/n) [n]: Y
Enter Proxy Username: proxyuser
Enter Proxy Password: proxypassword
Confirm Proxy Password: proxypassword
```

**Step 14**

If you change the device management IP address, then see the following tasks for management center connectivity depending on how you identified the management center during initial device setup using the **configure manager add** command:

- **IP address—No action.** If you identified the management center using a reachable IP address, then the management connection will be reestablished automatically after several minutes. We recommend that you also change the device IP address shown in management center to keep the information in sync; see [Update the Hostname or IP Address in the Management Center, on page 146](#). This action can help the connection reestablish faster. **Note:** If you specified an unreachable management center IP address, then you must manually reestablish the connection using [Update the Hostname or IP Address in the Management Center, on page 146](#).
- **NAT ID only—Manually reestablish the connection.** If you identified the management center using only the NAT ID, then the connection cannot be automatically reestablished. In this case, change the

device management IP address in management center according to [Update the Hostname or IP Address in the Management Center, on page 146](#).

---

## Modify the Threat Defense Data Interface Used for Management at the CLI

If the management connection between the threat defense and the management center was disrupted, and you want to specify a new data interface to replace the old interface, use the threat defense CLI to configure the new interface. This procedure assumes you want to replace the old interface with a new interface on the same network. If the management connection is active, then you should make any changes to an existing data interface using the management center. For initial setup of the data management interface, see the **configure network management-data-interface** command.

For high-availability pairs, perform all CLI steps on both units. Within the management center, perform steps only on the active unit. Once the configuration changes are deployed, the standby unit synchronizes configuration and other state information from the active unit.

---

**Note** This topic applies to the data interface that you configured for Management, not the dedicated Management interface. If you want to change network settings for the Management interface, see [Modify Threat Defense Management Interfaces at the CLI, on page 169](#).

---

For information about the threat defense CLI, see the [Cisco Secure Firewall Threat Defense Command Reference](#).

### Before you begin

You can create user accounts that can log into the CLI using the **configure user add** command. You can also configure AAA users according to [External Authentication, on page 1078](#).

### Procedure

---

**Step 1** If you are changing the data management interface to a new interface, move the current interface cable to the new interface.

**Step 2** Connect to the device CLI.

You should use the console port when using these commands. If you are performing initial setup, then you may be disconnected from the Management interface. If you are editing the configuration due to a disrupted management connection, and you have SSH access to the dedicated Management interface, then you can use that SSH connection.

**Step 3** Log in with the Admin username and password.

**Step 4** Disable the interface so you can reconfigure its settings.

**configure network management-data-interface disable**

#### Example:

```
> configure network management-data-interface disable
```

```
Configuration updated successfully..!!
```

```
Configuration disable was successful, please update the default route to point to a gateway
on management interface using the command 'configure network'
```

**Step 5** Configure the new data interface for manager access.

#### **configure network management-data-interface**

You are then prompted to configure basic network settings for the data interface.

When you change the data management interface to a new interface on the same network, use the same settings as for the previous interface except the interface ID. In addition, for the **Do you wish to clear all the device configuration before applying ? (y/n) [n]:** option, choose **y**. This choice will clear the old data management interface configuration, so that you can successfully reuse the IP address and interface name on the new interface.

```
> configure network management-data-interface
Data interface to use for management: ethernet1/4
Specify a name for the interface [outside]: internet
IP address (manual / dhcp) [dhcp]: manual
IPv4/IPv6 address: 10.10.6.7
Netmask/IPv6 Prefix: 255.255.255.0
Default Gateway: 10.10.6.1
Comma-separated list of DNS servers [none]: 208.67.222.222,208.67.220.220
DDNS server update URL [none]:
Do you wish to clear all the device configuration before applying ? (y/n) [n]: y
```

```
Configuration done with option to allow manager access from any network, if you wish to
change the manager access network
use the 'client' option in the command 'configure network management-data-interface'.
```

```
Setting IPv4 network configuration.
Network settings changed.
```

```
>
```

**Step 6** (Optional) Limit data interface access to the management center on a specific network.

#### **configure network management-data-interface client ip\_address netmask**

By default, all networks are allowed.

**Step 7** The connection will be reestablished automatically, but disabling and reenabling the connection in the management center will help the connection reestablish faster. See [Update the Hostname or IP Address in the Management Center, on page 146](#).

**Step 8** Check that the management connection was reestablished.

#### **sftunnel-status-brief**

See the following sample output for a connection that is up, with peer channel and heartbeat information shown:

```
> sftunnel-status-brief
PEER:10.10.17.202
Peer channel Channel-A is valid type (CONTROL), using 'eth0', connected to '10.10.17.202'
via '10.10.17.222'
Peer channel Channel-B is valid type (EVENT), using 'eth0', connected to '10.10.17.202' via
'10.10.17.222'
```

```

Registration: Completed.
IPv4 Connection to peer '10.10.17.202' Start Time: Wed Jun 10 14:27:12 2020 UTC
Heartbeat Send Time: Mon Jun 15 09:02:08 2020 UTC
Heartbeat Received Time: Mon Jun 15 09:02:16 2020 UTC

```

**Step 9** In the management center, choose **Devices > Device Management > Device > Management > Manager Access - Configuration Details**, and click **Refresh**.

The management center detects the interface and default route configuration changes, and blocks deployment to the threat defense. When you change the data interface settings locally on the device, you must reconcile those changes in the management center manually. You can view the discrepancies between the management center and the threat defense on the **Configuration** tab.

**Step 10** Choose **Devices > Device Management > Interfaces**, and make the following changes.

- a) Remove the IP address and name from the old data management interface, and disable manager access for this interface.
- b) Configure the new data management interface with the settings of the old interface (the ones you used at the CLI), and enable manager access for it.

**Step 11** Choose **Devices > Device Management > Routing > Static Route** and change the default route from the old data management interface to the new one.

**Step 12** Return to the **Manager Access - Configuration Details** dialog box, and click **Acknowledge** to remove the deployment block.

The next time you deploy, the management center configuration will overwrite any remaining conflicting settings on the threat defense. It is your responsibility to manually fix the configuration in the management center before you re-deploy.

You will see expected messages of "Config was cleared" and "Manager access changed and acknowledged."

## Edit the Management Center IP Address/Hostname on the Device

If you change the management center IP address or hostname, you should also change the value at the device CLI so the configurations match. Although in most cases, the management connection will be reestablished without changing the management center IP address or hostname on the device, in at least one case, you must perform this task for the connection to be reestablished: when you added the device to the management center and you specified the NAT ID only. Even in other cases, we recommend keeping the management center IP address or hostname up to date for extra network resiliency.

### Procedure

**Step 1** At the threat defense CLI, view the management center identifier.

**show managers**

**Example:**

```

> show managers
Type           : Manager
Host           : 10.10.1.4

```

```

Display name           : 10.10.1.4
Identifier             : f7ffad78-bf16-11ec-a737-baa2f76ef602
Registration          : Completed
Management type       : Configuration

```

**Step 2** At the threat defense CLI, edit the management center IP address or hostname.

```
configure manager edit identifier {hostname {ip_address | hostname} | displayname display_name}
```

If the management center was originally identified by **DONTRESOLVE** and a NAT ID, you can change the value to a hostname or IP address using this command. You cannot change an IP address or hostname to **DONTRESOLVE**.

The management connection will go down, and then reestablish. You can monitor the state of the connection using the **sftunnel-status** command.

**Example:**

```
> configure manager edit f7ffad78-bf16-11ec-a737-baa2f76ef602 hostname 10.10.5.1
```

## Manually Roll Back the Configuration if the Management Center Loses Connectivity

If you use a data interface on the threat defense for manager access, and you deploy a configuration change from the management center that affects the network connectivity, you can roll back the configuration on the threat defense to the last-deployed configuration so you can restore management connectivity. You can then adjust the configuration settings in management center so that the network connectivity is maintained, and re-deploy. You can use the rollback feature even if you do not lose connectivity; it is not limited to this troubleshooting situation.

Alternatively, you can enable auto rollback of the configuration if you lose connectivity after a deployment; see [Edit Deployment Settings, on page 195](#).

See the following guidelines:

- Only the previous deployment is available locally on the threat defense; you cannot roll back to any earlier deployments.
- Rollback is supported for high availability but not supported for clustering deployments.
- Rollback is not supported immediately after high availability creation.
- The rollback only affects configurations that you can set in the management center. For example, the rollback does not affect any local configuration related to the dedicated Management interface, which you can only configure at the threat defense CLI. Note that if you changed data interface settings after the last management center deployment using the **configure network management-data-interface** command, and then you use the rollback command, those settings will not be preserved; they will roll back to the last-deployed management center settings.
- UCAPL/CC mode cannot be rolled back.
- Out-of-band SCEP certificate data that was updated during the previous deployment cannot be rolled back.

- During the rollback, connections will drop because the current configuration will be cleared.

## Procedure

**Step 1** At the threat defense CLI, roll back to the previous configuration.

### configure policy rollback

**Note** For a high availability pair, this command is allowed only on the active unit.

After the rollback, the threat defense notifies the management center that the rollback was completed successfully. In the management center, the deployment screen will show a banner stating that the configuration was rolled back.

**Note** If the rollback failed and the management center management is restored, refer to <https://www.cisco.com/c/en/us/support/docs/security/firepower-ngfw-virtual/215258-troubleshooting-firepower-threat-defense.html> for common deployment problems. In some cases, the rollback can fail after the management center management access is restored; in this case, you can resolve the management center configuration issues, and redeploy from the management center.

### Example:

For the threat defense that uses a data interface for manager access:

```
> configure policy rollback

The last deployment to this FTD was on June 1, 2020 and its status was Successful.
Do you want to continue [Y/N]?

Y

Rolling back complete configuration on the FTD. This will take time.
.....
Policy rollback was successful on the FTD.
Configuration has been reverted back to transaction id:
Following is the rollback summary:
.....
.....
>
```

### Example:

For threat defenses in a high availability pair that use a data interface for management center access:

```
> configure policy rollback

Checking Eligibility ...
===== DEVICE DETAILS =====
Device Version: 7.2.0
Device Type: FTD
Device Mode: Offbox
Device in HA: true
Is HA disabled: false
HA state: active - standby ready
=====
Device is eligible for policy rollback
```

```

Do you want to continue [YES/NO]?

YES

Starting rollback...
  Preparing policy configuration on the device.           Status: success
  Applying updated policy configuration on the device.    Status: success
  Applying Lina File Configuration on the device.        Status: success
  Applying Lina Configuration on the device.            Status: success
  Commit Lina Configuration.                            Status: success
  Commit Lina File Configuration.                       Status: success
  Commit Lina File Configuration.                       Status: success
=====
POLICY ROLLBACK STATUS: SUCCESS
=====
>

```

**Step 2** Check that the management connection was reestablished.

In management center, check the management connection status on the **Devices > Device Management > Device > Management > Manager Access - Configuration Details > Connection Status** page.

At the threat defense CLI, enter the **sftunnel-status-brief** command to view the management connection status.

If it takes more than 10 minutes to reestablish the connection, you should troubleshoot the connection. See [Troubleshoot Management Connectivity on a Data Interface, on page 180](#).

## Troubleshoot Management Connectivity on a Data Interface

When you use a data interface for manager access instead of using the dedicated Management interface, you must be careful about changing the interface and network settings for the threat defense in the management center so you do not disrupt the connection. If you change the management interface type after you add the threat defense to the management center (from data to Management, or from Management to data), if the interfaces and network settings are not configured correctly, you can lose management connectivity.

This topic helps you troubleshoot the loss of management connectivity.

### View management connection status

In the management center, check the management connection status on the **Devices > Device Management > Device > Management > Manager Access - Configuration Details > Connection Status** page.

At the threat defense CLI, enter the **sftunnel-status-brief** command to view the management connection status. You can also use **sftunnel-status** to view more complete information.

See the following sample output for a connection that is down; there is no peer channel "connected to" information, nor heartbeat information shown:

```

> sftunnel-status-brief
PEER:10.10.17.202
Registration: Completed.
Connection to peer '10.10.17.202' Attempted at Mon Jun 15 09:21:57 2020 UTC
Last disconnect time : Mon Jun 15 09:19:09 2020 UTC
Last disconnect reason : Both control and event channel connections with peer went down

```

See the following sample output for a connection that is up, with peer channel and heartbeat information shown:

```
> sftunnel-status-brief
PEER:10.10.17.202
Peer channel Channel-A is valid type (CONTROL), using 'eth0', connected to '10.10.17.202'
via '10.10.17.222'
Peer channel Channel-B is valid type (EVENT), using 'eth0', connected to '10.10.17.202'
via '10.10.17.222'
Registration: Completed.
IPv4 Connection to peer '10.10.17.202' Start Time: Wed Jun 10 14:27:12 2020 UTC
Heartbeat Send Time: Mon Jun 15 09:02:08 2020 UTC
Heartbeat Received Time: Mon Jun 15 09:02:16 2020 UTC
```

### View the threat defense network information

At the threat defense CLI, view the Management and manager access data interface network settings:

#### show network

```
> show network
===== [ System Information ] =====
Hostname           : FTD-4
Domains            : cisco.com
DNS Servers        : 72.163.47.11
DNS from router    : enabled
Management port    : 8305
IPv4 Default route
  Gateway          : data-interfaces

===== [ management0 ] =====
Admin State        : enabled
Admin Speed        : 1gbps

MAC Address         : 68:87:C6:A6:54:A4
-----[ IPv4 ]-----
Configuration       : Manual
Address             : 10.89.5.6
Netmask            : 255.255.255.192
Gateway            : 10.89.5.1
-----[ IPv6 ]-----
Configuration       : Disabled

```

### Check that the threat defense registered with the management center

At the threat defense CLI, check that the management center registration was completed. Note that this command will not show the *current* status of the management connection.

#### show managers

```

> show managers
Type                : Manager
Host                : 16a3893c-caa7-11ee-8436-0925c06e7608DONTRESOLVE
Display name        : manager-1707852946.80444
Version             : 7.6.0 (Build 1385)
Identifier           : a904b8b2-ca9a-11ee-a583-5e804c16b2fd
Registration        : Completed
Management type     : Configuration

```

### Ping the management center

At the threat defense CLI, use the following command to ping the management center from the data interfaces:

#### ping *fmc\_ip*

At the threat defense CLI, use the following command to ping the management center from the Management interface, which should route over the backplane to the data interfaces:

#### ping system *fmc\_ip*

### Capture packets on the threat defense internal interface

At the threat defense CLI, capture packets on the internal backplane interface (*nlp\_int\_tap*) to see if management packets are being sent:

#### capture *name* interface *nlp\_int\_tap* trace detail match ip any any

#### show capture*name* trace detail

### Check the internal interface status, statistics, and packet count

At the threat defense CLI, see information about the internal backplane interface, *nlp\_int\_tap*:

#### show interface detail

```

> show interface detail
[...]
Interface Internal-Data0/1 "nlp_int_tap", is up, line protocol is up
  Hardware is en_ytun rev00, BW Unknown Speed-Capability, DLY 1000 usec
  (Full-duplex), (1000 Mbps)
  Input flow control is unsupported, output flow control is unsupported
  MAC address 0000.0100.0001, MTU 1500
  IP address 169.254.1.1, subnet mask 255.255.255.248
  37 packets input, 2822 bytes, 0 no buffer

```

```

Received 0 broadcasts, 0 runts, 0 giants
0 input errors, 0 CRC, 0 frame, 0 overrun, 0 ignored, 0 abort
0 pause input, 0 resume input
0 L2 decode drops
5 packets output, 370 bytes, 0 underruns
0 pause output, 0 resume output
0 output errors, 0 collisions, 0 interface resets
0 late collisions, 0 deferred
0 input reset drops, 0 output reset drops
input queue (blocks free curr/low): hardware (0/0)
output queue (blocks free curr/low): hardware (0/0)
Traffic Statistics for "nlp_int_tap":
37 packets input, 2304 bytes
5 packets output, 300 bytes
37 packets dropped
    1 minute input rate 0 pkts/sec,  0 bytes/sec
    1 minute output rate 0 pkts/sec,  0 bytes/sec
    1 minute drop rate, 0 pkts/sec
    5 minute input rate 0 pkts/sec,  0 bytes/sec
    5 minute output rate 0 pkts/sec,  0 bytes/sec
    5 minute drop rate, 0 pkts/sec
Control Point Interface States:
Interface number is 14
Interface config status is active
Interface state is active

```

### Check routing and NAT

At the threat defense CLI, check that the default route (S\*) was added and that internal NAT rules exist for the Management interface (nlp\_int\_tap).

#### show route

```

> show route

Codes: L - local, C - connected, S - static, R - RIP, M - mobile, B - BGP
       D - EIGRP, EX - EIGRP external, O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2, V - VPN
       i - IS-IS, su - IS-IS summary, L1 - IS-IS level-1, L2 - IS-IS level-2
       ia - IS-IS inter area, * - candidate default, U - per-user static route
       o - ODR, P - periodic downloaded static route, + - replicated route
       SI - Static InterVRF

Gateway of last resort is 10.89.5.1 to network 0.0.0.0

S*      0.0.0.0 0.0.0.0 [1/0] via 10.89.5.1, outside
C       10.89.5.0 255.255.255.192 is directly connected, outside
L       10.89.5.29 255.255.255.255 is directly connected, outside

>

```

#### show nat

```

> show nat

Auto NAT Policies (Section 2)
1 (nlp_int_tap) to (outside) source static nlp_server_0_sftunnel_intf3 interface service
  tcp 8305 8305
  translate_hits = 0, untranslate_hits = 6
2 (nlp_int_tap) to (outside) source static nlp_server_0_ssh_intf3 interface service

```

```

tcp ssh ssh
    translate_hits = 0, untranslate_hits = 73
3 (nlp_int_tap) to (outside) source static nlp_server_0_sftunnel_ipv6_intf3 interface
ipv6 service tcp 8305 8305
    translate_hits = 0, untranslate_hits = 0
4 (nlp_int_tap) to (outside) source dynamic nlp_client_0_intf3 interface
    translate_hits = 174, untranslate_hits = 0
5 (nlp_int_tap) to (outside) source dynamic nlp_client_0_ipv6_intf3 interface ipv6
    translate_hits = 0, untranslate_hits = 0
>

```

### Check other settings

See the following commands to check that all other settings are present. You can also see many of these commands on the management center's **Devices > Device Management > Device > Management > Manager Access - Configuration Details > CLI Output** page.

#### show running-config sftunnel

```

> show running-config sftunnel
sftunnel interface outside
sftunnel port 8305

```

#### show running-config ip-client

```

> show running-config ip-client
ip-client outside

```

#### show conn address fmc\_ip

```

> show conn address 10.89.5.35
5 in use, 16 most used
Inspect Snort:
    preserve-connection: 0 enabled, 0 in effect, 0 most enabled, 0 most in effect

TCP nlp_int_tap 10.89.5.29(169.254.1.2):51231 outside 10.89.5.35:8305, idle 0:00:04,
bytes 86684, flags UxIO
TCP nlp_int_tap 10.89.5.29(169.254.1.2):8305 outside 10.89.5.35:52019, idle 0:00:02,
bytes 1630834, flags UIO
>

```

### Check for a successful DDNS update

At the threat defense CLI, check for a successful DDNS update:

#### debug ddns

```

> debug ddns
DDNS update request = /v3/update?hostname=domain.example.org&myip=209.165.200.225
Successfully updated the DDNS sever with current IP addresses
DDNS: Another update completed, outstanding = 0
DDNS: IDB SB total = 0

```

If the update failed, use the **debug http** and **debug ssl** commands. For certificate validation failures, check that the root certificates are installed on the device:

#### show crypto ca certificates trustpoint\_name

To check the DDNS operation:

#### show ddns update interface fmc\_access\_ifc\_name

```
> show ddns update interface outside

Dynamic DNS Update on outside:
  Update Method Name Update Destination
  RBD_DDNS not available

Last Update attempted on 04:11:58.083 UTC Thu Jun 11 2020
Status : Success
FQDN : domain.example.org
IP addresses : 209.165.200.225
```

### Check management center log files

See <https://cisco.com/go/fmc-reg-error>.

## Troubleshoot Management Connectivity on a Data Interface in a High Availability Pair

This topic helps you troubleshoot the loss of management connectivity on a data interface in High Availability.

Model Support—Threat Defense

The management connection between the active peer and the Security Cloud Control can be disrupted due to the following reasons:

- Data interface used for management on the Active unit has connectivity issues.  
You should manually fail over to the standby unit and then configure a new data interface for Security Cloud Control access.
- Internet Service Provider has changed.  
You should manually update the new network details on the active unit using the CLI commands to restore the device connectivity with Security Cloud Control .

### Data Management Interface on Active unit has Connectivity Issues

1. In Security Cloud Control, manually switch the active unit to standby. See [Switch the Active Peer in the Threat Defense High Availability Pair, on page 632](#).  
Alternatively, you can run the **no failover active** command on the active unit.  
The standby device becomes the new active device in the high availability pair and establishes communication with Security Cloud Control.
2. Next to the device high-availability pair you want to edit, click **Edit** (✎).
3. Choose **Routing > Static Route** and delete the static route defined for the old data management interface.
4. Click the **Interfaces** tab, and make the following changes.
  - a. Remove the IP address and name from the old data management interface, and disable Security Cloud Control Access for this interface.

**Note** Before removing the old data management interface information, remember the details if you want to use the same information.

1. Click the **Edit** (✎) next to the interface you want to remove.

2. Clear the content in the **Name** field.
  3. Uncheck the **Enabled** checkbox.
  4. In the **IPv4** or **IPv6** tab, remove the active address.
  5. In the **Firewall Management Center Access** tab, uncheck **Enable management on this interface for the Firepower Management Center**.
  6. Click **OK**.
  7. Click **Yes** to confirm the changes.
- b. Configure the new data management interface with the settings of the old interface (the ones you used at the CLI), and enable Security Cloud Control Access for it.
1. Click **Edit** (✎) next to the data interface you want for handling management traffic.
  2. In the **Name** field, specify a name for the interface.
  3. Check the **Enabled** checkbox.
  4. In the **IPv4** or **IPv6** tab, specify the active address.
  5. In the **Firewall Management Center Access** tab, check **Enable management on this interface for the Firepower Management Center**.
  6. Click **OK**.
  7. Click **Yes** to confirm the changes.
5. Click the **High Availability** tab, and make the following changes.
    - a. In the **Monitored Interfaces** area, click the **Edit** (✎) next to the new data management interface.

| Monitored Interfaces |              |              |                            |                         |                          |
|----------------------|--------------|--------------|----------------------------|-------------------------|--------------------------|
| Interface Name       | Active IPv4  | Standby IPv4 | Active IPv6 - Standby IPv6 | Active Link- Local IPv6 | Standby Link- Local IPv6 |
| outside-new          | 192.168.0.11 |              |                            |                         |                          |
| diagnostic           |              |              |                            |                         |                          |

The **Active IP Address** shows the active device's IP address.

- b. On the **IPv4** tab, enter the **Standby IP Address** and **Gateway** address.

Edit outside-new ?

---

Monitor this interface for failures

IPv4    IPv6

---

Interface Name:  
outside-new

Active IP Address:  
192.168.0.11

Mask:  
255.255.255.0

Standby IP Address:

- c. If you configured the IPv6 address manually, on the IPv6 tab, click **Edit** (✎) next to the active IP address, enter the **Standby IP Address**, and click **OK**.
- d. Click **OK**.

6. Click **Save** at the top-right corner to save the changes.

7. Choose **Routing > Static Route** and add the static route defined for the new data management interface. The new data interface appears in the **Interface** list.

Add Static Route Configuration ?

---

Type:     IPv4     IPv6

Interface\*

Null0 (enables it is available for route leak)

**outside-new (Firewall Management Center Access)** Selected Network

diagnostic

IPv4-Benchmark-Tests

IPv4-Link-Local

IPv4-Multicast

IPv4-Private-10.0.0.0-8

IPv4-Private-172.16.0.0-12

Gateway\*  +

8. Click **Save** at the top-right corner to save the changes.

9. Deploy configuration changes..
10. When the deployment completes around 90 percent, the new management interface takes effect. At this stage, you must re-cable the FTD so that the Security Cloud Control reaches FTD on the new interface and completes the deployment successfully.

---

**Note** After you re-cable, the deployment may fail if it timed out before re-establishing the management connection to the new interface. In that case, you must reinitiate the deployment after re-cabling for a successful deployment.

---

11. Ensure the management connection is reestablished.

In Management Center, check the management connection status on the **Devices > Device Management > Device > Management > FMC Access Details > Connection Status** page.

Alternatively, at the FTD CLI, enter the **sftunnel-status-brief** command to view the management connection status.

### Internet Service Provider has Changed

If you have changed your ISP, you can lose management connectivity, even though High Availability health is normal. Configure the new network details of the management interface using the CLI commands.

---

**Note** These commands are available only on the active unit and not on standby.

---

For information about the threat defense CLI, see the [FTD command reference](#).

1. Connect to the device CLI.

You should use the console port when using these commands. If you are editing the configuration due to a disrupted management connection, and you have SSH access to the dedicated Management interface, then you can use that SSH connection.

See [Log Into the Command Line Interface on the Device, on page 49](#).

2. Log in with the Admin username and password.
3. Use one of the following commands depending on the network value you want to update:
  - **configure network management-data-interface ipv4 manual *ip\_address ip\_netmask* interface *interface\_id***
  - **configure network management-data-interface ipv4 *gateway\_ip* interface *interface\_id***
  - **configure network management-data-interface ipv4 manual *ip\_address ipv4\_netmask gateway\_ip* interface *interface\_id***

#### Example:

```
Configure network management-data-interface ipv4 manual 10.10.6.7 255.255.255.0 interface
gig0/0
Configuration updated successfully..!!
```

**Note** All other CLI commands of **configure network management-data-interface** are not supported on devices in a High Availability pair.

The configuration is automatically pushed to the standby device.

- Optional:** Limit data interface access to Security Cloud Control on a specific network.

**configure network management-data-interface client** *ip\_address netmask*

By default, all networks are allowed.

- Check that the management connection was reestablished.

**sftunnel-status-brief**

See the following sample output for a connection that is up, with peer channel and heartbeat information shown:

```
> sftunnel-status-brief
PEER:10.10.17.202
Peer channel Channel-A is valid type (CONTROL), using 'eth0', connected to '10.10.17.202'
via '10.10.17.222'
Peer channel Channel-B is valid type (EVENT), using 'eth0', connected to '10.10.17.202'
via '10.10.17.222'
Registration: Completed.
IPv4 Connection to peer '10.10.17.202' Start Time: Wed Jun 10 14:27:12 2020 UTC
Heartbeat Send Time: Mon Jun 15 09:02:08 2020 UTC
Heartbeat Received Time: Mon Jun 15 09:02:16 2020 UTC
```

- In Security Cloud Control, click **Inventory > FTD**.
- Select your threat defense and in the **Management** pane on the right, click **Device Summary**.
- In **Management > FMC Access Details**, click **Refresh**.

The Security Cloud Control detects the interface and default route configuration changes, and blocks deployment to the FTD. When you change the data interface settings locally on the device, you must reconcile those changes in Security Cloud Control manually. You can view the discrepancies between Security Cloud Control and the threat defense on the **Configuration** tab.

- Return to the **FMC Access Details** dialog box, and click **Acknowledge** to remove the deployment block.

The next time you deploy, the Security Cloud Control configuration will overwrite any remaining conflicting settings on the FTD. It is your responsibility to manually fix the configuration in the Security Cloud Control before you re-deploy.

You will see expected messages of "Config was cleared" and "FMC Access changed and acknowledged."

The configuration change made on the active unit is automatically pushed to standby. Once the Security Cloud Control restores its connectivity with the active unit, Security Cloud Control updates the standby IP address.

## View Inventory Details

The **Inventory Details** section of the **Device** page shows chassis details such as the CPU and memory.

**Figure 37: Inventory Details**

| Inventory Details  |                             |
|-------------------------------------------------------------------------------------------------------|-----------------------------|
| CPU Type:                                                                                             | CPU Xeon E5 series 2300 MHz |
| CPU Cores:                                                                                            | 1 CPU (4 cores)             |
| Memory:                                                                                               | 8192 MB RAM                 |
| Storage:                                                                                              | N/A                         |
| Chassis URL:                                                                                          | N/A                         |
| Chassis Serial Number:                                                                                | N/A                         |
| Chassis Module Number:                                                                                | N/A                         |
| Chassis Module Serial Number:                                                                         | N/A                         |

To update information, click **Refresh** .

## Edit Applied Policies

The **Applied Policies** section of the **Device** page displays the following policies applied to your firewall:

**Figure 38: Applied Policies**

| Applied Policies  |                                                                                                                         |
|--------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------|
| Access Control Policy:                                                                                 | <a href="#">Initial AC Policy</a>  |
| Prefilter Policy:                                                                                      | <a href="#">Default Prefilter Policy</a>                                                                                |
| SSL Policy:                                                                                            |                                                                                                                         |
| DNS Policy:                                                                                            | <a href="#">Default DNS Policy</a>                                                                                      |
| Identity Policy:                                                                                       |                                                                                                                         |
| NAT Policy:                                                                                            |                                                                                                                         |
| Platform Settings Policy:                                                                              |                                                                                                                         |
| QoS Policy:                                                                                            |                                                                                                                         |
| FlexConfig Policy:                                                                                     |                                                                                                                         |

For policies with links, you can click the link to view the policy.

For the Access Control Policy, view the **Access Policy Information for Troubleshooting** dialog box by clicking the **Exclamation**  icon. This dialog box shows how access rules are expanded into access control entries (ACEs).

**Figure 39: Access Policy Information for Troubleshooting**

```

Access Policy Information for Troubleshooting
-----
Cisco Firepower Management Center for VMware - v7.1.0 - (build 90)
Access Control Rule Expansion Computer

Device:

  UUID: 4f12c89a-5705-11ec-b324-b3df319dfb31
  Name: 7.10 FCS FTD

Access Control Policy:

  UUID: 00000000-0000-0ed3-0000-004294968119
  Name: Initial AC Policy
  Description:

Intrusion Policies:
-----
UUID	NAME
Date: 2022-Mar-31 at 20:22:22 UTC

NOTE: Computation is done on per rule basis. Count from shadow rules will not be applicable on device.
Run "Rule Conflict Detection" tool on AC Policy for specified device to detect and optimise such rules.

-----|-----|-----|
UUID	NAME	COUNT
TOTAL: 0		
-----|-----|-----|

```

You can assign policies to an individual device from the **Device Management** page.

## Procedure

- Step 1** Choose **Devices > Device Management**.
- Step 2** Next to the device where you want to assign policies, click **Edit** (✎).
- Step 3** Click **Device**.
- Step 4** In the **Applied Policies** section, click **Edit** (✎).

**Figure 40: Policy Assignments**

**Policy Assignments** ?

---

Access Control Policy:  ▼

NAT Policy:  ▼

Platform Settings Policy:  ▼

QoS Policy:  ▼

FlexConfig Policy:  ▼

- Step 5** For each policy type, choose a policy from the drop-down menu. Only existing policies are listed.

**Step 6** Click **Save**.

#### What to do next

- Deploy configuration changes.

## Edit Advanced Settings

The **Advanced Settings** section of the **Device** page displays a table of advanced configuration settings, as described below. You can edit any of these settings.

**Table 8: Advanced Section Table Fields**

| Field                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Application Bypass            | The state of Automatic Application Bypass on the device.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Bypass Threshold              | The Automatic Application Bypass threshold, in milliseconds.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

The following topics explain how to edit the advanced device settings.

**Note** For information about the Transfer Packets setting, see [Edit General Settings, on page 137](#).

## Configure Automatic Application Bypass

Automatic Application Bypass (AAB) allows packets to bypass detection if Snort is down or, for a Classic device, if a packet takes too long to process. AAB causes Snort to restart within ten minutes of the failure, and generates troubleshooting data that can be analyzed to investigate the cause of the Snort failure.

**Caution** AAB activation partially restarts the Snort process, which temporarily interrupts the inspection of a few packets. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See [Snort Restart Traffic Behavior, on page 234](#) for more information.

See the following behavior:

**Threat Defense Behavior:** If Snort is down, then AAB is triggered after the specified timer duration. If Snort is up, then AAB is never triggered, even if packet processing exceeds the configured timer.

**Classic Device Behavior:** AAB limits the time allowed to process packets through an interface. You balance packet processing delays with your network's tolerance for packet latency.

The feature functions with any deployment; however, it is most valuable in inline deployments.

Typically, you use Rule Latency Thresholding in the intrusion policy to fast-path packets after the latency threshold value is exceeded. Rule Latency Thresholding does not shut down the engine or generate troubleshooting data.

If detection is bypassed, the device generates a health monitoring alert.

By default the AAB is disabled; to enable AAB follow the steps described.

### Procedure

- 
- Step 1** Choose **Devices > Device Management**.
  - Step 2** Next to the device where you want to edit advanced device settings, click **Edit** (✎).
  - Step 3** Click **Device**, then click **Edit** (✎) in the **Advanced Settings** section.
  - Step 4** Check **Automatic Application Bypass**.
  - Step 5** Enter a **Bypass Threshold** from 250 ms to 60,000 ms. The default setting is 3000 milliseconds (ms).
  - Step 6** Click **Save**.
- 

### What to do next

- Deploy configuration changes.

## Configure Object Group Search

While operating, the threat defense device expands access control rules into multiple access control list entries based on the contents of any network or interface objects used in the access rule. You can reduce the memory required to search access control rules by enabling object group search. With object group search enabled, the system does not expand network or interface objects, but instead searches access rules for matches based

on those group definitions. Object group search does not impact how your access rules are defined or how they appear in management center. It impacts only how the device interprets and processes them while matching connections to access control rules.

Enabling object group search reduces memory requirements for access control policies that include network or interface objects. However, it is important to note that object group search might also decrease rule lookup performance and thus increase CPU utilization. You should balance the CPU impact against the reduced memory requirements for your specific access control policy. In most cases, enabling object group search provides a net operational improvement.

By default, the object group search is enabled for the threat defense devices that are added for the first time in the management center. In the case of upgraded devices, if the device is configured with disabled object group search, then you need to manually enable it. You can enable it on one device at a time; you cannot enable it globally. We recommend that you enable it on any device to which you deploy access rules that use network or interface objects.

---

**Note** If you enable object group search and then configure and operate the device for a while, be aware that subsequently disabling the feature might lead to undesirable results. When you disable object group search, your existing access control rules will be expanded in the device's running configuration. If the expansion requires more memory than is available on the device, your device can be left in an inconsistent state and you might see a performance impact. If your device is operating normally, you should not disable object group search once you have enabled it.

---

### Before you begin

- Model Support—Threat Defense
- We recommend that you also enable transactional commit on each device. From the device CLI, enter the **asp rule-engine transactional-commit access-group** command.
- Changing this setting can be disruptive to system operation while the device recompiles the ACLs. We recommend that you change this setting during a maintenance window.
- You can use FlexConfig to configure the **object-group-search threshold** command to enable a threshold to help prevent performance degradation. When operating with a threshold, for each connection, both the source and destination IP addresses are matched against network objects. If the number of objects matched by the source address times the number matched by the destination address exceeds 10,000, the connection is dropped. Configure your rules to prevent an excessive number of matches.

### Procedure

- 
- Step 1** Choose **Devices > Device Management**.
  - Step 2** Next to the threat defense device where you want to configure the rule, click the **Edit** (✎).
  - Step 3** Click the **Device** tab, then click the **Edit** (✎) in the **Advanced Settings** section.
  - Step 4** Check **Object Group Search**.
  - Step 5** To have object group search work on interface objects in addition to network objects, check **Interface Object Optimization**.

If you do not select **Interface Object Optimization**, the system deploys separate rules for each source/interface pair, rather than use the security zones and interface groups used in the rules. This means the interface groups are not available for object group search processing.

**Step 6** Click **Save**.

---

## Configure Interface Object Optimization

During deployment, interface groups and security zones used in the access control and prefilter policies generate separate rules for each source/destination interface pair. If you enable interface object optimization, the system will instead deploy a single rule per access control/prefilter rule, which can simplify the device configuration and improve deployment performance. If you select this option, also select the **Object Group Search** option to reduce memory usage on the device.

Interface object optimization is disabled by default. You can enable it on one device at a time; you cannot enable it globally.

**Note** If you disable interface object optimization, your existing access control rules will be deployed without using interface objects, which might make deployment take longer. In addition, if object group search is enabled, its benefits will not apply to interface objects, and you might see expansion in the access control rules in the device's running configuration. If the expansion requires more memory than is available on the device, your device can be left in an inconsistent state and you might see a performance impact.

### Procedure

- 
- Step 1** Choose **Devices > Device Management**.
  - Step 2** Next to the threat defense device where you want to configure the rule, click the **Edit** (✎).
  - Step 3** Click the **Device** tab, then click **Edit** (✎) in the **Advanced Settings** section.
  - Step 4** Check **Interface Object Optimization**.
  - Step 5** Click **Save**.
- 

## Edit Deployment Settings

The **Deployment Settings** section of the **Device** page displays the information described in the table below.

Figure 41: Deployment Settings

| Deployment Settings                            |          |
|------------------------------------------------|----------|
| Auto Rollback Deployment if Connectivity fails | Disabled |
| Connectivity Monitor Interval (in Minutes)     | 20 Mins. |

Table 9: Deployment Settings

| Field                                          | Description                                                                                                                                                                                                                     |
|------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Auto Rollback Deployment if Connectivity Fails | Enabled or Disabled.<br>You can enable auto rollback if the management connection fails as a result of the deployment; specifically if you use data for management center access, and then you misconfigure the data interface. |
| Connectivity Monitor Interval (in Minutes)     | Shows the amount of time to wait before rolling back the configuration.                                                                                                                                                         |

You can set deployment settings from the **Device Management** page. Deployment settings include enabling auto rollback of the deployment if the management connection fails as a result of the deployment; specifically if you use data for management center access, and then you misconfigure the data interface. You can alternatively manually roll back the configuration using the **configure policy rollback** command (see [Manually Roll Back the Configuration if the Management Center Loses Connectivity](#), on page 178).

See the following guidelines:

- Only the previous deployment is available locally on the threat defense; you cannot roll back to any earlier deployments.
- Rollback is supported for high availability but not supported for clustering deployments.
- Rollback is not supported immediately after high availability creation.
- The rollback only affects configurations that you can set in the management center. For example, the rollback does not affect any local configuration related to the dedicated Management interface, which you can only configure at the threat defense CLI. Note that if you changed data interface settings after the last management center deployment using the **configure network management-data-interface** command, and then you use the rollback command, those settings will not be preserved; they will roll back to the last-deployed management center settings.
- UCAPL/CC mode cannot be rolled back.
- Out-of-band SCEP certificate data that was updated during the previous deployment cannot be rolled back.
- During the rollback, connections will drop because the current configuration will be cleared.

## Procedure

**Step 1** Choose **Devices > Device Management**.

**Step 2** Next to the device where you want to assign policies, click **Edit** (✎).

**Step 3** Click **Device**.

**Step 4** In the **Deployment Settings** section, click **Edit** (✎).

**Figure 42: Deployment Settings**

Deployment Settings

Auto Rollback Deployment if Connectivity Fails:

Connectivity Monitor Interval (in Minutes): 20

The connectivity failure timeout will be applicable from next deployment incase, the deployment for this device is already in progress.

Cancel Save

**Step 5** Check **Auto Rollback Deployment if Connectivity Fails** to enable auto rollback.

**Step 6** Set the **Connectivity Monitor Interval (in Minutes)** to set the amount of time to wait before rolling back the configuration. The default is 20 minutes.

**Step 7** If a rollback occurs, see the following for next steps.

- If the auto rollback was successful, you see a success message instructing you to do a full deployment.
- You can also go to the **Deploy > Advanced Deploy** screen and click the **Preview** (📄) icon to view the parts of the configuration that were rolled back (see [Deploy Configuration Changes, on page 240](#)). Click **Show Rollback Changes** to view the changes, and **Hide Rollback Changes** to hide the changes.

Download as PDF OK

- In the Deployment History Preview, you can view the rollback changes. See [View Deployment History, on page 247](#).

**Step 8** Check that the management connection was reestablished.

In management center, check the management connection status on the **Devices > Device Management > Device > Management > FMC Access Details > Connection Status** page.

At the threat defense CLI, enter the `sftunnel-status-brief` command to view the management connection status.

If it takes more than 10 minutes to reestablish the connection, you should troubleshoot the connection. See [Troubleshoot Management Connectivity on a Data Interface, on page 180](#).

## Edit Cluster Health Monitor Settings

The **Cluster Health Monitor Settings** section of the **Cluster** page displays the settings described in the table below.

Figure 44: Cluster Health Monitor Settings

| Cluster Health Monitor Settings |          |                           |                    |

|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Timeouts</b>             |                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Hold Time                   | Between .3 and 45 seconds; The default is 3 seconds. To determine node system health, the cluster nodes send heartbeat messages on the cluster control link to other nodes. If a node does not receive any heartbeat messages from a peer node within the hold time period, the peer node is considered unresponsive or dead.                                                                                                             |
| Interface Debounce Time     | Between 300 and 9000 ms. The default is 500 ms. The interface debounce time is the amount of time before the node considers an interface to be failed, and the node is removed from the cluster.                                                                                                                                                                                                                                          |
| <b>Monitored Interfaces</b> | The interface health check monitors for link failures. If all physical ports for a given logical interface fail on a particular node, but there are active ports under the same logical interface on other nodes, then the node is removed from the cluster. The amount of time before the node removes a member from the cluster depends on the type of interface and whether the node is an established node or is joining the cluster. |
| Service Application         | Shows whether the Snort and disk-full processes are monitored.                                                                                                                                                                                                                                                                                                                                                                            |
| Unmonitored Interfaces      | Shows unmonitored interfaces.                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Auto-Rejoin Settings</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Cluster Interface           | Shows the auto-rejoin settings after a cluster control link failure.                                                                                                                                                                                                                                                                                                                                                                      |

| Field                            | Description                                                                                                                                              |
|----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>Attempts</i>                  | Between -1 and 65535. The default is -1 (unlimited). Sets the number of rejoin attempts.                                                                 |
| <i>Interval Between Attempts</i> | Between 2 and 60. The default is 5 minutes. Defines the interval duration in minutes between rejoin attempts.                                            |
| <i>Interval Variation</i>        | Between 1 and 3. The default is 1x the interval duration. Defines if the interval duration increases at each attempt.                                    |
| Data Interfaces                  | Shows the auto-rejoin settings after a data interface failure.                                                                                           |
| <i>Attempts</i>                  | Between -1 and 65535. The default is 3. Sets the number of rejoin attempts.                                                                              |
| <i>Interval Between Attempts</i> | Between 2 and 60. The default is 5 minutes. Defines the interval duration in minutes between rejoin attempts.                                            |
| <i>Interval Variation</i>        | Between 1 and 3. The default is 2x the interval duration. Defines if the interval duration increases at each attempt.                                    |
| System                           | Shows the auto-rejoin settings after internal errors. Internal failures include: application sync timeout; inconsistent application statuses; and so on. |
| <i>Attempts</i>                  | Between -1 and 65535. The default is 3. Sets the number of rejoin attempts.                                                                              |
| <i>Interval Between Attempts</i> | Between 2 and 60. The default is 5 minutes. Defines the interval duration in minutes between rejoin attempts.                                            |
| <i>Interval Variation</i>        | Between 1 and 3. The default is 2x the interval duration. Defines if the interval duration increases at each attempt.                                    |

**Note** If you disable the system health check, fields that do not apply when the system health check is disabled will not show.

You can change these settings from this section.

You can monitor any port-channel ID, single physical interface ID, as well as the Snort and disk-full processes. Health monitoring is not performed on VLAN subinterfaces or virtual interfaces such as VNIs or BVIs. You cannot configure monitoring for the cluster control link; it is always monitored.

## Procedure

- 
- Step 1** Choose **Devices > Device Management**.
  - Step 2** Next to the cluster you want to modify, click **Edit** (✎).
  - Step 3** Click **Cluster**.
  - Step 4** In the **Cluster Health Monitor Settings** section, click **Edit** (✎).
  - Step 5** Disable the system health check by clicking the **Health Check** slider .

Figure 45: Disable the System Health Check

Edit Cluster Health Monitor Settings

Health Check  ⓘ

▼ Timeouts

Hold Time  Range: 0.3 to 45 seconds

Interface Debounce Time  Range: 300 to 9000 milliseconds

> Auto-Rejoin Settings

> Monitored Interfaces

Reset to Defaults Cancel Save

When any topology changes occur (such as adding or removing a data interface, enabling or disabling an interface on the node or the switch, or adding an additional switch to form a VSS or vPC) you should disable the system health check feature and also disable interface monitoring for the disabled interfaces. When the topology change is complete, and the configuration change is synced to all nodes, you can re-enable the system health check feature and monitored interfaces.

**Step 6** Configure the hold time and interface debounce time.

- **Hold Time**—Set the hold time to determine the amount of time between node heartbeat status messages, between .3 and 45 seconds; The default is 3 seconds.
- **Interface Debounce Time**—Set the debounce time between 300 and 9000 ms. The default is 500 ms. Lower values allow for faster detection of interface failures. Note that configuring a lower debounce time increases the chances of false-positives. When an interface status update occurs, the node waits the number of milliseconds specified before marking the interface as failed, and the node is removed from the cluster. In the case of an EtherChannel that transitions from a down state to an up state (for example, the switch reloaded, or the switch enabled an EtherChannel), a longer debounce time can prevent the interface from appearing to be failed on a cluster node just because another cluster node was faster at bundling the ports.

**Step 7** Customize the auto-rejoin cluster settings after a health check failure.

Figure 46: Configure Auto-Rejoin Settings

▼ Auto-Rejoin Settings

---

**Cluster Interface**

Attempts  Range: 0-65535 (-1 for unlimited number of attempts)

Interval Between Attempts  Range: 2-60 minutes between rejoin attempts

Interval Variation  Range: 1-3. Defines if the interval duration increases. 1 (no change); 2 (2 x the previous duration), or 3 (3 x the previous duration).

**Data Interface**

Attempts  Range: 0-65535 (-1 for unlimited number of attempts)

Interval Between Attempts  Range: 2-60 minutes between rejoin attempts

Interval Variation  Range: 1-3. Defines if the interval duration increases. 1 (no change); 2 (2 x the previous duration), or 3 (3 x the previous duration).

**System**

Attempts  Range: 0-65535 (-1 for unlimited number of attempts)

Interval Between Attempts  Range: 2-60 minutes between rejoin attempts

Interval Variation  Range: 1-3. Defines if the interval duration increases. 1 (no change); 2 (2 x the previous duration), or 3 (3 x the previous duration).

Set the following values for the **Cluster Interface**, **Data Interface**, and **System** (internal failures include: application sync timeout; inconsistent application statuses; and so on):

- **Attempts**—Sets the number of rejoin attempts, between -1 and 65535. **0** disables auto-rejoining. The default for the **Cluster Interface** is -1 (unlimited). The default for the **Data Interface** and **System** is 3.
- **Interval Between Attempts**—Defines the interval duration in minutes between rejoin attempts, between 2 and 60. The default value is 5 minutes. The maximum total time that the node attempts to rejoin the cluster is limited to 14400 minutes (10 days) from the time of last failure.
- **Interval Variation**—Defines if the interval duration increases. Set the value between 1 and 3: **1** (no change); **2** (2 x the previous duration), or **3** (3 x the previous duration). For example, if you set the interval duration to 5 minutes, and set the variation to 2, then the first attempt is after 5 minutes; the 2nd attempt is 10 minutes (2 x 5); the 3rd attempt 20 minutes (2 x 10), and so on. The default value is **1** for the **Cluster Interface** and **2** for the **Data Interface** and **System**.

**Step 8**

Configure monitored interfaces by moving interfaces in the **Monitored Interfaces** or **Unmonitored Interfaces** window. You can also check or uncheck **Enable Service Application Monitoring** to enable or disable monitoring of the Snort and disk-full processes.

[Add](#)

Enable Service Application Monitoring

The interface health check monitors for link failures. If all physical ports for a given logical interface fail on a particular node, but there are active ports under the same logical interface on other nodes, then the node is removed from the cluster. The amount of time before the node removes a member from the cluster depends on the type of interface and whether the node is an established node or is joining the cluster. Health check is enabled by default for all interfaces and for the Snort and disk-full processes.

You might want to disable health monitoring of non-essential interfaces.

When any topology changes occur (such as adding or removing a data interface, enabling or disabling an interface on the node or the switch, or adding an additional switch to form a VSS or vPC) you should disable the system health check feature and also disable interface monitoring for the disabled interfaces. When the topology change is complete, and the configuration change is synced to all nodes, you can re-enable the system health check feature and monitored interfaces.

**Step 9** Click **Save**.

**Step 10** Deploy configuration changes.

## CHAPTER 8

# Change Management

---

You can enable Change Management if your organization needs to implement more formal processes for configuration changes, including audit tracking and official approval before changes are deployed.

- [About Change Management, on page 207](#)
- [Requirements and Prerequisites for Change Management, on page 211](#)
- [Guidelines and Limitations for Change Management, on page 211](#)
- [Enabling or Disabling Change Management, on page 212](#)
- [Managing Tickets, on page 213](#)
- [History for Change Management, on page 218](#)

## About Change Management

Some organizations need to implement a formal approach to deploying configuration changes. This might include more auditing, and an official approval process that must happen before configuration changes can be made to a device.

If your organization uses a more formal configuration change process, you can enable Change Management to enforce the process. With Change Management, administrators must open tickets before they can make configuration changes. Then, once the change is complete, they must submit the ticket for approval before they can deploy the proposed changes. This allows you to enforce your official approval process and ensure that the right employees make the final decisions.

When using Change Management, administrators can see their own changes within a ticket, but they cannot see changes anyone else has made within a ticket. Because a policy is locked once a user makes a change within a ticket, users should not be able to make interfering changes. However, users will not be able to make changes while another user has made a change that is pending approval.

Administrators can create multiple tickets so that a single ticket contains only logically-related policy changes. Tickets with a more limited scope are also easier to evaluate and approve quickly.

The following topics explain the Change Management Workflow and which policies and objects are subject to the ticketing and approval process.

## How to Configure Devices in the Change Management Workflow

When you enable Change Management, users who configure devices need to change their approach slightly. Configuration specialists need to take the following approach when making configuration changes to supported policies and objects.

### Procedure

---

**Step 1** Create a ticket.

**Step 2** Open the ticket.

**Step 3** Make the configuration changes.

Note that the procedures explained in the online help and user guides assume that Change Management is not active, and omit any steps for creating, opening, or submitting tickets.

**Step 4** Optionally, preview and validate the ticket to ensure the changes are complete and correct.

**Step 5** Submit the ticket. At this point, the approver can either approve or reject the ticket.

- If the ticket is approved, deploy the changes.
  - If the ticket is rejected, address the issues, and resubmit the ticket.
- 

## Creating Separate Approver and Configuration Roles

Some system-defined roles have permissions to modify (create/open/discard) and review (approve/reject) tickets:

- To both modify and review tickets:
  - Admin
- To modify tickets only:
  - Edit Only
- To review tickets only:
  - Deploy Only

---

**Note** A Read Only user cannot use the Change Management feature.

---

If you need more granular roles to separate these activities due to your organizational requirements, you can create separate roles to ensure that ticket approval is assigned only to those users who have the organizational authority to approve changes. To create a new user, navigate back to Security Cloud Control and from the Security Cloud Control navigation bar, choose **Settings > User Management**.

The approach you take depends on your precise requirements. For example:

- If your approvers should also be allowed to make configuration changes, you can simply assign them the system-defined roles, such as Administrator. Then, create custom configuration-only roles that include the same permissions but not the Review Tickets permission.
- If you need complete separation between approvers and those who make configuration changes, create custom roles for both, limiting the roles to either the Modify Tickets or the Review Tickets permission plus all other needed permissions for viewing or changing the supported policies and objects.

## Policies and Objects that Support Change Management

If a policy or object supports the change management workflow, then creating, editing, or deleting the policy or object, including assigning a policy to a device, must be done in an open ticket.

Any action, policy, or object that does not support the change management workflow can be created, edited, or deleted, and so forth, without an open ticket. Even if a ticket is open, the changes made to unsupported policies are not included in the ticketed changes and are available for deployment immediately.

The following lists include the policies and objects that are supported. Anything not listed is unsupported.

### Supported Policies

- Access Control, including rules, references to other policies, and inheritance settings.
- Device Configuration policies:
  - Interfaces
  - Inline Sets
  - DHCP
  - VTEP
  - All Routing
- Decryption policy
- DNS policy
- FlexConfig
- Intrusion policy and Network Analysis Policy (NAP), Snort 3 only.
- Malware and File policy
- Network Address Translation (NAT)
- Network Discovery policy
- Platform Settings
- Prefilter
- QoS
- Umbrella SASE Topology

- VPN policies, both site-to-site and remote access
- Zero Trust Access

### Supported Objects

- AAA Server
- Access List
- Address Pools
- AS Path
- Cipher suit lists
- Community List
- Distinguished Name objects
- DHCP IPv6 Pools
- DNS Server Group
- FlexConfig objects
- Group policy
- Interface
- Key Chain
- Network
- PKI certificates, all objects
- Policy List
- Port
- Prefix List
- Route Map
- Sinkhole
- SLA Monitor
- Time Range
- Time Zone
- Tunnel Zone
- URL
- Variable Set
- VLAN Tag
- VPN objects (IKEv1, IKEv2 IPSec and policy, PKI enrollment, certificate map)

# Requirements and Prerequisites for Change Management

## Model Support

Management Center

## User Roles

- To enable or disable Change Management: Admin.
- To both modify and review tickets:
  - Admin
- To modify tickets only:
  - Edit Only
- To review tickets only:
  - Deploy Only

# Guidelines and Limitations for Change Management

- When operating in change management mode, users can make changes to supported policies, but they cannot save the changes. For example, you could go through the dialog box to create a new Platform Settings policy without an open ticket, but when you click OK to actually create the policy, you will get an error and the policy will not be created.
- The following activities require that all tickets be in a terminal state, that is, approved or discarded: backup/restore.
- Deleting a device from the inventory requires that all tickets involving that device be approved or discarded.
- Some processes, such as deployment and backup/restore, prevent you from changing the Change Management mode. Wait until the process completes to change the mode.
- Your ability to create objects while configuring a feature is constrained based on whether the feature and objects are all supported by change management. For example, importing a configuration is not supported by change management. Therefore, you cannot create security zone objects, which are supported, during the import. On the other hand, you can create new objects while configuring access control rules, because both are supported.

When you create an object from Security Cloud Control, the system automatically creates a ticket internally and allows the object to be associated with the cloud-delivered Firewall Management Center. You do not have to create or have an open ticket to do this. However, when you want to create an object from the cloud-delivered Firewall Management Center, you need an existing ticket or create one. The object is synchronized to Security Cloud Control only after the ticket is approved.

- When using cloud-delivered Firewall Management Center, a user defined in Cisco Security Cloud Control is available to be assigned tickets only after the user cross-launches cdFMC at least once. Until the first cross-launch, the user does not exist in cdFMC.

## Enabling or Disabling Change Management

The default is that the Change Management workflow is disabled. Users do not need to open tickets and get approval when making configuration changes. If you want to enforce the Change Management workflow, you must enable it globally for the system.

### Before you begin

There are several system processes that prevent you from enabling/disabling change management. If any of the following are in process, you need to wait for them to complete before changing these settings: backup/restore; import/export; domain movement; upgrade; Flexconfig migration; device registration; high-availability registration, creation, break, or switch; cluster create, registration, break, edit, add or remove nodes; EPM break out or join.

An access control policy cannot be locked when you change these settings. If a policy is locked, you must wait for the lock to be released before enabling/disabling this feature.

### Procedure

---

**Step 1** Choose **System** (⚙) > **Configuration**.

**Step 2** Click **Change Management**.

**Step 3** Select **Enable Change Management**.

To disable the feature, deselect the option. All tickets must be approved or discarded to disable Change Management. You cannot disable Change Management if any ticket is in the In Progress, On Hold, Rejected, or Pending Approval state.

**Step 4** Select the **Number of approvals required**, which is how many administrators must approve the change for the ticket to be approved and deployable. The default is 1, but you can require up to 5 approvers per ticket. Users can override this number when creating tickets.

**Step 5** Select the **Ticket Purge Duration**, which is the number of days to keep approved tickets, from 1-100 days. The default is 5 days.

**Step 6** (Optional.) Enter the **Reply to Address** and the email addresses for the **List of Approver Addresses**. You must also configure the Email Notification system settings for email to work.

**Step 7** Click **Save**.

The system adds the **Ticket** (📄) shortcut to the menu bar, and the **System** (⚙) > **Change Management Workflow** command. Users can manage tickets using these methods.

---

# Managing Tickets

When you enable Change Management, configuration changes for supported policies must be done within the context of a ticket. You open a ticket, make your changes, then submit the ticket for approval.

You can see a list of tickets, and create new ones, either on the Change Management page or through the Ticket quick-access menu. All ticket changes are synchronized in each menu, so you can switch back and forth at your convenience and use whichever method you prefer.

**Note** When you open a ticket and make a change to a supported policy, that policy is locked from changes by other users or through other tickets. The policy remains locked until the ticket is approved or discarded.

## Procedure

**Step 1** Do any of the following:

- Choose **System** (⚙️) > **Change Management Workflow** to open a page showing existing tickets.
- Click the **Ticket** (📄) quick-access menu. The icon can either be named Select a Ticket (if no ticket is opened), the ticket name if a ticket is opened, or unnamed if no tickets exist.

Both pages are organized the same. The **Ticket** tab lists all tickets, whereas the **Review** tab lists tickets that have been submitted for approval. The default view shows your tickets only.

**Step 2** On the **Ticket** tab, take any of these actions:

- To create a new ticket, click **Add Ticket**.
- To view the details of a ticket, click the > next to the ticket name. The Details page includes UUID, name, description, user, last modified date, and comments. The History page includes the status changes for the ticket. The image at the top shows where the ticket stands in the overall workflow.
- To preview the configuration changes for an open ticket, click **Preview** (📄).
- To validate the configuration changes in an open ticket, click **Validate** (🔍) or **More** (⋮) > **Validate**. A dialog box opens showing error, warning, and informational messages, if there are any validation errors.
- To open a ticket, click **Open** (🔓) or **More** (⋮) > **Open**.
- To close an open ticket, click **Put Ticket on Hold (X)** or **More** (⋮) > **Put Ticket on Hold**. Closing a ticket does not submit it for review, nor does it release any locks placed on edited policies.
- To submit an open ticket for review and approval, click **Submit for Approval** (📄) or **More** (⋮) > **Submit for Approval**. The ticket must be open to be submitted.
- To discard a ticket, click **Discard** (🗑️) or **More** (⋮) > **Discard**.

- To take over or reassign a ticket, click **More** (⋮) > **Take Over Ticket** when viewing all tickets in the system.
- To search for a ticket, type a string in the search box. The search looks at ticket name, description, and responsible user.
- To filter the list by ticket status (on the Change Management Workflow page), click the status above the list: **New**, **Open**, **On Hold** (ticket was closed), **Rejected**, **Pending Approval**, **Approved**. Each status has a count of the number of tickets in that state. Click **All** under **My Tickets** to return to the default of showing all of your tickets, or **All** under **Tickets in System** to see everyone's tickets.

**Step 3** On the **Reviews** tab, take any of these actions on submitted tickets. The list is empty if there are no submitted tickets. In addition, only users with Review Ticket permissions can see this tab.

- To preview the configuration changes for a ticket, click **Preview** (🔍).
- To validate the configuration changes in an open ticket, click **Validate** (🔍) or **More** (⋮) > **Validate**.
- To approve the ticket, click **Approve** (👍) or **More** (⋮) > **Approve**.
- To disapprove the ticket, click **Reject** (👎) or **More** (⋮) > **Reject**.

## Creating Change Management Tickets

When using the Change Management workflow, you must do all configuration changes within the context of an open ticket. If you do not already have a ticket, you must create a new one.

### Procedure

**Step 1** Choose **System** (⚙️) > **Change Management Workflow**, or click the **Ticket** (📄) shortcut menu.

**Step 2** Click **Add Ticket**.

**Step 3** Configure the ticket options:

- **Name**—The name of the ticket. The name can include letters, numbers, spaces, and the following special characters: #-\_!
- **Description**—An optional description of what you intend to configure using this ticket. For example, if you have a case number related to what you intend to fix using this ticket, that would be useful information in a description.
- **Number of Approvers**—How many administrators must approve the change for the ticket to be approved and deployable. You can specify 1-5.
- **Assign to**—Select the user who will own the ticket and be responsible for implementing the changes. Choose **self** to assign it to yourself.

**Step 4** Click one of the following: .

- **Create**—The ticket is added to the list of tickets, but it is not opened. You need to open it before you can work within the context of the ticket.
- **Create and Open**—The ticket is added to the list of tickets and also opened.

---

## Opening a Ticket for Configuration Changes

Before you can make changes within a ticket, you must open the ticket.

If you have another ticket open, the system puts it on hold (closes it) for you before opening the new one.

### Procedure

---

**Step 1** Choose **System** (⚙️) > **Change Management Workflow**, or click the **Ticket** (📄) shortcut menu.

**Step 2** On the **Tickets** tab, click **Open** (📄) or **More** (⋮) > **Open** for the ticket.

**Step 3** Optionally, enter a comment for the action.

**Step 4** Click **Open**.

You can now start your configuration changes. The name of the Ticket icon changes to the name of the open ticket.

---

## Previewing a Ticket

You can preview a ticket while making your configuration changes, or before approving it. The preview shows all configuration changes made within the context of the ticket.

### Procedure

---

**Step 1** Choose **System** (⚙️) > **Change Management Workflow**, or click the **Ticket** (📄) shortcut menu.

**Step 2** Click **Preview** (📄) for the ticket.

The Preview dialog box opens. Changes are color coded according to the legend at the top of the dialog box.

**Step 3** Select the policy whose changes you want to view in the Changed Policies list.

You are shown both the current version of the policy as it is defined in Secure Firewall Management Center (on the left) and the proposed changes defined within the ticket.

For policies that contain pages, such as Platform Settings, you can select the overall policy to see all changes, or specific pages within the policy, in the Changed Policies list.

You cannot alter the changes from within the preview. If you need to change something, you must close the preview and return to the policy you want to change.

- Step 4** Optionally, click **Download as PDF** to save the preview to a PDF file for offline viewing or archival purposes.
- Step 5** Click **OK**.
- 

## Submitting a Ticket

After you have completed the changes needed for a ticket, you can preview and validate the changes. Then, when you are satisfied with the changes, submit the ticket for review and approval.

Changes made within the ticket are not applied until you submit the ticket and the ticket is approved. Until approval happens, all policies modified within a ticket are locked to that ticket and cannot be changed by anyone else.

### Procedure

---

- Step 1** Choose **System** (⚙) > **Change Management Workflow**, or click the **Ticket** (📄) shortcut menu.
- Step 2** Click **Submit for Approval** (📄) or **More** (⋮) > **Submit for Approval** for the open ticket.
- Step 3** Optionally, enter a comment for your action.
- Step 4** Click **Submit**.
- 

## Discarding a Ticket

If you no longer need to make the changes for which you created a ticket, you can discard the ticket. When you discard a ticket, any changes that you made within the ticket are removed.

You cannot undo this action and retrieve a ticket with its changes. If you need them, you must create a new ticket and start over.

You cannot discard a ticket after you submit it. However, if the approver rejects the ticket, you can then discard it.

- Note** If you have permission to modify tickets, you can discard tickets that belong to another user. This makes it possible to deal with situations where an admin is on vacation or otherwise unavailable to manage an in-process ticket. If you have Review Ticket permission, you can alternatively reassign or take over the ticket rather than discard it.
- 

### Procedure

---

- Step 1** Choose **System** (⚙) > **Change Management Workflow**, or click the **Ticket** (📄) shortcut menu.
- Step 2** Click **Discard** (🗑) or **More** (⋮) > **Discard** for the ticket.
- Step 3** Optionally, enter a comment for your action.

**Step 4** Click **Discard**.

---

## Approving or Rejecting a Ticket

When a user submits a ticket, it must be approved for the changes made within the ticket to become active and available for deployment.

Whether you can approve your own tickets, or there is a separate approver, depends on your workplace policies and how user roles are assigned, not on the management software.

The Details view includes a summary of how many approvers are required for the ticket, and who has approved the ticket.

If the changes are inadequate or undesirable, you can reject the ticket. Rejected tickets go back to the submitter, who can then make additional changes and resubmit the ticket, or simply discard the ticket and the configuration changes it contains.

### Procedure

---

**Step 1** Choose **System** (⚙) > **Change Management Workflow**, or click the **Ticket** (📄) shortcut menu.

**Step 2** On the **Review** tab, click **Preview** (📄) for the ticket and evaluate the proposed changes.

You can also click **Validate** (🔍) or **More** (⋮) > **Validate** to check for errors.

**Step 3** After completing your evaluation, do one of the following:

- To approve the ticket, click **Approve** (✅) or **More** (⋮) > **Approve**.
- To disapprove the ticket, click **Reject** (❌) or **More** (⋮) > **Reject**.

**Step 4** Optionally, enter a comment for your action.

**Step 5** Click **Approve** or **Reject**, as appropriate.

---

## Taking Over or Reassigning Tickets

Sometimes it might be necessary to take over a ticket that someone else created. For example, the ticket owner might be on vacation or is otherwise unavailable, and the ticket is blocking updates that need to be deployed.

You can also use this procedure to reassign your own ticket to another person.

### Before you begin

Following are the permissions required to take over tickets:

- Admin user—You can assign tickets to yourself or other users.
- Modify or Review ticket + System > User Management > Users (custom role)—You can assign tickets to yourself or other users.

However, you can assign a user only if the user has the same role as the current ticket owner, or the Admin role. This ensures that the new user has the permissions required to configure the features currently modified within the ticket.

You cannot reassign a ticket that has been submitted for approval.

## Procedure

---

**Step 1** Choose **System** (⚙️) > **Change Management Workflow**.

**Step 2** Click on **All** under **Tickets in System**.

**Step 3** Click **More** (⋮) > **Take Over Ticket**.

**Step 4** Select the user who should now own the ticket.

The list of users is restricted to those who have the permissions required to edit the policies already changed within the ticket. For example, if a ticket contains changes to the access control policy, the list of users contains only those users who are allowed to modify the access control policy.

**Step 5** Enter an optional comment and click **Takeover**.

---

## History for Change Management

| Feature            | Minimum Management Center | Minimum Threat Defense | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## CHAPTER 9

# Users

---

Managed devices include a default **admin** account for CLI access. This chapter discusses how to create custom user accounts.

- [About Users, on page 219](#)
- [Requirements and Prerequisites for User Accounts for Devices, on page 220](#)
- [Guidelines and Limitations for User Accounts for Devices, on page 221](#)
- [Add an Internal User at the CLI, on page 221](#)
- [Troubleshooting LDAP Authentication Connections, on page 223](#)

## About Users

You can add custom user accounts on managed devices, either as internal users or as external users on a LDAP or RADIUS server. Each managed device maintains separate user accounts. For example, when you add a user to the management center, that user only has access to the management center; you cannot then use that username to log directly into a managed device. You must separately add a user on the managed device.

## Internal and External Users

Managed devices support two types of users:

- Internal user—The device checks a local database for user authentication.
- External user—If the user is not present in the local database, the system queries an external LDAP or RADIUS authentication server.

## CLI Access

Firepower devices include a Firepower CLI that runs on top of Linux. You can create internal users on devices using the CLI. You can establish external users on threat defense devices using the management center.

**Caution** Users with CLI Config level access can access the Linux shell using the **expert** command, and obtain `sudoers` privileges in the Linux shell, which can present a security risk. For system security reasons, we strongly recommend:

- Only use the Linux shell under TAC supervision or when explicitly instructed by Firepower user documentation.
- Make sure that you restrict the list of users with CLI access appropriately.
- When granting CLI access privileges, restrict the list of users with Config level access.
- Do not add users directly in the Linux shell; only use the procedures in this chapter.
- Do not access Firepower devices using CLI expert mode unless directed by Cisco TAC or by explicit instructions in the Firepower user documentation.

## CLI User Roles

On managed devices, user access to commands in the CLI depends on the role you assign.

### None

The user cannot log into the device on the command line.

### Config

The user can access all commands, including configuration commands. Exercise caution in assigning this level of access to users.

### Basic

The user can access non-configuration commands only. Only internal users and threat defense external RADIUS users support the Basic role.

## Requirements and Prerequisites for User Accounts for Devices

### Model Support

- Threat Defense—Internal and external users

### Supported Domains

Any

### User Roles

Configure external users—Super Admin or Admin user

Configure internal users—Super Admin or Admin user

# Guidelines and Limitations for User Accounts for Devices

## Username

- You cannot add the same username for both internal and external users. If the external server uses a duplicate username, the deployment to the device fails.
- The username must be Linux-valid:
  - Maximum 32 alphanumeric characters, plus hyphen (-) and underscore (\_)
  - All lowercase
  - Cannot start with hyphen (-); cannot be all numbers; cannot include a period (.), at sign (@), or slash (/)

## Defaults

All devices include an **admin** user as a local user account; you cannot delete the **admin** user. The default initial password is **Admin123**; the system forces you to change this during the initialization process. See the getting started guide for your model for more information about system initialization.

## Number of User Accounts

You can create a maximum of 43 user accounts for the Firepower 1000.

# Add an Internal User at the CLI

Use the CLI to create internal users on the threat defense.

## Procedure

- 
- Step 1** Log into the device CLI using an account with Config privileges.
- The **admin** user account has the required privileges, but any account with Config privileges will work. You can use an SSH session or the Console port.
- For certain threat defense models, the Console port puts you into the FXOS CLI. Use the **connect ftd** command to get to the threat defense CLI.
- Step 2** Create the user account.
- configure user add** *username* {**basic** | **config**}
- *username*—Sets the username. The username must be Linux-valid:
    - Maximum 32 alphanumeric characters, plus hyphen (-) and underscore (\_)
    - All lowercase

- Cannot start with hyphen (-); cannot be all numbers; cannot include a period (.), at sign (@), or slash (/)
- **basic**—Gives the user basic access. This role does not allow the user to enter configuration commands.
- **config**—Gives the user configuration access. This role gives the user full administrator rights to all commands.

**Example:**

The following example adds a user account named johnrichton with Config access rights. The password is not shown as you type it.

```
> configure user add johnrichton config
Enter new password for user johnrichton: newpassword
Confirm new password for user johnrichton: newpassword
> show user
Login          UID   Auth Access  Enabled Reset   Exp Warn  Str Lock Max
admin          1000 Local Config Enabled No   Never N/A  Dis No  N/A
johnrichton    1001 Local Config Enabled No   Never N/A  Dis No   5
```

**Note** Tell users they can change their own passwords using the **configure password** command.

**Step 3** (Optional) Adjust the characteristics of the account to meet your security requirements.

You can use the following commands to change the default account behavior.

- **configure user aging** *username max\_days warn\_days*  
Sets an expiration date for the user's password. Specify the maximum number of days for the password to be valid followed by the number of days before expiration the user will be warned about the upcoming expiration. Both values are 1 to 9999, but the warning days must be less than the maximum days. When you create the account, there is no expiration date for the password.
- **configure user forcereset** *username*  
Forces the user to change the password on the next login.
- **configure user maxfailedlogins** *username number*  
Sets the maximum number of consecutive failed logins you will allow before locking the account, from 1 to 9999. Use the **configure user unlock** command to unlock accounts. The default for new accounts is 5 consecutive failed logins.
- **configure user minpasswdlen** *username number*  
Sets a minimum password length, which can be from 1 to 127.
- **configure user strengthcheck** *username {enable | disable}*  
Enables or disables password strength checking, which requires a user to meet specific password criteria when changing their password. When a user's password expires or if the **configure user forcereset** command is used, this requirement is automatically enabled the next time the user logs in.

**Step 4** Manage user accounts as necessary.

Users can get locked out of their accounts, or you might need to remove accounts or fix other issues. Use the following commands to manage the user accounts on the system.

- **configure user access** *username* {**basic** | **config**}  
Changes the privileges for a user account.
  - **configure user delete** *username*  
Deletes the specified account.
  - **configure user disable** *username*  
Disables the specified account without deleting it. The user cannot log in until you enable the account.
  - **configure user enable** *username*  
Enables the specified account.
  - **configure user password** *username*  
Changes the password for the specified user. Users should normally change their own password using the **configure password** command.
  - **configure user unlock** *username*  
Unlocks a user account that was locked due to exceeding the maximum number of consecutive failed login attempts.
- 

## Troubleshooting LDAP Authentication Connections

If you create an LDAP authentication object and it either does not succeed in connecting to the server you select or does not retrieve the list of users you want, you can tune the settings in the object.

If the connection fails when you test it, try the following suggestions to troubleshoot your configuration:

- Use the messages displayed at the top of the web interface screen and in the test output to determine which areas of the object are causing the issue.
- Check that the user name and password you used for the object are valid:
  - Check that you have the rights to browse to the directory indicated in your base-distinguished name by connecting to the LDAP server using a third-party LDAP browser.
  - Check that the user name is unique to the directory information tree for the LDAP server.
  - If you see an LDAP bind error 49 in the test output, the user binding for the user failed. Try authenticating to the server through a third-party application to see if the binding fails through that connection as well.
- Check that you have correctly identified the server:
  - Check that the server IP address or host name is correct.
  - Check that you have TCP/IP access from your local appliance to the authentication server where you want to connect.
  - Check that access to the server is not blocked by a firewall and that the port you have configured in the object is open.

- If you are using a certificate to connect via TLS or SSL, the host name in the certificate must match the host name used for the server.
- Check that you have not used an IPv6 address for the server connection if you are authenticating CLI access.
- If you used server type defaults, check that you have the correct server type and click **Set Defaults** again to reset the default values.
- If you typed in your base-distinguished name, click **Fetch DNS** to retrieve all the available base distinguished names on the server, and select the name from the list.
- If you are using any filters, access attributes, or advanced settings, check that each is valid and typed correctly.
- If you are using any filters, access attributes, or advanced settings, try removing each setting and testing the object without it.
- If you are using a base filter or a CLI access filter, make sure that the filter is enclosed in parentheses and that you are using a valid comparison operator (maximum 450 characters, including the enclosing parentheses).
- To test a more restricted base filter, try setting it to the base distinguished name for the user to retrieve just that user.
- If you are using an encrypted connection:
  - Check that the name of the LDAP server in the certificate matches the host name that you use to connect.
  - Check that you have not used an IPv6 address with an encrypted server connection.
- If you are using a test user, make sure that the user name and password are typed correctly.
- If you are using a test user, remove the user credentials and test the object.
- Test the query that you are using by connecting to the LDAP server and using this syntax:

```
ldapsearch -x -b 'base_distinguished_name'
-h LDAPserver_ip_address -p port -v -D
'user_distinguished_name' -W 'base_filter'
```

For example, if you are trying to connect to the security domain on `myrtle.example.com` using the `domainadmin@myrtle.example.com` user and a base filter of `(cn=*)`, you could test the connection using this statement:

```
ldapsearch -x -b 'CN=security,DC=myrtle,DC=example,DC=com'
-h myrtle.example.com -p 389 -v -D
'domainadmin@myrtle.example.com' -W '(cn=*)'
```

If you can test your connection successfully but authentication does not work after you deploy a platform settings policy, check that authentication and the object you want to use are both enabled in the platform settings policy that is applied to the device.

If you connect successfully but want to adjust the list of users retrieved by your connection, you can add or change a base filter or CLI access filter or use a more restrictive or less restrictive base DN.

While authenticating a connection to Active Directory (AD) server, rarely the connection event log indicates blocked LDAP traffic although the connection to AD server is successful. This incorrect connection log occurs when the AD server sends a duplicate reset packet. The threat defense device identifies the second reset packet as part of a new connection request and logs the connection with Block action.

## CHAPTER 10

# Configuration Deployment

This chapter describes how to download configuration changes to one or more managed devices.

- [About Configuration Deployment, on page 227](#)
- [Requirements and Prerequisites for Policy Management, on page 238](#)
- [Best Practices for Deploying Configuration Changes, on page 238](#)
- [Deploy the Configuration, on page 239](#)
- [Manage Deployments, on page 247](#)
- [History for Configuration Deployment, on page 254](#)

## About Configuration Deployment

All device configuration is managed by the management center and then deployed to the managed devices.

## Configuration Changes that Require Deployment

The system marks out-of-date policies with red status text that indicates how many of its targeted devices need a policy update. To clear this status, you must re-deploy the policy to the devices.

### Deployment Required

Configuration changes that require a deployment include:

- Modifying an access control policy: any changes to access control rules, the default action, policy targets, Security Intelligence filtering, advanced options including preprocessing, and so on.
- Modifying any of the policies that the access control policy invokes: the SSL policy, network analysis policies, intrusion policies, file policies, identity policies, or DNS policies.
- Changing any reusable object or configuration used in an access control policy or policies it invokes:
  - network, port, VLAN tag, URL, and geolocation objects
  - Security Intelligence lists and feeds
  - application filters or detectors
  - intrusion policy variable sets
  - file lists

- decryption-related objects and security zones
- Updating the system software, intrusion rules, or the vulnerability database (VDB).

Keep in mind that you can change some of these configurations from multiple places in the web interface. For example, you can modify security zones using the object manager (**Objects > Object Management**), but modifying an interface type in a device's configuration (**Devices > Device Management**) can also change a zone and require a deployment.

### Deployment Not Required

Note that the following updates do **not** require a deployment:

- automatic updates to Security Intelligence feeds and additions to the Security Intelligence global Block or Do Not Block list using the context menu
- automatic updates to URL filtering data
- scheduled geolocation database (GeoDB) updates

## Deployment Preview

Preview provides a snapshot of all the policy and object changes to be deployed on the device. The policy changes include the new policies, changes in the existing policies, and the deleted policies. The object changes include the added and modified objects which are used in policies. The unused object changes are not displayed because they are not deployed on the device.

The preview shows all the default values, even when they are not altered, along with the other configured settings when an interface or a platform settings policy is added for the first time. Similarly, the high availability-related policies and default values for settings are shown, even when they are not altered, in the first preview after a high availability pair is configured or disrupted.

To view changes due to an auto rollback, see [Edit Deployment Settings, on page 195](#).

### Unsupported Features

- Object additions and attribute changes are displayed in the preview only if the objects are associated with any device or interface. Object deletions are not displayed.
- Preview is not supported for the following policies:
  - High availability
  - Network discovery
  - Network analysis
  - Device settings
- User information at the rule level is not available for intrusion policies.
- The preview does not show the reordering of rules across policies.

For DNS policies, reordered rules appear in the preview list as rule additions and deletions. For example, moving a rule from position 1 to position 3 in the rule order is displayed as if the rule was deleted from position 1 and added as a new rule in position 3. Similarly, when a rule is deleted, the rules under it are

listed as edited rules as they have changed their positions. The changes are displayed in the final order in which they appear in the policy.

- Preview is not supported in the following HA scenarios:
  - If a device was in standalone mode and if a chain is made, then an auto-deployment is triggered. For that particular job, preview is not supported. On hover over the **Preview** (🔍), a message is displayed that it is a HA bootstrap deployment, and no preview is supported.
  - **Configuration groups** - Consider a flow in which a device was initially standalone. Subsequently, three deployments took place. In the fourth deployment, the device was a HA bootstrap deployment. After these, the user deploys devices 5, 6, and 7. The deployment 7 is an HA break deployment, and the user deploys devices 8, 9, and 10.  
  
In this flow, the preview between 3 and 5 is not supported because 4 was a HA deployment. Similarly, the preview between 8 and 3 is also not supported. Preview is supported only from 3 to 1, 7, 6, 5, 4, and 10, 9, and 8.
  - If a device is broken (HA is broken) then the new device is considered as a fresh device.

## Selective Policy Deployment

The management center allows you to select a specific policy within the list of all the changes on the device that are due for deployment and deploy only the selected policy. Selective deployment is available only for the following policies:

- Access control policies
- Intrusion policies
- Malware and file policies
- DNS policies
- Identity policies
- SSL policies
- QoS policies
- Prefilter policies
- Network discovery
- NAT policies
- Routing policies
- VPN policies

There are certain limitations to selectively deploying policies. Follow the contents in the table below to understand when selective policy deployment can be used.

Table 11: Limitations for Selective Deployment

| Type                                                         | Description                                                                                                                                                                                                                                                                      | Scenarios                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Full deployment                                              | Full deployment is necessary for specific deploy scenarios, and the management center does not support selective deployment in such scenarios. If you encounter an error in such scenarios, you may choose to proceed by selecting all the changes for deployment on the device. | <p>Scenarios wherein a full deployment is required are:</p> <ul style="list-style-type: none"> <li>• The first deployment after you have upgraded the threat defense or the management center.</li> <li>• The first deployment after you have restored the threat defense.</li> <li>• The first deployment after modifications in the threat defense interface settings.</li> <li>• The first deployment after modifications in the virtual router settings.</li> <li>• When the threat defense device is moved to a new domain (global to sub-domain or sub-domain to global).</li> </ul>                                                                     |
| Associated policy deployment                                 | The management center identifies interdependent policies which are interlinked. When one of the interlinked policies is selected, the remaining interlinked policies are automatically selected.                                                                                 | <p>Scenarios wherein an associated policy is automatically selected:</p> <ul style="list-style-type: none"> <li>• When a new object is associated with an existing policy.</li> <li>• When an existing policy's object is modified.</li> </ul> <p>Scenarios wherein multiple policies are automatically selected:</p> <ul style="list-style-type: none"> <li>• When a new object is associated with an existing policy, and the same object is already associated with other policies, all the associated policies are automatically selected.</li> <li>• When a shared object is modified, all the associated policies are automatically selected.</li> </ul> |
| Interdependent policy changes (shown using color-coded tags) | The management center dynamically detects dependencies in-between policies, and between the shared objects and the policies. The interdependency of the objects or policies is shown using color-coded tags.                                                                     | <p>Scenarios wherein color-coded interdependent policies or objects are automatically selected:</p> <ul style="list-style-type: none"> <li>• When all the out-of-date policies have interdependent changes.</li> </ul> <p>For example, when an access control policy, an intrusion policy, and a NAT policy are out-of-date. Since access control policy and NAT policy share an object, all policies are selected together for deployment.</p> <ul style="list-style-type: none"> <li>• When all out-of-date policies share an object, and the object is modified.</li> </ul>                                                                                 |

| Type                               | Description                                                                                                                             | Scenarios                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Access Policy Group specifications | Access Policy Group policies are listed together in the preview window under <b>Access Policy Group</b> when you click <b>View</b> (👁). | <p>The scenarios and the expected behavior for Access Policy Group policies are:</p> <ul style="list-style-type: none"> <li>• If the access control policy is out-of-date, all other out-of-date policies under this group, except file policy and intrusion policy, are selected when the access control policy is selected for deployment.</li> </ul> <p>However, if the access control policy is out-of-date, intrusion and file policies can be individually selected or deselected irrespective of whether the access control policy is selected or not, unless there are any dependent changes. For example, if a new intrusion policy is assigned to an access control rule, it indicates that there are dependent changes, then both the access control policy and the intrusion policy will be automatically selected when either of them is selected.</p> <ul style="list-style-type: none"> <li>• If no access control policy is out-of-date, other out-of-date policies in this group can be selected and deployed individually.</li> </ul> |

## System Username

The management center displays the username as **system** for the following operations:

- Rollback
- Upgrade
- Threat Defense backup and restore
- SRU update
- LSP update
- VDB update

## Auto-Enabling of Application Detectors

If you are performing application control but disable required detectors, the system automatically enables the appropriate system-provided detectors upon policy deploy. If none exist, the system enables the most recently modified user-defined detector for the application.

## Asset Rediscovery with Network Discovery Policy Changes

When you deploy changes to a network discovery policy, the system deletes and then rediscovers MAC address, TTL, and hops information from the network map for the hosts in your monitored networks. Also, the affected managed devices discard any discovery data that has not yet been sent to the management center.

## Snort Restart Scenarios

When the traffic inspection engine referred to as *the Snort process* on a managed device restarts, inspection is interrupted until the process resumes. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See [Snort Restart Traffic Behavior, on page 234](#) for more information. Additionally, resource demands may result in a small number of packets dropping without inspection when you deploy, regardless of whether the Snort process restarts.

Any of the scenarios in the following table cause the Snort process to restart.

**Table 12: Snort Restart Scenarios**

| Restart Scenario                                                                               | More Information                                                                                        |

## Restart Warnings for Devices

When you deploy, the **Inspect Interruption** column in the deploy page specifies whether a deployed configuration restarts the Snort process on the threat defense device. When the traffic inspection engine referred to as *the Snort process* restarts, inspection is interrupted until the process resumes. Whether traffic is interrupted or passes without inspection during the interruption depends on how the device handles traffic. Note that you can proceed with the deployment, cancel the deployment and modify the configuration, or delay the deployment until a time when deploying would have the least impact on your network.

When the **Inspect Interruption** column indicates **Yes** and you expand the device configuration listing, the system indicates any specific configuration type that would restart the Snort process with an **Inspect Interruption** (). When you hover your mouse over the icon, a message informs you that deploying the configuration may interrupt traffic.

The following table summarizes how the deploy page displays inspection interruption warnings.

Table 13: Inspection Interruption Indicators

| Type           | Inspect Interruption                                                                                                    | Description                                                                                                                                                                                                                                     |

| sensor         | --                                                                                                                      | The device identified as <i>sensor</i> is not the threat defense device; the system does not determine if a deployed configuration may interrupt traffic on this device.                                                                        |

For information on all configurations that restart the Snort process for all device types, see [Configurations that Restart the Snort Process When Deployed or Activated](#), on page 236.

## Inspect Traffic During Policy Apply

**Inspect traffic during policy apply** is an advanced access control policy general setting that allows managed devices to inspect traffic while deploying configuration changes; this is the case unless a configuration that you deploy requires the Snort process to restart. You can configure this option as follows:

- Enabled — Traffic is inspected during the deployment unless certain configurations require the Snort process to restart.  
  
When the configurations you deploy do not require a Snort restart, the system initially uses the currently deployed access control policy to inspect traffic, and switches during deployment to the access control policy you are deploying.
- Disabled — Traffic is not inspected during the deployment. The Snort process always restarts when you deploy.

The following graphic illustrates how Snort restarts can occur when you enable or disable **Inspect traffic during policy apply**.

**Caution**

When you deploy, resource demands may result in a small number of packets dropping without inspection. Additionally, deploying some configurations restarts the Snort process, which interrupts traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See [Snort Restart Traffic Behavior, on page 234](#) and [Configurations that Restart the Snort Process When Deployed or Activated, on page 236](#).

## Snort Restart Traffic Behavior

The following tables explain how different devices handle traffic when the Snort process restarts.

**Table 14: The Threat Defense and the Threat Defense Virtual Restart Traffic Effects**

| Interface Configuration                        | Restart Traffic Behavior                                                                                                                                                                                                                                   |
|------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| inline: <b>Snort Fail Open: Down:</b> disabled | dropped                                                                                                                                                                                                                                                    |
| inline: <b>Snort Fail Open: Down:</b> enabled  | passed without inspection<br><br>Some packets can be delayed in buffer for several seconds before the system recognizes that Snort is down. This delay can vary depending upon the load distribution. However, the buffered packets are eventually passed. |

| Interface Configuration                                                                                                                                                                                                                                                            | Restart Traffic Behavior                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| routed, transparent (including EtherChannel, redundant, subinterface): <b>preserve-connection</b> disabled ( <b>configure snort preserve-connection disable</b> )                                                                                                                  | dropped                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| inline: tap mode                                                                                                                                                                                                                                                                   | egress packet immediately, copy bypasses Snort                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| passive                                                                                                                                                                                                                                                                            | uninterrupted, not inspected                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

**Note** In addition to traffic handling when the Snort process is down while it restarts, traffic can also pass without inspection or drop when the Snort process is busy, depending on the configuration of the Snort Fail Open **Busy** option (see [Configure an Inline Set, on page 1030](#)). A device supports either the Failsafe option or the Snort Fail Open option, but not both.

**Note** When the Snort process is busy but not down during configuration deployment, some packets may drop on routed, switched, or transparent interfaces if the total CPU load exceeds 60 percent.

**Warning** Do not reboot the system while the Snort Rule Update is in progress.

Snort-busy drops happen when snort is not able to process the packets fast enough. Lina does not know whether Snort is busy due to processing delay, or if is stuck or due to call blocking. When transmission queue is full, snort-busy drops occur. Based on Transmission queue utilization, Lina will try to access if the queue is being serviced smoothly.

## Configurations that Restart the Snort Process When Deployed or Activated

Deploying any of the following configurations except AAB restarts the Snort process as described. Deploying AAB does not cause a restart, but excessive packet latency activates the currently deployed AAB configuration, causing a partial restart of the Snort process.

### Access Control Policy Advanced Settings

- Deploy when **Inspect Traffic During Policy Apply** is disabled.
- Add or remove an SSL policy.

### File Policy

Deploy the first or last of any one of the following configurations; note that while otherwise deploying these file policy configurations does not cause a restart, deploying non-file-policy configurations can cause restarts.

- Take either of the following actions:
  - Enable or disable **Inspect Archives** when the deployed access control policy includes at least one file policy.
  - Add the first or remove the last file policy rule when **Inspect Archives** is enabled (note that at least one rule is required for **Inspect Archives** to be meaningful).
- Enable or disable **Store files** in a **Detect Files** or **Block Files** rule.
- Add the first or remove the last active file rule that combines the **Malware Cloud Lookup** or **Block Malware** rule action with an analysis option (**Spero Analysis** or **MSEXE**, **Dynamic Analysis**, or **Local Malware Analysis**) or a store files option (**Malware**, **Unknown**, **Clean**, or **Custom**).

Note that access control rules that deploy these file policy configurations to security zones or tunnel zones cause a restart only when your configuration meets the following conditions:

- Source or destination security zones in your access control rule must match the security zones associated with interfaces on the target devices.
- Unless the destination zone in you access control rule is *any*, a source tunnel zone in the rule must match a tunnel zone assigned to a tunnel rule in the prefilter policy.

### Identity Policy

- When SSL decryption is disabled (that is, when the access control policy does not include an SSL policy), add the first or remove the last active authentication rule.

An active authentication rule has either an **Active Authentication** rule action, or a **Passive Authentication** rule action with **Use active authentication if passive or VPN identity cannot be established** selected.

### Network Discovery

- Enable or disable non-authoritative, traffic-based user detection over the HTTP, FTP, or MDNS protocols, using the network discovery policy.

## Device Management

- MTU: Change the highest MTU value among all non-management interfaces on a device.
- Automatic Application Bypass (AAB): The currently deployed AAB configuration activates when a malfunction of the Snort process or a device misconfiguration causes a single packet to use an excessive amount of processing time. The result is a partial restart of the Snort process to alleviate extremely high latency or prevent a complete traffic stall. This partial restart causes a few packets to pass without inspection, or drop, depending on how the device handles traffic.

## Updates

- System update: Deploy configurations the first time after a software update that includes a new version of the Snort binary or data acquisition library (DAQ).
- VDB: For managed devices running Snort 2, deploying configurations the first time after installing a vulnerability database (VDB) update that includes changes applicable to managed devices will require a detection engine restart and may result in a temporary traffic interruption. For these, a message warns you when you select the management center to begin installing. The deploy dialog provides additional warnings for the threat defense devices when VDB changes are pending. VDB updates that apply only to the management center do not cause detection engine restarts, and you cannot deploy them.

For managed devices running Snort 3, deploying configurations the first time after installing a vulnerability database (VDB) update may temporarily interrupt application detection, but there will be no traffic interruptions.

## Changes that Immediately Restart the Snort Process

The following changes immediately restart the Snort process without going through the deploy process. How the restart affects traffic depends on how the target device handles traffic. See [Snort Restart Traffic Behavior](#), on page 234 for more information.

- Take any of the following actions involving applications or application detectors:
  - Activate or deactivate a system or custom application detector.
  - Delete an activated custom detector.
  - **Save and Reactivate** an activated custom detector.
  - Create a user-defined application.

A message warns you that continuing restarts the Snort process, and allows you to cancel; the restart occurs on any managed device in the current domain or in any of its child domains.

- Create or break a threat defense high availability pair.

A message warns you that continuing to create a high availability pair restarts the Snort process on the primary and secondary devices and allows you to cancel.

# Best Practices for Deploying Configuration Changes

The following are guidelines for deploying configuration changes.

## Reliable Management Connection

The management connection between the management center and the device is a secure, TLS-1.3-encrypted communication channel between itself and the device.

You do not need to run this traffic over an additional encrypted tunnel such as Site-to-Site VPN for security purposes. If the VPN goes down, for example, you will lose your management connection, so we recommend a simple management path.

---

**Caution** We recommend against a device's management connection going through a VPN tunnel that terminates on the device itself. If you deploy a configuration change that causes the VPN to go down, the management connection will be disconnected and you will not have any way to recover the configuration without connecting directly to the device.

If management traffic exits a VPN-terminating interface, be sure to exclude the management traffic from the VPN tunnel.

---

## Maximum Concurrent Deployments

You should not deploy to more than 25% of the maximum devices allowed for a management center in the same job. For example, for the FMCv300, the maximum job size should be 75 devices (25% of 300). Concurrent deployment to more devices can cause performance issues.

### Deployment of Shared Policies

For best performance, deploy to devices that use the same policies. Create separate deployment jobs for each group of devices that share policies.

### Time to Deploy and Memory Limitations

The time it takes to deploy depends on multiple factors, including (but not limited to):

- The configurations you send to the device. For example, if you dramatically increase the number of Security Intelligence entries you block, deployment can take longer.
- Device model and memory. On lower-memory devices, deploying can take longer.

Do not exceed the capability of your devices. If you exceed the maximum number of rules or policies supported by a target device, the system displays a warning. The maximum depends on a number of factors—not only memory and the number of processors on the device, but also on policy and rule complexity. For information on optimizing policies and rules, see [Best Practices for Access Control Rules, on page 1823](#).

### Use a Maintenance Window to Lessen the Impact of Traffic Interruptions

We *strongly* recommend you deploy in a maintenance window or at a time when interruptions will have the least impact.

When you deploy, resource demands may result in a small number of packets dropping without inspection. Additionally, deploying some configurations restarts the Snort process, which interrupts traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See [Snort Restart Traffic Behavior, on page 234](#) and [Configurations that Restart the Snort Process When Deployed or Activated, on page 236](#).

For the threat defense devices, the **Inspect Interruption** column in the Deploy dialog warns you when deploying might interrupt traffic flow or inspection. You can either proceed with, cancel, or delay deployment; see [Restart Warnings for Devices, on page 232](#) for more information.

[Snort Restart Scenarios, on page 232](#)

## Deploy the Configuration

After you configure your deployment, and any time you change that configuration, you must deploy the changes to affected devices. You can view deployment status in the Message Center.

Deploying updates the following components:

- Device and interface configurations
- Device-related policies: NAT, VPN, QoS, platform settings
- Access control and related policies: DNS, file, identity, intrusion, network analysis, prefilter, SSL
- Network discovery policy
- Intrusion rule updates
- Configurations and objects associated with any of these elements

You can configure the system to deploy automatically by scheduling a deploy task or by setting the system to deploy when importing intrusion rule updates. Automating policy deployment is especially useful if you allow intrusion rule updates to modify system-provided base policies for intrusion and network analysis. Intrusion rule updates can also modify default values for the advanced preprocessing and performance options in your access control policies.

## Deploy Configuration Changes

After you change configurations, deploy them to the affected devices. We *strongly* recommend that you deploy in a maintenance window or at a time when any interruptions to traffic flow and inspection will have the least impact.

---

**Caution** When you deploy, resource demands may result in a small number of packets dropping without inspection. Additionally, deploying some configurations restarts the Snort process, which interrupts traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See [Snort Restart Traffic Behavior, on page 234](#) and [Configurations that Restart the Snort Process When Deployed or Activated, on page 236](#).

---

### Before you begin

- Be sure all managed devices use the same revision of the Security Zones object. If you have edited security zone objects: Do not deploy configuration changes to any device until you edit the zone setting for interfaces on *all* devices you want to sync. You must deploy to all managed devices at the same time.
- To preview the deployment changes, enable REST API access. To enable the REST API access, follow the steps in *Enabling REST API Access* in the [Cisco Secure Firewall Management Center Administration Guide](#).

---

**Note** The deployment process fails if the device configuration is being read at the device CLI during deployment. Do not execute commands such as **show running-config** during the deployment.

---

## Procedure

- 
- Step 1** On the management center menu bar, click **Deploy**.
- Step 2** For a quick deployment, check specific devices and then click **Deploy**, or click **Deploy All** to deploy to all devices. Otherwise, for additional deployment options, click **Advanced Deploy**.

The rest of this procedure applies to the **Advanced Deploy** screen.

Figure 48: Quick Deploy

Figure 49: Advanced Deploy

**Step 3** Click **Expand Arrow** (  ) to view device-specific configuration changes to be deployed.

Figure 50: Expand

- The **Modified By** column lists the users who have modified the policies or objects. On expanding the device listing, you can view the users who have modified the policies against each policy listing. For information about when the **System** user is shown (instead of the logged-in user), see [System Username, on page 231](#).

**Note** Usernames are not provided for deleted policies and objects.

- The **Inspect Interruption** column indicates if traffic inspection interruption may be caused in the device during deployment.

When the status indicates (Yes) that deploying will interrupt inspection, and perhaps traffic, on the threat defense device, the expanded list indicates the specific configurations causing the interruption with the

**Inspect Interruption** (🔥).

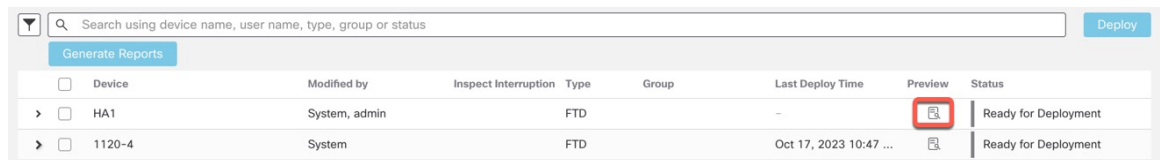

If the entry is blank in this column for a device, then it indicates that there will be no traffic inspection interruptions on that device during deployment.

See [Restart Warnings for Devices, on page 232](#) for information to help you identify configurations that interrupt traffic inspection and might interrupt traffic when deployed to the threat defense devices.

- The **Last Modified Time** column specifies when you last made the configuration changes.
- The **Preview** column allows you to preview the changes for the next deployment.
- The **Status** column provides the status for each deployment. For more information, see [View Deployment Status, on page 247](#).

**Step 4** In the **Preview** column, click **Preview** (📄) to see the configuration changes that you can deploy.

**Figure 51: Preview**

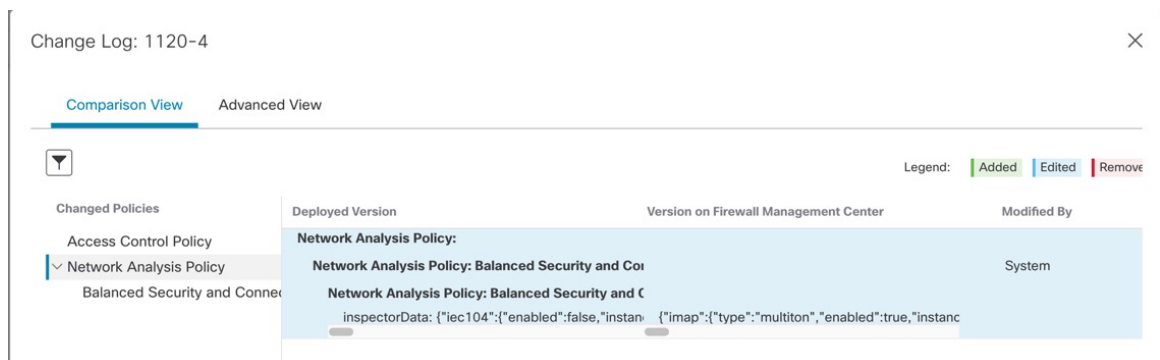

| Device | Modified by   | Inspect Interruption | Type | Group | Last Deploy Time       | Preview | Status               |
|--------|---------------|----------------------|------|-------|------------------------|---------|----------------------|
| HA1    | System, admin |                      | FTD  |       | -                      | 📄       | Ready for Deployment |
| 1120-4 | System        |                      | FTD  |       | Oct 17, 2023 10:47 ... | 📄       | Ready for Deployment |

**Note** If you change the management center name in **System** (⚙️) > **Configuration** > **Information**, the deployment preview does not specify this change, yet it requires a deployment.

For unsupported features for Preview, see [Deployment Preview, on page 228](#).

The **Comparison View** tab lists all the policy and object changes. The left pane lists all the different policy types that have changed on the device, organized in a tree structure.

**Figure 52: Comparison View**

| Changed Policies                                                                                                                                                                             | Deployed Version                                                                                    | Version on Firewall Management Center                                                                                                                                                             | Modified By |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------|
| <ul style="list-style-type: none"> <li>Access Control Policy</li> <li>Network Analysis Policy <ul style="list-style-type: none"> <li>Balanced Security and Connection</li> </ul> </li> </ul> | <b>Network Analysis Policy:</b><br><b>Network Analysis Policy: Balanced Security and Connection</b> | <b>Network Analysis Policy: Balanced Security and Connection</b><br><pre> inspectorData: {"iec104":{"enabled":false,"instance":{},"imap":{"type":"multiton","enabled":true,"instance":{}}} </pre> | System      |

The **Filter** icon (⌵) lets you filter the policies at the user level and policy level.

The right pane lists all the additions, changes, or deletions in the policy, or the object selected in the left pane. The two columns on the right pane provide the last deployed configuration settings (in the **Deployed Version** column) versus the changes that are due for deployment (in the **Version on Firewall Management Center** column). The last-deployed configuration settings are derived from a snapshot of the last saved deployment in the management center and not from the device. The background colors of the settings are color-coded as per the legend available on the top-right of the page.

The **Modified By** column lists the users who have modified, or added the configuration settings. At the policy level, the management center displays all the users who have modified the policy, and at the rule level, the management center displays only the last user who has modified the rule.

You can download a copy of the change log by clicking the **Download Report** button.

The **Advanced View** tab shows the CLI commands that will be applied. This view is useful if you are familiar with ASA CLI, which is used on the back end of the threat defense.

**Figure 53: Advanced View**

**Step 5** Use **Show or Hide Policy** (👁) to selectively view or hide the associated unmodified policies.

**Figure 54: Show or Hide Policy**

**Step 6** Check the box next to the device name to deploy all configuration changes, or click **Policy selection** (👁) to select individual policies or configurations to deploy while withholding the remaining changes without deploying them.

You can also view the interdependent changes for a certain policy or configuration using this option. The management center dynamically detects dependencies between policies (for example, between an access control policy and an intrusion policy), and between the shared objects and the policies. Interdependent changes are indicated using color-coded tags to identify a set of interdependent deployment changes. When one of the deployment changes is selected, the interdependent changes are automatically selected.

For more details, see [Selective Policy Deployment, on page 229](#).

- Note**
- When the changes in shared objects are deployed, the impacted policies should also be deployed along with them. When you select a shared object during deployment, the impacted policies are automatically selected.
  - Selective deployment is not supported for scheduled deployments and deployments using REST APIs. You can only opt for complete deployment of all the changes in these cases.
  - The pre-deployment checks for warnings and errors are performed not only on the selected policies, but on all the policies that are out-of-date. Therefore, the warnings or errors list shows the deselected policies as well.
  - Similarly, the **Inspect Interruption** column indication on the Deployment page considers all out-of-date policies and not just the selected policies. For information on the **Inspect Interruption** column, see [Restart Warnings for Devices, on page 232](#).

**Step 7** After you select the devices or policies to deploy, click **Estimate** to get a rough estimate of the deployment duration.

**Figure 55: Estimate**

**Figure 56: Deploy Time**

The time duration is a rough estimate (having around 70% accuracy), and the actual time taken for deployment may vary for a few scenarios. The estimate is dependable for deployments of up to 20 devices.

When an estimate is not available, it indicates that the data is not available, since the first successful deployment on the selected device is pending. This situation could occur after the management center reimage, version upgrade, or after a high availability failover.

- Note** The estimate is incorrect and unreliable for bulk policy changes (in case of bulk policy migrations), and selective deployments because the estimate is based on the heuristic technique.

**Step 8** Click **Deploy**.

**Step 9** If the system identifies errors or warnings in the changes to be deployed, it displays them in the **Validation Messages** window. To view complete details, click the arrow icon before the warnings or errors.

You have the following choices:

- Deploy—Continue deploying without resolving warning conditions. Check the **Ignore warnings** checkbox, to ignore warnings and deploy the changes. You cannot proceed if the system identifies errors.

- Close—Exit without deploying. Resolve the error and warning conditions, and attempt to deploy the configuration again.

### What to do next

- (Optional) Monitor deployment status; see *Viewing Deployment Messages* in the [Cisco Secure Firewall Management Center Administration Guide](#).
- If the deployment fails, see [Best Practices for Deploying Configuration Changes, on page 238](#).
- During deployment, if there are specific configuration changes in the deployment, the deployment failure may lead to traffic being interrupted. For example, in a cluster environment, an erroneous configuration of an IP address that is not in the same subnet as the Site IPs is configured on the interface. Due to this error, deployment fails and the device attempts to clear the configuration while the rollback operation is being processed. These events collectively lead to a deployment failure that interrupts the traffic.

See the following table to know what configuration changes may cause traffic interruption when deployment fails.

| Configuration Changes                                      | Exists? | Traffic Impacted? |
|------------------------------------------------------------|---------|-------------------|
| Threat Defense Service changes in an access control policy | Yes     | Yes               |
| VRF                                                        | Yes     | Yes               |
| Interface                                                  | Yes     | Yes               |
| QoS                                                        | Yes     | Yes               |

**Note** The configuration changes interrupting traffic during deployment is valid only if both the management center and the threat defense are of version 6.2.3 or higher.

## Redeploy Existing Configurations to a Device

You can force-deploy existing (unchanged) configurations to a single managed device. We *strongly* recommend you deploy in a maintenance window or at a time when any interruptions to traffic flow and inspection will have the least impact.

---

**Caution** When you deploy, resource demands may result in a small number of packets dropping without inspection. Additionally, deploying some configurations restarts the Snort process, which interrupts traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See [Snort Restart Traffic Behavior, on page 234](#) and [Configurations that Restart the Snort Process When Deployed or Activated, on page 236](#).

---

### Before you begin

Review the guidelines described in [Best Practices for Deploying Configuration Changes, on page 238](#).

### Procedure

---

**Step 1** Choose **Devices > Device Management**.

**Step 2** Click **Edit** (✎) next to the device where you want to force deployment.

**Step 3** Click **Device**.

**Step 4** Click **Edit** (✎) next to the **General** section heading.

**Step 5** Click **Force Deploy** (➔).

**Note** Force-deploy takes more time than the regular deployment because it involves the complete generation of the policy rules to be deployed on the threat defense.

**Step 6** Click **Deploy**.

The system identifies any errors or warnings with the configurations you are deploying. You can click **Proceed** to continue without resolving warning conditions. However, you cannot proceed if the system identifies an error.

---

### What to do next

- (Optional) Monitor deployment status; see *Viewing Deployment Messages* in the [Cisco Secure Firewall Management Center Administration Guide](#).
- If deploy fails, see [Best Practices for Deploying Configuration Changes, on page 238](#).

### Related Topics

[Snort Restart Scenarios, on page 232](#)

# Manage Deployments

## View Deployment Status

On the Deployment page, the **Status** column provides the deployment status for each device. If a deployment is in progress, then the live status of the deployment progress is displayed, else one of the following statuses is displayed:

- Pending—Indicates that there are changes in the device that are to be deployed.
- Warnings or errors—Indicates that the pre-deployment checks have identified warnings or errors for the deployment, and you have not proceeded with the deployment. You can continue with the deployment if there are any warnings, but not if there are any errors.

---

**Note** The status column provides the warning or error status only for a single user session on the deployment page. If you navigate away from the page or refresh the page, the status changes to pending.

---

- Failed—Indicates that the previous deployment attempt failed. Click on the status to view the details.
- In queue—Indicates that deployment is initiated, and the system is yet to start the deployment process.
- Completed—Indicates that deployment has completed successfully.

## View Deployment History

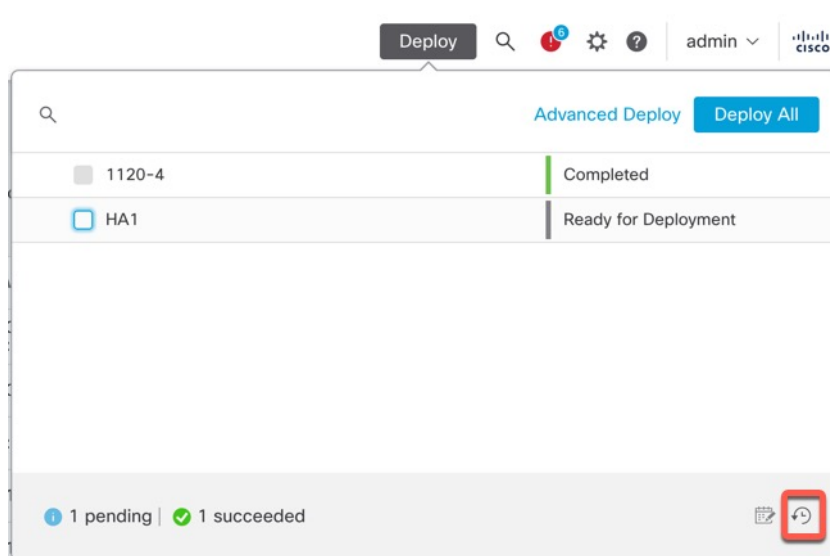

In the deployment history, the last 10 successful deployments, the last 5 failed deployments, and last 5 rollback deployments are captured.

### Procedure

---

- Step 1** On the management center menu bar, click **Deploy** and then click **Deployment History** (↻).

Figure 57: Deployment History Icon

A list of all the previous deployment and rollback jobs is displayed in reverse chronological order.

Figure 58: Deployment History Page

| Job Name            | Deployed by | Start Time            | End Time              | Status    | Deployment Notes       |
|---------------------|-------------|-----------------------|-----------------------|-----------|------------------------|
| > Deploy_Job_10     | admin       | Oct 25, 2023 12:59 PM | Oct 25, 2023 1:01 PM  | Failed    |                        |
| > Deploy_Job_9      | admin       | Oct 24, 2023 11:27 AM | Oct 24, 2023 11:30 AM | Completed |                        |
| > Certificate_Job_1 | System      | Oct 9, 2023 11:03 AM  | Oct 9, 2023 11:03 AM  | Failed    | Certificate deployment |

**Step 2**

Click **Expand Arrow** ( > ) next to the required deployment job to view the devices included in the job and their deployment statuses.

Figure 59: Expand

| Job Name        | Deployed by | Start Time            | End Time             | Status | Deployment Notes |
|-----------------|-------------|-----------------------|----------------------|--------|------------------|
| ▼ Deploy_Job_10 | admin       | Oct 25, 2023 12:59 PM | Oct 25, 2023 1:01 PM | Failed |                  |
| Device          | Transcript  | Preview               | Status               |        |                  |
| HA1             |             |                       | Failed               |        |                  |
| 1120-4          |             |                       | Completed            |        |                  |

- View notes in the **Deployment Notes** column.

Deployment notes are custom notes that a user can add as part of the deployment, and these notes are optional.

**Step 3**

(Optional) Click **Transcript Details** () to view the commands sent to the device, and the responses received.

Figure 60: Transcript Details Icon

| Job Name      | Deployed by | Start Time            | End Time             | Status | Deployment Notes |
|---------------|-------------|-----------------------|----------------------|--------|------------------|
| Deploy_Job_10 | admin       | Oct 25, 2023 12:59 PM | Oct 25, 2023 1:01 PM | Failed |                  |
| Device        | Transcript  | Preview               | Status               |        |                  |

| 1120-4        |             |                       | Completed            |        |                  |

Figure 61: Transcript Details

```

=====SNORT APPLY=====

===== CLI APPLY =====

FMC >> clear configuration session
FMC >> no strong-encryption-disable
FMC >> no dp-tcp-proxy
FMC >> policy-map global_policy
FMC >> class class-default
FMC >> class inspection_default
FMC >> exit
FMC >> vpn-addr-assign local
FMC >> access-group CSM_FW_ACL_ global
FMC >> clear configuration session
  
```

The transcript includes the following sections:

- **Snort Apply**—If there are any failures or responses from Snort-related policies, then the messages are displayed in this section. Normally, the section is empty.
- **CLI Apply**—This section covers features that are configured using commands that are sent to the device.
- **Infrastructure Messages**—This section shows the status of different deployment modules.

In the **CLI Apply** section, the deployment transcript includes commands that are sent to the device, and any responses returned from the device. These responses can be informative messages or error messages. For failed deployments, look for messages that indicate errors with the commands. Examining these errors can be particularly helpful if you are using FlexConfig policies to configure customized features. These errors can help you correct the script in the FlexConfig object that is trying to configure the commands.

**Note** There is no distinction that is made in the transcript between commands that are sent for managed features and those generated from FlexConfig policies.

For example, the following sequence shows that management center sent commands to configure GigabitEthernet0/0 with the logical name **outside**. The device responded that it automatically set the security level to 0. Threat Defense does not use the security level for anything.

```
===== CLI APPLY =====
```

```
FMC >> interface GigabitEthernet0/0
FMC >> nameif outside
FTDv 192.168.0.152 >> [info] : INFO: Security level for "outside" set to 0 by default.
```

- Step 4** (Optional) Click **Preview** (📄) to view the policy and object changes deployed on the device versus the previously deployed version.

**Figure 62: Preview Icon**

| Job Name      | Deployed by | Start Time            | End Time             | Status | Deployment Notes |
|---------------|-------------|-----------------------|----------------------|--------|------------------|

| 1120-4        | 📄           | 📄                     | Completed            |        |                  |

- a. To compare any two versions and view the change log, choose the required versions in the drop-down boxes and click the **Show** button. The drop-down boxes show the deployment job name and the end time of the deployment.

**Figure 63: Compare Versions**

**Note** The drop-down boxes also show failed deployments.

- b. The **Modified By** column lists the users who have modified the policies or objects.
1. At the policy level, management center displays all the user names who have modified the policy.
  2. At the rule level, management center displays the last user who has modified the rule.
- c. You can also download a copy of the change log by clicking **Download Report**.

- Note**
- Deployment history preview is not supported for certificate enrollments, HA operations, and failed deployments.
  - When a device is registered, preview is not supported for the job history record that is created.

- Step 5** (Optional) Against each deployment job, click the **More** (⋮) icon and execute other actions:
- **Bookmark**—To bookmark the deployment job.
  - **Edit Deployment Notes**—To edit your custom deployment notes that you added for a deployment job.
  - **Generate Report**—To generate a deployment report, which can be used for auditing. This report includes job properties with preview and transcript information, and the report can be downloaded as a PDF file.
    - a. Click **Generate Report** to generate a deployment report.

*Figure 64: Generate Report*

The screenshot shows a 'Generate Report' dialog box with the following fields and controls:

- Job Name: Deploy\_Job\_1
- Number of device(s): 1
- Email:
- Relay Host: No Relay Host
- Recipient List:
- Buttons: Cancel, Generate

- b. In the **Generate Report** popup window, check the **Email** checkbox.
- c. In the **Recipient List**, you can enter multiple email addresses, separated by semicolons.
- d. Click **Generate** to generate the report, and this report is emailed to the recipients.
- e. In the Notifications task tab, you can track the progress. After the report generation is complete, click the link in the notification task tab to download the PDF report.

## Download Policy Changes Report for Multiple Devices

Download reports on the policy and object changes made since your last deployment for multiple threat defense devices. You can download the reports in the form of a zip file that contains the following reports:

- A pending changes report for each device, that previews the additions, updates, or deletions in the policy, or the objects that are to be deployed on the device. For more information, see [Deploy Configuration Changes, on page 240](#) and [Deployment Preview](#).
- A consolidated report that categorizes each device based on the report status.

### Procedure

- Step 1** Choose **Deploy > Advanced Deploy**.

- Step 2** Check the check box next to the devices for which you want to generate a pending policy changes report, and then click **Pending Changes Reports**.
- Step 3** Click **Pending Changes Reports**. Reports are generated in the background.
- Step 4** On the management center menu bar, choose **Notifications > Tasks** to view the report generation task. When the report request task is complete, the download link appears within the task notification.
- Step 5** Click the **Download Report(s)** link to download the reports.
- 

## Compare Policies

To review policy changes for compliance with your organization's standards or to optimize system performance, you can examine the differences between two policies or between a saved policy and the running configuration.

You can compare the following policy types:

- DNS
- File
- Health
- Identity
- Intrusion (Only Snort 2 policies)
- Network Analysis
- SSL

The comparison view displays both policies in a side-by-side format. Differences between the two policies are highlighted:

- Blue indicates that the highlighted setting is different in the two policies, and the difference is noted in red text.
- Green indicates that the highlighted setting appears in one policy but not the other.

### Before you begin

You can compare policies only if you have access rights and any required licenses for the specific policy, and you are in the correct domain for configuring the policy.

### Procedure

---

- Step 1** Access the management page for the policy you want to compare:
- DNS—**Policies > Access Control > DNS**
  - File—**Policies > Access Control > Malware & File**
  - Health—**System (⚙) > Health > Policy**
  - Identity—**Policies > Access Control > Identity**

- Intrusion—**Policies > Access Control > Intrusion**

**Note** You can compare only Snort 2 policies.

- Network Analysis—**Policies > Access Control**, then click **Network Analysis Policy** or **Policies > Access Control > Intrusion**, then click **Network Analysis Policies**

**Note** If your custom user role limits access to the first path listed here, use the second path to access the policy.

- SSL—**Policies > Access Control > Decryption**

**Step 2** Click **Compare Policies**.

**Step 3** From the **Compare Against** drop-down list, choose the type of comparison you want to make:

- To compare two different policies, choose **Other Policy**.
- To compare two revisions of the same policy, choose **Other Revision**.
- To compare another policy to the currently active policy, choose **Running Configuration**.

**Step 4** Depending on the comparison type you choose, you have the following choices:

- If you are comparing two different policies, choose the policies you want to compare from the **Policy A** and **Policy B** drop-down lists.
- If you are comparing the running configuration to another policy, choose the second policy from the **Policy B** drop-down list.

**Step 5** Click **OK**.

**Step 6** Review the comparison results:

- Comparison Viewer—To use the comparison viewer to navigate individually through policy differences, click **Previous** or **Next** above the title bar.
- Comparison Report—To generate a PDF report that lists the differences between the two policies, click **Comparison Report**.

## Generate Current Policy Reports

For most policies, you can generate two kinds of reports. A report on a single policy provides details on the policy's current saved configuration, while a comparison report lists only the differences between two policies. You can generate a single-policy report for all policy types except health.

**Note** Intrusion policy reports combine the settings in the base policy with the settings of the policy layers, and make no distinction between which settings originated in the base policy or policy layer.

### Before you begin

You can generate policy reports only if you have access rights and any required licenses for the specific policy, and you are in the correct domain for configuring the policy.

## Procedure

**Step 1** Access the management page for the policy for which you want to generate a report:

- Access Control—**Policies > Access Control**
- DNS—**Policies > Access Control > DNS**
- File—**Policies > Access Control > Malware & File**
- Health—**System (⚙️) > Health > Policy**
- Identity—**Policies > Access Control > Identity**
- Intrusion—**Policies > Access Control > Intrusion**
- NAT—**Devices > NAT**
- Network Analysis—**Policies > Access Control**, then click **Network Analysis Policy** or **Policies > Access Control > Intrusion**, then click **Network Analysis Policies**

**Note** If your custom user role limits access to the first path listed here, use the second path to access the policy.

- SSL—**Policies > Access Control > Decryption**

**Step 2** Click **Report** (📄) next to the policy for which you want to generate a report.

## History for Configuration Deployment

| Feature                                                                        | Minimum Management Center | Minimum Threat Defense | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## Requirements and Prerequisites for the System Configuration

### Model Support

Management Center

### Supported Domains

Global

### User Roles

Admin

## Manage the Secure Firewall Management Center System Configuration

The system configuration identifies basic settings for the management center.

## Procedure

- 
- Step 1** Choose **System** (⚙️) > **Configuration**.
- Step 2** Use the navigation panel to choose configurations to change.
- 

# Access Control Preferences

Configure access control preferences on **System** (⚙️) > **Configuration** > **Access Control Preferences**.

## Requiring Comments on Rule Changes

You can track changes to access control rules by allowing (or requiring) users to comment when they save. This allows you to quickly assess why critical policies in a deployment were modified. By default, this feature is disabled.

## Object Optimization

When you deploy rule policies to a firewall device, you can configure the management center to evaluate and optimize the network/host policy objects that you use in the rules when it creates the associated network object groups on the device. Optimization merges adjacent networks and removes redundant network entries. This reduces the runtime access list data structures and the size of the configuration, which can be beneficial to some firewall devices that are memory-constrained.

For example, consider a network/host object that contains the following entries and that is used in an access rule:

```
192.168.1.0/24
192.168.1.23
10.1.1.0
10.1.1.1
10.1.1.2/31
```

When optimization is enabled, when you deploy the policy, the resulting object group configuration is generated:

```
object-group network test
description (Optimized by management center)
network-object 10.1.1.0 255.255.255.252
network-object 192.168.1.0 255.255.255.0
```

When optimization is disabled, the group configuration would be as follows:

```
object-group network test
network-object 192.168.1.0 255.255.255.0
network-object 192.168.1.23 255.255.255.255
network-object 10.1.1.0 255.255.255.255
network-object 10.1.1.1 255.255.255.255
network-object 10.1.1.2 255.255.255.254
```

This optimization does not change the definition of the network/host object, nor does it create a new network/host policy object. If a network object-group contains another network, host object, or object-groups, the objects are not combined. Instead, each network object-group is optimized separately. Also, only inline values of network object-groups are being modified as part of the optimization process during a deployment.

---

**Important** The optimizations occur on the *managed device* on the *first deploy* after the feature is enabled on the management center. If you have a high number of rules, the system can take several minutes to an hour to evaluate your policies and perform object optimization. During this time, you may also see higher CPU use on your devices. A similar thing occurs on the first deploy after the feature is disabled. After this feature is enabled or disabled, we recommend you deploy when it will have the least impact, such as a maintenance window or a low-traffic time.

---

This feature is enabled by default. To disable it, contact Cisco TAC.

## Change Reconciliation

To monitor the changes that users make and ensure that they follow your organization's preferred standard, you can configure the system to send, via email, a detailed report of changes made over the past 24 hours. Whenever a user saves changes to the system configuration, a snapshot is taken of the changes. The change reconciliation report combines information from these snapshots to present a clear summary of recent system changes.

The following sample graphic displays a User section of an example change reconciliation report and lists both the previous value for each configuration and the value after changes. When users make multiple changes to the same configuration, the report lists summaries of each distinct change in chronological order, beginning with the most recent.

You can view changes made during the previous 24 hours.

## Configuring Change Reconciliation

### Procedure

- 
- Step 1** Choose **System** (⚙️) > **Configuration**.
  - Step 2** Click **Change Reconciliation**.
  - Step 3** Check the **Enable** check box.
  - Step 4** Choose the time of day you want the system to send out the change reconciliation report from the **Time to Run** drop-down lists.
  - Step 5** Enter email addresses in the **Email to** field.
    - Tip** Once you have added email addresses, click **Resend Last Report** to send recipients another copy of the most recent change reconciliation report.
  - Step 6** If you want to include policy changes, check the **Include Policy Configuration** check box.
  - Step 7** If you want to include all changes over the past 24 hours, check the **Show Full Change History** check box.
  - Step 8** Click **Save**.

---

### Related Topics

[Using the Audit Log to Examine Changes](#)

## Change Reconciliation Options

The **Include Policy Configuration** option controls whether the system includes records of policy changes in the change reconciliation report. This includes changes to access control, intrusion, system, health, and network discovery policies. If you do not select this option, the report will not show changes to any policies. This option is available on management centers only.

The **Show Full Change History** option controls whether the system includes records of all changes over the past 24 hours in the change reconciliation report. If you do not select this option, the report includes only a consolidated view of changes for each category.

---

**Note** The change reconciliation report does not include changes to threat defense interfaces and routing settings.

---

## Change Management

You can enable Change Management if your organization needs to implement more formal processes for configuration changes, including audit tracking and official approval before changes are deployed.

When you enable Change Management, the system adds the **Ticket** (📄) shortcut to the menu bar, and **Change Management Workflow** to the **System** (⚙️) menu. Users can manage tickets using these methods.

For details about how to use Change Management, see [Change Management, on page 207](#) For details, see the Change Management chapter in [Cisco Secure Firewall Management Center Device Configuration Guide](#).

On the **System** (⚙️) > **Configuration** page, you can configure the following settings. Click **Save** to save your changes.

- **Enable Change Management**—Turn on ticketing and the Change Management workflow. Once enabled, you must approve or discard all tickets to turn off Change Management.

To disable the feature, deselect the option. All tickets must be approved or discarded to disable Change Management. You cannot disable Change Management if any ticket is in the In Progress, On Hold, Rejected, or Pending Approval state.

- **Number of approvals required**—How many administrators must approve the change for the ticket to be approved and deployable. The default is 1, but you can require up to 5 approvers per ticket. Users can override this number when creating tickets.

---

**Note** When Change Management is enabled and in use, you cannot change the number of approvers if at least one ticket is in the In Progress, On Hold, Rejected, or Pending Approval state. All tickets must be approved or discarded to change the required number of approvers.

---

- **Ticket Purge Duration**—The number of days to keep approved tickets, from 1-100 days. The default is 5 days.
- **Email Notification (Optional)**—Enter the **Reply to Address** and the email addresses for the **List of Approver Addresses**. You must also configure the Email Notification system settings for email to work.

For Cloud-delivered Firewall Management Center, the reply to address does not appear. Instead, configure this address in the Email Notification system settings.

### Notes

There are several system processes that prevent you from enabling/disabling change management. If any of the following are in process, you need to wait for them to complete before changing these settings: backup/restore; import/export; domain movement; upgrade; Flexconfig migration; device registration; high-availability registration, creation, break, or switch; cluster create, registration, break, edit, add or remove nodes; EPM break out or join.

An access control policy cannot be locked when you change these settings. If a policy is locked, you must wait for the lock to be released before enabling/disabling this feature.

## Email Notification

You cannot configure a mail host. The mail relay host is hardcoded to be used from a static host. It is set to email-smtp.us-west-2.amazonaws.com with authorization. For notifications, the email sender is set to cdo-alert@cisco.com

## Intrusion Policy Preferences

Configure various intrusion policy preferences to monitor and track changes to the critical policies in your deployment.

### Set Intrusion Policy Preferences

Configure the intrusion policy preferences.

#### Procedure

---

**Step 1** Choose **System** (⚙️) > **Configuration**.

**Step 2** Click **Intrusion Policy Preferences**.

**Step 3** You have the following options:

- **Comments on policy change:** Check this check box to track policy-related changes using the comment functionality when users modify intrusion policies. With policy change comments enabled, administrators can quickly assess why critical policies in a deployment were modified.

If you enable comments on policy changes, you can make the comment optional or mandatory. The management center prompts the user for a comment when each new change to a policy is saved.

- **Write changes in Intrusion Policy to audit log:** Check this check box to record the changes to the intrusion policies to the audit logs. This option is enabled by default.
- **Retain user overrides for deleted Snort 3 rules:** Check this check box to get notifications for changes to any *overridden* system-defined rules during LSP updates. When enabled, the system retains the rule

overrides in the new replacement rules that are added as part of the LSP update. On the management center menu bar, click **Notifications** > **Tasks** to view the notifications. This option is enabled by default.

- **Talos Threat Hunting Telemetry:** Check this check box to allow Cisco Talos to conduct threat hunting and to gather critical security intelligence. When enabled, a special set of threat-hunting rules is added to the global intrusion policy. Although the threat-hunting rules are processed like regular IPS rules, the events that the Talos threat hunting rules generate do not appear in the management center's event tables. Instead, the events are sent to Talos as telemetry for analysis. This option is enabled by default.

- Note**
- If you send firewall events to the Cisco Security Cloud via a direct connection by registering your management center to the cloud tenancy using your Security Cloud Control account, your Security Cloud Control account must have a Security Analytics and Logging license in order to forward threat-hunting rule events to Talos.

## Manager Remote Access

If managed devices do not have public IP addresses, then enter the management center's FQDN or public IP address that the device will use to establish the management connection. For example, if the management center's management interface IP address is being NATted by an upstream router, provide the *public* NAT address here. An FQDN is preferred because it guards against IP address changes.

If you use the serial number (zero-touch provisioning) method to register a device, then this field is used automatically for the initial configuration of the manager IP address/hostname. If you use the manual method, you can refer to the value on this screen when you perform the device's initial configuration to identify the public management center IP address/hostname.

**Figure 65: Manager Remote Access**

Provide Management Center FQDN or Public IP Address

ⓘ If managed devices do not have public IP addresses, then enter the management center's FQDN or public IP address that the device will use to establish the management connection. For example, if the management center's management interface IP address is being NATted by an upstream router, provide the public NAT address here. An FQDN is preferred because it guards against IP address changes.

## Network Analysis Policy Preferences

You can configure the system to track policy-related changes using the comment functionality when users modify network analysis policies. With policy change comments enabled, administrators can quickly assess why critical policies in a deployment were modified.

If you enable comments on policy changes, you can make the comment optional or mandatory. The system prompts the user for a comment when each new change to a policy is saved.

Optionally, you can have changes to network analysis policies written to the audit log.

## CHAPTER 12

# Users

---

The management center includes default **admin** accounts for web and CLI access. This chapter discusses how to create custom user accounts.

- [About Users, on page 263](#)
- [Create a User Record with Your Security Cloud Control Username, on page 266](#)
- [Troubleshooting LDAP Authentication Connections, on page 267](#)

## About Users

You can add custom user accounts on managed devices, either as internal users or as external users on a LDAP or RADIUS server. Each managed device maintains separate user accounts. For example, when you add a user to the management center, that user only has access to the management center; you cannot then use that username to log directly into a managed device. You must separately add a user on the managed device.

## Internal and External Users

Managed devices support two types of users:

- Internal user—The device checks a local database for user authentication.
- External user—If the user is not present in the local database, the system queries an external LDAP or RADIUS authentication server.

## User Roles

### Web Interface User Roles

There are a variety of user roles in Cisco Security Cloud Control (Security Cloud Control): Read-Only, Edit-Only, Deploy-only, Admin, and Super Admin. User roles are configured for each user on each tenant. If a Security Cloud Control user has access to more than one tenant, they may have the same user ID but different roles on different tenants. A user may have a read-only role on one tenant and a Super Admin role on another. When the interface or the documentation refers to a Read-only user, Deploy Only, Edit Only, an Admin user, or a Super Admin user we are describing that user's permission level on a particular tenant. Note that you cannot create user roles in the cloud-delivered Firewall Management Center because it uses Security Cloud Control user roles.

**Read Only**

Read Only users can view all device configurations but not change them.

**Deploy Only**

Deploy Only users can audit queued changes made to device configurations and deploy them but cannot change them.

**Edit Only**

Edit Only users can make changes to all device configurations but cannot deploy them to devices.

**Super Admin and Admin**

Super Admin and Admin users can access everything in the product. The difference between Super Admin and Admin users is that Super Admins can create accounts for other users on a tenant and modify existing user roles, while admins cannot.

To know more about user roles in Security Cloud Control, see [User Roles](#).

The following table maps the user roles in On-Premises Firewall Management Center to their equivalent roles in the cloud-delivered Firewall Management Center in Security Cloud Control.

---

**Tip** We recommend that you read through the table only if you are familiar with the user roles in On-Premises Firewall Management Center.

---

Table 15: Secure Firewall Management Center and Cloud-delivered Firewall Management Center User Role Mapping

| On-Premises Firewall Management Center User Role                 | Equivalent Cloud-delivered Firewall Management Center User Role | Capabilities                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|------------------------------------------------------------------|-----------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Access Admin, Discovery Admin, Intrusion Admin, Maintenance User | Edit Only                                                       | <p>You can search, filter, or view the following:</p> <ul style="list-style-type: none"> <li>• Access control policies and associated features</li> <li>• Intrusion policies</li> <li>• Intrusion rules</li> <li>• Network discovery rules</li> <li>• Custom detectors</li> <li>• Correlation policies</li> <li>• Objects</li> <li>• Rulesets</li> <li>• Interfaces</li> <li>• VPN configurations</li> <li>• Monitoring- and maintenance-related settings</li> </ul> <p>You can back up or restore a device but cannot deploy policies to the devices.</p> |
| Administrator                                                    | Super Admin                                                     | <p>You can access all features of the cloud-delivered Firewall Management Center and perform tasks, including create, read, modify, or delete policies or objects and deploy those changes to the devices. You can also edit user roles or create user records in Security Cloud Control.</p>                                                                                                                                                                                                                                                              |
| Network Admin                                                    | Admin                                                           | <p>You can access all features of the cloud-delivered Firewall Management Center and perform tasks, including create, read, modify, or delete policies or objects and deploy those changes to the devices. However, you cannot edit user roles or create user records in Security Cloud Control.</p>                                                                                                                                                                                                                                                       |

| On-Premises Firewall Management Center User Role | Equivalent Cloud-delivered Firewall Management Center User Role | Capabilities                                                                                                                                                                                                                                                                                           |
|--------------------------------------------------|-----------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Security Analyst, Security Analyst (Read Only)   | Read Only                                                       | You can view device information, policies, objects, and their related settings but cannot do the following: <ul style="list-style-type: none"> <li>• Create or edit objects</li> <li>• Create or edit policies</li> <li>• Modify device configurations</li> <li>• Backup or restore devices</li> </ul> |
| Security Approver                                | Deploy Only                                                     | You can view most settings and deploy staged changes to devices but cannot create or modify objects or policies.                                                                                                                                                                                       |

## Create a User Record with Your Security Cloud Control Username

Only a Security Cloud Control user with **Super Admin** privileges can create the Security Cloud Control user record. The **Super Admin** must create the user record with the same email address that was specified in the **Create Your Security Cloud Control Username** task above.

Use the following procedure to create a user record with an appropriate user role:

### Procedure

- 
- Step 1** Login to Security Cloud Control.
- Step 2** In the left pane, choose **Settings > User Management**.
- Step 3** Click  to add a new user to your tenant.
- Step 4** Provide the email address of the user.

**Note** The user's email address must correspond to the email address of the Cisco Secure Log-On account.

- Step 5** From the **Role** drop-down list, select the user's [role](#).
- Step 6** Click **OK**.
-

# Troubleshooting LDAP Authentication Connections

If you create an LDAP authentication object and it either does not succeed in connecting to the server you select or does not retrieve the list of users you want, you can tune the settings in the object.

If the connection fails when you test it, try the following suggestions to troubleshoot your configuration:

- Use the messages displayed at the top of the web interface screen and in the test output to determine which areas of the object are causing the issue.
- Check that the user name and password you used for the object are valid:
  - Check that you have the rights to browse to the directory indicated in your base-distinguished name by connecting to the LDAP server using a third-party LDAP browser.
  - Check that the user name is unique to the directory information tree for the LDAP server.
  - If you see an LDAP bind error 49 in the test output, the user binding for the user failed. Try authenticating to the server through a third-party application to see if the binding fails through that connection as well.
- Check that you have correctly identified the server:
  - Check that the server IP address or host name is correct.
  - Check that you have TCP/IP access from your local appliance to the authentication server where you want to connect.
  - Check that access to the server is not blocked by a firewall and that the port you have configured in the object is open.
  - If you are using a certificate to connect via TLS or SSL, the host name in the certificate must match the host name used for the server.
  - Check that you have not used an IPv6 address for the server connection if you are authenticating CLI access.
  - If you used server type defaults, check that you have the correct server type and click **Set Defaults** again to reset the default values.
- If you typed in your base-distinguished name, click **Fetch DNs** to retrieve all the available base distinguished names on the server, and select the name from the list.
- If you are using any filters, access attributes, or advanced settings, check that each is valid and typed correctly.
- If you are using any filters, access attributes, or advanced settings, try removing each setting and testing the object without it.
- If you are using a base filter or a CLI access filter, make sure that the filter is enclosed in parentheses and that you are using a valid comparison operator (maximum 450 characters, including the enclosing parentheses).
- To test a more restricted base filter, try setting it to the base distinguished name for the user to retrieve just that user.

- If you are using an encrypted connection:
  - Check that the name of the LDAP server in the certificate matches the host name that you use to connect.
  - Check that you have not used an IPv6 address with an encrypted server connection.
- If you are using a test user, make sure that the user name and password are typed correctly.
- If you are using a test user, remove the user credentials and test the object.
- Test the query that you are using by connecting to the LDAP server and using this syntax:

```
ldapsearch -x -b 'base_distinguished_name'  
-h LDAPserver_ip_address -p port -v -D  
'user_distinguished_name' -W 'base_filter'
```

For example, if you are trying to connect to the security domain on `myrtle.example.com` using the `domainadmin@myrtle.example.com` user and a base filter of `(cn=*)`, you could test the connection using this statement:

```
ldapsearch -x -b 'CN=security,DC=myrtle,DC=example,DC=com'  
-h myrtle.example.com -p 389 -v -D  
'domainadmin@myrtle.example.com' -W '(cn=*)'
```

If you can test your connection successfully but authentication does not work after you deploy a platform settings policy, check that authentication and the object you want to use are both enabled in the platform settings policy that is applied to the device.

If you connect successfully but want to adjust the list of users retrieved by your connection, you can add or change a base filter or CLI access filter or use a more restrictive or less restrictive base DN.

While authenticating a connection to Active Directory (AD) server, rarely the connection event log indicates blocked LDAP traffic although the connection to AD server is successful. This incorrect connection log occurs when the AD server sends a duplicate reset packet. The threat defense device identifies the second reset packet as part of a new connection request and logs the connection with Block action.

# CHAPTER 13

## Updates

---

This chapter explains how to perform content updates.

---

**Important** To upgrade threat defense software or chassis, see the [Cisco Secure Firewall Threat Defense Upgrade Guide for Cloud-Delivered Firewall Management Center](#).

---

- [About System Updates](#), on page 269
- [Guidelines and Limitations for System Updates](#), on page 271
- [Update the Vulnerability Database \(VDB\)](#), on page 271
- [Update the Geolocation Database \(GeoDB\)](#), on page 273
- [Update Intrusion Rules](#), on page 275

## About System Updates

Use the management center to upgrade the system software for the devices it manages. You can also update various databases and feeds that provide advanced services.

The system can obtain most updates from the internet. We recommend you schedule or enable automatic content updates whenever possible. Some updates are auto-enabled by the initial setup process or when you enable the related feature. Other updates you must schedule yourself. After initial setup, we recommend you review all auto-updates and adjust them if necessary.

Table 16: Upgrades and Updates

| Component                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## Guidelines and Limitations for System Updates

### Before You Update

Before you update any component of your deployment (including intrusion rules, VDB, or GeoDB) read the release notes or advisory text that accompanies the update. These provide critical and release-specific information, including compatibility, prerequisites, new capabilities, behavior changes, and warnings.

### Scheduled Updates

The system schedules tasks — including updates — in UTC. This means that when they occur locally depends on the date and your specific location. Also, because updates are scheduled in UTC, they do not adjust for Daylight Saving Time, summer time, or any such seasonal adjustments that you may observe in your location. If you are affected, scheduled updates occur one hour "later" in the summer than in the winter, according to local time.

---

**Important** We *strongly* recommend you review scheduled updates to be sure they occur when you intend.

---

### Bandwidth Guidelines

To upgrade the system software or perform a readiness check, the upgrade package must be on the appliance. Upgrade package sizes vary. Make sure you have the bandwidth to perform a large data transfer to your managed devices. See [Guidelines for Downloading Data from the Firepower Management Center to Managed Devices](#) (Troubleshooting TechNote).

## Update the Vulnerability Database (VDB)

The Cisco vulnerability database (VDB) is a database of known vulnerabilities to which hosts may be susceptible, as well as fingerprints for operating systems, clients, and applications. The system uses the VDB to help determine whether a particular host increases your risk of compromise.

Cisco issues periodic updates to the VDB. The time it takes to update the VDB and its associated mappings on the management center depends on the number of hosts in your network map. As a rule of thumb, divide the number of hosts by 1000 to determine the approximate number of minutes to perform the update.

The initial setup on the management center automatically downloads and installs the latest VDB from Cisco as a one-time operation. It also schedules a weekly task to download the latest available software updates, which includes the latest VDB. We recommend you review this weekly task and adjust if necessary. Optionally, schedule a new weekly task to actually update the VDB and deploy configurations. For more information, see [Vulnerability Database Update Automation, on page 425](#).

For VDB 343+, all application detector information is available through [Cisco Secure Firewall Application Detectors](#). This site includes a searchable database of application detectors. The release notes provide information on changes for a particular VDB release.

For VDB 363+, the system installs a smaller VDB (also called *VDB lite*) on lower memory devices running Snort 2. This smaller VDB contains the same applications, but fewer detection patterns. Devices using the smaller VDB can miss some application identification versus devices using the full VDB.

## Schedule VDB Updates

We recommend you schedule regular VDB updates. See [Vulnerability Database Update Automation, on page 425](#).

## Manually Update the VDB

Use this procedure to manually update the VDB. Starting with VDB 357, you can install any VDB as far back as the baseline VDB for the management center.

**Caution** Do not perform tasks related to mapped vulnerabilities while the VDB is updating. Even if the Message Center shows no progress for several minutes or indicates that the update has failed, do not restart the update. Instead, contact Cisco TAC.

In most cases, the first deploy after a VDB update restarts the Snort process, interrupting traffic inspection. The system warns you when this will happen (updated application detectors and operating system fingerprints require a restart; vulnerability information does not). Whether traffic drops or passes without further inspection during this interruption depends on how the targeted device handles traffic. For more information, see [Snort Restart Traffic Behavior, on page 234](#).

### Before you begin

If the management center cannot access the Cisco Support & Download site, get the update yourself: [Software Download https://www.cisco.com/go/firepower-software](#). Choose any management center model, then browse to the *Coverage and Content Updates* page.

### Procedure

- 
- Step 1** Choose **System** (⚙) > **Content Updates** > **VDB Updates**.
- Step 2** Choose how you want to get the VDB onto the management center.
- Direct download: Click the **Download Updates** button.

- Manual upload: Click **Upload Update**, then **Choose File** and browse to the VDB. After you choose the file, click **Upload**.

**Step 3** Install the VDB.

- a) Next to the Vulnerability and Fingerprint Database update you want to install, click either the **Install** icon (for a newer VDB) or the **Rollback** icon (for an older VDB).
- b) Choose the management center.
- c) Click **Install**.

Monitor update progress in the Message Center. After the update completes, the system uses the new vulnerability information. However, you must deploy before updated application detectors and operating system fingerprints can take effect.

**Step 4** Verify update success.

The VDB update page shows the current version.

---

**What to do next**

- Deploy configuration changes.
- If you based configurations on vulnerabilities, application detectors, or fingerprints that are no longer available, examine those configurations to make sure you are handling traffic as expected. Also, keep in mind a scheduled task to update the VDB can undo a rollback. To avoid this, change the scheduled task or delete any newer VDB packages.

## Update the Geolocation Database (GeoDB)

The geolocation database (GeoDB) is a database that you can leverage to view and filter traffic based on geographical location. We issue periodic updates to the GeoDB, and you must regularly update the GeoDB to have accurate geolocation information. As part of the initial configuration, the system schedules weekly GeoDB updates. We recommend you review this task and make changes if necessary, as described in [Schedule GeoDB Updates, on page 274](#).

A GeoDB update overrides any previous versions. The management center automatically updates its managed devices and you do not need to redeploy. You can see your current version on **System (⚙) > Content Updates > Geolocation Updates**.

**Note** In May 2022 we split the GeoDB into two packages: a country code package mapping IP addresses to countries/continents, and an IP package containing additional contextual data associated with routable IP addresses. In January 2024, we stopped providing the IP package. This saves disk space and does not affect geolocation rules or traffic handling in any way. Any contextual data is now stale, and upgrading to most later versions deletes the IP package. Options to download the IP package or view contextual data have no effect, and are removed in later versions.

## Schedule GeoDB Updates

As part of the initial configuration, the system schedules weekly GeoDB updates. We recommend you review this task and make changes if necessary, as described in this procedure.

---

**Note** The **IP Package Download** option available in some versions has no effect. We no longer provide an IP package. In later versions, this option is removed.

---

### Before you begin

Make sure the management center can access the Cisco Support & Download site.

### Procedure

- 
- Step 1** Choose **System** (⚙) > **Content Updates** > **Geolocation Updates**.
  - Step 2** Under **Recurring Geolocation Updates**, check **Enable Recurring Weekly Updates...**
  - Step 3** Specify the **Update Start Time**.
  - Step 4** Click **Save**.
- 

## Manually Update the GeoDB

Use this procedure to perform an on-demand GeoDB update.

### Before you begin

If the management center cannot access the Cisco Support & Download site, get the update yourself: <https://www.cisco.com/go/firepower-software>. Choose any management center model, then browse to the *Coverage and Content Updates* page.

### Procedure

- 
- Step 1** Choose **System** (⚙) > **Content Updates** > **Geolocation Updates**.
  - Step 2** Under **One-Time Geolocation Update**, choose how you want to update the GeoDB.
    - Direct download: Choose **Download and install...**
    - Manual upload: Choose **Upload and install...**, then click **Choose File** and browse to the package you downloaded earlier.
  - Step 3** Click **Import**.

Monitor update progress in the Message Center.

- Step 4** Verify update success.  
The GeoDB update page shows the current version.
- 

## Update Intrusion Rules

As new vulnerabilities become known, the Talos Intelligence Group releases intrusion rule updates. These updates affect intrusion rules, preprocessor rules, and the policies that use the rules. Intrusion rule updates are cumulative and we recommend you keep the system up to date. You cannot import an intrusion rule update that either matches or predates the version of the currently installed rules.

An intrusion rule update may provide the following:

- **New and modified rules and rule states**—Rule updates provide new and updated intrusion and preprocessor rules. For new rules, the rule state may be different in each system-provided intrusion policy. For example, a new rule may be enabled in the Security over Connectivity intrusion policy and disabled in the Connectivity over Security intrusion policy. Rule updates may also change the default state of existing rules, or delete existing rules entirely.
- **New rule categories**—Rule updates may include new rule categories, which are always added.
- **Modified preprocessor and advanced settings**—Rule updates may change the advanced settings in the system-provided intrusion policies and the preprocessor settings in system-provided network analysis policies. They can also update default values for the advanced preprocessing and performance options in your access control policies.
- **New and modified variables**—Rule updates may modify default values for existing default variables, but do not override your changes. New variables are always added.

### Understanding When Intrusion Rule Updates Modify Policies

Intrusion rule updates can affect both system-provided and custom network analysis policies, as well as all access control policies:

- **System provided**—Changes to system-provided network analysis and intrusion policies, as well as any changes to advanced access control settings, automatically take effect when you re-deploy the policies after the update.
- **Custom**—Because every custom network analysis and intrusion policy uses a system-provided policy as its base, or as the eventual base in a policy chain, rule updates can affect custom network analysis and intrusion policies. However, you can prevent rule updates from automatically making those changes. This allows you to update system-provided base policies manually, on a schedule independent of rule update imports. Regardless of your choice (implemented on a per-custom-policy basis), updates to system-provided policies do **not** override any settings you customized.

Note that importing a rule update discards all cached changes to network analysis and intrusion policies. For your convenience, the Rule Updates page lists policies with cached changes and the users who made those changes.

## Deploying Intrusion Rule Updates

For changes made by an intrusion rule update to take effect, you must redeploy configurations. When importing a rule update, you can configure the system to automatically redeploy to affected devices. This approach is especially useful if you allow the intrusion rule update to modify system-provided base intrusion policies.

**Caution** Although a rule update by itself does not restart the Snort process when you deploy, other changes you have made may. Restarting Snort briefly interrupts traffic flow and inspection on all devices, including those configured for high availability/scalability. Interface configurations determine whether traffic drops or passes without inspection during the interruption. When you deploy without restarting Snort, resource demands may result in a small number of packets dropping without inspection.

## Recurring Intrusion Rule Updates

You can import rule updates on a daily, weekly, or monthly basis, using the Rule Updates page.

Applicable subtasks in the intrusion rule update import occur in the following order: download, install, base policy update, and configuration deploy. When one subtask completes, the next subtask begins.

At the scheduled time, the system installs the rule update and deploys the changed configuration as you specified in the previous step. You can log off or use the web interface to perform other tasks before or during the import. When accessed during an import, the Rule Update Log displays a **Red Status** (⊖), and you can view messages as they occur in the Rule Update Log detailed view. Depending on the rule update size and content, several minutes may pass before status messages appear.

As part of the initial configuration, the system schedules daily intrusion rule updates. We recommend you review this task and make changes if necessary, as described in [Schedule Intrusion Rule Updates, on page 276](#).

## Importing Local Intrusion Rules

A local intrusion rule is a custom standard text rule that you import from a local machine as a plain text file with ASCII or UTF-8 encoding. You can create local rules using the instructions in the Snort users manual, which is available at <http://www.snort.org>.

# Schedule Intrusion Rule Updates

As part of the initial configuration, the system schedules daily intrusion rule updates. We recommend you review this task and make changes if necessary, as described in this procedure.

## Before you begin

- Make sure your process for updating intrusion rules complies with your security policies.
- Consider the update's effect on traffic flow and inspection due to bandwidth constraints and Snort restarts. We recommend performing updates in a maintenance window.
- Make sure the management center can access the Cisco Support & Download site.

## Procedure

- 
- Step 1** Choose **System** (⚙️) > **Content Updates** > **Rule Updates**.
  - Step 2** Under **Recurring Rule Update Imports**, check **Enable Recurring Rule Update Imports**.
  - Step 3** Specify the **Import Frequency** and start time.
  - Step 4** (Optional) Check **Reapply all policies...** to deploy after each update.
  - Step 5** Click **Save**.
- 

## Manually Update Intrusion Rules

Use this procedure to perform an on-demand intrusion rule update.

### Before you begin

- Make sure your process for updating intrusion rules complies with your security policies.
- Consider the update's effect on traffic flow and inspection due to bandwidth constraints and Snort restarts. We recommend performing updates in a maintenance window.
- If the management center cannot access the Cisco Support & Download site, get the update yourself: <https://www.cisco.com/go/firepower-software>. Choose any management center model, then browse to the *Coverage and Content Updates* page.

## Procedure

- 
- Step 1** Choose **System** (⚙️) > **Content Updates** > **Rule Updates**.
  - Step 2** Under **One-Time Rule Update/Rules Import**, choose how you want to update intrusion rules.
    - Direct download: Choose **Download new rule update...**
    - Manual upload: Choose **Rule update or text rule file...**, then click **Choose File** and browse to the intrusion rule update.
  - Step 3** (Optional) Check **Reapply all policies...** to deploy after the update.
  - Step 4** Click **Import**.

Monitor update progress in the Message Center. Even if the Message Center shows no progress for several minutes or indicates that the update has failed, do not restart the update. Instead, contact Cisco TAC.
  - Step 5** Verify update success.

The rule update page shows the current version.
-

### What to do next

If you did not deploy as a part of the update, deploy now.

## Import Local Intrusion Rules

Use this procedure to import local intrusion rules. Imported intrusion rules appear in the local rule category in a disabled state.

### Before you begin

- Make sure your local rule file follows the guidelines described in [Best Practices for Importing Local Intrusion Rules, on page 278](#).
- Make sure your process for importing local intrusion rules complies with your security policies.
- Consider the import's effect on traffic flow and inspection due to bandwidth constraints and Snort restarts. We recommend scheduling rule updates during maintenance windows.

### Procedure

---

- Step 1** Choose **System** (⚙) > **Content Updates** > **Rule Updates**.  
You can also click **Import Rules** in the intrusion rules editor (**Objects** > **Intrusion Rules**).
- Step 2** (Optional) Delete existing local rules.  
Click **Delete All Local Rules**, then confirm that you want to move all created and imported intrusion rules to the deleted folder.
- Step 3** Under **One-Time Rule Update/Rules Import**, choose **Rule update or text rule file to upload and install**, then click **Choose File** and browse to your local rule file.
- Step 4** Click **Import**.  
You can monitor import progress in the Message Center. Even if the Message Center shows no progress for several minutes or indicates that the update has failed, do not restart the import. Instead, contact Cisco TAC.
- 

### What to do next

- Edit intrusion policies and enable the rules you imported.
- Deploy configuration changes.

## Best Practices for Importing Local Intrusion Rules

Observe the following guidelines when importing a local rule file:

- The rules importer requires that all custom rules are imported in a plain text file encoded in ASCII or UTF-8.

- The text file name can include alphanumeric characters, spaces, and no special characters other than underscore (\_), period (.), and dash (-).
- The system imports local rules preceded with a single pound character (#), but they are flagged as deleted.
- The system imports local rules preceded with a single pound character (#), and does not import local rules preceded with two pound characters (##).
- Rules cannot contain any escape characters.
- You do not have to specify a Generator ID (GID) when importing a local rule. If you do, specify only GID 1 for a standard text rule.
- When importing a rule for the first time, do *not* specify a Snort ID (SID) or revision number. This avoids collisions with SIDs of other rules, including deleted rules. The system will automatically assign the rule the next available custom rule SID of 1000000 or greater, and a revision number of 1.

If you must import rules with SIDs, a SID can be any unique number 1,000,000 or greater.

- When importing an updated version of a local rule you have previously imported, or when reinstating a local rule you have deleted, you *must* include the SID assigned by the system and a revision number greater than the current revision number. You can determine the revision number for a current or deleted rule by editing the rule.

---

**Note** The system automatically increments the revision number when you delete a local rule; this is a device that allows you to reinstate local rules. All deleted local rules are moved from the local rule category to the deleted rule category.

---

- Import local rules on the primary management center in a high availability pair to avoid SID numbering issues.
- The import fails if a rule contains any of the following:
  - A SID greater than 2147483647.
  - A list of source or destination ports that is longer than 64 characters.
- Policy validation fails if you enable an imported local rule that uses the deprecated `threshold` keyword in combination with the intrusion event thresholding feature in an intrusion policy.
- All imported local rules are automatically saved in the local rule category.
- The system always sets local rules that you import to the disabled rule state. You must manually set the state of local rules before you can use them in your intrusion policy.

## View Intrusion Rule Update Logs

The system generates logs of rule updates/imports, listed by timestamp, user, and whether each update succeeded or failed. These logs contain detailed import information on all updated rules and components; see [Intrusion Rule Update Log Details, on page 280](#). Use this procedure to view rule import logs. Note that deleting an import log does not delete the imported objects.

## Procedure

- 
- Step 1** Choose **System** (⚙) > **Content Updates** > **Rule Updates**.
- Step 2** Click **Rule Update Log**.
- Step 3** (Optional) View details for any rule update by clicking **View** (🔍) next to the log file.
- 

## Intrusion Rule Update Log Details

**Tip** You search the entire Rule Update Import Log database even when you initiate a search by clicking **Search** on the toolbar from the Rule Update Import Log detailed view with only the records for a single import file displayed. Make sure you set your time constraints to include all objects you want to include in the search.

**Table 17: Intrusion Rule Update Log Details**

| Field          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Action         | An indication that one of the following has occurred for the object type: <ul style="list-style-type: none"> <li>• <code>new</code> (for a rule, this is the first time the rule has been stored on this appliance)</li> <li>• <code>changed</code> (for a rule update component or rule, the rule update component has been modified, or the rule has a higher revision number and the same GID and SID)</li> <li>• <code>collision</code> (for a rule update component or rule, import was skipped because its revision conflicts with an existing component or rule on the appliance)</li> <li>• <code>deleted</code> (for rules, the rule has been deleted from the rule update)</li> <li>• <code>enabled</code> (for a rule update edit, a preprocessor, rule, or other feature has been enabled in a default policy provided with the system)</li> <li>• <code>disabled</code> (for rules, the rule has been disabled in a default policy provided with the system)</li> <li>• <code>drop</code> (for rules, the rule has been set to Drop and Generate Events in a default policy provided with the system)</li> <li>• <code>error</code> (for a rule update or local rule file, the import failed)</li> <li>• <code>apply</code> (the <b>Reapply all policies after the rule update import completes</b> option was enabled for the import)</li> </ul> |
| Default Action | The default action defined by the rule update. When the imported object type is <code>rule</code> , the default action is <code>Pass</code> , <code>Alert</code> , or <code>Drop</code> . For all other imported object types, there is no default action.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Details        | A string unique to the component or rule. For rules, the GID, SID, and previous revision number for a changed rule, displayed as <code>previously (GID:SID:Rev)</code> . This field is blank for a rule that has not changed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Field       | Description                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GID         | The generator ID for a rule. For example, 1 (standard text rule, Global domain or legacy GID) or 3 (shared object rule).                                                                                                                                                                                                                                                                                                          |
| Name        | The name of the imported object, which for rules corresponds to the rule Message field, and for rule update components is the component name.                                                                                                                                                                                                                                                                                     |
| Policy      | For imported rules, this field displays <code>ALL</code> . This means that the rule was imported successfully, and can be enabled in all appropriate default intrusion policies. For other types of imported objects, this field is blank.                                                                                                                                                                                        |
| Rev         | The revision number for a rule.                                                                                                                                                                                                                                                                                                                                                                                                   |
| Rule Update | The rule update file name.                                                                                                                                                                                                                                                                                                                                                                                                        |
| SID         | The SID for a rule.                                                                                                                                                                                                                                                                                                                                                                                                               |
| Time        | The time and date the import began.                                                                                                                                                                                                                                                                                                                                                                                               |
| Type        | The type of imported object, which can be one of the following: <ul style="list-style-type: none"> <li>• <code>rule update component</code> (an imported component such as a rule pack or policy pack)</li> <li>• <code>rule</code> (for rules, a new or updated rule)</li> <li>• <code>policy apply</code> (the <b>Reapply all policies after the rule update import completes</b> option was enabled for the import)</li> </ul> |
| Count       | The count (1) for each record. The Count field appears in a table view when the table is constrained, and the Rule Update Log detailed view is constrained by default to rule update records. This field is not searchable.                                                                                                                                                                                                       |

# CHAPTER 14

## Licenses

This chapter provides in-depth information about the different license types, service subscriptions, licensing requirements and more.

**Note** The Management Center supports either a Smart License or a legacy PAK (Product Activation Keys) license for its platform license.

## About Licenses

Cisco Smart Licensing is a flexible licensing model that provides you with an easier, faster, and more consistent way to purchase and manage software across the Cisco portfolio and across your organization. And it's secure—you control what users can access. With Smart Licensing you get:

- **Easy Activation:** Smart Licensing establishes a pool of software licenses that can be used across the entire organization—no more PAKs (Product Activation Keys).
- **Unified Management:** My Cisco Entitlements (MCE) provides a complete view into all of your Cisco products and services in an easy-to-use portal, so you always know what you have and what you are using.
- **License Flexibility:** Your software is not node-locked to your hardware, so you can easily use and transfer licenses as needed.

To use Smart Licensing, you must first set up a Smart Account on Cisco Software Central ([software.cisco.com](https://software.cisco.com)).

For a more detailed overview on Cisco Licensing, go to [cisco.com/go/licensingguide](https://cisco.com/go/licensingguide)

## Smart Software Manager and Accounts

When you purchase one or more licenses, you manage them in the Smart Software Manager: <https://software.cisco.com/#module/SmartLicensing>. The Smart Software Manager lets you create a primary account for your organization. If you do not yet have an account, click the link to [set up a new account](#). The Smart Software Manager lets you create a primary account for your organization. For instructions, see [Create a Cisco Account](#).

By default, your licenses are assigned to the Default Virtual Account under your primary account. As the account administrator, you can create additional virtual accounts; for example, for regions, departments, or subsidiaries. Multiple virtual accounts help you manage large numbers of licenses and devices.

You manage licenses by virtual account. Only that virtual account's devices can use the licenses assigned to the account. If you need additional licenses, you can transfer an unused license from another virtual account. You can also transfer devices between virtual accounts.

## How Licensing Works for the Management Center and Devices

The management center registers with the Smart Software Manager, and then assigns licenses for each managed device. Devices do not register directly with the Smart Software Manager.

A physical management center does not require a license for its own use.

## Periodic Communication with the Smart Software Manager

In order to maintain your product license entitlement, your product must communicate periodically with the Smart Software Manager.

You use a Product Instance Registration Token to register the management center with the Smart Software Manager. The Smart Software Manager issues an ID certificate for communication between the management center and the Smart Software Manager. This certificate is valid for one year, although it will be renewed every six months. If an ID certificate expires (after a year with no communication), the management center may be removed from your account.

The management center communicates with the Smart Software Manager on a periodic basis. If you make changes in the Smart Software Manager, you can refresh the authorization on the management center so the changes immediately take effect. You also can wait for the management center to communicate as scheduled.

Your management center must either have direct internet access to the Smart Software Manager. In non-airgapped deployments, normal license communication occurs every 30 days, but with the grace period, your management center will operate for up to 90 days without contacting the Smart Software Manager. Ensure that the management center contacts the Smart Software Manager before 90 days have passed, or else the management center will revert to an unregistered state.

## Evaluation Mode

Before the management center registers with the Smart Software Manager, it operates for 90 days in evaluation mode. You can assign feature licenses to managed devices, and they will remain in compliance for the duration of evaluation mode. When this period ends, the management center becomes unregistered.

If you register the management center with the Smart Software Manager, the evaluation mode ends. If you later deregister the management center, you cannot resume evaluation mode, even if you did not initially use all 90 days.

For more information about the unregistered state, see [Unregistered State, on page 285](#).

---

**Note** You cannot receive an evaluation license for Strong Encryption (3DES/AES); you must register with the Smart Software Manager to receive the export-compliance token that enables the Strong Encryption (3DES/AES) license.

---

---

**Note** The Talos certificate for Evaluation Mode in Secure Firewall Version 7.6.0 is set to expire on March 31, 2025. After this date, access to Talos-hosted services in Evaluation Mode (specifically those related to web reputation/categorization lookups) will be discontinued.

---

## Out-of-Compliance State

The management center can become out of compliance in the following situations:

- License expiration—When a managed device term-based license expires.

In an out-of-compliance state, see the following effects:

- All managed device licenses—Operation is not affected.

After you resolve the licensing problem, the management center will show that it is now in compliance after its regularly scheduled authorization with the Smart Software Manager. To force an authorization, click

**Re-Authorize** on the **System** (⚙) > **Licenses** > **Smart Licenses** page.

## Unregistered State

The management center can become unregistered in the following situations:

- Evaluation mode expiration—Evaluation mode expires after 90 days.
- Manual deregistration of the management center
- Lack of communication with the Smart Software Manager—The management center does not communicate with the Smart Software Manager for 1 year. Note: After 90 days, the management center authorization expires, but it can successfully resume communication within one year to automatically re-authorize. After a year, the ID certificate expires, and the management center is removed from your account so you will have to manually re-register the management center.

In an unregistered state, the management center cannot deploy any configuration changes to devices *for features that require licenses*.

## End-User License Agreement

The Cisco end-user license agreement (EULA) and any applicable supplemental agreement (SEULA) that governs your use of this product are available from <http://www.cisco.com/go/softwareterms>.

## License Types and Restrictions

This section describes the types of licenses available.

**Table 18: Smart Licenses**

| License You Assign | Duration                                                                                                                | Granted Capabilities                                                                                                                                                                                                                                                                                                                                              |

| URL Filtering      | Subscription                                                                                                            | Category and reputation-based URL filtering<br>For details, see <a href="#">URL Filtering Licenses, on page 290</a> .<br>(IPS license is a prerequisite for a URL Filtering license.)                                                                                                                                                                             |

| License You Assign                                                                                                                                          | Duration                  | Granted Capabilities                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Export-Controlled Features                                                                                                                                  | Perpetual                 | Features that are subject to national security, foreign policy, and anti-terrorism laws and regulations; see <a href="#">Licensing for Export-Controlled Functionality, on page 291</a> .                                                                                                                                                                                                                                                                                                                                                |
| Remote Access VPN: <ul style="list-style-type: none"> <li>Secure Client Premier</li> <li>Secure Client Advantage</li> <li>Secure Client VPN Only</li> </ul> | Subscription or perpetual | Remote access VPN configuration. Your account must allow export-controlled functionality to configure remote access VPN. You select whether you meet export requirements when you register the device. The threat defense can use any valid Secure Client license. The available features do not differ based on license type.<br><br>For more information, see <a href="#">Secure Client Licenses, on page 291</a> and <i>VPN Licensing</i> in the <a href="#">Cisco Secure Firewall Management Center Device Configuration Guide</a> . |

**Note** Subscription licenses are term-based licenses.

## Essentials Licenses

The Essentials license allows you to:

- Configure your devices to perform switching and routing (including DHCP relay and NAT)
- Configure devices as a high availability pair
- Configure clustering
- Implement user and application control by adding user and application conditions to access control rules
- Update the Vulnerability database (VDB) and geolocation database (GeoDB).
- Download intrusion rules such as SRU/LSP. However, you cannot deploy access control policy or rules that have intrusion policy to the device unless IPS license is enabled.

### Secure Firewall 3100/4200

You obtain a Essentials license when you purchase the Secure Firewall 3100/4200.

### Other Models

Except in deployments using Specific License Reservation, a Essentials license is automatically added to your account when you register a device to the management center. For Specific License Reservation, you need to add the Essentials license to your account.

## Malware Defense Licenses

A Malware defense license lets you perform malware defense and Secure Malware Analytics. With this feature, you can use devices to detect and block malware in files transmitted over your network. To support this feature license, you can purchase the Malware defense (AMP) service subscription as a stand-alone subscription or in combination with IPS (TM) or IPS and URL Filtering (TMC) subscriptions. IPS license is a prerequisite for a Malware defense license.

---

**Note** Managed devices with Malware defense licenses enabled periodically attempt to connect to the Secure Malware Analytics Cloud even if you have not configured dynamic analysis. Because of this, the device's Interface Traffic dashboard widget shows transmitted traffic; this is expected behavior.

---

You configure malware defense as part of a file policy, which you then associate with one or more access control rules. File policies can detect your users uploading or downloading files of specific types over specific application protocols. Malware defense allows you to use local malware analysis and file preclassification to inspect a restricted set of those file types for malware. You can also download and submit specific file types to the Secure Malware Analytics Cloud for dynamic and Spero analysis to determine whether they contain malware. For these files, you can view the network file trajectory, which details the path the file has taken through your network. The Malware Defense license also allows you to add specific files to a file list and enable the file list within a file policy, allowing those files to be automatically allowed or blocked on detection.

Note that a Malware defense license is required only if you deploy malware defense and Secure Malware Analytics. Without a Malware defense license, the management center can receive Secure Endpoint malware events and indications of compromise (IOC) from the Secure Malware Analytics Cloud.

See also important information at *License Requirements for File and Malware Policies* in the [Cisco Secure Firewall Management Center Device Configuration Guide](#).

When you disable this license:

- The system stops querying the Secure Malware Analytics Cloud, and also stops acknowledging retrospective events sent from the Secure Malware Analytics Cloud.
- You cannot re-deploy existing access control policies if they include malware defense configurations.
- For a very brief time after a Malware defense license is disabled, the system can use existing cached file dispositions. After the time window expires, the system assigns a disposition of `Unavailable` to those files.

If the license expires, your entitlement for the above capabilities ceases and the management center moves to the out-of-compliance state.

## IPS Licenses

A IPS license allows you to perform intrusion detection and prevention, file control, and Security Intelligence filtering:

- *Intrusion detection and prevention* allows you to analyze network traffic for intrusions and exploits and, optionally, drop offending packets.
- *File control* allows you to detect and, optionally, block users from uploading (sending) or downloading (receiving) files of specific types over specific application protocols. *Malware defense*, which requires

a Malware defense license, allows you to inspect and block a restricted set of those file types based on their dispositions.

- *Security Intelligence filtering* allows you to block —deny traffic to and from—specific IP addresses, URLs, and DNS domain names, before the traffic is subjected to analysis by access control rules. Dynamic feeds allow you to immediately block connections based on the latest intelligence. Optionally, you can use a “monitor-only” setting for Security Intelligence filtering.

You can purchase a IPS license as a stand-alone subscription (T) or in combination with URL Filtering (TC), Malware defense (TM), or both (TMC).

When you disable this license:

- The management center stops acknowledging intrusion and file events from the affected devices. As a consequence, correlation rules that use those events as a trigger criteria stop firing.
- The management center does not contact the internet for either Cisco-provided or third-party Security Intelligence information.
- You cannot re-deploy existing intrusion policies until you re-enable IPS.

If the license expires, your entitlement for the above capabilities ceases and the management center moves to the out-of-compliance state.

## Carrier License

The Carrier license enables the inspection of the following protocols:

- **Diameter**—Diameter is an Authentication, Authorization, and Accounting (AAA) protocol used in next-generation mobile and fixed telecom networks such as EPS (Evolved Packet System) for LTE (Long Term Evolution) and IMS (IP Multimedia Subsystem). It replaces RADIUS and TACACS in these networks.
- **GTP/GPRS**—GPRS Tunneling Protocol (GTP) is used in GSM, UMTS, and LTE networks for general packet radio service (GPRS) traffic. GTP provides a tunnel control and management protocol to provide GPRS network access for a mobile station by creating, modifying, and deleting tunnels. GTP also uses a tunneling mechanism for carrying user data packets.
- **M3UA**—MTP3 User Adaptation (M3UA) is a client/server protocol that provides a gateway to the Signaling System 7 (SS7) network for IP-based applications that interface with the SS7 Message Transfer Part 3 (MTP3) layer. M3UA makes it possible to run the SS7 User Parts (such as ISUP) over an IP network.
- **SCTP**—Stream Control Transmission Protocol (SCTP) is a transport-layer protocol that supports the SS7 protocol over IP networks. It supports the 4G LTE mobile network architecture. SCTP can handle multiple simultaneous streams, multiplexed streams, and provides more security features.

---

**Note** After you enable this license on a device, use a FlexConfig policy to enable the protocol inspection.

---

The Carrier license PIDs are available per family and not per device model. You can enable this license for each device either in the evaluation mode or with a Smart License.

The Carrier license for Firepower 4100/9300, Secure Firewall 3100/4200, and Threat Defense Virtual is term-based. This license also supports Specific License Reservation.

### Supported Devices

The devices that support the Carrier License are:

- Secure Firewall 3110
- Secure Firewall 3120
- Secure Firewall 3130
- Secure Firewall 3140
- Firepower 4112
- Firepower 4115
- Firepower 4125
- Firepower 4145
- Secure Firewall 4215
- Secure Firewall 4225
- Secure Firewall 4245
- Firepower 9300
- Threat Defense Virtual

## URL Filtering Licenses

The URL Filtering license allows you to write access control rules that determine the traffic that can traverse your network based on URLs requested by monitored hosts, correlated with information about those URLs. To support this feature license, you can purchase the URL Filtering service subscription as a stand-alone subscription or in combination with IPS (TC) or Threat and Malware defense (TMC) subscriptions. IPS license is a prerequisite for this license.

---

**Tip** Without a URL Filtering license, you can specify individual URLs or groups of URLs to allow or block. This option gives you granular, custom control over web traffic, but does not allow you to use URL category and reputation data to filter network traffic.

---

Although you can add category and reputation-based URL conditions to access control rules without a URL Filtering license, the management center will not download URL information. You cannot deploy the access control policy until you first add a URL Filtering license to the management center, then enable it on the devices targeted by the policy.

When you disable this license:

- You may lose access to URL filtering.
- Access control rules with URL conditions immediately stop filtering URLs.

- Your management center can no longer download updates to URL data.
- You cannot re-deploy existing access control policies if they include rules with category and reputation-based URL conditions.

If the license expires, your entitlement for the above capabilities ceases and the management center moves to the out-of-compliance state.

## Secure Client Licenses

You can configure remote access VPN using the Secure Client and standards-based IPSec/IKEv2.

To enable remote access VPN, you must purchase and enable one of the following licenses: Secure Client Advantage, Secure Client Premier, or Secure Client VPN Only. You can select Secure Client Advantage and Secure Client Premier if you have both licenses and you want to use them both. The Secure Client VPN Only license cannot be used with **Apex** or **Plus**. The Secure Client license must be shared with the Smart Account. For more instructions, see <http://www.cisco.com/c/dam/en/us/products/collateral/security/anyconnect-og.pdf>.

You cannot deploy the remote access VPN configuration to the device if the specified device does not have the entitlement for a minimum of one of the specified Secure Client license types. If the registered license moves out of compliance or entitlements expire, the system displays licensing alerts and health events.

While using remote access VPN, your Smart Account must have the export controlled features (strong encryption) enabled. The threat defense requires strong encryption (which is higher than DES) for successfully establishing remote access VPN connections with Secure Clients.

You cannot deploy remote access VPN if the following are true:

- Smart Licensing on the management center is running in evaluation mode.
- Your Smart Account is not configured to use export-controlled features (strong encryption).

## Licensing for Export-Controlled Functionality

### Features that require export-controlled functionality

Certain software features are subject to national security, foreign policy, and anti-terrorism laws and regulations. These export-controlled features include:

- Security certifications compliance
- Remote access VPN
- Site-to-site VPN with strong encryption
- SSH platform policy with strong encryption
- SSL policy with strong encryption
- Functionality such as SNMPv3 with strong encryption

### How to determine whether export-controlled functionality is currently enabled for your system

To determine whether export-controlled functionality is currently enabled for your system: Go to **System > Licenses > Smart Licenses** and see if **Export-Controlled Features** displays **Enabled**.

### About enabling export-controlled functionality

If **Export-Controlled Features** shows **Disabled** and you want to use features that require strong encryption, there are two ways to enable strong cryptographic features. Your organization may be eligible for one or the other (or neither), but not both.

- If there is *no* option to enable export-controlled functionality when you generate a new Product Instance Registration Token in the Smart Software Manager, contact your account representative.
- If the option “Allow export-controlled functionality on the products registered with this token” appears when you generate a new Product Instance Registration Token in the Smart Software Manager, make sure you check it before generating the token.

If you did not enable export-controlled functionality for the Product Instance Registration Token that you used to register the management center, then you must deregister and then re-register the management center using a new Product Instance Registration Token with export-controlled functionality enabled.

If you registered devices to the management center in evaluation mode or before you enabled strong encryption on the management center, reboot each managed device to make strong encryption available. In a high availability deployment, the active and standby devices must be rebooted together to avoid an Active-Active condition.

The entitlement is perpetual and does not require a subscription.

### More Information

For general information about export controls, see <https://www.cisco.com/c/en/us/about/legal/global-export-trade.html>.

## Threat Defense Virtual Licenses

This section describes the performance-tiered license entitlements available for the threat defense virtual.

Any threat defense virtual license can be used on any supported threat defense virtual vCPU/memory configuration. This allows threat defense virtual customers to run on a wide variety of VM resource footprints. This also increases the number of supported AWS and Azure instances types. When configuring the threat defense virtual VM, the maximum supported number of cores (vCPUs) is 16 ; and the maximum supported memory is 32 GB RAM .

### Performance Tiers for Threat Defense Virtual Smart Licensing

Session limits for RA VPNs are determined by the installed threat defense virtual platform entitlement tier, and enforced via a rate limiter. The following table summarizes the session limits based on the entitlement tier and rate limiter.

**Table 19: Threat Defense Virtual Licensed Feature Limits Based on Entitlement**

| Performance Tier | Device Specifications (Core/RAM) | Rate Limit | RA VPN Session Limit |
|------------------|----------------------------------|------------|----------------------|
| FTDv5, 100Mbps   | 4 core/8 GB                      | 100Mbps    | 50                   |
| FTDv10, 1Gbps    | 4 core/8 GB                      | 1Gbps      | 250                  |
| FTDv20, 3Gbps    | 4 core/8 GB                      | 3Gbps      | 250                  |

| Performance Tier | Device Specifications (Core/RAM) | Rate Limit | RA VPN Session Limit |
|------------------|----------------------------------|------------|----------------------|
| FTDv30, 5Gbps    | 8 core/16 GB                     | 5Gbps      | 250                  |
| FTDv50, 10Gbps   | 12 core/24 GB                    | 10Gbps     | 750                  |
| FTDv100, 16Gbps  | 16 core/32 GB                    | 16Gbps     | 10,000               |

### Threat Defense Virtual Performance Tier Licensing Guidelines and Limitations

Please keep the following guidelines and limitations in mind when licensing your threat defense virtual device.

- The threat defense virtual supports performance-tiered licensing that provides different throughput levels and VPN connection limits based on deployment requirements.
- Any threat defense virtual license can be used on any supported threat defense virtual core/memory configuration. This allows the threat defense virtual customers to run on a wide variety of VM resource footprints.
- You can select a performance tier when you deploy the threat defense virtual, whether your device is in evaluation mode or is already registered with Cisco Smart Software Manager.

---

**Note** Make sure your Smart Licensing account contains the available licenses you need. It's important to choose the tier that matches the license you have in your account. If you are upgrading your threat defense virtual to Version 7.0, you can choose **FTDv - Variable** to maintain your current license compliance. Your threat defense virtual continues to perform with session limits based on your device capabilities (number of cores/RAM).

---

- The default performance tier is FTDv50 when deploying a new threat defense virtual device, or when provisioning the threat defense virtual using the REST API.
- Essentials licenses are subscription-based and mapped to performance tiers. Your virtual account needs to have the Essentials license entitlements for the threat defense virtual devices, as well as for IPS, Malware Defense, and URL Filtering licenses.
- Each HA peer consumes one entitlement, and the entitlements on each HA peer must match, including Essentials license.
- A change in performance tier for an HA pair should be applied to the primary peer.
- You assign feature licenses to the cluster as a whole, not to individual nodes. However, each node of the cluster consumes a separate license for each feature. The clustering feature itself does not require any licenses.
- Universal PLR licensing is applied to each device in an HA pair separately. The secondary device will not automatically mirror the performance tier of the primary device. It must be updated manually.

## License PIDs

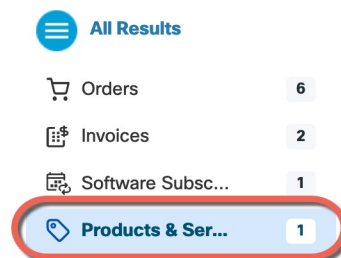

When you bought your device from Cisco or a reseller, your licenses should have been linked to your Smart Software License account. However, if you need to add licenses yourself, use the **Search All** field on the [Cisco Commerce Workspace](#).

**Figure 66: License Search**

Choose **Products & Services** from the results.

**Figure 67: Results**

### Threat Defense Virtual PIDs

When you order FTDV-SEC-SUB, you must choose a Essentials license and optional feature licenses (12 month term):

- Essentials license:
  - FTD-V-5S-BSE-K9
  - FTD-V-10S-BSE-K9
  - FTD-V-20S-BSE-K9
  - FTD-V-30S-BSE-K9
  - FTD-V-50S-BSE-K9
  - FTD-V-100S-BSE-K9
- IPS, Malware defense, and URL license combination:
  - FTD-V-5S-TMC
  - FTD-V-10S-TMC
  - FTD-V-20S-TMC
  - FTD-V-30S-TMC
  - FTD-V-50S-TMC

- FTD-V-100S-TMC
- Carrier—FTDV\_CARRIER
- Cisco Secure Client—See the [Cisco Secure Client Ordering Guide](#).

### Firepower 1010 PIDs

- IPS, Malware defense, and URL license combination:
  - L-FPR1010T-TMC=

When you add the above PID to your order, you can then choose a term-based subscription corresponding with one of the following PIDs:

- L-FPR1010T-TMC-1Y
- L-FPR1010T-TMC-3Y
- L-FPR1010T-TMC-5Y
- Cisco Secure Client—See the [Cisco Secure Client Ordering Guide](#).

### Firepower 1100 PIDs

- IPS, Malware defense, and URL license combination:
  - L-FPR1120T-TMC=
  - L-FPR1140T-TMC=
  - L-FPR1150T-TMC=

When you add one of the above PIDs to your order, you can then choose a term-based subscription corresponding with one of the following PIDs:

- L-FPR1120T-TMC-1Y
- L-FPR1120T-TMC-3Y
- L-FPR1120T-TMC-5Y
- L-FPR1140T-TMC-1Y
- L-FPR1140T-TMC-3Y
- L-FPR1140T-TMC-5Y
- L-FPR1150T-TMC-1Y
- L-FPR1150T-TMC-3Y
- L-FPR1150T-TMC-5Y
- Cisco Secure Client—See the [Cisco Secure Client Ordering Guide](#).

**Secure Firewall 1210/1220 PIDs**

- Essentials license:
  - *Included automatically*
- IPS, Malware defense, and URL license combination:
  - L-CSF1210CET-TMC=
  - L-CSF1210CPT-TMC=
  - L-CSF1220CXT-TMC=

When you add one of the above PIDs to your order, you can then choose a term-based subscription corresponding with one of the following PIDs:

- L-CSF1210CE-TMC-1Y
  - L-CSF1210CE-TMC-3Y
  - L-CSF1210CE-TMC-5Y
  - L-CSF1210CP-TMC-1Y
  - L-CSF1210CP-TMC-3Y
  - L-CSF1210CP-TMC-5Y
  - L-CSF1220CX-TMC-1Y
  - L-CSF1220CX-TMC-3Y
  - L-CSF1220CX-TMC-5Y
- Strong Encryption (3DES/AES):
    - L-CSF1200TD-ENCK9=. Only required if your account is not authorized for strong encryption.
  - Cisco Secure Client—See the [Cisco Secure Client Ordering Guide](#).

**Secure Firewall 1230/1240/1250/1260 PIDs**

- Essentials license:
  - *Included automatically*
- IPS, Malware defense, and URL license combination:
  - L-CSF1230T-TMC=
  - L-CSF1240T-TMC=
  - L-CSF1250T-TMC=
  - L-CSF1260T-TMC=

When you add one of the above PIDs to your order, you can then choose a term-based subscription corresponding with one of the following PIDs:

- L-CSF1230-TMC-1Y
  - L-CSF1230-TMC-3Y
  - L-CSF1230-TMC-5Y
  - L-CSF1240-TMC-1Y
  - L-CSF1240-TMC-3Y
  - L-CSF1240-TMC-5Y
  - L-CSF1250-TMC-1Y
  - L-CSF1250-TMC-3Y
  - L-CSF1250-TMC-5Y
  - L-CSF1260-TMC-1Y
  - L-CSF1260-TMC-3Y
  - L-CSF1260-TMC-5Y
- Strong Encryption (3DES/AES):
    - L-CSF1200TD-ENCK9=. Only required if your account is not authorized for strong encryption.
  - Cisco Secure Client—See the [Cisco Secure Client Ordering Guide](#).

### Secure Firewall 3100 PIDs

- Essentials license:
  - *Included automatically*
- IPS, Malware defense, and URL license combination:
  - L-FPR3110T-TMC=
  - L-FPR3120T-TMC=
  - L-FPR3130T-TMC=
  - L-FPR3140T-TMC=

When you add one of the above PIDs to your order, you can then choose a term-based subscription corresponding with one of the following PIDs:

- L-FPR3105T-TMC-1Y
- L-FPR3105T-TMC-3Y
- L-FPR3105T-TMC-5Y
- L-FPR3110T-TMC-1Y
- L-FPR3110T-TMC-3Y
- L-FPR3110T-TMC-5Y

- L-FPR3120T-TMC-1Y
- L-FPR3120T-TMC-3Y
- L-FPR3120T-TMC-5Y
- L-FPR3130T-TMC-1Y
- L-FPR3130T-TMC-3Y
- L-FPR3130T-TMC-5Y
- L-FPR3140T-TMC-1Y
- L-FPR3140T-TMC-3Y
- L-FPR3140T-TMC-5Y
- Carrier—L-FPR3K-FTD-CAR=
- Cisco Secure Client—See the [Cisco Secure Client Ordering Guide](#).

#### Firepower 4100 PIDs

- IPS, Malware defense, and URL license combination:
  - L-FPR4112T-TMC=
  - L-FPR4115T-TMC=
  - L-FPR4125T-TMC=
  - L-FPR4145T-TMC=

When you add one of the above PIDs to your order, you can then choose a term-based subscription corresponding with one of the following PIDs:

- L-FPR4112T-TMC-1Y
- L-FPR4112T-TMC-3Y
- L-FPR4112T-TMC-5Y
- L-FPR4115T-TMC-1Y
- L-FPR4115T-TMC-3Y
- L-FPR4115T-TMC-5Y
- L-FPR4125T-TMC-1Y
- L-FPR4125T-TMC-3Y
- L-FPR4125T-TMC-5Y
- L-FPR4145T-TMC-1Y
- L-FPR4145T-TMC-3Y
- L-FPR4145T-TMC-5Y

- Carrier—L-FPR4K-FTD-CAR=
- Cisco Secure Client—See the [Cisco Secure Client Ordering Guide](#).

### Secure Firewall 4200 PIDs

- Essentials license:
  - *Included automatically*
- IPS, Malware defense, and URL license combination:
  - L-FPR4215T-TMC=
  - L-FPR4225T-TMC=
  - L-FPR4245T-TMC=

When you add one of the above PIDs to your order, you can then choose a term-based subscription corresponding with one of the following PIDs:

- L-FPR4215T-TMC-1Y
  - L-FPR4215T-TMC-3Y
  - L-FPR4215T-TMC-5Y
  - L-FPR4225T-TMC-1Y
  - L-FPR4225T-TMC-3Y
  - L-FPR4225T-TMC-5Y
  - L-FPR4245T-TMC-1Y
  - L-FPR4245T-TMC-3Y
  - L-FPR4245T-TMC-5Y
- Carrier—L-FPR4200-FTD-CAR=
  - Cisco Secure Client—See the [Cisco Secure Client Ordering Guide](#).

### Firepower 9300 PIDs

- IPS, Malware defense, and URL license combination:
  - L-FPR9K-40T-TMC=
  - L-FPR9K-48T-TMC=
  - L-FPR9K-56T-TMC=

When you add one of the above PIDs to your order, you can then choose a term-based subscription corresponding with one of the following PIDs:

- L-FPR9K-40T-TMC-1Y
- L-FPR9K-40T-TMC-3Y

- L-FPR9K-40T-TMC-5Y
  - L-FPR9K-48T-TMC-1Y
  - L-FPR9K-48T-TMC-3Y
  - L-FPR9K-48T-TMC-5Y
  - L-FPR9K-56T-TMC-1Y
  - L-FPR9K-56T-TMC-3Y
  - L-FPR9K-56T-TMC-5Y
- Carrier—L-FPR9K-FTD-CAR=
  - Cisco Secure Client—See the [Cisco AnyConnect Ordering Guide](#).

### ISA 3000 PIDs

- IPS, Malware defense, and URL license combination:
  - L-ISA3000T-TMC=

When you add the above PID to your order, you can then choose a term-based subscription corresponding with one of the following PIDs:

- L-ISA3000T-TMC-1Y
  - L-ISA3000T-TMC-3Y
  - L-ISA3000T-TMC-5Y
- Cisco Secure Client—See the [Cisco AnyConnect Ordering Guide](#).

## Requirements and Prerequisites for Licensing

### General Prerequisites

- Make sure NTP is configured on the management center and managed devices. Time must be synchronized for registration to succeed.

For a Firepower 4100/9300, you must configure NTP on the chassis using the same NTP server for the chassis as for the management center.

### Supported Domains

Global, except where indicated.

### User Roles

- Admin

# Requirements and Prerequisites for Licensing for High Availability, Clustering, and Multi-Instance

This section describes the licensing requirements for device High Availability.

FTD Services does not support clustering or multi-instance deployments.

## Licensing for Device High-Availability

Both threat defense units in a high availability configuration must have the same licenses.

High availability configurations require two license entitlements: one for each device in the pair.

Before high availability is established, it does not matter which licenses are assigned to the secondary/standby device. During high availability configuration, the management center releases any unnecessary licenses assigned to the standby unit and replaces them with identical licenses assigned to the primary/active unit. For example, if the active unit has a Essentials license and a IPS license, and the standby unit has only a Essentials license, the management center communicates with the Smart Software Manager to obtain an available IPS license from your account for the standby unit. If your license account does not include enough purchased entitlements, your account becomes Out-of-Compliance until you purchase the correct number of licenses.

## Licensing for Device Clusters

Each threat defense virtual cluster node requires the same performance tier license. We recommend using the same number of CPUs and memory for all members, or else performance will be limited on all nodes to match the least capable member. The throughput level will be replicated from the control node to each data node so they match.

You assign feature licenses to the cluster as a whole, not to individual nodes. However, each node of the cluster consumes a separate license for each feature. The clustering feature itself does not require any licenses.

When you add the control node to the management center, you can specify the feature licenses you want to use for the cluster. Before you create the cluster, it doesn't matter which licenses are assigned to the data nodes; the license settings for the control node are replicated to each of the data nodes. You can modify licenses for the cluster in the **System (⚙️) > Licenses > Smart Licenses > Edit Licenses** or **Devices > Device Management > Cluster > License** area.

---

**Note** If you add the cluster before the management center is licensed (and running in Evaluation mode), then when you license the management center, you can experience traffic disruption when you deploy policy changes to the cluster. Changing to licensed mode causes all data units to leave the cluster and then rejoin.

---

## Create a Cisco Account

You must have a Cisco account to request a Smart Account and license any Cisco products.

## Procedure

- 
- Step 1** Open the URL <https://id.cisco.com/signin/register> to create a new account.
- Step 2** Enter all the required fields to create an account.  
The following figure shows an example.
- Step 3** Click **Register**.  
An email with an activation code is sent to verify your email address.
- Note** If you haven't received an email yet, send an email to the registration support team at [web-help@cisco.com](mailto:web-help@cisco.com).
- Step 4** In the **Verify with your email** page, enter the activation code to complete the registration process and click **Verify**.  
After successful registration, you will be redirected to the login page.
- 

### What to do next

Enter the newly created account details on the login page to request a Smart Account. See [Create a Smart Account and Add Licenses, on page 302](#).

# Create a Smart Account and Add Licenses

You should set up this account before you purchase licenses.

### Before you begin

Your account representative or reseller may have set up a Smart Account on your behalf. If so, obtain the necessary information to access the account from that person instead of using this procedure, then verify that you can access the account.

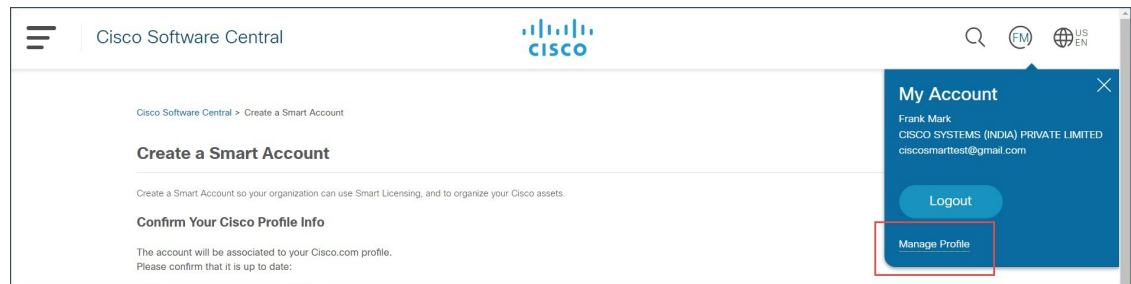

You must create a new Cisco account if you don't already have one. For instructions, see [Create a Cisco Account](#).

For general information about Smart Accounts, see <http://www.cisco.com/go/smartaccounts>.

## Procedure

- 
- Step 1** Go to the [Create a Smart Account](#) page. You are prompted to log in with your Cisco account.  
In the **Create a Smart Account** page, your basic account information is displayed.
- Step 2** Click the **My Account** icon appearing in the top right corner and click **Manage Profile**.

- Step 3** Click **Personal**.
- Step 4** In the **Your Company Details** section, click **Edit**.
- Step 5** In the **Company or organization** field, type your organization name.
- Step 6** If your company information is already present in our database, it will appear in the list. You can select your company.  
In the **Address** drop-down list, select the address of your company.
- Step 7** If your company is not listed in our database, you can continue to enter your company information in the **Company or organization** field.
- In the **Address** drop-down list, click the drop-down arrow and click **Add New Address**.
  - You can select one of the following **Address Type** options:
    - **Company/Organization**: To provide your organization's address. Cisco verifies this address. If the address and company name cannot be validated with the country, you may not be able to proceed. Therefore, you must ensure that the correct address is provided.
    - **Personal**: To provide your personal address.
- Step 8** Enter all the mandatory fields associated with your company and click **Update**.  
The **Your Company Details** section displays the company details you entered.  
A success message appears if your company details are validated.
- Step 9** Click **Update**.  
A success message appears if your company details are validated.
- Step 10** Open the **Create a Smart Account** page, which was opened in the previous tab. Refresh the page if changes are not reflecting.  
Alternatively, you can open this page using the <https://software.cisco.com/software/company/smartaccounts/home?route=module/accountcreation> URL and login using your credentials.
- Step 11** Click **Create Account**.  
The Account Summary page displays your account details.
- Step 12** Click **Done**.
- Step 13** Wait for an email telling you that your Smart Account is ready to set up. When it arrives, click the link it contains, as directed.
- Step 14** Make sure your Smart Licensing account contains the available licenses you need.

For license PIDs, see [License PIDs, on page 294](#).

---

### What to do next

To configure Smart License using the Smart Software Manager, see [Configure Smart Licensing, on page 304](#).

## Configure Smart Licensing

This section describes how to use Smart Licensing using the Smart Software Manager or the Smart Software Manager On-Prem.

### Register the Management Center for Smart Licensing

You can register the management center directly to the Smart Software Manager over the internet, or when using an air-gapped network, with the Smart Software Manager On-Prem.

### Register the Management Center with the Smart Software Manager

Register the management center with the Smart Software Manager.

#### Before you begin

- Make sure your Smart Licensing account contains the available licenses you need.

When you bought your device from Cisco or a reseller, your licenses should have been linked to your Smart Account. However, if you need to add licenses yourself, see [Cisco Commerce Workspace](#). For license PIDs, see [License PIDs, on page 294](#).

- Ensure that the management center can reach the Smart Software Manager at [smartreceiver.cisco.com](http://smartreceiver.cisco.com).
- Make sure you configure NTP. During registration, a key exchange occurs between the Smart Agent and the Smart Software Manager, so time must be in sync for proper registration.

For the Firepower 4100/9300, you must configure NTP on the chassis using the same NTP server for the chassis as for the management center.

- If your organization has multiple management centers, make sure each management center has a unique name that clearly identifies and distinguishes it from other management centers that may be registered to the same virtual account. This name is critical for managing your Smart License entitlements and ambiguous names will lead to problems later.

#### Procedure

---

- Step 1** In the [Smart Software Manager](#), request and copy a registration token for the virtual account to which you want to add this device.
- a) Click **Inventory**.

- b) On the **General** tab, click **New Token**.

- c) On the **Create Registration Token** dialog box enter the following settings, and then click **Create Token**:

### Create Registration Token

This will create a token that is used to register product instances, so that they can use licenses from this virtual account. Once it's created, go to the Smart Licensing configuration for your products and enter the token, to register them with this virtual account.

Virtual Account:

Description:

\* Expire After:  Days

*Between 1 - 365, 30 days recommended*

Max. Number of Uses:

*The token will be expired when either the expiration or the maximum uses is reached*

Allow export-controlled functionality on the products registered with this token ?

- **Description**
- **Expire After**—Cisco recommends 30 days.
- **Max. Number of Uses**
- **Allow export-controlled functionality on the products registered with this token**—Enables the export-compliance flag if you are in a country that allows for strong encryption. You must select this option now if you plan to use this functionality. If you enable this functionality later, you will need to re-register your device with a new product key and reload the device. If you do not see this option, your account does not support export-controlled functionality.

The token is added to your inventory.

- d) Click the arrow icon to the right of the token to open the **Token** dialog box so you can copy the token ID to your clipboard. Keep this token ready for later in the procedure when you need to register the threat defense.

Figure 68: View Token

| Token            | Expiration Date                   | Uses    | Export-Controlled |
|------------------|-----------------------------------|---------|-------------------|
| OWFINTZIYtgY2Ew. | 2024-May-18 17:41:53 (in 30 days) | 0 of 10 | Allowed           |

Figure 69: Copy Token

- Step 2** In the management center, choose **System** (⚙) > **Licenses** > **Smart Licenses**.
- Step 3** Click **Register**.
- Step 4** Paste the token you generated from Smart Software Manager into the **Product Instance Registration Token** field.  
Make sure there are no empty spaces or blank lines at the beginning or end of the text.
- Step 5** Click **Apply Changes**.

### What to do next

- Add a Device to the management center; see *Add a Device to the Management Center* in the [Cisco Secure Firewall Management Center Device Configuration Guide](#).

## Assign Licenses to Devices

You can assign most licenses when you register a device to the management center. You can also assign licenses per device, or for multiple devices.

### Assign Licenses to a Single Device

Although there are some exceptions, you cannot use the features associated with a license if you disable it on a managed device.

---

**Note** For container instances on the same security module/engine, you apply the license to each instance; note that the security module/engine consumes only one license per feature for all instances on the security module/engine.

---

---

**Note** For the threat defense cluster, you apply the licenses to the cluster as a whole; note that each unit in the cluster consumes a separate license per feature.

---

### Before you begin

You must have Admin or Network Admin privileges to perform this task. When operating with multiple domains, you must do this task in leaf domains.

### Procedure

- 
- Step 1** Choose **Devices > Device Management**.
  - Step 2** Next to the device where you want to assign or disable a license, click **Edit** (✎).
  - Step 3** Click **Device**.
  - Step 4** Next to the **License** section, click **Edit** (✎).
  - Step 5** Check or clear the appropriate check boxes to assign or disable licenses for the device.
  - Step 6** Click **Save**.
  - Step 7** Deploy configuration changes.
- 

### What to do next

Verify license status: Go to **System** (⚙) > **Licenses > Smart Licenses**, enter the hostname or IP address of the device into the filter at the top of the Smart Licenses table, and verify that only a green circle with a **Check Mark** (✔) appears for each device, for each license type. If you see any other icon, hover over the icon for more information.

## Assign Licenses to Multiple Managed Devices

Devices managed by the management center obtain their licenses via the management center, not directly from the Smart Software Manager.

Use this procedure to enable licensing on multiple devices at once.

---

**Note** For container instances on the same security module/engine, you apply the license to each instance; note that the security module/engine consumes only one license per feature for all instances on the security module/engine.

---

---

**Note** For the threat defense cluster, you apply the licenses to the cluster as a whole; note that each unit in the cluster consumes a separate license per feature.

---

## Procedure

---

**Step 1** Choose **System** (⚙) > **Licenses** > **Smart Licenses** or **Specific Licenses**.

**Step 2** Click **Edit Licenses**.

**Step 3** For each type of license you want to add to a device:

- a) Click the tab for that type of license.
- b) Click a device in the list on the left.
- c) Click **Add** to move that device to the list on the right.
- d) Repeat for each device to receive that type of license.

For now, don't worry about whether you have licenses for all of the devices you want to add.

- e) Repeat this subprocedure for each type of license you want to add.
- f) To remove a license, click the **Delete** (🗑) next to the device.
- g) Click **Apply**.

You can select a cluster and assign any license to all nodes of a cluster.

---

### What to do next

Verify that your licenses are correctly installed. Follow the procedure in [Monitoring Smart Licenses, on page 309](#).

## Manage Smart Licensing

This section describes how to manage Smart Licensing.

### Deregister the Management Center

Deregister your management center from the Smart Software Manager to release all of the license entitlements back to your Smart Account so they can be used for other devices. For example, deregister if you need to decommission the management center or reimagine it.

See [Unregistered State, on page 285](#) for more information about license enforcement in an unregistered state.

## Procedure

---

**Step 1** Choose **System** (⚙) > **Licenses** > **Smart Licenses**.

**Step 2** Click **Deregister** (✖).

## Monitoring Smart License Status

The **Smart License Status** section of the **System > Licenses > Smart Licenses** page provides an overview of license usage on the management center, as described below.

### Usage Authorization

Possible status values are:

- **In-compliance** (●) — All licenses assigned to managed devices are in compliance and the management center is communicating successfully with the Smart Software Manager.
- **License is in compliance but communication with licensing authority has failed** — Device licenses are in compliance, but the management center is not able to communicate with the Cisco licensing authority.
- **Out-of-compliance icon or unable to communicate with License Authority** — One or more managed devices is using a license that is out of compliance, or the management center has not communicated with the Smart Software Manager in more than 90 days.

### Product Registration

Specifies the last date when the management center contacted the Smart Software Manager and registered.

### Assigned Virtual Account

Specifies the Virtual Account under the Smart Account that you used to generate the Product Instance Registration Token and register the management center. If this deployment is not associated with a particular virtual account within your Smart Account, this information is not displayed.

### Export-Controlled Features

If this option is enabled, you can deploy restricted features. For details, see [Licensing for Export-Controlled Functionality, on page 291](#).

### Cisco Success Network

Specifies whether you have enabled Cisco Success Network for the management center. If this option is enabled, you provide usage information and statistics to Cisco which are essential to provide you with technical support. This information also allows Cisco to improve the product and make you aware of unused available features so that you can maximize the value of the product in your network.

## Monitoring Smart Licenses

To view the license status for the management center and its managed devices, use the Smart Licenses page.

For each type of license in your deployment, the page lists the total number of licenses consumed, whether the license is in compliance or out of compliance, the device type, and the domain and group where the device is deployed. You can also view the management center's Smart License Status. Container instances on the same security module/engine only consume one license per security module/engine. Therefore, even though

the management center lists each container instance separately under each license type, the number of licenses consumed for feature license types will only be one.

Other than the **Smart Licenses** page, there are a few other ways you can view licenses:

- The **Product Licensing** dashboard widget provides an at-a-glance overview of your licenses.
- The **Device Management** page (**Devices > Device Management**) lists the licenses applied to each of your managed devices.
- The **Smart License Monitor** health module communicates license status when used in a health policy.

## Procedure

- 
- Step 1** Choose **System** (⚙️) > **Licenses** > **Smart Licenses**.
- Step 2** In the **Smart Licenses** table, click the arrow at the left side of each **License Type** folder to expand that folder.
- Step 3** In each folder, verify that each device has a green circle with a **Check Mark** (✅) in the **License Status** column.

If all devices show a green circle with a **Check Mark** (✅), your devices are properly licensed and ready to use.

If you see any License Status other than a green circle with a **Check Mark** (✅), hover over the status icon to view the message.

---

### What to do next

- If you had any devices that did not have a green circle with a **Check Mark** (✅), you may need to purchase more licenses.

## Troubleshooting Smart Licensing

### Expected Licenses Do Not Appear in My Smart Account

If the licenses you expect to see are not in your Smart Account, try the following:

- Make sure they are not in a different Virtual Account. Your organization's license administrator may need to assist you with this.
- Check with the person who sold you the licenses to be sure that transfer to your account is complete.

### Unable to Connect to Smart License Server

Check the obvious causes first. For example, make sure your management center has outside connectivity. See [Internet Access Requirements, on page 2966](#).

### Unexpected Out-of-Compliance Notification or Other Error

- If a device is already registered to a different management center, you need to deregister the original management center before you can license the device under a new management center. See [Deregister the Management Center, on page 308](#).
- Check if the term of the subscription license has expired.

### Troubleshoot Other Issues

For solutions to other common issues, see <https://www.cisco.com/c/en/us/support/docs/security/firepower-management-center/215838-fmc-and-ftd-smart-license-registration-a.html>

## Configure Legacy Management Center PAK-Based Licenses

The management center supports either a Smart License or a legacy PAK (Product Activation Key) license for its platform license. This procedure describes how to apply a PAK-based license.

After re-registration of your Smart Account, you must manually add the classic licenses for all classic devices.

### Before you begin

- Make sure you have the product activation key (PAK) from the Software Claim Certificate that Cisco provided when you purchased the license. If you have a legacy, pre-Cisco license, contact Support.

### Procedure

- 
- Step 1** The license key uniquely identifies the management center in the Smart Software Manager. It is composed of a product code (for example, 66) and the MAC address of the management port (eth0) of the management center; for example, 66:00:00:77:FF:CC:88.
- a) Choose **System** (⚙) > **Licenses** > **Classic Licenses**.
  - b) Click **Add New License**.
  - c) Note the value in the **License Key** field at the top of the **Add Feature License** dialog.
- Step 2** Choose **System** (⚙) > **Licenses** > **Classic Licenses**.
- Step 3** Click **Add New License**.
- Step 4** Continue as appropriate:
- If you have already obtained the license text, skip to Step 8.
  - If you still need to obtain the license text, go to the next step.
- Step 5** Click **Get License** to open the License Registration Portal.
- Note** If you cannot access the Internet using your current computer, switch to a computer that can, and browse to <http://cisco.com/go/license>.
- Step 6** Generate a license from the PAK in the License Registration Portal: <https://cisco.com/go/license>.

This step requires the PAK you received during the purchase process, as well as the license key for the management center.

For more information on using this portal, see:

<https://slexui.cloudapps.cisco.com/SWIFT/LicensingUI/Quickstart>

You will need your account credentials in order to access these links.

**Step 7** Copy the license text from either the License Registration Portal display, or the email the License Registration Portal sends you.

**Important** The licensing text block in the portal or email message may include more than one license. Each license is bounded by a BEGIN LICENSE line and an END LICENSE line. Make sure that you copy and paste only one license at a time.

**Step 8** Return to the **Add Feature License** page in the management center virtual's web interface.

**Step 9** Paste the license text into the **License** field.

**Step 10** Click **Verify License**.

If the license is invalid, make sure that you correctly copied the license text.

**Step 11** Click **Submit License**.

---

## Additional Information about Licensing

For additional information to help resolve common licensing questions, see the following documents:

- [FAQ—Licensing FAQ](#)
- [License Roadmap](#)

## CHAPTER 15

# Security Certifications Compliance

The following topics describe how to configure your system to comply with security certifications standards:

- [Security Certifications Compliance Modes, on page 313](#)
- [Security Certifications Compliance Characteristics, on page 314](#)
- [Security Certifications Compliance Recommendations, on page 315](#)

## Security Certifications Compliance Modes

Your organization might be required to use only equipment and software complying with security standards established by the U.S. Department of Defense and global certification organizations. Secure Firewall supports compliance with the following security certifications standards:

- Common Criteria (CC): a global standard established by the international Common Criteria Recognition Arrangement, defining properties for security products
- Unified Capabilities Approved Products List (UCAPL): a list of products meeting security requirements established by the U.S. Defense Information Systems Agency (DISA)

---

**Note** The U.S. Government has changed the name of the Unified Capabilities Approved Products List (UCAPL) to the Department of Defense Information Network Approved Products List (DODIN APL). References to UCAPL in this documentation and the Secure Firewall Management Center web interface can be interpreted as references to DODIN APL.

---

- Federal Information Processing Standards (FIPS) 140: a requirements specification for encryption modules

You can enable security certifications compliance in CC mode or UCAPL mode. Enabling security certifications compliance does not guarantee strict compliance with all requirements of the security mode selected. For more information on hardening procedures, refer to the guidelines for this product provided by the certifying entity.

---

**Caution** After you enable this setting, you cannot disable it. If you need to take an appliance out of CC or UCAPL mode, you must reimage.

---

## Security Certifications Compliance Characteristics

The following table describes behavior changes when you enable CC or UCAPL mode. (Restrictions on login accounts refers to command line access, not web interface access. )

| System Change                                                                                                                                                      | Secure Firewall Management Center |            | Classic Managed Devices |            | Secure Firewall Threat Defense |            |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------|------------|-------------------------|------------|--------------------------------|------------|
|                                                                                                                                                                    | CC Mode                           | UCAPL Mode | CC Mode                 | UCAPL Mode | CC Mode                        | UCAPL Mode |
| FIPS compliance is enabled.                                                                                                                                        | Yes                               | Yes        | Yes                     | Yes        | Yes                            | Yes        |
| The system does not allow remote storage for backups or reports.                                                                                                   | Yes                               | Yes        | —                       | —          | —                              | —          |
| The system starts an additional system audit daemon.                                                                                                               | No                                | Yes        | No                      | Yes        | No                             | No         |
| The system boot loader is secured.                                                                                                                                 | No                                | Yes        | No                      | Yes        | No                             | No         |
| The system applies additional security to login accounts.                                                                                                          | No                                | Yes        | No                      | Yes        | No                             | No         |
| The system disables the reboot key sequence Ctrl+Alt+Del.                                                                                                          | No                                | Yes        | No                      | Yes        | No                             | No         |
| The system enforces a maximum of ten simultaneous login sessions.                                                                                                  | No                                | Yes        | No                      | Yes        | No                             | No         |
| Passwords must be at least 15 characters long, and must consist of alphanumeric characters of mixed case and must include at least one numeric character.          | No                                | Yes        | No                      | Yes        | No                             | No         |
| The minimum required password length for the local <code>admin</code> user can be configured using the local device CLI.                                           | No                                | No         | No                      | No         | Yes                            | Yes        |
| Passwords cannot be a word that appears in a dictionary or include consecutive repeating characters.                                                               | No                                | Yes        | No                      | Yes        | No                             | No         |
| The system locks out users other than <code>admin</code> after three failed login attempts in a row. In this case, the password must be reset by an administrator. | No                                | Yes        | No                      | Yes        | No                             | No         |
| The system stores password history by default.                                                                                                                     | No                                | Yes        | No                      | Yes        | No                             | No         |
| The <code>admin</code> user can be locked out after a maximum number of failed login attempts configurable through the web interface.                              | Yes                               | Yes        | Yes                     | Yes        | —                              | —          |

| System Change                                                                                                                                                                                                                                                        | Secure Firewall Management Center |            | Classic Managed Devices                                           |                                                                   | Secure Firewall Threat Defense |            |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------|------------|-------------------------------------------------------------------|-------------------------------------------------------------------|--------------------------------|------------|
|                                                                                                                                                                                                                                                                      | CC Mode                           | UCAPL Mode | CC Mode                                                           | UCAPL Mode                                                        | CC Mode                        | UCAPL Mode |
| The <code>admin</code> user can be locked out after a maximum number of failed login attempts configurable through the local appliance CLI.                                                                                                                          | No                                | No         | Yes, regardless of security certifications compliance enablement. | Yes, regardless of security certifications compliance enablement. | Yes                            | Yes        |
| The system automatically rekeys an SSH session with an appliance: <ul style="list-style-type: none"> <li>• After a key has been in use for one hour of session activity</li> <li>• After a key has been used to transmit 1 GB of data over the connection</li> </ul> | Yes                               | Yes        | Yes                                                               | Yes                                                               | Yes                            | Yes        |
| The system performs a file system integrity check (FSIC) at boot-time. If the FSIC fails, Secure Firewall software does not start, remote SSH access is disabled, and you can access the appliance only via local console. If this happens, contact Cisco TAC.       | Yes                               | Yes        | Yes                                                               | Yes                                                               | Yes                            | Yes        |

## Security Certifications Compliance Recommendations

Cisco recommends that you observe the following best practices when using a system with security certifications compliance enabled:

- To enable security certifications compliance in your deployment, enable it first on the Secure Firewall Management Center, then enable it in the same mode on all managed devices.

### Caution

The Secure Firewall Management Center will not receive event data from a managed device unless both are operating in the same security certifications compliance mode.

- For all users, enable password strength checking and set the minimum password length to the value required by the certifying agency.
- If you are using Secure Firewall Management Centers in a high-availability configuration, configure them both to use the same security certifications compliance mode.

- When you configure Secure Firewall Threat Defense on a Firepower 4100/9300 to operate in CC or UCAPL mode, you should also configure the Firepower 4100/9300 to operate in CC mode. For more information, see the *Cisco Firepower 4100/9300 FXOS Chassis Manager Configuration Guide*.
- Do not configure the system to use any of the following features:
  - Email reports, alerts, or data pruning notifications.
  - Nmap Scan, Cisco IOS Null Route, Set Attribute Value, or ISE EPS remediations.
  - Third-party client access to the system database.
  - External notifications or alerts transmitted via email (SMTP), SNMP trap, or syslog.
  - Audit log messages transmitted to an HTTP server or to a syslog server without using SSL certificates to secure the channel between the appliance and the server.
- Do not enable external authentication using LDAP or RADIUS in deployments using CC mode.
- Do not enable CACs in deployments using CC mode.
- Disable access to the Secure Firewall Management Center and managed devices via the Secure Firewall REST API in deployments using CC or UCAPL mode.
- Enable CACs in deployments using UCAPL mode.
- Do not configure SSO in deployments using CC mode.
- Do not configure Secure Firewall Threat Defense devices into a high availability pair unless they are both using the same security certifications compliance mode.

---

**Note** The system does not support CC or UCAPL mode for:

- Secure Firewall Threat Defense devices in clusters
  - Secure Firewall Threat Defense container instances on the Firepower 4100/9300
  - Exporting event data to an external client using eStreamer.
- 

## Appliance Hardening

For information about features you can use to further harden your system, see the latest versions of the *Cisco Secure Firewall Management Center Hardening Guide* and the *Cisco Secure Firewall Threat Defense Hardening Guide*, as well as the following topics within this document:

## About AIOps Insights

Firewalls are a critical component of any organization's network security architecture. However, as organizations expand and the threat landscape evolves, managing these firewalls becomes complex. Staying updated with the continuous changes and rules to adapt to new threats, network changes, and compliance requirements presents significant challenges. Improper management can lead to security gaps and vulnerabilities, posing risks to the organization's network security.

To effectively address these challenges, a new approach to firewall management is required. This is where AIOps becomes essential.

AIOps for firewalls leverages artificial intelligence (AI) and machine learning (ML) to streamline and enhance the management and security of network firewalls. By using dynamic baselines and advanced forecasting models, AIOps can detect policy anomalies and predict potential issues before they escalate, ensuring proactive maintenance and stability.

The key features include:

- **Real-Time Traffic and Capacity Monitoring:** Monitors network traffic and system capacity in real-time and detects anomalies such as elephant flows, ensuring resources are optimized for peak performance.
- **Policy Anomaly Detection:** Analyzes firewall policies, detecting misconfigurations or anomalies before they impact performance or security.
- **Feature Adoption Insights and Best Practice Recommendations:** Provides insights into the adoption of features and suggests best practices to optimize security configurations.
- **Predictive Forecasting for Network Issues:** Predicts potential future network issues, allowing you to address them proactively and minimize downtime.
- **Critical Alerts:** Filters and prioritizes the most urgent security events helping you focus on critical issues.

---

**Note** Currently, the AIOps features are available only for threat defense devices that are managed by cloud-delivered Firewall Management Center.

---

AIOps provides the following functionalities:

- **Summary Insights:** Provides detailed information on all **Active Insights** and **Insights Trend**. You can view a list of all anomalies that are categorized by severity and type.
- **Policy Analyzer and Optimizer:** Analyses security policies, detects anomalies, and provides recommendations on remediations that can be performed to optimize the policies, thereby improving the firewall performance.
- **Feature Adoption:** Provides insights into the features that are adopted and the percentage of adoption to modify the usage pattern and achieve optimal security. By analyzing the adoption rate of different features, you can make decisions on how to improve the usage pattern and enhance security measures.
- **Configuration Settings:** Provides the ability to configure thresholds for AIOps features and enable or disable insight preferences. You can customize these settings to suit your specific needs.

## AIOps Licensing Requirements

If you have licenses for the Secure Firewall Management Center, you can gain access to AIOps capabilities by enabling AIOps Insights on your tenant. The initial version of AIOps is included as part of your firewall license and is granted on a per-device basis.

## Prerequisites to Use AIOps

- Ensure you have access to a Security Cloud Control tenant where **AIOps Insights** is enabled and cloud-delivered Firewall Management Center is provisioned.
- Ensure that you have configured the thresholds and preferences for AIOps features.

## Enable AIOps Insights

To take advantage of AIOps' benefits, you must **Enable** AIOps Insights. Only with **Super Admin** or **Admin** user roles you can enable **AIOps Insights** for your tenant.

### Procedure

- 
- Step 1** On the welcome screen, click **Start Onboarding**.
  - Step 2** In the **AIOps Insights for Cisco Firewall** window, click **Setup**.
  - Step 3** On the **Setup AIOps** page, check the **Confirm AIOps activation** check-box.
  - Step 4** Click **Get Started**.

The onboarding process begins, and it takes a few minutes to fetch the data that is required to provide the insights. When completed, the **AIOps > Summary** page is displayed.

## View Summary Insights

The AIOps **Summary** page provides detailed information on all **Active insights**, including a categorized list of detected anomalies.

### Procedure

**Step 1** In the left pane, click **Insights & Reports > Summary**.

**Step 2** View the total number of **Active Insights**.

Insights are classified by:

- **Severity:** Insights are classified by their severity levels such as **Critical**, **Warning**, and **Info**.
- **Category:** Insights are classified by their categories such as **Configuration**, **Traffic & Capacity**, **Health & Operations**.

| Categories          | Subcategories                                                                                                                                                                            |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Configuration       | Access control policy anomaly detection                                                                                                                                                  |
| Traffic & Capacity  | <ul style="list-style-type: none"> <li>• Elephant flow detection</li> <li>• RA VPN capacity assessment</li> </ul>                                                                        |
| Health & Operations | <ul style="list-style-type: none"> <li>• High data plane CPU usage</li> <li>• Snort high CPU usage</li> <li>• High data plane memory usage</li> <li>• Snort high memory usage</li> </ul> |

**Step 3** **Insights Trend** displays a timeline showing the trend of insights over a specific duration of time. You can set the duration to 1, 6, 12, or 24 hours, and 2 or 7 days. The default view is set to 24 hours.

**Step 4** In the **All Insights** section, details of each insight are displayed, such as:

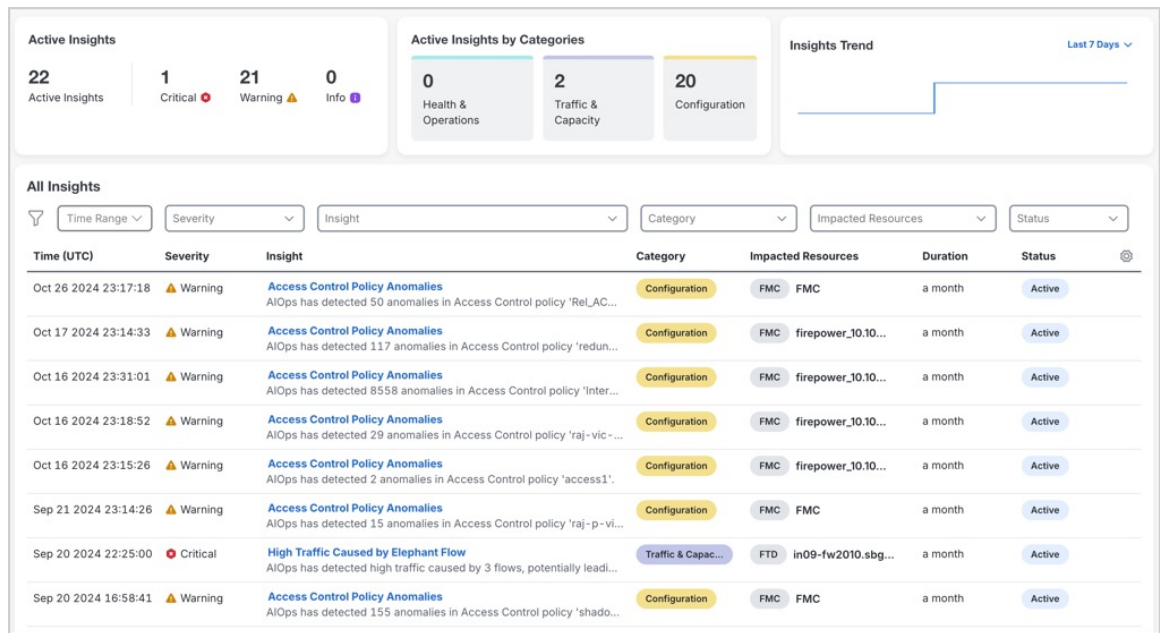

- **Time:** Time at which the insight was detected or updated.
- **Severity:** Severity of the insight such as **Critical**, **Warning**, and **Info**.
- **Insight:** Insight title and a short summary about the issue.
- **Category:** Insight category such as **Health & Operations**, **Traffic & Capacity**, and **Configuration**.

- **Impacted Resources:** Impacted resource for the insights, which can be a device, host, or policy. Currently, only threat defense devices and FMCs are supported.
- **Duration:** Duration of the issue since it was first detected until it was resolved.
- **Status:** Status of the insight such as **Active** and **Resolved**.

**Step 5** You can filter insights by factors such as **Time Range**, **Severity**, **Category**, **Impacted Resources**, **Duration**, and **Status**.

**Step 6** Click the gear icon to select which columns to display in the **All Insights** table.

Figure 70:

## Assess and Improve Feature Adoption

**Feature Adoption** provides insights into the features that are adopted and the percentage of adoption. This information helps you modify your usage patterns to achieve optimal security. By analyzing the adoption rate of different features, you can make decisions to enhance security measures.

### Procedure

**Step 1** In the left pane, click **Insights & Reports > Feature Adoption**.

**Step 2** In the **Summary** tile, you can view the total number of features available, including how many are **Not Adopted**, **Partially Adopted**, and **Adopted**.

**Step 3** In the **Feature Recommendation** tile, you can watch short videos about recommended features that will help enhance your organization's security.

**Step 4** In the **Feature Adoption** section, you can view the percentage of adoption of a particular feature. The feature adoption rate can vary between 0% and 100% depending on the usage.

- Note**
- The feature adoption data is refreshed every 24 hours.
  - We recommend increasing the usage of these features to improve overall security.

**Step 5** Click on a feature name to view more details, such as:

- A short description of the feature
- Feature adoption rate
- Steps to improve your feature adoption rate efficiency

**Figure 71: Feature Adoption**

## Configure Settings for AIOps

You can configure thresholds for the following AIOps features and enable or disable insight preferences for your tenant:

## Enable Traffic and Capacity Insights

You can modify preferences for traffic and capacity-related insights.

- 
- Note**
- The settings for **Elephant Flow Detection** and **RAVPN Capacity Assessment** are enabled by default.
  - The **RA VPN Capacity Assessment** runs every 24 hours, with changes applied in the subsequent assessment cycle.
- 

## Procedure

- 
- Step 1** In the left pane, click **Insights & Reports > Settings > Traffic & Capacity**.
- Step 2** Enable the toggle to detect the elephant flows that transfer large amounts of data and lead to system performance issues. Click **Submit**.
- For more information, see [Elephant Flow Detection](#).
- Step 3** Enable the toggle to forecast the trajectory of RA VPN user sessions using the current data, and determine the anticipated time until maximum system capacity is reached.
- For more information, see [Remote Access VPN](#).
- Choose the **Accuracy** from the drop-down. This determines the accuracy of the forecast based on the Root Mean Squared Error (RMSE) value.
  - Enter the **Max Session Threshold** value.
    - The default value is 90%.
    - The minimum value is 1%, and the maximum value is 100%.
  - Enter the **Forecast Duration in Days**.
    - The default duration is 90 days.
    - The minimum duration is 1 day, and the maximum duration is 90 days.
- 

When you have enabled the features for the tenant, you can view the detected anomalies on the **Summary** page, and the respective widgets are displayed on the dashboard.

## Enable Feature Adoption Insights

You can modify preferences for Feature Adoption-related insights.

- 
- Note** The settings for **Feature Adoption** is enabled by default.
-

## Procedure

- 
- Step 1** In the left pane, click **Insights & Reports > Settings > Feature Adoption**.
- Step 2** Enable the toggle to gain insights into feature adoption and the percentage of adoption.
- Step 3** Click **Submit**.
- 

When you have enabled the feature for the tenant, you can view the detected anomalies on the **Summary** page, and the respective widget is displayed on the dashboard.

## Enable Health and Operations Insights

You can modify your preferences for health and operations-related insights.

---

**Note** The settings for **Health & Operations** are enabled by default.

---

## Procedure

- 
- Step 1** In the left pane, click **Insights & Reports > Settings > Health**.
- You can enable the following health-related insights:
- Step 2** Enable the **Data Plane High CPU Usage** toggle to monitor data plane CPU usage and detect when thresholds are exceeded.
- Enter the **CPU Threshold** value.
    - The default value is 80%
    - The minimum value is 0% and the maximum value is 100%
  - Choose the **Insight Severity** from the drop-down.
- Step 3** Enable the **Snort High CPU Usage** toggle to monitor snort CPU usage and detect when thresholds are exceeded.
- Enter the **CPU Threshold** value.
    - The default value is 80%
    - The minimum value is 0% and the maximum value is 100%
  - Choose the **Insight Severity** from the drop-down.
- Step 4** Enable the **Data Plane High Memory Usage** toggle to to monitor data plane memory usage and detect when thresholds are exceeded.

- a. Enter the **Memory Threshold** value.
  - The default value is 80%
  - The minimum value is 0% and the maximum value is 100%
- b. Choose the **Insight Severity** from the drop-down.

**Step 5** Enable the **Snort High Memory Usage** toggle to to snort memory usage and detect when thresholds are exceeded.

- a. Enter the **Memory Threshold** value.
  - The default value is 80%
  - The minimum value is 0% and the maximum value is 100%
- b. Choose the **Insight Severity** from the drop-down.

**Step 6** Click **Submit**.

---

When you have enabled the feature for the tenant, you can view the detected anomalies on the **Summary** page, and the respective widget is displayed on the dashboard.

## Frequently Asked Questions About AIOps

### What is AIOps?

AIOps for firewalls leverages artificial intelligence (AI) and machine learning (ML) to streamline and enhance the management and security of network firewalls. By using dynamic baselines and advanced forecasting models, AIOps can detect policy anomalies and predict potential issues before they escalate, ensuring proactive maintenance and stability.

### Are AIOps features available for all types of FMC-managed threat defense devices?

AIOps features are available only for cloud-delivered Firewall Management Center-managed threat defense devices. Currently, there is no on-premises management center support.

### Can enabling AIOps fail?

In case of onboarding failure open a support ticket with Cisco Technical Assistance Center (TAC).

### Can AIOps Insights be disabled?

Yes, open a support ticket with Cisco Technical Assistance Center (TAC) to disable AIOps Insights.

## About Health Monitoring

The health monitor on the management center tracks various health indicators to ensure that the hardware and software in the system are working correctly. You can use the health monitor to check the status of critical functionality across your deployment.

You can configure the frequency for running the health modules for alerting. The Management Center also supports time series data collection. You can configure the frequency of collecting the time series data on the

device and its health modules. The device monitor reports these metrics in several predefined health monitor dashboards by default. The metric data is collected for analysis and hence no alerting is associated with it.

You can use the health monitor to create a collection of tests, referred to as a *health policy*, and apply the health policy to one or more appliances. The tests, referred to as *health modules*, are scripts that test for the criteria you specify. You can modify a health policy by enabling or disabling tests or by changing test settings, and you can delete health policies that you no longer need. You can also suppress messages from selected appliances by excluding them.

The health monitoring system runs the tests in a health policy at the configured intervals. You can also run all tests, or a specific test, on demand. The health monitor collects health events based on the test conditions configured.

The health modules are of two types: legacy-based and telegraph-based.

The legacy-based health module monitors the health status of certain systems, such as fans, power supplies, and database integrity. When the conditions specified in the health policy for these monitored systems are met, the legacy infrastructure-based health modules directly raise alerts (green, red, or orange) with a short message.

The telegraph-based health module monitors the telegraph plug-ins that retrieve metric information of the monitored system. You can create custom dashboards with your preferred health metrics for telegraph-based health module, allowing you to monitor specific statistics or troubleshoot specific issues.

**Note** All appliances automatically report their hardware status via the Hardware Alarms health module. The management center also automatically reports status using the modules configured in the default health policy. Some health modules, such as the Appliance Heartbeat module, run on the management center and report the status of the management center's managed devices. For the health modules to provide managed device status, you must deploy all health policies to the device.

You can use the health monitor to access health status information for the entire system, for a particular appliance, or, in a multi-domain deployment, a particular domain. Hexagon charts and status tables on the Health Monitor page provide a visual summary of the status of all appliances on your network, including the management center. Individual appliance health monitors let you drill down into health details for a specific appliance.

Fully customizable event views allow you to quickly and easily analyze the health status events gathered by the health monitor. These event views allow you to search and view event data and to access other information that may be related to the events you are investigating. For example, if you want to see all the occurrences of

CPU usage with a certain percentage, you can search for the CPU usage module and enter the percentage value.

You can also configure email, SNMP, or syslog alerting in response to health events. A *health alert* is an association between a standard alert and a health status level. For example, if you want to make sure an appliance never fails due to hardware overload, you can set up an email alert. You can then create a health alert that triggers an email alert whenever CPU, disk, or memory usage reaches the Warning level you configure in the health policy applied to that appliance. You can set alerting thresholds to minimize the number of repeating alerts you receive.

**Note** The health monitoring can take 5–6 minutes from the occurrence of the health event to generate the health alert.

You can also generate troubleshooting files for an appliance if you are asked to do so by Support.

Only users with administrator user role privileges can access system health data.

### High Availability Pair

In a management center high-availability deployment running Version 6.7 or higher, the active management center creates a health monitor page that uses REST APIs to show detailed metric-based information. The standby management center creates the health monitor page that shows the alert information and provide a visual summary of the status of all appliances on your network using pie charts and status tables. The standby management center does not display the metric-based information.

## Health Modules

*Health modules, or health tests, test for the criteria you specify in a health policy.*

**Table 20: Health Modules (All Appliances)**

| Module               | Module Type | Description                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|----------------------|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CPU Usage (per core) | Telegraph   | This module checks that the CPU usage on all the cores is not overloaded and alerts when CPU usage exceeds the thresholds configured for the module. The <b>Warning Threshold %</b> default value is 80. The <b>Critical Threshold %</b> default value is 90.                                                                                                                                                                                             |
| Disk Status          | Legacy      | This module examines the performance of the hard disk and malware storage pack (if installed) on the appliance.<br><br>This module generates a Warning (yellow) health alert when the hard disk and RAID controller (if installed) are in danger of failing, or if an additional hard drive is installed that is not a malware storage pack. This module generates an Alert (red) health alert when an installed malware storage pack cannot be detected. |

| Module                      | Module Type | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------------------|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Disk Usage                  | Telegraph   | <p>This module compares disk usage on the appliance's hard drive and malware storage pack to the limits configured for the module and alerts when usage exceeds the thresholds configured for the module. This module also alerts when the system excessively deletes files in monitored disk usage categories, or when disk usage excluding those categories reaches excessive levels, based on module thresholds.</p> <p>Use the Disk Usage health status module to monitor disk usage for the <code>/</code> and <code>/volume</code> partitions on the appliance and track draining frequency. Although the disk usage module lists the <code>/boot</code> partition as a monitored partition, the size of the partition is static so the module does not alert on the boot partition.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| File System Integrity Check | Legacy      | This module performs a file system integrity check and runs if the system has CC mode or UCAPL mode enabled, or if the system runs an image signed with a DEV key. This module is enabled by default.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Health Monitor Process      | Legacy      | This module monitors the status of the health monitor itself and alerts if the number of minutes since the last health event received by the management center exceeds the Warning or Critical limits.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Interface Status            | Legacy      | <p>This module determines if the device currently collects traffic and alerts based on the traffic status of physical interfaces and aggregate interfaces. For physical interfaces, the information includes interface name, link state, and bandwidth. For aggregate interfaces, the information includes interface name, number of active links, and total aggregate bandwidth.</p> <p><b>Note</b> This module also monitors the high availability standby device traffic flow. Though it is known that the standby device would not be receiving any traffic yet, the management center alerts that the interface is not receiving any traffic. The same alerting principle is applied when traffic is not received by some of the subinterfaces on a port channel.</p> <p>If you use the <b>show interface</b> CLI command to know the interface statistics of your device, the input and output rates in the CLI command result can be different from the traffic rates that appear in the interface module.</p> <p>This module displays the traffic rates according to the values from Lina. The sampling intervals of Lina and the management center interface statistics are different. Due to the difference in sampling interval, throughput values in the management center GUI can be different from the throughput values appears in the threat defense CLI result.</p> |
| Local Malware Analysis      | Legacy      | This module monitors ClamAV updates for Local Malware Analysis.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Module         | Module Type | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|----------------|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Memory Usage   | Legacy      | <p>This module compares memory usage on the appliance to the limits configured for the module and alerts when usage exceeds the levels configured for the module.</p> <p>When calculating the memory usage, the management center Memory Usage health module monitors and includes the usage of RAM, swap memory, and cache memory.</p> <p>For appliances with more than 4 GB of memory, the preset alert thresholds are based on a formula that accounts for proportions of available memory likely to cause system problems. On &gt;4 GB appliances, because the interval between Warning and Critical thresholds may be very narrow, its recommended that you manually set the <b>Warning Threshold %</b> value to 50. This will further ensure that you receive memory alerts for your appliance in time to address the issue.</p> <p>Beginning with Version 6.6.0, the minimum required RAM for management center virtual upgrades to Version 6.6.0+ is 28 GB, and the recommended RAM for management center virtual deployments is 32 GB. We recommend you do not decrease the default settings: 32 GB RAM for most management center virtual instances, 64 GB for the management center virtual 300 (VMware only).</p> <p><b>Attention</b>            A critical alert is generated by the health monitor when insufficient RAM is allocated to a management center virtual deployment.</p> <p>Complex access control policies and rules can command significant resources and negatively affect performance.</p> |
| Process Status | Legacy      | <p>This module determines if processes on the appliance exit or terminate outside of the process manager.</p> <p>If a process is deliberately exited outside of the process manager, the module status changes to Warning and the health event message indicates which process exited, until the module runs again and the process has restarted. If a process terminates abnormally or crashes outside of the process manager, the module status changes to Critical and the health event message indicates the terminated process, until the module runs again and the process has restarted.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Module                         | Module Type | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------------------------|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Threat Data Updates on Devices | Legacy      | <p>Certain intelligence data and configurations that devices use to detect threats are updated on the management center from the cloud every 30 minutes.</p> <p>This module alerts you if this information has not been updated on the devices within the time period you have specified.</p> <p>Monitored updates include:</p> <ul style="list-style-type: none"> <li>• Local URL category and reputation data</li> <li>• Security Intelligence URL lists and feeds, including global Block and Do Not Block lists and URLs from Threat Intelligence Director</li> <li>• Security Intelligence network lists and feeds (IP addresses), including global Block and Do Not Block lists and IP addresses from Threat Intelligence Director</li> <li>• Security Intelligence DNS lists and feeds, including global Block and Do Not Block lists and domains from Threat Intelligence Director</li> <li>• Local malware analysis signatures (from ClamAV)</li> <li>• SHA lists from Threat Intelligence Director, as listed on the <b>Objects &gt; Object Management &gt; Security Intelligence &gt; Network Lists and Feeds</b> page</li> <li>• Dynamic analysis settings configured on the <b>Integration &gt; AMP &gt; Dynamic Analysis Connections</b> page</li> <li>• Threat Configuration settings related to expiration of cached URLs, including the Cached URLs Expire setting on the <b>Integration &gt; Other Integrations &gt; Cloud Services</b> page. (Updates to the URL cache are not monitored by this module.)</li> <li>• Communication issues with the Cisco cloud for sending events. See the <b>Cisco Cloud</b> box on the <b>Integration &gt; Other Integrations &gt; Cloud Services</b> page.</li> </ul> <p><b>Note</b> Threat Intelligence Director updates are included only if TID is configured on your system and you have feeds.</p> <p>By default, this module sends a warning after 1 hour and a critical alert after 24 hours.</p> <p>If this module indicates failure on the management center or on any devices, verify that the management center can reach the devices.</p> |

Table 21: Management Center Health Modules

| Module                   | Module Type | Description                                                                                                                                                                                                                                                                                                       |
|--------------------------|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AMP for Endpoints Status | Legacy      | The module alerts if the management center cannot connect to the AMP cloud or Cisco AMP Private Cloud after an initial successful connection, or if the private cloud cannot contact the public AMP cloud. It also alerts if you deregister an AMP cloud connection using the Secure Endpoint management console. |

| Module                   | Module Type | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------------------|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AMP for Firepower Status | Legacy      | <p>This module alerts if:</p> <ul style="list-style-type: none"> <li>• The management center cannot contact the AMP cloud (public or private) or the Secure Malware Analytics Cloud or Appliance, or the AMP private cloud cannot contact the public AMP cloud.</li> <li>• The encryption keys used for the connection are invalid.</li> <li>• A device cannot contact the Secure Malware Analytics Cloud or Secure Malware Analytics Appliance to submit files for dynamic analysis.</li> <li>• An excessive number of files are detected in network traffic based on the file policy configuration.</li> </ul> <p>If your management center loses connectivity to the Internet, the system may take up to 30 minutes to generate a health alert.</p> |
| Appliance Heartbeat      | Legacy      | This module determines if an appliance heartbeat is being heard from the appliance and alerts based on the appliance heartbeat status.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Database Size            | Legacy      | This module checks the size of the configuration database and alerts when the size exceeds the values (in gigabytes) configured for the module.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Discovery Host Limit     | Legacy      | This module determines if the number of hosts the management center can monitor is approaching the limit and alerts based on the warning level configured for the module. For more information, see <a href="#">Host Limit</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Event Backlog Status     | Legacy      | <p>This module alerts if the backlog of event data awaiting transmission from the device to the management center has grown continuously for more than 30 minutes.</p> <p>To reduce the backlog, evaluate your bandwidth and consider logging fewer events.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Event Monitor            | Telegraph   | This module monitors overall incoming event rate to management center.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Event Stream Status      | Legacy      | This module monitors connections to third-party client applications that use the Event Streamer on the management center.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Hardware Statistics      | Telegraph   | This module monitors the status of the management center hardware entities, namely, fan speed, temperature, and power supply. This module alerts when the threshold value exceeds the configured Warning or Critical limits.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| ISE Connection Monitor   | Legacy      | This module monitors the status of the server connections between the Cisco Identity Services Engine (ISE) and the management center. ISE provides additional user data, device type data, device location data, SGTs (Security Group Tags), and SXP (Security Exchange Protocol) services.                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| License Monitor          | Legacy      | This module monitors license expiration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Module                      | Module Type | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Management Center HA Status | Legacy      | <p>This module monitors and alerts on the high availability status of the management center. If you have not established management center high availability, the HA Status is <code>Not in HA</code>.</p> <p><b>Note</b> This module replaces the high availability status module, which previously provided high availability status for the management center. In Version 7.0, we added high availability status for managed devices.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| MySQL Statistics            | Telegraph   | This module monitors the status of the MySQL database, including the database size, number of active connections, and memory use. Disabled by default.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| RabbitMQ Status             | Telegraph   | This module collects various statistics for RabbitMQ.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| RRD Server Process          | Legacy      | This module determines if the round robin data server that stores time series data is running properly. The module alerts if the RRD server has restarted since the last time it updated; it enters Critical or Warning status if the number of consecutive updates with an RRD server restart reaches the numbers specified in the module configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Realm                       | Legacy      | <p>Enables you to set a warning threshold for realm or user mismatches, which are:</p> <ul style="list-style-type: none"> <li>• User mismatch: A user is reported to the management center without being downloaded.</li> </ul> <p>A typical reason for a user mismatch is that the user belongs to a group you have excluded from being downloaded to the management center. Review the information discussed in <a href="#">Cisco Secure Firewall Management Center Device Configuration Guide</a>.</p> <ul style="list-style-type: none"> <li>• Realm mismatch: A user logs into a domain that corresponds to a realm not known to the management center.</li> </ul> <p>For more information, <a href="#">Cisco Secure Firewall Management Center Device Configuration Guide</a>.</p> <p>This module also displays health alerts when you try to download more users than the maximum number of downloaded users supported per realm. The maximum number of downloaded users for a single realm depends on your management center model.</p> <p>For more information, see <i>User Limit</i> in the <a href="#">Cisco Secure Firewall Management Center Device Configuration Guide</a></p> |
| Security Intelligence       | Legacy      | <p>This module alerts if Security Intelligence is in use and the management center cannot update a feed, or feed data is corrupt or contains no recognizable IP addresses.</p> <p>See also the Threat Data Updates on Devices module.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Module                         | Module Type | Description                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------------------------|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Smart License Monitor          | Legacy      | <p>This module monitors Smart Licensing status and alerts if:</p> <ul style="list-style-type: none"> <li>• There is a communication error between the Smart Licensing Agent (Smart Agent) and the Smart Software Manager.</li> <li>• The Product Instance Registration Token has expired.</li> <li>• The Smart License usage is out of compliance.</li> <li>• The Smart License authorization or evaluation mode has expired.</li> </ul> |
| Sybase Statistics              | Telegraph   | <p>This module monitors the status of the Sybase database on the management center, including the database size, number of active connections, and memory use.</p>                                                                                                                                                                                                                                                                       |
| Time Series Data (RRD) Monitor | Legacy      | <p>This module tracks the presence of corrupt files in the directory where time series data (such as correlation event counts) are stored and alerts when files are flagged as corrupt and removed.</p>                                                                                                                                                                                                                                  |
| Time Synchronization Status    | Legacy      | <p>This module tracks the synchronization of a device clock that obtains time using NTP with the clock on the NTP server and alerts if the difference in the clocks is more than ten seconds.</p>                                                                                                                                                                                                                                        |
| Unresolved Groups Monitor      | Legacy      | <p>Monitors unresolved groups used in policies.</p>                                                                                                                                                                                                                                                                                                                                                                                      |
| URL Filtering Monitor          | Legacy      | <p>This module alerts if the management center fails to:</p> <ul style="list-style-type: none"> <li>• Register with the Cisco cloud.</li> <li>• Download URL threat data updates from the Cisco cloud.</li> <li>• Complete URL lookups.</li> </ul> <p>You can configure time thresholds for these alerts.<br/>See also the Threat Data Updates on Devices module.</p>                                                                    |
| VPN Status                     | Legacy      | <p>This module alerts when one or more VPN tunnels between threat defense devices are down.</p> <p>This module tracks:</p> <ul style="list-style-type: none"> <li>• Site-to-site VPN for Secure Firewall Threat Defense</li> <li>• Remote access VPN for Secure Firewall Threat Defense</li> </ul>                                                                                                                                       |

Table 22: Device Health Modules

| Module                             | Module Type | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|------------------------------------|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AMP Connection Status              | Telegraph   | The module alerts if the threat defense cannot connect to the AMP cloud or Cisco AMP Private Cloud after an initial successful connection, or if the private cloud cannot contact the public AMP cloud. Disabled by default.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| AMP Threat Grid Connectivity       | Telegraph   | The module alerts if the threat defense cannot connect to the AMP Threat Grid cloud after an initial successful connection.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| ASP Drop                           | Telegraph   | This module monitors the connections dropped by the data plane accelerated security path.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Automatic Application Bypass       | Legacy      | This module monitors bypassed detection applications.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Chassis Environment Status         | Legacy      | This module monitors chassis parameters such as fan speed and chassis temperature, and enables you to set a warning threshold and critical threshold for temperature. The <b>Critical Chassis Temperature (Celsius)</b> default value is 85. The <b>Warning Chassis Temperature (Celsius)</b> default value is 75.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Cluster/HA Failover Status         | Legacy      | This module monitors the status of device clusters. The module alerts if: <ul style="list-style-type: none"> <li>• A new primary unit is elected to a cluster.</li> <li>• A new secondary unit joins a cluster.</li> <li>• A primary or secondary unit leaves a cluster.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Configuration Resource Utilization | Legacy      | <p>This module alerts if the size of your deployed configurations puts a device at risk of running out of memory.</p> <p>The alert shows you how much memory your configurations require, and by how much this exceeds the available memory. If this happens, re-evaluate your configurations. Most often you can reduce the number or complexity of access control rules or intrusion policies.</p> <p><b>Snort Memory Allocation</b></p> <ul style="list-style-type: none"> <li>• <i>Total Snort Memory</i> indicates the memory allotted for the Snort 2 instances running on the threat defense device.</li> <li>• <i>Available Memory</i> indicates the memory allotted by the system for a Snort 2 instance. Note that this value is not just the difference between the <i>Total Snort Memory</i> and the combined memory reserved for other modules. This value is derived after few other computations and then divided by the number of Snort 2 processes.</li> </ul> <p>A negative <i>Available Memory</i> value indicates that Snort 2 instance does not have enough memory for the deployed configuration. For support, contact Cisco Technical Assistance Center (TAC).</p> |
| Connection Statistics              | Telegraph   | This module monitors the connection statistics and NAT translation counts.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Module                                         | Module Type | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Data Plane CPU Usage                           | Telegraph   | This module checks that the average CPU usage of all data plane processes on the device is not overloaded and alerts when CPU usage exceeds the percentages configured for the module. The <b>Warning Threshold %</b> default value is 80. The <b>Critical Threshold %</b> default value is 90.                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Snort CPU Usage                                | Telegraph   | This module checks that the average CPU usage of the Snort processes on the device is not overloaded and alerts when CPU usage exceeds the percentages configured for the module. The <b>Warning Threshold %</b> default value is 80. The <b>Critical Threshold %</b> default value is 90.                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| System CPU Usage                               | Telegraph   | This module checks that the average CPU usage of all system processes on the device is not overloaded and alerts when CPU usage exceeds the percentages configured for the module. The <b>Warning Threshold %</b> default value is 80. The <b>Critical Threshold %</b> default value is 90.                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Critical Process Statistics                    | Telegraph   | This module monitors the state of critical processes, their resource consumption, and the restart counts.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Deployed Configuration Statistics              | Telegraph   | This module monitors statistics about the deployed configuration, such as the number of ACEs and IPS rules.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Firewall Threat Defense Platform Faults        | Legacy      | <p>This module generates an alert for platform faults for Firepower 1000 and Secure Firewall 3100, 4200 devices. A fault is a mutable object that is managed by the management center. Each fault represents a failure in the threat defense instance or an alarm threshold that has been raised. During the lifecycle of a fault, it can change from one state or severity to another.</p> <p>Each fault includes information about the operational state of the affected object at the time the fault was raised. If the fault is transitional and the failure is resolved, then the object transitions to a functional state.</p> <p>For more information, see the <i>Cisco Firepower 1000/2100 FXOS Faults and Error Messages Guide</i>.</p> |
| Management Center Access Configuration Changes | Legacy      | This module monitors access configuration changes made on the management center directly using the <b>configure network management-data-interface</b> command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Flow Offload Statistics                        | Telegraph   | This module monitors hardware flow offload statistics for a managed device.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Hardware Alarms                                | Legacy      | This module determines if hardware needs to be replaced on a physical managed device and alerts based on the hardware status. The module also reports on the status of hardware-related daemons.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Inline Link Mismatch Alarms                    | Legacy      | This module monitors the ports associated with inline sets and alerts if the two interfaces of an inline pair negotiate different speeds.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| Module                        | Module Type | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------------------------|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Intrusion and File Event Rate | Legacy      | <p>This module compares the number of intrusion events per second to the limits configured for this module and alerts if the limits are exceeded. If the Intrusion and File Event Rate is zero, the intrusion process may be down or the managed device may not be sending events. Select <b>Analysis &gt; Intrusions &gt; Events</b> to check if events are being received from the device.</p> <p>Typically, the event rate for a network segment averages 20 events per second. For a network segment with this average rate, Events per second (Critical) should be set to 50 and Events per second (Warning) should be set to 30. To determine limits for your system, find the Events/Sec value on the Statistics page for your device (<b>System</b> ⚙️ &gt; <b>Monitoring &gt; Statistics</b>), then calculate the limits using these formulas:</p> <ul style="list-style-type: none"> <li>• Events per second (Critical) = Events/Sec * 2.5</li> <li>• Events per second (Warning) = Events/Sec * 1.5</li> </ul> <p>The maximum number of events you can set for either limit is 999, and the Critical limit must be higher than the Warning limit.</p> |
| Link State Propagation        | Legacy      | <p>ISA 3000 only.</p> <p>This module determines when a link in a paired inline set fails and triggers the link state propagation mode. If a link state propagates to the pair, the status classification for that module changes to Critical and the state reads:</p> <pre>Module Link State Propagation: ethx_ethy is Triggered</pre> <p>where x and y are the paired interface numbers.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Memory Usage Data Plane       | Telegraph   | <p>This module checks the percentage of allocated memory used by the Data Plane processes and alerts when memory usage exceeds the percentages configured for the module. The <b>Warning Threshold %</b> default value is 80. The <b>Critical Threshold %</b> default value is 90.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Memory Usage Snort            | Telegraph   | <p>This module checks the percentage of allocated memory used by the Snort process and alerts when memory usage exceeds the percentages configured for the module. The <b>Warning Threshold %</b> default value is 80. The <b>Critical Threshold %</b> default value is 90.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Network Card Reset            | Legacy      | <p>This module checks for network cards which have restarted due to hardware failure and alerts when a reset occurs.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| NTP Statistics                | Telegraph   | <p>This module monitors the NTP clock synchronization status of the managed device. Disabled by default.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

|----------------------------------------------|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Snort Identity Memory Usage                  | Legacy      | <p>Enables you to set a warning threshold for Snort identity processing and alerts when memory usage exceeds the level configured for the module. The <b>Critical Threshold %</b> default value is 80.</p> <p>This health module specifically keeps track of the total space used for the user identity information in Snort. It displays the current memory usage details, the total number of user-to-IP bindings, and user-group mapping details. Snort records these details in a file. If the memory usage file is not available, the Health Alert for this module displays <i>Waiting for data</i>. This could happen during a Snort restart due to a new install or a major update, switch from Snort 2 to Snort 3 or back, or major policy deployment. Depending on the health monitoring cycle, and when the file is available, the warning disappears, and the health monitor displays the details for this module with its status turned Green.</p> |
| Snort Reconfiguring Detection                | Telegraph   | This module alerts if a device reconfiguration has failed. This module detects reconfiguration failure for both Snort 2 and Snort 3 instances.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Snort Statistics                             | Telegraph   | This module monitors the Snort statistics for events, flows, and packets.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Security Services Exchange Connection Status | Telegraph   | The module alerts if the threat defense cannot connect to the security services exchange cloud after an initial successful connection. Disabled by default.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Threat Defense HA (Split-brain check)        | Legacy      | This module monitors and alerts on the high availability status of the threat defense and provides a health alert for a split brain scenario. If you have not established threat defense high availability, the HA Status is <i>Not in HA</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| VPN Statistics                               | Telegraph   | This module monitors site-to-site and remote access VPN tunnels between threat defense devices.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| XTLS Counters                                | Telegraph   | This module monitors XTLS/SSL flows, memory and cache effectiveness. Disabled by default.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## Configuring Health Monitoring

### Procedure

- 
- Step 1** Determine which health modules you want to monitor as discussed in [Health Modules, on page 335](#).  
You can set up specific policies for each kind of appliance, enabling only the appropriate tests for that appliance.
- Tip** To quickly enable health monitoring without customizing the monitoring behavior, you can apply the default policy provided for that purpose.
- Step 2** Apply a health policy to each appliance where you want to track health status as discussed in [Creating Health Policies, on page 347](#).
- Step 3** (Optional.) Configure health monitor alerts as discussed in [Creating Health Monitor Alerts, on page 359](#).

You can set up email, syslog, or SNMP alerts that trigger when the health status level reaches a particular severity level for specific health modules.

---

## Health Policies

A health policy contains configurable health test criteria for several modules. You can control which health modules run against each of your appliances and configure the specific limits used in the tests run by each module.

When you configure a health policy, you decide whether to enable each health module for that policy. You also select the criteria that control which health status each enabled module reports each time it assesses the health of a process.

You can enable or disable health alerts for individual attributes within a health module. By adjusting the settings for health alerts at the attribute level, you can reduce the number of health alerts and streamline your focus on the most critical health alerts without interrupting data collection. You can continue to monitor the attribute from your **Health Monitor** dashboard. When you enable a health module in the health policy, the health alert configuration for all the attributes within that health module gets enabled by default.

You can create one health policy that can be applied to every appliance in your system, customize each health policy to the specific appliance where you plan to apply it, or use the default health policy provided for you.

---

**Note** When you register an appliance, the management center automatically assigns it the default health policy. To disassociate a health policy from an appliance, you must first associate a different health policy with it. An appliance must have at least one health policy assigned.

---

## Default Health Policy

The management center setup process creates and applies an initial health policy, in which most—but not all—available health modules are enabled. The system also applies this initial policy to devices added to the management center.

This initial health policy is based on a default health policy, which you can neither view nor edit, but which you can copy when you create a custom health policy.

You can create a custom health policy and set it as your default health policy. The management center applies the default health policy to any managed device when you add the device to the management center. Note that you cannot delete the health policy that you have set as the default. For detailed instructions for setting a default health policy, see [Set a Default Health Policy, on page 349](#).

### Upgrades and the Default Health Policy

When you upgrade the management center, any new health modules are added to all health policies, including the initial health policy, default health policy, and any other custom health policies. Usually, new health modules are added in an enabled state.

---

**Note** For a new health module to begin monitoring and alerting, reapply health policies after upgrade.

---

## Creating Health Policies

If you want to customize a health policy to use with your appliances, you can create a new policy. The settings in the policy initially populate with the settings from the health policy you choose as a basis for the new policy. You can edit the policy to specify your preferences, such as enable or disable modules within the policy, change the alerting criteria for each module as needed, and specify the run time intervals.

### Procedure

- 
- Step 1** Choose **System** (⚙️) > **Health** > **Policy**.
  - Step 2** Click **Create Policy**.
  - Step 3** Enter a name for the policy.
  - Step 4** Choose the existing policy that you want to use as the basis for the new policy from the **Base Policy** drop-down list.
  - Step 5** Enter a description for the policy.
  - Step 6** Choose **Save**.
- 

### What to do next

- Apply the health policy on devices as described in [Apply a Health Policy, on page 347](#).
- Edit the policy to specify the module-level policy settings as described in [Edit a Health Policy, on page 348](#).

## Apply a Health Policy

When you apply a health policy to an appliance, the health tests for all the modules you enabled in the policy automatically monitor the health of the processes and hardware on the appliance. Health tests then continue to run at the intervals you configured in the policy, collecting health data for the appliance and forwarding that data to the management center.

If you enable a module in a health policy and then apply the policy to an appliance that does not require that health test, the health monitor reports the status for that health module as disabled.

If you apply a policy with all modules disabled to an appliance, it removes all applied health policies from the appliance, so no health policy is applied. However, you must have at least one health policy assigned to an appliance.

When you apply a different policy to an appliance that already has a policy applied, expect some latency in the display of new data based on the newly applied tests.

## Procedure

---

**Step 1** Choose **System** (⚙️) > **Health** > **Policy**.

**Step 2** Click the **Deploy health policy** (📄) next to the policy you want to apply.

**Step 3** Choose the appliances where you want to apply the health policy.

**Note** An appliance must have at least one health policy assigned to it. To stop health monitoring for an appliance, create a health policy with all modules disabled and apply it to the appliance. To disassociate a health policy from an appliance, you must first associate a different health policy with it.

**Step 4** Click **Apply** to apply the policy to the appliances you chose.

---

### What to do next

- Optionally, monitor the task status; see [View Task Messages, on page 383](#).  
Monitoring of the appliance starts when the policy is successfully applied.

## Edit a Health Policy

You can edit a health policy that you want to modify.

## Procedure

---

**Step 1** Choose **System** (⚙️) > **Health** > **Policy**.

**Step 2** Click **Edit** (✎) next to the policy you want to modify.

**Step 3** To edit the policy name and its description, click the **Edit** (✎) icon provided against the policy name.

**Step 4** The **Health Modules** tab displays all the device modules and its attributes. Configure your health modules using the following actions:

- Click the toggle button that is provided against the module and its attributes—turn on () or turn off () to enable or disable testing of health status respectively.
- To execute a bulk enable or disable testing on the health modules, click the **Select All** toggle button
- After you enable a health module and when available, use the check box next to an individual attribute within a health module to enable or disable health alerts for that attribute. Note that disabling health alerts for an attribute does not stop the collection of metrics for that attribute. You can continue to monitor these attributes from the **Health Monitor** dashboard.

- Note**
- The modules and attributes are flagged with the supporting appliances—threat defense, management center, or both.
  - You cannot choose to include or exclude the individual attributes of CPU and Memory modules.

For information on the modules, see [Health Modules, on page 335](#).

**Step 5** Where appropriate, set the **Critical** and **Warning** threshold percentages.

**Step 6** In the **Settings** tab, enter the relevant values in the fields:

- **Health Module Run Time Interval**—The frequency for running the health modules. The minimum interval is 5 minutes.
- **Metric Collection Interval**—The frequency of collecting the time series data on the device and its health modules. The device monitor reports these metrics in several predefined health monitor dashboards by default. For detailed information on the dashboard, see [About Dashboards](#). The metric data is collected for analysis and hence no alerting is associated with it.
- **OpenConfig Streaming Telemetry**—Configure a health metrics telemetry stream from the threat defense devices to an external data collection system which uses the vendor neutral, OpenConfig model. See [Configure OpenConfig Streaming Telemetry](#) for details.

**Step 7** To view and modify the devices to which the policy is assigned, do the following:

- a) Click **Policy Assignments & Deploy**.
- b) From the **Available Devices** list, click the + icon next to the device to which you want to assign the health policy.
- c) Click **Apply**.

Alternatively, you can apply the health policy to your appliance as described in [Apply a Health Policy, on page 347](#)

Apply the health policy to each appliance where you want to track health status. When you apply the health policy to an appliance, all the modules you enabled in the policy monitor the health of the processes and hardware on the appliance, and forwards that data to the management center.

**Step 8** Click **Save**.

---

## Set a Default Health Policy

You can set a user-created health policy as your default health policy. The management center applies the default health policy to any managed device when you add the device to the management center.

---

**Note** Setting a new default health policy does not affect the health policy assigned to devices that are already registered.

---

## Procedure

- 
- Step 1** Choose **System** (⚙) > **Health** > **Policy**.
  - Step 2** Click the **More Actions** (⋮) icon next to the health policy that you want to set as the default, and click **Set as Default**.
  - Step 3** Click **Proceed**.
- 

## Delete a Health Policy

You can delete health policies that you no longer need. However, an appliance must have at least one health policy assigned to it. If you delete a policy that is still applied to an appliance, the policy settings remain in effect until you apply a different policy. In addition, if you delete a health policy that is applied to a device, any health monitoring alerts in effect for the device remain active until you disable the underlying associated alert response.

---

**Tip** To stop health monitoring for an appliance, create a health policy with all modules disabled and apply it to the appliance.

---

## Procedure

- 
- Step 1** Choose **System** (⚙) > **Health** > **Policy**.
  - Step 2** Click **Delete** (🗑) next to the policy that you want to delete, and then click **Delete health policy** to delete it.  
Note that you cannot delete a health policy that is set as the default policy. Set another health policy as the default before attempting to delete the current default policy. For more information, see [Set a Default Health Policy, on page 349](#).
- 

## Send Vendor-Neutral Telemetry Streams Using OpenConfig

OpenConfig is a vendor-independent software layer that provides a single way of streaming network telemetry data to multiple vendors to manage and monitor networks. The OpenConfig streaming telemetry option in the secure firewall uses gNMI (gRPC Network Management Interface) protocol and allows you to control and generate telemetry streams from your threat defense devices to a data collection system.

The firewall threat defense health policy contains all the configurations to support and enable the OpenConfig streaming telemetry functionality. When you deploy the health policy to the device, the OpenConfig streaming telemetry configuration activates a gNMI server and starts listening to Remote Procedure Call (RPC) messages from the data collectors.

### Subscription Model of OpenConfig Streaming Telemetry

OpenConfig uses a subscription-based model where the data collectors query the threat defense devices for telemetry data or act as collector for the streamed telemetry data. When a data collector wishes to receive updates and metrics from the threat defense device, it sends a `subscribeRequest` RPC message to the threat defense gNMI server. The subscription request includes details of one or more paths to which the data collector wishes to subscribe. The message also includes subscription mode which describes the longevity of the subscription. The threat defense server supports the following subscription modes:

- *Once subscription*—The threat defense device sends requested data to the gNMI paths only once.
- *Stream subscription*—The threat defense continuously streams telemetry data according to the triggers specified in the `SubscribeRequest` RPC message.
  - *Sampled subscription*—The threat defense server streams the requested data as per the interval specified in the subscription message. The minimum interval that the threat defense support is one minute.
  - *On-change subscription*—The threat defense sends the data whenever the requested values change.

The threat defense server generates `SubscribeResponse` RPC messages according to the type of subscription that is created, at the frequency requested by the data collectors.

### Deployment Modes for OpenConfig Streaming Telemetry

You can use the following deployment modes for OpenConfig streaming telemetry configuration:

- **DIAL-IN**—In this mode, the gNMI server opens a port on the threat defense and waits for `SubscribeRequest` RPC messages from data collectors. In the device health policy, you can specify the port number to use by the gNMI server and the IP address of the data collector that can connect with the gNMI service. If not specified, the gNMI server uses port number 50051. The Dial-in mode is ideal to use in a trusted network where the endpoint that subscribes to telemetry streams are trusted.
- **DIAL-OUT**—The gNMI service is designed to work in server mode where it accepts subscription requests from gNMI data collectors and serve the telemetry data. If the gNMI data collectors cannot reach the gNMI server, the threat defense uses a tunnel client and establishes a gRPC tunnel with the external server. This tunnel allows exchange of RPC messages between gNMI server and client. The Dial-Out mode is ideal to use when the data collectors are hosted on the cloud or outside the trusted network.

In both dial-in and dial-out mode, all the communication between gNMI server and gNMI client uses TLS encryption and this requires to generate a set of certificates with private keys for the TLS encryption. Dial-out mode requires extra keys for the tunnel infrastructure. See [How to Generate Certificate with Private Key](#) for more information.

## Generate Certificates and Private Keys

Generate the CA, server, and client certificate and private key sets required for OpenConfig streaming telemetry configuration.

---

**Note** To ensure that you generate certificates using the same CA, run the following commands together and from the same endpoint. If you want to retry the commands, you must retry all commands.

---

**Before you begin****Procedure**

**Step 1** Make a folder, for example `keys`, in the endpoint where you want to run the following commands.

**Example:**

```
mkdir keys
```

**Step 2** Create a self-signed CA certificate with a corresponding private key.

**Example:**

Following sample command generates a new RSA private key and uses it to create a self-signed X.509 certificate with provided subject information:

```
openssl req -x509 -newkey rsa:4096 -days 365 -nodes -keyout keys/ca-key.pem -out
keys/ca-cert.pem -subj "/C=XX
/ST=YY/L=ZZZ/O=Example/OU=EN/CN=gnmi-ca/emailAddress=abc@example.com"
```

The subject information includes the provided Country (C), State (ST), Locality (L), Organization (O), Organizational Unit (OU), Common Name (CN), and email address.

The private key is saved as `ca-key.pem` file, and the certificate is saved as `ca-cert.pem` file in the `keys` folder.

**Step 3** Create a self-signed server certificate with the specified Common Name (CN) and Subject Alternative Name (SAN):

**Example:**

Following sample command generates a new RSA private key and uses it to create a self-signed X.509 certificate with provided subject information. In this example, 192.168.0.200 is the IP address of the threat defense device and 192.168.0.202 is the IP address of the client.

**Note** Client IP is not required if you want to use this certificate and key sets in dial-in mode.

```
CN="192.168.0.200"
SAN="IP:192.168.0.200,IP:192.168.0.202"
openssl req -newkey rsa:4096 -nodes -keyout keys/server-key.pem -out keys/server-req.pem
-subj "/C=XX/ST=YY/L=ZZZ/O=Example/OU=EN/CN=${CN}/emailAddress=abc@example.com"
openssl x509 -req -extfile <(printf "subjectAltName=${SAN}") -in keys/server-req.pem -days
60 -CA keys/ca-cert.pem -CAkey keys/ca-key.pem -CAcreateserial -out keys/server-cert.pem
cat keys/server-key.pem keys/server-cert.pem keys/ca-cert.pem > keys/server-combined.pem
```

The `openssl req` command generates a new RSA private key and a Certificate Signing Request (CSR). The private key is saved as `server-key.pem` file, and the CSR is saved as `server-req.pem` file in the `keys` folder.

The `openssl x509` command processes the CSR and generates a server certificate. The server certificate is saved as `server-cert.pem` file in the `keys` folder.

The `cat` command combines the server key, server certificate, and the CA certificate into a single file named `server-combined.pem` and saves the file in the `keys` folder.

You have to upload the `server-combined.pem` while configuring **OpenConfig Streaming telemetry** from the management center. The gNMI server that runs on the threat defense and the tunnel server (dial-out mode) uses this certificate for TLS communication. If you encrypt the private key with a passphrase, ensure that you specify the passphrase while uploading the certificate to the management center.

**Step 4** Create client certificate with the specified Common Name (CN) and Subject Alternative Name (SAN).

**Example:**

Following sample command generates a new RSA private key and uses it to create a self-signed X.509 certificate with provided subject information. In this example, 192.168.0.202 is the IP address of the client.

```
CN="192.168.0.202"
SAN="IP:192.168.0.202"
openssl req -newkey rsa:4096 -nodes -keyout keys/client-key.pem -out keys/client-req.pem
-subj "/C=XX/ST=YY/L=ZZZ/O=example/OU=EN/CN=${CN}/emailAddress=abc@example.com"
openssl x509 -req -extfile <(printf "subjectAltName=${SAN}") -in keys/client-req.pem -days
60 -CA keys/ca-cert.pem -CAkey keys/ca-key.pem -CAcreateserial -out keys/client-cert.pem
```

The gNMI client uses the client certificate `client-cert.pem` and the private key for TLS communication.

- Step 5** (Optional) For dial-out mode, create the tunnel server certificate with the specified Common Name (CN) and Subject Alternative Name (SAN).

**Example:**

Following sample command generates a new RSA private key and uses it to create a self-signed X.509 certificate with provided subject information. In this example, 192.168.0.202 is the IP address of the client.

```
CN="192.168.0.202"
SAN="IP:192.168.0.202"
openssl req -newkey rsa:4096 -nodes -keyout keys/tunnel-server-key.pem -out
keys/tunnel-server-req.pem -subj "
/C=XX/ST=YY/L=ZZZ/O=Example/OU=EN/CN=${CN}/emailAddress=abc@example.com"
openssl x509 -req -extfile <(printf "subjectAltName=${SAN}") -in keys/tunnel-server-req.pem
-days 60 -CA keys/ca-cert.pem -CAkey keys/ca-key.pem -CAcreateserial -out
keys/tunnel-server-cert.pem
```

---

## Configure OpenConfig Streaming Telemetry

**Before you begin**

- Ensure that the threat defense device where you want to deploy the health policy configuration allows installation of the SSL certificate and private key.
- Ensure that you configure a gNMI client that supports the OpenConfig streaming telemetry implementation, from which you can make the gRPC requests to the gNMI server on the threat defense.
- To use dial-out mode and configure OpenConfig streaming telemetry, ensure that you configure a gRPC tunnel server and client on the management system. This tunnel configuration enables communication between the gNMI client and the threat defense device.
- You must be an admin user to perform the following task.

**Procedure**

- 
- Step 1** Choose **System > Policy**.
- Step 2** Click the **Edit health policy** icon next to the threat defense health policy that you want to modify.
- Step 3** Go to **Settings** tab.
- Step 4** Move the **OpenConfig Streaming Telemetry** slider to enable the configuration. This configuration is disabled by default.

**Step 5** Upload the **SSL Certificate**. The gNMI server uses this certificate to enable server authentication for the TLS connection and encrypt all communications through the channel.

The OpenConfig streaming telemetry configuration supports only certificate with PEM format.

**Step 6** (Optional) Specify the Passphrase if the private key files are encrypted.

**Step 7** Choose the deployment mode to use for streaming telemetry over gNMI protocol.

For **DIAL-IN** mode:

a. Assign a port number for the gNMI service.

The gNMI server opens the port and waits for gRPC requests from the collector.

b. Specify the IPv4/IPv6 address of the gNMI collectors that can connect to the threat defense device.

c. Click **Add Collector** to add more gNMI collectors. You can add a maximum of five collectors.

For **DIAL-OUT** mode:

a. Specify the hostname and port number for the gNMI collector, which can subscribe to streaming telemetry from the threat defense device.

b. Click **Add Collector** to add more gNMI collectors. You can add a maximum of five collectors.

**Step 8** Specify the username and password to validate the gNMI collector.

The threat defense server uses this credential to authenticate the gNMI collector when receiving the `SubscribeRequest` RPC message. Each telemetry message is not authenticated using the username and password. The system uses the previously authenticated encrypted streaming channel to carry telemetry messages.

**Step 9** Click **Save**.

### What to do next

Deploy the health policy to your threat defense device, for the configuration changes to take effect.

## Troubleshoot OpenConfig Streaming Telemetry

### Certificate signed by unknown authority

- Ensure that you have uploaded the correct certificate to the management center.
- Verify the certificate and key generation steps. Ensure that the IP Subject Alternative Name (SAN) is specified correctly.

### Certificate is not valid

If the management center displays the error "Request was made for (IP), but the certificate is not valid for (IP)" then verify the server certificate and key generation steps.

- Ensure sure that the IP SAN is correctly specified in the server certificate. If the configuration applies to more than one threat defense device, you must specify all the devices in the IP SAN field.

- If you are using dial-out mode, ensure that the client IP is specified in the server certificate.

### Failed to generate response object

If you receive "Failed to generate response object, did not receive any data" error, the gNMI input plug-in is waiting for metric export. Below is the sample response that appears when the telegraph is restarting:

```
root@cronserver:/home/secanup/openconfig-test# gnmic -a $ADDRESS:$PORT --tls-cert $CLIENTCERT
--tls-ca $CACERT --tls-key $CLIENTKEY -u $USER -p $PASS sub --mode once --path
"openconfig-system/system/memory"
rpc error: code = Aborted desc = Error in gnmi_server: failed to generate response object.did
not receive any data
Error: one or more requests failed
```

Wait for the gNMI input plug-in to restart and retry your request.

### Restart telegraph

When telegraph is not responding, restart the process using the following command on the threat defense CLI console:

```
pmtool restartbyid hmdaemon
```

### Get current status of gNMI server

When OpenConfig streaming telemetry is enabled, to know the status of the gNMI server, run the following command using the threat defense CLI console:

```
curl localhost:9275/OpenConfig/status
```

Below is the sample response to the command:

```
root@firepower:/home/admin# curl localhost:9275/openconfig/status
Mode (Dialin/Dialout): DialIn

## Device Exclusion in Health Monitoring

In the course of normal network maintenance, you disable appliances or make them temporarily unavailable. Because those outages are deliberate, you do not want the health status from those appliances to affect the summary health status on your management center.

You can use the health monitor exclude feature to disable health monitoring status reporting on an appliance or module. For example, if you know that a segment of your network will be unavailable, you can temporarily disable health monitoring for a managed device on that segment to prevent the health status on the management center from displaying a warning or critical state because of the lapsed connection to the device.

When you disable health monitoring status, health events are still generated, but they have a disabled status and do not affect the health status for the health monitor. If you remove the appliance or module from the excluded list, the events that were generated during the exclusion continue to show a status of disabled.

To temporarily disable health events from an appliance, go to the exclusion configuration page and add an appliance to the device exclude list. After the setting takes effect, the system no longer considers the excluded appliance when calculating the overall health status. The Health Monitor Appliance Status Summary lists the appliance as disabled.

You can also disable an individual health module. For example, when you reach the host limit on the management center, you can disable Host Limit status messages. Excluding health modules for individual interfaces is not supported on devices operating in transparent mode.

Note that on the main Health Monitor page you can distinguish between appliances that are excluded if you expand to view the list of appliances with a particular status by clicking the arrow in that status row.

---

**Note** On management center, Health Monitor exclusion settings are local configuration settings. Therefore, if you exclude a device, then delete it and later re-register it with the management center, the exclusion settings remain persistent. The newly re-registered device remains excluded.

---

## Excluding Appliances from Health Monitoring

You can exclude appliances individually or by group, model, or associated health policy.

If you need to set the events and health status for an individual appliance to disabled, you can exclude the appliance. After the exclusion settings take effect, the appliance shows as disabled in the Health Monitor Appliance Module Summary, and health events for the appliance have a status of disabled.

### Procedure

- 
- Step 1** Choose **System** (⚙) > **Health** > **Exclude**.
  - Step 2** Click **Add Device**.
  - Step 3** In the **Device Exclusion** dialog box, under **Available Devices**, click **Add** (+) against the device that you want to exclude from health monitoring.
  - Step 4** Click **Exclude**. The selected device is displayed in the exclusion main page.

- Step 5** To remove the device from the exclusion list, click **Delete** (.
- Step 6** Click **Apply**.

---

### What to do next

To exclude individual health policy modules on appliances, see [Excluding Health Policy Modules, on page 357](#).

## Excluding Health Policy Modules

You can exclude individual health policy modules on appliances. You may want to do this to prevent events from the module from changing the status for the appliance to warning or critical.

---

**Note** Excluding health modules for individual interfaces is not supported on devices operating in transparent mode.

After the exclusion settings take effect, the appliance shows the number of modules being excluded in the device from health monitoring.

---

**Tip** Make sure that you keep track of individually excluded modules so you can reactivate them when you need them. You may miss necessary warning or critical messages if you accidentally leave a module disabled.

---

### Procedure

- 
- Step 1** Choose **System** () > **Health** > **Exclude**.
- Step 2** Click **Edit** () next to the appliance you want to modify.
- Step 3** In the **Exclude Health Modules** dialog box, by default, all the modules of the device are excluded from health monitoring. Certain modules are applicable to specific devices only; for more information, see [Health Modules, on page 335](#).
- Step 4** To specify the duration of the exclusion for the device, from the **Exclude Period** drop-down list, select the duration.
- Step 5** To choose modules to be excluded from health monitoring, click the **Enable Module Level Exclusion** link. The **Exclude Health Modules** dialog box displays all the modules of the device. The modules that are not applicable for the associated health policies are disabled by default. To exclude a module, perform the following:
- Click the **Slider** () button next to the desired module.
  - To specify the duration of the exclusion for the selected modules, from the **Exclude Period** drop-down list, select the duration.
- Step 6** If you select an **Exclude Period** other than **Permanent**, for your exclusion configuration, you can choose to automatically delete the configuration when it expires. To enable this setting, check the **Auto-delete expired configurations** check box.

- Step 7** Click **OK**.
- Step 8** In the device exclusion main page, click **Apply**.
- 

## Expired Health Monitor Exclusions

When the exclusion period for a device or modules lapses, you can choose to clear or renew the exclusion.

### Procedure

---

- Step 1** Choose **System** (⚙) > **Health** > **Exclude**.
- The **Warning** (⚠) icon is displayed against the device indicating the expiry of the duration of exclusion of the device or the modules from alerting.
- Step 2** To renew the exclusion of the device, click **Edit** (✎) next to the appliance. In the **Exclude Health Modules** dialog box, click the **Renew** link. The exclusion period of the device is extended with the current value.
- Step 3** To clear the device from being excluded, click **Delete** (🗑) next to the appliance, click **Remove the device from exclusion**, and then click **Apply**.
- Step 4** To renew or clear the modules from exclusion, click **Edit** (✎) next to the appliance. In the **Exclude Health Modules** dialog box, click the **Enable Module Level Exclusion** link, and then click the **Renew** or **Clear** link against the modules. When you click **Renew**, the exclusion period is extended on the module with the current value.
- 

## Health Monitor Alerts

You can set up alerts to notify you through email, through SNMP, or through the syslog when the status changes for the modules in a health policy. You can associate an existing alert response with health event levels to trigger and alert when health events of a particular level occur.

For example, if you are concerned that your appliances may run out of hard disk space, you can automatically send an email to a system administrator when the remaining disk space reaches the warning level. If the hard drive continues to fill, you can send a second email when the hard drive reaches the critical level.

## Health Monitor Alert Information

The alerts generated by the health monitor contain the following information:

- Severity, which indicates the severity level of the alert.
- Module, which specifies the health module whose test results triggered the alert.
- Description, which includes the health test results that triggered the alert.

The table below describes these severity levels.

Table 23: Alert Severities

| Severity  | Description                                                                                                                |
|-----------|----------------------------------------------------------------------------------------------------------------------------|
| Critical  | The health test results met the criteria to trigger a Critical alert status.                                               |
| Warning   | The health test results met the criteria to trigger a Warning alert status.                                                |
| Normal    | The health test results met the criteria to trigger a Normal alert status.                                                 |
| Error     | The health test did not run.                                                                                               |
| Recovered | The health test results met the criteria to return to a normal alert status, following a Critical or Warning alert status. |

## Creating Health Monitor Alerts

You must be an Admin user to perform this procedure.

When you create a health monitor alert, you create an association between a severity level, a health module, and an alert response. You can use an existing alert or configure a new one specifically to report on system health. When the severity level occurs for the selected module, the alert triggers.

If you create or update a threshold in a way that duplicates an existing threshold, you are notified of the conflict. When duplicate thresholds exist, the health monitor uses the threshold that generates the fewest alerts and ignores the others. The timeout value for the threshold must be between 5 and 4,294,967,295 minutes.

### Before you begin

- Configure an alert response that governs the management center's communication with the SNMP, syslog, or email server where you send the health alert; see [Secure Firewall Management Center Alert Responses](#), on page 441.

### Procedure

- 
- Step 1** Choose **System** (⚙️) > **Health** > **Monitor Alerts**.
  - Step 2** Click **Add**.
  - Step 3** In the **Add Health Alert** dialog box, enter a name for the health alert in the **Health Alert Name** field.
  - Step 4** From the **Severity** drop-down list, choose the severity level you want to use to trigger the alert.
  - Step 5** From the **Alert** drop-down list, choose the alert response that you want to trigger when the specified severity level is reached. If you have not yet [Secure Firewall Management Center Alert Responses](#), click **Alerts** to visit the **Alerts** page and set them.
  - Step 6** From the **Health Modules** list, choose the health policy modules for which you want the alert to apply.
  - Step 7** Optionally, in the **Threshold Timeout** field, enter the number of minutes that should elapse before each threshold period ends and the threshold count resets.

Even if the policy run time interval value is less than the threshold timeout value, the interval between two reported health events from a given module is always greater. For example, if you change the threshold timeout

to 8 minutes and the policy run time interval is 5 minutes, there is a 10-minute interval (5 x 2) between reported events.

**Step 8** Click **Save** to save the health alert.

---

## Editing Health Monitor Alerts

You must be an Admin user to perform this procedure.

You can edit existing health monitor alerts to change the severity level, health module, or alert response associated with the health monitor alert.

### Procedure

---

- Step 1** Choose **System** (⚙) > **Health** > **Monitor Alerts**.
  - Step 2** Click the **Edit** (✎) icon that is provided against the required health alert that you want to modify.
  - Step 3** In the **Edit Health Alert** dialog box, from the **Alert** drop-down list, select the required alert entry, or click **Alerts** link to configure a new alert entry.
  - Step 4** Click **Save**.
- 

## Deleting Health Monitor Alerts

### Procedure

---

- Step 1** Choose **System** (⚙) > **Health** > **Monitor Alerts**.
  - Step 2** Click **Delete** (🗑) next to the health alert you want to delete, and then click **Delete health alert** to delete it.
- 

### What to do next

- Disable or delete the underlying alert response to ensure that alerting does not continue; see [Secure Firewall Management Center Alert Responses, on page 441](#).

## About the Health Monitor

You must be an Admin, Maintenance, or Security Analyst user to perform this procedure.

The health monitor provides the compiled health status for all devices managed by the management center, plus the management center itself. The health monitor is composed of:

- The Health Status summary page — Provides you with an at-a-glance view of the health of the management center and all of the devices that the management center manages. Devices are listed individually, or grouped according to their geolocation, high availability, or cluster status where applicable.
  - View the health summary of the management center and any device when you hover on the hexagon that represents the device health.
  - The dot to the left of a device indicates its health:
    - Green — No alarms.
    - Orange — At least one health warning.
    - Red — At least one critical health alarm.
- The Monitoring navigation pane — Allows you to navigate the device hierarchy. You can view health monitors for individual devices from the navigation pane.

## Procedure

---

**Step 1** Choose **System** (⚙) > **Health** > **Monitor**.

**Step 2** View the status of the management center and its managed devices in the **Health Status** landing page.

- Hover your pointer over a hexagon to view the health summary of a device. The popup window shows a truncated summary of the top five health alerts. Click on the popup to open a detailed view of the health alert summary.
- In the device list, click **Expand** (➤) and **Collapse** (⌵) to expand and collapse the list of health alerts for a device.

When you expand the row, all of the health alerts are listed, including the status, title, and details.

**Note** Health alerts are sorted by their severity level.

**Step 3** Use the Monitoring navigation pane to access device-specific health monitors. When you use the Monitoring navigation pane:

- Click **Home** to return Health Status summary page.
  - Click **Firewall Management Center** to view the health monitor for the Secure Firewall Management Center itself.
  - In the device list, click **Expand** (➤) and **Collapse** (⌵) to expand and collapse the list of managed devices.

When you expand the row, all of the devices are listed.
  - Click on a device to view a device-specific health monitor.
  - In the health monitor, hover over a graph to view all metrics and their respective values at that specific point on the graph. Click on the graph to pin the metrics statistics box, allowing you to explore the metrics and their values in detail. To close the statistics box and move to another point on the graph, simply click the close button.
-

### What to do next

- See [Device Health Monitors, on page 365](#) for information about the compiled health status and metrics for any device managed by the management center.
- See [Using Management Center Health Monitor, on page 362](#) for information about the health status of the management center.

To return to the Health Status landing page at any time, click **Home**.

## Using Management Center Health Monitor

You must be an Admin, Maintenance, or Security Analyst user to perform this procedure.

The management center monitor provides a detailed view of the health status of the management center. The health monitor is composed of:

- High Availability (if configured)—The High Availability (HA) panel displays the current HA status, including the status of the Active and Standby units, the last sync time, and overall device health.
- Event Rate—The Event Rate panel shows the maximum event rate as a base line as well as the overall event rate received by the management center.
- Event Capacity—The Event Capacity panel shows the current consumption by event categories, including the retention time of events, the current vs. maximum event capacity, and a capacity overflow mechanism where you are alerted when events are stored beyond the configured maximum capacity of the management center.
- Process Health—The Process Health panel has an at-a-glance view of the critical processes as well as a tab that lets you see state of all processes, including the CPU and memory usage for each process.
- CPU—The CPU panel lets you toggle between the average CPU usage (default) and the CPU usage of all cores.
- Memory—The Memory panel shows the overall memory usage on the management center.
- Interface—The Interface panel shows average input and output rate of all interfaces.
- Disk Usage—The Disk Usage panel shows the use of entire disk, and the use of the critical partitions where management center data is stored.
- Hardware Statistics—The hardware statistics shows the fan speed, power supply, and temperature of the management center chassis. For more information, see [Hardware Statistics on Management Center, on page 364](#).

---

**Tip** Your session normally logs you out after 1 hour of inactivity (or another configured interval). If you plan to passively monitor health status for long periods of time, consider exempting some users from session timeout, or changing the system timeout settings.

---

## Procedure

- 
- Step 1** Choose **System** (⚙️) > **Health** > **Monitor**.
- Step 2** Use the **Monitoring** navigation pane to access the management center and device-specific health monitors.
- A standalone management center is shown as a single node; a high-availability management center is shown as a pair of nodes.
  - The health monitor is available to both the active and standby management center in an HA pair.
- Step 3** Explore the management center dashboard.
- The management center dashboard includes a summary view of the HA state of the management center (if configured), as well as at-a-glance views of management center processes and device metrics such as CPU, memory, and disk usage.
- 

## Running All Modules for an Appliance

You must be an Admin, Maintenance, or Security Analyst user to perform this procedure.

Health module tests run automatically at the policy run time interval you configure when you create a health policy. However, you can also run all health module tests on demand to collect up-to-date health information for the appliance.

## Procedure

- 
- Step 1** View the health monitor for the appliance.
- Step 2** Click **Run All Modules**. The status bar indicates the progress of the tests, then the Health Monitor Appliance page refreshes.
- Note** When you manually run health modules, the first refresh that automatically occurs may not reflect the data from the manually run tests. If the value has not changed for a module that you just ran manually, wait a few seconds, then refresh the page by clicking the device name. You can also wait for the page to refresh again automatically.
- 

## Running a Specific Health Module

You must be an Admin, Maintenance, or Security Analyst user to perform this procedure.

Health module tests run automatically at the policy run time interval you configure when you create a health policy. However, you can also run a health module test on demand to collect up-to-date health information for that module.

## Procedure

- 
- Step 1** View the health monitor for the appliance.
  - Step 2** In the **Module Status Summary** graph, click the color for the health alert status category you want to view.
  - Step 3** In the **Alert Detail** row for the alert for which you want to view a list of events, click **Run**.

The status bar indicates the progress of the test, then the Health Monitor Appliance page refreshes.

**Note** When you manually run health modules, the first refresh that automatically occurs may not reflect the data from the manually run tests. If the value has not changed for a module that you just manually ran, wait a few seconds, then refresh the page by clicking the device name. You can also wait for the page to refresh automatically again.

---

## Generating Health Module Alert Graphs

You must be an Admin, Maintenance, or Security Analyst user to perform this procedure.

You can graph the results over a period of time of a particular health test for a specific appliance.

## Procedure

- 
- Step 1** View the health monitor for the appliance.
  - Step 2** In the **Module Status Summary** graph of the Health Monitor Appliance page, click the color for the health alert status category you want to view.
  - Step 3** In the **Alert Detail** row for the alert for which you want to view a list of events, click **Graph**.

**Tip** If no events appear, you may need to adjust the time range.

---

## Hardware Statistics on Management Center

The hardware statistics on the management center appliance (only physical) includes information on its hardware entities, such as fan speed, power supply, and temperature. For SNMP to poll and send traps to monitor the health of a management center:

1. Enable SNMP on the management center for polling the MIBs. By default, the SNMP on the management center is disabled.
2. Add an ACL entry for each of the required SNMP host to enable traps. Ensure to specify the host's IP address and select the port as SNMP. See [Configure an Access List](#).

To view the hardware statistics on the **Health > Monitor** page:

1. On the **Health > Policy** page, ensure that the Hardware Statistics module is enabled. You can change the default threshold values.

2. Add a portlet to the management center health monitoring dashboard—select Hardware Statistics metric group, and then select Fan Speed and Temperature metrics.

You can view the power supply status under the firewall management center in the **Health Monitoring > Home** page.

**Note**

- The fan speed is displayed in RPM.
- The temperature is displayed in °C (Celsius).
- When one slot of the power supply is active, the dashboard displays it as *Online* and the other slot as *No Power*.
- Each horizontal line in the graphs shows the status for each PSU and fan respectively.
- Hover over the graph to view the data of that individual statistics.

## Device Health Monitors

The device health monitor provides the compiled health status for any device managed by the management center. The device health monitor collects health metrics for Secure Firewall devices in order to predict and respond to system events. The device health monitor is comprised of the following components:

- System Details — Displays information about the managed device, including the installed Secure Firewall version and other deployment details.
- Troubleshooting & Links — Provides convenient links to frequently used troubleshooting topics and procedures.
- Health alerts — A health alert monitor provides an at-a-glance view of the health of the device.
- Time range — An adjustable time window to constrain the information that appears in the various device metrics windows.
- Device metrics — An array of key firewall device health metrics categorized across predefined dashboards, including:
  - CPU — CPU utilization, including the CPU usage by process and by physical cores.
  - Memory — Device memory utilization, including data plane and Snort memory usage.
  - Interfaces — Interface status and aggregate traffic statistics.
  - Connections — Connection statistics (such as elephant flows, active connections, peak connections, and so on) and NAT translation counts.
  - Snort — Statistics related to the Snort process.
  - Disk Usage — Device disk usage, including the disk size and disk utilization per partition.
  - Critical Processes — Statistics related to managed processes, including process restarts and other select health monitors such as CPU and memory utilization.

See [Cisco Secure Firewall Threat Defense Health Metrics](#) for a comprehensive list of the supported device metrics.

## Viewing System Details and Troubleshooting

You must be an Admin, Maintenance, or Security Analyst user to perform this procedure.

The System Details section provides a general system information for a selected device. You can also launch troubleshooting tasks for that device.

### Procedure

---

**Step 1** Choose **System** (⚙) > **Health** > **Monitor**.

Use the Monitoring navigation pane to access device-specific health monitors.

**Step 2** In the device list, click **Expand** (>) and **Collapse** (∨) to expand and collapse the list of managed devices.

**Step 3** Click on a device to view a device-specific health monitor.

**Step 4** Click the link for **View System & Troubleshoot Details ...**

This panel is collapsed by default. Clicking on the link expands the collapsed section to see **System Details** and **Troubleshooting & Links** for the device. The system details include:

- **Version:** The Secure Firewall software version.
- **Model:** The device model.
- **Mode:** The firewall mode. The threat defense device supports two firewall modes for regular firewall interfaces: Routed mode and Transparent mode.
- **VDB:** The Cisco vulnerability database (VDB) version.
- **SRU:** The intrusion rule set version.
- **Snort:** The Snort version.

**Step 5** You have the following troubleshoot choices:

- Generate troubleshooting files; see [Generate Troubleshooting Files for Specific System Functions, on page 389](#)
  - Generate and download advanced troubleshooting files; see [Download Advanced Troubleshooting Files, on page 390](#).
  - Create and modify health policies; see [Creating Health Policies, on page 347](#).
  - Create and modify health monitor alerts; see [Creating Health Monitor Alerts, on page 359](#).
- 

## Viewing the Device Health Monitor

You must be an Admin, Maintenance, or Security Analyst user to perform this procedure.

The device health monitor provides a detailed view of the health status of a firewall device. The device health monitor compiles device metrics and provides health status and trends of the device in an array of dashboards.

## Procedure

- 
- Step 1** Choose **System** (⚙) > **Health** > **Monitor**.  
Use the Monitoring navigation pane to access device-specific health monitors.
- Step 2** In the device list, click **Expand** (➤) and **Collapse** (▼) to expand and collapse the list of managed devices.
- Step 3** View the **Health Alerts** for the device in the alert notification at the top of page, directly to the right of the device name.  
  
Hover your pointer over the **Health Alerts** to view the health summary of the device. The popup window shows a truncated summary of the top five health alerts. Click on the popup to open a detailed view of the health alert summary.
- Step 4** You can configure the time range from the drop-down in the upper-right corner. The time range can reflect a period as short as the last hour (the default) or as long as two weeks. Select **Custom** from the drop-down to configure a custom start and end date.  
  
Click the refresh icon to set auto refresh to 5 minutes or to toggle off auto refresh.
- Step 5** Click the **Show the deployment details on top of the graph** (📊) icon for a deployment overlay on the trend graph, with respect to the selected time range.  
  
The **Show the deployment details on top of the graph** (📊) icon indicates the number of deployments during the selected time-range. A vertical band indicates the deployment start and end time. In the case of multiple deployments, multiple bands/lines can appear. Click the icon on top of the dotted line to view the deployment details.
- Step 6** The device monitor reports health and performance metrics in several predefined dashboards by default. The metrics dashboards include:
- Overview — Highlights key metrics from the other predefined dashboards, including CPU, memory, interfaces, connection statistics; plus disk usage and critical process information.
  - CPU — CPU utilization, including the CPU usage by process and by physical cores.
  - Memory — Device memory utilization, including data plane and Snort memory usage.
  - Interfaces — Interface status and aggregate traffic statistics.
  - Connections — Connection statistics (such as elephant flows, active connections, peak connections, and so on) and NAT translation counts.
  - Snort — Statistics related to the Snort process.
  - ASP Drops — Statistics related to the Accelerated Security Path (ASP) performance and behavior.
- You can navigate through the various metrics dashboards by clicking on the labels. See [Cisco Secure Firewall Threat Defense Health Metrics](#) for a comprehensive list of the supported device metrics.
- Step 7** Click the **Add New Dashboard** (+) to create a custom correlation dashboard by building your own variable set from the available metric groups; see [Correlating Device Metrics, on page 368](#).
-

## Correlating Device Metrics

The device health monitor includes an array of key threat defense device metrics that serve to predict and respond to system events. The health of any threat defense device can be determined by these reported metrics.

The device monitor reports these metrics in several predefined dashboards by default. These dashboards include:

- Overview — Highlights key metrics from the other predefined dashboards, including CPU, memory, interfaces, connection statistics; plus disk usage and critical process information.
- CPU — CPU utilization, including the CPU usage by process and by physical cores.
- Memory — Device memory utilization, including data plane and Snort memory usage.
- Interfaces — Interface status and aggregate traffic statistics.
- Connections — Connection statistics (such as elephant flows, active connections, peak connections, and so on) and NAT translation counts.
- Snort — Statistics related to the Snort process.
- ASP Drops — Statistics related to the Accelerated Security Path (ASP) performance and behavior.

You can add custom dashboards to correlate metrics that are interrelated. Select from predefined correlation groups, such as CPU and Snort; or create a custom correlation dashboard by building your own variable set from the available metric groups. See [Cisco Secure Firewall Threat Defense Health Metrics](#) for a comprehensive list of the supported device metrics.

### Before you begin

- To view and correlate the time series data (device metrics) in the health monitor dashboard, enable REST API (**Settings** > **Configuration** > **REST API Preferences**).
- You must be an Admin, Maintenance, or Security Analyst user to perform this procedure.

---

**Note** Correlating device metrics is available only for threat defense 6.7 and later versions. Hence, for threat defense versions earlier than 6.7, the health monitor dashboard does not display these metrics even if you enable REST API.

---

## Procedure

- 
- Step 1** Choose **System** (⚙️) > **Health** > **Monitor**.  
Use the Monitoring navigation pane to access device-specific health monitors.
- Step 2** In the **Devices** list, click **Expand** (➤) and **Collapse** (⏏) to expand and collapse the list of managed devices.
- Step 3** Choose the device for which you want to modify the dashboard.
- Step 4** Click the **Add New Dashboard** (+) icon to add a new dashboard.
- Step 5** Specify a name to identity the dashboard.

- Step 6** To create a dashboard from a predefined correlation group, click **Add from Predefined Correlations** drop-down, choose the group, and click **Add Dashboard**.
- Step 7** To create a custom correlation dashboard, choose a group from the **Select Metric Group** drop-down, then choose corresponding metrics from the **Select Metrics** drop-down.
- See [Cisco Secure Firewall Threat Defense Health Metrics](#) for a comprehensive list of the supported device metrics.
- Step 8** Click **Add Metrics** to add and select metrics from another group.
- Step 9** To remove an individual metric, click the **x** icon on the right side of the item. Click the delete icon to remove the entire group.
- Step 10** Click **Add Dashboard** to add the dashboard to the health monitor.
- Step 11** You can **Edit** or **Delete** the predefined dashboards and the custom correlation dashboards.

## Cluster Health Monitor

When a threat defense is the control node of a cluster, the management center collects various metrics periodically from the device metric data collector. The cluster health monitor is comprised of the following components:

- Overview dashboard—Displays information about the cluster topology, cluster statistics, and metric charts:
  - The topology section displays a cluster's live status, the health of individual threat defense, threat defense node type (control node or data node), and the status of the device. The status of the device could be *Disabled* (when the device leaves the cluster), *Added out of box* (in a public cloud cluster, the additional nodes that do not belong to the management center), or *Normal* (ideal state of the node).
  - The cluster statistics section displays current metrics of the cluster with respect to the CPU usage, memory usage, input rate, output rate, active connections, and NAT translations.

---

**Note** The CPU and memory metrics display the individual average of the data plane and snort usage.

---

- The metric charts, namely, CPU Usage, Memory Usage, Throughput, and Connections, diagrammatically display the statistics of the cluster over the specified time period.
- Load Distribution dashboard—Displays load distribution across the cluster nodes in two widgets:
  - The Distribution widget displays the average packet and connection distribution over the time range across the cluster nodes. This data depicts how the load is being distributed by the nodes. Using this widget, you can easily identify any abnormalities in the load distribution and rectify it.
  - The Node Statistics widget displays the node level metrics in table format. It displays metric data on CPU usage, memory usage, input rate, output rate, active connections, and NAT translations across the cluster nodes. This table view enables you to correlate data and easily identify any discrepancies.

- Member Performance dashboard—Displays current metrics of the cluster nodes. You can use the selector to filter the nodes and view the details of a specific node. The metric data include CPU usage, memory usage, input rate, output rate, active connections, and NAT translations.
- CCL dashboard—Displays, graphically, the cluster control link data namely, the input, and output rate.
- Troubleshooting and Links — Provides convenient links to frequently used troubleshooting topics and procedures.
- Time range—An adjustable time window to constrain the information that appears in the various cluster metrics dashboards and widgets.
- Custom Dashboard—Displays data on both cluster-wide metrics and node-level metrics. However, node selection only applies for the threat defense metrics and not for the entire cluster to which the node belongs.

## Viewing the Cluster Health Monitor

You must be an Admin, Maintenance, or Security Analyst user to perform this procedure.

The cluster health monitor provides a detailed view of the health status of a cluster and its nodes. This cluster health monitor provides health status and trends of the cluster in an array of dashboards.

### Before you begin

- Ensure you have created a cluster from one or more devices in the management center.

### Procedure

- 
- Step 1** Choose **System** (⚙) > **Health** > **Monitor**.  
Use the Monitoring navigation pane to access node-specific health monitors.
- Step 2** In the device list, click **Expand** (➤) and **Collapse** (▼) to expand and collapse the list of managed cluster devices.
- Step 3** To view the cluster health statistics, click on the cluster name. The cluster monitor reports health and performance metrics in several predefined dashboards by default. The metrics dashboards include:
- Overview — Highlights key metrics from the other predefined dashboards, including its nodes, CPU, memory, input and output rates, connection statistics, and NAT translation information.
  - Load Distribution — Traffic and packet distribution across the cluster nodes.
  - Member Performance — Node-level statistics on CPU usage, memory usage, input throughput, output throughput, active connection, and NAT translation.
  - CCL — Interface status and aggregate traffic statistics.

You can navigate through the various metrics dashboards by clicking on the labels. For a comprehensive list of the supported cluster metrics, see [Cisco Secure Firewall Threat Defense Health Metrics](#).

- Step 4** You can configure the time range from the drop-down in the upper-right corner. The time range can reflect a period as short as the last hour (the default) or as long as two weeks. Select **Custom** from the drop-down to configure a custom start and end date.
- Click the refresh icon to set auto refresh to 5 minutes or to toggle off auto refresh.
- Step 5** Click on deployment icon for a deployment overlay on the trend graph, with respect to the selected time range. The deployment icon indicates the number of deployments during the selected time-range. A vertical band indicates the deployment start and end time. For multiple deployments, multiple bands/lines appear. Click on the icon on top of the dotted line to view the deployment details.
- Step 6** (For node-specific health monitor) View the **Health Alerts** for the node in the alert notification at the top of page, directly to the right of the device name.
- Hover your pointer over the **Health Alerts** to view the health summary of the node. The popup window shows a truncated summary of the top five health alerts. Click on the popup to open a detailed view of the health alert summary.
- Step 7** (For node-specific health monitor) The device monitor reports health and performance metrics in several predefined dashboards by default. The metrics dashboards include:
- Overview — Highlights key metrics from the other predefined dashboards, including CPU, memory, interfaces, connection statistics; plus disk usage and critical process information.
  - CPU — CPU utilization, including the CPU usage by process and by physical cores.
  - Memory — Device memory utilization, including data plane and Snort memory usage.
  - Interfaces — Interface status and aggregate traffic statistics.
  - Connections — Connection statistics (such as elephant flows, active connections, peak connections, and so on) and NAT translation counts.
  - Snort — Statistics that are related to the Snort process.
  - ASP drops — Statistics related to the dropped packets against various reasons.
- You can navigate through the various metrics dashboards by clicking on the labels. See [Cisco Secure Firewall Threat Defense Health Metrics](#) for a comprehensive list of the supported device metrics.
- Step 8** Click the plus sign (+) in the upper right corner of the health monitor to create a custom dashboard by building your own variable set from the available metric groups.
- For cluster-wide dashboard, choose Cluster metric group, and then choose the metric.

---

## Health Monitor Status Categories

Available status categories are listed by severity in the table below.

Table 24: Health Status Indicator

| Status Level | Status Icon   | Status Color in Pie Chart | Description                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------|---------------|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Error        | Error (✘)     | Black                     | Indicates that at least one health monitoring module has failed on the appliance and has not been successfully re-run since the failure occurred. Contact your technical support representative to obtain an update to the health monitoring module.                                                                                                                                                         |
| Critical     | Critical (❗)  | Red                       | Indicates that the critical limits have been exceeded for at least one health module on the appliance and the problem has not been corrected.                                                                                                                                                                                                                                                                |
| Warning      | Warning (⚠)   | Yellow                    | Indicates that warning limits have been exceeded for at least one health module on the appliance and the problem has not been corrected.<br><br>This status also indicates a transitional state, where, the required data is temporarily unavailable or could not be processed because of changes in the device configuration. Depending on the monitoring cycle, this transitional state is auto-corrected. |
| Normal       | Normal (✔)    | Green                     | Indicates that all health modules on the appliance are running within the limits configured in the health policy applied to the appliance.                                                                                                                                                                                                                                                                   |
| Recovered    | Recovered (✔) | Green                     | Indicates that all health modules on the appliance are running within the limits configured in the health policy applied to the appliance, including modules that were in a Critical or Warning state.                                                                                                                                                                                                       |
| Disabled     | Disabled (⊘)  | Blue                      | Indicates that an appliance is disabled or excluded, that the appliance does not have a health policy applied to it, or that the appliance is currently unreachable.                                                                                                                                                                                                                                         |

## Health Event Views

The Health Event View page allows you to view health events logged by the health monitor on the management center logs health events. The fully customizable event views allow you to quickly and easily analyze the health status events gathered by the health monitor. You can search event data to easily access other information that may be related to the events you are investigating. If you understand what conditions each health module tests for, you can more effectively configure alerting for health events.

You can perform many of the standard event view functions on the health event view pages.

## Viewing Health Events

You must be an Admin, Maintenance, or Security Analyst user to perform this procedure.

The Table View of Health Events page provides a list of all health events on the specified appliance.

When you access health events from the Health Monitor page on your management center, you retrieve all health events for all managed appliances.

---

**Tip** You can bookmark this view to allow you to return to the page in the health events workflow containing the Health Events table of events. The bookmarked view retrieves events within the time range you are currently viewing, but you can then modify the time range to update the table with more recent information if needed.

---

## Procedure

---

Choose **System** (⚙️) > **Health** > **Events**.

**Tip** If you are using a custom workflow that does not include the table view of health events, click **(switch workflow)**. On the Select Workflow page, click **Health Events**.

**Note** If no events appear, you may need to adjust the time range.

---

## Viewing the Health Events Table

You can view and modify the Health Events Table.

## Procedure

---

**Step 1** Choose **System** (⚙️) > **Health** > **Events**.

**Step 2** You have the following choices:

- **Bookmark** — To bookmark the current page so that you can quickly return to it, click **Bookmark This Page**, provide a name for the bookmark, and click **Save**.
- **Change Workflow** — To choose another health events workflow, click **(switch workflow)**.
- **Delete Events** — To delete health events, check the check box next to the events you want to delete, and click **Delete**. To delete all the events in the current constrained view, click **Delete All**, then confirm you want to delete all the events.
- **Generate Reports** — Generate a report based on data in the table view — click **Report Designer**.
- **Modify** — Modify the time and date range for events listed in the Health table view. Note that events that were generated outside the appliance's configured time window (whether global or event-specific) may appear in an event view if you constrain the event view by time. This may occur even if you configured a sliding time window for the appliance.
- **Navigate** — Navigate through event view pages.
- **Navigate Bookmark** — To navigate to the bookmark management page, click **View Bookmarks** from any event view.
- **Navigate Other** — Navigate to other event tables to view associated events.

- Sort — Sort the events that appear, change what columns display in the table of events, or constrain the events that appear
- View All — To view event details for all events in the view, click **View All**.
- View Details — To view the details associated with a single health event, click the down arrow link on the left side of the event.
- View Multiple — To view event details for multiple health events, choose the check box next to the rows that correspond with the events you want to view details for and then click **View**.
- View Status — To view all events of a particular status, click status in the Status column for an event with that status.

## The Health Events Table

The Health Monitor modules you choose to enable in your health policy run various tests to determine appliance health status. When the health status meets criteria that you specify, a health event is generated.

The table below describes the fields that can be viewed and searched in the health events table.

**Table 25: Health Event Fields**

| Field                      | Description                                                                                                                                                                                                                                                                                            |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Module Name                | Specify the name of the module which generated the health events you want to view. For example, to view events that measure CPU performance, type <code>CPU</code> . The search should retrieve applicable CPU Usage and CPU temperature events.                                                       |
| Test Name<br>(Search only) | The name of the health module that generated the event.                                                                                                                                                                                                                                                |
| Time<br>(Search only)      | The timestamp for the health event.                                                                                                                                                                                                                                                                    |
| Description                | The description of the health module that generated the event. For example, health events generated when a process was unable to execute are labeled <code>Unable to Execute</code> .                                                                                                                  |
| Value                      | The value (number of units) of the result obtained by the health test that generated the event.<br><br>For example, if the management center generates a health event whenever a device it is monitoring is using 80 percent or more of its CPU resources, the value could be a number from 80 to 100. |
| Units                      | The units descriptor for the result. You can use the asterisk (*) to create wildcard searches.<br><br>For example, if the management center generates a health event when a device it is monitoring is using 80 percent or more of its CPU resources, the units descriptor is a percentage sign (%).   |
| Status                     | The status (Critical, Yellow, Green, or Disabled) reported for the appliance.                                                                                                                                                                                                                          |

| Field  | Description                                        |
|--------|----------------------------------------------------|
| Device | The appliance where the health event was reported. |

## About System Auditing

The appliances that are part of the system generate an audit record for each user interaction with the web interface.

### Audit Records

Secure Firewall Management Centers log read-only auditing information for user activity. Audit logs are presented in a standard event view that allows you to view, sort, and filter audit log messages based on any item in the audit view. You can easily delete and report on audit information and can view detailed reports of the changes that users make.

The audit log stores a maximum of 100,000 entries. When the number of audit log entries exceeds 100,000, the appliance prunes the oldest records from the database to reduce the number to 100,000.

The audit logs do not display the user or the source IP for login errors:

- When wrong password is used, the source IP is not displayed.
- When the user account does not exist, both source IP and the user are not displayed.
- If the attempt for an LDAP user fails, no audit log is triggered.

### Audit Log Workflow Fields

The following table describes the audit log fields that can be viewed and searched.

**Table 26: Audit Log Fields**

| Field     | Description                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Time      | Time and date that the appliance generated the audit record.                                                                                                                                                                                                                                                                                                                                                    |
| User      | User name of the user that triggered the audit event.                                                                                                                                                                                                                                                                                                                                                           |
| Subsystem | In a few cases where a menu path is not relevant, the Subsystem field displays only the event type. For example, <b>Login</b> classifies user login attempts.                                                                                                                                                                                                                                                   |
| Message   | The action the user performed or the button the user clicked on the page.<br><br>For example, <code>Page View</code> signifies that the user simply viewed the page indicated in the Subsystem, while <code>Save</code> means that the user clicked the <b>Save</b> button on the page.<br><br>Changes made to the system appear with a <b>Compare icon</b> that you can click to see a summary of the changes. |

| Field                                 | Description                                                                                                                                                                                                          |
|---------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Source IP                             | IP address associated with the host used by the user.<br>Note: When searching this field you must type a specific IP address; you cannot use IP ranges when searching audit logs.                                    |
| Domain                                | The current domain of the user when the audit event was triggered. This field is only present if you have ever configured the management center for multitenancy.                                                    |
| Configuration Change<br>(search only) | Specifies whether to view audit records of configuration changes in the search results. ( <i>yes</i> or <i>no</i> )                                                                                                  |
| Count                                 | The number of events that match the information that appears in each row. Note that the Count field appears only after you apply a constraint that creates two or more identical rows. This field is not searchable. |

## The Audit Events Table View

You can change the layout of the event view or constrain the events in the view by a field value. When disabling columns, after you click the **Close** (✕) in the column heading that you want to hide, in the pop-up window that appears, click **Apply**. When you disable a column, it is disabled for the duration of your session (unless you add it back later). Note that when you disable the first column, the Count column is added.

To hide or show other columns, or to add a disabled column back to the view, select or clear the appropriate check boxes before you click **Apply**.

Clicking a value within a row in a table view constrains the table view and does not drill down to the next page in the workflow.

---

**Tip** Table views always include “Table View” in the page name.

---

## CHAPTER 18

# Troubleshooting

---

The following topics describe ways to diagnose problems you may encounter:

- [Best Practices for Troubleshooting, on page 377](#)
- [System Messages, on page 377](#)
- [View Basic System Information, on page 380](#)
- [Manage System Messages, on page 381](#)
- [Memory Usage Thresholds for Health Monitor Alerts, on page 384](#)
- [Disk Usage and Drain of Events Health Monitor Alerts, on page 385](#)
- [Health Monitor Reports for Troubleshooting, on page 389](#)
- [General Troubleshooting, on page 391](#)
- [Connection-Based Troubleshooting, on page 391](#)
- [Advanced Troubleshooting for the Secure Firewall Threat Defense Device, on page 392](#)
- [Feature-Specific Troubleshooting, on page 402](#)

## Best Practices for Troubleshooting

- Before you make changes to try to fix a problem, generate a troubleshooting file to capture the original problem. See [Health Monitor Reports for Troubleshooting, on page 389](#) and its subsections.  
You may need this troubleshooting file if you need to contact Cisco TAC for support.
- Start your investigation by looking at error and warning messages in the Message Center. See [System Messages, on page 377](#)
- Look for applicable Tech Notes and other troubleshooting resources under the "Troubleshoot and Alerts" heading on the product documentation page for your product.

## System Messages

When you need to track down problems occurring in the system, the Message Center is the place to start your investigation. This feature allows you to view the messages that the system continually generates about system activities and status.

To open the Message Center, click on the System Status icon, located next to the Deploy menu in the main menu. This icon can take one of the following forms, depending on the system status:

-  — Indicates one or more errors and any number of warnings are present on the system.
-  — Indicates one or more warnings and no errors are present on the system.
-  — Indicates no warnings or errors are present on the system.

If a number is displayed with the icon, it indicates the total current number of error or warning messages.

To close the Message Center, click anywhere outside of it within the web interface.

In addition to the Message Center, the web interface displays pop-up notifications in immediate response to your activities and ongoing system activities. Some pop-up notifications automatically disappear after five seconds, while others are "sticky," meaning they display until you explicitly dismiss them by clicking **Dismiss** (). Click the **Dismiss** link at the top of the notifications list to dismiss all notifications at once.

---

**Tip** Hovering your cursor over a non-sticky pop-up notification causes it to be sticky.

---

The system determines which messages it displays to users in pop-up notifications and the Message Center based on their licenses, domains, and access roles.

## Message Types

The Message Center displays messages reporting system activities and status organized into three different tabs:

### Deployments

This tab displays current status related to configuration deployment for each appliance in your system, grouped by domain. The system reports the following deployment status values on this tab. You can get additional detail about the deployment jobs by clicking **Show History**.

- **Running (Spinning)** — The configuration is in the process of deploying.
- **Success** — The configuration has successfully been deployed.
- **Warning** () — Warning deployment statuses contribute to the message count displayed with the **Warning System Status icon**.
- **Failure** — The configuration has failed to deploy; see [Configuration Changes that Require Deployment, on page 227](#). Failed deployments contribute to the message count displayed with the **Error System Status icon**.

### Upgrades

This tab displays the current status related to software upgrade tasks for the managed devices. The system reports the following upgrade status values on this tab:

- **In progress**—Indicates that the upgrade task is in progress.
- **Completed**—Indicates that the software upgrade task is completed successful.
- **Failed**—Indicates that the software upgrade task has failed to complete.

## Health

This tab displays current health status information for each appliance in your system, grouped by domain. Health status is generated by health modules as described in [About Health Monitoring, on page 333](#). The system reports the following health status values on this tab:

- **Warning** (⚠) — Indicates that warning limits have been exceeded for a health module on an appliance and the problem has not been corrected. The Health Monitoring page indicates these conditions with a **Yellow Triangle** (⚠). Warning statuses contribute to the message count displayed with the **Warning System Status icon**.
- **Critical** (❗) — Indicates that critical limits have been exceeded for a health module on an appliance and the problem has not been corrected. The Health Monitoring page indicates these conditions with a **Critical** (❗) icon. Critical statuses contribute to the message count displayed with the **Error System Status icon**.
- **Error** (✖) — Indicates that a health monitoring module has failed on an appliance and has not been successfully re-run since the failure occurred. The Health Monitoring page indicates these conditions with a **Error icon**. Error statuses contribute to the message count displayed with the **Error System Status icon**.

You can click on links in the Health tab to view related detailed information on the Health Monitoring page. If there are no current health status conditions, the Health tab displays no messages.

## Tasks

Certain tasks (such as configuration backups or update installation) can require some time to complete. This tab displays the status of these long-running tasks, and can include tasks initiated by you or, if you have appropriate access, other users of the system. The tab presents messages in reverse chronological order based on the most recent update time for each message. Some task status messages include links to more detailed information about the task in question. The system reports the following task status values on this tab:

- **Waiting()** — Indicates a task that is waiting to run until another in-progress task is complete. This message type displays an updating progress bar.
- **Running** — Indicates a task that is in-progress. This message type displays an updating progress bar.
- **Retrying** — Indicates a task that is automatically retrying. Note that not all tasks are permitted to try again. This message type displays an updating progress bar.
- **Success** — Indicates a task that has completed successfully.
- **Failure** — Indicates a task that did not complete successfully. Failed tasks contribute to the message count displayed with the **Error System Status icon**.
- **Stopped or Suspended** — Indicates a task that was interrupted due to a system update. Stopped tasks cannot be resumed. After normal operations are restored, start the task again.
- **Skipped** — A process in progress prevented the task from starting. Try again to start the task.

New messages appear in this tab as new tasks are started. As tasks complete (status success, failure, or stopped), this tab continues to display messages with final status indicated until you remove them. Cisco recommends you remove messages to reduce clutter in the Tasks tab as well as the message database.

## Message Management

From the Message Center you can:

- Choose to display pop-up notifications.
- Display more task status messages from the system database (if any are available that have not been removed).
- Download a report of all the task manager notifications.
- Remove individual task status messages. (This affects all users who can view the removed messages.)
- Remove task status messages in bulk. (This affects all users who can view the removed messages.)

---

**Tip** Cisco recommends that you periodically remove accumulated task status messages from the Task tab to reduce clutter in the display as well the database. When the number of messages in the database approaches 100,000, the system automatically deletes task status messages that you have removed.

---

## View Basic System Information

The About page displays information about your appliance, including the model, serial number, and version information for various components of the system. It also includes Cisco copyright information.

### Procedure

- 
- Step 1** Click **Help** ( ? ) in the toolbar at the top of the page.
- Step 2** Choose **About**.
- 

## View Appliance Information

### Procedure

---

Choose **System** ( ⚙ ) > **Configuration**.

---

# Manage System Messages

## Procedure

---

**Step 1** Click **Notifications** to display the Message Center.

**Step 2** You have the following choices:

- Click **Deployments** to view messages related to configuration deployments. See [View Deployment Messages, on page 381](#). You must be an Admin user or have the **Deploy Configuration to Devices** permission to view these messages.
- Click **Upgrades** to view messages related to device upgrade tasks. See [Viewing Upgrade Messages](#). See [View Upgrade Messages](#). You must be an Admin user or have **Updates** permission to view these messages.
- Click **Health** to view messages related to the health of your management center and the devices registered to it. See [View Health Messages, on page 383](#). You must be an Admin user or have the **Health** permission to view these messages.

You can navigate to the Health Monitor page by clicking the **Health monitor** link.

- Click **Tasks** to view or manage messages related to long-running tasks. See [View Task Messages, on page 383](#) or [Manage Task Messages, on page 384](#). Everyone can see their own tasks. To see the tasks of other users, you must be an Admin user or have the **View Other Users' Tasks** permission. You can remove the completed tasks from the notification by clicking the **Remove completed tasks** link.
- Click the **Download Report** icon to generate a report of all the notifications in the task manager. Choose **Download CSV** or **Download PDF** to download the report.
- Click **Show Notifications** slider to enable or disable pop-up notification display.

---

## View Deployment Messages

You must be an Admin user or have the **Deploy Configuration to Devices** permission to view these messages.

## Procedure

---

**Step 1** Click **Notifications** to display the Message Center.

**Step 2** Click **Deployments**.

**Step 3** You have the following choices:

- Click **total** to view all current deployment statuses.
- Click a status value to view only messages with that deployment status.
- Hover your cursor over the time elapsed indicator for a message (for example, **1m 5s**) to view the elapsed time, and start and stop times for the deployment.

**Step 4** Click **show deployment history** to view more detailed information about the deployment jobs.

The Deployment History table lists the deployment jobs in the left column in reverse chronological order.

- a) Select a deployment job.

The table in the right column shows each device that was included in the job, and the deployment status per device.

- b) To view responses from the device, and commands sent to the device during deployment, click download in the **Transcript** column for the device.

The transcript includes the following sections:

- **Snort Apply**—If there are any failures or responses from Snort-related policies, messages appear in this section. Normally, the section is empty.
- **CLI Apply**—This section covers features that are configured using commands sent to the Lina process.
- **Infrastructure Messages**—This section shows the status of different deployment modules.

In the **CLI Apply** section, the deployment transcript includes commands sent to the device, and any responses returned from the device. These responses can be informative messages or error messages. For failed deployments, look for messages that indicate errors with the commands. Examining these errors can be particularly helpful if you are using FlexConfig policies to configure customized features. These errors can help you correct the script in the FlexConfig object that is trying to configure the commands.

**Note** There is no distinction made in the transcript between commands sent for managed features and those generated from FlexConfig policies.

For example, the following sequence shows that the management center sent commands to configure GigabitEthernet0/0 with the logical name outside. The device responded that it automatically set the security level to 0. The threat defense does not use the security level for anything.

```

===== CLI APPLY =====

FMC >> interface GigabitEthernet0/0
FMC >> nameif outside
FTDv 192.168.0.152 >> [info] : INFO: Security level for "outside" set to 0 by default.

```

## View Upgrade Messages

You must be an Admin user or have the **Updates** permission to view these messages.

### Procedure

- 
- Step 1** Click **Notifications** to display the Message Center.
- Step 2** Click **Upgrades**.
- Step 3** You can do the following:
- Click **total** to view all current upgrade tasks.
  - Click on a status value to see messages with only that status.

- Click **Device Management** for more details on the upgrade task.
- 

## View Health Messages

You must be an Admin user or have the **Health** permission to view these messages.

### Procedure

---

- Step 1** Click **Notifications** to display the Message Center.
- Step 2** Click **Health**.
- Step 3** You have the following choices:
- Click **total** to view all current health statuses. The break-up of the severity, namely, warning, critical, and error is also displayed.
  - Click on a status value to view only messages with that status.
  - Hover your cursor over the relative time indicator for a message (for example, **3 day(s) ago**) to view the time of the most recent update for that message.
  - To view detailed health status information for a particular message, click the message.
  - To view complete health status on the Health Monitoring page, click **Health Monitor**.
- 

## View Task Messages

Everyone can see their own tasks. To see the tasks of other users, you must be an Admin user or have the **View Other Users' Tasks** permission.

### Procedure

---

- Step 1** Click **Notifications** to display the Message Center.
- Step 2** Click **Tasks**.
- Step 3** You have the following choices:
- Click **total** to view all current task statuses. To view the tasks based on the status, namely, waiting, running, retrying, success, and failures, click on them.
  - Click a status value to view only messages for tasks with the that status.
- Note** Messages for stopped tasks appear only in the total list of task status messages. You cannot filter on stopped tasks.
- Hover your cursor over the relative time indicator for a message (e.g., **3 day(s) ago**) to view the time of the most recent update for that message.
  - Click any link within a message to view more information about the task.

- If more task status messages are available for display, click **Fetch more messages** at the bottom of the message list to retrieve them.

## Manage Task Messages

Everyone can see their own tasks. To see the tasks of other users, you must be an Admin user or have the **View Other Users' Tasks** permission.

### Procedure

**Step 1** Click System Status to display the Message Center.

**Step 2** Click Tasks.

**Step 3** You have the following choices:

- If more task status messages are available for display, click on **Fetch more messages** at the bottom of the message list to retrieve them.
- To remove a single message for a completed task (status stopped, success, or failure), click on **Remove** (  ) next to the message.
- To remove all messages for all tasks that have completed (status stopped, success, or failure), filter the messages on **total** and click on **Remove all completed tasks**.
- To remove all messages for all tasks that have completed successfully, filter the messages on **success**, and click on **Remove all successful tasks**.
- To remove all messages for all tasks that have failed, filter the messages on **failure**, and click on **Remove all failed tasks**.

## Memory Usage Thresholds for Health Monitor Alerts

The Memory Usage health module compares memory usage on an appliance to the limits configured for the module and alerts when usage exceeds the levels. The module monitors data from managed devices and from the management center itself.

Two configurable thresholds for memory usage, Critical and Warning, can be set as a percentage of memory used. When these thresholds are exceeded, a health alarm is generated with the severity level specified. However, the health alarm system does not calculate these thresholds in an exact manner.

With high memory devices, certain processes are expected to use a larger percentage of total system memory than in a low memory footprint device. The design is to use as much of the physical memory as possible while leaving a small value of memory free for ancillary processes.

Compare two devices, one with 32 GB of memory and one with 4 GB of memory. In the device with 32 GB of memory, 5% of memory (1.6GB) is a much larger value of memory to leave for ancillary processes than in the device with 4 GB of memory (5% of 4GB = 200MB).

To account for the higher percentage use of system memory by certain processes, the management center calculates the total memory to include both total physical memory and total swap memory. Thus the enforced memory threshold for the user-configured threshold input can result in a Health Event where the “Value” column of the event does not match the value that was entered to determine the exceeded threshold.

Beginning with version 7.4.1, the memory usage health module calculates memory usage by taking into account the free memory available, swap memory available, and buffer cache. To avoid premature memory usage health alerts, it is recommended not to exceed the warning and critical alarm thresholds of 88% and 90%, respectively.

The following table shows examples of user-input thresholds and the enforced thresholds, depending on the installed system memory.

**Note** The values in this table are examples. You can use this information to extrapolate thresholds for devices that do not match the installed RAM shown here, or you can contact Cisco TAC for more precise threshold calculations.

**Table 27: Memory Usage Thresholds Based On Installed RAM**

| User-Input Threshold Value | Enforced Threshold Per Installed Memory (RAM) |      |       |       |
|----------------------------|-----------------------------------------------|------|-------|-------|
|                            | 4 GB                                          | 6 GB | 32 GB | 48 GB |
| 10%                        | 10%                                           | 34%  | 72%   | 81%   |
| 20%                        | 20%                                           | 41%  | 75%   | 83%   |
| 30%                        | 30%                                           | 48%  | 78%   | 85%   |
| 40%                        | 40%                                           | 56%  | 81%   | 88%   |
| 50%                        | 50%                                           | 63%  | 84%   | 90%   |
| 60%                        | 60%                                           | 70%  | 88%   | 92%   |
| 70%                        | 70%                                           | 78%  | 91%   | 94%   |
| 80%                        | 80%                                           | 85%  | 94%   | 96%   |
| 90%                        | 90%                                           | 93%  | 97%   | 98%   |
| 100%                       | 100%                                          | 100% | 100%  | 100%  |

## Disk Usage and Drain of Events Health Monitor Alerts

The Disk Usage health module compares disk usage on a managed device’s hard drive and malware storage pack to the limits configured for the module and alerts when usage exceeds the percentages configured for the module. This module also alerts when the system excessively deletes files in monitored disk usage categories, or when disk usage excluding those categories reaches excessive levels, based on module thresholds.

This topic describes the symptoms and troubleshooting guidelines for two health alerts generated by the Disk Usage health module:

- Frequent Drain of Events
- Drain of Unprocessed Events

The disk manager process manages the disk usage of a device. Each type of file monitored by the disk manager is assigned with a silo. Based on the amount of disk space available on the system the disk manager computes a High Water Mark (HWM) and a Low Water Mark (LWM) for each silo.

To display detailed disk usage information for each part of the system, including silos, LWMs, and HWMs, use the **show disk-manager** command.

## Examples

The following is an example of the disk manager information:

```
> show disk-manager
Silo                               Used           Minimum       Maximum
Temporary Files                   0 KB           499.197 MB   1.950 GB
Action Queue Results              0 KB           499.197 MB   1.950 GB
User Identity Events              0 KB           499.197 MB   1.950 GB
UI Caches                          4 KB           1.462 GB     2.925 GB
Backups                           0 KB           3.900 GB     9.750 GB
Updates                           0 KB           5.850 GB     14.625 GB
Other Detection Engine             0 KB           2.925 GB     5.850 GB
Performance Statistics            33 KB          998.395 MB   11.700 GB
Other Events                       0 KB           1.950 GB     3.900 GB
IP Reputation & URL Filtering       0 KB           2.437 GB     4.875 GB

```

## Health Alert Format

When the Health Monitor process on the management center runs (once every 5 minutes or when a manual run is triggered), the Disk Usage module looks into the diskmanager.log file and, if the correct conditions are met, the health alert is triggered.

The structures of these health alerts are as follows:

- Frequent drain of <SILO NAME>
- Drain of unprocessed events from <SILO NAME>

For example,

- Frequent drain of Low Priority Events
- Drain of unprocessed events from Low Priority Events

Its possible for any silo to generate a *Frequent drain of <SILO NAME>* health alert. However, the most commonly seen are the alerts related to events. Among the event silos, the *Low Priority Events* are often seen because device generates this type of events frequently.

A *Frequent drain of <SILO NAME>* event has a **Warning** severity level when seen in relation to an event-related silo, because events will be queued to be sent to the management center. For a non-event related silo, such as the *Backups* silo, the alert has a **Critical** severity level because this information is lost.

---

**Important** Only event silos generate a *Drain of unprocessed events from <SILO NAME>* health alert. This alert always has a **Critical** severity level.

---

Additional symptoms besides the alerts can include:

- Slowness on the management center user interface
- Loss of events

### Common Troubleshoot Scenarios

A *Frequent drain of <SILO NAME>* event is caused by too much input into the silo for its size. In this case, the disk manager drains (purges) that file at least twice in the last 5-minute interval. In an event type silo, this is typically caused by excessive logging of that event type.

A *Drain of unprocessed events of <SILO NAME>* health alert is caused by a bottleneck in the event processing path.

There are three potential bottlenecks with respect to these Disk Usage alerts:

- Excessive logging — The EventHandler process on threat defense is oversubscribed (it reads slower than what Snort writes).
- Sftunnel bottleneck — The Eventing interface is unstable or oversubscribed.
- SFDataCorrelator bottleneck — The data transmission channel between the management center and the managed device is oversubscribed.

### Excessive Logging

One of the most common causes for the health alerts of this type is excessive input. The difference between the Low Water Mark (LWM) and High Water Mark (HWM) gathered from the **show disk-manager** command shows how much space there is available to take on that silo to go from LWM (freshly drained) to the HWM value. If there are frequent drain of events (with or without unprocessed events), review the logging configuration.

- Check for double logging — Double logging scenarios can be identified if you look at the correlator *perfstats* on the management center:

```
admin@FMC:~$ sudo perfstats -Cq < /var/sf/rna/correlator-stats/now
```
- Check logging settings for the ACP — Review the logging settings of the Access Control Policy (ACP). If the logging setting includes both "Beginning" and "End" of connection, modify the setting to log only the end to reduce the number of events.

### Communications Bottleneck – Sftunnel

Sftunnel is responsible for encrypted communications between the management center and the managed device. Events are sent over the tunnel to the management center. Connectivity issues and/or instability in the communication channel (sftunnel) between the managed device and the management center can be due to:

- Sftunnel is down or is unstable (flaps).

Ensure that the management center and the managed device have reachability between their management interfaces on TCP port 8305.

The sftunnel process should be stable and should not restart unexpectedly. Verify this by checking the `/var/log/message` file and search for messages that contain the `sftunneld` string.

- Sftunnel is oversubscribed.

Review trend data from the Health Monitor and look for signs of oversubscription of the management center's management interface, which can be a spike in management traffic or a constant oversubscription.

Use as a secondary management interface for eventing. To use this interface, you must configure its IP address and other parameters at the threat defense CLI using the **configure network management-interface** command.

### Communications Bottleneck – SFDataCorrelator

The SFDataCorrelator manages data transmission between the management center and the managed device; on the management center, it analyzes binary files created by the system to generate events, connection data, and network maps. The first step is to review the `diskmanager.log` file for important information to be gathered, such as:

- The frequency of the drain.
- The number of files with Unprocessed Events drained.
- The occurrence of the drain with Unprocessed Events.

Each time the disk manager process runs it generates an entry for each of the different silos on its own log file, which is located under `[ngfw]/var/log/diskmanager.log`. Information gathered from the `diskmanager.log` (in CSV format) can be used to help narrow the search for a cause.

Additional troubleshooting steps:

- The command **stats\_unified.pl** can help you to determine if the managed device does have some data which must be sent to management center. This condition can happen when the managed device and the management center experience a connectivity issue. The managed device stores the log data on to a hard drive.

```
admin@FMC:~$ sudo stats_unified.pl
```

- The **manage\_proc.pl** command can reconfigure the correlator on the management center side.

```
root@FMC:~# manage_procs.pl
```

### Before You Contact Cisco TAC

It is highly recommended to collect these items before you contact Cisco TAC:

- Screenshots of the health alert seen.

- Troubleshoot file generated from the management center.
- Troubleshoot file generated from the affected managed device.
- Date and Time when the problem was first seen.
- Information about any recent changes done to the policies (if applicable).
- The output of the stats\_unified.pl command as described in [Communications Bottleneck — SFDDataCorrelator](#), on page 388.

## Health Monitor Reports for Troubleshooting

In some cases, if you have a problem with your appliance, Support may ask you to supply troubleshooting files to help them diagnose the problem. The system can produce troubleshooting files with information targeted to specific functional areas, as well as advanced troubleshooting files you retrieve in cooperation with Support. You can select any of the options listed in the table below to customize the contents of a troubleshooting file for a specific function.

Note that some options overlap in terms of the data they report, but the troubleshooting files will not contain redundant copies, regardless of what options you select.

**Table 28: Selectable Troubleshoot Options**

| This option...                            | Reports...                                                                                                           |
|-------------------------------------------|----------------------------------------------------------------------------------------------------------------------|
| Snort Performance and Configuration       | data and configuration settings related to Snort on the appliance                                                    |
| Hardware Performance and Logs             | data and logs related to the performance of the appliance hardware                                                   |
| System Configuration, Policy, and Logs    | configuration settings, data, and logs related to the current system configuration of the appliance                  |
| Detection Configuration, Policy, and Logs | configuration settings, data, and logs related to detection on the appliance                                         |
| Interface and Network Related Data        | configuration settings, data, and logs related to inline sets and network configuration of the appliance             |
| Discovery, Awareness, VDB Data, and Logs  | configuration settings, data, and logs related to the current discovery and awareness configuration on the appliance |
| Upgrade Data and Logs                     | data and logs related to prior upgrades of the appliance                                                             |
| All Database Data                         | all database-related data that is included in a troubleshoot report                                                  |
| All Log Data                              | all logs collected by the appliance database                                                                         |
| Network Map Information                   | current network topology data                                                                                        |

## Generate Troubleshooting Files for Specific System Functions

You can generate and download customized troubleshooting files that you can send to Support.

### Before you begin

You must be an Admin, Maintenance, Security Analyst, or Security Analyst (Read Only) user to perform this task.

### Procedure

---

**Step 1** Choose **System** (⚙) > **Health** > **Monitor**, click the device in the left panel, then **View System & Troubleshoot Details**, and then click **Generate Troubleshooting Files**.

- Note**
- When you generate management center troubleshooting files from the Management Center web interface, the file is stored in the management center. Note that only the latest troubleshooting file will be stored in the management center.
  - When you generate threat defense troubleshooting files from the Management Center web interface, the file is generated in threat defense and copied to the management center. Note that only the latest threat defense troubleshooting file will be stored in the management center.
  - When the troubleshooting files for management center and threat defense are generated from the CLI, all the versions of the troubleshooting files are maintained in management center and threat defense respectively.

**Step 2** Choose All Data to generate all possible troubleshooting data, or check individual boxes as described in [View Task Messages, on page 383](#).

**Step 3** Click **Generate**.

**Step 4** View task messages in the Message Center; see [View Task Messages, on page 383](#).

**Step 5** Find the task that corresponds to the troubleshooting files you generated.

**Step 6** After the appliance generated the troubleshooting files and the task status changes to `Completed`, click **Click to retrieve generated files**.

**Step 7** Follow your browser's prompts to download the file. (The troubleshooting files are downloaded in a single `.tar.gz` file.)

**Step 8** Follow the directions from Support to send the troubleshooting files to Cisco.

---

## Download Advanced Troubleshooting Files

You can download troubleshooting files.

### Before you begin

You must be an Admin, Maintenance, Security Analyst, or Security Analyst (Read Only) user to perform this task.

### Procedure

---

**Step 1** View the health monitor for the appliance.

- Step 2** Choose **System** (⚙️) > **Health** > **Monitor**, click the device in the left panel, then **View System & Troubleshoot Details**, and then click **Advanced Troubleshooting**.
- Step 3** In **File Download**, enter the file name supplied by Support.
- Step 4** Click **Download**.
- Step 5** Follow your browser's prompts to download the file.
- Note** For managed devices, the system renames the file by prepending the device name to the file name.
- Step 6** Follow the directions from Support to send the troubleshooting files to Cisco.
- 

## General Troubleshooting

An internal power failure (hardware failure, power surge, and so on) or an external power failure (unplugged cord) can result in an ungraceful shutdown or reboot of the system. This can result in data corruption.

## Connection-Based Troubleshooting

Connection-based troubleshooting or debugging provides uniform debugging across modules to collect appropriate logs for a specific connection. It also supports level-based debugging up to seven levels and enables uniform log collection mechanism across modules. Connection-based debugging supports the following:

- A common connection-based debugging subsystem to troubleshoot issues in threat defense
- Uniform format for debug messages across modules
- Persistent debug messages across reboots
- End-to-end debugging across modules based on an existing connection
- Debugging ongoing connections

For more information about the troubleshooting connections, see [Troubleshoot a Connection](#), on page 391.

## Troubleshoot a Connection

### Procedure

---

- Step 1** Configure a filter to identify a connection using the **debug packet-condition** command.
- Example:
- ```
Debug packet-condition match tcp 192.168.100.177 255.255.255.255 192.168.102.177 255.255.255.255
```
- Step 2** Enable debugs for the interested modules and the corresponding levels. Enter the **debug packet** command.

Example:

```
Debug packet acl 5
```

**Step 3** Start debugging the packets using the following command:

```
debug packet-start
```

**Step 4** Fetch the debug messages from database to analyze the debug messages using the following command:

```
show packet-debuggs
```

**Step 5** Stop debugging the packets using the following command:

```
debug packet-stop
```

## Advanced Troubleshooting for the Secure Firewall Threat Defense Device

You can use Packet Tracer and Packet Capture features to perform an in-depth troubleshooting analysis on a Secure Firewall Threat Defense device. A packet tracer allows a firewall administrator to inject a virtual packet into a security appliance and track the flow from ingress to egress. Along the way, the packet is evaluated against flow and route lookups, ACLs, protocol inspection, NAT, and intrusion detection. This utility is effective because it can simulate real-world traffic by specifying source and destination addresses with protocol and port information. Packet capture is available with the trace option, which provides you with a verdict as to whether the packet is dropped or successful.

For more information about the troubleshooting files, see [Download Advanced Troubleshooting Files](#), on page 390.

### Packet Capture Overview

The packet capture feature with trace option allows real packets that are captured on the ingress interface to be traced through the system. The trace information is displayed at a later stage. These packets are not dropped on the egress interface, as they are real data-path traffic. Packet capture for threat defense devices supports troubleshooting and analysis of data packets.

Once the packet is acquired, Snort detects the tracing flag that is enabled in the packet. Snort writes tracer elements, through which the packet traverses. Snort verdict as a result of capturing packets can be one of the following:

*Table 29: Snort Verdicts*

Verdict	Description
Pass	Allow analyzed packet.
Block	Packet not forwarded.
Replace	Packet modified.
AllowFlow	Flow passed without inspection.

Verdict	Description
BlockFlow	Flow was blocked.
Ignore	Flow was blocked; occurs only for sessions with flows blocked on passive interfaces.
Retry	Flow is stalled, waiting on a enamelware or URL category/reputation query. In the event of a timeout, processing continues with an unknown result: in the case of enamelware, the file is allowed; in the case of URL category/reputation, AC rule lookup continues with an uncategorized and unknown reputation.

Based on the Snort verdict, the packets are dropped or allowed. For example, the packet is dropped if the Snort verdict is **BlockFlow**, and the subsequent packets in the session are dropped before reaching Snort. When the Snort verdict is **Block** or **BlockFlow**, the **Drop Reason** can be one of the following:

**Table 30: Drop Reasons**

Blocked or Flow Blocked by...	Cause
Snort	Snort is unable to process the packet, erg., snort can't decode packet since it is corrupted or has invalid format.
the App Id preprocessed	App Id module/preprocessed does not block packet by itself, but this may indicate that App Id detection causes other module (erg., firewall) to match a blocking rule.
the SSL preprocessed	There is a block/reset rule in SSL policy to match the traffic.
the firewall	There is a block/reset rule in firewall policy to match the traffic.
the captive portal preprocessed	There is a block/reset rule using the identity policy to match the traffic.
the safe search preprocessed	There is a block/reset rule using the safe-search feature in firewall policy to match the traffic.
the SI preprocessed	There is a block/reset rule a in Security Intelligence tab of AC Policy to block the traffic, erg., DNS or URL SI rule.
the filterer preprocessed	There is a block/reset rule in filterer tab of AC policy to match the traffic.
the stream preprocessed	There is an intrusion rule blocking/reset stream connection, erg., blocking when TCP normalization error.

Blocked or Flow Blocked by...	Cause
the session preprocessed	This session was already blocked earlier by some other module, so session preprocessed is blocking further packets of the same session.
the fragmentation preprocessed	Blocking because earlier fragment of the data is blocked.
the snort response preprocessed	There is a react snort rule, erg., sending a response page on a particular HTTP traffic.
the snort response preprocessed	There is a snort rule to send custom response on packets matching conditions.
the reputation preprocessed	Packet matches a reputation rule, erg., blocking a given IP address.
the x-Link2State preprocessed	Blocking due to buffer overflow vulnerability detected in SMTP.
back orifice preprocessed	Blocking due to detection of back orifice data.
the SMB preprocessed	There is a snort rule to block SMB traffic.
the file process preprocessed	There is file policy that blocks a file, erg., enamelware blocking.
the IPS preprocessed	There is a snort rule using IPS, erg., rate filtering.

The packet capture feature allows you to capture and download packets that are stored in the system memory. However, the buffer size is limited to 32 MB due to memory constraint. Systems capable of handling very high volume of packet captures exceed the maximum buffer size quickly and thereby the necessity of increasing the packet capture limit is required. It is achieved by using the secondary memory (by creating a file to write the capture data). The maximum supported file size is 10 GB.

When the **file-size** is configured, the captured data gets stored to the file and the file name is assigned based on the capture name **recapture**.

The **file-size** option is used when you need to capture packets with the size limit more than 32 MB.

For information, see the [Cisco Secure Firewall Threat Defense Command Reference](#).

## Use the Capture Trace

Packet capture is a utility that provides a live snapshot of network traffic passing the specified interface of a device based on a defined criteria. This process continues to capture the packets as long as it has not paused, or the allocated memory has not exhausted.

Packet capture data includes information from Snort and preprocessors about verdicts and actions the system takes while processing a packet. Multiple packet captures are possible at a time. You can configure the system to modify, delete, clear, and save captures.

---

**Note** Capturing packet data requires packet copy. This operation may cause delays while processing packets and may also degrade the packet throughput. We recommend that you use packet filters to capture specific traffic data.

---

### Before you begin

To use the packet capture tool on Secure Firewall Threat Defense devices, you must be an Admin or Maintenance user.

## Procedure

- 
- Step 1** On the management center, choose **Devices > Packet Capture**.
- Step 2** Select a device.
- Step 3** Click **Add Capture**.
- Step 4** Enter the **Name** for capturing the trace.
- Step 5** Select the **Interface** for the capturing the trace.
- Step 6** Specify **Match Criteria** details:
- Select the **Protocol**.
  - Enter the IP address for the **Source Host**.
  - Enter the IP address for the **Destination Host**.
  - (Optional) Check **SGT number** check box, and enter a Security Group Tag (SGT).
- Step 7** Specify **Buffer** details:
- (Optional) Enter a maximum **Packet Size**.
  - (Optional) Enter a minimum **Buffer Size**.
  - Select either **Continuous Capture** if you want the traffic captured without interruption, or **Stop when full** if you want the capture to stop when the maximum buffer size is reached.
- Note** If **Continues Capture** is enabled, and when the allocated memory is full, the oldest captured packets in the memory is overwritten by the new captured packets.
- Check the check box of **Trace**, if you want to capture the details for each packet.
  - Enter the value in **Trace Count** field. Default value is 128. You can enter values in the range of 1-1000.
- Step 8** Click **Save**.

---

The packet capture screen displays the packet capture details and its status. To have the packet capture page auto refreshed, check the **Enable Auto Refresh** check box and enter the auto refresh interval in seconds.

You can do the following on the packet capture:

- **Edit** () to modify the capture criteria.
- **Delete** () to delete the packet capture and the captured packets.

- **Clear** (🗑️) to erase all the captured packets from a Packet Capture. To erase the captured packets from all of the existing packet captures, click **Clear All Packets**.
- **Pause** (⏸️) to temporarily halt capturing packets.
- **Save** (💾) to save a copy of captured packets on a local machine in ASCII or PCAP format. Choose the required format option, and click **Save**. The saved packet capture is downloaded to your local machine.
- To view the details of the packets being captured, click the required capture row.

## Packet Tracer Overview

The Packet Tracer tool allows you to test policy configuration by modeling a packet with source and destination addresses, and protocol characteristics. The trace does a policy lookup to validate if the packet will be permitted or denied access based on the configured access rules, NAT, routing, access policies and rate-limiting policies. The packet flow is simulated based on interfaces, source address, destination address, ports, and protocols. This method of testing the packets allows you to verify the effectiveness of your policies and test whether the types of traffic you want to allow or deny are handled as required.

Besides verifying your configuration, you can use the tracer to debug unexpected behavior, such as packets being denied access when they should be allowed. To simulate a packet fully, the packet tracer traces the data path—slow-path and fast-path modules. Initially, processing was transacted on per-session and per-packet basis. The Packet Tracer tool and Capture with Trace feature log the tracing data on per packet basis when the firewall processes packets per session or per packet.

### PCAP File

You can initiate a packet tracer using a PCAP file, and that has a complete flow. Currently, only a PCAP with a single TCP/UDP-based flow and a maximum of 100 packets is supported. The packet tracer tool reads the PCAP file, and initializes the state for client and server replay entities. The tool starts replaying the packets in a synchronized manner by collecting and storing the trace output of each packet within the PCAP for subsequent processing and display.

### PCAP Replay

Packet replay is executed by the sequence of the packet in the PCAP file, and interferences, if any, to the replay activity terminates it and concludes the replay. The trace output is generated for all the packets in the PCAP on the specified ingress interface and egress interface, thereby providing a complete context for flow evaluation.

PCAP replay is not supported for some features that dynamically modify the packet during replay, such as IPsec, VPN, SSL, HTTPs decryption, NAT, and so on.

## Use the Packet Tracer

To use a packet tracer on Secure Firewall Threat Defense devices, you must be an Admin or Maintenance user.

### Procedure

- 
- Step 1** On the management center, choose **Devices > Packet Tracer**.
  - Step 2** From the **Select Device** drop-down, choose the device on which you want to run the trace.

- Step 3** From the **Ingress Interface** drop-down, choose the ingress interface for the packet trace.
- Note** Do not select VTI. VTI as ingress interface is not supported for packet tracer.
- Step 4** To use a PCAP replay in the packet-tracer, do the following:
- Click **Select a PCAP File**.
  - To upload a new PCAP file, click **Upload a PCAP file**. To reuse a recently uploaded file, click the file from the list.
- Note** Only .pcap and .pcapng file formats are supported. The PCAP file can contain only a single TCP/UDP based flow with a maximum of 100 packets. The maximum character limit on the PCAP file name (including the file formats) is 64.
- In the **Upload PCAP** box, you can either drag a PCAP file or click in the box to browse and upload the file. On selecting the file, the upload process starts automatically.
  - Go to this [Step 13](#).
- Step 5** To define the trace parameters, from the **Protocol** drop-down menu, select the packet type for the trace, and specify the protocol characteristics:
- **ICMP**—Enter the ICMP type, ICMP code (0-255), and optionally, the ICMP identifier.
  - **TCP/UDP/SCTP**—Enter the source and destination port numbers.
  - **GRE/IPIP**—Enter the protocol number, 0-255.
  - **ESP**—Enter the SPI value for Source, 0-4294967295.
  - **RAWIP**—Enter the port number, 0-255.
- Step 6** Select the **Source Type** for the packet trace, and enter the source IP address.
- Source and destination types include IPv4, IPv6, and fully-qualified domain names (FQDN). You can specify IPv4 or IPv6 addresses and FQDN, if you use Cisco TrustSec.
- Step 7** Select the **Source Port** for the packet trace.
- Step 8** Select the **Destination** type for the packet trace, and enter the destination IP address.
- Destination type options vary depending on the source type that you select.
- Step 9** Select the **Destination Port** for the packet trace.
- Step 10** Optionally, if you want to trace a packet where the Security Group Tag (SGT) value is embedded in the Layer 2 CMD header (TrustSec), enter a valid **SGT number**.
- Step 11** If you want packet tracer to enter a parent interface, which is later redirected to a sub-interface, enter a **VLAN ID**.
- This value is optional for non-sub-interfaces only, since all the interface types can be configured on a sub-interface.
- Step 12** Specify a **Destination MAC Address** for the packet trace.
- If the Secure Firewall Threat Defense device is running in transparent firewall mode, and the ingress interface is VTEP, **Destination MAC Address** is required if you enter a value in **VLAN ID**. Whereas if the interface is a bridge group member, **Destination MAC Address** is optional if you enter a **VLAN ID** value, but required if you do not enter a **VLAN ID** value.

If the Secure Firewall Threat Defense is running in routed firewall mode, **VLAN ID** and **Destination MAC Address** are optional if the input interface is a bridge group member.

- Step 13** (Optional) If you want the packet-tracer to ignore the security checks on the simulated packet, click **Bypass all security checks for simulated packet**. This enables packet-tracer to continue with tracing of packet through the system which, otherwise would have been dropped.
- Step 14** (Optional) To allow the packet to be sent out through the egress interface from the device, click **Allow simulated packet to transmit from device**.
- Step 15** (Optional) If you want the packet-tracer to consider the injected packet as an IPsec/SSL VPN decrypted packet, click **Treat simulated packet as IPsec/SSL VPN decrypt**.
- Step 16** Click **Trace**.

---

The **Trace Result** displays the results for each phase that the PCAP packets has traveled through the system. Click on the individual packet to view the traces results for the packet. You can do the following:

- Copy (📄) the trace results to clipboard.
- Expand or collapse (⌵) the displayed results.
- Maximize (⌵) the trace result screen.

The time elapsed information that is useful to gauge the processing efforts are displayed for each phase. The total time that is taken for the entire flow of packets flowing from an ingress to an egress interface is also displayed in the results section.

The **Trace History** pane displays the stored trace details for each PCAP trace. It can store up to 100 packet traces. You can select a saved trace and run the packet trace activity again. You can do the following:

- Search for a trace using any of the trace parameters.
- Disable saving of the trace to history using the  button.
- Delete specific trace results.
- Clear all the traces.

## CPU Profiler Overview

The CPU profiler gathers data on CPU usage by individual modules or inspectors of Snort 3, while packets are being processed within a specific timeframe. It provides information on the amount of CPU time that each module consumes in relation to the total CPU usage of the Snort 3 process. Using the CPU profiler does not require reloading the configuration or restarting Snort 3, thus minimizing downtime. The profiling result displays the processing time taken by all the modules during the last profiling session. CPU profiling results are saved in JSON format in the threat defense device and synchronized in the management center.

---

**Caution** CPU profiling might cause system performance degrade of approximately 3 percent.

---

## Use the CPU Profiler

### Before you begin

You must have Version 7.6 or later devices with Snort 3 to use CPU Profiling.

### Procedure

---

**Step 1** From the management center, choose **Devices > Snort 3 Profiling**.

**Step 2** Click the **CPU Profiling** tab.

**Step 3** From the **Select device for CPU Profiling** drop-down list, choose a device for CPU profiling.

**Note** You can run multiple profiling sessions simultaneously on different devices.

**Step 4** To start a CPU profiling session, click **Start**. (The session automatically stops after 120 minutes.)

You can stop the profiling session at any time by clicking **Stop**. However, canceling it before the scheduled 120 minutes might not give precise results.

**Note** While the CPU profiling session is in progress, a task is created. Click **Notifications > Tasks** to view the details.

The latest profiling result is automatically displayed in the **CPU Profiling Results** section. The table contains statistics for the processing time taken by all the Snort 3 modules or inspectors during the last profiling session. You can view the CPU profiler output in tabular format:

- **Module:** Name of the module or inspector.
- **% Total of CPU Time:** Percentage of time taken by the module relative to the overall time taken by Snort 3 for processing traffic. If this value is considerably higher than that of other modules, it means the module is contributing more to the unsatisfactory performance of Snort 3.
- **Time (µs):** Total time (in microseconds) taken by each module.
- **Avg/Check:** Average time taken by the module each time the module was invoked.
- **% Caller:** Time taken by the submodule (if configured) relative to the main module. This value is used for debugging purposes.

**Step 5** (Optional) Click **Download Snapshot** to download the profiling result. The downloaded file is in CSV format and contains all the fields from the profiling results page.

**Step 6** (Optional) Click the **Filter by % of Snort time** toggle button to filter out modules whose execution consumed more than *n*% of the profiling time.

**Step 7** (Optional) Use the **Search** field to search through the fields in the **CPU Profiling Results** table.

**Note** Except for **Module**, you can click any of the other column headers to sort the data.

**Step 8** (Optional) Click the **Profiling History** section (collapsible panel on the left) to expand it and view a set of cards representing the previous profiling sessions for a chosen device. When you click a card from history, the details are displayed in the **CPU Profiling Results** section.

---

---

**Note** If you initiate a deployment while CPU profiling is running, the profiling session is automatically terminated to accommodate the deployment, except for deployments resulting from changes to the access control policy rules and security intelligence. You must run the CPU profiling for the device again.

---

## Rule Profiler Overview

The Snort 3 rule profiler gathers data on the time spent processing a set of Snort 3 intrusion rules, highlights potential issues, and shows the rules with unsatisfactory performance. Within the Snort 3 engine, the rule profiler inspects traffic using the Snort 3 intrusion detection mechanism. The rule profiler displays the top 100 IPS rules that required the maximum time to check. Triggering the rule profiler does not require Snort 3 reload or restart. The rule profiling results are saved in JSON format in the threat defense device and synchronized in the management center.

## Use the Rule Profiler

### Before you begin

You must have Version 7.6 or later devices with Snort 3 to use Rule Profiling.

### Procedure

---

**Step 1** From the management center, choose **Devices > Snort 3 Profiling**.

**Step 2** Click the **Rule Profiling** tab.

**Step 3** From the **Select device for Rule Profiling** drop-down list, choose a device for rule profiling.

**Note** You can run multiple profiling sessions simultaneously on different devices.

**Step 4** To start a rule profiling session, click **Start**. (The session automatically stops after 120 minutes.)

You can stop the profiling session at any time by clicking **Stop**. However, canceling it before the scheduled 120 minutes might not give precise results.

**Note** While the rule profiling session is in progress, a task is created. Click **Notifications > Tasks** to view the details.

The latest profiling result is automatically displayed in the **Rule Profiling Results** section. The table contains statistics for the rules that took the most time to process (sorted in descending order) by the total time (in microseconds [ $\mu$ s]). You can view the IPS rule profiler output in tabular format:

- **% of Snort Time**: Time spent for processing the rule, relative to the total time of the Snort 3 operation.
- **Rev**: Revision number of the rule.
- **Checks**: Number of times the IPS rule was executed.
- **Matches**: Number of times the IPS rule fully matched in the traffic.
- **Alerts**: Number of times the IPS rule triggered an IPS alert.

- **Time:** Time (in microseconds) spent by Snort in checking the IPS rule.
- **Avg/Check:** Average time spent by Snort on a single check of the rule.
- **Avg/Match:** Average time spent by Snort on a single check, which resulted in a match.
- **Avg/Non-Match:** Average time spent by Snort on a single check, which did not result in a match.
- **Timeouts:** Number of times the rule exceeded the Rule Handling - Threshold configured in the Latency-Based Performance Settings of the access control policy.
- **Suspends:** Number of times the rule was suspended due to consecutive threshold violations.

- Step 5** (Optional) Click **Download Snapshot** to download the profiling result. The downloaded file is in CSV format and contains all the fields from the profiling results page.
- Step 6** (Optional) Click the **Filter by % of Snort time** toggle button to filter out rules whose execution took more than  $n\%$  of the profiling time. In general, a rule is considered as performing unsatisfactorily if it consumes 0.2% or more of Snort's overall processing time.
- Step 7** (Optional) Use the **Search** field to search through the fields in the **Rule Profiling Results** table.
- Step 8** (Optional) Click the **Rule Profiling History** section (collapsible panel on the left) to expand it and view a set of cards representing the previous profiling sessions for a chosen device. When you click a card from the history, the details are displayed in the **Rule Profiling Results** section.

**Note** If you initiate a deployment while rule profiling is running, the profiling session is automatically terminated to accommodate the deployment, except for deployments resulting from changes to the access control policy rules and security intelligence. You must run the rule profiling for the device again.

## How to use the Threat Defense Diagnostic CLI from the Web Interface

You can execute the selected threat defense diagnostic CLI commands from the management center. The commands **ping** (except **ping system**), **traceroute**, and select **show** commands run in the diagnostic CLI rather than the regular CLI.

When you run the **show** commands, if the message `Unable to execute the command properly. Please see logs for more details` is displayed, it means that the command is not valid in the diagnostic CLI. For example, **show access-list** works, but this message will be displayed if you enter **show access-control-policy**. To use non-diagnostic commands, use SSH to log in to a device outside management center.

For more information on the threat defense CLI, see the [Cisco Secure Firewall Threat Defense Command Reference](#).

### Before you begin

- You must be an Admin, Maintenance, or Security Analyst to use the diagnostic CLI.
- The purpose of diagnostic CLI is to enable the quick use of a few commands that are useful in troubleshooting a device. For access to the full range of commands, open an SSH session directly with the device.

- In deployments using management center high availability, diagnostic CLI is available only in the active management center.

## Procedure

**Step 1** Choose **Devices > Threat Defense CLI**.

You can also access the CLI tool through the health monitor for the device (**System**  **> Health > Monitor**). From there, you can select the device, click the **View System and Troubleshoot Details** link, click **Advanced Troubleshooting**, then click **Threat Defense CLI** on that page.

**Step 2** From the **Device** drop-down list, choose the device on which to execute the diagnostic command.

**Step 3** From the **Command** drop-down list, choose the command that you want to execute.

**Step 4** Enter the command parameters in the **Parameters** field.

See the [Cisco Secure Firewall Threat Defense Command Reference](#) for the valid parameters.

For example, to execute **show access-list** command, choose **show** from the **Command** drop-down list, then enter **access-list** in the **Parameters** field.

**Note** Do not type the full command in the **Parameters** field. Type only the relevant keywords.

**Step 5** Click **Execute** to view the command output.

If the message `Unable to execute the command properly. Please see logs for more details.` is displayed, examine the parameters closely. There might be syntax errors.

This message can also mean that the command you are trying to execute is not a valid command within the context of the diagnostic CLI (which you have accessed from the device using the **system support diagnostic-cli** command). Log in to the device using SSH to use these commands.

## Feature-Specific Troubleshooting

See the following table for feature-specific troubleshooting tips and techniques.

**Table 31: Feature-Specific Troubleshooting Topics**

Feature	Relevant Troubleshooting Information
Application control	<i>Best Practices for Application Control</i> in the <a href="#">Cisco Secure Firewall Management Center Device Configuration Guide</a>
LDAP external authentication	<a href="#">Troubleshooting LDAP Authentication Connections, on page 267</a>
Licensing	<a href="#">Troubleshooting Smart Licensing, on page 310</a>

- [Back Up Managed Devices, on page 412](#)
- [Restore Security Cloud Control-Managed Devices, on page 413](#)

## About Backup and Restore

The ability to recover from a disaster is an essential part of any system maintenance plan. As part of your disaster recovery plan, we recommend that you perform periodic backups to a secure remote location.

### On-Demand Backups

You can perform on-demand backups for multiple Secure Firewall Threat Defense devices in Security Cloud Control.

For more information, see [Back Up Managed Devices, on page 412](#).

### Scheduled Backups

You can use the scheduler on Security Cloud Control to automate backups. You can also schedule remote device backups from Security Cloud Control.

The Security Cloud Control setup process schedules weekly configuration-only backups, to be stored locally. This is not a substitute for full off-site backups. After initial setup finishes, you must review your scheduled tasks and adjust them to fit your organization's needs.

For more information, see [Back Up Managed Devices, on page 412](#).

### Store Backup Files

When you back up a device, the cloud-delivered Firewall Management Center stores the backup files in its secure cloud storage.

For more information, see [Back Up Managed Devices, on page 412](#).

### Restore Managed Devices

You must use the threat defense CLI to restore the threat defense device.

For more information, see [Restore Security Cloud Control-Managed Devices, on page 413](#).

### What Is Backed Up?

Device backups are always configuration-only.

### What Is Restored?

Restoring configurations overwrites *all* backed-up configurations.

Make sure you understand and plan for the following:

- You cannot restore what is not backed up.
- The threat defense restore process removes VPN certificates and all VPN configurations from threat defense devices, including certificates added after the backup was taken. After you restore a threat defense device, you must re-add/re-enroll all VPN certificates, and redeploy the device.

## Requirements for Backup and Restore

Backup and restore have the following requirements:

### Model Requirements: Backup

You can back up:

- Threat Defense standalone devices, native instances, container instances, HA pairs, and clusters
- Threat Defense Virtual for VMware devices, either standalone or HA pairs, and clusters

Backup is *not* supported for:

- Threat Defense Virtual implementations *other than* for VMware

If you must replace a device where backup and restore is not supported, you must manually recreate device-specific configurations.

### Model Requirements: Restore

A replacement managed device must be the same model as the one you are replacing, with the same number of network modules and same type and number of physical interfaces.

### Version Requirements

As the first step in any backup, note the patch level. To restore a backup, the old and the new appliance must be running the same Firewall version, including patches.

### License Requirements

Address licensing or orphan entitlement concerns as described in the best practices and procedures. If you notice licensing conflicts, contact Cisco TAC.

# Guidelines and Limitations for Backup and Restore

Backup and restore have the following guidelines and limitations.

- 
- Caution** Users with CLI access can access the Linux shell access with the **expert** command, which can present a security risk. For system security reasons, we strongly recommend:
- Only use the Linux shell under TAC supervision or when explicitly instructed by Firewall and Security Cloud Control user documentation.
  - Restrict the list of users with Linux shell access..
  - Do not add users directly in the Linux shell; only use the procedures in this chapter.
- 

## Backup and Restore Is for Disaster Recovery/Return Material Authorization

Backup and restore are primarily intended for Return Material Authorization (RMA) scenarios. Before you begin the restore process of a faulty or failed physical appliance, contact for replacement hardware.

## Backup and Restore Is Not Configuration Import/Export

A backup file contains information that uniquely identifies an appliance, and cannot be shared. Do not use the backup and restore process to copy configurations between appliances or devices, or as a way to save configurations while testing new ones. Instead, use the import/export feature.

For example, threat defense device backups include the device's management IP address and all information the device needs to connect to its managing Security Cloud Control. Do not restore an FTD backup to a device being managed by a different manager; the restored device attempts to connect to the manager specified in the backup.

## Restore Is Individual and Local

You restore threat defense devices individually and locally. This means:

- You cannot batch-restore to high availability (HA) devices. The restore procedures in this guide explain how to restore in an HA environment.
- You cannot use Security Cloud Control to restore a device. For threat defense devices, you must use the threat defense CLI, except for the ISA 3000 zero-touch restore, which uses an SD card and the reset button.
- You cannot use an management center user account to log into and restore one of its managed devices. The management center and threat defense devices maintain their own user accounts.

# Best Practices for Backup and Restore

Backup and restore have the following best practices.

## When to Back Up

We recommend backing up during a maintenance window or other time of low use.

You must back up in the following situations:

- Regular backups.

As part of your disaster recovery plan, we recommend that you perform periodic backups.

- Before upgrade or reimage.

If an upgrade fails catastrophically, you may have to reimage and restore. Reimaging returns most settings to factory defaults, including the system password. If you have a recent backup, you can return to normal operations more quickly.

- After upgrade.

Ensure that you back up the device after upgrade, so that you have a freshly upgraded device backup.

## Maintaining Backup File Security

Backup files are stored as unencrypted archive (.tar) files; they should be stored in a secure repository.

Private keys in PKI objects, which represent the public key certificates and paired private keys that are required to support your deployment are decrypted before they are backed up. The keys are reencrypted with a randomly generated key when you restore the backup.

Backup file should be stored securely.

## Backup and Restore in Threat Defense High Availability Deployments

In a threat defense HA deployment, you must:

- Back up the device pair from the cloud-delivered Firewall Management Center, but restore individually and locally from the threat defense CLI.

The backup process produces unique backup files for threat defense HA devices. Do not restore one HA peer with the backup file from the other. A backup file contains information that uniquely identifies an appliance, and cannot be shared.

A threat defense HA device's role is noted in its backup file name. When you restore, make sure you choose the appropriate backup file: primary vs secondary.

- Do *not* suspend or break HA before you restore.

Maintaining the HA configuration ensures that replacement devices can easily reconnect after restore. Note that you will have to resume HA synchronization to make this happen.

- Do *not* run the restore CLI command on both peers at the same time.

Assuming you have successful backups, you can replace either or both peers in an HA pair. Any physical replacement tasks that you can perform simultaneously: unracking, racking, and so on. However, do *not* run the restore command on the second device until the restore process completes for the first device, including the reboot.

## Backup and Restore in Threat Defense Clustering Deployments

In the threat defense clustering deployment, you must:

- Back up the entire cluster from the cloud-delivered Firewall Management Center, but restore nodes individually and locally from the threat defense CLI.

The backup process produces a bundled tar file that includes unique backup files for each cluster node. Do not restore one node with the backup file from another. A backup file contains information that uniquely identifies a device, and cannot be shared.

The node's role is noted in its backup file name. When you restore, make sure you choose the appropriate backup file: control or data.

You cannot back up individual nodes. If a data node fails to back up, the management center will still back up all other nodes. If the control node fails to back up, the backup is canceled.

- All the nodes that are part of the cluster must be registered in the management center, for the backup to be successful.
- Do *not* suspend or break clustering before you restore. Maintaining the cluster configuration ensures replacement devices can easily reconnect after restore.
- Do *not* run the **restore** CLI command on multiple nodes at the same time. We recommend that you restore the control node first and wait until it rejoins the cluster before you restore any data nodes.

Assuming you have successful backups, you can replace multiple nodes in the cluster. Any physical replacement tasks you can perform simultaneously: unracking, racking, and so on. However, do *not* run the **restore** command on an additional node until the restore process completes for the previous node, including the reboot.

### Before Restore

Before restore, you must:

- Revert licensing changes.

Revert any licensing changes made since you took backup.

Otherwise, you may have license conflicts or orphan entitlements after the restore. However, do *not* unregister from Cisco Smart Software Manager (CSSM). If you unregister from CSSM, you must unregister again after you restore, then re-register.

After the restore completes, reconfigure licensing. If you notice licensing conflicts or orphan entitlements, contact Cisco TAC.

- Disconnect faulty appliances.

Disconnect the management interface, and for devices, the data interfaces.

Restoring a threat defense device sets the management IP address of the replacement device to the management IP address of the old device. To avoid IP address conflicts, disconnect the old device from the management network before you restore the backup on its replacement.

- Do *not* unregister managed devices.

Whether you are restoring a managed device, do not unregister devices from the Security Cloud Control, even if you physically disconnect an appliance from the network.

If you unregister, you must redo some device configurations, such as security zone to interface mappings. After you restore, Security Cloud Control and devices should begin communicating normally.

- Reimage.

In an RMA scenario, the replacement appliance arrives configured with factory defaults. However, if the replacement appliance is already configured, we recommend you reimage. Reimaging returns most settings to factory defaults, including the system password. You can only reimage to major versions, so you may must patch after you reimage.

If you do not reimage, keep in mind that Security Cloud Control intrusion events and file lists are merged rather than overwritten.

### After Restore

After restore, you must:

- Reconfigure anything that was not restored.

This can include reconfiguring licensing, and audit log server certificate settings. You also must re-add/re-enroll failed threat defense VPN certificates.

- Deploy.

After you restore a device, deploy to that device. You *must* deploy. If the device or devices are not marked out of date, force deploy from the Device Management page.

## Back Up Managed Devices

You can perform on-demand or scheduled backups for supported Secure Firewall Threat Defense devices using cloud-delivered Firewall Management Center without a backup profile.

For more information, see [Back Up a Threat Defense Device from Cloud-delivered Firewall Management Center, on page 412](#).

### Related Information

## Back Up a Threat Defense Device from Cloud-delivered Firewall Management Center

Use this procedure to perform an on-demand backup of any of the following devices:

- Threat Defense: Physical devices, standalone, HA, or cluster
- Threat Defense Virtual: VMware, standalone, HA, or cluster

Backup and restore is not supported for any other platforms or configurations.

### Before you begin

You must read and understand the requirements, guidelines, limitations, and best practices. Do not skip any steps or ignore security concerns. Careful planning and preparation can help you avoid missteps.

- [Requirements for Backup and Restore, on page 408](#)
- [Guidelines and Limitations for Backup and Restore, on page 409](#)
- [Best Practices for Backup and Restore, on page 409](#)

**Caution**

Users with CLI access can access the Linux shell access with the **expert** command, which can present a security risk. For system security reasons, we strongly recommend:

- Only use the Linux shell under TAC supervision or when explicitly instructed by Firewall and Security Cloud Control user documentation.
- Restrict the list of users with Linux shell access..
- Do not add users directly in the Linux shell; only use the procedures in this chapter.

**Procedure**

- 
- Step 1** Log in to Security Cloud Control.
- Step 2** From the Security Cloud Control menu, navigate **Administration > Integrations & Migration > Cloud Services** to open the **Services** page.
- Step 3** Select **Cloud-Delivered FMC** and in the **Actions** pane, click **Monitoring** to navigate to the cloud-delivered Firewall Management Center user interface.
- Step 4** Select **System**() and then navigate **Tools > Backup/Restore**.
- Step 5** Click **Managed Device Backup**.
- Step 6** Select one or more threat defense devices in **Managed Devices**.  
For clustering, choose the cluster. You cannot perform backups on individual nodes.
- Step 7** Click **Start Backup** to start the on-demand backup.
- Step 8** Monitor the progress under **Tasks** in the **Notifications** pane.
- 

## Restore Security Cloud Control-Managed Devices

For threat defense devices, you must use the threat defense CLI to restore from backup. You cannot use the management center to restore a device.

**Related Information:**

### Restore a Threat Defense Device

Threat Defense backup and restore is intended for RMA. Restoring the configurations overwrites *all* configurations on the device, including the management IP address. It also reboots the device.

In case of hardware failure, this procedure outlines how to replace a firewall device, either standalone or in an HA pair. It assumes you have access to a successful backup of the device or devices you are replacing.

In a threat defense HA deployment, you can use this procedure to replace either or both peers. To replace both, perform all steps on both devices simultaneously, except the restore CLI command itself. You cannot replace a threat defense HA device without a successful backup.

---

**Note** Do *not* unregister from the Security Cloud Control, even when disconnecting a device from the network. In a threat defense HA deployment, do *not* suspend or break HA. Maintaining these links ensures replacement devices can automatically reconnect after a restore.

---

### Before you begin

You must read and understand the requirements, guidelines, limitations, and best practices. Do not skip any steps or ignore security concerns. Careful planning and preparation can help you avoid missteps.

- [Requirements for Backup and Restore, on page 408](#)
- [Guidelines and Limitations for Backup and Restore, on page 409](#)
- [Best Practices for Backup and Restore, on page 409](#)

### Procedure

- 
- Step 1** Contact Cisco TAC for replacement hardware.  
Obtain an identical model, with the same number of network modules and same type and number of physical interfaces. You can begin the RMA process from the [Cisco Returns Portal](#).
- Step 2** Navigate **System**() > **Tools** > **Backup/Restore**.
- Step 3** Locate a successful backup of the faulty device from **Device Backups** under **Backup Management**.  
Use **Download** that downloads the backup file(s) to your local storage or **Export Backup Links** that generates a URL to download the backup and exports it to a CSV file that gets downloaded. Use the URL to download the backup to a secure location. Note that the URL is valid only for six hours, after which you must export it again to get a different URL.  
In a threat defense HA deployment, you back up the pair as a unit but the backup process produces unique backup files for each device in the pair. The device's role is noted in the backup file name.  
If the only copy of the backup is on the faulty device, copy it somewhere else now. If you reimage the device, the backup will be erased. If something else goes wrong, you may not be able to recover the backup.  
The replacement device will need the backup, but can retrieve it with the secure copy (SCP) command during the restore process. We recommend you put the backup somewhere SCP-accessible to the replacement device. Or, you can copy the backup to the replacement device itself.
- Step 4** Remove (unrack) the faulty device and disconnect all interfaces. In threat defense HA deployments, this includes the failover link.  
See the hardware installation and getting started guides for your model: [Cisco Firepower NGFW: Install and Upgrade Guides](#).  
**Note** Do not unregister from the management center, even when disconnecting a device from the network. In threat defense HA deployments, do not suspend or break HA. Maintaining these links ensures replacement devices can automatically reconnect after restore.
- Step 5** Install the replacement device and connect it to the management network.

Connect the device to power and the management interface to the management network. In threat defense HA deployments, connect the failover link. However, do *not* connect the data interfaces.

See the hardware installation guide for your model: [Cisco Firepower NGFW: Install and Upgrade Guides](#).

**Step 6** (Optional) Reimage the replacement device.

In an RMA scenario, the replacement device will arrive configured with factory defaults. If the replacement device is not running the same major version as the faulty device, we recommend you reimage.

See the [Cisco Secure Firewall ASA and Threat Defense Reimage Guide](#).

**Step 7** Perform initial configuration on the replacement device.

Access the threat defense CLI as the admin user. You can use the console or you can SSH to the factory-default management interface IP address (192.168.45.45). A setup wizard prompts you to configure the management IP address, gateway, and other basic network settings.

See the initial configuration topics in the getting started guide for your model: [Cisco Firepower NGFW: Install and Upgrade Guides](#).

**Note** If you need to patch the replacement device, start the management center registration process as described in the getting started guide. If you do *not* need to patch, do not register.

**Step 8** Make sure the replacement device is running the same Firewall software version, including patches, as the faulty device.

The existing device should not be deleted from the management center. The replacement device should be unmanaged from the physical network and the new hardware as well as the replacing threat defense patch should have the same version. The threat defense CLI does not have an upgrade command. To patch:

a) From the management center web interface, complete the device registration process: See *Add a Device to the Management Center* in [Cisco Secure Firewall Management Center Device Configuration Guide](#).

Create a new AC policy and use the default action "Network Discovery". Leave this policy as is; do not add any features or modifications. This is being used to register the device and deploy a policy with no features so that you do not require licenses, and you will then be able to patch the device. Once backup is restored, it should restore the licensing and policy into the expected state.

b) Patch the device: [Cisco Firewall Management Center Upgrade Guide](#).

c) Unregister the freshly patched device from the management center: See *Delete a Device from the Management Center* in [Cisco Secure Firewall Management Center Device Configuration Guide](#).

If you do not unregister, you will have a ghost device registered to the management center after the restore process brings your "old" device back up.

**Step 9** Make sure the replacement device has access to the backup file.

The restore process can retrieve the backup with SCP, so we recommend you put the backup somewhere accessible. Or, you can manually copy the backup to the replacement device itself, to `/var/sf/backup`.

**Step 10** From the FTD CLI, restore the backup.

Access the threat defense CLI as the admin user. You can use the console or you can SSH to the newly configured management interface (IP address or hostname). Keep in mind that the restore process will change this IP address.

To restore:

- With SCP: **restore remote-manager-backup location scp-hostname username filepath backup tar-file**
- From the local device: **restore remote-manager-backup backup tar-file**

**Step 11** Log in to Security Cloud Control and wait for the devices to connect.

When the restore is done, the device logs you out of the CLI, reboots, and automatically connects to Security Cloud Control. At this time, the device should appear out of date.

At this time, the device should appear out of date.

**Step 12** Before you deploy, perform any post-restore tasks and resolve any post-restore issues:

- Resolve licensing conflicts or orphan entitlements. Contact Cisco TAC.
- Resume HA synchronization.
- Re-add/re-enroll all VPN certificates. The restore process removes VPN certificates from FTD devices, including certificates added after the backup was taken.

**Step 13** Deploy configurations.

You must deploy. If a restored device is not marked out of date, force deploy from the Device Management page.

**Step 14** Connect the device's data interfaces.

See the hardware installation guide for your model: [Cisco Secure Firewall Threat Defense: Install and Upgrade Guides](#).

## Restore Threat Defense from Backup: Threat Defense Virtual

Use this procedure to replace a faulty or failed threat defense virtual device for VMware.

In threat defense HA and clustering deployments, you can use this procedure to replace all peers. To replace all, perform all steps on all devices simultaneously, except the **restore** CLI command itself.

**Note** Do *not* unregister from the management center, even when disconnecting a device from the network. In threat defense HA and clustering deployments, do *not* suspend or break high availability or clusters. Maintaining registration ensures that replacement devices can automatically reconnect after restore.

### Before you begin

You must read and understand the requirements, guidelines, limitations, and best practices. Do not skip any steps or ignore security concerns. Careful planning and preparation can help you avoid missteps.

- [Requirements for Backup and Restore, on page 408](#)
- [Guidelines and Limitations for Backup and Restore, on page 409](#)
- [Best Practices for Backup and Restore, on page 409](#)

## Procedure

- 
- Step 1** Navigate **System**() > **Tools** > **Backup/Restore**.
- Step 2** Locate a successful backup of the faulty device from **Device Backups** under **Backup Management**.
- For clustering, node backup files are bundled together in a single compressed file for the cluster (*cluster\_name.timestamp.tar.gz*). Before you can restore nodes, you need to extract the individual node backup files (*node\_name\_control\_timestamp.tar* or *node\_name\_data\_timestamp.tar*).
- Use **Download** that downloads the backup file(s) to your local storage or **Export Backup Links** that generates a URL to download the backup and exports it to a CSV file that gets downloaded. Use the URL to download the backup to a secure location. Note that the URL is valid only for six hours, after which you must export it again to get a different URL.
- In threat defense HA deployments, you back up the pair as a unit, but the backup process produces unique backup files for each device in the pair. The device's role is noted in the backup file name.
- If the only copy of the backup is on the faulty device, copy it somewhere else now. If you reimaged the device, the backup will be erased. If something else goes wrong, you may not be able to recover the backup.
- The replacement device needs the backup, but can retrieve it with SCP during the restore process. We recommend you put the backup somewhere SCP-accessible to the replacement device. Or, you can copy the backup to the replacement device itself.
- Step 3** Remove the faulty device.
- Shut down, power off, and delete the virtual machine. For procedures, see the documentation for your virtual environment.
- Step 4** Deploy a replacement device.
- See the [Cisco Firepower Threat Defense Virtual for VMware Getting Started Guide](#).
- Step 5** Perform initial configuration on the replacement device.
- Use the VMware console to access the threat defense virtual CLI as the admin user. A setup wizard prompts you to configure the management IP address, gateway, and other basic network settings.
- Do not set the same management IP address as the faulty device. This can cause problems if you need to register the device in order to patch it. The restore process will correctly reset the management IP address.
- See the CLI setup topics in the getting started guide: [Cisco Firepower Threat Defense Virtual for VMware Getting Started Guide](#).
- Step 6** Make sure that the replacement device is running the same Firewall software version, including patches, as the faulty device.
- Ensure that the existing device should not be deleted from the Security Cloud Control. The replacement device should be unmanaged from the physical network and the new hardware and the replacing threat defense virtual patch should have the same version. The threat defense virtual CLI does not have an upgrade command. To patch:
- Complete the threat defense virtual registration process in Security Cloud Control.
  - Patch the threat defense virtual device.

- c. Unregister the freshly patched device from Security Cloud Control.

**Step 7** Make sure that the replacement device has access to the backup file.

The restore process can retrieve the backup with SCP, so we recommend you put the backup somewhere accessible. Or, you can manually copy the backup to the replacement device itself, to `/var/sf/backup`. For clusters, make sure you extract the individual node backup file from the main cluster bundle.

**Step 8** From the threat defense CLI, restore the backup.

Access the threat defense virtual CLI as the admin user. You can use the console or you can SSH to the newly configured management interface (IP address or hostname). Keep in mind that the restore process will change this IP address.

To restore:

- With SCP: **restore remote-manager-backup location scp-hostname username filepath backup tar-file**
- From the local device: **restore remote-manager-backup backup tar-file**

In threat defense HA and clustering deployments, make sure you choose the appropriate backup file: primary vs secondary, or control vs. data. The role is noted in the backup file name. If you are restoring all devices, do this sequentially. Do not run the **restore** command on the next device until the restore process completes for the first device, including the reboot.

**Step 9** Log into Security Cloud Control and wait for the devices to connect.

When the restore is done, the device logs you out of the CLI, reboots, and automatically connects to Security Cloud Control. At this time, the device should appear out of date.

At this time, the device should appear out of date.

**Step 10** Before you deploy, perform any post-restore tasks and resolve any post-restore issues:

- Resolve licensing conflicts or orphan entitlements. Contact Cisco TAC.
- Resume HA synchronization.
- Re-add/re-enroll all VPN certificates. The restore process removes VPN certificates from threat defense virtual devices, including certificates added after the backup was taken.

**Step 11** Deploy configurations.

You must deploy. If a restored device is not marked out of date, force deploy from the Device Management page.

**Step 12** Connect the device's data interfaces.

See the hardware installation guide for your model: [Cisco Secure Firewall Threat Defense: Install and Upgrade Guides](#).

---

## CHAPTER 20

# Scheduling

---

The following topics explain how to schedule tasks:

- [About Task Scheduling, on page 419](#)
- [Requirements and Prerequisites for Task Scheduling, on page 420](#)
- [Configuring a Recurring Task, on page 420](#)
- [Scheduled Task Review, on page 428](#)

## About Task Scheduling

You can schedule various tasks to run at designated times, either once or on a recurring basis.

Tasks are scheduled in UTC on the back end, which means when they occur locally depends on the date and your specific location. Also, because tasks are scheduled in UTC, they do not adjust for Daylight Saving Time, summer time, or any such seasonal adjustments that you may observe in your location. If you are affected, scheduled tasks occur one hour "later" in the summer than in the winter, according to local time.

Some tasks are automatically scheduled or performed by the initial setup process:

- A one-time task to download and install the latest VDB.
- A weekly scheduled task to download the latest available software updates and VDB.

You should review the weekly tasks and adjust if necessary. Optionally, schedule new recurring tasks to actually update the VDB and/or software, and deploy configurations.

---

### Important

We *strongly* recommend you review scheduled tasks to be sure they occur when you intend. Some tasks (such as those involving automated software updates or that require pushing updates to managed devices) may place a significant load on networks with low bandwidths. You should schedule tasks like these to run during periods of low network use. Other tasks, such as deploying configurations, can cause traffic interruptions. You should schedule tasks like these during maintenance windows.

---

# Requirements and Prerequisites for Task Scheduling

## Model Support

Any.

## Supported Domains

Any

## User Roles

- Admin
- Maintenance User

## Configuring a Recurring Task

You set the frequency for a recurring task using the same process for all types of tasks.

Note that the time displayed on most pages on the web interface is the local time, which is determined by using the time zone you specify in your local configuration. Further, the management center automatically adjusts its local time display for daylight saving time (DST), where appropriate. However, recurring tasks that span the transition dates from DST to standard time and back do not adjust for the transition. That is, if you create a task scheduled for 2:00 AM during standard time, it will run at 3:00 AM during DST. Similarly, if you create a task scheduled for 2:00 AM during DST, it will run at 1:00 AM during standard time.

### Procedure

---

**Step 1** Select **System** (⚙️) > **Tools** > **Scheduling**.

**Step 2** Click **Add Task**.

**Step 3** From the **Job Type** drop-down list, select the type of task that you want to schedule.

- Backup - Schedule backup jobs as described in [Schedule Remote Device Backups, on page 421](#).
- Deploy Policies - Schedule policy deployment as described in [Automating Policy Deployment, on page 422](#).
- Download Latest Update - Automate software and vulnerability downloads as described in [Automating Software Downloads, on page 423](#) and [Automating VDB Update Downloads, on page 425](#).
- Install Latest Update - Automate software installation as described in [Automating Software Installs, on page 424](#).
- Push Latest Update - Schedule pushing software to a device before updating it, as described in [Automating Software Pushes, on page 424](#).
- Update URL Filtering Database - [Automating URL Filtering Updates Using a Scheduled Task, on page 427](#).

- Step 4** Click **Recurring** next to the **Schedule task to run** option.
- Step 5** In the **Start On** field, specify the date when you want to start your recurring task.
- Step 6** In the **Repeat Every** field, specify how often you want the task to recur.
- You can either type a number or click **Up** (▲) and **Down** (▼) to specify the interval. For example, type 2 and click **Days** to run the task every two days.
- Step 7** In the **Run At** field, specify the time when you want to start your recurring task.
- Step 8** For a task to be run on a weekly or monthly basis, select the days when you want to run the task in the **Repeat On** field.
- Step 9** Give the job a name.
- Step 10** Click **Save**.
- 

## Scheduled Backups

You can schedule backups of Secure Firewall Threat Defense devices from the cloud-delivered Firewall Management Center. Note that not all devices support remote backups.

No more than 20 threat defense devices should be scheduled during one job. Backup jobs should be spaced at least 30 minutes apart.

For more information on backups, see [Backup/Restore, on page 407](#).

## Schedule Remote Device Backups

You can use the scheduler on cloud-delivered Firewall Management Center to automate device backups. Note that not all devices support remote backups. For more information, see [Backup/Restore, on page 407](#).

### Procedure

---

- Step 1** Choose **System** (⚙️) > **Tools** > **Scheduling**.
- Step 2** From the **Job Type** list, select **Backup**.
- Step 3** Specify whether you want to back up **Once** or **Recurring**.
- For one-time tasks, use the drop-down lists to specify the start date and time.
  - For recurring tasks, see [Configuring a Recurring Task, on page 420](#).
- Step 4** Enter a **Job Name**.
- Step 5** For the **Backup Type**, click **Device**.
- Step 6** Select one or more devices.
- If your device is not listed, it does not support remote backup.
- Step 7** (Optional) Enter a **Comment**.
- Keep comments brief. They will appear in the Task Details section of the schedule calendar page.

- Step 8** (Optional) Enter an email address, or a comma-separated list of email addresses, in the **Email Status To:** field.
- Step 9** Click **Save**.

## Automating Policy Deployment

After modifying configuration settings in the management center, you must deploy those changes to the affected devices.

**Caution** When you deploy, resource demands may result in a small number of packets dropping without inspection. Additionally, deploying some configurations restarts the Snort process, which interrupts traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See [Snort Restart Traffic Behavior, on page 234](#) and [Configurations that Restart the Snort Process When Deployed or Activated, on page 236](#).

### Procedure

- Step 1** Select **System** (⚙) > **Tools** > **Scheduling**.
- Step 2** Click **Add Task**.
- Step 3** From **Job Type**, select **Deploy Policies**.
- Step 4** Specify how you want to schedule the task, **Once** or **Recurring**:
- For one-time tasks, use the drop-down lists to specify the start date and time.
  - For recurring tasks, see [Configuring a Recurring Task, on page 420](#) for details.
- Step 5** Type a name in the **Job Name** field.
- Step 6** In the **Device** field, select a device where you want to deploy policies.
- Step 7** Select or deselect the **Skip deployment for up-to-date devices** check box, as required.
- By default, the **Skip deployment for up-to-date devices** option is enabled to improve performance during the policy deployment process.
- Note** The system does not perform a scheduled policy deployment task if a policy deployment initiated from the management center web interface is in progress. Correspondingly, the system does not permit you to initiate a policy deployment from the web interface if a scheduled policy deployment task is in-progress.
- Step 8** If you want to comment on the task, type a comment in the **Comment** field.
- The comment field displays in the Tasks Details section of the schedule calendar page; keep comments brief.
- Step 9** If you want to email task status messages, type an email address (or multiple email addresses separated by commas) in the **Email Status To:** field. You must have a valid email relay server configured to send status messages.

**Step 10** Click **Save**.

---

**Related Topics**

[Configuration Changes that Require Deployment](#), on page 227

## Software Upgrade Automation

You can automatically download patches, and apply maintenance releases and patches.

To upgrade managed devices, schedule Download, Push, and Install tasks. Make sure you leave adequate time between the tasks; for example, installations scheduled to occur while a push is still running will fail.

This feature is not supported for major releases. When scheduling upgrades to device groups, the upgrade will run on all grouped devices simultaneously.

---

**Note** As part of the initial configuration, the system schedules weekly downloads. We recommend you review this task and make changes if necessary, as described in [Automating Software Downloads, on page 423](#). This task only downloads the updates. It is your responsibility to install any updates this task downloads.

---

**Related Topics**

[Updates](#), on page 269

## Automating Software Downloads

Use this procedure to schedule patch downloads.

### Procedure

---

- Step 1** Select **System** (⚙) > **Tools** > **Scheduling**.
- Step 2** Click **Add Task**.
- Step 3** From the **Job Type** list, select **Download Latest Update**.
- Step 4** Specify how you want to schedule the task, **Once** or **Recurring**:
- For one-time tasks, use the drop-down lists to specify the start date and time.
  - For recurring tasks, see [Configuring a Recurring Task, on page 420](#) for details.
- Step 5** Type a name in the **Job Name** field.
- Step 6** Next to **Update Items**, check **Software** check box.
- Step 7** If you want to comment on the task, type a comment in the **Comment** field.
- The comment field appears in the Task Details section of the schedule calendar page; keep comments brief.
- Step 8** If you want to email task status messages, type an email address (or multiple email addresses separated by commas) in the **Email Status To:** field. You must have a valid email relay server configured to send status messages.

**Step 9** Click **Save**.

---

## Automating Software Pushes

If you want to automate the installation of software updates on managed devices, you must push the updates to the devices before installing.

When you create the task to push software updates to managed devices, make sure you allow enough time between the push task and a scheduled install task for the updates to be copied to the device.

You must be in the global domain to perform this task.

### Procedure

---

**Step 1** Select **System** (⚙) > **Tools** > **Scheduling**.

**Step 2** Click **Add Task**.

**Step 3** From the **Job Type** list, select **Push Latest Update**.

**Step 4** Specify how you want to schedule the task, **Once** or **Recurring**:

- For one-time tasks, use the drop-down lists to specify the start date and time.
- For recurring tasks, see [Configuring a Recurring Task, on page 420](#) for details.

**Step 5** Type a name in the **Job Name** field.

**Step 6** From the **Device** drop-down list, select the device that you want to update.

**Step 7** If you want to comment on the task, type a comment in the **Comment** field.

The comment field appears in the Task Details section of the schedule calendar page; keep comments brief.

**Step 8** If you want to email task status messages, type an email address (or multiple email addresses separated by commas) in the **Email Status To:** field. You must have a valid email relay server configured to send status messages.

**Step 9** Click **Save**.

---

## Automating Software Installs

Make sure you allow enough time between the task that pushes the update to a managed device and the task that installs the update.

You must be in the global domain to perform this task.

---

**Caution** Depending on the update being installed, the appliance may reboot after the software is installed.

---

## Procedure

- 
- Step 1** Select **System** (⚙️) > **Tools** > **Scheduling**.
- Step 2** Click **Add Task**.
- Step 3** From the **Job Type** list, select **Install Latest Update**.
- Step 4** Specify how you want to schedule the task, **Once** or **Recurring**:
- For one-time tasks, use the drop-down lists to specify the start date and time.
  - For recurring tasks, see [Configuring a Recurring Task, on page 420](#) for details.
- Step 5** Type a name in the **Job Name** field.
- Step 6** From the **Device** drop-down list, select the appliance where you want to install the update.
- Step 7** Next to **Update Items**, check the **Software** check box.
- Step 8** If you want to comment on the task, type a comment in the **Comment** field.
- The comment field appears in the Task Details section of the schedule calendar page; keep comments brief.
- Step 9** If you want to email task status messages, type an email address (or multiple email addresses separated by commas) in the **Email Status To:** field. You must have a valid email relay server configured to send status messages.
- Step 10** Click **Save**.
- 

## Vulnerability Database Update Automation

You can use the scheduling feature to update the Cisco vulnerability database (VDB), thereby ensuring that you are using the most up-to-date information to evaluate the hosts on your network. You must schedule the download, install, and subsequent deploy as separate tasks, allowing enough time between tasks.

**Note** The initial setup on the management center automatically downloads and installs the latest VDB from Cisco as a one-time operation. It also schedules a weekly task to download the latest available software updates, which includes the latest VDB. We recommend you review this weekly task and adjust if necessary. Optionally, schedule a new weekly task to actually update the VDB and deploy configurations.

---

## Automating VDB Update Downloads

### Procedure

- 
- Step 1** Select **System** (⚙️) > **Tools** > **Scheduling**.
- Step 2** Click **Add Task**.
- Step 3** From the **Job Type** list, select **Download Latest Update**.

- Step 4** Specify how you want to schedule the task, **Once** or **Recurring**:
- For one-time tasks, use the drop-down lists to specify the start date and time.
  - For recurring tasks, see [Configuring a Recurring Task, on page 420](#) for details.
- Step 5** Type a name in the **Job Name** field.
- Step 6** Next to **Update Items**, check the **Vulnerability Database** check box.
- Step 7** (Optional) Type a brief comment in the **Comment** field.
- Step 8** If you want to email task status messages, type an email address (or multiple email addresses separated by commas) in the **Email Status To:** field. You must have a valid email relay server configured to send status messages.
- Step 9** Click **Save**.

---

## Automating VDB Update Installs

Allow enough time between the task that downloads the VDB update and the task that installs the update.

You must be in the global domain to perform this task.

---

**Caution** In most cases, the first deploy after a VDB update restarts the Snort process, interrupting traffic inspection. The system warns you when this will happen (updated application detectors and operating system fingerprints require a restart; vulnerability information does not). Whether traffic drops or passes without further inspection during this interruption depends on how the targeted device handles traffic. For more information, see [Snort Restart Traffic Behavior, on page 234](#).

---

### Procedure

- 
- Step 1** Select **System** (⚙) > **Tools** > **Scheduling**.
- Step 2** Click **Add Task**.
- Step 3** From the **Job Type** list, select **Install Latest Update**.
- Step 4** Specify how you want to schedule the task, **Once** or **Recurring**:
- For one-time tasks, use the drop-down lists to specify the start date and time.
  - For recurring tasks, see [Configuring a Recurring Task, on page 420](#) for details.
- Step 5** Type a name in the **Job Name** field.
- Step 6** From the **Device** drop-down list, select the management center.
- Step 7** Next to **Update Items**, check the **Vulnerability Database** check box.
- Step 8** (Optional) Type a brief comment in the **Comment** field.
- Step 9** If you want to email task status messages, type an email address (or multiple email addresses separated by commas) in the **Email Status To:** field. You must have a valid email relay server configured to send status messages.

**Step 10** Click **Save**.

---

## Automating URL Filtering Updates Using a Scheduled Task

In order to ensure that threat data for URL filtering is current, the system must obtain data updates from the Cisco Collective Security Intelligence (CSI) cloud.

By default, when you enable URL filtering, automatic updates are enabled. However, if you need to control when these updates occur, use the procedure described in this topic instead of the default update mechanism.

Although daily updates tend to be small, if it has been more than five days since your last update, new URL filtering data may take up to 20 minutes to download, depending on your bandwidth. Then, it may take up to 30 minutes to perform the update itself.

### Before you begin

- Ensure the management center has internet access; see [Security, Internet Access, and Communication Ports](#), on page 2965.
- Ensure that URL filtering is enabled. For more information, see the *Enable URL Filtering Using Category and Reputation* in the [Cisco Secure Firewall Management Center Device Configuration Guide](#).
- Verify that **Enable Automatic Updates** is not selected on the **Cloud Services** under the **Integration > Other Integrations** menu.
- You must be in the global domain to perform this task. You must also have the URL Filtering license.

### Procedure

---

- Step 1** Select **System** (⚙) > **Tools** > **Scheduling**.
- Step 2** Click **Add Task**.
- Step 3** From the **Job Type** list, select **Update URL Filtering Database**.
- Step 4** Specify how you want to schedule the update, **Once** or **Recurring**:
- For one-time tasks, use the drop-down lists to specify the start date and time.
  - For recurring tasks, see [Configuring a Recurring Task](#), on page 420 for details.
- Step 5** Type a name in the **Job Name** field.
- Step 6** If you want to comment on the task, type a comment in the **Comment** field.  
The comment field appears in the Task Details section of the schedule calendar page; keep comments brief.
- Step 7** If you want to email task status messages, type an email address (or multiple email addresses separated by commas) in the **Email Status To:** field. You must have a valid email relay server configured to send status messages.
- Step 8** Click **Save**.
-

# Scheduled Task Review

After adding scheduled tasks, you can view them and evaluate their status. The View Options section of the page allows you to view scheduled tasks using a calendar and a list of scheduled tasks.

The Calendar view option allows you to view which scheduled tasks occur on which day.

The Task List shows a list of tasks along with their status. The task list appears below the calendar when you open the calendar. In addition, you can view it by selecting a date or task from the calendar.

You can edit a scheduled task that you previously created. This feature is especially useful if you want to test a scheduled task once to make sure that the parameters are correct. Later, after the task completes successfully, you can change it to a recurring task.

There are two types of deletions you can perform from the Schedule View page. You can delete a specific one-time task that has not yet run or you can delete every instance of a recurring task. If you delete an instance of a recurring task, all instances of the task are deleted. If you delete a task that is scheduled to run once, only that task is deleted.

## Task List Details

**Table 32: Task List Columns**

Column	Description
Name	Displays the name of the scheduled task and the comment associated with it.
Type	Displays the type of scheduled task.
Start Time	Displays the scheduled start date and time.
Frequency	Displays how often the task is run.
Last Run Time	Displays the actual start date and time. For a recurring task, this applies to the most recent execution.
Last Run Status	Describes the current status for a scheduled task: <ul style="list-style-type: none"> <li>• A <b>Check Mark</b> (✓) indicates that the task ran successfully.</li> <li>• A question mark icon (<b>Question Mark</b> (?) ) indicates that the task is in an unknown state.</li> <li>• An exclamation mark icon (!) indicates that the task failed.</li> </ul> For a recurring task, this applies to the most recent execution.
Next Run Time	Displays the next execution time for a recurring task. Displays N/A for a one-time task.
Creator	Displays the name of the user that created the scheduled task.

Column	Description
Edit	Edits the scheduled task.
Delete	Deletes the scheduled task.

## Viewing Scheduled Tasks on the Calendar

You can view a scheduled task on the calendar.

### Procedure

- 
- Step 1** Select **System** (⚙️) > **Tools** > **Scheduling**.
- Step 2** You can perform the following tasks using the calendar view:
- Click **Double Left Arrow** (⏪) to move back one year.
  - Click **Single Left Arrow** (⏩) to move back one month.
  - Click **Single Right Arrow** (⏪) to move forward one month.
  - Click **Double Right Arrow** (⏩) to move forward one year.
  - Click **Today** to return to the current month and year.
  - Click **Add Task** to schedule a new task.
  - Click a date to view all scheduled tasks for the specific date in a task list table below the calendar.
  - Click a specific task on a date to view the task in a task list table below the calendar.
- 

## Editing Scheduled Tasks

You can edit scheduled tasks.

### Procedure

- 
- Step 1** Select **System** (⚙️) > **Tools** > **Scheduling**.
- Step 2** On the calendar, click either the task that you want to edit or the day on which the task appears.
- Step 3** In the **Task Details** table, click **Edit** (✎) next to the task you want to edit.
- Step 4** Edit the task.

**Step 5** Click **Save**.

---

## Deleting Scheduled Tasks

You can delete a scheduled task.

### Procedure

---

- Step 1** Select **System** (⚙) > **Tools** > **Scheduling**.
- Step 2** In the calendar, click the task you want to delete. For a recurring task, click an instance of the task.
- Step 3** In the **Task Details** table, click **Delete** (🗑), then confirm your choice.
-

## CHAPTER 21

# Import/Export

---

The following topics explain how to use the Import/Export feature:

- [About Configuration Import/Export, on page 431](#)
- [Requirements and Prerequisites for Configuration Import/Export, on page 433](#)
- [Exporting Configurations, on page 433](#)
- [Importing Configurations, on page 434](#)

## About Configuration Import/Export

You can use the Import/Export feature to copy configurations between appliances. Import/Export is not a backup tool, but can simplify the process of adding new appliances to your deployment.

You can export a single configuration, or you can export a set of configurations (of the same type or of different types) with a single action. When you later import the package onto another appliance, you can choose which configurations in the package to import.

An exported package contains revision information for that configuration, which determines whether you can import that configuration onto another appliance. When the appliances are compatible but the package includes a duplicate configuration, the system offers resolution options.

---

**Note** The importing and exporting appliances must be running the same software version. For access control and its subpolicies (including intrusion policies), the intrusion rule update version must also match. If the versions do not match, the import fails. You cannot use the Import/Export feature to update intrusion rules. Instead, download and apply the latest rule update version.

---

## Configurations that Support Import/Export

Import/Export is supported for the following configurations:

- Access control policies and the policies they invoke: prefilter, network analysis, intrusion, SSL, file, Threat Defense Service Policy
- Intrusion policies, independently of access control
- NAT policies (Secure Firewall Threat Defense only)

- FlexConfig policies. However, the contents of any secret key variables are cleared when you export the policy. You must manually edit the values of all secret keys after importing a FlexConfig policy that uses secret keys.
- Platform settings
- Health policies
- Alert responses
- Application detectors (both user-defined and those provided by Cisco Professional Services)
- Dashboards
- Custom tables
- Custom workflows
- Saved searches
- Custom user roles
- Report templates
- Third-party product and vulnerability mappings
- Users and groups for user control

## Special Considerations for Configuration Import/Export

When you export a configuration, the system also exports other required configurations. For example, exporting an access control policy also exports any subpolicies it invokes, objects and object groups it uses, ancestor policies, and so on. As another example, if you export a platform settings policy with external authentication enabled, the authentication object is exported as well. There are some exceptions, however:

- System-provided databases and feeds—The system does not export URL filtering category and reputation data, Cisco Intelligence Feed data, or the geolocation database (GeoDB). Make sure all the appliances in your deployment obtain up-to-date information from Cisco.
- Global Security Intelligence lists—The system exports Global Security Intelligence Block and Do Not Block lists associated with exported configurations. The import process converts these lists to user-created lists, then uses those new lists in the imported configurations. This ensures that imported lists do not conflict with existing Global Block and Do Not Block lists. To use Global lists on the importing management center, manually add the lists to your imported configurations.
- Intrusion policy shared layers—The export process breaks intrusion policy shared layers. The previously shared layer is included in the package, and imported intrusion policies do not contain shared layers.
- Intrusion policy default variable set—The export package includes a default variable set with custom variables and system-provided variables with user-defined values. The import process updates the default variable set on the importing management center with the imported values. However, the import process does **not** delete custom variables not present in the export package. The import process also does not revert user-defined values on the importing management center, for values not set in the export package. Therefore, an imported intrusion policy may behave differently than expected if the importing management center has differently configured default variables.

- Custom user objects—If you have created custom user groups or objects in your management center and if such a custom user object is a part of any rule in your access control policy, note that the export file (.sfo) does not carry the user object information and therefore while importing such a policy, any reference to such custom user objects will be removed and will not be imported to the destination management center. To avoid detection issues due to the missing user group, add the customized user objects manually to the new management center and re-configure the access control policy after import.

When you import objects and object groups:

- Generally, the import process imports objects and groups as new, and you cannot replace existing objects and groups. However, if network and port objects or groups in an imported configuration match existing objects or groups, the imported configuration reuses the existing objects/groups, rather than creating new objects/groups. The system determines a match by comparing the name (minus any autogenerated number) and content of each network and port object/group.
- If the names of imported objects match existing objects on the importing management center, the system appends autogenerated numbers to the imported object and group names to make them unique.
- You must map any security zones and interface groups used in the imported configurations to matching-type zones and groups managed by the importing management center.
- If you export a configuration that uses PKI objects containing private keys, the system decrypts the private keys before export. On import, the system encrypts the keys with a randomly generated key.

## Requirements and Prerequisites for Configuration Import/Export

### Model Support

Any

### Supported Domains

Any

### User Roles

- Admin

## Exporting Configurations

Depending on the number of configurations being exported and the number of objects those configurations reference, the export process may take several minutes.

### Tip

Many list pages include an **YouTube EDU** () next to list items. Where this icon is present, you can use it as a quick alternative to the export procedure that follows.

**Before you begin**

- Confirm that the importing and exporting appliances are running the same software version. For access control and its subpolicies (including intrusion policies), the intrusion rule update version must also match.

**Procedure**

- 
- Step 1** Choose **System** (⚙) > **Tools** > **Import/Export**.
  - Step 2** Click **Collapse** (∨) and **Expand** (>) to collapse and expand the list of available configurations.
  - Step 3** Check the configurations you want to export and click **Export**.
  - Step 4** Follow your web browser's prompts to save the exported package to your computer.
- 

## Importing Configurations

Depending on the number of configurations being imported and the number of objects those configurations reference, the import process may take several minutes.

- 
- Note** If you log out of the system or if your user session expires after you click **Import**, the import process continues in the background until it is complete. We recommend that you wait for the import process to complete before creating any new objects or policies. Attempting to create them while the import process is still running might result in failures.
- 

**Before you begin**

- Confirm that the importing and exporting appliances are running the same software version. For access control and its subpolicies (including intrusion policies), the intrusion rule update version must also match.

**Procedure**

- 
- Step 1** On the importing appliance, choose **System** (⚙) > **Tools** > **Import/Export**.
  - Step 2** Click **Upload Package**.
  - Step 3** Enter the path to the exported package or browse to its location, then click **Upload**.
  - Step 4** If there are no version mismatches or other issues, choose the configurations you want to import, then click **Import**.  
If you do not need to perform any conflict resolution or interface object mapping, the import completes and a success message appears. Skip the rest of this procedure.

- Step 5** If prompted, on the Import Conflict Resolution page, map interface objects used in the imported configurations to zones and groups with matching interface types managed by the importing management center.
- Interface object type (security zone or interface group) and interface type (passive, inline, routed, and so on) of source and destination objects must match. For information, see [Interface, on page 1494](#).
- If the configurations you are importing reference security zones or interface groups that do not already exist, you can map them to existing interface objects, or create new ones.
- Note** For individual access control policies, you have the option of replacing an existing policy with the imported ones. However, for nested access control policies, you can only import them as new policies.
- Step 6** Click **Import**.
- Step 7** If prompted, on the Import Resolution page, expand each configuration and choose the appropriate option as described in [Import Conflict Resolution, on page 435](#).
- Step 8** Click **Import**.
- Step 9** Update all feeds.
- For example, go to **Objects > Object Management > Security Intelligence** and click the **Update Feed** button on the URL, Network, and DNS Lists and Feeds pages.
- Imported policies do not include feed contents.
- Step 10** Wait for all feed updates to complete before deploying the policies to devices.

---

### What to do next

**Note** If you import a configuration that contains Microsoft Active Directory users and groups we strongly recommend you download all users and groups after the import to avoid issues in decryption policies, access control policies, and possibly other policies. (**Integration > Other Integrations > Realms**, then click  **(Download Now)**).

- Optionally, view a report summarizing the imported configurations; see [View Task Messages, on page 383](#).

## Import Conflict Resolution

When you attempt to import a configuration, the system determines whether a configuration of the same name and type already exists on the appliance. When an import includes a duplicate configuration, the system offers resolution options suitable to your deployment from among the following:

- **Keep existing**

The system does not import that configuration.

- **Replace existing**

The system overwrites the current configuration with the configuration selected for import.

- **Keep newest**

The system imports the selected configuration only if its timestamp is more recent than the timestamp on the current configuration on the appliance.

---

**Note** If you import a configuration that contains Microsoft Active Directory users and groups we strongly recommend you download all users and groups after the import to avoid issues in decryption policies, access control policies, and possibly other policies. (**Integration > Other Integrations > Realms**, then click [↓](#) (**Download Now**)).

---

- **Import as new**

The system imports the selected duplicate configuration, appending a system-generated number to the name to make it unique. (You can change this name before completing the import process.) The original configuration on the appliance remains unchanged.

The resolution options the system offers depends on whether your deployment uses domains, and whether the imported configuration is a duplicate of a configuration defined in the current domain, or a configuration defined in an ancestor or descendant of the current domain. The following table lists when the system does or does not present a resolution option.

Resolution Option	Secure Firewall Management Center		Managed Device
	Duplicate in current domain	Duplicate in ancestor or descendant domain	
Keep existing	Yes	Yes	Yes
Replace existing	Yes	No	Yes
Keep newest	Yes	No	Yes
Import as new	Yes	Yes	Yes

When you import an access control policy with a file policy that uses clean or custom detection file lists and a file list presents a duplicate name conflict, the system offers conflict resolution options as described in the table above, but the action the system performs on the policies and file lists varies as described in the table below:

Resolution Option	System Action	
	Access control policy and its associated file policy are imported as new and the file lists are merged	Existing access control policy and its associated file policy and file lists remain unchanged
Keep existing	No	Yes
Replace existing	Yes	No
Import as new	Yes	No

Resolution Option	System Action	
	Access control policy and its associated file policy are imported as new and the file lists are merged	Existing access control policy and its associated file policy and file lists remain unchanged
<b>Keep newest</b> and access control policy being imported is the newest	Yes	No
<b>Keep newest</b> and existing access control policy is the newest	No	Yes

If you modify an imported configuration on an appliance, and later re-import that configuration to the same appliance, you must choose which version of the configuration to keep.

## PART **VII**

# Reporting and Alerting

- [External Alerting with Alert Responses, on page 441](#)
- [External Alerting for Intrusion Events, on page 449](#)

## CHAPTER 22

# External Alerting with Alert Responses

The following topics describe how to send external event alerts from the Secure Firewall Management Center using alert responses:

- [Secure Firewall Management Center Alert Responses, on page 441](#)
- [Requirements and Prerequisites for Alert Responses, on page 442](#)
- [Creating an SNMP Alert Response, on page 442](#)
- [Creating a Syslog Alert Response, on page 444](#)
- [Creating an Email Alert Response, on page 446](#)

## Secure Firewall Management Center Alert Responses

External event notification via SNMP, syslog, or email can help with critical-system monitoring. The Secure Firewall Management Center uses configurable *alert responses* to interact with external servers. An *alert response* is a configuration that represents a connection to an email, SNMP, or syslog server. They are called *responses* because you can use them to send alerts in response to events detected by Secure Firewall. You can configure multiple alert responses to send different types of alerts to different monitoring servers and/or people.

---

**Note** Depending on your device and Secure Firewall version, alert responses may not be the best way to send syslog messages. See the *About Syslog* chapter in the [Cisco Secure Firewall Management Center Device Configuration Guide](#).

---

---

**Note** Alerts that use alert responses are sent by the Secure Firewall Management Center. Intrusion email alerts, which do not use alert responses, are also sent by the Secure Firewall Management Center. By contrast, SNMP and syslog alerts that are based on individual intrusion rules triggering are sent directly by managed devices.

---

In most cases, the information in an external alert is the same as the information in any associated event you logged to the database. However, for correlation event alerts where the correlation rule contains a connection tracker, the information you receive is the same as for an alert on a traffic profile change, regardless of the base event type.

You create and manage alert responses on the Alerts page (**Policies > Actions > Alerts**). New alert responses are automatically enabled. To temporarily stop alert generation, you can disable alert responses rather than deleting them.

Changes to alert responses take effect immediately, except when sending connection logs to an SNMP trap or syslog server.

## Configurations Supporting Alert Responses

After you create an alert response, you can use it to send the following external alerts from the Secure Firewall Management Center.

Alert/Event Type	For More Information
Health events, by health module and severity level	<a href="#">Creating Health Monitor Alerts, on page 359</a>

## Requirements and Prerequisites for Alert Responses

### Model Support

Any.

### Supported Domains

Any

### User Roles

- Admin

## Creating an SNMP Alert Response

You can create SNMP alert responses using SNMPv1, SNMPv2, or SNMPv3 for any device type except threat defense.

**Note** When selecting SNMP versions for the SNMP protocol, note that SNMPv2 only supports read-only communities and SNMPv3 only supports read-only users. SNMPv3 also supports encryption with AES128.

If you want to monitor 64-bit values with SNMP, you must use SNMPv2 or SNMPv3. SNMPv1 does not support 64-bit monitoring.

### Before you begin

- If your network management system requires the management center's management information base (MIB) file, obtain it at `/etc/sf/DCEALERT.MIB`.

## Procedure

**Step 1** Choose **Policies > Actions > Alerts**.

**Step 2** From the **Create Alert** drop-down menu, choose **Create SNMP Alert**.

**Step 3** Edit the SNMP Alert Configuration fields:

a) **Name**—Enter a name to identify the SNMP response.

b) **Trap Server**—Enter the hostname or IP address of the SNMP trap server.

**Note** The system does **not** warn you if you enter an invalid IPv4 address (such as 192.169.1.456) in this field. Instead, the invalid address is treated as a hostname.

c) **Version**—Choose the SNMP version you want to use from the drop-down list. SNMPv3 is the default.

**Choose from:**

- **SNMPv1** or **SNMPv2**: Enter a read-only SNMP community name in the **Community String** field, then skip to the end of the procedure.

**Note** Do not include special characters (< > / % # & ? ', etc.) in the SNMP community string name.

- For **SNMPv3**: Enter the name of the user that you want to authenticate with the SNMP server in the **User Name** field and continue to the next step.

d) **Authentication Protocol**—Choose the protocol you want to use to encrypt authentication from the drop-down list.

**Choose from:**

- **MD5**—Message Digest 5 (MD5) hash function.
- **SHA**—Secure Hash Algorithm (SHA) hash function.

e) **Authentication Password**—Enter the password to enable authentication.

f) **Privacy Protocol**—Choose the protocol you want to use to encrypt a private password from the drop-down list.

**Choose from:**

- **DES**—Data Encryption Standard (DES) using 56-bit keys in a symmetric secret-key block algorithm.
- **AES**—Advanced Encryption Standard (AES) using 56-bit keys in a symmetric cipher algorithm.
- **AES128**—AES using 128-bit keys in a symmetric cipher algorithm. A longer key provides higher security but a reduction in performance.

g) **Privacy Password**—Enter the privacy password required by the SNMP server. If you specify a private password, privacy is enabled, and you must also specify an authentication password.

h) **Engine ID**—Enter an identifier for the SNMP engine, in hexadecimal notation, using an even number of digits.

When you use SNMPv3, the system uses an Engine ID value to encode the message. Your SNMP server requires this value to decode the message.

Cisco recommends that you use the hexadecimal version of the management center's IP address. For example, if the management center has an IP address of 10.1.1.77, use 0a01014D0.

**Step 4** Click **Save**.

---

#### What to do next

Changes take effect immediately, except if you are using alert responses to send connection logs, you must deploy configuration changes after you edit those alert responses.

## Creating a Syslog Alert Response

When configuring a syslog alert response, you can specify the severity and facility associated with the syslog messages to ensure that they are processed properly by the syslog server. The facility indicates the subsystem that creates the message and the severity defines the severity of the message. Facilities and severities are not displayed in the actual message that appears in the syslog, but are instead used to tell the system that receives the syslog message how to categorize it.

**Tip** For more detailed information about how syslog works and how to configure it, refer to the documentation for your system. On UNIX systems, the `man` pages for `syslog` and `syslog.conf` provide conceptual information and configuration instructions.

---

Although you can choose any type of facility when creating a syslog alert response, you should choose one that makes sense based on your syslog server; not all syslog servers support all facilities. For UNIX syslog servers, the `syslog.conf` file should indicate which facilities are saved to which log files on the server.

Syslog messages are transmitted over either UDP or TCP, depending on the configuration of the syslog server.

#### Before you begin

- This procedure is not the recommended way to send syslog messages in many cases.
- Confirm that the syslog server can accept remote messages.

### Procedure

---

**Step 1** Choose **Policies** > **Actions** > **Alerts**.

**Step 2** From the **Create Alert** drop-down menu, choose **Create Syslog Alert**.

**Step 3** Enter a **Name** for the alert.

**Step 4** In the **Host** field, enter the hostname or IP address of your syslog server.

**Note** The system does **not** warn you if you enter an invalid IPv4 address (such as 192.168.1.456) in this field. Instead, the invalid address is treated as a hostname.

**Step 5** In the **Port** field, enter the port the server uses for syslog messages. By default, this value is 514.

- Step 6** From the **Facility** list, choose a facility described in [Syslog Alert Facilities, on page 445](#).
- Step 7** From the **Severity** list, choose a severity described in [Syslog Severity Levels, on page 446](#).
- Step 8** In the **Tag** field, enter the tag name that you want to appear with the syslog message.
- For example, if you wanted all messages sent to the syslog to be preceded with `FromMC`, enter `FromMC` in the field.
- Step 9** Click **Save**.

### What to do next

Changes take effect immediately, EXCEPT:

If you are using alert responses to send connection logs to a syslog server, you must deploy configuration changes after you edit those alert responses.

## Syslog Alert Facilities

The following table lists the syslog facilities you can select.

*Table 33: Available Syslog Facilities*

Facility	Description
AUTH	A message associated with security and authorization.
AUTHPRIV	A restricted access message associated with security and authorization. On many systems, these messages are forwarded to a secure file.
CONSOLE	An alert message.
CRON	A message generated by the clock daemon. Note that syslog servers running a Linux operating system will use the <code>CRON</code> facility.
DAEMON	A message generated by a system daemon.
FTP	A message generated by the FTP daemon.
KERN	A message generated by the kernel. On many systems, these messages are printed to the console when they appear.
LOCAL0-LOCAL7	A message generated by an internal process.
LPR	A message generated by the printing subsystem.
MAIL	A message generated by a mail system.
NEWS	A message generated by the network news subsystem.
NTP	A message generated by the NTP daemon.
SECURITY	A message generated by the audit subsystem.

Facility	Description
SYSLOG	A message generated by the syslog daemon.
SOLARIS-CRON	A message generated by the clock daemon. Note that syslog servers running a Windows operating system will use the <code>CLOCK</code> facility.
USER	A message generated by a user-level process.
UUCP	A message generated by the UUCP subsystem.

## Syslog Severity Levels

The following table lists the standard syslog severity levels you can select.

*Table 34: Syslog Severity Levels*

Level	Description
ALERT	A condition that should be corrected immediately.
CRIT	A critical condition.
DEBUG	Messages that contain debugging information.
EMERG	A panic condition broadcast to all users.
ERR	An error condition.
INFO	Informational messages.
NOTICE	Conditions that are not error conditions, but require attention.
WARNING	Warning messages.

## Creating an Email Alert Response

### Before you begin

- Ensure that the Secure Firewall Management Center can reverse-resolve its own IP address. Some mail servers may perform reverse DNS lookups to verify the sender's identity as a measure to prevent spam and unauthorized access.

### Procedure

- 
- Step 1** Choose **Policies** > **Actions** > **Alerts**.

- Step 2** From the **Create Alert** drop-down menu, choose **Create Email Alert**.
- Step 3** Enter a **Name** for the alert response.
- Step 4** In the **To** field, enter the email addresses where you want to send alerts, separated by commas.
- Step 5** In the **From** field, enter the email address that you want to appear as the sender of the alert.
- Step 6** Next to **Relay Host**, verify the listed mail server is the one that you want to use to send the alert.
- Tip** To change the email server, click **Edit** (✎).
- Step 7** Click **Save**.
-

## CHAPTER 23

# External Alerting for Intrusion Events

---

The following topics describe how to configure external alerting for intrusion events:

- [About External Alerting for Intrusion Events](#), on page 449
- [License Requirements for External Alerting for Intrusion Events](#), on page 450
- [Requirements and Prerequisites for External Alerting for Intrusion Events](#), on page 450
- [Configuring SNMP Alerting for Intrusion Events](#), on page 450
- [Configuring Syslog Alerting for Intrusion Events](#), on page 452
- [Configuring Email Alerting for Intrusion Events](#), on page 454

## About External Alerting for Intrusion Events

External intrusion event notification can help with critical-system monitoring:

- **SNMP**—Configured per intrusion policy and sent from managed devices. You can enable SNMP alerting per intrusion rule.
- **Syslog**—Configured per intrusion policy and sent from managed devices. When you enable syslog alerting in an intrusion policy, you turn it on for every rule in the policy.
- **Email**—Configured across all intrusion policies and sent from the Secure Firewall Management Center. You can enable email alerts per intrusion rule, as well as limit their length and frequency.

Keep in mind that if you configured intrusion event suppression or thresholding, the system may not generate intrusion events (and thus may not send alerts) every time a rule triggers.

---

**Note** The Secure Firewall Management Center also uses SNMP, syslog, and email *alert responses* to send different types of external alerts; see [Secure Firewall Management Center Alert Responses](#), on page 441. The system does **not** use alert responses to send alerts based on individual intrusion events.

---

# Configuring SNMP Alerting for Intrusion Events

After you enable external SNMP alerting in an intrusion policy, you can configure individual rules to send SNMP alerts when they trigger. These alerts are sent from the managed device.

## Procedure

- 
- Step 1** In the intrusion policy editor's navigation pane, click **Advanced Settings**.
  - Step 2** Make sure **SNMP Alerting** is **Enabled**, then click **Edit**.  
A message at the bottom of the page identifies the intrusion policy layer that contains the configuration.
  - Step 3** Choose an **SNMP Version**, then specify configuration options as described in [Intrusion SNMP Alert Options, on page 451](#).
  - Step 4** In the navigation pane, click **Rules**.
  - Step 5** In the rules pane, choose the rules where you want to set SNMP alerts, then choose **Alerting > Add SNMP Alert**.

**Step 6** To save changes you made in this policy since the last policy commit, choose **Policy Information**, then click **Commit Changes**.

If you leave the policy without committing changes, changes since the last commit are discarded if you edit a different policy.

#### What to do next

- Deploy configuration changes.

## Intrusion SNMP Alert Options

If your network management system requires a management information base file (MIB), you can obtain it from the Secure Firewall Management Center at `/etc/sf/DCEALERT.MIB`.

### SNMP v2 Options

Option	Description
Trap Type	The trap type to use for IP addresses that appear in the alerts. If your network management system correctly renders the INET_IPV4 address type, choose <b>as Binary</b> . Otherwise, choose <b>as String</b> . For example, HP OpenView requires <b>as String</b> .
Trap Server	The server that will receive SNMP traps notification. You can specify a single IP address or hostname.
Community String	The community name.

### SNMP v3 Options

Managed devices encode SNMPv3 alerts with an Engine ID value. To decode the alerts, your SNMP server requires this value, which is the hexadecimal version of the sending device's management interface IP address, appended with "01."

For example, if the device sending the SNMP alert has a management interface IP address of 172.16.1.50, the Engine ID value is 0xAC10013201.

Option	Description
Trap Type	The trap type to use for IP addresses that appear in the alerts. If your network management system correctly renders the INET_IPV4 address type, choose <b>as Binary</b> . Otherwise, choose <b>as String</b> . For example, HP OpenView requires <b>as String</b> .
Trap Server	The server that will receive SNMP traps notification. You can specify a single IP address or hostname.

Option	Description
Authentication Password	The password required for authentication. SNMP v3 uses either the Message Digest 5 (MD5) hash function or the Secure Hash Algorithm (SHA) hash function to encrypt this password, depending on configuration.  If you specify an authentication password, authentication is enabled.
Private Password	The SNMP key for privacy. SNMP v3 uses the Data Encryption Standard (DES) block cipher to encrypt this password. When you enter an SNMP v3 password, the password displays in plain text during initial configuration but is saved in encrypted format.  If you specify a private password, privacy is enabled, and you must also specify an authentication password.
User Name	Your SNMP user name.

## Configuring Syslog Alerting for Intrusion Events

After you enable syslog alerting in an intrusion policy, the system sends all intrusion events to the syslog, either on the managed device itself or to an external host or hosts. If you specify an external host, syslog alerts are sent from the managed device.

### Procedure

- 
- Step 1** In the intrusion policy editor's navigation pane, click **Advanced Settings**.
- Step 2** Make sure **Syslog Alerting** is **Enabled**, then click **Edit**.  
A message at the bottom of the page identifies the intrusion policy layer that contains the configuration. The **Syslog Alerting** page is added under **Advanced Settings**.
- Step 3** Enter the IP addresses of the **Logging Hosts** where you want to send syslog alerts.  
  
If you leave the **Logging Hosts** field blank, the logging hosts details are taken from Logging in the associated Access Control Policy.
- Step 4** Choose **Facility** and **Severity** levels as described in [Facilities and Severities for Intrusion Syslog Alerts, on page 453](#).
- Step 5** To save changes you made in this policy since the last policy commit, choose **Policy Information**, then click **Commit Changes**.  
  
If you leave the policy without committing changes, changes since the last commit are discarded if you edit a different policy.
- 

### What to do next

- Deploy configuration changes.

## Facilities and Severities for Intrusion Syslog Alerts

Managed devices can send intrusion events as syslog alerts using a particular facility and **Severity**, so that the logging host can categorize the alerts. The *facility* specifies the subsystem that generated it. These facility and **Severity** values do not appear in the actual syslog messages.

Choose values that make sense based on your environment. Local configuration files (such as `syslog.conf` on UNIX-based logging hosts) may indicate which facilities are saved to which log files.

### Syslog Alert Facilities

Facility	Description
AUTH	A message associated with security and authorization.
AUTHPRIV	A restricted access message associated with security and authorization. On many systems, these messages are forwarded to a secure file.
CONSOLE	An alert message.
CRON	A message generated by the clock daemon.
DAEMON	A message generated by a system daemon.
FTP	A message generated by the FTP daemon.
KERN	A message generated by the kernel. On many systems, these messages are printed to the console when they appear.
LOCAL0-LOCAL7	A message generated by an internal process.
LPR	A message generated by the printing subsystem.
MAIL	A message generated by a mail system.
NEWS	A message generated by the network news subsystem.
SYSLOG	A message generated by the syslog daemon.
USER	A message generated by a user-level process.
UUCP	A message generated by the UUCP subsystem.

### Syslog Alert Severities

Level	Description
EMERG	A panic condition broadcast to all users
ALERT	A condition that should be corrected immediately
CRIT	A critical condition
ERR	An error condition

Level	Description
WARNING	Warning messages
NOTICE	Conditions that are not error conditions, but require attention
INFO	Informational messages
DEBUG	Messages that contain debug information

## Configuring Email Alerting for Intrusion Events

If you enable intrusion email alerting, the system can send email when it generates an intrusion event, regardless of which managed device or intrusion policy detected the intrusion. These alerts are sent from the Secure Firewall Management Center.

### Before you begin

- Ensure that the Secure Firewall Management Center can reverse-resolve its own IP address. Some mail servers may perform reverse DNS lookups to verify the sender's identity as a measure to prevent spam and unauthorized access.

### Procedure

- 
- Step 1** Choose **Policies > Actions > Alerts**.
  - Step 2** Click **Intrusion Email**.
  - Step 3** Choose alerting options, including the intrusion rules or rule groups for which you want to alert, as described in [Intrusion Email Alert Options, on page 454](#).
  - Step 4** Click **Save**.
- 

## Intrusion Email Alert Options

### On/Off

Enables or disables intrusion email alerts.

---

**Note** Enabling it will enable alerting for all rules unless individual rules are selected.

---

### From/To Addresses

The email sender and recipients. You can specify a comma-separated list of recipients.

### Max Alerts and Frequency

The maximum number of email alerts (**Max Alerts**) that the Secure Firewall Management Center will send per time interval (**Frequency**).

### Coalesce Alerts

Reduces the number of alerts sent by grouping alerts that have the same source IP and rule ID.

### Summary Output

Enables brief alerts, suitable for text-limited devices. Brief alerts contain:

- Timestamp
- Protocol
- Source and destination IPs and ports
- Message
- The number of intrusion events generated against the same source IP

For example: 2011-05-18 10:35:10 10.1.1.100 icmp 10.10.10.1:8 -> 10.2.1.3:0  
snort\_decoder: Unknown Datagram decoding problem! (116:108)

If you enable **Summary Output**, also consider enabling **Coalesce Alerts**. You may also want to lower **Max Alerts** to avoid exceeding text-message limits.

### Time Zone

The time zone for alert timestamps.

### Email Alerting on Specific Rules Configuration

Allows you to choose the rules where you want to set email alerts.

## PART **VIII**

## CHAPTER 24

# Cisco Security Analytics and Logging

- [About Security Analytics and Logging, on page 459](#)
- [Comparison of SAL Remote Event Storage and Monitoring Options, on page 460](#)
- [About SAL \(OnPrem\), on page 460](#)
- [Manage SAL \(OnPrem\) for Security Cloud Control-Managed Threat Defense Devices, on page 461](#)
- [Configure SAL \(OnPrem\) Integration, on page 463](#)
- [About SAL \(SaaS\), on page 466](#)

## About Security Analytics and Logging

Security Analytics and Logging (SAL) is a central log management and advanced threat detection service which delivers scalable Cisco firewall logging and correlated analytics. Central logging helps in providing visibility, helps troubleshoot network access issues including disruptions, and enables device and overall network health monitoring. Analytics provide detection against advanced threats.

The SAL service is available in the following two methods:

- **Security Analytics and Logging (SaaS)**—A hosted software as a service (SaaS) which stores events and provides data for security analytics using Secure Cloud Analytics (formerly Stealthwatch Cloud). This service connects the Security Analytics and Logging cloud data store to the firewall cloud manager, Cisco Security Cloud Control (Security Cloud Control).

In this documentation, this method is also referred to as SAL (SaaS).

- **Security Analytics and Logging (On Premises)**—A service that runs on the Secure Network Analytics (formerly Stealthwatch) appliances to store event logs at the customer's own premises. This service connects the Security Analytics and Logging (On Premises) data to the on-premises manager, Secure Firewall Management Center.

In this documentation, this method is also referred to as SAL (OnPrem).

For more information about Security Analytics and Logging, see <https://www.cisco.com/c/en/us/products/security/security-analytics-logging/index.html>.

# Comparison of SAL Remote Event Storage and Monitoring Options

SAL integration shows similar options for storing event data externally to a management center and Security Cloud Control:

	SAL (OnPrem)	SAL (SaaS)
Why choose this solution?	You want to increase your on-premises firewall event data storage capacity, retain this data for a longer period, and export your event data to the Secure Network Analytics appliance.	You want to send firewall events for storage and optionally make your firewall event data available for security analytics using Secure Cloud Analytics.
Licensing	Purchase license and set-up the storage system behind your firewall.  For more information, see <a href="#">Licensing for SAL (OnPrem), on page 461</a>	Purchase license and a data storage plan and send your data to the Cisco cloud.  For more information, see <a href="#">Licensing for SAL (SaaS), on page 466</a>
Supported event types	<ul style="list-style-type: none"> <li>• Connection</li> <li>• File and Malware</li> <li>• Intrusion</li> <li>• LINA</li> <li>• Security Intelligence</li> </ul>	<ul style="list-style-type: none"> <li>• Connection</li> <li>• File and Malware</li> <li>• Intrusion</li> <li>• Security Intelligence</li> </ul>
Supported methods to send events	Supports both, syslog and direct integration.	Supports both, syslog and direct integration.
Event viewing	<ul style="list-style-type: none"> <li>• View events on the Secure Network Analytics Manager.</li> <li>• Cross-launch from the management center event viewer to view events on the Secure Network Analytics Manager.</li> <li>• View remotely stored connection and security intelligence events in the management center.</li> </ul>	View events in Security Cloud Control or Secure Network Analytics Manager, depending on your license. Cross-launch from the management center event viewer.

## About SAL (OnPrem)

You can configure SAL (OnPrem) to store firewall event data for increased storage at a larger retention period. By deploying Secure Network Analytics appliances and integrating them with your firewall deployment, you can export your event data to a Secure Network Analytics appliance.

This provides you with the following capabilities:

- Store events on the Secure Network Analytics appliance.
- Specify this remote data source to view these events in the management center.
- Review event data from the Secure Network Analytics Manager (formerly Stealthwatch Management Console) Web App UI using the *Event Viewer*.
- Cross-launch from the management center UI to the *Event Viewer* to view additional context on the information from which you cross-launched.

## Licensing for SAL (OnPrem)

You must obtain the Logging and Troubleshooting smart license to use SAL (OnPrem). You can obtain the license based on the amount of data you anticipate while sending the syslog data from your firewall deployment to your Secure Network Analytics appliance on a daily basis.

For information on licensing the Secure Network Analytics appliances, see [Secure Network Analytics Smart Software Licensing Guide](#).

For information on the available SAL (OnPrem) licensing options, see the [Cisco Security Analytics and Logging Ordering Guide](#).

---

**Note** For license calculation purposes, the amount of data is reported to the nearest whole GB. For example, If you send 4.9 GB in a day, it is reported as 4 GB.

---

## Manage SAL (OnPrem) for Security Cloud Control-Managed Threat Defense Devices

Starting with Secure Firewall Threat Defense(formerly Firepower Threat Defense) version 7.2, you can choose to send fully qualified events that are generated by Security Cloud Control-managed threat defense devices to the management center. The management center receives and displays data analytics for these events. The management center receiving and displaying the event data is also referred to as an analytics-only management center .

If your devices are enabled to send connection events to a Secure Network Analytics Manager using SAL (OnPrem), you can view and work with these remotely stored events in the management center event viewer and context explorer, and include them when generating reports. By deploying the Secure Network Analytics appliance and integrating it with the firewall deployment, you can export the event data to the Secure Network Analytics appliance. This allows you to view and manage the events in the management center UI. From the management center interface, you can also cross-launch to Secure Network Analytics Manager to view and manage the events data.

The management center can receive and display event analytics for the following Security Cloud Control-managed threat defense devices:

- New or existing threat defense devices onboarded to Security Cloud Control

For information on onboarding a threat defense device to Security Cloud Control, see [Prerequisites to Onboard a Device to Cloud-delivered Firewall Management Center, on page 28](#).

The workflow is as follows:

1. Onboard a threat defense device to Security Cloud Control.

Onboard the threat defense devices using the onboarding methods that are described in [Prerequisites to Onboard a Device to Cloud-delivered Firewall Management Center, on page 28](#). The onboarding process includes assigning policies and choosing the appropriate licenses.

2. Register this threat defense device in the appropriate management center.

For the management center to display events generated by a Security Cloud Control-managed threat defense device, you must register the threat defense device in the management center. To register this device in the management center, enable the device to be registered using the **configure manager add** `{hostname | IPv4_address | IPv6_address} reg_key[nat_id]` CLI, and then add the device to the management center using the **Security Cloud Control Managed Device** check box.

---

**Note** The registration key and the NAT ID must be unique from those used while onboarding the device to Security Cloud Control.

---

For more information, see *Add a Device to the Management Center* and *Complete the Threat Defense Initial Configuration Using the CLI* in [Firepower Management Center Device Configuration Guide](#).

3. View events in the management center or cross-launch to a configured Secure Network Analytics Manager.

To view and work with the events in the management center event viewer. If the Secure Network Analytics appliance is deployed and integrated with the firewall deployment, you can export the event data to the Secure Network Analytics appliance. This allows you to cross-launch from the management center UI to the Secure Network Analytics Manager to view and manage the events data.

For more information, see *Events and Assets* and *Event Analysis Using External Tools*.

- Existing threat defense devices on the management center.

You can change the management of the threat defense devices from management center to Security Cloud Control using the change threat defense manager functionality. The change threat defense manager functionality provides you to ability to change the management of threat defense devices from management center to Security Cloud Control. While changing the manager, you can choose to retain the events data generated by these threat defense devices on the management center. If you choose to retain the events data on the management center, a copy of the threat defense device in an analytics-only mode is retained on the management center.

For more information, see [Migrate Secure Firewall Threat Defense to Cloud](#).

The workflow is as follows:

1. Onboard the management center to Security Cloud Control

To onboard the existing threat defense devices from management center to Security Cloud Control, you must onboard the appropriate management center to Security Cloud Control.

For more information, see [Onboard an FMC](#).

2. Complete the change threat defense management process

During the change threat defense management process, while changing the device manager, you can choose to retain events data generated by these threat defense devices on the management center.

For more information, see [Migrate Secure Firewall Threat Defense to Cloud](#).

3. View events in the management center or cross-launch to configured Secure Network Analytics appliance.

To view and work with the events in the management center event viewer. If the Secure Network Analytics appliance is deployed and integrated with the firewall deployment, you can export the event data to the Secure Network Analytics appliance. This allows you to cross-launch from the management center UI to the Secure Network Analytics Manager to view and manage the events data.

For more information, see [Events and Assets](#) and [Event Analysis Using External Tools](#).

## Configure SAL (OnPrem) Integration

You can configure Security Cloud Control to send events to the Secure Network Analytics appliance using one of the following deployment options:

- **Secure Network Analytics Manager Only**—Deploy a standalone manager to receive and store events. The threat defense devices send event data to the Network Analytics Manager. All event data is stored on the Network Analytics Manager. From the management center user interface, you can cross-launch the manager to view more information about the stored events.
- **Secure Network Analytics Data Store**—Deploy a Cisco Secure Network Analytics Flow Collector to receive events, a Cisco Secure Network Analytics Data Store (containing 3 Cisco Secure Network Analytics Data Nodes) to store events, and a manager. The threat defense devices send event data to the flow collector from where the events are sent to the Data Store for storage. From the management center user interface, you can cross-launch the manager to view more information about the stores events.

Starting with threat defense version 7.2, you can choose to associate different flow collectors to different devices.

## Configure a Secure Network Analytics Manager

Configure the Secure Network Analytics Manager deployment to integrate SAL (OnPrem) with Security Cloud Control-managed threat defense devices.

### Before you begin

Ensure the following:

- You have a provisioned Security Cloud Control tenant and have the following Security Cloud Control user roles:
  - Admin
  - Super admin

- Your threat defense devices are working as expected and are generating events.
- If you are currently using syslog to send events to the Secure Network Analytics Manager from device versions that support sending events directly, disable syslog for those devices (or assign those devices an access control policy that does not include syslog configurations) to avoid duplicating events on the remote volume.
- You have the hostname or the IP address of your Secure Network Analytics Manager.

---

**Note** You may be logged out of the Secure Network Analytics Manager during the registration process; complete any work in progress before you start with the deployment wizard.

---

## Procedure

- 
- Step 1** Log in to Security Cloud Control.
  - Step 2** From the Security Cloud Control menu, navigate **Administration > Integrations & Migration > Cloud Services** to open the **Services** page.
  - Step 3** Select **Cloud-Delivered FMC** and then click **Configuration**.
  - Step 4** Navigate to **Integration > Security Analytics & Logging**.
  - Step 5** In the **Secure Network Analytics Manager Only** widget, click **Start**.
  - Step 6** Enter the hostname or the IP address and port number of the Secure Network Analytics Manager and click **Next**.
  - Step 7** Deploy the changes to the managed devices.

The event data is not logged to the SAL (OnPrem) until the logging policy changes are deployed to the registered threat defense devices.

**Note** If you must change any of these configurations, run the wizard again. If you disable the configuration or run the wizard again, all settings except the account credentials are retained.

You can view and work with these remotely stored events in the event viewer and context explorer in the management center, and include them when generating reports. You can also cross-launch from an event in the management center to view related data on your Secure Network Analytics appliance.

For more information, see the online help for the management center.

- Step 8** Click **OK**.
- 

## Configure a Secure Network Analytics Data Store

Configure a Secure Network Analytics data store deployment to integrate SAL (OnPrem) with threat defense devices that are Security Cloud Control-managed.

## Before you begin

Ensure the following:

- You have a provisioned Security Cloud Control tenant and have the following Security Cloud Control user roles:
  - Admin
  - Super admin
- Your threat defense devices are working as expected and generating events.
- If you are currently using syslog to send events to the Secure Network Analytics appliance from device versions that support sending events directly, disable syslog for those devices (or assign those devices an access control policy that does not include syslog configurations) to avoid duplicate events on the remote volume.
- Gather the following information:
  - The hostname or the IP address of your Secure Network Analytics Manager.
  - The IP address of your flow collector.

---

**Note** You may be logged out of the Secure Network Analytics Manager during the registration process; complete any work in progress before you start with the deployment wizard.

---

## Procedure

- 
- Step 1** Log in to Security Cloud Control.
  - Step 2** From the Security Cloud Control menu, navigate **Administration > Integrations & Migration > Cloud Services** to open the **Services** page.
  - Step 3** Choose **Cloud-Delivered FMC** and click **Configuration**.
  - Step 4** Navigate to **Integration > Security Analytics & Logging**.
  - Step 5** In the **Secure Network Analytics Data Store** widget, click **Start**.
  - Step 6** Enter the hostname or the IP address and port number of the flow collector.  
To add more flow collectors, click **+Add another Flow Collector**.
  - Step 7** If you have configured more than one flow collector, associate the managed devices with different flow collectors:

**Note** By default, all the managed devices are assigned to the default flow collector.

- a) Click **Assign Devices**.
- b) Select the managed devices that you want to assign.
- c) From the reassign device drop-down list, choose the flow collector.

If you do not want a managed device to send event data to any of the flow collectors, select that device, and choose **Do not log to flow collector from the reassign device drop-down list**.

You can change the default flow collector by hovering over the intended flow collector and clicking **Set default**.

- d) Click **Apply Changes**.
- e) Click **Next**.

**Step 8** Click **Next**.

**Step 9** Deploy the changes to the registered managed devices.

The event data is not logged to the SAL (OnPrem) until the logging policy changes are deployed to the registered threat defense devices.

**Note** If you must change any of these configurations, run the wizard again. If you disable the configuration or run the wizard again, all settings except the account credentials are retained.

You can view and work with these remotely stored events in the event viewer and context explorer in the management center, and include them when generating reports. You can also cross-launch from an event in the management center to view related data on your Secure Network Analytics Manager.

For more information, see the online help for the management center.

---

## About SAL (SaaS)

SAL (SaaS) allows you to capture connection, intrusion, file, malware, and Security Intelligence events from all of your threat defense devices and view them in one place in Security Cloud Control. The events are stored in the Cisco cloud and are viewable from the Event Logging page in Security Cloud Control, where you can filter and review them to gain a clear understanding of what security rules are triggering in your network.

With additional licensing, after you capture these events, you can cross-launch from Security Cloud Control to the Secure Cloud Analytics portal provisioned for you. Secure Cloud Analytics is a software as a service (SaaS) solution that tracks the state of your network by performing a behavioral analysis on events and network flow data. By gathering information about your network traffic from sources including firewall events and network flow data, it creates observations about the traffic and automatically identifies roles for network entities based on their traffic patterns. Using this information combined with other sources of threat intelligence, such as Talos, Secure Cloud Analytics generates alerts, which constitute a warning that there is behavior that may be malicious in nature. Along with the alerts, Secure Cloud Analytics provides network and host visibility, and contextual information it has gathered to provide you with a better basis to research the alert and locate sources of malicious behavior.

## Licensing for SAL (SaaS)

The SAL (SaaS) license allows you to use a Security Cloud Control tenant to view firewall logs and a Cisco Secure Cloud Analytics instance for analytics, without holding separate licenses for either of these products.

For details on the available SAL (SaaS) licensing options, see the [Cisco Security Analytics and Logging Ordering Guide](#).

# CHAPTER 25

## FTD Dashboard

- [About the FTD Dashboard, on page 467](#)
- [View the FTD Dashboard, on page 468](#)
- [FTD Dashboard Widgets, on page 469](#)
- [Modify Time Settings for the FTD Dashboard, on page 472](#)

### About the FTD Dashboard

The FTD dashboard provides you an at-a-glance view of the status, including events data collected and generated by all Security Cloud Control-managed threat defense devices.

You can use this dashboard to view collective information that is related to the device status and the overall health of the devices in your deployment. The information that the FTD dashboard provides depends on how you license, configure, and deploy the devices in your system. Although, the FTD dashboard displays data for all Security Cloud Control-managed threat defense devices, you can choose to filter device-based data. You can also choose the time range to display for specific time range.

This dashboard uses tabs to display predefined widgets: small, self-contained components that provide insights into different aspects of the system. For example, the Network Activity widget shows you event graphs that display information about all connection, malware, and intrusion events. The widgets in the dashboard are predefined and cannot be customized. This dashboard is visible to all Security Cloud Control users who have access to a Security Cloud Control tenant.

- The dashboard does not displays any event statistics for historic events.
- Since the aggregation service batch processes the events to aggregate every five minutes, you can expect a five-minute latency between the time the events are aggregated to the time the statistics are displayed.

**Figure 72: FTD Dashboard**

Number	Description
1	Allows you to change the time range to reflect a period as short as the last hour or as long as the last year. When you change the time range, the widgets automatically update the events data to reflect the new time range.
2	Allows you to filter the events data based on selected devices. If no devices are selected, the widgets display all available events data.
3	Reinitiates the events data query
4	Displays the events data in a PDF output format. You can choose to download or save a copy of this PDF on your local machine.

## View the FTD Dashboard

From the Security Cloud Control menu, choose **Insights & Reports > Firewall Threat Defense > Dashboard** to view the **FTD Dashboard**.

By default, the home page for your tenant displays the **Overview** tab.

The dashboard includes widgets that are listed under each tab: Threat, Network, Applications, and Status tab.

The following table lists the widgets available under each tab:

Name of the Tab	Available Widgets
Overview	All available widgets
Threat	<ul style="list-style-type: none"> <li>• Top Intrusion Rules</li> <li>• Top Intrusion Attackers</li> <li>• Top Intrusion Targets</li> <li>• Top Malware Signatures</li> <li>• Top Malware Senders</li> <li>• Top Malware Receivers</li> <li>• Malware Events by Disposition</li> </ul>

Name of the Tab	Available Widgets
Network	<ul style="list-style-type: none"> <li>• Network Activity</li> <li>• Event Activity</li> <li>• Access Control Actions</li> <li>• Top Access Control Policies</li> <li>• Top Access Control Rules</li> <li>• Top Devices</li> <li>• Top Users</li> <li>• Top Users by Blocked Connections</li> </ul>
Status	<ul style="list-style-type: none"> <li>• Top Devices with Health Alerts</li> <li>• Top Loaded Devices</li> </ul>
Applications	<ul style="list-style-type: none"> <li>• Top Web Applications</li> <li>• Top Client Applications</li> <li>• Blocked Web Applications</li> </ul>

## FTD Dashboard Widgets

The FTD dashboard displays predefined widgets that can provide you with at-a-glance views of the current system status. These views include:

- Data about the events collected and generated by threat defense devices managed FMC.
- Information about the status and the overall health of the devices in your deployment.

### Top Intrusion Rules Widget

The **Top Intrusion Rules** widget displays counts of the intrusion events that have occurred over the specified time range and are organized by priority. These counts include statistics on intrusion events with dropped packets and different impacts. The generated list is scrollable.

### Top Intrusion Attackers Widget

The **Top Intrusion Attackers** widget displays counts of intrusion events for the top attacking host IP addresses (causing those events) on your monitored network.

## Top Intrusion Targets Widget

The **Top Intrusion Targets** widget displays counts of intrusion events for the top target host IP addresses (targeted in the connections causing those events) on your monitored network.

## Top Malware Signatures Widget

The **Top Malware Signatures** widget displays counts of the top malware signatures detected in the network traffic for top file-sending host IP addresses.

## Top Malware Senders Widget

The **Top Malware Senders** widget displays counts of the top malware threats that are detected in the network traffic for top file-sending host IP addresses.

## Top Malware Receivers Widget

The **Top Malware Receivers** widget displays counts of the top malware threats that are detected in the network traffic for all top file-receiving host IP addresses.

## Malware Events by Disposition Widget

The **Malware Events by Disposition** widget displays counts of all disposition of malware events that are generated when the managed device detects a file containing malware.

## Network Activity Widget

The **Network Activity** widget displays all ingress and egress data rate that is based on information from the connection events.

## Event Activity Widget

The **Event Activity** widget displays counts of events that have occurred in the last hour and the total number of each event type that is available in the database.

## Access Control Actions Widget

The **Access Control Actions** widget displays counts of events that are logged based on the allowed or blocked access control actions for each event. If you hover on the pie chart, you can view the percentage of the allowed and blocked actions.

## Top Access Control Policies Widget

The **Top Access Control Policies** widget displays counts of top access control policies generating events.

## Top Access Control Rules Widget

The **Top Access Control Rules** widget displays the top five counts of the access control rules that are used for each event. These counts can be sorted by bytes or events.

## Top Devices Widget

The **Top Devices** widget displays counts of events per devices. These count can be sorted by bytes or events.

## Top Users Widget

The **Top Users** widget displays a list of users on your monitored network that are associated with the highest intrusion event counts. It draws data primarily from the intrusion detection (IDS) User Statistics and Intrusion Events tables. It displays authoritative user data.

## Top Users by Blocked Connections Widget

The **Top Users by Blocked Connections** widget displays users who have the highest number of blocked connection events associated with them in your monitored network.

## Top Devices with Health Alerts Widget

The **Top Devices with Health Alerts** widget displays the current compiled health status for Security Cloud Control-managed threat defense devices.

## Top Loaded Devices Widget

The **Top Loaded Devices** widget displays a list of Secure Firewall Threat Defense devices along with the CPU usage information.

## Top Web Applications Widget

The **Top Web Applications** widget displays the web applications that are associated with the highest number of connection events in your monitored network. You can sort this list based on bytes or event count.

## Top Client Applications Widget

The **Top Client Applications** widget displays the most used client applications in your monitored network. You can sort this list based on bytes or event count.

## Top Blocked Web Applications Widget

The **Top Web Applications** widget displays the top web applications that are associated with blocked connection events and the count of blocked connection events in your monitored network.

# Modify Time Settings for the FTD Dashboard

You can change the time range to reflect a period as short as the last hour (the default) or as long as the last year. When you change the time range, the widgets that can be constrained by time automatically update to reflect the new time range.

The maximum number of data points in any graph is 300, and the time setting determines how much time is summarized within each data point. Following is the number of data points, and the time span covered, in the FTD dashboard for each time range:

- 1 hour = 12 data points, 5 minutes each
- 6 hours = 72 data points, 5 minutes each
- 1 day = 288 data points, 5 minutes each
- 1 week = 300 data points, 33.6 minutes each
- 2 weeks = 300 data points, 67.2 minutes each
- 30 days = 300 data points, 144 minutes each
- 90 days = 300 data points, 432 minutes each
- 180 days = 300 data points, 864 minutes each
- 1 year = 300 data points, 1752 minutes each

## CHAPTER 26

# Connection Logging

---

The following topics describe how to configure the system to log connections made by hosts on your monitored network:

- [About Connection Logging, on page 473](#)
- [Limitations of Connection Logging, on page 480](#)
- [Best Practices for Connection Logging, on page 480](#)
- [Requirements and Prerequisites for Connection Logging, on page 482](#)
- [Configure Connection Logging, on page 483](#)

## About Connection Logging

The system can generate logs of the connections its managed devices detect. These logs are called *connection events*. Settings in rules and policies give you granular control over which connections you log, when you log them, and where you store the data. Special connection events, called *security-related connection events*, represent connections that were blocked by the reputation-based Security Intelligence feature.

Connection events contain data about the detected sessions. The information available for any individual connection event depends on several factors, but in general includes:

- Basic connection properties: timestamp, source and destination IP address, ingress and egress zones, the device that handled the connection, and so on
- Additional connection properties discovered or inferred by the system: applications, requested URLs, or users associated with the connection, and so on
- Metadata about why the connection was logged: which configuration handled the traffic, whether the connection was allowed or blocked, details about encrypted and decrypted connections, and so on

Log connections according to the security and compliance needs of your organization. When setting up connection logging, keep in mind that the system can log a connection for multiple reasons, and that disabling logging in one place does not mean that matching connections will not be logged.

The information in a connection event depends on several factors, including traffic characteristics, the configuration that ultimately handled the connection, and so on.

---

**Note** You can supplement the connection logs gathered by your managed devices with connection data generated from exported NetFlow records. This is especially useful if you have NetFlow-enabled routers or other devices deployed on networks that your managed devices cannot monitor.

---

## Connections That Are Always Logged

Unless you disable connection event storage, the system automatically saves the following end-of-connection events to the management center database, regardless of any other logging configurations.

### Connections Associated with Intrusions

The system automatically logs connections associated with intrusion events, unless the connection is handled by the access control policy's default action.

When an intrusion policy associated with the access control default action generates an intrusion event, the system does *not* automatically log the end of the associated connection. Instead, you must explicitly enable default action connection logging. This is useful for intrusion prevention-only deployments where you do not want to log any connection data.

However, if you enable beginning-of-connection logging for the default action, the system *does* log the end of the connection when an associated intrusion policy triggers, in addition to logging the beginning of the connection.

### Connections Associated with File and Malware Events

The system automatically logs connections associated with file and malware events.

---

**Note** File events generated by inspecting NetBIOS-SSN (SMB) traffic do not immediately generate connection events because the client and server establish a persistent connection. The system generates connection events after the client or server ends the session.

---

### Connections Associated with Intelligent Application Bypass

The system automatically logs bypassed and would-have-bypassed connections associated with IAB.

### Monitored Connections

The system always logs the ends of connections for monitored traffic, even if the traffic matches no other rules and you do not enable default action logging. For more information, see [Logging for Monitored Connections, on page 476](#).

## Other Connections You Can Log

So that you log only critical connections, enable connection logging on a per-rule basis. If you enable connection logging for a rule, the system logs all connections handled by that rule.

You can also log connections handled by policy default actions. Depending on the rule or default action (and for access control, a rule's inspection configuration), your logging options differ.

#### **Prefilter Policy: Rules and Default Action**

You can log connections (including entire plaintext, passthrough tunnels) that you fastpath or block with a prefilter policy.

Prefiltering uses outer-header criteria to handle traffic. For tunnels that you log, the resulting connection events contain information from the outer, encapsulation headers.

For traffic subject to further analysis, logging in the prefilter policy is disabled, although matching connections may still be logged by other configurations. The system performs all further analysis using inner headers, that is, the system independently handles and logs each connection within an allowed tunnel.

#### **Decryption Policy: Rules and Default Action**

You can log connections that match a decryption rule or decryption policy default action.

For blocked connections, the system immediately ends the session and generates an event. For monitored connections and connections that you pass to access control rules, the system generates an event when the session ends.

#### **Access Control Policy: Security Intelligence Decisions**

You can log a connection whenever it is blocked by the reputation-based Security Intelligence feature.

Optionally, and recommended in passive deployments, you can use a monitor-only setting for Security Intelligence filtering. This allows the system to further analyze connections that would have been blocked by Security Intelligence, but still log the match. Security Intelligence monitoring also allows you to create traffic profiles using Security Intelligence information.

When the system logs a connection event as the result of Security Intelligence filtering, it also logs a matching Security Intelligence event, which is a special kind of connection event that you can view and analyze separately, and that is also stored and pruned separately. So that you can identify the matching IP address in the connection, host icons beside blocked and monitored IP addresses look slightly different in the tables on the pages under the **Analysis > Connections** menus.

#### **Access Control Policy: Rules and Default Action**

You can log connections that match an access control rule or access control policy default action.

#### **Related Topics**

[How Rules and Policy Actions Affect Logging](#), on page 475

## **How Rules and Policy Actions Affect Logging**

Connection events contain metadata about why the connection was logged, including which configurations handled the traffic. Where you can configure connection logging, rule actions, and policy default actions determine not only how the system inspects and handles matching traffic, but also when and how you can log details about matching traffic.

#### **Related Topics**

[Connection and Security-Related Connection Event Fields](#)

## Logging for Fastpathed Connections

You can log fastpathed connections and non-encrypted tunnels, which includes traffic matching the following rules and actions in the prefilter policy:

- Tunnel rules—**Fastpath** action (logs the outer session)
- Prefilter rules—**Fastpath** action

Fastpathed traffic bypasses the rest of access control and QoS, so connection events for fastpathed connections contain limited information.

## Logging for Monitored Connections

The system always logs the ends of connections for traffic matching the following configurations, even if the traffic matches no other rules and you do not enable default action logging:

- Security Intelligence—Block lists set to monitor (also generates a Security Intelligence event)
- SSL rules—**Monitor** action
- Access control rules—**Monitor** action

The system does not generate a separate event each time a single connection matches a Monitor rule. Because a single connection can match multiple Monitor rules, each connection event can include and display information on the first eight Monitor access control rules that the connection matches, as well as the first matching SSL Monitor rule.

Similarly, if you send connection events to an external syslog or SNMP trap server, the system does not send a separate alert each time a single connection matches a Monitor rule. Rather, the alert that the system sends at the end of the connection contains information on the Monitor rules the connection matched.

## Logging for Trusted Connections

You can log the beginnings and ends of trusted connections, which includes traffic matching the following rules and actions:

- Access control rules—**Trust** action
- Access control default action—**Trust All Traffic**

---

**Note** Although you *can* log trusted connections, we recommend you do not do so because trusted connections are not subject to deep inspection or discovery, so connection events for trusted connections contain limited information.

---

TCP connections detected by a Trust rule on the first packet generate only an end-of-connection event. The system generates the event one hour after the final session packet.

## Logging for Blocked Connections

You can log blocked connections, which includes traffic matching the following rules and actions:

- Tunnel rules—**Block**

- Prefilter rules—**Block**
- Prefilter default action—**Block all tunnel traffic**
- Security Intelligence—Block lists not set to Monitor (also generates a Security Intelligence event)
- Decryption rules—**Block** and **Block with reset**
- SSL default action—**Block** and **Block with reset**
- Access control rules—**Block**, **Block with reset**, and **Interactive Block**
- Access control default action—**Block All Traffic**

Only devices deployed inline (that is, using routed, switched, or transparent interfaces, or inline interface pairs) can block traffic. Because blocked connections are not actually blocked in passive deployments, the system may report multiple beginning-of-connection events for each blocked connection.

---

**Caution** Logging blocked TCP connections during a Denial of Service (DoS) attack can affect system performance and overwhelm the database with multiple similar events. Before you enable logging for an Block rule, consider whether the rule monitors traffic on an Internet-facing interface or other interface vulnerable to DoS attack.

---

### Beginning vs End-of-Connection Logging for Blocked Connections

When you log a blocked connection, how the system logs it depends on why the connection was blocked; this is important to keep in mind when configuring correlation rules based on connection logs:

- For decryption rules and decryption policy default actions that block encrypted traffic, the system logs **end**-of-connection events. This is because the system cannot determine if a connection is encrypted using the first packet in the session.
- For other blocking actions, the system logs **beginning**-of-connection events. Matching traffic is denied without further inspection.

### Logging Bypassed Interactive Blocks

Interactive blocking access control rules, which cause the system to display a warning page when a user browses to a prohibited website, allow you to configure end-of-connection logging. This is because if the user clicks through the warning page, the connection is considered a new, allowed connection which the system can monitor and log.

Therefore, for packets that match an Interactive Block or Interactive Block with Reset rule, the system can generate the following connection events:

- A beginning-of-connection event when a user's request is initially blocked and the warning page is displayed; this event has an associated action of `Interactive Block` or `Interactive Block with Reset`
- Multiple beginning- or end-of-connection events if the user clicks through the warning page and loads the originally requested page; these events have an associated action of `Allow` and a reason of `User Bypass`

The following figure shows an example of an interactive block followed by allow.

## Connection Events (switch workflow)

[Connections with Application Details](#) > [Table View of Connection Events](#)

No Search Constraints ([Edit Search](#))

Jump to...	<input type="checkbox"/>	First Packet	Last Packet	Action	Reason	Initiator IP
	<input type="checkbox"/>	<a href="#">2018-09-17 09:57:45</a>	<a href="#">2018-09-17 09:58:21</a>	Allow		
	<input type="checkbox"/>	<a href="#">2018-09-17 09:57:43</a>	<a href="#">2018-09-17 09:57:43</a>	Interactive Block		

## Logging for Allowed Connections

You can log allowed connections, which includes traffic matching the following rules and actions:

- SSL rules—**Decrypt** action
- SSL rules—**Do not decrypt** action
- SSL default action—**Do not decrypt**
- Access control rules—**Allow** action
- Access control default action—**Network Discovery Only** and any intrusion prevention option

Enabling logging for these configurations ensures the connection is logged, while also permitting (or specifying) the next phase of inspection and traffic handling. SSL logging is always end-of-connection; access control configurations also allow beginning-of-connection logging.

Although the **Analyze** action in tunnel and prefilter rules also allows connections to continue with access control, logging is disabled for rules with this action. Matching connections may still be logged by other configurations. Allowed tunnels might have their encapsulated sessions evaluated and logged individually.

When you allow traffic with an access control rule or default action, you can use an associated intrusion policy to further inspect traffic and block intrusions. For access control rules, you can also use a file policy to detect and block prohibited files, including malware. Unless you disable connection event storage, the system automatically logs most allowed connections associated with intrusion, file, and malware events. For detailed information, see [Connections That Are Always Logged, on page 474](#).

Connections with encrypted payloads are not subject to deep inspection, so connection events for encrypted connections contain limited information.

### File and Malware Event Logging for Allowed Connections

When a file policy detects or blocks a file, it logs one of the following events to the management center database:

- *File events*, which represent detected or blocked files, including malware files.
- *Malware events*, which represent detected or blocked malware files only.
- *Retrospective malware events*, which are generated when the malware disposition for a previously detected file changes.

You can disable this logging on a per-access-control-rule basis. You can also disable file and malware event storage entirely.

**Note** We recommend you leave file and malware event logging enabled.

## Beginning vs End-of-Connection Logging

You can log a connection at its beginning or its end, with the following exceptions for blocked traffic:

- **Blocked traffic**—Because blocked traffic is immediately denied without further inspection, usually you can log only beginning-of-connection events for blocked traffic. There is no unique end of connection to log.
- **Blocked encrypted traffic**—When you enable connection logging in a decryption policy, the system logs end-of-connection rather than beginning-of-connection events. This is because the system cannot determine if a connection is encrypted using the first packet in the session, and thus cannot immediately block encrypted sessions.

To optimize performance, log either the beginning or the end of any connection, but not both. Monitoring a connection for any reason forces end-of-connection logging. For a single non-blocked connection, the end-of-connection event contains all of the information in the beginning-of-connection event, as well as information gathered over the duration of the session.

The following table details the differences between beginning and end-of-connection events, including the advantages to logging each.

**Table 35: Comparing Beginning and End-of-Connection Events**

	<b>Beginning-of-Connection Events</b>	<b>End-of-Connection Events</b>
Can be generated...	When the system detects the beginning of a connection (or, after the first few packets if event generation depends on application or URL identification).	When the system: <ul style="list-style-type: none"> <li>• Detects the close of a connection.</li> <li>• Does not detect the end of a connection after a period of time.</li> <li>• Can no longer track the session due to memory constraints.</li> </ul>
Can be logged for...	All connections except those blocked by the decryption policy.	Most connections.

	Beginning-of-Connection Events	End-of-Connection Events
Contain...	Only information that can be determined in the first packet (or the first few packets, if event generation depends on application or URL identification).	All information in the beginning-of-connection event, plus information determined by examining traffic over the duration of the session; for example, the total amount of data transmitted or the timestamp of the last packet in the connection.  <b>Note</b> The connection event does not count the amount of data transmitted after the threat defense returns a snort verdict for the connection or if you fastpath the connection.
Are useful...	If you want to log: <ul style="list-style-type: none"> <li>• Blocked connections.</li> <li>• Only the beginning of a connection because the end-of-connection information does not matter to you.</li> </ul>	If you want to: <ul style="list-style-type: none"> <li>• Log encrypted connections handled by a decryption policy.</li> <li>• Perform any kind of detailed analysis on, or trigger correlation rules using, information collected over the duration of the session.</li> <li>• View connection summaries (aggregated connection data) in custom workflows, view connection data in graphical format, or create and use traffic profiles.</li> </ul>

## Limitations of Connection Logging

You cannot log:

- The outer session of a plaintext, passthrough tunnel whose encapsulated connections are inspected by access control
- TCP connections if the three-way handshake is not completed.

These connections are not logged as doing so would provide an opportunity for a denial-of-service attack against your Secure Firewall deployment.

However, you can use the following workaround to monitor or debug failed connections:

- Use the packet capture feature to get more details about these connections. See [Packet Capture Overview, on page 392](#) its and subtopics.

## Best Practices for Connection Logging

Use the following best practices to ensure that you log *only* the connections you want to log.

So that you log only critical connections, enable connection logging on a per-access-control-rule basis.

### Connections that are always logged

The system automatically logs the following:

- Some connections associated with detected files, malware, intrusions, and Intelligent Application Bypass (IAB).

For more information, see [Connections That Are Always Logged, on page 474](#).

- Monitored connections.

For more information, see [Logging for Monitored Connections, on page 476](#).

### Connections to never log

Do not enable logging for the following:

- Access control rules with a Trust action.

Trusted connections are not subject to deep inspection or discovery, so connection events for trusted connections contain limited information.

- Do not enable logging for Block rules in passive deployments. To log connections that the system *would have blocked* if your devices were deployed inline, use a Monitor rule instead of a Block rule.

Only devices deployed inline (that is, using routed, switched, or transparent interfaces, or inline interface pairs) can block traffic. Because blocked connections are not actually blocked in passive deployments, the system may report multiple beginning-of-connection events for each blocked connection.

- Traffic you're not interested in. Examples follow:
  - Specific allowed traffic, such as DNS requests to a trusted DNS host.
  - Infrastructure traffic that is not related to your service offering.

(As previously mentioned, you can still monitor this traffic for threats.)

As discussed in [Connections That Are Always Logged, on page 474](#), even if you disable logging for the preceding, intrusion events, malware, and IAB are still logged.

### Avoid logging what's being logged elsewhere

If another device or service is logging connection data for a network segment, disable logging for that segment's data in the management center. Examples follow:

- If a router logs connection events on the same network segment as the management center, avoid logging the same connections on the management center unless you need those connection events for something else, such as correlation policies or traffic profiles.
- If you use Secure Network Analytics to leverage NetFlow records reported from switches and routers to identify potential behavioral anomalies and suspicious traffic patterns, you can disable connection logging for rules monitoring those segments and instead rely on Secure Network Analytics for behavioral analytics for those parts of your network.

For more information, consult the [Secure Network Analytics documentation](#).

### Log either the beginning or end of the connection (not both)

If you have a choice between beginning and end-of-connection logging, enable end-of-connection logging. This is because end-of-connection logs information from beginning-of-connection events, as well as information gathered over the duration of the session.

Log the beginning of connections *only* if you want to log blocked connections, or if end-of-connection information does not matter to you.

For more information, see [Beginning vs End-of-Connection Logging, on page 479](#).

### Logging for blocked traffic

Because blocked traffic is immediately denied without further inspection, usually you can log only beginning-of-connection events.

For more information, see [Logging for Blocked Connections, on page 476](#).

### Log events to an external location

If your company's security policy permits it, you can save disk space on your management center by streaming logs to an external source using any of the following:

- eStreamer, which enables you to stream logs from a management center to a custom-developed client application. For more information, see the *Secure Firewall Management Center Event Streamer Integration Guide*.
- Syslog or SNMP trap, which are referred to as *alert responses*. For more information, see [Secure Firewall Management Center Alert Responses, on page 441](#).

### Control what is displayed in connection events

To specify the number of rows displayed in connection events, click your username in the upper right of the management center and click **User Preferences > Event View Settings**. The maximum you can set is 1000 events per page.

### Set up connection event reports

To make sure you do not miss connection events, you can set up automated reports in .csv format and optionally schedule them to occur at a regular interval. For more information, see the following:

- Use the report designer (**Analysis > Connection > Events > Report Designer**): .
- Schedule tasks (**System > Tools > Scheduling**): [About Task Scheduling, on page 419](#).

## Requirements and Prerequisites for Connection Logging

### Model Support

Any.

### Supported Domains

Any

### User Roles

- Admin
- Access Admin
- Network Admin

## Configure Connection Logging

The following sections describe how to set up connection logging to match various rules and conditions.

### Logging Connections with Tunnel and Prefilter Rules

The prefilter policy applies to Secure Firewall Threat Defense devices only.

#### Before you begin

- Set the rule action to **Block** or **Fastpath**. Logging is disabled for the **Analyze** action, which allows connections to continue with access control, where other configurations determine their handling and logging.
- Logging is performed on inner flows, not on the encapsulating flow.

#### Procedure

- 
- Step 1** In the prefilter policy editor, click **Edit** (✎) next to the rule where you want to configure logging. If **View** (👁) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.
- Step 2** Click **Logging**.
- Step 3** Specify whether you want to **Log at Beginning of Connection** or **Log at End of Connection**.  
To optimize performance, log either the beginning or the end of any connection, but not both. Because blocked traffic is immediately denied without further inspection, you cannot log end-of-connection events for Block rules.
- Step 4** Specify where to send connection events:
- Step 5** Click **Save** to save the rule.
- Step 6** Click **Save** to save the prefilter policy.
- 

#### What to do next

- Deploy configuration changes.

## Logging Decryptable Connections with TLS/SSLDecryption Rules

### Procedure

- 
- Step 1** In the decryption policy editor, click **Edit** (✎) next to the rule where you want to configure logging. If **View** (👁) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.
- Step 2** Click **Logging**.
- Step 3** Check the **Log at End of Connection** check box.  
For monitored traffic, end-of-connection logging is required.
- Step 4** Specify where to send connection events.  
Send events to the event viewer if you want to perform management center-based analysis on these connection events. For monitored traffic, this is required.
- Step 5** Click **Save** to save the rule.
- Step 6** Click **Save** to save the decryption policy.
- 

### What to do next

- Deploy configuration changes.

## Logging Connections with Security Intelligence

The Security Intelligence policy requires the Threat Smart License or Protection Classic License.

### Procedure

- 
- Step 1** In the access control policy editor, click **Security Intelligence**.
- Step 2** Click the **Logging** (🔒) icon to enable Security Intelligence logging using the following criteria:
- By IP address—Click the logging icon next to **Networks**.
  - By URL—Click the logging icon next to **URLs**.
  - By Domain Name—Click the logging icon next to the **DNS Policy** drop-down list.
- If the logging icon is disabled, settings are inherited from an ancestor policy, or you do not have permission to modify the configuration. If the configuration is unlocked, uncheck **Inherit from base policy** to enable editing.
- Step 3** Check the **Log Connections** check box.
- Step 4** Specify where to send connection and Security-Related connection events.

Send events to the Security Cloud Control if you want to perform Security Cloud Control-based analysis, or if you set a Block list to monitor-only.

**Step 5** Click **OK** to set logging options.

**Step 6** Click **Save** to save the policy.

---

#### What to do next

- Deploy configuration changes.

## Logging Connections with Access Control Rules

Depending on your choices for the rule action and deep inspection options, your logging options differ; see [How Rules and Policy Actions Affect Logging, on page 475](#).

### Procedure

---

- Step 1** In the access control policy editor, click **Edit** (✎) next to the rule where you want to configure logging. If **View** (👁) appears instead, the configuration is inherited from an ancestor policy, belongs to an ancestor domain, or you do not have permission to modify the configuration.
- Step 2** Click **Logging**.
- Step 3** Specify whether you want to **Log at Beginning of Connection** or **Log at End of Connection**. To optimize performance, log either the beginning or the end of any connection, but not both.
- Step 4** (Optional) Check the **Log Files** check box to log file and malware events associated with the connection. It is recommended to leave this option enabled.
- Step 5** Specify where to send the connection events:
- **Event Viewers:** Send events to the management center. When using cloud management, send events to the cloud-delivered management center and to an on-premises management center if you have configured it to perform event analytics only. You can view the events in the event viewer of either product.
  - **Syslog Server:** Send connection events to the syslog server configured in the Logging tab in Access Control Policy, unless overridden.
- Show Overrides:** Displays the options to override the settings configured in the access control policy.
- **Override Severity:** When you choose this option and select a severity for the rule, connection events for this rule will have the selected severity regardless of the severity configured in the Logging tab in Access Control Policy.
  - **Override Default Syslog Destination:** Send the syslog generated for the connection event for this rule to destination specified in this alert.
  - **SNMP Trap:** Connection events are sent to the selected SNMP trap.

- Step 6** Click **Confirm**.
- Step 7** Click **Apply** to save the rule.

### What to do next

- Deploy configuration changes.

## Logging Connections with a Policy Default Action

A policy's default action determines how the system handles traffic that matches none of the rules in the policy (except Monitor rules in access control and decryption policies, which match and log—but do not handle or inspect—traffic).

Logging settings for the decryption policies default action also govern how the system logs undecryptable sessions.

### Before you begin

- For prefilter default action logging, set the default action to **Block all tunnel traffic**. Logging is disabled for the **Allow all tunnel traffic** action, which allows connections to continue with access control, where other configurations determine their handling and logging.

### Procedure

**Step 1** In the policy editor, click the **Logging** (  ) **Default Logging and Inspection**  next to the **Default Action** drop-down list.

**Step 2** Specify when you want to log matching connections:

- Log at Beginning of Connection—Not supported for SSL default actions.
- Log at End of Connection—Not supported if you choose the access control **Block All Traffic** default action or the prefilter **Block all tunnel traffic** default action.

To optimize performance, log either the beginning or the end of any connection, but not both.

If the controls are dimmed, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration. In an access control policy, the configuration may also be inherited from an ancestor policy.

**Step 3** Specify where to send connection events.

Send events to the event viewer if you want to perform management center-based analysis on these connection events.

**Step 4** Click **Apply**.

**Step 5** Click **Save** to save the policy.

**What to do next**

- Deploy configuration changes.

## Limiting Logging of Long URLs

End-of-connection events for HTTP traffic record the URL requested by monitored hosts. Disabling or limiting the number of stored URL characters may improve system performance. Disabling URL logging (storing zero characters) does not affect URL filtering. The system filters traffic based on requested URLs even though the system does not record them.

**Procedure**

- 
- Step 1** In the access control policy editor, click **More > Advanced Settings**, then click **Edit** (✎) next to **General Settings**.
- If **View** (👁) appears instead, the configuration is inherited from an ancestor policy, belongs to an ancestor domain, or you do not have permission to modify the configuration. If the configuration is unlocked, uncheck **Inherit from base policy** to enable editing.
- Step 2** Enter the **Maximum URL characters to store in connection events**.
- Step 3** Click **OK**.
- Step 4** Click **Save** to save the policy.
- 

**What to do next**

- Deploy configuration changes.

## CHAPTER 27

# Transparent or Routed Firewall Mode

This chapter describes how to set the firewall mode to routed or transparent, as well as how the firewall works in each firewall mode.

**Note** The firewall mode only affects regular firewall interfaces, and not IPS-only interfaces such as inline sets or passive interfaces. IPS-only interfaces can be used in both firewall modes. See [Inline Sets and Passive Interfaces, on page 1023](#) for more information about IPS-only interfaces. Inline sets might be familiar to you as "transparent inline sets," but the inline interface type is unrelated to the transparent firewall mode described in this chapter or the firewall-type interfaces.

### Caution

- Use FTD CLI commands to set "Firewall Mode."

- [About the Firewall Mode, on page 491](#)
- [Default Settings, on page 499](#)
- [Guidelines for Firewall Mode, on page 499](#)
- [Set the Firewall Mode, on page 500](#)

## About the Firewall Mode

The threat defense supports two firewall modes for regular firewall interfaces: Routed Firewall mode and Transparent Firewall mode.

### About Routed Firewall Mode

In routed mode, the threat defense device is considered to be a router hop in the network. Each interface that you want to route between is on a different subnet.

With Integrated Routing and Bridging, you can use a "bridge group" where you group together multiple interfaces on a network, and the threat defense device uses bridging techniques to pass traffic between the interfaces. Each bridge group includes a Bridge Virtual Interface (BVI) to which you assign an IP address on the network. The threat defense device routes between BVIs and regular routed interfaces. If you do not need clustering or EtherChannel member interfaces, you might consider using routed mode instead of transparent

mode. In routed mode, you can have one or more isolated bridge groups like in transparent mode, but also have normal routed interfaces as well for a mixed deployment.

## About Transparent Firewall Mode

Traditionally, a firewall is a routed hop and acts as a default gateway for hosts that connect to one of its screened subnets. A transparent firewall, on the other hand, is a Layer 2 firewall that acts like a “bump in the wire,” or a “stealth firewall,” and is not seen as a router hop to connected devices. However, like any other firewall, access control between interfaces is controlled, and all of the usual firewall checks are in place.

Layer 2 connectivity is achieved by using a "bridge group" where you group together the inside and outside interfaces for a network, and the threat defense device uses bridging techniques to pass traffic between the interfaces. Each bridge group includes a Bridge Virtual Interface (BVI) to which you assign an IP address on the network. You can have multiple bridge groups for multiple networks. In transparent mode, these bridge groups cannot communicate with each other.

## Using the Transparent Firewall in Your Network

The threat defense device connects the same network between its interfaces. Because the firewall is not a routed hop, you can easily introduce a transparent firewall into an existing network.

The following figure shows a typical transparent firewall network where the outside devices are on the same subnet as the inside devices. The inside router and hosts appear to be directly connected to the outside router.

**Figure 73: Transparent Firewall Network**

## Passing Traffic For Routed-Mode Features

For features that are not directly supported on the transparent firewall, you can allow traffic to pass through so that upstream and downstream routers can support the functionality. For example, by using an access rule,

you can allow DHCP traffic (instead of the unsupported DHCP relay feature) or multicast traffic such as that created by IP/TV. You can also establish routing protocol adjacencies through a transparent firewall; you can allow OSPF, RIP, EIGRP, or BGP traffic through based on an access rule. Likewise, protocols like HSRP or VRRP can pass through the threat defense device.

## About Bridge Groups

A bridge group is a group of interfaces that the threat defense device bridges instead of routes. Bridge groups are supported in both transparent and routed firewall mode. Like any other firewall interfaces, access control between interfaces is controlled, and all of the usual firewall checks are in place.

### Bridge Virtual Interface (BVI)

Each bridge group includes a Bridge Virtual Interface (BVI). The threat defense device uses the BVI IP address as the source address for packets originating from the bridge group. The BVI IP address must be on the same subnet as the bridge group member interfaces. The BVI does not support traffic on secondary networks; only traffic on the same network as the BVI IP address is supported.

In transparent mode: Only bridge group member interfaces are named and can be used with interface-based features.

In routed mode: The BVI acts as the gateway between the bridge group and other routed interfaces. To route between bridge groups/routed interfaces, you must name the BVI. For some interface-based features, you can use the BVI itself:

- DHCPv4 server—Only the BVI supports the DHCPv4 server configuration.
- Static routes—You can configure static routes for the BVI; you cannot configure static routes for the member interfaces.
- Syslog server and other traffic sourced from the threat defense device—When specifying a syslog server (or SNMP server, or other service where the traffic is sourced from the threat defense device), you can specify either the BVI or a member interface.

If you do not name the BVI in routed mode, then the threat defense device does not route bridge group traffic. This configuration replicates transparent firewall mode for the bridge group. If you do not need clustering or EtherChannel member interfaces, you might consider using routed mode instead. In routed mode, you can have one or more isolated bridge groups like in transparent mode, but also have normal routed interfaces as well for a mixed deployment.

### Bridge Groups in Transparent Firewall Mode

Bridge group traffic is isolated from other bridge groups; traffic is not routed to another bridge group within the threat defense device, and traffic must exit the threat defense device before it is routed by an external router back to another bridge group in the threat defense device. Although the bridging functions are separate for each bridge group, many other functions are shared between all bridge groups. For example, all bridge groups share a syslog server or AAA server configuration.

You can include multiple interfaces per bridge group. See [Guidelines for Firewall Mode, on page 499](#) for the exact number of bridge groups and interfaces supported. If you use more than 2 interfaces per bridge group, you can control communication between multiple segments on the same network, and not just between inside and outside. For example, if you have three inside segments that you do not want to communicate with each other, you can put each segment on a separate interface, and only allow them to communicate with the outside interface. Or you can customize the access rules between interfaces to allow only as much access as desired.

The following figure shows two networks connected to the threat defense device, which has two bridge groups.

Figure 74: Transparent Firewall Network with Two Bridge Groups

### Bridge Groups in Routed Firewall Mode

Bridge group traffic can be routed to other bridge groups or routed interfaces. You can choose to isolate bridge group traffic by not assigning a name to the BVI interface for the bridge group. If you name the BVI, then the BVI participates in routing like any other regular interface.

One use for a bridge group in routed mode is to use extra interfaces on the threat defense instead of an external switch. For example, the default configuration for some devices include an outside interface as a regular interface, and then all other interfaces assigned to the inside bridge group. Because the purpose of this bridge group is to replace an external switch, you need to configure an access policy so all bridge group interfaces can freely communicate.

Figure 75: Routed Firewall Network with an Inside Bridge Group and an Outside Routed Interface

## Allowing Layer 3 Traffic

- Unicast IPv4 and IPv6 traffic requires an access rule to be allowed through the bridge group.
- ARPs are allowed through the bridge group in both directions without an access rule. ARP traffic can be controlled by ARP inspection.
- IPv6 neighbor discovery and router solicitation packets can be passed using access rules.
- Broadcast and multicast traffic can be passed using access rules.

## Allowed MAC Addresses

The following destination MAC addresses are allowed through the bridge group if allowed by your access policy (see [Allowing Layer 3 Traffic](#), on page 495). Any MAC address not on this list is dropped.

- TRUE broadcast destination MAC address equal to FFFF.FFFF.FFFF
- IPv4 multicast MAC addresses from 0100.5E00.0000 to 0100.5EFE.FFFF
- IPv6 multicast MAC addresses from 3333.0000.0000 to 3333.FFFF.FFFF
- BPDU multicast address equal to 0100.0CCC.CCCD

## BPDU Handling

To prevent loops using the Spanning Tree Protocol, BPDUs are passed by default.

By default BPDUs are also forwarded for advanced inspection, which is unnecessary for this type of packet, and which can cause problems if they are blocked due to an inspection restart, for example. We recommend

that you always exempt BPDUs from advanced inspection. To do so, use FlexConfig to configure an EtherType ACL that trusts BPDUs and exempts them from advanced inspection on each member interface. See [#unique\\_574](#).

The FlexConfig object should deploy the following commands, where you replace <if-name> with an interface name. Add as many access-group commands as needed to cover each bridge group member interface on the device. You can also choose a different name for the ACL.

```
access-list permit-bpdu ethertype trust bpdu
access-group permit-bpdu in interface <if-name>
```

## MAC Address vs. Route Lookups

For traffic within a bridge group, the outgoing interface of a packet is determined by performing a destination MAC address lookup instead of a route lookup.

Route lookups, however, are necessary for the following situations:

- Traffic originating on the threat defense device—Add a default/static route on the threat defense device for traffic destined for a remote network where a syslog server, for example, is located.
- Voice over IP (VoIP) and TFTP traffic, and the endpoint is at least one hop away—Add a static route on the threat defense device for traffic destined for the remote endpoint so that secondary connections are successful. The threat defense device creates a temporary "pinhole" in the access control policy to allow the secondary connection; and because the connection might use a different set of IP addresses than the primary connection, the threat defense device needs to perform a route lookup to install the pinhole on the correct interface.

Affected applications include:

- H.323
  - RTSP
  - SIP
  - Skinny (SCCP)
  - SQL\*Net
  - SunRPC
  - TFTP
- Traffic at least one hop away for which the threat defense device performs NAT—Configure a static route on the threat defense device for traffic destined for the remote network. You also need a static route on the upstream router for traffic destined for the mapped addresses to be sent to the threat defense device.

This routing requirement is also true for embedded IP addresses for VoIP and DNS with NAT enabled, and the embedded IP addresses are at least one hop away. The threat defense device needs to identify the correct egress interface so it can perform the translation.

Figure 76: NAT Example: NAT within a Bridge Group

## Unsupported Features for Bridge Groups in Transparent Mode

The following table lists the features are not supported in bridge groups in transparent mode.

Table 36: Unsupported Features in Transparent Mode

Feature	Description
Dynamic DNS	—
DHCP relay	The transparent firewall can act as a DHCPv4 server, but it does not support DHCP relay. DHCP relay is not required because you can allow DHCP traffic to pass through using two access rules: one that allows DCHP requests from the inside interface to the outside, and one that allows the replies from the server in the other direction.

Feature	Description
Dynamic routing protocols	You can, however, add static routes for traffic originating on the threat defense device for bridge group member interfaces. You can also allow dynamic routing protocols through the threat defense device using an access rule.
Multicast IP routing	You can allow multicast traffic through the threat defense device by allowing it in an access rule.
QoS	—
VPN termination for through traffic	The transparent firewall supports site-to-site VPN tunnels for management connections only on bridge group member interfaces. It does not terminate VPN connections for traffic through the threat defense device. You can pass VPN traffic through the ASA using an access rule, but it does not terminate non-management connections.

## Unsupported Features for Bridge Groups in Routed Mode

The following table lists the features are not supported in bridge groups in routed mode.

**Table 37: Unsupported Features in Routed Mode**

Feature	Description
EtherChannel member interfaces	Only physical interfaces, redundant interfaces, and subinterfaces are supported as bridge group member interfaces. Management interfaces are also not supported.
Clustering	Bridge groups are not supported in clustering.
Dynamic DNS	—
DHCP relay	The routed firewall can act as a DHCPv4 server, but it does not support DHCP relay on BVIs or bridge group member interfaces.
Dynamic routing protocols	You can, however, add static routes for BVIs. You can also allow dynamic routing protocols through the threat defense device using an access rule. Non-bridge group interfaces support dynamic routing.
Multicast IP routing	You can allow multicast traffic through the threat defense device by allowing it in an access rule. Non-bridge group interfaces support multicast routing.
QoS	Non-bridge group interfaces support QoS.

Feature	Description
VPN termination for through traffic	<p>You cannot terminate a VPN connection on the BVI. Non-bridge group interfaces support VPN.</p> <p>Bridge group member interfaces support site-to-site VPN tunnels for management connections only. It does not terminate VPN connections for traffic through the threat defense device. You can pass VPN traffic through the bridge group using an access rule, but it does not terminate non-management connections.</p>

## Default Settings

### Bridge Group Defaults

By default, all ARP packets are passed within the bridge group.

## Guidelines for Firewall Mode

### Bridge Group Guidelines (Transparent and Routed Mode)

- You can create up to 250 bridge groups, with 64 interfaces per bridge group.
- Each directly-connected network must be on the same subnet.
- The threat defense device does not support traffic on secondary networks; only traffic on the same network as the BVI IP address is supported.
- An IP address for the BVI is required for each bridge group for to-the-device and from-the-device management traffic, as well as for data traffic to pass through the threat defense device. For IPv4 traffic, specify an IPv4 address. For IPv6 traffic, specify an IPv6 address.
- You can only configure IPv6 addresses manually.
- The BVI IP address must be on the same subnet as the connected network. You cannot set the subnet to a host subnet (255.255.255.255).
- Management interfaces are not supported as bridge group members.
- For multi-instance mode, shared interfaces are not supported for bridge group member interfaces (in transparent mode or routed mode).
- For the threat defense virtual on VMware with bridged ixgbevf interfaces, transparent mode is not supported, and bridge groups are not supported in routed mode.
- 
- For the Firepower 1010 and Secure Firewall 1210/20, you cannot mix logical VLAN interfaces and physical firewall interfaces in the same bridge group.
- For the Firepower 4100/9300, data-sharing interfaces are not supported as bridge group members.
- In transparent mode, you must use at least 1 bridge group; data interfaces must belong to a bridge group.

- In transparent mode, do not specify the BVI IP address as the default gateway for connected devices; devices need to specify the router on the other side of the threat defense as the default gateway.
- In transparent mode, the *default* route, which is required to provide a return path for management traffic, is only applied to management traffic from one bridge group network. This is because the default route specifies an interface in the bridge group as well as the router IP address on the bridge group network, and you can only define one default route. If you have management traffic from more than one bridge group network, you need to specify a regular static route that identifies the network from which you expect management traffic.
- Transparent mode is not supported on threat defense virtual instances deployed on Amazon Web Services, Microsoft Azure, Google Cloud Platform, and Oracle Cloud Infrastructure.
- In routed mode, to route between bridge groups and other routed interfaces, you must name the BVI.
- In routed mode, threat defense-defined EtherChannel interfaces are not supported as bridge group members. EtherChannels on the Firepower 4100/9300 can be bridge group members.
- Bidirectional Forwarding Detection (BFD) echo packets are not allowed through the threat defense when using bridge group members. If there are two neighbors on either side of the threat defense running BFD, then the threat defense will drop BFD echo packets because they have the same source and destination IP address and appear to be part of a LAND attack.

## Set the Firewall Mode

You can set the firewall mode when you perform the initial system setup at the CLI. We recommend setting the firewall mode during setup because changing the firewall mode erases your configuration to ensure you do not have incompatible settings. If you need to change the firewall mode later, you must do so from the CLI.

### Procedure

- 
- Step 1** Unregister the threat defense device from the management center.  
You cannot change the mode until you deregister the device.
- Choose **Devices > Device Management**.
  - Next to the device you want to unregister, click **More** (⋮), and then click **Delete**.

**Step 2** Access the threat defense device CLI, preferably from the console port.

**Step 3** Change the firewall mode:

```
configure firewall [routed | transparent]
```

**Example:**

```
> configure firewall transparent
This will destroy the current interface configurations, are you sure that you want to
proceed? [y/N] y
The firewall mode was changed successfully.
```

**Step 4** Re-register with the management center.

---

## CHAPTER 28

# Logical Devices on the Firepower 4100/9300

The Firepower 4100/9300 is a flexible security platform on which you can install one or more *logical devices*. Before you can add the threat defense to the management center, you must configure chassis interfaces, add a logical device, and assign interfaces to the device on the Firepower 4100/9300 chassis using the Secure Firewall chassis manager or the FXOS CLI. This chapter describes basic interface configuration and how to add a standalone or High Availability logical device using the Secure Firewall chassis manager. To use the FXOS CLI, see the FXOS CLI configuration guide. For more advanced FXOS procedures and troubleshooting, see the FXOS configuration guide.

- [About Interfaces, on page 503](#)
- [About Logical Devices, on page 517](#)
- [Licenses for Container Instances, on page 525](#)
- [Requirements and Prerequisites for Logical Devices, on page 526](#)
- [Guidelines and Limitations for Logical Devices, on page 533](#)
- [Configure Interfaces, on page 536](#)
- [Configure Logical Devices, on page 538](#)

## About Interfaces

The Firepower 4100/9300 chassis supports physical interfaces, VLAN subinterfaces for container instances, and EtherChannel (port-channel) interfaces. EtherChannel interfaces can include up to 16 member interfaces of the same type.

## Chassis Management Interface

The chassis management interface is used for management of the FXOS Chassis by SSH or chassis manager. This interface is separate from the mgmt-type interface that you assign to the logical devices for application management.

To configure parameters for this interface, you must configure them from the CLI. To view information about this interface in the FXOS CLI, connect to local management and show the management port:

```
Firepower # connect local-mgmt
```

```
Firepower(local-mgmt) # show mgmt-port
```

Note that the chassis management interface remains up even if the physical cable or SFP module are unplugged, or if the **mgmt-port shut** command is performed.

---

**Note** The chassis management interface does not support jumbo frames.

---

## Interface Types

Physical interfaces, VLAN subinterfaces for container instances, and EtherChannel (port-channel) interfaces can be one of the following types:

- **Data**—Use for regular data. Data interfaces cannot be shared between logical devices, and logical devices cannot communicate over the backplane to other logical devices. For traffic on Data interfaces, all traffic must exit the chassis on one interface and return on another interface to reach another logical device.
- **Data-sharing**—Use for regular data. Only supported with container instances, these data interfaces can be shared by one or more logical devices/container instances (threat defense-using-management center only). Each container instance can communicate over the backplane with all other instances that share this interface. Shared interfaces can affect the number of container instances you can deploy. Shared interfaces are not supported for bridge group member interfaces (in transparent mode or routed mode), inline sets, passive interfaces, clusters, or failover links.
- **Mgmt**—Use to manage application instances. These interfaces can be shared by one or more logical devices to access external hosts; logical devices cannot communicate over this interface with other logical devices that share the interface. You can only assign one management interface per logical device. Depending on your application and manager, you can later enable management from a data interface; but you must assign a Management interface to the logical device even if you don't intend to use it after you enable data management. For information about the separate chassis management interface, see [Chassis Management Interface, on page 503](#).

---

**Note** Mgmt interface change will cause reboot of the logical device, for example one change mgmt from e1/1 to e1/2 will cause the logical device to reboot to apply the new management.

---

- **Eventing**—Use as a secondary management interface for threat defense-using-management center devices. To use this interface, you must configure its IP address and other parameters at the threat defense CLI. For example, you can separate management traffic from events (such as web events). See the [management center configuration guide](#) for more information. Eventing interfaces can be shared by one or more logical devices to access external hosts; logical devices cannot communicate over this interface with other logical devices that share the interface. If you later configure a data interface for management, you cannot use a separate eventing interface.

---

**Note** A virtual Ethernet interface is allocated when each application instance is installed. If the application does not use an eventing interface, then the virtual interface will be in an admin down state.

```
Firepower # show interface Vethernet775
Firepower # Vethernet775 is down (Administratively down)
Bound Interface is Ethernet1/10
Port description is server 1/1, VNIC ext-mgmt-nic5
```

---

- Cluster—Use as the cluster control link for a clustered logical device. By default, the cluster control link is automatically created on Port-channel 48. The Cluster type is only supported on EtherChannel interfaces. For multi-instance clustering, you cannot share a Cluster-type interface across devices. You can add VLAN subinterfaces to the Cluster EtherChannel to provide separate cluster control links per cluster. If you add subinterfaces to a Cluster interface, you cannot use that interface for a native cluster. The device manager and Security Cloud Control does not support clustering.

**Note** This chapter discusses *FXOS* VLAN subinterfaces only. You can separately create subinterfaces within the threat defense application. See [FXOS Interfaces vs. Application Interfaces, on page 506](#) for more information.

See the following table for interface type support for the threat defense and ASA applications in standalone and cluster deployments.

**Table 38: Interface Type Support**

Application		Data	Data: Subinterface	Data-Sharing	Data-Sharing: Subinterface	Mgmt	Eventing	Cluster (EtherChannel only)	Cluster: Subinterface
Threat Defense	Standalone Native Instance	Yes	—	—	—	Yes	Yes	—	—
	Standalone Container Instance	Yes	Yes	Yes	Yes	Yes	Yes	—	—
	Cluster Native Instance	Yes (EtherChannel only for inter-chassis cluster)	—	—	—	Yes	Yes	Yes	—
	Cluster Container Instance	Yes (EtherChannel only for inter-chassis cluster)	—	—	—	Yes	Yes	Yes	Yes
ASA	Standalone Native Instance	Yes	—	—	—	Yes	—	Yes	—
	Cluster Native Instance	Yes (EtherChannel only for inter-chassis cluster)	—	—	—	Yes	—	Yes	—

## FXOS Interfaces vs. Application Interfaces

The Firepower 4100/9300 manages the basic Ethernet settings of physical interfaces, VLAN subinterfaces for container instances, and EtherChannel (port-channel) interfaces. Within the application, you configure higher level settings. For example, you can only create EtherChannels in FXOS; but you can assign an IP address to the EtherChannel within the application.

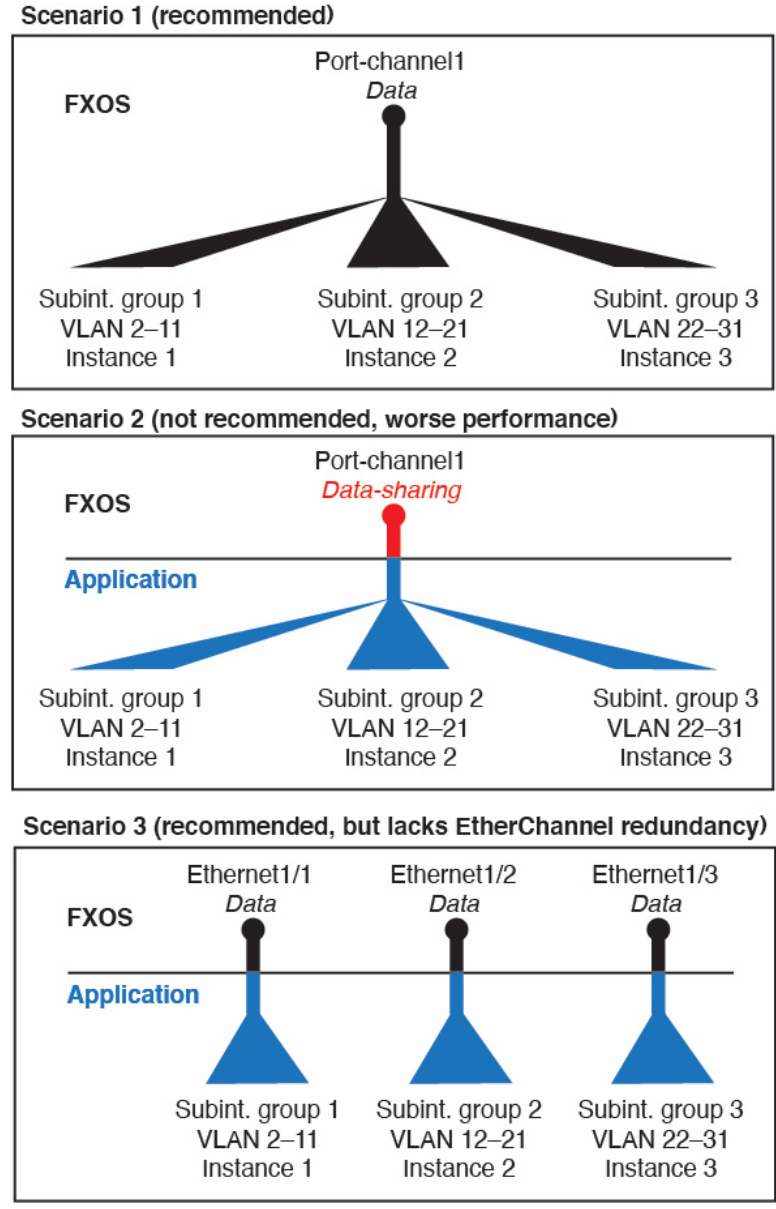

The following sections describe the interaction between FXOS and the application for interfaces.

### VLAN Subinterfaces

For all logical devices, you can create VLAN subinterfaces within the application.

For container instances in standalone mode only, you can *also* create VLAN subinterfaces in FXOS. Multi-instance clusters do not support subinterfaces in FXOS except on the Cluster-type interface. Application-defined subinterfaces are not subject to the FXOS limit. Choosing in which operating system to create subinterfaces depends on your network deployment and personal preference. For example, to share a subinterface, you must create the subinterface in FXOS. Another scenario that favors FXOS subinterfaces comprises allocating separate subinterface groups on a single interface to multiple instances. For example, you want to use Port-channel1 with VLAN 2–11 on instance A, VLAN 12–21 on instance B, and VLAN 22–31 on instance C. If you create these subinterfaces within the application, then you would have to share the parent interface in FXOS, which may not be desirable. See the following illustration that shows the three ways you can accomplish this scenario:

Figure 77: VLANs in FXOS vs. the Application for Container Instances

**Independent Interface States in the Chassis and in the Application**

You can administratively enable and disable interfaces in both the chassis and in the application. For an interface to be operational, the interface must be enabled in both operating systems. Because the interface state is controlled independently, you may have a mismatch between the chassis and application.

The default state of an interface within the application depends on the type of interface. For example, the physical interface or EtherChannel is disabled by default within the application, but a subinterface is enabled by default.

# Shared Interface Scalability

Instances can share data-sharing type interfaces. This capability lets you conserve physical interface usage as well as support flexible networking deployments. When you share an interface, the chassis uses unique MAC addresses to forward traffic to the correct instance. However, shared interfaces can cause the forwarding table to grow large due to the need for a full mesh topology within the chassis (every instance must be able to communicate with every other instance that is sharing the same interface). Therefore, there are limits to how many interfaces you can share.

In addition to the forwarding table, the chassis maintains a VLAN group table for VLAN subinterface forwarding. You can create up to 500 VLAN subinterfaces.

See the following limits for shared interface allocation:

## Shared Interface Best Practices

For optimal scalability of the forwarding table, share as few interfaces as possible. Instead, you can create up to 500 VLAN subinterfaces on one or more physical interfaces and then divide the VLANs among the container instances.

When sharing interfaces, follow these practices in the order of most scalable to least scalable:

1. Best—Share subinterfaces under a single parent, and use the same set of subinterfaces with the same group of instances.

For example, create a large EtherChannel to bundle all of your like-kind interfaces together, and then share subinterfaces of that EtherChannel: Port-Channel1.2, 3, and 4 instead of Port-Channel2, Port-Channel3, and Port-Channel4. When you share subinterfaces from a single parent, the VLAN group table provides better scaling of the forwarding table than when sharing physical/EtherChannel interfaces or subinterfaces across parents.

**Figure 78: Best: Shared Subinterface Group on One Parent**

If you do not share the same set of subinterfaces with a group of instances, your configuration can cause more resource usage (more VLAN groups). For example, share Port-Channel1.2, 3, and 4 with instances 1, 2, and 3 (one VLAN group) instead of sharing Port-Channel1.2 and 3 with instances 1 and 2, while sharing Port-Channel1.3 and 4 with instance 3 (two VLAN groups).

**Figure 79: Good: Sharing Multiple Subinterface Groups on One Parent**

**2. Fair—Share subinterfaces across parents.**

For example, share Port-Channel1.2, Port-Channel2.3, and Port-Channel3.4 instead of Port-Channel2, Port-Channel4, and Port-Channel4. Although this usage is not as efficient as only sharing subinterfaces on the same parent, it still takes advantage of VLAN groups.

Figure 80: Fair: Shared Subinterfaces on Separate Parents

3. Worst—Share individual parent interfaces (physical or EtherChannel).  
This method uses the most forwarding table entries.

Figure 81: Worst: Shared Parent Interfaces

## Shared Interface Usage Examples

See the following tables for examples of interface sharing and scalability. The below scenarios assume use of one physical/EtherChannel interface for management shared across all instances, and another physical or EtherChannel interface with dedicated subinterfaces for use with High Availability.

- [Table 39: Physical/EtherChannel Interfaces and Instances on a Firepower 9300 with Three SM-44s, on page 511](#)
- [Table 40: Subinterfaces on One Parent and Instances on a Firepower 9300 with Three SM-44s, on page 512](#)
- [Table 41: Physical/EtherChannel Interfaces and Instances on a Firepower 9300 with One SM-44, on page 514](#)
- [Table 42: Subinterfaces on One Parent and Instances on a Firepower 9300 with One SM-44, on page 515](#)

### Firepower 9300 with Three SM-44s

The following table applies to three SM-44 security modules on a 9300 using only physical interfaces or EtherChannels. Without subinterfaces, the maximum number of interfaces are limited. Moreover, sharing multiple physical interfaces uses more forwarding table resources than sharing multiple subinterfaces.

Each SM-44 module can support up to 14 instances. Instances are split between modules as necessary to stay within limits.

**Table 39: Physical/EtherChannel Interfaces and Instances on a Firepower 9300 with Three SM-44s**

Dedicated Interfaces	Shared Interfaces	Number of Instances	% Forwarding Table Used
<b>32:</b> <ul style="list-style-type: none"> <li>• 8</li> <li>• 8</li> <li>• 8</li> <li>• 8</li> </ul>	<b>0</b>	<b>4:</b> <ul style="list-style-type: none"> <li>• Instance 1</li> <li>• Instance 2</li> <li>• Instance 3</li> <li>• Instance 4</li> </ul>	16%

## Viewing Shared Interface Resources

To view forwarding table and VLAN group usage, . For example:

## Inline Set Link State Propagation for the Threat Defense

An inline set acts like a bump on the wire, and binds two interfaces together to slot into an existing network. This function allows the system to be installed in any network environment without the configuration of adjacent network devices. Inline interfaces receive all traffic unconditionally, but all traffic received on these interfaces is retransmitted out of an inline set unless explicitly dropped.

When you configure an inline set in the threat defense application and enable link state propagation, the threat defense sends inline set membership to the FXOS chassis. Link state propagation means that the chassis automatically brings down the second interface in the inline interface pair when one of the interfaces in an

inline set goes down. When the downed interface comes back up, the second interface automatically comes back up, also. In other words, if the link state of one interface changes, the chassis senses the change and updates the link state of the other interface to match it. Note that the chassis requires up to 4 seconds to propagate link state changes. Link state propagation is especially useful in resilient network environments where routers are configured to reroute traffic automatically around network devices that are in a failure state.

---

**Note** Do not enable Hardware Bypass and link state propagation for the same inline set.

---

## About Logical Devices

A logical device lets you run one application instance (either ASA or threat defense) and also one optional decorator application (Radware DefensePro) to form a service chain.

When you add a logical device, you also define the application instance type and version, assign interfaces, and configure bootstrap settings that are pushed to the application configuration.

---

**Note** For the Firepower 9300, you can install different application types (ASA and threat defense) on separate modules in the chassis. You can also run different versions of an application instance type on separate modules.

---

## Standalone and Clustered Logical Devices

You can add the following logical device types:

- **Standalone**—A standalone logical device operates as a standalone unit or as a unit in a High Availability pair.
- **Cluster**—A clustered logical device lets you group multiple units together, providing all the convenience of a single device (management, integration into a network) while achieving the increased throughput and redundancy of multiple devices. Multiple module devices, like the Firepower 9300, support intra-chassis clustering. For the Firepower 9300, all three modules must participate in the cluster, for both native and container instances. The device manager does not support clustering.

## Logical Device Application Instances: Container and Native

Application instances run in the following deployment types:

- **Native instance**—A native instance uses all of the resources (CPU, RAM, and disk space) of the security module/engine, so you can only install one native instance.
- **Container instance**—A container instance uses a subset of resources of the security module/engine, so you can install multiple container instances. Multi-instance capability is only supported for the threat defense using management center; it is not supported for the ASA or the threat defense using device manager.

---

**Note** Multi-instance capability is similar to ASA multiple context mode, although the implementation is different. Multiple context mode partitions a single application instance, while multi-instance capability allows independent container instances. Container instances allow hard resource separation, separate configuration management, separate reloads, separate software updates, and full threat defense feature support. Multiple context mode, due to shared resources, supports more contexts on a given platform. Multiple context mode is not available on the threat defense.

---

For the Firepower 9300, you can use a native instance on some modules, and container instances on the other module(s).

## Container Instance Interfaces

To provide flexible physical interface use for container instances, you can create VLAN subinterfaces in FXOS and also share interfaces (VLAN or physical) between multiple instances. Native instances cannot use VLAN subinterfaces or shared interfaces. A multi-instance cluster cannot use VLAN subinterfaces or shared interfaces. An exception is made for the cluster control link, which can use a subinterface of the Cluster EtherChannel. See [Shared Interface Scalability, on page 508](#) and [Add a VLAN Subinterface for Container Instances, on page 537](#).

---

**Note** This document discusses *FXOS* VLAN subinterfaces only. You can separately create subinterfaces within the threat defense application. See [FXOS Interfaces vs. Application Interfaces, on page 506](#) for more information.

---

## How the Chassis Classifies Packets

Each packet that enters the chassis must be classified, so that the chassis can determine to which instance to send a packet.

- **Unique Interfaces**—If only one instance is associated with the ingress interface, the chassis classifies the packet into that instance. For bridge group member interfaces (in transparent mode or routed mode), inline sets, or passive interfaces, this method is used to classify packets at all times.
- **Unique MAC Addresses**—The chassis automatically generates unique MAC addresses for all interfaces, including shared interfaces. If multiple instances share an interface, then the classifier uses unique MAC addresses assigned to the interface in each instance. An upstream router cannot route directly to an instance without unique MAC addresses. You can also set the MAC addresses manually when you configure each interface within the application.

---

**Note** If the destination MAC address is a multicast or broadcast MAC address, the packet is duplicated and delivered to each instance.

---

## Classification Examples

### Packet Classification with a Shared Interface Using MAC Addresses

The following figure shows multiple instances sharing an outside interface. The classifier assigns the packet to Instance C because Instance C includes the MAC address to which the router sends the packet.

**Figure 82: Packet Classification with a Shared Interface Using MAC Addresses**

### Incoming Traffic from Inside Networks

Note that all new incoming traffic must be classified, even from inside networks. The following figure shows a host on the Instance C inside network accessing the internet. The classifier assigns the packet to Instance C because the ingress interface is Ethernet 1/2.3, which is assigned to Instance C.

Figure 83: Incoming Traffic from Inside Networks

**Transparent Firewall Instances**

For transparent firewalls, you must use unique interfaces. The following figure shows a packet destined to a host on the Instance C inside network from the internet. The classifier assigns the packet to Instance C because the ingress interface is Ethernet 1/2.3, which is assigned to Instance C.

Figure 84: Transparent Firewall Instances

**Inline Sets**

For inline sets, you must use unique interfaces and they must be physical interfaces or EtherChannels. The following figure shows a packet destined to a host on the Instance C inside network from the internet. The classifier assigns the packet to Instance C because the ingress interface is Ethernet 1/5, which is assigned to Instance C.

Figure 85: Inline Sets

## Cascading Container Instances

Placing an instance directly in front of another instance is called *cascading instances*; the outside interface of one instance is the same interface as the inside interface of another instance. You might want to cascade instances if you want to simplify the configuration of some instances by configuring shared parameters in the top instance.

The following figure shows a gateway instance with two instances behind the gateway.

Figure 86: Cascading Instances

**Note** Do not use cascading instances (using a shared interface) with High Availability. After a failover occurs and the standby unit rejoins, MAC addresses can overlap temporarily and cause an outage. You should instead use unique interfaces for the gateway instance and inside instance using an external switch to pass traffic between the instances.

## Typical Multi-Instance Deployment

The following example includes three container instances in routed firewall mode. They include the following interfaces:

- Management—All instances use the Port-Channel1 interface (management type). This EtherChannel includes two 10 Gigabit Ethernet interfaces. Within each application, the interface uses a unique IP address on the same management network.
- Inside—Each instance uses a subinterface on Port-Channel2 (data type). This EtherChannel includes two 10 Gigabit Ethernet interfaces. Each subinterface is on a separate network.

- Outside—All instances use the Port-Channel3 interface (data-sharing type). This EtherChannel includes two 10 Gigabit Ethernet interfaces. Within each application, the interface uses a unique IP address on the same outside network.
- Failover—Each instance uses a subinterface on Port-Channel4 (data type). This EtherChannel includes two 10 Gigabit Ethernet interfaces. Each subinterface is on a separate network.

## Automatic MAC Addresses for Container Instance Interfaces

The chassis automatically generates MAC addresses for instance interfaces, and guarantees that a shared interface in each instance uses a unique MAC address.

If you manually assign a MAC address to a shared interface within the instance, then the manually-assigned MAC address is used. If you later remove the manual MAC address, the autogenerated address is used. In the rare circumstance that the generated MAC address conflicts with another private MAC address in your network, we suggest that you manually set the MAC address for the interface within the instance.

Because autogenerated addresses start with A2, you should not start manual MAC addresses with A2 due to the risk of overlapping addresses.

The chassis generates the MAC address using the following format:

A2xx.yyzz.zzzz

Where xx.yy is a user-defined prefix or a system-defined prefix, and zz.zzzz is an internal counter generated by the chassis. The system-defined prefix matches the lower 2 bytes of the first MAC address in the burned-in MAC address pool that is programmed into the IDPROM. Use **connect fxos**, then **show module** to view the MAC address pool. For example, if the range of MAC addresses shown for module 1 is b0aa.772f.f0b0 to b0aa.772f.f0bf, then the system prefix will be f0b0.

The user-defined prefix is an integer that is converted into hexadecimal. For an example of how the user-defined prefix is used, if you set a prefix of 77, then the chassis converts 77 into the hexadecimal value 004D (yyxx). When used in the MAC address, the prefix is reversed (xxyy) to match the chassis native form:

A24D.00zz.zzzz

For a prefix of 1009 (03F1), the MAC address is:

A2F1.03zz.zzzz

## Container Instance Resource Management

To specify resource usage per container instance, create one or more resource profiles in FXOS. When you deploy the logical device/application instance, you specify the resource profile that you want to use. The resource profile sets the number of CPU cores; RAM is dynamically allocated according to the number of cores, and disk space is set to 40 GB per instance. To view the available resources per model, see [Requirements and Prerequisites for Container Instances, on page 528](#). To add a resource profile, see [Add a Resource Profile for Container Instances, on page 538](#).

## Performance Scaling Factor for Multi-Instance Capability

The maximum throughput (connections, VPN sessions, and TLS proxy sessions) for a platform is calculated for a native instance's use of memory and CPU (and this value is shown in **show resource usage**). If you use multiple instances, then you need to calculate the throughput based on the percentage of CPU cores that you assign to the instance. For example, if you use a container instance with 50% of the cores, then you should initially calculate 50% of the throughput. Moreover, the throughput available to a container instance may be less than that available to a native instance.

For detailed instructions on calculating the throughput for instances, see <https://www.cisco.com/c/en/us/products/collateral/security/firewalls/white-paper-c11-744750.html>.

## Container Instances and High Availability

You can use High Availability using a container instance on 2 separate chassis; for example, if you have 2 chassis, each with 10 instances, you can create 10 High Availability pairs. Note that High Availability is not configured in FXOS; configure each High Availability pair in the application manager.

For detailed requirements, see [Requirements and Prerequisites for High Availability, on page 529](#) and [Add a High Availability Pair, on page 541](#).

## Container Instances and Clustering

You can create a cluster of container instances using one container instance per security module/engine.

## Licenses for Container Instances

All licenses are consumed per security engine/chassis (for the Firepower 4100) or per security module (for the Firepower 9300), and not per container instance. See the following details:

- Essentials licenses are automatically assigned: one per security module/engine.
- Feature licenses are manually assigned to each instance; but you only consume one license per feature per security module/engine. For example, for the Firepower 9300 with 3 security modules, you only need

one URL Filtering license per module for a total of 3 licenses, regardless of the number of instances in use.

For example:

**Table 43: Sample License Usage for Container Instances on a Firepower 9300**

Firepower 9300	Instance	Licenses
Security Module 1	Instance 1	Essentials, URL Filtering, Malware Defense
	Instance 2	Essentials, URL Filtering
	Instance 3	Essentials, URL Filtering
Security Module 2	Instance 4	Essentials, IPS
	Instance 5	Essentials, URL Filtering, Malware Defense, IPS
Security Module 3	Instance 6	Essentials, Malware Defense, IPS
	Instance 7	Essentials, IPS

**Table 44: Total Number of Licenses**

Essentials	URL Filtering	Malware Defense	IPS
3	2	3	2

## Requirements and Prerequisites for Logical Devices

See the following sections for requirements and prerequisites.

### Requirements and Prerequisites for Hardware and Software Combinations

The Firepower 4100/9300 supports multiple models, security modules, application types, and high availability and scalability features. See the following requirements for allowed combinations.

#### Firepower 9300 Requirements

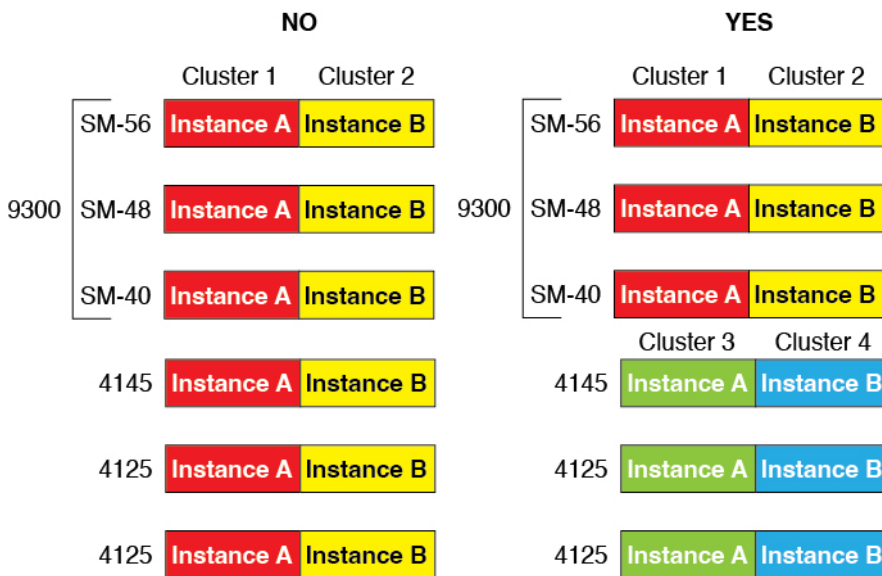

The Firepower 9300 includes 3 security module slots and multiple types of security modules. See the following requirements:

- **Security Module Types**—You can install modules of different types in the Firepower 9300. For example, you can install the SM-48 as module 1, SM-40 as module 2, and SM-56 as module 3.
- **Native instance Clustering**—All security modules in the cluster, whether it is intra-chassis or inter-chassis, must be the same type. You can have different quantities of installed security modules in each chassis, although all modules present in the chassis must belong to the cluster including any empty slots. For

example, you can install 2 SM-40s in chassis 1, and 3 SM-40s in chassis 2. You cannot use clustering if you install 1 SM-48 and 2 SM-40s in the same chassis.

- Container instance Clustering—You can create a cluster using instances on different model types. For example, you can create a cluster using an instance on a Firepower 9300 SM-56, SM-48, and SM-40. You *cannot* mix the Firepower 9300 and the Firepower 4100 in the same cluster, however.

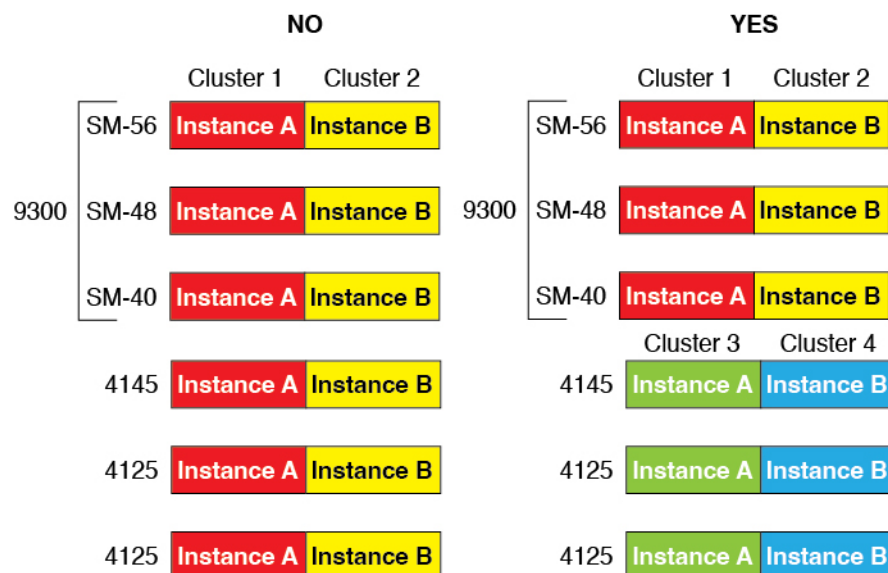

- High Availability—High Availability is only supported between same-type modules on the Firepower 9300. However, the two chassis can include mixed modules. For example, each chassis has an SM-40, SM-48, and SM-56. You can create High Availability pairs between the SM-40 modules, between the SM-48 modules, and between the SM-56 modules.
- ASA and threat defense application types—You can install different application types on separate modules in the chassis. For example, you can install ASA on module 1 and module 2, and threat defense on module 3.
- ASA or threat defense versions—You can run different versions of an application instance type on separate modules, or as separate container instances on the same module. For example, you can install the threat defense 6.3 on module 1, threat defense 6.4 on module 2, and threat defense 6.5 on module 3.

### Firepower 4100 Requirements

The Firepower 4100 comes in multiple models. See the following requirements:

- Native and Container instances—When you install a container instance on a Firepower 4100, that device can only support other container instances. A native instance uses all of the resources for a device, so you can only install a single native instance on the device.
- Native instance Clustering—All chassis in the cluster must be the same model.
- Container instance Clustering—You can create a cluster using instances on different model types. For example, you can create a cluster using an instance on a Firepower 4145 and a 4125. You *cannot* mix the Firepower 9300 and the Firepower 4100 in the same cluster, however.

- High Availability—High Availability is only supported between same-type models.
- ASA and threat defense application types—The Firepower 4100 can only run a single application type.
- The threat defense container instance versions—You can run different versions of threat defense as separate container instances on the same module.

## Requirements and Prerequisites for Container Instances

For information about high-availability or clustering requirements with multi-instance, see [Requirements and Prerequisites for High Availability, on page 529](#) and see [Requirements and Prerequisites for Clustering, on page 529](#).

### Supported Application Types

- The threat defense using management center

### Maximum Container Instances and Resources per Model

For each container instance, you can specify the number of CPU cores to assign to the instance. RAM is dynamically allocated according to the number of cores, and disk space is set to 40 GB per instance.

*Table 45: Maximum Container Instances and Resources per Model*

Model	Max. Container Instances	Available CPU Cores	Available RAM	Available Disk Space
Firepower 4112	3	22	78 GB	308 GB
Firepower 4115	7	46	162 GB	308 GB
Firepower 4125	10	62	162 GB	644 GB
Firepower 4140	7	70	222 GB	311.8 GB

Model	Max. Container Instances	Available CPU Cores	Available RAM	Available Disk Space
Firepower 4145	14	86	344 GB	608 GB
Firepower 9300 SM-40 security module	13	78	334 GB	1359 GB
Firepower 9300 SM-48 security module	15	94	334 GB	1341 GB
Firepower 9300 SM-56 security module	18	110	334 GB	1314 GB

### Management Center Requirements

For all instances on a Firepower 4100 chassis or Firepower 9300 module, you must use the same management center due to the licensing implementation.

## Requirements and Prerequisites for High Availability

- The two units in a High Availability Failover configuration must:
  - Be on a separate chassis; intra-chassis High Availability for the Firepower 9300 is not supported.
  - Be the same model.
  - Have the same interfaces assigned to the High Availability logical devices.
  - Have the same number and types of interfaces. All interfaces must be preconfigured in FXOS identically before you enable High Availability.
- High Availability is only supported between same-type modules on the Firepower 9300; but the two chassis can include mixed modules. For example, each chassis has an SM-56, SM-48, and SM-40. You can create High Availability pairs between the SM-56 modules, between the SM-48 modules, and between the SM-40 modules.
- For container instances, each unit must use the same resource profile attributes.
- For container instances: Do not use cascading instances (using a shared interface) with High Availability. After a failover occurs and the standby unit rejoins, MAC addresses can overlap temporarily and cause an outage. You should instead use unique interfaces for the gateway instance and inside instance using an external switch to pass traffic between the instances.
- For other High Availability system requirements, see [High Availability System Requirements, on page 610](#).

## Requirements and Prerequisites for Clustering

### Cluster Model Support

The Threat Defense supports clustering on the following models:

- Firepower 9300— You can include up to 16 nodes in the cluster. For example, you can use 1 module in 16 chassis, or 2 modules in 8 chassis, or any combination that provides a maximum of 16 modules. Supports clustering with multiple chassis and clustering isolated to security modules within one chassis.
- Firepower 4100—Supported for up to 16 nodes using clustering with multiple chassis.

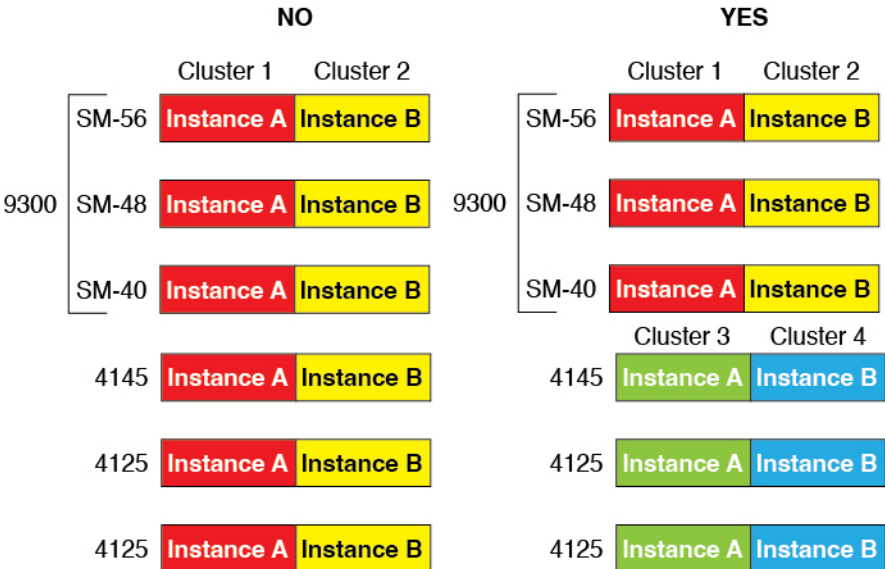

**User Roles**

- Admin
- Access Admin
- Network Admin

**Clustering Hardware and Software Requirements**

All chassis in a cluster:

- Native instance clustering—For the Firepower 4100: All chassis must be the same model. For the Firepower 9300: All security modules must be the same type. For example, if you use clustering, all modules in the Firepower 9300 must be SM-40s. You can have different quantities of installed security modules in each chassis, although all modules present in the chassis must belong to the cluster including any empty slots.
- Container instance clustering—We recommend that you use the same security module or chassis model for each cluster instance. However, you can mix and match container instances on different Firepower 9300 security module types or Firepower 4100 models in the same cluster if required. You cannot mix Firepower 9300 and 4100 instances in the same cluster. For example, you can create a cluster using an instance on a Firepower 9300 SM-56, SM-48, and SM-40. Or you can create a cluster on a Firepower 4145 and a 4125.

- Must run the identical FXOS and application software except at the time of an image upgrade. Mismatched software versions can lead to poor performance, so be sure to upgrade all nodes in the same maintenance window.

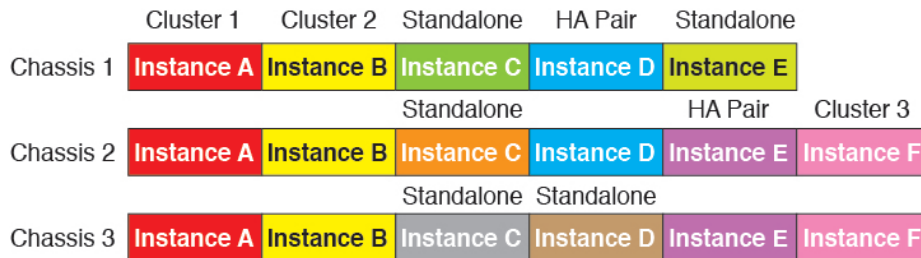

- Must include the same interface configuration for interfaces you assign to the cluster, such as the same Management interface, EtherChannels, active interfaces, speed and duplex, and so on. You can use different network module types on the chassis as long as the capacity matches for the same interface IDs and interfaces can successfully bundle in the same spanned EtherChannel. Note that all data interfaces must be EtherChannels in clusters with multiple chassis. If you change the interfaces in FXOS after you enable clustering (by adding or removing interface modules, or configuring EtherChannels, for example), then perform the same changes on each chassis, starting with the data nodes, and ending with the control node.
- Must use the same NTP server. For threat defense, the management center must also use the same NTP server. Do not set the time manually.

**Multi-Instance Clustering Requirements**

- No intra-security-module/engine clustering—For a given cluster, you can only use a single container instance per security module/engine. You cannot add 2 container instances to the same cluster if they are running on the same module.

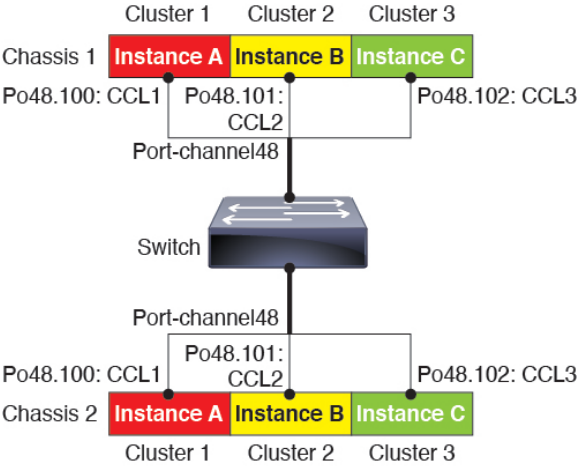

- Mix and match clusters and standalone instances—Not all container instances on a security module/engine need to belong to a cluster. You can use some instances as standalone or High Availability nodes. You can also create multiple clusters using separate instances on the same security module/engine.

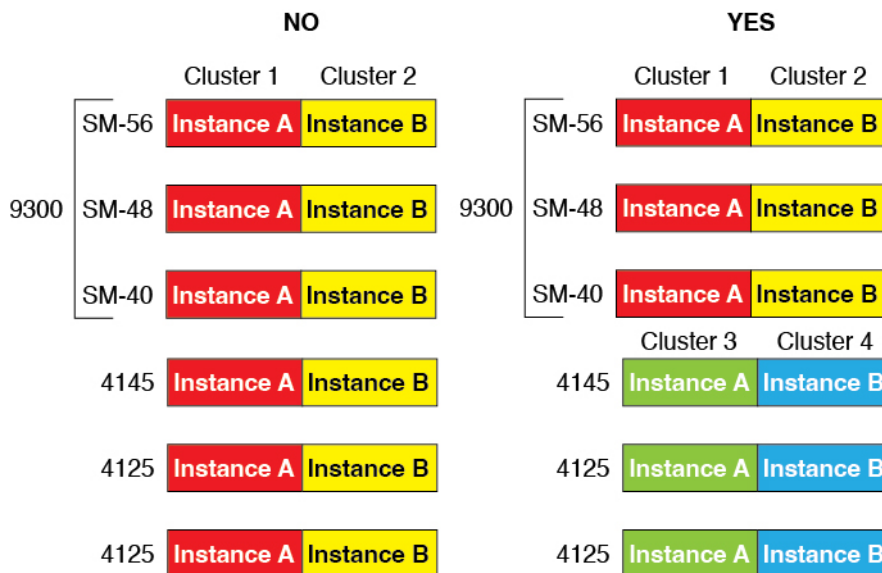

- All 3 modules in a Firepower 9300 must belong to the cluster—For the Firepower 9300, a cluster requires a single container instance on all 3 modules. You cannot create a cluster using instances on module 1 and 2, and then use a native instance on module 3, or example.

- Match resource profiles—We recommend that each node in the cluster use the same resource profile attributes; however, mismatched resources are allowed when changing cluster nodes to a different resource profile, or when using different models.
- Dedicated cluster control link—For clusters with multiple chassis, each cluster needs a dedicated cluster control link. For example, each cluster can use a separate subinterface on the same cluster-type EtherChannel, or use separate EtherChannels.

- No shared interfaces—Shared-type interfaces are not supported with clustering. However, the same Management and Eventing interfaces can be used by multiple clusters.
- No subinterfaces—A multi-instance cluster cannot use FXOS-defined VLAN subinterfaces. An exception is made for the cluster control link, which can use a subinterface of the Cluster EtherChannel.
- Mix chassis models—We recommend that you use the same security module or chassis model for each cluster instance. However, you can mix and match container instances on different Firepower 9300 security module types or Firepower 4100 models in the same cluster if required. You cannot mix Firepower 9300 and 4100 instances in the same cluster. For example, you can create a cluster using an instance on a Firepower 9300 SM-56, SM-48, and SM-40. Or you can create a cluster on a Firepower 4145 and a 4125.

- Maximum 6 nodes—You can use up to six container instances in a cluster.

### Switch Requirements

- Be sure to complete the switch configuration and successfully connect all the EtherChannels from the chassis to the switch(es) before you configure clustering on the Firepower 4100/9300 chassis.
- For supported switch characteristics, see [Cisco FXOS Compatibility](#).

## Guidelines and Limitations for Logical Devices

See the following sections for guidelines and limitations.

### Guidelines and Limitations for Interfaces

#### VLAN Subinterfaces

- This document discusses *FXOS* VLAN subinterfaces only. You can separately create subinterfaces within the threat defense application. See [FXOS Interfaces vs. Application Interfaces, on page 506](#) for more information.
- Subinterfaces (and the parent interfaces) can only be assigned to container instances.

**Note** If you assign a parent interface to a container instance, it only passes untagged (non-VLAN) traffic. Do not assign the parent interface unless you intend to pass untagged traffic. For Cluster type interfaces, the parent interface cannot be used.

- Subinterfaces are supported on Data or Data-sharing type interfaces, as well as Cluster type interfaces. If you add subinterfaces to a Cluster interface, you cannot use that interface for a native cluster.

- For multi-instance clustering, FXOS subinterfaces are not supported on Data interfaces. However, subinterfaces are supported for the cluster control link, so you can use either a dedicated EtherChannel or a subinterface of an EtherChannel for the cluster control link. Note that *application*-defined subinterfaces are supported for Data interfaces.
- You can create up to 500 VLAN IDs.
- See the following limitations within the logical device application; keep these limitations in mind when planning your interface allocation.
  - You cannot use subinterfaces for an threat defense inline set or as a passive interface.
  - If you use a subinterface for the failover link, then all subinterfaces on that parent, and the parent itself, are restricted for use as failover links. You cannot use some subinterfaces as failover links, and some as regular data interfaces.

**Data-sharing Interfaces**

- You cannot use a data-sharing interface with a native instance.
  - Maximum 14 instances per shared interface. For example, you can allocate Ethernet1/1 to Instance1 through Instance14.
- Maximum 10 shared interfaces per instance. For example, you can allocate Ethernet1/1.1 through Ethernet1/1.10 to Instance1.

- You cannot use a data-sharing interface in a cluster.

- See the following limitations within the logical device application; keep these limitations in mind when planning your interface allocation.
  - You cannot use a data-sharing interface with a transparent firewall mode device.
  - You cannot use a data-sharing interface with threat defense inline sets or passive interfaces.
  - You cannot use a data-sharing interface for the failover link.

### Inline Sets for Threat Defense

- Supported for physical interfaces (both regular and breakout ports) and EtherChannels. Subinterfaces are not supported.
- Link state propagation is supported.
- Do not enable Hardware Bypass and link state propagation for the same inline set.

### Hardware Bypass

- Supported for the threat defense; you can use them as regular interfaces for the ASA.
- The threat defense only supports Hardware Bypass with inline sets.
- Hardware Bypass-capable interfaces cannot be configured for breakout ports.
- You cannot include Hardware Bypass interfaces in an EtherChannel and use them for Hardware Bypass; you can use them as regular interfaces in an EtherChannel.
- Hardware Bypass is not supported with High Availability.
- Do not enable Hardware Bypass and link state propagation for the same inline set.

### Default MAC Addresses

#### For native instances:

Default MAC address assignments depend on the type of interface.

- Physical interfaces—The physical interface uses the burned-in MAC address.
- EtherChannels—For an EtherChannel, all interfaces that are part of the channel group share the same MAC address. This feature makes the EtherChannel transparent to network applications and users, because they only see the one logical connection; they have no knowledge of the individual links. The port-channel interface uses a unique MAC address from a pool; interface membership does not affect the MAC address.

#### For container instances:

- MAC addresses for all interfaces are taken from a MAC address pool. For subinterfaces, if you decide to manually configure MAC addresses, make sure you use unique MAC addresses for all subinterfaces on the same parent interface to ensure proper classification. See [Automatic MAC Addresses for Container Instance Interfaces, on page 524](#).

## General Guidelines and Limitations

### Firewall Mode

You can set the firewall mode to routed or transparent in the bootstrap configuration for the threat defense.

### High Availability

- Configure high availability within the application configuration.
- You can use any data interfaces as the failover and state links. Data-sharing interfaces are not supported.

### Multi-Instance

- Multi-instance capability with container instances is only available for the threat defense using management center.
- For threat defense container instances, a single management center must manage all instances on a security module/engine.
- For threat defense container instances, the following features are not supported:
  - Radware DefensePro link decorator
  - Management Center UCAPL/CC mode
  - Flow offload to hardware

## Configure Interfaces

By default, physical interfaces are disabled. You can enable interfaces, add EtherChannels, add VLAN subinterfaces, and edit interface properties.

### Configure a Physical Interface

You can physically enable and disable interfaces, as well as set the interface speed and duplex. To use an interface, it must be physically enabled in FXOS and logically enabled in the application.

---

**Note** For QSFPH40G-CUxM, auto-negotiation is always enabled by default and you cannot disable it.

---

#### Before you begin

- Interfaces that are already a member of an EtherChannel cannot be modified individually. Be sure to configure settings before you add it to the EtherChannel.

## Add an EtherChannel (Port Channel)

An EtherChannel (also known as a port channel) can include up to 16 member interfaces of the same media type and capacity, and must be set to the same speed and duplex. The media type can be either RJ-45 or SFP; SFPs of different types (copper and fiber) can be mixed. You cannot mix interface capacities (for example 1GB and 10GB interfaces) by setting the speed to be lower on the larger-capacity interface. The Link Aggregation Control Protocol (LACP) aggregates interfaces by exchanging the Link Aggregation Control Protocol Data Units (LACPDU) between two network devices.

You can configure each physical Data or Data-sharing interface in an EtherChannel to be:

- **Active**—Sends and receives LACP updates. An active EtherChannel can establish connectivity with either an active or a passive EtherChannel. You should use the active mode unless you need to minimize the amount of LACP traffic.
- **On**—The EtherChannel is always on, and LACP is not used. An “on” EtherChannel can only establish a connection with another “on” EtherChannel.

---

**Note** It may take up to three minutes for an EtherChannel to come up to an operational state if you change its mode from On to Active or from Active to On.

---

Non-data interfaces only support active mode.

LACP coordinates the automatic addition and deletion of links to the EtherChannel without user intervention. It also handles misconfigurations and checks that both ends of member interfaces are connected to the correct channel group. “On” mode cannot use standby interfaces in the channel group when an interface goes down, and the connectivity and configurations are not checked.

When the Firepower 4100/9300 chassis creates an EtherChannel, the EtherChannel stays in a **Suspended** state for Active LACP mode or a **Down** state for On LACP mode until you assign it to a logical device, even if the physical link is up. The EtherChannel will be brought out of this **Suspended** state in the following situations:

- The EtherChannel is added as a data or management interface for a standalone logical device
- The EtherChannel is added as a management interface or cluster control link for a logical device that is part of a cluster
- The EtherChannel is added as a data interface for a logical device that is part of a cluster and at least one unit has joined the cluster

Note that the EtherChannel does not come up until you assign it to a logical device. If the EtherChannel is removed from the logical device or the logical device is deleted, the EtherChannel will revert to a **Suspended** or **Down** state.

## Add a VLAN Subinterface for Container Instances

You can add between 250 and 500 VLAN subinterfaces to the chassis, depending on your network deployment. You can add up to 500 subinterfaces to your chassis.

For multi-instance clustering, you can only add subinterfaces to the Cluster-type interface; subinterfaces on data interfaces are not supported.

VLAN IDs per interface must be unique, and within a container instance, VLAN IDs must be unique across all assigned interfaces. You can reuse VLAN IDs on *separate* interfaces as long as they are assigned to different container instances. However, each subinterface still counts towards the limit even though it uses the same ID.

This document discusses *FXOS* VLAN subinterfaces only. You can separately create subinterfaces within the threat defense application. For more information on when to use *FXOS* subinterfaces vs. application subinterfaces, see [FXOS Interfaces vs. Application Interfaces, on page 506](#).

## Configure Logical Devices

Add a standalone logical device or a High Availability pair on the Firepower 4100/9300.

### Add a Resource Profile for Container Instances

To specify resource usage per container instance, create one or more resource profiles. When you deploy the logical device/application instance, you specify the resource profile that you want to use. The resource profile sets the number of CPU cores; RAM is dynamically allocated according to the number of cores, and disk space is set to 40 GB per instance.

- The minimum number of cores is 6.

---

**Note** Instances with a smaller number of cores might experience relatively higher CPU utilization than those with larger numbers of cores. Instances with a smaller number of cores are more sensitive to traffic load changes. If you experience traffic drops, try assigning more cores.

---

- You can assign cores as an even number (6, 8, 10, 12, 14 etc.) up to the maximum.
- The maximum number of cores available depends on the security module/chassis model; see [Requirements and Prerequisites for Container Instances, on page 528](#).

The chassis includes a default resource profile called "Default-Small," which includes the minimum number of cores. You can change the definition of this profile, and even delete it if it is not in use. Note that this profile is created when the chassis reloads and no other profile exists on the system.

Changing the resource profile after you assign it is disruptive. See the following guidelines:

- You cannot change the resource profile settings if it is currently in use. You must disable any instances that use it, then change the resource profile, and finally reenable the instance.
- If you change the resource profile settings after you add the threat defense instance to the management center, then update the inventory for each unit on the management center **Devices > Device Management > Device > System > Inventory** dialog box.
- If you assign a different profile to an instance, it reboots.
- If you assign a different profile to instances in an established high-availability pair, which requires the profile to be the same on both units, you must:
  1. Break high availability.

2. Assign the new profile to both units.
  3. Re-establish high availability.
- If you assign a different profile to instances in an established cluster, which allows mismatched profiles, then apply the new profile on the data nodes first; after they all come back up, you can apply the new profile to the control node.

## Add a Standalone Threat Defense

Standalone logical devices work either alone or in a High Availability pair. On the Firepower 9300 with multiple security modules, you can deploy either a cluster or standalone devices. The cluster must use all modules, so you cannot mix and match a 2-module cluster plus a single standalone device, for example.

You can use native instances on some modules, and container instances on the other module(s).

### Before you begin

- Download the application image you want to use for the logical device from Cisco.com, and then that image to the Firepower 4100/9300 chassis.

---

**Note** For the Firepower 9300, you can install different application types (ASA and threat defense) on separate modules in the chassis. You can also run different versions of an application instance type on separate modules.

---

- Configure a management interface to use with the logical device. The management interface is required. Note that this management interface is not the same as the chassis management port that is used only for chassis management.
- You can later enable management from a data interface; but you must assign a Management interface to the logical device even if you don't intend to use it after you enable data management. See the **configure network management-data-interface** command in the [FTD command reference](#) for more information.
- You must also configure at least one Data type interface. Optionally, you can also create a firepower-eventing interface to carry all event traffic (such as web events). See [Interface Types, on page 504](#) for more information.
- For container instances, if you do not want to use the default profile, add a resource profile according to [Add a Resource Profile for Container Instances, on page 538](#).
- For container instances, before you can install a container instance for the first time, you must reinitialize the security module/engine so that the disk has the correct formatting. An existing logical device will be deleted and then reinstalled as a new device, losing any local application configuration. If you are replacing a native instance with container instances, you will need to delete the native instance in any case. You cannot automatically migrate a native instance to a container instance.
- Gather the following information:
  - Interface IDs for this device
  - Management interface IP address and network mask

- Gateway IP address
- management center IP address and/or NAT ID of your choosing
- DNS server IP address
- threat defense hostname and domain name

## Procedure

---

See the management center configuration guide to add the threat defense as a managed device and start configuring your security policy.

---

## Add a Standalone Threat Defense for the Cisco Security Cloud Control

You can use Security Cloud Control with both native and container instances. Standalone logical devices work either alone or in a High Availability pair.

### Before you begin

- Download the application image you want to use for the logical device from Cisco.com, and then that image to the Firepower 4100/9300 chassis.

---

**Note** For the Firepower 9300, you can install different application types (ASA and threat defense) on separate modules in the chassis. You can also run different versions of an application instance type on separate modules.

---

- Configure a management interface to use with the logical device. The management interface is required. Note that this management interface is not the same as the chassis management port that is used only for chassis management.
- You must also configure at least one Data type interface.
- You must onboard the FTD device in Security Cloud Control.
- Gather the following information:
  - Interface IDs for this device
  - Management interface IP address and network mask
  - Gateway IP address
  - DNS server IP address
  - Threat Defense hostname and domain name
  - Security Cloud Control onboard string
  - Threat Defense hostname and domain name

**Procedure**

**Step 1** Save the configuration.

**commit-buffer**

The chassis deploys the logical device by downloading the specified software version and pushing the bootstrap configuration and management interface settings to the application instance. Check the status of the deployment using the **show app-instance** command. The application instance is running and ready to use when the **Admin State** is **Enabled** and the **Oper State** is **Online**.

**Example:**

```
Firepower /ssa/logical-device* # commit-buffer
Firepower /ssa/logical-device # exit
Firepower /ssa # show app-instance
```

App Name	Identifier	Slot ID	Admin State	Oper State	Running Version	Startup Version
Deploy Type	Profile Name	Cluster	State	Cluster Role		
asa	asa1	2	Disabled	Not Installed		9.12.1
Native			Not Applicable	None		
ftd	ftd1	1	Enabled	Online	7.3.0	7.3.0
Container	Default-Small		Not Applicable	None		

**Step 2** See the Security Cloud Control configuration guide to start configuring your security policy.

**Add a High Availability Pair**

Threat Defense High Availability (also known as failover) is configured within the application, not in FXOS. However, to prepare your chassis for high availability, see the following steps.

**Before you begin**

See [Requirements and Prerequisites for High Availability, on page 529](#).

**Procedure**

**Step 1** Allocate the same interfaces to each logical device.

**Step 2** Allocate 1 or 2 data interfaces for the failover and state link(s).

These interfaces exchange high availability traffic between the 2 chassis. We recommend that you use a 10 GB data interface for a combined failover and state link. If you have available interfaces, you can use separate failover and state links; the state link requires the most bandwidth. You cannot use the management-type interface for the failover or state link. We recommend that you use a switch between the chassis, with no other device on the same network segment as the failover interfaces.

For container instances, data-sharing interfaces are not supported for the failover link. We recommend that you create subinterfaces on a parent interface or EtherChannel, and assign a subinterface for each instance to

use as a failover link. Note that you must use all subinterfaces on the same parent as failover links. You cannot use one subinterface as a failover link and then use other subinterfaces (or the parent interface) as regular data interfaces.

- Step 3** Enable High Availability on the logical devices. See [High Availability, on page 609](#).
- Step 4** If you need to make interface changes after you enable High Availability, perform the changes on the standby unit first, and then perform the changes on the active unit.

## Change an Interface on a Threat Defense Logical Device

You can allocate or unallocate an interface on the threat defense logical device. You can then sync the interface configuration in the management center.

Adding a new interface, or deleting an unused interface has minimal impact on the threat defense configuration. However, deleting an interface that is used in your security policy will impact the configuration. Interfaces can be referenced directly in many places in the threat defense configuration, including access rules, NAT, SSL, identity rules, VPN, DHCP server, and so on. Policies that refer to security zones are not affected. You can also edit the membership of an allocated EtherChannel without affecting the logical device or requiring a sync on the management center.

Deleting an interface will delete any configuration associated with that interface.

### Before you begin

- Configure your interfaces, and add any EtherChannels according to [Configure a Physical Interface, on page 536](#) and [Add an EtherChannel \(Port Channel\), on page 537](#).
- If you want to add an already-allocated interface to an EtherChannel (for example, all interfaces are allocated by default to a cluster), you need to unallocate the interface from the logical device first, then add the interface to the EtherChannel. For a new EtherChannel, you can then allocate the EtherChannel to the device.
- For clustering or High Availability, make sure you add or remove the interface on all units before you sync the configuration in the management center. We recommend that you make the interface changes on the data/standby unit(s) first, and then on the control/active unit. Note that new interfaces are added in an administratively down state, so they do not affect interface monitoring.
- In mult-instance mode, for changing a sub-interface with another sub-interface with the same vlan tag, you must first remove all the configuration (including nameif config) of the interface and then unallocate the interface from chassis manager. Once unallocated, add the new interface and then use sync interfaces from the management center.

### Procedure

- Step 1** Sync the interfaces in the management center.
- a) Log into the management center.
  - b) Select **Devices > Device Management** and click **Edit** (✎) for your threat defense device. The **Interfaces** page is selected by default.

- c) Click the **Sync Device** button on the top left of the **Interfaces** page.
- d) After the changes are detected, you will see a red banner on the **Interfaces** page indicating that the interface configuration has changed. Click the **Click to know more** link to view the interface changes.
- e) If you plan to delete an interface, manually transfer any interface configuration from the old interface to the new interface.

Because you have not yet deleted any interfaces, you can refer to the existing configuration. You will have additional opportunity to fix the configuration after you delete the old interface and re-run the validation. The validation will show you all locations in which the old interface is still used.

- f) Click **Validate Changes** to make sure your policy will still work with the interface changes.  
If there are any errors, you need to change your policy and rerun the validation.
- g) Click **Save**.
- h) Click **Deploy > Deployment**.
- i) Select the devices and click **Deploy** to deploy the policy to the assigned devices. The changes are not active until you deploy them.

**Step 2** Sync the interfaces again in the management centerthe .

## Connect to the Console of the Application

Use the following procedure to connect to the console of the application.

### Procedure

**Step 1** Connect to the module CLI using a console connection or a Telnet connection.

```
connect module slot_number { console | telnet}
```

To connect to the security engine of a device that does not support multiple security modules, always use **1** as the *slot\_number*.

The benefits of using a Telnet connection is that you can have multiple sessions to the module at the same time, and the connection speed is faster.

#### Example:

```
Firepower# connect module 1 console
Telnet escape character is '~'.
Trying 127.5.1.1...
Connected to 127.5.1.1.
Escape character is '~'.
```

```
CISCO Serial Over LAN:
Close Network Connection to Exit
```

```
Firepower-module1>
```

**Step 2** Connect to the application console.

```
connect ftd name
```

To view the instance names, enter the command without a name.

**Example:**

```
Firepower-module1> connect ftd ftd1
Connecting to ftd(ftd-native) console... enter exit to return to bootCLI
[...]  
>
```

**Step 3** Exit the application console to the FXOS module CLI.

- Threat Defense—Enter **exit**

**Step 4** Return to the supervisor level of the FXOS CLI.

**Exit the console:**

- Enter ~  
You exit to the Telnet application.
- To exit the Telnet application, enter:  
telnet>**quit**

**Exit the Telnet session:**

- Enter **Ctrl-], .**
-

## CHAPTER 29

# Multi-Instance Mode for the Secure Firewall 3100

---

You can deploy the Secure Firewall 3100 as a single device (*appliance mode*) or as multiple container instances (*multi-instance mode*). This chapter describes how to deploy the device in multi-instance mode.

- [About Multi-Instance Mode, on page 545](#)
- [Licenses for Instances, on page 558](#)
- [Requirements and Prerequisites for Instances, on page 558](#)
- [Guidelines and Limitations for Instances, on page 560](#)
- [Configure Instances, on page 562](#)
- [Monitoring Multi-Instance Mode, on page 605](#)
- [History for Multi-Instance Mode, on page 608](#)

## About Multi-Instance Mode

In multi-instance mode, you can deploy multiple container instances on a single chassis that act as completely independent devices.

## Multi-Instance Mode vs. Appliance Mode

You can run the device in either multi-instance mode or appliance mode.

### Appliance Mode

Appliance mode is the default. The device runs the native threat defense image and acts as a single device. The only chassis-level configuration available (on the **Chassis Manager** page) is for network module management (breakout ports or enabling/disabling a network module).

### Multi-Instance Mode

If you change to multi-instance mode, the device runs the Secure Firewall eXtensible Operating System (FXOS) on the chassis, while each instance runs separate threat defense images. You can configure the mode using the FXOS CLI.

Because multiple instances run on the same chassis, you need to perform chassis-level management of:

- CPU and memory resources using resource profiles.

- Interface configuration and assignment.
- Deployment and monitoring of instances.

For a multi-instance device, you add the *chassis* to the management center and configure chassis-level settings on the **Chassis Manager** page.

## Chassis Management Interface

### Chassis Management

The chassis uses the dedicated Management interface on the device. Multi-instance mode does not support using a data interface for chassis management or DHCP addressing for the Management interface.

You can only configure the chassis Management interface at the threat defense CLI (at initial setup) or FXOS CLI (after you convert to multi-instance mode). See [Change Chassis Management Settings at the FXOS CLI, on page 602](#) to change Management interface settings in multi-instance mode.

---

**Note** By default, SSH is not allowed to this interface in multi-instance mode unless you enable the SSH server and an SSH access list. This difference means that you can connect to the application-mode threat defense Management interface using SSH, but after you convert to multi-instance mode, you can no longer connect using SSH by default. See [Configure SSH and SSH Access List, on page 587](#).

---

### Instance Management

All instances share the chassis management interface, and each instance has its own IP address on the Management network. After you add the instance and specify the IP address, you can make changes to the network settings at the threat defense CLI.

The instance Management IP address allows SSH by default.

## Instance Interfaces

To provide flexible physical interface use for instances, you can create VLAN subinterfaces on the chassis and also share interfaces (VLAN or physical) between multiple instances. See [Shared Interface Scalability, on page 549](#) and [Configure a Subinterface, on page 573](#).

---

**Note** This chapter discusses *chassis* VLAN subinterfaces only. You can separately create subinterfaces within the threat defense instance. See [Chassis Interfaces vs. Instance Interfaces, on page 547](#) for more information.

---

## Interface Types

Physical interfaces, VLAN subinterfaces, and EtherChannel interfaces can be one of the following types:

- **Data**—Use for regular data or the failover link. Data interfaces cannot be shared between instances, and instances cannot communicate over the backplane to other instances. For traffic on Data interfaces, all traffic must exit the chassis on one interface and return on another interface to reach another instance.

You can add VLAN subinterfaces to a data interface to provide separate failover links per High Availability pair.

- **Data-sharing**—Use for regular data. These data interfaces can be shared by one or more instances. Each instance can communicate over the backplane with all other instances that share this interface. Shared interfaces can affect the number of instances you can deploy. Shared interfaces are not supported for bridge group member interfaces (in transparent mode or routed mode), inline sets, passive interfaces, or failover links.

## Chassis Interfaces vs. Instance Interfaces

At the chassis level, you manage the basic Ethernet settings of physical interfaces, VLAN subinterfaces for instances, and EtherChannel interfaces. Within the instance, you configure higher level settings. For example, you can only create EtherChannels in the chassis; but you can assign an IP address to the EtherChannel within the instance.

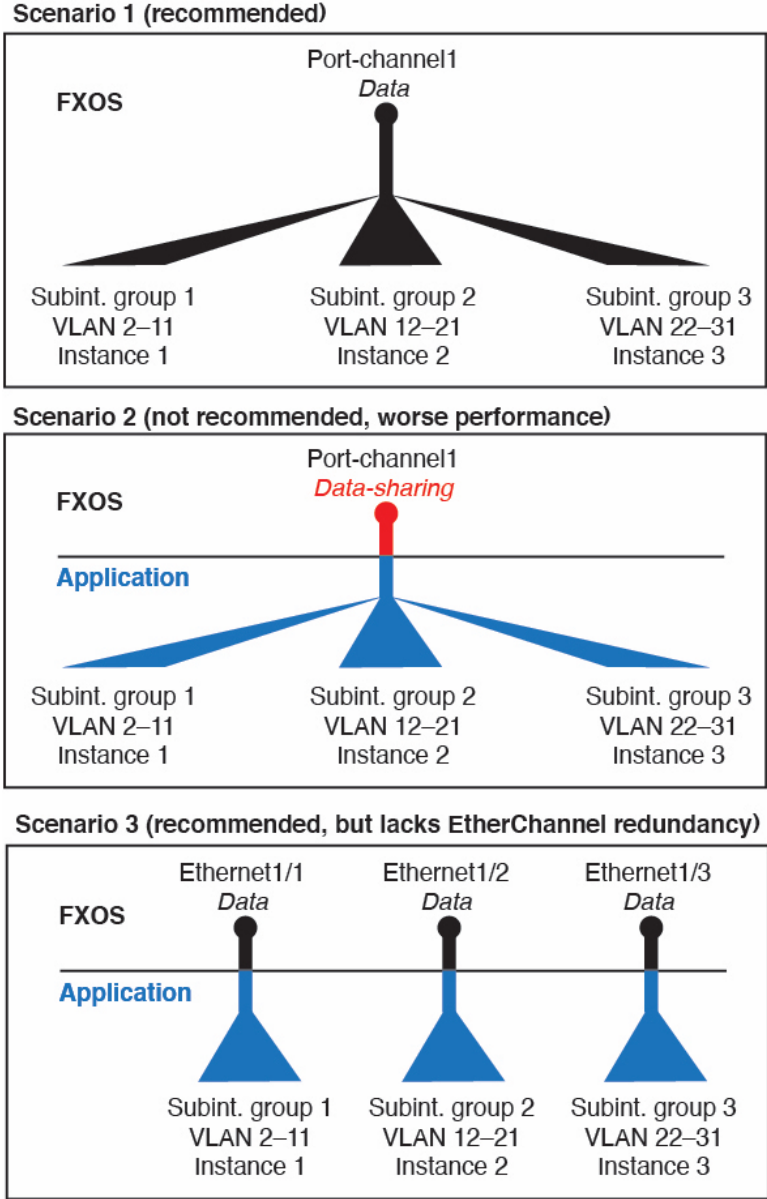

The following sections describe the interaction between the chassis and the instance for interfaces.

### VLAN Subinterfaces

You can create VLAN subinterfaces within the instance, just as you would for any device.

You can *also* create VLAN subinterfaces in the chassis. The instance-defined subinterfaces are not subject to the chassis limit. Choosing in which location to create subinterfaces depends on your network deployment and personal preference. For example, to share a subinterface, you must create the subinterface on the chassis. Another scenario that favors chassis subinterfaces comprises allocating separate subinterface groups on a single interface to multiple instances. For example, you want to use Port-channel1 with VLAN 2–11 on instance A, VLAN 12–21 on instance B, and VLAN 22–31 on instance C. If you create these subinterfaces in the instance, then you would have to share the parent interface in the chassis, which may not be desirable. See the following illustration that shows the three ways you can accomplish this scenario:

Figure 87: VLANs in the Chassis vs. the Instance

**Independent Interface States in the Chassis and in the Instance**

You can administratively enable and disable interfaces in both the chassis and in the instance. For an interface to be operational, the interface must be enabled in both locations. Because the interface state is controlled independently, you may have a mismatch between the chassis and instance.

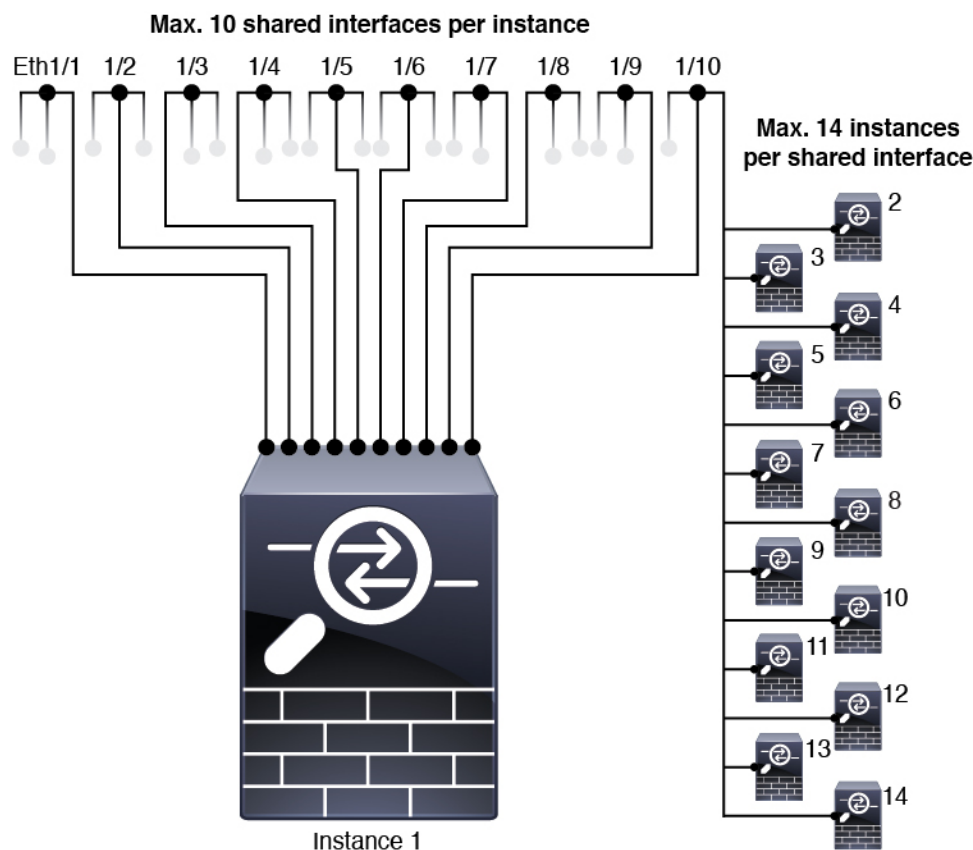

The default state of an interface within the instance depends on the type of interface. For example, the physical interface or EtherChannel is disabled by default within the instance, but a subinterface is enabled by default.

## Shared Interface Scalability

Instances can share data-sharing type interfaces. This capability lets you conserve physical interface usage as well as support flexible networking deployments. When you share an interface, the chassis uses unique MAC addresses to forward traffic to the correct instance. However, shared interfaces can cause the forwarding table to grow large due to the need for a full mesh topology within the chassis (every instance must be able to communicate with every other instance that is sharing the same interface). Therefore, there are limits to how many interfaces you can share.

In addition to the forwarding table, the chassis maintains a VLAN group table for VLAN subinterface forwarding. You can create up to 500 VLAN subinterfaces.

See the following limits for shared interface allocation:

## Shared Interface Best Practices

For optimal scalability of the forwarding table, share as few interfaces as possible. Instead, you can create up to 500 VLAN subinterfaces on one or more physical interfaces and then divide the VLANs among the container instances.

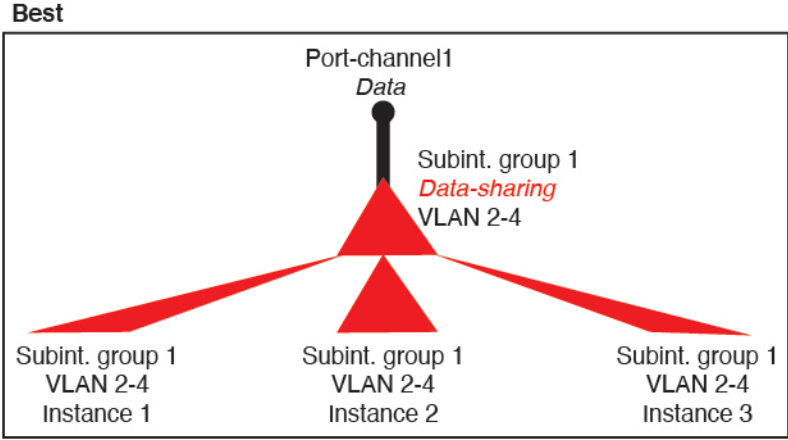

When sharing interfaces, follow these practices in the order of most scalable to least scalable:

1. Best—Share subinterfaces under a single parent, and use the same set of subinterfaces with the same group of instances.

For example, create a large EtherChannel to bundle all of your like-kind interfaces together, and then share subinterfaces of that EtherChannel: Port-Channel1.2, 3, and 4 instead of Port-Channel2,

Port-Channel3, and Port-Channel4. When you share subinterfaces from a single parent, the VLAN group table provides better scaling of the forwarding table than when sharing physical/EtherChannel interfaces or subinterfaces across parents.

Figure 88: Best: Shared Subinterface Group on One Parent

If you do not share the same set of subinterfaces with a group of instances, your configuration can cause more resource usage (more VLAN groups). For example, share Port-Channel1.2, 3, and 4 with instances 1, 2, and 3 (one VLAN group) instead of sharing Port-Channel1.2 and 3 with instances 1 and 2, while sharing Port-Channel1.3 and 4 with instance 3 (two VLAN groups).

Figure 89: Good: Sharing Multiple Subinterface Groups on One Parent

2. Fair—Share subinterfaces across parents.

For example, share Port-Channel1.2, Port-Channel2.3, and Port-Channel3.4 instead of Port-Channel2, Port-Channel4, and Port-Channel4. Although this usage is not as efficient as only sharing subinterfaces on the same parent, it still takes advantage of VLAN groups.

Figure 90: Fair: Shared Subinterfaces on Separate Parents

3. Worst—Share individual parent interfaces (physical or EtherChannel). This method uses the most forwarding table entries.

Figure 91: Worst: Shared Parent Interfaces

## How the Chassis Classifies Packets

Each packet that enters the chassis must be classified, so that the chassis can determine to which instance to send a packet.

- **Unique Interfaces**—If only one instance is associated with the ingress interface, the chassis classifies the packet into that instance. For bridge group member interfaces (in transparent mode or routed mode), inline sets, or passive interfaces, this method is used to classify packets at all times.
- **Unique MAC Addresses**—The chassis automatically generates unique MAC addresses for all interfaces, including shared interfaces. If multiple instances share an interface, then the classifier uses unique MAC addresses assigned to the interface in each instance. An upstream router cannot route directly to an instance without unique MAC addresses. You can also set the MAC addresses manually when you configure each interface within the application.

**Note** If the destination MAC address is a multicast or broadcast MAC address, the packet is duplicated and delivered to each instance.

# Classification Examples

## Packet Classification with a Shared Interface Using MAC Addresses

The following figure shows multiple instances sharing an outside interface. The classifier assigns the packet to Instance C because Instance C includes the MAC address to which the router sends the packet.

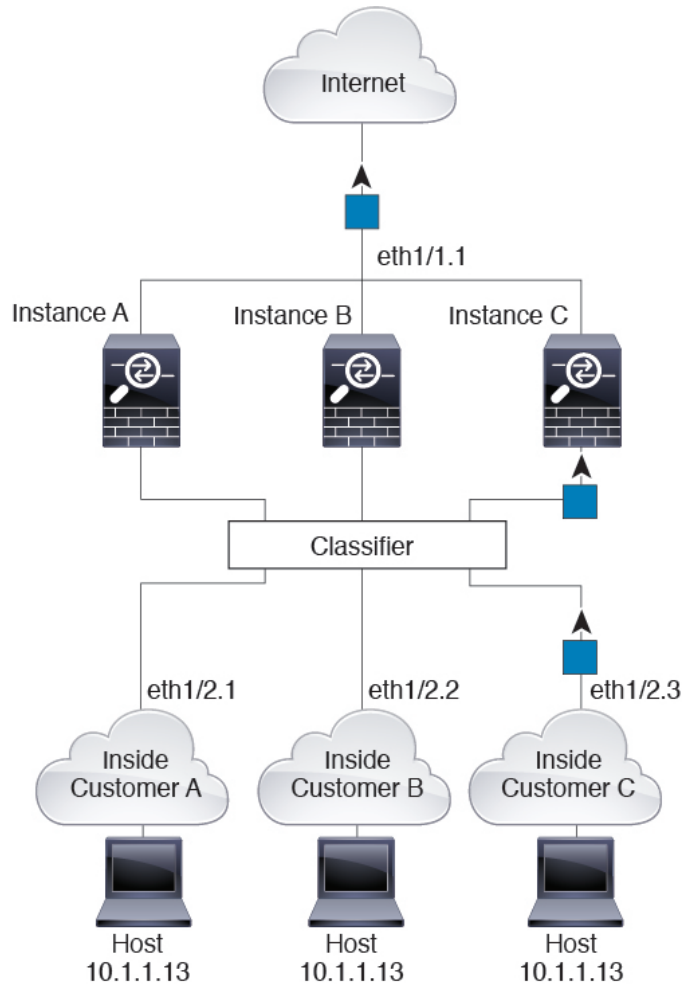

Figure 92: Packet Classification with a Shared Interface Using MAC Addresses

## Incoming Traffic from Inside Networks

Note that all new incoming traffic must be classified, even from inside networks. The following figure shows a host on the Instance C inside network accessing the internet. The classifier assigns the packet to Instance C because the ingress interface is Ethernet 1/2.3, which is assigned to Instance C.

Figure 93: Incoming Traffic from Inside Networks

**Transparent Firewall Instances**

For transparent firewalls, you must use unique interfaces. The following figure shows a packet destined to a host on the Instance C inside network from the internet. The classifier assigns the packet to Instance C because the ingress interface is Ethernet 1/2.3, which is assigned to Instance C.

Figure 94: Transparent Firewall Instances

**Inline Sets**

For inline sets, you must use unique interfaces and they must be physical interfaces or EtherChannels. The following figure shows a packet destined to a host on the Instance C inside network from the internet. The classifier assigns the packet to Instance C because the ingress interface is Ethernet 1/5, which is assigned to Instance C.

Figure 95: Inline Sets

## Cascading Instances

Placing an instance directly in front of another instance is called *cascading instances*; the outside interface of one instance is the same interface as the inside interface of another instance. You might want to cascade instances if you want to simplify the configuration of some instances by configuring shared parameters in the top instance.

The following figure shows a gateway instance with two instances behind the gateway.

Figure 96: Cascading Instances

**Note** Do not use cascading instances (using a shared interface) with High Availability. After a failover occurs and the standby unit rejoins, MAC addresses can overlap temporarily and cause an outage. You should instead use unique interfaces for the gateway instance and inside instance using an external switch to pass traffic between the instances.

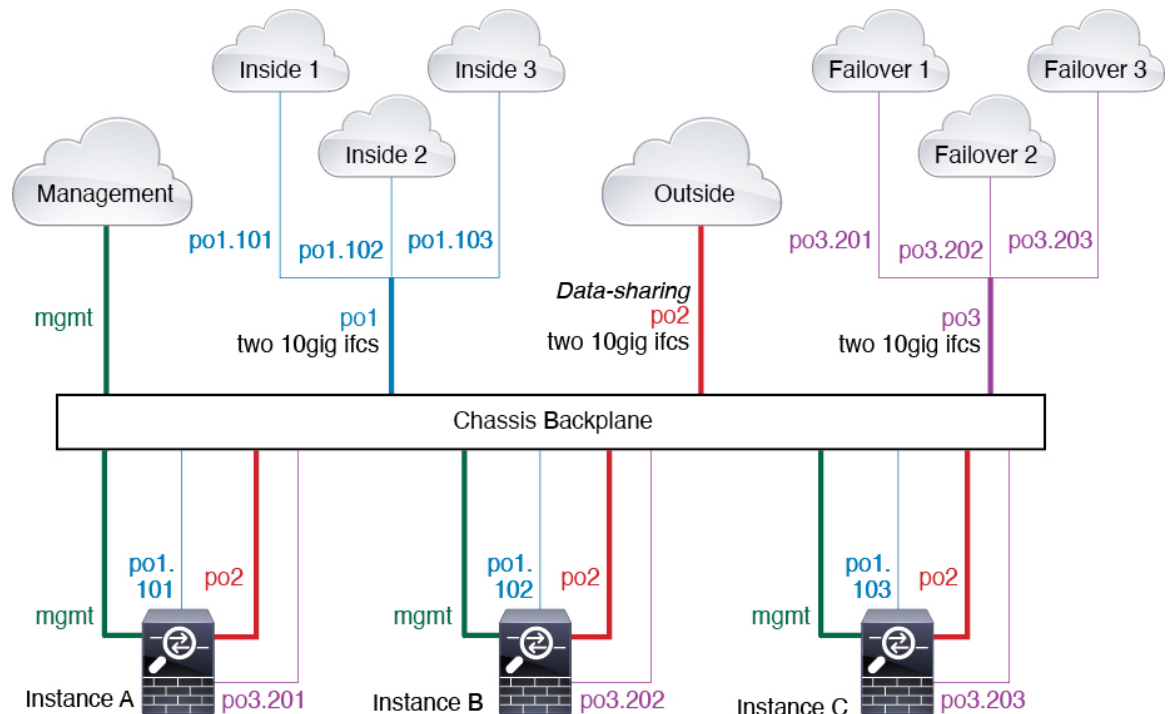

## Typical Multi-Instance Deployment

The following example includes three container instances in routed firewall mode. They include the following interfaces:

- Management—All instances and the chassis use the dedicated Management interface. Within each instance (and the chassis), the interface uses a unique IP address on the same management network.
- Inside—Each instance uses a subinterface on Port-Channel1 (data type). This EtherChannel includes two 10 Gigabit Ethernet interfaces. Each subinterface is on a separate network.

- Outside—All instances use the Port-Channel2 interface (data-sharing type). This EtherChannel includes two 10 Gigabit Ethernet interfaces. Within each application, the interface uses a unique IP address on the same outside network.
- Failover—Each instance uses a subinterface on Port-Channel3 (data type). This EtherChannel includes two 10 Gigabit Ethernet interfaces. Each subinterface is on a separate network.

Figure 97: Typical Multi-Instance Deployment

## Automatic MAC Addresses for Instance Interfaces

The chassis automatically generates MAC addresses for instance interfaces, and guarantees that a shared interface in each instance uses a unique MAC address.

If you manually assign a MAC address to a shared interface within the instance, then the manually-assigned MAC address is used. If you later remove the manual MAC address, the autogenerated address is used. In the rare circumstance that the generated MAC address conflicts with another private MAC address in your network, we suggest that you manually set the MAC address for the interface within the instance.

Because autogenerated addresses start with A2, you should not start manual MAC addresses with A2 due to the risk of overlapping addresses.

The chassis generates the MAC address using the following format:

A2xx.yyzz.zzzz

Where xx.yy is a user-defined prefix or a system-defined prefix, and zz.zzzz is an internal counter generated by the chassis. The system-defined prefix matches the lower 2 bytes of the first MAC address in the burned-in MAC address pool that is programmed into the IDPROM. Use **connect fxos**, then **show module** to view the

MAC address pool. For example, if the range of MAC addresses shown for module 1 is b0aa.772f.f0b0 to b0aa.772f.f0bf, then the system prefix will be f0b0.

The user-defined prefix is an integer that is converted into hexadecimal. For an example of how the user-defined prefix is used, if you set a prefix of 77, then the chassis converts 77 into the hexadecimal value 004D (yyxx). When used in the MAC address, the prefix is reversed (xxyy) to match the chassis native form:

A24D.00zz.zzzz

For a prefix of 1009 (03F1), the MAC address is:

A2F1.03zz.zzzz

## Performance Scaling Factor for Multi-Instance Mode

The maximum throughput (connections, VPN sessions) for a platform is calculated for an appliance mode device's use of memory and CPU (and this value is shown in **show resource usage**). If you use multiple instances, then you need to calculate the throughput based on the percentage of CPU cores that you assign to the instance. For example, if you use an instance with 50% of the cores, then you should initially calculate 50% of the throughput. Moreover, the throughput available to an instance may be less than that available to an appliance.

For detailed instructions on calculating the throughput for instances, see <https://www.cisco.com/c/en/us/products/collateral/security/firewalls/white-paper-c11-744750.html>.

## Instances and High Availability

You can use High Availability using an instance on 2 separate chassis; for example, if you have 2 chassis, each with 10 instances, you can create 10 High Availability pairs. You can also have standalone instances on the same chassis as High Availability instances. For detailed requirements, see [Requirements and Prerequisites for Instances, on page 558](#).

---

**Note** Clustering is not supported.

---

## Licenses for Instances

All licenses are consumed per chassis and not per instance. See the following details:

- Essentials licenses are assigned to the chassis as a whole, one per chassis.
- Feature licenses are assigned to each instance, but you only *consume* one license per feature per chassis.

## Requirements and Prerequisites for Instances

### Model Support

- Secure Firewall 3110

- Secure Firewall 3120
- Secure Firewall 3130
- Secure Firewall 3140
- Secure Firewall 4215
- Secure Firewall 4225
- Secure Firewall 4245

**Note** The Secure Firewall 3105 is not supported.

### Maximum Container Instances and Resources per Model

For each container instance, you can specify the number of CPU cores (or more specifically, threads) to assign to the instance. We use the term "core" generically to account for different hardware architecture. RAM is dynamically allocated according to the number of cores, and disk space is set to 40 GB per instance.

**Table 46: Maximum Container Instances and Resources per Model**

Model	Max. Container Instances	Available CPU Cores (Threads)
Secure Firewall 3110	3	22
Secure Firewall 3120	5	30
Secure Firewall 3130	7	46
Secure Firewall 3140	10	62
Secure Firewall 4215	10	62
Secure Firewall 4225	14	126
Secure Firewall 4245	34	254

### Software Requirements

You can run different versions of threat defense software on each instance as long as they are all compatible with the version of FXOS running on the chassis.

### High Availability Requirements

- The two instances in a High Availability configuration must:
  - Be on separate chassis.
  - Be on the same model.
  - Have the same interfaces assigned. All interfaces must be preconfigured in the chassis identically before you enable High Availability.

- Use the same resource profile attributes. The profile names can be different, but the definitions need to match.

### Management Center Requirements

For chassis management and all instances on the chassis, you must use the same management center due to the licensing implementation.

## Guidelines and Limitations for Instances

### General Guidelines

- A single management center must manage all instances on a chassis, as well as manage the chassis itself.
- For instances, the following features are not supported:
  - TLS crypto acceleration
  - Clustering
  - Management Center UCAPL/CC mode
  - Flow offload to hardware
- Primary management of the chassis by Security Cloud Control cloud-delivered management center and separate analytics-only management of the chassis by an on-prem management center is not supported. You can however add Security Cloud Control-managed instances to an analytics-only on-prem management center.

### Management Interface

- No support for a data interface for chassis management; only the dedicated Management interface can be used
- No DHCP addressing for the Management interface

### VLAN Subinterfaces

- This document discusses *chassis* VLAN subinterfaces only. You can separately create subinterfaces within the instance.
- If you assign a parent interface to an instance, it only passes untagged (non-VLAN) traffic. Do not assign the parent interface unless you intend to pass untagged traffic.
- Subinterfaces are supported on Data or Data-sharing type interfaces.
- You can create up to 500 VLAN IDs.
- You cannot use subinterfaces for an inline set or as a passive interface.

- If you use a subinterface for the failover link, then all subinterfaces on that parent, and the parent itself, are restricted for use as failover links. You cannot use some subinterfaces as failover links, and some as regular data interfaces.

### EtherChannels

- You can configure up to 48 EtherChannels, limited by the number of physical interfaces.
- The EtherChannel can have up to 8 active interfaces.
- All interfaces in the EtherChannel must be the same media type and speed capacity. The media type can be either RJ-45 or SFP; SFPs of different types (copper and fiber) can be mixed. You cannot mix interface capacities (for example 1GB and 10GB interfaces) by setting the speed to be lower on the larger-capacity interface, unless you set the speed to **Detect SFP**; in this case, you can use different interface capacities, and the lowest common speed is used.
- The chassis does not support LACPDU s that are VLAN-tagged. If you enable native VLAN tagging on the neighboring switch using the Cisco IOS **vlan dot1Q tag native** command, then the chassis will drop the tagged LACPDU s. Be sure to disable native VLAN tagging on the neighboring switch.
- In Cisco IOS software versions earlier than 15.1(1)S2, the chassis did not support connecting an EtherChannel to a switch stack. With default switch settings, if the chassis EtherChannel is connected cross stack, and if the primary switch is powered down, then the EtherChannel connected to the remaining switch will not come up. To improve compatibility, set the **stack-mac persistent timer** command to a large enough value to account for reload time; for example, 8 minutes or 0 for indefinite. Or, you can upgrade to more a more stable switch software version, such as 15.1(1)S2.

### Data-sharing Interfaces

- Maximum 14 instances per shared interface. For example, you can allocate Ethernet1/1 to Instance1 through Instance14.

Maximum 10 shared interfaces per instance. For example, you can allocate Ethernet1/1.1 through Ethernet1/1.10 to Instance1.

- You cannot use a data-sharing interface with a transparent firewall mode instance.
- You cannot use a data-sharing interface with inline sets or passive interfaces.
- You cannot use a data-sharing interface for the failover link.

**Default MAC Addresses**

- MAC addresses for all interfaces are taken from a MAC address pool. For subinterfaces, if you decide to manually configure MAC addresses, make sure you use unique MAC addresses for all subinterfaces on the same parent interface to ensure proper classification. See [Automatic MAC Addresses for Instance Interfaces, on page 557](#).

# Configure Instances

Before you configure instances, you need to enable multi-instance mode, add the chassis to the management center, and configure chassis interfaces. You can also customize the chassis settings.

## Onboard the Multi-Instance Chassis

You need to connect to the chassis FXOS CLI at the console port to enable multi-instance mode and perform initial setup. After you configure the chassis, you can add it to the cloud-delivered Firewall Management

Center. The management center and the chassis share a separate management connection using the chassis MGMT interface.

**Note** Although you can connect to SSH on the management port, we recommend using the console port to avoid multiple disconnections. If you use SSH before you switch to multi-instance mode, you connect to the threat defense CLI and need to connect to FXOS using **connect fxos**. This procedure covers the console port.

Use the cloud-delivered Firewall Management Center to configure all chassis settings as well as instances. The Secure Firewall chassis manager or configuration at the FXOS CLI is not supported.

## Procedure

**Step 1** Connect to the chassis console port.

The console port connects to the FXOS CLI.

**Step 2** Log in with the username **admin** and the password **Admin123**.

The first time you log in to FXOS, you are prompted to change the password.

**Note** If the password was already changed, and you do not know it, you must reimage the device to reset the password to the default. See the [FXOS troubleshooting guide](#) for the [reimage procedure](#).

### Example:

```
firepower login: admin
Password: Admin123
Successful login attempts for user 'admin' : 1

[...]

Hello admin. You must change your password.
Enter new password: *****
Confirm new password: *****
Your password was updated successfully.

[...]

firepower#
```

**Step 3** Check your current mode, Native or Container. If the mode is Native, you can continue with this procedure to convert to multi-instance (Container) mode.

**show system detail**

### Example:

```
firepower # show system detail

Systems:
  Name: firepower
  Mode: Stand Alone
  System IP Address: 172.16.0.50
```

```

System IPv6 Address: ::
System Owner:
System Site:
Deploy Mode: Native
Description for System:
firepower #

```

**Step 4** Enable multi-instance mode.

**scope system**

**set deploymode container**

You are prompted to reboot.

**Example:**

```

firepower# scope system
firepower /system # set deploymode container
All configuration and bootable images will be lost and system will reboot.
If there was out of band upgrade, it might reboot with the base version and need to re-image
to get the expected running version.
Do you still want to change deploy mode? (yes/no):yes
firepower /system #

```

To change the mode back to appliance mode, enter **set deploymode native**.

**Step 5** After the chassis finishes rebooting, set the Management IP address. You can use IPv4 and/or IPv6. The default address is 192.168.45.45/24 with a gateway of 192.168.45.1.

**IPv4:**

**scope fabric-interconnect**

**set out-of-band static ip** *ip\_address netmask network\_mask gw gateway\_ip\_address*

**IPv6:**

**scope fabric-interconnect**

**scope ipv6-config**

**set out-of-band static ipv6** *ipv6\_address ipv6-prefix prefix\_length ipv6-gw gateway\_address*

**Example:**

**IPv4:**

```

firepower-3110# scope fabric-interconnect
firepower-3110 /fabric-interconnect # set out-of-band static ip 10.5.23.8 netmask
255.255.255.0 gw 10.5.23.1

```

**IPv6:**

```

firepower-3110# scope fabric-interconnect
firepower-3110 / fabric-interconnect # scope ipv6-config
firepower-3110 / fabric-interconnect /ipv6-config # set out-of-band static ipv6 2001:DB8::34
ipv6-prefix 64 ipv6-gw 2001:DB8::1

```

**Step 6** In the Security Cloud Control navigation pane, click **Inventory**, then click the blue plus button (  ) to **Onboard** a device.

**Step 7** Click the **FTD Chassis** tile to open the **Add Chassis** dialog box.

**Figure 98: FTD Chassis Tile**

**Figure 99: Add Chassis**

Add Chassis ×

ⓘ This operation is only supported on 3100, 4100 & 9300 chassis

Copy the CLI key below and paste it into the FXOS CLI of the chassis

```
create device-manager localhost hostname localhost nat-id PA5dsUm55M1pHVJjoGweXNEXWmjJzZi9
```

Paste the following string when prompted for the "Registration Key"

```
4tqmzu8Qs04Pk9IyQQPiGofgvhmrWRqb
```

Chassis name\*

Device Group

**Step 8** Click **Copy** (  ) to copy the top generated command, then paste it at the FXOS CLI of your chassis.

**Step 9** When prompted for the Registration Key at the FXOS CLI, click **Copy** (  ) on the **Add Chassis** dialog box for the generated registration key and paste it at the FXOS CLI.

You can disconnect from the FXOS CLI at this point.

**Step 10** In the cloud-delivered Firewall Management Center **Chassis Name** field, enter a name for the chassis as you want it to display in the management center.

**Step 11** (Optional) Add the chassis to a **Device Group**.

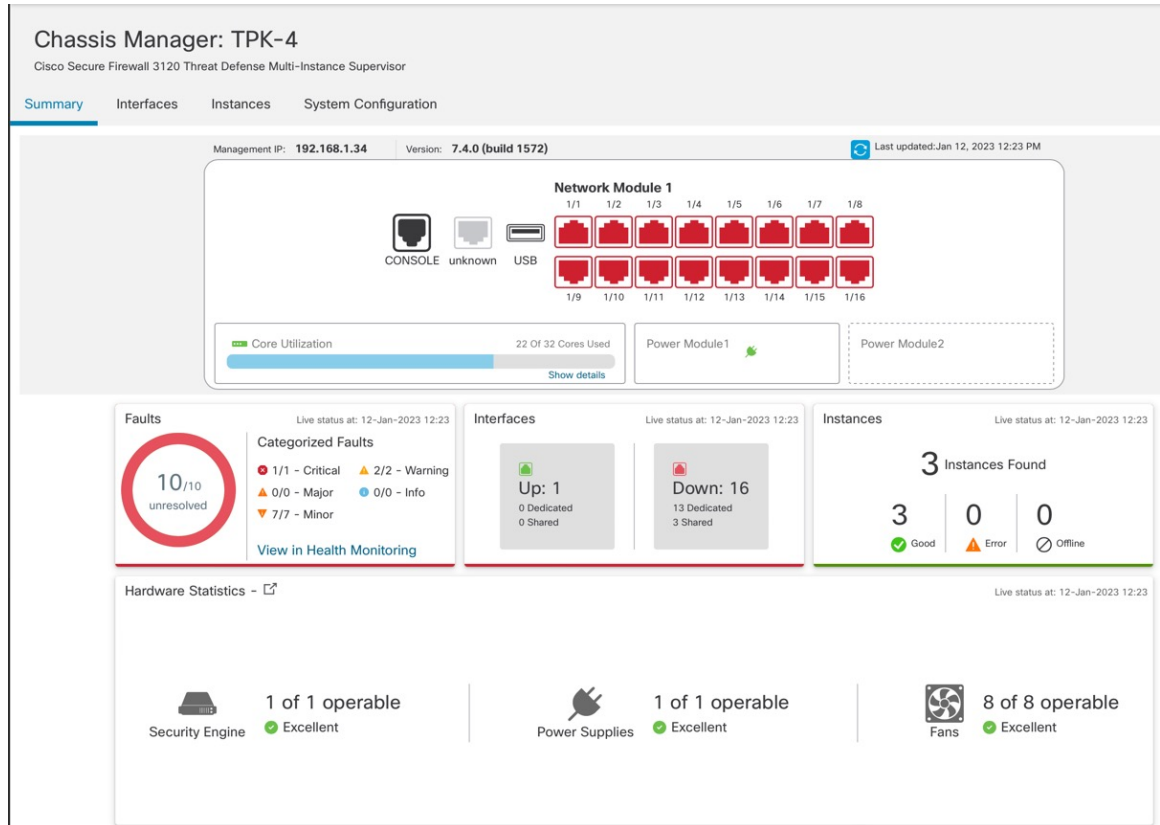

**Step 12** Click **Submit**.

The chassis is added to the **Device > Device Management** page.

**Step 13** To view and configure the chassis, click **Manage** in the **Chassis** column, or click **Edit** (  ).

The **Chassis Manager** page opens for the chassis to the **Summary** page.

Figure 100: Chassis Summary

## Configure Chassis Interfaces

At the chassis-level, you configure basic Ethernet settings of physical interfaces, VLAN subinterfaces for instances, and EtherChannel interfaces. By default, physical interfaces are disabled.

**Note** To configure breakout ports and perform other network module operations, see [Manage the Network Module for the Secure Firewall 3100/4200, on page 925](#).

**Note** For information about the **Sync Device** button, see [Sync Interface Changes with the Management Center, on page 922](#).

## Configure a Physical Interface

You can physically enable and disable interfaces, as well as set the interface speed and duplex and other hardware settings. To use an interface, it must be physically enabled for the chassis and logically enabled in

the instance. By default, physical interfaces are disabled. For VLAN subinterfaces, the admin state is inherited from the parent interface.

**Procedure**

**Step 1** From **Devices > Device Management**, click **Manage** in the **Chassis** column or click **Edit** (✎).

*Figure 101: Manage Chassis*

The **Chassis Manager** page opens for the chassis to the **Summary** page.

**Step 2** Click **Interfaces**.

*Figure 102: Interfaces*

Chassis Manager: TPK-4 Save Cancel

Cisco Secure Firewall 3120 Threat Defense Multi-Instance Supervisor

Summary Interfaces Instances System Configuration

**Network Module 1**

Sync Device Add

Interface Name	Port Type	Instances	VLAN ID	Admin Speed	Admin Duplex	Admin State	Auto Negotiation	Admin FEC	
Ethernet1/1	Data	instance2		1Gbps	Full	Enabled	No	Auto	✎
Ethernet1/2	Data	instance1		100Mbps	Half	Disabled	No	Auto	✎
Ethernet1/3	Data	instance1		100Mbps	Half	Disabled	No	Auto	✎
Ethernet1/4	Data			1Gbps	Full	Enabled	Yes	Auto	✎
Ethernet1/5	Data	instance2		1Gbps	Full	Disabled	No	Auto	✎
Ethernet1/6	Data Sharing	instance2		1Gbps	Full	Enabled	No	Auto	✎
Ethernet1/7	Data Sharing	instance2		1Gbps	Full	Enabled	No	Auto	✎
Ethernet1/8	Data Sharing			1Gbps	Full	Disabled	Yes	Auto	✎
Ethernet1/9	Data			Detect SFP	Full	Disabled	Yes	Auto	✎
Ethernet1/10	Data	instance3		10Gbps	Full	Enabled	Yes	Auto	✎
Ethernet1/11	Data	instance3		10Gbps	Full	Disabled	Yes	Auto	✎
Ethernet1/12	Data	instance3		10Gbps	Full	Disabled	Yes	Auto	✎
Ethernet1/13	Data	instance3		Detect SFP	Full	Disabled	Yes	Auto	✎
Ethernet1/14	Data			10Gbps	Full	Enabled	Yes	Auto	✎
Ethernet1/15	Data			10Gbps	Full	Disabled	Yes	cl108-rs	✎

**Step 3** Click **Edit** (✎) for the interface you want to edit.

*Figure 103: Edit Physical Interface*

**Step 4** Enable the interface by checking the **Enabled** check box.

**Step 5** For the **Port Type**, choose **Data** or **Data Sharing**.

*Figure 104: Port Type*

**Step 6** Set the **Admin Duplex**.

Speeds of 1Gbps and higher only support **Full** duplex. SFP interfaces only support **Full** duplex.

**Step 7** Set the **Admin Speed**.

For SFPs, Choose **Detect SFP** to detect the speed of the installed SFP module and use the appropriate speed. Duplex is always Full, and auto-negotiation is always enabled. This option is useful if you later change the network module to a different model, and want the speed to update automatically.

**Step 8** (Optional) Check **LLDP Transmit** and/or **LLDP Receive** to enable Link Layer Discovery Protocol (LLDP) packets.

**Step 9** (Optional) Check **Flow Control Send** to enable pause (XOFF) frames for flow control.

Flow control enables connected Ethernet ports to control traffic rates during congestion by allowing congested nodes to pause link operation at the other end. If the threat defense port experiences congestion (exhaustion

of queuing resources on the internal switch) and cannot receive any more traffic, it notifies the other port by sending a pause frame to stop sending until the condition clears. Upon receipt of a pause frame, the sending device stops sending any data packets, which prevents any loss of data packets during the congestion period.

**Note** The threat defense supports transmitting pause frames so that the remote peer can rate-control the traffic.

However, receiving of pause frames is not supported.

The internal switch has a global pool of 8000 buffers of 250 bytes each, and the switch allocates buffers dynamically to each port. A pause frame is sent out every interface with flow control enabled when the buffer usage exceeds the global high-water mark (2 MB (8000 buffers)); and a pause frame is sent out of a particular interface when its buffer exceeds the port high-water mark (.3125 MB (1250 buffers)). After a pause is sent, an XON frame can be sent when the buffer usage is reduced below the low-water mark (1.25 MB globally (5000 buffers); .25 MB per port (1000 buffers)). The link partner can resume traffic after receiving an XON frame.

Only flow control frames defined in 802.3x are supported. Priority-based flow control is not supported.

**Step 10** (Optional) Check **Auto Negotiation** to set the interface to negotiate the speed, link status, and flow control. You cannot edit this setting for speeds lower than 1Gbps. For SFP interfaces, you can only disable auto-negotiation when the speed is set to 1Gbps.

**Step 11** Click **Save** and then **Save** in the top right of the **Interfaces** page.

You can now **Deploy** the policy to the chassis. The changes are not active until you deploy them.

---

## Configure an EtherChannel

An EtherChannel (also known as a port channel) can include up to 8 member interfaces of the same media type and capacity, and must be set to the same speed and duplex. The media type can be either RJ-45 or SFP; SFPs of different types (copper and fiber) can be mixed. You cannot mix interface capacities (for example 1GB and 10GB interfaces) by setting the speed to be lower on the larger-capacity interface, unless you set the speed to **Detect SFP**; in this case, you can use different interface capacities, and the lowest common speed is used.

The Link Aggregation Control Protocol (LACP) aggregates interfaces by exchanging the Link Aggregation Control Protocol Data Units (LACPDU) between two network devices. LACP coordinates the automatic addition and deletion of links to the EtherChannel without user intervention. It also handles misconfigurations and checks that both ends of member interfaces are connected to the correct channel group. “On” mode cannot use standby interfaces in the channel group when an interface goes down, and the connectivity and configurations are not checked.

When the chassis creates an EtherChannel, the EtherChannel stays in a **Suspended** state for Active LACP mode or a **Down** state for On LACP mode until you assign it to a logical device, even if the physical link is up. The EtherChannel will be brought out of this **Suspended** state when it is added to an instance.

### Before you begin

Enable physical interfaces and set hardware parameters. See [Configure a Physical Interface](#), on page 566.

## Procedure

**Step 1** From **Devices > Device Management**, click **Manage** in the **Chassis** column or click **Edit** (✎).

**Figure 105: Manage Chassis**

The **Chassis Manager** page opens for the chassis to the **Summary** page.

**Step 2** Click **Interfaces**.

**Figure 106: Interfaces**

The screenshot shows the 'Chassis Manager: TPK-4' page. The 'Interfaces' tab is selected. At the top right, there are 'Save' and 'Cancel' buttons. Below the title, there are tabs for 'Summary', 'Interfaces', 'Instances', and 'System Configuration'. The 'Interfaces' tab is active. In the center, there is a diagram of 'Network Module 1' showing 16 Ethernet ports (1/1 to 1/16) and other ports like CONSOLE, unknown, and USB. Below the diagram is a search bar 'Search Interfaces' and 'Sync Device' and 'Add' buttons. The main part of the page is a table of interfaces.

Interface Name	Port Type	Instances	VLAN ID	Admin Speed	Admin Duplex	Admin State	Auto Negotiation	Admin FEC	
Ethernet1/1	Data	instance2		1Gbps	Full	Enabled	No	Auto	✎
Ethernet1/2	Data	instance1		100Mbps	Half	Disabled	No	Auto	✎
Ethernet1/3	Data	instance1		100Mbps	Half	Disabled	No	Auto	✎
Ethernet1/4	Data			1Gbps	Full	Enabled	Yes	Auto	✎
Ethernet1/5	Data	instance2		1Gbps	Full	Disabled	No	Auto	✎
Ethernet1/6	Data Sharing	instance2		1Gbps	Full	Enabled	No	Auto	✎
Ethernet1/7	Data Sharing	instance2		1Gbps	Full	Enabled	No	Auto	✎
Ethernet1/8	Data Sharing			1Gbps	Full	Disabled	Yes	Auto	✎
Ethernet1/9	Data			Detect SFP	Full	Disabled	Yes	Auto	✎
Ethernet1/10	Data	instance3		10Gbps	Full	Enabled	Yes	Auto	✎
Ethernet1/11	Data	instance3		10Gbps	Full	Disabled	Yes	Auto	✎
Ethernet1/12	Data	instance3		10Gbps	Full	Disabled	Yes	Auto	✎
Ethernet1/13	Data	instance3		Detect SFP	Full	Disabled	Yes	Auto	✎
Ethernet1/14	Data			10Gbps	Full	Enabled	Yes	Auto	✎
Ethernet1/15	Data			10Gbps	Full	Disabled	Yes	cl108-rs	✎

**Step 3** Click **Add > EtherChannel Interface**.

Figure 107: Add EtherChannel

**Step 4** Set the following **Interfaces** parameters.

Figure 108: Interfaces Settings

 A screenshot of the 'Add EtherChannel Interface' configuration page. The page has two tabs: 'Interfaces' (active) and 'Configuration'. Under 'Interfaces', there is a text input for 'EtherChannel ID: (1-48)' containing the number '1', a checked 'Enabled' checkbox, and a dropdown for 'Port Type' set to 'Data'. Below this is a section for selecting member interfaces. On the left, 'Available Interfaces (14)' lists Ethernet1/1 through Ethernet1/10, each with a plus icon. On the right, 'Selected Interfaces (2)' lists Ethernet1/4 and Ethernet1/5, each with a trash icon. Double arrow buttons (>> and <<) are between the lists. At the bottom are 'Cancel' and 'Save' buttons.

- For the **EtherChannel ID**, specify an ID between 1 and 48.
- Check **Enabled**.
- For the **Port Type**, choose **Data** or **Data Shared**.

For information about the port type, see [Interface Types, on page 546](#).

- To add a physical interface to the EtherChannel, select click **Add (+)** in the **Available Interfaces** list to move it to the **Selected Interfaces** list.

To add or remove all interfaces, click the double arrow button.

**Note** You cannot add an interface that is already assigned to an instance.

**Step 5** (Optional) Set the following **Configuration** parameters.

Many of these settings (excluding the LACP settings) set the requirements for interfaces to be included in the EtherChannel; they do not override the settings of member interfaces. So if you check **LLDP Transmit**, for example, you should only add interfaces that have that setting. If you set the **Admin Speed** to 1Gbps, then only 1Gbps interfaces can be included.

**Figure 109: Configuration Settings**

The screenshot shows a web interface for configuring an EtherChannel. The title is "Add EtherChannel Interface". There are two tabs: "Interfaces" and "Configuration", with "Configuration" being the active tab. The settings are as follows:

- Admin Duplex:** A dropdown menu set to "Full".
- Admin Speed:** A dropdown menu set to "1Gbps".
- LACP Mode:** A dropdown menu set to "Active".
- LACP Rate:** A dropdown menu set to "Default".
- Auto Negotiation:** A checked checkbox.
- LLDP Transmit:** An unchecked checkbox.
- LLDP Receive:** A checked checkbox.
- Flow Control Send:** An unchecked checkbox.

At the bottom of the form, there are two buttons: "Cancel" and "Save".

- Choose the required **Admin Duplex** for the member interfaces, **Full Duplex** or **Half Duplex**.  
If you add a member interface that is configured with the specified duplex, it will not successfully join the port channel.
- Choose the required **Admin Speed** for the member interfaces from the drop-down list.  
If you add a member interface that is not at the specified speed, it will not successfully join the port channel.
- Choose the **LACP Mode**, **Active** or **On**.
  - **Active**—Sends and receives LACP updates. An active EtherChannel can establish connectivity with either an active or a passive EtherChannel. You should use the active mode unless you need to minimize the amount of LACP traffic.
  - **On**—The EtherChannel is always on, and LACP is not used. An “on” EtherChannel can only establish a connection with another “on” EtherChannel.

**Note** It may take up to three minutes for an EtherChannel to come up to an operational state if you change its mode from On to Active or from Active to On.
- Choose the **LACP Rate**, **Default**, **Fast**, or **Normal**.

The default is **Fast**.

- e) Choose the required Link Layer Discovery Protocol (LLDP) settings for member interfaces by checking **LLDP Transmit** and/or **LLDP Receive**.
- f) Check the required **Flow Control Send** setting for member interfaces.

**Step 6** Click **Save** and then **Save** in the top right of the **Interfaces** page.

You can now **Deploy** the policy to the chassis. The changes are not active until you deploy them.

---

## Configure a Subinterface

You can add up to 500 subinterfaces to your chassis.

VLAN IDs per interface must be unique, and within an instance, VLAN IDs must be unique across all assigned interfaces. You can reuse VLAN IDs on *separate* interfaces as long as they are assigned to different instances. However, each subinterface still counts towards the limit even though it uses the same ID.

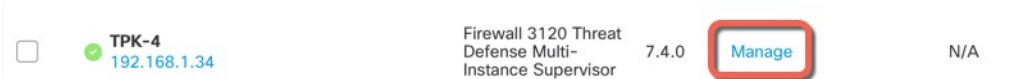

This section discusses *FXOS* VLAN subinterfaces only. You can separately create subinterfaces within the instance. See [Chassis Interfaces vs. Instance Interfaces](#), on page 547.

### Procedure

```

- **IPv4, IPv6, or Both**—Set a **Management IP** address on the same network as the chassis Management interface. Set the **Network Mask** and gateway (likely the same gateway as the chassis). The chassis Management interface is shared with each instance, and each instance has its own IP address on the network. You can SSH to this IP address by default to reach the threat defense CLI.
- (Optional) **FQDN**
- **Firewall Mode**—**Routed** or **Transparent**. For more information about the firewall mode, see [Transparent or Routed Firewall Mode, on page 491](#).
- **DNS Servers**—Enter a comma-separated list of DNS servers for management traffic only.
- (Optional) **Permit Expert Mode for CLI**—Expert Mode provides threat defense shell access for advanced troubleshooting.

If you enable this option, then users who access the instance directly from an SSH session can enter Expert Mode. If you disable this option, then only users who access the instance from the FXOS CLI can enter Expert Mode. We recommend disabling this option to increase isolation between instances.

Use Expert Mode only if a documented procedure tells you it is required, or if the Cisco Technical Assistance Center asks you to use it. To enter this mode, use the **expert** command in the threat defense CLI.

- **Resource Profile**—The resource profile sets the number of CPU cores; RAM is dynamically allocated according to the number of cores, and disk space is set to 40 GB per instance. The chassis includes the following default resource profiles: Default-Small, Default-Medium, and Default-Large. You can add additional profiles for this chassis by clicking **Add (+)**. You cannot later edit the resource profile.

**Figure 118: Add Resource Profile**

Add resource profile

Name\*

silver

(Set the name of the profile between 1 and 64 characters.)

Description

Number of Cores\*

24

Assign an even number of cores, 6 to 100.

Cancel Add

- The minimum number of cores is 6.

**Note** Instances with a smaller number of cores might experience relatively higher CPU utilization than those with larger numbers of cores. Instances with a smaller number of cores are more sensitive to traffic load changes. If you experience traffic drops, try assigning more cores.

- You can assign cores as an even number (6, 8, 10, 12, 14 etc.) up to the maximum.
- The maximum number of cores available depends on the model; see [Requirements and Prerequisites for Instances, on page 558](#).

If you later assign a different resource profile, then the instance will reload, which can take approximately 5 minutes. Note that for an established High Availability pair, if you assign a different-sized resource profile, be sure to make all members the same size as soon as possible.

- **Device SSH Password**—Set the threat defense admin user password for CLI access, either SSH or console. Repeat the password in the **Confirm Password** field.

**Step 5** On **Interface Assignment**, assign the chassis interfaces to the instance, then click **Next**.

*Figure 119: Interface Assignment*

Shared interfaces show the sharing icon (🔗).

**Step 6** On **Device Management**, set the device-specific settings, then click **Next**.

*Figure 120: Device Management*

The screenshot shows the 'Add Instance' wizard window. At the top, there is a progress bar with five steps: 1 Agreement, 2 Instance Configuration, 3 Interface Assignment, 4 Device Management (highlighted in blue), and 5 Summary. Below the progress bar, the settings for the 'Device Management' step are displayed:

- Device Group:** A dropdown menu with an 'X' and a downward arrow.
- Access Control Policy\*:** A dropdown menu showing 'inside-outside' with a '+' sign to the right.
- Platform Settings:** A dropdown menu showing 'instance-settings' with an 'X' and a downward arrow, and a '+' sign to the right.
- Smart Licensing:** Three checkboxes, all of which are checked:
  - Malware
  - Threat
  - URL Filter

At the bottom right of the window, there are three buttons: 'Cancel', 'Back', and 'Next' (highlighted in blue).

- **Device Group**
- **Access Control Policy**—Choose an existing access control policy, or create a new policy.
- **Platform Settings**—Choose an existing platform setting policy, or create a new policy.
- **Smart Licensing**

**Step 7** On **Summary**, confirm your settings, then click **Save**.

Figure 121: Summary

Add Instance

1 Agreement — 2 Instance Configuration — 3 Interface Assignment — 4 Device Management — 5 Summary

Instance Configuration		Device Management - This info is required only during instance creation.	
Name:	instance4	Auto registration:	true
Version:	7.4.0.1572	Access Policy:	inside-outside
Resource Profile:	Default-Small	Device Group:	instance-settings
IP:	192.168.1.38	Platform Policy:	instance-settings
Mask:	255.255.255.0	Licenses:	MALWARE,THREAT,URLFilter
Gateway:	192.168.1.254		
Mode:	routed		
Password:	*****		
FQDN:	cisco-fw-4.cisco.com		
Expert Mode:	enabled		

Interface Assignment - 2 dedicated and 1 shared interfaces attached [Show All](#)

Cancel Back Save

You can edit any settings on this screen before saving the instance. After you save, the instance is added to the **Instances** screen.

**Step 8** On the **Instances** screen, click **Save**.

**Step 9** Deploy the chassis configuration.

**Step 10** Manually add the instance to Security Cloud Control as an FTD.

a) Add the instance **Using a CLI Registration Key**. See [Onboard a Device with a CLI Registration Key, on page 30](#).

For the **Device Name**, you can use the instance name that you specified or any other name.

b) Access the chassis CLI and connect to the instance CLI. See [Log Into the Command Line Interface on the Device, on page 49](#).

**connect ftd name**

c) Delete the current manager; this manager needs to be deleted and reconfigured.

**configure manager delete**

d) Paste the generated **configure manager add** command from Security Cloud Control.

# Customize the System Configuration

You can configure chassis-level settings such as SNMP. You can also import or export the chassis FXOS configuration.

## Configure SNMP

You can access chassis-level MIBs through the data interface of one of the instances, which you specify in the chassis system configuration. You can only use this instance for chassis SNMP information. You cannot access SNMP through the chassis Management interface.

### Before you begin

Configure SNMP for one of the instances. See [SNMP, on page 1092](#).

### Procedure

**Step 1** From **Devices > Device Management**, click **Manage** in the **Chassis** column or click **Edit** (✎).

Figure 122: Manage Chassis

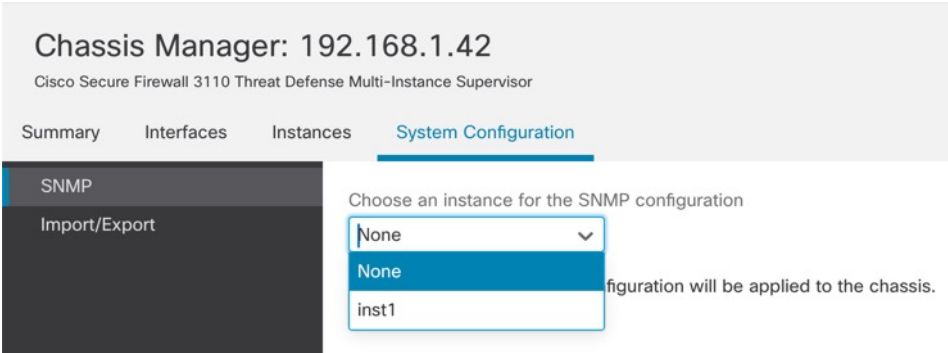

The **Chassis Manager** page opens for the chassis to the **Summary** page.

**Step 2** Click **System Configuration**.

**Step 3** Click **SNMP**, and choose the instance from the drop-down list.

Figure 123: SNMP

SNMP on the chassis will be accessible from the selected instance.

**Step 4** Click **Save**.

**Step 5** Deploy the chassis configuration.

## Import or Export the Chassis Configuration

You can use the configuration export feature to export an XML file containing chassis configuration settings to your local computer. You can later import that configuration file to quickly apply the configuration settings to your chassis to return to a known good configuration or to recover from a system failure. You can also import the chassis configuration to a new chassis, for example for an RMA, as long as the prerequisites are met.

When exporting, only chassis configurations are exported; instance configuration settings are not exported. Instances need to be backed up separately using the device backup/restore feature.

When importing, all existing configurations on the chassis will be replaced by the configuration in the import file.

### Before you begin

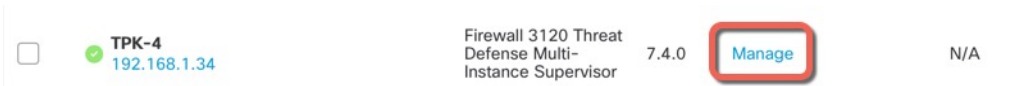

For the chassis where you want to import a configuration, the following characteristics must match:

- Same chassis software version
- Same threat defense instance images
- Same network modules

### Procedure

**Step 1** From **Devices > Device Management**, click **Manage** in the **Chassis** column or click **Edit** (✎).

*Figure 124: Manage Chassis*

<input type="checkbox"/>	<input checked="" type="checkbox"/> TPK-4 192.168.1.34	Firewall 3120 Threat Defense Multi- Instance Supervisor	7.4.0	<b>Manage</b>	N/A
--------------------------	---	---	-------	---------------	-----

The **Chassis Manager** page opens for the chassis to the **Summary** page.

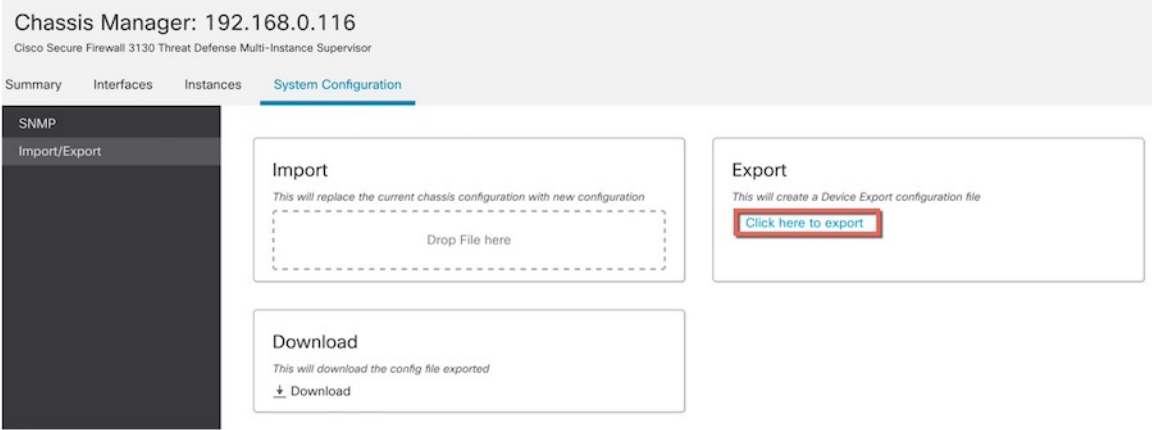

**Step 2** Click **System Configuration**.

**Step 3** Click **Import/Export**.

**Step 4** To export the configuration, follow these steps.

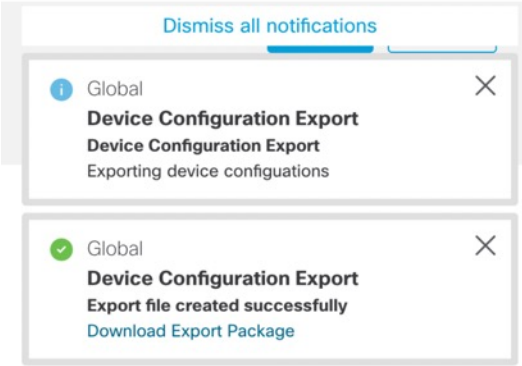

- a) In the **Export** area, click **Click here to export**.

Figure 125: Create Export File

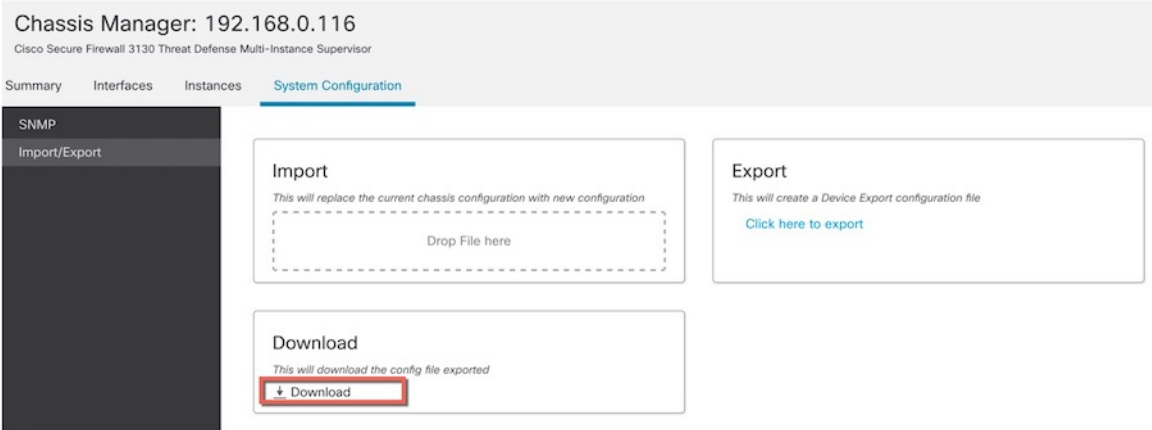

b) Monitor the notifications for the **Export file created successfully** message.

Figure 126: Export File Created Successfully

c) Download the export file by clicking the notification message (**Download Export Package**) or by clicking **Download**.

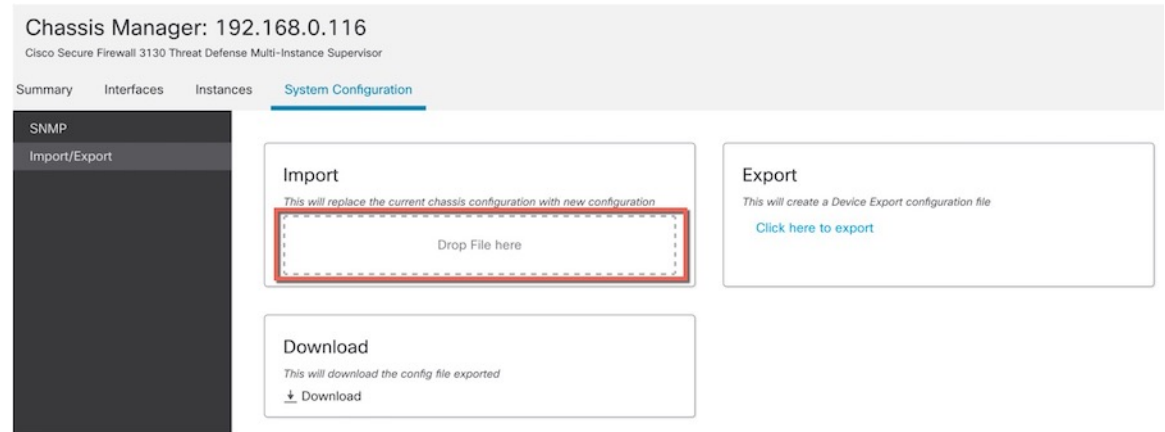

Figure 127: Download

The file is saved with the **.sfo** extension.

**Step 5** To import a configuration, drag the **.sfo** file on the **Import > Drop File here** area.

**Figure 128: Import**

## Configure Chassis Platform Settings

Chassis platform settings configure a range of features for managing the chassis. You can share the policy among multiple chassis. If you want different settings per chassis, you must create multiple policies.

### Create a Chassis Platform Settings Policy

Use the **Platform Settings** page (**Devices > Platform Settings**) to manage platform settings policies. This page indicates the type of device for each policy. The **Status** column shows the device targets for the policy.

#### Procedure

**Step 1** Choose **Devices > Platform Settings**.

**Step 2** For an existing policy, you can **Copy** (📄), **Edit** (✎), or **Delete** (🗑️) the policy.

**Caution** You should not delete a policy that is the last-deployed policy on any of its target devices, even if it is out of date. Before you delete the policy completely, it is good practice to deploy a different policy to those targets.

**Step 3** To create a new policy, click **New Policy**.

- Choose **Chassis Platform Settings** from the drop-down list.
- Enter a **Name** for the new policy and optionally, a **Description**.
- Optionally, choose the **Available Chassis** where you want to apply the policy and click **Add** (or drag and drop) to add the selected chassis. You can enter a search string in the **Search** field to narrow the list of chassis.
- Click **Save**.

The system creates the policy and opens it for editing.

- Step 4** To change the target chassis for a policy, click **Edit** (✎) next to the platform settings policy that you want to edit.
- Click **Policy Assignment**.
  - To assign a chassis to the policy, select it in the **Available Chassis** list and click **Add**. You can also drag and drop.
  - To remove a chassis assignment, click **Delete** (🗑) next to a chassis in the **Selected Chassis** list.
  - Click **OK**.

## Configure DNS

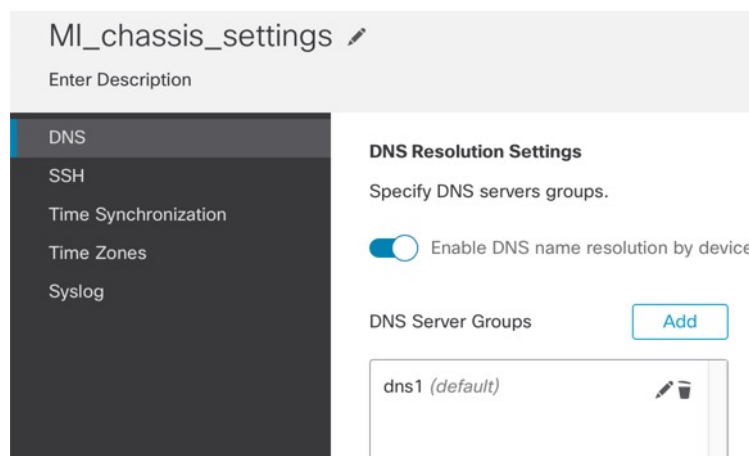

You need to specify a DNS server if the chassis requires resolution of hostnames to IP addresses. These chassis DNS settings are separate from the DNS settings per instance, which are configured in the device platform settings.

When you configure multiple DNS servers, the chassis uses servers in a random order. You can configure up to four servers across four DNS server groups. For example, you can configure a single server group with four servers, or you can configure four server groups with one server each.

### Procedure

- Step 1** Choose **Devices > Platform Settings** and create or edit the chassis policy.
- Step 2** Choose **DNS**.

*Figure 129: DNS*

- Step 3** Enable the **Enable DNS name resolution by device** slider.
- Step 4** Click **Add** to add a DNS server group.

Figure 130: Add DNS Server Group

- Step 5** Either select an existing DNS server group (see [Creating DNS Server Group Objects, on page 1482](#)), or click **(+)** **New Group**.

If you add a new group, you see the following dialog box. Provide a name and up to four DNS server IP addresses as comma-separated values, and click **Add**.

Figure 131: New DNS Server Group Object

- Step 6** Click **Save** to add the DNS server to the list.
- Step 7** Repeat these steps to add additional server groups.  
Make sure you only identify a maximum of four DNS servers in all groups combined.
- Step 8** Click **Save** to save all policy changes.

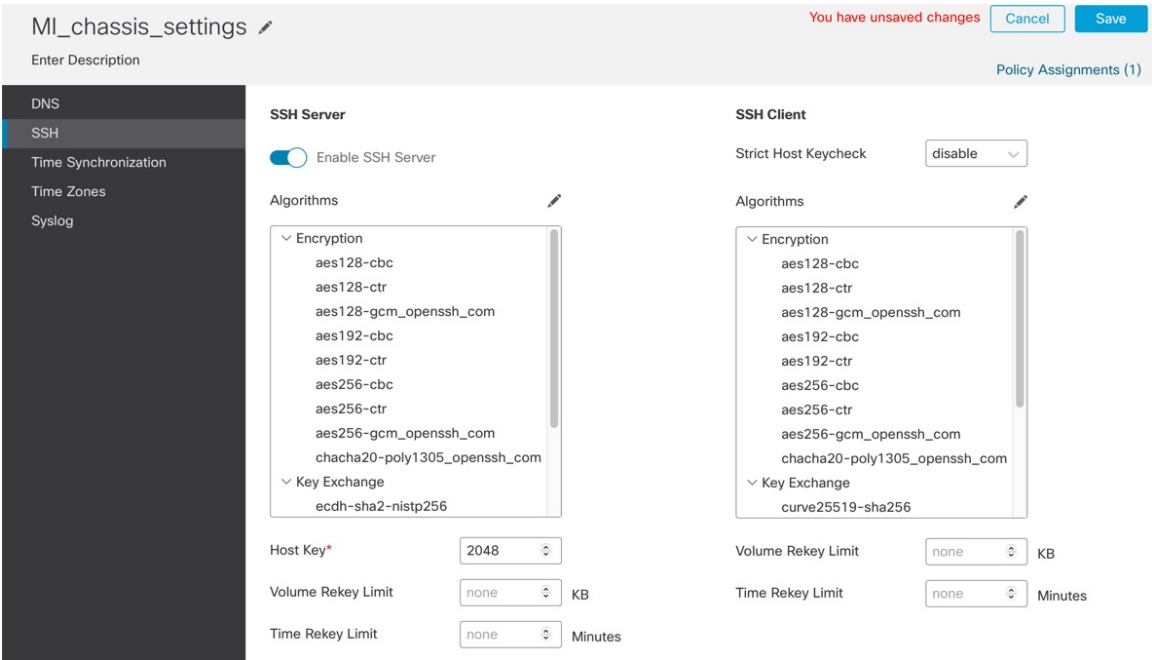

## Configure SSH and SSH Access List

To allow SSH sessions from the admin user to the chassis on the Management interface, enable the SSH server and configure the allowed networks.

Procedure

- Step 1** Choose **Devices > Platform Settings** and create or edit the chassis policy.
- Step 2** Choose **SSH**.
- Step 3** To enable SSH access to the chassis, enable the **Enable SSH Server** slider.

Figure 132: SSH

- Step 4** To set the allowed **Algorithms**, click **Edit** (✎).

Figure 133: Add Algorithms

- a) Select the **Encryption** algorithms.
- b) Select the **Key Exchange** algorithms.

The key exchange provides a shared secret that cannot be determined by either party alone. The key exchange is combined with a signature and the host key to provide host authentication. This key-exchange method provides explicit server authentication.

- c) Select the **Mac** integrity algorithms.

**Step 5** For **Host Key**, enter the modulus size for the RSA key pairs.

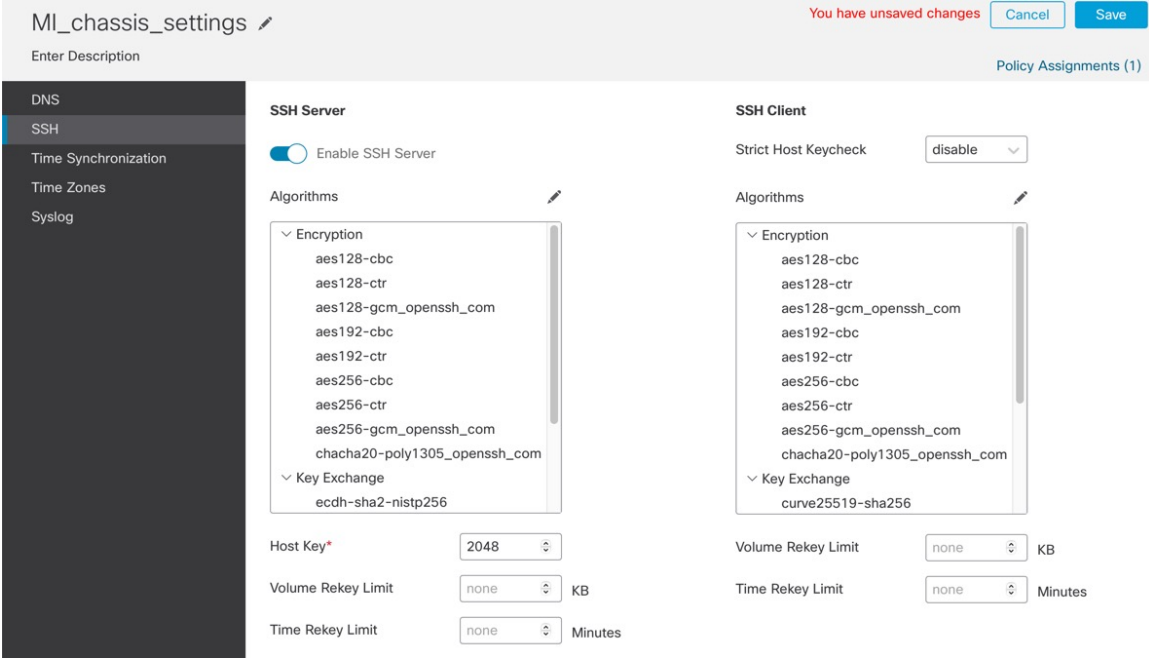

The modulus value (in bits) is in multiples of 8 from 1024 to 2048. The larger the key modulus size you specify, the longer it takes to generate an RSA key pair. We recommend a value of 2048.

**Step 6** For the server **Volume Rekey Limit**, set the amount of traffic in KB allowed over the connection before FXOS disconnects from the session.

**Step 7** For the server **Time Rekey Limit**, set the minutes for how long an SSH session can be idle before FXOS disconnects the session.

**Step 8** For the **SSH Client**, configure the following settings.

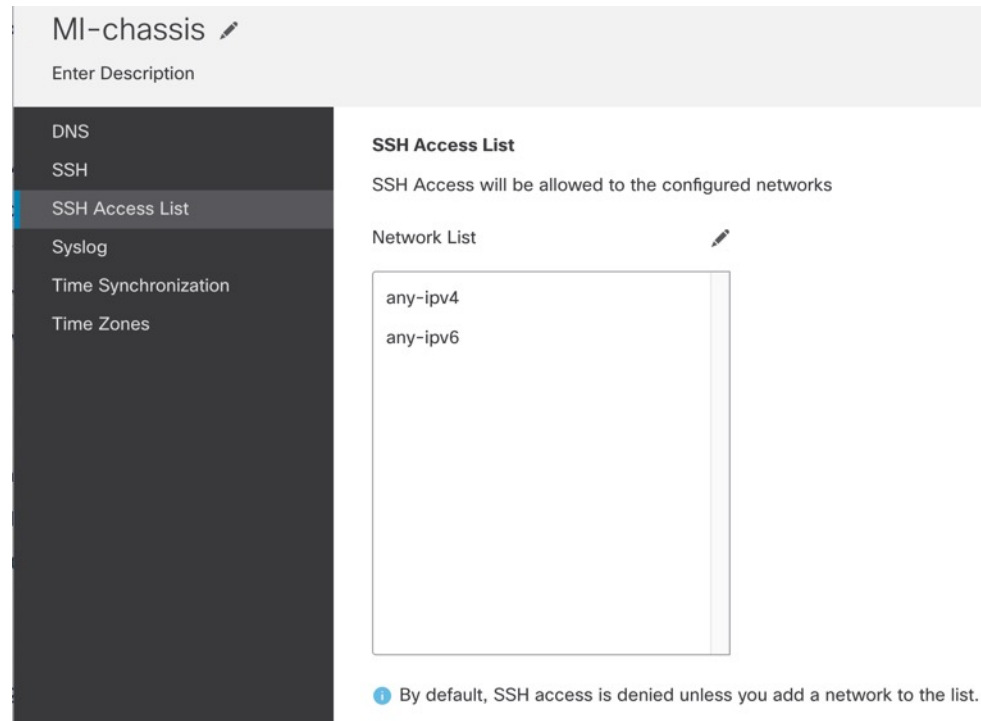

Figure 134: SSH

- **Strict Host Keycheck**—Choose **enable**, **disable**, or **prompt** to control SSH host key checking.
  - **enable**—The connection is rejected if the host key is not already in the FXOS known hosts file. You must manually add hosts at the FXOS CLI using the **enter ssh-host** command in the system/services scope.
  - **prompt**—You are prompted to accept or reject the host key if it is not already stored on the chassis.
  - **disable**—(The default) The chassis accepts the host key automatically if it was not stored before.
- **Algorithms**—Click **Edit** (✎) and select the **Encryption**, **Key Exchange**, and **Mac** algorithms.
- **Volume Rekey Limit**—Set the amount of traffic in KB allowed over the connection before FXOS disconnects from the session.
- **Time Rekey Limit**—Set the minutes for how long an SSH session can be idle before FXOS disconnects the session.

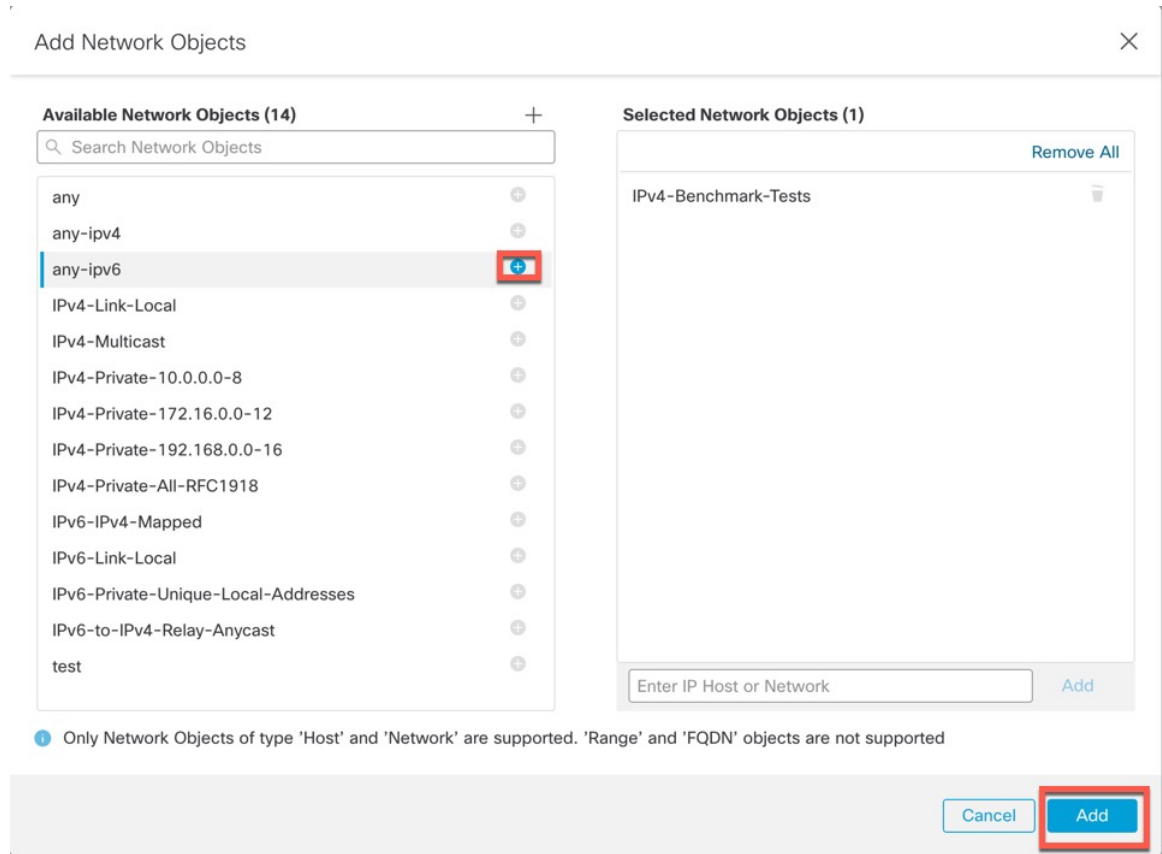

**Step 9** Choose **SSH Access List**. You need to allow access to IP addresses or networks before you can use SSH.

**Figure 135: SSH Access List**

**Step 10** Click **Edit** (✎) to add network objects and click **Save**. You can also manually enter IP addresses.

Figure 136: Network Objects

**Step 11** Click **Save** to save all policy changes.

## Configure Syslog

You can enable syslogs from the chassis. These syslogs come from the chassis' FXOS operating system.

### Procedure

- Step 1** Choose **Devices > Platform Settings** and create or edit the chassis policy.
- Step 2** Choose **Syslog**.
- Step 3** Click the **Local Destinations** tab, and complete the following fields.

Figure 137: Syslog Local Destinations

Facility:

By sending syslog messages to a remote destination, you can archive messages according to the available disk space on the external syslog server, and manipulate logging data after it is saved. For example, you could specify actions to be executed when certain types of syslog messages are logged, extract data from the log and save the records to another file for reporting, or track statistics using a site-specific script.

Name	Description
<b>Admin State</b> field	Check the <b>Enable</b> check box if you want to have syslog messages stored in a remote log file.

**Step 5** Click the **Local Sources** tab, and complete the following fields.

Figure 139: Syslog Local Sources

Name	Description
Faults > Enable Admin State	Enable system fault logging.
Audits > Enable Admin State	Enable audit logging.
Events > Enable Admin State	Enable system event logging.

**Step 6** Click **Save** to save all policy changes.

## Configure Time Synchronization

NTP is used to implement a hierarchical system of servers that provide a precisely synchronized time among network systems. This kind of accuracy is required for time-sensitive operations, such as validating CRLs, which include a precise time stamp. You can configure up to four NTP servers.

- Note**
- FXOS uses NTP version 3.
  - If the stratum value of an external NTP server is 13 or greater, the application instance cannot sync to the NTP server on the FXOS chassis. Each time a NTP client syncs to a NTP server, the stratum value increases by one.
- If you have set up your own NTP server, you can find its stratum value in the /etc/ntp.conf file on the server. If the NTP server has stratum value of 13 or greater you can either change the stratum value in the ntp.conf file and restart the server, or use a different NTP server (for example: pool.ntp.org).

### Before you begin

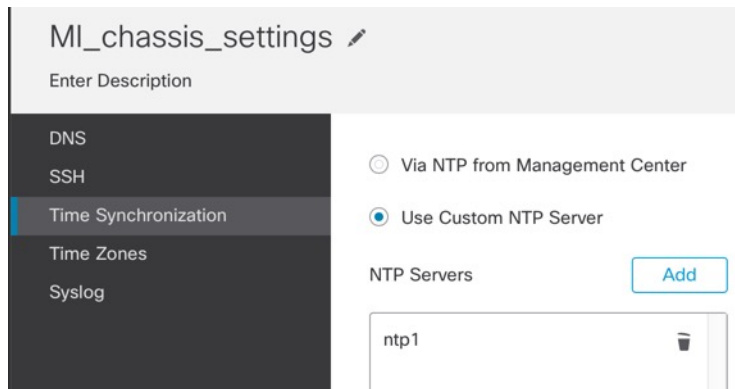

If you use a hostname for the NTP server, you must configure a DNS server. See [Configure DNS, on page 586](#).

## Procedure

**Step 1** Choose **Devices > Platform Settings** and create or edit the chassis policy.

**Step 2** Choose **Time Synchronization**.

*Figure 140: Time Synchronization*

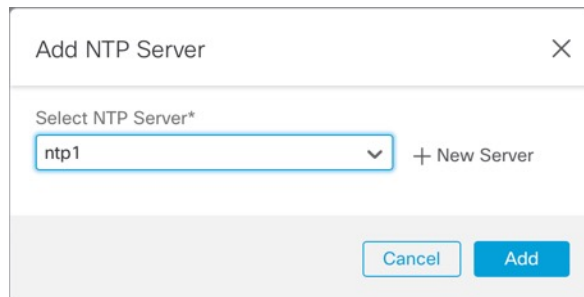

**Step 3** If you want to obtain the time from the management center, click **Via NTP from Management Center**. This option ensures both the chassis and the management center have the same time.

**Step 4** To use an external NTP server, click **Use Custom NTP Server**.

a) Click **Add** to add a server.

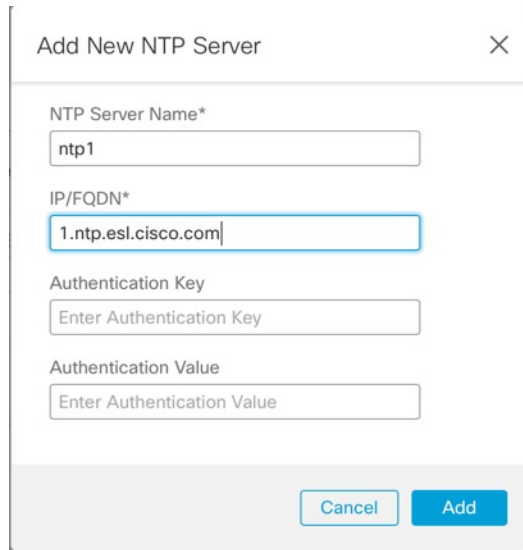

*Figure 141: Add NTP Server*

b) Choose any already-defined servers from the drop-down menu and click **Add**, or click **+ New Server** to add a new server.

Figure 142: Add New NTP Server

The screenshot shows a dialog box titled "Add New NTP Server" with a close button (X) in the top right corner. The dialog contains the following fields and values:

- NTP Server Name\*: ntp1
- IP/FQDN\*: 1.ntp.esl.cisco.com
- Authentication Key: Enter Authentication Key
- Authentication Value: Enter Authentication Value

At the bottom of the dialog, there are two buttons: "Cancel" and "Add".

c) For a new server, enter the following fields, and click **Add**.

- **NTP Server Name**—A name to identify this server.
- **IP/FQDN**—The IP address or hostname of the server.
- **Authentication Key** and **Authentication Value**—Obtain the key ID and value from the NTP server. For example, to generate the SHA1 key on NTP server Version 4.2.8p8 or later with OpenSSL installed, enter the **ntp-keygen -M** command, and then view the key ID and value in the ntp.keys file. The key is used to tell both the client and server which value to use when computing the message digest.

Only SHA1 is supported for NTP server authentication.

**Step 5** Click **Save** to save all policy changes.

---

## Configure Time Zones

Set the time zone for the chassis.

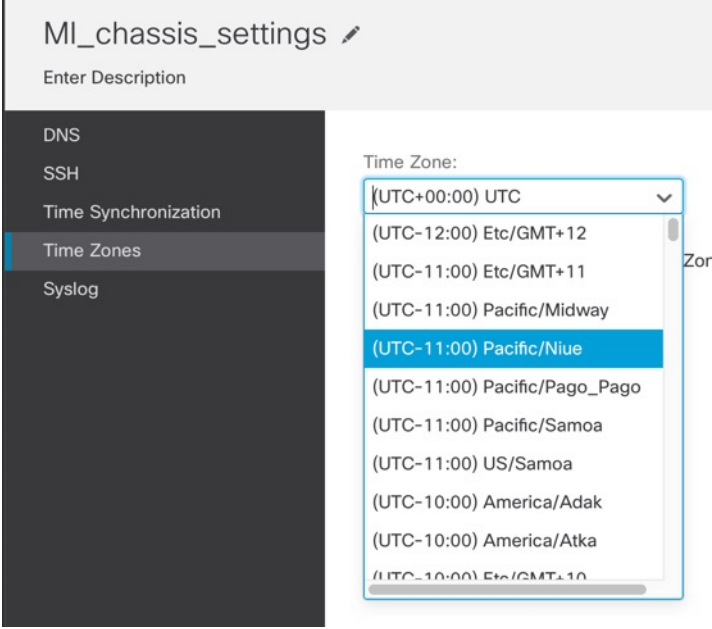

### Procedure

---

**Step 1** Choose **Devices > Platform Settings** and create or edit the chassis policy.

**Step 2** Choose **Time Zones**.

Figure 143: Time Zones

- Step 3** Choose your **Time Zone** from the drop-down menu.
- Step 4** Click **Save** to save all policy changes.

## Manage Multi-Instance Mode

This section describes less common tasks, including changing settings at the FXOS CLI or changing interfaces assigned to the chassis.

### Change Interfaces Assigned to an Instance

You can allocate or unallocate an interface on the instance. Adding a new interface, or deleting an unused interface, has minimal impact on the instance configuration. You can also edit the membership of an allocated EtherChannel without affecting the instance. However, deleting an interface that is used in your security policy will impact the configuration.

Interfaces can be referenced directly in many places in the instance configuration, including access rules, NAT, SSL, identity rules, VPN, DHCP server, and so on. Deleting an interface will delete any configuration associated with that interface.

Policies that refer to security zones are not affected.

**Note** For high availability, you need to make the same interface changes for the other unit. Otherwise, high availability might not operate correctly.

**Before you begin**

- Configure your interfaces according to [Configure Instances, on page 562](#).
- If you want to add an already-allocated interface to an EtherChannel, you need to unallocate the interface from the instance first, then add the interface to the EtherChannel. For a new EtherChannel, you can then allocate the EtherChannel to the instance.

**Procedure**

**Step 1** From **Devices > Device Management**, click **Manage** in the **Chassis** column or click **Edit** (✎).

**Figure 144: Manage Chassis**

<input type="checkbox"/>	<span style="color: green;">●</span> <b>TPK-4</b> 192.168.1.34	Firewall 3120 Threat Defense Multi- Instance Supervisor	7.4.0	<b>Manage</b>	N/A
--------------------------	---	---	-------	---------------	-----

The **Chassis Manager** page opens for the chassis to the **Summary** page.

**Step 2** Click **Instances**, and click **Edit** (✎) next to the instance for which you want to change interfaces.

**Figure 145: Instances**

**Step 3** Click **Next** until you get to the **Interface Assignment** screen.

Figure 146: Interface Assignment

Shared interfaces show the sharing icon ()

- Step 4** Make your interface changes, and then click **Next**.
- Step 5** Click **Save** on the **Summary** screen.
- Step 6** For high availability, you need to make the same interface changes for the other unit. Otherwise, high availability might not operate correctly.

## Change Chassis Management Settings at the FXOS CLI

If you want to change the chassis management interface IP address and gateway, change the management center to a new manager, change the admin password, or disable multi-instance mode, you can do so from the FXOS CLI.

### Procedure

- Step 1** Connect to the chassis console port.

The console port connects to the FXOS CLI.

**Note** We recommend using the console port. You can also connect using SSH to the management interface, if configured in the chassis platform settings in the management center; however, if you change the management IP address, you will be disconnected.

**Step 2** Log in with the username **admin** and the password you set during initial setup.

**Step 3** Change the Management IP address. You can use a static IPv4 and/or IPv6 address.

**IPv4:**

**scope fabric-interconnect**

**set out-of-band static ip** *ip\_address* **netmask** *network\_mask* **gw** *gateway\_ip\_address*

**IPv6:**

**scope fabric-interconnect**

**scope ipv6-config**

**set out-of-band static ipv6** *ipv6\_address* **ipv6-prefix** *prefix\_length* **ipv6-gw** *gateway\_address*

**Example:**

**IPv4:**

```
firepower-3110# scope fabric-interconnect
firepower-3110 /fabric-interconnect # set out-of-band static ip 10.5.23.8 netmask
255.255.255.0
gw 10.5.23.1
```

**IPv6:**

```
firepower-3110# scope fabric-interconnect
firepower-3110 / fabric-interconnect # scope ipv6-config
firepower-3110 / fabric-interconnect /ipv6-config # set out-of-band static ipv6 2001:DB8::34
ipv6-prefix 64 ipv6-gw 2001:DB8::1
```

**Step 4** Change the management center.

You should first unregister the chassis from the current management center.

**enter device-manager** *manager\_name* [**hostname** {*hostname* | *ipv4\_address* | *ipv6\_address*}] [**nat-id** *nat\_id*]

You are prompted for the registration key.

You can enter this command from any scope.

- **hostname** {*hostname* | *ipv4\_address* | *ipv6\_address*}—Specifies either the FQDN or IP address of the management center. At least one of the devices, either the management center or the chassis, must have a reachable IP address to establish the two-way, TLS-1.3-encrypted communication channel between the two devices. If you do not specify a **hostname**, then the chassis must have a reachable IP address or hostname and you must specify the **nat-id**.
- **nat-id** *nat\_id*—Specifies a unique, one-time string of your choice that you will also specify on the management center when you register the chassis when one side does not specify a reachable IP address or hostname. It is required if you do not specify a **hostname**, however we recommend that you always

set the NAT ID even when you specify a hostname or IP address. The NAT ID must not exceed 37 characters. Valid characters include alphanumeric characters (A–Z, a–z, 0–9) and the hyphen (-). This ID cannot be used for any other devices registering to the management center.

- **Registration Key:** *reg\_key*—You will be prompted for a one-time registration key of your choice that you will also specify on the management center when you register the chassis. The registration key must not exceed 37 characters. Valid characters include alphanumeric characters (A–Z, a–z, 0–9) and the hyphen (-).

**Example:**

```
firepower-3110# enter device-manager boulder_fmc hostname 10.89.5.35 nat-id 93002
(Valid registration key characters: [a-z],[A-Z],[0-9],[-]. Length: [2-36])
Registration Key: Impala67
```

**Step 5** Change the admin password.

**scope security**

**set password**

Enter a password: *password*

Confirm the password: *password*

**Example:**

```
firepower-3110# scope security
firepower-3110 /security # set password
Enter new password: Sw@nsong67
Confirm new password: Sw@nsong67
firepower-3110 /security #
```

**Step 6** Disable multi-instance mode and set the system back to appliance mode.

**scope system**

**set deploymode native**

You are prompted to reboot.

**Example:**

```
firepower-3110# scope system
firepower-3110 /system # set deploymode native
All configuration and bootable images will be lost and system will reboot.
If there was out of band upgrade, it might reboot with the base version and
need to re-image to get the expected running version.
Do you still want to change deploy mode? (yes/no):yes
firepower-3110 /system #
```

To change the mode back to multi-instance mode, enter **set deploymode container**. You can check the current mode using the **show system detail** command.

# Monitoring Multi-Instance Mode

This section helps you troubleshoot and diagnose your multi-instance mode chassis and instances.

## Monitoring Multi-Instance Setup

### show system detail

This FXOS command shows the current mode, Native or Container. If the mode is Native (also known as appliance mode), you can convert to multi-instance (Container) mode. Note that the prompt/name in multi-instance mode is generic "firepower-<model>" while the prompt in appliance mode is the hostname you set for the threat defense (by default "firepower")

```
firepower # show system detail

Systems:
  Name: firepower
  Mode: Stand Alone
  System IP Address: 172.16.0.50
  System IPv6 Address: ::
  System Owner:
  System Site:
  Deploy Mode: Native
  Description for System:
firepower #
```

### scope system > show

This FXOS command shows the current mode in a table format. Note that the prompt/name in multi-instance mode is generic "firepower-<model>" while the prompt in appliance mode is the hostname you set for the threat defense.

```
firepower-3110# scope system
firepower-3110 /system # show

Systems:
  Name           Mode           Deploy Mode System IP Address System IPv6 Address
  -----
  firepower-3110
                   Stand Alone Container   10.89.5.42           ::

3110-1# scope system
3110-1 /system # show

Systems:
  Name           Mode           Deploy Mode System IP Address System IPv6 Address
  -----
  3110-1         Stand Alone Native       10.89.5.41           ::
3110-1 /system #
```

## Monitoring Instance Interfaces

### show portmanager switch forward-rules hardware mac-filter

This command shows the internal switch-forwarding rule for two instances with a dedicated physical interface assigned to each instance. Ethernet 1/2 is assigned to ftd1 and Ethernet 1/1 is assigned to ftd2.

ECMP group 1540 is assigned to ftd1 and ECMP group 1541 is assigned to ftd2.

```
secfw-3140(local-mgmt)# show portmanager switch forward-rules hardware mac-filter
      VLAN  SRC_PORT  PC_ID  SRC_ID  DST_PORT  PKT_CNT  DMAC
1         0         17      0      17       19      29164  0:0:0:0:0:0
2         0         19      0      19       17      67588  0:0:0:0:0:0
3         0          1      0     101     1541         0  a2:5b:83:0:0:15
4         0          1      0     101     1541      8181  ff:ff:ff:ff:ff:ff
5         0          2      0     102     1540         0  a2:5b:83:0:0:18
6         0          2      0     102     1540        431  ff:ff:ff:ff:ff:ff
7         0         17      0      0         0     11133  0:0:0:0:0:0
8         0         17      0      0         0         0  0:0:0:0:0:0
```

This command shows the internal switch-forwarding rule for two instances with shared physical interfaces assigned to two instances. Ethernet 1/1 is shared between ftd1 and ftd2.

ECMP group 1540 is assigned to ftd1 and ECMP group 1541 is assigned to ftd2.

MCAST group 4096 is used for replicating broadcast traffic between ftd1 and ftd2.

```
firepower-3140(local-mgmt)# show portmanager switch forward-rules hardware mac-filter
      VLAN  SRC_PORT  PC_ID  SRC_ID  DST_PORT  PKT_CNT  DMAC
1         0         17      0      17       19      2268  0:0:0:0:0:0
2         0         19      0      19       17      4844  0:0:0:0:0:0
3         0          1      0     101     1541         0  a2:5b:83:0:0:9
4         0          1      0     101     4096        546  ff:ff:ff:ff:ff:ff
5         0          1      0     101     1540         0  a2:5b:83:0:0:c
6         0         17      0      0         0     1263  0:0:0:0:0:0
7         0         17      0      0         0         0  0:0:0:0:0:0
```

This command shows the internal switch-forwarding rule for two instances with shared subinterfaces assigned to both instances. Ethernet 1/1.2452 is shared between ftd1 and ftd2.

ECMP group 1540 is assigned to ftd1 and ECMP group 1541 is assigned to ftd2.

MCAST group 4097 is used for replicating broadcast traffic between ftd1 and ftd2.

```
firepower-3140(local-mgmt)# show portmanager switch forward-rules hardware mac-filter
      VLAN  SRC_PORT  PC_ID  SRC_ID  DST_PORT  PKT_CNT  DMAC
1         0         17      0      17       19      21305  0:0:0:0:0:0
2         0         19      0      19       17      50976  0:0:0:0:0:0
3     2452          1      0     101     1541        430  a2:5b:83:0:0:f
4     2452          1      0     101     4097         0  ff:ff:ff:ff:ff:ff
5     2452          1      0     101     1540        122  a2:5b:83:0:0:12
6         0         17      0      0         0     11038  0:0:0:0:0:0
7         0         17      0      0         0         0  0:0:0:0:0:0
```

### show portmanager switch ecmp-groups detail

Use this command to list each Instance Ecmp-Vport-Physical port mapping detail.

**Note** Physical-Port 18 is the backplane uplink interface between the internal switch and the instance.

```
firepower-3140(local-mgmt)# show portmanager switch ecmp-groups detail
      ECMP-GROUP  VPORT      PHYSICAL-PORT
1      1536        256         18
2      1537        257         18
3      1538        258         18
4      1539        259         18
5      1540        260         18
6      1541        261         18
7      1542        262         18
8      1543        263         18
9      1544        264         18
10     1545        265         18
```

#### **show portmanager switch mcast-groups detail**

Use this command to list MCAST group membership details.

```
firepower-3140(local-mgmt)# show portmanager switch mcast-groups detail
      MCAST-GROUP
1      4096
      Member-ports
      Ethernet 1/1
      ECMP-ID 1541
      ECMP-ID 1540
```

#### **show portmanager counters mcast-group**

Use this command to check the MCAST group packet counter.

```
firepower-3140(local-mgmt)# show portmanager counters mcast-group 4096
PKT_CNT: 8106
```

#### **show portmanager counters ecmp**

Use this command to check the ECMP group packet counter.

```
firepower-3140(local-mgmt)# show portmanager counters ecmp 1541
PKT_CNT: 430
```

# History for Multi-Instance Mode

Table 47:

Feature	Minimum Management Center	Minimum Threat Defense	Details
Multi-instance mode conversion in the management center		7.6.0	<p>You can now register an application-mode device to the management center and then convert it to multi-instance mode without having to use the CLI.</p> <p>New/modified screens:</p> <ul style="list-style-type: none"> <li>• <b>Devices &gt; Device Management &gt; More (⋮) &gt; Convert to Multi-Instance</b></li> <li>• <b>Devices &gt; Device Management &gt; Select Bulk Action &gt; Convert to Multi-Instance</b></li> </ul>
Multi-instance mode for the Secure Firewall 4200		7.6.0	Multi-instance mode is now supported for the Secure Firewall 4200.

In multi-instance mode, you can deploy multiple container instances on a single chassis that act as completely independent devices. Note that in multi-instance mode, you upgrade the operating system and the firmware (<i>chassis upgrade</i>) separately from the container instances (<i>threat defense upgrade</i>).</p> <p>New/modified screens:</p> <ul style="list-style-type: none"> <li>• <b>Inventory &gt; FTD Chassis</b></li> <li>• <b>Devices &gt; Device Management &gt; Device &gt; Chassis Manager</b></li> <li>• <b>Devices &gt; Platform Settings &gt; New Policy &gt; Chassis Platform Settings</b></li> <li>• <b>Devices &gt; Chassis Upgrade</b></li> </ul> <p>New/modified threat defense CLI commands: <b>configure multi-instance network ipv4</b>, <b>configure multi-instance network ipv6</b></p> <p>New/modified FXOS CLI commands: <b>create device-manager</b>, <b>set deploymode</b></p> <p>Platform restrictions: Not supported on the Secure Firewall 3105.</p>

## CHAPTER 30

# High Availability

---

The following topics describe how to configure Active/Standby failover to accomplish high availability of the threat defense.

- [About Secure Firewall Threat Defense High Availability, on page 609](#)
- [Config-Sync Optimization, on page 623](#)
- [Requirements and Prerequisites for High Availability, on page 624](#)
- [Guidelines for High Availability, on page 624](#)
- [Add a High Availability Pair, on page 627](#)
- [Configure Optional High Availability Parameters, on page 630](#)
- [Manage High Availability, on page 632](#)
- [Monitoring High Availability, on page 638](#)
- [Troubleshooting High Availability Break in a Remote Branch Deployment, on page 639](#)
- [History for High Availability, on page 644](#)

## About Secure Firewall Threat Defense High Availability

Configuring high availability, also called failover, requires two identical threat defense devices connected to each other through a dedicated failover link and, optionally, a state link. threat defense supports Active/Standby failover, where one unit is the active unit and passes traffic. The standby unit does not actively pass traffic, but synchronizes configuration and other state information from the active unit. When a failover occurs, the active unit fails over to the standby unit, which then becomes active.

The health of the active unit (hardware, interfaces, software, and environmental status) is monitored to determine if specific failover conditions are met. If those conditions are met, failover occurs.

---

**Note** High availability is not supported on threat defense virtual running in the public cloud. See the [Cisco Secure Firewall Threat Defense Virtual Getting Started Guide](#) for more information about configuring the threat defense virtual device for high availability.

---

## High Availability Support on Threat Defense Devices in a Remote Branch Office Deployment

In a remote branch office deployment, the data interface of the threat defense device is used for Cisco Security Cloud Control management instead of the Management interface on the device. Because most remote branch offices only have a single internet connection, outside Security Cloud Control access makes centralized management possible.

You can use *any* data interface for Security Cloud Control access, for example, the inside interface if you have an inside Security Cloud Control. However, this guide primarily covers outside interface access, because it is the most likely scenario for remote branch offices.

Security Cloud Control provides high availability support on the threat defense devices that it manages through the data interface. This feature is supported on devices running on software version 7.2 or later.

For more information, see *Firepower Threat Defense Deployment with a Remote FMC* in the [Cisco Firepower Getting Started Guide](#).

## High Availability System Requirements

This section describes the hardware, software, and license requirements for threat defense devices in a High Availability configuration.

### Hardware Requirements

The two units in a High Availability configuration must:

- Be the same model. In addition, for container instances, they must use the same resource profile attributes.

For the Firepower 9300, High Availability is only supported between same-type modules; but the two chassis can include mixed modules. For example, each chassis has an SM-56, SM-48, and SM-40. You can create High Availability pairs between the SM-56 modules, between the SM-48 modules, and between the SM-40 modules.

If you change the resource profile after you add the High Availability pair to the Security Cloud Control, update the inventory for each unit on the **Devices > Device Management > Device > System > Inventory** dialog box.

If you assign a different profile to instances in an established high-availability pair, which requires the profile to be the same on both units, you must:

1. Break high availability.
2. Assign the new profile to both units.
3. Re-establish high availability.

- Have the same number and types of interfaces.

For the Firepower 4100/9300 chassis, all interfaces must be preconfigured in FXOS identically before you enable High Availability. If you change the interfaces after you enable High Availability, make the interface changes in FXOS on the Standby unit, and then make the same changes on the Active unit.

- Have the following settings in a remote branch deployment:
  - Have the same data management interface to handle management traffic in a remote deployment.

For example, if you have used eth0 in device 1, use the same interface (eth0) in device 2 as well.

- Use data management interface for management traffic.

You cannot have one unit managed using a data interface and the other using a management interface.

If you are using units with different flash memory sizes in your High Availability configuration, make sure the unit with the smaller flash memory has enough space to accommodate the software image files and the configuration files. If it does not, configuration synchronization from the unit with the larger flash memory to the unit with the smaller flash memory will fail.

## Software Requirements

The two units in a High Availability configuration must:

- Be in the same firewall mode (routed or transparent).
- Have the same software version.
- Be in the same domain or group on the management center.
- Have the same NTP configuration. See [Configure NTP Time Synchronization for Threat Defense](#).
- Be fully deployed on the management center with no uncommitted changes.
- Not have DHCP or PPPoE configured in any of their interfaces.
- (Firepower 4100/9300) Have the same flow offload mode, either both enabled or both disabled.

## License Requirements for Threat Defense Devices in a High Availability Pair

Both threat defense units in a high availability configuration must have the same licenses.

High availability configurations require two license entitlements: one for each device in the pair.

Before high availability is established, it does not matter which licenses are assigned to the secondary/standby device. During high availability configuration, the management center releases any unnecessary licenses assigned to the standby unit and replaces them with identical licenses assigned to the primary/active unit. For example, if the active unit has a Essentials license and a IPS license, and the standby unit has only a Essentials license, the management center communicates with the Smart Software Manager to obtain an available IPS license from your account for the standby unit. If your license account does not include enough purchased entitlements, your account becomes Out-of-Compliance until you purchase the correct number of licenses.

## Failover and Stateful Failover Links

The failover link and the optional stateful failover link are dedicated connections between the two units. Cisco recommends to use the same interface between two devices in a failover link or a stateful failover link. For example, in a failover link, if you have used eth0 in device 1, use the same interface (eth0) in device 2 as well.

### Failover Link

The two units in a failover pair constantly communicate over a failover link to determine the operating status of each unit.

## Failover Link Data

The following information is communicated over the failover link:

- The unit state (active or standby)
- Hello messages (keep-alives)
- Network link status
- MAC address exchange
- Configuration replication and synchronization

## Interface for the Failover Link

You can use an unused data interface (physical, or EtherChannel) as the failover link; however, you cannot specify an interface that is currently configured with a name. You cannot use a data management interface if the interface is configured for communication with Security Cloud Control. You also cannot use a subinterface with the exception of a subinterface defined on the chassis for multi-instance mode. The failover link interface is not configured as a normal networking interface; it exists for failover communication only. This interface can only be used for the failover link (and also for the state link).

The threat defense does not support sharing interfaces between user data and the failover link. You also cannot use separate subinterfaces on the same parent for the failover link and for data (multi-instance chassis subinterfaces only). If you use a chassis subinterface for the failover link, then all subinterfaces on that parent, and the parent itself, are restricted for use as failover links.

---

**Note** When using an EtherChannel as the failover or state link, you must confirm that the same EtherChannel with the same member interfaces exists on both devices before establishing high availability.

---

See the following guidelines for the failover link:

- Firepower 4100/9300—We recommend that you use a 10 GB data interface for the combined failover and state link.
- All other models—1 GB interface is large enough for a combined failover and state link.

The alternation frequency is equal to the unit hold time.

---

**Note** If you have a large configuration and a low unit hold time, alternating between the member interfaces can prevent the secondary unit from joining/re-joining. In this case, disable one of the member interfaces until after the secondary unit joins.

---

For an EtherChannel used as the failover link, to prevent out-of-order packets, only one interface in the EtherChannel is used. If that interface fails, then the next interface in the EtherChannel is used. You cannot alter the EtherChannel configuration while it is in use as a failover link.

## Connecting the Failover Link

Connect the failover link in one of the following two ways:

- Using a switch, with no other device on the same network segment (broadcast domain or VLAN) as the failover interfaces of the threat defense device.
- Using an Ethernet cable to connect the units directly, without the need for an external switch.

If you do not use a switch between the units, if the interface fails, the link is brought down on both peers. This condition may hamper troubleshooting efforts because you cannot easily determine which unit has the failed interface and caused the link to come down.

## Stateful Failover Link

To use Stateful Failover, you must configure a Stateful Failover link (also known as the state link) to pass connection state information.

### Shared with the Failover Link

Sharing a failover link is the best way to conserve interfaces. However, you must consider a dedicated interface for the state link and failover link, if you have a large configuration and a high traffic network.

### Dedicated Interface for the Stateful Failover Link

You can use a dedicated data interface (physical or EtherChannel) for the state link. See [Interface for the Failover Link, on page 612](#) for requirements for a dedicated state link, and [Connecting the Failover Link, on page 612](#) for information about connecting the state link as well.

For optimum performance when using long distance failover, the latency for the state link should be less than 10 milliseconds and no more than 250 milliseconds. If latency is more than 10 milliseconds, some performance degradation occurs due to retransmission of failover messages.

## Avoiding Interrupted Failover and Data Links

We recommend that failover links and data interfaces travel through different paths to decrease the chance that all interfaces fail at the same time. If the failover link is down, the threat defense device can use the data interfaces to determine if a failover is required. Subsequently, the failover operation is suspended until the health of the failover link is restored.

See the following connection scenarios to design a resilient failover network.

### Scenario 1—Not Recommended

If a single switch or a set of switches are used to connect both failover and data interfaces between two threat defense devices, then when a switch or inter-switch-link is down, both threat defense devices become active. Therefore, the two connection methods shown in the following figures are **not** recommended.

**Figure 147: Connecting with a Single Switch** ❖❖❖ **Not Recommended**

**Figure 148: Connecting with a Double-Switch**—**Not Recommended**

### Scenario 2—Recommended

We recommend that failover links not use the same switch as the data interfaces. Instead, use a different switch or use a direct cable to connect the failover link, as shown in the following figures.

**Figure 149: Connecting with a Different Switch**

**Figure 150: Connecting with a Cable**

### Scenario 3—Recommended

If the threat defense data interfaces are connected to more than one set of switches, then a failover link can be connected to one of the switches, preferably the switch on the secure (inside) side of network, as shown in the following figure.

**Figure 151: Connecting with a Secure Switch**

## MAC Addresses and IP Addresses in High Availability

When you configure your interfaces, you can specify an active IP address and a standby IP address on the same network. Generally, when a failover occurs, the new active unit takes over the active IP addresses and MAC addresses. Because network devices see no change in the MAC to IP address pairing, no ARP entries change or time out anywhere on the network.

**Note** Although recommended, the standby address is not required. Without a standby IP address, the active unit cannot perform network tests to check the standby interface health; it can only track the link state. You also cannot connect to the standby unit on that interface for management purposes.

The IP address and MAC address for the state link do not change at failover.

### Active/Standby IP Addresses and MAC Addresses

For Active/Standby High Availability, see the following for IP address and MAC address usage during a failover event:

1. The active unit always uses the primary unit's IP addresses and MAC addresses.
2. When the active unit fails over, the standby unit assumes the IP addresses and MAC addresses of the failed unit and begins passing traffic.
3. When the failed unit comes back online, it is now in a standby state and takes over the standby IP addresses and MAC addresses.

However, if the secondary unit boots without detecting the primary unit, then the secondary unit becomes the active unit and uses its own MAC addresses, because it does not know the primary unit MAC addresses. When the primary unit becomes available, the secondary (active) unit changes the MAC addresses to those of the primary unit, which can cause an interruption in your network traffic. Similarly, if you swap out the primary unit with new hardware, a new MAC address is used.

If you disable high availability and set the failover configurations to a disabled state, you will need to manually resume high availability, or reboot the device. It is recommended to use the command **configure high-availability resume** and resume the high availability instead of rebooting the device. If you reload the standby unit with the failover configuration disabled, the standby unit boots up as the active unit and uses the primary unit's IP addresses and MAC addresses. This leads to duplicate IP addresses and causes network traffic disruptions. Use the command **configure high-availability resume** to enable failover and restore the traffic flow.

Virtual MAC addresses guard against this disruption, because the active MAC addresses are known to the secondary unit at startup, and remain the same in the case of new primary unit hardware. We recommend that you configure the virtual MAC address on both the primary and secondary units to ensure that the secondary unit uses the correct MAC addresses when it is the active unit, even if it comes online before the primary unit. If you do not configure virtual MAC addresses, you might need to clear the ARP tables on connected routers to restore traffic flow. The threat defense device does not send gratuitous ARPs for static NAT addresses when the MAC address changes, so connected routers do not learn of the MAC address change for these addresses.

### Virtual MAC Addresses

The threat defense device has multiple methods to configure virtual MAC addresses. We recommend using only one method. If you set the MAC address using multiple methods, the MAC address used depends on many variables, and might not be predictable.

For multi-instance capability, the FXOS chassis autogenerates only primary MAC addresses for all interfaces. You can overwrite the generated MAC address with a virtual MAC address with both the primary and secondary MAC addresses, but predefining the secondary MAC address is not essential; setting the secondary MAC address does ensure that to-the-box management traffic is not interrupted in the case of new secondary unit hardware.

### MAC Address Table Update in Failover

During failover, the device that is designated as the new active device generates multicast packets for each MAC address entry in the MAC table and sends them to all the bridge group interfaces. This action prompts the upstream switches in the bridge group to update their routing tables with the new active device's interface to ensure accurate traffic forwarding.

The time taken to generate multicast packets and update the routing tables of the upstream switches depends on the number of entries in the MAC address table and the number of bridge group interfaces. Use the **show failover statistics state-switch-delay** command to display statistics related to the delays encountered during failover events.

## Stateful Failover

During Stateful Failover, the active unit continually passes per-connection state information to the standby unit. After a failover occurs, the same connection information is available at the new active unit. Supported end-user applications are not required to reconnect to keep the same communication session.

### Supported Features

For Stateful Failover, the following state information is passed to the standby threat defense device:

- NAT translation table.
- TCP and UDP connections and states, including HTTP connection states. Other types of IP protocols, and ICMP, are not parsed by the active unit, because they get established on the new active unit when a new packet arrives.
- Snort connection states, inspection results, and pin hole information, including strict TCP enforcement.
- The ARP table
- The Layer 2 bridge table (for bridge groups)
- The ISAKMP and IPsec SA table
- GTP PDP connection database
- SIP signaling sessions and pin holes.
- Static and dynamic routing tables—Stateful Failover participates in dynamic routing protocols, like OSPF and EIGRP, so routes that are learned through dynamic routing protocols on the active unit are maintained in a Routing Information Base (RIB) table on the standby unit. Upon a failover event, packets travel normally with minimal disruption to traffic because the active secondary unit initially has rules that mirror the primary unit. Immediately after failover, the re-convergence timer starts on the newly active unit. Then the epoch number for the RIB table increments. During re-convergence, OSPF and EIGRP routes become updated with a new epoch number. Once the timer is expired, stale route entries (determined by the epoch number) are removed from the table. The RIB then contains the newest routing protocol forwarding information on the newly active unit.

---

**Note** Routes are synchronized only for link-up or link-down events on an active unit. If the link goes up or down on the standby unit, dynamic routes sent from the active unit may be lost. This is normal, expected behavior.

---

- DHCP Server—DHCP address leases are not replicated. However, a DHCP server configured on an interface will send a ping to make sure an address is not being used before granting the address to a DHCP client, so there is no impact to the service. State information is not relevant for DHCP relay or DDNS.

- Access control policy decisions—Decisions related to traffic matching (including URL, URL category, geolocation, and so forth), intrusion detection, malware, and file type are preserved during failover. However, for connections being evaluated at the moment of failover, there are the following caveats:
  - AVC—App-ID verdicts are replicated, but not detection states. Proper synchronization occurs as long as the App-ID verdicts are complete and synchronized before failover occurs.
  - Intrusion detection state—Upon failover, once mid-flow pickup occurs, new inspections are completed, but old states are lost.
  - File malware blocking—The file disposition must become available before failover.
  - File type detection and blocking—The file type must be identified before failover. If failover occurs while the original active device is identifying the file, the file type is not synchronized. Even if your file policy blocks that file type, the new active device downloads the file.
- User identity decisions from the identity policy, including the user-to-IP address mappings gathered passively through ISE Session Directory, and active authentication through captive portal. Users who are actively authenticating at the moment of failover might be prompted to authenticate again.
- Network AMP—Cloud lookups are independent from each device, so failover does not affect this feature in general. Specifically:
  - Signature Lookup—If failover occurs in the middle of a file transmission, no file event is generated and no detection occurs.
  - File Storage—If failover occurs when the file is being stored, it is stored on the original active device. If the original active device went down while the file was being stored, the file does not get stored.
  - File Pre-classification (Local Analysis)—If failover occurs in the middle of pre-classification, detection fails.
  - File Dynamic Analysis (Connectivity to the cloud)—If failover occurs, the system might submit the file to the cloud.
  - Archive File Support—If failover occurs in the middle of an analysis, the system loses visibility into the file/archive.
  - Custom Blocking—If failover occurs, no events are generated.
- Security Intelligence decisions. However, DNS-based decisions that are in process at the moment of failover are not completed.
- RA VPN—Remote access VPN end users do not have to reauthenticate or reconnect the VPN session after a failover. However, applications operating over the VPN connection could lose packets during the failover process and not recover from the packet loss.
- From all the connections, only established ones will be replicated on the Standby ASA.

## Unsupported Features

For Stateful Failover, the following state information is not passed to the standby threat defense device:

- Sessions in plaintext tunnels other than GREv0 and IPv4-in-IP. Sessions inside tunnels are not replicated and the new active node will not be able to reuse existing inspection verdicts to match the correct policy rules.
- Decrypted TLS/SSL connections—The decryption states are not synchronized, and if the active unit fails, then decrypted connections will be reset. New connections will need to be established to the new active unit. Connections that are not decrypted (in other words, those that match a TLS/SSL Do Not Decrypt rule action) are not affected and are replicated correctly.
- TCP state bypass connections
- Multicast routing.

## Bridge Group Requirements for High Availability

There are special considerations for high availability when using bridge groups.

When the active unit fails over to the standby unit, the switch port running Spanning Tree Protocol (STP) can go into a blocking state for 30 to 50 seconds when it senses the topology change. To avoid traffic loss on the bridge group member interfaces while the port is in a blocking state, you can configure one of the following workarounds:

- Switch port is in Access mode—Enable the STP PortFast feature on the switch:

```
interface interface_id
  spanning-tree portfast
```

The PortFast feature immediately transitions the port into STP forwarding mode upon linkup. The port still participates in STP. So if the port is to be a part of the loop, the port eventually transitions into STP blocking mode.

- If the switch port is in Trunk mode, or you cannot enable STP PortFast, then you can use one of the following less desirable workarounds that impacts failover functionality or STP stability:
  - Disable interface monitoring on the bridge group and member interfaces.
  - Increase the interface hold time in the failover criteria to a high value that will allow STP to converge before the unit fails over.
  - Decrease the STP timers on the switch to allow STP to converge faster than the interface hold time.

## Failover Health Monitoring

The threat defense device monitors each unit for overall health and for interface health. This section includes information about how the threat defense device performs tests to determine the state of each unit.

### Unit Health Monitoring

The threat defense device determines the health of the other unit by monitoring the failover link with hello messages. When a unit does not receive three consecutive hello messages on the failover link, the unit sends LANTEST messages on each data interface, including the failover link, to validate whether or not the peer is

responsive. The action that the threat defense device takes depends on the response from the other unit. See the following possible actions:

- If the threat defense device receives a response on the failover link, then it does not fail over.
- If the threat defense device does not receive a response on the failover link, but it does receive a response on a data interface, then the unit does not failover. The failover link is marked as failed. You should restore the failover link as soon as possible because the unit cannot fail over to the standby while the failover link is down.
- If the threat defense device does not receive a response on any interface, then the standby unit switches to active mode and classifies the other unit as failed.

## Heartbeat Module Redundancy

Each unit in the HA periodically sends a broadcast keepalive heartbeat packet over the cluster control link. If the control plane is too busy handling traffic, sometimes the heartbeat packets do not reach the peers, or the peers do not process the heartbeat packets due to CPU overloading. When peers cannot communicate the keepalive status within the configurable timeout period, a false failover or split-brain scenario occurs.

The heartbeat module in the data plane helps to avoid the occurrence of false failover or split-brain due to traffic congestion in the control plane.

- The additional heartbeat module works similarly to the control plane module but sends and receives heartbeat messages using the data plane transport infrastructure.
- When the peer receives heartbeat packets in the data plane, a counter gets incremented.
- If the heartbeat transfer in the control plane fails, the node checks the heartbeat counter in the data plane. If the counter is incrementing, then the peer is alive, and the cluster does not perform a failover in this situation.

---

**Note**

- The additional heartbeat module is enabled by default whenever HA is enabled. You do not have to set a poll interval for the additional heartbeat module in the data plane. This module uses the same heartbeat interval that you set for the control plane.
- 

## Interface Monitoring

When a unit does not receive hello messages on a monitored interface for 15 seconds, it runs interface tests. If one of the interface tests fails for an interface, but this same interface on the other unit continues to successfully pass traffic, then the interface is considered to be failed, and the device stops running tests.

If the threshold you define for the number of failed interfaces is met (see **Devices > Device Management > High Availability > Failover Trigger Criteria**), and the active unit has more failed interfaces than the standby unit, then a failover occurs. If an interface fails on both units, then both interfaces go into the “Unknown” state and do not count towards the failover limit defined by failover interface policy.

An interface becomes operational again if it receives any traffic. A failed device returns to standby mode if the interface failure threshold is no longer met.

If an interface has IPv4 and IPv6 addresses configured on it, the device uses the IPv4 addresses to perform the health monitoring. If an interface has only IPv6 addresses configured on it, then the device uses IPv6

neighbor discovery instead of ARP to perform the health monitoring tests. For the broadcast ping test, the device uses the IPv6 all nodes address (FE02::1).

## Interface Tests

The threat defense device uses the following interface tests. The duration of each test is approximately 1.5 seconds.

1. **Link Up/Down test**—A test of the interface status. If the Link Up/Down test indicates that the interface is down, then the device considers it failed, and testing stops. If the status is Up, then the device performs the Network Activity test.
2. **Network Activity test**—A received network activity test. At the start of the test, each unit clears its received packet count for its interfaces. As soon as a unit receives any eligible packets during the test, then the interface is considered operational. If both units receive traffic, then testing stops. If one unit receives traffic and the other unit does not, then the interface on the unit that does not receive traffic is considered failed, and testing stops. If neither unit receives traffic, then the device starts the ARP test.
3. **ARP test**—A test for successful ARP replies. Each unit sends a single ARP request for the IP address in the most recent entry in its ARP table. If the unit receives an ARP reply or other network traffic during the test, then the interface is considered operational. If the unit does not receive an ARP reply, then the device sends a single ARP request for the IP address in the *next* entry in the ARP table. If the unit receives an ARP reply or other network traffic during the test, then the interface is considered operational. If both units receive traffic, then testing stops. If one unit receives traffic, and the other unit does not, then the interface on the unit that does not receive traffic is considered failed, and testing stops. If neither unit receives traffic, then the device starts the Broadcast Ping test.
4. **Broadcast Ping test**—A test for successful ping replies. Each unit sends a broadcast ping, and then counts all received packets. If the unit receives any packets during the test, then the interface is considered operational. If both units receive traffic, then testing stops. If one unit receives traffic, and the other unit does not, then the interface on the unit that does not receive traffic is considered failed, and testing stops. If neither unit receives traffic, then testing starts over again with the ARP test. If both units continue to receive no traffic from the ARP and Broadcast Ping tests, then these tests will continue running in perpetuity.

## Interface Status

Monitored interfaces can have the following status:

- **Unknown**—Initial status. This status can also mean the status cannot be determined.
- **Normal**—The interface is receiving traffic.
- **Normal (Waiting)**—The interface is up, but has not yet received a hello packet from the corresponding interface on the peer unit.
- **Normal (Not-Monitored)**—The interface is up, but is not monitored by the failover process.
- **Testing**—Hello messages are not heard on the interface for five poll times.
- **Link Down**—The interface or VLAN is administratively down.
- **Link Down (Waiting)**—The interface or VLAN is administratively down and has not yet received a hello packet from the corresponding interface on the peer unit.
- **Link Down (Not-Monitored)**—The interface or VLAN is administratively down, but is not monitored by the failover process.

- No Link—The physical link for the interface is down.
- No Link (Waiting)—The physical link for the interface is down and has not yet received a hello packet from the corresponding interface on the peer unit.
- No Link (Not-Monitored)—The physical link for the interface is down, but is not monitored by the failover process.
- Failed—No traffic is received on the interface, yet traffic is heard on the peer interface.

## Failover Triggers and Detection Timing

The following events trigger failover in a Firepower high availability pair:

- More than 50% of the Snort instances on the active unit are down.
- Disk space on the active unit is more than 90% full.
- The **no failover active** command is run on the active unit or the **failover active** command is run on the standby unit.
- The active unit has more failed interfaces than the standby unit.
- Interface failure on the active device exceeds the threshold configured.

By default, failure of a single interface causes failover. You can change the default value by configuring a threshold for the number of interfaces or a percentage of monitored interfaces that must fail for the failover to occur. If the threshold breaches on the active device, failover occurs. If the threshold breaches on the standby device, the unit moves to **Fail** state.

To change the default failover criteria, enter the following command in global configuration mode:

**Table 48:**

Command	Purpose
<b>failover interface-policy num [%]</b>  hostname (config)# failover interface-policy 20%	Changes the default failover criteria.  When specifying a specific number of interfaces, the <i>num</i> argument can be from 1 to 250.  When specifying a percentage of interfaces, the <i>num</i> argument can be from 1 to 100.

The following table shows the failover triggering events and associated failure detection timing. If failover occurs, you can view the reason for the failover in the Message Center, along with various operations pertaining to the high availability pair. You can configure these thresholds to a value within the specified minimum-maximum range.

Table 49: Threat Defense Failover Times

Failover Triggering Event	Minimum	Default	Maximum
Active unit loses power, hardware goes down, or the software reloads or crashes. When any of these occur, the monitored interfaces or failover link do not receive any hello message.	800 milliseconds	15 seconds	45 seconds
Active unit interface physical link down.	500 milliseconds	5 seconds	15 seconds
Active unit interface up, but connection problem causes interface testing.	5 seconds	25 seconds	75 seconds

## About Active/Standby Failover

Active/Standby failover lets you use a standby threat defense device to take over the functionality of a failed unit. When the active unit fails, the standby unit becomes the active unit.

### Primary/Secondary Roles and Active/Standby Status

When setting up Active/Standby failover, you configure one unit to be primary and the other to be secondary. During configuration, the primary unit's policies are synchronized to the secondary unit. At this point, the two units act as a single device for device and policy configuration. However, for events, dashboards, reports and health monitoring, they continue to display as separate devices.

The main differences between the two units in a failover pair are related to which unit is active and which unit is standby, namely which IP addresses to use and which unit actively passes traffic.

However, a few differences exist between the units based on which unit is primary (as specified in the configuration) and which unit is secondary:

- The primary unit always becomes the active unit if both units start up at the same time (and are of equal operational health).
- The primary unit MAC addresses are always coupled with the active IP addresses. The exception to this rule occurs when the secondary unit becomes active and cannot obtain the primary unit MAC addresses over the failover link. In this case, the secondary unit MAC addresses are used.

### Active Unit Determination at Startup

The active unit is determined by the following:

- If a unit boots and detects a peer already running as active, it becomes the standby unit.
- If a unit boots and does not detect a peer, it becomes the active unit.
- If both units boot simultaneously, then the primary unit becomes the active unit, and the secondary unit becomes the standby unit.

### Failover Events

In Active/Standby failover, failover occurs on a unit basis.

The following table shows the failover action for each failure event. For each failure event, the table shows the failover policy (failover or no failover), the action taken by the active unit, the action taken by the standby unit, and any special notes about the failover condition and actions.

**Table 50: Failover Events**

Failure Event	Policy	Active Unit Action	Standby Unit Action	Notes
Active unit failed (power or hardware)	Failover	n/a	Become active Mark active as failed	No hello messages are received on any monitored interface or the failover link.
Formerly active unit recovers	No failover	Become standby	No action	None.
Standby unit failed (power or hardware)	No failover	Mark standby as failed	n/a	When the standby unit is marked as failed, then the active unit does not attempt to fail over, even if the interface failure threshold is surpassed.
Failover link failed during operation	No failover	Mark failover link as failed	Mark failover link as failed	You should restore the failover link as soon as possible because the unit cannot fail over to the standby unit while the failover link is down.
Failover link failed at startup	No failover	Become active Mark failover link as failed	Become active Mark failover link as failed	If the failover link is down at startup, both units become active.
State link failed	No failover	No action	No action	State information becomes out of date, and sessions are terminated if a failover occurs.
Interface failure on active unit above threshold	Failover	Mark active as failed	Become active	None.
Interface failure on standby unit above threshold	No failover	No action	Mark standby as failed	When the standby unit is marked as failed, then the active unit does not attempt to fail over even if the interface failure threshold is surpassed.

## Config-Sync Optimization

When a device reboots or rejoins following a suspend or resume high availability, the joining device clears its running configuration. The active device then sends its entire configuration to the joining device for a full configuration synchronization. If the active device has a large configuration, this process can take several minutes.

The configuration sync optimization functionality enables comparing the configuration of the joining device and the active device by exchanging configuration hash values. If the hash computed on both active and

joining devices match, the joining device skips full configuration synchronization and rejoin the high availability configuration. This functionality ensures faster peering and reduces maintenance window and upgrade time.

### Guidelines and Limitations of Config-Sync Optimization

- The configuration sync optimization functionality is enabled by default.
- threat defense multiple context mode supports configuration sync optimization by sharing the context order during full configuration synchronization, allowing comparison of context order during subsequent node-rejoin.
- If you configure passphrase and failover IPsec key, then configuration sync optimization is not effective as the hash value computed in the active and standby devices differs.
- If you configure the device with dynamic ACL or SNMPv3, configuration sync optimization is not effective.
- Active device synchronizes full configuration with flapping LAN links as default behavior. During failover flaps between active and standby devices, configuration sync optimization is not triggered and devices perform a full configuration synchronization.
- Configuration sync optimization gets triggered when the high availability configuration recovers from an interruption or loss of network communication between the active and standby devices.

### Monitoring Config-Sync Optimization

When configuration sync optimization functionality is enabled, syslog messages are generated displaying whether the hash values computed on the active and joining unit match, does not match, or if the operation timeout expires. The syslog message also displays the time elapsed, from the time of sending the hash request to the time of getting and comparing the hash response.

## Guidelines for High Availability

### Model Support

- Firepower 1010 and Secure Firewall 1210/1220:

- You should not use the switch port functionality when using High Availability. Because the switch ports operate in hardware, they continue to pass traffic on both the active *and* the standby units. High Availability is designed to prevent traffic from passing through the standby unit, but this feature does not extend to switch ports. In a normal High Availability network setup, active switch ports on both units will lead to network loops. We suggest that you use external switches for any switching capability. Note that VLAN interfaces can be monitored by failover, while switch ports cannot. Theoretically, you can put a single switch port on a VLAN and successfully use High Availability, but a simpler setup is to use physical firewall interfaces instead.
- You can only use a firewall interface as the failover link.
- Firepower 9300—Intra-chassis High Availability is not supported.
- The threat defense virtual on public cloud networks such as Microsoft Azure and Amazon Web Services are not supported with High Availability because Layer 2 connectivity is required.

### Additional Guidelines

- When the active unit fails over to the standby unit, the connected switch port running Spanning Tree Protocol (STP) can go into a blocking state for 30 to 50 seconds when it senses the topology change. To avoid traffic loss while the port is in a blocking state, you can enable the STP PortFast feature on the switch:

#### **interface *interface\_id* spanning-tree portfast**

This workaround applies to switches connected to both routed mode and bridge group interfaces. The PortFast feature immediately transitions the port into STP forwarding mode upon linkup. The port still participates in STP. So if the port is to be a part of the loop, the port eventually transitions into STP blocking mode.

- Configuring port security on the switches connected to the threat defense device failover pair can cause communication problems when a failover event occurs. This problem occurs when a secure MAC address configured or learned on one secure port moves to another secure port, a violation is flagged by the switch port security feature.
- For Active/Standby High Availability and a VPN IPsec tunnel, you cannot monitor both the active and standby units using SNMP over the VPN tunnel. The standby unit does not have an active VPN tunnel, and will drop traffic destined for the NMS. You can instead use SNMPv3 with encryption so the IPsec tunnel is not required.
- Both the peer devices go into unknown state and high-availability configuration fails if you run `clish` in any of the peer devices while creating a High Availability pair.
- Immediately after failover, the source address of syslog messages will be the failover interface address for a few seconds.
- For better convergence (during a failover), you must shut down the interfaces on a HA pair that are not associated with any configuration or instance.
- If you configure failover encryption in evaluation mode, the systems use DES for the encryption. If you then register the devices using an export-compliant account, the devices will use AES after a reboot. Thus, if a system reboots for any reason, including after installing an upgrade, the peers will be unable to communicate and both units will become the active unit. We recommend that you do not configure encryption until after you register the devices. If you do configure this in evaluation mode, we recommend you remove the encryption before registering the devices.

- When using SNMPv3 with failover, if you replace a failover unit, then SNMPv3 users are not replicated to the new unit. You must remove the users, re-add them, and then redeploy your configuration to force the users to replicate to the new unit.
- The device does not share SNMP client engine data with its peer.
- If you have a very large number of access control and NAT rules, the size of the configuration can prevent efficient configuration replication, resulting in the standby unit taking an excessively long time to reach standby ready state. This can also impact your ability to connect to the standby unit during replication through the console or SSH session. To enhance configuration replication performance, enable transactional commit for both access rules and NAT, using the **asp rule-engine transactional-commit access-group** and **asp rule-engine transactional-commit nat** commands.
- A unit in a High Availability pair transitioning to the standby role synchronizes its clock with the active unit.

Example:

```
firepower#show clock
01:00:52 UTC Mar 1 2022

...
01:01:18 UTC Mar 1 2022 <===== Incorrect (previous) clock
Cold Standby                Sync Config                Detected an Active mate

19:38:21 UTC Apr 9 2022 <===== Updated clock
Sync Config                  Sync File System          Detected an Active mate
...
firepower/sec/stby#show clock
19:38:40 UTC Apr 9 2022
```

- The units in High Availability do not dynamically synchronize the clock. Here are some examples of events when synchronization takes place:
  - A new High Availability pair is created.
  - High Availability is broken and re-created.
  - Communication over the failover link was disrupted and reestablished.
  - Failover status was manually changed at the CLI using the **no failover/failover** or **configure high-availability suspend/resume** (threat defense) commands.
- Enabling High Availability forces all routes to be deleted and are re-added after the High Availability progression changes to the Active state. You could experience connection loss during this phase.
- If you replace the primary unit, then when you re-create high-availability, you should set the replacement unit as the *secondary* unit so that the configurations are replicated from the former secondary unit to the replacement unit. If you set the replacement unit as primary, you will accidentally overwrite the configuration that is present on the operational unit.
- Deploying Firepower 1100 devices in high availability with hundreds of interfaces configured on them can result in increased delay in the failover time (seconds).
- In the High Availability configuration, short-lived connections, usually using port 53, are closed quickly and never transferred or synchronized from Active to Standby, so there might be a difference in the number of connections on both High Availability devices. This is expected behavior for short-lived connections. You can try to compare the connections that are long-lived ( for example, more than 30-60 seconds).

- In the High Availability configuration, embryonic connections—connection requests that have not yet completed the three-way handshake process—are closed quickly and not synchronized between the active and standby devices. This design ensures HA system efficiency and security. For this reason, there might be a difference in the number of connections on both High Availability devices, which is to be expected.
- If the failover LAN link is not connected back-to-back and instead connected through one or more switches, a failure within the intermediate path can cause the active unit to lose connectivity with the standby unit, resulting in inconsistent active/standby states. Although this does not impact High Availability functionality, it is recommended to check and recover the failover-link path between the active and standby units.

When the failover LAN link is down, it is not recommended to deploy any configuration, as it may not be replicated to the peer unit.

- See the [Cisco Secure Firewall Threat Defense Virtual Getting Started Guide](#) and review your threat defense virtual device configurations for high availability.

## Add a High Availability Pair

When establishing an Active/Standby high-availability pair, you designate one of the devices as primary and the other as secondary. The management center deploys a merged configuration to the paired devices. If there is a conflict, the primary device setting is used.

---

**Note** The failover link and the stateful failover link are in a private IP space and are only used for communication between peers in a high-availability pair. After high availability is established, selected interface links and encryption settings cannot be modified without breaking the high-availability pair and reconfiguring it.

---

---

**Caution** Creating or breaking a high-availability pair immediately restarts the Snort process on the primary and secondary devices, temporarily interrupting traffic inspection on both devices. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See [Snort Restart Traffic Behavior, on page 234](#) for more information. The system warns you that continuing to create a high-availability pair restarts the Snort process on the primary and secondary devices and allows you to cancel.

---

### Before you begin

Confirm that both devices:

- Are the same model.
- Have the same number and type of interfaces.
- Are in the same domain and group.
- Have normal health status and are running the same software.
- Are either in routed or transparent mode.

---

**Note** Only routed mode is supported for manager access on a data interface.

---

- Have the same NTP configuration. See [Time Synchronization, on page 1127](#).
- Are fully deployed with no uncommitted changes.
- Do not have DHCP or PPPoE configured on any interfaces.
- For manager access on a data interface:
  - Use the same data interface on both devices for manager access.
  - Redundant manager access data interface is not supported.
  - You cannot use DHCP; only a static IP address is supported. Features that rely on DHCP cannot be used, including DDNS and zero-touch provisioning.
  - Have different static IP addresses in the same subnet.
  - Use either IPv4 or IPv6; you cannot set both.
  - Use the same manager configuration (**configure manager add** command) to ensure that the connectivity is the same.
  - You cannot use the data interface as the failover or state link.

---

**Note** The high availability formation is possible between the two threat defense devices when the certificate available on the primary device is not present on the secondary device. When high availability is formed, the certificate will be synched on the secondary device.

---

## Procedure

- 
- Step 1** In the Security Cloud Control navigation bar, click **Inventory**.
  - Step 2** Click the **Devices** tab to locate your device.
  - Step 3** Click the **FTD** tab and select the device you want to establish as the primary device.
  - Step 4** In the **Management** pane, click **High Availability**.
  - Step 5** Enter a display **Name** for the high-availability pair.
  - Step 6** Under **Device Type**, choose **Firepower Threat Defense**.
  - Step 7** Choose the **Primary Peer** device for the high-availability pair.
  - Step 8** Choose the **Secondary Peer** device for the high-availability pair.

- Note** In the remote deployment, the devices appearing in the **Secondary Peer** list depend on the active device selected in the **Primary Peer** list:
- If the selected primary peer uses a data interface for management, only the data interface managed devices are listed in the secondary peer list.
  - If the data management interface on the primary peer has an IPv4 address configured on it, then the secondary peer lists only the data interface managed devices that have an IPv4 address configured on them. The same rule applies to IPv6-managed devices as well.
  - The data management interface names of primary and secondary devices should be the same. Devices with different interface names will not be listed in the secondary peer list.

**Step 9** Click **Continue**.

**Step 10** Under **LAN Failover Link**, choose an **Interface** with enough bandwidth to reserve for failover communications.

**Note** Only interfaces that do not have a logical name, do not belong to a security zone, and are not used for handling management traffic, will be listed in the **Interface** drop-down in the **Add High Availability Pair** dialog.

**Step 11** Type any identifying **Logical Name**.

**Step 12** Type a **Primary IP** address for the failover link on the active unit.

This address should be on an unused subnet. This subnet can be 31-bits (255.255.255.254 or /31) with only two IP addresses.

**Note** 169.254.1.0/24 and fd00:0:0::\*:/64 are internally used subnets and cannot be used for the failover or state links.

**Step 13** Optionally, choose **Use IPv6 Address**.

**Step 14** Type a **Secondary IP** address for the failover link on the standby unit. This IP address must be in the same subnet as the primary IP address.

**Step 15** If IPv4 addresses are used, type a **Subnet Mask** that applies to both the primary and secondary IP addresses.

**Step 16** Optionally, under **Stateful Failover Link**, choose the same **Interface**, or choose a different interface and enter the high availability configuration information.

This subnet can be 31-bits (255.255.255.254 or /31) with only two IP addresses.

**Note** 169.254.1.0/24 and fd00:0:0::\*:/64 are internally used subnets and cannot be used for the failover or state links.

**Step 17** Optionally, choose **Enabled** and choose the **Key Generation** method for IPsec Encryption between the failover links.

**Step 18** Click **OK**. This process takes a few minutes as the process synchronizes system data.

---

After a successful configuration, you can see the **FTD High Availability** label on the threat defense node on the Security Cloud Control **Inventory** page. Select the node to see the active and standby devices you configured for high availability

### What to do next

Back up the devices. You can use the backup to quickly replace the devices when they fail and to restore the high availability service without being delinked from the management center.

## Configure Optional High Availability Parameters

You can view the initial High Availability Configuration on the management center. You cannot edit these settings without breaking the high availability pair and then re-establishing it.

You can edit the Failover Trigger Criteria to improve failover results. Interface Monitoring allows you to determine which interfaces are better suited for failover.

## Configure Standby IP Addresses and Interface Monitoring

For each interface, set a standby IP address. Although recommended, the standby address is not required. Without a standby IP address, the active unit cannot perform network tests to check the standby interface health; it can only track the link state.

By default, monitoring is enabled on all physical interfaces, for the Firepower 1010 and Secure Firewall 1210/1220 all VLAN interfaces, with logical names configured. You might want to exclude interfaces attached to less critical networks from affecting your failover policy. Firepower 1010 and Secure Firewall 1210/1220 switch ports are not eligible for interface monitoring.

### Procedure

- 
- Step 1** Choose **Devices > Device Management**.
  - Step 2** Next to the device high-availability pair you want to edit, click the **Edit** (✎).
  - Step 3** Click the **High Availability** tab.
  - Step 4** In the **Monitored Interfaces** area, click the **Edit** (✎) next to the interface you want to edit.
  - Step 5** Check the **Monitor this interface for failures** check box.
  - Step 6** On the **IPv4** tab, enter the **Standby IP Address**.  
This address must be a free address on the same network as the active IP address.
  - Step 7** If you configured the IPv6 address manually, on the **IPv6** tab, click the **Edit** (✎) next to the active IP address, enter the **Standby IP Address**, and click **OK**.  
This address must be a free address on the same network as the active IP address. For autogenerated and **Enforce EUI 64** addresses, the standby address is automatically generated.

**Step 8** Click **OK**.

---

## Edit High Availability Failover Criteria

You can customize failover criteria based on your network deployment.

### Procedure

---

- Step 1** Choose **Devices > Device Management**.
- Step 2** Next to the device high-availability pair you want to edit, click the **Edit** (✎).
- Step 3** Choose **High Availability**.
- Step 4** Next to **Failover Trigger Criteria**, click the **Edit** (✎).
- Step 5** Under **Interface Failure Threshold**, choose the number or percentage of interfaces that must fail before the device fails over.
- Step 6** Under **Hello packet Intervals**, choose how often hello packets are sent over the failover link.
- Step 7** Click **OK**.
- 

## Configure Virtual MAC Addresses

You can configure active and standby MAC addresses for failover using the following methods in the Secure Firewall Management Center:

- From the **Advanced** tab on the **Edit Interface** page during interface configuration; see [Configure the MAC Address, on page 1011](#).
- From the **Add Interface MAC Address** dialog-box which is accessed from the **High Availability** page; see this procedure.

---

**Note** To configure the MAC address in both primary and secondary units (so that the MAC address is transferred to all sub-interfaces to both the high-availability units), the recommended approach is to use the **Interfaces** tab to replicate the MAC addresses on sub-interfaces over both active and standby high-availability units.

---

If you configure active and standby MAC addresses in both locations, the addresses defined during interface configuration take precedence for failover.

You can minimize loss of traffic during failover by designating active and standby MAC addresses to the physical interface. This feature offers redundancy against IP address mapping for failover.

## Procedure

---

**Step 1** Choose **Devices > Device Management**.

**Step 2** Next to the device high-availability pair you want to edit, click **Edit** (✎).

**Step 3** Click **High Availability**.

**Step 4** Click the **Add** (+) icon next to Interface MAC Addresses.

**Step 5** Choose a **Physical Interface**.

**Step 6** Enter the **Active Interface Mac Address**.

**Step 7** Enter the **Standby Interface Mac Address**.

**Step 8** Click **OK**.

**Note** For detailed information, see [Task 2](#), steps from 10 to 14 in [Configure FTD High Availability on Firepower Appliances](#).

---

# Manage High Availability

This section describes how to manage High Availability units after you enable High Availability, including how to change the High Availability setup and how to force failover from one unit to another.

## Switch the Active Peer in the Threat Defense High Availability Pair

After you establish the threat defense high availability pair, you can manually switch the active and standby units, effectively forcing failover for reasons such as persistent fault or health events on the current active unit. Both units should be fully deployed before you complete this procedure.

### Before you begin

[Refresh Node Status for a Single Threat Defense High Availability Pair, on page 633](#). This ensures that the status on the threat defense high availability device pair is in sync with the status on the management center.

## Procedure

---

**Step 1** Choose **Devices > Device Management**.

**Step 2** Next to the high availability pair where you want to change the active peer, click the **Switch Active Peer**.

**Step 3** You can:

- Click **Yes** to immediately make the standby device the active device in the high availability pair.
  - Click **No** to cancel and return to the Device Management page.
-

## Refresh Node Status for a Single Threat Defense High Availability Pair

Whenever active or standby devices in the threat defense high availability pair are rebooted, the management center may not display accurate high availability status for either device. This is because when the device reboots, the high availability status is immediately updated on the device and its corresponding event is sent to the management center. However, the status may not be updated on the management center because the communication between the device and the management center is yet to be established.

Communication failures or weak communication channels between the management center and devices may result in out of sync data. When you switch the active and standby devices in a high availability pair, the change may not be reflected in the management center even after a significant time duration.

In these scenarios, you can refresh the high availability node status to obtain accurate information about the active and standby device in a high availability pair.

### Procedure

- 
- Step 1** Choose **Devices > Device Management**.
  - Step 2** Next to the high availability pair where you want to refresh the node status, click the **Refresh HA Node Status**.
  - Step 3** Click **Yes** to refresh the node status.
- 

## Suspend and Resume High Availability

You can suspend a unit in a high-availability pair, which is useful when:

- Both units are in an active-active situation, and fixing the communication on the failover link does not correct the problem.
- You want to troubleshoot an active or standby unit and do not want the units to fail over during that time.

When you suspend high availability, the currently active device remains active, handling all user connections. However, failover criteria are no longer monitored, and the system will never fail over to the now pseudo-standby device.

When using a data interface for manager access, the management connection will be broken until after you resume.

The key difference between suspending high availability and breaking high availability is that on a suspended high-availability device, the high-availability configuration is retained. When you break high availability, the configuration is erased. Thus, you have the option to resume high availability on a suspended system, which enables the existing configuration and makes the two devices function as a failover pair again.

To suspend high availability, use the **configure high-availability suspend** command.

```
> configure high-availability suspend
Please ensure that no deployment operation is in progress before suspending
high-availability.
Please enter 'YES' to continue if there is no deployment operation in
progress and 'NO' if you wish to abort: YES
Successfully suspended high-availability.
```

If you suspend high availability from the active unit, the configuration is suspended on both the active and standby units. The standby unit interface configuration is also erased. If you suspend it from the standby unit, it is suspended on the standby unit only, but the active unit will not attempt to fail over to a suspended unit.

To resume failover, use the **configure high-availability resume** command.

```
> configure high-availability resume
Successfully resumed high-availability.
```

You can resume a unit only if it is in Suspended state. The unit will negotiate active/standby status with the peer unit.

---

**Note** Suspending high availability is a temporary state. If you reload a unit, it resumes the high-availability configuration automatically and negotiates the active/standby state with the peer.

---

## Replace a Unit in Threat Defense High Availability Pair

To replace a failed unit in the threat defense high availability pair using a backup file, see *Restoring Management Centers and Managed Devices* in the [Cisco Secure Firewall Management Center Administration Guide](#).

If you do not have a backup of the failed device, you must break high availability. Then, register the replacement device to the Secure Firewall Management Center and reestablish high availability. The process varies depending on whether the device is primary or secondary:

- [Replace a Primary Threat Defense HA Unit with no Backup, on page 634](#)
- [Replace a Secondary Threat Defense HA Unit with no Backup, on page 635](#)

### Replace a Primary Threat Defense HA Unit with no Backup

Follow the steps below to replace a failed primary unit in the threat defense high availability pair. Failing to follow these steps can overwrite the existing high availability configuration.

---

**Caution** Creating or breaking the threat defense high availability pair immediately restarts the Snort process on the primary and secondary devices, temporarily interrupting traffic inspection on both devices. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See [Snort Restart Traffic Behavior, on page 234](#) for more information. The system warns you that continuing to create a high availability pair restarts the Snort process on the primary and secondary devices and allows you to cancel.

---

---

**Caution** Never move a disk from sensor or management center to another device without reimaging the disk. This is an unsupported configuration and can cause breakage in functionality.

---

## Procedure

- 
- Step 1** Choose **Force Break** to separate the high availability pair; see [Break a High Availability Pair, on page 636](#).
- Note** The break operation removes all the configuration related to HA from threat defense and management center, and you need to recreate it manually later. To successfully configure the same HA pair, ensure that you save the IPs, MAC addresses, and monitoring configuration of all the interfaces/subinterfaces prior to executing the HA break operation.
- Step 2** Unregister the failed primary threat defense device from the management center.
- Step 3** Register the replacement threat defense to the management center [Prerequisites to Onboard a Device to Cloud-delivered Firewall Management Center, on page 28](#).
- Step 4** Configure high availability, using the existing secondary/active unit as the primary device and the replacement device as the secondary/standby device during registration; see [Add a High Availability Pair, on page 627](#).
- 

## Replace a Secondary Threat Defense HA Unit with no Backup

Follow the steps below to replace a failed secondary unit in the threat defense high availability pair.

- 
- Caution** Creating or breaking the threat defense high availability pair immediately restarts the Snort process on the primary and secondary devices, temporarily interrupting traffic inspection on both devices. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See [Snort Restart Traffic Behavior, on page 234](#) for more information. The system warns you that continuing to create a high availability pair restarts the Snort process on the primary and secondary devices and allows you to cancel.
- 

## Procedure

- 
- Step 1** Choose **Force Break** to separate the high availability pair; see [Break a High Availability Pair, on page 636](#).
- Note** The break operation removes all the configuration related to HA from threat defense and management center, and you need to recreate it manually later. To successfully configure the same HA pair, ensure that you save the IPs, MAC addresses, and monitoring configuration of all the interfaces/subinterfaces prior to executing the HA break operation.
- Step 2** Unregister the secondary threat defense device from the management center.
- Step 3** Register the replacement threat defense to the management center [Prerequisites to Onboard a Device to Cloud-delivered Firewall Management Center, on page 28](#).
- Step 4** Configure high availability, using the existing primary/active unit as the primary device and the replacement device as the secondary/standby device during registration; see [Add a High Availability Pair, on page 627](#).
-

## Break a High Availability Pair

When you break a high-availability pair, the high-availability configuration is removed from both units.

**When using the Management interface for manager access:** The active unit remains up and passing traffic. The standby unit interface configuration is erased.

**When using a data interface for manager access:** See the following details.

- The active unit remains up and passing traffic.
- The standby unit data interfaces are shut down except for the manager access interface, which remains up using the standby IP address so it can maintain the management connection.
- In a remote branch deployment setup, all standby unit data interfaces that are assigned with a logical name are shut down except for the manager access interface, which remains up to maintain the management connection.
- If the primary unit is in the standby state:
  - The IP addresses for manager access are swapped permanently in the management center configuration: the primary unit uses the standby IP address, and the secondary unit uses the active IP address.

Policies that were not deployed to the active unit prior to the break operation continue to remain un-deployed after the break operation is complete. Deploy the policies on the standalone device after the break operation is complete.

### Note

- When IPsec is enabled on high availability interfaces on the threat defense device, the device cannot prioritize the encrypted packets into the high-priority receive queue. As a result, during high-volume data traffic scenarios, attempts to break high availability may fail as the device cannot efficiently manage and prioritize the large number of encrypted connections. To view the device's resource usage and the maximum throughput, use the `show resource usage` command.
- If you cannot reach the high-availability pair using the management center, connect to the CLI on each device and enter **configure high-availability disable** to manually break high availability. See also [Remove a High Availability Pair](#), on page 637.

### Caution

Breaking the threat defense high-availability pair immediately restarts the Snort process on the primary and secondary units, temporarily interrupting traffic inspection on both devices. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See [Snort Restart Traffic Behavior](#), on page 234 for more information.

### Before you begin

- [Refresh Node Status for a Single Threat Defense High Availability Pair](#), on page 633. This ensures that the status on the high-availability pair is in sync with the status on the management center.

## Procedure

- 
- Step 1** Choose **Devices > Device Management**.
- Step 2** Next to the high-availability pair you want to break, click the more actions icon (⋮) and choose **Break**.
- Step 3** If the standby peer does not respond, check **Force Break**.
- Step 4** Click **Yes**.

The Break operation removes the high-availability configuration from the active and standby units.

A FlexConfig policy deployed on the active unit may show a deployment failure after the break high-availability operation. You must alter and re-deploy the FlexConfig policy on the active unit.

---

### What to do next

If you are using a FlexConfig policy on the active unit, alter and re-deploy the FlexConfig policy to eliminate deployment errors.

---

**Note** After you break high availability, the threat defense device that was operating as the active unit will still have the standby unit's IP address listed in its configuration. To resolve this, do an additional deployment on the formerly active threat defense device to remove the standby unit's IP address from its configuration.

---

## Remove a High Availability Pair

You can unregister the pair from the management center, which keeps the High Availability pair intact. You might want to unregister the pair if you want to register it to a new management center or if the management center can no longer reach the pair.

Unregistering a High Availability pair:

- Severs all communication between the management center and the pair.
- Removes the pair from the **Device Management** page.
- Returns the pair to local time management if the pair's platform settings policy is configured to receive time from the management center using NTP.
- Leaves the configuration intact, so the pair continues to process traffic.

Policies, such as NAT and VPN, ACLs, and the interface configurations remain intact.

Registering the pair again to the same or a different management center causes the configuration to be removed, so the pair will stop processing traffic at that point; the High Availability configuration remains intact so you can add the pair as a whole. You can choose an access control policy at registration, but you will have to re-apply other policies after registration and then deploy the configuration before it will process traffic again.

**Before you begin**

- This procedure requires CLI access to the primary unit.

**Procedure**

- 
- Step 1** Log into Security Cloud Control and click **Inventory**.
  - Step 2** Click the **FTD** tab and locate the High Availability pair you want to unregister. Select it so the device row is highlighted.
  - Step 3** In the **Device Actions** pane located to the right, click **Remove**.
  - Step 4** When prompted, select **OK** to confirm the removal of the selected device.
- 

## Monitoring High Availability

This section lets you monitor the High Availability status.

### View Failover History

You can view the failover history of both high availability devices in a single view. The history displays in chronological order and includes the reason for any failover.

**Procedure**

- 
- Step 1** Choose **Devices > Device Management**.
  - Step 2** Next to the device high-availability pair you want to edit, click **Edit** (✎).
  - Step 3** Choose **Summary**.
  - Step 4** Under General, click **View** (👁).
- 

### View Stateful Failover Statistics

You can view the stateful failover link statistics of both the primary and secondary devices in the high availability pair.

**Procedure**

- 
- Step 1** Choose **Devices > Device Management**.
  - Step 2** Next to the device high-availability pair you want to edit, click **Edit** (✎).

- Step 3** Choose **High Availability**.
  - Step 4** Under Stateful Failover Link, click **View** (👁).
  - Step 5** Choose a device to view statistics.
- 

## Troubleshooting High Availability Break in a Remote Branch Deployment

This section describes how to solve some of the common problems you may encounter when breaking a High Availability pair in a remote deployment.

- Both Units are in Active-Active State.
- The primary or secondary device has lost connectivity with Security Cloud Control, and the failover link has become non-operational.
- The secondary device is in failed or disabled state and has lost connectivity with Security Cloud Control.

### How to Break a High Availability Pair in Active-Active State

Both units in a remote deployment are in an active-active state because the failover interface became non-operational and they stopped receiving a response on their data interfaces. In this case, both units use the active IP address on their data management interface, which results in an unstable network between the units and Security Cloud Control.

You can determine if the units are both in active mode by logging into the device CLI and using the “show failover state” command on both units. The device status of both units shows ‘active’, and the same active IP address is assigned to both units.

---

**Note** You can try rectifying the failover interface to restore the communication between the two peers and then perform the **Force Break** operation.

If you cannot repair the connectivity issues of the failover interface, then perform the following steps:

---

#### Procedure

- 
- Step 1** Identify a device you want to remove from the network among the two units.
  - Step 2** Connect to the CLI of the identified device, either from the console port or using SSH.
  - Step 3** Log in with the Admin username and password.
  - Step 4** Enter the **pmtool disablebyid sftunnel** command.
    - Note** Only use **pmtool** commands under the direction of the Cisco Technical Assistance Center.
  - Step 5** Disconnect all the interfaces from the device you want to remove from the network.

**Step 6** Enter **configure network management-data-interface ipv4 manual** *ip\_address ipv4\_netmask gateway\_ip\_address interfaceinterface\_id* command.

In *ip\_address* specify the IP address of the standby device.

**Example:**

```
Configure network management-data-interface ipv4 manual 10.10.6.7 255.255.255.0 interface
gig0/0
Configuration updated successfully..!!
```

**Step 7** Enter **configure high-availability suspend** to suspend HA.

```
configure high-availability suspend
Please ensure that no deployment operation is in progress before suspending
high-availability.
Please enter 'YES' to continue if there is no deployment operation in
progress and 'NO' if you wish to abort: YES
Successfully suspended high-availability.
```

**Step 8** In the Security Cloud Control navigation bar, click **Inventory**.

**Step 9** Click the **Devices** tab to locate your device.

**Step 10** Click the **FTD** tab and select the primary device.

**Step 11** In the **Management** pane on the left, click **High Availability**.

**Step 12** Choose **Device > Device Management**.

**Step 13** Next to the high availability pair where you want to separate the high availability pair, click **Force Break**.

A message is displayed that the high-availability pair is separated successfully.

**Step 14** Connect all the interfaces to the device.

**Step 15** At the FTD CLI, enter **pmtool enablebyId sftunnel**.

The threat defense device establishes its connection with Security Cloud Control in sometime.

**Note** It may take up to 5 minutes for the device to establish communication with Security Cloud Control.

**Step 16** Enter the **sftunnel-status-brief** command to view the management connection status.

```
sftunnel-status-brief
PEER:10.10.17.202
Registration: Completed.
Connection to peer '10.10.17.202' Attempted at Wed Feb 9 09:21:57 2020 UTC
Last disconnect time : Wed Feb 9 09:19:09 2020 UTC
```

**Step 17** Choose **Deploy > Deployment** to deploy the changes.

Before the Security Cloud Control deploys the changes, it will detect the configuration differences and stop the deployment. Security Cloud Control detects the IP address change made to the device outside of the Cisco Security Cloud Control.

**Step 18** Synchronize interface changes with Security Cloud Control. See [Sync Interface Changes with the Management Center, on page 922](#).

**Step 19** You can now deploy the pending changes to the device. See [Deploy configuration changes](#).

The device now becomes a standalone device with a new the IP address of the standby device.

#### What to do next

(optional) Deploy any pending changes to the other device having the IP address of the active device.

## How to Break a High Availability Pair when Active or Standby Unit has Lost Connectivity

**Problem:** One of the peers has lost connectivity with Management Center, and the failover link has become non-operational.

*Table 51: Scenario:*

Primary Device State	Secondary Device Stat	Primary Device Connectivity with Security Cloud Control?	Secondary Device Connectivity with Security Cloud Control?	Failover link Operational? (Connectivity between Primary and Secondary devices)
Active	Standby	Yes	No	No
Standby	Active	No	Yes	No

#### Solution:

First, you can try rectifying the failover interface to restore the communication between the two peers and then perform the break or force break operation to separate the units.

If you cannot repair the connectivity issues of the failover interface, then you must complete additional steps using the device CLI after performing a high availability break operation.

### Procedure

- 
- Step 1** In the Security Cloud Control navigation bar, click **Inventory**.
  - Step 2** Click the **Devices** tab to locate your device.
  - Step 3** Click the **FTD** tab and select the primary device.
  - Step 4** In the **Management** pane on the left, click **High Availability**.
  - Step 5** Choose **Devices > Device Management**.
  - Step 6** Next to the high-availability pair you want to break, click the **Break HA** .
  - Step 7** Optionally, you can also check the check box to force break as one of the peers does not respond.
  - Step 8** Click **Yes**.
  - Step 9** Delete the standby device from Security Cloud Control.
    - a) Choose **Devices > Device Management**.
    - b) Next to the device you want to delete, click **Delete**.
  - Step 10** Connect to the standby device's CLI, either from the console port or using SSH.

- Step 11** Log in with the Admin username and password.
- Step 12** Enter **configure manager delete** to delete the manager.  
This command disables the current manager Security Cloud Control.
- Step 13** Enter **configure high-availability disable** to remove the failover configuration and disable the data management interface on the device.
- Step 14** Enter **configure network management-data-interface**.

**Example:**

```
configure network management-data-interface
Data interface to use for management: ethernet1/1
Specify a name for the interface [outside]: internet
IP address (manual / dhcp) [dhcp]: manual
IPv4/IPv6 address: 10.10.6.7
Netmask/IPv6 Prefix: 255.255.255.0
Default Gateway: 10.10.6.1
Comma-separated list of DNS servers [none]: 208.67.222.222,208.67.220.220
DDNS server update URL [none]:
Do you wish to clear all the device configuration before applying ? (y/n) [n]:
```

Configuration done with option to allow FMC access from any network, if you wish to change the FMC access network use the 'client' option in the command 'configure network management-data-interface'.

Setting IPv4 network configuration.  
Network settings changed.

The new newtwork settings are assigned to the data device.

**What to do next**

You can onboard the device as a standalone device to Security Cloud Control if required.

## How to a Break High Availability Pair when the Secondary Device is in a Failed or Disabled State

**Problem:** The secondary device is in a failed or disabled state and has lost connectivity with Security Cloud Control. In addition, the failover link may or may not be operational.

*Table 52: Scenario:*

Primary Device State	Secondary Device Stat	Primary Device Connectivity with Security Cloud Control?	Secondary Device Connectivity with Security Cloud Control?	Failover link Operational? (Connectivity between Primary and Secondary devices)
Active	Failed	Yes	No	Yes or No
Active	Disabled	Yes	No	Yes or No

**Solution:**

Perform a high availability force break to separate the units and then use the device CLI to remove the configuration from the standby unit and make the device a standalone device.

**Procedure**

- 
- Step 1** In the Security Cloud Control navigation bar, click **Inventory**.
  - Step 2** Click the **Devices** tab to locate your device.
  - Step 3** Click the **FTD** tab and select the primary device.
  - Step 4** In the **Management** pane on the left, click **High Availability**.
  - Step 5** Choose **Devices > Device Management**.
  - Step 6** Next to the high-availability pair you want to break, click the **Break HA**.
  - Step 7** Check the check box to force break as one of the peers does not respond.
  - Step 8** Click **Yes**.
  - Step 9** Delete the standby device from Security Cloud Control.
    - a) Choose **Devices > Device Management**.
    - b) Next to the device you want to delete, click **Delete**.
  - Step 10** Connect to the standby device's CLI, either from the console port or using SSH.
  - Step 11** Log in with the Admin username and password.
  - Step 12** Enter **configure high-availability disable** to remove the failover configuration and disable the data management interface on the device.
  - Step 13** Enter **configure network management-data-interface**.

**Example:**

```
configure network management-data-interface
Data interface to use for management: ethernet1/1
Specify a name for the interface [outside]: internet
IP address (manual / dhcp) [dhcp]: manual
IPv4/IPv6 address: 10.10.6.7
Netmask/IPv6 Prefix: 255.255.255.0
Default Gateway: 10.10.6.1
Comma-separated list of DNS servers [none]: 208.67.222.222,208.67.220.220
DDNS server update URL [none]:
Do you wish to clear all the device configuration before applying ? (y/n) [n]:
```

Configuration done with option to allow FMC access from any network, if you wish to change the FMC access network use the 'client' option in the command 'configure network management-data-interface'.

```
Setting IPv4 network configuration.
Network settings changed.
```

The new network settings are assigned to the data device.

---

**What to do next**

You can onboard the device as a standalone device to Security Cloud Control if required.

# History for High Availability

Feature	Minimum Management Center	Minimum Threat Defense	Details
High availability support for the manager access data interface	7.4	7.4	You can now use a data interface for manager access with threat defense high availability.
Unregistering a high-availability pair now allows you to re-register without breaking the pair	7.3	Any	When you delete (unregister) a high-availability pair, you no longer have to manually break the pair at the CLI and re-register standalone devices. You can now add the primary unit to a new management center, and the standby unit will be discovered automatically. Re-registering the pair will still erase the configuration, and your policies will need to be re-applied.
Policy rollback support for high availability	7.2	Any	The <b>configure policy rollback</b> command is supported for high availability.
Config-Sync Optimization feature for faster HA peering	7.2	Any	The Config-Sync Optimization feature enables comparing the configuration of the joining unit and the active unit by exchanging config-hash values. If the hash computed on both active and joining units match, the joining unit skips full config-sync and rejoin the HA. This feature enables faster HA peering and reduces maintenance window and upgrade time.
Improvements to the upgrade workflow for clustered and high-availability devices	7.1	Any	We made the following improvements to the upgrade workflow for clustered and high-availability devices: <ul style="list-style-type: none"> <li>• The upgrade wizard now correctly displays clustered and high-availability units as groups, rather than as individual devices. The system can identify, report, and preemptively require fixes for group-related issues you might have. For example, you cannot upgrade a cluster on the Firepower 4100/9300 if you have made unsynced changes on Firepower Chassis Manager.</li> <li>• We improved the speed and efficiency of copying upgrade packages to clusters and high-availability pairs. Previously, the FMC copied the package to each group member sequentially. Now, group members can get the package from each other as part of their normal sync process.</li> <li>• You can now specify the upgrade order of data units in a cluster. The control unit always upgrades last.</li> </ul>
Clearing routes in a high-availability group or cluster.	7.1	Any	In previous releases, the <b>clear route</b> command cleared the routing table on the unit only. Now, when operating in a high-availability group or cluster, the command is available on the active or control unit only, and clears the routing table on all units in the group or cluster.

Feature	Minimum Management Center	Minimum Threat Defense	Details
FTD High Availability Hardening	6.2.3	Any	<p>Version 6.2.3 introduces the following features for FTD devices in high availability:</p> <ul style="list-style-type: none"> <li>• Whenever active or standby FTD devices in a high-availability pair restart, the FMC may not display accurate high-availability status for either managed device. However, the status may not upgrade on the FMC because the communication between the device and the FMC is not established yet. The <b>Refresh Node Status</b> option on the <b>Devices &gt; Device Management</b> page allows you to refresh the high-availability unit status to obtain accurate information about the active and standby device in a high-availability pair.</li> <li>• The <b>Devices &gt; Device Management</b> page of the FMC UI has a new <b>Switch Active Peer</b> icon.</li> <li>• Version 6.2.3 includes a new REST API object, <b>Device High Availability Pair Services</b>, that contains four functions: <ul style="list-style-type: none"> <li>• <b>DELETE ftddevicehapairs</b></li> <li>• <b>PUT ftddevicehapairs</b></li> <li>• <b>POST ftddevicehapairs</b></li> <li>• <b>GET ftddevicehapairs</b></li> </ul> </li> </ul>

## CHAPTER 31

# Clustering for the Secure Firewall 3100/4200

Clustering lets you group multiple threat defense units together as a single logical device. A cluster provides all the convenience of a single device (management, integration into a network) while achieving the increased throughput and redundancy of multiple devices.

**Note** Some features are not supported when using clustering. See [Unsupported Features with Clustering, on page 698](#).

- [About Clustering for the Secure Firewall 3100/4200, on page 647](#)

## About Clustering for the Secure Firewall 3100/4200

This section describes the clustering architecture and how it works.

### How the Cluster Fits into Your Network

The cluster consists of multiple firewalls acting as a single unit. To act as a cluster, the firewalls need the following infrastructure:

- Isolated, high-speed backplane network for intra-cluster communication, known as the *cluster control link*.
- Management access to each firewall for configuration and monitoring.

When you place the cluster in your network, the upstream and downstream routers need to be able to load-balance the data coming to and from the cluster using one of the following methods:

- **Spanned EtherChannel (Recommended)**—Interfaces on multiple members of the cluster are grouped into a single EtherChannel; the EtherChannel performs load balancing between units.
- **Policy-Based Routing (Routed firewall mode only)**—The upstream and downstream routers perform load balancing between units using route maps and ACLs.
- **Equal-Cost Multi-Path Routing (Routed firewall mode only)**—The upstream and downstream routers perform load balancing between units using equal cost static or dynamic routes.

## Control and Data Node Roles

One member of the cluster is the control node. If multiple cluster nodes come online at the same time, the control node is determined by the priority setting; the priority is set between 1 and 100, where 1 is the highest priority. All other members are data nodes. When you first create the cluster, you specify which node you want to be the control node, and it will become the control node simply because it is the first node added to the cluster.

All nodes in the cluster share the same configuration. The node that you initially specify as the control node will overwrite the configuration on the data nodes when they join the cluster, so you only need to perform initial configuration on the control node before you form the cluster.

Some features do not scale in a cluster, and the control node handles all traffic for those features.

## Cluster Interfaces

You can configure data interfaces as either Spanned EtherChannels or as Individual interfaces. All data interfaces in the cluster must be one type only. See [About Cluster Interfaces, on page 654](#) for more information.

For Spanned EtherChannels: You can use regular firewall interfaces or IPS-only interfaces (inline sets or passive interfaces). For Individual interfaces: IPS-only interfaces are not supported.

## Cluster Control Link

Each unit must dedicate at least one hardware interface as the cluster control link. See [Cluster Control Link, on page 654](#) for more information.

## Configuration Replication

All nodes in the cluster share a single configuration. You can only make configuration changes on the control node (with the exception of the bootstrap configuration), and changes are automatically synced to all other nodes in the cluster.

## Management Network

You must manage each node using the Management interface; management from a data interface is not supported with clustering.

# Licenses for Clustering

You assign feature licenses to the cluster as a whole, not to individual nodes. However, each node of the cluster consumes a separate license for each feature. The clustering feature itself does not require any licenses.

When you add the control node to the management center, you can specify the feature licenses you want to use for the cluster. Before you create the cluster, it doesn't matter which licenses are assigned to the data nodes; the license settings for the control node are replicated to each of the data nodes. You can modify licenses for the cluster in the **System** (⚙️) > **Licenses** > **Smart Licenses** > **Edit Licenses** or **Devices** > **Device Management** > **Cluster** > **License** area.

---

**Note** If you add the cluster before the management center is licensed (and running in Evaluation mode), then when you license the management center, you can experience traffic disruption when you deploy policy changes to the cluster. Changing to licensed mode causes all data units to leave the cluster and then rejoin.

---

## Requirements and Prerequisites for Clustering

### Model Requirements

- Secure Firewall 3100—Maximum 16 units
- Secure Firewall 4200—Maximum 16 units

### User Roles

- Admin
- Access Admin
- Network Admin

### Hardware and Software Requirements

All units in a cluster:

- Must be the same model.
- Must include the same interfaces.
- The management center access must be from the Management interface; data interface management is not supported.
- Must run the identical software except at the time of an image upgrade. Hitless upgrade is supported.
- Must be in the same firewall mode, routed or transparent.
- Must be in the same domain.
- Must be in the same group.

- Must not have any deployment pending or in progress.
- The control node must not have any unsupported features configured (see [Unsupported Features with Clustering, on page 698](#)).
- Data nodes must not have any VPN configured. The control node can have site-to-site VPN configured.

### Switch Requirements

- Be sure to complete the switch configuration before you configure clustering. Make sure the ports connected to the cluster control link have the correct (higher) MTU configured. By default, the cluster control link MTU is set to 100 bytes higher than the data interfaces. If the switches have an MTU mismatch, the cluster formation will fail.

## Guidelines for Clustering

### Firewall Mode

The firewall mode must match on all units.

### High Availability

High Availability is not supported with clustering.

### IPv6

The cluster control link is only supported using IPv4.

### Switches

- Make sure connected switches match the MTU for both cluster data interfaces and the cluster control link interface. You should configure the cluster control link interface MTU to be at least 100 bytes higher than the data interface MTU, so make sure to configure the cluster control link connecting switch appropriately. Because the cluster control link traffic includes data packet forwarding, the cluster control link needs to accommodate the entire size of a data packet plus cluster traffic overhead. In addition, we do not recommend setting the cluster control link MTU between 2561 and 8362; due to block pool handling, this MTU size is not optimal for system operation.
- For Cisco IOS XR systems, if you want to set a non-default MTU, set the IOS XR interface MTU to be 14 bytes higher than the cluster device MTU. Otherwise, OSPF adjacency peering attempts may fail unless the **mtu-ignore** option is used. Note that the cluster device MTU should match the IOS XR *IPv4* MTU. This adjustment is not required for Cisco Catalyst and Cisco Nexus switches.
- On the switch(es) for the cluster control link interfaces, you can optionally enable Spanning Tree PortFast on the switch ports connected to the cluster unit to speed up the join process for new units.
- On the switch, we recommend that you use one of the following EtherChannel load-balancing algorithms: **source-dest-ip** or **source-dest-ip-port** (see the Cisco Nexus OS and Cisco IOS-XE **port-channel load-balance** command). Do not use a **vlan** keyword in the load-balance algorithm because it can cause unevenly distributed traffic to the devices in a cluster.

- If you change the load-balancing algorithm of the EtherChannel on the switch, the EtherChannel interface on the switch temporarily stops forwarding traffic, and the Spanning Tree Protocol restarts. There will be a delay before traffic starts flowing again.
- Switches on the cluster control link path should not verify the L4 checksum. Redirected traffic over the cluster control link does not have a correct L4 checksum. Switches that verify the L4 checksum could cause traffic to be dropped.
- Port-channel bundling downtime should not exceed the configured keepalive interval.
- On Supervisor 2T EtherChannels, the default hash distribution algorithm is adaptive. To avoid asymmetric traffic in a VSS design, change the hash algorithm on the port-channel connected to the cluster device to fixed:

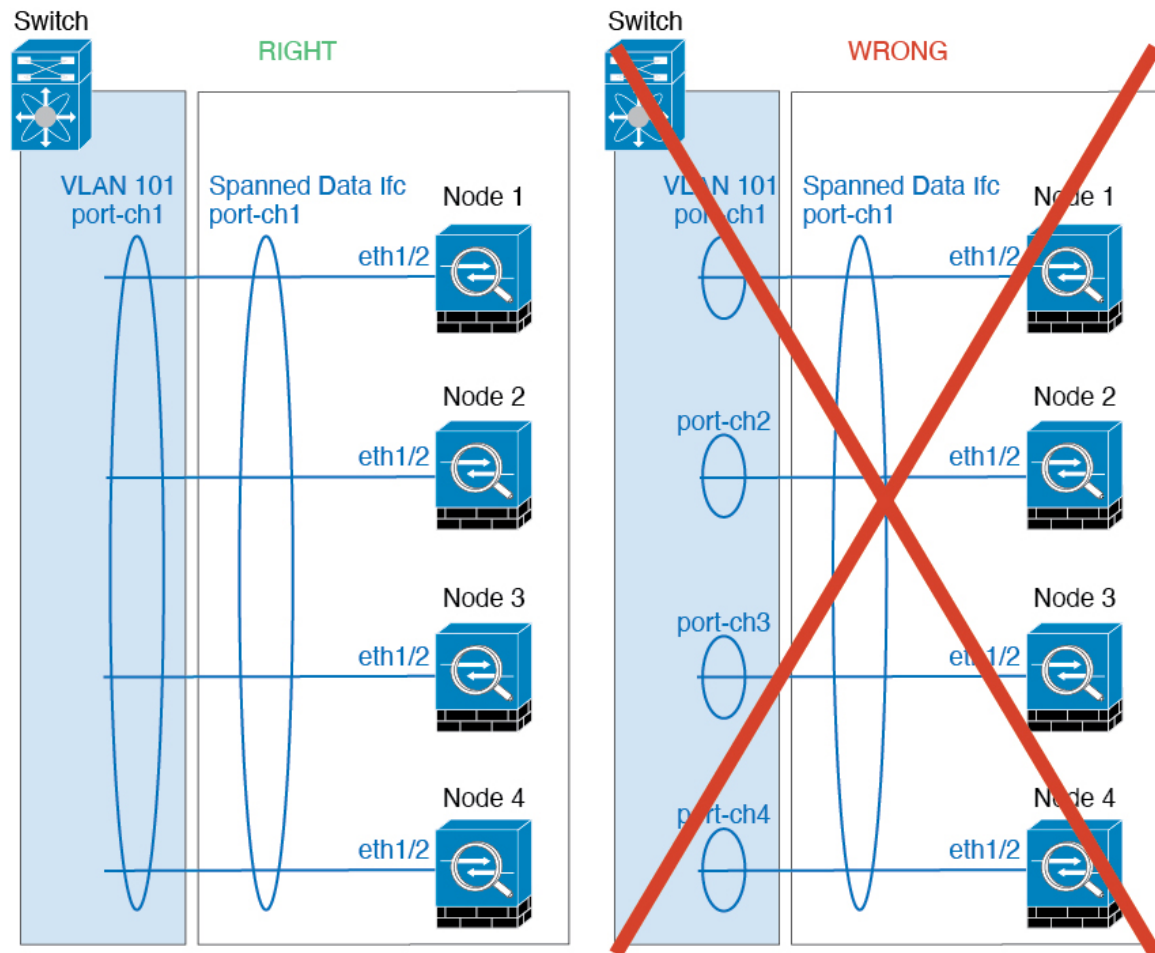

```
router(config)# port-channel id hash-distribution fixed
```

Do not change the algorithm globally; you may want to take advantage of the adaptive algorithm for the VSS peer link.

- You should disable the LACP Graceful Convergence feature on all cluster-facing EtherChannel interfaces for Cisco Nexus switches.

### EtherChannels

- In Catalyst 3750-X Cisco IOS software versions earlier than 15.1(1)S2, the cluster unit did not support connecting an EtherChannel to a switch stack. With default switch settings, if the cluster unit EtherChannel is connected cross stack, and if the control unit switch is powered down, then the EtherChannel connected to the remaining switch will not come up. To improve compatibility, set the **stack-mac persistent timer** command to a large enough value to account for reload time; for example, 8 minutes or 0 for indefinite. Or, you can upgrade to more a more stable switch software version, such as 15.1(1)S2.
- Spanned vs. Device-Local EtherChannel Configuration—Be sure to configure the switch appropriately for Spanned EtherChannels vs. Device-local EtherChannels.
  - Spanned EtherChannels—For cluster unit *Spanned* EtherChannels, which span across all members of the cluster, the interfaces are combined into a single EtherChannel on the switch. Make sure each interface is in the same channel group on the switch.

- Device-local EtherChannels—For cluster unit *Device-local* EtherChannels including any EtherChannels configured for the cluster control link, be sure to configure discrete EtherChannels on the switch; do not combine multiple cluster unit EtherChannels into one EtherChannel on the switch.

### Additional Guidelines

- When significant topology changes occur (such as adding or removing an EtherChannel interface, enabling or disabling an interface on the threat defense or the switch, adding an additional switch to form a VSS or vPC) you should disable the health check feature and also disable interface monitoring for the disabled interfaces. When the topology change is complete, and the configuration change is synced to all units, you can re-enable the interface health check feature.
- When adding a unit to an existing cluster, or when reloading a unit, there will be a temporary, limited packet/connection drop; this is expected behavior. In some cases, the dropped packets can hang your connection; for example, dropping a FIN/ACK packet for an FTP connection will make the FTP client hang. In this case, you need to reestablish the FTP connection.
- If you use a Windows 2003 server connected to a Spanned EtherChannel, when the syslog server port is down and the server does not throttle ICMP error messages, then large numbers of ICMP messages are sent back to the ASA cluster. These messages can result in some units of the ASA cluster experiencing high CPU, which can affect performance. We recommend that you throttle ICMP error messages.
- For decrypted TLS/SSL connections, the decryption states are not synchronized, and if the connection owner fails, then decrypted connections will be reset. New connections will need to be established to a

new unit. Connections that are not decrypted (they match a do-not-decrypt rule) are not affected and are replicated correctly.

### Defaults for Clustering

- The cLACP system ID is auto-generated, and the system priority is 1 by default.
- The cluster health check feature is enabled by default with the holdtime of 3 seconds. Interface health monitoring is enabled on all interfaces by default.
- The cluster auto-rejoin feature for a failed cluster control link is unlimited attempts every 5 minutes.
- The cluster auto-rejoin feature for a failed data interface is 3 attempts every 5 minutes, with the increasing interval set to 2.
- Connection replication delay of 5 seconds is enabled by default for HTTP traffic.

## Configure Clustering

To add a cluster to the management center, add each node to the management center as a standalone unit, configure interfaces on the unit you want to make the control node, and then form the cluster.

## About Cluster Interfaces

You can configure data interfaces as either Spanned EtherChannels or as Individual interfaces. All data interfaces in the cluster must be one type only. You cannot configure Ethernet 1/1 as a Spanned EtherChannel and configure Ethernet 1/2 as an Individual interface within the same cluster, for example.

For Spanned EtherChannels: You can use regular firewall interfaces or IPS-only interfaces (inline sets or passive interfaces). For Individual interfaces: IPS-only interfaces are not supported.

Each unit must also dedicate at least one hardware interface as the cluster control link.

## Cluster Control Link

Each unit must dedicate at least one hardware interface as the cluster control link. We recommend using an EtherChannel for the cluster control link if available.

### Cluster Control Link Traffic Overview

Cluster control link traffic includes both control and data traffic.

Control traffic includes:

- Control node election.
- Configuration replication.
- Health monitoring.

Data traffic includes:

- State replication.

- Connection ownership queries and data packet forwarding.

## Cluster Control Link Interfaces and Network

You can use any physical interface or EtherChannel for the cluster control link. You cannot use a VLAN subinterface as the cluster control link. You also cannot use the Management interface.

Each cluster control link has an IP address on the same subnet. This subnet should be isolated from all other traffic, and should include only the cluster control link interfaces.

---

**Note** For a 2-member cluster, do not directly-connect the cluster control link from one node to the other node. If you directly connect the interfaces, then when one unit fails, the cluster control link fails, and thus the remaining healthy unit fails. If you connect the cluster control link through a switch, then the cluster control link remains up for the healthy unit. If you need to directly-connect the units (for testing purposes, for example), then you should configure and enable the cluster control link interface on both nodes before you form the cluster.

---

## Size the Cluster Control Link

If possible, you should size the cluster control link to match the expected throughput of each chassis so the cluster control link can handle the worst-case scenarios.

Cluster control link traffic is comprised mainly of state update and forwarded packets. The amount of traffic at any given time on the cluster control link varies. The amount of forwarded traffic depends on the load-balancing efficacy or whether there is a lot of traffic for centralized features. For example:

- NAT results in poor load balancing of connections, and the need to rebalance all returning traffic to the correct units.
- When membership changes, the cluster needs to rebalance a large number of connections, thus temporarily using a large amount of cluster control link bandwidth.

A higher-bandwidth cluster control link helps the cluster to converge faster when there are membership changes and prevents throughput bottlenecks.

---

**Note** If your cluster has large amounts of asymmetric (rebalanced) traffic, then you should increase the cluster control link size.

---

## Cluster Control Link Redundancy

The following diagram shows how to use an EtherChannel as a cluster control link in a Virtual Switching System (VSS), Virtual Port Channel (vPC), StackWise, or StackWise Virtual environment. All links in the EtherChannel are active. When the switch is part of a redundant system, then you can connect firewall interfaces within the same EtherChannel to separate switches in the redundant system. The switch interfaces are members of the same EtherChannel port-channel interface, because the separate switches act like a single switch. Note that this EtherChannel is device-local, not a Spanned EtherChannel.

**Cluster Control Link Reliability**

To ensure cluster control link functionality, be sure the round-trip time (RTT) between units is less than 20 ms. This maximum latency enhances compatibility with cluster members installed at different geographical sites. To check your latency, perform a ping on the cluster control link between units.

The cluster control link must be reliable, with no out-of-order or dropped packets; for example, for inter-site deployment, you should use a dedicated link.

**Spanned EtherChannels (Recommended)**

You can group one or more interfaces per chassis into an EtherChannel that spans all chassis in the cluster. The EtherChannel aggregates the traffic across all the available active interfaces in the channel.

For regular firewall interfaces: A Spanned EtherChannel can be configured in both routed and transparent firewall modes. In routed mode, the EtherChannel is configured as a routed interface with a single IP address. In transparent mode, the IP address is assigned to the BVI, not to the bridge group member interface.

The EtherChannel inherently provides load balancing as part of basic operation.

### Spanned EtherChannel Benefits

The EtherChannel method of load-balancing is recommended over other methods for the following benefits:

- Faster failure discovery.
- Faster convergence time. Individual interfaces rely on routing protocols to load-balance traffic, and routing protocols often have slow convergence during a link failure.
- Ease of configuration.

### Guidelines for Maximum Throughput

To achieve maximum throughput, we recommend the following:

- Use a load-balancing hash algorithm that is “symmetric,” meaning that packets from both directions will have the same hash and will be sent to the same threat defense in the Spanned EtherChannel. We recommend using the source and destination IP address (the default) or the source and destination port as the hashing algorithm.
- Use the same type of line cards when connecting the threat defenses to the switch so that hashing algorithms applied to all packets are the same.

### Load Balancing

The EtherChannel link is selected using a proprietary hash algorithm, based on source or destination IP addresses and TCP and UDP port numbers.

---

**Note** On the switch, we recommend that you use one of the following algorithms: **source-dest-ip** or **source-dest-ip-port** (see the Cisco Nexus OS or Cisco IOS **port-channel load-balance** command). Do not use a **vlan** keyword in the load-balance algorithm because it can cause unevenly distributed traffic to the ASAs in a cluster.

---

The number of links in the EtherChannel affects load balancing.

Symmetric load balancing is not always possible. If you configure NAT, then forward and return packets will have different IP addresses and/or ports. Return traffic will be sent to a different unit based on the hash, and the cluster will have to redirect most returning traffic to the correct unit.

## EtherChannel Redundancy

The EtherChannel has built-in redundancy. It monitors the line protocol status of all links. If one link fails, traffic is re-balanced between remaining links. If all links in the EtherChannel fail on a particular unit, but other units are still active, then the unit is removed from the cluster.

## Connecting to a Redundant Switch System

You can include multiple interfaces per threat defense in the Spanned EtherChannel. Multiple interfaces per threat defense are especially useful for connecting to both switches in a VSS, vPC, StackWise, or StackWise Virtual system.

Depending on your switches, you can configure up to 32 active links in the spanned EtherChannel. This feature requires both switches in the vPC to support EtherChannels with 16 active links each (for example the Cisco Nexus 7000 with F2-Series 10 Gigabit Ethernet Module).

For switches that support 8 active links in the EtherChannel, you can configure up to 16 active links in the spanned EtherChannel when connecting to two switches in a redundant system.

The following figure shows a 16-active-link spanned EtherChannel in a 4-node cluster and an 8-node cluster.

## Individual Interfaces (Routed Firewall Mode Only)

Individual interfaces are normal routed interfaces, each with their own *Local IP address* used for routing. The *Main cluster IP address* for each interface is a fixed address that always belongs to the control node. When the control node changes, the Main cluster IP address moves to the new control node, so management of the cluster continues seamlessly.

IPS-only interfaces (inline sets and passive interfaces) are not supported as Individual interfaces.

Because interface configuration must be configured only on the control node, you configure a pool of IP addresses to be used for a given interface on the cluster nodes, including one for the control node.

Load balancing must be configured separately on the upstream switch.

## Policy-Based Routing

When using Individual interfaces, each threat defense interface maintains its own IP address and MAC address. One method of load balancing is Policy-Based Routing (PBR).

We recommend this method if you are already using PBR, and want to take advantage of your existing infrastructure.

PBR makes routing decisions based on a route map and ACL. You must manually divide traffic between all threat defenses in a cluster. Because PBR is static, it may not achieve the optimum load balancing result at all times. To achieve the best performance, we recommend that you configure the PBR policy so that forward and return packets of a connection are directed to the same threat defense. For example, if you have a Cisco router, redundancy can be achieved by using Cisco IOS PBR with Object Tracking. Cisco IOS Object Tracking monitors each threat defense using ICMP ping. PBR can then enable or disable route maps based on reachability of a particular threat defense. See the following URLs for more details:

<http://www.cisco.com/c/en/us/solutions/data-center-virtualization/intelligent-traffic-director/index.html>

[http://www.cisco.com/en/US/products/ps6599/products\\_white\\_paper09186a00800a4409.shtml](http://www.cisco.com/en/US/products/ps6599/products_white_paper09186a00800a4409.shtml)

## Equal-Cost Multi-Path Routing

When using Individual interfaces, each threat defense interface maintains its own IP address and MAC address. One method of load balancing is Equal-Cost Multi-Path (ECMP) routing.

We recommend this method if you are already using ECMP, and want to take advantage of your existing infrastructure.

ECMP routing can forward packets over multiple “best paths” that tie for top place in the routing metric. Like EtherChannel, a hash of source and destination IP addresses and/or source and destination ports can be used to send a packet to one of the next hops. If you use static routes for ECMP routing, then the threat defense failure can cause problems; the route continues to be used, and traffic to the failed threat defense will be lost.

If you use static routes, be sure to use a static route monitoring feature such as Object Tracking. We recommend using dynamic routing protocols to add and remove routes, in which case, you must configure each threat defense to participate in dynamic routing.

### Cisco Intelligent Traffic Director (Routed Firewall Mode Only)

When using Individual interfaces, each threat defense interface maintains its own IP address and MAC address. Intelligent Traffic Director (ITD) is a high-speed hardware load-balancing solution for Nexus 5000, 6000, 7000, and 9000 switch series. In addition to fully covering the functional capabilities of traditional PBR, it offers a simplified configuration workflow and multiple additional features for a more granular load distribution.

ITD supports IP stickiness, consistent hashing for bi-directional flow symmetry, virtual IP addressing, health monitoring, sophisticated failure handling policies with N+M redundancy, weighted load-balancing, and application IP SLA probes including DNS. Due to the dynamic nature of load-balancing, it achieves a more even traffic distribution across all cluster nodes as compared to PBR. In order to achieve bi-directional flow symmetry, we recommend configuring ITD such that forward and return packets of a connection are directed to the same threat defense. See the following URL for more details:

[https://www.cisco.com/c/dam/en/us/td/docs/switches/datacenter/sw/design/itd\\_deployment/ITD\\_ASA\\_Deployment\\_Guide.pdf](https://www.cisco.com/c/dam/en/us/td/docs/switches/datacenter/sw/design/itd_deployment/ITD_ASA_Deployment_Guide.pdf)

## Cable and Add Devices to the Management Center

Before configuring clustering, you need to prepare your devices. In particular, the cluster will not come up unless all nodes can communicate over the cluster control link. Therefore, before you form the cluster, the cluster control link must be ready to go.

### Procedure

- 
- Step 1** Cable the cluster control link network, management network, and data networks.
- Step 2** Configure the upstream and downstream equipment.
- For the cluster control link network, set the MTU to be at least 100 bytes higher than the data interface MTU.  
  
By default, the data interface MTU is 1500 bytes, so the cluster control link MTU on the cluster node will be set to 1600 bytes. If you use higher MTUs on your data interfaces, increase the cluster control link MTU on connecting switches accordingly.
  - Configure cluster control link interfaces on upstream and downstream equipment, including for an optional EtherChannel.  
  
See [Cluster Control Link Interfaces and Network](#), on page 655 for cluster control link requirements.
  - Configure data interfaces on upstream and downstream equipment, including Spanned EtherChannels.  
  
See [About Cluster Interfaces](#), on page 654 for information about how to cable Spanned EtherChannels.
- Step 3** Add each node to the management center as a standalone device in the same domain and group.
- You can create a cluster with a single device, and then add more nodes later. The initial settings (licensing, access control policy) that you set when you add a device will be inherited by all cluster nodes from the control node. You will choose the control node when forming the cluster.

**Step 4** Enable the cluster control link on the device you want to be the control node.

When you add the other nodes, they will inherit the cluster control link configuration.

**Note** Do *not* configure the name or IP addressing for the cluster control link. The MTU of the cluster control link interface is automatically set to 100 bytes more than the highest data interface MTU when you form the cluster, so you do not need to set it now. However, we do not recommend setting the cluster control link MTU between 2561 and 8362; due to block pool handling, this MTU size is not optimal for system operation. If the MTU is set in this range when you add the cluster, we recommend returning to the **Interfaces** page and manually increasing it above 8362.

- a) On the device you want to be the control node, choose **Devices > Device Management**, and click **Edit** (✎).
- b) Click **Interfaces**.
- c) Enable the interface. If you are going to use an EtherChannel for the cluster control link, enable all members. See [Enable the Physical Interface and Configure Ethernet Settings, on page 911](#).

*Figure 152: Enable the Cluster Control Link Interface*

The screenshot shows the 'Edit Physical Interface' configuration page. At the top, there are four tabs: 'General', 'IPv4', 'IPv6', and 'Path Monitoring'. The 'General' tab is active. Below the tabs, there is a 'Name:' label followed by an empty text input field. Below the input field, there is a checkbox labeled 'Enabled' which is checked. A red rectangular box highlights the 'Enabled' checkbox.

- d) (Optional) Add an EtherChannel. See [Configure an EtherChannel, on page 918](#).

We recommend using the On mode for cluster control link member interfaces to reduce unnecessary traffic on the cluster control link (Active mode is the default). The cluster control link does not need the overhead of LACP traffic because it is an isolated, stable network. **Note:** We recommend setting *data* EtherChannels to Active mode.

- e) Click **Save** and then **Deploy** to deploy the interface changes to the control node.

## Create a Cluster

Form a cluster from one or more devices in the management center.

### Procedure

**Step 1** Choose **Devices > Device Management**, and then choose **Add > Cluster**.

The **Add Cluster Wizard** appears.

Figure 153: Add Cluster Wizard

### Add Cluster Wizard

1 Configuration — 2 Summary

**!** Create a cluster for supported models. Note: For the Firepower 4100/9300 and threat defense virtual (AWS/GCP/Azure), use the Add Device option. Make sure connected switches match the MTUs for data interfaces and the cluster control link interface.

**Cluster Name \***

**Cluster Key**

**Control Node**  
 You can form the cluster with just the control node to reduce formation time.

**Node \***  **Cluster Control Link Network \***  /

**Cluster Control Link \***  **Cluster Control Link IPv4 Address \***  **Priority \***  **Site ID**

**Cluster Mode**

**Data Nodes (Optional)**  
 Data node hardware needs to match the control node hardware.

**Node \***  **Cluster Control Link IPv4 Address \***  **Priority \***  **Site ID**  [Remove](#)

[Add a data node](#)

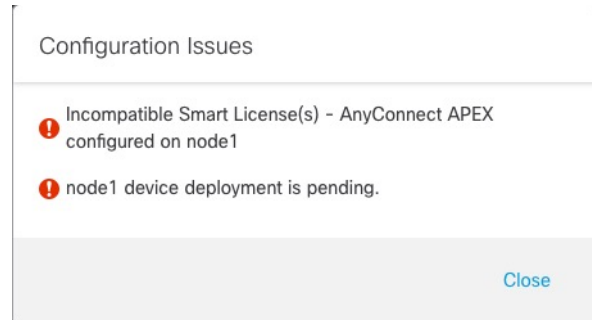

[Cancel](#) [Continue](#)

Figure 154:

- Step 2** Specify a **Cluster Name** and an authentication **Cluster Key** for control traffic.
- **Cluster Name**—An ASCII string from 1 to 38 characters.
  - **Cluster Key**—An ASCII string from 1 to 63 characters. The **Cluster Key** value is used to generate the encryption key. This encryption does not affect datapath traffic, including connection state update and forwarded packets, which are always sent in the clear.
- Step 3** For the **Control Node**, set the following:
- **Node**—Choose the device that you want to be the control node initially. When the management center forms the cluster, it will add this node to the cluster first so it will be the control node.

**Note** If you see an **Error** (❗) icon next to the node name, click the icon to view configuration issues. You must cancel cluster formation, resolve the issues, and then return to cluster formation. For example:

*Figure 155: Configuration Issues*

To resolve the above issues, remove the unsupported VPN license and deploy pending configuration changes to the device.

- **Cluster Control Link Network**—Specify an IPv4 subnet; IPv6 is not supported for this interface. Specify a **24, 25, 26, or 27** subnet.
- **Cluster Control Link**—Choose the physical interface or EtherChannel you want to use for the cluster control link.

**Note** The MTU of the cluster control link interface is automatically set to 100 bytes more than the highest data interface MTU; by default, the MTU is 1600 bytes. We do not recommend setting the cluster control link MTU between 2561 and 8362; due to block pool handling, this MTU size is not optimal for system operation. If the MTU is set in this range when you add the cluster, we recommend increasing the MTU above 8362 on the **Devices > Device Management > Interfaces** page.

Make sure you configure switches connected to the cluster control link to the correct (higher) MTU; otherwise, cluster formation will fail.

- **Cluster Control Link IPv4 Address**—This field will be auto-populated with the first address on the cluster control link network. You can edit the host address if desired.
- **Priority**—Set the priority of this node for control node elections. The priority is between 1 and 100, where 1 is the highest priority. Even if you set the priority to be lower than other nodes, this node will still be the control node when the cluster is first formed.
- **Site ID**—(FlexConfig feature) Enter the site ID for this node between 1 and 8. A value of 0 disables inter-site clustering. Additional inter-site cluster customizations to enhance redundancy and stability, such as director localization, site redundancy, and cluster flow mobility, are only configurable using the FlexConfig feature.

**Step 4** For the **Cluster Mode**, choose **Spanned EtherChannel Mode** or **Individual Interface Mode**.

**Step 5** For **Data Nodes (Optional)**, click **Add a data node** to add a node to the cluster.

You can form the cluster with only the control node for faster cluster formation, or you can add all nodes now. Set the following for each data node:

- **Node**—Choose the device that you want to add.

**Note** If you see an **Error** (❗) icon next to the node name, click the icon to view configuration issues. You must cancel cluster formation, resolve the issues, and then return to cluster formation.

- **Cluster Control Link IPv4 Address**—This field will be auto-populated with the next address on the cluster control link network. You can edit the host address if desired.
- **Priority**—Set the priority of this node for control node elections. The priority is between 1 and 100, where 1 is the highest priority.
- **Site ID**—(FlexConfig feature) Enter the site ID for this node between 1 and 8. A value of 0 disables inter-site clustering. Additional inter-site cluster customizations to enhance redundancy and stability, such as director localization, site redundancy, and cluster flow mobility, are only configurable using the FlexConfig feature.

**Step 6** Click **Continue**. Review the **Summary**, and then click **Save**.

The cluster name shows on the **Devices > Device Management** page; expand the cluster to see the cluster nodes.

**Figure 156: Cluster Management**

Node Name	Model	Version	Priority	Site ID	Policy
172.16.0.50 (Control) 172.16.0.50 - Transparent	Firewall 3120 Threat Defense	7.1.0	Manage	Base, Threat (2 more...)	Default AC Policy
172.16.0.51 172.16.0.51 - Transparent	Firewall 3120 Threat Defense	7.1.0	N/A	Base, Threat (2 more...)	Default AC Policy

A node that is currently registering shows the loading icon.

**Figure 157: Node Registration**

Node Name	Model	Version	Priority	Site ID	Policy
172.16.0.50 (Control) 172.16.0.50 - Transparent	Firewall 3120 Threat Defense	7.1.0	Manage	Base, Threat (2 more...)	Default AC Policy
172.16.0.51 172.16.0.51 - Transparent	Firewall 3120 Threat Defense	7.1.0	N/A	Base, Threat (2 more...)	Default AC Policy

You can monitor cluster node registration by clicking the **Notifications** icon and choosing **Tasks**. The management center updates the Cluster Registration task as each node registers.

IP/ID	Status	Duration
10.10.1.12	Deployment to device successful.	1m 54s
10.10.1.13	Deployment to device successful.	1m 3s
TD_Cluster	Deployment to device successful.	35s

**Step 7** Configure device-specific settings by clicking the **Edit** (✎) for the cluster.

Most configuration can be applied to the cluster as a whole, and not nodes in the cluster. For example, you can change the display name per node, but you can only configure interfaces for the whole cluster.

**Step 8** On the **Devices > Device Management > Cluster** screen, you see **General** and other settings for the cluster.

**Figure 158: Cluster Settings**

## Configure Interfaces

You can configure data interfaces as either Spanned EtherChannels or as Individual interfaces. Each method uses a different load-balancing mechanism. You cannot configure both types in the same configuration.

### Configure Spanned EtherChannels

Configure data interfaces as Spanned EtherChannels.

#### Procedure

- Step 1** Choose **Devices > Device Management**, and click **Edit** () next to the cluster.
- Step 2** Click **Interfaces**.
- Step 3** Configure Spanned EtherChannel data interfaces.
  - a) Configure one or more EtherChannels. See [Configure an EtherChannel, on page 918](#).

You can include one or more member interfaces in the EtherChannel. Because this EtherChannel is spanned across all of the nodes, you only need one member interface per node; however, for greater throughput and redundancy, multiple members are recommended.

- b) (Optional) For regular firewall interfaces, configure VLAN subinterfaces on the EtherChannel. The rest of this procedure applies to the subinterfaces. See [Add a Subinterface, on page 967](#).
- c) Click **Edit** (✎) for the EtherChannel interface.
- d) Configure the name and other parameters. For regular firewall interfaces, see [Configure Routed Mode Interfaces, on page 985](#) or, for transparent mode, [Configure Bridge Group Interfaces, on page 990](#). For IPS-only interfaces, see [Inline Sets and Passive Interfaces, on page 1023](#).
  - If the cluster control link interface MTU is not at least 100 bytes higher than the data interface MTU, you will see an error that you must reduce the MTU of the data interface. By default, the cluster control link MTU is 1600 bytes. If you want to increase the MTU of data interfaces, first increase the cluster control link MTU. Note that we do not recommend setting the cluster control link MTU between 2561 and 8362; due to block pool handling, this MTU size is not optimal for system operation.
  - For routed mode, DHCP, PPPoE, IPv6 autoconfig and manual link-local addresses are not supported. For point-to-point connections, you can specify a 31-bit subnet mask (255.255.255.254). In this case, no IP addresses are reserved for the network or broadcast addresses.
- e) Set a manual global MAC address for the EtherChannel. Click **Advanced**, and in the **Active Mac Address** field, enter a MAC address in H.H.H format, where H is a 16-bit hexadecimal digit.

For example, the MAC address 00-0C-F1-42-4C-DE would be entered as 00C.F142.4CDE. The MAC address must not have the multicast bit set, that is, the second hexadecimal digit from the left cannot be an odd number.

Do not set the **Standby Mac Address**; it is ignored.

You must configure a MAC address for a Spanned EtherChannel to avoid potential network connectivity problems. With a manually-configured MAC address, the MAC address stays with the current control unit. If you do not configure a MAC address, then if the control unit changes, the new control unit uses a new MAC address for the interface, which can cause a temporary network outage.
- f) Click **OK**. Repeat the above steps for other data interfaces.

**Step 4** Click **Save**.

You can now go to **Deploy > Deployment** and deploy the policy to assigned devices. The changes are not active until you deploy them.

---

## Configure Individual Interfaces

Individual interfaces are normal routed interfaces, each with their own IP address taken from a pool of IP addresses. The Main cluster IP address is a fixed address for the cluster that always belongs to the control node.

Individual management interfaces let you SSH directly to each unit if necessary, while a Spanned EtherChannel interface only allows connection to the control node.

IPS-only interfaces (inline sets or passive interfaces) are not supported for Individual interfaces.

### Before you begin

- You must be in Individual interface mode.
- Individual interfaces require you to configure load balancing on neighbor devices. External load balancing is not required for the management interface.
- (Optional) Configure the interface as a device-local EtherChannel interface, and/or configure subinterfaces.  
For an EtherChannel, this EtherChannel is local to the unit, and is not a Spanned EtherChannel.

### Procedure

**Step 1** Choose **Objects > Object Management > Address Pools** to add an IPv4 and/or IPv6 address pool. See [Address Pools, on page 1472](#).

Include at least as many addresses as there are units in the cluster. The main IP address is not a part of this pool, but needs to be on the same network. You cannot determine the exact Local address assigned to each unit in advance.

*Figure 162: Add Address Pool*

### Add IPv4 Pool ?

**Name\***

**Description**

**IPv4 Address Range\***

**Format: ipaddr-ipaddr e.g., 10.72.1.1-10.72.1.150**

**Mask\***

Allow Overrides

**i** Configure device overrides in the address pool object to avoid IP address conflicts in case of object is shared across multiple devices

> Override (0)

Cancel Save

**Note** Although not common, if you want to set the MAC addresses manually, you can also add a MAC address pool object.

- Step 2** On **Devices > Device Management > Interfaces**, click **Edit** (✎) for the interface you want to configure.
- Step 3** On the **IPv4** page, enter the **Virtual IP Address** and mask. This main ("virtual") IP address is a fixed address for the cluster, and always belongs to the control node.

DHCP and PPPoE are not supported. For point-to-point connections, you can specify a 31-bit subnet mask (255.255.255.254). In this case, no IP addresses are reserved for the network or broadcast addresses.

**Figure 163: IPv4 Page**

- Step 4** From the **IPv4 Address Pool** drop-down list, choose the address pool you created.
- Step 5** On **IPv6 > Basic**, from the **IPv6 Address Pool** drop-down list, choose the address pool you created.

IPv6 autoconfig and manual link-local addresses are not supported.

- Step 6** Configure other interface settings as normal.

To set the MAC addresses manually, you can select the MAC address pool from the interface's **Advanced** page.

**Note** If the cluster control link interface MTU is not at least 100 bytes higher than the data interface MTU, you will see an error that you must reduce the MTU of the data interface. By default, the cluster control link MTU is 1600 bytes. If you want to increase the MTU of data interfaces, first increase the cluster control link MTU. Note that we do not recommend setting the cluster control link MTU between 2561 and 8362; due to block pool handling, this MTU size is not optimal for system operation.

## Configure Interfaces

Configure data interfaces as Spanned EtherChannels.

### Procedure

- Step 1** Choose **Devices > Device Management**, and click **Edit** (✎) next to the cluster.
- Step 2** Click **Interfaces**.
- Step 3** Configure Spanned EtherChannel data interfaces.
- Configure one or more EtherChannels. See [Configure an EtherChannel](#), on page 918.

You can include one or more member interfaces in the EtherChannel. Because this EtherChannel is spanned across all of the nodes, you only need one member interface per node; however, for greater throughput and redundancy, multiple members are recommended.

- b) (Optional) For regular firewall interfaces, configure VLAN subinterfaces on the EtherChannel. The rest of this procedure applies to the subinterfaces. See [Add a Subinterface, on page 967](#).
- c) Click **Edit** (✎) for the EtherChannel interface.
- d) Configure the name and other parameters. For regular firewall interfaces, see [Configure Routed Mode Interfaces, on page 985](#) or, for transparent mode, [Configure Bridge Group Interfaces, on page 990](#). For IPS-only interfaces, see [Inline Sets and Passive Interfaces, on page 1023](#).
  - If the cluster control link interface MTU is not at least 100 bytes higher than the data interface MTU, you will see an error that you must reduce the MTU of the data interface. By default, the cluster control link MTU is 1600 bytes. If you want to increase the MTU of data interfaces, first increase the cluster control link MTU. Note that we do not recommend setting the cluster control link MTU between 2561 and 8362; due to block pool handling, this MTU size is not optimal for system operation.
  - For routed mode, DHCP, PPPoE, IPv6 autoconfig and manual link-local addresses are not supported. For point-to-point connections, you can specify a 31-bit subnet mask (255.255.255.254). In this case, no IP addresses are reserved for the network or broadcast addresses.
- e) Set a manual global MAC address for the EtherChannel. Click **Advanced**, and in the **Active Mac Address** field, enter a MAC address in H.H.H format, where H is a 16-bit hexadecimal digit.

For example, the MAC address 00-0C-F1-42-4C-DE would be entered as 000C.F142.4CDE. The MAC address must not have the multicast bit set, that is, the second hexadecimal digit from the left cannot be an odd number.

Do not set the **Standby Mac Address**; it is ignored.

You must configure a MAC address for a Spanned EtherChannel to avoid potential network connectivity problems. With a manually-configured MAC address, the MAC address stays with the current control unit. If you do not configure a MAC address, then if the control unit changes, the new control unit uses a new MAC address for the interface, which can cause a temporary network outage.

- f) Click **OK**. Repeat the above steps for other data interfaces.

#### Step 4 Click **Save**.

You can now go to **Deploy > Deployment** and deploy the policy to assigned devices. The changes are not active until you deploy them.

## Configure Cluster Health Monitor Settings

The **Cluster Health Monitor Settings** section of the **Cluster** page displays the settings described in the table below.

Figure 164: Cluster Health Monitor Settings

Cluster Health Monitor Settings			
<b>Timeouts</b>			
Hold Time			3 s
Interface Debounce Time			9000 ms
<b>Monitored Interfaces</b>			
Service Application			Enabled
Unmonitored Interfaces			None
<b>Auto-Rejoin Settings</b>			
	Attempts	Interval Between Attempts	Interval Variation
Cluster Interface	-1	5	1
Data Interface	3	5	2
System	3	5	2

Table 53: Cluster Health Monitor Settings Section Table Fields

Field	Description
<b>Timeouts</b>	
Hold Time	Between .3 and 45 seconds; The default is 3 seconds. To determine node system health, the cluster nodes send heartbeat messages on the cluster control link to other nodes. If a node does not receive any heartbeat messages from a peer node within the hold time period, the peer node is considered unresponsive or dead.
Interface Debounce Time	Between 300 and 9000 ms. The default is 500 ms. The interface debounce time is the amount of time before the node considers an interface to be failed, and the node is removed from the cluster.
<b>Monitored Interfaces</b>	The interface health check monitors for link failures. If all physical ports for a given logical interface fail on a particular node, but there are active ports under the same logical interface on other nodes, then the node is removed from the cluster. The amount of time before the node removes a member from the cluster depends on the type of interface and whether the node is an established node or is joining the cluster.
Service Application	Shows whether the Snort and disk-full processes are monitored.
Unmonitored Interfaces	Shows unmonitored interfaces.
<b>Auto-Rejoin Settings</b>	
Cluster Interface	Shows the auto-rejoin settings after a cluster control link failure.

Field	Description
<i>Attempts</i>	Between -1 and 65535. The default is -1 (unlimited). Sets the number of rejoin attempts.
<i>Interval Between Attempts</i>	Between 2 and 60. The default is 5 minutes. Defines the interval duration in minutes between rejoin attempts.
<i>Interval Variation</i>	Between 1 and 3. The default is 1x the interval duration. Defines if the interval duration increases at each attempt.
Data Interfaces	Shows the auto-rejoin settings after a data interface failure.
<i>Attempts</i>	Between -1 and 65535. The default is 3. Sets the number of rejoin attempts.
<i>Interval Between Attempts</i>	Between 2 and 60. The default is 5 minutes. Defines the interval duration in minutes between rejoin attempts.
<i>Interval Variation</i>	Between 1 and 3. The default is 2x the interval duration. Defines if the interval duration increases at each attempt.
System	Shows the auto-rejoin settings after internal errors. Internal failures include: application sync timeout; inconsistent application statuses; and so on.
<i>Attempts</i>	Between -1 and 65535. The default is 3. Sets the number of rejoin attempts.
<i>Interval Between Attempts</i>	Between 2 and 60. The default is 5 minutes. Defines the interval duration in minutes between rejoin attempts.
<i>Interval Variation</i>	Between 1 and 3. The default is 2x the interval duration. Defines if the interval duration increases at each attempt.

**Note** If you disable the system health check, fields that do not apply when the system health check is disabled will not show.

You can change these settings from this section.

You can monitor any port-channel ID, single physical interface ID, as well as the Snort and disk-full processes. Health monitoring is not performed on VLAN subinterfaces or virtual interfaces such as VNIs or BVIs. You cannot configure monitoring for the cluster control link; it is always monitored.

**Procedure**

- Step 1** Choose **Devices > Device Management**.
- Step 2** Next to the cluster you want to modify, click **Edit** (✎).
- Step 3** Click **Cluster**.
- Step 4** In the **Cluster Health Monitor Settings** section, click **Edit** (✎).
- Step 5** Disable the system health check by clicking the **Health Check** slider .

Figure 165: Disable the System Health Check

Edit Cluster Health Monitor Settings

Health Check  ⓘ

▼ Timeouts

Hold Time  Range: 0.3 to 45 seconds

Interface Debounce Time  Range: 300 to 9000 milliseconds

> Auto-Rejoin Settings

> Monitored Interfaces

Reset to Defaults Cancel Save

When any topology changes occur (such as adding or removing a data interface, enabling or disabling an interface on the node or the switch, or adding an additional switch to form a VSS or vPC) you should disable the system health check feature and also disable interface monitoring for the disabled interfaces. When the topology change is complete, and the configuration change is synced to all nodes, you can re-enable the system health check feature and monitored interfaces.

**Step 6** Configure the hold time and interface debounce time.

- **Hold Time**—Set the hold time to determine the amount of time between node heartbeat status messages, between .3 and 45 seconds; The default is 3 seconds.
- **Interface Debounce Time**—Set the debounce time between 300 and 9000 ms. The default is 500 ms. Lower values allow for faster detection of interface failures. Note that configuring a lower debounce time increases the chances of false-positives. When an interface status update occurs, the node waits the number of milliseconds specified before marking the interface as failed, and the node is removed from the cluster. In the case of an EtherChannel that transitions from a down state to an up state (for example, the switch reloaded, or the switch enabled an EtherChannel), a longer debounce time can prevent the interface from appearing to be failed on a cluster node just because another cluster node was faster at bundling the ports.

**Step 7** Customize the auto-rejoin cluster settings after a health check failure.

Figure 166: Configure Auto-Rejoin Settings

▼ Auto-Rejoin Settings

---

**Cluster Interface**

Attempts  Range: 0-65535 (-1 for unlimited number of attempts)

Interval Between Attempts  Range: 2-60 minutes between rejoin attempts

Interval Variation  Range: 1-3. Defines if the interval duration increases. 1 (no change); 2 (2 x the previous duration), or 3 (3 x the previous duration).

**Data Interface**

Attempts  Range: 0-65535 (-1 for unlimited number of attempts)

Interval Between Attempts  Range: 2-60 minutes between rejoin attempts

Interval Variation  Range: 1-3. Defines if the interval duration increases. 1 (no change); 2 (2 x the previous duration), or 3 (3 x the previous duration).

**System**

Attempts  Range: 0-65535 (-1 for unlimited number of attempts)

Interval Between Attempts  Range: 2-60 minutes between rejoin attempts

Interval Variation  Range: 1-3. Defines if the interval duration increases. 1 (no change); 2 (2 x the previous duration), or 3 (3 x the previous duration).

Set the following values for the **Cluster Interface**, **Data Interface**, and **System** (internal failures include: application sync timeout; inconsistent application statuses; and so on):

- **Attempts**—Sets the number of rejoin attempts, between -1 and 65535. **0** disables auto-rejoining. The default for the **Cluster Interface** is -1 (unlimited). The default for the **Data Interface** and **System** is 3.
- **Interval Between Attempts**—Defines the interval duration in minutes between rejoin attempts, between 2 and 60. The default value is 5 minutes. The maximum total time that the node attempts to rejoin the cluster is limited to 14400 minutes (10 days) from the time of last failure.
- **Interval Variation**—Defines if the interval duration increases. Set the value between 1 and 3: **1** (no change); **2** (2 x the previous duration), or **3** (3 x the previous duration). For example, if you set the interval duration to 5 minutes, and set the variation to 2, then the first attempt is after 5 minutes; the 2nd attempt is 10 minutes (2 x 5); the 3rd attempt 20 minutes (2 x 10), and so on. The default value is **1** for the **Cluster Interface** and **2** for the **Data Interface** and **System**.

**Step 8**

Configure monitored interfaces by moving interfaces in the **Monitored Interfaces** or **Unmonitored Interfaces** window. You can also check or uncheck **Enable Service Application Monitoring** to enable or disable monitoring of the Snort and disk-full processes.

**Figure 167: Configure Monitored Interfaces**

- GigabitEthernet0/4
- GigabitEthernet0/5
- GigabitEthernet0/6
- GigabitEthernet0/7
- Diagnostic0/0

Add

Unmonitored Interfaces 0

Enable Service Application Monitoring

The interface health check monitors for link failures. If all physical ports for a given logical interface fail on a particular node, but there are active ports under the same logical interface on other nodes, then the node is removed from the cluster. The amount of time before the node removes a member from the cluster depends on the type of interface and whether the node is an established node or is joining the cluster. Health check is enabled by default for all interfaces and for the Snort and disk-full processes.

You might want to disable health monitoring of non-essential interfaces.

When any topology changes occur (such as adding or removing a data interface, enabling or disabling an interface on the node or the switch, or adding an additional switch to form a VSS or vPC) you should disable the system health check feature and also disable interface monitoring for the disabled interfaces. When the topology change is complete, and the configuration change is synced to all nodes, you can re-enable the system health check feature and monitored interfaces.

**Step 9** Click **Save**.

**Step 10** Deploy configuration changes.

## Manage Cluster Nodes

After you deploy the cluster, you can change the configuration and manage cluster nodes.

### Add a New Cluster Node

You can add one or more new cluster nodes to an existing cluster.

## Procedure

**Step 1** Choose **Devices > Device Management**, click **More** (⋮) for the cluster, and choose **Add Nodes**.

*Figure 168: Add Nodes*

The **Manage Cluster Wizard** appears.

**Step 2** From the **Node** menu, choose a device, adjust the IP address, priority, and Site ID if desired.

*Figure 169: Manage Cluster Wizard*

Manage Cluster Wizard

1 Configuration — 2 Summary

Cluster Name\*  
ftdcluster

Cluster Key  
.....  
.....

**Control Node**  
You can form the cluster with just the control node to reduce formation time.

Node*	Cluster Control Link Network*		
172.16.0.50	10.10.10.0 / 24 (254 addresses)		
Cluster Control Link*	Cluster Control Link IPv4 Address*	Priority*	Site ID
Ethernet1/7	10.10.10.1	1	0

**Data Nodes (Optional)**  
Data node hardware needs to match the control node hardware.

Node*	Cluster Control Link IPv4 Address*	Priority*	Site ID
172.16.0.51	10.10.10.2	2	0
Node*	Cluster Control Link IPv4 Address*	Priority*	Site ID
Type device name	10.10.10.3	3	0

[Add a data node](#) [Remove](#)

**Step 3** To add additional nodes, click **Add a data node**.

**Step 4** Click **Continue**. Review the **Summary**, and then click **Save**

The node that is currently registering shows the loading icon.

**Figure 170: Node Registration**

You can monitor cluster node registration by clicking the **Notifications** icon and choosing **Tasks**.

## Break a Node

You can remove a node from the cluster so that it becomes a standalone device. You cannot break the control node unless you break the entire cluster. The data node has its configuration erased.

### Procedure

- Step 1** Choose **Devices > Device Management**, click **More** (⋮) for the node you want to break, and choose **Break Node**.

**Figure 171: Break a Node**

You can optionally break one or more nodes from the cluster More menu by choosing **Break Nodes**.

- Step 2** You are prompted to confirm the break; click **Yes**.

Figure 172: Confirm Break

You can monitor the cluster node break by clicking the **Notifications** icon and choosing **Tasks**.

## Break the Cluster

You can break the cluster and convert all nodes to standalone devices. The control node retains the interface and security policy configuration, while data nodes have their configuration erased.

### Procedure

**Step 1** Make sure all cluster nodes are being managed by the management center by reconciling nodes. See [Reconcile Cluster Nodes](#), on page 686.

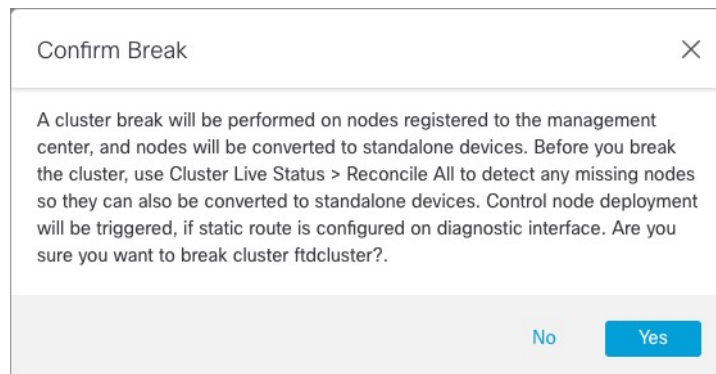

**Step 2** Choose **Devices > Device Management**, click **More** (⋮) for the cluster, and choose **Break Cluster**.

Figure 173: Break Cluster

**Step 3** You are prompted to break the cluster; click **Yes**.

Figure 174: Confirm Break

You can monitor the cluster break by clicking the **Notifications** icon and choosing **Tasks**.

## Disable Clustering

You may want to deactivate a node in preparation for deleting the node, or temporarily for maintenance. This procedure is meant to temporarily deactivate a node; the node will still appear in the management center device list. When a node becomes inactive, all data interfaces are shut down.

### Procedure

- Step 1** For the unit you want to disable, choose **Devices > Device Management**, click **More** (⋮), and choose **Disable Node Clustering**.

Figure 175: Disable Clustering

If you disable clustering on the control node, one of the data nodes will become the new control node. Note that for centralized features, if you force a control node change, then all connections are dropped, and you have to re-establish the connections on the new control node. You cannot disable clustering on the control node if it is the only node in the cluster.

- Step 2** Confirm that you want to disable clustering on the node.  
The node will show **(Disabled)** next to its name in the **Devices > Device Management** list.
- Step 3** To reenable clustering, see [Rejoin the Cluster, on page 684](#).

## Rejoin the Cluster

If a node was removed from the cluster, for example for a failed interface or if you manually disabled clustering, you must manually rejoin the cluster. Make sure the failure is resolved before you try to rejoin the cluster.

### Procedure

---

- Step 1** For the unit you want to reactivate, choose **Devices > Device Management**, click **More** (⋮), and choose **Enable Node Clustering**.
- Step 2** Confirm that you want to enable clustering on the unit.
- 

## Change the Control Node

**Caution** The best method to change the control node is to disable clustering on the control node, wait for a new control election, and then re-enable clustering. If you must specify the *exact* unit you want to become the control node, use the procedure in this section. Note that for centralized features, if you force a control node change using either method, then all connections are dropped, and you have to re-establish the connections on the new control node.

---

To change the control node, perform the following steps.

### Procedure

---

- Step 1** Open the **Cluster Status** dialog box by choosing **Devices > Device Management > More** (⋮) > **Cluster Live Status**.

Figure 176: Cluster Status

Cluster Status ?

---

Overall Status:  Cluster has all nodes in sync

Nodes details (2)

	Status	Device Name	Unit Name	Chassis URL	
>	In Sync.	172.16.0.50 <span style="background-color: #ccc; padding: 2px;">Control</span>	172.16.0.50	N/A	⋮
>	In Sync.	172.16.0.51	172.16.0.51	N/A	⋮

Dated: 11:52:26 | 20 Dec 2021

**Step 2** For the unit you want to become the control unit, choose **More** (⋮) > **Change Role to Control**.

**Step 3** You are prompted to confirm the role change. Check the checkbox, and click **OK**.

## Edit the Cluster Configuration

You can edit the cluster configuration. If you change the cluster key, cluster control link interface, or cluster control link network, the cluster will be broken and reformed automatically. Until the cluster is reformed, you may experience traffic disruption. If you change the cluster control link IP address for a node, node priority, or site ID, only the affected nodes are broken and readded to the cluster.

### Procedure

**Step 1** Choose **Devices > Device Management**, click **More** (⋮) for the cluster, and choose **Edit Configuration**.

Figure 177: Edit Configuration

The **Manage Cluster Wizard** appears.

**Step 2** Update the cluster configuration.

Figure 178: Manage Cluster Wizard

If the cluster control link is an EtherChannel, you can edit the interface membership and LACP configuration by clicking **Edit** (✎) next to the interface drop-down menu.

**Step 3** Click **Continue**. Review the **Summary**, and then click **Save**

## Reconcile Cluster Nodes

If a cluster node fails to register, you can reconcile the cluster membership from the device to the management center. For example, a data node might fail to register if the management center is occupied with certain processes, or if there is a network issue.

## Procedure

- Step 1** Choose **Devices > Device Management > More** (⋮) for the cluster, and then choose **Cluster Live Status** to open the **Cluster Status** dialog box.

**Figure 179: Cluster Live Status**

- Step 2** Click **Reconcile All**.

**Figure 180: Reconcile All**

Cluster Status ?

Overall Status: ✔ Cluster has all nodes in sync

	Status	Device Name	Unit Name	Chassis URL	
>	In Sync.	172.16.0.50 <span style="background-color: #ccc;">Control</span>	172.16.0.50	N/A	⋮
>	In Sync.	172.16.0.51	172.16.0.51	N/A	⋮

Dated: 11:52:26 | 20 Dec 2021 Close

For more information about the cluster status, see [Monitoring the Cluster](#), on page 689.

## Unregister the Cluster or Nodes and Register to a New Management Center

You can unregister the cluster from the management center, which keeps the cluster intact. You might want to unregister the cluster if you want to add the cluster to a new management center.

You can also unregister a node from the management center without breaking the node from the cluster. Although the node is not visible in the management center, it is still part of the cluster, and it will continue to pass traffic and could even become the control node. You cannot unregister the current control node. You might want to unregister the node if it is no longer reachable from the management center, but you still want to keep it as part of the cluster while you troubleshoot management connectivity.

Unregistering a cluster:

- Severs all communication between the management center and the cluster.
- Removes the cluster from the **Device Management** page.
- Returns the cluster to local time management if the cluster's platform settings policy is configured to receive time from the management center using NTP.
- Leaves the configuration intact, so the cluster continues to process traffic.

Policies, such as NAT and VPN, ACLs, and the interface configurations remain intact.

Registering the cluster again to the same or a different management center causes the configuration to be removed, so the cluster will stop processing traffic at that point; the cluster configuration remains intact so you can add the cluster as a whole. You can choose an access control policy at registration, but you will have to re-apply other policies after registration and then deploy the configuration before it will process traffic again.

### Before you begin

This procedure requires CLI access to one of the nodes.

### Procedure

- 
- Step 1** Choose **Devices > Device Management**, click **More** (⋮) for the cluster or node, and choose **Unregister**.

**Figure 181: Unregister Cluster or Node**

- Step 2** You are prompted to unregister the cluster or node; click **Yes**.
- Step 3** You can register the cluster to a new (or the same) management center by adding one of the cluster members as a new device.
- You only need to add one of the cluster nodes as a device, and the rest of the cluster nodes will be discovered.
- Step 4** To re-add an unregistered node, see [Reconcile Cluster Nodes, on page 686](#).
- 

## Monitoring the Cluster

You can monitor the cluster in the management center and at the threat defense CLI.

- **Cluster Status** dialog box, which is available from the **Devices > Device Management > More** (⋮) icon or from the **Devices > Device Management > Cluster** page > **General** area > **Cluster Live Status** link.

Figure 182: Cluster Status

The Control node has a graphic indicator identifying its role.

Cluster member **Status** includes the following states:

- In Sync.—The node is registered with the management center.
- Pending Registration—The node is part of the cluster, but has not yet registered with the management center. If a node fails to register, you can retry registration by clicking **Reconcile All**.
- Clustering is disabled—The node is registered with the management center, but is an inactive member of the cluster. The clustering configuration remains intact if you intend to later re-enable it, or you can delete the node from the cluster.
- Joining cluster...—The node is joining the cluster on the chassis, but has not completed joining. After it joins, it will register with the management center.

For each node, you can view the **Summary** or the **History**.

- System (⚙️) > Tasks page.

The **Tasks** page shows updates of the Cluster Registration task as each node registers.

- Devices > Device Management > *cluster\_name*.

When you expand the cluster on the devices listing page, you can see all member nodes, including the control node shown with its role next to the IP address. For nodes that are still registering, you can see the loading icon.

- **show cluster** {**access-list** [*acl\_name*] | **conn** [**count**] | **cpu** [**usage**] | **history** | **interface-mode** | **memory** | **resource usage** | **service-policy** | **traffic** | **xlate count**}

To view aggregated data for the entire cluster or other information, use the **show cluster** command.

- **show cluster info** [**auto-join** | **clients** | **conn-distribution** | **flow-mobility counters** | **goid** [*options*] | **health** | **incompatible-config** | **loadbalance** | **old-members** | **packet-distribution** | **trace** [*options*] | **transport** { **asp** | **cp**}]

To view cluster information, use the **show cluster info** command.

# Cluster Health Monitor Dashboard

## Cluster Health Monitor

When a threat defense is the control node of a cluster, the management center collects various metrics periodically from the device metric data collector. The cluster health monitor is comprised of the following components:

- Overview dashboard—Displays information about the cluster topology, cluster statistics, and metric charts:
  - The topology section displays a cluster's live status, the health of individual threat defense, threat defense node type (control node or data node), and the status of the device. The status of the device could be *Disabled* (when the device leaves the cluster), *Added out of box* (in a public cloud cluster, the additional nodes that do not belong to the management center), or *Normal* (ideal state of the node).
  - The cluster statistics section displays current metrics of the cluster with respect to the CPU usage, memory usage, input rate, output rate, active connections, and NAT translations.

---

**Note** The CPU and memory metrics display the individual average of the data plane and snort usage.

---

- The metric charts, namely, CPU Usage, Memory Usage, Throughput, and Connections, diagrammatically display the statistics of the cluster over the specified time period.
- Load Distribution dashboard—Displays load distribution across the cluster nodes in two widgets:
  - The Distribution widget displays the average packet and connection distribution over the time range across the cluster nodes. This data depicts how the load is being distributed by the nodes. Using this widget, you can easily identify any abnormalities in the load distribution and rectify it.
  - The Node Statistics widget displays the node level metrics in table format. It displays metric data on CPU usage, memory usage, input rate, output rate, active connections, and NAT translations across the cluster nodes. This table view enables you to correlate data and easily identify any discrepancies.
- Member Performance dashboard—Displays current metrics of the cluster nodes. You can use the selector to filter the nodes and view the details of a specific node. The metric data include CPU usage, memory usage, input rate, output rate, active connections, and NAT translations.
- CCL dashboard—Displays, graphically, the cluster control link data namely, the input, and output rate.
- Troubleshooting and Links — Provides convenient links to frequently used troubleshooting topics and procedures.
- Time range—An adjustable time window to constrain the information that appears in the various cluster metrics dashboards and widgets.
- Custom Dashboard—Displays data on both cluster-wide metrics and node-level metrics. However, node selection only applies for the threat defense metrics and not for the entire cluster to which the node belongs.

## Viewing Cluster Health

You must be an Admin, Maintenance, or Security Analyst user to perform this procedure.

The cluster health monitor provides a detailed view of the health status of a cluster and its nodes. This cluster health monitor provides health status and trends of the cluster in an array of dashboards.

### Before you begin

- Ensure you have created a cluster from one or more devices in the management center.

### Procedure

- 
- Step 1** Choose **System** (⚙) > **Health** > **Monitor**.  
Use the Monitoring navigation pane to access node-specific health monitors.
- Step 2** In the device list, click **Expand** (➤) and **Collapse** (▼) to expand and collapse the list of managed cluster devices.
- Step 3** To view the cluster health statistics, click on the cluster name. The cluster monitor reports health and performance metrics in several predefined dashboards by default. The metrics dashboards include:
- **Overview** — Highlights key metrics from the other predefined dashboards, including its nodes, CPU, memory, input and output rates, connection statistics, and NAT translation information.
  - **Load Distribution** — Traffic and packet distribution across the cluster nodes.
  - **Member Performance** — Node-level statistics on CPU usage, memory usage, input throughput, output throughput, active connection, and NAT translation.
  - **CCL** — Interface status and aggregate traffic statistics.
- You can navigate through the various metrics dashboards by clicking on the labels. For a comprehensive list of the supported cluster metrics, see [Cisco Secure Firewall Threat Defense Health Metrics](#).
- Step 4** You can configure the time range from the drop-down in the upper-right corner. The time range can reflect a period as short as the last hour (the default) or as long as two weeks. Select **Custom** from the drop-down to configure a custom start and end date.  
Click the refresh icon to set auto refresh to 5 minutes or to toggle off auto refresh.
- Step 5** Click on deployment icon for a deployment overlay on the trend graph, with respect to the selected time range.  
The deployment icon indicates the number of deployments during the selected time-range. A vertical band indicates the deployment start and end time. For multiple deployments, multiple bands/lines appear. Click on the icon on top of the dotted line to view the deployment details.
- Step 6** (For node-specific health monitor) View the **Health Alerts** for the node in the alert notification at the top of page, directly to the right of the device name.  
Hover your pointer over the **Health Alerts** to view the health summary of the node. The popup window shows a truncated summary of the top five health alerts. Click on the popup to open a detailed view of the health alert summary.

**Step 7** (For node-specific health monitor) The device monitor reports health and performance metrics in several predefined dashboards by default. The metrics dashboards include:

- Overview — Highlights key metrics from the other predefined dashboards, including CPU, memory, interfaces, connection statistics; plus disk usage and critical process information.
- CPU — CPU utilization, including the CPU usage by process and by physical cores.
- Memory — Device memory utilization, including data plane and Snort memory usage.
- Interfaces — Interface status and aggregate traffic statistics.
- Connections — Connection statistics (such as elephant flows, active connections, peak connections, and so on) and NAT translation counts.
- Snort — Statistics that are related to the Snort process.
- ASP drops — Statistics related to the dropped packets against various reasons.

You can navigate through the various metrics dashboards by clicking on the labels. See [Cisco Secure Firewall Threat Defense Health Metrics](#) for a comprehensive list of the supported device metrics.

**Step 8** Click the plus sign (+) in the upper right corner of the health monitor to create a custom dashboard by building your own variable set from the available metric groups.

For cluster-wide dashboard, choose Cluster metric group, and then choose the metric.

## Cluster Metrics

The cluster health monitor tracks statistics that are related to a cluster and its nodes, and aggregate of load distribution, performance, and CCL traffic statistics.

**Table 54: Cluster Metrics**

Metric	Description	Format
CPU	Average of CPU metrics on the nodes of a cluster (individually for data plane and snort).	percentage
Memory	Average of memory metrics on the nodes of a cluster (individually for data plane and snort).	percentage
Data Throughput	Incoming and outgoing data traffic statistics for a cluster.	bytes
CCL Throughput	Incoming and outgoing CCL traffic statistics for a cluster.	bytes
Connections	Count of active connections in a cluster.	number
NAT Translations	Count of NAT translations for a cluster.	number
Distribution	Connection distribution count in the cluster for every second.	number

Metric	Description	Format
Packets	Packet distribution count in the cluster for every second.	number

## Troubleshooting the Cluster

You can use the **CCL Ping** tool to make sure the cluster control link is operating correctly.

### Perform a Ping on the Cluster Control Link

You can check to make sure all the cluster nodes can reach each other over the cluster control link by performing a ping. One major cause for the failure of a node to join the cluster is an incorrect cluster control link configuration; for example, the cluster control link MTU may be set higher than the connecting switch MTUs.

#### Procedure

- Step 1** Choose **Devices > Device Management**, click the **More** (⋮) icon next to the cluster, and choose **> Cluster Live Status**.

*Figure 185: Cluster Status*

Cluster Status ?

Overall Status: ✔ Cluster has all nodes in sync

Nodes details (2) Refresh Reconcile All

	Status	Device Name	Unit Name	Chassis URL

>	In Sync.	172.16.0.51	172.16.0.51	N/A	⋮

Dated: 11:52:26 | 20 Dec 2021 Close

- Step 2** Expand one of the nodes, and click **CCL Ping**.

Figure 186: CCL Ping

Cluster Status ?

Overall Status: ❌ Clustering is disabled for 1 node(s)

Nodes details (3) Refresh Reconcile All

Status	Device Name	Unit Name	Chassis URL	
In Sync.	10.10.43.21	Control	10.10.43.21	N/A
<div style="display: flex; justify-content: space-between; border-bottom: 1px solid #ccc; padding-bottom: 5px;"> <span>Summary</span> <span>History</span> <span style="border: 2px solid red; padding: 2px;">CCL Ping</span> </div> <pre> ping 10.10.3.2 size 1654 Sending 5, 1654-byte ICMP Echos to 10.10.3.2, timeout is 2 seconds: ????? Success rate is 0 percent (0/5) ----- ping 10.10.3.1 size 1654 </pre>				
>	Clustering is disabled	10.10.43.22	10.10.43.22	N/A

Dated: 18:38:41 | 01 Mar 2023 Close

The node sends a ping on the cluster control link to every other node using a packet size that matches the maximum MTU.

## Examples for Clustering

These examples include examples for typical deployments.

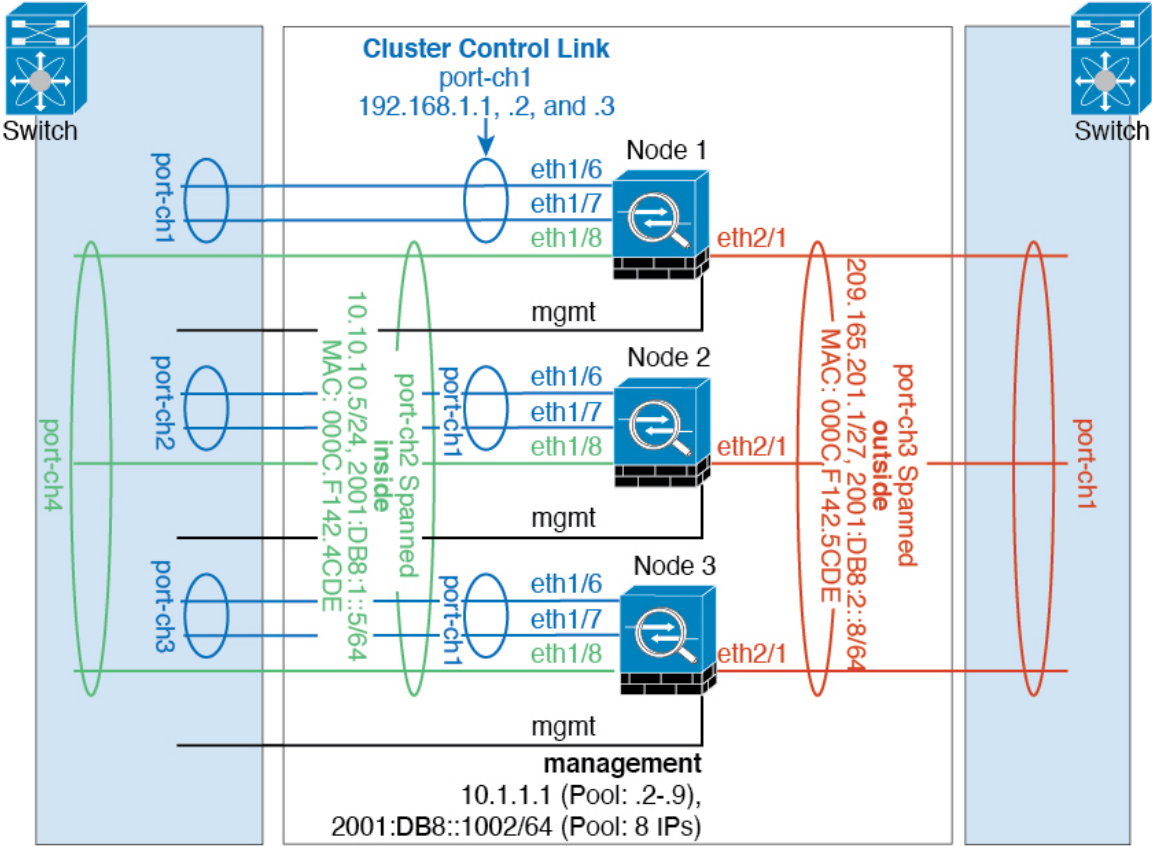

# Firewall on a Stick

Data traffic from different security domains are associated with different VLANs, for example, VLAN 10 for the inside network and VLAN 20 for the outside network. Each has a single physical port connected to the external switch or router. Trunking is enabled so that all packets on the physical link are 802.1q encapsulated. This is the firewall between VLAN 10 and VLAN 20.

When using Spanned EtherChannels, all data links are grouped into one EtherChannel on the switch side. If the becomes unavailable, the switch will rebalance traffic between the remaining units.

# Traffic Segregation

You may prefer physical separation of traffic between the inside and outside network.

As shown in the diagram above, there is one Spanned EtherChannel on the left side that connects to the inside switch, and the other on the right side to outside switch. You can also create VLAN subinterfaces on each EtherChannel if desired.

## Reference for Clustering

This section includes more information about how clustering operates.

## Threat Defense Features and Clustering

Some threat defense features are not supported with clustering, and some are only supported on the control unit. Other features might have caveats for proper usage.

## Unsupported Features with Clustering

These features cannot be configured with clustering enabled, and the commands will be rejected.

---

**Note** To view FlexConfig features that are also not supported with clustering, for example WCCP inspection, see the [ASA general operations configuration guide](#). FlexConfig lets you configure many ASA features that are not present in the management center GUI. See [FlexConfig Policies, on page 2703](#).

---

- Remote access VPN (SSL VPN and IPsec VPN)
- DHCP client, server, and proxy. DHCP relay is supported.
- Virtual Tunnel Interfaces (VTIs)
- High Availability
- Integrated Routing and Bridging
- Management Center UCAPL/CC mode

## Centralized Features for Clustering

The following features are only supported on the control node, and are not scaled for the cluster.

---

**Note** Traffic for centralized features is forwarded from member nodes to the control node over the cluster control link.

If you use the rebalancing feature, traffic for centralized features may be rebalanced to non-control nodes before the traffic is classified as a centralized feature; if this occurs, the traffic is then sent back to the control node.

For centralized features, if the control node fails, all connections are dropped, and you have to re-establish the connections on the new control node.

---

---

**Note** To view FlexConfig features that are also centralized with clustering, for example RADIUS inspection, see the [ASA general operations configuration guide](#). FlexConfig lets you configure many ASA features that are not present in the management center GUI. See [FlexConfig Policies, on page 2703](#).

---

- The following application inspections:
  - DCERPC
  - ESMTTP
  - NetBIOS
  - PPTP
  - RSH
  - SQLNET
  - SUNRPC

- TFTP
- XDMCP
- Static route monitoring
- Site-to-site VPN
- IGMP multicast control plane protocol processing (data plane forwarding is distributed across the cluster)
- PIM multicast control plane protocol processing (data plane forwarding is distributed across the cluster)
- Dynamic routing (Spanned EtherChannel mode only)

## Connection Settings and Clustering

Connection limits are enforced cluster-wide. Each node has an estimate of the cluster-wide counter values based on broadcast messages. Due to efficiency considerations, the configured connection limit across the cluster might not be enforced exactly at the limit number. Each node may overestimate or underestimate the cluster-wide counter value at any given time. However, the information will get updated over time in a load-balanced cluster.

## FTP and Clustering

- If FTP data channel and control channel flows are owned by different cluster members, then the data channel owner will periodically send idle timeout updates to the control channel owner and update the idle timeout value. However, if the control flow owner is reloaded, and the control flow is re-hosted, the parent/child flow relationship will not longer be maintained; the control flow idle timeout will not be updated.

## Multicast Routing in Individual Interface Mode

In Individual interface mode, units do not act independently with multicast. All data and routing packets are processed and forwarded by the control unit, thus avoiding packet replication.

## Multicast Routing in Individual Interface Mode

In Individual interface mode, units do not act independently with multicast. All data and routing packets are processed and forwarded by the control unit, thus avoiding packet replication.

## NAT and Clustering

NAT can affect the overall throughput of the cluster. Inbound and outbound NAT packets can be sent to different threat defenses in the cluster, because the load balancing algorithm relies on IP addresses and ports, and NAT causes inbound and outbound packets to have different IP addresses and/or ports. When a packet arrives at the threat defense that is not the NAT owner, it is forwarded over the cluster control link to the owner, causing large amounts of traffic on the cluster control link. Note that the receiving node does not create a forwarding flow to the owner, because the NAT owner may not end up creating a connection for the packet depending on the results of security and policy checks.

If you still want to use NAT in clustering, then consider the following guidelines:

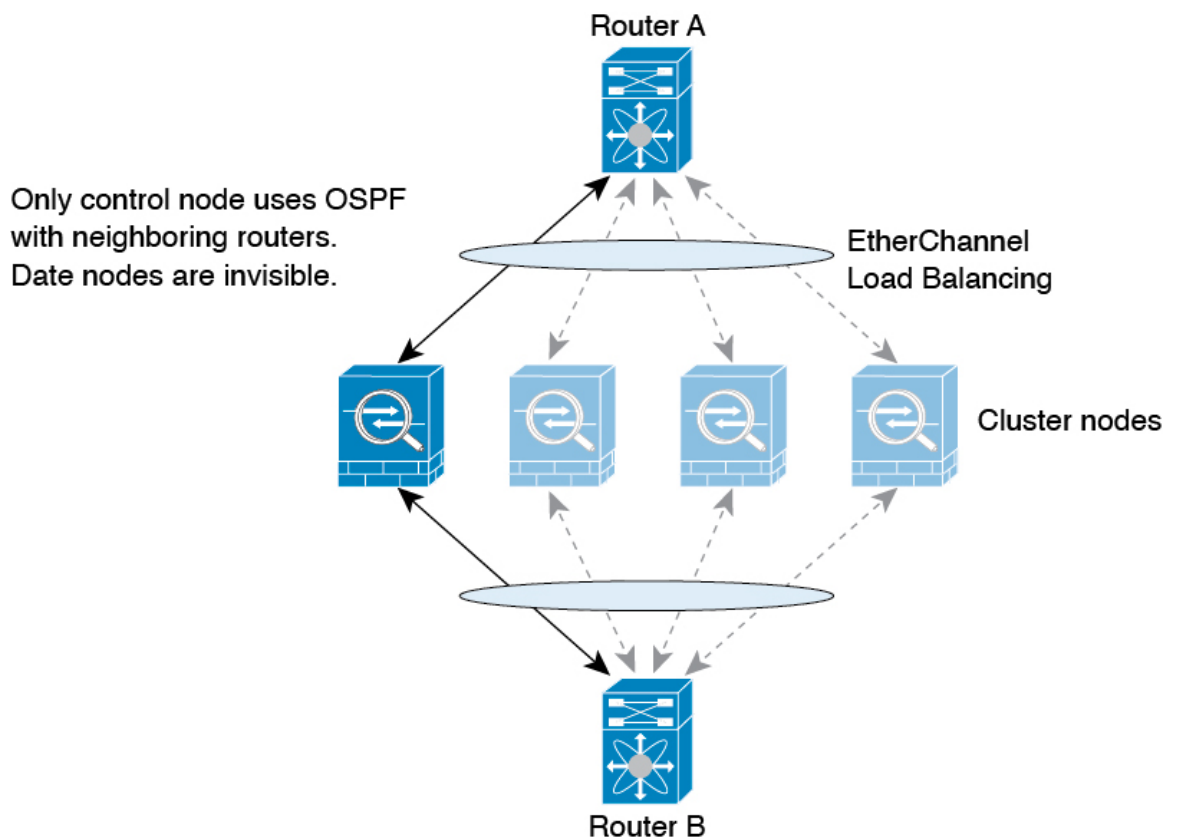

- No Proxy ARP—For Individual interfaces, a proxy ARP reply is never sent for mapped addresses. This prevents the adjacent router from maintaining a peer relationship with an ASA that may no longer be in the cluster. The upstream router needs a static route or PBR with Object Tracking for the mapped addresses that points to the Main cluster IP address. This is not an issue for a Spanned EtherChannel, because there is only one IP address associated with the cluster interface.
- No interface PAT on an Individual interface—Interface PAT is not supported for Individual interfaces.
- PAT with Port Block Allocation—See the following guidelines for this feature:
  - Maximum-per-host limit is not a cluster-wide limit, and is enforced on each node individually. Thus, in a 3-node cluster with the maximum-per-host limit configured as 1, if the traffic from a host is load-balanced across all 3 nodes, then it can get allocated 3 blocks with 1 in each node.
  - Port blocks created on the backup node from the backup pools are not accounted for when enforcing the maximum-per-host limit.
  - On-the-fly PAT rule modifications, where the PAT pool is modified with a completely new range of IP addresses, will result in xlate backup creation failures for the xlate backup requests that were still in transit while the new pool became effective. This behavior is not specific to the port block allocation feature, and is a transient PAT pool issue seen only in cluster deployments where the pool is distributed and traffic is load-balanced across the cluster nodes.
  - When operating in a cluster, you cannot simply change the block allocation size. The new size is effective only after you reload each device in the cluster. To avoid having to reload each device, we recommend that you delete all block allocation rules and clear all xlates related to those rules. You can then change the block size and recreate the block allocation rules.
- NAT pool address distribution for dynamic PAT—When you configure a PAT pool, the cluster divides each IP address in the pool into port blocks. By default, each block is 512 ports, but if you configure port block allocation rules, your block setting is used instead. These blocks are distributed evenly among the nodes in the cluster, so that each node has one or more blocks for each IP address in the PAT pool. Thus, you could have as few as one IP address in a PAT pool for a cluster, if that is sufficient for the number of PAT'ed connections you expect. Port blocks cover the 1024-65535 port range, unless you configure the option to include the reserved ports, 1-1023, on the PAT pool NAT rule.
- Reusing a PAT pool in multiple rules—To use the same PAT pool in multiple rules, you must be careful about the interface selection in the rules. You must either use specific interfaces in all rules, or "any" in all rules. You cannot mix specific interfaces and "any" across the rules, or the system might not be able to match return traffic to the right node in the cluster. Using unique PAT pools per rule is the most reliable option.
- No round-robin—Round-robin for a PAT pool is not supported with clustering.
- No extended PAT—Extended PAT is not supported with clustering.
- Dynamic NAT xlates managed by the control node—The control node maintains and replicates the xlate table to data nodes. When a data node receives a connection that requires dynamic NAT, and the xlate is not in the table, it requests the xlate from the control node. The data node owns the connection.
- Stale xlates—The xlate idle time on the connection owner does not get updated. Thus, the idle time might exceed the idle timeout. An idle timer value higher than the configured timeout with a refcnt of 0 is an indication of a stale xlate.
- No static PAT for the following inspections—

- FTP
  - RSH
  - SQLNET
  - TFTP
  - XDMCP
  - SIP
- If you have an extremely large number of NAT rules, over ten thousand, you should enable the transactional commit model using the **asp rule-engine transactional-commit nat** command in the device CLI. Otherwise, the node might not be able to join the cluster.

## Dynamic Routing

The routing process only runs on the control node, and routes are learned through the control node and replicated to data nodes. If a routing packet arrives at a data node, it is redirected to the control node.

*Figure 187: Dynamic Routing in Spanned EtherChannel Mode*

After the data node learn the routes from the control node, each node makes forwarding decisions independently.

The OSPF LSA database is not synchronized from the control node to data nodes. If there is a control node switchover, the neighboring router will detect a restart; the switchover is not transparent. The OSPF process

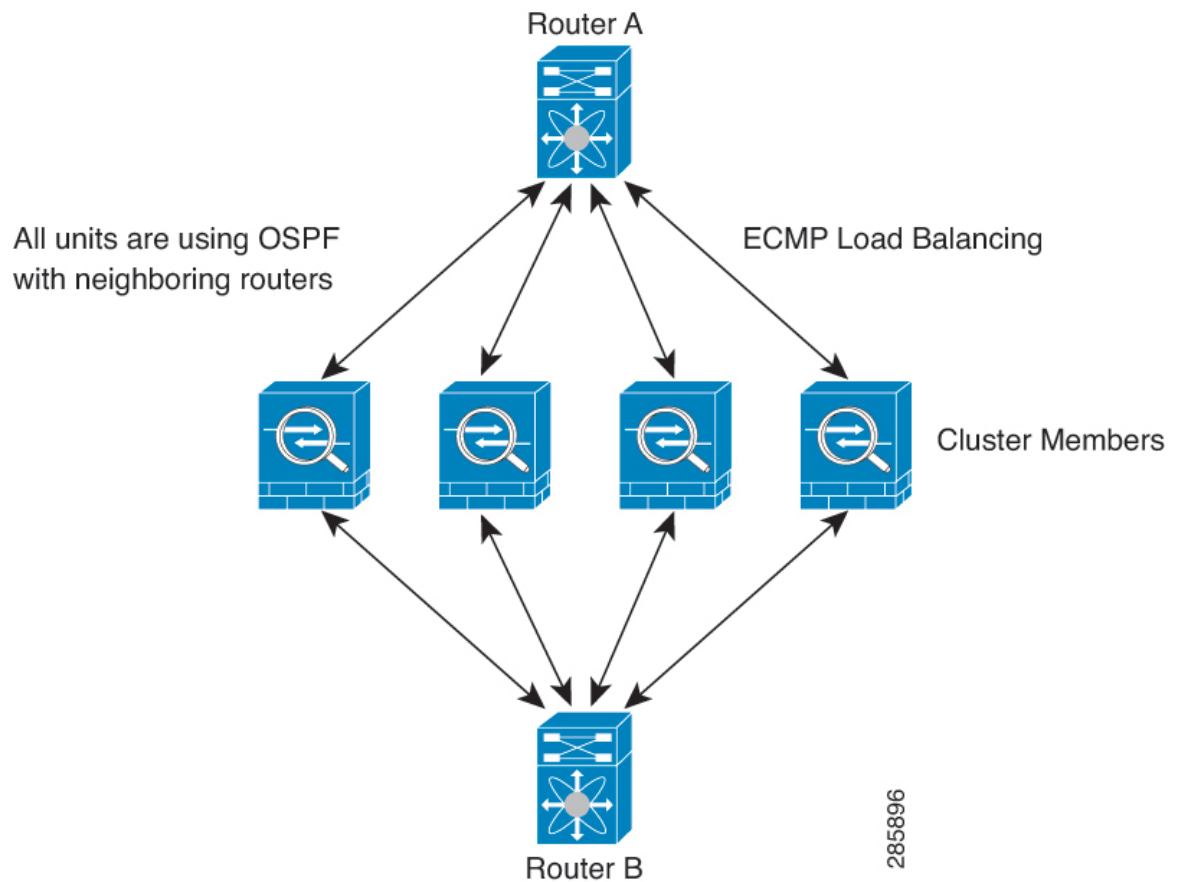

picks an IP address as its router ID. Although not required, you can assign a static router ID to ensure a consistent router ID is used across the cluster. See the OSPF Non-Stop Forwarding feature to address the interruption.

## Dynamic Routing in Individual Interface Mode

In Individual interface mode, each node runs the routing protocol as a standalone router, and routes are learned by each node independently.

**Figure 188: Dynamic Routing in Individual Interface Mode**

In the above diagram, Router A learns that there are 4 equal-cost paths to Router B, each through a node. ECMP is used to load balance traffic between the 4 paths. Each node picks a different router ID when talking to external routers.

You must configure a cluster pool for the router ID so that each node has a separate router ID.

EIGRP does not form neighbor relationships with cluster peers in individual interface mode.

**Note** If the cluster has multiple adjacencies to the same router for redundancy purposes, asymmetric routing can lead to unacceptable traffic loss. To avoid asymmetric routing, group all of these node interfaces into the same traffic zone. See [Create an ECMP Zone, on page 1337](#).

## SIP Inspection and Clustering

A control flow can be created on any node (due to load balancing); its child data flows must reside on the same node.

## SNMP and Clustering

You should always use the Local address, and not the Main cluster IP address for SNMP polling. If the SNMP agent polls the Main cluster IP address, if a new control node is elected, the poll to the new control node will fail.

When using SNMPv3 with clustering, if you add a new cluster node after the initial cluster formation, then SNMPv3 users are not replicated to the new node. You must remove the users, and re-add them, and then redeploy your configuration to force the users to replicate to the new node.

## Syslog and Clustering

- Each node in the cluster generates its own syslog messages. You can configure logging so that each node uses either the same or a different device ID in the syslog message header field. For example, the hostname configuration is replicated and shared by all nodes in the cluster. If you configure logging to use the hostname as the device ID, syslog messages generated by all nodes look as if they come from a single node. If you configure logging to use the local-node name that is assigned in the cluster bootstrap configuration as the device ID, syslog messages look as if they come from different nodes.

## Cisco TrustSec and Clustering

Only the control node learns security group tag (SGT) information. The control node then populates the SGT to data nodes, and data nodes can make a match decision for SGT based on the security policy.

## VPN and Clustering

Site-to-site VPN is a centralized feature; only the control node supports VPN connections.

---

**Note** Remote access VPN is not supported with clustering.

---

VPN functionality is limited to the control node and does not take advantage of the cluster high availability capabilities. If the control node fails, all existing VPN connections are lost, and VPN users will see a disruption in service. When a new control node is elected, you must reestablish the VPN connections.

When you connect a VPN tunnel to a Spanned EtherChannel address, connections are automatically forwarded to the control node. For connections to an Individual interface when using PBR or ECMP, you must always connect to the Main cluster IP address, not a Local address.

VPN-related keys and certificates are replicated to all nodes.

## Performance Scaling Factor

When you combine multiple units into a cluster, you can expect the total cluster performance to be approximately 80% of the maximum combined throughput.

For example, if your model can handle approximately 10 Gbps of traffic when running alone, then for a cluster of 8 units, the maximum combined throughput will be approximately 80% of 80 Gbps (8 units x 10 Gbps): 64 Gbps.

## Control Node Election

Nodes of the cluster communicate over the cluster control link to elect a control node as follows:

1. When you enable clustering for a node (or when it first starts up with clustering already enabled), it broadcasts an election request every 3 seconds.
2. Any other nodes with a higher priority respond to the election request; the priority is set between 1 and 100, where 1 is the highest priority.
3. If after 45 seconds, a node does not receive a response from another node with a higher priority, then it becomes the control node.

---

**Note** If multiple nodes tie for the highest priority, the cluster node name and then the serial number is used to determine the control node.

---

4. If a node later joins the cluster with a higher priority, it does not automatically become the control node; the existing control node always remains as the control node unless it stops responding, at which point a new control node is elected.
5. In a "split brain" scenario when there are temporarily multiple control nodes, then the node with highest priority retains the role while the other nodes return to data node roles.

---

**Note** You can manually force a node to become the control node. For centralized features, if you force a control node change, then all connections are dropped, and you have to re-establish the connections on the new control node.

---

## High Availability Within the Cluster

Clustering provides high availability by monitoring node and interface health and by replicating connection states between nodes.

### Node Health Monitoring

Each node periodically sends a broadcast heartbeat packet over the cluster control link. If the control node does not receive any heartbeat packets or other packets from a data node within the configurable timeout period, then the control node removes the data node from the cluster. If the data nodes do not receive packets from the control node, then a new control node is elected from the remaining nodes.

If nodes cannot reach each other over the cluster control link because of a network failure and not because a node has actually failed, then the cluster may go into a "split brain" scenario where isolated data nodes will elect their own control nodes. For example, if a router fails between two cluster locations, then the original control node at location 1 will remove the location 2 data nodes from the cluster. Meanwhile, the nodes at location 2 will elect their own control node and form their own cluster. Note that asymmetric traffic may fail

in this scenario. After the cluster control link is restored, then the control node that has the higher priority will keep the control node's role.

See [Control Node Election, on page 705](#) for more information.

## Interface Monitoring

Each node monitors the link status of all named hardware interfaces in use, and reports status changes to the control node.

- **Spanned EtherChannel**—Uses cluster Link Aggregation Control Protocol (cLACP). Each node monitors the link status and the cLACP protocol messages to determine if the port is still active in the EtherChannel. The status is reported to the control node.
- **Individual interfaces (Routed mode only)**—Each node self-monitors its interfaces and reports interface status to the control node.

When you enable health monitoring, all physical interfaces (including the main EtherChannel) are monitored by default; you can optionally disable monitoring per interface. Only named interfaces can be monitored. For example, the named EtherChannel must fail to be considered failed, which means all member ports of an EtherChannel must fail to trigger cluster removal.

A node is removed from the cluster if its monitored interfaces fail. The amount of time before the threat defense removes a member from the cluster depends on the type of interface and whether the node is an established member or is joining the cluster. For EtherChannels (spanned or not): If the interface is down on an established member, then the threat defense removes the member after 9 seconds. The threat defense does not monitor interfaces for the first 90 seconds that a node joins the cluster. Interface status changes during this time will not cause the threat defense to be removed from the cluster. For non-EtherChannels, the node is removed after 500 ms, regardless of the member state.

## Status After Failure

When a node in the cluster fails, the connections hosted by that node are seamlessly transferred to other nodes; state information for traffic flows is shared over the control node's cluster control link.

If the control node fails, then another member of the cluster with the highest priority (lowest number) becomes the control node.

The threat defense automatically tries to rejoin the cluster, depending on the failure event.

---

**Note** When the threat defense becomes inactive and fails to automatically rejoin the cluster, all data interfaces are shut down; only the Management interface can send and receive traffic.

---

## Rejoining the Cluster

After a cluster member is removed from the cluster, how it can rejoin the cluster depends on why it was removed:

- **Failed cluster control link when initially joining**—After you resolve the problem with the cluster control link, you must manually rejoin the cluster by re-enabling clustering.
- **Failed cluster control link after joining the cluster**—The threat defense automatically tries to rejoin every 5 minutes, indefinitely.

- Failed data interface—The threat defense automatically tries to rejoin at 5 minutes, then at 10 minutes, and finally at 20 minutes. If the join is not successful after 20 minutes, then the threat defense application disables clustering. After you resolve the problem with the data interface, you have to manually enable clustering.
- Failed node—If the node was removed from the cluster because of a node health check failure, then rejoining the cluster depends on the source of the failure. For example, a temporary power failure means the node will rejoin the cluster when it starts up again as long as the cluster control link is up. The threat defense application attempts to rejoin the cluster every 5 seconds.
- Internal error—Internal failures include: application sync timeout; inconsistent application statuses; and so on.
- Failed configuration deployment—If you deploy a new configuration from management center, and the deployment fails on some cluster members but succeeds on others, then the nodes that failed are removed from the cluster. You must manually rejoin the cluster by re-enabling clustering. If the deployment fails on the control node, then the deployment is rolled back, and no members are removed. If the deployment fails on all data nodes, then the deployment is rolled back, and no members are removed.

## Data Path Connection State Replication

Every connection has one owner and at least one backup owner in the cluster. The backup owner does not take over the connection in the event of a failure; instead, it stores TCP/UDP state information, so that the connection can be seamlessly transferred to a new owner in case of a failure. The backup owner is usually also the director.

Some traffic requires state information above the TCP or UDP layer. See the following table for clustering support or lack of support for this kind of traffic.

*Table 55: Features Replicated Across the Cluster*

Traffic	State Support	Notes
Up time	Yes	Keeps track of the system up time.
ARP Table	Yes	—
MAC address table	Yes	—
User Identity	Yes	—
IPv6 Neighbor database	Yes	—
Dynamic routing	Yes	—
SNMP Engine ID	<b>No</b>	—

## How the Cluster Manages Connections

Connections can be load-balanced to multiple nodes of the cluster. Connection roles determine how connections are handled in both normal operation and in a high availability situation.

## Connection Roles

See the following roles defined for each connection:

- **Owner**—Usually, the node that initially receives the connection. The owner maintains the TCP state and processes packets. A connection has only one owner. If the original owner fails, then when new nodes receive packets from the connection, the director chooses a new owner from those nodes.
- **Backup owner**—The node that stores TCP/UDP state information received from the owner, so that the connection can be seamlessly transferred to a new owner in case of a failure. The backup owner does not take over the connection in the event of a failure. If the owner becomes unavailable, then the first node to receive packets from the connection (based on load balancing) contacts the backup owner for the relevant state information so it can become the new owner.

As long as the director (see below) is not the same node as the owner, then the director is also the backup owner. If the owner chooses itself as the director, then a separate backup owner is chosen.

For clustering on the Firepower 9300, which can include up to 3 cluster nodes in one chassis, if the backup owner is on the same chassis as the owner, then an additional backup owner will be chosen from another chassis to protect flows from a chassis failure.

- **Director**—The node that handles owner lookup requests from forwarders. When the owner receives a new connection, it chooses a director based on a hash of the source/destination IP address and ports (see below for ICMP hash details), and sends a message to the director to register the new connection. If packets arrive at any node other than the owner, the node queries the director about which node is the owner so it can forward the packets. A connection has only one director. If a director fails, the owner chooses a new director.

As long as the director is not the same node as the owner, then the director is also the backup owner (see above). If the owner chooses itself as the director, then a separate backup owner is chosen.

ICMP/ICMPv6 hash details:

- For Echo packets, the source port is the ICMP identifier, and the destination port is 0.
  - For Reply packets, the source port is 0, and the destination port is the ICMP identifier.
  - For other packets, both source and destination ports are 0.
- **Forwarder**—A node that forwards packets to the owner. If a forwarder receives a packet for a connection it does not own, it queries the director for the owner, and then establishes a flow to the owner for any other packets it receives for this connection. The director can also be a forwarder. Note that if a forwarder receives the SYN-ACK packet, it can derive the owner directly from a SYN cookie in the packet, so it does not need to query the director. (If you disable TCP sequence randomization, the SYN cookie is not used; a query to the director is required.) For short-lived flows such as DNS and ICMP, instead of querying, the forwarder immediately sends the packet to the director, which then sends them to the owner. A connection can have multiple forwarders; the most efficient throughput is achieved by a good load-balancing method where there are no forwarders and all packets of a connection are received by the owner.

---

**Note** We do not recommend disabling TCP sequence randomization when using clustering. There is a small chance that some TCP sessions won't be established, because the SYN/ACK packet might be dropped.

---

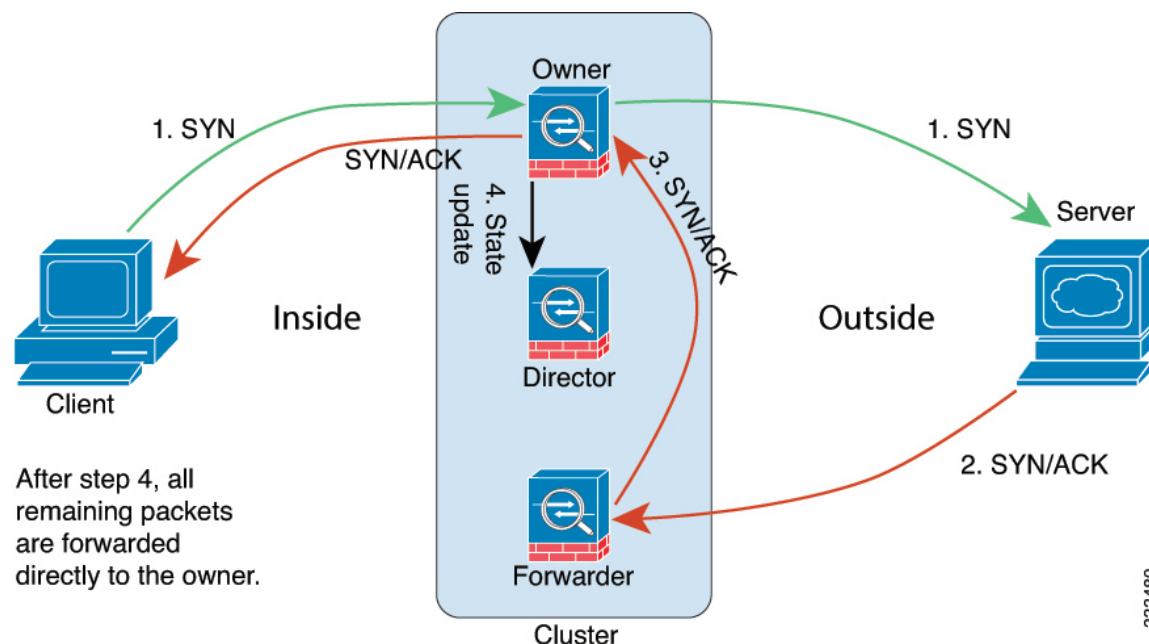

- **Fragment Owner**—For fragmented packets, cluster nodes that receive a fragment determine a fragment owner using a hash of the fragment source IP address, destination IP address, and the packet ID. All fragments are then forwarded to the fragment owner over the cluster control link. Fragments may be load-balanced to different cluster nodes, because only the first fragment includes the 5-tuple used in the switch load balance hash. Other fragments do not contain the source and destination ports and may be load-balanced to other cluster nodes. The fragment owner temporarily reassembles the packet so it can determine the director based on a hash of the source/destination IP address and ports. If it is a new connection, the fragment owner will register to be the connection owner. If it is an existing connection, the fragment owner forwards all fragments to the provided connection owner over the cluster control link. The connection owner will then reassemble all fragments.

## New Connection Ownership

When a new connection is directed to a node of the cluster via load balancing, that node owns both directions of the connection. If any connection packets arrive at a different node, they are forwarded to the owner node over the cluster control link. If a reverse flow arrives at a different node, it is redirected back to the original node.

## Sample Data Flow for TCP

The following example shows the establishment of a new connection.

1. The SYN packet originates from the client and is delivered to one threat defense (based on the load balancing method), which becomes the owner. The owner creates a flow, encodes owner information into a SYN cookie, and forwards the packet to the server.
2. The SYN-ACK packet originates from the server and is delivered to a different threat defense (based on the load balancing method). This threat defense is the forwarder.
3. Because the forwarder does not own the connection, it decodes owner information from the SYN cookie, creates a forwarding flow to the owner, and forwards the SYN-ACK to the owner.

4. The owner sends a state update to the director, and forwards the SYN-ACK to the client.
5. The director receives the state update from the owner, creates a flow to the owner, and records the TCP state information as well as the owner. The director acts as the backup owner for the connection.
6. Any subsequent packets delivered to the forwarder will be forwarded to the owner.
7. If packets are delivered to any additional nodes, it will query the director for the owner and establish a flow.
8. Any state change for the flow results in a state update from the owner to the director.

## Sample Data Flow for ICMP and UDP

The following example shows the establishment of a new connection.

1. *Figure 189: ICMP and UDP Data Flow*

The first UDP packet originates from the client and is delivered to one threat defense (based on the load balancing method).

2. The node that received the first packet queries the director node that is chosen based on a hash of the source/destination IP address and ports.
3. The director finds no existing flow, creates a director flow and forwards the packet back to the previous node. In other words, the director has elected an owner for this flow.
4. The owner creates the flow, sends a state update to the director, and forwards the packet to the server.
5. The second UDP packet originates from the server and is delivered to the forwarder.

6. The forwarder queries the director for ownership information. For short-lived flows such as DNS, instead of querying, the forwarder immediately sends the packet to the director, which then sends it to the owner.
7. The director replies to the forwarder with ownership information.
8. The forwarder creates a forwarding flow to record owner information and forwards the packet to the owner.
9. The owner forwards the packet to the client.

## History for Clustering

Feature	Minimum Management Center	Minimum Threat Defense	Details
16-node clusters for the Secure Firewall 3100/4200.	20241030	7.6.0	For the Secure Firewall 3100 and 4200, the maximum nodes were increased from 8 to 16.  See: <a href="#">Clustering for the Secure Firewall 3100/4200</a>
Individual interface mode for Secure Firewall 3100/4200 clusters.	20241030	7.6.0	Individual interfaces are normal routed interfaces, each with their own local IP address used for routing. The main cluster IP address for each interface is a fixed address that always belongs to the control node. When the control node changes, the main cluster IP address moves to the new control node, so management of the cluster continues seamlessly. Load balancing must be configured separately on the upstream switch.  Restrictions: Not supported for container instances.  New/modified screens: <ul style="list-style-type: none"> <li>• <b>Devices &gt; Device Management &gt; Add Cluster</b></li> <li>• <b>Devices &gt; Device Management &gt; Cluster &gt; Interfaces / EIGRP / OSPF / OSPFv3 / BGP</b></li> <li>• <b>Objects &gt; Object Management &gt; Address Pools &gt; MAC Address Pool</b></li> </ul> See: <a href="#">Clustering for the Secure Firewall 3100/4200</a> and <a href="#">Address Pools</a>
Clustering for the Secure Firewall 4200	20230929	7.4.0	The Secure Firewall 4200 supports Spanned EtherChannel clustering for up to 8 nodes.
Cluster health monitor settings	20221213	Any	You can now edit cluster health monitor settings.  New/Modified screens: <b>Devices &gt; Device Management &gt; Cluster &gt; Cluster Health Monitor Settings</b>  <b>Note</b> If you previously configured these settings using FlexConfig, be sure to remove the FlexConfig configuration before you deploy. Otherwise the FlexConfig configuration will overwrite the management center configuration.

Feature	Minimum Management Center	Minimum Threat Defense	Details
Cluster health monitor dashboard	20221213	Any	You can now view cluster health on the cluster health monitor dashboard. New/Modified screens: <b>System (⚙️) &gt; Health &gt; Monitor</b>
Automatic configuration of the cluster control link MTU	20220609	7.2.0	The MTU of the cluster control link interface is now automatically set to 100 bytes more than the highest data interface MTU; by default, the MTU is 1600 bytes.
Clustering for the Secure Firewall 3100	20220609	7.1.0	The Secure Firewall 3100 supports Spanned EtherChannel clustering for up to 8 nodes. New/Modified screens: <ul style="list-style-type: none"> <li>• <b>Devices &gt; Device Management &gt; Add Cluster</b></li> <li>• <b>Devices &gt; Device Management &gt; More</b> menu</li> <li>• <b>Devices &gt; Device Management &gt; Cluster</b></li> </ul> Supported platforms: Secure Firewall 3100

## CHAPTER 32

# Clustering for Threat Defense Virtual in a Private Cloud

Clustering lets you group multiple threat defense virtuals together as a single logical device. A cluster provides all the convenience of a single device (management, integration into a network) while achieving the increased throughput and redundancy of multiple devices. You can deploy threat defense virtual clusters in a private cloud using VMware and KVM. Only routed firewall mode is supported.

**Note** Some features are not supported when using clustering. See [Unsupported Features and Clustering](#), on page 748.

- [About Threat Defense Virtual Clustering in the Private Cloud](#), on page 713
- [Licenses for Threat Defense Virtual Clustering](#), on page 717
- [Requirements and Prerequisites for Threat Defense Virtual Clustering](#), on page 717

- [Manage Cluster Nodes](#), on page 733
- [Monitoring the Cluster](#), on page 742
- [Reference for Clustering](#), on page 748
- [History for Threat Defense Virtual Clustering in a Private Cloud](#), on page 760

## About Threat Defense Virtual Clustering in the Private Cloud

This section describes the clustering architecture and how it works.

### How the Cluster Fits into Your Network

The cluster consists of multiple firewalls acting as a single device. To act as a cluster, the firewalls need the following infrastructure:

- Isolated network for intra-cluster communication, known as the *cluster control link*, using VXLAN interfaces. VXLANs, which act as Layer 2 virtual networks over Layer 3 physical networks, let the threat defense virtual send broadcast/multicast messages over the cluster control link.

- Management access to each firewall for configuration and monitoring. The threat defense virtual deployment includes a Management 0/0 interface that you will use to manage the cluster nodes.

When you place the cluster in your network, the upstream and downstream routers need to be able to load-balance the data coming to and from the cluster using Layer 3 Individual interfaces and one of the following methods:

- Policy-Based Routing—The upstream and downstream routers perform load balancing between nodes using route maps and ACLs.
- Equal-Cost Multi-Path Routing—The upstream and downstream routers perform load balancing between nodes using equal cost static or dynamic routes.

---

**Note** Layer 2 Spanned EtherChannels are not supported.

---

## Control and Data Node Roles

One member of the cluster is the control node. If multiple cluster nodes come online at the same time, the control node is determined by the priority setting; the priority is set between 1 and 100, where 1 is the highest priority. All other members are data nodes. When you first create the cluster, you specify which node you want to be the control node, and it will become the control node simply because it is the first node added to the cluster.

All nodes in the cluster share the same configuration. The node that you initially specify as the control node will overwrite the configuration on the data nodes when they join the cluster, so you only need to perform initial configuration on the control node before you form the cluster.

Some features do not scale in a cluster, and the control node handles all traffic for those features.

## Individual Interfaces

You can configure cluster interfaces as *Individual interfaces*.

Individual interfaces are normal routed interfaces, each with their own *Local IP address* used for routing. The *Main cluster IP address* for each interface is a fixed address that always belongs to the control node. When the control node changes, the Main cluster IP address moves to the new control node, so management of the cluster continues seamlessly.

IPS-only interfaces (inline sets and passive interfaces) are not supported as Individual interfaces.

Because interface configuration must be configured only on the control node, you configure a pool of IP addresses to be used for a given interface on the cluster nodes, including one for the control node.

Load balancing must be configured separately on the upstream switch.

**Note** Layer 2 Spanned EtherChannels are not supported.

## Policy-Based Routing

When using Individual interfaces, each threat defense interface maintains its own IP address and MAC address. One method of load balancing is Policy-Based Routing (PBR).

We recommend this method if you are already using PBR, and want to take advantage of your existing infrastructure.

PBR makes routing decisions based on a route map and ACL. You must manually divide traffic between all threat defenses in a cluster. Because PBR is static, it may not achieve the optimum load balancing result at all times. To achieve the best performance, we recommend that you configure the PBR policy so that forward and return packets of a connection are directed to the same threat defense. For example, if you have a Cisco router, redundancy can be achieved by using Cisco IOS PBR with Object Tracking. Cisco IOS Object Tracking monitors each threat defense using ICMP ping. PBR can then enable or disable route maps based on reachability of a particular threat defense. See the following URLs for more details:

<http://www.cisco.com/c/en/us/solutions/data-center-virtualization/intelligent-traffic-director/index.html>

[http://www.cisco.com/en/US/products/ps6599/products\\_white\\_paper09186a00800a4409.shtml](http://www.cisco.com/en/US/products/ps6599/products_white_paper09186a00800a4409.shtml)

## Equal-Cost Multi-Path Routing

When using Individual interfaces, each threat defense interface maintains its own IP address and MAC address. One method of load balancing is Equal-Cost Multi-Path (ECMP) routing.

We recommend this method if you are already using ECMP, and want to take advantage of your existing infrastructure.

ECMP routing can forward packets over multiple “best paths” that tie for top place in the routing metric. Like EtherChannel, a hash of source and destination IP addresses and/or source and destination ports can be used to send a packet to one of the next hops. If you use static routes for ECMP routing, then the threat defense failure can cause problems; the route continues to be used, and traffic to the failed threat defense will be lost. If you use static routes, be sure to use a static route monitoring feature such as Object Tracking. We recommend using dynamic routing protocols to add and remove routes, in which case, you must configure each threat defense to participate in dynamic routing.

## Cluster Control Link

Each node must dedicate one interface as a VXLAN (VTEP) interface for the cluster control link. For more information about VXLAN, see [Configure VXLAN Interfaces, on page 977](#).

### VXLAN Tunnel Endpoint

VXLAN tunnel endpoint (VTEP) devices perform VXLAN encapsulation and decapsulation. Each VTEP has two interface types: one or more virtual interfaces called VXLAN Network Identifier (VNI) interfaces, and a regular interface called the VTEP source interface that tunnels the VNI interfaces between VTEPs. The VTEP source interface is attached to the transport IP network for VTEP-to-VTEP communication.

### VTEP Source Interface

The VTEP source interface is a regular threat defense virtual interface with which you plan to associate the VNI interface. You can configure one VTEP source interface to act as the cluster control link. The source interface is reserved for cluster control link use only. Each VTEP source interface has an IP address on the same subnet. This subnet should be isolated from all other traffic, and should include only the cluster control link interfaces.

### VNI Interface

A VNI interface is similar to a VLAN interface: it is a virtual interface that keeps network traffic separated on a given physical interface by using tagging. You can only configure one VNI interface. Each VNI interface has an IP address on the same subnet.

### Peer VTEPs

Unlike regular VXLAN for data interfaces, which allows a single VTEP peer, The threat defense virtual clustering allows you to configure multiple peers.

## Cluster Control Link Traffic Overview

Cluster control link traffic includes both control and data traffic.

Control traffic includes:

- Control node election.
- Configuration replication.
- Health monitoring.

Data traffic includes:

- State replication.

- Connection ownership queries and data packet forwarding.

## Configuration Replication

All nodes in the cluster share a single configuration. You can only make configuration changes on the control node (with the exception of the bootstrap configuration), and changes are automatically synced to all other nodes in the cluster.

## Management Network

You must manage each node using the Management interface; management from a data interface is not supported with clustering.

## Licenses for Threat Defense Virtual Clustering

Each threat defense virtual cluster node requires the same performance tier license. We recommend using the same number of CPUs and memory for all members, or else performance will be limited on all nodes to match the least capable member. The throughput level will be replicated from the control node to each data node so they match.

You assign feature licenses to the cluster as a whole, not to individual nodes. However, each node of the cluster consumes a separate license for each feature. The clustering feature itself does not require any licenses.

When you add the control node to the management center, you can specify the feature licenses you want to use for the cluster. Before you create the cluster, it doesn't matter which licenses are assigned to the data nodes; the license settings for the control node are replicated to each of the data nodes. You can modify licenses for the cluster in the **System (⚙️) > Licenses > Smart Licenses > Edit Licenses** or **Devices > Device Management > Cluster > License** area.

---

**Note** If you add the cluster before the management center is licensed (and running in Evaluation mode), then when you license the management center, you can experience traffic disruption when you deploy policy changes to the cluster. Changing to licensed mode causes all data units to leave the cluster and then rejoin.

---

## Requirements and Prerequisites for Threat Defense Virtual Clustering

### Model Requirements

- FTDv5, FTDv10, FTDv20, FTDv30, FTDv50, FTDv100
- VMware or KVM

- In threat defense virtual 7.3 and earlier, a maximum of 4 nodes in a cluster in a 2x2 configuration is supported. You can set up a maximum of two hosts with a maximum of two threat defense virtual instances in each host.

### Hardware and Software Requirements

All units in a cluster:

- Must have jumbo frame reservation enabled for the cluster control link. Do this in the Day 0 configuration when you deploy the threat defense virtual by setting "DeploymentType": "Cluster". Otherwise, you must restart each node to enable jumbo frames after the cluster has formed and is healthy.
- (KVM only) Must use CPU hard partitioning (CPU pinning) for all VMs on the KVM host.
- Must be the same performance tier. We recommend using the same number of CPUs and memory for all nodes, or performance will be limited on all nodes to match the least capable node.
- Must use the management interface for management center communications. Data interface management is not supported.
- Must run the same version, except during upgrade. Hitless upgrade is supported.
- Must be in the same group.
- Must not have any deployment pending or in progress.
- Must not have any unsupported features configured on the control node: [Unsupported Features and Clustering, on page 748](#).
- Must not have VPN configured on the data nodes. The control node can have site-to-site VPN configured.

### Management Center Requirements

Make sure the management center NTP server is set to a reliable server that is reachable by all cluster nodes to ensure proper clock sync. By default, the device uses the same NTP server as the management center. If the time is not set to be the same on all cluster nodes, they can be removed automatically from the cluster.

### Switch Requirements

Be sure to complete the switch configuration before you configure clustering. Make sure the ports connected to the cluster control link have the correct (higher) MTU configured. By default, the cluster control link MTU is set to 154 bytes higher than the data interfaces. If the switches have an MTU mismatch, the cluster formation will fail.

## Guidelines for Threat Defense Virtual Clustering

### High Availability

High Availability is not supported with clustering.

### IPv6

The cluster control link is only supported using IPv4.

### Additional Guidelines

- When significant topology changes occur (such as adding or removing an EtherChannel interface, enabling or disabling an interface on the threat defense virtual, adding an additional switch to form a VSS or vPC) you should disable the health check feature and also disable interface monitoring for the interfaces that are affected by the topology changes. When the topology change is complete, and the configuration change is synced to all units, you can re-enable the interface health check feature.
- When adding a unit to an existing cluster, or when reloading a unit, there will be a temporary, limited packet/connection drop; this is expected behavior. In some cases, the dropped packets can hang your connection; for example, dropping a FIN/ACK packet for an FTP connection will make the FTP client hang. In this case, you need to reestablish the FTP connection.
- For decrypted TLS/SSL connections, the decryption states are not synchronized, and if the connection owner fails, then decrypted connections will be reset. New connections will need to be established to a new unit. Connections that are not decrypted (they match a do-not-decrypt rule) are not affected and are replicated correctly.
- We do not support VXLANs for data interfaces; only the cluster control link supports VXLAN.

### Defaults for Clustering

- The cLACP system ID is auto-generated, and the system priority is 1 by default.
- The cluster health check feature is enabled by default with the holdtime of 3 seconds. Interface health monitoring is enabled on all interfaces by default.
- The cluster auto-rejoin feature for a failed cluster control link is unlimited attempts every 5 minutes.
- The cluster auto-rejoin feature for a failed data interface is 3 attempts every 5 minutes, with the increasing interval set to 2.
- Connection replication delay of 5 seconds is enabled by default for HTTP traffic.

## Configure Threat Defense Virtual Clustering

To configure clustering after you deploy your threat defense virtuals, perform the following tasks.

### Add Devices to the Management Center

Before configuring clustering, deploy each cluster node, then add the devices as standalone units on the management center.

#### Procedure

- 
- Step 1** Deploy each cluster node according the [Cisco Secure Firewall Threat Defense Virtual Getting Started Guide](#).  
All units in a cluster:

- Must have jumbo frame reservation enabled for the cluster control link. Do this in the Day 0 configuration when you deploy the threat defense virtual by setting `"DeploymentType": "Cluster"`. Otherwise, you must restart each node to enable jumbo frames after the cluster has formed and is healthy.
- (KVM only) Must use CPU hard partitioning (CPU pinning) for all VMs on the KVM host.

**Step 2** Add each node to the management center as a standalone device in the same domain and group.

You can create a cluster with a single device, and then add more nodes later. The initial settings (licensing, access control policy) that you set when you add a device will be inherited by all cluster nodes from the control node. You will choose the control node when forming the cluster.

---

## Create a Cluster

Form a cluster from one or more devices in the management center.

### Before you begin

Some features are not compatible with clustering, so you should wait to perform configuration until after you enable clustering. Some features will block cluster creation if they are already configured. For example, do not configure any IP addresses on interfaces, or unsupported interface types such as BVIs.

### Procedure

---

**Step 1** Choose **Devices > Device Management**, and then choose **Add > Cluster**.

The **Add Cluster Wizard** appears.

Figure 190: Add Cluster Wizard

Add Cluster Wizard

1 Configuration — 2 Summary

▲ Create a cluster for supported models. Note: For the Firepower 4100/9300/AWS/Azure/GCP, use the Add Device option.

Cluster Name\*

cluster1

Cluster Key

....

....

Control Node

You can form the cluster with just the control node to reduce formation time.

Node\*

node1

VXLAN Network Identifier (VNI) Network\*

10.10.1.0 / 27 (30 addresses)

Virtual Tunnel Endpoint (VTEP) Network\*

209.165.200.224 / 27 (30 addresses)

Cluster Control Link\*

GigabitEthernet0/7

VTEP IPv4 Address\*

209.165.200.225

Priority\*

1

Data Nodes (Optional)

Data node hardware needs to match the control node hardware.

[Add a data node](#)

**Step 2** Specify a **Cluster Name** and an authentication **Cluster Key** for control traffic.

- **Cluster Name**—An ASCII string from 1 to 38 characters.
- **Cluster Key**—An ASCII string from 1 to 63 characters. The **Cluster Key** value is used to generate the encryption key. This encryption does not affect datapath traffic, including connection state update and forwarded packets, which are always sent in the clear.

**Step 3** For the **Control Node**, set the following:

- **Node**—Choose the device that you want to be the control node initially. When the management center forms the cluster, it will add this node to the cluster first so it will be the control node.

**Note** If you see an **Error** (❗) icon next to the node name, click the icon to view configuration issues. You must cancel cluster formation, resolve the issues, and then return to cluster formation. For example:

*Figure 191: Configuration Issues*

To resolve the above issues, remove the unsupported VPN license and deploy pending configuration changes to the device.

- **VXLAN Network Identifier (VNI) Network**—Specify an IPv4 subnet for the VNI network; IPv6 is not supported for this network. Specify a **24**, **25**, **26**, or **27** subnet. An IP address will be auto-assigned to each node on this network. The VNI network is the encrypted virtual network that runs on top of the physical VTEP network.
- **Cluster Control Link**—Choose the physical interface you want to use for the cluster control link.
- **Virtual Tunnel Endpoint (VTEP) Network**—Specify an IPv4 subnet for the physical interface network; IPv6 is not supported for this network. The VTEP network is a different network than the VNI network, and it is used for the physical cluster control link.
- **VTEP IPv4 Address**—This field will be auto-populated with the first address on the VTEP network.
- **Priority**—Set the priority of this node for control node elections. The priority is between 1 and 100, where 1 is the highest priority. Even if you set the priority to be lower than other nodes, this node will still be the control node when the cluster is first formed.

**Step 4** For **Data Nodes (Optional)**, click **Add a data node** to add a node to the cluster.

You can form the cluster with only the control node for faster cluster formation, or you can add all nodes now. Set the following for each data node:

- **Node**—Choose the device that you want to add.

**Note** If you see an **Error** (❗) icon next to the node name, click the icon to view configuration issues. You must cancel cluster formation, resolve the issues, and then return to cluster formation.

- **VTEP IPv4 Address**—This field will be auto-populated with the next address on the VTEP network.
- **Priority**—Set the priority of this node for control node elections. The priority is between 1 and 100, where 1 is the highest priority.

**Step 5** Click **Continue**. Review the **Summary**, and then click **Save**.

The cluster bootstrap configuration is saved to the cluster nodes. The bootstrap configuration includes the VXLAN interface used for the cluster control link.

The cluster name shows on the **Devices > Device Management** page; expand the cluster to see the cluster nodes.

**Figure 192: Cluster Management**

Node ID	Role	Version	Management	Base, Threat (2 more...)	Default AC Policy
172.16.0.50 (Control) 172.16.0.50 - Routed	FTDv for VMware	7.2.0	Manage	Base, Threat (2 more...)	Default AC Policy
172.16.0.51 172.16.0.51 - Routed	FTDv for VMware	7.2.0	N/A	Base, Threat (2 more...)	Default AC Policy

A node that is currently registering shows the loading icon.

**Figure 193: Node Registration**

Node ID	Role	Status
172.16.0.50 (Control) 172.16.0.50 - Routed	Control	Routed
172.16.0.51 172.16.0.51 - Routed	Control	Routed (Loading)

You can monitor cluster node registration by clicking the **Notifications** icon and choosing **Tasks**. The management center updates the Cluster Registration task as each node registers.

Task ID	Task Description	Duration
10.10.1.12	Deployment to device successful.	1m 54s
10.10.1.13	Deployment to device successful.	1m 3s
TD_Cluster	Deployment to device successful.	35s

**Step 6** Configure device-specific settings by clicking the **Edit** (✎) for the cluster.

Most configuration can be applied to the cluster as a whole, and not nodes in the cluster. For example, you can change the display name per node, but you can only configure interfaces for the whole cluster.

**Step 7** On the **Devices > Device Management > Cluster** screen, you see **General** and other settings for the cluster.

Figure 194: Cluster Settings

Performance Profile: Default

TLS Crypto Acceleration: Disabled

Force Deploy: →

- **Management > Host**—If you change the management IP address in the device configuration, you must match the new address in the management center so that it can reach the device on the network. First disable the connection, edit the **Host** address in the **Management** area, then re-enable the connection.

Management <span style="float: right;"></span>	
Host:	10.89.5.20
Status:	✓

- Step 9** If you deployed your cluster nodes without enabling jumbo-frame reservation, then restart all cluster nodes to enable jumbo frames, which are required for the cluster control link. See [Shut Down or Restart the Device, on page 89](#).

If you previously enabled jumbo-frame reservation, you can skip this step.

Because the cluster control link traffic includes data packet forwarding, the cluster control link needs to accommodate the entire size of a data packet plus cluster traffic overhead (100 bytes) and VXLAN overhead (54 bytes). When you create the cluster, the MTU is set to 154 bytes higher than the highest data interface MTU (1654 by default). If you later increase the data interface MTU, be sure to also increase the cluster control link MTU. For example, because the maximum MTU is 9198 bytes, then the highest data interface MTU can be 9044, while the cluster control link can be set to 9198. See [Configure the MTU, on page 1010](#).

**Note** Make sure you configure switches connected to the cluster control link to the correct (higher) MTU; otherwise, cluster formation will fail.

## Configure Interfaces

This section describes how to configure interfaces to be Individual interfaces compatible with clustering. Individual interfaces are normal routed interfaces, each with their own IP address taken from a pool of IP

addresses. The Main cluster IP address is a fixed address for the cluster that always belongs to the current control node. All data interfaces must be Individual interfaces.

---

**Note** You cannot use subinterfaces.

---

## Procedure

- 
- Step 1** Choose **Objects > Object Management > Address Pools** to add an IPv4 and/or IPv6 address pool. See [Address Pools, on page 1472](#).
- Include at least as many addresses as there are units in the cluster. The Virtual IP address is not a part of this pool, but needs to be on the same network. You cannot determine the exact Local address assigned to each unit in advance.
- Step 2** Choose **Devices > Device Management**, and click **Edit** (✎) next to the cluster.
- Step 3** Click **Interfaces**, and then click **Edit** (✎) for a data interface.
- Step 4** On the **IPv4**, enter the **IP Address** and mask. This IP address is a fixed address for the cluster, and always belongs to the current control unit.
- Step 5** From the **IPv4 Address Pool** drop-down list, choose the address pool you created.
- Note** If you want to manually assign a MAC address to this interface, you need to create a **mac-address pool** using FlexConfig.
- Step 6** On **IPv6 > Basic**, from the **IPv6 Address Pool** drop-down list, choose the address pool you created.
- Step 7** Configure other interface settings as normal.
- Step 8** Click **Save**.
- You can now go to **Deploy > Deployment** and deploy the policy to assigned devices. The changes are not active until you deploy them.
- 

## Configure Cluster Health Monitor Settings

The **Cluster Health Monitor Settings** section of the **Cluster** page displays the settings described in the table below.

Figure 197: Cluster Health Monitor Settings

Cluster Health Monitor Settings			
<b>Timeouts</b>			
Hold Time			3 s
Interface Debounce Time			9000 ms
<b>Monitored Interfaces</b>			
Service Application			Enabled
Unmonitored Interfaces			None
<b>Auto-Rejoin Settings</b>			
	Attempts	Interval Between Attempts	Interval Variation
Cluster Interface	-1	5	1
Data Interface	3	5	2
System	3	5	2

Table 56: Cluster Health Monitor Settings Section Table Fields

Field	Description
<b>Timeouts</b>	
Hold Time	Between .3 and 45 seconds; The default is 3 seconds. To determine node system health, the cluster nodes send heartbeat messages on the cluster control link to other nodes. If a node does not receive any heartbeat messages from a peer node within the hold time period, the peer node is considered unresponsive or dead.
Interface Debounce Time	Between 300 and 9000 ms. The default is 500 ms. The interface debounce time is the amount of time before the node considers an interface to be failed, and the node is removed from the cluster.
<b>Monitored Interfaces</b>	The interface health check monitors for link failures. If all physical ports for a given logical interface fail on a particular node, but there are active ports under the same logical interface on other nodes, then the node is removed from the cluster. The amount of time before the node removes a member from the cluster depends on the type of interface and whether the node is an established node or is joining the cluster.
Service Application	Shows whether the Snort and disk-full processes are monitored.
Unmonitored Interfaces	Shows unmonitored interfaces.
<b>Auto-Rejoin Settings</b>	
Cluster Interface	Shows the auto-rejoin settings after a cluster control link failure.

Field	Description
<i>Attempts</i>	Between -1 and 65535. The default is -1 (unlimited). Sets the number of rejoin attempts.
<i>Interval Between Attempts</i>	Between 2 and 60. The default is 5 minutes. Defines the interval duration in minutes between rejoin attempts.
<i>Interval Variation</i>	Between 1 and 3. The default is 1x the interval duration. Defines if the interval duration increases at each attempt.
Data Interfaces	Shows the auto-rejoin settings after a data interface failure.
<i>Attempts</i>	Between -1 and 65535. The default is 3. Sets the number of rejoin attempts.
<i>Interval Between Attempts</i>	Between 2 and 60. The default is 5 minutes. Defines the interval duration in minutes between rejoin attempts.
<i>Interval Variation</i>	Between 1 and 3. The default is 2x the interval duration. Defines if the interval duration increases at each attempt.
System	Shows the auto-rejoin settings after internal errors. Internal failures include: application sync timeout; inconsistent application statuses; and so on.
<i>Attempts</i>	Between -1 and 65535. The default is 3. Sets the number of rejoin attempts.
<i>Interval Between Attempts</i>	Between 2 and 60. The default is 5 minutes. Defines the interval duration in minutes between rejoin attempts.
<i>Interval Variation</i>	Between 1 and 3. The default is 2x the interval duration. Defines if the interval duration increases at each attempt.

**Note** If you disable the system health check, fields that do not apply when the system health check is disabled will not show.

You can change these settings from this section.

You can monitor any port-channel ID, single physical interface ID, as well as the Snort and disk-full processes. Health monitoring is not performed on VLAN subinterfaces or virtual interfaces such as VNIs or BVIs. You cannot configure monitoring for the cluster control link; it is always monitored.

**Procedure**

- Step 1** Choose **Devices > Device Management**.
- Step 2** Next to the cluster you want to modify, click **Edit** (✎).
- Step 3** Click **Cluster**.
- Step 4** In the **Cluster Health Monitor Settings** section, click **Edit** (✎).
- Step 5** Disable the system health check by clicking the **Health Check** slider .

**Figure 198: Disable the System Health Check**

Edit Cluster Health Monitor Settings

Health Check  ⓘ

▼ Timeouts

Hold Time  Range: 0.3 to 45 seconds

Interface Debounce Time  Range: 300 to 9000 milliseconds

> Auto-Rejoin Settings

> Monitored Interfaces

Reset to Defaults Cancel Save

When any topology changes occur (such as adding or removing a data interface, enabling or disabling an interface on the node or the switch, or adding an additional switch to form a VSS or vPC) you should disable the system health check feature and also disable interface monitoring for the disabled interfaces. When the topology change is complete, and the configuration change is synced to all nodes, you can re-enable the system health check feature and monitored interfaces.

**Step 6** Configure the hold time and interface debounce time.

- **Hold Time**—Set the hold time to determine the amount of time between node heartbeat status messages, between .3 and 45 seconds; The default is 3 seconds.
- **Interface Debounce Time**—Set the debounce time between 300 and 9000 ms. The default is 500 ms. Lower values allow for faster detection of interface failures. Note that configuring a lower debounce time increases the chances of false-positives. When an interface status update occurs, the node waits the number of milliseconds specified before marking the interface as failed, and the node is removed from the cluster. In the case of an EtherChannel that transitions from a down state to an up state (for example, the switch reloaded, or the switch enabled an EtherChannel), a longer debounce time can prevent the interface from appearing to be failed on a cluster node just because another cluster node was faster at bundling the ports.

**Step 7** Customize the auto-rejoin cluster settings after a health check failure.

Figure 199: Configure Auto-Rejoin Settings

▼ Auto-Rejoin Settings

---

**Cluster Interface**

Attempts  Range: 0-65535 (-1 for unlimited number of attempts)

Interval Between Attempts  Range: 2-60 minutes between rejoin attempts

Interval Variation  Range: 1-3. Defines if the interval duration increases. 1 (no change); 2 (2 x the previous duration), or 3 (3 x the previous duration).

**Data Interface**

Attempts  Range: 0-65535 (-1 for unlimited number of attempts)

Interval Between Attempts  Range: 2-60 minutes between rejoin attempts

Interval Variation  Range: 1-3. Defines if the interval duration increases. 1 (no change); 2 (2 x the previous duration), or 3 (3 x the previous duration).

**System**

Attempts  Range: 0-65535 (-1 for unlimited number of attempts)

Interval Between Attempts  Range: 2-60 minutes between rejoin attempts

Interval Variation  Range: 1-3. Defines if the interval duration increases. 1 (no change); 2 (2 x the previous duration), or 3 (3 x the previous duration).

Set the following values for the **Cluster Interface**, **Data Interface**, and **System** (internal failures include: application sync timeout; inconsistent application statuses; and so on):

- **Attempts**—Sets the number of rejoin attempts, between -1 and 65535. **0** disables auto-rejoining. The default for the **Cluster Interface** is -1 (unlimited). The default for the **Data Interface** and **System** is 3.
- **Interval Between Attempts**—Defines the interval duration in minutes between rejoin attempts, between 2 and 60. The default value is 5 minutes. The maximum total time that the node attempts to rejoin the cluster is limited to 14400 minutes (10 days) from the time of last failure.
- **Interval Variation**—Defines if the interval duration increases. Set the value between 1 and 3: **1** (no change); **2** (2 x the previous duration), or **3** (3 x the previous duration). For example, if you set the interval duration to 5 minutes, and set the variation to 2, then the first attempt is after 5 minutes; the 2nd attempt is 10 minutes (2 x 5); the 3rd attempt 20 minutes (2 x 10), and so on. The default value is **1** for the **Cluster Interface** and **2** for the **Data Interface** and **System**.

**Step 8**

Configure monitored interfaces by moving interfaces in the **Monitored Interfaces** or **Unmonitored Interfaces** window. You can also check or uncheck **Enable Service Application Monitoring** to enable or disable monitoring of the Snort and disk-full processes.

**Figure 200: Configure Monitored Interfaces**

▼ Monitored Interfaces

- Diagnostic0/0

Add

Unmonitored Interfaces 0

Enable Service Application Monitoring

The interface health check monitors for link failures. If all physical ports for a given logical interface fail on a particular node, but there are active ports under the same logical interface on other nodes, then the node is removed from the cluster. The amount of time before the node removes a member from the cluster depends on the type of interface and whether the node is an established node or is joining the cluster. Health check is enabled by default for all interfaces and for the Snort and disk-full processes.

You might want to disable health monitoring of non-essential interfaces.

When any topology changes occur (such as adding or removing a data interface, enabling or disabling an interface on the node or the switch, or adding an additional switch to form a VSS or vPC) you should disable the system health check feature and also disable interface monitoring for the disabled interfaces. When the topology change is complete, and the configuration change is synced to all nodes, you can re-enable the system health check feature and monitored interfaces.

**Step 9** Click **Save**.

**Step 10** Deploy configuration changes.

## Manage Cluster Nodes

### Add a New Cluster Node

You can add one or more new cluster nodes to an existing cluster.

## Procedure

**Step 1** Choose **Devices > Device Management**, click the **More** (⋮) for the cluster, and choose **Add Nodes**.

*Figure 201: Add Nodes*

The **Manage Cluster Wizard** appears.

**Step 2** From the **Node** menu, choose a device, and adjust the IP address and priority if desired.

*Figure 202: Manage Cluster Wizard*

 A screenshot of the 'Manage Cluster Wizard' configuration page. The page has two tabs: 'Configuration' (active) and 'Summary'. The configuration fields are:
 

- Cluster Name\*: cluster1
- Cluster Key: [masked]
- Control Node:
  - You can form the cluster with just the control node to reduce formation time.
  - Node\*: node1
  - VXLAN Network Identifier (VNI) Network\*: 10.10.1.0 / 27 (30 addresses)
  - Virtual Tunnel Endpoint (VTEP) Network\*: 209.165.200.224 / 27 (30 addresses)
  - Cluster Control Link\*: GigabitEthernet0/7
  - VTEP IPv4 Address\*: 209.165.200.225
  - Priority\*: 1
- Data Nodes (Optional):
  - Data node hardware needs to match the control node hardware.
  - Node\*: [dropdown menu with 'Type device name' selected]
  - VTEP IPv4 Address\*: 209.165.200.226
  - Priority\*: 2
  - Remove button
  - Add a data node link

**Step 3** To add additional nodes, click **Add a data node**.

**Step 4** Click **Continue**. Review the **Summary**, and then click **Save**

The node that is currently registering shows the loading icon.

**Figure 203: Node Registration**

You can monitor cluster node registration by clicking the **Notifications** icon and choosing **Tasks**.

## Break a Node

You can remove a node from the cluster so that it becomes a standalone device. You cannot break the control node unless you break the entire cluster. The data node has its configuration erased.

### Procedure

**Step 1** Choose **Devices > Device Management**, click the **More** (⋮) for the node you want to break, and choose **Break Node**.

**Figure 204: Break a Node**

You can optionally break one or more nodes from the cluster More menu by choosing **Break Nodes**.

**Step 2** You are prompted to confirm the break; click **Yes**.

**Figure 205: Confirm Break**

You can monitor the cluster node break by clicking the **Notifications** icon and choosing **Tasks**.

## Break the Cluster

You can break the cluster and convert all nodes to standalone devices. The control node retains the interface and security policy configuration, while data nodes have their configuration erased.

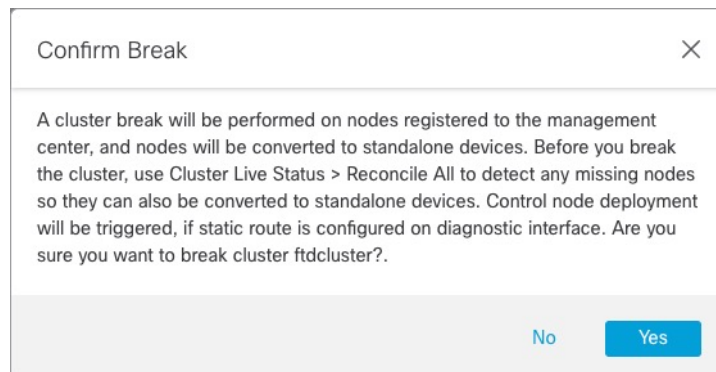

### Procedure

**Step 1** Make sure all cluster nodes are being managed by the management center by reconciling nodes. See [Reconcile Cluster Nodes](#), on page 740.

**Step 2** Choose **Devices > Device Management**, click the **More** (⋮) for the cluster, and choose **Break Cluster**.

**Figure 206: Break Cluster**

**Step 3** You are prompted to break the cluster; click **Yes**.

**Figure 207: Confirm Break**

You can monitor the cluster break by clicking the **Notifications** icon and choosing **Tasks**.

## Disable Clustering

You may want to deactivate a node in preparation for deleting the node, or temporarily for maintenance. This procedure is meant to temporarily deactivate a node; the node will still appear in the management center device list. When a node becomes inactive, all data interfaces are shut down.

### Procedure

- Step 1** For the unit you want to disable, choose **Devices > Device Management**, click the **More** (⋮), and choose **Disable Node Clustering**.

**Figure 208: Disable Clustering**

If you disable clustering on the control node, one of the data nodes will become the new control node. Note that for centralized features, if you force a control node change, then all connections are dropped, and you have to re-establish the connections on the new control node. You cannot disable clustering on the control node if it is the only node in the cluster.

- Step 2** Confirm that you want to disable clustering on the node.  
The node will show **(Disabled)** next to its name in the **Devices > Device Management** list.
- Step 3** To reenable clustering, see [Rejoin the Cluster, on page 738](#).

## Rejoin the Cluster

If a node was removed from the cluster, for example for a failed interface or if you manually disabled clustering, you must manually rejoin the cluster. Make sure the failure is resolved before you try to rejoin the cluster.

### Procedure

---

- Step 1** For the unit you want to reactivate, choose **Devices > Device Management**, click the **More** (⋮), and choose **Enable Node Clustering**.
- Step 2** Confirm that you want to enable clustering on the node.
- 

## Change the Control Node

**Caution** The best method to change the control node is to disable clustering on the control node, wait for a new control election, and then re-enable clustering. If you must specify the *exact* unit you want to become the control node, use the procedure in this section. Note that for centralized features, if you force a control node change using either method, then all connections are dropped, and you have to re-establish the connections on the new control node.

---

To change the control node, perform the following steps.

### Procedure

---

- Step 1** Open the **Cluster Status** dialog box by choosing **Devices > Device Management > More** (⋮) > **Cluster Live Status**.

Figure 209: Cluster Status

Cluster Status ?

---

Overall Status:  Cluster has all nodes in sync

Nodes details (2) Refresh Reconcile All

	Status	Device Name	Unit Name	Chassis URL	
>	In Sync.	172.16.0.50 <span style="border: 1px solid gray; padding: 2px;">Control</span>	172.16.0.50	N/A	⋮
>	In Sync.	172.16.0.51	172.16.0.51	N/A	⋮

---

Dated: 11:52:26 | 20 Dec 2021 Close

**Step 2** For the unit you want to become the control unit, choose **More** (⋮) > **Change Role to Control**.

**Step 3** You are prompted to confirm the role change. Check the checkbox, and click **OK**.

## Edit the Cluster Configuration

You can edit the cluster configuration. If you change any values other than the VTEP IP address for a node or node priority, the cluster will be broken and reformed automatically. Until the cluster is reformed, you may experience traffic disruption. If you change the VTEP IP address for a node or node priority, only the affected nodes are broken and readded to the cluster.

### Procedure

**Step 1** Choose **Devices > Device Management**, click the **More** (⋮) for the cluster, and choose **Edit Configuration**.

Figure 210: Edit Configuration

The **Manage Cluster Wizard** appears.

**Step 2** Update the cluster configuration.

Figure 211: Manage Cluster Wizard

Manage Cluster Wizard ✕

1 Configuration — 2 Summary

▲ Editing the cluster bootstrap configuration requires restarting all cluster nodes. This operation may result in traffic disruption, and you should perform bootstrap changes during the maintenance window.

# Reconcile Cluster Nodes

If a cluster node fails to register, you can reconcile the cluster membership from the device to the management center. For example, a data node might fail to register if the management center is occupied with certain processes, or if there is a network issue.

## Procedure

**Step 1** Choose **Devices > Device Management > More** (⋮) for the cluster, and then choose **Cluster Live Status** to open the **Cluster Status** dialog box.

**Figure 212: Cluster Live Status**

**Step 2** Click **Reconcile All**.

**Figure 213: Reconcile All**

---

Dated: 11:52:26 | 20 Dec 2021 Close

For more information about the cluster status, see [Monitoring the Cluster](#), on page 742.

## Delete the Cluster or Nodes from the Management Center

You can delete the cluster from the Security Cloud Control, which keeps the cluster intact. You might want to delete the cluster if you want to add the cluster to a new Security Cloud Control.

You can also delete a node from the Security Cloud Control without breaking the node from the cluster. Although the node is not visible in the Security Cloud Control, it is still part of the cluster, and it will continue to pass traffic and could even become the control node. You cannot delete the current control node. You might want to delete the node if it is no longer reachable from the Security Cloud Control, but you still want to keep it as part of the cluster.

### Procedure

- 
- Step 1** Log into Security Cloud Control and click **Inventory**.
- Step 2** Click the **FTD** tab and locate the cluster you want. Select it so the device row is highlighted.
- Step 3** Do the following:
- To delete a node within the cluster, in the **Cluster** pane to the right, click the delete icon appearing beside the device you want to delete.
  - To delete the cluster, in the **Device Actions** pane to the right, click **Remove**.
- Step 4** When prompted, select **OK** to confirm the removal of the selected device.
- 

## Monitoring the Cluster

You can monitor the cluster in the management center and at the threat defense CLI.

- **Cluster Status** dialog box, which is available from the **Devices > Device Management > More** (⋮) icon or from the **Devices > Device Management > Cluster** page > **General** area > **Cluster Live Status** link.

Figure 214: Cluster Status

Cluster Status ?

Overall Status:  Cluster has all nodes in sync

Nodes details (2)

	Status	Device Name	Unit Name	Chassis URL	
>	In Sync.	172.16.0.50 <span style="background-color: #ccc; padding: 2px;">Control</span>	172.16.0.50	N/A	⋮

Dated: 11:52:26 | 20 Dec 2021

The Control node has a graphic indicator identifying its role.

Cluster member **Status** includes the following states:

- In Sync.—The node is registered with the management center.
- Pending Registration—The node is part of the cluster, but has not yet registered with the management center. If a node fails to register, you can retry registration by clicking **Reconcile All**.
- Clustering is disabled—The node is registered with the management center, but is an inactive member of the cluster. The clustering configuration remains intact if you intend to later re-enable it, or you can delete the node from the cluster.
- Joining cluster...—The node is joining the cluster on the chassis, but has not completed joining. After it joins, it will register with the management center.

For each node, you can view the **Summary** or the **History**.

- **System** (⚙) > **Tasks** page.

The **Tasks** page shows updates of the Cluster Registration task as each node registers.

- **Devices** > **Device Management** > *cluster\_name*.

When you expand the cluster on the devices listing page, you can see all member nodes, including the control node shown with its role next to the IP address. For nodes that are still registering, you can see the loading icon.

- **show cluster** {**access-list** [*acl\_name*] | **conn** [**count**] | **cpu** [**usage**] | **history** | **interface-mode** | **memory** | **resource usage** | **service-policy** | **traffic** | **xlate count**}

To view aggregated data for the entire cluster or other information, use the **show cluster** command.

- **show cluster info** [**auto-join** | **clients** | **conn-distribution** | **flow-mobility counters** | **goid** [*options*] | **health** | **incompatible-config** | **loadbalance** | **old-members** | **packet-distribution** | **trace** [*options*] | **transport** { **asp** | **cp** }]

To view cluster information, use the **show cluster info** command.

# Cluster Health Monitor Dashboard

## Cluster Health Monitor

When a threat defense is the control node of a cluster, the management center collects various metrics periodically from the device metric data collector. The cluster health monitor is comprised of the following components:

- Overview dashboard—Displays information about the cluster topology, cluster statistics, and metric charts:
  - The topology section displays a cluster's live status, the health of individual threat defense, threat defense node type (control node or data node), and the status of the device. The status of the device could be *Disabled* (when the device leaves the cluster), *Added out of box* (in a public cloud cluster, the additional nodes that do not belong to the management center), or *Normal* (ideal state of the node).
  - The cluster statistics section displays current metrics of the cluster with respect to the CPU usage, memory usage, input rate, output rate, active connections, and NAT translations.

---

**Note** The CPU and memory metrics display the individual average of the data plane and snort usage.

---

- The metric charts, namely, CPU Usage, Memory Usage, Throughput, and Connections, diagrammatically display the statistics of the cluster over the specified time period.
- Load Distribution dashboard—Displays load distribution across the cluster nodes in two widgets:
  - The Distribution widget displays the average packet and connection distribution over the time range across the cluster nodes. This data depicts how the load is being distributed by the nodes. Using this widget, you can easily identify any abnormalities in the load distribution and rectify it.
  - The Node Statistics widget displays the node level metrics in table format. It displays metric data on CPU usage, memory usage, input rate, output rate, active connections, and NAT translations across the cluster nodes. This table view enables you to correlate data and easily identify any discrepancies.
- Member Performance dashboard—Displays current metrics of the cluster nodes. You can use the selector to filter the nodes and view the details of a specific node. The metric data include CPU usage, memory usage, input rate, output rate, active connections, and NAT translations.
- CCL dashboard—Displays, graphically, the cluster control link data namely, the input, and output rate.
- Troubleshooting and Links — Provides convenient links to frequently used troubleshooting topics and procedures.
- Time range—An adjustable time window to constrain the information that appears in the various cluster metrics dashboards and widgets.
- Custom Dashboard—Displays data on both cluster-wide metrics and node-level metrics. However, node selection only applies for the threat defense metrics and not for the entire cluster to which the node belongs.

## Viewing Cluster Health

You must be an Admin, Maintenance, or Security Analyst user to perform this procedure.

The cluster health monitor provides a detailed view of the health status of a cluster and its nodes. This cluster health monitor provides health status and trends of the cluster in an array of dashboards.

### Before you begin

- Ensure you have created a cluster from one or more devices in the management center.

### Procedure

---

**Step 1** Choose **System** (⚙) > **Health** > **Monitor**.

Use the Monitoring navigation pane to access node-specific health monitors.

**Step 2** In the device list, click **Expand** (>) and **Collapse** (v) to expand and collapse the list of managed cluster devices.

**Step 3** To view the cluster health statistics, click on the cluster name. The cluster monitor reports health and performance metrics in several predefined dashboards by default. The metrics dashboards include:

- Overview — Highlights key metrics from the other predefined dashboards, including its nodes, CPU, memory, input and output rates, connection statistics, and NAT translation information.
- Load Distribution — Traffic and packet distribution across the cluster nodes.
- Member Performance — Node-level statistics on CPU usage, memory usage, input throughput, output throughput, active connection, and NAT translation.
- CCL — Interface status and aggregate traffic statistics.

You can navigate through the various metrics dashboards by clicking on the labels. For a comprehensive list of the supported cluster metrics, see [Cisco Secure Firewall Threat Defense Health Metrics](#).

**Step 4** You can configure the time range from the drop-down in the upper-right corner. The time range can reflect a period as short as the last hour (the default) or as long as two weeks. Select **Custom** from the drop-down to configure a custom start and end date.

Click the refresh icon to set auto refresh to 5 minutes or to toggle off auto refresh.

**Step 5** Click on deployment icon for a deployment overlay on the trend graph, with respect to the selected time range.

The deployment icon indicates the number of deployments during the selected time-range. A vertical band indicates the deployment start and end time. For multiple deployments, multiple bands/lines appear. Click on the icon on top of the dotted line to view the deployment details.

**Step 6** (For node-specific health monitor) View the **Health Alerts** for the node in the alert notification at the top of page, directly to the right of the device name.

Hover your pointer over the **Health Alerts** to view the health summary of the node. The popup window shows a truncated summary of the top five health alerts. Click on the popup to open a detailed view of the health alert summary.

- Step 7** (For node-specific health monitor) The device monitor reports health and performance metrics in several predefined dashboards by default. The metrics dashboards include:
- Overview — Highlights key metrics from the other predefined dashboards, including CPU, memory, interfaces, connection statistics; plus disk usage and critical process information.
  - CPU — CPU utilization, including the CPU usage by process and by physical cores.
  - Memory — Device memory utilization, including data plane and Snort memory usage.
  - Interfaces — Interface status and aggregate traffic statistics.
  - Connections — Connection statistics (such as elephant flows, active connections, peak connections, and so on) and NAT translation counts.
  - Snort — Statistics that are related to the Snort process.
  - ASP drops — Statistics related to the dropped packets against various reasons.

You can navigate through the various metrics dashboards by clicking on the labels. See [Cisco Secure Firewall Threat Defense Health Metrics](#) for a comprehensive list of the supported device metrics.

- Step 8** Click the plus sign (+) in the upper right corner of the health monitor to create a custom dashboard by building your own variable set from the available metric groups.

For cluster-wide dashboard, choose Cluster metric group, and then choose the metric.

## Cluster Metrics

The cluster health monitor tracks statistics that are related to a cluster and its nodes, and aggregate of load distribution, performance, and CCL traffic statistics.

**Table 57: Cluster Metrics**

Metric	Description	Format
CPU	Average of CPU metrics on the nodes of a cluster (individually for data plane and snort).	percentage
Memory	Average of memory metrics on the nodes of a cluster (individually for data plane and snort).	percentage
Data Throughput	Incoming and outgoing data traffic statistics for a cluster.	bytes
CCL Throughput	Incoming and outgoing CCL traffic statistics for a cluster.	bytes
Connections	Count of active connections in a cluster.	number
NAT Translations	Count of NAT translations for a cluster.	number
Distribution	Connection distribution count in the cluster for every second.	number

Metric	Description	Format
Packets	Packet distribution count in the cluster for every second.	number

## Reference for Clustering

This section includes more information about how clustering operates.

### Threat Defense Features and Clustering

Some threat defense features are not supported with clustering, and some are only supported on the control unit. Other features might have caveats for proper usage.

### Unsupported Features and Clustering

These features cannot be configured with clustering enabled, and the commands will be rejected.

**Note** To view FlexConfig features that are also not supported with clustering, for example WCCP inspection, see the [ASA general operations configuration guide](#). FlexConfig lets you configure many ASA features that are not present in the management center GUI. See [FlexConfig Policies, on page 2703](#).

- Remote access VPN (SSL VPN and IPsec VPN)
- DHCP client, server, and proxy. DHCP relay is supported.
- Virtual Tunnel Interfaces (VTIs)
- High Availability
- Integrated Routing and Bridging
- Management Center UCAPL/CC mode

### Centralized Features for Clustering

The following features are only supported on the control node, and are not scaled for the cluster.

**Note** Traffic for centralized features is forwarded from member nodes to the control node over the cluster control link.

If you use the rebalancing feature, traffic for centralized features may be rebalanced to non-control nodes before the traffic is classified as a centralized feature; if this occurs, the traffic is then sent back to the control node.

For centralized features, if the control node fails, all connections are dropped, and you have to re-establish the connections on the new control node.

---

**Note** To view FlexConfig features that are also centralized with clustering, for example RADIUS inspection, see the [ASA general operations configuration guide](#). FlexConfig lets you configure many ASA features that are not present in the management center GUI. See [FlexConfig Policies, on page 2703](#).

---

- The following application inspections:
  - DCERPC
  - ESMTP
  - NetBIOS
  - PPTP
  - RSH
  - SQLNET
  - SUNRPC
  - TFTP
  - XDMCP
  
- Static route monitoring

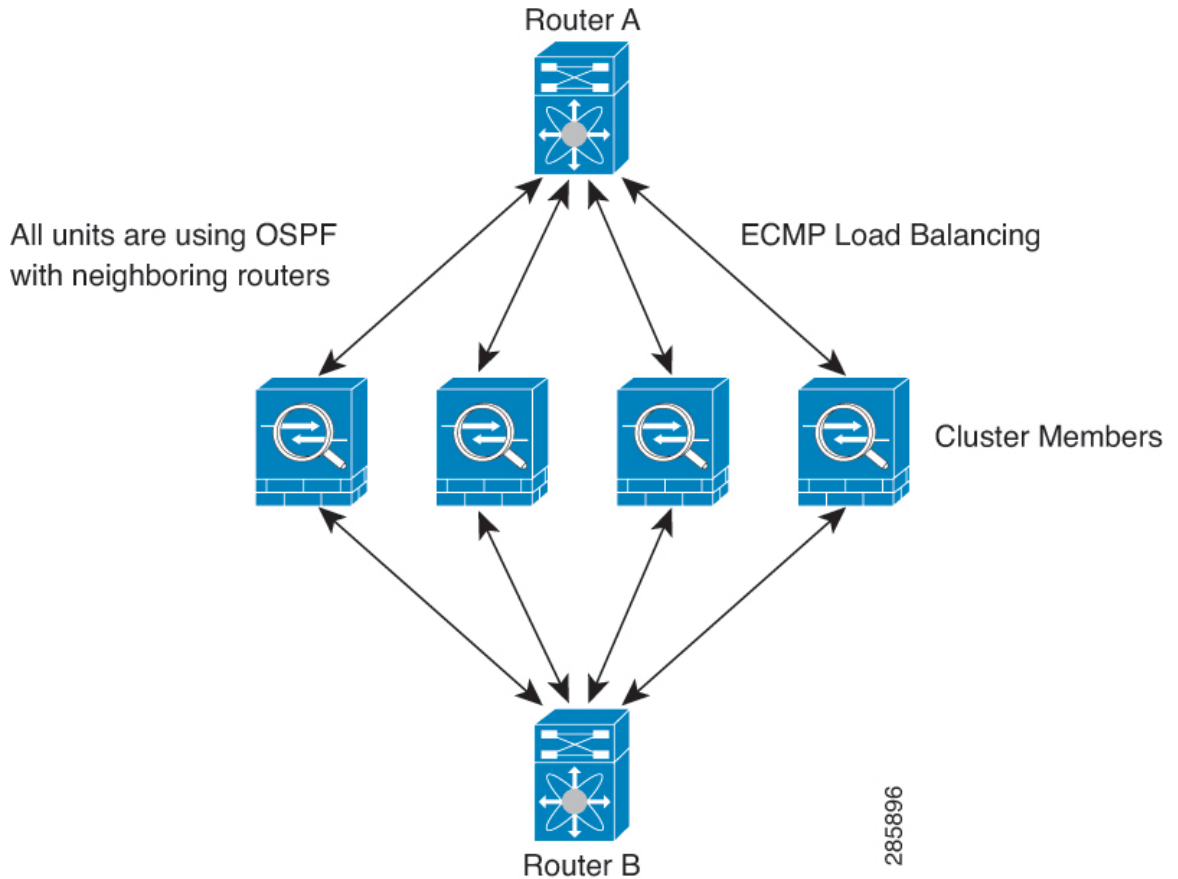

## Connection Settings and Clustering

Connection limits are enforced cluster-wide. Each node has an estimate of the cluster-wide counter values based on broadcast messages. Due to efficiency considerations, the configured connection limit across the cluster might not be enforced exactly at the limit number. Each node may overestimate or underestimate the cluster-wide counter value at any given time. However, the information will get updated over time in a load-balanced cluster.

## Dynamic Routing and Clustering

In Individual interface mode, each node runs the routing protocol as a standalone router, and routes are learned by each node independently.

Figure 217: Dynamic Routing in Individual Interface Mode

In the above diagram, Router A learns that there are 4 equal-cost paths to Router B, each through a node. ECMP is used to load balance traffic between the 4 paths. Each node picks a different router ID when talking to external routers.

You must configure a cluster pool for the router ID so that each node has a separate router ID.

## FTP and Clustering

- If FTP data channel and control channel flows are owned by different cluster members, then the data channel owner will periodically send idle timeout updates to the control channel owner and update the idle timeout value. However, if the control flow owner is reloaded, and the control flow is re-hosted, the parent/child flow relationship will not longer be maintained; the control flow idle timeout will not be updated.

## NAT and Clustering

NAT can affect the overall throughput of the cluster. Inbound and outbound NAT packets can be sent to different threat defenses in the cluster, because the load balancing algorithm relies on IP addresses and ports, and NAT causes inbound and outbound packets to have different IP addresses and/or ports. When a packet arrives at the threat defense that is not the NAT owner, it is forwarded over the cluster control link to the owner, causing large amounts of traffic on the cluster control link. Note that the receiving node does not create

a forwarding flow to the owner, because the NAT owner may not end up creating a connection for the packet depending on the results of security and policy checks.

If you still want to use NAT in clustering, then consider the following guidelines:

- No Proxy ARP—For Individual interfaces, a proxy ARP reply is never sent for mapped addresses. This prevents the adjacent router from maintaining a peer relationship with an ASA that may no longer be in the cluster. The upstream router needs a static route or PBR with Object Tracking for the mapped addresses that points to the Main cluster IP address.
- No interface PAT on an Individual interface—Interface PAT is not supported for Individual interfaces.
- PAT with Port Block Allocation—See the following guidelines for this feature:
  - Maximum-per-host limit is not a cluster-wide limit, and is enforced on each node individually. Thus, in a 3-node cluster with the maximum-per-host limit configured as 1, if the traffic from a host is load-balanced across all 3 nodes, then it can get allocated 3 blocks with 1 in each node.
  - Port blocks created on the backup node from the backup pools are not accounted for when enforcing the maximum-per-host limit.
  - On-the-fly PAT rule modifications, where the PAT pool is modified with a completely new range of IP addresses, will result in xlate backup creation failures for the xlate backup requests that were still in transit while the new pool became effective. This behavior is not specific to the port block allocation feature, and is a transient PAT pool issue seen only in cluster deployments where the pool is distributed and traffic is load-balanced across the cluster nodes.
  - When operating in a cluster, you cannot simply change the block allocation size. The new size is effective only after you reload each device in the cluster. To avoid having to reload each device, we recommend that you delete all block allocation rules and clear all xlates related to those rules. You can then change the block size and recreate the block allocation rules.
- NAT pool address distribution for dynamic PAT—When you configure a PAT pool, the cluster divides each IP address in the pool into port blocks. By default, each block is 512 ports, but if you configure port block allocation rules, your block setting is used instead. These blocks are distributed evenly among the nodes in the cluster, so that each node has one or more blocks for each IP address in the PAT pool. Thus, you could have as few as one IP address in a PAT pool for a cluster, if that is sufficient for the number of PAT'ed connections you expect. Port blocks cover the 1024-65535 port range, unless you configure the option to include the reserved ports, 1-1023, on the PAT pool NAT rule.
- Reusing a PAT pool in multiple rules—To use the same PAT pool in multiple rules, you must be careful about the interface selection in the rules. You must either use specific interfaces in all rules, or "any" in all rules. You cannot mix specific interfaces and "any" across the rules, or the system might not be able to match return traffic to the right node in the cluster. Using unique PAT pools per rule is the most reliable option.
- No round-robin—Round-robin for a PAT pool is not supported with clustering.
- No extended PAT—Extended PAT is not supported with clustering.
- Dynamic NAT xlates managed by the control node—The control node maintains and replicates the xlate table to data nodes. When a data node receives a connection that requires dynamic NAT, and the xlate is not in the table, it requests the xlate from the control node. The data node owns the connection.

- Stale xlates—The xlate idle time on the connection owner does not get updated. Thus, the idle time might exceed the idle timeout. An idle timer value higher than the configured timeout with a refcnt of 0 is an indication of a stale xlate.
- No static PAT for the following inspections—
  - FTP
  - RSH
  - SQLNET
  - TFTP
  - XDMCP
  - SIP
- If you have an extremely large number of NAT rules, over ten thousand, you should enable the transactional commit model using the **asp rule-engine transactional-commit nat** command in the device CLI. Otherwise, the node might not be able to join the cluster.

## SIP Inspection and Clustering

A control flow can be created on any node (due to load balancing); its child data flows must reside on the same node.

## SNMP and Clustering

You should always use the Local address, and not the Main cluster IP address for SNMP polling. If the SNMP agent polls the Main cluster IP address, if a new control node is elected, the poll to the new control node will fail.

When using SNMPv3 with clustering, if you add a new cluster node after the initial cluster formation, then SNMPv3 users are not replicated to the new node. You must remove the users, and re-add them, and then redeploy your configuration to force the users to replicate to the new node.

## Syslog and Clustering

- Each node in the cluster generates its own syslog messages. You can configure logging so that each node uses either the same or a different device ID in the syslog message header field. For example, the hostname configuration is replicated and shared by all nodes in the cluster. If you configure logging to use the hostname as the device ID, syslog messages generated by all nodes look as if they come from a single node. If you configure logging to use the local-node name that is assigned in the cluster bootstrap configuration as the device ID, syslog messages look as if they come from different nodes.

## Cisco Trustsec and Clustering

Only the control node learns security group tag (SGT) information. The control node then populates the SGT to data nodes, and data nodes can make a match decision for SGT based on the security policy.

## VPN and Clustering

VPN functionality is limited to the control node and does not take advantage of the cluster high availability capabilities. If the control node fails, all existing VPN connections are lost, and VPN users will see a disruption in service. When a new control node is elected, you must reestablish the VPN connections.

For connections to an Individual interface when using PBR or ECMP, you must always connect to the Main cluster IP address, not a Local address.

VPN-related keys and certificates are replicated to all nodes.

---

**Note** Remote access VPN is not supported with clustering.

---

## Performance Scaling Factor

When you combine multiple units into a cluster, you can expect the total cluster performance to be approximately 80% of the maximum combined throughput.

For example, if your model can handle approximately 10 Gbps of traffic when running alone, then for a cluster of 8 units, the maximum combined throughput will be approximately 80% of 80 Gbps (8 units x 10 Gbps): 64 Gbps.

## Control Node Election

Nodes of the cluster communicate over the cluster control link to elect a control node as follows:

1. When you enable clustering for a node (or when it first starts up with clustering already enabled), it broadcasts an election request every 3 seconds.
2. Any other nodes with a higher priority respond to the election request; the priority is set between 1 and 100, where 1 is the highest priority.
3. If after 45 seconds, a node does not receive a response from another node with a higher priority, then it becomes the control node.

---

**Note** If multiple nodes tie for the highest priority, the cluster node name and then the serial number is used to determine the control node.

---

4. If a node later joins the cluster with a higher priority, it does not automatically become the control node; the existing control node always remains as the control node unless it stops responding, at which point a new control node is elected.
5. In a "split brain" scenario when there are temporarily multiple control nodes, then the node with highest priority retains the role while the other nodes return to data node roles.

---

**Note** You can manually force a node to become the control node. For centralized features, if you force a control node change, then all connections are dropped, and you have to re-establish the connections on the new control node.

---

## High Availability within the Cluster

Clustering provides high availability by monitoring node and interface health and by replicating connection states between nodes.

### Node Health Monitoring

Each node periodically sends a broadcast heartbeat packet over the cluster control link. If the control node does not receive any heartbeat packets or other packets from a data node within the configurable timeout period, then the control node removes the data node from the cluster. If the data nodes do not receive packets from the control node, then a new control node is elected from the remaining nodes.

If nodes cannot reach each other over the cluster control link because of a network failure and not because a node has actually failed, then the cluster may go into a "split brain" scenario where isolated data nodes will elect their own control nodes. For example, if a router fails between two cluster locations, then the original control node at location 1 will remove the location 2 data nodes from the cluster. Meanwhile, the nodes at location 2 will elect their own control node and form their own cluster. Note that asymmetric traffic may fail in this scenario. After the cluster control link is restored, then the control node that has the higher priority will keep the control node's role.

### Interface Monitoring

Each node monitors the link status of all named hardware interfaces in use, and reports status changes to the control node.

All physical interfaces are monitored; only named interfaces can be monitored. You can optionally disable monitoring per interface.

A node is removed from the cluster if its monitored interfaces fail. The node is removed after 500 ms.

### Status After Failure

When a node in the cluster fails, the connections hosted by that node are seamlessly transferred to other nodes; state information for traffic flows is shared over the control node's cluster control link.

If the control node fails, then another member of the cluster with the highest priority (lowest number) becomes the control node.

The threat defense automatically tries to rejoin the cluster, depending on the failure event.

---

**Note** When the threat defense becomes inactive and fails to automatically rejoin the cluster, all data interfaces are shut down; only the Management interface can send and receive traffic.

---

## Rejoining the Cluster

After a cluster member is removed from the cluster, how it can rejoin the cluster depends on why it was removed:

- Failed cluster control link when initially joining—After you resolve the problem with the cluster control link, you must manually rejoin the cluster by re-enabling clustering.
- Failed cluster control link after joining the cluster—The threat defense automatically tries to rejoin every 5 minutes, indefinitely.
- Failed data interface—The threat defense automatically tries to rejoin at 5 minutes, then at 10 minutes, and finally at 20 minutes. If the join is not successful after 20 minutes, then the threat defense application disables clustering. After you resolve the problem with the data interface, you have to manually enable clustering.
- Failed node—If the node was removed from the cluster because of a node health check failure, then rejoining the cluster depends on the source of the failure. For example, a temporary power failure means the node will rejoin the cluster when it starts up again as long as the cluster control link is up. The threat defense application attempts to rejoin the cluster every 5 seconds.
- Internal error—Internal failures include: application sync timeout; inconsistent application statuses; and so on.
- Failed configuration deployment—If you deploy a new configuration from management center, and the deployment fails on some cluster members but succeeds on others, then the nodes that failed are removed from the cluster. You must manually rejoin the cluster by re-enabling clustering. If the deployment fails on the control node, then the deployment is rolled back, and no members are removed. If the deployment fails on all data nodes, then the deployment is rolled back, and no members are removed.

## Data Path Connection State Replication

Every connection has one owner and at least one backup owner in the cluster. The backup owner does not take over the connection in the event of a failure; instead, it stores TCP/UDP state information, so that the connection can be seamlessly transferred to a new owner in case of a failure. The backup owner is usually also the director.

Some traffic requires state information above the TCP or UDP layer. See the following table for clustering support or lack of support for this kind of traffic.

**Table 58: Features Replicated Across the Cluster**

Traffic	State Support	Notes
Up time	Yes	Keeps track of the system up time.
ARP Table	Yes	—
MAC address table	Yes	—
User Identity	Yes	—
IPv6 Neighbor database	Yes	—
Dynamic routing	Yes	—

Traffic	State Support	Notes
SNMP Engine ID	No	—

## How the Cluster Manages Connections

Connections can be load-balanced to multiple nodes of the cluster. Connection roles determine how connections are handled in both normal operation and in a high availability situation.

### Connection Roles

See the following roles defined for each connection:

- **Owner**—Usually, the node that initially receives the connection. The owner maintains the TCP state and processes packets. A connection has only one owner. If the original owner fails, then when new nodes receive packets from the connection, the director chooses a new owner from those nodes.
- **Backup owner**—The node that stores TCP/UDP state information received from the owner, so that the connection can be seamlessly transferred to a new owner in case of a failure. The backup owner does not take over the connection in the event of a failure. If the owner becomes unavailable, then the first node to receive packets from the connection (based on load balancing) contacts the backup owner for the relevant state information so it can become the new owner.

As long as the director (see below) is not the same node as the owner, then the director is also the backup owner. If the owner chooses itself as the director, then a separate backup owner is chosen.

For clustering on the Firepower 9300, which can include up to 3 cluster nodes in one chassis, if the backup owner is on the same chassis as the owner, then an additional backup owner will be chosen from another chassis to protect flows from a chassis failure.

- **Director**—The node that handles owner lookup requests from forwarders. When the owner receives a new connection, it chooses a director based on a hash of the source/destination IP address and ports (see below for ICMP hash details), and sends a message to the director to register the new connection. If packets arrive at any node other than the owner, the node queries the director about which node is the owner so it can forward the packets. A connection has only one director. If a director fails, the owner chooses a new director.

As long as the director is not the same node as the owner, then the director is also the backup owner (see above). If the owner chooses itself as the director, then a separate backup owner is chosen.

ICMP/ICMPv6 hash details:

- For Echo packets, the source port is the ICMP identifier, and the destination port is 0.
  - For Reply packets, the source port is 0, and the destination port is the ICMP identifier.
  - For other packets, both source and destination ports are 0.
- **Forwarder**—A node that forwards packets to the owner. If a forwarder receives a packet for a connection it does not own, it queries the director for the owner, and then establishes a flow to the owner for any other packets it receives for this connection. The director can also be a forwarder. Note that if a forwarder receives the SYN-ACK packet, it can derive the owner directly from a SYN cookie in the packet, so it does not need to query the director. (If you disable TCP sequence randomization, the SYN cookie is not used; a query to the director is required.) For short-lived flows such as DNS and ICMP, instead of querying, the forwarder immediately sends the packet to the director, which then sends them to the owner.

A connection can have multiple forwarders; the most efficient throughput is achieved by a good load-balancing method where there are no forwarders and all packets of a connection are received by the owner.

---

**Note** We do not recommend disabling TCP sequence randomization when using clustering. There is a small chance that some TCP sessions won't be established, because the SYN/ACK packet might be dropped.

---

- **Fragment Owner**—For fragmented packets, cluster nodes that receive a fragment determine a fragment owner using a hash of the fragment source IP address, destination IP address, and the packet ID. All fragments are then forwarded to the fragment owner over the cluster control link. Fragments may be load-balanced to different cluster nodes, because only the first fragment includes the 5-tuple used in the switch load balance hash. Other fragments do not contain the source and destination ports and may be load-balanced to other cluster nodes. The fragment owner temporarily reassembles the packet so it can determine the director based on a hash of the source/destination IP address and ports. If it is a new connection, the fragment owner will register to be the connection owner. If it is an existing connection, the fragment owner forwards all fragments to the provided connection owner over the cluster control link. The connection owner will then reassemble all fragments.

## New Connection Ownership

When a new connection is directed to a node of the cluster via load balancing, that node owns both directions of the connection. If any connection packets arrive at a different node, they are forwarded to the owner node over the cluster control link. If a reverse flow arrives at a different node, it is redirected back to the original node.

## Sample Data Flow for TCP

The following example shows the establishment of a new connection.

1. The SYN packet originates from the client and is delivered to one threat defense (based on the load balancing method), which becomes the owner. The owner creates a flow, encodes owner information into a SYN cookie, and forwards the packet to the server.
2. The SYN-ACK packet originates from the server and is delivered to a different threat defense (based on the load balancing method). This threat defense is the forwarder.
3. Because the forwarder does not own the connection, it decodes owner information from the SYN cookie, creates a forwarding flow to the owner, and forwards the SYN-ACK to the owner.
4. The owner sends a state update to the director, and forwards the SYN-ACK to the client.
5. The director receives the state update from the owner, creates a flow to the owner, and records the TCP state information as well as the owner. The director acts as the backup owner for the connection.
6. Any subsequent packets delivered to the forwarder will be forwarded to the owner.
7. If packets are delivered to any additional nodes, it will query the director for the owner and establish a flow.
8. Any state change for the flow results in a state update from the owner to the director.

## Sample Data Flow for ICMP and UDP

The following example shows the establishment of a new connection.

1. Figure 218: ICMP and UDP Data Flow

The first UDP packet originates from the client and is delivered to one threat defense (based on the load balancing method).

2. The node that received the first packet queries the director node that is chosen based on a hash of the source/destination IP address and ports.
3. The director finds no existing flow, creates a director flow and forwards the packet back to the previous node. In other words, the director has elected an owner for this flow.
4. The owner creates the flow, sends a state update to the director, and forwards the packet to the server.
5. The second UDP packet originates from the server and is delivered to the forwarder.
6. The forwarder queries the director for ownership information. For short-lived flows such as DNS, instead of querying, the forwarder immediately sends the packet to the director, which then sends it to the owner.
7. The director replies to the forwarder with ownership information.
8. The forwarder creates a forwarding flow to record owner information and forwards the packet to the owner.
9. The owner forwards the packet to the client.

## History for Threat Defense Virtual Clustering in a Private Cloud

Feature	Minimum Management Center	Minimum Threat Defense	Details

## CHAPTER 33

# Clustering for Threat Defense Virtual in a Public Cloud

---

Clustering lets you group multiple Threat Defense Virtuals together as a single logical device. A cluster provides all the convenience of a single device (management, integration into a network) while achieving the increased throughput and redundancy of multiple devices. You can deploy Threat Defense Virtual clusters in a public cloud using the following public cloud platforms:

- Amazon Web Services (AWS)
- Microsoft Azure
- Google Cloud Platform (GCP)

Currently, only routed firewall mode is supported.

---

**Note** Some features are not supported when using clustering. See [Unsupported Features and Clustering](#), on page 833.

---

# About Threat Defense Virtual Clustering in the Public Cloud

This section describes the clustering architecture and how it works.

## How the Cluster Fits into Your Network

The cluster consists of multiple firewalls acting as a single device. To act as a cluster, the firewalls need the following infrastructure:

- Isolated network for intra-cluster communication, known as the *cluster control link*, using VXLAN interfaces. VXLANs, which act as Layer 2 virtual networks over Layer 3 physical networks, let the Threat Defense Virtual send broadcast/multicast messages over the cluster control link.
- Load Balancer(s)—For external load balancing, you have the following options depending on your public cloud:

- AWS Gateway Load Balancer

The AWS Gateway Load Balancer combines a transparent network gateway and a load balancer that distributes traffic and scales virtual appliances on demand. The Threat Defense Virtual supports the Gateway Load Balancer centralized control plane with a distributed data plane (Gateway Load Balancer endpoint) using a Geneve interface single-arm proxy.

- Azure Gateway Load Balancer

In an Azure service chain, Threat Defense Virtuals act as a transparent gateway that can intercept packets between the internet and the customer service. The Threat Defense Virtual defines an external interface and an internal interface on a single NIC by utilizing VXLAN segments in a paired proxy.

- Native GCP load balancers, internal and external

- Equal-Cost Multi-Path Routing (ECMP) using inside and outside routers such as Cisco Cloud Services Router

ECMP routing can forward packets over multiple “best paths” that tie for top place in the routing metric. Like EtherChannel, a hash of source and destination IP addresses and/or source and destination ports can be used to send a packet to one of the next hops. If you use static routes for ECMP routing, then the Threat Defense failure can cause problems; the route continues to be used, and traffic to the failed Threat Defense will be lost. If you use static routes, be sure to use a static route monitoring feature such as Object Tracking. We recommend using dynamic routing protocols to add and remove routes, in which case, you must configure each Threat Defense to participate in dynamic routing.

---

**Note** Layer 2 Spanned EtherChannels are not supported for load balancing.

---

## Individual Interfaces

You can configure cluster interfaces as *Individual interfaces*.

Individual interfaces are normal routed interfaces, each with their own local IP address. Interface configuration must be configured only on the control node, and each interface uses DHCP.

**Note** Layer 2 Spanned EtherChannels are not supported.

## Control and Data Node Roles

One member of the cluster is the control node. If multiple cluster nodes come online at the same time, the control node is determined by the priority setting; the priority is set between 1 and 100, where 1 is the highest priority. All other members are data nodes. When you first create the cluster, you specify which node you want to be the control node, and it will become the control node simply because it is the first node added to the cluster.

All nodes in the cluster share the same configuration. The node that you initially specify as the control node will overwrite the configuration on the data nodes when they join the cluster, so you only need to perform initial configuration on the control node before you form the cluster.

Some features do not scale in a cluster, and the control node handles all traffic for those features.

## Cluster Control Link

Each node must dedicate one interface as a VXLAN (VTEP) interface for the cluster control link. For more information about VXLAN, see [Configure VXLAN Interfaces, on page 977](#).

### VXLAN Tunnel Endpoint

VXLAN tunnel endpoint (VTEP) devices perform VXLAN encapsulation and decapsulation. Each VTEP has two interface types: one or more virtual interfaces called VXLAN Network Identifier (VNI) interfaces, and a regular interface called the VTEP source interface that tunnels the VNI interfaces between VTEPs. The VTEP source interface is attached to the transport IP network for VTEP-to-VTEP communication.

### VTEP Source Interface

The VTEP source interface is a regular threat defense virtual interface with which you plan to associate the VNI interface. You can configure one VTEP source interface to act as the cluster control link. The source interface is reserved for cluster control link use only. Each VTEP source interface has an IP address on the same subnet. This subnet should be isolated from all other traffic, and should include only the cluster control link interfaces.

### VNI Interface

A VNI interface is similar to a VLAN interface: it is a virtual interface that keeps network traffic separated on a given physical interface by using tagging. You can only configure one VNI interface. Each VNI interface has an IP address on the same subnet.

### Peer VTEPs

Unlike regular VXLAN for data interfaces, which allows a single VTEP peer, The threat defense virtual clustering allows you to configure multiple peers.

## Cluster Control Link Traffic Overview

Cluster control link traffic includes both control and data traffic.

Control traffic includes:

- Control node election.
- Configuration replication.
- Health monitoring.

Data traffic includes:

- State replication.
- Connection ownership queries and data packet forwarding.

## Configuration Replication

All nodes in the cluster share a single configuration. You can only make configuration changes on the control node (with the exception of the bootstrap configuration), and changes are automatically synced to all other nodes in the cluster.

## Management Network

You must manage each node using the Management interface; management from a data interface is not supported with clustering.

## Licenses for Threat Defense Virtual Clustering

Each threat defense virtual cluster node requires the same performance tier license. We recommend using the same number of CPUs and memory for all members, or else performance will be limited on all nodes to match the least capable member. The throughput level will be replicated from the control node to each data node so they match.

You assign feature licenses to the cluster as a whole, not to individual nodes. However, each node of the cluster consumes a separate license for each feature. The clustering feature itself does not require any licenses.

When you add the control node to the Management Center, you can specify the feature licenses you want to use for the cluster. You can modify licenses for the cluster in the **Devices > Device Management > Cluster > License** area.

---

**Note** If you add the cluster before the Management Center is licensed (and running in Evaluation mode), then when you license the Management Center, you can experience traffic disruption when you deploy policy changes to the cluster. Changing to licensed mode causes all data units to leave the cluster and then rejoin.

---

# Requirements and Prerequisites for Threat Defense Virtual Clustering

## Model Requirements

- FTDv5, FTDv10, FTDv20, FTDv30, FTDv50, FTDv100

---

**Note** FTDv5 and FTDv10 do not support Amazon Web Services (AWS) Gateway Load Balancer (GWLB) and Azure GWLB.

---

- The following public cloud services:
  - Amazon Web Services (AWS)
  - Microsoft Azure
  - Google Cloud Platform (GCP)
- Maximum 16 nodes

See also the general requirements for the Threat Defense Virtual in the [Cisco Secure Firewall Threat Defense Virtual Getting Started Guide](#).

## User Roles

- Admin
- Access Admin
- Network Admin

## Hardware and Software Requirements

All units in a cluster:

- Must be in the same performance tier. We recommend using the same number of CPUs and memory for all nodes, or else performance will be limited on all nodes to match the least capable node.
- The Management Center access must be from the Management interface; data interface management is not supported.
- Must run the identical software except at the time of an image upgrade. Hitless upgrade is supported.
- All units in a cluster must be deployed in the same availability zone.
- Cluster control link interfaces of all units must be in the same subnet.

## MTU

Make sure the ports connected to the cluster control link have the correct (higher) MTU configured. If there is an MTU mismatch, the cluster formation will fail. The cluster control link MTU should be 154 bytes higher than the data interfaces. Because the cluster control link traffic includes data packet forwarding, the cluster control link needs to accommodate the entire size of a data packet plus cluster traffic overhead (100 bytes) plus VXLAN overhead (54 bytes).

For AWS with GWLB, the data interface uses Geneve encapsulation. In this case, the entire Ethernet datagram is being encapsulated, so the new packet is larger and requires a larger MTU. You should set the source interface MTU to be the network MTU + 306 bytes. So for the standard 1500 MTU network path, the source interface MTU should be 1806, and the cluster control link MTU should be +154, 1960.

For Azure with GWLB, the data interface uses VXLAN encapsulation. In this case, the entire Ethernet datagram is being encapsulated, so the new packet is larger and requires a larger MTU. You should set the cluster control link MTU to be the source interface MTU + 80 bytes.

The following table shows the default values for the cluster control link MTU and the data interface MTU.

**Note** We do not recommend setting the cluster control link MTU between 2561 and 8362; due to block pool handling, this MTU size is not optimal for system operation.

**Table 59: Default MTU**

Public Cloud	Cluster Control Link MTU	Data Interface MTU
AWS with GWLB	1980	1826
AWS	1654	1500
Azure with GWLB	1454	1374
Azure	1454	1300
GCP	1554	1400

# Guidelines for Threat Defense Virtual Clustering

## High Availability

High Availability is not supported with clustering.

## IPv6

The cluster control link is only supported using IPv4.

## Additional Guidelines

- When significant topology changes occur (such as adding or removing an EtherChannel interface, enabling or disabling an interface on the Threat Defense or the switch, adding an additional switch to form a VSS or vPC) you should disable the health check feature and also disable interface monitoring for the disabled

interfaces. When the topology change is complete, and the configuration change is synced to all units, you can re-enable the interface health check feature.

- When adding a node to an existing cluster, or when reloading a node, there will be a temporary, limited packet/connection drop; this is expected behavior. In some cases, the dropped packets can hang your connection; for example, dropping a FIN/ACK packet for an FTP connection will make the FTP client hang. In this case, you need to reestablish the FTP connection.
- Do not power off a node without first disabling clustering on the node.
- For decrypted TLS/SSL connections, the decryption states are not synchronized, and if the connection owner fails, then decrypted connections will be reset. New connections will need to be established to a new node. Connections that are not decrypted (they match a do-not-decrypt rule) are not affected and are replicated correctly.
- Dynamic scaling is not supported.
- Stateful Target Failover is not supported when you deploy the cluster on AWS.
- Perform a global deployment after the completion of each maintenance window.
- Ensure that you do not remove more than one device at a time from the auto scale group (AWS) / instance group (GCP) / scale set (Azure). We also recommend that you run the **cluster disable** command on the device before removing the device from the auto scale group (AWS) / instance group (GCP) / scale set (Azure).
- If you want to disable data nodes and the control node in a cluster, we recommend that you disable the data nodes before disabling the control node. If a control node is disabled while there are other data nodes in the cluster, one of the data nodes has to be promoted to be the control node. Note that the role change could disturb the cluster.
- In the customized day 0 configuration scripts given in this guide, you can change the IP addresses as per your requirement, provide custom interface names, and change the sequence of the CCL-Link interface.
- If you experience CCL instability issues, such as intermittent ping failures, after deploying a Threat Defense Virtual cluster on a cloud platform, we recommend that you address the reasons that are causing CCL instability. Also, you can increase the hold time as a temporary workaround to mitigate CCL instability issues to a certain extent. For more information on how to change the hold time, see [Edit Cluster Health Monitor Settings](#).
- When you are configuring your security firewall rule or security group for the Management Center virtual, you must include both Private and Public IP addresses of the Threat Defense Virtual in the Source IP address range. Also, ensure to specify the Private and Public IP addresses of the Management Center Virtual in the security firewall rule or security group of the Threat Defense Virtual. This is important to ensure proper registration of nodes during clustering deployment.

### Defaults for Clustering

- The cLACP system ID is auto-generated, and the system priority is 1 by default.
- The cluster health check feature is enabled by default with the holdtime of 3 seconds. Interface health monitoring is enabled on all interfaces by default.
- The cluster auto-rejoin feature for a failed cluster control link is unlimited attempts every 5 minutes.

- The cluster auto-rejoin feature for a failed data interface is 3 attempts every 5 minutes, with the increasing interval set to 2.
- Connection replication delay of 5 seconds is enabled by default for HTTP traffic.

# Deploy the Cluster in AWS

To deploy a cluster in AWS, you can either manually deploy or use CloudFormation templates to deploy a stack. You can use the cluster with AWS Gateway Load Balancer, or with a non-native load-balancer such as the Cisco Cloud Services Router.

## AWS Gateway Load Balancer and Geneve Single-Arm Proxy

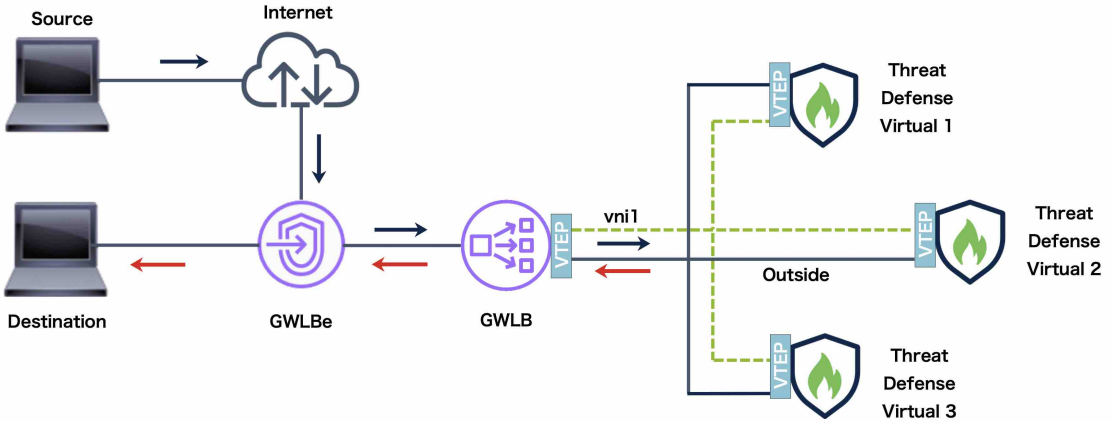

**Note** This use case is the only currently supported use case for Geneve interfaces.

The AWS Gateway Load Balancer combines a transparent network gateway and a load balancer that distributes traffic and scales virtual appliances on demand. The Threat Defense Virtual supports the Gateway Load Balancer centralized control plane with a distributed data plane (Gateway Load Balancer endpoint). The following figure shows traffic forwarded to the Gateway Load Balancer from the Gateway Load Balancer endpoint. The Gateway Load Balancer balances traffic among multiple Threat Defense Virtuals, which inspect the traffic before either dropping it or sending it back to the Gateway Load Balancer (U-turn traffic). The Gateway Load Balancer then sends the traffic back to the Gateway Load Balancer endpoint and to the destination.

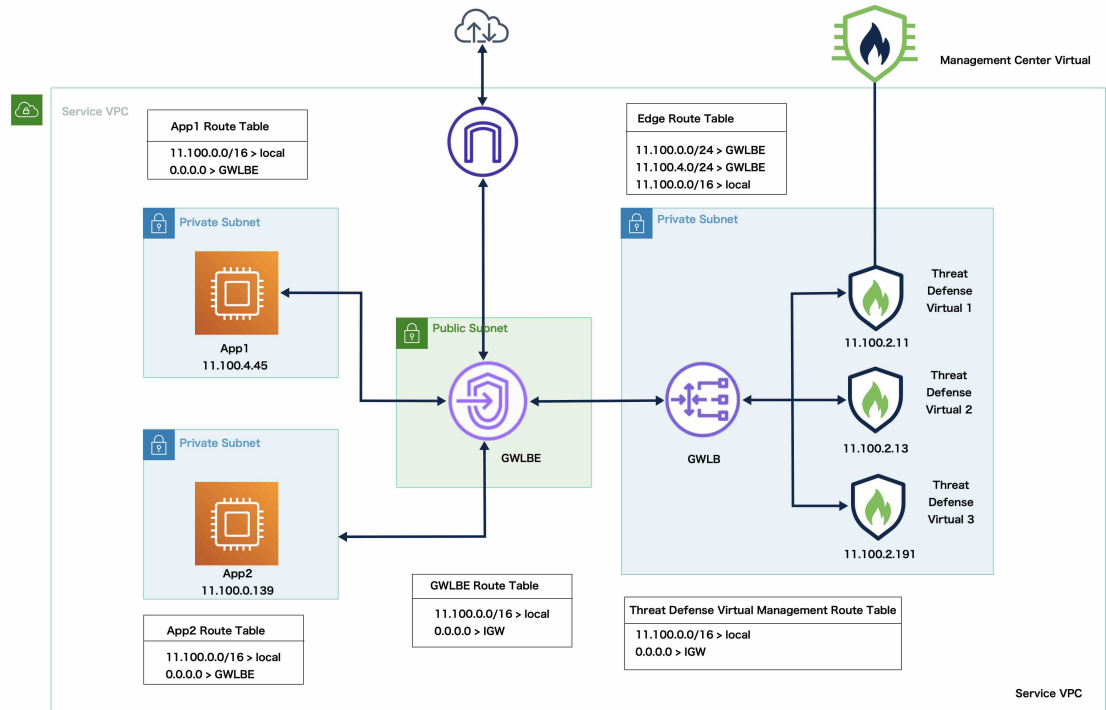

**Note** Transport Layer Security (TLS) Server Identity Discovery is not supported with Geneve single-arm setup on AWS.

Figure 219: Geneve Single-Arm Proxy

# Sample Topology

The topology given below depicts both inbound and outbound traffic flow. There are three Threat Defense Virtual instances in the cluster that is connected to a GWLB. A Management Center Virtual instance is used to manage the cluster.

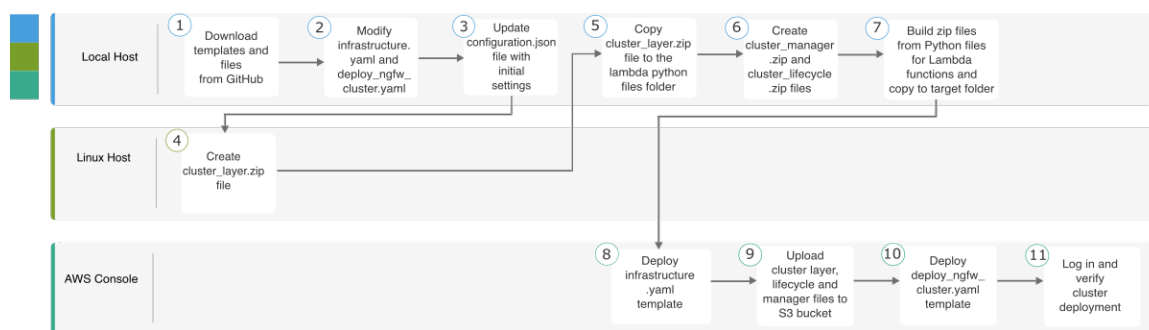

Inbound traffic from the internet goes to the GWLB endpoint which then transmits the traffic to the GWLB. Traffic is then forwarded to the Threat Defense Virtual cluster. After the traffic has been inspected by a Threat Defense Virtual instance in the cluster, it is forwarded to the application VM, App1 /App2.

Outbound traffic from App1/App2 is transmitted to the GWLB endpoint which then sends it out to the internet.

## End-to-End Process for Deploying Threat Defense Virtual Cluster on AWS

### Template-based Deployment

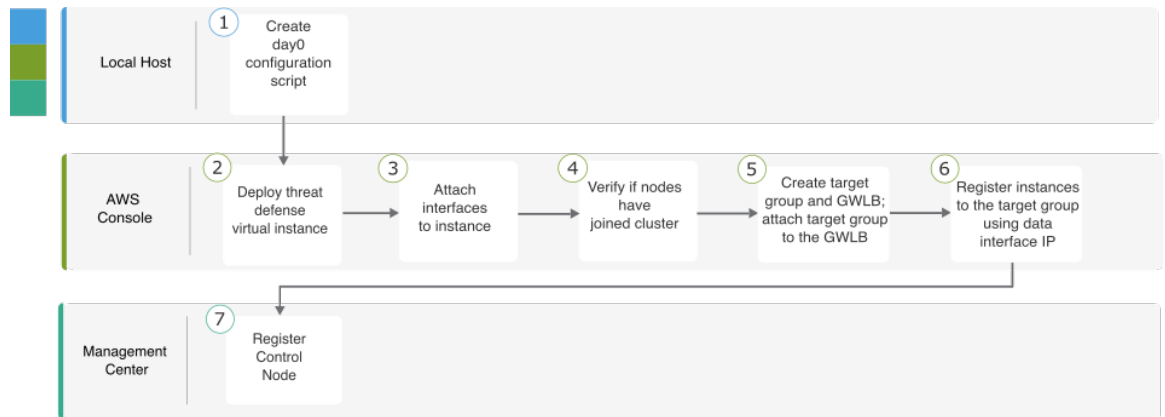

The following flowchart illustrates the workflow for template-based deployment of the Threat Defense Virtual cluster on AWS.

	Workspace	Steps
①	Local Host	Clone the repository from GitHub
②	Local Host	Modify <i>infrastructure.yaml</i> and <i>deploy_ngfw_cluster.yaml</i> templates.
③	Local Host	Update the <i>Configuration.json</i> file with FMC object names.
④	Linux Host	Create <i>cluster_layer.zip</i> file.
⑤	Local Host	Copy <i>cluster_layer.zip</i> file to the Lambda python files folder.
⑥	Local Host	Create <i>cluster_manager.zip</i> , <i>custom_metrics_publisher.zip</i> , and <i>cluster_lifecycle.zip</i> files.
⑦	Local Host	Build zip files from Python files for Lambda functions and copy to target folder.
⑧	AWS Console	Deploy <i>infrastructure.yaml</i> template.
⑨	AWS Console	Upload <i>cluster_layer.zip</i> , <i>cluster_lifecycle.zip</i> , <i>custom_metrics_publisher.zip</i> , and <i>cluster_manager.zip</i> to the S3 bucket.
⑩	AWS Console	Deploy <i>deploy_ngfw_cluster.yaml</i> template.
⑪	AWS Console	Log in and verify cluster deployment.

### Manual Deployment

The following flowchart illustrates the workflow for manual deployment of the Threat Defense Virtual cluster on AWS.

	Workspace	Steps
1	Local Host	Create the Day0 Configuration for AWS
2	AWS Console	Deploy Threat Defense Virtual instance.
3	AWS Console	Attach interfaces to instance.
4	AWS Console	Verify if nodes have joined cluster.
5	AWS Console	Create target group and GWLB; attach target group to the GWLB.
6	AWS Console	Register instances with the target group using data interface IP.
7	Management Center	Register control node.

## Templates

The templates given below are available in GitHub. The parameter values are self-explanatory with the parameter names, default values, allowed values, and description, given in the template.

- [infrastructure.yaml](#) – Template for infrastructure deployment.
- [deploy\\_ngfw\\_cluster.yaml](#) – Template for cluster deployment.

**Note** Ensure that you check the list of supported AWS instance types before deploying cluster nodes. This list is found in the *deploy\_ngfw\_cluster.yaml* template, under allowed values for the parameter InstanceType.

# Deploy the Stack in AWS Using a CloudFormation Template

Deploy the stack in AWS using the customized CloudFormation template.

## Before you begin

- You need a Amazon Linux virtual machine with Python 3.
- To allow the cluster to auto-register with the management center, you need to create *two* users with administrative privileges on the management center that can use the REST API. See the [Cisco Secure Firewall Management Center Administration Guide](#).
- Add an access policy in the management center that matches the name of the policy that you specified in `Configuration.json`.

## Procedure

### Step 1

Prepare the template.

- Clone the GitHub repository to your local folder. See <https://github.com/CiscoDevNet/cisco-ftdv/tree/master/cluster/aws>.
- Modify `infrastructure.yaml` and `deploy_ngfw_cluster.yaml` with the required parameters.
- Modify `cluster/aws/lambda-python-files/Configuration.json` with initial settings.

For example:

```
{
  "licenseCaps": ["BASE", "MALWARE", "THREAT"],
  "performanceTier": "FTDv50",
  "fmcIpforDeviceReg": "DONTRESOLVE",
  "RegistrationId": "cisco",
  "NatId": "cisco",
  "fmcAccessPolicyName": "AWS-ACL"
}
```

- Keep the `fmcIpforDeviceReg` setting as `DONTRESOLVE`.
- The `fmcAccessPolicyName` needs to match an access policy on the management center.

**Note** FTDv5 and FTDv10 tiers are not supported.

- Create a file named `cluster_layer.zip` to provide essential Python libraries to Lambda functions.

We recommend to use the Amazon Linux with Python 3.9 installed to create the `cluster_layer.zip` file.

**Note** If you need an Amazon Linux environment, you can create an EC2 instance using Amazon Linux 2023 AMI or use AWS Cloudshell, which runs the latest version of Amazon Linux.

For creating the `cluster-layer.zip` file, you need to first create `requirements.txt` file that consists of the python library package details and then run the shell script.

- Create the `requirements.txt` file by specifying the python package details.

The following is the sample package details that you provide in the `requirements.txt` file:

```
$ cat requirements.txt
pycryptodome
paramiko
requests
scp
jsonschema
cffi
zipp
importlib-metadata
```

2. Run the following shell script to create **cluster\_layer.zip** file.

```
$ pip3 install --platform manylinux2014_x86_64
--target=./python/lib/python3.9/site-packages
--implementation cp --python-version 3.9 --only-binary=:all:
--upgrade -r requirements.txt
$ zip -r cluster_layer.zip ./python
```

**Note** If you encounter a dependency conflict error during installation, such as urllib3 or cryptography, it is recommended that you include the conflicting packages along with their recommended versions in the **requirements.txt** file. After that, you can run the installation again to resolve the conflict.

- e) Copy the resulting **cluster\_layer.zip** file to the lambda python files folder - `cluster/aws/lambda-python-files`.
- f) Create the **cluster\_layer.zip**, **custom\_metrics\_publisher.zip**, **cluster\_manger.zip** and **lifecycle\_ftdv.zip** files.

A **make.py** file can be found in the cloned repository (`cluster/aws/make.py`). This will zip the python files into a Zip file and copy to a target folder.

**python3 make.py build**

**Step 2**

Deploy **infrastructure.yaml** and note the output values for cluster deployment. Before deploying the infrastructure stack, it is important to identify the AWS region and the availability zones that will be used. Each AWS region has a different set of availability zones and VPC infrastructure, therefore it is essential to select the correct region and availability zones for your deployment.

- a) On the AWS Console, go to **CloudFormation** and click **Create stack**; select **With new resources(standard)**.
- b) Select **Upload a template file**, click **Choose file**, and select **infrastructure.yaml** from the target folder.
- c) Click **Next** and provide the required information.
- d) Enter a unique **Cluster Name** and **Cluster Number** for the cluster.
- e) Select the availability zone from the **Availability Zone** list. This field lists only availability zones based on the AWS region that you select for deploying the infrastructure stack using the ClusterFormation template.
- f) Click **Next**, then **Create stack**.
- g) After the deployment is complete, go to **Outputs** and note the S3 **BucketName**.

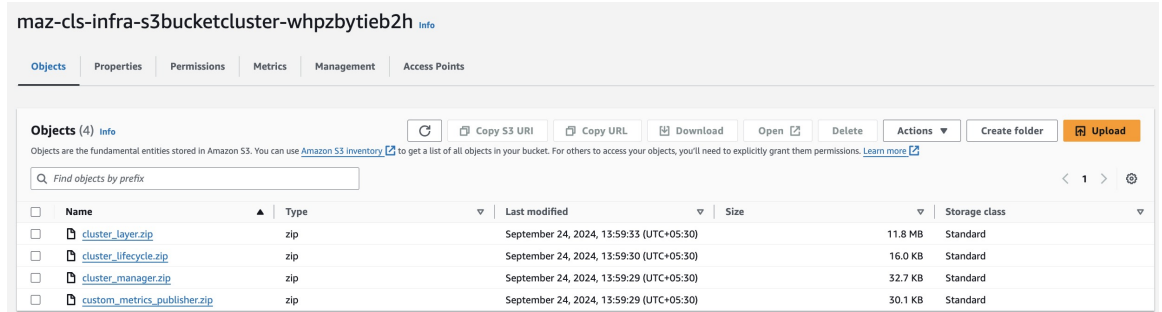

Figure 220: Output of infrastructure.yaml

Outputs (13)				
<input type="text" value="Search outputs"/>				
Key	Value	Description	Export name	
BucketName	maz-cla-infra-s3bucketcluster-whpzbytieb2h	Name of the Amazon S3 bucket	-	
BucketUrl	<a href="http://maz-cla-infra-s3bucketcluster-whpzbytieb2h.s3-website-us-east-1.amazonaws.com">http://maz-cla-infra-s3bucketcluster-whpzbytieb2h.s3-website-us-east-1.amazonaws.com</a>	URL of S3 Bucket Static Website	-	
CCLSubnetIds	subnet-0bc04e2cc9e53e5c0,subnet-0d7d046a0fca25615,subnet-03ef42bf527551569	List of CCL subnet IDs (comma seperated)	-	
EIPforNATgw	3.218.44.132	EIP reserved for NAT GW	-	
FmInstanceSGID	sg-076880aa64df2db5c	Security Group ID for FMC if user would like to launch in this VPC itself	-	
InInterfaceSGId	sg-06ed933d6624fe51b	Security Group ID for Inside Interfaces	-	
InsideSubnetIds	subnet-03d12cab8ee0eafff,subnet-0be9158b0970aeba b,subnet-0b53c96fceb7c1f4d	List of Inside subnet IDs (comma seperated)	-	
InstanceSGId	sg-0680b74be473186aa	Security Group ID for Instances Management Interface	-	
LambdaSecurityGroupId	sg-057da2a9954e0d204	Security Group ID for Lambda Functions	-	
LambdaSubnetIds	subnet-03439803d989e6bdf,subnet-087488a9d6ffc95cd	List of lambda subnet IDs (comma seperated)	-	
ListOfAZs	us-east-1a,us-east-1b,us-east-1c	Availability zones for NGFWv instances	-	
MgmtSubnetIds	subnet-06f0bbbd3f207a504,subnet-0c339dc43688cddc9,subnet-0a67629632a655de7	List of Mangement subnet IDs (comma seperated)	-	
VpcName	vpc-09c2b0ad995e2fb24	Name of the VPC created	-	

**Step 3** Upload `cluster_layer.zip`, `cluster_manager.zip`, `custom_metrics_publisher.zip`, and `cluster_lifecycle.zip` to the S3 bucket created by `infrastructure.yaml`.

Figure 221: S3 Bucket

**Step 4** Deploy `deploy_ngfw_cluster.yaml`.

- Go to **CloudFormation** and click on **Create stack**; select **With new resources(standard)**.
- Select **Upload a template file**, click **Choose file**, and select `deploy_ngfw_cluster.yaml` from the target folder.
- Click **Next** and provide the required information.
- Provide the following cluster and infrastructure configuration information.

Parameter	Allowed Values/Type	Description
<b>Cluster Configuration</b>		
ClusterGrpNamePrefix	String	This is the cluster name Prefix. The cluster number will be added as a suffix.
ClusterNumber	String	This is the cluster number. This will be suffixed to the cluster name (msa-ftdv-infra). For example, if this value is <b>1</b> , the group name will be <i>msa-ftdv-infra-1</i> .  It should be at least 1 digit, but not more than 3 digits. Default: 1.
ClusterSize	Numbers	This is the total number of Threat Defense Virtual nodes in a cluster.  Minimum: 1 Maximum: 16
<b>Infrastructure Details</b>		
NoOfAZs	String	This is the total number of availability zones into which Threat Defense Virtual is deployed. (The number of availability zones varies from a Minimum 1 to Maximum 3 depending on a region).  The subnet will be created in these availability zones.  The availability zones available in this list is based on the region selected for deploying the cluster.

Parameter	Allowed Values/Type	Description
		<b>Note</b> Management, Inside, and Cluster Control Link (CCL) subnets are created across three availability zones based on this parameters.
AZ	String	The availability zone list is based on the region you plan to deploy.  In Availability Zone list, select the valid availability zone (1 availability zone or 2 availability zones or 3 availability zones).  Count should match with the value of Number of Availability Zones parameter.
NotifyEmailID	String	Email address to which cluster events email will be sent. You must accept a subscription email request to receive this email notification.  Example: <a href="mailto:admin@company.com">admin@company.com</a>
VpcId	String	The VPC ID for the cluster group.  Type: AWS::EC2::VPC::Id
S3BktName	String	The S3 Bucket that contains the uploaded Lambda zip files. You must specify correct bucket name.
MgmtSubnetIds	List	Enter only <i>one</i> subnet per availability zone.  If you select multiple subnets from a same availability zone, then selecting an incorrect subnet may cause issues while deploying the Threat Defense Virtual instances.  Type: List<AWS::EC2::Subnet::Id>
InsideSubnetIds	List	Enter at least <i>one</i> subnet per availability zone.  If multiple subnets from the same Availability Zone are selected, then selecting an incorrect subnet may cause issues while deploying the Threat Defense Virtual instances.  Type: List<AWS::EC2::Subnet::Id>
LambdaSubnets	List	Enter at least <i>two</i> subnet for the Lambda functions. The <i>two</i> subnets you enter must have a NAT gateway to enable the Lambda functions to communicate with AWS services, which are public DNS.  Type: List<AWS::EC2::Subnet::Id>
CCLSubnetIds	String	Enter at least <i>one</i> subnet per availability zone.  If multiple subnets from the same Availability Zone are selected, then selecting an incorrect subnet may cause

Parameter	Allowed Values/Type	Description
		issues while deploying the Threat Defense Virtual instances. Type: List<AWS::EC2::Subnet::Id>
CCLSubnetRanges	String	Enter IP addresses range of CCL subnets for different availability zones.  Exclude first 4 reserved IP addresses. IP address pool for Cluster Control Link (CCL).  IP address is allocated to the CCL interfaces of the Threat Defense Virtual instance from CCL IP address pool.
MgmtInterfaceSG	List	Select security group ID for the Threat Defense Virtual instances.  Type: List<AWS::EC2::SecurityGroup::Id>
InsideInterfaceSG	List	Select security group ID for the inside interface of Threat Defense Virtual instances.  Type: List<AWS::EC2::SecurityGroup::Id>
LambdaSG	List	Select a security group for the Lambda functions.  Ensure outbound connections is set to <b>ANYWHERE</b> .  Type: List<AWS::EC2::SecurityGroup::Id>
CCLInterfaceSG	List	Select a security group ID for CCL interface of the Threat Defense Virtual instances.
<b>GWLB Configuration</b>		
DeployGWLBE	String	Click <b>Yes</b> to deploy the GWLB endpoint.  By default, the value is set to <b>No</b> .
VpcIdLBE	String	Enter VPC to deploy Gateway Load Balancer Endpoint.  <b>Note</b> Do not enter any value in this field if you are not deploying the GWLB endpoint.
GWLBSubnetId	String	Enter only one subnet ID.  <b>Note</b> Do not enter any value in this field if you are not deploying the GWLB endpoint.  Ensure that the subnet belongs to the correct VPC, and the availability zones that you have specified.
TargetFailover	String	Enable Target Failover support when a target fails or deregisters. (By default, the value of this parameter is set to <b>rebalance</b> ).

Parameter	Allowed Values/Type	Description
		<ul style="list-style-type: none"> <li>• <b>no_rebalance</b>: Directs existing flows to failed targets and new flows to healthy targets, ensuring backward compatibility.</li> <li>• <b>rebalance</b>: Redistributes existing flows while ensuring that new flows go to healthy targets.</li> </ul> <p><i>rebalance</i> is supported from Threat Defense Virtual Version 7.4.1 and later.</p>
TgHealthPort	String	<p>Enter Health Check Port for GWLB.</p> <p><b>Note</b> By default, this port must not be used for traffic.</p> <p>Ensure the value you provide is a valid TCP port. Default: 8080</p>
<b>Cisco NGFWv Instance Configuration</b>		
InstanceType	String	<p>Cisco Threat Defense Virtual EC2 instance type.</p> <p>Ensure that the AWS Region supports Instance Type you select.</p> <p>By default, <b>c5.xlarge</b> is selected.</p>
LicenseType	String	<p>Choose Cisco Threat Defense Virtual EC2 instance license type. Ensure that the AMI ID that you enter in <b>AMI-ID</b> parameter is of the same licensing type.</p> <p>By default, <b>BYOL</b> is selected.</p>
AssignPublicIP	String	<p>Set the value as <b>true</b> to assign a public IP address for Threat Defense Virtual from the AWS IP address pool.</p>
AmiID	String	<p>Choose the correct AMI ID as per the region, version, and license type (BYOL or PAYG).</p> <p>Threat Defense Virtual 7.2 and later support clustering, and Threat Defense Virtual Version 7.6 and later support the autoscaling and multiple availability zone enhancements.</p> <p>Type: AWS::EC2::Image::Id</p>
ngfwPassword	String	<p>Threat Defense Virtual instance password.</p> <p>All Threat Defense Virtual instances come up with a default password, which is in the Userdata field of the Launch Template (Cluster Group).</p>

Parameter	Allowed Values/Type	Description
		<p>The password is activated after Threat Defense Virtual is accessible.</p> <p>Minimum length must be 8 characters. The password can either be a plain text password or a KMS encrypted password.</p>
KmsArn	String	<p>Enter ARN of an existing KMS (AWS KMS key to encrypt at rest).</p> <p>If you specify a value in this field, then the Threat Defense Virtual instance's <i>admin</i> password must be an encrypted password.</p> <p>Example of generating an encrypted password: <code>"aws kms encrypt --key-id &lt;KMS ARN&gt; --plaintext &lt;password&gt;"</code></p> <p>The password encryption must be done using only the specified ARN.</p>
<b>FMC Automation Configuration</b>		
fmcDeviceGrpName	String	Enter a unique name for the cluster group in management center.
fmcPublishMetrics	String	<p>Select <b>true</b> to create a Lambda Function to poll management center and publish specific device group metrics to AWS CloudWatch.</p> <p>Allowed values:</p> <ul style="list-style-type: none"> <li>• true</li> <li>• false</li> </ul> <p>By default, the value is set to <b>true</b>.</p>
fmcMetricsUsername	String	<p>Enter a unique internal user name for polling memory metrics from management center.</p> <p>The user must have privileges of <b>Network Admin</b> and <b>Maintenance User</b> or more .</p>
fmcMetricsPassword	String	<p>Enter the password.</p> <p>If you have mentioned KMS Master Key ARN parameter, ensure to provide an encrypted password.</p> <p>Ensure to enter the correct password because entering incorrect password may result in failure of metrics collection.</p>

Parameter	Allowed Values/Type	Description
fmcServer	String	The IP address can be an external IP address or the IP address reachable in Threat Defense Virtual management subnet in the VPC.  Minimum length: 7 Maximum length:15
fmcOperationsUsername	String	Provide a unique internal user name for Management Center Virtual for CloudWatch.  The user must have <b>Administrator</b> privileges.
fmcOperationsPassword	String	Enter the password.  If you have mentioned KMS Master Key ARN parameter, ensure to provide an encrypted password.
<b>Scaling Configuration</b>		
CpuThresholds	CommaDelimitedList	(Optional) Specifying non-zero lower and upper thresholds will create scale policies. If (0,0) is selected, no CPU scaling alarm or policies will be created. Evaluation points and data points are at default or recommended values.  By default, <b>Autoscale</b> is enabled in this template. Autoscale can be disabled after deployment.
MemoryThresholds	CommaDelimitedList	Specifying non-zero lower and upper threshold will create scale policies. If (0,0) is selected, no memory scaling alarm or policies will be created. Evaluation points and data points are at default or recommended values.

- e) Click **Next**, then **Create stack**.

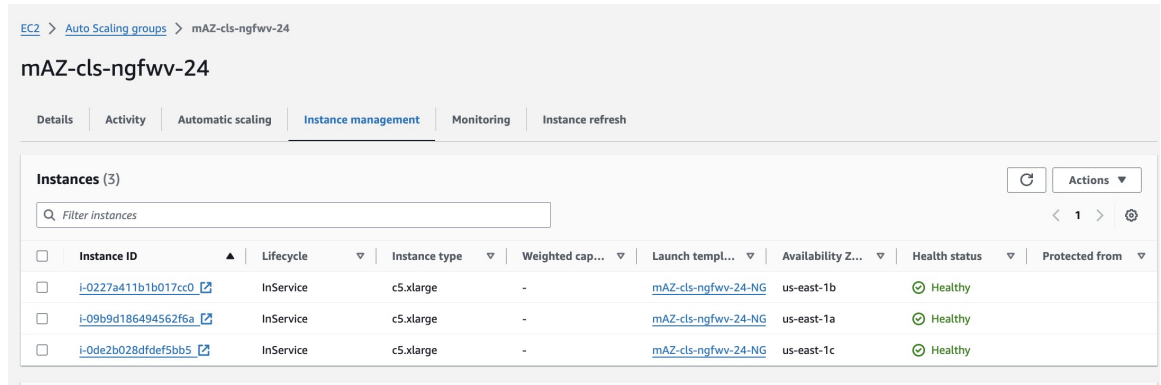

The Lambda functions manage the rest of the process, and the threat defense virtuals will automatically register with the management center.

*Figure 222: Deployed Resources*

The status changes from **CREATE\_IN\_PROGRESS** to **CREATE COMPLETE** indicating successful deployment.

**Step 5** Verify the cluster deployment by logging into any one of the nodes and using the **show cluster info** command.

**Figure 223: Cluster Nodes**

## Deploy the Cluster in AWS Manually

To deploy the cluster manually, prepare the day 0 configuration, deploy each node, and then add the control node to the management center.

### Create the Day0 Configuration for AWS

You can use either a fixed configuration or a customized configuration. We recommend using the fixed configuration.

#### Create the Day0 Configuration With a Fixed Configuration for AWS

The fixed configuration will auto-generate the cluster bootstrap configuration.

##### Single Availability Zone - Day0 Configuration with a fixed configuration for AWS

```
{
  "AdminPassword": "password",
  "Hostname": "hostname",
  "FirewallMode": "Routed",
  "ManageLocally": "No",
  "Cluster": {
    "CclSubnetRange": "ip_address_start ip_address_end",
    "ClusterGroupName": "cluster_name",
    [For Gateway Load Balancer] "Geneve": "{Yes | No}",
    [For Gateway Load Balancer] "HealthProbePort": "port"
  }
}
```

For example:

```
{
  "AdminPassword": "Sup3rnatural",
  "Hostname": "ciscoftdv",
  "FirewallMode": "Routed",
  "ManageLocally": "No",
  "Cluster": {
    "CclSubnetRange": "10.5.90.4 10.5.90.30",
    "ClusterGroupName": "ftdv-cluster",
    "Geneve": "Yes",
    "HealthProbePort": "7777"
  }
}
```

For the **CclSubnetRange** variable, specify a range of IP addresses starting from x.x.x.4. Ensure that you have at least 16 available IP addresses for clustering. Some examples of start (*ip\_address\_start*) and end (*ip\_address\_end*) IP addresses given below.

**Table 60: Examples of Start and End IP addresses**

CIDR	Start IP Address	End IP Address
10.1.1.0/27	10.1.1.4	10.1.1.30
10.1.1.32/27	10.1.1.36	10.1.1.62

CIDR	Start IP Address	End IP Address
10.1.1.64/27	10.1.1.68	10.1.1.94
10.1.1.96/27	10.1.1.100	10.1.1.126
10.1.1.128/27	10.1.1.132	10.1.1.158
10.1.1.160/27	10.1.1.164	10.1.1.190
10.1.1.192/27	10.1.1.196	10.1.1.222
10.1.1.224/27	10.1.1.228	10.1.1.254
10.1.1.0/24	10.1.1.4	10.1.1.254

## Deploy Cluster Nodes

Deploy the cluster nodes so they form a cluster.

### Procedure

**Step 1** Deploy the Threat Defense Virtual instance by using the cluster day 0 configuration with the required number of interfaces - four interfaces if you are using Gateway Load Balancer (GWLB), or five interfaces if you are using non-native load balancer. To do this, in the **Configure Instance Details > Advanced Details** section, paste the cluster day 0 configuration.

**Note** Ensure that you attach interfaces to the instances in the order given below.

- AWS Gateway Load Balancer - four interfaces - management, diagnostic, inside, and cluster control link.
- Non-native load balancers - five interfaces - management, diagnostic, inside, outside, and cluster control link.

For more information on deploying Threat Defense Virtual on AWS, see [Deploy the Threat Defense Virtual on AWS](#).

**Step 2** Repeat Step 1 to deploy the required number of additional nodes.

**Step 3** Use the **show cluster info** command on the Threat Defense Virtual console to verify if all nodes have successfully joined the cluster.

**Step 4** Configure the AWS Gateway Load Balancer.

- a) Create a target group and GWLB.
- b) Attach the target group to the GWLB.

**Note** Ensure that you configure the GWLB to use the correct security group, listener configuration, and health check settings.

- c) Register the data interface (inside interface) with the Target Group using IP addresses.

For more information, see [Create a Gateway Load Balancer](#).

**Step 5** Add the control node to the Management Center. See [Add the Cluster to the Management Center \(Manual Deployment\)](#), on page 812.

## Deploy the Cluster in Azure

You can use the cluster with the Azure Gateway Load Balancer (GWLB), or with a non-native load-balancer. To deploy a cluster in Azure, use Azure Resource Manager (ARM) templates to deploy a Virtual Machine Scale Set.

### Sample Topology for GWLB-based Cluster Deployment

Figure 225: Inbound Traffic Use Case and Topology with GWLB

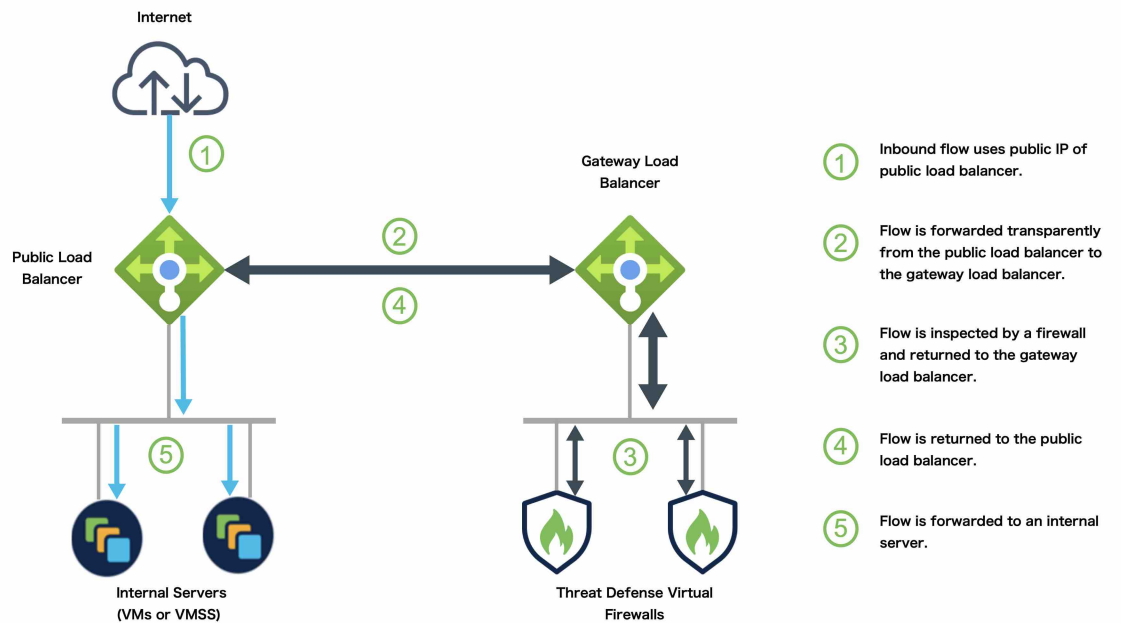

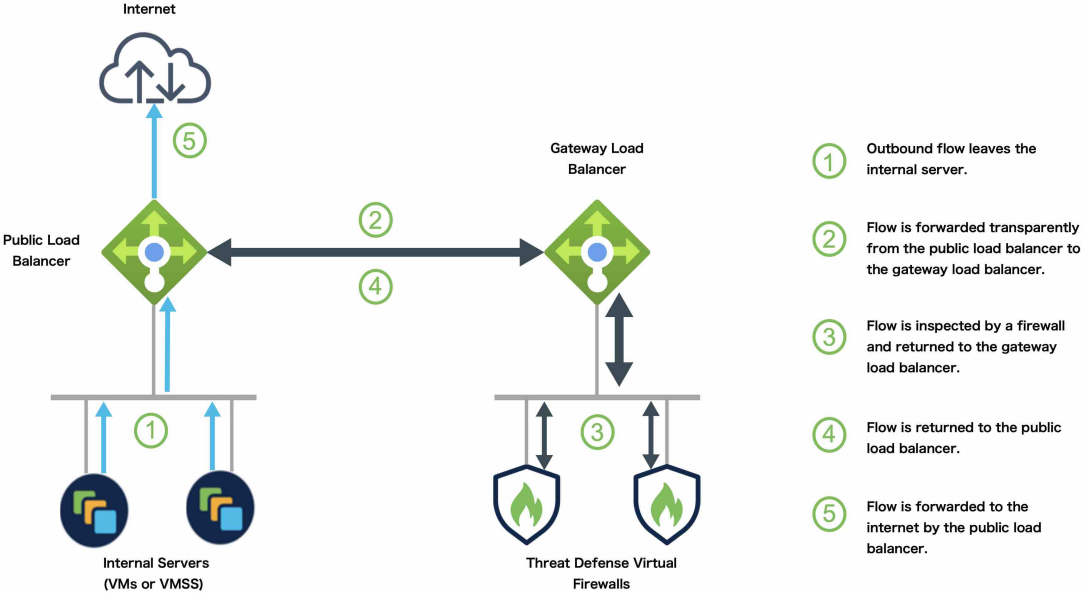

Figure 226: Outbound Traffic Use Case and Topology with GWLB

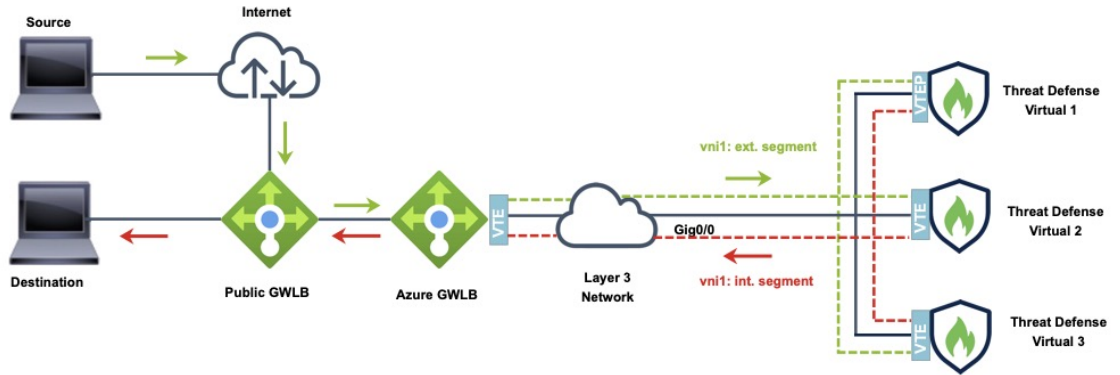

# Azure Gateway Load Balancer and Paired Proxy

In an Azure service chain, Threat Defense Virtuals act as a transparent gateway that can intercept packets between the internet and the customer service. The Threat Defense Virtual defines an external interface and an internal interface on a single NIC by utilizing VXLAN segments in a paired proxy.

The following figure shows traffic forwarded to the Azure Gateway Load Balancer from the Public Gateway Load Balancer on the external VXLAN segment. The Gateway Load Balancer balances traffic among multiple Threat Defense Virtuals, which inspect the traffic before either dropping it or sending it back to the Gateway Load Balancer on the internal VXLAN segment. The Azure Gateway Load Balancer then sends the traffic back to the Public Gateway Load Balancer and to the destination.

Figure 227: Azure Gateway Load Balancer with Paired Proxy

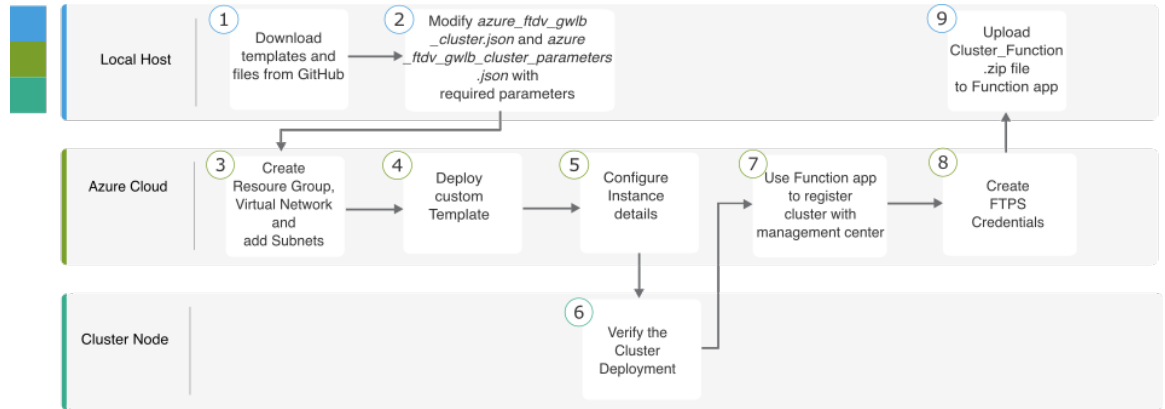

Traffic flow between GWLB to GWLB (Geneve Single-Arm Proxy) in Azure

# End-to-End Process for Deploying Threat Defense Virtual Cluster in Azure with GWLB

## Template-based Deployment

The following flowchart illustrates the workflow for template-based deployment of the Threat Defense Virtual cluster in Azure with GWLB.

	Workspace	Steps
1	Local Host	Download templates and files from GitHub.
2	Local Host	Modify <code>azure_ftdv_gwlb_cluster.json</code> and <code>azure_ftdv_gwlb_cluster_parameters.json</code> with the required parameters.
3	Azure Cloud	Create the resource group, virtual network, and subnets.

	Workspace	Steps
④	Azure Cloud	Deploy custom template.
⑤	Azure Cloud	Configure instance details.
⑥	Cluster Node	Verify cluster deployment.
⑦	Azure Cloud	Use the Function app to register the cluster with the Management Center.
⑧	Azure Cloud	Create FTPS credentials.
⑨	Local Host	Upload <i>Cluster_Function.zip</i> file to the Function app.

### Manual Deployment

The following flowchart illustrates the workflow of manual deployment of Threat Defense Virtual cluster in Azure with GWLB.

	Workspace	Steps
①	Local Host	Create a VMSS from the Marketplace image.
②	Local Host	Attach interfaces.
③	Local Host	Add day 0 configuration in the customData field.
④	Local Host	Update scaling instance count.
⑤	Local Host	Configure GWLB.
⑥	Management Center	Add control node.

## Templates

The templates given below are available in GitHub. The parameter values are self-explanatory with the parameter names, and values, given in the template.

- [azure\\_ftdv\\_gwlb\\_cluster\\_parameters.json](#) – Template to enter parameters for the Threat Defense Virtual cluster with GWLB.
- [azure\\_ftdv\\_gwlb\\_cluster.json](#) – Template to deploy Threat Defense Virtual cluster with GWLB.

## Prerequisites

- To allow the cluster to auto-register to the management center, create a user with Network Admin & Maintenance User privileges on the management center. Users with these privileges can use REST API. See the [Cisco Secure Firewall Management Center Administration Guide](#).
- Add an access policy in the management center that matches the name of the policy that you will specify during template deployment.
- Ensure that the Management Center Virtual is licensed appropriately.
- Perform the steps given below after the cluster is added to the Management Center Virtual:
  1. Configure platform settings with the health check port number in the Management Center. For more information on configuring this, see [Platform Settings](#).
  2. Create a static route for data traffic. For more information on creating a static route, see [Add a Static Route](#).

Sample static route configuration:

```
Network: any-ipv4
Interface: vxlan_tunnel
Leaked from Virtual Router: Global
Gateway: vxlan_tunnel_gw
Tunneled: false
Metric: 2
```

---

**Note** *vxlan\_tunnel\_gw* is the data subnet's gateway IP address.

---

## Deploy Cluster on Azure with GWLB Using an Azure Resource Manager Template

Deploy the Virtual Machine Scale Set for Azure GWLB using the customized Azure Resource Manager (ARM) template.

## Procedure

- Step 1** Prepare the template.
- Clone the github repository to your local folder. See <https://github.com/CiscoDevNet/cisco-ftdv/tree/master/cluster/azure>.
  - Modify `azure_ftdv_gwlb_cluster.json` and `azure_ftdv_gwlb_cluster_parameters.json` with the required parameters.
- Step 2** Log into the Azure Portal: <https://portal.azure.com>.
- Step 3** Create a Resource Group.
- In the **Basics** tab, choose the **Subscription** and **Resource Group** from the drop-down lists.
  - Choose the required **Region**.
- Step 4** Create a virtual network with 4 subnets: Management, Diagnostic, Outside, and Cluster Control Link (CCL).
- Create the virtual network.
    - In the **Basics** tab, choose the **Subscription** and **Resource Group** from the drop-down lists.
    - Choose the required **Region**. Click **Next: IP addresses**.

In the **IP Addresses** tab, click **Add subnet** and add the following subnets – Management, Diagnostic, Data, and Cluster Control Link.
  - Add the subnets.
- Step 5** Deploy the custom template.
- Click **Create > Template deployment (deploy using custom templates)**.
  - Click **Build your own template in the editor**.
  - Click **Load File**, and upload `azure_ftdv_gwlb_cluster.json`.
  - Click **Save**.
- Step 6** Configure the Instance details.
- Enter the required values and then click **Review + create**.
  - Click **Create** after the validation is passed.
- Step 7** After the instance is running, verify the cluster deployment by logging into any one of the nodes and entering the `show cluster info` command.

**Figure 228: show cluster info**

```
> show cluster info
Cluster gwlb-cluster-template-with-AN: On
Interface mode: individual
Cluster Member Limit : 16
This is "12" in state CONTROL_NODE
ID : 0
Version : 99.19(1)180
Serial No.: 9AKGFV8VH4G
CCL IP : 10.1.1.12
CCL MAC : 000d.3a55.5470
Module : NGFWv
Resource : 8 cores / 28160 MB RAM
Last join : 11:13:24 UTC Sep 5 2022
Last leave: N/A
```

- Step 8** In the Azure Portal, click the Function app to register the cluster with the Management Center.

**Note** If you do not want to use the Function app, you can alternatively register the control node to the management center directly by using **Add > Device** (not **Add > Cluster**). The rest of the cluster nodes will register automatically.

**Step 9** Create FTPS Credentials by clicking **Deployment Center > FTPS credentials > User scope > Configure Username and Password**, and then click **Save**.

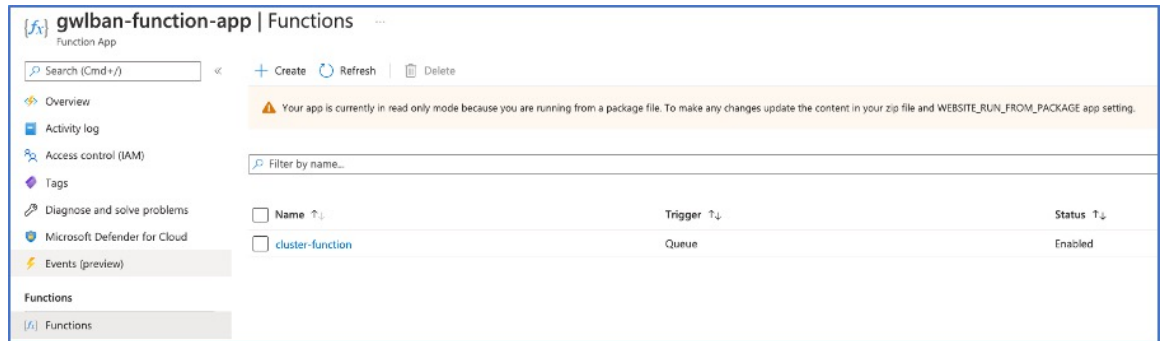

**Step 10** Upload the Cluster\_Function.zip file to the Function app by executing the following **curl** command in the local terminal.

```
curl -X POST -u username --data-binary @"Cluster_Function.zip" https://Function_App_Name.scm.azurewebsites.net/api/zipdeploy
```

**Note** The **curl** command might take few minutes (~2 to 3 minutes) to complete command execution.

The function will be uploaded to the Function app. The function will start, and you can see the logs in the storage account's outqueue. The device registration with the Management Center will be initiated.

**Figure 229: Functions**

**Figure 230: Queues**

## Sample Topology for NLB-based Cluster Deployment

This topology depicts both inbound and outbound traffic flow. The Threat Defense Virtual cluster is sandwiched between the internal and external load balancers. A Management Center Virtual instance is used to manage the cluster.

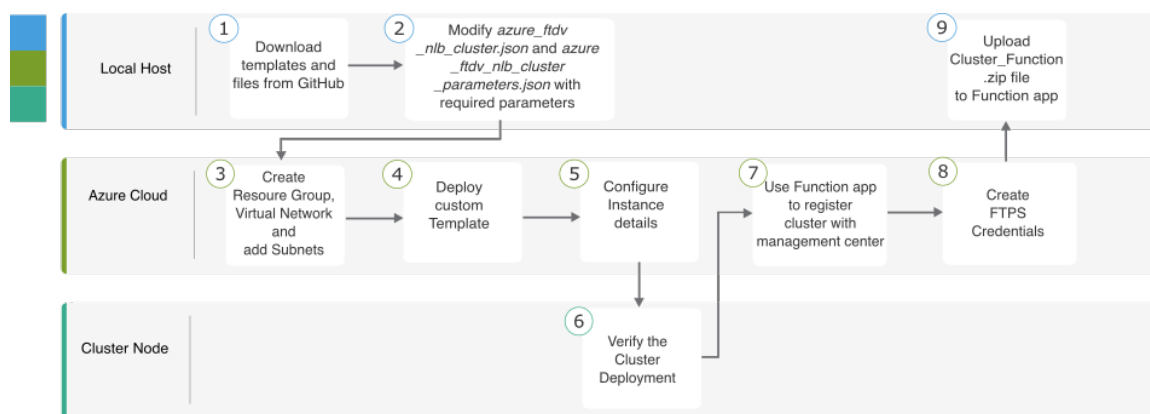

Inbound traffic from the internet goes to the external load balancer which then transmits the traffic to the Threat Defense Virtual cluster. After the traffic has been inspected by a Threat Defense Virtual instance in the cluster, it is forwarded to the application VM.

Outbound traffic from the application VM is transmitted to the internal load balancer. Traffic is then forwarded to the Threat Defense Virtual cluster and then sent out to the internet.

## End-to-End Process for Deploying Threat Defense Virtual Cluster in Azure with NLB

### Template-based Deployment

The following flowchart illustrates the workflow of template-based deployment of Threat Defense Virtual cluster in Azure with NLB.

	Workspace	Steps
1	Local Host	Download templates and files from GitHub.
2	Local Host	Modify <i>azure_ftdv_nlb_cluster.json</i> and <i>azure_ftdv_nlb_cluster_parameters.json</i> with the required parameters.
3	Azure Cloud	Create the resource group, virtual network, and subnets.
4	Azure Cloud	Deploy custom template.
5	Azure Cloud	Configure instance details.
6	Cluster Node	Verify cluster deployment.
7	Azure Cloud	Use the Function app to register the cluster with the Management Center.
8	Azure Cloud	Create FTPS credentials.

	Workspace	Steps
9	Local Host	Upload <i>Cluster_Function.zip</i> file to the Function app.

**Manual Deployment**

The following flowchart illustrates the workflow of manual deployment of Threat Defense Virtual cluster in Azure with NLB.

	Workspace	Steps
1	Local Host	Create a VMSS from the Marketplace image.
2	Local Host	Attach interfaces.
3	Local Host	Add day 0 configuration in the customData field.
4	Local Host	Update scaling instance count.
5	Local Host	Configure NLB.
6	Management Center	Add control node.

**Templates**

The templates given below are available in GitHub. The parameter values are self-explanatory with the parameter names, and values, given in the template.

- [azure\\_ftdv\\_nlb\\_cluster\\_parameters.json](#) – Template to enter parameters for the Threat Defense Virtual cluster with NLB.
- [azure\\_ftdv\\_nlb\\_cluster.json](#) – Template to deploy Threat Defense Virtual cluster with NLB.

## Prerequisites

- To allow the cluster to auto-register with the Management Center, create a user with Network Admin & Maintenance User privileges on the Management Center. Users with these privileges can use REST API. See the [Cisco Secure Firewall Management Center Administration Guide](#).
- Add an access policy in the Management Center that matches the name of the policy that you will specify during template deployment.
- Ensure that the Management Center Virtual is licensed appropriately.
- After the cluster is added to the Management Center Virtual:
  1. Configure platform settings with the health check port number in the Management Center. For more information on configuring this, see [Platform Settings](#).
  2. Create static routes for traffic from outside and inside interfaces. For more information on creating a static route, see [Add a Static Route](#).

Sample static route configuration for the outside interface:

```
Network: any-ipv4
Interface: outside
Leaked from Virtual Router: Global
Gateway: ftdv-cluster-outside
Tunneled: false
Metric: 10
```

---

**Note** *ftdv-cluster-outside* is the outside subnet's gateway IP address.

---

Sample static route configuration for the inside interface:

```
Network: any-ipv4
Interface: inside
Leaked from Virtual Router: Global
Gateway: ftdv-cluster-inside-gw
Tunneled: false
Metric: 11
```

---

**Note** *ftdv-cluster-inside-gw* is the inside subnet's gateway IP address.

---

3. Configure NAT rule for data traffic. For more information on configuring NAT rules, see [Network Address Translation](#).

## Deploy Cluster on Azure with NLB Using an Azure Resource Manager Template

Deploy the cluster for Azure NLB using the customized Azure Resource Manager (ARM) template.

## Procedure

- 
- Step 1** Prepare the template.
- Clone the github repository to your local folder. See <https://github.com/CiscoDevNet/cisco-ftdv/tree/master/cluster/azure>.
  - Modify *azure\_ftdv\_nlb\_cluster.json* and *azure\_ftdv\_nlb\_cluster\_parameters.json* with the required parameters.
- Step 2** Log into the Azure Portal: <https://portal.azure.com>.
- Step 3** Create a Resource Group.
- In the **Basics** tab, choose the **Subscription** and **Resource Group** from the drop-down lists.
  - Choose the required **Region**.
- Step 4** Create a virtual network with 5 subnets: Management, Diagnostic, Inside, Outside, and Cluster Control Link.
- Create the virtual network.
    - In the **Basics** tab, choose the **Subscription** and **Resource Group** from the drop-down lists.
    - Choose the required **Region**. Click **Next: IP addresses**.
  - Add the subnets.

In the **IP Addresses** tab, click **Add subnet** and add the following subnets – Management, Diagnostic, Inside, Outside, and Cluster Control Link.
- Step 5** Deploy the custom template.
- Click **Create > Template deployment (deploy using custom templates)**.
  - Click **Build your own template in the editor**.
  - Click **Load File**, and upload *azure\_ftdv\_nlb\_cluster.json*.
  - Click **Save**.
- Step 6** Configure the instance details.
- Enter the required values and then click **Review + create**.

**Note** For the cluster control link starting and ending addresses, specify only as many addresses as you need (up to 16). A larger range can affect performance.
  - Click **Create** after the validation is passed.
- Step 7** After the instance is running, verify the cluster deployment by logging into any one of the nodes and using the **show cluster info** command.

Figure 232: show cluster info

```

> show cluster info
Cluster gwlb-cluster-template-with-AN: On
  Interface mode: individual
Cluster Member Limit : 16
  This is "12" in state CONTROL_NODE
  ID      : 0
  Version : 99.19(1)180
  Serial No.: 9AKGFV8VH4G
  CCL IP   : 10.1.1.12
  CCL MAC  : 000d.3a55.5470
  Module   : NGFWv
  Resource : 8 cores / 28160 MB RAM
  Last join : 11:13:24 UTC Sep 5 2022
  Last leave: N/A

```

**Step 8** In the Azure Portal, click the Function app to register the cluster to the management center.

**Note** If you do not want to use the Function app, you can alternatively register the control node with the Management Center directly by using **Add > Device** (not **Add > Cluster**). The rest of the cluster nodes will register automatically.

**Step 9** Create FTPS Credentials by clicking **Deployment Center > FTPS credentials > User scope > Configure Username and Password**, and then click **Save**.

**Step 10** Upload the Cluster\_Function.zip file to the Function app by executing the following **curl** command in the local terminal.

```

curl -X POST -u username --data-binary @"Cluster_Function.zip" https://
Function_App_Name.scm.azurewebsites.net/api/zipdeploy

```

**Note** The **curl** command might take a few minutes (~2 to 3 minutes) to complete command execution.

The function will be uploaded to the Function app. The function will start, and you can see the logs in the storage account's outqueue. The device registration with the Management Center will be initiated.

## Deploy the Cluster in Azure Manually

To deploy the cluster manually, prepare the day0 configuration, deploy each node, and then add the control node to the management center.

### Create the Day0 Configuration for Azure

You can use either a fixed configuration or a customized configuration.

#### Create the Day0 Configuration With a Fixed Configuration for Azure

The fixed configuration will auto-generate the cluster bootstrap configuration.

```

{
  "AdminPassword": "password",
  "FirewallMode": "Routed",
  "ManageLocally": "No",
  "Diagnostic": "OFF", //For deployment of version 7.4.1 and later without Diagnostics
  template, set this parameter to OFF.
}

```

```

. "FmcIp": "<FMC_IP>",
  "FmcRegKey": "<REGISTRATION_KEY>",
  "FmcNatId": "<NAT_ID>",
  "Cluster": {
    "CclSubnetRange": "ip_address_start ip_address_end",
    "ClusterGroupName": "cluster_name",
    "HealthProbePort": "port_number",
    "GatewayLoadBalancerIP": "ip_address",
    "EncapsulationType": "vxlan",
    "InternalPort": "internal_port_number",
    "ExternalPort": "external_port_number",
    "InternalSegId": "internal_segment_id",
    "ExternalSegId": "external_segment_id"
  }
}

```

### Example

A sample day 0 configuration is given below.

```

{
  "AdminPassword": "password",
  "FirewallMode": "routed",
  "ManageLocally": "No",
  "Diagnostic": "OFF", //For deployment of version 7.4.1 and later without Diagnostics
  template, set this parameter to OFF.
  "FmcIp": "<FMC_IP>",
  "FmcRegKey": "<REGISTRATION_KEY>",
  "FmcNatId": "<NAT_ID>",
  "Cluster": {
    "CclSubnetRange": "10.45.3.4 10.45.3.30", //mandatory user input
    "ClusterGroupName": "ngfwv-cluster", //mandatory user input
    "HealthProbePort": "7777", //mandatory user input
    "GatewayLoadBalanceIP": "10.45.2.4", //mandatory user input
    "EncapsulationType": "vxlan",
    "InternalPort": "2000",
    "ExternalPort": "2001",
    "InternalSegId": "800",
    "ExternalSegId": "801"
  }
}

```

**Note** If you are copying and pasting the configuration given above, ensure that you remove **//mandatory user input** from the configuration

For the Azure health check settings, be sure to specify the **HealthProbePort** you set here.

For the **CclSubnetRange** variable, specify a range of IP addresses starting from x.x.x.4. Ensure that you have at least 16 available IP addresses for clustering. Some examples of start and end IP addresses are given below.

**Table 61: Examples of Start and End IP addresses**

CIDR	Start IP Address	End IP Address
10.1.1.0/27	10.1.1.4	10.1.1.30
10.1.1.32/27	10.1.1.36	10.1.1.62
10.1.1.64/27	10.1.1.68	10.1.1.94

CIDR	Start IP Address	End IP Address
10.1.1.96/27	10.1.1.100	10.1.1.126
10.1.1.128/27	10.1.1.132	10.1.1.158
10.1.1.160/27	10.1.1.164	10.1.1.190
10.1.1.192/27	10.1.1.196	10.1.1.222
10.1.1.224/27	10.1.1.228	10.1.1.254

## Create the Day0 Configuration With a Customized Configuration for Azure

You can enter the entire cluster bootstrap configuration using commands.

```
{
  "AdminPassword": "password",
  "FirewallMode": "Routed",
  "ManageLocally": "No",
  "Diagnostic": "OFF", //For deployment of version 7.4.1 and later without Diagnostics
  template, set this parameter to OFF.
  "FmcIp": "<FMC_IP>",
  "FmcRegKey": "<REGISTRATION_KEY>",
  "FmcNatId": "<NAT_ID>",
  "Cluster": {
    "CclSubnetRange": "ip_address_start ip_address_end",
    "ClusterGroupName": "cluster_name",
    "HealthProbePort": "port_number",
    "GatewayLoadBalancerIP": "ip_address",
    "EncapsulationType": "vxlan",
    "InternalPort": "internal_port_number",
    "ExternalPort": "external_port_number",
    "InternalSegId": "internal_segment_id",
    "ExternalSegId": "external_segment_id"
  }
}
```

### Example

A sample day 0 configuration for **version 7.4 and later** is given below.

```
{
  "AdminPassword": "Sup3rnatural",
  "Hostname": "clusterftdv",
  "FirewallMode": "routed",
  "ManageLocally": "No",
  "Diagnostic": "OFF", //For deployment of version 7.4.1 and later without Diagnostics
  template, set this parameter to OFF.
  "FmcIp": "<FMC_IP>",
  "FmcRegKey": "<REGISTRATION_KEY>",
  "FmcNatId": "<NAT_ID>",
  "run_config": [
    "cluster interface-mode individual force",
    "policy-map global_policy",
    "class inspection_default",
    "no inspect h323 h225",
    "no inspect h323 ras",
    "no inspect rtsp",
    "no inspect skinny",
    "interface Management0/0",
  ]
}
```

```

"management-only",
"nameif management",
"security-level 0",
"ip address dhcp",
"interface GigabitEthernet0/0",
"no shutdown",
"nameif vxlan_tunnel",
"security-level 0",
"ip address dhcp",
"interface GigabitEthernet0/1",
"no shutdown",
"nve-only cluster",
"nameif ccl_link",
"security-level 0",
"ip address dhcp",
"interface vni1",
"description Clustering Interface",
"segment-id 1",
"vtep-nve 1",
"interface vni2",
"proxy paired",
"nameif GWLB-backend-pool",
"internal-segment-id 800",
"external-segment-id 801",
"internal-port 2000",
"external-port 2001",
"security-level 0",
"vtep-nve 2",
"object network ccl#link",
"range 10.45.3.4 10.45.3.30", //mandatory user input
"object-group network cluster#group",
"network-object object ccl#link",
"nve 1 ",
"encapsulation vxlan",
"source-interface ccl_link",
"peer-group cluster#group",
"nve 2 ",
"encapsulation vxlan",
"source-interface vxlan_tunnel",
"peer ip <GatewayLoadbalancerIP>", //mandatory user input
"cluster group ftdv-cluster",

"cluster-interface vni1 ip 1.1.1.1 255.255.255.0",
"priority 1",
"enable",
"mtu vxlan_tunnel 1454",
"mtu ccl_link 1454"
]
}

```

A sample day 0 configuration for **version 7.3 and earlier** is given below.

```

{
  "AdminPassword": "Sup3rnatural",
  "Hostname": "clusterftdv",
  "FirewallMode": "routed",
  "ManageLocally": "No",
  "FmcIp": "<FMC_IP>",
  "FmcRegKey": "<REGISTRATION_KEY>",
  "FmcNatId": "<NAT_ID>",
  "run_config": [
    "cluster interface-mode individual force",
    "policy-map global_policy",
    "class inspection_default",

```

```

"no inspect h323 h225",
"no inspect h323 ras",
"no inspect rtsp",
"no inspect skinny",
"interface Management0/0",
"management-only",
"nameif management",
"security-level 0",
"ip address dhcp",
"interface GigabitEthernet0/0",
"no shutdown",
"nameif vxlan_tunnel",
"security-level 0",
"ip address dhcp",
"interface GigabitEthernet0/1",
"no shutdown",
"nve-only cluster",
"nameif ccl_link",
"security-level 0",
"ip address dhcp",
"interface vni1",
"description Clustering Interface",
"segment-id 1",
"vtep-nve 1",
"interface vni2",
"proxy paired",
"nameif GWLB-backend-pool",
"internal-segment-id 800",
"external-segment-id 801",
"internal-port 2000",
"external-port 2001",
"security-level 0",
"vtep-nve 2",
"object network ccl#link",
"range 10.45.3.4 10.45.3.30",
"object-group network cluster#group",
"network-object object ccl#link",
"nve 1 ",
"encapsulation vxlan",
"source-interface ccl_link",
"peer-group cluster#group",
"nve 2 ",
"encapsulation vxlan",
"source-interface vxlan_tunnel",
"peer ip <GatewayLoadbalancerIP>",
"cluster group ftdv-cluster",
"local-unit 1",
"cluster-interface vni1 ip 1.1.1.1 255.255.255.0",
"priority 1",
"enable",
"mtu vxlan_tunnel 1454",
"mtu ccl_link 1554"
]
}

```

**Note** If you are copying and pasting the configuration given above, ensure that you remove **//mandatory user input** from the configuration.

## Deploy Cluster Nodes Manually - GWLB-based Deployment

Deploy the cluster nodes so they form a cluster.

### Procedure

- 
- Step 1** Create a Virtual Machine Scale Set from the Marketplace image with 0 instance count using the **az vmss create** CLI.
- ```
az vmss create --resource-group <ResourceGroupName> --name <VMSSName> --vm-sku <InstanceSize>
--image <FTDvImage> --instance-count 0 --admin-username <AdminUserName> --admin-password
<AdminPassword> --plan-name <ftdv-azure-byol/ftdv-azure-payg> --plan-publisher cisco --plan-product
cisco-ftdv --plan-promotion-code <ftdv-azure-byol/ftdv-azure-payg> --vnet-name <VirtualNetworkName>
--subnet <MgmtSubnetName>
```
- Step 2** Attach three interfaces—Diagnostic, Data, and Cluster Control Link.
- Step 3** Go to the virtual machine scale set you have created and perform the following steps:
- Under the **Operating system** section, add the day 0 configuration in the **customData** field.
  - Click **Save**.
  - Under the **Scaling** section, update the instance count with the required cluster node. You can set the instance count range of minimum 1 and maximum 16.
- Step 4** Configure the Azure Gateway Load Balancer. See [Auto Scale with Azure Gateway Load Balancer Use Case](#) for more information.
- Step 5** Add the control node to the management center. See [Add the Cluster to the Management Center \(Manual Deployment\)](#), on page 812.
- 

## Deploy Cluster Nodes Manually - NLB-based Deployment

Deploy the cluster nodes so they form a cluster.

### Procedure

- 
- Step 1** Create a Virtual Machine Scale Set from the Marketplace image with 0 instance count using the **az vmss create** CLI.
- ```
az vmss create --resource-group <ResourceGroupName> --name <VMSSName> --vm-sku <InstanceSize>
--image <FTDvImage> --instance-count 0 --admin-username <AdminUserName> --admin-password
<AdminPassword> --plan-name <ftdv-azure-byol/ftdv-azure-payg> --plan-publisher cisco --plan-product
cisco-ftdv --plan-promotion-code <ftdv-azure-byol/ftdv-azure-payg> --vnet-name <VirtualNetworkName>
--subnet <MgmtSubnetName>
```
- Step 2** Attach 4 interfaces—Diagnostic, Inside, Outside, and Cluster Control Link.
- Step 3** Go to the virtual machine scale set you have created and perform the following:
- Under the **Operating system** section, add the day0 configuration in the **customData** field.
  - Click **Save**.

- c) Under the **Scaling** section, update the instance count with the required cluster node. You can set the instance count range of minimum 1 and maximum 16.

**Step 4** Add the control node to the Management Center. See [Add the Cluster to the Management Center \(Manual Deployment\)](#), on page 812.

---

## Troubleshooting Cluster Deployment in Azure

- Issue: No traffic flow

Troubleshooting:

- Check if the health probe status of the Threat Defense Virtual instances deployed with a GWLB is healthy.
- If the Threat Defense Virtual instance's health probe status is unhealthy-
  - Check if the static route is configured in the Management Center Virtual.
  - Check if the default gateway is the data subnet's gateway IP.
  - Check if the Threat Defense Virtual instance is receiving health probe traffic.
  - Check if the access list configured in the Management Center Virtual allows health probe traffic.

- Issue: Cluster is not formed

Troubleshooting:

- Check the IP address of the nve-only cluster interface. Ensure that you can ping the nve-only cluster interface of other nodes.
- Check the IP address of the nve-only cluster interfaces are part of the object group.
- Ensure that the NVE interface is configured with the object group .
- Ensure that the cluster interface in the cluster group has the right VNI interface. This VNI interface has the NVE with the corresponding object group.
- Ensure that the nodes are pingable from each other. Since each node has its own cluster interface IP, these should be pingable from each other.
- Check if the CCL Subnet's Start and End Address mentioned during template deployment is correct. The start address should begin with the first available IP address in the subnet. For example, if the subnet is 192.168.1.0/24. The start address should be 192.168.1.4 (the three IP addresses at the start are reserved by Azure).
- Check if the Management Center Virtual has a valid license.

- Issue: Role-related error while deploying resources again in the same resource group.

Troubleshooting: Remove the roles given below by using the following commands on the terminal.

Error message:

```

"error": {
  "code": "RoleAssignmentUpdateNotPermitted",
  "message": "Tenant ID, application ID, principal ID, and scope are not allowed to be updated."}

```

- **az role assignment delete --resource-group <Resource Group Name> --role "Storage Queue Data Contributor"**
- **az role assignment delete --resource-group <Resource Group Name> --role "Contributor"**

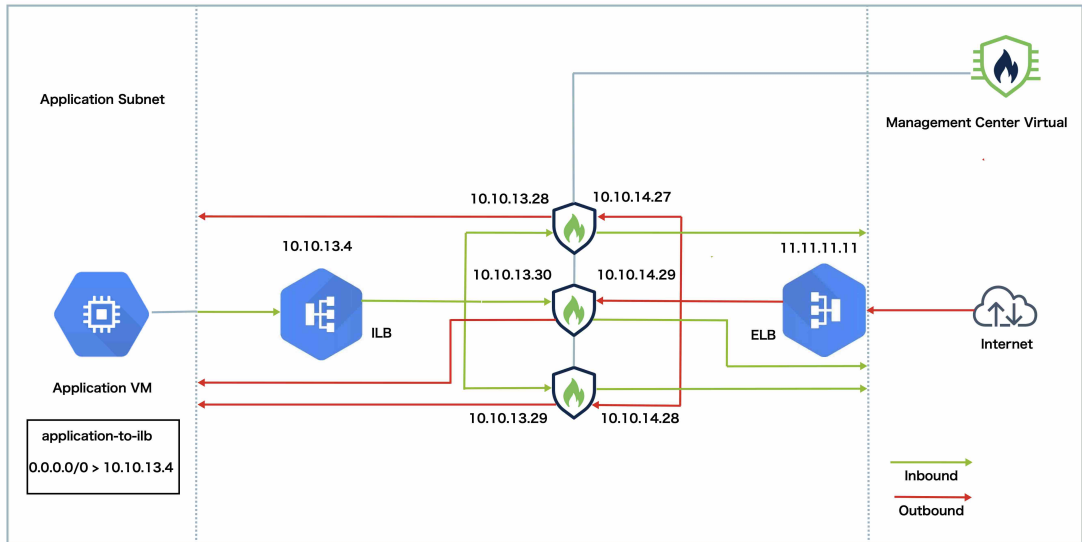

# Deploy the Cluster in GCP

To deploy a cluster in GCP, you can either manually deploy or use an instance template to deploy an instance group. You can use the cluster with native GCP load-balancers, or non-native load balancers such as the Cisco Cloud Services Router.

**Note** Outbound traffic requires interface NAT and is limited to 64K connections.

## Sample Topology

This topology depicts both inbound and outbound traffic flow. The Threat Defense Virtual cluster is sandwiched between the internal and external load balancers. A Management Center Virtual instance is used to manage the cluster.

Inbound traffic from the internet goes to the external load balancer which then transmits the traffic to the Threat Defense Virtual cluster. After the traffic has been inspected by a Threat Defense Virtual instance in the cluster, it is forwarded to the application VM.

Outbound traffic from the application VM is transmitted to the internal load balancer. Traffic is then forwarded to the Threat Defense Virtual cluster and then sent out to the internet.

## End-to-End Process for Deploying Threat Defense Virtual Cluster in GCP

### Template-based Deployment

The following flowchart illustrates the workflow for template-based deployment of the Threat Defense Virtual cluster on GCP.

	Workspace	Steps
1	Local Host	Download templates and files from GitHub.
2	Local Host	Edit template parameters.
3	Google Cloud Platform	Create GCP bucket.
4	Local Host	Create Google Cloud function source archive file <i>ftdv_cluster_function.zip</i> .
5	Google Cloud Platform	Upload the Google function source archive file.
6	Google Cloud Platform	Deploy <i>infrastructure.yaml</i> .
7	Google Cloud Platform	If private IP addresses are used, create VPC connector.
8	Google Cloud Platform	If external IP addresses are used, set <i>deployWithExternalIP</i> to <i>True</i> in <i>cluster_function_infra.yaml</i> .
9	Google Cloud Platform	Deploy cluster function infrastructure template.
10	Google Cloud Platform	Deploy cluster.

### Manual Deployment

The following flowchart illustrates the workflow for manual deployment of the Threat Defense Virtual cluster on GCP.

	Workspace	Steps
①	Local Host	Create the Day0 Configuration for GCP
②	Google Cloud Platform	Create instance template using day 0 configuration.
③	Google Cloud Platform	Configure the interfaces.
④	Google Cloud Platform	Create instance group and attach instance template.
⑤	Google Cloud Platform	Create NLB and attach to instance group.
⑥	Google Cloud Platform	Create firewall rules for NLB.
⑦	Management Center	Create access rules for health check traffic.
⑧	Management Center	Add control node.

# Templates

The templates given below are available in GitHub. The parameter values are self-explanatory with the parameter names, and values, given in the template.

- Cluster deployment template for East-West traffic - [deploy\\_ngfw\\_cluster.yaml](#)
- Cluster deployment template for North-South traffic - [deploy\\_ngfw\\_cluster.yaml](#)

## Deploy the Instance Group in GCP Using an Instance Template

Deploy the instance group in GCP using an instance template.

### Before you begin

- Use Google Cloud Shell for deployment. Alternatively, you can use Google SDK on any macOS/Linux/Windows machine.
- To allow the cluster to auto-register with the Management Center, you need to create a user with administrative privileges on the Management Center that can use the REST API. See the [Cisco Secure Firewall Management Center Administration Guide](#).
- Add an access policy in the Management Center that matches the name of the policy that you specified in *cluster\_function\_infra.yaml*.

### Procedure

- 
- Step 1** Download the templates from [GitHub](#) to your local folder.
- Step 2** Edit **infrastructure.yaml**, **cluster\_function\_infra.yaml** and **deploy\_ngfw\_cluster.yaml** with the required *resourceNamePrefix* parameter (for example, ngfwvcls) and other required user inputs.
- Note that there is a **deploy\_ngfw\_cluster.yaml** file in both the **east-west** and **north-south** folders in GitHub. Download the appropriate template as per your traffic flow requirement.
- Step 3** Create a bucket using Google Cloud Shell to upload the Google cloud function source archive file *ftdv\_cluster\_function.zip*.
- ```
gsutil mb --pap enforced gs://resourceNamePrefix-ftdv-cluster-bucket/
```
- Ensure that the *resourceNamePrefix* variable here matches the *resourceNamePrefix* variable that you specified in **cluster\_function\_infra.yaml**.
- Step 4** Create an archive file for the cluster infrastructure.
- Example:**
- ```
zip -j ftdv_cluster_function.zip ./cluster-function/*
```
- Step 5** Upload the Google source archive that you created earlier.
- ```
gsutil cp ftdv_cluster_function.zip gs://resourceNamePrefix-ftdv-cluster-bucket/
```
- Step 6** Deploy infrastructure for the cluster.
- ```
gcloud deployment-manager deployments create cluster_name --config infrastructure.yaml
```
- Step 7** If you are using private IP addresses, perform the steps given below:
- Launch and set up the Management Center Virtual with a Threat Defense Virtual management VPC.
  - Create a VPC connector to connect the Google Cloud functions with the Threat Defense Virtual management VPC.
- ```
gcloud compute networks vpc-access connectors create vpc-connector-name --region us-central1 --subnet resourceNamePrefix-ftdv-mgmt-subnet28
```
- Step 8** If the Management Center is remote from the Threat Defense Virtual, and the Threat Defense Virtual needs an external IP address, ensure that you set **deployWithExternalIP** to **True** in **cluster\_function\_infra.yaml**.
- Step 9** Deploy the cluster function infrastructure.

**Step 10**

Deploy the cluster.

- a. For North-South topology deployment:

```
gcloud deployment-manager deployments create cluster_name --config cluster_function_infra.yaml
north-south/deploy_ngfw_cluster.yaml
```

- b. For East-West topology deployment:

```
gcloud deployment-manager deployments create cluster_name --config
east-west/deploy_ngfw_cluster.yaml
```

## Deploy the Cluster in GCP Manually

To deploy the cluster manually, prepare the day0 configuration, deploy each node, and then add the control node to the management center.

### Create the Day0 Configuration for GCP

You can use either a fixed configuration or a customized configuration.

#### Create the Day0 Configuration With a Fixed Configuration for GCP

The fixed configuration will auto-generate the cluster bootstrap configuration.

```
{
  "AdminPassword": "password",
  "Hostname": "hostname",
  "FirewallMode": "Routed",
  "ManageLocally": "No",
  "Diagnostic": "OFF",
  "Cluster": {
    "CclSubnetRange": "ip_address_start ip_address_end",
    "ClusterGroupName": "cluster_name"
  }
}
```

For example:

```
{
  "AdminPassword": "DeanWlnche$ter",
  "Hostname": "ciscoftdv",
  "FirewallMode": "Routed",
  "ManageLocally": "No",
  "Cluster": {
    "CclSubnetRange": "10.10.55.2 10.10.55.253",           //mandatory user input
    "ClusterGroupName": "ftdv-cluster"                   //mandatory user input
  }
}
```

**Note** If you are copying and pasting the configuration given above, ensure that you remove **//mandatory user input** from the configuration.

For the **CciSubnetRange** variable, note that you cannot use the first two IP addresses and the last two IP addresses in the subnet. See [Reserved IP addresses in IPv4 subnets](#) for more information. Ensure that you have at least 16 available IP addresses for clustering. Some examples of start and end IP addresses are given below.

**Table 62: Examples of Start and End IP addresses**

| CIDR          | Start IP Address | End IP Address |
|---------------|------------------|----------------|
| 10.1.1.0/27   | 10.1.1.2         | 10.1.1.29      |
| 10.1.1.32/27  | 10.1.1.34        | 10.1.1.61      |
| 10.1.1.64/27  | 10.1.1.66        | 10.1.1.93      |
| 10.1.1.96/27  | 10.1.1.98        | 10.1.1.125     |
| 10.1.1.128/27 | 10.1.1.130       | 10.1.1.157     |
| 10.1.1.160/27 | 10.1.1.162       | 10.1.1.189     |
| 10.1.1.192/27 | 10.1.1.194       | 10.1.1.221     |
| 10.1.1.224/27 | 10.1.1.226       | 10.1.1.253     |
| 10.1.1.0/24   | 10.1.1.2         | 10.1.1.253     |

## Create the Day0 Configuration With a Customized Configuration for GCP

You can enter the entire cluster bootstrap configuration using commands.

```
{
  "AdminPassword": "password",
  "Hostname": "hostname",
  "FirewallMode": "Routed",
  "ManageLocally": "No",
  "run_config": [comma_separated_threat_defense_configuration]
}
```

The following example creates a configuration with Management, Inside, and Outside interfaces, and a VXLAN interface for the cluster control link. Note the values in bold that need to be unique per node.

```
{
  "AdminPassword": "W1nch3sterBr0s",
  "Hostname": "ftdvl",
  "FirewallMode": "Routed",
  "ManageLocally": "No",
  "run_config": [
    "cluster interface-mode individual force",
    "interface Management0/0",
    "management-only",
    "nameif management",
    "ip address dhcp",
    "interface GigabitEthernet0/0",
  ]
}
```

```

    "no shutdown",
    "nameif outside",
    "ip address dhcp",
    "interface GigabitEthernet0/1",
    "no shutdown",
    "nameif inside",
    "ip address dhcp",
    "interface GigabitEthernet0/2",
    "nve-only cluster",
    "nameif ccl_link",
    "ip address dhcp",
    "no shutdown",
    "interface vni1",
    "description Clustering Interface",
    "segment-id 1",
    "vtep-nve 1",
    "object network ccl#link",
    "range 10.1.90.2 10.1.90.17",
    "object-group network cluster#group",
    "network-object object ccl#link",
    "nve 1",
    "encapsulation vxlan",
    "source-interface ccl_link",
    "peer-group cluster#group",
    "cluster group ftdv-cluster",
    "local-unit 1",
    "cluster-interface vni1 ip 10.1.1.1 255.255.255.0",
    "priority 1",
    "enable",
    "mtu outside 1400",
    "mtu inside 1400"
  ]
}

```

---

**Note** For the cluster control link network object, specify only as many addresses as you need (up to 16). A larger range can affect performance.

---

## Deploy Cluster Nodes Manually

Deploy the cluster nodes so they form a cluster. For clustering on GCP, you cannot use the 4 vCPU machine type. The 4 vCPU machine type only supports four interfaces, and five are needed. Use a machine type that supports five interfaces, such as c2-standard-8.

### Procedure

- 
- Step 1** Create an instance template using the day 0 configuration (in the **Metadata > Startup Script** section) with 5 interfaces: outside, inside, management, diagnostic, and cluster control link.  
See [Cisco Secure Firewall Threat Defense Virtual Getting Started Guide](#).
  - Step 2** Create an instance group, and attach the instance template.
  - Step 3** Create GCP network load balancers (internal and external), and attach the instance group.
  - Step 4** For GCP network load balancers, allow health checks in your security policy on the Management Center. See [Allow Health Checks for GCP Network Load Balancers, on page 811](#).

**Step 5** Add the control node to the Management Center. See [Add the Cluster to the Management Center \(Manual Deployment\)](#), on page 812.

## Allow Health Checks for GCP Network Load Balancers

Google Cloud provides health checks to determine if backends respond to traffic.

See <https://cloud.google.com/load-balancing/docs/health-checks> to create firewall rules for network load balancers. Then in the management center, create access rules to allow the health check traffic. See <https://cloud.google.com/load-balancing/docs/health-check-concepts> for the required network ranges. See [Access Control Rules](#), on page 1853.

You also need to configure dynamic manual NAT rules to redirect the health check traffic to the Google metadata server at 169.254.169.254. See [Configure Dynamic Manual NAT](#), on page 1159.

### North-South NAT Rules Sample Configuration

```

nat (inside,outside) source dynamic GCP-HC ILB-SOUTH destination static ILB-SOUTH METADATA
nat (outside,outside) source dynamic GCP-HC ELB-NORTH destination static ELB-NORTH METADATA

nat (outside,inside) source static any interface destination static ELB-NORTH Ubuntu-App-VM
nat (inside,outside) source dynamic any interface destination static obj-any obj-any

object network Metadata
  host 169.254.169.254

object network ILB-SOUTH
  host <ILB_IP>
object network ELB-NORTH
  host <ELB_IP>

object-group network GCP-HC
  network-object 35.191.0.0 255.255.0.0
  network-object 130.211.0.0 255.255.252.0
  network-object 209.85.204.0 255.255.252.0
  network-object 209.85.152.0 255.255.252.0
    
```

The screenshot shows a configuration page for NAT rules. At the top, there are buttons for 'Show Warnings', 'Save', and 'Cancel'. Below that, there are tabs for 'Rules' and 'Policy Assignments (1)'. A search bar with 'Filter by Device' and 'Filter Rules' is present. The main content is a table with columns for 'Original Packet' and 'Translated Packet'. The table lists four NAT rules:

| # | Direction | Type   | Source Interface Objects | Destination Interface Objects | Original Sources | Original Destinations | Original Services                 | Translated Sources | Translated Destinations | Translated Services | Options    |
|---|-----------|--------|--------------------------|-------------------------------|------------------|-----------------------|-----------------------------------|--------------------|-------------------------|---------------------|------------|
| 1 | X         | Dyn... | inside                   | outside                       | GCP-HC           | ILB-SOUTH             | LB Health Check NAT rule          | ILB-SOUTH          | METADATA                |                     | Dis: false |
| 2 | X         | Dyn... | outside                  | outside                       | GCP-HC           | ELB-NORTH             |                                   | ELB-NORTH          | METADATA                |                     | Dis: false |
| 3 | z         | Static | outside                  | inside                        | any              | ELB-NORTH             | Interface                         | Interface          | Ubuntu-App-VM           |                     | Dis: false |
| 4 | X         | Dyn... | inside                   | outside                       | any              | obj-any               | Inbound/Outbound traffic NAT rule | Interface          | obj-any                 |                     | Dis: false |

### East-West NAT Rules Sample Configuration

```

nat (inside,outside) source dynamic GCP-HC ILB-East destination static ILB-East Metadata
nat (outside,outside) source dynamic GCP-HC ILB-West destination static ILB-West Metadata

object network Metadata
  host 169.254.169.254

object network ILB-East
    
```

```

host <ILB_East_IP>
object network ILB-West
host <ILB_West_IP>

object-group network GCP-HC
network-object 35.191.0.0 255.255.0.0
network-object 130.211.0.0 255.255.252.0
network-object 209.85.204.0 255.255.252.0
network-object 209.85.152.0 255.255.252.0

```

The screenshot shows the configuration page for a NAT rule named 'nat-ftdv-cluster'. The interface includes a 'Rules' tab, a 'Filter by Device' dropdown, and a table of NAT rules. Two rules are listed under 'NAT Rules Before'.

| # | Direction | Type   | Source Interface Objects | Destination Interface Objects | Original Packet  |                       |                          | Translated Packet  |                         |                     | Options |
|---|-----------|--------|--------------------------|-------------------------------|------------------|-----------------------|--------------------------|--------------------|-------------------------|---------------------|---------|
|   |           |        |                          |                               | Original Sources | Original Destinations | Original Services        | Translated Sources | Translated Destinations | Translated Services |         |
| 1 | ↔         | Dyn... | inside                   | outside                       | GCP-HC           | ILB-East              | LB Health Check NAT rule | ILB-East           | Metadata                | Disc: false         |         |

## Add the Cluster to the Management Center (Manual Deployment)

Use this procedure to add the cluster to the management center if you manually deployed the cluster. If you used a template, the cluster will auto-register on the management center.

Add one of the cluster units as a new device to the management center; the management center auto-detects all other cluster members.

### Before you begin

- All cluster units must be in a successfully-formed cluster prior to adding the cluster to the management center. You should also check which unit is the control unit. Use the threat defense **show cluster info** command.

### Procedure

- Step 1** In the management center, choose **Devices > Device Management**, and then choose **Add > Add Device** to add the control unit using the unit's management IP address.

Figure 233: Add Device

Add Device
?

---

CDO Managed Device

Host:†

Display Name:

Registration Key:\*

Group:

Access Control Policy:\*

**Smart Licensing**  
 Note: All virtual Firewall Threat Defense devices require a performance tier license. Make sure your Smart Licensing account contains the available licenses you need. It's important to choose the tier that matches the license you have in your account. Click [here](#) for information about the Firewall Threat Defense performance-tiered licensing. Until you choose a tier, your Firewall Threat Defense virtual defaults to the FTDv50 selection.

Performance Tier (only for Firewall Threat Defense virtual 7.0 and above):

Malware  
 Threat  
 URL Filtering

Advanced

Unique NAT ID:†

Transfer Packets

- a) In the **Host** field, enter the IP address or hostname of the control unit.  
 We recommend adding the control unit for the best performance, but you can add any unit of the cluster. If you used a NAT ID during device setup, you may not need to enter this field.
- b) In the **Display Name** field, enter a name for the control unit as you want it to display in the management center.  
 This display name is not for the cluster; it is only for the control unit you are adding. You can later change the name of other cluster members and the cluster display name.
- c) In the **Registration Key** field, enter the same registration key that you used during device setup. The registration key is a one-time-use shared secret.

- d) (Optional) Add the device to a device **Group**.
- e) Choose an initial **Access Control Policy** to deploy to the device upon registration, or create a new policy.  
If you create a new policy, you create a basic policy only. You can later customize the policy as needed.

**New Policy**

Name:

Description:

Select Base Policy:

Default Action:  
 Block all traffic  
 Intrusion Prevention  
 Network Discovery

Snort3:

- f) Choose licenses to apply to the device.
- g) If you used a NAT ID during device setup, expand the **Advanced** section and enter the same NAT ID in the **Unique NAT ID** field.
- h) Check the **Transfer Packets** check box to allow the device to transfer packets to the management center.  
This option is enabled by default. When events like IPS or Snort are triggered with this option enabled, the device sends event metadata information and packet data to the management center for inspection. If you disable it, only event information will be sent to the management center but packet data is not sent.
- i) Click **Register**.

The management center identifies and registers the control unit, and then registers all data units. If the control unit does not successfully register, then the cluster is not added. A registration failure can occur if the cluster was not up, or because of other connectivity issues. In this case, we recommend that you try re-adding the cluster unit.

The cluster name shows on the **Devices > Device Management** page; expand the cluster to see the cluster units.

**Figure 234: Cluster Management**

| ftdcluster (2)<br>Cluster                                         |                      |                 |       |        |                          |                   |
|-------------------------------------------------------------------|----------------------|-----------------|-------|--------|--------------------------|-------------------|
| <span style="color: green;">●</span> 172.16.0.50(Control) Snort 3 | 172.16.0.50 - Routed | FTDv for VMware | 7.2.0 | Manage | Base, Threat (2 more...) | Default AC Policy |

A unit that is currently registering shows the loading icon.

Figure 235: Node Registration

You can monitor cluster unit registration by clicking the **Notifications** icon and choosing **Tasks**. The management center updates the Cluster Registration task as each unit registers. If any units fail to register, see [Reconcile Cluster Nodes, on page 824](#).

**Step 2** Configure device-specific settings by clicking the **Edit** (✎) for the cluster.

Most configuration can be applied to the cluster as a whole, and not nodes in the cluster. For example, you can change the display name per node, but you can only configure interfaces for the whole cluster.

**Step 3** On the **Devices > Device Management > Cluster** screen, you see **General**, **License**, **System**, and **Health** settings.

See the following cluster-specific items:

- **General > Name**—Change the cluster display name by clicking the **Edit** (✎).

| General  |                                                                                     |
|---------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------|
| Name:      | TD_Cluster                                                                          |
| Transfer Packets:                                                                           | Yes                                                                                 |
| Status:                                                                                     |  |
| Control:                                                                                    | 10.10.1.13                                                                          |
| Cluster Live Status:                                                                        | <a href="#">View</a>                                                                |

Then set the **Name** field.

| General  |                                                |
|--------------------------------------------------------------------------------------------|------------------------------------------------|
| Name:                                                                                      | <input type="text" value="TD Native Cluster"/> |
| Transfer Packets:                                                                          | <input type="checkbox"/>                       |
| Compliance Mode:                                                                           |                                                |
| Performance Profile:                                                                       |                                                |
| TLS Crypto Acceleration:                                                                   |                                                |
| Force Deploy:                                                                              | <a href="#">→</a>                              |
| <input type="button" value="Cancel"/> <input type="button" value="Save"/>                  |                                                |

- **General > Cluster Live Status**—Click the **View** link to open the **Cluster Status** dialog box.

| Field                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Timeouts</b>             |                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Hold Time                   | Between .3 and 45 seconds; The default is 3 seconds. To determine node system health, the cluster nodes send heartbeat messages on the cluster control link to other nodes. If a node does not receive any heartbeat messages from a peer node within the hold time period, the peer node is considered unresponsive or dead.                                                                                                             |
| Interface Debounce Time     | Between 300 and 9000 ms. The default is 500 ms. The interface debounce time is the amount of time before the node considers an interface to be failed, and the node is removed from the cluster.                                                                                                                                                                                                                                          |
| <b>Monitored Interfaces</b> | The interface health check monitors for link failures. If all physical ports for a given logical interface fail on a particular node, but there are active ports under the same logical interface on other nodes, then the node is removed from the cluster. The amount of time before the node removes a member from the cluster depends on the type of interface and whether the node is an established node or is joining the cluster. |
| Service Application         | Shows whether the Snort and disk-full processes are monitored.                                                                                                                                                                                                                                                                                                                                                                            |
| Unmonitored Interfaces      | Shows unmonitored interfaces.                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Auto-Rejoin Settings</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Cluster Interface           | Shows the auto-rejoin settings after a cluster control link failure.                                                                                                                                                                                                                                                                                                                                                                      |

| Field                            | Description                                                                                                                                              |
|----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>Attempts</i>                  | Between -1 and 65535. The default is -1 (unlimited). Sets the number of rejoin attempts.                                                                 |
| <i>Interval Between Attempts</i> | Between 2 and 60. The default is 5 minutes. Defines the interval duration in minutes between rejoin attempts.                                            |
| <i>Interval Variation</i>        | Between 1 and 3. The default is 1x the interval duration. Defines if the interval duration increases at each attempt.                                    |
| Data Interfaces                  | Shows the auto-rejoin settings after a data interface failure.                                                                                           |
| <i>Attempts</i>                  | Between -1 and 65535. The default is 3. Sets the number of rejoin attempts.                                                                              |
| <i>Interval Between Attempts</i> | Between 2 and 60. The default is 5 minutes. Defines the interval duration in minutes between rejoin attempts.                                            |
| <i>Interval Variation</i>        | Between 1 and 3. The default is 2x the interval duration. Defines if the interval duration increases at each attempt.                                    |
| System                           | Shows the auto-rejoin settings after internal errors. Internal failures include: application sync timeout; inconsistent application statuses; and so on. |
| <i>Attempts</i>                  | Between -1 and 65535. The default is 3. Sets the number of rejoin attempts.                                                                              |
| <i>Interval Between Attempts</i> | Between 2 and 60. The default is 5 minutes. Defines the interval duration in minutes between rejoin attempts.                                            |
| <i>Interval Variation</i>        | Between 1 and 3. The default is 2x the interval duration. Defines if the interval duration increases at each attempt.                                    |

**Note** If you disable the system health check, fields that do not apply when the system health check is disabled will not show.

You can change these settings from this section.

You can monitor any port-channel ID, single physical interface ID, as well as the Snort and disk-full processes. Health monitoring is not performed on VLAN subinterfaces or virtual interfaces such as VNIs or BVIs. You cannot configure monitoring for the cluster control link; it is always monitored.

**Procedure**

- Step 1** Choose **Devices > Device Management**.
- Step 2** Next to the cluster you want to modify, click **Edit** (✎).
- Step 3** Click **Cluster**.
- Step 4** In the **Cluster Health Monitor Settings** section, click **Edit** (✎).
- Step 5** Disable the system health check by clicking the **Health Check** slider .

**Figure 237: Disable the System Health Check**

Edit Cluster Health Monitor Settings

Health Check  ⓘ

▼ Timeouts

Hold Time  Range: 0.3 to 45 seconds

Interface Debounce Time  Range: 300 to 9000 milliseconds

> Auto-Rejoin Settings

> Monitored Interfaces

Reset to Defaults Cancel Save

When any topology changes occur (such as adding or removing a data interface, enabling or disabling an interface on the node or the switch, or adding an additional switch to form a VSS or vPC) you should disable the system health check feature and also disable interface monitoring for the disabled interfaces. When the topology change is complete, and the configuration change is synced to all nodes, you can re-enable the system health check feature and monitored interfaces.

**Step 6**

Configure the hold time and interface debounce time.

- **Hold Time**—Set the hold time to determine the amount of time between node heartbeat status messages, between .3 and 45 seconds; The default is 3 seconds.
- **Interface Debounce Time**—Set the debounce time between 300 and 9000 ms. The default is 500 ms. Lower values allow for faster detection of interface failures. Note that configuring a lower debounce time increases the chances of false-positives. When an interface status update occurs, the node waits the number of milliseconds specified before marking the interface as failed, and the node is removed from the cluster. In the case of an EtherChannel that transitions from a down state to an up state (for example, the switch reloaded, or the switch enabled an EtherChannel), a longer debounce time can prevent the interface from appearing to be failed on a cluster node just because another cluster node was faster at bundling the ports.

**Step 7**

Customize the auto-rejoin cluster settings after a health check failure.

Figure 238: Configure Auto-Rejoin Settings

▼ Auto-Rejoin Settings

---

**Cluster Interface**

Attempts  Range: 0-65535 (-1 for unlimited number of attempts)

Interval Between Attempts  Range: 2-60 minutes between rejoin attempts

Interval Variation  Range: 1-3. Defines if the interval duration increases. 1 (no change); 2 (2 x the previous duration), or 3 (3 x the previous duration).

**Data Interface**

Attempts  Range: 0-65535 (-1 for unlimited number of attempts)

Interval Between Attempts  Range: 2-60 minutes between rejoin attempts

Interval Variation  Range: 1-3. Defines if the interval duration increases. 1 (no change); 2 (2 x the previous duration), or 3 (3 x the previous duration).

**System**

Attempts  Range: 0-65535 (-1 for unlimited number of attempts)

Interval Between Attempts  Range: 2-60 minutes between rejoin attempts

Interval Variation  Range: 1-3. Defines if the interval duration increases. 1 (no change); 2 (2 x the previous duration), or 3 (3 x the previous duration).

Set the following values for the **Cluster Interface**, **Data Interface**, and **System** (internal failures include: application sync timeout; inconsistent application statuses; and so on):

- **Attempts**—Sets the number of rejoin attempts, between -1 and 65535. **0** disables auto-rejoining. The default for the **Cluster Interface** is -1 (unlimited). The default for the **Data Interface** and **System** is 3.
- **Interval Between Attempts**—Defines the interval duration in minutes between rejoin attempts, between 2 and 60. The default value is 5 minutes. The maximum total time that the node attempts to rejoin the cluster is limited to 14400 minutes (10 days) from the time of last failure.
- **Interval Variation**—Defines if the interval duration increases. Set the value between 1 and 3: **1** (no change); **2** (2 x the previous duration), or **3** (3 x the previous duration). For example, if you set the interval duration to 5 minutes, and set the variation to 2, then the first attempt is after 5 minutes; the 2nd attempt is 10 minutes (2 x 5); the 3rd attempt 20 minutes (2 x 10), and so on. The default value is **1** for the **Cluster Interface** and **2** for the **Data Interface** and **System**.

**Step 8**

Configure monitored interfaces by moving interfaces in the **Monitored Interfaces** or **Unmonitored Interfaces** window. You can also check or uncheck **Enable Service Application Monitoring** to enable or disable monitoring of the Snort and disk-full processes.

Enable Service Application Monitoring

The interface health check monitors for link failures. If all physical ports for a given logical interface fail on a particular node, but there are active ports under the same logical interface on other nodes, then the node is removed from the cluster. The amount of time before the node removes a member from the cluster depends on the type of interface and whether the node is an established node or is joining the cluster. Health check is enabled by default for all interfaces and for the Snort and disk-full processes.

You might want to disable health monitoring of non-essential interfaces.

When any topology changes occur (such as adding or removing a data interface, enabling or disabling an interface on the node or the switch, or adding an additional switch to form a VSS or vPC) you should disable the system health check feature and also disable interface monitoring for the disabled interfaces. When the topology change is complete, and the configuration change is synced to all nodes, you can re-enable the system health check feature and monitored interfaces.

**Step 9** Click **Save**.

**Step 10** Deploy configuration changes.

## Manage Cluster Nodes

### Disable Clustering

You may want to deactivate a node in preparation for deleting the node, or temporarily for maintenance. This procedure is meant to temporarily deactivate a node; the node will still appear in the management center device list. When a node becomes inactive, all data interfaces are shut down.

---

**Note** Do not power off the node without first disabling clustering.

---

### Procedure

- 
- Step 1** For the unit you want to disable, choose **Devices > Device Management**, click the **More** (⋮), and choose **Disable Node Clustering**.
  - Step 2** Confirm that you want to disable clustering on the node.  
The node will show **(Disabled)** next to its name in the **Devices > Device Management** list.
  - Step 3** To reenabling clustering, see [Rejoin the Cluster, on page 824](#).
- 

## Rejoin the Cluster

If a node was removed from the cluster, for example for a failed interface or if you manually disabled clustering, you must manually rejoin the cluster. Make sure the failure is resolved before you try to rejoin the cluster.

### Procedure

- 
- Step 1** For the unit you want to reactivate, choose **Devices > Device Management**, click the **More** (⋮), and choose **Enable Node Clustering**.
  - Step 2** Confirm that you want to enable clustering on the node.
- 

## Reconcile Cluster Nodes

If a cluster node fails to register, you can reconcile the cluster membership from the device to the management center. For example, a data node might fail to register if the management center is occupied with certain processes, or if there is a network issue.

### Procedure

- 
- Step 1** Choose **Devices > Device Management > More** (⋮) for the cluster, and then choose **Cluster Live Status** to open the **Cluster Status** dialog box.
  - Step 2** Click **Reconcile All**.

Figure 240: Reconcile All

Cluster Status

Overall Status: Cluster has all nodes in sync

| > | In Sync. | 172.16.0.50 <span>Control</span> | 172.16.0.50 | N/A         | ⋮ |
| > | In Sync. | 172.16.0.51                      | 172.16.0.51 | N/A         | ⋮ |

Dated: 11:52:26 | 20 Dec 2021 Close

For more information about the cluster status, see [Monitoring the Cluster, on page 826](#).

## Unregister the Cluster or Nodes and Register to a New Management Center

You can unregister the cluster from the management center, which keeps the cluster intact. You might want to unregister the cluster if you want to add the cluster to a new management center.

You can also unregister a node from the management center without breaking the node from the cluster. Although the node is not visible in the management center, it is still part of the cluster, and it will continue to pass traffic and could even become the control node. You cannot unregister the current control node. You might want to unregister the node if it is no longer reachable from the management center, but you still want to keep it as part of the cluster while you troubleshoot management connectivity.

Unregistering a cluster:

- Severs all communication between the management center and the cluster.
- Removes the cluster from the **Device Management** page.
- Returns the cluster to local time management if the cluster's platform settings policy is configured to receive time from the management center using NTP.
- Leaves the configuration intact, so the cluster continues to process traffic.

Policies, such as NAT and VPN, ACLs, and the interface configurations remain intact.

Registering the cluster again to the same or a different management center causes the configuration to be removed, so the cluster will stop processing traffic at that point; the cluster configuration remains intact so

you can add the cluster as a whole. You can choose an access control policy at registration, but you will have to re-apply other policies after registration and then deploy the configuration before it will process traffic again.

### Before you begin

This procedure requires CLI access to one of the nodes.

### Procedure

---

- Step 1** Choose **Devices > Device Management**, click **More** (ⓘ) for the cluster or node, and choose **Unregister**.
- Step 2** You are prompted to unregister the cluster or node; click **Yes**.
- Step 3** You can register the cluster to a new (or the same) management center by adding one of the cluster members as a new device.
- You only need to add one of the cluster nodes as a device, and the rest of the cluster nodes will be discovered.
- Step 4** To re-add a deleted node, see [Reconcile Cluster Nodes, on page 824](#).
- 

## Monitoring the Cluster

You can monitor the cluster in the management center and at the threat defense CLI.

- **Cluster Status** dialog box, which is available from the **Devices > Device Management > More** (ⓘ) icon or from the **Devices > Device Management > Cluster** page > **General** area > **Cluster Live Status** link.

Dated: 11:52:26 | 20 Dec 2021

The Control node has a graphic indicator identifying its role.

Cluster member **Status** includes the following states:

- In Sync.—The node is registered with the management center.
- Pending Registration—The node is part of the cluster, but has not yet registered with the management center. If a node fails to register, you can retry registration by clicking **Reconcile All**.
- Clustering is disabled—The node is registered with the management center, but is an inactive member of the cluster. The clustering configuration remains intact if you intend to later re-enable it, or you can delete the node from the cluster.
- Joining cluster...—The node is joining the cluster on the chassis, but has not completed joining. After it joins, it will register with the management center.

For each node, you can view the **Summary** or the **History**.

Figure 242: Node Summary

| Status   | Device Name                | Unit Name   | Chassis URL |

- **System** (⚙️) > **Tasks** page.

The **Tasks** page shows updates of the Cluster Registration task as each node registers.

- **Devices** > **Device Management** > *cluster\_name*.

When you expand the cluster on the devices listing page, you can see all member nodes, including the control node shown with its role next to the IP address. For nodes that are still registering, you can see the loading icon.

- **show cluster** {*access-list* [*acl\_name*] | *conn* [*count*] | *cpu* [*usage*] | *history* | *interface-mode* | *memory* | *resource usage* | *service-policy* | *traffic* | *xlate count*}

To view aggregated data for the entire cluster or other information, use the **show cluster** command.

- **show cluster info** [*auto-join* | *clients* | *conn-distribution* | *flow-mobility counters* | *goid* [*options*] | *health* | *incompatible-config* | *loadbalance* | *old-members* | *packet-distribution* | *trace* [*options*] | *transport* { *asp* | *cp* }]

To view cluster information, use the **show cluster info** command.

# Cluster Health Monitor Dashboard

## Cluster Health Monitor

When a threat defense is the control node of a cluster, the management center collects various metrics periodically from the device metric data collector. The cluster health monitor is comprised of the following components:

- Overview dashboard—Displays information about the cluster topology, cluster statistics, and metric charts:
  - The topology section displays a cluster's live status, the health of individual threat defense, threat defense node type (control node or data node), and the status of the device. The status of the device could be *Disabled* (when the device leaves the cluster), *Added out of box* (in a public cloud cluster, the additional nodes that do not belong to the management center), or *Normal* (ideal state of the node).
  - The cluster statistics section displays current metrics of the cluster with respect to the CPU usage, memory usage, input rate, output rate, active connections, and NAT translations.

---

**Note** The CPU and memory metrics display the individual average of the data plane and snort usage.

---

- The metric charts, namely, CPU Usage, Memory Usage, Throughput, and Connections, diagrammatically display the statistics of the cluster over the specified time period.
- Load Distribution dashboard—Displays load distribution across the cluster nodes in two widgets:
  - The Distribution widget displays the average packet and connection distribution over the time range across the cluster nodes. This data depicts how the load is being distributed by the nodes. Using this widget, you can easily identify any abnormalities in the load distribution and rectify it.
  - The Node Statistics widget displays the node level metrics in table format. It displays metric data on CPU usage, memory usage, input rate, output rate, active connections, and NAT translations across the cluster nodes. This table view enables you to correlate data and easily identify any discrepancies.
- Member Performance dashboard—Displays current metrics of the cluster nodes. You can use the selector to filter the nodes and view the details of a specific node. The metric data include CPU usage, memory usage, input rate, output rate, active connections, and NAT translations.
- CCL dashboard—Displays, graphically, the cluster control link data namely, the input, and output rate.
- Troubleshooting and Links — Provides convenient links to frequently used troubleshooting topics and procedures.
- Time range—An adjustable time window to constrain the information that appears in the various cluster metrics dashboards and widgets.
- Custom Dashboard—Displays data on both cluster-wide metrics and node-level metrics. However, node selection only applies for the threat defense metrics and not for the entire cluster to which the node belongs.

## Viewing Cluster Health

You must be an Admin, Maintenance, or Security Analyst user to perform this procedure.

The cluster health monitor provides a detailed view of the health status of a cluster and its nodes. This cluster health monitor provides health status and trends of the cluster in an array of dashboards.

### Before you begin

- Ensure you have created a cluster from one or more devices in the management center.

### Procedure

---

**Step 1** Choose **System** (⚙) > **Health** > **Monitor**.

Use the Monitoring navigation pane to access node-specific health monitors.

**Step 2** In the device list, click **Expand** (>) and **Collapse** (v) to expand and collapse the list of managed cluster devices.

**Step 3** To view the cluster health statistics, click on the cluster name. The cluster monitor reports health and performance metrics in several predefined dashboards by default. The metrics dashboards include:

- **Overview** — Highlights key metrics from the other predefined dashboards, including its nodes, CPU, memory, input and output rates, connection statistics, and NAT translation information.
- **Load Distribution** — Traffic and packet distribution across the cluster nodes.
- **Member Performance** — Node-level statistics on CPU usage, memory usage, input throughput, output throughput, active connection, and NAT translation.
- **CCL** — Interface status and aggregate traffic statistics.

You can navigate through the various metrics dashboards by clicking on the labels. For a comprehensive list of the supported cluster metrics, see [Cisco Secure Firewall Threat Defense Health Metrics](#).

**Step 4** You can configure the time range from the drop-down in the upper-right corner. The time range can reflect a period as short as the last hour (the default) or as long as two weeks. Select **Custom** from the drop-down to configure a custom start and end date.

Click the refresh icon to set auto refresh to 5 minutes or to toggle off auto refresh.

**Step 5** Click on deployment icon for a deployment overlay on the trend graph, with respect to the selected time range.

The deployment icon indicates the number of deployments during the selected time-range. A vertical band indicates the deployment start and end time. For multiple deployments, multiple bands/lines appear. Click on the icon on top of the dotted line to view the deployment details.

**Step 6** (For node-specific health monitor) View the **Health Alerts** for the node in the alert notification at the top of page, directly to the right of the device name.

Hover your pointer over the **Health Alerts** to view the health summary of the node. The popup window shows a truncated summary of the top five health alerts. Click on the popup to open a detailed view of the health alert summary.

- Step 7** (For node-specific health monitor) The device monitor reports health and performance metrics in several predefined dashboards by default. The metrics dashboards include:
- Overview — Highlights key metrics from the other predefined dashboards, including CPU, memory, interfaces, connection statistics; plus disk usage and critical process information.
  - CPU — CPU utilization, including the CPU usage by process and by physical cores.
  - Memory — Device memory utilization, including data plane and Snort memory usage.
  - Interfaces — Interface status and aggregate traffic statistics.
  - Connections — Connection statistics (such as elephant flows, active connections, peak connections, and so on) and NAT translation counts.
  - Snort — Statistics that are related to the Snort process.
  - ASP drops — Statistics related to the dropped packets against various reasons.

You can navigate through the various metrics dashboards by clicking on the labels. See [Cisco Secure Firewall Threat Defense Health Metrics](#) for a comprehensive list of the supported device metrics.

- Step 8** Click the plus sign (+) in the upper right corner of the health monitor to create a custom dashboard by building your own variable set from the available metric groups.

For cluster-wide dashboard, choose Cluster metric group, and then choose the metric.

## Cluster Metrics

The cluster health monitor tracks statistics that are related to a cluster and its nodes, and aggregate of load distribution, performance, and CCL traffic statistics.

**Table 64: Cluster Metrics**

| Metric           | Description                                                                                  | Format     |
|------------------|----------------------------------------------------------------------------------------------|------------|
| CPU              | Average of CPU metrics on the nodes of a cluster (individually for data plane and snort).    | percentage |
| Memory           | Average of memory metrics on the nodes of a cluster (individually for data plane and snort). | percentage |
| Data Throughput  | Incoming and outgoing data traffic statistics for a cluster.                                 | bytes      |
| CCL Throughput   | Incoming and outgoing CCL traffic statistics for a cluster.                                  | bytes      |
| Connections      | Count of active connections in a cluster.                                                    | number     |
| NAT Translations | Count of NAT translations for a cluster.                                                     | number     |
| Distribution     | Connection distribution count in the cluster for every second.                               | number     |

| Metric  | Description                                                | Format |
|---------|------------------------------------------------------------|--------|
| Packets | Packet distribution count in the cluster for every second. | number |

## Upgrading the Cluster

Perform the following steps to upgrade a threat defense virtual cluster:

### Procedure

- 
- Step 1** Upload the target image version to the cloud image storage.
  - Step 2** Update the cloud instance template of the cluster with the updated target image version.
    - a) Create a copy of the instance template with the target image version.
    - b) Attach the newly created template to cluster instance group.
  - Step 3** Upload the target image version upgrade package to the management center.
  - Step 4** Perform readiness check on the cluster that you want to upgrade.
  - Step 5** After successful readiness check, initiate installation of upgrade package.
  - Step 6** The management center upgrades the cluster nodes one at a time.
  - Step 7** The management center displays a notification after successful upgrade of the cluster.

There is no change in the serial number and UUID of the instance after the upgrade.

**Note**

- If you initiate the cluster upgrade from the management center, ensure that no threat defense virtual device is accidentally terminated or replaced by the auto scaling group during the post-upgrade reboot process. To prevent this, go to the AWS console, click **Auto scaling group** -> **Advanced configurations**, and suspend the processes - Health Check and Replace Unhealthy. After the upgrade is completed, go to **Advanced configurations** again and remove any suspended processes to detect unhealthy instances.

- If you upgrade a cluster deployed on AWS from a major release to a patch release and then scale up the cluster, the new nodes will come up with the major release version instead of the patch release. You have to then manually upgrade each node to the patch release from the management center.

Alternatively, you can also create an Amazon Machine Image (AMI) from a snapshot of a standalone threat defense virtual instance on which the patch has been applied and which does not have a day 0 configuration. Use this AMI in the cluster deployment template. Any new nodes that come up when you scale up the cluster will have the patch release.

## Reference for Clustering

This section includes more information about how clustering operates.

## Threat Defense Features and Clustering

Some threat defense features are not supported with clustering, and some are only supported on the control unit. Other features might have caveats for proper usage.

### Unsupported Features and Clustering

These features cannot be configured with clustering enabled, and the commands will be rejected.

---

**Note** To view FlexConfig features that are also not supported with clustering, for example WCCP inspection, see the [ASA general operations configuration guide](#). FlexConfig lets you configure many ASA features that are not present in the management center GUI. See [FlexConfig Policies, on page 2703](#).

---

- Remote access VPN (SSL VPN and IPsec VPN)
- DHCP client, server, and proxy. DHCP relay is supported.
- Virtual Tunnel Interfaces (VTIs)
- High Availability
- Integrated Routing and Bridging
- Management Center UCAPL/CC mode

### Centralized Features for Clustering

The following features are only supported on the control node, and are not scaled for the cluster.

---

**Note** Traffic for centralized features is forwarded from member nodes to the control node over the cluster control link.

If you use the rebalancing feature, traffic for centralized features may be rebalanced to non-control nodes before the traffic is classified as a centralized feature; if this occurs, the traffic is then sent back to the control node.

For centralized features, if the control node fails, all connections are dropped, and you have to re-establish the connections on the new control node.

---

---

**Note** To view FlexConfig features that are also centralized with clustering, for example RADIUS inspection, see the [ASA general operations configuration guide](#). FlexConfig lets you configure many ASA features that are not present in the management center GUI. See [FlexConfig Policies, on page 2703](#).

---

- The following application inspections:
  - DCERPC
  - ESMTP

- NetBIOS
  - PPTP
  - RSH
  - SQLNET
  - SUNRPC
  - TFTP
  - XDMCP
- Static route monitoring

## Cisco Trustsec and Clustering

Only the control node learns security group tag (SGT) information. The control node then populates the SGT to data nodes, and data nodes can make a match decision for SGT based on the security policy.

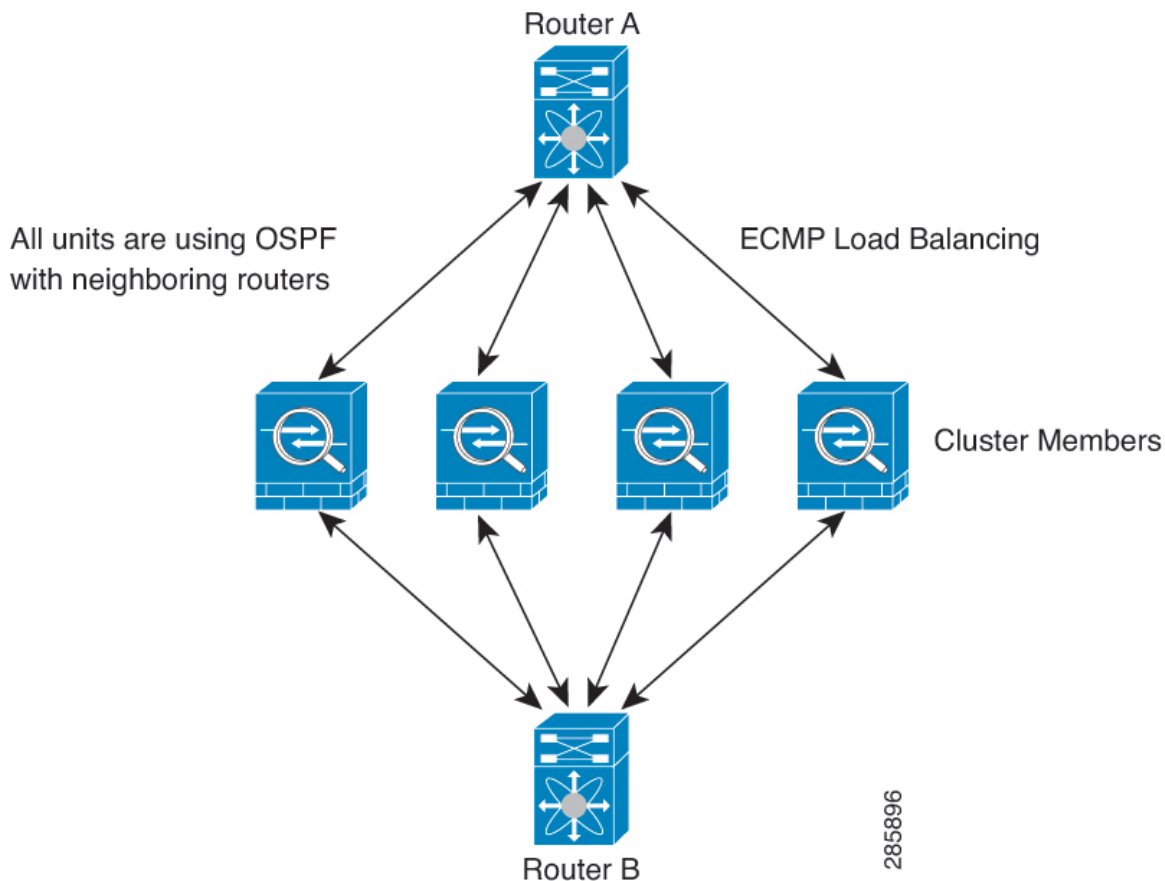

## Connection Settings and Clustering

Connection limits are enforced cluster-wide. Each node has an estimate of the cluster-wide counter values based on broadcast messages. Due to efficiency considerations, the configured connection limit across the cluster might not be enforced exactly at the limit number. Each node may overestimate or underestimate the cluster-wide counter value at any given time. However, the information will get updated over time in a load-balanced cluster.

## Dynamic Routing and Clustering

In Individual interface mode, each node runs the routing protocol as a standalone router, and routes are learned by each node independently.

Figure 244: Dynamic Routing in Individual Interface Mode

In the above diagram, Router A learns that there are 4 equal-cost paths to Router B, each through a node. ECMP is used to load balance traffic between the 4 paths. Each node picks a different router ID when talking to external routers.

You must configure a cluster pool for the router ID so that each node has a separate router ID.

## FTP and Clustering

- If FTP data channel and control channel flows are owned by different cluster members, then the data channel owner will periodically send idle timeout updates to the control channel owner and update the idle timeout value. However, if the control flow owner is reloaded, and the control flow is re-hosted, the parent/child flow relationship will not longer be maintained; the control flow idle timeout will not be updated.

## NAT and Clustering

For NAT usage, see the following limitations.

NAT can affect the overall throughput of the cluster. Inbound and outbound NAT packets can be sent to different threat defenses in the cluster, because the load balancing algorithm relies on IP addresses and ports, and NAT causes inbound and outbound packets to have different IP addresses and/or ports. When a packet arrives at the threat defense that is not the NAT owner, it is forwarded over the cluster control link to the

owner, causing large amounts of traffic on the cluster control link. Note that the receiving node does not create a forwarding flow to the owner, because the NAT owner may not end up creating a connection for the packet depending on the results of security and policy checks.

If you still want to use NAT in clustering, then consider the following guidelines:

- **No Proxy ARP**—For Individual interfaces, a proxy ARP reply is never sent for mapped addresses. This prevents the adjacent router from maintaining a peer relationship with an ASA that may no longer be in the cluster. The upstream router needs a static route or PBR with Object Tracking for the mapped addresses that points to the Main cluster IP address.
- **PAT with Port Block Allocation**—See the following guidelines for this feature:
  - **Maximum-per-host limit** is not a cluster-wide limit, and is enforced on each node individually. Thus, in a 3-node cluster with the maximum-per-host limit configured as 1, if the traffic from a host is load-balanced across all 3 nodes, then it can get allocated 3 blocks with 1 in each node.
  - **Port blocks created on the backup node** from the backup pools are not accounted for when enforcing the maximum-per-host limit.
  - **On-the-fly PAT rule modifications**, where the PAT pool is modified with a completely new range of IP addresses, will result in xlate backup creation failures for the xlate backup requests that were still in transit while the new pool became effective. This behavior is not specific to the port block allocation feature, and is a transient PAT pool issue seen only in cluster deployments where the pool is distributed and traffic is load-balanced across the cluster nodes.
  - **When operating in a cluster**, you cannot simply change the block allocation size. The new size is effective only after you reload each device in the cluster. To avoid having to reload each device, we recommend that you delete all block allocation rules and clear all xlates related to those rules. You can then change the block size and recreate the block allocation rules.
- **NAT pool address distribution for dynamic PAT**—When you configure a PAT pool, the cluster divides each IP address in the pool into port blocks. By default, each block is 512 ports, but if you configure port block allocation rules, your block setting is used instead. These blocks are distributed evenly among the nodes in the cluster, so that each node has one or more blocks for each IP address in the PAT pool. Thus, you could have as few as one IP address in a PAT pool for a cluster, if that is sufficient for the number of PAT'ed connections you expect. Port blocks cover the 1024-65535 port range, unless you configure the option to include the reserved ports, 1-1023, on the PAT pool NAT rule.
- **Reusing a PAT pool in multiple rules**—To use the same PAT pool in multiple rules, you must be careful about the interface selection in the rules. You must either use specific interfaces in all rules, or "any" in all rules. You cannot mix specific interfaces and "any" across the rules, or the system might not be able to match return traffic to the right node in the cluster. Using unique PAT pools per rule is the most reliable option.
- **No round-robin**—Round-robin for a PAT pool is not supported with clustering.
- **No extended PAT**—Extended PAT is not supported with clustering.
- **Dynamic NAT xlates managed by the control node**—The control node maintains and replicates the xlate table to data nodes. When a data node receives a connection that requires dynamic NAT, and the xlate is not in the table, it requests the xlate from the control node. The data node owns the connection.
- **Stale xlates**—The xlate idle time on the connection owner does not get updated. Thus, the idle time might exceed the idle timeout. An idle timer value higher than the configured timeout with a refcnt of 0 is an indication of a stale xlate.

- No static PAT for the following inspections—
  - FTP
  - RSH
  - SQLNET
  - TFTP
  - XDMCP
  - SIP
- If you have an extremely large number of NAT rules, over ten thousand, you should enable the transactional commit model using the **asp rule-engine transactional-commit nat** command in the device CLI. Otherwise, the node might not be able to join the cluster.

## SIP Inspection and Clustering

A control flow can be created on any node (due to load balancing); its child data flows must reside on the same node.

## SNMP and Clustering

You should always use the Local address, and not the Main cluster IP address for SNMP polling. If the SNMP agent polls the Main cluster IP address, if a new control node is elected, the poll to the new control node will fail.

When using SNMPv3 with clustering, if you add a new cluster node after the initial cluster formation, then SNMPv3 users are not replicated to the new node. You must remove the users, and re-add them, and then redeploy your configuration to force the users to replicate to the new node.

## Syslog and Clustering

- Each node in the cluster generates its own syslog messages. You can configure logging so that each node uses either the same or a different device ID in the syslog message header field. For example, the hostname configuration is replicated and shared by all nodes in the cluster. If you configure logging to use the hostname as the device ID, syslog messages generated by all nodes look as if they come from a single node. If you configure logging to use the local-node name that is assigned in the cluster bootstrap configuration as the device ID, syslog messages look as if they come from different nodes.

## VPN and Clustering

Site-to-site VPN is a centralized feature; only the control node supports VPN connections.

---

**Note** Remote access VPN is not supported with clustering.

---

VPN functionality is limited to the control node and does not take advantage of the cluster high availability capabilities. If the control node fails, all existing VPN connections are lost, and VPN users will see a disruption in service. When a new control node is elected, you must reestablish the VPN connections.

For connections to an Individual interface when using PBR or ECMP, you must always connect to the Main cluster IP address, not a Local address.

VPN-related keys and certificates are replicated to all nodes.

## Performance Scaling Factor

When you combine multiple units into a cluster, you can expect the total cluster performance to be approximately 80% of the maximum combined throughput.

For example, if your model can handle approximately 10 Gbps of traffic when running alone, then for a cluster of 8 units, the maximum combined throughput will be approximately 80% of 80 Gbps (8 units x 10 Gbps): 64 Gbps.

## Control Node Election

Nodes of the cluster communicate over the cluster control link to elect a control node as follows:

1. When you enable clustering for a node (or when it first starts up with clustering already enabled), it broadcasts an election request every 3 seconds.
2. Any other nodes with a higher priority respond to the election request; the priority is set between 1 and 100, where 1 is the highest priority.
3. If after 45 seconds, a node does not receive a response from another node with a higher priority, then it becomes the control node.

---

**Note** If multiple nodes tie for the highest priority, the cluster node name and then the serial number is used to determine the control node.

---

4. If a node later joins the cluster with a higher priority, it does not automatically become the control node; the existing control node always remains as the control node unless it stops responding, at which point a new control node is elected.
5. In a "split brain" scenario when there are temporarily multiple control nodes, then the node with highest priority retains the role while the other nodes return to data node roles.

---

**Note** You can manually force a node to become the control node. For centralized features, if you force a control node change, then all connections are dropped, and you have to re-establish the connections on the new control node.

---

## High Availability within the Cluster

Clustering provides high availability by monitoring node and interface health and by replicating connection states between nodes.

## Node Health Monitoring

Each node periodically sends a broadcast heartbeat packet over the cluster control link. If the control node does not receive any heartbeat packets or other packets from a data node within the configurable timeout period, then the control node removes the data node from the cluster. If the data nodes do not receive packets from the control node, then a new control node is elected from the remaining nodes.

If nodes cannot reach each other over the cluster control link because of a network failure and not because a node has actually failed, then the cluster may go into a "split brain" scenario where isolated data nodes will elect their own control nodes. For example, if a router fails between two cluster locations, then the original control node at location 1 will remove the location 2 data nodes from the cluster. Meanwhile, the nodes at location 2 will elect their own control node and form their own cluster. Note that asymmetric traffic may fail in this scenario. After the cluster control link is restored, then the control node that has the higher priority will keep the control node's role.

## Interface Monitoring

Each node monitors the link status of all named hardware interfaces in use, and reports status changes to the control node.

All physical interfaces are monitored; only named interfaces can be monitored. You can optionally disable monitoring per interface.

A node is removed from the cluster if its monitored interfaces fail. The node is removed after 500 ms.

## Status After Failure

If the control node fails, then another member of the cluster with the highest priority (lowest number) becomes the control node.

The Threat Defense automatically tries to rejoin the cluster, depending on the failure event.

---

**Note** When the Threat Defense becomes inactive and fails to automatically rejoin the cluster, all data interfaces are shut down; only the Management interface can send and receive traffic.

---

## Rejoining the Cluster

After a cluster member is removed from the cluster, how it can rejoin the cluster depends on why it was removed:

- Failed cluster control link when initially joining—After you resolve the problem with the cluster control link, you must manually rejoin the cluster by re-enabling clustering.
- Failed cluster control link after joining the cluster—The threat defense automatically tries to rejoin every 5 minutes, indefinitely.
- Failed data interface—The threat defense automatically tries to rejoin at 5 minutes, then at 10 minutes, and finally at 20 minutes. If the join is not successful after 20 minutes, then the threat defense application disables clustering. After you resolve the problem with the data interface, you have to manually enable clustering.
- Failed node—If the node was removed from the cluster because of a node health check failure, then rejoining the cluster depends on the source of the failure. For example, a temporary power failure means

the node will rejoin the cluster when it starts up again as long as the cluster control link is up. The threat defense application attempts to rejoin the cluster every 5 seconds.

- Internal error—Internal failures include: application sync timeout; inconsistent application statuses; and so on.
- Failed configuration deployment—If you deploy a new configuration from management center, and the deployment fails on some cluster members but succeeds on others, then the nodes that failed are removed from the cluster. You must manually rejoin the cluster by re-enabling clustering. If the deployment fails on the control node, then the deployment is rolled back, and no members are removed. If the deployment fails on all data nodes, then the deployment is rolled back, and no members are removed.

## Data Path Connection State Replication

Every connection has one owner and at least one backup owner in the cluster. The backup owner does not take over the connection in the event of a failure; instead, it stores TCP/UDP state information, so that the connection can be seamlessly transferred to a new owner in case of a failure. The backup owner is usually also the director.

Some traffic requires state information above the TCP or UDP layer. See the following table for clustering support or lack of support for this kind of traffic.

**Table 65: Features Replicated Across the Cluster**

| Traffic                | State Support | Notes                              |
|------------------------|---------------|------------------------------------|
| Up time                | Yes           | Keeps track of the system up time. |
| ARP Table              | Yes           | —                                  |
| MAC address table      | Yes           | —                                  |
| User Identity          | Yes           | —                                  |
| IPv6 Neighbor database | Yes           | —                                  |
| Dynamic routing        | Yes           | —                                  |
| SNMP Engine ID         | No            | —                                  |

## How the Cluster Manages Connections

Connections can be load-balanced to multiple nodes of the cluster. Connection roles determine how connections are handled in both normal operation and in a high availability situation.

### Connection Roles

See the following roles defined for each connection:

- Owner—Usually, the node that initially receives the connection. The owner maintains the TCP state and processes packets. A connection has only one owner. If the original owner fails, then when new nodes receive packets from the connection, the director chooses a new owner from those nodes.

- **Backup owner**—The node that stores TCP/UDP state information received from the owner, so that the connection can be seamlessly transferred to a new owner in case of a failure. The backup owner does not take over the connection in the event of a failure. If the owner becomes unavailable, then the first node to receive packets from the connection (based on load balancing) contacts the backup owner for the relevant state information so it can become the new owner.

As long as the director (see below) is not the same node as the owner, then the director is also the backup owner. If the owner chooses itself as the director, then a separate backup owner is chosen.

For clustering on the Firepower 9300, which can include up to 3 cluster nodes in one chassis, if the backup owner is on the same chassis as the owner, then an additional backup owner will be chosen from another chassis to protect flows from a chassis failure.

- **Director**—The node that handles owner lookup requests from forwarders. When the owner receives a new connection, it chooses a director based on a hash of the source/destination IP address and ports (see below for ICMP hash details), and sends a message to the director to register the new connection. If packets arrive at any node other than the owner, the node queries the director about which node is the owner so it can forward the packets. A connection has only one director. If a director fails, the owner chooses a new director.

As long as the director is not the same node as the owner, then the director is also the backup owner (see above). If the owner chooses itself as the director, then a separate backup owner is chosen.

ICMP/ICMPv6 hash details:

- For Echo packets, the source port is the ICMP identifier, and the destination port is 0.
  - For Reply packets, the source port is 0, and the destination port is the ICMP identifier.
  - For other packets, both source and destination ports are 0.
- **Forwarder**—A node that forwards packets to the owner. If a forwarder receives a packet for a connection it does not own, it queries the director for the owner, and then establishes a flow to the owner for any other packets it receives for this connection. The director can also be a forwarder. Note that if a forwarder receives the SYN-ACK packet, it can derive the owner directly from a SYN cookie in the packet, so it does not need to query the director. (If you disable TCP sequence randomization, the SYN cookie is not used; a query to the director is required.) For short-lived flows such as DNS and ICMP, instead of querying, the forwarder immediately sends the packet to the director, which then sends them to the owner. A connection can have multiple forwarders; the most efficient throughput is achieved by a good load-balancing method where there are no forwarders and all packets of a connection are received by the owner.

---

**Note** We do not recommend disabling TCP sequence randomization when using clustering. There is a small chance that some TCP sessions won't be established, because the SYN/ACK packet might be dropped.

---

- **Fragment Owner**—For fragmented packets, cluster nodes that receive a fragment determine a fragment owner using a hash of the fragment source IP address, destination IP address, and the packet ID. All fragments are then forwarded to the fragment owner over the cluster control link. Fragments may be load-balanced to different cluster nodes, because only the first fragment includes the 5-tuple used in the switch load balance hash. Other fragments do not contain the source and destination ports and may be load-balanced to other cluster nodes. The fragment owner temporarily reassembles the packet so it can determine the director based on a hash of the source/destination IP address and ports. If it is a new

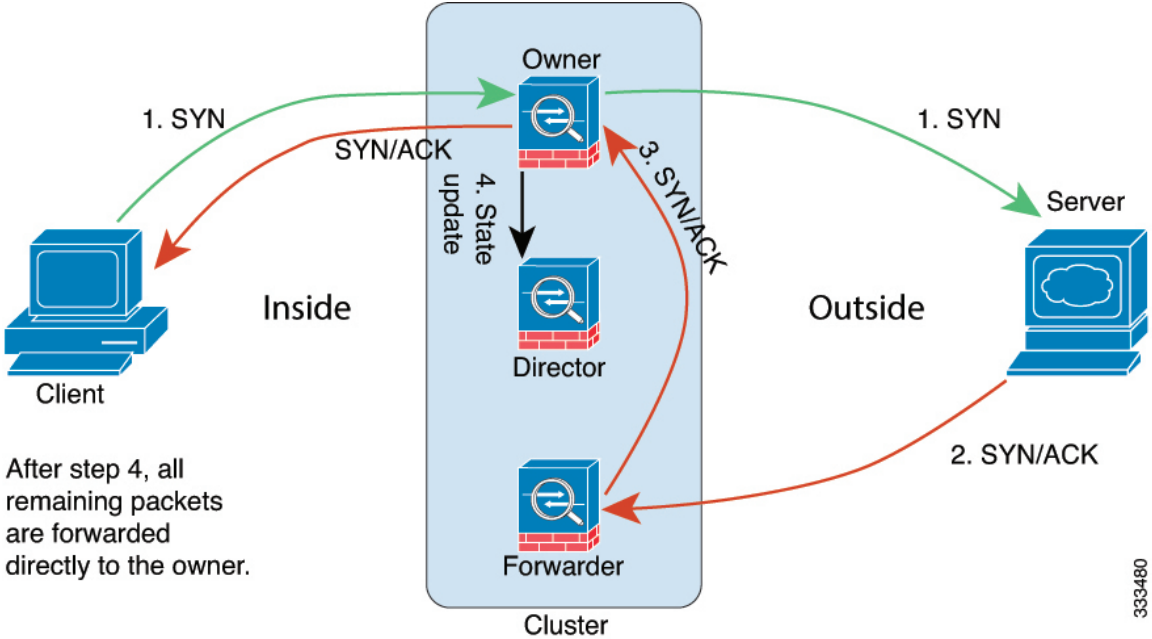

connection, the fragment owner will register to be the connection owner. If it is an existing connection, the fragment owner forwards all fragments to the provided connection owner over the cluster control link. The connection owner will then reassemble all fragments.

### New Connection Ownership

When a new connection is directed to a node of the cluster via load balancing, that node owns both directions of the connection. If any connection packets arrive at a different node, they are forwarded to the owner node over the cluster control link. If a reverse flow arrives at a different node, it is redirected back to the original node.

### Sample Data Flow for TCP

The following example shows the establishment of a new connection.

1. The SYN packet originates from the client and is delivered to one threat defense (based on the load balancing method), which becomes the owner. The owner creates a flow, encodes owner information into a SYN cookie, and forwards the packet to the server.
2. The SYN-ACK packet originates from the server and is delivered to a different threat defense (based on the load balancing method). This threat defense is the forwarder.
3. Because the forwarder does not own the connection, it decodes owner information from the SYN cookie, creates a forwarding flow to the owner, and forwards the SYN-ACK to the owner.
4. The owner sends a state update to the director, and forwards the SYN-ACK to the client.
5. The director receives the state update from the owner, creates a flow to the owner, and records the TCP state information as well as the owner. The director acts as the backup owner for the connection.
6. Any subsequent packets delivered to the forwarder will be forwarded to the owner.

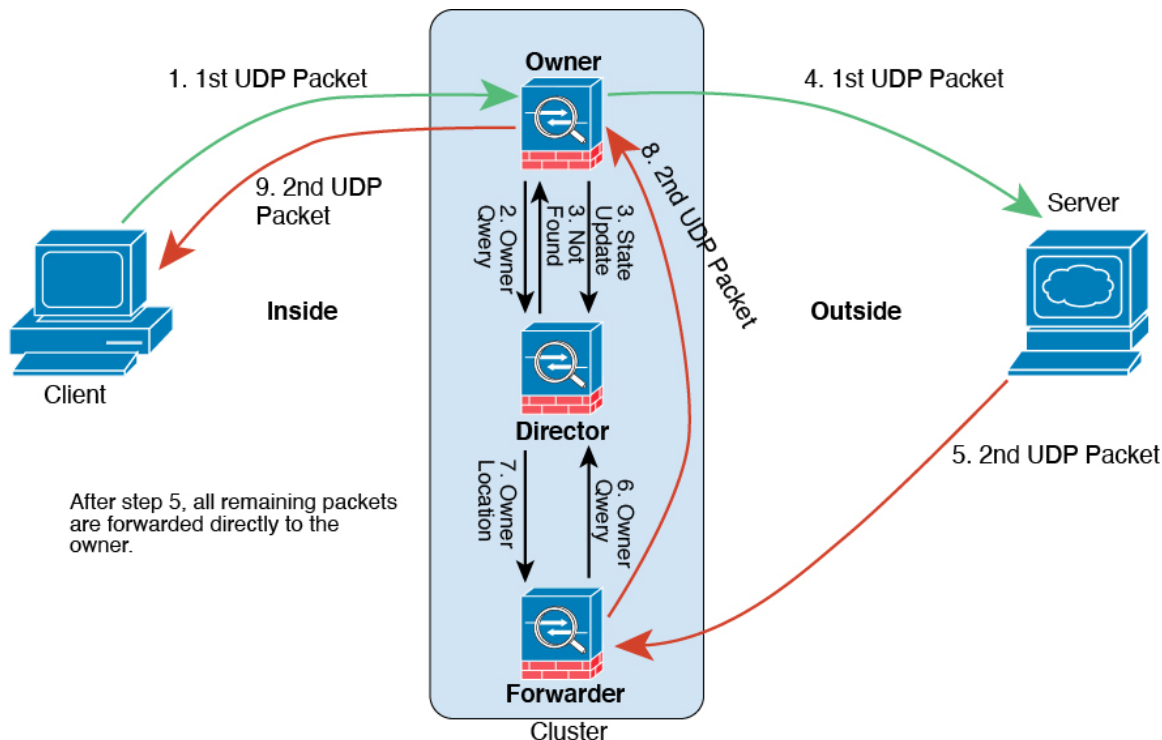

333480

7. If packets are delivered to any additional nodes, it will query the director for the owner and establish a flow.
8. Any state change for the flow results in a state update from the owner to the director.

## Sample Data Flow for ICMP and UDP

The following example shows the establishment of a new connection.

1. *Figure 245: ICMP and UDP Data Flow*

The first UDP packet originates from the client and is delivered to one threat defense (based on the load balancing method).

2. The node that received the first packet queries the director node that is chosen based on a hash of the source/destination IP address and ports.
3. The director finds no existing flow, creates a director flow and forwards the packet back to the previous node. In other words, the director has elected an owner for this flow.
4. The owner creates the flow, sends a state update to the director, and forwards the packet to the server.
5. The second UDP packet originates from the server and is delivered to the forwarder.
6. The forwarder queries the director for ownership information. For short-lived flows such as DNS, instead of querying, the forwarder immediately sends the packet to the director, which then sends it to the owner.
7. The director replies to the forwarder with ownership information.
8. The forwarder creates a forwarding flow to record owner information and forwards the packet to the owner.

9. The owner forwards the packet to the client.

## History for Threat Defense Virtual Clustering in the Public Cloud

| Feature                                                                                                       | Minimum Management Center | Minimum Threat Defense | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## CHAPTER 34

# Clustering for the Firepower 4100/9300

Clustering lets you group multiple threat defense nodes together as a single logical device. A cluster provides all the convenience of a single device (management, integration into a network) while achieving the increased throughput and redundancy of multiple devices.

**Note** Some features are not supported when using clustering. See [Unsupported Features with Clustering, on page 885](#).

## About Clustering on the Firepower 4100/9300 Chassis

When you deploy a cluster on the Firepower 4100/9300 chassis, it does the following:

- For native instance clustering: Creates a *cluster-control link* (by default, port-channel 48) for node-to-node communication.

For multi-instance clustering: You should pre-configure subinterfaces on one or more cluster-type EtherChannels; each instance needs its own cluster control link.

For a cluster isolated to security modules within one Firepower 9300 chassis, this link utilizes the Firepower 9300 backplane for cluster communications.

For clustering with multiple chassis, you need to manually assign physical interface(s) to this EtherChannel for communications between chassis.

- Creates the cluster bootstrap configuration within the application.

When you deploy the cluster, the chassis supervisor pushes a minimal bootstrap configuration to each unit that includes the cluster name, cluster control link interface, and other cluster settings.

- Assigns data interfaces to the cluster as *Spanned* interfaces.

For a cluster isolated to security modules within one Firepower 9300 chassis, spanned interfaces are not limited to EtherChannels, like it is for clustering with multiple chassis. The Firepower 9300 supervisor uses EtherChannel technology internally to load-balance traffic to multiple modules on a shared interface, so any data interface type works for Spanned mode. For clustering with multiple chassis, you must use Spanned EtherChannels for all data interfaces.

---

**Note** Individual interfaces are not supported, with the exception of a management interface.

---

- Assigns a management interface to all units in the cluster.

See the following sections for more information about clustering.

## Bootstrap Configuration

When you deploy the cluster, the Firepower 4100/9300 chassis supervisor pushes a minimal bootstrap configuration to each unit that includes the cluster name, cluster control link interface, and other cluster settings.

## Cluster Members

Cluster members work together to accomplish the sharing of the security policy and traffic flows.

One member of the cluster is the **control** unit. The control unit is determined automatically. All other members are **data** units.

You must perform all configuration on the control unit only; the configuration is then replicated to the data units.

Some features do not scale in a cluster, and the control unit handles all traffic for those features. .

## Cluster Control Link

For native instance clustering: The cluster control link is automatically created using the Port-channel 48 interface.

For multi-instance clustering: You should pre-configure subinterfaces on one or more cluster-type EtherChannels; each instance needs its own cluster control link.

For a cluster isolated to security modules within one Firepower 9300 chassis, this interface has no member interfaces. This Cluster type EtherChannel utilizes the Firepower 9300 backplane for cluster communications. For clustering with multiple chassis, you must add one or more interfaces to the EtherChannel.

For a cluster with two chassis, do not directly connect the cluster control link from one chassis to the other chassis. If you directly connect the interfaces, then when one unit fails, the cluster control link fails, and thus

the remaining healthy unit fails. If you connect the cluster control link through a switch, then the cluster control link remains up for the healthy unit.

Cluster control link traffic includes both control and data traffic.

## Size the Cluster Control Link

If possible, you should size the cluster control link to match the expected throughput of each chassis so the cluster control link can handle the worst-case scenarios.

Cluster control link traffic is comprised mainly of state update and forwarded packets. The amount of traffic at any given time on the cluster control link varies. The amount of forwarded traffic depends on the load-balancing efficacy or whether there is a lot of traffic for centralized features. For example:

- NAT results in poor load balancing of connections, and the need to rebalance all returning traffic to the correct units.
- When membership changes, the cluster needs to rebalance a large number of connections, thus temporarily using a large amount of cluster control link bandwidth.

A higher-bandwidth cluster control link helps the cluster to converge faster when there are membership changes and prevents throughput bottlenecks.

**Note** If your cluster has large amounts of asymmetric (rebalanced) traffic, then you should increase the cluster control link size.

## Cluster Control Link Redundancy

The following diagram shows how to use an EtherChannel as a cluster control link in a Virtual Switching System (VSS), Virtual Port Channel (vPC), StackWise, or StackWise Virtual environment. All links in the EtherChannel are active. When the switch is part of a redundant system, then you can connect firewall interfaces within the same EtherChannel to separate switches in the redundant system. The switch interfaces are members of the same EtherChannel port-channel interface, because the separate switches act like a single switch. Note that this EtherChannel is device-local, not a Spanned EtherChannel.

## Cluster Control Link Reliability for Inter-Chassis Clustering

To ensure cluster control link functionality, be sure the round-trip time (RTT) between units is less than 20 ms. This maximum latency enhances compatibility with cluster members installed at different geographical sites. To check your latency, perform a ping on the cluster control link between units.

The cluster control link must be reliable, with no out-of-order or dropped packets; for example, for inter-site deployment, you should use a dedicated link.

## Cluster Control Link Network

The Firepower 4100/9300 chassis auto-generates the cluster control link interface IP address for each unit based on the chassis ID and slot ID: `127.2.chassis_id.slot_id`. For multi-instance clusters, which typically use different VLAN subinterfaces of the same EtherChannel, the same IP address can be used for different clusters because of VLAN separation. The cluster control link network cannot include any routers between units; only Layer 2 switching is allowed.

## Management Network

We recommend connecting all units to a single management network. This network is separate from the cluster control link.

## Management Interface

You must assign a Management type interface to the cluster. This interface is a special individual interface as opposed to a Spanned interface. The management interface lets you connect directly to each unit. This Management logical interface is separate from the other interfaces on the device. It is used to set up and register the device to the Secure Firewall Management Center. It uses its own local authentication, IP address, and static routing. Each cluster member uses a separate IP address on the management network that you set as part of the bootstrap configuration.

## Cluster Interfaces

For a cluster isolated to security modules within one Firepower 9300 chassis, you can assign both physical interfaces or EtherChannels (also known as port channels) to the cluster. Interfaces assigned to the cluster are Spanned interfaces that load-balance traffic across all members of the cluster.

For clustering with multiple chassis, you can only assign data EtherChannels to the cluster. These Spanned EtherChannels include the same member interfaces on each chassis; on the upstream switch, all of these interfaces are included in a single EtherChannel, so the switch does not know that it is connected to multiple devices.

You can use regular firewall interfaces or IPS-only interfaces (inline sets or passive interfaces).

Individual interfaces are not supported, with the exception of a management interface.

## Spanned EtherChannels

You can group one or more interfaces per chassis into an EtherChannel that spans all chassis in the cluster. The EtherChannel aggregates the traffic across all the available active interfaces in the channel.

For regular firewall interfaces: A Spanned EtherChannel can be configured in both routed and transparent firewall modes. In routed mode, the EtherChannel is configured as a routed interface with a single IP address. In transparent mode, the IP address is assigned to the BVI, not to the bridge group member interface.

The EtherChannel inherently provides load balancing as part of basic operation.

For multi-instance clusters, each cluster requires dedicated data EtherChannels; you cannot use shared interfaces or VLAN subinterfaces.

## Configuration Replication

All nodes in the cluster share a single configuration. You can only make configuration changes on the control node (with the exception of the bootstrap configuration), and changes are automatically synced to all other nodes in the cluster.

## Licenses for Clustering

You assign feature licenses to the cluster as a whole, not to individual nodes. However, each node of the cluster consumes a separate license for each feature. The clustering feature itself does not require any licenses.

When you add a cluster node to the management center, you can specify the feature licenses you want to use for the cluster. You can modify licenses for the cluster in the **Devices > Device Management > Cluster > License** area.

---

**Note** If you add the cluster before the management center is licensed (and running in Evaluation mode), then when you license the management center, you can experience traffic disruption when you deploy policy changes to the cluster. Changing to licensed mode causes all data units to leave the cluster and then rejoin.

---

## Requirements and Prerequisites for Clustering

### Cluster Model Support

The Threat Defense supports clustering on the following models:

- Firepower 9300— You can include up to 16 nodes in the cluster. For example, you can use 1 module in 16 chassis, or 2 modules in 8 chassis, or any combination that provides a maximum of 16 modules. Supports clustering with multiple chassis and clustering isolated to security modules within one chassis.
- Firepower 4100—Supported for up to 16 nodes using clustering with multiple chassis.

### User Roles

- Admin
- Access Admin
- Network Admin

### Clustering Hardware and Software Requirements

All chassis in a cluster:

- Native instance clustering—For the Firepower 4100: All chassis must be the same model. For the Firepower 9300: All security modules must be the same type. For example, if you use clustering, all modules in the Firepower 9300 must be SM-40s. You can have different quantities of installed security modules in each chassis, although all modules present in the chassis must belong to the cluster including any empty slots.
- Container instance clustering—We recommend that you use the same security module or chassis model for each cluster instance. However, you can mix and match container instances on different Firepower 9300 security module types or Firepower 4100 models in the same cluster if required. You cannot mix Firepower 9300 and 4100 instances in the same cluster. For example, you can create a cluster using an instance on a Firepower 9300 SM-56, SM-48, and SM-40. Or you can create a cluster on a Firepower 4145 and a 4125.

- Must run the identical FXOS and application software except at the time of an image upgrade. Mismatched software versions can lead to poor performance, so be sure to upgrade all nodes in the same maintenance window.
- Must include the same interface configuration for interfaces you assign to the cluster, such as the same Management interface, EtherChannels, active interfaces, speed and duplex, and so on. You can use different network module types on the chassis as long as the capacity matches for the same interface IDs and interfaces can successfully bundle in the same spanned EtherChannel. Note that all data interfaces must be EtherChannels in clusters with multiple chassis. If you change the interfaces in FXOS after you enable clustering (by adding or removing interface modules, or configuring EtherChannels, for example), then perform the same changes on each chassis, starting with the data nodes, and ending with the control node.
- Must use the same NTP server. For threat defense, the management center must also use the same NTP server. Do not set the time manually.

**Multi-Instance Clustering Requirements**

- No intra-security-module/engine clustering—For a given cluster, you can only use a single container instance per security module/engine. You cannot add 2 container instances to the same cluster if they are running on the same module.

- Mix and match clusters and standalone instances—Not all container instances on a security module/engine need to belong to a cluster. You can use some instances as standalone or High Availability nodes. You can also create multiple clusters using separate instances on the same security module/engine.

- All 3 modules in a Firepower 9300 must belong to the cluster—For the Firepower 9300, a cluster requires a single container instance on all 3 modules. You cannot create a cluster using instances on module 1 and 2, and then use a native instance on module 3, or example.

- Match resource profiles—We recommend that each node in the cluster use the same resource profile attributes; however, mismatched resources are allowed when changing cluster nodes to a different resource profile, or when using different models.
- Dedicated cluster control link—For clusters with multiple chassis, each cluster needs a dedicated cluster control link. For example, each cluster can use a separate subinterface on the same cluster-type EtherChannel, or use separate EtherChannels.

- No shared interfaces—Shared-type interfaces are not supported with clustering. However, the same Management and Eventing interfaces can be used by multiple clusters.
- No subinterfaces—A multi-instance cluster cannot use FXOS-defined VLAN subinterfaces. An exception is made for the cluster control link, which can use a subinterface of the Cluster EtherChannel.
- Mix chassis models—We recommend that you use the same security module or chassis model for each cluster instance. However, you can mix and match container instances on different Firepower 9300

security module types or Firepower 4100 models in the same cluster if required. You cannot mix Firepower 9300 and 4100 instances in the same cluster. For example, you can create a cluster using an instance on a Firepower 9300 SM-56, SM-48, and SM-40. Or you can create a cluster on a Firepower 4145 and a 4125.

- Maximum 6 nodes—You can use up to six container instances in a cluster.

### Switch Requirements

- Be sure to complete the switch configuration and successfully connect all the EtherChannels from the chassis to the switch(es) before you configure clustering on the Firepower 4100/9300 chassis.
- For supported switch characteristics, see [Cisco FXOS Compatibility](#).

## Clustering Guidelines and Limitations

### Switches for Clustering

- Make sure connected switches match the MTU for both cluster data interfaces and the cluster control link interface. You should configure the cluster control link interface MTU to be at least 100 bytes higher than the data interface MTU, so make sure to configure the cluster control link connecting switch appropriately. Because the cluster control link traffic includes data packet forwarding, the cluster control link needs to accommodate the entire size of a data packet plus cluster traffic overhead. In addition, we do not recommend setting the cluster control link MTU between 2561 and 8362; due to block pool handling, this MTU size is not optimal for system operation.
- For Cisco IOS XR systems, if you want to set a non-default MTU, set the IOS XR interface MTU to be 14 bytes higher than the cluster device MTU. Otherwise, OSPF adjacency peering attempts may fail unless the **mtu-ignore** option is used. Note that the cluster device MTU should match the IOS XR IPv4 MTU. This adjustment is not required for Cisco Catalyst and Cisco Nexus switches.

- On the switch(es) for the cluster control link interfaces, you can optionally enable Spanning Tree PortFast on the switch ports connected to the cluster unit to speed up the join process for new units.
- On the switch, we recommend that you use one of the following EtherChannel load-balancing algorithms: **source-dest-ip** or **source-dest-ip-port** (see the Cisco Nexus OS and Cisco IOS-XE **port-channel load-balance** command). Do not use a **vlan** keyword in the load-balance algorithm because it can cause unevenly distributed traffic to the devices in a cluster.
- If you change the load-balancing algorithm of the EtherChannel on the switch, the EtherChannel interface on the switch temporarily stops forwarding traffic, and the Spanning Tree Protocol restarts. There will be a delay before traffic starts flowing again.
- Switches on the cluster control link path should not verify the L4 checksum. Redirected traffic over the cluster control link does not have a correct L4 checksum. Switches that verify the L4 checksum could cause traffic to be dropped.
- Port-channel bundling downtime should not exceed the configured keepalive interval.
- On Supervisor 2T EtherChannels, the default hash distribution algorithm is adaptive. To avoid asymmetric traffic in a VSS design, change the hash algorithm on the port-channel connected to the cluster device to fixed:
 

```
router(config)# port-channel id hash-distribution fixed
```

Do not change the algorithm globally; you may want to take advantage of the adaptive algorithm for the VSS peer link.
- Firepower 4100/9300 clusters support LACP graceful convergence. So you can leave LACP graceful convergence enabled on connected Cisco Nexus switches.
- When you see slow bundling of a Spanned EtherChannel on the switch, you can enable LACP rate fast for an individual interface on the switch. FXOS EtherChannels have the LACP rate set to fast by default. Note that some switches, such as the Nexus series, do not support LACP rate fast when performing in-service software upgrades (ISSUs), so we do not recommend using ISSUs with clustering.

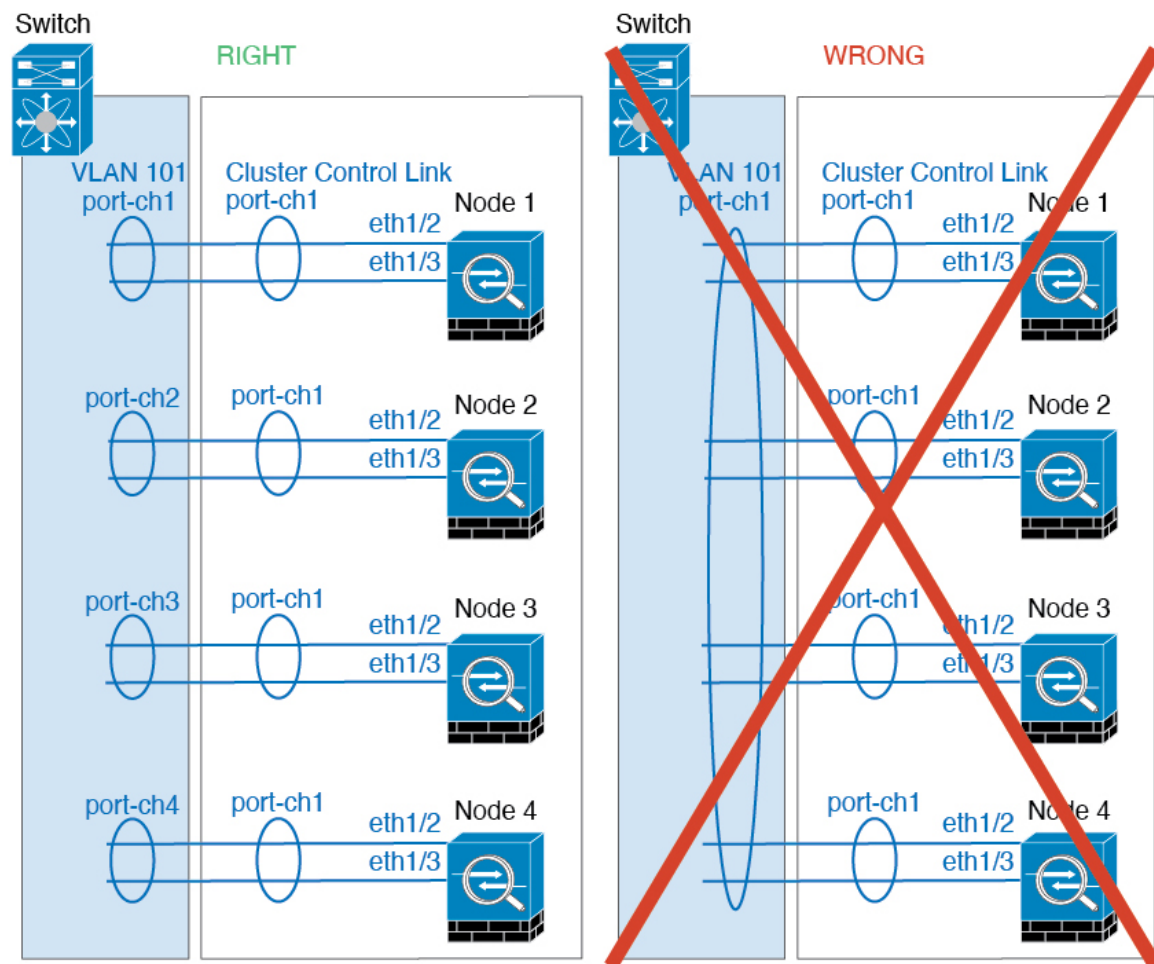

### EtherChannels for Clustering

- In Catalyst 3750-X Cisco IOS software versions earlier than 15.1(1)S2, the cluster unit did not support connecting an EtherChannel to a switch stack. With default switch settings, if the cluster unit EtherChannel is connected cross stack, and if the control unit switch is powered down, then the EtherChannel connected to the remaining switch will not come up. To improve compatibility, set the **stack-mac persistent timer** command to a large enough value to account for reload time; for example, 8 minutes or 0 for indefinite. Or, you can upgrade to more a more stable switch software version, such as 15.1(1)S2.
- Spanned vs. Device-Local EtherChannel Configuration—Be sure to configure the switch appropriately for Spanned EtherChannels vs. Device-local EtherChannels.
  - Spanned EtherChannels—For cluster unit *Spanned* EtherChannels, which span across all members of the cluster, the interfaces are combined into a single EtherChannel on the switch. Make sure each interface is in the same channel group on the switch.

- Device-local EtherChannels—For cluster unit *Device-local* EtherChannels including any EtherChannels configured for the cluster control link, be sure to configure discrete EtherChannels on the switch; do not combine multiple cluster unit EtherChannels into one EtherChannel on the switch.

### Additional Guidelines

- When significant topology changes occur (such as adding or removing an EtherChannel interface, enabling or disabling an interface on the Firepower 4100/9300 chassis or the switch, adding an additional switch to form a VSS, vPC, StackWise, or StackWise Virtual) you should disable the health check feature, and also disable interface monitoring for the disabled interfaces. When the topology change is complete, and the configuration change is synced to all units, you can re-enable the health check feature.
- When adding a unit to an existing cluster, or when reloading a unit, there will be a temporary, limited packet/connection drop; this is expected behavior. In some cases, the dropped packets can hang connections; for example, dropping a FIN/ACK packet for an FTP connection will make the FTP client hang. In this case, you need to reestablish the FTP connection.
- If you use a Windows 2003 server connected to a Spanned EtherChannel interface, when the syslog server port is down, and the server does not throttle ICMP error messages, then large numbers of ICMP messages are sent back to the cluster. These messages can result in some units of the cluster experiencing high CPU, which can affect performance. We recommend that you throttle ICMP error messages.
- We recommend connecting EtherChannels to a VSS, vPC, StackWise, or StackWise Virtual for redundancy.

- Within a chassis, you cannot cluster some security modules and run other security modules in standalone mode; you must include all security modules in the cluster.
- For decrypted TLS/SSL connections, the decryption states are not synchronized, and if the connection owner fails, then decrypted connections will be reset. New connections will need to be established to a new unit. Connections that are not decrypted (they match a do-not-decrypt rule) are not affected and are replicated correctly.

### Defaults

- The cluster health check feature is enabled by default with the holdtime of 3 seconds. Interface health monitoring is enabled on all interfaces by default.
- The cluster auto-rejoin feature for a failed cluster control link is set to unlimited attempts every 5 minutes.
- The cluster auto-rejoin feature for a failed data interface is set to 3 attempts every 5 minutes, with the increasing interval set to 2.
- Connection replication delay of 5 seconds is enabled by default for HTTP traffic.

## Configure Clustering

You can easily deploy the cluster from the Firepower 4100/9300 supervisor. All initial configuration is automatically generated for each unit. You can then add the units to the management center and group them into a cluster.

### FXOS: Add a Threat Defense Cluster

In native mode: You can add a cluster to a single Firepower 9300 chassis that is isolated to security modules within the chassis, or you can use multiple chassis.

In multi-instance mode: You can add one or more clusters to a single Firepower 9300 chassis that are isolated to security modules within the chassis (you must include an instance on each module), or add one or more clusters on multiple chassis.

For clusters on multiple chassis, you must configure each chassis separately. Add the cluster on one chassis; you can then

### Create a Threat Defense Cluster

You can easily deploy the cluster from the Firepower 4100/9300 chassis supervisor. All initial configuration is automatically generated for each unit.

For clustering on multiple chassis, you must configure each chassis separately. Deploy the cluster on one chassis; you can then copy the bootstrap configuration from the first chassis to the next chassis for ease of deployment.

In a Firepower 9300 chassis, you must enable clustering for all 3 module slots, or for container instances, a container instance in each slot, even if you do not have a module installed. If you do not configure all 3 modules, the cluster will not come up.

### Before you begin

- Download the application image you want to use for the logical device from Cisco.com, and then upload that image to the Firepower 4100/9300 chassis.
- For container instances, if you do not want to use the default profile, add a resource profile according to [Add a Resource Profile for Container Instances, on page 538](#).
- For container instances, before you can install a container instance for the first time, you must reinitialize the security module/engine so that the disk has the correct formatting. An existing logical device will be deleted and then reinstalled as a new device, losing any local application configuration. If you are replacing a native instance with container instances, you will need to delete the native instance in any case. You cannot automatically migrate a native instance to a container instance.
- Gather the following information:
  - Management interface ID, IP addresses, and network mask
  - Gateway IP address
  - management center IP address and/or NAT ID of your choosing
  - DNS server IP address
  - Threat Defense hostname and domain name

### Procedure

---

Configure interfaces.

- a) Add at least one Data type interface or EtherChannel (also known as a port-channel) before you deploy the cluster. See [Add an EtherChannel \(Port Channel\), on page 537](#) or [Configure a Physical Interface, on page 536](#).

For clustering on multiple chassis, all data interfaces must be Spanned EtherChannels with at least one member interface. Add the same EtherChannels on each chassis. Combine the member interfaces from all cluster units into a single EtherChannel on the switch. See [Clustering Guidelines and Limitations, on page 853](#) for more information about EtherChannels.

For multi-instance clustering, you cannot use FXOS-defined VLAN subinterfaces or data-sharing interfaces in the cluster. Only application-defined subinterfaces are supported. See [FXOS Interfaces vs. Application Interfaces, on page 506](#) for more information.

- b) Add a Management type interface or EtherChannel. See [Add an EtherChannel \(Port Channel\), on page 537](#) or [Configure a Physical Interface, on page 536](#).

The management interface is required. Note that this management interface is not the same as the chassis management interface that is used only for chassis management (in FXOS, you might see the chassis management interface displayed as MGMT, management0, or other similar names).

For clustering on multiple chassis, add the same Management interface on each chassis.

For multi-instance clustering, you can share the same management interface across multiple clusters on the same chassis, or with standalone instances.

- c) For clustering on multiple chassis, add a member interface to the cluster control link EtherChannel (by default, port-channel 48). See [Add an EtherChannel \(Port Channel\), on page 537](#).

Do not add a member interface for a cluster isolated to security modules within one Firepower 9300 chassis. If you add a member, the chassis assumes this cluster will be using multiple chassis, and will only allow you to use Spanned EtherChannels, for example.

Add the same member interfaces on each chassis. The cluster control link is a device-local EtherChannel on each chassis. Use separate EtherChannels on the switch per device. See [Clustering Guidelines and Limitations, on page 853](#) for more information about EtherChannels.

For multi-instance clustering, you can create additional Cluster type EtherChannels. Unlike the Management interface, the cluster control link is *not* sharable across multiple devices, so you will need a Cluster interface for each cluster. However, we recommend using VLAN subinterfaces instead of multiple EtherChannels; see the next step to add a VLAN subinterface to the Cluster interface.

- d) For multi-instance clustering, add VLAN subinterfaces to the cluster EtherChannel so you have a subinterface for each cluster. See [Add a VLAN Subinterface for Container Instances, on page 537](#).

If you add subinterfaces to a Cluster interface, you cannot use that interface for a native cluster.

- e) (Optional) Add an eventing interface. See [Add an EtherChannel \(Port Channel\), on page 537](#) or [Configure a Physical Interface, on page 536](#).

This interface is a secondary management interface for the threat defense devices. To use this interface, you must configure its IP address and other parameters at the threat defense CLI. For example, you can separate management traffic from events (such as web events). See the **configure network** commands in the threat defense command reference.

For clustering on multiple chassis, add the same eventing interface on each chassis.

---

## Add More Cluster Nodes

Add or replace the threat defense cluster node in an existing cluster. When you add a new cluster node in FXOS, the management center adds the node automatically.

---

**Note** The FXOS steps in this procedure only apply to adding a new *chassis*; if you are adding a new module to a Firepower 9300 where clustering is already enabled, the module will be added automatically.

---

### Before you begin

- In the case of a replacement, you must delete the old cluster node from the management center. When you replace it with a new node, it is considered to be a new device on the management center.
- The interface configuration must be the same on the new chassis. You can export and import FXOS chassis configuration to make this process easier.

## Management Center: Add a Cluster

Add one of the cluster units as a new device to the Secure Firewall Management Center; the management center auto-detects all other cluster members.

### Before you begin

- All cluster units must be in a successfully-formed cluster on FXOS prior to adding the cluster to the management center. You should also check which unit is the control unit. Refer to the chassis manager **Logical Devices** screen or use the threat defense **show cluster info** command.

### Procedure

---

- Step 1** In the management center, choose **Devices > Device Management**, and then choose **Add > Add Device** to add the control unit using the unit's management IP address you assigned when you deployed the cluster.

Figure 246: Add Device

Add Device
?

---

CDO Managed Device

Host:†

Display Name:

Registration Key: \*

Group:

Access Control Policy: \*

**Smart Licensing**  
 Note: All virtual Firewall Threat Defense devices require a performance tier license. Make sure your Smart Licensing account contains the available licenses you need. It's important to choose the tier that matches the license you have in your account. Click [here](#) for information about the Firewall Threat Defense performance-tiered licensing. Until you choose a tier, your Firewall Threat Defense virtual defaults to the FTDv50 selection.

Performance Tier (only for Firewall Threat Defense virtual 7.0 and above):

Malware  
 Threat  
 URL Filtering

Advanced

Unique NAT ID: †

Transfer Packets

- a) In the **Host** field, enter the IP address or hostname of the control unit.  
 We recommend adding the control unit for the best performance, but you can add any unit of the cluster. If you used a NAT ID during device setup, you may not need to enter this field.
- b) In the **Display Name** field, enter a name for the control unit as you want it to display in the management center.  
 This display name is not for the cluster; it is only for the control unit you are adding. You can later change the name of other cluster members and the cluster display name.
- c) In the **Registration Key** field, enter the same registration key that you used when you deployed the cluster in FXOS. The registration key is a one-time-use shared secret.

- d) (Optional) Add the device to a device **Group**.
- e) Choose an initial **Access Control Policy** to deploy to the device upon registration, or create a new policy.  
If you create a new policy, you create a basic policy only. You can later customize the policy as needed.

### New Policy

Name:

Description:

Select Base Policy:

Default Action:  
 Block all traffic  
 Intrusion Prevention  
 Network Discovery

Snort3:

- f) Choose licenses to apply to the device.
- g) If you used a NAT ID during device setup, expand the **Advanced** section and enter the same NAT ID in the **Unique NAT ID** field.
- h) Check the **Transfer Packets** check box to allow the device to transfer packets to the management center.  
This option is enabled by default. When events like IPS or Snort are triggered with this option enabled, the device sends event metadata information and packet data to the management center for inspection. If you disable it, only event information will be sent to the management center but packet data is not sent.
- i) Click **Register**.

The management center identifies and registers the control unit, and then registers all data units. If the control unit does not successfully register, then the cluster is not added. A registration failure can occur if the cluster was not up on the chassis, or because of other connectivity issues. In this case, we recommend that you try re-adding the cluster unit.

The cluster name shows on the **Devices > Device Management** page; expand the cluster to see the cluster units.

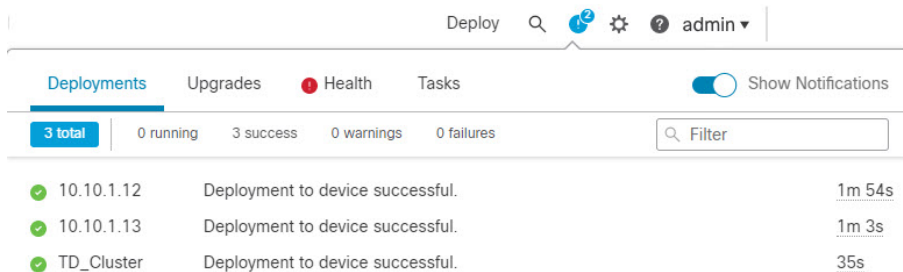

| <input type="checkbox"/>            | Name                                                                                                    | Model           | Versi... | Chassis | Licenses   | Access Control Policy | Auto RollBack |     |

| <input type="checkbox"/>            | <span style="color: green;">●</span> 10.10.1.12 <small>Snort 3</small><br>10.10.1.12 - Routed           | FTDv for VMware | 7.3.0    | N/A     | Essentials | wfx_automation1       | ↶             | ✎ ⋮ |
| <input type="checkbox"/>            | ▼ TD_Cluster (1)<br>Cluster                                                                             |                 |          |         |            |                       |               | ✎ ⋮ |
| <input checked="" type="checkbox"/> | <span style="color: green;">●</span> 10.10.1.13 (Control) <small>Snort 3</small><br>10.10.1.13 - Routed | FTDv for VMware | 7.3.0    | N/A     | Essentials | wfx_automation1       | N/A           | ⋮   |

A unit that is currently registering shows the loading icon.

You can monitor cluster unit registration by clicking the **Notifications** icon and choosing **Tasks**. The management center updates the Cluster Registration task as each unit registers. If any units fail to register, see [Reconcile Cluster Members, on page 878](#).

**Step 2** Configure device-specific settings by clicking the **Edit** (✎) for the cluster.

Most configuration can be applied to the cluster as a whole, and not member units in the cluster. For example, you can change the display name per unit, but you can only configure interfaces for the whole cluster.

**Step 3** On the **Devices > Device Management > Cluster** screen, you see **General, License, System, and Health** settings.

See the following cluster-specific items:

- **General > Name**—Change the cluster display name by clicking the **Edit** (✎).

| Cluster                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | Device                               | Routing | Interfaces | Inline Sets | DHCP | VTEP |                                           |            |                   |     |         |                                      |          |            |                      |                      |

- **License**—Click **Edit** () to set license entitlements.

**Step 4** On the **Devices > Device Management > Devices**, you can choose each member in the cluster from the top right drop-down menu and configure the following settings.

- **General > Name**—Change the cluster member display name by clicking the **Edit** ()

**General**   

Name: 10.89.5.21

Transfer Packets: Yes

Mode: routed

Compliance Mode: None

TLS Crypto Acceleration: Enabled

Then set the **Name** field.

Host: 10.89.5.20

Status: ✓

## Management Center: Configure Cluster, Data Interfaces

This procedure configures basic parameters for each data interface that you assigned to the cluster when you deployed it in FXOS. For clustering on multiple chassis, data interfaces are always Spanned EtherChannel interfaces. For the cluster control link interface for a cluster isolated to security modules within one Firepower 9300 chassis, you must increase the MTU from the default.

**Note** When using Spanned EtherChannels for clustering on multiple chassis, the port-channel interface will not come up until clustering is fully enabled. This requirement prevents traffic from being forwarded to a unit that is not an active unit in the cluster.

## Procedure

**Step 1** Choose **Devices > Device Management**, and click **Edit** (✎) next to the cluster.

**Step 2** Click **Interfaces**.

**Step 3** Configure the cluster control link.

For clustering on multiple chassis, set the cluster control link MTU to be at least 100 bytes higher than the highest MTU of the data interfaces. Because the cluster control link traffic includes data packet forwarding, the cluster control link needs to accommodate the entire size of a data packet plus cluster traffic overhead. We suggest setting the MTU to the maximum of 9184; the minimum value is 1400 bytes. For example, because the maximum MTU is 9184, then the highest data interface MTU can be 9084, while the cluster control link can be set to 9184.

For native clusters: The cluster control link interface is Port-Channel48 by default. If you don't know which interface is the cluster control link, check the FXOS configuration for chassis for the Cluster-type interface assigned to the cluster.

- a) Click **Edit** (✎) for the cluster control link interface.
- b) On the **General** page, in the **MTU** field, enter a value between 1400 and 9184 but not between 2561 and 8362. Due to block pool handling, this MTU size is not optimal for system operation. We suggest using the maximum, 9184.
- c) Click **OK**.

**Step 4** Configure data interfaces.

- a) (Optional) For regular firewall interfaces, configure VLAN subinterfaces on the data interface. The rest of this procedure applies to the subinterfaces. See [Add a Subinterface, on page 967](#).
- b) Click **Edit** (✎) for the data interface.
- c) Configure the name and other parameters. For regular firewall interfaces, see [Configure Routed Mode Interfaces, on page 985](#) or, for transparent mode, [Configure Bridge Group Interfaces, on page 990](#). For IPS-only interfaces, see [Inline Sets and Passive Interfaces, on page 1023](#).

**Note** If the cluster control link interface MTU is not at least 100 bytes higher than the data interface MTU, you will see an error that you must reduce the MTU of the data interface. See, [Step 3, on page 867](#) to increase the cluster control link MTU, after which you can continue configuring the data interfaces.

- d) For clustering on multiple chassis, set a manual global MAC address for the EtherChannel. Click **Advanced**, and in the **Active Mac Address** field, enter a MAC address in H.H.H format, where H is a 16-bit hexadecimal digit.

For example, the MAC address 00-0C-F1-42-4C-DE would be entered as 000C.F142.4CDE. The MAC address must not have the multicast bit set, that is, the second hexadecimal digit from the left cannot be an odd number.

Do not set the **Standby Mac Address**; it is ignored.

You must configure a MAC address for a Spanned EtherChannel to avoid potential network connectivity problems. With a manually-configured MAC address, the MAC address stays with the current control unit. If you do not configure a MAC address, then if the control unit changes, the new control unit uses a new MAC address for the interface, which can cause a temporary network outage.

e) Click **OK**. Repeat the above steps for other data interfaces.

**Step 5** Click **Save**.

You can now go to **Deploy > Deployment** and deploy the policy to assigned devices. The changes are not active until you deploy them.

## Management Center: Configure Cluster Health Monitor Settings

The **Cluster Health Monitor Settings** section of the **Cluster** page displays the settings described in the table below.

*Figure 247: Cluster Health Monitor Settings*

| Cluster Health Monitor Settings  |          |                           |                    |

| Field                   | Description                                                                                                                                                                                                                                                                                                                   |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Timeouts</b>         |                                                                                                                                                                                                                                                                                                                               |
| Hold Time               | Between .3 and 45 seconds; The default is 3 seconds. To determine node system health, the cluster nodes send heartbeat messages on the cluster control link to other nodes. If a node does not receive any heartbeat messages from a peer node within the hold time period, the peer node is considered unresponsive or dead. |
| Interface Debounce Time | Between 300 and 9000 ms. The default is 500 ms. The interface debounce time is the amount of time before the node considers an interface to be failed, and the node is removed from the cluster.                                                                                                                              |

| Field                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                               |
|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Monitored Interfaces</b>      | The interface health check monitors for link failures. If all physical ports for a given logical interface fail on a particular node, but there are active ports under the same logical interface on other nodes, then the node is removed from the cluster. The amount of time before the node removes a member from the cluster depends on the type of interface and whether the node is an established node or is joining the cluster. |
| Service Application              | Shows whether the Snort and disk-full processes are monitored.                                                                                                                                                                                                                                                                                                                                                                            |
| Unmonitored Interfaces           | Shows unmonitored interfaces.                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Auto-Rejoin Settings</b>      |                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Cluster Interface                | Shows the auto-rejoin settings after a cluster control link failure.                                                                                                                                                                                                                                                                                                                                                                      |
| <i>Attempts</i>                  | Between -1 and 65535. The default is -1 (unlimited). Sets the number of rejoin attempts.                                                                                                                                                                                                                                                                                                                                                  |
| <i>Interval Between Attempts</i> | Between 2 and 60. The default is 5 minutes. Defines the interval duration in minutes between rejoin attempts.                                                                                                                                                                                                                                                                                                                             |
| <i>Interval Variation</i>        | Between 1 and 3. The default is 1x the interval duration. Defines if the interval duration increases at each attempt.                                                                                                                                                                                                                                                                                                                     |
| Data Interfaces                  | Shows the auto-rejoin settings after a data interface failure.                                                                                                                                                                                                                                                                                                                                                                            |
| <i>Attempts</i>                  | Between -1 and 65535. The default is 3. Sets the number of rejoin attempts.                                                                                                                                                                                                                                                                                                                                                               |
| <i>Interval Between Attempts</i> | Between 2 and 60. The default is 5 minutes. Defines the interval duration in minutes between rejoin attempts.                                                                                                                                                                                                                                                                                                                             |
| <i>Interval Variation</i>        | Between 1 and 3. The default is 2x the interval duration. Defines if the interval duration increases at each attempt.                                                                                                                                                                                                                                                                                                                     |
| System                           | Shows the auto-rejoin settings after internal errors. Internal failures include: application sync timeout; inconsistent application statuses; and so on.                                                                                                                                                                                                                                                                                  |
| <i>Attempts</i>                  | Between -1 and 65535. The default is 3. Sets the number of rejoin attempts.                                                                                                                                                                                                                                                                                                                                                               |
| <i>Interval Between Attempts</i> | Between 2 and 60. The default is 5 minutes. Defines the interval duration in minutes between rejoin attempts.                                                                                                                                                                                                                                                                                                                             |
| <i>Interval Variation</i>        | Between 1 and 3. The default is 2x the interval duration. Defines if the interval duration increases at each attempt.                                                                                                                                                                                                                                                                                                                     |

**Note** If you disable the system health check, fields that do not apply when the system health check is disabled will not show.

You can change these settings from this section.

You can monitor any port-channel ID, single physical interface ID, as well as the Snort and disk-full processes. Health monitoring is not performed on VLAN subinterfaces or virtual interfaces such as VNIs or BVIs. You cannot configure monitoring for the cluster control link; it is always monitored.

## Procedure

- Step 1** Choose **Devices > Device Management**.
- Step 2** Next to the cluster you want to modify, click **Edit** (✎).
- Step 3** Click **Cluster**.
- Step 4** In the **Cluster Health Monitor Settings** section, click **Edit** (✎).
- Step 5** Disable the system health check by clicking the **Health Check** slider .

*Figure 248: Disable the System Health Check*

The screenshot shows a dialog box titled "Edit Cluster Health Monitor Settings". At the top right is a close button (X). Below the title bar, there is a "Health Check" section with a toggle switch that is currently turned off (grey). To the right of the toggle is a small blue circle with a white exclamation mark. Below this is a "Timeouts" section with a downward arrow. Under "Timeouts", there are two input fields: "Hold Time" with a value of "3" and a range of "0.3 to 45 seconds"; and "Interface Debounce Time" with a value of "9000" and a range of "300 to 9000 milliseconds". Below these are two expandable sections: "Auto-Rejoin Settings" and "Monitored Interfaces", each with a rightward arrow. At the bottom of the dialog, there are three buttons: "Reset to Defaults" (blue text), "Cancel" (blue text), and "Save" (white text on a blue button).

When any topology changes occur (such as adding or removing a data interface, enabling or disabling an interface on the node or the switch, or adding an additional switch to form a VSS or vPC) you should disable the system health check feature and also disable interface monitoring for the disabled interfaces. When the topology change is complete, and the configuration change is synced to all nodes, you can re-enable the system health check feature and monitored interfaces.

- Step 6** Configure the hold time and interface debounce time.
- **Hold Time**—Set the hold time to determine the amount of time between node heartbeat status messages, between .3 and 45 seconds; The default is 3 seconds.
  - **Interface Debounce Time**—Set the debounce time between 300 and 9000 ms. The default is 500 ms. Lower values allow for faster detection of interface failures. Note that configuring a lower debounce time increases the chances of false-positives. When an interface status update occurs, the node waits the number of milliseconds specified before marking the interface as failed, and the node is removed from the cluster. In the case of an EtherChannel that transitions from a down state to an up state (for example, the switch reloaded, or the switch enabled an EtherChannel), a longer debounce time can prevent the interface from appearing to be failed on a cluster node just because another cluster node was faster at bundling the ports.

**Step 7** Customize the auto-rejoin cluster settings after a health check failure.

**Figure 249: Configure Auto-Rejoin Settings**

▼ Auto-Rejoin Settings

---

**Cluster Interface**

Attempts  *Range: 0-65535 (-1 for unlimited number of attempts)*

Interval Between Attempts  *Range: 2-60 minutes between rejoin attempts*

Interval Variation  *Range: 1-3. Defines if the interval duration increases. 1 (no change); 2 (2 x the previous duration), or 3 (3 x the previous duration).*

**Data Interface**

Attempts  *Range: 0-65535 (-1 for unlimited number of attempts)*

Interval Between Attempts  *Range: 2-60 minutes between rejoin attempts*

Interval Variation  *Range: 1-3. Defines if the interval duration increases. 1 (no change); 2 (2 x the previous duration), or 3 (3 x the previous duration).*

**System**

Attempts  *Range: 0-65535 (-1 for unlimited number of attempts)*

Interval Between Attempts  *Range: 2-60 minutes between rejoin attempts*

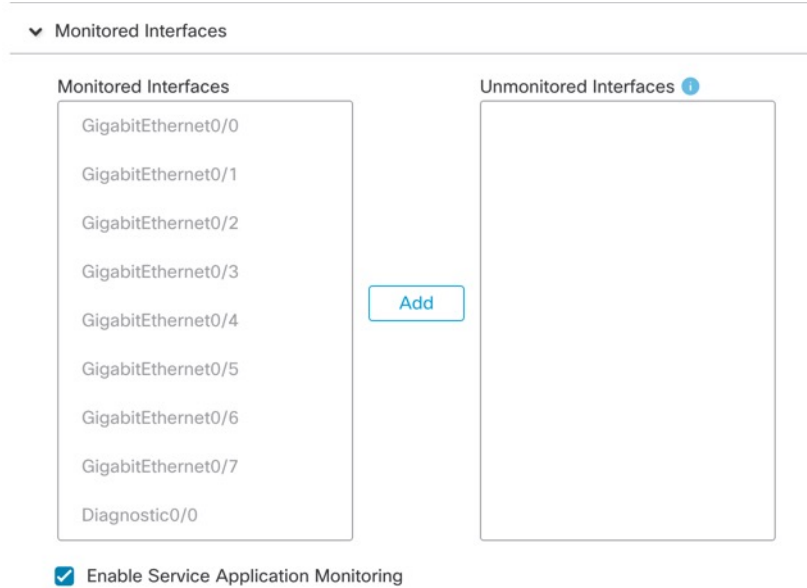

Interval Variation  *Range: 1-3. Defines if the interval duration increases. 1 (no change); 2 (2 x the previous duration), or 3 (3 x the previous duration).*

Set the following values for the **Cluster Interface**, **Data Interface**, and **System** (internal failures include: application sync timeout; inconsistent application statuses; and so on):

- **Attempts**—Sets the number of rejoin attempts, between -1 and 65535. **0** disables auto-rejoining. The default for the **Cluster Interface** is -1 (unlimited). The default for the **Data Interface** and **System** is 3.
- **Interval Between Attempts**—Defines the interval duration in minutes between rejoin attempts, between 2 and 60. The default value is 5 minutes. The maximum total time that the node attempts to rejoin the cluster is limited to 14400 minutes (10 days) from the time of last failure.
- **Interval Variation**—Defines if the interval duration increases. Set the value between 1 and 3: **1** (no change); **2** (2 x the previous duration), or **3** (3 x the previous duration). For example, if you set the interval duration to 5 minutes, and set the variation to 2, then the first attempt is after 5 minutes; the 2nd attempt is 10 minutes (2 x 5); the 3rd attempt 20 minutes (2 x 10), and so on. The default value is **1** for the **Cluster Interface** and **2** for the **Data Interface** and **System**.

**Step 8** Configure monitored interfaces by moving interfaces in the **Monitored Interfaces** or **Unmonitored Interfaces** window. You can also check or uncheck **Enable Service Application Monitoring** to enable or disable monitoring of the Snort and disk-full processes.

Figure 250: Configure Monitored Interfaces

The interface health check monitors for link failures. If all physical ports for a given logical interface fail on a particular node, but there are active ports under the same logical interface on other nodes, then the node is removed from the cluster. The amount of time before the node removes a member from the cluster depends on the type of interface and whether the node is an established node or is joining the cluster. Health check is enabled by default for all interfaces and for the Snort and disk-full processes.

You might want to disable health monitoring of non-essential interfaces.

When any topology changes occur (such as adding or removing a data interface, enabling or disabling an interface on the node or the switch, or adding an additional switch to form a VSS or vPC) you should disable the system health check feature and also disable interface monitoring for the disabled interfaces. When the topology change is complete, and the configuration change is synced to all nodes, you can re-enable the system health check feature and monitored interfaces.

**Step 9** Click **Save**.

**Step 10** Deploy configuration changes.

# FXOS: Remove a Cluster Node

The following sections describe how to remove nodes temporarily or permanently from the cluster.

### Temporary Removal

A cluster node will be automatically removed from the cluster due to a hardware or network failure, for example. This removal is temporary until the conditions are rectified, and it can rejoin the cluster. You can also manually disable clustering.

To check whether a device is currently in the cluster, check the cluster status

| Gateway   | Management Port | Status |
|-----------|-----------------|--------|
| 10.89.5.1 | Ethernet1/4     | Online |

**Attributes**

```

Cluster Operational Status : in-cluster
FIREPOWER-MGMT-IP       : 10.89.5.20
CLUSTER-ROLE            : control-node
CLUSTER-IP              : 127.2.1.1
MGMT-URL                 : https://
UUID                     : 95507f24-32aa-11ed-b9da-d0a0d37634c

```

For threat defense using the management center, you should leave the device in the management center device list so that it can resume full functionality after you reenables clustering.

- Disable clustering in the application—You can disable clustering using the application CLI. Enter the **cluster remove unit name** command to remove any node other than the one you are logged into. The bootstrap configuration remains intact, as well as the last configuration synced from the control node, so you can later re-add the node without losing your configuration. If you enter this command on a data node to remove the control node, a new control node is elected.

When a device becomes inactive, all data interfaces are shut down; only the Management interface can send and receive traffic. To resume traffic flow, re-enable clustering. The Management interface remains up using the IP address the node received from the bootstrap configuration. However if you reload, and the node is still inactive in the cluster, the Management interface is disabled.

To reenables clustering, on the threat defense enter **cluster enable**.

- Disable the application instance—
- Shut down the security module/engine—
- Shut down the chassis—

### Permanent Removal

You can permanently remove a cluster node using the following methods.

For threat defense using the management center, be sure to remove the node from the management center device list after you disable clustering on the chassis.

- Delete the logical device—
- Remove the chassis or security module from service—If you remove a device from service, you can add replacement hardware as a new node of the cluster.

# Management Center: Manage Cluster Members

After you deploy the cluster, you can change the configuration and manage cluster members.

## Add a New Cluster Member

When you add a new cluster member in FXOS, the Secure Firewall Management Center adds the member automatically.

### Before you begin

- Make sure the interface configuration is the same on the replacement unit as for the other chassis.

### Procedure

- 
- Step 1** Add the new unit to the cluster in FXOS. See the [FXOS configuration guide](#).
- Wait for the new unit to be added to the cluster. Refer to the chassis manager **Logical Devices** screen or use the threat defense **show cluster info** command to view cluster status.
- Step 2** The new cluster member is added automatically. To monitor the registration of the replacement unit, view the following:
- **Cluster Status** dialog box (which is available from the **Devices > Device Management More** (ⓘ) icon or from the **Devices > Device Management > Cluster** tab > **General** area > **Cluster Live Status** link)—A unit that is joining the cluster on the chassis shows "Joining cluster..." After it joins the cluster, the management center attempts to register it, and the status changes to "Available for Registration". After it completes registration, the status changes to "In Sync." If the registration fails, the unit will stay at "Available for Registration". In this case, force a re-registration by clicking **Reconcile**.
  - **System status > Tasks**—The management center shows all registration events and failures.
  - **Devices > Device Management**—When you expand the cluster on the devices listing page, you can see when a unit is registering when it has the loading icon to the left.
- 

## Replace a Cluster Member

You can replace a cluster member in an existing cluster. The management center auto-detects the replacement unit. However, you must manually delete the old cluster member in the management center. This procedure also applies to a unit that was reinitialized; in this case, although the hardware remains the same, it appears to be a new member.

### Before you begin

- Make sure the interface configuration is the same on the replacement unit as for other chassis.

## Procedure

- Step 1** For a new chassis, if possible, backup and restore the configuration from the old chassis in FXOS.
- If you are replacing a module in a Firepower 9300, you do not need to perform these steps.
- If you do not have a backup FXOS configuration from the old chassis, first perform the steps in [Add a New Cluster Member](#), on page 874.
- For information about all of the below steps, see the [FXOS configuration guide](#).
- Use the configuration export feature to export an XML file containing logical device and platform configuration settings for your Firepower 4100/9300 chassis.
  - Import the configuration file to the replacement chassis.
  - Accept the license agreement.
  - If necessary, upgrade the logical device application instance version to match the rest of the cluster.

- Step 2** In the management center for the old unit, choose **Devices > Device Management > More (⚙) > Delete**.

- Step 3** Confirm that you want to delete the unit.

The unit is removed from the cluster and from the management center devices list.

- Step 4** The new or reinitialized cluster member is added automatically. To monitor the registration of the replacement unit, view the following:

- Cluster Status** dialog box (**Devices > Device Management > More (⚙) icon** or **Devices > Device Management > Cluster** page > **General** area > **Cluster Live Status** link)—A unit that is joining the cluster on the chassis shows "Joining cluster..." After it joins the cluster, the management center attempts to register it, and the status changes to "Available for Registration". After it completes registration, the status changes to "In Sync." If the registration fails, the unit will stay at "Available for Registration". In this case, force a re-registration by clicking **Reconcile All**.
- System (⚙) > Tasks**—The management center shows all registration events and failures.
- Devices > Device Management**—When you expand the cluster on the devices listing page, you can see when a unit is registering when it has the loading icon to the left.

## Deactivate a Member

You may want to deactivate a member in preparation for deleting the unit, or temporarily for maintenance. This procedure is meant to temporarily deactivate a member; the unit will still appear in the management center device list.

**Note** When a unit becomes inactive, all data interfaces are shut down; only the Management interface can send and receive traffic. To resume traffic flow, reenables clustering. The Management interface remains up using the IP address the unit received from the bootstrap configuration. However if you reload, and the unit is still inactive in the cluster, the management interface is disabled. You must use the console for any further configuration.

## Procedure

**Step 1** For the unit you want to deactivate, choose **Devices > Device Management > More (⋮) > Disable Clustering**.

| Unit Name              | IP Address | Role    | Hardware                | Software | Services                                  | Interfaces                  | Status |
|------------------------|------------|---------|-------------------------|----------|-------------------------------------------|-----------------------------|--------|
| chassis1-mod1          | 10.89.5.20 | Snort 3 | Firepower 9300 with FTD | 7.3.0    | fp9300-docs.cisco.com Security Module - 1 | Essentials, IPS (3 more...) | in-out |
| chassis2-mod1(Control) | 10.89.5.11 | Snort 3 | Firepower 9300 with FTD | 7.3.0    | FP9300-2.cisco.com:4 Security Module - 1  | Essentials, IPS (3 more...) | in-out |
| chassis2-mod2          | 10.89.5.12 | Snort 3 | Firepower 9300 with FTD | 7.3.0    | FP9300-2.cisco.com:4 Security Module - 2  | Essentials, IPS (3 more...) | in-out |

You can also deactivate a unit from the **Cluster Status** dialog box (**Devices > Device Management > More (⋮) > Cluster Live Status**).

**Step 2** Confirm that you want to disable clustering on the unit.

The unit will show **(Disabled)** next to its name in the **Devices > Device Management** list.

| Unit Name      | IP Address | Role | Status     |
|----------------|------------|------|------------|
| 10.89.5.21     | 10.89.5.21 |      | (Disabled) |
| 9300-1(Master) | 10.89.5.20 |      |            |

**Step 3** To reenables clustering, see [Rejoin the Cluster, on page 876](#).

## Rejoin the Cluster

If a unit was removed from the cluster, for example for a failed interface or if you manually disabled clustering, you must manually rejoin the cluster.

## Procedure

**Step 1** For the unit you want to reactivate, choose **Devices > Device Management > More (⋮) > Enable Clustering**.

| Node Name       | Status   | IP Address | Role    | Version | Platform | Services                       | Direction | Other |
|-----------------|----------|------------|---------|---------|----------|--------------------------------|-----------|-------|
| node1(Control)  | Active   | 10.89.5.36 | Control | 7.3.0   | N/A      | Essentials, Threat (3 more...) | in-out    | N/A   |
| node2(Disabled) | Disabled | 10.89.5.44 | Data    | 7.3.0   | N/A      | Essentials, Threat (2 more...) | in-out    | N/A   |

You can also reactivate a unit from the **Cluster Status** dialog box (**Devices > Device Management > More** **> Cluster Live Status**).

**Step 2** Confirm that you want to enable clustering on the unit.

## Unregister a Data Node

If you need to permanently remove a cluster node (for example, if you remove a module on the Firepower 9300, or remove a chassis), then you should unregister it from the management center.

Do not unregister the node if it is still a healthy part of the cluster, or if you only want to disable the node temporarily. To remove it permanently from the cluster in FXOS, see [FXOS: Remove a Cluster Node, on page 872](#). If you unregister it from the management center, and it is still part of the cluster, it will continue to pass traffic, and could even become the control node—a control node that the management center can no longer manage.

### Before you begin

To manually deactivate the node, see [Deactivate a Member, on page 875](#). Before you unregister a node, the node must be inactive, either manually or because of a health failure.

### Procedure

**Step 1** Make sure the node is ready to be unregistered from the management center. On **Devices > Device Management**, make sure the node shows **(Disabled)**.

| Node Name  | Status   | IP Address | Role    |
|------------|----------|------------|---------|
| 10.89.5.21 | Disabled | 10.89.5.21 | Data    |
| 9300-1     | Master   | 10.89.5.20 | Control |

You can also view each node's status on the **Cluster Status** dialog box available from **More** . If the status is stale, click **Reconcile All** on the **Cluster Status** dialog box to force an update.

- Step 2** In the management center for the data node you want to delete, choose **Devices > Device Management > More (⋮) > Unregister**.
- Step 3** Confirm that you want to unregister the node.  
The node is removed from the cluster and from the management center devices list.
- 

## Change the Control Unit

**Caution** The best method to change the control unit is to disable clustering on the control unit, wait for a new control election, and then re-enable clustering. If you must specify the *exact* unit you want to become the control unit, use the procedure in this section. Note that for centralized features, if you force a control unit change, then all connections are dropped, and you have to re-establish the connections on the new control unit.

---

To change the control unit, perform the following steps.

### Procedure

---

- Step 1** Open the **Cluster Status** dialog box by choosing **Devices > Device Management > More (⋮) > Cluster Live Status**.  
You can also access the **Cluster Status** dialog box from **Devices > Device Management > Cluster** page > **General** area > **Cluster Live Status** link.
- Step 2** For the unit you want to become the control unit, choose **More (⋮) > Change Role to Control**.
- Step 3** You are prompted to confirm the role change. Check the checkbox, and click **OK**.
- 

## Reconcile Cluster Members

If a cluster member fails to register, you can reconcile the cluster membership from the chassis to the Secure Firewall Management Center. For example, a data unit might fail to register if the management center is occupied with certain processes, or if there is a network issue.

### Procedure

---

- Step 1** Choose **Devices > Device Management > More (⋮)** for the cluster, and then choose **Cluster Live Status** to open the **Cluster Status** dialog box.  
You can also open the **Cluster Status** dialog box from the **Devices > Device Management > Cluster** page > **General** area > **Cluster Live Status** link.
- Step 2** Click **Reconcile All**.

For more information about the cluster status, see [Management Center: Monitoring the Cluster, on page 879](#).

## Management Center: Monitoring the Cluster

You can monitor the cluster in Secure Firewall Management Center and at the threat defense CLI.

- **Cluster Status** dialog box, which is available from the **Devices > Device Management > More** (ⓘ) icon or from the **Devices > Device Management > Cluster** page > **General** area > **Cluster Live Status** link.

Cluster Status ?

Overall Status:  Clustering is disabled for 1 node(s)

Nodes details (2) Refresh Reconcile All

| Status                 | Device Name | Unit Name | Chassis URL |
|------------------------|-------------|-----------|-------------|
| In Sync                | node1       | Control   | node1       |
| Clustering is disabled | node2       | node2     | N/A         |

Summary History

Dated: 08:56:56 | 09 Sep 2022 Close

The Control unit has a graphic indicator identifying its role.

Cluster member **Status** includes the following states:

- **In Sync**.—The unit is registered with the management center.
- **Pending Registration**.—The unit is part of the cluster, but has not yet registered with the management center. If a unit fails to register, you can retry registration by clicking **Reconcile All**.

- Clustering is disabled—The unit is registered with the management center, but is an inactive member of the cluster. The clustering configuration remains intact if you intend to later re-enable it, or you can delete the unit from the cluster.
- Joining cluster...—The unit is joining the cluster on the chassis, but has not completed joining. After it joins, it will register with the management center.

For each unit, you can view the **Summary** or the **History**.

For each unit from the **More** (⋮) menu, you can perform the following status changes:

- **Disable Clustering**
- **Enable Clustering**
- **Change Role to Control**

- **System** (⚙) > **Tasks** page.

The **Tasks** page shows updates of the Cluster Registration task as each unit registers.

- **Devices** > **Device Management** > *cluster\_name*.

When you expand the cluster on the devices listing page, you can see all member units, including the control unit shown with its role next to the IP address. For units that are still registering, you can see the loading icon.

- **show cluster** {**access-list** [*acl\_name*] | **conn** [*count*] | **cpu** [*usage*] | **history** | **interface-mode** | **memory** | **resource usage** | **service-policy** | **traffic** | **xlate count**}

To view aggregated data for the entire cluster or other information, use the **show cluster** command.

- **show cluster info** [**auto-join** | **clients** | **conn-distribution** | **flow-mobility counters** | **goid** [*options*] | **health** | **incompatible-config** | **loadbalance** | **old-members** | **packet-distribution** | **trace** [*options*] | **transport** { **asp** | **cp**}]

To view cluster information, use the **show cluster info** command.

## Cluster Health Monitor Dashboard

### Cluster Health Monitor

When a threat defense is the control node of a cluster, the management center collects various metrics periodically from the device metric data collector. The cluster health monitor is comprised of the following components:

- Overview dashboard—Displays information about the cluster topology, cluster statistics, and metric charts:
  - The topology section displays a cluster's live status, the health of individual threat defense, threat defense node type (control node or data node), and the status of the device. The status of the device could be *Disabled* (when the device leaves the cluster), *Added out of box* (in a public cloud cluster, the additional nodes that do not belong to the management center), or *Normal* (ideal state of the node).

- The cluster statistics section displays current metrics of the cluster with respect to the CPU usage, memory usage, input rate, output rate, active connections, and NAT translations.

---

**Note** The CPU and memory metrics display the individual average of the data plane and snort usage.

---

- The metric charts, namely, CPU Usage, Memory Usage, Throughput, and Connections, diagrammatically display the statistics of the cluster over the specified time period.
- Load Distribution dashboard—Displays load distribution across the cluster nodes in two widgets:
  - The Distribution widget displays the average packet and connection distribution over the time range across the cluster nodes. This data depicts how the load is being distributed by the nodes. Using this widget, you can easily identify any abnormalities in the load distribution and rectify it.
  - The Node Statistics widget displays the node level metrics in table format. It displays metric data on CPU usage, memory usage, input rate, output rate, active connections, and NAT translations across the cluster nodes. This table view enables you to correlate data and easily identify any discrepancies.
- Member Performance dashboard—Displays current metrics of the cluster nodes. You can use the selector to filter the nodes and view the details of a specific node. The metric data include CPU usage, memory usage, input rate, output rate, active connections, and NAT translations.
- CCL dashboard—Displays, graphically, the cluster control link data namely, the input, and output rate.
- Troubleshooting and Links — Provides convenient links to frequently used troubleshooting topics and procedures.
- Time range—An adjustable time window to constrain the information that appears in the various cluster metrics dashboards and widgets.
- Custom Dashboard—Displays data on both cluster-wide metrics and node-level metrics. However, node selection only applies for the threat defense metrics and not for the entire cluster to which the node belongs.

## Viewing Cluster Health

You must be an Admin, Maintenance, or Security Analyst user to perform this procedure.

The cluster health monitor provides a detailed view of the health status of a cluster and its nodes. This cluster health monitor provides health status and trends of the cluster in an array of dashboards.

### Before you begin

- Ensure you have created a cluster from one or more devices in the management center.

## Procedure

**Step 1** Choose **System** (⚙) > **Health** > **Monitor**.

Use the Monitoring navigation pane to access node-specific health monitors.

**Step 2** In the device list, click **Expand** (>) and **Collapse** (v) to expand and collapse the list of managed cluster devices.

**Step 3** To view the cluster health statistics, click on the cluster name. The cluster monitor reports health and performance metrics in several predefined dashboards by default. The metrics dashboards include:

- Overview — Highlights key metrics from the other predefined dashboards, including its nodes, CPU, memory, input and output rates, connection statistics, and NAT translation information.
- Load Distribution — Traffic and packet distribution across the cluster nodes.
- Member Performance — Node-level statistics on CPU usage, memory usage, input throughput, output throughput, active connection, and NAT translation.
- CCL — Interface status and aggregate traffic statistics.

You can navigate through the various metrics dashboards by clicking on the labels. For a comprehensive list of the supported cluster metrics, see [Cisco Secure Firewall Threat Defense Health Metrics](#).

**Step 4** You can configure the time range from the drop-down in the upper-right corner. The time range can reflect a period as short as the last hour (the default) or as long as two weeks. Select **Custom** from the drop-down to configure a custom start and end date.

Click the refresh icon to set auto refresh to 5 minutes or to toggle off auto refresh.

**Step 5** Click on deployment icon for a deployment overlay on the trend graph, with respect to the selected time range.

The deployment icon indicates the number of deployments during the selected time-range. A vertical band indicates the deployment start and end time. For multiple deployments, multiple bands/lines appear. Click on the icon on top of the dotted line to view the deployment details.

**Step 6** (For node-specific health monitor) View the **Health Alerts** for the node in the alert notification at the top of page, directly to the right of the device name.

Hover your pointer over the **Health Alerts** to view the health summary of the node. The popup window shows a truncated summary of the top five health alerts. Click on the popup to open a detailed view of the health alert summary.
