CONTENTS

CHAPTER 1

Getting Started With Firepower 1

Introduction to Managed Devices	1
7000 and 8000 Series Managed Devices	2
NGIPSv	2
Cisco ASA with FirePOWER Services	2
Firepower Threat Defense	3
Firepower Threat Defense Virtual	3
Introduction to the Firepower Management Center	4
Firepower Management Center Capabilities	4
Firepower System Components	4
Redundancy and Resource Sharing	5
Network Traffic Management for 7000 & 8000 Series Devices	5
Multitenancy	6
Discovery and Identity	6
Access Control	7
SSL Inspection	7
Intrusion Detection and Prevention	7
Cisco Advanced Malware Protection and File Control	8
Application Programming Interfaces	9
The Context Menu	10
Switching Domains on the Firepower Management Center	12
Firepower Online Help and Documentation	12
Top-Level Documentation Listing Pages for FMC Deployments	12
License Statements in the Documentation	14
Supported Devices Statements in the Documentation	14
Access Statements in the Documentation	14

Firepower System IP Address Conventions 15

PART I

Your User Account 17

CHAPTER 2

Logging into the Firepower System 19

Firepower System User Accounts 19

Firepower System User Interfaces 21

Web Interface Considerations 23

Session Timeout 24

Logging Into the Firepower Management Center Web Interface 24

Logging Into the Web Interface of a 7000 or 8000 Series Device 25

Logging Into the Firepower Management Center with CAC Credentials 26

Logging Into a 7000 or 8000 Series Device with CAC Credentials 26

Logging Into the CLI on 7000/8000 Series, ASA FirePOWER, and NGIPSv Devices 27

Logging Into the Command Line Interface on Firepower Threat Defense Devices 28

Logging Out of a Firepower System Web Interface 29

CHAPTER 3

Specifying User Preferences 31

User Preferences Introduction 31

Changing Your Password 31

Changing an Expired Password 32

Specifying Your Home Page 32

Configuring Event View Settings 33

Event View Preferences 33

File Download Preferences 34

Default Time Windows 35

Default Workflows 37

Setting Your Default Time Zone 37

Specifying Your Default Dashboard 37

PART II

Firepower System Management 39

CHAPTER 4

Firepower System User Management 41

User Roles 41

Predefined User Roles	42
Custom User Roles	43
Example: Custom User Roles and Access Control	44
User Account Privileges	44
Overview Menu	44
Analysis Menu	45
Policies Menu	49
Devices Menu	51
Object Manager Menu	52
Cisco AMP	52
Deploy Configuration to Devices	52
System Menu	52
Help Menu	54
Managing User Roles	54
Activating and Deactivating User Roles	55
Creating Custom User Roles	56
Copying User Roles	57
Editing Custom User Roles	58
User Role Escalation	58
Setting the Escalation Target Role	59
Configuring a Custom User Role for Escalation	59
Escalating Your User Role	60
User Accounts	60
Managing User Accounts	61
Creating a User Account	61
Editing a User Account	62
Assigning User Roles in Multiple Domains	63
Converting a User from Internal to External Authentication	63
User Account Login Options	64
Command Line Access Levels	65
Firepower System User Authentication	66
Internal Authentication	67
External Authentication	68
LDAP Authentication	69

Required Information for Creating LDAP Authentication Objects	69
CAC Authentication	71
Configuring CAC Authentication	71
Creating Basic LDAP Authentication Objects	73
Creating Advanced LDAP Authentication Objects	75
LDAP Authentication Server Fields	78
Identifying the LDAP Authentication Server	79
LDAP-Specific Fields	80
Configuring LDAP-Specific Parameters	82
LDAP Group Fields	84
Configuring Access Rights by Group	85
LDAP Shell Access Fields	86
Configuring LDAP Shell Access	87
Testing LDAP Authentication Connections	88
Troubleshooting LDAP Authentication Connections	89
RADIUS Authentication	90
Creating RADIUS Authentication Objects	91
Configuring RADIUS Connection Settings	93
Configuring RADIUS User Roles	95
Configuring RADIUS Shell Access	96
Defining Custom RADIUS Attributes	97
Testing RADIUS Authentication Connections	98
Single Sign-on (SSO)	99
Configuring SSO	99

CHAPTER 5
Licensing the Firepower System 101

About Firepower Licenses	101
Requirements and Prerequisites for Licensing	102
License Requirements for Firepower Management Center	102
Firepower Management Center Virtual Licenses	102
Evaluation License Caveats	102
Smart vs. Classic Licenses	103
License Firepower Threat Defense Devices (FTD)	103
Smart Software Manager (CSSM)	104

Periodic Communication with the License Authority	104
Service Subscriptions for FTD Features	104
FTD License Types and Restrictions	105
Base Licenses	106
Malware Licenses for Firepower Threat Defense Devices	107
Threat Licenses	107
URL Filtering Licenses for Firepower Threat Defense Devices	108
Licensing for Export-Controlled Functionality	108
Licensing for FTD Clusters	109
Create a Smart Account to Hold Your Licenses	109
How to Configure Smart Licensing with Direct Internet Access	110
Obtain a Product License Registration Token for Smart Licensing	111
Register Smart Licenses	112
Smart Software Manager On-Prem Overview	113
How to Deploy Smart Software Manager On-Prem	113
Assign Licenses to Multiple Managed Devices	114
View FTD Licenses and License Status	115
FTD License Status	116
Move or Remove Licenses from FTD Devices	117
Transfer FTD Licenses to a Different Firepower Management Center	118
If FTD License Status is Out of Compliance	118
Deregister a Firepower Management Center from the Cisco Smart Software Manager	118
Synchronize a Firepower Management Center with the Cisco Smart Software Manager	119
Troubleshoot FTD Licensing	119
License Classic Devices (Firepower 7000/8000 Series, ASA FirePOWER, and NGIPSv)	120
Product License Registration Portal	120
Service Subscriptions for Firepower Features (Classic Licensing)	120
Classic License Types and Restrictions	121
Protection Licenses	122
Control Licenses	123
URL Filtering Licenses for Classic Devices	124
Malware Licenses for Classic Devices	124
VPN Licenses for 7000 and 8000 Series Devices	125
Classic Licenses in Device Stacks and High-Availability Pairs	125

- View Your Classic Licenses 125
- Identify the License Key 126
- Generate a Classic License and Add It to the Firepower Management Center 126
- How to Convert a Classic License for Use on an FTD Device 128
- Assign Licenses to Managed Devices from the Device Management Page 130
- Additional Information about Firepower Licensing 131

CHAPTER 6

System Updates 133

- About System Updates 133
- Requirements and Prerequisites for System Updates 134
- Guidelines and Limitations for System Updates 135
- Upgrade System Software 135
- Update the Vulnerability Database (VDB) 135
 - Manually Update the VDB 136
 - Schedule VDB Updates 137
- Update the Geolocation Database 137
 - Manually Update the GeoDB (Internet Connection) 138
 - Manually Update the GeoDB (No Internet Connection) 138
 - Schedule GeoDB Updates 139
- Update Intrusion Rules 139
 - Update Intrusion Rules One-Time Manually 141
 - Update Intrusion Rules One-Time Automatically 141
 - Schedule Intrusion Rule Updates 142
 - Best Practices for Importing Local Intrusion Rules 143
 - Import Local Intrusion Rules 144
- Rule Update Log 145
 - Intrusion Rule Update Log Table 145
 - Viewing the Intrusion Rule Update Log 146
 - Fields in an Intrusion Rule Update Log 146
 - Viewing Details of the Intrusion Rule Update Import Log 148
- Maintain Your Air-Gapped Deployment 149

CHAPTER 7

Backup and Restore 151

- About Backup and Restore 151

Requirements for Backup and Restore	152
Guidelines and Limitations for Backup and Restore	153
Best Practices for Backup and Restore	154
Backing Up FMCs or Managed Devices	157
Back up the FMC	157
Back up a Device from the FMC	158
Back up a 7000/8000 Series Device Locally	159
Create a Backup Profile	161
Restoring FMCs and Managed Devices	162
Restore an FMC from Backup	162
Restore a 7000/8000 Series Device from Backup	163
Manage Backups and Remote Storage	164
Backup Storage Locations	165

CHAPTER 8

Configuration Import and Export	169
About Configuration Import/Export	169
Configurations that Support Import/Export	169
Special Considerations for Configuration Import/Export	170
Requirements and Prerequisites for Configuration Import/Export	171
Exporting Configurations	171
Importing Configurations	172
Import Conflict Resolution	173

CHAPTER 9

Task Scheduling	175
About Task Scheduling	175
Requirements and Prerequisites for Task Scheduling	175
Configuring a Recurring Task	176
Scheduled Backups	177
Schedule FMC Backups	177
Schedule Local 7000 & 8000 Series Device Backups	178
Configuring Certificate Revocation List Downloads	178
Automating Policy Deployment	179
Nmap Scan Automation	180
Scheduling an Nmap Scan	180

- Automating Report Generation 181
 - Specify Report Generation Settings for a Scheduled Report 182
- Automating Firepower Recommendations 183
- Software Update Automation 184
 - Automating Software Downloads 185
 - Automating Software Pushes 186
 - Automating Software Installs 186
- Vulnerability Database Update Automation 187
 - Automating VDB Update Downloads 188
 - Automating VDB Update Installs 188
- Automating URL Filtering Updates Using a Scheduled Task 189
- Scheduled Task Review 190
 - Task List Details 191
 - Viewing Scheduled Tasks on the Calendar 191
 - Editing Scheduled Tasks 192
 - Deleting Scheduled Tasks 192

CHAPTER 10 Data Storage 193

- Data Stored on the FMC 193
 - Purging Data from the FMC Database 194
- External Data Storage 195

CHAPTER 11 Device Management Basics 197

- About Device Management 197
 - About the Firepower Management Center and Device Management 197
 - What Can Be Managed by a Firepower Management Center? 198
 - Beyond Policies and Events 198
- About Device Management Interfaces 199
 - Management Interfaces on 199
 - Management Interface Support Per Device Model 199
 - Network Routes on Device Management Interfaces 200
 - NAT Environments 201
 - Management and Event Traffic Channel Examples 202
- Requirements and Prerequisites for Device Management 204

Complete the FTD Initial Configuration Using the CLI	204
Add a Device to the FMC	207
Delete a Device from the FMC	209
Add a Device Group	210
Configure Device Settings	211
Managing System Shut Down	211
Edit Management Settings	211
Update the Hostname or IP Address in FMC	212
Modify Management Interfaces at the CLI	212
Edit General Settings	217
Edit License Settings	218
Edit Advanced Settings	218
Configure Automatic Application Bypass	218
Inspect Local Router Traffic	219
Configure Fastpath Rules (8000 Series)	220
Change the Manager for the Device	221
Reestablish the Management Connection if You Change the FMC IP Address	222
Identify a New FMC	222
Switch from Firepower Device Manager to FMC	223
Switch from FMC to Firepower Device Manager	224
Viewing Device Information	226
Device Management Page Information	226
General Information	227
License Information	227
System Information	227
Health Information	228
Management Information	228
Advanced Settings	228
<hr/>	
PART III	System Monitoring 231
<hr/>	
CHAPTER 12	Dashboards 233
	About Dashboards 233
	Firepower System Dashboard Widgets 234

Widget Availability	234
Dashboard Widget Availability by User Role	235
Predefined Dashboard Widgets	236
The Appliance Information Widget	236
The Appliance Status Widget	236
The Correlation Events Widget	237
The Current Interface Status Widget	237
The Current Sessions Widget	238
The Custom Analysis Widget	238
The Disk Usage Widget	242
The Interface Traffic Widget	242
The Intrusion Events Widget	243
The Network Compliance Widget	244
The Product Licensing Widget	244
The Product Updates Widget	244
The RSS Feed Widget	245
The System Load Widget	245
The System Time Widget	245
The White List Events Widget	245
Managing Dashboards	246
Adding a Dashboard	247
Adding Widgets to a Dashboard	247
Configuring Widget Preferences	248
Creating Custom Dashboards	248
Custom Dashboard Options	248
Customizing the Widget Display	249
Editing Dashboards Options	250
Modifying Dashboard Time Settings	250
Renaming a Dashboard	251
Viewing Dashboards	252

CHAPTER 13	Health Monitoring	253
	Requirements and Prerequisites for Health Monitoring	253
	About Health Monitoring	253

Health Modules	255
Configuring Health Monitoring	260
Health Policies	260
Default Health Policy	260
Creating Health Policies	261
Applying Health Policies	262
Editing Health Policies	262
Deleting Health Policies	263
The Health Monitor Blocklist	264
Blocklisting Appliances	264
Blocklisting Health Policy Modules	265
Health Monitor Alerts	266
Health Monitor Alert Information	266
Creating Health Monitor Alerts	267
Editing Health Monitor Alerts	267
Deleting Health Monitor Alerts	268
Using the Health Monitor	268
Health Monitor Status Categories	269
Viewing Appliance Health Monitors	270
Running All Modules for an Appliance	271
Running a Specific Health Module	271
Generating Health Module Alert Graphs	272
Health Monitor Reports for Troubleshooting	272
Generating Appliance Troubleshooting Files	273
Downloading Troubleshooting Files	273
Health Event Views	274
Viewing Health Events	274
Viewing Health Events by Module and Appliance	275
Viewing the Health Events Table	275
Hardware Alert Details for 7000 and 8000 Series Devices	276
The Health Events Table	277
<hr/>	
CHAPTER 14	Monitoring the System 279
	About System Statistics 279

- The Host Statistics Section 279
- The Disk Usage Section 280
- The Processes Section 280
 - Process Status Fields 280
 - System Daemons 282
 - Executables and System Utilities 283
- The SFDataCorrelator Process Statistics Section 285
- The Intrusion Event Information Section 286
- Viewing System Statistics 287
- System Messages 287
 - Message Types 288
 - Message Management 289
- Managing System Messages 290
 - Viewing Deployment Messages 290
 - Viewing Health Messages 290
 - Viewing Task Messages 291
 - Managing Task Messages 291
 - Configuring Notification Behavior 292

PART IV

Deployment Management 293

CHAPTER 15

Domain Management 295

- Introduction to Multitenancy Using Domains 295
 - Domains Terminology 296
 - Domain Properties 297
- Requirements and Prerequisites for Domains 298
- Managing Domains 298
- Creating New Domains 299
- Moving Data Between Domains 300
- Moving Devices Between Domains 301

CHAPTER 16

Policy Management 303

- Requirements and Prerequisites for Policy Management 303
- Policy Deployment 304

Best Practices for Deploying Configuration Changes	304
Deploy Configuration Changes	306
Redeploy Existing Configurations to a Device	307
Snort® Restart Scenarios	308
Inspect Traffic During Policy Apply	309
Snort® Restart Traffic Behavior	310
Configurations that Restart the Snort Process When Deployed or Activated	311
Changes that Immediately Restart the Snort Process	313
Policy Comparison	314
Comparing Policies	314
Policy Reports	315
Generating Current Policy Reports	315
Out-of-Date Policies	316
Performance Considerations for Limited Deployments	317
Discovery Without Intrusion Prevention	317
Intrusion Prevention Without Discovery	318

CHAPTER 17

Rule Management: Common Characteristics	319
Requirements and Prerequisites for Rule Management	319
Introduction to Rules	319
Rule Condition Types	321
Rule Condition Mechanics	322
Security Zone Conditions	323
Network Conditions	324
Configuring Network Conditions	325
VLAN Conditions	326
Port and ICMP Code Conditions	327
Configuring Port Conditions	329
Application Conditions (Application Control)	329
Configuring Application Conditions and Filters	331
Application Characteristics	332
Best Practices for Application Control	333
Best Practices for Configuring Application Control	335
Application-Specific Notes and Limitations	336

Troubleshoot Application Control Rules	337
URL Conditions (URL Filtering)	338
User, Realm, and ISE Attribute Conditions (User Control)	338
User Control Prerequisites	339
Configuring User and Realm Conditions	339
Configuring ISE Attribute Conditions	340
Troubleshoot User Control	341
Searching for Rules	342
Filtering Rules by Device	342
Rule and Other Policy Warnings	343

CHAPTER 18**Reusable Objects 345**

Introduction to Reusable Objects	345
The Object Manager	347
Editing Objects	348
Viewing Objects and Their Usage	348
Filtering Objects or Object Groups	349
Object Groups	349
Grouping Reusable Objects	350
Object Overrides	351
Managing Object Overrides	352
Allowing Object Overrides	352
Adding Object Overrides	353
Editing Object Overrides	353
Network Objects	354
Creating Network Objects	354
Port Objects	355
Creating Port Objects	355
Application Filters	356
VLAN Tag Objects	356
Creating VLAN Tag Objects	356
URL Objects	357
Creating URL Objects	358
Geolocation Objects	358

Creating Geolocation Objects	358
Security Zones	359
Creating Security Zone Objects	360
Variable Sets	360
Variable Sets in Intrusion Policies	362
Variables	362
Predefined Default Variables	363
Network Variables	365
Port Variables	366
Advanced Variables	367
Variable Reset	367
Adding Variables to Sets	368
Nesting Variables	370
Managing Variable Sets	371
Creating Variable Sets	372
Managing Variables	372
Adding Variables	374
Editing Variables	374
Security Intelligence Lists and Feeds	375
How to Modify Security Intelligence Objects	377
Global and Domain Security Intelligence Lists	377
Security Intelligence Lists and Multitenancy	377
Add Entries to Global Security Intelligence Lists	379
Delete Entries from Global Security Intelligence Lists	380
List and Feed Updates for Security Intelligence	380
Changing the Update Frequency for Security Intelligence Feeds	381
Custom Security Intelligence Lists and Feeds	381
Custom Lists and Feeds: Requirements	381
URL Lists and Feeds: URL Syntax and Matching Criteria	382
Custom Security Intelligence Feeds	383
Custom Security Intelligence Lists	384
Sinkhole Objects	386
Creating Sinkhole Objects	386
File Lists	387

Source Files for File Lists	387
Adding Individual SHA-256 Values to File Lists	388
Uploading Individual Files to File Lists	389
Uploading Source Files to File Lists	390
Editing SHA-256 Values in File Lists	391
Downloading Source Files from File Lists	391
Cipher Suite Lists	392
Creating Cipher Suite Lists	392
Distinguished Name Objects	393
Creating Distinguished Name Objects	394
PKI Objects	395
Internal Certificate Authority Objects	396
CA Certificate and Private Key Import	396
Importing a CA Certificate and Private Key	397
Generating a New CA Certificate and Private Key	397
New Signed Certificates	398
Creating an Unsigned CA Certificate and CSR	398
Uploading a Signed Certificate Issued in Response to a CSR	399
CA Certificate and Private Key Downloads	399
Downloading a CA Certificate and Private Key	400
Trusted Certificate Authority Objects	400
Trusted CA Object	401
Adding a Trusted CA Object	401
Certificate Revocation Lists in Trusted CA Objects	402
Adding a Certificate Revocation List to a Trusted CA Object	402
External Certificate Objects	403
Adding External Certificate Objects	403
Internal Certificate Objects	403
Adding Internal Certificate Objects	404
SLA Monitor Objects	405
Prefix Lists	406
Configure IPv6 Prefix List	406
Configure IPv4 Prefix List	407
Route Maps	408

Access List	411
Configure Extended ACL Objects	411
Configure Standard ACL Objects	412
AS Path Objects	413
Community Lists	414
Policy Lists	415

PART V**Classic Device Configuration Basics 417****CHAPTER 19****Classic Device Management Basics 419**

Requirements and Prerequisites for Classic Device Management	419
Remote Management Configuration (Classic Devices)	419
Configuring Remote Management on a Managed Device	420
Editing Remote Management on a Managed Device	421
Changing the Management Port	421
Interface Configuration Settings	422
The Physical Hardware View	422
The Interfaces Page	422
Interface Icons	424
Using the Physical Hardware View	424
Configuring Sensing Interfaces	425
Configuring HA Link Interfaces	426
Disabling Interfaces	427
Managing Cisco ASA FirePOWER Interfaces	428
MTU Ranges for 7000 and 8000 Series Devices and NGIPSv	428
Synchronizing Security Zone Object Revisions	429

CHAPTER 20**IPS Device Deployments and Configuration 431**

Introduction to IPS Device Deployment and Configuration	431
License Requirements for IPS Device Deployment	431
Requirements and Prerequisites for IPS Device Deployment	431
Passive IPS Deployments	432
Passive Interfaces on the Firepower System	432
Configuring Passive Interfaces	433

Inline IPS Deployments	434
Inline Interfaces on the Firepower System	435
Configuring Inline Interfaces	436
Inline Sets	437
Viewing Inline Sets	438
Adding Inline Sets	438
Advanced Inline Set Options	439
Configuring Advanced Inline Set Options	441
Deleting Inline Sets	441

PART VI
Classic Device High Availability and Scalability 443

CHAPTER 21
7000 and 8000 Series Device High Availability 445

About 7000 and 8000 Series Device High Availability	445
Device High Availability Requirements	446
Device High Availability Failover and Maintenance Mode	446
Configuration Deployment and Upgrade Behavior for High-Availability Pairs	447
Deployment Types and Device High Availability	447
7000/8000 Series High Availability Configuration	449
Establishing Firepower 7000/8000 Series High Availability	449
Editing Device High Availability	450
Configuring Individual Devices in a High-Availability Pair	451
Configuring Individual Device Stacks in a High-Availability Pair	451
Configuring Interfaces on a Device in a High-Availability Pair	452
Switching the Active Peer in a Device High-Availability Pair	453
Placing a High-Availability Peer into Maintenance Mode	453
Replacing a Device in a Stack in a High-Availability Pair	454
Device High Availability State Sharing	454
Establishing Device High-Availability State Sharing	456
Device High Availability State Sharing Statistics for Troubleshooting	457
Viewing Device High Availability State Sharing Statistics	459
Separating Device High-Availability Pairs	460

CHAPTER 22
8000 Series Device Stacking 461

About Device Stacks	461
Device Stack Configuration	463
Establishing Device Stacks	464
Editing Device Stacks	465
Replacing a Device in a Stack	465
Replacing a Device in a Stack in a High-Availability Pair	466
Configuring Individual Devices in a Stack	467
Configuring Interfaces on a Stacked Device	467
Separating Stacked Devices	468
Replacing a Device in a Stack	469

PART VII
Firepower Threat Defense Getting Started 471

CHAPTER 23
Transparent or Routed Firewall Mode for Firepower Threat Defense 473

About the Firewall Mode	473
About Routed Firewall Mode	473
About Transparent Firewall Mode	473
Using the Transparent Firewall in Your Network	474
Interface	474
Passing Traffic For Routed-Mode Features	474
About Bridge Groups	475
Bridge Virtual Interface (BVI)	475
Bridge Groups in Transparent Firewall Mode	475
Bridge Groups in Routed Firewall Mode	476
Allowing Layer 3 Traffic	477
Allowed MAC Addresses	477
BPDU Handling	477
MAC Address vs. Route Lookups	478
Unsupported Features for Bridge Groups in Transparent Mode	479
Unsupported Features for Bridge Groups in Routed Mode	480
Default Settings	480
Guidelines for Firewall Mode	481
Set the Firewall Mode	482

CHAPTER 24	Logical Devices for the Firepower Threat Defense on the Firepower 4100/9300	485
	About Interfaces	485
	Chassis Management Interface	485
	Interface Types	486
	FXOS Interfaces vs. Application Interfaces	487
	About Logical Devices	487
	Standalone and Clustered Logical Devices	487
	Requirements and Prerequisites for Logical Devices	487
	Requirements and Prerequisites for Hardware and Software Combinations	487
	Requirements and Prerequisites for High Availability	488
	Guidelines and Limitations for Logical Devices	488
	Guidelines and Limitations for Interfaces	489
	General Guidelines and Limitations	489
	Configure Interfaces	489
	Enable or Disable an Interface	489
	Configure a Physical Interface	490
	Add an EtherChannel (Port Channel)	491
	Configure Logical Devices	492
	Add a Standalone FTD	493
	Add a High Availability Pair	495
	Change an Interface on a FTD Logical Device	496
	Connect to the Console of the Application	498
	History for Firepower Threat Defense Logical Devices	499
<hr/>		
PART VIII	Firepower Threat Defense Interfaces and Device Settings	501
<hr/>		
CHAPTER 25	Interface Overview for Firepower Threat Defense	503
	Management/Diagnostic Interface	503
	Management Interface	503
	Diagnostic Interface	503
	Interface Mode and Types	504
	Security Zones	505
	Auto-MDI/MDIX Feature	506

Default Settings for Interfaces	506
Enable the Physical Interface and Configure Ethernet Settings	506
Sync Interface Changes with the Firepower Management Center	508

CHAPTER 26

Regular Firewall Interfaces for Firepower Threat Defense	511
Requirements and Prerequisites for Regular Firewall Interfaces	511
Configure EtherChannel and Redundant Interfaces	511
About EtherChannels	512
About Redundant Interfaces (ASA Platform Only)	512
About EtherChannels	512
Guidelines for EtherChannels	515
Configure a Redundant Interface (ASA Platform Only)	516
Configure an EtherChannel	517
Configure VLAN Subinterfaces and 802.1Q Trunking	519
Guidelines and Limitations for VLAN Subinterfaces	519
Maximum Number of VLAN Subinterfaces by Device Model	520
Add a Subinterface	520
Configure Routed and Transparent Mode Interfaces	521
About Routed and Transparent Mode Interfaces	521
Dual IP Stack (IPv4 and IPv6)	522
Guidelines and Limitations for Routed and Transparent Mode Interfaces	522
Configure Routed Mode Interfaces	523
Configure Transparent Mode Bridge Group Interfaces	525
Configure General Bridge Group Member Interface Parameters	525
Configure the Bridge Virtual Interface (BVI)	527
Configure a Diagnostic (Management) Interface for Transparent Mode	528
Configure IPv6 Addressing	529
About IPv6	529
Configure a Global IPv6 Address	530
Configure IPv6 Neighbor Discovery	532
Configure Advanced Interface Settings	535
About Advanced Interface Configuration	535
About MAC Addresses	535
About the MTU	535

ARP Inspection for Bridge Group Traffic	536
MAC Address Table	537
Default Settings	537
Guidelines for ARP Inspection and the MAC Address Table	538
Configure the MTU	538
Configure the MAC Address	539
Add a Static ARP Entry	539
Add a Static MAC Address and Disable MAC Learning for a Transparent Mode Bridge Group	540
Set Security Configuration Parameters	541

CHAPTER 27 **Inline Sets and Passive Interfaces for Firepower Threat Defense** 545

About IPS Interfaces	545
IPS Interface Types	545
Guidelines for Inline Sets and Passive Interfaces	546
Configure a Passive Interface	547
Configure an Inline Set	549

CHAPTER 28 **DHCP and DDNS Services for Threat Defense** 553

About DHCP and DDNS Services	553
About the DHCPv4 Server	553
DHCP Options	553
About the DHCP Relay Agent	554
Requirements and Prerequisites for DHCP and DDNS	554
Guidelines for DHCP and DDNS Services	554
Configure the DHCP Server	556
Configure the DHCP Relay Agent	557
Configure Dynamic DNS	558

PART IX **Firepower Threat Defense High Availability and Scalability** 563

CHAPTER 29 **High Availability for FTD** 565

About Firepower Threat Defense High Availability	565
High Availability System Requirements	565
Hardware Requirements	565

Software Requirements	566
License Requirements for FTD Devices in a High Availability Pair	566
Failover and Stateful Failover Links	566
Failover Link	567
Stateful Failover Link	568
Avoiding Interrupted Failover and Data Links	568
MAC Addresses and IP Addresses in High Availability	570
Stateful Failover	571
Supported Features	571
Unsupported Features	573
Bridge Group Requirements for High Availability	573
Failover Health Monitoring	574
Unit Health Monitoring	574
Interface Monitoring	574
Failover Triggers and Detection Timing	576
About Active/Standby Failover	577
Primary/Secondary Roles and Active/Standby Status	577
Active Unit Determination at Startup	577
Failover Events	577
Requirements and Prerequisites for High Availability	578
Guidelines for High Availability	579
Add a Firepower Threat Defense High Availability Pair	580
Configure Optional High Availability Parameters	582
Configure Standby IP Addresses and Interface Monitoring	582
Edit High Availability Failover Criteria	583
Configure Virtual MAC addresses	583
Manage High Availability	584
Switch the Active Peer in a Firepower Threat Defense High Availability Pair	584
Suspend and Resume High Availability	585
Replace a Unit in an FTD High Availability Pair	585
Replace a Primary FTD HA Unit	585
Replace a Secondary FTD HA Unit	586
Separate Units in a High Availability Pair	587
Unregister a High Availability Pair	587

Monitoring High Availability	588
View Failover History	588
View Stateful Failover Statistics	588

CHAPTER 30

Clustering for the Firepower Threat Defense 591

About Clustering on the Firepower 4100/9300 Chassis	591
Bootstrap Configuration	592
Cluster Members	592
Cluster Control Link	592
Size the Cluster Control Link	593
Cluster Control Link Redundancy	593
Cluster Control Link Reliability for Inter-Chassis Clustering	593
Cluster Control Link Network	594
Management Network	594
Management Interface	594
Cluster Interfaces	594
Spanned EtherChannels	594
Connecting to a Redundant Switch System	595
Configuration Replication	595
Licenses for Clustering	595
Requirements and Prerequisites for Clustering	596
Clustering Guidelines and Limitations	596
Configure Clustering	597
FXOS: Add a FTD Cluster	597
Create a FTD Cluster	597
FMC: Add a Cluster	601
FMC: Configure Cluster, Data, and Diagnostic Interfaces	602
Remove a Cluster Node	603
FMC: Manage Cluster Members	605
Add or Replace a Cluster Member	605
Deactivate a Member	605
Rejoin the Cluster	606
Delete a Data Unit	607
FMC: Monitoring the Cluster	607

Examples for Clustering	608
Firewall on a Stick	608
Traffic Segregation	609
Spanned EtherChannel with Backup Links (Traditional 8 Active/8 Standby)	609
Reference for Clustering	612
Firepower Threat Defense Features and Clustering	613
Unsupported Features with Clustering	613
Centralized Features for Clustering	613
Dynamic Routing and Clustering	614
Connection Settings	614
FTP and Clustering	614
NAT and Clustering	615
SIP Inspection and Clustering	615
SNMP and Clustering	616
Syslog and Clustering	616
TLS/SSL Connections and Clustering	616
Cisco TrustSec and Clustering	616
Performance Scaling Factor	616
Control Unit Election	616
High Availability Within the Cluster	617
Chassis-Application Monitoring	617
Unit Health Monitoring	617
Interface Monitoring	618
Decorator Application Monitoring	618
Status After Failure	618
Rejoining the Cluster	618
Data Path Connection State Replication	619
How the Cluster Manages Connections	619
Connection Roles	619
New Connection Ownership	621
Sample Data Flow for TCP	621
History for Clustering	622

CHAPTER 31	Routing Overview for Firepower Threat Defense	625
	Path Determination	625
	Supported Route Types	625
	Static Versus Dynamic	626
	Single-Path Versus Multipath	626
	Flat Versus Hierarchical	626
	Link-State Versus Distance Vector	627
	Supported Internet Protocols for Routing	627
	Routing Table	627
	How the Routing Table Is Populated	627
	Administrative Distances for Routes	628
	Backup Dynamic and Floating Static Routes	629
	How Forwarding Decisions Are Made	630
	Dynamic Routing and High Availability	630
	Dynamic Routing in Clustering	630
	Routing Table for Management Traffic	631
	Equal-Cost Multi-Path (ECMP) Routing	631
	About Route Maps	632
	Permit and Deny Clauses	632
	Match and Set Clause Values	632
CHAPTER 32	Static and Default Routes for Firepower Threat Defense	635
	About Static and Default Routes	635
	Default Route	635
	Static Routes	636
	Route Priorities	636
	Transparent Firewall Mode Routes	636
	Static Route Tracking	636
	Requirements and Prerequisites for Static Routes	637
	Guidelines for Static and Default Routes	637
	Add a Static Route	638
CHAPTER 33	OSPF for Firepower Threat Defense	641

OSPF for Firepower Threat Defense	641
About OSPF	641
OSPF Support for Fast Hello Packets	643
Prerequisites for OSPF Support for Fast Hello Packets	643
OSPF Hello Interval and Dead Interval	643
OSPF Fast Hello Packets	643
Benefits of OSPF Fast Hello Packets	643
Implementation Differences Between OSPFv2 and OSPFv3	644
Requirements and Prerequisites for OSPF	644
Guidelines for OSPF	644
Configure OSPFv2	646
Configure OSPF Areas, Ranges, and Virtual Links	646
Configure OSPF Redistribution	649
Configure OSPF Inter-Area Filtering	650
Configure OSPF Filter Rules	651
Configure OSPF Summary Addresses	652
Configure OSPF Interfaces and Neighbors	653
Configure OSPF Advanced Properties	655
Configure OSPFv3	658
Configure OSPFv3 Areas, Route Summaries, and Virtual Links	658
Configure OSPFv3 Redistribution	660
Configure OSPFv3 Summary Prefixes	661
Configure OSPFv3 Interfaces, Authentication, and Neighbors	662
Configure OSPFv3 Advanced Properties	664

CHAPTER 34
BGP for Firepower Threat Defense 669

About BGP	669
Routing Table Changes	669
When to Use BGP	670
BGP Path Selection	670
BGP Multipath	671
Requirements and Prerequisites for BGP	672
Guidelines for BGP	672
Configure BGP	673

Configure BGP Basic Settings	673
Configure BGP General Settings	675
Configure BGP Neighbor Settings	676
Configure BGP Aggregate Address Settings	680
Configure BGPv4 Filtering Settings	680
Configure BGP Network Settings	681
Configure BGP Redistribution Settings	681
Configure BGP Route Injection Settings	682

CHAPTER 35	RIP for Firepower Threat Defense	685
	About RIP	685
	Routing Update Process	685
	RIP Routing Metric	686
	RIP Stability Features	686
	RIP Timers	686
	Requirements and Prerequisites for RIP	687
	Guidelines for RIP	687
	Configure RIP	688

PART XI	Appliance Platform Settings	691
----------------	------------------------------------	------------

CHAPTER 36	System Configuration	693
	Requirements and Prerequisites for the System Configuration	694
	About System Configuration	694
	Navigating the Firepower Management Center System Configuration	694
	System Configuration Settings	695
	Appliance Information	696
	View Appliance Information	697
	View Basic System Information	697
	HTTPS Certificates	697
	Default HTTPS Server Certificates	698
	Custom HTTPS Server Certificates	698
	HTTPS Client Certificates	698
	Viewing the Current Server Certificate	698

Generating and Submitting a Certificate Signing Request	699
Server Certificate Upload	699
Uploading Server Certificates	700
Requiring Valid User Certificates	700
External Database Access Settings	701
Enabling External Access to the Database	702
Database Event Limits	702
Configuring Database Event Limits	703
Database Event Limits	703
Management Interfaces	705
About FMC Management Interfaces	705
Management Interfaces on the FMC	705
Management Interface Support Per FMC Model	706
Network Routes on FMC Management Interfaces	706
NAT Environments	706
Management and Event Traffic Channel Examples	708
Modify FMC Management Interfaces	710
Shut Down or Restart	713
Shut Down or Restart the FMC	713
Remote Storage Management	714
Configuring Local Storage	714
Configuring NFS for Remote Storage	714
Configuring SMB for Remote Storage	715
Configuring SSH for Remote Storage	716
Remote Storage Management Advanced Options	717
Change Reconciliation	717
Configuring Change Reconciliation	717
Change Reconciliation Options	718
Policy Change Comments	718
Configuring Comments to Track Policy Changes	719
Access List	719
Configure an Access List	720
Audit Logs	720
Configure Audit Log Streaming	721

Dashboard Settings	722
Enabling Custom Analysis Widgets for Dashboards	722
DNS Cache	722
Configuring DNS Cache Properties	723
Email Notifications	723
Configuring a Mail Relay Host and Notification Address	724
Language Selection	724
Set the Language for the Web Interface	724
Login Banners	725
Customize the Login Banner	725
SNMP Polling	725
Configure SNMP Polling	726
STIG Compliance	727
Enabling STIG Compliance	727
Time and Time Synchronization	728
Synchronize Time on the FMC with an NTP Server	728
Synchronize Time Without Access to a Network NTP Server	729
About Changing Time Synchronization Settings	730
View Current System Time, Source, and NTP Server Connection Status	731
NTP Server Status	731
Session Timeouts	732
Configure Session Timeouts	732
Vulnerability Mapping	733
Mapping Vulnerabilities for Servers	733
Remote Console Access Management	734
Configuring Remote Console Settings on the System	734
Lights-Out Management User Access Configuration	735
Enabling Lights-Out Management User Access	735
Serial Over LAN Connection Configuration	735
Configuring Serial Over LAN with IPMItool	737
Configuring Serial Over LAN with IPMIutil	737
Lights-Out Management Overview	737
Configuring Lights-Out Management with IPMItool	739
Configuring Lights-Out Management with IPMIutil	739

VMware Tools and Virtual Systems	739
Enabling VMware Tools on the Firepower Management Center for VMware	740

CHAPTER 37**Platform Settings Policies 741**

Introduction to Platform Settings	741
Requirements and Prerequisites for Platform Settings Policies	742
Managing Platform Settings Policies	742
Create a Platform Settings Policy	743
Setting Target Devices for a Platform Settings Policy	743

CHAPTER 38**Platform Settings for Classic Devices 745**

About Platform Settings for Classic Devices	745
Requirements for Platform Settings for Classic Devices	746
Configure Platform Settings for Classic Devices	747
Configure Access Lists for Classic Devices	747
Stream Audit Logs from Classic Devices	748
Enable External Authentication to 7000/8000 Series Devices	749
About External Authentication for 7000/8000 Series Devices	749
Set the Language for the 7000/8000 Series Web Interface	750
Customize the Login Banner for Classic Devices	751
Synchronize Time on Classic Devices with an NTP Server	751
Configure Session Timeouts for Classic Devices	752
Configure SNMP Polling on Classic Devices	753
Local System Configuration for 7000/8000 Series Devices	754
Prohibit Packet Transfer to FMC	755
Configure Management Interfaces on a 7000/8000 Series Device	755
Shut Down or Restart a 7000/8000 Series Device	758
View System Time for 7000/8000 Series Devices	759

CHAPTER 39**Platform Settings for Firepower Threat Defense 761**

Configure ARP Inspection	761
Configure Banners	762
Configure External Authentication for SSH and HTTP	763
Configure Fragment Handling	765

Configure HTTP	766
Configure ICMP Access Rules	767
Configure Secure Shell	768
Configure SMTP	770
Configure SNMP for Threat Defense	770
Add SNMPv3 Users	771
Add SNMP Hosts	773
Configure SNMP Traps	774
About Configuring Syslog	775
About Syslog	775
Severity Levels	776
Syslog Message Filtering	777
Syslog Message Classes	777
Guidelines for Logging	780
Configure Syslog Logging for FTD Devices	780
Enable Logging and Configure Basic Settings	781
Enable Logging Destinations	782
Send Syslog Messages to an E-mail Address	783
Create a Custom Event List	784
Limit the Rate of Syslog Message Generation	785
Configure Syslog Settings	785
Configure a Syslog Server	787
Configure Global Timeouts	788
Configure NTP Time Synchronization for Threat Defense	789
History for Firepower Threat Defense Platform Settings	791

PART XII
Network Address Translation (NAT) 793

CHAPTER 40
NAT Policy Management 795

Requirements and Prerequisites for NAT Policies	795
Managing NAT Policies	795
Creating NAT Policies	796
Configuring NAT Policies	797
Configuring NAT Policy Targets	798

Copying NAT Policies 799

CHAPTER 41

NAT for 7000 and 8000 Series Devices 801

NAT Policy Configuration 801

NAT Policies Configuration Guidelines 802

Rule Organization in a NAT Policy 802

Organizing NAT Rules 803

NAT Rule Warnings and Errors 804

Showing and Hiding NAT Rule Warnings 804

NAT Policy Rules Options 804

Creating and Editing NAT Rules 805

NAT Rule Types 806

NAT Rule Condition Types 808

NAT Rule Conditions and Condition Mechanics 808

NAT Rule Conditions 809

Adding Conditions to NAT Rules 809

Literal Conditions in NAT Rules 811

Objects in NAT Rule Conditions 811

Zone Conditions in NAT Rules 811

Adding Zone Conditions to NAT Rules 812

Source Network Conditions in Dynamic NAT Rules 813

Adding Network Conditions to a Dynamic NAT Rule 814

Destination Network Conditions in NAT Rules 815

Adding Destination Network Conditions to NAT Rules 816

Port Conditions in NAT Rules 817

Adding Port Conditions to NAT Rules 817

CHAPTER 42

Network Address Translation (NAT) for Firepower Threat Defense 819

Why Use NAT? 819

NAT Basics 820

NAT Terminology 820

NAT Types 820

NAT in Routed and Transparent Mode 821

NAT in Routed Mode 821

NAT in Transparent Mode	822
Auto NAT and Manual NAT	823
Auto NAT	823
Manual NAT	823
Comparing Auto NAT and Manual NAT	824
NAT Rule Order	824
NAT Interfaces	826
Configuring Routing for NAT	826
Addresses on the Same Network as the Mapped Interface	827
Addresses on a Unique Network	827
The Same Address as the Real Address (Identity NAT)	827
Guidelines for NAT	828
Firewall Mode Guidelines for NAT	828
IPv6 NAT Guidelines	828
IPv6 NAT Best Practices	829
NAT Support for Inspected Protocols	829
Additional Guidelines for NAT	831
Configure NAT for Threat Defense	832
Dynamic NAT	833
About Dynamic NAT	833
Dynamic NAT Disadvantages and Advantages	834
Configure Dynamic Auto NAT	835
Configure Dynamic Manual NAT	836
Dynamic PAT	838
About Dynamic PAT	838
Dynamic PAT Disadvantages and Advantages	839
PAT Pool Object Guidelines	839
Configure Dynamic Auto PAT	840
Configure Dynamic Manual PAT	842
Static NAT	845
About Static NAT	845
Configure Static Auto NAT	849
Configure Static Manual NAT	850
Identity NAT	853

Configure Identity Auto NAT	854
Configure Identity Manual NAT	855
NAT Rule Properties for Firepower Threat Defense	857
General Properties for Auto NAT	858
General Properties for Manual NAT	859
PAT Pool NAT Properties	860
Advanced NAT Properties	861
Examples for NAT	862
Providing Access to an Inside Web Server (Static Auto NAT)	862
Dynamic Auto NAT for Inside Hosts and Static NAT for an Outside Web Server	864
Inside Load Balancer with Multiple Mapped Addresses (Static Auto NAT, One-to-Many)	867
Single Address for FTP, HTTP, and SMTP (Static Auto NAT-with-Port-Translation)	870
Different Translation Depending on the Destination (Dynamic Manual PAT)	874
Different Translation Depending on the Destination Address and Port (Dynamic Manual PAT)	877
History for FTD NAT	881

PART XIII
7000 and 8000 Series Advanced Deployment Options 883

CHAPTER 43
Setting Up Virtual Switches 885

Virtual Switches	885
Switched Interface Configuration	885
Switched Interface Configuration Notes	886
Configuring Physical Switched Interfaces	887
Adding Logical Switched Interfaces	888
Deleting Logical Switched Interfaces	889
Virtual Switch Configuration	890
Virtual Switch Configuration Notes	890
Adding Virtual Switches	891
Advanced Virtual Switch Settings	891
Configuring Advanced Virtual Switch Settings	892
Deleting Virtual Switches	893

CHAPTER 44
Setting Up Virtual Routers 895

Virtual Routers	895
-----------------	-----

Routed Interfaces	896
Configuring Physical Routed Interfaces	897
Adding Logical Routed Interfaces	899
Deleting Logical Routed Interfaces	901
Configuring SFRP	901
Virtual Router Configuration	903
Adding Virtual Routers	904
DHCP Relay	905
Setting Up DHCPv4 Relay	905
Setting Up DHCPv6 Relay	906
Static Routes	907
Viewing the Static Routes Table	907
Adding Static Routes	908
Dynamic Routing	909
RIP Configuration	909
Adding Interfaces for RIP Configuration	909
Configuring Authentication Settings for RIP Configuration	910
Configuring Advanced Settings for RIP Configuration	911
Adding Import Filters for RIP Configuration	912
Adding Export Filters for RIP Configuration	913
OSPF Configuration	914
OSPF Routing Areas	914
OSPF Area Interfaces	915
Adding OSPF Area Interfaces	917
Adding OSPF Area Vlinks	918
Adding Import Filters for OSPF Configuration	919
Adding Export Filters for OSPF Configuration	920
Virtual Router Filters	920
Viewing Virtual Router Filters	921
Setting Up Virtual Router Filters	922
Adding Virtual Router Authentication Profiles	923
Viewing Virtual Router Statistics	924
Deleting Virtual Routers	924

CHAPTER 45

Aggregate Interfaces and LACP	927
About Aggregate Interfaces	927
LAG Configuration	928
Aggregate Switched Interfaces	928
Aggregate Routed Interfaces	929
Logical Aggregate Interfaces	929
Load-Balancing Algorithms	930
Link Selection Policies	931
Link Aggregation Control Protocol (LACP)	932
LACP	932
Adding Aggregate Switched Interfaces	933
Adding Aggregate Routed Interfaces	935
Adding Logical Aggregate Interfaces	938
Viewing Aggregate Interface Statistics	939
Deleting Aggregate Interfaces	939

CHAPTER 46

Hybrid Interfaces	941
About Hybrid Interfaces	941
Logical Hybrid Interfaces	941
Adding Logical Hybrid Interfaces	942
Deleting Logical Hybrid Interfaces	944

CHAPTER 47

Gateway VPNs	945
Gateway VPN Basics	945
IPsec	945
IKE	946
VPN Deployments	946
Point-to-Point VPN Deployments	946
Star VPN Deployments	947
Mesh VPN Deployments	948
VPN Deployment Management	948
VPN Deployment Options	949
Point-to-Point VPN Deployment Options	949

- Star VPN Deployment Options 950
- Mesh VPN Deployment Options 952
- Advanced VPN Deployment Options 953
- Managing VPN Deployments 954
 - Configuring Point-to-Point VPN Deployments 955
 - Configuring Star VPN Deployments 955
 - Configuring Mesh VPN Deployments 956
 - Configuring Advanced VPN Deployment Settings 957
 - Editing VPN Deployments 958
- VPN Deployment Status 959
 - Viewing VPN Status 959
- VPN Statistics and Logs 959
 - Viewing VPN Statistics and Logs 961

PART XIV **Access Control 963**

CHAPTER 48 **Understanding Access Control 965**

- Introduction to Access Control 965
- Access Control Policy Default Action 965
- Deep Inspection Using File and Intrusion Policies 967
 - Access Control Traffic Handling with Intrusion and File Policies 968
 - File and Intrusion Inspection Order 969
- Access Control Policy Inheritance 971

CHAPTER 49 **Best Practices for Access Control 973**

- General Best Practices for Access Control 973
- Best Practices for Access Control Rules 974
 - Best Practices for Ordering Rules 974
 - Rule Preemption 975
 - Rule Actions and Rule Order 975
 - Content Restriction Rule Order 976
 - Application Rule Order 976
 - SSL Rule Order 977
 - URL Rule Order 977

Best Practices for Simplifying and Focusing Rules	978
Maximum Number of Access Control Rules and Intrusion Policies	978

CHAPTER 50**Access Control Policies 979**

Access Control Policy Components	979
Requirements and Prerequisites for Access Control Policies	981
Managing Access Control Policies	981
System-Created Access Control Policies	982
Creating a Basic Access Control Policy	982
Editing an Access Control Policy	983
Managing Access Control Policy Inheritance	985
Choosing a Base Access Control Policy	986
Inheriting Access Control Policy Settings from the Base Policy	986
Locking Settings in Descendant Access Control Policies	987
Requiring an Access Control Policy in a Domain	987
Setting Target Devices for an Access Control Policy	988
Access Control Policy Advanced Settings	989
Associating Other Policies with Access Control	990
History for Access Control Policies	992

CHAPTER 51**Access Control Rules 993**

Introduction to Access Control Rules	993
Access Control Rule Management	995
Access Control Rule Components	995
Access Control Rule Order	997
Requirements and Prerequisites for Access Control Rules	997
Adding an Access Control Rule Category	998
Create and Edit Access Control Rules	998
Enabling and Disabling Access Control Rules	1000
Positioning an Access Control Rule	1000
Access Control Rule Actions	1001
Access Control Rule Monitor Action	1001
Access Control Rule Trust Action	1002
Access Control Rule Blocking Actions	1002

Access Control Rule Interactive Blocking Actions	1003
Access Control Rule Allow Action	1004
Access Control Rule Comments	1004
Adding Comments to an Access Control Rule	1005

CHAPTER 52**URL Filtering 1007**

URL Filtering Overview	1007
About URL Filtering with Category and Reputation	1007
Best Practices for URL Filtering	1008
Filtering HTTPS Traffic	1010
License Requirements for URL Filtering	1011
Requirements and Prerequisites for URL Filtering	1011
How to Configure URL Filtering with Category and Reputation	1012
Enable URL Filtering Using Category and Reputation	1013
URL Filtering Options	1013
Configuring URL Conditions	1014
Rules with URL Conditions	1016
URL Rule Order	1016
Manual URL Filtering	1016
Manual URL Filtering Options	1017
Supplement or Selectively Override Category and Reputation-Based URL Filtering	1018

CHAPTER 53**HTTP Response Pages and Interactive Blocking 1021**

About HTTP Response Pages	1021
Limitations to HTTP Response Pages	1021
Requirements and Prerequisites for HTTP Response Pages	1022
Choosing HTTP Response Pages	1022
Interactive Blocking with HTTP Response Pages	1023
Configuring Interactive Blocking	1024
Setting the User Bypass Timeout for a Blocked Website	1024

CHAPTER 54**Blocking Traffic with Security Intelligence 1027**

About Security Intelligence	1027
Best Practices for Security Intelligence	1028

License Requirements for Security Intelligence	1028
Requirements and Prerequisites for Security Intelligence	1029
Security Intelligence Sources	1029
Configure Security Intelligence	1030
Security Intelligence Options	1032
Security Intelligence Categories	1033
Block List Icons	1034
Configuration Example: Security Intelligence Blocking	1035
Security Intelligence Monitoring	1036
Override Security Intelligence Blocking	1037
Troubleshooting Security Intelligence	1037
Security Intelligence Categories Are Missing from the Available Options List	1037
Troubleshooting Memory Use	1038
History for Security Intelligence Block Listing	1038

CHAPTER 55
DNS Policies 1039

DNS Policy Overview	1039
DNS Policy Components	1040
License Requirements for DNS Policies	1041
Requirements and Prerequisites for DNS Policies	1041
Managing DNS Policies	1041
Creating Basic DNS Policies	1042
Editing DNS Policies	1042
DNS Rules	1043
Creating and Editing DNS Rules	1044
DNS Rule Management	1044
Enabling and Disabling DNS Rules	1044
DNS Rule Order Evaluation	1045
DNS Rule Actions	1046
DNS Rule Conditions	1047
Controlling Traffic Based on DNS and Security Zone	1047
Controlling Traffic Based on DNS and Network	1048
Controlling Traffic Based on DNS and VLAN	1048
Controlling Traffic Based on DNS List, Feed, or Category	1049

DNS Policy Deploy 1050

CHAPTER 56

Intelligent Application Bypass 1051

Introduction to IAB 1051

IAB Options 1052

Requirements and Prerequisites for Intelligent Application Bypass 1054

Configuring Intelligent Application Bypass 1054

IAB Logging and Analysis 1055

PART XV

Encrypted Traffic Handling 1059

CHAPTER 57

Understanding Traffic Decryption 1061

Traffic Decryption Explained 1061

TLS/SSL Best Practices 1063

The Case for Decryption 1063

When to Decrypt Traffic, When Not to Decrypt 1064

 Decrypt and Resign (Outgoing Traffic) 1065

 Known Key Decryption (Incoming Traffic) 1066

Other TLS/SSL Rule Actions 1066

TLS/SSL Rule Examples 1066

 Block Nonsecure Protocols 1066

TLS/SSL Rule Components 1068

TLS/SSL Rule Order Evaluation 1069

 Multi-Rule Example 1070

How to Configure TLS/SSL Policies and Rules 1072

TLS/SSL Inspection Appliance Deployment Scenarios 1074

Traffic Decryption in a Passive Deployment 1074

 Encrypted Traffic Monitoring in a Passive Deployment 1075

 Undecrypted Encrypted Traffic in a Passive Deployment 1076

 Encrypted Traffic Inspection with a Private Key in a Passive Deployment 1077

Traffic Decryption in an Inline Deployment 1079

 Encrypted Traffic Monitoring in an Inline Deployment 1080

 Undecrypted Encrypted Traffic in an Inline Deployment 1081

 Encrypted Traffic Blocking in an Inline Deployment 1082

Encrypted Traffic Inspection with a Private Key in an Inline Deployment	1083
Encrypted Traffic Inspection with a Re-signed Certificate in an Inline Deployment	1085
History for TLS/SSL	1087

CHAPTER 58**Start Creating SSL Policies 1089**

SSL Policies Overview	1089
SSL Policy Default Actions	1090
Default Handling Options for Undecryptable Traffic	1091
Requirements and Prerequisites for SSL Policies	1092
Manage SSL Policies	1092
Create Basic SSL Policies	1093
Set Default Handling for Undecryptable Traffic	1094
Editing an SSL Policy	1095

CHAPTER 59**Get Started with TLS/SSL Rules 1097**

TLS/SSL Rules Overview	1097
TLS/SSL Rule Guidelines and Limitations	1097
Guideline for Using TLS/SSL Decryption	1098
TLS/SSL Rule Unsupported Features	1098
TLS/SSL Do Not Decrypt Guidelines	1099
TLS/SSL Decrypt - Resign Guidelines	1099
TLS/SSL Decrypt - Known Key Guidelines	1101
TLS/SSL Block Guidelines	1102
TLS/SSL Certificate Pinning Guidelines	1103
TLS/SSL Heartbeat Guidelines	1103
TLS/SSL Anonymous Cipher Suite Limitation	1103
TLS/SSL Normalizer Guidelines	1103
Other TLS/SSL Rule Guidelines	1104
Requirements and Prerequisites for TLS/SSL Rules	1104
Encrypted Traffic Inspection Configuration	1105
Creating and Modifying TLS/SSL Rules	1106
Adding a TLS/SSL Rule to a Rule Category	1106
Positioning a TLS/SSL Rule by Number	1107
TLS/SSL Rule Search	1107

Searching TLS/SSL Rules	1108
Enabling and Disabling TLS/SSL Rules	1108
Moving a TLS/SSL Rule	1108
Adding a New TLS/SSL Rule Category	1109
TLS/SSL Rule Conditions	1109
TLS/SSL Rule Condition Types	1110
TLS/SSL Rule Actions	1111
TLS/SSL Rule Monitor Action	1111
TLS/SSL Rule Do Not Decrypt Action	1112
TLS/SSL Rule Blocking Actions	1112
TLS/SSL Rule Decrypt Actions	1112
Configuring TLS/SSL Rule Actions	1113
Configuring a Decrypt - Resign Action	1114
Configuring a Decrypt - Known Key Action	1114
TLS/SSL Rules Management	1115
<hr/>	
CHAPTER 60	Decryption Tuning Using TLS/SSL Rules
TLS/SSL Rule Conditions Overview	1117
Requirements and Prerequisites for Decryption Tuning	1118
Network-Based TLS/SSL Rule Conditions	1118
Network Zone TLS/SSL Rule Conditions	1119
Controlling Encrypted Traffic by Network Zone	1119
Network or Geolocation TLS/SSL Rule Conditions	1120
Controlling Encrypted Traffic by Network or Geolocation	1121
VLAN TLS/SSL Rule Conditions	1122
Controlling Encrypted VLAN Traffic	1122
Port TLS/SSL Rule Conditions	1123
Controlling Encrypted Traffic by Port	1124
User-Based TLS/SSL Rule Conditions	1124
Controlling Encrypted Traffic Based on User	1125
Reputation-Based TLS/SSL Rule Conditions	1125
Selected Applications and Filters in TLS/SSL Rules	1125
Application Filters in TLS/SSL Rules	1126
Available Applications in TLS/SSL Rules	1127

Application-Based TLS/SSL Rule Condition Requirements	1128
Adding an Application Condition to a TLS/SSL Rule	1129
Limitations to Encrypted Application Control	1129
Reputation-Based URL Blocking in Encrypted Traffic	1130
Block Encrypted Traffic Based on URL Reputation	1130
Server Certificate-Based TLS/SSL Rule Conditions	1131
Certificate Distinguished Name TLS/SSL Rule Conditions	1132
Controlling Encrypted Traffic by Certificate Distinguished Name	1133
Certificate TLS/SSL Rule Conditions	1134
Controlling Encrypted Traffic by Certificate	1134
Certificate Status TLS/SSL Rule Conditions	1135
Trusting External Certificate Authorities	1138
Matching Traffic on Certificate Status	1139
Cipher Suite TLS/SSL Rule Conditions	1141
Controlling Encrypted Traffic by Cipher Suite	1143
Encryption Protocol Version TLS/SSL Rule Conditions	1144
Controlling Traffic by Encryption Protocol Version	1144

CHAPTER 61

Troubleshoot TLS/SSL Rules	1145
About TLS/SSL Pinning	1145
Troubleshoot TLS/SSL Pinning	1145
Troubleshoot Unknown or Bad Certificates or Certificate Authorities	1147
Verify TLS/SSL Cipher Suites	1149

PART XVI

Advanced Malware Protection (AMP) and File Control	1151
---	-------------

CHAPTER 62

File Policies and Malware Protection	1153
About File Policies and Advanced Malware Protection	1153
File Policies	1153
Requirements and Prerequisites for File Policies	1154
License Requirements for File and Malware Policies	1155
Best Practices for File Policies and Malware Detection	1155
File Rule Best Practices	1155
File Detection Best Practices	1156

File Blocking Best Practices	1156
File Policy Best Practices	1157
How to Configure Malware Protection	1157
Plan and Prepare for Malware Protection	1158
Configure File Policies	1159
Add File Policies to Your Access Control Configuration	1160
Configuring an Access Control Rule to Perform Malware Protection	1160
Set Up Maintenance and Monitoring of Malware Protection	1161
Cloud Connections for Malware Protection	1162
AMP Cloud Connection Configurations	1163
Requirements and Best Practices for AMP Cloud Connections	1163
Choose an AMP Cloud	1164
Cisco AMP Private Cloud	1164
Managing Connections to the AMP Cloud (Public or Private)	1165
Change AMP Options	1166
Dynamic Analysis Connections	1167
Requirements for Dynamic Analysis	1167
Viewing the Default Dynamic Analysis Connection	1167
Dynamic Analysis On-Premises Appliance (Cisco Threat Grid)	1168
Maintain Your System: Update File Types Eligible for Dynamic Analysis	1169
File Policies and File Rules	1170
Create or Edit a File Policy	1170
Advanced and Archive File Inspection Options	1170
Managing File Policies	1173
File Rules	1174
File Rule Components	1175
File Rule Actions	1176
Creating File Rules	1183
Access Control Rule Logging for Malware Protection	1184
Retrospective Disposition Changes	1184
(Optional) Malware Protection with AMP for Endpoints	1184
Comparison of Malware Protection: Firepower vs. AMP for Endpoints	1185
About Integrating Firepower with AMP for Endpoints	1186
Benefits of Integrating Firepower and AMP for Endpoints	1186

AMP for Endpoints and AMP Private Cloud	1186
Integrate Firepower and AMP for Endpoints	1186
History for File Policies and Malware Protection	1188

CHAPTER 63 **File and Malware Inspection Performance and Storage Tuning** 1191

File and Malware Inspection Performance and Storage Options	1191
Tuning File and Malware Inspection Performance and Storage	1193

PART XVII **Intrusion Detection and Prevention** 1195

CHAPTER 64 **An Overview of Intrusion Detection and Prevention** 1197

Network Analysis and Intrusion Policy Basics	1197
How Policies Examine Traffic For Intrusions	1198
Decoding, Normalizing, and Preprocessing: Network Analysis Policies	1199
Access Control Rules: Intrusion Policy Selection	1200
Intrusion Inspection: Intrusion Policies, Rules, and Variable Sets	1201
Intrusion Event Generation	1202
System-Provided and Custom Network Analysis and Intrusion Policies	1203
System-Provided Network Analysis and Intrusion Policies	1203
Benefits of Custom Network Analysis and Intrusion Policies	1205
Benefits of Custom Network Analysis Policies	1205
Benefits of Custom Intrusion Policies	1206
Limitations of Custom Policies	1207
License Requirements for Network Analysis and Intrusion Policies	1209
Requirements and Prerequisites for Network Analysis and Intrusion Policies	1209
The Navigation Panel: Network Analysis and Intrusion Policies	1209
Conflicts and Changes: Network Analysis and Intrusion Policies	1211
Exiting a Network Analysis or Intrusion Policy	1212

CHAPTER 65 **Layers in Intrusion and Network Analysis Policies** 1213

Layer Basics	1213
License Requirements for Network Analysis and Intrusion Policy Layers	1213
Requirements and Prerequisites for Network Analysis and Intrusion Policy Layers	1214
The Layer Stack	1214

- The Base Layer 1215
 - System-Provided Base Policies 1215
 - Custom Base Policies 1215
 - The Effect of Rule Updates on Base Policies 1216
 - Changing the Base Policy 1217
- The Firepower Recommendations Layer 1217
- Layer Management 1218
 - Shared Layers 1219
 - Managing Layers 1220
 - Navigating Layers 1221
 - Intrusion Rules in Layers 1222
 - Configuring Intrusion Rules in Layers 1223
 - Removing Rule Settings from Multiple Layers 1223
 - Accepting Rule Changes from a Custom Base Policy 1225
 - Preprocessors and Advanced Settings in Layers 1225
 - Configuring Preprocessors and Advanced Settings in Layers 1226

CHAPTER 66

- Getting Started with Intrusion Policies 1229**
 - Intrusion Policy Basics 1229
 - License Requirements for Intrusion Policies 1230
 - Requirements and Prerequisites for Intrusion Policies 1231
 - Managing Intrusion Policies 1231
 - Custom Intrusion Policy Creation 1232
 - Creating a Custom Intrusion Policy 1232
 - Editing Snort 2 Intrusion Policies 1233
 - Intrusion Policy Changes 1234
 - Access Control Rule Configuration to Perform Intrusion Prevention 1234
 - Access Control Rule Configuration and Intrusion Policies 1235
 - Configuring an Access Control Rule to Perform Intrusion Prevention 1235
 - Drop Behavior in an Inline Deployment 1236
 - Setting Drop Behavior in an Inline Deployment 1236
 - Drop Behavior in a Dual System Deployment 1237
 - Intrusion Policy Advanced Settings 1237
 - Optimizing Performance for Intrusion Detection and Prevention 1238

CHAPTER 67

Tuning Intrusion Policies Using Rules	1239
Intrusion Rule Tuning Basics	1239
Intrusion Rule Types	1239
License Requirements for Intrusion Rules	1240
Requirements and Prerequisites for Intrusion Rules	1241
Viewing Intrusion Rules in an Intrusion Policy	1241
Intrusion Rules Page Columns	1241
Intrusion Rule Details	1242
Viewing Intrusion Rule Details	1243
Setting a Threshold for an Intrusion Rule	1244
Setting Suppression for an Intrusion Rule	1244
Setting a Dynamic Rule State from the Rule Details Page	1245
Setting an SNMP Alert for an Intrusion Rule	1246
Adding a Comment to an Intrusion Rule	1246
Intrusion Rule Filters in an Intrusion Policy	1247
Intrusion Rule Filters Notes	1247
Intrusion Policy Rule Filters Construction Guidelines	1247
Intrusion Rule Configuration Filters	1250
Intrusion Rule Content Filters	1250
Intrusion Rule Categories	1251
Intrusion Rule Filter Components	1251
Intrusion Rule Filter Usage	1252
Setting a Rule Filter in an Intrusion Policy	1252
Intrusion Rule States	1253
Intrusion Rule State Options	1253
Setting Intrusion Rule States	1254
Intrusion Event Notification Filters in an Intrusion Policy	1255
Intrusion Event Thresholds	1255
Intrusion Event Thresholds Configuration	1255
Adding and Modifying Intrusion Event Thresholds	1257
Viewing and Deleting Intrusion Event Thresholds	1258
Intrusion Policy Suppression Configuration	1259
Intrusion Policy Suppression Types	1259

Suppressing Intrusion Events for a Specific Rule 1259

Viewing and Deleting Suppression Conditions 1260

Dynamic Intrusion Rule States 1261

Dynamic Intrusion Rule State Configuration 1262

Setting a Dynamic Rule State from the Rules Page 1262

Adding Intrusion Rule Comments 1264

CHAPTER 68

Tailoring Intrusion Protection to Your Network Assets 1267

About Firepower Recommended Rules 1267

Default Settings for Firepower Recommendations 1268

Advanced Settings for Firepower Recommendations 1269

Generating and Applying Firepower Recommendations 1270

CHAPTER 69

Sensitive Data Detection 1273

Sensitive Data Detection Basics 1273

Global Sensitive Data Detection Options 1274

Individual Sensitive Data Type Options 1275

System-Provided Sensitive Data Types 1276

License Requirements for Sensitive Data Detection 1277

Requirements and Prerequisites for Sensitive Data Detection 1277

Configuring Sensitive Data Detection 1277

Monitored Application Protocols and Sensitive Data 1279

Selecting Application Protocols to Monitor 1279

Special Case: Sensitive Data Detection in FTP Traffic 1280

Custom Sensitive Data Types 1281

Data Patterns in Custom Sensitive Data Types 1281

Configuring Custom Sensitive Data Types 1283

Editing Custom Sensitive Data Types 1284

CHAPTER 70

Globally Limiting Intrusion Event Logging 1287

Global Rule Thresholding Basics 1287

Global Rule Thresholding Options 1288

License Requirements for Global Thresholds 1289

Requirements and Prerequisites for Global Thresholds 1290

Configuring Global Thresholds	1290
Disabling the Global Threshold	1291

CHAPTER 71**The Intrusion Rules Editor 1293**

An Introduction to Intrusion Rule Editing	1293
License Requirements for the Intrusion Rule Editor	1294
Requirements and Prerequisites for the Intrusion Rule Editor	1294
Rule Anatomy	1294
The Intrusion Rule Header	1295
Intrusion Rule Header Action	1296
Intrusion Rule Header Protocol	1296
Intrusion Rule Header Direction	1297
Intrusion Rule Header Source and Destination IP Addresses	1297
Intrusion Rule Header Source and Destination Ports	1300
Intrusion Event Details	1301
Adding a Custom Classification	1304
Defining an Event Priority	1305
Defining an Event Reference	1305
Custom Rule Creation	1306
Writing New Rules	1307
Modifying Existing Rules	1308
Viewing Rule Documentation	1309
Adding Comments to Intrusion Rules	1309
Deleting Custom Rules	1310
Searching for Rules	1311
Search Criteria for Intrusion Rules	1311
Rule Filtering on the Intrusion Rules Editor Page	1312
Filtering Guidelines	1312
Keyword Filtering	1313
Character String Filtering	1314
Combination Keyword and Character String Filtering	1314
Filtering Rules	1315
Keywords and Arguments in Intrusion Rules	1315
The content and protected_content Keywords	1316

Basic content and protected_content Keyword Arguments	1317
content and protected_content Keyword Search Locations	1318
Overview: HTTP content and protected_content Keyword Arguments	1321
Overview: content Keyword Fast Pattern Matcher	1324
The replace Keyword	1327
The byte_jump Keyword	1328
The byte_test Keyword	1330
The byte_extract Keyword	1332
Overview: The pcre Keyword	1334
pcre Syntax	1335
pcre Modifier Options	1337
pcre Example Keyword Values	1340
The metadata Keyword	1342
Service Metadata	1343
Metadata Search Guidelines	1348
IP Header Values	1349
ICMP Header Values	1351
TCP Header Values and Stream Size	1352
The stream_reassembly Keyword	1356
SSL Keywords	1356
The appid Keyword	1358
Application Layer Protocol Values	1359
The RPC Keyword	1359
The ASN.1 Keyword	1359
The urilen Keyword	1360
DCE/RPC Keywords	1361
SIP Keywords	1364
GTP Keywords	1366
SCADA Keywords	1378
Modbus Keywords	1378
DNP3 Keywords	1379
Packet Characteristics	1382
Active Response Keywords	1383
The resp Keyword	1384

The react Keyword	1385
The detection_filter Keyword	1385
The tag Keyword	1387
The flowbits Keyword	1388
flowbits Keyword Options	1388
Guidelines for Using the flowbits Keyword	1389
flowbits Keyword Examples	1390
The http_encode Keyword	1395
http_encode Keyword Syntax	1396
http_encode Keyword example: Using Two http_encode Keywords to Search for Two Encodings	1396
Overview: The file_type and file_group Keywords	1396
The file_type and file_group Keywords	1397
The file_data Keyword	1398
The pkt_data Keyword	1399
The base64_decode and base64_data Keywords	1399

CHAPTER 72**Intrusion Prevention Performance Tuning 1401**

About Intrusion Prevention Performance Tuning	1401
License Requirements for Intrusion Prevention Performance Tuning	1402
Requirements and Prerequisites for Intrusion Prevention Performance Tuning	1402
Limiting Pattern Matching for Intrusions	1402
Regular Expression Limits Overrides for Intrusion Rules	1403
Overriding Regular Expression Limits for Intrusion Rules	1404
Per Packet Intrusion Event Generation Limits	1404
Limiting Intrusion Events Generated Per Packet	1405
Packet and Intrusion Rule Latency Threshold Configuration	1405
Packet Latency Thresholding	1406
Packet Latency Thresholding Notes	1407
Configuring Packet Latency Thresholding	1407
Rule Latency Thresholding	1407
Rule Latency Thresholding Notes	1409
Configuring Rule Latency Thresholding	1409
Intrusion Performance Statistic Logging Configuration	1410

Configuring Intrusion Performance Statistic Logging 1410

PART XVIII

Advanced Network Analysis and Preprocessing 1413

CHAPTER 73

Advanced Access Control Settings for Network Analysis and Intrusion Policies 1415

About Advanced Access Control Settings for Network Analysis and Intrusion Policies 1415

Requirements and Prerequisites for Advanced Access Control Settings for Network Analysis and Intrusion Policies 1415

Inspection of Packets That Pass Before Traffic Is Identified 1416

Best Practices for Handling Packets That Pass Before Traffic Identification 1416

Specify a Policy to Handle Packets That Pass Before Traffic Identification 1416

Advanced Settings for Network Analysis Policies 1418

Setting the Default Network Analysis Policy 1418

Network Analysis Rules 1419

Configuring Network Analysis Rules 1420

Managing Network Analysis Rules 1420

CHAPTER 74

Getting Started with Network Analysis Policies 1423

Network Analysis Policy Basics 1423

License Requirements for Network Analysis Policies 1424

Requirements and Prerequisites for Network Analysis Policies 1424

Managing Network Analysis Policies 1424

Custom Network Analysis Policy Creation for Snort 2 1425

Creating a Custom Network Analysis Policy 1425

Network Analysis Policy Management for Snort 2 1426

Network Analysis Policy Settings and Cached Changes 1427

Editing Network Analysis Policies 1427

Preprocessor Configuration in a Network Analysis Policy for Snort 2 1428

Preprocessor Traffic Modification in Inline Deployments 1429

Preprocessor Configuration in a Network Analysis Policy Notes 1429

CHAPTER 75

Application Layer Preprocessors 1431

Introduction to Application Layer Preprocessors 1431

License Requirements for Application Layer Preprocessors 1432

Requirements and Prerequisites for Application Layer Preprocessors	1432
The DCE/RPC Preprocessor	1432
Connectionless and Connection-Oriented DCE/RPC Traffic	1433
DCE/RPC Target-Based Policies	1434
RPC over HTTP Transport	1434
DCE/RPC Global Options	1435
DCE/RPC Target-Based Policy Options	1437
Traffic-Associated DCE/RPC Rules	1441
Configuring the DCE/RPC Preprocessor	1441
The DNS Preprocessor	1443
DNS Preprocessor Options	1444
Configuring the DNS Preprocessor	1445
The FTP/Telnet Decoder	1446
Global FTP and Telnet Options	1446
Telnet Options	1447
Server-Level FTP Options	1448
FTP Command Validation Statements	1450
Client-Level FTP Options	1451
Configuring the FTP/Telnet Decoder	1452
The HTTP Inspect Preprocessor	1454
Global HTTP Normalization Options	1454
Server-Level HTTP Normalization Options	1455
Server-Level HTTP Normalization Encoding Options	1463
Configuring The HTTP Inspect Preprocessor	1466
Additional HTTP Inspect Preprocessor Rules	1467
The Sun RPC Preprocessor	1468
Sun RPC Preprocessor Options	1468
Configuring the Sun RPC Preprocessor	1469
The SIP Preprocessor	1469
SIP Preprocessor Options	1470
Configuring the SIP Preprocessor	1472
Additional SIP Preprocessor Rules	1473
The GTP Preprocessor	1474
GTP Preprocessor Rules	1474

Configuring the GTP Preprocessor	1475
The IMAP Preprocessor	1476
IMAP Preprocessor Options	1476
Configuring the IMAP Preprocessor	1477
Additional IMAP Preprocessor Rules	1478
The POP Preprocessor	1479
POP Preprocessor Options	1479
Configuring the POP Preprocessor	1480
Additional POP Preprocessor Rules	1481
The SMTP Preprocessor	1482
SMTP Preprocessor Options	1482
Configuring SMTP Decoding	1486
The SSH Preprocessor	1487
SSH Preprocessor Options	1488
Configuring the SSH Preprocessor	1491
The SSL Preprocessor	1491
How SSL Preprocessing Works	1492
SSL Preprocessor Options	1493
Configuring the SSL Preprocessor	1494
SSL Preprocessor Rules	1495

CHAPTER 76**SCADA Preprocessors 1497**

Introduction to SCADA Preprocessors	1497
License Requirements for SCADA Preprocessors	1497
Requirements and Prerequisites for SCADA Preprocessors	1498
The Modbus Preprocessor	1498
Modbus Preprocessor Ports Option	1498
Configuring the Modbus Preprocessor	1498
Modbus Preprocessor Rules	1499
The DNP3 Preprocessor	1500
DNP3 Preprocessor Options	1500
Configuring the DNP3 Preprocessor	1500
DNP3 Preprocessor Rules	1501

CHAPTER 77**Transport & Network Layer Preprocessors 1503**

- Introduction to Transport and Network Layer Preprocessors 1503
- License Requirements for Transport and Network Layer Preprocessors 1503
- Requirements and Prerequisites for Transport and Network Layer Preprocessors 1504
- Advanced Transport/Network Preprocessor Settings 1504
 - Ignored VLAN Headers 1504
 - Active Responses in Intrusion Drop Rules 1505
 - Advanced Transport/Network Preprocessor Options 1505
 - Configuring Advanced Transport/Network Preprocessor Settings 1506
- Checksum Verification 1507
 - Checksum Verification Options 1507
 - Verifying Checksums 1508
- The Inline Normalization Preprocessor 1508
 - Inline Normalization Options 1509
 - Configuring Inline Normalization 1514
- The IP Defragmentation Preprocessor 1515
 - IP Fragmentation Exploits 1515
 - Target-Based Defragmentation Policies 1516
 - IP Defragmentation Options 1516
 - Configuring IP Defragmentation 1518
- The Packet Decoder 1520
 - Packet Decoder Options 1520
 - Configuring Packet Decoding 1523
- TCP Stream Preprocessing 1524
 - State-Related TCP Exploits 1524
 - Target-Based TCP Policies 1524
 - TCP Stream Reassembly 1525
 - TCP Stream Preprocessing Options 1526
 - Configuring TCP Stream Preprocessing 1533
- UDP Stream Preprocessing 1534
 - UDP Stream Preprocessing Options 1535
 - Configuring UDP Stream Preprocessing 1535

CHAPTER 78**Detecting Specific Threats 1537**

- Introduction to Specific Threat Detection 1537
- License Requirements for Specific Threat Detection 1537
- Requirements and Prerequisites for Specific Threat Detection 1538
- Back Orifice Detection 1538
 - Back Orifice Detection Preprocessor 1538
 - Detecting Back Orifice 1539
- Portscan Detection 1539
 - Portscan Types, Protocols, and Filtered Sensitivity Levels 1540
 - Portscan Event Generation 1542
 - Portscan Event Packet View 1543
 - Configuring Portscan Detection 1544
- Rate-Based Attack Prevention 1546
 - Rate-Based Attack Prevention Examples 1547
 - detection_filter Keyword Example 1547
 - Dynamic Rule State Thresholding or Suppression Example 1548
 - Policy-Wide Rate-Based Detection and Thresholding or Suppression Example 1549
 - Rate-Based Detection with Multiple Filtering Methods Example 1550
 - Rate-Based Attack Prevention Options and Configuration 1551
 - Rate-Based Attack Prevention, Detection Filtering, and Thresholding or Suppression 1553
 - Configuring Rate-Based Attack Prevention 1553

CHAPTER 79**Adaptive Profiles 1557**

- About Adaptive Profiles 1557
- License Requirements for Adaptive Profiles 1558
- Requirements and Prerequisites for Adaptive Profiles 1558
- Adaptive Profiles and Firepower Recommended Rules 1558
- Adaptive Profile Options 1559
- Configuring Adaptive Profiles 1559

PART XIX**Discovery and Identity 1561**

CHAPTER 80**Introduction to Network Discovery and Identity 1563**

Uses for Host, Application, and User Discovery and Identity Data	1563
Host and Application Detection Fundamentals	1564
Passive Detection of Operating System and Host Data	1564
Active Detection of Operating System and Host Data	1564
Current Identities for Applications and Operating Systems	1565
Current User Identities	1566
Application and Operating System Identity Conflicts	1566
Netflow Data in the Firepower System	1567
Requirements for Using NetFlow Data	1568
Differences between NetFlow and Managed Device Data	1568
About User Identity	1571
Identity Terminology	1571
Best Practices for User Identity	1572
Identity Deployments	1574
The User Activity Database	1574
The Users Database	1574
Firepower System Host and User Limits	1575
Firepower System Host Limit	1575
Firepower System User Limit	1576
<hr/>	
CHAPTER 81	Host Identity Sources 1579
Overview: Host Data Collection	1579
Requirements and Prerequisites for Host Identity Sources	1580
Determining Which Host Operating Systems the System Can Detect	1580
Identifying Host Operating Systems	1580
Custom Fingerprinting	1581
Managing Fingerprints	1582
Activating and Deactivating Fingerprints	1582
Editing an Active Fingerprint	1583
Editing an Inactive Fingerprint	1583
Creating a Custom Fingerprint for Clients	1584
Creating a Custom Fingerprint for Servers	1586
Host Input Data	1589
Requirements for Using Third-Party Data	1589

- Third-Party Product Mappings 1590
 - Mapping Third-Party Products 1590
 - Mapping Third-Party Product Fixes 1592
- Mapping Third-Party Vulnerabilities 1593
- Custom Product Mappings 1594
 - Creating Custom Product Mappings 1594
 - Editing Custom Product Mapping Lists 1595
 - Activating and Deactivating Custom Product Mappings 1595
- eStreamer Server Streaming 1596
 - Choosing eStreamer Event Types 1596
 - Configuring eStreamer Client Communications 1597
- Configuring the Host Input Client 1598
- Nmap Scanning 1599
 - Nmap Remediation Options 1599
 - Nmap Scanning Guidelines 1603
 - Example: Using Nmap to Resolve Unknown Operating Systems 1604
 - Example: Using Nmap to Respond to New Hosts 1606
- Managing Nmap Scanning 1607
 - Adding an Nmap Scan Instance 1607
 - Editing an Nmap Scan Instance 1608
 - Adding an Nmap Scan Target 1609
 - Editing an Nmap Scan Target 1610
 - Creating an Nmap Remediation 1611
 - Editing an Nmap Remediation 1613
- Running an On-Demand Nmap Scan 1613
- Nmap Scan Results 1614
 - Viewing Nmap Scan Results 1615
 - Nmap Scan Results Fields 1616
 - Importing Nmap Scan Results 1616

CHAPTER 82

Application Detection 1619

- Overview: Application Detection 1619
 - Application Detector Fundamentals 1620
 - Identification of Application Protocols in the Web Interface 1621

Implied Application Protocol Detection from Client Detection	1622
Host Limits and Discovery Event Logging	1622
Special Considerations for Application Detection	1623
Requirements and Prerequisites for Application Detection	1624
Custom Application Detectors	1624
Custom Application Detector and User-Defined Application Fields	1625
Configuring Custom Application Detectors	1628
Creating a User-Defined Application	1629
Specifying Detection Patterns in Basic Detectors	1629
Specifying Detection Criteria in Advanced Detectors	1630
Testing a Custom Application Protocol Detector	1631
Viewing or Downloading Detector Details	1632
Sorting the Detector List	1633
Filtering the Detector List	1633
Filter Groups for the Detector List	1633
Navigating to Other Detector Pages	1634
Activating and Deactivating Detectors	1635
Editing Custom Application Detectors	1635
Deleting Detectors	1636

CHAPTER 83
User Identity Sources 1637

About User Identity Sources	1637
The User Agent Identity Source	1638
User Agent Guidelines	1639
Configure the User Agent for User Control	1639
Troubleshoot the User Agent Identity Source	1640
The ISE Identity Source	1640
How to Configure ISE for User Control	1641
ISE Guidelines and Limitations	1641
Configure ISE for User Control	1642
ISE Configuration Fields	1643
Troubleshoot ISE or Cisco TrustSec Issues	1644
The Captive Portal Identity Source	1646
Captive Portal Guidelines and Limitations	1646

How to Configure the Captive Portal for User Control	1648
Configure the Captive Portal Part 1: Create an Identity Policy	1650
Configure the Captive Portal Part 2: Create a TCP Port Access Control Rule	1651
Configure the Captive Portal Part 3: Create a User Access Control Rule	1652
Configure Captive Portal Part 4: Create an SSL Decrypt-Resign Policy	1653
Configure Captive Portal Part 5: Associate Identity and SSL Policies with the Access Control Policy	1654
Captive Portal Fields	1655
Exclude Applications from Captive Portal	1656
Troubleshoot the Captive Portal Identity Source	1657
The Traffic-Based Detection Identity Source	1658

CHAPTER 84**Network Discovery Policies 1661**

Overview: Network Discovery Policies	1661
Requirements and Prerequisites for Network Discovery Policies	1662
Network Discovery Customization	1662
Configuring the Network Discovery Policy	1663
Network Discovery Rules	1663
Configuring Network Discovery Rules	1664
Actions and Discovered Assets	1665
Monitored Networks	1665
Port Exclusions	1668
Zones in Network Discovery Rules	1669
The Traffic-Based Detection Identity Source	1670
Configuring Advanced Network Discovery Options	1672
Network Discovery General Settings	1673
Configuring Network Discovery General Settings	1674
Network Discovery Identity Conflict Settings	1674
Configuring Network Discovery Identity Conflict Resolution	1675
Network Discovery Vulnerability Impact Assessment Options	1675
Enabling Network Discovery Vulnerability Impact Assessment	1676
Indications of Compromise	1676
Enabling Indications of Compromise Rules	1677
Adding NetFlow Exporters to a Network Discovery Policy	1678

Network Discovery Data Storage Settings	1678
Configuring Network Discovery Data Storage	1680
Configuring Network Discovery Event Logging	1680
Adding Network Discovery OS and Server Identity Sources	1681
Troubleshooting Your Network Discovery Strategy	1682

CHAPTER 85
Realms and Identity Policies 1685

About Realms and Identity Policies	1685
About Realms	1685
Realms and Trusted Domains	1687
Supported Servers for Realms	1687
Supported Server Object Class and Attribute Names	1688
Troubleshoot Realms and User Downloads	1689
About Identity Policies	1691
License Requirements for Realms	1692
Requirements and Prerequisites for Realms	1692
Create a Realm	1692
Realm Fields	1693
Realm Directory and Download fields	1695
Realms and Identity Policies	1697
Connect Securely to Active Directory	1697
Find the Active Directory Server's Name	1697
Export the Active Directory Server's Root Certificate	1698
Export the Active Directory Server's Root Certificate	1700
Find the Active Directory Server's Name	1701
Configure a Realm Directory	1702
Download Users and Groups	1703
Create an Identity Policy	1704
Create an Identity Rule	1705
Identity Rule Fields	1706
Manage a Realm	1708
Compare Realms	1708
Manage an Identity Policy	1709
Manage an Identity Rule	1710

History for Realms 1710

PART XX

Correlation and Compliance 1711

CHAPTER 86

Compliance White Lists 1713

Introduction to Compliance White Lists 1713

Compliance White List Target Networks 1714

Compliance White List Host Profiles 1715

Operating System-Specific Host Profiles 1716

Shared Host Profiles 1716

White Violation Triggers 1717

Requirements and Prerequisites for Compliance 1718

Creating a Compliance White List 1718

Setting Target Networks for a Compliance White List 1719

Building White List Host Profiles 1720

Adding an Application Protocol to a Compliance White List 1721

Adding a Client to a Compliance White List 1722

Adding a Web Application to a Compliance White List 1723

Adding a Protocol to a Compliance White List 1723

Managing Compliance White Lists 1724

Editing a Compliance White List 1724

Managing Shared Host Profiles 1726

CHAPTER 87

Correlation Policies 1727

Introduction to Correlation Policies and Rules 1727

Requirements and Prerequisites for Compliance 1728

Configuring Correlation Policies 1729

Adding Responses to Rules and White Lists 1729

Managing Correlation Policies 1730

Configuring Correlation Rules 1731

Syntax for Intrusion Event Trigger Criteria 1732

Syntax for Malware Event Trigger Criteria 1735

Syntax for Discovery Event Trigger Criteria 1736

Syntax for User Activity Event Trigger Criteria 1739

Syntax for Host Input Event Trigger Criteria	1740
Syntax for Connection Event Trigger Criteria	1741
Syntax for Traffic Profile Changes	1744
Syntax for Correlation Host Profile Qualifications	1746
Syntax for User Qualifications	1748
Connection Trackers	1749
Adding a Connection Tracker	1750
Syntax for Connection Trackers	1750
Syntax for Connection Tracker Events	1752
Sample Configuration for Excessive Connections From External Hosts	1753
Sample Configuration for Excessive BitTorrent Data Transfers	1755
Snooze and Inactive Periods	1757
Correlation Rule Building Mechanics	1757
Adding and Linking Conditions in Correlation Rules	1759
Using Multiple Values in Correlation Rule Conditions	1759
Managing Correlation Rules	1760
Configuring Correlation Response Groups	1761
Managing Correlation Response Groups	1761

CHAPTER 88
Traffic Profiling 1763

Introduction to Traffic Profiles	1763
Traffic Profile Conditions	1765
Requirements and Prerequisites for Traffic Profiles	1767
Managing Traffic Profiles	1767
Configuring Traffic Profiles	1768
Adding Traffic Profile Conditions	1769
Adding Host Profile Qualifications to a Traffic Profile	1769
Syntax for Traffic Profile Conditions	1770
Syntax for Host Profile Qualifications in a Traffic Profile	1771
Using Multiple Values in a Traffic Profile Condition	1773

CHAPTER 89
Remediations 1775

Requirements and Prerequisites for Remediations	1775
Introduction to Remediations	1775

	Cisco IOS Null Route Remediations	1776
	Configuring Remediations for Cisco IOS Routers	1777
	Nmap Scan Remediations	1781
	Set Attribute Value Remediations	1781
	Configuring Set Attribute Remediations	1782
	Managing Remediation Modules	1783
	Managing Remediation Instances	1784
	Managing Instances for a Single Remediation Module	1784
<hr/>		
PART XXI	Reporting and Alerting	1787
<hr/>		
CHAPTER 90	Working with Reports	1789
	Introduction to Reports	1789
	Report Templates	1790
	Report Template Fields	1790
	Report Template Creation	1791
	Creating a Custom Report Template	1792
	Creating a Report Template from an Existing Template	1793
	Creating a Report Template from an Event View	1793
	Creating a Report Template by Importing a Dashboard or Workflow	1794
	Data Source Options on Import Report Sections	1794
	Report Template Configuration	1795
	Setting the Table and Data Format for a Report Template Section	1796
	Specifying the Search or Filter for a Report Template Section	1796
	Setting the Search Fields that Appear in Table Format Sections	1797
	Adding a Text Section to a Report Template	1797
	Adding a Page Break to a Report Template	1798
	Global Time Windows and Report Template Sections	1798
	Setting the Global Time Window for a Report Template and Its Sections	1798
	Setting the Local Time Window for Report Template Sections	1799
	Renaming a Report Template Section	1799
	Previewing a Report Template Section	1799
	Searches in Report Template Sections	1799
	Searching in Report Template Sections	1800

Input Parameters	1800
Predefined Input Parameters	1801
User-Defined Input Parameters	1801
Creating User-Defined Input Parameters	1802
Editing User-Defined Input Parameters	1802
Constraining a Search with User-Defined Input Parameters	1803
Document Attributes in a Report Template	1803
Editing Document Attributes in a Report Template	1804
Customizing a Cover Page	1804
Managing Report Template Logos	1805
Adding a New Logo	1805
Changing the Logo for a Report Template	1806
Deleting a Logo	1806
Managing Report Templates	1806
Editing Report Templates	1807
Exporting Report Templates	1808
Generating Reports	1808
Report Generation Options	1809
Distributing Reports by Email at Generation Time	1810
About Working with Generated Reports	1810
Viewing Reports	1810
Downloading Reports	1811
Storing Reports Remotely	1811
Moving Reports to Remote Storage	1812
Deleting Reports	1813

CHAPTER 91

External Alerting with Alert Responses	1815
Firepower Management Center Alert Responses	1815
Configurations Supporting Alert Responses	1816
Requirements and Prerequisites for Alert Responses	1816
Creating an SNMP Alert Response	1816
Creating a Syslog Alert Response	1818
Syslog Alert Facilities	1819
Syslog Severity Levels	1820

[Creating an Email Alert Response](#) 1821
[Configuring Impact Flag Alerting](#) 1821
[Configuring Discovery Event Alerting](#) 1822
[Configuring AMP for Networks Alerting](#) 1822

CHAPTER 92 **External Alerting for Intrusion Events** 1825

[About External Alerting for Intrusion Events](#) 1825
[License Requirements for External Alerting for Intrusion Events](#) 1826
[Requirements and Prerequisites for External Alerting for Intrusion Events](#) 1826
[Configuring SNMP Alerting for Intrusion Events](#) 1826
 [Intrusion SNMP Alert Options](#) 1827
[Configuring Syslog Alerting for Intrusion Events](#) 1828
 [Facilities and Priorities for Intrusion Syslog Alerts](#) 1829
[Configuring Email Alerting for Intrusion Events](#) 1830
 [Intrusion Email Alert Options](#) 1830

PART XXII **Event and Asset Analysis Tools** 1833

CHAPTER 93 **Using the Context Explorer** 1835

[About the Context Explorer](#) 1835
[Differences Between the Dashboard and the Context Explorer](#) 1836
[The Traffic and Intrusion Event Counts Time Graph](#) 1836
[The Indications of Compromise Section](#) 1837
 [The Hosts by Indication Graph](#) 1837
 [The Indications by Host Graph](#) 1837
[The Network Information Section](#) 1837
 [The Operating Systems Graph](#) 1837
 [The Traffic by Source IP Graph](#) 1838
 [The Traffic by Source User Graph](#) 1838
 [The Connections by Access Control Action Graph](#) 1838
 [The Traffic by Destination IP Graph](#) 1839
 [The Traffic by Ingress/Egress Security Zone Graph](#) 1839
[The Application Information Section](#) 1839
 [Focusing the Application Information Section](#) 1840

The Traffic by Risk/Business Relevance and Application Graph	1840
The Intrusion Events by Risk/Business Relevance and Application Graph	1840
The Hosts by Risk/Business Relevance and Application Graph	1841
The Application Details List	1841
The Security Intelligence Section	1841
The Security Intelligence Traffic by Category Graph	1842
The Security Intelligence Traffic by Source IP Graph	1842
The Security Intelligence Traffic by Destination IP Graph	1842
The Intrusion Information Section	1842
The Intrusion Events by Impact Graph	1843
The Top Attackers Graph	1843
The Top Users Graph	1843
The Intrusion Events by Priority Graph	1843
The Top Targets Graph	1843
The Top Ingress/Egress Security Zones Graph	1843
The Intrusion Event Details List	1844
The Files Information Section	1844
The Top File Types Graph	1844
The Top File Names Graph	1844
The Files by Disposition Graph	1845
The Top Hosts Sending Files Graph	1845
The Top Hosts Receiving Files Graph	1845
The Top Malware Detections Graph	1846
The Geolocation Information Section	1846
The Connections by Initiator/Responder Country Graph	1846
The Intrusion Events by Source/Destination Country Graph	1846
The File Events by Sending/Receiving Country Graph	1847
The URL Information Section	1847
The Traffic by URL Graph	1847
The Traffic by URL Category Graph	1847
The Traffic by URL Reputation Graph	1848
Requirements and Prerequisites for the Context Explorer	1848
Refreshing the Context Explorer	1848
Setting the Context Explorer Time Range	1849

- Minimizing and Maximizing Context Explorer Sections 1849
- Drilling Down on Context Explorer Data 1850
- Filters in the Context Explorer 1851
 - Data Type Field Options 1852
 - Creating a Filter from the Add Filter Window 1853
 - Creating a Quick Filter from the Context Menu 1854
 - Saving Filtered Context Explorer Views 1855
 - Viewing Filter Data 1855
 - Deleting a Filter 1855

CHAPTER 94

Using the Network Map 1857

- Requirements and Prerequisites for the Network Map 1857
- The Network Map 1857
 - The Hosts Network Map 1858
 - The Network Devices Network Map 1859
 - The Mobile Devices Network Map 1860
 - The Indications of Compromise Network Map 1860
 - The Application Protocols Network Map 1860
 - The Vulnerabilities Network Map 1861
 - The Host Attributes Network Map 1862
 - Viewing Network Maps 1862
- Custom Network Topologies 1863
 - Creating Custom Topologies 1864
 - Importing Networks from the Network Discovery Policy 1864
 - Manually Adding Networks to Your Custom Topology 1865
 - Activating and Deactivating Custom Topologies 1865
 - Editing Custom Topologies 1866

CHAPTER 95

Incidents 1867

- About Incident Handling 1867
 - Definition of an Incident 1867
 - Common Incident Handling Processes 1868
 - Incident Types in the Firepower System 1870
- License Requirements for Incidents 1871

Requirements and Prerequisites for Incidents	1871
Creating Custom Incident Types	1871
Creating an Incident	1872
Editing an Incident	1872
Generating Incident Reports	1873

PART XXIII
Workflows 1875

CHAPTER 96
Workflows 1877

Overview: Workflows	1877
Predefined Workflows	1877
Predefined Intrusion Event Workflows	1878
Predefined Malware Workflows	1879
Predefined File Workflows	1879
Predefined Captured File Workflows	1879
Predefined Connection Data Workflows	1880
Predefined Security Intelligence Workflows	1881
Predefined Host Workflows	1881
Predefined Indications of Compromise Workflows	1882
Predefined Applications Workflows	1882
Predefined Application Details Workflows	1883
Predefined Servers Workflows	1883
Predefined Host Attributes Workflows	1883
The Predefined Discovery Events Workflow	1883
Predefined User Workflows	1884
Predefined Vulnerabilities Workflows	1884
Predefined Third-Party Vulnerabilities Workflows	1884
Predefined Correlation and White List Workflows	1885
Predefined System Workflows	1885
Custom Table Workflows	1885
Using Workflows	1886
Workflow Access by User Role	1887
Workflow Selection	1888
Workflow Pages	1889

Workflow Page Navigation Tools	1891
Workflow Page Traversal Tools	1891
File Trajectory Icons	1891
Host Profile Icons	1892
Threat Score Icons	1892
The Workflow Toolbar	1892
Using Drill-Down Pages	1893
Using Table View Pages	1893
Geolocation	1894
Connection Event Graphs	1895
Using Connection Event Graphs	1896
Event Time Constraints	1901
Per-Session Time Window Customization for Events	1901
The Default Time Window for Events	1905
Event View Constraints	1907
Constraining Events	1907
Compound Event View Constraints	1908
Using Compound Event View Constraints	1909
Inter-Workflow Navigation	1909
Bookmarks	1910
Creating Bookmarks	1910
Viewing Bookmarks	1910

CHAPTER 97
Searching for Events 1913

Event Searches	1913
Search Constraints	1913
General Search Constraints	1914
Wildcards and Symbols in Searches	1914
Objects and Application Filters in Searches	1915
Time Constraints in Searches	1915
IP Addresses in Searches	1916
Managed Devices in Searches	1917
Ports in Searches	1917
Event Fields in Searches	1917

Performing a Search	1918
Saving a Search	1919
Loading a Saved Search	1920
Query Overrides Via the Shell	1921
Shell-Based Query Management Syntax	1921
Stopping Long-Running Queries	1921

CHAPTER 98
Custom Workflows 1923

Introduction to Custom Workflows	1923
Saved Custom Workflows	1923
Custom Workflow Creation	1924
Creating Custom Workflows Based on Non-Connection Data	1925
Creating Custom Connection Data Workflows	1926
Custom Workflow Use and Management	1927
Viewing Custom Workflows Based on Predefined Tables	1928
Viewing Custom Workflows Based on Custom Tables	1928
Editing Custom Workflows	1928

CHAPTER 99
Custom Tables 1931

Introduction to Custom Tables	1931
Predefined Custom Tables	1931
Possible Table Combinations	1932
User-Defined Custom Tables	1936
Creating a Custom Table	1936
Modifying a Custom Table	1937
Deleting a Custom Table	1938
Viewing a Workflow Based on a Custom Table	1938
Searching Custom Tables	1938

PART XXIV
Events and Assets 1941

CHAPTER 100
Connection Logging 1943

About Connection Logging	1943
Other Connections You Can Log	1944

- Connections That Are Always Logged 1944
- Beginning vs End-of-Connection Logging 1945
- Firepower Management Center vs External Logging 1946
- How Rules and Policy Actions Affect Logging 1947
 - Logging for Monitored Connections 1947
 - Logging for Trusted Connections 1948
 - Logging for Blocked Connections 1948
 - Logging for Allowed Connections 1949
- Connection Logging Strategies 1950
- Logging Decryptable Connections with SSL Rules 1951
- Logging Connections with Security Intelligence 1951
- Logging Connections with Access Control Rules 1952
- Logging Connections with a Policy Default Action 1953
- Limiting Logging of Long URLs 1953

CHAPTER 101

Connection and Security Intelligence Events 1955

- About Connection Events 1955
 - Connection vs. Security Intelligence Events 1955
 - NetFlow Connections 1956
 - Connection Summaries (Aggregated Data for Graphs) 1956
 - Long-Running Connections 1957
 - Combined Connection Summaries from External Responders 1957
- Connection and Security Intelligence Event Fields 1957
 - About Connection and Security Intelligence Event Fields 1969
 - A Note About Initiator/Responder, Source/Destination, and Sender/Receiver Fields 1970
 - Connection Event Reasons 1970
 - Requirements for Populating Connection Event Fields 1971
 - Information Available in Connection Event Fields 1973
- Using Connection and Security Intelligence Event Tables 1976
 - Viewing Files and Malware Detected in a Connection 1978
 - Viewing Intrusion Events Associated with a Connection 1979
 - Encrypted Connection Certificate Details 1980
- Viewing the Connection Summary Page 1980

CHAPTER 102**Working with Intrusion Events 1983**

- About Intrusion Events 1983
- Tools for Reviewing and Evaluating Intrusion Events 1983
- License Requirements for Intrusion Events 1984
- Requirements and Prerequisites for Intrusion Events 1984
- Viewing Intrusion Events 1984
 - About Intrusion Event Fields 1985
 - Intrusion Event Fields 1986
 - Intrusion Event Impact Levels 1995
 - Viewing Connection Data Associated with Intrusion Events 1996
 - Marking Intrusion Events Reviewed 1997
 - Viewing Previously Reviewed Intrusion Events 1998
 - Marking Reviewed Intrusion Events Unreviewed 1998
 - Preprocessor Events 1998
 - Preprocessor Generator IDs 1999
- Intrusion Event Workflow Pages 2000
 - Using Intrusion Event Workflows 2001
 - Intrusion Event Drill-Down Page Constraints 2003
 - Intrusion Event Table View Constraints 2003
 - Using the Intrusion Event Packet View 2004
 - Event Information Fields 2005
 - Frame Information Fields 2011
 - Data Link Layer Information Fields 2012
 - Viewing Network Layer Information 2013
 - Viewing Transport Layer Information 2015
 - Viewing Packet Byte Information 2018
 - Internally Sourced Intrusion Events 2018
- The Intrusion Events Clipboard 2018
 - Generating Clipboard Reports 2018
 - Deleting Events from the Clipboard 2019
- Viewing Intrusion Event Statistics 2020
 - Host Statistics 2020
 - Event Overview 2021

Event Statistics **2021**

Viewing Intrusion Event Performance Graphs **2022**

Intrusion Event Performance Statistics Graph Types **2022**

Viewing Intrusion Event Graphs **2026**

CHAPTER 103

File/Malware Events and Network File Trajectory **2027**

About File/Malware Events and Network File Trajectory **2027**

File and Malware Events **2028**

File and Malware Event Types **2028**

File Events **2028**

Malware Events **2028**

Retrospective Malware Events **2030**

Malware Events Generated by AMP for Endpoints **2030**

Using File and Malware Event Workflows **2032**

File and Malware Event Fields **2032**

Malware Event Sub-Types **2040**

Information Available in File and Malware Event Fields **2041**

View Details About Analyzed Files **2044**

File Composition Report **2044**

View File Details in AMP Private Cloud **2044**

Threat Scores and Dynamic Analysis Summary Reports **2044**

Using Captured File Workflows **2045**

Captured File Fields **2046**

Stored Files Download **2048**

Manually Submit Files for Analysis **2049**

Network File Trajectory **2049**

Recently Detected Malware and Analyzed Trajectories **2050**

Network File Trajectory Detailed View **2050**

Network File Trajectory Summary Information **2050**

Network File Trajectory Map and Related Events List **2052**

Using a Network File Trajectory **2053**

Work with Event Data in the AMP for Endpoints Console **2054**

CHAPTER 104

Using Host Profiles **2055**

Requirements and Prerequisites for Host Profiles	2055
Host Profiles	2056
Host Profile Limitations	2057
Viewing Host Profiles	2057
Basic Host Information in the Host Profile	2057
Operating Systems in the Host Profile	2059
Viewing Operating System Identities	2061
Setting the Current Operating System Identity	2062
Operating System Identity Conflicts	2062
Making a Conflicting Operating System Identity Current	2063
Resolving an Operating System Identity Conflict	2063
Servers in the Host Profile	2063
Server Details in the Host Profile	2065
Viewing Server Details	2066
Editing Server Identities	2066
Resolving Server Identity Conflicts	2067
Web Applications in the Host Profile	2068
Deleting Web Applications from the Host Profile	2069
Host Protocols in the Host Profile	2069
Deleting a Protocol From the Host Profile	2070
Indications of Compromise in the Host Profile	2070
VLAN Tags in the Host Profile	2070
User History in the Host Profile	2071
Host Attributes in the Host Profile	2071
Predefined Host Attributes	2071
White List Host Attributes	2072
User-Defined Host Attributes	2072
Creating Text- or URL-Based Host Attributes	2073
Creating Integer-Based Host Attributes	2073
Creating List-Based Host Attributes	2074
Setting Host Attribute Values	2074
White List Violations in the Host Profile	2075
Creating Shared White List Host Profiles	2075
Malware Detections in the Host Profile	2076

Vulnerabilities in the Host Profile	2077
Downloading Patches for Vulnerabilities	2077
Deactivating Vulnerabilities for Individual Hosts	2078
Deactivating Individual Vulnerabilities	2078
Scan Results in the Host Profile	2079
Scanning a Host from the Host Profile	2079
<hr/>	
CHAPTER 105	Working with Discovery Events 2081
Requirements and Prerequisites for Discovery Events	2081
Discovery and Identity Data in Discovery Events	2081
Viewing Discovery Event Statistics	2082
The Statistics Summary Section	2083
The Event Breakdown Section	2084
The Protocol Breakdown Section	2084
The Application Protocol Breakdown Section	2084
The OS Breakdown Section	2085
Viewing Discovery Performance Graphs	2085
Discovery Performance Graph Types	2086
Using Discovery and Identity Workflows	2086
Discovery and Host Input Events	2088
Discovery Event Types	2088
Host Input Event Types	2092
Viewing Discovery and Host Input Events	2094
Discovery Event Fields	2094
Host Data	2095
Viewing Host Data	2096
Host Data Fields	2096
Creating a Traffic Profile for Selected Hosts	2100
Creating a Compliance White List Based on Selected Hosts	2101
Host Attribute Data	2101
Viewing Host Attributes	2101
Host Attribute Data Fields	2102
Setting Host Attributes for Selected Hosts	2103
Indications of Compromise Data	2103

View and Work with Indications of Compromise Data	2103
Indications of Compromise Data Fields	2105
Editing Indication of Compromise Rule States for a Single Host	2105
Viewing Source Events for Indication of Compromise Tags	2106
Resolving Indication of Compromise Tags	2106
Server Data	2107
Viewing Server Data	2107
Server Data Fields	2108
Application and Application Details Data	2110
Viewing Application Data	2110
Application Data Fields	2111
Viewing Application Detail Data	2112
Application Detail Data Fields	2113
Vulnerability Data	2114
Vulnerability Data Fields	2115
Vulnerability Deactivation	2116
Viewing Vulnerability Data	2117
Viewing Vulnerability Details	2118
Deactivating Multiple Vulnerabilities	2118
Third-Party Vulnerability Data	2119
Viewing Third-Party Vulnerability Data	2119
Third-Party Vulnerability Data Fields	2119
Users and User Activity Data	2121
User-Related Fields	2121
User Data	2124
User Activity Data	2126
User Profile and Host History	2128
History for Working with Discovery Events	2130

CHAPTER 106
Correlation and Compliance Events 2131

Viewing Correlation Events	2131
Correlation Event Fields	2132
Using Compliance White List Workflows	2134
Viewing White List Events	2135

- White List Event Fields 2136
- Viewing White List Violations 2137
- White List Violation Fields 2138
- Remediation Status Events 2139
 - Viewing Remediation Status Events 2139
 - Remediation Status Table Fields 2140
 - Using the Remediation Status Events Table 2141

CHAPTER 107

Auditing the System 2143

- The System Log 2143
 - Viewing the System Log 2143
 - Syntax for System Log Filters 2144
- About System Auditing 2145

CHAPTER 1

Getting Started With Firepower

Cisco Firepower is an integrated suite of network security and traffic management products, deployed either on purpose-built platforms or as a software solution. The system is designed to help you handle network traffic in a way that complies with your organization's security policy—your guidelines for protecting your network.

In a typical deployment, multiple traffic-sensing *managed devices* installed on network segments monitor traffic for analysis and report to a *manager*:

- Firepower Management Center
- Adaptive Security Device Manager (ASDM)

Managers provide a centralized management console with graphical user interface that you can use to perform administrative, management, analysis, and reporting tasks.

This guide focuses on the *Firepower Management Center* managing appliance. For information about ASA with FirePOWER Services managed via ASDM, see the guide for that management method.

- *ASA with FirePOWER Services Local Management Configuration Guide*

- [Firepower System IP Address Conventions, on page 15](#)

Introduction to Managed Devices

Managed devices installed on network segments monitor traffic for analysis. Deployed passively, managed devices gather detailed information about your organization's assets: hosts, operating systems, applications, users, sent files (including malware), vulnerabilities, and so on. The Firepower System correlates this information for your analysis so you can monitor the websites your users visit and the applications they use, assess traffic patterns, and receive notifications of intrusions and other attacks.

Deployed inline, the system can affect the flow of traffic using *access control*, which allows you to specify, in a granular fashion, how to handle the traffic entering, exiting, and traversing your network. The data that you collect about your network traffic and all the information you glean from it can be used to filter and control that traffic based on:

- Simple, easily-determined transport and network layer characteristics: source and destination, port, protocol, and so on
- The latest contextual information on the traffic, including characteristics such as reputation, risk, business relevance, application used, or URL visited
- Microsoft Active Directory and LDAP users in your organization; you can grant different levels of access to different users
- Characteristics of encrypted traffic; you can also decrypt this traffic for further analysis
- Whether unencrypted or decrypted traffic contains a prohibited file, detected malware, or intrusion event

Note For the system to affect traffic, you must deploy relevant configurations to managed devices using routed, switched, or transparent interfaces, or inline interface pairs.

Each type of traffic inspection and control occurs where it makes the most sense for maximum flexibility and performance. For example, reputation-based blacklisting, because it uses simple source and destination data, can block prohibited traffic early in the process. In contrast, detecting and blocking intrusions and exploits is a last-line defense.

Network management features on 7000 and 8000 Series devices allow them to serve in switched and routed environments, perform network address translation (NAT), and to build secure virtual private network (VPN) tunnels between virtual routers you configure. You can also configure bypass interfaces, aggregated interfaces, 8000 Series fastpath rules, and strict TCP enforcement.

7000 and 8000 Series Managed Devices

Cisco Firepower 7000 and 8000 Series appliances are physical devices purpose-built for the Firepower System. 7000 and 8000 Series devices have a range of throughputs, but share most of the same capabilities. In general, 8000 Series devices are more powerful than 7000 Series; they also support additional features such as 8000 Series fastpath rules, link aggregation, and stacking.

NGIPSv

You can deploy NGIPSv (a 64-bit virtual device as an ESXi host) using the VMware vSphere Hypervisor or vCloud Director environment. You can also enable VMware Tools on all supported ESXi versions.

By default, NGIPSv uses e1000 (1 Gbit/s) interfaces. You can also use the VMware vSphere Client to replace the default sensing and management interfaces with vmxnet3 (10 Gbit/s) interfaces.

Regardless of license, NGIPSv does not support any of the system's hardware-based features: redundancy and resource sharing, switching, routing, and so on.

Cisco ASA with FirePOWER Services

Cisco ASA with FirePOWER Services (or an ASA *FirePOWER module*) functions similarly to NGIPSv. In an ASA FirePOWER deployment, the ASA device provides the first-line system policy and passes traffic to the Firepower System for discovery and access control.

Regardless of the licenses installed and applied, ASA FirePOWER does not support any of the following Firepower System features:

- ASA FirePOWER does not support the Firepower System 7000 and 8000 Series hardware-based features: device high availability, stacking, switching, routing, VPN, NAT, and so on. However, the ASA platform does provide these features, which you can configure using the ASA CLI and ASDM. See the ASA documentation for more information.
- You cannot use the Firepower Management Center web interface to configure ASA FirePOWER interfaces. The Firepower Management Center does not display ASA interfaces when the ASA FirePOWER is deployed in SPAN port mode.
- You cannot use the Firepower Management Center to shut down, restart, or otherwise manage ASA FirePOWER processes.

ASA FirePOWER has a software and a command line interface (CLI) unique to the ASA platform. You use these ASA-specific tools to install the system and to perform other platform-specific administrative tasks.

Note If you edit an ASA FirePOWER and switch from multiple context mode to single context mode (or vice versa), the device renames all of its interfaces. You **must** reconfigure all Firepower System security zones, correlation rules, and related configurations to use the updated ASA FirePOWER interface names.

Firepower Threat Defense

The Firepower Threat Defense appliance provides a unified next-generation firewall and next-generation IPS device. In addition to the IPS features available on Firepower Software models, firewall and platform features include Site-to-Site VPN, robust routing, NAT, clustering (for the Firepower 9300), and other optimizations in application inspection and access control.

The Firepower Threat Defense software is supported on the following platforms:

- Firepower 9300
- Firepower 4100 series
- ASA 5512-X through 5555-X
- ASA 5508-X and 5516-X
- ASA 5506-X series

Firepower Threat Defense Virtual

The Firepower Threat Defense Virtual (a 64-bit virtual appliance) provides unified next-generation firewall and next-generation IPS capabilities to virtualized environments. Firepower Threat Defense Virtual is designed to work in multiple hypervisor environments, reduce administrative overhead, and increase operational efficiency.

You can deploy Firepower Threat Defense Virtual using the VMware vSphere hypervisor and the KVM (Kernel-based Virtual Machine) hypervisor environments. You can also deploy Firepower Threat Defense Virtual through Amazon Web Services (AWS) cloud platform.

You can use the Firepower Management Center for comprehensive multi-device deployment and management of both the virtual appliance and the physical Firepower Threat Defense appliances.

Introduction to the Firepower Management Center

A Firepower Management Center is a fault-tolerant, purpose-built network appliance that provides a centralized management console and database repository for your Firepower System deployment. You can also deploy 64-bit virtual Firepower Management Centers using the VMware vSphere and the KVM (Kernel-based Virtual Machine) hypervisor environments, and also through Amazon Web Services (AWS) cloud platform. Firepower Management Centers have a range of device management, event storage, host monitoring, and user monitoring capabilities. Any Firepower Management Center can manage any type of Firepower System device.

Firepower Management Centers aggregate and correlate network traffic information and performance data, assessing the impact of events on particular hosts. You can monitor the information that your devices report, and assess and control the overall activity that occurs on your network. Firepower Management Centers also control the network management features on your devices: switching, routing, NAT, VPN, and so on.

Key features of the Firepower Management Center include:

- Device, license, and policy management
- Event and contextual information displayed in tables, graphs, and charts
- Health and performance monitoring
- External notification and alerting
- Correlation, indications of compromise, and remediation features for real-time threat response
- Custom and template-based reporting

Firepower Management Center Capabilities

When running this version, all Firepower Management Centers have similar capabilities, with the primary differences being capacity and speed. Firepower Management Center models vary in terms of how many devices they can manage, how many events they can store, and how many hosts and users they can monitor.

Configuration of features available in the Firepower Management Center web interface may be limited by the license and model of the device you are managing.

The MC4000 introduces Cisco's Unified Computing System (UCS) platform into the Firepower System. The MC4000 does not support Cisco functionality that uses tools on the baseboard management controller (BMC), such as the UCS Manager or the Cisco Integrated Management Controller (CIMC).

[About Device Management](#), on page 197

[Configuring Database Event Limits](#), on page 703

Firepower System Components

The topics that follow describe some of the key capabilities of the Firepower System that contribute to your organization's security, acceptable use policy, and traffic management strategy.

Tip Many Firepower System features are appliance model, license, and user role dependent. This documentation includes information about which Firepower System licenses and devices are required for each feature, and which user roles have permission to complete each procedure.

Redundancy and Resource Sharing

The redundancy and resource-sharing features of the Firepower System allow you to ensure continuity of operations and to combine the processing resources of multiple 7000 and 8000 Series devices.

Device Stacking

Device stacking allows you to increase the amount of traffic inspected on a network segment by connecting two to four devices in a stacked configuration. When you establish a stacked configuration, you combine the resources of each stacked device into a single, shared configuration.

7000 and 8000 Series Device High Availability

7000 and 8000 Series *device high availability* allows you to establish redundancy of networking functionality and configuration data between two or more 7000 or 8000 Series devices or stacks. Configuring two or more peer devices or stacks into a high-availability pair results in a single logical system for policy applies, system updates, and registration. With device high availability, the system can fail over either manually or automatically.

In most cases, you can achieve Layer 3 redundancy without configuring a high-availability pair by using SFRP. SFRP allows devices to act as redundant gateways for specified IP addresses. With network redundancy, you can configure two or more devices or stacks to provide identical network connections, ensuring connectivity for other hosts on the network.

Network Traffic Management for 7000 & 8000 Series Devices

The Firepower System's network traffic management features allow 7000 and 8000 Series devices to act as part of your organization's network infrastructure. You can configure 7000 and 8000 Series devices to serve in a switched, routed, or hybrid (switched and routed) environment; to perform network address translation (NAT); and to build secure virtual private network (VPN) tunnels.

Switching

You can configure the Firepower System in a Layer 2 deployment so that it provides packet switching between two or more network segments. In a Layer 2 deployment, you configure switched interfaces and virtual switches on 7000 and 8000 Series devices to operate as standalone broadcast domains. A virtual switch uses the MAC address from a host to determine where to send packets. You can also group multiple physical interfaces into a single logical link that provides packet switching between two endpoints in your network. The endpoints can be two 7000 and 8000 Series devices, or a managed device connected to a third-party access switch.

Routing

You can configure the Firepower System in a Layer 3 deployment so that it routes traffic between two or more interfaces. In a Layer 3 deployment, you configure routed interfaces and virtual routers on 7000 and

8000 Series devices to receive and forward traffic. The system routes packets by making packet forwarding decisions according to the destination IP address. Routers obtain the destination from the outgoing interface based on the forwarding criteria, and access control rules designate the security policies to apply.

When you configure virtual routers, you can define static routes. In addition, you can configure Routing Information Protocol (RIP) and Open Shortest Path First (OSPF) dynamic routing protocols. You can also configure a combination of static routes and RIP or static routes and OSPF. You can set up DHCP relay for each virtual router you configure.

If you use both virtual switches and virtual routers in your deployment, you can configure associated hybrid interfaces to bridge traffic between them. These utilities analyze traffic to determine its type and the appropriate response (route, switch, or otherwise). You can also group multiple physical interfaces into a single logical link that routes traffic between two endpoints in your network. The endpoints can be two 7000 and 8000 Series devices, or a managed device connected to a third-party router.

NAT

In a Layer 3 deployment, you can configure network address translation (NAT) using 7000 and 8000 Series devices. You can expose an internal server to an external network, or allow an internal host or server to connect to an external application. You can also configure NAT to hide private network addresses from an external network by using a block of IP addresses, or by using a limited block of IP addresses and port translation.

VPN

A virtual private network (VPN) is a network connection that establishes a secure tunnel between endpoints via a public source, like the Internet or other network. You can configure the Firepower System to build secure VPN tunnels between the virtual routers of 7000 and 8000 Series devices.

Multitenancy

The *domains* feature allows you to implement multitenancy within a Firepower System deployment, by segmenting user access to managed devices, configurations, and events.

In addition to any restrictions imposed by your user role, your current domain level can also limit your ability to modify configurations. The system limits most management tasks, like system software updates, to the Global domain.

Discovery and Identity

Cisco's discovery and identity technology collects information about hosts, operating systems, applications, users, files, networks, geolocation information, and vulnerabilities, in order to provide you with a complete view of your network:

- *Network discovery* policies monitor traffic on your network and collect host, application, and non-authoritative user data.
- *Identity* policies associate users on your network with a *realm* and an authentication method in order to collect authoritative user data.

You configure *realms* alongside your identity policies in order to establish connections to LDAP or AD servers and to perform user data downloads.

You can use certain types of discovery and identity data to build a comprehensive map of your network assets, perform forensic analysis, behavioral profiling, access control, and mitigate and respond to the vulnerabilities and exploits to which your organization is susceptible.

You can also use the Firepower Management Center's web interface to view and analyze the data collected by the system.

Access Control

Access control is a policy-based feature that allows you to specify, inspect, and log the traffic that can traverse your network. An *access control policy* determines how the system handles traffic on your network.

The simplest access control policy directs its target devices to handle all traffic using its *default action*. You can set this default action to block or trust all traffic without further inspection, or to inspect traffic for intrusions and discovery data.

A more complex access control policy can blacklist traffic based on IP, URL, and DNS Security Intelligence data, as well as use *access control rules* to exert granular control over network traffic logging and handling. These rules can be simple or complex, matching and inspecting traffic using multiple criteria; you can control traffic by security zone, network or geographical location, VLAN, port, application, requested URL, and user. Advanced access control options include decryption, preprocessing, and performance.

Each access control rule also has an *action*, which determines whether you monitor, trust, block, or allow matching traffic. When you allow traffic, you can specify that the system first inspect it with intrusion or file policies to block any exploits, malware, or prohibited files before they reach your assets or exit your network.

SSL Inspection

SSL inspection is a policy-based feature that allows you to handle encrypted traffic without decryption, or decrypt encrypted traffic for further access control inspection. You can choose to block a source of untrusted encrypted traffic without decrypting or further analyzing the traffic, or you can choose to not decrypt encrypted traffic and inspect it with access control instead.

For further insight into encrypted traffic, you can use public key certificates and paired private keys you upload to the system to decrypt encrypted traffic traversing your network, then inspect the decrypted traffic with access control as if it was never encrypted. If the system does not block the decrypted traffic post-analysis, it reencrypts the traffic before passing it to the destination host. The system can log details about encrypted connections as it acts on them.

Intrusion Detection and Prevention

Intrusion detection and prevention is the system's last line of defense before traffic is allowed to its destination. *Intrusion policies* are defined sets of intrusion detection and prevention configurations invoked by your access control policy. Using *intrusion rules* and other settings, these policies inspect traffic for security violations and, in inline deployments, can block or alter malicious traffic.

Cisco delivers several intrusion policies with the Firepower System. By using system-provided policies you can take advantage of the experience of the Cisco Talos Intelligence Group (Talos). For these policies, Talos sets intrusion and preprocessor rule states (enabled or disabled), as well as provides the initial configurations for other advanced settings. An enabled rule causes the system to generate intrusion events for (and optionally block) traffic matching the rule.

If the system-provided policies do not fully address the security needs of your organization, custom policies can improve the performance of the system in your environment and can provide a focused view of the malicious traffic and policy violations occurring on your network. By creating and tuning custom policies you can configure, at a very granular level, how the system processes and inspects the traffic on your network for intrusions.

Cisco Advanced Malware Protection and File Control

To help you identify and mitigate the effects of malware, the Firepower System's file control, network file trajectory, and Advanced Malware Protection (AMP) components can detect, track, capture, analyze, and optionally block the transmission of files (including malware files and nested files inside archive files) in network traffic.

File Control

File control allows managed devices to detect and block your users from uploading (sending) or downloading (receiving) files of specific types over specific application protocols. You configure file control as part of your overall access control configuration; file policies associated with access control rules inspect network traffic that meets rule conditions.

AMP for Firepower

AMP for Firepower is a network-based AMP solution, which allows the system to inspect network traffic for malware in several types of files. Appliances can store detected files for further analysis, either to their hard drive or (for some models) a malware storage pack.

You can analyze files locally on your device using *local malware analysis* to preclassify malware. Regardless of whether you store a detected file, you can submit it to the AMP cloud for a simple known-disposition lookup using the file's SHA-256 hash value. You can also submit files to the Cisco Threat Grid cloud for *dynamic analysis*, which produces a threat score. Using this contextual information, you can configure the system to block or allow specific files.

You configure AMP for Firepower as part of your overall access control configuration; file policies associated with access control rules inspect network traffic that meets rule conditions.

AMP for Endpoints Integration

AMP for Endpoints is an enterprise-class endpoint-based AMP solution. Individual users install lightweight connectors on their computers and mobile devices that communicate with the AMP cloud. The Firepower Management Center can then import records of scans, malware detections, and quarantines, as well as indications of compromise (IOC), and can display trajectories for detected threats.

Use the AMP for Endpoints management console to configure your AMP for Endpoints deployment. The console helps you quickly identify and quarantine malware. You can identify outbreaks when they occur, track their trajectories, understand their effects, and learn how to successfully recover. You can also use AMP for Endpoints to create custom protections, block execution of certain applications based on group policy, and create custom whitelists.

Network File Trajectory

The network file trajectory feature allows you to track a file's transmission path across a network. The system uses SHA-256 hash values to track files; so, to track a file, the system must either:

- Calculate the file's SHA-256 hash value and query the AMP cloud using that value

- Receive endpoint-based threat and quarantine data about that file, using the Firepower Management Center's integration with your organization's AMP for Endpoints deployment

Each file has an associated trajectory map, which contains a visual display of the file's transfers over time and additional information about the file.

Cisco AMP Private Cloud Virtual Appliance

If your organization's security policy does not allow the system to connect directly to the AMP cloud, whether for AMP for Firepower or AMP for Endpoints, you can configure a Cisco AMP Private Cloud Virtual Appliance (AMPv).

AMPv is a virtual machine that acts as a compressed, on-premises version of, or anonymized proxy to, the AMP cloud. Data and actions that usually involve a direct connection to the AMP cloud (such as events from AMP for Endpoints, file disposition lookups, retrospective events, and so on) are instead handled by a local connection to AMPv. With AMPv, no endpoint event data is shared over an external connection.

Cisco AMP Threat Grid On-Premises Appliance

If your organization has privacy or security concerns with submitting files to the public Cisco Threat Grid cloud, you can deploy an on-premises Cisco Threat Grid appliance. Like the public cloud, the on-premises appliance runs eligible files in a sandbox environment, and returns a threat score and dynamic analysis report to the Firepower System. However, the on-premises appliance does not communicate with the public cloud, or any other system external to your network.

Application Programming Interfaces

There are several ways to interact with the system using application programming interfaces (APIs).

eStreamer

The Event Streamer (eStreamer) allows you to stream several kinds of event data from a Firepower Management Center to a custom-developed client application. After you create a client application, you can connect it to the eStreamer server on the Firepower Management Center, start the eStreamer service, and begin exchanging data.

eStreamer integration requires custom programming, but allows you to request specific data from an appliance. If, for example, you display network host data within one of your network management applications, you could write a program to retrieve host criticality or vulnerability data from the Firepower Management Center and add that information to your display.

External Database Access

The database access feature allows you to query several database tables on a Firepower Management Center, using a third-party client that supports JDBC SSL connections.

You can use an industry-standard reporting tool such as Crystal Reports, Actuate BIRT, or JasperSoft iReport to design and submit queries. Or, you can configure your own custom application to query Cisco data. For example, you could build a servlet to report intrusion and discovery event data periodically or refresh an alert dashboard.

Host Input

The host input feature allows you to augment discovery data by importing data from third-party sources using scripts or command-line import files.

The web interface also provides some host input functionality; you can modify operating system or application protocol identities, validate or invalidate vulnerabilities, and delete various items from network maps, including clients and server ports.

Remediation

The system includes an API that allows you to create *remediations* that your Firepower Management Center can automatically launch when conditions on your network violate an associated correlation policy or compliance white list. Remediations can automatically mitigate attacks when you are not immediately available to address them, and ensure that your system remains compliant with your organization's security policy. In addition to remediations that you create, the Firepower Management Center ships with several predefined remediation modules.

The Context Menu

Certain pages in the Firepower System web interface support a right-click (most common) or left-click context menu that you can use as a shortcut for accessing other features in the Firepower System. The contents of the context menu depend where you access it—not only the page but also the specific data.

For example:

- IP address hotspots provide information about the host associated with that address, including any available whois and host profile information.
- SHA-256 hash value hotspots allow you to add a file's SHA-256 hash value to the clean list or custom detection list, or view the entire hash value for copying.

On pages or locations that do not support the Firepower System context menu, the normal context menu for your browser appears.

Policy Editors

Many policy editors contain hotspots over each rule. You can insert new rules and categories; cut, copy, and paste rules; set the rule state; and edit the rule.

Intrusion Rules Editor

The intrusion rules editor contains hotspots over each intrusion rule. You can edit the rule, set the rule state, configure thresholding and suppression options, and view rule documentation.

Event Viewer

Event pages (the drill-down pages and table views available under the Analysis menu) contain hotspots over each event, IP address, URL, DNS query, and certain files' SHA-256 hash values. While viewing most event types, you can:

- View related information in the Context Explorer.
- Drill down into event information in a new window.
- View the full text in places where an event field contains text too long to fully display in the event view, such as a file's SHA-256 hash value, a vulnerability description, or a URL.

While viewing connection events, you can add items to the default Security Intelligence Block and Do Not Block lists:

- An IP address, from an IP address hotspot.
- A URL or domain name, from a URL hotspot.
- A DNS query, from a DNS query hotspot.

While viewing captured files, file events, and malware events, you can:

- Add a file to or remove a file from the clean list or custom detection list.
- Download a copy of the file.
- View nested files inside an archive file.
- Download the parent archive file for a nested file.
- View the file composition.
- Submit the file for local malware and dynamic analysis.

While viewing intrusion events, you can perform similar tasks to those in the intrusion rules editor or an intrusion policy:

- Edit the triggering rule.
- Set the rule state, including disabling the rule.
- Configure thresholding and suppression options.
- View rule documentation.

Intrusion Event Packet View

Intrusion event packet views contain IP address hotspots. The packet view uses a left-click context menu.

Dashboard

Many dashboard widgets contain hotspots to view related information in the Context Explorer. Dashboard widgets can also contain IP address and SHA-256 hash value hotspots.

Context Explorer

The Context Explorer contains hotspots over its charts, tables, and graphs. If you want to examine data from graphs or lists in more detail than the Context Explorer allows, you can drill down to the table views of the relevant data. You can also view related host, user, application, file, and intrusion rule information.

The Context Explorer uses a left-click context menu, which also contains filtering and other options unique to the Context Explorer.

[Security Intelligence Lists and Feeds](#), on page 375

Switching Domains on the Firepower Management Center

In a multidomain deployment, user role privileges determine which domains a user can access and which privileges the user has within each of those domains. You can associate a single user account with multiple domains and assign different privileges for that user in each domain. For example, you can assign a user read-only privileges in the Global domain, but Administrator privileges in a descendant domain.

Users associated with multiple domains can switch between domains within the same web interface session.

Under your user name in the toolbar, the system displays a tree of available domains. The tree:

- Displays ancestor domains, but may disable access to them based on the privileges assigned to your user account.
- Hides any other domain your user account cannot access, including sibling and descendant domains.

When you switch to a domain, the system displays:

- Data that is relevant to that domain only.
- Menu options determined by the user role assigned to you for that domain.

Procedure

From the drop-down list under your user name, choose the domain you want to access.

Firepower Online Help and Documentation

You can reach the online help from the web interface:

- By clicking the context-sensitive help link on each page
- By choosing **Help > Online**

You can find additional documentation related to the Firepower system using the documentation roadmap: <http://www.cisco.com/c/en/us/td/docs/security/firepower/roadmap/firepower-roadmap.html>.

Top-Level Documentation Listing Pages for FMC Deployments

The following documents may be helpful when configuring Firepower Management Center deployments, Version 6.0+.

Note Some of the linked documents are not applicable to Firepower Management Center deployments. For example, some links on Firepower Threat Defense pages are specific to deployments managed by Firepower Device Manager, and some links on hardware pages are unrelated to FMC. To avoid confusion, pay careful attention to document titles. Also, some documents cover multiple products and therefore may appear on multiple product pages.

Firepower Management Center

- Firepower Management Center hardware appliances:
<http://www.cisco.com/c/en/us/support/security/defense-center/tsd-products-support-series-home.html>
- Firepower Management Center Virtual appliances:
 - <http://www.cisco.com/c/en/us/support/security/defense-center-virtual-appliance/tsd-products-support-series-home.html>

License Statements in the Documentation

The License statement at the beginning of a section indicates which Classic or Smart license you must assign to a managed device in the Firepower System to enable the feature described in the section.

Because licensed capabilities are often additive, the license statement provides only the highest required license for each feature.

An “or” statement in a License statement indicates that you must assign a particular license to the managed device to enable the feature described in the section, but an additional license can add functionality. For example, within a file policy, some file rule actions require that you assign a Protection license to the device while others require that you assign a Malware license.

For more information about licenses, see [About Firepower Licenses, on page 101](#).

Related Topics

[About Firepower Licenses, on page 101](#)

Supported Devices Statements in the Documentation

The Supported Devices statement at the beginning of a chapter or topic indicates that a feature is supported only on the specified device series, family, or model. For example, many features are supported only on Firepower Threat Defense devices.

For more information on platforms supported by this release, see the release notes.

Access Statements in the Documentation

The Access statement at the beginning of each procedure in this documentation indicates the predefined user roles required to perform the procedure. Any of the listed roles can perform the procedure.

Users with custom roles may have permission sets that differ from those of the predefined roles. When a predefined role is used to indicate access requirements for a procedure, a custom role with similar permissions also has access. Some users with custom roles may use slightly different menu paths to reach configuration pages. For example, users who have a custom role with only intrusion policy privileges access the network analysis policy via the intrusion policy instead of the standard path through the access control policy.

For more information about user roles, see [Predefined User Roles, on page 42](#) and [Custom User Roles, on page 43](#).

Firepower System IP Address Conventions

You can use IPv4 Classless Inter-Domain Routing (CIDR) notation and the similar IPv6 prefix length notation to define address blocks in many places in the Firepower System.

When you use CIDR or prefix length notation to specify a block of IP addresses, the Firepower System uses **only** the portion of the network IP address specified by the mask or prefix length. For example, if you type 10.1.2.3/8, the Firepower System uses 10.0.0.0/8.

In other words, although Cisco recommends the standard method of using a network IP address on the bit boundary when using CIDR or prefix length notation, the Firepower System does not require it.

PART I

Your User Account

- [Logging into the Firepower System, on page 19](#)
- [Specifying User Preferences, on page 31](#)

CHAPTER 2

Logging into the Firepower System

The following topics describe how to log into the Firepower System:

- [Firepower System User Accounts, on page 19](#)
- [Firepower System User Interfaces, on page 21](#)
- [Logging Into the Firepower Management Center Web Interface, on page 24](#)
- [Logging Into the Web Interface of a 7000 or 8000 Series Device, on page 25](#)
- [Logging Into the Firepower Management Center with CAC Credentials, on page 26](#)
- [Logging Into a 7000 or 8000 Series Device with CAC Credentials, on page 26](#)
- [Logging Into the CLI on 7000/8000 Series, ASA FirePOWER, and NGIPSv Devices, on page 27](#)
- [Logging Into the Command Line Interface on Firepower Threat Defense Devices, on page 28](#)
- [Logging Out of a Firepower System Web Interface, on page 29](#)

Firepower System User Accounts

You must provide a username and password to obtain local access to the web interface, shell, or CLI on an FMC or managed device. On managed devices, CLI users with Config level access can use the `expert` command to access the Linux shell. On the FMC, all CLI users can use the `expert` command. The FTD and FMC can be configured to use external authentication, storing user credentials on an external LDAP or RADIUS server; you can withhold or provide CLI/shell access rights to external users.

The FMC CLI provides a single **admin** user who has access to all commands. The features FMC web interface users can access are controlled by the privileges an administrator grants to the user account. On managed devices, the features that users can access for both the CLI and the web interface are controlled by the privileges an administrator grants to the user account.

Note The system audits user activity based on user accounts; make sure that users log into the system with the correct account.

-
- Caution** All FMC CLI users and, on managed devices, users with Config level CLI access can obtain root privileges in the Linux shell, which can present a security risk. For system security reasons, we strongly recommend:
- If you establish external authentication, make sure that you restrict the list of users with CLI/shell access appropriately.
 - When granting CLI access privileges on managed devices, restrict the list of internal users with Config level CLI access.
 - Do not establish Linux shell users; use only the pre-defined **admin** user and users created by the **admin** user within the CLI.
-

-
- Caution** We strongly recommend that you do not use the Linux shell unless directed by Cisco TAC or explicit instructions in the Firepower user documentation.
-

Different appliances support different types of user accounts, each with different capabilities.

Firepower Management Centers

Firepower Management Centers support the following user account types:

- A pre-defined **admin** account for web interface access, which has the administrator role and can be managed through the web interface.
- Custom user accounts, which provide web interface access and which **admin** users and users with administrator privileges can create and manage.
- A pre-defined **admin** account for shell access, which can obtain root privileges.

-
- Caution** For system security reasons, Cisco strongly recommends that you not establish additional Linux shell users on any appliance.
-

7000 & 8000 Series Devices

7000 & 8000 Series devices support the following user account types:

- A pre-defined **admin** account which can be used for all forms of access to the device.
- Custom user accounts, which **admin** users and users with the administrator role can create and manage.

The 7000 & 8000 Series supports external authentication for users.

NGIPSv Devices

NGIPSv devices support the following user account types:

- A pre-defined **admin** account which can be used for all forms of access to the device.
- Custom user accounts, which **admin** users and users with Config access can create and manage.

The NGIPSv does not support external authentication for users.

Firepower Threat Defense and Firepower Threat Defense Virtual Devices

Firepower Threat Defense and Firepower Threat Defense Virtual devices support the following user account types:

- A pre-defined **admin** account which can be used for all forms of access to the device.
- Custom user accounts, which **admin** users and users with Config access can create and manage.

The Firepower Threat Defense supports external authentication for SSH users accessing the Diagnostic or data interfaces (and also for HTTP access for packet captures); external authentication is not available for SSH to the Management interface. See [Configure External Authentication for SSH and HTTP](#), on page 763.

ASA FirePOWER Devices

The ASA FirePOWER module supports the following user account types:

- A pre-defined **admin** account.
- Custom user accounts, which **admin** users and users with Config access can create and manage.

The ASA FirePOWER module does not support external authentication for users. Accessing ASA devices via the ASA CLI and ASDM is described in the *Cisco ASA Series General Operations CLI Configuration Guide* and the *Cisco ASA Series General Operations ASDM Configuration Guide*.

Firepower System User Interfaces

Depending on appliance type, you can interact with Firepower appliances using a web-based GUI, auxiliary CLI, or the Linux shell. In a Firepower Management Center deployment, you perform most configuration tasks from the FMC GUI. Only a few tasks require that you access the appliance directly using the CLI or Linux shell. We strongly discourage using the Linux shell unless directed by Cisco TAC or explicit instructions in the Firepower user documentation.

For information on browser requirements, see the [Firepower Release Notes](#).

Appliance	Web-Based GUI	Auxiliary CLI	Linux Shell
Firepower Management Center	<ul style="list-style-type: none"> • Supported for predefined admin user and custom user accounts. • Can be used for administrative, management, and analysis tasks. 	—	<ul style="list-style-type: none"> • Supported for predefined admin user and custom external user accounts. • Accessible using an SSH, serial, or keyboard and monitor connection. • Should be used only for administration and troubleshooting directed by Cisco TAC or by explicit instructions in the FMC documentation.

[Managing User Accounts](#), on page 61

Web Interface Considerations

- If your organization uses Common Access Cards (CACs) for authentication, external users authenticated with LDAP can use CAC credentials to obtain access to the web interface of an appliance.
- The first time you visit the appliance home page during a web session, you can view information about your last login session for that appliance. You can see the following information about your last login:
 - the day of the week, month, date, and year of the login
 - the appliance-local time of the login in 24-hour notation
 - the host and domain name last used to access the appliance
- The menus and menu options listed at the top of the default home page are based on the privileges for your user account. However, the links on the default home page include options that span the range of user account privileges. If you click a link that requires different privileges from those granted to your account, the system displays a warning message and logs the activity.
- Some processes that take a significant amount of time may cause your web browser to display a message that a script has become unresponsive. If this occurs, make sure you allow the script to continue until it finishes.

Related Topics

[Specifying Your Home Page](#), on page 32

Session Timeout

By default, the Firepower System automatically logs you out of a session after 1 hour of inactivity, unless you are otherwise configured to be exempt from session timeout.

Users with the Administrator role can change the session timeout interval for an appliance via the following settings:

Appliance	Setting
Firepower Management Center	System > Configuration > Shell Timeout
7000 & 8000 Series devices	Devices > Platform Settings > Shell Timeout

Related Topics

[Configure Session Timeouts](#), on page 732

Logging Into the Firepower Management Center Web Interface

Users are restricted to a single active session. If you try to log in with a user account that already has an active session, the system prompts you to terminate the other session or log in as a different user.

In a NAT environment where multiple FMCs share the same IP address:

- Each FMC can support only one login session at a time.
- To access different FMCs, use a different browser for each login (for example Firefox and Chrome), or set the browser to incognito or private mode.

Before you begin

- If you do not have access to the web interface, contact your system administrator to modify your account privileges, or log in as a user with Administrator access and modify the privileges for the account.
- Create user accounts as described in [Creating a User Account, on page 61](#).

Procedure

Step 1 Direct your browser to **https://ipaddress_or_hostname/**, where *ipaddress* or *hostname* corresponds to your FMC.

Step 2 In the **Username** and **Password** fields, enter your user name and password. Pay attention to the following guidelines:

- User names are *not* case-sensitive.
- In a multidomain deployment, prepend the user name with the domain where your user account was created. You are not required to prepend any ancestor domains. For example, if your user account was created in SubdomainB, which has an ancestor DomainA, enter your user name in the following format:

```
SubdomainB\username
```

- If your organization uses SecurID® tokens when logging in, append the token to your SecurID PIN and use that as your password to log in. For example, if your PIN is 1111 and the SecurID token is 222222, enter 1111222222. You must have already generated your SecurID PIN before you can log into the Firepower System.

Step 3 Click **Login**.

Related Topics

[Session Timeout](#), on page 24

Logging Into the Web Interface of a 7000 or 8000 Series Device

Users are restricted to a single active session on a 7000 & 8000 Series device. If you try to log in with a user account that already has an active session, the system prompts you to terminate the other session or log in as a different user.

Before you begin

- If you do not have access to the web interface, contact your system administrator to modify your account privileges, or log in as a user with Administrator access and modify the privileges for the account.
- Complete the initial setup process and create user accounts as described in the Firepower getting started guide appropriate to the device, and [Creating a User Account, on page 61](#).

Procedure

-
- Step 1** Direct your browser to `https://hostname/`, where `hostname` corresponds to the host name of the managed device you want to access.
- Step 2** In the **Username** and **Password** fields, enter your user name and password. Pay attention to the following guidelines:
- User names are *not* case-sensitive.
 - If your organization uses SecurID® tokens when logging in, append the token to your SecurID PIN and use that as your password to log in. For example, if your PIN is 1111 and the SecurID token is 222222, enter 1111222222. You must have already generated your SecurID PIN before you can log into the Firepower System.
- Step 3** Click **Login**.

[Session Timeout](#), on page 24

Logging Into the Firepower Management Center with CAC Credentials

Users are restricted to a single active session. If you try to log in with a user account that already has an active session, the system prompts you to terminate the other session or log in as a different user.

In a NAT environment where multiple FMCs share the same IP address:

- Each FMC can support only one login session at a time.
- To access different FMCs, use a different browser for each login (for example Firefox and Chrome), or set the browser to incognito or private mode.

Caution Do **not** remove a CAC during an active browsing session. If you remove or replace a CAC during a session, your web browser terminates the session and the system logs you out of the web interface.

Before you begin

- If you do not have access to the web interface, contact your system administrator to modify your account privileges, or log in as a user with Administrator access and modify the privileges for the account.
- Create user accounts as described in the [Creating a User Account, on page 61](#).
- Configure CAC authentication and authorization as described in [Configuring CAC Authentication, on page 71](#).

Procedure

- Step 1** Insert a CAC as instructed by your organization.
- Step 2** Direct your browser to **https://ipaddress_or_hostname/**, where *ipaddress* or *hostname* corresponds to your FMC.
- Step 3** If prompted, enter the PIN associated with the CAC you inserted in step 1.
- Step 4** If prompted, choose the appropriate certificate from the drop-down list.
- Step 5** Click **Continue**.

Related Topics

- [CAC Authentication, on page 71](#)
- [Session Timeout, on page 24](#)

Logging Into a 7000 or 8000 Series Device with CAC Credentials

Users are restricted to a single active session on a 7000 & 8000 Series device.

Caution Do **not** remove a CAC during an active browsing session. If you remove or replace a CAC during a session, your web browser terminates the session and the system logs you out of the web interface.

Before you begin

- If you do not have access to the web interface, contact your system administrator to modify your account privileges, or log in as a user with Administrator access and modify the privileges for the account.
- Create user accounts as described in [Creating a User Account, on page 61](#).
- Configure CAC authentication and authorization as described in [Configuring CAC Authentication, on page 71](#).

Procedure

-
- Step 1** Insert a CAC as instructed by your organization.
- Step 2** Direct your browser to `https://hostname/`, where `hostname` corresponds to the host name of the appliance you want to access.
- Step 3** If prompted, enter the PIN associated with the CAC you inserted in step 1.
- Step 4** If prompted, choose the appropriate certificate from the drop-down list.
- Step 5** Click **Continue**.

Related Topics

- [CAC Authentication](#), on page 71
- [Session Timeout](#), on page 24

Logging Into the CLI on 7000/8000 Series, ASA FirePOWER, and NGIPSv Devices

With a minimum of basic CLI configuration access, you can log directly into Classic managed devices.

Before you begin

- Complete the initial setup process using the default **admin** user for the initial login.
- Create additional user accounts that can log into the CLI using the **configure user add** command.
- For the 7000 & 8000 Series devices, create user accounts at the web interface as described in [Creating a User Account, on page 61](#).

Procedure

-
- Step 1** SSH to the device's management interface (hostname or IP address) or use the console.

With the exception of ASA 5585-X devices, which have dedicated ASA FirePOWER console port, ASA FirePOWER devices accessed via the console default to the operating system CLI. This requires an extra step to access the Firepower CLI: **session sfr**.

If your organization uses SecurID® tokens when logging in, append the token to your SecurID PIN and use that as your password to log in. For example, if your PIN is 1111 and the SecurID token is 222222, enter 1111222222. You must have already generated your SecurID PIN before you can log in.

Step 2 At the CLI prompt, use any of the commands allowed by your level of command line access.

Logging Into the Command Line Interface on Firepower Threat Defense Devices

You can log directly into the command line interface on Firepower Threat Defense managed devices.

Before you begin

Complete the initial setup process using the default **admin** user for the initial login. Create additional user accounts that can log into the CLI using the **configure user add** command.

Procedure

Step 1 Connect to the Firepower Threat Defense CLI, either from the console port or using SSH.

You can SSH to the management interface of the Firepower Threat Defense device. You can also connect to the address on a data interface if you open the interface for SSH connections. SSH access to data interfaces is disabled by default. See [Configure Secure Shell, on page 768](#) to allow SSH connections to specific data interfaces.

You can directly connect to the Console port on the device. Use the console cable included with the device to connect your PC to the console using a terminal emulator set for 9600 baud, 8 data bits, no parity, 1 stop bit, no flow control. See the hardware guide for your device for more information about the console cable.

The initial CLI you access on the Console port differs by device type.

- ASA Series devices—The CLI on the Console port is the regular Firepower Threat Defense CLI.
- Firepower Series devices—The CLI on the Console port is FXOS. You can get to the Firepower Threat Defense CLI using the **connect ftd** command. Use the FXOS CLI for chassis-level configuration and troubleshooting only. Use the Firepower Threat Defense CLI for basic configuration, monitoring, and normal system troubleshooting. See the FXOS documentation for information on FXOS commands.

Step 2 Log in with the **admin** username and password.

Step 3 At the CLI prompt (>), use any of the commands allowed by your level of command line access.

Step 4 (Optional) Access the diagnostic CLI:

system support diagnostic-cli

Use this CLI for advanced troubleshooting. This CLI includes additional **show** and other commands, including the **session wlan console** command needed to enter the CLI for the wireless access point on an ASA 5506W-X.

This CLI has two sub-modes: user EXEC and privileged EXEC mode. More commands are available in privileged EXEC mode. To enter privileged EXEC mode, enter the **enable** command; press enter without entering a password when prompted.

Example:

```
> system support diagnostic-cli
firepower> enable
Password:
firepower#
```

To return to the regular CLI, type **Ctrl-a, d**.

Logging Out of a Firepower System Web Interface

When you are no longer actively using a Firepower System web interface, Cisco recommends that you log out, even if you are only stepping away from your web browser for a short period of time. Logging out ends your web session and ensures that no one can use the interface with your credentials.

Note If you are logging out of an SSO session at the FMC, when you log out the system redirects your browser to the SSO IdP for your organization. To ensure FMC security and prevent others from accessing the FMC using your SSO account, we recommend you log out of the SSO federation at the IdP.

Procedure

- Step 1** From the drop-down list under your user name, choose **Logout**.
- Step 2** If you are logging out of an SSO session at the FMC, the system redirects you to the SSO IdP for your organization. Log out at the IdP to ensure FMC security.
-

[Session Timeout](#), on page 24

CHAPTER 3

Specifying User Preferences

The following topics describe how to specify user preferences:

- [User Preferences Introduction, on page 31](#)
- [Changing Your Password, on page 31](#)
- [Changing an Expired Password, on page 32](#)
- [Specifying Your Home Page, on page 32](#)
- [Configuring Event View Settings, on page 33](#)
- [Setting Your Default Time Zone, on page 37](#)
- [Specifying Your Default Dashboard, on page 37](#)

User Preferences Introduction

Depending on your user role, you can specify certain preferences for your user account.

In a multidomain deployment, user preferences apply to all domains where your account has access. When specifying home page and dashboard preferences, keep in mind that certain pages and dashboard widgets are constrained by domain.

Changing Your Password

All user accounts are protected with a password. You can change your password at any time, and depending on the settings for your user account, you may have to change your password periodically.

If password strength checking is enabled, passwords must be at least eight alphanumeric characters of mixed case and must include at least one numeric character. Passwords cannot be a word that appears in a dictionary or include consecutive repeating characters.

If you are an LDAP or a RADIUS user, you cannot change your password through the web interface.

Procedure

- Step 1** From the drop-down list under your user name, choose **User Preferences**.
- Step 2** Enter your **Current Password**, and click **Change**.
- Step 3** In the **New Password** and **Confirm** fields, enter your new password.

Step 4 Click **Change**.

Changing an Expired Password

Depending on the settings for your user account, your password may expire. The password expiration time period is set when your account is created. If your password has expired, the Password Expiration Warning page appears.

Procedure

On the Password Expiration Warning page, you have two choices:

- Click **Change Password** to change your password now. If you have zero warning days left, you **must** change your password.

Tip If password strength checking is enabled, passwords must be at least eight alphanumeric characters of mixed case and must include at least one numeric character. Passwords cannot be a word that appears in a dictionary or include consecutive repeating characters.

- Click **Skip** to change your password later.
-

Specifying Your Home Page

You can specify the page within the web interface to use as your home page for the appliance. The default home page is the default dashboard (**Overview > Dashboards**), except for user accounts with no dashboard access, such as External Database users. (See [Specifying Your Default Dashboard, on page 37](#) to set the default dashboard.)

In a multidomain deployment, the home page you choose applies to all domains where your user account has access. When choosing a home page for an account that frequently accesses multiple domains, keep in mind that certain pages are constrained to the Global domain.

Procedure

Step 1 From the drop-down list under your user name, choose **User Preferences**.

Step 2 Click **Home Page**.

Step 3 Choose the page you want to use as your home page from the drop-down list.

The options in the drop-down list are based on the access privileges for your user account. For more information, see [User Account Privileges, on page 44](#).

Step 4 Click **Save**.

Configuring Event View Settings

Use the Event View Settings page to configure characteristics of event views on the Firepower Management Center. Note that some event view configurations are available only for specific user roles. Users with the External Database User role can view parts of the event view settings user interface, but changing those settings has no meaningful result.

Procedure

-
- Step 1** From the drop-down list under your user name, choose **User Preferences**.
 - Step 2** Click **Event View Settings**.
 - Step 3** In the **Event Preferences** section, configure the basic characteristics of event views; see [Event View Preferences, on page 33](#).
 - Step 4** In the **File Preferences** section, configure file download preferences; see [File Download Preferences, on page 34](#).
 - Step 5** In the **Default Time Windows** section, configure the default time window or windows; see [Default Time Windows, on page 35](#).
 - Step 6** In the **Default Workflow** sections, configure default workflows; see [Default Workflows, on page 37](#).
 - Step 7** Click **Save**.
-

Event View Preferences

Use the Event Preferences section of the Event View Settings page to configure basic characteristics of event views in the Firepower System. This section is available for all user roles, although it has little to no significance for users who cannot view events.

The following fields appear in the Event Preferences section:

- The **Confirm “All” Actions** field controls whether the appliance forces you to confirm actions that affect all events in an event view.

For example, if this setting is enabled and you click **Delete All** on an event view, you must confirm that you want to delete all the events that meet the current constraints (including events not displayed on the current page) before the appliance will delete them from the database.

- The **Resolve IP Addresses** field allows the appliance, whenever possible, to display host names instead of IP addresses in event views.

Note that an event view may be slow to display if it contains a large number of IP addresses and you have enabled this option. Note also that for this setting to take effect, you must use management interfaces configuration to establish a DNS server in the system settings.

- The **Expand Packet View** field allows you to configure how the packet view for intrusion events appears. By default, the appliance displays a collapsed version of the packet view:
 - **None** - collapse all subsections of the Packet Information section of the packet view
 - **Packet Text** - expand only the Packet Text subsection

- **Packet Bytes** - expand only the Packet Bytes subsection
- **All** - expand all sections

Regardless of the default setting, you can always manually expand the sections in the packet view to view detailed information about a captured packet.

- The **Rows Per Page** field controls how many rows of events per page you want to appear in drill-down pages and table views.
- The **Refresh Interval** field sets the refresh interval for event views in minutes. Entering 0 disables the refresh option. Note that this interval does not apply to dashboards.
- The **Statistics Refresh Interval** controls the refresh interval for event summary pages such as the Intrusion Event Statistics and Discovery Statistics pages. Entering 0 disables the refresh option. Note that this interval does not apply to dashboards.
- The **Deactivate Rules** field controls which links appear on the packet view of intrusion events generated by standard text rules:
 - **All Policies** - a single link that deactivates the standard text rule in all the locally defined custom intrusion policies
 - **Current Policy** - a single link that deactivates the standard text rule in only the currently deployed intrusion policy. Note that you cannot deactivate rules in the default policies.
 - **Ask** - links for each of these options

To see these links on the packet view, your user account must have either Administrator or Intrusion Admin access.

[Management Interfaces](#), on page 705

File Download Preferences

Use the File Preferences section of the Event View Settings page to configure basic characteristics of local file downloads. This section is only available to users with the Administrator, Security Analyst, or Security Analyst (Read Only) user roles.

Note that if your appliance does not support downloading captured files, these options are disabled.

The following fields appear in the File Preferences section:

- The **Confirm 'Download File' Actions** check box controls whether a File Download pop-up window appears each time you download a file, displaying a warning and prompting you to continue or cancel.

Caution

Cisco strongly recommends you do **not** download malware, as it can cause adverse consequences. Exercise caution when downloading any file, as it may contain malware. Ensure you have taken any necessary precautions to secure the download destination before downloading files.

Note that you can disable this option any time you download a file.

- When you download a captured file, the system creates a password-protected .zip archive containing the file. The **Zip File Password** field defines the password you want to use to restrict access to the .zip file. If you leave this field blank, the system creates archive files without passwords.
- The **Show Zip File Password** check box toggles displaying plain text or obfuscated characters in the **Zip File Password** field. When this field is cleared, the **Zip File Password** displays obfuscated characters.

Default Time Windows

The time window, sometimes called the time range, imposes a time constraint on the events in any event view. Use the Default Time Windows section of the Event View Settings page to control the default behavior of the time window.

User role access to this section is as follows:

- Administrators and Maintenance Users can access the full section.
- Security Analysts and Security Analysts (Read Only) can access all options except **Audit Log Time Window**.
- Access Admins, Discovery Admins, External Database Users, Intrusion Admins, Network Admins, and Security Approvers can access only the **Events Time Window** option.

Note that, regardless of the default time window setting, you can always manually change the time window for individual event views during your event analysis. Also, keep in mind that time window settings are valid for only the current session. When you log out and then log back in, time windows are reset to the defaults you configured on this page.

There are three types of events for which you can set the default time window:

- The **Events Time Window** sets a single default time window for most events that can be constrained by time.
- The **Audit Log Time Window** sets the default time window for the audit log.
- The **Health Monitoring Time Window** sets the default time window for health events.

You can only set time windows for event types your user account can access. All user types can set event time windows. Administrators, Maintenance Users, and Security Analysts can set health monitoring time windows. Administrators and Maintenance Users can set audit log time windows.

Note that because not all event views can be constrained by time, time window settings have no effect on event views that display hosts, host attributes, applications, clients, vulnerabilities, user identity, or compliance white list violations.

You can either use **Multiple** time windows, one for each of these types of events, or you can use a **Single** time window that applies to all events. If you use a single time window, the settings for the three types of time window disappear and a new **Global Time Window** setting appears.

There are three types of time window:

- *static*, which displays all the events generated from a specific start time to a specific end time
- *expanding*, which displays all the events generated from a specific start time to the present; as time moves forward, the time window expands and new events are added to the event view

- *sliding*, which displays all the events generated from a specific start time (for example, one day ago) to the present; as time moves forward, the time window “slides” so that you see only the events for the range you configured (in this example, for the last day)

The maximum time range for all time windows is from midnight on January 1, 1970 (UTC) to 3:14:07 AM on January 19, 2038 (UTC).

The following options appear in the **Time Window Settings** drop-down list:

- The **Show the Last - Sliding** option allows you to configure a sliding default time window of the length you specify.

The appliance displays all the events generated from a specific start time (for example, 1 hour ago) to the present. As you change event views, the time window “slides” so that you always see events from the last hour.

- The **Show the Last - Static/Expanding** option allows you to configure either a static or expanding default time window of the length you specify.

For **static** time windows, enable the **Use End Time** check box. The appliance displays all the events generated from a specific start time (for example, 1 hour ago) to the time when you first viewed the events. As you change event views, the time window stays fixed so that you see only the events that occurred during the static time window.

For **expanding** time windows, disable the **Use End Time** check box. The appliance displays all the events generated from a specific start time (for example, 1 hour ago) to the present. As you change event views, the time window expands to the present time.

- The **Current Day - Static/Expanding** option allows you to configure either a static or expanding default time window for the current day. The current day begins at midnight, based on the time zone setting for your current session.

For **static** time windows, enable the **Use End Time** check box. The appliance displays all the events generated from midnight to the time when you first viewed the events. As you change event views, the time window stays fixed so that you see only the events that occurred during the static time window.

For **expanding** time windows, disable the **Use End Time** check box. The appliance displays all the events generated from midnight to the present. As you change event views, the time window expands to the present time. Note that if your analysis continues for over 24 hours before you log out, this time window can be more than 24 hours.

- The **Current Week - Static/Expanding** option allows you to configure either a static or expanding default time window for the current week. The current week begins at midnight on the previous Sunday, based on the time zone setting for your current session.

For **static** time windows, enable the **Use End Time** check box. The appliance displays all the events generated from midnight to the time when you first viewed the events. As you change event views, the time window stays fixed so that you see only the events that occurred during the static time window.

For **expanding** time windows, disable the **Use End Time** check box. The appliance displays all the events generated from midnight Sunday to the present. As you change event views, the time window expands to the present time. Note that if your analysis continues for over 1 week before you log out, this time window can be more than 1 week.

Default Workflows

A workflow is a series of pages displaying data that analysts use to evaluate events. For each event type, the appliance ships with at least one predefined workflow. For example, as a Security Analyst, depending on the type of analysis you are performing, you can choose among ten different intrusion event workflows, each of which presents intrusion event data in a different way.

The appliance is configured with a default workflow for each event type. For example, the Events by Priority and Classification workflow is the default for intrusion events. This means whenever you view intrusion events (including reviewed intrusion events), the appliance displays the Events by Priority and Classification workflow.

You can, however, change the default workflow for each event type. The default workflows you are able to configure depend on your user role. For example, intrusion event analysts cannot set default discovery event workflows.

Setting Your Default Time Zone

This setting determines the times displayed in the web interface for your user account only, for things like task scheduling and viewing dashboards. This setting does not change the system time or affect any other user, and does not affect data stored in the system, which generally uses UTC.

Warning

The Time Zone function (in User Preferences) assumes that the system clock is set to UTC time. **DO NOT ATTEMPT TO CHANGE THE SYSTEM TIME.** Changing the system time from UTC is NOT supported, and doing so will require you to reimage the device to recover from an unsupported state.

Procedure

-
- Step 1** From the drop-down list under your user name, choose **User Preferences**.
 - Step 2** Click **Time Zone**.
 - Step 3** Choose the continent or area that contains the time zone you want to use.
 - Step 4** Choose the country and state name that corresponds with the time zone you want to use.
-

Specifying Your Default Dashboard

The default dashboard appears when you choose **Overview > Dashboards**. Unless changed, the default dashboard for all users is the Summary dashboard. You can change the default dashboard if your user role is Administrator, Maintenance, or Security Analyst.

In a multidomain deployment, the default dashboard you choose applies to all domains where your user account has access. When choosing a dashboard for an account that frequently accesses multiple domains, keep in mind that certain dashboard widgets are constrained by domain.

Procedure

- Step 1** From the drop-down list under your user name, choose **User Preferences**.
- Step 2** Click **Dashboard Settings**.
- Step 3** Choose the dashboard you want to use as your default from the drop-down list. If you choose **None**, when you select **Overview > Dashboards**, you can then choose a dashboard to view.
- Step 4** Click **Save**.

CHAPTER 4

Firepower System User Management

The following topics describe how a user with Administrator access can manage user accounts in the Firepower System:

- [User Roles, on page 41](#)
- [User Accounts, on page 60](#)
- [Firepower System User Authentication, on page 66](#)
- [LDAP Authentication, on page 69](#)
- [RADIUS Authentication, on page 90](#)
- [Single Sign-on \(SSO\), on page 99](#)

User Roles

The Firepower System lets you allocate user privileges based on the user's role. For example, you can grant analysts predefined roles such as Security Analyst and Discovery Admin and reserve the Administrator role for the security administrator managing the Firepower System. You can also create custom user roles with access privileges tailored to your organization's needs.

In the platform settings policy for a managed device, you set a default access role for all users from that device who are externally authenticated. After an externally authenticated user logs in for the first time, you can add or remove access rights for that user on the User Management page. If you do not modify the user's rights, the user has only the rights granted by default. Because you create internally authenticated users manually, you set the access rights when you create them.

If you configured management of access rights through LDAP groups, the access rights for users are based on their membership in LDAP groups. They receive the default access rights for the group that they belong to that has the highest level of access. If they do not belong to any groups and you have configured group access, they receive the default user access rights configured in the authentication object for the LDAP server. If you configure group access, those settings override the default access setting in the platform settings policy.

Similarly, if you assign a user to specific user role lists in a RADIUS authentication object, the user receives all assigned roles, unless one or more of those roles are mutually incompatible. If a user is on the lists for two mutually incompatible roles, the user receives the role that has the highest level of access. If the user does not belong to any lists and you have configured a default access role in the authentication object, the user receives that role. If you configure default access in the authentication object, those settings override the default access setting in the platform settings policy.

In a multidomain deployment, you can assign users roles in multiple domains. For example, you can assign a user read-only privileges in the Global domain, but Administrator privileges in a subdomain.

Predefined User Roles

The Firepower System includes ten predefined user roles that provide a range of access privilege sets to meet the needs of your organization. Note that 7000 and 8000 Series devices have access to only three of the ten predefined user roles: Administrator, Maintenance User, and Security Analyst.

Although you cannot edit predefined user roles, you can use their access privilege sets as the basis for custom user roles. In addition, you cannot configure them to escalate to another user role.

The following table briefly describes the predefined roles available to you.

Access Admin

Provides access to access control policy and associated features in the **Policies** menu. Access Admins cannot deploy policies.

Administrator

Administrators have access to all functionality; their sessions present a higher security risk if compromised, so you cannot make them exempt from login session timeouts.

You should limit use of the Administrator role for security reasons.

Discovery Admin

Provides access to network discovery, application detection, and correlation features in the **Policies** menu. Discovery Admins cannot deploy policies.

External Database User

Provides read-only access to the Firepower System database using an application that supports JDBC SSL connections. For the third-party application to authenticate to the Firepower System appliance, you must enable database access in the system settings. On the web interface, External Database Users have access only to online help-related options in the **Help** menu. Because this role's function does not involve the web interface, access is provided only for ease of support and password changes.

Intrusion Admin

Provides access to all intrusion policy, intrusion rule, and network analysis policy features in the **Policies** and **Objects** menus. Intrusion Admins cannot deploy policies.

Maintenance User

Provides access to monitoring and maintenance features. Maintenance Users have access to maintenance-related options in the **Health** and **System** menus.

Network Admin

Provides access to access control, SSL inspection, DNS policy, and identity policy features in the **Policies** menu, as well as device configuration features in the **Devices** menu. Network Admins can deploy configuration changes to devices.

Security Analyst

Provides access to security event analysis features, and read-only access to health events, in the **Overview**, **Analysis**, **Health**, and **System** menus.

Security Analyst (Read Only)

Provides read-only access to security event analysis features and health event features in the **Overview**, **Analysis**, **Health**, and **System** menus.

Security Approver

Provides limited access to access control and associated policies and network discovery policies in the **Policies** menu. Security Approvers can view and deploy these policies, but cannot make policy changes.

Externally authenticated users, if assigned no other roles, have minimum access rights based on the settings in LDAP or RADIUS authentication objects and in platform settings. You can assign additional rights to these users, but to remove or change minimum access rights, you must perform the following tasks:

- Move the user from one list to another in the authentication object or change the user's attribute value or group membership on the external authentication server.
- Update platform settings.
- Use the User Management page to remove the access from that user account.

Related Topics

[User Account Privileges](#), on page 44

Custom User Roles

In addition to the predefined user roles, you can also create custom user roles with specialized access privileges. Custom user roles can have any set of menu-based and system permissions, and may be completely original or based on a predefined user role. Like predefined user roles, custom roles can serve as the default role for externally authenticated users. Unlike predefined roles, you can modify and delete custom roles.

Selectable permissions are hierarchical, and are based on the Firepower System menu layout. Permissions are expandable if they have sub-pages or if they have more fine-grained permissions available beyond simple page access. In that case, the parent permission grants page view access and the children granular access to related features of that page. Permissions that contain the word “Manage” grant the ability to edit and delete information that other users create.

Tip For pages or features not included in the menu structure, privileges are granted by parent or related pages. For example, the Modify Intrusion Policy privilege also allows you to modify network analysis policies.

You can apply restricted searches to a custom user role. These constrain the data a user may see in the event viewer. You can configure a restricted search by first creating a private saved search and selecting it from the **Restricted Search** drop-down menu under the appropriate menu-based permission.

When you configure a custom user role on a Firepower Management Center, all menu-based permissions are available for you to grant. When you configure a custom user role on a managed device, only some permissions are available — those relevant to device functions.

The selectable options under System Permissions allow you to create a user role that can make queries to the external database or escalate to the permissions of a target user role.

Optionally, instead of creating a new custom user role, you can export a custom user role from another appliance, then import it onto your appliance. You can then edit the imported role to suit your needs before you apply it.

Example: Custom User Roles and Access Control

You can create custom user roles for access control-related features to designate whether Firepower System users can view and modify access control and associated policies.

The following table lists custom roles that you could create and user permissions granted for each example. The table lists the privileges required for each custom role. In this example, Policy Approvers can view (but not modify) access control and intrusion policies. They can also deploy configuration changes to devices.

Table 1: Example Access Control Custom Roles

Custom Role Permission	Example: Access Control Editor	Example: Intrusion & Network Analysis Editor	Example: Policy Approver
Access Control	yes	no	yes
Access Control Policy	yes	no	yes
Modify Access Control Policy	yes	no	no
Intrusion Policy	no	yes	yes
Modify Intrusion Policy	no	yes	no
Deploy Configuration to Devices	no	no	yes

User Account Privileges

The following sections provide a list of the configurable user permissions in the Firepower System and the predefined user roles that can access them. Not all permissions are available on managed devices; permissions available only on the Firepower Management Center are marked accordingly.

Overview Menu

The following table lists, in order, the user role privileges required to access each option in the Overview menu and whether the user role has access to the sub-permissions within. The Security Approver, Discovery Admin, Intrusion Admin, Access Admin, Network Admin, and External Database User roles have no permissions in the Overview menu.

Help Menu

The Help menu and its permissions are accessible to all user roles. You cannot restrict Help menu options.

Managing User Roles

Smart License	Classic License	Supported Devices	Supported Domains	Access
Any	Any	Any	Any	Admin

Each Firepower System user is associated with a user access role or roles. These user roles are assigned permissions that determine access to menus and other options in the system. For example, an analyst needs access to event data to analyze the security of your network, but might not require access to administrative functions for the Firepower System itself. You can grant Security Analyst access to analysts while reserving the Administrator role for the user or users managing the Firepower System.

The Firepower System includes ten predefined user roles designed for a variety of administrators and analysts. These predefined user roles have a set of predetermined access privileges.

You can also create custom user roles with more granular access privileges.

You can also restrict the data that a user role can view in the event viewer by applying a restricted search to that role. To create a custom role with restricted access, you must choose the tables you want to restrict from the Menu Based Permissions list, then choose private saved searches from the Restrictive Search drop-down lists.

You cannot delete predefined user roles, but you can delete custom roles that are no longer necessary. If you want to disable a custom role without removing it entirely, you can deactivate it instead. Note that you cannot delete your own user role or a role that is set as a default user role in a platform settings policy.

Procedure

-
- Step 1** Choose **System > Users**.
- Step 2** Click the **User Roles** tab.
- Step 3** Manage user roles:
- **Activate** — Activate or deactivate a predefined user role as described in [Activating and Deactivating User Roles, on page 55](#).
 - **Create** — Create custom user roles as described in [Creating Custom User Roles, on page 56](#)
 - **Copy** — Copy an existing user role to create a new custom user role as described in [Copying User Roles, on page 57](#).
 - **Edit** — Edit a custom user role as described in [Editing Custom User Roles, on page 58](#).
 - **Delete** — Click **Delete** () next to the custom role you want to delete. If the controls are dimmed, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.
 - **Note** If a deleted role is the only role assigned to a given user, that user can log in and access the User Preferences menu, but is otherwise unable to access the Firepower System.
-

Activating and Deactivating User Roles

Smart License	Classic License	Supported Devices	Supported Domains	Access
Any	Any	Any	Any	Admin

You cannot delete predefined user roles, but you can deactivate them. Deactivating a role removes that role and all associated permissions from any user who is assigned that role.

In a multidomain deployment, the system displays custom user roles created in the current domain, which you can edit. It also displays custom user roles created in ancestor domains, which you cannot edit. To view and edit custom user roles in a lower domain, switch to that domain.

Caution If a deactivated role is the only role assigned to a given user, that user can log in and access the User Preferences menu, but is otherwise unable to access the Firepower System.

Procedure

- Step 1** Choose **System** > **Users**.
- Step 2** Click the **User Roles** tab.
- Step 3** Click the slider next to the user role you want to activate or deactivate.

If the controls are dimmed, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

If you deactivate, then reactivate, a role with Lights-Out Management while a user with that role is logged in, or restore a user or user role from a backup during that user's login session, that user must log back into the web interface to regain access to IPMItool commands.

Creating Custom User Roles

Smart License	Classic License	Supported Devices	Supported Domains	Access
Any	Any	Any	Any	Admin

Caution Users with menu-based User Management permissions have the ability to elevate their own privileges or create new user accounts with extensive privileges, including the Administrator user role. For system security reasons we strongly recommend you restrict the list of users with User Management permissions appropriately.

Procedure

- Step 1** Choose **System** > **Users**.
- Step 2** Click the **User Roles** tab.
- Step 3** Click **Create User Role**.
- Step 4** In the **Name** field, enter a name for the new user role. User role names are case sensitive.
- Step 5** Optionally, add a **Description**.
- Step 6** Choose menu-based permissions for the new role.

When you choose a permission, all of its children are chosen, and the multi-value permissions use the first value. If you clear a high-level permission, all of its children are cleared also. If you choose a permission but not its children, it appears in italic text.

Copying a predefined user role to use as the base for your custom role preselects the permissions associated with that predefined role.

- Step 7** Optionally, set database access permissions for the new role by checking or unchecking the **External Database Access** checkbox.
- Step 8** Optionally, on Firepower Management Centers, set escalation permissions for the new user role as described in [Configuring a Custom User Role for Escalation, on page 59](#).
- Step 9** Click **Save**.

Copying User Roles

Smart License	Classic License	Supported Devices	Supported Domains	Access
Any	Any	Any	Any	Admin

You can copy an existing role to use as the basis for a new custom role. This preselects the existing role's permissions in the User Role Editor so you can model one role on another.

You can copy any existing role, including predefined user roles and custom user roles inherited from ancestor domains.

Procedure

- Step 1** Choose **System > Users**.
- Step 2** Click the **User Roles** tab.
- Step 3** Click **Copy**  next to the user role you want to copy.
- Step 4** Enter a new **Name**.
- The system creates a default name for the new user role by combining the name of the original user role and the `(copy)` suffix.
- Step 5** Enter a new **Description**.
- The system retains the description of the original user role if you do not overwrite it.
- Step 6** Optionally, modify the menu-based permissions inherited from the original user role.
- When you choose a permission, all of its children are chosen, and the multi-value permissions use the first value. If you clear a high-level permission, all of its children are cleared also. If you choose a permission but not its children, the permission appears in italic text.
- Step 7** Optionally, set the database access permissions for the new role by checking or unchecking the **External Database Access** checkbox.
- Step 8** Optionally, set escalation permissions for the new user role as described in [Configuring a Custom User Role for Escalation, on page 59](#).
- Step 9** Click **Save**.

Editing Custom User Roles

Smart License	Classic License	Supported Devices	Supported Domains	Access
Any	Any	Any	Any	Admin

You cannot edit predefined user roles.

In a multidomain deployment, the system displays custom user roles created in the current domain, which you can edit. It also displays custom user roles created in ancestor domains, which you cannot edit. To view and edit custom user roles in a lower domain, switch to that domain.

Procedure

-
- Step 1** Choose **System** > **Users**.
 - Step 2** Click the **User Roles** tab.
 - Step 3** Click **Edit** () next to the custom user role you want to modify. If **View** () appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.
 - Step 4** Modify the **Name** and **Description** fields. User role names are case sensitive.
 - Step 5** Choose menu-based permissions for the user role.

When you choose a permission, all of its children are chosen, and the multi-value permissions use the first value. If you clear a high-level permission, all of its children are cleared also. If you choose a permission but not its children, the permission appears in italic text.
 - Step 6** Optionally, set the database access permissions for the role by checking or unchecking the **External Database Access** checkbox.
 - Step 7** Optionally, on Firepower Management Centers, set escalation permissions for the user role as described in [Configuring a Custom User Role for Escalation, on page 59](#).
 - Step 8** Click **Save**.
-

User Role Escalation

You can give custom user roles the permission, with a password, to temporarily gain the privileges of another, targeted user role in addition to those of the base role. This allows you to easily substitute one user for another during an absence, or to more closely track the use of advanced user privileges.

For example, a user whose base role has very limited privileges may escalate to the Administrator role to perform administrative actions. You can configure this feature so that users can use their own passwords, or so they use the password of another user that you specify. The second option allows you to easily manage one escalation password for all applicable users.

Note that only one user role at a time can be the escalation target role. You can use a custom or predefined user role. Each escalation lasts for the duration of a login session and is recorded in the audit log.

Setting the Escalation Target Role

Smart License	Classic License	Supported Devices	Supported Domains	Access
Any	Any	Any	Any	Admin

You can assign any of your user roles, predefined or custom, to act as the system-wide escalation target role. This is the role to which any other role may escalate, if it has the ability.

Procedure

-
- Step 1** Choose **System > Users**.
- Step 2** Click **User Roles**.
- Step 3** Click **Configure Permission Escalation**.
- Step 4** Choose a user role from the drop-down list.
- Step 5** Click **OK** to save your changes.

Note Changing the escalation target role is effective immediately. Users in escalated sessions now have the permissions of the new escalation target.

Configuring a Custom User Role for Escalation

Smart License	Classic License	Supported Device	Supported Domains	Access
Any	Any	Any	Any	Admin

Consider the needs of your organization when you configure the escalation password for a custom role. If you want to easily manage many escalating users, you may want to choose another user whose password serves as the escalation password. If you change that user's password or deactivate that user, all escalating users who require that password are affected. This allows you to manage user role escalation more efficiently, especially if you choose an externally authenticated user that you can manage centrally.

Procedure

-
- Step 1** Begin configuring your custom user role as described in [Creating Custom User Roles, on page 56](#).
- Step 2** In System Permissions, choose the **Set this role to escalate to:** check box.
The current escalation target role is listed beside the check box.
- Step 3** Choose the password that this role uses to escalate. You have two options:
- If you want users with this role to use their own passwords when they escalate, choose **Authenticate with the assigned user's password**.
 - If you want users with this role to use the password of another user, choose **Authenticate with the specified user's password** and enter that username.

Note When authenticating with another user's password, you can enter any username, even that of a deactivated or nonexistent user. Deactivating the user whose password is used for escalation makes escalation impossible for users with the role that requires it. You can use this feature to quickly remove escalation powers if necessary.

Step 4 Click **Save**.
Users with this role can now escalate to the target user role.

Escalating Your User Role

Smart License	Classic License	Supported Device	Supported Domains	Access
Any	Any	FMC	Any	Any

When a user has an assigned custom user role with permission to escalate, that user may escalate to the target role's permissions at any time. Note that escalation has no effect on user preferences.

Before you begin

- Confirm that a system administrator configured the escalation target role or custom user role for escalation as described in [Setting the Escalation Target Role, on page 59](#) or [Configuring a Custom User Role for Escalation, on page 59](#).

Procedure

Step 1 From the drop-down list under your user name, choose **Escalate Permissions**.

Step 2 Enter the authentication password.

Step 3 Click **Escalate**. You now have all permissions of the escalation target role in addition to your current role.

Note Escalation lasts for the remainder of your login session. To return to the privileges of your base role only, you must log out, then begin a new session.

User Accounts

The admin account and optional, custom user accounts on a Firepower Management Center or Firepower 7000 and 8000 Series device allow users to log into these. For internally-authenticated users, accounts must be created manually. For externally-authenticated users, accounts are created automatically.

[Custom User Roles, on page 43](#)

Creating a User Account

Smart License	Classic License	Supported Devices	Supported Domains	Access
Any	Any	FMC 7000 & 8000 Series	Any	Admin

When you set up a new user account, you can control which parts of the system the account can access. You can set password expiration and strength settings for the user account during creation. For a local account on a 7000 or 8000 Series device, you can also configure the level of command line access the user will have.

In a multidomain deployment, you can create user accounts in any domain in which you have been assigned Admin access. You can also create accounts in a higher-level domain and assign the users lower-level access only. For example, you might want a single user to be an administrator of two domains, but deny them access to the ancestor domain. This kind of user account can only be modified by switching to a subdomain in which access is assigned.

Procedure

Step 1 Choose **System** > **Users**.

Step 2 Click **Create User**.

Step 3 Enter a **User Name**.

Step 4 Modify the login options; see [User Account Login Options, on page 64](#).

Step 5 Enter values in **Password** and **Confirm Password**.

The values you construct must be based on the password options you set earlier.

Step 6 If you are creating a user account on a 7000 or 8000 Series device, assign the appropriate level of **Command-Line Interface Access** as described in [Command Line Access Levels, on page 65](#).

Step 7 Assign user roles:

- Check or uncheck the check box next to the user role(s) you want to assign the user.
- In a multidomain deployment, if you are adding a user account to a domain with descendant domains, click the **Add Domains** button that displays instead of the user role check boxes. Continue as described in [Assigning User Roles in Multiple Domains, on page 63](#).

Note User roles determine the user's access rights. For more information, see [Managing User Roles, on page 54](#).

Step 8 Click **Save**.

Editing a User Account

Smart License	Classic License	Supported Devices	Supported Domains	Access
Any	Any	Any	Any	Admin

After adding user accounts to the system, you can modify access privileges, account options, or passwords at any time. Note that password management options do not apply to users who authenticate to an external directory server. You manage those settings on the external server. However, you must configure access rights for all accounts, including those that are externally authenticated.

Note For externally authenticated users, you cannot remove the minimum access rights through the Firepower System user management page for users assigned an access role because of LDAP group or RADIUS list membership or attribute values. You can, however, assign additional rights. When you modify the access rights for an externally authenticated user, the Authentication Method column on the User Management page provides a status of **External - Locally Modified**.

If you change the authentication for a user from externally authenticated to internally authenticated, you must supply a new password for the user.

Procedure

Step 1 Choose **System > Users**.

Step 2 Click **Edit** () next to the user you want to modify.

Step 3 Modify settings described in [Creating a User Account, on page 61](#).

Step 4 Click **Save**.

Assigning User Roles in Multiple Domains

Smart License	Classic License	Supported Devices	Supported Domains	Access
Any	Any	Any	Any	Admin

In a multidomain deployment, you can assign users roles in ancestor and descendant domains. For example, you can assign a user read-only privileges in the Global domain, but Admin privileges in a descendant domain.

Procedure

- Step 1** In the user account editor, click **Add Domain**.
- Step 2** Choose a domain from the **Domain** drop-down list.
- Step 3** Check the user roles you want to assign the user.
- Step 4** Click **Save**.
-

Converting a User from Internal to External Authentication

Smart License	Classic License	Supported Devices	Supported Domains	Access
Any	Any	Any	Any	Admin

Note When you convert a user from internal to external authentication, the user account retains the permissions already present in that account. The existing permissions override any permissions associated with the associated authentication object group or the default user role set in the platform settings policy.

Before you begin

- A user record with the same user name must be present on the external authentication server.

Procedure

- Step 1** Enable LDAP (with or without CAC) or RADIUS authentication. For more information, see [LDAP Authentication, on page 69](#) or [RADIUS Authentication, on page 90](#).
- Step 2** Instruct the user to log in with the password stored for that user on the external server.
-

User Account Login Options

The following table describes some of the options you can use to regulate passwords and account access for Firepower System users.

Note

- Password management options do not apply to users who authenticate to an external directory server. You manage those settings on the external authentication server. After you enable **Use External Authentication Method**, the system removes password management options from the display.
- If you enable STIG compliance or Lights-Out Management (LOM) on an appliance, different password restrictions apply. For more information on STIG compliance, see [Enabling STIG Compliance, on page 727](#).

Table 8: User Account Login Options

Option	Description
Use External Authentication Method	<p>Select this check box if you want this user's credentials to be externally authenticated. If you enable this option, the password management options are no longer displayed.</p> <p>Note</p> <ul style="list-style-type: none"> • For users to authenticate to an external directory server, you must also create an authentication object for the server you want to use, and deploy a platform settings policy with authentication enabled. • Note that for externally authenticated users, if the authentication object for the server is disabled, the Authentication Method column in the Users list displays External (Disabled). • If you select this option for the user and the external authentication server is unavailable, that user can log into the web interface but cannot access any functionality.
Maximum Number of Failed Logins	Enter an integer, without spaces, that determines the maximum number of times each user can try to log in after a failed login attempt before the account is locked. The default setting is five tries; use 0 to allow an unlimited number of failed logins.
Minimum Password Length	<p>Enter an integer, without spaces, that determines the minimum required length, in characters, of a user's password. The default setting is 8. A value of 0 indicates that no minimum length is required.</p> <p>If you enable the Check Password Strength option, and set a value for Minimum Password Length that exceeds 8 characters, the higher value applies.</p>
Days Until Password Expiration	Enter the number of days after which the user's password expires. The default setting is 0 , which indicates that the password never expires. If you set this option, the Password Lifetime column of the Users list indicates the days remaining on each user's password.

Option	Description
Days Before Password Expiration Warning	Enter the number of warning days users have to change their password before their password actually expires. The default setting is 0 days. Note The number of warning days must be less than the number of days before the password expires.
Force Password Reset on Login	Select this option to force users to change their passwords the next time they log in.
Check Password Strength	Select this option to require strong passwords. A strong password must be at least eight alphanumeric characters of mixed case and must include at least one numeric character and one special character. It cannot be a word that appears in a dictionary or include consecutive repeating characters.
Exempt from Browser Session Timeout	Select this option if you do not want a user's login sessions to terminate due to inactivity. Users with the Administrator role cannot be made exempt.

Command Line Access Levels

You can use the local web interface on a 7000 or 8000 Series device to assign command line interface access to local device users. Note that you can also assign command line access for users on an NGIPSv, but you use commands from the command line interface.

The commands a user can run depend on the level of access you assign to the user. Possible values for the **Command-Line Interface Access** setting include:

None

The user cannot log into the appliance on the command line. Any session the user starts will close when the user provides credentials. The access level defaults to **None** on user creation.

Configuration

The user can access any of the command line options. Exercise caution in assigning this level of access to users.

Caution Command line access granted to externally authenticated users defaults to the **Configuration** level of command line access, granting rights to all command line utilities.

Basic

A specific set of commands can be run by the user, listed below.

Table 9: Basic Command Line Commands

configure password	interfaces
end	lcd
exit	link-state

Firepower System User Authentication

When a user logs into the web interface on a Firepower Management Center or a managed device, the appliance looks for a match for the user name and password in the local list of users. This process is called *authentication*.

There are two types of authentication:

- *internal authentication* — The system checks the list in the local database for the user.
- *external authentication* — The system checks the list in the local database for the user and, if the user is not present on that list, queries an external authentication server for its user list.

The authentication process is illustrated below.

When you create a user account, you specify either internal or external authentication for that user.

Internal Authentication

In internal authentication, user credentials are verified against records in the internal Firepower System database. This is the default authentication type.

You set the access rights for internal authentication users when you create the user's account.

Note When an internally authenticated user is converted to external authentication, you cannot revert to internal authentication.

External Authentication

In external authentication, the Firepower Management Center or managed device retrieves user credentials from a repository on an external server. External servers can be either a Lightweight Directory Access Protocol (LDAP) directory server or a Remote Authentication Dial In User Service (RADIUS) authentication server.

You enable external authentication using a platform settings policy and settings in individual user accounts. Note the following guidelines:

- You can use multiple external authentication objects to authenticate users to access the Firepower Management Center web interface. In other words, if you have five external authentication objects, users from any of them can be authenticated to access the web interface.
- You can use only one external authentication object for shell access to the Firepower Management Center. If you have more than one external authentication object set up, users can authenticate using only the first object in the list.

When the user logs into an appliance for the first time, the appliance associates the external credentials with a set of permissions by creating a local user record. The user is assigned permissions based on either:

- the group or access list they belong to
- the default user access role you set in the platform settings policy for the appliance

If permissions are granted through group or list membership, they cannot be modified. However, if they are assigned by default user role, you can modify them in the user account, and the modifications you make override the default settings. For example:

- If the default role for externally authenticated user accounts is set to a specific access role, users can log into the appliance using their external account credentials without any additional configuration by the system administrator.
- If an account is externally authenticated and by default receives no access privileges, users can log in but cannot access any functionality. You (or your system administrator) can then change the permissions to grant the appropriate access to user functionality.

You cannot manage passwords for externally authenticated users or deactivate externally authenticated users through the Firepower System interface. For externally authenticated users, you cannot remove the minimum access rights through the Firepower System user management page for users assigned an access role because of LDAP group or RADIUS list membership or attribute values. On the Edit User page for an externally authenticated user, rights granted because of settings on an external authentication server are marked with a status of **Externally Modified**.

You can, however, assign additional rights. When you modify the access rights for an externally authenticated user, the Authentication Method column on the User Management page provides a status of **External - Locally Modified**.

[RADIUS Authentication](#), on page 90

LDAP Authentication

LDAP, or the Lightweight Directory Access Protocol, allows you to set up a directory on your network that organizes objects, such as user credentials, in a centralized location. Multiple applications can then access those credentials and the information used to describe them. If you ever need to change a user's credentials, you can change them in one place.

You must create LDAP authentication objects on a Firepower Management Center, but you can use the external authentication object on any managed devices that have a web interface (that is, on 7000 and 8000 Series devices) by deploying a platform settings policy where the object is enabled to the device. When you deploy the policy, the object is copied to the device.

Note Before enabling external authentication on 7000 and 8000 Series devices, remove any internally-authenticated shell or CLI users that have the same user name as externally-authenticated users included in your shell access filter.

You can use LDAP naming standards for address specification and for filter and attribute syntax in your authentication object. For more information, see the RFCs listed in the Lightweight Directory Access Protocol (v3): Technical Specification, RFC 3377. Examples of syntax are provided throughout this procedure. Note that when you set up an authentication object to connect to a Microsoft Active Directory Server, you can use the address specification syntax documented in the Internet RFC 822 (Standard for the Format of ARPA Internet Text Messages) specification when referencing a user name that contains a domain. For example, to refer to a user object, you might type `JoeSmith@security.example.com` rather than the equivalent user distinguished name of `cn=JoeSmith,ou=security,dc=example,dc=com` when using Microsoft Active Directory Server.

Note Currently, the Firepower System supports LDAP external authentication on LDAP servers running Microsoft Active Directory on Windows Server 2008, Oracle Directory Server Enterprise Edition 7.0 on Windows Server 2008, or OpenLDAP on Linux. However, the Firepower System does not support external authentication for NGIPSv or ASA FirePOWER devices.

Microsoft has announced that Active Directory servers will start enforcing LDAP binding and LDAP signing in 2020. Microsoft is making these a requirement because when using default settings, an elevation of privilege vulnerability exists in Microsoft Windows that could allow a man-in-the-middle attacker to successfully forward an authentication request to a Windows LDAP server. For more information, see [2020 LDAP channel binding and LDAP signing requirement for Windows](#) on the Microsoft support site.

If you have not done so already, we recommend you start using TLS/SSL encryption to authenticate with an Active Directory server.

Required Information for Creating LDAP Authentication Objects

Before you configure a connection to your LDAP server, you should collect the information that you need to create the LDAP authentication object.

Note You must have TCP/IP access from your local appliance to the authentication server where you want to connect.

You need the following, at minimum, to create a basic authentication object:

- the server name or IP address for the server where you plan to connect
- the server type of the server where you plan to connect
- the user name and password for a user account with sufficient privileges to browse the LDAP tree; Cisco recommends that you use a domain admin user account for this purpose
- if there is a firewall between the appliance and the LDAP server, an entry in the firewall to allow outgoing connections
- if possible, the base distinguished name for the server directory where the user names reside

Tip You can use a third-party LDAP client to browse the LDAP tree and see base DN and attribute descriptions. You can also use that client to confirm that your selected user can browse the base DN you select. Ask your LDAP administrator to recommend an approved LDAP client for your LDAP server.

Depending on how you plan to customize your advanced LDAP authentication object configuration, you might also need the information in the following table.

Table 10: Additional LDAP Configuration Information

To...	You need...
connect over a port other than 389	the port number
connect via an encrypted connection	the certificate for the connection
filter the users who can access your appliance based on an attribute value	the attribute-value pair to filter by
use an attribute as a UI access attribute rather than checking the user distinguished name	the name of the attribute
use an attribute as a shell login attribute rather than checking the user distinguished name	the name of the attribute
filter the users who can access your appliance via the shell based on an attribute value	the attribute-value pair to filter by
associate groups with specific user roles	the distinguished name of each group, as well as the group member attribute if the groups are static groups or the group member URL attribute if the groups are dynamic groups

To...	You need...
use CACs for authentication and authorization	your CAC, a server certificate signed by the same CA that issued your CAC, and the certificate chain for both certificates

CAC Authentication

If your organization uses Common Access Cards (CACs), you can configure LDAP authentication to authenticate users logging into the web interface and authorize access to specific functionality based on group membership or default access rights. With CAC authentication and authorization configured, users have the option to log in directly without providing a separate username and password for the appliance.

Note You **must** have a valid user certificate present in your browser (in this case, a certificate passed to your browser via your CAC) to enable user certificates as part of the CAC configuration process. After you configure CAC authentication and authorization, users on your network **must** maintain the CAC connection for the duration of their browsing session. If you remove or replace a CAC during a session, your web browser terminates the session and the system logs you out of the web interface.

CAC-authenticated users are identified in the system by their electronic data interchange personal identifier (EDIPI) numbers. After users log in using their CAC credentials for the first time, you can manually add or remove access privileges for those users on the User Management page. If you did not preconfigure a user's privileges using group-controlled access roles, the user has only the privileges granted by default in the platform settings policy.

Tip The system purges manually configured access privileges when it purges CAC-authenticated users from the User Management page after 24 hours of inactivity. The users are restored to the page after each subsequent login, but you must reconfigure any manual changes to their access privileges.

Configuring CAC Authentication

Smart License	Classic License	Supported Devices	Supported Domains	Access
Any	Any	FMC 7000 and 8000 Series	Any	Admin/Network Admin

Before users on your network can log into Firepower Management Centers and 7000 and 8000 Series devices using their CAC credentials, a user with appropriate permissions must complete the multi-step configuration process for CAC authentication and authorization.

Before you begin

- Gather the information described in [Required Information for Creating LDAP Authentication Objects](#), on page 69.

Procedure

- Step 1** Insert a CAC as directed by your organization.
- Step 2** Direct your browser to the web interface of the FMC or device.
- Step 3** If prompted, enter the PIN associated with the CAC you inserted in step 1.
- Step 4** If prompted, choose the appropriate certificate from the drop-down list.
- Step 5** On the Login page, in the **Username** and **Password** fields, log in as a user with Administrator privileges. User names are case sensitive.
- You cannot log in using your CAC credentials until you have fully configured CAC authentication and authorization.
- Step 6** Navigate to **System > Users** and click the **External Authentication** tab.
- Step 7** Create an LDAP authentication object exclusively for CAC authentication and authorization.
- See [Creating Advanced LDAP Authentication Objects, on page 75](#). You must configure:
- The **User Name Template** in the advanced options of the **LDAP-Specific Parameters** section.
 - The **UI Access Attribute** in the **Attribute Mapping** section.
 - The distinguished names for existing LDAP groups in the **Group Controlled Access Roles** section, if you want to preconfigure access rights through LDAP group membership.
- You cannot configure both CAC authentication and shell access in the same authentication object. If you also want to authorize users for shell access, create and enable separate authentication objects.
- Step 8** Click **Save**.
- Step 9** Enable external authentication and CAC authentication.
- Step 10** Select **System > Configuration** and click **HTTPS Certificate**.
- Step 11** Import a HTTPS server certificate, if necessary.
- See [Uploading Server Certificates, on page 700](#). The same certificate authority (CA) must issue the HTTPS server certificate and the user certificates on the CACs you plan to use for authentication and authorization.
- Step 12** Under **HTTPS User Certificate Settings**, choose **Enable User Certificates**.
- For more information, see [Requiring Valid User Certificates, on page 700](#).
-

What to do next

- After the user logs in for the first time, you can manually add or remove the user's access rights. If you do not modify the rights, the user has only the rights granted by default. For more information, see [Editing a User Account, on page 62](#).

Creating Basic LDAP Authentication Objects

Smart License	Classic License	Supported Devices	Supported Domains	Access
Any	Any	Any	Any	Admin

You can set up an LDAP authentication object where you customize many of the values. However, if you just want to authenticate all the users in a particular directory, you can create a basic authentication object with the base DN for that directory. If you set defaults to those for your server type and supply authentication credentials for the account used to retrieve user data from the server, you can quickly create an authentication object. Follow the procedure below to do so.

Note If you prefer to consider and possibly customize each authentication setting when creating the authentication object (to grant shell access, for example), use the advanced procedure to create the object. You should also use the advanced procedure if you plan to encrypt your connection to the server, set user timeouts, customize the user name template, or assign Firepower user roles based on LDAP group membership.

In a multidomain deployment, external authentication objects are only available in the domain in which they are created.

Before you begin

- Gather the information described in [Required Information for Creating LDAP Authentication Objects, on page 69](#).

Procedure

-
- Step 1** Choose **System > Users**.
- Step 2** Click the **External Authentication** tab.
- Step 3** Click **Add External Authentication Object**.
- Step 4** Choose **LDAP** from the **Authentication Method** drop-down list.
- Step 5** Provide a **Name**, **Description**, **Server Type**, and **Primary Server Host Name/IP Address** as described in [Identifying the LDAP Authentication Server, on page 79](#).
- Tip** If you click **Set Defaults**, the system populates the **User Name Template**, **UI Access Attribute**, **Shell Access Attribute**, **Group Member Attribute**, and **Group Member URL Attribute** fields with default values.
- Step 6** Choose **Fetch DNs** to specify a base distinguished name and, optionally, provide a **Base Filter** as described in [Configuring LDAP-Specific Parameters, on page 82](#).
- Step 7** Enter a distinguished name as the **User Name** and the **Password** for a user who has sufficient credentials to browse the LDAP server as described in [Configuring LDAP-Specific Parameters, on page 82](#).
- Step 8** Re-enter the password in the **Confirm Password** field.
- Step 9** Test the connection as described in [Testing LDAP Authentication Connections, on page 88](#).

Step 10 Click **Save**.**Example**

The following figures illustrate a basic configuration of an LDAP login authentication object for a Microsoft Active Directory Server. The LDAP server in this example has an IP address of 10.11.3.4. The connection uses port 389 for access.

External Authentication Object

Authentication Method: LDAP

CAC: Use for CAC authentication and authorization

Name *: Basic Configuration Example

Description:

Server Type: MS Active Directory

Primary Server

Host Name/IP Address *: ex. IP or hostname

Port *: 389

Backup Server (Optional)

Host Name/IP Address: ex. IP or hostname

Port: 389

LDAP-Specific Parameters

Base DN *: ou=security,DC=it,DC=example,DC=com ex. dc=sourcefire,dc=com

Base Filter: ex. (cn=jsmith), (lcn=jsmith), (&(cn=jsmith)(!(cn=bsmith)(cn=csmith*)))

User Name *: CN=admin,DC=example,DC=com ex. cn=jsmith,dc=sourcefire,dc=com

Password *:

Confirm Password *:

Show Advanced Options

372784

This example shows a connection using a base distinguished name of `OU=security,DC=it,DC=example,DC=com` for the security organization in the information technology domain of the Example company.

However, because this server is a Microsoft Active Directory server, it uses the `sAMAccountName` attribute to store user names rather than the `uid` attribute. Choosing the MS Active Directory server type and clicking **Set Defaults** sets the UI Access Attribute to `sAMAccountName`. As a result, the system checks the `sAMAccountName` attribute for each object for matching user names when a user attempts to log into the system.

In addition, a Shell Access Attribute of `sAMAccountName` causes each `sAMAccountName` attribute to be checked for all objects in the directory for matches when a user logs into a shell or CLI account on the appliance.

Note that because no base filter is applied to this server, the system checks attributes for all objects in the directory indicated by the base distinguished name. Connections to the server time out after the default time period (or the timeout period set on the LDAP server).

What to do next

- If you want to refine the list of users retrieved, see [Troubleshooting LDAP Authentication Connections, on page 89](#) for more information.

Creating Advanced LDAP Authentication Objects

Smart License	Classic License	Supported Devices	Supported Domains	Access
Any	Any	Any	Any	Admin

When you create a basic authentication object, you define basic settings that let you connect to an authentication server. When you create an advanced authentication object, you define basic settings and you also choose the directory context and search criteria you want to use to retrieve user data from the server. Optionally, you can configure shell access authentication.

Although you can use the default settings for your server type to quickly set up an LDAP configuration, you can also customize advanced settings to control whether the appliance makes an encrypted connection to the LDAP server, the timeout for the connection, and which attributes the server checks for user information.

For the LDAP-specific parameters, you can use LDAP naming standards and filter and attribute syntax. For more information, see the RFCs listed in the Lightweight Directory Access Protocol (v3): Technical Specification, RFC 3377. Examples of syntax are provided throughout this procedure. Note that when you set up an authentication object to connect to a Microsoft Active Directory Server, you can use the address specification syntax documented in the Internet RFC 822 (Standard for the Format of ARPA Internet Text Messages) specification when referencing a user name that contains a domain. For example, to refer to a user object, you might enter `JoeSmith@security.example.com` rather than the equivalent user distinguished name of `cn=JoeSmith,ou=security,dc=example,dc=com` when using Microsoft Active Directory Server.

Note If you are configuring an LDAP authentication object for use with CAC authentication, do **not** remove the CAC inserted in your computer. You **must** have a CAC inserted at all times after enabling user certificates.

In a multidomain deployment, external authentication objects are only available in the domain in which they are created.

Before you begin

- Gather the information described in [Required Information for Creating LDAP Authentication Objects, on page 69](#).
- Remove any internally authenticated shell users that have the same user name as externally authenticated users included in your shell access filter.

Procedure

- Step 1** Choose **System > Users**.
- Step 2** Click **External Authentication**, then **Add External Authentication Object**.
- Step 3** Identify the authentication server as described in [Identifying the LDAP Authentication Server, on page 79](#).
- Step 4** Configure authentication settings as described in [Configuring LDAP-Specific Parameters, on page 82](#).
- Step 5** Optionally, configure LDAP groups to use as the basis for default access role assignments as described in [Configuring Access Rights by Group, on page 85](#).
- If you plan to use this object for CAC authentication and authorization, we recommend you configure LDAP groups to manage access role assignments.
- Step 6** Optionally, configure authentication settings for shell access as described in [Configuring LDAP Shell Access, on page 87](#).
- Step 7** Test your configuration as described in [Testing LDAP Authentication Connections, on page 88](#).
- Step 8** Click **Save**.
-

Example

This example illustrates an advanced configuration of an LDAP login authentication object for a Microsoft Active Directory Server. The LDAP server in this example has an IP address of 10.11.3.4. The connection uses port 636 for access.

Authentication Object

Authentication Method:

Name *:

Description:

Server Type:

Primary Server

Host Name/IP Address *:

Port *:

This example shows a connection using a base distinguished name of `OU=security,DC=it,DC=example,DC=com` for the security organization in the information technology domain of the Example company. However, note that this server has a base filter of `(cn=*smith)`. The filter restricts the users retrieved from the server to those with a common name ending in `smith`.

LDAP-Specific Parameters

Base DN *:

Base Filter:

User Name *:

Password *:

Confirm Password *:

Show Advanced Options:

Encryption: SSL TLS None

SSL Certificate Upload Path:

User Name Template:

Timeout (Seconds):

Attribute Mapping

UI Access Attribute *:

Shell Access Attribute *:

The connection to the server is encrypted using SSL and a certificate named `certificate.pem` is used for the connection. In addition, connections to the server time out after 60 seconds because of the **Timeout** setting.

Because this server is a Microsoft Active Directory server, it uses the `sAMAccountName` attribute to store user names rather than the `uid` attribute. Note that the configuration includes a UI Access Attribute of `sAMAccountName`. As a result, the Firepower System checks the `sAMAccountName` attribute for each object for matching user names when a user attempts to log into the Firepower System.

In addition, a Shell Access Attribute of `sAMAccountName` causes each `sAMAccountName` attribute to be checked for all objects in the directory for matches when a user logs into a shell account on the appliance.

This example also has group settings in place. The Maintenance User role is automatically assigned to all members of the group with a `member` group attribute and the base domain name of `CN=SFmaintenance,DC=it,DC=example,DC=com`.

The shell access filter is set to be the same as the base filter, so the same users can access the appliance through the shell or CLI as through the web interface.

LDAP Authentication Server Fields

CAC

Select this checkbox if you want to use CAC for authentication and authorization.

Name

A name for the authentication server.

Description

A description for the authentication server.

Server Type

The type of LDAP server you plan to connect to. You have the following options when selecting a type:

- If you are connecting to a Microsoft Active Directory server, select **MS Active Directory**.

- If you are connecting to a Sun Java Systems Directory Server or Oracle Directory Server, select **Oracle Directory**.
- If you are connecting to an OpenLDAP server, select **OpenLDAP**.
- If you are connecting to a LDAP server other than those listed above and want to clear default settings, select **Other**.

Tip If you click Set Defaults, the system populates the **User Name Template**, **UI Access Attribute**, **Shell Access Attribute**, **Group Member Attribute**, and **Group Member URL Attribute** fields with default values.

Primary Server Host Name/IP Address

The IP address or host name for the primary server where you want to obtain authentication data.

Note If you are using a certificate to connect via TLS or SSL, the host name in the certificate must match the host name used in this field. In addition, IPv6 addresses are not supported for encrypted connections.

Primary Server Port

The port used by the primary authentication server.

Backup Server Host Name/IP Address

The IP address or host name for the backup server where you want to obtain authentication data.

Backup Server Port

The port used by the backup authentication server.

Identifying the LDAP Authentication Server

Smart License	Classic License	Supported Devices	Supported Domains	Access
Any	Any	Any	Any	Admin

When you create an authentication object, you first specify the primary and backup server and server port where you want the managed device or Firepower Management Center to connect for authentication.

Note If you are configuring an LDAP authentication object for use with CAC authentication, do **not** remove the CAC inserted in your computer. You **must** have a CAC inserted at all times after enabling user certificates.

In a multidomain deployment, external authentication objects are only available in the domain in which they are created.

Procedure

- Step 1** Choose **System** > **Users**.
- Step 2** Click the **External Authentication** tab.
- Step 3** Click **Add External Authentication Object**.
- Step 4** Choose **LDAP** from the **Authentication Method** drop-down list.
- Step 5** Optionally, check the check box for **CAC** if you plan to use this authentication object for CAC authentication and authorization.
- Note** You must follow the procedure in [Configuring CAC Authentication, on page 71](#) to fully configure CAC authentication and authorization.
- Step 6** Enter a name and description for the authentication server in the **Name** and **Description** fields.
- Step 7** Choose a **Server Type** from the drop-down list as described in [LDAP Authentication Server Fields, on page 78](#). Optionally, click **Set Defaults**.
- Step 8** Enter a **Primary Server Host Name/IP Address**.
- Note** If you are using a certificate to connect via TLS or SSL, the host name in the certificate must match the host name used in this field. In addition, IPv6 addresses are not supported for encrypted connections.
- Step 9** Optionally, enter a **Primary Server Port**.
- Step 10** Optionally, enter a **Backup Server Host Name/IP Address**.
- Step 11** Optionally, enter a **Backup Server Port**.
-

What to do next

- Continue creating your LDAP authentication object as described in [Creating Advanced LDAP Authentication Objects, on page 75](#).

LDAP-Specific Fields

The following table describes each of the LDAP-specific parameters.

Table 11: LDAP-Specific Parameters

Setting	Description	Examples
Base DN	<p>Supplies the base distinguished name of the directory where the appliance searches for user information on the LDAP server.</p> <p>Typically, the base DN has a basic structure indicating the company domain and operational unit.</p> <p>Note that after you identify a primary server, you can automatically retrieve a list of available base DN's from the server and select the appropriate base DN.</p>	<p>The Security organization of the Example company might have a base DN of <code>ou=security,dc=example,dc=com</code></p>

Setting	Description	Examples
Base Filter	Focuses your search by only retrieving objects in the base DN that have the specific attribute-value pair set in the filter. The base filter is an attribute type, a comparison operator, and the attribute value you want to use as a filter enclosed in parentheses.	To filter for only users with a common name starting with F, use the filter <code>(cn=F*)</code> .
User Name/Password	Allows the local appliance to access the user objects. Supplies user credentials for a user with appropriate rights to the authentication objects you want to retrieve. The distinguished name for the user you specify must be unique to the directory information tree for the LDAP server. Server user names associated with a Microsoft Active Directory Server cannot end with the <code>\$</code> character.	The user name for the <code>admin</code> user in the Security organization of the Example company might have a user name of <code>cn=admin, ou=security, dc=example, dc=com</code>
Encryption	Determines whether and how the communications are encrypted. You can choose no encryption, Transport Layer Security (TLS), or Secure Sockets Layer (SSL) encryption. Note that if you are using a certificate to authenticate when connecting via TLS or SSL, the name of the LDAP server in the certificate must match the User Name you supply. If you change the encryption method after specifying the port, the port resets to the default value for the selected server type.	If you enter <code>10.10.10.250</code> in the external authentication settings and <code>computer1.example.com</code> in the certificate, the connection fails, even if <code>computer1.example.com</code> has an IP address of <code>10.10.10.250</code> . Changing the name of the server in the external authentication settings to <code>computer1.example.com</code> causes the connection to succeed.
SSL Certificate Upload Path	Indicates the path on your local computer to the certificate to be used for encryption.	<code>c:/server.crt</code>
User Name Template	Indicates how user names entered on login should be formatted, by mapping the string conversion character (<code>%s</code>) to the value of the UI Access Attribute for the user. The user name template is the format for the distinguished name used for authentication. When a user enters a user name into the login page, the appliance substitutes the name for the string conversion character and uses the resulting distinguished name to search for the user credentials. If you want to use this object for CAC authentication and authorization, you must enter a User Name Template .	<code>%s@security.example.com,</code> <code>%s@mail.com,</code> <code>%s@mil,</code> <code>%s@smil.mil,</code>
Timeout	Sets a timeout for the connection attempt to the primary server, so the connection rolls over to the backup server. If the number of seconds indicated in this field (or the timeout on the LDAP server) elapses without a response from the primary authentication server, the appliance then queries the backup server. However, if LDAP is running on the port of the primary LDAP server and for some reason refuses to service the request, the failover to the backup server does not occur.	If the primary server has LDAP disabled, the appliance queries the backup server.

Setting	Description	Examples
UI Access Attribute	<p>Tells the local appliance to match the value of a specific attribute rather than the value of the user distinguished name. You can use any attribute, if the value of the attribute is a valid user name for the Firepower System web interface. If one of the objects has a matching user name and password, the user login request is authenticated.</p> <p>Selecting a server type and setting defaults prepopulates the UI Access Attribute with a value typically appropriate for that type of server.</p> <p>If you leave this field blank, the local appliance checks the user distinguished name value for each user record on the LDAP server to see if it matches the user name.</p> <p>If you want to use this object for CAC authentication and authorization, you must enter a value that corresponds with your User Name Template value.</p>	sAMAccountName, userPrincipalName, mail

Configuring LDAP-Specific Parameters

Smart License	Classic License	Supported Devices	Supported Domains	Access
Any	Any	Any	Any	Admin

The settings in the LDAP-specific parameters section determine the area of the LDAP directory where the appliance searches for user names, and control details of how the appliance connects to the LDAP server.

Valid user names are unique, and can include underscores (_), periods (.), hyphens (-), and alphanumeric characters.

In addition for most LDAP-specific settings, you can use LDAP naming standards and filter and attribute syntax. For more information, see the RFCs listed in the Lightweight Directory Access Protocol (v3): Technical Specification, RFC 3377. Examples of syntax are provided throughout this procedure. Note that when you set up an authentication object to connect to a Microsoft Active Directory Server, you can use the address specification syntax documented in the Internet RFC 822 (Standard for the Format of ARPA Internet Text Messages) specification when referencing a user name that contains a domain. For example, to refer to a user object, you might enter `JoeSmith@security.example.com` rather than the equivalent user distinguished name of `cn=JoeSmith,ou=security,dc=example,dc=com` when using Microsoft Active Directory Server.

Note If you are configuring an LDAP authentication object for use with CAC authentication, do **not** remove the CAC inserted in your computer. You **must** have a CAC inserted at all times after enabling user certificates.

Procedure

Step 1

In the **LDAP-Specific Parameters** section of the Create External Authentication Object page, you have two options for setting the base DN:

- Click **Fetch DNs**, and choose the appropriate base distinguished name from the drop-down list.

- Enter the base distinguished name for the LDAP directory you want to access in the **Base DN** field. For example, to authenticate names in the Security organization at the Example company, enter `ou=security,dc=example,dc=com`.

Step 2 Optionally, enter a **Base Filter**.

Example:

For example, if the user objects in a directory tree have a `physicalDeliveryOfficeName` attribute and users in the New York office have an attribute value of `NewYork` for that attribute, to retrieve only users in the New York office, enter `(physicalDeliveryOfficeName=NewYork)`.

Step 3 Enter a distinguished name as the **User Name** and the **Password** for a user who has sufficient credentials to browse the LDAP server.

Example:

For example, if you are connecting to an OpenLDAP server where user objects have a `uid` attribute and the object for the administrator in the Security division at our example company has a `uid` value of `NetworkAdmin`, you might enter `uid=NetworkAdmin,ou=security,dc=example,dc=com`.

Caution If you are connecting to a Microsoft Active Directory Server, you cannot provide a server user name that ends with the `$` character.

Step 4 Re-enter the password in the **Confirm Password** field.

Step 5 After you configure the basic LDAP-specific parameters, you have several options:

- To access advanced options, click the arrow next to **Show Advanced Options** and continue with the next step.
- If you want to configure user default roles based on LDAP group membership, continue with [Configuring Access Rights by Group, on page 85](#).
- If you are not using LDAP groups for authentication, continue with [Configuring LDAP Shell Access, on page 87](#).

Step 6 Choose an **Encryption** mode for your LDAP connection.

Note Note that if you change the encryption method after specifying a port, you reset the port to the default value for that method. For none or TLS, the port uses the default value of 389. If you choose SSL encryption, the port uses the default of 636.

Step 7 If you choose TLS or SSL encryption and you want to use a certificate to authenticate, **Browse** to the location of a valid TLS or SSL certificate.

Note If you previously uploaded a certificate and want to replace it, upload the new certificate and redeploy the configuration to your appliances to copy over the new certificate.

Step 8 Optionally, provide a **User Name Template** that corresponds with your **UI Access Attribute**.

Example:

For example, to authenticate all users who work in the Security organization of our example company by connecting to an OpenLDAP server where the UI access attribute is `uid`, you might enter `uid=%s,ou=security,dc=example,dc=com` in the **User Name Template** field. For a Microsoft Active Directory server, you could enter `%s@security.example.com`.

Note If you want to use CAC credentials for authentication and authorization, you **must** enter a value in the **User Name Template** field.

Step 9 Optionally, in the **Timeout** field, enter the number of seconds that should elapse before rolling over to the backup connection.

Step 10 Optionally, to retrieve users based on an attribute instead of the Base DN and Base Filter, you have two options:

- Click **Fetch Attrs** to retrieve a list of available attributes, and choose the appropriate attribute.
- Enter a **UI Access Attribute**. For example, on a Microsoft Active Directory Server, you may want to use the UI Access Attribute to retrieve users, because there may not be a `uid` attribute on Active Directory Server user objects. Instead, you can search the `userPrincipalName` attribute by typing `userPrincipalName` in the **UI Access Attribute** field.

Note If you want to use CAC credentials for authentication and authorization, you **must** enter a value in the **UI Access Attribute** field.

What to do next

- Continue creating your LDAP authentication object as described in [Creating Advanced LDAP Authentication Objects](#), on page 75.

LDAP Group Fields

Any group you reference must exist on the LDAP server. You can reference static LDAP groups or dynamic LDAP groups. Static LDAP groups are groups where membership is determined by group object attributes that point to specific users, and dynamic LDAP groups are groups where membership is determined by creating an LDAP search that retrieves group users based on user object attributes. Group access rights for a role only affect users who are members of the group.

The access rights granted when a user logs into the Firepower System depend on the LDAP configuration:

- If no group access rights are configured for your LDAP server, when a new user logs in, the Firepower System authenticates the user against the LDAP server and then grants user rights based on the default minimum access role set in the platform settings policy.
- If you configure any group settings, new users belonging to specified groups inherit the minimum access setting for the groups where they are members.
- If a new user does not belong to any specified groups, the user is assigned the default minimum access role specified in the Group Controlled Access Roles section of the authentication object.
- If a user belongs to more than one configured group, the user receives the access role for the group with the highest access as a minimum access role.

You cannot use the Firepower System user management page to remove the minimum access rights for users assigned an access role because of LDAP group membership. You can, however, assign additional rights. When you modify the access rights for an externally authenticated user, the Authentication Method column on the User Management page provides a status of **External - Locally Modified**.

Note If you use a dynamic group, the LDAP query is used exactly as it is configured on the LDAP server. For this reason, the Firepower System limits the number of recursions of a search to four to prevent search syntax errors from causing infinite loops. If a user's group membership is not established in those recursions, the default access role defined in the Group Controlled Access Roles section is granted to the user.

Firepower System User Roles

The distinguished names for the LDAP groups that contain users who should be assigned each user role.

Default User Role

The default minimum access role for users that do not belong to any of the specified groups.

Group Member Attribute

The LDAP attribute that contains the LDAP search string in a static group.

Group Member URL Attribute

The LDAP attribute that designates membership in a dynamic group

Configuring Access Rights by Group

Smart License	Classic License	Supported Devices	Supported Domains	Access
Any	Any	Any	Any	Admin

If you prefer to base default access rights on a user's membership in an LDAP group, you can specify distinguished names for existing groups on your LDAP server for each of the access roles used by your Firepower System. When you do so, you can configure a default access setting for those users detected by LDAP that do not belong to any specified groups. When a user logs in, the Firepower System dynamically checks the LDAP server and assigns default access rights according to the user's current group membership.

If you do not configure a user's privileges using group-controlled access roles, a user has only the privileges granted by default in the platform settings policy.

If you plan to use an object for CAC authentication and authorization, Cisco recommends configuring LDAP groups to manage access role assignments for CAC-authenticated users.

Note If you are configuring an LDAP authentication object for use with CAC authentication, do **not** remove the CAC inserted in your computer. You **must** have a CAC inserted at all times after enabling user certificates.

Before you begin

- Confirm that the group you plan to reference exists on the LDAP server.

Procedure

Step 1 On the Create External Authentication Object page, click the down arrow next to **Group Controlled Access Roles**.

Step 2 Optionally, in the **DN** fields that correspond to Firepower System user roles, enter the distinguished name for the LDAP groups that contain users who should be assigned to those roles.

Example:

For example, you might enter the following in the **Administrator** field to authenticate names in the information technology organization at the `Example` company:

```
cn=itgroup,ou=groups, dc=example,dc=com
```

Step 3 Choose a **Default User Role**.

Step 4 If you use static groups, enter a **Group Member Attribute**.

Example:

For example, if the `member` attribute is used to indicate membership in the static group you reference for default Security Analyst access, enter `member`.

Step 5 If you use dynamic groups, enter a **Group Member URL Attribute**.

Example:

For example, if the `memberURL` attribute contains the LDAP search that retrieves members for the dynamic group you specified for default Admin access, enter `memberURL`.

What to do next

- Continue creating your LDAP authentication object as described in [Creating Advanced LDAP Authentication Objects, on page 75](#).

LDAP Shell Access Fields

With the exception of the admin account, shell access is controlled entirely through the shell access attribute you set. The shell access filter you set determines which set of users on the LDAP server can log into the shell.

Note that a home directory for each shell user is created on login, and when an LDAP shell access user account is disabled (by disabling the LDAP connection), the directory remains, but the user shell is set to `/bin/false` in `/etc/passwd` to disable the shell. If the user then is re-enabled, the shell is reset, using the same home directory.

Shell users can log in using user names with lowercase, uppercase, or mixed case letters. Login authentication for the shell is case sensitive.

Shell Access Attribute

The access attribute you want to use for filtering. You can use any attribute if the value of the attribute is a valid user name for shell access.

If you leave this field blank, the user distinguished name is used for shell access authentication.

Tip Selecting a server type and setting defaults prepopulates this field with an attribute typically appropriate for that type of server.

Shell Access Filter

The attribute value you want to use to retrieve administrative user entries for shell access. The filter is an attribute name, a comparison operator, and the attribute value.

The **Same as Base Filter** check box allows you to search more efficiently if all users qualified in the base DN are also qualified for shell access privileges. Normally, the LDAP query to retrieve users combines the base filter with the shell access filter. If the shell access filter was the same as the base filter, the same query runs twice, which is unnecessarily time-consuming. You can use the **Same as Base Filter** option to run the query only once for both purposes.

If you leave this field blank, you prevent LDAP authentication of shell access.

Configuring LDAP Shell Access

Smart License	Classic License	Supported Devices	Supported Domains	Access
Any	Any	Any	Any	Admin

You can use the LDAP server to authenticate accounts for shell access on your managed device or Firepower Management Center. Specify a search filter that retrieves entries for users you want to grant shell access.

You **cannot** configure CAC authentication and authorization and shell access in the same authentication object. Instead, create and enable separate authentication objects.

The authentication object for shell access must be the first authentication object on the Firepower Management Center.

Cisco does not support external authentication for NGIPSv devices or ASA FirePOWER devices. In addition, IPv6 is not supported for shell access authentication.

Caution On all appliances, users with shell access (whether obtained through external authentication or through using the CLI `expert` command) have `sudoers` privileges in the shell, which can present a security risk. If you establish external authentication, make sure that you restrict the list of users with shell access appropriately. Similarly, when granting CLI access privileges, restrict the list of users with **Configuration** level access. Cisco strongly recommends that you do not establish additional shell users on the Firepower Management Center.

You **cannot** configure CAC authentication and authorization and shell access in the same authentication object. Checking the **CAC** check box disables the shell access configuration options on the page. Instead, create and enable separate authentication objects.

Before you begin

- Remove any internally-authenticated CLI or shell users that have the same user name as externally-authenticated users included in your shell access filter.

Procedure

Step 1 On the Create External Authentication Object page, if you want to use a shell access attribute other than the user distinguished type a **Shell Access Attribute**.

Example:

For example, on a Microsoft Active Directory Server, use the `sAMAccountName` shell access attribute to retrieve shell access users by typing `sAMAccountName` in the **Shell Access Attribute** field.

Step 2 Set a shell access account filter. You have multiple options:

- To retrieve administrative user entries based on attribute value, enter the attribute name, a comparison operator, and the attribute value you want to use as a filter, enclosed in parentheses, in the **Shell Access Filter** field. For example, if all network administrators have a `manager` attribute which has an attribute value of `shell`, you can set a base filter of `(manager=shell)`.
- To use the same filter you specified when configuring authentication settings, choose **Same as Base Filter**.
- To prevent LDAP authentication of shell access, leave the field blank.

What to do next

- Continue creating your LDAP authentication object as described in [Creating Advanced LDAP Authentication Objects, on page 75](#).

Testing LDAP Authentication Connections

Smart License	Classic License	Supported Devices	Supported Domains	Access
Any	Any	Any	Any	Admin

After you configure LDAP server and authentication settings, you can specify user credentials for a user who should be able to authenticate to test those settings.

For the **User Name**, you can enter the value for the `uid` attribute for the user you want to test with. If you are connecting to a Microsoft Active Directory Server and supplied a UI access attribute in place of `uid`, use the value for that attribute as the user name. You can also specify a fully qualified distinguished name for the user.

Use the **Password** for the same user.

The test output lists valid and invalid user names. Valid user names are unique, and can include underscores (`_`), periods (`.`), hyphens (`-`), and alphanumeric characters.

Note that testing the connection to servers with more than 1000 users only returns 1000 users because of web interface page size limitations.

Tip If you mistype the name or password of the test user, the test fails even if the server configuration is correct. Test the server configuration without the additional test parameters first. If that succeeds supply a user name and password to test with the specific user.

Procedure

Step 1 On the Add External Authentication Object page, enter a **User Name** and **Password**.

Example:

For example, to test to see if you can retrieve the `JSmith` user credentials at the Example company, enter `JSmith` and `password`.

Step 2 Click **Test**. You have two options:

- If the test succeeds, the test output appears at the bottom of the page. Click **Save**.
 - If the test fails, see [Troubleshooting LDAP Authentication Connections, on page 89](#) for suggestions for troubleshooting the connection.
-

Troubleshooting LDAP Authentication Connections

If you create an LDAP authentication object and it either does not succeed in connecting to the server you select, or does not retrieve the list of users you want, you can tune the settings in the object.

If the connection fails when you test it, try the following suggestions to troubleshoot your configuration:

- Use the messages displayed at the top of the screen and in the test output to determine which areas of the object are causing the issue.
- Check that the user name and password you used for the object are valid:
 - Check that the user has the rights to browse to the directory indicated in your base distinguished name by connecting to the LDAP server using a third-party LDAP browser.
 - Check that the user name is unique to the directory information tree for the LDAP server.
 - If you see an LDAP bind error 49 in the test output, the user binding for the user failed. Try authenticating to the server through a third-party application to see if the binding fails through that connection as well.
- Check that you have correctly identified the server:
 - Check that the server IP address or host name is correct.
 - Check that you have TCP/IP access from your local appliance to the authentication server where you want to connect.
 - Check that access to the server is not blocked by a firewall and that the port you have configured in the object is open.
 - If you are using a certificate to connect via TLS or SSL, the host name in the certificate must match the host name used for the server.
 - Check that you have not used an IPv6 address for the server connection if you are authenticating shell access.
 - If you used server type defaults, check that you have the correct server type and click **Set Defaults** again to reset the default values.

- If you typed in your base distinguished name, click **Fetch DNs** to retrieve all the available base distinguished names on the server, and select the name from the list.
- If you are using any filters, access attributes, or advanced settings, check that each is valid and typed correctly.
- If you are using any filters, access attributes, or advanced settings, try removing each setting and testing the object without it.
- If you are using a base filter or a shell access filter, make sure that the filter is enclosed in parentheses and that you are using a valid comparison operator.
- To test a more restricted base filter, try setting it to the base distinguished name for the user to retrieve just that user.
- If you are using an encrypted connection:
 - Check that the name of the LDAP server in the certificate matches the host name that you use to connect.
 - Check that you have not used an IPv6 address with an encrypted server connection.
- If you are using a test user, make sure that the user name and password are typed correctly.
- If you are using a test user, remove the user credentials and test the object.
- Test the query you are using by connecting to the LDAP server via the command line on the appliance you want to connect from using this syntax:

```
ldapsearch -x -b 'base_distinguished_name'
-h LDAPserver_ip_address -p port -v -D
'user_distinguished_name' -W 'base_filter'
```

For example, if you are trying to connect to the security domain on `myrtle.example.com` using the `domainadmin@myrtle.example.com` user and a base filter of `(cn=*)`, you could test the connection using this statement:

```
ldapsearch -x -b 'CN=security,DC=myrtle,DC=example,DC=com'
-h myrtle.example.com -p 389 -v -D
'domainadmin@myrtle.example.com' -W '(cn=*)'
```

If you can test your connection successfully but authentication does not work after you deploy a platform settings policy, check that authentication and the object you want to use are both enabled in the platform settings policy that is applied to the appliance.

If you connect successfully but want to adjust the list of users retrieved by your connection, you can add or change a base filter or shell access filter or use a more restrictive or less restrictive base DN.

RADIUS Authentication

The Remote Authentication Dial In User Service (RADIUS) is an authentication protocol used to authenticate, authorize, and account for user access to network resources. You can create an authentication object for any RADIUS server that conforms to RFC 2865.

When a user authenticated on a RADIUS server logs in for the first time, the user receives the roles specified for that user in the authentication object. If the user is not listed for any of the user roles, they receive the default access role you selected in the authentication object. If no default access role is selected in the authentication object, they receive the default access role set in the platform settings policy. You can modify a user's roles, if needed, unless the settings are granted through the user lists in the authentication object. Note that when a user authenticated on a RADIUS server using attribute matching attempts to log in for the first time, the login is rejected as the user account is created. The user must log in a second time.

Note Before enabling external authentication on 7000 or 8000 Series devices, remove any internally-authenticated CLI users that have the same user name as externally-authenticated users included in your shell access filter.

The Firepower System implementation of RADIUS supports the use of SecurID® tokens. When you configure authentication by a server using SecurID, users authenticated against that server append the SecurID token to the end of their SecurID PIN and use that as their password when they log into a Cisco system. As long as SecurID is configured correctly to authenticate users outside the Firepower System, those users can log into a Firepower Management Center or 7000 or 8000 Series device using their PIN plus the SecurID token without any additional configuration.

Creating RADIUS Authentication Objects

Smart License	Classic License	Supported Devices	Supported Domains	Access
Any	Any	Any	Any	Admin

When you create a RADIUS authentication object, you define settings that let you connect to an authentication server. You also grant user roles to specific and default users. If your RADIUS server returns custom attributes for any users you plan to authenticate, you must define those custom attributes. Optionally, you can also configure CLI or shell access authentication.

In a multidomain deployment, external authentication objects are only available in the domain in which they are created.

Before you begin

- Confirm that you have TCP/IP access from your local appliance to the authentication server where you want to connect.

Procedure

- Step 1** Choose **System > Users**.
- Step 2** Click the **External Authentication** tab.
- Step 3** Click **Add External Authentication Object**.
- Step 4** Choose **RADIUS** from the **Authentication Method** drop-down list.
- Step 5** Identify the authentication server as described in [Configuring RADIUS Connection Settings, on page 93](#).
- Step 6** Configure user roles as described in [Configuring RADIUS User Roles, on page 95](#).
- Step 7** Optionally, configure shell access as described in [Configuring RADIUS Shell Access, on page 96](#).

- Step 8** Optionally, define custom attributes as described in [Defining Custom RADIUS Attributes, on page 97](#).
- Step 9** Test your configuration as described in [Testing RADIUS Authentication Connections, on page 98](#).

Example

The following figure illustrates a sample RADIUS login authentication object for a server running FreeRADIUS with an IP address of 10.10.10.98. Note that the connection uses port 1812 for access, and note that connections to the server time out after 30 seconds of disuse, then retry three times before attempting to connect to a backup authentication server.

This example illustrates important aspects of RADIUS user role configuration:

Users `ewharton` and `gsand` are granted administrative access to appliances where this authentication object is enabled.

The user `cbronte` is granted Maintenance User access to appliances where this authentication object is enabled.

The user `jausten` is granted Security Analyst access to appliances where this authentication object is enabled.

The user `ewharton` can log into the appliance using a shell account.

The following graphic depicts the role configuration for the example:

RADIUS-Specific Parameters

Timeout (Seconds)	30
Retries	3
Access Admin	
Administrator	ewharton, gsand
External Database User	
Intrusion Admin	
Maintenance User	cbronte
Network Admin	
Discovery Admin	
Security Approver	
Security Analyst	jausten
Security Analyst (Read Only)	
Default User Role	Access Admin Administrator External Database User Intrusion Admin
Shell Access Filter	
Administrator Shell Access User List	ewharton

371902

Example

You can use an attribute-value pair to identify users who should receive a particular user role. If the attribute you use is a custom attribute, you must define the custom attribute.

The following figure illustrates the role configuration and custom attribute definition in a sample RADIUS login authentication object for the same FreeRADIUS server as in the previous example.

In this example, however, the `MS-RAS-Version` custom attribute is returned for one or more of the users because a Microsoft remote access server is in use. Note the `MS-RAS-Version` custom attribute is a string. In this example, all users logging in to RADIUS through a Microsoft v. 5.00 remote access server should receive the Security Analyst (Read Only) role, so you enter the attribute-value pair of `MS-RAS-Version=MSRASV5.00` in the **Security Analyst (Read Only)** field.

The screenshot shows a configuration window with the following sections:

- RADIUS-Specific Parameters:** A list of fields for user roles. The 'Security Analyst (Read Only)' field contains the value 'MS-RAS-Version=MSRASV5.00'. The 'Default User Role' dropdown is set to 'Access Admin'.
- Shell Access Filter:** The 'Administrator Shell Access User List' field contains 'ewharton'.
- Define Custom RADIUS Attributes:** A table with columns for Attribute Name, Attribute ID, and Attribute Type. One attribute is defined: 'MS-Ras-Version' with ID '18' and Type 'string'.

Attribute Name	Attribute ID	Attribute Type
MS-Ras-Version	18	string

Configuring RADIUS Connection Settings

Smart License	Classic License	Supported Devices	Supported Domains	Access
Any	Any	Any	Any	Admin

When you create a RADIUS authentication object, you first specify the primary and backup server and server port where you want the local appliance (managed device or Firepower Management Center) to connect for authentication.

Note For RADIUS to function correctly, you must open its authentication and accounting ports (by default, 1812 and 1813) on your firewall.

If you specify a backup authentication server, you can set a timeout for the connection attempt to the primary server. If the number of seconds indicated in the **Timeout** field (or the timeout on the LDAP server) elapses without a response from the primary authentication server, the appliance then re-queries the primary server.

After the appliance re-queries the primary authentication server the number of times indicated by the **Retries** field and the number of seconds indicated in the **Timeout** field again elapses without a response from the primary authentication server, the appliance then rolls over to the backup server.

If, for example, the primary server has RADIUS disabled, the appliance queries the backup server. If RADIUS is running on the port of the primary RADIUS server and for some reason refuses to service the request (due to misconfiguration or other issues), however, the failover to the backup server does not occur.

Procedure

- Step 1** Choose **System** > **Users**.
- Step 2** Click the **External Authentication** tab.
- Step 3** Click **Create External** > **Authentication Object**.
- Step 4** Choose **RADIUS** from the **Authentication Method** drop-down list.
- Step 5** Enter a **Name** and **Description** for the authentication server.
- Step 6** Enter the IP address or host name for the primary RADIUS server where you want to obtain authentication data in the **Primary Server Host Name/IP Address** field.
 - Note** IPv6 addresses are not supported for shell authentication. To allow shell authentication when using an IPv6 address for your primary RADIUS server, set up an authentication object using an IPv4 address for the server and use that IPv4 object as the first authentication object on the Firepower Management Center.
- Step 7** Optionally, modify the port used by the primary RADIUS authentication server in the **Primary Server Port** field.
 - Note** If your authentication port and accounting port numbers are not sequential, leave this field blank. The system then determines RADIUS port numbers from the `radius` and `radacct` data in your appliance's `/etc/services` file.
- Step 8** Enter the **RADIUS Secret Key** for the primary RADIUS authentication server.
- Step 9** Optionally, enter the IP address or host name for the backup RADIUS authentication server where you want to obtain authentication data in the **Backup Server Host Name/IP Address** field.
- Step 10** If you set a backup server, modify the **Backup Server Port**, **RADIUS Secret Key**, and **Timeout** and enter the number of times the primary server connection should be tried before rolling over to the backup connection in the **Retries** field.

Note If your authentication port and accounting port numbers are not sequential, leave this field blank. The system then determines RADIUS port numbers from the `radius` and `radacct` data in your appliance's `/etc/services` file.

What to do next

- Continue creating your RADIUS authentication object as described in [Creating RADIUS Authentication Objects, on page 91](#).

Configuring RADIUS User Roles

Smart License	Classic License	Supported Devices	Supported Domains	Access
Any	Any	Any	Any	Admin

When a user logs in, the Firepower System checks the RADIUS server and grants access rights depending on the RADIUS configuration:

- If specific access rights are not configured for a user and a default access role is not specified, when a new user logs in, the Firepower System authenticates the user against the RADIUS server and then grants user rights based on the default access role (or roles) set in the platform settings policy.
- If a new user is not specified on any lists and default access roles are specified in the **Default User Role** list of the authentication object, the user is assigned those access roles.
- If you add a user to the list for one or more specific role, that user receives all assigned access roles.

You can also use attribute-value pairs, rather than user names, to identify users who should receive a particular user role. For example, if you know all users who should be Security Analysts have the value `Analyst` for their `User-Category` attribute, you can enter `User-Category=Analyst` in the Security Analyst List field to grant that role to those users.

You can assign a default user role (or roles) to be assigned to any users that are authenticated externally but not listed for a specific role. You can specify multiple roles in the **Default User Role** list.

You cannot remove the minimum access rights for users assigned an access role because of RADIUS user list membership through the Firepower System user management page. You can, however, assign additional rights.

Caution If you want to change the minimum access setting for a user, you must not only move the user from one list to another in the RADIUS Specific Parameters section or change the user's attribute on the RADIUS server, you must redeploy the configuration to the managed device and remove the assigned user right on the user management page.

Before you begin

- Define custom attributes if you plan to use them to set user role membership, as described in [Defining Custom RADIUS Attributes, on page 97](#).

Procedure

- Step 1** On the Create External Authentication Object page, in the fields that correspond to Firepower System user roles, enter the name of each user or identifying attribute-value pair that should be assigned to those roles. Separate usernames and attribute-value pairs with commas.
- Example:**
- For example, to grant the Administrator role to the users `jsmith` and `jdoh`, enter `jsmith, jdoh` in the **Administrator** field. As another example, to grant the Maintenance User role to all users with a `User-Category` value of `Maintenance`, enter `User-Category=Maintenance` in the **Maintenance User** field.
- Step 2** Choose the default minimum access role for users that do not belong to any of the specified groups from the **Default User Role** list.

What to do next

- Continue creating your RADIUS authentication object as described in [Creating RADIUS Authentication Objects](#), on page 91.

Configuring RADIUS Shell Access

Smart License	Classic License	Supported Devices	Supported Domains	Access
Any	Any	Any	Any	Admin

You can also use the RADIUS server to authenticate accounts for CLI or shell access on your local appliance (managed device or Firepower Management Center). Specify user names for users you want to grant CLI or shell access.

- Note** IPv6 addresses are not supported for shell authentication. If you configure a primary RADIUS server with an IPv6 address and also configure administrative shell access, the shell access settings are ignored. To allow shell authentication when using an IPv6 address for your primary RADIUS server, set up another authentication object using an IPv4 address for the server and use that object as the first authentication object on the Firepower Management Center.

With the exception of the admin account, the shell access list you set on the RADIUS authentication object entirely controls CLI or shell access on the appliance. CLI or shell users are configured as local users on the appliance when you deploy the platform settings policy. Note that when a user authenticated on a RADIUS server using attribute matching attempts to log in for the first time, the login is rejected as the user account is created. The user must log in a second time.

Note that a home directory for each CLI or shell user is created on login, and when an RADIUS shell access user account is disabled (by disabling the RADIUS connection), the directory remains, but the user shell is set to `/bin/false` in `/etc/passwd` to disable the shell. If the user then is re-enabled, the shell is reset, using the same home directory.

CLI or shell users can log in using user names with lowercase, uppercase, or mixed case letters. Login authentication for the CLI or shell is case sensitive.

Caution On all appliances, users with shell access (whether obtained through external authentication or through using the CLI `expert` command) have `sudoers` privileges in the shell, which can present a security risk. If you establish external authentication, make sure that you restrict the list of users with shell access appropriately. Similarly, when granting CLI access privileges, restrict the list of users with **Configuration** level access. Cisco strongly recommends that you do not establish additional shell users on the Firepower Management Center.

Procedure

On the Create External Authentication Object page, enter the user names, separated by commas, in the **Administrator Shell Access User List** field.

Note If you choose not to specify a shell access filter, a warning displays when you save the authentication object to confirm that you meant to leave the filter blank.

What to do next

- Continue creating your RADIUS authentication object as described in [Creating RADIUS Authentication Objects, on page 91](#).

Defining Custom RADIUS Attributes

Smart License	Classic License	Supported Devices	Supported Domains	Access
Any	Any	Any	Any	Admin

If your RADIUS server returns values for attributes not included in the `dictionary` file in `/etc/radiusclient/` and you plan to use those attributes to set user roles for users with those attributes, you need to define those attributes in the login authentication object. You can locate the attributes returned for a user by looking at the user's profile on your RADIUS server.

When you define an attribute, you provide the name of the attribute, which consists of alphanumeric characters. Note that words in an attribute name should be separated by dashes rather than spaces. You also provide the attribute ID, which should be an integer and should not conflict with any existing attribute IDs in the `etc/radiusclient/dictionary` file. You also specify the type of attribute: string, IP address, integer, or date.

When you create a RADIUS authentication object, a new dictionary file for that object is created on the appliance in the `/var/sf/userauth` directory. Any custom attributes you add to the authentication object are added to the dictionary file.

In a multidomain deployment, external authentication objects are only available in the domain in which they are created.

Procedure

-
- Step 1** On the Add External Authentication Object page, click the arrow to expand the Define Custom RADIUS Attributes section.
- Step 2** Enter an attribute name in the **Attribute Name** field.
- Step 3** Enter the attribute ID, in integer form, in the **Attribute ID** field.
- Step 4** Choose the type of attribute from the **Attribute Type** drop-down list.
- Step 5** Click **Add** to add the custom attribute to the authentication object.

Tip You can remove a custom attribute from an authentication object by clicking **Delete** next to the attribute.

Example

If a RADIUS server is used on a network with a Cisco router, you might want to use the `Ascend-Assign-IP-Pool` attribute to grant a specific role to all users logging in from a specific IP address pool. `Ascend-Assign-IP-Pool` is an integer attribute that defines the address pool where the user is allowed to log in, with the integer indicating the number of the assigned IP address pool.

To declare that custom attribute, you create a custom attribute with an attribute name of `Ascend-IP-Pool-Definition`, an attribute ID of 218, and an attribute type of `integer`.

You could then enter `Ascend-Assign-IP-Pool=2` in the **Security Analyst (Read Only)** field to grant read-only security analyst rights to all users with an `Ascend-IP-Pool-Definition` attribute value of 2.

What to do next

- Continue creating your RADIUS authentication object as described in [Creating RADIUS Authentication Objects](#), on page 91.

Testing RADIUS Authentication Connections

Smart License	Classic License	Supported Devices	Supported Domains	Access
Any	Any	Any	Any	Admin

After you configure RADIUS connection, user role, and custom attribute settings, you can specify user credentials for a user who should be able to authenticate to test those settings.

For the user name, you can enter the user name for the user you want to test with.

Note that testing the connection to servers with more than 1000 users only returns 1000 users because of UI page size limitations.

Tip If you mistype the name or password of the test user, the test fails even if the server configuration is correct. To verify that the server configuration is correct, click **Test** without entering user information in the **Additional Test Parameters** field first. If that succeeds, supply a user name and password to test with the specific user.

Procedure

Step 1 On the Add External Authentication Object page, in the **User Name** and **Password** fields, enter the user name and password for the user whose credentials should be used to validate access to the RADIUS server.

Example:

For example, to test to see if you can retrieve the `jsmith` user credentials at our example company, enter `jsmith`.

Step 2 Choose **Show Details**, and click **Test**.

Step 3 If the test succeeds, click **Save**.

Single Sign-on (SSO)

Single sign-on (SSO) enables integration between Cisco Security Manager (CSM) Version 4.7 or higher and the Firepower Management Center, which allows you to access the Firepower Management Center from CSM without additional authentication to log in. When managing an ASA FirePOWER module, you may want to modify the policies deployed to the module. You can select the managing Firepower Management Center in CSM and launch it in a web browser.

If you have access based on your user role, the system navigates you to the Device tab of the Device Management page for the device you cross-launched from in CSM. Otherwise, the system navigates you to the Summary Dashboard page (**Overview > Dashboards**), except for user accounts with no dashboard access, which use the Welcome page.

The system disables SSO when STIG compliance is enabled for the Firepower Management Center.

Note You cannot login with single sign-on if your organization uses CACs for authentication.

Related Topics

[STIG Compliance](#), on page 727

Configuring SSO

Smart License	Classic License	Supported Devices	Supported Domains	Access
Any	Any	ASA FirePOWER	Any	Admin

You must set up a one-way, encrypted authentication path from CSM to the Firepower Management Center before you configure Single sign-on.

In NAT environments, the Firepower Management Center and CSM must reside on the same side of the NAT boundary. You must provide specific criteria to enable communications between CSM and the Firepower Management Center.

Note You cannot login with single sign-on if your organization uses CACs for authentication.

Procedure

- Step 1** From CSM, generate an SSO shared encryption key that identifies the connection. See your CSM documentation for more information.
- Step 2** From the Firepower Management Center, choose **System > Users**.
- Step 3** Choose **CSM Single Sign-on**.
- Step 4** Enter the **CSM hostname** or **IP** address and the server **Port**.
- Step 5** Enter the **Shared key** that you generated from CSM.
- Step 6** Optionally, if you want to use the Firepower Management Center's proxy server to communicate with CSM, choose the **Use Proxy For Connection** check box.
- Step 7** Click **Submit**.
- Step 8** Click **Confirm Certificate** to save the Certificate.
You can now log in from CSM to the Firepower Management Center without an additional login.

CHAPTER 5

Licensing the Firepower System

The Licensing chapter of the Firepower Management Center Configuration Guide provides in-depth information about the different license types, service subscriptions, licensing requirements and more. The chapter also provides procedures and requirements for deploying Smart and Classic licenses and licensing for air-gapped solutions.

The following topics explain how to license Firepower.

- [About Firepower Licenses, on page 101](#)
- [Requirements and Prerequisites for Licensing, on page 102](#)
- [License Requirements for Firepower Management Center, on page 102](#)
- [Evaluation License Caveats, on page 102](#)
- [Smart vs. Classic Licenses, on page 103](#)
- [License Firepower Threat Defense Devices \(FTD\), on page 103](#)
- [License Classic Devices \(Firepower 7000/8000 Series, ASA FirePOWER, and NGIPSv\), on page 120](#)
- [How to Convert a Classic License for Use on an FTD Device, on page 128](#)
- [Assign Licenses to Managed Devices from the Device Management Page, on page 130](#)
- [Additional Information about Firepower Licensing, on page 131](#)

About Firepower Licenses

Your Firepower products (Firepower Management Center and managed devices) include licenses for basic operation, but some features require separate licensing or service subscriptions, as described in this chapter.

A "right-to-use" license does not expire, but service subscriptions require periodic renewal.

The type of license your products require (Smart or Classic) depends on the software you use, not on the hardware it runs on.

Note "NGFW" means different things to different people, so this documentation does not use this term.

Requirements and Prerequisites for Licensing

Model Support

Any, but the specific licenses requires per model differ as indicated in the procedures.

Supported Domains

Global, except where indicated.

User Roles

- Admin

License Requirements for Firepower Management Center

Firepower Management Center allows you to assign licenses to managed devices and manage licenses for the system.

A single Firepower Management Center can manage both devices that require Classic licenses and devices that require Smart Licenses.

Hardware FMC

A hardware Firepower Management Center does not require purchase of additional licenses or service subscriptions in order to manage devices.

Virtual FMC

Firepower Management Center Virtual has additional licensing requirements. See [Firepower Management Center Virtual Licenses, on page 102](#).

Firepower Management Center Virtual Licenses

If a single FMCv manages Firepower Threat Defense devices that are configured in a high availability pair, you still need one entitlement for each device (*not* one entitlement for the pair of FTDs.)

This entitlement appears in Cisco Smart Software Manager as **Firepower MCv Device License** with different numbers of entitlements.

Evaluation License Caveats

Not all functionality is available with an evaluation license, functionality under an evaluation license may be partial, and transition from evaluation licensing to standard licensing may not be seamless.

For example, if you have Firepower Threat Defense devices configured in a cluster, and you switch from an evaluation license to Smart Licensing, service will be interrupted when you deploy the change.

Review information about evaluation license caveats in information about particular features in this Licensing chapter and in the chapters related to deploying each feature.

Smart vs. Classic Licenses

For managed devices, the licenses you need (Smart or Classic) depend on the software that runs on the device.

Any FMC can simultaneously manage devices with Smart and Classic licenses. You must configure each type of licensing separately.

Software	License Type	More Information
Firepower Management Center (hardware)	None	FMC hardware models themselves require no license.
Firepower Management Center Virtual	Device entitlements	See Firepower Management Center Virtual Licenses , on page 102.
Firepower Threat Defense Firepower Threat Defense Virtual	Smart	See the topics under License Firepower Threat Defense Devices (FTD) , on page 103.
NGIPS software: <ul style="list-style-type: none"> • Firepower 7000/8000 series • ASA FirePOWER • NGIPSv 	Classic	See License Classic Devices (Firepower 7000/8000 Series, ASA FirePOWER, and NGIPSv) , on page 120.
All other software products, including those that run on Firepower hardware	See licensing information for your software product.	

License Firepower Threat Defense Devices (FTD)

Firepower Threat Defense devices require Smart Licensing.

Cisco Smart Licensing lets you purchase and manage a pool of licenses centrally. Unlike product authorization key (PAK) licenses, Smart Licenses are not tied to a specific serial number or license key. Smart Licensing lets you assess your license usage and needs at a glance.

In addition, Smart Licensing does not prevent you from using product features that you have not yet purchased. You can start using a license immediately, as long as you are registered with the Cisco Smart Software Manager, and purchase the license later. This allows you to deploy and use a feature, and avoid delays due to purchase order approval.

Smart Software Manager (CSSM)

When you purchase one or more Smart Licenses for Firepower features, you manage them in the Cisco Smart Software Manager: <http://www.cisco.com/web/ordering/smart-software-manager/index.html>. The Smart Software Manager lets you create a primary account for your organization.

By default, your licenses are assigned to the Default Virtual Account under your primary account. As the account administrator, you can create additional virtual accounts; for example, for regions, departments, or subsidiaries. Multiple virtual accounts help you manage large numbers of licenses and appliances.

You manage licenses and appliances by virtual account. Only that virtual account's appliances can use the licenses assigned to the account. If you need additional licenses, you can transfer an unused license from another virtual account. You can also transfer appliances between virtual accounts.

For each virtual account, you can create a Product Instance Registration Token. Enter this token ID when you deploy each Firepower Management Center, or when you register an existing FMC. You can create a new token if an existing token expires. An expired token does not affect a registered FMC that used this token for registration, but you cannot use an expired token to register a FMC. Also, a registered FMC becomes associated with a virtual account based on the token you use.

For more information about the Cisco Smart Software Manager, see *Cisco Smart Software Manager User Guide* or <https://www.cisco.com/c/en/us/buy/smart-accounts/software-manager.html> or the online help in CSSM, also available from: <https://www.cisco.com/web/fw/softwareworkspace/smartlicensing/SSMCompiledHelps/>.

Periodic Communication with the License Authority

In order to maintain your product license entitlement, your product must communicate periodically with the Cisco License Authority.

When you use a Product Instance Registration Token to register a Firepower Management Center, the appliance registers with the Cisco License Authority. The License Authority issues an ID certificate for communication between the Firepower Management Center and the License Authority. This certificate is valid for one year, although it will be renewed every six months. If an ID certificate expires (usually in nine months or a year with no communication), the Firepower Management Center reverts to a deregistered state and licensed features usage become suspended.

The Firepower Management Center communicates with the License Authority on a periodic basis. If you make changes in the Smart Software Manager, you can refresh the authorization on the Firepower Management Center so the changes immediately take effect. You also can wait for the appliance to communicate as scheduled.

Your Firepower Management Center must either have direct Internet access to the License Authority through the Cisco Smart Software Manager or access through the Smart Software Satellite Server at scheduled time periods. Normal license communication occurs every 30 days, but with the grace period, your appliance will operate for up to 90 days without calling home. You must contact the License Authority before 90 days have passed.

Service Subscriptions for FTD Features

Some features require a service subscription.

A service subscription enables a specific Firepower feature on a managed device for a set length of time. Service subscriptions can be purchased in one-, three-, or five-year terms. If a subscription expires, Cisco

notifies you that you must renew the subscription. If a subscription expires for a Firepower Threat Defense device, you can continue to use the related features.

Table 12: Service Subscriptions and Corresponding Smart Licenses

Subscription You Purchase	Smart Licenses You Assign in Firepower System
T	Threat
TC	Threat + URL Filtering
TM	Threat + Malware
TMC	Threat + URL Filtering + Malware
URL	URL Filtering (can be added to Threat or used without Threat)
AMP	Malware (the Threat license is also required)

Your purchase of a managed device that uses Smart Licenses automatically includes a Base license. This license is perpetual and enables system updates. All service subscriptions are optional for Firepower Threat Defense devices.

FTD License Types and Restrictions

This section describes the types of Smart Licenses available in a Firepower System deployment. The Firepower Management Center requires Smart Licenses to manage Firepower Threat Defense devices.

The following table summarizes Firepower System Smart Licenses.

Table 13: Firepower System Smart Licenses

License You Assign in Firepower System	Subscription You Purchase	Duration	Granted Capabilities
Base (Base licenses are automatically assigned with all Firepower Threat Defense devices)	No subscription required (license is included with device)	Perpetual	User and application control Switching and routing NAT For details, see Base Licenses, on page 106 .
Threat	<ul style="list-style-type: none"> • T • TC (Threat + URL) • TMC (Threat + Malware + URL) 	Term-based	Intrusion detection and prevention File control Security Intelligence filtering For details, see Threat Licenses, on page 107

License You Assign in Firepower System	Subscription You Purchase	Duration	Granted Capabilities
Malware	<ul style="list-style-type: none"> • TM (Threat + Malware) • TMC (Threat + Malware + URL) • AMP 	Term-based	AMP for Networks (network-based Advanced Malware Protection) Cisco Threat Grid File storage For details, see Malware Licenses for Firepower Threat Defense Devices, on page 107 and License Requirements for File and Malware Policies, on page 1155 .
URL Filtering	<ul style="list-style-type: none"> • TC (Threat + URL) • TMC (Threat + Malware + URL) • URL 	Term-based	Category and reputation-based URL filtering For details, see URL Filtering Licenses for Firepower Threat Defense Devices, on page 108 .
Firepower Management Center Virtual	No subscription required.	Perpetual	The platform license determines the number of devices the virtual appliance can manage. For details, see Firepower Management Center Virtual Licenses, on page 102 .
Export-Controlled Features	No subscription required.	Perpetual	Features that are subject to national security, foreign policy, and anti-terrorism laws and regulations; see Licensing for Export-Controlled Functionality, on page 108 .

Base Licenses

A base license is automatically included with every purchase of a Firepower Threat Defense or Firepower Threat Defense Virtual device.

The Base license allows you to:

- configure your Firepower Threat Defense devices to perform switching and routing (including DHCP relay and NAT)
- configure Firepower Threat Defense devices as a high availability pair
- configure security modules as a cluster within a Firepower 9300 chassis (intra-chassis clustering)
- configure Firepower 9300 or Firepower 4100 series devices running Firepower Threat Defense as a cluster (inter-chassis clustering)

- implement user and application control by adding user and application conditions to access control rules

Threat and malware detection and URL filtering features require additional, optional licenses.

Base licenses are automatically added to the Firepower Management Center for every Firepower Threat Defense device you register.

Malware Licenses for Firepower Threat Defense Devices

A Malware license for Firepower Threat Defense devices allows you to perform Cisco Advanced Malware Protection (AMP) with AMP for Networks and Cisco Threat Grid. With this feature, you can use Firepower Threat Defense devices to detect and block malware in files transmitted over your network. To support this feature license, you can purchase the Malware (AMP) service subscription as a stand-alone subscription or in combination with Threat (TM) or Threat and URL Filtering (TMC) subscriptions.

Note Firepower Threat Defense managed devices with Malware licenses enabled periodically attempt to connect to the AMP cloud even if you have not configured dynamic analysis. Because of this, the device's Interface Traffic dashboard widget shows transmitted traffic; this is expected behavior.

You configure AMP for Networks as part of a file policy, which you then associate with one or more access control rules. File policies can detect your users uploading or downloading files of specific types over specific application protocols. AMP for Networks allows you to use local malware analysis and file preclassification to inspect a restricted set of those file types for malware. You can also download and submit specific file types to the Cisco Threat Grid cloud for dynamic and Spero analysis to determine whether they contain malware. For these files, you can view the network file trajectory, which details the path the file has taken through your network. The Malware license also allows you to add specific files to a file list and enable the file list within a file policy, allowing those files to be automatically allowed or blocked on detection.

If you disable all your Malware licenses, the system stops querying the AMP cloud, and also stops acknowledging retrospective events sent from the AMP cloud. You cannot re-deploy existing access control policies if they include AMP for Networks configurations. Note that for a very brief time after a Malware license is disabled, the system can use existing cached file dispositions. After the time window expires, the system assigns a disposition of `Unavailable` to those files.

Note that a Malware license is required only if you deploy AMP for Networks and Cisco Threat Grid. Without a Malware license, the Firepower Management Center can receive AMP for Endpoints malware events and indications of compromise (IOC) from the AMP cloud.

See also important information at [License Requirements for File and Malware Policies, on page 1155](#).

Threat Licenses

A Threat license allows you to perform intrusion detection and prevention, file control, and Security Intelligence filtering:

- *Intrusion detection and prevention* allows you to analyze network traffic for intrusions and exploits and, optionally, drop offending packets.
- *File control* allows you to detect and, optionally, block users from uploading (sending) or downloading (receiving) files of specific types over specific application protocols. *AMP for Networks*, which requires a Malware license, allows you to inspect and block a restricted set of those file types based on their dispositions.

- *Security Intelligence filtering* allows you to block —deny traffic to and from—specific IP addresses, URLs, and DNS domain names, before the traffic is subjected to analysis by access control rules. Dynamic feeds allow you to immediately block connections based on the latest intelligence. Optionally, you can use a “monitor-only” setting for Security Intelligence filtering.

You can purchase a Threat license as a stand-alone subscription (T) or in combination with URL Filtering (TC), Malware (TM), or both (TMC).

If you disable Threat on managed devices, the Firepower Management Center stops acknowledging intrusion and file events from the affected devices. As a consequence, correlation rules that use those events as a trigger criteria stop firing. Additionally, the Firepower Management Center will not contact the internet for either Cisco-provided or third-party Security Intelligence information. You cannot re-deploy existing intrusion policies until you re-enable Threat.

URL Filtering Licenses for Firepower Threat Defense Devices

The URL Filtering license allows you to write access control rules that determine the traffic that can traverse your network based on URLs requested by monitored hosts, correlated with information about those URLs. To support this feature license, you can purchase the URL Filtering (URL) service subscription as a stand-alone subscription or in combination with Threat (TC) or Threat and Malware (TMC) subscriptions.

Tip Without a URL Filtering license, you can specify individual URLs or groups of URLs to allow or block. This gives you granular, custom control over web traffic, but does not allow you to use URL category and reputation data to filter network traffic.

Although you can add category and reputation-based URL conditions to access control rules without a URL Filtering license, the Firepower Management Center will not download URL information. You cannot deploy the access control policy until you first add a URL Filtering license to the Firepower Management Center, then enable it on the devices targeted by the policy.

If you disable the URL Filtering license on managed devices, you may lose access to URL filtering. If your license expires or if you disable it, access control rules with URL conditions immediately stop filtering URLs, and your Firepower Management Center can no longer download updates to URL data. You cannot re-deploy existing access control policies if they include rules with category and reputation-based URL conditions.

Licensing for Export-Controlled Functionality

Features that require export-controlled functionality

Certain software features are subject to national security, foreign policy, and anti-terrorism laws and regulations. These export-controlled features include:

- SSH platform policy with strong encryption
- SSL policy with strong encryption
- Functionality such as SNMPv3 with strong encryption

How to determine whether export-controlled functionality is currently enabled for your system

To determine whether export-controlled functionality is currently enabled for your system: Go to **System > Licenses > Smart Licenses** and see if **Export-Controlled Features** displays **Enabled**.

About enabling export-controlled functionality

If **Export-Controlled Features** shows **Disabled** and you want to use features that require strong encryption:

- If there is *no* option to enable export-controlled functionality when you generate a new Product Instance Registration Token in Cisco Smart Software Manager (CSSM):

Your Smart Account is not authorized to use this functionality.

- If the option to use export-controlled functionality appears when you generate a new Product Instance Registration Token in Cisco Smart Software Manager:
 - In order to use export-controlled functionality, your Smart Account must be enabled for this functionality before you license your Firepower Management Center.
 - After export-controlled functionality is enabled for your Smart Account in Cisco Smart Software Manager (CSSM), you must re-register your Firepower Management Center using a new Product Instance Registration Token.
 - When you create the new Product Instance Registration Token, you must select the option “Allow export-controlled functionality on the products registered with this token.” This option is enabled by default if this functionality is permitted for your Smart Account.
 - After you install a token with export-controlled functionality on your Firepower Management Center and assign the relevant licenses to managed Firepower Threat Defense devices:
 - Reboot each device to make the newly-enabled features available.
 - In a high availability deployment, the active and standby devices must be rebooted together to avoid an Active-Active condition.

More Information

For general information about export controls, see <https://www.cisco.com/c/en/us/about/legal/global-export-trade.html>.

Licensing for FTD Clusters

In addition to information in this Licensing chapter, see:

- [Licenses for Clustering, on page 595](#)
- [FMC: Add a Cluster, on page 601](#).

Create a Smart Account to Hold Your Licenses

A Smart Account is required for Smart Licenses and can also hold Classic licenses.

You should set up this account before you purchase Smart Licenses.

Before you begin

Your account representative or reseller may have set up a Smart Account on your behalf. If so, obtain the necessary information to access the account from that person instead of using this procedure, then verify that you can access the account.

For general information about Smart Accounts, see <http://www.cisco.com/go/smartaccounts>.

Procedure

- Step 1** Request a Smart Account:
For instructions, see <https://community.cisco.com/t5/licensing-enterprise-agreements/request-a-smart-account-for-customers/ta-p/3636515?attachment-id=150577> .
For additional information, see <https://communities.cisco.com/docs/DOC-57261>.
- Step 2** Wait for an email telling you that your Smart Account is ready to set up. When it arrives, click the link it contains, as directed.
- Step 3** Set up your Smart Account:
Go here: <https://software.cisco.com/software/company/smartaccounts/home?route=module/accountcreation>.
For instructions, see <https://community.cisco.com/t5/licensing-enterprise-agreements/complete-smart-account-setup-for-customers/ta-p/3636631?attachment-id=132604>.
- Step 4** Verify that you can access the account in the Cisco Smart Software Manager (CSSM).
Go to <https://software.cisco.com/#module/SmartLicensing> and sign in.
-

How to Configure Smart Licensing with Direct Internet Access

Procedure

- Step 1** Obtain a token from the Cisco Smart Software Manager licensing portal.
See [Obtain a Product License Registration Token for Smart Licensing, on page 111](#).
- Step 2** Register your Firepower Management Center with the Smart licensing portal.
See [Register Smart Licenses, on page 112](#). Be sure to address the prerequisites in this topic.
- Step 3** Verify that your FMC registered successfully with the Smart licensing portal.
In the Firepower Management Center web interface, go to **System > Licenses > Smart Licenses**.
Product Registration should show a green checkmark.
- Step 4** If you have not yet done so, add devices to your FMC.
See [Add a Device to the FMC, on page 207](#).
- Step 5** Assign licenses to the devices that are managed by your FMC.
See [Assign Licenses to Multiple Managed Devices, on page 114](#).
- Step 6** Verify that licenses are successfully installed.

See [View FTD Licenses and License Status, on page 115](#).

What to do next

If applicable, set up licensing for high-availability and clustered deployments.

Obtain a Product License Registration Token for Smart Licensing

Before you begin

- Create a Smart Account, if you have not already done so: Visit <https://software.cisco.com/smartaccounts/setup#accountcreation-account>. For information, see <https://www.cisco.com/c/en/us/buy/smart-accounts.html>.
- Ensure that you have purchased the type and number of licenses you require.
- Verify that the licenses you need appear in your Smart Account.
If your licenses do not appear in your Smart Account, ask the person who ordered them (for example, your Cisco sales representative or authorized reseller) to transfer those licenses to your Smart Account.
- Ideally, check the prerequisites for [Register Smart Licenses, on page 112](#) to ensure that your registration process goes smoothly.
- Make sure you have your credentials to sign in to the Cisco Smart Software Manager.

Procedure

- Step 1** Go to <https://software.cisco.com>.
- Step 2** Click **Smart Software Licensing** (in the License section.)
- Step 3** Sign in to the Cisco Smart Software Manager.
- Step 4** Click **Inventory**.
- Step 5** Click **General**.
- Step 6** Click **New Token**.
- Step 7** For **Description**, enter a name that uniquely and clearly identifies the Firepower Management Center for which you will use this token.
- Step 8** Enter an expiration time within 365 days.
This determines how much time you have to register the token to a Firepower Management Center. (Your license entitlement term is independent of this setting but may start to count down even if you have not yet registered your token.)
- Step 9** If you see an option to enable export-controlled functionality, and you plan to use features that require strong encryption, select this option.
- Important** If you see this option, you must select it now if you plan to use this functionality. You cannot enable export-controlled functionality later.
If you do not see this option but you expect to, cancel out of this procedure now and contact your Cisco account representative.

- Step 10** Click **Create Token**.
- Step 11** Locate your new token in the list and click **Actions**, then choose **Copy** or **Download**.
- Step 12** If necessary, save your token in a safe place until you are ready to enter it into your Firepower Management Center.
-

What to do next

Continue with the steps in [Register Smart Licenses, on page 112](#).

Register Smart Licenses

Register the Firepower Management Center with the Cisco Smart Software Manager.

Before you begin

- If your deployment is air-gapped, do not use this procedure. Instead, see [Configure the Connection to Smart Software Manager On-Prem, on page 114](#).
- Ensure that the Firepower Management Center can reach the Cisco Smart Software Manager (CSSM) server at tools.cisco.com:443.
- Make sure the NTP daemon is running on your Firepower Management Center. During registration, a key exchange occurs between the NTP server and the Cisco Smart Software Manager, so time must be in sync for proper registration.

If you are deploying Firepower Threat Defense on a Firepower 4100/9300 chassis, you must configure NTP on the Firepower chassis using the same NTP server for the chassis as for the Firepower Management Center.

- If your organization has multiple Firepower Management Center appliances, make sure each FMC has a unique name that clearly identifies and distinguishes it from other Firepower Management Center appliances that may be registered to the same virtual account. This name is critical for managing your Smart License entitlements and ambiguous names will lead to problems later.
- Generate the necessary product license registration token from the Cisco Smart Software Manager. See [Obtain a Product License Registration Token for Smart Licensing, on page 111](#), including all prerequisites. Make sure the token is accessible from the machine from which you will access your Firepower Management Center.

Procedure

- Step 1** Choose **System > Licenses > Smart Licenses**.
- Step 2** Click **Register**.
- Step 3** Paste the token you generated from Cisco Smart Software Manager into the **Product Instance Registration Token** field.
- Make sure there are no empty spaces or blank lines at the beginning or end of the text.
- Step 4** Click **Apply Changes**.
-

What to do next

- Add your Firepower Threat Defense devices to the Firepower Management Center; see [Add a Device to the FMC, on page 207](#).
- Assign licenses to your Firepower Threat Defense devices; see [Assign Licenses to Multiple Managed Devices, on page 114](#).

Smart Software Manager On-Prem Overview

As described in [Periodic Communication with the License Authority, on page 104](#), your system must communicate regularly with Cisco to maintain your license entitlement. If you have one of the following situations, you might want to use a Smart Software Manager On-Prem (also known as SSM On-Prem, and formerly known as "Smart Software Satellite Server") as a proxy for connections to the License Authority:

- Your Firepower Management Center is offline or otherwise has limited or no connectivity (in other words, is deployed in an air-gapped network.)
- Your Firepower Management Center has permanent connectivity, but you want to manage your Smart Licenses via a single connection from your network.

Cisco Smart Software Manager On-Prem allows you to schedule synchronization or manually synchronize Smart License authorization with the Smart Software Manager.

For more information about Smart Software Manager On-Prem, see <https://www.cisco.com/c/en/us/buy/smart-accounts/software-manager.html#~on-prem>

How to Deploy Smart Software Manager On-Prem

Procedure

-
- | | |
|---------------|---|
| Step 1 | Deploy and set up Smart Software Manager On-Prem.
See the documentation for the Smart Software Manager On-Prem, available from https://www.cisco.com/c/en/us/buy/smart-accounts/software-manager.html#~on-prem . |
| Step 2 | Connect the Firepower Management Center to Smart Software Manager On-Prem, obtain a registration token, and register the FMC to SSM On-Prem.
See Configure the Connection to Smart Software Manager On-Prem, on page 114 . |
| Step 3 | Add devices to be managed.
See Add a Device to the FMC, on page 207 . |
| Step 4 | Assign licenses to managed devices
See Assign Licenses to Multiple Managed Devices, on page 114 |
| Step 5 | Synchronize Smart Software Manager On-Prem to the Cisco Smart Software Management Server (CSSM).
See the Smart Software Manager On-Prem documentation, above. |
| Step 6 | Schedule ongoing synchronization times. |

Configure the Connection to Smart Software Manager On-Prem

Before you begin

- Set up Smart Software Manager On-Prem (SSM On-Prem). For information, see [How to Deploy Smart Software Manager On-Prem, on page 113](#).
- Make a note of the CN of the TLS/SSL certificate on your SSM On-Prem.
- Verify that your FMC can reach your SSM On-Prem. For example, verify that the FQDN configured as the SSM On-Prem call-home URL can be resolved by your internal DNS server.
- Go to <http://www.cisco.com/security/pki/certs/clrca.cer> and copy the entire body of the TLS/SSL certificate (from "-----BEGIN CERTIFICATE-----" to "-----END CERTIFICATE-----") into a place you can access during configuration.

Procedure

-
- Step 1** Choose **System > Integration**.
- Step 2** Click **Smart Software Satellite**.
- Step 3** Select **Connect to Cisco Smart Software Satellite Server**.
- Step 4** Enter the **URL** of your Smart Software Manager On-Prem, using the CN value you collected in the prerequisites of this procedure, in the following format:
- `https://FQDN_or_hostname_of_your_SSM_On-Prem/Transportgateway/services/DeviceRequestHandler`
- The FQDN or hostname must match the CN value of the certificate presented by your SSM On-Prem.
- Step 5** Add a new **SSL Certificate** and paste the certificate text that you copied in the prerequisites for this procedure.
- Step 6** Click **Apply**.
- Step 7** Select **System > Licenses > Smart Licenses** and click **Register**.
- Step 8** Create a new token on Smart Software Manager On-Prem.
- Step 9** Copy the token.
- Step 10** Paste the token into the form on the management center page.
- Step 11** Click **Apply Changes**.
- The management center is now registered to Smart Software Manager On-Prem.
-

What to do next

Complete remaining steps in [How to Deploy Smart Software Manager On-Prem, on page 113](#).

Assign Licenses to Multiple Managed Devices

Devices managed by a Firepower Management Center obtain their licenses via the Firepower Management Center, not directly from the Cisco Smart Software Manager.

Use this procedure to enable licensing on multiple Firepower Threat Defense devices at once.

Note For an Firepower Threat Defense cluster, you apply the licenses to the cluster as a whole; note that each unit in the cluster consumes a separate license per feature.

Before you begin

- If you have not yet done so, register your devices with the Firepower Management Center. See [Add a Device to the FMC, on page 207](#).
- Prepare licenses for distribution to managed devices: See [Register Smart Licenses, on page 112](#)

Procedure

Step 1 Choose **System > Licenses > Smart Licenses**.

Step 2 Click **Edit Licenses**.

Step 3 For each type of license you want to add to a device:

- a) Click the tab for that type of license.
- b) Click a device in the list on the left.
- c) Click **Add** to move that device to the list on the right.
- d) Repeat for each device to receive that type of license.

For now, don't worry about whether you have licenses for all of the devices you want to add.

- e) Repeat this subprocedure for each type of license you want to add.
 - f) Click **Apply**.
-

What to do next

- Verify that your licenses are correctly installed. Follow the procedure in [View FTD Licenses and License Status, on page 115](#).
- If export-controlled functionality is newly enabled, reboot each device. If devices are configured in a high-availability pair, reboot both devices at the same time to avoid an Active-Active condition.
- Deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

View FTD Licenses and License Status

To view the license status for a Firepower Management Center and its managed Firepower Threat Defense devices, use the Smart Licenses page in FMC.

For each type of license in your deployment, the page lists the total number of licenses consumed, whether the license is in compliance or out of compliance, the device type, and the domain and group where the device is deployed. You can also view the Firepower Management Center's Smart License Status.

Other than the Smart Licenses page, there are a few other ways you can view licenses:

- The Product Licensing dashboard widget provides an at-a-glance overview of your licenses.
See [Adding Widgets to a Dashboard](#), on page 247 and [Dashboard Widget Availability by User Role](#), on page 235 and [The Product Licensing Widget](#), on page 244.
- The Device Management page (**Devices > Device Management**) lists the licenses applied to each of your managed devices.
- The Smart License Monitor health module communicates license status when used in a health policy.

Procedure

- Step 1** Choose **System > Licenses > Smart Licenses**.
- Step 2** In the **Smart Licenses** table, click the arrow at the left side of each **License Type** folder to expand that folder.
- Step 3** In each folder, verify that each device has a green circle with a **Check Mark** (✔) in the **License Status** column.

Note If you see duplicate Firepower Management Center Virtual licenses, each represents one managed device.

If all devices show a green circle with a **Check Mark** (✔), your devices are properly licensed and ready to use.

If you see any License Status other than a green circle with a **Check Mark** (✔), hover over the status icon to view the message.

What to do next

- If you had any devices that did NOT have a green circle with a **Check Mark** (✔), you may need to purchase more licenses.

FTD License Status

Smart Licensing

The Smart License Status section of the **System > Licenses > Smart Licenses** page provides an overview of license usage on the Firepower Management Center, as described below.

Usage Authorization

Possible status values are:

- **In-compliance** (✔) — All licenses assigned to managed devices are in compliance and the Firepower Management Center is communicating successfully with the Cisco licensing authority.
- **License is in compliance but communication with licensing authority has failed**— Device licenses are in compliance, but the Firepower Management Center is not able to communicate with the Cisco licensing authority.

- **Out-of-compliance icon or unable to communicate with License Authority**— One or more managed devices is using a license that is out of compliance, or the Firepower Management Center has not communicated with the Cisco licensing authority in more than 90 days.

Product Registration

Specifies the last date when the Firepower Management Center contacted the License Authority and registered.

Assigned Virtual Account

Specifies the Virtual Account under the Smart Account that you used to generate the Product Instance Registration Token and register the Firepower Management Center. If this deployment is not associated with a particular virtual account within your Smart Account, this information is not displayed.

Export-Controlled Features

If this option is enabled, you can deploy restricted features. For details, see [Licensing for Export-Controlled Functionality, on page 108](#).

Move or Remove Licenses from FTD Devices

Use this procedure to manage licenses for Firepower Threat Defense devices managed by an Firepower Management Center.

For example, you can move a license from one FTD device to another device registered to the same FMC, or to remove a license from a device.

If you remove (disable) a license for a device, you cannot use the features associated with that license on that device.

Important If you need to move a license to a device managed by a *different* Firepower Management Center, see [Transfer FTD Licenses to a Different Firepower Management Center, on page 118](#).

Procedure

-
- Step 1** Choose **System > Licenses > Smart Licenses**.
 - Step 2** Click **Edit Licenses**.
 - Step 3** Click either the **Malware, Threat, or URL Filtering**.
 - Step 4** Choose the devices you want to license, then click **Add**, and/or click each device form which you want to remove a license and click the **Delete** ()
 - Step 5** Click **Apply**.
-

What to do next

Deploy the changes to the managed devices.

Transfer FTD Licenses to a Different Firepower Management Center

When you register a Smart License to a Firepower Management Center, your virtual account allocates the license to the FMC. If you need to transfer your Smart Licenses to another Firepower Management Center, you must deregister the currently licensed FMC. This removes it from your virtual account and frees your existing licenses, so you can register the licenses to the new FMC. Otherwise, you cannot reuse these licenses, and you may receive an Out-of-Compliance notification because your virtual account does not have enough free licenses. For instructions, see [Deregister a Firepower Management Center from the Cisco Smart Software Manager, on page 118](#).

Then you can register the licenses to the destination Firepower Management Center.

If FTD License Status is Out of Compliance

If the Usage Authorization status on the Smart Licenses page (**System > Licenses > Smart Licenses**) shows Out of Compliance, you must take action.

Procedure

- Step 1** Look at the Smart Licenses section at the bottom of the page to determine which licenses are needed.
 - Step 2** Purchase the required licenses through your usual channels.
 - Step 3** In Cisco Smart Software Manager (<https://software.cisco.com/#SmartLicensing-Inventory>), verify that the licenses appear in your virtual account.

If the expected licenses are not present, see [Troubleshoot FTD Licensing, on page 119](#).
 - Step 4** In Firepower Management Center, select **System > Licenses > Smart Licenses**.
 - Step 5** Click **Re-Authorize**.
-

Deregister a Firepower Management Center from the Cisco Smart Software Manager

Deregister (unregister) your Firepower Management Center from the Cisco Smart Software Manager before you reinstall (reimage) the appliance, or if you need to release all of the license entitlements back to your Smart Account for any reason.

Deregistering removes the FMC from your virtual account. All license entitlements associated with the Firepower Management Center release back to your virtual account. After deregistration, the Firepower Management Center enters Enforcement mode where no update or changes on licensed features are allowed.

If you need to remove the licenses from a subset of managed Firepower Threat Defense devices, see [Assign Licenses to Multiple Managed Devices, on page 114](#) or [Assign Licenses to Managed Devices from the Device Management Page, on page 130](#).

Procedure

- Step 1** Choose **System > Licenses > Smart Licenses**.

Step 2 Click **Deregister** (🔴).

Synchronize a Firepower Management Center with the Cisco Smart Software Manager

If you make changes in the Cisco Smart Software Manager, you can refresh the authorization on the Firepower Management Center so the changes immediately take effect.

Procedure

Step 1 Choose **System > Licenses > Smart Licenses**.

Step 2 Click **Refresh** (🔄).

Troubleshoot FTD Licensing

Expected Licenses Do Not Appear in My Smart Account

If the licenses you expect to see are not in your Smart Account, try the following:

- Make sure they are not in a different Virtual Account. Your organization's license administrator may need to assist you with this.
- Check with the person who sold you the licenses to be sure that transfer to your account is complete.

Unable to Connect to Smart License Server

Check the obvious causes first. For example, make sure your Firepower system has outside connectivity. See [Internet Access Requirements, on page 2154](#).

Unexpected Out-of-Compliance Notification or Other Error

- If a device is already registered to a different FMC, you need to deregister the original FMC before you can license the device under a new FMC. See [Deregister a Firepower Management Center from the Cisco Smart Software Manager, on page 118](#).
- Try synchronizing: [Synchronize a Firepower Management Center with the Cisco Smart Software Manager, on page 119](#).

Troubleshoot Other Issues

For solutions to other common issues, see <https://www.cisco.com/c/en/us/support/docs/security/firepower-management-center/215838-fmc-and-ftd-smart-license-registration-a.html>

License Classic Devices (Firepower 7000/8000 Series, ASA FirePOWER, and NGIPSv)

7000 and 8000 Series and NGIPSv devices and ASA FirePOWER modules require Classic licenses. These devices are frequently referred to in this documentation as Classic devices.

Important If you are running Firepower hardware but not Firepower software, see licensing information for the software product you are using. This documentation is not applicable.

Classic licenses require a product authorization key (PAK) to activate and are device-specific. Classic licensing is sometimes also referred to as "traditional licensing."

Product License Registration Portal

When you purchase one or more Classic licenses for Firepower features, you manage them in the Cisco Product License Registration Portal:

<https://cisco.com/go/license>

For more information on using this portal, see:

<https://slexui.cloudapps.cisco.com/SWIFT/LicensingUI/Quickstart>

You will need your account credentials in order to access these links.

Service Subscriptions for Firepower Features (Classic Licensing)

Some features require a service subscription.

A service subscription enables a specific Firepower feature on a managed device for a set length of time. Service subscriptions can be purchased in one-, three-, or five-year terms. If a subscription expires, Cisco notifies you that you must renew the subscription. If a subscription expires for a Classic device, you might not be able to use the related features, depending on the feature type.

Table 14: Service Subscriptions and Corresponding Classic Licenses

Subscription You Purchase	Classic Licenses You Assign in Firepower System
TA	Control + Protection (a.k.a. "Threat & Apps," required for system updates)
TAC	Control + Protection + URL Filtering
TAM	Control + Protection + Malware
TAMC	Control + Protection + URL Filtering + Malware
URL	URL Filtering (add-on where TA is already present)
AMP	Malware (add-on where TA is already present)

Your purchase of a managed device that uses Classic licenses automatically includes Control and Protection licenses. These licenses are perpetual, but you must also purchase a TA service subscription to enable system updates. Service subscriptions for additional features are optional.

Classic License Types and Restrictions

This section describes the types of Classic licenses available in a Firepower System deployment. The licenses you can enable on a device depend on its model, version, and the other licenses enabled.

Licenses are model-specific for 7000 and 8000 Series and NGIPSv devices and for ASA FirePOWER modules. You cannot enable a license on a managed device unless the license exactly matches the device's model. For example, you cannot use a Firepower 8250 Malware license (FP8250-TAM-LIC=) to enable Malware capabilities on an 8140 device; you must purchase a Firepower 8140 Malware license (FP8140-TAM-LIC=).

Note For NGIPSv or ASA FirePOWER, the Control license allows you to perform user and application control, but these devices do not support switching, routing, stacking, or 7000 and 8000 Series device high availability.

There are a few ways you may lose access to licensed features in the Firepower System:

- You can remove Classic licenses from the Firepower Management Center, which affects all of its managed devices.
- You can disable licensed capabilities on specific managed devices.

Though there are some exceptions, you cannot use the features associated with an expired or deleted license.

The following table summarizes Classic licenses in the Firepower System.

Table 15: Firepower System Classic Licenses

License You Assign in Firepower System	Service Subscription You Purchase	Platforms	Granted Capabilities	Also Requires	Expire Capable?
Any	TA, TAC, TAM, or TAMC	7000 and 8000 Series ASA FirePOWER NGIPSv	host, application, and user discovery decrypting and inspecting SSL- and TLS-encrypted traffic	none	depends on license
Protection	TA (included with device)	7000 and 8000 Series ASA FirePOWER NGIPSv	intrusion detection and prevention file control Security Intelligence filtering	none	no

License You Assign in Firepower System	Service Subscription You Purchase	Platforms	Granted Capabilities	Also Requires	Expire Capable?
Control	none (included with device)	7000 and 8000 Series	user and application control switching and routing 7000 and 8000 Series device high availability 7000 and 8000 Series network address translation (NAT)	Protection	no
Control	none (included with device)	ASA FirePOWER NGIPSv	user and application control	Protection	no
Malware	TAM, TAMC, or AMP	7000 and 8000 Series ASA FirePOWER NGIPSv	AMP for Networks (network-based Advanced Malware Protection) File storage	Protection	yes
URL Filtering	TAC, TAMC, or URL	7000 and 8000 Series ASA FirePOWER NGIPSv	category and reputation-based URL filtering	Protection	yes
VPN	none (contact Sales for more information)	7000 and 8000 Series	deploying virtual private networks	Control	yes

Protection Licenses

A Protection license allows you to perform intrusion detection and prevention, file control, and Security Intelligence filtering:

- *Intrusion detection and prevention* allows you to analyze network traffic for intrusions and exploits and, optionally, drop offending packets.
- *File control* allows you to detect and, optionally, block users from uploading (sending) or downloading (receiving) files of specific types over specific application protocols. *AMP for Networks*, which requires a Malware license, allows you to inspect and block a restricted set of those file types based on their dispositions.
- *Security Intelligence filtering* allows you to block —deny traffic to and from—specific IP addresses, URLs, and DNS domain names, before the traffic is subjected to analysis by access control rules. Dynamic feeds allow you to immediately block connections based on the latest intelligence. Optionally, you can use a “monitor-only” setting for Security Intelligence filtering.

A Protection license (along with a Control license) is automatically included in the purchase of any Classic managed device. This license is perpetual, but you must also purchase a TA subscription to enable system updates.

Although you can configure an access control policy to perform Protection-related inspection without a license, you cannot deploy the policy until you first add a Protection license to the Firepower Management Center, then enable it on the devices targeted by the policy.

If you delete your Protection license from the Firepower Management Center or disable Protection on managed devices, the Firepower Management Center stops acknowledging intrusion and file events from the affected devices. As a consequence, correlation rules that use those events as a trigger criteria stop firing. Additionally, the Firepower Management Center will not contact the internet for either Cisco-provided or third-party Security Intelligence information. You cannot re-deploy existing policies until you re-enable Protection.

Because a Protection license is required for URL Filtering, Malware, and Control licenses, deleting or disabling a Protection license has the same effect as deleting or disabling your URL Filtering, Malware, or Control license.

Control Licenses

A Control license allows you to implement user and application control by adding user and application conditions to access control rules. For 7000 and 8000 Series devices only, this license also allows you to configure switching and routing (including DHCP relay and NAT) and device high-availability pairs. To enable a Control license on a managed device, you must also enable a Protection license. A Control license is automatically included (along with a Protection license) in the purchase of any Classic managed device. This license is perpetual, but you must also purchase a TA subscription to enable system updates.

If you do not enable a Control license for a Classic managed device, you can add user and application conditions to rules in an access control policy, but you cannot deploy the policy to the device. If you do not enable a Control license for 7000 or 8000 Series devices specifically, you also cannot:

- create switched, routed, or hybrid interfaces
- create NAT entries
- configure DHCP relay for virtual routers
- deploy a device configuration that includes switch or routing to the device
- establish high availability between devices

Note Although you can create virtual switches and routers without a Control license, they are not useful without switched and routed interfaces to populate them.

If you delete a Control license from the Firepower Management Center or disable Control on individual devices:

- The affected devices do **not** stop performing switching or routing, nor do device high-availability pairs break.
- You can continue to edit and delete existing configurations, but you cannot deploy those changes to the affected devices.
- You cannot add new switched, routed, or hybrid interfaces, nor can you add new NAT entries, configure DHCP relay, or establish 7000 or 8000 Series device high-availability.
- You cannot re-deploy existing access control policies if they include rules with user or application conditions.

URL Filtering Licenses for Classic Devices

URL filtering allows you to write access control rules that determine the traffic that can traverse your network based on URLs requested by monitored hosts, correlated with information about those URLs. To enable a URL Filtering license, you must also enable a Protection license. You can purchase a URL Filtering license for Classic devices as a services subscription combined with Threat & Apps (TAC) or Threat & Apps and Malware (TAMC) subscriptions, or as an add-on subscription (URL) for a system where Threat & Apps (TA) is already enabled.

Tip Without a URL Filtering license, you can specify individual URLs or groups of URLs to allow or block. This gives you granular, custom control over web traffic, but does not allow you to use URL category and reputation data to filter network traffic.

Although you can add category and reputation-based URL conditions to access control rules without a URL Filtering license, the Firepower Management Center will not download URL information. You cannot deploy the access control policy until you first add a URL Filtering license to the Firepower Management Center, then enable it on the devices targeted by the policy.

You may lose access to URL filtering if you delete the license from the Firepower Management Center or disable URL Filtering on managed devices. Also, URL Filtering licenses may expire. If your license expires or if you delete or disable it, access control rules with URL conditions immediately stop filtering URLs, and your Firepower Management Center can no longer download updates to URL data. You cannot re-deploy existing access control policies if they include rules with category and reputation-based URL conditions.

Malware Licenses for Classic Devices

A Malware license allows you to perform Cisco Advanced Malware Protection (AMP) with AMP for Networks and Cisco Threat Grid. You can use managed devices to detect and block malware in files transmitted over your network. To enable a Malware license, you must also enable Protection. You can purchase a Malware license as a subscription combined with Threat & Apps (TAM) or Threat & Apps and URL Filtering (TAMC) subscriptions, or as an add-on subscription (AMP) for a system where Threat & Apps (TA) is already enabled.

Note 7000 and 8000 Series managed devices with Malware licenses enabled attempt to connect periodically to the AMP cloud even if you have not configured dynamic analysis. Because of this, the device's Interface Traffic dashboard widget shows transmitted traffic; this is expected behavior.

You configure AMP for Networks as part of a file policy, which you then associate with one or more access control rules. File policies can detect your users uploading or downloading files of specific types over specific application protocols. AMP for Networks allows you to use local malware analysis and file preclassification to inspect a restricted set of those file types for malware. You can also download and submit specific file types to the Cisco Threat Grid cloud for dynamic and Spero analysis to determine whether they contain malware. For these files, you can view the network file trajectory, which details the path the file has taken through your network. The Malware license also allows you to add specific files to a file list and enable the file list within a file policy, allowing those files to be automatically allowed or blocked on detection.

Before you can deploy an access control policy that includes AMP for Networks configurations, you **must** add a Malware license, then enable it on the devices targeted by the policy. If you later disable the license on the devices, you cannot re-deploy the existing access control policy to those devices.

If you delete all your Malware licenses or they all expire, the system stops querying the AMP cloud, and also stops acknowledging retrospective events sent from the AMP cloud. You cannot re-deploy existing access control policies if they include AMP for Networks configurations. Note that for a very brief time after a Malware license expires or is deleted, the system can use existing cached file dispositions. After the time window expires, the system assigns a disposition of `Unavailable` to those files.

A Malware license is required only if you deploy AMP for Networks and Cisco Threat Grid. Without a Malware license, the Firepower Management Center can receive AMP for Endpoints malware events and indications of compromise (IOC) from the AMP cloud.

See also important information at [License Requirements for File and Malware Policies, on page 1155](#).

VPN Licenses for 7000 and 8000 Series Devices

VPN allows you to establish secure tunnels between endpoints via a public source, such as the Internet or other network. You can configure the Firepower System to build secure VPN tunnels between the virtual routers of 7000 and 8000 Series devices. To enable VPN, you must also enable Protection and Control licenses. To purchase a VPN license, contact Sales.

Without a VPN license, you cannot configure a VPN deployment with your 7000 and 8000 Series devices. Although you can create deployments, they are not useful without at least one VPN-enabled routed interface to populate them.

If you delete your VPN license from the Firepower Management Center or disable VPN on individual devices, the affected devices do **not** break the current VPN deployments. Although you can edit and delete existing deployments, you cannot deploy your changes to the affected devices.

Classic Licenses in Device Stacks and High-Availability Pairs

Individual devices must have equivalent licenses before they can be stacked or configured into 7000 or 8000 Series device high-availability pairs. After you stack devices, you can change the licenses for the entire stack. However, you cannot change the enabled licenses on a 7000 or 8000 Series device high-availability pair.

See also [About Device Stacks, on page 461](#) and [Device High Availability Requirements, on page 446](#).

View Your Classic Licenses

Procedure

Do one of the following, depending on your needs:

To View	Do This
The Classic licenses that you have added to the Firepower Management Center and details including their type, status, usage, expiration dates, and the managed devices to which they are applied.	Choose System > Licenses > Classic Licenses . The summary shows the number of licenses you have purchased, followed by the number of licenses that are in used in parentheses.
The licenses applied to each of your managed devices	Choose Devices > Device Management .

To View	Do This
License status in the Health Monitor	Use the Classic License Monitor health module in a health policy. For information, see Health Monitoring, on page 253 , including #unique_190 and Creating Health Policies, on page 261 .
An overview of your licenses in the Dashboard	Add the Product Licensing widget to the dashboard of your choice. For instructions, see The Product Licensing Widget, on page 244 and Adding Widgets to a Dashboard, on page 247 and Dashboard Widget Availability by User Role, on page 235 .

Identify the License Key

The license key uniquely identifies the Firepower Management Center in the Cisco License Registration Portal. It is composed of a product code (for example, 66) and the MAC address of the management port (eth0) of the Firepower Management Center; for example, 66:00:00:77:FF:CC:88.

You will use the license key in the Cisco License Registration Portal to obtain the license text required to add licenses to the Firepower Management Center.

Procedure

- Step 1** Choose **System > Licenses > Classic Licenses**.
- Step 2** Click **Add New License**.
- Step 3** Note the value in the **License Key** field at the top of the **Add Feature License** dialog.

What to do next

- Add a license to the Firepower Management Center; see [Generate a Classic License and Add It to the Firepower Management Center, on page 126](#).

This procedure includes the process of generating the actual license text using the license key.

Generate a Classic License and Add It to the Firepower Management Center

Note If you add licenses after a backup has completed, these licenses will not be removed or overwritten if this backup is restored. To prevent a conflict on restore, remove those licenses before restoring the backup, noting where the licenses were used, and add and reconfigure them after restoring the backup. If a conflict occurs, contact Support.

Tip You can also request licenses on the **Licenses** tab after you log into the Support Site.

Before you begin

- Make sure you have the product activation key (PAK) from the Software Claim Certificate that Cisco provided when you purchased the license. If you have a legacy, pre-Cisco license, contact Support.
- Identify the license key for the Firepower Management Center; see [Identify the License Key, on page 126](#).
- You will need your account credentials to complete this procedure.

Procedure

Step 1 Choose **System > Licenses > Classic Licenses**.

Step 2 Click **Add New License**.

Step 3 Continue as appropriate:

- If you have already obtained the license text, skip to Step 8.
- If you still need to obtain the license text, go to the next step.

Step 4 Click **Get License** to open the Cisco License Registration Portal.

Note If you cannot access the Internet using your current computer, switch to a computer that can, and browse to <http://cisco.com/go/license>.

Step 5 Generate a license from the PAK in the License Registration Portal.

This step requires the PAK you received during the purchase process, as well as the license key for the Firepower Management Center.

For information, see [Product License Registration Portal, on page 120](#).

Step 6 Copy the license text from either the License Registration Portal display, or the email the License Registration Portal sends you.

Important The licensing text block in the portal or email message may include more than one license. Each license is bounded by a BEGIN LICENSE line and an END LICENSE line. Make sure that you copy and paste only one license at a time.

Step 7 Return to the **Add Feature License** page in the Firepower Management Center's web interface.

Step 8 Paste the license text into the **License** field.

Step 9 Click **Verify License**.

If the license is invalid, make sure that you correctly copied the license text.

Step 10 Click **Submit License**.

What to do next

- Assign the license to a managed device; see [Assign Licenses to Managed Devices from the Device Management Page, on page 130](#). You **must** assign licenses to your managed devices before you can use licensed features on those devices.

How to Convert a Classic License for Use on an FTD Device

You can convert licenses using either the License Registration Portal (LRP) or the Cisco Smart Software Manager (CSSM), and you can convert an unused Product Authorization Key (PAK) or a Classic license that has already been assigned to a device.

Important You cannot undo this process. You cannot convert a Smart License to a Classic license, even if the license was originally a Classic license.

In documentation on Cisco.com, Classic licenses may also be referred to as "traditional" licenses.

Before you begin

- It is easiest to convert a Classic license to a Smart License when it is still an unused PAK that has not yet been assigned to a product instance.
- Your hardware must be able to run Firepower Threat Defense. See the *Cisco Firepower Compatibility Guide* at <https://www.cisco.com/c/en/us/support/security/defense-center/products-device-support-tables-list.html>.
- You must have a Smart Account. If you do not have one, create one. See [Create a Smart Account to Hold Your Licenses, on page 109](#).
- The PAKs or licenses that you want to convert must appear in your Smart Account.
- If you convert using the License Registration Portal instead of the Cisco Smart Software Manager, you must have your Smart Account credentials in order to initiate the conversion process.

Procedure

- Step 1** The conversion process you will follow depends on whether or not the license has been consumed:
- If the PAK that you want to convert has never been used, follow instructions for converting a PAK.
 - If the PAK you want to convert has already been assigned to a device, follow instructions for converting a Classic license.
- Make sure your existing classic license is still registered to your device.
- Step 2** See instructions for your type of conversion (PAK or installed Classic license) in the following documentation:
- To convert PAKs or licenses using the LRP:

- To view a video that steps you through the License Registration Portal part of the conversion process, click <https://salesconnect.cisco.com/#/content-detail/7da52358-0fc1-4d85-8920-14a1b7721780>.

- Search for "Convert" in the following document: <https://cisco.app.box.com/s/mds3ab3fctk6pzonq5meukvcpjzt7wu>.

There are three conversion procedures. Choose the conversion procedure applicable to your situation.

- Sign in to the License Registration Portal (LRP) at <https://tools.cisco.com/SWIFT/LicensingUI/Home> and follow the instructions in the documentation above.

- To convert PAKs or licenses using CSSM:

- *Converting Hybrid Licenses to Smart Software Licenses QRG:*

- <https://community.cisco.com/t5/licensing-enterprise-agreements/converting-hybrid-licenses-to-smart-software-licenses-qrg/ta-p/3628609?attachment-id=134907>

- Sign in to CSSM at <https://software.cisco.com/#SmartLicensing-LicenseConversion> and follow the instructions for your type of conversion (PAK or installed Classic license) in the documentation above.

Step 3 Freshly install Firepower Threat Defense on your hardware.

See the instructions for your hardware at <https://www.cisco.com/c/en/us/support/security/firepower-ngfw/products-installation-guides-list.html>.

Step 4 If you will use Firepower Device Manager to manage this device as a standalone device:

See information about licensing the device in the *Cisco Firepower Threat Defense Configuration Guide for Firepower Device Manager* at <https://www.cisco.com/c/en/us/support/security/firepower-ngfw/products-installation-and-configuration-guides-list.html>.

Skip the rest of this procedure.

Step 5 If you have already deployed Smart Licensing on your Firepower Management Center:

a) Set up Smart Licensing on your new Firepower Threat Defense device.

See [Assign Licenses to Multiple Managed Devices, on page 114](#).

b) Verify that the new Smart License has been successfully applied to the device.

See [View FTD Licenses and License Status, on page 115](#).

Step 6 If you have not yet deployed Smart Licensing on your Firepower Management Center:

See [Register Smart Licenses, on page 112](#).

Assign Licenses to Managed Devices from the Device Management Page

Although there are some exceptions, you cannot use the features associated with a license if you disable it on a managed device.

Note For an Firepower Threat Defense cluster, you apply the licenses to the cluster as a whole; note that each unit in the cluster consumes a separate license per feature.

Before you begin

- Add your devices to the Firepower Management Center. See [Add a Device to the FMC, on page 207](#).
- You must have Admin or Network Admin privileges to perform this task. When operating with multiple domains, you must do this task in leaf domains.
- If you will assign Smart Licenses:
 - If you need to apply Smart Licenses to many devices at one time, use the Smart Licenses page instead of following this procedure. See [Assign Licenses to Multiple Managed Devices, on page 114](#)
 - Prepare Smart Licenses for distribution to managed devices: See [Register Smart Licenses, on page 112](#)

Procedure

- Step 1** Choose **Devices > Device Management**.
- Step 2** Next to the device where you want to assign or disable a license, click **Edit** ().
- In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.
- Step 3** Click **Device**.
- Step 4** Next to the License section, click **Edit** ().
- Step 5** Check or clear the appropriate check boxes to assign or disable licenses for the device.
- Step 6** Click **Save**.
-

What to do next

- If you assigned Smart Licenses, verify license status:
 - Go to **System > Licenses > Smart Licenses**, enter the hostname or IP address of the device into the filter at the top of the Smart Licenses table, and verify that only a green circle with a **Check Mark** ()

appears for each device, for each license type. If you see any other icon, hover over the icon for more information.

- Deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).
- If you are licensing Firepower Threat Defense devices and you applied a Base license with export-controlled functionality enabled, reboot each device. For devices configured in a high-availability pair, reboot both devices at the same time to avoid an Active-Active condition.

Additional Information about Firepower Licensing

For additional information to help resolve common licensing questions, see the following documents:

- The *Frequently Asked Questions (FAQ) about Firepower Licensing* document at:
<https://www.cisco.com/c/en/us/td/docs/security/firepower/licensing/faq/firepower-license-FAQ.html>
- The *Cisco Firepower System Feature Licenses* document at:
<https://www.cisco.com/c/en/us/td/docs/security/firepower/roadmap/firepower-licenseroadmap.html>

CHAPTER 6

System Updates

The following topics explain how to update Firepower deployments:

- [About System Updates](#), on page 133
- [Requirements and Prerequisites for System Updates](#), on page 134
- [Guidelines and Limitations for System Updates](#), on page 135
- [Upgrade System Software](#), on page 135
- [Update the Vulnerability Database \(VDB\)](#), on page 135
- [Update the Geolocation Database](#), on page 137
- [Update Intrusion Rules](#), on page 139
- [Maintain Your Air-Gapped Deployment](#), on page 149

About System Updates

You can use the FMC to upgrade the system software for itself and the devices it manages. You can also update various databases and feeds that provide advanced services.

For FMCs with internet access, the system can often obtain updates directly from Cisco. We recommend you schedule or enable automatic updates whenever possible. Some updates are auto-enabled when you enable the related feature. Other updates you must schedule yourself. After initial setup, we recommend you review all auto-updates and adjust them if necessary.

Table 16: Upgrades and Updates in FMC Deployments

Component	Description	Details
Firepower software	<p><i>Major</i> software releases contain new features, functionality, and enhancements. They may include infrastructure or architectural changes.</p> <p><i>Patches</i> are on-demand updates limited to critical fixes with time urgency.</p> <p><i>Hotfixes</i> can address specific customer issues.</p>	<p>Direct Download: Select releases only, usually some time after the release is available for manual download. The length of the delay depends on release type, release adoption, and other factors.</p> <p>Schedule: Patches only, on System > Tools > Scheduling.</p> <p>Uninstall: Patches only.</p> <p>Reimage: Major releases only.</p> <p>See: Upgrade System Software, on page 135</p>

Component	Description	Details
Vulnerability database (VDB)	The Cisco vulnerability database (VDB) is a database of known vulnerabilities to which hosts may be susceptible, as well as fingerprints for operating systems, clients, and applications. The system uses the VDB to help determine whether a particular host increases your risk of compromise.	<p>Direct Download: Yes.</p> <p>Schedule: Yes, on System > Tools > Scheduling.</p> <p>Uninstall: No.</p> <p>See: Update the Vulnerability Database (VDB), on page 135</p>
Geolocation database (GeoDB)	The Cisco geolocation database (GeoDB) is a database of geographical and connection-related data associated with routable IP addresses.	<p>Direct Download: Yes.</p> <p>Schedule: Yes, on System > Updates.</p> <p>Uninstall: No.</p> <p>See: Update the Geolocation Database, on page 137</p>
Intrusion rules (SRU)	<p>Intrusion rule updates provide new and updated intrusion rules and preprocessor rules, modified states for existing rules, and modified default intrusion policy settings.</p> <p>Rule updates may also delete rules, provide new rule categories and default variables, and modify default variable values.</p>	<p>Direct Download: Yes.</p> <p>Schedule: Yes, on System > Updates.</p> <p>Uninstall: No.</p> <p>See: Update Intrusion Rules, on page 139</p>
Security Intelligence feeds	Security Intelligence feeds are collections of IP addresses, domain names, and URLs that you can use to quickly filter traffic that matches an entry.	<p>Direct Download: Yes.</p> <p>Schedule: Yes, on Objects > Object Management.</p> <p>Uninstall: No.</p> <p>See: List and Feed Updates for Security Intelligence, on page 380</p>
URL categories and reputations	URL filtering allows you to control access to websites based on the URL's general classification (category) and risk level (reputation).	<p>Direct Download: Yes.</p> <p>Schedule: Yes, on System > Integration > Cloud Services <i>or</i> System > Tools > Scheduling, depending on your requirements.</p> <p>Uninstall: No.</p> <p>See: Enable URL Filtering Using Category and Reputation, on page 1013</p>

Guidelines and Limitations for System Updates

Before You Update

Before you update any component of your Firepower deployment (including intrusion rules, VDB, or GeoDB) read the release notes or advisory text that accompanies the update. These provide critical and release-specific information, including compatibility, prerequisites, new capabilities, behavior changes, and warnings.

Scheduled Updates

The system schedules tasks — including updates — in UTC. This means that when they occur locally depends on the date and your specific location. Also, because updates are scheduled in UTC, they do not adjust for Daylight Saving Time, summer time, or any such seasonal adjustments that you may observe in your location. If you are affected, scheduled updates occur one hour "later" in the summer than in the winter, according to local time.

Important We *strongly* recommend you review scheduled updates to be sure they occur when you intend.

Bandwidth Guidelines

To upgrade a Firepower appliance (or perform a readiness check), the upgrade package must be on the appliance. Firepower upgrade package sizes vary. Make sure you have the bandwidth to perform a large data transfer to your managed devices. See [Guidelines for Downloading Data from the Firepower Management Center to Managed Devices](#) (Troubleshooting TechNote).

Upgrade System Software

This guide does not contain detailed upgrade instructions for either system software or companion operating systems. Instead, see the [Cisco Firepower Management Center Upgrade Guide, Version 6.0–7.0](#).

For information on scheduling downloads and installations for system software patches, see [Software Update Automation, on page 184](#).

Update the Vulnerability Database (VDB)

The Cisco vulnerability database (VDB) is a database of known vulnerabilities to which hosts may be susceptible, as well as fingerprints for operating systems, clients, and applications. The system uses the VDB to help determine whether a particular host increases your risk of compromise.

Cisco issues periodic updates to the VDB. The time it takes to update the VDB and its associated mappings on the FMC depends on the number of hosts in your network map. As a rule of thumb, divide the number of hosts by 1000 to determine the approximate number of minutes to perform the update.

If the FMC has internet access, we recommend you schedule tasks to perform automatic recurring VDB update downloads and installations.

Caution Updating the VDB *immediately* restarts the Snort process on all managed devices. Additionally, the first deploy after installing the VDB *might* cause a Snort restart depending on the VDB content. Snort restarts cause an interruption in traffic inspection and, depending on how the managed device handles traffic, possibly interrupts traffic flow. For more information, see [Snort® Restart Traffic Behavior, on page 310](#).

Manually Update the VDB

To update the VDB, the VDB update package must be on the FMC.

Before you begin

- Download the update from <https://www.cisco.com/go/firepower-software>.

Note Beginning with VDB Release 343, all application detector information is available through [Cisco Secure Firewall Application Detectors](#). This site includes a searchable database of application detectors. The Release Notes provide information on changes for a particular VDB release.

- Consider the update's effect on traffic flow and inspection due to Snort restarts. We recommend performing updates in a maintenance window.

Procedure

Step 1 Choose **System** > **Updates**, then click **Product Updates**.

Step 2 Choose how you want to upload the VDB update to the FMC.

- Download directly from Cisco.com: Click **Download Updates**. If it can access the Cisco Support & Download site, the Firepower Management Center downloads the latest VDB. Note that the Firepower Management Center also downloads a package for each patch and hotfix (but not major release) associated with the version your appliances are currently running.
- Upload manually: Click **Upload Update**, then **Choose File**. Browse to the update you downloaded earlier, and click **Upload**.

VDB updates appear on the same page as Firepower software upgrade and uninstaller packages.

Step 3 Install the update.

- Click **Install** next to the Vulnerability and Fingerprint Database update.
- Choose the Firepower Management Center.
- Click **Install**.

Step 4 (Optional) Monitor update progress in the Message Center.

Do not perform tasks related to mapped vulnerabilities until the update completes. Even if the Message Center shows no progress for several minutes or indicates that the update has failed, do not restart the update. Instead, contact Cisco TAC.

After the update completes and Snort restarts, the system uses the new vulnerability information. However, you must deploy before updated application detectors and operating system fingerprints can take effect.

Step 5 Verify update success.

Choose **Help** > **About** to view the current VDB version.

What to do next

Deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

Schedule VDB Updates

If your FMC has internet access, we recommend you schedule regular VDB updates. See [Vulnerability Database Update Automation, on page 187](#).

Update the Geolocation Database

The geolocation database (GeoDB) is a database that you can leverage to view and filter traffic based on geographical location.

The system comes with an initial GeoDB that maps IP addresses to countries/continents, so that information should always be available. If you update the GeoDB, the system also downloads contextual data. This contextual data includes additional location details, as well as connection information such as ISP, connection type, proxy type, domain name, and so on. We issue periodic updates to the GeoDB. You must regularly update the GeoDB to have accurate geolocation information.

The time needed to update the GeoDB depends on your appliance, but can take up to 45 minutes depending on the size of the update—for example, if this is the first time you are downloading the full GeoDB. Although a GeoDB update does not interrupt any other system functions (including the ongoing collection of geolocation information), the update does consume system resources while it completes. Consider this when planning your updates.

The GeoDB update overrides any previous versions of the GeoDB and is effective immediately. When you update the GeoDB, the FMC automatically updates the related data on its managed devices. It may take a few minutes for a GeoDB update to take effect throughout your deployment. You do not need to re-deploy after you update.

The **System** > **Updates** > **Geolocation Updates** page and the **Help** > **About** page both list the current version.

Note In May 2022 we split the GeoDB into two packages: a country code package that maps IP addresses to countries/continents, and an IP package that contains contextual data. The new country code package has the same file name as the old all-in-one package. This allows FMCs running Version 7.1 and earlier to continue to obtain GeoDB updates. However, because this package now contains only country code mappings, the contextual data is no longer updated and will grow stale. To obtain fresh data, upgrade or reimage to Version 7.2+ and update the GeoDB. Note that this split does not affect geolocation rules or traffic handling in any way—those rules rely only on the data in the country code package.

Manually Update the GeoDB (Internet Connection)

You can import a new GeoDB update by automatically connecting to the Support Site only if the appliance has Internet access.

Procedure

-
- Step 1** Choose **System** > **Updates**.
 - Step 2** Click **Geolocation Updates**.
 - Step 3** Choose **Download and install geolocation update from the Support Site**.
 - Step 4** Click **Import**.
The system queues a Geolocation Update task, which checks for the latest updates on the Cisco Support Site (<http://www.cisco.com/cisco/web/support/index.html>).
 - Step 5** Optionally, monitor the task status; see [Viewing Task Messages, on page 291](#).
 - Step 6** After the update finishes, return to the Geolocation Updates page or choose **Help** > **About** to confirm that the GeoDB build number matches the update you installed.
-

Manually Update the GeoDB (No Internet Connection)

Use this procedure to perform an on-demand update of the GeoDB if the FMC does not have internet access.

Procedure

-
- Step 1** Download the GeoDB from the Cisco Support & Download site: <https://www.cisco.com/go/firepower-software>.
Select or search for your model (or choose any model—you use the same GeoDB for all FMCs), then browse to the *Coverage and Content Updates* page.
Make sure you download the country code package: `Cisco_GEODB_Update-date-build`. The IP package is for Version 7.2+.
 - Step 2** Choose **System** > **Updates** > **Geolocation Updates**.
 - Step 3** Under One-Time Geolocation Update, choose **Upload and install geolocation update**.
 - Step 4** Click **Choose File**, then browse to the country code package you downloaded earlier.

- Step 5** Click **Import**.
You can monitor update progress in the Message Center.
- Step 6** Verify update success.
The Geolocation Updates page and the **Help > About** page both list the current version.
-

Schedule GeoDB Updates

If the Firepower Management Center has internet access, we recommend you schedule weekly GeoDB updates.

Before you begin

Make sure the FMC can access the internet.

Procedure

- Step 1** Choose **System > Updates**, then click **Geolocation Updates**.
- Step 2** Under **Recurring Geolocation Updates**, check **Enable Recurring Weekly Updates...**
- Step 3** Specify the **Update Start Time**.
- Step 4** Click **Save**.
-

Update Intrusion Rules

As new vulnerabilities become known, the Cisco Talos Intelligence Group (Talos) releases intrusion rule updates that you can import onto your Firepower Management Center, and then implement by deploying the changed configuration to your managed devices. These updates affect intrusion rules, preprocessor rules, and the policies that use the rules.

Intrusion rule updates are cumulative, and Cisco recommends you always import the latest update. You cannot import an intrusion rule update that either matches or predates the version of the currently installed rules.

An intrusion rule update may provide the following:

- **New and modified rules and rule states**—Rule updates provide new and updated intrusion and preprocessor rules. For new rules, the rule state may be different in each system-provided intrusion policy. For example, a new rule may be enabled in the Security over Connectivity intrusion policy and disabled in the Connectivity over Security intrusion policy. Rule updates may also change the default state of existing rules, or delete existing rules entirely.
- **New rule categories**—Rule updates may include new rule categories, which are always added.
- **Modified preprocessor and advanced settings**—Rule updates may change the advanced settings in the system-provided intrusion policies and the preprocessor settings in system-provided network analysis policies. They can also update default values for the advanced preprocessing and performance options in your access control policies.

- **New and modified variables**—Rule updates may modify default values for existing default variables, but do not override your changes. New variables are always added.

In a multidomain deployment, you can import local intrusion rules in any domain, but you can import intrusion rule updates from Talos in the Global domain only.

Caution The first deploy after importing an intrusion rule update restarts the Snort process, which interrupts traffic inspection. Whether traffic drops during the interruption or passes without further inspection depends on how the target device handles traffic. For more information, see [Snort® Restart Traffic Behavior, on page 310](#).

Understanding When Intrusion Rule Updates Modify Policies

Intrusion rule updates can affect both system-provided and custom network analysis policies, as well as all access control policies:

- **system provided**—Changes to system-provided network analysis and intrusion policies, as well as any changes to advanced access control settings, automatically take effect when you re-deploy the policies after the update.
- **custom**—Because every custom network analysis and intrusion policy uses a system-provided policy as its base, or as the eventual base in a policy chain, rule updates can affect custom network analysis and intrusion policies. However, you can prevent rule updates from automatically making those changes. This allows you to update system-provided base policies manually, on a schedule independent of rule update imports. Regardless of your choice (implemented on a per-custom-policy basis), updates to system-provided policies do **not** override any settings you customized.

Note that importing a rule update discards all cached changes to network analysis and intrusion policies. For your convenience, the Rule Updates page lists policies with cached changes and the users who made those changes.

Deploying Intrusion Rule Updates

For changes made by an intrusion rule update to take effect, you must redeploy configurations. When importing a rule update, you can configure the system to automatically redeploy to affected devices. This approach is especially useful if you allow the intrusion rule update to modify system-provided base intrusion policies.

Recurring Intrusion Rule Updates

You can import rule updates on a daily, weekly, or monthly basis, using the Rule Updates page.

Applicable subtasks in the intrusion rule update import occur in the following order: download, install, base policy update, and configuration deploy. When one subtask completes, the next subtask begins.

At the scheduled time, the system installs the rule update and deploys the changed configuration as you specified in the previous step. You can log off or use the web interface to perform other tasks before or during the import. When accessed during an import, the Rule Update Log displays a **Red Status** (🔴), and you can view messages as they occur in the Rule Update Log detailed view. Depending on the rule update size and content, several minutes may pass before status messages appear.

As a part of initial configuration the FMC configures a daily automatic intrusion rule update from the Cisco support site. (The FMC deploys automatic intrusion rule updates to affected managed devices when it next deploys affected policies.) You can observe the status of this update using the web interface Message Center.

If configuring the update fails and your FMC has internet access, we recommend you configure regular intrusion rule updates as described in [Schedule Intrusion Rule Updates, on page 142](#).

Importing Local Intrusion Rules

A local intrusion rule is a custom standard text rule that you import from a local machine as a plain text file with ASCII or UTF-8 encoding. You can create local rules using the instructions in the Snort users manual, which is available at <http://www.snort.org>.

In a multidomain deployment, you can import local intrusion rules in any domain. You can view local intrusion rules imported in the current domain and ancestor domains.

Update Intrusion Rules One-Time Manually

Caution The first deploy after importing an intrusion rule update restarts the Snort process, which interrupts traffic inspection. Whether traffic drops during the interruption or passes without further inspection depends on how the target device handles traffic. For more information, see [Snort® Restart Traffic Behavior, on page 310](#).

Procedure

-
- Step 1** Manually download the update from the Cisco Support Site (<http://www.cisco.com/cisco/web/support/index.html>).
 - Step 2** Choose **System > Updates**, then click **Rule Updates**.
 - Step 3** If you want to move all user-defined rules that you have created or imported to the deleted folder, you must click **Delete All Local Rules** in the toolbar, then click **OK**.
 - Step 4** Choose **Rule Update or text rule file to upload and install** and click **Browse** to navigate to and choose the rule update file.
 - Step 5** If you want to automatically re-deploy policies to your managed devices after the update completes, choose **Reapply all policies after the rule update import completes**.
 - Step 6** Click **Import**. The system installs the rule update and displays the Rule Update Log detailed view.

Note Contact Support if you receive an error message while installing the rule update.

Update Intrusion Rules One-Time Automatically

To import a new intrusion rule update automatically, your appliance must have Internet access to connect to the Support Site.

Caution The first deploy after importing an intrusion rule update restarts the Snort process, which interrupts traffic inspection. Whether traffic drops during the interruption or passes without further inspection depends on how the target device handles traffic. For more information, see [Snort® Restart Traffic Behavior, on page 310](#).

Before you begin

- Ensure the Firepower Management Center has internet access; see [Security, Internet Access, and Communication Ports, on page 2153](#).

Procedure

Step 1 Choose **System > Updates**.

Tip You can also click **Import Rules** on the Rule Editor page, which you access by choosing **Policies > Intrusion > Intrusion Rules**.

Step 2 Click **Rule Updates**.

Step 3 If you want to move all user-defined rules that you have created or imported to the deleted folder, click **Delete All Local Rules** in the toolbar, then click **OK**.

Step 4 Choose **Download new Rule Update from the Support Site**.

Step 5 If you want to automatically re-deploy the changed configuration to managed devices after the update completes, check the **Reapply all policies after the rule update import completes** check box.

Step 6 Click **Import**.

The system installs the rule update and displays the Rule Update Log detailed view.

Caution Contact Support if you receive an error message while installing the rule update.

Schedule Intrusion Rule Updates

Caution The first deploy after importing an intrusion rule update restarts the Snort process, which interrupts traffic inspection. Whether traffic drops during the interruption or passes without further inspection depends on how the target device handles traffic. For more information, see [Snort® Restart Traffic Behavior, on page 310](#).

Procedure

Step 1 Choose **System > Updates**.

Tip You can also click **Import Rules** on the Rule Editor page, which you access by choosing **Policies > Intrusion > Intrusion Rules**.

Step 2 Click **Rule Updates**.

Step 3 If you want to move all user-defined rules that you have created or imported to the deleted folder, click **Delete All Local Rules** in the toolbar, then click **OK**.

Step 4 Check **Enable Recurring Rule Update Imports from the Support Site** check box.

Import status messages appear beneath the **Recurring Rule Update Imports** section heading.

- Step 5** In the **Import Frequency** field, specify:
- The frequency of the update (**Daily**, **Weekly**, or **Monthly**)
 - The day of the week or month you want the update to occur
 - The time you want the update to start
- Step 6** If you want to automatically re-deploy the changed configuration to your managed devices after the update completes, check the **Deploy updated policies to targeted devices after rule update completes** check box.
- Step 7** Click **Save**.

Caution Contact Support if you receive an error message while installing the intrusion rule update.

The status message under the Recurring Rule Update Imports section heading changes to indicate that the rule update has not yet run.

Best Practices for Importing Local Intrusion Rules

Observe the following guidelines when importing a local rule file:

- The rules importer requires that all custom rules are imported in a plain text file encoded in ASCII or UTF-8.
- The text file name can include alphanumeric characters, spaces, and no special characters other than underscore (`_`), period (`.`), and dash (`-`).
- The system imports local rules preceded with a single pound character (`#`), but they are flagged as deleted.
- The system imports local rules preceded with a single pound character (`#`), and does not import local rules preceded with two pound characters (`##`).
- Rules cannot contain any escape characters.
- You do not have to specify a Generator ID (GID) when importing a local rule. If you do, specify only GID 1 for a standard text rule.
- When importing a rule for the first time, do *not* specify a Snort ID (SID) or revision number. This avoids collisions with SIDs of other rules, including deleted rules. The system will automatically assign the rule the next available custom rule SID of 1000000 or greater, and a revision number of 1.

If you must import rules with SIDs, the SIDs must be unique numbers between 1,000,000 and 9,999,999.

In a multidomain deployment, the system assigns SIDs to imported rules from a shared pool used by all domains on the Firepower Management Center. If multiple administrators are importing local rules at the same time, SIDs within an individual domain might appear to be non-sequential, because the system assigned the intervening numbers in the sequence to another domain.

- When importing an updated version of a local rule you have previously imported, or when reinstating a local rule you have deleted, you *must* include the SID assigned by the system and a revision number greater than the current revision number. You can determine the revision number for a current or deleted rule by editing the rule.

Note The system automatically increments the revision number when you delete a local rule; this is a device that allows you to reinstate local rules. All deleted local rules are moved from the local rule category to the deleted rule category.

- The import fails if a rule contains any of the following: .
 - A SID greater than 2147483647.
 - A list of source or destination ports that is longer than 64 characters.
- Policy validation fails if you enable an imported local rule that uses the deprecated `threshold` keyword in combination with the intrusion event thresholding feature in an intrusion policy.
- All imported local rules are automatically saved in the local rule category.
- The system always sets local rules that you import to the disabled rule state. You must manually set the state of local rules before you can use them in your intrusion policy.

Import Local Intrusion Rules

- Make sure your local rule file follows the guidelines described in [Best Practices for Importing Local Intrusion Rules, on page 143](#).
- Make sure your process for importing local intrusion rules complies with your security policies.
- Consider the import's effect on traffic flow and inspection due to bandwidth constraints and Snort restarts. We recommend scheduling rule updates during maintenance windows.
- You can perform this task in any domain.

Use this procedure to import local intrusion rules. Imported intrusion rules appear in the local rule category in a disabled state.

Procedure

- Step 1** Choose **System > Updates**, then click **Rule Updates**.
- Step 2** (Optional) Delete existing local rules.
Click **Delete All Local Rules**, then confirm that you want to move all created and imported intrusion rules to the deleted folder.
- Step 3** Under **One-Time Rule Update/Rules Import**, choose **Rule update or text rule file to upload and install**, then click **Choose File** and browse to your local rule file.
- Step 4** Click **Import**.
- Step 5** Monitor import progress in the Message Center.

To display the Message Center, click System Status on the menu bar. Even if the Message Center shows no progress for several minutes or indicates that the import has failed, do not restart the import. Instead, contact Cisco TAC.

What to do next

- Edit intrusion policies and enable the rules you imported.
- Deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

Rule Update Log

The Firepower Management Center generates a record for each rule update and local rule file that you import.

Each record includes a time stamp, the name of the user who imported the file, and a status icon indicating whether the import succeeded or failed. You can maintain a list of all rule updates and local rule files that you import, delete any record from the list, and access detailed records for all imported rules and rule update components.

The Rule Update Import Log detailed view lists a detailed record for each object imported in a rule update or local rule file. You can also create a custom workflow or report from the records listed that includes only the information that matches your specific needs.

Intrusion Rule Update Log Table

Table 17: Intrusion Rule Update Log Fields

Field	Description
Summary	The name of the import file. If the import fails, a brief statement of the reason for the failure appears under the file name.
Time	The time and date that the import started.
User ID	The user name of the user that triggered the import.
Status	Whether the import: <ul style="list-style-type: none"> • Succeeded  • failed or is currently in progress Red Status  <p>The red status icon indicating an unsuccessful or incomplete import appears on the Rule Update Log page during the import and is replaced by the green icon only when the import has successfully completed.</p>

Tip You can view import details as they appear while an intrusion rule update import is in progress.

Viewing the Intrusion Rule Update Log

In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.

Procedure

Step 1 Choose **System > Updates**.

Tip You can also click **Import Rules** on the intrusion rules editor page (**Objects > Intrusion Rules**).

Step 2 Click **Rule Updates**.

Step 3 Click **Rule Update Log**.

Step 4 You have two options:

- **View** — To view details for each object imported in a rule update or local rule file, click **View** () next to the file you want to view; see [Viewing Details of the Intrusion Rule Update Import Log, on page 148](#).
- **Delete** — To delete an import file record from the import log, including detailed records for all objects included with the file, click **Delete** () next to the import file name.

Note Deleting the file from the log does not delete any object imported in the import file, but only deletes the import log records.

Fields in an Intrusion Rule Update Log

Tip You search the entire Rule Update Import Log database even when you initiate a search by clicking **Search** on the toolbar from the Rule Update Import Log detailed view with only the records for a single import file displayed. Make sure you set your time constraints to include all objects you want to include in the search.

Table 18: Rule Update Import Log Detailed View Fields

Field	Description
Action	An indication that one of the following has occurred for the object type: <ul style="list-style-type: none"> • <code>new</code> (for a rule, this is the first time the rule has been stored on this appliance) • <code>changed</code> (for a rule update component or rule, the rule update component has been modified, or the rule has a higher revision number and the same GID and SID) • <code>collision</code> (for a rule update component or rule, import was skipped because its revision conflicts with an existing component or rule on the appliance) • <code>deleted</code> (for rules, the rule has been deleted from the rule update) • <code>enabled</code> (for a rule update edit, a preprocessor, rule, or other feature has been enabled in a default policy provided with the system) • <code>disabled</code> (for rules, the rule has been disabled in a default policy provided with the system) • <code>drop</code> (for rules, the rule has been set to Drop and Generate Events in a default policy provided with the system) • <code>error</code> (for a rule update or local rule file, the import failed) • <code>apply</code> (the Reapply all policies after the rule update import completes option was enabled for the import)
Default Action	The default action defined by the rule update. When the imported object type is <code>rule</code> , the default action is <code>Pass</code> , <code>Alert</code> , or <code>Drop</code> . For all other imported object types, there is no default action.
Details	A string unique to the component or rule. For rules, the GID, SID, and previous revision number for a changed rule, displayed as <code>previously (GID:SID:Rev)</code> . This field is blank for a rule that has not changed.
Domain	The domain whose intrusion policies can use the updated rule. Intrusion policies in descendant domains can also use the rule. This field is only present in a multidomain deployment.
GID	The generator ID for a rule. For example, <code>1</code> (standard text rule) or <code>3</code> (shared object rule).
Name	The name of the imported object, which for rules corresponds to the rule Message field, and for rule update components is the component name.
Policy	For imported rules, this field displays <code>All</code> . This means that the rule was imported successfully, and can be enabled in all appropriate default intrusion policies. For other types of imported objects, this field is blank.
Rev	The revision number for a rule.
Rule Update	The rule update file name.
SID	The SID for a rule.
Time	The time and date the import began.

Field	Description
Type	The type of imported object, which can be one of the following: <ul style="list-style-type: none"> <code>rule update component</code> (an imported component such as a rule pack or policy pack) <code>rule</code> (for rules, a new or updated rule; note that in Version 5.0.1 this value replaced the <code>update</code> value, which is deprecated) <code>policy apply</code> (the Reapply all policies after the rule update import completes option was enabled for the import)
Count	The count (1) for each record. The Count field appears in a table view when the table is constrained, and the Rule Update Log detailed view is constrained by default to rule update records. This field is not searchable.

Viewing Details of the Intrusion Rule Update Import Log

In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.

Procedure

Step 1 Choose **System > Updates**.

Tip You can also click **Import Rules** on the Rule Editor page, which you access by choosing **Policies > Intrusion > Intrusion Rules**.

Step 2 Click **Rule Updates**.

Step 3 Click **Rule Update Log**.

Step 4 Click **View** (🔍) next to the file whose detailed records you want to view.

Step 5 You can take any of the following actions:

- **Bookmark**—To bookmark the current page, click **Bookmark This Page**.
- **Edit Search**—To open a search page prepopulated with the current single constraint, choose **Edit Search** or **Save Search** next to Search Constraints.
- **Manage bookmarks**—To navigate to the bookmark management page, click **Report Designer**.
- **Report**—To generate a report based on the data in the current view, click **Report Designer**.
- **Search**—To search the entire Rule Update Import Log database for rule update import records, click **Search**.
- **Sort**—To sort and constrain records on the current workflow page, see [Using Drill-Down Pages, on page 1893](#) for more information.
- **Switch workflows**—To temporarily use a different workflow, click (**switch workflows**).

Maintain Your Air-Gapped Deployment

If your Firepower system is not connected to the internet, essential updates will not occur automatically.

You must manually obtain and install these updates. See the following information:

- [Manually Update the VDB, on page 136](#)
- [Update Intrusion Rules One-Time Manually, on page 141](#)
- [Manually Update the GeoDB \(No Internet Connection\), on page 138](#)
- The *Firepower Management Center Software Upgrade Guide* at <https://www.cisco.com/c/en/us/td/docs/security/firepower/upgrade/fpmc-upgrade-guide.html>

CHAPTER 7

Backup and Restore

- [About Backup and Restore, on page 151](#)
- [Requirements for Backup and Restore, on page 152](#)
- [Guidelines and Limitations for Backup and Restore, on page 153](#)
- [Best Practices for Backup and Restore, on page 154](#)
- [Backing Up FMCs or Managed Devices, on page 157](#)
- [Restoring FMCs and Managed Devices, on page 162](#)
- [Manage Backups and Remote Storage, on page 164](#)

About Backup and Restore

The ability to recover from a disaster is an essential part of any system maintenance plan. As part of your disaster recovery plan, we recommend that you perform periodic backups to a secure remote location.

On-Demand Backups

You can perform on-demand backups for the FMC and 7000/8000 series devices from the FMC.

You can also use the local web interface on a 7000/8000 series device to perform on-demand backups. Local backup management on 7000/8000 series devices is slightly different and has fewer options than backup management on the FMC, but in general works in the same way. Note that you can use the FMC to back up these devices remotely.

For more information, see [Backing Up FMCs or Managed Devices, on page 157](#).

Scheduled Backups

You can use the scheduler on an FMC or 7000/8000 series device to automate backups. You cannot schedule remote device backups from the FMC.

For more information, see [Scheduled Backups, on page 177](#).

Storing Backup Files

You can store backups locally. However, we recommend you back up FMCs and managed devices to a secure remote location by mounting an NFS, SMB, or SSHFS network volume as remote storage. After you do this, all subsequent backups are copied to that volume, but you can still use the FMC to manage them.

For more information, see [Remote Storage Management, on page 714](#) and [Manage Backups and Remote Storage, on page 164](#).

Restoring the FMC and Managed Devices

You restore the FMC and 7000/8000 series devices from the local Backup Management page.

For more information, see [Restoring FMCs and Managed Devices, on page 162](#).

What Is Backed Up?

FMC backups can include:

- Configurations.

All configurations you can set on the FMC web interface are included in a configuration backup, with the exception of remote storage and audit log server certificate settings. In a multidomain deployment, you must back up configurations. You cannot back up events or only.

- Events.

Event backups include all events in the FMC database. However, FMC event backups do not include intrusion event review status. Restored intrusion events do not appear on Reviewed Events pages.

7000/8000 series device backups are always configuration-only.

What Is Restored?

Restoring configurations overwrites *all* backed-up configurations, with very few exceptions. On the FMC, restoring events overwrites *all* existing events, with the exception of intrusion events.

Make sure you understand and plan for the following:

- You cannot restore what is not backed up.

FMC configuration backups do not include remote storage and audit log server certificate settings, so you must reconfigure these after restore. Also, because FMC event backups do not include intrusion event review status, restored intrusion events do not appear on Reviewed Events pages.

- Restoring to a configured FMC — instead of factory-fresh or reimaged — merges intrusion events and file lists.

The FMC event restore process does not overwrite intrusion events. Instead, the intrusion events in the backup are added to the database. To avoid duplicates, delete existing intrusion events before you restore.

The FMC configuration restore process does not overwrite clean and custom detection file lists used by AMP for Networks. Instead, it merges existing file lists with the file lists in the backup. To replace file lists, delete existing file lists before you restore.

Requirements for Backup and Restore

Backup and restore has the following requirements.

Model Requirements: Backup

You can back up:

- FMCs
- 7000/8000 series devices

Backup is *not* supported for:

- Firepower Threat Defense
- NGIPSv
- ASA FirePOWER

If you need to replace a device where backup and restore is not supported, you must manually recreate device-specific configurations. However, backing up the FMC does back up policies and other configurations that you deploy to managed devices, as well as events already transmitted from the devices to the FMC.

Model Requirements: Restore

A replacement appliance must be the same model as the one you are replacing. Replacement managed devices should have the same number of network modules and same type and number of physical interfaces.

Version Requirements

As the first step in any backup, note the patch level. To restore a backup, the old and the new appliance must be running the same Firepower version, including patches.

For FMC backups, you must also have the same VDB. You are *not* required to have the same SRU.

License Requirements

Address licensing or orphan entitlements concerns as described in the best practices and procedures. If you notice licensing conflicts, contact Cisco TAC.

Domain Requirements

To:

- Back up or restore the FMC: Global only.
- Back up a device from the FMC: Global only.
- Restore a device: None. Restore devices locally.

In a multidomain deployment you cannot back up only events. You must also back up configurations.

Guidelines and Limitations for Backup and Restore

Backup and restore has the following guidelines and limitations.

Backup and Restore is for Disaster Recovery/RMA

Backup and restore is primarily intended for RMA scenarios. Before you begin the restore process of a faulty or failed physical appliance, contact Cisco TAC for replacement hardware.

Backup and Restore is not Configuration Import/Export

A backup file contains information that uniquely identifies an appliance, and cannot be shared. Do not use the backup and restore process to copy configurations between appliances or devices, or as a way to save configurations while testing new ones. Instead, use the import/export feature.

Restore is Individual and Local

You restore to cloud-delivered Firewall Management Centers and threat defense managed devices individually and locally. This means:

- You cannot batch-restore to high availability (HA) FMCs or devices. The restore procedures in this guide explain how to restore in an HA environment.
- You cannot use the cloud-delivered Firewall Management Center to restore a device. For the cloud-delivered Firewall Management Center and 7000/8000 series devices, you can use the local web interface to restore.
- You cannot use an cloud-delivered Firewall Management Center user account to log into and restore one of its managed devices. cloud-delivered Firewall Management Centers and devices maintain their own user accounts.

Best Practices for Backup and Restore

Backup and restore has the following best practices.

When to Back Up

We recommend backing up during a maintenance window or other time of low use.

While the system collects backup data, there may be a temporary pause in data correlation (cloud-delivered Firewall Management Center only), and you may be prevented from changing configurations related to the backup. If you include event data, event-related features such as eStreamer are not available.

You should back up in the following situations:

- Regular scheduled backups.
As part of your disaster recovery plan, we recommend that you perform periodic backups. To automate this process, see [Scheduled Backups, on page 177](#).
- Before upgrade or reimage.
If an upgrade fails catastrophically, you may have to reimage and restore. Reimaging returns most settings to factory defaults, including the system password. If you have a recent backup, you can return to normal operations more quickly.
- After upgrade.
Back up after you upgrade, so you have a snapshot of your freshly upgraded deployment. We recommend you back up the cloud-delivered Firewall Management Center *after* you upgrade its managed devices, so your new cloud-delivered Firewall Management Center backup file 'knows' that its devices have been upgraded.

Maintaining Backup File Security

Backups are stored as unencrypted archive (.tar) files.

Private keys in PKI objects—which represent the public key certificates and paired private keys required to support your deployment—are decrypted before they are backed up. The keys are reencrypted with a randomly generated key when you restore the backup.

Caution

We recommend you back up cloud-delivered Firewall Management Centers and devices to a secure remote location and verify transfer success. Backups left locally may be deleted, either manually or by the upgrade process, which purges locally stored backups.

Especially because backup files are unencrypted, do *not* allow unauthorized access. If backup files are modified, the restore process will fail. Keep in mind that anyone with the Admin/Maint role can access the Backup Management page, where they can move and delete files from remote storage.

In the cloud-delivered Firewall Management Center's system configuration, you can mount an NFS, SMB, or SSHFS network volume as remote storage. After you do this, all subsequent backups are copied to that volume, but you can still use the cloud-delivered Firewall Management Center to manage them. For more information, see [Remote Storage Management, on page 714](#) and [Manage Backups and Remote Storage, on page 164](#).

Note that only the cloud-delivered Firewall Management Center mounts the network volume. Managed device backup files are routed through the cloud-delivered Firewall Management Center. Make sure you have the bandwidth to perform a large data transfer between the cloud-delivered Firewall Management Center and its devices. For more information, see [Guidelines for Downloading Data from the Firepower Management Center to Managed Devices](#) (Troubleshooting TechNote).

Before Backup

Before you back up, you should:

- Update the VDB and SRU on the cloud-delivered Firewall Management Center.

We always recommend you use the latest vulnerability database (VDB) and intrusion rules (SRU). Before you back up an cloud-delivered Firewall Management Center, check the Cisco Support & Download site for newer versions.

This is especially important for the VDB, because the VDB versions must match to restore a backup. Because you cannot downgrade the VDB, you do not want a situation where your replacement cloud-delivered Firewall Management Center has a newer VDB than the backed up cloud-delivered Firewall Management Center.

- Check Disk Space.

Before you begin a backup, make sure you have enough disk space on the appliance or on your remote storage server. The space available is displayed on the Backup Management page.

Backups can fail if there is not enough space. Especially if you schedule backups, make sure you regularly prune backup files or allocate more disk space to the remote storage location.

Before Restore

Before restore, you should:

- Revert licensing changes.

Revert any licensing changes made since you took the backup.

Otherwise, you may have license conflicts or orphan entitlements after the restore. However, do *not* unregister from Cisco Smart Software Manager (CSSM). If you unregister from CSSM, you must unregister again after you restore, then re-register.

After the restore completes, reconfigure licensing. If you notice licensing conflicts or orphan entitlements, contact Cisco TAC.

- Disconnect faulty appliances.

Disconnect the management interface, and for devices, the data interfaces.

Note that restoring an cloud-delivered Firewall Management Center or 7000/8000 series device does *not* change the management IP address. You must set that manually on the replacement — just make sure you disconnect the old appliance from the network before you do.

- Do *not* unregister managed devices.

Whether you are restoring an FMC or managed device, do not unregister devices from the cloud-delivered Firewall Management Center, even if you physically disconnect an appliance from the network.

If you unregister, you will need to redo some device configurations, such as security zone to interface mappings. After you restore, the cloud-delivered Firewall Management Center and devices should begin communicating normally.

- Reimage.

In an RMA scenario, the replacement appliance will arrive configured with factory defaults. However, if the replacement appliance is already configured, we recommend you reimage. Reimaging returns most settings to factory defaults, including the system password. You can only reimage to major versions, so you may need to patch after you reimage.

If you do not reimage, keep in mind that cloud-delivered Firewall Management Center intrusion events and file lists are merged rather than overwritten.

After Restore

After restore, you should:

- Reconfigure anything that was not restored.

This can include reconfiguring licensing, remote storage, and audit log server certificate settings.

- Update the VDB and SRU on the cloud-delivered Firewall Management Center.

We always recommend you use the latest vulnerability database (VDB) and intrusion rules (SRU).

- Deploy.

After you restore an cloud-delivered Firewall Management Center, deploy to all managed devices. After you restore a device, deploy to that device. You *must* deploy. If the a device or devices are not marked out of date, force deploy from the Device Management page: [Redeploy Existing Configurations to a Device, on page 307](#).

Backing Up FMCs or Managed Devices

You can perform on-demand or scheduled backups for supported appliances.

You do not need a backup profile to back up 7000/8000 series devices from the FMC. However, FMC backups require backup profiles, as do local backups on 7000/8000 series devices.. The on-demand backup process allows you to create a new backup profile.

For more information, see:

- [Back up the FMC, on page 157](#)
- [Back up a Device from the FMC, on page 158](#)
- [Back up a 7000/8000 Series Device Locally, on page 159](#)
- [Create a Backup Profile, on page 161](#)
- [Scheduled Backups, on page 177](#)

Back up the FMC

Use this procedure to perform an on-demand FMC backup. To back up a 7000/8000 series device from its local web interface, see [Back up a 7000/8000 Series Device Locally, on page 159](#).

Before you begin

You must read and understand the requirements, guidelines, limitations, and best practices. You do not want to skip any steps or ignore security concerns. Careful planning and preparation can help you avoid missteps.

- [Requirements for Backup and Restore, on page 152](#)
- [Guidelines and Limitations for Backup and Restore, on page 153](#)
- [Best Practices for Backup and Restore, on page 154](#)

Procedure

Step 1 Select **System > Tools > Backup/Restore**.

The Backup Management page lists all locally and remotely stored backups. It also lists how much disk space you have available to store backups. Backups can fail if there is not enough space.

Step 2 Choose whether to use an existing backup profile or start fresh.

FMC backups require that you use or create a backup profile.

- Click **Backup Profiles** to use an existing backup profile.

Next to the profile you want to use, click the edit icon. You can then click **Start Backup** to begin the backup right now. Or, if you want to edit the profile, go on to the next step.

- Click **Firepower Management Backup** to start fresh and create a new backup profile.

Enter a **Name** for the backup profile.

Step 3 Choose what to back up:

- **Back Up Configuration**
- **Back Up Events**

In a multidomain deployment, you must back up configurations. You cannot back up events or only. For details on what is and what is not backed up for each of these choices, see [About Backup and Restore, on page 151](#).

Step 4 Note the **Storage Location** for FMC backup files.

This will either be local storage in `/var/sf/backup/`, or a remote network volume. For more information, see [Manage Backups and Remote Storage, on page 164](#).

Step 5 (Optional) Enable **Copy when complete** to copy completed FMC backups to a remote server.

Provide a hostname or IP address, the path to the remote directory, and a username and password. To use an SSH public key instead of a password, copy the contents of the **SSH Public Key** field to the specified user's `authorized_keys` file on the remote server.

Note This option is useful if you want to store backups locally and also SCP them to a remote location. If you configured SSH remote storage, do *not* copy backup files to the same directory using **Copy when complete**.

Step 6 (Optional) Enable **Email** and enter an email address to be notified when the backup completes.

To receive email notifications, you must configure the FMC to connect to a mail server: [Configuring a Mail Relay Host and Notification Address, on page 724](#).

Step 7 Click **Start Backup** to start the on-demand backup.

If you are not using an existing backup profile, the system automatically creates one and uses it. If you decide not to run the backup now, you can click **Save** or **Save As New** to save the profile. In either case, you can use the newly created profile to configure scheduled backups.

Step 8 Monitor progress in the Message Center.

While the system collects backup data, there may be a temporary pause in data correlation, and you may be prevented from changing configurations related to the backup. If you configured remote storage or enabled **Copy when complete**, the FMC may write temporary files to the remote server. These files are cleaned up at the end of the backup process.

What to do next

If you configured remote storage or enabled **Copy when complete**, verify transfer success of the backup file.

Back up a Device from the FMC

Use this procedure to perform an on-demand backup of a 7000/8000 series device from the FMC. At this time, backup and restore is not supported for Firepower Threat Defense.

Before you begin

You must read and understand the requirements, guidelines, limitations, and best practices. You do not want to skip any steps or ignore security concerns. Careful planning and preparation can help you avoid missteps.

- [Requirements for Backup and Restore, on page 152](#)
- [Guidelines and Limitations for Backup and Restore, on page 153](#)
- [Best Practices for Backup and Restore, on page 154](#)

Procedure

Step 1 Select **System > Tools > Backup/Restore**, then click **Managed Device Backup**.

Step 2 Select one or more **Managed Devices**.

Step 3 To back up event data that has not yet been sent to the FMC, select **Include All Unified Files**.

Step 4 Note the **Storage Location** for device backup files.

This will either be local storage in `/var/sf/remote-backup/`, or a remote network volume. For more information, see [Manage Backups and Remote Storage, on page 164](#).

Step 5 If you did not configure remote storage, choose whether you want to **Retrieve to Management Center**.

- Enabled: Saves the backup to the FMC in `/var/sf/remote-backup/`.
- Disabled (default): Saves the backup to the device in `/var/sf/backup`.

Step 6 Click **Start Backup** to start the on-demand backup.

Step 7 Monitor progress in the Message Center.

What to do next

If you configured remote storage, verify transfer success of the backup file.

Back up a 7000/8000 Series Device Locally

Use this procedure to perform a local, on-demand backup for a 7000/8000 series device. Device backups are always configuration-only.

Note that local backup management on 7000/8000 series devices is slightly different and has fewer options than backup management on the FMC, but in general works in the same way. Unless you have a specific need (such as scheduling backups), we recommend you use the FMC to back up these devices remotely.

Before you begin

You must read and understand the requirements, guidelines, limitations, and best practices. You do not want to skip any steps or ignore security concerns. Careful planning and preparation can help you avoid missteps.

- [Requirements for Backup and Restore, on page 152](#)
- [Guidelines and Limitations for Backup and Restore, on page 153](#)

- [Best Practices for Backup and Restore, on page 154](#)

Procedure

- Step 1** On the device's local web interface, select **System > Tools > Backup/Restore**.
- The Backup Management page lists all locally stored backups. It also lists how much disk space you have available to store backups. Backups can fail if there is not enough space.
- Step 2** Choose whether to use an existing backup profile or start fresh.
- 7000/8000 series local backups require that you use or create a backup profile. When you perform an on-demand backup, if you do not pick an existing backup profile, the system automatically creates one and uses it. You can then use the newly created profile to configure scheduled backups.
- Click **Backup Profiles** to use an existing backup profile.
- Next to the profile you want to use, click the edit icon. You can then click **Start Backup** to begin the backup right now. Or, if you want to edit the profile, go on to the next step.
- Click **Device Backup** to start fresh and create a new backup profile.
- Enter a **Name** for the backup profile.
- Step 3** (Optional) Enable **Copy when complete** to copy completed backups to a remote server.
- This is your only option for remote storage for 7000/8000 series local backups.
- Provide a hostname or IP address, the path to the remote directory, and a username and password. To use an SSH public key instead of a password, copy the contents of the **SSH Public Key** field to the specified user's `authorized_keys` file on the remote server.
- Step 4** (Optional) Enable **Email** and enter an email address to be notified when the backup completes.
- To receive email notifications, you must configure the device to connect to a mail server: [Configuring a Mail Relay Host and Notification Address, on page 724](#).
- Step 5** Click **Start Backup** to start the on-demand backup.
- If you are not using an existing backup profile, the system automatically creates one and uses it. If you decide not to run the backup now, you can click **Save** or **Save As New** to save the profile. In either case, you can use the newly created profile to configure scheduled backups.
- Step 6** Monitor progress in the Message Center.
- While the system collects backup data, you may be prevented from changing configurations related to the backup. If you enabled **Copy when complete**, the device may write temporary files to the remote server. These files are cleaned up at the end of the backup process.
-

What to do next

If you enabled **Copy when complete**, verify transfer success of the backup file.

Create a Backup Profile

A backup profile is a saved set of preferences—what to back up, where to store the backup file, and so on. FMC backups and 7000/8000 series local backups require backup profiles. Backup profiles are not required to back up a device from the FMC.

When you perform an on-demand FMC or 7000/8000 series local backup, if you do not pick an existing backup profile, the system automatically creates one and uses it. You can then use the newly created profile to configure scheduled backups. Note that you cannot schedule 7000/8000 series device backups from the FMC.

The following procedure explains how to create a backup profile without performing an on-demand backup.

Procedure

Step 1 Select **System > Tools > Backup/Restore**, then click **Backup Profiles**.

Step 2 Click **Create Profile** and enter a **Name**.

Step 3 (FMC only) Choose what to back up.

7000/8000 series backups are always configuration-only.

- **Back Up Configuration**
- **Back Up Events**

In a multidomain deployment, you must back up configurations. You cannot back up events or only. For details on what is and what is not backed up for each of these choices, see [About Backup and Restore, on page 151](#).

Step 4 Note the **Storage Location** for backup files.

For FMC backup profiles, this will either be local storage in `/var/sf/backup/`, or a remote network volume. For 7000/8000 local backup profiles, this is always `/var/sf/backup/`. For more information, see [Manage Backups and Remote Storage, on page 164](#).

Step 5 (Optional) Enable **Copy when complete** to copy completed FMC backups to a remote server.

Provide a hostname or IP address, the path to the remote directory, and a username and password. To use an SSH public key instead of a password, copy the contents of the **SSH Public Key** field to the specified user's `authorized_keys` file on the remote server.

Note This option is useful if you want to store backups locally and also SCP them to a remote location. If you configured SSHFS remote storage, do *not* copy backup files to the same directory using **Copy when complete**.

Step 6 (Optional) Enable **Email** and enter an email address to be notified when the backup completes.

To receive email notifications, you must configure the FMC to connect to a mail server: [Configuring a Mail Relay Host and Notification Address, on page 724](#).

Step 7 Click **Save**.

Restoring FMCs and Managed Devices

For the FMC and 7000/8000 series devices, you use the local web interface to restore from backup. You cannot use the FMC to restore a device.

The following sections explain how to restore FMCs and managed devices.

- [Restore an FMC from Backup, on page 162](#)
- [Restore a 7000/8000 Series Device from Backup, on page 163](#)

Restore an FMC from Backup

When you restore an FMC backup, you can choose to restore any or all of the components included in the backup file (events, configurations).

Note Restoring configurations overwrites *all* configurations, with very few exceptions. It also reboots the FMC. Restoring events overwrites *all* existing events, with the exception of intrusion events. Make sure you are ready.

Use this procedure to restore an FMC from backup. To restore a 7000/8000 series device, see [Restore a 7000/8000 Series Device from Backup, on page 163](#).

Before you begin

You must read and understand the requirements, guidelines, limitations, and best practices. You do not want to skip any steps or ignore security concerns. Careful planning and preparation can help you avoid missteps.

- [Requirements for Backup and Restore, on page 152](#)
- [Guidelines and Limitations for Backup and Restore, on page 153](#)
- [Best Practices for Backup and Restore, on page 154](#)

Procedure

Step 1 Log into the FMC you want to restore.

Step 2 Select **System > Tools > Backup/Restore**.

The Backup Management page lists all locally and remotely stored backup files. You can click a backup file to view its contents.

If the backup file is not in the list and you have it saved on your local computer, click **Upload Backup**; see [Manage Backups and Remote Storage, on page 164](#).

Step 3 Select the backup file you want to restore and click **Restore**.

Step 4 Select from the available components to restore, then click **Restore** again to begin.

Step 5 Monitor progress in the Message Center.

If you are restoring configurations, you can log back in after the FMC reboots.

What to do next

- If necessary, reconfigure any licensing settings that you reverted before the restore. If you notice licensing conflicts or orphan entitlements, contact Cisco TAC.
- If necessary, reconfigure remote storage and audit log server certificate settings. These settings are not included in backups.
- (Optional) Update the SRU and VDB. If the SRU or the VDB available on the Cisco Support & Download site is newer than the version currently running, we recommend you install the newer version.
- Deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

Restore a 7000/8000 Series Device from Backup

This procedure explains how to use the 7000/8000 series local web interface to restore from backup. Restoring overwrites *all* configurations, with very few exceptions. It also reboots the device.

Before you begin

You must read and understand the requirements, guidelines, limitations, and best practices. You do not want to skip any steps or ignore security concerns. Careful planning and preparation can help you avoid missteps.

- [Requirements for Backup and Restore, on page 152](#)
- [Guidelines and Limitations for Backup and Restore, on page 153](#)
- [Best Practices for Backup and Restore, on page 154](#)

Procedure

- Step 1** Log into the device you want to restore.
- Step 2** Select **System > Tools > Backup/Restore**.
- The Backup Management page lists all locally stored backup files. You can click a backup file to view its contents.
- If the backup file is not in the list and you have it saved on your local computer, click **Upload Backup**; see [Manage Backups and Remote Storage, on page 164](#).
- Step 3** Select the backup file you want to restore and click **Restore**.
- Step 4** Make sure **Replace Configuration Data** is enabled, then click **Restore** again to begin.
- Device backups are always configuration-only.
- Step 5** Monitor progress in the Message Center until the device reboots.
-

What to do next

Deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

Manage Backups and Remote Storage

Backups are stored as unencrypted archive (.tar) files. The file name includes identifying information that can include:

- The name of the backup profile or scheduled task associated with the backup.
- The display name or IP address of the backed-up appliance.
- The appliance's role, such as a member of an HA pair.

We recommend you back up appliances to a secure remote location and verify transfer success. Backups left on an appliance may be deleted, either manually or by the upgrade process; upgrades purge locally stored backups. For more information on your options, see [Backup Storage Locations, on page 165](#).

Caution Especially because backup files are unencrypted, do *not* allow unauthorized access. If backup files are modified, the restore process will fail. Keep in mind that anyone with the Admin/Maint role can access the Backup Management page, where they can move and delete files from remote storage.

The following procedure describes how to manage backup files.

Procedure

Step 1 Select **System > Tools > Backup/Restore**.

The Backup Management page lists available backups. It also lists how much disk space you have available to store backups. Backups can fail if there is not enough space.

Step 2 Do one of the following:

Table 19: Remote Storage and Backup File Management

To	Do This
Enable or disable remote storage for backups without having to edit the FMC system configuration.	<p>Click Enable Remote Storage for Backups.</p> <p>This option appears only after you configure remote storage. Toggling it here also toggles it in the system configuration (System > Configuration > Remote Storage Device).</p> <p>Tip To quickly access your remote storage configuration, click Remote Storage at the upper right of the Backup Management page.</p> <p>Note To store backup on the remote storage location, you must also enable the Retrieve to Management Center option (see Back up a Device from the FMC, on page 158).</p>

To	Do This
Move a file between the FMC and the remote storage location.	<p>Click Move.</p> <p>You can move a file back and forth as many times as you want. This will delete—not copy—the file from the current location.</p> <p>When you move a backup file from remote storage to the FMC, where it is stored on the FMC depends on the kind of backup:</p> <ul style="list-style-type: none"> • FMC backups: <code>/var/sf/backup</code> • Device backups: <code>/var/sf/remote-backup</code>
View the contents of the backup.	Click the backup file.
Delete a backup file.	<p>Choose a backup file and click Delete.</p> <p>You can delete both locally and remotely stored backup files.</p>
Upload a backup file from your computer.	Click Upload Backup , choose a backup file, and click Upload Backup again.
Download a backup to your computer.	<p>Choose a backup file and click Download.</p> <p>Unlike moving a backup file, this does not delete the backup from the FMC.</p>

Backup Storage Locations

The following table describes backup storage options for FMCs and managed devices.

Table 20: Backup Storage Locations

Location	Details
Remote, by mounting a network volume (NFS, SMB, SSHFS).	<p>Note Backup is stored on a remote storage location only when you have configured remote storage and enabled the Retrieve to Management Center option (see Back up a Device from the FMC, on page 158).</p> <p>In the FMC's system configuration, you can mount an NFS, SMB, or SSHFS network volume as remote storage for FMC and device backups; see Remote Storage Management, on page 714.)</p> <p>After you do this, all subsequent FMC backups <i>and FMC-initiated device backups</i> are copied to that volume, but you can still use the FMC to manage them (restore, download, upload, delete, move).</p> <p>Note that only the FMC mounts the network volume. Managed device backup files are routed through the FMC. Make sure you have the bandwidth to perform a large data transfer between the FMC and its devices. For more information, see Guidelines for Downloading Data from the Firepower Management Center to Managed Devices (Troubleshooting TechNote).</p>
Remote, by copying (SCP).	<p>Note Backup is stored on a remote storage location only when you have configured remote storage and enabled the Retrieve to Management Center option (see Back up a Device from the FMC, on page 158).</p> <p>For the FMC and for 7000/8000 series <i>local</i> backups, you can use a Copy when complete option to securely copy (SCP) completed backups to a remote server.</p> <p>Compared with remote storage by mounting a network volume, Copy when complete cannot copy to NFS or SMB volumes. You cannot provide CLI options or set a disk space threshold, and it does not affect remote storage of reports. You also cannot manage backup files after they are copied out.</p> <p>This option is useful if you want to store backups locally <i>and</i> SCP them to a remote location. It is also your only option for remote storage for 7000/8000 series local backups.</p> <p>Note If you configure SSHFS remote storage in the FMC system configuration, do <i>not</i> copy backup files to the same directory using Copy when complete.</p>
Local, on the FMC.	<p>If you do not configure remote storage by mounting a network volume, you can save backup files on the FMC:</p> <ul style="list-style-type: none"> • FMC backups are saved to <code>/var/sf/backup</code>. • Device backups are saved to <code>/var/sf/remote-backup</code> on the FMC if you enable the Retrieve to Management Center option when you perform the backup. <p>Note that you cannot save 7000/8000 series local backups to the FMC.</p>

Location	Details
Local, on the device internal flash memory.	Device backup files are saved to <code>/var/sf/backup</code> on the device if you: <ul style="list-style-type: none"><li data-bbox="751 331 1463 363">• Do not configure remote storage by mounting a network volume.<li data-bbox="751 384 1295 415">• Do not enable Retrieve to Management Center.

CHAPTER 8

Configuration Import and Export

The following topics explain how to use the Import/Export feature:

- [About Configuration Import/Export, on page 169](#)
- [Requirements and Prerequisites for Configuration Import/Export, on page 171](#)
- [Exporting Configurations, on page 171](#)
- [Importing Configurations, on page 172](#)

About Configuration Import/Export

You can use the Import/Export feature to copy configurations between appliances. Import/Export is not a backup tool, but can simplify the process of adding new appliances to your deployment.

You can export a single configuration, or you can export a set of configurations (of the same type or of different types) with a single action. When you later import the package onto another appliance, you can choose which configurations in the package to import.

An exported package contains revision information for that configuration, which determines whether you can import that configuration onto another appliance. When the appliances are compatible but the package includes a duplicate configuration, the system offers resolution options.

Note The importing and exporting appliances must be running the same version of the Firepower System. For access control and its subpolicies (including intrusion policies), the intrusion rule update version must also match. If the versions do not match, the import fails. You cannot use the Import/Export feature to update intrusion rules. Instead, download and apply the latest rule update version.

Configurations that Support Import/Export

Import/Export is supported for the following configurations:

- Access control policies and the policies they invoke: network analysis, intrusion, SSL, file
- Intrusion policies, independently of access control
- Platform settings
- Health policies

- Alert responses
- Application detectors (both user-defined and those provided by Cisco Professional Services)
- Dashboards
- Custom tables
- Custom workflows
- Saved searches
- Custom user roles
- Report templates
- Third-party product and vulnerability mappings

Special Considerations for Configuration Import/Export

When you export a configuration, the system also exports other required configurations. For example, exporting an access control policy also exports any subpolicies it invokes, objects and object groups it uses, ancestor policies (in a multidomain deployment), and so on. As another example, if you export a platform settings policy with external authentication enabled, the authentication object is exported as well. There are some exceptions, however:

- System-provided databases and feeds—The system does not export URL filtering category and reputation data, Cisco Intelligence Feed data, or the geolocation database (GeoDB). Make sure all the appliances in your deployment obtain up-to-date information from Cisco.
- Global Security Intelligence lists—The system exports Global Security Intelligence Block and Do Not Block lists associated with exported configurations. (In a multidomain deployment, this occurs regardless of your current domain. The system does **not** export descendant domain lists.) The import process converts these lists to user-created lists, then uses those new lists in the imported configurations. This ensures that imported lists do not conflict with existing Global Block and Do Not Block lists. To use Global lists on the importing Firepower Management Center in your imported configurations, add them manually.
- Intrusion policy shared layers—The export process breaks intrusion policy shared layers. The previously shared layer is included in the package, and imported intrusion policies do not contain shared layers.
- Intrusion policy default variable set—The export package includes a default variable set with custom variables and system-provided variables with user-defined values. The import process updates the default variable set on the importing Firepower Management Center with the imported values. However, the import process does **not** delete custom variables not present in the export package. The import process also does not revert user-defined values on the importing Firepower Management Center, for values not set in the export package. Therefore, an imported intrusion policy may behave differently than expected if the importing Firepower Management Center has differently configured default variables.
- Custom user objects—If you have created custom user groups or objects in your Firepower Management Center and if such a custom user object is a part of any rule in your access control policy, note that the export file (.sfo) does not carry the user object information and therefore while importing such a policy, any reference to such custom user objects will be removed and will not be imported to the destination Firepower Management Center. To avoid detection issues due to the missing user group, add the customized user objects manually to the new Firepower Management Center and re-configure the access control policy after import.

When you import objects and object groups:

- The import process imports objects and groups as new. You cannot replace existing objects and groups.
- If the names of imported objects match existing objects on the importing Firepower Management Center, the system appends autogenerated numbers to the imported object and group names to make them unique.
- You must map any security zones used in the imported configurations to matching-type zones managed by the importing Firepower Management Center.
- If you export a configuration that uses PKI objects containing private keys, the system decrypts the private keys before export. On import, the system encrypts the keys with a randomly generated key.

Requirements and Prerequisites for Configuration Import/Export

Exporting Configurations

Depending on the number of configurations being exported and the number of objects those configurations reference, the export process may take several minutes.

Tip Many list pages in the Firepower System include an **YouTube EDU** () next to list items. Where this icon is present, you can use it as a quick alternative to the export procedure that follows.

Before you begin

- Confirm that the importing and exporting appliances are running the same version of the Firepower System. For access control and its subpolicies (including intrusion policies), the intrusion rule update version must also match.

Procedure

- Step 1** Choose **System > Tools > Import/Export**.
- Step 2** Click **Collapse** () and **Expand** () to collapse and expand the list of available configurations.

- Step 3** Check the configurations you want to export and click **Export**.
- Step 4** Follow your web browser's prompts to save the exported package to your computer.
-

Importing Configurations

Depending on the number of configurations being imported and the number of objects those configurations reference, the import process may take several minutes.

Before you begin

- Confirm that the importing and exporting appliances are running the same version of the Firepower System. For access control and its subpolicies (including intrusion policies), the intrusion rule update version must also match.
- Create security zones on an importing Firepower Management Center whose types match the zone types in an access control policy to be imported. For information, see [Security Zones, on page 359](#).

Procedure

- Step 1** On the importing appliance, choose **System > Tools > Import/Export**.
- Step 2** Click **Upload Package**.
- Step 3** Enter the path to the exported package or browse to its location, then click **Upload**.
- Step 4** If there are no version mismatches or other issues, choose the configurations you want to import, then click **Import**.
If you do not need to perform any conflict resolution or security zone mapping, the import completes and a success message appears. Skip the rest of this procedure.
- Step 5** If prompted, on the Access Control Import Resolution page, map security zones used in the imported configurations to zones with matching interface types managed by the importing Firepower Management Center.
- Step 6** Click **Import**.
- Step 7** If prompted, on the Import Resolution page, expand each configuration and choose the appropriate option as described in [Import Conflict Resolution, on page 173](#).
- Step 8** Click **Import**.
- Step 9** Update all feeds.
For example, go to **Objects > Object Management > Security Intelligence** and click the **Update Feed** button on the URL, Network, and DNS Lists and Feeds pages.
Imported policies do not include feed contents.
- Step 10** Wait for all feed updates to complete before deploying the policies to devices.
-

Import Conflict Resolution

When you attempt to import a configuration, the system determines whether a configuration of the same name and type already exists on the appliance. In a multidomain deployment, the system also determines whether a configuration is a duplicate of a configuration defined in the current domain or any of its ancestor or descendant domains. (You cannot view configurations in descendant domains, but if a configuration with a duplicate name exists in a descendant domain, the system notifies you of the conflict.) When an import includes a duplicate configuration, the system offers resolution options suitable to your deployment from among the following:

- **Keep existing**

The system does not import that configuration.

- **Replace existing**

The system overwrites the current configuration with the configuration selected for import.

- **Keep newest**

The system imports the selected configuration only if its timestamp is more recent than the timestamp on the current configuration on the appliance.

- **Import as new**

The system imports the selected duplicate configuration, appending a system-generated number to the name to make it unique. (You can change this name before completing the import process.) The original configuration on the appliance remains unchanged.

The resolution options the system offers depends on whether your deployment uses domains, and whether the imported configuration is a duplicate of a configuration defined in the current domain, or a configuration defined in an ancestor or descendant of the current domain. The following table lists when the system does or does not present a resolution option.

Resolution Option	Firepower Management Center		Managed Device
	Duplicate in current domain	Duplicate in ancestor or descendant domain	
Keep existing	Yes	Yes	Yes
Replace existing	Yes	No	Yes
Keep newest	Yes	No	Yes
Import as new	Yes	Yes	Yes

When you import an access control policy with a file policy that uses clean or custom detection file lists and a file list presents a duplicate name conflict, the system offers conflict resolution options as described in the table above, but the action the system performs on the policies and file lists varies as described in the table below:

Resolution Option	System Action	
	Access control policy and its associated file policy are imported as new and the file lists are merged	Existing access control policy and its associated file policy and file lists remain unchanged
Keep existing	No	Yes
Replace existing	Yes	No
Import as new	Yes	No
Keep newest and access control policy being imported is the newest	Yes	No
Keep newest and existing access control policy is the newest	No	Yes

If you modify an imported configuration on an appliance, and later re-import that configuration to the same appliance, you must choose which version of the configuration to keep.

CHAPTER 9

Task Scheduling

The following topics explain how to schedule tasks:

- [About Task Scheduling, on page 175](#)
- [Requirements and Prerequisites for Task Scheduling, on page 175](#)
- [Configuring a Recurring Task, on page 176](#)
- [Scheduled Task Review, on page 190](#)

About Task Scheduling

You can schedule many different types of administrative tasks to run at designated times, either once or on a recurring basis.

Tasks configured using this feature are scheduled in UTC, which means when they occur locally depends on the date and your specific location. Also, because tasks are scheduled in UTC, they do not adjust for Daylight Saving Time, summer time, or any such seasonal adjustments that you may observe in your location. If you are affected, scheduled tasks occur one hour "later" in the summer than in the winter, according to local time.

Important We *strongly* recommend you review scheduled tasks to be sure they occur when you intend.

Note Some tasks (such as those involving automated software updates or that require pushing updates to managed devices) may place a significant load on networks with low bandwidths. You should schedule tasks like these to run during periods of low network use.

Requirements and Prerequisites for Task Scheduling

Model Support

Any.

Supported Domains

User Roles

- Admin
- Maintenance User

Configuring a Recurring Task

You set the frequency for a recurring task using the same process for all types of tasks.

Note that the time displayed on most pages on the web interface is the local time, which is determined by using the time zone you specify in your local configuration. Further, the Firepower Management Center automatically adjusts its local time display for daylight saving time (DST), where appropriate. However, recurring tasks that span the transition dates from DST to standard time and back do not adjust for the transition. That is, if you create a task scheduled for 2:00 AM during standard time, it will run at 3:00 AM during DST. Similarly, if you create a task scheduled for 2:00 AM during DST, it will run at 1:00 AM during standard time.

Procedure

- Step 1** Select **System > Tools > Scheduling**.
- Step 2** Click **Add Task**.
- Step 3** From the **Job Type** drop-down list, select the type of task that you want to schedule.
- Step 4** Click **Recurring** next to the **Schedule task to run** option.
- Step 5** In the **Start On** field, specify the date when you want to start your recurring task.
- Step 6** In the **Repeat Every** field, specify how often you want the task to recur.
- You can either type a number or click **Up** (▲) and **Down** (▼) to specify the interval. For example, type 2 and click **Days** to run the task every two days.
- Step 7** In the **Run At** field, specify the time when you want to start your recurring task.
- Step 8** For a task to be run on a weekly or monthly basis, select the days when you want to run the task in the **Repeat On** field.
- Step 9** Select the remaining options for the type of task you are creating:
- Backup - Schedule backup jobs as described in [Schedule FMC Backups, on page 177](#).
 - Download CRL - Schedule certificate revocation list downloads as described in [Configuring Certificate Revocation List Downloads, on page 178](#).
 - Deploy Policies - Schedule policy deployment as described in [Automating Policy Deployment, on page 179](#).
 - Nmap Scan - Schedule Nmap scans as described in [Scheduling an Nmap Scan, on page 180](#).
 - Report - Schedule report generation as described in [Automating Report Generation, on page 181](#)

- Firepower Recommended Rules - Schedule automatic update of Firepower recommended rules as described in [Automating Firepower Recommendations, on page 183](#)
- Download Latest Update - Schedule software or VDB update downloads as described in [Automating Software Downloads, on page 185](#) or [Automating VDB Update Downloads, on page 188](#).
- Install Latest Update - Schedule installation of software or VDB updates on a Firepower Management Center or managed device as described in [Automating Software Installs, on page 186](#) or [Automating VDB Update Installs, on page 188](#)
- Push Latest Update - Schedule push of software updates to managed devices as described in [Automating Software Pushes, on page 186](#).
- Update URL Filtering Database - Scheduling automatic update of URL filtering data as described in [Automating URL Filtering Updates Using a Scheduled Task, on page 189](#)

Step 10 Click **Save**

Scheduled Backups

You can use the scheduler on a Firepower Management Center or a 7000/8000 series device to automate its own backups. For more information on backups, see [Backup and Restore, on page 151](#).

You cannot schedule device backups from the FMC.

Schedule FMC Backups

You can use the scheduler on the Firepower Management Center to automate its own backups. You cannot schedule a device backup from the FMC.

Before you begin

Create a backup profile that specifies your backup preferences: [Create a Backup Profile, on page 161](#).

You must be in the global domain to perform this task.

Procedure

- Step 1** Choose **System > Tools > Scheduling**.
- Step 2** From the **Job Type** list, select **Backup**.
- Step 3** Specify whether you want to back up **Once** or **Recurring**.
- For one-time tasks, use the drop-down lists to specify the start date and time.
 - For recurring tasks, see [Configuring a Recurring Task, on page 176](#).
- Step 4** Enter a **Job Name**.
- Step 5** Choose a **Backup Profile**.
- Step 6** (Optional) Enter a **Comment**.
- Keep comments brief. They will appear in the Task Details section of the schedule calendar page.

Step 7 (Optional) Enter an email address, or a comma-separated list of email addresses, in the **Email Status To:** field.

For information on setting up an email relay server to send task status messages, see [Configuring a Mail Relay Host and Notification Address, on page 724](#).

Step 8 Click **Save**.

Schedule Local 7000 & 8000 Series Device Backups

You can use the scheduler on a 7000 or 8000 Series device to automate its own backups. You *cannot* schedule any kind of device backup from the FMC.

Before you begin

Create a backup profile that specifies your backup preferences: [Create a Backup Profile, on page 161](#).

Procedure

Step 1 On the device's web interface, choose **System > Tools > Scheduling**.

Step 2 From the **Job Type** list, select **Backup**.

Step 3 Specify whether you want to back up **Once** or **Recurring**.

- For one-time tasks, use the drop-down lists to specify the start date and time.
- For recurring tasks, see [Configuring a Recurring Task, on page 176](#).

Step 4 Enter a **Job Name**.

Step 5 Choose a **Backup Profile**.

Step 6 (Optional) Enter a **Comment**.

Keep comments brief. They will appear in the Task Details section of the schedule calendar page.

Step 7 (Optional) Enter an email address, or a comma-separated list of email addresses, in the **Email Status To:** field.

For information on setting up an email relay server to send task status messages, see [Configuring a Mail Relay Host and Notification Address, on page 724](#).

Step 8 Click **Save**.

Configuring Certificate Revocation List Downloads

You must perform this procedure using the local web interface for the Firepower Management Center or the 7000 or 8000 Series device. In a multidomain deployment, this task is only supported in the Global domain for the Firepower Management Center.

The system automatically creates the Download CRL task when you enable downloading a certificate revocation list (CRL) in the local configuration on an appliance where you enable user certificates or audit log certificates for the appliance. You can use the scheduler to edit the task to set the frequency of the update.

Before you begin

- Enable and configure user certificates and set a CRL download URL. See [Requiring Valid User Certificates, on page 700](#) for more information.

Procedure

- Step 1** Select **System > Tools > Scheduling**.
- Step 2** Click **Add Task**.
- Step 3** From **Job Type**, select **Download CRL**.
- Step 4** Specify how you want to schedule the CRL download, **Once** or **Recurring**:
- For one-time tasks, use the drop-down lists to specify the start date and time.
 - For recurring tasks, see [Configuring a Recurring Task, on page 176](#) for details.
- Step 5** Type a name in the **Job Name** field.
- Step 6** If you want to comment on the task, type a comment in the **Comment** field.
- The comment field appears in the Task Details section of the schedule calendar page; keep comments brief.
- Step 7** If you want to email task status messages, type an email address (or multiple email addresses separated by commas) in the **Email Status To:** field. You must have a valid email relay server configured on the Firepower Management Center to send status messages.
- Step 8** Click **Save**.

Related Topics

[Configuring a Mail Relay Host and Notification Address, on page 724](#)

Automating Policy Deployment

After modifying configuration settings in the FMC, you must deploy those changes to the affected devices.

In a multidomain deployment, you can schedule policy deployments only for your current domain.

Caution

When you deploy, resource demands may result in a small number of packets dropping without inspection. Additionally, deploying some configurations restarts the Snort process, which interrupts traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See [Snort® Restart Traffic Behavior, on page 310](#) and [Configurations that Restart the Snort Process When Deployed or Activated, on page 311](#).

Procedure

- Step 1** Select **System > Tools > Scheduling**.
- Step 2** Click **Add Task**.
- Step 3** From **Job Type**, select **Deploy Policies**.
- Step 4** Specify how you want to schedule the task, **Once** or **Recurring**:
- For one-time tasks, use the drop-down lists to specify the start date and time.
 - For recurring tasks, see [Configuring a Recurring Task](#), on page 176 for details.
- Step 5** Type a name in the **Job Name** field.
- Step 6** In the **Device** field, select a device where you want to deploy policies.
- Step 7** If you want to comment on the task, type a comment in the **Comment** field.
The comment field displays in the Tasks Details section of the schedule calendar page; keep comments brief.
- Step 8** If you want to email task status messages, type an email address (or multiple email addresses separated by commas) in the **Email Status To:** field. You must have a valid email relay server configured to send status messages.
- Step 9** Click **Save**.

Related Topics

- [Configuring a Mail Relay Host and Notification Address](#), on page 724
- [Out-of-Date Policies](#), on page 316

Nmap Scan Automation

You can schedule regular Nmap scans of targets on your network. Automated scans allow you to refresh information previously supplied by an Nmap scan. Because the Firepower System cannot update Nmap-supplied data, you need to rescan periodically to keep that data up to date. You can also schedule scans to automatically test for unidentified applications or servers on hosts in your network.

Note that a Discovery Administrator can also use an Nmap scan as a remediation. For example, when an operating system conflict occurs on a host, that conflict may trigger an Nmap scan. Running the scan obtains updated operating system information for the host, which resolves the conflict.

If you have not used the Nmap scanning capability before, you configure Nmap scanning before defining a scheduled scan.

Related Topics

- [Nmap Scanning](#), on page 1599

Scheduling an Nmap Scan

After Nmap replaces a host's operating system, applications, or servers detected by the system with the results from an Nmap scan, the system no longer updates the information replaced by Nmap for the host. Nmap-supplied service and operating system data remains static until you run another Nmap scan. If you plan to scan a host using Nmap, you may want to set up regularly scheduled scans to keep Nmap-supplied operating systems, applications, or servers up to date. If the host is deleted from the network map and re-added, any

Nmap scan results are discarded and the system resumes monitoring of all operating system and service data for the host.

In a multidomain deployment:

- You can schedule scans only for your current domain
- The remediation and Nmap targets you select must exist at your current domain or an ancestor domain.
- Choosing to perform an Nmap scan on a non-leaf domain scans the same targets in each descendant of that domain.

Procedure

- Step 1** Select **System > Tools > Scheduling**.
- Step 2** Click **Add Task**.
- Step 3** From **Job Type**, select **Nmap Scan**.
- Step 4** Specify how you want to schedule the task, **Once** or **Recurring**:
- For one-time tasks, use the drop-down lists to specify the start date and time.
 - For recurring tasks, see [Configuring a Recurring Task, on page 176](#) for details.
- Step 5** Type a name in the **Job Name** field.
- Step 6** In the **Nmap Remediation** field, select an Nmap remediation.
- Step 7** In the **Nmap Target** field, select the scan target.
- Step 8** In the **Domain** field, select the domain whose network map you want to augment.
- Step 9** If you want to comment on the task, type a comment in the **Comment** field.
- Tip** The comment field appears in the Task Details section of the calendar schedule page; keep comments brief.
- Step 10** If you want to email task status messages, type an email address (or multiple email addresses separated by commas) in the **Email Status To:** field. You must have a valid email relay server configured to send status messages.
- Step 11** Click **Save**.

Related Topics

[Configuring a Mail Relay Host and Notification Address](#), on page 724

Automating Report Generation

You can automate reports so that they run at regular intervals.

In a multidomain deployment, you can schedule reports only for your current domain.

Before you begin

- Create a report template. See [Report Templates, on page 1790](#) for more information.

- If you want to distribute email reports using the scheduler, configure a mail relay host and specify report recipients and message information. See [Configuring a Mail Relay Host and Notification Address, on page 724](#) and [Distributing Reports by Email at Generation Time, on page 1810](#).
- (Optional) Set or change the file name, output format, time window, or email distribution settings of the scheduled report. See [Specify Report Generation Settings for a Scheduled Report, on page 182](#).

Procedure

- Step 1** Select **System > Tools > Scheduling**.
- Step 2** Click **Add Task**.
- Step 3** From the **Job Type** list, select **Report**.
- Step 4** Specify how you want to schedule the task, **Once** or **Recurring**:
- For one-time tasks, use the drop-down lists to specify the start date and time.
 - For recurring tasks, see [Configuring a Recurring Task, on page 176](#) for details.
- Step 5** Type a name in the **Job Name** field.
- Step 6** In the **Report Template** field, select a report template.
- Step 7** If you want to comment on the task, type a comment in the **Comment** field.
- The comment field appears in the Tasks Details section of the schedule calendar page; keep comments brief.
- Step 8** If you want to email task status messages, type an email address (or multiple email addresses separated by commas) in the **Email Status To:** field. You must have a valid email relay server configured to send status messages.
- Note** Configuring this option does **not** distribute the reports.
- Step 9** If you do not want to receive report email attachments when reports have no data (for example, when no events of a certain type occurred during the report period), select the **If report is empty, still attach to email** check box.
- Step 10** Click **Save**.
-

Specify Report Generation Settings for a Scheduled Report

You must have Admin or Security Analyst privileges to perform this task.

To specify or change the file name, output format, time window, or email distribution settings of a scheduled report:

Procedure

- Step 1** Select **Overview > Reporting > Report Templates**.
- Step 2** Click **Edit** for the report template to change.
- Step 3** Click **Generate**.

Note If you want to change report generation settings without generating the report now, you must click **Generate** from the template configuration page. Changes will not be saved if you click **Generate** from the template list view unless you generate the report.

Step 4 Modify settings.

Step 5 To save the new settings without generating the report, click **Cancel**.

To save the new settings and generate the report, click **Generate** and skip the rest of the steps in this procedure.

Step 6 Click **Save**.

Step 7 If you see a prompt to save even though you haven't made changes, click **OK**.

Automating Firepower Recommendations

You can automatically generate rule state recommendations based on network discovery data for your network using the most recently saved configuration settings in a custom intrusion policy.

Note If the system automatically generates scheduled recommendations for an intrusion policy with unsaved changes, you must discard your changes in that policy and commit the policy if you want the policy to reflect the automatically generated recommendations.

When the task runs, the system automatically generates recommended rule states, and modifies the states of intrusion rules based on the configuration of your policy. Modified rule states take effect the next time you deploy your intrusion policy.

In a multidomain deployment, you can automate recommendations for intrusion policies at the current domain level. The system builds a separate network map for each leaf domain. In a multidomain deployment, if you enable this feature in an intrusion policy in an ancestor domain, the system generates recommendations using data from all descendant leaf domains. This can enable intrusion rules tailored to assets that may not exist in all leaf domains, which can affect performance.

Before you begin

- Configure Firepower recommended rules in an intrusion policy as described in [Generating and Applying Firepower Recommendations, on page 1270](#)
- If you want to email task status messages, configure a valid email relay server.
- You must have the Threat Smart License or Protection Classic License to generate recommendations.

Procedure

Step 1 Choose **System > Tools > Scheduling**.

Step 2 Click **Add Task**.

Step 3 From **Job Type**, choose **Firepower Recommended Rules**.

Step 4 Specify how you want to schedule the task, **Once** or **Recurring**:

- For one-time tasks, use the drop-down lists to specify the start date and time.
- For recurring tasks, see [Configuring a Recurring Task, on page 176](#) for details.

- Step 5** Enter a name in the **Job Name** field.
- Step 6** Next to **Policies**, choose one or more intrusion policies where you want to generate recommendations. Check **All Policies** check box to choose all intrusion policies.
- Step 7** (Optional) Enter a comment in the **Comment** field.
Keep comments brief. Comments appear in the Task Details section of the schedule calendar page.
- Step 8** (Optional) To email task status messages, type an email address (or multiple email addresses separated by commas) in the **Email Status To:** field.
- Step 9** Click **Save**.

Related Topics

- [Conflicts and Changes: Network Analysis and Intrusion Policies, on page 1211](#)
- [About Firepower Recommended Rules, on page 1267](#)

Software Update Automation

You can automatically download and apply most patches and feature releases to the Firepower System.

The tasks you must schedule to install software updates vary depending on whether you are updating the FMC or are using a FMC to update managed devices.

Note Cisco **strongly** recommends that you use your FMCs to update the devices they manage.

- To update the FMC, schedule the software installation using the Install Latest Update task.
- To use a FMC to automate software updates for its managed devices, you must schedule two tasks:
 - Push (copy) the update to managed devices using the Push Latest Update task.
 - Install the update on managed devices using the Install Latest Update task.

When scheduling updates to managed devices, schedule the push and install tasks to happen in succession; you must first push the update to the device before you can install it. Allow enough time between tasks for the process to complete; schedule tasks at least 30 minutes apart. If you schedule a task to install an update and the update has not finished copying from the FMC to the device, the installation task will not succeed. However, if the scheduled installation task repeats daily, it will install the pushed update when it runs the next day.

Note You must manually upload and install updates in two situations. First, you cannot schedule major updates to the Firepower System. Second, you cannot schedule updates for or pushes from FMC that cannot access the Support Site. If your FMC is not directly connected to the Internet, you should use management interfaces configuration to set up a proxy to allow it to download updates from the Support Site.

Note that a task scheduled to install an update on a device group will install the pushed update to each device within the device group simultaneously. Allow enough time for the scheduled task to complete for each device within the device group.

If you want to have more control over this process, you can use the **Once** option to download and install updates during off-peak hours after you learn that an update has been released.

[Management Interfaces](#), on page 705

[System Updates](#), on page 133

Automating Software Downloads

You can create a scheduled task that automatically downloads the latest software updates from Cisco. You can use this task to schedule download of updates you plan to install manually.

You must be in the global domain to perform this task.

Procedure

- Step 1** Select **System > Tools > Scheduling**.
- Step 2** Click **Add Task**.
- Step 3** From the **Job Type** list, select **Download Latest Update**.
- Step 4** Specify how you want to schedule the task, **Once** or **Recurring**:
- For one-time tasks, use the drop-down lists to specify the start date and time.
 - For recurring tasks, see [Configuring a Recurring Task, on page 176](#) for details.
- Step 5** Type a name in the **Job Name** field.
- Step 6** Next to **Update Items**, check **Software** check box.
- Step 7** If you want to comment on the task, type a comment in the **Comment** field.
- The comment field appears in the Task Details section of the schedule calendar page; keep comments brief.
- Step 8** If you want to email task status messages, type an email address (or multiple email addresses separated by commas) in the **Email Status To:** field. You must have a valid email relay server configured to send status messages.
- Step 9** Click **Save**.

Related Topics

[Configuring a Mail Relay Host and Notification Address](#), on page 724

Automating Software Pushes

If you want to automate the installation of software updates on managed devices, you must push the updates to the devices before installing.

When you create the task to push software updates to managed devices, make sure you allow enough time between the push task and a scheduled install task for the updates to be copied to the device.

You must be in the global domain to perform this task.

Procedure

- Step 1** Select **System > Tools > Scheduling**.
- Step 2** Click **Add Task**.
- Step 3** From the **Job Type** list, select **Push Latest Update**.
- Step 4** Specify how you want to schedule the task, **Once** or **Recurring**:
- For one-time tasks, use the drop-down lists to specify the start date and time.
 - For recurring tasks, see [Configuring a Recurring Task, on page 176](#) for details.
- Step 5** Type a name in the **Job Name** field.
- Step 6** From the **Device** drop-down list, select the device that you want to update.
- Step 7** If you want to comment on the task, type a comment in the **Comment** field.
- The comment field appears in the Task Details section of the schedule calendar page; keep comments brief.
- Step 8** If you want to email task status messages, type an email address (or multiple email addresses separated by commas) in the **Email Status To:** field. You must have a valid email relay server configured to send status messages.
- Step 9** Click **Save**.

Related Topics

[Configuring a Mail Relay Host and Notification Address, on page 724](#)

Automating Software Installs

Make sure you allow enough time between the task that pushes the update to a managed device and the task that installs the update.

You must be in the global domain to perform this task.

Caution Depending on the update being installed, the appliance may reboot after the software is installed.

Procedure

- Step 1** Select **System > Tools > Scheduling**.

- Step 2** Click **Add Task**.
- Step 3** From the **Job Type** list, select **Install Latest Update**.
- Step 4** Specify how you want to schedule the task, **Once** or **Recurring**:
- For one-time tasks, use the drop-down lists to specify the start date and time.
 - For recurring tasks, see [Configuring a Recurring Task, on page 176](#) for details.
- Step 5** Type a name in the **Job Name** field.
- Step 6** From the **Device** drop-down list, select the appliance (including the Firepower Management Center) where you want to install the update.
- Step 7** Next to **Update Items**, check the **Software** check box.
- Step 8** If you want to comment on the task, type a comment in the **Comment** field.
- The comment field appears in the Task Details section of the schedule calendar page; keep comments brief.
- Step 9** If you want to email task status messages, type an email address (or multiple email addresses separated by commas) in the **Email Status To:** field. You must have a valid email relay server configured to send status messages.
- Step 10** Click **Save**.

Vulnerability Database Update Automation

Cisco uses vulnerability database (VDB) updates to expand the list of network assets, traffic, and vulnerabilities that the Firepower System recognizes. You can use the scheduling feature to update the VDB, thereby ensuring that you are using the most up-to-date information to evaluate the hosts on your network.

When automating VDB updates, you must automate two separate steps:

- Downloading the VDB update.
- Installing the VDB update.

Caution Installing a vulnerability database (VDB) update *immediately* restarts the Snort process on all managed devices. Additionally, the first deploy after installing the VDB *might* cause a Snort restart depending on the VDB content. In either scenario, the restart interrupts traffic inspection. Whether traffic drops during the interruption or passes without further inspection depends on how the target device handles traffic. See [Snort® Restart Traffic Behavior, on page 310](#) for more information.

Allow enough time between tasks for the process to complete. For example, if you schedule a task to install an update and the update has not fully downloaded, the installation task will not succeed. However, if the scheduled installation task repeats daily, it will install the downloaded VDB update when the task runs the next day.

Note:

- You cannot schedule updates for appliances that cannot access the Support Site. If your FMC is not directly connected to the Internet, you should use management interfaces configuration to set up a proxy to allow it to download updates from the Support Site.
- If you want to have more control over this process, you can use the **Once** option to download and install VDB updates during off-peak hours after you learn that an update has been released.
- In multidomain deployments, you can only schedule VDB updates for the Global domain. The changes take effect when you redeploy policies.

Related Topics

[Management Interfaces](#), on page 705

Automating VDB Update Downloads

You must be in the global domain to perform this task.

Procedure

- Step 1** Select **System > Tools > Scheduling**.
- Step 2** Click **Add Task**.
- Step 3** From the **Job Type** list, select **Download Latest Update**.
- Step 4** Specify how you want to schedule the task, **Once** or **Recurring**:
 - For one-time tasks, use the drop-down lists to specify the start date and time.
 - For recurring tasks, see [Configuring a Recurring Task](#), on page 176 for details.
- Step 5** Type a name in the **Job Name** field.
- Step 6** Next to **Update Items**, check the **Vulnerability Database** check box.
- Step 7** If you want to comment on the task, type a comment in the **Comment** field.

The comment field appears in the Task Details section of the calendar schedule page; keep comments brief.
- Step 8** If you want to email task status messages, type an email address (or multiple email addresses separated by commas) in the **Email Status To:** field. You must have a valid email relay server configured to send status messages.
- Step 9** Click **Save**.

[Configuring a Mail Relay Host and Notification Address](#), on page 724

Automating VDB Update Installs

Allow enough time between the task that downloads the VDB update and the task that installs the update.

You must be in the global domain to perform this task.

Caution Installing a vulnerability database (VDB) update *immediately* restarts the Snort process on all managed devices. Additionally, the first deploy after installing the VDB *might* cause a Snort restart depending on the VDB content. In either scenario, the restart interrupts traffic inspection. Whether traffic drops during the interruption or passes without further inspection depends on how the target device handles traffic. See [Snort® Restart Traffic Behavior, on page 310](#) for more information.

Procedure

- Step 1** Select **System > Tools > Scheduling**.
- Step 2** Click **Add Task**.
- Step 3** From the **Job Type** list, select **Install Latest Update**.
- Step 4** Specify how you want to schedule the task, **Once** or **Recurring**:
 - For one-time tasks, use the drop-down lists to specify the start date and time.
 - For recurring tasks, see [Configuring a Recurring Task, on page 176](#) for details.
- Step 5** Type a name in the **Job Name** field.
- Step 6** From the **Device** drop-down list, select the FMC.
- Step 7** Next to **Update Items**, check the **Vulnerability Database** check box.
- Step 8** If you want to comment on the task, type a comment in the **Comment** field.

Tip The comment field appears in the View Tasks section of the page, so you should try to keep it relatively short.
- Step 9** If you want to email task status messages, type an email address (or multiple email addresses separated by commas) in the **Email Status To:** field. You must have a valid email relay server configured to send status messages.
- Step 10** Click **Save**.

[Configuring a Mail Relay Host and Notification Address, on page 724](#)

Automating URL Filtering Updates Using a Scheduled Task

In order to ensure that threat data for URL filtering is current, the system must obtain data updates from the Cisco Collective Security Intelligence (CSI) cloud.

By default, when you enable URL filtering, automatic updates are enabled. However, if you need to control when these updates occur, use the procedure described in this topic instead of the default update mechanism.

Although daily updates tend to be small, if it has been more than five days since your last update, new URL filtering data may take up to 20 minutes to download, depending on your bandwidth. Then, it may take up to 30 minutes to perform the update itself.

Before you begin

- Ensure the Firepower Management Center has internet access; see [Security, Internet Access, and Communication Ports, on page 2153](#).
- Ensure that URL filtering is enabled. See [Enable URL Filtering Using Category and Reputation, on page 1013](#) for more information.
- Verify that **Enable Automatic Updates** is not selected on the **Cisco CSI** under the **System > Integration** menu.
- You must be in the global domain to perform this task. You must also have the URL Filtering license.

Procedure

- Step 1** Select **System > Tools > Scheduling**.
- Step 2** Click **Add Task**.
- Step 3** From the **Job Type** list, select **Update URL Filtering Database**.
- Step 4** Specify how you want to schedule the update, **Once** or **Recurring**:
- For one-time tasks, use the drop-down lists to specify the start date and time.
 - For recurring tasks, see [Configuring a Recurring Task, on page 176](#) for details.
- Step 5** Type a name in the **Job Name** field.
- Step 6** If you want to comment on the task, type a comment in the **Comment** field.
- The comment field appears in the Task Details section of the schedule calendar page; keep comments brief.
- Step 7** If you want to email task status messages, type an email address (or multiple email addresses separated by commas) in the **Email Status To:** field. You must have a valid email relay server configured to send status messages.
- Step 8** Click **Save**.

Scheduled Task Review

After adding scheduled tasks, you can view them and evaluate their status. The View Options section of the page allows you to view scheduled tasks using a calendar and a list of scheduled tasks.

The Calendar view option allows you to view which scheduled tasks occur on which day.

The Task List shows a list of tasks along with their status. The task list appears below the calendar when you open the calendar. In addition, you can view it by selecting a date or task from the calendar.

You can edit a scheduled task that you previously created. This feature is especially useful if you want to test a scheduled task once to make sure that the parameters are correct. Later, after the task completes successfully, you can change it to a recurring task.

There are two types of deletions you can perform from the Schedule View page. You can delete a specific one-time task that has not yet run or you can delete every instance of a recurring task. If you delete an instance of a recurring task, all instances of the task are deleted. If you delete a task that is scheduled to run once, only that task is deleted.

Task List Details

Table 21: Task List Columns

Column	Description
Name	Displays the name of the scheduled task and the comment associated with it.
Type	Displays the type of scheduled task.
Start Time	Displays the scheduled start date and time.
Frequency	Displays how often the task is run.
Last Run Time	Displays the actual start date and time. For a recurring task, this applies to the most recent execution.
Last Run Status	Describes the current status for a scheduled task: <ul style="list-style-type: none"> • A Check Mark () indicates that the task ran successfully. • A question mark icon (Question Mark ()) indicates that the task is in an unknown state. • An exclamation mark icon () indicates that the task failed. For a recurring task, this applies to the most recent execution.
Next Run Time	Displays the next execution time for a recurring task. Displays N/A for a one-time task.
Creator	Displays the name of the user that created the scheduled task.
Edit	Edits the scheduled task.
Delete	Deletes the scheduled task.

Viewing Scheduled Tasks on the Calendar

In a multidomain deployment, you can view scheduled tasks only for your current domain.

Procedure

Step 1 Select **System > Tools > Scheduling**.

- Step 2** You can perform the following tasks using the calendar view:
- Click **Double Left Arrow** (⏪) to move back one year.
 - Click **Single Left Arrow** (⏩) to move back one month.
 - Click **Single Right Arrow** (⏪) to move forward one month.
 - Click **Double Right Arrow** (⏩) to move forward one year.
 - Click **Today** to return to the current month and year.
 - Click **Add Task** to schedule a new task.
 - Click a date to view all scheduled tasks for the specific date in a task list table below the calendar.
 - Click a specific task on a date to view the task in a task list table below the calendar.
-

Editing Scheduled Tasks

In a multidomain deployment, you can edit scheduled tasks only for your current domain.

Procedure

- Step 1** Select **System > Tools > Scheduling**.
- Step 2** On the calendar, click either the task that you want to edit or the day on which the task appears.
- Step 3** In the **Task Details** table, click **Edit** () next to the task you want to edit.
- Step 4** Edit the task.
- Step 5** Click **Save**.
-

Deleting Scheduled Tasks

In a multidomain deployment, you can delete scheduled tasks only for your current domain.

Procedure

- Step 1** Select **System > Tools > Scheduling**.
- Step 2** In the calendar, click the task you want to delete. For a recurring task, click an instance of the task.
- Step 3** In the **Task Details** table, click **Delete** () , then confirm your choice.
-

CHAPTER 10

Data Storage

- [Data Stored on the FMC, on page 193](#)
- [External Data Storage, on page 195](#)

Data Stored on the FMC

For	See
General information about data storage on the FMC	The Disk Usage Widget, on page 242
Purging old data	Purging Data from the FMC Database, on page 194
Allowing external access to the data on the FMC (this is an advanced feature)	External Database Access Settings, on page 701
Backups	Manage Backups and Remote Storage, on page 164 and subtopics
Reports	Configuring Local Storage, on page 714
Events	Connection Logging, on page 1943 Database Event Limits, on page 702 and subtopics
Network discovery data	Network Discovery Data Storage Settings, on page 1678 and subsequent topics
Files	Information about storing files in File Policies and Malware Protection, on page 1153 , including best practices. File and Malware Inspection Performance and Storage Tuning, on page 1191
Packet data	Edit General Settings, on page 217
Users and user activity	The Users Database, on page 1574 The User Activity Database, on page 1574

Purging Data from the FMC Database

You can use the database purge page to purge discovery, identity, connection, and Security Intelligence data files from the FMC databases. Note that when you purge a database, the appropriate process is restarted.

Caution Purging a database removes the data you specify from the Firepower Management Center. After the data is deleted, it *cannot* be recovered.

Before you begin

You must have Admin or Security Analyst privileges to purge data. You can be in the global domain only.

Procedure

Step 1 Choose **System > Tools > Data Purge**.

Step 2 Under **Discovery and Identity**, perform any or all of the following:

- Check the **Network Discovery Events** check box to remove all network discovery events from the database.
- Check the **Hosts** check box to remove all hosts and Indications of Compromise flags from the database.
- Check the **User Activity** check box to remove all user activity events from the database.
- Check the **User Identities** check box to remove all user login and user history data from the database.

Step 3 Under **Connections**, perform any or all of the following:

- Check the **Connection Events** check box to remove all connection data from the database.
- Check the **Connection Summary Events** check box to remove all connection summary data from the database.
- Check the **Security Intelligence Events** check box to remove all Security Intelligence data from the database.

Note Checking the **Connection Events** check box does not remove Security Intelligence events. Connections with Security Intelligence data will still appear in the Security Intelligence event page (available under the Analysis > Connections menu). Correspondingly, checking the **Security Intelligence Events** check box does not remove connection events with associated Security Intelligence data.

Step 4 Click **Purge Selected Events**.

The items are purged and the appropriate processes are restarted.

External Data Storage

You can optionally use remote data storage for store certain types of data.

For	See
Backups	Manage Backups and Remote Storage, on page 164 and subtopics Remote Storage Management, on page 714 and subtopics
Reports	Remote Storage Management, on page 714 and subtopics Moving Reports to Remote Storage, on page 1812

Important If you will use syslog or store events externally, avoid special characters in object names such as policy and rule names. Object names should not contain special characters, such as commas, that the receiving application may use as separators.

CHAPTER 11

Device Management Basics

The following topics describe how to manage devices in the Firepower System:

- [About Device Management, on page 197](#)
- [Requirements and Prerequisites for Device Management, on page 204](#)
- [Complete the FTD Initial Configuration Using the CLI, on page 204](#)
- [Add a Device to the FMC, on page 207](#)
- [Delete a Device from the FMC, on page 209](#)
- [Add a Device Group, on page 210](#)
- [Configure Device Settings, on page 211](#)
- [Change the Manager for the Device, on page 221](#)
- [Viewing Device Information, on page 226](#)

About Device Management

Use the Firepower Management Center to manage your devices.

About the Firepower Management Center and Device Management

When the Firepower Management Center manages a device, it sets up a two-way, SSL-encrypted communication channel between itself and the device. The Firepower Management Center uses this channel to send information to the device about how you want to analyze and manage your network traffic to the device. As the device evaluates the traffic, it generates events and sends them to the Firepower Management Center using the same channel.

By using the Firepower Management Center to manage devices, you can:

- configure policies for all your devices from a single location, making it easier to change configurations
- install various types of software updates on devices
- push health policies to your managed devices and monitor their health status from the Firepower Management Center

The Firepower Management Center aggregates and correlates intrusion events, network discovery information, and device performance data, allowing you to monitor the information that your devices are reporting in relation to one another, and to assess the overall activity occurring on your network.

You can use a Firepower Management Center to manage nearly every aspect of a device's behavior.

Note Although a Firepower Management Center can manage devices running certain previous releases as specified in the compatibility matrix available at <http://www.cisco.com/c/en/us/support/security/defense-center/products-device-support-tables-list.html>, new features are not available to these previous-release devices.

What Can Be Managed by a Firepower Management Center?

You can use the Firepower Management Center as a central management point in a Firepower System deployment to manage the following devices:

- 7000 and 8000 Series devices
- ASA FirePOWER modules
- NGIPSv devices
- Firepower Threat Defense (physical hardware and virtual)

When you manage a device, information is transmitted between the Firepower Management Center and the device over a secure, SSL-encrypted TCP tunnel.

The following illustration lists what is transmitted between a Firepower Management Center and its managed devices. Note that the types of events and policies that are sent between the appliances are based on the device type.

Beyond Policies and Events

In addition to deploying policies to devices and receiving events from them, you can also perform other device-related tasks on the Firepower Management Center.

Backing Up a Device

You **cannot** create or restore backup files for NGIPSv devices or ASA FirePOWER modules.

When you perform a backup of a physical managed device from the device itself, you back up the device configuration **only**. To back up configuration data and, optionally, unified files, perform a backup of the device using the managing Firepower Management Center.

To back up event data, perform a backup of the managing Firepower Management Center.

Updating Devices

From time to time, Cisco releases updates to the Firepower System, including:

- intrusion rule updates, which may contain new and updated intrusion rules
- vulnerability database (VDB) updates
- geolocation updates
- software patches and updates

You can use the Firepower Management Center to install an update on the devices it manages.

About Device Management Interfaces

Each device includes a single dedicated Management interface for communicating with the FMC.

You can perform initial setup on the management interface, or on the console port.

Management interfaces are also used to communicate with the Smart Licensing server, to download updates, and to perform other management functions.

Management Interfaces on

When you set up your device, you specify the FMC IP address that you want to connect to. Both management and event traffic go to this address at initial registration. Note: In some situations, the FMC might establish the *initial* connection on a different management interface; subsequent connections should use the management interface with the specified IP address.

If the FMC has a separate event-only interface, the managed device sends subsequent event traffic is sent to the FMC event-only interface if the network allows. In addition, some managed-device models include an additional management interface that you can configure for event-only traffic. If the event network goes down, then event traffic reverts to the regular management interfaces on the FMC and/or on the managed device.

Management Interface Support Per Device Model

See the hardware installation guide for your model for the management interface locations.

Note For the Firepower 4100/9300 chassis, the MGMT interface is for *chassis* management, not for Firepower Threat Defense logical device management. You must configure a separate NIC interface to be of type mgmt (and/or firepower-eventing), and then assign it to the Firepower Threat Defense logical device.

Note For Firepower Threat Defense on any chassis, the physical management interface is shared between the Diagnostic logical interface, which is useful for SNMP or syslog, and is configured along with data interfaces in the FMC, and the Management logical interface for FMC communication.

See the following table for supported management interfaces on each managed device model.

Table 22: Management Interface Support on Managed Devices

Model	Management Interface	Optional Event Interface
7000 series	eth0	No support
8000 series	eth0	eth1
ASA FirePOWER services module on the ASA 5585-X	eth0 Note eth0 is the internal name of the Management 1/0 interface.	eth1 Note eth1 is the internal name of the Management 1/1 interface.
Firepower Threat Defense on the Firepower 4100 and 9300	management0 Note management0 is the internal name of this interface, regardless of the physical interface ID.	management1 Note management1 is the internal name of this interface, regardless of the physical interface ID.
Firepower Threat Defense on the ASA 5506-X, 5508-X, or 5516-X	br1 Note br1 is the internal name of the Management 1/1 interface.	No support
Firepower Threat Defense on the 5512-X through 5555-X	br1 Note br1 is the internal name of the Management 0/0 interface.	No support
Firepower Threat Defense Virtual	br1	No support

Network Routes on Device Management Interfaces

Management interfaces (including event-only interfaces) support only static routes to reach remote networks. When you set up your managed device, the setup process creates a default route to the gateway IP address that you specify. You cannot delete this route; you can only modify the gateway address.

Note The routing for management interfaces is completely separate from routing that you configure for data interfaces.

The default route always uses the lowest-numbered management interface (e.g. management0).

At least one static route is recommended per management interface to access remote networks. We recommend placing each interface on a separate network to avoid potential routing problems, including routing problems from other devices to the FTD. If you do not experience problems with interfaces on the same network, then be sure to configure static routes correctly. For example, both management0 and management1 are on the same network, but the FMC management and event interfaces are on different networks. The gateway is 192.168.45.1. If you want management1 to connect to the FMC's event-only interface at 10.6.6.1/24, you can create a static route for 10.6.6.0/24 through management1 with the same gateway of 192.168.45.1. Traffic to 10.6.6.0/24 will hit this route before it hits the default route, so management1 will be used as expected.

Another example includes separate management and event-only interfaces on both the FMC and the managed device. The event-only interfaces are on a separate network from the management interfaces. In this case, add a static route through the event-only interface for traffic destined for the remote event-only network, and vice versa.

NAT Environments

Network address translation (NAT) is a method of transmitting and receiving network traffic through a router that involves reassigning the source or destination IP address. The most common use for NAT is to allow private networks to communicate with the internet. Static NAT performs a 1:1 translation, which does not pose a problem for FMC communication with devices, but port address translation (PAT) is more common. PAT lets you use a single public IP address and unique ports to access the public network; these ports are dynamically assigned as needed, so you cannot initiate a connection to a device behind a PAT router.

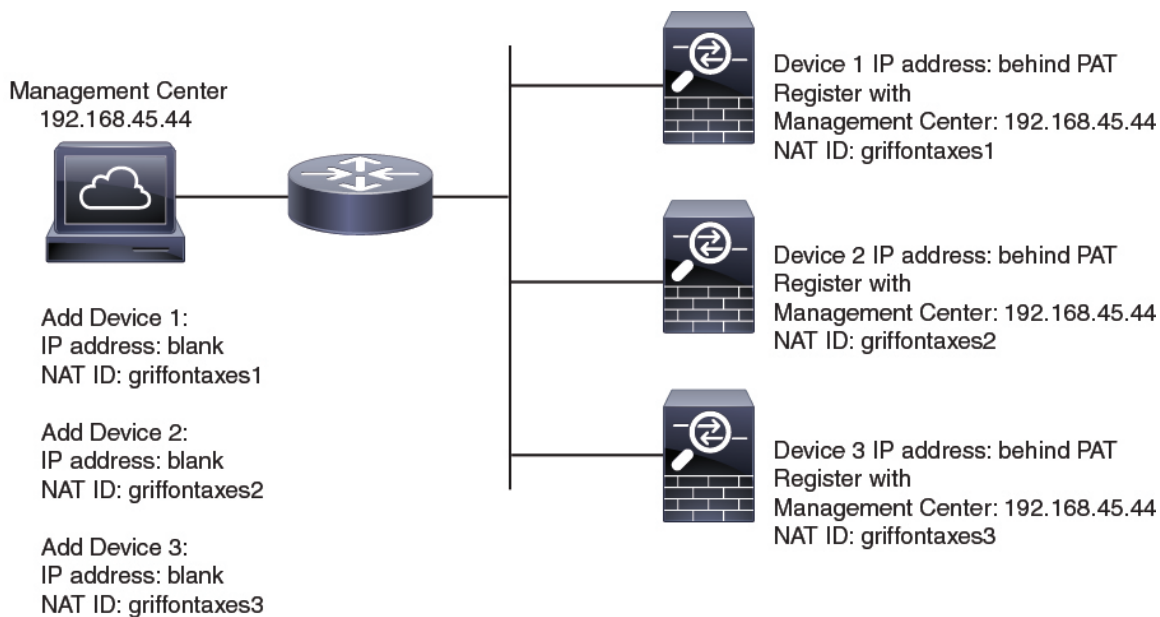

Normally, you need both IP addresses (along with a registration key) for both routing purposes and for authentication: the FMC specifies the device IP address when you add a device, and the device specifies the FMC IP address. However, if you only know one of the IP addresses, which is the minimum requirement for routing purposes, then you must also specify a unique NAT ID on both sides of the connection to establish trust for the initial communication and to look up the correct registration key. The FMC and device use the registration key and NAT ID (instead of IP addresses) to authenticate and authorize for initial registration.

For example, you add a device to the FMC, and you do not know the device IP address (for example, the device is behind a PAT router), so you specify only the NAT ID and the registration key on the FMC; leave the IP address blank. On the device, you specify the FMC IP address, the same NAT ID, and the same registration key. The device registers to the FMC's IP address. At this point, the FMC uses the NAT ID instead of IP address to authenticate the device.

Although the use of a NAT ID is most common for NAT environments, you might choose to use the NAT ID to simplify adding many devices to the FMC. On the FMC, specify a unique NAT ID for each device you want to add while leaving the IP address blank, and then on each device, specify both the FMC IP address and the NAT ID. Note: The NAT ID must be unique per device.

The following example shows three devices behind a PAT IP address. In this case, specify a unique NAT ID per device on both the FMC and the devices, and specify the FMC IP address on the devices.

Figure 1: NAT ID for Managed Devices Behind PAT

The following example shows the FMC behind a PAT IP address. In this case, specify a unique NAT ID per device on both the FMC and the devices, and specify the device IP addresses on the FMC.

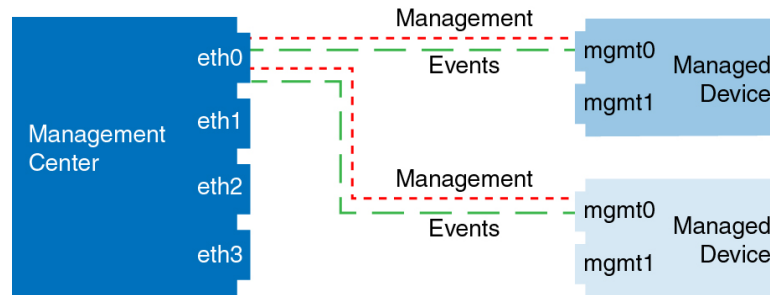

Figure 2: NAT ID for FMC Behind PAT

Management and Event Traffic Channel Examples

The following example shows the Firepower Management Center and managed devices using only the default management interfaces.

Figure 3: Single Management Interface on the Firepower Management Center

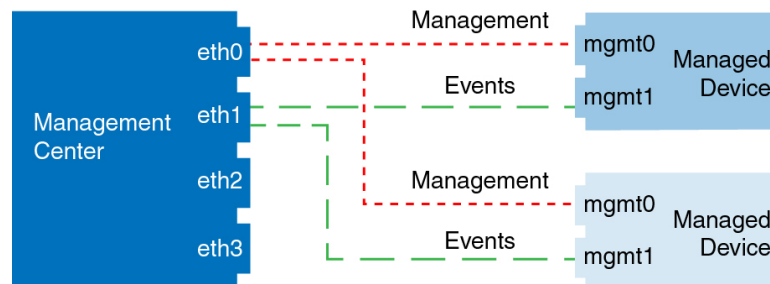

The following example shows the Firepower Management Center using separate management interfaces for devices; and each managed device using 1 management interface.

Figure 4: Multiple Management Interfaces on the Firepower Management Center

The following example shows the Firepower Management Center and managed devices using a separate event interface.

Figure 5: Separate Event Interface on the Firepower Management Center and Managed Devices

The following example shows a mix of multiple management interfaces and a separate event interface on the Firepower Management Center and a mix of managed devices using a separate event interface, or using a single management interface.

Figure 6: Mixed Management and Event Interface Usage

Requirements and Prerequisites for Device Management

Model Support

Any managed device; unless noted in the procedure.

Supported Domains

The domain in which the device resides.

User Roles

- Admin
- Network Admin

Complete the FTD Initial Configuration Using the CLI

Connect to the FTD CLI to perform initial setup, including setting the Management IP address, gateway, and other basic networking settings using the setup wizard. The dedicated Management interface is a special interface with its own network settings. You will also configure FMC communication settings. You can only configure the Management interface settings; you must configure data interface settings in FMC.

Before you begin

This procedure applies to all FTD devices except for the Firepower 4100/9300.

Procedure

-
- Step 1** Connect to the FTD CLI, either from the console port or using SSH to the Management interface, which obtains an IP address from a DHCP server by default. If you intend to change the network settings, we recommend using the console port so you do not get disconnected.
- Step 2** Log in with the username **admin** and the password **Admin123**.

Note If the password was already changed, and you do not know it, you must reimage the device to reset the password to the default.

Step 3 The first time you log in to FTD, you are prompted to accept the End User License Agreement (EULA) and to change the admin password. You are then presented with the CLI setup script.

Note You cannot repeat the CLI setup wizard unless you clear the configuration; for example, by reimaging. However, all of these settings can be changed later at the CLI using **configure network** commands. See the [FTD command reference](#).

Defaults or previously entered values appear in brackets. To accept previously entered values, press **Enter**.

See the following guidelines:

- **Enter the IPv4 default gateway for the management interface**—The **data-interfaces** setting applies only to Firepower Device Manager management; you should set a gateway IP address for Management 1/1 when using FMC. In the edge deployment example shown in the network deployment section, the inside interface acts as the management gateway. In this case, you should set the gateway IP address to be the *intended* inside interface IP address; you must later use FMC to set the inside IP address.
- **If your networking information has changed, you will need to reconnect**—If you are connected with SSH but you change the IP address at initial setup, you will be disconnected. Reconnect with the new IP address and password. Console connections are not affected. Note also that the DHCP server on Management will be disabled if you change the IP address.
- **Manage the device locally?**—Enter **no** to use FMC. A **yes** answer means you will use Firepower Device Manager instead. Note also that the DHCP server on Management 1/1 will be disabled if it wasn't already.
- **Configure firewall mode?**—We recommend that you set the firewall mode at initial configuration. Changing the firewall mode after initial setup erases your running configuration.

Example:

```
You must accept the EULA to continue.
Press <ENTER> to display the EULA:
End User License Agreement
[...]

Please enter 'YES' or press <ENTER> to AGREE to the EULA:

System initialization in progress. Please stand by.
You must change the password for 'admin' to continue.
Enter new password: *****
Confirm new password: *****
You must configure the network to continue.
You must configure at least one of IPv4 or IPv6.
Do you want to configure IPv4? (y/n) [y]:
Do you want to configure IPv6? (y/n) [n]:
Configure IPv4 via DHCP or manually? (dhcp/manual) [manual]:
Enter an IPv4 address for the management interface [192.168.45.45]: 10.10.10.15
Enter an IPv4 netmask for the management interface [255.255.255.0]: 255.255.255.192
Enter the IPv4 default gateway for the management interface [data-interfaces]: 10.10.10.1
Enter a fully qualified hostname for this system [firepower]: ftd-1.cisco.com
Enter a comma-separated list of DNS servers or 'none' [208.67.222.222,208.67.220.220]:
Enter a comma-separated list of search domains or 'none' []:
If your networking information has changed, you will need to reconnect.
DHCP Server Disabled
The DHCP server has been disabled. You may re-enable with configure network ipv4
dhcp-server-enable
For HTTP Proxy configuration, run 'configure network http-proxy'

Manage the device locally? (yes/no) [yes]: no
DHCP Server Disabled
```

```
Configure firewall mode? (routed/transparent) [routed]:
Configuring firewall mode ...
```

```
Update policy deployment information
- add device configuration
- add network discovery
- add system policy
```

You can register the sensor to a Firepower Management Center and use the Firepower Management Center to manage it. Note that registering the sensor to a Firepower Management Center disables on-sensor Firepower Services management capabilities.

When registering the sensor to a Firepower Management Center, a unique alphanumeric registration key is always required. In most cases, to register a sensor to a Firepower Management Center, you must provide the hostname or the IP address along with the registration key.

```
'configure manager add [hostname | ip address ] [registration key ]'
```

However, if the sensor and the Firepower Management Center are separated by a NAT device, you must enter a unique NAT ID, along with the unique registration key.

```
'configure manager add DONTRESOLVE [registration key ] [ NAT ID ]'
```

Later, using the web interface on the Firepower Management Center, you must use the same registration key and, if necessary, the same NAT ID when you add this sensor to the Firepower Management Center.

```
>
```

Step 4 Identify the FMC that will manage this FTD.

```
configure manager add {hostname | IPv4_address | IPv6_address | DONTRESOLVE} reg_key [nat_id]
```

- {hostname | IPv4_address | IPv6_address | **DONTRESOLVE**}—Specifies either the FQDN or IP address of the FMC. If the FMC is not directly addressable, use **DONTRESOLVE** and also specify the *nat_id*. At least one of the devices, either the FMC or the FTD, must have a reachable IP address to establish the two-way, SSL-encrypted communication channel between the two devices. If you specify **DONTRESOLVE** in this command, then the FTD must have a reachable IP address or hostname.
- *reg_key*—Specifies a one-time registration key of your choice that you will also specify on the FMC when you register the FTD. The registration key must not exceed 37 characters. Valid characters include alphanumerical characters (A–Z, a–z, 0–9) and the hyphen (-).
- *nat_id*—Specifies a unique, one-time string of your choice that you will also specify on the FMC when you register the FTD when one side does not specify a reachable IP address or hostname. It is required if you set the FMC to **DONTRESOLVE**. The NAT ID must not exceed 37 characters. Valid characters include alphanumerical characters (A–Z, a–z, 0–9) and the hyphen (-). This ID cannot be used for any other devices registering to the FMC.

Example:

```
> configure manager add MC.example.com 123456
Manager successfully configured.
```

If the FMC is behind a NAT device, enter a unique NAT ID along with the registration key, and specify **DONTRESOLVE** instead of the hostname, for example:

Example:

```
> configure manager add DONTRESOLVE regk3y78 natid90
Manager successfully configured.
```

If the FTD is behind a NAT device, enter a unique NAT ID along with the FMC IP address or hostname, for example:

Example:

```
> configure manager add 10.70.45.5 regk3y78 natid56
Manager successfully configured.
```

What to do next

Register your device to a FMC.

Add a Device to the FMC

Use this procedure to add a single device to the FMC. If you plan to link devices for redundancy or performance, you must still use this procedure, keeping in mind the following points:

- 8000 Series stacks—Use this procedure to add each device to the Firepower Management Center, then establish the stack; see [Establishing Device Stacks, on page 464](#).
- 7000 and 8000 Series high availability—Use this procedure to add each device to the Firepower Management Center, then establish high availability; see [Establishing Firepower 7000/8000 Series High Availability, on page 449](#). For high availability stacks, first stack the devices, then establish high availability between the stacks.
- Firepower Threat Defense high availability—Use this procedure to add each device to the Firepower Management Center, then establish high availability; see [Add a Firepower Threat Defense High Availability Pair, on page 580](#).
- Firepower Threat Defense clusters—Make sure cluster units are in a successfully formed cluster on FXOS, then use this procedure to add each unit to the Firepower Management Center as a separate managed device. Finally, cluster the units on the Firepower Management Center. For more information, see [FMC: Add a Cluster, on page 601](#).

Before you begin

- Set up the device to be managed by the FMC. See:
 - Firepower Threat Defense devices: [Complete the FTD Initial Configuration Using the CLI, on page 204](#)
 - 7000 and 8000 Series devices: [Configuring Remote Management on a Managed Device, on page 420](#)
 - Other device types: The getting started guide for your model

- If you are adding an FTD device, the FMC must be registered for Smart Licensing. A valid evaluation license is sufficient, but if it expires, you will not be able to add new devices until you successfully register.
- If you registered a FMC and a device using IPv4 and want to convert them to IPv6, you must delete and reregister the device.

Procedure

- Step 1** Choose **Devices > Device Management**.
- Step 2** From the **Add** drop-down menu, choose **Device**.
- Step 3** In the **Host** field, enter the IP address or the hostname of the device you want to add.
- The hostname of the device is the fully qualified domain name or the name that resolves through the local DNS to a valid IP address. Use a hostname rather than an IP address if your network uses DHCP to assign IP addresses.
- In a NAT environment, you may not need to specify the IP address or hostname of the device, if you already specified the IP address or hostname of the FMC when you configured the device to be managed by the FMC. For more information, see [NAT Environments, on page 201](#).
- Step 4** In the **Display Name** field, enter a name for the device as you want it to display in the FMC.
- Step 5** In the **Registration Key** field, enter the same registration key that you used when you configured the device to be managed by the FMC. The registration key is a one-time-use shared secret. The key can include alphanumeric characters and hyphens (-).
- Step 6** In a multidomain deployment, regardless of your current domain, assign the device to a leaf **Domain**.
- If your current domain is a leaf domain, the device is automatically added to the current domain. If your current domain is not a leaf domain, post-registration, you must switch to the leaf domain to configure the device.
- Step 7** (Optional) Add the device to a device **Group**.
- Step 8** Choose an initial **Access Control Policy** to deploy to the device upon registration, or create a new policy.
- If the device is incompatible with the policy you choose, deploying will fail. This incompatibility could occur for multiple reasons, including licensing mismatches, model restrictions, passive vs inline issues, and other misconfigurations. After you resolve the issue that caused the failure, manually deploy configurations to the device.
- Step 9** Choose licenses to apply to the device.
- If you registered the FMC to use Smart Licensing, then this dialog box only shows available Smart Licenses.

Smart Licensing

Assign the Smart Licenses you need for the features you want to deploy:

- **Malware** (if you intend to use AMP malware inspection)
- **Threat** (if you intend to use intrusion prevention)
- **URL** (if you intend to implement category-based URL filtering)

Classic Licensing

If you registered the FMC to use Smart Licensing, then this dialog box only shows available Smart Licenses. For classic licenses, go to the **Devices > Device Management > Device > License** area to assign licenses.

- Control, Malware, and URL Filtering licenses require a Protection license.
- VPN licenses require a 7000 or 8000 Series device.
- Control licenses are supported on NGIPSv and ASA FirePOWER devices, but *do not* allow you to configure 8000 Series fastpath rules, switching, routing, stacking, or device high availability.

- Step 10** If you used a NAT ID during device setup, expand in the **Advanced** section and enter the same NAT ID in the **Unique NAT ID** field. The NAT ID can include alphanumeric characters and hyphens (-).
- Step 11** Check the **Transfer Packets** check box to allow the device to transfer packets to the Firepower Management Center.

This option is enabled by default. When events like IPS or Snort are triggered with this option enabled, the device sends event metadata information and packet data to the FMC for inspection. If you disable it, only event information will be sent to the FMC but packet data is not sent.

- Step 12** Click **Register**.

It may take up to two minutes for the FMC to verify the device's heartbeat and establish communication. If the registration succeeds, the device is added to the list. If it fails, you will see an error message. If the device fails to register, check the following items:

- Ping—Access the device CLI, and ping the FMC IP address using the following command:

```
ping system ip_address
```

If the ping is not successful, check your network settings using the **show network** command. If you need to change the device IP address, use the **configure network {ipv4 | ipv6} manual** command.

- Registration key, NAT ID, and FMC IP address—Make sure you are using the same registration key, and if used, NAT ID, on both devices. You can set the registration key and NAT ID on the device using the **configure manager add** command.

For more troubleshooting information, see <https://cisco.com/go/fmc-reg-error>.

Delete a Device from the FMC

If you no longer want to manage a device, you can delete it from the FMC. Deleting a device:

- Severs all communication between the FMC and the device.
- Removes the device from the Device Management page.
- Returns the device to local time management if the device is configured using the platform settings policy to receive time from the FMC using NTP.

After deleting the device from the FMC:

- The FTD continues to process the traffic after you delete it from the FMC.
 - Policies, such as NAT and VPN, ACLs, and the interface configurations remain intact.

- Registering the FTD again to the same or a different FMC, the FTD configuration is removed from the FTD.
 - The ACLs that are selected during registration replace the earlier ACLs and the interface configuration remains intact.
- To manage the device later, re-add it to the FMC.

Note When a device is deleted and then re-added, the FMC web interface prompts you to re-apply your access control policies. However, there is no option to re-apply the NAT and VPN policies during registration. Any previously applied NAT or VPN configuration will be removed during registration and must be re-applied after registration is complete.

Procedure

-
- Step 1** Choose **Devices > Device Management**.
- Step 2** Next to the device you want to delete, click **Delete** () .
- Step 3** Confirm that you want to delete the device.
-

Add a Device Group

The Firepower Management Center allows you to group devices so you can easily deploy policies and install updates on multiple devices. You can expand and collapse the list of devices in the group.

In a multidomain deployment, you can create device groups within a leaf domain only. When you configure a Firepower Management Center for multitenancy, existing device groups are removed; you can re-add them at the leaf domain level.

If you add the primary device in a stack or a high-availability pair to a group, both devices are added to the group. If you unstack the devices or break the high-availability pair, both devices remain in that group.

Procedure

-
- Step 1** Choose **Devices > Device Management**.
- Step 2** From the **Add** drop-down menu, choose **Add Group**.
- To edit an existing group, click **Edit** () for the group you want to edit.
- Step 3** Enter a **Name**.
- Step 4** Under **Available Devices**, choose one or more devices to add to the device group. Use Ctrl or Shift while clicking to choose multiple devices.
- Step 5** Click **Add** to include the devices you chose in the device group.

- Step 6** Optionally, to remove a device from the device group, click **Delete** () next to the device you want to remove.
- Step 7** Click **OK** to add the device group.

Configure Device Settings

After you add a device, you can configure some settings on the device's **Device** page.

Managing System Shut Down

Smart License	Classic License	Supported Devices	Supported Domains	Access
Any	Any	Any except ASA FirePOWER	Leaf only	Admin/Network Admin

Note You cannot shut down or restart the ASA FirePOWER with the Firepower System user interface. See the ASA documentation for more information on how to shut down the respective devices.

Procedure

- Step 1** Choose **Devices > Device Management**.
- Step 2** Next to the device that you want to restart, click **Edit** () .
In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.
- Step 3** Click **Device**.
- Tip** For stacked devices, you shut down or restart an individual device on the Devices page of the appliance editor.
- Step 4** To shut down the device, click **Shut Down Device** () in the **System** section.
- Step 5** When prompted, confirm that you want to shut down the device.
- Step 6** To restart the device, click **Restart Device** () .
- Step 7** When prompted, confirm that you want to restart the device.

Edit Management Settings

You can edit management settings in the **Management** area.

Update the Hostname or IP Address in FMC

If you edit the hostname or IP address of a device after you added it to the FMC (using the device's CLI, for example), you need to use the procedure below to manually update the hostname or IP address on the managing FMC.

Procedure

Step 1 Choose **Devices > Device Management**.

Step 2 Next to the device where you want to modify management options, click **Edit** ().

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

Step 3 Click **Device**, and view the **Management** area.

Tip For stacked devices, you modify management options on an individual device on the **Device** page of the appliance editor.

Step 4 Disable management temporarily by clicking the slider so it is disabled (.

You are prompted to proceed with disabling management; click **Yes**.

Disabling management blocks the connection between the Firepower Management Center and the device, but does **not** delete the device from the Firepower Management Center.

Step 5 Edit the **Host** IP address or hostname by clicking **Edit** (.

Management

Host: 192.168.0.147

Status: 

Step 6 In the **Management** dialog box, modify the name or IP address in the **Host** field, and click **Save**.

Step 7 Reenable management by clicking the slider so it is enabled (.

Modify Management Interfaces at the CLI

Modify the management interface settings on the managed device using the CLI. Many of these settings are ones that you set when you performed the initial setup; this procedure lets you change those settings, and set additional settings such as enabling an event interface if your model supports it, or adding static routes.

For information about the CLI, see [Command Line Reference, on page 2159](#) in this guide.

Note When using SSH, be careful when making changes to the management interface; if you cannot re-connect because of a configuration error, you will need to access the device console port.

Note If you change the device management IP address, then see the following tasks for FMC connectivity depending on how you identified the FMC during initial device setup using the **configure manager add** command (see [Identify a New FMC, on page 222](#)):

- **IP address—No action.** If you identified the FMC using a reachable IP address, then the management connection will be reestablished automatically after several minutes. We recommend that you also change the device IP address shown in FMC to keep the information in sync; see [Update the Hostname or IP Address in FMC, on page 212](#). This action can help the connection reestablish faster. **Note:** If you specified an unreachable FMC IP address, then see the procedure for NAT ID below.
- **NAT ID only—Manually reestablish the connection.** If you identified the FMC using only the NAT ID, then the connection cannot be automatically reestablished. In this case, change the device management IP address in FMC according to [Update the Hostname or IP Address in FMC, on page 212](#).

Before you begin

- For Firepower Threat Defense devices, you can create user accounts that can log into the CLI using the **configure user add** command.
- For the 7000 & 8000 Series devices, you can create user accounts at the web interface as described in [Creating a User Account, on page 61](#).

Procedure

- Step 1** Connect to the device CLI, either from the console port or using SSH.
- Step 2** Log in with the Admin username and password.
- Step 3** Enable an event-only interface (for supported models; see [Management Interface Support Per Device Model, on page 199](#)).

```
configure network management-interface enable management_interface
```

```
configure network management-interface disable-management-channel management_interface
```

Example:

This example is for a Firepower 4100 or 9300 device; valid interface names differ by device type.

```
> configure network management-interface enable management1
Configuration updated successfully

> configure network management-interface disable-management-channel management1
Configuration updated successfully

>
```

The Firepower Management Center event-only interface cannot accept management channel traffic, so you should simply disable the management channel on the device event interface.

You can optionally disable events for the management interface using the **configure network management-interface disable-events-channel** command. In either case, the device will try to send events

on the event-only interface, and if that interface is down, it will send events on the management interface even if you disable the event channel.

You cannot disable both event and management channels on an interface.

Step 4

Configure the network settings of the management interface and/or event interface:

If you do not specify the *management_interface* argument, then you change the network settings for the default management interface. When configuring an event interface, be sure to specify the *management_interface* argument. The event interface can be on a separate network from the management interface, or on the same network. If you are connected to the interface you are configuring, you will be disconnected. You can re-connect to the new IP address.

a) Configure the IPv4 address:

- Manual configuration:

```
configure network ipv4 manual ip_address netmask gateway_ip [management_interface]
```

Note that the *gateway_ip* in this command is used to create the default route for the device. If you configure an event-only interface, then you must enter the *gateway_ip* as part of the command; however, this entry just configures the default route to the value you specify and does not create a separate static route for the eventing interface. If you are using an event-only interface on a different network from the management interface, we recommend that you set the *gateway_ip* for use with the management interface, and then create a static route separately for the event-only interface using the **configure network static-routes** command.

Example:

```
> configure network ipv4 manual 10.10.10.45 255.255.255.0 10.10.10.1 management1
Setting IPv4 network configuration.
Network settings changed.
```

```
>
```

- DHCP (supported on the default management interface only):

```
configure network ipv4 dhcp
```

b) Configure the IPv6 address:

- Stateless autoconfiguration:

```
configure network ipv6 router [management_interface]
```

Example:

```
> configure network ipv6 router management0
Setting IPv6 network configuration.
Network settings changed.
```

```
>
```

- Manual configuration:

```
configure network ipv6 manual ip6_address ip6_prefix_length [ip6_gateway_ip]
[management_interface]
```

Note that the *ipv6_gateway_ip* in this command is used to create the default route for the device. If you configure an event-only interface, then you must enter the *ipv6_gateway_ip* as part of the command; however, this entry just configures the default route to the value you specify and does not create a separate static route for the eventing interface. If you are using an event-only interface on a different network from the management interface, we recommend that you set the *ipv6_gateway_ip* for use with the management interface, and then create a static route separately for the event-only interface using the **configure network static-routes** command.

Example:

```
> configure network ipv6 manual 2001:0DB8:BA98::3210 64 management1
Setting IPv6 network configuration.
Network settings changed.

>
```

- DHCPv6 (supported on the default management interface only):

configure network ipv6 dhcp

Step 5 Add a static route for the event-only interface if the Firepower Management Center is on a remote network; otherwise, all traffic will match the default route through the management interface.

configure network static-routes {ipv4 | ipv6} add management_interface destination_ip netmask_or_prefix gateway_ip

For the *default* route, do not use this command; you can only change the default route gateway IP address when you use the **configure network ipv4** or **ipv6** commands (see step 4).

For information about routing, see [Network Routes on Device Management Interfaces, on page 200](#).

Example:

```
> configure network static-routes ipv4 add management1 192.168.6.0 255.255.255.0 10.10.10.1
Configuration updated successfully

> configure network static-routes ipv6 add management1 2001:0DB8:AA89::5110 64
2001:0DB8:BA98::3211
Configuration updated successfully

>
```

To display static routes, enter **show network-static-routes** (the default route is not shown):

```
> show network-static-routes
-----[ IPv4 Static Routes ]-----
Interface           : management1
Destination         : 192.168.6.0
Gateway             : 10.10.10.1
Netmask             : 255.255.255.0
[...]
```

Step 6 Set the hostname:

configure network hostname name

Example:

```
> configure network hostname farscapel.cisco.com
```

Syslog messages do not reflect a new hostname until after a reboot.

Step 7

Set the search domains:

```
configure network dns searchdomains domain_list
```

Example:

```
> configure network dns searchdomains example.com,cisco.com
```

Set the search domain(s) for the device, separated by commas. These domains are added to hostnames when you do not specify a fully-qualified domain name in a command, for example, **ping system**. The domains are used only on the management interface, or for commands that go through the management interface.

Step 8

Set up to 3 DNS servers, separated by commas:

```
configure network dns servers dns_ip_list
```

Example:

```
> configure network dns servers 10.10.6.5,10.20.89.2,10.80.54.3
```

Step 9

Set the remote management port for communication with the FMC:

```
configure network management-interface tcpport number
```

Example:

```
> configure network management-interface tcpport 8555
```

The FMC and managed devices communicate using a two-way, SSL-encrypted communication channel, which by default is on port 8305.

Note Cisco **strongly** recommends that you keep the default settings for the remote management port, but if the management port conflicts with other communications on your network, you can choose a different port. If you change the management port, you must change it for **all** devices in your deployment that need to communicate with each other.

Step 10

Configure an HTTP proxy. The device is configured to directly-connect to the internet on ports TCP/443 (HTTPS) and TCP/80 (HTTP). You can use a proxy server, to which you can authenticate via HTTP Digest. After issuing the command, you are prompted for the HTTP proxy address and port, whether proxy authentication is required, and if it is required, the proxy username, proxy password, and confirmation of the proxy password.

```
configure network http-proxy
```

Example:

```
> configure network http-proxy
Manual proxy configuration
Enter HTTP Proxy address: 10.100.10.10
Enter HTTP Proxy Port: 80
Use Proxy Authentication? (y/n) [n]: Y
```

Enter Proxy Username: **proxyuser**
Enter Proxy Password: **proxypassword**
Confirm Proxy Password: **proxypassword**

Step 11 If you change the device management IP address, then see the following tasks for FMC connectivity depending on how you identified the FMC during initial device setup using the **configure manager add** command (see [Identify a New FMC, on page 222](#)):

- **IP address—No action.** If you identified the FMC using a reachable IP address, then the management connection will be reestablished automatically after several minutes. We recommend that you also change the device IP address shown in FMC to keep the information in sync; see [Update the Hostname or IP Address in FMC, on page 212](#). This action can help the connection reestablish faster. **Note:** If you specified an unreachable FMC IP address, then you must manually reestablish the connection using [Update the Hostname or IP Address in FMC, on page 212](#).
- **NAT ID only—Manually reestablish the connection.** If you identified the FMC using only the NAT ID, then the connection cannot be automatically reestablished. In this case, change the device management IP address in FMC according to [Update the Hostname or IP Address in FMC, on page 212](#).

Edit General Settings

Procedure

Step 1 Choose **Devices > Device Management**.

Step 2 Next to the device you want to modify, click **Edit** () .

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

Step 3 Click **Device**.

Step 4 In the **General** section, click **Edit** () .

Step 5 Enter a **Name** for the managed device.

Tip For stacked devices, you edit the assigned device name for the stack on the Stack page of the appliance editor. You can edit the assigned device name for an individual device on the Devices page of the appliance editor.

Step 6 Change the **Transfer Packets** setting:

- Check the check box to allow packet data to be stored with events on the Firepower Management Center.
- Clear the check box to prevent the managed device from sending packet data with the events.

Step 7 Click **Force Deploy** to force deployment of current policies and device configuration to the device.

Step 8 Click **Deploy**.

What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

Edit License Settings

You can enable licenses on your device if you have available licenses on your Firepower Management Center.

Procedure

Step 1 Choose **Devices > Device Management**.

Step 2 Next to the device where you want to enable or disable licenses, click **Edit** .

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

Step 3 Click **Device**.

Tip For stacked devices, you enable or disable the licenses for the stack on the Stack page of the appliance editor.

Step 4 In the **License** section, click **Edit** .

Step 5 Check or clear the check box next to the license you want to enable or disable for the managed device.

Step 6 Click **Save**.

What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

Edit Advanced Settings

The following topics explain how to edit the advanced device settings.

Note For information about the Transfer Packets setting, see [Edit General Settings, on page 217](#).

Configure Automatic Application Bypass

Automatic Application Bypass (AAB) allows packets to bypass detection if Snort is down or if a packet takes too long to process. AAB causes Snort to restart within ten minutes of the failure, and generates troubleshooting data that can be analyzed to investigate the cause of the Snort failure.

Caution AAB activation partially restarts the Snort process, which temporarily interrupts the inspection of a few packets. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See [Snort® Restart Traffic Behavior, on page 310](#) for more information.

AAB limits the time allowed to process packets through an interface. You balance packet processing delays with your network's tolerance for packet latency.

The feature functions with any deployment; however, it is most valuable in inline deployments.

Typically, you use Rule Latency Thresholding in the intrusion policy to fast-path packets after the latency threshold value is exceeded. Rule Latency Thresholding does not shut down the engine or generate troubleshooting data.

If detection is bypassed, the device generates a health monitoring alert.

By default the AAB is disabled; to enable AAB follow the steps described.

Before you begin

Model Support—ASA FirePOWER, 7000 & 8000 Series, and NGIPSv

Procedure

- Step 1** Choose **Devices > Device Management**.
- Step 2** Next to the device where you want to edit advanced device settings, click **Edit** () .
In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.
- Step 3** Click **Device** (or **Stack** for stacked devices), then click **Edit** () in the **Advanced** section.
- Step 4** Check **Automatic Application Bypass**.
- Step 5** Enter a **Bypass Threshold** from 250 ms to 60,000 ms. The default setting is 3000 milliseconds (ms).
- Step 6** Click **Save**.
-

What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

Inspect Local Router Traffic

If locally-bound traffic matches a Monitor rule in a Layer 3 deployment, that traffic may bypass inspection. To ensure inspection of the traffic, enable Inspect Local Router Traffic.

Before you begin

Model Support—7000 & 8000 Series

Procedure

- Step 1** Choose **Devices > Device Management**.
- Step 2** Next to the device where you want to edit advanced device settings, click **Edit** (✎).
- In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.
- Step 3** Click **Device** (or **Stack** for stacked devices), then click **Edit** (✎) in the **Advanced Settings** section.
- Step 4** Check **Inspect Local Router Traffic** to inspect exception traffic when a 7000 or 8000 Series device is deployed as a router.
- Step 5** Click **Save**.
-

What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

Configure Fastpath Rules (8000 Series)

As a form of early traffic handling, 8000 Series fastpath rules can send traffic directly through an 8000 Series device without further inspection or logging. (In a passive deployment, 8000 Series fastpath rules simply stop analysis.) Each 8000 Series fastpath rule applies to a specific security zone or inline interface set. Because 8000 Series fastpath rules function at the hardware level, you can use only the following simple, outer-header criteria to fastpath traffic:

- Initiator and responder IP address or address block
- Protocol, and for TCP and UDP, initiator and responder port
- VLAN ID

By default, 8000 Series fastpath rules affect connections from specified initiators to specified responders. To fastpath all connections that meets the rule's criteria, regardless of which host is the initiator and which is the responder, you can make the rule bidirectional.

Note When you specify a port other than *Any* for TCP or UDP traffic, only the first fragment in matching fragmented traffic is fastpathed. All other fragments are forwarded for further inspection. This is because the 8000 Series only fastpaths fragmented traffic when the IP header in each fragment contains all the IP header information needed to match the fastpath rule, and subsequent fragments do not contain the field that identifies the port.

Before you begin

Model Support—8000 Series

Procedure

- Step 1** Choose **Devices > Device Management**.
- Step 2** Next to the 8000 Series device where you want to configure the rule, click **Edit** (✎).
In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.
- Step 3** Click **Device** (or **Stack** for stacked devices), then click **Edit** (✎) in the Advanced Settings section.
- Step 4** Click **New IPv4 Rule** or **New IPv6 Rule**.
- Step 5** From the **Domain** drop-down list, choose an inline set or passive security zone.
- Step 6** Configure the traffic you want to fastpath. Traffic must meet all the conditions to be fastpathed.
- Initiator and Responder (required): Enter IP addresses or address blocks for initiators and responders.
 - Protocol: Choose a protocol, or choose **All**.
 - Initiator Port and Responder Port: For TCP and UDP traffic, enter initiator and responder ports. Leave the fields blank or enter **Any** to match all TCP or UDP traffic. You can enter a comma-separated list of ports, but you cannot enter port ranges.
 - VLAN: Enter a VLAN ID. Leave the field blank or enter **Any** to match all traffic regardless of VLAN tag.
- Step 7** (Optional) Make the rule **Bidirectional**.
- Step 8** Click **Save**, then **Save** again.
-

What to do next

Deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

Change the Manager for the Device

You might need to change the manager on a device in the following circumstances:

- [Reestablish the Management Connection if You Change the FMC IP Address, on page 222](#)—If you change the FMC IP address or hostname, reestablishing the management connection depends on how you added the device to the FMC.
- [Identify a New FMC, on page 222](#)—After you delete the device from the old FMC, if present, you can configure the device for the new FMC, and then add it to the FMC.
- [Switch from Firepower Device Manager to FMC, on page 223](#)—You cannot use both FDM and FMC at the same time for the same device. If you change from FDM to FMC, the FTD configuration will be erased, and you will need to start over.
- [Switch from FMC to Firepower Device Manager, on page 224](#)—You cannot use both FDM and FMC at the same time for the same device. If you change from FMC to FDM, the FTD configuration will be erased, and you will need to start over.

Reestablish the Management Connection if You Change the FMC IP Address

When you change the FMC IP address, there is not a command on the device to change the FMC IP address to the new address. Reestablishing the management connection depends on how you added the device to the FMC.

Before you begin

Model Support—FTD

Procedure

Depending on how you added the device to the FMC, see the following tasks:

- **IP address—No action.** If you added the device to the FMC using a reachable device IP address, then the management connection will be reestablished automatically after several minutes even though the IP address identified on the FTD is the old IP address. **Note:** If you specified a device IP address that is unreachable, then you must contact Cisco TAC, who can advise you how to restore connectivity for your devices.
- **NAT ID only—Contact Cisco TAC.** If you added the device using only the NAT ID, then the connection cannot be reestablished. In this case, you must contact Cisco TAC, who can advise you how to restore connectivity for your devices.

Identify a New FMC

This procedure shows how to identify a new FMC for the managed device. You should perform these steps even if the new FMC uses the old FMC's IP address.

Procedure

Step 1 On the old FMC, if present, delete the managed device.

You cannot change the FMC IP address if you have an active connection with an FMC.

Step 2 Connect to the device CLI, for example using SSH.

Step 3 Configure the new FMC.

```
configure manager add {hostname | IPv4_address | IPv6_address | DONTRESOLVE } regkey [nat_id]
```

- {hostname | IPv4_address | IPv6_address}—Sets the FMC hostname, IPv4 address, or IPv6 address.
- **DONTRESOLVE**—If the FMC is not directly addressable, use **DONTRESOLVE** instead of a hostname or IP address. If you use **DONTRESOLVE**, then a *nat_id* is required. When you add this device to the FMC, make sure that you specify both the device IP address and the *nat_id*; one side of the connection needs to specify an IP address, and both sides need to specify the same, unique NAT ID.

- *regkey*—Make up a registration key to be shared between the FMC and the device during registration. You can choose any text string for this key between 1 and 37 characters; you will enter the same key on the FMC when you add the FTD.
- *nat_id*—Make up an alphanumeric string from 1 to 37 characters used only during the registration process between the FMC and the device when one side does not specify an IP address. This NAT ID is a one-time password used only during registration. Make sure the NAT ID is unique, and not used by any other devices awaiting registration. Specify the same NAT ID on the FMC when you add the FTD.

Example:

```
> configure manager add DONTRESOLVE abc123 efg456
Manager successfully configured.
Please make note of reg_key as this will be required while adding Device in FMC.
>
```

Step 4 Add the device to the FMC.

Switch from Firepower Device Manager to FMC

This procedure describes how to change your manager from Firepower Device Manager (FDM), a local device manager, to FMC. You can switch between FDM and FMC without reinstalling the software. You cannot use both FDM and FMC at the same time for the same device. If you change from FDM to FMC, the FTD configuration will be erased, and you will need to start over.

Caution Changing the manager resets the Firepower Threat Defense configuration to the factory default. However, the management bootstrap configuration is maintained.

Before you begin

Model Support—FTD

Procedure

- Step 1** In FDM, for High Availability, break the high availability configuration. Ideally, break HA from the active unit.
- Step 2** In FDM, unregister the device from the Smart Licensing server.
- Step 3** Connect to the device CLI, for example using SSH.
- Step 4** Remove the current management setting.

configure manager delete

Caution Deleting the local manager resets the Firepower Threat Defense configuration to the factory default. However, the management bootstrap configuration is maintained.

Example:

```
> configure manager delete
```

```
If you enabled any feature licenses, you must disable them in
Firepower Device Manager before deleting the local manager.
Otherwise, those licenses remain assigned to the device in
Cisco Smart Software Manager.
```

```
Do you want to continue[yes/no]:yes
```

```
DHCP Server Disabled
```

```
>
```

Step 5 Configure the new FMC.

```
configure manager add {hostname | IPv4_address | IPv6_address | DONTRESOLVE } regkey [nat_id]
```

- {hostname | IPv4_address | IPv6_address}—Sets the FMC hostname, IPv4 address, or IPv6 address.
- **DONTRESOLVE**—If the FMC is not directly addressable, use **DONTRESOLVE** instead of a hostname or IP address. If you use **DONTRESOLVE**, then a *nat_id* is required. When you add this device to the FMC, make sure that you specify both the device IP address and the *nat_id*; one side of the connection needs to specify an IP address, and both sides need to specify the same, unique NAT ID.
- *regkey*—Make up a registration key to be shared between the FMC and the device during registration. You can choose any text string for this key between 1 and 37 characters; you will enter the same key on the FMC when you add the FTD.
- *nat_id*—Make up an alphanumeric string from 1 to 37 characters used only during the registration process between the FMC and the device when one side does not specify an IP address. This NAT ID is a one-time password used only during registration. Make sure the NAT ID is unique, and not used by any other devices awaiting registration. Specify the same NAT ID on the FMC when you add the FTD.

Example:

```
> configure manager add DONTRESOLVE abc123 efg456
Manager successfully configured.
Please make note of reg_key as this will be required while adding Device in FMC.
```

```
>
```

Step 6 Add the device to the FMC.

Switch from FMC to Firepower Device Manager

This procedure describes how to change your manager from FMC to Firepower Device Manager (FDM), a local device manager. You can switch between FDM and FMC without reinstalling the software. You cannot use both FDM and FMC at the same time for the same device. If you change from FMC to FDM, the FTD configuration will be erased, and you will need to start over.

Caution Changing the manager resets the Firepower Threat Defense configuration to the factory default. However, the management bootstrap configuration is maintained.

Before you begin

Model Support—FTD

Procedure

-
- Step 1** In FMC, for High Availability, break the high availability configuration. Ideally, break HA from the active unit.
- Step 2** In FMC, delete the managed device.
You cannot change the manager if you have an active connection with an FMC.
- Step 3** Connect to the device CLI, for example using SSH.
- Step 4** Remove the current management setting.

configure manager delete

Caution Deleting the local manager resets the Firepower Threat Defense configuration to the factory default. However, the management bootstrap configuration is maintained.

Example:

```
> configure manager delete
```

```
If you enabled any feature licenses, you must disable them in
Firepower Device Manager before deleting the local manager.
Otherwise, those licenses remain assigned to the device in
Cisco Smart Software Manager.
Do you want to continue[yes/no]:yes
```

```
DHCP Server Disabled
>
```

- Step 5** Configure the new FMC.

configure manager add {*hostname* | *IPv4_address* | *IPv6_address* | **DONTRESOLVE** } *regkey* [*nat_id*]

- {*hostname* | *IPv4_address* | *IPv6_address*}—Sets the FMC hostname, IPv4 address, or IPv6 address.
- **DONTRESOLVE**—If the FMC is not directly addressable, use **DONTRESOLVE** instead of a hostname or IP address. If you use **DONTRESOLVE**, then a *nat_id* is required. When you add this device to the FMC, make sure that you specify both the device IP address and the *nat_id*; one side of the connection needs to specify an IP address, and both sides need to specify the same, unique NAT ID.
- *regkey*—Make up a registration key to be shared between the FMC and the device during registration. You can choose any text string for this key between 1 and 37 characters; you will enter the same key on the FMC when you add the FTD.
- *nat_id*—Make up an alphanumeric string from 1 to 37 characters used only during the registration process between the FMC and the device when one side does not specify an IP address. This NAT ID is a one-time password used only during registration. Make sure the NAT ID is unique, and not used by any other devices awaiting registration. Specify the same NAT ID on the FMC when you add the FTD.

Example:

```
> configure manager add DONTRESOLVE abc123 efg456
Manager successfully configured.
Please make note of reg_key as this will be required while adding Device in FMC.

>
```

Step 6 Add the device to the FMC.

Viewing Device Information

In a multidomain deployment, ancestor domains can view information about all devices in descendant domains. You must be in a leaf domain to edit a device.

Procedure

Step 1 Choose **Devices > Device Management**.

Step 2 Click **Edit** () next to the device you want to view.

In a multidomain deployment, if you are in an ancestor domain, you can click **View** () to view a device from a descendant domain in read-only mode.

Step 3 Click **Device**.

Step 4 You can view the following information:

- **General** — Displays general settings for the device; see [General Information, on page 227](#).
 - **License** — Displays license information for the device; see [License Information, on page 227](#).
 - **System** — Displays system information about the device; see [System Information, on page 227](#).
 - **Health** — Displays information about the current health status of the device; see [Health Information, on page 228](#).
 - **Management** — Displays information about the communication channel between the Firepower Management Center and the device; see [Management Information, on page 228](#).
 - **Advanced** — Displays information about advanced feature configuration; see [Advanced Settings, on page 228](#).
-

Device Management Page Information

The Device Management page provides you with range of information and options to manage Firepower devices:

- **View By**—Use this option to view the devices based on group, licenses, model, or access control policy.
- **Device State**—You can also view the devices based on its state. You can click on a state icon to view the devices belonging to it. The number of devices belonging to the states are provided within brackets.

- Search—You can search for a configured device by providing the device name, host name, or the IP address.
- Add options—You can use the add options to configure device, high availability, FTD cluster, stack, and group.
- Edit and other actions—Against each configured device, use the **Edit** (✎) icon to edit the device parameters and attributes.

When you click on the device, the device properties page appears with several tabs. You can use the tabs to view the device information, and configure routing, interfaces, inline sets, and DHCP.

General Information

The General section of the **Device** tab displays the settings described in the table below.

Table 23: General Section Table Fields

Field	Description
Name	The display name of the device on the Firepower Management Center.
Transfer Packets	This displays whether or not the managed device sends packet data with the events to the Firepower Management Center.
Mode	The displays the mode of the management interface for the device: routed or transparent . Note The Mode field is displayed only for Firepower Threat Defense devices.
Compliance Mode	This displays the security certifications compliance for a device. Valid values are CC, UCAPL and None.

License Information

The License section of the **Device** page displays the licenses enabled for the device.

System Information

The System section of the **Device** page displays a read-only table of system information, as described in the following table.

Table 24: System Section Table Fields

Field	Description
Model	The model name and number for the managed device.
Serial	The serial number of the chassis of the managed device.
Time	The current system time of the device. This is always in UTC.

Field	Description
Version	The version of the software currently installed on the managed device.
Policy	A link to the platform settings policy currently deployed to the managed device.

You can also shut down or restart the device.

Health Information

The Health section of the **Device** page displays the information described in the table below.

Table 25: Health Section Table Fields

Field	Description
Status	An icon that represents the current health status of the device. Clicking the icon displays the Health Monitor for the appliance.
Policy	A link to a read-only version of the health policy currently deployed at the device.
Blacklist	A link to the Health Blacklist page, where you can enable and disable health blacklist modules.

Management Information

The **Management** section of the **Device** page displays the fields described in the table below.

Table 26: Management Section Table Fields

Field	Description
Host	The IP address or hostname of the device. To change the hostname or IP Address of the device, see Edit Management Settings, on page 211 .
Status	An icon indicating the status of the communication channel between the Firepower Management Center and the managed device. You can hover over the status icon to view the last time the Firepower Management Center contacted the device.

Advanced Settings

The **Advanced** section of the **Device** page displays a table of advanced configuration settings, as described below. You can edit any of these settings.

Table 27: Advanced Section Table Fields

Field	Description	Supported Devices
Application Bypass	The state of Automatic Application Bypass on the device.	7000 & 8000 Series
Bypass Threshold	The Automatic Application Bypass threshold, in milliseconds.	NGIPSv ASA FirePOWER
Inspect Local Router Traffic	Whether the device inspects traffic received on routed interfaces that is destined for itself, such as ICMP, DHCP, and OSPF traffic.	7000 & 8000 Series
Fast-Path Rules	The number of 8000 Series fastpath rules that have been created on the device.	8000 Series

System Monitoring

- [Dashboards, on page 233](#)
- [Health Monitoring, on page 253](#)
- [Monitoring the System, on page 279](#)

CHAPTER 12

Dashboards

The following topics describe how to use dashboards in the Firepower System:

- [About Dashboards, on page 233](#)
- [Firepower System Dashboard Widgets, on page 234](#)
- [Managing Dashboards, on page 246](#)

About Dashboards

Firepower System dashboards provide you with at-a-glance views of current system status, including data about the events collected and generated by the system. You can also use dashboards to see information about the status and overall health of the appliances in your deployment. Keep in mind that the information the dashboard provides depends on how you license, configure, and deploy the system.

Tip The dashboard is a complex, highly customizable monitoring feature that provides exhaustive data. For a broad, brief, and colorful picture of your monitored network, use the Context Explorer.

Dashboards are available on the Firepower Management Center and 7000 & 8000 Series devices.

A dashboard uses tabs to display widgets: small, self-contained components that provide insight into different aspects of the system. For example, the predefined Appliance Information widget tells you the appliance name, model, and currently running version of the Firepower System software. The system constrains widgets by the dashboard time range, which you can change to reflect a period as short as the last hour or as long as the last year.

The system is delivered with several predefined dashboards, which you can use and modify. If your user role has access to dashboards (Administrator, Maintenance User, Security Analyst, Security Analyst [Read Only], and custom roles with the Dashboards permission), by default your home page is the predefined Summary Dashboard. However, you can configure a different default home page, including non-dashboards. You can also change the default dashboard. Note that if your user role cannot access dashboards, your default home page is relevant to the role; for example, a Discovery Admin sees the Network Discovery page.

You can also use predefined dashboards as the base for custom dashboards, which you can either share or restrict as private. Unless you have Administrator access, you cannot view or modify private dashboards created by other users.

Note Some drill-down pages and table views of events include a **Dashboard** toolbar link that you can click to view a relevant predefined dashboard. If you delete a predefined dashboard or tab, the associated toolbar links do not function.

In a multidomain deployment, you cannot view dashboards from ancestor domains; however, you can create new dashboards that are copies of the higher-level dashboards.

Firepower System Dashboard Widgets

A dashboard has one or more tabs, each of which can display one or more widgets in a three-column layout. The Firepower System is delivered with many predefined dashboard widgets, each of which provides insight into a different aspect of the Firepower System. Widgets are grouped into three categories:

- *Analysis & Reporting widgets* display data about the events collected and generated by the Firepower System.
- *Miscellaneous widgets* display neither event data nor operations data. Currently, the only widget in this category displays an RSS feed.
- *Operations widgets* display information about the status and overall health of the Firepower System.

The dashboard widgets that you can view depend on:

- the type of appliance you are using
- your user role
- your current domain (in a multidomain deployment)

In addition, each dashboard has a set of preferences that determines its behavior.

You can minimize and maximize widgets, add and remove widgets from tabs, as well as rearrange the widgets on a tab.

Note For widgets that display event counts over a time range, the total number of events may not reflect the number of events for which detailed data is available in the tables on pages under the Analysis menu. This occurs because the system sometimes prunes older event details to manage disk space usage. To minimize the occurrence of event detail pruning, you can fine-tune event logging to log only those events most important to your deployment.

Widget Availability

The dashboard widgets that you can view depend on the type of appliance you are using, your user role, and your current domain (in a multidomain deployment).

In a multidomain deployment, if you do not see a widget that you expect to see, switch to the Global domain. See [Switching Domains on the Firepower Management Center, on page 12](#).

Note that:

- An *invalid* widget is one that you cannot view because you are using the wrong type of appliance.
- An *unauthorized* widget is one that you cannot view because your user account does not have the necessary privileges.

For example, the Appliance Status widget is available only on the FMC for users with Administrator, Maintenance User, Security Analyst, or Security Analyst (Read Only) account privileges.

Although you cannot add an unauthorized or invalid widget to a dashboard, an imported dashboard may contain unauthorized or invalid widgets. For example, such widgets can be present if the imported dashboard:

- Was created by a user with different access privileges, or
- Belongs to an ancestor domain.

Unavailable widgets are disabled and display error messages that indicate why you cannot view them.

Individual widgets also display error messages when those widgets have timed out or are otherwise experiencing problems.

Note You can delete or minimize unauthorized and invalid widgets, as well as widgets that display no data, keeping in mind that modifying a widget on a shared dashboard modifies it for all users of the appliance.

Dashboard Widget Availability by User Role

The following table lists the user account privileges required to view each widget. Only user accounts with Administrator, Maintenance User, Security Analyst, or Security Analyst (Read Only) access can use dashboards.

Users with custom roles may have access to any combination of widgets, or none at all, as their user roles permit.

Table 28: User Roles and Dashboard Widget Availability

Widget	Administrator	Maintenance User	Security Analyst	Security
Appliance Information	yes	yes	yes	yes
Appliance Status	yes	yes	yes	no
Correlation Events	yes	no	yes	yes
Current Interface Status	yes	yes	yes	yes
Current Sessions	yes	no	no	no
Custom Analysis	yes	no	yes	yes
Disk Usage	yes	yes	yes	yes
Interface Traffic	yes	yes	yes	yes
Intrusion Events	yes	no	yes	yes

Widget	Administrator	Maintenance User	Security Analyst	Security Ana
Network Compliance	yes	no	yes	yes
Product Licensing	yes	yes	no	no
Product Updates	yes	yes	no	no
RSS Feed	yes	yes	yes	yes
System Load	yes	yes	yes	yes
System Time	yes	yes	yes	yes
White List Events	yes	no	yes	yes

Predefined Dashboard Widgets

The Firepower System is delivered with several predefined widgets that, when used on dashboards, can provide you with at-a-glance views of current system status. These views include:

- data about the events collected and generated by the system
- information about the status and overall health of the appliances in your deployment

Note The dashboard widgets you can view depend on the type of appliance you are using, your user role, and your current domain in a multidomain deployment.

The Appliance Information Widget

The Appliance Information widget provides a snapshot of the appliance. It appears by default on the Status tabs of the Detailed Dashboard and the Summary Dashboard. The widget provides:

- the name, IPv4 address, IPv6 address, and model of the appliance
- the versions of the Firepower System software, operating system, Snort, rule update, rule pack, module pack, vulnerability database (VDB), and geolocation update installed on the appliances with dashboards, except for virtual Firepower Management Centers
- for managed appliances, the name and status of the communications link with the managing appliance

You can configure the widget to display more or less information by modifying the widget preferences to display a simple or an advanced view; the preferences also control how often the widget updates.

The Appliance Status Widget

The Appliance Status widget indicates the health of the appliance and of any appliances it is managing. Note that because the Firepower Management Center does not automatically apply a health policy to managed devices, you must manually apply a health policy to devices or their status appears as `Disabled`. This widget appears by default on the Status tabs of the Detailed Dashboard and the Summary Dashboard.

You can configure the widget to display appliance status as a pie chart or in a table by modifying the widget preferences.

The preferences also control how often the widget updates.

You can click a section on the pie chart or one of the numbers on the appliance status table to go to the Health Monitor page and view the compiled health status of the appliance and of any appliances it is managing.

The Correlation Events Widget

The Correlation Events widget shows the average number of correlation events per second, by priority, over the dashboard time range. It appears by default on the Correlation tab of the Detailed Dashboard.

You can configure the widget to display correlation events of different priorities by modifying the widget preferences, as well as to choose a linear (incremental) or logarithmic (factor of ten) scale.

Check one or more **Priorities** check boxes to display separate graphs for events of specific priorities, including events that do not have a priority. Choose **Show All** to display an additional graph for all correlation events, regardless of priority. The preferences also control how often the widget updates.

You can click a graph to view correlation events of a specific priority, or click the **All** graph to view all correlation events. In either case, the events are constrained by the dashboard time range; accessing correlation events via the dashboard changes the events (or global) time window for the appliance.

The Current Interface Status Widget

The Current Interface Status widget shows the status of all interfaces on the appliance, enabled or unused. On a Firepower Management Center, you can display the management (`eth0`, `eth1`, and so on) interfaces. On a managed device, you can choose to show only sensing (`s1p1` and so on) interfaces or both management and sensing interfaces. Interfaces are grouped by type: management, inline, passive, switched, routed, stacked, and unused.

For each interface, the widget provides:

- the name of the interface
- the link state of the interface
- the link mode (for example, 100Mb full duplex, or 10Mb half duplex) of the interface
- the type of interface, that is, copper or fiber
- the amount of data received (Rx) and transmitted (Tx) by the interface

The color of the ball representing link state indicates the current status, as follows:

- green: link is up and at full speed
- yellow: link is up but not at full speed
- red: link is not up
- gray: link is administratively disabled
- blue: link state information is not available (for example, ASA)

The widget preferences control how often the widget updates.

The Current Sessions Widget

The Current Sessions widget shows which users are currently logged into the appliance, the IP address associated with the machine where the session originated, and the last time each user accessed a page on the appliance (based on the local time for the appliance). The user that represents you, that is, the user currently viewing the widget, is marked with a **User icon** and rendered in bold type. Sessions are pruned from this widget's data within one hour of logoff or inactivity. This widget appears by default on the Status tabs of the Detailed Dashboard and the Summary Dashboard.

On the Current Sessions widget, you can:

- click any user name to manage user accounts on the User Management page.
- click the **Host icon** or **Compromised Host icon** next to any IP address to view the host profile for the associated machine.
- click any IP address or access time to view the audit log constrained by that IP address and by the time that the user associated with that IP address logged on to the web interface.

The widget preferences control how often the widget updates.

The Custom Analysis Widget

The Custom Analysis widget is a highly customizable widget that allows you to display detailed information on the events collected and generated by the Firepower System.

The widget is delivered with multiple presets that provide quick access to information about your deployment. The predefined dashboards make extensive use of these presets. You can use these presets or create a custom configuration. At a minimum, a custom configuration specifies the data you are interested in (table and field), and an aggregation method for that data. You can also set other display-related preferences, including whether you want to show events as relative occurrences (bar graph) or over time (line graph).

The widget displays the last time it updated, based on local time. The widget updates with a frequency that depends on the dashboard time range. For example, if you set the dashboard time range to an hour, the widget updates every five minutes. On the other hand, if you set the dashboard time range to a year, the widget updates once a week. To determine when the dashboard will update next, hover your pointer over the **Last updated** notice in the bottom left corner of the widget.

Note A red-shaded Custom Analysis widget indicates that its use is harming system performance. If the widget continues to stay red over time, remove the widget. You can also disable all Custom Analysis widgets from the Dashboard settings in your system configuration (**System > Configuration > Dashboard**)

Displaying Relative Occurrences of Events (Bar Graphs)

For bar graphs in the Custom Analysis widget, the colored bars in the widget background show the relative number of occurrences of each event. Read the bars from right to left.

The **Direction icon** indicates and controls the sort order of the display. A downward-pointing icon indicates descending order; an upward-pointing icon indicates ascending order. To change the sort order, click the icon.

Next to each event, the widget can display one of three icons to indicate any changes from the most recent results:

- The new event icon **Add** (+) signifies that the event is new to the results.

- The **Up Arrow icon** indicates that the event has moved up in the standings since the last time the widget updated. A number indicating how many places the event has moved up appears next to the icon.
- The **Down Arrow icon** indicates that the event has moved down in the standings since the last time the widget updated. A number indicating how many places the event has moved down appears next to the icon.

Displaying Events Over Time (Line Graphs)

If you want information on events or other collected data over time, you can configure the Custom Analysis widget to display a line graph, such as one that displays the total number of intrusion events generated in your deployment over time.

Limitations to the Custom Analysis Widget

A Custom Analysis widget may indicate that you are unauthorized to view the data that is configured to display. For example, Maintenance Users are not authorized to view discovery events. As another example, the widget does not display information related to unlicensed features. However, you (and any other users who share the dashboard) can modify the widget preferences to display data that you can see, or even delete the widget. If you want to make sure that this does not happen, save the dashboard as private.

When viewing user data, the system displays only authoritative users.

When viewing URL category information, the system does not display uncategorized URLs.

When viewing intrusion events aggregated by **Count**, the count includes reviewed events for intrusion events; if you view the count in tables on pages under the Analysis menus, the count will not include reviewed events.

Note In a multidomain deployment, the system builds a separate network map for each leaf domain. As a result, a leaf domain can contain an IP address that is unique within its network, but identical to an IP address in another leaf domain. When you view Custom Analysis widgets in an ancestor domain, multiple instances of that repeated IP address can be displayed. At first glance, they might appear to be duplicate entries. However, if you drill down to the host profile information for each IP address, the system shows that they belong to different leaf domains.

How to Create Dashboard Widgets for a Device

Any widgets that show events from devices can be configured to use a filter that limits the display of events for a given device or a set of devices.

1. Create and save a search: Go to **Analysis > Search** and enter the search parameters to match the specific device names.

Note You must provide exact text match as there is no drop-down listing the deployed device names.

2. Go to **Overview > Dashboards > Add Widgets** to create a **Custom Analysis** widget.
3. Return to **Overview > Dashboards** and modify the new widget to customize with the scope of search.

Example: Configuration of Custom Analysis Widget

You can configure the Custom Analysis widget to display a list of recent intrusion events by configuring the widget to display data from the **Intrusion Events** table. Choosing the **Classification** field and aggregating this data by **Count** displays the number of events that were generated for each type.

On the other hand, aggregating by **Unique Events** displays the number of unique intrusion events of each type (for example, how many detections of network trojans, potential violations of corporate policy, attempted denial-of-service attacks, and so on).

You can further customize the widget using a saved search, either one of the predefined searches delivered with your appliance or a custom search that you created. For example, constraining the first example (intrusion events using the **Classification** field, aggregated by **Count**) using the **Dropped Events** search displays the number of intrusion events that were dropped for each type.

Related Topics

[Modifying Dashboard Time Settings](#), on page 250

Custom Analysis Widget Preferences

The following table describes the preferences you can set in the Custom Analysis widget.

Different preferences appear depending on how you configure the widget. For example, a different set of preferences appears if you configure the widget to show relative occurrences of events (a bar graph) vs a graph over time (a line graph). Some preferences, such as Filter, only appear if you choose a specific table from which to display data.

Table 29: Custom Analysis Widget Preferences

Preference	Details
Title	If you do not specify a title for the widget, the system uses the configured event type as the title.
Preset	Custom Analysis presets provide quick access to information about your deployment. The predefined dashboards make extensive use of these presets. You can use these presets or you can create a custom configuration.
Table (required)	The table of events or assets that contains the data the widget displays.
Field (required)	The specific field of the event type you want to display. To show data over time (line graphs), choose Time . To show relative occurrences of events (bar graphs), choose another option.
Aggregate (required)	The aggregation method configures how the widget groups the data it displays. For most event types, the default option is Count .
Filter	You can use application filters to constrain data from the Application Statistics and Intrusion Event Statistics by Application tables.

Preference	Details
Search	<p>You can use a saved search to constrain the data that the widget displays. You do not have to specify a search, although some presets use predefined searches.</p> <p>Only you can access searches that you have saved as private. If you configure the widget on a shared dashboard and constrain its events using a private search, the widget resets to not using the search when another user logs in. This affects your view of the widget as well. If you want to make sure that this does not happen, save the dashboard as private.</p> <p>Only fields that constrain connection summaries can constrain Custom Analysis dashboard widgets based on connection events. Invalid saved searches are dimmed.</p> <p>If you constrain a Custom Analysis widget using a saved search, then edit the search, the widget does not reflect your changes until the next time it updates.</p>
Show	Choose whether you want to display the most (Top) or the least (Bottom) frequently occurring events.
Results	Choose the number of result rows to display.
Show Movers	Choose whether you want to display the icons that indicate changes from the most recent results.
Time Zone	Choose the time zone you want to use to display results.
Color	You can change the color of the bars in the widget's bar graph.

Related Topics

[Configuring Widget Preferences](#), on page 248

Viewing Associated Events from the Custom Analysis Widget

From a Custom Analysis widget, you can invoke an event view (workflow) that provides detailed information about the events displayed in the widget. The events appear in the default workflow for that event type, constrained by the dashboard time range. This also changes the appropriate time window on the Firepower Management Center, depending on how many time windows you configured and on the event type.

For example:

- If you configure multiple time windows, then access health events from a Custom Analysis widget, the events appear in the default health events workflow, and the health monitoring time window changes to the dashboard time range.
- If you configure a single time window and then access any type of event from the Custom Analysis widget, the events appear in the default workflow for that event type, and the global time window changes to the dashboard time range.

Procedure

You have the following choices:

- On any Custom Analysis widget, click **View**  in the lower right corner of the widget to view all associated events, constrained by the widget preferences.

- On a Custom Analysis widget showing relative occurrences of events (bar graph), click any event to view associated events constrained by the widget preferences, as well as by that event.

The Disk Usage Widget

The Disk Usage widget displays the percentage of space used on the hard drive, based on disk usage category. It also indicates the percentage of space used on and capacity of each partition of the appliance's hard drive. The Disk Usage widget displays the same information for the malware storage pack if installed in the device, or if the Firepower Management Center manages a device containing a malware storage pack. This widget appears by default on the Status tabs of the Default Dashboard and the Summary Dashboard.

The By Category stacked bar displays each disk usage category as a proportion of the total available disk space used. The following table describes the available categories.

Table 30: Disk Usage Categories

Disk Usage Category	Description
Events	all events logged by the system
Files	all files stored by the system
Backups	all backup files
Updates	all files related to updates, such as rule updates and system updates
Other	system troubleshooting files and other miscellaneous files
Free	free space remaining on the appliance

You can hover your pointer over a disk usage category in the By Category stacked bar to view the percentage of available disk space used by that category, the actual storage space on the disk, and the total disk space available for that category. Note that if you have a malware storage pack installed, the total disk space available for the Files category is the available disk space on the malware storage pack.

You can configure the widget to display only the By Category stacked bar, or you can show the stacked bar plus the `admin (/)`, `/Volume`, and `/boot` partition usage, as well as the `/var/storage` partition if the malware storage pack is installed, by modifying the widget preferences.

The widget preferences also control how often the widget updates, as well as whether it displays the current disk usage or collected disk usage statistics over the dashboard time range.

The Interface Traffic Widget

The Interface Traffic widget shows the rate of traffic received (Rx) and transmitted (Tx) on the appliance's management interface. For 7000 & 8000 Series devices, the widget also shows information on the sensing interfaces. The widget does not appear by default on any of the predefined dashboards.

Devices with Malware licenses enabled periodically attempt to connect to the AMP cloud even if you have not configured dynamic analysis. Because of this, these devices show transmitted traffic; this is expected behavior. Outbound (transmitted) traffic includes flow control packets. Because of this, passive sensing interfaces on 7000 & 8000 Series devices may show transmitted traffic; this is also expected behavior.

The widget preferences control how often the widget updates. On 7000 & 8000 Series devices, the preferences also control whether the widget displays the traffic rate for unused interfaces (by default, the widget only displays the traffic rate for active interfaces).

The Intrusion Events Widget

The Intrusion Events widget shows the intrusion events that occurred over the dashboard time range, organized by priority. This includes statistics on intrusion events with dropped packets and different impacts. This widget appears by default on the Intrusion Events tab of the Summary Dashboard.

In the widget preferences, you can choose:

- **Event Flags** to display separate graphs for events with dropped packets, would have dropped packets, or specific impacts. Choose **All** to display an additional graph for all intrusion events, regardless of impact or rule state.

For explanations of the icons, see [Working with Intrusion Events, on page 1983](#). The arrow (if any) that appears above the impact level numbers describes the inline result and is defined as follows:

Table 31: Inline Result Field Contents in Workflow and Table Views

This Icon	Indicates
A black down arrow	The system dropped the packet that triggered the rule.
A gray down arrow	IPS would have dropped the packet if you enabled the Drop when Inline intrusion policy option (in an inline deployment), or if a Drop and Generate rule generated the event while the system was pruning.
No icon (blank)	The triggered rule was not set to Drop and Generate Events

In a passive deployment, the system does not drop packets, including when an inline interface is in tap mode, regardless of the rule state or the inline drop behavior of the intrusion policy.

- **Show** to specify **Average Events Per Second (EPS)** or **Total Events**.
- **Vertical Scale** to specify **Linear** (incremental) or **Logarithmic** (factor of ten) scale.
- How often the widget updates.

On the widget, you can:

- Click a graph corresponding to dropped packets, to would have dropped packets, or to a specific impact to view intrusion events of that type.
- Click the graph corresponding to dropped events to view dropped events.
- Click the graph corresponding to would have dropped events to view would have dropped events.
- Click the **All** graph to view all intrusion events.

The resulting event view is constrained by the dashboard time range; accessing intrusion events via the dashboard changes the events (or global) time window for the appliance. Note that packets in a passive deployment are not dropped, regardless of intrusion rule state or the inline drop behavior of the intrusion policy.

The Network Compliance Widget

The Network Compliance widget summarizes your hosts' compliance with the white lists you configured. By default, the widget displays a pie chart that shows the number of hosts that are compliant, non-compliant, and that have not been evaluated, for all compliance white lists in active correlation policies. This widget appears by default on the Correlation tab of the Detailed Dashboard.

You can configure the widget to display network compliance either for all white lists or for a specific white list by modifying the widget preferences.

If you choose to display network compliance for all white lists, the widget considers a host to be non-compliant if it is not compliant with any white list in an active correlation policy.

You can also use the widget preferences to specify which of three different styles you want to use to display network compliance.

The **Network Compliance** style (the default) displays a pie chart that shows the number of hosts that are compliant, non-compliant, and that have not been evaluated. You can click the pie chart to view the host violation count, which lists the hosts that violate at least one white list.

The **Network Compliance over Time (%)** style displays a stacked area graph showing the relative proportion of hosts that are compliant, non-compliant, and that have not yet been evaluated, over the dashboard time range.

The **Network Compliance over Time** style displays a line graph that shows the number of hosts that are compliant, non-compliant, and that have not yet been evaluated, over the dashboard time range.

The preferences control how often the widget updates. You can check the **Show Not Evaluated** box to hide events which have not been evaluated.

The Product Licensing Widget

The Product Licensing widget shows the device and feature licenses currently installed on the Firepower Management Center. It also indicates the number of items licensed and the number of remaining licensed items allowed. It does not appear by default on any of the predefined dashboards.

The top section of the widget displays all device and feature licenses installed on the Firepower Management Center, including temporary licenses, while the Expiring Licenses section displays only temporary and expired licenses.

The bars in the widget background show the percentage of each type of license that is being used; you should read the bars from right to left. Expired licenses are marked with a strikethrough.

You can configure the widget to display either the features that are currently licensed, or all the features that you can license, by modifying the widget preferences. The preferences also control how often the widget updates.

You can click any of the license types to go to the License page of the local configuration and add or delete feature licenses.

The Product Updates Widget

The Product Updates widget provides you with a summary of the software currently installed on the appliance as well as information on updates that you have downloaded, but not yet installed. This widget appears by default on the Status tabs of the Detailed Dashboard and the Summary Dashboard.

Because the widget uses scheduled tasks to determine the latest version, it displays `Unknown` until you configure a scheduled task to download, push or install updates.

You can configure the widget to hide the latest versions by modifying the widget preferences. The preferences also control how often the widget updates.

The widget also provides you with links to pages where you can update the software. You can:

- Manually update an appliance by clicking the current version.
- Create a scheduled task to download an update by clicking the latest version.

The RSS Feed Widget

The RSS Feed widget adds an RSS feed to a dashboard. By default, the widget shows a feed of Cisco security news. It appears by default on the Status tabs of the Detailed Dashboard and the Summary Dashboard.

You can also configure the widget to display a preconfigured feed of company news, the Snort.org blog, or the Cisco Threat Research blog, or you can create a custom connection to any other RSS feed by specifying its URL in the widget preferences.

Feeds update every 24 hours (although you can manually update the feed), and the widget displays the last time the feed was updated based on the local time of the appliance. Keep in mind that the appliance must have access to the web site (for the two preconfigured feeds) or to any custom feed you configure.

When you configure the widget, you can also choose how many stories from the feed you want to show in the widget, as well as whether you want to show descriptions of the stories along with the headlines; keep in mind that not all RSS feeds use descriptions.

On the RSS Feed widget, you can:

- click one of the stories in the feed to view the story
- click the **more** link to go to the feed's web site
- click **Update** (🔄) to manually update the feed

The System Load Widget

The System Load widget shows the CPU usage (for each CPU), memory (RAM) usage, and system load (also called the load average, measured by the number of processes waiting to execute) on the appliance, both currently and over the dashboard time range. It appears by default on the Status tabs of the Detailed Dashboard and the Summary Dashboard.

You can configure the widget to show or hide the load average by modifying the widget preferences. The preferences also control how often the widget updates.

The System Time Widget

The System Time widget shows the local system time, uptime, and boot time for the appliance. It appears by default on the Status tabs of the Detailed Dashboard and the Summary Dashboard.

You can configure the widget to hide the boot time by modifying the widget preferences. The preferences also control how often the widget synchronizes with the appliance's clock.

The White List Events Widget

The White List Events widget shows the average events per second by priority, over the dashboard time range. It appears by default on the Correlation tab of the Default Dashboard.

You can configure the widget to display white list events of different priorities by modifying the widget preferences.

In the widget preferences, you can:

- choose one or more **Priorities** check boxes to display separate graphs for events of specific priorities, including events that do not have a priority
- choose **Show All** to display an additional graph for all white list events, regardless of priority
- choose **Vertical Scale** to choose **Linear** (incremental) or **Logarithmic** (factor of ten) scale

The preferences also control how often the widget updates.

You can click a graph to view white list events of a specific priority, or click the **All** graph to view all white list events. In either case, the events are constrained by the dashboard time range; accessing white list events via the dashboard changes the events (or global) time window for the Firepower Management Center.

Managing Dashboards

Procedure

Step 1 Choose **Overview > Dashboards**, and then choose the dashboard you want to modify from the menu.

Step 2 Manage your dashboards:

- Create Dashboards — Create a custom dashboard; see [Creating Custom Dashboards, on page 248](#).
- Delete Dashboards — To delete a dashboard, click **Delete** () next to the dashboard you want to delete. If you delete your default dashboard, you must define a new default or the appliance prompts you to choose a dashboard every time you attempt to view a dashboard.
- Edit Options — Edit custom dashboard options; see [Editing Dashboards Options, on page 250](#).
- Modify Time Constraints — Modify the time display or pause/unpause the dashboard as described in [Modifying Dashboard Time Settings, on page 250](#).

Step 3 Add (see [Adding a Dashboard, on page 247](#)), Delete (click **Close** ()), and Rename (see [Renaming a Dashboard, on page 251](#)) dashboards.

Note You cannot change the order of dashboards.

Step 4 Manage dashboard widgets:

- Add Widgets — Add widgets to a dashboard; see [Adding Widgets to a Dashboard, on page 247](#).
- Configure Preferences — Configure widget preferences; see [Configuring Widget Preferences, on page 248](#).
- Customize Display — Customize the widget display; see [Customizing the Widget Display, on page 249](#).
- View Events — View associated events from the Custom Analysis Widget; see [Viewing Associated Events from the Custom Analysis Widget, on page 241](#).

Tip Every configuration of the Custom Analysis widget in the Cisco predefined dashboards corresponds to a system preset for that widget. If you change or delete one of these widgets, you can restore it by creating a new Custom Analysis widget based on the appropriate preset.

Adding a Dashboard

Procedure

- Step 1** View the dashboard you want to modify; see [Viewing Dashboards, on page 252](#).
 - Step 2** Click **Add (+)**.
 - Step 3** Enter a name.
 - Step 4** Click **OK**.
-

Adding Widgets to a Dashboard

Each tab can display one or more widgets in a three-column layout. When adding a widget to a dashboard, you choose the tab to which you want to add the widget. The system automatically adds it to the column with the fewest widgets. If all columns have an equal number of widgets, the new widget is added to the leftmost column. You can add a maximum of 15 widgets to a dashboard tab.

Tip After you add widgets, you can move them to any location on the tab. You cannot, however, move widgets from tab to tab.

The dashboard widgets you can view depend on the type of appliance you are using, your user role, and your current domain (in a multidomain deployment). Keep in mind that because not all user roles have access to all dashboard widgets, users with fewer permissions viewing a dashboard created by a user with more permissions may not be able to use all of the widgets on the dashboard. Although the unauthorized widgets still appear on the dashboard, they are disabled.

Procedure

- Step 1** View the dashboard where you want to add a widget; see [Viewing Dashboards, on page 252](#).
- Step 2** Click the tab where you want to add the widget.
- Step 3** Click **Add Widgets**. You can view the widgets in each category by clicking on the category name, or you can view all widgets by clicking **All Categories**.
- Step 4** Click **Add** next to the widgets you want to add. The Add Widgets page indicates how many widgets of each type are on the tab, including the widget you want to add.

Tip To add multiple widgets of the same type (for example, you may want to add multiple RSS Feed widgets, or multiple Custom Analysis widgets), click **Add** again.

Step 5 When you are finished adding widgets, click **Done** to return to the dashboard.

What to do next

- If you added a Custom Analysis widget, configure the widget preferences; see [Configuring Widget Preferences, on page 248](#).

Related Topics

[Widget Availability](#), on page 234

Configuring Widget Preferences

Each widget has a set of preferences that determines its behavior.

Procedure

Step 1 On the title bar of the widget whose preferences you want to change, click **Show Preferences** (∨).

Step 2 Make changes as needed.

Step 3 On the widget title bar, click **Hide Preferences** (^) to hide the preferences section.

Creating Custom Dashboards

Tip Instead of creating a new dashboard, you can export a dashboard from another appliance, then import it onto your appliance. You can then edit the imported dashboard to suit your needs.

Procedure

Step 1 Choose **Overview > Dashboards > Management**.

Step 2 Click **Create Dashboard**.

Step 3 Modify the custom dashboard options as described in [Custom Dashboard Options, on page 248](#).

Step 4 Click **Save**.

Custom Dashboard Options

The table below describes options you can use when creating or editing custom dashboards.

Table 32: Custom Dashboard Options

Option	Description
Copy Dashboard	<p>When you create a custom dashboard, you can choose to base it on any existing dashboard, whether user-created or system-defined. This option makes a copy of the preexisting dashboard, which you can modify to suit your needs. Optionally, you can create a blank new dashboard by choosing None. This option is available only when you create a new dashboard.</p> <p>In a multidomain deployment, you can copy any non-private dashboards from ancestor domains.</p>
Name	A unique name for the custom dashboard.
Description	A brief description of the custom dashboard.
Change Tabs Every	Specifies (in minutes) how often the dashboard should cycle through its tabs. Unless you pause the dashboard or your dashboard has only one tab, this setting advances your view to the next tab at the interval you specify. To disable tab cycling, enter 0 in the Change Tabs Every field.
Refresh Page Every	<p>Determines how often the entire dashboard page automatically refreshes.</p> <p>Refreshing the entire dashboard allows you to see any preference or layout changes that were made to a shared dashboard by another user, or that you made to a private dashboard on another computer, since the last time the dashboard refreshed. A frequent refresh can be useful, for example, in a networks operations center (NOC) where a dashboard is displayed at all times. If you make changes to the dashboard at a local computer, the dashboard in the NOC automatically refreshes at the interval you specify, and no manual refresh is required.</p> <p>This refresh does not update the data, and you do not need to refresh the entire dashboard to see data updates; individual widgets update according to their preferences.</p> <p>This value must be greater than the Change Tabs Every setting. Unless you pause the dashboard, this setting will refresh the entire dashboard at the interval you specify. To disable the periodic page refresh, enter 0 in the Refresh Page Every field.</p> <p>Note This setting is separate from the update interval available on many individual widgets; although refreshing the dashboard page resets the update interval on individual widgets, widgets will update according to their individual preferences even if you disable the Refresh Page Every setting.</p>
Save As Private	Determines whether the custom dashboard can be viewed and modified by all users of the appliance or is associated with your user account and reserved solely for your own use. Keep in mind that any user with dashboard access, regardless of role, can modify shared dashboards. If you want to make sure that only you can modify a particular dashboard, save it as private.

Customizing the Widget Display

You can minimize and maximize widgets, as well as rearrange the widgets on a tab.

Procedure

-
- Step 1** View a dashboard; see [Viewing Dashboards, on page 252](#).

Step 2 Customize the widget display:

- To rearrange a widget on a tab, click the title bar of the widget you want to move, then drag it to its new location.

Note You cannot move widgets from tab to tab. If you want a widget to appear on a different tab, you must delete it from the existing tab and add it to the new tab.

- To minimize or maximize a widget on the dashboard, click **Minimize** (–) or **Maximize** (□) in a widget's title bar.
 - To delete a widget if you no longer want to view it on a tab, click **Close** (✕) in the title bar of the widget.
-

Editing Dashboards Options

Procedure

Step 1 View the dashboard you want to edit; see [Viewing Dashboards, on page 252](#).

Step 2 Click **Edit** (✎).

Step 3 Change the options as described in [Custom Dashboard Options, on page 248](#).

Step 4 Click **Save**.

Modifying Dashboard Time Settings

You can change the time range to reflect a period as short as the last hour (the default) or as long as the last year. When you change the time range, the widgets that can be constrained by time automatically update to reflect the new time range.

The maximum number of data points in any graph is 300, and the time setting determines how much time is summarized within each data point. Following is the number of data points, and the time span covered, in the dashboards for each time range:

- 1 hour = 12 data points, 5 minutes each
- 6 hours = 72 data points, 5 minutes each
- 1 day = 288 data points, 5 minutes each
- 1 week = 300 data points, 33.6 minutes each
- 2 weeks = 300 data points, 67.2 minutes each
- 30 days = 300 data points, 144 minutes each
- 90 days = 300 data points, 432 minutes each
- 180 days = 300 data points, 864 minutes each
- 1 year = 300 data points, 1752 minutes each

Note that not all widgets can be constrained by time. For example, the dashboard time range has no effect on the Appliance Information widget, which provides information that includes the appliance name, model, and current version of the Firepower System software.

Keep in mind that for enterprise deployments of the Firepower System, changing the time range to a long period may not be useful for widgets like the Custom Analysis widget, depending on how often newer events replace older events.

You can also pause a dashboard, which allows you to examine the data provided by the widgets without the display changing and interrupting your analysis. Pausing a dashboard has the following effects:

- Individual widgets stop updating, regardless of any **Update Every** widget preference.
- Dashboard tabs stop cycling, regardless of the **Cycle Tabs Every** setting in the dashboard properties.
- Dashboard pages stop refreshing, regardless of the **Refresh Page Every** setting in the dashboard properties.
- Changing the time range has no effect.

When you are finished with your analysis, you can unpause the dashboard. Unpausing the dashboard causes all appropriate widgets on the page to update to reflect the current time range. In addition, dashboard tabs resume cycling and the dashboard page resumes refreshing according to the settings you specified in the dashboard properties.

If you experience connectivity problems or other issues that interrupt the flow of system information to the dashboard, the dashboard automatically pauses and an error notice appears until the problem is resolved.

Note Your session normally logs you out after 1 hour of inactivity (or another configured interval), regardless of whether the dashboard is paused. If you plan to passively monitor the dashboard for long periods of time, consider exempting some users from session timeout, or changing the system timeout settings.

Procedure

- Step 1** View the dashboard where you want to add a widget; see [Viewing Dashboards, on page 252](#).
 - Step 2** Optionally, to change the dashboard time range, choose a time range from the **Show the Last** drop-down list.
 - Step 3** Optionally, pause or unpause the dashboard on the time range control, using **Pause (||)** or **Play (▶)**.
-

Renaming a Dashboard

Procedure

- Step 1** View the dashboard you want to modify; see [Viewing Dashboards, on page 252](#).
- Step 2** Click the dashboard title you want to rename.
- Step 3** Type a name.

Step 4 Click **OK**.

Viewing Dashboards

By default, the home page for your appliance displays the default dashboard. If you do not have a default dashboard defined, the home page shows the Dashboard Management page, where you can choose a dashboard to view.

Procedure

At any time, you can do one of the following:

- To view the default dashboard for your appliance, choose **Overview > Dashboards**.
 - To view a specific dashboard, choose **Overview > Dashboards**, and choose the dashboard from the menu.
 - To view all available dashboards, choose **Overview > Dashboards > Management**. You can then choose **View** (🔍) next to an individual dashboard to view it.
-

Maintenance User

About Health Monitoring

The health monitor on the Firepower Management Center tracks a variety of health indicators to ensure that the hardware and software in the Firepower System are working correctly. You can use the health monitor to check the status of critical functionality across your Firepower System deployment.

You can use the health monitor to create a collection of tests, referred to as a *health policy*, and apply the health policy to one or more appliances. The tests, referred to as *health modules*, are scripts that test for criteria you specify. You can modify a health policy by enabling or disabling tests or by changing test settings, and you can delete health policies that you no longer need. You can also suppress messages from selected appliances by blocking them.

The tests in a health policy run automatically at the interval you configure. You can also run all tests, or a specific test, on demand. The health monitor collects health events based on the test conditions configured.

Note All appliances automatically report their hardware status via the Hardware Alarms health module. The Firepower Management Center also automatically reports status using the modules configured in the default health policy. Some health modules, such as the Appliance Heartbeat module, run on the Firepower Management Center and report the status of the Firepower Management Center's managed devices. Some health modules do not provide managed device status unless you apply a health policy configured with those modules to a device.

You can use the health monitor to access health status information for the entire system, for a particular appliance, or, in a multidomain deployment, a particular domain. Pie charts and status tables on the Health Monitor page provide a visual summary of the status of all appliances on your network, including the Firepower Management Center. Individual appliance health monitors let you drill down into health details for a specific appliance.

Fully customizable event views allow you to quickly and easily analyze the health status events gathered by the health monitor. These event views allow you to search and view event data and to access other information that may be related to the events you are investigating. For example, if you want to see all the occurrences of CPU usage with a certain percentage, you can search for the CPU usage module and enter the percentage value.

You can also configure email, SNMP, or syslog alerting in response to health events. A *health alert* is an association between a standard alert and a health status level. For example, if you need to make sure an appliance never fails due to hardware overload, you can set up an email alert. You can then create a health alert that triggers that email alert whenever CPU, disk, or memory usage reaches the Warning level you configure in the health policy applied to that appliance. You can set alerting thresholds to minimize the number of repeating alerts you receive.

Note The health monitoring can take 5-6 minutes from the occurrence of the health event to generate a health alert.

You can also generate troubleshooting files for an appliance if you are asked to do so by Support.

Because health monitoring is an administrative activity, only users with administrator user role privileges can access system health data.

High Availability Pair

In a FMC high-availability deployment running Version 6.7 or higher, the active FMC creates a health monitor page that uses REST APIs to show detailed metric-based information. The standby FMC creates the health monitor page that shows the alert information and provide a visual summary of the status of all appliances on your network using pie charts and status tables. The standby FMC does not display the metric-based information.

Health Modules

Health modules, or health tests, test for the criteria you specify in a health policy.

Table 33: Health Modules

Module	Platforms	Description
AMP for Endpoints Status	FMC	The module alerts if the FMC cannot connect to the AMP cloud or Cisco AMP Private Cloud after an initial successful connection, or if the private cloud cannot contact the public AMP cloud. It also alerts if you deregister an AMP cloud connection using the AMP for Endpoints management console.
AMP for Firepower Status (AMP for Networks Status)	FMC	<p>This module alerts if:</p> <ul style="list-style-type: none"> • The FMC cannot contact the AMP cloud (public or private) or the Cisco Threat Grid public cloud or on-premises appliance, or the AMP private cloud cannot contact the public AMP cloud. • The encryption keys used for the connection are invalid. • A device cannot contact the Cisco Threat Grid cloud or an Cisco Threat Grid on-premises appliance to submit files for dynamic analysis. • An excessive number of files are detected in network traffic based on the file policy configuration. <p>If your FMC loses connectivity to the Internet, the system may take up to 30 minutes to generate a health alert.</p>
Appliance Heartbeat	Any	This module determines if an appliance heartbeat is being heard from the appliance and alerts based on the appliance heartbeat status.
Automatic Application Bypass Status	Firepower 7000/8000 series	This module determines if an appliance has been bypassed because it did not respond within the number of seconds set in the bypass threshold, and alerts when a bypass occurs.
Card Reset	Any	This module checks for network cards which have restarted due to hardware failure and alerts when a reset occurs.
Classic License Monitor	FMC	This module determines if sufficient Classic licenses remain. It also alerts when devices in a stack have mismatched license sets. It alerts based on a warning level automatically configured for the module. You cannot change the configuration of this module.

Module	Platforms	Description
Cluster/Failover Status	FTD	This module monitors the status of device clusters. The module alerts if: <ul style="list-style-type: none"> • A new primary unit is elected to a cluster. • A new secondary unit joins a cluster. • A primary or secondary unit leaves a cluster.
CPU Usage	Any	This module checks that the CPU on the appliance is not overloaded and alerts when CPU usage exceeds the percentages configured for the module.
Disk Status	Any	This module examines performance of the hard disk, and malware storage pack (if installed) on the appliance. This module generates a Warning (yellow) health alert when the hard disk and RAID controller (if installed) are in danger of failing, or if an additional hard drive is installed that is not a malware storage pack. This module generates an Alert (red) health alert when an installed malware storage pack cannot be detected.
Disk Usage	Any	This module compares disk usage on the appliance's hard drive and malware storage pack to the limits configured for the module and alerts when usage exceeds the percentages configured for the module. This module also alerts when the system excessively deletes files in monitored disk usage categories, or when disk usage excluding those categories reaches excessive levels, based on module thresholds. Use the Disk Usage health status module to monitor disk usage for the <code>/</code> and <code>/volume</code> partitions on the appliance and track draining frequency. Although the disk usage module lists the <code>/boot</code> partition as a monitored partition, the size of the partition is static so the module does not alert on the boot partition. Attention If you receive alerts for high unmanaged disk usage for the partition <code>/volume</code> even though the usage is below the critical or warning threshold specified in the health policy, this could indicate that there are files which need to be deleted manually from the system. Contact TAC if you receive these alerts.
Hardware Alarms	Firepower 7000/8000 series FTD hardware	This module determines if hardware needs to be replaced on a physical managed device and alerts based on the hardware status. The module also reports on the status of hardware-related daemons and on the status of 7000 and 8000 Series devices in high-availability deployments.
Health Monitor Process	Any	This module monitors the status of the health monitor itself and alerts if the number of minutes since the last health event received by the FMC exceeds the Warning or Critical limits.
FireSIGHT Host Limit	FMC	This module determines if the number of hosts the FMC can monitor is approaching the limit and alerts based on the warning level configured for the module. For more information, see Firepower System Host Limit, on page 1575 .

Module	Platforms	Description
Inline Link Mismatch Alarms	Any managed device except ASA FirePOWER	This module monitors the ports associated with inline sets and alerts if the two interfaces of an inline pair negotiate different speeds.
Interface Status	Any	<p>This module determines if the device currently collects traffic and alerts based on the traffic status of physical interfaces and aggregate interfaces. For physical interfaces, the information includes interface name, link state, and bandwidth. For aggregate interfaces, the information includes interface name, number of active links, and total aggregate bandwidth.</p> <p>Note This module also monitors the HA standby device traffic flow. Though it is known that the standby device would not be receiving any traffic, yet, the FMC alerts that the interface is not receiving any traffic. The same alerting principle is applied when traffic is not received by some of the subinterfaces on a port channel.</p> <p>If you use the show interface CLI command to know the interface statistics of your device, the input and output rates in the CLI command result can be different from the traffic rates that appear in this interface module.</p> <p>This module displays the traffic rates according to the values from Snort performance monitoring. Sampling intervals of snort performance monitoring and the FTD interface statistics are different. This difference in sampling interval results in different throughput values in the FMC GUI and in the FTD show interface CLI command result.</p> <p>For ASA FirePOWER, interfaces labeled DataPlaneInterfacex, where x is a numerical value, are internal interfaces (not user-defined) and involve packet flow within the system.</p>
Intrusion and File Event Rate	Any managed device	<p>This module compares the number of intrusion events per second to the limits configured for this module and alerts if the limits are exceeded. If the Intrusion and File Event Rate is zero, the intrusion process may be down or the managed device may not be sending events. Select Analysis > Intrusions > Events to check if events are being received from the device.</p> <p>Typically, the event rate for a network segment averages 20 events per second. For a network segment with this average rate, Events per second (Critical) should be set to 50 and Events per second (Warning) should be set to 30. To determine limits for your system, find the Events/Sec value on the Statistics page for your device (System > Monitoring > Statistics), then calculate the limits using these formulas:</p> <ul style="list-style-type: none"> • Events per second (Critical) = Events/Sec * 2.5 • Events per second (Warning) = Events/Sec * 1.5 <p>The maximum number of events you can set for either limit is 999, and the Critical limit must be higher than the Warning limit.</p>

Module	Platforms	Description
Link State Propagation	Firepower 7000/8000 series ASA 5500-X series	<p>This module determines when a link in a paired inline set fails and triggers the link state propagation mode.</p> <p>If a link state propagates to the pair, the status classification for that module changes to Critical and the state reads:</p> <pre>Module Link State Propagation: ethx_ethy is Triggered</pre> <p>where <i>x</i> and <i>y</i> are the paired interface numbers.</p>
Local Malware Analysis	Any	This module alerts if a device is configured for local malware analysis and fails to download local malware analysis engine signature updates from the AMP cloud.
Memory Usage	Any	<p>This module compares memory usage on the appliance to the limits configured for the module and alerts when usage exceeds the levels configured for the module.</p> <p>For appliances with more than 4 GB of memory, the preset alert thresholds are based on a formula that accounts for proportions of available memory likely to cause system problems. On >4 GB appliances, because the interval between Warning and Critical thresholds may be very narrow, Cisco recommends that you manually set the Warning Threshold % value to 50. This will further ensure that you receive memory alerts for your appliance in time to address the issue.</p> <p>Complex access control policies and rules can command significant resources and negatively affect performance. Some lower-end ASA devices with FirePOWER Services Software may generate intermittent memory usage warnings, as the device's memory allocation is being used to the fullest extent possible.</p>
Power Supply	FMC hardware Firepower 7000/8000 series	<p>This module determines if power supplies on the device require replacement and alerts based on the power supply status.</p> <p>Note If an 8000 Series device experiences a power failure, it may take up to 20 minutes to generate an alert.</p>
Process Status	Any	<p>This module determines if processes on the appliance exit or terminate outside of the process manager.</p> <p>If a process is deliberately exited outside of the process manager, the module status changes to Warning and the health event message indicates which process exited, until the module runs again and the process has restarted. If a process terminates abnormally or crashes outside of the process manager, the module status changes to Critical and the health event message indicates the terminated process, until the module runs again and the process has restarted.</p>
Reconfiguring Detection	Any managed device	This module alerts if a device reconfiguration has failed.

Module	Platforms	Description
RRD Server Process	FMC	This module determines if the round robin data server that stores time series data is running properly. The module will alert if the RRD server has restarted since the last time it updated; it will enter Critical or Warning status if the number of consecutive updates with an RRD server restart reaches the numbers specified in the module configuration.
Security Intelligence	FMC and devices running Version 6.2.3 or earlier	This module alerts if Security Intelligence is in use and: <ul style="list-style-type: none"> • The FMC cannot update a feed, or feed data is corrupt or contains no recognizable IP addresses. • A device running Version 6.2.3 or earlier had a problem receiving updated Security Intelligence data from the FMC. • A device running Version 6.2.3 or earlier cannot load all of the Security Intelligence data provided to it by the FMC due to memory issues; see Troubleshooting Memory Use, on page 1038.
Smart License Monitor	FMC	This module alerts if: <ul style="list-style-type: none"> • There is a communication error between the Smart Licensing Agent (Smart Agent) and the Smart Software Manager. • The Product Instance Registration Token has expired. • The Smart License usage is out of compliance. • The Smart License authorization or evaluation mode has expired.
Time Series Data Monitor	FMC	This module tracks the presence of corrupt files in the directory where time series data (such as correlation event counts) are stored and alerts when files are flagged as corrupt and removed.
Time Synchronization Status	Any	This module tracks the synchronization of a device clock that obtains time using NTP with the clock on the NTP server and alerts if the difference in the clocks is more than ten seconds.
URL Filtering Monitor	FMC	This module alerts if the FMC fails to: <ul style="list-style-type: none"> • Communicate with, or retrieve a URL threat intelligence data update from, Cisco Collective Security Intelligence (CSI). • Push URL threat data to devices.
User Agent Status	FMC	This module alerts when heartbeats are not detected for any User Agents connected to the FMC.
VPN Status	FMC	This module alerts when one or more VPN tunnels between Firepower devices are down.

Configuring Health Monitoring

Procedure

- Step 1** Determine which health modules you want to monitor as discussed in [#unique_190](#).
You can set up specific policies for each kind of appliance you have in your Firepower System, enabling only the appropriate tests for that appliance.
- Tip** To quickly enable health monitoring without customizing the monitoring behavior, you can apply the default policy provided for that purpose.
- Step 2** Apply a health policy to each appliance where you want to track health status as discussed in [Creating Health Policies, on page 261](#).
- Step 3** (Optional.) Configure health monitor alerts as discussed in [Creating Health Monitor Alerts, on page 267](#).
You can set up email, syslog, or SNMP alerts that trigger when the health status level reaches a particular severity level for specific health modules.
-

Health Policies

A health policy contains configured health test criteria for several modules. You can control which health modules run against each of your appliances and configure the specific limits used in the tests run by each module.

When you configure a health policy, you decide whether to enable each health module for that policy. You also select the criteria that control which health status each enabled module reports each time it assesses the health of a process.

You can create one health policy that can be applied to every appliance in your system, customize each health policy to the specific appliance where you plan to apply it, or use the default health policy provided for you. In a multidomain deployment, administrators in ancestor domains can apply health policies to devices in descendant domains, which descendant domains can use or replace with customized local policies.

Default Health Policy

The Firepower Management Center setup process creates and applies an initial health policy, in which most—but not all—available health modules are enabled. The system also applies this initial policy to devices added to the Firepower Management Center.

This *initial* health policy is based on a *default* health policy, which you can neither view nor edit, but which you can copy when you create a custom health policy.

Upgrades and the Default Health Policy

When you upgrade the FMC, any new health modules are added to all health policies, including the initial health policy, default health policy, and any other custom health policies. Usually, new health modules are added in an enabled state.

Note For a new health module to begin monitoring and alerting, reapply health policies after upgrade.

Creating Health Policies

If you want to customize a health policy to use with your appliances, you can create a new policy. The settings in the policy initially populate with the settings from the health policy you choose as a basis for the new policy. You can enable or disable modules within the policy and change the alerting criteria for each module as needed.

In a multidomain deployment, the system displays policies created in the current domain, which you can edit. It also displays policies created in ancestor domains, which you cannot edit. To view and edit policies created in a lower domain, switch to that domain. Administrators in ancestor domains can apply health policies to devices in descendant domains, which descendant domains can use or replace with customized local policies.

Procedure

- Step 1** Choose **System > Health > Policy** .
 - Step 2** Click **New Policy**.
 - Step 3** Choose the existing policy that you want to use as the basis for the new policy from the **Copy Policy** drop-down list.
 - Step 4** Enter a name for the policy.
 - Step 5** Enter a description for the policy.
 - Step 6** Choose **Save** to save the policy information.
 - Step 7** Choose the module you want to use.
 - Step 8** Choose **On** for the **Enabled** option to enable use of the module for health status testing.
 - Step 9** Where appropriate, set the **Critical** and **Warning** criteria.
 - Step 10** Configure any additional settings for the module. Repeat steps 7-10 for each module.
 - Step 11** You have three choices:
 - To save your changes to this module and return to the Health Policy page, click **Save Policy and Exit**.
 - To return to the Health Policy page without saving any of your settings for this module, click **Cancel**.
 - To temporarily save your changes to this module and switch to another module's settings to modify, choose the other module from the list at the left of the page. If you click **Save Policy and Exit** when you are done, all changes you made will be saved; if you click **Cancel**, you discard all changes.
-

What to do next

- Apply the health policy to each appliance as described in [Applying Health Policies, on page 262](#). This applies your changes and updates the policy status for all affected policies.

Applying Health Policies

When you apply a health policy to an appliance, the health tests for all the modules you enabled in the policy automatically monitor the health of the processes and hardware on the appliance. Health tests then continue to run at the intervals you configured in the policy, collecting health data for the appliance and forwarding that data to the Firepower Management Center.

If you enable a module in a health policy and then apply the policy to an appliance that does not require that health test, the health monitor reports the status for that health module as disabled.

If you apply a policy with all modules disabled to an appliance, it removes all applied health policies from the appliance so no health policy is applied.

When you apply a different policy to an appliance that already has a policy applied, expect some latency in the display of new data based on the newly applied tests.

In a multidomain deployment, the system displays policies created in the current domain, which you can edit. It also displays policies created in ancestor domains, which you cannot edit. To view and edit policies created in a lower domain, switch to that domain. Administrators in ancestor domains can apply health policies to devices in descendant domains, which descendant domains can use or replace with customized local policies.

Procedure

Step 1 Choose **System > Health > Policy** .

Step 2 Click the **Apply** (✔) next to the policy you want to apply.

Tip The **Status** (✔) next to the Health Policy column indicates the current health status for the appliance. The **Status** (✔) next to the System Policy column indicates the communication status between the Firepower Management Center and the device. Note that you can remove the currently applied policy by clicking remove **Remove** (✘).

Step 3 Choose the appliances where you want to apply the health policy.

Step 4 Click **Apply** to apply the policy to the appliances you chose.

What to do next

- Optionally, monitor the task status; see [Viewing Task Messages, on page 291](#).

Monitoring of the appliance starts as soon as the policy is successfully applied.

Editing Health Policies

In a multidomain deployment, the system displays policies created in the current domain, which you can edit. It also displays policies created in ancestor domains, which you cannot edit. To view and edit policies created in a lower domain, switch to that domain. Administrators in ancestor domains can apply health policies to devices in descendant domains, which descendant domains can use or replace with customized local policies.

Procedure

- Step 1** Choose **System > Health > Policy** .
- Step 2** Click **Edit** () next to the policy you want to modify.
- Step 3** Edit the **Policy Name** or **Policy Description** fields as desired.
- Step 4** Click the health module you want to modify.
- Step 5** Modify settings as described in [Health Modules, on page 255](#).
- Step 6** You have three options:
- To save your changes to this module and return to the Health Policy page, click **Save Policy and Exit**.
 - To return to the Health Policy page without saving any of your settings for this module, click **Cancel**.
 - To temporarily save your changes to this module and switch to another module's settings to modify, choose the other module from the list at the left of the page. If you click **Save Policy and Exit** when you are done, all changes you made will be saved; if you click **Cancel**, you discard all changes.
- Step 7** Apply the health policy to your appliance as described in [Applying Health Policies, on page 262](#).
- Apply the health policy to each appliance where you want to track health status. When you apply the health policy to an appliance, all the modules you enabled in the policy monitor the health of the processes and hardware on the appliance, and forwards that data to the FMC.
-

What to do next

- Reapply the health policy as described in [Applying Health Policies, on page 262](#). This applies your changes and updates the policy status for all affected policies.

Deleting Health Policies

You can delete health policies that you no longer need. If you delete a policy that is still applied to an appliance, the policy settings remain in effect until you apply a different policy. In addition, if you delete a health policy that is applied to a device, any health monitoring alerts in effect for the device remain active until you disable the underlying associated alert response.

In a multidomain deployment, you can only delete health policies created in the current domain.

Tip To stop health monitoring for an appliance, create a health policy with all modules disabled and apply it to the appliance.

Procedure

- Step 1** Choose **System > Health > Policy** .
- Step 2** Click **Delete** () next to the policy you want to delete.

A message appears, indicating if the deletion was successful.

The Health Monitor Blocklist

In the course of normal network maintenance, you disable appliances or make them temporarily unavailable. Because those outages are deliberate, you do not want the health status from those appliances to affect the summary health status on your Firepower Management Center.

You can use the health monitor blocklist feature to disable health monitoring status reporting on an appliance or module. For example, if you know that a segment of your network will be unavailable, you can temporarily disable health monitoring for a managed device on that segment to prevent the health status on the Firepower Management Center from displaying a warning or critical state because of the lapsed connection to the device.

When you disable health monitoring status, health events are still generated, but they have a disabled status and do not affect the health status for the health monitor. If you remove the appliance or module from the blocklist, the events that were generated during the blocklisting continue to show a status of disabled.

To temporarily disable health events from an appliance, go to the blocklist configuration page and add an appliance to the blocklist. After the setting takes effect, the system no longer includes the blocklisted appliance when calculating the overall health status. The Health Monitor Appliance Status Summary lists the appliance as disabled.

You can also disable an individual health module. For example, when you reach the host limit on a Firepower Management Center, you can disable FireSIGHT Host Limit status messages.

Note that on the main Health Monitor page you can distinguish between appliances that are blocklisted if you expand to view the list of appliances with a particular status by clicking the arrow in that status row.

A **Blocklist** (🔒) icon and a notation are visible after you expand the view for a blocklisted or partially blocklisted appliance.

Note On a Firepower Management Center, Health Monitor blocklist settings are local configuration settings. Therefore, if you blocklist a device, then delete it and later re-register it with the Firepower Management Center, the blocklist settings remain persistent. The newly re-registered device remains blocklisted.

In a multidomain deployment, administrators in ancestor domains can blocklist an appliance or health module in descendant domains. However, administrators in the descendant domains can override the ancestor configuration and clear the blocklist for devices in their domain.

Blocklisting Appliances

You can blocklist appliances individually or by group, model, or associated health policy.

If you need to set the events and health status for an individual appliance to disabled, you can blocklist the appliance. After the blocklist settings take effect, the appliance shows as disabled in the Health Monitor Appliance Module Summary, and health events for the appliance have a status of disabled.

In a multidomain deployment, blocklisting an appliance in an ancestor domain blocklists it for all descendant domains. Descendant domains can override this inherited configuration and clear the blocklist. You can only blocklist the Firepower Management Center at the Global level.

Procedure

Step 1 Choose **System > Health > Blacklist**.

Step 2 Use the drop-down list on the right to sort the list by group, model, or by health policy.

Tip The status icon next to the Health Policy column **Status** (✔) indicates the current health status for the appliance. The status icon next to the System Policy column **Status** (✔) indicates the communication status between the Firepower Management Center and the device.

Step 3 You have two choices:

- To blocklist all appliances in a group, model, or policy category, check the check box for the category, then click **Blacklist Selected Devices**.
 - To clear blocklisting from all appliances in a group, model, or policy category, check the check box for the category, then click **Clear Blacklist on Selected Devices**.
-

What to do next

To blocklist individual health policy module on appliances, see [Blocklisting Health Policy Modules, on page 265](#).

Blocklisting Health Policy Modules

You can blocklist individual health policy modules on appliances. You may want to do this to prevent events from the module from changing the status for the appliance to warning or critical.

After the blocklist settings take effect, the appliance shows as **Partially Blocklisted** or **All Modules Blocklisted** on the Blocklist page and in the Appliance Health Monitor Module Status Summary, but only in expanded views on the main Appliance Status Summary page.

Tip Make sure that you keep track of individually blocklisted modules so you can reactivate them when you need them. You may miss necessary warning or critical messages if you accidentally leave a module disabled.

In a multidomain deployment, administrators in ancestor domains can blocklist health modules in descendant domains. However, administrators in descendant domains can override this ancestor configuration and clear the blocklisting for policies applied in their domains. You can only blocklist Firepower Management Center health modules at the Global level.

Procedure

Step 1 Choose **System > Health > Blacklist**.

- Step 2** Click **Edit** () next to the appliance you want to modify.
- Step 3** Check the check boxes next to the health policy modules you want to blocklist. Certain modules are applicable to specific devices only; for more information, see [Health Modules, on page 255](#).
- Step 4** Click **OK**.
- Step 5** In the device exclusion main page, click **Apply**.
-

Health Monitor Alerts

You can set up alerts to notify you through email, through SNMP, or through the system log when the status changes for the modules in a health policy. You can associate an existing alert response with health event levels to trigger and alert when health events of a particular level occur.

For example, if you are concerned that your appliances may run out of hard disk space, you can automatically send an email to a system administrator when the remaining disk space reaches the warning level. If the hard drive continues to fill, you can send a second email when the hard drive reaches the critical level.

In a multidomain deployment, you can view and modify health monitor alerts created in the current domain only.

Health Monitor Alert Information

The alerts generated by the health monitor contain the following information:

- Severity, which indicates the severity level of the alert.
- Module, which specifies the health module whose test results triggered the alert.
- Description, which includes the health test results that triggered the alert.

The table below describes these severity levels.

Table 34: Alert Severities

Severity	Description
Critical	The health test results met the criteria to trigger a Critical alert status.
Warning	The health test results met the criteria to trigger a Warning alert status.
Normal	The health test results met the criteria to trigger a Normal alert status.
Error	The health test did not run.
Recovered	The health test results met the criteria to return to a normal alert status, following a Critical or Warning alert status.

Creating Health Monitor Alerts

You must be an Admin user to perform this procedure.

When you create a health monitor alert, you create an association between a severity level, a health module, and an alert response. You can use an existing alert or configure a new one specifically to report on system health. When the severity level occurs for the selected module, the alert triggers.

If you create or update a threshold in a way that duplicates an existing threshold, you are notified of the conflict. When duplicate thresholds exist, the health monitor uses the threshold that generates the fewest alerts and ignores the others. The timeout value for the threshold must be between 5 and 4,294,967,295 minutes.

In a multidomain deployment, you can view and modify health monitor alerts created in the current domain only.

Before you begin

- Configure an alert response that governs the Firepower Management Center's communication with the SNMP, syslog, or email server where you send the health alert; see [Firepower Management Center Alert Responses](#), on page 1815.

Procedure

- Step 1** Choose **System > Health > Monitor Alerts**.
- Step 2** Enter a name for the health alert in the **Health Alert Name** field.
- Step 3** From the **Severity** list, choose the severity level you want to use to trigger the alert.
- Step 4** From the **Module** list, choose the health policy modules for which you want the alert to apply.
- Step 5** From the **Alert** list, choose the alert response that you want to trigger when the specified severity level is reached.
- Step 6** Optionally, in the **Threshold Timeout** field, enter the number of minutes that should elapse before each threshold period ends and the threshold count resets.
- Even if the policy run time interval value is less than the threshold timeout value, the interval between two reported health events from a given module is always greater. For example, if you change the threshold timeout to 8 minutes and the policy run time interval is 5 minutes, there is a 10-minute interval (5 x 2) between reported events.
- Step 7** Click **Save** to save the health alert.
-

Editing Health Monitor Alerts

You must be an Admin user to perform this procedure.

You can edit existing health monitor alerts to change the severity level, health module, or alert response associated with the health monitor alert.

In a multidomain deployment, you can view and modify health monitor alerts created in the current domain only.

Procedure

- Step 1** Choose **System > Health > Monitor Alerts**.
 - Step 2** Choose the alert you want to modify from the **Active Health Alerts** list.
 - Step 3** Click **Load** to load the configured settings for the alert you chose.
 - Step 4** Modify settings as needed.
 - Step 5** Click **Save** to save the modified health alert.
A message indicates if the alert configuration was successfully saved.
-

Deleting Health Monitor Alerts

In a multidomain deployment, you can view and modify health monitor alerts created in the current domain only.

Procedure

- Step 1** Choose **System > Health > Monitor Alerts**.
 - Step 2** Choose the active health alerts you want to delete, then click **Delete**.
-

What to do next

- Disable or delete the underlying alert response to ensure that alerting does not continue; see [Firepower Management Center Alert Responses, on page 1815](#).

Using the Health Monitor

You must be an Admin, Maintenance, or Security Analyst user to perform this procedure.

The health monitor provides the compiled health status for all devices managed by the Firepower Management Center, plus the Firepower Management Center. The health monitor is composed of: The health summary is shown when hovering on the hexagon that representing the device health.

- The status table — Provides a count of the managed appliances for this Firepower Management Center by overall health status.
- The pie chart — Indicates the percentage of appliances currently in each health status category.
- The appliance list — Provides details on the health of the managed devices.

In a multidomain deployment, the health monitor in an ancestor domain displays data from all descendant domains. In the descendant domains, it displays data from the current domain only.

Procedure

Step 1 Choose **System > Health > Monitor**.

Step 2 Choose the appropriate status in the **Status** column of the table or the appropriate portion of the pie chart to the list appliances with that status.

Tip If the arrow in the row for a status level points down, the appliance list for that status shows in the lower table. If the arrow points right, the appliance list is hidden.

Step 3 You have the following choices:

- View appliance health monitors; see [Viewing Appliance Health Monitors, on page 270](#).
- Create health policies; see [Creating Health Policies, on page 261](#).
- Create health monitor alerts; see [Creating Health Monitor Alerts, on page 267](#).

Health Monitor Status Categories

Available status categories are listed by severity in the table below.

Table 35: Health Status Indicator

Status Level	Status Icon	Status Color in Pie Chart	Description
Error	Error (✘)	Black	Indicates that at least one health monitoring module has failed on the appliance and has not been successfully re-run since the failure occurred. Contact your technical support representative to obtain an update to the health monitoring module.
Critical	Critical (⚠)	Red	Indicates that the critical limits have been exceeded for at least one health module on the appliance and the problem has not been corrected.
Warning	Warning (⚠)	Yellow	Indicates that warning limits have been exceeded for at least one health module on the appliance and the problem has not been corrected. This status also indicates a transitional state, where the required data is temporarily unavailable or could not be processed because of changes in the device configuration. Depending on the monitoring cycle, this transitional state is auto-corrected.
Normal	Normal (✔)	Green	Indicates that all health modules on the appliance are running within the limits configured in the health policy applied to the appliance.

Status Level	Status Icon	Status Color in Pie Chart	Description
Recovered	Recovered (✔)	Green	Indicates that all health modules on the appliance are running within the limits configured in the health policy applied to the appliance, including modules that were in a Critical or Warning state.
Disabled	Disabled (✘)	Blue	Indicates that an appliance is disabled or blocked, that the appliance does not have a health policy applied to it, or that the appliance is currently unreachable.

Viewing Appliance Health Monitors

You must be an Admin, Maintenance, or Security Analyst user to perform this procedure.

The Appliance Health Monitor provides a detailed view of the health status of an appliance.

In a multidomain deployment, you can view the health status of appliances in descendant domains.

Tip Your session normally logs you out after 1 hour of inactivity (or another configured interval). If you plan to passively monitor health status for long periods of time, consider exempting some users from session timeout, or changing the system timeout settings. See [User Account Login Options, on page 64](#) and [Configure Session Timeouts, on page 732](#) for more information.

Procedure

Step 1 Choose **System > Health > Monitor**.

Step 2 Expand the appliance list. To show appliances with a particular status, click the arrow in that status row. Alternatively, in the **Appliance Status Summary** graph, click the color for the appliance status category you want to view.

Tip If the arrow in the row for a status level points down, the appliance list for that status shows in the lower table. If the arrow points right, the appliance list is hidden.

Step 3 In the **Appliance** column of the appliance list, click the name of the appliance for which you want to view details.

Step 4 Optionally, in the **Module Status Summary** graph, click the color for the event status category you want to view.

The Alert Detail list toggles the display to show or hide events.

Running All Modules for an Appliance

You must be an Admin, Maintenance, or Security Analyst user to perform this procedure.

Health module tests run automatically at the policy run time interval you configure when you create a health policy. However, you can also run all health module tests on demand to collect up-to-date health information for the appliance.

In a multidomain deployment, you can run health module tests for appliances in the current domain and in any descendant domains.

Procedure

- Step 1** View the health monitor for the appliance; see [Viewing Appliance Health Monitors, on page 270](#).
- Step 2** Click **Run All Modules**. The status bar indicates the progress of the tests, then the Health Monitor Appliance page refreshes.

Note When you manually run health modules, the first refresh that automatically occurs may not reflect the data from the manually run tests. If the value has not changed for a module that you just ran manually, wait a few seconds, then refresh the page by clicking the device name. You can also wait for the page to refresh again automatically.

Running a Specific Health Module

You must be an Admin, Maintenance, or Security Analyst user to perform this procedure.

Health module tests run automatically at the policy run time interval you configure when you create a health policy. However, you can also run a health module test on demand to collect up-to-date health information for that module.

In a multidomain deployment, you can run health module tests for appliances in the current domain and in any descendant domains.

Procedure

- Step 1** View the health monitor for the appliance; see [Viewing Appliance Health Monitors, on page 270](#).
- Step 2** In the **Module Status Summary** graph, click the color for the health alert status category you want to view.
- Step 3** In the **Alert Detail** row for the alert for which you want to view a list of events, click **Run**.

The status bar indicates the progress of the test, then the Health Monitor Appliance page refreshes.

Note When you manually run health modules, the first refresh that automatically occurs may not reflect the data from the manually run tests. If the value has not changed for a module that you just manually ran, wait a few seconds, then refresh the page by clicking the device name. You can also wait for the page to refresh automatically again.

Generating Health Module Alert Graphs

You must be an Admin, Maintenance, or Security Analyst user to perform this procedure.

You can graph the results over a period of time of a particular health test for a specific appliance.

Procedure

-
- Step 1** View the health monitor for the appliance; see [Viewing Appliance Health Monitors, on page 270](#).
- Step 2** In the **Module Status Summary** graph of the Health Monitor Appliance page, click the color for the health alert status category you want to view.
- Step 3** In the **Alert Detail** row for the alert for which you want to view a list of events, click **Graph**.
- Tip** If no events appear, you may need to adjust the time range.
-

Health Monitor Reports for Troubleshooting

In some cases, if you have a problem with your appliance, Support may ask you to generate troubleshooting files to help them diagnose the problem. You can select any of the options listed in the table below to customize the troubleshooting data that the health monitor reports.

Note that some options overlap in terms of the data they report, but the troubleshooting files will not contain redundant copies, regardless of what options you select.

Table 36: Selectable Troubleshoot Options

This option...	Reports...
Snort Performance and Configuration	data and configuration settings related to Snort on the appliance
Hardware Performance and Logs	data and logs related to the performance of the appliance hardware
System Configuration, Policy, and Logs	configuration settings, data, and logs related to the current system configuration of the appliance
Detection Configuration, Policy, and Logs	configuration settings, data, and logs related to detection on the appliance
Interface and Network Related Data	configuration settings, data, and logs related to inline sets and network configuration of the appliance
Discovery, Awareness, VDB Data, and Logs	configuration settings, data, and logs related to the current discovery and awareness configuration on the appliance
Upgrade Data and Logs	data and logs related to prior upgrades of the appliance
All Database Data	all database-related data that is included in a troubleshoot report
All Log Data	all logs collected by the appliance database
Network Map Information	current network topology data

Generating Appliance Troubleshooting Files

Smart License	Classic License	Supported Devices	Supported Domains	Access
Any	Any	Any	Any	Admin/Maint/Any Security Analyst

You can generate customized troubleshooting files that you can send to Support.

In a multidomain deployment, you can generate troubleshooting files for devices in descendant domains.

Caution Generating troubleshooting files for lower-memory devices can trigger Automatic Application Bypass (AAB) when AAB is enabled. At a minimum, triggering AAB restarts the Snort process, temporarily interrupting traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See [Snort® Restart Traffic Behavior, on page 310](#) for more information. In some such cases, triggering AAB can render the device temporarily inoperable. If inoperability persists, contact Cisco Technical Assistance Center (TAC), who can propose a solution appropriate to your deployment. Susceptible devices include Firepower 7010, 7020, and 7030; ASA 5506-X, 5508-X, 5516-X, 5512-X, 5515-X, and 5525-X; NGIPSv.

Procedure

-
- Step 1** View the health monitor for the appliance; see [Viewing Appliance Health Monitors, on page 270](#).
 - Step 2** Click **Generate Troubleshooting Files**.
 - Step 3** Choose **All Data** to generate all possible troubleshooting data, or check individual check boxes to customize your report.
 - Step 4** Click **OK**.
-

What to do next

- Optionally, monitor the task status; see [Viewing Task Messages, on page 291](#).
- Download the troubleshooting files as described in [Downloading Troubleshooting Files, on page 273](#).

Downloading Troubleshooting Files

Smart License	Classic License	Supported Devices	Supported Domains	Access
Any	Any	Any	Any	Admin/Maint/Any Security Analyst

In a multidomain deployment, you can download troubleshooting files for devices in descendant domains.

Procedure

- Step 1** View task messages in the Message Center; see [Viewing Task Messages, on page 291](#).
- Step 2** Find the task that corresponds to the troubleshooting files you generated.
- Step 3** After the appliance generates the troubleshooting files and the task status changes to `Completed`, click **Click to retrieve generated files**.
- Step 4** Follow your browser's prompts to download the files.
- Note** For managed devices, the system renames the file by prepending the device name to the file name.
- Step 5** Follow the directions from Support to send the troubleshooting files to Cisco.
-

Health Event Views

The Health Event View page allows you to view health events logged by the health monitor on the Firepower Management Center logs health events. The fully customizable event views allow you to quickly and easily analyze the health status events gathered by the health monitor. You can search event data to easily access other information that may be related to the events you are investigating. If you understand what conditions each health module tests for, you can more effectively configure alerting for health events.

You can perform many of the standard event view functions on the health event view pages.

Viewing Health Events

You must be an Admin, Maintenance, or Security Analyst user to perform this procedure.

The Table View of Health Events page provides a list of all health events on the specified appliance.

When you access health events from the Health Monitor page on your Firepower Management Center, you retrieve all health events for all managed appliances.

In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.

- Tip** You can bookmark this view to allow you to return to the page in the health events workflow containing the Health Events table of events. The bookmarked view retrieves events within the time range you are currently viewing, but you can then modify the time range to update the table with more recent information if needed.
-

Procedure

Choose **System > Health > Events**.

- Tip** If you are using a custom workflow that does not include the table view of health events, click **(switch workflow)**. On the Select Workflow page, click **Health Events**.

Note If no events appear, you may need to adjust the time range.

Viewing Health Events by Module and Appliance

Procedure

- Step 1** View the health monitor for the appliance; see [Viewing Appliance Health Monitors, on page 270](#).
- Step 2** In the **Module Status Summary** graph, click the color for the event status category you want to view.
The Alert Detail list toggles the display to show or hide events.
- Step 3** In the **Alert Detail** row for the alert for which you want to view a list of events, click **Events**.
The Health Events page appears, containing results for a query with the name of the appliance and the name of the specified health alert module as constraints. If no events appear, you may need to adjust the time range.
- Step 4** If you want to view all health events for the specified appliance, expand **Search Constraints**, and click the **Module Name** constraint to remove it.
-

Viewing the Health Events Table

In a multidomain deployment, you can view data for the current domain and for any descendant domains. You cannot view data from higher level or sibling domains.

Procedure

- Step 1** Choose **System > Health > Events**.
- Step 2** You have the following choices:
- **Bookmark** — To bookmark the current page so that you can quickly return to it, click **Bookmark This Page**, provide a name for the bookmark, and click **Save**.
 - **Change Workflow** — To choose another health events workflow, click **(switch workflow)**.
 - **Delete Events** — To delete health events, check the check box next to the events you want to delete, and click **Delete**. To delete all the events in the current constrained view, click **Delete All**, then confirm you want to delete all the events.
 - **Generate Reports** — Generate a report based on data in the table view — click **Report Designer**.
 - **Modify** — Modify the time and date range for events listed in the Health table view. Note that events that were generated outside the appliance's configured time window (whether global or event-specific) may appear in an event view if you constrain the event view by time. This may occur even if you configured a sliding time window for the appliance.
 - **Navigate** — Navigate through event view pages.
 - **Navigate Bookmark** — To navigate to the bookmark management page, click **View Bookmarks** from any event view.
 - **Navigate Other** — Navigate to other event tables to view associated events.

- Sort — Sort the events that appear, change what columns display in the table of events, or constrain the events that appear
- View All — To view event details for all events in the view, click **View All**.
- View Details — To view the details associated with a single health event, click the down arrow link on the left side of the event.
- View Multiple — To view event details for multiple health events, choose the check box next to the rows that correspond with the events you want to view details for and then click **View**.
- View Status — To view all events of a particular status, click status in the Status column for an event with that status.

Hardware Alert Details for 7000 and 8000 Series Devices

Note The 8350 hardware platform has six fans, which display as FAN2 through FAN7. This is expected behavior. If you receive a hardware alert related to FAN1 or fan numbering in general on the 8350 platform, you can disregard the alert.

Table 37: Conditions Monitored for 7000 and 8000 Series Devices

Condition Monitored	Causes of Yellow or Red Error Conditions
Device high availability status	If 7000 or 8000 Series devices in a high-availability pair are no longer communicating with each other (due, for example, to a cabling problem), the Hardware Alarms module changes to red.
<code>ftwo</code> daemon status	If the <code>ftwo</code> daemon goes down, health status for the Hardware Alarms module changes to red and message details include a reference to the daemon.
NFE cards detected	Indicates the number of NFE cards detected on the system. If this value does not match the appliance's expected NFE count, the Hardware Alarms module changes to red.
NFE hardware status	If one or more NFE cards are not communicating, the Hardware Alarms module changes to red and the applicable card appears in the message details.
NFE heartbeat	If the system detects no NFE heartbeat, the Hardware Alarms module changes to red and message details include a reference to the relevant card(s).
NFE internal link status	If the link between the NMSB and NFE card(s) goes down, the Hardware Alarms module changes to red and message details include a reference to the relevant ports.
NFE Message daemon	If the NFE Message daemon goes down, health status for the Hardware Alarms module changes to red and the message details include a reference to the daemon (and, if applicable, the NFE card number).

Condition Monitored	Causes of Yellow or Red Error Conditions
NFE temperature	<p>If NFE temperature exceeds 97 degrees Celsius, health status for the Hardware Alarms module changes to yellow and message details include a reference to the NFE temperature (and, if applicable, the NFE card number).</p> <p>If NFE temperature exceeds 102 degrees Celsius, health status for the Hardware Alarms module changes to red and message details include a reference to the NFE temperature. (and, if applicable, the NFE card number).</p>
NFE temperature status	Indicates the current temperature status of the given NFE card. The Hardware Alarms module indicates green for OK, yellow for Warning, and red for Critical (and, if applicable, the NFE card number).
NFE <code>TCAM</code> daemon	If the NFE <code>TCAM</code> daemon goes down, health status for the Hardware Alarms module changes to red and message details include a reference to the daemon (and, if applicable, the NFE card number).
<code>nfm_ipfragd</code> (host frag) daemon	If the <code>nfm_ipfragd</code> daemon goes down, health status for the Hardware Alarms module changes to red and message details include a reference to the daemon (and, if applicable, the NFE card number).
NFE Platform daemon	If the NFE Platform daemon goes down, health status for the Hardware Alarms module changes to red and message details include a reference to the daemon (and, if applicable, the NFE card number).
NMSB communications	If the Media assembly is not present or not communicating, health status for the Hardware Alarms module changes to red and message details include a reference to the NFE temperature (and, if applicable, the NFE card number).
<code>psls</code> daemon status	If the <code>psls</code> daemon goes down, health status for the Hardware Alarms module changes to red and message details include a reference to the daemon.
<code>Rulesd</code> (host rules) daemon	If the <code>Rulesd</code> daemon goes down, health status for the Hardware Alarms module changes to yellow and message details include a reference to the daemon (and, if applicable, the NFE card number).
<code>scmd</code> daemon status	If the <code>scmd</code> daemon goes down, health status for the Hardware Alarms module changes to red and message details include a reference to the daemon.

The Health Events Table

The Health Monitor modules you choose to enable in your health policy run various tests to determine appliance health status. When the health status meets criteria that you specify, a health event is generated.

The table below describes the fields that can be viewed and searched in the health events table.

Table 38: Health Event Fields

Field	Description
Module Name	Specify the name of the module which generated the health events you want to view. For example, to view events that measure CPU performance, type <code>CPU</code> . The search should retrieve applicable CPU Usage and CPU temperature events.
Test Name (Search only)	The name of the health module that generated the event.
Time (Search only)	The timestamp for the health event.
Description	The description of the health module that generated the event. For example, health events generated when a process was unable to execute are labeled <code>Unable to Execute</code> .
Value	The value (number of units) of the result obtained by the health test that generated the event. For example, if the Firepower Management Center generates a health event whenever a device it is monitoring is using 80 percent or more of its CPU resources, the value could be a number from 80 to 100.
Units	The units descriptor for the result. You can use the asterisk (*) to create wildcard searches. For example, if the Firepower Management Center generates a health event when a device it is monitoring is using 80 percent or more of its CPU resources, the units descriptor is a percentage sign (%).
Status	The status (Critical, Yellow, Green, or Disabled) reported for the appliance.
Domain	For health events reported by managed devices, the domain of the device that reported the health event. For health events reported by the Firepower Management Center, <code>Global</code> . This field is only present in a multidomain deployment.
Device	The appliance where the health event was reported.

CHAPTER 14

Monitoring the System

The following topics describe how to monitor the Firepower System:

- [About System Statistics, on page 279](#)
- [System Messages, on page 287](#)
- [Managing System Messages, on page 290](#)

About System Statistics

You can view system statistics for the Firepower Management Center and 7000 & 8000 Series devices.

The Statistics page lists the current status of general appliance statistics, including disk usage and system processes, Data Correlator statistics (FMC only), and intrusion event information (FMC only).

The Host Statistics Section

The following table describes the host statistics listed on the Statistics page.

Table 39: Host Statistics

Category	Description
Time	The current time on the system.
Uptime	The number of days (if applicable), hours, and minutes since the system was last started.
Memory Usage	The percentage of system memory that is being used.
Load Average	The average number of processes in the CPU queue for the past 1 minute, 5 minutes, and 15 minutes.
Disk Usage	The percentage of the disk that is being used. Click the arrow to view more detailed host statistics.
Processes	A summary of the processes running on the system.

The Disk Usage Section

The Disk Usage section of the Statistics page provides a quick synopsis of disk usage, both by category and by partition status. If you have a malware storage pack installed on a device, you can also check its partition status. You can monitor this page from time to time to ensure that enough disk space is available for system processes and the database.

Tip You can also use the Disk Usage health monitor on the Firepower Management Center to monitor disk usage and alert on low disk space conditions.

The Processes Section

The Processes section of the Statistics page allows you to see the processes that are currently running on an appliance. It provides general process information and specific information for each running process. You can use the Firepower Management Center's web interface to view the process status for any managed device.

Note that there are two different types of processes that run on an appliance: daemons and executable files. Daemons always run, and executable files are run when required.

Process Status Fields

When you expand the Processes section of the Statistics page, you can also view the following:

Cpu(s)

Lists the following CPU usage information:

- user process usage percentage
- system process usage percentage
- nice usage percentage (CPU usage of processes that have a negative nice value, indicating a higher priority). Nice values indicate the scheduled priority for system processes and can range between -20 (highest priority) and 19 (lowest priority).
- idle usage percentage

Mem

Lists the following memory usage information:

- total number of kilobytes in memory
- total number of used kilobytes in memory
- total number of free kilobytes in memory
- total number of buffered kilobytes in memory

Swap

Lists the following swap usage information:

- total number of kilobytes in swap
- total number of used kilobytes in swap
- total number of free kilobytes in swap
- total number of cached kilobytes in swap

The following table describes each column that appears in the Processes section.

Table 40: Process List Columns

Column	Description
Pid	The process ID number
Username	The name of the user or group running the process
Pri	The process priority
Nice	The <i>nice</i> value, which is a value that indicates the scheduling priority of a process. Values range between -20 (highest priority) and 19 (lowest priority)
Size	The memory size used by the process (in kilobytes unless the value is followed by <i>m</i> , which indicates megabytes)
Res	The amount of resident paging files in memory (in kilobytes unless the value is followed by <i>m</i> , which indicates megabytes)
State	The process state: <ul style="list-style-type: none"> • D — process is in uninterruptible sleep (usually Input/Output) • N — process has a positive nice value • R — process is runnable (on queue to run) • S — process is in sleep mode • T — process is being traced or stopped • W — process is paging • X — process is dead • Z — process is defunct • < — process has a negative nice value
Time	The amount of time (in hours:minutes:seconds) that the process has been running
Cpu	The percentage of CPU that the process is using
Command	The executable name of the process

Related Topics

[System Daemons](#), on page 282

[Executables and System Utilities](#), on page 283

System Daemons

Daemons continually run on an appliance. They ensure that services are available and spawn processes when required. The following table lists daemons that you may see on the Process Status page and provides a brief description of their functionality.

Note The table below is not an exhaustive list of all processes that may run on an appliance.

Table 41: System Daemons

Daemon	Description
crond	Manages the execution of scheduled commands (cron jobs)
dhclient	Manages dynamic host IP addressing
fpcollect	Manages the collection of client and server fingerprints
httpd	Manages the HTTP (Apache web server) process
httpsd	Manages the HTTPS (Apache web server with SSL) service, and checks for working SSL certificate authentication; runs in the background to provide secure web access to the appliance
keventd	Manages Linux kernel event notification messages
klogd	Manages the interception and logging of Linux kernel messages
kswapd	Manages Linux kernel swap memory
kupdated	Manages the Linux kernel update process, which performs disk synchronization
mysqld	Manages database processes
ntpd	Manages the Network Time Protocol (NTP) process
pm	Manages all Firepower System processes, starts required processes, restarts any process that unexpectedly
reportd	Manages reports
safe_mysqld	Manages safe mode operation of the database; restarts the database daemon if an error occurs; logs runtime information to a file
SFDataCorrelator	Manages data transmission
sfstreamer (FMC only)	Manages connections to third-party client applications that use the Event Streamer
sfmgr	Provides the RPC service for remotely managing and configuring an appliance using an SSH connection to the appliance
SFRemediateD (FMC only)	Manages remediation responses

Daemon	Description
sftimeserviced (FMC only)	Forwards time synchronization messages to managed devices
sfmbservice	Provides access to the sfmb message broker process running on a remote appliance, using a connection to the appliance. Currently used only by health monitoring to send health events from a managed device to a Firepower Management Center.
sftroughd	Listens for connections on incoming sockets and then invokes the correct executable (Cisco message broker, sfmb) to handle the request
sftunnel	Provides the secure communication channel for all processes requiring communication with the appliance
sshd	Manages the Secure Shell (SSH) process; runs in the background to provide SSH access to the appliance
syslogd	Manages the system logging (syslog) process

Executables and System Utilities

There are a number of executables on the system that run when executed by other processes or through user action. The following table describes the executables that you may see on the Process Status page.

Table 42: System Executables and Utilities

Executable	Description
awk	Utility that executes programs written in the <code>awk</code> programming language
bash	GNU Bourne-Again Shell
cat	Utility that reads files and writes content to standard output
chown	Utility that changes user and group file permissions
chsh	Utility that changes the default login shell
SFDataCorrelator (FMC only)	Analyzes binary files created by the system to generate events, connection data, and network maps
cp	Utility that copies files
df	Utility that lists the amount of free space on the appliance
echo	Utility that writes content to standard output
egrep	Utility that searches files and folders for specified input; supports extended set of regular expressions not supported in standard <code>grep</code>
find	Utility that recursively searches directories for specified input
grep	Utility that searches files and directories for specified input
halt	Utility that stops the server

Executable	Description
httpsdctl	Handles secure Apache Web processes
hwclock	Utility that allows access to the hardware clock
ifconfig	Indicates the network configuration executable. Ensures that the MAC address stays constant
iptables	Handles access restriction based on changes made to the Access Configuration page.
iptables-restore	Handles iptables file restoration
iptables-save	Handles saved changes to the iptables
kill	Utility that can be used to end a session and process
killall	Utility that can be used to end all sessions and processes
ksh	Public domain version of the Korn shell
logger	Utility that provides a way to access the syslog daemon from the command line
md5sum	Utility that prints checksums and block counts for specified files
mv	Utility that moves (renames) files
myisamchk	Indicates database table checking and repairing
mysql	Indicates a database process; multiple instances may appear
openssl	Indicates authentication certificate creation
perl	Indicates a perl process
ps	Utility that writes process information to standard output
sed	Utility used to edit one or more text files
sfheartbeat	Identifies a heartbeat broadcast, indicating that the appliance is active; heartbeat used to maintain contact between a device and Firepower Management Center
symb	Indicates a message broker process; handles communication between Firepower Management Centers and device.
sh	Public domain version of the Korn shell
shutdown	Utility that shuts down the appliance
sleep	Utility that suspends a process for a specified number of seconds
smtpclient	Mail client that handles email transmission when email event notification functionality is enabled

Executable	Description
snmptrap	Forwards SNMP trap data to the SNMP trap server specified when SNMP notification functionality is enabled
snort	Indicates that Snort is running
ssh	Indicates a Secure Shell (SSH) connection to the appliance
sudo	Indicates a sudo process, which allows users other than admin to run executables
top	<p>Utility that displays information about the top CPU processes</p> <p>Note The CPU usage output of this utility is a split up of different types of usages of the CPU core. You must add both user and system processes usage to know the actual total CPU usage.</p> <p>For example, if the output of top command is: %Cpu(s): 76.6 us, 22.1 sy, 0.0 ni, 0.0 id, 0.0 wa, 0.0 hi, 1.3 si, 0.0 st</p> <p>Here, 76.6% of CPU time are used by user processes, 22.1% of CPU time is used by system(kernel) processes. The total CPU usage is 98.7%.</p> <p>Thus, the CPU usage reported in this utility appear to be different from the Health Monitor dashboard. In addition, this utility uses a three seconds interval to calculate the CPU usage. Whereas, the management center health monitor uses one-second intervals.</p>
touch	Utility that can be used to change the access and modification times of specified files
vim	Utility used to edit text files
wc	Utility that performs line, word, and byte counts on specified files

Related Topics

[Configure an Access List](#), on page 720

The SFDataCorrelator Process Statistics Section

On a Firepower Management Center, you can view statistics about the Data Correlator and network discovery processes for the current day. As the managed devices perform data acquisition, decoding, and analysis, the network discovery process correlates the data with the fingerprint and vulnerability databases, then produces binary files that are processed by the Data Correlator running on the Firepower Management Center. The Data Correlator analyzes the information from the binary files, generates events, and creates network maps.

The statistics that appear for network discovery and the Data Correlator are averages for the current day, using statistics gathered between 12:00 AM and 11:59 PM for each device.

The following table describes the statistics displayed for the Data Correlator process.

Table 43: Data Correlator Process Statistics

Category	Description
Events/Sec	Number of discovery events that the Data Correlator receives and processes per second
Connections/Sec	Number of connections that the Data Correlator receives and processes per second
CPU Usage — User (%)	Average percentage of CPU time spent on user processes for the current day
CPU Usage — System (%)	Average percentage of CPU time spent on system processes for the current day
VmSize (KB)	Average size of memory allocated to the Data Correlator for the current day, in kilobytes
VmRSS (KB)	Average amount of memory used by the Data Correlator for the current day, in kilobytes

The Intrusion Event Information Section

On both the Firepower Management Center and managed devices, you can view summary information about intrusion events on the Statistics page. This information includes the date and time of the last intrusion event, the total number of events that have occurred in the past hour and the past day, and the total number of events in the database.

Note The information in the Intrusion Event Information section of the Statistics page is based on intrusion events stored on the managed device rather than those sent to the Firepower Management Center. No intrusion event information is listed on this page if the managed device cannot (or is configured not to) store intrusion events locally.

The following table describes the statistics displayed in the Intrusion Event Information section of the Statistics page.

Table 44: Intrusion Event Information

Statistic	Description
Last Alert Was	The date and time that the last event occurred
Total Events Last Hour	The total number of events that occurred in the past hour
Total Events Last Day	The total number of events that occurred in the past twenty-four hours
Total Events in Database	The total number of events in the events database

Viewing System Statistics

On the Firepower Management Center, the web interface displays statistics for the FMC and any devices it manages. On 7000 and 8000 Series devices, the system displays statistics for that device only.

Before you begin

You must be an Admin or Maintenance user and be in the Global domain to view system statistics.

Procedure

- Step 1** Choose **System > Monitoring > Statistics**.
- Step 2** (FMC only) Choose a device from the **Select Device(s)** list, and click **Select Devices**.
- Step 3** View available statistics.
- Step 4** In the Disk Usage section, you can:
- Hover your pointer over a disk usage category in the **By Category** stacked bar to view (in order):
 - the percentage of available disk space used by that category
 - the actual storage space on the disk
 - the total disk space available for that category
 - Click the down arrow next to **By Partition** to expand it. If you have a malware storage pack installed, the `/var/storage` partition usage is displayed.
- Step 5** (Optional) Click the arrow next to **Processes** to view the information described in [Process Status Fields](#), on page 280.
-

System Messages

When you need to track down problems occurring in the Firepower System, the Message Center is the place to start your investigation. This feature allows you to view the messages that the Firepower System continually generates about system activities and status.

To open the Message Center, click on the System Status icon, located to the immediate right of the Deploy button in the main menu. This icon can take one of the following forms, depending on the system status:

-  — Indicates one or more errors and any number of warnings are present on the system.
-  — Indicates one or more warnings and no errors are present on the system.
-  — Indicates no warnings or errors are present on the system.

If a number is displayed with the icon, it indicates the total current number of error or warning messages.

To close the Message Center, click anywhere outside of it within the Firepower System web interface.

In addition to the Message Center, the web interface displays pop-up notifications in immediate response to your activities and ongoing system activities. Some pop-up notifications automatically disappear after five seconds, while others are "sticky," meaning they display until you explicitly dismiss them by clicking **Dismiss** (✕). Click the **Dismiss** link at the top of the notifications list to dismiss all notifications at once.

Tip Hovering your cursor over a non-sticky pop-up notification causes it to be sticky.

The system determines which messages it displays to users in pop-up notifications and the Message Center based on their licenses, domains, and access roles.

Message Types

The Message Center displays messages reporting system activities and status organized into three different tabs:

Deployments

This tab displays current status related to configuration deployment for each appliance in your system, grouped by domain. The Firepower System reports the following deployment status values on this tab.

- **Running (Spinning)** — The configuration is in the process of deploying.
- **Success** — The configuration has successfully been deployed.
- **Warning** (⚠) — Warning deployment statuses contribute to the message count displayed with the **Warning System Status icon**.
- **Failure** — The configuration has failed to deploy; see [Out-of-Date Policies, on page 316](#). Failed deployments contribute to the message count displayed with the **Error System Status icon**.

Health

This tab displays current health status information for each appliance in your system, grouped by domain. Health status is generated by health modules as described in [About Health Monitoring, on page 253](#). The Firepower System reports the following health status values on this tab:

- **Warning** (⚠) — Indicates that warning limits have been exceeded for a health module on an appliance and the problem has not been corrected. The Health Monitoring page indicates these conditions with a **Yellow Triangle** (⚠). Warning statuses contribute to the message count displayed with the **Warning System Status icon**.
- **Critical** (🚨) — Indicates that critical limits have been exceeded for a health module on an appliance and the problem has not been corrected. The Health Monitoring page indicates these conditions with a **Critical** (🚨) icon. Critical statuses contribute to the message count displayed with the **Error System Status icon**.
- **Error** (✖) — Indicates that a health monitoring module has failed on an appliance and has not been successfully re-run since the failure occurred. The Health Monitoring page indicates these conditions with a **Error icon**. Error statuses contribute to the message count displayed with the **Error System Status icon**.

You can click on links in the Health tab to view related detailed information on the Health Monitoring page. If there are no current health status conditions, the Health tab displays no messages.

Tasks

In the Firepower System, you can perform certain tasks (such as configuration backups or update installation) that can require some time to complete. This tab displays the status of these long-running tasks, and can include tasks initiated by you or, if you have appropriate access, other users of the system. The tab presents messages in reverse chronological order based on the most recent update time for each message. Some task status messages include links to more detailed information about the task in question. The Firepower System reports the following task status values on this tab:

- **Waiting()** — Indicates a task that is waiting to run until another in-progress task is complete. This message type displays an updating progress bar.
- **Running** — Indicates a task that is in-progress. This message type displays an updating progress bar.
- **Retrying** — Indicates a task that is automatically retrying. Note that not all tasks are permitted to try again. This message type displays an updating progress bar.
- **Success** — Indicates a task that has completed successfully.
- **Failure** — Indicates a task that did not complete successfully. Failed tasks contribute to the message count displayed with the **Error System Status icon**.
- **Stopped or Suspended** — Indicates a task that was interrupted due to a system update. Stopped tasks cannot be resumed. After normal operations are restored, start the task again.
- **Skipped** — A process in progress prevented the task from starting. Try again to start the task.

New messages appear in this tab as new tasks are started. As tasks complete (status success, failure, or stopped), this tab continues to display messages with final status indicated until you remove them. Cisco recommends you remove messages to reduce clutter in the Tasks tab as well as the message database.

Message Management

From the Message Center you can:

- Configure pop-up notification behavior (choosing whether to display them).
- Display additional task status messages from the system database (if any are available that have not been removed).
- Remove individual task status messages. (This affects all users who can view the removed messages.)
- Remove task status messages in bulk. (This affects all users who can view the removed messages.)

Tip

Cisco recommends that you periodically remove accumulated task status messages from the Task tab to reduce clutter in the display as well as the database. When the number of messages in the database approaches 100,000, the system automatically deletes task status messages that you have removed.

Managing System Messages

Procedure

Step 1 Click System Status to display the Message Center.

Step 2 You have the following choices:

- Click **Deployments** to view messages related to configuration deployments. See [Viewing Deployment Messages, on page 290](#). You must be an Admin user or have the **Deploy Configuration to Devices** permission to view these messages.
 - Click **Health** to view messages related to the health of your Firepower Management Center and the devices registered to it. See [Viewing Health Messages, on page 290](#). You must be an Admin user or have the **Health** permission to view these messages.
 - Click **Tasks** to view or manage messages related to long-running tasks. See [Viewing Task Messages, on page 291](#) or [Managing Task Messages, on page 291](#). Everyone can see their own tasks. To see the tasks of other users, you must be an Admin user or have the **View Other Users' Tasks** permission.
 - Click **Cog** (⚙) in the upper right corner of the Message Center to configure pop-up notification behavior. See [Configuring Notification Behavior, on page 292](#).
-

Viewing Deployment Messages

You must be an Admin user or have the **Deploy Configuration to Devices** permission to view these messages.

Procedure

Step 1 Click System Status to display the Message Center.

Step 2 Click **Deployments**.

Step 3 You have the following choices:

- Click **total** to view all current deployment statuses.
 - Click a status value to view only messages with that deployment status.
 - Hover your cursor over the time elapsed indicator for a message (for example, **1m 5s**) to view the elapsed time, and start and stop times for the deployment.
-

Related Topics

[Deploy Configuration Changes, on page 306](#)

Viewing Health Messages

You must be an Admin user or have the **Health** permission to view these messages.

Procedure

Step 1 Click System Status to display the Message Center.

Step 2 Click **Health**.

Step 3 You have the following choices:

- Click **total** to view all current health statuses.
 - Click on a status value to view only messages with that status.
 - Hover your cursor over the relative time indicator for a message (for example, **3 day(s) ago**) to view the time of the most recent update for that message.
 - To view detailed health status information for a particular message, click the message.
 - To view complete health status on the Health Monitoring page, click **Health Monitor**.
-

Related Topics

[About Health Monitoring](#), on page 253

Viewing Task Messages

Everyone can see their own tasks. To see the tasks of other users, you must be an Admin user or have the **View Other Users' Tasks** permission.

Procedure

Step 1 Click System Status to display the Message Center.

Step 2 Click **Tasks**.

Step 3 You have the following choices:

- Click **total** to view all current task statuses.
- Click a status value to view only messages for tasks with the that status.

Note Messages for stopped tasks appear only in the total list of task status messages. You cannot filter on stopped tasks.

- Hover your cursor over the relative time indicator for a message (e.g., **3 day(s) ago**) to view the time of the most recent update for that message.
 - Click any link within a message to view more information about the task.
 - If more task status messages are available for display, click **Fetch more messages** at the bottom of the message list to retrieve them.
-

Managing Task Messages

Everyone can see their own tasks. To see the tasks of other users, you must be an Admin user or have the **View Other Users' Tasks** permission.

Procedure

Step 1 Click System Status to display the Message Center.

Step 2 Click Tasks.

Step 3 You have the following choices:

- If more task status messages are available for display, click on **Fetch more messages** at the bottom of the message list to retrieve them.
 - To remove a single message for a completed task (status stopped, success, or failure), click on **Remove** (✕) next to the message.
 - To remove all messages for all tasks that have completed (status stopped, success, or failure), filter the messages on **total** and click on **Remove all completed tasks**.
 - To remove all messages for all tasks that have completed successfully, filter the messages on **success**, and click on **Remove all successful tasks**.
 - To remove all messages for all tasks that have failed, filter the messages on **failure**, and click on **Remove all failed tasks**.
-

Configuring Notification Behavior

Note This setting affects all pop-up notifications and persists between login sessions.

Procedure

Step 1 Click System Status to display the Message Center.

Step 2 Click **Cog** (⚙) in the upper right corner of the Message Center.

Step 3 To enable or disable pop-up notification display, click the **Show notifications** slider.

Step 4 Click **Cog** (⚙) again to hide the slider.

Step 5 Click System Status again to close the Message Center.

CHAPTER 15

Domain Management

The following topics describe how to manage multitenancy using domains:

- [Introduction to Multitenancy Using Domains, on page 295](#)
- [Requirements and Prerequisites for Domains, on page 298](#)
- [Managing Domains, on page 298](#)
- [Creating New Domains, on page 299](#)
- [Moving Data Between Domains, on page 300](#)
- [Moving Devices Between Domains, on page 301](#)

Introduction to Multitenancy Using Domains

The Firepower System allows you to implement multitenancy using *domains*. Domains segment user access to managed devices, configurations, and events. You can create up to 50 subdomains under a top-level Global domain, in two or three levels.

When you log into the Firepower Management Center, you log into a single domain, called the *current domain*. Depending on your user account, you may be able to switch to other domains.

In addition to any restrictions imposed by your user role, your current domain level can also limit your ability to modify various Firepower System configurations. The system limits most management tasks, like system software updates, to the Global domain.

The system limits other tasks to *leaf domains*, which are domains with no subdomains. For example, you must associate each managed device with a leaf domain, and perform device management tasks from the context of that leaf domain.

Each leaf domain builds its own network map, based on the discovery data collected by that leaf domain's devices. Events reported by a managed device (connection, intrusion, malware, and so on) are also associated with the device's leaf domain.

One Domain Level: Global

If you do not configure multitenancy, all devices, configurations, and events belong to the Global domain, which in this scenario is also a leaf domain. Except for domain management, the system hides domain-specific configurations and analysis options until you add subdomains.

Two Domain Levels: Global and Second-Level

In a two-level multidomain deployment, the Global domain has direct descendant domains only. For example, a managed security service provider (MSSP) can use a single Firepower Management Center to manage network security for multiple customers:

- Administrators at the MSSP logging into the Global domain, cannot view or edit customers' deployments. They must log into respective second-level named subdomains to manage the customers' deployment.
- Administrators for each customer can log into second-level named subdomains to manage only the devices, configurations, and events applicable to their organizations. These local administrators cannot view or affect the deployments of other customers of the MSSP.

Three Domain Levels: Global, Second-Level, and Third-Level

In a three-level multidomain deployment, the Global domain has subdomains, at least one of which has its own subdomain. To extend the previous example, consider a scenario where an MSSP customer—already restricted to a subdomain—wants to further segment its deployment. This customer wants to separately manage two classes of device: devices placed on network edges and devices placed internally:

- Administrators for the customer logging into the second-level subdomain cannot view or edit the customer's edge network deployments. They must log into the respective leaf domain to manage the devices deployed on the network edge.
- Administrators for the customer's edge network can log into a third-level (leaf) domain to manage only the devices, configurations, and events applicable to devices deployed on the network edge. Similarly, administrators for the customer's internal network can log into a different third-level domain to manage internal devices, configurations, and events. Edge and internal administrators cannot view each other's deployment.

Note In an FMC that uses multi-tenancy, the SSO configuration can be applied only at the global domain level, and applies to the global domain and all subdomains.

Domains Terminology

This documentation uses the following terms when describing domains and multidomain deployments:

Global Domain

In a multidomain deployment, the top-level domain. If you do not configure multitenancy, all devices, configurations, and events belong to the Global domain. Administrators in the Global domain can manage the entire Firepower System deployment.

Subdomain

A second or third-level domain.

Second-level domain

A child of the Global domain. Second-level domains can be leaf domains, or they can have subdomains.

Third-level domain

A child of a second-level domain. Third-level domains are always leaf domains.

Leaf domain

A domain with no subdomains. Each device must belong to a leaf domain.

Descendant domain

A domain descending from the current domain in the hierarchy.

Child domain

A domain's direct descendant.

Ancestor domain

A domain from which the current domain descends.

Parent domain

A domain's direct ancestor.

Sibling domain

A domain with the same parent.

Current domain

The domain you are logged into now. The system displays the name of the current domain before your user name at the top right of the web interface. Unless your user role is restricted, you can edit configurations in the current domain.

Domain Properties

To modify a domain's properties, you must have Administrator access in that domain's parent domain.

Name and Description

Each domain must have a unique name within its hierarchy. A description is optional.

Parent Domain

Second- and third-level domains have a parent domain. You cannot change a domain's parent after you create the domain.

Devices

Only leaf domains may contain devices. In other words, a domain may contain subdomains or devices, but not both. You cannot save a deployment where a non-leaf domain directly controls a device.

In the domain editor, the web interface displays available and selected devices according to their current place in your domain hierarchy.

Host Limit

The number of hosts a FMC can monitor, and therefore store in network maps, depends on its model. In a multidomain deployment, leaf domains share the available pool of monitored hosts, but have separate network maps.

To ensure that each leaf domain can populate its network map, you can set host limits at each subdomain level. If you set a domain's host limit to 0, the domain shares in the general pool.

Setting the host limit has a different effect at each domain level:

- **Leaf** — For a leaf domain, a host limit is a simple limit on the number of hosts the leaf domain can monitor.
- **Second Level** — For a second-level domain that manages third-level leaf domains, a host limit represents the total number of hosts that the leaf domains can monitor. The leaf domains share the pool of available hosts.
- **Global** — For the Global domain, the host limit is equal to the total number of hosts a FMC can monitor. You cannot change it

The sum of subdomains' host limits can add up to more than their parent domain's host limit. For example, if the Global domain host limit is 150,000, you can configure multiple subdomains each with a host limit of 100,000. Any of those domains, but not all, can monitor 100,000 hosts.

The network discovery policy controls what happens when you detect a new host after you reach the host limit; you can drop the new host, or replace the host that has been inactive for the longest time. Because each leaf domain has its own network discovery policy, each leaf domain governs its own behavior when the system discovers a new host.

If you reduce the host limit for a domain and its network map contains more hosts than the new limit, the system deletes the hosts that have been inactive the longest.

Requirements and Prerequisites for Domains

Model Support

Any.

Supported Domains

Any

User Roles

- Admin

Managing Domains

To modify a domain's properties, you must have Administrator access in that domain's parent domain.

Procedure

Step 1 Choose **System > Domains**.

Step 2 Manage your domains:

- Add — Click **Add Domain**, or click **Add Subdomain** next to the parent domain; see [Creating New Domains, on page 299](#).
- Edit — Click **Edit** () next to the domain you want to modify; see [Domain Properties, on page 297](#).
- Delete — Click **Delete** () next to the empty domain you want to delete, then confirm your choice. Move devices from domains you want to delete by editing their destination domain.

Step 3 When you are done making changes to the domain structure and all devices are associated with leaf domains, click **Save** to implement your changes.

Step 4 If prompted, make additional changes:

- If you changed a leaf domain to a parent domain, move or delete the old network map; see [Moving Data Between Domains, on page 300](#).
- If you moved devices between domains and must assign new policies and security zones, see [Moving Devices Between Domains, on page 301](#).

What to do next

- Configure user roles and policies (access control, network discovery, and so on) for any new domains. Update device properties as needed.
- Deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

Creating New Domains

You can create up to 50 subdomains under a top-level Global domain, in two or three levels.

You must assign all devices to a leaf domain before you can implement the domain configuration. When you add a subdomain to a leaf domain, the domain stops being a leaf domain and you must reassign its devices.

Procedure

- Step 1** In a Global or a second-level domain, choose **System > Domains**.
- Step 2** Click **Add Domain**, or click **Add Subdomain** next to the parent domain.
- Step 3** Enter a **Name** and **Description**.
- Step 4** Choose a **Parent Domain**.
- Step 5** On **Devices**, choose the **Available Devices** to add to the domain, then click **Add to Domain** or drag and drop into the list of **Selected Devices**.
- Step 6** Optionally, click **Advanced** to limit the number of hosts the new domain may monitor; see [Domain Properties, on page 297](#).
- Step 7** Click **Save** to return to the domain management page.

The system warns you if any devices are assigned to non-leaf domains. Click **Create New Domain** to create a new domain for those devices. Click **Keep Unassigned** if you plan to move the devices to existing domains.

- Step 8** When you are done making changes to the domain structure and all devices are associated with leaf domains, click **Save** to implement your changes.
- Step 9** If prompted, make additional changes:
- If you changed a leaf domain to a parent domain, move or delete the old network map; see [Moving Data Between Domains, on page 300](#).
 - If you moved devices between domains and must assign new policies and security zones, see [Moving Devices Between Domains, on page 301](#).
-

What to do next

- Configure user roles and policies (access control, network discovery, and so on) for any new domains. Update device properties as needed.
- Deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

Moving Data Between Domains

Because events and network maps are associated with leaf domains, when you change a leaf domain to a parent domain, you have two choices:

- Move the network map and associated events to a new leaf domain.
- Delete the network map but retain the events. In this case, the events remain associated with the parent domain until the system prunes events as needed or as configured. Or, you can delete old events manually.

Before you begin

Implement a domain configuration where a former leaf domain is now a parent domain; see [Managing Domains, on page 298](#).

Procedure

- Step 1** For each former leaf domain that is now a parent domain:
- Choose a new **Leaf Domain** to inherit the **Parent Domain**'s events and network map.
 - Choose **None** to delete the parent domain's network map, but retain old events.
- Step 2** Click **Save**.
-

What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

Moving Devices Between Domains

You can move devices between domains when you are in the global domain or a second-level domain. Moving a device between domains can affect the configurations and policies applied to the device. The system automatically retains and updates what it can. It deletes what it cannot update, namely, object overrides, dynamic routing configuration, static routes, IP pool associated with the diagnostic interface, and DDNS.

If you assign a Remote Access VPN policy to a device, you cannot move the same device from one domain to another domain.

When you move a device, the system can prompt you to choose the following new, essential configurations:

- **Access Control Policy** — If the access control policy assigned to a moved device is not valid or accessible in the new domain, choose a new policy. Every device must have an assigned access control policy.
- **Health Policy** — If the health policy applied to a moved device is inaccessible in the new domain, you can choose a new health policy.
- **Security Zones** — If the interfaces on the moved devices belong to a security zone that is inaccessible in the new domain, you can choose a new zone.

If devices require a policy update but you do not need to move interfaces between zones, the system displays a message stating that zone configurations are up to date. For example, if a device's interfaces belong to a security zone configured in a common ancestor domain, you do not need to update zone configurations when you move devices from subdomain to subdomain.

Before you begin

- Implement a domain configuration where you moved a device from domain to domain and now must assign new policies and security zones; see [Managing Domains, on page 298](#).

Procedure

-
- Step 1** In the **Move Devices** dialog box, under **Select Device(s) to Configure**, check the device you want to configure. Check multiple devices to assign the same health and access control policies.
 - Step 2** Choose an **Access Control Policy** to apply to the device, or choose **New Policy** to create a new policy.
 - Step 3** Choose a **Health Policy** to apply to the device, or choose **None** to leave the device without a health policy.
 - Step 4** If prompted to assign interfaces to new zones, choose a **New Security Zone** for each listed interface, or choose **None** to assign it later.
 - Step 5** After you configure all affected devices, click **Save** to save policy and zone assignments.
 - Step 6** Click **Save** to implement the domain configuration.
-

What to do next

- Update other configurations on the moved device that were affected by the move.
- Deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

CHAPTER 16

Policy Management

The following topics describe how to manage various policies on the Firepower Management Center:

Policy Deployment

Caution Do NOT push the FMC deployments over a VPN tunnel that is terminating directly on the Firepower Threat Defense. Pushing the FMC deployments can potentially inactivate the tunnel and disconnect the FMC and the Firepower Threat Defense.

Recovering the device from this situation can be very disruptive and require executing the disaster recovery procedure. This procedure resets the Firepower Threat Defense configuration to factory defaults by changing manager from FMC to local and configuring the device from beginning. For more information, see [Deploying the FMC Policy Configuration over VPN Tunnel, on page 304](#).

After you configure your deployment, and any time you change that configuration, you must deploy the changes to affected devices. You can view deployment status in the Message Center.

Deploying updates the following components:

- Device and interface configurations
- Device-related policies: NAT, VPN, platform settings
- Access control and related policies: DNS, file, identity, intrusion, network analysis, SSL
- Network discovery policy
- Intrusion rule updates
- Configurations and objects associated with any of these elements

You can configure the system to deploy automatically by scheduling a deploy task or by setting the system to deploy when importing intrusion rule updates. Automating policy deployment is especially useful if you allow intrusion rule updates to modify system-provided base policies for intrusion and network analysis. Intrusion rule updates can also modify default values for the advanced preprocessing and performance options in your access control policies.

In a multidomain deployment, you can deploy changes for any domain where your user account belongs:

- Switch to an ancestor domain to deploy changes to all subdomains at the same time.
- Switch to a leaf domain to deploy changes to only that domain.

Best Practices for Deploying Configuration Changes

The following are guidelines for deploying configuration changes.

Deploying the FMC Policy Configuration over VPN Tunnel

You can deploy the FMC policy configuration over a VPN tunnel, only if the deployment is for a device that does not terminate the tunnel. The FMC to Firepower Threat Defense management traffic should be its own secure transport SF tunnel and does not need to be over S2S VPN tunnel for any connectivity.

For policy-based VPN tunnel, choose the protected networks on both side to exclude the FMC to Firepower Threat Defense management traffic. For route-based VPN tunnel, configure the routing to exclude the FMC to Firepower Threat Defense management traffic to the VTI interface.

When you push the FMC deployments over the VPN tunnel with the management traffic that is also passing through the tunnel, in the event of any VPN misconfiguration, it inactivates the tunnel and results in disconnecting the FMC and the Firepower Threat Defense.

To reinitiate the tunnel configuration, you can either:

- Remove the sensor from the Firepower Threat Defense and the FMC (resulting in losing all of its configuration), and then add the sensor again to the FMC.

Or

- Contact Cisco TAC.

Note Reinstantiating the tunnel configuration requires overhauling of the system.

Inline vs Passive Deployments

Do not apply inline configurations to devices deployed passively, and vice versa.

Time to Deploy and Memory Limitations

The time it takes to deploy depends on multiple factors, including (but not limited to):

- The configurations you send to the device. For example, if you dramatically increase the number of Security Intelligence entries you block, deploy can take longer.
- Device model and memory. On lower-memory devices, deploying can take longer. For example, it can take up to five minutes to deploy to a Firepower 7010, 7020, or 7030 device.

Do not exceed the capability of your devices. If you exceed the maximum number of rules or policies supported by a target device, the system displays a warning. The maximum depends on a number of factors—not only memory and the number of processors on the device, but also on policy and rule complexity. For information on optimizing policies and rules, see [Best Practices for Access Control Rules, on page 974](#).

Interruptions to Traffic Flow and Inspection During Deploy

When you deploy, resource demands may result in a small number of packets dropping without inspection. Additionally, deploying some configurations restarts the Snort process, which interrupts traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See [Snort® Restart Traffic Behavior, on page 310](#) and [Configurations that Restart the Snort Process When Deployed or Activated, on page 311](#).

Caution We *strongly* recommend you deploy in a maintenance window or at a time when interruptions will have the least impact.

Auto-Enabling Application Detectors

If you are performing application control but disable required detectors, the system automatically enables the appropriate system-provided detectors upon policy deploy. If none exist, the system enables the most recently modified user-defined detector for the application.

Asset Rediscovery with Network Discovery Policy Changes

When you deploy changes to a network discovery policy, the system deletes and then rediscovers MAC address, TTL, and hops information from the network map for the hosts in your monitored networks. Also, the affected managed devices discard any discovery data that has not yet been sent to the FMC.

Related Topics

[Snort® Restart Scenarios](#), on page 308

Deploy Configuration Changes

Caution Do NOT push the FMC deployments over a VPN tunnel that is terminating directly on the Firepower Threat Defense. Pushing the FMC deployments can potentially inactivate the tunnel and disconnect the FMC and the Firepower Threat Defense.

Recovering the device from this situation can be very disruptive and require executing the disaster recovery procedure. This procedure resets the Firepower Threat Defense configuration to factory defaults by changing manager from FMC to local and configuring the device from beginning. For more information, see [Deploying the FMC Policy Configuration over VPN Tunnel, on page 304](#).

After you change configurations, deploy them to the affected devices. We *strongly* recommend that you deploy in a maintenance window or at a time when any interruptions to traffic flow and inspection will have the least impact.

Caution When you deploy, resource demands may result in a small number of packets dropping without inspection. Additionally, deploying some configurations restarts the Snort process, which interrupts traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See [Snort® Restart Traffic Behavior, on page 310](#) and [Configurations that Restart the Snort Process When Deployed or Activated, on page 311](#).

Before you begin

- Review the guidelines described in [Best Practices for Deploying Configuration Changes, on page 304](#).
- Be sure all managed devices use the same revision of the Security Zones object. If you have edited security zone objects: Do not deploy configuration changes to any device until you edit the zone setting for interfaces on *all* devices you want to sync. You must deploy to all managed devices at the same time. See [Synchronizing Security Zone Object Revisions, on page 429](#).

Note Policy deployment process fails if the sensor configuration is being read by the system during deployment. Executing commands such as `show running-config` from the sensor CLI disturbs the deployment, which results in deployment failure.

Procedure

Step 1 On the FMC menu bar, click **Deploy**.

The Deploy Policies dialog lists devices with out-of-date configurations. The **Version** at the top of the dialog specifies when you last made configuration changes. The **Current Version** column in the device table specifies when you last deployed changes to each device.

Step 2 Identify and choose the devices where you want to deploy configuration changes.

- **Sort**—Sort the device list by clicking a column heading.
- **Expand**—Click **Plus** to expand a device listing to view the configuration changes to be deployed. The system marks out-of-date policies with an **Index**.
- **Filter**—Filter the device list. Click the arrow in the upper-right corner of any column heading in the display, enter text in the **Filters** text box, and press Enter. Check or uncheck the check box to activate or deactivate the filter.
- **Arrange**—Place the mouse on a column heading to drag and drop the column in your preferred order.

Step 3 Click **Deploy**.

Step 4 If the system identifies errors or warnings in the changes to be deployed, it displays them in the **Errors and Warnings for Requested Deployment** window.

You have the following choices:

- **Proceed**—Continue deploying without resolving warning conditions. You cannot proceed if the system identifies errors.
- **Cancel**—Exit without deploying. Resolve the error and warning conditions, and attempt to deploy the configuration again.

What to do next

- (Optional) Monitor deployment status; see [Viewing Deployment Messages, on page 290](#).
- If deploy fails, see [Best Practices for Deploying Configuration Changes, on page 304](#).

Related Topics

[Snort® Restart Scenarios, on page 308](#)

Redeploy Existing Configurations to a Device

You can force-deploy existing (unchanged) configurations to a single managed device. We *strongly* recommend you deploy in a maintenance window or at a time when any interruptions to traffic flow and inspection will have the least impact.

Caution When you deploy, resource demands may result in a small number of packets dropping without inspection. Additionally, deploying some configurations restarts the Snort process, which interrupts traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See [Snort® Restart Traffic Behavior, on page 310](#) and [Configurations that Restart the Snort Process When Deployed or Activated, on page 311](#).

Before you begin

Review the guidelines described in [Best Practices for Deploying Configuration Changes, on page 304](#).

Procedure

Step 1 Choose **Devices > Device Management**.

Step 2 Click **Edit** (✎) next to the device where you want to force deployment.
 In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

Step 3 Click **Device**.

Step 4 Click **Edit** (✎) next to the **General** section heading.

Step 5 Click **Force Deploy** (➕).

Step 6 Click **Deploy**.

The system identifies any errors or warnings with the configurations you are deploying. You can click **Proceed** to continue without resolving warning conditions. However, you cannot proceed if the system identifies an error.

Related Topics

[Snort® Restart Scenarios, on page 308](#)

Snort® Restart Scenarios

When the traffic inspection engine referred to as *the Snort process* on a managed device restarts, inspection is interrupted until the process resumes. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See [Snort® Restart Traffic Behavior, on page 310](#) for more information. Additionally, resource demands may result in a small number of packets dropping without inspection when you deploy, regardless of whether the Snort process restarts.

Any of the scenarios in the following table cause the Snort process to restart.

Table 45: Snort Restart Scenarios

Restart Scenario	More Information
Deploying a specific configuration that requires the Snort process to restart.	Configurations that Restart the Snort Process When Deployed or Activated, on page 311

Restart Scenario	More Information
Modifying a configuration that immediately restarts the Snort process.	Changes that Immediately Restart the Snort Process, on page 313

[Configurations that Restart the Snort Process When Deployed or Activated](#), on page 311

Inspect Traffic During Policy Apply

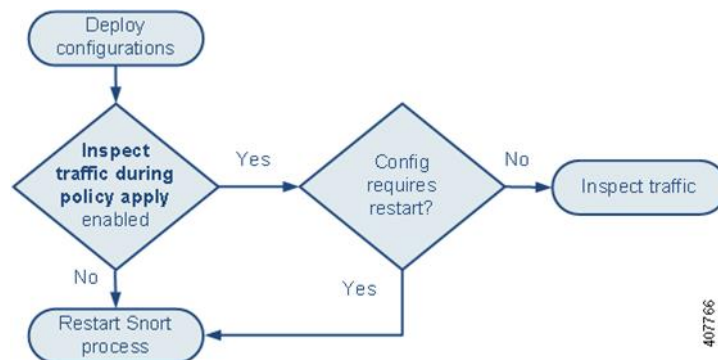

Inspect traffic during policy apply is an advanced access control policy general setting that allows managed devices to inspect traffic while deploying configuration changes; this is the case unless a configuration that you deploy requires the Snort process to restart. You can configure this option as follows:

- Enabled — Traffic is inspected during the deployment unless certain configurations require the Snort process to restart.

When the configurations you deploy do not require a Snort restart, the system initially uses the currently deployed access control policy to inspect traffic, and switches during deployment to the access control policy you are deploying.

- Disabled — Traffic is not inspected during the deployment. The Snort process always restarts when you deploy.

The following graphic illustrates how Snort restarts can occur when you enable or disable **Inspect traffic during policy apply**.

Caution

When you deploy, resource demands may result in a small number of packets dropping without inspection. Additionally, deploying some configurations restarts the Snort process, which interrupts traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See [Snort® Restart Traffic Behavior, on page 310](#) and [Configurations that Restart the Snort Process When Deployed or Activated, on page 311](#).

Snort® Restart Traffic Behavior

The following tables explain how different devices handle traffic when the Snort process restarts.

Table 46: FTD and FTDv Restart Traffic Effects

Interface Configuration	Restart Traffic Behavior
inline: Failsafe enabled or disabled	passed without inspection A few packets might drop if Failsafe is disabled and Snort is busy but not down.
inline: tap mode	egress packet immediately, copy bypasses Snort
passive	uninterrupted, not inspected
routed, transparent (including EtherChannel, redundant, transparent)	dropped

Table 47: 7000 and 8000, NGIPSv Restart Traffic Effects

Interface Configuration	Restart Traffic Behavior
inline: Failsafe enabled or disabled	passed without inspection A few packets might drop if Failsafe is disabled and Snort is busy but not down.
inline: tap mode	egress packet immediately, copy bypasses Snort
passive	uninterrupted, not inspected
routed, switched (7000 and 8000 Series only)	dropped

Table 48: ASA FirePOWER Restart Traffic Effects

Interface Configuration	Restart Traffic Behavior
routed or transparent with fail-open	passed without inspection
routed or transparent with fail-close	dropped

Note In addition to traffic handling when the Snort process is down while it restarts, traffic can also pass without inspection or drop when the Snort process is busy, depending on the configuration of the Failsafe option. See [Inline Sets, on page 437](#).

Warning Do not reboot the system while the Snort Rule Update is in progress.

Snort-busy drops happen when snort is not able to process the packets fast enough. Lina does not know whether Snort is busy due to processing delay, or if is stuck or due to call blocking. When transmission queue is full, snort-busy drops occur. Based on Transmission queue utilization, Lina will try to access if the queue is being serviced smoothly.

Note When the Snort process is busy but not down during configuration deployment, some packets may drop on routed, switched, or transparent interfaces if the total CPU load exceeds 50 percent.

Configurations that Restart the Snort Process When Deployed or Activated

Deploying any of the following configurations except AAB restarts the Snort process as described. Deploying AAB does not cause a restart, but excessive packet latency activates the currently deployed AAB configuration, causing a partial restart of the Snort process.

Access Control Policy

- Add the first or remove the last URL category/reputation condition in an access control rule.
- Change the total number of active intrusion policies by adding an intrusion policy that is not currently used, or by removing the last instance of an intrusion policy. You can use an intrusion policy in an access control rule, as the default action, or as the default intrusion policy.

Access Control Policy Advanced Settings

- Deploy when **Inspect Traffic During Policy Apply** is disabled.
- Configure a non-default value under Files and Malware Settings.
- Add or remove an SSL policy.
- Enable or disable adaptive profiles.
- Enable or disable the **Log Session/Protocol Distribution** troubleshooting option.

Security Intelligence

Add or delete multiple Security Intelligence whitelist or blacklist networks or network objects. Changes can be to custom or system-provided lists, and whether the Snort process restarts can vary by device, depending on the memory available for inspection.

SSL Policy

- Add the first or remove the last category/reputation condition in an SSL rule.

File Policy

Deploy the first or last of any one of the following configurations; note that while otherwise deploying these file policy configurations does not cause a restart, deploying non-file-policy configurations can cause restarts.

- Enable or disable **Inspect Archives**.
- Take either of the following actions:

- Enable or disable **Inspect Archives** when the deployed access control policy includes at least one file policy.
- Add the first or remove the last file policy rule when **Inspect Archives** is enabled (note that at least one rule is required for **Inspect Archives** to be meaningful).
- Select **Detect Files** or **Block Files** in a file rule.
- Enable or disable **Store files** in a **Detect Files** or **Block Files** rule.
- Add the first or remove the last active file rule that combines the **Malware Cloud Lookup** or **Block Malware** rule action with an analysis option (**Spero Analysis** or **MSEXE**, **Dynamic Analysis**, or **Local Malware Analysis**) or a store files option (**Malware**, **Unknown**, **Clean**, or **Custom**).

Note that access control rules that deploy these file policy configurations to security zones or tunnel zones cause a restart only when your configuration meets the following conditions:

- Source or destination security zones in your access control rule must match the security zones associated with interfaces on the target devices.
- Unless the destination zone in you access control rule is *any*, a source tunnel zone in the rule must match a tunnel zone assigned to a tunnel rule in the prefilter policy.

Identity Policy

- When SSL decryption is disabled (that is, when the access control policy does not include an SSL policy), add the first or remove the last active authentication rule.

An active authentication rule has either an **Active Authentication** rule action, or a **Passive Authentication** rule action with **Use active authentication if passive authentication cannot identify user** selected.

Network Analysis Policy

- Change the total number of network analysis policies by adding a network analysis policy that is not currently used, or by removing the last instance of a network analysis policy. You can use a network analysis policy with network analysis rules or as the default network analysis policy.
- Change the value for the IMAP, POP, or SMTP preprocessor **Base64 Decoding Depth**, **7-Bit/8-Bit/Binary Decoding Depth**, **Quoted-Printable Decoding Depth**, or **Unix-to-Unix Decoding Depth**.

Network Discovery

- Enable or disable non-authoritative, traffic-based user detection over the HTTP, FTP, or MDNS protocols, using the network discovery policy.

Device Management

- Routing: Add a routed interface pair or virtual router to a 7000 or 8000 Series device.
- VPN: Add or remove a VPN on a 7000 or 8000 Series device.

Caution The system does not warn you that the Snort process restarts when you add or remove a VPN on a 7000 or 8000 Series device.

- MTU: Change the highest MTU value among all non-management interfaces on a device.
- 7000/8000 series high availability: Change a high-availability state sharing option.
- Automatic Application Bypass (AAB): The currently deployed AAB configuration activates when a malfunction of the Snort process or a device misconfiguration causes a single packet to use an excessive amount of processing time. The result is a partial restart of the Snort process to alleviate extremely high latency or prevent a complete traffic stall. This partial restart causes a few packets to pass without inspection, or drop, depending on how the device handles traffic.

Updates

- System update: Deploy configurations the first time after a software update that includes a new version of the Snort binary or data acquisition library (DAQ).
- VDB: Deploy configurations the first time after installing a vulnerability database (VDB).
- Intrusion rule update: Deploying configurations the first time after importing an intrusion rule update (also known as a *Snort Rule Update* or *SRU*).

Caution Intrusion rule updates are cumulative. Any shared object rule that is added or modified since your last update causes a restart when you deploy, even if the current update has no shared object rule changes.

Related Topics

[Deploy Configuration Changes](#), on page 306

[Snort® Restart Scenarios](#), on page 308

Changes that Immediately Restart the Snort Process

The following changes immediately restart the Snort process without going through the deploy process. How the restart affects traffic depends on how the target device handles traffic. See [Snort® Restart Traffic Behavior](#), on page 310 for more information.

- Take any of the following actions involving applications or application detectors:
 - Activate or deactivate a system or custom application detector.
 - Delete an activated custom detector.
 - **Save and Reactivate** an activated custom detector.
 - Create a user-defined application.

The Snort process restarts on all managed devices.

- Create or break a Firepower Threat Defense high availability pair—Restarts the Snort process on the primary and secondary devices.

- Install a vulnerability database (VDB) update.
- Restart the Snort process in the 7000 or 8000 Series user interface (**System > Configuration > Process**)—The system prompts you for confirmation and allows you to cancel.

Policy Comparison

To review policy changes for compliance with your organization's standards or to optimize system performance, you can examine the differences between two policies or between a saved policy and the running configuration.

You can compare the following policy types:

- DNS
- File
- Health
- Identity
- Intrusion (Only Snort 2 policies)
- Network Analysis
- SSL

The comparison view displays both policies in a side-by-side format. Differences between the two policies are highlighted:

- Blue indicates that the highlighted setting is different in the two policies, and the difference is noted in red text.
- Green indicates that the highlighted setting appears in one policy but not the other.

Comparing Policies

You can compare policies only if you have access rights and any required licenses for the specific policy, and you are in the correct domain for configuring the policy.

Procedure

Step 1 Access the management page for the policy you want to compare:

- DNS—**Policies > Access Control > DNS**
- File—**Policies > Access Control > Malware & File**
- Health—**System > Health > Policy**
- Identity—**Policies > Access Control > Identity**
- Intrusion—**Policies > Access Control > Intrusion**

Note You can compare only Snort 2 policies.

- Network Analysis—**Policies > Access Control**, then click **Network Analysis Policies** or **Policies > Access Control > Intrusion**, then click **Network Analysis Policies**

Note If your custom user role limits access to the first path listed here, use the second path to access the policy.

- SSL—**Policies > Access Control > SSL**

Step 2 Click **Compare Policies**.

Step 3 From the **Compare Against** drop-down list, choose the type of comparison you want to make:

- To compare two different policies, choose **Other Policy**.
- To compare two revisions of the same policy, choose **Other Revision**.
- To compare another policy to the currently active policy, choose **Running Configuration**.

Step 4 Depending on the comparison type you choose, you have the following choices:

- If you are comparing two different policies, choose the policies you want to compare from the **Policy A** and **Policy B** drop-down lists.
- If you are comparing the running configuration to another policy, choose the second policy from the **Policy B** drop-down list.

Step 5 Click **OK**.

Step 6 Review the comparison results:

- Comparison Viewer—To use the comparison viewer to navigate individually through policy differences, click **Previous** or **Next** above the title bar.
- Comparison Report—To generate a PDF report that lists the differences between the two policies, click **Comparison Report**.

Policy Reports

For most policies, you can generate two kinds of reports. A report on a single policy provides details on the policy's current saved configuration, while a comparison report lists only the differences between two policies. You can generate a single-policy report for all policy types except health.

Note Intrusion policy reports combine the settings in the base policy with the settings of the policy layers, and make no distinction between which settings originated in the base policy or policy layer.

Generating Current Policy Reports

You can generate policy reports only if you have access rights and any required licenses for the specific policy, and you are in the correct domain for configuring the policy.

Procedure

Step 1 Access the management page for the policy for which you want to generate a report:

- Access Control—**Policies > Access Control**
- DNS—**Policies > Access Control > DNS**
- File—**Policies > Access Control > Malware & File**
- Health—**System > Health > Policy**
- Identity—**Policies > Access Control > Identity**
- Intrusion—**Policies > Access Control > Intrusion**
- NAT for 7000 & 8000 Series devices—**Devices > NAT**
- Network Analysis—**Policies > Access Control**, then click **Network Analysis Policies** or **Policies > Access Control > Intrusion**, then click **Network Analysis Policies**

Note If your custom user role limits access to the first path listed here, use the second path to access the policy.

- SSL—**Policies > Access Control > SSL**

Step 2 Click **Report**  next to the policy for which you want to generate a report.

Out-of-Date Policies

The Firepower System marks out-of-date policies with red status text that indicates how many of its targeted devices need a policy update. To clear this status, you must re-deploy the policy to the devices.

Configuration changes that require a policy re-deploy include:

- Modifying an access control policy: any changes to access control rules, the default action, policy targets, Security Intelligence filtering, advanced options including preprocessing, and so on.
- Modifying any of the policies that the access control policy invokes: the SSL policy, network analysis policies, intrusion policies, file policies, identity policies, or DNS policies.
- Changing any reusable object or configuration used in an access control policy or policies it invokes:
 - network, port, VLAN tag, URL, and geolocation objects
 - Security Intelligence lists and feeds
 - application filters or detectors
 - intrusion policy variable sets
 - file lists
 - decryption-related objects and security zones
- Updating the system software, intrusion rules, or the vulnerability database (VDB).

Keep in mind that you can change some of these configurations from multiple places in the web interface. For example, you can modify security zones using the object manager (**Objects > Object Management**), but modifying an interface type in a device's configuration (**Devices > Device Management**) can also change a zone and require a policy re-deploy.

Note that the following updates do **not** require policy re-deploy:

- automatic updates to Security Intelligence feeds and additions to the Security Intelligence global Block or Do Not Block list using the context menu
- automatic updates to URL filtering data
- scheduled geolocation database (GeoDB) updates

Performance Considerations for Limited Deployments

Host, application, and user discovery data allow the system to create a complete, up-to-the-minute profile of your network. The system can also act as an intrusion detection and prevention system (IPS), analyzing network traffic for intrusions and exploits and, optionally, dropping offending packets.

Combining discovery and IPS gives context to your network activity and allows you to take advantage of many features, including:

- impact flags and indications of compromise, which can tell you which of your hosts are vulnerable to a particular exploit, attack, or piece of malware
- adaptive profiles and Firepower recommendations, which allow you to examine traffic differently depending on the destination host
- correlation, which allows you to respond to intrusions (and other events) differently depending on the affected host

However, if your organization is interested in performing only IPS, or only discovery, there are a few configurations that can optimize the performance of the system.

Discovery Without Intrusion Prevention

The *discovery* feature allows you to monitor network traffic and determine the number and types of hosts (including network devices) on your network, as well as the operating systems, active applications, and open ports on those hosts. You can also configure managed devices to monitor user activity on your network. You can use discovery data to perform traffic profiling, assess network compliance, and respond to policy violations.

In a basic deployment (discovery and simple, network-based access control only), you can improve a device's performance by following a few important guidelines when configuring its access control policy.

Note You must use an access control policy, even if it simply allows all traffic. The network discovery policy can **only** examine traffic that the access control policy allows to pass.

First, make sure your access control policy does not require complex processing and uses only simple, network-based criteria to handle network traffic. You must implement **all** of the following guidelines; misconfiguring any one of these options eliminates the performance benefit:

- Do **not** use the Security Intelligence feature. Remove any populated global Block or Do Not Block list from the policy's Security Intelligence configuration.
- Do **not** include access control rules with Monitor or Interactive Block actions. Use only Allow, Trust, and Block rules. Keep in mind that allowed traffic can be inspected by discovery; trusted and blocked traffic cannot.
- Do **not** include access control rules with application, user, URL, ISE attribute, or geolocation-based network conditions. Use only simple network-based conditions: zone, IP address, VLAN tag, and port.
- Do **not** include access control rules that perform file, malware, or intrusion inspection. In other words, do not associate a file policy or intrusion policy with any access control rule.
- In the Advanced settings for the access control policy, make sure that **Intrusion Policy used before Access Control rule is determined** is set to **No Rules Active**.
- Select **Network Discovery Only** as the policy's default action. Do **not** choose a default action for the policy that performs intrusion inspection.

In conjunction with the access control policy, you can configure and deploy the network discovery policy, which specifies the network segments, ports, and zones that the system examines for discovery data, as well as whether hosts, applications, and users are discovered on the segments, ports, and zones.

Related Topics

[Inspection of Packets That Pass Before Traffic Is Identified](#), on page 1416

Intrusion Prevention Without Discovery

Disabling discovery if you don't need it (for example, in an IPS-only deployment) can improve performance. To disable discovery you must implement *all* of these changes:

- Delete *all* rules from your network discovery policy.
- Use *only* simple network-based conditions to perform access control: zone, IP address, VLAN tag, and port.

Do *not* perform any kind of, application, user, URL, or geolocation control. Although you can disable storage of discovery data, the system still must collect and examine it to implement those features.

After you deploy, new discovery halts on target devices. The system gradually deletes information in the network map according to your timeout preferences. Or, you can purge all discovery data immediately.

CHAPTER 17

Rule Management: Common Characteristics

The following topics describe how to manage common characteristics of rules in various policies on the Firepower Management Center:

- [Requirements and Prerequisites for Rule Management, on page 319](#)
- [Introduction to Rules, on page 319](#)
- [Rule Condition Types, on page 321](#)
- [Searching for Rules, on page 342](#)
- [Filtering Rules by Device, on page 342](#)
- [Rule and Other Policy Warnings, on page 343](#)

Requirements and Prerequisites for Rule Management

Model Support

Any.

Supported Domains

Any

User Roles

- Admin
- Access Admin
- Network Admin

Introduction to Rules

Rules in various policies exert granular control over network traffic. The system evaluates traffic against rules in the order that you specify, using a first-match algorithm.

Although these rules may include other configurations that are not consistent across policies, they share many basic characteristics and configuration mechanics, including:

- **Conditions:** Rule conditions specify the traffic that each rule handles. You can configure each rule with multiple conditions. Traffic must match all conditions to match the rule.
- **Action:** A rule's action determines how the system handles matching traffic. Note that even if a rule does not have an **Action** list you can choose from, the rule still has an associated action. For example, a custom network analysis rule uses a network analysis policy as its "action."
- **Position:** A rule's position determines its evaluation order. When using a policy to evaluate traffic, the system matches traffic to rules in the order you specify. Usually, the system handles traffic according to the first rule where all the rule's conditions match the traffic. (Monitor rules, which are designed to track and log, are an exception.) Proper rule order reduces the resources required to process network traffic, and prevents rule preemption.
- **Category:** To organize some rule types, you can create custom rule categories in each parent policy.
- **Logging:** For many rules, logging settings govern whether and how the system logs connections handled by the rule. Some rules (such as identity and network analysis rules) do not include logging settings because the rules neither determine the final disposition of connections, nor are they specifically designed to log connections.
- **Comments:** For some rule types, each time you save changes, you can add comments. For example, you might summarize the overall configuration for the benefit of other users, or note when you change a rule and the reason for the change.

Tip A right-click menu in many policy editors provides shortcuts to many rule management options, including editing, deleting, moving, enabling, and disabling.

Rules with Shared Characteristics

This chapter documents many common aspects of the following rules and configurations. For information on non-shared configurations, see:

- Access control rules: [Access Control Rules, on page 993](#)
- SSL rules: [Creating and Modifying TLS/SSL Rules, on page 1106](#)
- DNS rules: [Creating and Editing DNS Rules, on page 1044](#)
- Identity rules: [Create an Identity Rule, on page 1705](#)
- Network analysis rules: [Configuring Network Analysis Rules, on page 1420](#)
- Intelligent Application Bypass (IAB): [Intelligent Application Bypass, on page 1051](#)
- Application filters: [Application Filters, on page 356](#)

Rules without Shared Characteristics

Rules whose configurations are not documented in this chapter include:

- Intrusion rules: [Tuning Intrusion Policies Using Rules, on page 1239](#)
- File and malware rules: [File Rules, on page 1174](#)
- Correlation rules: [Configuring Correlation Rules, on page 1731](#)

- NAT rules (Classic): [NAT for 7000 and 8000 Series Devices, on page 801](#)
- 8000 Series fastpath rules: [Configure Fastpath Rules \(8000 Series\), on page 220](#)

Rule Condition Types

The following table describes the common rule conditions documented in this chapter, and lists the configurations where they are used.

Condition	Controls Traffic By...	Supported Rules/Configurations
Security Zone Conditions, on page 323	Source and destination security zones	Access control rules SSL rules DNS rules Identity rules Network analysis rules
Network Conditions, on page 324	Source and destination IP address, and where supported, geographical location	Access control rules SSL rules DNS rules Identity rules Network analysis rules
VLAN Conditions, on page 326	VLAN tag	Access control rules Note For FTD, VLAN tags in access rules only apply to inline sets; they cannot be used in access rules applied to firewall interfaces. SSL rules DNS rules Identity rules Network analysis rules
Port and ICMP Code Conditions, on page 327	Source and destination ports, protocols, and ICMP codes	Access control rules SSL rules Identity rules

Condition	Controls Traffic By...	Supported Rules/Configurations
Application Conditions (Application Control), on page 329	Application or application characteristic (type, risk, business relevance, category, and tags)	Access control rules SSL rules Identity rules Application filters Intelligent Application Bypass (IAB)
URL Conditions (URL Filtering), on page 338	URL, and where supported, URL characteristic (category and reputation)	Access control rules SSL rules
User, Realm, and ISE Attribute Conditions (User Control), on page 338	Logged-in authoritative user of a host, or that user's realm, group, or ISE attributes	Access control rules SSL rules (no ISE attributes)

Rule Condition Mechanics

Rule conditions specify the traffic that each rule handles. You can configure each rule with multiple conditions, and traffic must match all conditions to match the rule. The available condition types depend on the rule type.

In rule editors, each condition type has its own tab page. Build conditions by choosing the traffic characteristics you want to match. In general, choose criteria from one or two lists of available items on the left, then add or combine those criteria into one or two lists of selected items on the right. For example, in URL conditions in access control rules, you can combine URL category and reputation criteria to create a single group of websites to block.

To help you build conditions, you can match traffic using various system-provided and custom configurations, including realms, ISE attributes, and various types of objects and object groups. Often, you can manually specify rule criteria.

Leave matching criteria empty whenever possible, especially those for security zones, network objects, and port objects. When you specify multiple criteria, the system must match against every combination of the contents of the criteria you specify.

Caution Failure to set up your access control rules properly can have unexpected results, including traffic being allowed that should be blocked. In general, application control rules should be lower in your access control list because it takes longer for those rules to match than rules based on IP address, for example.

Access control rules that use *specific* conditions (such as networks and IP addresses) should be ordered *before* rules that use general conditions (such as applications). If you're familiar with the Open Systems Interconnect (OSI) model, use similar numbering in concept. Rules with conditions for layers 1, 2, and 3 (physical, data link, and network) should be ordered first in your access control rules. Conditions for layers 5, 6, and 7 (session, presentation, and application) should be ordered later in your access control rules. For more information about the OSI model, see this [Wikipedia article](#).

Source and Destination Criteria

Where a rule involves source and destination criteria (zones, networks, ports), usually you can use either or both criteria as constraints. If you use both, matching traffic must originate from one of the specified source zones, networks, or ports and leave through one of the destination zones, networks, or ports.

Items per Condition

You can add up to 50 items to each condition. For rules with source and destination criteria, you can use up to 50 of each. Traffic that matches any of the selected items matches the condition.

Simple Rule Mechanics

In rule editors, you have the following general choices. For detailed instructions on building conditions, see the topics for each condition type.

- Choose Item—Click an item or check its check box. Often you can use Ctrl or Shift to choose multiple items, or right-click to **Select All**.
- Search—Enter criteria in the search field. The list updates as you type. The system searches item names and, for objects and object groups, their values. Click **Reload** (🔄) or **Clear** (✖) to clear the search.
- Add Predefined Item—After you choose one or more available items, click an **Add** button or drag and drop. The system prevents you from adding invalid items: duplicates, invalid combinations, and so on.
- Add Manual Item—Click the field under the **Selected** items list, enter a valid value, and click **Add**. When you add ports, you may also choose a protocol from the drop-down list.
- Create Object—Click **Add** (🍀) to create a new, reusable object that you can immediately use in the condition you are building, then manage in the object manager. When using this method to add application filters on the fly, you cannot save a filter that includes another user-created filter.
- Delete—Click the **Delete** (🗑️) for an item, or choose one or more items and right-click to **Delete Selected**.

Security Zone Conditions

Security zones segment your network to help you manage and classify traffic flow by grouping interfaces across multiple devices.

Zone rule conditions control traffic by its source and destination security zones. If you add both source and destination zones to a zone condition, matching traffic must originate from an interface in one of the source zones and leave through an interface in one of the destination zones.

Just as all interfaces in a zone must be of the same type (all inline, passive, switched, routed, or ASA FirePOWER), all zones used in a zone condition must be of the same type. Because devices deployed passively do not transmit traffic, you cannot use a zone with passive interfaces as a destination zone.

Leave matching criteria empty whenever possible, especially those for security zones, network objects, and port objects. When you specify multiple criteria, the system must match against every combination of the contents of the criteria you specify.

Tip Constraining rules by zone is one of the best ways to improve system performance. If a rule does not apply to traffic through any of device's interfaces, that rule does not affect that device's performance.

Security Zone Conditions and Multitenancy

In a multidomain deployment, a zone created in an ancestor domain can contain interfaces that reside on devices in different domains. When you configure a zone condition in an descendant domain, your configurations apply to only the interfaces you can see.

Rules with Security Zone Conditions

The following rules support security zone conditions:

- Access control
- SSL
- DNS (source zone constraints only)
- Identity
- Network analysis

Example: Access Control Using Security Zones

Consider a deployment where you want hosts to have unrestricted access to the internet, but you nevertheless want to protect them by inspecting incoming traffic for intrusions and malware.

First, create two security zones: Internal and External. Then, assign interface pairs on one or more devices to those zones, with one interface in each pair in the Internal zone and one in the External zone. Hosts connected to the network on the Internal side represent your protected assets.

Note You are not required to group all internal (or external) interfaces into a single zone. Choose the grouping that makes sense for your deployment and security policies.

Then, configure an access control rule with a destination zone condition set to Internal. This simple rule matches traffic that leaves the device from any interface in the Internal zone. To inspect matching traffic for intrusions and malware, choose a rule action of **Allow**, then associate the rule with an intrusion and a file policy.

Network Conditions

Network rule conditions control traffic by its source and destination IP address, using inner headers. Tunnel rules, which use outer headers, have tunnel endpoint conditions instead of network conditions.

You can use predefined objects to build network conditions, or manually specify individual IP addresses or address blocks.

Note The system builds a separate network map for each leaf domain. In a multidomain deployment, using literal IP addresses to constrain this configuration can have unexpected results. Using override-enabled objects allows descendant domain administrators to tailor Global configurations to their local environments.

Leave matching criteria empty whenever possible, especially those for security zones, network objects, and port objects. When you specify multiple criteria, the system must match against every combination of the contents of the criteria you specify.

Geolocation in Network Conditions

Some rules can match traffic using the geographical location of the source or destination. If a rule type supports geolocation, you can mix network and geolocation criteria. To ensure you are using up-to-date geolocation data to filter your traffic, Cisco strongly recommends you regularly update the geolocation database (GeoDB).

Rules with Network Conditions

Rule Type	Supports Geolocation Constraints?
Access control	yes
SSL	yes
DNS (source networks only)	no
Identity	yes
Network analysis	no

Configuring Network Conditions

Procedure

-
- Step 1** In the rule editor, click **Networks**.
- Step 2** Find and choose the predefined networks you want to add from the **Available Networks** list.
- If the rule supports geolocation, you can mix network and geolocation criteria in the same rule:
- Networks—Click **Networks** to choose networks.
 - Geolocation—Click **Geolocation** to choose geolocation objects.
- Step 3** Click **Add to Source** or **Add to Destination**, or drag and drop.
- Step 4** Add networks that you want to specify manually. Enter a source or destination IP address or address block, then click **Add**.
- Note** The system builds a separate network map for each leaf domain. In a multidomain deployment, using literal IP addresses to constrain this configuration can have unexpected results. Using override-enabled objects allows descendant domain administrators to tailor Global configurations to their local environments.

Step 5 Save or continue editing the rule.

Example: Network Condition in an Access Control Rule

The following graphic shows the network condition for an access control rule that blocks connections originating from your internal network and attempting to access resources either in North Korea or on 93.184.216.119 (example.com).

In this example, a network object group called Private Networks (that comprises the IPv4 and IPv6 Private Networks network objects, not shown) represents your internal networks. The example also manually specifies the example.com IP address, and uses a system-provided North Korea geolocation object to represent North Korea IP addresses.

What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

VLAN Conditions

VLAN rule conditions control VLAN-tagged traffic, including Q-in-Q (stacked VLAN) traffic. The system uses the innermost VLAN tag to filter VLAN traffic.

Note the following Q-in-Q support:

- NGIPSv, Firepower 7000, Firepower 8000—Supports Q-in-Q for all interface types.
- ASA FirePOWER module—Does not support Q-in-Q (supports only one VLAN tag).
- FTD on Firepower 4100/9300—Does not support Q-in-Q (supports only one VLAN tag).
- FTD on all other models:
 - Inline sets and passive interfaces—Supports Q-in-Q, up to 2 VLAN tags.
 - Firewall interfaces—Does not support Q-in-Q (supports only one VLAN tag).

You can use predefined objects to build VLAN conditions, or manually enter any VLAN tag from **1** to **4094**. Use a hyphen to specify a range of VLAN tags.

You can specify a maximum of 50 VLAN conditions.

Note The system builds a separate network map for each leaf domain. In a multidomain deployment, using literal VLAN tags to constrain this configuration can have unexpected results. Using override-enabled objects allows descendant domain administrators to tailor Global configurations to their local environments.

Rules with VLAN Conditions

The following rule types support VLAN conditions:

- Access control

Note For FTD, VLAN tags in access rules only apply to inline sets; they cannot be used in access rules applied to firewall interfaces.

- SSL
- DNS
- Identity
- Network analysis

Port and ICMP Code Conditions

Port conditions allow you to control traffic by its source and destination ports. Depending on the rule type, “port” can represent any of the following:

- TCP and UDP—You can control TCP and UDP traffic based on the transport layer protocol. The system represents this configuration using the protocol number in parentheses, plus an optional associated port or port range. For example: TCP(6)/22.
- ICMP—You can control ICMP and ICMPv6 (IPv6-ICMP) traffic based on its internet layer protocol plus an optional type and code. For example: ICMP(1):3:3.
- No port—You can control traffic using other protocols that do not use ports.

Leave matching criteria empty whenever possible, especially those for security zones, network objects, and port objects. When you specify multiple criteria, the system must match against every combination of the contents of the criteria you specify.

Best Practices for Port-Based Rules

Specifying ports is the traditional way to target applications. However, applications can be configured to use unique ports to bypass access control blocks. Thus, whenever possible, use application filtering criteria rather than port criteria to target traffic.

Application filtering is also recommended for applications, like FTP, that open separate channels dynamically for control vs. data flow. Using port-based access control rules can prevent these kinds of applications from performing correctly, and could result in blocking desirable connections.

Using Source and Destination Port Constraints

If you add both source and destination port constraints, you can only add ports that share a single transport protocol (TCP or UDP). For example, if you add DNS over TCP as a source port, you can add Yahoo Messenger Voice Chat (TCP) as a destination port but not Yahoo Messenger Voice Chat (UDP).

If you add only source ports or only destination ports, you can add ports that use different transport protocols. For example, you can add both DNS over TCP and DNS over UDP as source port conditions in a single access control rule.

Matching Non-TCP Traffic with Port Conditions

Although you can configure port conditions to match non-TCP traffic, there are some restrictions:

- Access control rules—You can match GRE-encapsulated traffic with an access control rule by using the GRE (47) protocol as a destination port condition. To a GRE-constrained rule, you can add only network-based conditions: zone, IP address, port, and VLAN tag. Also, the system uses outer headers to match **all** traffic in access control policies with GRE-constrained rules.
- SSL rules—SSL rules support TCP port conditions only.
- Identity rules—The system cannot enforce active authentication on non-TCP traffic. If an identity rule action is Active Authentication or if you check the option to **Use active authentication if passive authentication cannot identify user**, use TCP ports constraints only. If the identity rule action is Passive Authentication or No Authentication, you can create port conditions based on non-TCP traffic.

Caution

Adding the first or removing the last active authentication rule when SSL decryption is disabled (that is, when the access control policy does not include an SSL policy) restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See [Snort® Restart Traffic Behavior, on page 310](#) for more information.

Note that an active authentication rule has either an **Active Authentication** rule action, or a **Passive Authentication** rule action with **Use active authentication if passive authentication cannot identify user** selected.

- ICMP echo—A destination ICMP port with the type set to 0 or a destination ICMPv6 port with the type set to 129 only matches unsolicited echo replies. ICMP echo replies sent in response to ICMP echo requests are ignored. For a rule to match on any ICMP echo, use ICMP type 8 or ICMPv6 type 128.

Rules with Port Conditions

The following rules support port conditions:

- Access control
- SSL (supports TCP traffic only)
- Identity (active authentication supports TCP traffic only)

Configuring Port Conditions

Procedure

- Step 1** In the rule editor, click **Ports**.
- Step 2** Find and choose the predefined ports you want to add from the **Available Ports** list.
- Step 3** Click **Add to Source** or **Add to Destination**, or drag and drop.
- Step 4** Add any source or destination ports that you want to specify manually:
- Source—Choose a **Protocol**, enter a single **Port** from 0 to 65535, and click **Add**.
 - Destination (non-ICMP)—Choose or enter a **Protocol**. If you do not want to specify a protocol, or if you choose **TCP** or **UDP**, enter a single **Port** from 0 to 65535. Click **Add**.
 - Destination (ICMP)—Choose **ICMP** or **IPv6-ICMP** from the **Protocol** drop down list, then choose a **Type** and related **Code** in the pop-up window that appears. For more information on ICMP types and codes, see the Internet Assigned Numbers Authority (IANA) website.
- Step 5** Save or continue editing the rule.
-

What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

Application Conditions (Application Control)

When the system analyzes IP traffic, it can identify and classify the commonly used applications on your network. This discovery-based *application awareness* is the basis for *application control*—the ability to control application traffic.

System-provided *application filters* help you perform application control by organizing applications according to basic characteristics: type, risk, business relevance, category, and tags. You can create reusable user-defined filters based on combinations of the system-provided filters, or on custom combinations of applications.

At least one detector must be enabled for each application rule condition in the policy. If no detector is enabled for an application, the system automatically enables all system-provided detectors for the application; if none exist, the system enables the most recently modified user-defined detector for the application. For more information about application detectors, see [Application Detector Fundamentals, on page 1620](#).

You can use both application filters and individually specified applications to ensure complete coverage. However, understand the following note before you order your access control rules.

Caution Failure to set up your access control rules properly can have unexpected results, including traffic being allowed that should be blocked. In general, application control rules should be lower in your access control list because it takes longer for those rules to match than rules based on IP address, for example.

Access control rules that use *specific* conditions (such as networks and IP addresses) should be ordered *before* rules that use general conditions (such as applications). If you're familiar with the Open Systems Interconnect (OSI) model, use similar numbering in concept. Rules with conditions for layers 1, 2, and 3 (physical, data link, and network) should be ordered first in your access control rules. Conditions for layers 5, 6, and 7 (session, presentation, and application) should be ordered later in your access control rules. For more information about the OSI model, see this [Wikipedia article](#).

Benefits of Application Filters

Application filters help you quickly configure application control. For example, you can easily use system-provided filters to create an access control rule that identifies and blocks all high risk, low business relevance applications. If a user attempts to use one of those applications, the system blocks the session.

Using application filters simplifies policy creation and administration. It assures you that the system controls application traffic as expected. Because Cisco frequently updates and adds application detectors via system and vulnerability database (VDB) updates, you can ensure that the system uses up-to-date detectors to monitor application traffic. You can also create your own detectors and assign characteristics to the applications they detect, automatically adding them to existing filters.

Configurations with Application Conditions

The configurations in the following table help you perform application control. The table also shows how you can constrain application control, depending on the configuration.

Configuration	Type, Risk, Relevance, Category	Tags	User-Defined Filters
Access control rules	yes	yes	yes
SSL rules	yes	no; automatically constrained to encrypted application traffic by the SSL Protocol tag	no
Identity rules (to exempt applications from active authentication)	yes	no; automatically constrained by the User-Agent Exclusion tag	no
User-defined application filter in the object manager	yes	yes	no; you cannot nest user-defined filters
Intelligent Application Bypass (IAB)	yes	yes	yes

Related Topics

[Overview: Application Detection](#), on page 1619

Configuring Application Conditions and Filters

To build an application condition or filter, choose the applications whose traffic you want to control from a list of available applications. Optionally (and recommended), constrain the available applications using filters. You can use filters and individually specified applications in the same condition.

Before you begin

- Adaptive profiling **must** be enabled as described in [Configuring Adaptive Profiles, on page 1559](#) for access control rules to perform application control.
- For Classic device models, you must have the Control license to configure these conditions.

Procedure

- Step 1** Invoke the rule or configuration editor:
- Access control, SSL rule condition—In the rule editor, click **Applications**.
 - Identity rule condition—In the rule editor, click **Realms & Settings** and enable active authentication; see [Create an Identity Rule, on page 1705](#).
 - Application filter—On the Application Filters page of the object manager, add or edit an application filter. Provide a unique **Name** for the filter.
 - Intelligent Application Bypass (IAB)—In the access control policy editor, click **Advanced**, edit IAB settings, then click **Bypassable Applications and Filters**.
- Step 2** Find and choose the applications you want to add from the **Available Applications** list.
- To constrain the applications displayed in **Available Applications**, choose one or more **Application Filters** or search for individual applications.
- Tip** Click **Information** (i) next to an application to display summary information and internet search links. **Unlock** marks applications that the system can identify only in decrypted traffic.
- When you choose filters, singly or in combination, the Available Applications list updates to display only the applications that meet your criteria. You can choose system-provided filters in combination, but not user-defined filters.
- Multiple filters for the same characteristic (risk, business relevance, and so on)—Application traffic must match only one of the filters. For example, if you choose both the medium and high-risk filters, the Available Applications list displays all medium and high-risk applications.
 - Filters for different application characteristics—Application traffic must match both filter types. For example, if you choose both the high-risk and low business relevance filters, the Available Applications list displays only applications that meet both criteria.
- Step 3** Click **Add to Rule**, or drag and drop.
- Tip** Before you add more filters and applications, click **Clear Filters** to clear your current choices.
- The web interface lists filters added to a condition above and separately from individually added applications.
- Step 4** Save or continue editing the rule or configuration.
-

Example: Application Condition in an Access Control Rule

The following graphic shows the application condition for an access control rule that blocks a user-defined application filter for MyCompany, all applications with high risk and low business relevance, gaming applications, and some individually selected applications.

**What to do next**

- Deploy configuration changes; see [Deploy Configuration Changes](#), on page 306.

Application Characteristics

The system characterizes each application that it detects using the criteria described in the following table. Use these characteristics as application filters.

Table 49: Application Characteristics

Characteristic	Description	Example
Type	Application protocols represent communications between hosts. Clients represent software running on a host. Web applications represent the content or requested URL for HTTP traffic.	HTTP and SSH are application protocols. Web browsers and email clients are clients. MPEG video and Facebook are web applications.
Risk	The likelihood that the application is being used for purposes that might be against your organization's security policy.	Peer-to-peer applications tend to have a very high risk.
Business Relevance	The likelihood that the application is being used within the context of your organization's business operations, as opposed to recreationally.	Gaming applications tend to have a very low business relevance.

Characteristic	Description	Example
Category	A general classification for the application that describes its most essential function. Each application belongs to at least one category.	Facebook is in the social networking category.
Tag	Additional information about the application. Applications can have any number of tags, including none.	Video streaming web applications often are tagged high bandwidth and displays ads.

Best Practices for Application Control

Keep in mind the following guidelines and limitations for application control:

Automatically Enabling Application Detectors

If no detector is enabled for an application you want to detect, the system automatically enables all system-provided detectors for the application. If none exist, the system enables the most recently modified user-defined detector for the application.

Configure Your Policy to Examine the Packets That Must Pass Before an Application Is Identified

The system cannot perform application control, including Intelligent Application Bypass (IAB), before *both* of the following occur:

- A monitored connection is established between a client and server
- The system identifies the application in the session

This identification should occur in 3 to 5 packets, or after the server certificate exchange in the SSL handshake if the traffic is encrypted.

Important! To ensure that your system examines these initial packets, see [Specify a Policy to Handle Packets That Pass Before Traffic Identification, on page 1416](#).

If early traffic matches all other criteria but application identification is incomplete, the system allows the packet to pass and the connection to be established (or the SSL handshake to complete). After the system completes its identification, the system applies the appropriate action to the remaining session traffic.

Create Separate Rules for URL and Application Filtering

Create separate rules for URL and application filtering whenever possible, because combining application and URL criteria can lead to unexpected results, especially for encrypted traffic.

Rules that include both application and URL criteria should come after application-only or URL-only rules, unless the application+URL rule is acting as an exception to a more general application-only or URL-only rule.

URL Rules Before Application and Other Rules

For the most effective URL matching, place rules that include URL conditions before other rules, particularly if the URL rules are block rules and the other rules meet both of the following criteria:

- They include application conditions.
- The traffic to be inspected is encrypted.

Application Control for Encrypted and Decrypted Traffic

The system can identify and filter encrypted and decrypted traffic:

- Encrypted traffic—The system can detect application traffic encrypted with StartTLS, including SMTPS, POPS, FTPS, TelnetS, and IMAPS. In addition, it can identify certain encrypted applications based on the Server Name Indication in the TLS ClientHello message, or the subject distinguished name value from the server certificate. These applications are tagged `SSL Protocol`; in an SSL rule, you can choose only these applications. Applications without this tag can only be detected in unencrypted or decrypted traffic.
- Decrypted traffic—The system assigns the `decrypted traffic` tag to applications that the system can detect in decrypted traffic only, not encrypted or unencrypted.

Exempting Applications from Active Authorization

In an identity policy, you can exempt certain applications from active authentication, allowing traffic to continue to access control. These applications are tagged `User-Agent Exclusion`. In an identity rule, you can choose only these applications.

Handling Application Traffic Packets Without Payloads

When performing access control, the system applies the default policy action to packets that do not have a payload in a connection where an application is identified.

Handling Referred Application Traffic

To handle traffic referred by a web server, such as advertisement traffic, match the referred application rather than the referring application.

Controlling Application Traffic That Uses Multiple Protocols (Skype, Zoho)

Some applications use multiple protocols. To control their traffic, make sure your access control policy covers all relevant options. For example:

- Skype—To control Skype traffic, choose the **Skype** tag from the **Application Filters** list rather than selecting individual applications. This ensures that the system can detect and control all Skype traffic the same way.
- Zoho—To control Zoho mail, choose *both* **Zoho** and **Zoho mail** from the Available Application list.

Search Engines Supported for Content Restriction Features

The system supports Safe Search filtering for specific search engines only. The system assigns the `safesearch supported` tag to application traffic from these search engines.

Controlling Evasive Application Traffic

See [Application-Specific Notes and Limitations](#), on page 336.

Additional Guidelines for Rule Ordering for Application Control

For guidelines about rule ordering for application control, see [Best Practices for Configuring Application Control, on page 335](#).

Related Topics

[Inspection of Packets That Pass Before Traffic Is Identified](#), on page 1416

[Special Considerations for Application Detection](#), on page 1623

Best Practices for Configuring Application Control

We recommend controlling applications' access to the network as follows:

- To allow or block application access from a less secure network to a more secure network: Use **Port** (Selected Destination Port) conditions on the access control rule
For example, allow ICMP traffic from the internet (less secure) to an internal network (more secure.)
- To allow or block applications being accessed by user groups: Use **Application** conditions on the access control rule

For example, block Facebook from being accessed by members of the Contractors group

Caution

Failure to set up your access control rules properly can have unexpected results, including traffic being allowed that should be blocked. In general, application control rules should be lower in your access control list because it takes longer for those rules to match than rules based on IP address, for example.

Access control rules that use *specific* conditions (such as networks and IP addresses) should be ordered *before* rules that use general conditions (such as applications). If you're familiar with the Open Systems Interconnect (OSI) model, use similar numbering in concept. Rules with conditions for layers 1, 2, and 3 (physical, data link, and network) should be ordered first in your access control rules. Conditions for layers 5, 6, and 7 (session, presentation, and application) should be ordered later in your access control rules. For more information about the OSI model, see this [Wikipedia article](#).

The following table provides an example of how to set up your access control rules:

Type of control	Action	Zones, Networks, VLAN Tags	Users	Applications	Ports	URLs	SGT/ISE Attributes	Inspection, Logging, Comments
Application from more secure to less secure network when application uses a port (for example, SSH)	Your choice (Allow in this example)	Destination zones or networks using the outside interface	Any	Do not set	Available Ports : SSH Add to Selected Destination Ports	Any	Use only with ISE.	Any

Type of control	Action	Zones, Networks, VLAN Tags	Users	Applications	Ports	URLs	SGT/ISE Attributes	Inspection, Logging, Comments
Application from more secure to less secure network when application does not use a port (for example, ICMP)	Your choice (Allow in this example)	Destination zones or networks using the outside interface	Any	Do not set	Selected Destination Ports Protocol: ICMP Type: Any	Do not set	Use only with ISE.	Any
Application access by a user group	Your choice (Block in this example)	Your choice	Choose a user group (Contractors group in this example)	Choose the name of the application (Facebook in this example)	Do not set	Do not set	Use only with ISE.	Your choice

Application-Specific Notes and Limitations

- Office 365 Admin Portal:

Limitation: If the access policy has logging enabled at the beginning as well as at the end, the first packet will be detected as Office 365 and the end of connection will be detected as Office 365 Admin Portal. This should not affect blocking.

- Skype:

See [Best Practices for Application Control, on page 333](#)

- GoToMeeting

In order to fully detect GoToMeeting, your rule must include all of the following applications:

- GoToMeeting
- Citrix Online
- Citrix GoToMeeting Platform
- LogMeIn
- STUN

- Zoho:

See [Best Practices for Application Control, on page 333](#)

- Evasive applications such as Bittorrent, Tor, Psiphon, and Ultrasurf:

For evasive applications, only the highest-confidence scenarios are detected by default. If you need to take action on this traffic (such as block or implement QoS), it may be necessary to configure more aggressive detection with better effectiveness. To do this, contact TAC to review your configurations as these changes may result in false positives.

- WeChat:

It is not possible to selectively block WeChat Media if you allow WeChat.

Troubleshoot Application Control Rules

If your application control rules don't function as you expect, use the guidelines discussed in this section.

We recommend controlling applications' access to the network as follows:

- To allow or block application access from a less secure network to a more secure network: Use **Port** (Selected Destination Port) conditions on the access control rule
For example, allow ICMP traffic from the internet (less secure) to an internal network (more secure.)
- To allow or block applications being accessed by user groups: Use **Application** conditions on the access control rule

For example, block Facebook from being accessed by members of the Contractors group

Caution

Failure to set up your access control rules properly can have unexpected results, including traffic being allowed that should be blocked. In general, application control rules should be lower in your access control list because it takes longer for those rules to match than rules based on IP address, for example.

Access control rules that use *specific* conditions (such as networks and IP addresses) should be ordered *before* rules that use general conditions (such as applications). If you're familiar with the Open Systems Interconnect (OSI) model, use similar numbering in concept. Rules with conditions for layers 1, 2, and 3 (physical, data link, and network) should be ordered first in your access control rules. Conditions for layers 5, 6, and 7 (session, presentation, and application) should be ordered later in your access control rules. For more information about the OSI model, see this [Wikipedia article](#).

The following table provides an example of how to set up your access control rules:

Type of control	Action	Zones, Networks, VLAN Tags	Users	Applications	Ports	URLs	SGT/ISE Attributes	Inspection, Logging, Comments
Application from more secure to less secure network when application uses a port (for example, SSH)	Your choice (Allow in this example)	Destination zones or networks using the outside interface	Any	Do not set	Available Ports : SSH Add to Selected Destination Ports	Any	Use only with ISE.	Any

Type of control	Action	Zones, Networks, VLAN Tags	Users	Applications	Ports	URLs	SGT/ISE Attributes	Inspection, Logging, Comments
Application from more secure to less secure network when application does not use a port (for example, ICMP)	Your choice (Allow in this example)	Destination zones or networks using the outside interface	Any	Do not set	Selected Destination Ports Protocol: ICMP Type: Any	Do not set	Use only with ISE.	Any
Application access by a user group	Your choice (Block in this example)	Your choice	Choose a user group (Contractors group in this example)	Choose the name of the application (Facebook in this example)	Do not set	Do not set	Use only with ISE.	Your choice

Initial Packets Are Passing Uninspected

See [Inspection of Packets That Pass Before Traffic Is Identified](#), on page 1416 and subtopics.

Related Topics

[Best Practices for Ordering Rules](#), on page 974

URL Conditions (URL Filtering)

Use URL conditions to control the websites that users on your network can access.

For complete information, see [URL Filtering](#), on page 1007.

User, Realm, and ISE Attribute Conditions (User Control)

You can perform *user control* with the *authoritative user identity data* collected by the Firepower System.

Identity sources monitor users as they log in and out, or as they authenticate using Microsoft Active Directory (AD) or LDAP credentials. You can then configure rules that use this collected identity data to handle traffic based on the logged-in authoritative user associated with a monitored host. A user remains associated with a host until the user logs off (as reported by an identity source), a realm times out the session, or you delete the user data from the system's database.

For information on the authoritative user identity sources supported in your version of the Firepower System, see [About User Identity Sources](#), on page 1637.

You can use the following rule conditions to perform user control:

- User and realm conditions—Match traffic based on the logged-in authoritative user of a host. You can control traffic based on realms, individual users, or the groups those users belong to.

- ISE attribute conditions—Match traffic based on a user's ISE-assigned Security Group Tag (SGT), Device Type (also referred to as Endpoint Profile), or Location IP (also referred to as Endpoint Location). Requires that you configure ISE as an identity source.

Rules with User Conditions

Rule Type	Supports User and Realm Conditions?	Supports ISE Attribute Conditions?
Access control	yes	yes
SSL	yes	no

Related Topics

- [The User Agent Identity Source](#), on page 1638
- [The ISE Identity Source](#), on page 1640
- [The Captive Portal Identity Source](#), on page 1646

User Control Prerequisites

Configure Identity Sources/Authentication Methods

Configure identity sources for the types of authentication you want to perform. For more information, see [About User Identity Sources](#), on page 1637.

If you configure an ISE or user agent device to monitor a large number of user groups, or if you have a very large number of users mapped to hosts on your network, the system may drop user mappings based on groups, due to your Firepower Management Center user limit. As a result, rules with realm, user, or user group conditions may not match traffic as expected.

Configure Realms

Configure a realm for each AD or LDAP server you want to monitor, including your ISE or User Agent servers, and perform a user download. For more information, see [Create a Realm](#), on page 1692.

When you configure a realm, you specify the users and user groups whose activity you want to monitor. Including a user group automatically includes all of that group's members, including members of any secondary groups. However, if you want to use the secondary group as a rule criterion, you must explicitly include the secondary group in the realm configuration.

For each realm, you can enable automatic download of user data to refresh authoritative data for users and user groups.

Create Identity Policies

Create an identity policy to associate the realm with an authentication method, and associate that policy with access control. For more information, see [Create an Identity Policy](#), on page 1704.

Policies that perform user control on a device (access control, SSL) share an identity policy. That identity policy determines the realms, users, and groups that you can use in rules affecting traffic on those devices.

Configuring User and Realm Conditions

You can constrain a rule by realm, or by users and user groups within that realm.

Before you begin

- Fulfill the user control prerequisites described in [User, Realm, and ISE Attribute Conditions \(User Control\)](#), on page 338.
- For Classic device models, you must have the Control license to configure these conditions.

Procedure

- Step 1** In the rule editor, click **Users**.
- Step 2** (Optional) Find and choose the realm you want to use from the **Available Realms**.
- Step 3** (Optional) Further constrain the rule by choosing users and groups from the **Available Users** list.
- Step 4** Click **Add to Rule**, or drag and drop.
- Step 5** Save or continue editing the rule.
-

What to do next

- Deploy configuration changes; see [Deploy Configuration Changes](#), on page 306.

Configuring ISE Attribute Conditions

Before you begin

- Fulfill the user control prerequisites described in [User, Realm, and ISE Attribute Conditions \(User Control\)](#), on page 338.
- For Classic device models, you must have the Control license to configure these conditions.

Procedure

- Step 1** In the rule editor, click **ISE Attributes**.
- Step 2** Find and choose the ISE attributes you want to use from the **Available ISE Session Attributes** list:
- Security Group Tag (SGT)
 - Device Type (also referred to as Endpoint Profile)
 - QoS—Click **ISE Attributes**.
 - Location IP (also referred to as Endpoint Location)
- Step 3** Further constrain the rule by choosing attribute metadata from the **Available ISE Metadata** list. Or, keep the default: **any**.
- Step 4** Click **Add to Rule**, or drag and drop.
- Step 5** (Optional) Constrain the rule with an IP address in the **Add a Location IP Address** field, then click **Add**.

The system builds a separate network map for each leaf domain. In a multidomain deployment, using literal IP addresses to constrain this configuration can have unexpected results.

Step 6 Save or continue editing the rule.

What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

Troubleshoot User Control

If you notice unexpected user rule behavior, consider tuning your rule, identity source, or realm configurations. For other related troubleshooting information, see:

- [Troubleshoot the User Agent Identity Source, on page 1640](#)
- [Troubleshoot ISE or Cisco TrustSec Issues, on page 1644](#)
- [Troubleshoot the Captive Portal Identity Source, on page 1657](#)
- [Troubleshoot Realms and User Downloads, on page 1689](#)

Rules targeting realms, users, or user groups are not matching traffic

If you configure an ISE or user agent device to monitor a large number of user groups, or if you have a very large number of users mapped to hosts on your network, the system may drop user records due to your Firepower Management Center user limit. As a result, rules with user conditions may not match traffic as expected.

Rules targeting user groups or users within user groups are not matching traffic as expected

If you configure a rule with a user group condition, your LDAP or Active Directory server must have user groups configured. The system cannot perform user group control if the server organizes the users in basic object hierarchy.

Rules targeting users in secondary groups are not matching traffic as expected

If you configure a rule with a user group condition that includes or excludes users who are members of a secondary group on your Active Directory server, your server may be limiting the number of users it reports.

By default, Active Directory servers limit the number of users they report from secondary groups. You must customize this limit so that all of the users in your secondary groups are reported to the Firepower Management Center and eligible for use in rules with user conditions.

Rules are not matching users when seen for the first time

After the system detects activity from a previously-unseen user, the system retrieves information about them from the server. Until the system successfully retrieves this information, activity seen by this user is *not* handled by matching rules. Instead, the user session is handled by the next rule it matches (or the policy's default action, if applicable).

For example, this might explain when:

- Users who are members of user groups are not matching rules with user group conditions.

- Users who were reported by a , user agent, or ISE device are not matching rules, when the server used for user data retrieval is an Active Directory server.

Note that this might also cause the system to delay the display of user data in event views and analysis tools.

Rules are not matching all ISE users

This is expected behavior. You can perform user control on ISE users who were authenticated by an Active Directory domain controller. You cannot perform user control on ISE users who were authenticated by an LDAP, RADIUS, or RSA domain controller.

Searching for Rules

In many policies, you can search for and within rules. The system matches your input to rule names and condition values, including objects and object groups.

You cannot search for values in a Security Intelligence or URL list or feed.

Procedure

-
- Step 1** In the policy editor, click **Rules**.
 - Step 2** Click **Search Rules**, enter a complete or partial search string, then press Enter. The matching value is highlighted for each matching rule. A status message displays the current match and the total number of matches.
 - Step 3** View the rules you are interested in.
To navigate between matching rules, click **Next-Match** or **Previous-Match**.
-

What to do next

- Before you begin a new search, click **Clear** (✕) to clear the search and any highlighting.

Filtering Rules by Device

Some policy editors allow you to filter your rule view by affected devices.

Filter by device only works for rules that use zones or interface groups. (Otherwise a rule applies to all devices.)

The system uses a rule's interface constraints to determine if the rule affects a device. If you constrain a rule by interface (security zone condition), the device where that interface is located is affected by that rule. Rules with no interface constraint apply to any interface, and therefore every device.

Procedure

-
- Step 1** In the policy editor, click **Rules**, then click **Filter by Device**.

A list of targeted devices and device groups appears.

Step 2 Check one or more check boxes to display only the rules that apply to those devices or groups. Or, check **All** to reset and display all of the rules.

Tip Hover your pointer over a rule criterion to see its value. If the criterion represents an object with device-specific overrides, the system displays the override value when you filter the rules list by only that device. If the criterion represents an object with domain-specific overrides, the system displays the override value when you filter the rules list by devices in that domain.

Step 3 Click **OK**.

Related Topics

[Create and Edit Access Control Rules](#), on page 998

Rule and Other Policy Warnings

Policy and rule editors use icons to mark configurations that could adversely affect traffic analysis and flow. Depending on the issue, the system may warn you when you deploy or prevent you from deploying entirely.

Tip Hover your pointer over an icon to read the warning, error, or informational text.

Table 50: Policy Error Icons

Icon	Description	Example
Errors (❗) error	If a rule or configuration has an error, you cannot deploy until you correct the issue, even if you disable any affected rules.	A rule that performs category and reputation-based URL filtering is valid until you target a device that does not have a URL Filtering license. At that point, an error icon appears next to the rule, and you cannot deploy until you edit or delete the rule, retarget the policy, or enable the license.
Warning (⚠️) warning	You can deploy a policy that displays rule or other warnings. However, misconfigurations marked with warnings have no effect. If you disable a rule with a warning, the warning icon disappears. It reappears if you enable the rule without correcting the underlying issue.	Preempted rules or rules that cannot match traffic due to misconfiguration have no effect. This includes conditions using empty object groups, application filters that match no applications, excluded LDAP users, invalid ports, and so on. However, if a warning icon marks a licensing error or model mismatch, you cannot deploy until you correct the issue.

Icon	Description	Example
Information  information	Information icons convey helpful information about configurations that may affect the flow of traffic. These issues do not prevent you from deploying.	With application control, the system might skip matching the first few packets of a connection against some rules, until the system identifies the application or web traffic in that connection. This allows connections to be established so that applications and HTTP requests can be identified.

Introduction to Reusable Objects

For increased flexibility and web interface ease-of-use, the Firepower System uses named *objects*, which are reusable configurations that associate a name with a value. When you want to use that value, use the named object instead. The system supports object use in various places in the web interface, including many policies and rules, event searches, reports, dashboards, and so on. The system provides many predefined objects that represent frequently used configurations.

Use the object manager to create and manage objects. Many configurations that use objects also allow you to create objects on the fly, as needed. You can also use the object manager to:

- View the policies, settings, and other objects where a network, port, VLAN, or URL object is used; see [Viewing Objects and Their Usage, on page 348](#).
- Group objects to reference multiple objects with a single configuration; see [Object Groups, on page 349](#).
- Override object values for selected devices or, in a multidomain deployment, selected domains; see [Object Overrides, on page 351](#).

After you edit an object used in an active policy, you must redeploy the changed configuration for your changes to take effect. You cannot delete an object that is in use by an active policy.

Note An object is configured on a managed device if, and only if, the object is used in a policy that is assigned to that device. If you remove an object from all policies assigned to a given device, the object is also removed from the device configuration on the next deployment, and subsequent changes to the object are not reflected in the device configuration.

Object Types

The following table lists the objects you can create in the Firepower System, and indicates whether each object type can be grouped or configured to allow overrides.

Object Type	Groupable?	Allows Overrides?
Network	yes	yes
Port	yes	yes
Security Zone	no	no
Application Filter	no	no
VLAN Tag	yes	yes
URL	yes	yes
Geolocation	no	no
Variable Set	no	no
Security Intelligence: Network, DNS, and URL lists and feeds	no	no
Sinkhole	no	no
File List	no	no
Cipher Suite List	no	no
Distinguished Name	yes	no

Object Type	Groupable?	Allows Overrides?
Public Key Infrastructure (PKI): <ul style="list-style-type: none"> • Internal and Trusted CA • Internal and External Certs 	yes	no
SLA Monitor	no	no
Prefix List: IPv4 and IPv6	no	yes
Route Map	no	yes
Access List: Standard and Extended	no	yes
AS Path	no	yes
Community List	no	yes
Policy List	no	yes

Objects and Multitenancy

In a multidomain deployment, you can create objects in Global and descendant domains. The system displays objects created in the current domain, which you can edit. It also displays objects created in ancestor domains, which you cannot edit, with the exception of security zones.

Note Because security zones are tied to device interfaces, which you configure at the leaf level, administrators in descendant domains can view and edit security zones created in ancestor domains. Subdomain users can add and delete interfaces from ancestor zones, but cannot delete or rename the zones.

Object names must be unique within the domain hierarchy. The system may identify a conflict with the name of an object you cannot view in your current domain.

For objects that support grouping, you can group objects in the current domain with objects inherited from ancestor domains.

Object overrides allow you to define device-specific or domain-specific values for certain types of object, including network, port, VLAN tag, and URL. In a multidomain deployment, you can define a default value for an object in an ancestor domain, but allow administrators in descendant domains to add override values for that object.

The Object Manager

You can use the object manager to create and manage objects and object groups.

The object manager displays 20 objects or groups per page. If you have more than 20 of any type of object or group, use the navigation links at the bottom of the page to view additional pages. You can also go to a specific page or click **Refresh** (🔄) to refresh your view.

By default, the page lists objects and groups alphabetically by name. You can filter the objects on the page by name or value.

Editing Objects

In a multidomain deployment, the system displays objects created in the current domain, which you can edit. It also displays objects created in ancestor domains, which in most cases you cannot edit. To view and edit objects in a descendant domain, switch to that domain.

Procedure

- Step 1** Choose **Objects > Object Management**.
- Step 2** Choose an object type from the list; see [Introduction to Reusable Objects, on page 345](#).
- Step 3** Click **Edit** () next to the object you want to edit.
- If **View** () appears instead, the object belongs to an ancestor domain and has been configured not to allow overrides, or you do not have permission to modify the object.
- Step 4** Modify the object settings as desired.
- Step 5** If you are editing a variable set, manage the variables in the set; see [Managing Variables, on page 372](#).
- Step 6** For objects that can be configured to allow overrides:
- If you want to allow overrides for this object, check the **Allow Overrides** check box; see [Allowing Object Overrides, on page 352](#). You can change this setting only for objects that belong to the current domain.
 - If you want to add override values to this object, expand the Override section and click **Add**; see [Adding Object Overrides, on page 353](#).
- Step 7** Click **Save**.
- Step 8** If you are editing a variable set, and that set is in use by an access control policy, click **Yes** to confirm that you want to save your changes.
-

What to do next

- If an active policy references your object, deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

Viewing Objects and Their Usage

You can view usage details of objects on the Object Management page. The network, port, VLAN, and URL object types are the only object types that provide this functionality.

Note In a multidomain deployment, you can view objects from any other domain. However, to find usage of objects in a descendant domain, switch to that domain.

Procedure

Step 1 Choose **Objects > Object Management**.

Step 2 Choose one of the following object types:

- Network
- Port
- VLAN Tag
- URL

Step 3 Click **Find Usage** (🔍) next to the object.

The Object Usage window displays a list of all the policies, objects, and other settings where the object is in use. Click any of the listed items to know more about the object usage. For policies and some other settings where the object is used, you can click the corresponding links to visit the respective UI pages.

Filtering Objects or Object Groups

In a multidomain deployment, the system displays objects created in the current and ancestor domains, which you can filter.

Procedure

Step 1 Choose **Objects > Object Management**.

Step 2 Enter your filter criteria in the **Filter** field.

The page updates as you type to display matching items.

You can use the following wildcards:

- The asterisk (*) matches zero or more occurrences of a character.
 - The caret (^) matches content at the beginning of a string.
 - The dollar sign (\$) matches content at the end of a string.
-

Object Groups

Grouping objects allows you to reference multiple objects with a single configuration. The system allows you to use objects and object groups interchangeably in the web interface. For example, anywhere you would use a port object, you can also use a port object group.

You can group network, port, VLAN tag, URL, and PKI objects.

Objects and object groups of the same type cannot have the same name. In a multidomain deployment, the names of object groups must be unique within the domain hierarchy. Note that the system may identify a conflict with the name of an object group you cannot view in your current domain.

When you edit an object group used in a policy (for example, a network object group used in an access control policy), you must re-deploy the changed configuration for your changes to take effect.

Deleting a group does not delete the objects in the group, just their association with each other. Additionally, you cannot delete a group that is in use in an active policy. For example, you cannot delete a VLAN tag group that you are using in a VLAN condition in a saved access control policy.

Grouping Reusable Objects

In a multidomain deployment, the system displays objects created in the current domain, which you can edit. It also displays objects created in ancestor domains, which in most cases you cannot edit. To view and edit objects in a descendant domain, switch to that domain.

You can group objects in the current domain with objects inherited from ancestor domains.

Procedure

-
- Step 1** Choose **Objects > Object Management**.
- Step 2** If the object type you want to group is **Network, Port, URL, or VLAN Tag**:
- Choose the object type from the list of object types.
 - Choose **Add Group** from the **Add [Object Type]** drop-down list.
- Step 3** If the object type you want to group is **Distinguished Name**:
- Expand the **Distinguished Name** node.
 - Choose **Object Groups**.
 - Click **Add Distinguished Name Group**.
- Step 4** If the object type you want to group is **PKI**:
- Expand the **PKI** node.
 - Choose one of the following:
 - **Internal CA Groups**
 - **Trusted CA Groups**
 - **Internal Cert Groups**
 - **External Cert Groups**
 - Click **Add [Object Type] Group**.
- Step 5** Enter a unique **Name**.
- Step 6** Choose one or more objects from the list, and click **Add**.

You can also:

- Use the filter field **Search** (🔍) to search for existing objects to include, which updates as you type to display matching items. Click **Reload** (🔄) above the search field or click **Clear** (✖) in the search field to clear the search string.

- Click **Add** (➕) to create objects on the fly if no existing objects meet your needs.

Step 7 Optionally for **Network**, **Port**, **URL**, and **VLAN Tag** groups:

- Enter a **Description**.
- Check the **Allow Overrides** check box to allow overrides for this object group; see [Allowing Object Overrides, on page 352](#).

Step 8 Click **Save**.

What to do next

- If an active policy references your object group, deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

Object Overrides

An object override allows you to define an alternate value for an object, which the system uses for the devices you specify.

You can create an object whose definition works for most devices, and then use overrides to specify modifications to the object for the few devices that need different definitions. You can also create an object that needs to be overridden for all devices, but its use allows you to create a single policy for all devices. Object overrides allow you to create a smaller set of shared policies for use across devices without giving up the ability to alter policies when needed for individual devices.

For example, you might want to deny ICMP traffic to the different departments in your company, each of which is connected to a different network. You can do this by defining an access control policy with a rule that includes a network object called Departmental Network. By allowing overrides for this object, you can then create overrides on each relevant device that specifies the actual network where that device is connected.

In a multidomain deployment, you can define a default value for an object in an ancestor domain and allow administrators in descendant domains to add override values for that object. For example, a managed security service provider (MSSP) might use a single Firepower Management Center to manage network security for multiple customers. Administrators at the MSSP can define an object in the Global domain for use in all customers' deployments. Administrators for each customer can log into descendant domains to override that object for their organizations. These local administrators cannot view or affect the override values of other customers of the MSSP.

You can target an object override to a specific domain. In this case, the system uses the object override value for all devices in the targeted domain unless you override it at the device level.

From the object manager, you can choose an object that can be overridden and define a list of device-level or domain-level overrides for that object.

You can use object overrides with the following object types only:

- Network
- Port
- VLAN tag
- URL

- SLA Monitor
- Prefix List
- Route Map
- Access List
- AS Path
- Community List
- Policy List

If you can override an object, the **Override** column appears for the object type in the object manager. Possible values for this column include:

- Green checkmark — indicates that you can create overrides for the object and no overrides have been added yet
- Red X — indicates that you cannot create overrides for the object
- Number — represents a count of the overrides that have been added to that object (for example, "2" indicates two overrides have been added)

Managing Object Overrides

Procedure

Step 1 Choose **Objects > Object Management**.

Step 2 Choose from the list of object types; see [Introduction to Reusable Objects, on page 345](#).

Step 3 Click **Edit** () next to the object you want to edit.

If **View** () appears instead, the object belongs to an ancestor domain and has been configured not to allow overrides, or you do not have permission to modify the object.

Step 4 Manage the object overrides:

- Add—Add object overrides; see [Adding Object Overrides, on page 353](#).
 - Allow—Allow object overrides; see [Allowing Object Overrides, on page 352](#).
 - Delete—In the object editor, click **Delete** () next to the override you want to remove.
 - Edit—Edit object overrides; see [Editing Object Overrides, on page 353](#).
-

Allowing Object Overrides

Procedure

Step 1 In the object editor, check the **Allow Overrides** check box.

Step 2 Click **Save**.

What to do next

Add object override values; see [Adding Object Overrides, on page 353](#).

Adding Object Overrides

Before you begin

Allow object overrides; see [Allowing Object Overrides, on page 352](#).

Procedure

- Step 1** In the object editor, expand the **Override** section.
- Step 2** Click **Add**.
- Step 3** On **Targets**, choose domains or devices in the **Available Devices and Domains** list and click **Add**.
- Step 4** On the **Override** tab, enter a **Name**.
- Step 5** Optionally, enter a **Description**.
- Step 6** Enter an override value.

Example:

For a network object, enter a network value.

- Step 7** Click **Add**.
 - Step 8** Click **Save**.
-

What to do next

- If an active policy references your object, deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

Editing Object Overrides

You can modify the description and the value of an existing override, but you cannot modify the existing target list. Instead, you must add a new override with new targets, which replaces the existing override.

Procedure

- Step 1** In the object editor, expand the **Override** section.
- Step 2** Click **Edit** () next to the override you want to modify.
- Step 3** Optionally, modify the **Description**.
- Step 4** Modify the override value.

Step 5 Click **Save** to save the override.

Step 6 Click **Save** to save the object.

What to do next

- If an active policy references your object, deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

Network Objects

A network object represents one or more IP addresses that you can specify either individually or as address blocks. You can use network objects and groups in various places in the system's web interface, including access control policies, network variables, identity rules, network discovery rules, event searches, reports, and so on.

Creating Network Objects

Procedure

Step 1 Choose **Objects > Object Management**.

Step 2 Choose **Network** from the list of object types.

Step 3 Choose **Add Object** from the **Add Network** drop-down menu.

Step 4 Enter a **Name**.

In a multidomain deployment, object names must be unique within the domain hierarchy. The system may identify a conflict with the name of an object you cannot view in your current domain.

Step 5 Optionally, enter a **Description**.

Step 6 In the **Network** field, enter an IP address or address block to add to the object.

Step 7 Manage overrides for the object:

- If you want to allow overrides for this object, check the **Allow Overrides** check box; see [Allowing Object Overrides, on page 352](#).
- If you want to add override values to this object, expand the Override section and click **Add**; see [Adding Object Overrides, on page 353](#).

Step 8 Click **Save**.

What to do next

- If an active policy references your object, deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

Port Objects

Port objects represent different protocols in slightly different ways:

TCP and UDP

A port object represents the transport layer protocol, with the protocol number in parentheses, plus an optional associated port or port range. For example: `TCP (6) / 22`.

ICMP and ICMPv6 (IPv6-ICMP)

A port object represents the Internet layer protocol plus an optional type and code. For example: `ICMP (1) : 3 : 3`.

You can restrict an ICMP or IPV6-ICMP port object by type and, if applicable, code. For more information on ICMP types and codes, see:

- <http://www.iana.org/assignments/icmp-parameters/icmp-parameters.xml>
- <http://www.iana.org/assignments/icmpv6-parameters/icmpv6-parameters.xml>

Other

A port object can represent other protocols that do not use ports.

The Firepower System provides default port objects for well-known ports. You cannot modify or delete these default objects. You can create custom port objects in addition to the default objects.

You can use port objects and groups in various places in the system's web interface, including access control policies, identity rules, network discovery rules, port variables, and event searches. For example, if your organization uses a custom client that uses a specific range of ports and causes the system to generate excessive and misleading events, you can configure your network discovery policy to exclude monitoring those ports.

When using port objects, observe the following guidelines:

- You cannot add any protocol other than TCP or UDP for source port conditions in access control rules. Also, you cannot mix transport protocols when setting both source and destination port conditions in a rule.
- If you add an unsupported protocol to a port object group used in a source port condition, the rule where it is used does not take effect on the managed device when the configuration is deployed.
- If you create a port object containing both TCP and UDP ports, then add it as a source port condition in a rule, you cannot add a destination port, and vice versa.

Creating Port Objects

Procedure

- Step 1** Choose **Objects > Object Management**.
- Step 2** Choose **Port** from the list of object types.
- Step 3** Choose **Add Object** from the **Add Port** drop-down list.
- Step 4** Enter a **Name**.

- Step 5** Choose a **Protocol**.
- Step 6** Depending on the protocol you chose, constrain by **Port**, or choose an ICMP **Type** and **Code**.
You can enter ports from **1** to **65535**. Use a hyphen to specify a port range. You must constrain the object by port if you chose to match **All** protocols, using the **Other** drop-down list.
- Step 7** Manage overrides for the object:
- If you want to allow overrides for this object, check the **Allow Overrides** check box; see [Allowing Object Overrides, on page 352](#).
 - If you want to add override values to this object, expand the Override section and click **Add**; see [Adding Object Overrides, on page 353](#).
- Step 8** Click **Save**.
-

What to do next

- If an active policy references your object, deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

Application Filters

System-provided application filters help you perform application control by organizing applications according to basic characteristics: type, risk, business relevance, category, and tags. In the object manager, you can create and manage reusable user-defined application filters based on combinations of the system-provided filters, or on custom combinations of applications. For detailed information, see [Application Conditions \(Application Control\), on page 329](#).

VLAN Tag Objects

Each VLAN tag object you configure represents a VLAN tag or range of tags.

You can group VLAN tag objects. Groups represent multiple objects; using a range of VLAN tags in a single object is not considered a group in this sense.

You can use VLAN tag objects and groups in various places in the system's web interface, including rules and event searches. For example, you could write an access control rule that applies only to a specific VLAN.

Creating VLAN Tag Objects

Procedure

- Step 1** Choose **Objects > Object Management**.
- Step 2** Choose **VLAN Tag** from the list of object types.
- Step 3** Choose **Add Object** from the **Add VLAN Tag** drop-down list.
- Step 4** Enter a **Name**.

- Step 5** Enter a **Description**.
- Step 6** Enter a value in the **VLAN Tag** field. Use a hyphen to specify a range of VLAN tags.
- Step 7** Manage overrides for the object:
- If you want to allow overrides for this object, check the **Allow Overrides** check box; see [Allowing Object Overrides, on page 352](#).
 - If you want to add override values to this object, expand the Override section and click **Add**; see [Adding Object Overrides, on page 353](#).
- Step 8** Click **Save**.
-

What to do next

- If an active policy references your object, deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

URL Objects

Important For best practices for using this and similar options in Security Intelligence configurations and for URL rules in access control policies, see [Manual URL Filtering Options, on page 1017](#).

A URL object defines a single URL or IP address, whereas a URL group object can define more than one URL or address. You can use URL objects and groups in various places in the system's web interface, including access control policies and event searches.

The system makes a simple substring match on any URL that you enter, which may not necessarily be what you expect. See matching example URLs at [Manual URL Filtering Options, on page 1017](#).

When creating URL objects, especially if you do not configure SSL inspection to decrypt or block encrypted traffic, keep the following points in mind:

- If you plan to use a URL object to match HTTPS traffic in an access control rule, create the object using the subject common name in the public key certificate used to encrypt the traffic. Also, the system disregards subdomains within the subject common name, so do not include subdomain information. For example, use `example.com` rather than `www.example.com`.
- When matching web traffic using access control rules with URL conditions, the system disregards the encryption protocol (HTTP vs HTTPS). In other words, if you block a website, both HTTP and HTTPS traffic to that website is blocked, unless you use an application condition to refine the rule. When creating a URL object, you do not need to specify the protocol when creating an object. For example, use `example.com` rather than `http://example.com/`.

Creating URL Objects

Procedure

- Step 1** Choose **Objects > Object Management**.
- Step 2** Choose **URL** from the list of object types.
- Step 3** Choose **Add Object** from the **Add URL** drop-down list.
- Step 4** Enter a **Name**.

In a multidomain deployment, object names must be unique within the domain hierarchy. The system may identify a conflict with the name of an object you cannot view in your current domain.

- Step 5** Optionally, enter a **Description**.
- Step 6** Enter the **URL** or IP address.
- Step 7** Manage overrides for the object:
- If you want to allow overrides for this object, check the **Allow Overrides** check box; see [Allowing Object Overrides, on page 352](#).
 - If you want to add override values to this object, expand the Override section and click **Add**; see [Adding Object Overrides, on page 353](#).
- Step 8** Click **Save**.
-

What to do next

- If an active policy references your object, deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

Geolocation Objects

Each geolocation object you configure represents one or more countries or continents that the system has identified as the source or destination of traffic on your monitored network. You can use geolocation objects in various places in the system's web interface, including access control policies, SSL policies, and event searches. For example, you could write an access control rule that blocks traffic to or from certain countries.

To ensure that you are using up-to-date information to filter your network traffic, Cisco strongly recommends that you regularly update your Geolocation Database (GeoDB).

Creating Geolocation Objects

Procedure

- Step 1** Choose **Objects > Object Management**.
- Step 2** Choose **Geolocation** from the list of object types.

Step 3 Click **Add Geolocation**.

Step 4 Enter a **Name**.

In a multidomain deployment, object names must be unique within the domain hierarchy. The system may identify a conflict with the name of an object you cannot view in your current domain.

Step 5 Check the check boxes for the countries and continents you want to include in your geolocation object. Checking a continent chooses all countries within that continent, as well as any countries that GeoDB updates may add under that continent in the future. Unchecking any country under a continent unchecks the continent. You can choose any combination of countries and continents.

Step 6 Click **Save**.

What to do next

- If an active policy references your object, deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

Security Zones

Security zones segment your network to help you manage and classify traffic flow. A security zone simply groups interfaces. These groups may span multiple devices; you can also configure multiple zones on a single device.

All interfaces in a security zone must be of the same type: all inline, passive, switched, routed, or ASA FirePOWER. After you create a security zone, you cannot change the type of interfaces it contains. An interface can belong to only one zone.

The Security Zones page of the object manager lists the zones configured on your managed devices. The page also displays the type of interfaces in each zone, and you can expand each zone to view which interfaces on which devices belong to each zone.

Note Create inline sets before you add security zones for the interfaces in the inline set; otherwise security zones are removed and you must add them again.

Model-Specific Notes and Warnings

During initial configuration of a 7000 or 8000 Series device, the system creates security zones based on the detection mode you selected for the device. For example, the system creates a Passive zone in passive deployments, while in inline deployments the system creates External and Internal zones. When you register the device to the Firepower Management Center, those security zones are added to the FMC.

Zones and Multitenancy

In a multidomain deployment, you can create security zones at any level. A zone created in an ancestor domain can contain interfaces that reside on devices in different domains. In this situation, subdomain users viewing the ancestor zone configuration in the object manager can see only the interfaces in their domain.

Unless restricted by role, subdomain users can view **and** edit zones created in ancestor domains. Subdomain users can add and delete interfaces from these zones. They cannot, however, delete or rename the zones. You can neither view nor edit zones created in descendant domains.

Creating Security Zone Objects

Tip You can create empty security zones and add interfaces to them later. To add an interface, the interface must have a name. You can also create security zones while configuring interfaces in **Devices > Device Management**.

Before you begin

- Understand the usage requirements and restrictions for each type of security zone. See [Security Zones, on page 359](#).

Procedure

- Step 1** Choose **Objects > Object Management**.
 - Step 2** Choose **Security Zones** from the list of object types.
 - Step 3** Click **Add Security Zone**.
 - Step 4** Enter a **Name**.
 - Step 5** Choose an **Interface Type**.
 - Step 6** From the **Device > Interfaces** drop-down list, choose a device that contains interfaces you want to add.
 - Step 7** Choose one or more interfaces.
 - Step 8** Click **Add** to add the interfaces you chose, grouped by device.
 - Step 9** Click **Save**.
-

What to do next

- If an active policy references your object, deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

Variable Sets

Variables represent values commonly used in intrusion rules to identify source and destination IP addresses and ports. You can also use variables in intrusion policies to represent IP addresses in rule suppressions, adaptive profiles, and dynamic rule states.

Tip Preprocessor rules can trigger events regardless of the hosts defined by network variables used in intrusion rules.

You use variable sets to manage, customize, and group your variables. You can use the default variable set provided by the system or create your own custom sets. Within any set you can modify predefined default variables and add and modify user-defined variables.

Most of the shared object rules and standard text rules that the Firepower System provides use predefined default variables to define networks and port numbers. For example, the majority of the rules use the variable `$HOME_NET` to specify the protected network and the variable `$EXTERNAL_NET` to specify the unprotected (or outside) network. In addition, specialized rules often use other predefined variables. For example, rules that detect exploits against web servers use the `$HTTP_SERVERS` and `$HTTP_PORTS` variables.

Rules are more effective when variables more accurately reflect your network environment. At a minimum, you should modify default variables in the default set. By ensuring that a variable such as `$HOME_NET` correctly defines your network and `$HTTP_SERVERS` includes all web servers on your network, processing is optimized and all relevant systems are monitored for suspicious activity.

To use your variables, you link variable sets to intrusion policies associated with access control rules or with the default action of an access control policy. By default, the default variable set is linked to all intrusion policies used by access control policies.

Adding a variable to any set adds it to all sets; that is, each variable set is a collection of all variables currently configured on your system. Within any variable set, you can add user-defined variables and customize the value of any variable.

Initially, the Firepower System provides a single, default variable set comprised of predefined default values. Each variable in the default set is initially set to its default value, which for a predefined variable is the value set by the Cisco Talos Intelligence Group (Talos) and provided in rule updates.

Although you can leave predefined default variables configured to their default values, Cisco recommends that you modify a subset of predefined variables.

You could work with variables only in the default set, but in many cases you can benefit most by adding one or more custom sets, configuring different variable values in different sets, and perhaps even adding new variables.

When using multiple sets, it is important to remember that the *current value* of any variable in the default set determines the *default value* of the variable in all other sets.

When you select **Variable Sets** on the Object Manager page, the object manager lists the default variable set and any custom sets you created.

On a freshly installed system, the default variable set is comprised only of the default variables predefined by Cisco.

Each variable set includes the default variables provided by the system and all custom variables you have added from any variable set. Note that you can edit the default set, but you cannot rename or delete the default set.

In a multidomain deployment, the system generates a default variable set for each subdomain.

Caution Importing an access control or an intrusion policy overwrites existing default variables in the default variable set with the imported default variables. If your existing default variable set contains a custom variable not present in the imported default variable set, the unique variable is preserved.

[Managing Variable Sets](#), on page 371

Variable Sets in Intrusion Policies

By default, the Firepower System links the default variable set to all intrusion policies used in an access control policy. When you deploy an access control policy that uses an intrusion policy, intrusion rules that you have enabled in the intrusion policy use the variable values in the linked variable set.

When you modify a custom variable set used by an intrusion policy in an access control policy, the system reflects the status for that policy as out-of-date on the Access Control Policy page. You must re-deploy the access control policy to implement changes in your variable set. When you modify the default set, the system reflects the status of all access control policies that use intrusion policies as out-of-date, and you must re-deploy all access control policies to implement your changes.

Variables

Variables belong to one of the following categories:

Default Variables

Variables provided by the Firepower System. You cannot rename or delete a default variable, and you cannot change its default value. However, you can create a customized version of a default variable.

Customized Variables

Variables you create. These variables can include:

- *customized default variables*

When you edit the value for a default variable, the system moves the variable from the Default Variables area to the Customized Variables area. Because variable values in the default set determine the default values of variables in custom sets, customizing a default variable in the default set modifies the default value of the variable in all other sets.

- *user-defined variables*

You can add and delete your own variables, customize their values within different variable sets, and reset customized variables to their default values. When you reset a user-defined variable, it remains in the Customized Variables area.

User-defined variables can be one of the following types:

- *network* variables specify the IP addresses of hosts in your network traffic.
- *port* variables specify TCP or UDP ports in network traffic, including the value `any` for either type.

For example, if you create custom standard text rules, you might also want to add your own user-defined variables to more accurately reflect your traffic or as shortcuts to simplify the rule creation process. Alternatively, if you create a rule that you want to inspect traffic in the “demilitarized zone” (or DMZ) only, you can create a variable named `$_DMZ` whose value lists the server IP addresses that are exposed. You can then use the `$_DMZ` variable in any rule written for this zone.

Advanced Variables

Variables provided by the Firepower System under specific conditions. These variables have a very limited deployment.

Predefined Default Variables

By default, the Firepower System provides a single default variable set, which is comprised of predefined default variables. The Cisco Talos Intelligence Group (Talos) uses rule updates to provide new and updated intrusion rules and other intrusion policy elements, including default variables.

Because many intrusion rules provided by the system use predefined default variables, you should set appropriate values for these variables. Depending on how you use variable sets to identify traffic on your network, you can modify the values for these default variables in any or all variable sets.

Caution Importing an access control or an intrusion policy overwrites existing default variables in the default variable set with the imported default variables. If your existing default variable set contains a custom variable not present in the imported default variable set, the unique variable is preserved.

The following table describes the variables provided by the system and indicates which variables you typically would modify. For assistance determining how to tailor variables to your network, contact Professional Services or Support.

Table 51: System-Provided Variables

Variable Name	Description	Modify?
\$AIM_SERVERS	Defines known AOL Instant Messenger (AIM) servers, and is used in chat-based rules and rules that look for AIM exploits.	Not required.
\$DNS_SERVERS	Defines Domain Name Service (DNS) servers. If you create a rule that affects DNS servers specifically, you can use the \$DNS_SERVERS variable as a destination or source IP address.	Not required in current rule set.
\$EXTERNAL_NET	Defines the network that the Firepower System views as the unprotected network, and is used in many rules to define the external network.	Yes, you should adequately define \$HOME_NET and then exclude \$HOME_NET as the value for \$EXTERNAL_NET.
\$FILE_DATA_PORTS	Defines non-encrypted ports used in intrusion rules that detect files in a network stream.	Not required.
\$FTP_PORTS	Defines the ports of FTP servers on your network, and is used for FTP server exploit rules.	Yes, if your FTP servers use ports other than the default ports (you can view the default ports in the web interface).
\$GTP_PORTS	Defines the data channel ports where the packet decoder extracts the payload inside a GTP (General Packet Radio Service [GPRS] Tunneling Protocol) PDU.	Not required.
\$HOME_NET	Defines the network that the associated intrusion policy monitors, and is used in many rules to define the internal network.	Yes, to include the IP addresses for your internal network.

Variable Name	Description	Modify?
\$HTTP_PORTS	Defines the ports of web servers on your network, and is used for web server exploit rules.	Yes, if your web servers use ports other than the default ports (you can view the default ports in the web interface).
\$HTTP_SERVERS	Defines the web servers on your network. Used in web server exploit rules.	Yes, if you run HTTP servers.
\$ORACLE_PORTS	Defines Oracle database server ports on your network, and is used in rules that scan for attacks on Oracle databases.	Yes, if you run Oracle servers.
\$SHELLCODE_PORTS	Defines the ports you want the system to scan for shell code exploits, and is used in rules that detect exploits that use shell code.	Not required.
\$SIP_PORTS	Defines the ports of SIP servers on your network, and is used for SIP exploit rules.	Not required.
\$SIP_SERVERS	Defines SIP servers on your network, and is used in rules that address SIP-targeted exploits.	Yes, if you run SIP servers, you should adequately define \$HOME_NET and then include \$HOME_NET as the value for \$SIP_SERVERS.
\$SMTP_SERVERS	Defines SMTP servers on your network, and is used in rules that address exploits that target mail servers.	Yes, if you run SMTP servers.
\$SNMP_SERVERS	Defines SNMP servers on your network, and is used in rules that scan for attacks on SNMP servers.	Yes, if you run SNMP servers.
\$SNORT_BPF	Identifies a legacy advanced variable that appears only when it existed on your system in a Firepower System software release before Version 5.3.0 that you subsequently upgraded to Version 5.3.0 or greater.	No, you can only view or delete this variable. You cannot edit it or recover it after deleting it.
\$SQL_SERVERS	Defines database servers on your network, and is used in rules that address database-targeted exploits.	Yes, if you run SQL servers.
\$SSH_PORTS	Defines the ports of SSH servers on your network, and is used for SSH server exploit rules.	Yes, if your SSH servers use ports other than the default port (you can view the default ports in the web interface).
\$SSH_SERVERS	Defines SSH servers on your network, and is used in rules that address SSH-targeted exploits.	Yes, if you run SSH servers, you should adequately define \$HOME_NET and then include \$HOME_NET as the value for \$SSH_SERVERS.
\$TELNET_SERVERS	Defines known Telnet servers on your network, and is used in rules that address Telnet server-targeted exploits.	Yes, if you run Telnet servers.

Variable Name	Description	Modify?
\$USER_CONF	Provides a general tool that allows you to configure one or more features not otherwise available via the web interface. Conflicting or duplicate \$USER_CONF configurations will halt the system.	No, only as instructed in a feature description or with the guidance of Support.

Network Variables

Network variables represent IP addresses you can use in intrusion rules that you enable in an intrusion policy and in intrusion policy rule suppressions, dynamic rule states, and adaptive profiles. Network variables differ from network objects and network object groups in that network variables are specific to intrusion policies and intrusion rules, whereas you can use network objects and groups to represent IP addresses in various places in the system's web interface, including access control policies, network variables, intrusion rules, network discovery rules, event searches, reports, and so on.

You can use network variables in the following configurations to specify the IP addresses of hosts on your network:

- intrusion rules—Intrusion rule **Source IPs** and **Destination IPs** header fields allow you to restrict packet inspection to the packets originating from or destined to specific IP addresses.
- suppressions—The **Network** field in source or destination intrusion rule suppressions allows you to suppress intrusion event notifications when a specific IP address or range of IP addresses triggers an intrusion rule or preprocessor.
- dynamic rule states—The **Network** field in source or destination dynamic rule states allows you to detect when too many matches for an intrusion rule or preprocessor rule occur in a given time period.
- adaptive profiles—The adaptive profiles **Networks** field identifies hosts where you want to improve reassembly of packet fragments and TCP streams in passive deployments.

When you use variables in the fields identified in this section, the variable set you link to an intrusion policy determines the variable values in the network traffic handled by an access control policy that uses the intrusion policy.

You can add any combination of the following network configurations to a variable:

- any combination of network variables, network objects, and network object groups that you select from the list of available networks
- individual network objects that you add from the New Variable or Edit Variable page, and can then add to your variable and to other existing and future variables
- literal, single IP addresses or address blocks

You can list multiple literal IP addresses and address blocks by adding each individually. You can list IPv4 and IPv6 addresses and address blocks alone or in any combination. When specifying IPv6 addresses, you can use any addressing convention defined in RFC 4291.

The default value for included networks in any variable you add is the word `any`, which indicates any IPv4 or IPv6 address. The default value for excluded networks is `none`, which indicates no network. You can also specify the address `::` in a literal value to indicate any IPv6 address in the list of included networks, or no IPv6 addresses in the list of exclusions.

Adding networks to the excluded list negates the specified addresses and address blocks. That is, you can match any IP address with the exception of the excluded IP address or address blocks.

For example, excluding the literal address `192.168.1.1` specifies any IP address other than `192.168.1.1`, and excluding `2001:db8:ca2e::fa4c` specifies any IP address other than `2001:db8:ca2e::fa4c`.

You can exclude any combination of networks using literal or available networks. For example, excluding the literal values `192.168.1.1` and `192.168.1.5` *includes* any IP address other than `192.168.1.1` or `192.168.1.5`. That is, the system interprets this as “**not** `192.168.1.1` **and not** `192.168.1.5`,” which matches any IP address other than those listed between brackets.

Note the following points when adding or editing network variables:

- You cannot logically exclude the value `any` which, if excluded, would indicate no address. For example, you cannot add a variable with the value `any` to the list of excluded networks.
- Network variables identify traffic for the specified intrusion rule and intrusion policy features. Note that preprocessor rules can trigger events regardless of the hosts defined by network variables used in intrusion rules.
- Excluded values must resolve to a subset of included values. For example, you cannot include the address block `192.168.5.0/24` and exclude `192.168.6.0/24`.

Port Variables

Port variables represent TCP and UDP ports you can use in the **Source Port** and **Destination Port** header fields in intrusion rules that you enable in an intrusion policy. Port variables differ from port objects and port object groups in that port variables are specific to intrusion rules. You can create port objects for protocols other than TCP and UDP, and you can use port objects in various places in the system’s web interface, including port variables, access control policies, network discovery rules, and event searches.

You can use port variables in the intrusion rule **Source Port** and **Destination Port** header fields to restrict packet inspection to packets originating from or destined to specific TCP or UDP ports.

When you use variables in these fields, the variable set you link to the intrusion policy associated with an access control rule or policy determines the values for these variables in the network traffic where you deploy the access control policy.

You can add any combination of the following port configurations to a variable:

- any combination of port variables and port objects that you select from the list of available ports
Note that the list of available ports does not display port object groups, and you cannot add these to variables.
- individual port objects that you add from the New Variable or Edit Variable page, and can then add to your variable and to other existing and future variables

Only TCP and UDP ports, including the value `any` for either type, are valid variable values. If you use the new or edit variables page to add a valid port object that is not a valid variable value, the object is added to the system but is not displayed in the list of available objects. When you use the object manager to edit a port object that is used in a variable, you can only change its value to a valid variable value.

- single, literal port values and port ranges

You must separate port ranges with a dash (-). Port ranges indicated with a colon (:) are supported for backward compatibility, but you cannot use a colon in port variables that you create.

You can list multiple literal port values and ranges by adding each individually in any combination.

Note the following points when adding or editing port variables:

- The default value for included ports in any variable you add is the word `any`, which indicates any port or port range. The default value for excluded ports is `none`, which indicates no ports.

Tip To create a variable with the value `any`, name and save the variable without adding a specific value.

- You cannot logically exclude the value `any` which, if excluded, would indicate no ports. For example, you cannot save a variable set when you add a variable with the value `any` to the list of excluded ports.
- Adding ports to the excluded list negates the specified ports and port ranges. That is, you can match any port with the exception of the excluded ports or port ranges.
- Excluded values must resolve to a subset of included values. For example, you cannot include the port range 10-50 and exclude port 60.

Advanced Variables

Advanced variables allow you to configure features that you cannot otherwise configure via the web interface. The Firepower System currently provides only one advanced variable, the `USER_CONF` variable.

USER_CONF

`USER_CONF` provides a general tool that allows you to configure one or more features not otherwise available via the web interface.

Caution Do **not** use the advanced variable `USER_CONF` to configure an intrusion policy feature unless you are instructed to do so in the feature description or by Support. Conflicting or duplicate configurations will halt the system.

When editing `USER_CONF`, you can type up to 4096 total characters on a single line; the line wraps automatically. You can include any number of valid instructions or lines until you reach the 8192 maximum character length for a variable or a physical limit such as disk space. Use the backslash (`\`) line continuation character after any complete argument in a command directive.

Resetting `USER_CONF` empties it.

Variable Reset

You can reset a variable to its default value on the variable set new or edit variables page. The following table summarizes the basic principles of resetting variables.

Table 52: Variable Reset Values

Resetting this variable type...	In this set type...	Resets it to...
default	default	the rule update value

Resetting this variable type...	In this set type...	Resets it to...
user-defined	default	any
default or user-defined	custom	the current default set value (modified or unmodified)

Resetting a variable in a custom set simply resets it to the current value for that variable in the default set.

Conversely, resetting or modifying the value of a variable in the default set always updates the default value of that variable in all custom sets. When the reset icon is grayed out, indicating that you cannot reset the variable, this means that the variable has no customized value in that set. Unless you have customized the value for a variable in a custom set, a change to the variable in the default set updates the value used in any intrusion policy where you have linked the variable set.

Note It is good practice when you modify a variable in the default set to assess how the change affects any intrusion policy that uses the variable in a linked custom set, especially when you have not customized the variable value in the custom set.

You can hover your pointer over the **Reset icon** in a variable set to see the reset value. When the customized value and the reset value are the same, this indicates one of the following:

- you are in the custom or default set where you added the variable with the value `any`
- you are in the custom set where you added the variable with an explicit value and elected to use the configured value as the default value

Adding Variables to Sets

Adding a variable to a variable set adds it to all other sets. When you add a variable from a custom set, you must choose whether to use the configured value as the customized value in the default set:

- **If you use the configured value** (for example, 192.168.0.0/16), the variable is added to the default set using the configured value as a customized value with a default value of `any`. Because the current value in the default set determines the default value in other sets, the initial, default value in other custom sets is the configured value (which in the example is 192.168.0.0/16).
- **If you do not use the configured value**, the variable is added to the default set using only the default value `any` and, consequently, the initial, default value in other custom sets is `any`.

Example: Adding User-Defined Variables to Default Sets

The following diagram illustrates set interactions when you add the user-defined variable `Var1` to the default set with the value `192.168.1.0/24`.

You can customize the value of `var1` in any set. In Custom Set 2 where `var1` has not been customized, its value is `192.168.1.0/24`. In Custom Set 1 the customized value `192.168.2.0/24` of `var1` overrides the default value. Resetting a user-defined variable in the default set resets its default value to `any` in all sets.

It is important to note in this example that, if you do not update `var1` in Custom Set 2, further customizing or resetting `var1` in the default set consequently updates the current, default value of `var1` in Custom Set 2, thereby affecting any intrusion policy linked to the variable set.

Although not shown in the example, note that interactions between sets are the same for user-defined variables and default variables except that resetting a default variable in the default set resets it to the value configured by Cisco in the current rule update.

Example: Adding User-Defined Variables to Custom Sets

The next two examples illustrate variable set interactions when you add a user-defined variable to a custom set. When you save the new variable, you are prompted whether to use the configured value as the default value for other sets. In the following example, you elect **to use** the configured value.

Note that, except for the origin of `var1` from Custom Set 1, this example is identical to the example above where you added `var1` to the default set. Adding the customized value `192.168.1.0/24` for `var1` to Custom Set 1 copies the value to the default set as a customized value with a default value of `any`. Thereafter, `var1` values and interactions are the same as if you had added `var1` to the default set. As with the previous example, keep in mind that further customizing or resetting `var1` in the default set consequently updates the current, default value of `var1` in Custom Set 2, thereby affecting any intrusion policy linked to the variable set.

In the next example, you add `var1` with the value `192.168.1.0/24` to Custom Set 1 as in the previous example, but you elect **not to use** the configured value of `var1` as the default value in other sets.

This approach adds `var1` to all sets with a default value of `any`. After adding `var1`, you can customize its value in any set. An advantage of this approach is that, by not initially customizing `var1` in the default set,

you decrease your risk of customizing the value in the default set and thus inadvertently changing the current value in a set such as Custom Set 2 where you have not customized `var1`.

Nesting Variables

You can nest variables so long as the nesting is not circular. Nested, negated variables are not supported.

Valid Nested Variables

In this example, SMTP_SERVERS, HTTP_SERVERS, and OTHER_SERVERS are valid nested variables.

Variable	Type	Included Networks	Excluded Networks
SMTP_SERVERS	customized default	10.1.1.1	—
HTTP_SERVERS	customized default	10.1.1.2	—
OTHER_SERVERS	user-defined	10.2.2.0/24	—
HOME_NET	customized default	10.1.1.0/24 OTHER_SERVERS	SMTP_SERVERS HTTP_SERVERS

An Invalid Nested Variable

In this example, HOME_NET is an invalid nested variable because the nesting of HOME_NET is circular; that is, the definition of OTHER_SERVERS includes HOME_NET, so you would be nesting HOME_NET in itself.

Variable	Type	Included Networks	Excluded Networks
SMTP_SERVERS	customized default	10.1.1.1	—
HTTP_SERVERS	customized default	10.1.1.2	—
OTHER_SERVERS	user-defined	10.2.2.0/24 HOME_NET	—
HOME_NET	customized default	10.1.1.0/24 OTHER_SERVERS	SMTP_SERVERS HTTP_SERVERS

An Unsupported Nested, Negated Variable

Because nested, negated variables are not supported, you cannot use the variable NONCORE_NET as shown in this example to represent IP addresses that are outside of your protected networks.

Variable	Type	Included Networks	Excluded Networks
HOME_NET	customized default	10.1.0.0/16 10.2.0.0/16 10.3.0.0/16	—
EXTERNAL_NET	customized default	—	HOME_NET
DMZ_NET	user-defined	10.4.0.0/16	—
NOT_DMZ_NET	user-defined	—	DMZ_NET
NONCORE_NET	user-defined	EXTERNAL_NET NOT_DMZ_NET	—

Alternative to an Unsupported Nested, Negated Variable

As an alternative to the example above, you could represent IP addresses that are outside of your protected networks by creating the variable NONCORE_NET as shown in this example.

Variable	Type	Included Networks	Excluded Networks
HOME_NET	customized default	10.1.0.0/16 10.2.0.0/16 10.3.0.0/16	—
DMZ_NET	user-defined	10.4.0.0/16	—
NONCORE_NET	user-defined	—	HOME_NET DMZ_NET

Managing Variable Sets

To use variable sets, you must have the Threat license (for FTD devices) or the Protection license (all other device types).

In a multidomain deployment, the system displays objects created in the current domain, which you can edit. It also displays objects created in ancestor domains, which in most cases you cannot edit. To view and edit objects in a descendant domain, switch to that domain.

Procedure

-
- Step 1** Choose **Objects > Object Management**.
 - Step 2** Choose **Variable Set** from the list of object types.
 - Step 3** Manage your variable sets:

- Add — If you want to add a custom variable set, click **Add Variable Set**; see [Creating Variable Sets, on page 372](#).

- Delete — If you want to delete a custom variable set, click **Delete** () next to the variable set, then click **Yes**. You cannot delete the default variable set or variable sets belonging to ancestor domains.

Note Variables created in a variable set you delete are not deleted or otherwise affected in other sets.

- Edit — If you want to edit a variable set, click **Edit** () next to the variable set you want to modify; see [Editing Objects, on page 348](#).
- Filter — If you want to filter variable sets by name, begin entering a name; as you type, the page refreshes to display matching names. If you want to clear name filtering, click **Clear** (✕) in the filter field.
- Manage Variables — To manage the variables included in variable sets, see [Managing Variables, on page 372](#).

Creating Variable Sets

Procedure

- Step 1** Choose **Objects > Object Management**.
- Step 2** Choose **Variable Set** from the list of object types.
- Step 3** Click **Add Variable Set**.
- Step 4** Enter a **Name**.

In a multidomain deployment, object names must be unique within the domain hierarchy. The system may identify a conflict with the name of an object you cannot view in your current domain.

- Step 5** Optionally, enter a **Description**.
- Step 6** Manage the variables in the set; see [Managing Variables, on page 372](#).
- Step 7** Click **Save**.

What to do next

- If an active policy references your object, deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

Managing Variables

You must have the Threat license (for FTD devices) or the Protection license (all other device types).

In a multidomain deployment, the system displays objects created in the current domain, which you can edit. It also displays objects created in ancestor domains, which in most cases you cannot edit. To view and edit objects in a descendant domain, switch to that domain.

Procedure

Step 1 Choose **Objects > Object Management**.

Step 2 Choose **Variable Set** from the list of object types.

Step 3 Click **Edit** () next to the variable set you want to edit.

If **View** () appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

Step 4 Manage your variables:

- **Display** — If you want to display the complete value for a variable, hover your pointer over the value in the **Value** column next to the variable.
- **Add** — If you want to add a variable, click **Add**; see [Adding Variables, on page 374](#).
- **Delete** — Click **Delete** () next to the variable. If you have saved the variable set since adding the variable, click **Yes** to confirm that you want to delete the variable.

You *cannot* delete the following:

- default variables
 - user-defined variables that are used by intrusion rules or other variables
 - variables belonging to ancestor domains
- **Edit** — Click **Edit** () next to the variable you want to edit; see [Editing Variables, on page 374](#).
 - **Reset** — If you want to reset a modified variable to its default value, click **Reset** next to a modified variable. If reset is dimmed, one of the following is true:
 - The current value is already the default value.
 - The configuration belongs to an ancestor domain.

Tip Hover your pointer over an active reset to display the default value.

Step 5 Click **Save** to save the variable set. If the variable set is in use by an access control policy, click **Yes** to confirm that you want to save your changes.

Because the current value in the default set determines the default value in all other sets, modifying or resetting a variable in the default set changes the current value in other sets where you have not customized the default value.

What to do next

- If an active policy references your object, deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

Adding Variables

You must have the Threat license (for FTD devices) or the Protection license (all other device types).

Procedure

Step 1 In the variable set editor, click **Add**.

Step 2 Enter a unique variable **Name**.

Step 3 From the **Type** drop-down list, choose either **Network** or **Port**.

Step 4 Specify values for the variable:

- If you want to move items from the list of available networks or ports to the list of included or excluded items, you can choose one or more items and then drag and drop, or click **Include** or **Exclude**.

Tip If addresses or ports in the included and excluded lists for a network or port variable overlap, excluded addresses or ports take precedence.

- Enter a single literal value, then click **Add**. For network variables, you can enter a single IP address or address block. For port variables you can add a single port or port range, separating the upper and lower values with a hyphen (-). Repeat this step as needed to enter multiple literal values.

- If you want to remove an item from the included or excluded lists, click **Delete** () next to the item.

Note The list of items to include or exclude can be comprised of any combination of literal strings and existing variables, objects, and network object groups in the case of network variables.

Step 5 Click **Save** to save the variable. If you are adding a new variable from a custom set, you have the following options:

- Click **Yes** to add the variable using the configured value as the customized value in the default set and, consequently, the default value in other custom sets.
- Click **No** to add the variable as the default value of `any` in the default set and, consequently, in other custom sets.

Step 6 Click **Save** to save the variable set. Your changes are saved, and any access control policy the variable set is linked to displays an out-of-date status.

What to do next

- If an active policy references your object, deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

Editing Variables

You must have the Threat license (for FTD devices) or the Protection license (all other device types).

In a multidomain deployment, the system displays objects created in the current domain, which you can edit. It also displays objects created in ancestor domains, which in most cases you cannot edit. To view and edit objects in a descendant domain, switch to that domain.

You can edit both custom and default variables.

You cannot change the **Name** or **Type** values in an existing variable.

Procedure

Step 1 In the variable set editor, click **Edit** () next to the variable you want to modify.

If **View** () appears instead, the object belongs to an ancestor domain, or you do not have permission to modify the object.

Step 2 Modify the variable:

- If you want to move items from the list of available networks or ports to the list of included or excluded items, you can select one or more items and then drag and drop, or click **Include** or **Exclude**.

Tip If addresses or ports in the included and excluded lists for a network or port variable overlap, excluded addresses or ports take precedence.

- Enter a single literal value, then click **Add**. For network variables, you can enter a single IP address or address block. For port variables you can add a single port or port range, separating the upper and lower values with a hyphen (-). Repeat this step as needed to enter multiple literal values.

- If you want to remove an item from the included or excluded lists, click **Delete** () next to the item.

Note The list of items to include or exclude can be comprised of any combination of literal strings and existing variables, objects, and network object groups in the case of network variables.

Step 3 Click **Save** to save the variable.

Step 4 Click **Save** to save the variable set. If the variable set is in use by an access control policy, click **Yes** to confirm that you want to save your changes. Your changes are saved, and any access control policy the variable set is linked to displays an out-of-date status.

What to do next

- If an active policy references your object, deploy configuration changes; see [Deploy Configuration Changes](#), on page 306.

Security Intelligence Lists and Feeds

Security Intelligence functionality requires the Threat license (for FTD devices) or the Protection license (all other device types).

Security Intelligence *lists* and *feeds* are collections of IP addresses, domain names, and URLs that you can use to quickly filter traffic that matches an entry on a list or feed.

- A list is a static collection that you manage manually.
- A feed is a dynamic collection that updates on an interval over HTTP or HTTPS.

Security Intelligence lists/feeds are grouped into:

- DNS (Domain names)
- Network (IP addresses)
- URLs

System-Provided Feeds

Cisco provides the following feeds as Security Intelligence objects:

- Security Intelligence feeds updated regularly with the latest threat intelligence from Talos:
 - Cisco-DNS-and-URL-Intelligence-Feed (under DNS Lists and Feeds)
 - Cisco-Intelligence-Feed (for IP addresses, under Network Lists and Feeds)

You cannot delete the system-provided feeds, but you can change the frequency of (or disable) their updates.

Predefined Lists: Global Block Lists and Global Do Not Block Lists

The system ships with predefined global Block lists and Do Not Block lists for domains (DNS), IP addresses (Networks), and URLs.

These lists are empty until you populate them. To build these lists, see [Global and Domain Security Intelligence Lists, on page 377](#).

By default, access control and DNS policies use these lists as part of Security Intelligence.

Custom Feeds

You can use third-party feeds, or use a custom internal feed to easily maintain an enterprise-wide Block list in a large deployment with multiple Firepower Management Center appliances.

See [Custom Security Intelligence Feeds, on page 383](#).

Custom Lists

Custom lists can augment and fine-tune feeds and the Global lists.

See [Custom Security Intelligence Lists, on page 384](#).

Where Security Intelligence Lists and Feeds Are Used

- IP address and address blocks—Use Block and Do Not Block lists in access control policies, as part of Security Intelligence.
- Domain Names—Use Block and Do Not Block lists in DNS policies, as part of Security Intelligence.
- URLs—Use Block and Do Not Block lists in access control policies, as part of Security Intelligence. You can also use URL lists in access control rules, whose analysis and traffic handling phases occur after Security Intelligence.

How to Modify Security Intelligence Objects

To add or delete entries on a Block list, Do Not Block list, feed, or sinkhole object:

Object Type	Edit Capabilities	Requires Redeploy After Edit?
Custom Block and Do Not Block lists	Upload new and replacement lists using the object manager.	Yes
Default (but custom-populated) Block lists and Do Not Block lists: Global, descendant, and domain-specific	Add entries using the context menu or delete entries using the object manager.	No
System-provided Intelligence Feeds	Disable or change update frequency using the object manager.	No
Custom feeds	Fully modify using the object manager.	No
Sinkhole	Fully modify using the object manager.	Yes

Global and Domain Security Intelligence Lists

Firepower Management Center ships with empty Global Block and Do-Not-Block lists to which you can instantly add URLs, domains, and IP addresses from events on your network at any time. These lists allow you to use Security Intelligence to always block particular connections, or to exempt particular connections from blocking by Security Intelligence, allowing them to be evaluated by other threat detection processes that you have configured.

For example, if you notice a set of routable IP addresses in intrusion events associated with exploit attempts, you can immediately block those IP addresses. Although it may take a few minutes for your changes to propagate, you do not have to redeploy.

By default, Access control and DNS policies use these Global lists, which apply to all security zones. You can opt not to use these lists on a per-policy basis.

Note These options apply to Security Intelligence only. Security Intelligence cannot block traffic that has already been fastpathed. Similarly, adding an item to a Security Intelligence Do Not Block list does not automatically trust or fastpath matching traffic. For more information, see [About Security Intelligence, on page 1027](#).

In a multidomain deployment, you can choose the Firepower System domains where you want to enforce blocking, or exempting from Security Intelligence blocking, by adding items to Domain lists as well as the Global lists; see [Security Intelligence Lists and Multitenancy, on page 377](#).

Security Intelligence Lists and Multitenancy

In a multidomain deployment, the Global domain owns the Global Block lists and Do Not Block lists. Only Global administrators can add to or remove items from the Global lists. So that subdomain users can add networks, domain names, and URLs to Block and Do Not Block lists, multitenancy adds:

- Domain lists—Block or Do Not Block lists whose contents apply to a particular subdomain only. The Global lists are Domain lists for the Global domain.
- Descendant Domain lists—Block or Do Not Block lists that aggregate the Domain lists of the current domain's descendants.

Domain Lists

In addition to being able to access (but not edit) the Global lists, each subdomain has its own named lists, the contents of which apply only to that subdomain. For example, a subdomain named Company A owns:

- Domain Block list - Company A and Domain Do Not Block list - Company A
- Domain Block list for DNS - Company A, Domain Do Not Block list for DNS - Company A
- Domain Block list for URL - Company A, Domain Do Not Block list for URL - Company A

Any administrator at or above the current domain can populate these lists. You can use the context menu to add an item to the Block or Do Not Block list in the current and all descendant domains. However, only an administrator in the associated domain can remove an item from a Domain list.

For example, a Global administrator could choose to add the same IP address to the Block list in the Global domain and Company A's domain, but not add it to the Block list in Company B's domain. This action would add the same IP address to:

- Global Block list (where it can be removed only by Global administrators)
- Domain Block list - Company A (where it can be removed only by Company A administrators)

The system builds a separate network map for each leaf domain. In a multidomain deployment, using literal IP addresses to constrain this configuration can have unexpected results.

Descendant Domain Lists

A Descendant Domain list is a Do Not Block list or Block list that aggregates the Domain lists of the current domain's descendants. Leaf domains do not have Descendant Domain lists.

Descendant Domain lists are useful because a higher-level domain administrator can enforce general Security Intelligence settings, while still allowing subdomain users to add items to a Block or Do Not Block list in their own deployment.

For example, the Global domain has the following Descendant Domain lists:

- Descendant Block lists - Global, Descendant Do Not Block lists - Global
- Descendant Block lists for DNS - Global, Descendant Do Not Block lists for DNS - Global
- Descendant Block lists for URL - Global, Descendant Do Not Block lists for URL - Global

Note Descendant Domain lists do not appear in the object manager because they are symbolic aggregations, not hand-populated lists. They appear where you can use them: in access control and DNS policies.

Add Entries to Global Security Intelligence Lists

When reviewing events and dashboards, you can instantly block future traffic involving IP addresses, domains, and URLs that appear in those events by adding them to a predefined Block list.

Similarly, if Security Intelligence is blocking traffic that you want evaluated by threat detection processes subsequent to Security Intelligence blocking, you can add IP addresses, domains, and URLs from events to a predefined Do Not Block list.

Traffic is evaluated against entries on these lists during the Security Intelligence phase of threat detection.

For more information about these lists, see [Global and Domain Security Intelligence Lists, on page 377](#).

Before you begin

Because adding an entry to a Security Intelligence list affects access control, you must have one of the following user roles:

- Administrator
- A combination of roles: Network Admin or Access Admin, plus Security Analyst and Security Approver
- A custom role with both Modify Access Control Policy and Deploy Configuration to Devices permissions

If appropriate, verify that these lists are used in the policies in which you expect them to be used.

Procedure

- Step 1** Navigate to an event that includes an IP address, domain, or URL that you want to always block using Security Intelligence, or exempt from Security Intelligence blocking.
- Step 2** Right-click the IP address, domain, or URL and choose the appropriate option:

Target Item	Context Menu Option	Affected Global Lists
An IP address	Blacklist Now Whitelist Now	Global Block List Global Whitelist
A URL	Blacklist HTTP/S Connections to URL Now Whitelist HTTP/S Connections to URL Now	Global Block List for URL Global Whitelist for URL
An entire domain	Blacklist HTTP/S Connections to Domain Now Whitelist HTTP/S Connections to Domain Now	Global Block List for URL Global Whitelist for URL
DNS requests for an entire domain	Blacklist DNS Requests to Domain Now Whitelist DNS Requests to Domain Now	Global Block List for DNS Global Whitelist for DNS

What to do next

You do NOT need to redeploy for these changes to take effect.

If you want to delete an item from a list, see [Delete Entries from Global Security Intelligence Lists, on page 380](#).

Delete Entries from Global Security Intelligence Lists**Note**

- In multi-domain deployments, the names of these lists may not be "Global." For more information, see [Security Intelligence Lists and Multitenancy, on page 377](#).
- To add entries to these lists, see [Add Entries to Global Security Intelligence Lists, on page 379](#).

Procedure

-
- Step 1** Choose **Objects > Object Management**.
- Step 2** Click **Security Intelligence**.
- Step 3** Click the appropriate option:
- **Network Lists and Feeds** (for IP addresses)
 - **DNS Lists and Feeds** (for domain names)
 - **URL Lists and Feeds**
- Step 4** Click the pencil beside the Global Block or Global Do-Not-Block list.
- Step 5** Click the trash button beside the entry to delete.
-

List and Feed Updates for Security Intelligence

List and feed updates replace the existing list or feed file with the contents of the new file. Contents of existing and new files are not merged.

If the system downloads a corrupt feed or a feed with no recognizable entries, the system continues using the old feed data (unless it is the first download). However, if the system can recognize even one entry in the feed, it uses the entries it can recognize.

By default, each feed updates the Management Center every two hours; you can modify this frequency. Any updates the Management Center receives are passed immediately to managed devices. In addition, managed devices poll the FMC every 30 minutes for changes. You cannot modify this frequency.

In a multidomain deployment, the system-provided feeds belong to the Global domain and can be modified only by an administrator in that domain. You can modify the update frequency for custom feeds belonging to your domain.

To modify feed update intervals, see [Changing the Update Frequency for Security Intelligence Feeds, on page 381](#).

Changing the Update Frequency for Security Intelligence Feeds

You can specify the intervals at which the Firepower Management Center updates Security Intelligence Feeds. For details about feed updates, see [List and Feed Updates for Security Intelligence, on page 380](#).

Procedure

- Step 1** Choose **Objects > Object Management**.
- Step 2** Expand the **Security Intelligence** node, then choose the feed type whose frequency you want to change. The system-provided URL feed is combined with the domain feed under **DNS Lists and Feeds**.
- Step 3** Next to the feed you want to update, click **Edit** ().
- If **View** () appears instead, the object belongs to an ancestor domain, or you do not have permission to modify the object.
- Step 4** Edit the **Update Frequency**.
- Step 5** Click **Save**.
-

Custom Security Intelligence Lists and Feeds

Custom Lists and Feeds: Requirements

List and Feed Formatting

Each list or feed must be a simple text file no larger than 500MB. List files must have the .txt extension. Include one entry or comment per line: one IP address, one URL, one domain name.

Tip The number of entries you can include is limited by the maximum size of the file. For example, a URL list with no comments and an average URL length of 100 characters (including Punycode or percent Unicode representations and newlines) can contain more than 5.24 million entries.

In a DNS list entry, you can specify an asterisk (*) wildcard character for a domain label. All labels match the wildcard. For example, an entry of `www.example.*` matches both `www.example.com` and `www.example.co`.

If you add comment lines within the source file, they must start with the pound (#) character. If you upload a source file with comments, the system removes your comments during upload. Source files you download contain all your entries without your comments.

Feed Requirements

When you configure a feed, you specify its location using a URL; the URL cannot be Punycode-encoded.

If you use an MD5 checksum, the checksum must be stored in a simple text file with only the checksum. Comments are not supported.

URL Lists and Feeds: URL Syntax and Matching Criteria

Security Intelligence URL lists and feeds, including custom lists and feeds and entries in the global Block list and Do Not Block list, can include the following, which have the matching behavior as described:

- Hostnames

For example, **www.example.com**.

- URLs

example.com matches **example.com** and all subdomains, including **www.example.com**, **eu.example.com**, **example.com/abc**, and **www.example.com/def** -- but NOT **example.co.uk** or **examplexyz.com** or **example.com.malicious-site.com**

You can also include an entire URL path, such as

https://www.cisco.com/c/en/us/products/security/firewalls/index.html

- A slash at the end of a URL to specify an exact match

example.com/ matches ONLY **example.com**; it does NOT match **www.example.com** or any other URL.

- A wildcard (*) to represent any domain in a URL

An asterisk can represent a complete domain string separated by dots, but not a partial domain string, and not any part of the URL following the first slash.

Valid examples:

- ***.example.com**
- **www.*.com**
- **example.***

(This will match **example.com** and **example.org** and **example.de**, for example, but NOT **example.co.uk**)

- ***.example.***
- **example.*/**

Invalid examples:

- **example*.com**
- **example.com/***

- IP addresses (IPv4)

For IPv6 addresses, or to use ranges or CIDR notation, use the Security Intelligence Network object.

You can include one or more wildcards representing an octet, for example **10.10.10.*** or **10.10.*.***.

See also [Custom Security Intelligence Lists, on page 384](#).

Custom Security Intelligence Feeds

Custom or third-party Security Intelligence feeds allow you to augment the system-provided Intelligence Feeds with other regularly-updated reputable Block lists and Do Not Block lists on the Internet. You can also set up an internal feed, which is useful if you want to update multiple Firepower Management Center appliances in your deployment using one source list.

Note You cannot add address blocks to Block or Do Not Block lists using a /0 netmask in a Security Intelligence feed. If you want to monitor or block all traffic targeted by a policy, use an access control rule with the **Monitor** or **Block** rule action, respectively, and a default value of `any` for the **Source Networks** and **Destination Networks**.

You also can configure the system to use an MD5 checksum to determine whether to download an updated feed. If the checksum has not changed since the last time the system downloaded the feed, the system does not need to re-download it. You may want to use MD5 checksums for internal feeds, especially if they are large.

Note The system does **not** perform peer SSL certificate verification when downloading custom feeds, nor does the system support the use of certificate bundles or self-signed certificates to verify the remote peer.

If you want strict control over when the system updates a feed from the Internet, you can disable automatic updates for that feed. However, automatic updates ensure the most up-to-date, relevant data.

Manually updating Security Intelligence feeds updates all feeds, including the Intelligence Feeds.

See complete requirements at [Custom Lists and Feeds: Requirements, on page 381](#).

Creating Security Intelligence Feeds

You must have the Threat license (for FTD devices) or the Protection license (all other device types).

Procedure

- Step 1** Choose **Objects > Object Management**.
- Step 2** Expand the **Security Intelligence** node, then choose a feed type you want to add.
- Step 3** Click the option appropriate to the feed type you chose above:
 - **Add Network Lists and Feeds** (for IP addresses)
 - **Add DNS Lists and Feeds**
 - **Add URL Lists and Feeds**
- Step 4** Enter a **Name** for the feed.

In a multidomain deployment, object names must be unique within the domain hierarchy. The system may identify a conflict with the name of an object you cannot view in your current domain.
- Step 5** Choose **Feed** from the **Type** drop-down list.
- Step 6** Enter a **Feed URL**.

- Step 7** (Optional) Enter an **MD5 URL**.
This is used to determine whether the feed contents have changed since the last update, so the system does not download unchanged feeds.
- Step 8** Choose an **Update Frequency**.
- Step 9** Click **Save**.
Unless you disabled feed updates, the system attempts to download and verify the feed.
-

Manually Updating Security Intelligence Feeds

You must have the Threat license (for FTD devices) or the Protection license (all other device types).

Before you begin

At least one device must already be added to the management center.

Procedure

- Step 1** Choose **Objects > Object Management**.
- Step 2** Expand the **Security Intelligence** node, then choose a feed type.
- Step 3** Click **Update Feeds**, then confirm.
- Step 4** Click **OK**.
-

After the Firepower Management Center downloads and verifies the feed updates, it communicates any changes to its managed devices. Your deployment begins filtering traffic using the updated feeds.

Custom Security Intelligence Lists

Security Intelligence lists are simple static lists of IP addresses and address blocks, URLs, or domain names that you manually upload to the system. Custom lists are useful if you want to augment and fine-tune feeds or one of the global lists, for a single Firepower Management Center's managed devices.

For example, if a reputable feed improperly blocks your access to vital resources but is overall useful to your organization, you can create a custom Do Not Block list that contains only the improperly classified IP addresses, rather than removing the IP address feed object from the access control policy's Block list.

- Note** You cannot add address blocks to a Block or Do Not Block list using a /0 netmask in a Security Intelligence list. If you want to monitor or block all traffic targeted by a policy, use an access control rule with the **Monitor** or **Block** rule action, respectively, and a default value of `any` for the **Source Networks** and **Destination Networks**.
-

Regarding list entry formatting, note the following:

- Netmasks for address blocks can be integers from 0 to 32 or 0 to 128, for IPv4 and IPv6, respectively.
- Unicode in domain names must be encoded in Punycode format, and are case insensitive.

- Characters in domain names are case-insensitive.
- Unicode in URLs should be encoded in percent-encoding format.
- Characters in URL subdirectories are case-sensitive.
- List entries that start with the pound sign (#) are treated as comments.
- See additional formatting requirements at [Custom Lists and Feeds: Requirements, on page 381](#).

Regarding matching list entries, note the following:

- The system matches sub-level domains if a higher-level domain exists in a URL or DNS list. For example, if you add `example.com` to a DNS list, the system matches both `www.example.com` and `test.example.com`.
- The system does not perform DNS lookups (forward or reverse) on DNS or URL list entries. For example, if you add `http://192.168.0.2` to a URL list, and it resolves to `http://www.example.com`, the system only matches `http://192.168.0.2`, not `http://www.example.com`.

Uploading New Security Intelligence Lists to the Firepower Management Center

To modify a Security Intelligence list, you must make your changes to the source file and upload a new copy. You cannot modify the file's contents using the web interface. If you do not have access to the source file, download a copy from the system.

Procedure

- Step 1** Choose **Objects > Object Management**.
- Step 2** Expand the **Security Intelligence** node, then choose a list type.
- Step 3** Click the option appropriate to the list you chose above:
- **Add Network Lists and Feeds** (for IP addresses)
 - **Add DNS Lists and Feeds**
 - **Add URL Lists and Feeds**
- Step 4** Enter a **Name**.
- In a multidomain deployment, object names must be unique within the domain hierarchy. The system may identify a conflict with the name of an object you cannot view in your current domain.
- Step 5** From the **Type** drop-down list, choose **List**.
- Step 6** Click **Browse** to browse to the list `.txt` file, then click **Upload**.
- Step 7** Click **Save**.
-

What to do next

If an active policy references your object, deploy configuration changes, see [Deploy Configuration Changes, on page 306](#)

Updating Security Intelligence Lists

In a multidomain deployment, the system displays objects created in the current domain, which you can edit. It also displays objects created in ancestor domains, which in most cases you cannot edit. To view and edit objects in a descendant domain, switch to that domain.

Procedure

- Step 1** Choose **Objects > Object Management**.
 - Step 2** Expand the **Security Intelligence** node, then choose a list type.
 - Step 3** Next to the list you want to update, click **Edit** (✎).
If **View** (👁) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.
 - Step 4** If you need a copy of the list to edit, click **Download**, then follow your browser's prompts to save the list as a text file.
 - Step 5** Make changes to the list as necessary.
 - Step 6** On the Security Intelligence pop-up window, click **Browse** to browse to the modified list, then click **Upload**.
 - Step 7** Click **Save**.
-

What to do next

If an active policy references your object, deploy configuration changes, see [Deploy Configuration Changes, on page 306](#).

Sinkhole Objects

A sinkhole object represents either a DNS server that gives non-routeable addresses for all domain names within the sinkhole, or an IP address that does not resolve to a server. You can reference the sinkhole object within a DNS policy rule to redirect matching traffic to the sinkhole. You must assign the object both an IPv4 address and an IPv6 address.

Creating Sinkhole Objects

You must have the Threat license (for FTD devices) or the Protection license (all other device types).

Procedure

- Step 1** Choose **Objects > Object Management**.
- Step 2** Choose **Sinkhole** from the list of object types.
- Step 3** Click **Add Sinkhole**.
- Step 4** Enter a **Name**.

In a multidomain deployment, object names must be unique within the domain hierarchy. The system may identify a conflict with the name of an object you cannot view in your current domain.

- Step 5** Enter the **IPv4 Address** and **IPv6 Address** of your sinkhole.
- Step 6** You have the following options:
- If you want to redirect traffic to a sinkhole server, choose **Log Connections to Sinkhole**.
 - If you want to redirect traffic to a non-resolving IP address, choose **Block and Log Connections to Sinkhole**.
- Step 7** If you want to assign an Indication of Compromise (IoC) type to your sinkhole, choose one from the **Type** drop-down.
- Step 8** Click **Save**.
-

File Lists

If you use AMP for Networks, and the AMP cloud incorrectly identifies a file's disposition, you can add the file to a *file list* to better detect the file in the future. These files are specified using SHA-256 hash values. Each file list can contain up to 10000 unique SHA-256 values.

There are two predefined categories of file lists:

Clean List

If you add a file to this list, the system treats it as if the AMP cloud assigned a clean disposition.

Custom Detection List

If you add a file to this list, the system treats it as if the AMP cloud assigned a malware disposition.

In a multidomain deployment, a clean list and custom detection list is present for each domain. In lower-level domains, you can view but not modify ancestor's lists.

Because you manually specify the blocking behavior for the files included in these lists, the system does not query the AMP cloud for these files' dispositions. You must configure a rule in the file policy with either a **Malware Cloud Lookup** or **Block Malware** action and a matching file type to calculate a file's SHA value.

Caution Do **not** include malware on the clean list. The clean list overrides both the AMP cloud and the custom detection list.

Source Files for File Lists

You can add multiple SHA-256 values to a file list by uploading a comma-separated value (CSV) source file containing a list of SHA-256 values and descriptions. The Firepower Management Center validates the contents and populates the file list with valid SHA-256 values.

The source file must be a simple text file with a .csv file name extension. Any header must start with a pound sign (#); it is treated as a comment and not uploaded. Each entry should contain a single SHA-256 value followed by a description and end with either the LF or CR+LF Newline character. The system ignores any additional information in the entry.

Note the following:

- Deleting a source file from the file list also removes all associated SHA-256 hashes from the file list.
- You cannot upload multiple files to a file list if the successful source file upload results in the file list containing more than 10000 distinct SHA-256 values.
- The system truncates descriptions exceeding 256 characters to the first 256 characters on upload. If the description contains commas, you must use an escape character (\,). If no description is included, the source file name is used instead.
- All non-duplicate SHA-256 values are added to the file list. If a file list contains a SHA-256 value, and you upload a source file containing that value, the newly uploaded value does not modify the existing SHA-256 value. When viewing captured files, file events, or malware events related to the SHA-256 value, any threat name or description is derived from the individual SHA-256 value.
- The system does not upload invalid SHA-256 values in a source file.
- If multiple uploaded source files contain an entry for the same SHA-256 value, the system uses the most recent value.
- If a source file contains multiple entries for the same SHA-256 value, the system uses the last one.
- You cannot directly edit a source file within the object manager. To make changes, you must first modify your source file directly, delete the copy on the system, then upload the modified source file.
- The number of entries associated with a source file refers to the number of distinct SHA-256 values. If you delete a source file from a file list, the total number of SHA-256 entries the file list contains decreases by the number of valid entries in the source file.

Adding Individual SHA-256 Values to File Lists

You must have the Malware license for this procedure.

You can submit a file's SHA-256 value to add it to a file list. You cannot add duplicate SHA-256 values.

In a multidomain deployment, the system displays objects created in the current domain, which you can edit. It also displays objects created in ancestor domains, which in most cases you cannot edit. To view and edit objects in a descendant domain, switch to that domain.

Before you begin

- Right-click a file or malware event from the event view, choose **Show Full Text** in the context menu, and copy the full SHA-256 value for pasting into the file list.

Procedure

- Step 1** Choose **Objects > Object Management**.
- Step 2** Choose **File List** from the list of object types.
- Step 3** Click **Edit** () next to the clean list or custom detection list where you want to add a file.

If **View** () appears instead, the object belongs to an ancestor domain, or you do not have permission to modify the object.

- Step 4** Choose `Enter SHA Value` from the **Add by** drop-down list.
- Step 5** Enter a description of the source file in the **Description** field.
- Step 6** Enter or paste the file's entire value in the **SHA-256** field. The system does not support matching partial values.
- Step 7** Click **Add**.
- Step 8** Click **Save**.

What to do next

- If an active policy references your object, deploy configuration changes; see [Deploy Configuration Changes](#), on page 306.

Note After configuration changes are deployed, the system no longer queries the AMP cloud for files on the list.

Uploading Individual Files to File Lists

You must have the Malware license for this procedure.

If you have a copy of the file you want to add to a file list, you can upload the file to the Firepower Management Center for analysis; the system calculates the file's SHA-256 value and adds the file to the list. The system does not enforce a limit on the size of files for SHA-256 calculation.

In a multidomain deployment, the system displays objects created in the current domain, which you can edit. It also displays objects created in ancestor domains, which in most cases you cannot edit. To view and edit objects in a descendant domain, switch to that domain.

Procedure

- Step 1** Choose **Objects > Object Management**.
- Step 2** Choose **File List** from the list of object types.
- Step 3** Click **Edit** () next to the clean list or custom detection list where you want to add a file.

If **View** () appears instead, the object belongs to an ancestor domain, or you do not have permission to modify the object.
- Step 4** From the **Add by** drop-down list, choose **Calculate SHA**.
- Step 5** Optionally, enter a description of the file in the **Description** field. If you do not enter a description, the file name is used for the description on upload.
- Step 6** Click **Browse**, and choose a file to upload.
- Step 7** Click **Calculate and Add SHA**.

Step 8 Click **Save**.

What to do next

- If an active policy references your object, deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

Note After you deploy configuration changes, the system no longer queries the AMP cloud for files on the list.

Uploading Source Files to File Lists

You must have the Malware license for this procedure.

In a multidomain deployment, the system displays objects created in the current domain, which you can edit. It also displays objects created in ancestor domains, which in most cases you cannot edit. To view and edit objects in a descendant domain, switch to that domain.

Procedure

Step 1 Choose **Objects > Object Management**.

Step 2 Click **File List**.

Step 3 Click **Edit** () next to the file list where you want to add values from a source file.

If **View** () appears instead, the object belongs to an ancestor domain, or you do not have permission to modify the object.

Step 4 In the **Add by** drop-down list, choose `List of SHAs`.

Step 5 Optionally, enter a description of the source file in the **Description** field. If you do not enter a description, the system uses the file name.

Step 6 Click **Browse** to browse to the source file, then click **Upload and Add List**.

Step 7 Click **Save**.

What to do next

- If an active policy references your object, deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

Note After you deploy the policies, the system no longer queries the AMP cloud for files on the list.

Editing SHA-256 Values in File Lists

You must have the Malware license for this procedure.

You can edit or delete individual SHA-256 values on a file list. Note that you cannot directly edit a source file within the object manager. To make changes, you must first modify your source file directly, delete the copy on the system, then upload the modified source file.

In a multidomain deployment, the system displays objects created in the current domain, which you can edit. It also displays objects created in ancestor domains, which in most cases you cannot edit. To view and edit objects in a descendant domain, switch to that domain.

Procedure

Step 1 Choose **Objects > Object Management**.

Step 2 Click **File List**.

Step 3 Click **Edit** () next to the clean list or custom detection list where you want to modify a file.

If **View** () appears instead, the object belongs to an ancestor domain, or you do not have permission to modify the object.

Step 4 You can:

- Click **Edit** () next to the SHA-256 value you want to change, and modify the **SHA-256** or **Description** values as desired.
- Click **Delete** () next to the SHA-256 value you want to delete.

Step 5 Click **Save** to update the file entry in the list.

Step 6 Click **Save** to save the file list.

What to do next

- If an active policy references your object, deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

Note After configuration changes are deployed, the system no longer queries the AMP cloud for files on the list.

Downloading Source Files from File Lists

You must have the Malware license for this procedure.

In a multidomain deployment, the system displays objects created in the current domain, which you can edit. It also displays objects created in ancestor domains, which in most cases you cannot edit. To view and edit objects in a descendant domain, switch to that domain.

Procedure

- Step 1** Choose **Objects > Object Management**.
 - Step 2** Choose **File List** from the list of object types.
 - Step 3** Click **Edit** () next to the clean list or custom detection list where you want to download a source file.
If **View** () appears instead, the object belongs to an ancestor domain, or you do not have permission to modify the object.
 - Step 4** Next to the source file you want to download, click **View** ()
 - Step 5** Click **Download SHA List** and follow the prompts to save the source file.
 - Step 6** Click **Close**.
-

Cipher Suite Lists

A cipher suite list is an object comprised of several cipher suites. Each predefined cipher suite value represents a cipher suite used to negotiate an SSL- or TLS-encrypted session. You can use cipher suites and cipher suite lists in SSL rules to control encrypted traffic based on whether the client and server negotiated the SSL session using that cipher suite. If you add a cipher suite list to an SSL rule, SSL sessions negotiated with any of the cipher suites in the list match the rule.

Note Although you can use cipher suites in the web interface in the same places as cipher suite lists, you cannot add, modify, or delete cipher suites.

Creating Cipher Suite Lists

You can use these objects with any device type except NGIPSv.

Procedure

- Step 1** Choose **Objects > Object Management**.
- Step 2** Choose **Cipher Suite List** from the list of object types.
- Step 3** Click **Add Cipher Suites**.
- Step 4** Enter a **Name**.
In a multidomain deployment, object names must be unique within the domain hierarchy. The system may identify a conflict with the name of an object you cannot view in your current domain.
- Step 5** Choose one or more cipher suites from the **Available Ciphers** list.
- Step 6** Click **Add**.

- Step 7** Optionally, click **Delete** () next to any cipher suites in the **Selected Ciphers** list that you want to remove.
- Step 8** Click **Save**.

What to do next

- If an active policy references your object, deploy configuration changes; see [Deploy Configuration Changes](#), on page 306.

Distinguished Name Objects

Each distinguished name object represents the [distinguished name](#) for a public key certificate's subject or issuer. You can use distinguished name objects and groups in TLS/SSL rules to control encrypted traffic based on whether the client and server negotiated the TLS/SSL session using a server certificate with the distinguished name as subject or issuer.

(A *distinguished name group* is a named collection of existing distinguished name objects.)

The distinguished name can consist of country code, common name, organization, and organizational unit, but typically consists of a common name only. For example, the common name in the certificate for `https://www.cisco.com` is `cisco.com`. The certificate can contain multiple Subject Alternative Names (SANs) you can use as DN's in a rule condition. For detailed information about SANs, see [RFC 528, section 4.2.1.6](#).

The format of a distinguished name object that references a common name is `CN=name`. If you add a DN rule condition without `CN=`, the system prepends `CN=` before saving the object.

The Firepower System uses [Server Name Indication \(SNI\)](#) to match the DN in the TLS/SSL rule whenever possible.

You can also add a distinguished name with one of each of the attributes listed in the following table, separated by commas.

Table 53: Distinguished name attributes

Attribute	Description	Allowed Values
C	Country Code	two alphabetic characters
CN	Common Name	up to 64 alphanumeric, backslash (/), hyphen (-), quotation ("), or asterisk (*) characters, or spaces
O	Organization	up to 64 alphanumeric, backslash (/), hyphen (-), quotation ("), or asterisk (*) characters, or spaces
OU	Organizational Unit	up to 64 alphanumeric, backslash (/), hyphen (-), quotation ("), or asterisk (*) characters, or spaces

Important notes about DN rule conditions

- The first time the system detects an encrypted session to a new server, DN data is not available for ClientHello processing, which *might* result in an undecrypted first session.

- You *cannot* configure a distinguished name condition if you also choose the **Decrypt - Known Key** action. Because that action requires you to choose a server certificate to decrypt traffic, the certificate already matches the traffic.

Wildcard examples

You can define one or more asterisks (*) as wildcards in an attribute. In a common name attribute, you can define one or more asterisks per domain name label. wildcards match only in that label, but you can define multiple labels with wildcards. See the following table for examples.

Table 54: Common Name attribute wildcard examples

Attribute	Matches	Does Not Match
CN=*ample.com	example.com	mail.example.com example.text.com ampleexam.com
CN=exam*.com	example.com	mail.example.com example.text.com ampleexam.com
CN=*xamp*.com	example.com	mail.example.com example.text.com ampleexam.com
CN=*.example.com	mail.example.com	www.myhost.example.com example.com example.text.com ampleexam.com

Note The DN object `CN=amp.cisco.com` would *not* match a CN like `CN=auth.amp.cisco.com`, which is why we recommend wildcards in these cases.

Creating Distinguished Name Objects

You can use these objects with any device type except NGIPSv.

Procedure

- Step 1** Choose **Objects > Object Management**.
- Step 2** Expand the **Distinguished Name** node, and choose **Individual Objects**.

Step 3 Click **Add Distinguished Name**.

Step 4 Enter a **Name**.

In a multidomain deployment, object names must be unique within the domain hierarchy. The system may identify a conflict with the name of an object you cannot view in your current domain.

Step 5 In the **DN** field, enter a value for the distinguished name or common name. You have the following options:

- If you add a distinguished name, you can include one of each attribute listed in [Distinguished Name Objects, on page 393](#) separated by commas.
- If you add a common name, you can include multiple labels and wild cards.

Step 6 Click **Save**.

What to do next

- If an active policy references your object, deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

PKI Objects

PKI Objects for SSL Application

PKI objects represent the public key certificates and paired private keys required to support your deployment. Internal and trusted CA objects consist of certificate authority (CA) certificates; internal CA objects also contain the private key paired with the certificate. Internal and external certificate objects consist of server certificates; internal certificate objects also contain the private key paired with the certificate.

If you use trusted certificate authority objects and internal certificate objects to configure a connection to ISE, you can use ISE as an identity source.

If you use internal certificate objects to configure captive portal, the system can authenticate the identity of your captive portal device when connecting to users' web browsers.

If you use trusted certificate authority objects to configure realms, you can configure secure connections to LDAP or AD servers.

If you use PKI objects in SSL rules, you can match traffic encrypted with:

- the certificate in an external certificate object
- a certificate either signed by the CA in a trusted CA object, or within the CA's chain of trust

If you use PKI objects in SSL rules, you can decrypt:

- outgoing traffic by re-signing the server certificate with an internal CA object
- incoming traffic using the known private key in an internal certificate object

You can manually input certificate and key information, upload a file containing that information, or in some cases, generate a new CA certificate and private key.

When you view a list of PKI objects in the object manager, the system displays the certificate's Subject distinguished name as the object value. Hover your pointer over the value to view the full certificate Subject distinguished name. To view other certificate details, edit the PKI object.

Note The Firepower Management Center and managed devices encrypt all private keys stored in internal CA objects and internal certificate objects with a randomly generated key before saving them. If you upload private keys that are password protected, the appliance decrypts the key using the user-supplied password, then reencrypts it with the randomly generated key before saving it.

Internal Certificate Authority Objects

Each internal certificate authority (CA) object you configure represents the CA public key certificate of a CA your organization controls. The object consists of the object name, CA certificate, and paired private key. You can use internal CA objects and groups in SSL rules to decrypt outgoing encrypted traffic by re-signing the server certificate with the internal CA.

Note If you reference an internal CA object in a **Decrypt - Resign** SSL rule and the rule matches an encrypted session, the user's browser may warn that the certificate is not trusted while negotiating the SSL handshake. To avoid this, add the internal CA object certificate to either the client or domain list of trusted root certificates.

You can create an internal CA object in the following ways:

- import an existing RSA-based or elliptic curve-based CA certificate and private key
- generate a new self-signed RSA-based CA certificate and private key
- generate an unsigned RSA-based CA certificate and private key. You must submit a certificate signing request (CSR) to another CA to sign the certificate before using the internal CA object.

After you create an internal CA object containing a signed certificate, you can download the CA certificate and private key. The system encrypts downloaded certificates and private keys with a user-provided password.

Whether system-generated or user-created, you can modify the internal CA object name, but cannot modify other object properties.

You cannot delete an internal CA object that is in use. Additionally, after you edit an internal CA object used in an SSL policy, the associated access control policy goes out-of-date. You must re-deploy the access control policy for your changes to take effect.

CA Certificate and Private Key Import

You can configure an internal CA object by importing an X.509 v3 CA certificate and private key. You can upload files encoded in one of the following supported formats:

- Distinguished Encoding Rules (DER)
- Privacy-enhanced Electronic Mail (PEM)

If the private key file is password-protected, you can supply the decryption password. If the certificate and key are encoded in the PEM format, you can also copy and paste the information.

You can upload only files that contain proper certificate or key information, and that are paired with each other. The system validates the pair before saving the object.

Note If you configure a rule with the **Decrypt - Resign** action, the rule matches traffic based on the referenced internal CA certificate's encryption algorithm type, in addition to any configured rule conditions. You must upload an elliptic curve-based CA certificate to decrypt outgoing traffic encrypted with an elliptic curve-based algorithm, for example.

Importing a CA Certificate and Private Key

You can use these objects with any device type except NGIPsv.

In a multidomain deployment, the system displays objects created in the current domain, which you can edit. It also displays objects created in ancestor domains, which in most cases you cannot edit. To view and edit objects in a descendant domain, switch to that domain.

Procedure

- Step 1** Choose **Objects > Object Management**.
- Step 2** Expand the **PKI** node, and choose **Internal CAs**.
- Step 3** Click **Import CA**.
- Step 4** Enter a **Name**.

In a multidomain deployment, object names must be unique within the domain hierarchy. The system may identify a conflict with the name of an object you cannot view in your current domain.
- Step 5** Above the **Certificate Data** field, click **Browse** to upload a DER or PEM-encoded X.509 v3 CA certificate file.
- Step 6** Above the **Key** field, click **Browse** to upload a DER or PEM-encoded paired private key file.
- Step 7** If the uploaded file is password-protected, check the **Encrypted, and the password is:** check box, and enter the password.
- Step 8** Click **Save**.

What to do next

- If an active policy references your object, deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

Generating a New CA Certificate and Private Key

You can use these objects with any device type except NGIPsv.

You can configure an internal CA object by providing identification information to generate a self-signed RSA-based CA certificate and private key.

The generated CA certificate is valid for ten years. The Valid From date is a week before generation.

In a multidomain deployment, the system displays objects created in the current domain, which you can edit. It also displays objects created in ancestor domains, which in most cases you cannot edit. To view and edit objects in a descendant domain, switch to that domain.

Procedure

- Step 1** Choose **Objects > Object Management**.
- Step 2** Expand the **PKI** node, and choose **Internal CAs**.
- Step 3** Click **Generate CA**.
- Step 4** Enter a **Name**.

In a multidomain deployment, object names must be unique within the domain hierarchy. The system may identify a conflict with the name of an object you cannot view in your current domain.

- Step 5** Enter the identification attributes.
 - Step 6** Click **Generate self-signed CA**.
-

New Signed Certificates

You can configure an internal CA object by obtaining a signed certificate from a CA. This involves two steps:

- Provide identification information to configure the internal CA object. This generates an unsigned certificate and paired private key, and creates a certificate signing request (CSR) to a CA you specify.
- After the CA issues the signed certificate, upload it to the internal CA object, replacing the unsigned certificate.

You can only reference an internal CA object in an SSL rule if it contains a signed certificate.

Creating an Unsigned CA Certificate and CSR

You can use these objects with any device type except NGIPsv.

Procedure

- Step 1** Choose **Objects > Object Management**.
- Step 2** Expand the **PKI** node, and choose **Internal CAs**.
- Step 3** Click **Generate CA**.
- Step 4** Enter a **Name**.

In a multidomain deployment, object names must be unique within the domain hierarchy. The system may identify a conflict with the name of an object you cannot view in your current domain.

- Step 5** Enter the identification attributes.
- Step 6** Click **Generate CSR**.
- Step 7** Copy the CSR to submit to a CA.

Step 8 Click **OK**.

What to do next

- You must upload a signed certificate issued by a CA as described in [Uploading a Signed Certificate Issued in Response to a CSR, on page 399](#)

Uploading a Signed Certificate Issued in Response to a CSR

You can use these objects with any device type except NGIPSv.

In a multidomain deployment, the system displays objects created in the current domain, which you can edit. It also displays objects created in ancestor domains, which in most cases you cannot edit. To view and edit objects in a descendant domain, switch to that domain.

Once uploaded, the signed certificate can be referenced in SSL rules.

Procedure

- Step 1** Choose **Objects > Object Management**.
- Step 2** Expand the **PKI** node, and choose **Internal CAs**.
- Step 3** Click **Edit** () next to the CA object containing the unsigned certificate awaiting the CSR.
- Step 4** Click **Install Certificate**.
- Step 5** Click **Browse** to upload a DER or PEM-encoded X.509 v3 CA certificate file.
- Step 6** If the uploaded file is password protected, check the **Encrypted, and the password is:** check box, and enter the password.
- Step 7** Click **Save** to upload a signed certificate to the CA object.
-

What to do next

- If an active policy references your object, deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

CA Certificate and Private Key Downloads

You can back up or transfer a CA certificate and paired private key by downloading a file containing the certificate and key information from an internal CA object.

Caution Always store downloaded key information in a secure location.

The system encrypts the private key stored in an internal CA object with a randomly generated key before saving it to disk. If you download a certificate and private key from an internal CA object, the system first decrypts the information before creating a file containing the certificate and private key information. You must then provide a password the system uses to encrypt the downloaded file.

Caution Private keys downloaded as part of a system backup are decrypted, then stored in the unencrypted backup file.

Downloading a CA Certificate and Private Key

You can use these objects with any device type except NGIPSv.

In a multidomain deployment, the system displays objects created in the current domain, which you can edit. It also displays objects created in ancestor domains, which in most cases you cannot edit. To view and edit objects in a descendant domain, switch to that domain.

You can download CA certificates for both the current domain and ancestor domains.

Procedure

-
- Step 1** Choose **Objects > Object Management**.
- Step 2** Expand the **PKI** node, and choose **Internal CAs**.
- Step 3** Next to the internal CA object whose certificate and private key you want to download, click **Edit** ().
- In a multidomain deployment, click **View** () to download the certificate and private key for an object in an ancestor domain.
- Step 4** Click **Download**.
- Step 5** Enter an encryption password in the **Password** and **Confirm Password** fields.
- Step 6** Click **OK**.
-

Trusted Certificate Authority Objects

Each trusted certificate authority (CA) object you configure represents a CA public key certificate belonging to a trusted CA. The object consists of the object name and CA public key certificate. You can use external CA objects and groups in:

- your SSL policy to control traffic encrypted with a certificate signed either by the trusted CA, or any CA within the chain of trust.
- your realm configurations to establish secure connections to LDAP or AD servers.
- your ISE connection. Select trusted certificate authority objects for the **pxGrid Server CA** and **MNT Server CA** fields.

After you create the trusted CA object, you can modify the name and add certificate revocation lists (CRL), but cannot modify other object properties. There is no limit on the number of CRLs you can add to an object. If you want to modify a CRL you have uploaded to an object, you must delete the object and recreate it.

Note Adding a CRL to an object has no effect when the object is used in your ISE integration configuration.

You cannot delete a trusted CA object that is in use. Additionally, after you edit a trusted CA object that is in use, the associated access control policy goes out-of-date. You must re-deploy the access control policy for your changes to take effect.

Trusted CA Object

You can configure an external CA object by uploading an X.509 v3 CA certificate. You can upload a file encoded in one of the following supported formats:

- Distinguished Encoding Rules (DER)
- Privacy-enhanced Electronic Mail (PEM)

If the file is password-protected, you must supply the decryption password. If the certificate is encoded in the PEM format, you can also copy and paste the information.

You can upload a CA certificate only if the file contains proper certificate information; the system validates the certificate before saving the object.

Adding a Trusted CA Object

You can use these objects with any device type except NGIPsv.

Procedure

- Step 1** Choose **Objects > Object Management**.
- Step 2** Expand the **PKI** node, and choose **Trusted CAs**.
- Step 3** Click **Add Trusted CAs**.
- Step 4** Enter a **Name**.
- In a multidomain deployment, object names must be unique within the domain hierarchy. The system may identify a conflict with the name of an object you cannot view in your current domain.
- Step 5** Click **Browse** to upload a DER or PEM-encoded X.509 v3 CA certificate file.
- Step 6** If the file is password-protected, check the **Encrypted, and the password is:** check box, and enter the password.
- Step 7** Click **Save**.
-

What to do next

- If an active policy references your object, deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

Certificate Revocation Lists in Trusted CA Objects

You can upload CRLs to a trusted CA object. If you reference that trusted CA object in an SSL policy, you can control encrypted traffic based on whether the CA that issued the session encryption certificate subsequently revoked the certificate. You can upload files encoded in one of the following supported formats:

- Distinguished Encoding Rules (DER)
- Privacy-enhanced Electronic Mail (PEM)

After you add the CRL, you can view the list of revoked certificates. If you want to modify a CRL you have uploaded to an object, you must delete the object and recreate it.

You can upload only files that contain a proper CRL. There is no limit to the number of CRLs you can add to a trusted CA object. However, you must save the object each time you upload a CRL, before adding another CRL.

Note Adding a CRL to an object has no effect when the object is used in your ISE integration configuration.

Adding a Certificate Revocation List to a Trusted CA Object

You can use these objects with any device type except NGIPSv.

In a multidomain deployment, the system displays objects created in the current domain, which you can edit. It also displays objects created in ancestor domains, which in most cases you cannot edit. To view and edit objects in a descendant domain, switch to that domain.

Note Adding a CRL to an object has no effect when the object is used in your ISE integration configuration.

Procedure

Step 1 Choose **Objects > Object Management**.

Step 2 Expand the **PKI** node, and choose **Trusted CAs**.

Step 3 Click **Edit** () next to a trusted CA object.

If **View** () appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

Step 4 Click **Add CRL** to upload a DER or PEM-encoded CRL file.

Step 5 Click **OK**.

What to do next

- If an active policy references your object, deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

External Certificate Objects

Each external certificate object you configure represents a server public key certificate that does not belong to your organization. The object consists of the object name and certificate. You can use external certificate objects and groups in SSL rules to control traffic encrypted with the server certificate. For example, you can upload a self-signed server certificate that you trust, but cannot verify with a trusted CA certificate.

You can configure an external certificate object by uploading an X.509 v3 server certificate. You can upload a file in one of the following supported formats:

- Distinguished Encoding Rules (DER)
- Privacy-enhanced Electronic Mail (PEM)

You can upload only files that contains proper server certificate information; the system validates the file before saving the object. If the certificate is encoded in the PEM format, you can also copy and paste the information.

Adding External Certificate Objects

You can use these objects with any device type except NGIPSv.

Procedure

-
- | | |
|---------------|--|
| Step 1 | Choose Objects > Object Management . |
| Step 2 | Expand the PKI node, and choose External Certs . |
| Step 3 | Click Add External Cert . |
| Step 4 | Enter a Name . |
- In a multidomain deployment, object names must be unique within the domain hierarchy. The system may identify a conflict with the name of an object you cannot view in your current domain.
- | | |
|---------------|---|
| Step 5 | Above the Certificate Data field, click Browse to upload a DER or PEM-encoded X.509 v3 server certificate file. |
| Step 6 | Click Save . |
-

What to do next

- If an active policy references your object, deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

Internal Certificate Objects

Each internal certificate object you configure represents a server public key certificate belonging to your organization. The object consists of the object name, public key certificate, and paired private key. You can use internal certificate objects and groups in:

- your SSL rules to decrypt traffic incoming to one of your organization's servers using the known private key.

- your ISE connection. Select an internal certificate object for the **MC Server Certificate** field.
- your captive portal configuration to authenticate the identity of your captive portal device when connecting to users' web browsers. Select an internal certificate object for the **Server Certificate** field.

You can configure an internal certificate object by uploading an X.509 v3 RSA-based or elliptic curve-based server certificate and paired private key. You can upload a file in one of the following supported formats:

- Distinguished Encoding Rules (DER)
- Privacy-enhanced Electronic Mail (PEM)

If the file is password-protected, you must supply the decryption password. If the certificate and key are encoded in the PEM format, you can also copy and paste the information.

You can upload only files that contain proper certificate or key information, and that are paired with each other. The system validates the pair before saving the object.

After you create the internal certificate object, you can modify the name, but cannot modify other object properties.

You cannot delete an internal certificate object that is in use. Additionally, after you edit an internal certificate object that is in use, the associated access control policy goes out-of-date. You must re-deploy the access control policy for your changes to take effect.

Adding Internal Certificate Objects

You can use these objects with any device type except NGIPSv.

Procedure

-
- Step 1** Choose **Objects > Object Management**.
- Step 2** Expand the **PKI** node, and choose **Internal Certs**.
- Step 3** Click **Add Internal Cert**.
- Step 4** Enter a **Name**.
- In a multidomain deployment, object names must be unique within the domain hierarchy. The system may identify a conflict with the name of an object you cannot view in your current domain.
- Step 5** Above the **Certificate Data** field, click **Browse** to upload a DER or PEM-encoded X.509 v3 server certificate file.
- Step 6** Above the **Key** field, or click **Browse** to upload a DER or PEM-encoded paired private key file.
- Step 7** If the uploaded private key file is password-protected, check the **Encrypted, and the password is:** check box, and enter the password.
- Step 8** Click **Save**.
-

SLA Monitor Objects

Each Internet Protocol Service Level Agreement (SLA) monitor defines a connectivity policy to a monitored address and tracks the availability of a route to the address. The route is periodically checked for availability by sending ICMP echo requests and waiting for the response. If the requests time out, the route is removed from the routing table and replaced with a backup route. SLA monitoring jobs start immediately after deployment and continue to run unless you remove the SLA monitor from the device configuration (that is, they do not age out). The Internet Protocol Service Level Agreement (SLA) Monitor Object is used in the Route Tracking field of an IPv4 Static Route Policy. IPv6 routes do not have the option to use SLA monitor via route tracking.

You can use these objects with Firepower Threat Defense devices.

Procedure

-
- Step 1** Select **Objects > Object Management** and choose **SLA Monitor** from the table of contents.
- Step 2** Click **Add SLA Monitor**.
- Step 3** Enter a name for the object in the **Name** field.
- Step 4** (Optional) Enter a description for the object in the **Description** field.
- Step 5** Enter the frequency of ICMP echo request transmissions, in seconds, in the **Frequency** field. Valid values range from 1 to 604800 seconds (7 days). The default is 60 seconds.
- Note** The frequency cannot be less than the timeout value; you must convert frequency to milliseconds to compare the values.
- Step 6** Enter the ID number of the SLA operation in the **SLA Monitor ID** field. Values range from 1 to 2147483647. You can create a maximum of 2000 SLA operations on a device. Each ID number must be unique to the policy and the device configuration.
- Step 7** Enter the amount of time that must pass after an ICMP echo request before a rising threshold is declared, in milliseconds, in the **Threshold** field. Valid values range from 0 to 2147483647 milliseconds. The default is 5000 milliseconds. The threshold value is used only to indicate events that exceed the defined value. You can use these events to evaluate the proper timeout value. It is not a direct indicator of the reachability of the monitored address.
- Note** The threshold value should not exceed the timeout value.
- Step 8** Enter the amount of time that the SLA operation waits for a response to the ICMP echo requests, in milliseconds, in the **Timeout** field. Values range from 0 to 604800000 milliseconds (7 days). The default is 5000 milliseconds. If a response is not received from the monitored address within the amount of time defined in this field, the static route is removed from the routing table and replaced by the backup route.
- Note** The timeout value cannot exceed the frequency value (adjust the frequency value to milliseconds to compare the numbers).
- Step 9** Enter the size of the ICMP request packet payload, in bytes, in the **Data Size** field. Values range from 0 to 16384 bytes. The default is 28 bytes, which creates a total ICMP packet of 64 bytes. Do not set this value higher than the maximum allowed by the protocol or the Path Maximum Transmission Unit (PMTU). For purposes of reachability, you might need to increase the default data size to detect PMTU changes between the source and the target. A low PMTU can affect session performance and, if detected, might indicate that the secondary path should be used.

- Step 10** Enter a value for type of service (ToS) defined in the IP header of the ICMP request packet in the **ToS** field. Values range from 0 to 255. The default is 0. This field contains information such as delay, precedence, reliability, and so on. It can be used by other devices on the network for policy routing and features such as committed access rate.
- Step 11** Enter the number of packets that are sent in the **Number of Packets** field. Values range from 1 to 100. The default is 1 packet.
- Note** Increase the default number of packets if you are concerned that packet loss might falsely cause the Firepower Threat Defense device to believe that the monitored address cannot be reached.
- Step 12** Enter the IP address that is being monitored for availability by the SLA operation, in the **Monitored Address** field.
- Step 13** The **Available Zones** list displays both zones and interface groups. In the **Zones/Interfaces** list, add the zones or interface groups that contain the interfaces through which the device communicates with the management station. To specify a single interface, you need to create a zone or the interface groups for the interface; see [Creating Security Zone Objects, on page 360](#). The host will be configured on a device only if the device includes the selected interfaces or zones.
- Step 14** Click **Save**.
-

Prefix Lists

You can create prefix list objects for IPv4 and IPv6 to use when you are configuring route maps, policy maps, OSPF Filtering, or BGP Neighbor Filtering.

Configure IPv6 Prefix List

Use the Configure IPv6 Prefix list page to create, copy and edit prefix list objects. You can create prefix list objects to use when you are configuring route maps, policy maps, OSPF Filtering, or BGP Neighbor Filtering.

You can use this object with Firepower Threat Defense devices.

Procedure

- Step 1** Select **Objects > Object Management** and choose **Prefix Lists > IPv6 Prefix List** from the table of contents.
- Step 2** Click **Add Prefix List**.
- Step 3** Enter a name for the prefix list object in the **Name** field on the **New Prefix List Object** window.
- Step 4** Click **Add** on the **New Prefix List Object** window.
- Step 5** Select the appropriate action, Allow or Block from the **Action** drop-down list, to indicate the redistribution access.
- Step 6** Enter a unique number that indicates the position a new prefix list entry will have in the list of prefix list entries already configured for this object, in the **Sequence No.** field. If left blank, the sequence number will default to five more than the largest sequence number currently in use.
- Step 7** Specify the IPv6 address in the IP address/mask length format in the **IP address** field. The mask length must be a valid value between 1-128.

- Step 8** Enter the minimum prefix length in the **Minimum Prefix Length** field. The value must be greater than the mask length and less than or equal to the Maximum Prefix Length, if specified.
- Step 9** Enter the maximum prefix length in the **Maximum Prefix Length** field. The value must be greater than or equal to the Minimum Prefix Length, if present, or greater than the mask length if the Minimum Prefix Length is not specified.
- Step 10** Click **Add**.
- Step 11** If you want to allow overrides for this object, check the **Allow Overrides** check box; see [Allowing Object Overrides, on page 352](#).
- Step 12** Click **Save**.
-

Configure IPv4 Prefix List

Use the Configure IPv4 Prefix list page to create, copy and edit prefix list objects. You can create prefix list objects to use when you are configuring route maps, policy maps, OSPF Filtering, or BGP Neighbor Filtering. You can use this object with Firepower Threat Defense devices.

Procedure

- Step 1** Select **Objects > Object Management** and choose **Prefix Lists > IPv4 Prefix List** from the table of contents.
- Step 2** Click **Add Prefix List**.
- Step 3** Enter a name for the prefix list object in the **Name** field on the **New Prefix List Object** window.
- Step 4** Click **Add**.
- Step 5** Select the appropriate action, Allow or Block from the **Action** drop-down list, to indicate the redistribution access.
- Step 6** Enter a unique number that indicates the position a new prefix list entry will have in the list of prefix list entries already configured for this object, in the **Sequence No.** field. If left blank, the sequence number will default to five more than the largest sequence number currently in use.
- Step 7** Specify the IPv4 address in the IP address/mask length format in the **IP address** field. The mask length must be a valid value between 1- 32.
- Step 8** Enter the minimum prefix length in the **Minimum Prefix Length** field. The value must be greater than the mask length and less than or equal to the Maximum Prefix Length, if specified.
- Step 9** Enter the maximum prefix length in the **Maximum Prefix Length** field. The value must be greater than or equal to the Minimum Prefix Length, if present, or greater than the mask length if the Minimum Prefix Length is not specified.
- Step 10** Click **Add**.
- Step 11** If you want to allow overrides for this object, check the **Allow Overrides** check box; see [Allowing Object Overrides, on page 352](#).
- Step 12** Click **Save**.
-

Route Maps

Route maps are used when redistributing routes into any routing process. They are also used when generating a default route into a routing process. A route map defines which of the routes from the specified routing protocol are allowed to be redistributed into the target routing process. Configure a route map, to create a new route map entry for a Route Map object or to edit an existing one.

You can use this object with Firepower Threat Defense devices.

Before you begin

A Route Map may use one or more of these objects; it is not mandatory to add all these objects. Create and use any of these objects as required, to configure your route map.

- Add ACLs.
- Add Prefix Lists.
- Add AS Path.
- Add Community Lists.
- Add Policy Lists.

Procedure

-
- Step 1** Select **Objects > Object Management** and choose **Route Map** from the table of contents.
- Step 2** Click **Add Route Map**.
- Step 3** Click **Add** on the **New Route Map Object** window.
- Step 4** In the **Sequence No.** field, enter a number, between 0 and 65535, that indicates the position a new route map entry will have in the list of route maps entries already configured for this route map object.
- Note** We recommend that you number clauses in intervals of at least 10 to reserve numbering space in case you need to insert clauses in the future.
- Step 5** Select the appropriate action, Allow or Block from the **Redistribution** drop-down list, to indicate the redistribution access.
- Step 6** Click the **Match Clauses** tab to match (routes/traffic) based on the following criteria, which you select in the table of contents:
- **Security Zones** — Match traffic based on the (ingress/egress) interfaces. You can select zones and add them, or type in interface names and add them.
 - **IPv4** — Match IPv4 (routes/traffic) based on the following criteria; select the tab to define the criteria.
 - a. Click the **Address** tab to match routes based on the route address. For IPv4 addresses, choose whether to use an Access list or Prefix list for matching from the drop-down list and then enter or select the ACL objects or Prefix list objects you want to use for matching.
 - b. Click the **Next Hop** tab to match routes based on the next hop address of a route. For IPv4 addresses, choose whether to use an access list or Prefix list for matching from the drop-down list and then enter or select the ACL objects or Prefix list objects you want to use for matching.

- c. Click the **Route Source** tab to match routes based on the advertising source address of the route. For IPv4 addresses, choose whether to use an access list or Prefix list for matching from the drop-down list and then enter or select the ACL objects or Prefix list objects you want to use for matching.
- **IPv6** — Match IPv6 (routes/traffic) based on the route address, next-hop address or advertising source address of route.
- **BGP** — Match BGP (routes/traffic) based on the following criteria; select the tab to define the criteria.
 - a. Click the **AS Path** tab to enable matching the BGP autonomous system path access list with the specified path access list. If you specify more than one path access list, then the route can match either path access list.
 - b. Click the **Community List** tab to enable matching the BGP community with the specified community. If you specify more than one community, then the route can match either community. Any route that does not match at least one Match community will not be advertised for outbound route maps.
 - c. Click the **Policy List** tab to configure a route map to evaluate and process a BGP policy. When multiple policy lists perform matching within a route map entry, all policy lists match on the incoming attribute only.
- **Others** — Match routes or traffic based on the following criteria.
 - a. Enter the metric values to use for matching in the **Metric Route Value** field, to enable matching the metric of a route. You can enter multiple values separated by commas. This setting allows you to match any routes that have a specified metric. The metric values can range from 0 to 4294967295.
 - b. Enter the tag values to use for matching in the **Tag Values** field. You can enter multiple values separated by commas. This setting allows you to match any routes that have a specified security group tag. The tag values can range from 0 to 4294967295.
 - c. Check the appropriate **Route Type** option to enable matching of the route type. Valid route types are External1, External2, Internal, Local, NSSA-External1, and NSSA-External2. You can choose more than one route type from the list.

Step 7

Click the **Set Clauses** tab to set routes/traffic based on the following criteria, which you select in the table of contents:

- **Metric Values** — Set either Bandwidth, all of the values or none of the values.
 - a. Enter a metric value or bandwidth in Kbits per second in the **Bandwidth** field. Valid values are an integer value in the range from 0 to 4294967295.
 - b. Select to specify the type of metric for the destination routing protocol, from the **Metric Type** drop-down list. Valid values are : internal, type-1, or type-2.
- **BGP Clauses** — Set BGP routes based on the following criteria; select the tab to define the criteria.
 - a. Click the **AS Path** tab to modify an autonomous system path for BGP routes.
 1. Enter an AS path number in the **Prepend AS Path** field to prepend an arbitrary autonomous system path string to BGP routes. Usually the local AS number is prepended multiple times, increasing the autonomous system path length. If you specify more than one AS path number then the route can prepend either AS number.

2. Enter an AS path number in the **Prepend Last AS to AS Path** field to prepend the AS path with the last AS number. Enter a value for the AS number from 1 to 10.
 3. Check the **Convert route tag into AS path** check box to convert the tag of a route into an autonomous system path.
- b. Click the **Community List** tab to set the community attributes.
1. Click the **None** radio button, to remove the community attribute from the prefixes that pass the route map.
 2. Click the **Specific Community** radio button, to enter a community number, if applicable. Valid values are from 1 to 4294967295.
 3. Check the **Add to existing communities** check box, to add the community to the already existing communities.
 4. Select the **Internet**, **No-Advertise**, or **No-Export** check-boxes to use one of the well-known communities.
- c. Click the **Others** tab to set additional attributes.
1. Check the **Set Automatic Tag** check-box to automatically compute the tag value.
 2. Enter a preference value for the autonomous system path in the **Set Local Preference** field. Enter a value between 0 and 4294967295.
 3. Enter a BGP weight for the routing table in the **Set Weight** field. Enter a value between 0 and 65535.
 4. Select to specify the BGP origin code. Valid values are **Local IGP** Local IGP and **Incomplete**.
 5. In the IPv4 Settings section, specify a next hop IPv4 address of the next hop to which packets are output. It need not be an adjacent router. If you specify more than one IPv4 address then the packets can output at either IP address.
Select to specify an IPv4 prefix list in the **Prefix List** drop-down list.
 6. In the IPv6 Settings section, specify a next hop IPv6 address of the next hop to which packets are output. It need not be an adjacent router. If you specify more than one IPv6 address then the packets can output at either IP address.
Select to specify an IPv6 prefix in the **Prefix List** drop-down list.

Step 8 Click **Add**.

Step 9 If you want to allow overrides for this object, check the **Allow Overrides** check box; see [Allowing Object Overrides, on page 352](#).

Step 10 Click **Save**.

Access List

An access list object, also known as an access control list (ACL), selects the traffic to which a service will apply. You use these objects when configuring particular features, such as route maps, for Firepower Threat Defense devices. Traffic identified as allowed by the ACL is provided the service, whereas “blocked” traffic is excluded from the service. Excluding traffic from a service does not necessarily mean that it is dropped altogether.

You can configure the following types of ACL:

- **Extended**—Identifies traffic based on source and destination address and ports. Supports IPv4 and IPv6 addresses, which you can mix in a given rule.
- **Standard**—Identifies traffic based on destination address only. Supports IPv4 only.

An ACL is composed of one or more access control entry (ACE), or rule. The order of ACEs is important. When the ACL is evaluated to determine if a packet matches an “allowed” ACE, the packet is tested against each ACE in the order in which the entries are listed. After a match is found, no more ACEs are checked. For example, if you want to “allow” 10.100.10.1, but “block” the rest of 10.100.10.0/24, the allow entry must come before the block entry. In general, place more specific rules at the top of an ACL.

Packets that do not match an “allow” entry are considered to be blocked.

The following topics explain how to configure ACL objects.

Configure Extended ACL Objects

Use extended ACL objects when you want to match traffic based on source and destination addresses, protocol and port, or if the traffic is IPv6.

Procedure

- Step 1** Select **Objects > Object Management** and choose **Access Control Lists > Extended** from the table of contents.
- Step 2** Do one of the following:
- Click **Add Extended ACL** to create a new object.
 - Click **Edit** () to edit an existing object.
- Step 3** In the Extended ACL Object dialog box, enter a name for the object (no spaces allowed), and configure the access control entries:
- a) Do one of the following:
 - Click **Add** to create a new entry.
 - Click **Edit** () to edit an existing entry.

The right-click menu also includes options to cut, copy, and paste entries, or to delete them.

- b) Select the **Action**, whether to Allow (match) or Block (not match) the traffic criteria.

Note The **Logging**, **Log Level**, and **Log Interval** options are used for access rules only (ACLs attached to interfaces or applied globally). Because ACL objects are not used for access rules, leave these values at their defaults.

- c) Configure the source and destination addresses on the **Network** tab using any of the following techniques:

- Select the desired network objects or groups from the Available list and click **Add to Source** or **Add to Destination**. You can create new objects by clicking the + button above the list. You can mix IPv4 and IPv6 addresses.
- Type an address in the edit box below the source or destination list and click **Add**. You can specify a single host address (such as 10.100.10.5 or 2001:DB8::0DB8:800:200C:417A), or a subnet (in 10.100.10.0/24 or 10.100.10.0 255.255.255.0 format, or for IPv6, 2001:DB8:0:CD30::/60).

- d) Click the **Port** tab and configure the service using any of the following techniques.

- Select the desired port objects from the Available list and click **Add to Source** or **Add to Destination**. You can create new objects by clicking the + button above the list. The object can specify TCP/UDP ports, ICMP/ICMPv6 message types, or other protocols (including “any”). However, the source port, which you typically would leave empty, accepts TCP/UDP only. You cannot select port groups.
- Type or select a port or protocol in the edit box below the source or destination list and click **Add**.

Note To get an entry that applies to all IP traffic, select a destination port object that specifies “all” protocols.

- e) Click **Add** to add the entry to the object.
 f) If necessary, click and drag the entry to move it up or down in the rule order to the desired location.
 Repeat the process to create or edit additional entries in the object.

Step 4 If you want to allow overrides for this object, check the **Allow Overrides** check box; see [Allowing Object Overrides, on page 352](#).

Step 5 Click **Save**.

Configure Standard ACL Objects

Use standard ACL objects when you want to match traffic based on destination IPv4 address only. Otherwise, use extended ACLs.

Procedure

Step 1 Select **Objects > Object Management** and choose **Access Control Lists > Standard** from the table of contents.

Step 2 Do one of the following:

- Click **Add Standard ACL** to create a new object.

- Click **Edit** () to edit an existing object.

Step 3 In the Standard ACL Object dialog box, enter a name for the object (no spaces allowed), and configure the access control entries:

- Do one of the following:
 - Click **Add** to create a new entry.
 - Click **Edit** () to edit an existing entry.

The right-click menu also includes options to cut, copy, and paste entries, or to delete them.

- For each access control entry, configure the following properties:
 - **Action**—Whether to Allow (match) or Block (not match) the traffic criteria.
 - **Network**—Add the IPv4 network objects or groups that identify the destination of the traffic.
- Click **Add** to add the entry to the object.
- If necessary, click and drag the entry to move it up or down in the rule order to the desired location.

Repeat the process to create or edit additional entries in the object.

Step 4 If you want to allow overrides for this object, check the **Allow Overrides** check box; see [Allowing Object Overrides, on page 352](#).

Step 5 Click **Save**.

AS Path Objects

An AS Path is a mandatory attribute to set up BGP. It is a sequence of AS numbers through which a network can be accessed. An AS-PATH is a sequence of intermediate AS numbers between source and destination routers that form a directed route for packets to travel. Neighboring autonomous systems (ASes) use BGP to exchange and update messages about how to reach different AS prefixes. After each router makes a new local decision on the best route to a destination, it will send that route, or path information, along with the accompanying distance metrics and path attributes, to each of its peers. As this information travels through the network, each router along the path prepends its unique AS number to a list of ASes in the BGP message. This list is the route's AS-PATH. An AS-PATH along with an AS prefix, provides a specific handle for a one-way transit route through the network. Use the Configure AS Path page to create, copy and edit autonomous system (AS) path policy objects. You can create AS path objects to use when you are configuring route maps, policy maps, or BGP Neighbor Filtering. An AS path filter allows you to filter the routing update message by using regular expressions.

You can use this object with Firepower Threat Defense devices.

Procedure

Step 1 Select **Objects > Object Management** and choose **AS Path** from the table of contents.

- Step 2** Click **Add AS Path**.
- Step 3** Enter a name for the AS Path object in the **Name** field. Valid values are between 1 and 500.
- Step 4** Click **Add** on the **New AS Path Object** window.
- Select the Allow or Block options from the **Action** drop-down list to indicate redistribution access.
 - Specify the regular expression that defines the AS path filter in the **Regular Expression** field.
 - Click **Add**.
- Step 5** If you want to allow overrides for this object, check the **Allow Overrides** check box; see [Allowing Object Overrides, on page 352](#).
- Step 6** Click **Save**.

Community Lists

A Community is an optional transitive BGP attribute. A community is a group of destinations that share some common attribute. It is used for route tagging. The BGP community attribute is a numerical value that can be assigned to a specific prefix and advertised to other neighbors. Communities can be used to mark a set of prefixes that share a common attribute. Upstream providers can use these markers to apply a common routing policy such as filtering or assigning a specific local preference or modifying other attributes. Use the Configure Community Lists page to create, copy and edit community list policy objects. You can create community list objects to use when you are configuring route maps or policy maps. You can use community lists to create groups of communities to use in a match clause of a route map. The community list is an ordered list of matching statements. Destinations are matched against the rules until a match is found.

You can use this object with Firepower Threat Defense devices.

Procedure

- Step 1** Select **Objects > Object Management** and choose **Community List** from the table of contents.
- Step 2** Click **Add Community List**.
- Step 3** In the **Name** field, specify a name for the community list object.
- Step 4** Click **Add** on the **New Community List Object** window.
- Step 5** Select the **Standard** radio button to indicate the community rule type.
- Standard community lists are used to specify well-known communities and community numbers.
- Note** You cannot have entries using Standard and entries using Expanded community rule types in the same Community List object.
- Select the Allow or Block options from the **Action** drop-down list to indicate redistribution access.
 - In the **Communities** field, specify a community number. Valid values can be from 1 to 4294967295 or from 0:1 to 65534:65535.
 - Select the appropriate **Route Type**.
 - Internet** — Select to specify the Internet well-known community. Routes with this community are advertised to all peers (internal and external).
 - No Advertise** — Select to specify the no-advertise well-known community. Routes with this community are not advertised to any peer (internal or external).

- **No Export** — Select to specify the no-export well-known community. Routes with this community are advertised to only peers in the same autonomous system or to only other sub-autonomous systems within a confederation. These routes are not advertised to external peers.

- Step 6** Select the **Expanded** radio button to indicate the community rule type.
Expanded community lists are used to filter communities using a regular expression. Regular expressions are used to specify patterns to match COMMUNITIES attributes.
- Select the Allow or Block options from the **Action** drop-down list to indicate redistribution access.
 - Specify the regular expression in the **Expressions** field.
- Step 7** Click **Add**.
- Step 8** If you want to allow overrides for this object, check the **Allow Overrides** check box; see [Allowing Object Overrides, on page 352](#).
- Step 9** Click **Save**.
-

Policy Lists

Use the Configure Policy List page to create, copy, and edit policy list policy objects. You can create policy list objects to use when you are configuring route maps. When a policy list is referenced within a route map, all of the match statements within the policy list are evaluated and processed. Two or more policy lists can be configured with a route map. A policy list can also coexist with any other preexisting match and set statements that are configured within the same route map but outside of the policy list. When multiple policy lists perform matching within a route map entry, all policy lists match on the incoming attribute only.

You can use this object with Firepower Threat Defense devices.

Procedure

- Step 1** Select **Objects > Object Management** and choose **Policy List** from the table of contents.
- Step 2** Click **Add Policy List**.
- Step 3** Enter a name for the policy list object in the **Name** field. Object names are not case-sensitive.
- Step 4** Select whether to allow or block access for matching conditions from the **Action** drop-down list.
- Step 5** Click the **Interface** tab to distribute routes that have their next hop out of one of the interfaces specified.
- In the **Zones/Interfaces** list, add the zones that contain the interfaces through which the device communicates with the management station. For interfaces not in a zone, you can type the interface name into the field below the **Selected Zone/Interface** list and click **Add**. The host will be configured on a device only if the device includes the selected interfaces or zones.
- Step 6** Click the **Address** tab to redistribute any routes that have a destination address that is permitted by a standard access list or prefix list.
- Choose whether to use an **Access List** or **Prefix List** for matching and then enter or select the Standard Access List Objects or Prefix list objects you want to use for matching.
- Step 7** Click the **Next Hop** tab to redistribute any routes that have a next hop router address passed by one of the access lists or prefix lists specified.

Choose whether to use an **Access List** or **Prefix List** for matching and then enter or select the Standard Access List Objects or Prefix list objects you want to use for matching.

- Step 8** Click the **Route Source** tab to redistribute routes that have been advertised by routers and access servers at the address specified by the access lists or prefix list.
- Choose whether to use an **Access List** or **Prefix List** for matching and then enter or select the Standard Access List Objects or Prefix list objects you want to use for matching.
- Step 9** Click the **AS Path** tab to match a BGP autonomous system path. If you specify more than one AS path, then the route can match either AS path.
- Step 10** Click the **Community Rule** tab to enable matching the BGP community with the specified community. If you specify more than one community, then the route can match either community. To enable matching the BGP community exactly with the specified community, check the **Match the specified community exactly** check box.
- Step 11** Click the **Metric & tag** tab to match the metric and security group tag of a route.
- Enter the metric values to use for matching in the **Metric** field. You can enter multiple values separated by commas. This setting allows you to match any routes that have a specified metric. The metric values can range from 0 to 4294967295.
 - Enter the tag values to use for matching in the **Tag** field. You can enter multiple values separated by commas. This setting allows you to match any routes that have a specified security group tag. The tag values can range from 0 to 4294967295.
- Step 12** If you want to allow overrides for this object, check the **Allow Overrides** check box; see [Allowing Object Overrides, on page 352](#).
- Step 13** Click **Save**.
-

PART **V**

Classic Device Configuration Basics

- [Classic Device Management Basics, on page 419](#)
- [IPS Device Deployments and Configuration, on page 431](#)

CHAPTER 19

Classic Device Management Basics

The following topics describe how to manage Classic devices (7000 and 8000 Series/ASA with FirePOWER Services/NGIPSv) in the Firepower System:

- [Requirements and Prerequisites for Classic Device Management](#), on page 419
- [Remote Management Configuration \(Classic Devices\)](#), on page 419
- [Interface Configuration Settings](#), on page 422

Requirements and Prerequisites for Classic Device Management

Model Support

Classic models as indicated in the procedures.

Supported Domains

Leaf unless indicated otherwise.

User Roles

- Admin
- Network Admin

Remote Management Configuration (Classic Devices)

All Devices Except 7000 and 8000 Series

For information on configuring remote management for devices that use Classic licenses, see the quick start guide for your device.

7000 and 8000 Series Devices

Configure remote management of a 7000 or 8000 Series device using its local web interface, before you register the device to the FMC.

Before you can manage a Firepower device, you must set up a two-way, SSL-encrypted communication channel between the device and the Firepower Management Center. The appliances use the channel to share configuration and event information. High availability peers also use the channel, which is by default on port 8305/tcp.

To enable communications between two appliances, you must provide a way for the appliances to recognize each other, as follows:

- The hostname or IP address of the appliance with which you are trying to establish communication.
In NAT environments, even if the other appliance does not have a routable address, you must provide a hostname or an IP address either when you are configuring remote management, or when you are adding the managed appliance.
- A self-generated alphanumeric registration key up to 37 characters in length that identifies the connection.
- An optional unique alphanumeric NAT ID that can help establish communications in a NAT environment.
The NAT ID *must* be unique among all NAT IDs used to register managed appliances.

Configuring Remote Management on a Managed Device

This procedure applies to 7000 & 8000 Series devices.

Procedure

-
- Step 1** On the web interface for the device you want to manage, choose **System > Integration > Remote Management**.
- Step 2** Click **Remote Management**, if it is not already displaying.
- Step 3** Click **Add Manager**.
- Step 4** In the **Management Host** field, enter one of the following for the Firepower Management Center that you want to use to manage this appliance:
- The IP address
 - The fully qualified domain name or the name that resolves through the local DNS to a valid IP address (that is, the host name)
- Caution** Use a host name rather than an IP address if your network uses DHCP to assign IP addresses.
- In a NAT environment, you do not need to specify an IP address or host name here if you plan to specify it when you add the managed appliance. In this case, the Firepower System uses the NAT ID you will provide later to identify the remote manager on the managed appliance's web interface.
- Step 5** In the **Registration Key** field, enter the registration key that you want to use to set up communications between appliances.
- Step 6** For NAT environments, in the **Unique NAT ID** field, enter a **unique** alphanumeric NAT ID that you want to use to set up communications between appliances.
- Step 7** Click **Save**.
-

What to do next

- Wait until the appliances confirm that they can communicate with each other and the Pending Registration status appears.
- Add this device to the Firepower Management Center; see [Add a Device to the FMC, on page 207](#).

Editing Remote Management on a Managed Device

This procedure applies to 7000 & 8000 Series devices.

When editing a remote manager, note that:

- The **Host** field specifies the fully qualified domain name or the name that resolves through the local DNS to a valid IP address (that is, the host name).
- The **Name** field specifies the display name of the managing appliance, which is used only within the context of the Firepower System. Entering a different display name does not change the host name for the managing device.

Procedure

-
- Step 1** On the web interface for the device, choose **System > Integration**.
- Step 2** Click **Remote Management**, if it is not already displaying.
- Step 3** You can:
- Disable remote management — Click the slider next to the manager to enable or disable it. Disabling management blocks the connection between the Firepower Management Center and the device, but does **not** delete the device from the Firepower Management Center. If you no longer want to manage a device, see [Delete a Device from the FMC, on page 209](#).
 - Edit manager information — Click **Edit** () next to the manager you want to modify, modify the **Name** and **Host** fields, and click **Save**.
-

Changing the Management Port

Appliances communicate using a two-way, SSL-encrypted communication channel, which by default is on port 8305.

Although Cisco *strongly* recommends that you keep the default setting, you can choose a different port if the management port conflicts with other communications on your network. Usually, changes to the management port are made during installation.

Caution If you change the management port, you must change it for all appliances in your deployment that need to communicate with each other.

You must perform this task in the global domain.

Procedure

- Step 1** Choose **System > Configuration**.
- Step 2** Click **Management Interfaces**.
- Step 3** In the **Shared Settings** section, enter the port number that you want to use in the **Remote Management Port** field.
- Step 4** Click **Save**.
-

What to do next

Repeat this procedure for every appliance in your deployment that must communicate with this appliance.

Interface Configuration Settings

The Interfaces page of the appliance editor displays detailed interface configuration information. The page is composed of the physical hardware view and the interfaces table view, which allow you to drill down to configuration details. You can add and edit interfaces from this page.

The Physical Hardware View

The top of the Interfaces page provides a graphical representation of the physical hardware view of a 7000 or 8000 Series device.

Use the physical hardware view to:

- view a network module's type, part number, and serial number
- select an interface in the interfaces table view
- open an interface editor
- view the name of the interface, the type of interface, whether the interface has link, the interface's speed setting, and whether the interface is currently in bypass mode
- view the details about an error or warning

The Interfaces Page

The interfaces page lists all the available interfaces you have on a device. The table includes an expandable navigation tree you can use to view all configured interfaces. You can click the arrow icon next to an interface to collapse or expand the interface to hide or view its subcomponents. The interfaces table view also provides summarized information about each interface.

Field	Description
Name	<p>Each interface type is represented by a unique icon that indicates its type and link state (if applicable). You can hover your pointer over the name or the icon to view a tooltip with additional information. The interface icons are described in Interface Icons, on page 424.</p> <p>The icons use a badging convention to indicate the current link state of the interface, which may be one of three states:</p> <ul style="list-style-type: none"> • Error • Fault • Not available <p>Logical interfaces have the same link state as their parent physical interface. ASA FirePOWER modules do not display link state. Note that disabled interfaces are represented by semi-transparent icons.</p> <p>Interface names, which appear to the right of the icons, are auto-generated with the exception of hybrid and ASA FirePOWER interfaces, which are user-defined. Note that for ASA FirePOWER interfaces, the system displays only interfaces that are enabled, named, and have link.</p> <p>Physical interfaces display the name of the physical interface. Logical interfaces display the name of the physical interface and the assigned VLAN tag.</p> <p>ASA FirePOWER interfaces display the name of the security context and the name of the interface if there are multiple security contexts. If there is only one security context, the system displays only the name of the interface.</p>
Security Zone	<p>The security zone where the interface is assigned. To add or edit a security zone, click Edit ()</p>
Used by	<p>The inline set, virtual switch, or virtual router where the interface is assigned.</p>
MAC Address	<p>The MAC address displayed for the interface when it is enabled for switched and routed features.</p> <p>For NGIPSv devices, the MAC address is displayed so that you can match the network adapters configured on your device to the interfaces that appear on the Interfaces page.</p>
IP Addresses (7000/8000 series only)	<p>IP addresses assigned to the interface. Hover your pointer over an IP address to view whether it is active. Inactive IP addresses are also grayed out.</p>

Interface Icons

Table 55: Interface Icon Types and Descriptions

Icon	Interface Type	Description	See
Physical	Physical	Unconfigured physical interface.	Configuring Physical Switched Interfaces, on page 887 or Configuring Physical Routed Interfaces, on page 897
Passive	Passive	Sensing interface configured to analyze traffic in a passive deployment.	Configuring Passive Interfaces, on page 433
Inline	Inline	Sensing interface configured to handle traffic in an inline deployment.	Configuring Inline Interfaces, on page 436
Switched	Switched	Interface configured to switch traffic in a Layer 2 deployment.	Switched Interface Configuration, on page 885
Routed	Routed	Interface configured to route traffic in a Layer 3 deployment.	Routed Interfaces, on page 896
Aggregate	Aggregate	Multiple physical interfaces configured as a single logical link.	About Aggregate Interfaces, on page 927
Aggregate Switched	Aggregate Switched	Multiple physical interfaces configured as a single logical link in a Layer 2 deployment.	Adding Aggregate Switched Interfaces, on page 933
Aggregate Routed	Aggregate Routed	Multiple physical interfaces configured as a single logical link in a Layer 3 deployment.	Adding Aggregate Routed Interfaces, on page 935
Hybrid	Hybrid	Logical interface configured to bridge traffic between a virtual router and a virtual switch.	Logical Hybrid Interfaces, on page 941
ASA FirePOWER	ASA FirePOWER	Interface configured on an ASA device with the ASA FirePOWER module installed.	Managing Cisco ASA FirePOWER Interfaces, on page 428

Using the Physical Hardware View

This task applies to 7000 & 8000 Series devices.

Procedure

-
- Step 1** Choose **Devices > Device Management**.
- Step 2** Click edit **Edit** () next to the device you want to manage.

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

- Step 3** Use the graphical interface to:
- Choose — If you want to choose an interface, click interface. The system highlights the related entry in the interface table.
 - Edit — If you want to open an interface editor, double-click interface.
 - View error or warning information — If you want to view the details about an error or warning, hover your cursor over the affected port on the network module.
 - View interface information — If you want to view the name of the interface, the type of interface, whether the interface has link, the interface's speed setting, and whether the interface is currently in bypass mode, hover your cursor over the interface.
 - View network module information — If you want to view a network module's type, part number, and serial number, hover your cursor over the dark circle in the lower left corner of the network module.

Configuring Sensing Interfaces

You can configure the sensing interfaces of a managed device, according to your Firepower deployment, from the Interfaces page of the appliance editor. Note that you can only configure a total of 1024 interfaces on a managed device.

Note The Firepower Management Center does not display ASA interfaces when the ASA FirePOWER is deployed in SPAN port mode.

Procedure

- Step 1** Choose **Devices > Device Management**.
- Step 2** Next to the device where you want to configure an interface, click **Edit** ().
In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.
- Step 3** Click **Edit** () next to the interface you want to configure.
- Step 4** Use the interface editor to configure the sensing interface:
- HA Link — If you want an interface configured on each member of a high-availability pair of 7000/8000 series devices to act as a redundant communications channel between the devices; also called a high availability link interface, click **HA Link** and proceed as described in [Configuring HA Link Interfaces, on page 426](#).
 - Inline — If you want an interface configured to handle traffic in an inline deployment, click **Inline** and proceed as described in [Configuring Inline Interfaces, on page 436](#).
 - Passive — If you want an interface configured to analyze traffic in a passive deployment, click **Passive** and proceed as described in [Configuring Passive Interfaces, on page 433](#).

- **Routed** — If you want an interface configured to route traffic in a 7000/8000 series Layer 3 deployment, click **Routed** and proceed as described in [Routed Interfaces, on page 896](#).
- **Switched** — If you want an interface configured to switch traffic in a 7000/8000 series Layer 2 deployment, click **Switched** and proceed as described in [Switched Interface Configuration, on page 885](#).

Step 5 Click **Save**.

What to do next

Deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

Configuring HA Link Interfaces

After you establish a 7000 or 8000 Series device high-availability pair, you should configure a physical interface as a high availability (HA) link interface. This link acts as a redundant communications channel for sharing health information between the paired devices. When you configure an HA link interface on one device, you automatically configure an interface on the second device. You must configure both HA links on the same broadcast domain.

Dynamic NAT relies on dynamically allocating IP addresses and ports to map to other IP addresses and ports. Without an HA link, these mappings are lost in a failover, causing all translated connections to fail as they are routed through the now-active device in the high-availability pair.

Similarly, 7000 or 8000 Series devices with high-availability state sharing, dynamic NAT, or VPN require an HA link interface.

Procedure

Step 1 Choose **Devices > Device Management**.

Step 2 Next to the peer where you want to configure the HA link interface, click **Edit** (✎).
In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

Step 3 Next to the interface you want to configure as a HA link interface, click **Edit** (✎).

Step 4 Click **HA Link**.

Step 5 Check the **Enabled** check box.
If you clear the check box, the system administratively takes down the interface, disabling it.

Step 6 From the **Mode** drop-down list, choose an option to designate the link mode, or choose **Autonegotiation** to specify that the interface is configured to autonegotiate speed and duplex settings.

Step 7 From the **MDI/MDIX** drop-down list, choose an option to designate whether the interface is configured for MDI (medium dependent interface), MDIX (medium dependent interface crossover), or Auto-MDIX.
Normally, MDI/MDIX is set to **Auto-MDIX**, which automatically handles switching between MDI and MDIX to attain link.

Step 8 Enter a maximum transmission unit (MTU) in the **MTU** field.

The range of MTU values can vary depending on the model of the managed device and the interface type. See [MTU Ranges for 7000 and 8000 Series Devices and NGIPSv, on page 428](#) for more information.

Caution Changing the highest MTU value among all non-management interfaces on the device restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Inspection is interrupted on all non-management interfaces, not just the interface you modified. Whether this interruption drops traffic or passes it without further inspection depends on the model of the managed device and the interface type. See [Snort® Restart Traffic Behavior, on page 310](#) for more information.

Step 9 Click **Save**.

What to do next

Deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

Related Topics

[Snort® Restart Scenarios, on page 308](#)

[MTU Ranges for 7000 and 8000 Series Devices and NGIPSv, on page 428](#)

Disabling Interfaces

You can disable an interface by setting the interface type to **None**. Disabled interfaces appear grayed out in the interface list.

This procedure applies to NGIPSv and 7000 & 8000 Series devices.

Procedure

Step 1 Choose **Devices > Device Management**.

Step 2 Next to the device where you want to disable the interface, click **Edit** ()

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

Step 3 Next to the interface you want to disable, click **Edit** ()

Step 4 Click **None**.

Step 5 Click **Save**.

What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

Managing Cisco ASA FirePOWER Interfaces

When editing an ASA FirePOWER interface, you can configure only the interface's security zone from the Firepower Management Center.

You fully configure ASA FirePOWER interfaces using the ASA-specific software and CLI. If you edit an ASA FirePOWER and switch from multiple context mode to single context mode (or visa versa), the ASA FirePOWER renames all of its interfaces. You must reconfigure all Firepower System security zones, correlation rules, and related configurations to use the updated ASA FirePOWER interface names. For more information about ASA FirePOWER interface configuration, see the ASA documentation.

Note You cannot change the type of ASA FirePOWER interface, nor can you disable the interface from the Firepower Management Center.

Procedure

-
- Step 1** Choose **Devices > Device Management**.
 - Step 2** Next to the device where you want to edit the interface, click **Edit** ().
 - In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.
 - Step 3** Click **Interfaces** if it is not already displaying.
 - Step 4** Next to the interface you want to edit, click **Edit** ().
 - Step 5** Choose an existing security zone from the **Security Zone** drop-down list, or choose **New** to add a new security zone.
 - Step 6** Click **Save** to configure the security zone.
-

What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

MTU Ranges for 7000 and 8000 Series Devices and NGIPSv

Changing the highest MTU value among all non-management interfaces on the device restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Inspection is interrupted on all non-management interfaces, not just the interface you modified. Whether this interruption drops traffic or passes it without further inspection depends on the model of the managed device and the interface type. See [Snort® Restart Traffic Behavior, on page 310](#) for more information.

Note The system trims 18 bytes from the configured MTU value. Do not set the IPv4 MTU lower than 594 or the IPv6 MTU lower than 1298.

Platform	MTU Range
7000 & 8000 Series	576-9234 (management interface) 576-10172 (inline sets, passive interface) 576-9922 (all others)
NGIPsv	576-9018 (all interfaces, inline sets)

Related Topics

[About the MTU](#), on page 535

Synchronizing Security Zone Object Revisions

When you update a security zone object, the system saves a new revision of the object. As a result, if you have managed devices in the same security zone that have different revisions of the security zone object configured in the interfaces, you may log what appear to be duplicate connections.

If you notice duplicate connection reporting, you can update all managed devices to use the same revision of the object.

This procedure applies to NGIPsv and 7000 & 8000 Series devices.

Procedure

-
- Step 1** Choose **Devices > Device Management**.
- Step 2** Next to the device where you want to update the security zone selection, click **Edit** ().
- In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.
- Step 3** For each interface logging duplicate connection events, change the **Security Zone** to another zone, click **Save**, then change it back to the desired zone, and click **Save** again.
- Step 4** Repeat steps 2 through 3 for each device logging duplicate events. You must edit all devices before you continue.
-

What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

Caution Do not deploy configuration changes to any device until you edit the zone setting for interfaces on *all* devices you want to sync. You must deploy to all managed devices at the same time.

CHAPTER 20

IPS Device Deployments and Configuration

The following topics describe how to configure your device in an IPS deployment:

- [Introduction to IPS Device Deployment and Configuration, on page 431](#)
- [License Requirements for IPS Device Deployment, on page 431](#)
- [Requirements and Prerequisites for IPS Device Deployment, on page 431](#)
- [Passive IPS Deployments, on page 432](#)
- [Inline IPS Deployments, on page 434](#)

Introduction to IPS Device Deployment and Configuration

You can configure your device in either a passive or inline IPS deployment. In a passive deployment, you deploy the system out of band from the flow of network traffic. In an inline deployment, you configure the system transparently on a network segment by binding two ports together.

- Network Admin

Passive IPS Deployments

In a passive IPS deployment, the Firepower System monitors traffic flowing across a network using a switch SPAN (or mirror) port. The SPAN port allows for traffic to be copied from other ports on the switch. This provides the system visibility within the network without being in the flow of network traffic. When configured in a passive deployment, the system cannot take certain actions such as blocking or shaping traffic. Passive interfaces receive all traffic unconditionally, and no traffic received on these interfaces is retransmitted. Passive interfaces support both local SPAN and remote SPAN (RSPAN) traffic.

Note Outbound traffic includes flow control packets. Because of this, passive interfaces on your appliances may show outbound traffic and, depending on your configuration, generate events; this is expected behavior.

Passive Interfaces on the Firepower System

You can configure one or more physical ports on a managed device as passive interfaces.

When you enable a passive interface to monitor traffic, you designate mode and MDI/MDIX settings, which are available only for copper interfaces. Interfaces on 8000 Series appliances do not support half-duplex options.

When you disable a passive interface, users can no longer access it for security purposes.

The range of MTU values can vary depending on the model of the managed device and the interface type.

Caution Changing the highest MTU value among all non-management interfaces on the device restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Inspection is interrupted on all non-management interfaces, not just the interface you modified. Whether this interruption drops traffic or passes it without further inspection depends on the model of the managed device and the interface type. See [Snort® Restart Traffic Behavior, on page 310](#) for more information.

[Snort® Restart Scenarios](#), on page 308

Configuring Passive Interfaces

Procedure

- Step 1** Choose **Devices > Device Management**.
- Step 2** Click **Edit** () next to the device where you want to configure the passive interface.
In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.
- Step 3** Click **Edit** () next to the interface you want to configure as a passive interface.
- Step 4** Click **Passive**.
- Step 5** If you want to associate the passive interface with a security zone, do one of the following:
- Choose an existing security zone from the **Security Zone** drop-down list.
 - Choose **New** to add a new security zone; see [Creating Security Zone Objects, on page 360](#).
- Step 6** Check the **Enabled** check box.
If you clear the check box, the interface becomes disabled so that users cannot access it for security purposes.
- Step 7** 7000 & 8000 Series only: From the **Mode** drop-down list, designate the link mode, or choose **Autonegotiation** to specify that the interface is configured to automatically negotiate speed and duplex settings.
Mode settings are available only for copper interfaces.
Interfaces on 8000 Series appliances do not support half-duplex options.
- Step 8** 7000 & 8000 Series only: From the **MDI/MDIX** drop-down list, designate whether the interface is configured for MDI (medium dependent interface), MDIX (medium dependent interface crossover), or Auto-MDIX.
MDI/MDIX settings are available only for copper interfaces.
By default, MDI/MDIX is set to **Auto-MDIX**, which automatically handles switching between MDI and MDIX to attain link.
- Step 9** Enter a maximum transmission unit (MTU) in the **MTU** field.
The range of MTU values can vary depending on the model of the managed device and the interface type.
- Caution** Changing the highest MTU value among all non-management interfaces on the device restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Inspection is interrupted on all non-management interfaces, not just the interface you modified. Whether this interruption drops traffic or passes it without further inspection depends on the model of the managed device and the interface type. See [Snort® Restart Traffic Behavior, on page 310](#) for more information.
- Step 10** Click **Save**.
-

What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

Inline IPS Deployments

In an inline IPS deployment, you configure the Firepower System transparently on a network segment by binding two ports together. This allows the system to be installed in any network environment without the configuration of adjacent network devices. Inline interfaces receive all traffic unconditionally, but all traffic received on these interfaces is retransmitted out of an inline set unless explicitly dropped.

Note For the system to affect traffic, you must deploy relevant configurations to managed devices using routed, switched, or transparent interfaces, or inline interface pairs.

You can configure the interfaces on your managed device to route traffic between a host on your network and external hosts through different inline interface pairs, depending on whether the device traffic is inbound or outbound. This is an *asynchronous routing* configuration. If you deploy asynchronous routing but you include only one interface pair in an inline set, the device might not correctly analyze your network traffic because it might see only half of the traffic.

Adding multiple inline interface pairs to the same inline interface set allows the system to identify the inbound and outbound traffic as part of the same traffic flow. For passive interfaces only, you can also achieve this by including the interface pairs in the same security zone.

When the system generates a connection event from traffic passing through an asynchronous routing configuration, the event may identify an ingress and egress interface from the same inline interface pair. The configuration in the following diagram, for example, would generate a connection event identifying **eth3** as the ingress interface and **eth2** as the egress interface. This is expected behavior in this configuration.

Note If you assign multiple interface pairs to a single inline interface set but you experience issues with duplicate traffic, reconfigure to help the system uniquely identify packets. For example, you could reassign your interface pairs to separate inline sets or modify your security zones.

For devices with inline sets, a software bridge is automatically set up to transport packets after the device restarts. If the device is restarting, there is no software bridge running anywhere. If you enable bypass mode on the inline set, it goes into hardware bypass while the device is restarting. In that case, you may lose a few seconds of packets as the system goes down and comes back up, due to renegotiation of link with the device. However, the system will pass traffic while Snort is restarting.

[Snort® Restart Scenarios](#), on page 308

Inline Interfaces on the Firepower System

You can configure one or more physical ports on a managed device as inline interfaces. You must assign a pair of inline interfaces to an inline set before they can handle traffic in an inline deployment.

Note:

- The system warns you if you set the interfaces in an inline pair to different speeds or if the interfaces negotiate to different speeds.
- If you configure an interface as an inline interface, the adjacent port on its NetMod automatically becomes an inline interface as well to complete the pair.
- To configure inline interfaces on an NGIPSv device, you must create the inline pair using adjacent interfaces.

Configuring Inline Interfaces

Procedure

- Step 1** Choose **Devices > Device Management**.
- Step 2** Click **Edit** () next to the device where you want to configure the interface.
In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.
- Step 3** Click **Edit** () next to the interface you want to configure.
- Step 4** Click **Inline**.
- Step 5** If you want to associate the inline interface with a security zone, do one of the following:
- Choose an existing security zone from the **Security Zone** drop-down list.
 - Choose **New** to add a new security zone; see [Creating Security Zone Objects, on page 360](#).
- Step 6** Choose an existing inline set from the **Inline Set** drop-down list, or choose **New** to add a new inline set.
- Note** If you add a new inline set, you must configure it after you set up the inline interface; see [Adding Inline Sets, on page 438](#).
- Step 7** Check the **Enabled** check box.
If you clear the check box, the interface becomes disabled so that users cannot access it for security purposes.
- Step 8** 7000 & 8000 Series only: From the **Mode** drop-down list, designate the link mode, or choose **Autonegotiation** to specify that the interface is configured to automatically negotiate speed and duplex settings.
Mode settings are available only for copper interfaces.
Interfaces on 8000 Series appliances do not support half-duplex options.
- Step 9** 7000 & 8000 Series only: From the **MDI/MDIX** drop-down list, designate whether the interface is configured for MDI (medium dependent interface), MDIX (medium dependent interface crossover), or Auto-MDIX.
MDI/MDIX settings are available only for copper interfaces.
By default, MDI/MDIX is set to **Auto-MDIX**, which automatically handles switching between MDI and MDIX to attain link.
- Step 10** Click **Save**.
-

What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

Inline Sets

Before you can use inline interfaces in an inline deployment, you must configure inline sets and assign inline interface pairs to them. An inline set is a grouping of one or more inline interface pairs on a device; an inline interface pair can belong to only one inline set at a time.

The **Inline Sets** tab of the Device Management page displays a list of all inline sets you have configured on a device.

You can add inline sets from the **Inline Sets** tab of the Device Management page or you can add inline sets as you configure inline interfaces.

You can assign **only** inline interface pairs to an inline set. If you want to create an inline set before you configure the inline interfaces on your managed devices, you can create an empty inline set and add interfaces to it later. You can use alphanumeric characters and spaces when you type a name for an inline set.

Note Create inline sets before you add security zones for the interfaces in the inline set; otherwise security zones are removed and you must add them again.

Name

The name of the inline set.

Interfaces

A list of all inline interface pairs assigned to the inline set. A pair is not available when you disable either interface in the pair from the Interfaces tab.

MTU

The maximum transmission unit for the inline set. The range of MTU values can vary depending on the model of the managed device and the interface type.

Caution Changing the highest MTU value among all non-management interfaces on the device restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Inspection is interrupted on all non-management interfaces, not just the interface you modified. Whether this interruption drops traffic or passes it without further inspection depends on the model of the managed device and the interface type. See [Snort® Restart Traffic Behavior, on page 310](#) for more information.

Failsafe

Allows traffic to bypass detection and continue through the device. Managed devices monitor internal traffic buffers and bypass detection if those buffers are full.

Bypass Mode

Firepower 7000 or 8000 Series only: The configured bypass mode of the inline set. This setting determines how the relays in the inline interfaces respond when an interface fails. The bypass mode allows traffic to continue to pass through the interfaces. The non-bypass mode blocks traffic.

Caution In bypass mode, you may lose a few packets when you reboot the appliance. You cannot configure bypass mode for inline sets on 7000 or 8000 Series devices in a high-availability pair, for non-bypass NetMods on 8000 Series devices, or for SFP modules on Firepower 7115 or 7125 devices.

Viewing Inline Sets

Procedure

-
- Step 1** Choose **Devices > Device Management**.
- Step 2** Click **Edit** () next to the device where you want to view the inline sets.
In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.
- Step 3** Click **Inline Sets**.
-

Adding Inline Sets

Procedure

-
- Step 1** Choose **Devices > Device Management**.
- Step 2** Click **Edit** () next to the device where you want to add the inline set.
In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.
- Step 3** Click **Inline Sets**.
- Step 4** Click **Add Inline Set**.
- Step 5** Enter a **Name**.
- Step 6** Next to **Interfaces**, choose one or more inline interface pairs, then click **Add Selected**. To add all interface pairs to the inline set, click **Add All**.
- Tip** To remove inline interfaces from the inline set, choose one or more inline interface pairs and click **Remove Selected**. To remove all interface pairs from the inline set, click **Remove All**. Disabling either interface in a pair from **Interfaces** also removes the pair.

- Step 7** Enter a maximum transmission unit (MTU) in the **MTU** field.
The range of MTU values can vary depending on the model of the managed device and the interface type.
- Caution** Changing the highest MTU value among all non-management interfaces on the device restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Inspection is interrupted on all non-management interfaces, not just the interface you modified. Whether this interruption drops traffic or passes it without further inspection depends on the model of the managed device and the interface type. See [Snort® Restart Traffic Behavior, on page 310](#) for more information.
- Step 8** If you want to specify that traffic is allowed to bypass detection and continue through the device, choose **Failsafe**.
Managed devices monitor internal traffic buffers and bypass detection if those buffers are full.
- Step 9** (7000/8000 series only) Specify the bypass mode.
- Click **Bypass** to allow traffic to continue to pass through the interfaces.
 - Click **Non-Bypass** to block traffic.
- Note** You cannot configure bypass mode for inline sets on 7000 or 8000 Series devices in high-availability pairs, inline sets on an NGIPSv device, for non-bypass NetMods on 8000 Series devices, or for SFP modules on Firepower 7115 or 7125 devices.
- Step 10** Optionally, configure advanced settings; see [Advanced Inline Set Options, on page 439](#).
- Step 11** Click **OK**.

What to do next

Deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

Related Topics

[MTU Ranges for 7000 and 8000 Series Devices and NGIPSv](#), on page 428

[Snort® Restart Scenarios](#), on page 308

Advanced Inline Set Options

There are a number of advanced options you may consider as you configure inline sets.

Tap Mode

Tap mode is available on 7000 and 8000 Series devices when you create an inline or inline with fail-open interface set.

With tap mode, the device is deployed inline, but instead of the packet flow passing through the device, a copy of each packet is sent to the device and the network traffic flow is undisturbed. Because you are working with copies of packets rather than the packets themselves, rules that you set to drop and rules that use the replace keyword do not affect the packet stream. However, rules of these types do generate intrusion events when they are triggered, and the table view of intrusion events indicates that the triggering packets would have dropped in an inline deployment.

There are benefits to using tap mode with devices that are deployed inline. For example, you can set up the cabling between the device and the network as if the device were inline and analyze the kinds of intrusion events the device generates. Based on the results, you can modify your intrusion policy and add the drop rules that best protect your network without impacting its efficiency. When you are ready to deploy the device inline, you can disable tap mode and begin dropping suspicious traffic without having to reconfigure the cabling between the device and the network.

Note that you cannot enable this option and strict TCP enforcement on the same inline set.

Propagate Link State

Note Link state propagation is not supported on virtual devices. Only 7000 and 8000 Series devices support link state propagation.

Link state propagation is a feature for inline sets configured in bypass mode and non-bypass mode so both pairs of an inline set track state. Link state propagation is available for both copper and fiber configurable bypass interfaces.

Link state propagation automatically brings down the second interface in the inline interface pair when one of the interfaces in an inline set goes down. When the downed interface comes back up, the second interface automatically comes back up, also. In other words, if the link state of one interface changes, the appliance senses the change and updates the link state of the other interface to match it. Note that appliances require up to 4 seconds to propagate link state changes.

Link state propagation is especially useful in resilient network environments where routers are configured to reroute traffic automatically around network devices that are in a failure state.

You cannot disable link state propagation for inline sets configured on 7000 and 8000 Series devices in high-availability pairs.

Transparent Inline Mode

Transparent Inline Mode option allows the device to act as a “bump in the wire” and means that the device forwards all the network traffic it sees, regardless of its source and destination. You cannot disable this option on 7000 and 8000 Series devices.

Strict TCP Enforcement

Note Strict TCP enforcement is not supported on virtual devices. Only 7000 and 8000 Series devices support this option. In addition, you cannot enable this option and tap mode on the same inline set.

To maximize TCP security, you can enable strict enforcement, which blocks connections where the three-way handshake was not completed. Strict enforcement also blocks:

- non-SYN TCP packets for connections where the three-way handshake was not completed
- non-SYN/RST packets from the initiator on a TCP connection before the responder sends the SYN-ACK
- non-SYN-ACK/RST packets from the responder on a TCP connection after the SYN but before the session is established

- SYN packets on an established TCP connection from either the initiator or the responder

Configuring Advanced Inline Set Options

Procedure

- Step 1** Choose **Devices > Device Management**.
- Step 2** Click **Edit** () next to the device where you want to edit the inline set.
In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.
- Step 3** Click **Inline Sets**.
- Step 4** Click **Edit** () next to the inline set you want to edit.
- Step 5** Click **Advanced**.
- Step 6** Configure options as described in [Advanced Inline Set Options, on page 439](#).
- Note** Link state propagation and strict TCP enforcement are not supported on virtual devices.
- Step 7** Click **OK**.
-

What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

Deleting Inline Sets

When you delete an inline set, any inline interfaces assigned to the set become available for inclusion in another set. The interfaces are not deleted.

Procedure

- Step 1** Choose **Devices > Device Management**.
- Step 2** Next to the device where you want to delete the inline set, click **Edit** ().
In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.
- Step 3** Click **Inline Sets**.
- Step 4** Next to the inline set you want to delete, click **Delete** ()
- Step 5** When prompted, confirm that you want to delete the inline set.
-

What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

PART VI

Classic Device High Availability and Scalability

- [7000 and 8000 Series Device High Availability, on page 445](#)
- [8000 Series Device Stacking, on page 461](#)

CHAPTER 21

7000 and 8000 Series Device High Availability

The following topics describe how to configure high availability for Firepower 7000 Series and 8000 Series devices in the Firepower System:

- [About 7000 and 8000 Series Device High Availability, on page 445](#)
- [Establishing Firepower 7000/8000 Series High Availability, on page 449](#)
- [Editing Device High Availability, on page 450](#)
- [Configuring Individual Devices in a High-Availability Pair, on page 451](#)
- [Configuring Individual Device Stacks in a High-Availability Pair, on page 451](#)
- [Configuring Interfaces on a Device in a High-Availability Pair, on page 452](#)
- [Switching the Active Peer in a Device High-Availability Pair, on page 453](#)
- [Placing a High-Availability Peer into Maintenance Mode, on page 453](#)
- [Replacing a Device in a Stack in a High-Availability Pair, on page 454](#)
- [Device High Availability State Sharing, on page 454](#)
- [Device High Availability State Sharing Statistics for Troubleshooting, on page 457](#)
- [Separating Device High-Availability Pairs, on page 460](#)

About 7000 and 8000 Series Device High Availability

With 7000 and 8000 Series device high availability, you can establish redundancy of networking functionality and configuration data between two peer devices or two peer device stacks.

You achieve configuration redundancy by configuring two peer devices or two peer device stacks into a high-availability pair to act as a single logical system for policy deploys, system updates, and registration. The system automatically synchronizes other configuration data.

Note Static routes, non-SFRP IP addresses, and routing priorities are not synchronized between the peer devices or peer device stacks. Each peer device or peer device stack maintains its own routing intelligence.

Related Topics

[SFRP](#)

[Advanced Virtual Switch Settings, on page 891](#)

Device High Availability Requirements

Before you can configure a 7000 and 8000 Series device high-availability pair, the following must be true:

- You can only pair single devices with single devices or device stacks with device stacks.
- Both devices or device stacks must have normal health status, be running the same software, and have the same licenses. See [Using the Health Monitor, on page 268](#) for more information. In particular, the devices cannot have hardware failures that would cause them to enter maintenance mode and trigger a failover.

Note After you pair the devices, you cannot change the license options for individual paired devices, but you can change the license for the entire high-availability pair.

- Interfaces must be configured on each device or each primary device in a stack.
- Both devices or the primary members of the device stacks must be the same model and have identical copper or fiber interfaces.
- Device stacks must have identical hardware configurations, except for an installed malware storage pack. For example, you can pair a Firepower 8290 with another 8290. None, one, or all devices in either stack might have a malware storage pack.

Caution Do not attempt to install a hard drive that was not supplied by Cisco in your device. Installing an unsupported hard drive may damage the device. Malware storage pack kits are available for purchase **only** from Cisco, and are for use **only** with 8000 Series devices. Contact Support if you require assistance with the malware storage pack. See the *Firepower System Malware Storage Pack Guide* for more information.

- If the devices are targeted by NAT policies, both peers must have the same NAT policy.
- In a multidomain deployment, you can only establish 7000 or 8000 Series device high-availability or device stacks within a leaf domain.

Note After failover and recovery, SFRP preempts to the primary node.

Device High Availability Failover and Maintenance Mode

With a 7000 and 8000 Series device high availability, the system fails over either manually or automatically. You manually trigger failover by placing one of the paired devices or stacks in maintenance mode.

Automatic failover occurs after the health of the active device or stack becomes compromised, during a system update, or after a user with Administrator privileges shuts down the device. Automatic failover also occurs after an active device or device stack experiences NMSB failure, NFE failure, hardware failure, firmware

failure, critical process failure, a disk full condition, or link failure between two stacked devices. If the health of the standby device or stack becomes similarly compromised, the system does not fail over and enters a degraded state. The system also does not fail over when one of the devices or device stacks is in maintenance mode. Note that disconnecting the stacking cable from an active stack sends that stack into maintenance mode. Shutting down the secondary device in an active stack also sends that stack into maintenance mode.

Note If the active member of the high-availability pair goes into maintenance mode and the active role fails over to the other pair member, when the original active pair member is restored to normal operation it does not automatically reclaim the active role.

Configuration Deployment and Upgrade Behavior for High-Availability Pairs

This topic describes upgrade and deployment behavior for 7000 and 8000 Series devices (and stacks) in high availability pairs.

Behavior During Deploy

You deploy configuration changes to the members of a high availability pair at the same time. Deploy either succeeds or fails for both peers. The Firepower Management Center deploys to the active device; if that succeeds then changes are deployed to the standby.

Caution When you deploy, resource demands may result in a small number of packets dropping without inspection. Additionally, deploying some configurations restarts the Snort process, which interrupts traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See [Snort® Restart Traffic Behavior, on page 310](#) and [Configurations that Restart the Snort Process When Deployed or Activated, on page 311](#).

Behavior During Upgrade

You should not experience interruptions in traffic flow or inspection while upgrading devices (or device stacks) in high availability pairs. To ensure continuity of operations, they upgrade one at a time. Devices operate in maintenance mode while they upgrade.

Which peer upgrades first depends on your deployment:

- Routed or switched—Standby upgrades first. The devices switch roles, then the new standby upgrades. When the upgrade completes, the devices' roles remain switched. If you want to preserve the active/standby roles, manually switch the roles before you upgrade. That way, the upgrade process switches them back.
- Access control only—Active upgrades first. When the upgrade completes, the active and standby maintain their old roles.

Deployment Types and Device High Availability

You determine how to configure 7000 or 8000 Series device high availability depending on your Firepower System deployment: passive, inline, routed, or switched. You can also deploy your system in multiple roles at once. Of the four deployment types, only passive deployments require that you configure devices or stacks

using high availability to provide redundancy. You can establish network redundancy for the other deployment types with or without device high availability. For a brief overview on high availability in each deployment type, see the sections below.

Note You can achieve Layer 3 redundancy without using device high availability by using the Cisco Redundancy Protocol (SFRP). SFRP allows devices to act as redundant gateways for specified IP addresses. With network redundancy, you configure two devices or stacks to provide identical network connections, ensuring connectivity for other hosts on the network.

Passive Deployment Redundancy

Passive interfaces are generally connected to tap ports on central switches, which allows them to analyze all of the traffic flowing across the switch. If multiple devices are connected to the same tap feed, the system generates events from each of the devices. When configured in a high-availability pair, devices act as either active or standby, which allows the system to analyze traffic even in the event of a system failure while also preventing duplicate events.

Inline Deployment Redundancy

Because an inline set has no control over the routing of the packets being passed through it, it must always be active in a deployment. Therefore, redundancy relies on external systems to route traffic correctly. You can configure redundant inline sets with or without 7000 or 8000 Series device high availability.

To deploy redundant inline sets, you configure the network topology so that it allows traffic to pass through only one of the inline sets while preventing circular routing. If one of the inline sets fails, the surrounding network infrastructure detects the loss of connectivity to the gateway address and adjusts the routes to send traffic through the redundant set.

Routed Deployment Redundancy

Hosts in an IP network must use a well-known gateway address to send traffic to different networks. Establishing redundancy in a routed deployment requires that routed interfaces share the gateway addresses so that only one interface handles traffic for that address at any given time. To accomplish this, you must maintain an equal number of IP addresses on a virtual router. One interface advertises the address. If that interface goes down, the standby interface begins advertising the address.

In devices that are not members of a high-availability pair, you use SFRP to establish redundancy by configuring gateway IP addresses shared between multiple routed interfaces. You can configure SFRP with or without 7000 or 8000 Series device high availability. You can also establish redundancy using dynamic routing such as OSPF or RIP.

Switched Deployment Redundancy

You establish redundancy in a switched deployment using the Spanning Tree Protocol (STP), one of the advanced virtual switch settings. STP is a protocol that manages the topology of bridged networks. It is specifically designed to allow redundant links to provide automatic standby for switched interfaces without configuring standby links. Devices in a switched deployment rely on STP to manage traffic between redundant interfaces. Two devices connected to the same broadcast network receive traffic based on the topology calculated by STP.

Note Cisco strongly recommends that you enable STP when configuring a virtual switch that you plan to deploy in a 7000 or 8000 Series device high-availability pair.

7000/8000 Series High Availability Configuration

When establishing 7000 or 8000 Series device high availability, you designate one of the devices or stacks as active and the other as standby. The system applies a merged configuration to the paired devices. If there is a conflict, the system applies the configuration from the device or stack you designated as active.

After you pair the devices, you cannot change the license options for individual paired devices, but you can change the license for the entire high availability pair. If there are interface attributes that need to be set on switched interfaces or routed interfaces, the system establishes the high availability pair, but sets it to a pending status. After you configure the necessary attributes, the system completes the high availability pair and sets it to a normal status.

After you establish a high availability pair, the system treats the peer devices or stacks as a single device on the Device Management page. Device high availability pairs display the High Availability icon () in the appliance list. Any configuration changes you make are synchronized between the paired devices. The Device Management page displays which device or stack in the high availability pair is active, which changes after manual or automatic failover.

Removing registration of a device high availability pair from a Firepower Management Center removes registration from both devices or stacks. You remove a device high availability pair from the FMC as you would an individual managed device.

You can then register the high availability pair on another FMC. To register single devices from a high availability pair, you add remote management to the active device in the pair and then add that device to the FMC, which adds the whole pair. To register stacked devices in a high availability pair, you add remote management to the primary device of the either stack and then add that device to the FMC, which adds the whole pair.

After you establish a device high availability pair, you should configure a high-availability link interface.

Note If you plan to set up dynamic NAT, HA state sharing, or VPN using the devices in the high availability pair, you must configure a high-availability link interface. For more information, see [Configuring HA Link Interfaces, on page 426](#).

Establishing Firepower 7000/8000 Series High Availability

Smart License	Classic License	Supported Devices	Supported Domains	Access
N/A	Control	7000 & 8000 Series	Any	Admin/Network Admin

Note This procedure describes establishing a 7000 & 8000 Series device high-availability pair. For information on establishing Firepower Threat Defense high availability, see [Add a Firepower Threat Defense High Availability Pair, on page 580](#).

When establishing a 7000 & 8000 Series device high-availability pair, you designate one of the devices or stacks as active and the other as standby. The system applies a merged configuration to the paired devices. If there is a conflict, the system applies the configuration from the device or stack you designated as active.

In a multidomain deployment, devices in a high-availability pair must belong to the same domain.

Before you begin

Confirm that all requirements are met; see [Device High Availability Requirements, on page 446](#).

Procedure

-
- Step 1** Choose **Devices > Device Management**.
 - Step 2** From the **Add** drop-down menu, choose **Add High Availability**.
 - Step 3** Enter a **Name**.
 - Step 4** Under **Device Type**, choose **Firepower**.
 - Step 5** Assign roles for the devices or stacks:
 - a) Choose the **Active Peer** device or stack for the high-availability pair.
 - b) Choose the **Standby Peer** device or stack for the high-availability pair.
 - Step 6** Click **Add**. The process takes a few minutes as the system synchronizes data.
-

What to do next

Create an HA Link interface on each of the devices in the high-availability pair if you plan to set up HA state sharing, dynamic NAT, or VPN with the devices. For more information on HA link interfaces, see [Configuring HA Link Interfaces, on page 426](#).

Editing Device High Availability

Smart License	Classic License	Supported Devices	Supported Domains	Access
N/A	Control	7000 & 8000 Series	Leaf only	Admin/Network Admin

After you establish a 7000 or 8000 Series device high-availability pair, most changes you make to the device configuration also change the configuration of the whole high-availability pair.

You can view the status of the high-availability pair by hovering your pointer over the status icon in the General section. You can also view which device or stack is the active peer and standby peer in the pair.

Procedure

-
- Step 1** Choose **Devices > Device Management**.
- Step 2** Next to the device high availability pair where you want to edit the configuration, click the edit icon (✎).
In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.
- Step 3** Use the sections on the High Availability page to make changes to the high-availability pair configuration as you would a single device configuration.
-

Configuring Individual Devices in a High-Availability Pair

Smart License	Classic License	Supported Devices	Supported Domains	Access
N/A	Control	7000 & 8000 Series	Leaf only	Admin/Network Admin

After you establish a 7000 or 8000 Series device high-availability pair, you can still configure some attributes for each device within the pair. You can make changes to a paired device just as you would to a single device.

Procedure

-
- Step 1** Choose **Devices > Device Management**.
- Step 2** Next to the device high-availability pair where you want to edit the configuration, click the edit icon (✎).
In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.
- Step 3** Click the **Devices** tab.
- Step 4** From the **Selected Device** drop-down list, choose the device you want to modify.
- Step 5** Use the sections on the Devices page to make changes to the individual paired device as you would a single device.
-

Configuring Individual Device Stacks in a High-Availability Pair

Smart License	Classic License	Supported Devices	Supported Domains	Access
N/A	Control	Firepower 8140, Firepower 8200 family, Firepower 8300 family	Leaf only	Admin/Network Admin

After you configure stacked 8000 Series devices into a high-availability pair, the system limits the stack attributes that you can edit. You can edit the name of a stack in a paired stack. In addition, you can edit the

network configuration of the stack, as described in [Configuring Interfaces on a Device in a High-Availability Pair, on page 452](#).

Procedure

-
- Step 1** Choose **Devices > Device Management**.
- Step 2** Next to the device high-availability pair where you want to edit the configuration, click the edit icon (✎).
In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.
- Step 3** Click the **Stacks** tab.
- Step 4** From the **Selected Device** drop-down list, choose the stack you want to modify.
- Step 5** Next to the **General** section, click the edit icon (✎).
- Step 6** Enter a **Name**.
- Step 7** Click **Save**.
-

What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

Configuring Interfaces on a Device in a High-Availability Pair

Smart License	Classic License	Supported Devices	Supported Domains	Access
N/A	Control	7000 & 8000 Series	Leaf only	Admin/Network Admin

You can configure interfaces on individual devices in a 7000 or 8000 Series device high-availability pair. However, you must also configure an equivalent interface on the peer device in the pair. For paired stacks, you configure identical interfaces on the primary devices of the stacks. When you configure virtual routers, you select the stack where you want to configure the routers.

Procedure

-
- Step 1** Choose **Devices > Device Management**.
- Step 2** Next to the device high-availability pair where you want to configure interfaces, click the edit icon (✎).
In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.
- Step 3** Click the **Interfaces** tab.
- Step 4** From the **Selected Device** drop-down list, choose the device you want to modify.
- Step 5** Configure interfaces as you would on an individual device.
-

[Virtual Router Configuration](#), on page 903

Switching the Active Peer in a Device High-Availability Pair

Smart License	Classic License	Supported Devices	Supported Domains	Access
N/A	Control	7000 & 8000 Series	Any	Admin/Network Admin

After you establish a 7000 or 8000 Series device high-availability pair, you can manually switch the active and standby peer devices or stacks.

Procedure

-
- Step 1** Choose **Devices > Device Management**.
- Step 2** Next to the device high-availability pair where you want to change the active peer, click the Switch Active Peer icon (.
- Step 3** You can:
- Click **Yes** to immediately make the standby peer the active peer in the high-availability pair.
 - Click **No** to cancel and return to the Device Management page.
-

Placing a High-Availability Peer into Maintenance Mode

Smart License	Classic License	Supported Devices	Supported Domains	Access
N/A	Control	7000 & 8000 Series	Any	Admin/Network Admin

After you establish a 7000 or 8000 Series device high-availability pair, you can manually trigger failover by placing one of the peers into maintenance mode to perform maintenance on the devices. In maintenance mode, the system administratively takes down all interfaces except for the management interface. After maintenance is completed, you can re-enable the peer to resume normal operation.

Note You should not place both peers in a high-availability pair into maintenance mode at the same time. Doing so will prevent that pair from inspecting traffic.

Procedure

-
- Step 1** Choose **Devices > Device Management**.

- Step 2** Next to the peer you want to place in maintenance mode, click the toggle maintenance mode icon (.
- Step 3** Click **Yes** to confirm maintenance mode.

What to do next

- When maintenance is complete, click the toggle maintenance mode icon () again to bring the peer out of maintenance mode.

Replacing a Device in a Stack in a High-Availability Pair

Smart License	Classic License	Supported Devices	Supported Domains	Access
N/A	Control	Firepower 8140, 8200 family, 8300 family	Any	Admin/Network Admin

After you place a stack that is a member of a high-availability pair into maintenance mode, you can replace a secondary device in the stack for another device. You can only select devices that are not currently stacked or paired. The new device must follow the same guidelines for establishing a device stack.

Procedure

- Step 1** Choose **Devices > Device Management**.
- Step 2** Next to the stack member you want to place into maintenance mode, click the toggle maintenance mode icon (.
- Step 3** Click **Yes** to confirm maintenance mode.
- Step 4** Click the replace device icon (.
- Step 5** Choose the **Replacement Device** from the drop-down list.
- Step 6** Click **Replace** to replace the device.
- Step 7** Click the toggle maintenance mode icon () again to bring the stack immediately out of maintenance mode.

Note You do not need to re-deploy the device configuration.

Device High Availability State Sharing

Device high availability state sharing allows devices or stacks in high-availability pairs to synchronize as much state as necessary, so that if either device or stack fails, the other peer can take over with no interruption to traffic flow. Without state sharing, the following features may not fail over properly:

- Strict TCP enforcement

- Unidirectional access control rules
- Blocking persistence

Note, however, that enabling state sharing slows system performance.

You must configure and enable HA link interfaces on both devices or the primary stacked devices in the high-availability pair before you can configure high availability state sharing. Firepower 82xx Family and 83xx Family devices require a 10G HA link, while other model devices require a 1G HA link.

You must disable state sharing before you can modify the HA link interfaces.

Note If paired devices fail over, the system terminates all existing SSL-encrypted sessions on the active device. Even if you establish high availability state sharing, these sessions must be renegotiated on the standby device. If the server establishing the SSL session supports session reuse and the standby device does not have the SSL session ID, it cannot renegotiate the session.

Strict TCP Enforcement

When you enable strict TCP enforcement for a domain, the system drops any packets that are out of order on TCP sessions. For example, the system drops non-SYN packets received on an unestablished connection. With state sharing, devices in the high-availability pair allow TCP sessions to continue after failover without having to reestablish the connection, even if strict TCP enforcement is enabled. You can enable strict TCP enforcement on inline sets, virtual routers, and virtual switches.

Unidirectional Access Control Rules

If you have configured unidirectional access control rules, network traffic may match a different access control rule than intended when the system reevaluates a connection midstream after failover. For example, consider if you have a policy containing the following two access control rules:

```
Rule 1: Allow from 192.168.1.0/24 to 192.168.2.0/24
Rule 2: Block all
```

Without state sharing, if an allowed connection from 192.168.1.1 to 192.168.2.1 is still active following a failover and the next packet is seen as a response packet, the system denies the connection. With state sharing, a midstream pickup would match the existing connection and continue to be allowed.

Blocking Persistence

While many connections are blocked on the first packet based on access control rules or other factors, there are cases where the system allows some number of packets through before determining that the connection should be blocked. With state sharing, the system immediately blocks the connection on the peer device or stack as well.

When establishing state sharing for a high-availability pair, you can configure the following options:

Enabled

Click the check box to enable state sharing. Clear the check box to disable state sharing.

Minimum Flow Lifetime

Specify the minimum time (in milliseconds) for a session before the system sends any synchronization messages for it. You can use any integer from 0 to 65535. The system does not synchronize any sessions that have not met the minimum flow lifetime, and the system synchronizes only when a packet is received for the connection.

Minimum Sync. Interval

Specify the minimum time (in milliseconds) between update messages for a session. You can use any integer from 0 to 65535. The minimum synchronization interval prevents synchronization messages for a given connection from being sent more frequently than the configured value after the connection reaches the minimum lifetime.

Maximum HTTP URL Length

Specify the maximum characters for the URL the system synchronizes between the paired devices. You may use any integer from 0 to 225.

Establishing Device High-Availability State Sharing

Smart License	Classic License	Supported Devices	Supported Domains	Access
N/A	Control	7000 & 8000 Series	Leaf only	Admin/Network Admin

Device high-availability state sharing allows 7000 or 8000 Series devices or stacks in high-availability pairs to synchronize as much state as necessary, so that if either device or stack fails, the other peer can take over with no interruption to traffic flow.

Caution Modifying a high-availability state sharing option on a 7000 or 8000 Series device restarts the Snort process on the primary and secondary devices, temporarily interrupting traffic inspection on both devices. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See [Snort® Restart Traffic Behavior, on page 310](#) for more information.

Procedure

- Step 1** Configure HA link interfaces for each device in the device high-availability pair; see [Configuring HA Link Interfaces, on page 426](#).
- Step 2** Choose **Devices > Device Management**.
- Step 3** Next to the device high-availability pair you want to edit, click the edit icon (✎).
In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.
- Step 4** In the **State Sharing** section, click the edit icon (✎).

- Step 5** Decrease the state sharing values to improve paired peer readiness, or increase the values to allow better performance.
We recommend you use the default values, unless your deployment presents a good reason to change them.
- Step 6** Click **OK**.
-

What to do next

Deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

Device High Availability State Sharing Statistics for Troubleshooting

The sections below describe the statistics you can view for each device and how you can use them to troubleshoot your state sharing configuration for 7000 and 8000 Series device high-availability pairs.

Messages Received (Unicast)

Messages received are the number of high availability synchronization messages received from the paired peer.

The value should be close to the number of messages sent by the peer. During active use, the values may not match, but should be close. If traffic stops, the values should become stable and the messages received will match the messages sent.

For troubleshooting, you should view both the messages received and the messages sent, compare the rate of increase, and make sure the values are close. The sent value on each peer should be incrementing at approximately the same rate as the received value on the opposite peer.

Contact Support if the received messages stop incrementing or increment slower than the messages sent by the peer.

Packets Received

The system batches multiple messages into single packets in order to decrease overhead. The Packets Received counter displays the total number of these data packets, as well as other control packets that have been received by a device.

The value should be close to the number of packets sent by the peer device. During active use, the values may not match, but should be close. Because the number of messages received should be close and incrementing at the same rate as the number of messages sent by the peer, the number of packets received should have the same behavior.

For troubleshooting, you should view both the packets received and the messages sent, compare the rate of increase, and make sure the values are increasing at the same rate. If the sent value on the paired peer is incrementing, the received value on the device should also increase at the same rate.

Contact Support if the received packets stop incrementing or increment slower than the messages sent by the peer.

Total Bytes Received

Total bytes received are the number of bytes that make up the packets received by the peer.

The value should be close to the number of bytes sent by the other peer. During active use, the values may not match, but should be close.

For troubleshooting, you should view both the total bytes received and the messages sent, compare the rate of increase, and make sure the values are increasing at the same rate. If the sent value on the paired peer is incrementing, the received value on the device should also increase at the same rate.

Contact Support if the received bytes stop incrementing or increment slower than the messages sent by the peer.

Protocol Bytes Received

Protocol bytes received are the number of bytes of protocol overhead received, which includes everything but the payload of session state synchronization messages.

The value should be close to the number of bytes sent by the peer. During active use, the values may not match, but should be close.

For troubleshooting, you should view the total bytes received to discover how much actual state data is being shared in comparison to protocol data. If the protocol data is a large percentage of the data being sent, you can adjust the minimum sync interval.

Contact Support if the protocol bytes received increment at a similar rate to the total bytes received. Protocol bytes received should be minimal in relation to the total bytes received.

Messages Sent

Messages sent are the number of high availability synchronization messages sent to the paired peer.

This data is useful in comparison to the number of messages received. During active use, the values may not match, but should be close.

For troubleshooting, you should view both the messages received and the messages sent, compare the rate of increase, and make sure the values are close.

Contact Support if the messages sent increment at a similar rate to the total bytes received.

Bytes Sent

Bytes sent are the total number of bytes sent that make up the high availability synchronization messages sent to the peer.

This data are useful in comparison to the number of messages received. During active use, the values may not match, but should be close. The number of bytes received on the peer should be close to, but not more than this value.

Contact Support if the total bytes received is not incrementing at about the same rate as the bytes sent.

Tx Errors

Tx errors are the number of memory allocation failures the system encounters when trying to allocate space for messages to be sent to the paired peer.

This value should be zero at all times on both peers. Contact Support if this number is not zero or if the number steadily increases, which indicates the system has encountered an error where it cannot allocate memory.

Tx Overruns

Tx overruns are the number of times the system attempts and fails to place a message into the transit queue.

This value should be zero at all times on both peers. When the value is not zero or is steadily increasing, it indicates that the system is sharing too much data across the HA link that cannot be sent quickly enough.

You should increase the HA link MTU if it was previously set below the default value (9918 or 9922). You can change the minimum flow lifetime and minimum synchronization interval settings to reduce the amount of data shared across the HA link to prevent the number from incrementing.

Contact Support if this value persists or continues to increase.

Recent Logs

The system log displays the most recent high availability synchronization messages. The log should not display any ERROR or WARN messages. It should remain comparable between the peers, such as the same number of sockets being connected.

However, the data displayed may be opposite in some instances, for example, one peer reports that it received a connection from the other peer and references different IP addresses. The log provides a comprehensive view of the high availability state sharing connection, and any errors within the connection.

Contact Support if the log displays an ERROR or WARN message, or any message that does not appear to be purely informational.

Viewing Device High Availability State Sharing Statistics

Smart License	Classic License	Supported Devices	Supported Domains	Access
N/A	Control	7000 & 8000 Series	Leaf only	Admin/Network Admin

After you establish state sharing, you can view the following information about the configuration in the **State Sharing** section of the High Availability page:

- The HA link interface that is being used and its current link state
- Detailed synchronization statistics for troubleshooting issues

The state sharing statistics are primarily counters for different aspects of the high availability synchronization traffic sent and received, along with some other error counters. In addition, you can view the latest system logs for each device in the high-availability pair.

Procedure

- Step 1** Choose **Devices > Device Management**.
- Step 2** Next to the device high-availability pair you want to edit, click the edit icon (✎).
In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.
- Step 3** In the **State Sharing** section, click the view statistics icon (📊).
- Step 4** Choose a **Device** to view if your high-availability pair is composed of device stacks.
- Step 5** You can:
- Click **Refresh** to update the statistics.
 - Click **View** to view the latest data log for each device in the high-availability pair.
-

Separating Device High-Availability Pairs

Smart License	Classic License	Supported Devices	Supported Domains	Access
N/A	Control	7000 & 8000 Series	Any	Admin/Network Admin

When you separate, or "break," a 7000 or 8000 Series device high-availability pair:

- The active peer (device or stack) retains full deployment functionality
- The standby peer (device or stack) loses its interface configurations and fails over to the active peer, unless you choose to leave the interface configurations active, in which case the standby peer resumes normal operation.
- The standby peer always loses the configuration of passive interfaces.
- Any peer in maintenance mode resumes normal operation.

Procedure

- Step 1** Choose **Devices > Device Management**.
- Step 2** Next to the high-availability pair you want to break, click the Break HA icon (🔪).
- Step 3** Optionally, check the check box to remove the interface configurations on the standby peer.
This step administratively takes down all interfaces except for the management interface.
- Step 4** Click **Yes**.
-

CHAPTER 22

8000 Series Device Stacking

The following topics describe how to work with Firepower 8000 Series device stacks in the Firepower System:

- [About Device Stacks, on page 461](#)
- [Device Stack Configuration, on page 463](#)
- [Establishing Device Stacks, on page 464](#)
- [Editing Device Stacks, on page 465](#)
- [Replacing a Device in a Stack, on page 465](#)
- [Replacing a Device in a Stack in a High-Availability Pair, on page 466](#)
- [Configuring Individual Devices in a Stack, on page 467](#)
- [Configuring Interfaces on a Stacked Device, on page 467](#)
- [Separating Stacked Devices, on page 468](#)
- [Replacing a Device in a Stack, on page 469](#)

About Device Stacks

You can increase the amount of traffic inspected on a network segment by using devices in a stacked configuration. For each stacked configuration, all devices in the stack must have the same hardware. However, none, some, or all devices might have an installed malware storage pack. The devices must also be from the same device family based on the following stacked configurations:

The stacked configuration is supported for Firepower 8140, Firepower 8200 family, Firepower 8300 family devices.

For the 81xx Family:

- two Firepower 8140s

For the 82xx Family:

- up to four Firepower 8250s
- a Firepower 8260 (a primary device and a secondary device)
- a Firepower 8270 (a primary device with 40G capacity and two secondary devices)
- a Firepower 8290 (a primary device with 40G capacity and three secondary devices)

For the 83xx Family:

- up to four Firepower 8350s
- up to four AMP8350s
- a Firepower 8360 (a primary device with 40G capacity and a secondary device)
- an AMP8360 (a primary device with 40G capacity and a secondary device)
- a Firepower 8370 (a primary device with 40G capacity and two secondary devices)
- an AMP8370 (a primary device with 40G capacity and two secondary devices)
- a Firepower 8390 (a primary device with 40G capacity and three secondary devices)
- an AMP8390 (a primary device with 40G capacity and three secondary devices)

For more information about stacked configurations, see the [Cisco Firepower 8000 Series Getting Started Guide](#). For more information about the malware storage pack, see the *Firepower System Malware Storage Pack Guide*.

Caution Do not attempt to install a hard drive that was not supplied by Cisco in your device. Installing an unsupported hard drive may damage the device. Malware storage pack kits are available for purchase **only** from Cisco, and are for use **only** with 8000 Series devices. Contact Support if you require assistance with the malware storage pack. See the *Firepower System Malware Storage Pack Guide* for more information.

When you establish a stacked configuration, you combine the resources of each stacked device into a single, shared configuration.

You designate one device as the *primary* device, where you configure the interfaces for the entire stack. You designate the other devices as *secondary*. Secondary devices must not be currently sensing any traffic and must not have link on any interface.

Connect the primary device to the network segment you want to analyze in the same way you would configure a single device. Connect the secondary devices to the primary device using the stacked device cabling instructions found in the [Cisco Firepower 8000 Series Getting Started Guide](#).

All devices in the stacked configuration must have the same hardware, run the same software version, and have the same licenses. If the devices are targeted by NAT policies, both the primary and secondary device must have the same NAT policy. You must deploy updates to the entire stack from the Firepower Management Center. If an update fails on one or more devices in the stack, the stack enters a mixed-version state. You cannot deploy policies to or update a stack in a mixed-version state. To correct this state, you can break the stack or remove individual devices with different versions, update the individual devices, then reestablish the stacked configuration. After you stack the devices, you can change the licenses only for the entire stack at once.

After you establish the stacked configuration, the devices act like a single, shared configuration. If the primary device fails, no traffic is passed to the secondary devices. Health alerts are generated indicating that the stacking heartbeat has failed on the secondary devices.

If the secondary device in a stack fails, inline sets with configurable bypass enabled go into bypass mode on the primary device. For all other configurations, the system continues to load balance traffic to the failed secondary device. In either case, a health alert is generated to indicate loss of link.

You can use a device stack as you would a single device in your deployment, with a few exceptions. If you have 7000 or 8000 Series devices in a high-availability pair, you cannot stack a device high-availability pair or a device in a high-availability pair. You also cannot configure NAT on a device stack.

Note If you use eStreamer to stream event data from stacked devices to an external client application, collect the data from each device and ensure that you configure each device identically. The eStreamer settings are not automatically synchronized between stacked devices.

In a multidomain deployment, you can only stack devices that belong to the same domain.

[About Health Monitoring](#), on page 253

Device Stack Configuration

You can increase the amount of traffic inspected on a network segment by stacking two Firepower 8140 devices, up to four Firepower 8250s, a Firepower 8260, a Firepower 8270, a Firepower 8290, up to four Firepower 8350s, a Firepower 8360, a Firepower 8370, or a Firepower 8390 and using their combined resources in a single, shared, configuration. If you have 7000 or 8000 Series devices in a high-availability pair, you cannot stack a device high-availability pair or a device in a high-availability pair. However, you can configure two device stacks into a high-availability pair.

After you establish a device stack, the system treats the devices as a single device on the Device Management page. Device stacks display the stack icon () in the appliance list.

Removing registration of a device stack from a Firepower Management Center also removes registration from both devices. You delete stacked devices from the Firepower Management Center as you would a single managed device; you can then register the stack on another Firepower Management Center. You only need to register one of the stacked devices on the new Firepower Management Center for the entire stack to appear.

After you establish the device stack, you cannot change which devices are primary or secondary unless you break and reestablish the stack. However, you can:

- add secondary devices to an existing stack of two or three Firepower 8250s, a Firepower 8260, or a Firepower 8270 up to the limit of four Firepower 8250s in a stack
- add secondary devices to an existing stack of two or three Firepower 8350s, a Firepower 8360, or a Firepower 8370 up to the limit of four Firepower 8350s in a stack

For additional devices, the primary device in the stack must have the necessary stacking NetMods for additional cabled devices. For example, if you have a Firepower 8260 where the primary only has a single stacking NetMod, you cannot add another secondary device to this stack. You add secondary devices to an existing stack in the same manner that you initially establish a stacked device configuration.

Establishing Device Stacks

Smart License	Classic License	Supported Devices	Supported Domains	Access
N/A	Any	Firepower 8140, 8200 family, 8300 family	Any	Admin/Network Admin

All devices in a stack must be of the same hardware model (for example, a Firepower 8140 with another 8140). You can stack a total of four devices (one primary device and up to three secondary devices) in the 8200 family and in the 8300 family.

In a multidomain deployment, all devices in the stack must belong to the same domain.

Before you begin

- Decide which unit will be the primary device.
- Confirm that the units are cabled properly before designating the primary/secondary relationship. For information about cabling, see the [Cisco Firepower 8000 Series Getting Started Guide](#).

Procedure

-
- Step 1** Choose **Devices > Device Management**.
- Step 2** From the **Add** drop-down menu, choose **Add Stack**.
- Step 3** From the **Primary** drop-down list, choose the device that you cabled for primary operation.
- Note** If you choose a device that is not cabled as the primary device, you cannot perform the next series of steps.
- Step 4** Enter a **Name**.
- Step 5** Click **Add** to choose the devices you want to include in the stack.
- Step 6** From the **Slot on Primary Device** drop-down list, choose the stacking network module that connects the primary device to the secondary device.
- Step 7** From the **Secondary Device** drop-down list, choose the device you cabled for secondary operation.
- Step 8** From the **Slot on Secondary Device** drop-down list, choose the stacking network module that connects the secondary device to the primary device.
- Step 9** Click **Add**.
- Step 10** Repeat steps 5 through 9 if you are adding secondary devices to an existing stack of Firepower 8250s, a Firepower 8260, a Firepower 8270, an existing stack of Firepower 8350s, a Firepower 8360, or a Firepower 8370.
- Step 11** Click **Stack** to establish the device stack or to add secondary devices. Note that this process takes a few minutes as the process synchronizes system data.

Editing Device Stacks

Smart License	Classic License	Supported Devices	Supported Domains	Access
N/A	Any	Firepower 8140, Firepower 8200 family, Firepower 8300 family	Leaf only	Admin/Network Admin

After you establish a device stack, most changes you make to the device configuration also change the configuration of the entire stack. On the Stack page of the appliance editor, you can make changes to the stack configuration as on the Device page of a single device.

You can change the display name of the stack, enable and disable licenses, view system and health policies, and configure advanced settings.

Procedure

-
- Step 1** Choose **Devices > Device Management**.
- Step 2** Next to the stacked device where you want to edit the configuration, click the edit icon (🔧).
In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.
- Step 3** Use the sections on the Stack page to make changes to the stacked configuration as you would a single device configuration.
-

Replacing a Device in a Stack

Smart License	Classic License	Supported Devices	Supported Domains	Access
N/A	Any	FirePOWER 8140, 8200 family, 8300 family	Any	Admin/Network Admin

If the Firepower Management Center cannot communicate with the device, you must connect to the device and use CLI commands to separate the stack and unregister the device. For more information, see **stacking disable** and **delete** CLI commands in the relevant chapter: [Classic Device CLI Configuration Commands](#), on page 2191.

To replace a device within a stack:

Procedure

-
- Step 1** Select the stack with the device to replace and break that stack. For more information, see [Separating Stacked Devices, on page 468](#).
 - Step 2** Unregister the device from the Firepower Management Center. For more information, see [Delete a Device from the FMC, on page 209](#).
 - Step 3** Register the replacement device to the Firepower Management Center. For more information, see [Add a Device to the FMC, on page 207](#).
 - Step 4** Create a device stack that includes the replacement device. For more information, see [Establishing Device Stacks, on page 464](#).
-

Replacing a Device in a Stack in a High-Availability Pair

Smart License	Classic License	Supported Devices	Supported Domains	Access
N/A	Control	Firepower 8140, 8200 family, 8300 family	Any	Admin/Network Admin

After you place a stack that is a member of a high-availability pair into maintenance mode, you can replace a secondary device in the stack for another device. You can only select devices that are not currently stacked or paired. The new device must follow the same guidelines for establishing a device stack.

Procedure

-
- Step 1** Choose **Devices > Device Management**.
 - Step 2** Next to the stack member you want to place into maintenance mode, click the toggle maintenance mode icon ()
 - Step 3** Click **Yes** to confirm maintenance mode.
 - Step 4** Click the replace device icon ()
 - Step 5** Choose the **Replacement Device** from the drop-down list.
 - Step 6** Click **Replace** to replace the device.
 - Step 7** Click the toggle maintenance mode icon () again to bring the stack immediately out of maintenance mode.

Note You do not need to re-deploy the device configuration.

Configuring Individual Devices in a Stack

Smart License	Classic License	Supported Devices	Supported Domains	Access
N/A	Any	Firepower 8140, Firepower 8200 family, Firepower 8300 family	Leaf only	Admin/Network Admin

After you establish a device stack, you can still configure some attributes for an individual device within the stack. You can make changes to a device configured in a stack as you would for a single device. You can change the display name of a device, view system settings, shut down or restart a device, view health information, and edit device management settings.

Procedure

-
- Step 1** Choose **Devices > Device Management**.
 - Step 2** Next to the stacked device where you want to edit the configuration, click the edit icon (🔧).
In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.
 - Step 3** Click the **Device** tab.
 - Step 4** From the **Selected Device** drop-down list, choose the device you want to modify.
 - Step 5** Use the sections on the Devices page to make changes to the individual stacked device as you would a single device.
-

Configuring Interfaces on a Stacked Device

Smart License	Classic License	Supported Devices	Supported Domains	Access
N/A	Any	Firepower 8140, Firepower 8200 family, Firepower 8300 family	Leaf only	Admin/Network Admin

With the exception of the management interface, you configure stacked device interfaces on the Interfaces page of the primary device in the stack. You can choose any device in the stack to configure the management interface.

The Interfaces page of a Firepower stacked device includes the hardware and interfaces views that you find on an individual device.

Procedure

-
- Step 1** Choose **Devices > Device Management**.
- Step 2** Next to the primary stacked device, click the edit icon ().
In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.
- Step 3** Click the **Interfaces** tab.
- Step 4** From the **Selected Device** drop-down list, choose the device you want to modify.
- Step 5** Configure interfaces as you would on an individual device; see [Configuring Sensing Interfaces, on page 425](#).
-

Separating Stacked Devices

Smart License	Classic License	Supported Devices	Supported Domains	Access
N/A	Any	FirePOWER 8140, 8200 family, 8300 family	Any	Admin/Network Admin

If you no longer need to use a stacked configuration for your devices, you can break the stack and separate the devices.

-
- Note** If a stacked device fails, or if communication fails between member devices of a stack, you cannot separate the stacked devices using the Firepower Management Center web interface. In this case, use the auxiliary CLI command `configure stacking disable` to remove the stack configuration from each device individually.
-

Procedure

-
- Step 1** Choose **Devices > Device Management**.
- Step 2** Next to the device stack you want to break, click the break stack icon ().
- Tip** To remove a secondary device from a stack of three or more Firepower 8250 devices without breaking the stack, click the remove from stack icon (). Removing the secondary device causes a brief disruption of traffic inspection, traffic flow, or link state as the system reconfigures the stack for operation without the extra device.
- Step 3** Click **Yes** to separate the device stack.
-

Replacing a Device in a Stack

Smart License	Classic License	Supported Devices	Supported Domains	Access
N/A	Any	FirePOWER 8140, 8200 family, 8300 family	Any	Admin/Network Admin

If the Firepower Management Center cannot communicate with the device, you must connect to the device and use CLI commands to separate the stack and unregister the device. For more information, see **stacking disable** and **delete** CLI commands in the relevant chapter: [Classic Device CLI Configuration Commands, on page 2191](#).

Firepower Threat Defense Getting Started

- [Transparent or Routed Firewall Mode for Firepower Threat Defense, on page 473](#)
- [Logical Devices for the Firepower Threat Defense on the Firepower 4100/9300, on page 485](#)

CHAPTER 23

Transparent or Routed Firewall Mode for Firepower Threat Defense

This chapter describes how to set the firewall mode to routed or transparent, as well as how the firewall works in each firewall mode.

Note The firewall mode only affects regular firewall interfaces, and not IPS-only interfaces such as inline sets or passive interfaces. IPS-only interfaces can be used in both firewall modes. See [Inline Sets and Passive Interfaces for Firepower Threat Defense, on page 545](#) for more information about IPS-only interfaces. Inline sets might be familiar to you as "transparent inline sets," but the inline interface type is unrelated to the transparent firewall mode described in this chapter or the firewall-type interfaces.

- [About the Firewall Mode, on page 473](#)
- [Default Settings, on page 480](#)
- [Guidelines for Firewall Mode, on page 481](#)
- [Set the Firewall Mode, on page 482](#)

About the Firewall Mode

The FTD supports two firewall modes for regular firewall interfaces: Routed Firewall mode and Transparent Firewall mode.

About Routed Firewall Mode

In routed mode, the FTD device is considered to be a router hop in the network. Each interface that you want to route between is on a different subnet.

About Transparent Firewall Mode

Traditionally, a firewall is a routed hop and acts as a default gateway for hosts that connect to one of its screened subnets. A transparent firewall, on the other hand, is a Layer 2 firewall that acts like a “bump in the wire,” or a “stealth firewall,” and is not seen as a router hop to connected devices. However, like any other firewall, access control between interfaces is controlled, and all of the usual firewall checks are in place.

Layer 2 connectivity is achieved by using a "bridge group" where you group together the inside and outside interfaces for a network, and the FTD device uses bridging techniques to pass traffic between the interfaces. Each bridge group includes a Bridge Virtual Interface (BVI) to which you assign an IP address on the network. You can have multiple bridge groups for multiple networks. In transparent mode, these bridge groups cannot communicate with each other.

Using the Transparent Firewall in Your Network

The FTD device connects the same network between its interfaces. Because the firewall is not a routed hop, you can easily introduce a transparent firewall into an existing network.

The following figure shows a typical transparent firewall network where the outside devices are on the same subnet as the inside devices. The inside router and hosts appear to be directly connected to the outside router.

Figure 7: Transparent Firewall Network

Interface

In addition to each Bridge Virtual Interface (BVI) IP address, you can add a separate *slot/port* interface that is not part of any bridge group, and that allows only management traffic to the FTD device.

Passing Traffic For Routed-Mode Features

For features that are not directly supported on the transparent firewall, you can allow traffic to pass through so that upstream and downstream routers can support the functionality. For example, by using an access rule, you can allow DHCP traffic (instead of the unsupported DHCP relay feature) or multicast traffic such as that created by IP/TV. You can also establish routing protocol adjacencies through a transparent firewall; you can allow OSPF, RIP, EIGRP, or BGP traffic through based on an access rule. Likewise, protocols like HSRP or VRRP can pass through the FTD device.

About Bridge Groups

A bridge group is a group of interfaces that the FTD device bridges instead of routes. Bridge groups are only supported in Transparent Firewall Mode. Like any other firewall interfaces, access control between interfaces is controlled, and all of the usual firewall checks are in place.

Bridge Virtual Interface (BVI)

Each bridge group includes a Bridge Virtual Interface (BVI). The FTD device uses the BVI IP address as the source address for packets originating from the bridge group. The BVI IP address must be on the same subnet as the bridge group member interfaces. The BVI does not support traffic on secondary networks; only traffic on the same network as the BVI IP address is supported.

Only bridge group member interfaces are named and can be used with interface-based features.

Bridge Groups in Transparent Firewall Mode

Bridge group traffic is isolated from other bridge groups; traffic is not routed to another bridge group within the FTD device, and traffic must exit the FTD device before it is routed by an external router back to another bridge group in the FTD device. Although the bridging functions are separate for each bridge group, many other functions are shared between all bridge groups. For example, all bridge groups share a syslog server or AAA server configuration.

You can include multiple interfaces per bridge group. See [Guidelines for Firewall Mode, on page 481](#) for the exact number of bridge groups and interfaces supported. If you use more than 2 interfaces per bridge group, you can control communication between multiple segments on the same network, and not just between inside and outside. For example, if you have three inside segments that you do not want to communicate with each other, you can put each segment on a separate interface, and only allow them to communicate with the outside interface. Or you can customize the access rules between interfaces to allow only as much access as desired.

The following figure shows two networks connected to the FTD device, which has two bridge groups.

Figure 8: Transparent Firewall Network with Two Bridge Groups

Bridge Groups in Routed Firewall Mode

Bridge group traffic can be routed to other bridge groups or routed interfaces. You can choose to isolate bridge group traffic by not assigning a name to the BVI interface for the bridge group. If you name the BVI, then the BVI participates in routing like any other regular interface.

One use for a bridge group in routed mode is to use extra interfaces on the FTD instead of an external switch. For example, the default configuration for some devices include an outside interface as a regular interface, and then all other interfaces assigned to the inside bridge group. Because the purpose of this bridge group is to replace an external switch, you need to configure an access policy so all bridge group interfaces can freely communicate.

Figure 9: Routed Firewall Network with an Inside Bridge Group and an Outside Routed Interface

Allowing Layer 3 Traffic

- Unicast IPv4 and IPv6 traffic requires an access rule to be allowed through the bridge group.
- ARPs are allowed through the bridge group in both directions without an access rule. ARP traffic can be controlled by ARP inspection.
- IPv6 neighbor discovery and router solicitation packets can be passed using access rules.
- Broadcast and multicast traffic can be passed using access rules.

Allowed MAC Addresses

The following destination MAC addresses are allowed through the bridge group if allowed by your access policy (see [Allowing Layer 3 Traffic, on page 477](#)). Any MAC address not on this list is dropped.

- TRUE broadcast destination MAC address equal to FFFF.FFFF.FFFF
- IPv4 multicast MAC addresses from 0100.5E00.0000 to 0100.5EFE.FFFF
- IPv6 multicast MAC addresses from 3333.0000.0000 to 3333.FFFF.FFFF
- BPDU multicast address equal to 0100.0CCC.CCCD

BPDU Handling

To prevent loops using the Spanning Tree Protocol, BPDUs are passed by default.

MAC Address vs. Route Lookups

For traffic within a bridge group, the outgoing interface of a packet is determined by performing a destination MAC address lookup instead of a route lookup.

Route lookups, however, are necessary for the following situations:

- Traffic originating on the FTD device—Add a default/static route on the FTD device for traffic destined for a remote network where a syslog server, for example, is located.
- Voice over IP (VoIP) and TFTP traffic, and the endpoint is at least one hop away—Add a static route on the FTD device for traffic destined for the remote endpoint so that secondary connections are successful. The FTD device creates a temporary "pinhole" in the access control policy to allow the secondary connection; and because the connection might use a different set of IP addresses than the primary connection, the FTD device needs to perform a route lookup to install the pinhole on the correct interface.

Affected applications include:

- H.323
 - RTSP
 - SIP
 - Skinny (SCCP)
 - SQL*Net
 - SunRPC
 - TFTP
- Traffic at least one hop away for which the FTD device performs NAT—Configure a static route on the FTD device for traffic destined for the remote network. You also need a static route on the upstream router for traffic destined for the mapped addresses to be sent to the FTD device.

This routing requirement is also true for embedded IP addresses for VoIP and DNS with NAT enabled, and the embedded IP addresses are at least one hop away. The FTD device needs to identify the correct egress interface so it can perform the translation.

Figure 10: NAT Example: NAT within a Bridge Group

Unsupported Features for Bridge Groups in Transparent Mode

The following table lists the features are not supported in bridge groups in transparent mode.

Table 56: Unsupported Features in Transparent Mode

Feature	Description
Dynamic DNS	—
DHCP relay	The transparent firewall can act as a DHCPv4 server, but it does not support DHCP relay. DHCP relay is not required because you can allow DHCP traffic to pass through using two access rules: one that allows DHCP requests from the inside interface to the outside, and one that allows the replies from the server in the other direction.
Dynamic routing protocols	You can, however, add static routes for traffic originating on the FTD device for bridge group member interfaces. You can also allow dynamic routing protocols through the FTD device using an access rule.

Feature	Description
Multicast IP routing	You can allow multicast traffic through the FTD device by allowing it in an access rule.
QoS	—

Unsupported Features for Bridge Groups in Routed Mode

The following table lists the features are not supported in bridge groups in routed mode.

Table 57: Unsupported Features in Routed Mode

Feature	Description
EtherChannel member interfaces	Only physical interfaces, redundant interfaces, and subinterfaces are supported as bridge group member interfaces. interfaces are also not supported.
Clustering	Bridge groups are not supported in clustering.
Dynamic DNS	—
DHCP relay	The routed firewall can act as a DHCPv4 server, but it does not support DHCP relay on BVIs or bridge group member interfaces.
Dynamic routing protocols	You can, however, add static routes for BVIs. You can also allow dynamic routing protocols through the FTD device using an access rule. Non-bridge group interfaces support dynamic routing.
Multicast IP routing	You can allow multicast traffic through the FTD device by allowing it in an access rule. Non-bridge group interfaces support multicast routing.
QoS	Non-bridge group interfaces support QoS.
VPN termination for through traffic	You cannot terminate a VPN connection on the BVI. Non-bridge group interfaces support VPN. Bridge group member interfaces support site-to-site VPN tunnels for management connections only. It does not terminate VPN connections for traffic through the FTD device. You can pass VPN traffic through the bridge group using an access rule, but it does not terminate non-management connections.

Default Settings

Bridge Group Defaults

By default, all ARP packets are passed within the bridge group.

Guidelines for Firewall Mode

Bridge Group Guidelines (Transparent Mode)

- You can create up to 250 bridge groups, with 4 interfaces per bridge group.
- Each directly-connected network must be on the same subnet.
- The FTD device does not support traffic on secondary networks; only traffic on the same network as the BVI IP address is supported.
- An IP address for the BVI is required for each bridge group for to-the-device and from-the-device management traffic, as well as for data traffic to pass through the FTD device. For IPv4 traffic, specify an IPv4 address. For IPv6 traffic, specify an IPv6 address.
- You can only configure IPv6 addresses manually.
- The BVI IP address must be on the same subnet as the connected network. You cannot set the subnet to a host subnet (255.255.255.255).
- Management interfaces are not supported as bridge group members.
- For the FTDv on VMware with bridged ixgbevf interfaces, transparent mode is not supported.
- In transparent mode, you must use at least 1 bridge group; data interfaces must belong to a bridge group.
- In transparent mode, do not specify the BVI IP address as the default gateway for connected devices; devices need to specify the router on the other side of the FTD as the default gateway.
- In transparent mode, the *default* route, which is required to provide a return path for management traffic, is only applied to management traffic from one bridge group network. This is because the default route specifies an interface in the bridge group as well as the router IP address on the bridge group network, and you can only define one default route. If you have management traffic from more than one bridge group network, you need to specify a regular static route that identifies the network from which you expect management traffic.
- In transparent mode, PPPoE is not supported for the interface.
- Transparent mode is not supported on threat defense virtual instances deployed on Amazon Web Services, Microsoft Azure, Google Cloud Platform, and Oracle Cloud Infrastructure.
- Bidirectional Forwarding Detection (BFD) echo packets are not allowed through the FTD when using bridge group members. If there are two neighbors on either side of the FTD running BFD, then the FTD will drop BFD echo packets because they have the same source and destination IP address and appear to be part of a LAND attack.

Set the Firewall Mode

Smart License	Classic License	Supported Devices	Supported Domains	Access
Any	N/A	Firepower Threat Defense	Any	Admin Access Admin Network Admin

You can set the firewall mode when you perform the initial system setup at the CLI. We recommend setting the firewall mode during setup because changing the firewall mode erases your configuration to ensure you do not have incompatible settings. If you need to change the firewall mode later, you must do so from the CLI.

Procedure

Step 1 Deregister the Firepower Threat Defense device from the FMC.

You cannot change the mode until you deregister the device.

- Choose **Devices > Device Management**.
- Select the device from the list of managed devices.
- Delete the device (click Trash can), confirm, and wait for system to remove the device.

Step 2 Access the Firepower Threat Defense device CLI, preferably from the console port.

If you use SSH to the diagnostic interface, then changing the mode erases your interface configuration and you will be disconnected. You should instead connect to the management interface.

Step 3 Change the firewall mode:

```
configure firewall [routed | transparent]
```

Example:

```
> configure firewall transparent
This will destroy the current interface configurations, are you sure that you want to
proceed? [y/N] y
The firewall mode was changed successfully.
```

Step 4 Re-register with the FMC:

```
configure manager add {hostname | ip_address | DONTRESOLVE} reg_key [nat_id]
```

where:

- `{hostname | ip_address | DONTRESOLVE}` specifies either the fully qualified host name or IP address of the FMC. If the FMC is not directly addressable, use **DONTRESOLVE**.
- `reg_key` is the unique alphanumeric registration key required to register a device to the FMC.

- *nat_id* is an optional alphanumeric string used during the registration process between the FMC and the device. It is required if the hostname is set to **DONTRESOLVE**.
-

CHAPTER 24

Logical Devices for the Firepower Threat Defense on the Firepower 4100/9300

The Firepower 4100/9300 is a flexible security platform on which you can install one or more *logical devices*. Before you can add the Firepower Threat Defense to the FMC, you must configure chassis interfaces, add a logical device, and assign interfaces to the device on the Firepower 4100/9300 chassis using the Firepower Chassis Manager or the FXOS CLI. This chapter describes basic interface configuration and how to add a standalone or High Availability logical device using the Firepower Chassis Manager. To add a clustered logical device, see [Clustering for the Firepower Threat Defense, on page 591](#). To use the FXOS CLI, see the FXOS CLI configuration guide. For more advanced FXOS procedures and troubleshooting, see the FXOS configuration guide.

- [About Interfaces, on page 485](#)
- [About Logical Devices, on page 487](#)
- [Requirements and Prerequisites for Logical Devices, on page 487](#)
- [Guidelines and Limitations for Logical Devices, on page 488](#)
- [Configure Interfaces, on page 489](#)
- [Configure Logical Devices, on page 492](#)
- [History for Firepower Threat Defense Logical Devices, on page 499](#)

About Interfaces

The Firepower 4100/9300 chassis supports physical interfaces and EtherChannel (port-channel) interfaces. EtherChannel interfaces can include up to 16 member interfaces of the same type.

Chassis Management Interface

The chassis management interface is used for management of the FXOS Chassis by SSH or Firepower Chassis Manager. This interface appears at the top of the **Interfaces** tab as **MGMT**, and you can only enable or disable this interface on the **Interfaces** tab. This interface is separate from the mgmt-type interface that you assign to the logical devices for application management.

To configure parameters for this interface, you must configure them from the CLI. To view information about this interface in the FXOS CLI, connect to local management and show the management port:

```
Firepower # connect local-mgmt
```

```
Firepower(local-mgmt) # show mgmt-port
```

Note that the chassis management interface remains up even if the physical cable or SFP module are unplugged, or if the **mgmt-port shut** command is performed.

Note The chassis management interface does not support jumbo frames.

Interface Types

Physical interfaces and EtherChannel (port-channel) interfaces can be one of the following types:

- **Data**—Use for regular data. Data interfaces cannot be shared between logical devices, and logical devices cannot communicate over the backplane to other logical devices. For traffic on Data interfaces, all traffic must exit the chassis on one interface and return on another interface to reach another logical device.
- **Mgmt**—Use to manage application instances. These interfaces can be shared by one or more logical devices to access external hosts; logical devices cannot communicate over this interface with other logical devices that share the interface. You can only assign one management interface per logical device. Depending on your application and manager, you can later enable management from a data interface; but you must assign a Management interface to the logical device even if you don't intend to use it after you enable data management.

Note Mgmt interface change will cause reboot of the logical device, for example one change mgmt from e1/1 to e1/2 will cause the logical device to reboot to apply the new management.

- **Eventing**—Use as a secondary management interface for Firepower Threat Defense devices. To use this interface, you must configure its IP address and other parameters at the Firepower Threat Defense CLI. For example, you can separate management traffic from events (such as web events). See the [management center configuration guide](#) for more information. Eventing interfaces can be shared by one or more logical devices to access external hosts; logical devices cannot communicate over this interface with other logical devices that share the interface.

Note A virtual Ethernet interface is allocated when each application instance is installed. If the application does not use an eventing interface, then the virtual interface will be in an admin down state.

```
Firepower # show interface Vethernet775
Firepower # Vethernet775 is down (Administratively down)
Bound Interface is Ethernet1/10
Port description is server 1/1, VNIC ext-mgmt-nic5
```

- **Cluster**—Use as the cluster control link for a clustered logical device. By default, the cluster control link is automatically created on Port-channel 48. The Cluster type is only supported on EtherChannel interfaces.

FXOS Interfaces vs. Application Interfaces

The Firepower 4100/9300 manages the basic Ethernet settings of physical interfaces and EtherChannel (port-channel) interfaces. Within the application, you configure higher level settings. For example, you can only create EtherChannels in FXOS; but you can assign an IP address to the EtherChannel within the application.

The following sections describe the interaction between FXOS and the application for interfaces.

VLAN Subinterfaces

For all logical devices, you can create VLAN subinterfaces within the application.

Independent Interface States in the Chassis and in the Application

You can administratively enable and disable interfaces in both the chassis and in the application. For an interface to be operational, the interface must be enabled in both operating systems. Because the interface state is controlled independently, you may have a mismatch between the chassis and application.

About Logical Devices

A logical device lets you run one application instance.

When you add a logical device, you also define the application instance type and version, assign interfaces, and configure bootstrap settings that are pushed to the application configuration.

Standalone and Clustered Logical Devices

You can add the following logical device types:

- **Standalone**—A standalone logical device operates as a standalone unit or as a unit in a High Availability pair.
- **Cluster**—A clustered logical device lets you group multiple units together, providing all the convenience of a single device (management, integration into a network) while achieving the increased throughput and redundancy of multiple devices. Multiple module devices, like the Firepower 9300, support intra-chassis clustering. For the Firepower 9300, all three modules must participate in the cluster.

Requirements and Prerequisites for Logical Devices

See the following sections for requirements and prerequisites.

Requirements and Prerequisites for Hardware and Software Combinations

The Firepower 4100/9300 supports multiple models, security modules, application types, and high availability and scalability features. See the following requirements for allowed combinations.

Firepower 9300 Requirements

The Firepower 9300 includes 3 security module slots and multiple types of security modules. See the following requirements:

- Security Module Types—All modules in the Firepower 9300 must be the same type.
- Clustering—All security modules in the cluster, whether it is intra-chassis or inter-chassis, must be the same type. You can have different quantities of installed security modules in each chassis, although all modules present in the chassis must belong to the cluster including any empty slots. For example, you can install 2 SM-40s in chassis 1, and 3 SM-40s in chassis 2.
- High Availability—High Availability is only supported between same-type modules on the Firepower 9300.
- ASA and FTD application types—You can only install one application type on the chassis, ASA or FTD.
- ASA or FTD versions—You can run different versions of an application instance type on separate modules. For example, you can install the FTD 6.3 on module 1, FTD 6.4 on module 2, and FTD 6.5 on module 3.

Firepower 4100 Requirements

The Firepower 4100 comes in multiple models. See the following requirements:

- Clustering—All chassis in the cluster must be the same model.
- High Availability—High Availability is only supported between same-type models.
- ASA and FTD application types—The Firepower 4100 can only run a single application type.

Requirements and Prerequisites for High Availability

- The two units in a High Availability Failover configuration must:
 - Be on a separate chassis; intra-chassis High Availability for the Firepower 9300 is not supported.
 - Be the same model.
 - Have the same interfaces assigned to the High Availability logical devices.
 - Have the same number and types of interfaces. All interfaces must be preconfigured in FXOS identically before you enable High Availability.
- For High Availability system requirements, see [High Availability System Requirements, on page 565](#).

Guidelines and Limitations for Logical Devices

See the following sections for guidelines and limitations.

Guidelines and Limitations for Interfaces

Inline Sets for FTD

- Supported for physical interfaces only (both regular and breakout ports); EtherChannels are not supported.
- Link state propagation is not supported.

Default MAC Addresses

Default MAC address assignments depend on the type of interface.

- Physical interfaces—The physical interface uses the burned-in MAC address.
- EtherChannels—For an EtherChannel, all interfaces that are part of the channel group share the same MAC address. This feature makes the EtherChannel transparent to network applications and users, because they only see the one logical connection; they have no knowledge of the individual links. The port-channel interface uses a unique MAC address from a pool; interface membership does not affect the MAC address.

General Guidelines and Limitations

Firewall Mode

You can set the firewall mode to routed or transparent in the bootstrap configuration for the Firepower Threat Defense.

High Availability

- Configure high availability within the application configuration.
- You can use any data interfaces as the failover and state links.

Configure Interfaces

By default, physical interfaces are disabled. You can enable interfaces, add EtherChannels, and edit interface properties.

Enable or Disable an Interface

You can change the **Admin State** of each interface to be enabled or disabled. By default, physical interfaces are disabled.

Procedure

-
- Step 1** Choose **Interfaces** to open the Interfaces page.

The Interfaces page shows a visual representation of the currently installed interfaces at the top of the page and provides a listing of the installed interfaces in the table below.

Step 2 To enable the interface, click the disabled **Slider disabled** () so that it changes to the enabled **Slider enabled** () .

Click **Yes** to confirm the change. The corresponding interface in the visual representation changes from gray to green.

Step 3 To disable the interface, click the enabled **Slider enabled** () so that it changes to the disabled **Slider disabled** () .

Click **Yes** to confirm the change. The corresponding interface in the visual representation changes from green to gray.

Configure a Physical Interface

You can physically enable and disable interfaces, as well as set the interface speed and duplex. To use an interface, it must be physically enabled in FXOS and logically enabled in the application.

Note For QSFPH40G-CUxM, auto-negotiation is always enabled by default and you cannot disable it.

Before you begin

- Interfaces that are already a member of an EtherChannel cannot be modified individually. Be sure to configure settings before you add it to the EtherChannel.

Procedure

Step 1 Choose **Interfaces** to open the Interfaces page.

The **All Interfaces** page shows a visual representation of the currently installed interfaces at the top of the page and provides a listing of the installed interfaces in the table below.

Step 2 Click **Edit** in the row for the interface you want to edit to open the **Edit Interface** dialog box.

Step 3 To enable the interface, check the **Enable** check box. To disable the interface, uncheck the **Enable** check box.

Step 4 Choose the interface **Type**:

- **Data**
- **Mgmt**
- **Firepower-eventing**—For Firepower Threat Defense only.

- **Cluster**—Do not choose the **Cluster** type; by default, the cluster control link is automatically created on Port-channel 48.

- Step 5** (Optional) Choose the speed of the interface from the **Speed** drop-down list.
- Step 6** (Optional) If your interface supports **Auto Negotiation**, click the **Yes** or **No** radio button.
- Step 7** (Optional) Choose the duplex of the interface from the **Duplex** drop-down list.
- Step 8** (Optional) Explicitly configure **Debounce Time (ms)**. Enter a value between 0-15000 milli-seconds.
- Step 9** Click **OK**.

Add an EtherChannel (Port Channel)

An EtherChannel (also known as a port channel) can include up to 16 member interfaces of the same media type and capacity, and must be set to the same speed and duplex. The media type can be either RJ-45 or SFP; SFPs of different types (copper and fiber) can be mixed. You cannot mix interface capacities (for example 1GB and 10GB interfaces) by setting the speed to be lower on the larger-capacity interface. The Link Aggregation Control Protocol (LACP) aggregates interfaces by exchanging the Link Aggregation Control Protocol Data Units (LACPDU)s between two network devices.

The Firepower 4100/9300 chassis only supports EtherChannels in Active LACP mode so that each member interface sends and receives LACP updates. An active EtherChannel can establish connectivity with either an active or a passive EtherChannel. You should use the active mode unless you need to minimize the amount of LACP traffic.

LACP coordinates the automatic addition and deletion of links to the EtherChannel without user intervention. It also handles misconfigurations and checks that both ends of member interfaces are connected to the correct channel group.

When the Firepower 4100/9300 chassis creates an EtherChannel, the EtherChannel stays in a **Suspended** state until you assign it to a logical device, even if the physical link is up. The EtherChannel will be brought out of this **Suspended** state in the following situations:

- The EtherChannel is added as a data or management interface for a standalone logical device
- The EtherChannel is added as a management interface or cluster control link for a logical device that is part of a cluster
- The EtherChannel is added as a data interface for a logical device that is part of a cluster and at least one unit has joined the cluster

Note that the EtherChannel does not come up until you assign it to a logical device. If the EtherChannel is removed from the logical device or the logical device is deleted, the EtherChannel will revert to a **Suspended** state.

Procedure

- Step 1** Choose **Interfaces** to open the Interfaces page.

The **All Interfaces** page shows a visual representation of the currently installed interfaces at the top of the page and provides a listing of the installed interfaces in the table below.

- Step 2** Click **Add Port Channel** above the interfaces table to open the **Add Port Channel** dialog box.
- Step 3** Enter an ID for the port channel in the **Port Channel ID** field. Valid values are between 1 and 47.
- Port-channel 48 is reserved for the cluster control link when you deploy a clustered logical device. If you do not want to use Port-channel 48 for the cluster control link, you can delete it and configure a Cluster type EtherChannel with a different ID. For intra-chassis clustering, do not assign any interfaces to the Cluster EtherChannel.
- Step 4** To enable the port channel, check the **Enable** check box. To disable the port channel, uncheck the **Enable** check box.
- Step 5** Choose the interface **Type**:
- **Data**
 - **Mgmt**
 - **Firepower-eventing**—For Firepower Threat Defense only.
 - **Cluster**
- Step 6** Set the required **Admin Speed** for the member interfaces from the drop-down list.
- If you add a member interface that is not at the specified speed, it will not successfully join the port channel.
- Step 7** Set the required **Admin Duplex** for the member interfaces, **Full Duplex** or **Half Duplex**.
- If you add a member interface that is configured with the specified duplex, it will not successfully join the port channel.
- Step 8** To add an interface to the port channel, select the interface in the **Available Interface** list and click **Add Interface** to move the interface to the Member ID list.
- You can add up to 16 member interfaces of the same media type and capacity. The member interfaces must be set to the same speed and duplex, and must match the speed and duplex that you configured for this port channel. The media type can be either RJ-45 or SFP; SFPs of different types (copper and fiber) can be mixed. You cannot mix interface capacities (for example 1GB and 10GB interfaces) by setting the speed to be lower on the larger-capacity interface.
- Tip** You can add multiple interfaces at one time. To select multiple individual interfaces, click on the desired interfaces while holding down the **Ctrl** key. To select a range of interfaces, select the first interface in the range, and then, while holding down the **Shift** key, click to select the last interface in the range.
- Step 9** To remove an interface from the port channel, click the **Delete** button to the right of the interface in the Member ID list.
- Step 10** Click **OK**.
-

Configure Logical Devices

Add a standalone logical device or a High Availability pair on the Firepower 4100/9300 chassis.

For clustering, see [Clustering for the Firepower Threat Defense, on page 591](#).

Add a Standalone FTD

Standalone logical devices work either alone or in a High Availability pair. On the Firepower 9300 with multiple security modules, you can deploy either a cluster or standalone devices. The cluster must use all modules, so you cannot mix and match a 2-module cluster plus a single standalone device, for example.

Before you begin

- Download the application image you want to use for the logical device from Cisco.com, and then upload that image to the Firepower 4100/9300 chassis.
- Configure a management interface to use with the logical device. The management interface is required. Note that this management interface is not the same as the chassis management port that is used only for chassis management (and that appears at the top of the **Interfaces** tab as **MGMT**).
- You must also configure at least one Data type interface. Optionally, you can also create a firepower-eventing interface to carry all event traffic (such as web events). See [Interface Types](#), on page 486 for more information.
- Gather the following information:
 - Interface IDs for this device
 - Management interface IP address and network mask
 - Gateway IP address
 - FMC IP address and/or NAT ID of your choosing
 - DNS server IP address
 - Firepower Threat Defense hostname and domain name

Procedure

Step 1

Choose **Logical Devices**.

Step 2

Click **Add Device**, and set the following parameters:

- a) Provide a **Device Name**.

This name is used by the chassis supervisor to configure management settings and to assign interfaces; it is not the device name used in the application configuration.

Note You cannot change this name after you add the logical device.

- b) For the **Template**, choose **Cisco Firepower Threat Defense**.
c) Choose the **Image Version**.
d) For the **Usage**, click the **Standalone** radio button.
e) Click **OK**.

You see the Provisioning - *device name* window.

Step 3

Expand the **Data Ports** area, and click each interface that you want to assign to the device.

You can only assign data interfaces that you previously enabled on the **Interfaces** page. You will later enable and configure these interfaces in FMC, including setting the IP addresses.

Step 4 Click the device icon in the center of the screen.

A dialog box appears where you can configure initial bootstrap settings. These settings are meant for initial deployment only, or for disaster recovery. For normal operation, you can later change most values in the application CLI configuration.

Step 5 On the **General Information** page, complete the following:

- a) (For the Firepower 9300) Under **Security Module Selection** click the security module that you want to use for this logical device.
- b) Choose the **Management Interface**.
This interface is used to manage the logical device. This interface is separate from the chassis management port.
- c) Choose the management interface **Address Type: IPv4 only, IPv6 only, or IPv4 and IPv6**.
- d) Configure the **Management IP** address.
Set a unique IP address for this interface.
- e) Enter a **Network Mask** or **Prefix Length**.
- f) Enter a **Network Gateway** address.

Step 6 On the **Settings** tab, complete the following:

- a) Enter the **Firepower Management Center IP** of the managing FMC.
- b) Enter the **Search Domains** as a comma-separated list.
- c) Choose the **Firewall Mode: Transparent** or **Routed**.

In routed mode, the Firepower Threat Defense is considered to be a router hop in the network. Each interface that you want to route between is on a different subnet. A transparent firewall, on the other hand, is a Layer 2 firewall that acts like a “bump in the wire,” or a “stealth firewall,” and is not seen as a router hop to connected devices.

The firewall mode is only set at initial deployment. If you re-apply the bootstrap settings, this setting is not used.

- d) Enter the **DNS Servers** as a comma-separated list.
The Firepower Threat Defense uses DNS if you specify a hostname for the FMC, for example.
- e) Enter the **Fully Qualified Hostname** for the Firepower Threat Defense.
- f) Enter a **Registration Key** to be shared between the FMC and the device during registration.
You can choose any text string for this key between 1 and 37 characters; you will enter the same key on the FMC when you add the Firepower Threat Defense.
- g) Enter a **Password** for the Firepower Threat Defense admin user for CLI access.
- h) Choose the **Eventing Interface** on which events should be sent. If not specified, the management interface will be used.

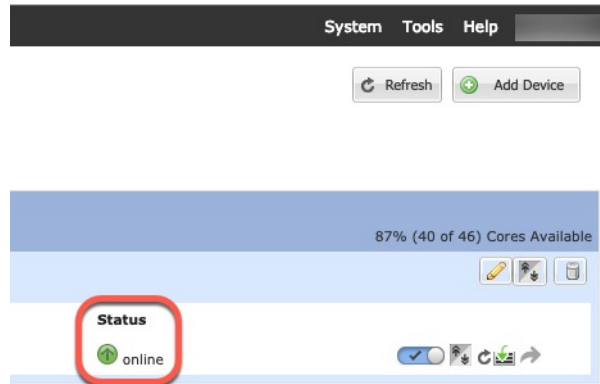

This interface must be defined as a Firepower-eventing interface.

Step 7 On the **Agreement** tab, read and accept the end user license agreement (EULA).

Step 8 Click **OK** to close the configuration dialog box.

Step 9 Click **Save**.

The chassis deploys the logical device by downloading the specified software version and pushing the bootstrap configuration and management interface settings to the application instance. Check the **Logical Devices** page for the status of the new logical device. When the logical device shows its **Status** as **online**, you can start configuring the security policy in the application.

**Step 10** See the FMC configuration guide to add the Firepower Threat Defense as a managed device and start configuring your security policy.

Add a High Availability Pair

FTD High Availability (also known as failover) is configured within the application, not in FXOS. However, to prepare your chassis for high availability, see the following steps.

Before you begin

See [Requirements and Prerequisites for High Availability, on page 488](#).

Procedure

Step 1 Allocate the same interfaces to each logical device.

Step 2 Allocate 1 or 2 data interfaces for the failover and state link(s).

These interfaces exchange high availability traffic between the 2 chassis. We recommend that you use a 10 GB data interface for a combined failover and state link. If you have available interfaces, you can use separate failover and state links; the state link requires the most bandwidth. You cannot use the management-type interface for the failover or state link. We recommend that you use a switch between the chassis, with no other device on the same network segment as the failover interfaces.

Step 3 Enable High Availability on the logical devices. See [High Availability for FTD, on page 565](#).

Step 4 If you need to make interface changes after you enable High Availability, perform the changes on the standby unit first, and then perform the changes on the active unit.

Change an Interface on a FTD Logical Device

You can allocate or unallocate an interface, or replace a management interface on the Firepower Threat Defense logical device. You can then sync the interface configuration in the FMCthe .

Adding a new interface, or deleting an unused interface has minimal impact on the Firepower Threat Defense configuration. However, deleting an interface that is used in your security policy will impact the configuration. Interfaces can be referenced directly in many places in the Firepower Threat Defense configuration, including access rules, NAT, SSL, identity rules, VPN, DHCP server, and so on. Policies that refer to security zones are not affected. You can also edit the membership of an allocated EtherChannel without affecting the logical device or requiring a sync on the FMCthe .

Deleting an interface will delete any configuration associated with that interface.

Before you begin

- Configure your interfaces, and add any EtherChannels according to [Configure a Physical Interface, on page 490](#) and [Add an EtherChannel \(Port Channel\), on page 491](#).
- If you want to add an already-allocated interface to an EtherChannel (for example, all interfaces are allocated by default to a cluster), you need to unallocate the interface from the logical device first, then add the interface to the EtherChannel. For a new EtherChannel, you can then allocate the EtherChannel to the device.
- If you want to replace the management or eventing interface with a management EtherChannel, then you need to create the EtherChannel with at least 1 unallocated data member interface, and then replace the current management interface with the EtherChannel. After the FTD device reboots (management interface changes cause a reboot), and you sync the configuration in the FMCthe , you can add the (now unallocated) management interface to the EtherChannel as well.
- For clustering or High Availability, make sure you add or remove the interface on all units before you sync the configuration in the FMCthe . We recommend that you make the interface changes on the data/standby unit(s) first, and then on the control/active unit. Note that new interfaces are added in an administratively down state, so they do not affect interface monitoring.
- In mult-instance mode, for changing a sub-interface with an another sub-interface with the same vlan tag, you must first remove all the configuration (including nameif config) of the interface and then unallocate the interface from Firepower Chassis Manager. Once unallocated, add the new interface and then use sync interfaces from the FMC.

Procedure

- Step 1** In the Firepower Chassis Manager, choose **Logical Devices**.
- Step 2** Click the **Edit** icon at the top right to edit the logical device.
- Step 3** Allocate a new data interface by selecting the interface in the **Data Ports** area.
- Do not delete any interfaces yet.

Step 4 Replace the management or eventing interface:

For these types of interfaces, the device reboots after you save your changes.

- a) Click the device icon in the center of the page.
- b) On the **General** or **Cluster Information** tab, choose the new **Management Interface** from the drop-down list.
- c) On the **Settings** tab, choose the new **Eventing Interface** from the drop-down list.
- d) Click **OK**.

If you change the IP address of the Management interface, then you must also change the IP address for the device in the FMC: go to **Devices > Device Management > Device/Cluster**. In the **Management** area, set the IP address to match the bootstrap configuration address.

Step 5 Click **Save**.

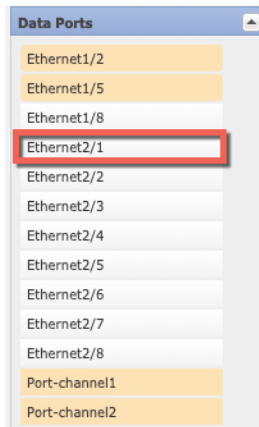

Step 6 Sync the interfaces in the FMC.

- a) Log into the FMC.
- b) Select **Devices > Device Management** and click **Edit** (🔧) for your Firepower Threat Defense device. The **Interfaces** page is selected by default.
- c) Click the **Sync Device** button on the top left of the **Interfaces** page.
- d) After the changes are detected, you will see a red banner on the **Interfaces** page indicating that the interface configuration has changed. Click the **Click to know more** link to view the interface changes.
- e) If you plan to delete an interface, manually transfer any interface configuration from the old interface to the new interface.

Because you have not yet deleted any interfaces, you can refer to the existing configuration.

- f) Click **Save**.
- g) Select the devices and click **Deploy** to deploy the policy to the assigned devices. The changes are not active until you deploy them.

Step 7 In the Firepower Chassis Manager, unallocate a data interface by de-selecting the interface in the **Data Ports** area.

Step 8 Click **Save**.

Step 9 Sync the interfaces again in the FMCthe .

Connect to the Console of the Application

Use the following procedure to connect to the console of the application.

Procedure

Step 1 Connect to the module CLI.

connect module *slot_number* console

To connect to the security engine of a device that does not support multiple security modules, always use **1** as the *slot_number*.

Example:

```
Firepower# connect module 1 console
Telnet escape character is '~'.
Trying 127.5.1.1...
Connected to 127.5.1.1.
Escape character is '~'.
```

```
CISCO Serial Over LAN:
Close Network Connection to Exit
```

```
Firepower-module1>
```

Step 2 Connect to the application console.

connect ftd

Example:

```
Firepower-module1> connect ftd
Connecting to ftd(ftd-native) console... enter exit to return to bootCLI
[...]
```

>

Step 3 Exit the application console to the FXOS module CLI.

- FTD—Enter **Ctrl-a, d**

Step 4 Return to the supervisor level of the FXOS CLI.

a) Enter ~

You exit to the Telnet application.

b) To exit the Telnet application, enter:

telnet>**quit**

History for Firepower Threat Defense Logical Devices

- [DHCP and DDNS Services for Threat Defense, on page 553](#)

CHAPTER 25

Interface Overview for Firepower Threat Defense

The Firepower Threat Defense device includes data interfaces that you can configure in different modes, as well as a management/diagnostic interface.

- [Management/Diagnostic Interface, on page 503](#)
- [Interface Mode and Types, on page 504](#)
- [Security Zones, on page 505](#)
- [Auto-MDI/MDIX Feature, on page 506](#)
- [Default Settings for Interfaces, on page 506](#)
- [Enable the Physical Interface and Configure Ethernet Settings, on page 506](#)
- [Sync Interface Changes with the Firepower Management Center, on page 508](#)

Management/Diagnostic Interface

The physical management interface is shared between the Diagnostic logical interface and the Management logical interface.

Management Interface

The Management interface is separate from the other interfaces on the device. It is used to set up and register the device to the Firepower Management Center. It runs a separate SSH server and uses its own local authentication, IP address, and static routing. You can configure its settings at the CLI using the **configure network** command. If you change the IP address at the CLI after you add it to the Firepower Management Center, you can match the IP address in the Firepower Management Center in the **Devices > Device Management > Devices > Management** area.

Diagnostic Interface

The Diagnostic logical interface can be configured along with the rest of the data interfaces on the **Devices > Device Management > Interfaces** screen. Using the Diagnostic interface is optional (see the routed and transparent mode deployments for scenarios). The Diagnostic interface and data interfaces allow for LDAP or RADIUS external authentication. If you do not want to allow SSH access on a data interface, for example, then you may choose to configure the Diagnostic interface for SSH access. The Diagnostic interface only allows management traffic, and does not allow through traffic. The Diagnostic interface is useful for SNMP or syslog monitoring.

Interface Mode and Types

You can deploy Firepower Threat Defense interfaces in two modes: Regular firewall mode and IPS-only mode. You can include both firewall and IPS-only interfaces on the same device.

Regular Firewall Mode

Firewall mode interfaces subject traffic to firewall functions such as maintaining flows, tracking flow states at both IP and TCP layers, IP defragmentation, and TCP normalization. You can also optionally configure IPS functions for this traffic according to your security policy.

The types of firewall interfaces you can configure depends on the firewall mode set for the device: routed or transparent mode. See [Transparent or Routed Firewall Mode for Firepower Threat Defense, on page 473](#) for more information.

- Routed mode interfaces (routed firewall mode only)—Each interface that you want to route between is on a different subnet.
- Bridge group interfaces (transparent firewall mode only)—You can group together multiple interfaces on a network, and the Firepower Threat Defense device uses bridging techniques to pass traffic between the interfaces. Each bridge group includes a Bridge Virtual Interface (BVI) to which you assign an IP address on the network. each bridge group is separate and cannot communicate with each other.

IPS-Only Mode

IPS-only mode interfaces bypass many firewall checks and only support IPS security policy. You might want to implement IPS-only interfaces if you have a separate firewall protecting these interfaces and do not want the overhead of firewall functions.

Note The firewall mode only affects regular firewall interfaces, and not IPS-only interfaces such as inline sets or passive interfaces. IPS-only interfaces can be used in both firewall modes.

IPS-only interfaces can be deployed as the following types:

- Inline Set, with optional Tap mode—An inline set acts like a bump on the wire, and binds two interfaces together to slot into an existing network. This function allows the FTD to be installed in any network environment without the configuration of adjacent network devices. Inline interfaces receive all traffic unconditionally, but all traffic received on these interfaces is retransmitted out of an inline set unless explicitly dropped.

With tap mode, the FTD is deployed inline, but the network traffic flow is undisturbed. Instead, the FTD makes a copy of each packet so that it can analyze the packets. Note that rules of these types do generate intrusion events when they are triggered, and the table view of intrusion events indicates that the triggering packets would have dropped in an inline deployment. There are benefits to using tap mode with FTDs that are deployed inline. For example, you can set up the cabling between the FTD and the network as if the FTD were inline and analyze the kinds of intrusion events the FTD generates. Based on the results, you can modify your intrusion policy and add the drop rules that best protect your network without impacting its efficiency. When you are ready to deploy the FTD inline, you can disable tap mode and begin dropping suspicious traffic without having to reconfigure the cabling between the FTD and the network.

Note Tap mode *significantly* impacts FTD performance, depending on the traffic.

Note Inline sets might be familiar to you as "transparent inline sets," but the inline interface type is unrelated to the transparent firewall mode or the firewall-type interfaces.

- Passive or ERSPAN Passive—Passive interfaces monitor traffic flowing across a network using a switch SPAN or mirror port. The SPAN or mirror port allows for traffic to be copied from other ports on the switch. This function provides the system visibility within the network without being in the flow of network traffic. When you configure the FTD in a passive deployment, the FTD cannot take certain actions such as blocking or shaping traffic. Passive interfaces receive all traffic unconditionally, and no traffic received on these interfaces is retransmitted. Encapsulated remote switched port analyzer (ERSPAN) interfaces allow you to monitor traffic from source ports distributed over multiple switches, and uses GRE to encapsulate the traffic. ERSPAN interfaces are only allowed when the FTD is in routed firewall mode.

Note Using SR-IOV interfaces as passive interfaces on NGFWv is not supported on some Intel network adapters (such as Intel X710 or 82599) using SR-IOV drivers due to a promiscuous mode restriction. In such cases, use a network adapter that supports this functionality. See [Intel Ethernet Products](#) for more information on Intel network adapters.

Security Zones

Each interface can be assigned to a *security zone*. You then apply your security policy based on zones. For example, you can assign the "inside" interface to the "inside" zone; and the "outside" interface to the "outside" zone. You can configure your access control policy to enable traffic to go from inside to outside, but not from outside to inside, for example. Note that the interface or zone name itself does not provide any default behavior in regards to the security policy, we recommend using names that are self-describing to avoid mistakes in future configuration. A good name signifies a logical segment or traffic specification, for example:

- Names of internal interfaces—InsideV110, InsideV160, InsideV195
- Names of DMZ interfaces—DMZV11, DMZV12, DMZV-TEST
- Names of external interfaces—Outside-ASN78, Outside-ASN91

You can create security zones on the **Objects** page. You can also add a zone when you are configuring the interface. You can only add interfaces to the correct zone type for your interface, either Passive, Inline, Routed, or Switched zone types.

Note Policies that apply to **any** zone (a global policy) apply to interfaces in zones as well as any interfaces that are not assigned to a zone.

The Diagnostic/Management interface does not belong to a zone.

Auto-MDI/MDIX Feature

For RJ-45 interfaces, the default auto-negotiation setting also includes the Auto-MDI/MDIX feature. Auto-MDI/MDIX eliminates the need for crossover cabling by performing an internal crossover when a straight cable is detected during the auto-negotiation phase. Either the speed or duplex must be set to auto-negotiate to enable Auto-MDI/MDIX for the interface. If you explicitly set both the speed and duplex to a fixed value, thus disabling auto-negotiation for both settings, then Auto-MDI/MDIX is also disabled. For Gigabit Ethernet, when the speed and duplex are set to 1000 and full, then the interface always auto-negotiates; therefore Auto-MDI/MDIX is always enabled and you cannot disable it.

Default Settings for Interfaces

This section lists default settings for interfaces.

Default State of Interfaces

The default state of an interface depends on the type.

- Physical interfaces—Disabled. The exception is the interface that is enabled for initial setup.
- Redundant Interfaces—Enabled. However, for traffic to pass through the redundant interface, the member physical interfaces must also be enabled.
- VLAN subinterfaces—Enabled. However, for traffic to pass through the subinterface, the physical interface must also be enabled.
- EtherChannel port-channel interfaces—Enabled. However, for traffic to pass through the EtherChannel, the channel group physical interfaces must also be enabled.

Default Speed and Duplex

By default, the speed and duplex for copper (RJ-45) interfaces are set to auto-negotiate.

By default, the speed and duplex for fiber (SFP) interfaces are set to the maximum speed, with auto-negotiation enabled.

Enable the Physical Interface and Configure Ethernet Settings

This section describes how to:

- Enable the physical interface. By default, physical interfaces are disabled (with the exception of the interface).

- Set a specific speed and duplex. By default, speed and duplex are set to Auto.

This procedure only covers a small subset of Interface settings. Refrain from setting other parameters at this point. For example, you cannot name an interface that you want to use as part of an EtherChannel or redundant interface.

Note For the Firepower 4100/9300, you configure basic interface settings in FXOS. See [Configure a Physical Interface, on page 490](#) for more information.

Before you begin

If you changed the physical interfaces on the device after you added it to the FMC, you need to refresh the interface listing by clicking **Sync Interfaces from device** on the top left of **Interfaces**.

Procedure

- Step 1** Select **Devices > Device Management** and click **Edit** () for your Firepower Threat Defense device. The **Interfaces** page is selected by default.
- Step 2** Click **Edit** () for the interface you want to edit.
- Step 3** Enable the interface by checking the **Enabled** check box.
- Step 4** (Optional) Add a description in the **Description** field.
The description can be up to 200 characters on a single line, without carriage returns.
- Step 5** (Optional) Set the duplex and speed by clicking **Hardware Configuration**.
 - **Duplex**—Choose **Full**, **Half**, or **Auto**. Auto is the default for RJ-45 interfaces. You cannot select Auto for SFP interfaces.
 - **Speed**—Choose **Auto** to have the interface negotiate the speed, link status, and flow control (Auto is only available for RJ-45 interfaces), or pick a specific speed: **10**, **100**, **1000** Mbps. For SFP interfaces, setting the speed enables auto-negotiation of link status and flow control. For SFP interfaces, depending on your hardware, you can select **No Negotiate** to set the speed to 1000 and disable link negotiation.
- Step 6** In the **Mode** drop-down list, choose one of the following:
 - **None**—Choose this setting for regular firewall interfaces and inline sets. The mode will automatically be changed to Routed, Switched, or Inline based on further configuration.
 - **Passive**—Choose this setting for passive IPS-only interfaces.
 - **Ersparn**—Choose this setting for ERSPAN passive IPS-only interfaces.
- Step 7** Click **OK**.
- Step 8** Click **Save**.
You can now click **Deploy** and deploy the policy to assigned devices. The changes are not active until you deploy them.

- Step 9** Continue configuring interfaces.
- [Regular Firewall Interfaces for Firepower Threat Defense, on page 511](#)
 - [Inline Sets and Passive Interfaces for Firepower Threat Defense, on page 545](#)
-

Sync Interface Changes with the Firepower Management Center

Interface configuration changes on the device can cause the FMC and the device to get out of sync. The FMC can detect interface changes by one of the following methods:

- Event sent from the device
- Sync when you deploy from the FMC

If the FMC detects interface changes when it attempts to deploy, the deploy will fail. You must first accept the interface changes.

- Manual sync

Adding a new interface, or deleting an unused interface has minimal impact on the Firepower Threat Defense configuration. However, deleting an interface that is used in your security policy will impact the configuration. Interfaces can be referenced directly in many places in the Firepower Threat Defense configuration, including access rules, NAT, SSL, identity rules, VPN, DHCP server, and so on. Deleting an interface will delete any configuration associated with that interface. Policies that refer to security zones are not affected. You can also edit the membership of an allocated EtherChannel without affecting the logical device or requiring a sync on the FMC.

This procedure describes how to manually sync device changes if required and how to acknowledge the detected changes. If device changes are temporary, you should not save the changes in the FMC; you should wait until the device is stable, and then re-sync.

Before you begin

- Model Support—FTD
- User Roles:
 - Admin
 - Access Admin
 - Network Admin

Procedure

- Step 1** Select **Devices > Device Management** and click **Edit** () for your Firepower Threat Defense device. The **Interfaces** page is selected by default.
- Step 2** If required, click **Sync Device** on the top left of **Interfaces**.

Step 3

After the changes are detected, see the following steps.

- a) You will see a red banner on **Interfaces** indicating that the interface configuration has changed. Click the **Click to know more** link to view the interface changes.
- b) Click **Save**.

You can now click **Deploy** and deploy the policy to assigned devices.

CHAPTER 26

Regular Firewall Interfaces for Firepower Threat Defense

This chapter includes regular firewall Firepower Threat Defense interface configuration including EtherChannels, VLAN subinterfaces, IP addressing, and more.

Note For initial interface configuration on the Firepower 4100/9300, see [Configure Interfaces, on page 489](#).

- [Requirements and Prerequisites for Regular Firewall Interfaces, on page 511](#)
- [Configure EtherChannel and Redundant Interfaces, on page 511](#)
- [Configure VLAN Subinterfaces and 802.1Q Trunking, on page 519](#)
- [Configure Routed and Transparent Mode Interfaces, on page 521](#)
- [Configure Advanced Interface Settings, on page 535](#)

Configure EtherChannel and Redundant Interfaces

This section tells how to configure EtherChannels and redundant interfaces.

Note For the Firepower 4100/9300, you configure EtherChannels in FXOS. See [Add an EtherChannel \(Port Channel\), on page 491](#) for more information.

Note Only ASA 5500-X models support redundant interfaces; Firepower models do not support them.

About EtherChannels

This section describes EtherChannels.

About Redundant Interfaces (ASA Platform Only)

A logical redundant interface consists of a pair of physical interfaces: an active and a standby interface. When the active interface fails, the standby interface becomes active and starts passing traffic. You can configure a redundant interface to increase the Firepower Threat Defense device reliability.

You can configure up to 8 redundant interface pairs.

Redundant Interface MAC Address

The redundant interface uses the MAC address of the first physical interface that you add. If you change the order of the member interfaces in the configuration, then the MAC address changes to match the MAC address of the interface that is now listed first. Alternatively, you can assign a manual MAC address to the redundant interface, which is used regardless of the member interface MAC addresses. When the active interface fails over to the standby, the same MAC address is maintained so that traffic is not disrupted.

About EtherChannels

An 802.3ad EtherChannel is a logical interface (called a port-channel interface) consisting of a bundle of individual Ethernet links (a channel group) so that you increase the bandwidth for a single network. A port channel interface is used in the same way as a physical interface when you configure interface-related features.

You can configure up to 48 EtherChannels, depending on how many interfaces your model supports.

Channel Group Interfaces

Each channel group can have up to 8 active interfaces, except for ASA models and the ISA 3000, which supports 16 active interfaces. For switches that support only 8 active interfaces, you can assign up to 16 interfaces to a channel group: while only 8 interfaces can be active, the remaining interfaces can act as standby links in case of interface failure.

All interfaces in the channel group must be the same type and speed. The first interface added to the channel group determines the correct type and speed.

The EtherChannel aggregates the traffic across all the available active interfaces in the channel. The interface is selected using a proprietary hash algorithm, based on source or destination MAC addresses, IP addresses, TCP and UDP port numbers and VLAN numbers.

Connecting to an EtherChannel on Another Device

The device to which you connect the FTD EtherChannel must also support 802.3ad EtherChannels; for example, you can connect to the Catalyst 6500 switch or the Cisco Nexus 7000.

When the switch is part of a Virtual Switching System (VSS) or Virtual Port Channel (vPC), then you can connect FTD interfaces within the same EtherChannel to separate switches in the VSS/vPC. The switch interfaces are members of the same EtherChannel port-channel interface, because the separate switches act like a single switch.

Figure 11: Connecting to a VSS/vPC

Note If the FTD device is in transparent firewall mode, and you place the FTD device between two sets of VSS/vPC switches, then be sure to disable Unidirectional Link Detection (UDLD) on any switch ports connected to the FTD device with an EtherChannel. If you enable UDLD, then a switch port may receive UDLD packets sourced from both switches in the other VSS/vPC pair. The receiving switch will place the receiving interface in a down state with the reason "UDLD Neighbor mismatch".

If you use the FTD device in an Active/Standby failover deployment, then you need to create separate EtherChannels on the switches in the VSS/vPC, one for each FTD device. On each FTD device, a single EtherChannel connects to both switches. Even if you could group all switch interfaces into a single EtherChannel connecting to both FTD devices (in this case, the EtherChannel will not be established because of the separate FTD system IDs), a single EtherChannel would not be desirable because you do not want traffic sent to the standby FTD device.

Figure 12: Active/Standby Failover and VSS/vPC

Link Aggregation Control Protocol

The Link Aggregation Control Protocol (LACP) aggregates interfaces by exchanging the Link Aggregation Control Protocol Data Units (LACPDU)s between two network devices.

You can configure each physical interface in an EtherChannel to be:

- **Active**—Sends and receives LACP updates. An active EtherChannel can establish connectivity with either an active or a passive EtherChannel. You should use the active mode unless you need to minimize the amount of LACP traffic.
- **Passive**—Receives LACP updates. A passive EtherChannel can only establish connectivity with an active EtherChannel. Not supported on hardware models.
- **On**—The EtherChannel is always on, and LACP is not used. An “on” EtherChannel can only establish a connection with another “on” EtherChannel.

LACP coordinates the automatic addition and deletion of links to the EtherChannel without user intervention. It also handles misconfigurations and checks that both ends of member interfaces are connected to the correct channel group. “On” mode cannot use standby interfaces in the channel group when an interface goes down, and the connectivity and configurations are not checked.

Load Balancing

The FTD device distributes packets to the interfaces in the EtherChannel by hashing the source and destination IP address of the packet (this criteria is configurable). The resulting hash is divided by the number of active links in a modulo operation where the resulting remainder determines which interface owns the flow. All packets with a $hash_value \bmod active_links$ result of 0 go to the first interface in the EtherChannel, packets with a result of 1 go to the second interface, packets with a result of 2 go to the third interface, and so on. For example, if you have 15 active links, then the modulo operation provides values from 0 to 14. For 6 active links, the values are 0 to 5, and so on.

If an active interface goes down and is not replaced by a standby interface, then traffic is rebalanced between the remaining links. The failure is masked from both Spanning Tree at Layer 2 and the routing table at Layer 3, so the switchover is transparent to other network devices.

EtherChannel MAC Address

All interfaces that are part of the channel group share the same MAC address. This feature makes the EtherChannel transparent to network applications and users, because they only see the one logical connection; they have no knowledge of the individual links.

Firepower Hardware

The port-channel interface uses the MAC address of the internal interface Internal-Data 0/1. Alternatively you can manually configure a MAC address for the port-channel interface. All EtherChannel interfaces on a chassis use the same MAC address, so be aware that if you use SNMP polling, for example, multiple interfaces will have the same MAC address.

Note Member interfaces only use the Internal-Data 0/1 MAC address after a reboot. Prior to rebooting, the member interface uses its own MAC address. If you add a new member interface after a reboot, you will have to perform another reboot to update its MAC address.

ASA Hardware

The port-channel interface uses the lowest numbered channel group interface MAC address as the port-channel MAC address. Alternatively you can manually configure a MAC address for the port-channel interface. We recommend manually configuring a unique MAC address in case the group channel interface membership changes. If you remove the interface that was providing the port-channel MAC address, then the port-channel MAC address changes to the next lowest numbered interface, thus causing traffic disruption.

Guidelines for EtherChannels

High Availability

- When you use an EtherChannel interface as a High Availability link, it must be pre-configured on both units in the High Availability pair; you cannot configure it on the primary unit and expect it to replicate to the secondary unit because *the High Availability link itself is required for replication*.
- If you use an EtherChannel interface for the state link, no special configuration is required; the configuration can replicate from the primary unit as normal. For the Firepower 4100/9300 chassis, all interfaces, including EtherChannels, need to be pre-configured on both units.
- You can monitor EtherChannel interfaces for High Availability. When an active member interface fails over to a standby interface, this activity does not cause the EtherChannel interface to appear to be failed when being monitored for device-level High Availability. Only when all physical interfaces fail does the EtherChannel interface appear to be failed (for an EtherChannel interface, the number of member interfaces allowed to fail is configurable).
- If you use an EtherChannel interface for a High Availability or state link, then to prevent out-of-order packets, only one interface in the EtherChannel is used. If that interface fails, then the next interface in the EtherChannel is used. You cannot alter the EtherChannel configuration while it is in use as a High Availability link. To alter the configuration, you need to temporarily disable High Availability, which prevents High Availability from occurring for the duration.

Model Support

- You cannot add EtherChannels in the FMC for the Firepower 4100/9300 or the FTDv. The Firepower 4100/9300 supports EtherChannels, but you must perform all hardware configuration of EtherChannels in FXOS on the chassis.

General EtherChannel Guidelines

- You can configure up to 48 EtherChannels, depending on how many interfaces are available on your model.
- Each channel group can have up to 8 active interfaces, except for ASA models and the ISA 3000, which supports 16 active interfaces. For switches that support only 8 active interfaces, you can assign up to 16 interfaces to a channel group: while only 8 interfaces can be active, the remaining interfaces can act as standby links in case of interface failure.
- All interfaces in the channel group must be the same media type and speed capacity. The media type can be either RJ-45 or SFP; SFPs of different types (copper and fiber) can be mixed. You cannot mix interface capacities (for example 1GB and 10GB interfaces) by setting the speed to be lower on the larger-capacity interface.
- The device to which you connect the FTD EtherChannel must also support 802.3ad EtherChannels.
- The FTD device does not support LACPDU s that are VLAN-tagged. If you enable native VLAN tagging on the neighboring switch using the Cisco IOS **vlan dot1Q tag native** command, then the FTD device will drop the tagged LACPDUs. Be sure to disable native VLAN tagging on the neighboring switch.
- Devices do not support LACP rate fast, except for ASA models and the ISA 3000; LACP always uses the normal rate. This setting is not configurable. Note that the Firepower 4100/9300, which configures EtherChannels in FXOS, has the LACP rate set to fast by default; on these platforms, the rate is configurable.
- In Cisco IOS software versions earlier than 15.1(1)S2, FTD did not support connecting an EtherChannel to a switch stack. With default switch settings, if the FTD EtherChannel is connected cross stack, and if the primary switch is powered down, then the EtherChannel connected to the remaining switch will not come up. To improve compatibility, set the **stack-mac persistent timer** command to a large enough value to account for reload time; for example, 8 minutes or 0 for indefinite. Or, you can upgrade to more a more stable switch software version, such as 15.1(1)S2.
- All the FTD configuration refers to the logical EtherChannel interface instead of the member physical interfaces.

Configure a Redundant Interface (ASA Platform Only)

A logical redundant interface consists of a pair of physical interfaces: an active and a standby interface. When the active interface fails, the standby interface becomes active and starts passing traffic. You can configure a redundant interface to increase the Firepower Threat Defense reliability. By default, redundant interfaces are enabled.

- You can configure up to 8 redundant interface pairs.
- Both member interfaces must be of the same physical type. For example, both must be GigabitEthernet.

Note Redundant interfaces are not supported on the Firepower platform; only ASA 5500-X models support redundant interfaces.

Before you begin

- You cannot add a physical interface to the redundant interface if you configured a name for it. You must first remove the name.

Caution If you are using a physical interface already in your configuration, removing the name will clear any configuration that refers to the interface.

Procedure

-
- Step 1** Select **Devices > Device Management** and click **Edit** () for your Firepower Threat Defense device. The **Interfaces** page is selected by default.
- Step 2** Enable the member interfaces according to [Enable the Physical Interface and Configure Ethernet Settings, on page 506](#).
- Step 3** Click **Add Interfaces > Redundant Interface**.
- Step 4** On the **General** tab, set the following parameters:
- a) **Redundant ID**—Set an integer between 1 and 8.
 - b) **Primary Interface**—Choose an interface from the drop-down list. After you add the interface, any configuration for it (such as an IP address) is removed.
 - c) **Secondary Interface**—The second interface must be the same physical type as the first interface.
- Step 5** Click **OK**.
- Step 6** Click **Save**.
- You can now click **Deploy** and deploy the policy to assigned devices. The changes are not active until you deploy them.
- Step 7** (Optional) Add a VLAN subinterface. See [Add a Subinterface, on page 520](#).
- Step 8** Configure the routed or transparent mode interface parameters. See [Configure Routed Mode Interfaces, on page 523](#) or [Configure Transparent Mode Bridge Group Interfaces, on page 525](#).
-

Configure an EtherChannel

This section describes how to create an EtherChannel port-channel interface, assign interfaces to the EtherChannel, and customize the EtherChannel.

Guidelines

- You can configure up to 48 EtherChannels, depending on the number of interfaces for your model.

- Each channel group can have up to 16 active interfaces. For switches that support only 8 active interfaces, you can assign up to 16 interfaces to a channel group: while only 8 interfaces can be active, the remaining interfaces can act as standby links in case of interface failure.
- All interfaces in the channel group must be the same type, speed, and duplex. Half duplex is not supported.

Note For the Firepower 4100/9300, you configure EtherChannels in FXOS. See [Add an EtherChannel \(Port Channel\), on page 491](#) for more information.

Before you begin

- You cannot add a physical interface to the channel group if you configured a name for it. You must first remove the name.

Note If you are using a physical interface already in your configuration, removing the name will clear any configuration that refers to the interface.

Procedure

-
- Step 1** Select **Devices > Device Management** and click **Edit** () for your Firepower Threat Defense device. The **Interfaces** page is selected by default.
- Step 2** Enable the member interfaces according to [Enable the Physical Interface and Configure Ethernet Settings, on page 506](#).
- Step 3** Click **Add Interfaces > Ether Channel Interface**.
- Step 4** On the **General** tab, set the **Ether Channel ID** to a number between 1 and 48.
- Step 5** In the **Available Interfaces** area, click an interface and then click **Add** to move it to the **Selected Interfaces** area. Repeat for all interfaces that you want to make members.

Make sure all interfaces are the same type and speed. The first interface you add determines the type and speed of the EtherChannel. Any non-matching interfaces you add will be put into a suspended state. The FMC does not prevent you from adding non-matching interfaces.

- Step 6** (Optional) Click the **Advanced** tab to customize the EtherChannel. Set the following parameters on the **Information** sub-tab:

- **Load Balancing**—Select the criteria used to load balance the packets across the group channel interfaces. By default, the Firepower Threat Defense device balances the packet load on interfaces according to the source and destination IP address of the packet. If you want to change the properties on which the packet is categorized, choose a different set of criteria. For example, if your traffic is biased heavily towards the same source and destination IP addresses, then the traffic assignment to interfaces in the EtherChannel will be unbalanced. Changing to a different algorithm can result in more evenly distributed traffic. For more information about load balancing, see [Load Balancing, on page 514](#).
- **LACP Mode**—Choose Active, Passive, or On. We recommend using Active mode (the default).

- **Active Physical Interface: Range**—From the left drop-down list, choose the minimum number of active interfaces required for the EtherChannel to be active, between 1 and 16. The default is 1. From the right drop-down list, choose the maximum number of active interfaces allowed in the EtherChannel, between 1 and 16. The default is 16. If your switch does not support 16 active interfaces, be sure to set this command to 8 or fewer.
- **Active Mac Address**—Set a manual MAC address if desired. The `mac_address` is in H.H.H format, where H is a 16-bit hexadecimal digit. For example, the MAC address 00-0C-F1-42-4C-DE is entered as 000C.F142.4CDE.

Step 7 (Optional) Click the **Hardware Configuration** tab and set the Duplex and Speed to override these settings for all member interfaces. This method provides a shortcut to set these parameters because these parameters must match for all interfaces in the channel group.

Step 8 Click **OK**.

Step 9 Click **Save**.

You can now click **Deploy** and deploy the policy to assigned devices. The changes are not active until you deploy them.

Step 10 (Optional) Add a VLAN subinterface. See [Add a Subinterface, on page 520](#).

Step 11 Configure the routed or transparent mode interface parameters. See [Configure Routed Mode Interfaces, on page 523](#) or [Configure Transparent Mode Bridge Group Interfaces, on page 525](#).

Configure VLAN Subinterfaces and 802.1Q Trunking

VLAN subinterfaces let you divide a physical, redundant, or EtherChannel interface into multiple logical interfaces that are tagged with different VLAN IDs. An interface with one or more VLAN subinterfaces is automatically configured as an 802.1Q trunk. Because VLANs let you keep traffic separate on a given physical interface, you can increase the number of interfaces available to your network without adding additional physical interfaces or devices.

Guidelines and Limitations for VLAN Subinterfaces

High Availability

You cannot use a subinterface for the failover or state link.

Additional Guidelines

- Preventing untagged packets on the physical interface—If you use subinterfaces, you typically do not also want the physical interface to pass traffic, because the physical interface passes untagged packets. This property is also true for the active physical interface in a redundant interface pair and for EtherChannel links. Because the physical, redundant, or EtherChannel interface must be enabled for the subinterface to pass traffic, ensure that the physical, redundant, or EtherChannel interface does not pass traffic by not configuring a name for the interface. If you want to let the physical, redundant, or EtherChannel interface pass untagged packets, you can configure the name as usual.
- You cannot configure subinterfaces on the `interface`.

- The FTD does not support the Dynamic Trunking Protocol (DTP), so you must configure the connected switch port to trunk unconditionally.
- You might want to assign unique MAC addresses to subinterfaces defined on the FTD, because they use the same burned-in MAC address of the parent interface. For example, your service provider might perform access control based on the MAC address. Also, because IPv6 link-local addresses are generated based on the MAC address, assigning unique MAC addresses to subinterfaces allows for unique IPv6 link-local addresses, which can avoid traffic disruption in certain instances on the FTD.

Maximum Number of VLAN Subinterfaces by Device Model

The device model limits the maximum number of VLAN subinterfaces that you can configure. Note that you can configure subinterfaces on data interfaces only, you cannot configure them on the management interface.

The following table explains the limits for each device model.

Model	Maximum VLAN Subinterfaces
Firepower 4100	1024
Firepower 9300	1024
FTDv	50
ASA 5506-X	30
ASA 5506W-X	
ASA 5506H-X	
ASA 5508-X	50
ASA 5512-X	100
ASA 5515-X	100
ASA 5516-X	100
ASA 5525-X	200
ASA 5545-X	300
ASA 5555-X	500

Add a Subinterface

Add one or more subinterfaces to a physical, redundant, or port-channel interface.

Note The parent physical interface passes untagged packets. You may not want to pass untagged packets, so be sure not to include the parent interface in your security policy.

Procedure

- Step 1** Select **Devices > Device Management** and click **Edit** () for your Firepower Threat Defense device. The **Interfaces** page is selected by default.
- Step 2** Enable the parent interface according to [Enable the Physical Interface and Configure Ethernet Settings, on page 506](#).
- Step 3** Click **Add Interfaces > Sub Interface**.
- Step 4** On **General**, set the following parameters:
- Interface**—Choose the physical, redundant, or port-channel interface to which you want to add the subinterface.
 - Sub-Interface ID**—Enter the subinterface ID as an integer between 1 and 4294967295. The number of subinterfaces allowed depends on your platform. You cannot change the ID after you set it.
 - VLAN ID**—Enter the VLAN ID between 1 and 4094 that will be used to tag the packets on this subinterface.
This VLAN ID must be unique.
- Step 5** Click **OK**.
- Step 6** Click **Save**.
- You can now click **Deploy** and deploy the policy to assigned devices. The changes are not active until you deploy them.
- Step 7** Configure the routed or transparent mode interface parameters. See [Configure Routed Mode Interfaces, on page 523](#) or [Configure Transparent Mode Bridge Group Interfaces, on page 525](#).
-

Configure Routed and Transparent Mode Interfaces

This section includes tasks to complete the regular interface configuration for all models in routed or transparent firewall mode.

About Routed and Transparent Mode Interfaces

Firewall mode interfaces subject traffic to firewall functions such as maintaining flows, tracking flow states at both IP and TCP layers, IP defragmentation, and TCP normalization. You can also optionally configure IPS functions for this traffic according to your security policy.

The types of firewall interfaces you can configure depends on the firewall mode set for the device: routed or transparent mode. See [Transparent or Routed Firewall Mode for Firepower Threat Defense, on page 473](#) for more information.

- Routed mode interfaces (routed firewall mode only)—Each interface that you want to route between is on a different subnet.
- Bridge group interfaces (transparent firewall mode only)—You can group together multiple interfaces on a network, and the Firepower Threat Defense device uses bridging techniques to pass traffic between

the interfaces. Each bridge group includes a Bridge Virtual Interface (BVI) to which you assign an IP address on the network. Each bridge group is separate and cannot communicate with each other.

Dual IP Stack (IPv4 and IPv6)

The FTD device supports both IPv6 and IPv4 addresses on an interface. Make sure you configure a default route for both IPv4 and IPv6.

Guidelines and Limitations for Routed and Transparent Mode Interfaces

High Availability, Clustering

- Do not configure failover links with the procedures in this chapter. See the High Availability chapter for more information.
- For cluster interfaces, see the clustering chapter for requirements.
- When you use High Availability, you must set the IP address and standby address for data interfaces manually; DHCP and PPPoE are not supported. Set the standby IP addresses on the **Devices > Device Management > High Availability** tab in the **Monitored Interfaces** area. See the High Availability chapter for more information.

IPv6

- IPv6 is supported on all interfaces.
- You can only configure IPv6 addresses manually in transparent mode.
- The FTD device does not support IPv6 anycast addresses.

Transparent Mode and Bridge Group Guidelines

- You can create up to 250 bridge groups, with 4 interfaces per bridge group.
- Each directly-connected network must be on the same subnet.
- The FTD device does not support traffic on secondary networks; only traffic on the same network as the BVI IP address is supported.
- An IP address for the BVI is required for each bridge group for to-the-device and from-the-device management traffic, as well as for data traffic to pass through the FTD device. For IPv4 traffic, specify an IPv4 address. For IPv6 traffic, specify an IPv6 address.
- You can only configure IPv6 addresses manually.
- The BVI IP address must be on the same subnet as the connected network. You cannot set the subnet to a host subnet (255.255.255.255).
- Management interfaces are not supported as bridge group members.
- For the FTDv on VMware with bridged ixgbevf interfaces, transparent mode is not supported.
- In transparent mode, you must use at least 1 bridge group; data interfaces must belong to a bridge group.

- In transparent mode, do not specify the BVI IP address as the default gateway for connected devices; devices need to specify the router on the other side of the FTD as the default gateway.
- In transparent mode, the *default* route, which is required to provide a return path for management traffic, is only applied to management traffic from one bridge group network. This is because the default route specifies an interface in the bridge group as well as the router IP address on the bridge group network, and you can only define one default route. If you have management traffic from more than one bridge group network, you need to specify a regular static route that identifies the network from which you expect management traffic.
- In transparent mode, PPPoE is not supported for the interface.
- Transparent mode is not supported on threat defense virtual instances deployed on Amazon Web Services, Microsoft Azure, Google Cloud Platform, and Oracle Cloud Infrastructure.
- Bidirectional Forwarding Detection (BFD) echo packets are not allowed through the FTD when using bridge group members. If there are two neighbors on either side of the FTD running BFD, then the FTD will drop BFD echo packets because they have the same source and destination IP address and appear to be part of a LAND attack.

Additional Guidelines and Requirements

- The FTD supports only one 802.1Q header in a packet and does not support multiple headers (known as Q-in-Q support) for firewall interfaces. **Note:** For inline sets and passive interfaces, the FTD supports Q-in-Q up to two 802.1Q headers in a packet, with the exception of the Firepower 4100/9300, which only supports one 802.1Q header.

Configure Routed Mode Interfaces

This procedure describes how to set the name, security zone, and IPv4 address.

Before you begin

- **Firepower 4100/9300**
 1. [Configure a Physical Interface, on page 490](#)
 2. (Optional) Configure any special interfaces.
 - [Add an EtherChannel \(Port Channel\), on page 491](#)
 - [Add a Subinterface, on page 520](#) in FMC
- (Optional) **All other models:**
 - [Configure a Redundant Interface \(ASA Platform Only\), on page 516](#)
 - [Configure an EtherChannel, on page 517](#)
 - [Add a Subinterface, on page 520](#)

Procedure

- Step 1** Select **Devices > Device Management** and click **Edit** (🔧) for your Firepower Threat Defense device. The **Interfaces** page is selected by default.
- Step 2** Click **Edit** (🔧) for the interface you want to edit.
- Step 3** In the **Name** field, enter a name up to 48 characters in length.
- Step 4** Enable the interface by checking the **Enabled** check box.
- Step 5** (Optional) Set this interface to **Management Only** to limit traffic to management traffic; through-the-box traffic is not allowed.
- Step 6** (Optional) Add a description in the **Description** field.
The description can be up to 200 characters on a single line, without carriage returns.
- Step 7** In the **Mode** drop-down list, choose **None**.
Regular firewall interfaces have the mode set to None. The other modes are for IPS-only interface types.
- Step 8** From the **Security Zone** drop-down list, choose a security zone or add a new one by clicking **New**.
The routed interface is a Routed-type interface, and can only belong to Routed-type zones.
- Step 9** See [Configure the MTU, on page 538](#) for information about the **MTU**.
- Step 10** Click the **IPv4** tab. To set the IP address, use one of the following options from the **IP Type** drop-down list.
High Availability and clustering interfaces only support static IP address configuration; DHCP and PPPoE are not supported.
- **Use Static IP**—Enter the IP address and subnet mask. For High Availability, you can only use a static IP address. Set the standby IP address on the **Devices > Device Management > High Availability** tab in the **Monitored Interfaces** area. If you do not set the standby IP address, the active unit cannot monitor the standby interface using network tests; it can only track the link state.
 - **Use DHCP**—Configure the following optional parameters:
 - **Obtain default route using DHCP**—Obtains the default route from the DHCP server.
 - **DHCP route metric**—Assigns an administrative distance to the learned route, between 1 and 255. The default administrative distance for the learned routes is 1.
 - **Use PPPoE**—If the interface is connected to a DSL, cable modem, or other connection to your ISP, and your ISP uses PPPoE to provide your IP address, configure the following parameters:
 - **VPDN Group Name**—Specify a group name of your choice to represent this connection.
 - **PPPoE User Name**—Specify the username provided by your ISP.
 - **PPPoE Password/Confirm Password**—Specify and confirm the password provided by your ISP.
 - **PPP Authentication**—Choose **PAP**, **CHAP**, or **MSCHAP**.
PAP passes a cleartext username and password during authentication and is not secure. With CHAP, the client returns the encrypted [challenge plus password], with a cleartext username in response to the server challenge. CHAP is more secure than PAP, but it does not encrypt data. MSCHAP is similar to CHAP but is more secure because the server stores and compares only encrypted passwords

rather than cleartext passwords as in CHAP. MSCHAP also generates a key for data encryption by MPPE.

- **PPPoE route metric**—Assign an administrative distance to the learned route. Valid values are from 1 to 255. By default, the administrative distance for the learned routes is 1.
- **Store Username and Password in Flash**—Stores the username and password in flash memory. The Firepower Threat Defense device stores the username and password in a special location of NVRAM.

- Step 11** (Optional) See [Configure IPv6 Addressing, on page 529](#) to configure IPv6 addressing on the **IPv6** tab.
- Step 12** (Optional) See [Configure the MAC Address, on page 539](#) to manually configure the MAC address on the **Advanced** tab.
- Step 13** (Optional) Set the duplex and speed by clicking **Hardware Configuration**.
- **Duplex**—Choose **Full**, **Half**, or **Auto**. Auto is the default for RJ-45 interfaces. You cannot select Auto for SFP interfaces.
 - **Speed**—Choose **Auto** to have the interface negotiate the speed, link status, and flow control (Auto is only available for RJ-45 interfaces), or pick a specific speed: **10**, **100**, **1000** Mbps. For SFP interfaces, setting the speed enables auto-negotiation of link status and flow control. For SFP interfaces, depending on your hardware, you can select **No Negotiate** to set the speed to 1000 and disable link negotiation.
- Step 14** Click **OK**.
- Step 15** Click **Save**.
- You can now click **Deploy** and deploy the policy to assigned devices. The changes are not active until you deploy them.

Configure Transparent Mode Bridge Group Interfaces

A bridge group is a group of interfaces that the Firepower Threat Defense device bridges instead of routes. Bridge groups are only supported in Transparent Firewall Mode. For more information about bridge groups, see [About Bridge Groups, on page 475](#).

To configure bridge groups and associated interfaces, perform these steps.

Configure General Bridge Group Member Interface Parameters

This procedure describes how to set the name and security zone for each bridge group member interface. The same bridge group can include different types of interfaces: physical interfaces, VLAN subinterfaces, EtherChannels, and redundant interfaces. The `Loopback` interface is not supported.

Before you begin

- **Firepower 4100/9300**
 1. [Configure a Physical Interface, on page 490](#)
 2. (Optional) Configure any special interfaces.

- [Add an EtherChannel \(Port Channel\), on page 491](#)
- [Add a Subinterface, on page 520](#) in FMC
- (Optional) **All other models:**
 - [Configure a Redundant Interface \(ASA Platform Only\), on page 516](#)
 - [Configure an EtherChannel, on page 517](#)
 - [Add a Subinterface, on page 520](#)

Procedure

- Step 1** Select **Devices > Device Management** and click **Edit** () for your Firepower Threat Defense device. The **Interfaces** page is selected by default.
- Step 2** Click **Edit** () for the interface you want to edit.
- Step 3** In the **Name** field, enter a name up to 48 characters in length.
- Step 4** Enable the interface by checking the **Enabled** check box.
- Step 5** (Optional) Set this interface to **Management Only** to limit traffic to management traffic; through-the-box traffic is not allowed.
- Step 6** (Optional) Add a description in the **Description** field.
The description can be up to 200 characters on a single line, without carriage returns.
- Step 7** In the **Mode** drop-down list, choose **None**.
Regular firewall interfaces have the mode set to None. The other modes are for IPS-only interface types. After you assign this interface to a bridge group, the mode will show as **Switched**.
- Step 8** From the **Security Zone** drop-down list, choose a security zone or add a new one by clicking **New**.
The bridge group member interface is a Switched-type interface, and can only belong to Switched-type zones. Do not configure any IP address settings for this interface. You will set the IP address for the Bridge Virtual Interface (BVI) only. Note that the BVI does not belong to a zone, and you cannot apply access control policies to the BVI.
- Step 9** See [Configure the MTU, on page 538](#) for information about the **MTU**.
- Step 10** (Optional) Set the duplex and speed by clicking **Hardware Configuration**.
- **Duplex**—Choose **Full**, **Half**, or **Auto**. Auto is the default for RJ-45 interfaces. You cannot select Auto for SFP interfaces.
 - **Speed**—Choose **Auto** to have the interface negotiate the speed, link status, and flow control (Auto is only available for RJ-45 interfaces), or pick a specific speed: **10**, **100**, **1000** Mbps. For SFP interfaces, setting the speed enables auto-negotiation of link status and flow control. For SFP interfaces, depending on your hardware, you can select **No Negotiate** to set the speed to 1000 and disable link negotiation.
- Step 11** (Optional) See [Configure IPv6 Addressing, on page 529](#) to configure IPv6 addressing on the **IPv6** tab.

- Step 12** (Optional) See [Configure the MAC Address, on page 539](#) to manually configure the MAC address on the **Advanced** tab.
- Step 13** Click **OK**.
- Step 14** Click **Save**.

You can now click **Deploy** and deploy the policy to assigned devices. The changes are not active until you deploy them.

Configure the Bridge Virtual Interface (BVI)

Each bridge group requires a BVI for which you configure an IP address. The Firepower Threat Defense uses this IP address as the source address for packets originating from the bridge group. The BVI IP address must be on the same subnet as the connected network. For IPv4 traffic, the BVI IP address is required to pass any traffic. For IPv6 traffic, you must, at a minimum, configure the link-local addresses to pass traffic, but a global management address is recommended for full functionality, including remote management and other management operations.

Note For a separate interface, a non-configurable bridge group (ID 301) is automatically added to your configuration. This bridge group is not included in the bridge group limit.

Before you begin

You cannot add the BVI to a security zone; therefore, you cannot apply Access Control policies to the BVI. You must apply your policy to the bridge group member interfaces based on their zones.

Procedure

- Step 1** Select **Devices > Device Management** and click **Edit** () for your Firepower Threat Defense device. The **Interfaces** page is selected by default.
- Step 2** Choose **Add Interfaces > Bridge Group Interface**.
- Step 3** In the **Bridge Group ID** field, enter the bridge group ID between 1 and 250.
- Step 4** In the **Description** field, enter a description for this bridge group.
- Step 5** On the **Interfaces** tab, click an interface and then click **Add** to move it to the **Selected Interfaces** area. Repeat for all interfaces that you want to make members of the bridge group.
- Step 6** Click the **IPv4** tab. In the **IP Address** field, enter the IPv4 address and subnet mask.

Do not assign a host address (/32 or 255.255.255.255) to the BVI. Also, do not use other subnets that contain fewer than 3 host addresses (one each for the upstream router, downstream router, and transparent firewall) such as a /30 subnet (255.255.255.252). The Firepower Threat Defense device drops all ARP packets to or from the first and last addresses in a subnet. For example, if you use a /30 subnet and assign a reserved address from that subnet to the upstream router, then the Firepower Threat Defense device drops the ARP request from the downstream router to the upstream router.

For High Availability, set the standby IP address on the **Devices > Device Management > High Availability** tab in the **Monitored Interfaces** area. If you do not set the standby IP address, the active unit cannot monitor the standby interface using network tests; it can only track the link state.

- Step 7** (Optional) See [Configure IPv6 Addressing, on page 529](#) to configure IPv6 addressing.
- Step 8** (Optional) See [Add a Static ARP Entry, on page 539](#) and [Add a Static MAC Address and Disable MAC Learning for a Transparent Mode Bridge Group, on page 540](#) (for transparent mode only) to configure the **ARP** and **MAC** settings.
- Step 9** Click **OK**.
- Step 10** Click **Save**.

You can now click **Deploy** and deploy the policy to assigned devices. The changes are not active until you deploy them.

Configure a Diagnostic (Management) Interface for Transparent Mode

In transparent firewall mode, all interfaces must belong to a bridge group. The only exception is the Diagnostic *slot/port* interface. For the Firepower 4100/9300 chassis, the diagnostic interface ID depends on the mgmt-type interface that you assigned to the Firepower Threat Defense logical device. You cannot use any other interface types as diagnostic interfaces. You can configure one diagnostic interface.

Before you begin

Do not assign this interface to a bridge group; a non-configurable bridge group (ID 301) is automatically added to your configuration. This bridge group is not included in the bridge group limit.

Procedure

- Step 1** Select **Devices > Device Management** and click **Edit** (🔧) for your Firepower Threat Defense device. The **Interfaces** page is selected by default.
- Step 2** Click **Edit** (🔧) for the interface.
- Step 3** In the **Name** field, enter a name up to 48 characters in length.
- Step 4** Click the **IPv4** tab. To set the IP address, use one of the following options from the **IP Type** drop-down list.
- **Use Static IP**—Enter the IP address and subnet mask.
 - **Use DHCP**—Configure the following optional parameters:
 - **Obtain default route using DHCP**—Obtains the default route from the DHCP server.
 - **DHCP route metric**—Assigns an administrative distance to the learned route, between 1 and 255. The default administrative distance for the learned routes is 1.
 - **Use PPPoE**—Configure the following parameters:
 - **VPDN Group Name**—Specify a group name.
 - **PPPoE User Name**—Specify the username provided by your ISP.
 - **PPPoE Password/Confirm Password**—Specify and confirm the password provided by your ISP.

- **PPP Authentication**—Choose **PAP**, **CHAP**, or **MSCHAP**.

PAP passes a cleartext username and password during authentication and is not secure. With CHAP, the client returns the encrypted [challenge plus password], with a cleartext username in response to the server challenge. CHAP is more secure than PAP, but it does not encrypt data. MSCHAP is similar to CHAP but is more secure because the server stores and compares only encrypted passwords rather than cleartext passwords as in CHAP. MSCHAP also generates a key for data encryption by MPPE.

- **PPPoE route metric**—Assign an administrative distance to the learned route. Valid values are from 1 to 255. By default, the administrative distance for the learned routes is 1.
- **Enable Route Settings**—To manually configure the PPPoE IP address, check this box and then enter the **IP Address**.
- **Store Username and Password in Flash**—Stores the username and password in flash memory. The Firepower Threat Defense device stores the username and password in a special location of NVRAM.

Step 5 (Optional) See [Configure IPv6 Addressing, on page 529](#) to configure **IPv6** addressing.

Step 6 (Optional) On the **Advanced** tab, configure optional settings.

- See [Configure the MAC Address, on page 539](#).
- See [Add a Static ARP Entry, on page 539](#).
- See [Set Security Configuration Parameters, on page 541](#).

Step 7 Click **OK**.

Step 8 Click **Save**.

You can now click **Deploy** and deploy the policy to assigned devices. The changes are not active until you deploy them.

Configure IPv6 Addressing

This section describes how to configure IPv6 addressing in routed and transparent mode.

About IPv6

This section includes information about IPv6.

IPv6 Addressing

You can configure two types of unicast addresses for IPv6:

- **Global**—The global address is a public address that you can use on the public network. For a bridge group, this address needs to be configured for the BVI, and not per member interface. You can also configure a global IPv6 address for the management interface in transparent mode.
- **Link-local**—The link-local address is a private address that you can only use on the directly-connected network. Routers do not forward packets using link-local addresses; they are only for communication

on a particular physical network segment. They can be used for address configuration or for the Neighbor Discovery functions such as address resolution. In a bridge group, only member interfaces have link-local addresses; the BVI does not have a link-local address.

At a minimum, you need to configure a link-local address for IPv6 to operate. If you configure a global address, a link-local address is automatically configured on the interface, so you do not also need to specifically configure a link-local address. For bridge group member interfaces, when you configure the global address on the BVI, the FTD device automatically generates link-local addresses for member interfaces. If you do not configure a global address, then you need to configure the link-local address, either automatically or manually.

Modified EUI-64 Interface IDs

RFC 3513: Internet Protocol Version 6 (IPv6) Addressing Architecture requires that the interface identifier portion of all unicast IPv6 addresses, except those that start with binary value 000, be 64 bits long and be constructed in Modified EUI-64 format. The FTD device can enforce this requirement for hosts attached to the local link.

When this feature is enabled on an interface, the source addresses of IPv6 packets received on that interface are verified against the source MAC addresses to ensure that the interface identifiers use the Modified EUI-64 format. If the IPv6 packets do not use the Modified EUI-64 format for the interface identifier, the packets are dropped and the following system log message is generated:

```
325003: EUI-64 source address check failed.
```

The address format verification is only performed when a flow is created. Packets from an existing flow are not checked. Additionally, the address verification can only be performed for hosts on the local link.

Configure a Global IPv6 Address

To configure a global IPv6 address for any routed mode interface and for the transparent mode BVI, perform the following steps.

Note Configuring the global address automatically configures the link-local address, so you do not need to configure it separately.

For subinterfaces defined on the FTD, we recommend that you also set the MAC address manually, because they use the same burned-in MAC address of the parent interface. IPv6 link-local addresses are generated based on the MAC address, so assigning unique MAC addresses to subinterfaces allows for unique IPv6 link-local addresses, which can avoid traffic disruption in certain instances on the FTD. See [Configure the MAC Address, on page 539](#).

Before you begin

For IPv6 neighbor discovery for bridge groups, you must explicitly allow Neighbor Solicitation (ICMPv6 type 135) and Neighbor Advertisement (ICMPv6 type 136) packets through the FTD bridge group member interfaces using a bidirectional access rule.

Procedure

- Step 1** Select **Devices > Device Management** and click **Edit** (✎) for your Firepower Threat Defense device. The **Interfaces** page is selected by default.
- Step 2** Click **Edit** (✎) for the interface you want to edit.
- Step 3** Click the **IPv6** page.
- For routed mode, the **Basic** page is selected by default. For transparent mode, the **Address** page is selected by default.
- Step 4** On the **Basic** page, check **Enable IPv6**.
- Step 5** Configure the global IPv6 address using one of the following methods.
- (Routed interface) Stateless autoconfiguration—Check the **Autoconfiguration** check box.
Enabling stateless autoconfiguration on the interface configures IPv6 addresses based upon prefixes received in Router Advertisement messages. A link-local address, based on the Modified EUI-64 interface ID, is automatically generated for the interface when stateless autoconfiguration is enabled.
Although RFC 4862 specifies that hosts configured for stateless autoconfiguration do not send Router Advertisement messages, the Firepower Threat Defense device does send Router Advertisement messages in this case. Uncheck the **IPv6 > Settings > Enable RA** check box to suppress messages.
 - Manual configuration—To manually configure a global IPv6 address:
 - a. Click the **Address** page, and click **Add Address**.
The **Add Address** dialog box appears.
 - b. In the **Address** field, enter either a full global IPv6 address, including the interface ID, or enter the IPv6 prefix, along with the IPv6 prefix length. (Routed Mode) If you only enter the prefix, then be sure to check the **Enforce EUI 64** check box to generate the interface ID using the Modified EUI-64 format. For example, 2001:0DB8::BA98:0:3210/48 (full address) or 2001:0DB8::/48 (prefix, with EUI 64 checked).
For High Availability (if you did not set **Enforce EUI 64**), set the standby IP address on the **Devices > Device Management > High Availability** page in the **Monitored Interfaces** area. If you do not set the standby IP address, the active unit cannot monitor the standby interface using network tests; it can only track the link state.
- Step 6** For Routed interfaces, you can optionally set the following values on the **Basic** page:
- To enforce the use of Modified EUI-64 format interface identifiers in IPv6 addresses on a local link, check the **Enforce EUI-64** check box.
 - To manually set the link-local address, enter an address in the **Link-Local address** field.
A link-local address should start with FE8, FE9, FEA, or FEB, for example fe80::20d:88ff:feee:6a82. If you do not want to configure a global address, and only need to configure a link-local address, you have the option of manually defining the link-local address. Note that we recommend automatically assigning the link-local address based on the Modified EUI-64 format. For example, if other devices enforce the use of the Modified EUI-64 format, then a manually-assigned link-local address may cause packets to be dropped.

- Check the **Enable DHCP for address config** check box to set the Managed Address Config flag in the IPv6 router advertisement packet.

This flag in IPv6 router advertisements informs IPv6 autoconfiguration clients that they should use DHCPv6 to obtain addresses, in addition to the derived stateless autoconfiguration address.

- Check the **Enable DHCP for non-address config** check box to set the Other Address Config flag in the IPv6 router advertisement packet.

This flag in IPv6 router advertisements informs IPv6 autoconfiguration clients that they should use DHCPv6 to obtain additional information from DHCPv6, such as the DNS server address.

Step 7 For Routed interfaces, see [Configure IPv6 Neighbor Discovery, on page 532](#) to configure settings on the **Prefixes** and **Settings** pages. For BVI interfaces, see the following read-only parameters on the **Settings** page:

- **DAD attempts**—The maximum number of DAD attempts. 1 attempt is the default.
- **NS Interval**—The interval between IPv6 neighbor solicitation retransmissions on an interface. The default value is 1000 ms.
- **Reachable Time**—The amount of time that a remote IPv6 node is considered reachable after a reachability confirmation event has occurred. The default value is 0 ms. When 0 is used for the value, the reachable time is sent as undetermined. It is up to the receiving devices to set and track the reachable time value. The neighbor reachable time enables detecting unavailable neighbors. Shorter configured times enable detecting unavailable neighbors more quickly, however, shorter times consume more IPv6 network bandwidth and processing resources in all IPv6 network devices. Very short configured times are not recommended in normal IPv6 operation.

Step 8 Click **OK**.

Step 9 Click **Save**.

You can now click **Deploy** and deploy the policy to assigned devices. The changes are not active until you deploy them.

Configure IPv6 Neighbor Discovery

The IPv6 neighbor discovery process uses ICMPv6 messages and solicited-node multicast addresses to determine the link-layer address of a neighbor on the same network (local link), verify the readability of a neighbor, and keep track of neighboring routers.

Nodes (hosts) use neighbor discovery to determine the link-layer addresses for neighbors known to reside on attached links and to quickly purge cached values that become invalid. Hosts also use neighbor discovery to find neighboring routers that are willing to forward packets on their behalf. In addition, nodes use the protocol to actively keep track of which neighbors are reachable and which are not, and to detect changed link-layer addresses. When a router or the path to a router fails, a host actively searches for functioning alternates.

Before you begin

Supported in Routed mode only. For IPv6 neighbor settings supported in transparent mode, see [Configure a Global IPv6 Address, on page 530](#).

Procedure

- Step 1** Select **Devices** > **Device Management** and click **Edit** (✎) for your Firepower Threat Defense device. The **Interfaces** page is selected by default.
- Step 2** Click **Edit** (✎) for the interface you want to edit.
- Step 3** Click **IPv6**, and then **Prefixes**.
- Step 4** (Optional) To configure which IPv6 prefixes are included in IPv6 router advertisements, perform the following steps:
- a) Click **Add Prefix**.
 - b) In the **Address** field, enter the IPv6 address with the prefix length or check the **Default** check box to use the default prefix.
 - c) (Optional) Uncheck the **Advertisement** check box to indicate that the IPv6 prefix is not advertised.
 - d) Check the **Off Link** check box to indicate that the specified prefix is assigned to the link. Nodes sending traffic to addresses that contain the specified prefix consider the destination to be locally reachable on the link. This prefix should not be used for on-link determination.
 - e) To use the specified prefix for autoconfiguration, check the **Autoconfiguration** check box.
 - f) For the **Prefix Lifetime**, click **Duration** or **Expiration Date**.
 - **Duration**—Enter a **Preferred Lifetime** for the prefix in seconds. This setting is the amount of time that the specified IPv6 prefix is advertised as being valid. The maximum value represents infinity. Valid values are from 0 to 4294967295. The default is 2592000 (30 days). Enter a **Valid Lifetime** for the prefix in seconds. This setting is the amount of time that the specified IPv6 prefix is advertised as being preferred. The maximum value represents infinity. Valid values are from 0 to 4294967295. The default setting is 604800 (seven days). Alternatively, check the **Infinite** checkbox to set an unlimited duration.
 - **Expiration Date**—Choose a **Valid** and **Preferred** date and time.
 - g) Click **OK**.
- Step 5** Click **Settings**.
- Step 6** (Optional) Set the maximum number of **DAD attempts**, between 1 and 600. 1 attempt is the default. Set the value to 0 to disable duplicate address detection (DAD) processing.

This setting configures the number of consecutive neighbor solicitation messages that are sent on an interface while DAD is performed on IPv6 addresses.

During the stateless autoconfiguration process, Duplicate Address Detection verifies the uniqueness of new unicast IPv6 addresses before the addresses are assigned to interfaces.

When a duplicate address is identified, the state of the address is set to DUPLICATE, the address is not used, and the following error message is generated:

```
325002: Duplicate address ipv6_address/MAC_address on interface
```

If the duplicate address is the link-local address of the interface, the processing of IPv6 packets is disabled on the interface. If the duplicate address is a global address, the address is not used.

Step 7 (Optional) Configure the interval between IPv6 neighbor solicitation retransmissions in the **NS Interval** field, between 1000 and 3600000 ms.

The default value is 1000 ms.

Neighbor solicitation messages (ICMPv6 Type 135) are sent on the local link by nodes attempting to discover the link-layer addresses of other nodes on the local link. After receiving a neighbor solicitation message, the destination node replies by sending a neighbor advertisement message (ICMPv6 Type 136) on the local link.

After the source node receives the neighbor advertisement, the source node and destination node can communicate. Neighbor solicitation messages are also used to verify the reachability of a neighbor after the link-layer address of a neighbor is identified. When a node wants to verify the reachability of a neighbor, the destination address in a neighbor solicitation message is the unicast address of the neighbor.

Neighbor advertisement messages are also sent when there is a change in the link-layer address of a node on a local link.

Step 8 (Optional) Configure the amount of time that a remote IPv6 node is considered reachable after a reachability confirmation event has occurred in the **Reachable Time** field, between 0 and 3600000 ms.

The default value is 0 ms. When 0 is used for the value, the reachable time is sent as undetermined. It is up to the receiving devices to set and track the reachable time value.

The neighbor reachable time enables detecting unavailable neighbors. Shorter configured times enable detecting unavailable neighbors more quickly, however, shorter times consume more IPv6 network bandwidth and processing resources in all IPv6 network devices. Very short configured times are not recommended in normal IPv6 operation.

Step 9 (Optional) To suppress the router advertisement transmissions, uncheck the **Enable RA** check box. If you enable router advertisement transmissions, you can set the RA lifetime and interval.

Router advertisement messages (ICMPv6 Type 134) are automatically sent in response to router solicitation messages (ICMPv6 Type 133). Router solicitation messages are sent by hosts at system startup so that the host can immediately autoconfigure without needing to wait for the next scheduled router advertisement message.

You may want to disable these messages on any interface for which you do not want the Firepower Threat Defense device to supply the IPv6 prefix (for example, the outside interface).

- **RA Lifetime**—Configure the router lifetime value in IPv6 router advertisements, between 0 and 9000 seconds.

The default is 1800 seconds.

- **RA Interval**—Configure the interval between IPv6 router advertisement transmissions, between 3 and 1800 seconds.

The default is 200 seconds.

Step 10 Click **OK**.

Step 11 Click **Save**.

You can now click **Deploy** and deploy the policy to assigned devices. The changes are not active until you deploy them.

Configure Advanced Interface Settings

This section describes how to configure MAC addresses for regular firewall mode interfaces, how to set the maximum transmission unit (MTU), and how to set other advanced parameters.

About Advanced Interface Configuration

This section describes advanced interface settings.

About MAC Addresses

You can manually assign MAC addresses to override the default.

**Note**

You might want to assign unique MAC addresses to subinterfaces defined on the FTD, because they use the same burned-in MAC address of the parent interface. For example, your service provider might perform access control based on the MAC address. Also, because IPv6 link-local addresses are generated based on the MAC address, assigning unique MAC addresses to subinterfaces allows for unique IPv6 link-local addresses, which can avoid traffic disruption in certain instances on the FTD device.

Default MAC Addresses

Default MAC address assignments depend on the type of interface.

- Physical interfaces—The physical interface uses the burned-in MAC address.
- EtherChannels (Firepower Models)—For an EtherChannel, all interfaces that are part of the channel group share the same MAC address. This feature makes the EtherChannel transparent to network applications and users, because they only see the one logical connection; they have no knowledge of the individual links. The port-channel interface uses a unique MAC address from a pool; interface membership does not affect the MAC address.
- EtherChannels (ASA Models)—The port-channel interface uses the lowest-numbered channel group interface MAC address as the port-channel MAC address. Alternatively you can configure a MAC address for the port-channel interface. We recommend configuring a unique MAC address in case the group channel interface membership changes. If you remove the interface that was providing the port-channel MAC address, then the port-channel MAC address changes to the next lowest numbered interface, thus causing traffic disruption.
- Subinterfaces—All subinterfaces of a physical interface use the same burned-in MAC address. You might want to assign unique MAC addresses to subinterfaces. For example, your service provider might perform access control based on the MAC address. Also, because IPv6 link-local addresses are generated based on the MAC address, assigning unique MAC addresses to subinterfaces allows for unique IPv6 link-local addresses, which can avoid traffic disruption in certain instances on the FTD.

About the MTU

The MTU specifies the maximum frame *payload* size that the FTD device can transmit on a given Ethernet interface. The MTU value is the frame size *without* Ethernet headers, VLAN tagging, or other overhead. For

example, when you set the MTU to 1500, the expected frame size is 1518 bytes including the headers, or 1522 when using VLAN. Do not set the MTU value higher to accommodate these headers.

Path MTU Discovery

The FTD device supports Path MTU Discovery (as defined in RFC 1191), which lets all devices in a network path between two hosts coordinate the MTU so they can standardize on the lowest MTU in the path.

Default MTU

The default MTU on the FTD device is 1500 bytes. This value does not include the 18-22 bytes for the Ethernet header, VLAN tagging, or other overhead.

MTU and Fragmentation

For IPv4, if an outgoing IP packet is larger than the specified MTU, it is fragmented into 2 or more frames. Fragments are reassembled at the destination (and sometimes at intermediate hops), and fragmentation can cause performance degradation. For IPv6, packets are typically not allowed to be fragmented at all. Therefore, your IP packets should fit within the MTU size to avoid fragmentation.

For UDP or ICMP, the application should take the MTU into account to avoid fragmentation.

Note The FTD device can receive frames larger than the configured MTU as long as there is room in memory.

MTU and Jumbo Frames

A larger MTU lets you send larger packets. Larger packets might be more efficient for your network. See the following guidelines:

- Matching MTUs on the traffic path—We recommend that you set the MTU on all FTD interfaces and other device interfaces along the traffic path to be the same. Matching MTUs prevents intermediate devices from fragmenting the packets.
- Accommodating jumbo frames—You can set the MTU 9000 bytes or higher when you enable jumbo frames. The maximum depends on the model.

Note For the Firepower 4100/9300, if you use VLAN tagging, the maximum MTU is 4-bytes smaller: 8996.

ARP Inspection for Bridge Group Traffic

By default, all ARP packets are allowed between bridge group members. You can control the flow of ARP packets by enabling ARP inspection.

ARP inspection prevents malicious users from impersonating other hosts or routers (known as ARP spoofing). ARP spoofing can enable a “man-in-the-middle” attack. For example, a host sends an ARP request to the gateway router; the gateway router responds with the gateway router MAC address. The attacker, however, sends another ARP response to the host with the attacker MAC address instead of the router MAC address. The attacker can now intercept all the host traffic before forwarding it on to the router.

ARP inspection ensures that an attacker cannot send an ARP response with the attacker MAC address, so long as the correct MAC address and the associated IP address are in the static ARP table.

When you enable ARP inspection, the FTD device compares the MAC address, IP address, and source interface in all ARP packets to static entries in the ARP table, and takes the following actions:

- If the IP address, MAC address, and source interface match an ARP entry, the packet is passed through.
- If there is a mismatch between the MAC address, the IP address, or the interface, then the FTD device drops the packet.
- If the ARP packet does not match any entries in the static ARP table, then you can set the FTD device to either forward the packet out all interfaces (flood), or to drop the packet.

Note The dedicated interface never floods packets even if this parameter is set to flood.

MAC Address Table

When you use bridge groups, the FTD learns and builds a MAC address table in a similar way as a normal bridge or switch: when a device sends a packet through the bridge group, the FTD adds the MAC address to its table. The table associates the MAC address with the source interface so that the FTD knows to send any packets addressed to the device out the correct interface. Because traffic between bridge group members is subject to the FTD security policy, if the destination MAC address of a packet is not in the table, the FTD does not flood the original packet on all interfaces as a normal bridge does. Instead, it generates the following packets for directly-connected devices or for remote devices:

- Packets for directly-connected devices—The FTD generates an ARP request for the destination IP address, so that it can learn which interface receives the ARP response.
- Packets for remote devices—The FTD generates a ping to the destination IP address so that it can learn which interface receives the ping reply.

The original packet is dropped.

Default Settings

- If you enable ARP inspection, the default setting is to flood non-matching packets.
- The default timeout value for dynamic MAC address table entries is 5 minutes.
- By default, each interface automatically learns the MAC addresses of entering traffic, and the FTD device adds corresponding entries to the MAC address table.

Note Firepower Threat Defense device generates a reset packet to reset a connection that is denied by a stateful inspection engine. Here, the destination MAC address of the packet is not determined based on the ARP table lookup but instead it is taken directly from the packets (connections) that are being denied.

Guidelines for ARP Inspection and the MAC Address Table

- ARP inspection is only supported for bridge groups.
- MAC address table configuration is only supported for bridge groups.
- Bridge groups are only supported in transparent firewall mode.

Configure the MTU

Customize the MTU on the interface, for example, to allow jumbo frames.

Caution Changing the highest MTU value on the device for a data interface restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Inspection is interrupted on all data interfaces, not just the interface you modified. Whether this interruption drops traffic or passes it without further inspection depends on the model of the managed device and the interface type. This caution does not apply to the Diagnostic interface or management-only interfaces. See [Snort® Restart Traffic Behavior, on page 310](#) for more information.

Before you begin

- Changing the MTU above 1500 bytes automatically enables jumbo frames; for ASA models, you must reload the system before you can use jumbo frames.
- If you use an interface in an inline set, the MTU setting is not used. However, the jumbo frame setting *is* relevant to inline sets; jumbo frames enable the inline interfaces to receive packets up to 9000 bytes. To enable jumbo frames, you must set the MTU of *any* interface above 1500 bytes.

Procedure

Step 1 Select **Devices > Device Management** and click **Edit** () for your Firepower Threat Defense device. The **Interfaces** page is selected by default.

Step 2 Click **Edit** () for the interface you want to edit.

Step 3 On the **General** tab, set the **MTU** between 64 and 9198 bytes; the maximum is 9000 for the Firepower Threat Defense Virtual and the Firepower Threat Defense on the Firepower 4100/9300 chassis.

The default is 1500 bytes.

Note If you use VLAN tagging, the maximum value for the Firepower 4100/9300 chassis is reduced by 4 bytes: 8996. Even if you can set the MTU to a value of 8997-9000, the actual payload size will be 8996.

Step 4 Click **OK**.

Step 5 Click **Save**.

You can now click **Deploy** and deploy the policy to assigned devices. The changes are not active until you deploy them.

- Step 6** For ASA models, if you set the MTU above 1500 bytes, reload the system to enable jumbo frames.
-

Configure the MAC Address

You might need to manually assign a MAC address. You can also set the Active and Standby MAC addresses on the **Devices > Device Management > High Availability** tab. If you set the MAC address for an interface on both screens, the addresses on the **Interfaces > Advanced** tab take precedence.

Procedure

- Step 1** Select **Devices > Device Management** and click **Edit** () for your Firepower Threat Defense device. The **Interfaces** page is selected by default.
- Step 2** Click **Edit** () for the interface you want to edit.
- Step 3** Click the **Advanced** tab.
The **Information** tab is selected.
- Step 4** In the **Active MAC Address** field, enter a MAC address in H.H.H format, where H is a 16-bit hexadecimal digit.

For example, the MAC address 00-0C-F1-42-4C-DE would be entered as 000C.F142.4CDE. The MAC address must not have the multicast bit set, that is, the second hexadecimal digit from the left cannot be an odd number.
- Step 5** In the **Standby MAC Address** field, enter a MAC address for use with High Availability.

If the active unit fails over and the standby unit becomes active, the new active unit starts using the active MAC addresses to minimize network disruption, while the old active unit uses the standby address.
- Step 6** Click **OK**.
- Step 7** Click **Save**.

You can now click **Deploy** and deploy the policy to assigned devices. The changes are not active until you deploy them.
-

Add a Static ARP Entry

By default, all ARP packets are allowed between bridge group members. You can control the flow of ARP packets by enabling ARP inspection (see [Configure ARP Inspection, on page 761](#)). ARP inspection compares ARP packets with *static* ARP entries in the ARP table.

For routed interfaces, you can enter static ARP entries, but normally dynamic entries are sufficient. For routed interfaces, the ARP table is used to deliver packets to directly-connected hosts. Although senders identify a packet destination by an IP address, the actual delivery of the packet on Ethernet relies on the Ethernet MAC address. When a router or host wants to deliver a packet on a directly connected network, it sends an ARP request asking for the MAC address associated with the IP address, and then delivers the packet to the MAC address according to the ARP response. The host or router keeps an ARP table so it does not have to send ARP requests for every packet it needs to deliver. The ARP table is dynamically updated whenever ARP

responses are sent on the network, and if an entry is not used for a period of time, it times out. If an entry is incorrect (for example, the MAC address changes for a given IP address), the entry needs to time out before it can be updated with the new information.

For transparent mode, the Firepower Threat Defense only uses dynamic ARP entries in the ARP table for traffic to and from the Firepower Threat Defense device, such as management traffic.

Before you begin

This screen is only available for named interfaces.

Procedure

-
- Step 1** Select **Devices > Device Management** and click **Edit** () for your Firepower Threat Defense device. The **Interfaces** page is selected by default.
- Step 2** Click **Edit** () for the interface you want to edit.
- Step 3** Click the **Advanced** tab, and then click the **ARP** tab (called **ARP and MAC** for transparent mode).
- Step 4** Click **Add ARP Config**.
The **Add ARP Config** dialog box appears.
- Step 5** In the **IP Address** field, enter the IP address of the host.
- Step 6** In the **MAC Address** field, enter the MAC address of the host; for example, 00e0.1e4e.3d8b.
- Step 7** To perform proxy ARP for this address, check the **Enable Alias** check box.
- If the Firepower Threat Defense device receives an ARP request for the specified IP address, then it responds with the specified MAC address.
- Step 8** Click **OK**, and then click **OK** again to exit the Advanced settings.
- Step 9** Click **Save**.
- You can now click **Deploy** and deploy the policy to assigned devices. The changes are not active until you deploy them.
-

Add a Static MAC Address and Disable MAC Learning for a Transparent Mode Bridge Group

Normally, MAC addresses are added to the MAC address table dynamically as traffic from a particular MAC address enters an interface. You can disable MAC address learning; however, unless you statically add MAC addresses to the table, no traffic can pass through the Firepower Threat Defense device. You can also add static MAC addresses to the MAC address table. One benefit to adding static entries is to guard against MAC spoofing. If a client with the same MAC address as a static entry attempts to send traffic to an interface that does not match the static entry, then the Firepower Threat Defense device drops the traffic and generates a system message. When you add a static ARP entry (see [Add a Static ARP Entry, on page 539](#)), a static MAC address entry is automatically added to the MAC address table.

Before you begin

This screen is only available for named interfaces.

Procedure

-
- Step 1** Select **Devices > Device Management** and click **Edit** () for your Firepower Threat Defense device. The **Interfaces** page is selected by default.
- Step 2** Click **Edit** () for the interface you want to edit.
- Step 3** Click the **Advanced** tab, and then click the **ARP and MAC** tab.
- Step 4** (Optional) Disable MAC learning by unchecking the **Enable MAC Learning** check box.
- Step 5** To add a static MAC address, click **Add MAC Config**.
The **Add MAC Config** dialog box appears.
- Step 6** In the **MAC Address** field, enter the MAC address of the host; for example, 00e0.1e4e.3d8b. Click **OK**.
- Step 7** Click **OK** to exit the Advanced settings.
- Step 8** Click **Save**.

You can now click **Deploy** and deploy the policy to assigned devices. The changes are not active until you deploy them.

Set Security Configuration Parameters

This section describes how to prevent IP spoofing, allow full fragment reassembly, and override the default fragment setting set for at the device level in **Platform Settings** .

Anti-Spoofing

This section lets you enable Unicast Reverse Path Forwarding on an interface. Unicast RPF guards against IP spoofing (a packet uses an incorrect source IP address to obscure its true source) by ensuring that all packets have a source IP address that matches the correct source interface according to the routing table.

Normally, the Firepower Threat Defense device only looks at the destination address when determining where to forward the packet. Unicast RPF instructs the device to also look at the source address; this is why it is called Reverse Path Forwarding. For any traffic that you want to allow through the Firepower Threat Defense device, the device routing table must include a route back to the source address. See RFC 2267 for more information.

For outside traffic, for example, the Firepower Threat Defense device can use the default route to satisfy the Unicast RPF protection. If traffic enters from an outside interface, and the source address is not known to the routing table, the device uses the default route to correctly identify the outside interface as the source interface.

If traffic enters the outside interface from an address that is known to the routing table, but is associated with the inside interface, then the Firepower Threat Defense device drops the packet. Similarly, if traffic enters the inside interface from an unknown source address, the device drops the packet because the matching route (the default route) indicates the outside interface.

Unicast RPF is implemented as follows:

- ICMP packets have no session, so each packet is checked.

- UDP and TCP have sessions, so the initial packet requires a reverse route lookup. Subsequent packets arriving during the session are checked using an existing state maintained as part of the session. Non-initial packets are checked to ensure they arrived on the same interface used by the initial packet.

Fragment per Packet

By default, the Firepower Threat Defense device allows up to 24 fragments per IP packet, and up to 200 fragments awaiting reassembly. You might need to let fragments on your network if you have an application that routinely fragments packets, such as NFS over UDP. However, if you do not have an application that fragments traffic, we recommend that you do not allow fragments through the Firepower Threat Defense device. Fragmented packets are often used as DoS attacks.

Fragment Reassembly

The Firepower Threat Defense device performs the following fragment reassembly processes:

- IP fragments are collected until a fragment set is formed or until a timeout interval has elapsed.
- If a fragment set is formed, integrity checks are performed on the set. These checks include no overlapping, no tail overflow, and no chain overflow.
- IP fragments that terminate at the Firepower Threat Defense device are always fully reassembled.
- If **Full Fragment Reassembly** is disabled (the default), the fragment set is forwarded to the transport layer for further processing.
- If **Full Fragment Reassembly** is enabled, the fragment set is first coalesced into a single IP packet. The single IP packet is then forwarded to the transport layer for further processing.

Before you begin

This screen is only available for named interfaces.

Procedure

-
- Step 1** Select **Devices > Device Management** and click **Edit** () for your Firepower Threat Defense device. The **Interfaces** page is selected by default.
- Step 2** Click **Edit** () for the interface you want to edit.
- Step 3** Click the **Advanced** tab, and then click the **Security Configuration** tab.
- Step 4** To enable Unicast Reverse Path Forwarding, check the **Anti-Spoofing** check box.
- Step 5** To enable full fragment reassembly, check the **Full Fragment Reassembly** check box.
- Step 6** To change the number of fragments allowed per packet, check the **Override Default Fragment Setting** check box, and set the following values:
- **Size**—Set the maximum number of packets that can be in the IP reassembly database waiting for reassembly. The default is 200. Set this value to 1 to disable fragments.
 - **Chain**—Set the maximum number of packets into which a full IP packet can be fragmented. The default is 24 packets.
 - **Timeout**—Set the maximum number of seconds to wait for an entire fragmented packet to arrive. The timer starts after the first fragment of a packet arrives. If all fragments of the packet do not arrive by the

number of seconds specified, all fragments of the packet that were already received will be discarded. The default is 5 seconds.

Step 7 Click **OK**.

Step 8 Click **Save**.

You can now click **Deploy** and deploy the policy to assigned devices. The changes are not active until you deploy them.

CHAPTER 27

Inline Sets and Passive Interfaces for Firepower Threat Defense

You can configure IPS-only passive interfaces, passive ERSPAN interfaces, and inline sets. IPS-only mode interfaces bypass many firewall checks and only support IPS security policy. You might want to implement IPS-only interfaces if you have a separate firewall protecting these interfaces and do not want the overhead of firewall functions.

- [About IPS Interfaces, on page 545](#)
- [Guidelines for Inline Sets and Passive Interfaces, on page 546](#)
- [Configure a Passive Interface, on page 547](#)
- [Configure an Inline Set, on page 549](#)

About IPS Interfaces

This section describes IPS interfaces.

IPS Interface Types

IPS-only mode interfaces bypass many firewall checks and only support IPS security policy. You might want to implement IPS-only interfaces if you have a separate firewall protecting these interfaces and do not want the overhead of firewall functions.

Note The firewall mode only affects regular firewall interfaces, and not IPS-only interfaces such as inline sets or passive interfaces. IPS-only interfaces can be used in both firewall modes.

IPS-only interfaces can be deployed as the following types:

- **Inline Set, with optional Tap mode**—An inline set acts like a bump on the wire, and binds two interfaces together to slot into an existing network. This function allows the FTD to be installed in any network environment without the configuration of adjacent network devices. Inline interfaces receive all traffic unconditionally, but all traffic received on these interfaces is retransmitted out of an inline set unless explicitly dropped.

With tap mode, the FTD is deployed inline, but the network traffic flow is undisturbed. Instead, the FTD makes a copy of each packet so that it can analyze the packets. Note that rules of these types do generate

intrusion events when they are triggered, and the table view of intrusion events indicates that the triggering packets would have dropped in an inline deployment. There are benefits to using tap mode with FTDs that are deployed inline. For example, you can set up the cabling between the FTD and the network as if the FTD were inline and analyze the kinds of intrusion events the FTD generates. Based on the results, you can modify your intrusion policy and add the drop rules that best protect your network without impacting its efficiency. When you are ready to deploy the FTD inline, you can disable tap mode and begin dropping suspicious traffic without having to reconfigure the cabling between the FTD and the network.

Note Tap mode *significantly* impacts FTD performance, depending on the traffic.

Note Inline sets might be familiar to you as "transparent inline sets," but the inline interface type is unrelated to the transparent firewall mode or the firewall-type interfaces.

- Passive or ERSPAN Passive—Passive interfaces monitor traffic flowing across a network using a switch SPAN or mirror port. The SPAN or mirror port allows for traffic to be copied from other ports on the switch. This function provides the system visibility within the network without being in the flow of network traffic. When you configure the FTD in a passive deployment, the FTD cannot take certain actions such as blocking or shaping traffic. Passive interfaces receive all traffic unconditionally, and no traffic received on these interfaces is retransmitted. Encapsulated remote switched port analyzer (ERSPAN) interfaces allow you to monitor traffic from source ports distributed over multiple switches, and uses GRE to encapsulate the traffic. ERSPAN interfaces are only allowed when the FTD is in routed firewall mode.

Note Using SR-IOV interfaces as passive interfaces on NGFWv is not supported on some Intel network adapters (such as Intel X710 or 82599) using SR-IOV drivers due to a promiscuous mode restriction. In such cases, use a network adapter that supports this functionality. See [Intel Ethernet Products](#) for more information on Intel network adapters.

Guidelines for Inline Sets and Passive Interfaces

Firewall Mode

- ERSPAN interfaces are only allowed when the device is in routed firewall mode.
- Firepower Threat Defense cannot load balance GRE traffic to multiple Rx rings. Flow-offload feature does not work for ERSPAN traffic. Hence, high rate of ERSPAN traffic can cause packet drop and impact the Firepower Threat Defense performance.

General Guidelines

- Inline sets and passive interfaces support physical interfaces only, and cannot use EtherChannels, redundant interfaces, VLANs, and so on.
- Inline sets and passive interfaces are supported in intra-chassis and inter-chassis clustering.
- Bidirectional Forwarding Detection (BFD) echo packets are not allowed through the Firepower Threat Defense when using inline sets. If there are two neighbors on either side of the Firepower Threat Defense running BFD, then the Firepower Threat Defense will drop BFD echo packets because they have the same source and destination IP address and appear to be part of a LAND attack.
- For inline sets and passive interfaces, the FTD supports up to two 802.1Q headers in a packet (also known as Q-in-Q support), with the exception of the Firepower 4100/9300, which only supports one 802.1Q header. **Note:** Firewall-type interfaces do not support Q-in-Q, and only support one 802.1Q header.

Unsupported Firewall Features on IPS Interfaces

- DHCP server
- DHCP relay
- DHCP client
- TCP Intercept
- Routing
- NAT
- VPN
- Application inspection
- QoS
- NetFlow
- VXLAN

Configure a Passive Interface

This section describes how to:

- Enable the interface. By default, interfaces are disabled.
- Set the interface mode to Passive or ERSPAN. For ERSPAN interfaces, you will set the ERSPAN parameters and the IP address.
- Change the MTU. By default, the MTU is set to 1500 bytes. For more information about the MTU, see [About the MTU, on page 535](#).
- Set a specific speed and duplex (if available). By default, speed and duplex are set to Auto.

Note For the Firepower Threat Defense on the FXOS chassis, you configure basic interface settings on the Firepower 4100/9300 chassis. See [Configure a Physical Interface, on page 490](#) for more information.

Procedure

- Step 1** Select **Devices > Device Management** and click **Edit** () for your Firepower Threat Defense device. The **Interfaces** page is selected by default.
- Step 2** Click **Edit** () for the interface you want to edit.
- Step 3** In the **Mode** drop-down list, choose **Passive** or **Erspan**.
- Step 4** Enable the interface by checking the **Enabled** check box.
- Step 5** In the **Name** field, enter a name up to 48 characters in length.
- Step 6** From the **Security Zone** drop-down list, choose a security zone or add a new one by clicking **New**.
- Step 7** (Optional) Add a description in the **Description** field.
The description can be up to 200 characters on a single line, without carriage returns.
- Step 8** (Optional) On **General**, set the **MTU** between 64 and 9198 bytes; for the Firepower Threat Defense Virtual and Firepower Threat Defense on the FXOS chassis, the maximum is 9000 bytes.
The default is 1500 bytes.
- Step 9** For ERSPAN interfaces, set the following parameters:
- **Flow Id**—Configure the ID used by the source and destination sessions to identify the ERSPAN traffic, between 1 and 1023. This ID must also be entered in the ERSPAN destination session configuration.
 - **Source IP**—Configure the IP address used as the source of the ERSPAN traffic.
- Step 10** For ERSPAN interfaces, set the IPv4 address and mask on **IPv4**.
- Step 11** (Optional) Set the duplex and speed by clicking **Hardware Configuration**.
The exact speed and duplex options depend on your hardware.
- **Duplex**—Choose **Full**, **Half**, or **Auto**. Auto is the default.
 - **Speed**—Choose **10**, **100**, **1000**, or **Auto**. Auto is the default.
- Step 12** Click **OK**.
- Step 13** Click **Save**.
You can now click **Deploy** and deploy the policy to assigned devices. The changes are not active until you deploy them.

Configure an Inline Set

This section enables and names two physical interfaces that you can add to an inline set.

Note For the FTD on the FXOS chassis, you configure basic interface settings on the Firepower 4100/9300 chassis. See [Configure a Physical Interface, on page 490](#) for more information.

Before you begin

- We recommend that you set STP PortFast for STP-enabled switches that connect to the FTD inline pair interfaces.

Procedure

- Step 1** Select **Devices > Device Management** and click **Edit** () for your Firepower Threat Defense device. The **Interfaces** page is selected by default.
- Step 2** Click **Edit** () for the interface you want to edit.
- Step 3** In the **Mode** drop-down list, choose **None**.
After you add this interface to an inline set, this field will show **Inline** for the mode.
- Step 4** Enable the interface by checking the **Enabled** check box.
- Step 5** In the **Name** field, enter a name up to 48 characters in length.
Do not set the security zone yet; you must set it after you create the inline set later in this procedure.
- Step 6** (Optional) Add a description in the **Description** field.
The description can be up to 200 characters on a single line, without carriage returns.
- Step 7** (Optional) Set the duplex and speed by clicking **Hardware Configuration**.
The exact speed and duplex options depend on your hardware.
 - **Duplex**—Choose **Full**, **Half**, or **Auto**. **Auto** is the default.
 - **Speed**—Choose **10**, **100**, **1000**, or **Auto**. **Auto** is the default.
- Step 8** Click **OK**.
Do not set any other settings for this interface.
- Step 9** Click **Edit** () for the second interface you want to add to the inline set.
- Step 10** Configure the settings as for the first interface.
- Step 11** Click **Inline Sets**.
- Step 12** Click **Add Inline Set**.

The **Add Inline Set** dialog box appears with **General** selected.

Step 13 In the **Name** field, enter a name for the set.

Step 14 (Optional) Change the **MTU** to enable jumbo frames.

For inline sets, the MTU setting is not used. However, the jumbo frame setting *is* relevant to inline sets; jumbo frames enable the inline interfaces to receive packets up to 9000 bytes. To enable jumbo frames, you must set the MTU of *any* interface on the device above 1500 bytes.

Step 15 (Optional) To specify that traffic is allowed to bypass detection and continue through the device in the case of a sensor failure, check the **Failsafe** check box.

Managed devices monitor internal traffic buffers and bypass detection if those buffers are full.

Step 16 In the **Available Interfaces Pairs** area, click a pair and then click **Add** to move it to the **Selected Interface Pair** area.

All possible pairings between named and enabled interfaces with the mode set to None show in this area.

Step 17 (Optional) Click **Advanced** to set the following optional parameters:

- **Tap Mode**—Set to inline tap mode.

Note that you cannot enable this option and strict TCP enforcement on the same inline set.

Note Tap mode *significantly* impacts the FTD performance, depending on the traffic.

- **Propagate Link State**—Configure link state propagation.

Link state propagation automatically brings down the second interface in the inline interface pair when one of the interfaces in an inline set goes down. When the downed interface comes back up, the second interface automatically comes back up, also. In other words, if the link state of one interface changes, the device senses the change and updates the link state of the other interface to match it. Note that devices require up to 4 seconds to propagate link state changes. Link state propagation is especially useful in resilient network environments where routers are configured to reroute traffic automatically around network devices that are in a failure state.

Note This feature is not supported on the Firepower 4100/9300 chassis.

- **Strict TCP Enforcement**—To maximize TCP security, you can enable strict enforcement, which blocks connections where the three-way handshake was not completed.

Strict enforcement also blocks:

- Non-SYN TCP packets for connections where the three-way handshake was not completed
- Non-SYN/RST packets from the initiator on a TCP connection before the responder sends the SYN-ACK
- Non-SYN-ACK/RST packets from the responder on a TCP connection after the SYN but before the session is established
- SYN packets on an established TCP connection from either the initiator or the responder

Step 18 Click **Interfaces**.

Step 19 Click **Edit** () for one of the member interfaces.

- Step 20** From the **Security Zone** drop-down list, choose a security zone or add a new one by clicking **New**.
You can only set the zone after you add the interface to the inline set; adding it to an inline set configures the mode to Inline and lets you choose inline-type security zones.
- Step 21** Click **OK**.
- Step 22** Set the security zone for the second interface.
- Step 23** Click **Save**.
You can now click **Deploy** and deploy the policy to assigned devices. The changes are not active until you deploy them.
-

CHAPTER 28

DHCP and DDNS Services for Threat Defense

The following topics explain DHCP and DDNS services and how to configure them on Threat Defense devices.

- [About DHCP and DDNS Services, on page 553](#)
- [Requirements and Prerequisites for DHCP and DDNS, on page 554](#)
- [Guidelines for DHCP and DDNS Services, on page 554](#)

About DHCP and DDNS Services

The following topics describe the DHCP server, DHCP relay agent, and DDNS update.

About the DHCPv4 Server

DHCP provides network configuration parameters, such as IP addresses, to DHCP clients. The FTD device can provide a DHCP server to DHCP clients attached to FTD device interfaces. The DHCP server provides network configuration parameters directly to DHCP clients.

An IPv4 DHCP client uses a broadcast rather than a multicast address to reach the server. The DHCP client listens for messages on UDP port 68; the DHCP server listens for messages on UDP port 67.

The DHCP server for IPv6 is not supported.

DHCP Options

DHCP provides a framework for passing configuration information to hosts on a TCP/IP network. The configuration parameters are carried in tagged items that are stored in the Options field of the DHCP message and the data are also called options. Vendor information is also stored in Options, and all of the vendor information extensions can be used as DHCP options.

For example, Cisco IP Phones download their configuration from a TFTP server. When a Cisco IP Phone starts, if it does not have both the IP address and TFTP server IP address preconfigured, it sends a request with option 150 or 66 to the DHCP server to obtain this information.

- DHCP option 150 provides the IP addresses of a list of TFTP servers.
- DHCP option 66 gives the IP address or the hostname of a single TFTP server.

- DHCP option 3 sets the default route.

A single request might include both options 150 and 66. In this case, the ASA DHCP server provides values for both options in the response if they are already configured on the ASA.

You can use advanced DHCP options to provide DNS, WINS, and domain name parameters to DHCP clients; DHCP option 15 is used for the DNS domain suffix. You can also use the DHCP automatic configuration setting to obtain these values or define them manually. When you use more than one method to define this information, it is passed to DHCP clients in the following sequence:

1. Manually configured settings.
2. Advanced DHCP options settings.
3. DHCP automatic configuration settings.

For example, you can manually define the domain name that you want the DHCP clients to receive and then enable DHCP automatic configuration. Although DHCP automatic configuration discovers the domain together with the DNS and WINS servers, the manually defined domain name is passed to DHCP clients with the discovered DNS and WINS server names, because the domain name discovered by the DHCP automatic configuration process is superseded by the manually defined domain name.

About the DHCP Relay Agent

You can configure a DHCP relay agent to forward DHCP requests received on an interface to one or more DHCP servers. DHCP clients use UDP broadcasts to send their initial DHCPDISCOVER messages because they do not have information about the network to which they are attached. If the client is on a network segment that does not include a server, UDP broadcasts normally are not forwarded by the FTD device because it does not forward broadcast traffic. The DHCP relay agent lets you configure the interface of the FTD device that is receiving the broadcasts to forward DHCP requests to a DHCP server on another interface.

Requirements and Prerequisites for DHCP and DDNS

Model Support

FTD

User Roles

- Admin
- Access Admin
- Network Admin

Guidelines for DHCP and DDNS Services

This section includes guidelines and limitations that you should check before configuring DHCP and DDNS services.

Firewall Mode

- DHCP Relay is not supported in transparent firewall mode.
- DHCP Server is supported in transparent firewall mode on a bridge group member interface.
- DDNS is not supported in transparent firewall mode.

IPv6

Does not support IPv6.

DHCPv4 Server

- The maximum available DHCP pool is 256 addresses.
- You can configure only one DHCP server on each interface. Each interface can have its own pool of addresses to use. However the other DHCP settings, such as DNS servers, domain name, options, ping timeout, and WINS servers, are configured globally and used by the DHCP server on all interfaces.
- You cannot configure an interface as a DHCP client if that interface also has DHCP server enabled; you must use a static IP address.
- You cannot configure both a DHCP server and DHCP relay on the same device, even if you want to enable them on different interfaces; you can only configure one type of service.
- FTD device does not support QIP DHCP servers for use with the DHCP proxy service.
- The DHCP server does not support BOOTP requests.

DHCP Relay

- You can configure a maximum of 10 DHCPv4 relay servers, global and interface-specific servers combined, with a maximum of 4 servers per interface.
- You cannot configure both a DHCP server and DHCP relay on the same device, even if you want to enable them on different interfaces; you can only configure one type of service.
- DHCP relay services are not available in transparent firewall mode. You can, however, allow DHCP traffic through using an access rule. To allow DHCP requests and replies through the FTD device, you need to configure two access rules, one that allows DHCP requests from the inside interface to the outside (UDP destination port 67), and one that allows the replies from the server in the other direction (UDP destination port 68).
- For IPv4, clients must be directly-connected to the FTD device and cannot send requests through another relay agent or a router.
- The DHCP clients must be on different interfaces from the DHCP servers to which the FTD device relays requests.
- You cannot enable DHCP Relay on an interface in a traffic zone.
- DHCP relay is not supported on Virtual Tunnel Interfaces (VTIs).

Configure the DHCP Server

See the following steps to configure a DHCP server.

Procedure

- Step 1** Choose **Devices > Device Management**, and edit the Firepower Threat Defense device.
- Step 2** Select **DHCP > DHCP Server**.
- Step 3** Configure the following DHCP server options:
- **Ping Timeout**—The amount of time in milliseconds that Firepower Threat Defense device waits to time out a DHCP ping attempt. Valid values range from 10 to 10000 milliseconds. The default value is 50 milliseconds.

To avoid address conflicts, the Firepower Threat Defense device sends two ICMP ping packets to an address before assigning that address to a DHCP client.
 - **Lease Length**—The amount of time in seconds that the client may use its allocated IP address before the lease expires. Valid values range from 300 to 1048575 seconds. The default value is 3600 seconds (1 hour).
 - (Routed mode) **Auto-configuration**—Enables DHCP auto configuration on the Firepower Threat Defense device. Auto-configuration enables the DHCP server to provide the DHCP clients with the DNS server, domain name, and WINS server information obtained from a DHCP client running on the specified interface. Otherwise, you can disable auto configuration and add the values yourself in Step 4.
 - (Routed mode) **Interface**—Specifies the interface to be used for auto configuration.
- Step 4** To override auto-configured settings, do the following:
- Enter the domain name of the interface. For example, your device may be in the Your_Company domain.
 - From the drop-down list, choose the DNS servers (primary and secondary) configured for the interface. To add a new DNS server, see [Creating Network Objects, on page 354](#).
 - From the drop-down list, choose the WINS servers (primary and secondary) configured for the interface. To add a new WINS server, see [Creating Network Objects, on page 354](#).
- Step 5** Select **Server**, click **Add**, and configure the following options:
- **Interface**—Choose the interface from the drop-down list. In transparent mode, specify a named bridge group member interface.
 - **Address Pool**—The range of IP addresses from lowest to highest that is used by the DHCP server. The range of IP addresses must be on the same subnet as the selected interface and cannot include the IP address of the interface itself.
 - **Enable DHCP Server**—Enables the DHCP server on the selected interface.
- Step 6** Click **OK** to save the DHCP server configuration.

Step 7 (Optional) Select **Advanced**, click **Add**, and specify the type of information you want the option to return to the DHCP client:

- **Option Code**—The Firepower Threat Defense device supports the DHCP options listed in RFC 2132, RFC 2562, and RFC 5510 to send information. All DHCP options (1 through 255) are supported except for 1, 12, 50–54, 58–59, 61, 67, and 82. See [About the DHCPv4 Server, on page 553](#) for more information on DHCP option codes.

Note The Firepower Threat Defense device does not verify that the option type and value that you provide match the expected type and value for the option code, as defined in RFC 2132. For more information about option codes and their associated types and expected values, see RFC 2132.

- **Type**—DHCP option type. Available options include **IP**, **ASCII**, and **HEX**. If you chose IP, you must add IP addresses in the IP Address fields. If you chose ASCII, you must add the ASCII value in the ASCII field. If you chose HEX, you must add the HEX value in the HEX field.
- **IP Address 1** and **IP Address 2**—The IP address(es) to be returned with this option code. To add a new IP address, see [Creating Network Objects, on page 354](#).
- **ASCII**—The ASCII value that is returned to the DHCP client. The string cannot include spaces.
- **HEX**—The HEX value that is returned to the DHCP client. The string must have an even number of digits and no spaces. You do not need to use a 0x prefix.

Step 8 Click **OK** to save the option code configuration.

Step 9 Click **Save** on the DHCP page to save your changes.

Configure the DHCP Relay Agent

You can configure a DHCP relay agent to forward DHCP requests received on an interface to one or more DHCP servers. DHCP clients use UDP broadcasts to send their initial DHCPDISCOVER messages because they do not have information about the network to which they are attached. If the client is on a network segment that does not include a server, UDP broadcasts normally are not forwarded by the Firepower Threat Defense device because it does not forward broadcast traffic.

You can remedy this situation by configuring the interface of the Firepower Threat Defense device that is receiving the broadcasts to forward DHCP requests to a DHCP server on another interface.

Note DHCP Relay is not supported in transparent firewall mode or for IPv6 traffic.

Procedure

Step 1 Choose **Devices > Device Management**, and edit the Firepower Threat Defense device.

Step 2 Select **DHCP > DHCP Relay**.

- Step 3** In the **Timeout** field, enter the amount of time in seconds that the Firepower Threat Defense device waits to time out the DHCP relay agent. Valid values range from 1 to 3600 seconds. The default value is 60 seconds. The timeout is for address negotiation through the local DHCP Relay agent.
- Step 4** On **DHCP Relay Agent**, click **Add**, and configure the following options:
- **Interface**—The interface connected to the DHCP clients.
 - **Enable DHCP Relay**—Enables IPv4 DHCP Relay for this interface.
 - **Set Route**—Changes the default gateway address in the DHCP message from the server to that of the Firepower Threat Defense device interface that is closest to the DHCP client, which relayed the original DHCP request. This action allows the client to set its default route to point to the Firepower Threat Defense device even if the DHCP server specifies a different router. If there is no default router option in the packet, the Firepower Threat Defense device adds one containing the interface address.
- Step 5** Click **OK** to save the DHCP relay agent changes.
- Step 6** On **DHCP Servers**, click **Add**, and configure the following options:
- **Server**—The IP address of the DHCP server. Chose an IP address from the drop-down list. To add a new one, see [Creating Network Objects, on page 354](#)
 - **Interface**—The interface to which the specified DHCP server is attached. The DHCP Relay agent and the DHCP server cannot be configured on the same interface.
- Step 7** Click **OK** to save the DHCP server changes.
- Step 8** Click **Save** on the DHCP page to save your changes.
-

Configure Dynamic DNS

When an interface uses DHCP IP addressing, the assigned IP address can change when the DHCP lease is renewed. When the interface needs to be reachable using a fully qualified domain name (FQDN), the IP address change can cause the DNS server resource records (RRs) to become stale. Dynamic DNS (DDNS) provides a mechanism to update DNS RRs whenever the IP address or hostname changes. You can also use DDNS for static or PPPoE IP addressing.

DDNS updates the following RRs on the DNS server: the A RR includes the name-to-IP address mapping, while the PTR RR maps addresses to names.

The FTD supports the DDNS update method is defined by RFC 2136. It does not support the Web update method. With this method, the FTD and the DHCP server use DNS requests to update the DNS RRs. The FTD or DHCP server sends a DNS request to its local DNS server for information about the hostname and, based on the response, determines the main DNS server that owns the RRs. The FTD or DHCP server then sends an update request directly to the main DNS server. See the following typical scenarios.

- The FTD updates the A RR, and the DHCP server updates the PTR RR.

Typically, the FTD "owns" the A RR, while the DHCP server "owns" the PTR RR, so both entities need to request updates separately. When the IP address or hostname changes, the FTD sends a DHCP request to the DHCP server to inform it that it needs to request a PTR RR update.

- The DHCP server updates both the A and PTR RR.

Use this scenario if the FTD does not have the authority to update the A RR. When the IP address or hostname changes, the FTD sends a DHCP request to the DHCP server to inform it that it needs to request an A and PTR RR update.

You can configure different ownership depending on your security needs and the requirements of the main DNS server. For example, for a static address, the FTD should own the updates for both records.

The **DDNS** page also supports setting DHCP server settings relating to DDNS.

Note DDNS is not supported on the BVI or bridge group member interfaces.

Before you begin

- Configure the device hostname. You can configure the hostname when you perform the FTD initial setup, or by using the **configure network hostname** command. If you do not specify the hostname per interface, then the device hostname is used.

Procedure

Step 1 Choose **Devices > Device Management**, and edit the Firepower Threat Defense device.

Step 2 Choose **DHCP > DDNS**.

Step 3 Configure a DDNS update method to enable DNS requests from the FTD.

You do not need to configure a DDNS update method if the DHCP server will perform all requests.

- a) On **DDNS Update Methods**, click **Add**.
- b) Set the **Method Name**.
- c) (Optional) Configure the **Update Interval** between DNS requests. By default when all values are set to 0, update requests are sent whenever the IP address or hostname changes. To send requests regularly, set the **Days** (0-364), **Hours**, **Minutes**, and **Seconds**.
- d) Set the **Update Records** you want the FTD to update.

This setting only affects the records you want to update directly from the FTD; to determine the records you want the DHCP server to update, configure the DHCP client settings per interface or globally. See [Step 4, on page 559](#).

- **Not Defined**—Disables DNS updates from the FTD.
- **Both A and PTR Records**—Sets the FTD to update both A and PTR RRs. Use this option for static or PPPoE IP addressing.
- **A Records**—Sets the FTD to update the A RR only. Use this option if you want the DHCP server to update the PTR RR.

- e) Click **OK**.
- f) Assign this method to the interface in [Step 4, on page 559](#).

Step 4 Configure interface settings for DDNS, including setting the update method, DHCP client settings, and the hostname for this interface.

- a) On **DDNS Interface Settings**, click **Add**.

- b) Choose the **Interface** from the drop-down list.
- c) Choose the **Method Name** that you created on the **DDNS Update Methods** page.

You do not need to assign a method if you want the DHCP server to perform all updates.

- d) Set the **Host Name** for this interface.

If you do not set the hostname, the device hostname is used. If you do not specify an FQDN, then the default domain from the DNS server group is appended (for static or PPPoE IP addressing) or the domain name from the DHCP server is appended (for DHCP IP addressing).

- e) Configure the **DHCP Client requests DHCP server to update requests** to determine which records you want the DHCP server to update.

The FTD sends DHCP client requests to the DHCP server. Note that the DHCP server must also be configured to support DDNS. The server can be configured to honor the client requests, or it can override the client (in which case, it will reply to the client so the client does not also try to perform updates that the server is performing).

For static or PPPoE IP addressing, these settings are ignored.

Note You can also set these values globally for all interfaces on the **DDNS** page. The per-interface settings take precedence over the global settings.

- **Not Selected**—Disables DDNS requests to the DHCP server. Even if the client does not request DDNS updates, the DHCP server can be configured to send updates anyway.
- **No Update**—Requests the DHCP server not to perform updates. This setting works in conjunction with a DDNS update method with **Both A and PTR Records** enabled.
- **Only PTR**—Requests that the DHCP server perform the PTR RR update. This setting works in conjunction with a DDNS update method with **A Records** enabled.
- **Both A and PTR Records**—Requests that the DHCP server perform both A and PTR RR updates. This setting does not require a DDNS update method to be associated with the interface.

- f) Click **OK**.

Note The **Dynamic DNS Update** settings relate to DHCP server settings when you enable a DHCP server on the FTD. See Step [Step 5, on page 560](#) for more information.

Step 5 If you enable the DHCP server on an FTD, you can configure DHCP server settings for DDNS.

To enable the DHCP server, see [Configure the DHCP Server, on page 556](#)). You can configure the server behavior when DHCP clients use the standard DDNS update method. If the server performs any updates, then if the client lease expires (and is not renewed), the server will request that the DNS server remove the RRs for which it was responsible.

- a) You can configure server settings globally or per interface. For global settings, see the main **DDNS** page. For per-interface settings, see the **DDNS Interface Settings** page. Interface settings take precedence over global settings.
- b) Configure which DNS RRs you want the DHCP server to update under **Dynamic DNS Update**.
 - **Not Selected**—DDNS updates are disabled, even if the client requests them.
 - **Only PTR**—Enables DDNS updates. If you enable the **Override DHCP Client Requests** setting, then the server will only update the PTR RR. Otherwise, the server will update RRs that the client

requests. If the client does not send an update request with the FQDN option, the server will request an update for both A and PTR RRs using the hostname discovered in DHCP option 12.

- **Both A and PTR Records**—Enables DDNS updates. If you enable the **Override DHCP Client Requests** setting, then the server will update both the A and PTR RRs. Otherwise, the server will update RRs that the client requests. If the client does not send an update request with the FQDN option, the server will request an update for both A and PTR RRs using the hostname discovered in DHCP option 12.

- c) To override the update actions requested by the DHCP client, check **Override DHCP Client Requests**. The server will reply to the client that the request was overridden, so the client does not also try to perform updates that the server is performing.

Step 6 (Optional) Configure general DHCP client settings. These settings are not related to DDNS, but are related to how the DHCP client behaves.

- a) On the **DDNS** page, check **Enable DHCP Client Broadcast** to request that the DHCP server broadcast the DHCP reply (DHCP option 1).
- b) To force a MAC address to be stored inside a DHCP request packet for option 61 instead of the default internally generated string, on **DDNS > DHCP Client ID Interface**, choose the interface from the **Available Interfaces** list, and then click **Add** to move it to the **Selected Interfaces** list.

Some ISPs expect option 61 to be the interface MAC address. If the MAC address is not included in the DHCP request packet, then an IP address will not be assigned. This setting does not directly relate to DDNS, but is a general DHCP client setting.

Step 7 Click **Save** on the Device page to save your changes.

PART **IX**

Firepower Threat Defense High Availability and Scalability

- [High Availability for FTD, on page 565](#)
- [Clustering for the Firepower Threat Defense, on page 591](#)

CHAPTER 29

High Availability for FTD

The following topics describe how to configure Active/Standby failover to accomplish high availability of the Firepower Threat Defense.

- [About Firepower Threat Defense High Availability, on page 565](#)
- [Requirements and Prerequisites for High Availability, on page 578](#)
- [Guidelines for High Availability, on page 579](#)
- [Add a Firepower Threat Defense High Availability Pair, on page 580](#)
- [Configure Optional High Availability Parameters, on page 582](#)
- [Manage High Availability, on page 584](#)
- [Monitoring High Availability, on page 588](#)

About Firepower Threat Defense High Availability

Configuring high availability, also called failover, requires two identical Firepower Threat Defense devices connected to each other through a dedicated failover link and, optionally, a state link. Firepower Threat Defense supports Active/Standby failover, where one unit is the active unit and passes traffic. The standby unit does not actively pass traffic, but synchronizes configuration and other state information from the active unit. When a failover occurs, the active unit fails over to the standby unit, which then becomes active.

The health of the active unit (hardware, interfaces, software, and environmental status) is monitored to determine if specific failover conditions are met. If those conditions are met, failover occurs.

Note High availability is not supported on Firepower Threat Defense Virtual running in the public cloud.

High Availability System Requirements

This section describes the hardware, software, and license requirements for Firepower Threat Defense devices in a High Availability configuration.

Hardware Requirements

The two units in a High Availability configuration must:

- Be the same model.

- Have the same number and types of interfaces.

For the Firepower 4100/9300 chassis, all interfaces must be preconfigured in FXOS identically before you enable High Availability. If you change the interfaces after you enable High Availability, make the interface changes in FXOS on the Standby unit, and then make the same changes on the Active unit.

If you are using units with different flash memory sizes in your High Availability configuration, make sure the unit with the smaller flash memory has enough space to accommodate the software image files and the configuration files. If it does not, configuration synchronization from the unit with the larger flash memory to the unit with the smaller flash memory will fail.

Software Requirements

The two units in a High Availability configuration must:

- Be in the same firewall mode (routed or transparent).
- Have the same software version.
- Be in the same domain or group on the FMC.
- Have the same NTP configuration. See [Configure NTP Time Synchronization for Threat Defense, on page 789](#).
- Be fully deployed on the FMC with no uncommitted changes.
- Not have DHCP or PPPoE configured in any of their interfaces.

License Requirements for FTD Devices in a High Availability Pair

Firepower Threat Defense devices in a high availability configuration must have the same licenses.

High availability configurations require two Smart License entitlements; one for each device in the pair.

Before high availability is established, it does not matter which licenses are assigned to the secondary/standby device. During high availability configuration, the Firepower Management Center releases any unnecessary licenses assigned to the standby device and replaces them with identical licenses assigned to the primary/active device. For example, if the active device has a Base license and a Threat license, and the standby device has only a Base license, the Firepower Management Center communicates with the Cisco Smart Software Manager to obtain an available Threat license from your account for the standby device. If your Smart Licenses account does not include enough purchased entitlements, your account becomes Out-of-Compliance until you purchase the correct number of licenses.

In a virtual Firepower Management Center high availability configuration, each FTD to be registered requires an additional Firepower MCV Device license.

Failover and Stateful Failover Links

The failover link and the optional stateful failover link are dedicated connections between the two units. Cisco recommends to use the same interface between two devices in a failover link or a stateful failover link. For example, in a failover link, if you have used eth0 in device 1, use the same interface (eth0) in device 2 as well.

Failover Link

The two units in a failover pair constantly communicate over a failover link to determine the operating status of each unit.

Failover Link Data

The following information is communicated over the failover link:

- The unit state (active or standby)
- Hello messages (keep-alives)
- Network link status
- MAC address exchange
- Configuration replication and synchronization

Interface for the Failover Link

You can use an unused data interface (physical, redundant, or EtherChannel) as the failover link; however, you cannot specify an interface that is currently configured with a name. You also cannot use a subinterface. The failover link interface is not configured as a normal networking interface; it exists for failover communication only. This interface can only be used for the failover link (and also for the state link).

The FTD does not support sharing interfaces between user data and the failover link.

Note When using an EtherChannel or redundant interface as the failover or state link, you must confirm that the same EtherChannel or redundant interface with the same member interfaces exists on both devices before establishing high availability.

See the following guidelines for the failover link:

- Firepower 4100/9300—We recommend that you use a 10 GB data interface for the combined failover and state link.
- All other models—1 GB interface is large enough for a combined failover and state link.

For a redundant interface used as the failover link, see the following benefits for added redundancy:

- When a failover unit boots up, it alternates between the member interfaces to detect an active unit.
- If a failover unit stops receiving keepalive messages from its peer on one of the member interfaces, it switches to the other member interface.

The alternation frequency is equal to the unit hold time.

Note If you have a large configuration and a low unit hold time, alternating between the member interfaces can prevent the secondary unit from joining/re-joining. In this case, disable one of the member interfaces until after the secondary unit joins.

For an EtherChannel used as the failover link, to prevent out-of-order packets, only one interface in the EtherChannel is used. If that interface fails, then the next interface in the EtherChannel is used. You cannot alter the EtherChannel configuration while it is in use as a failover link.

Connecting the Failover Link

Connect the failover link in one of the following two ways:

- Using a switch, with no other device on the same network segment (broadcast domain or VLAN) as the failover interfaces of the Firepower Threat Defense device.
- Using an Ethernet cable to connect the units directly, without the need for an external switch.

If you do not use a switch between the units, if the interface fails, the link is brought down on both peers. This condition may hamper troubleshooting efforts because you cannot easily determine which unit has the failed interface and caused the link to come down.

Stateful Failover Link

To use Stateful Failover, you must configure a Stateful Failover link (also known as the state link) to pass connection state information.

Shared with the Failover Link

Sharing a failover link is the best way to conserve interfaces. However, you must consider a dedicated interface for the state link and failover link, if you have a large configuration and a high traffic network.

Dedicated Interface for the Stateful Failover Link

You can use a dedicated data interface (physical, redundant, or EtherChannel) for the state link. See [Interface for the Failover Link, on page 567](#) for requirements for a dedicated state link, and [Connecting the Failover Link, on page 568](#) for information about connecting the state link as well.

For optimum performance when using long distance failover, the latency for the state link should be less than 10 milliseconds and no more than 250 milliseconds. If latency is more than 10 milliseconds, some performance degradation occurs due to retransmission of failover messages.

Avoiding Interrupted Failover and Data Links

We recommend that failover links and data interfaces travel through different paths to decrease the chance that all interfaces fail at the same time. If the failover link is down, the Firepower Threat Defense device can use the data interfaces to determine if a failover is required. Subsequently, the failover operation is suspended until the health of the failover link is restored.

See the following connection scenarios to design a resilient failover network.

Scenario 1—Not Recommended

If a single switch or a set of switches are used to connect both failover and data interfaces between two Firepower Threat Defense devices, then when a switch or inter-switch-link is down, both Firepower Threat Defense devices become active. Therefore, the two connection methods shown in the following figures are **not** recommended.

Figure 13: Connecting with a Single Switch—Not Recommended

Figure 14: Connecting with a Double-Switch—Not Recommended

Scenario 2—Recommended

We recommend that failover links not use the same switch as the data interfaces. Instead, use a different switch or use a direct cable to connect the failover link, as shown in the following figures.

Figure 15: Connecting with a Different Switch

Figure 16: Connecting with a Cable

Scenario 3—Recommended

If the Firepower Threat Defense data interfaces are connected to more than one set of switches, then a failover link can be connected to one of the switches, preferably the switch on the secure (inside) side of network, as shown in the following figure.

Figure 17: Connecting with a Secure Switch

Scenario 4—Recommended

The most reliable failover configurations use a redundant interface on the failover link, as shown in the following figures.

Figure 18: Connecting with Redundant Interfaces

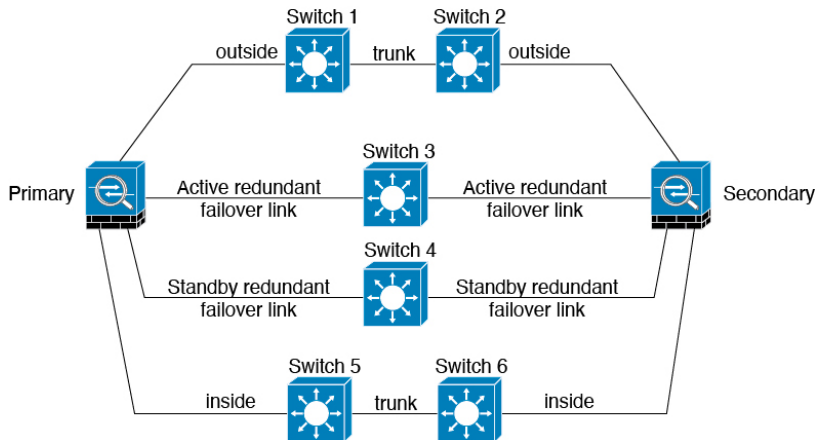

Figure 19: Connecting with Inter-switch Links

MAC Addresses and IP Addresses in High Availability

When you configure your interfaces, you can specify an active IP address and a standby IP address on the same network. Generally, when a failover occurs, the new active unit takes over the active IP addresses and MAC addresses. Because network devices see no change in the MAC to IP address pairing, no ARP entries change or time out anywhere on the network.

Note Although recommended, the standby address is not required. Without a standby IP address, the active unit cannot perform network tests to check the standby interface health; it can only track the link state. You also cannot connect to the standby unit on that interface for management purposes.

The IP address and MAC address for the state link do not change at failover.

Active/Standby IP Addresses and MAC Addresses

For Active/Standby High Availability, see the following for IP address and MAC address usage during a failover event:

1. The active unit always uses the primary unit's IP addresses and MAC addresses.
2. When the active unit fails over, the standby unit assumes the IP addresses and MAC addresses of the failed unit and begins passing traffic.
3. When the failed unit comes back online, it is now in a standby state and takes over the standby IP addresses and MAC addresses.

However, if the secondary unit boots without detecting the primary unit, then the secondary unit becomes the active unit and uses its own MAC addresses, because it does not know the primary unit MAC addresses. When the primary unit becomes available, the secondary (active) unit changes the MAC addresses to those of the primary unit, which can cause an interruption in your network traffic. Similarly, if you swap out the primary unit with new hardware, a new MAC address is used.

If you reload the standby unit with the failover configuration disabled, the standby unit boots up as the active unit and uses the primary unit's IP addresses and MAC addresses. This leads to duplicate IP addresses and causes network traffic disruptions. Use the command **configure high-availability resume** to enable failover and restore the traffic flow.

Virtual MAC addresses guard against this disruption, because the active MAC addresses are known to the secondary unit at startup, and remain the same in the case of new primary unit hardware. We recommend that you configure the virtual MAC address on both the primary and secondary units to ensure that the secondary unit uses the correct MAC addresses when it is the active unit, even if it comes online before the primary unit. If you do not configure virtual MAC addresses, you might need to clear the ARP tables on connected routers to restore traffic flow. The FTD device does not send gratuitous ARPs for static NAT addresses when the MAC address changes, so connected routers do not learn of the MAC address change for these addresses.

Virtual MAC Addresses

The FTD device has multiple methods to configure virtual MAC addresses. We recommend using only one method. If you set the MAC address using multiple methods, the MAC address used depends on many variables, and might not be predictable.

Stateful Failover

During Stateful Failover, the active unit continually passes per-connection state information to the standby unit. After a failover occurs, the same connection information is available at the new active unit. Supported end-user applications are not required to reconnect to keep the same communication session.

Supported Features

For Stateful Failover, the following state information is passed to the standby FTD device:

- NAT translation table.
- TCP and UDP connections and states, including HTTP connection states. Other types of IP protocols, and ICMP, are not parsed by the active unit, because they get established on the new active unit when a new packet arrives.
- Snort connection states, inspection results, and pin hole information, including strict TCP enforcement.

- The ARP table
- The Layer 2 bridge table (for bridge groups)
- GTP PDP connection database
- SIP signaling sessions and pin holes.
- Static and dynamic routing tables—Stateful Failover participates in dynamic routing protocols, like OSPF and EIGRP, so routes that are learned through dynamic routing protocols on the active unit are maintained in a Routing Information Base (RIB) table on the standby unit. Upon a failover event, packets travel normally with minimal disruption to traffic because the active secondary unit initially has rules that mirror the primary unit. Immediately after failover, the re-convergence timer starts on the newly active unit. Then the epoch number for the RIB table increments. During re-convergence, OSPF and EIGRP routes become updated with a new epoch number. Once the timer is expired, stale route entries (determined by the epoch number) are removed from the table. The RIB then contains the newest routing protocol forwarding information on the newly active unit.

Note Routes are synchronized only for link-up or link-down events on an active unit. If the link goes up or down on the standby unit, dynamic routes sent from the active unit may be lost. This is normal, expected behavior.

- DHCP Server—DHCP address leases are not replicated. However, a DHCP server configured on an interface will send a ping to make sure an address is not being used before granting the address to a DHCP client, so there is no impact to the service. State information is not relevant for DHCP relay or DDNS.
- Access control policy decisions—Decisions related to traffic matching (including URL, URL category, geolocation, and so forth), intrusion detection, malware, and file type are preserved during failover. However, for connections being evaluated at the moment of failover, there are the following caveats:
 - AVC—App-ID verdicts are replicated, but not detection states. Proper synchronization occurs as long as the App-ID verdicts are complete and synchronized before failover occurs.
 - Intrusion detection state—Upon failover, once mid-flow pickup occurs, new inspections are completed, but old states are lost.
 - File malware blocking—The file disposition must become available before failover.
 - File type detection and blocking—The file type must be identified before failover. If failover occurs while the original active device is identifying the file, the file type is not synchronized. Even if your file policy blocks that file type, the new active device downloads the file.
- User identity decisions from the identity policy, including the user-to-IP address mappings gathered passively through the User Agent and ISE Session Directory, and active authentication through captive portal. Users who are actively authenticating at the moment of failover might be prompted to authenticate again.
- Network AMP—Cloud lookups are independent from each device, so failover does not affect this feature in general. Specifically:
 - Signature Lookup—If failover occurs in the middle of a file transmission, no file event is generated and no detection occurs.

- File Storage—If failover occurs when the file is being stored, it is stored on the original active device. If the original active device went down while the file was being stored, the file does not get stored.
 - File Pre-classification (Local Analysis)—If failover occurs in the middle of pre-classification, detection fails.
 - File Dynamic Analysis (Connectivity to the cloud)—If failover occurs, the system might submit the file to the cloud.
 - Archive File Support—If failover occurs in the middle of an analysis, the system loses visibility into the file/archive.
 - Custom Blocking—If failover occurs, no events are generated.
- Security Intelligence decisions. However, DNS-based decisions that are in process at the moment of failover are not completed.
 - From all the connections, only established ones will be replicated on the Standby ASA.

Unsupported Features

For Stateful Failover, the following state information is not passed to the standby FTD device:

- Sessions in plaintext tunnels such as GRE or IP-in-IP. Sessions inside tunnels are not replicated and the new active node will not be able to reuse existing inspection verdicts to match the correct policy rules.
- Decrypted TLS/SSL connections—The decryption states are not synchronized, and if the active unit fails, then decrypted connections will be reset. New connections will need to be established to the new active unit. Connections that are not decrypted (in other words, those that match a TLS/SSL Do Not Decrypt rule action) are not affected and are replicated correctly.
- Multicast routing.

Bridge Group Requirements for High Availability

There are special considerations for high availability when using bridge groups.

When the active unit fails over to the standby unit, the switch port running Spanning Tree Protocol (STP) can go into a blocking state for 30 to 50 seconds when it senses the topology change. To avoid traffic loss on the bridge group member interfaces while the port is in a blocking state, you can configure one of the following workarounds:

- Switch port is in Access mode—Enable the STP PortFast feature on the switch:

```
interface interface_id
  spanning-tree portfast
```

The PortFast feature immediately transitions the port into STP forwarding mode upon linkup. The port still participates in STP. So if the port is to be a part of the loop, the port eventually transitions into STP blocking mode.

- If the switch port is in Trunk mode, or you cannot enable STP PortFast, then you can use one of the following less desirable workarounds that impacts failover functionality or STP stability:

- Disable interface monitoring on the bridge group and member interfaces.
- Increase the interface hold time in the failover criteria to a high value that will allow STP to converge before the unit fails over.
- Decrease the STP timers on the switch to allow STP to converge faster than the interface hold time.

Failover Health Monitoring

The Firepower Threat Defense device monitors each unit for overall health and for interface health. This section includes information about how the Firepower Threat Defense device performs tests to determine the state of each unit.

Unit Health Monitoring

The FTD device determines the health of the other unit by monitoring the failover link with hello messages. When a unit does not receive three consecutive hello messages on the failover link, the unit sends LANTEST messages on each data interface, including the failover link, to validate whether or not the peer is responsive. The action that the FTD device takes depends on the response from the other unit. See the following possible actions:

- If the FTD device receives a response on the failover link, then it does not fail over.
- If the FTD device does not receive a response on the failover link, but it does receive a response on a data interface, then the unit does not failover. The failover link is marked as failed. You should restore the failover link as soon as possible because the unit cannot fail over to the standby while the failover link is down.
- If the FTD device does not receive a response on any interface, then the standby unit switches to active mode and classifies the other unit as failed.

Interface Monitoring

When a unit does not receive hello messages on a monitored interface for 15 seconds, it runs interface tests. If one of the interface tests fails for an interface, but this same interface on the other unit continues to successfully pass traffic, then the interface is considered to be failed, and the device stops running tests.

If the threshold you define for the number of failed interfaces is met (see **Devices > Device Management > High Availability > Failover Trigger Criteria**), and the active unit has more failed interfaces than the standby unit, then a failover occurs. If an interface fails on both units, then both interfaces go into the “Unknown” state and do not count towards the failover limit defined by failover interface policy.

An interface becomes operational again if it receives any traffic. A failed device returns to standby mode if the interface failure threshold is no longer met.

If an interface has IPv4 and IPv6 addresses configured on it, the device uses the IPv4 addresses to perform the health monitoring. If an interface has only IPv6 addresses configured on it, then the device uses IPv6 neighbor discovery instead of ARP to perform the health monitoring tests. For the broadcast ping test, the device uses the IPv6 all nodes address (FE02::1).

Interface Tests

The Firepower Threat Defense device uses the following interface tests. The duration of each test is approximately 1.5 seconds.

1. Link Up/Down test—A test of the interface status. If the Link Up/Down test indicates that the interface is down, then the device considers it failed, and testing stops. If the status is Up, then the device performs the Network Activity test.
2. Network Activity test—A received network activity test. At the start of the test, each unit clears its received packet count for its interfaces. As soon as a unit receives any eligible packets during the test, then the interface is considered operational. If both units receive traffic, then testing stops. If one unit receives traffic and the other unit does not, then the interface on the unit that does not receive traffic is considered failed, and testing stops. If neither unit receives traffic, then the device starts the ARP test.
3. ARP test—A test for successful ARP replies. Each unit sends a single ARP request for the IP address in the most recent entry in its ARP table. If the unit receives an ARP reply or other network traffic during the test, then the interface is considered operational. If the unit does not receive an ARP reply, then the device sends a single ARP request for the IP address in the *next* entry in the ARP table. If the unit receives an ARP reply or other network traffic during the test, then the interface is considered operational. If both units receive traffic, then testing stops. If one unit receives traffic, and the other unit does not, then the interface on the unit that does not receive traffic is considered failed, and testing stops. If neither unit receives traffic, then the device starts the Broadcast Ping test.
4. Broadcast Ping test—A test for successful ping replies. Each unit sends a broadcast ping, and then counts all received packets. If the unit receives any packets during the test, then the interface is considered operational. If both units receive traffic, then testing stops. If one unit receives traffic, and the other unit does not, then the interface on the unit that does not receive traffic is considered failed, and testing stops. If neither unit receives traffic, then testing starts over again with the ARP test. If both units continue to receive no traffic from the ARP and Broadcast Ping tests, then these tests will continue running in perpetuity.

Interface Status

Monitored interfaces can have the following status:

- Unknown—Initial status. This status can also mean the status cannot be determined.
- Normal—The interface is receiving traffic.
- Normal (Waiting)—The interface is up, but has not yet received a hello packet from the corresponding interface on the peer unit.
- Normal (Not-Monitored)—The interface is up, but is not monitored by the failover process.
- Testing—Hello messages are not heard on the interface for five poll times.
- Link Down—The interface or VLAN is administratively down.
- Link Down (Waiting)—The interface or VLAN is administratively down and has not yet received a hello packet from the corresponding interface on the peer unit.
- Link Down (Not-Monitored)—The interface or VLAN is administratively down, but is not monitored by the failover process.
- No Link—The physical link for the interface is down.
- No Link (Waiting)—The physical link for the interface is down and has not yet received a hello packet from the corresponding interface on the peer unit.
- No Link (Not-Monitored)—The physical link for the interface is down, but is not monitored by the failover process.

- Failed—No traffic is received on the interface, yet traffic is heard on the peer interface.

Failover Triggers and Detection Timing

The following events trigger failover in a Firepower high availability pair:

- More than 50% of the Snort instances on the active unit are down.
- Disk space on the active unit is more than 90% full.
- The **no failover active** command is run on the active unit or the **failover active** command is run on the standby unit.
- The active unit has more failed interfaces than the standby unit.
- Interface failure on the active device exceeds the threshold configured.

By default, failure of a single interface causes failover. You can change the default value by configuring a threshold for the number of interfaces or a percentage of monitored interfaces that must fail for the failover to occur. If the threshold breaches on the active device, failover occurs. If the threshold breaches on the standby device, the unit moves to **Fail** state.

To change the default failover criteria, enter the following command in global configuration mode:

Table 58:

Command	Purpose
failover interface-policy num [%] hostname (config)# failover interface-policy 20%	Changes the default failover criteria. When specifying a specific number of interfaces, the <i>num</i> argument can be from 1 to 250. When specifying a percentage of interfaces, the <i>num</i> argument can be from 1 to 100.

The following table shows the failover triggering events and associated failure detection timing. If failover occurs, you can view the reason for the failover in the Message Center, along with various operations pertaining to the high availability pair. You can configure these thresholds to a value within the specified minimum-maximum range.

Table 59: FTD Failover Times

Failover Triggering Event	Minimum	Default	Maximum
Active unit loses power, hardware goes down, or the software reloads or crashes. When any of these occur, the monitored interfaces or failover link do not receive any hello message.	800 milliseconds	15 seconds	45 seconds
Active unit interface physical link down.	500 milliseconds	5 seconds	15 seconds
Active unit interface up, but connection problem causes interface testing.	5 seconds	25 seconds	75 seconds

About Active/Standby Failover

Active/Standby failover lets you use a standby FTD device to take over the functionality of a failed unit. When the active unit fails, the standby unit becomes the active unit.

Primary/Secondary Roles and Active/Standby Status

When setting up Active/Standby failover, you configure one unit to be primary and the other to be secondary. During configuration, the primary unit's policies are synchronized to the secondary unit. At this point, the two units act as a single device for device and policy configuration. However, for events, dashboards, reports and health monitoring, they continue to display as separate devices.

The main differences between the two units in a failover pair are related to which unit is active and which unit is standby, namely which IP addresses to use and which unit actively passes traffic.

However, a few differences exist between the units based on which unit is primary (as specified in the configuration) and which unit is secondary:

- The primary unit always becomes the active unit if both units start up at the same time (and are of equal operational health).
- The primary unit MAC addresses are always coupled with the active IP addresses. The exception to this rule occurs when the secondary unit becomes active and cannot obtain the primary unit MAC addresses over the failover link. In this case, the secondary unit MAC addresses are used.

Active Unit Determination at Startup

The active unit is determined by the following:

- If a unit boots and detects a peer already running as active, it becomes the standby unit.
- If a unit boots and does not detect a peer, it becomes the active unit.
- If both units boot simultaneously, then the primary unit becomes the active unit, and the secondary unit becomes the standby unit.

Failover Events

In Active/Standby failover, failover occurs on a unit basis.

The following table shows the failover action for each failure event. For each failure event, the table shows the failover policy (failover or no failover), the action taken by the active unit, the action taken by the standby unit, and any special notes about the failover condition and actions.

Table 60: Failover Events

Failure Event	Policy	Active Unit Action	Standby Unit Action	Notes
Active unit failed (power or hardware)	Failover	n/a	Become active Mark active as failed	No hello messages are received on any monitored interface or the failover link.
Formerly active unit recovers	No failover	Become standby	No action	None.

Failure Event	Policy	Active Unit Action	Standby Unit Action	Notes
Standby unit failed (power or hardware)	No failover	Mark standby as failed	n/a	When the standby unit is marked as failed, then the active unit does not attempt to fail over, even if the interface failure threshold is surpassed.
Failover link failed during operation	No failover	Mark failover link as failed	Mark failover link as failed	You should restore the failover link as soon as possible because the unit cannot fail over to the standby unit while the failover link is down.
Failover link failed at startup	No failover	Become active Mark failover link as failed	Become active Mark failover link as failed	If the failover link is down at startup, both units become active.
State link failed	No failover	No action	No action	State information becomes out of date, and sessions are terminated if a failover occurs.
Interface failure on active unit above threshold	Failover	Mark active as failed	Become active	None.
Interface failure on standby unit above threshold	No failover	No action	Mark standby as failed	When the standby unit is marked as failed, then the active unit does not attempt to fail over even if the interface failure threshold is surpassed.

Guidelines for High Availability

Model Support

- Firepower 9300—Intra-chassis High Availability is not supported.
- The FTDv on public cloud networks such as Microsoft Azure and Amazon Web Services are not supported with High Availability because Layer 2 connectivity is required.

Additional Guidelines

- When the active unit fails over to the standby unit, the connected switch port running Spanning Tree Protocol (STP) can go into a blocking state for 30 to 50 seconds when it senses the topology change. To avoid traffic loss while the port is in a blocking state, you can enable the STP PortFast feature on the switch:

interface *interface_id* **spanning-tree portfast**

This workaround applies to switches connected to both routed mode and bridge group interfaces. The PortFast feature immediately transitions the port into STP forwarding mode upon linkup. The port still participates in STP. So if the port is to be a part of the loop, the port eventually transitions into STP blocking mode.

- Configuring port security on the switches connected to the FTD device failover pair can cause communication problems when a failover event occurs. This problem occurs when a secure MAC address configured or learned on one secure port moves to another secure port, a violation is flagged by the switch port security feature.
- For Active/Standby High Availability and a VPN IPsec tunnel, you cannot monitor both the active and standby units using SNMP over the VPN tunnel. The standby unit does not have an active VPN tunnel, and will drop traffic destined for the NMS. You can instead use SNMPv3 with encryption so the IPsec tunnel is not required.
- Make sure each unit in the high-availability pair uses a unique hostname; the FMC cannot add the secondary unit if it has the same name as the primary unit.
- Immediately after failover, the source address of syslog messages will be the failover interface address for a few seconds.
- For better convergence (during a failover), you must shut down the interfaces on a HA pair that are not associated with any configuration or instance.
- When using SNMPv3 with failover, if you replace a failover unit, then SNMPv3 users are not replicated to the new unit. You must remove the users, re-add them, and then redeploy your configuration to force the users to replicate to the new unit.
- If you have a very large number of access control and NAT rules, the size of the configuration can prevent efficient configuration replication, resulting in the standby unit taking an excessively long time to reach standby ready state. This can also impact your ability to connect to the standby unit during replication through the console or SSH session. To enhance configuration replication performance, enable transactional commit for both access rules and NAT, using the **asp rule-engine transactional-commit access-group** and **asp rule-engine transactional-commit nat** commands.

- A unit in a High Availability pair transitioning to the standby role synchronizes its clock with the active unit.

Example:

```
firepower#show clock
01:00:52 UTC Mar 1 2022

...
01:01:18 UTC Mar 1 2022 <===== Incorrect (previous) clock
Cold Standby                Sync Config                Detected an Active mate

19:38:21 UTC Apr 9 2022 <===== Updated clock
Sync Config                  Sync File System          Detected an Active mate
...
firepower/sec/stby#show clock
19:38:40 UTC Apr 9 2022
```

- The units in High Availability do not dynamically synchronize the clock. Here are some examples of events when synchronization takes place:
 - A new High Availability pair is created.
 - High Availability is broken and re-created.
 - Communication over the failover link was disrupted and reestablished.
 - Failover status was manually changed at the CLI using the **no failover/failover** or **configure high-availability suspend/resume** (FTD) commands.
- Enabling High Availability forces all routes to be deleted and are re-added after the High Availability progression changes to the Active state. You could experience connection loss during this phase.
- If you replace the primary unit, then when you re-create high-availability, you should set the replacement unit as the *secondary* unit so that the configurations are replicated from the former secondary unit to the replacement unit. If you set the replacement unit as primary, you will accidentally overwrite the configuration that is present on the operational unit.
- Deploying Firepower 1100 and 2100 devices in high availability with hundreds of interfaces configured on them can result in increased delay in the failover time (seconds).
- In the High Availability configuration, short-lived connections, usually using port 53, are closed quickly and never transferred or synchronized from Active to Standby, so there might be a difference in the number of connections on both High Availability devices. This is expected behavior for short-lived connections. You can try to compare the connections that are long-lived (for example, more than 30-60 seconds).

Add a Firepower Threat Defense High Availability Pair

When establishing an Active/Standby High Availability pair, you designate one of the devices as primary and the other as secondary. The system applies a merged configuration to the paired devices. If there is a conflict, the system applies the configuration from the device you designated as primary.

In a multidomain deployment, devices in a high availability pair must belong to the same domain.

Note The system uses the failover link to sync configuration, while the stateful failover link is used to sync application content between peers. The failover link and the stateful failover link are in a private IP space and are only used for communication between peers in a high availability pair. After high availability is established, selected interface links and encryption settings cannot be modified without breaking the high availability pair and reconfiguring it.

Caution Creating or breaking a Firepower Threat Defense high availability pair immediately restarts the Snort process on the primary and secondary devices, temporarily interrupting traffic inspection on both devices. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See [Snort® Restart Traffic Behavior, on page 310](#) for more information.

Before you begin

Confirm that both devices:

- Are the same model.
- Have the same number and type of interfaces.
- Are in the same domain and group.
- Have normal health status and are running the same software.
- Are either in routed or transparent mode.
- Have the same NTP configuration. See [Configure NTP Time Synchronization for Threat Defense, on page 789](#).
- Are fully deployed with no uncommitted changes.
- Do not have DHCP or PPPoE configured in any of their interfaces.

Procedure

-
- Step 1** Add both devices to the Firepower Management Center according to [Add a Device to the FMC, on page 207](#).
- Step 2** Choose **Devices > Device Management**.
- Step 3** From the **Add** drop-down menu, choose **High Availability**.
- Step 4** Enter a display **Name** for the high availability pair.
- Step 5** Under **Device Type**, choose **Firepower Threat Defense**.
- Step 6** Choose the **Primary Peer** device for the high availability pair.
- Step 7** Choose the **Secondary Peer** device for the high availability pair.
- Step 8** Click **Continue**.
- Step 9** Under LAN Failover Link, choose an **Interface** with enough bandwidth to reserve for failover communications.

Note Only interfaces that do not have a logical name and do not belong to a security zone, will be listed in the **Interface** drop-down in the **Add High Availability Pair** dialog.

- Step 10** Type any identifying **Logical Name**.
- Step 11** Type a **Primary IP** address for the failover link on the active unit.
This address should be on an unused subnet.
Note 169.254.0.0/16 and fd00:0:0:*::/64 are internally used subnets and cannot be used for the failover or state links.
- Step 12** Optionally, choose **Use IPv6 Address**.
- Step 13** Type a **Secondary IP** address for the failover link on the standby unit. This IP address must be in the same subnet as the primary IP address.
- Step 14** If IPv4 addresses are used, type a **Subnet Mask** that applies to both the primary and secondary IP addresses.
- Step 15** Optionally, under Stateful Failover Link, choose the same **Interface**, or choose a different interface and enter the high availability configuration information.
Note 169.254.0.0/16 and fd00:0:0:*::/64 are internally used subnets and cannot be used for the failover or state links.
- Step 16** Optionally, choose **Enabled** and choose the **Key Generation** method for IPsec Encryption between the failover links.
- Step 17** Click **OK**. This process takes a few minutes as the process synchronizes system data.
-

Configure Optional High Availability Parameters

You can view the initial High Availability Configuration on the Firepower Management Center. You cannot edit these settings without breaking the high availability pair and then re-establishing it.

You can edit the Failover Trigger Criteria to improve failover results. Interface Monitoring allows you to determine which interfaces are better suited for failover.

Configure Standby IP Addresses and Interface Monitoring

For each interface, set a standby IP address. Although recommended, the standby address is not required. Without a standby IP address, the active unit cannot perform network tests to check the standby interface health; it can only track the link state.

By default, monitoring is enabled on all physical interfaces with logical names configured. You might want to exclude interfaces attached to less critical networks from affecting your failover policy.

Procedure

- Step 1** Choose **Devices > Device Management**.
- Step 2** Next to the device high-availability pair you want to edit, click the **Edit** ().
- In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.
- Step 3** Click the **High Availability** tab.

- Step 4** In the **Monitored Interfaces** area, click the **Edit** (✎) next to the interface you want to edit.
- Step 5** Check the **Monitor this interface for failures** check box.
- Step 6** On the **IPv4** tab, enter the **Standby IP Address**.
This address must be a free address on the same network as the active IP address.
- Step 7** If you configured the IPv6 address manually, on the **IPv6** tab, click the **Edit** (✎) next to the active IP address, enter the **Standby IP Address**, and click **OK**.
This address must be a free address on the same network as the active IP address. For autogenerated and **Enforce EUI 64** addresses, the standby address is automatically generated.
- Step 8** Click **OK**.
-

Edit High Availability Failover Criteria

You can customize failover criteria based on your network deployment.

Procedure

- Step 1** Choose **Devices > Device Management**.
- Step 2** Next to the device high-availability pair you want to edit, click the **Edit** (✎).
In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.
- Step 3** Choose **High Availability**.
- Step 4** Next to **Failover Trigger Criteria**, click the **Edit** (✎).
- Step 5** Under **Interface Failure Threshold**, choose the number or percentage of interfaces that must fail before the device fails over.
- Step 6** Under **Hello packet Intervals**, choose how often hello packets are sent over the failover link.
- Note** If you use remote access VPN on the Firepower 2100, use the default hello packet intervals. Otherwise, you might see high CPU usage that can cause a failover to occur.
- Step 7** Click **OK**.
-

Configure Virtual MAC addresses

You can configure active and standby MAC addresses for failover in two places on the Firepower Management Center:

- The Advanced tab of the Edit Interface page during interface configuration; see [Configure the MAC Address, on page 539](#).
- The Add Interface MAC Address page accessed from the High Availability page; see

If active and standby MAC addresses are configured in both locations, the addresses defined during interface configuration takes preference for failover.

You can minimize loss of traffic during failover by designating active and standby mac addresses to the physical interface. This feature offers redundancy against IP address mapping for failover.

Procedure

- Step 1** Choose **Devices > Device Management**.
 - Step 2** Next to the device high-availability pair you want to edit, click **Edit** ().
In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.
 - Step 3** Choose **High Availability**.
 - Step 4** Choose **Add** () next to Interface Mac Addresses.
 - Step 5** Choose a **Physical Interface**.
 - Step 6** Type an **Active Interface Mac Address**.
 - Step 7** Type a **Standby Interface Mac Address**.
 - Step 8** Click **OK**.
-

Manage High Availability

This section describes how to manage High Availability units after you enable High Availability, including how to change the High Availability setup and how to force failover from one unit to another.

Switch the Active Peer in a Firepower Threat Defense High Availability Pair

After you establish a Firepower Threat Defense high availability pair, you can manually switch the active and standby units, effectively forcing failover for reasons such as persistent fault or health events on the current active unit. Both units should be fully deployed before you complete this procedure.

Procedure

- Step 1** Choose **Devices > Device Management**.
 - Step 2** Next to the high availability pair where you want to change the active peer, click the **Switch Active Peer**.
 - Step 3** You can:
 - Click **Yes** to immediately make the standby device the active device in the high availability pair.
 - Click **No** to cancel and return to the Device Management page.
-

Suspend and Resume High Availability

You can suspend a unit in a high availability pair. This is useful when:

- Both units are in an active-active situation and fixing the communication on the failover link does not correct the problem.
- You want to troubleshoot an active or standby unit and do not want the units to fail over during that time.

When you suspend high availability, you stop the pair of devices from behaving as a failover unit. The currently active device remains active, handling all user connections. However, failover criteria are no longer monitored, and the system will never fail over to the now pseudo-standby device. The standby device will retain its configuration, but it will remain inactive.

The key difference between suspending HA and breaking HA is that on a suspended HA device, the high availability configuration is retained. When you break HA, the configuration is erased. Thus, you have the option to resume HA on a suspended system, which enables the existing configuration and makes the two devices function as a failover pair again.

To suspend HA, use the **configure failover suspend** command.

If you suspend high availability from the active unit, the configuration is suspended on both the active and standby unit. If you suspend it from the standby unit, it is suspended on the standby unit only, but the active unit will not attempt to fail over to a suspended unit.

To resume failover, use the **configure failover resume** command.

You can resume a unit only if it is in Suspended state. The unit will negotiate active/standby status with the peer unit.

Note Suspending high availability is a temporary state. If you reload a unit, it resumes the high-availability configuration automatically and negotiates the active/standby state with the peer.

Replace a Unit in an FTD High Availability Pair

You must break high availability before you replace a failed unit in a Firepower Threat Defense high availability pair. Then, register the replacement device to the Firepower Management Center and reestablish high availability. The process varies depending on whether the device is primary or secondary:

- [Replace a Primary FTD HA Unit, on page 585](#)
- [Replace a Secondary FTD HA Unit, on page 586](#)

Replace a Primary FTD HA Unit

Follow the steps below to replace a failed primary unit in a Firepower Threat Defense high availability pair. Failing to follow these steps can overwrite the existing high availability configuration.

Caution Creating or breaking a Firepower Threat Defense high availability pair immediately restarts the Snort process on the primary and secondary devices, temporarily interrupting traffic inspection on both devices. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See [Snort® Restart Traffic Behavior, on page 310](#) for more information.

Procedure

- Step 1** Choose **Force Break** to separate the high availability pair; see [Separate Units in a High Availability Pair, on page 587](#).
- Note** The break operation removes all the configuration related to HA from Firepower Threat Defense and Firepower Management Center, and you need to recreate it manually later. To successfully configure the same HA pair, ensure that you save the IPs, MAC addresses, and monitoring configuration of all the interfaces/subinterfaces prior to executing the HA break operation.
- Step 2** Unregister the failed primary Firepower Threat Defense device from the Firepower Management Center; see [Delete a Device from the FMC, on page 209](#).
- Step 3** Register the replacement Firepower Threat Defense to the Firepower Management Center; see [Add a Device to the FMC, on page 207](#).
- Step 4** Configure high availability, using the existing secondary/active unit as the primary device and the replacement device as the secondary/standby device during registration; see [Add a Firepower Threat Defense High Availability Pair, on page 580](#).
-

Replace a Secondary FTD HA Unit

Follow the steps below to replace a failed secondary unit in a Firepower Threat Defense high availability pair.

Caution Creating or breaking a Firepower Threat Defense high availability pair immediately restarts the Snort process on the primary and secondary devices, temporarily interrupting traffic inspection on both devices. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See [Snort® Restart Traffic Behavior, on page 310](#) for more information.

Procedure

- Step 1** Choose **Force Break** to separate the high availability pair; see [Separate Units in a High Availability Pair, on page 587](#).
- Note** The break operation removes all the configuration related to HA from Firepower Threat Defense and Firepower Management Center, and you need to recreate it manually later. To successfully configure the same HA pair, ensure that you save the IPs, MAC addresses, and monitoring configuration of all the interfaces/subinterfaces prior to executing the HA break operation.

- Step 2** Unregister the secondary Firepower Threat Defense device from the Firepower Management Center; see [Delete a Device from the FMC, on page 209](#).
- Step 3** Register the replacement Firepower Threat Defense to the Firepower Management Center; see [Add a Device to the FMC, on page 207](#).
- Step 4** Configure high availability, using the existing primary/active unit as the primary device and the replacement device as the secondary/standby device during registration; see [Add a Firepower Threat Defense High Availability Pair, on page 580](#).
-

Separate Units in a High Availability Pair

When you break a high availability pair, the active device retains full deployed functionality. The standby device loses its failover and interface configurations, and becomes a standalone device. When you break a high availability pair, policies that were yet to be deployed to the active device, prior to the break operation are automatically deployed to the active device when the break operation is completed.

Tip An exception to this is the FlexConfig policy. A FlexConfig policy deployed on the active device may show a deployment failure after the break HA operation. You must alter and re-deploy the FlexConfig policy on the active device.

Note If you cannot reach the high availability pair using the Firepower Management Center, use the CLI command **configure high-availability disable** to remove the failover configuration from both devices.

Procedure

- Step 1** Choose **Devices > Device Management**.
- Step 2** Next to the high-availability pair you want to break, click the **Break HA**.
- Step 3** Optionally, check the check box to force break, if the standby peer does not respond.
- Step 4** Click **Yes**. The device high-availability pair is separated.

The Break operation removes the failover configuration from the active and standby devices.

What to do next

(Optional) If you are using a flex-config policy on the active device, alter and re-deploy the flex-config policy to eliminate deployment errors.

Unregister a High Availability Pair

You can delete the pair from the Firepower Management Center and disable High Availability on each unit using the CLI.

Before you begin

This procedure requires CLI access.

Procedure

- Step 1** Choose **Devices > Device Management**.
- Step 2** Next to the high-availability pair you want to unregister, click **Delete** ()
- Step 3** Click **Yes**. The device high availability pair is deleted.
- Step 4** On each unit, access the Firepower Threat Defense CLI, and enter the following command:

configure high-availability disable

If you do not enter this command, you cannot re-register the units and form a new HA pair.

Note Enter this command *before* you change the firewall mode; if you change the mode, the unit will not later let you enter the **configure high-availability disable** command, and the Firepower Management Center cannot re-form the HA pair without this command.

Monitoring High Availability

This section lets you monitor the High Availability status.

View Failover History

You can view the failover history of both high availability devices in a single view. The history displays in chronological order and includes the reason for any failover.

Procedure

- Step 1** Choose **Devices > Device Management**.
- Step 2** Next to the device high-availability pair you want to edit, click **Edit** ()
- In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.
- Step 3** Choose **Summary**.
- Step 4** Under General, click **View** ()
-

View Stateful Failover Statistics

You can view the stateful failover link statistics of both the primary and secondary devices in the high availability pair.

Procedure

- Step 1** Choose **Devices > Device Management**.
- Step 2** Next to the device high-availability pair you want to edit, click **Edit** ().
- In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.
- Step 3** Choose **High Availability**.
- Step 4** Under Stateful Failover Link, click **View** (.
- Step 5** Choose a device to view statistics.
-

CHAPTER 30

Clustering for the Firepower Threat Defense

Clustering lets you group multiple Firepower Threat Defense units together as a single logical device. Clustering is only supported for the Firepower Threat Defense device on the Firepower 9300. A cluster provides all the convenience of a single device (management, integration into a network) while achieving the increased throughput and redundancy of multiple devices.

Note The Firepower Threat Defense device does not support a cluster across multiple chassis (inter-chassis); only intra-chassis clustering is supported.

Note Some features are not supported when using clustering. See [Unsupported Features with Clustering](#), on page 613.

- [About Clustering on the Firepower 4100/9300 Chassis](#), on page 591
- [Licenses for Clustering](#), on page 595

- [Reference for Clustering](#), on page 612
- [History for Clustering](#), on page 622

About Clustering on the Firepower 4100/9300 Chassis

When you deploy a cluster on the Firepower 4100/9300 chassis, it does the following:

- Creates a *cluster-control link* (by default, port-channel 48) for node-to-node communication.

For a cluster isolated to security modules within one Firepower 9300 chassis, this link utilizes the Firepower 9300 backplane for cluster communications.

- Creates the cluster bootstrap configuration within the application.

When you deploy the cluster, the chassis supervisor pushes a minimal bootstrap configuration to each unit that includes the cluster name, cluster control link interface, and other cluster settings.

- Assigns data interfaces to the cluster as *Spanned* interfaces.

For a cluster isolated to security modules within one Firepower 9300 chassis, spanned interfaces are not limited to EtherChannels. The Firepower 9300 supervisor uses EtherChannel technology internally to load-balance traffic to multiple modules on a shared interface, so any data interface type works for Spanned mode.

Note Individual interfaces are not supported, with the exception of a management interface.

- Assigns a management interface to all units in the cluster.

See the following sections for more information about clustering.

Bootstrap Configuration

When you deploy the cluster, the Firepower 9300 chassis supervisor pushes a minimal bootstrap configuration to each unit that includes the cluster name, cluster control link interface, and other cluster settings.

Cluster Members

Cluster members work together to accomplish the sharing of the security policy and traffic flows.

One member of the cluster is the **control** unit. The control unit is determined automatically. All other members are **data** units.

You must perform all configuration on the control unit only; the configuration is then replicated to the data units.

Some features do not scale in a cluster, and the control unit handles all traffic for those features. .

Cluster Control Link

The cluster control link is automatically created using the Port-channel 48 interface.

For a cluster isolated to security modules within one Firepower 9300 chassis, this interface has no member interfaces. This Cluster type EtherChannel utilizes the Firepower 9300 backplane for cluster communications. For clustering with multiple chassis, you must add one or more interfaces to the EtherChannel.

For a cluster with two chassis, do not directly connect the cluster control link from one chassis to the other chassis. If you directly connect the interfaces, then when one unit fails, the cluster control link fails, and thus the remaining healthy unit fails. If you connect the cluster control link through a switch, then the cluster control link remains up for the healthy unit.

Cluster control link traffic includes both control and data traffic.

Size the Cluster Control Link

If possible, you should size the cluster control link to match the expected throughput of each chassis so the cluster control link can handle the worst-case scenarios.

Cluster control link traffic is comprised mainly of state update and forwarded packets. The amount of traffic at any given time on the cluster control link varies. The amount of forwarded traffic depends on the load-balancing efficacy or whether there is a lot of traffic for centralized features. For example:

- NAT results in poor load balancing of connections, and the need to rebalance all returning traffic to the correct units.
- When membership changes, the cluster needs to rebalance a large number of connections, thus temporarily using a large amount of cluster control link bandwidth.

A higher-bandwidth cluster control link helps the cluster to converge faster when there are membership changes and prevents throughput bottlenecks.

Note If your cluster has large amounts of asymmetric (rebalanced) traffic, then you should increase the cluster control link size.

Cluster Control Link Redundancy

The following diagram shows how to use an EtherChannel as a cluster control link in a Virtual Switching System (VSS), Virtual Port Channel (vPC), StackWise, or StackWise Virtual environment. All links in the EtherChannel are active. When the switch is part of a redundant system, then you can connect firewall interfaces within the same EtherChannel to separate switches in the redundant system. The switch interfaces are members of the same EtherChannel port-channel interface, because the separate switches act like a single switch. Note that this EtherChannel is device-local, not a Spanned EtherChannel.

Cluster Control Link Reliability for Inter-Chassis Clustering

To ensure cluster control link functionality, be sure the round-trip time (RTT) between units is less than 20 ms. This maximum latency enhances compatibility with cluster members installed at different geographical sites. To check your latency, perform a ping on the cluster control link between units.

The cluster control link must be reliable, with no out-of-order or dropped packets; for example, for inter-site deployment, you should use a dedicated link.

Cluster Control Link Network

The Firepower 4100/9300 chassis auto-generates the cluster control link interface IP address for each unit based on the chassis ID and slot ID: `127.2.chassis_id.slot_id`. The cluster control link network cannot include any routers between units; only Layer 2 switching is allowed.

Management Network

We recommend connecting all units to a single management network. This network is separate from the cluster control link.

Management Interface

You must assign a Management type interface to the cluster. This interface is a special individual interface as opposed to a Spanned interface. The management interface lets you connect directly to each unit. This Management logical interface is separate from the other interfaces on the device. It is used to set up and register the device to the Firepower Management Center. It runs a separate SSH server and uses its own local authentication, IP address, and static routing. Each cluster member uses a separate IP address on the management network that you set as part of the bootstrap configuration.

The management interface is shared between the Management logical interface and the *Diagnostic* logical interface. The Diagnostic logical interface is optional and is not configured as part of the bootstrap configuration. The Diagnostic interface can be configured along with the rest of the data interfaces. If you choose to configure the Diagnostic interface, configure a Main cluster IP address as a fixed address for the cluster that always belongs to the current control unit. You also configure a range of addresses so that each unit, including the current control unit, can use a Local address from the range. The Main cluster IP address provides consistent diagnostic access to an address; when a control unit changes, the Main cluster IP address moves to the new control unit, so access to the cluster continues seamlessly. For example, you can manage the cluster by connecting to the Main cluster IP address, which is always attached to the current control unit. To manage an individual member, you can connect to the Local IP address. For outbound management traffic such as TFTP or syslog, each unit, including the control unit, uses the Local IP address to connect to the server.

Cluster Interfaces

For a cluster isolated to security modules within one Firepower 9300 chassis, you can assign both physical interfaces or EtherChannels (also known as port channels) to the cluster. Interfaces assigned to the cluster are Spanned interfaces that load-balance traffic across all members of the cluster.

Individual interfaces are not supported, with the exception of a management interface.

Spanned EtherChannels

You can group one or more interfaces per chassis into an EtherChannel that spans all chassis in the cluster. The EtherChannel aggregates the traffic across all the available active interfaces in the channel. A Spanned EtherChannel can be configured in both routed and transparent firewall modes. In routed mode, the EtherChannel is configured as a routed interface with a single IP address. In transparent mode, the IP address is assigned to the BVI, not to the bridge group member interface. The EtherChannel inherently provides load balancing as part of basic operation.

Connecting to a Redundant Switch System

We recommend connecting EtherChannels to a redundant switch system such as a VSS, vPC, StackWise, or StackWise Virtual system to provide redundancy for your interfaces.

Configuration Replication

All nodes in the cluster share a single configuration. You can only make configuration changes on the control node (with the exception of the bootstrap configuration), and changes are automatically synced to all other nodes in the cluster.

Licenses for Clustering

The Firepower Threat Defense uses Smart Licensing. You assign licenses to the cluster as a whole, not to individual units. However, each unit of the cluster consumes a separate license for each feature. The clustering feature itself does not require any licenses.

When you add a cluster member to the FMC, you can specify the feature licenses you want to use for the cluster. If you choose different feature licenses for each device before you form them into a cluster in the FMC, then the licenses you chose for the control unit are used for the cluster. You can modify licenses for the cluster in the **Devices > Device Management > Cluster > License** area.

Note If you add the cluster before the FMC is licensed (and running in Evaluation mode), then when you license the FMC, you can experience traffic disruption when you deploy policy changes to the cluster. Changing to licensed mode causes all data units to leave the cluster and then rejoin.

Requirements and Prerequisites for Clustering

Cluster Model Support

The FTD supports clustering on the following models:

- Firepower 9300—You must include all modules installed in the chassis for a maximum 3-unit, intra-chassis cluster.

User Roles

- Admin
- Access Admin
- Network Admin

Clustering Guidelines and Limitations

- When adding a unit to an existing cluster, or when reloading a unit, there will be a temporary, limited packet/connection drop; this is expected behavior. In some cases, the dropped packets can hang connections; for example, dropping a FIN/ACK packet for an FTP connection will make the FTP client hang. In this case, you need to reestablish the FTP connection.
- If you use a Windows 2003 server connected to a Spanned EtherChannel interface, when the syslog server port is down, and the server does not throttle ICMP error messages, then large numbers of ICMP messages are sent back to the cluster. These messages can result in some units of the cluster experiencing high CPU, which can affect performance. We recommend that you throttle ICMP error messages.
- We recommend connecting EtherChannels to a VSS, vPC, StackWise, or StackWise Virtual for redundancy.
- Within a chassis, you cannot cluster some security modules and run other security modules in standalone mode; you must include all security modules in the cluster.
- For decrypted TLS/SSL connections, the decryption states are not synchronized, and if the connection owner fails, then decrypted connections will be reset. New connections will need to be established to a new unit. Connections that are not decrypted (they match a do-not-decrypt rule) are not affected and are replicated correctly.

Defaults

- The cluster health check feature is enabled by default with the holdtime of 3 seconds. Interface health monitoring is enabled on all interfaces by default.

Configure Clustering

You can easily deploy the cluster from the Firepower 4100/9300 chassis supervisor. All initial configuration is automatically generated for each unit. You can then add the units to the FMC and group them into a cluster.

FXOS: Add a FTD Cluster

You can add a cluster to a single Firepower 9300 chassis that is isolated to security modules within the chassis.

Create a FTD Cluster

You can easily deploy the cluster from the Firepower 4100/9300 chassis supervisor. All initial configuration is automatically generated for each unit.

In a Firepower 9300 chassis, you must enable clustering for all 3 module slots, even if you do not have a module installed. If you do not configure all 3 modules, the cluster will not come up.

Before you begin

- Download the application image you want to use for the logical device from Cisco.com, and then upload that image to the Firepower 4100/9300 chassis.
- Gather the following information:
 - Management interface ID, IP addresses, and network mask
 - Gateway IP address
 - FMC IP address and/or NAT ID of your choosing
 - DNS server IP address
 - FTD hostname and domain name

Procedure

Step 1

Configure interfaces.

Step 2

Choose **Logical Devices**.

Step 3

Click **Add > ClusterAdd Device**, and set the following parameters:

- a) Provide a **Device Name**.

This name is used internally by the chassis supervisor to configure management settings and to assign interfaces; it is not the device name used in the application configuration.

- b) For the **Template**, choose **Cisco Firepower Threat Defense**.

- c) Choose the **Image Version**.
- d) For the **Instance Type**, .
- e) Click **OK**.

You see the Provisioning - *device name* window.

Step 4 Choose the interfaces you want to assign to this cluster.
All valid interfaces are assigned by default.

Step 5 Click the device icon in the center of the screen.

A dialog box appears where you can configure initial bootstrap settings. These settings are meant for initial deployment only, or for disaster recovery. For normal operation, you can later change most values in the application CLI configuration.

Step 6 On the **Cluster Information** page, complete the following.

Figure 20:

The screenshot shows the 'Cisco Secure Firewall Threat Defense - Bootstrap Configuration' dialog box with the 'Cluster Information' tab selected. The 'Security Module' section lists 'Security Module - 1, Security Module - 2, Security Module - 3'. The 'Interface Information' section contains the following fields:

- Chassis ID: 1
- Site ID: 1
- Cluster Key: ****
- Confirm Cluster Key: ****
- Cluster Group Name: cluster1
- Management Interface: Ethernet1/4 (dropdown menu)
- CCL Subnet IP: Eg:x.x.0.0

At the bottom of the dialog are 'OK' and 'Cancel' buttons.

- a) In the **Cluster Key** field, configure an authentication key for control traffic on the cluster control link.
The shared secret is an ASCII string from 1 to 63 characters. The shared secret is used to generate the key. This option does not affect datapath traffic, including connection state update and forwarded packets, which are always sent in the clear.
- b) Set the **Cluster Group Name**, which is the cluster group name in the logical device configuration.
The name must be an ASCII string from 1 to 38 characters.
Important From 2.4.1, spaces in cluster group name will be considered as special characters and may result in error while deploying the logical devices. To avoid this issue, you must rename the cluster group name without a space.
- c) Choose the **Management Interface**.

This interface is used to manage the logical device. This interface is separate from the chassis management port.

Step 7 On the **Settings** page, complete the following.

The screenshot shows the 'Cisco Firepower Threat Defense - Bootstrap Configuration' dialog box with the 'Settings' tab selected. The fields are as follows:

- Registration Key: [Redacted]
- Confirm Registration Key: [Redacted]
- Password: [Redacted]
- Confirm Password: [Redacted]
- Firepower Management Center IP: 10.89.5.35
- Search domains: cisco.com
- Firewall Mode: Routed (dropdown)
- DNS Servers: 72.163.47.11,173.37.137.8
- Firepower Management Center NAT ID: [Empty]
- Fully Qualified Hostname: cluster1.cisco.com
- Eventing Interface: [Empty]

Buttons: OK, Cancel

- a) In the **Registration Key** field, enter the key to be shared between the FMC and the cluster members during registration.

You can choose any text string for this key between 1 and 37 characters; you will enter the same key on the FMC when you add the Firepower Threat Defense.

- b) Enter a **Password** for the Firepower Threat Defense admin user for CLI access.
- c) In the **Firepower Management Center IP** field, enter the IP address of the managing FMC.
- d) (Optional) In the **Search Domains** field, enter a comma-separated list of search domains for the management network.
- e) (Optional) From the **Firewall Mode** drop-down list, choose **Transparent** or **Routed**.

In routed mode, the Firepower Threat Defense is considered to be a router hop in the network. Each interface that you want to route between is on a different subnet. A transparent firewall, on the other hand, is a Layer 2 firewall that acts like a “bump in the wire,” or a “stealth firewall,” and is not seen as a router hop to connected devices.

The firewall mode is only set at initial deployment. If you re-apply the bootstrap settings, this setting is not used.

- f) (Optional) In the **DNS Servers** field, enter a comma-separated list of DNS servers.

The Firepower Threat Defense uses DNS if you specify a hostname for the FMC, for example.

- g) (Optional) In the **Fully Qualified Hostname** field, enter a fully qualified name for the Firepower Threat Defense device.

Valid characters are the letters from a to z, the digits from 0 to 9, the dot (.), and the hyphen (-); maximum number of characters is 253.

- h) (Optional) From the **Eventing Interface** drop-down list, choose the interface on which events should be sent. If not specified, the management interface will be used.

To specify a separate interface to use for events, you must configure an interface as a *firepower-eventing* interface.

Step 8

On the **Interface Information** page, configure a management IP address for each security module in the cluster. Select the type of address from the **Address Type** drop-down list and then complete the following for each security module.

Note You must set the IP address for all 3 module slots in a chassis, even if you do not have a module installed. If you do not configure all 3 modules, the cluster will not come up.

The screenshot shows the 'Interface Information' tab of the 'Cisco Secure Firewall Threat Defense - Bootstrap Configuration' dialog. It features a tabbed interface with 'Cluster Information', 'Interface Information', 'Settings', and 'Agreement'. The 'Interface Information' tab is active, showing a dropdown for 'Address Type' set to 'IPv4 only'. Below this, three sections are visible for 'Security Module 1', 'Security Module 2', and 'Security Module 3'. Each section contains fields for 'Management IP', 'Network Mask', and 'Gateway'. For all three modules, the 'Management IP' values are 10.89.5.20, 10.89.5.21, and 10.89.5.22 respectively. The 'Network Mask' and 'Gateway' values are consistent across all modules, set to 255.255.255.192 and 10.89.5.1. At the bottom of the dialog are 'OK' and 'Cancel' buttons.

- a) In the **Management IP** field, configure an IP address.
Specify a unique IP address on the same network for each module.
- b) Enter a **Network Mask** or **Prefix Length**.
- c) Enter a **Network Gateway** address.

Step 9

On the **Agreement** tab, read and accept the end user license agreement (EULA).

Step 10

Click **OK** to close the configuration dialog box.

Step 11

Click **Save**.

The chassis deploys the logical device by downloading the specified software version and pushing the bootstrap configuration and management interface settings to the application instance. Check the **Logical Devices** page for the status of the new logical device. When the logical device shows its **Status** as **online**, you can start configuring the cluster in the application. You may see the "Security module not responding" status as part of the process; this status is normal and is temporary.

FMC: Add a Cluster

Add the logical devices to the FMC, and then group them into a cluster.

Before you begin

- Refer to the Firepower Chassis Manager **Logical Devices** screen to see which unit is the control unit.
- All cluster units must be in a successfully formed cluster on FXOS prior to adding them to the FMC.

Procedure

- Step 1** In the FMC, choose **Devices > Device Management**, and choose **Add > Add Device** to add each unit as a separate managed device using the management IP addresses you assigned when you deployed the cluster.
- Step 2** Choose **Add > Add Cluster** to group the units into a cluster.
- Choose the control device from the drop-down list.
All other eligible members are added to the data devices box.
 - Specify a **Name** for the cluster.
 - Click **OK**.
- The cluster object is added to the **Devices** screen, with the member units underneath. The current control unit is indicated by its role after the unit name.
- Note** If you add more units to the cluster later on the FXOS chassis, then you must add each unit to the FMC, and then add them as data nodes of the cluster as soon as possible.
- Step 3** To configure device-specific settings, click **Edit** () for the cluster; you can only configure the cluster as a whole, and not member units in the cluster.

Step 4 On the **Devices > Device Management > Cluster**, you can see **General**, **License**, and **Health** settings. This is useful for setting license entitlements.

Step 5 On the **Devices > Device Management > Devices**, you can choose each member in the cluster from the top right drop-down menu.

If you change the management IP address in the device configuration, you must match the new address in the FMC so that it can reach the device on the network; edit the **Host** address in the **Management** area.

FMC: Configure Cluster, Data, and Diagnostic Interfaces

This procedure configures basic parameters for each data interface that you assigned to the cluster when you deployed it in FXOS. For inter-chassis clustering, data interfaces are always Spanned EtherChannel interfaces. For the cluster control link interface for inter-chassis clustering, you must increase the MTU from the default. You can also configure the Diagnostic interface, which is the only interface that can run as an individual interface.

Note When using Spanned EtherChannels for inter-chassis clustering, the port-channel interface will not come up until clustering is fully enabled. This requirement prevents traffic from being forwarded to a unit that is not an active unit in the cluster.

Procedure

Step 1 Choose **Devices > Device Management**, and click **Edit** () next to the cluster.

Step 2 Click **Interfaces**.

Step 3 Configure the cluster control link.

For inter-chassis clustering, set the cluster control link MTU to be at least 100 bytes higher than the highest MTU of the data interfaces. Because the cluster control link traffic includes data packet forwarding, the cluster control link needs to accommodate the entire size of a data packet plus cluster traffic overhead. We suggest setting the MTU to the maximum of 9184; the minimum value is 1400 bytes. For example, because the maximum MTU is 9184, then the highest data interface MTU can be 9084, while the cluster control link can be set to 9184.

The cluster control link interface is Port-Channel48 by default.

- a) Click **Edit** () for the cluster control link interface.
- b) On the **General** page, in the **MTU** field, enter a value between 1400 and 9184. We suggest using the maximum, 9184.
- c) Click **OK**.

Step 4 Configure data interfaces.

- a) (Optional) Configure VLAN subinterfaces on the data interface. The rest of this procedure applies to the subinterfaces.
- b) Click **Edit** () for the data interface.

- c) Configure the name, IP address, and other parameters.

Note If the cluster control link interface MTU is not at least 100 bytes higher than the data interface MTU, you will see an error that you must reduce the MTU of the data interface. See [step Step 3, on page 602](#) to increase the cluster control link MTU, after which you can continue configuring the data interfaces.

- d) For inter-chassis clusters, set a manual global MAC address for the EtherChannel. Click **Advanced**, and in the **Active Mac Address** field, enter a MAC address in H.H.H format, where H is a 16-bit hexadecimal digit.

For example, the MAC address 00-0C-F1-42-4C-DE would be entered as 000C.F142.4CDE. The MAC address must not have the multicast bit set, that is, the second hexadecimal digit from the left cannot be an odd number.

Do not set the **Standby Mac Address**; it is ignored.

You must configure a MAC address for a Spanned EtherChannel to avoid potential network connectivity problems. With a manually-configured MAC address, the MAC address stays with the current control unit. If you do not configure a MAC address, then if the control unit changes, the new control unit uses a new MAC address for the interface, which can cause a temporary network outage.

- e) Click **OK**. Repeat the above steps for other data interfaces.

Step 5 (Optional) Configure the Diagnostic interface.

The Diagnostic interface is the only interface that can run in Individual interface mode. You can use this interface for syslog messages or SNMP, for example.

- a) On **Devices > Device Management > Interfaces**, click **Edit** (🔧) for the Diagnostic interface.
- b) On the **IPv4**, enter the **IP Address** and mask. This IP address is a fixed address for the cluster, and always belongs to the current control unit.
- c) For the **Start Address** and **End Address**, enter the start and end of an IP address pool, one of which will be assigned to each cluster unit for the interface.

Include at least as many addresses as there are units in the cluster. The Virtual IP address is not a part of this pool, but needs to be on the same network. You cannot determine the exact Local address assigned to each unit in advance.

- d) For the **Mask**, enter the subnet mask for the cluster IP pool.
- e) On the **IPv6**, under **Basic > Cluster IPv6 Pool** specify the *ipv6-address/prefix-length* for the **Address** and the number of addresses in the pool for the **Count**.
- f) Configure other interface settings as normal.

Step 6 Click **Save**.

You can now click **Deploy** and deploy the policy to assigned devices. The changes are not active until you deploy them.

Remove a Cluster Node

The following sections describe how to remove nodes temporarily or permanently from the cluster.

Temporary Removal

A cluster node will be automatically removed from the cluster due to a hardware or network failure, for example. This removal is temporary until the conditions are rectified, and it can rejoin the cluster. You can also manually disable clustering.

To check whether a device is currently in the cluster, check the cluster status on the Firepower Chassis Manager **Logical Devices** page:

The screenshot shows the Firepower Chassis Manager interface. At the top right, there are icons for edit, refresh, delete, and back. Below this is a table with two columns: 'Management Port' and 'Status'. The 'Management Port' is 'Ethernet1/4' and the 'Status' is 'online' with a green up arrow icon. To the right of the status is a slider control that is currently turned on (blue). Below the table is an 'Attributes' section with the following key-value pairs:

Attributes	
Cluster Operational Status	: not-in-cluster
FIREPOWER-MGMT-IP	: 10.89.5.20
CLUSTER-ROLE	: none
CLUSTER-IP	: 127.2.1.1
MGMT-URL	: https://10.89.5.35/
UUID	: 8e459170-451d-11e9-8475-f22f06c32630

- Disable clustering in the application—You can disable clustering using the application CLI. Enter the **cluster remove unit** *name* command to remove any node other than the one you are logged into. The bootstrap configuration remains intact, as well as the last configuration synced from the control node, so you can later re-add the node without losing your configuration. If you enter this command on a data node to remove the control node, a new control node is elected.

When a device becomes inactive, all data interfaces are shut down; only the Management interface can send and receive traffic. To resume traffic flow, re-enable clustering. The Management interface remains up using the IP address the node received from the bootstrap configuration. However if you reload, and the node is still inactive in the cluster, the Management interface is disabled.

- Disable the application instance—In the Firepower Chassis Manager on the **Logical Devices** page, click the **Slider enabled** () . You can later reenable it using the **Slider disabled** () .
- Shut down the security module/engine—In the Firepower Chassis Manager on the **Security Module/Engine** page, click the **Power Off icon**.
- Shut down the chassis—In the Firepower Chassis Manager on the **Overview** page, click the **Shut Down icon**.

Permanent Removal

You can permanently remove a cluster node using the following methods.

- Delete the logical device—In the Firepower Chassis Manager on the **Logical Devices** page, click the **Delete** () . You can then deploy a standalone logical device, a new cluster, or even add a new logical device to the same cluster.
- Remove the chassis or security module from service—If you remove a device from service, you can add replacement hardware as a new node of the cluster.

FMC: Manage Cluster Members

After you deploy the cluster, you can change the configuration and manage cluster members.

Add or Replace a Cluster Member

You can add a new cluster member to an existing cluster, for example, when you add an additional module to the Firepower 9300 device, or replace a unit. This procedure also applies to a unit that was reinitialized; in this case, although the hardware remains the same, it appears to be a new member.

Before you begin

- Add the units to the cluster on the FXOS chassis, and make sure they are in the FXOS cluster before you add them to the FMC. Make sure the interface configuration is the same as other chassis.

Procedure

Step 1 In the case of a replacement or a reinitialized unit, you must delete the old cluster member from the Firepower Management Center.

When you replace it with a new or reinitialized unit, it is considered to be a new device on the Firepower Management Center

- a) In the FMC, choose **Devices > Device Management**, and click **Delete** () next to the data unit.
- b) Confirm that you want to delete the unit.

The unit is removed from the cluster and from the FMC devices list.

Step 2 Choose **Devices > Device Management**, and choose **Add > Add Device** to add the new logical device.

Step 3 Choose **Add > Add Cluster**.

Step 4 Choose the current control device from the drop-down list.

When you choose a control device that is already in a cluster, then the existing cluster name is auto-filled, and all eligible data devices are added to the data devices box, including the new unit you just added to the FMC.

Step 5 Click **Add**, and then **Deploy**.

The cluster is updated to include the new member(s).

Deactivate a Member

You may want to deactivate a member in preparation for deleting the unit, or temporarily for maintenance. This procedure is meant to temporarily deactivate a member; the unit will still appear in the FMC device list.

To deactivate a member other than the unit you are logged into, perform the following steps at the Firepower Threat Defense CLI.

Note When a unit becomes inactive, all data interfaces are shut down; only the Management interface can send and receive traffic. To resume traffic flow, reenables clustering. The Management interface remains up using the IP address the unit received from the bootstrap configuration. However if you reload, and the unit is still inactive in the cluster, the management interface is disabled. You must use the console for any further configuration.

Procedure

Step 1 Access the Firepower Threat Defense CLI.

Step 2 Remove the unit from the cluster:

cluster remove unit *unit_name*

The bootstrap configuration remains intact, as well as the last configuration synched from the control unit, so that you can later re-add the unit without losing your configuration. If you enter this command on a data unit to remove the control unit, a new control unit is elected.

To view member names, enter **cluster remove unit ?**, or enter the **show cluster info** command.

Example:

```
> cluster remove unit ?
```

```
Current active units in the cluster:
ftd1
ftd2
ftd3
```

```
> cluster remove unit ftd2
```

```
WARNING: Clustering will be disabled on unit ftd2. To bring it back
to the cluster please logon to that unit and re-enable clustering
```

Step 3 To reenables clustering, see [Rejoin the Cluster, on page 606](#).

Rejoin the Cluster

If a unit was removed from the cluster, for example for a failed interface, you must manually rejoin the cluster by accessing the unit CLI. Make sure the failure is resolved before you try to rejoin the cluster. See [Rejoining the Cluster, on page 618](#) for more information about why a unit can be removed from a cluster.

Procedure

Step 1 Access the CLI of the unit that needs to rejoin the cluster, either from the console port or using SSH to the Management interface. Log in with the username **admin** and the password you set during initial setup.

Step 2 Enable clustering:

cluster enable

Delete a Data Unit

If you need to permanently remove a cluster member (for example, if you remove a module on the Firepower 9300), then you should delete it from the FMC.

Do not delete the member if it is still a healthy part of the cluster, or if you only want to disable the member temporarily. To delete it permanently from the cluster in FXOS, see [Remove a Cluster Node, on page 603](#). If you remove it from the FMC, and it is still part of the cluster, it will continue to pass traffic, and could even become the control unit—a control unit that the FMC can no longer manage.

Before you begin

To manually deactivate the unit, see [Deactivate a Member, on page 605](#). Before you delete a unit, the unit must be inactive, either manually or because of a health failure.

Procedure

- Step 1** In the FMC for the data unit you want to delete, choose **Devices > Device Management**, and click **Delete** .
- Step 2** Confirm that you want to delete the unit.
- The unit is removed from the cluster and from the FMC devices list.
-

FMC: Monitoring the Cluster

You can monitor the cluster in Firepower Management Center and at the Firepower Threat Defense CLI.

- **Devices > Device Management > *cluster_name***.

When you expand the cluster on the devices listing page, you can see all member units, including the control unit shown with its role next to the IP address.

- **show cluster {access-list [*acl_name*] | conn [count] | cpu [usage] | history | interface-mode | memory | resource usage | service-policy | traffic | xlate count}**

To view aggregated data for the entire cluster or other information, use the **show cluster** command.

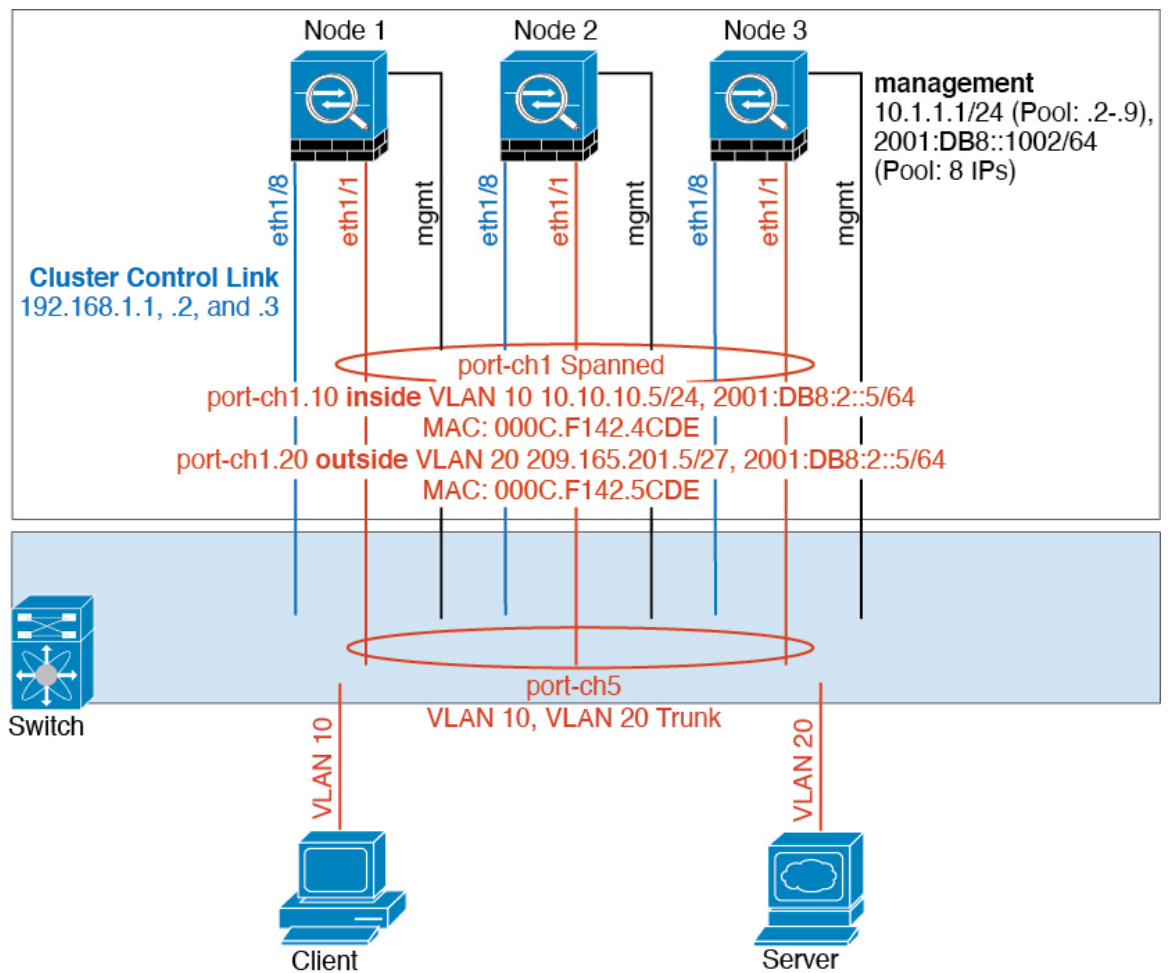

- **show cluster info [auto-join | clients | conn-distribution | flow-mobility counters | goid [*options*] | health | incompatible-config | loadbalance | old-members | packet-distribution | trace [*options*] | transport { asp | cp}]**

To view cluster information, use the **show cluster info** command.

Examples for Clustering

These examples include typical deployments.

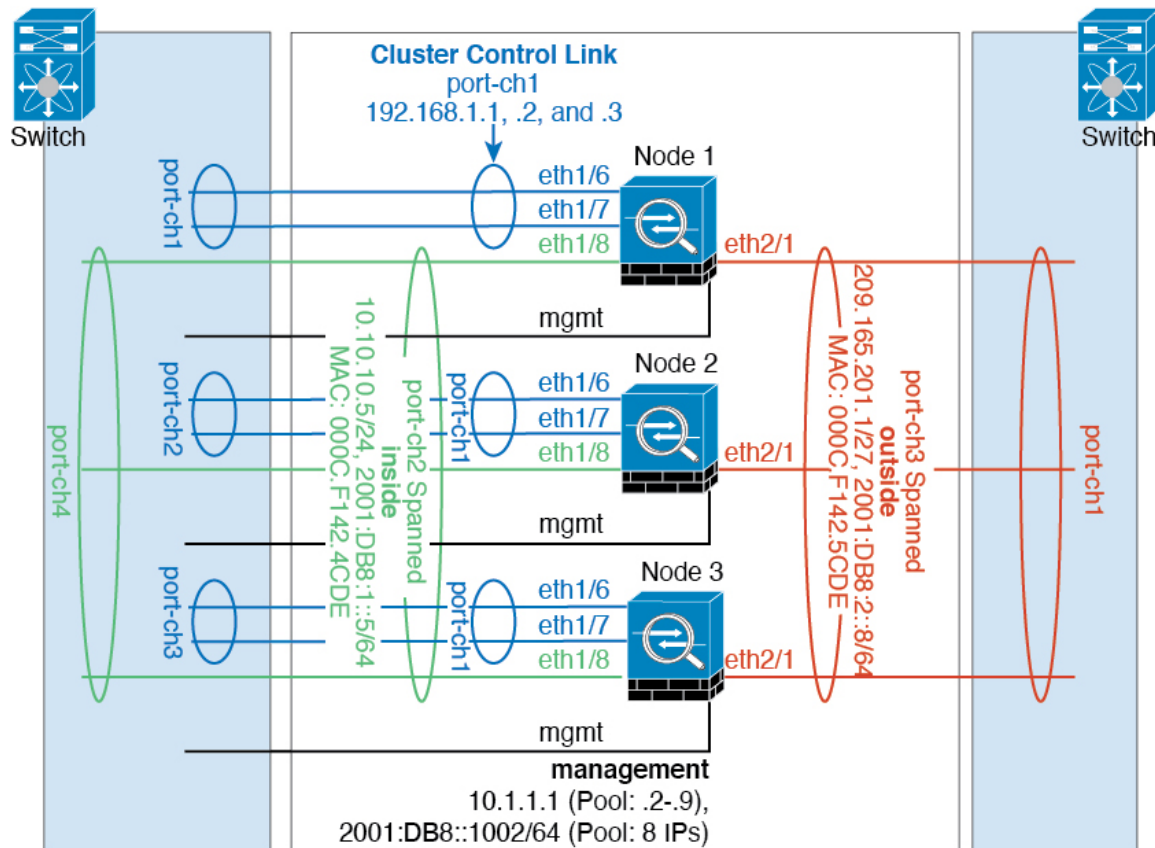

Firewall on a Stick

Data traffic from different security domains are associated with different VLANs, for example, VLAN 10 for the inside network and VLAN 20 for the outside network. Each has a single physical port connected to the external switch or router. Trunking is enabled so that all packets on the physical link are 802.1q encapsulated. This is the firewall between VLAN 10 and VLAN 20.

When using Spanned EtherChannels, all data links are grouped into one EtherChannel on the switch side. If the becomes unavailable, the switch will rebalance traffic between the remaining units.

Traffic Segregation

You may prefer physical separation of traffic between the inside and outside network.

As shown in the diagram above, there is one Spanned EtherChannel on the left side that connects to the inside switch, and the other on the right side to outside switch. You can also create VLAN subinterfaces on each EtherChannel if desired.

Spanned EtherChannel with Backup Links (Traditional 8 Active/8 Standby)

The maximum number of active ports in a traditional EtherChannel is limited to 8 from the switch side. If you have an 8-unit cluster, and you allocate 2 ports per unit to the EtherChannel, for a total of 16 ports total, then 8 of them have to be in standby mode. The FTD uses LACP to negotiate which links should be active or standby. If you enable multi-switch EtherChannel using VSS, vPC, StackWise, or StackWise Virtual, you can achieve inter-switch redundancy. On the FTD, all physical ports are ordered first by the slot number then by the port number. In the following figure, the lower ordered port is the “control” port (for example, Ethernet 1/1), and the other one is the “data” port (for example, Ethernet 1/2). You must guarantee symmetry in the hardware connection: all control links must terminate on one switch, and all data links must terminate on another switch if a redundant switch system is used. The following diagram shows what happens when the total number of links grows as more units join the cluster:

Spanned EtherChannel with Backup Links (Traditional 8 Active/8 Standby)

The principle is to first maximize the number of active ports in the channel, and secondly keep the number of active control ports and the number of active data ports in balance. Note that when a 5th unit joins the cluster, traffic is not balanced evenly between all units.

Link or device failure is handled with the same principle. You may end up with a less-than-perfect load balancing situation. The following figure shows a 4-unit cluster with a single link failure on one of the units.

There could be multiple EtherChannels configured in the network. The following diagram shows an EtherChannel on the inside and one on the outside. The FTD is removed from the cluster if both control and data links in one EtherChannel fail. This prevents the FTD from receiving traffic from the outside network when it has already lost connectivity to the inside network.

Reference for Clustering

This section includes more information about how clustering operates.

Firepower Threat Defense Features and Clustering

Some Firepower Threat Defense features are not supported with clustering, and some are only supported on the control unit. Other features might have caveats for proper usage.

Unsupported Features with Clustering

These features cannot be configured with clustering enabled, and the commands will be rejected.

Note To view FlexConfig features that are also not supported with clustering, for example WCCP inspection, see the [ASA general operations configuration guide](#). FlexConfig lets you configure many ASA features that are not present in the FMC GUI.

- DHCP client, server, and proxy. DHCP relay is supported.
- High Availability
- FMC UCAPL/CC mode

Centralized Features for Clustering

The following features are only supported on the control unit, and are not scaled for the cluster.

Note Traffic for centralized features is forwarded from member units to the control unit over the cluster control link.

If you use the rebalancing feature, traffic for centralized features may be rebalanced to non-control units before the traffic is classified as a centralized feature; if this occurs, the traffic is then sent back to the control unit.

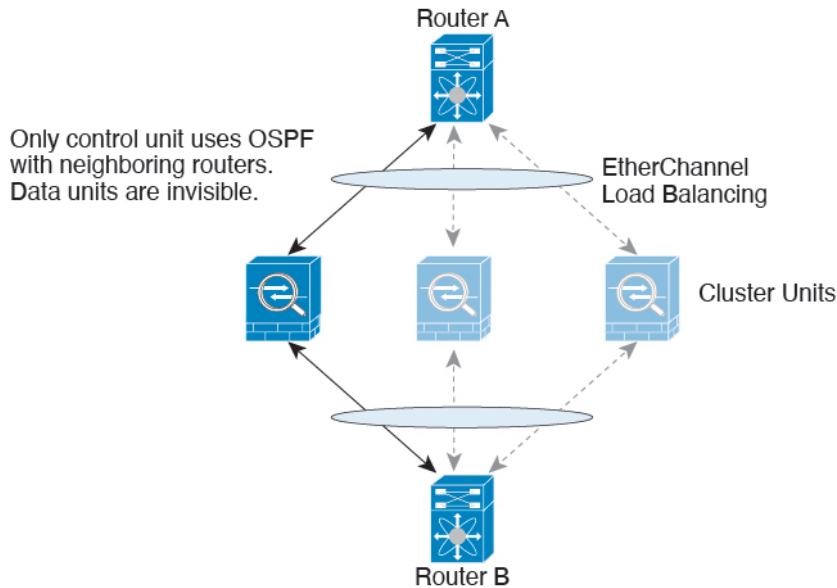

For centralized features, if the control unit fails, all connections are dropped, and you have to re-establish the connections on the new control unit.

- The following application inspections:
 - DCERPC
 - NetBIOS
 - RSH
 - SUNRPC
 - TFTP
 - XDMCP
- Dynamic routing
- Static route monitoring

Dynamic Routing and Clustering

The routing process only runs on the control unit, and routes are learned through the control unit and replicated to secondaries. If a routing packet arrives at a data unit, it is redirected to the control unit.

Figure 21: Dynamic Routing

After the data units learn the routes from the control unit, each unit makes forwarding decisions independently.

The OSPF LSA database is not synchronized from the control unit to data units. If there is a control unit switchover, the neighboring router will detect a restart; the switchover is not transparent. The OSPF process picks an IP address as its router ID. Although not required, you can assign a static router ID to ensure a consistent router ID is used across the cluster. See the OSPF Non-Stop Forwarding feature to address the interruption.

Connection Settings

Connection limits are enforced cluster-wide. Each node has an estimate of the cluster-wide counter values based on broadcast messages. Due to efficiency considerations, the configured connection limit across the cluster might not be enforced exactly at the limit number. Each node may overestimate or underestimate the cluster-wide counter value at any given time. However, the information will get updated over time in a load-balanced cluster.

FTP and Clustering

- If FTP data channel and control channel flows are owned by different cluster members, then the data channel owner will periodically send idle timeout updates to the control channel owner and update the idle timeout value. However, if the control flow owner is reloaded, and the control flow is re-hosted, the parent/child flow relationship will not longer be maintained; the control flow idle timeout will not be updated.

NAT and Clustering

NAT can affect the overall throughput of the cluster. Inbound and outbound NAT packets can be sent to different FTDs in the cluster, because the load balancing algorithm relies on IP addresses and ports, and NAT causes inbound and outbound packets to have different IP addresses and/or ports. When a packet arrives at the FTD that is not the NAT owner, it is forwarded over the cluster control link to the owner, causing large amounts of traffic on the cluster control link. Note that the receiving node does not create a forwarding flow to the owner, because the NAT owner may not end up creating a connection for the packet depending on the results of security and policy checks.

If you still want to use NAT in clustering, then consider the following guidelines:

- NAT pool address distribution for dynamic PAT—The control node evenly pre-distributes addresses across the cluster. If a member receives a connection and they have no addresses assigned, then the connection is forwarded to the control node for PAT. If a cluster member leaves the cluster (due to failure), a backup member will get the PAT IP address, and if the backup exhausts its normal PAT IP address, it can make use of the new address. Make sure to include at least as many NAT addresses as there are nodes in the cluster, plus at least one extra address, to ensure that each node receives an address, and that a failed node can get a new address if its old address is in use by the member that took over the address. Use the **show nat pool cluster** command in the device CLI to see the address allocations.
- Reusing a PAT pool in multiple rules—To use the same PAT pool in multiple rules, you must be careful about the interface selection in the rules. You must either use specific interfaces in all rules, or "any" in all rules. You cannot mix specific interfaces and "any" across the rules, or the system might not be able to match return traffic to the right node in the cluster. Using unique PAT pools per rule is the most reliable option.
- No round-robin—Round-robin for a PAT pool is not supported with clustering.
- Dynamic NAT xlates managed by the control node—The control node maintains and replicates the xlate table to data nodes. When a data node receives a connection that requires dynamic NAT, and the xlate is not in the table, it requests the xlate from the control node. The data node owns the connection.
- Stale xlates—The xlate idle time on the connection owner does not get updated. Thus, the idle time might exceed the idle timeout. An idle timer value higher than the configured timeout with a refcnt of 0 is an indication of a stale xlate.
- No static PAT for the following inspections—
 - FTP
 - RSH
 - SQLNET
 - TFTP
 - XDMCP
 - SIP

SIP Inspection and Clustering

A control flow can be created on any node (due to load balancing); its child data flows must reside on the same node.

SNMP and Clustering

An SNMP agent polls each individual FTD by its interface Local IP address. You cannot poll consolidated data for the cluster.

You should always use the Local address, and not the Main cluster IP address for SNMP polling. If the SNMP agent polls the Main cluster IP address, if a new control node is elected, the poll to the new control node will fail.

Syslog and Clustering

- Each node in the cluster generates its own syslog messages. You can configure logging so that each node uses either the same or a different device ID in the syslog message header field. For example, the hostname configuration is replicated and shared by all nodes in the cluster. If you configure logging to use the hostname as the device ID, syslog messages generated by all nodes look as if they come from a single node. If you configure logging to use the local-node name that is assigned in the cluster bootstrap configuration as the device ID, syslog messages look as if they come from different nodes.

TLS/SSL Connections and Clustering

The decryption states of TLS/SSL connections are not synchronized, and if the connection owner fails, then the decrypted connections will be reset. New connections will need to be established to a new unit. Connections that are not decrypted (they match a do-not-decrypt rule) are not affected and are replicated correctly.

Cisco TrustSec and Clustering

Only the control node learns security group tag (SGT) information. The control node then populates the SGT to data nodes, and data nodes can make a match decision for SGT based on the security policy.

Performance Scaling Factor

When you combine multiple units into a cluster, you can expect the total cluster performance to be approximately 80% of the maximum combined throughput.

For example, for TCP throughput, the Firepower 9300 with 3 SM-40 modules can handle approximately 135 Gbps of real world firewall traffic when running alone. For 2 chassis, the maximum combined throughput will be approximately 80% of 270 Gbps (2 chassis x 135 Gbps): 216 Gbps.

Control Unit Election

Members of the cluster communicate over the cluster control link to elect a control unit as follows:

1. When you deploy the cluster, each unit broadcasts an election request every 3 seconds.
2. Any other units with a higher priority respond to the election request; the priority is set when you deploy the cluster and is not configurable.
3. If after 45 seconds, a unit does not receive a response from another unit with a higher priority, then it becomes the control unit.

Note If multiple units tie for the highest priority, the cluster unit name and then the serial number is used to determine the control unit.

4. If a unit later joins the cluster with a higher priority, it does not automatically become the control unit; the existing control unit always remains as the control unit unless it stops responding, at which point a new control unit is elected.
5. In a "split brain" scenario when there are temporarily multiple control units, then the unit with highest priority retains the role while the other units return to data unit roles.

Note You can manually force a unit to become the control unit. For centralized features, if you force a control unit change, then all connections are dropped, and you have to re-establish the connections on the new control unit.

High Availability Within the Cluster

Clustering provides high availability by monitoring chassis, unit, and interface health and by replicating connection states between units.

Chassis-Application Monitoring

Chassis-application health monitoring is always enabled. The Firepower 4100/9300 chassis supervisor checks the FTD application periodically (every second). If the FTD device is up and cannot communicate with the Firepower 4100/9300 chassis supervisor for 3 seconds, the FTD device generates a syslog message and leaves the cluster.

If the Firepower 4100/9300 chassis supervisor cannot communicate with the application after 45 seconds, it reloads the FTD device. If the FTD device cannot communicate with the supervisor, it removes itself from the cluster.

Unit Health Monitoring

Each unit periodically sends a broadcast keepalivekeepalive packet over the cluster control link. If the control node does not receive any keepalivekeepalive packets or other packets from a data node within the timeout period, then the control node removes the data node from the cluster. If the data nodes do not receive packets from the control node, then a new control node is elected from the remaining node.

If nodes cannot reach each other over the cluster control link because of a network failure and not because a node has actually failed, then the cluster may go into a "split brain" scenario where isolated data nodes will elect their own control nodes. For example, if a router fails between two cluster locations, then the original control node at location 1 will remove the location 2 data nodes from the cluster. Meanwhile, the nodes at location 2 will elect their own control node and form their own cluster. Note that asymmetric traffic may fail in this scenario. After the cluster control link is restored, then the control node that has the higher priority will keep the control node's role. See [Control Unit Election](#), on page 616 for more information.

Interface Monitoring

Each node monitors the link status of all hardware interfaces in use, and reports status changes to the control node. All physical interfaces are monitored by default (including the main EtherChannel for EtherChannel interfaces). Only named interfaces that are in an Up state can be monitored. For example, all member ports of an EtherChannel must fail before a *named* EtherChannel is removed from the cluster.

If a monitored interface fails on a particular node, but it is active on other nodes, then the node is removed from the cluster. The amount of time before the FTD device removes a node from the cluster depends on whether the node is an established member or is joining the cluster. The FTD device does not monitor interfaces for the first 90 seconds that a node joins the cluster. Interface status changes during this time will not cause the FTD device to be removed from the cluster. For an established member, the node is removed after 500 ms.

Decorator Application Monitoring

When you install a decorator application on an interface, such as the Radware DefensePro application, then both the FTD device and the decorator application must be operational to remain in the cluster. The unit does not join the cluster until both applications are operational. Once in the cluster, the unit monitors the decorator application health every 3 seconds. If the decorator application is down, the unit is removed from the cluster.

Status After Failure

When a node in the cluster fails, the connections hosted by that node are seamlessly transferred to other nodes; state information for traffic flows is shared over the control node's cluster control link.

If the control node fails, then another member of the cluster with the highest priority (lowest number) becomes the control node.

The FTD automatically tries to rejoin the cluster, depending on the failure event.

Note When the FTD becomes inactive and fails to automatically rejoin the cluster, all data interfaces are shut down; only the Management/Diagnostic interface can send and receive traffic.

Rejoining the Cluster

After a cluster member is removed from the cluster, how it can rejoin the cluster depends on why it was removed:

- Failed cluster control link when initially joining—After you resolve the problem with the cluster control link, you must manually rejoin the cluster by re-enabling clustering.
- Failed cluster control link after joining the cluster—The FTD automatically tries to rejoin every 5 minutes, indefinitely.
- Failed data interface—The Firepower Threat Defense automatically tries to rejoin at 5 minutes, then at 10 minutes, and finally at 20 minutes. If the join is not successful after 20 minutes, then the Firepower Threat Defense application disables clustering. After you resolve the problem with the data interface, you have to manually enable clustering.
- Failed unit—If the unit was removed from the cluster because of a unit health check failure, then rejoining the cluster depends on the source of the failure. For example, a temporary power failure means the unit

will rejoin the cluster when it starts up again as long as the cluster control link is up. The Firepower Threat Defense application attempts to rejoin the cluster every 5 seconds.

- **Failed Chassis-Application Communication**—When the Firepower Threat Defense application detects that the chassis-application health has recovered, it tries to rejoin the cluster automatically.
- **Internal error**—Internal failures include: application sync timeout; inconsistent application statuses; and so on. After you resolve the problem, you must manually rejoin the cluster by re-enabling clustering.
- **Failed configuration deployment**—If you deploy a new configuration from FMC, and the deployment fails on some cluster members but succeeds on others, then the units that failed are removed from the cluster. You must manually rejoin the cluster by re-enabling clustering. If the deployment fails on the control unit, then the deployment is rolled back, and no members are removed.

Data Path Connection State Replication

Every connection has one owner and at least one backup owner in the cluster. The backup owner does not take over the connection in the event of a failure; instead, it stores TCP/UDP state information, so that the connection can be seamlessly transferred to a new owner in case of a failure. The backup owner is usually also the director.

Some traffic requires state information above the TCP or UDP layer. See the following table for clustering support or lack of support for this kind of traffic.

Table 61: Features Replicated Across the Cluster

Traffic	State Support	Notes
Up time	Yes	Keeps track of the system up time.
ARP Table	Yes	Transparent mode only.
MAC address table	Yes	Transparent mode only.
User Identity	Yes	—
IPv6 Neighbor database	Yes	—
Dynamic routing	Yes	—
SNMP Engine ID	No	—

How the Cluster Manages Connections

Connections can be load-balanced to multiple nodes of the cluster. Connection roles determine how connections are handled in both normal operation and in a high availability situation.

Connection Roles

See the following roles defined for each connection:

- **Owner**—Usually, the node that initially receives the connection. The owner maintains the TCP state and processes packets. A connection has only one owner. If the original owner fails, then when new nodes receive packets from the connection, the director chooses a new owner from those nodes.

- **Backup owner**—The node that stores TCP/UDP state information received from the owner, so that the connection can be seamlessly transferred to a new owner in case of a failure. The backup owner does not take over the connection in the event of a failure. If the owner becomes unavailable, then the first node to receive packets from the connection (based on load balancing) contacts the backup owner for the relevant state information so it can become the new owner.

As long as the director (see below) is not the same node as the owner, then the director is also the backup owner. If the owner chooses itself as the director, then a separate backup owner is chosen.

- **Director**—The node that handles owner lookup requests from forwarders. When the owner receives a new connection, it chooses a director based on a hash of the source/destination IP address and ports (see below for ICMP hash details), and sends a message to the director to register the new connection. If packets arrive at any node other than the owner, the node queries the director about which node is the owner so it can forward the packets. A connection has only one director. If a director fails, the owner chooses a new director.

As long as the director is not the same node as the owner, then the director is also the backup owner (see above). If the owner chooses itself as the director, then a separate backup owner is chosen.

ICMP/ICMPv6 hash details:

- For Echo packets, the source port is the ICMP identifier, and the destination port is 0.
 - For Reply packets, the source port is 0, and the destination port is the ICMP identifier.
 - For other packets, both source and destination ports are 0.
- **Forwarder**—A node that forwards packets to the owner. If a forwarder receives a packet for a connection it does not own, it queries the director for the owner, and then establishes a flow to the owner for any other packets it receives for this connection. The director can also be a forwarder. Note that if a forwarder receives the SYN-ACK packet, it can derive the owner directly from a SYN cookie in the packet, so it does not need to query the director. (If you disable TCP sequence randomization, the SYN cookie is not used; a query to the director is required.) For short-lived flows such as DNS and ICMP, instead of querying, the forwarder immediately sends the packet to the director, which then sends them to the owner. A connection can have multiple forwarders; the most efficient throughput is achieved by a good load-balancing method where there are no forwarders and all packets of a connection are received by the owner.

Note We do not recommend disabling TCP sequence randomization when using clustering. There is a small chance that some TCP sessions won't be established, because the SYN/ACK packet might be dropped.

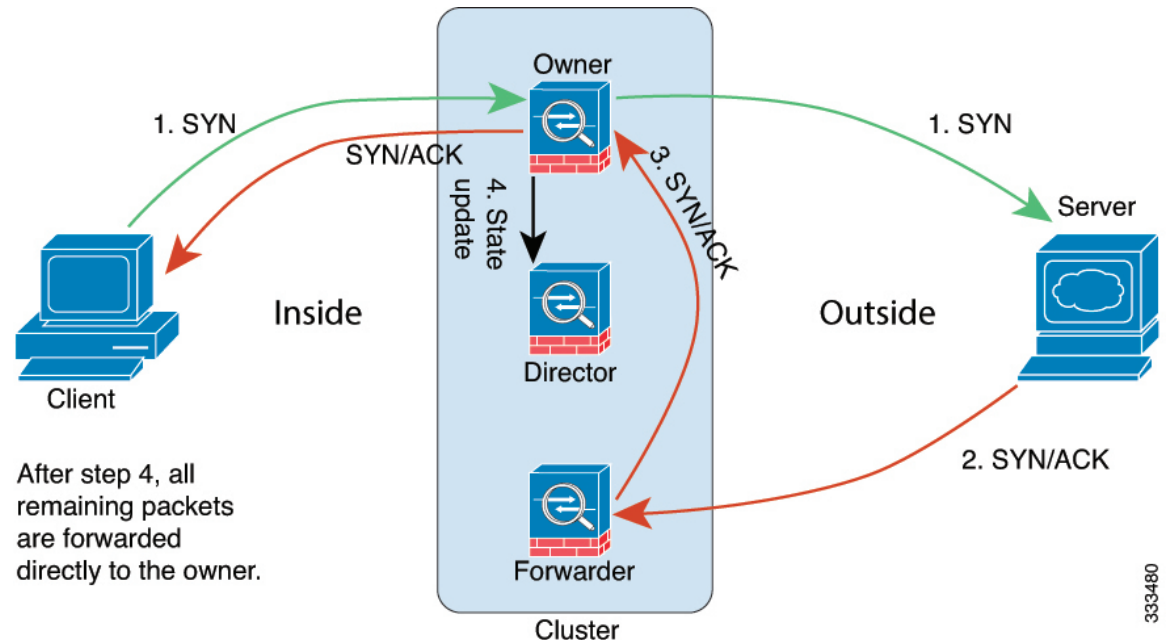

- **Fragment Owner**—For fragmented packets, cluster nodes that receive a fragment determine a fragment owner using a hash of the fragment source IP address, destination IP address, and the packet ID. All fragments are then forwarded to the fragment owner over the cluster control link. Fragments may be load-balanced to different cluster nodes, because only the first fragment includes the 5-tuple used in the switch load balance hash. Other fragments do not contain the source and destination ports and may be load-balanced to other cluster nodes. The fragment owner temporarily reassembles the packet so it can determine the director based on a hash of the source/destination IP address and ports. If it is a new connection, the fragment owner will register to be the connection owner. If it is an existing connection, the fragment owner forwards all fragments to the provided connection owner over the cluster control link. The connection owner will then reassemble all fragments.

New Connection Ownership

When a new connection is directed to a node of the cluster via load balancing, that node owns both directions of the connection. If any connection packets arrive at a different node, they are forwarded to the owner node over the cluster control link. If a reverse flow arrives at a different node, it is redirected back to the original node.

Sample Data Flow for TCP

The following example shows the establishment of a new connection.

1. The SYN packet originates from the client and is delivered to one FTD (based on the load balancing method), which becomes the owner. The owner creates a flow, encodes owner information into a SYN cookie, and forwards the packet to the server.
2. The SYN-ACK packet originates from the server and is delivered to a different FTD (based on the load balancing method). This FTD is the forwarder.
3. Because the forwarder does not own the connection, it decodes owner information from the SYN cookie, creates a forwarding flow to the owner, and forwards the SYN-ACK to the owner.
4. The owner sends a state update to the director, and forwards the SYN-ACK to the client.
5. The director receives the state update from the owner, creates a flow to the owner, and records the TCP state information as well as the owner. The director acts as the backup owner for the connection.
6. Any subsequent packets delivered to the forwarder will be forwarded to the owner.
7. If packets are delivered to any additional nodes, it will query the director for the owner and establish a flow.
8. Any state change for the flow results in a state update from the owner to the director.

CHAPTER 31

Routing Overview for Firepower Threat Defense

This chapter describes underlying concepts of how routing behaves within the Firepower Threat Defense.

- [Path Determination, on page 625](#)
- [Supported Route Types, on page 625](#)
- [Supported Internet Protocols for Routing, on page 627](#)
- [Routing Table, on page 627](#)
- [Routing Table for Management Traffic, on page 631](#)
- [Equal-Cost Multi-Path \(ECMP\) Routing, on page 631](#)
- [About Route Maps, on page 632](#)

Path Determination

Routing protocols use metrics to evaluate what path will be the best for a packet to travel. A metric is a standard of measurement, such as path bandwidth, that is used by routing algorithms to determine the optimal path to a destination. To aid the process of path determination, routing algorithms initialize and maintain routing tables, which include route information. Route information varies depending on the routing algorithm used.

Routing algorithms fill routing tables with a variety of information. Destination or next hop associations tell a router that a particular destination can be reached optimally by sending the packet to a particular router representing the next hop on the way to the final destination. When a router receives an incoming packet, it checks the destination address and attempts to associate this address with a next hop.

Routing tables also can include other information, such as data about the desirability of a path. Routers compare metrics to determine optimal routes, and these metrics differ depending on the design of the routing algorithm used.

Routers communicate with one another and maintain their routing tables through the transmission of a variety of messages. The routing update message is one such message that generally consists of all or a portion of a routing table. By analyzing routing updates from all other routers, a router can build a detailed picture of network topology. A link-state advertisement, another example of a message sent between routers, informs other routers of the state of the sender links. Link information also can be used to build a complete picture of network topology to enable routers to determine optimal routes to network destinations.

Supported Route Types

There are several route types that a router can use. The FTD device uses the following route types:

- Static Versus Dynamic
- Single-Path Versus Multipath
- Flat Versus Hierarchical
- Link-State Versus Distance Vector

Static Versus Dynamic

Static routing algorithms are actually table mappings established by the network administrator. These mappings do not change unless the network administrator alters them. Algorithms that use static routes are simple to design and work well in environments where network traffic is relatively predictable and where network design is relatively simple.

Because static routing systems cannot react to network changes, they generally are considered unsuitable for large, constantly changing networks. Most of the dominant routing algorithms are dynamic routing algorithms, which adjust to changing network circumstances by analyzing incoming routing update messages. If the message indicates that a network change has occurred, the routing software recalculates routes and sends out new routing update messages. These messages permeate the network, stimulating routers to rerun their algorithms and change their routing tables accordingly.

Dynamic routing algorithms can be supplemented with static routes where appropriate. A router of last resort (a default route for a router to which all unroutable packets are sent), for example, can be designated to act as a repository for all unroutable packets, ensuring that all messages are at least handled in some way.

Single-Path Versus Multipath

Some sophisticated routing protocols support multiple paths to the same destination. Unlike single-path algorithms, these multipath algorithms permit traffic multiplexing over multiple lines. The advantages of multipath algorithms are substantially better throughput and reliability, which is generally called load sharing.

Flat Versus Hierarchical

Some routing algorithms operate in a flat space, while others use routing hierarchies. In a flat routing system, the routers are peers of all others. In a hierarchical routing system, some routers form what amounts to a routing backbone. Packets from non-backbone routers travel to the backbone routers, where they are sent through the backbone until they reach the general area of the destination. At this point, they travel from the last backbone router through one or more non-backbone routers to the final destination.

Routing systems often designate logical groups of nodes, called domains, autonomous systems, or areas. In hierarchical systems, some routers in a domain can communicate with routers in other domains, while others can communicate only with routers within their domain. In very large networks, additional hierarchical levels may exist, with routers at the highest hierarchical level forming the routing backbone.

The primary advantage of hierarchical routing is that it mimics the organization of most companies and therefore supports their traffic patterns well. Most network communication occurs within small company groups (domains). Because intradomain routers need to know only about other routers within their domain, their routing algorithms can be simplified, and, depending on the routing algorithm being used, routing update traffic can be reduced accordingly.

Link-State Versus Distance Vector

Link-state algorithms (also known as shortest path first algorithms) flood routing information to all nodes in the internetwork. Each router, however, sends only the portion of the routing table that describes the state of its own links. In link-state algorithms, each router builds a picture of the entire network in its routing tables. Distance vector algorithms (also known as Bellman-Ford algorithms) call for each router to send all or some portion of its routing table, but only to its neighbors. In essence, link-state algorithms send small updates everywhere, while distance vector algorithms send larger updates only to neighboring routers. Distance vector algorithms know only about their neighbors. Typically, link-state algorithms are used in conjunction with OSPF routing protocols.

Supported Internet Protocols for Routing

The FTD device supports several Internet protocols for routing. Each protocol is briefly described in this section.

- Open Shortest Path First (OSPF)

OSPF is a routing protocol developed for Internet Protocol (IP) networks by the interior gateway protocol (IGP) working group of the Internet Engineering Task Force (IETF). OSPF uses a link-state algorithm to build and calculate the shortest path to all known destinations. Each router in an OSPF area includes an identical link-state database, which is a list of each of the router usable interfaces and reachable neighbors.

- Routing Information Protocol (RIP)

RIP is a distance-vector protocol that uses hop count as its metric. RIP is widely used for routing traffic in the global Internet and is an interior gateway protocol (IGP), which means that it performs routing within a single autonomous system.

- Border Gateway Protocol (BGP)

BGP is an interautonomous system routing protocol. BGP is used to exchange routing information for the Internet and is the protocol used between Internet service providers (ISP). Customers connect to ISPs, and ISPs use BGP to exchange customer and ISP routes. When BGP is used between autonomous systems (AS), the protocol is referred to as External BGP (EBGP). If a service provider is using BGP to exchange routes within an AS, then the protocol is referred to as Interior BGP (IBGP).

Routing Table

The FTD uses separate routing tables for data traffic (through-the-device) and for management traffic (from-the-device). This section describes how the routing tables work. For information about the management routing table, see also [Routing Table for Management Traffic, on page 631](#).

How the Routing Table Is Populated

The FTD routing table can be populated by statically defined routes, directly connected routes, and routes discovered by the dynamic routing protocols. Because the FTD device can run multiple routing protocols in addition to having static and connected routes in the routing table, it is possible that the same route is discovered

or entered in more than one manner. When two routes to the same destination are put into the routing table, the one that remains in the routing table is determined as follows:

- If the two routes have different network prefix lengths (network masks), then both routes are considered unique and are entered into the routing table. The packet forwarding logic then determines which of the two to use.

For example, if the RIP and OSPF processes discovered the following routes:

- RIP: 192.168.32.0/24
- OSPF: 192.168.32.0/19

Even though OSPF routes have the better administrative distance, both routes are installed in the routing table because each of these routes has a different prefix length (subnet mask). They are considered different destinations and the packet forwarding logic determines which route to use.

- If the FTD device learns about multiple paths to the same destination from a single routing protocol, such as RIP, the route with the better metric (as determined by the routing protocol) is entered into the routing table.

Metrics are values associated with specific routes, ranking them from most preferred to least preferred. The parameters used to determine the metrics differ for different routing protocols. The path with the lowest metric is selected as the optimal path and installed in the routing table. If there are multiple paths to the same destination with equal metrics, load balancing is done on these equal cost paths.

- If the FTD device learns about a destination from more than one routing protocol, the administrative distances of the routes are compared, and the routes with lower administrative distance are entered into the routing table.

Administrative Distances for Routes

You can change the administrative distances for routes discovered by or redistributed into a routing protocol. If two routes from two different routing protocols have the same administrative distance, then the route with the lower *default* administrative distance is entered into the routing table. In the case of EIGRP and OSPF routes, if the EIGRP route and the OSPF route have the same administrative distance, then the EIGRP route is chosen by default.

Administrative distance is a route parameter that the FTD device uses to select the best path when there are two or more different routes to the same destination from two different routing protocols. Because the routing protocols have metrics based on algorithms that are different from the other protocols, it is not always possible to determine the best path for two routes to the same destination that were generated by different routing protocols.

Each routing protocol is prioritized using an administrative distance value. The following table shows the default administrative distance values for the routing protocols supported by the FTD device.

Table 62: Default Administrative Distance for Supported Routing Protocols

Route Source	Default Administrative Distance
Connected interface	0
VPN route	1
Static route	1

Route Source	Default Administrative Distance
EIGRP Summary Route	5
External BGP	20
Internal EIGRP	90
OSPF	110
RIP	120
EIGRP external route	170
Internal and local BGP	200
Unknown	255

The smaller the administrative distance value, the more preference is given to the protocol. For example, if the FTD device receives a route to a certain network from both an OSPF routing process (default administrative distance - 110) and a RIP routing process (default administrative distance - 120), the FTD device chooses the OSPF route because OSPF has a higher preference. In this case, the router adds the OSPF version of the route to the routing table.

A VPN advertised route (V-Route/RRI) is equivalent to a static route with the default administrative distance 1. But it has a higher preference as with the network mask 255.255.255.255.

In this example, if the source of the OSPF-derived route was lost (for example, due to a power shutdown), the FTD device would then use the RIP-derived route until the OSPF-derived route reappears.

The administrative distance is a local setting. For example, if you change the administrative distance of routes obtained through OSPF, that change would only affect the routing table for the FTD device on which the command was entered. The administrative distance is not advertised in routing updates.

Administrative distance does not affect the routing process. The routing processes only advertise the routes that have been discovered by the routing process or redistributed into the routing process. For example, the RIP routing process advertises RIP routes, even if routes discovered by the OSPF routing process are used in the routing table.

Backup Dynamic and Floating Static Routes

A backup route is registered when the initial attempt to install the route in the routing table fails because another route was installed instead. If the route that was installed in the routing table fails, the routing table maintenance process calls each routing protocol process that has registered a backup route and requests them to reinstall the route in the routing table. If there are multiple protocols with registered backup routes for the failed route, the preferred route is chosen based on administrative distance.

Because of this process, you can create floating static routes that are installed in the routing table when the route discovered by a dynamic routing protocol fails. A floating static route is simply a static route configured with a greater administrative distance than the dynamic routing protocols running on the FTD device. When the corresponding route discovered by a dynamic routing process fails, the static route is installed in the routing table.

How Forwarding Decisions Are Made

Forwarding decisions are made as follows:

- If the destination does not match an entry in the routing table, the packet is forwarded through the interface specified for the default route. If a default route has not been configured, the packet is discarded.
- If the destination matches a single entry in the routing table, the packet is forwarded through the interface associated with that route.
- If the destination matches more than one entry in the routing table, then the packet is forwarded out of the interface associated with the route that has the longer network prefix length.

For example, a packet destined for 192.168.32.1 arrives on an interface with the following routes in the routing table:

- 192.168.32.0/24 gateway 10.1.1.2
- 192.168.32.0/19 gateway 10.1.1.3

In this case, a packet destined to 192.168.32.1 is directed toward 10.1.1.2, because 192.168.32.1 falls within the 192.168.32.0/24 network. It also falls within the other route in the routing table, but 192.168.32.0/24 has the longest prefix within the routing table (24 bits versus 19 bits). Longer prefixes are always preferred over shorter ones when forwarding a packet.

Note Existing connections continue to use their established interfaces even if a new similar connection would result in different behavior due to a change in routes.

Dynamic Routing and High Availability

Dynamic routes are synchronized on the standby unit when the routing table changes on the active unit. This means that all additions, deletions, or changes on the active unit are immediately propagated to the standby unit. If the standby unit becomes active in an active/standby ready High Availability pair, it will already have an identical routing table as that of the former active unit because routes are synchronized as a part of the High Availability bulk synchronization and continuous replication processes.

Dynamic Routing in Clustering

The routing process only runs on the control node, and routes are learned through the control node and replicated to data nodes. If a routing packet arrives at a data node, it is redirected to the control node.

Figure 22: Dynamic Routing in Clustering

After the data node learn the routes from the control node, each node makes forwarding decisions independently.

The OSPF LSA database is not synchronized from the control node to data nodes. If there is a control node switchover, the neighboring router will detect a restart; the switchover is not transparent. The OSPF process picks an IP address as its router ID. Although not required, you can assign a static router ID to ensure a consistent router ID is used across the cluster. See the OSPF Non-Stop Forwarding feature to address the interruption.

Routing Table for Management Traffic

Equal-Cost Multi-Path (ECMP) Routing

The FTD device supports Equal-Cost Multi-Path (ECMP) routing.

You can have up to 8 equal cost static or dynamic routes per interface. For example, you can configure multiple default routes on the outside interface that specify different gateways.

```
route for 0.0.0.0 0.0.0.0 through outside to 10.1.1.2
route for 0.0.0.0 0.0.0.0 through outside to 10.1.1.3
route for 0.0.0.0 0.0.0.0 through outside to 10.1.1.4
```

In this case, traffic is load-balanced on the outside interface between 10.1.1.2, 10.1.1.3, and 10.1.1.4. Traffic is distributed among the specified gateways based on an algorithm that hashes the source and destination IP addresses, incoming interface, protocol, source and destination ports.

About Route Maps

Route maps are used when redistributing routes into an OSPF, RIP or BGP routing process. They are also used when generating a default route into an OSPF routing process. A route map defines which of the routes from the specified routing protocol are allowed to be redistributed into the target routing process.

Route maps have many features in common with widely known ACLs. These are some of the traits common to both:

- They are an ordered sequence of individual statements, and each has a permit or deny result. Evaluation of an ACL or a route map consists of a list scan, in a predetermined order, and an evaluation of the criteria of each statement that matches. A list scan is aborted once the first statement match is found and an action associated with the statement match is performed.
- They are generic mechanisms. Criteria matches and match interpretation are dictated by the way that they are applied and the feature that uses them. The same route map applied to different features might be interpreted differently.

These are some of the differences between route maps and ACLs:

- Route maps are more flexible than ACLs and can verify routes based on criteria which ACLs can not verify. For example, a route map can verify if the type of route is internal.
- Each ACL ends with an implicit deny statement, by design convention. If the end of a route map is reached during matching attempts, the result depends on the specific application of the route map. Route maps that are applied to *redistribution* behave the same way as ACLs: if the route does not match any clause in a route map then the route redistribution is denied, as if the route map contained a deny statement at the end.

Permit and Deny Clauses

Route maps can have permit and deny clauses. The deny clause rejects route matches from redistribution. You can use an ACL as the matching criterion in the route map. Because ACLs also have permit and deny clauses, the following rules apply when a packet matches the ACL:

- ACL permit + route map permit: routes are redistributed.
- ACL permit + route map deny: routes are not redistributed.
- ACL deny + route map permit or deny: the route map clause is not matched, and the next route-map clause is evaluated.

Match and Set Clause Values

Each route map clause has two types of values:

- A match value selects routes to which this clause should be applied.

- A set value modifies information that will be redistributed into the target protocol.

For each route that is being redistributed, the router first evaluates the match criteria of a clause in the route map. If the match criteria succeeds, then the route is redistributed or rejected as dictated by the permit or deny clause, and some of its attributes might be modified by the values set from the set commands. If the match criteria fail, then this clause is not applicable to the route, and the software proceeds to evaluate the route against the next clause in the route map. Scanning of the route map continues until a clause is found that matches the route or until the end of the route map is reached.

A match or set value in each clause can be missed or repeated several times, if one of these conditions exists:

- If several match entries are present in a clause, all must succeed for a given route in order for that route to match the clause (in other words, the logical AND algorithm is applied for multiple match commands).
- If a match entry refers to several objects in one entry, either of them should match (the logical OR algorithm is applied).
- If a match entry is not present, all routes match the clause.
- If a set entry is not present in a route map permit clause, then the route is redistributed without modification of its current attributes.

Note Do not configure a set entry in a route map deny clause because the deny clause prohibits route redistribution—there is no information to modify.

A route map clause without a match or set entry does perform an action. An empty permit clause allows a redistribution of the remaining routes without modification. An empty deny clause does not allow a redistribution of other routes (this is the default action if a route map is completely scanned, but no explicit match is found).

CHAPTER 32

Static and Default Routes for Firepower Threat Defense

This chapter describes how to configure static and default routes on the Firepower Threat Defense.

- [About Static and Default Routes, on page 635](#)
- [Requirements and Prerequisites for Static Routes, on page 637](#)
- [Guidelines for Static and Default Routes, on page 637](#)
- [Add a Static Route, on page 638](#)

About Static and Default Routes

To route traffic to a non-connected host or network, you must define a route to the host or network, either using static or dynamic routing. Generally, you must configure at least one static route: a default route for all traffic that is not routed by other means to a default network gateway, typically the next hop router.

Default Route

The simplest option is to configure a default static route to send all traffic to an upstream router, relying on the router to route the traffic for you. A default route identifies the gateway IP address to which the FTD device sends all IP packets for which it does not have a learned or static route. A default static route is simply a static route with 0.0.0.0/0 (IPv4) or ::/0 (IPv6) as the destination IP address.

You should always define a default route.

Because FTD uses separate routing tables for data traffic and for management traffic, you can optionally configure a default route for data traffic and another default route for management traffic. Note that from-the-device traffic uses either the management-only or data routing table by default depending on the type (see [Routing Table for Management Traffic, on page 631](#)), but will fall back to the other routing table if a route is not found. Default routes will always match traffic, and will prevent a fall back to the other routing table. In this case, you must specify the interface you want to use for egress traffic if that interface is not in the default routing table. The Diagnostic interface is included in the management-only table. The special Management interface uses a separate Linux routing table, and has its own default route. See the **configure network** commands.

Static Routes

You might want to use static routes in the following cases:

- Your networks use an unsupported router discovery protocol.
- Your network is small and you can easily manage static routes.
- You do not want the traffic or CPU overhead associated with routing protocols.
- In some cases, a default route is not enough. The default gateway might not be able to reach the destination network, so you must also configure more specific static routes. For example, if the default gateway is outside, then the default route cannot direct traffic to any inside networks that are not directly connected to the FTD device.
- You are using a feature that does not support dynamic routing protocols.

Route Priorities

- Routes that identify a specific destination take precedence over the default route.
- When multiple routes exist to the same destination (either static or dynamic), then the administrative distance for the route determines priority. Static routes are set to 1, so they typically are the highest priority routes.
- When you have multiple static routes to the same destination with the same administrative distance, see [Equal-Cost Multi-Path \(ECMP\) Routing, on page 631](#).
- For traffic emerging from a tunnel with the Tunneled option, this route overrides any other configured or learned default routes.

Transparent Firewall Mode Routes

For traffic that originates on the FTD device and is destined through a bridge group member interface for a non-directly connected network, you need to configure either a default route or static routes so the FTD device knows out of which bridge group member interface to send traffic. Traffic that originates on the FTD device might include communications to a syslog server or SNMP server. If you have servers that cannot all be reached through a single default route, then you must configure static routes. For transparent mode, you cannot specify the BVI as the gateway interface; only member interfaces can be used. See [#unique_948](#) for more information.

Static Route Tracking

One of the problems with static routes is that there is no inherent mechanism for determining if the route is up or down. They remain in the routing table even if the next hop gateway becomes unavailable. Static routes are only removed from the routing table if the associated interface on the FTD device goes down.

The static route tracking feature provides a method for tracking the availability of a static route and installing a backup route if the primary route should fail. For example, you can define a default route to an ISP gateway and a backup default route to a secondary ISP in case the primary ISP becomes unavailable.

The FTD device implements static route tracking by associating a static route with a monitoring target host on the destination network that the FTD device monitors using ICMP echo requests. If an echo reply is not received within a specified time period, the host is considered down, and the associated route is removed from the routing table. An untracked backup route with a higher metric is used in place of the removed route.

When selecting a monitoring target, you need to make sure that it can respond to ICMP echo requests. The target can be any network object that you choose, but you should consider using the following:

- The ISP gateway (for dual ISP support) address
- The next hop gateway address (if you are concerned about the availability of the gateway)
- A server on the target network, such as a syslog server, that the FTD device needs to communicate with
- A persistent network object on the destination network

Note A PC that may be shut down at night is not a good choice.

You can configure static route tracking for statically defined routes or default routes obtained through DHCP or PPPoE. You can only enable PPPoE clients on multiple interfaces with route tracking configured.

Requirements and Prerequisites for Static Routes

Model Support

FTD

Supported Domains

Any

User Roles

Admin

Network Admin

Guidelines for Static and Default Routes

Firewall Mode and Bridge Groups

- In transparent mode, static routes must use the bridge group member interface as the gateway; you cannot specify the BVI.
- Static route tracking is not supported for bridge group member interfaces.

Supported Network Address

- Static route tracking is not supported for IPv6.

- ASA does not support CLASS E routing. Hence, CLASS E network is not routable as static routes.

Clustering and Multiple Context Mode

- In clustering, static route tracking is only supported on the primary unit.
- Static route tracking is not supported in multiple context mode.

ASP and RIB Route Entries

All routes and its distance installed on the device are captured in the ASP routing table. This is common for all static and dynamic routing protocols. Only the best distance route is captured in the RIB table.

Add a Static Route

A static route defines where to send traffic for specific destination networks. You should at a minimum define a default route. A default route is simply a static route with 0.0.0.0/0 as the destination IP address.

Procedure

-
- Step 1** Choose **Devices > Device Management**, and edit the Firepower Threat Defense device.
- Step 2** Click **Routing**.
- Step 3** Select **Static Route**.
- Step 4** Click **Add Routes**.
- Step 5** Click **IPv4** or **IPv6** depending on the type of static route that you are adding.
- Step 6** Choose the **Interface** to which this static route applies.
For transparent mode, choose a bridge group member interface name.
- Step 7** In the **Available Network** list, choose the destination network.
To define a default route, create an object with the address 0.0.0.0/0 and select it here.
- Step 8** In the **Gateway** or **IPv6 Gateway** field, enter or choose the gateway router which is the next hop for this route. You can provide an IP address or a Networks/Hosts object.
- Step 9** In the **Metric** field, enter the number of hops to the destination network. Valid values range from 1 to 255; the default value is 1. The metric is a measurement of the “expense” of a route, based on the number of hops (hop count) to the network on which a specific host resides. Hop count is the number of networks that a network packet must traverse, including the destination network, before it reaches its final destination. The metric is used to compare routes among different routing protocols. The default administrative distance for static routes is 1, giving it precedence over routes discovered by dynamic routing protocols but not directly connected routes. The default administrative distance for routes discovered by OSPF is 110. If a static route has the same administrative distance as a dynamic route, the static route takes precedence. Connected routes always take precedence over static or dynamically discovered routes.
- Step 10** (Optional) For a default route, click the **Tunneled** checkbox to define a separate default route for VPN traffic.
You can define a separate default route for VPN traffic if you want your VPN traffic to use a different default route than your non VPN traffic. For example, traffic incoming from VPN connections can be easily directed towards internal networks, while traffic from internal networks can be directed towards the outside. When

you create a default route with the tunneled option, all traffic from a tunnel terminating on the device that cannot be routed using learned or static routes, is sent to this route. You can configure only one default tunneled gateway per device. ECMP for tunneled traffic is not supported.

Step 11 (IPv4 static route only) To monitor route availability, enter or choose the name of an SLA (service level agreement) Monitor object that defines the monitoring policy, in the **Route Tracking** field.

See [SLA Monitor Objects, on page 405](#).

Step 12 Click **Ok**.

CHAPTER 33

OSPF for Firepower Threat Defense

This chapter describes how to configure the Firepower Threat Defense to route data, perform authentication, and redistribute routing information using the Open Shortest Path First (OSPF) routing protocol.

- [OSPF for Firepower Threat Defense, on page 641](#)
- [Requirements and Prerequisites for OSPF, on page 644](#)
- [Guidelines for OSPF, on page 644](#)
- [Configure OSPFv2, on page 646](#)
- [Configure OSPFv3, on page 658](#)

OSPF for Firepower Threat Defense

This chapter describes how to configure the Firepower Threat Defense to route data, perform authentication, and redistribute routing information using the Open Shortest Path First (OSPF) routing protocol.

About OSPF

OSPF is an interior gateway routing protocol that uses link states rather than distance vectors for path selection. OSPF propagates link-state advertisements rather than routing table updates. Because only LSAs are exchanged instead of the entire routing tables, OSPF networks converge more quickly than RIP networks.

OSPF uses a link-state algorithm to build and calculate the shortest path to all known destinations. Each router in an OSPF area contains an identical link-state database, which is a list of each of the router usable interfaces and reachable neighbors.

The advantages of OSPF over RIP include the following:

- OSPF link-state database updates are sent less frequently than RIP updates, and the link-state database is updated instantly, rather than gradually, as stale information is timed out.
- Routing decisions are based on cost, which is an indication of the overhead required to send packets across a certain interface. The FTD device calculates the cost of an interface based on link bandwidth rather than the number of hops to the destination. The cost can be configured to specify preferred paths.

The disadvantage of shortest path first algorithms is that they require a lot of CPU cycles and memory.

The FTD device can run two processes of OSPF protocol simultaneously on different sets of interfaces. You might want to run two processes if you have interfaces that use the same IP addresses (NAT allows these interfaces to coexist, but OSPF does not allow overlapping addresses). Or you might want to run one process

on the inside and another on the outside, and redistribute a subset of routes between the two processes. Similarly, you might need to segregate private addresses from public addresses.

You can redistribute routes into an OSPF routing process from another OSPF routing process, a RIP routing process, or from static and connected routes configured on OSPF-enabled interfaces.

The FTD device supports the following OSPF features:

- Intra-area, inter-area, and external (Type I and Type II) routes.
- Virtual links.
- LSA flooding.
- Authentication to OSPF packets (both password and MD5 authentication).
- Configuring the FTD device as a designated router or a designated backup router. The FTD device also can be set up as an ABR.
- Stub areas and not-so-stubby areas.
- Area boundary router Type 3 LSA filtering.

OSPF supports MD5 and clear text neighbor authentication. Authentication should be used with all routing protocols when possible because route redistribution between OSPF and other protocols (such as RIP) can potentially be used by attackers to subvert routing information.

If NAT is used, if OSPF is operating on public and private areas, and if address filtering is required, then you need to run two OSPF processes—one process for the public areas and one for the private areas.

A router that has interfaces in multiple areas is called an Area Border Router (ABR). A router that acts as a gateway to redistribute traffic between routers using OSPF and routers using other routing protocols is called an Autonomous System Boundary Router (ASBR).

An ABR uses LSAs to send information about available routes to other OSPF routers. Using ABR Type 3 LSA filtering, you can have separate private and public areas with the ASA acting as an ABR. Type 3 LSAs (inter-area routes) can be filtered from one area to other, which allows you to use NAT and OSPF together without advertising private networks.

Note Only Type 3 LSAs can be filtered. If you configure the FTD device as an ASBR in a private network, it will send Type 5 LSAs describing private networks, which will get flooded to the entire AS, including public areas.

If NAT is employed but OSPF is only running in public areas, then routes to public networks can be redistributed inside the private network, either as default or Type 5 AS external LSAs. However, you need to configure static routes for the private networks protected by the FTD device. Also, you should not mix public and private networks on the same FTD device interface.

You can have two OSPF routing processes, one RIP routing process, and one EIGRP routing process running on the FTD device at the same time.

OSPF Support for Fast Hello Packets

The OSPF Support for Fast Hello Packets feature provides a way to configure the sending of hello packets in intervals less than one second. Such a configuration would result in faster convergence in an Open Shortest Path First (OSPF) network.

Prerequisites for OSPF Support for Fast Hello Packets

OSPF must be configured in the network already or configured at the same time as the OSPF Support for Fast Hello Packets feature.

OSPF Hello Interval and Dead Interval

OSPF hello packets are packets that an OSPF process sends to its OSPF neighbors to maintain connectivity with those neighbors. The hello packets are sent at a configurable interval (in seconds). The defaults are 10 seconds for an Ethernet link and 30 seconds for a non broadcast link. Hello packets include a list of all neighbors for which a hello packet has been received within the dead interval. The dead interval is also a configurable interval (in seconds), and defaults to four times the value of the hello interval. The value of all hello intervals must be the same within a network. Likewise, the value of all dead intervals must be the same within a network.

These two intervals work together to maintain connectivity by indicating that the link is operational. If a router does not receive a hello packet from a neighbor within the dead interval, it will declare that neighbor to be down.

OSPF Fast Hello Packets

OSPF fast hello packets refer to hello packets being sent at intervals of less than 1 second. To understand fast hello packets, you should already understand the relationship between OSPF hello packets and the dead interval. See [OSPF Hello Interval and Dead Interval](#), on page 643.

OSPF fast hello packets are achieved by using the `ospf dead-interval` command. The dead interval is set to 1 second, and the `hello-multiplier` value is set to the number of hello packets you want sent during that 1 second, thus providing subsecond or "fast" hello packets.

When fast hello packets are configured on the interface, the hello interval advertised in the hello packets that are sent out this interface is set to 0. The hello interval in the hello packets received over this interface is ignored.

The dead interval must be consistent on a segment, whether it is set to 1 second (for fast hello packets) or set to any other value. The hello multiplier need not be the same for the entire segment as long as at least one hello packet is sent within the dead interval.

Benefits of OSPF Fast Hello Packets

The benefit of the OSPF Fast Hello Packets feature is that your OSPF network will experience faster convergence time than it would without fast hello packets. This feature allows you to detect lost neighbors within 1 second. It is especially useful in LAN segments, where neighbor loss might not be detected by the Open System Interconnection (OSI) physical layer and data-link layer.

Implementation Differences Between OSPFv2 and OSPFv3

OSPFv3 is not backward compatible with OSPFv2. To use OSPF to route both IPv4 and IPv6 traffic, you must run both OSPFv2 and OSPFv3 at the same time. They coexist with each other, but do not interact with each other.

The additional features that OSPFv3 provides include the following:

- Protocol processing per link.
- Removal of addressing semantics.
- Addition of flooding scope.
- Support for multiple instances per link.
- Use of the IPv6 link-local address for neighbor discovery and other features.
- LSAs expressed as prefix and prefix length.
- Addition of two LSA types.
- Handling of unknown LSA types.
- Authentication support using the IPsec ESP standard for OSPFv3 routing protocol traffic, as specified by RFC-4552.

Requirements and Prerequisites for OSPF

Model Support

FTD

FTDv

Supported Domains

Any

User Roles

Admin

Network Admin

Guidelines for OSPF

Firewall Mode Guidelines

OSPF supports routed firewall mode only. OSPF does not support transparent firewall mode.

High Availability Guidelines

OSPFv2 and OSPFv3 support Stateful High Availability.

IPv6 Guidelines

- OSPFv2 does not support IPv6.
- OSPFv3 supports IPv6.
- OSPFv3 uses IPv6 for authentication.
- The FTD device installs OSPFv3 routes into the IPv6 RIB, provided it is the best route.

OSPFv3 Hello Packets and GRE

Typically, OSPF traffic does not pass through GRE tunnel. When OSPFv3 on IPv6 is encapsulated inside GRE, the IPv6 header validation for security check such as Multicast Destination fails. The packet is dropped due to the implicit security check validation, as this packet has destination IPv6 multicast.

You may define a pre-filter rule to bypass GRE traffic. However, with pre-filter rule, inner packets would not be interrogated by the inspection engine.

Clustering Guidelines

- OSPFv3 encryption is not supported. An error message appears if you try to configure OSPFv3 encryption in a clustering environment.
- In Spanned interface mode, dynamic routing is not supported on management-only interfaces.
- When a control role change occurs in the cluster, the following behavior occurs:
 - In spanned interface mode, the router process is active only on the control unit and is in a suspended state on the data units. Each cluster unit has the same router ID because the configuration has been synchronized from the control unit. As a result, a neighboring router does not notice any change in the router ID of the cluster during a role change.

Multiprotocol Label Switching (MPLS) and OSPF Guidelines

When a MPLS-configured router sends Link State (LS) update packets containing opaque Type-10 link-state advertisements (LSAs) that include an MPLS header, authentication fails and the appliance silently drops the update packets, rather than acknowledging them. Eventually the peer router will terminate the neighbor relationship because it has not received any acknowledgments.

Make sure that non-stop forwarding (NSF) is disabled on the appliance to ensure that the neighbor relationship remains stable:

- Navigate to the **Non Stop Forwarding** page in FMC(**Devices > Device Management (select the desired device) > Routing > OSPF > Advanced > Non Stop Forwarding**).

Ensure the **Non Stop Forwarding Capability** boxes are not checked.

Note The Firepower 4100/9300 models may have high latency when using MPLS because they lack load balancing across multiple receiving queues.

Route Redistribution Guidelines

- Redistribution of route maps with IPv4 or IPv6 prefix list on OSPFv2 or OSPFv3 is not supported. Use an access list in the route map on OSPF for redistribution.
- When OSPF is configured on a device that is a part of EIGRP network or vice versa, ensure that OSPF-router is configured to tag the route (EIGRP does not support route tag yet).

When redistributing OSPF into EIGRP and EIGRP into OSPF, a routing loop occurs when there is an outage on one of the links, interfaces, or even when the route originator is down. To prevent the redistribution of routes from one domain back into the same domain, a router can tag a route that belongs to a domain while it is redistributing, and those routes can be filtered on the remote router based on the same tag. Because the routes will not be installed into the routing table, they will not be redistributed back into the same domain.

Additional Guidelines

- OSPFv2 and OSPFv3 support multiple instances on an interface.
- OSPFv3 supports encryption through ESP headers in a non-clustered environment.
- OSPFv3 supports Non-Payload Encryption.
- OSPFv2 supports Cisco NSF Graceful Restart and IETF NSF Graceful Restart mechanisms as defined in RFCs 4811, 4812 & 3623 respectively.
- OSPFv3 supports Graceful Restart mechanism as defined in RFC 5187.
- There is a limit to the number of intra area (type 1) routes that can be distributed. For these routes, a single type-1 LSA contains all prefixes. Because the system has a limit of 35 KB for packet size, 3000 routes result in a packet that exceeds the limit. Consider 2900 type 1 routes to be the maximum number supported.
- To avoid adjacency flaps due to route updates being dropped if the route update is larger than the minimum MTU on the link, ensure that you configure the same MTU on the interfaces on both sides of the link.

Configure OSPFv2

This section describes the tasks involved in configuring an OSPFv2 routing process.

Configure OSPF Areas, Ranges, and Virtual Links

You can configure several OSPF area parameters, which include setting authentication, defining stub areas, and assigning specific costs to the default summary route. You can enable up to two OSPF process instances. Each OSPF process has its own associated areas and networks. Authentication provides password-based protection against unauthorized access to an area.

Stub areas are areas into which information on external routes is not sent. Instead, there is a default external route generated by the ABR into the stub area for destinations outside the autonomous system. To take advantage of the OSPF stub area support, default routing must be used in the stub area.

Procedure

-
- Step 1** Choose **Devices > Device Management**, and edit the Firepower Threat Defense device.
- Step 2** Click **Routing**.
- Step 3** Click **OSPF**.
- Step 4** Select **Process 1**. You can enable up to two OSPF process instances for each context. You must choose an OSPF process to be able to configure the Area parameters.
- Step 5** Choose the OSPF role from the drop-down list, and enter a description for it in the next field. The options are Internal, ABR, ASBR, and ABR and ASBR. See [About OSPF, on page 641](#) for a description of the OSPF roles.
- Step 6** Select **Area > Add**.

You can click **Edit** () , or use the right-click menu to cut, copy, paste, insert, and delete areas.

- Step 7** Configure the following area options for each OSPF process:
- **OSPF Process**—Choose 1 or 2.
 - **Area ID**—Designation of the area for which routes are to be summarized.
 - **Area Type**—Choose one of the following:
 - **Normal**—(Default) Standard OSPF area.
 - **Stub**—A stub area does not have any routers or areas beyond it. Stub areas prevent Autonomous System (AS) External LSAs (Type 5 LSAs) from being flooded into the stub area. When you create a stub area, you can prevent summary LSAs (Types 3 and 4) from being flooded into the area by NOT checking the **Summary Stub** check box.
 - **NSSA**—Makes the area a not-so-stubby area (NSSA). NSSAs accept Type 7 LSAs. You can disable route redistribution by NOT checking the **Redistribute check box** and checking the **Default Information Originate** check box. You can prevent summary LSAs from being flooded into the area by NOT checking the **Summary NSSA** check box.
 - **Metric Value**—The metric used for generating the default route. The default value is 10. Valid metric values range from 0 through 16777214.
 - **Metric Type**—The metric type is the external link type that is associated with the default route that is advertised into the OSPF routing domain. The available options are 1 for a Type 1 external route or 2 for a Type 2 external route.
 - **Available Network**—Choose one of the available networks and click **Add**, or click **Add** () to add a new network object. See [Network Objects, on page 354](#) for the procedure for adding networks.
 - **Authentication**—Choose the OSPF authentication:
 - **None**—(Default) Disables OSPF area authentication.

- **Password**—Provides a clear text password for area authentication, which is not recommended where security is a concern.
- **MD5**—Allows MD5 authentication.
- **Default Cost**—The default cost for the OSPF area, which is used to determine the shortest paths to the destination. Valid values range from 0 through 65535. The default value is 1.

Step 8 Click **OK** to save the area configuration.

Step 9 Select **Range > Add**.

- Choose one of the available networks and whether to advertise, or,
- Click **Add (+)** to add a new network object. See [Network Objects, on page 354](#) for the procedure for adding networks.

Step 10 Click **OK** to save the range configuration.

Step 11 Select **Virtual Link**, click **Add**, and configure the following options for each OSPF process:

- **Peer Router**—Choose the IP address of the peer router. To add a new peer router, click **Add (+)**. See [Network Objects, on page 354](#) for the procedure for adding networks.
- **Hello Interval**—The time in seconds between the hello packets sent on an interface. The hello interval is an unsigned integer that is to be advertised in the hello packets. The value must be the same for all routers and access servers on a specific network. Valid values range from 1 through 65535. The default is 10.

The smaller the hello interval, the faster topological changes are detected, but the more traffic is sent on the interface.

- **Transmit Delay**—The estimated time in seconds that is required to send an LSA packet on the interface. The integer value must be greater than zero. Valid values range from 1 through 8192. The default is 1.

LSAs in the update packet have their own ages incremented by this amount before transmission. If the delay is not added before transmission over a link, the time in which the LSA propagates over the link is not considered. The value assigned should take into account the transmission and propagation delays for the interface. This setting has more significance on very low-speed links.

- **Retransmit Interval**—The time in seconds between LSA retransmissions for adjacencies that belong to the interface. The retransmit interval is the expected round-trip delay between any two routers on the attached network. The value must be greater than the expected round-trip delay, and can range from 1 through 65535. The default is 5.

When a router sends an LSA to its neighbor, it keeps the LSA until it receives the acknowledgment message. If the router receives no acknowledgment, it resends the LSA. Be conservative when setting this value, or needless retransmission can result. The value should be larger for serial lines and virtual links.

- **Dead Interval**—The time in seconds that hello packets are not seen before a neighbor indicates that the router is down. The dead interval is an unsigned integer. The default is four times the hello interval, or 40 seconds. The value must be the same for all routers and access servers that are attached to a common network. Valid values range from 1 through 65535.

- **Authentication**—Choose the OSPF virtual link authentication from the following:

- **None**—(Default) Disables virtual link area authentication.
- **Area Authentication**—Enables area authentication using MD5. Click **Add**, and enter the key ID, key, confirm the key, and then click **OK**.
- **Password**—Provides a clear text password for virtual link authentication, which is not recommended where security is a concern.
- **MD5**—Allows MD5 authentication. Click **Add**, and enter the key ID, key, confirm the key, and then click **OK**.

Note Ensure to enter only numbers as the MD5 key ID.

Step 12 Click **OK** to save the virtual link configuration.

Step 13 Click **Save** on the Routing page to save your changes.

What to do next

Continue with [Configure OSPF Redistribution](#).

Configure OSPF Redistribution

The Firepower Threat Defense device can control the redistribution of routes between the OSPF routing processes. The rules for redistributing routes from one routing process into an OSPF routing process are displayed. You can redistribute routes discovered by RIP and BGP into the OSPF routing process. You can also redistribute static and connected routes into the OSPF routing process.

Procedure

Step 1 Choose **Devices > Device Management**, and edit the Firepower Threat Defense device.

Step 2 Click **Routing**.

Step 3 Click **OSPF**.

Step 4 Select **Redistribution > Add**.

You can click **Edit** () , or use the right-click menu to cut, copy, past, insert, and delete areas.

Step 5 Configure the following redistribution options for each OSPF process:

- **Route Type**—Choose one of the following types:
 - **Static**—Redistributes static routes to the OSPF routing process.
 - **Connected**—Redistributes connected routes (routes established automatically by virtue of having the IP address enabled on the interface) to the OSPF routing process. Connected routes are redistributed as external to the device. You can select whether to use subnets under the Optional list.

- **OSPF**—Redistributes routes from another OSPF routing process, for example, internal, external 1 and 2, NSSA external 1 and 2, or whether to use subnets. You can select these options under the Optional list.
 - **BGP**—Redistribute routes from the BGP routing process. Add the AS number and whether to use subnets.
 - **RIP**—Redistributes routes from the RIP routing process. You can select whether to use subnets under the Optional list.
- **Metric Value**—Metric value for the routes being distributed. The default value is 10. Valid values range from 0 to 16777214.
- When redistributing from one OSPF process to another OSPF process on the same device, the metric will be carried through from one process to the other if no metric value is specified. When redistributing other processes to an OSPF process, the default metric is 20 when no metric value is specified.
- **Metric Type**—The metric type is the external link type that is associated with the default route that is advertised into the OSPF routing domain. The available options are 1 for a Type 1 external route or 2 for a Type 2 external route.
 - **Tag Value**—Tag specifies the 32-bit decimal value attached to each external route that is not used by OSPF itself, but which may be used to communicate information between ASBRs. If none is specified, then the remote autonomous system number is used for routes from BGP and EGP. For other protocols, zero is used. Valid values are from 0 to 4294967295.
 - **RouteMap**—Checks for filtering the importing of routes from the source routing protocol to the current routing protocol. If this parameter is not specified, all routes are redistributed. If this parameter is specified, but no route map tags are listed, no routes are imported. Or you can add a new route map by clicking **Add** (+). See [Route Maps](#) to add a new route map.

Step 6 Click **OK** to save the redistribution configuration.

Step 7 Click **Save** on the Routing page to save your changes.

What to do next

Continue with [Configure OSPF Inter-Area Filtering, on page 650](#).

Configure OSPF Inter-Area Filtering

ABR type 3 LSA filtering extends the capability of an ABR that is running OSPF to filter type 3 LSAs between different OSPF areas. Once a prefix list is configured, only the specified prefixes are sent from one OSPF area to another OSPF area. All other prefixes are restricted to their OSPF area. You can apply this type of area filtering to traffic going into or coming out of an OSPF area, or to both the incoming and outgoing traffic for that area.

When multiple entries of a prefix list match a given prefix, the entry with the lowest sequence number is used. For efficiency, you may want to put the most common matches or denials near the top of the list by manually assigning them a lower sequence number. By default, sequence numbers are automatically generated in increments of 5, beginning with 5.

Procedure

Step 1 Choose **Devices > Device Management**, and edit the Firepower Threat Defense device.

Step 2 Click **Routing**.

Step 3 Click **OSPF**.

Step 4 Select **InterArea > Add**.

You can click **Edit** () , or use the right-click menu to cut, copy, past, insert, and delete inter-areas.

Step 5 Configure the following inter-area filtering options for each OSPF process:

- **OSPF Process**—Choose 1 or 2.
- **Area ID**—The area for which routes are to be summarized.
- **PrefixList**—The name of the prefix. To add a new prefix list object, see Step 5.
- **Traffic Direction**—Inbound or outbound. Choose Inbound to filter LSAs coming into an OSPF area, or Outbound to filter LSAs coming out of an OSPF area. If you are editing an existing filter entry, you cannot modify this setting.

Step 6 Click **Add** () , and enter a name for the new prefix list, and whether to allow overrides.

You must configure a prefix list before you can configure a prefix rule.

Step 7 Click **Add** to configure prefix rules, and configure the following parameters:

- **Action**—Select **Block** or **Allow** for the redistribution access.
- **Sequence No**—The routing sequence number. By default, sequence numbers are automatically generated in increments of 5, beginning with 5.
- **IP Address**—Specify the prefix number in the format of IP address/mask length.
- **Min Prefix Length**—(Optional) The minimum prefix length.
- **Max Prefix Length**—(Optional) The maximum prefix length.

Step 8 Click **OK** to save the inter-area filtering configuration.

Step 9 Click **Save** on the Routing page to save your changes.

What to do next

Continue with [Configure OSPF Filter Rules, on page 651](#).

Configure OSPF Filter Rules

You can configure ABR Type 3 LSA filters for each OSPF process. ABR Type 3 LSA filters allow only specified prefixes to be sent from one area to another area and restrict all other prefixes. You can apply this type of area filtering out of a specific OSPF area, into a specific OSPF area, or into and out of the same OSPF

area at the same time. OSPF ABR Type 3 LSA filtering improves your control of route distribution between OSPF areas.

Procedure

-
- Step 1** Choose **Devices > Device Management**, and edit the Firepower Threat Defense device.
 - Step 2** Click **Routing**.
 - Step 3** Click **OSPF**.
 - Step 4** Select **Filter Rule > Add**.

You can click **Edit** () , or use the right-click menu to cut, copy, paste, insert, and delete filter rules.

- Step 5** Configure the following filter rule options for each OSPF process:
 - **OSPF Process**—Choose 1 or 2.
 - **Access List**—The access list for this OSPF process. To add a new standard access list object, click **Add** () and see [Configure Standard ACL Objects, on page 412](#).
 - **Traffic Direction**—Choose In or Out for the traffic direction being filtered. Choose In to filter LSAs coming into an OSPF area, or Out to filter LSAs coming out of an OSPF area. If you are editing an existing filter entry, you cannot modify this setting.
 - **Interface**—The interface for this filter rule.
 - Step 6** Click **OK** to save the filter rule configuration.
 - Step 7** Click **Save** on the Routing page to save your changes.
-

What to do next

Continue with [Configure OSPF Summary Addresses, on page 652](#).

Configure OSPF Summary Addresses

When routes from other protocols are redistributed into OSPF, each route is advertised individually in an external LSA. However, you can configure the Firepower Threat Defense device to advertise a single route for all the redistributed routes that are included for a specified network address and mask. This configuration decreases the size of the OSPF link-state database. Routes that match the specified IP address mask pair can be suppressed. The tag value can be used as a match value for controlling redistribution through route maps.

Routes learned from other routing protocols can be summarized. The metric used to advertise the summary is the smallest metric of all the more specific routes. Summary routes help reduce the size of the routing table.

Using summary routes for OSPF causes an OSPF ASBR to advertise one external route as an aggregate for all redistributed routes that are covered by the address. Only routes from other routing protocols that are being redistributed into OSPF can be summarized.

Procedure

- Step 1** Choose **Devices > Device Management**, and edit the Firepower Threat Defense device.
- Step 2** Click **Routing**.
- Step 3** Click **OSPF**.
- Step 4** Select **Summary Address > Add**.

You can click **Edit** () to edit, or use the right-click menu to cut, copy, past, insert, and delete summary addresses.

- Step 5** Configure the following summary address options for each OSPF process:
- **OSPF Process**—Choose 1 or 2.
 - **Available Network**—The IP address of the summary address. Select one from the Available networks list and click **Add**, or to add a new network, click **Add** (+). See [Network Objects, on page 354](#) for the procedure for adding networks.
 - **Tag**—A 32-bit decimal value that is attached to each external route. This value is not used by OSPF itself, but may be used to communicate information between ASBRs.
 - **Advertise**—**Advertises** the summary route. Uncheck this check box to suppress routes that fall under the summary address. By default, this check box is checked.
- Step 6** Click **OK** to save the summary address configuration.
- Step 7** Click **Save** on the Routing page to save your changes.
-

What to do next

Continue with [Configure OSPF Interfaces and Neighbors, on page 653](#).

Configure OSPF Interfaces and Neighbors

You can change some interface-specific OSPFv2 parameters, if necessary. You are not required to change any of these parameters, but the following interface parameters must be consistent across all routers in an attached network: the hello interval, the dead interval, and the authentication key. If you configure any of these parameters, be sure that the configurations for all routers on your network have compatible values.

You need to define static OSPFv2 neighbors to advertise OSPFv2 routes over a point-to-point, non-broadcast network. This feature lets you broadcast OSPFv2 advertisements across an existing VPN connection without having to encapsulate the advertisements in a GRE tunnel.

Procedure

- Step 1** Choose **Devices > Device Management**, and edit the Firepower Threat Defense device.
- Step 2** Click **Routing**.
- Step 3** Click **OSPF**.

Step 4 Select **Interface > Add**.

You can click **Edit** () , or use the right-click menu to cut, copy, past, insert, and delete areas.

Step 5 Configure the following Interface options for each OSPF process:

- **Interface**—The interface you are configuring.
- **Default Cost**—The cost of sending a packet through the interface. The default value is 10.
- **Priority**—**Determines** the designated router for a network. Valid values range from 0 to 255. The default value is 1. Entering 0 for this setting makes the router ineligible to become the designated router or backup designated router.

When two routers connect to a network, both attempt to become the designated router. The device with the higher router priority becomes the designated router. If there is a tie, the router with the higher router ID becomes the designated router. This setting does not apply to interfaces that are configured as point-to-point interfaces.

- **MTU Ignore**—**OSPF** checks whether neighbors are using the same MTU on a common interface. This check is performed when neighbors exchange DBD packets. If the receiving MTU in the DBD packet is higher than the IP MTU configured on the incoming interface, OSPF adjacency is not established.
- **Database Filter**—Use this setting to filter the outgoing LSA interface during synchronization and flooding. By default, OSPF floods new LSAs over all interfaces in the same area, except the interface on which the LSA arrives. In a fully meshed topology, this flooding can waste bandwidth and lead to excessive link and CPU usage. Checking this check box prevents OSPF flooding of the LSA on the selected interface.
- **Hello Interval**—Specifies the interval, in seconds, between hello packets sent on an interface. Valid values range 1–8192 seconds. The default value is 10 seconds.

The smaller the hello interval, the faster topological changes are detected, but more traffic is sent on the interface. This value must be the same for all routers and access servers on a specific interface.

- **Transmit Delay**—Estimated time in seconds to send an LSA packet on the interface. Valid values range 1–65535 seconds. The default is 1 second.

LSAs in the update packet have their ages increased by the amount specified by this field before transmission. If the delay is not added before transmission over a link, the time in which the LSA propagates over the link is not considered. The value assigned should take into account the transmission and propagation delays for the interface. This setting has more significance on very low-speed links.

- **Retransmit Interval**—Time in seconds between LSA retransmissions for adjacencies that belong to the interface. The time must be greater than the expected round-trip delay between any two routers on the attached network. Valid values range from 1 to 65535 seconds. The default is 5 seconds.

When a router sends an LSA to its neighbor, it keeps the LSA until it receives the acknowledgment message. If the router receives no acknowledgment, it resends the LSA. Be conservative when setting this value, or needless retransmission can result. The value should be larger for serial lines and virtual links.

- **Dead Interval**—Time period in seconds for which hello packets must not be seen before neighbors indicate that the router is down. The value must be the same for all nodes on the network and can range 1–65535.
- **Hello Multiplier**—Specifies the number of Hello packets to be sent per second. Valid values are 3–20.

- **Point-to-Point**—Lets you transmit OSPF routes over VPN tunnels.
 - **Authentication**—Choose the OSPF interface authentication from the following:
 - **None**—(Default) Disables interface authentication.
 - **Area Authentication**—Enables interface authentication using MD5. Click **Add**, and enter the key ID, key, confirm the key, and then click **OK**.
 - **Password**—Provides a clear text password for virtual link authentication, which is not recommended where security is a concern.
 - **MD5**—Allows MD5 authentication. Click **Add**, and enter the key ID, key, confirm the key, and then click **OK**.
- Note** Ensure to enter only numbers as the MD5 key ID.
- **Enter Password**—The password you configure if you choose Password as the type of authentication.
 - **Confirm Password**—Confirm the password that you chose.

Step 6 Select **Neighbor > Add**.

You can click **Edit** (✎), or use the right-click menu to cut, copy, past, insert, and delete areas.

Step 7 Configure the following parameters for each OSPF process:

- **OSPF Process**—Choose 1 or 2.
- **Neighbor**—Choose one of the neighbors in the drop-down list, or click **Add** (+) to add a new neighbor; enter the name, description, network, whether to allow overrides, and then click **Save**.
- **Interface**—Choose the interface associated with the neighbor.

Step 8 Click **OK** to save the neighbor configuration.

Step 9 Click **Save** on the Routing page to save your changes.

Configure OSPF Advanced Properties

The Advanced Properties allows you to configure options, such as syslog message generation, administrative route distances, an LSA timer, and graceful restarts.

Graceful Restarts

The Firepower Threat Defense device may experience some known failure situations that should not affect packet forwarding across the switching platform. The Non-Stop Forwarding (NSF) capability allows data forwarding to continue along known routes, while the routing protocol information is being restored. This capability is useful when there is a scheduled hitless software upgrade. You can configure graceful restart on OSPFv2 by using either using NSF Cisco (RFC 4811 and RFC 4812) or NSF IETF (RFC 3623).

Note NSF capability is also useful in HA mode and clustering.

Configuring the NSF graceful-restart feature involves two steps; configuring capabilities and configuring a device as NSF-capable or NSF-aware. A NSF-capable device can indicate its own restart activities to neighbors and a NSF-aware device can help a restarting neighbor.

A device can be configured as NSF-capable or NSF-aware, depending on some conditions:

- A device can be configured as NSF-aware irrespective of the mode in which it is.
- A device has to be in either Failover or Spanned Etherchannel (L2) cluster mode to be configured as NSF-capable.
- For a device to be either NSF-aware or NSF-capable, it should be configured with the capability of handling opaque Link State Advertisements (LSAs)/ Link Local Signaling (LLS) block as required.

Procedure

Step 1 Choose **Devices > Device Management**, and edit the Firepower Threat Defense device.

Step 2 Click **Routing**.

Step 3 Click **OSPF > Advanced Settings**.

Step 4 Select **General**, and configure the following:

- **Router ID**—Choose **Automatic** or **IP address** for the router ID. If you choose IP address, enter the IP address in the IP Address field.
- **Ignore LSA MOSPF**—Suppresses syslog messages when the route receives unsupported LSA Type 6 multicast OSPF (MOSPF) packets.
- **RFC 1583 Compatible**—Configures RFC 1583 compatibility as the method used to calculate summary route costs. Routing loops can occur with RFC 1583 compatibility enabled. Disable it to prevent routing loops. All OSPF routers in an OSPF routing domain should have RFC compatibility set identically.
- **Adjacency Changes**—Defines the adjacency changes that cause syslog messages to be sent.

By default, a syslog message is generated when an OSPF neighbor goes up or down. You can configure the router to send a syslog message when an OSPF neighbor goes down and also a syslog for each state.

- **Log Adjacency Changes**—Causes the Firepower Threat Defense device to send a syslog message whenever an OSPF neighbor goes up or down. This setting is checked by default.
- **Log Adjacency Change Details**—Causes the Firepower Threat Defense device to send a syslog message whenever any state change occurs, not just when a neighbor goes up or down. This setting is unchecked by default.
- **Administrative Route Distance**—Allows you to modify the settings that were used to configure administrative route distances for inter-area, intra-area, and external IPv6 routes. The administrative route distance is an integer from 1 to 254. The default is 110.
- **LSA Group Pacing**—Specifies the interval in seconds at which LSAs are collected into a group and refreshed, check summed, or aged. Valid values range from 10 to 1800. The default value is 240.

- **Enable Default Information Originate**—Check the **Enable** check box to generate a default external route into an OSPF routing domain and configure the following options:
 - **Always advertise the default route**—Ensures that the default route is always advertised.
 - **Metric Value**—Metric used for generating the default route. Valid metric values range from 0 to 16777214. The default value is 10.
 - **Metric Type**—The external link type that is associated with the default route that is advertised into the OSPFv3 routing domain. Valid values are 1 (Type 1 external route) and 2 (Type 2 external route). The default is Type 2 external route.
 - **RouteMap**—Choose the routing process that generates the default route if the route map is satisfied or click **Add** (🟢) to add a new one. See [Route Maps](#) to add a new route map.

Step 5 Click **OK** to save the general configuration.

Step 6 Select **Non Stop Forwarding**, and configure Cisco NSF graceful restart for OSPFv2, for an NSF-capable or NSF-aware device:

Note There are two graceful restart mechanisms for OSPFv2, Cisco NSF and IETF NSF. Only one of these graceful restart mechanisms can be configured at a time for an OSPF instance. An NSF-aware device can be configured as both Cisco NSF helper and IETF NSF helper but a NSF-capable device can be configured in either Cisco NSF or IETF NSF mode at a time for an OSPF instance.

- a) Check the **Enable Cisco Non Stop Forwarding Capability** check box.
- b) (Optional) Check the **Cancel NSF restart when non-NSF-aware neighboring networking devices are detected** check box if required.
- c) (Optional) Make sure the **Enable Cisco Non Stop Forwarding Helper mode** check box is unchecked to disable the helper mode on an NSF-aware device.

Step 7 Configure IETF NSF Graceful Restart for OSPFv2, for an NSF-capable or NSF-aware device:

- a) Check the **Enable IETF Non Stop Forwarding Capability** check box.
- b) In the **Length of graceful restart interval (seconds)** field, enter the restart interval in seconds. The default value is 120 seconds. For a restart interval below 30 seconds, graceful restart will be terminated.
- c) (Optional) Make sure the **Enable IETF nonstop forwarding (NSF) for helper mode** check box is unchecked to disable the IETF NSF helper mode on an NSF-aware device.
- d) **Enable Strict Link State advertisement checking**—When enabled, it indicates that the helper router will terminate the process of restarting the router if it detects that there is a change to a LSA that would be flooded to the restarting router, or if there is a changed LSA on the retransmission list of the restarting router when the graceful restart process is initiated.
- e) **Enable IETF Non Stop Forwarding**—Enables non stop forwarding, which allows for the forwarding of data packets to continue along known routes while the routing protocol information is being restored following a switchover. OSPF uses extensions to the OSPF protocol to recover its state from neighboring OSPF devices. For the recovery to work, the neighbors must support the NSF protocol extensions and be willing to act as "helpers" to the device that is restarting. The neighbors must also continue forwarding data traffic to the device that is restarting while protocol state recovery takes place.

Configure OSPFv3

This section describes the tasks involved in configuring an OSPFv3 routing process.

Configure OSPFv3 Areas, Route Summaries, and Virtual Links

To enable OSPFv3, you need to create an OSPFv3 routing process, create an area for OSPFv3, enable an interface for OSPFv3, and then redistribute the route into the targeted OSPFv3 routing process.

Procedure

- Step 1** Choose **Devices > Device Management**, and edit the Firepower Threat Defense device.
- Step 2** Select **Routing > OSPFv3**.
- Step 3** By default **Enable Process 1** is selected. You can enable up to two OSPF process instances.
- Step 4** Chose the OSPFv3 role from the drop-down list, and enter a description for it. The options are Internal, ABR, ASBR, and ABR and ASBR. See [About OSPF, on page 641](#) for descriptions of the OSPFv3 roles.
- Step 5** Select **Area > Add**.

You can click **Edit** () , or use the right-click menu to cut, copy, past, insert, and delete areas.

- Step 6** Select **General**, and configure the following options for each OSPF process:
- **Area ID**—The area for which routes are to be summarized.
 - **Cost**—The metric or cost for the summary route, which is used during OSPF SPF calculations to determine the shortest paths to the destination. Valid values range from 0 to 16777215.
 - **Type**—Specifies Normal, NSSA, or Stub. If you select Normal, there are no other parameters to configure. If you select Stub, you can choose to send summary LSAs in the area. If you select NSSA, you can configure the next three options:
 - **Allow Sending summary LSA into this area**—Allows the sending of summary LSAs into the area.
 - **Redistribute imports routes to normal and NSSA area**—Allows redistribution to import routes to normal and not to stubby areas.
 - **Defaults information originate**—Generates a default external route into an OSPFv3 routing domain.
 - **Metric**—Metric used for generating the default route. The default value is 10. Valid metric values range from 0 to 16777214.
 - **Metric Type**—The metric type is the external link type that is associated with the default route that is advertised into the OSPFv3 routing domain. The available options are 1 for a Type 1 external route or 2 for a Type 2 external route.

- Step 7** Click **OK** to save the general configuration.
- Step 8** Select **Route Summary > Add Route Summary**.

You can click **Edit** () , or use the right-click menu to cut, copy, past, insert, and delete route summaries.

Step 9

Configure the following route summary options for each OSPF process:

- **IPv6 Prefix/Length**—The IPv6 prefix. To add a new network object, click **Add** () . See [Network Objects, on page 354](#) for the procedure for adding networks.
- **Cost**—The metric or cost for the summary route, which is used during OSPF SPF calculations to determine the shortest paths to the destination. Valid values range from 0 to 16777215.
- **Advertise**—Advertises the summary route. Uncheck this check box to suppress routes that fall under the summary address. By default, this check box is checked.

Step 10

Click **OK** to save the route summary configuration.

Step 11

Select **Virtual Link**, click **Add Virtual Link**, and configure the following options for each OSPF process:

- **Peer RouterID**—Choose the IP address of the peer router. To add a new network object, click **Add** () . See [Network Objects, on page 354](#) for the procedure for adding networks.

- **TTL Security**—Enables TTL security check. The value for the hop-count is a number from 1 to 254. The default is 1.

OSPF sends outgoing packets with an IP header Time to Live (TTL) value of 255 and discards incoming packets that have TTL values less than a configurable threshold. Because each device that forwards an IP packet decrements the TTL, packets received via a direct (one-hop) connection have a value of 255. Packets that cross two hops have a value of 254, and so on. The receive threshold is configured in terms of the maximum number of hops that a packet may have traveled.

- **Dead Interval**—The time in seconds that hello packets are not seen before a neighbor indicates that the router is down. The default is four times the hello interval, or 40 seconds. Valid values range from 1 to 65535.

The dead interval is an unsigned integer. The value must be the same for all routers and access servers that are attached to a common network.

- **Hello Interval**—The time in seconds between the hello packets sent on an interface. Valid values range from 1 to 65535. The default is 10.

The hello interval is an unsigned integer that is to be advertised in the hello packets. The value must be the same for all routers and access servers on a specific network. The smaller the hello interval, the faster topological changes are detected, but the more traffic is sent on the interface.

- **Retransmit Interval**—The time in seconds between LSA retransmissions for adjacencies that belong to the interface. The retransmit interval is the expected round-trip delay between any two routers on the attached network. The value must be greater than the expected round-trip delay, and can range from 1 to 65535. The default is 5.

When a router sends an LSA to its neighbor, it keeps the LSA until it receives the acknowledgment message. If the router receives no acknowledgment, it resends the LSA. Be conservative when setting this value, or needless retransmission can result. The value should be larger for serial lines and virtual links.

- **Transmit Delay**—The estimated time in seconds that is required to send an LSA packet on the interface. The integer value must be greater than zero. Valid values range from 1 to 8192. The default is 1.

LSAs in the update packet have their own ages incremented by this amount before transmission. If the delay is not added before transmission over a link, the time in which the LSA propagates over the link is not considered. The value assigned should take into account the transmission and propagation delays for the interface. This setting has more significance on very low-speed links.

Step 12 Click **OK** to save the virtual link configuration.

Step 13 Click **Save** on the Router page to save your changes.

What to do next

Continue with [Configure OSPFv3 Redistribution](#).

Configure OSPFv3 Redistribution

The Firepower Threat Defense device can control the redistribution of routes between the OSPF routing processes. The rules for redistributing routes from one routing process into an OSPF routing process are displayed. You can redistribute routes discovered by RIP and BGP into the OSPF routing process. You can also redistribute static and connected routes into the OSPF routing process.

Procedure

Step 1 Choose **Devices > Device Management**, and edit the Firepower Threat Defense device.

Step 2 Select **Routing > OSPF**.

Step 3 Select **Redistribution**, and click **Add**.

You can click **Edit** () , or use the right-click menu to cut, copy, past, insert, and delete areas.

Step 4 Configure the following redistribution options for each OSPF process:

- **Source Protocol**—The source protocol from which routes are being redistributed. The supported protocols are connected, OSPF, static, and BGP. If you choose OSPF, you must enter the Process ID in the **Process ID** field. If you choose BGP, you must add the AS number in the **AS Number** field.
- **Metric** —Metric value for the routes being distributed. The default value is 10. Valid values range from 0 to 16777214.
When redistributing from one OSPF process to another OSPF process on the same device, the metric will be carried through from one process to the other if no metric value is specified. When redistributing other processes to an OSPF process, the default metric is 20 when no metric value is specified.
- **Metric Type**—The metric type is the external link type that is associated with the default route that is advertised into the OSPF routing domain. The available options are 1 for a Type 1 external route or 2 for a Type 2 external route.
- **Tag** —Tag specifies the 32-bit decimal value attached to each external route that is not used by OSPF itself, but which may be used to communicate information between ASBRs. If none is specified, then the remote autonomous system number is used for routes from BGP and EGP. For other protocols, zero is used. Valid values are from 0 to 4294967295.

- **Route Map**—Checks for filtering the importing of routes from the source routing protocol to the current routing protocol. If this parameter is not specified, all routes are redistributed. If this parameter is specified, but no route map tags are listed, no routes are imported. Or you can add a new route map by clicking **Add** (👍). See [Route Maps, on page 408](#) for the procedure to add a new route map.
- **Process ID**—The OSPF process ID, either 1 or 2.
 - Note** The Process ID is enabled the OSPFv3 process is redistributing a route learned by another OSPFv3 process.
- **Match**—Enables OSPF routes to be redistributed into other routing domains:
 - **Internal** for routes that are internal to a specific autonomous system.
 - **External 1** for routes that are external to the autonomous system, but are imported into OSPFv3 as Type 1 external routes.
 - **External 2** for routes that are external to the autonomous system, but are imported into OSPFv3 as Type 2 external routes.
 - **NSSA External 1** for routes that are external to the autonomous system, but are imported into OSPFv3 in an NSSA for IPv6 as Type 1 external routes.
 - **NSSA External 2** for routes that are external to the autonomous system, but are imported into OSPFv3 in an NSSA for IPv6 as Type 2 external routes.

Step 5 Click **OK** to save the redistribution configuration.

Step 6 Click **Save** on the Routing page to save your changes.

What to do next

Continue with [Configure OSPFv3 Summary Prefixes, on page 661](#).

Configure OSPFv3 Summary Prefixes

You can configure the Firepower Threat Defense device to advertise routes that match a specified IPv6 prefix and mask pair.

Procedure

Step 1 Choose **Devices > Device Management**, and edit the Firepower Threat Defense device.

Step 2 Select **Routing > OSPFv3**.

Step 3 Select **Summary Prefix > Add**.

You can click **Edit** (✎), or use the right-click menu to cut, copy, past, insert, and delete summary prefixes.

Step 4 Configure the following summary prefix options for each OSPF process:

- **IPv6 Prefix/Length**—The IPv6 prefix and prefix length label. Select one from the list or click **Add** (+) to add a new network object. See [Network Objects, on page 354](#) for the procedure for adding networks.
- **Advertise**—Advertises routes that match the specified prefix and mask pair. Uncheck this check box to suppress routes that match the specified prefix and mask pair.
- (Optional) **Tag**—A value that you can use as a match value for controlling redistribution through route maps.

Step 5 Click **OK** to save the summary prefix configuration.

Step 6 Click **Save** on the Routing page to save your changes.

What to do next

Continue with [Configure OSPFv3 Interfaces, Authentication, and Neighbors, on page 662](#).

Configure OSPFv3 Interfaces, Authentication, and Neighbors

You can change certain interface-specific OSPFv3 parameters, if necessary. You are not required to change any of these parameters, but the following interface parameters must be consistent across all routers in an attached network: the hello interval and the dead interval. If you configure any of these parameters, be sure that the configurations for all routers on your network have compatible values.

Procedure

Step 1 Choose **Devices > Device Management**, and edit the Firepower Threat Defense device.

Step 2 Select **Routing > OSPFv3**.

Step 3 Select **Interface > Add**.

You can click **Edit** to edit, or use the right-click menu to cut, copy, past, insert, and delete areas.

Step 4 Configure the following interface options for each OSPFv3 process:

- **Interface**—The interface you are configuring.
- **Enable OSPFv3**—Enables OSPFv3.
- **OSPF Process**—Choose 1 or 2.
- **Area**—The area ID for this process.
- **Instance**—Specifies the area instance ID to be assigned to the interface. An interface can have only one OSPFv3 area. You can use the same area on multiple interfaces, and each interface can use a different area instance ID.

Step 5 Select **Properties**, and configuring the following options for each OSPFv3 process:

- **Filter Outgoing Link Status Advertisements**—Filters outgoing LSAs to an OSPFv3 interface. All outgoing LSAs are flooded to the interface by default.

- **Disable MTU mismatch detection**—Disables the OSPF MTU mismatch detection when DBD packets are received. OSPF MTU mismatch detection is enabled by default.
- **Flood Reduction**—Changes normal LSAs into Do Not Age LSAs, so that they don't get flooded every 3600 seconds across areas.

OSPF LSAs are refreshed every 3600 seconds. In large OSPF networks, this can lead to large amounts of unnecessary LSA flooding from area to area.

- **Point-to-Point Network**—Lets you transmit OSPF routes over VPN tunnels. When an interface is configured as point-to-point, non-broadcast, the following restrictions apply:
 - You can define only one neighbor for the interface.
 - You need to manually configure the neighbor.
 - You need to define a static route pointing to the crypto endpoint.
 - If OSPF over a tunnel is running on the interface, regular OSPF with an upstream router cannot be run on the same interface.
 - You should bind the crypto map to the interface before specifying the OSPF neighbor to ensure that the OSPF updates are passed through the VPN tunnel. If you bind the crypto map to the interface after specifying the OSPF neighbor, use the **clear local-host all** command to clear OSPF connections so that the OSPF adjacencies can be established over the VPN tunnel.

- **Broadcast**— Specifies that the interface is a broadcast interface. By default, this check box is checked for Ethernet interfaces. Uncheck this check box to designate the interface as a point-to-point, nonbroadcast interface. Specifying an interface as point-to-point, nonbroadcast lets you transmit OSPF routes over VPN tunnels.

- **Cost**—Specifies the cost of sending a packet on the interface. Valid values for this setting range from 0 to 255. The default value is 1. Entering 0 for this setting makes the router ineligible to become the designated router or backup designated router. This setting does not apply to interfaces that are configured as point-to-point, nonbroadcast interfaces.

When two routers connect to a network, both attempt to become the designated router. The device with the higher router priority becomes the designated router. If there is a tie, the router with the higher router ID becomes the designated router.

- **Priority**—Determines the designated router for a network. Valid values range from 0 to 255.
- **Dead Interval**—Time period in seconds for which hello packets must not be seen before neighbors indicate that the router is down. The value must be the same for all nodes on the network and can range from 1 to 65535.
- **Poll Interval**— Time period in seconds between OSPF packets that the router will send before adjacency is established with a neighbor. Once the routing device detects an active neighbor, the hello packet interval changes from the time specified in the poll interval to the time specified in the hello interval. Valid values range from 1 to 65535 seconds.
- **Retransmit Interval**—Time in seconds between LSA retransmissions for adjacencies that belong to the interface. The time must be greater than the expected round-trip delay between any two routers on the attached network. Valid values range from 1 to 65535 seconds. The default is 5 seconds.
- **Transmit Delay**—Estimated time in seconds to send a link-state update packet on the interface. Valid values range from 1 to 65535 seconds. The default is 1 second.

Step 6 Click **OK** to save the properties configuration.

Step 7 Select **Authentication**, and configure the following options for each OSPFv3 process:

- **Type**—Type of authentication. The available options are Area, Interface, and None. The None option indicates that no authentication is used.
- **Security Parameters Index**— A number from 256 to 4294967295. Configure this if you chose Interface as the type.
- **Authentication**—Type of authentication algorithm. Supported values are SHA-1 and MD5. Configure this if you chose Interface as the type.
- **Authentication Key**— When MD5 authentication is used, the key must be 32 hexadecimal digits (16 bytes) long. When SHA-1 authentication is used, the key must be 40 hexadecimal digits (20 bytes) long.
- **Encrypt Authentication Key**—Enables encryption of the authentication key.
- **Include Encryption**— Enables encryption.
- **Encryption Algorithm**—Type of encryption algorithm. Supported value is DES. The NULL entry indicates no encryption. Configure this if you chose **Include Encryption**.
- **Encryption Key**—Enter the encryption key. Configure this if you chose **Include Encryption**.
- **Encrypt Key**—Enables the key to be encrypted.

Step 8 Click **OK** to save the authentication configuration.

Step 9 Select **Neighbor**, click **Add**, and configure the following options for each OSPFv3 process:

- **Link Local Address**—The IPv6 address of the static neighbor.
- **Cost**—Enables cost. Enter the cost in the **Cost** field, and check the **Filter Outgoing Link State Advertisements** if you want to advertise.
- (Optional) **Poll Interval**—Enables the poll interval. Enter the **Priority** level and the **Poll Interval** in seconds.

Step 10 Click **Add** to add the neighbor.

Step 11 Click **OK** to save the Interface configuration.

Configure OSPFv3 Advanced Properties

The Advanced Properties allows you to configure options, such as syslog message generation, administrative route distances, passive OSPFv3 routing, LSA timers, and graceful restarts.

Graceful Restarts

The Firepower Threat Defense device may experience some known failure situations that should not affect packet forwarding across the switching platform. The Non-Stop Forwarding (NSF) capability allows data forwarding to continue along known routes, while the routing protocol information is being restored. This capability is useful when there is a scheduled hitless software upgrade. You can configure graceful restart on OSPFv3 using graceful-restart (RFC 5187).

Note NSF capability is also useful in HA mode and clustering.

Configuring the NSF graceful-restart feature involves two steps; configuring capabilities and configuring a device as NSF-capable or NSF-aware. A NSF-capable device can indicate its own restart activities to neighbors and a NSF-aware device can help a restarting neighbor.

A device can be configured as NSF-capable or NSF-aware, depending on some conditions:

- A device can be configured as NSF-aware irrespective of the mode in which it is.
- A device has to be in either Failover or Spanned Etherchannel (L2) cluster mode to be configured as NSF-capable.
- For a device to be either NSF-aware or NSF-capable, it should be configured with the capability of handling opaque Link State Advertisements (LSAs)/ Link Local Signaling (LLS) block as required.

Procedure

- Step 1** Choose **Devices > Device Management**, and edit the Firepower Threat Defense device.
- Step 2** Select **Routing > OSPFv3 > Advanced**.
- Step 3** For **Router ID**, choose **Automatic** or **IP address**. If you choose IP address, enter the IP address in the IP Address field.
- Step 4** Check the **Ignore LSA MOSPF** check box if you want to suppress syslog messages when the route receives unsupported LSA Type 6 multicast OSPF (MOSPF) packets.
- Step 5** Select **General**, and configure the following:
 - **Adjacency Changes**—Defines the adjacency changes that cause syslog messages to be sent.
By default, a syslog message is generated when an OSPF neighbor goes up or down. You can configure the router to send a syslog message when an OSPF neighbor goes down and also a syslog for each state.
 - **Adjacency Changes**—Causes the Firepower Threat Defense device to send a syslog message whenever an OSPF neighbor goes up or down. This setting is checked by default.
 - **Include Details**—Causes the Firepower Threat Defense device to send a syslog message whenever any state change occurs, not just when a neighbor goes up or down. This setting is unchecked by default.
 - **Administrative Route Distances**—Allows you to modify the settings that were used to configure administrative route distances for inter-area, intra-area, and external IPv6 routes. The administrative route distance is an integer from 1 to 254. The default is 110.
 - **Default Information Originate**—Check the **Enable** check box to generate a default external route into an OSPFv3 routing domain and configure the following options:
 - **Always Advertise**—Will always advertise the default route whether or not one exists.
 - **Metric**—Metric used for generating the default route. Valid metric values range from 0 to 16777214. The default value is 10.

- **Metric Type**—The external link type that is associated with the default route that is advertised into the OSPFv3 routing domain. Valid values are 1 (Type 1 external route) and 2 (Type 2 external route). The default is Type 2 external route.
- **Route Map**—Choose the routing process that generates the default route if the route map is satisfied or click **Add** (+) to add a new one. See [Route Maps, on page 408](#) to add a new route map.

Step 6 Click **OK** to save the general configuration.

Step 7 Select **Passive Interface**, select the interfaces on which you want to enable passive OSPFv3 routing from the Available Interfaces list, and click **Add** to move them to the Selected Interfaces list.

Passive routing assists in controlling the advertisement of OSPFv3 routing information and disables the sending and receiving of OSPFv3 routing updates on an interface.

Step 8 Click **OK** to save the passive interface configuration.

Step 9 Select **Timer**, and configure the following LSA pacing and SPF calculation timers:

- **Arrival**—Specifies the minimum delay in milliseconds that must pass between acceptance of the same LSA arriving from neighbors. The range is from 0 to 6000,000 milliseconds. The default is 1000 milliseconds.
- **Flood Pacing**—Specifies the time in milliseconds at which LSAs in the flooding queue are paced in between updates. The configurable range is from 5 to 100 milliseconds. The default value is 33 milliseconds.
- **Group Pacing**—Specifies the interval in seconds at which LSAs are collected into a group and refreshed, check summed, or aged. Valid values range from 10 to 1800. The default value is 240.
- **Retransmission Pacing**—Specifies the time in milliseconds at which LSAs in the retransmission queue are paced. The configurable range is from 5 to 200 milliseconds. The default value is 66 milliseconds.
- **LSA Throttle**—Specifies the delay in milliseconds to generate the first occurrence of the LSA. The default value is 0 millisecond. The minimum specifies the minimum delay in milliseconds to originate the same LSA. The default value is 5000 milliseconds. The maximum specifies the maximum delay in milliseconds to originate the same LSA. The default value is 5000 milliseconds.

Note For LSA throttling, if the minimum or maximum time is less than the first occurrence value, then OSPFv3 automatically corrects to the first occurrence value. Similarly, if the maximum delay specified is less than the minimum delay, then OSPFv3 automatically corrects to the minimum delay value.

- **SPF Throttle**—Specifies the delay in milliseconds to receive a change to the SPF calculation. The default value is 5000 milliseconds. The minimum specifies the delay in milliseconds between the first and second SPF calculations. The default value is 10000 milliseconds. The maximum specifies the maximum wait time in milliseconds for SPF calculations. The default value is 10000 milliseconds.

Note For SPF throttling, if the minimum or maximum time is less than the first occurrence value, then OSPFv3 automatically corrects to the first occurrence value. Similarly, if the maximum delay specified is less than the minimum delay, then OSPFv3 automatically corrects to the minimum delay value.

Step 10 Click **OK** to save the LSA timer configuration.

- Step 11** Select **Non Stop Forwarding**, and check the **Enable graceful-restart helper** check box. This is checked by default. Uncheck this to disable the graceful-restart helper mode on an NSF-aware device.
- Step 12** Check the **Enable link state advertisement** check box to enable strict link state advertisement checking.
- When enabled, it indicates that the helper router will terminate the process of restarting the router if it detects that there is a change to a LSA that would be flooded to the restarting router, or if there is a changed LSA on the retransmission list of the restarting router when the graceful restart process is initiated.
- Step 13** Check the **Enable graceful-restart (Use when Spanned Cluster or Failover Configured)** and enter the graceful-restart interval in seconds. The range is 1-1800. The default value is 120 seconds. For a restart interval below 30 seconds, graceful restart will be terminated.
- Step 14** Click **OK** to save the graceful restart configuration.
- Step 15** Click **Save** on the Routing page to save your changes.
-

CHAPTER 34

BGP for Firepower Threat Defense

This section describes how to configure the Firepower Threat Defense to route data, perform authentication, and redistribute routing information using the Border Gateway Protocol (BGP).

- [About BGP, on page 669](#)
- [Requirements and Prerequisites for BGP, on page 672](#)
- [Guidelines for BGP, on page 672](#)
- [Configure BGP, on page 673](#)

About BGP

BGP is an inter and intra autonomous system routing protocol. An autonomous system is a network or group of networks under a common administration and with common routing policies. BGP is used to exchange routing information for the Internet and is the protocol used between Internet service providers (ISP).

Routing Table Changes

BGP neighbors exchange full routing information when the TCP connection between neighbors is first established. When changes to the routing table are detected, the BGP routers send to their neighbors only those routes that have changed. BGP routers do not send periodic routing updates, and BGP routing updates advertise only the optimal path to a destination network.

Note AS loop detection is done by scanning the full AS path (as specified in the AS_PATH attribute), and checking that the AS number of the local system does not appear in the AS path. By default, EBGP advertises the learned routes to the same peer to prevent additional CPU cycles on the ASA in performing loop checks and to avoid delays in the existing outgoing update tasks.

Routes learned via BGP have properties that are used to determine the best route to a destination, when multiple paths exist to a particular destination. These properties are referred to as BGP attributes and are used in the route selection process:

- **Weight**—This is a Cisco-defined attribute that is local to a router. The weight attribute is not advertised to neighboring routers. If the router learns about more than one route to the same destination, the route with the highest weight is preferred.

- **Local preference**—The local preference attribute is used to select an exit point from the local AS. Unlike the weight attribute, the local preference attribute is propagated throughout the local AS. If there are multiple exit points from the AS, the exit point with the highest local preference attribute is used as an exit point for a specific route.
- **Multi-exit discriminator**—The multi-exit discriminator (MED) or metric attribute is used as a suggestion to an external AS regarding the preferred route into the AS that is advertising the metric. It is referred to as a suggestion because the external AS that is receiving the MEDs may also be using other BGP attributes for route selection. The route with the lower MED metric is preferred.
- **Origin**—The origin attribute indicates how BGP learned about a particular route. The origin attribute can have one of three possible values and is used in route selection.
 - **IGP**—The route is interior to the originating AS. This value is set when the network router configuration command is used to inject the route into BGP.
 - **EGP**—The route is learned via the Exterior Border Gateway Protocol (EBGP).
 - **Incomplete**—The origin of the route is unknown or learned in some other way. An origin of incomplete occurs when a route is redistributed into BGP.
- **AS_path**—When a route advertisement passes through an autonomous system, the AS number is added to an ordered list of AS numbers that the route advertisement has traversed. Only the route with the shortest AS_path list is installed in the IP routing table.
- **Next hop**—The EBGP next-hop attribute is the IP address that is used to reach the advertising router. For EBGP peers, the next-hop address is the IP address of the connection between the peers. For IBGP, the EBGP next-hop address is carried into the local AS.
- **Community**—The community attribute provides a way of grouping destinations, called communities, to which routing decisions (such as acceptance, preference, and redistribution) can be applied. Route maps are used to set the community attribute. The predefined community attributes are as follows:
 - **no-export**—Do not advertise this route to EBGP peers.
 - **no-advertise**—Do not advertise this route to any peer.
 - **internet**—Advertise this route to the Internet community; all routers in the network belong to it.

When to Use BGP

Customer networks, such as universities and corporations, usually employ an Interior Gateway Protocol (IGP) such as OSPF for the exchange of routing information within their networks. Customers connect to ISPs, and ISPs use BGP to exchange customer and ISP routes. When BGP is used between autonomous systems (AS), the protocol is referred to as External BGP (EBGP). If a service provider is using BGP to exchange routes within an AS, then the protocol is referred to as Interior BGP (IBGP).

BGP can also be used for carrying routing information for IPv6 prefix over IPv6 networks.

BGP Path Selection

BGP may receive multiple advertisements for the same route from different sources. BGP selects only one path as the best path. When this path is selected, BGP puts the selected path in the IP routing table and

propagates the path to its neighbors. BGP uses the following criteria, in the order presented, to select a path for a destination:

- If the path specifies a next hop that is inaccessible, drop the update.
- Prefer the path with the largest weight.
- If the weights are the same, prefer the path with the largest local preference.
- If the local preferences are the same, prefer the path that was originated by BGP running on this router.
- If no route was originated, prefer the route that has the shortest AS_path.
- If all paths have the same AS_path length, prefer the path with the lowest origin type (where IGP is lower than EGP, and EGP is lower than incomplete).
- If the origin codes are the same, prefer the path with the lowest MED attribute.
- If the paths have the same MED, prefer the external path over the internal path.
- If the paths are still the same, prefer the path through the closest IGP neighbor.
- Determine if multiple paths require installation in the routing table for [BGP Multipath, on page 671](#).
- If both paths are external, prefer the path that was received first (the oldest one).
- Prefer the path with the lowest IP address, as specified by the BGP router ID.
- If the originator or router ID is the same for multiple paths, prefer the path with the minimum cluster list length.
- Prefer the path that comes from the lowest neighbor address.

BGP Multipath

BGP Multipath allows installation into the IP routing table of multiple equal-cost BGP paths to the same destination prefix. Traffic to the destination prefix is then shared across all installed paths.

These paths are installed in the table together with the best path for load-sharing. BGP Multipath does not affect best-path selection. For example, a router still designates one of the paths as the best path, according to the algorithm, and advertises this best path to its BGP peers.

In order to be candidates for multipath, paths to the same destination need to have these characteristics equal to the best-path characteristics:

- Weight
- Local preference
- AS-PATH length
- Origin code
- Multi Exit Discriminator (MED)
- One of these:
 - Neighboring AS or sub-AS (before the addition of the BGP Multipaths)
 - AS-PATH (after the addition of the BGP Multipaths)

Some BGP Multipath features put additional requirements on multipath candidates:

- The path should be learned from an external or confederation-external neighbor (eBGP).
- The IGP metric to the BGP next hop should be equal to the best-path IGP metric.

These are the additional requirements for internal BGP (iBGP) multipath candidates:

- The path should be learned from an internal neighbor (iBGP).
- The IGP metric to the BGP next hop should be equal to the best-path IGP metric, unless the router is configured for unequal-cost iBGP multipath.

BGP inserts up to n most recently received paths from multipath candidates into the IP routing table, where n is the number of routes to install to the routing table, as specified when you configure BGP Multipath. The default value, when multipath is disabled, is 1.

For unequal-cost load balancing, you can also use BGP Link Bandwidth.

Note The equivalent next-hop-self is performed on the best path that is selected among eBGP multipaths before it is forwarded to internal peers.

Requirements and Prerequisites for BGP

Model Support

FTD

FTDv

Supported Domains

Any

User Roles

Admin

Network Admin

Guidelines for BGP

Firewall Mode Guidelines

Does not support transparent firewall mode. BGP is supported only in routed mode.

IPv6 Guidelines

Supports IPv6. Graceful restart is not supported for IPv6 address family.

Additional Guidelines

- The system does not add route entry for the IP address received over PPPoE in the CP route table. BGP always looks into CP route table for initiating the TCP session, hence BGP does not form TCP session. Thus, BGP over PPPoE is not supported.
- To avoid adjacency flaps due to route updates being dropped if the route update is larger than the minimum MTU on the link, ensure that you configure the same MTU on the interfaces on both sides of the link.
- The BGP table of the member unit is not synchronized with the control unit table. Only its routing table is synchronized with the control unit routing table.

Configure BGP

To configure BGP, see the following topics:

Procedure

- Step 1** [Configure BGP Basic Settings, on page 673](#)
- Step 2** [Configure BGP General Settings, on page 675](#)
- Step 3** [Configure BGP Neighbor Settings, on page 676](#)
- Step 4** [Configure BGP Aggregate Address Settings, on page 680](#)
- Step 5** [Configure BGPv4 Filtering Settings, on page 680](#)

Note The Filtering section is applicable only to IPv4 settings

- Step 6** [Configure BGP Network Settings, on page 681](#)
 - Step 7** [Configure BGP Redistribution Settings, on page 681](#)
 - Step 8** [Configure BGP Route Injection Settings, on page 682](#)
-

Configure BGP Basic Settings

You can set many basic settings for BGP.

Procedure

- Step 1** Choose **Devices > Device Management**, and edit the Firepower Threat Defense device.
- Step 2** Select **Routing**.
- Step 3** (For a non-virtual-router-aware device) Select **BGP**.
- Step 4** Select the **Enable BGP** check box to enable the BGP routing process.
- Step 5** In the **AS Number** field, enter the autonomous system (AS) number for the BGP process. The AS number internally includes multiple autonomous numbers. The AS number can be from 1 to 4294967295 or from 1.0 to 65535.65535. The AS number is a uniquely assigned value, that identifies each network on the Internet.

Step 6 (Optional) Edit the various BGP settings, starting with **General**. The defaults for these settings are appropriate in most cases, but you can adjust them to fit the needs of your network. Click **Edit** (pencil) to edit the settings in the group:

- a) In the **Router ID** drop-down list, select Automatic or Manual from the drop-down list. If you choose Automatic, the highest-level IP address on the Firepower Threat Defense device is used as the router ID. To use a fixed router ID, choose Manual and enter an IPv4 address in the **IP Address** field. The default value is Automatic.
- b) Enter the **Number of AS numbers in AS_PATH attribute**. An AS_PATH attribute is a sequence of intermediate AS numbers between source and destination routers that form a directed route for packets to travel. Valid values are between 1 and 254. The default value is None.
- c) Check the **Log Neighbor Changes** check box to enable logging of BGP neighbor changes (up or down) and resets. This helps in troubleshooting network connectivity problems and measuring network stability. This is enabled by default.
- d) Check the **Use TCP Path MTU Discovery** check box to use the Path MTU determining technique to determine the maximum transmission unit (MTU) size on the network path between two IP hosts. This avoids IP fragmentation. This is enabled by default.
- e) Check the **Reset session upon Failover** check box to reset the external BGP session immediately upon link failure. This is enabled by default.
- f) Check the **Enforce that the first AS is peer's AS for EBGP routes** check box to discard incoming updates received from external BGP peers that do not list their AS number as the first segment in the AS_PATH attribute. This prevents a mis-configured or unauthorized peer from misdirecting traffic by advertising a route as if it was sourced from another autonomous system. This is enabled by default.
- g) Check the **Use dot notation for AS number** check box to split the full binary 4-byte AS number into two words of 16 bits each, separated by a dot. AS numbers from 0-65535 are represented as decimal numbers and AS numbers larger than 65535 are represented using the dot notation. This is disabled by default.
- h) Click **OK**.

Step 7 (Optional) Edit the **Best Path Selection** section:

- a) Enter a value for **Default Local Preference** between 0 and 4294967295. The default value is 100. Higher values indicate higher preference. This preference is sent to all routers and access servers in the local autonomous system.
- b) Check the **Allow comparing MED from different neighbors** check box to allow the comparison of Multi Exit Discriminator (MED) for paths from neighbors in different autonomous systems. This is disabled by default.
- c) Check the **Compare Router ID for identical EBGP paths** check box to compare similar paths received from external BGP peers during the best path selection process and switch the best path to the route with the lowest router ID. This is disabled by default.
- d) Check the **Pick the best MED path among paths advertised from the neighboring AS** check box to enable MED comparison among paths learned from confederation peers. The comparison between MEDs is made only if no external autonomous systems are there in the path. This is disabled by default.
- e) Check the **Treat missing MED as the least preferred one** check box to consider the missing MED attribute as having a value of infinity, making the path the least desirable; therefore, a path with a missing MED is least preferred. This is disabled by default.
- f) Click **OK**.

Step 8 (Optional) Edit the **Neighbor Timers** section:

- a) Enter the time interval for which the BGP neighbor remains active after not sending a keepalive message in the **Keepalive interval** field. At the end of this keepalive interval, the BGP peer is declared dead, if no messages are sent. The default value is 60 seconds.

- b) Enter the time interval for which the BGP neighbor remains active while a BGP connection is being initiated and configured in the **Hold time** field. The default value is 180 seconds.
- c) (Optional) Enter the minimum time interval for which the BGP neighbor remains active while a BGP connection is being initiated and configured in the **Min Hold time** field. Specify a value from 0 to 65535.

Note A hold time of less than 20 seconds increases the possibility of peer flapping.

- d) Click **OK**.

Step 9 (Optional) Edit the **Graceful Restart** section:

Note This section is available only when the Firepower Threat Defense device is in failover or spanned cluster mode. This is done so that there is no drop in packets in the traffic flow, when one of the devices in the failover setup fails.

- a) Check the **Enable Graceful Restart** checkbox to enable Firepower Threat Defense peers to avoid a routing flap following a switchover.
- b) Specify the time duration that Firepower Threat Defense peers will wait to delete stale routes before a BGP open message is received in the **Restart Time** field. The default value is 120 seconds. Valid values are between 1 and 3600 seconds.
- c) Enter the time duration that the Firepower Threat Defense will wait before deleting stale routes after an end of record (EOR) message is received from the restarting Firepower Threat Defense in the **Stalepath Time** field. The default value is 360 seconds. Valid values are between 1 and 3600 seconds.
- d) Click **OK**.

Step 10 Click **Save**.

Configure BGP General Settings

Configure Route maps, Administrative Route Distances, Synchronisation, Next-hop, and packet forwarding. The defaults for these settings are appropriate in most cases, but you can adjust them to fit the needs of your network.

Procedure

Step 1 On the **Device Management** page, click **Routing**.

Step 2 Choose **BGP > IPv4** or **IPv6**.

Step 3 Click **General**.

Step 4 In **General**, update the following sections:

- a) In the **Settings** section, enter or select a **Route Map** object and enter a **Scanning Interval** for BGP routers for next-hop validation. Valid values are from 5 to 60 seconds. The default value is 60. Click **OK**.

Note The **Route Map** field is applicable only to IPv4 settings

- b) In the **Routes and Synchronization** section, update the following as required, and click **OK**:

- (Optional) **Generate Default Routes** — Select this option to configure default-information originate.

- (Optional) **Summarize subnet routes into network-level routes**— Select this to configure automatic summarization of subnet routes into network-level routes. This check box is applicable only to IPv4 settings.
 - (Optional) **Advertise inactive routes**— Select this to advertise routes that are not installed in the routing information base (RIB).
 - (Optional) **Synchronise between BGP and IGP system**— Select this to enable synchronization between BGP and your Interior Gateway Protocol (IGP) system. Usually, a BGP speaker does not advertise a route to an external neighbor unless that route is local or exists in the IGP. This feature allows routers and access servers within an autonomous system to have the route before BGP makes it available to other autonomous systems.
 - (Optional) **Redistribute IBGP into IGP**— Select this to configure iBGP redistribution into an interior gateway protocol (IGP), such as OSPF.
- c) In the **Administrative Route Distances** section, update the following as required, and click **OK**:
- **External** — Enter the administrative distance for external BGP routes. Routes are external when learned from an external autonomous system. The range of values for this argument are from 1 to 255. The default value is 20.
 - **Internal** — Enter administrative distance for internal BGP routes. Routes are internal when learned from peer in the local autonomous system. The range of values for this argument are from 1 to 255. The default value is 200.
 - **Local** — Enter administrative distance for local BGP routes. Local routes are those networks listed with a network router show command, often as back doors, for the router or for the networks that is being redistributed from another process. The range of values for this argument are from 1 to 255. The default value is 200.
- d) In the **Next Hop** section, optionally select the **Enable address tracking** check box to enable BGP next hop address tracking and enter the **Delay Interval** between checks on updated next-hop routes installed in the routing table. Click **OK**.
- Note** The **Next Hop** section is applicable only to IPv4 settings.
- e) In the **Forward Packets over Multiple Paths** section, update the following as required and click **OK**:
- (Optional) **Number of Paths** — Specify the maximum number of Border Gateway Protocol routes that can be installed in a routing table. The range of values are from 1 to 8. The default value is 1.
 - (Optional) **IBGP Number of Paths** — Specify the maximum number of parallel internal Border Gateway Protocol (iBGP) routes that can be installed in a routing table. The range of values are from 1 to 8. The default value is 1.

Step 5 Click **Save**.

Configure BGP Neighbor Settings

A BGP router must connect with each of its peers before exchanging updates. These peers are called BGP neighbors. Use Neighbor to define BGP IPv4 or IPv6 neighbors and neighbor settings.

Procedure

- Step 1** On the Device Management page, click **Routing**.
- Step 2** Choose **BGP > IPv4** or **IPv6**.
- Step 3** Click **Neighbor**.
- Step 4** Click **Add** to define BGP neighbors and neighbor settings.
- Step 5** Enter the BGP neighbor **IP address**. This IP address is added to the BGP neighbor table.
- Step 6** Choose the BGP neighbor **Interface**.

Note The **Interface** field is only applicable to IPv6 settings.

- Step 7** Enter the autonomous system to which the BGP neighbor belongs, in the **Remote AS** field.
- Step 8** Select the **Enabled address** check box to enable communication with this BGP neighbor. Further neighbor settings will be configured only if the Enabled address check box is selected.
- Step 9** (Optional) Select the **Shutdown administratively** check box to disable a neighbor or peer group.
- Step 10** (Optional) Select the **Configure graceful restart** check box to enable configuration of the BGP graceful restart capability for this neighbor. After selecting this option, you must use the Graceful Restart (failover / spanned mode) option to specify whether graceful restart should be enabled or disabled for this neighbor.

Note The graceful restart fields are only applicable to IPv4 settings.

- Step 11** (Optional) Enter a **Description** for the BGP neighbor.
- Step 12** (Optional) In **Filtering Routes**, use access lists, route maps, prefix lists and AS path filters as required, to distribute BGP Neighbor information. Update the following sections:
- Enter or Select the appropriate incoming or outgoing **Access List** to distribute BGP neighbor information.

Note Access Lists are only applicable to IPv4 settings.
 - Enter or Select the appropriate incoming or outgoing **Route Maps** to apply a route map to incoming or outgoing routes.
 - Enter or Select the appropriate incoming or outgoing **Prefix List** to distribute BGP neighbor information.
 - Enter or Select the appropriate incoming or outgoing **AS path filter** to distribute BGP neighbor information.
 - Select the **Limit the number of prefixes allowed from the neighbor** to control the number of prefixes that can be received from a neighbor.
 - Enter the maximum number of prefixes allowed from a specific neighbor in the **Maximum Prefixes** field.
 - Enter the percentage (of maximum) at which the router starts to generate a warning message in the **Threshold Level** field. Valid values are integers between 1 and 100. The default value is 75.
 - Select the **Control prefixes received from the peer** check box to specify additional controls for the prefixes received from a peer. Do one of the following
 - Select **Terminate peering when prefix limit is exceeded** to stop the BGP neighbor when the prefix limit is reached. Specify the interval after which the BGP neighbor will restart in the **Restart interval** field.
 - Select **Give only warning message when prefix limit is exceeded** to generate a log message when the maximum prefix limit is exceeded. Here, the BGP neighbor will not be terminated.

g) Click **OK**.

Step 13

(Optional) In **Routes**, specify miscellaneous Neighbor route parameter. Proceed to update the following:

- a) Enter the minimum interval (in seconds) between the sending of BGP routing updates in the **Advertisement Interval** field. Valid values are between 1 and 600.
- b) Select the **Remove private AS numbers from outbound routing updates** to exclude the private AS numbers from being advertised on outbound routes.
- c) Select the **Generate default routes** checkbox to allow the local router to send the default route 0.0.0.0 to a neighbor to use as a default route. Enter or Select the route map that allows the route 0.0.0.0 to be injected conditionally in the **Route map** field.
- d) To add conditionally advertised routes, click Add Row +. In the Add Advertised Route dialog box, do the following:
 1. Add or select a route map in the **Advertise Map** field, that will be advertised if the conditions of the exist map or the non-exist map are met.
 2. Select **Exist Map** and choose a route map from the Route Map Object Selector. This route map is compared with the routes in the BGP table, to determine whether the advertise map route is advertised.
 3. Select **Non-Exist Map** and choose a route map from the Route Map Object Selector. This route map is compared with the routes in the BGP table, to determine whether the advertise map route is advertised.
 4. Click **OK**.

Step 14

In **Timers**, select the **Set Timers for the BGP Peer** check box to set the keepalive frequency, hold time and minimum hold time

- **Keepalive Interval**—Enter the frequency (in seconds) with which the Firepower Threat Defense device sends keepalive messages to the neighbor. Valid values are between 0 and 65535. The default value is 60 seconds.
- **Hold time**—Enter the interval (in seconds) after not receiving a keepalive message that the Firepower Threat Defense device declares a peer dead. Valid values are between 0 and 65535. The default value is 180 seconds.
- **Min hold time**—(Optional) Enter the minimum interval (in seconds) after not receiving a keepalive message that the Firepower Threat Defense device declares a peer dead. Valid values are between 0 and 65535. The default value is 0 seconds.

Note A hold time of less than 20 seconds increases the possibility of peer flapping.

Step 15

In **Advanced**, update the following:

- a) (Optional) Select **Enable Authentication** to enable MD5 authentication on a TCP connection between two BGP peers.
 1. Choose an encryption type from the **Enable Encryption** drop-down list.
 2. Enter a password in the **Password** field. Reenter the password in the **Confirm** field. The password is case-sensitive and can be up to 25 characters long when the service password-encryption command is enabled and up to 81 characters long when the service password-encryption command is not enabled. The string can contain any alphanumeric characters, including spaces.

Note You cannot specify a password in the format number-space-anything. The space after the number can cause authentication to fail.

- b) (Optional) Select the **Send Community attribute to this neighbor** check box to specify that communities attributes should be sent to the BGP neighbor
- c) (Optional) Select the **Use FTD as next hop for this neighbor** check box to configure the router as the next-hop for a BGP speaking neighbor or peer group.
- d) Select the **Disable Connection Verification** checkbox to disable the connection verification process for eBGP peering sessions that are reachable by a single hop but are configured on a loopback interface or otherwise configured with a non-directly connected IP address. When deselected (default), a BGP routing process will verify the connection of single-hop eBGP peering session (TTL=254) to determine if the eBGP peer is directly connected to the same network segment by default. If the peer is not directly connected to same network segment, connection verification will prevent the peering session from being established.
- e) Select **Allow connections with neighbor that is not directly connected** to accept and attempt BGP connections to external peers residing on networks that are not directly connected. (Optional) Enter the time-to-live in the **TTL hops** field. Valid values are between 1 and 255. Alternately, select **Limited number of TTL hops to neighbor**, to secure a BGP peering session. Enter the maximum number of hops that separate eBGP peers in the **TTL hops** field. Valid values are between 1 and 254.
- f) (Optional) Select the **Use TCP MTU path discovery** check box to enable a TCP transport session for a BGP session.
- g) Choose the TCP connection mode from the **TCP Transport Mode** drop-down list. Options are Default, Active, or Passive.
- h) (Optional) Enter a **Weight** for the BGP neighbor connection.
- i) Select the **BGP Version** that the Firepower Threat Defense device will accept from the drop-down list. The version can be set to 4-Only to force the software to use only Version 4 with the specified neighbor. The default is to use Version 4 and dynamically negotiate down to Version 2 if requested.

Step 16 Update **Migration**, only if AS migration is considered.

Note The AS migration customization should be removed after transition has been completed.

- a) (Optional) Select the **Customize the AS number for routes received from the neighbor** check box to customize the AS_PATH attribute for routes received from an eBGP neighbor.
- b) Enter the local autonomous system number in the **Local AS number** field. Valid values are any valid autonomous system number from 1 to 4294967295 or 1.0 to 65535.65535.
- c) (Optional) Select the **Do not prepend local AS number to routes received from neighbor** check box to prevent the local AS number from being prepended to any routes received from eBGP peer.
- d) (Optional) Select the **Replace real AS number with local AS number in routes received from neighbor** check box to replace the real autonomous system number with the local autonomous system number in the eBGP updates. The autonomous system number from the local BGP routing process is not prepended.
- e) (Optional) Select the **Accept either real AS number or local AS number in routes received from neighbor** check box to configure the eBGP neighbor to establish a peering session using the real autonomous system number (from the local BGP routing process) or by using the local autonomous system number.

Step 17 Click **OK**.

Step 18 Click **Save**.

Configure BGP Aggregate Address Settings

BGP neighbors store and exchange routing information and the amount of routing information increases as more BGP speakers are configured. Route aggregation is the process of combining the attributes of several different routes so that only a single route is advertised. Aggregate prefixes use the classless interdomain routing (CIDR) principle to combine contiguous networks into one classless set of IP addresses that can be summarized in routing tables. As a result fewer routes need to be advertised. Use the Add/Edit Aggregate Address dialog box to define the aggregation of specific routes into one route.

Procedure

- Step 1** When editing a Firepower Threat Defense device, click **Routing**.
- Step 2** Choose **BGP > IPv4** or **IPv6**.
- Step 3** Click **Add Aggregate Address**.
- Step 4** Enter a value for the aggregate timer (in seconds) in the **Aggregate Timer** field. Valid values are 0 or any value between 6 and 60. The default value is 30.
- Step 5** Click **Add** and update the **Add Aggregate Address** dialog:
- Network** — Enter an IPv4 address or select the desired network/hosts objects.
 - Attribute Map** — (Optional) Enter or select the route map used to set the attribute of the aggregate route.
 - Advertise Map** — (Optional) Enter or select the route map used to select the routes to create AS_SET origin communities.
 - Suppress Map** — (Optional) Enter or select the route map used to select the routes to be suppressed.
 - Generate AS set path Information** — (Optional) Select the check box to enable generation of autonomous system set path information.
 - Filter all routes from updates** — (Optional) Select the check box to filter all more-specific routes from updates.
 - Click **OK**.
-

What to do next

- For BGPv4 settings, proceed to [Configure BGPv4 Filtering Settings, on page 680](#)
- For BGPv6 settings, proceed to [Configure BGP Network Settings, on page 681](#)

Configure BGPv4 Filtering Settings

Filtering settings are used to filter routes or networks received in incoming BGP updates. Filtering is used to restrict routing information that the router learns or advertises.

Before you begin

Filtering is only applicable for a BGP IPv4 routing policy.

Procedure

- Step 1** On the Device Management page, click **Routing**.
- Step 2** Choose **BGP > IPv4**.
- Step 3** Click **Filtering**.
- Step 4** Click **Add** and update the **Add Filter** dialog:
- Access List**— Select an access control list that defines which networks are to be received and which are to be suppressed in routing updates.
 - Direction**— (Optional) Select a direction that specifies if the filter should be applied to inbound updates or outbound updates.
 - Protocol**— (Optional) Select the routing process for which you want to filter: None, BGP, Connected, OSPF, RIP, or Static.
 - Process ID**— (Optional) Enter the process ID for the OSPF routing protocol.
 - Click **OK**.
- Step 5** Click **Save**.
-

Configure BGP Network Settings

Network settings are used to add networks that will be advertised by the BGP routing process and route maps that will be examined to filter the networks to be advertised.

Procedure

- Step 1** On the **Device Management** page, click **Routing**.
- Step 2** Choose **BGP > IPv4** or **IPv6**.
- Step 3** Click **Networks**.
- Step 4** Click **Add** and update the **Add Networks** dialog:
- Network**— Enter the network to be advertised by the BGP routing processes.
 - (Optional) **Route Map**— Enter or select a route map that should be examined to filter the networks to be advertised. If not specified, all networks are redistributed.
 - Click **OK**.
- Step 5** Click **Save**.
-

Configure BGP Redistribution Settings

Redistribution settings allow you to define the conditions for redistributing routes from another routing domain into BGP.

Procedure

- Step 1** On the **Device Management** page, click **Routing**.
- Step 2** Choose **BGP > IPv4** or **IPv6**.
- Step 3** Click **Redistribution**.
- Step 4** Click **Add** and update the **Add Redistribution** dialog:
- Source Protocol**— Select the protocol from which you want to redistribute routes into the BGP domain from the Source Protocol drop-down list.
 - Process ID**— Enter the identifier for the selected source protocol. Applies to the OSPF protocol.
 - Metric**— (Optional) Enter a metric for the redistributed route.
 - Route Map**— Enter or select a route map that should be examined to filter the networks to be redistributed. If not specified, all networks are redistributed.
 - Match**— The conditions used for redistributing routes from one routing protocol to another. The routes must match the selected condition to be redistributed. You can choose one or more of the following match conditions. These options are enabled only when OSPF is chosen as the Source Protocol.
 - Internal
 - External 1
 - External 2
 - NSSA External 1
 - NSSA External 2
 - f) Click **OK**.
-

Configure BGP Route Injection Settings

Route Injection settings allow you to define the routes to be conditionally injected into the BGP routing table.

Procedure

- Step 1** On the **Device Management** page, click **Routing**.
- Step 2** Choose **BGP > IPv4** or **IPv6**.
- Step 3** Click **Route Injection**.
- Step 4** Click **Add** and update the **Add Route Injection** dialog:
- Inject Map**— Enter or select the route map that specifies the prefixes to inject into the local BGP routing table.
 - Exist Map**— Enter or select the route map containing the prefixes that the BGP speaker will track.
 - Injected routes will inherit the attributes of the aggregate route**— Select this to configure the injected route to inherit attributes of the aggregate route.
 - d) Click **OK**.

Step 5 Click **Save**.

CHAPTER 35

RIP for Firepower Threat Defense

This chapter describes how to configure the Firepower Threat Defense to route data, perform authentication, and redistribute routing information, using the Routing Information Protocol (RIP).

- [About RIP, on page 685](#)
- [Requirements and Prerequisites for RIP, on page 687](#)
- [Guidelines for RIP, on page 687](#)
- [Configure RIP, on page 688](#)

About RIP

The Routing Information Protocol, or RIP, as it is more commonly called, is one of the most enduring of all routing protocols. RIP has four basic components: routing update process, RIP routing metrics, routing stability, and routing timers. Devices that support RIP send routing-update messages at regular intervals and when the network topology changes. These RIP packets include information about the networks that the devices can reach, as well as the number of routers or gateways that a packet must travel through to reach the destination address. RIP generates more traffic than OSPF, but is easier to configure.

RIP is a distance-vector routing protocol that uses hop count as the metric for path selection. When RIP is enabled on an interface, the interface exchanges RIP broadcasts with neighboring devices to dynamically learn about and advertise routes.

The Firepower Threat Defense device supports both RIP Version 1 and RIP Version 2. RIP Version 1 does not send the subnet mask with the routing update. RIP Version 2 sends the subnet mask with the routing update and supports variable-length subnet masks. Additionally, RIP Version 2 supports neighbor authentication when routing updates are exchanged. This authentication ensures that the Firepower Threat Defense device receives reliable routing information from a trusted source.

RIP has advantages over static routes because the initial configuration is simple, and you do not need to update the configuration when the topology changes. The disadvantage to RIP is that there is more network and processing overhead than in static routing.

Routing Update Process

RIP sends routing-update messages at regular intervals and when the network topology changes. When a router receives a routing update that includes changes to an entry, it updates its routing table to reflect the new route. The metric value for the path is increased by 1, and the sender is indicated as the next hop. RIP routers maintain only the best route (the route with the lowest metric value) to a destination. After updating

its routing table, the router immediately begins transmitting routing updates to inform other network routers of the change. These updates are sent independently of the regularly scheduled updates that RIP routers send.

RIP Routing Metric

RIP uses a single routing metric (hop count) to measure the distance between the source and a destination network. Each hop in a path from source to destination is assigned a hop count value, which is typically 1. When a router receives a routing update that contains a new or changed destination network entry, the router adds 1 to the metric value indicated in the update and enters the network in the routing table. The IP address of the sender is used as the next hop.

RIP Stability Features

RIP prevents routing loops from continuing indefinitely by implementing a limit on the number of hops allowed in a path from the source to a destination. The maximum number of hops in a path is 15. If a router receives a routing update that contains a new or changed entry, and if increasing the metric value by 1 causes the metric to be infinity (that is, 16), the network destination is considered unreachable. The downside of this stability feature is that it limits the maximum diameter of a RIP network to less than 16 hops.

RIP includes a number of other stability features that are common to many routing protocols. These features are designed to provide stability despite potentially rapid changes in network topology. For example, RIP implements the split horizon and hold-down mechanisms to prevent incorrect routing information from being propagated.

RIP Timers

RIP uses numerous timers to regulate its performance. Following are the timer stages for RIP:

- **Update**—The routing-update timer is the interval between periodic routing updates. This is how often the device sends routing updates. Generally, it is set to 30 seconds, with a small random amount of time added whenever the timer is reset. This is done to help prevent congestion, which could result from all routers simultaneously attempting to update their neighbors.
- **Invalid**—Each routing table entry has a route-timeout timer associated with it. This is the number of seconds since the device received the last valid update. When the route-timeout timer expires, the route is marked invalid but is retained in the table until the route-flush timer expires. Once this timer expires, the route goes into holddown. The default is 180 seconds (3 minutes).
- **Holddown**—The holddown period is the number of seconds the system waits before accepting any new updates for the route that is in holddown (that is, routes that have been marked invalid). The default is 180 seconds (3 minutes).
- **Flush**—The route-flush timer is the number of seconds since the system received the last valid update until the route is discarded and removed from the routing table. The default is 240 seconds (4 minutes).

As an example, when the interface on an adjacent router goes down, the system no longer receives routing updates from the adjacent router. At this time, the Invalid and Flush timers start increasing. In the first 180 seconds, nothing will happen. After 180 seconds, the invalid timer expires, making the route invalid, and the Holddown timer starts and holds the route for another 60 seconds. If there is still no update regarding the interface status on the adjacent router (that is, it is still down), then the route enters into the Flush state where in total the system has waited for 240 seconds from the last update (180 seconds for the Invalid timer and 60 seconds for Holddown timer), and the system flushes the route. Even if the adjacent routers interface comes

up immediately, the system does not accept a routing update until the Holddown timer completes the remaining 120 seconds.

Guidelines for RIP

IPv6 Guidelines

Does not support IPv6.

Additional Guidelines

The following information applies to RIP Version 2 only:

- If using neighbor authentication, the authentication key and key ID must be the same on all neighbor devices that provide RIP Version 2 updates to the interface.
- With RIP Version 2, the Firepower Threat Defense device transmits and receives default route updates using the multicast address 224.0.0.9. In passive mode, it receives route updates at that address.
- When RIP Version 2 is configured on an interface, the multicast address 224.0.0.9 is registered on that interface. When a RIP Version 2 configuration is removed from an interface, that multicast address is unregistered.

Limitations

- The Firepower Threat Defense device cannot pass RIP updates between interfaces.
- RIP Version 1 does not support variable-length subnet masks.
- RIP has a maximum hop count of 15. A route with a hop count greater than 15 is considered unreachable.
- RIP convergence is relatively slow compared to other routing protocols.
- You can only enable a single RIP process on the Firepower Threat Defense device.

Configure RIP

RIP is a distance-vector routing protocol that uses hop count as the metric for path selection.

Procedure

- Step 1** Choose **Devices > Device Management**, and edit the Firepower Threat Defense device.
- Step 2** Select **Routing**.
- Step 3** Select **RIP** from the table of contents.
- Step 4** Select the **Enable RIP** check box to configure the RIP settings.
- Step 5** Select the RIP versions for sending and receiving RIP updates from the **RIP Version** drop-down list.
- Step 6** (Optional) Select the **Generate Default Route** check box to generate a default route for distribution, based on the route map that you specify.
- Specify a route map name to use for generating default routes, in the **Route Map** field.
The default route 0.0.0.0/0 is generated for distribution over a certain interface, when the route map, specified in the **Route Map** field, is present.
- Step 7** When Send and Receive Version 2 is the chosen RIP Version, the **Enable Auto Summary** option is available. When the **Enable Auto Summary** checkbox is checked, automatic route summarization is enabled. Disable automatic summarization if you must perform routing between disconnected subnets. When automatic summarization is disabled, subnets are advertised.
- Note** RIP Version 1 always uses automatic summarization—you cannot disable it.
- Step 8** Click **Networks**. Define one or more networks for RIP routing. Enter IP address(es), or enter or select the desired Network/Hosts objects. There is no limit to the number of networks you can add to the security appliance configuration. Any interface that belongs to a network defined by this command, will participate in the RIP routing process. The RIP routing updates will be sent and received only through interfaces on the specified networks. Also, if the network of an interface is not specified, the interface will not be advertised in any RIP updates.
- Note** RIP only supports IPv4 objects.
- Step 9** (Optional) Click **Passive Interface**. Use this option to specify passive interfaces on the appliance, and by extension the active interfaces. The device listens for RIP routing broadcasts on passive interfaces, using that information to populate its routing tables, but does not broadcast routing updates on passive interfaces. Interfaces that are not designated as passive, receive and send updates.
- Step 10** Click **Redistribution** to manage redistribution routes. These are the routes that are being redistributed from other routing processes into the RIP routing process.
- Click **Add** to specify redistribution routes.
 - Select the routing protocol to redistribute into the RIP routing process, in the **Protocol** drop-down list.
- Note** For the OSPF protocol, specify a process ID. Similarly, specify an AS path for BGP. When you choose the Connected option in the **Protocol** drop-down list, you can redistribute, directly connected networks into the RIP routing process.
- (Optional) If you are redistributing OSPF routes into the RIP routing process, you can select specific types of OSPF routes to redistribute in the **Match** drop-down list. Ctrl-click to select multiple types:

- Internal – Routes internal to the autonomous system (AS) are redistributed.
- External 1 – Type 1 routes external to the AS are redistributed.
- External 2 – Type 2 routes external to the AS are redistributed.
- NSSA External 1 – Type 1 routes external to a not-so-stubby area (NSSA) are redistributed.
- NSSA External 2 – Type 2 routes external to an NSSA are redistributed

Note The default is match Internal, External 1, and External 2

- d) Select the RIP metric type to apply to the redistributed routes in the **Metric** drop-down list. The two choices are:
- Transparent – Use the current route metric
 - Specified Value – Assign a specific metric value. Enter a specific value from 0-16, in the **Metric Value** field.
 - None – No metric is specified. Do not use any metric value, to apply to redistributed routes.
- e) (Optional) Enter the name of a route map that must be satisfied, in the **Route Map** field before the route can be redistributed into the RIP routing process. Routes are redistributed only if IP address matches an allow statement in the route map address list.
- f) Click **OK**.

Step 11

(Optional) Click **Filtering** to manage filters for the RIP policy. In this section, filters are used to prevent routing updates through an interface, control the advertising of routes in routing updates, control the processing of routing updates and filtering sources of routing updates.

- a) Click **Add** to add RIP filters.
- b) Select the type of traffic to be filtered - Inbound or Outbound in the **Traffic Direction** field.

Note If traffic direction is inbound, you can only define an Interface filter.

- c) Specify whether the filter is based on an Interface or a Route, by selecting appropriate in the **Filter On** field. If you select Interface, enter or Select the name of the interface on which routing updates are to be filtered. If you select Route, choose the route type:
- Static – Only static routes are filtered.
 - Connected – Only connected routes are filtered.
 - OSPF – Only OSPFv2 routes discovered by the specified OSPF process are filtered. Enter the Process ID of the OSPF process to be filtered.
 - BGP – Only BGPv4 routes discovered by the specified BGP process are filtered. Enter the AS path of the BGP process to be filtered.
- d) In the **Access List** field, enter or select the name of one or more access control lists (ACLs) that define the networks to be allowed or removed from RIP route advertisements.
- e) Click **OK**.

Step 12

(Optional) Click **Broadcast** to add or edit interface configurations. Using Broadcastf, you can override the global RIP versions to send or receive per interface. You can also define the authentication parameters per interface if you want to implement authentication to ensure valid RIP updates.

- a) Click **Add** to add interface configurations.
- b) Enter or Select an interface defined on this appliance in the **Interface** field.
- c) In the Send option, select the appropriate boxes to specify sending updates using the RIP **Version 1**, **Version 2**, or both. These options let you override, for the specified interface, the global Send versions specified .
- d) In the Receive option, select the appropriate boxes to specify accepting updates using the RIP **Version 1**, **Version 2**, or both. These options let you override, for the specified interface, the global Receive versions specified .
- e) Select the **Authentication** used on this interface for RIP broadcasts.
 - None – No authentication
 - MD5 – Employ MD5
 - Clear Text – Employ clear-text authentication

If you choose MD5 or Clear Text, you must also provide the following authentication parameters.

- Key ID – The ID of the authentication key. Valid values are from 0 to 255.
 - Key – The key used by the chosen authentication method. Can contain up to 16 characters
 - Confirm – Enter the authentication key again, to confirm
- f) Click **OK**.

About System Configuration

System configuration settings apply to either a Firepower Management Center or a Classic managed device (7000 and 8000 Series, ASA FirePOWER, NGIPSv):

- For the Firepower Management Center these configuration settings are part of a "local" system configuration. Note that system configuration on the Firepower Management Center is specific to a single system, and changes to a FMC's system configuration affect only that system.
- For a Classic managed device, you apply a configuration from the Firepower Management Center as part of a platform settings policy. You create a shared policy to configure a subset of the system configuration settings, appropriate for managed devices, that are likely to be similar across a deployment.

Tip For 7000 and 8000 Series devices, you can perform limited system configuration tasks from the local web interface, such as console configuration and remote management. These are not the same configurations that you apply to a 7000 or 8000 Series device using a platform settings policy.

Navigating the Firepower Management Center System Configuration

The system configuration identifies basic settings for a Firepower Management Center.

Procedure

Step 1 Choose **System > Configuration**.

Step 2 Use the navigation panel to choose configurations to change; see [Table 63: System Configuration Settings](#), on page 695 for more information.

System Configuration Settings

Note that for managed devices, many of these configurations are handled by a *platform settings* policy applied from the FMC; see [Platform Settings Policies, on page 741](#). For 7000/8000 series devices, you can also log into the local web interface for non-policy based system configurations; see [Local System Configuration for 7000/8000 Series Devices, on page 754](#).

Table 63: System Configuration Settings

Setting	Description
Access Control Preferences	Configure the system to prompt users for a comment when they add or modify an access control policy; see Policy Change Comments, on page 718 .
Access List	Control which computers can access the system on specific ports; see Access List, on page 719 .
Audit Log	Configure the system to send an audit log to an external host; see Audit Logs, on page 720 .
Change Reconciliation	Configure the system to send a detailed report of changes to the system over the last 24 hours; see Change Reconciliation, on page 717 .
Console Configuration	Configure console access via VGA or serial port, or via Lights-Out Management (LOM); see Remote Console Access Management, on page 734 .
Dashboard	Enable Custom Analysis widgets on the dashboard; see Dashboard Settings, on page 722 .
Database	Specify the maximum number of each type of event that the Firepower Management Center can store; see Database Event Limits, on page 702 .
DNS Cache	Configure the system to resolve IP addresses automatically on event view pages; see DNS Cache, on page 722 .
Email Notification	Configure a mail host, select an encryption method, and supply authentication credentials for email-based notifications and reporting; see Email Notifications, on page 723 .
External Database Access	Enable external read-only access to the database, and provide a client driver to download; see External Database Access Settings, on page 701 .
HTTPS Certificate	Request an HTTPS server certificate, if needed, from a trusted authority and upload certificates to the system; see HTTPS Certificates, on page 697 .
Information	View current information about the appliance and edit the display name; see Appliance Information, on page 696 .
Intrusion Policy Preferences	Configure the system to prompt users for a comment when they modify an intrusion policy; see Policy Change Comments, on page 718 .
Language	Specify a different language for the web interface; see Language Selection, on page 724 .
Login Banner	Create a custom login banner that appears when users log in; see Login Banners, on page 725 .
Management Interfaces	Change options such as the IP address, hostname, and proxy settings of the appliance; see Management Interfaces, on page 705 .

Setting	Description
Network Analysis Policy Preferences	Configure the system to prompt users for a comment when they modify a network analysis policy; see Policy Change Comments , on page 718.
Process	Shut down, reboot, or restart Firepower processes; see Shut Down or Restart , on page 713.
Remote Storage Device	Configure remote storage for backups and reports; see Remote Storage Management , on page 714.
Shell Timeout	Configure the amount of idle time, in minutes, before a user's login session times out due to inactivity; see Session Timeouts , on page 732.
SNMP	Enable Simple Network Management Protocol (SNMP) polling; see SNMP Polling , on page 725.
STIG Compliance	Enable compliance with specific requirements set out by the United States Department of Defense; see STIG Compliance , on page 727.
Time	View and change the current time setting; see Time and Time Synchronization , on page 728.
Time Synchronization	Manage time synchronization on the system; see Time and Time Synchronization , on page 728.
VMware Tools	Enable and use VMware Tools on a Firepower Management Center Virtual; see VMware Tools and Virtual Systems , on page 739.
Vulnerability Mapping	Map vulnerabilities to a host IP address for any application protocol traffic received or sent from that address; see Vulnerability Mapping , on page 733.

Related Topics

[About Platform Settings for Classic Devices](#), on page 745

Appliance Information

The **System > Configuration** page of the web interface includes the information listed in the table below. Unless otherwise noted, all fields are read-only.

Note See also the **Help > About** page, which includes similar but slightly different information.

Field	Description
Name	A descriptive name you assign to the FMC appliance. Although you can use the host name as the name of the appliance, entering a different name in this field does not change the host name.
Product Model	The model name of the appliance.
Serial Number	The serial number of the appliance.
Software Version	The version of the software currently installed on the appliance.

Field	Description
Prohibit Packet Transfer to the Firepower Management Center	Specifies whether the managed device sends packet data with events, allowing the data to be stored on the Firepower Management Center. This setting is available on the local web interface on 7000 and 8000 Series devices.
Operating System	The operating system currently running on the appliance.
Operating System Version	The version of the operating system currently running on the appliance.
IPv4 Address	The IPv4 address of the default (eth0) management interface. If IPv4 management is disabled, this field indicates that.
IPv6 Address	The IPv6 address of the default (eth0) management interface. If IPv6 management is disabled, this field indicates that.
Current Policies	The system-level policies currently deployed. If a policy has been updated since it was last deployed, the name of the policy appears in italics.
Model Number	The appliance-specific model number stored on the internal flash drive. This number may be important for troubleshooting.

View Appliance Information

Procedure

Choose **System > Configuration**.

View Basic System Information

The About page displays information about your appliance, including the model, serial number, and version information for various components of the Firepower System. It also includes Cisco copyright information.

Procedure

-
- Step 1** Click **Help** in the toolbar at the top of the page.
- Step 2** Choose **About**.
-

HTTPS Certificates

Secure Sockets Layer (SSL)/TLS certificates enable Firepower Management Centers and 7000 and 8000 Series devices to establish an encrypted channel between the system and a web browser. A default certificate is included with all Firepower devices, but it is not generated by a certificate authority (CA) trusted by any

globally known CA. For this reason, consider replacing it with a custom certificate signed by a globally known or internally trusted CA.

Default HTTPS Server Certificates

If you use the default server certificate provided with an appliance, do not configure the system to require a valid HTTPS client certificate for web interface access because the default server certificate is not signed by the CA that signs your client certificate.

The default server certificate provided with an appliance expires 20 years from when it was first generated.

Custom HTTPS Server Certificates

You can use the Firepower Management Center web interface to generate a server certificate request based on your system information and the identification information you supply. You can use that request to sign a certificate if you have an internal certificate authority (CA) installed that is trusted by your browser. You can also send the resulting request to a certificate authority to request a server certificate. After you have a signed certificate from a certificate authority (CA), you can import it.

HTTPS Client Certificates

You can restrict access to the Firepower System web server using client browser certificate checking. When you enable user certificates, the web server checks that a user's browser client has a valid user certificate selected. That user certificate must be generated by the same trusted certificate authority that is used for the server certificate. The browser cannot load the web interface under any of the following circumstances:

- The user selects a certificate in the browser that is not valid.
- The user selects a certificate in the browser that is not generated by the certificate authority that signed the server certificate.
- The user selects a certificate in the browser that is not generated by a certificate authority in the certificate chain on the device.

You can also load a certificate revocation list (CRL) for the server. The CRL lists any certificates that the certificate authority has revoked, so the web server can verify that the client browser certificate is valid. If the user selects a certificate that is listed in the CRL as a revoked certificate, the browser cannot load the web interface.

Viewing the Current Server Certificate

You can only view server certificates for the appliance you are logged into.

Procedure

- Step 1** Choose **System > Configuration**.
- Step 2** Click **HTTPS Certificate**.
-

Generating and Submitting a Certificate Signing Request

When you generate a certificate request through the local configuration HTTPS Certificate page using this procedure, you can only generate a certificate for a single system. Similarly, if you install a certificate that is not signed by a globally known or internally trusted CA, you receive a security warning when you connect to the system.

The key generated for the certificate request is in Base-64 encoded PEM format.

Procedure

- Step 1** Choose **System > Configuration**.
- Step 2** Click **HTTPS Certificate**.
- Step 3** Click **Generate New CSR**.
- Step 4** Enter a country code in the **Country Name (two-letter code)** field.
- Step 5** Enter a state or province postal abbreviation in the **State or Province** field.
- Step 6** Enter a **Locality or City**.
- Step 7** Enter an **Organization** name.
- Step 8** Enter an **Organizational Unit (Department)** name.
- Step 9** Enter the fully qualified domain name of the server for which you want to request a certificate in the **Common Name** field.
- Note** You must enter the fully qualified domain name of the server exactly as it should appear in the certificate in the **Common Name** field. If the common name and the DNS host name do not match, you receive a warning when connecting to the appliance.
- Step 10** Click **Generate**.
- Step 11** Open a text editor.
- Step 12** Copy the entire block of text in the certificate request, including the `BEGIN CERTIFICATE REQUEST` and `END CERTIFICATE REQUEST` lines, and paste it into a blank text file.
- Step 13** Save the file as `servername.csr`, where `servername` is the name of the server where you plan to use the certificate.
- Step 14** Click **Save**.
-

What to do next

- Upload the signed server certificate; see [Uploading Server Certificates, on page 700](#).

Server Certificate Upload

If the signing authority that generated the certificate requires you to trust an intermediate CA, you must also supply a certificate chain, sometimes referred to as a certificate path. If you require user certificates, they must be generated by a certificate authority whose intermediate authority is included in the certificate chain.

Uploading Server Certificates

If the signing authority that generated the certificate requires you to trust an intermediate CA, you must also supply a certificate chain, sometimes referred to as a certificate path. If you require user certificates, they must be generated by a certificate authority whose intermediate authority is included in the certificate chain.

Before you begin

- Generate a certificate signing request; see [Generating and Submitting a Certificate Signing Request, on page 699](#).
- Upload the CSR file to the certificate authority where you want to request a certificate, or use the CSR to create a self-signed certificate.

Procedure

-
- Step 1** Choose **System > Configuration**.
 - Step 2** Click **HTTPS Certificate**.
 - Step 3** Click **Import HTTPS Certificate**.
 - Step 4** Open the server certificate in a text editor, copy the entire block of text, including the `BEGIN CERTIFICATE` and `END CERTIFICATE` lines, and paste it into the **Server Certificate** field.
 - Step 5** If you want to upload a private key, open the private key file, copy the entire block of text, including the `BEGIN RSA PRIVATE KEY` and `END RSA PRIVATE KEY` lines, and paste it into the **Private Key** field.
 - Step 6** Open any intermediate certificates you need to provide, copy the entire block of text, for each, and paste it into the **Certificate Chain** field.
 - Step 7** Click **Save**.
-

Requiring Valid User Certificates

The system supports upload of CRLs in Distinguished Encoding Rules (DER) format. You can only load one CRL for a server.

To ensure that the list of revoked certificates stays current, you can create a scheduled task to update the CRL. The most recent refresh of the CRL is listed in the interface.

-
- Note** You **must** have a valid user certificate present in your browser (or a CAC inserted in your reader) to enable user certificates and to access the web interface after doing so.
-

Before you begin

- Use the same certificate authority used for the server certificate to generate the user certificate.
- Upload the intermediate certificate for the certificates; see [Server Certificate Upload, on page 699](#).

Procedure

- Step 1** Choose **System > Configuration**.
- Step 2** Click **HTTPS Certificate**.
- Step 3** Choose **Enable User Certificates**. If prompted, select the appropriate certificate from the drop-down list.
- Step 4** If you want to retrieve the CRL, choose **Enable Fetching of CRL**.
- Step 5** Enter a valid URL to an existing CRL file and click **Refresh CRL**. The current CRL at the supplied URL loads to the server.
- Note** Enabling fetching of the CRL creates a scheduled task to update the CRL on a regular basis. Edit the task to set the frequency of the update.
- Step 6** Verify that you have a valid user certificate generated by the same certificate authority that created the server certificate.
- Caution** If you save a configuration with enabled user certificates, but you do not have a valid user certificate in your browser certificate store, you disable all web server access to the appliance. Make sure you have a valid certificate installed before saving settings.
- Step 7** Click **Save**.
-

External Database Access Settings

You can configure the Firepower Management Center to allow read-only access to its database by a third-party client. This allows you to query the database using SQL using any of the following:

- industry-standard reporting tools such as Actuate BIRT, JasperSoft iReport, or Crystal Reports
- any other reporting application (including a custom application) that supports JDBC SSL connections
- the Cisco-provided command-line Java application called RunQuery, which you can either run interactively or use to obtain comma-separated results for a single query

Use the Firepower Management Center's system configuration to enable database access and create an access list that allows selected hosts to query the database. Note that this access list does not also control appliance access.

You can also download a package that contains the following:

- RunQuery, the Cisco-provided database query tool
- InstallCert, a tool you can use to retrieve and accept the SSL certificate from the Firepower Management Center you want to access
- the JDBC driver you must use to connect to the database

See the *Firepower System Database Access Guide* for information on using the tools in the package you downloaded to configure database access.

Enabling External Access to the Database

Procedure

- Step 1** Choose **System > Configuration**.
- Step 2** Click **External Database Access**.
- Step 3** Select the **Allow External Database Access** check box.
- Step 4** Enter an appropriate value in the **Server Hostname** field. Depending on your third-party application requirements, this value can be either the fully qualified domain name (FQDN), IPv4 address, or IPv6 address of the Firepower Management Center.
- Note** In an FMC high availability setup, enter only the active peer details. We do not recommend entering details of the standby peer.
- Step 5** Next to **Client JDBC Driver**, click **Download** and follow your browser's prompts to download the `client.zip` package.
- Step 6** To add database access for one or more IP addresses, click **Add Hosts**. An **IP Address** field appears in the **Access List** field.
- Step 7** In the **IP Address** field, enter an IP address or address range, or `any`.
- Step 8** Click **Add**.
- Step 9** Click **Save**.
- Tip** If you want to revert to the last saved database settings, click **Refresh**.
-

[Firepower System IP Address Conventions](#), on page 15

Database Event Limits

To manage disk space, the FMC periodically prunes the oldest intrusion events, audit records, Security Intelligence data, and URL filtering data from the event database. For each event type, you can specify how many records the FMC retains after pruning; never rely on the event database containing more records of any type than the retention limit configured for that type. To improve performance, tailor the event limits to the number of events you regularly work with. You can optionally choose to receive email notifications when pruning occurs. For some event types, you can disable storage.

To manually delete individual events, use the event viewer. You can also manually purge the database; see [Data Storage](#), on page 193.

Configuring Database Event Limits

Before you begin

- If you want to receive email notifications when events are pruned from the Firepower Management Center's database, you must configure an email server; see [Configuring a Mail Relay Host and Notification Address](#), on page 724.

Procedure

-
- Step 1** Choose **System > Configuration**.
- Step 2** Choose **Database**.
- Step 3** For each of the databases, enter the number of records you want to store.
For information on how many records each database can maintain, see [Database Event Limits](#), on page 703.
- Step 4** Optionally, in the **Data Pruning Notification Address** field, enter the email address where you want to receive pruning notifications.
- Step 5** Click **Save**.
-

Database Event Limits

The following table lists the minimum and maximum number of records for each event type that you can store on a Firepower Management Center.

Table 64: Database Event Limits

Event Type	Upper Limit	Lower Limit
Intrusion events	10 million (FMC Virtual) 20 million (FMC750) 30 million (FMC1500,) 60 million (FMC2000,) 150 million (FMC3500) 300 million (FMC4000,)	10,000
Discovery events	10 million (FMC Virtual) 20 million (FMC2000, FMC4000,)	Zero (disables storage)

Event Type	Upper Limit	Lower Limit
Connection events	50 million (FMC Virtual, FMC750)	Zero (disables storage)
Security Intelligence events	100 million (FMC1500,) 300 million (FMC2000,) 500 million (FMC3500) 1 billion (FMC4000,) Limit is shared between connection events and Security Intelligence events. The sum of the configured maximums cannot exceed this limit.	Setting Maximum Connection Events to zero immediately purges existing connection events. Note that disabling connection event storage on the Firepower Management Center does not affect connection summaries or correlation. The system still uses connection event information for features like traffic profiles, correlation policies, and dashboard displays.
Connection summaries (aggregated connection events)	50 million (FMC Virtual, FMC750) 100 million (FMC1500,) 300 million (FMC2000,) 500 million (FMC3500) 1 billion (FMC4000,)	Zero (disables storage)
Correlation events and compliance white list events	1 million (FMC Virtual) 2 million (FMC2000, , FMC4000)	One
Malware events	10 million (FMC Virtual) 20 million (FMC2000,, FMC4000)	10,000
File events	10 million (FMC Virtual) 20 million (FMC2000, , FMC4000)	Zero (disables storage)
Health events	1 million	Zero (disables storage)
Audit records	100,000	One
Remediation status events	10 million	One
White list violation history	a 30-day history of violations	One day's history
User activity (user events)	10 million	One
User logins (user history)	10 million	One
Intrusion rule update import log records	1 million	One

Management Interfaces

After setup, you can change the management network settings, including adding more management interfaces, hostname, search domains, DNS servers, and HTTP proxy on the FMC.

About FMC Management Interfaces

By default, the FMC manages all devices on a single management interface. You can also perform initial setup on the management interface and log into the FMC on this interface as an administrator. The management interface is also used to communicate with the Smart Licensing server, to download updates, and to perform other management functions.

For information about device management interfaces, see [About Device Management Interfaces, on page 199](#).

Management Interfaces on the FMC

The FMC uses the eth0 interface for initial setup, HTTP access for administrators, management of devices, as well as other management functions such as licensing and updates.

You can also configure additional management interfaces on the same network, or on different networks. When the FMC manages large numbers of devices, adding more management interfaces can improve throughput and performance. You can also use these interfaces for all other management functions. You might want to use each management interface for particular functions; for example, you might want to use one interface for HTTP administrator access and another for device management.

For device management, the management interface carries two separate traffic channels: the *management traffic channel* carries all internal traffic (such as inter-device traffic specific to managing the device), and the *event traffic channel* carries all event traffic (such as web events). You can optionally configure a separate event-only interface on the FMC to handle event traffic; you can configure only one event interface. Event traffic can use a large amount of bandwidth, so separating event traffic from management traffic can improve the performance of the FMC. For example, you can assign a 10 GigabitEthernet interface to be the event interface, if available, while using 1 GigabitEthernet interfaces for management. You might want to configure an event-only interface on a completely secure, private network while using the regular management interface on a network that includes Internet access, for example. You can also use both management and event interfaces on the same network if the goal is only to take advantage of increased throughput. Managed devices will send management traffic to the FMC management interface and event traffic to the FMCs event-only interface. If the managed device cannot reach the event-only interface, then it will fall back to sending events to the management interface.

Note All management interfaces support HTTP administrator access as controlled by your Access List configuration. Conversely, you cannot restrict an interface to *only* HTTP access; management interfaces always support device management (management traffic, event traffic, or both).

Note Only the eth0 interface supports DHCP IP addressing. Other management interfaces only support static IP addresses.

Management Interface Support Per FMC Model

See the hardware installation guide for your model for the management interface locations.

See the following table for supported management interfaces on each FMC model.

Table 65: Management Interface Support on the FMC

Model	Management Interfaces
MC750, MC1500, MC3500	eth0 (Default) eth1
MC2000, MC4000	eth0 (Default) eth1 eth2 eth3
Firepower Management Center Virtual	eth0 (Default)

Network Routes on FMC Management Interfaces

Management interfaces (including event-only interfaces) support only static routes to reach remote networks. When you set up your FMC, the setup process creates a default route to the gateway IP address that you specify. You cannot delete this route; you can only modify the gateway address.

The default route always uses the lowest-numbered management interface (e.g. eth0).

At least one static route is recommended per management interface to access remote networks. We recommend placing each interface on a separate network to avoid potential routing problems, including routing problems from other devices to the FMC. If you do not experience problems with interfaces on the same network, then be sure to configure static routes correctly. For example, on the FMC both eth0 and eth1 are on the same network, but you want to manage a different group of devices on each interface. The default gateway is 192.168.45.1. If you want eth1 to manage devices on the remote 10.6.6.0/24 destination network, you can create a static route for 10.6.6.0/24 through eth1 with the same gateway of 192.168.45.1. Traffic to 10.6.6.0/24 will hit this route before it hits the default route, so eth1 will be used as expected.

If you want to use two FMC interfaces to manage remote devices that are on the same network, then static routing on the FMC may not scale well, because you need separate static routes per device IP address.

Another example includes separate management and event-only interfaces on both the FMC and the managed device. The event-only interfaces are on a separate network from the management interfaces. In this case, add a static route through the event-only interface for traffic destined for the remote event-only network, and vice versa.

NAT Environments

Network address translation (NAT) is a method of transmitting and receiving network traffic through a router that involves reassigning the source or destination IP address. The most common use for NAT is to allow private networks to communicate with the internet. Static NAT performs a 1:1 translation, which does not pose a problem for FMC communication with devices, but port address translation (PAT) is more common. PAT lets you use a single public IP address and unique ports to access the public network; these ports are dynamically assigned as needed, so you cannot initiate a connection to a device behind a PAT router.

Normally, you need both IP addresses (along with a registration key) for both routing purposes and for authentication: the FMC specifies the device IP address when you add a device, and the device specifies the FMC IP address. However, if you only know one of the IP addresses, which is the minimum requirement for routing purposes, then you must also specify a unique NAT ID on both sides of the connection to establish trust for the initial communication and to look up the correct registration key. The FMC and device use the registration key and NAT ID (instead of IP addresses) to authenticate and authorize for initial registration.

For example, you add a device to the FMC, and you do not know the device IP address (for example, the device is behind a PAT router), so you specify only the NAT ID and the registration key on the FMC; leave the IP address blank. On the device, you specify the FMC IP address, the same NAT ID, and the same registration key. The device registers to the FMC's IP address. At this point, the FMC uses the NAT ID instead of IP address to authenticate the device.

Although the use of a NAT ID is most common for NAT environments, you might choose to use the NAT ID to simplify adding many devices to the FMC. On the FMC, specify a unique NAT ID for each device you want to add while leaving the IP address blank, and then on each device, specify both the FMC IP address and the NAT ID. Note: The NAT ID must be unique per device.

The following example shows three devices behind a PAT IP address. In this case, specify a unique NAT ID per device on both the FMC and the devices, and specify the FMC IP address on the devices.

Figure 23: NAT ID for Managed Devices Behind PAT

The following example shows the FMC behind a PAT IP address. In this case, specify a unique NAT ID per device on both the FMC and the devices, and specify the device IP addresses on the FMC.

Figure 24: NAT ID for FMC Behind PAT

Management and Event Traffic Channel Examples

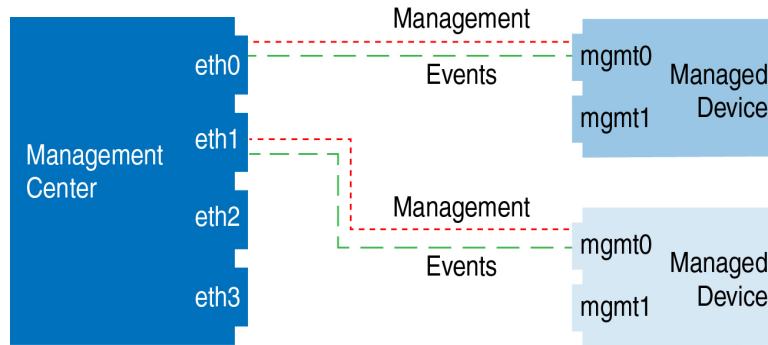

The following example shows the Firepower Management Center and managed devices using only the default management interfaces.

Figure 25: Single Management Interface on the Firepower Management Center

The following example shows the Firepower Management Center using separate management interfaces for devices; and each managed device using 1 management interface.

Figure 26: Multiple Management Interfaces on the Firepower Management Center

The following example shows the Firepower Management Center and managed devices using a separate event interface.

Figure 27: Separate Event Interface on the Firepower Management Center and Managed Devices

The following example shows a mix of multiple management interfaces and a separate event interface on the Firepower Management Center and a mix of managed devices using a separate event interface, or using a single management interface.

Figure 28: Mixed Management and Event Interface Usage

Modify FMC Management Interfaces

Caution Do NOT push the FMC deployments over a VPN tunnel that is terminating directly on the Firepower Threat Defense. Pushing the FMC deployments can potentially inactivate the tunnel and disconnect the FMC and the Firepower Threat Defense.

Recovering the device from this situation can be very disruptive and require executing the disaster recovery procedure. This procedure resets the Firepower Threat Defense configuration to factory defaults by changing manager from FMC to local and configuring the device from beginning. For more information, see [Deploying the FMC Policy Configuration over VPN Tunnel, on page 304](#).

Modify the management interface settings on the Firepower Management Center. You can optionally enable additional management interfaces or configure an event-only interface.

Caution Be careful when making changes to the management interface to which you are connected; if you cannot re-connect because of a configuration error, you need to access the FMC console port to re-configure the network settings in the Linux shell. You must contact Cisco TAC to guide you in this operation.

- Note** If you change the FMC IP address, then see the following tasks to ensure device management connectivity depending on how you added the device to the FMC:
- **IP address—No action.** If you added the device to the FMC using a reachable device IP address, then the management connection will be reestablished automatically after several minutes even though the IP address identified on the FTD is the old IP address. **Note:** If you specified a device IP address that is unreachable, then you must contact Cisco TAC, who can advise you how to restore connectivity for your devices.
 - **NAT ID only—Contact Cisco TAC.** If you added the device using only the NAT ID, then the connection cannot be reestablished. In this case, you must contact Cisco TAC, who can advise you how to restore connectivity for your devices.

Before you begin

- For information about how device management works, see [About Device Management Interfaces, on page 199](#).
- If you use a proxy:
 - Proxies that use NT LAN Manager (NTLM) authentication are not supported.
 - If you use or will use Smart Licensing, the proxy FQDN cannot have more than 64 characters.

Procedure

Step 1 Choose **System > Configuration**, and then choose **Management Interfaces**.

Step 2 In the **Interfaces** area, click **Edit** next to the interface that you want to configure.

All available interfaces are listed in this section. You cannot add more interfaces.

You can configure the following options on each management interface:

- **Enabled**—Enable the management interface. Do **not** disable the default eth0 management interface. Some processes require the eth0 interface.
- **Channels**—Configure an event-only interface; you can configure only one event interface on the FMC. To do so, uncheck the **Management Traffic** check box, and leave the **Event Traffic** check box checked. You can optionally disable **Event Traffic** for the management interface(s). In either case, the device will try to send events to the event-only interface, and if that interface is down, it will send events on the management interface even if you disable the event channel. You cannot disable both event and management channels on an interface.
- **Mode**—Specify a link mode. Note that any changes you make to auto-negotiation are ignored for GigabitEthernet interfaces.
- **MDI/MDIX**—Set the **Auto-MDIX** setting.
- **MTU**—Set the maximum transmission unit (MTU). The default is 1500. The range within which you can set the MTU can vary depending on the model and interface type.

Because the system automatically trims 18 bytes from the configured MTU value, any value below 1298 does not comply with the minimum IPv6 MTU setting of 1280, and any value below 594 does not comply with the minimum IPv4 MTU setting of 576. For example, the system automatically trims a configured value of 576 to 558.

- **IPv4 Configuration**—Set the IPv4 IP address. Choose:
 - **Static**—Manually enter the **IPv4 Management IP** address and **IPv4 Netmask**.
 - **DHCP**—Set the interface to use DHCP (eth0 only).
 - **Disabled**—Disable IPv4. Do **not** disable both IPv4 and IPv6.
- **IPv6 Configuration**—Set the IPv6 IP address. Choose:
 - **Static**—Manually enter the **IPv6 Management IP** address and **IPv6 Prefix Length**.
 - **DHCP**—Set the interface to use DHCPv6 (eth0 only).
 - **Router Assigned**—Enable stateless autoconfiguration.
 - **Disabled**—Disable IPv6. Do **not** disable both IPv4 and IPv6.

Step 3 In the **Routes** area, edit a static route by clicking **Edit** () , or add a route by clicking **Add** () .

View the route table by clicking  .

You need a static route for each additional interface to reach remote networks. For more information about when new routes are needed, see [Network Routes on FMC Management Interfaces, on page 706](#).

Note For the default route, you can change only the gateway IP address. The default route always uses the eth0 interface.

You can configure the following settings for a static route:

- **Destination**—Set the destination address of the network to which you want to create a route.
- **Netmask or Prefix Length**—Set the netmask (IPv4) or prefix length (IPv6) for the network.
- **Interface**—Set the egress management interface.
- **Gateway**—Set the gateway IP address.

Step 4 In the **Shared Settings** area, set network parameters shared by all interfaces.

Note If you selected **DHCP** for the eth0 interface, you cannot manually specify some shared settings derived from the DHCP server.

You can configure the following shared settings:

- **Hostname**—Set the FMC hostname. The hostname must start and end with a letter or digit, and have only letters, digits, or a hyphen. If you change the hostname, reboot the FMC if you want the new hostname reflected in syslog messages. Syslog messages do not reflect a new hostname until after a reboot.
- **Domains**—Set the search domain(s) for the FMC, separated by commas. These domains are added to hostnames when you do not specify a fully-qualified domain name in a command, for example, **ping system**. The domains are used only on the management interface, or for commands that go through the management interface.
- **Primary DNS Server, Secondary DNS Server, Tertiary DNS Server**—Set the DNS servers to be used in order of preference.
- **Remote Management Port**—Set the remote management port for communication with managed devices. The FMC and managed devices communicate using a two-way, SSL-encrypted communication channel, which by default is on port 8305.

Note Cisco **strongly** recommends that you keep the default settings for the remote management port, but if the management port conflicts with other communications on your network, you can choose a different port. If you change the management port, you must change it for **all** devices in your deployment that need to communicate with each other.

Step 5 In the **Proxy** area, configure HTTP proxy settings.

The FMC is configured to directly-connect to the internet on ports TCP/443 (HTTPS) and TCP/80 (HTTP). You can use a proxy server, to which you can authenticate via HTTP Digest.

See proxy requirements in the prerequisites to this topic.

- Check the **Enabled** check box.
- In the **HTTP Proxy** field, enter the IP address or fully-qualified domain name of your proxy server.
See requirements in the prerequisites to this topic.
- In the **Port** field, enter a port number.
- Supply authentication credentials by choosing **Use Proxy Authentication**, and then provide a **User Name** and **Password**.

Step 6 Click **Save**.

Step 7 If you change the FMC IP address, then see If you change the FMC IP address, then see the following tasks to ensure device management connectivity depending on how you added the device to the FMC:

- **IP address—No action.** If you added the device to the FMC using a reachable device IP address, then the management connection will be reestablished automatically after several minutes even though the IP address identified on the FTD is the old IP address. **Note:** If you specified a device IP address that is unreachable, then you must contact Cisco TAC, who can advise you how to restore connectivity for your devices.
- **NAT ID only—Contact Cisco TAC.** If you added the device using only the NAT ID, then the connection cannot be reestablished. In this case, you must contact Cisco TAC, who can advise you how to restore connectivity for your devices.

Shut Down or Restart

Use the web interface to control the shut down and restart of processes on the FMC. You can:

- Shut down: Initiate a graceful shutdown of the appliance.

Caution Do **not** shut off Firepower appliances using the power button; it may cause a loss of data. Using the web interface (or CLI) prepares the system to be safely powered off and restarted without losing configuration data.

- Reboot: Shut down and restart gracefully.
- Restart the console: Restart the communications, database, and HTTP server processes. This is typically used during troubleshooting.

Tip For information on shutting down/restarting a 7000/8000 series device, including restarting the Snort process, see [Shut Down or Restart a 7000/8000 Series Device, on page 758](#). For virtual devices, refer to the documentation for your virtual platform. For VMware in particular, custom power options are part of VMware Tools.

Shut Down or Restart the FMC

Procedure

- Step 1** Choose **System > Configuration**.
- Step 2** Choose **Process**.
- Step 3** Do one of the following:

Shut down	Click Run Command next to Shutdown Management Center .
-----------	--

Reboot	Click Run Command next to Reboot Management Center . Note Rebooting logs you out, and the system runs a database check that can take up to an hour to complete.
Restart the console	Click Run Command next to Restart Management Center Console . Note Restarting may cause deleted hosts to reappear in the network map.

Remote Storage Management

On Firepower Management Centers, you can use the following for local or remote storage for backups and reports:

- Network File System (NFS)
- Server Message Block (SMB)/Common Internet File System (CIFS)
- Secure Shell (SSH)

You cannot send backups to one remote system and reports to another, but you can choose to send either to a remote system and store the other on the Firepower Management Center.

Tip After configuring and selecting remote storage, you can switch back to local storage **only** if you **have not** increased the connection database limit.

Configuring Local Storage

Procedure

- Step 1** Choose **System > Configuration**.
- Step 2** Choose **Remote Storage Device**.
- Step 3** Choose **Local (No Remote Storage)** from the **Storage Type** drop-down list.
- Step 4** Click **Save**.

Configuring NFS for Remote Storage

Before you begin

- Ensure that your external remote storage system is functional and accessible from your FMC.

Procedure

- Step 1** Choose **System > Configuration**.
- Step 2** Click **Remote Storage Device**.
- Step 3** Choose **NFS** from the **Storage Type** drop-down list.
- Step 4** Add the connection information:
- Enter the IPv4 address or hostname of the storage system in the **Host** field.
 - Enter the path to your storage area in the **Directory** field.
- Step 5** Optionally, check the **Use Advanced Options** check box and enter any required command line options; see [Remote Storage Management Advanced Options, on page 717](#).
- Step 6** Under **System Usage**:
- Choose **Use for Backups** to store backups on the designated host.
 - Choose **Use for Reports** to store reports on the designated host.
 - Enter **Disk Space Threshold** for backup to remote storage. Default is 90%.
- Step 7** To test the settings, click **Test**.
- Step 8** Click **Save**.
-

Configuring SMB for Remote Storage

Before you begin

Ensure that your external remote storage system is functional and accessible from your FMC:

- The system recognizes top-level SMB shares, not full file paths. You must use Windows to share the exact directory you want to use.
- Make sure the Windows user you will use to access the SMB share from the FMC has ownership of and read/change access to the share location.
- To ensure security, you should install SMB 2.0 or greater.

Procedure

- Step 1** Choose **System > Configuration**.
- Step 2** Click **Remote Storage Device**.
- Step 3** Choose **SMB** from the **Storage Type** drop-down list.
- Step 4** Add the connection information:
- Enter the IPv4 address or hostname of the storage system in the **Host** field.
 - Enter the share of your storage area in the **Share** field.

- Optionally, enter the domain name for the remote storage system in the **Domain** field.
- Enter the user name for the storage system in the **Username** field and the password for that user in the **Password** field.

Step 5 Optionally, check the **Use Advanced Options** check box and enter any required command line options; see [Remote Storage Management Advanced Options, on page 717](#).

Step 6 Under **System Usage**:

- Choose **Use for Backups** to store backups on the designated host.
- Choose **Use for Reports** to store reports on the designated host.

Step 7 To test the settings, click **Test**.

Step 8 Click **Save**.

Configuring SSH for Remote Storage

Caution If you enable STIG compliance on an appliance, you cannot use SSH for remote storage for that appliance.

Before you begin

- Ensure that your external remote storage system is functional and accessible from your Firepower Management Center.

Procedure

Step 1 Choose **System > Configuration**.

Step 2 Click **Remote Storage Device**.

Step 3 Choose **SSH** from the **Storage Type** drop-down list.

Step 4 Add the connection information:

- Enter the IP address or host name of the storage system in the **Host** field.
- Enter the path to your storage area in the **Directory** field.
- Enter the storage system's user name in the **Username** field and the password for that user in the **Password** field. To specify a network domain as part of the connection user name, precede the user name with the domain followed by a forward slash (/).
- To use SSH keys, copy the content of the **SSH Public Key** field and place it in your `authorized_keys` file.

Step 5 Optionally, check the **Use Advanced Options** check box and enter any required command line options; see [Remote Storage Management Advanced Options, on page 717](#).

Step 6 Under **System Usage**:

- Choose **Use for Backups** to store backups on the designated host.
- Choose **Use for Reports** to store reports on the designated host.

Step 7 If you want to test the settings, you must click **Test**.

Step 8 Click **Save**.

Remote Storage Management Advanced Options

If you select the Network File System (NFS) protocol, Server Message Block (SMB) protocol, or `SSH` to use secure file transfer protocol (SFTP) to store your reports and backups, you can select the **Use Advanced Options** check box to use one of the mount binary options as documented in an NFS, SMB, or SSH mount main page.

If you select SMB or NFS storage type, you can specify the version number of the remote storage in the **Command Line Option** field using the following format:

```
vers=version
```

where `version` is the version number of SMB or NFS remote storage you want to use. For example, to select NFSv4, enter `vers=4.0`.

If SMB encryption is enabled for a file server, only SMB version 3.0 clients are allowed to access the file server. To access encrypted SMB file server from the FMC, type the following in the **Command Line Option** field:

```
vers=3.0
```

where you select encrypted SMBv3 to copy or save backup files from the FMC to the encrypted SMB file server.

Change Reconciliation

To monitor the changes that users make and ensure that they follow your organization's preferred standard, you can configure the system to send, via email, a detailed report of changes made over the past 24 hours. Whenever a user saves changes to the system configuration, a snapshot is taken of the changes. The change reconciliation report combines information from these snapshots to present a clear summary of recent system changes.

The following sample graphic displays a User section of an example change reconciliation report and lists both the previous value for each configuration and the value after changes. When users make multiple changes to the same configuration, the report lists summaries of each distinct change in chronological order, beginning with the most recent.

You can view changes made during the previous 24 hours.

Configuring Change Reconciliation

Before you begin

- Configure an email server to receive emailed reports of changes made to the system over a 24 hour period; see [Configuring a Mail Relay Host and Notification Address, on page 724](#) for more information.

Procedure

Step 1 Choose **System > Configuration**.

Step 2 Click **Change Reconciliation**.

Step 3 Check the **Enable** check box.

Step 4 Choose the time of day you want the system to send out the change reconciliation report from the **Time to Run** drop-down lists.

Step 5 Enter email addresses in the **Email to** field.

Tip Once you have added email addresses, click **Resend Last Report** to send recipients another copy of the most recent change reconciliation report.

Step 6 If you want to include policy changes, check the **Include Policy Configuration** check box.

Step 7 If you want to include all changes over the past 24 hours, check the **Show Full Change History** check box.

Step 8 Click **Save**.

Related Topics

[Using the Audit Log to Examine Changes](#), on page 2147

Change Reconciliation Options

The **Include Policy Configuration** option controls whether the system includes records of policy changes in the change reconciliation report. This includes changes to access control, intrusion, system, health, and network discovery policies. If you do not select this option, the report will not show changes to any policies. This option is available on Firepower Management Centers only.

The **Show Full Change History** option controls whether the system includes records of all changes over the past 24 hours in the change reconciliation report. If you do not select this option, the report includes only a consolidated view of changes for each category.

Note The change reconciliation report does not include changes to Firepower Threat Defense interfaces and routing settings.

Policy Change Comments

You can configure the Firepower System to track several policy-related changes using the comment functionality when users modify access control, intrusion, or network analysis policies.

With policy change comments enabled, administrators can quickly assess why critical policies in a deployment were modified. Optionally, you can have changes to intrusion and network analysis policies written to the audit log.

Configuring Comments to Track Policy Changes

You can configure the Firepower System to prompt users for comments when they modify an access control policy, intrusion policy, or network analysis policy. You can use comments to track users' reasons for policy changes. If you enable comments on policy changes, you can make the comment optional or mandatory. The system prompts the user for a comment when each new change to a policy is saved.

Procedure

- Step 1** Choose **System > Configuration**.
- The system configuration options appear in the left navigation panel.
- Step 2** Configure the policy comment preferences for any of the following:
- Click **Access Control Preferences** for comment preferences for access control policies.
 - Click **Intrusion Policy Preferences** for comment preferences for intrusion policies.
 - Click **Network Analysis Policy Preferences** for comment preferences for network analysis policies.
- Step 3** You have the following choices for each policy type:
- **Disabled**—Disables change comments.
 - **Optional**—Gives users the option to describe their changes in a comment.
 - **Required**—Requires users to describe their changes in a comment before saving.
- Step 4** Optionally for intrusion or network analysis policy comments:
- Check **Write changes in Intrusion Policy to audit log** to write all intrusion policy changes to the audit log.
 - Check **Write changes in Network Analysis Policy to audit log** to write all network analysis policy changes to the audit log.
- Step 5** Click **Save**.
-

Access List

You can limit access to the FMC by IP address and port. By default, the following ports are enabled for any IP address:

- 443 (HTTPS) for web interface access.
- 22 (SSH) for CLI access.

You can also add access to poll for SNMP information over port 161. Because SNMP is disabled by default, you must first enable SNMP before you can add SNMP access rules. For more information, see [Configure SNMP Polling, on page 726](#).

Caution By default, access is not restricted. To operate in a more secure environment, consider adding access for specific IP addresses and then deleting the default **any** option.

Configure an Access List

This access list does not control external database access. See [Enabling External Access to the Database, on page 702](#).

Caution If you delete access for the IP address that you are currently using to connect to the FMC, and there is no entry for “IP=any port=443”, you will lose access when you save.

To configure access lists for Classic devices, use device platform settings. See [Configure Access Lists for Classic Devices, on page 747](#).

Before you begin

By default, the access list includes rules for HTTPS and SSH. To add SNMP rules to the access list, you must first enable SNMP. For more information, see [Configure SNMP Polling, on page 726](#).

Procedure

- Step 1** Choose **System > Configuration**.
- Step 2** (Optional) Click **SNMP** to configure SNMP if you want to add SNMP rules to the access list. By default, SNMP is disabled; see [Configure SNMP Polling, on page 726](#).
- Step 3** Click **Access List**.
- Step 4** To add access for one or more IP addresses, click **Add Rules**.
- Step 5** In the **IP Address** field, enter an IP address or address range, or *any*.
- Step 6** Choose **SSH**, **HTTPS**, **SNMP**, or a combination of these options to specify which ports you want to enable for these IP addresses.
- Step 7** Click **Add**.
- Step 8** Click **Save**.

Related Topics

[Firepower System IP Address Conventions, on page 15](#)

Audit Logs

The Firepower Management Center records user activity in read-only audit logs. You can review audit log data in several ways:

- Use the web interface: [Auditing the System, on page 2143](#).

Audit logs are presented in a standard event view where you can view, sort, and filter audit log messages based on any item in the audit view. You can easily delete and report on audit information and you can view detailed reports of the changes that users make.

- Stream audit log messages to the syslog.
- Stream audit log messages to an HTTP server.

Streaming audit log data to an external server allows you to conserve space on the FMC; see [Configure Audit Log Streaming, on page 721](#).

Classic devices also maintain audit logs. To stream audit logs from a Classic devices, see [Stream Audit Logs from Classic Devices, on page 748](#).

Configure Audit Log Streaming

The following is an example of the output structure:

```
Date Time Host [Tag] Sender: [User_Name]@[User_IP], [Subsystem], [Action]
```

where the local date, time, and hostname precede the bracketed optional tag, and the sending device name precedes the audit log message.

For example:

```
Mar 01 14:45:24 localhost [TAG] Dev-DC3500: admin@10.1.1.2, Operations > Monitoring, Page View
```

Before you begin

- Ensure that the external host is functional and accessible from the system sending the audit log.

Procedure

-
- Step 1** Choose **System > Configuration**.
 - Step 2** Click **Audit Log**.
 - Step 3** Choose **Enabled** from the **Send Audit Log to Syslog** drop-down menu.
 - Step 4** Designate the destination host for the audit information by using the IP address or the fully qualified name of the host in the **Host** field. The default port (514) is used.
Caution If the computer you configure to receive an audit log is not set up to accept remote messages, the host will not accept the audit log.
 - Step 5** Choose a syslog **Facility**.
 - Step 6** Choose a **Severity**.
 - Step 7** Optionally, insert a reference tag in the **Tag (optional)** field.
 - Step 8** To send regular audit log updates to an external HTTP server, choose **Enabled** from the **Send Audit Log to HTTP Server** drop-down list.
 - Step 9** In the **URL to Post Audit** field, designate the URL where you want to send audit information. You must enter an URL that corresponds to a listener program that expects the HTTP POST variables as listed:
 - subsystem
 - actor
 - event_type
 - message
 - action_source_ip

- `action_destination_ip`
- `result`
- `time`
- `tag` (if defined, as above)

Caution To allow encrypted posts, you must use an HTTPS URL. Note that sending audit information to an external URL may affect system performance.

Step 10 Click **Save**.

Dashboard Settings

Dashboards provide you with at-a-glance views of current system status through the use of widgets: small, self-contained components that provide insight into different aspects of the Firepower System. The Firepower System is delivered with several predefined dashboard widgets.

You can configure the Firepower Management Center so that Custom Analysis widgets are enabled on the dashboard.

Related Topics

[About Dashboards](#), on page 233

Enabling Custom Analysis Widgets for Dashboards

Use Custom Analysis dashboard widgets to create a visual representation of events based on a flexible, user-configurable query.

Procedure

- Step 1** Choose **System > Configuration**.
 - Step 2** Click **Dashboard**.
 - Step 3** Check the **Enable Custom Analysis Widgets** check box to allow users to add Custom Analysis widgets to dashboards.
 - Step 4** Click **Save**.
-

DNS Cache

You can configure the system to resolve IP addresses automatically on the event view pages. You can also configure basic properties for DNS caching performed by the appliance. Configuring DNS caching allows you to identify IP addresses you previously resolved without performing additional lookups. This can reduce

the amount of traffic on your network and speed the display of event pages when IP address resolution is enabled.

Configuring DNS Cache Properties

DNS resolution caching is a system-wide setting that allows the caching of previously resolved DNS lookups.

Procedure

- Step 1** Choose **System > Configuration**.
- Step 2** Choose **DNS Cache**.
- Step 3** From the **DNS Resolution Caching** drop-down list, choose one of the following:
- **Enabled**—Enable caching.
 - **Disabled**—Disable caching.
- Step 4** In the **DNS Cache Timeout (in minutes)** field, enter the number of minutes a DNS entry remains cached in memory before it is removed for inactivity.
- The default setting is 300 minutes (five hours).
- Step 5** Click **Save**.
-

[Configuring Event View Settings](#), on page 33

Email Notifications

Configure a mail host if you plan to:

- Email event-based reports
- Email status reports for scheduled tasks
- Email change reconciliation reports
- Email data-pruning notifications
- Use email for discovery event, impact flag, correlation event alerting, intrusion event alerting, and health event alerting

When you configure email notification, you can select an encryption method for the communication between the system and mail relay host, and can supply authentication credentials for the mail server if needed. After configuring, you can test the connection.

Configuring a Mail Relay Host and Notification Address

Procedure

- Step 1** Choose **System > Configuration**.
- Step 2** Click **Email Notification**.
- Step 3** In the **Mail Relay Host** field, enter the hostname or IP address of the mail server you want to use. The mail host you enter **must** allow access from the appliance.
- Step 4** In the **Port Number** field, enter the port number to use on the email server.
- Typical ports include:
- 25, when using no encryption
 - 465, when using SSLv3
 - 587, when using TLS
- Step 5** Choose an **Encryption Method**:
- **TLS**—Encrypt communications using Transport Layer Security.
 - **SSLv3**—Encrypt communications using Secure Socket Layers.
 - **None**—Allow unencrypted communication.
- Note** Certificate validation is not required for encrypted communication between the appliance and mail server.
- Step 6** In the **From Address** field, enter the valid email address you want to use as the source email address for messages sent by the appliance.
- Step 7** Optionally, to supply a user name and password when connecting to the mail server, choose **Use Authentication**. Enter a user name in the **Username** field. Enter a password in the **Password** field.
- Step 8** To send a test email using the configured mail server, click **Test Mail Server Settings**.
- A message appears next to the button indicating the success or failure of the test.
- Step 9** Click **Save**.
-

Language Selection

You can use the Language page to specify a different language for the web interface.

Set the Language for the Web Interface

The language you specify here is used for the web interface for every user. You can choose from:

- English
- Japanese

To set the language for 7000/8000 series devices, use device platform settings: [Set the Language for the 7000/8000 Series Web Interface, on page 750](#).

Procedure

- Step 1** Choose **System > Configuration**.
 - Step 2** Click **Language**.
 - Step 3** Choose the language you want to use.
 - Step 4** Click **Save**.
-

Login Banners

You can use the Login Banner page to specify session, login, or custom message banners for a security appliance or shared policy.

You can use ASCII characters and carriage returns to create a custom login banner. The system does not preserve tab spacing. If your login banner is too large or causes errors, Telnet or SSH sessions can fail when the system attempts to display the banner.

Customize the Login Banner

To customize login banners for Classic devices, use device platform settings. See [Customize the Login Banner for Classic Devices , on page 751](#).

Procedure

- Step 1** Choose **System > Configuration**.
 - Step 2** Choose **Login Banner**.
 - Step 3** In the **Custom Login Banner** field, enter the login banner text you want to use.
 - Step 4** Click **Save**.
-

SNMP Polling

You can enable Simple Network Management Protocol (SNMP) polling. This feature supports use of versions 1, 2, and 3 of the SNMP protocol. This feature allows access to the standard management information base (MIB), which includes system details such as contact, administrative, location, service information, IP addressing and routing information, and transmission protocol usage statistics.

Note When selecting SNMP versions for the SNMP protocol, note that SNMPv2 only supports read-only communities and SNMPv3 only supports read-only users. SNMPv3 also supports encryption with AES128.

Enabling SNMP polling does not cause the system to send SNMP traps; it only makes the information in the MIBs available for polling by your network management system.

Configure SNMP Polling

To configure SNMP polling on Classic managed devices, use the device platform settings. See [Configure SNMP Polling on Classic Devices, on page 753](#).

Before you begin

Add SNMP access for each computer you plan to use to poll the system. See [Configure an Access List, on page 720](#).

Note The SNMP MIB contains information that could be used to attack your deployment. We recommend that you restrict your access list for SNMP access to the specific hosts that will be used to poll for the MIB. We also recommend you use SNMPv3 and use strong passwords for network management access.

Procedure

- Step 1** Choose **System > Configuration**.
- Step 2** Click **SNMP**.
- Step 3** From the **SNMP Version** drop-down list, choose the SNMP version you want to use:
 - **Version 1** or **Version 2**: Enter a read-only SNMP community name in the **Community String** field, then skip to the end of the procedure.

Note Do not include special characters (< > / % # & ? ' , etc.) in the SNMP community string name.
 - **Version 3**: Click **Add User** to display the user definition page. SNMPv3 only supports read-only users and encryption with AES128.
- Step 4** Enter a **Username**.
- Step 5** Choose the protocol you want to use for authentication from the **Authentication Protocol** drop-down list.
- Step 6** Enter the password required for authentication with the SNMP server in the **Authentication Password** field.
- Step 7** Re-enter the authentication password in the **Verify Password** field.
- Step 8** Choose the privacy protocol you want to use from the **Privacy Protocol** list, or choose **None** to not use a privacy protocol.
- Step 9** Enter the SNMP privacy key required by the SNMP server in the **Privacy Password** field.
- Step 10** Re-enter the privacy password in the **Verify Password** field.
- Step 11** Click **Add**.

Step 12 Click **Save**.

STIG Compliance

Organizations within the United States federal government sometimes need to comply with a series of security checklists set out in Security Technical Implementation Guides (STIGs). Firepower supports compliance with STIG requirements established by the United States Department of Defense.

If you enable STIG compliance on any appliances in your deployment, you must enable it on all appliances. Non-compliant managed devices cannot be registered to STIG-compliant Firepower Management Centers and STIG-compliant devices cannot be registered to non-compliant FMCs.

Enabling STIG compliance does not guarantee strict compliance to all applicable STIGs.

When you enable STIG compliance, password complexity and retention rules for local shell access accounts change. In addition, you cannot use SSH remote storage when in STIG compliance mode.

Caution You cannot disable this setting without assistance from Cisco TAC. In addition, this setting may substantially impact the performance of your system. We do not recommend enabling STIG compliance except to comply with Department of Defense security requirements.

Enabling STIG Compliance

This configuration applies to either a Firepower Management Center or a Classic managed device (7000 and 8000 Series, ASA FirePOWER, and NGIPSv):

- For the Firepower Management Center, this configuration is part of the system configuration.
- For a Classic managed device, you apply this configuration from the Firepower Management Center as part of a platform settings policy.

In either case, the configuration does not take effect until you save your system configuration changes or deploy the shared platform settings policy.

Caution If you enable STIG compliance on any appliances in your deployment, you must enable it on all appliances. You cannot disable this setting without assistance from Support. In addition, this setting may substantially impact the performance of your system. Cisco does not recommend enabling STIG compliance except to comply with Department of Defense security requirements.

Procedure

- Step 1** Depending on whether you are configuring a Firepower Management Center or a Classic managed device:
- FMC—Choose **System** > **Configuration**.
 - Managed device—Choose **Devices** > **Platform Settings** and create or edit a Firepower policy.

Step 2 Click **STIG Compliance**.

Note Appliances reboot when you enable STIG compliance. The Firepower Management Center reboots when you save the system configuration; managed devices reboot when you deploy configuration changes.

Step 3 If you want to *permanently* enable STIG compliance on the appliance, choose **Enable STIG Compliance**.

Step 4 Click **Save**.

What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).
- If your appliances were updated from versions earlier than Version 5.2.0, enabling STIG compliance regenerates appliance certificates. After you enable STIG compliance across your deployment, re-register managed devices to the Firepower Management Center.

Time and Time Synchronization

Synchronizing the system time on your Firepower Management Center (FMC) and its managed devices is essential to successful operation of your Firepower System. We recommend that you specify NTP servers during FMC initial configuration, but you can use the information in this section to establish or change time synchronization settings after initial configuration is complete.

Use a Network Time Protocol (NTP) server to synchronize system time on the FMC and all devices.

Caution Unintended consequences can occur when time is not synchronized between the FMC and managed devices.

To synchronize time on FMC and managed devices, see:

- Recommended: [Synchronize Time on the FMC with an NTP Server, on page 728](#)

This topic provides instructions for configuring your FMC to synchronize with an NTP server or servers and includes links to instructions on configuring managed devices to synchronize with the same NTP server or servers.

- Otherwise: [Synchronize Time Without Access to a Network NTP Server, on page 729](#)

This topic provides instructions for setting the time on your FMC, configuring your FMC to serve as an NTP server, and links to instructions on configuring managed devices to synchronize with the FMC NTP server.

Synchronize Time on the FMC with an NTP Server

Time synchronization among all of the components of your system is critically important.

The best way to ensure proper time synchronization between FMC and all managed devices is to use an NTP server on your network.

The FMC supports NTPv4.

You must have Admin or Network Admin privileges to do this procedure.

Before you begin

Note the following:

- If your FMC and managed devices cannot access a network NTP server, do not use this procedure. Instead, see [Synchronize Time Without Access to a Network NTP Server, on page 729](#).
- Do not specify an untrusted NTP server.
- Connections to NTP servers do not use configured proxy settings.
- Firepower 4100 Series devices and Firepower 9300 devices cannot use this procedure to set the system time. Instead, configure those devices to use the same NTP server(s) that you configure using this procedure. For instructions, see the documentation for your hardware model.

Caution

If the FMC is rebooted and your DHCP server sets an NTP server record different than the one you specify here, the DHCP-provided NTP server will be used instead. To avoid this situation, configure your DHCP server to use the same NTP server.

Procedure

- Step 1** Choose **System > Configuration**.
 - Step 2** Click **Time Synchronization**.
 - Step 3** If **Serve Time via NTP** is **Enabled**, choose **Disabled** to disable the FMC as an NTP server.
 - Step 4** For the **Set My Clock** option, choose **Via NTP from** and enter the hostname or IP address of an NTP server. If your organization has corroborative NTP servers, enter multiple NTP servers as a comma-separated list.
 - Step 5** Click **Save**.
-

What to do next

Set managed devices to synchronize with the same NTP server or servers:

- Configure device platform settings: [Configure NTP Time Synchronization for Threat Defense, on page 789](#) and [Synchronize Time on Classic Devices with an NTP Server, on page 751](#).
- Deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

Synchronize Time Without Access to a Network NTP Server

If your devices cannot directly reach the network NTP server, or your organization does not have a network NTP server, a physical-hardware FMC can serve as an NTP server.

**Important**

- Do not use this procedure unless you have no other NTP server. Instead, use the procedure in [Synchronize Time on the FMC with an NTP Server, on page 728](#).
- Do not use a virtual FMC as an NTP server.

To change the time manually **after** configuring the FMC as an NTP server, you must disable the NTP option, change the time manually, and then re-enable the NTP option.

Procedure**Step 1**

Manually set the system time on the FMC:

- Choose **System > Configuration**.
- Click **Time Synchronization**.
- If **Serve Time via NTP** is **Enabled**, choose **Disabled**.
- Click **Save**.
- For **Set My Clock**, choose **Manually in Local Configuration**.
- Click **Save**.
- In the navigation panel at the left side of the screen, click **Time**.
- Use the **Set Time** drop-down lists to set the time.
- If the time zone displayed is not UTC, click it and set the time zone to **UTC**.
- Click **Save**.
- Click **Done**.
- Click **Apply**.

Step 2

Set the FMC to serve as an NTP server:

- In the navigation panel at the left side of the screen, click **Time Synchronization**.
- For **Serve Time via NTP**, choose **Enabled**.
- Click **Save**.

Step 3

Set managed devices to synchronize with the FMC NTP server:

- In the Time Synchronization settings for the platform settings policy assigned to your managed devices, set the clock to synchronize **Via NTP from Management Center**.
- Deploy the change to managed devices.

For instructions:

- For FTD devices, see [Configure NTP Time Synchronization for Threat Defense, on page 789](#).
- For all other devices, see [Synchronize Time on Classic Devices with an NTP Server, on page 751](#).

About Changing Time Synchronization Settings

- Your Firepower Management Center and its managed devices are heavily dependent on accurate time. The system clock is a system facility that maintains the time of the Firepower System. The system clock

is set to Universal Coordinated Time (UTC), which is the primary time standard by which the world regulates clocks and time.

DO NOT ATTEMPT TO CHANGE THE SYSTEM TIME. Changing the system time zone from UTC is NOT supported, and doing so will require you to reimagine the device to recover from an unsupported state.

- If you configure the FMC to serve time using NTP, and then later disable it, the NTP service on managed devices still attempts to synchronize time with the FMC. You must update and redeploy any applicable platform settings policies to establish a new time source.
- To change the time manually **after** configuring the Firepower Management Center as an NTP server, you must disable the NTP option, change the time manually, and then re-enable the NTP option.

View Current System Time, Source, and NTP Server Connection Status

Time settings are displayed on most pages in local time using the time zone you set on the Time Zone page in User Preferences (the default is America/New York), but are stored on the appliance using UTC time.

Restriction

The Time Zone function (in User Preferences) assumes that the default system clock is set to UTC time. DO NOT ATTEMPT TO CHANGE THE SYSTEM TIME. Be advised that changing the system time from UTC is NOT supported, and doing so will require you to reimagine the device to recover from an unsupported state.

Note

To view time and time source information on your 7000- and 8000-Series hardware device, see [View System Time for 7000/8000 Series Devices, on page 759](#).

Procedure

Step 1 Choose **System > Configuration**.

Step 2 Click **Time**.

The current time is displayed using the time zone specified for your account in User Preferences.

If your appliance uses an NTP server: For information about the table entries, see [NTP Server Status, on page 731](#).

NTP Server Status

If you are synchronizing time from an NTP server, you can view connection status on the **Time** page (choose **System > Configuration**).

Table 66: NTP Status

Column	Description
NTP Server	The IP address or name of the configured NTP server.
Status	<p>The status of the NTP server time synchronization:</p> <ul style="list-style-type: none"> • Being Used indicates that the appliance is synchronized with the NTP server. • Available indicates that the NTP server is available for use, but time is not yet synchronized. • Not Available indicates that the NTP server is in your configuration, but the NTP daemon is unable to use it. • Pending indicates that the NTP server is new or the NTP daemon was recently restarted. Over time, its value should change to Being Used, Available, or Not Available. • Unknown indicates that the status of the NTP server is unknown.
Offset	The number of milliseconds of difference between the time on the appliance and the configured NTP server. Negative values indicate that the appliance is behind the NTP server, and positive values indicate that it is ahead.
Last Update	The number of seconds that have elapsed since the time was last synchronized with the NTP server. The NTP daemon automatically adjusts the synchronization times based on a number of conditions. For example, if you see larger update times such as 300 seconds, that indicates that the time is relatively stable and the NTP daemon has determined that it does not need to use a lower update increment.

Session Timeouts

Unattended login sessions may be security risks. You can configure the amount of idle time before a user's login session times out due to inactivity.

Note that you can exempt specific web interface users from timeout, for scenarios where you plan to passively, securely monitor the system for long periods of time. Users with the Administrator role, whose complete access to menu options poses an extra risk if compromised, cannot be made exempt from session timeouts.

Configure Session Timeouts

To configure session timeouts for Classic devices, use device platform settings. See [Configure Session Timeouts for Classic Devices](#), on page 752.

Procedure

-
- Step 1** Choose **System > Configuration**.
- Step 2** Click **Shell Timeout**.

Step 3 Configure session timeouts:

- Web interface (FMC only): Configure the **Browser Session Timeout (Minutes)**. The default value is 60; the maximum value is 1440 (24 hours).
To exempt users from this session timeout, see [User Account Login Options, on page 64](#).
- CLI: Configure the **Shell Timeout (Minutes)** field. The default value is 0; the maximum value is 1440 (24 hours).

Step 4 Click **Save**.

Vulnerability Mapping

The Firepower System automatically maps vulnerabilities to a host IP address for any application protocol traffic received or sent from that address, when the server has an application ID in the discovery event database and the packet header for the traffic includes a vendor and version.

For any servers which do not include vendor or version information in their packets, you can configure whether the system associates vulnerabilities with server traffic for these vendor and versionless servers.

For example, a host serves SMTP traffic that does not have a vendor or version in the header. If you enable the SMTP server on the Vulnerability Mapping page of a system configuration, then save that configuration to the Firepower Management Center managing the device that detects the traffic, all vulnerabilities associated with SMTP servers are added to the host profile for the host.

Although detectors collect server information and add it to host profiles, the application protocol detectors will not be used for vulnerability mapping, because you cannot specify a vendor or version for a custom application protocol detector and cannot select the server for vulnerability mapping.

Mapping Vulnerabilities for Servers

This procedure requires any Smart License or the Protection classic license.

Procedure

Step 1 Choose **System > Configuration**.**Step 2** Choose **Vulnerability Mapping**.**Step 3** You have the following choices:

- To prevent vulnerabilities for a server from being mapped to hosts that receive application protocol traffic without vendor or version information, clear the check box for that server.
- To cause vulnerabilities for a server to be mapped to hosts that receive application protocol traffic without vendor or version information, check the check box for that server.

Tip You can check or clear all check boxes at once using the check box next to **Enabled**.**Step 4** Click **Save**.

Remote Console Access Management

You can use a Linux system console for remote access on supported systems via either the VGA port (which is the default) or the serial port on the physical appliance. Use the Console Configuration page to choose the option most suitable to the physical layout of your organization's Firepower deployment.

On supported physical-hardware-based Firepower systems, you can use Lights-Out Management (LOM) on a Serial Over LAN (SOL) connection on the default (`eth0`) management interface to remotely monitor or manage the system without logging into the management interface of the system. You can perform limited tasks, such as viewing the chassis serial number or monitoring such conditions as fan speed and temperature, using a command line interface on an out-of-band management connection. For information about the cable connection to support LOM, see the *Firepower Management Center Getting Started Guide* for your hardware model.

You must enable LOM for both the system and the user you want to manage the system. After you enable the system and the user, you use a third-party Intelligent Platform Management Interface (IPMI) utility to access and manage your system.

Configuring Remote Console Settings on the System

You must be an Admin user to perform this procedure.

Before you begin

- Disable Spanning Tree Protocol (STP) on any third-party switching equipment connected to the device's management interface.
- If you plan to enable Lights-Out Management see the [Getting Started Guide](#) for your appliance for information about installing and using an Intelligent Platform Management Interface (IPMI) utility.

Procedure

- Step 1** Choose **System > Configuration**.
 - Step 2** Click **Console Configuration**.
 - Step 3** Click **Save**.
 - Step 4** The system displays the following warning: "You will have to reboot your system for these changes to take effect." Click **OK** to reboot now or **Cancel** to reboot later.
-

What to do next

- If you configured serial access, be sure the rear-panel serial port is connected to a local computer, terminal server, or other device that can support remote serial access over ethernet as described in the [Getting Started Guide](#) for your FMC model.
- If you configured Lights-Out Management, enable a Lights-Out Management user; see [Lights-Out Management User Access Configuration, on page 735](#).

Lights-Out Management User Access Configuration

You must explicitly grant Lights-Out Management permissions to users who will use the feature. LOM users also have the following restrictions:

- You must assign the Administrator role to the user.
- The username may have up to 16 alphanumeric characters. Hyphens and longer user names are not supported for LOM users.
- A user's LOM password is the same as that user's system password. Cisco recommends that you use a complex, non-dictionary-based password of the maximum supported length for your appliance and change it every three months.
- If LOM is enabled on a Firepower 7110, 7115, 7120, or 7125 device, the password may have up to 16 alphanumeric characters.
- Physical Firepower Management Centers and 8000 Series devices can have up to 13 LOM users. 7000 Series devices can have up to eight LOM users.

Note that if you deactivate, then reactivate, a user with LOM while a that user is logged in, or restore a user from a backup during that user's login session, that user may need to log back into the web interface to regain access to `impitool` commands.

Enabling Lights-Out Management User Access

You must be an Admin user to perform this procedure.

You configure LOM and LOM users on a per-system basis using each system's local web interface. You cannot use the Firepower Management Center to configure LOM on a managed device. Similarly, because users are managed independently per appliance, enabling or creating a LOM-enabled user on the Firepower Management Center does not transfer that capability to users on managed devices.

Procedure

- Step 1** Choose **System > Users > Users**.
 - Step 2** To grant LOM user access to an existing user, click **Edit** () next to a user name in the list.
 - Step 3** Under **User Configuration**, enable the Administrator role.
 - Step 4** Check the **Allow Lights-Out Management Access** check box.
 - Step 5** Click **Save**.
-

Serial Over LAN Connection Configuration

You use a third-party IPMI utility on your computer to create a Serial Over LAN connection to the appliance. If your computer uses a Linux-like or Mac environment, use IPMITool; for Windows environments, you can use IPMIutil or IPMITool, depending on your Windows version.

Note Cisco recommends using IPMItool version 1.8.12 or greater.

Linux

IPMItool is standard with many distributions and is ready to use.

Mac

You must install IPMItool on a Mac. First, confirm that your Mac has Apple's XCode Developer tools installed, making sure that the optional components for command line development are installed (UNIX Development and System Tools in newer versions, or Command Line Support in older versions). Then you can install macports and the IPMItool. Use your favorite search engine for more information or try these sites:

```
https://developer.apple.com/technologies/tools/  
http://www.macports.org/  
http://github.com/ipmitool/ipmitool/
```

Windows

For Windows Versions 10 and greater with Windows Subsystem for Linux (WSL) enabled, as well as some older versions of Windows Server, you can use IPMItool. Otherwise, you must compile IPMIutil on your Windows system; you can use IPMIutil itself to compile. Use your favorite search engine for more information or try this site:

```
http://ipmiutil.sourceforge.net/man.html#ipmiutil
```

Understanding IPMI Utility Commands

Commands used for IPMI utilities are composed of segments as in the following example for IPMItool on Mac:

```
ipmitool -I lanplus -H IP_address -U user_name command
```

where:

- `ipmitool` invokes the utility.
- `-I lanplus` specifies to use an encrypted IPMI v2.0 RMCP+ LAN Interface for the session.
- `-H IP_address` indicates the IP address you have configured for Lights-Out Management on the appliance you want to access.
- `-U user_name` is the name of an authorized remote session user.
- `command` is the name of the command you want to use.

Note Cisco recommends using IPMItool version 1.8.12 or greater.

The same command for IMPIutil on Windows looks like this:

```
ipmiutil command -V 4 -J 3 -N IP_address -User_name
```

This command connects you to the command line on the appliance where you can log in as if you were physically present at the appliance. You may be prompted to enter a password.

Configuring Serial Over LAN with IPMItool

You must be an Admin user with LOM access to perform this procedure.

Procedure

Using IPMItool, enter the following command, and a password if prompted:

```
ipmitool -I lanplus -H IP_address -U user_name sol activate
```

Configuring Serial Over LAN with IPMIutil

You must be an Admin user with LOM access to perform this procedure.

Procedure

Using IPMIutil, enter the following command, and a password if prompted:

```
ipmiutil -J 3 -N IP_address -U username sol -a
```

Lights-Out Management Overview

Lights-Out Management (LOM) provides the ability to perform a limited set of actions over an SOL connection on the default (`eth0`) management interface without the need to log into the system. You use the command to create a SOL connection followed by one of the LOM commands. After the command is completed, the connection ends. Note that not all power control commands are valid on 70xx Family devices.

Note The baseboard management controller (BMC) for a Firepower 71xx, Firepower 82xx, or a Firepower 83xx device is only accessible via 1 Gbps link speeds when the host is powered on. When the device is powered down, the BMC can only establish Ethernet link at 10 and 100 Mbps. Therefore if LOM is being used to remotely power the device, connect the device to the network using 10 and 100 Mbps link speeds only.

Caution In rare cases, if your computer is on a different subnet than the system's management interface and the system is configured for DHCP, attempting to access LOM features can fail. If this occurs, you can either disable and then re-enable LOM on the system, or use a computer on the same subnet as the system to ping its management interface. You should then be able to use LOM.

Caution Cisco is aware of a vulnerability inherent in the Intelligent Platform Management Interface (IPMI) standard (CVE-2013-4786). Enabling Lights-Out Management (LOM) on an system exposes this vulnerability. To mitigate this vulnerability, deploy your systems on a secure management network accessible only to trusted users and use a complex, non-dictionary-based password of the maximum supported length for your system and change it every three months. To prevent exposure to this vulnerability, do not enable LOM.

If all attempts to access your system have failed, you can use LOM to restart your system remotely. Note that if a system is restarted while the SOL connection is active, the LOM session may disconnect or time out.

Caution Do **not** restart your system unless it does not respond to any other attempts to restart. Remotely restarting does not gracefully reboot the system and you may lose data.

Table 67: Lights-Out Management Commands

IPMITool	IPMIutil	Description
(not applicable)	-V 4	Enables admin privileges for the IPMI session
-I lanplus	-J 3	Enables encryption for the IPMI session
-H <i>hostname/IP address</i>	-N <i>nodename/IP address</i>	Indicates the LOM IP address or hostname for the FM
-U	-U	Indicates the username of an authorized LOM account
sol activate	sol -a	Starts the SOL session
sol deactivate	sol -d	Ends the SOL session
chassis power cycle	power -c	Restarts the appliance (not valid on 70xx Family device)
chassis power on	power -u	Powers up the appliance
chassis power off	power -d	Powers down the appliance (not valid on 70xx Family device)
sdr	sensor	Displays appliance information, such as fan speeds and temperatures

For example, to display a list of appliance information, the IPMITool command is:

```
ipmitool -I lanplus -H IP_address -U user_name sdr
```

Note Cisco recommends using IPMItool version 1.8.12 or greater.

The same command with the IPMIutil utility is:

```
ipmiutil sensor -V 4 -J 3 -N IP_address -U user_name
```

Configuring Lights-Out Management with IPMItool

You must be an Admin user with LOM access to perform this procedure.

Procedure

Enter the following command for IPMItool and a password if prompted:

```
ipmitool -I lanplus -H IP_address -U user_name command
```

Configuring Lights-Out Management with IPMIutil

You must be an Admin user with LOM access to perform this procedure.

Procedure

Enter the following command for IPMIutil and a password if prompted:

```
ipmiutil -J 3 -N IP_address -U username command
```

VMware Tools and Virtual Systems

VMware Tools is a suite of performance-enhancing utilities intended for virtual machines. These utilities allow you to make full use of the convenient features of VMware products. Firepower virtual appliances running on VMware support the following plugins:

- guestInfo
- powerOps
- timeSync
- vmbackup

You can also enable VMware Tools on all supported versions of ESXi. For a list of supported versions, see the [Cisco Firepower NGIPSv Quick Start Guide for VMware](#). For information on the full functionality of VMware Tools, see the VMware website (<http://www.vmware.com/>).

Enabling VMware Tools on the Firepower Management Center for VMware

Smart License	Classic License	Supported Devices	Supported Domains	Access
Any	Any	Firepower Management Center	Global only	Admin

Because NGIPSv does not have a web interface, you must use the CLI to enable VMware Tools on that platform; see the [Cisco Firepower NGIPSv Quick Start Guide for VMware](#).

Procedure

- Step 1** Choose **System > Configuration**.
 - Step 2** Click **VMware Tools**.
 - Step 3** Click **Enable VMware Tools**.
 - Step 4** Click **Save**.
-

CHAPTER 37

Platform Settings Policies

The following topics explain platform settings policies and how to deploy them to managed devices:

- [Introduction to Platform Settings](#), on page 741
- [Requirements and Prerequisites for Platform Settings Policies](#), on page 742
- [Managing Platform Settings Policies](#), on page 742
- [Create a Platform Settings Policy](#), on page 743
- [Setting Target Devices for a Platform Settings Policy](#), on page 743

Introduction to Platform Settings

A platform settings policy is a shared set of features or parameters that define the aspects of a managed device that are likely to be similar to other managed devices in your deployment, such as time settings and external authentication.

A shared policy makes it possible to configure multiple managed devices at once, which provides consistency in your deployment and streamlines your management efforts. Any changes to a platform settings policy affects all the managed devices where you applied the policy. Even if you want different settings per device, you must create a shared policy and apply it to the desired device.

For example, your organization's security policies may require that your appliances have a "No Unauthorized Use" message when a user logs in. With platform settings, you can set the login banner once in a platform settings policy.

You can also benefit from having multiple platform settings policies on a Firepower Management Center. For example, if you have different mail relay hosts that you use under different circumstances or if you want to test different access lists, you can create several platform settings policies and switch between them, rather than editing a single policy.

Related Topics

- [Configure Platform Settings for Classic Devices](#), on page 747
- [System Configuration Settings](#), on page 695

Requirements and Prerequisites for Platform Settings Policies

Model Support

Any, but you must create the correct type of policy for the target devices:

- **Firepower Settings** to create a shared policy for Classic managed devices: ASA FirePOWER, NGIPSv, 7000 & 8000 Series.
- **Threat Defense Settings** to create a shared policy for Firepower Threat Defense managed devices.

Supported Domains

Any

User Roles

Admin

Access Admin

Network Admin

Managing Platform Settings Policies

Use the Platform Settings page (**Devices > Platform Settings**) to manage platform settings policies. This page indicates the type of device for each policy. The Status column shows the device targets for the policy.

Procedure

Step 1 Choose **Devices > Platform Settings**.

Step 2 Manage your platform settings policies:

- **Create** — To create a new platform settings policy, click **New Policy**; see [Create a Platform Settings Policy, on page 743](#).
- **Copy** — To copy a platform settings policy, click **Copy** (.
- **Edit** — To modify the settings in an existing platform settings policy, click **Edit** (.
- **Delete** — To delete a policy that is not in use, click **Delete** () , then confirm your choice.

Caution You should not delete a policy that is the last deployed policy on any of its target devices, even if it is out of date. Before you delete the policy completely, it is good practice to deploy a different policy to those targets.

What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

Create a Platform Settings Policy

Platform settings for Firepower Threat Defense devices differ from platform settings for Classic devices. When you create a new platform settings policy you must choose a type: *Firepower* (for Classic managed devices) or *Threat Defense* (for FTD devices).

Procedure

-
- Step 1** Choose **Devices > Platform Settings**.
 - Step 2** Click **New Policy**.
 - Step 3** Choose a device type from the drop-down list:
 - **Firepower Settings** to create a shared policy for Classic managed devices.
 - **Threat Defense Settings** to create a shared policy for Firepower Threat Defense managed devices.
 - Step 4** Enter a **Name** for the new policy and optionally, a **Description**.
 - Step 5** Optionally, choose the **Available Devices** where you want to apply the policy and click **Add to Policy** (or drag and drop) to add the selected devices. You can enter a search string in the **Search** field to narrow the list of devices.
 - Step 6** Click **Save**.
The system creates the policy and opens it for editing.
 - Step 7** Configure the platform settings based on the device platform type:
 - For Firepower Settings, see [Platform Settings for Classic Devices, on page 745](#).
 - For Threat Defense Settings, see [Platform Settings for Firepower Threat Defense, on page 761](#).
 - Step 8** Click **Save**.
-

What to do next

Deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

Setting Target Devices for a Platform Settings Policy

You can add targeted devices at the same time you create a new policy, or you can change them later.

Procedure

-
- Step 1** Choose **Devices > Platform Settings**.
 - Step 2** Click **Edit** () next to the platform settings policy that you want to edit.

Step 3 Click **Policy Assignment**.

Step 4 Do any of the following:

- To assign a device, stack, high-availability pair, or device group to the policy, select it in the **Available Devices** list and click **Add to Policy**. You can also drag and drop.
- To remove a device assignment, click **Delete** () next to a device, stack, high-availability pair, or device group in the **Selected Devices** list.

Step 5 Click **OK**.

What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

CHAPTER 38

Platform Settings for Classic Devices

The following topics explain Firepower platform settings and how to configure them on Classic devices:

- [About Platform Settings for Classic Devices, on page 745](#)
- [Requirements for Platform Settings for Classic Devices, on page 746](#)
- [Configure Platform Settings for Classic Devices, on page 747](#)
- [Local System Configuration for 7000/8000 Series Devices, on page 754](#)

About Platform Settings for Classic Devices

Platform settings for managed devices are policy-based so that you can apply the same configuration to multiple devices. Use a *Firepower* platform settings policy with Classic devices:

- 7000/8000 series devices
- ASA FirePOWER modules
- NGIPSv

Note that for the FMC, many of these settings are handled in the *system configuration*; see [System Configuration, on page 693](#).

Table 68: Firepower Platform Settings for Classic Devices

Platform Setting	Description	See
Access List	Control which computers can access the system on specific ports.	Configure Access Lists for Classic Devices, on page 747
Audit Log	Configure the system to send an audit log to an external host.	Stream Audit Logs from Classic Devices, on page 748
External Authentication	Set the default user role for any 7000/8000 series device user who is authenticated by an external RADIUS, LDAP or Microsoft Active Directory repository.	Enable External Authentication to 7000/8000 Series Devices, on page 749

Platform Setting	Description	See
Language	Specify a different language for the web interface on a 7000/8000 series device.	Set the Language for the 7000/8000 Series Web Interface, on page 750
Login Banner	Create a custom login banner that appears when users log in.	Customize the Login Banner for Classic Devices , on page 751
Shell Timeout	Configure the amount of idle time, in minutes, before a user's login session times out due to inactivity.	Configure Session Timeouts for Classic Devices, on page 752
SNMP	Enable Simple Network Management Protocol (SNMP) polling.	Configure SNMP Polling on Classic Devices, on page 753
STIG Compliance	Enable compliance with specific requirements set out by the United States Department of Defense.	STIG Compliance, on page 727
Time Synchronization	Manage time synchronization on the system.	Synchronize Time on Classic Devices with an NTP Server, on page 751

Requirements for Platform Settings for Classic Devices

License Requirements

None.

Model Requirements

You can apply a Firepower platform settings policy to any Classic device.

Some platform settings apply only to 7000/8000 series devices because those devices have a web interface: external authentication settings, display language, session timeouts, and so on. Applying these settings to ASA FirePOWER or NGIPSv has no effect.

You can also log into the local web interface on 7000/8000 series devices for non-policy based system configurations. See [Local System Configuration for 7000/8000 Series Devices, on page 754](#).

Domain Requirements

None.

You can apply a Firepower platform setting policy at any Domain level.

Configure Platform Settings for Classic Devices

Platform settings for managed devices are policy-based so that you can apply the same configuration to multiple devices. Use a Firepower platform settings policy with Classic devices.

Procedure

- Step 1** Choose **Devices > Platform Settings** and create or edit a Firepower policy.
See [About Platform Settings for Classic Devices, on page 745](#) and [Create a Platform Settings Policy, on page 743](#).
 - Step 2** Choose the **Available Devices** where you want to deploy the policy by clicking **Policy Assignment**.
 - Step 3** Click **Add to Policy** (or drag and drop) to add the selected devices.
 - Step 4** Click **Save**.
-

What to do next

Deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

Configure Access Lists for Classic Devices

By default, access to Firepower devices is not restricted. Port 22 (SSH) is open for CLI access. For 7000/8000 series devices, port 443 (HTTPS) is also open for web interface access.

To operate in a more secure environment, consider adding access for specific IP addresses. You can also add access to poll for SNMP information over port 161.

Procedure

- Step 1** Choose **Devices > Platform Settings** and create or edit a Firepower policy.
 - Step 2** Click **Access List**.
 - Step 3** To add access for one or more IP addresses, click **Add Rules**.
 - Step 4** In the **IP Address** field, enter an IP address or address range, or *any*.
 - Step 5** Choose **SSH**, **HTTPS**, **SNMP**, or a combination of these options to specify which ports you want to enable for these IP addresses.
 - Step 6** Click **Add**.
 - Step 7** Click **Save**.
-

What to do next

Deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

Stream Audit Logs from Classic Devices

Firepower appliances generate records (or *audit logs*) of user interactions. You can stream these audit logs to a syslog or HTTP server. Note that sending audit information to an external URL may affect system performance.

Tip On 7000/8000 series devices, you can also review audit logs on the device's web interface: [Auditing the System, on page 2143](#).

Audit logs have the following format:

```
timestamp host [tag] appliance_name: username@ip_address, subsystem, action
```

For example:

```
Mar 01 14:45:24 localhost [FIREPOWER] MyFirepowerAppliance: admin@10.1.1.2, System > Configuration, Page View
```

Note that the tag is optional and user-configurable. Syslog events also have an optional facility and severity..

Before you begin

Make sure your devices can communicate with the server or servers where you plan to stream audit logs. For syslog streaming, the system uses port 7/UDP to verify that the syslog server is reachable when you save the configuration. Then, the system uses port 514/UDP to stream audit logs.

Procedure

Step 1 Choose **Devices > Platform Settings** and create or edit a Firepower policy.

Step 2 Click **Audit Log** to configure audit log streaming.

Syslog streaming:

- a) Set **Send Audit Log to Syslog** to **Enabled**.
- b) Provide **Host** information for the syslog server: IPv4 address or fully qualified name.
- c) Choose a **Facility** ([Syslog Alert Facilities, on page 1819](#)) and **Severity** ([Syslog Severity Levels, on page 1820](#)).

HTTP streaming:

- a) Set **Send Audit Log to HTTP Server** to **Enabled**.
- b) Provide a **URL to Post Audit** where you want to send audit logs. HTTPS is supported.

The URL must correspond to a Listener program that expects the following HTTP POST variables:

```
subsystem, actor, event_type, message, action_source_ip, action_destination_ip, result, time, tag (if provided).
```

Step 3 (Optional) Enter a **Tag** in include in each message. For example, you might want to tag Firepower audit logs with **FIREPOWER**.

Step 4 Click **Save**.

If you configured syslog streaming, the system verifies that the syslog server is reachable.

What to do next

Deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

Enable External Authentication to 7000/8000 Series Devices

Use device platform settings to allow users of 7000/8000 series devices to authenticate to an LDAP or RADIUS server, rather than using the local database.

Before you begin

Configure external authentication objects. See [External Authentication, on page 68](#).

Procedure

-
- Step 1** Choose **Devices > Platform Settings** and create or edit a Firepower policy.
 - Step 2** Click **External Authentication**.
 - Step 3** From the **Status** drop-down list, choose **Enabled**.
 - Step 4** From the **Default User Role** drop-down list, choose user roles to define the default permissions you want to grant to externally authenticated users.
 - Step 5** If you want to use the external server to authenticate CLI or shell access accounts, choose **Enabled** from the **Shell Authentication** drop-down list.
 - Step 6** If you want to enable CAC authentication and authorization, choose an available CAC authentication object from the **CAC Authentication** drop-down list.
For more information, see [CAC Authentication, on page 71](#).
 - Step 7** Check the check boxes next to the each external authentication object that you want to use. If you enable more than 1 object, then users are checked against servers in the order specified. See the next step to reorder servers.
If you enable shell authentication, you must enable an external authentication object that includes a **Shell Access Filter**. CLI/shell access users can only authenticate against the server whose authentication object is highest in the list.
If you need both CLI and CAC authentication, you must use separate authentication objects for each purpose.
 - Step 8** (Optional) Use the up and down arrows to change the order in which authentication servers are accessed when an authentication request occurs.
 - Step 9** Click **Save**.
-

What to do next

Deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

About External Authentication for 7000/8000 Series Devices

If you create an authentication object referencing an external authentication server, you can enable external authentication to let users logging into the managed device authenticate to that server, rather than using the local database.

When you enable external authentication, the system verifies the user credentials against users on an LDAP or RADIUS server. In addition, if a user has local, internal authentication enabled and the user credentials are not found in the internal database, the system then checks the external server for a set of matching credentials. If a user has the same username on multiple systems, all passwords across all servers work. Note, however, that if authentication fails on the available external authentication servers, the system does not revert to checking the local database.

When you enable external authentication, you can set the default user role for any user whose account is externally authenticated. You can select multiple roles, as long as those roles can be combined. For example, if you enable external authentication that retrieves only users in the Network Security group in your company, you may set the default user role to include the Security Analyst role so users can access collected event data without any additional user configuration on your part. However, if your external authentication retrieves records for other personnel in addition to the security group, you would probably want to leave the default role unselected.

If no access role is selected, users can log in but cannot access any functionality. After a user attempts to log in, their account is listed on the user management page (**System > Users**), where you can edit the account settings to grant additional permissions.

Tip If you configure the system to use one user role and apply the policy, then later modify the configuration to use different default user roles, any user accounts created before the modification retain the first user role until you modify the accounts, or delete and recreate them.

If you want to specify the set of users who can authenticate against the LDAP server for CLI/shell access or for CAC authentication and authorization, you must create separate authentication objects for each and enable the objects separately.

If a user with internal authentication attempts to log in, the system first checks if that user is in the local user database. If the user exists, the system then checks the username and password against the local database. If a match is found, the user logs in successfully. If the login fails, however, and external authentication is enabled, the system checks the user against each external authentication server in the authentication order shown in the configuration. If the username and password match results from an external server, the system changes the user to an external user with the default privileges for that authentication object.

If an external user attempts to log in, the system checks the username and password against the external authentication server. If a match is found, the user logs in successfully. If the login fails, the user login attempt is rejected. External users cannot authenticate against the user list in the local database. If the user is a new external user, an external user account is created in the local database with the default privileges from the external authentication object.

Set the Language for the 7000/8000 Series Web Interface

The language you specify here is used for the web interface for every user who logs in. You can choose from:

- English
- Japanese

Procedure

- Step 1** Choose **Devices > Platform Settings** and create or edit a Firepower policy.
 - Step 2** Click **Language**.
 - Step 3** Choose the language you want to use.
 - Step 4** Click **Save**.
-

What to do next

Deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

Customize the Login Banner for Classic Devices

You can customize the CLI login banner for Classic devices. For 7000/8000 series devices, the login banner also appears in the web interface. Note that if the banner is too large or causes errors, CLI sessions can fail when the system attempts to display the banner.

Procedure

- Step 1** Choose **Devices > Platform Settings** and create or edit a Firepower policy.
 - Step 2** Choose **Login Banner**.
 - Step 3** In the **Custom Login Banner** field, enter the login banner text you want to use.
The system will not preserve tab spacing.
 - Step 4** Click **Save**.
-

What to do next

Deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

Synchronize Time on Classic Devices with an NTP Server

Synchronizing the system time on your FMC and all its managed devices is essential to successful operations. If your deployment includes the Firepower Threat Defense devices, see [Configure NTP Time Synchronization for Threat Defense, on page 789](#).

The device supports NTPv4.

Caution Unintended consequences can occur when time is not synchronized between the FMC and managed devices.

After you deploy, it may take a few minutes for managed devices to synchronize with the configured NTP servers.

Before you begin

Make sure the device can communicate with the NTP server or servers you plan to use. You can either:

- (Recommended.) Use the same NTP servers as the FMC: [Synchronize Time on the FMC with an NTP Server, on page 728](#).
If you choose this option, the device gets its time directly from the configured NTP server. If the device's configured NTP servers are not reachable for any reason, it synchronizes its time with the FMC.
- If your device cannot reach an NTP server or your organization does not have one, you must use the **Via NTP from Management Center** option discussed in the following procedure.

Procedure

- Step 1** Choose **Devices > Platform Settings** and create or edit a Firepower policy.
- Step 2** Click **Time Synchronization**.
- Step 3** Specify how time is synchronized:
- **Via NTP from:** If your Firepower Management Center is using NTP servers on the network, select this option and enter the fully-qualified DNS name (such as ntp.example.com), or IPv4 or IPv6 address, of the same NTP servers you specified in **System > Configuration > Time Synchronization**. If the NTP servers are not reachable, the Firepower Management Center acts as an NTP server.
 - **Via NTP from Management Center:** (Default). The managed device gets time from the NTP servers you configured for the Firepower Management Center (except for authenticated NTP servers) and synchronizes time with those servers directly. However, if any of the following are true, the managed device synchronizes time from the Firepower Management Center:
 - The Firepower Management Center's NTP servers are not reachable by the device.
 - The Firepower Management Center has no unauthenticated servers.
- Step 4** Click **Save**.
-

What to do next

Deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

Configure Session Timeouts for Classic Devices

Unattended login sessions may be security risks. You can configure the amount of idle time before a user's login session times out due to inactivity. The maximum value is 24 hours, or 1440 minutes.

Procedure

- Step 1** Choose **Devices > Platform Settings** and create or edit a Firepower policy.
- Step 2** Click **Shell Timeout**.
- Step 3** Configure session timeouts:

- Web interface (7000/8000 series only): Enter a **Browser Session Timeout (Minutes)**.

You can exempt specific web interface users from timeout, for scenarios where you plan to passively, securely monitor the system for long periods of time. For more information, see [User Account Login Options, on page 64](#).

- CLI: Enter a **Shell Timeout (Minutes)**.

Step 4 Click **Save**.

What to do next

Deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

Configure SNMP Polling on Classic Devices

Simple Network Management Protocol (SNMP) polling allows access to the standard management information base (MIB) on Firepower devices, which includes system details such as contact, administrative, location, service information, IP addressing and routing information, and transmission protocol usage statistics. Additional MIBs for 7000/8000 series devices include statistics on traffic passing through physical interfaces, logical interfaces, virtual interfaces, ARP, NDP, virtual bridges, and virtual routers. Note that enabling SNMP polling does not cause the system to send SNMP traps; it only makes the information in the MIBs available for polling by your network management system.

The system supports SNMPv1, v2, and v3. SNMPv2 only supports read-only communities and SNMPv3 only supports read-only users. SNMPv3 also supports encryption with AES128.

Before you begin

Add SNMP access for each computer you plan to use to poll the system. See [Configure Access Lists for Classic Devices, on page 747](#).

Note The SNMP MIB contains information that could be used to attack your deployment. We recommend that you restrict your access list for SNMP access to the specific hosts that will be used to poll for the MIB. We also recommend you use SNMPv3 and use strong passwords for network management access.

Procedure

Step 1 Choose **Devices > Platform Settings** and create or edit a Firepower policy.

Step 2 Click **SNMP**.

Step 3 From the **SNMP Version** drop-down list, choose the SNMP version you want to use:

- **Version 1** or **Version 2**: Enter a read-only SNMP community name in the **Community String** field, then skip to the end of the procedure.

Note Do not include special characters (<> / % # & ? ', etc.) in the SNMP community string name.

- **Version 3:** Click **Add User** to display the user definition page. SNMPv3 only supports read-only users and encryption with AES128.

- Step 4** Enter a **Username**.
- Step 5** Choose the protocol you want to use for authentication from the **Authentication Protocol** drop-down list.
- Step 6** Enter the password required for authentication with the SNMP server in the **Authentication Password** field.
- Step 7** Re-enter the authentication password in the **Verify Password** field.
- Step 8** Choose the privacy protocol you want to use from the **Privacy Protocol** list, or choose **None** to not use a privacy protocol.
- Step 9** Enter the SNMP privacy key required by the SNMP server in the **Privacy Password** field.
- Step 10** Re-enter the privacy password in the **Verify Password** field.
- Step 11** Click **Add**.
- Step 12** Click **Save**.

What to do next

Deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

Local System Configuration for 7000/8000 Series Devices

You can log into the local web interface on 7000/8000 series devices for non-policy based system configurations. Many of these configurations parallel FMC system configurations, and are documented in the FMC system configuration chapter: [System Configuration, on page 693](#).

Table 69: Local System Configurations for 7000/8000 Series Devices

System Configuration	Description	See
Change Reconciliation	Send a detailed report of changes to the system over the last 24 hours.	Change Reconciliation, on page 717
Console Configuration	Configure console access via VGA or serial port, or via Lights-Out Management (LOM).	Remote Console Access Management, on page 734
HTTPS Certificate	Request an HTTPS server certificate, if needed, from a trusted authority and upload certificates to the system.	HTTPS Certificates, on page 697
Information	View current information about the appliance and edit the display name.	Appliance Information, on page 696
Management Interfaces	Change options such as the IP address, hostname, and proxy settings of the appliance.	Configure Management Interfaces on a 7000/8000 Series Device, on page 755
Process	Shut down, reboot, or restart Firepower processes.	Shut Down or Restart a 7000/8000 Series Device, on page 758

System Configuration	Description	See
Prohibit Packet Transfer	Disable sending packet data from 7000/8000 series devices to the FMC in a low-bandwidth deployment.	Prohibit Packet Transfer to FMC, on page 755
Time	View the current time settings.	View System Time for 7000/8000 Series Devices, on page 759

Prohibit Packet Transfer to FMC

Smart License	Classic License	Supported Devices	Supported Domains	Access
N/A	Any	7000 & 8000 Series	N/A	Admin

You may want to disable sending packet data from 7000 or 8000 Series devices to the Firepower Management Center in a low-bandwidth deployment if you are not concerned about the specific content of the packet that triggered an intrusion policy violation.

Procedure

-
- Step 1** In the local web interface of your 7000 or 8000 Series device, choose **System > Configuration**.
 - Step 2** Click **Information**.
 - Step 3** Select **Prohibit Packet Transfer to the Management Center**.
 - Step 4** Click **Save**.
-

Configure Management Interfaces on a 7000/8000 Series Device

Smart License	Classic License	Supported Devices	Supported Domains	Access
N/A	Any	7000 & 8000 Series	Global only	Admin

Modify the management interface settings on the managed device using the web interface. You can optionally enable an event interface if your model supports it. For more information on management interfaces, see [About Device Management Interfaces, on page 199](#).

Caution Be careful when making changes to the management interface; if you cannot re-connect because of a configuration error, you will need to access the device console port and reconfigure the settings at the CLI.

Procedure

-
- Step 1** Choose **System > Configuration**, and then choose **Management Interfaces**.

Step 2 In the **Interfaces** area, click **Edit** next to the interface that you want to configure.

All available interfaces are listed in this section. You cannot add more interfaces.

You can configure the following options on each management interface:

- **Enabled**—Enable the management interface. Do **not** disable the default eth0 management interface. Some processes require the eth0 interface.
- **Channels**—(8000 series only) Configure an event-only interface. You can enable the eth1 management interface on your 8000 series device to act as an event interface. To do so, uncheck the **Management Traffic** check box, and leave the **Event Traffic** check box checked. For the eth0 management interface, leave both check boxes checked.

The Firepower Management Center event-only interface cannot accept management channel traffic, so you should simply disable the management channel on the device event interface.

You can optionally disable **Event Traffic** for the management interface. In either case, the device will try to send events on the event-only interface, and if that interface is down, it will send events on the management interface even if you disable the event channel.

You cannot disable both event and management channels on an interface.

- **Mode**—Specify a link mode. Note that any changes you make to auto-negotiation are ignored for GigabitEthernet interfaces.
- **MTU**—Set the maximum transmission unit (MTU). The default is 1500. The range within which you can set the MTU can vary depending on the model and interface type.

Because the system automatically trims 18 bytes from the configured MTU value, any value below 1298 does not comply with the minimum IPv6 MTU setting of 1280, and any value below 594 does not comply with the minimum IPv4 MTU setting of 576. For example, the system automatically trims a configured value of 576 to 558.

- **MDI/MDIX**—Set the **Auto-MDIX** setting.
- **IPv4 Configuration**—Set the IPv4 IP address. Choose:
 - **Static**—Manually enter the **IPv4 Management IP** address and **IPv4 Netmask**.
 - **DHCP**—Set the interface to use DHCP (eth0 only).
 - **Disabled**—Disable IPv4. Do **not** disable both IPv4 and IPv6.
- **IPv6 Configuration**—Set the IPv6 IP address. Choose:
 - **Static**—Manually enter the **IPv6 Management IP** address and **IPv6 Prefix Length**.
 - **DHCP**—Set the interface to use DHCPv6 (eth0 only).
 - **Router Assigned**—Enable stateless autoconfiguration.
 - **Disabled**—Disable IPv6. Do **not** disable both IPv4 and IPv6.

Step 3 In the **Routes** area, edit a static route by clicking **Edit** () , or add a route by clicking **Add** (). View the route statistics by clicking **View** (.

Note You need to add a static route for the event-only interface if the Firepower Management Center is on a remote network; otherwise, all traffic will match the default route through the management interface. For the default route, you can change only the gateway IP address. The default route always uses the eth0 interface. For information about routing, see [Network Routes on Device Management Interfaces, on page 200](#).

You can configure the following settings for a static route:

- **Destination**—Set the destination address of the network to which you want to create a route.
- **Netmask** or **Prefix Length**—Set the netmask (IPv4) or prefix length (IPv6) for the network.
- **Interface**—Set the egress management interface.
- **Gateway**—Set the gateway IP address.

Step 4 In the **Shared Settings** area, set network parameters shared by all interfaces.

Note If you selected **DHCP** for the eth0 interface, you cannot manually specify some shared settings derived from the DHCP server.

You can configure the following shared settings:

- **Hostname**—Set the device hostname. If you change the hostname, reboot the device if you want the new hostname reflected in syslog messages. Syslog messages do not reflect a new hostname until after a reboot.
- **Domains**—Set the search domain(s) for the device, separated by commas. These domains are added to hostnames when you do not specify a fully-qualified domain name in a command, for example, **ping system**. The domains are used only on the management interface, or for commands that go through the management interface.
- **Primary DNS Server, Secondary DNS Server, Tertiary DNS Server**—Set the DNS servers to be used in order of preference.
- **Remote Management Port**—Set the remote management port for communication with the FMC. The FMC and managed devices communicate using a two-way, SSL-encrypted communication channel, which by default is on port 8305.

Note Cisco **strongly** recommends that you keep the default settings for the remote management port, but if the management port conflicts with other communications on your network, you can choose a different port. If you change the management port, you must change it for **all** devices in your deployment that need to communicate with each other.

Step 5 In the **LCD Panel** area, check the **Allow reconfiguration of network settings** check box to enable changing network settings using the device's LCD panel.

You can use the LCD panel to edit the IP address for the device. Confirm that any changes you make are reflected on the managing Firepower Management Center. In some cases, you may need to update the data manually on the Firepower Management Center as well.

Caution Allowing reconfiguration using the LCD panel can present a security risk. You need only physical access, not authentication, to configure network settings using the LCD panel. The web interface warns you that enabling this option is a potential security issue.

Step 6 In the **Proxy** area, configure HTTP proxy settings.

The device is configured to directly-connect to the internet on ports TCP/443 (HTTPS) and TCP/80 (HTTP). You can use a proxy server, to which you can authenticate via HTTP Digest.

Note Proxies that use NT LAN Manager (NTLM) authentication are not supported.

- a) Check the **Enabled** check box.
- b) In the **HTTP Proxy** field, enter the IP address or fully-qualified domain name of your proxy server.
- c) In the **Port** field, enter a port number.
- d) Supply authentication credentials by choosing **Use Proxy Authentication**, and then provide a **User Name** and **Password**.

Step 7 Click **Save**.

Step 8 If you changed the management IP address, it might affect communication between the FMC and the managed device.

Changing the IP address will not affect the current connection. However, if the device or FMC reloads, then the connection needs to be reestablished. You need at least one of the devices (FMC or managed device) to have the correct IP address of the peer. For example, if you specified a NAT ID (instead of an IP address) for the FMC during device setup, then the device IP address that you defined on the FMC when you added the device will be wrong, and the FMC will not be able to reestablish communications. In this case, you must change the management IP address of the device in the FMC; see [Update the Hostname or IP Address in FMC, on page 212](#).

Shut Down or Restart a 7000/8000 Series Device

Procedure

Step 1 On the device's web interface, choose **System > Configuration**.

Step 2 Choose **Process**.

Step 3 Do one of the following:

Shut down	Click Run Command next to Shutdown Appliance . Caution Do not shut off Firepower appliances using the power button; it may cause a loss of data. Using the web interface (or CLI) prepares the system to be safely powered off and restarted without losing configuration data.
Reboot	Click Run Command next to Reboot Appliance . Note Rebooting logs you out, and the system runs a database check that can take up to an hour to complete.
Restart the console	Click Run Command next to Restart Appliance Console .

Restart the Snort process	Click Run Command next to Restart Snort . Caution Restarting the Snort process temporarily interrupts traffic inspection. Whether traffic drops during this interruption or passes without inspection depends on how the device is configured. See Snort® Restart Traffic Behavior, on page 310 for more information.
---------------------------	---

View System Time for 7000/8000 Series Devices

Time settings are displayed on most pages in local time using the time zone you set on the Time Zone page in User Preferences, but are stored on the appliance using UTC time. In addition, the current time appears in UTC at the top of the Time Synchronization page (local time is displayed in the Manual clock setting option, if enabled).

Restriction The Time Zone function (in User Preferences) assumes that the default system clock is set to UTC time. *Do not change this.* Changing the system time from UTC is *not* supported, and you will have to reimagine the device.

Use this procedure to verify system time information on 7000 and 8000 Series devices.

Procedure

- Step 1** Log into the device's web interface and choose **System > Configuration**.
- Step 2** Click **Time**.
If you are using NTP, see [NTP Server Status, on page 731](#).
-

CHAPTER 39

Platform Settings for Firepower Threat Defense

Platform settings for Firepower Threat Defense devices configure a range of unrelated features whose values you might want to share among several devices. Even if you want different settings per device, you must create a shared policy and apply it to the desired device.

- [Configure ARP Inspection, on page 761](#)
- [Configure Banners, on page 762](#)
- [Configure External Authentication for SSH and HTTP, on page 763](#)
- [Configure Fragment Handling, on page 765](#)
- [Configure HTTP, on page 766](#)
- [Configure ICMP Access Rules, on page 767](#)
- [Configure Secure Shell, on page 768](#)
- [Configure SMTP, on page 770](#)
- [Configure SNMP for Threat Defense, on page 770](#)
- [About Configuring Syslog, on page 775](#)
- [Configure Global Timeouts, on page 788](#)
- [Configure NTP Time Synchronization for Threat Defense, on page 789](#)
- [History for Firepower Threat Defense Platform Settings, on page 791](#)

Configure ARP Inspection

By default, all ARP packets are allowed between bridge group members. You can control the flow of ARP packets by enabling ARP inspection.

ARP inspection prevents malicious users from impersonating other hosts or routers (known as ARP spoofing). ARP spoofing can enable a “man-in-the-middle” attack. For example, a host sends an ARP request to the gateway router; the gateway router responds with the gateway router MAC address. The attacker, however, sends another ARP response to the host with the attacker MAC address instead of the router MAC address. The attacker can now intercept all the host traffic before forwarding it on to the router.

ARP inspection ensures that an attacker cannot send an ARP response with the attacker MAC address, so long as the correct MAC address and the associated IP address are in the static ARP table.

When you enable ARP inspection, the FTD device compares the MAC address, IP address, and source interface in all ARP packets to static entries in the ARP table, and takes the following actions:

- If the IP address, MAC address, and source interface match an ARP entry, the packet is passed through.

- If there is a mismatch between the MAC address, the IP address, or the interface, then the FTD device drops the packet.
- If the ARP packet does not match any entries in the static ARP table, then you can set the FTD device to either forward the packet out all interfaces (flood), or to drop the packet.

Note The dedicated interface never floods packets even if this parameter is set to flood.

Procedure

- Step 1** Select **Devices > Platform Settings** and create or edit the Firepower Threat Defense policy.
- Step 2** Select **ARP Inspection**.
- Step 3** Add entries to the ARP inspection table.
- a) Click **Add** to create a new entry, or click **Edit** if the entry already exists.
 - b) Select the desired options.
 - **Inspect Enabled**—To perform ARP inspection on the selected interfaces and zones.
 - **Flood Enabled**—Whether to flood ARP requests that do not match static ARP entries out all interfaces other than the originating interface or the dedicated management interface. This is the default behavior. If you do not elect to flood ARP requests, then only those requests that exactly match static ARP entries are allowed.
 - **Security Zones**—Add the zones that contain the interfaces on which to perform the selected actions. The zones must be switched zones. For interfaces not in a zone, you can type the interface name into the field below the Selected Security Zone list and click **Add**. These rules will be applied to a device only if the device includes the selected interfaces or zones.
 - c) Click **OK**.
- Step 4** Add static ARP entries according to [Add a Static ARP Entry, on page 539](#).
- Step 5** Click **Save**.
- You can now click **Deploy** and deploy the policy to assigned devices. The changes are not active until you deploy them.
-

Configure Banners

You can configure messages to show users when they connect to the device command line interface (CLI).

Procedure

- Step 1** Select **Devices > Platform Settings** and create or edit the Firepower Threat Defense policy.

Step 2 Select **Banner**.

Step 3 Configure the banner.

Following are some tips and requirements for banners.

- Only ASCII characters are allowed. You can use line returns (press Enter), but you cannot use tabs.
- You can dynamically add the hostname or domain name of the device by including the variables **\$(hostname)** or **\$(domain)**.
- Although there is no absolute length restriction on banners, Telnet or SSH sessions will close if there is not enough system memory available to process the banner messages.
- From a security perspective, it is important that your banner discourage unauthorized access. Do not use the words "welcome" or "please," as they appear to invite intruders in. The following banner sets the correct tone for unauthorized access:

```
You have logged in to a secure device.  
If you are not authorized to access this device,  
log out immediately or risk criminal charges.
```

Step 4 Click **Save**.

You can now click **Deploy** and deploy the policy to assigned devices. The changes are not active until you deploy them.

Configure External Authentication for SSH and HTTP

Attention External authentication is not supported on Firepower Threat Defense virtual devices.

You must configure RADIUS or LDAP authentication for SSH access. External authentication is optional for HTTP access.

You can create up to 16 named servers of the same type (RADIUS or LDAP) for each management application. You can use separate protocols for SSH and HTTP if desired; for example, you can use RADIUS for SSH, and LDAP for HTTP. You can specify the same server for both applications if desired by checking both SSH and HTTP for the server. If the primary server (that is first in the list) is not reachable, then the device tries each server in the order they appear in the table.

Before you begin

- To enable SSH access, you must also allow SSH per interface. See [Configure Secure Shell, on page 768](#).
- To enable HTTP access, you must also allow HTTP per interface. See [Configure HTTP, on page 766](#).
- The physical management interface is shared between the Diagnostic logical interface and the Management logical interface; this configuration applies only to the Diagnostic logical interface, if used, or to other data interfaces. The Management logical interface is separate from the other interfaces on the device. It

is used to set up and register the device to the Firepower Management Center. It runs a separate SSH server and uses its own local authentication, IP address, and static routing.

Procedure

-
- Step 1** Select **Devices > Platform Settings** and create or edit the Firepower Threat Defense policy.
- Step 2** Select **External Authorization**.
- Step 3** Click **Add** to add a new rule, or click **Edit** to edit an existing rule.
- Step 4** Check the **Enable for SSH** check box and/or the **Enable for HTTP** check box.
- Step 5** Enter the AAA server attributes:
- **Name**—Set a name of your choice for the server.
 - (Optional) **Description**—Add a description for this server.
 - **IP Address**—The network object that identifies the server. Choose an object from the drop-down menu, or add a new network object by clicking +.
 - **Port**—Set the authentication port to be used for authentication of users. For RADIUS, the default port is 1645; for LDAP, it is 389.
 - **Timeout**—Specify the length of time, in seconds, that the device waits for a response from the primary server before sending the request to the backup server(s). The default is 10 seconds.
- Step 6** Choose the **Authentication Method, LDAP or RADIUS**.
- All servers in the group must use the same authentication method, so choose the same method if you add additional servers later.
- Step 7** (Optional) For RADIUS, configure and confirm a **Secret Key**.
- The device uses this key to authenticate with the RADIUS server. The server secret that you configure should match the one configured on the RADIUS server. If you do not know the server secret value, ask the RADIUS server administrator. The maximum length is 64 characters.
- Step 8** (Optional) For LDAP, configure the following options:
- **Enable SSL**—We strongly recommend that you secure LDAP communications with SSL. The default port changes to 636 when you enable SSL.
 - **Server Type**—The default is AUTO-DETECT. If auto-detection fails to determine the LDAP server type, and you know the server type, you can set it manually.
 - **Base DN**—Specify the location in the LDAP hierarchy where the server should begin searching when it receives an authorization request as a case-sensitive string of up to 128 characters, for example, OU=Cisco. Spaces are not permitted in the string, but other special characters are allowed. Click **Fetch DNSs** to choose a Base DN from the strings available for the configured LDAP server.
 - **Ldap Scope**—Set the number of levels in the LDAP hierarchy for the server to search when it receives an authorization request. Choose **onelevel** to search only one level beneath the Base DN or **subtree** to search all levels beneath the Base DN.
 - **User Name**—The username for LDAP server authentication.

- **Authentication Password**—Configure and confirm the authentication password for communication with the LDAP server.

Step 9 In **Security Zones**, add the zones that contain the interfaces on which the server resides. For interfaces not in a zone, you can type the interface name into the field below the Selected Security Zone list and click **Add**. These rules will be applied to a device only if the device includes the selected interfaces or zones.

Step 10 Click **OK**.

Step 11 Add additional servers of the same type if desired to act as backup servers.

Step 12 Click **Save**.

You can now click **Deploy** and deploy the policy to assigned devices. The changes are not active until you deploy them.

Configure Fragment Handling

By default, the Firepower Threat Defense device allows up to 24 fragments per IP packet, and up to 200 fragments awaiting reassembly. You might need to let fragments on your network if you have an application that routinely fragments packets, such as NFS over UDP. However, if you do not have an application that fragments traffic, we recommend that you do not allow fragments by setting **Chain** to 1. Fragmented packets are often used as Denial of Service (DoS) attacks.

Note These settings establish the defaults for devices assigned this policy. You can override these settings for specific interfaces on a device by selecting **Override Default Fragment Setting** in the interface configuration. When you edit an interface, you can find the option on **Advanced > Security Configuration**. Select **Devices > Device Management**, edit a Firepower Threat Defense device, and select **Interfaces** to edit interface properties..

Procedure

Step 1 Select **Devices > Platform Settings** and create or edit the Firepower Threat Defense policy.

Step 2 Select **Fragment Settings**.

Step 3 Configure the following options. Click **Reset to Defaults** if you want to use the default settings.

- **Size (Block)**—The maximum number of packet fragments from all connections collectively that can be waiting for reassembly. The default is 200 fragments.
- **Chain (Fragment)**—The maximum number of packets into which a full IP packet can be fragmented. The default is 24 packets. Set this option to 1 to disallow fragments.
- **Timeout (Sec)**—The maximum number of seconds to wait for an entire fragmented packet to arrive. The default is 5 seconds. If all fragments are not received within this time, all fragments are discarded.

Step 4 Click **Save**.

You can now click **Deploy** and deploy the policy to assigned devices. The changes are not active until you deploy them.

Configure HTTP

If you want to allow HTTPS connections to one or more interfaces on the Firepower Threat Defense device, configure HTTPS settings. You can use HTTPS to download packet captures for troubleshooting.

Before you begin

- When you manage the Firepower Threat Defense using the FMC, HTTPS access to the Firepower Threat Defense is only for viewing packet capture files. The Firepower Threat Defense does not have a web interface for configuration in this management mode.
- The physical management interface is shared between the Diagnostic logical interface and the Management logical interface; this configuration applies only to the Diagnostic logical interface, if used, or to other data interfaces. The Management logical interface is separate from the other interfaces on the device. It is used to set up and register the device to the FMC. It has a separate IP address and static routing.
- To use HTTPS, you do not need an access rule allowing the host IP address. You only need to configure HTTPS access according to this section.
- You can only use HTTPS to a reachable interface; if your HTTPS host is located on the outside interface, you can only initiate a management connection directly to the outside interface.
- The device allows a maximum of 5 concurrent HTTPS connections.
- You need network objects that define the hosts or networks you will allow to make HTTPS connections to the device. Select **Objects > Object Management** to configure objects.

Procedure

- Step 1** Select **Devices > Platform Settings** and create or edit the Firepower Threat Defense policy.
- Step 2** Select **HTTP**.
- Step 3** Enable the HTTPS server by clicking **Enable HTTP server**.
- Step 4** (Optional) Change the HTTPS port. The default is 443.
- Step 5** Identify the interfaces and IP addresses that allow HTTPS connections.

Use this table to limit which interfaces will accept HTTPS connections, and the IP addresses of the clients who are allowed to make those connections. You can use network addresses rather than individual IP addresses.

- Click **Add** to add a new rule, or click **Edit** to edit an existing rule.
- Configure the rule properties:
 - **IP Address**—The network object that identifies the hosts or networks you are allowing to make HTTPS connections. Choose an object from the drop-down menu, or add a new network object by clicking +.

- **Security Zones**—Add the zones that contain the interfaces to which you will allow HTTPS connections. For interfaces not in a zone, you can type the interface name into the field below the Selected Security Zone list and click **Add**. These rules will be applied to a device only if the device includes the selected interfaces or zones.

c) Click **OK**.

Step 6 Click **Save**.

You can now click **Deploy** and deploy the policy to assigned devices. The changes are not active until you deploy them.

Configure ICMP Access Rules

By default, you can send ICMP packets to any interface using either IPv4 or IPv6, with these exceptions:

- The FTD does not respond to ICMP echo requests directed to a broadcast address.
- The FTD only responds to ICMP traffic sent to the interface that traffic comes in on; you cannot send ICMP traffic through an interface to a far interface.

To protect the device from attacks, you can use ICMP rules to limit ICMP access to interfaces to particular hosts, networks, or ICMP types. ICMP rules function like access rules, where the rules are ordered, and the first rule that matches a packet defines the action.

If you configure any ICMP rule for an interface, an implicit deny ICMP rule is added to the end of the ICMP rule list, changing the default behavior. Thus, if you want to simply deny a few message types, you must include a permit any rule at the end of the ICMP rule list to allow the remaining message types.

We recommend that you always grant permission for the ICMP unreachable message type (type 3). Denying ICMP unreachable messages disables ICMP path MTU discovery, which can halt IPsec and PPTP traffic. Additionally ICMP packets in IPv6 are used in the IPv6 neighbor discovery process.

Before you begin

Ensure that the objects needed in the rules already exist. Select **Objects > Object Management** to configure objects. You need network objects that define the desired hosts or networks, and port objects that define the ICMP message types you want to control.

Procedure

Step 1 Select **Devices > Platform Settings** and create or edit the Firepower Threat Defense policy.

Step 2 Select **ICMP**.

Step 3 Configure ICMP rules.

- a) Click **Add** to add a new rule, or click **Edit** to edit an existing rule.
- b) Configure the rule properties:
 - **Action**—Whether to permit (allow) or deny (drop) matching traffic.
 - **ICMP Service**—The port object that identifies the ICMP message type.

- **Network**—The network object that identifies the hosts or networks whose access you are controlling.
- **Security Zones**—Add the zones that contain the interfaces that you are protecting. For interfaces not in a zone, you can type the interface name into the field below the Selected Security Zone list and click **Add**. These rules will be applied to a device only if the device includes the selected interfaces or zones.

c) Click **OK**.

Step 4 (Optional.) Set rate limits on ICMPv4 Unreachable messages.

- **Rate Limit**—Sets the rate limit of unreachable messages, between 1 and 100 messages per second. The default is 1 message per second.
- **Burst Size**—Sets the burst rate, between 1 and 10. The system sends this number of replies, but subsequent replies are not sent until the rate limit is reached.

Step 5 Click **Save**.

You can now click **Deploy** and deploy the policy to assigned devices. The changes are not active until you deploy them.

Configure Secure Shell

This section describes how to enable SSH connections to one or more *data* or Diagnostic interfaces on the Firepower Threat Defense.

Note SSH is enabled by default on the Management interface; however, this screen does not affect Management SSH access.

The Management logical interface is separate from the other interfaces on the device. It is used to set up and register the device to the FMC. SSH for Management runs a separate SSH server and uses its own local authentication, IP address, and static routing. To configure local users for the Management interface, see the **configure user add** command in [Classic Device CLI Configuration Commands, on page 2191](#). To configure a static route, see the **configure network static-routes** command. By default, you configure the default route through the Management interface at initial setup.

To use SSH, you do not also need an access rule allowing the host IP address. You only need to configure SSH access according to this section.

You can only SSH to a reachable interface; if your SSH host is located on the outside interface, you can only initiate a management connection directly to the outside interface.

The device allows a maximum of 5 concurrent SSH connections.

Before you begin

- These settings simply enable SSH connections. In addition, you must identify the users who will be allowed to complete SSH connections. Select **External Authentication** from the platform settings table

of contents, and define AAA servers for user authentication. See [Configure External Authentication for SSH and HTTP, on page 763](#). Local users are not supported.

- You need network objects that define the hosts or networks you will allow to make SSH connections to the device. Select **Objects > Object Management** to configure objects.

Note You cannot use the system-provided **any** network object. Instead, use **any-ipv4** or **any-ipv6**.

Procedure

- Step 1** Select **Devices > Platform Settings** and create or edit the Firepower Threat Defense policy.
- Step 2** Select **Secure Shell**.
- Step 3** (Optional) Change SSH access limitations.
- **SSH Version**—By default, users can connect using SSH version 1 and 2. You can limit access to just one of those versions. For example, select 2 if you want to support SSH version 2 only.
 - **Timeout**—How long an SSH session can be idle before the system disconnects the session. Set the timeout from 1 to 60 minutes. The default is 5 minutes.
 - **Enable Secure Copy**—Whether to enable the secure copy (SCP) server on the device. This allows the device to function as an SCP server for transferring files from or to the device. Only clients that are allowed to access the security appliance using SSH can establish a secure copy connection. SCP requires SSH version 2.
- Step 4** Identify the interfaces and IP addresses that allow SSH connections.
- Use this table to limit which interfaces will accept SSH connections, and the IP addresses of the clients who are allowed to make those connections. You can use network addresses rather than individual IP addresses.
- a) Click **Add** to add a new rule, or click **Edit** to edit an existing rule.
 - b) Configure the rule properties:
 - **IP Address**—The network object that identifies the hosts or networks you are allowing to make SSH connections. Choose an object from the drop-down menu, or add a new network object by clicking +.
 - **Security Zones**—Add the zones that contain the interfaces to which you will allow SSH connections. For interfaces not in a zone, you can type the interface name into the field below the Selected Security Zone list and click **Add**. These rules will be applied to a device only if the device includes the selected interfaces or zones.
 - c) Click **OK**.
- Step 5** Click **Save**.
- You can now click **Deploy** and deploy the policy to assigned devices. The changes are not active until you deploy them.
-

Configure SMTP

You must identify an SMTP server if you configure email alerts in the Syslog settings. The source email address you configure for Syslog must be a valid account on the SMTP servers.

Before you begin

Ensure that the network objects that define the host address of the primary and secondary SMTP servers exist. Select **Objects > Object Management** to define the objects. Alternatively, you can create the objects while editing the policy.

Procedure

- Step 1** Select **Devices > Platform Settings** and create or edit the Firepower Threat Defense policy.
- Step 2** Click **SMTP Server**.
- Step 3** Select the network objects that identify the **Primary Server IP Address** and optionally, the **Secondary Server IP Address**.
- Step 4** Click **Save**.

You can now click **Deploy** and deploy the policy to assigned devices. The changes are not active until you deploy them.

Configure SNMP for Threat Defense

Simple Network Management Protocol (SNMP) defines a standard way for network management stations running on PCs or workstations to monitor the health and status of many types of devices, including switches, routers, and security appliances. You can use the SNMP page to configure a firewall device for monitoring by SNMP management stations.

The Simple Network Management Protocol (SNMP) enables monitoring of network devices from a central location. Cisco security appliances support network monitoring using SNMP versions 1, 2c, and 3, as well as traps and SNMP read access; SNMP write access is not supported.

SNMPv3 supports read-only users and encryption with DES, 3DES, AES256, AES192, and AES128.

Note To create an alert to an external SNMP server, access **Policies > Action > Alerts**

Procedure

- Step 1** Select **Devices > Platform Settings** and create or edit the Firepower Threat Defense policy.
- Step 2** Select **SNMP**.
- Step 3** Enable SNMP and configure basic options.

- **Enable SNMP Servers**—Whether to provide SNMP information to the configured SNMP hosts. You can deselect this option to disable SNMP monitoring while retaining the configuration information.
- **Read Community String, Confirm**—Enter the password used by a SNMP management station when sending requests to the Firepower Threat Defense device. The SNMP community string is a shared secret among the SNMP management stations and the network nodes being managed. The security device uses the password to determine if the incoming SNMP request is valid. The password is a case-sensitive alphanumeric string of up to 32 characters; spaces and special characters are not permitted.
- **System Administrator Name**—Enter the name of the device administrator or other contact person. This string is case-sensitive and can be up to 127 characters. Spaces are accepted, but multiple spaces are shortened to a single space.
- **Location**—Enter the location of this security device (for example, Building 42, Sector 54). This string is case-sensitive and can be up to 127 characters. Spaces are accepted, but multiple spaces are shortened to a single space.
- **Port**—Enter the UDP port on which incoming requests will be accepted. The default is 161.

Step 4 (SNMPv3 only.) [Add SNMPv3 Users, on page 771.](#)

Step 5 [Add SNMP Hosts, on page 773.](#)

Step 6 [Configure SNMP Traps, on page 774.](#)

Step 7 Click **Save**.

You can now click **Deploy** and deploy the policy to assigned devices. The changes are not active until you deploy them.

Add SNMPv3 Users

Note You create users for SNMPv3 only. These steps are not applicable for SNMPv1 or SNMPv2c.

Note that SNMPv3 only supports read-only users.

SNMP users have a specified username, an authentication password, an encryption password, and authentication and encryption algorithms to use. The authentication algorithm options are MD5 and SHA. The encryption algorithm options are DES, 3DES, AES256, AES192, and AES128.

Note When using SNMPv3 with clustering or High Availability, if you add a new cluster unit after the initial cluster formation or you replace a High Availability unit, then SNMPv3 users are not replicated to the new unit. You must remove the users, re-add them, and then redeploy your configuration to force the users to replicate to the new unit.

Procedure

Step 1 Select **Devices > Platform Settings** and create or edit the Firepower Threat Defense policy.

Step 2 Click **SNMP > Users**.

Step 3 Click **Add**.

Step 4 Select the security level for the user from the **Security Level** drop-down list.

- **Auth**—Authentication but No Privacy, which means that messages are authenticated.
- **No Auth**—No Authentication and No Privacy, which means that no security is applied to messages.
- **Priv**—Authentication and Privacy, which means that messages are authenticated and encrypted.

Step 5 Enter the name of the SNMP user in the **Username** field. Usernames must be 32 characters or less.

Step 6 Select the type of password, you want to use in the **Encryption Password Type** drop-down list.

- **Clear text**—The Firepower Threat Defense device will still encrypt the password when deploying to the device.
- **Encrypted**—The Firepower Threat Defense device will directly deploy the encrypted password.

Step 7 In the **Auth Algorithm Type** drop-down list, select the type of authentication you want to use: MD5, SHA.

Step 8 In the **Authentication Password** field, enter the password to use for authentication. If you selected Encrypted as the Encrypt Password Type, the password must be formatted as xx:xx:xx..., where xx are hexadecimal values.

Note The length of the password will depend on the authentication algorithm selected. For all passwords, the length must be 256 characters or less.

If you selected Clear Text as the Encrypt Password Type, repeat the password in the **Confirm** field.

Step 9 In the **Encryption Type** drop-down list, select the type of encryption you want to use: AES128, AES192, AES256, 3DES, or DES.

Note To use AES or 3DES encryption, you must have the appropriate license installed on the device.

Step 10 Enter the password to use for encryption in the **Encryption Password** field. If you selected Encrypted as the Encrypt Password Type, the password must be formatted as xx:xx:xx..., where xx are hexadecimal values. For encrypted passwords, the length of the password depends on the encryption type selected. The password sizes are as follows (where each xx is one octal):

- AES 128 requires 16 octals
- AES 192 requires 24 octals
- AES 256 requires 32 octals
- 3DES requires 32 octals
- DES can be any size

Note For all passwords, the length must be 256 characters or less.

If you selected Clear Text as the Encrypt Password Type, repeat the password in the **Confirm** field.

Step 11 Click **OK**.

Step 12 Click **Save**.

You can now click **Deploy** and deploy the policy to assigned devices. The changes are not active until you deploy them.

Add SNMP Hosts

Use Host to add or edit entries in the SNMP Hosts table on the SNMP page. These entries represent SNMP management stations allowed to access the Firepower Threat Defense device.

Before you begin

Ensure that the network objects that define the SNMP management stations exist. Select **Device > Object Management** to configure network objects.

Note Only IPv4 addresses are supported.

Procedure

- Step 1** Select **Devices > Platform Settings** and create or edit the Firepower Threat Defense policy.
- Step 2** Click **SNMP > Hosts**.
- Step 3** Click **Add**.
- Step 4** In the **IP Address** field, either enter a valid IPv6 or IPv4 host or select the network object that defines the SNMP management station's host address.
- Step 5** Select the appropriate SNMP version from the **SNMP version** drop-down list.
- Step 6** (SNMPv3 only.) Select the username of the SNMP user that you configured from the **User Name** drop-down list.
- Note** You can associate up to 23 SNMP users per SNMP host.
- Step 7** (SNMPv1, 2c only.) In the **Read Community String** field, enter the community string that you have already configured, for read access to the device. Re-enter the string to confirm it.
- Note** This string is required, only if the string used with this SNMP station is different from the one already defined in the **Enable SNMP Server** section.
- Step 8** Select the type of communication between the device and the SNMP management station. You can select both types.
- **Poll**—The management station periodically requests information from the device.
 - **Trap**—The device sends trap events to the management station as they occur.
- Step 9** In the **Port** field, enter a UDP port number for the SNMP host. The default value is 162. The valid range is 1 to 65535.
- Step 10** Click **Add** to enter or select the interface on which this SNMP management station contacts the device.
- Step 11** In the **Zones/Interfaces** list, add the zones that contain the interfaces through which the device communicates with the management station. For interfaces not in a zone, you can type the interface name into the field below

the **Selected Zone/Interface** list and click **Add**. The host will be configured on a device only if the device includes the selected interfaces or zones.

Step 12 Click **OK**.

Step 13 Click **Save**.

You can now click **Deploy** and deploy the policy to assigned devices. The changes are not active until you deploy them.

Configure SNMP Traps

Use SNMP Traps to configure SNMP traps (event notifications) for the Firepower Threat Defense device. Traps are different from browsing; they are unsolicited “comments” from the Firepower Threat Defense device to the management station for certain events, such as linkup, linkdown, and syslog event generated. An SNMP object ID (OID) for the device appears in SNMP event traps sent from the device.

Some traps are not applicable to certain hardware models. These traps will be ignored if you apply the policy to one of these models. For example, not all models have field-replaceable units, so the **Field Replaceable Unit Insert/Delete** trap will not be configured on those models.

SNMP traps are defined in either standard or enterprise-specific MIBs. Standard traps are created by the IETF and documented in various RFCs. SNMP traps are compiled into the Firepower Threat Defense software.

If needed, you can download RFCs, standard MIBs, and standard traps from the following location:

<http://www.ietf.org/>

Browse the complete list of Cisco MIBs, traps, and OIDs from the following location:

[SNMP Object Navigator](#)

In addition, download Cisco OIDs by FTP from the following location:

<ftp://ftp.cisco.com/pub/mibs/oid/oid.tar.gz>

Procedure

Step 1 Select **Devices > Platform Settings** and create or edit the Firepower Threat Defense policy.

Step 2 Click **SNMP > SNMP Traps** to configure SNMP traps (event notifications) for the Firepower Threat Defense device.

Step 3 Select the appropriate Enable Traps options. You can select either or both options.

- a) Check **Enable All SNMP Traps** to quickly select all traps in the subsequent four sections.
- b) Check **Enable All Syslog Traps** to enable transmission of trap-related syslog messages.

Note SNMP traps are of higher priority than other notification messages from the Firepower Threat Defense as they are expected to be near real-time. When you enable all SNMP or syslog traps, it is possible for the SNMP process to consume excess resources in the agent and in the network, causing the system to hang. If you notice system delays, unfinished requests, or timeouts, you can selectively enable SNMP and syslog traps. You can also limit the rate at which syslog messages are generated by severity level or message ID. For example, all syslog message IDs that begin with the digits 212 are associated with the SNMP class; see [Limit the Rate of Syslog Message Generation, on page 785](#).

- Step 4** The event-notification traps in the **Standard** section are enabled by default for an existing policy:
- **Authentication** – Unauthorized SNMP access. This authentication failure occurs for packets with an incorrect community string.
 - **Link Up** – One of the device’s communication links has become available (it has “come up”), as indicated in the notification.
 - **Link Down** – One of the device’s communication links has failed, as indicated in the notification.
 - **Cold Start** – The device is reinitializing itself such that its configuration or the protocol entity implementation may be altered.
 - **Warm Start** – The device is reinitializing itself such that its configuration and the protocol entity implementation is unaltered.
- Step 5** Select the desired event-notification traps in the **Entity MIB** section:
- **Field Replaceable Unit Insert** – A Field Replaceable Unit (FRU) has been inserted, as indicated. (FRUs include assemblies such as power supplies, fans, processor modules, interface modules, etc.)
 - **Field Replaceable Unit Delete** – A Field Replaceable Unit (FRU) has been removed, as indicated in the notification
 - **Configuration Change** – There has been a hardware change, as indicated in the notification
- Step 6** Select the desired event-notification traps in the **Resource** section:
- **Connection Limit Reached** – This trap indicates that a connection attempt was rejected because the configured connections limit has been reached.
- Step 7** Select the desired event-notification traps in the **Other** section:
- **NAT Packet Discard** – This notification is generated when IP packets are discarded by the NAT function. Available Network Address Translation addresses or ports have fallen below configured threshold.
- Step 8** Click **Save**.
- You can now click **Deploy** and deploy the policy to assigned devices. The changes are not active until you deploy them.
-

About Configuring Syslog

You can enable system logging (syslog) for Firepower Threat Defense devices. Logging information can help you identify and isolate network or device configuration problems. The following topics explain logging and how to configure it.

About Syslog

System logging is a method of collecting messages from devices to a server running a syslog daemon. Logging to a central syslog server helps in aggregation of logs and alerts. Cisco devices can send their log messages

to a UNIX-style syslog service. A syslog service accepts messages and stores them in files, or prints them according to a simple configuration file. This form of logging provides protected long-term storage for logs. Logs are useful both in routine troubleshooting and in incident handling.

Table 70: System Logs for Firepower Threat Defense

Logs Related To	Details	Configure In
Device and system health, network configuration	This syslog configuration generates messages for features running on the data plane, that is, features that are defined in the CLI configuration that you can view with the show running-config command. This includes features such as routing, VPN, data interfaces, DHCP server, NAT, and so forth. Data plane syslog messages are numbered, and they are the same as those generated by devices running ASA software. However, Firepower Threat Defense does not necessarily generate every message type that is available for ASA Software. For information on these messages, see <i>Cisco Firepower Threat Defense Syslog Messages</i> at https://www.cisco.com/c/en/us/td/docs/security/firepower/Syslogs/b_fptd_syslog_guide.html . This configuration is explained in the following topics.	Platform Settings
Policies, rules, and events	This syslog configuration generates alerts for access control rules, intrusion rules, and other advanced services as described in Configurations Supporting Alert Responses, on page 1816 . These messages are not numbered. For information on configuring this type of syslog, see Creating a Syslog Alert Response, on page 1818 .	Alert Responses

You can configure more than one syslog server, and control the messages and events sent to each server. You can also configure different destinations, such as console, email, internal buffer, and so forth.

Severity Levels

The following table lists the syslog message severity levels.

Table 71: Syslog Message Severity Levels

Level Number	Severity Level	Description
0	emergencies	System is unusable.
1	alert	Immediate action is needed.
2	critical	Critical conditions.
3	error	Error conditions.
4	warning	Warning conditions.
5	notification	Normal but significant conditions.
6	informational	Informational messages only.

Level Number	Severity Level	Description
7	debugging	Debugging messages only. Log at this level only temporarily, when debugging issues. This log level can potentially generate so many messages that system performance can be affected.

Note ASA and FTD do not generate syslog messages with a severity level of zero (emergencies).

Syslog Message Filtering

You can filter generated syslog messages so that only certain syslog messages are sent to a particular output destination. For example, you could configure the FTD device to send all syslog messages to one output destination and to send a subset of those syslog messages to a different output destination.

Specifically, you can direct syslog messages to an output destination according to the following criteria:

- Syslog message ID number
- Syslog message severity level
- Syslog message class (equivalent to a functional area)

You customize these criteria by creating a message list that you can specify when you set the output destination. Alternatively, you can configure the FTD device to send a particular message class to each type of output destination independently of the message list.

Syslog Message Classes

You can use syslog message classes in two ways:

- Specify an output location for an entire category of syslog messages.
- Create a message list that specifies the message class.

The syslog message class provides a method of categorizing syslog messages by type, equivalent to a feature or function of the device. For example, the rip class denotes RIP routing.

All syslog messages in a particular class share the same initial three digits in their syslog message ID numbers. For example, all syslog message IDs that begin with the digits 611 are associated with the vpn (VPN client) class. Syslog messages associated with the VPN client feature range from 611101 to 611323.

In addition, most of the ISAKMP syslog messages have a common set of prepended objects to help identify the tunnel. These objects precede the descriptive text of a syslog message when available. If the object is not known at the time that the syslog message is generated, the specific heading = value combination does not appear.

The objects are prefixed as follows:

Group = *groupname*, Username = *user*, IP = *IP_address*

Where the group is the tunnel-group, the username is the username from the local database or AAA server, and the IP address is the public IP address of the remote access client or Layer 2 peer.

The following table lists the message classes and the range of message IDs in each class.

Table 72: Syslog Message Classes and Associated Message ID Numbers

Class	Definition	Syslog Message ID Numbers
auth	User Authentication	109, 113
—	Access Lists	106
—	Application Firewall	415
—	Botnet Traffic Filtering	338
bridge	Transparent Firewall	110, 220
ca	PKI Certification Authority	717
citrix	Citrix Client	723
—	Clustering	747
—	Card Management	323
config	Command Interface	111, 112, 208, 308
csd	Secure Desktop	724
cts	Cisco TrustSec	776
dap	Dynamic Access Policies	734
eap, eapoudp	EAP or EAPoUDP for Network Admission Control	333, 334
eigrp	EIGRP Routing	336
email	E-mail Proxy	719
—	Environment Monitoring	735
ha	Failover	101, 102, 103, 104, 105, 210, 311, 709
—	Identity-based Firewall	746
ids	Intrusion Detection System	400, 733
—	IKEv2 Toolkit	750, 751, 752
ip	IP Stack	209, 215, 313, 317, 408
ipaa	IP Address Assignment	735
ips	Intrusion Protection System	400, 401, 420

Class	Definition	Syslog Message ID Numbers
—	IPv6	325
—	Licensing	444
mdm-proxy	MDM Proxy	802
nac	Network Admission Control	731, 732
nacpolicy	NAC Policy	731
nacsettings	NAC Settings to apply NAC Policy	732
—	NAT and PAT	305
—	Network Access Point	713
np	Network Processor	319
—	NP SSL	725
ospf	OSPF Routing	318, 409, 503, 613
—	Password Encryption	742
—	Phone Proxy	337
rip	RIP Routing	107, 312
rm	Resource Manager	321
—	Smart Call Home	120
session	User Session	106, 108, 201, 202, 204, 302, 303, 304, 305, 314, 405, 406, 407, 500, 502, 607, 608, 609, 616, 620, 703, 710
snmp	SNMP	212
—	ScanSafe	775
ssl	SSL Stack	725
svc	SSL VPN Client	722
sys	System	199, 211, 214, 216, 306, 307, 315, 414, 604, 605, 606, 610, 612, 614, 615, 701, 711, 741
—	Threat Detection	733
tag-switching	Service Tag Switching	779
vm	VLAN Mapping	730

Class	Definition	Syslog Message ID Numbers
vpdn	PPTP and L2TP Sessions	213, 403, 603
vpn	IKE and IPsec	316, 320, 402, 404, 501, 602, 702, 713, 714, 715
vpnc	VPN Client	611
vpnfo	VPN Failover	720
vpnfb	VPN Load Balancing	718
—	VXLAN	778
webfo	WebVPN Failover	721
webvpn	WebVPN and AnyConnect Client	716

Guidelines for Logging

This section includes guidelines and limitations that you should review before configuring logging.

IPv6 Guidelines

Does not support IPv6.

Additional Guidelines

- The syslog server must run a server program called syslogd. Windows provides a syslog server as part of its operating system.
- To view logs generated by the FTD device, you must specify a logging output destination. If you enable logging without specifying a logging output destination, the FTD device generates messages but does not save them to a location from which you can view them. You must specify each different logging output destination separately.
- It is not possible to have two different lists or classes being assigned to different syslog servers or same locations.
- You can configure up to 16 syslog servers.
- The syslog server should be reachable through the FTD device. You should configure the device to deny ICMP unreachable messages on the interface through which the syslog server is reachable and to send syslogs to the same server. Make sure that you have enabled logging for all severity levels. To prevent the syslog server from crashing, suppress the generation of syslogs 313001, 313004, and 313005.
- When the FTD device sends syslogs via TCP, the connection takes about one minute to initiate after the syslogd service restarts.

Configure Syslog Logging for FTD Devices

To configure syslog settings, perform the following steps:

Before you begin

See requirements in [Guidelines for Logging, on page 780](#).

Procedure

- Step 1** Select **Devices > Platform Settings** and create or edit the Firepower Threat Defense policy.
- Step 2** Click **Syslog** from the table of contents.
- Step 3** Click **Logging Setup** to enable logging, specify FTP Server settings, and specify Flash usage. For more information, see [Enable Logging and Configure Basic Settings, on page 781](#)
- Step 4** Click **Logging Destinations** to enable logging to specific destinations and to specify filtering on message severity level, event class, or on a custom event list. For more information, see [Enable Logging Destinations, on page 782](#)
- You must enable a logging destination to see messages at that destination.
- Step 5** Click **E-mail Setup** to specify the e-mail address that is used as the source address for syslog messages that are sent as e-mail messages. For more information, see [Send Syslog Messages to an E-mail Address, on page 783](#)
- Step 6** Click **Events List** to define a custom event list that includes an event class, a severity level, and an event ID. For more information, see [Create a Custom Event List, on page 784](#)
- Step 7** Click **Rate Limit** to specify the volume of messages being sent to all configured destinations and define the message severity level to which you want to assign rate limits. For more information, see [Limit the Rate of Syslog Message Generation, on page 785](#)
- Step 8** Click **Syslog Settings** to specify the logging facility, enable the inclusion of a time stamp, and enable other settings to set up a server as a syslog destination. For more information, see [Configure Syslog Settings, on page 785](#)
- Step 9** Click **Syslog Servers** to specify the IP address, protocol used, format, and security zone for the syslog server that is designated as a logging destination. For more information, see [Configure a Syslog Server, on page 787](#)
-

Enable Logging and Configure Basic Settings

You must enable logging for the system to generate syslog messages for data plane events.

You can also set up archiving on flash or an FTP server as a storage location when the local buffer becomes full. You can manipulate logging data after it is saved. For example, you could specify actions to be executed when certain types of syslog messages are logged, extract data from the log and save the records to another file for reporting, or track statistics using a site-specific script.

The following procedure explains some of the basic syslog settings.

Procedure

- Step 1** Select **Devices > Platform Settings** and create or edit the Firepower Threat Defense policy.
- Step 2** Select **Syslog > Logging Setup**.
- Step 3** Enable logging and configure basic logging settings.
- **Enable Logging**—Turns on data plane system logging for the Firepower Threat Defense device.

- **Enable Logging on the Failover Standby Unit**—Turns on logging for the standby for the Firepower Threat Defense device, if available.
- **Send syslogs in EMBLEM format**—Enables EMBLEM format logging for every logging destination. If you enable EMBLEM, you must use the UDP protocol to publish syslog messages; EMBLEM is not compatible with TCP.

Note Syslog messages in RFC5424 format, typically displays the priority value (PRI). However, in FMC, if you want to display the PRI value in the syslog messages of the managed FTD, ensure to enable the EMBLEM format. For more information on PRI, see [RFC5424](#).

- **Send debug messages as syslogs**—Redirects all the debug trace output to the syslog. The syslog message does not appear in the console if this option is enabled. Therefore, to see debug messages, you must enable logging at the console and configure it as the destination for the debug syslog message number and logging level. The syslog message number used is 71101. Default logging level for this syslog is debug.
- **Memory Size of Internal Buffer**—Specify the size of the internal buffer to which syslog messages are saved if the logging buffer is enabled. When the buffer fills up, it is overwritten. The default is 4096 bytes. The range is 4096 to 52428800.

Step 4 (Optional) Configure an FTP server if you want to save log buffer contents to the server before the buffer is overwritten. Specify the FTP Server information.

- **FTP Server Buffer Wrap**— To save the buffer contents to the FTP server before it is overwritten, check this box and enter the necessary destination information in the following fields. To remove the FTP configuration, deselect this option.
- **IP Address**—Select the host network object that contains the IP address of the FTP server.
- **User Name**—Enter the user name to use when connecting to the FTP server.
- **Path**—Enter the path, relative to the FTP root, where the buffer contents should be saved.
- **Password/ Confirm**—Enter and confirm the password used to authenticate the user name to the FTP server.

Step 5 (Optional) Specify Flash size if you want to save log buffer contents to flash before the buffer is overwritten.

- **Flash**—To save the buffer contents to the flash memory before it is overwritten, check this box.
- **Maximum flash to be used by logging (KB)**—Specify the maximum space to be used in the flash memory for logging(in KB). The range is 4-8044176 kilobytes.
- **Minimum free space to be preserved (KB)**—Specifies the minimum free space to be preserved in flash memory (in KB). The range is 0-8044176 kilobytes.

Step 6 Click **Save**.

You can now click **Deploy** and deploy the policy to assigned devices. The changes are not active until you deploy them.

Enable Logging Destinations

You must enable a logging destination to see messages at that destination. When enabling a destination, you must also specify the message filter for the destination.

Procedure

- Step 1** Select **Devices > Platform Settings** and create or edit the Firepower Threat Defense policy.
- Step 2** Select **Syslog > Logging Destinations**.
- Step 3** Click **Add** to enable a destination and apply a logging filter, or edit an existing destination.
- Step 4** In the **Logging Destinations** dialog box, select a destination and configure the filter to use for a destination:
- Choose the destination you are enabling in the **Logging Destination** drop-down list. You can create one filter per destination: Console, E-Mail, Internal buffer, SNMP trap, SSH Sessions, and Syslog servers.
Note Console and SSH session logging works in the diagnostic CLI only. Enter **system support diagnostic-cli**.
 - In **Event Class**, choose the filter that will apply to all classes not listed in the table.
You can configure these filters:
 - Filter on severity** —Select the severity level. Messages at this level or higher are sent to the destination
 - Use Event List** —Select the event list that defines the filter. You create these lists on the **Event Lists** page.
 - Disable Logging** —Prevents messages from being sent to this destination.
 - If you want to create filters per event class, click **Add** to create a new filter, or edit an existing filter, and select the event class and severity level to limit messages in that class. Click **OK** to save the filter.
For an explanation of the event classes, see [Syslog Message Classes, on page 777](#).
 - Click **OK**.
- Step 5** Click **Save**.
- You can now click **Deploy** and deploy the policy to assigned devices. The changes are not active until you deploy them.
-

Send Syslog Messages to an E-mail Address

You can set up a list of recipients for syslog messages to be sent as e-mails.

Before you begin

- Configure an SMTP server on the SMTP Server platform settings page
- [Enable Logging and Configure Basic Settings, on page 781](#)
- [Enable Logging Destinations](#)

Procedure

- Step 1** Select **Devices > Platform Settings** and create or edit the Firepower Threat Defense policy.

- Step 2** Select **Syslog > Email Setup**.
- Step 3** Specify the e-mail address that is used as the source address for syslog messages that are sent as e-mail messages.
- Step 4** Click **Add** to enter a new e-mail address recipient of the specified syslog messages.
- Step 5** Choose the severity level of the syslog messages that are sent to the recipient from the drop-down list.
- The syslog message severity filter used for the destination e-mail address causes messages of the specified severity level and higher to be sent. For information on the levels, see [Severity Levels, on page 776](#).
- Step 6** Click **OK**.
- Step 7** Click **Save**.
- You can now click **Deploy** and deploy the policy to assigned devices. The changes are not active until you deploy them.

Create a Custom Event List

An event list is a custom filter you can apply to a logging destination to control which messages are sent to the destination. Normally, you filter messages for a destination based on severity only, but you can use an event list to fine-tune which messages are sent based on a combination of event class, severity, and message identifier (ID).

Creating a custom event list is a two-step process. You create a custom list in the **Event Lists**, and then use the event list to define the logging filter for the various types of destination, in the **Logging Destinations**.

Procedure

- Step 1** Select **Devices > Platform Settings** and create or edit the Firepower Threat Defense policy.
- Step 2** Select **Syslog > Events List**.
- Step 3** Configure an event list.
- Click **Add** to add a new list, or edit an existing list.
 - Enter a name for the event list in the **Name** field. Spaces are not allowed.
 - To identify messages based on severity or event class, select the **Severity/Event Class** tab and add or edit entries.

For information on the available classes see [Syslog Message Classes, on page 777](#).

For information on the levels, see [Severity Levels, on page 776](#).

Certain event classes are not applicable for the device in transparent mode. If such options are configured then they will be bypassed and not deployed.
 - To identify messages specifically by message ID, select the **Message ID** and add or edit the IDs.

You can enter a range of IDs using a hyphen, for example, 100000-200000. IDs are six digits. For information on how the initial three digits map to features, see [Syslog Message Classes, on page 777](#).

For specific message numbers, see [Cisco ASA Series Syslog Messages](#).
 - Click **OK** to save the event list.
- Step 4** Click **Logging Destinations** and add or edit the destination that should use the filter.

See [Enable Logging Destinations, on page 782](#).

Step 5 Click **Save**.

You can now click **Deploy** and deploy the policy to assigned devices. The changes are not active until you deploy them.

Limit the Rate of Syslog Message Generation

You can limit the rate at which syslog messages are generated by severity level or message ID. You can specify individual limits for each logging level and each Syslog message ID. If the settings conflict, the Syslog message ID limits take precedence.

Procedure

Step 1 Select **Devices > Platform Settings** and create or edit the Firepower Threat Defense policy.

Step 2 Select **Syslog > Rate Limit**.

Step 3 To limit message generation by severity level, click **Logging Level > Add** and configure the following options:

- **Logging Level**—The severity level you are rate limiting. For information on the levels, see [Severity Levels, on page 776](#).
- **Number of messages**—The maximum number of messages of the specified type allowed in the specified time period.
- **Interval**—The number of seconds before the rate limit counter resets.

Step 4 Click **OK**.

Step 5 To limit message generation by syslog message ID, click **Syslog Level > Add** and configure the following options:

- **Syslog ID**—The syslog message ID you are rate limiting. For specific message numbers, see [Cisco ASA Series Syslog Messages](#).
- **Number of messages**—The maximum number of messages of the specified type allowed in the specified time period.
- **Interval**—The number of seconds before the rate limit counter resets.

Step 6 Click **OK**.

Step 7 Click **Save**.

You can now click **Deploy** and deploy the policy to assigned devices. The changes are not active until you deploy them.

Configure Syslog Settings

You can configure general syslog settings to set the facility code to be included in syslog messages that are sent to syslog servers, specify whether a timestamp is included in each message, specify the device ID to include in messages, view and modify the severity levels for messages, and disable the generation of specific messages.

Procedure

- Step 1** Select **Devices > Platform Settings** and create or edit the Firepower Threat Defense policy.
- Step 2** Select **Syslog > Syslog Settings**.
- Step 3** Select a system log facility for syslog servers to use as a basis to file messages in the **Facility** drop-down list. The default is LOCAL4(20), which is what most UNIX systems expect. However, because your network devices share available facilities, you might need to change this value for system logs.
- Step 4** Select the **Enable timestamp on each syslog message** check box to include the date and time a message was generated in the syslog message. Timestamp timezone is always UTC.
- Step 5** If you want to add a device identifier to syslog messages (which is placed at the beginning of the message), check the **Enable Syslog Device ID** check box and then select the type of ID.
- **Interface**—To use the IP address of the selected interface, regardless of the interface through which the appliance sends the message. Select the security zone that identifies the interface. The zone must map to a single interface.
 - **User Defined ID**—To use a text string (up to 16 characters) of your choice.
 - **Host Name**—To use the hostname of the device.
- Step 6** Use the Syslog Message table to alter the default settings for specific syslog messages. You need to configure rules in this table only if you want to change the default settings. You can change the severity assigned to a message, or you can disable the generation of a message. By default, Netflow is enabled and the entries are shown in the table.
- a) To suppress syslog messages that are redundant because of Netflow, select **Netflow Equivalent Syslogs**. This adds the messages to the table as suppressed messages.

Note If any of these syslog equivalents are already in the table, your existing rules are not overwritten.
 - b) To add a rule, click **Add**.
 - c) You select the message number whose configuration you want to change, from the **Syslog ID** drop down list and then select the new severity level from the **Logging Level** drop down list, or select **Suppressed** to disable the generation of the message. Typically, you would not change the severity level and disable the message, but you can make changes to both fields if desired.
 - d) Click **OK** to add the rule to the table.
- Step 7** Click **Save**. You can now click **Deploy** and deploy the policy to assigned devices. The changes are not active until you deploy them.
-

What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

Configure a Syslog Server

To configure a syslog server to handle messages generated from your system, perform the following steps.

Before you begin

- See requirements in [Guidelines for Logging, on page 780](#).
- Make sure your devices can reach your syslog collector on the network.

Procedure

-
- Step 1** Select **Devices > Platform Settings** and create or edit the Firepower Threat Defense policy.
- Step 2** Select **Syslog > Syslog Server**.
- Step 3** Check the **Allow user traffic to pass when TCP syslog server is down** check box, to allow traffic if any syslog server that is using the TCP protocol is down.
- Step 4** Enter a size of the queue for storing syslog messages on the security appliance when syslog server is busy in the **Message queue size (messages)** field. The minimum is 1 message. The default is 512. Specify 0 to allow an unlimited number of messages to be queued (subject to available block memory).
- Step 5** Click **Add** to add a new syslog server.
- In the **IP Address** drop-down list, select a network host object that contains the IP address of the syslog server.
 - Choose the protocol (either TCP or UDP) and enter the port number for communications between the Firepower Threat Defense device and the syslog server.

UDP is faster and uses less resources on the device than TCP.

The default ports are 514 for UDP, 1470 for TCP. Valid non-default port values for either protocol are 1025 through 65535.
 - Check the **Log messages in Cisco EMBLEM format (UDP only)** check box to specify whether to log messages in Cisco EMBLEM format (available only if UDP is selected as the protocol).

Note Syslog messages in RFC5424 format, typically displays the priority value (PRI). However, in FMC, only when you enable logging in Cisco EMBLEM format, the PRI value in the syslog messages of the managed FTD is displayed. For more information on PRI, see [RFC5424](#).
 - Check the **Enable Secure Syslog** check box to encrypt the connection between the device and server using SSL/TLS over TCP.
 - Add the zones that contain the interfaces used to communicate with the syslog server. For interfaces not in a zone, you can type the interface name into the field below the **Selected Zones/Interface** list and click **Add**. These rules will be applied to a device only if the device includes the selected interfaces or zones.

Note If the syslog server is on the network attached to the physical Management interface, you must type the name of that interface into the **Interface Name** field below the **Selected Security Zones** list and click **Add**. You must also configure this name (if not already configured), and an IP address, for the Diagnostic interface (edit the device from the Device Management page and select the Interfaces tab). For more information about the management/diagnostic interface, see [Diagnostic Interface, on page 503](#).

f) Click **OK**.

Step 6 Click **Save**.

You can now click **Deploy** and deploy the policy to assigned devices. The changes are not active until you deploy them.

What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

Configure Global Timeouts

You can set the global idle timeout durations for the connection and translation slots of various protocols. If the slot has not been used for the idle time specified, the resource is returned to the free pool.

You can also set a time out for console sessions with the device.

Procedure

Step 1 Select **Devices > Platform Settings** and create or edit the Firepower Threat Defense policy.

Step 2 Select **Timeouts**.

Step 3 Configure the timeouts you want to change.

For any given setting, select **Custom** to define your own value, **Default** to return to the system default value. In most cases, the maximum timeout is 1193 hours.

You can disable some timeouts by selecting **Disable**.

- **Console Timeout**—The idle time until a connection to the console is closed, range is 0 to 60 minutes. The default is 0, which means the session does not time out. If you change the value, existing console sessions use the old timeout value. The new value applies to new connections only.
- **Translation Slot (xlate)**—The idle time until a NAT translation slot is freed. This duration must be at least 1 minute. The default is 3 hours.
- **Connection (Conn)**—The idle time until a connection slot is freed. This duration must be at least 5 minutes. The default is 1 hour.
- **Half-Closed**—The idle time until a TCP half-closed connection closes. A connection is considered half-closed if both the FIN and FIN-ACK have been seen. If only the FIN has been seen, the regular connection timeout applies. The minimum is 30 seconds. The default is 10 minutes.
- **UDP**—The idle time until a UDP connection closes. This duration must be at least 1 minute. The default is 2 minutes.
- **ICMP**—The idle time after which general ICMP states are closed. The default (and minimum) is 2 seconds.
- **RPC/Sun RPC**—The idle time until a SunRPC slot is freed. This duration must be at least 1 minute. The default is 10 minutes.

- **H.225**—The idle time until an H.225 signaling connection closes. The default is 1 hour. To close a connection immediately after all calls are cleared, a timeout of 1 second (0:0:1) is recommended.
- **H.323**—The idle time after which H.245 (TCP) and H.323 (UDP) media connections close. The default (and minimum) is 5 minutes. Because the same connection flag is set on both H.245 and H.323 media connections, the H.245 (TCP) connection shares the idle timeout with the H.323 (RTP and RTCP) media connection.
- **SIP**—The idle time until a SIP signaling port connection closes. This duration must be at least 5 minutes. The default is 30 minutes.
- **SIP Media**—The idle time until a SIP media port connection closes. This duration must be at least 1 minute. The default is 2 minutes. The SIP media timer is used for SIP RTP/RTCP with SIP UDP media packets, instead of the UDP inactivity timeout.
- **SIP Disconnect**—The idle time after which SIP session is deleted if the 200 OK is not received for a CANCEL or a BYE message, between 0:0:1 and 0:10:0. The default is 2 minutes (0:2:0).
- **SIP Invite**—The idle time after which pinholes for PROVISIONAL responses and media xlates will be closed, between 0:1:0 and 00:30:0. The default is 3 minutes (0:3:0).
- **SIP Provisional Media**—The timeout value for SIP provisional media connections, between 1 and 30 minutes. The default is 2 minutes.
- **Floating Connection**—When multiple routes exist to a network with different metrics, the system uses the one with the best metric at the time of connection creation. If a better route becomes available, then this timeout lets connections be closed so a connection can be reestablished to use the better route. The default is 0 (the connection never times out). To make it possible to use better routes, set the timeout to a value between 0:0:30 and 1193:0:0.
- **ARP Timeout**—(Transparent mode only.) The number of seconds between ARP table rebuilds, from 60 to 4294967. The default is 14,400 seconds (4 hours).

Step 4 Click **Save**.

You can now click **Deploy** and deploy the policy to assigned devices. The changes are not active until you deploy them.

Configure NTP Time Synchronization for Threat Defense

Use a Network Time Protocol (NTP) server to synchronize the clock settings on your devices. We recommend you configure all Firepower Threat Defenses managed by an FMC to use the same NTP server as the FMC. The Firepower Threat Defense gets its time directly from the configured NTP server. If the Firepower Threat Defense's configured NTP servers are not reachable for any reason, it synchronizes its time with the FMC.

The device supports NTPv4.

Note If you are deploying Firepower Threat Defense on the Firepower 4100/9300 chassis, you must configure NTP on the Firepower 4100/9300 chassis so that Smart Licensing will work properly and to ensure proper timestamps on device registrations. You should use the same NTP server for the Firepower 4100/9300 chassis and the FMC.

Before you begin

- If your organization has one or more NTP servers that your FTD can reach, use the same NTP server or servers for your devices that you have configured for Time Synchronization on the **System > Configuration** page on your FMC. Copy the specified value.
- If your device cannot reach an NTP server or your organization does not have one, you must use the **Via NTP from Defense Center** option as discussed in the following procedure.

Procedure

Step 1 Select **Devices > Platform Settings** and create or edit the Firepower Threat Defense policy.

Step 2 Select **Time Synchronization**.

Step 3 Configure one of the following clock options:

- **Via NTP from Defense Center**—(Default). The managed device gets time from the NTP servers you configured for the FMC (except for authenticated NTP servers) and synchronizes time with those servers directly. However, if any of the following are true, the managed device synchronizes time from the FMC:
 - The FMC's NTP servers are not reachable by the device.
 - The FMC has no unauthenticated servers.
- **Via NTP from**—If your FMC is using NTP servers on the network, select this option and enter the fully-qualified DNS name (such as ntp.example.com), or IPv4 or IPv6 address, of the same NTP servers you specified in **System > Configuration > Time Synchronization**. If the NTP servers are not reachable, the FMC acts as an NTP server.

Step 4 Click **Save**.

What to do next

- Make sure the policy is assigned to your devices. See [Setting Target Devices for a Platform Settings Policy, on page 743](#).
- Deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).
- If your system includes Classic devices, set up time synchronization for those devices. See [Synchronize Time on Classic Devices with an NTP Server, on page 751](#).

- [Network Address Translation \(NAT\) for Firepower Threat Defense, on page 819](#)

CHAPTER 40

NAT Policy Management

The following topics describe how to manage NAT policies for your Firepower System:

- [Requirements and Prerequisites for NAT Policies, on page 795](#)
- [Managing NAT Policies, on page 795](#)
- [Creating NAT Policies, on page 796](#)
- [Configuring NAT Policies, on page 797](#)
- [Configuring NAT Policy Targets, on page 798](#)
- [Copying NAT Policies, on page 799](#)

Requirements and Prerequisites for NAT Policies

Model Support

Any, but you must select the correct type of policy for the device model:

- **Firepower NAT** for 7000 & 8000 Series devices.
- **Threat Defense NAT** for FTD devices.

Supported Domains

Any

User Roles

Admin

Access Admin

Network Admin

Managing NAT Policies

In a multidomain deployment, the system displays policies created in the current domain, which you can edit. It also displays policies created in ancestor domains, which you cannot edit. To view and edit policies created in a lower domain, switch to that domain.

Administrators in ancestor domains can target NAT policies to devices in descendant domains, which descendant domains can use or replace with customized local policies. If a NAT policy targets devices in different descendant domains, administrators in the descendant domains can view information about target devices belonging to their domain only.

Procedure

Step 1 Choose **Devices > NAT**.

Step 2 Manage your NAT policies:

- Copy — Click **Copy** () next to the policy you want to copy; see [Copying NAT Policies, on page 799](#).
- Create — Click **New Policy**; see [Creating NAT Policies, on page 796](#).

- Delete — Click **Delete** () next to the policy you want to delete, then click **OK**. When prompted whether to continue, you are also informed if another user has unsaved changes in the policy.

Caution After you have deployed a NAT policy to a managed device, you cannot delete the policy from the device. Instead, you must deploy a NAT policy with no rules to remove the NAT rules already present on the managed device. You also cannot delete a policy that is the last deployed policy on any of its target devices, even if it is out of date. Before you can delete the policy completely, you must deploy a different policy to those targets.

- Deploy—Click **Deploy**; see [Deploy Configuration Changes, on page 306](#).
 - Edit — Click **Edit** () ; see [Configuring NAT Policies, on page 797](#).
 - Report—Click **Report** () ; see [Generating Current Policy Reports, on page 315](#).
-

Creating NAT Policies

When you create a new NAT policy you must, at minimum, give it a unique name. Although you are not required to identify policy targets at policy creation time, you must perform this step before you can deploy the policy. If you apply a NAT policy with no rules to a device, the system removes all NAT rules from that device.

In a multidomain deployment, the system displays policies created in the current domain, which you can edit. It also displays policies created in ancestor domains, which you cannot edit. To view and edit policies created in a lower domain, switch to that domain.

Administrators in ancestor domains can target NAT policies to devices in descendant domains, which descendant domains can use or replace with customized local policies. If a NAT policy targets devices in different descendant domains, administrators in the descendant domains can view information about target devices belonging to their domain only.

Procedure

- Step 1** Choose **Devices > NAT** .
- Step 2** From the **New Policy** drop-down list, choose **Firepower NAT**.
- Step 3** Enter a unique **Name**.
- In a multidomain deployment, policy names must be unique within the domain hierarchy. The system may identify a conflict with the name of a policy you cannot view in your current domain.
- Step 4** Optionally, enter a **Description**.
- Step 5** Choose the devices where you want to deploy the policy:
- Choose a device in the **Available Devices** list, and click **Add to Policy**.
 - Click and drag a device from the **Available Devices** list to the **Selected Devices** list.
 - Remove a device from the **Selected Devices** list by clicking **Delete** () next to the device.
- Step 6** Click **Save**.
-

What to do next

Deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

Configuring NAT Policies

In a multidomain deployment, the system displays policies created in the current domain, which you can edit. It also displays policies created in ancestor domains, which you cannot edit. To view and edit policies created in a lower domain, switch to that domain.

Administrators in ancestor domains can target NAT policies to devices in descendant domains, which descendant domains can use or replace with customized local policies. If a NAT policy targets devices in different descendant domains, administrators in the descendant domains can view information about target devices belonging to their domain only.

If you change the type of an interface to a type that is not valid for use with a NAT policy that targets a device with that interface, the policy labels the interface as deleted. Click **Save** in the NAT policy to automatically remove the interface from the policy.

Procedure

- Step 1** Choose **Devices > NAT** .
- Step 2** Click **Edit** () next to the NAT policy you want to modify.
- If **View** () appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.
- Step 3** Configure your NAT policies:

- To modify the policy name or description, click the **Name** or **Description** field, delete any characters as needed, then enter the new name or description. In a multidomain deployment, policy names must be unique within the domain hierarchy. The system may identify a conflict with the name of a policy you cannot view in your current domain.
- To manage policy targets, see [Configuring NAT Policy Targets, on page 798](#).
- To save your policy changes, click **Save**.
- To add a rule to a policy, click **Add Rule**.
- To edit an existing rule, click **Edit** () next to the rule.
- To delete a rule, click **Delete** () next to the rule, then click **OK**.
- To enable or disable an existing rule, right-click a rule, choose **State**, and choose **Disable** or **Enable**.
- To display the configuration page for a specific rule attribute, click the name or value in the column for the condition on the row for the rule. For example, click the name or value in the **Source Networks** column to display the Source Network page for the selected rule.

What to do next

Deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

Configuring NAT Policy Targets

You can identify the managed devices you want to target with your policy while creating or editing a policy. You can search a list of available devices, 7000 or 8000 Series stacks, and high-availability pairs, and add them to a list of selected devices.

You cannot target stacked devices running different versions of the Firepower System (for example, if an upgrade on one of the devices fails).

In a multidomain deployment, the system displays policies created in the current domain, which you can edit. It also displays policies created in ancestor domains, which you cannot edit. To view and edit policies created in a lower domain, switch to that domain.

Administrators in ancestor domains can target NAT policies to devices in descendant domains, which descendant domains can use or replace with customized local policies. If a NAT policy targets devices in different descendant domains, administrators in the descendant domains can view information about target devices belonging to their domain only.

Procedure

Step 1 Choose **Devices > NAT** .

Step 2 Click **Edit** () next to the NAT policy you want to modify.

If **View** () appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

Step 3 Click **Policy Assignments**.

- Step 4** Do any of the following:
- To assign a device, stack, high-availability pair, or device group to the policy, select it in the **Available Devices** list and click **Add to Policy**. You can also drag and drop.
 - To remove a device assignment, click **Delete** () next to a device, stack, high-availability pair, or device group in the **Selected Devices** list.
- Step 5** Click **OK**.
-

What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

Copying NAT Policies

You can make a copy of a NAT policy. The copy includes all policy rules and configurations. In a multidomain deployment, you can copy policies from current and ancestor domains.

Procedure

- Step 1** Choose **Devices > NAT**.
- Step 2** Click **Copy** () next to the NAT policy you want to copy.
- Step 3** Enter a unique **Name** for the policy.
- In a multidomain deployment, policy names must be unique within the domain hierarchy. The system may identify a conflict with the name of a policy you cannot view in your current domain.
- Step 4** Click **OK**.
-

CHAPTER 41

NAT for 7000 and 8000 Series Devices

The following topics describe how to configure NAT for 7000 and 8000 Series devices:

- [NAT Policy Configuration, on page 801](#)
- [Rule Organization in a NAT Policy, on page 802](#)
- [Organizing NAT Rules, on page 803](#)
- [NAT Policy Rules Options, on page 804](#)

NAT Policy Configuration

You can configure NAT policies in different ways to manage specific network needs. You can:

- *Expose an internal server to an external network.*

In this configuration, you define a static translation from an external IP address to an internal IP address so the system can access an internal server from outside the network. Traffic sent to the server targets the external IP address or IP address and port, and is translated into the internal IP address or IP address and port. Return traffic from the server is translated back to the external address.

- *Allow an internal host/server to connect to an external application.*

In this configuration, you define a static translation from an internal address to an external address. This definition allows the internal host or server to initiate a connection to an external application that is expecting the internal host or server to have a specific IP address and port. Therefore, the system cannot dynamically allocate the address of the internal host or server.

- *Hide private network addresses from an external network.*

You can obscure your internal network addresses using either of the following configurations:

- If you have a sufficient number of external IP addresses to satisfy your internal network needs, you can use a block of IP addresses. In this configuration, you create a dynamic translation that automatically converts the source IP address of any outgoing traffic to an unused IP address from your externally facing IP addresses.
- If you have an insufficient number of external IP addresses to satisfy your internal network needs, you can use a limited block of IP addresses and port translation. In this configuration, you create a dynamic translation that automatically converts the source IP address and port of outgoing traffic to an unused IP address and port from your externally facing IP addresses.

Caution In 7000 or 8000 Series device high-availability pairs, only select an individual peer interface for a static NAT rule on a paired device if all networks affected by the NAT translations are private. Do **not** use configurations for static NAT rules affecting traffic between public and private networks.

NAT Policies Configuration Guidelines

To configure a NAT policy, you must give the policy a unique name and identify the devices, or *targets*, where you want to deploy the policy. You can also add, edit, delete, enable, and disable NAT rules. After you create or modify a NAT policy, you can deploy the policy to all or some targeted devices.

You can deploy NAT policies to a 7000 or 8000 Series device high-availability pair, including paired stacks, as you would a standalone device. However, you can define static NAT rules for interfaces on individual paired devices or the entire high-availability pair and use the interfaces in source zones. For dynamic rules, you can use only the interfaces on the whole high-availability pair in source or destination zones.

Caution In 7000 or 8000 Series device high-availability pairs, only select an individual peer interface for a static NAT rule on a paired device if all networks affected by the NAT translations are private. Do **not** use this configuration for static NAT rules affecting traffic between public and private networks.

If you configure dynamic NAT on a device high-availability pair without HA link interfaces established, both paired devices independently allocate dynamic NAT entries, and the system cannot synchronize the entries between devices.

You can deploy NAT policies to a device stack as you would a standalone device. If you establish a device stack from devices that were included in a NAT policy and had rules associated with interfaces from the secondary device that was a member of the stack, the interfaces from the secondary device remain in the NAT policy. You can save and deploy policies with the interfaces, but the rules do not provide any translation.

In a multidomain deployment, the system displays policies created in the current domain, which you can edit. It also displays policies created in ancestor domains, which you cannot edit. To view and edit policies created in a lower domain, switch to that domain. Administrators in ancestor domains can target NAT policies to devices in descendant domains, which descendant domains can use or replace with customized local policies.

Rule Organization in a NAT Policy

The Edit page for the NAT policy lists static NAT rules and dynamic NAT rules separately. The system sorts static rules alphabetically by name, and you cannot change the display order. You cannot create static rules with identical matching values. The system inspects static translations for a match before it inspects any dynamic translations.

Dynamic rules are processed in numerical order. The numeric position of each dynamic rule appears on the left side of the page next to the rule. You can move or insert dynamic rules and otherwise change the rule order. For example, if you move dynamic rule 10 under dynamic rule 3, rule 10 becomes rule 4 and all subsequent numbers increment accordingly.

A dynamic rule's position is important because the system compares packets to dynamic rules in the rules' numeric order on the policy Edit page. When a packet meets all the conditions of a dynamic rule, the system applies the conditions of that rule to the packet and ignores all subsequent rules for that packet.

You can specify a dynamic rule's numeric position when you add or edit a dynamic rule. You can also highlight a dynamic rule before adding a new dynamic rule to insert the new rule below the rule you highlighted.

You can select one or more dynamic rules by clicking a blank space in the row for the rule. You can drag and drop selected dynamic rules into a new location, thereby changing the position of the rules you moved and all subsequent rules.

You can cut or copy selected rules and paste them above or below an existing rule. You can only paste static rules in the Static Translations list and only dynamic rules in the Dynamic Translations list. You can also delete selected rules and insert new rules into any location in the list of existing rules.

You can display explanatory warnings to identify rules that will never match because they are preempted by preceding rules.

If you have access control policies in your deployment, the system does not translate traffic until it has passed through access control.

Organizing NAT Rules

Smart License	Classic License	Supported Devices	Supported Domains	Access
N/A	Control	7000 & 8000 Series	Any	Admin/Network Admin

Procedure

-
- Step 1** Choose **Devices > NAT** .
- Step 2** Click the edit icon (✎) next to the NAT policy you want to modify.
- If **View** (👁) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.
- Step 3** Organize your NAT rules:
- To choose a rule, click a blank area in the row for a rule.
 - To clear rule selections, click the reload icon (🔄) on the lower right side of the page. To clear individual rules, click a blank area in a rule's row while holding the Ctrl key.
 - To cut or copy selected rules, right-click a blank area in the row for a selected rule, then select **Cut** or **Copy**.
 - To paste rules you have cut or copied into the rule list, right-click a blank area in the row for a rule where you want to paste selected rules, then select **Paste above** or **Paste below**.
 - To move selected rules, drag and drop selected rules beneath a new location, indicated by a horizontal blue line that appears above your pointer as you drag.
 - To delete a rule, click the delete icon (🗑) next to the rule, then click **OK**.
 - To show warnings, click **Show Warnings**.
-

NAT Rule Warnings and Errors

The conditions of a NAT rule may preempt a subsequent rule from matching traffic. Any type of rule condition can preempt a subsequent rule.

A rule also preempts an identical subsequent rule where all configured conditions are the same. A subsequent rule would not be preempted if any condition were different.

If you create a rule that causes the NAT policy to fail upon deploy, an error icon () appears next to the rule. An error occurs if there is a conflict in the static rules, or if you edit a network object used in the policy that now makes the policy invalid. For example, an error occurs if you change a network object to use only IPv6 addresses and the rule that uses that object no longer has any valid networks where at least one network is required. Error icons appear automatically; you do not have to click **Show Warnings**.

Showing and Hiding NAT Rule Warnings

Smart License	Classic License	Supported Devices	Supported Domains	Access
N/A	Control	7000 & 8000 Series	Any	Admin/Network Admin

Procedure

-
- Step 1** Choose **Devices > NAT** .
- Step 2** Click the edit icon () next to the NAT policy you want to modify.
- If **View** () appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.
- Step 3** To show warnings, click **Show Warnings**.
- The page updates with a warning icon () next to each preempted rule.
- Step 4** To display the warning for a rule, hover your pointer over the warning icon () next to a rule. A message indicates which rule preempts the rule.
- Step 5** To clear warnings, click **Hide Warnings**.
- The page refreshes and the warnings disappear.
-

NAT Policy Rules Options

A NAT rule is simply a set of configurations and conditions that:

- qualifies network traffic
- specifies how the traffic that matches those qualifications is translated

You create and edit NAT rules from within an existing NAT policy. Each rule belongs to only one policy.

The web interface for adding or editing a rule is similar. You specify the rule name, state, type, and position (if dynamic) at the top of the page. You build conditions using the tabs on the left side of the page; each condition type has its own tab.

The following list summarizes the configurable components of a NAT rule.

Name

Give each rule a unique name. For static NAT rules, use a maximum of 22 characters. For dynamic NAT rules, use a maximum of 30 characters. You can use printable characters, including spaces and special characters, with the exception of the colon (:).

Rule State

By default, rules are enabled. If you disable a rule, the system does not use it to evaluate network traffic for translation. When viewing the list of rules in a NAT policy, disabled rules are grayed out, although you can still modify them.

Type

A rule's type determines how the system handles traffic that matches the rule's conditions. When you create and edit NAT rules, the configurable components vary according to rule type.

Position (Dynamic Rules Only)

Dynamic rules in a NAT policy are numbered, starting at 1. The system matches traffic to NAT rules in top-down order by ascending rule number.

When you add a rule to a policy, you specify its position by placing it **above** or **below** a specific rule, using rule numbers as a reference point. When editing an existing rule, you can **Move** the rule in a similar fashion.

Conditions

Rule conditions identify the specific traffic you want to translate. Conditions can match traffic by any combination of multiple attributes, including security zone, network, and transport protocol port.

Related Topics

[Creating and Editing NAT Rules](#), on page 805

Creating and Editing NAT Rules

Smart License	Classic License	Supported Devices	Supported Domains	Access
N/A	Control	7000 & 8000 Series	Any	Admin/Network Admin

In a multidomain deployment, the system displays policies and rules created in the current domain, which you can edit. It also displays policies and rules created in ancestor domains, which you cannot edit. To view and edit rules created in a lower domain, switch to that domain.

Procedure

Step 1 Choose **Devices > NAT** .

Step 2 Click the edit icon (✎) next to the NAT policy where you want to add a rule.

If **View** (👁) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

Step 3 Add a new rule or edit an existing rule:

- To add a new rule, click **Add Rule**.
- To edit an existing rule, click the edit icon (✎) next to the rule you want to edit.

Step 4 Enter a unique rule **Name**.

Step 5 Configure the following rule components:

- Specify whether the rule is **Enabled**.
- Specify a rule **Type**.
- Specify the rule position (dynamic rules only).
- Configure the rule's conditions.

Note Static rules must include an original destination network. Dynamic rules must include a translated source network.

Step 6 Click **Add**.

Step 7 Click **Save**.

What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

NAT Rule Types

Every NAT rule has an associated type that:

- qualifies network traffic
- specifies how the traffic that matches those qualifications is translated

The following list summarizes the NAT rule types.

Static

Static rules provide one-to-one translations on destination networks and optionally port and protocol. When configuring static translations, you can configure source zones, destination networks, and destination ports. You cannot configure destination zones or source networks.

You **must** specify an original destination network. For destination networks, you can only select network objects and groups containing a single IP address or enter literal IP addresses that represent a single IP address. You can only specify a single original destination network and a single translated destination network.

Note The system builds a separate network map for each leaf domain. In a multidomain deployment, using literal IP addresses to constrain this configuration can have unexpected results. Using override-enabled objects allows descendant domain administrators to tailor Global configurations to their local environments.

You can specify a single original destination port and a single translated destination port. You must specify an original destination network before you can specify an original destination port. In addition, you cannot specify a translated destination port unless you also specify an original destination port, and the translated value must match the protocol of the original value.

Caution For static NAT rules on a 7000 or 8000 Series device in a high-availability pair, only select an individual peer interface if all networks affected by the NAT translations are private. Do **not** use this configuration for static NAT rules affecting traffic between public and private networks.

Dynamic IP Only

Dynamic IP Only rules translate many-to-many source networks, but maintain port and protocol. When configuring dynamic IP only translations, you can configure zones, source networks, original destination networks, and original destination ports. You cannot configure translated destination networks or translated destination ports.

You **must** specify at least one translated source network. If the number of translated source network values is less than the number of original source networks, the system displays a warning on the rule that it is possible to run out of translated addresses before all original addresses are matched.

If there are multiple rules with conditions that match the same packet, the low priority rules become dead, meaning they can never be triggered. The system also displays warnings for dead rules. You can view tooltips to determine which rule supersedes the dead rule.

Note You can save and deploy policies with dead rules, but the rules cannot provide any translation.

In some instances, you may want to create rules with limited scope preceding rules with a broader scope. For example:

```
Rule 1: Match on address A and port A/Translate to address B
Rule 2: Match on address A/Translate to Address C
```

In this example, rule 1 matches some packets that also match rule 2. Therefore, rule 2 is not completely dead.

If you specify only original destination ports, you cannot specify translated destination ports.

Dynamic IP + Port

Dynamic IP and port rules translate many-to-one or many-to-many source networks and port and protocol. When configuring dynamic IP and port translations, you can configure zones, source networks, original

destination networks, and original destination ports. You cannot configure translated destination networks or translated destination ports.

You **must** specify at least one translated source network. If there are multiple rules with conditions that match the same packet, the low priority rules become dead, meaning they can never be triggered. The system also displays warnings for dead rules. You can view tool tips to determine which rule supersedes the dead rule.

Note You can save and deploy policies with dead rules, but the rules cannot provide any translation.

If you specify only original destination ports, you cannot specify translated destination ports.

Note If you create a dynamic IP and port rule, and the system passes traffic that does not use a port, no translation occurs for the traffic. For example, a ping (ICMP) from an IP address that matches the source network does not map, because ICMP does not use a port.

NAT Rule Condition Types

The following table summarizes the NAT rule condition types that can be configured based on the specified NAT rule type:

Table 73: Available NAT Rule Condition Types per NAT Rule Type

Condition	Static	Dynamic (IP Only or IP + Port)
Source Zones	Optional	Optional
Destination Zones	Not allowed	Optional
Original Source Networks	Not allowed	Optional
Translated Source Networks	Not allowed	Required
Original Destination Networks	Required	Optional
Translated Destination Networks	Optional; single address only	Not allowed
Original Destination Ports	Optional; single port only, and only allowed if you define the original destination network	Optional
Translated Destination Ports	Optional; single port only, and only allowed if you define the original destination port	Not allowed

NAT Rule Conditions and Condition Mechanics

You can add conditions to NAT rules to identify the type of traffic that matches the rule. For each condition type, you select conditions you want to add to a rule from a list of available conditions. When applicable, condition filters allow you to constrain available conditions. Lists of available and selected conditions may

be as short as a single condition or many pages long. You can search available conditions and display only those matching a typed name or value in a list that updates as you type.

Depending on the type of condition, lists of available conditions may be comprised of a combination of conditions provided directly by Cisco or configured using other Firepower System features, including objects created using the object manager (**Objects > Object Management**), objects created directly from individual conditions pages, and literal conditions.

NAT Rule Conditions

You can set a NAT rule to match traffic meeting any of the conditions described in the following table:

Table 74: NAT Rule Condition Types

Condition	Description
Zones	A configuration of one or more routed interfaces where you can deploy NAT policies. Zones provide a mechanism for classifying traffic on source and destination interfaces, and you can add source and destination zone conditions to rules.
Networks	Any combination of individual IP addresses, CIDR blocks, and prefix lengths, either specified explicitly or using network objects and groups. You can add source and destination network conditions to NAT rules.
Destination Ports	Transport protocol ports, including individual and group port objects you create based on transport protocols.

Adding Conditions to NAT Rules

Smart License	Classic License	Supported Devices	Supported Domains	Access
N/A	Control	7000 & 8000 Series	Any	Admin/Network Admin

Adding conditions to NAT rules is essentially the same for each type of condition. You choose from a list of available conditions on the left, and add the conditions you chose to one or two lists of selected conditions on the right.

For all condition types, you choose one or more individual available conditions by clicking on them to highlight them. You can either click a button between the two types of lists to add available conditions that you choose to your lists of selected conditions, or drag and drop available conditions that you choose into the list of selected conditions.

You can add up to 50 conditions of each type to a list of selected conditions. For example, you can add up to 50 source zone conditions, up to 50 destination zone conditions, up to 50 source network conditions, and so on, until you reach the upper limit for the appliance.

Procedure

Step 1 Choose **Devices > NAT** .

Step 2 Click the edit icon () next to the NAT policy you want to modify.

If **View** () appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

Step 3 Click **Add Rule**.

Step 4 Enter a **Name** for the rule.

Step 5 Specify a **Type** for the rule.

Step 6 Click the tab for the type of condition you want to add to the rule.

Step 7 Take any of the following actions:

- To choose available conditions to add to a list of selected conditions, click the available condition.
- To choose all listed available conditions, right-click the row for any available condition, then click **Select All**.
- To choose a list of available conditions or filters, click inside the **Search** field and enter a search string. The list updates as you type to display matching items.

You can search on object names and on the values configured for objects. For example, if you have an individual network object named `Texas Office` with the configured value `192.168.3.0/24`, and the object is included in the group object `US Offices`, you can display both objects by entering a partial or complete search string such as `Tex`, or by entering a value such as `3`.

- To clear a search when searching available conditions or filters, click the reload icon () above the Search field or the clear icon () in the Search field.
- To add selected zone conditions from a list of available conditions to a list of selected source or destination conditions, click **Add to Source** or **Add to Destination**.
- To add selected network and port conditions from a list of available conditions to a list of selected original or translated conditions, click **Add to Original** or **Add to Translated**.
- To drag and drop selected available conditions into a list of selected conditions, click a selected condition, then drag and drop into the list of selected conditions.
- To add a literal condition to a list of selected conditions using a literal field, click to remove the prompt from the literal field, enter the literal condition, and click **Add**. Network conditions provide a field for adding literal conditions.
- To add a literal condition to a list of selected conditions using a drop-down list, choose a condition from the drop-down list, then click **Add**. Port conditions provide a drop-down list for adding literal conditions.
- To add an individual object or condition filter so you can then choose it from the list of available conditions, click the add icon () .
- To delete a single condition from a list of selected conditions, click the delete icon () next to the condition.
- To delete a condition from a list of selected conditions, right-click to highlight the row for a selected condition, then click **Delete**.

Step 8 Click **Add** to save your configuration.

Literal Conditions in NAT Rules

You can add a literal value to the list of original and translated conditions for the following condition types:

- Networks
- Ports

For network conditions, you type the literal value in a configuration field below the list of original or translated conditions.

In the case of port conditions, you choose a protocol from a drop-down list. When the protocol is `ALL`, or `TCP` or `UDP`, you enter a port number in a configuration field.

Each relevant conditions page provides the controls needed to add literal values. Values you enter in a configuration field appear as red text if the value is invalid, or until it is recognized as valid. Values change to blue text as you type when they are recognized as valid. A grayed **Add** button activates when a valid value is recognized. Literal values you add appear immediately in the list of selected conditions.

Note The system builds a separate network map for each leaf domain. In a multidomain deployment, using literal IP addresses to constrain this configuration can have unexpected results. Using override-enabled objects allows descendant domain administrators to tailor Global configurations to their local environments.

Objects in NAT Rule Conditions

Objects that you create in the object manager (**Objects > Object Management**) are immediately available for you to select from relevant lists of available NAT rule conditions.

You can also create objects on-the-fly from the NAT policy. A control on relevant conditions pages provides access to the same configuration controls that you use in the object manager.

Individual objects created on-the-fly appear immediately in the list of available objects. You can add them to the current rule, and to other existing and future rules. On the relevant conditions page, and also on the policy Edit page, you can hover your pointer over an individual object to display the contents of the object, and over a group object to display the number of individual objects in the group.

Zone Conditions in NAT Rules

The security zones on your system are comprised of interfaces on your managed devices. Zones that you add to a NAT rule target the rule to devices on your network that have routed or hybrid interfaces in those zones. You can only add security zones with routed or hybrid interfaces as conditions for NAT rules.

You can add either zones or standalone interfaces that are currently assigned to a virtual router to NAT rules.

If there are devices with un-deployed device configurations, the Zones page displays a warning icon (⚠) at the top of the available zones list, indicating that only deployed zones and interfaces are displayed. You can click the arrow icon (▾) next to a zone to collapse or expand the zone to hide or view its interfaces.

If an interface is on a 7000 or 8000 Series device in a high-availability pair, the available zones list displays an additional branch from that interface with the other interfaces in the high-availability pair as children of

the primary interface on the active device in the high-availability pair. You can also click the arrow icon () to collapse or expand the paired device interfaces to hide or view its interfaces.

Note You can save and deploy policies with disabled interfaces, but the rules cannot provide any translation until the interfaces are enabled.

The two lists on the right are the source and destination zones used for matching purposes by the NAT rules. If the rule already has values configured, these lists display the existing values when you edit the rule. If the source zones list is empty, the rule matches traffic *from* any zone or interface. If the destination zones list is empty, the rule matches traffic *to* any zone or interface.

The system displays warnings for rules with zone combinations that never trigger on a targeted device.

Note You can save and deploy policies with these zone combinations, but the rules will not provide any translation.

You can add individual interfaces by selecting an item in a zone or by selecting a standalone interface. You can only add interfaces in a zone if the zone it is assigned to has not already been added to a source zones or destination zones list. These individually selected interfaces are not affected by changes to zones, even if you remove them and add them to a different zone. If an interface is the primary member of a high-availability pair and you are configuring a dynamic rule, you can add only the primary interface to the source zones or destination zones list. For static rules, you can add individual high-availability pair member interfaces to the source zones list. You can only add a primary high-availability pair interface to a list if none of its children have been added, and you can only add individual high-availability pair interfaces if the primary has not been added.

If you add a zone, the rule uses all interfaces associated with the zone. If you add or remove an interface from the zone, the rule will not use the updated version of the zone until the device configuration has been re-deployed to the devices where the interfaces reside.

Note In a static NAT rule, you can add only source zones. In a dynamic NAT rule, you can add both source and destination zones.

Adding Zone Conditions to NAT Rules

Smart License	Classic License	Supported Devices	Supported Domains	Access
N/A	Control	7000 & 8000 Series	Any	Admin/Network Admin

Procedure

- Step 1** Choose **Devices > NAT** .
- Step 2** Click the edit icon () next to the NAT policy you want to modify.

If **View** () appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

Step 3 Click **Add Rule**.

Step 4 Enter a **Name** for the rule.

Step 5 Specify a **Type** for the rule.

Step 6 Click the **Zones** tab.

Step 7 Click a zone or interface in the **Available Zones** list.

Step 8 You have the following choices:

- To match traffic by source zone, click **Add to Source**.
- To match traffic by destination zone, click **Add to Destination**.

Note You can add only source zones to static NAT rules. Additionally, while you can add disabled interfaces to a NAT rule, the rule does not provide any translation.

Step 9 Click **Add** to save the new rule.

Step 10 Click **Save** to save the changed policy.

What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

Source Network Conditions in Dynamic NAT Rules

You configure the matching values and translation values of the source IP address for packets. If the original source network is not configured, then any source IP address matches the dynamic NAT rule. Note that you cannot configure source networks for static NAT rules. If a packet matches the NAT rule, the system uses the values in the translated source network to assign the new value for the source IP address. For dynamic rules, you must configure a translated source network with at least one value.

Caution If a network object or object group is being used by a NAT rule, and you change or delete the object or group, it can cause the rule to become invalid.

You can add any of the following kinds of source network conditions to a dynamic NAT rule:

- individual and group network objects that you have created using the object manager
- individual network objects that you add from the Source Network conditions page, and can then add to your rule and to other existing and future rules
- literal, single IP addresses, ranges, or address blocks

Note The system builds a separate network map for each leaf domain. In a multidomain deployment, using literal IP addresses to constrain this configuration can have unexpected results. Using override-enabled objects allows descendant domain administrators to tailor Global configurations to their local environments.

Adding Network Conditions to a Dynamic NAT Rule

Smart License	Classic License	Supported Devices	Supported Domains	Access
N/A	Control	7000 & 8000 Series	Any	Admin/Network Admin

When you update the network conditions in a dynamic rule in use in a deployed policy, the system drops any network sessions using the existing translated address pool.

Procedure

-
- Step 1** Choose **Devices > NAT** .
- Step 2** Click the edit icon () next to the NAT policy you want to modify.
- If **View** () appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.
- Step 3** Click **Add Rule**.
- Step 4** Enter a **Name** for the rule.
- Step 5** Specify a dynamic **Type** for the rule:
- **Dynamic IP Only**
 - **Dynamic IP + Port**
- Step 6** Click the **Source Networks** tab.
- Step 7** Optionally, add an individual network object to the **Available Networks** list by clicking the add icon () above the list.
- You can add multiple IP addresses, CIDR blocks, and prefix lengths to each network object.
- Step 8** Click a condition in the **Available Networks** list.
- Step 9** You have the following choices:
- To match traffic by original source network, click **Add to Original**.
 - To specify the translation value for traffic that matches the translated source network, click **Add to Translated**.
- Step 10** To add a literal IP address, range, or address block:
- a) Click the **Enter an IP address** prompt below the **Original Source Network** or **Translated Source Network** list.
 - b) Enter an IP address, range, or address block.

You add ranges in the following format: lower IP address-upper IP address. For example:
179.13.1.1-179.13.1.10.

Note The system builds a separate network map for each leaf domain. In a multidomain deployment, using literal IP addresses to constrain this configuration can have unexpected results. Using override-enabled objects allows descendant domain administrators to tailor Global configurations to their local environments.

c) Click **Add** next to the value you entered.

Step 11 Click **Add** to save the rule.

Step 12 Click **Save** to save the changed policy.

What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

Destination Network Conditions in NAT Rules

You configure the matching values and translation values of the destination IP address for packets. Note that you cannot configure translated destination networks for dynamic NAT rules.

Because static NAT rules are one-to-one translations, the **Available Networks** list contains only network objects and groups that contain only a single IP address. For static translations, you can add only a single object or literal value to both the **Original Destination Network** or **Translated Destination Network** lists.

Caution If a network object or object group is being used by a NAT rule, and you change or delete the object or group, it can cause the rule to become invalid.

You can add any of the following kinds of destination network conditions to a NAT rule:

- individual and group network objects that you have created using the object manager
- individual network objects that you add from the Destination Network conditions page, and can then add to your rule and to other existing and future rules
- literal, single IP addresses, range, or address blocks

For static NAT rules, you can add only a CIDR with subnet mask /32, and only if there is not already a value in the list.

Note The system builds a separate network map for each leaf domain. In a multidomain deployment, using literal IP addresses to constrain this configuration can have unexpected results. Using override-enabled objects allows descendant domain administrators to tailor Global configurations to their local environments.

Adding Destination Network Conditions to NAT Rules

Smart License	Classic License	Supported Devices	Supported Domains	Access
N/A	Control	7000 & 8000 Series	Any	Admin/Network Admin

When you update the network conditions in a dynamic rule in use in a deployed policy, the system drops any network sessions using the existing translated address pool.

Procedure

-
- Step 1** Choose **Devices > NAT** .
- Step 2** Click the edit icon (✎) next to the NAT policy you want to modify.
- If **View** (👁) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.
- Step 3** Click **Add Rule**.
- Step 4** Enter a **Name** for the rule.
- Step 5** Specify a **Type** for the rule.
- Step 6** Click the **Destination Network** tab.
- Step 7** Optionally, add an individual network object to the **Available Networks** list by clicking the add icon (+) above the list.
- For dynamic rules, you can add multiple IP addresses, CIDR blocks, and prefix lengths to each network object. For static rules, you can add only a single IP address.
- Step 8** Click a condition or object in the **Available Networks** list.
- Step 9** You have the following choices:
- To match traffic by original destination network, click **Add to Original**.
 - To specify the translation value for traffic that matches the translated destination network, click **Add to Translated**.
- Step 10** Optionally, click the **Enter an IP address** prompt below the **Original Destination Network** or **Translated Destination Network** list, enter an IP address or address block, and click **Add**.
- Step 11** Click **Add**.
- Step 12** Click **Save** to save the changes to the policy.
-

What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

Port Conditions in NAT Rules

You can add a port condition to a rule to match network traffic based on the original and translated destination port and transport protocol for translation. If the original port is not configured, any destination port matches the rule. If a packet matches the NAT rule and a translated destination port is configured, the system translates the port into that value. Note that for dynamic rules, you can specify only the original destination port. For static rules, you can define a translated destination port, but only with an object with the same protocol as the original destination port object or literal value.

The system matches the destination port against the value of the port object or literal port in the original destination port list for static rules, or multiple values for dynamic rules.

Because static NAT rules are one-to-one translations, the **Available Ports** list contains only port objects and groups that contain only a single port. For static translations, you can add only a single object or literal value to both the **Original Port** or **Translated Port** lists.

For dynamic rules, you can add a range of ports. For example, when specifying the original destination port, you can add 1000-1100 as a literal value.

Caution If a port object or object group is being used by a NAT rule, and you change or delete the object or group, it can cause the rule to become invalid.

You can add any of the following kinds of port conditions to a NAT rule:

- individual and group port objects that you have created using the object manager
- individual port objects that you add from the Destination Ports conditions page, and can then add to your rule and to other existing and future rules
- literal port values, consisting of a TCP, UDP, or All (TCP and UDP) transport protocol and a port

Adding Port Conditions to NAT Rules

Smart License	Classic License	Supported Devices	Supported Domains	Access
N/A	Control	7000 & 8000 Series	Any	Admin/Network Admin

Procedure

- Step 1** Choose **Devices > NAT**.
- Step 2** Click the edit icon (✎) next to the NAT policy you want to modify.
If **View** (👁) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.
- Step 3** Click **Add Rule**.
- Step 4** Enter a **Name** for the rule.
- Step 5** Specify a **Type** for the rule.

- Step 6** Click the **Destination Port** tab.
- Step 7** Optionally, add an individual port object to the **Available Ports** list by clicking the add icon (+) above the list.
- You can identify a single port or a port range in each port object that you add. You can then choose objects you added as conditions for your rule. For static rules, you can use only port objects with single ports.
- Step 8** Click a condition in the **Available Ports** list.
- Step 9** You have the following choices:
- Click **Add to Original**.
 - Click **Add to Translated**.
 - Drag and drop available ports into a list.
- Step 10** To add a literal port:
- a) Choose an entry from the **Protocol** drop-down list beneath the **Original Port** or **Translated Port** lists.
 - b) Enter a port.
 - c) Click **Add**.
- For dynamic rules, you can specify a single port or a range.
- Step 11** Click **Add**.
- Step 12** Click **Save** to save the changes to the policy.
-

- Deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

CHAPTER 42

Network Address Translation (NAT) for Firepower Threat Defense

The following topics explain Network Address Translation (NAT) and how to configure it on Firepower Threat Defense devices.

- [Why Use NAT?, on page 819](#)
- [NAT Basics, on page 820](#)
- [Guidelines for NAT, on page 828](#)
- [Configure NAT for Threat Defense, on page 832](#)
- [Examples for NAT, on page 862](#)
- [History for FTD NAT, on page 881](#)

Why Use NAT?

Each computer and device within an IP network is assigned a unique IP address that identifies the host. Because of a shortage of public IPv4 addresses, most of these IP addresses are private, not routable anywhere outside of the private company network. RFC 1918 defines the private IP addresses you can use internally that should not be advertised:

- 10.0.0.0 through 10.255.255.255
- 172.16.0.0 through 172.31.255.255
- 192.168.0.0 through 192.168.255.255

One of the main functions of NAT is to enable private IP networks to connect to the Internet. NAT replaces a private IP address with a public IP address, translating the private addresses in the internal private network into legal, routable addresses that can be used on the public Internet. In this way, NAT conserves public addresses because it can be configured to advertise at a minimum only one public address for the entire network to the outside world.

Other functions of NAT include:

- Security—Keeping internal IP addresses hidden discourages direct attacks.
- IP routing solutions—Overlapping IP addresses are not a problem when you use NAT.

- Flexibility—You can change internal IP addressing schemes without affecting the public addresses available externally; for example, for a server accessible to the Internet, you can maintain a fixed IP address for Internet use, but internally, you can change the server address.
- Translating between IPv4 and IPv6 (Routed mode only) —If you want to connect an IPv6 network to an IPv4 network, NAT lets you translate between the two types of addresses.

Note NAT is not required. If you do not configure NAT for a given set of traffic, that traffic will not be translated, but will have all of the security policies applied as normal.

NAT Basics

The following topics explain some of the basics of NAT.

NAT Terminology

This document uses the following terminology:

- Real address/host/network/interface—The real address is the address that is defined on the host, before it is translated. In a typical NAT scenario where you want to translate the inside network when it accesses the outside, the inside network would be the “real” network. Note that you can translate any network connected to the device, not just an inside network. Therefore if you configure NAT to translate outside addresses, “real” can refer to the outside network when it accesses the inside network.
- Mapped address/host/network/interface—The mapped address is the address that the real address is translated to. In a typical NAT scenario where you want to translate the inside network when it accesses the outside, the outside network would be the “mapped” network.

Note During address translation, IP addresses configured for the device interfaces are not translated.

- Bidirectional initiation—Static NAT allows connections to be initiated *bidirectionally*, meaning both to the host and from the host.
- Source and destination NAT—For any given packet, both the source and destination IP addresses are compared to the NAT rules, and one or both can be translated/untranslated. For static NAT, the rule is bidirectional, so be aware that “source” and “destination” are used in commands and descriptions throughout this guide even though a given connection might originate at the “destination” address.

NAT Types

You can implement NAT using the following methods:

- Dynamic NAT—A group of real IP addresses are mapped to a (usually smaller) group of mapped IP addresses, on a first come, first served basis. Only the real host can initiate traffic. See [Dynamic NAT, on page 833](#).
- Dynamic Port Address Translation (PAT)—A group of real IP addresses are mapped to a single IP address using a unique source port of that IP address. See [Dynamic PAT, on page 838](#).
- Static NAT—A consistent mapping between a real and mapped IP address. Allows bidirectional traffic initiation. See [Static NAT, on page 845](#).
- Identity NAT—A real address is statically translated to itself, essentially bypassing NAT. You might want to configure NAT this way when you want to translate a large group of addresses, but then want to exempt a smaller subset of addresses. See [Identity NAT, on page 853](#).

NAT in Routed and Transparent Mode

You can configure NAT in both routed and transparent firewall mode. You cannot configure NAT for interfaces operating in inline, inline tap, or passive modes. The following sections describe typical usage for each firewall mode.

NAT in Routed Mode

The following figure shows a typical NAT example in routed mode, with a private network on the inside.

Figure 29: NAT Example: Routed Mode

1. When the inside host at 10.1.2.27 sends a packet to a web server, the real source address of the packet, 10.1.2.27, is translated to a mapped address, 209.165.201.10.
2. When the server responds, it sends the response to the mapped address, 209.165.201.10, and the FTD device receives the packet because the FTD device performs proxy ARP to claim the packet.

3. The FTD device then changes the translation of the mapped address, 209.165.201.10, back to the real address, 10.1.2.27, before sending it to the host.

NAT in Transparent Mode

Using NAT in transparent mode eliminates the need for the upstream or downstream routers to perform NAT for their networks.

NAT in transparent mode has the following requirements and limitations:

- You cannot configure interface PAT when the mapped address is a bridge group member interface, because there is no IP address attached to the interface.
- ARP inspection is not supported. Moreover, if for some reason a host on one side of the FTD sends an ARP request to a host on the other side of the FTD, and the initiating host real address is mapped to a different address on the same subnet, then the real address remains visible in the ARP request.
- Translating between IPv4 and IPv6 networks is not supported. Translating between two IPv6 networks, or between two IPv4 networks is supported.

The following figure shows a typical NAT scenario in transparent mode, with the same network on the inside and outside interfaces. The transparent firewall in this scenario is performing the NAT service so that the upstream router does not have to perform NAT.

Figure 30: NAT Example: Transparent Mode

1. When the inside host at 10.1.1.75 sends a packet to a web server, the real source address of the packet, 10.1.1.75, is changed to a mapped address, 209.165.201.15.
2. When the server responds, it sends the response to the mapped address, 209.165.201.15, and the FTD receives the packet because the upstream router includes this mapped network in a static route directed to the FTD management IP address.

3. The FTD then undoes the translation of the mapped address, 209.165.201.15, back to the real address, 10.1.1.1.75. Because the real address is directly-connected, the FTD sends it directly to the host.
4. For host 192.168.1.2, the same process occurs, except for returning traffic, the FTD looks up the route in its routing table and sends the packet to the downstream router at 10.1.1.3 based on the FTD static route for 192.168.1.0/24.

Auto NAT and Manual NAT

You can implement address translation in two ways: *auto NAT* and *manual NAT*.

We recommend using auto NAT unless you need the extra features that manual NAT provides. It is easier to configure auto NAT, and it might be more reliable for applications such as Voice over IP (VoIP). (For VoIP, you might see a failure in the translation of indirect addresses that do not belong to either of the objects used in the rule.)

Auto NAT

All NAT rules that are configured as a parameter of a network object are considered to be *auto NAT* rules. This is a quick and easy way to configure NAT for a network object. You cannot create these rules for a group object, however.

Although these rules are configured as part of the object itself, you cannot see the NAT configuration in the object definition through the object manager.

When a packet enters an interface, both the source and destination IP addresses are checked against the auto NAT rules. The source and destination address in the packet can be translated by separate rules if separate matches are made. These rules are not tied to each other; different combinations of rules can be used depending on the traffic.

Because the rules are never paired, you cannot specify that sourceA/destinationA should have a different translation than sourceA/destinationB. Use manual NAT for that kind of functionality, where you can identify the source and destination address in a single rule.

Manual NAT

Manual NAT lets you identify both the source and destination address in a single rule. Specifying both the source and destination addresses lets you specify that sourceA/destinationA can have a different translation than sourceA/destinationB.

Note For static NAT, the rule is bidirectional, so be aware that “source” and “destination” are used in commands and descriptions throughout this guide even though a given connection might originate at the “destination” address. For example, if you configure static NAT with port address translation, and specify the source address as a Telnet server, and you want all traffic going to that Telnet server to have the port translated from 2323 to 23, then you must specify the *source* ports to be translated (real: 23, mapped: 2323). You specify the source ports because you specified the Telnet server address as the source address.

The destination address is optional. If you specify the destination address, you can either map it to itself (identity NAT), or you can map it to a different address. The destination mapping is always a static mapping.

Comparing Auto NAT and Manual NAT

The main differences between these two NAT types are:

- How you define the real address.
 - Auto NAT—The NAT rule becomes a parameter for a network object. The network object IP address serves as the original (real) address.
 - Manual NAT—You identify a network object or network object group for both the real and mapped addresses. In this case, NAT is not a parameter of the network object; the network object or group is a parameter of the NAT configuration. The ability to use a network object *group* for the real address means that manual NAT is more scalable.
- How source and destination NAT is implemented.
 - Auto NAT— Each rule can apply to either the source or destination of a packet. So two rules might be used, one for the source IP address, and one for the destination IP address. These two rules cannot be tied together to enforce a specific translation for a source/destination combination.
 - Manual NAT—A single rule translates both the source and destination. A packet matches one rule only, and further rules are not checked. Even if you do not configure the optional destination address, a matching packet still matches one manual NAT rule only. The source and destination are tied together, so you can enforce different translations depending on the source/destination combination. For example, sourceA/destinationA can have a different translation than sourceA/destinationB.
- Order of NAT Rules.
 - Auto NAT—Automatically ordered in the NAT table.
 - Manual NAT—Manually ordered in the NAT table (before or after auto NAT rules).

NAT Rule Order

Auto NAT and manual NAT rules are stored in a single table that is divided into three sections. Section 1 rules are applied first, then section 2, and finally section 3, until a match is found. For example, if a match is found in section 1, sections 2 and 3 are not evaluated. The following table shows the order of rules within each section.

Table 75: NAT Rule Table

Table Section	Rule Type	Order of Rules within the Section
Section 1	Manual NAT	<p>Applied on a first match basis, in the order they appear in the configuration. Because the first match is applied, you must ensure that specific rules come before more general rules, or the specific rules might not be applied as desired. By default, manual NAT rules are added to section 1.</p> <p>By "specific rules first," we mean:</p> <ul style="list-style-type: none"> • Static rules should come before dynamic rules. • Rules that include destination translation should come before rules with source translation only. <p>If you cannot eliminate overlapping rules, where more than one rule might apply based on the source or destination address, be especially careful to follow these recommendations.</p>
Section 2	Auto NAT	<p>If a match in section 1 is not found, section 2 rules are applied in the following order:</p> <ol style="list-style-type: none"> 1. Static rules. 2. Dynamic rules. <p>Within each rule type, the following ordering guidelines are used:</p> <ol style="list-style-type: none"> 1. Quantity of real IP addresses—From smallest to largest. For example, an object with one address will be assessed before an object with 10 addresses. 2. For quantities that are the same, then the IP address number is used, from lowest to highest. For example, 10.1.1.0 is assessed before 11.1.1.0. 3. If the same IP address is used, then the name of the network object is used, in alphabetical order. For example, abracadabra is assessed before catwoman.
Section 3	Manual NAT	<p>If a match is still not found, section 3 rules are applied on a first match basis, in the order they appear in the configuration. This section should contain your most general rules. You must also ensure that any specific rules in this section come before general rules that would otherwise apply.</p>

For section 2 rules, for example, you have the following IP addresses defined within network objects:

- 192.168.1.0/24 (static)
- 192.168.1.0/24 (dynamic)
- 10.1.1.0/24 (static)

- 192.168.1.1/32 (static)
- 172.16.1.0/24 (dynamic) (object def)
- 172.16.1.0/24 (dynamic) (object abc)

The resultant ordering would be:

- 192.168.1.1/32 (static)
- 10.1.1.0/24 (static)
- 192.168.1.0/24 (static)
- 172.16.1.0/24 (dynamic) (object abc)
- 172.16.1.0/24 (dynamic) (object def)
- 192.168.1.0/24 (dynamic)

NAT Interfaces

Except for bridge group member interfaces, you can configure a NAT rule to apply to any interface (in other words, all interfaces), or you can identify specific real and mapped interfaces. You can also specify any interface for the real address, and a specific interface for the mapped address, or vice versa.

For example, you might want to specify any interface for the real address and specify the outside interface for the mapped address if you use the same private addresses on multiple interfaces, and you want to translate them all to the same global pool when accessing the outside.

Figure 31: Specifying Any Interface

Note You cannot configure NAT for interfaces operating in inline, inline tap, or passive modes.

Configuring Routing for NAT

The Firepower Threat Defense device needs to be the destination for any packets sent to the translated (mapped) address.

When sending packets, the device uses the destination interface if you specify one, or a routing table lookup if you do not, to determine the egress interface. For identity NAT, you have the option to use a route lookup even if you specify a destination interface.

The type of routing configuration needed depends on the type of mapped address, as explained in the following topics.

Addresses on the Same Network as the Mapped Interface

If you use addresses on the same network as the destination (mapped) interface, the FTD device uses proxy ARP to answer any ARP requests for the mapped addresses, thus intercepting traffic destined for a mapped address. This solution simplifies routing because the FTD device does not have to be the gateway for any additional networks. This solution is ideal if the outside network contains an adequate number of free addresses, a consideration if you are using a 1:1 translation like dynamic NAT or static NAT. Dynamic PAT greatly extends the number of translations you can use with a small number of addresses, so even if the available addresses on the outside network is small, this method can be used. For PAT, you can even use the IP address of the mapped interface.

Note If you configure the mapped interface to be any interface, and you specify a mapped address on the same network as one of the mapped interfaces, then if an ARP request for that mapped address comes in on a *different* interface, then you need to manually configure an ARP entry for that network on the ingress interface, specifying its MAC address. Typically, if you specify any interface for the mapped interface, then you use a unique network for the mapped addresses, so this situation would not occur. Configure the ARP table in the ingress interface's **Advanced** settings.

Addresses on a Unique Network

If you need more addresses than are available on the destination (mapped) interface network, you can identify addresses on a different subnet. The upstream router needs a static route for the mapped addresses that points to the FTD device.

Alternatively for routed mode, you can configure a static route on the FTD device for the mapped addresses using any IP address on the destination network as the gateway, and then redistribute the route using your routing protocol. For example, if you use NAT for the inside network (10.1.1.0/24) and use the mapped IP address 209.165.201.5, then you can configure a static route for 209.165.201.5 255.255.255.255 (host address) to the 10.1.1.99 gateway that can be redistributed.

For transparent mode, if the real host is directly-connected, configure the static route on the upstream router to point to the FTD device: specify the bridge group IP address. For remote hosts in transparent mode, in the static route on the upstream router, you can alternatively specify the downstream router IP address.

The Same Address as the Real Address (Identity NAT)

The default behavior for identity NAT has proxy ARP enabled, matching other static NAT rules. You can disable proxy ARP if desired. You can also disable proxy ARP for regular static NAT if desired, in which case you need to be sure to have proper routes on the upstream router.

Normally for identity NAT, proxy ARP is not required, and in some cases can cause connectivity issues. For example, if you configure a broad identity NAT rule for “any” IP address, then leaving proxy ARP enabled can cause problems for hosts on the network directly connected to the mapped interface. In this case, when a host on the mapped network wants to communicate with another host on the same network, then the address

in the ARP request matches the NAT rule (which matches “any” address). The FTD device will then proxy ARP for the address, even though the packet is not actually destined for the FTD device. (Note that this problem occurs even if you have a manual NAT rule; although the NAT rule must match both the source and destination addresses, the proxy ARP decision is made only on the “source” address). If the FTD device ARP response is received before the actual host ARP response, then traffic will be mistakenly sent to the FTD device.

Guidelines for NAT

The following topics provide detailed guidelines for implementing NAT.

Firewall Mode Guidelines for NAT

NAT is supported in routed and transparent firewall mode.

However, configuring NAT on bridge group member interfaces (interfaces that are part of a Bridge Group Virtual Interface, or BVI) has the following restrictions:

- When configuring NAT for the members of a bridge group, you specify the member interface. You cannot configure NAT for the bridge group interface (BVI) itself.
- When doing NAT between bridge group member interfaces, you must specify the real and mapped addresses. You cannot specify “any” as the interface.
- You cannot configure interface PAT when the mapped address is a bridge group member interface, because there is no IP address attached to the interface.
- You cannot translate between IPv4 and IPv6 networks (NAT64/46) when the source and destination interfaces are members of the same bridge group. Static NAT/PAT 44/66, dynamic NAT44/66, and dynamic PAT44 are the only allowed methods; dynamic PAT66 is not supported.

Note You cannot configure NAT for interfaces operating in inline, inline tap, or passive modes.

IPv6 NAT Guidelines

NAT supports IPv6 with the following guidelines and restrictions.

- For standard routed mode interfaces, you can also translate between IPv4 and IPv6.
- You cannot translate between IPv4 and IPv6 for interfaces that are members of the same bridge group. You can translate between two IPv6 or two IPv4 networks only.
- You cannot use dynamic PAT for IPv6 (NAT66) when translating between interfaces in the same bridge group.
- For static NAT, you can specify an IPv6 subnet up to /64. Larger subnets are not supported.
- When using FTP with NAT46, when an IPv4 FTP client connects to an IPv6 FTP server, the client must use either the extended passive mode (EPSV) or extended port mode (EPRT); PASV and PORT commands are not supported with IPv6.

IPv6 NAT Best Practices

You can use NAT to translate between IPv6 networks, and also to translate between IPv4 and IPv6 networks (routed mode only). We recommend the following best practices:

- **NAT66 (IPv6-to-IPv6)**—We recommend using static NAT. Although you can use dynamic NAT or PAT, IPv6 addresses are in such large supply, you do not have to use dynamic NAT. If you do not want to allow returning traffic, you can make the static NAT rule unidirectional (manual NAT only).
- **NAT46 (IPv4-to-IPv6)**—We recommend using static NAT. Because the IPv6 address space is so much larger than the IPv4 address space, you can easily accommodate a static translation. If you do not want to allow returning traffic, you can make the static NAT rule unidirectional (manual NAT only). When translating to an IPv6 subnet (/96 or lower), the resulting mapped address is by default an IPv4-embedded IPv6 address, where the 32-bits of the IPv4 address is embedded after the IPv6 prefix. For example, if the IPv6 prefix is a /96 prefix, then the IPv4 address is appended in the last 32-bits of the address. For example, if you map 192.168.1.0/24 to 201b::0/96, then 192.168.1.4 will be mapped to 201b::0.192.168.1.4 (shown with mixed notation). If the prefix is smaller, such as /64, then the IPv4 address is appended after the prefix, and a suffix of 0s is appended after the IPv4 address. You can also optionally translate the addresses net-to-net, where the first IPv4 address maps to the first IPv6 address, the second to the second, and so on.
- **NAT64 (IPv6-to-IPv4)**—You may not have enough IPv4 addresses to accommodate the number of IPv6 addresses. We recommend using a dynamic PAT pool to provide a large number of IPv4 translations.

NAT Support for Inspected Protocols

Some application layer protocols that open secondary connections, or that embedded IP addresses in packets, are inspected to provide the following services:

- **Pinhole creation**—Some application protocols open secondary TCP or UDP connections either on standard or negotiated ports. Inspection opens pinholes for these secondary ports so that you do not need to create access control rules to allow them.
- **NAT rewrite**—Protocols such as FTP embed IP addresses and ports for the secondary connections in packet data as part of the protocol. If there is NAT translation involved for either of the endpoints, the inspection engines rewrite the packet data to reflect the NAT translation of the embedded addresses and ports. The secondary connections would not work without NAT rewrite.
- **Protocol enforcement**—Some inspections enforce some degree of conformance to the RFCs for the inspected protocol.

The following table lists the inspected protocols that apply NAT rewrite and their NAT limitations. Keep these limitations in mind when writing NAT rules that include these protocols. Inspected protocols not listed here do not apply NAT rewrite. These inspections include GTP, HTTP, IMAP, POP, SMTP, SSH, and SSL.

Note NAT rewrite is supported on the listed ports only. For some of these protocols, you can extend inspection to other ports using Network Analysis Policies, but NAT rewrite is not extended to those ports. This includes DCERPC, DNS, FTP, and Sun RPC inspection. If you use these protocols on non-standard ports, do not use NAT on the connections.

Table 76: NAT Supported Application Inspection

Application	Inspected Protocol, Port	NAT Limitations	Pinholes Created
DCERPC	TCP/135	No NAT64.	Yes
DNS over UDP	UDP/53	No NAT support is available for name resolution through WINS.	No
ESMTP	TCP/25	No NAT64.	No
FTP	TCP/21	(Clustering) No static PAT.	Yes
H.323 H.225 (Call signaling) H.323 RAS	TCP/1720 UDP/1718 For RAS, UDP/1718-1719	(Clustering) No static PAT. No extended PAT. No NAT64.	Yes
ICMP ICMP Error	ICMP (ICMP traffic directed to a device interface is never inspected.)	No limitations.	No
IP Options	RSVP	No NAT64.	No
NetBIOS Name Server over IP	UDP/137, 138 (Source ports)	No extended PAT. No NAT64.	No
RSH	TCP/514	No PAT. No NAT64. (Clustering) No static PAT.	Yes
RTSP	TCP/554 (No handling for HTTP cloaking.)	No extended PAT. No NAT64. (Clustering) No static PAT.	Yes
SIP	TCP/5060 UDP/5060	No extended PAT. No NAT64 or NAT46. (Clustering) No static PAT.	Yes
Skinny (SCCP)	TCP/2000	No extended PAT. No NAT64, NAT46, or NAT66. (Clustering) No static PAT.	Yes
SQL*Net (versions 1, 2)	TCP/1521	No extended PAT. No NAT64. (Clustering) No static PAT.	Yes

Application	Inspected Protocol, Port	NAT Limitations	Pinholes Created
Sun RPC	TCP/111 UDP/111	No extended PAT. No NAT64.	Yes
TFTP	UDP/69	No NAT64. (Clustering) No static PAT. Payload IP addresses are not translated.	Yes
XDMCP	UDP/177	No extended PAT. No NAT64. (Clustering) No static PAT.	Yes

Additional Guidelines for NAT

- (Auto NAT only.) You can only define a single NAT rule for a given object; if you want to configure multiple NAT rules for an object, you need to create multiple objects with different names that specify the same IP address.
- If you define a site-to-site VPN on a device that is behind a device that is applying dynamic PAT, so that UDP ports 500 and 4500 are not the ones actually used, you must initiate the connection from the device that is behind the PAT device. The responder cannot initiate the security association (SA) because it does not know the correct port numbers.
- If you change the NAT configuration, and you do not want to wait for existing translations to time out before the new NAT configuration is used, you can clear the translation table using the **clear xlate** command in the device CLI. However, clearing the translation table disconnects all current connections that use translations. Use the **system support** command to enter the diagnostic CLI, where you have access to the **clear xlate** command.

If you create a new NAT rule that should apply to an existing connection (such as a VPN tunnel), you need to use **clear conn** to end the connection. Then, the attempt to re-establish the connection should hit the NAT rule and the connection should be NAT'ed correctly.

Note If you remove a dynamic NAT or PAT rule, and then add a new rule with mapped addresses that overlap the addresses in the removed rule, then the new rule will not be used until all connections associated with the removed rule time out or are cleared using the **clear xlate** or **clear conn** commands. This safeguard ensures that the same address is not assigned to multiple hosts.

- You cannot use an object group with both IPv4 and IPv6 addresses; the object group must include only one type of address.
- (Manual NAT only.) When using **any** as the source address in a NAT rule, the definition of “any” traffic (IPv4 vs. IPv6) depends on the rule. Before the FTD device performs NAT on a packet, the packet must be IPv6-to-IPv6 or IPv4-to-IPv4; with this prerequisite, the FTD device can determine the value of **any** in a NAT rule. For example, if you configure a rule from “any” to an IPv6 server, and that server was

mapped from an IPv4 address, then **any** means “any IPv6 traffic.” If you configure a rule from “any” to “any,” and you map the source to the interface IPv4 address, then **any** means “any IPv4 traffic” because the mapped interface address implies that the destination is also IPv4.

- You can use the same mapped object or group in multiple NAT rules.
- The mapped IP address pool cannot include:
 - The mapped interface IP address. If you specify “any” interface for the rule, then all interface IP addresses are disallowed. For interface PAT (routed mode only), specify the interface name instead of the interface address.
 - The failover interface IP address.
 - (Transparent mode.) The management IP address.
- Avoid using overlapping addresses in static and dynamic NAT policies. For example, with overlapping addresses, a PPTP connection can fail to get established if the secondary connection for PPTP hits the static instead of dynamic xlate.
- You cannot use overlapping addresses in the source address of a NAT rule and a remote access VPN address pool.
- If you specify a destination interface in a rule, then that interface is used as the egress interface rather than looking up the route in the routing table. However, for identity NAT, you have the option to use a route lookup instead.
- NAT applies to through traffic only. Traffic generated by the system is not subject to NAT.
- Do not name a network object or group pat-pool, using any combination of upper- or lower-case letters.
- You cannot use NAT on the internal payload of Protocol Independent Multicast (PIM) registers.
- (Manual NAT) When writing NAT rules for a dual ISP interface setup (primary and backup interfaces using service level agreements in the routing configuration), do not specify destination criteria in the rule. Ensure the rule for the primary interface comes before the rule for the backup interface. This allows the device to choose the correct NAT destination interface based on the current routing state when the primary ISP is unavailable. If you specify destination objects, the NAT rule will always select the primary interface for the otherwise duplicate rules.
- If you get the ASP drop reason nat-no-xlate-to-pat-pool for traffic that should not match the NAT rules defined for the interface, configure identity NAT rules for the affected traffic so the traffic can pass untranslated.
- If you configure NAT for GRE tunnel endpoints, you must disable keepalives on the endpoints or the tunnel cannot be established. The endpoints send keepalives to the original addresses.

Configure NAT for Threat Defense

Network address translation can be very complex. We recommend that you keep your rules as simple as possible to avoid translation problems and difficult troubleshooting situations. Careful planning before you implement NAT is critical. The following procedure provides the basic approach.

Procedure

- Step 1** Choose **Devices > Device Management**, and edit the Firepower Threat Defense device. Select **NAT**.
- Step 2** Decide what kinds of rules you need.
- You can create dynamic NAT, dynamic PAT, static NAT, and identity NAT rules. For an overview, see [NAT Types, on page 820](#).
- Step 3** Decide which rules should be implemented as manual or auto NAT.
- For a comparison of these two implementation options, see [Auto NAT and Manual NAT, on page 823](#).
- Step 4** Create the rules as explained in the following sections.
- [Dynamic NAT, on page 833](#)
 - [Dynamic PAT, on page 838](#)
 - [Static NAT, on page 845](#)
 - [Identity NAT, on page 853](#)
- Step 5** Manage the NAT policy and rules.
- You can do the following to manage the policy and its rules.
- To change whether a rule is enabled or disabled, right click the rule and select the desired option from the **State** command. You can temporarily disable a rule without deleting it using these controls.
 - To edit a rule, click **Edit** () for the rule.
 - To delete a rule, click **Delete** () for the rule.
- Step 6** Click **Save**.
- You can now click **Deploy** and deploy the policy to assigned devices. The changes are not active until you deploy them.
-

Dynamic NAT

The following topics explain dynamic NAT and how to configure it.

About Dynamic NAT

Dynamic NAT translates a group of real addresses to a pool of mapped addresses that are routable on the destination network. The mapped pool typically includes fewer addresses than the real group. When a host you want to translate accesses the destination network, NAT assigns the host an IP address from the mapped pool. The translation is created only when the real host initiates the connection. The translation is in place only for the duration of the connection, and a given user does not keep the same IP address after the translation times out. Users on the destination network, therefore, cannot initiate a reliable connection to a host that uses dynamic NAT, even if the connection is allowed by an access rule.

Note For the duration of the translation, a remote host can initiate a connection to the translated host if an access rule allows it. Because the address is unpredictable, a connection to the host is unlikely. Nevertheless, in this case you can rely on the security of the access rule.

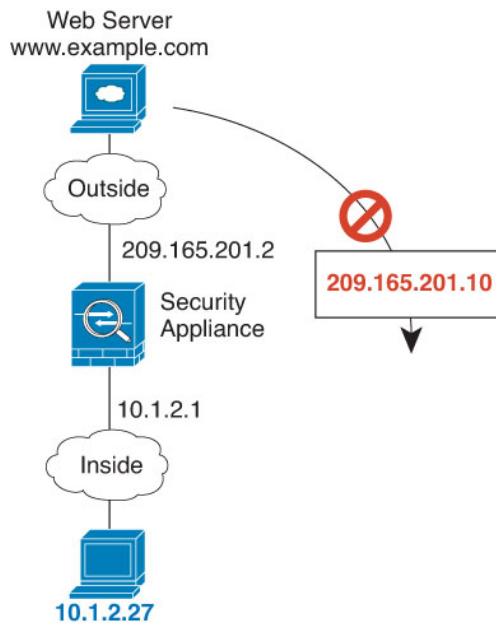

The following figure shows a typical dynamic NAT scenario. Only real hosts can create a NAT session, and responding traffic is allowed back.

Figure 32: Dynamic NAT

The following figure shows a remote host attempting to initiate a connection to a mapped address. This address is not currently in the translation table; therefore, the packet is dropped.

Figure 33: Remote Host Attempts to Initiate a Connection to a Mapped Address

Dynamic NAT Disadvantages and Advantages

Dynamic NAT has these disadvantages:

- If the mapped pool has fewer addresses than the real group, you could run out of addresses if the amount of traffic is more than expected.

Use PAT or a PAT fall-back method if this event occurs often because PAT provides over 64,000 translations using ports of a single address.

- You have to use a large number of routable addresses in the mapped pool, and routable addresses may not be available in large quantities.

The advantage of dynamic NAT is that some protocols cannot use PAT. PAT does not work with the following:

- IP protocols that do not have a port to overload, such as GRE version 0.
- Some multimedia applications that have a data stream on one port, the control path on another port, and are not open standard.

Configure Dynamic Auto NAT

Use dynamic auto NAT rules to translate addresses to different IP addresses that are routable on the destination network.

Before you begin

Select **Objects > Object Management** and create the network objects or groups needed in the rule. Alternatively, you can create the objects while defining the NAT rule. The objects must meet the following requirements:

- **Original Source**—This must be a network object (not a group), and it can be a host or subnet. You must select the **Allow Overrides** option.
- **Translated Source**—This can be a network object or group, but it cannot include a subnet. The group cannot contain both IPv4 and IPv6 addresses; it must contain one type only.

Procedure

-
- Step 1** Choose **Devices > Device Management**, and edit the Firepower Threat Defense device. Select **NAT**.
- Step 2** Do one of the following:
- Select **Add NAT Rule > Add Auto NAT** to create a new rule.
 - Click **Edit** (🔧) to edit an existing rule.
- The right click menu also has options to cut, copy, paste, insert, and delete rules.
- Step 3** Configure the basic rule options:
- **Type**—Select **Dynamic**.
 - **Source Interface, Destination Interface**—(Required for bridge group member interfaces.) The interfaces where this NAT rule applies. **Source** is the real interface, the one through which the traffic enters the device. **Destination** is the mapped interface, the one through which traffic exits the device. By default, the rule applies to all interfaces (**Any**) except for bridge group member interfaces.
- Step 4** On **General**, configure the following options:
- **Original Source**—The network object that contains the addresses you are translating.
 - **Translated Source**—The network object or group that contains the mapped addresses.

- Step 5** (Optional.) On **Advanced**, select the desired options:
- **Translate DNS replies that match this rule**—Whether to translate the IP address in DNS replies. For DNS replies traversing from a mapped interface to a real interface, the Address (the IPv4 A or IPv6 AAAA) record is rewritten from the mapped value to the real value. Conversely, for DNS replies traversing from a real interface to a mapped interface, the record is rewritten from the real value to the mapped value. This option is used in specific circumstances, and is sometimes needed for NAT64/46 translation, where the rewrite also converts between A and AAAA records.
 - **Fallthrough to Interface PAT (Destination Interface)**—Whether to use the IP address of the destination interface as a backup method when the other mapped addresses are already allocated (interface PAT fallback). This option is available only if you select a destination interface that is not a member of a bridge group. To use the IPv6 address of the interface, also check the **IPv6** option.
 - **IPv6**—Whether to use the IPv6 address of the destination interface for interface PAT.
- Step 6** Click **Save** to add the rule.
- Step 7** Click **Save** on the NAT page to save your changes.
-

Configure Dynamic Manual NAT

Use dynamic manual NAT rules when auto NAT does not meet your needs. For example, if you want to do different translations based on the destination. Dynamic NAT translates addresses to different IP addresses that are routable on the destination network.

Before you begin

Select **Objects > Object Management** and create the network objects or groups needed in the rule. Groups cannot contain both IPv4 and IPv6 addresses; they must contain one type only. Alternatively, you can create the objects while defining the NAT rule. The objects must also meet the following requirements:

- **Original Source**—This can be a network object or group, and it can contain a host or subnet. If you want to translate all original source traffic, you can skip this step and specify **Any** in the rule.
- **Translated Source**—This can be a network object or group, but it cannot include a subnet.

You can also create network objects for the **Original Destination** and **Translated Destination** if you are configuring a static translation for those addresses in the rule.

For dynamic NAT, you can also perform port translation on the destination. In the Object Manager, ensure that there are port objects you can use for the **Original Destination Port** and **Translated Destination Port**. If you specify the source port, it will be ignored.

Procedure

- Step 1** Choose **Devices > Device Management**, and edit the Firepower Threat Defense device. Select **NAT**.
- Step 2** Do one of the following:
- Select **Add NAT Rule > Add Manual NAT** to create a new rule.
 - Click **Edit** () to edit an existing rule.

The right click menu also has options to cut, copy, paste, insert, and delete rules.

Step 3 Configure the basic rule options:

- **Type**—Select **Dynamic**. This setting only applies to the source address. If you define a translation for the destination address, the translation is always static.
- **Enabled**—Whether you want the rule to be active. You can later activate or deactivate the rule using the right-click menu on the rules page.
- **Insert**—Where you want to add the rule. You can insert it in a category (before or after auto NAT rules), or above or below the rule number you specify.
- **Source Interface, Destination Interface**—(Required for bridge group member interfaces.) The interfaces where this NAT rule applies. **Source** is the real interface, the one through which the traffic enters the device. **Destination** is the mapped interface, the one through which traffic exits the device. By default, the rule applies to all interfaces (**Any**) except for bridge group member interfaces.

Step 4 Identify the original packet addresses, either IPv4 or IPv6; namely, the packet addresses as they appear in the original packet.

See the following figure for an example of the original packet vs. the translated packet.

- **Original Source**—The network object or group that contains the addresses you are translating.
- **Original Destination**—(Optional.) The network object that contains the addresses of the destinations. If you leave this blank, the source address translation applies regardless of destination. If you do specify the destination address, you can configure a static translation for that address or just use identity NAT for it.

You can select **Interface** to base the original destination on the source interface (which cannot be Any). If you select this option, you must also select a translated destination object. To implement a static interface NAT with port translation for the destination addresses, select this option and also select the appropriate port objects for the destination ports.

Step 5 Identify the translated packet addresses, either IPv4 or IPv6; namely, the packet addresses as they appear on the destination interface network. You can translate between IPv4 and IPv6 if desired.

- **Translated Source**—The network object or group that contains the mapped addresses.
- **Translated Destination**—(Optional.) The network object or group that contains the destination addresses used in the translated packet. If you selected an object for **Original Destination**, you can set up identity NAT (that is, no translation) by selecting the same object.

Step 6 (Optional.) Identify the destination service ports for service translation: **Original Destination Port, Translated Destination Port**.

Dynamic NAT does not support port translation, so leave the **Original Source Port** and **Translated Source Port** fields empty. However, because the destination translation is always static, you can perform port translation for the destination port.

NAT only supports TCP or UDP. When translating a port, be sure the protocols in the real and mapped service objects are identical (both TCP or both UDP). For identity NAT, you can use the same service object for both the real and mapped ports.

Step 7 (Optional.) On **Advanced**, select the desired options:

- (For source translation only.) **Translate DNS replies that match this rule**—Whether to translate the IP address in DNS replies. For DNS replies traversing from a mapped interface to a real interface, the Address (the IPv4 A or IPv6 AAAA) record is rewritten from the mapped value to the real value. Conversely, for DNS replies traversing from a real interface to a mapped interface, the record is rewritten from the real value to the mapped value. This option is used in specific circumstances, and is sometimes needed for NAT64/46 translation, where the rewrite also converts between A and AAAA records.
- **Fallthrough to Interface PAT (Destination Interface)**—Whether to use the IP address of the destination interface as a backup method when the other mapped addresses are already allocated (interface PAT fallback). This option is available only if you select a destination interface that is not a member of a bridge group. To use the IPv6 address of the interface, also check the **IPv6** option.
- **IPv6**—Whether to use the IPv6 address of the destination interface for interface PAT.

Step 8 Click **Save** to add the rule.

Step 9 Click **Save** on the NAT page to save your changes.

Dynamic PAT

The following topics describe dynamic PAT.

About Dynamic PAT

Dynamic PAT translates multiple real addresses to a single mapped IP address by translating the real address and source port to the mapped address and a unique port.

Each connection requires a separate translation session because the source port differs for each connection. For example, 10.1.1.1:1025 requires a separate translation from 10.1.1.1:1026.

The following figure shows a typical dynamic PAT scenario. Only real hosts can create a NAT session, and responding traffic is allowed back. The mapped address is the same for each translation, but the port is dynamically assigned.

Figure 34: Dynamic PAT

For the duration of the translation, a remote host on the destination network can initiate a connection to the translated host if an access rule allows it. Because the port address (both real and mapped) is unpredictable, a connection to the host is unlikely. Nevertheless, in this case you can rely on the security of the access rule.

After the connection expires, the port translation also expires.

Note We recommend that you use different PAT pools for each interface. If you use the same pool for multiple interfaces, especially if you use it for "any" interface, the pool can be quickly exhausted, with no ports available for new translations.

Dynamic PAT Disadvantages and Advantages

Dynamic PAT lets you use a single mapped address, thus conserving routable addresses. You can even use the FTD device interface IP address as the PAT address.

You cannot use dynamic PAT for IPv6 (NAT66) when translating between interfaces in the same bridge group.

Dynamic PAT does not work with some multimedia applications that have a data stream that is different from the control path. For more information, see [NAT Support for Inspected Protocols, on page 829](#).

Dynamic PAT might also create a large number of connections appearing to come from a single IP address, and servers might interpret the traffic as a DoS attack. You can configure a PAT pool of addresses and use a round-robin assignment of PAT addresses to mitigate this situation.

PAT Pool Object Guidelines

When creating network objects for a PAT pool, follow these guidelines.

For a PAT pool

- If available, the real source port number is used for the mapped port. However, if the real port is *not* available, by default the mapped ports are chosen from the same range of ports as the real port number: 0 to 511, 512 to 1023, and 1024 to 65535. Therefore, ports below 1024 have only a small PAT pool that can be used. If you have a lot of traffic that uses the lower port ranges, you can specify a flat range of ports to be used instead of the three unequal-sized tiers: either 1024 to 65535, or 1 to 65535.
- If you use the same PAT pool object in two separate rules, then be sure to specify the same options for each rule. For example, if one rule specifies extended PAT, then the other rule must also specify extended PAT.
- If a host has an existing connection, then subsequent connections from that host use the same PAT IP address. If no ports are available, this can prevent the connection. Use the round robin option to avoid this problem.
- For best performance, limit the number of IP addresses within a PAT pool to 10,000.

For extended PAT for a PAT pool

- Many application inspections do not support extended PAT.
- If you enable extended PAT for a dynamic PAT rule, then you cannot also use an address in the PAT pool as the PAT address in a separate static NAT with port translation rule. For example, if the PAT pool includes 10.1.1.1, then you cannot create a static NAT-with-port-translation rule using 10.1.1.1 as the PAT address.
- If you use a PAT pool and specify an interface for fallback, you cannot specify extended PAT.

- For VoIP deployments that use ICE or TURN, do not use extended PAT. ICE and TURN rely on the PAT binding to be the same for all destinations.
- Extended PAT increases memory usage on the device.

For round robin for a PAT pool

- If a host has an existing connection, then subsequent connections from that host will use the same PAT IP address if ports are available. However, this “stickiness” does not survive a failover. If the device fails over, then subsequent connections from a host might not use the initial IP address.
- IP address “stickiness” is also impacted if you mix PAT pool/round robin rules with interface PAT rules on the same interface. For any given interface, choose either a PAT pool or interface PAT; do not create competing PAT rules.
- Round robin, especially when combined with extended PAT, can consume a large amount of memory. Because NAT pools are created for every mapped protocol/IP address/port range, round robin results in a large number of concurrent NAT pools, which use memory. Extended PAT results in an even larger number of concurrent NAT pools.

Configure Dynamic Auto PAT

Use dynamic auto PAT rules to translate addresses to unique IP address/port combinations, rather than to multiple IP addresses only. You can translate to a single address (either the destination interface's address or another address), or use a PAT pool of addresses to provide a larger number of possible translations.

Before you begin

Select **Objects > Object Management** and create the network objects or groups needed in the rule. Alternatively, you can create the objects while defining the NAT rule. The objects must meet the following requirements:

- **Original Source**—This must be a network object (not a group), and it can be a host or subnet. You must select the **Allow Overrides** option.
- **Translated Source**—You have the following options to specify the PAT address:
 - **Destination Interface**—To use the destination interface address, you do not need a network object.
 - **Single PAT address**—Create a network object containing a single host.
 - **PAT pool**—Create a network object group that contains more than one host address. You cannot include subnets. The group cannot contain both IPv4 and IPv6 addresses; it must contain one type only.

Procedure

-
- Step 1** Choose **Devices > Device Management**, and edit the Firepower Threat Defense device. Select **NAT**.
- Step 2** Do one of the following:
- Select **Add NAT Rule > Add Auto NAT** to create a new rule.

- Click **Edit** (🔧) to edit an existing rule.

The right click menu also has options to cut, copy, paste, insert, and delete rules.

Step 3 Configure the basic rule options:

- **Type**—Select **Dynamic**.
- **Source Interface, Destination Interface**—(Required for bridge group member interfaces.) The interfaces where this NAT rule applies. **Source** is the real interface, the one through which the traffic enters the device. **Destination** is the mapped interface, the one through which traffic exits the device. By default, the rule applies to all interfaces (**Any**) except for bridge group member interfaces.

Step 4 On **General**, configure the following options:

- **Original Source**—The network object that contains the addresses you are translating.
- **Translated Source**—One of the following:
 - (Interface PAT.) To use the address of the destination interface, select **Interface**. You must also select a specific destination interface. To use the IPv6 address of the interface, you must also select the **IPv6** option on **Advanced**. Skip the step for configuring a PAT pool.
 - To use a single address other than the destination interface address, select the host network object you created for this purpose. Skip the step for configuring a PAT pool.
 - To use a PAT pool, leave **Translated Source** empty.

Step 5 If you are using a PAT pool, select the **PAT Pool** page and do the following:

- a) Select **Enable PAT pool**.
- b) Select the network object group that contains the addresses for the pool in the **PAT > Address** field.
You can alternatively select **Interface**, which is another way to implement interface PAT.
- c) (Optional) Select the following options as needed:
 - **Use Round Robin Allocation**—To assign addresses/ports in a round-robin fashion. By default without round robin, all ports for a PAT address will be allocated before the next PAT address is used. The round-robin method assigns one address/port from each PAT address in the pool before returning to use the first address again, and then the second address, and so on.
 - **Extended PAT Table**—To use extended PAT. Extended PAT uses 65535 ports per *service*, as opposed to per IP address, by including the destination address and port in the translation information. Normally, the destination port and address are not considered when creating PAT translations, so you are limited to 65535 ports per PAT address. For example, with extended PAT, you can create a translation of 10.1.1.1:1027 when going to 192.168.1.7:23 as well as a translation of 10.1.1.1:1027 when going to 192.168.1.7:80. You cannot use this option with interface PAT or interface PAT fallback.
 - **Flat Port Range, Include Reserved Ports**—To use the 1024 to 65535 port range as a single flat range when allocating TCP/UDP ports. When choosing the mapped port number for a translation, PAT uses the real source port number if it is available. However, without this option, if the real port is *not* available, by default the mapped ports are chosen from the same range of ports as the real port number: 1 to 511, 512 to 1023, and 1024 to 65535. To avoid running out of ports at the low ranges, configure this setting. To use the entire range of 1 to 65535, also check the **Include Reserved Ports** option.

- Step 6** (Optional.) On **Advanced**, select the desired options:
- **Fallthrough to Interface PAT (Destination Interface)**—Whether to use the IP address of the destination interface as a backup method when the other mapped addresses are already allocated (interface PAT fallback). This option is available only if you select a destination interface that is not a member of a bridge group. To use the IPv6 address of the interface, also check the **IPv6** option. You cannot select this option if you already configured interface PAT as the translated address or PAT pool.
 - **IPv6**—Whether to use the IPv6 address of the destination interface for interface PAT.
- Step 7** Click **Save** to add the rule.
- Step 8** Click **Save** on the NAT page to save your changes.
-

Configure Dynamic Manual PAT

Use dynamic manual PAT rules when auto PAT does not meet your needs. For example, if you want to do different translations based on the destination. Dynamic PAT translates addresses to unique IP address/port combinations, rather than to multiple IP addresses only. You can translate to a single address (either the destination interface's address or another address), or use a PAT pool of addresses to provide a larger number of possible translations.

Before you begin

Select **Objects > Object Management** and create the network objects or groups needed in the rule. Groups cannot contain both IPv4 and IPv6 addresses; they must contain one type only. Alternatively, you can create the objects while defining the NAT rule. The objects must also meet the following requirements:

- **Original Source**—This can be a network object or group, and it can contain a host or subnet. If you want to translate all original source traffic, you can skip this step and specify **Any** in the rule.
- **Translated Source**—You have the following options to specify the PAT address:
 - **Destination Interface**—To use the destination interface address, you do not need a network object.
 - **Single PAT address**—Create a network object containing a single host.
 - **PAT pool**—Create a network object group that contains more than one host address. You cannot include subnets.

You can also create network objects for the **Original Destination** and **Translated Destination** if you are configuring a static translation for those addresses in the rule.

For dynamic NAT, you can also perform port translation on the destination. In the Object Manager, ensure that there are port objects you can use for the **Original Destination Port** and **Translated Destination Port**. If you specify the source port, it will be ignored.

Procedure

- Step 1** Choose **Devices > Device Management**, and edit the Firepower Threat Defense device. Select **NAT**.
- Step 2** Do one of the following:
- Select **Add NAT Rule > Add Manual NAT** to create a new rule.

- Click **Edit** (🔧) to edit an existing rule.

The right click menu also has options to cut, copy, paste, insert, and delete rules.

Step 3

Configure the basic rule options:

- **Type**—Select **Dynamic**. This setting only applies to the source address. If you define a translation for the destination address, the translation is always static.
- **Enable**—Whether you want the rule to be active. You can later activate or deactivate the rule using the right-click menu on the rules page.
- **Insert**—Where you want to add the rule. You can insert it in a category (before or after auto NAT rules), or above or below the rule number you specify.
- **Source Interface, Destination Interface**—(Required for bridge group member interfaces.) The interfaces where this NAT rule applies. **Source** is the real interface, the one through which the traffic enters the device. **Destination** is the mapped interface, the one through which traffic exits the device. By default, the rule applies to all interfaces (**Any**) except for bridge group member interfaces.

Step 4

Identify the original packet addresses, either IPv4 or IPv6; namely, the packet addresses as they appear in the original packet.

See the following figure for an example of the original packet vs. the translated packet.

- **Original Source**—The network object or group that contains the addresses you are translating.
- **Original Destination**—(Optional.) The network object that contains the addresses of the destinations. If you leave this blank, the source address translation applies regardless of destination. If you do specify the destination address, you can configure a static translation for that address or just use identity NAT for it.

You can select **Interface** to base the original destination on the source interface (which cannot be Any). If you select this option, you must also select a translated destination object. To implement a static interface NAT with port translation for the destination addresses, select this option and also select the appropriate port objects for the destination ports.

Step 5

Identify the translated packet addresses, either IPv4 or IPv6; namely, the packet addresses as they appear on the destination interface network. You can translate between IPv4 and IPv6 if desired.

- **Translated Source**—One of the following:
 - (Interface PAT.) To use the address of the destination interface, select **Interface**. You must also select a specific destination interface. To use the IPv6 address of the interface, you must also select the **IPv6** option on **Advanced**. Skip the step for configuring a PAT pool.
 - To use a single address other than the destination interface address, select the host network object you created for this purpose. Skip the step for configuring a PAT pool.

- To use a PAT pool, leave **Translated Source** empty.
- **Translated Destination**—(Optional.) The network object or group that contains the destination addresses used in the translated packet. If you selected an object for **Original Destination**, you can set up identity NAT (that is, no translation) by selecting the same object.

Step 6 (Optional.) Identify the destination service ports for service translation: **Original Destination Port**, **Translated Destination Port**.

Dynamic NAT does not support port translation, so leave the **Original Source Port** and **Translated Source Port** fields empty. However, because the destination translation is always static, you can perform port translation for the destination port.

NAT only supports TCP or UDP. When translating a port, be sure the protocols in the real and mapped service objects are identical (both TCP or both UDP). For identity NAT, you can use the same service object for both the real and mapped ports.

Step 7 If you are using a PAT pool, select the **PAT Pool** page and do the following:

- Select **Enable PAT pool**.
- Select the network object group that contains the addresses for the pool in the **PAT > Address** field.

You can alternatively select **Interface**, which is another way to implement interface PAT.

- (Optional) Select the following options as needed:

- **Use Round Robin Allocation**—To assign addresses/ports in a round-robin fashion. By default without round robin, all ports for a PAT address will be allocated before the next PAT address is used. The round-robin method assigns one address/port from each PAT address in the pool before returning to use the first address again, and then the second address, and so on.
- **Extended PAT Table**—To use extended PAT. Extended PAT uses 65535 ports per *service*, as opposed to per IP address, by including the destination address and port in the translation information. Normally, the destination port and address are not considered when creating PAT translations, so you are limited to 65535 ports per PAT address. For example, with extended PAT, you can create a translation of 10.1.1.1:1027 when going to 192.168.1.7:23 as well as a translation of 10.1.1.1:1027 when going to 192.168.1.7:80. You cannot use this option with interface PAT or interface PAT fallback.
- **Flat Port Range, Include Reserved Ports**—To use the 1024 to 65535 port range as a single flat range when allocating TCP/UDP ports. When choosing the mapped port number for a translation, PAT uses the real source port number if it is available. However, without this option, if the real port is *not* available, by default the mapped ports are chosen from the same range of ports as the real port number: 1 to 511, 512 to 1023, and 1024 to 65535. To avoid running out of ports at the low ranges, configure this setting. To use the entire range of 1 to 65535, also check the **Include Reserved Ports** option.

Step 8 (Optional.) On **Advanced**, select the desired options:

- **Fallthrough to Interface PAT (Destination Interface)**—Whether to use the IP address of the destination interface as a backup method when the other mapped addresses are already allocated (interface PAT fallback). This option is available only if you select a destination interface that is not a member of a bridge group. To use the IPv6 address of the interface, also check the **IPv6** option.
- **IPv6**—Whether to use the IPv6 address of the destination interface for interface PAT.

Step 9 Click **Save** to add the rule.

Step 10 Click **Save** on the NAT page to save your changes.

Static NAT

The following topics explain static NAT and how to implement it.

About Static NAT

Static NAT creates a fixed translation of a real address to a mapped address. Because the mapped address is the same for each consecutive connection, static NAT allows bidirectional connection initiation, both to and from the host (if an access rule exists that allows it). With dynamic NAT and PAT, on the other hand, each host uses a different address or port for each subsequent translation, so bidirectional initiation is not supported.

The following figure shows a typical static NAT scenario. The translation is always active so both real and remote hosts can initiate connections.

Figure 35: Static NAT

Note You can disable bidirectionality if desired.

Static NAT with Port Translation

Static NAT with port translation lets you specify a real and mapped protocol and port.

When you specify the port with static NAT, you can choose to map the port and/or the IP address to the same value or to a different value.

The following figure shows a typical static NAT with port translation scenario showing both a port that is mapped to itself and a port that is mapped to a different value; the IP address is mapped to a different value in both cases. The translation is always active so both translated and remote hosts can initiate connections.

Figure 36: Typical Static NAT with Port Translation Scenario

Static NAT-with-port-translation rules limit access to the destination IP address for the specified port only. If you try to access the destination IP address on a different port not covered by a NAT rule, then the connection is blocked. In addition, for manual NAT, traffic that does not match the source IP address of the NAT rule will be dropped if it matches the destination IP address, regardless of the destination port. Therefore, you must add additional rules for all other traffic allowed to the destination IP address. For example, you can configure a static NAT rule for the IP address, without port specification, and place it after the port translation rule.

Note For applications that require application inspection for secondary channels (for example, FTP and VoIP), NAT automatically translates the secondary ports.

Following are some other uses of static NAT with port translation.

Static NAT with Identity Port Translation

You can simplify external access to internal resources. For example, if you have three separate servers that provide services on different ports (such as FTP, HTTP, and SMTP), you can give external users a single IP address to access those services. You can then configure static NAT with identity port translation to map the single external IP address to the correct IP addresses of the real servers based on the port they are trying to access. You do not need to change the port, because the servers are using the standard ones (21, 80, and 25 respectively).

Static NAT with Port Translation for Non-Standard Ports

You can also use static NAT with port translation to translate a well-known port to a non-standard port or vice versa. For example, if inside web servers use port 8080, you can allow outside users to connect to port 80, and then undo translation to the original port 8080. Similarly, to provide extra security, you can tell web users to connect to non-standard port 6785, and then undo translation to port 80.

Static Interface NAT with Port Translation

You can configure static NAT to map a real address to an interface address/port combination. For example, if you want to redirect Telnet access for the device's outside interface to an inside host, then you can map the inside host IP address/port 23 to the outside interface address/port 23.

One-to-Many Static NAT

Typically, you configure static NAT with a one-to-one mapping. However, in some cases, you might want to configure a single real address to several mapped addresses (one-to-many). When you configure one-to-many static NAT, when the real host initiates traffic, it always uses the first mapped address. However, for traffic initiated to the host, you can initiate traffic to any of the mapped addresses, and they will be untranslated to the single real address.

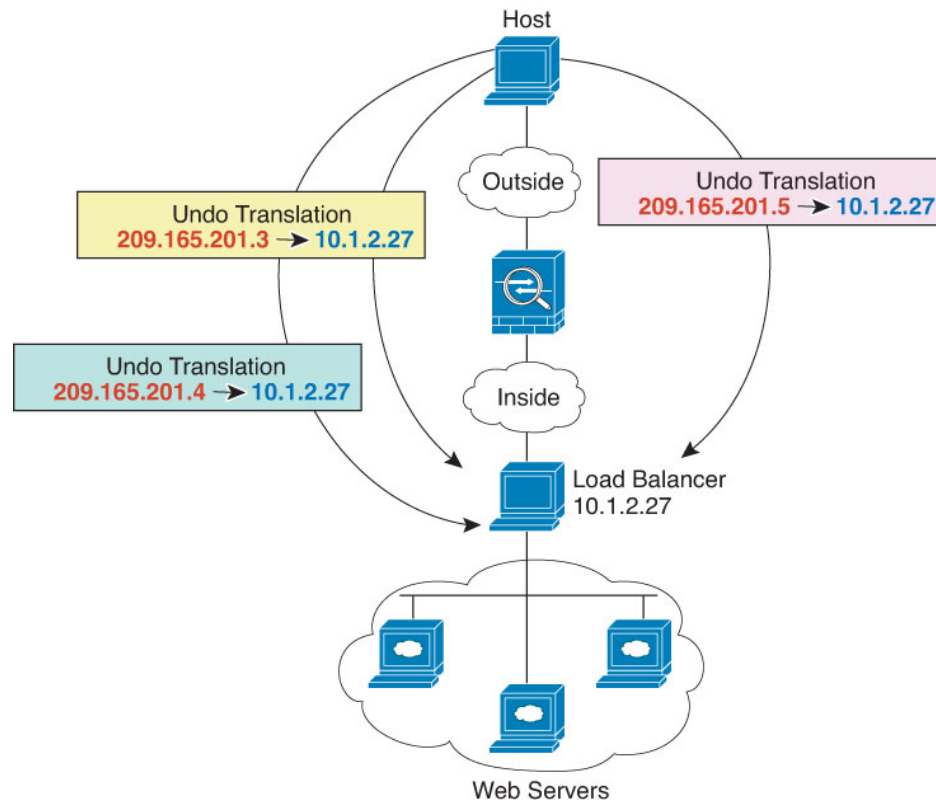

The following figure shows a typical one-to-many static NAT scenario. Because initiation by the real host always uses the first mapped address, the translation of real host IP/first mapped IP is technically the only bidirectional translation.

Figure 37: One-to-Many Static NAT

For example, you have a load balancer at 10.1.2.27. Depending on the URL requested, it redirects traffic to the correct web server.

Figure 38: One-to-Many Static NAT Example

Other Mapping Scenarios (Not Recommended)

NAT has the flexibility to allow any kind of static mapping scenario: one-to-one, one-to-many, but also few-to-many, many-to-few, and many-to-one mappings. We recommend using only one-to-one or one-to-many mappings. These other mapping options might result in unintended consequences.

Functionally, few-to-many is the same as one-to-many; but because the configuration is more complicated and the actual mappings may not be obvious at a glance, we recommend creating a one-to-many configuration for each real address that requires it. For example, for a few-to-many scenario, the few real addresses are mapped to the many mapped addresses in order (A to 1, B to 2, C to 3). When all real addresses are mapped, the next mapped address is mapped to the first real address, and so on until all mapped addresses are mapped (A to 4, B to 5, C to 6). This results in multiple mapped addresses for each real address. Just like a one-to-many configuration, only the first mappings are bidirectional; subsequent mappings allow traffic to be initiated *to* the real host, but all traffic *from* the real host uses only the first mapped address for the source.

The following figure shows a typical few-to-many static NAT scenario.

Figure 39: Few-to-Many Static NAT

For a many-to-few or many-to-one configuration, where you have more real addresses than mapped addresses, you run out of mapped addresses before you run out of real addresses. Only the mappings between the lowest real IP addresses and the mapped pool result in bidirectional initiation. The remaining higher real addresses can initiate traffic, but traffic cannot be initiated to them (returning traffic for a connection is directed to the correct real address because of the unique 5-tuple (source IP, destination IP, source port, destination port, protocol) for the connection).

Note Many-to-few or many-to-one NAT is not PAT. If two real hosts use the same source port number and go to the same outside server and the same TCP destination port, and both hosts are translated to the same IP address, then both connections will be reset because of an address conflict (the 5-tuple is not unique).

The following figure shows a typical many-to-few static NAT scenario.

Figure 40: Many-to-Few Static NAT

Instead of using a static rule this way, we suggest that you create a one-to-one rule for the traffic that needs bidirectional initiation, and then create a dynamic rule for the rest of your addresses.

Configure Static Auto NAT

Use static auto NAT rules to translate addresses to different IP addresses that are routable on the destination network. You can also do port translation with the static NAT rule.

Before you begin

Select **Objects > Object Management** and create the network objects or groups needed in the rule. Alternatively, you can create the objects while defining the NAT rule. The objects must meet the following requirements:

- **Original Source**—This must be a network object (not a group), and it can be a host or subnet. You must select the **Allow Overrides** option.
- **Translated Source**—You have the following options to specify the translated address:
 - **Destination Interface**—To use the destination interface address, you do not need a network object. This configures static interface NAT with port translation: the source address/port is translated to the interface's address and the same port number.
 - **Address**—Create a network object or group containing hosts or subnets. A group cannot contain both IPv4 and IPv6 addresses; it must contain one type only. Typically, you configure the same number of mapped addresses as real addresses for a one-to-one mapping. You can, however, have a mismatched number of addresses.

Procedure

-
- Step 1** Choose **Devices > Device Management**, and edit the Firepower Threat Defense device. Select **NAT**.
- Step 2** Do one of the following:
- Select **Add NAT Rule > Add Auto NAT** to create a new rule.
 - Click **Edit** () to edit an existing rule.
- The right click menu also has options to cut, copy, paste, insert, and delete rules.
- Step 3** Configure the basic rule options:
- **Type**—Select **Static**.
 - **Source Interface, Destination Interface**—(Required for bridge group member interfaces.) The interfaces where this NAT rule applies. **Source** is the real interface, the one through which the traffic enters the device. **Destination** is the mapped interface, the one through which traffic exits the device. By default, the rule applies to all interfaces (**Any**) except for bridge group member interfaces.
- Step 4** On **General**, configure the following options:
- **Original Source**—The network object that contains the addresses you are translating.
 - **Translated Source**—One of the following:
 - To use a set group of addresses, select **Address** and the network object or group that contains the mapped addresses. Typically, you configure the same number of mapped addresses as real addresses for a one-to-one mapping. You can, however, have a mismatched number of addresses.

- (Static interface NAT with port translation.) To use the address of the destination interface, select **Interface**. You must also select a specific destination interface. To use the IPv6 address of the interface, you must also select the **IPv6** option on **Advanced**. This configures static interface NAT with port translation: the source address/port is translated to the interface's address and the same port number.
- (Optional.) **Original Port, Translated Port**—If you need to translate a TCP or UDP port, select the protocol in **Original Port**, and type the original and translated port numbers. For example, you can translate TCP/80 to 8080 if necessary.

Step 5 (Optional.) On **Advanced**, select the desired options:

- **Translate DNS replies that match this rule**—Whether to translate the IP address in DNS replies. For DNS replies traversing from a mapped interface to a real interface, the Address (the IPv4 A or IPv6 AAAA) record is rewritten from the mapped value to the real value. Conversely, for DNS replies traversing from a real interface to a mapped interface, the record is rewritten from the real value to the mapped value. This option is used in specific circumstances, and is sometimes needed for NAT64/46 translation, where the rewrite also converts between A and AAAA records. This option is not available if you are doing port translation.
- **IPv6**—Whether to use the IPv6 address of the destination interface for interface PAT.
- **Net to Net Mapping**—For NAT 46, select this option to translate the first IPv4 address to the first IPv6 address, the second to the second, and so on. Without this option, the IPv4-embedded method is used. For a one-to-one translation, you must use this option.
- **Do not proxy ARP on Destination Interface**—Disables proxy ARP for incoming packets to the mapped IP addresses. If you use addresses on the same network as the mapped interface, the system uses proxy ARP to answer any ARP requests for the mapped addresses, thus intercepting traffic destined for a mapped address. This solution simplifies routing because the device does not have to be the gateway for any additional networks. You can disable proxy ARP if desired, in which case you need to be sure to have proper routes on the upstream router. Normally for identity NAT, proxy ARP is not required, and in some cases can cause connectivity issues.

Step 6 Click **Save** to add the rule.

Step 7 Click **Save** on the NAT page to save your changes.

Configure Static Manual NAT

Use static manual NAT rules when auto NAT does not meet your needs. For example, if you want to do different translations based on the destination. Static NAT translates addresses to different IP addresses that are routable on the destination network. You can also do port translation with the static NAT rule.

Before you begin

Select **Objects > Object Management** and create the network objects or groups needed in the rule. Groups cannot contain both IPv4 and IPv6 addresses; they must contain one type only. Alternatively, you can create the objects while defining the NAT rule. The objects must also meet the following requirements:

- **Original Source**—This can be a network object or group, and it can contain a host or subnet. If you want to translate all original source traffic, you can skip this step and specify **Any** in the rule.
- **Translated Source**—You have the following options to specify the translated address:

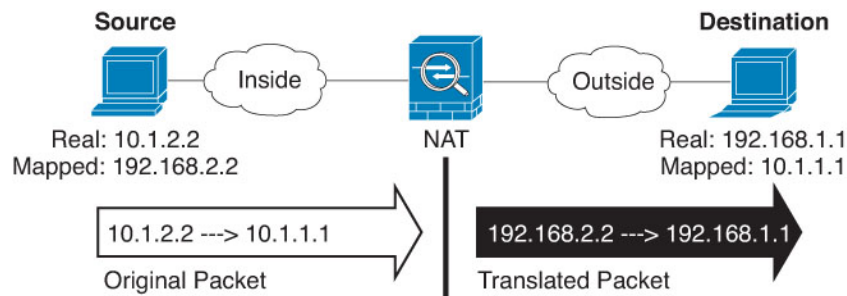

- **Destination Interface**—To use the destination interface address, you do not need a network object. This configures static interface NAT with port translation: the source address/port is translated to the interface's address and the same port number.
- **Address**—Create a network object or group containing hosts or subnets. Typically, you configure the same number of mapped addresses as real addresses for a one-to-one mapping. You can, however, have a mismatched number of addresses.

You can also create network objects for the **Original Destination** and **Translated Destination** if you are configuring a static translation for those addresses in the rule. If you want to configure destination static interface NAT with port translation only, you can skip adding an object for the destination mapped addresses and specify the interface in the rule.

You can also perform port translation on the source, destination, or both. In the Object Manager, ensure that there are port objects you can use for the original and translated ports.

Procedure

- Step 1** Choose **Devices > Device Management**, and edit the Firepower Threat Defense device. Select **NAT**.
- Step 2** Do one of the following:
- Select **Add NAT Rule > Add Manual NAT** to create a new rule.
 - Click **Edit** () to edit an existing rule.
- The right click menu also has options to cut, copy, paste, insert, and delete rules.
- Step 3** Configure the basic rule options:
- **Type**—Select **Static**. This setting only applies to the source address. If you define a translation for the destination address, the translation is always static.
 - **Enable**—Whether you want the rule to be active. You can later activate or deactivate the rule using the right-click menu on the rules page.
 - **Insert**—Where you want to add the rule. You can insert it in a category (before or after auto NAT rules), or above or below the rule number you specify.
 - **Source Interface, Destination Interface**—(Required for bridge group member interfaces.) The interfaces where this NAT rule applies. **Source** is the real interface, the one through which the traffic enters the device. **Destination** is the mapped interface, the one through which traffic exits the device. By default, the rule applies to all interfaces (**Any**) except for bridge group member interfaces.
- Step 4** Identify the original packet addresses, either IPv4 or IPv6; namely, the packet addresses as they appear in the original packet.
- See the following figure for an example of the original packet vs. the translated packet.

- **Original Source**—The network object or group that contains the addresses you are translating.
- **Original Destination**—(Optional.) The network object that contains the addresses of the destinations. If you leave this blank, the source address translation applies regardless of destination. If you do specify the destination address, you can configure a static translation for that address or just use identity NAT for it.

You can select **Interface** to base the original destination on the source interface (which cannot be Any). If you select this option, you must also select a translated destination object. To implement a static interface NAT with port translation for the destination addresses, select this option and also select the appropriate port objects for the destination ports.

Step 5 Identify the translated packet addresses, either IPv4 or IPv6; namely, the packet addresses as they appear on the destination interface network. You can translate between IPv4 and IPv6 if desired.

- **Translated Source**—One of the following:
 - To use a set group of addresses, select **Address** and the network object or group that contains the mapped addresses. Typically, you configure the same number of mapped addresses as real addresses for a one-to-one mapping. You can, however, have a mismatched number of addresses.
 - (Static interface NAT with port translation.) To use the address of the destination interface, select **Interface**. You must also select a specific destination interface. To use the IPv6 address of the interface, you must also select the **IPv6** option on **Advanced**. This configures static interface NAT with port translation: the source address/port is translated to the interface's address and the same port number.
- **Translated Destination**—(Optional.) The network object or group that contains the destination addresses used in the translated packet. If you selected an object for **Original Destination**, you can set up identity NAT (that is, no translation) by selecting the same object.

Step 6 (Optional.) Identify the source or destination service ports for service translation.

If you are configuring static NAT with port translation, you can translate ports for the source, destination, or both. For example, you can translate between TCP/80 and TCP/8080.

NAT only supports TCP or UDP. When translating a port, be sure the protocols in the real and mapped service objects are identical (both TCP or both UDP). For identity NAT, you can use the same service object for both the real and mapped ports.

- **Original Source Port, Translated Source Port**—Defines a port translation for the source address.
- **Original Destination Port, Translated Destination Port**—Defines a port translation for the destination address.

Step 7 (Optional.) On **Advanced**, select the desired options:

- **Translate DNS replies that match this rule**—Whether to translate the IP address in DNS replies. For DNS replies traversing from a mapped interface to a real interface, the Address (the IPv4 A or IPv6 AAAA) record is rewritten from the mapped value to the real value. Conversely, for DNS replies traversing from a real interface to a mapped interface, the record is rewritten from the real value to the mapped value. This option is used in specific circumstances, and is sometimes needed for NAT64/46 translation, where the rewrite also converts between A and AAAA records. This option is not available if you are doing port translation.
- **IPv6**—Whether to use the IPv6 address of the destination interface for interface PAT.
- **Net to Net Mapping**—For NAT 46, select this option to translate the first IPv4 address to the first IPv6 address, the second to the second, and so on. Without this option, the IPv4-embedded method is used. For a one-to-one translation, you must use this option.
- **Do not proxy ARP on Destination Interface**—Disables proxy ARP for incoming packets to the mapped IP addresses. If you use addresses on the same network as the mapped interface, the system uses proxy ARP to answer any ARP requests for the mapped addresses, thus intercepting traffic destined for a mapped address. This solution simplifies routing because the device does not have to be the gateway for any additional networks. You can disable proxy ARP if desired, in which case you need to be sure to have proper routes on the upstream router. Normally for identity NAT, proxy ARP is not required, and in some cases can cause connectivity issues.
- **Unidirectional**—Select this option to prevent the destination addresses from initiating traffic to the source addresses. The unidirectional option is mainly useful for testing purposes and might not work with all protocols. For example, SIP requires protocol inspection to translate SIP headers using NAT, but this will not occur if you make the translation unidirectional.

Step 8 Click **Save** to add the rule.

Step 9 Click **Save** on the NAT page to save your changes.

Identity NAT

You might have a NAT configuration in which you need to translate an IP address to itself. For example, if you create a broad rule that applies NAT to every network, but want to exclude one network from NAT, you can create a static NAT rule to translate an address to itself.

The following figure shows a typical identity NAT scenario.

Figure 41: Identity NAT

The following topics explain how to configure identity NAT.

Configure Identity Auto NAT

Use static identity auto NAT rules to prevent the translation of an address. That is, to translate the address to itself.

Before you begin

Select **Objects > Object Management** and create the network objects or groups needed in the rule. Alternatively, you can create the objects while defining the NAT rule. The objects must meet the following requirements:

- **Original Source**—This must be a network object (not a group), and it can be a host or subnet. You must select the **Allow Overrides** option.
- **Translated Source**—A network object or group with the exact same contents as the original source object. You can use the same object.

Procedure

Step 1 Choose **Devices > Device Management**, and edit the Firepower Threat Defense device. Select **NAT**.

Step 2 Do one of the following:

- Select **Add NAT Rule > Add Auto NAT** to create a new rule.
- Click **Edit** () to edit an existing rule.

The right click menu also has options to cut, copy, paste, insert, and delete rules.

Step 3 Configure the basic rule options:

- **Type**—Select **Static**.
- **Source Interface, Destination Interface**—(Required for bridge group member interfaces.) The interfaces where this NAT rule applies. **Source** is the real interface, the one through which the traffic enters the device. **Destination** is the mapped interface, the one through which traffic exits the device. By default, the rule applies to all interfaces (**Any**) except for bridge group member interfaces.

Step 4 On **General**, configure the following options:

- **Original Source**—The network object that contains the addresses you are translating.
- **Translated Source**—The same object as the original source. Optionally, you can select a different object that has the exact same contents.

Do not configure the **Original Port** and **Translated Port** options for identity NAT.

Step 5 (Optional.) On **Advanced**, select the desired options:

- **Translate DNS replies that match this rule**—Do not configure this option for identity NAT.
- **IPv6**—Do not configure this option for identity NAT.
- **Net to Net Mapping**—Do not configure this option for identity NAT.
- **Do not proxy ARP on Destination Interface**—Disables proxy ARP for incoming packets to the mapped IP addresses. If you use addresses on the same network as the mapped interface, the system uses proxy ARP to answer any ARP requests for the mapped addresses, thus intercepting traffic destined for a mapped address. This solution simplifies routing because the device does not have to be the gateway for any additional networks. You can disable proxy ARP if desired, in which case you need to be sure to

have proper routes on the upstream router. Normally for identity NAT, proxy ARP is not required, and in some cases can cause connectivity issues.

- **Perform Route Lookup for Destination Interface**— If you select source and destination interfaces when selecting the same object for original and translated source address, you can select this option to have the system determine the destination interface based on the routing table rather than using the destination interface configured in the NAT rule.

Step 6 Click **Save** to add the rule.

Step 7 Click **Save** on the NAT page to save your changes.

Configure Identity Manual NAT

Use static identity manual NAT rules when auto NAT does not meet your needs. For example, if you want to do different translations based on the destination. Use static identity NAT rules to prevent the translation of an address. That is, to translate the address to itself.

Before you begin

Select **Objects > Object Management** and create the network objects or groups needed in the rule. Groups cannot contain both IPv4 and IPv6 addresses; they must contain one type only. Alternatively, you can create the objects while defining the NAT rule. The objects must also meet the following requirements:

- **Original Source**—This can be a network object or group, and it can contain a host or subnet. If you want to translate all original source traffic, you can skip this step and specify **Any** in the rule.
- **Translated Source**—The same object as the original source. Optionally, you can select a different object that has the exact same contents.

You can also create network objects for the **Original Destination** and **Translated Destination** if you are configuring a static translation for those addresses in the rule. If you want to configure destination static interface NAT with port translation only, you can skip adding an object for the destination mapped addresses and specify the interface in the rule.

You can also perform port translation on the source, destination, or both. In the Object Manager, ensure that there are port objects you can use for the original and translated ports. You can use the same object for identity NAT.

Procedure

Step 1 Choose **Devices > Device Management**, and edit the Firepower Threat Defense device. Select **NAT**.

Step 2 Do one of the following:

- Select **Add NAT Rule > Add Manual NAT** to create a new rule.
- Click **Edit** () to edit an existing rule.

The right click menu also has options to cut, copy, paste, insert, and delete rules.

Step 3 Configure the basic rule options:

- **Type**—Select **Static**. This setting only applies to the source address. If you define a translation for the destination address, the translation is always static.

- **Enable**—Whether you want the rule to be active. You can later activate or deactivate the rule using the right-click menu on the rules page.
- **Insert**—Where you want to add the rule. You can insert it in a category (before or after auto NAT rules), or above or below the rule number you specify.
- **Source Interface, Destination Interface**—(Required for bridge group member interfaces.) The interfaces where this NAT rule applies. **Source** is the real interface, the one through which the traffic enters the device. **Destination** is the mapped interface, the one through which traffic exits the device. By default, the rule applies to all interfaces (**Any**) except for bridge group member interfaces.

Step 4 Identify the original packet addresses, either IPv4 or IPv6; namely, the packet addresses as they appear in the original packet.

See the following figure for an example of the original packet vs. the translated packet where you perform identity NAT on the inside host but translate the outside host.

- **Original Source**—The network object or group that contains the addresses you are translating.
- **Original Destination**—(Optional.) The network object that contains the addresses of the destinations. If you leave this blank, the source address translation applies regardless of destination. If you do specify the destination address, you can configure a static translation for that address or just use identity NAT for it.

You can select **Interface** to base the original destination on the source interface (which cannot be Any). If you select this option, you must also select a translated destination object. To implement a static interface NAT with port translation for the destination addresses, select this option and also select the appropriate port objects for the destination ports.

Step 5 Identify the translated packet addresses, either IPv4 or IPv6; namely, the packet addresses as they appear on the destination interface network. You can translate between IPv4 and IPv6 if desired.

- **Translated Source**—The same object as the original source. Optionally, you can select a different object that has the exact same contents.
- **Translated Destination**—(Optional.) The network object or group that contains the destination addresses used in the translated packet. If you selected an object for **Original Destination**, you can set up identity NAT (that is, no translation) by selecting the same object.

Step 6 (Optional.) Identify the source or destination service ports for service translation.

If you are configuring static NAT with port translation, you can translate ports for the source, destination, or both. For example, you can translate between TCP/80 and TCP/8080.

NAT only supports TCP or UDP. When translating a port, be sure the protocols in the real and mapped service objects are identical (both TCP or both UDP). For identity NAT, you can use the same service object for both the real and mapped ports.

- **Original Source Port, Translated Source Port**—Defines a port translation for the source address.
- **Original Destination Port, Translated Destination Port**—Defines a port translation for the destination address.

Step 7 (Optional.) On **Advanced**, select the desired options:

- **Translate DNS replies that match this rule**—Do not configure this option for identity NAT.
- **IPv6**—Whether to use the IPv6 address of the destination interface for interface PAT.
- **Do not proxy ARP on Destination Interface**—Disables proxy ARP for incoming packets to the mapped IP addresses. If you use addresses on the same network as the mapped interface, the system uses proxy ARP to answer any ARP requests for the mapped addresses, thus intercepting traffic destined for a mapped address. This solution simplifies routing because the device does not have to be the gateway for any additional networks. You can disable proxy ARP if desired, in which case you need to be sure to have proper routes on the upstream router. Normally for identity NAT, proxy ARP is not required, and in some cases can cause connectivity issues.
- **Perform Route Lookup for Destination Interface**— If you select source and destination interfaces when selecting the same object for original and translated source address, you can select this option to have the system determine the destination interface based on the routing table rather than using the destination interface configured in the NAT rule.
- **Unidirectional**—Select this option to prevent the destination addresses from initiating traffic to the source addresses. The unidirectional option is mainly useful for testing purposes and might not work with all protocols. For example, SIP requires protocol inspection to translate SIP headers using NAT, but this will not occur if you make the translation unidirectional.

Step 8 Click **Save** to add the rule.

Step 9 Click **Save** on the NAT page to save your changes.

NAT Rule Properties for Firepower Threat Defense

Use Network Address Translation (NAT) rules to translate IP addresses to other IP addresses. You would typically use NAT rules to convert private addresses to publically routable addresses. The translation can be from one address to another, or you can use Port Address Translation (PAT) to translate many addresses to one or a few addresses, using port numbers to distinguish among the source addresses.

NAT rules include the following basic properties. The properties are the same for auto NAT and manual NAT rules except where indicated.

Type

Whether the translation rule is **Dynamic** or **Static**. Dynamic translation automatically chooses the mapped address from a pool of addresses, or an address/port combination when implementing PAT. Use static translation if you want to precisely define the mapped address/port.

Source Interface, Destination Interface

(Required for bridge group member interfaces.) The interfaces where this NAT rule applies. **Source** is the real interface, the one through which the traffic enters the device. **Destination** is the mapped interface, the one through which traffic exits the device. By default, the rule applies to all interfaces (**Any**) except for bridge group member interfaces.

Enable (Manual NAT only.)

Whether you want the rule to be active. You can later activate or deactivate the rule using the right-click menu on the rules page. You cannot disable auto NAT rules.

Insert (Manual NAT only.)

Where you want to add the rule. You can insert it in a category (before or after auto NAT rules), or above or below the rule number you specify.

Description (Optional. Manual NAT only.)

A description of the purpose of the rule.

The following topics describe the tabs for the NAT rules properties.

General Properties for Auto NAT

Use the options on **General** to define the source addresses and the mapped translated addresses. The following properties apply to auto NAT only.

Original Source (Always required.)

The network object that contains the addresses you are translating. This must be a network object (not a group), and it can be a host or subnet. You must select the **Allow Overrides** option in the object, but do not define an override.

You cannot create auto NAT rules for the system-defined any-ipv4 or any-ipv6 objects.

Translated Source (Usually required.)

The mapped addresses, the ones to which you are translating. What you select here depends on the type of translation rule you are defining.

- **Dynamic NAT**—The network object or group that contains the mapped addresses. This can be a network object or group, but it cannot include a subnet. The group cannot contain both IPv4 and IPv6 addresses; it must contain one type only.
- **Dynamic PAT**—One of the following:
 - (Interface PAT.) To use the address of the destination interface, select **Interface**. You must also select a specific destination interface. To use the IPv6 address of the interface, you must also select the **IPv6** option on **Advanced**. Do not configure a PAT pool.
 - To use a single address other than the destination interface address, select the host network object you created for this purpose. Do not configure a PAT pool.
 - To use a PAT pool, leave **Translated Source** empty. Select the PAT pool object on **PAT Pool**.
- **Static NAT**—One of the following:
 - To use a set group of addresses, select **Address** and the network object or group that contains the mapped addresses. The object or group can contain hosts or subnets. Typically, you configure the same number of mapped addresses as real addresses for a one-to-one mapping. You can, however, have a mismatched number of addresses.
 - (Static interface NAT with port translation.) To use the address of the destination interface, select **Interface**. You must also select a specific destination interface. To use the IPv6 address of the interface, you must also select the **IPv6** option on the **Advanced** tab. This configures

static interface NAT with port translation: the source address/port is translated to the interface's address and the same port number.

- **Identity NAT**—The same object as the original source. Optionally, you can select a different object that has the exact same contents.

Original Port, Translated Port (Static NAT only.)

If you need to translate a TCP or UDP port, select the protocol in **Original Port**, and type the original and translated port numbers. For example, you can translate TCP/80 to 8080 if necessary. Do not configure these options for identity NAT.

General Properties for Manual NAT

Use the options on **General** to define the source addresses and the mapped translated addresses. The following properties apply to manual NAT only. All are optional except as indicated.

Original Source (Always required.)

The network object or group that contains the addresses you are translating. This can be a network object or group, and it can contain a host or subnet. If you want to translate all original source traffic, you can specify **Any** in the rule.

Translated Source (Usually required.)

The mapped addresses, the ones to which you are translating. What you select here depends on the type of translation rule you are defining.

- **Dynamic NAT**—The network object or group that contains the mapped addresses. This can be a network object or group, but it cannot include a subnet. The group cannot contain both IPv4 and IPv6 addresses; it must contain one type only.
- **Dynamic PAT**—One of the following:
 - (Interface PAT.) To use the address of the destination interface, select **Interface**. You must also select a specific destination interface. To use the IPv6 address of the interface, you must also select the **IPv6** option on **Advanced**. Do not configure a PAT pool.
 - To use a single address other than the destination interface address, select the host network object you created for this purpose. Do not configure a PAT pool.
 - To use a PAT pool, leave **Translated Source** empty. Select the PAT pool object on **PAT Pool**.
- **Static NAT**—One of the following:
 - To use a set group of addresses, select **Address** and the network object or group that contains the mapped addresses. The object or group can contain hosts or subnets. Typically, you configure the same number of mapped addresses as real addresses for a one-to-one mapping. You can, however, have a mismatched number of addresses.
 - (Static interface NAT with port translation.) To use the address of the destination interface, select **Interface**. You must also select a specific destination interface. To use the IPv6 address of the interface, you must also select the **IPv6** option on the **Advanced** tab. This configures static interface NAT with port translation: the source address/port is translated to the interface's address and the same port number.

- **Identity NAT**—The same object as the original source. Optionally, you can select a different object that has the exact same contents.

Original Destination

The network object that contains the addresses of the destinations. If you leave this blank, the source address translation applies regardless of destination. If you do specify the destination address, you can configure a static translation for that address or just use identity NAT for it.

You can select **Interface** to base the original destination on the source interface (which cannot be Any). If you select this option, you must also select a translated destination object. To implement a static interface NAT with port translation for the destination addresses, select this option and also select the appropriate port objects for the destination ports.

Translated Destination

The network object or group that contains the destination addresses used in the translated packet. If you selected an object for **Original Destination**, you can set up identity NAT (that is, no translation) by selecting the same object.

Original Source Port, Translated Source Port, Original Destination Port, Translated Destination Port

The port objects that define the source and destination services for the original and translated packets. You can translate the ports, or select the same object to make the rule sensitive to the service without translating the ports. Keep the following rules in mind when configuring services:

- (Dynamic NAT or PAT.) You cannot do translation on the **Original Source Port** and **Translated Source Port**. You can do translation on the destination port only.
- NAT only supports TCP or UDP. When translating a port, be sure the protocols in the real and mapped service objects are identical (both TCP or both UDP). For identity NAT, you can use the same service object for both the real and mapped ports.

PAT Pool NAT Properties

When you configure dynamic NAT, you can define a pool of addresses to use for Port Address Translation using the properties on the **PAT Pool** tab.

Enable PAT Pool

Select this option to configure a pool of addresses for PAT.

PAT

The addresses to use for the PAT pool, one of the following:

- **Address**—The network object group that contains the host addresses for the PAT pool. You cannot include subnets. The group cannot contain both IPv4 and IPv6 addresses; it must contain one type only.
- **Interface**—Indicates that you want to use the destination interface as the PAT address. For this option, you must select a specific **Destination Interface**; you cannot use **Any** as the destination interface. This is another way to implement interface PAT.

Round Robin

To assign addresses/ports in a round-robin fashion. By default without round robin, all ports for a PAT address will be allocated before the next PAT address is used. The round-robin method assigns one

address/port from each PAT address in the pool before returning to use the first address again, and then the second address, and so on.

Extended PAT Table

To use extended PAT. Extended PAT uses 65535 ports per *service*, as opposed to per IP address, by including the destination address and port in the translation information. Normally, the destination port and address are not considered when creating PAT translations, so you are limited to 65535 ports per PAT address. For example, with extended PAT, you can create a translation of 10.1.1.1:1027 when going to 192.168.1.7:23 as well as a translation of 10.1.1.1:1027 when going to 192.168.1.7:80. You cannot use this option with interface PAT or interface PAT fallback.

Flat Port Range; Include Reserved Ports

To use the 1024 to 65535 port range as a single flat range when allocating TCP/UDP ports. When choosing the mapped port number for a translation, PAT uses the real source port number if it is available. However, without this option, if the real port is *not* available, by default the mapped ports are chosen from the same range of ports as the real port number: 1 to 511, 512 to 1023, and 1024 to 65535. To avoid running out of ports at the low ranges, configure this setting. To use the entire range of 1 to 65535, also check the **Include Reserved Ports** option.

Advanced NAT Properties

When you configure NAT, you can configure properties that provide specialized services in the **Advanced** options. All of these properties are optional: configure them only if you need the service.

Translate DNS replies that match this rule

Whether to translate the IP address in DNS replies. For DNS replies traversing from a mapped interface to a real interface, the Address (the IPv4 A or IPv6 AAAA) record is rewritten from the mapped value to the real value. Conversely, for DNS replies traversing from a real interface to a mapped interface, the record is rewritten from the real value to the mapped value. This option is used in specific circumstances, and is sometimes needed for NAT64/46 translation, where the rewrite also converts between A and AAAA records. This option is not available if you are doing port translation in a static NAT rule.

Fallthrough to Interface PAT (Destination Interface) (Dynamic NAT only.)

Whether to use the IP address of the destination interface as a backup method when the other mapped addresses are already allocated (interface PAT fallback). This option is available only if you select a destination interface that is not a member of a bridge group. To use the IPv6 address of the interface, also check the **IPv6** option. You cannot select this option if you already configured interface PAT as the translated address. You also cannot select the option if you configure a PAT pool.

IPv6

Whether to use the IPv6 address of the destination interface for interface PAT.

Net to Net Mapping (Static NAT only.)

For NAT 46, select this option to translate the first IPv4 address to the first IPv6 address, the second to the second, and so on. Without this option, the IPv4-embedded method is used. For a one-to-one translation, you must use this option.

Do not proxy ARP on Destination Interface (Static NAT only.)

Disables proxy ARP for incoming packets to the mapped IP addresses. If you use addresses on the same network as the mapped interface, the system uses proxy ARP to answer any ARP requests for the mapped addresses, thus intercepting traffic destined for a mapped address. This solution simplifies routing because

the device does not have to be the gateway for any additional networks. You can disable proxy ARP if desired, in which case you need to be sure to have proper routes on the upstream router. Normally for identity NAT, proxy ARP is not required, and in some cases can cause connectivity issues.

Perform Route Lookup for Destination Interface (Static Identity NAT only. Routed mode only.)

If you select source and destination interfaces when selecting the same object for original and translated source address, you can select this option to have the system determine the destination interface based on the routing table rather than using the destination interface configured in the NAT rule.

Unidirectional (Manual NAT only, static NAT only.)

Select this option to prevent the destination addresses from initiating traffic to the source addresses. The unidirectional option is mainly useful for testing purposes and might not work with all protocols. For example, SIP requires protocol inspection to translate SIP headers using NAT, but this will not occur if you make the translation unidirectional.

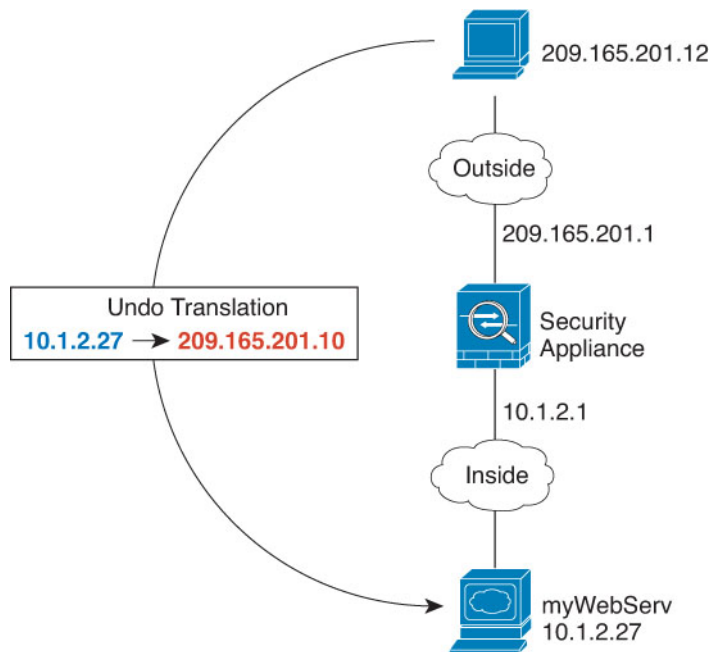

Examples for NAT

The following topics provide examples for configuring NAT on Threat Defense devices.

Providing Access to an Inside Web Server (Static Auto NAT)

The following example performs static NAT for an inside web server. The real address is on a private network, so a public address is required. Static NAT is necessary so hosts can initiate traffic to the web server at a fixed address.

Figure 42: Static NAT for an Inside Web Server

Procedure

Step 1 Create the network objects that define the server's private and public host addresses.

- Choose **Objects > Object Management**.
- Select **Network** from the table of contents and click **Add Network > Add Object**.
- Define the web server's private address.

Name the network object (for example, WebServerPrivate) and enter the real host IP address, 10.1.2.27. Select the **Allow Overrides** option, but do not define an override.

Edit Network Objects

Name:

Description:

Network:

Allow Overrides:

Override (0)

- Click **Save**.
- Click **Add Network > Add Object** and define the public address.

Name the network object (for example, WebServerPublic) and enter the host address 209.165.201.10.

New Network Objects

Name:

Description:

Network:

Allow Overrides:

Override (0)

- Click **Save**.

Step 2 Configure static NAT for the object.

- Select **Devices > Device Management** and edit the Threat Defense device on which you are defining the rule. Select **NAT**.

Ensure that you are currently in the same leaf domain that includes the device, if you are using domains.

- Click **Add NAT Rule > Add Auto NAT**.
- Configure the following properties:

- **Type** = Static.
- **Source Interface** = inside.

- **Destination Interface** = outside.
- **Original Source** = WebServerPrivate network object.
- **Translated Source > Address**= WebServerPublic network object.

Add NAT Rule

Type: **Static** Enable Translated By: barbosa-fptd-5512

Source Interface: **inside** Destination Interface: **outside**

General PAT Pool Advance

Original Packet

Original Source*: **WebServerPrivate**

Original Port: **TCP**

Translated Packet

Translated Source: **Address** **WebServerPublic**

Translated Port:

d) Click **Save**.

Step 3 Click **Save** on the NAT rule page.

Dynamic Auto NAT for Inside Hosts and Static NAT for an Outside Web Server

The following example configures dynamic NAT for inside users on a private network when they access the outside. Also, when inside users connect to an outside web server, that web server address is translated to an address that appears to be on the inside network.

Figure 43: Dynamic NAT for Inside, Static NAT for Outside Web Server

248773

Procedure

- Step 1** Create a network object group for the dynamic NAT pool to which you want to translate the inside addresses.
- Choose **Objects > Object Management**.
 - Select **Network** from the table of contents and click **Add Network > Add Group**.
 - Define the dynamic NAT pool.

Name the network object (for example, myNATpool). Enter each of the 11 host addresses between 209.165.201.20 and 209.165.201.30 separately in the “inline” edit box below the Selected Networks list and click **Add**.

- Click **Save**.

- Step 2** Create a network object for the inside network.

- Click **Add Network > Add Object**.
- Name the network object (for example, MyInsNet) and enter the network address 10.1.2.0/24. Select the **Allow Overrides** option, but do not define an override.

- Click **Save**.

- Step 3** Create a network object for the outside web server.

- Click **Add Network > Add Object**.
- Name the network object (for example, MyWebServer) and enter the host address 209.165.201.12. Select the **Allow Overrides** option, but do not define an override.

New Network Objects

Name:	myWebServer
Description:	
Network:	209.165.201.12
Allow Overrides:	<input checked="" type="checkbox"/>

c) Click **Save**.

Step 4 Create a network object for the translated web server address.

- Click **Add Network > Add Object**.
- Name the network object (for example, TransWebServer) and enter the host address 10.1.2.20.

New Network Objects

Name:	TransWebServer
Description:	
Network:	10.1.2.20
Allow Overrides:	<input checked="" type="checkbox"/>

c) Click **Save**.

Step 5 Configure dynamic NAT for the inside network using the dynamic NAT pool object.

- Select **Devices > Device Management** and edit the Threat Defense device on which you are defining the rule. Select **NAT**.

Ensure that you are currently in the same leaf domain that includes the device, if you are using domains.

- Click **Add NAT Rule > Add Auto NAT**.
- Configure the following properties:
 - **Type** = Dynamic.
 - **Source Interface** = inside.
 - **Destination Interface** = outside.
 - **Original Source** = myInsNet network object.
 - **Translated Source > Address** = myNATpool network group.

Add NAT Rule

Type:	Dynamic	<input checked="" type="checkbox"/> Enable	Translated By:	barbosa-fptd-5512
Source Interface:	inside		Destination Interface:	outside
General PAT Pool Advance				
Original Packet		Translated Packet		
Original Source:*	MyInsNet	Translated Source:	Address	myNATpool
Original Port:	TCP	Translated Port:		

d) Click **Save**.

Step 6 Configure static NAT for the web server.

a) Click **Add NAT Rule** > **Add Auto NAT**.

b) Configure the following properties:

- **Type** = Static.
- **Source Interface** = outside.
- **Destination Interface** = inside.
- **Original Source** = myWebServer network object.
- **Translated Source** > **Address**= TransWebServer network object.

Add NAT Rule

Type:	Static	<input checked="" type="checkbox"/> Enable	Translated By:	barbosa-fptd-5512
Source Interface:	outside		Destination Interface:	inside
General PAT Pool Advance				
Original Packet		Translated Packet		
Original Source:*	MyWebServer	Translated Source:	Address	TransWebServer
Original Port:	TCP	Translated Port:		

c) Click **Save**.

Step 7 Click **Save** on the NAT rule page.

Inside Load Balancer with Multiple Mapped Addresses (Static Auto NAT, One-to-Many)

The following example shows an inside load balancer that is translated to multiple IP addresses. When an outside host accesses one of the mapped IP addresses, it is untranslated to the single load balancer address. Depending on the URL requested, it redirects traffic to the correct web server.

Figure 44: Static NAT with One-to-Many for an Inside Load Balancer

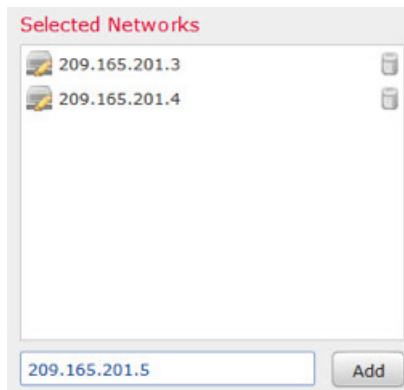

Procedure

Step 1 Create a network object group for the addresses to which you want to map the load balancer.

- Choose **Objects > Object Management**.
- Select **Network** from the table of contents and click **Add Network > Add Group**.
- Define the addresses.

Name the network object (for example, myPublicIPs). Enter each of the 3 host addresses, 209.165.201.3, 209.165.201.4, and 209.165.201.5, separately in the “inline” edit box below the Selected Networks list and click **Add**.

d) Click **Save**.

Step 2

Create a network object for the load balancer.

- Click **Add Network > Add Object**.
- Name the network object (for example, myLBHost), enter the host address 10.1.2.27. Select the **Allow Overrides** option, but do not define an override.

c) Click **Save**.

Step 3

Configure static NAT for the load balancer.

- Select **Devices > Device Management** and edit the Threat Defense device on which you are defining the rule. Select **NAT**.

Ensure that you are currently in the same leaf domain that includes the device, if you are using domains.

- Click **Add NAT Rule > Add Auto NAT**.
- Configure the following properties:
 - **Type** = Static.
 - **Source Interface** = inside.
 - **Destination Interface** = outside.
 - **Original Source** = myLBHost network object.
 - **Translated Source > Address** = myPublicIPs network group.

Add NAT Rule

Type:	Static	<input checked="" type="checkbox"/> Enable	Translated By:	barbosa-fptd-5512
Source Interface:	inside		Destination Interface:	outside
General PAT Pool Advance				
Original Packet			Translated Packet	
Original Source:*	myLBHost		Translated Source:	Address myPublicIPs
Original Port:	TCP		Translated Port:	

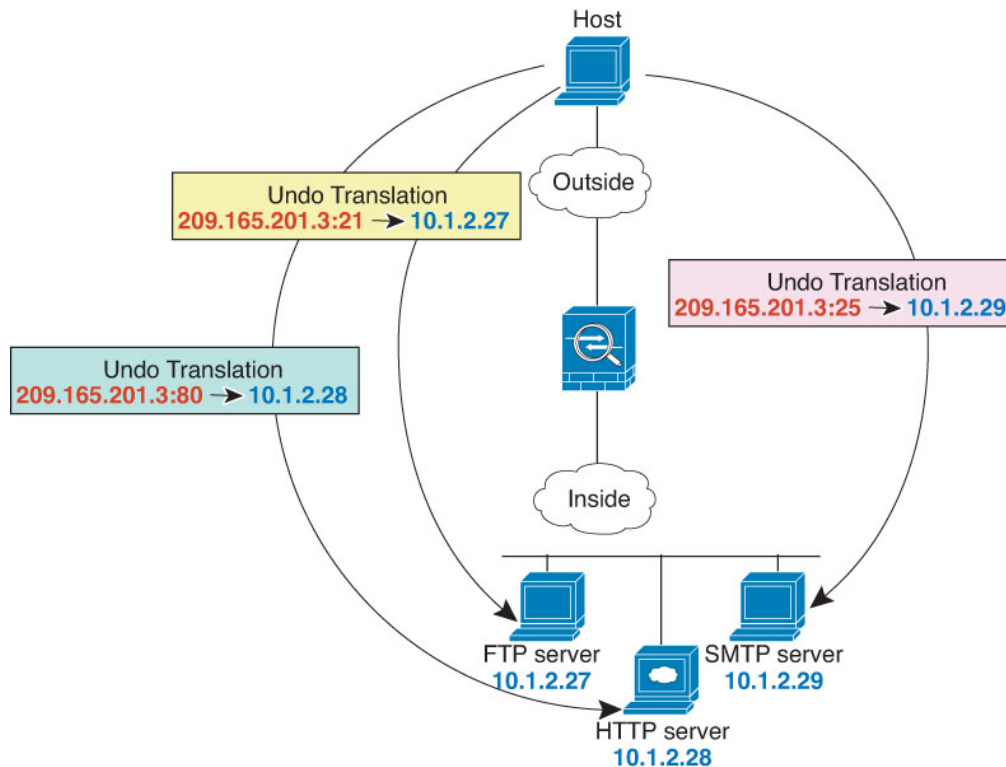

d) Click **Save**.

Step 4 Click **Save** on the NAT rule page.

Single Address for FTP, HTTP, and SMTP (Static Auto NAT-with-Port-Translation)

The following static NAT-with-port-translation example provides a single address for remote users to access FTP, HTTP, and SMTP. These servers are actually different devices on the real network, but for each server, you can specify static NAT-with-port-translation rules that use the same mapped IP address, but different ports.

Figure 45: Static NAT-with-Port-Translation

Procedure

- Step 1** Create a network object for the FTP server.
- Choose **Objects > Object Management**.
 - Select **Network** from the table of contents and click **Add Network > Add Object**.
 - Name the network object (for example, FTPserver), and enter the real IP address for the FTP server, 10.1.2.27. Select the **Allow Overrides** option, but do not define an override.

New Network Objects

Name:	FTPserver
Description:	
Network:	10.1.2.27
Allow Overrides:	<input checked="" type="checkbox"/>

- Click **Save**.

- Step 2** Create a network object for the HTTP server.

- Click **Add Network > Add Object**.
- Name the network object (for example, HTTPserver), enter the host address 10.1.2.28. Select the **Allow Overrides** option, but do not define an override.

New Network Objects

Name:	HTTPserver
Description:	
Network:	10.1.2.28
Allow Overrides:	<input checked="" type="checkbox"/>

- Click **Save**.

- Step 3** Create a network object for the SMTP server.

- Click **Add Network > Add Object**.
- Name the network object (for example, SMTPserver), enter the host address 10.1.2.29. Select the **Allow Overrides** option, but do not define an override.

Edit Network Objects

Name:	SMTPserver
Description:	
Network:	10.1.2.29
Allow Overrides:	<input checked="" type="checkbox"/>

- Click **Save**.

Step 4 Create a network object for the public IP address used for the three servers.

- a) Click **Add Network > Add Object**.
- b) Name the network object (for example, ServerPublicIP) and enter the host address 209.165.201.3.

New Network Objects

Name:	ServerPublicIP
Description:	
Network:	209.165.201.3
Allow Overrides:	<input checked="" type="checkbox"/>

- c) Click **Save**.

Step 5 Configure static NAT with port translation for the FTP server, mapping the FTP port to itself.

- a) Select **Devices > Device Management** and edit the Threat Defense device on which you are defining the rule. Select **NAT**.

Ensure that you are currently in the same leaf domain that includes the device, if you are using domains.

- b) Click **Add NAT Rule > Add Auto NAT**.
- c) Configure the following properties:

- **Type** = Static.
- **Source Interface** = inside.
- **Destination Interface** = outside.
- **Original Source** = FTPserver network object.
- **Translated Source > Address**= ServerPublicIP network object.
- **Original Port > TCP** = 21.
- **Translated Port** = 21.

Add NAT Rule

Type:	Static	<input checked="" type="checkbox"/> Enable	Translated By:	barbosa-fptd-5512

Step 8 Click **Save** on the NAT rule page.

Different Translation Depending on the Destination (Dynamic Manual PAT)

The following figure shows a host on the 10.1.2.0/24 network accessing two different servers. When the host accesses the server at 209.165.201.11, the real address is translated to 209.165.202.129:port. When the host accesses the server at 209.165.200.225, the real address is translated to 209.165.202.130:port.

Figure 46: Manual NAT with Different Destination Addresses

Procedure

- Step 1** Create a network object for the inside network.
- Choose **Objects > Object Management**.
 - Select **Network** from the table of contents and click **Add Network > Add Object**.
 - Name the network object (for example, myInsideNetwork), and enter the real network address, 10.1.2.0/24.

New Network Objects

Name:	myInsideNetwork
Description:	
Network:	10.1.2.0/24
Allow Overrides:	<input checked="" type="checkbox"/>

d) Click **Save**.

Step 2 Create a network object for the DMZ network 1.

- a) Click **Add Network > Add Object**.
- b) Name the network object (for example, DMZnetwork1) and enter the network address 209.165.201.0/27 (subnet mask of 255.255.255.224).

New Network Objects

Name:	DMZnetwork1
Description:	
Network:	209.165.201.0/27
Allow Overrides:	<input checked="" type="checkbox"/>

c) Click **Save**.

Step 3 Create a network object for the PAT address for DMZ network 1.

- a) Click **Add Network > Add Object**.
- b) Name the network object (for example, PATaddress1) and enter the host address 209.165.202.129.

New Network Objects

Name:	PATaddress1
Description:	
Network:	209.165.202.129
Allow Overrides:	<input checked="" type="checkbox"/>

c) Click **Save**.

Step 4 Create a network object for the DMZ network 2.

- a) Click **Add Network > Add Object**.
- b) Name the network object (for example, DMZnetwork2) and enter the network address 209.165.200.224/27 (subnet mask of 255.255.255.224).

New Network Objects

Name:	DMZnetwork2
Description:	
Network:	209.165.200.224/27
Allow Overrides:	<input checked="" type="checkbox"/>

c) Click **Save**.

Step 5 Create a network object for the PAT address for DMZ network 2.

- a) Click **Add Network > Add Object**.
- b) Name the network object (for example, PATaddress2) and enter the host address 209.165.202.130.

New Network Objects

Name:	PATaddress2
Description:	
Network:	209.165.202.130
Allow Overrides:	<input checked="" type="checkbox"/>

c) Click **Save**.

Step 6

Configure dynamic manual PAT for DMZ network 1.

a) Select **Devices > Device Management** and edit the Threat Defense device on which you are defining the rule. Select **NAT**.

Ensure that you are currently in the same leaf domain that includes the device, if you are using domains.

b) Click **Add NAT Rule > Add Manual NAT**.

c) Configure the following properties:

- **Type** = Dynamic.
- **Source Interface** = inside.
- **Destination Interface** = dmz.
- **Original Source** = myInsideNetwork network object.
- **Translated Source > Address** = PATaddress1 network object.
- **Original Destination > Address** = DMZnetwork1 network object.
- **Translated Destination** = DMZnetwork1 network object.

Note Because you do not want to translate the destination address, you need to configure identity NAT for it by specifying the same address for the original and translated destination addresses. Leave all of the port fields blank.

Add NAT Rule

Type:	Dynamic	<input checked="" type="checkbox"/> Enable	Insert:	In Category	NAT Rules Before																					
Source Interface:	inside		Destination Interface:	dmz

Original Source:*	myInsideNetwork		Translated Source:	Address	PATaddress1																					
Original Destination:	Address	DMZnetwork1	Translated Destination:	DMZnetwork1																						

d) Click **Save**.

Step 7

Configure dynamic manual PAT for DMZ network 2.

a) Click **Add NAT Rule > Add Manual NAT**.

b) Configure the following properties:

- **Type** = Dynamic.
- **Source Interface** = inside.
- **Destination Interface** = dmz.
- **Original Source** = myInsideNetwork network object.
- **Translated Source > Address** = PATaddress2 network object.
- **Original Destination > Address** = DMZnetwork2 network object.
- **Translated Destination** = DMZnetwork2 network object.

Add NAT Rule

Type:	Dynamic	<input checked="" type="checkbox"/> Enable	Insert:	In Category	NAT Rules Before
Source Interface:	inside		Destination Interface:	dmz	
Description:					
<div style="display: flex; border-bottom: 1px solid #ccc;"> <div style="border-right: 1px solid #ccc; padding: 2px 5px;">General</div> <div style="padding: 2px 5px;">PAT Pool</div> <div style="padding: 2px 5px;">Advance</div> </div>					
Original Packet			Translated Packet		
Original Source:*	myInsideNetwork	<input type="button" value="+"/>	Translated Source:	Address	PATaddress2
Original Destination:	Address	DMZnetwork2	Translated Destination:	DMZnetwork2	

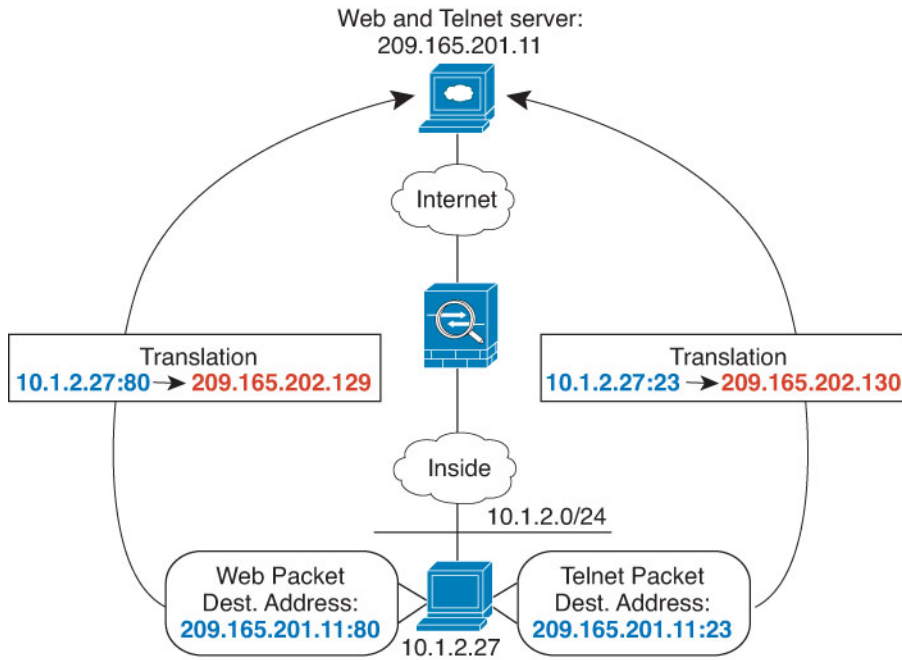

c) Click **Save**.

Step 8 Click **Save** on the NAT rule page.

Different Translation Depending on the Destination Address and Port (Dynamic Manual PAT)

The following figure shows the use of source and destination ports. The host on the 10.1.2.0/24 network accesses a single host for both web services and Telnet services. When the host accesses the server for Telnet services, the real address is translated to 209.165.202.129:port. When the host accesses the same server for web services, the real address is translated to 209.165.202.130:port.

Figure 47: Manual NAT with Different Destination Ports

Procedure

Step 1

Create a network object for the inside network.

- Choose **Objects > Object Management**.
- Select **Network** from the table of contents and click **Add Network > Add Object**.
- Name the network object (for example, myInsideNetwork) and enter the real network address, 10.1.2.0/24.

New Network Objects

Name:	myInsideNetwork
Description:	
Network:	10.1.2.0/24
Allow Overrides:	<input checked="" type="checkbox"/>

- Click **Save**.

Step 2

Create a network object for the Telnet/Web server.

- Click **Add Network > Add Object**.
- Name the network object (for example, TelnetWebServer) and enter the host address 209.165.201.11.

New Network Objects

Name:

Description:

Network:

Allow Overrides:

CHAPTER 43

Setting Up Virtual Switches

The following topics describe how to set up virtual switches in the Firepower System:

- [Virtual Switches, on page 885](#)
- [Switched Interface Configuration, on page 885](#)
- [Virtual Switch Configuration, on page 890](#)

Virtual Switches

You can configure a 7000 or 8000 Series device in a Layer 2 deployment so that it provides packet switching between two or more networks. In a Layer 2 deployment, you can configure virtual switches to operate as standalone broadcast domains, dividing your network into logical segments. A virtual switch uses the media access control (MAC) address from a host to determine where to send packets.

When you configure a virtual switch, the switch initially broadcasts packets through every available port on the switch. Over time, the switch uses tagged return traffic to learn which hosts reside on the networks connected to each port.

A virtual switch must contain two or more switched interfaces to handle traffic. For each virtual switch, traffic becomes limited to the set of ports configured as switched interfaces. For example, if you configure a virtual switch with four switched interfaces, packets sent in through one port for broadcast can only be sent out of the remaining three ports on the switch.

When you configure a physical switched interface, you must assign it to a virtual switch. You can also define additional logical switched interfaces on a physical port as needed. You can group multiple physical interfaces into a single logical switched interface called a link aggregation group (LAG). This single aggregate logical link provides higher bandwidth, redundancy, and load-balancing between two endpoints.

Caution If a Layer 2 deployment fails for any reason, the device no longer passes traffic.

Switched Interface Configuration

You can set up switched interfaces to have either physical or logical configurations. You can configure physical switched interfaces for handling untagged VLAN traffic. You can also create logical switched interfaces for handling traffic with designated VLAN tags.

In a Layer 2 deployment, the system drops any traffic received on an external physical interface that does not have a switched interface waiting for it. If the system receives a packet with no VLAN tag and you have not configured a physical switched interface for that port, it drops the packet. If the system receives a VLAN-tagged packet and you have not configured a logical switched interface, it also drops the packet.

The system handles traffic that has been received with VLAN tags on switched interfaces by stripping the outermost VLAN tag on ingress before any rules evaluation or forwarding decisions. Packets leaving the device through a VLAN-tagged logical switched interface are encapsulated with the associated VLAN tag on egress.

Note that if you change the parent physical interface to inline or passive, the system deletes all the associated logical interfaces.

Switched Interface Configuration Notes

You can configure one or more physical ports on a managed device as switched interfaces. You must assign a physical switched interface to a virtual switch before it can handle traffic. You can configure link mode settings and MDI/MDIX settings only for copper interfaces.

Note Interfaces on 8000 Series appliances do not support half-duplex options.

For each physical switched interface, you can add multiple logical switched interfaces. You must associate each logical interface with a VLAN tag to handle traffic received by the physical interface with that specific tag. You must assign a logical switched interface to a virtual switch to handle traffic.

When configuring a switched interface, the range within which you can set the MTU can vary depending on the Firepower System device model and interface type.

The range of MTU values can vary depending on the model of the managed device and the interface type.

Caution Changing the highest MTU value among all non-management interfaces on the device restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Inspection is interrupted on all non-management interfaces, not just the interface you modified. Whether this interruption drops traffic or passes it without further inspection depends on the model of the managed device and the interface type. See [Snort® Restart Traffic Behavior, on page 310](#) for more information.

To edit an existing logical switched interface, click the edit icon () next to the interface.

When you delete a logical switched interface, you remove it from the physical interface where it resides, as well as the virtual switch and security zone it is associated with.

Configuring Physical Switched Interfaces

Smart License	Classic License	Supported Devices	Supported Domains	Access
Any	Control	7000 & 8000 Series	Leaf only	Admin/Network Admin

Procedure

- Step 1** Choose **Devices > Device Management**.
- Step 2** Next to the device where you want to configure the switched interface, click **Edit** (✎).
In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.
- Step 3** Next to the interface you want to configure as a switched interface, click **Edit** (✎).
- Step 4** Click the **Switched** tab.
- Step 5** If you want to associate the switched interface with a security zone, do one of the following:
- Choose an existing security zone from the **Security Zone** drop-down list.
 - Choose **New** to add a new security zone; see [Creating Security Zone Objects, on page 360](#).
- Step 6** If you want to associate the switched interface with a virtual switch, do one of the following:
- Choose an existing virtual switch from the **Virtual Switch** drop-down list.
 - Choose **New** to add a new virtual switch; see [Adding Virtual Switches, on page 891](#).
- Step 7** Check the **Enabled** check box to allow the switched interface to handle traffic.
- Note** If you clear the check box, the interface becomes disabled so that users cannot access it for security purposes.
- Step 8** From the **Mode** drop-down list, choose an option to designate the link mode, or choose **Autonegotiation** to specify that the interface is configured to auto negotiate speed and duplex settings.
Mode settings are available only for copper interfaces.
Interfaces on 8000 Series appliances do not support half-duplex options.
- Step 9** From the **MDI/MDIX** drop-down list, choose an option to designate whether the interface is configured for MDI (medium dependent interface), MDIX (medium dependent interface crossover), or Auto-MDIX.
By default, MDI/MDIX is set to Auto-MDIX, which automatically handles switching between MDI and MDIX to attain link.
- Step 10** In the **MTU** field, enter a maximum transmission unit (MTU), which designates the largest size packet allowed.
The range of MTU values can vary depending on the model of the managed device and the interface type.

Caution Changing the highest MTU value among all non-management interfaces on the device restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Inspection is interrupted on all non-management interfaces, not just the interface you modified. Whether this interruption drops traffic or passes it without further inspection depends on the model of the managed device and the interface type. See [Snort® Restart Traffic Behavior, on page 310](#) for more information.

Step 11 Click **Save**.

What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

Adding Logical Switched Interfaces

Smart License	Classic License	Supported Devices	Supported Domains	Access
Any	Control	7000 & 8000 Series	Leaf only	Admin/Network Admin

Procedure

- Step 1** Choose **Devices > Device Management**.
- Step 2** Next to the device where you want to add the switched interface, click the edit icon (✎).
 In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.
- Step 3** Choose **Add Logical Interface** from the **Add** drop-down menu.
- Step 4** Click **Switched**.
- Step 5** From the **Interface** drop-down list, choose the physical interface that will receive the VLAN-tagged traffic.
- Step 6** In the **VLAN Tag** field, enter a tag value that gets assigned to inbound and outbound traffic on this interface.
 The tag value can be any integer from 1 to 4094.
- Step 7** If you want to associate the switched interface with a security zone, do one of the following:
- Choose an existing security zone from the **Security Zone** drop-down list.
 - Choose **New** to add a new security zone; see [Creating Security Zone Objects, on page 360](#).
- Step 8** If you want to associate the switched interface with a virtual switch, do one of the following:
- Choose an existing virtual switch from the **Virtual Switch** drop-down list.
 - Choose **New** to add a new virtual switch; see [Adding Virtual Switches, on page 891](#).

- Step 9** Check the **Enabled** check box to allow the switched interface to handle traffic.
- If you clear the check box, the interface becomes disabled and administratively taken down. If you disable a physical interface, you also disable all of the logical interfaces associated with it.
- Step 10** In the **MTU** field, enter a maximum transmission unit (MTU), which designates the largest size packet allowed. The range of MTU values can vary depending on the model of the managed device and the interface type.
- Caution** Changing the highest MTU value among all non-management interfaces on the device restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Inspection is interrupted on all non-management interfaces, not just the interface you modified. Whether this interruption drops traffic or passes it without further inspection depends on the model of the managed device and the interface type. See [Snort® Restart Traffic Behavior, on page 310](#) for more information.
- Step 11** Click **Save**.

What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

Deleting Logical Switched Interfaces

Smart License	Classic License	Supported Devices	Supported Domains	Access
Any	Control	7000 & 8000 Series	Leaf only	Admin/Network Admin

Procedure

- Step 1** Choose **Devices > Device Management**.
- Step 2** Next to the managed device that contains the switched interface you want to delete, click the edit icon ().
- In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.
- Step 3** Next to the logical switched interface you want to delete, click the delete icon (.
- Step 4** When prompted, confirm that you want to delete the interface.

What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

Virtual Switch Configuration

Before you can use switched interfaces in a Layer 2 deployment, you must configure virtual switches and assign switched interfaces to them. A virtual switch is a group of switched interfaces that process inbound and outbound traffic through your network.

Virtual Switch Configuration Notes

You can add virtual switches from the Virtual Switches tab of the Device Management page. The Virtual Switches tab displays a list of all the virtual switches you have configured on a device. The page includes summary information about each switch.

Table 77: Virtual Switches Table View Fields

Field	Description
Name	The name of the virtual switch.
Interfaces	All switched interfaces that are assigned to the virtual switch. Interfaces that you have disabled from the Interfaces tab are not available.
Hybrid Interface	The optionally configured hybrid interface that ties the virtual switch to a virtual router.
Unicast Packets	Unicast packet statistics for the virtual switch, including: <ul style="list-style-type: none"> • Unicast packets received • Unicast packets forwarded (excludes drops by host) • Unicast packets unintentionally dropped
Broadcast Packets	Broadcast packet statistics for the virtual switch, including: <ul style="list-style-type: none"> • Broadcast packets received • Broadcast packets forwarded • Broadcast packets unintentionally dropped

You can also add switches as you configure switched interfaces. You can assign only switched interfaces to a virtual switch. If you want to create a virtual switch before you configure the switched interfaces on your managed devices, you can create an empty virtual switch and add interfaces to it later.

Tip

To edit an existing virtual switch, click the edit icon (🖋️) next to the switch.

Adding Virtual Switches

Smart License	Classic License	Supported Devices	Supported Domains	Access
Any	Control	7000 & 8000 Series	Leaf only	Admin/Network Admin

Procedure

Step 1 Choose **Devices > Device Management**.

Step 2 Next to the device where you want to add the virtual switch, click **Edit** ().

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

Step 3 Click the **Virtual Switches** tab.

Step 4 Click **Add Virtual Switch**.

Step 5 Enter a name in the **Name** field.

Step 6 From the **Available** list, choose one or more switched interfaces to add to the virtual switch.

Tip Interfaces that you have disabled from the Interfaces tab are not available; disabling an interface after you add it removes it from the configuration.

Step 7 Click **Add**.

Step 8 If you want to tie the virtual switch to a virtual router, choose a hybrid interface from the **Hybrid Interface** drop-down list.

Step 9 Optionally, configure advanced settings for the switch; see [Advanced Virtual Switch Settings, on page 891](#)

Step 10 Click **Save**.

What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

Advanced Virtual Switch Settings

Adding Static MAC Entries

Over time, a virtual switch learns MAC addresses by tagging return traffic from the network. You can manually add a static MAC entry, which designates that a MAC address resides on a specific port. Regardless of whether you ever receive traffic from that port, the MAC address remains static in the table. You can specify one or more static MAC addresses for each virtual switch.

Enabling Spanning Tree Protocol (STP) and Dropping Bridge Protocol Data Units (BPDU)

STP is a network protocol used to prevent network loops. BPDUs are exchanged through the network, carrying information about network bridges. The protocol uses BPDUs to identify and select the fastest network links, if there are redundant links in the network. If a network link fails, Spanning Tree fails over to an existing alternate link.

Note Cisco strongly recommends that you enable STP when configuring a virtual switch that you plan to deploy in a 7000 or 8000 Series device high-availability pair. Only enable STP if your virtual switch switches traffic between multiple network interfaces.

If your virtual switch routes traffic between VLANs, similar to a router on a stick, BPDUs enter and exit the device through different logical switched interfaces, but the same physical switched interface. As a result, STP identifies the device as a redundant network loop, which can cause issues in certain Layer 2 deployments. To prevent this, you can configure the virtual switch at the domain level to have the device drop BPDUs when monitoring traffic. You can only drop BPDUs if you disable STP.

Note Drop BPDUs only if your virtual switch routes traffic between VLANs on a single physical interface.

Enabling Strict TCP Enforcement

To maximize TCP security, you can enable strict enforcement, which blocks connections where the three-way handshake was not completed. Strict enforcement also blocks:

- non-SYN TCP packets for connections where the three-way handshake was not completed
- non-SYN/RST packets from the initiator on a TCP connection before the responder sends the SYN-ACK
- non-SYN-ACK/RST packets from the responder on a TCP connection after the SYN but before the session is established
- SYN packets on an established TCP connection from either the initiator or the responder

Note that if you associate the virtual switch with a logical hybrid interface, the switch uses the same strict TCP enforcement setting as the virtual router associated with the logical hybrid interface. You cannot specify strict TCP enforcement on the switch in this case.

Configuring Advanced Virtual Switch Settings

Smart License	Classic License	Supported Devices	Supported Domains	Access
Any	Control	7000 & 8000 Series	Leaf only	Admin/Network Admin

Procedure

Step 1 Choose **Devices > Device Management**.

- Step 2** Next to the device that contains the virtual switch you want to edit, click the edit icon (✎).
In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.
- Step 3** Click the **Virtual Switches** tab.
- Step 4** Next to the virtual switch that you want to edit, click the edit icon (✎).
- Step 5** Click the **Advanced** tab.
- Step 6** To add a static MAC entry, click **Add**.
- Step 7** In the **MAC Address** field, enter the address using the standard format of six groups of two hexadecimal digits separated by colons (for example, 01:23:45:67:89:AB).
- Note** Broadcast addresses (00:00:00:00:00:00 and FF:FF:FF:FF:FF:FF) cannot be added as static MAC addresses.
- Step 8** From the **Interface** drop-down list, choose the interface where you want to assign the MAC address.
- Step 9** Click **OK**.
- Step 10** If you want to enable the Spanning Tree Protocol, check the **Enable Spanning Tree Protocol** check box.
- Step 11** If you want to enable strict TCP enforcement, check the **Strict TCP Enforcement** check box.
If you associate the virtual switch with a logical hybrid interface, this option does not appear and the switch uses the same setting as the virtual router associated with the logical hybrid interface.
- Step 12** If you want to drop BPDUs at the domain level, check the **Drop BPDUs** check box.
- Step 13** Click **Save**.

What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

Deleting Virtual Switches

Smart License	Classic License	Supported Devices	Supported Domains	Access
Any	Control	7000 & 8000 Series	Leaf only	Admin/Network Admin

When you delete a virtual switch, any switched interfaces assigned to the switch become available for inclusion in another switch.

Procedure

- Step 1** Choose **Devices > Device Management**.
- Step 2** Next to the managed device that contains the virtual switch you want to delete, click the edit icon (✎).
In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

- Step 3** Click the **Virtual Switches** tab.
- Step 4** Next to the virtual switch that you want to delete, click the delete icon ().
- Step 5** When prompted, confirm that you want to delete the virtual switch.
-

What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

CHAPTER 44

Setting Up Virtual Routers

The following topics describe how to set up virtual routers in the Firepower System:

- [Virtual Routers, on page 895](#)
- [Routed Interfaces, on page 896](#)
- [Configuring Physical Routed Interfaces, on page 897](#)
- [Adding Logical Routed Interfaces, on page 899](#)
- [Deleting Logical Routed Interfaces, on page 901](#)
- [Configuring SFRP, on page 901](#)
- [Virtual Router Configuration, on page 903](#)
- [Adding Virtual Routers, on page 904](#)
- [DHCP Relay, on page 905](#)
- [Static Routes, on page 907](#)
- [Dynamic Routing, on page 909](#)
- [Virtual Router Filters, on page 920](#)
- [Adding Virtual Router Authentication Profiles, on page 923](#)
- [Viewing Virtual Router Statistics, on page 924](#)
- [Deleting Virtual Routers, on page 924](#)

Virtual Routers

You can configure a managed device in a Layer 3 deployment so that it routes traffic between two or more interfaces. To route traffic, you must assign an IP address to each interface and assign the interfaces to the virtual router. The interfaces assigned to virtual routers can be physical, logical, or link aggregation group (LAG) interfaces.

You can configure the system to route packets by making packet forwarding decisions according to the destination address. Interfaces configured as routed interfaces receive and forward the Layer 3 traffic. Routers obtain the destination from the outgoing interface based on the forwarding criteria, and access control rules designate the security policies to be applied.

In Layer 3 deployments, you can define static routes. In addition, you can configure Routing Information Protocol (RIP) and Open Shortest Path First (OSPF) dynamic routing protocols. You can also configure a combination of static routes and RIP or static routes and OSPF.

Note that you can only configure virtual routers, physical routed interfaces, or logical routed interfaces on a 7000 or 8000 Series device.

Caution If a Layer 3 deployment fails for any reason, the device no longer passes traffic.

Related Topics

[LAG Configuration](#), on page 928

Routed Interfaces

You can set up routed interfaces with either physical or logical configurations. You can configure physical routed interfaces for handling untagged VLAN traffic. You can also create logical routed interfaces for handling traffic with designated VLAN tags.

In a Layer 3 deployment, the system drops any traffic received on an external physical interface that does not have a routed interface waiting for it. The system drops a packet if:

- It receives a packet with no VLAN tag, and you have not configured a physical routed interface for that port.
- It receives a VLAN-tagged packet, and you have not configured a logical routed interface for that port.

The system handles traffic that has been received with VLAN tags on switched interfaces by stripping the outermost VLAN tag on ingress prior to any rules evaluation or forwarding decisions. Packets leaving the device through a VLAN-tagged logical routed interface are encapsulated with the associated VLAN tag on egress. The system drops any traffic received with a VLAN tag after the stripping process completes.

You can add static Address Resolution Protocol (ARP) entries to a routed interface. If an external host needs to know the MAC address of the destination IP address it needs to send traffic to on your local network, it sends an ARP request. When you configure static ARP entries, the virtual router responds with an IP address and associated MAC address.

Note that disabling the **ICMP Enable Responses** option for logical routed interfaces does not prevent ICMP responses in all scenarios. You can add network-based rules to an access control policy to drop packets where the destination IP is the routed interface's IP and the protocol is ICMP.

If you have enabled the **Inspect Local Router Traffic** option on the managed device, the system drops the packets before they reach the host, thereby preventing any response.

The range of MTU values can vary depending on the model of the managed device and the interface type.

Caution Changing the highest MTU value among all non-management interfaces on the device restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Inspection is interrupted on all non-management interfaces, not just the interface you modified. Whether this interruption drops traffic or passes it without further inspection depends on the model of the managed device and the interface type. See [Snort® Restart Traffic Behavior](#), on page 310 for more information.

If you change the parent physical interface to inline or passive, the system deletes all the associated logical interfaces.

Related Topics

[Snort® Restart Scenarios](#), on page 308

Configuring Physical Routed Interfaces

Smart License	Classic License	Supported Devices	Supported Domains	Access
N/A	Control	7000 & 8000 Series	Leaf only	Admin/Network Admin

You can configure one or more physical ports on a managed device as routed interfaces. You must assign a physical routed interface to a virtual router before it can route traffic.

Caution Adding a routed interface pair on a 7000 or 8000 Series device restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See [Snort® Restart Traffic Behavior](#), on page 310 for more information.

Procedure

-
- Step 1** Choose **Devices > Device Management**.
- Step 2** Next to the device you want to modify, click **Edit** (✎).
In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.
- Step 3** Next to the interface you want to modify, click **Edit** (✎).
- Step 4** Click **Routed** to display the routed interface options.
- Step 5** If you want to apply a security zone, do one of the following:
- Choose an existing security zone from the **Security Zone** drop-down list.
 - Choose **New** to add a new security zone; see [Creating Security Zone Objects](#), on page 360.
- Step 6** If you want to specify a virtual router, do one of the following:
- Choose an existing virtual router from the **Virtual Router** drop-down list.
 - Choose **New** to add a new virtual router; [Adding Virtual Routers](#), on page 904.
- Step 7** Check the **Enabled** check box to allow the routed interface to handle traffic. If you clear the check box, the interface becomes disabled so that users cannot access it for security purposes.
- Step 8** From the **Mode** drop-down list, choose an option to designate the link mode, or choose **Autonegotiation** to specify that the interface is configured to auto negotiate speed and duplex settings.
Mode settings are available only for copper interfaces.
Interfaces on 8000 Series appliances do not support half-duplex options.
- Step 9** From the **MDI/MDIX** drop-down list, choose an option to designate whether the interface is configured for MDI (medium dependent interface), MDIX (medium dependent interface crossover), or Auto-MDIX.

Normally, MDI/MDIX is set to Auto-MDIX, which automatically handles switching between MDI and MDIX to attain link.

MDI/MDIX settings are available only for copper interfaces.

Step 10 In the **MTU** field, choose a maximum transmission unit (MTU), which designates the largest size packet allowed.

The MTU is the Layer 2 MTU/MRU and not the Layer 3 MTU.

The range of MTU values can vary depending on the model of the managed device and the interface type.

Caution Changing the highest MTU value among all non-management interfaces on the device restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Inspection is interrupted on all non-management interfaces, not just the interface you modified. Whether this interruption drops traffic or passes it without further inspection depends on the model of the managed device and the interface type. See [Snort® Restart Traffic Behavior, on page 310](#) for more information.

Step 11 Next to **ICMP**, check the **Enable Responses** check box to allow the interface to respond to ICMP traffic such as pings and traceroute.

Step 12 Next to **IPv6 NDP**, check the **Enable Router Advertisement** check box to enable the interface to broadcast router advertisements.

Step 13 To add an IP address, click **Add**.

Step 14 In the **Address** field, enter the routed interface's IP address and subnet mask using CIDR notation.

Note the following:

- You cannot add network and broadcast addresses, or the static MAC addresses 00:00:00:00:00:00 and FF:FF:FF:FF:FF:FF.
- You cannot add identical IP addresses, regardless of subnet mask, to interfaces in virtual routers.

Step 15 If your organization uses IPv6 addresses and you want to set the IP address of the interface automatically, check the **Address Autoconfiguration** check box next to the **IPv6** field.

Step 16 For **Type**, choose either **Normal** or **SFRP**.

For SFRP options, see [Configuring SFRP, on page 901](#) for more information.

Step 17 Click **OK**.

- To edit an IP address, click **Edit** (.

- To delete an IP address, click **Delete** (.

When adding an IP address to a routed interface of a 7000 or 8000 Series device in a high-availability pair, you must add a corresponding IP address to the routed interface on the high-availability pair peer.

Step 18 To add a static ARP entry, click **Add**.

Step 19 In the **IP Address** field, enter an IP address for the static ARP entry.

Step 20 In the **MAC Address** field, enter a MAC address to associate with the IP address. Use the standard address format of six groups of two hexadecimal digits separated by colons (for example, 01:23:45:67:89:AB).

Step 21 Click **OK**.

Step 22 Click **Save**.

What to do next

Deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

[MTU Ranges for 7000 and 8000 Series Devices and NGIPSv](#), on page 428

[Snort® Restart Scenarios](#), on page 308

Adding Logical Routed Interfaces

Smart License	Classic License	Supported Devices	Supported Domains	Access
N/A	Control	7000 & 8000 Series	Leaf only	Admin/Network Admin

For each physical routed interface, you can add multiple logical routed interfaces. You must associate each logical interface with a VLAN tag to handle traffic received by the physical interface with that specific tag. You must assign a logical routed interface to a virtual router to route traffic.

Caution Adding a routed interface pair on 7000 or 8000 Series devices restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See [Snort® Restart Traffic Behavior, on page 310](#) for more information.

Procedure

- Step 1** Choose **Devices > Device Management**.
- Step 2** Next to the device you want to modify, click the edit icon (✎).
In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.
- Step 3** Click **Add Interface**.
- Step 4** Click **Routed** to display the routed interface options.
- Step 5** From the **Interface** drop-down list, choose the physical interface where you want to add the logical interface.
- Step 6** In the **VLAN Tag** field, enter a tag value that gets assigned to inbound and outbound traffic on this interface. The value can be any integer from 1 to 4094.
- Step 7** If you want to apply a security zone, do one of the following:
- Choose an existing security zone from the **Security Zone** drop-down list.
 - Choose **New** to add a new security zone; see [Creating Security Zone Objects, on page 360](#).
- Step 8** If you want to specify a virtual router, do one of the following:

- Choose an existing virtual router from the **Virtual Router** drop-down list.
- Choose **New** to add a new virtual router; [Adding Virtual Routers, on page 904](#).

Step 9 Check the **Enabled** check box to allow the routed interface to handle traffic.

If you clear the check box, the interface becomes disabled and administratively taken down. If you disable a physical interface, you also disable all of the logical interfaces associated with it.

Step 10 In the **MTU** field, enter a maximum transmission unit (MTU), which designates the largest size packet allowed. The MTU is the Layer 2 MTU/MRU and not the Layer 3 MTU.

The range of MTU values can vary depending on the model of the managed device and the interface type.

Caution Changing the highest MTU value among all non-management interfaces on the device restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Inspection is interrupted on all non-management interfaces, not just the interface you modified. Whether this interruption drops traffic or passes it without further inspection depends on the model of the managed device and the interface type. See [Snort® Restart Traffic Behavior, on page 310](#) for more information.

Step 11 Next to **ICMP**, check the **Enable Responses** check box to communicate updates or error information to other routers, intermediary devices, or hosts.

Step 12 Next to **IPv6 NDP**, check the **Enable Router Advertisement** check box to enable the interface to broadcast router advertisements.

Step 13 To add an IP address, click **Add**.

Step 14 In the **Address** field, enter the IP address in CIDR notation.

Note the following:

- You cannot add network and broadcast addresses, or the static MAC addresses 00:00:00:00:00:00 and FF:FF:FF:FF:FF:FF.
- You cannot add identical IP addresses, regardless of subnet mask, to interfaces in virtual routers.

Step 15 If your organization uses IPv6 addresses and you want to set the IP address of the interface automatically, choose the **Address Autoconfiguration** check box next to the **IPv6** field.

Step 16 For **Type**, choose either **Normal** or **SFRP**.

For SFRP options, see [Configuring SFRP, on page 901](#) for more information.

Step 17 Click **OK**.

- To edit an IP address, click the edit icon (.
- To delete an IP address, click the delete icon (.

When you add an IP address to a routed interface of a 7000 or 8000 Series device in a high-availability pair, you must add a corresponding IP address to the routed interface on the high-availability pair peer.

Step 18 To add a static ARP entry, click **Add**.

Step 19 In the **IP Address** field, enter an IP address for the static ARP entry.

Step 20 In the **MAC Address** field, enter a MAC address to associate with the IP address. Use the standard address format of six groups of two hexadecimal digits separated by colons (for example, 01:23:45:67:89:AB).

- Step 21** Click **OK**. The static ARP entry is added.
- Step 22** Click **Save**.

What to do next

Deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

Related Topics

- [Snort® Restart Scenarios](#), on page 308

Deleting Logical Routed Interfaces

Smart License	Classic License	Supported Devices	Supported Domains	Access
Any	Control	7000 & 8000 Series	Leaf only	Admin/Network Admin

When you delete a logical routed interface, you remove it from the physical interface where it resides, as well as its assigned virtual router and security zone.

Procedure

- Step 1** Choose **Devices > Device Management**.
- Step 2** Next to the device you want to modify, click the edit icon **Edit** ().
- In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.
- Step 3** Next to the logical routed interface you want to delete, click **Delete** (.
- Step 4** When prompted, confirm that you want to delete the interface.

What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

Configuring SFRP

Smart License	Classic License	Supported Devices	Supported Domains	Access
Any	Control	7000 & 8000 Series	Leaf only	Admin/Network Admin

You can configure Cisco Redundancy Protocol (SFRP) to achieve network redundancy for high availability on either a 7000 or 8000 Series device high-availability pair or individual devices. SFRP provides gateway redundancy for both IPv4 and IPv6 addresses. You can configure SFRP on routed and hybrid interfaces.

If the interfaces are configured on individual devices, they must be in the same broadcast domain. You must designate at least one of the interfaces as primary and an equal number as backup. The system supports only one primary and one backup per IP address. If network connectivity is lost, the system automatically promotes the backup to primary to maintain connectivity.

The options you set for SFRP must be the same on all interfaces in a group of SFRP interfaces. Multiple IP addresses in a group must be in the same primary/backup state. Therefore, when you add or edit an IP address, the state you set for that address propagates to all the addresses in the group. For security purposes, you must enter values for **Group ID** and **Shared Secret** that are shared among the interfaces in the group.

To enable SFRP IP addresses on a virtual router, you must also configure one non-SFRP IP address. Note that only one non-SFRP address should be configured per interface.

As all SFRPs in a group failover together, all SFRPs on the same virtual router should be in the same SFRP group. In addition, you should also set up an HA link interface on each device in a high-availability pair when using NAT, HA state sharing, or VPN. For more information on HA link interfaces, see [Configuring HA Link Interfaces, on page 426](#).

For 7000 or 8000 Series devices in a high-availability pair, you designate the shared secret and the system copies it to the high-availability pair peer along with the SFRP IP configuration. The shared secret authenticates peer data.

Note We do not recommend enabling more than one non-SFRP IP address on a 7000 or 8000 Series device high-availability pair's routed or hybrid interface where one SFRP IP address is already configured. The system does not perform NAT if a 7000 or 8000 Series device high-availability pair fails over while in standby mode.

Procedure

-
- Step 1** Choose **Devices > Device Management**.
- Step 2** Next to the device you want to modify, click **Edit** () .
- In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.
- Step 3** Next to the interface where you want to configure SFRP, click **Edit** () .
- Step 4** Choose the type of interface where you want to configure SFRP, either **Routed** or **Hybrid**.
- Step 5** You can configure SFRP while adding or editing an IP address. Click **Add** to add an IP address. To edit an IP address, click **Edit** () .
- Step 6** For **Type**, choose **SFRP** to display the SFRP options.
- Step 7** In the **Group ID** field, enter a value that designates a group of primary or backup interfaces configured for SFRP.
- Step 8** For **Priority**, choose either primary or backup to designate the preferred interface:
- For individual devices, you must set one interface to primary on one device and the other to backup on a second device.

- For 7000 or 8000 Series device high-availability pairs, when you set one interface as primary, the other automatically becomes the backup.

- Step 9** In the **Shared Secret** field, enter a shared secret.
- The Shared Secret field populates automatically for a group in a 7000 or 8000 Series device high-availability pair.
- Step 10** In the **Adv. Interval (seconds)** field, enter an interval for route advertisements for Layer 3 traffic.
- Step 11** Click **OK**.
- Step 12** Click **Save**.
-

What to do next

Deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

Related Topics

[About 7000 and 8000 Series Device High Availability](#), on page 445

Virtual Router Configuration

Caution Adding a virtual router on a 7000 or 8000 Series device restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See [Snort® Restart Traffic Behavior, on page 310](#) for more information.

Before you can use routed interfaces in a Layer 3 deployment, you must configure virtual routers and assign routed interfaces to them. A virtual router is a group of routed interfaces that route Layer 3 traffic.

You can assign only routed and hybrid interfaces to a virtual router.

To maximize TCP security, you can enable strict enforcement, which blocks connections where the three-way handshake was not completed. Strict enforcement also blocks:

- non-SYN TCP packets for connections where the three-way handshake was not completed
- non-SYN/RST packets from the initiator on a TCP connection before the responder sends the SYN-ACK
- non-SYN-ACK/RST packets from the responder on a TCP connection after the SYN but before the session is established
- SYN packets on an established TCP connection from either the initiator or the responder

Note that if you change the configuration of a Layer 3 interface to a non-Layer 3 interface or remove a Layer 3 interface from the virtual router, the router may fall into an invalid state. For example, if it is used in DHCPv6, it may cause an upstream and downstream mismatch.

Adding Virtual Routers

Smart License	Classic License	Supported Devices	Supported Domains	Access
Any	Control	7000 & 8000 Series	Leaf only	Admin/Network Admin

You can add virtual routers from the **Virtual Routers** tab of the device management page. You can also add routers as you configure routed interfaces.

If you want to create a virtual router before you configure the interfaces on your managed devices, you can create an empty virtual router and add interfaces to it later.

Caution Adding a virtual router on a 7000 or 8000 Series device restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See [Snort® Restart Traffic Behavior, on page 310](#) for more information.

Procedure

Step 1 Choose **Devices > Device Management**.

Step 2 Next to the device you want to modify, click **Edit** ()

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

Step 3 Click the **Virtual Routers** tab.

Tip If your devices are in a stack in a high-availability pair, choose the stack you want to modify from the **Selected Device** drop-down list.

Step 4 Click **Add Virtual Router**.

Step 5 In the **Name** field, enter a name for the virtual router. You can use alphanumeric characters and spaces.

Step 6 Configure IPv6 static routing, OSPFv3, and RIPng on your virtual router by checking or clearing the **IPv6 Support** check box.

Step 7 If you do not want to enable strict TCP enforcement, clear the **Strict TCP Enforcement** check box. This option is enabled by default.

Step 8 Choose one or more interfaces from the **Available** list under **Interfaces**, and click **Add**.

The **Available** list contains all enabled Layer 3 interfaces, routed and hybrid, on the device that you can assign to the virtual router.

Tip To remove a routed or hybrid interface from the virtual router, click **Delete** () . Disabling a configured interface from the Interfaces tab also removes it.

Step 9 Click **Save**.

What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

DHCP Relay

DHCP provides configuration parameters to Internet hosts. A DHCP client that has not yet acquired an IP address cannot communicate directly with a DHCP server outside its broadcast domain. To allow DHCP clients to communicate with DHCP servers, you can configure DHCP relay instances to handle cases where the client is not on the same broadcast domain as the server.

You can set up DHCP relay for each virtual router you configure. By default, this feature is disabled. You can enable either DHCPv4 relay or DHCPv6 relay.

Note You cannot run a DHCPv6 Relay chain through two or more virtual routers running on the same device.

Setting Up DHCPv4 Relay

Smart License	Classic License	Supported Devices	Supported Domains	Access
Any	Control	7000 & 8000 Series	Leaf only	Admin/Network Admin

The following procedure explains how to set up DHCPv4 relay on a virtual router.

Procedure

- Step 1** Choose **Devices > Device Management**.
- Step 2** Next to the device you want to modify, click the edit icon (✎).
In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.
- Step 3** Click the **Virtual Routers** tab.
- Step 4** Next to the virtual router you want to modify, click the edit icon (✎).
- Step 5** Check the **DHCPv4** check box.
- Step 6** Under the **Servers** field, enter a server IP address.
- Step 7** Click **Add**.
You can add up to four DHCP servers.
- Step 8** In the **Max Hops** field, enter the maximum number of hops from 1 to 255.

Step 9 Click **Save**.

What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

Setting Up DHCPv6 Relay

Smart License	Classic License	Supported Devices	Supported Domains	Access
Any	Control	7000 & 8000 Series	Leaf only	Admin/Network Admin

You cannot run a DHCPv6 Relay chain through two or more virtual routers running on the same device.

Procedure

Step 1 Choose **Devices > Device Management**.

Step 2 Next to the device you want to modify, click the edit icon (✎).

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

Step 3 Click the **Virtual Routers** tab.

Step 4 Next to the virtual router where you want to set up DHCP relay, click the edit icon (✎).

Step 5 Check the **DHCPv6** check box.

Step 6 In the **Interfaces** field, check the check boxes next to one or more interfaces that have been assigned to the virtual router.

Tip You cannot disable an interface from the **Interfaces** tab while it is configured for DHCPv6 Relay. You must first clear the DHCPv6 Relay interfaces check box and save the configuration.

Step 7 Next to a selected interface, click the drop-down icon and choose whether the interface relays DHCP requests **Upstream**, **Downstream**, or **Both**.

Note You must include at least one downstream interface and one upstream interface. Choosing both means that the interface is both downstream and upstream.

Step 8 In the **Max Hops** field, enter the maximum number of hops from 1 to 255

Step 9 Click **Save**.

What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

Static Routes

Static routing allows you to write rules about the IP addresses of traffic passing through a router. It is the simplest way of configuring path selection of a virtual router because there is no communication with other routers regarding the current topology of the network.

Do not configure routing to IP interfaces for DHCPv4 servers that the assigned virtual router cannot route packets to. Doing so will render previously specified routable DHCP4 servers unroutable.

The Static Routes table includes summary information about each route, as described in the following table.

Table 78: Static Routes Table View Fields

Field	Description
Enabled	Specifies whether this route is currently enabled or disabled.
Name	The name of the static route.
Destination	The destination network where traffic is routed.
Type	Specifies the action that is taken for this route, which will be one of the following: <ul style="list-style-type: none"> • IP — designates that the route forwards packets to the address of a neighboring router. • Interface — designates that the route forwards packets to an interface through which traffic is routed to hosts on a directly connected network. • Discard — designates that the static route drops packets.
Gateway	The target IP address if you selected IP as the static route type or the interface if you selected Interface as the static route type.
Preference	Determines the route selection. If you have multiple routes to the same destination, the system selects the route with the higher preference.

Viewing the Static Routes Table

Smart License	Classic License	Supported Devices	Supported Domains	Access
Any	Control	7000 & 8000 Series	Any	Admin/Network Admin

Procedure

Step 1 Choose **Devices > Device Management**.

Step 2 Next to the device you want to view, click the edit icon (✎).

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

Step 3 Click the **Virtual Routers** tab.

Step 4 Next to the virtual router where you want to view static routes, click the edit icon (✎).

If a view icon (🔍) appears instead, the configuration belongs to a descendant domain, or you do not have permission to modify the configuration.

Step 5 Click the **Static** tab.

Adding Static Routes

Smart License	Classic License	Supported Devices	Supported Domains	Access
Any	Control	7000 & 8000 Series	Leaf only	Admin/Network Admin

Procedure

Step 1 Choose **Devices > Device Management**.

Step 2 Next to the device where you want to add the static route, click the edit icon (✎).

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

Step 3 Click the **Virtual Routers** tab.

Step 4 Next to the virtual router where you want to add the static route, click the edit icon (✎).

Step 5 Click **Static** to display the static route options.

Step 6 Click **Add Static Route**.

Step 7 In the **Route Name** field, enter a name for the static route. You can use alphanumeric characters and spaces.

Step 8 For **Enabled**, check the check box to specify that the route is currently enabled.

Step 9 In the **Preference** field, enter a numerical value between 1 and 65535 to determine the route selection.

Note If you have multiple routes to the same destination, the system uses the route with the higher preference.

Step 10 From the **Type** drop-down list, choose the type of static route you are configuring.

Step 11 In the **Destination** field, enter the IP address for the destination network where traffic should be routed.

Step 12 In the **Gateway** field, you have two options:

- If you chose **IP** as the selected static route type, choose an IP address.
- If you chose **Interface** as the selected static route type, choose an enabled interface from the drop-down list.

Tip Interfaces you have disabled from the **Interfaces** tab are not available; disabling an interface you have added removes it from the configuration.

- Step 13** Click **OK**.
- Step 14** Click **Save**.

What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

Dynamic Routing

Dynamic, or adaptive, routing uses a routing protocol to alter the path that a route takes in response to a change in network conditions. The adaptation is intended to allow as many routes as possible to remain valid, that is, have destinations that can be reached in response to the change. This allows the network to “route around” damage, such as loss of a node or a connection between nodes, so long as other path choices are available. You can configure a router with no dynamic routing, or you can configure the Routing Information Protocol (RIP) or the Open Shortest Path First (OSPF) routing protocol.

RIP Configuration

Routing Information Protocol (RIP) is a dynamic routing protocol, designed for small IP networks, that relies on hop count to determine routes. The best routes use the fewest number of hops. The maximum number of hops allowed for RIP is 15. This hop limit also limits the size of the network that RIP can support.

Adding Interfaces for RIP Configuration

Smart License	Classic License	Supported Devices	Supported Domains	Access
Any	Control	7000 & 8000 Series	Leaf only	Admin/Network Admin

While configuring RIP, you must choose interfaces from those already included in the virtual router, where you want to configure RIP. Disabled interfaces are not available.

Procedure

- Step 1** Choose **Devices > Device Management**.
- Step 2** Next to the device you want to modify, click the edit icon (✎).
In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.
- Step 3** Click the **Virtual Routers** tab.
- Step 4** Next to the virtual router you want to modify, click the edit icon (✎).
- Step 5** Click **Dynamic Routing** to display the dynamic routing options.
- Step 6** Click **RIP** to display the RIP options.
- Step 7** Under **Interfaces**, click the add icon (+).

- Step 8** From the **Name** drop-down list, choose the interface where you want to configure RIP.
- Tip** Interfaces you have disabled from the Interfaces tab are not available; disabling an interface you have added removes it from the configuration.
- Step 9** In the **Metric** field, enter a metric for the interface. When routes from different RIP instances are available and all of them have the same preference, the route with the lowest metric becomes the preferred route.
- Step 10** From the **Mode** drop-down list, choose one of the following options:
- **Multicast** — default mode where RIP multicasts the entire routing table to all adjacent routers at a specified address.
 - **Broadcast** — forces RIP to use broadcast (for example, RIPv1) even though multicast mode is possible.
 - **Quiet** — RIP will not transmit any periodic messages to this interface.
 - **No Listen** — RIP will send to this interface but not listen to it.
- Step 11** Click **Save**.

What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

Configuring Authentication Settings for RIP Configuration

Smart License	Classic License	Supported Devices	Supported Domains	Access
Any	Control	7000 & 8000 Series	Leaf only	Admin/Network Admin

RIP authentication uses one of the authentication profiles you configured on the virtual router.

Procedure

- Step 1** Choose **Devices > Device Management**.
- Step 2** Next to the device you want to modify, click the edit icon (✎).
In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.
- Step 3** Click the **Virtual Routers** tab.
- Step 4** Next to the virtual router where you want to add the RIP authentication profile, click the edit icon (✎).
- Step 5** Click **Dynamic Routing** to display the dynamic routing options.
- Step 6** Click **RIP** to display the RIP options.
- Step 7** Under **Authentication**, choose an existing virtual router authentication profile from the **Profile** drop-down list, or choose **None**.
- Step 8** Click **Save**.
-

What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

Configuring Advanced Settings for RIP Configuration

Smart License	Classic License	Supported Devices	Supported Domains	Access
Any	Control	7000 & 8000 Series	Leaf only	Admin/Network Admin

You can configure several advanced RIP settings pertaining to various timeout values and other features that affect the behavior of the protocol.

Caution Changing any of the advanced RIP settings to incorrect values can prevent the router from communicating successfully with other RIP routers.

Procedure

-
- Step 1** Choose **Devices > Device Management**.
- Step 2** Next to the device you want to modify, click the edit icon (✎).
In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.
- Step 3** Click the **Virtual Routers** tab.
- Step 4** Next to the virtual router you want to modify, click the edit icon (✎).
- Step 5** Click **Dynamic Routing** to display the dynamic routing options.
- Step 6** Click **RIP** to display the RIP options.
- Step 7** In the **Preference** field, enter a numerical value (higher is better) for the preference of the routing protocol. The system prefers routes learned through RIP over static routes.
- Step 8** In the **Period** field, enter the interval, in seconds, between periodic updates. A lower number determines faster convergence, but larger network load.
- Step 9** In the **Timeout Time** field, enter a numerical value that specifies how old routes must be, in seconds, before being considered unreachable.
- Step 10** In the **Garbage Time** field, enter a numerical value that specifies how old routes must be, in seconds, before being discarded.
- Step 11** In the **Infinity** field, enter a numerical value that specifies a value for infinity distance in convergence calculations. Larger values will make protocol convergence slower.
- Step 12** From the **Honor** drop-down list, choose one of the following options to designate when requests for dumping routing tables should be honored:
- **Always** — always honor requests
 - **Neighbor** — only honor requests sent from a host on a directly connected network
 - **Never** — never honor requests

Step 13 Click **Save**.

What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

Adding Import Filters for RIP Configuration

Smart License	Classic License	Supported Devices	Supported Domains	Access
Any	Control	7000 & 8000 Series	Leaf only	Admin/Network Admin

You can add an import filter to designate which routes are accepted or rejected from RIP into the route table. Import filters are applied in the order they appear in the table.

When adding an import filter, you use one of the filters you configured on the virtual router.

Tip To edit a RIP import filter, click the edit icon (✎). To delete a RIP import filter, click the delete icon (🗑).

Before you begin

- Add a virtual router as described in [Adding Virtual Routers, on page 904](#).
- Configure a filter on the virtual router as described in [Setting Up Virtual Router Filters, on page 922](#).

Procedure

Step 1 Choose **Devices > Device Management**.

Step 2 Next to the device you want to modify, click the edit icon (✎).

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

Step 3 Click the **Virtual Routers** tab.

Step 4 Next to the virtual router where you want to add the RIP virtual router filter, click the edit icon (✎).

Step 5 Click **Dynamic Routing** to display the dynamic routing options.

Step 6 Click **RIP** to display the RIP options.

Step 7 Under **Import Filters**, click the add icon (+).

Step 8 From the **Name** drop-down list, choose the filter you want to add as an import filter.

Step 9 Next to **Action**, choose **Accept** or **Reject**.

Step 10 Click **OK**.

Tip

To change the order of the import filters, click the move up (⬆) and move down (⬇) icons as needed. You can also drag the filters up or down in the list.

Step 11 Click **Save**.

What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

Adding Export Filters for RIP Configuration

Smart License	Classic License	Supported Devices	Supported Domains	Access
Any	Control	7000 & 8000 Series	Leaf only	Admin/Network Admin

You can add an export filter to define which routes will be accepted or rejected from the route table to RIP. Export filters are applied in the order they appear in the table.

When adding an export filter, you use one of the filters you configured on the virtual router.

Procedure

Step 1 Choose **Devices > Device Management**.

Step 2 Next to the device you want to modify, click the edit icon (✎).

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

Step 3 Click the **Virtual Routers** tab.

Step 4 Next to the virtual router where you want to add the RIP virtual router filter, click the edit icon (✎).

Step 5 Click **Dynamic Routing** to display the dynamic routing options.

Step 6 Click **RIP** to display the RIP options.

Step 7 Under **Export Filters**, click the add icon (+).

Step 8 From the **Name** drop-down list, choose the filter you want to add as an export filter.

Step 9 Next to **Action**, choose **Accept** or **Reject**.

Step 10 Click **OK**.

Tip

To change the order of the export filters, click the move up (⬆) and move down (⬇) icons as needed. You can also drag the filters up or down in the list.

Step 11 Click **Save**.

What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

OSPF Configuration

Open Shortest Path First (OSPF) is an adaptive routing protocol that defines routes dynamically by obtaining information from other routers and advertising routes to other routers using link state advertisements. The router keeps information about the links between it and the destination to make routing decisions. OSPF assigns a cost to each routed interface, and considers the best routes to have the lowest costs.

OSPF Routing Areas

An OSPF network may be structured, or subdivided, into routing areas to simplify administration and optimize traffic and resource use. Areas are identified by 32-bit numbers, expressed either simply in decimal or often in octet-based dot-decimal notation.

By convention, area zero or 0.0.0.0 represents the core or backbone region of an OSPF network. You may choose to identify other areas. Often, administrators select the IP address of a main router in an area as the area's identification. Each additional area must have a direct or virtual connection to the backbone OSPF area. Such connections are maintained by an interconnecting router, known as the area border router (ABR). An ABR maintains separate link state databases for each area it serves and maintains summarized routes for all areas in the network.

Adding OSPF Areas

Smart License	Classic License	Supported Devices	Supported Domains	Access
Any	Control	7000 & 8000 Series	Leaf only	Admin/Network Admin

Procedure

-
- Step 1** Choose **Devices > Device Management**.
 - Step 2** Next to the device you want to modify, click the edit icon (✎).
In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.
 - Step 3** Click the **Virtual Routers** tab.
 - Step 4** Next to the virtual router you want to modify, click the edit icon (✎).
 - Step 5** Click **Dynamic Routing** to display the dynamic routing options.
 - Step 6** Click **OSPF** to display the OSPF options.
 - Step 7** Under **Areas**, click the add icon (+).
 - Step 8** In the **Area Id** field, enter a numerical value for the area. This value can be either an integer or an IPv4 address.
 - Step 9** Optionally, check the **Stubnet** check box to designate that the area does not receive router advertisements external to the autonomous system and routing from within the area is based entirely on a default route. If you clear the check box, the area becomes a backbone area or otherwise non-stub area.
 - Step 10** In the **Default cost** field, enter a cost associated with the default route for the area.
 - Step 11** Under **Stubnets**, click the add icon (+).
 - Step 12** In the **IP Address** field, enter an IP address in CIDR notation.
 - Step 13** Choose the **Hidden** check box to indicate that the stubnet is hidden.

Hidden stubnets are not propagated into other areas.

- Step 14** Choose the **Summary** check box to designate that default stubnets that are subnetworks of this stubnet are suppressed.
- Step 15** In the **Stub cost** field, enter a value that defines the cost associated with routing to this stub network.
- Step 16** Click **OK**.
- Step 17** If you want to add a network, click the add icon (+) under **Networks**.
- Step 18** In the **IP Address** field, enter an IP address in CIDR notation for the network.
- Step 19** Check the **Hidden** check box to indicate that the network is hidden. Hidden networks are not propagated into other areas.
- Step 20** Click **OK**.
- Step 21** Click **Save**.
-

What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

OSPF Area Interfaces

You can configure a subset of the interfaces assigned to the virtual router for OSPF. The following list describes the options you can specify on each interface.

Interfaces

Select the interface where you want to configure OSPF. Interfaces you have disabled from the Interfaces tab are not available.

Type

Select the type of OSPF interface from the following choices:

- **Broadcast** — On broadcast networks, flooding and hello messages are sent using multicasts, a single packet for all the neighbors. The option designates a router to be responsible for synchronizing the link state databases and originating network link state advertisements. This network type cannot be used on physically non-broadcast multiple-access (NBMP) networks and on unnumbered networks without proper IP prefixes.
- **Point-to-Point (PtP)** — Point-to-point networks connect just two routers together. No election is performed and no network link state advertisement is originated, which makes it simpler and faster to establish. This network type is useful not only for physically PtP interfaces, but also for broadcast networks used as PtP links. This network type cannot be used on physically NBMP networks.
- **Non-Broadcast** — On NBMP networks, the packets are sent to each neighbor separately because of the lack of multicast capabilities. Similar to broadcast networks, the option designates a router, which plays a central role in the propagation of link state advertisements. This network type cannot be used on unnumbered networks.
- **Autodetect** — The system determines the correct type based on the specified interface.

Cost

Specify the output cost of the interface.

Stub

Specify whether the interface should listen for OSPF traffic and transmit its own traffic.

Priority

Enter a numerical value that specifies the priority value used in designated router election. On every multiple access network, the system designates a router and backup router. These routers have some special functions in the flooding process. Higher priority increases preferences in this election. You cannot configure a router with a priority of 0.

Nonbroadcast

Specify whether hello packets are sent to any undefined neighbors. This switch is ignored on any NBMA network.

Authentication

Select the OSPF authentication profile that this interface uses from one of the authentication profiles you configured on the virtual router or select **None**. For more information about configuring authentication profiles, see [Adding Virtual Router Authentication Profiles, on page 923](#).

Hello Interval

Type the interval, in seconds, between the sending of hello messages.

Poll

Type the interval, in seconds, between the sending of hello messages for some neighbors on NBMA networks.

Retrans Interval

Type the interval, in seconds, between retransmissions of unacknowledged updates.

Retrans Delay

Type the estimated number of seconds it takes to transmit a link state update packet over the interface.

Wait Time

Type the number of seconds that the router waits between starting election and building adjacency.

Dead Interval

Type the number of seconds that the router waits before declaring a neighbor down when not receiving messages from it. If this value is defined, it overrides the value calculated from dead count.

Dead Count

Type a numerical value that when multiplied by the hello interval specifies the number of seconds that the router waits before declaring a neighbor down when not receiving messages from it.

To edit an OSPF area interface, click the edit icon (). To delete an OSPF area interface, click the delete icon (). Disabling a configured interface from the Interfaces tab also deletes it.

Adding OSPF Area Interfaces

Smart License	Classic License	Supported Devices	Supported Domains	Access
Any	Control	7000 & 8000 Series	Leaf only	Admin/Network Admin

You can configure a subset of the interfaces assigned to the virtual router for OSPF.

You can choose only one interface for use in an OSPF area.

Procedure

-
- Step 1** Choose **Devices > Device Management**.
- Step 2** Next to the device where you want to add the OSPF interface, click the edit icon ().
In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.
- Step 3** Click the **Virtual Routers** tab.
- Step 4** Next to the virtual router where you want to add the OSPF interface, click the edit icon ().
- Step 5** Click **Dynamic Routing** to display the dynamic routing options.
- Step 6** Click **OSPF** to display the OSPF options.
- Step 7** Under **Areas**, click the add icon ().
- Step 8** Click **Interfaces**.
- Step 9** Click the add icon ().
- Step 10** Take any of the actions as described in [OSPF Area Interfaces, on page 915](#).
- Step 11** If you want to add a network, click the add icon () under **Networks**.
- Step 12** In the **IP address** field, enter an IP address for the neighbor receiving hello messages on non-broadcast networks from this interface.
- Step 13** Check the **Eligible** check box to indicate that the neighbor is eligible to receive messages.
- Step 14** Click **OK**.
- Tip** To edit a neighbor, click the edit icon (). To delete a neighbor, click the delete icon (.
- Step 15** Click **OK**.
- Step 16** Click **Save**.
- Step 17** Click **Save**.
-

What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

Adding OSPF Area Vlinks

Smart License	Classic License	Supported Devices	Supported Domains	Access
Any	Control	7000 & 8000 Series	Leaf only	Admin/Network Admin

All areas in an OSPF autonomous system must be physically connected to the backbone area. In some cases where this physical connection is not possible, you can use a vlink to connect to the backbone through a non-backbone area. Vlinks can also be used to connect two parts of a partitioned backbone through a non-backbone area.

You must add a minimum of two OSPF areas before you can add a vlink.

Procedure

-
- Step 1** Choose **Devices > Device Management**.
 - Step 2** Next to the device you want to modify, click the edit icon (✎).
In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.
 - Step 3** Click the **Virtual Routers** tab.
 - Step 4** Next to the virtual router you want to modify, click the edit icon (✎).
 - Step 5** Click **Dynamic Routing** to display the dynamic routing options.
 - Step 6** Click **OSPF** to display the OSPF options.
 - Step 7** Under **Areas**, click the add icon (+).
 - Step 8** Click **Vlinks**.
 - Step 9** Click the add icon (+).
 - Step 10** In the **Router ID** field, enter an IP address for the router.
 - Step 11** From the **Authentication** drop-down list, choose the authentication profile the vlink will use.
 - Step 12** In the **Hello Interval** field, enter the interval, in seconds, between sending of hello messages.
 - Step 13** In the **Retrans Interval** field, enter the interval, in seconds, between retransmissions of unacknowledged updates.
 - Step 14** In the **Wait Time** field, enter the number of seconds that the router waits between starting election and building adjacency.
 - Step 15** In the **Dead Interval** field, enter the number of seconds that the router waits before declaring a neighbor down when not receiving messages from it. If this value is defined, it overrides the value calculated from dead count.
 - Step 16** In the **Dead Count** field, enter a numerical value that when multiplied by the hello interval, specifies the number of seconds that the router waits before declaring a neighbor down when not receiving messages from it.
 - Step 17** Click **OK**.
 - Step 18** Click **Save**.

Step 19 Click **Save**.

What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

Adding Import Filters for OSPF Configuration

Smart License	Classic License	Supported Devices	Supported Domains	Access
Any	Control	7000 & 8000 Series	Leaf only	Admin/Network Admin

You can add an import filter to define which routes are accepted or rejected from OSPF into the route table. Import filters are applied in the order they appear in the table.

When adding an import filter, you use one of the filters you configured on the virtual router.

Procedure

Step 1 Choose **Devices > Device Management**.

Step 2 Next to the device you want to modify, click the edit icon (✎).

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

Step 3 Click **Virtual Routers**.

Step 4 Next to the virtual router you want to modify, click the edit icon (✎).

Step 5 Click **Dynamic Routing** to display the dynamic routing options.

Step 6 Click **OSPF** to display the OSPF options.

Step 7 Under **Import Filters**, click the add icon (+).

Step 8 From the **Name** drop-down list, choose the filter you want to add as an import filter.

Step 9 Next to **Action**, choose **Accept** or **Reject**.

Step 10 Click **OK**.

Tip

To change the order of the import filters, click the move up (⬆) and move down (⬇) icons as needed. You can also drag the filters up or down in the list.

Step 11 Click **Save**.

What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

Adding Export Filters for OSPF Configuration

Smart License	Classic License	Supported Devices	Supported Domains	Access
Any	Control	7000 & 8000 Series	Leaf only	Admin/Network Admin

You can add an export filter to define which routes will be accepted or rejected from the route table to OSPF. Export filters are applied in the order they appear in the table.

When adding an export filter, you use one of the filters you configured on the virtual router.

Procedure

Step 1 Choose **Devices > Device Management**.

Step 2 Next to the device you want to modify, click the edit icon (✎).

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

Step 3 Click the **Virtual Routers** tab.

Step 4 Next to the virtual router where you want to add the OSPF virtual router filter, click the edit icon (✎).

Step 5 Click the **Dynamic Routing** tab to display the dynamic routing options.

Step 6 Click **OSPF** to display the OSPF options.

Step 7 Under **Export Filters**, click the add icon (+).

Step 8 From the **Name** drop-down list, choose the filter you want to add as an export filter.

Step 9 Next to **Action**, choose **Accept** or **Reject**.

Step 10 Click **OK**.

Tip

To change the order of the export filters, click the move up (▲) and move down (▼) icons as needed. You can also drag the filters up or down in the list.

Step 11 Click **Save**.

What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

Virtual Router Filters

Filters provide a way to match routes for importing into the virtual router's route table and for exporting routes to dynamic protocols. You can create and manage a list of filters. Each filter defines specific criteria to look for in routes that are defined statically or received from a dynamic protocol.

The Virtual Routers Filters table includes summary information about each filter you have configured on a virtual router, as described in the following table.

Table 79: Virtual Router Filters Table View Fields

Field	Description
Name	The name of the filter.
Protocol	The protocol that the route originates from: <ul style="list-style-type: none"> • Static — The route originates as a local static route. • RIP — The route originates from a dynamic RIP configuration. • OSPF — The route originates from a dynamic OSPF configuration.
From Router	The router IP addresses that this filter attempts to match in a router. You must enter this value for static and RIP filters.
Next Hop	The next hop where packets using this route are forwarded. You must enter this value for static filters.
Destination Type	The type of destination where packets are sent: <ul style="list-style-type: none"> • Router • Device • Discard
Destination Network	The networks that this filter attempts to match in a route.
OSPF Path Type	Applies only to OSPF protocol. The path type can be one of the following: <ul style="list-style-type: none"> • Ext-1 • Ext-2 • Inter Area • Intra Area
OSPF Router ID	Applies only to OSPF protocol. The router ID of the router advertising that route/network.

Viewing Virtual Router Filters

Smart License	Classic License	Supported Devices	Supported Domains	Access
Any	Control	7000 & 8000 Series	Any	Admin/Network Admin

The **Filter** tab of the virtual router editor displays a table listing of all the filters you have configured on a virtual router. The table includes summary information about each filter.

Procedure

- Step 1** Choose **Devices > Device Management**.
- Step 2** Next to the device you want to view, click the edit icon (✎).
In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.
- Step 3** Click the **Virtual Routers** tab.
- Step 4** Next to the virtual router where you want to view the filters, click the edit icon (✎).
- Step 5** Click the **Filter** tab.
-

Setting Up Virtual Router Filters

Smart License	Classic License	Supported Devices	Supported Domains	Access
Any	Control	7000 & 8000 Series	Leaf only	Admin/Network Admin

Procedure

- Step 1** Choose **Devices > Device Management**.
- Step 2** Next to the device you want to modify, click the edit icon (✎).
In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.
- Step 3** Click the **Virtual Routers** tab.
- Step 4** Next to the virtual router you want to modify, click the edit icon (✎).
- Step 5** Click the **Filter** tab.
- Step 6** Click **Add Filter**.
- Step 7** In the **Name** field, enter a name for the filter. You can use alphanumeric characters only.
- Step 8** Under **Protocol**, choose **All** or choose the protocol that applies to the filter.
- Step 9** If you chose All, Static, or RIP as the **Protocol**, under **From Router**, enter the router IP addresses that this filter will attempt to match in a route.
- Note** You can also enter a /32 CIDR block for IPv4 addresses and a /128 prefix length for IPv6 addresses. All other address blocks are invalid for this field.
- Step 10** Click **Add**.
- Step 11** If you chose All, Static, or RIP as the **Protocol**, under **Next Hop**, enter the IP addresses for the gateways that this filter will attempt to match in a route.
- Note** You can also enter a /32 CIDR block for IPv4 addresses and a /128 prefix length for IPv6 addresses. All other address blocks are invalid for this field.

- Step 12** Click **Add**.
- Step 13** Under **Destination Type**, choose the options that apply to the filter.
- Step 14** Under **Destination Network**, enter the IP address of the network that this filter will attempt to match in a route.
- Step 15** Click **Add**.
- Step 16** If you chose All or OSPF as the **Protocol**, under **Path Type**, choose the options that apply to the filter. You must choose at least one path type.
- Step 17** If you chose OSPF as the **Protocol**, under **Router ID**, enter the IP address that serves as the router ID of the router advertising the route/network.
- Step 18** Click **Add**.
- Step 19** Click **OK**.
- Step 20** Click **Save**.

What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 306](#).

Adding Virtual Router Authentication Profiles

Smart License	Classic License	Supported Devices	Supported Domains	Access
Any	Control	7000 & 8000 Series	Leaf only	Admin/Network Admin

You can set up Authentication Profiles for use in RIP and OSPF configurations. You can configure a simple password or specify a shared cryptographic key. Simple passwords allow for every packet to carry eight bytes of the password. The system ignores received packets lacking this password. Cryptographic keys allow for validation, a 16-byte long digest generated from a password to be appended to every packet.

Note that for OSPF, each area can have a different authentication method. Therefore, you create authentication profiles that can be shared among many areas. You cannot add authentication for OSPFv3.

Procedure

- Step 1** Choose **Devices > Device Management**.
- Step 2** Next to the device you want to modify, click the edit icon (✎).
In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.
- Step 3** Click the **Virtual Routers** tab.
- Step 4** Next to the virtual router you want to modify, click the edit icon (✎).
