- Step 5** Next to **Client JDBC Driver**, click **Download** and follow your browser's prompts to download the `client.zip` package.
- Step 6** To add database access for one or more IP addresses, click **Add Hosts**. An **IP Address** field appears in the **Access List** field.
- Step 7** In the **IP Address** field, enter an IP address or address range, or `any`.
- Step 8** Click **Add**.
- Step 9** Click **Save**.
- Tip** If you want to revert to the last saved database settings, click **Refresh**.

## Database Event Limits

To manage disk space, the FMC periodically prunes the oldest intrusion events, audit records, Security Intelligence data, and URL filtering data from the event database. For each event type, you can specify how many records the FMC retains after pruning; never rely on the event database containing more records of any type than the retention limit configured for that type. To improve performance, tailor the event limits to the number of events you regularly work with. You can optionally choose to receive email notifications when pruning occurs. For some event types, you can disable storage.

To manually delete individual events, use the event viewer. You can also manually purge the database; see [Data Storage](#), on page 197.

# Configuring Database Event Limits

## Before you begin

- If you want to receive email notifications when events are pruned from the Firepower Management Center's database, you must configure an email server; see [Configuring a Mail Relay Host and Notification Address](#), on page 906.

## Procedure

- 
- Step 1** Choose **System > Configuration**.
- Step 2** Choose **Database**.
- Step 3** For each of the databases, enter the number of records you want to store.  
For information on how many records each database can maintain, see [Database Event Limits](#), on page 879.
- Step 4** Optionally, in the **Data Pruning Notification Address** field, enter the email address where you want to receive pruning notifications.
- Step 5** Click **Save**.

## Database Event Limits

The following table lists the minimum and maximum number of records for each event type that you can store on a Firepower Management Center.

*Table 70: Database Event Limits*

| Event Type       | Upper Limit                                                                                                                                                                   | Lower Limit             |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| Intrusion events | 10 million (FMC Virtual)<br>20 million (FMC750)<br>30 million (FMC1000, FMC1500, )<br>60 million (FMC2000,FMC2500)<br>150 million (FMC3500)<br>300 million (FMC4000, FMC4500) | 10,000                  |

## Management Interfaces

After setup, you can change the management network settings, including adding more management interfaces, hostname, search domains, DNS servers, and HTTP proxy on the FMC.

### About FMC Management Interfaces

By default, the FMC manages all devices on a single management interface. You can also perform initial setup on the management interface and log into the FMC on this interface as an administrator. The management interface is also used to communicate with the Smart Licensing server, to download updates, and to perform other management functions.

For information about device management interfaces, see [About Device Management Interfaces, on page 221](#).

### Management Interfaces on the FMC

The FMC uses the eth0 interface for initial setup, HTTP access for administrators, management of devices, as well as other management functions such as licensing and updates.

You can also configure additional management interfaces on the same network, or on different networks. When the FMC manages large numbers of devices, adding more management interfaces can improve throughput and performance. You can also use these interfaces for all other management functions. You might want to use each management interface for particular functions; for example, you might want to use one interface for HTTP administrator access and another for device management.

For device management, the management interface carries two separate traffic channels: the *management traffic channel* carries all internal traffic (such as inter-device traffic specific to managing the device), and the *event traffic channel* carries all event traffic (such as web events). You can optionally configure a separate event-only interface on the FMC to handle event traffic; you can configure only one event interface. Event traffic can use a large amount of bandwidth, so separating event traffic from management traffic can improve the performance of the FMC. For example, you can assign a 10 GigabitEthernet interface to be the event interface, if available, while using 1 GigabitEthernet interfaces for management. You might want to configure an event-only interface on a completely secure, private network while using the regular management interface on a network that includes Internet access, for example. You can also use both management and event interfaces on the same network if the goal is only to take advantage of increased throughput. Managed devices will send management traffic to the FMC management interface and event traffic to the FMCs event-only interface. If the managed device cannot reach the event-only interface, then it will fall back to sending events to the management interface.

**Note** All management interfaces support HTTP administrator access as controlled by your Access List configuration. Conversely, you cannot restrict an interface to *only* HTTP access; management interfaces always support device management (management traffic, event traffic, or both).

**Note** Only the eth0 interface supports DHCP IP addressing. Other management interfaces only support static IP addresses.

## Management Interface Support Per FMC Model

See the hardware installation guide for your model for the management interface locations.

See the following table for supported management interfaces on each FMC model.

**Table 71: Management Interface Support on the FMC**

| Model                               | Management Interfaces                  |
|-------------------------------------|----------------------------------------|
| MC750, MC1500, MC3500               | eth0 (Default)<br>eth1                 |
| MC2000, MC4000                      | eth0 (Default)<br>eth1<br>eth2<br>eth3 |
| MC1000                              | eth0 (Default)<br>eth1                 |
| MC2500, MC4500                      | eth0 (Default)<br>eth1<br>eth2<br>eth3 |
| Firepower Management Center Virtual | eth0 (Default)                         |

## Network Routes on FMC Management Interfaces

Management interfaces (including event-only interfaces) support only static routes to reach remote networks. When you set up your FMC, the setup process creates a default route to the gateway IP address that you specify. You cannot delete this route; you can only modify the gateway address.

The default route always uses the lowest-numbered management interface (e.g. eth0).

At least one static route is recommended per management interface to access remote networks. We recommend placing each interface on a separate network to avoid potential routing problems, including routing problems from other devices to the FMC. If you do not experience problems with interfaces on the same network, then be sure to configure static routes correctly. For example, on the FMC both eth0 and eth1 are on the same network, but you want to manage a different group of devices on each interface. The default gateway is 192.168.45.1. If you want eth1 to manage devices on the remote 10.6.6.0/24 destination network, you can create a static route for 10.6.6.0/24 through eth1 with the same gateway of 192.168.45.1. Traffic to 10.6.6.0/24 will hit this route before it hits the default route, so eth1 will be used as expected.

If you want to use two FMC interfaces to manage remote devices that are on the same network, then static routing on the FMC may not scale well, because you need separate static routes per device IP address.

Another example includes separate management and event-only interfaces on both the FMC and the managed device. The event-only interfaces are on a separate network from the management interfaces. In this case, add a static route through the event-only interface for traffic destined for the remote event-only network, and vice versa.

## NAT Environments

Network address translation (NAT) is a method of transmitting and receiving network traffic through a router that involves reassigning the source or destination IP address. The most common use for NAT is to allow private networks to communicate with the internet. Static NAT performs a 1:1 translation, which does not pose a problem for FMC communication with devices, but port address translation (PAT) is more common. PAT lets you use a single public IP address and unique ports to access the public network; these ports are dynamically assigned as needed, so you cannot initiate a connection to a device behind a PAT router.

Normally, you need both IP addresses (along with a registration key) for both routing purposes and for authentication: the FMC specifies the device IP address when you add a device, and the device specifies the FMC IP address. However, if you only know one of the IP addresses, which is the minimum requirement for routing purposes, then you must also specify a unique NAT ID on both sides of the connection to establish trust for the initial communication and to look up the correct registration key. The FMC and device use the registration key and NAT ID (instead of IP addresses) to authenticate and authorize for initial registration.

For example, you add a device to the FMC, and you do not know the device IP address (for example, the device is behind a PAT router), so you specify only the NAT ID and the registration key on the FMC; leave the IP address blank. On the device, you specify the FMC IP address, the same NAT ID, and the same registration key. The device registers to the FMC's IP address. At this point, the FMC uses the NAT ID instead of IP address to authenticate the device.

Although the use of a NAT ID is most common for NAT environments, you might choose to use the NAT ID to simplify adding many devices to the FMC. On the FMC, specify a unique NAT ID for each device you want to add while leaving the IP address blank, and then on each device, specify both the FMC IP address and the NAT ID. Note: The NAT ID must be unique per device.

The following example shows three devices behind a PAT IP address. In this case, specify a unique NAT ID per device on both the FMC and the devices, and specify the FMC IP address on the devices.

Figure 26: NAT ID for Managed Devices Behind PAT

The following example shows the FMC behind a PAT IP address. In this case, specify a unique NAT ID per device on both the FMC and the devices, and specify the device IP addresses on the FMC.

Figure 27: NAT ID for FMC Behind PAT

## Management and Event Traffic Channel Examples

The following example shows the Firepower Management Center and managed devices using only the default management interfaces.

**Figure 28: Single Management Interface on the Firepower Management Center**

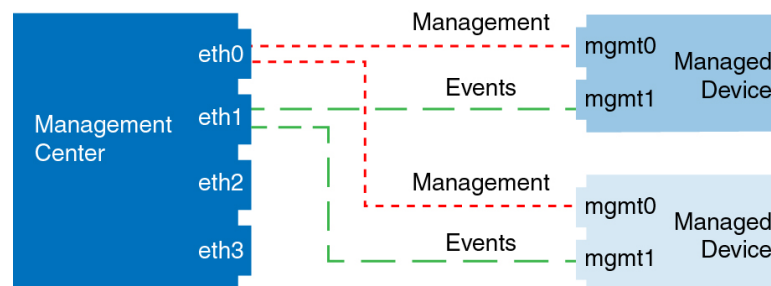

The following example shows the Firepower Management Center using separate management interfaces for devices; and each managed device using 1 management interface.

**Figure 29: Multiple Management Interfaces on the Firepower Management Center**

The following example shows the Firepower Management Center and managed devices using a separate event interface.

**Figure 30: Separate Event Interface on the Firepower Management Center and Managed Devices**

The following example shows a mix of multiple management interfaces and a separate event interface on the Firepower Management Center and a mix of managed devices using a separate event interface, or using a single management interface.

Figure 31: Mixed Management and Event Interface Usage

## Modify FMC Management Interfaces

**Caution** Do NOT push the FMC deployments over a VPN tunnel that is terminating directly on the Firepower Threat Defense. Pushing the FMC deployments can potentially inactivate the tunnel and disconnect the FMC and the Firepower Threat Defense.

Recovering the device from this situation can be very disruptive and require executing the disaster recovery procedure. This procedure resets the Firepower Threat Defense configuration to factory defaults by changing manager from FMC to local and configuring the device from beginning. For more information, see [Deploying the FMC Policy Configuration over VPN Tunnel, on page 344](#).

Modify the management interface settings on the Firepower Management Center. You can optionally enable additional management interfaces or configure an event-only interface.

**Caution** Be careful when making changes to the management interface to which you are connected; if you cannot re-connect because of a configuration error, you need to access the FMC console port to re-configure the network settings in the Linux shell. You must contact Cisco TAC to guide you in this operation.

**Note** If you change the FMC IP address, then see the following tasks to ensure device management connectivity depending on how you added the device to the FMC:

- **IP address—No action.** If you added the device to the FMC using a reachable device IP address, then the management connection will be reestablished automatically after several minutes even though the IP address identified on the FTD is the old IP address. **Note:** If you specified a device IP address that is unreachable, then you must contact Cisco TAC, who can advise you how to restore connectivity for your devices.
- **NAT ID only—Contact Cisco TAC.** If you added the device using only the NAT ID, then the connection cannot be reestablished. In this case, you must contact Cisco TAC, who can advise you how to restore connectivity for your devices.

### Before you begin

- For information about how device management works, see [About Device Management Interfaces, on page 221](#).
- If you use a proxy:
  - Proxies that use NT LAN Manager (NTLM) authentication are not supported.
  - If you use or will use Smart Licensing, the proxy FQDN cannot have more than 64 characters.

### Procedure

**Step 1** Choose **System > Configuration**, and then choose **Management Interfaces**.

**Step 2** In the **Interfaces** area, click **Edit** next to the interface that you want to configure.

All available interfaces are listed in this section. You cannot add more interfaces.

You can configure the following options on each management interface:

- **Enabled**—Enable the management interface. Do **not** disable the default eth0 management interface. Some processes require the eth0 interface.
- **Channels**—Configure an event-only interface; you can configure only one event interface on the FMC. To do so, uncheck the **Management Traffic** check box, and leave the **Event Traffic** check box checked. You can optionally disable **Event Traffic** for the management interface(s). In either case, the device will try to send events to the event-only interface, and if that interface is down, it will send events on the management interface even if you disable the event channel. You cannot disable both event and management channels on an interface.
- **Mode**—Specify a link mode. Note that any changes you make to auto-negotiation are ignored for GigabitEthernet interfaces.
- **MDI/MDIX**—Set the **Auto-MDIX** setting.
- **MTU**—Set the maximum transmission unit (MTU). The default is 1500. The range within which you can set the MTU can vary depending on the model and interface type.  
  
Because the system automatically trims 18 bytes from the configured MTU value, any value below 1298 does not comply with the minimum IPv6 MTU setting of 1280, and any value below 594 does not comply with the minimum IPv4 MTU setting of 576. For example, the system automatically trims a configured value of 576 to 558.
- **IPv4 Configuration**—Set the IPv4 IP address. Choose:
  - **Static**—Manually enter the **IPv4 Management IP** address and **IPv4 Netmask**.
  - **DHCP**—Set the interface to use DHCP (eth0 only).
  - **Disabled**—Disable IPv4. Do **not** disable both IPv4 and IPv6.
- **IPv6 Configuration**—Set the IPv6 IP address. Choose:
  - **Static**—Manually enter the **IPv6 Management IP** address and **IPv6 Prefix Length**.
  - **DHCP**—Set the interface to use DHCPv6 (eth0 only).

- **Router Assigned**—Enable stateless autoconfiguration.
- **Disabled**—Disable IPv6. Do **not** disable both IPv4 and IPv6.

**Step 3** In the **Routes** area, edit a static route by clicking **Edit** () , or add a route by clicking **Add** ().

View the route table by clicking  .

You need a static route for each additional interface to reach remote networks. For more information about when new routes are needed, see [Network Routes on FMC Management Interfaces, on page 882](#).

**Note** For the default route, you can change only the gateway IP address. The default route always uses the eth0 interface.

You can configure the following settings for a static route:

- **Destination**—Set the destination address of the network to which you want to create a route.
- **Netmask** or **Prefix Length**—Set the netmask (IPv4) or prefix length (IPv6) for the network.
- **Interface**—Set the egress management interface.
- **Gateway**—Set the gateway IP address.

**Step 4** In the **Shared Settings** area, set network parameters shared by all interfaces.

**Note** If you selected **DHCP** for the eth0 interface, you cannot manually specify some shared settings derived from the DHCP server.

You can configure the following shared settings:

- **Hostname**—Set the FMC hostname. The hostname must start and end with a letter or digit, and have only letters, digits, or a hyphen. If you change the hostname, reboot the FMC if you want the new hostname reflected in syslog messages. Syslog messages do not reflect a new hostname until after a reboot.
- **Domains**—Set the search domain(s) for the FMC, separated by commas. These domains are added to hostnames when you do not specify a fully-qualified domain name in a command, for example, **ping system**. The domains are used only on the management interface, or for commands that go through the management interface.
- **Primary DNS Server, Secondary DNS Server, Tertiary DNS Server**—Set the DNS servers to be used in order of preference.
- **Remote Management Port**—Set the remote management port for communication with managed devices. The FMC and managed devices communicate using a two-way, SSL-encrypted communication channel, which by default is on port 8305.

**Note** Cisco **strongly** recommends that you keep the default settings for the remote management port, but if the management port conflicts with other communications on your network, you can choose a different port. If you change the management port, you must change it for **all** devices in your deployment that need to communicate with each other.

**Step 5** In the **Proxy** area, configure HTTP proxy settings.

The FMC is configured to directly-connect to the internet on ports TCP/443 (HTTPS) and TCP/80 (HTTP). You can use a proxy server, to which you can authenticate via HTTP Digest.

See proxy requirements in the prerequisites to this topic.

- a) Check the **Enabled** check box.
- b) In the **HTTP Proxy** field, enter the IP address or fully-qualified domain name of your proxy server.  
See requirements in the prerequisites to this topic.
- c) In the **Port** field, enter a port number.
- d) Supply authentication credentials by choosing **Use Proxy Authentication**, and then provide a **User Name** and **Password**.

**Step 6** Click **Save**.

**Step 7** If you change the FMC IP address, then see If you change the FMC IP address, then see the following tasks to ensure device management connectivity depending on how you added the device to the FMC:

- **IP address—No action.** If you added the device to the FMC using a reachable device IP address, then the management connection will be reestablished automatically after several minutes even though the IP address identified on the FTD is the old IP address. **Note:** If you specified a device IP address that is unreachable, then you must contact Cisco TAC, who can advise you how to restore connectivity for your devices.
- **NAT ID only—Contact Cisco TAC.** If you added the device using only the NAT ID, then the connection cannot be reestablished. In this case, you must contact Cisco TAC, who can advise you how to restore connectivity for your devices.

---

## Shut Down or Restart

Use the web interface to control the shut down and restart of processes on the FMC. You can:

- Shut down: Initiate a graceful shutdown of the appliance.

---

**Caution** Do **not** shut off Firepower appliances using the power button; it may cause a loss of data. Using the web interface (or CLI) prepares the system to be safely powered off and restarted without losing configuration data.

---

- Reboot: Shut down and restart gracefully.
- Restart the console: Restart the communications, database, and HTTP server processes. This is typically used during troubleshooting.

---

**Tip** For information on shutting down/restarting a 7000/8000 series device, including restarting the Snort process, see [Shut Down or Restart a 7000/8000 Series Device, on page 947](#). For virtual devices, refer to the documentation for your virtual platform. For VMware in particular, custom power options are part of VMware Tools.

---

## Shut Down or Restart the FMC

### Procedure

**Step 1** Choose **System > Configuration**.

**Step 2** Choose **Process**.

**Step 3** Do one of the following:

|                     |                                                                                                                                                                                         |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Shut down           | Click <b>Run Command</b> next to <b>Shutdown Management Center</b> .                                                                                                                    |
| Reboot              | Click <b>Run Command</b> next to <b>Reboot Management Center</b> .<br><b>Note</b> Rebooting logs you out, and the system runs a database check that can take up to an hour to complete. |
| Restart the console | Click <b>Run Command</b> next to <b>Restart Management Center Console</b> .<br><b>Note</b> Restarting may cause deleted hosts to reappear in the network map.                           |

## Remote Storage Management

On Firepower Management Centers, you can use the following for local or remote storage for backups and reports:

- Network File System (NFS)
- Server Message Block (SMB)/Common Internet File System (CIFS)
- Secure Shell (SSH)

You cannot send backups to one remote system and reports to another, but you can choose to send either to a remote system and store the other on the Firepower Management Center.

**Tip** After configuring and selecting remote storage, you can switch back to local storage **only** if you **have not** increased the connection database limit.

## Configuring Local Storage

### Procedure

**Step 1** Choose **System > Configuration**.

- Step 2** Choose **Remote Storage Device**.
  - Step 3** Choose **Local (No Remote Storage)** from the **Storage Type** drop-down list.
  - Step 4** Click **Save**.
- 

## Configuring NFS for Remote Storage

### Before you begin

- Ensure that your external remote storage system is functional and accessible from your FMC.

### Procedure

---

- Step 1** Choose **System > Configuration**.
  - Step 2** Click **Remote Storage Device**.
  - Step 3** Choose **NFS** from the **Storage Type** drop-down list.
  - Step 4** Add the connection information:
    - Enter the IPv4 address or hostname of the storage system in the **Host** field.
    - Enter the path to your storage area in the **Directory** field.
  - Step 5** Optionally, check the **Use Advanced Options** check box and enter any required command line options; see [Remote Storage Management Advanced Options, on page 893](#).
  - Step 6** Under **System Usage**:
    - Choose **Use for Backups** to store backups on the designated host.
    - Choose **Use for Reports** to store reports on the designated host.
    - Enter **Disk Space Threshold** for backup to remote storage. Default is 90%.
  - Step 7** To test the settings, click **Test**.
  - Step 8** Click **Save**.
- 

## Configuring SMB for Remote Storage

### Before you begin

Ensure that your external remote storage system is functional and accessible from your FMC:

- The system recognizes top-level SMB shares, not full file paths. You must use Windows to share the exact directory you want to use.
- Make sure the Windows user you will use to access the SMB share from the FMC has ownership of and read/change access to the share location.

- To ensure security, you should install SMB 2.0 or greater.

### Procedure

---

- Step 1** Choose **System > Configuration**.
- Step 2** Click **Remote Storage Device**.
- Step 3** Choose **SMB** from the **Storage Type** drop-down list.
- Step 4** Add the connection information:
- Enter the IPv4 address or hostname of the storage system in the **Host** field.
  - Enter the share of your storage area in the **Share** field.
  - Optionally, enter the domain name for the remote storage system in the **Domain** field.
  - Enter the user name for the storage system in the **Username** field and the password for that user in the **Password** field.
- Step 5** Optionally, check the **Use Advanced Options** check box and enter any required command line options; see [Remote Storage Management Advanced Options, on page 893](#).
- Step 6** Under **System Usage**:
- Choose **Use for Backups** to store backups on the designated host.
  - Choose **Use for Reports** to store reports on the designated host.
- Step 7** To test the settings, click **Test**.
- Step 8** Click **Save**.
- 

## Configuring SSH for Remote Storage

### Before you begin

- Ensure that your external remote storage system is functional and accessible from your Firepower Management Center.

### Procedure

---

- Step 1** Choose **System > Configuration**.
- Step 2** Click **Remote Storage Device**.
- Step 3** Choose **SSH** from the **Storage Type** drop-down list.
- Step 4** Add the connection information:
- Enter the IP address or host name of the storage system in the **Host** field.
  - Enter the path to your storage area in the **Directory** field.

- Enter the storage system's user name in the **Username** field and the password for that user in the **Password** field. To specify a network domain as part of the connection user name, precede the user name with the domain followed by a forward slash (/).
- To use SSH keys, copy the content of the **SSH Public Key** field and place it in your authorized\_keys file.

**Step 5** Optionally, check the **Use Advanced Options** check box and enter any required command line options; see [Remote Storage Management Advanced Options, on page 893](#).

**Step 6** Under System Usage:

- Choose **Use for Backups** to store backups on the designated host.
- Choose **Use for Reports** to store reports on the designated host.

**Step 7** If you want to test the settings, you must click **Test**.

**Step 8** Click **Save**.

---

## Remote Storage Management Advanced Options

If you select the Network File System (NFS) protocol, Server Message Block (SMB) protocol, or SSH to use secure file transfer protocol (SFTP) to store your reports and backups, you can select the **Use Advanced Options** check box to use one of the mount binary options as documented in an NFS, SMB, or SSH mount main page.

If you select SMB or NFS storage type, you can specify the version number of the remote storage in the **Command Line Option** field using the following format:

```
vers=version
```

where *version* is the version number of SMB or NFS remote storage you want to use. For example, to select NFSv4, enter `vers=4.0`.

If SMB encryption is enabled for a file server, only SMB version 3.0 clients are allowed to access the file server. To access encrypted SMB file server from the FMC, type the following in the **Command Line Option** field:

```
vers=3.0
```

where you select encrypted SMBv3 to copy or save backup files from the FMC to the encrypted SMB file server.

## Change Reconciliation

To monitor the changes that users make and ensure that they follow your organization's preferred standard, you can configure the system to send, via email, a detailed report of changes made over the past 24 hours. Whenever a user saves changes to the system configuration, a snapshot is taken of the changes. The change reconciliation report combines information from these snapshots to present a clear summary of recent system changes.

The following sample graphic displays a User section of an example change reconciliation report and lists both the previous value for each configuration and the value after changes. When users make multiple changes

to the same configuration, the report lists summaries of each distinct change in chronological order, beginning with the most recent.

You can view changes made during the previous 24 hours.

## Configuring Change Reconciliation

### Before you begin

- Configure an email server to receive emailed reports of changes made to the system over a 24 hour period; see [Configuring a Mail Relay Host and Notification Address, on page 906](#) for more information.

### Procedure

---

**Step 1** Choose **System > Configuration**.

**Step 2** Click **Change Reconciliation**.

**Step 3** Check the **Enable** check box.

**Step 4** Choose the time of day you want the system to send out the change reconciliation report from the **Time to Run** drop-down lists.

**Step 5** Enter email addresses in the **Email to** field.

**Tip** Once you have added email addresses, click **Resend Last Report** to send recipients another copy of the most recent change reconciliation report.

**Step 6** If you want to include policy changes, check the **Include Policy Configuration** check box.

**Step 7** If you want to include all changes over the past 24 hours, check the **Show Full Change History** check box.

**Step 8** Click **Save**.

### Related Topics

[Using the Audit Log to Examine Changes, on page 2419](#)

## Change Reconciliation Options

The **Include Policy Configuration** option controls whether the system includes records of policy changes in the change reconciliation report. This includes changes to access control, intrusion, system, health, and network discovery policies. If you do not select this option, the report will not show changes to any policies. This option is available on Firepower Management Centers only.

The **Show Full Change History** option controls whether the system includes records of all changes over the past 24 hours in the change reconciliation report. If you do not select this option, the report includes only a consolidated view of changes for each category.

---

**Note** The change reconciliation report does not include changes to Firepower Threat Defense interfaces and routing settings.

---

# Policy Change Comments

You can configure the Firepower System to track several policy-related changes using the comment functionality when users modify access control, intrusion, or network analysis policies.

With policy change comments enabled, administrators can quickly assess why critical policies in a deployment were modified. Optionally, you can have changes to intrusion and network analysis policies written to the audit log.

## Configuring Comments to Track Policy Changes

You can configure the Firepower System to prompt users for comments when they modify an access control policy, intrusion policy, or network analysis policy. You can use comments to track users' reasons for policy changes. If you enable comments on policy changes, you can make the comment optional or mandatory. The system prompts the user for a comment when each new change to a policy is saved.

### Procedure

---

- Step 1** Choose **System > Configuration**.
- The system configuration options appear in the left navigation panel.
- Step 2** Configure the policy comment preferences for any of the following:
- Click **Access Control Preferences** for comment preferences for access control policies.
  - Click **Intrusion Policy Preferences** for comment preferences for intrusion policies.
  - Click **Network Analysis Policy Preferences** for comment preferences for network analysis policies.
- Step 3** You have the following choices for each policy type:
- **Disabled**—Disables change comments.
  - **Optional**—Gives users the option to describe their changes in a comment.
  - **Required**—Requires users to describe their changes in a comment before saving.
- Step 4** Optionally for intrusion or network analysis policy comments:
- Check **Write changes in Intrusion Policy to audit log** to write all intrusion policy changes to the audit log.
  - Check **Write changes in Network Analysis Policy to audit log** to write all network analysis policy changes to the audit log.
- Step 5** Click **Save**.
- 

## Access List

You can limit access to the FMC by IP address and port. By default, the following ports are enabled for any IP address:

- 443 (HTTPS) for web interface access.
- 22 (SSH) for CLI access.

You can also add access to poll for SNMP information over port 161. Because SNMP is disabled by default, you must first enable SNMP before you can add SNMP access rules. For more information, see [Configure SNMP Polling, on page 908](#).

---

**Caution** By default, access is not restricted. To operate in a more secure environment, consider adding access for specific IP addresses and then deleting the default **any** option.

---

## Configure an Access List

This access list does not control external database access. See [Enabling External Access to the Database, on page 878](#).

---

**Caution** If you delete access for the IP address that you are currently using to connect to the FMC, and there is no entry for “IP=`any` port=443”, you will lose access when you save.

---

To configure access lists for Classic devices, use device platform settings. See [Configure Access Lists for Classic Devices, on page 933](#).

### Before you begin

By default, the access list includes rules for HTTPS and SSH. To add SNMP rules to the access list, you must first enable SNMP. For more information, see [Configure SNMP Polling, on page 908](#).

### Procedure

- 
- Step 1** Choose **System > Configuration**.
  - Step 2** (Optional) Click **SNMP** to configure SNMP if you want to add SNMP rules to the access list. By default, SNMP is disabled; see [Configure SNMP Polling, on page 908](#).
  - Step 3** Click **Access List**.
  - Step 4** To add access for one or more IP addresses, click **Add Rules**.
  - Step 5** In the **IP Address** field, enter an IP address or address range, or `any`.
  - Step 6** Choose **SSH**, **HTTPS**, **SNMP**, or a combination of these options to specify which ports you want to enable for these IP addresses.
  - Step 7** Click **Add**.
  - Step 8** Click **Save**.
- 

### Related Topics

[Firepower System IP Address Conventions, on page 15](#)

# Audit Logs

The Firepower Management Center records user activity in read-only audit logs. You can review audit log data in several ways:

- Use the web interface: [Auditing the System, on page 2415](#).

Audit logs are presented in a standard event view where you can view, sort, and filter audit log messages based on any item in the audit view. You can easily delete and report on audit information and you can view detailed reports of the changes that users make.

- Stream audit log messages to the syslog: [Stream Audit Logs to Syslog, on page 897](#).
- Stream audit log messages to an HTTP server: [Stream Audit Logs to an HTTP Server, on page 898](#).

Streaming audit log data to an external server allows you to conserve space on the FMC. Note that sending audit information to an external URL may affect system performance.

Optionally, you can secure the channel for audit log streaming, enable TLS and mutual authentication using TLS certificates; see [Audit Log Certificate, on page 900](#).

Classic devices also maintain audit logs. To stream audit logs from a Classic devices, see [Stream Audit Logs from Classic Devices, on page 934](#).

## Stream Audit Logs to Syslog

When this feature is enabled, audit log records appear in the syslog in the following format :

```
Date Time Host [Tag] Sender: User_Name@User_IP, Subsystem, Action
```

Where the local date, time, and originating hostname precede the bracketed optional tag, and the sending device name precedes the audit log message.

For example, if you specify a tag of `FMC-AUDIT-LOG` for audit log messages from your management center, a sample audit log message from your FMC could appear as follows:

```
Mar 01 14:45:24 localhost [FMC-AUDIT-LOG] Dev-MC7000: admin@10.1.1.2, Operations > Monitoring,
Page View
```

If you specify a severity and facility, these values do not appear in syslog messages; instead, they tell the system that receives the syslog messages how to categorize them.

To stream audit logs from Classic devices, use device platform settings: [Stream Audit Logs from Classic Devices, on page 934](#).

### Before you begin

Make sure the FMC can communicate with the syslog server. When you save your configuration, the system uses ICMP/ARP and TCP SYN packets to verify that the syslog server is reachable. Then, the system uses port 514/UDP to stream audit logs. If you secure the channel (optional, see [Audit Log Certificate, on page 900](#)), you must manually configure port 1470 for TCP.

## Procedure

- Step 1** Choose **System > Configuration**.
- Step 2** Click **Audit Log**.
- Step 3** Choose **Enabled** from the **Send Audit Log to Syslog** drop-down menu.
- Step 4** The following fields are applicable only for audit logs sent to syslog:

| Option   | Description                                                                                                                                                                                                                                                                                                                                           |
|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Host     | The IP address or the fully qualified name of the syslog server to which you will send audit logs.                                                                                                                                                                                                                                                    |
| Facility | The subsystem that creates the message.<br>Choose a facility described in <a href="#">Syslog Alert Facilities, on page 2079</a> . For example, choose AUDIT.                                                                                                                                                                                          |
| Severity | The severity of the message.<br>Choose a severity described in <a href="#">Syslog Severity Levels, on page 2080</a> .                                                                                                                                                                                                                                 |
| Tag      | An optional tag to include in audit log syslog messages.<br>Best practice: Enter a value in this field to easily differentiate audit log messages from other, similar syslog messages such as health alerts.<br>For example, if you want all audit log records sent to the syslog to be labeled with FMC-AUDIT-LOG, enter FMC-AUDIT-LOG in the field. |

- Step 5** (Optional) To test whether the IP address of the syslog server is valid, click **Test Syslog Server**.

The system sends the following packets to verify whether the syslog server is reachable:

- ICMP echo request
- TCP SYN on 443 and 80 ports
- ICMP time stamp query
- TCP SYN on random ports

**Note** If the FMC and syslog server are in the same subnet, ARP is used instead of ICMP.

The system displays the result for the server.

- Step 6** Click **Save**.

## Stream Audit Logs to an HTTP Server

When this feature is enabled, the appliance sends audit log records to an HTTP server in the following format:

```
Date Time Host [Tag] Sender: User_Name@User_IP, Subsystem, Action
```

Where the local date, time, and originating hostname precede the bracketed optional tag, and the sending appliance or device name precedes the audit log message.

For example, if you specify a tag of `FROMMC`, a sample audit log message could appear as follows:

```
Mar 01 14:45:24 localhost [FROMMC] Dev-MC7000: admin@10.1.1.2, Operations > Monitoring,
Page View
```

To stream audit logs from Classic devices, use device platform settings: [Stream Audit Logs from Classic Devices, on page 934](#).

### Before you begin

Make sure the device can communicate with the HTTP server. Optionally, secure the channel; see [Audit Log Certificate, on page 900](#).

### Procedure

---

- Step 1** Choose **System > Configuration**.
- Step 2** Click **Audit Log**.
- Step 3** Optionally, in the **Tag** field, enter the tag name that you want to appear with the message. For example, if you want all audit log records to be preceded with `FROMMC`, enter `FROMMC` in the field.
- Step 4** Choose **Enabled** from the **Send Audit Log to HTTP Server** drop-down list.
- Step 5** In the **URL to Post Audit** field, designate the URL where you want to send the audit information. Enter a URL that corresponds to a Listener program that expects the HTTP POST variables as listed:
- `subsystem`
  - `actor`
  - `event_type`
  - `message`
  - `action_source_ip`
  - `action_destination_ip`
  - `result`
  - `time`
  - `tag` (if defined; see Step 3)
- Caution** To allow encrypted posts, use an HTTPS URL. Sending audit information to an external URL may affect system performance.
- Step 6** Click **Save**.
-

# Audit Log Certificate

You can use Transport Layer Security (TLS) certificates to secure communications between Firepower appliances and a trusted audit log server.

## Client Certificates (Required)

For *each appliance* (client certificates are unique), you must generate a certificate signing request (CSR), submit it to a Certificate Authority (CA) for signing, then import the signed certificate onto the appliance.

You cannot use the FMC to import audit log certificates onto its managed devices. These certificates are unique to each appliance, and you must log into *each appliance* to import them locally:

- For the FMC, use the local system configuration: [Obtain a Signed Audit Log Client Certificate for the FMC, on page 901](#) and [Import an Audit Log Client Certificate into the FMC, on page 902](#).
- For 7000/8000 series devices, use the local system configuration: [Obtain a Signed Client Certificate for Secure Audit Log Streaming on a 7000/8000 Series Device, on page 942](#).
- For ASA FirePOWER and NGIPSv, generate a CSR with a tool like OpenSSL, then use the CLI to import the signed certificate: **configure audit\_cert import**.

## Server Certificates (Optional)

For additional security, we recommend you require mutual authentication between Firepower appliances and the audit log server. To accomplish this, load one or more certificate revocation lists (CRLs). You cannot stream audit logs to servers with revoked certificates listed in those CRLs.

Firepower supports CRLs encoded in Distinguished Encoding Rules (DER) format. Note that these are the same CRLs that the system uses to validate HTTPS client certificates for the FMC web interface.

To require valid audit log server certificates, use the FMC web interface:

- For the FMC, use the local system configuration: [Require Valid Audit Log Server Certificates, on page 903](#).
- For Classic devices (including 7000/8000 series), use device platform settings: [Require Valid Audit Log Server Certificates for Classic Devices, on page 935](#).

## Securely Stream Audit Logs

If you stream the audit log to a trusted HTTP server or syslog server, you can use Transport Layer Security (TLS) certificates to secure the channel between the FMC and the server. You must generate a unique client certificate for each appliance you want to audit.

To securely stream audit logs to Classic devices, see [Stream Audit Logs from Classic Devices, on page 934](#).

### Before you begin

See ramifications of requiring client and server certificates at [Audit Log Certificate, on page 900](#).

## Procedure

---

- Step 1** Obtain and install a signed client certificate on the FMC:
- a) [Obtain a Signed Audit Log Client Certificate for the FMC, on page 901](#):  
Generate a Certificate Signing Request (CSR) from the FMC based on your system information and the identification information you supply.  
Submit the CSR to a recognized, trusted certificate authority (CA) to request a signed client certificate.  
If you will require mutual authentication between the FMC and the audit log server, the client certificate must be signed by the same CA that signed the server certificate to be used for the connection.
  - b) After you receive the signed certificate from the certificate authority, import it into the FMC. See [Import an Audit Log Client Certificate into the FMC, on page 902](#).
- Step 2** Configure the communication channel with the server to use Transport Layer Security (TLS) and enable mutual authentication.  
See [Require Valid Audit Log Server Certificates, on page 903](#).
- Step 3** Configure audit log streaming if you have not yet done so.  
See [Stream Audit Logs to Syslog, on page 897](#) or [Stream Audit Logs to an HTTP Server, on page 898](#).
- 

## Obtain a Signed Audit Log Client Certificate for the FMC

To obtain a certificate for a managed Classic device, see [Obtain a Signed Client Certificate for Secure Audit Log Streaming on a 7000/8000 Series Device, on page 942](#).

---

**Important** The **Audit Log Certificate** page is not available on a standby Firepower Management Center in a high availability setup. You cannot perform this task from a standby Firepower Management Center.

---

The system generates certificate request keys in Base-64 encoded PEM format.

### Before you begin

Keep the following in mind:

- You must generate a certificate signing request (CSR) from the device or appliance on which you will install the certificate. (For example, you cannot generate a certificate signing request for Device B from Appliance A.) You must generate a unique certificate signing request from each device and appliance.
- To ensure security, use a globally recognized and trusted Certificate Authority (CA) to sign your certificate.
- If you will require mutual authentication between the appliance and the audit log server, the same Certificate Authority must sign both the client certificate and the server certificate.

## Procedure

---

- Step 1** Choose **System > Configuration**.
- Step 2** Click **Audit Log Certificate**.
- Step 3** Click **Generate New CSR**.
- Step 4** Enter a country code in the **Country Name (two-letter code)** field.
- Step 5** Enter a state or province postal abbreviation in the **State or Province** field.
- Step 6** Enter a **Locality or City**.
- Step 7** Enter an **Organization** name.
- Step 8** Enter an **Organizational Unit (Department)** name.
- Step 9** Enter the fully qualified domain name of the server for which you want to request a certificate in the **Common Name** field.
- Note** If the common name and the DNS hostname do not match, audit log streaming will fail.
- Step 10** Click **Generate**.
- Step 11** Open a new blank file with a text editor.
- Step 12** Copy the entire block of text in the certificate request, including the `BEGIN CERTIFICATE REQUEST` and `END CERTIFICATE REQUEST` lines, and paste it into a blank text file.
- Step 13** Save the file as `clientname.csr`, where `clientname` is the name of the appliance where you plan to use the certificate.
- Step 14** Click **Close**.
- 

## What to do next

- Submit the certificate signing request to the certificate authority that you selected using the guidelines in the "Before You Begin" section of this procedure.
- When you receive the signed certificate, import it to the appliance; see [Import an Audit Log Client Certificate into the FMC, on page 902](#).

# Import an Audit Log Client Certificate into the FMC

In an FMC high availability setup, you *must* use the active peer.

For ASA FirePOWER and NGIPSv, use the CLI to import a signed certificate: **configure audit\_cert import**. For 7000/8000 series devices, use the system configuration (**System > Configuration**) on the device's local web interface: [Obtain a Signed Client Certificate for Secure Audit Log Streaming on a 7000/8000 Series Device, on page 942](#).

## Before you begin

- [Obtain a Signed Audit Log Client Certificate for the FMC, on page 901](#).
- Make sure you are importing the signed certificate for the correct appliance. Each certificate is unique to a specific appliance or device.

- If the signing authority that generated the certificate requires you to trust an intermediate CA, be prepared to provide the necessary certificate chain (or certificate path). The CA that signed the client certificate must be the same CA that signed any intermediate certificates in the certificate chain.

### Procedure

---

- Step 1** On the FMC, choose **System > Configuration**.
- Step 2** Click **Audit Log Certificate**.
- Step 3** Click **Import Audit Client Certificate**.
- Step 4** Open the client certificate in a text editor, copy the entire block of text, including the `BEGIN CERTIFICATE` and `END CERTIFICATE` lines. Paste this text into the **Client Certificate** field.
- Step 5** To upload a private key, open the private key file and copy the entire block of text, including the `BEGIN RSA PRIVATE KEY` and `END RSA PRIVATE KEY` lines. Paste this text into the **Private Key** field.
- Step 6** Open any required intermediate certificates, copy the entire block of text for each, and paste it into the **Certificate Chain** field.
- Step 7** Click **Save**.
- 

## Require Valid Audit Log Server Certificates

The system supports validating audit log server certificates using imported CRLs in Distinguished Encoding Rules (DER) format.

---

**Note** If you choose to verify certificates using CRLs, the system uses the same CRLs to validate both audit log server certificates and certificates used to secure the HTTP connection between an appliance and a web browser.

---

---

**Important** You cannot perform this procedure on the standby Firepower Management Center in a high availability pair.

---

### Before you begin

- Understand the ramifications of requiring mutual authentication and of using certificate revocation lists (CRLs) to ensure that certificates are still valid. See [Audit Log Certificate, on page 900](#).
- Obtain and import the client certificate following the steps in [Securely Stream Audit Logs, on page 900](#) and the topics referenced in that procedure.

### Procedure

---

- Step 1** On the FMC, choose **System > Configuration**.
- Step 2** Click **Audit Log Certificate**.

- Step 3** To use Transport Layer Security to securely stream the audit log to an external server, choose **Enable TLS**.
- Step 4** If you want to accept server certificates without verification (not recommended):
- Deselect **Enable Mutual Authentication**.
  - Click **Save** and skip the remainder of this procedure.
- Step 5** To verify the certificate of the audit log server, choose **Enable Mutual Authentication**.
- Step 6** (If you enabled mutual authentication) To automatically recognize certificates that are no longer valid:
- Select **Enable Fetching of CRL**.
 

**Note** Enabling fetching of the CRL creates a scheduled task to regularly update the CRL or CRLs.
  - Enter a valid URL to an existing CRL file and click **Add CRL**.
 

Repeat to add up to 25 CRLs.
  - Click **Refresh CRL** to load the current CRL or CRLs from the specified URL or URLs.
- Step 7** Verify that you have a valid server certificate generated by the same certificate authority that created the client certificate.
- Step 8** Click **Save**.

---

### What to do next

(Optional) Set the frequency of CRL updates. See [Configuring Certificate Revocation List Downloads, on page 182](#).

## View the Audit Log Client Certificate on the FMC

You can view the audit log client certificate only for the appliance that you are logged in to. In FMC high availability pairs, you can view the certificate only on the active peer.

To view audit log certificates on Classic devices, use the system configuration on a 7000/8000 series device's web interface, or the CLI: **show audit\_cert**.

### Procedure

---

- Step 1** Choose **System > Configuration**.
- Step 2** Click **Audit Log Certificate**.
- 

## Dashboard Settings

Dashboards provide you with at-a-glance views of current system status through the use of widgets: small, self-contained components that provide insight into different aspects of the Firepower System. The Firepower System is delivered with several predefined dashboard widgets.

You can configure the Firepower Management Center so that Custom Analysis widgets are enabled on the dashboard.

**Related Topics**

[About Dashboards](#), on page 255

## Enabling Custom Analysis Widgets for Dashboards

Use Custom Analysis dashboard widgets to create a visual representation of events based on a flexible, user-configurable query.

**Procedure**

---

- Step 1** Choose **System > Configuration**.
  - Step 2** Click **Dashboard**.
  - Step 3** Check the **Enable Custom Analysis Widgets** check box to allow users to add Custom Analysis widgets to dashboards.
  - Step 4** Click **Save**.
- 

## DNS Cache

You can configure the system to resolve IP addresses automatically on the event view pages. You can also configure basic properties for DNS caching performed by the appliance. Configuring DNS caching allows you to identify IP addresses you previously resolved without performing additional lookups. This can reduce the amount of traffic on your network and speed the display of event pages when IP address resolution is enabled.

## Configuring DNS Cache Properties

DNS resolution caching is a system-wide setting that allows the caching of previously resolved DNS lookups.

**Procedure**

---

- Step 1** Choose **System > Configuration**.
  - Step 2** Choose **DNS Cache**.
  - Step 3** From the **DNS Resolution Caching** drop-down list, choose one of the following:
    - **Enabled**—Enable caching.
    - **Disabled**—Disable caching.
  - Step 4** In the **DNS Cache Timeout (in minutes)** field, enter the number of minutes a DNS entry remains cached in memory before it is removed for inactivity.

The default setting is 300 minutes (five hours).
  - Step 5** Click **Save**.

[Configuring Event View Settings](#), on page 33

# Email Notifications

Configure a mail host if you plan to:

- Email event-based reports
- Email status reports for scheduled tasks
- Email change reconciliation reports
- Email data-pruning notifications
- Use email for discovery event, impact flag, correlation event alerting, intrusion event alerting, and health event alerting

When you configure email notification, you can select an encryption method for the communication between the system and mail relay host, and can supply authentication credentials for the mail server if needed. After configuring, you can test the connection.

## Configuring a Mail Relay Host and Notification Address

**Procedure**

---

- Step 1** Choose **System > Configuration**.
- Step 2** Click **Email Notification**.
- Step 3** In the **Mail Relay Host** field, enter the hostname or IP address of the mail server you want to use. The mail host you enter **must** allow access from the appliance.
- Step 4** In the **Port Number** field, enter the port number to use on the email server.
- Typical ports include:
- 25, when using no encryption
  - 465, when using SSLv3
  - 587, when using TLS
- Step 5** Choose an **Encryption Method**:
- **TLS**—Encrypt communications using Transport Layer Security.
  - **SSLv3**—Encrypt communications using Secure Socket Layers.
  - **None**—Allow unencrypted communication.
- Note** Certificate validation is not required for encrypted communication between the appliance and mail server.
- Step 6** In the **From Address** field, enter the valid email address you want to use as the source email address for messages sent by the appliance.

- Step 7** Optionally, to supply a user name and password when connecting to the mail server, choose **Use Authentication**. Enter a user name in the **Username** field. Enter a password in the **Password** field.
- Step 8** To send a test email using the configured mail server, click **Test Mail Server Settings**.  
A message appears next to the button indicating the success or failure of the test.
- Step 9** Click **Save**.
- 

## Language Selection

You can use the Language page to specify a different language for the web interface.

### Set the Language for the Web Interface

The language you specify here is used for the web interface for every user. You can choose from:

- English
- Chinese (simplified)
- Japanese
- Korean

To set the language for 7000/8000 series devices, use device platform settings: [Set the Language for the 7000/8000 Series Web Interface, on page 938](#).

#### Procedure

---

- Step 1** Choose **System > Configuration**.
- Step 2** Click **Language**.
- Step 3** Choose the language you want to use.
- Step 4** Click **Save**.
- 

## Login Banners

You can use the Login Banner page to specify session, login, or custom message banners for a security appliance or shared policy.

You can use ASCII characters and carriage returns to create a custom login banner. The system does not preserve tab spacing. If your login banner is too large or causes errors, Telnet or SSH sessions can fail when the system attempts to display the banner.

## Customize the Login Banner

To customize login banners for Classic devices, use device platform settings. See [Customize the Login Banner for Classic Devices](#), on page 938.

### Procedure

---

- Step 1** Choose **System > Configuration**.
  - Step 2** Choose **Login Banner**.
  - Step 3** In the **Custom Login Banner** field, enter the login banner text you want to use.
  - Step 4** Click **Save**.
- 

## SNMP Polling

You can enable Simple Network Management Protocol (SNMP) polling. This feature supports use of versions 1, 2, and 3 of the SNMP protocol. This feature allows access to the standard management information base (MIB), which includes system details such as contact, administrative, location, service information, IP addressing and routing information, and transmission protocol usage statistics.

---

**Note** When selecting SNMP versions for the SNMP protocol, note that SNMPv2 only supports read-only communities and SNMPv3 only supports read-only users. SNMPv3 also supports encryption with AES128.

---

Enabling SNMP polling does not cause the system to send SNMP traps; it only makes the information in the MIBs available for polling by your network management system.

## Configure SNMP Polling

To configure SNMP polling on Classic managed devices, use the device platform settings. See [Configure SNMP Polling on Classic Devices](#), on page 940.

### Before you begin

Add SNMP access for each computer you plan to use to poll the system. See [Configure an Access List](#), on page 896.

---

**Note** The SNMP MIB contains information that could be used to attack your deployment. We recommend that you restrict your access list for SNMP access to the specific hosts that will be used to poll for the MIB. We also recommend you use SNMPv3 and use strong passwords for network management access.

---

## Procedure

---

- Step 1** Choose **System > Configuration**.
- Step 2** Click **SNMP**.
- Step 3** From the **SNMP Version** drop-down list, choose the SNMP version you want to use:
- **Version 1** or **Version 2**: Enter a read-only SNMP community name in the **Community String** field, then skip to the end of the procedure.
- Note** Do not include special characters (<> / % # & ? ', etc.) in the SNMP community string name.
- **Version 3**: Click **Add User** to display the user definition page. SNMPv3 only supports read-only users and encryption with AES128.
- Step 4** Enter a **Username**.
- Step 5** Choose the protocol you want to use for authentication from the **Authentication Protocol** drop-down list.
- Step 6** Enter the password required for authentication with the SNMP server in the **Authentication Password** field.
- Step 7** Re-enter the authentication password in the **Verify Password** field.
- Step 8** Choose the privacy protocol you want to use from the **Privacy Protocol** list, or choose **None** to not use a privacy protocol.
- Step 9** Enter the SNMP privacy key required by the SNMP server in the **Privacy Password** field.
- Step 10** Re-enter the privacy password in the **Verify Password** field.
- Step 11** Click **Add**.
- Step 12** Click **Save**.
- 

# Security Certifications Compliance

Your organization might be required to use only equipment and software complying with security standards established by the U.S. Department of Defense and global certification organizations. The following security certifications standards are supported:

- **Common Criteria (CC)**: a global standard established by the international Common Criteria Recognition Arrangement, defining properties for security products
- **Unified Capabilities Approved Products List (UCAPL)**: a list of products meeting security requirements established by the U.S. Defense Information Systems Agency (DISA)

---

**Note** The U.S. Government has changed the name of the Unified Capabilities Approved Products List (UCAPL) to the Department of Defense Information Network Approved Products List (DODIN APL). References to UCAPL in this documentation and the FMC web interface can be interpreted as references to DODIN APL.

---

- **Federal Information Processing Standards (FIPS) 140**: a requirements specification for encryption modules

You can enable security certifications compliance in CC mode or UCAPL mode. Enabling security certifications compliance does not guarantee strict compliance with all requirements of the security mode selected. For more information on hardening procedures, refer to the guidelines for this product provided by the certifying entity.

**Caution** After you enable this setting, you cannot disable it. If you need to take an appliance out of CC or UCAPL mode, you must reimaging.

## Security Certifications Compliance Characteristics

The following table describes behavior changes when you enable CC or UCAPL mode. (Restrictions on login accounts refers to command line or shell access, not web interface access. )

| System Change                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | CC Mode | UCAPL Mode |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|------------|
| FIPS compliance is enabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Yes     | Yes        |
| The system does not allow remote storage for backups or reports.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Yes     | Yes        |
| The system starts an additional system audit daemon.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | No      | Yes        |
| The system boot loader is secured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | No      | Yes        |
| The system applies additional security to login accounts.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | No      | Yes        |
| The system disables the reboot key sequence Ctrl-Alt-Del.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | No      | Yes        |
| The system enforces a maximum of ten simultaneous login sessions.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | No      | Yes        |
| The system supports exporting event data using eStreamer only for Version 6.2.0.3 or subsequent 6.2.0.x patches.                                                                                                                                                                                                                                                                                                                                                                                                                                               | Yes     | Yes        |
| The system applies more stringent safeguards for login accounts: <ul style="list-style-type: none"> <li>• Passwords must be at least fifteen alphanumeric characters of mixed case and must include at least one numeric character.</li> <li>• Passwords cannot be a word that appears in a dictionary or include consecutive repeating characters.</li> <li>• The system locks out a user after three failed login attempts in a row. In this case, the password must be reset by an administrator.</li> <li>• The system stores password history.</li> </ul> | No      | Yes        |

## Security Certifications Compliance Recommendations

Cisco recommends that you observe the following best practices when using a system with security certifications compliance enabled:

- To enable security certifications compliance in your deployment, enable it first on the Firepower Management Center, then enable it in the same mode on all managed devices.

---

**Caution** The Firepower Management Center will not receive event data from a managed device unless both are operating in the same security certifications compliance mode.

---

- For all users, enable password strength checking and set the minimum password length to the value required by the certifying agency.
- If you are using Firepower Management Centers in a high-availability configuration, configure them both to use the same security certifications compliance mode.
- Do not configure the system to use any of the following features:
  - Email reports, alerts, or data pruning notifications.
  - Nmap Scan, Cisco IOS Null Route, Set Attribute Value, or ISE EPS remediations.
  - Remote storage for backups or reports.
  - Third-party client access to the system database.
  - External notifications or alerts transmitted via email, SNMP trap, or syslog.
  - Audit log messages transmitted to an HTTP server or to a syslog server without using SSL certificates to secure the channel between the appliance and the server.
- You may configure the system to export event data to an external client using eStreamer only for Version 6.2.0.3 and subsequent 6.2.0.x patches.
- Do not enable external authentication using LDAP or RADIUS in deployments using CC mode.
- Do not enable CACs in deployments using CC mode.
- Disable access to the Firepower Management Center and managed devices via the Firepower REST API in deployments using CC or UCAPL mode.
- Enable CACs in deployments using UCAPL mode.

---

**Note** The Firepower System does not support CC or UCAPL mode for classic devices in stacks or high availability pairs.

---

## Enable Security Certifications Compliance

This configuration applies to either a Firepower Management Center or a Classic managed device:

- For the Firepower Management Center, this configuration is part of the system configuration.
- For a managed device, you apply this configuration from the FMC as part of a platform settings policy.

In either case, the configuration does not take effect until you save your system configuration changes or deploy the shared platform settings policy.

---

**Caution** After you enable this setting, you cannot disable it. If you need to take the appliance out of CC or UCAPL mode, you must reimage.

---

### Before you begin

- We recommend you register all devices that you plan to be part of your deployment to the FMC before enabling security certifications compliance on any appliances.
- You must be an Admin user to perform this task.

### Procedure

---

**Step 1** Depending on whether you are configuring an FMC or a managed device:

- FMC: Choose **System > Configuration**.
- Classic device: Choose **Devices > Platform Settings** and create or edit a Firepower policy.

**Step 2** Click **UCAPL/CC Compliance**.

**Note** Appliances reboot when you enable UCAPL or CC compliance. The FMC reboots when you save the system configuration; managed devices reboot when you deploy configuration changes.

**Step 3** To *permanently* enable security certifications compliance on the appliance, you have two choices:

- To enable security certifications compliance in Common Criteria mode, choose **CC** from the drop-down list.
- To enable security certifications compliance in Unified Capabilities Approved Products List mode, choose **UCAPL** from the drop-down list.

**Step 4** Click **Save**.

---

### What to do next

- If you have not already, apply Control and Protection licenses to all Classic devices in your deployment.
- If your appliances were updated from versions earlier than Version 5.2.0, enabling security certifications compliance regenerates appliance certificates. After you enable security certifications compliance in the same mode across your deployment, reregister managed devices to the FMC.
- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

# Time and Time Synchronization

Synchronizing the system time on your Firepower Management Center (FMC) and its managed devices is essential to successful operation of your Firepower System. We recommend that you specify NTP servers during FMC initial configuration, but you can use the information in this section to establish or change time synchronization settings after initial configuration is complete.

Use a Network Time Protocol (NTP) server to synchronize system time on the FMC and all devices.

---

**Caution** Unintended consequences can occur when time is not synchronized between the FMC and managed devices.

---

To synchronize time on FMC and managed devices, see:

- Recommended: [Synchronize Time on the FMC with an NTP Server, on page 913](#)

This topic provides instructions for configuring your FMC to synchronize with an NTP server or servers and includes links to instructions on configuring managed devices to synchronize with the same NTP server or servers.

- Otherwise: [Synchronize Time Without Access to a Network NTP Server, on page 914](#)

This topic provides instructions for setting the time on your FMC, configuring your FMC to serve as an NTP server, and links to instructions on configuring managed devices to synchronize with the FMC NTP server.

## Synchronize Time on the FMC with an NTP Server

Time synchronization among all of the components of your system is critically important.

The best way to ensure proper time synchronization between FMC and all managed devices is to use an NTP server on your network.

The FMC supports NTPv4.

You must have Admin or Network Admin privileges to do this procedure.

### Before you begin

Note the following:

- If your FMC and managed devices cannot access a network NTP server, do not use this procedure. Instead, see [Synchronize Time Without Access to a Network NTP Server, on page 914](#).
- Do not specify an untrusted NTP server.
- Connections to NTP servers do not use configured proxy settings.
- Firepower 4100 Series devices and Firepower 9300 devices cannot use this procedure to set the system time. Instead, configure those devices to use the same NTP server(s) that you configure using this procedure. For instructions, see the documentation for your hardware model.

**Caution** If the FMC is rebooted and your DHCP server sets an NTP server record different than the one you specify here, the DHCP-provided NTP server will be used instead. To avoid this situation, configure your DHCP server to use the same NTP server.

### Procedure

- 
- Step 1** Choose **System > Configuration**.
- Step 2** Click **Time Synchronization**.
- Step 3** If **Serve Time via NTP** is **Enabled**, choose **Disabled** to disable the FMC as an NTP server.
- Step 4** For the **Set My Clock** option, choose **Via NTP from** and enter the hostname or IP address of an NTP server. If your organization has corroborative NTP servers, enter multiple NTP servers as a comma-separated list.
- Step 5** Click **Save**.
- 

### What to do next

Set managed devices to synchronize with the same NTP server or servers:

- Configure device platform settings: [Configure NTP Time Synchronization for Threat Defense, on page 976](#) and [Synchronize Time on Classic Devices with an NTP Server, on page 939](#).
- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## Synchronize Time Without Access to a Network NTP Server

If your devices cannot directly reach the network NTP server, or your organization does not have a network NTP server, a physical-hardware FMC can serve as an NTP server.

- 
- Important**
- Do not use this procedure unless you have no other NTP server. Instead, use the procedure in [Synchronize Time on the FMC with an NTP Server, on page 913](#).
  - Do not use a virtual FMC as an NTP server.
- 

To change the time manually **after** configuring the FMC as an NTP server, you must disable the NTP option, change the time manually, and then re-enable the NTP option.

### Procedure

- 
- Step 1** Manually set the system time on the FMC:
- Choose **System > Configuration**.
  - Click **Time Synchronization**.

- c) If **Serve Time via NTP** is **Enabled**, choose **Disabled**.
- d) Click **Save**.
- e) For **Set My Clock**, choose **Manually in Local Configuration**.
- f) Click **Save**.
- g) In the navigation panel at the left side of the screen, click **Time**.
- h) Use the **Set Time** drop-down lists to set the time.
- i) If the time zone displayed is not UTC, click it and set the time zone to **UTC**.
- j) Click **Save**.
- k) Click **Done**.
- l) Click **Apply**.

**Step 2** Set the FMC to serve as an NTP server:

- a) In the navigation panel at the left side of the screen, click **Time Synchronization**.
- b) For **Serve Time via NTP**, choose **Enabled**.
- c) Click **Save**.

**Step 3** Set managed devices to synchronize with the FMC NTP server:

- a) In the Time Synchronization settings for the platform settings policy assigned to your managed devices, set the clock to synchronize **Via NTP from Management Center**.
- b) Deploy the change to managed devices.

For instructions:

- For FTD devices, see [Configure NTP Time Synchronization for Threat Defense, on page 976](#).
- For all other devices, see [Synchronize Time on Classic Devices with an NTP Server, on page 939](#).

---

## About Changing Time Synchronization Settings

- Your Firepower Management Center and its managed devices are heavily dependent on accurate time. The system clock is a system facility that maintains the time of the Firepower System. The system clock is set to Universal Coordinated Time (UTC), which is the primary time standard by which the world regulates clocks and time.

DO NOT ATTEMPT TO CHANGE THE SYSTEM TIME. Changing the system time zone from UTC is NOT supported, and doing so will require you to reimage the device to recover from an unsupported state.

- If you configure the FMC to serve time using NTP, and then later disable it, the NTP service on managed devices still attempts to synchronize time with the FMC. You must update and redeploy any applicable platform settings policies to establish a new time source.
- To change the time manually **after** configuring the Firepower Management Center as an NTP server, you must disable the NTP option, change the time manually, and then re-enable the NTP option.

## View Current System Time, Source, and NTP Server Connection Status

Time settings are displayed on most pages in local time using the time zone you set on the Time Zone page in User Preferences (the default is America/New York), but are stored on the appliance using UTC time.

**Restriction** The Time Zone function (in User Preferences) assumes that the default system clock is set to UTC time. **DO NOT ATTEMPT TO CHANGE THE SYSTEM TIME.** Be advised that changing the system time from UTC is NOT supported, and doing so will require you to reimage the device to recover from an unsupported state.

**Note** To view time and time source information on your 7000- and 8000-Series hardware device, see [View System Time for 7000/8000 Series Devices, on page 947](#).

### Procedure

**Step 1** Choose **System > Configuration**.

**Step 2** Click **Time**.

The current time is displayed using the time zone specified for your account in User Preferences.

If your appliance uses an NTP server: For information about the table entries, see [NTP Server Status, on page 916](#).

## NTP Server Status

If you are synchronizing time from an NTP server, you can view connection status on the **Time** page (choose **System > Configuration**).

*Table 72: NTP Status*

| Column     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NTP Server | The IP address or name of the configured NTP server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Status     | <p>The status of the NTP server time synchronization:</p> <ul style="list-style-type: none"> <li>• <b>Being Used</b> indicates that the appliance is synchronized with the NTP server.</li> <li>• <b>Available</b> indicates that the NTP server is available for use, but time is not yet synchronized.</li> <li>• <b>Not Available</b> indicates that the NTP server is in your configuration, but the NTP daemon is unable to use it.</li> <li>• <b>Pending</b> indicates that the NTP server is new or the NTP daemon was recently restarted. Over time, its value should change to <b>Being Used</b>, <b>Available</b>, or <b>Not Available</b>.</li> <li>• <b>Unknown</b> indicates that the status of the NTP server is unknown.</li> </ul> |

| Column      | Description                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Offset      | The number of milliseconds of difference between the time on the appliance and the configured NTP server. Negative values indicate that the appliance is behind the NTP server, and positive values indicate that it is ahead.                                                                                                                                                                                |
| Last Update | The number of seconds that have elapsed since the time was last synchronized with the NTP server. The NTP daemon automatically adjusts the synchronization times based on a number of conditions. For example, if you see larger update times such as 300 seconds, that indicates that the time is relatively stable and the NTP daemon has determined that it does not need to use a lower update increment. |

## Session Timeouts

Unattended login sessions may be security risks. You can configure the amount of idle time before a user's login session times out due to inactivity.

Note that you can exempt specific web interface users from timeout, for scenarios where you plan to passively, securely monitor the system for long periods of time. Users with the Administrator role, whose complete access to menu options poses an extra risk if compromised, cannot be made exempt from session timeouts.

## Configure Session Timeouts

To configure session timeouts for Classic devices, use device platform settings. See [Configure Session Timeouts for Classic Devices, on page 940](#).

### Procedure

- 
- Step 1** Choose **System > Configuration**.
- Step 2** Click **Shell Timeout**.
- Step 3** Configure session timeouts:
- Web interface (FMC only): Configure the **Browser Session Timeout (Minutes)**. The default value is 60; the maximum value is 1440 (24 hours).  
To exempt users from this session timeout, see [User Account Login Options, on page 64](#).
  - CLI: Configure the **Shell Timeout (Minutes)** field. The default value is 0; the maximum value is 1440 (24 hours).
- Step 4** Click **Save**.
-

# Vulnerability Mapping

The Firepower System automatically maps vulnerabilities to a host IP address for any application protocol traffic received or sent from that address, when the server has an application ID in the discovery event database and the packet header for the traffic includes a vendor and version.

For any servers which do not include vendor or version information in their packets, you can configure whether the system associates vulnerabilities with server traffic for these vendor and versionless servers.

For example, a host serves SMTP traffic that does not have a vendor or version in the header. If you enable the SMTP server on the Vulnerability Mapping page of a system configuration, then save that configuration to the Firepower Management Center managing the device that detects the traffic, all vulnerabilities associated with SMTP servers are added to the host profile for the host.

Although detectors collect server information and add it to host profiles, the application protocol detectors will not be used for vulnerability mapping, because you cannot specify a vendor or version for a custom application protocol detector and cannot select the server for vulnerability mapping.

## Mapping Vulnerabilities for Servers

This procedure requires any Smart License or the Protection classic license.

### Procedure

---

**Step 1** Choose **System > Configuration**.

**Step 2** Choose **Vulnerability Mapping**.

**Step 3** You have the following choices:

- To prevent vulnerabilities for a server from being mapped to hosts that receive application protocol traffic without vendor or version information, clear the check box for that server.
- To cause vulnerabilities for a server to be mapped to hosts that receive application protocol traffic without vendor or version information, check the check box for that server.

**Tip** You can check or clear all check boxes at once using the check box next to **Enabled**.

**Step 4** Click **Save**.

---

## Remote Console Access Management

You can use a Linux system console for remote access on supported systems via either the VGA port (which is the default) or the serial port on the physical appliance. Use the Console Configuration page to choose the option most suitable to the physical layout of your organization's Firepower deployment.

On supported physical-hardware-based Firepower systems, you can use Lights-Out Management (LOM) on a Serial Over LAN (SOL) connection on the default (`eth0`) management interface to remotely monitor or manage the system without logging into the management interface of the system. You can perform limited tasks, such as viewing the chassis serial number or monitoring such conditions as fan speed and temperature,

using a command line interface on an out-of-band management connection. For information about the cable connection to support LOM, see the *Firepower Management Center Getting Started Guide* for your hardware model.

You must enable LOM for both the system and the user you want to manage the system. After you enable the system and the user, you use a third-party Intelligent Platform Management Interface (IPMI) utility to access and manage your system.

## Configuring Remote Console Settings on the System

You must be an Admin user to perform this procedure.

### Before you begin

- Disable Spanning Tree Protocol (STP) on any third-party switching equipment connected to the device's management interface.
- If you plan to enable Lights-Out Management see the [Getting Started Guide](#) for your appliance for information about installing and using an Intelligent Platform Management Interface (IPMI) utility.

### Procedure

---

- Step 1** Choose **System > Configuration**.
  - Step 2** Click **Console Configuration**.
  - Step 3** Click **Save**.
  - Step 4** The system displays the following warning: "You will have to reboot your system for these changes to take effect." Click **OK** to reboot now or **Cancel** to reboot later.
- 

### What to do next

- If you configured serial access, be sure the rear-panel serial port is connected to a local computer, terminal server, or other device that can support remote serial access over ethernet as described in the [Getting Started Guide](#) for your FMC model.
- If you configured Lights-Out Management, enable a Lights-Out Management user; see [Lights-Out Management User Access Configuration, on page 919](#).

## Lights-Out Management User Access Configuration

You must explicitly grant Lights-Out Management permissions to users who will use the feature. LOM users also have the following restrictions:

- You must assign the Administrator role to the user.
- The username may have up to 16 alphanumeric characters. Hyphens and longer user names are not supported for LOM users.

- A user's LOM password is the same as that user's system password. Cisco recommends that you use a complex, non-dictionary-based password of the maximum supported length for your appliance and change it every three months.
- If LOM is enabled on a Firepower 7110, 7115, 7120, or 7125 device, the password may have up to 16 alphanumeric characters.
- Physical Firepower Management Centers and 8000 Series devices can have up to 13 LOM users. 7000 Series devices can have up to eight LOM users.

Note that if you deactivate, then reactivate, a user with LOM while a that user is logged in, or restore a user from a backup during that user's login session, that user may need to log back into the web interface to regain access to `impitool` commands.

## Enabling Lights-Out Management User Access

You must be an Admin user to perform this procedure.

You configure LOM and LOM users on a per-system basis using each system's local web interface. You cannot use the Firepower Management Center to configure LOM on a managed device. Similarly, because users are managed independently per appliance, enabling or creating a LOM-enabled user on the Firepower Management Center does not transfer that capability to users on managed devices.

### Procedure

- 
- Step 1** Choose **System > Users > Users**.
  - Step 2** To grant LOM user access to an existing user, click **Edit** () next to a user name in the list.
  - Step 3** Under **User Configuration**, enable the Administrator role.
  - Step 4** Check the **Allow Lights-Out Management Access** check box.
  - Step 5** Click **Save**.
- 

## Serial Over LAN Connection Configuration

You use a third-party IPMI utility on your computer to create a Serial Over LAN connection to the appliance. If your computer uses a Linux-like or Mac environment, use IPMItool; for Windows environments, you can use IPMIutil or IPMItool, depending on your Windows version.

---

**Note** Cisco recommends using IPMItool version 1.8.12 or greater.

---

### Linux

IPMItool is standard with many distributions and is ready to use.

## Mac

You must install IPMItool on a Mac. First, confirm that your Mac has Apple's XCode Developer tools installed, making sure that the optional components for command line development are installed (UNIX Development and System Tools in newer versions, or Command Line Support in older versions). Then you can install macports and the IPMItool. Use your favorite search engine for more information or try these sites:

```
https://developer.apple.com/technologies/tools/
http://www.macports.org/
http://github.com/ipmitool/ipmitool/
```

## Windows

For Windows Versions 10 and greater with Windows Subsystem for Linux (WSL) enabled, as well as some older versions of Windows Server, you can use IPMItool. Otherwise, you must compile IPMIutil on your Windows system; you can use IPMIutil itself to compile. Use your favorite search engine for more information or try this site:

```
http://ipmiutil.sourceforge.net/man.html#ipmiutil
```

## Understanding IPMI Utility Commands

Commands used for IPMI utilities are composed of segments as in the following example for IPMItool on Mac:

```
ipmitool -I lanplus -H IP_address -U user_name command
```

where:

- `ipmitool` invokes the utility.
- `-I lanplus` specifies to use an encrypted IPMI v2.0 RMCP+ LAN Interface for the session.
- `-H IP_address` indicates the IP address you have configured for Lights-Out Management on the appliance you want to access.
- `-U user_name` is the name of an authorized remote session user.
- `command` is the name of the command you want to use.

---

**Note** Cisco recommends using IPMItool version 1.8.12 or greater.

---

The same command for IPMIutil on Windows looks like this:

```
ipmiutil command -V 4 -J 3 -N IP_address -Uuser_name
```

This command connects you to the command line on the appliance where you can log in as if you were physically present at the appliance. You may be prompted to enter a password.

## Configuring Serial Over LAN with IPMItool

You must be an Admin user with LOM access to perform this procedure.

**Procedure**

---

Using IPMItool, enter the following command, and a password if prompted:

```
ipmitool -I lanplus -H IP_address -U user_name sol activate
```

---

**Configuring Serial Over LAN with IPMIutil**

You must be an Admin user with LOM access to perform this procedure.

**Procedure**

---

Using IPMIutil, enter the following command, and a password if prompted:

```
ipmiutil -J 3 -N IP_address -U username sol -a
```

---

**Lights-Out Management Overview**

Lights-Out Management (LOM) provides the ability to perform a limited set of actions over an SOL connection on the default (`eth0`) management interface without the need to log into the system. You use the command to create a SOL connection followed by one of the LOM commands. After the command is completed, the connection ends. Note that not all power control commands are valid on 70xx Family devices.

---

**Note** The baseboard management controller (BMC) for a Firepower 71xx, Firepower 82xx, or a Firepower 83xx device is only accessible via 1 Gbps link speeds when the host is powered on. When the device is powered down, the BMC can only establish Ethernet link at 10 and 100 Mbps. Therefore if LOM is being used to remotely power the device, connect the device to the network using 10 and 100 Mbps link speeds only.

---

---

**Caution** In rare cases, if your computer is on a different subnet than the system's management interface and the system is configured for DHCP, attempting to access LOM features can fail. If this occurs, you can either disable and then re-enable LOM on the system, or use a computer on the same subnet as the system to ping its management interface. You should then be able to use LOM.

---

---

**Caution** Cisco is aware of a vulnerability inherent in the Intelligent Platform Management Interface (IPMI) standard (CVE-2013-4786). Enabling Lights-Out Management (LOM) on an system exposes this vulnerability. To mitigate this vulnerability, deploy your systems on a secure management network accessible only to trusted users and use a complex, non-dictionary-based password of the maximum supported length for your system and change it every three months. To prevent exposure to this vulnerability, do not enable LOM.

---

If all attempts to access your system have failed, you can use LOM to restart your system remotely. Note that if a system is restarted while the SOL connection is active, the LOM session may disconnect or time out.

**Caution** Do **not** restart your system unless it does not respond to any other attempts to restart. Remotely restarting does not gracefully reboot the system and you may lose data.

**Table 73: Lights-Out Management Commands**

| IPMItool                      | IPMIutil                      | Description                                                        |
|-------------------------------|-------------------------------|--------------------------------------------------------------------|
| (not applicable)              | -V 4                          | Enables admin privileges for the IPMI session                      |
| -I lanplus                    | -J 3                          | Enables encryption for the IPMI session                            |
| -H <i>hostname/IP address</i> | -N <i>nodename/IP address</i> | Indicates the LOM IP address or hostname for the                   |
| -U                            | -U                            | Indicates the username of an authorized LOM acco                   |
| sol activate                  | sol -a                        | Starts the SOL session                                             |
| sol deactivate                | sol -d                        | Ends the SOL session                                               |
| chassis power cycle           | power -c                      | Restarts the appliance (not valid on 70xx Family d                 |
| chassis power on              | power -u                      | Powers up the appliance                                            |
| chassis power off             | power -d                      | Powers down the appliance (not valid on 70xx Fam                   |
| sdr                           | sensor                        | Displays appliance information, such as fan speeds<br>temperatures |

For example, to display a list of appliance information, the IPMItool command is:

```
ipmitool -I lanplus -H IP_address -U user_name sdr
```

**Note** Cisco recommends using IPMItool version 1.8.12 or greater.

The same command with the IPMIutil utility is:

```
ipmiutil sensor -V 4 -J 3 -N IP_address -U user_name
```

## Configuring Lights-Out Management with IPMItool

You must be an Admin user with LOM access to perform this procedure.

### Procedure

Enter the following command for IPMItool and a password if prompted:

```
ipmitool -I lanplus -H IP_address -U user_name command
```

---

## Configuring Lights-Out Management with IPMIutil

You must be an Admin user with LOM access to perform this procedure.

### Procedure

---

Enter the following command for IPMIutil and a password if prompted:

```
ipmiutil -J 3 -N IP_address -U username command
```

---

## REST API Preferences

The Firepower REST API provides a lightweight interface for third-party applications to view and manage appliance configuration using a REST client and standard HTTP methods. For more information on the Firepower REST API, see the *Firepower REST API Quick Start Guide*.

By default, the Firepower Management Center allows requests from applications using the REST API. You can configure the Firepower Management Center to block this access.

## Enabling REST API Access

---

**Note** In deployments using the FMC high availability, this feature is available only in the active FMC.

---

### Procedure

---

- Step 1** Choose **System > Configuration**
  - Step 2** Click **REST API Preferences**.
  - Step 3** To enable or disable REST API access to the FMC, check or uncheck the **Enable REST API** check box.
  - Step 4** Click **Save**.
  - Step 5** Access the REST API Explorer at:  
`https://<management_center_IP_or_name>:<https_port>/api/api-explorer`
-

# VMware Tools and Virtual Systems

VMware Tools is a suite of performance-enhancing utilities intended for virtual machines. These utilities allow you to make full use of the convenient features of VMware products. Firepower virtual appliances running on VMware support the following plugins:

- guestInfo
- powerOps
- timeSync
- vmbackup

You can also enable VMware Tools on all supported versions of ESXi. For a list of supported versions, see the [Cisco Firepower NGIPSv Quick Start Guide for VMware](#). For information on the full functionality of VMware Tools, see the VMware website (<http://www.vmware.com/>).

## Enabling VMware Tools on the Firepower Management Center for VMware

| Smart License | Classic License | Supported Devices           | Supported Domains | Access |
|---------------|-----------------|-----------------------------|-------------------|--------|
| Any           | Any             | Firepower Management Center | Global only       | Admin  |

Because NGIPSv does not have a web interface, you must use the CLI to enable VMware Tools on that platform; see the [Cisco Firepower NGIPSv Quick Start Guide for VMware](#).

### Procedure

- 
- Step 1** Choose **System > Configuration**.
  - Step 2** Click **VMware Tools**.
  - Step 3** Click **Enable VMware Tools**.
  - Step 4** Click **Save**.
-

## CHAPTER 45

# Platform Settings Policies

---

The following topics explain platform settings policies and how to deploy them to managed devices:

- [Introduction to Platform Settings](#), on page 927
- [Requirements and Prerequisites for Platform Settings Policies](#), on page 928
- [Managing Platform Settings Policies](#), on page 928
- [Create a Platform Settings Policy](#), on page 929
- [Setting Target Devices for a Platform Settings Policy](#), on page 929

## Introduction to Platform Settings

A platform settings policy is a shared set of features or parameters that define the aspects of a managed device that are likely to be similar to other managed devices in your deployment, such as time settings and external authentication.

A shared policy makes it possible to configure multiple managed devices at once, which provides consistency in your deployment and streamlines your management efforts. Any changes to a platform settings policy affects all the managed devices where you applied the policy. Even if you want different settings per device, you must create a shared policy and apply it to the desired device.

For example, your organization's security policies may require that your appliances have a "No Unauthorized Use" message when a user logs in. With platform settings, you can set the login banner once in a platform settings policy.

You can also benefit from having multiple platform settings policies on a Firepower Management Center. For example, if you have different mail relay hosts that you use under different circumstances or if you want to test different access lists, you can create several platform settings policies and switch between them, rather than editing a single policy.

### Related Topics

- [Configure Platform Settings for Classic Devices](#), on page 933
- [System Configuration Settings](#), on page 869

# Requirements and Prerequisites for Platform Settings Policies

## Model Support

Any, but you must create the correct type of policy for the target devices:

- **Firepower Settings** to create a shared policy for Classic managed devices: ASA FirePOWER, NGIPSv, 7000 & 8000 Series.
- **Threat Defense Settings** to create a shared policy for Firepower Threat Defense managed devices.

## Supported Domains

Any

## User Roles

Admin

Access Admin

Network Admin

# Managing Platform Settings Policies

Use the Platform Settings page (**Devices > Platform Settings**) to manage platform settings policies. This page indicates the type of device for each policy. The Status column shows the device targets for the policy.

## Procedure

---

**Step 1** Choose **Devices > Platform Settings**.

**Step 2** Manage your platform settings policies:

- **Create** — To create a new platform settings policy, click **New Policy**; see [Create a Platform Settings Policy, on page 929](#).
- **Copy** — To copy a platform settings policy, click **Copy** (.
- **Edit** — To modify the settings in an existing platform settings policy, click **Edit** (.
- **Delete** — To delete a policy that is not in use, click **Delete** () , then confirm your choice.

**Caution** You should not delete a policy that is the last deployed policy on any of its target devices, even if it is out of date. Before you delete the policy completely, it is good practice to deploy a different policy to those targets.

---

**What to do next**

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## Create a Platform Settings Policy

Platform settings for Firepower Threat Defense devices differ from platform settings for Classic devices. When you create a new platform settings policy you must choose a type: *Firepower* (for Classic managed devices) or *Threat Defense* (for FTD devices).

**Procedure**

- 
- Step 1** Choose **Devices > Platform Settings**.
  - Step 2** Click **New Policy**.
  - Step 3** Choose a device type from the drop-down list:
    - **Firepower Settings** to create a shared policy for Classic managed devices.
    - **Threat Defense Settings** to create a shared policy for Firepower Threat Defense managed devices.
  - Step 4** Enter a **Name** for the new policy and optionally, a **Description**.
  - Step 5** Optionally, choose the **Available Devices** where you want to apply the policy and click **Add to Policy** (or drag and drop) to add the selected devices. You can enter a search string in the **Search** field to narrow the list of devices.
  - Step 6** Click **Save**.  
The system creates the policy and opens it for editing.
  - Step 7** Configure the platform settings based on the device platform type:
    - For Firepower Settings, see [Platform Settings for Classic Devices, on page 931](#).
    - For Threat Defense Settings, see [Platform Settings for Firepower Threat Defense, on page 949](#).
  - Step 8** Click **Save**.
- 

**What to do next**

Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## Setting Target Devices for a Platform Settings Policy

You can add targeted devices at the same time you create a new policy, or you can change them later.

**Procedure**

- 
- Step 1** Choose **Devices > Platform Settings**.
  - Step 2** Click **Edit** () next to the platform settings policy that you want to edit.

**Step 3** Click **Policy Assignment**.

**Step 4** Do any of the following:

- To assign a device, stack, high-availability pair, or device group to the policy, select it in the **Available Devices** list and click **Add to Policy**. You can also drag and drop.
- To remove a device assignment, click **Delete** () next to a device, stack, high-availability pair, or device group in the **Selected Devices** list.

**Step 5** Click **OK**.

---

#### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

# CHAPTER 46

## Platform Settings for Classic Devices

The following topics explain Firepower platform settings and how to configure them on Classic devices:

- [About Platform Settings for Classic Devices, on page 931](#)
- [Requirements for Platform Settings for Classic Devices, on page 932](#)
- [Configure Platform Settings for Classic Devices, on page 933](#)
- [Local System Configuration for 7000/8000 Series Devices, on page 941](#)

### About Platform Settings for Classic Devices

*Platform settings* for managed devices are policy-based so that you can apply the same configuration to multiple devices. Use a *Firepower* platform settings policy with Classic devices:

- 7000/8000 series devices
- ASA FirePOWER modules
- NGIPSv

Note that for the FMC, many of these settings are handled in the *system configuration*; see [System Configuration, on page 867](#).

**Table 74: Firepower Platform Settings for Classic Devices**

| Platform Setting      | Description                                                                                                            | See                                                                                          |
|-----------------------|------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------|
| Access List           | Control which computers can access the system on specific ports.                                                       | <a href="#">Configure Access Lists for Classic Devices, on page 933</a>                      |
| Audit Log             | Configure the system to send an audit log to an external host.                                                         | <a href="#">Stream Audit Logs from Classic Devices, on page 934</a>                          |
| Audit Log Certificate | As part of audit log secure streaming, require mutual authentication between Classic devices and the audit log server. | <a href="#">Require Valid Audit Log Server Certificates for Classic Devices, on page 935</a> |

| Platform Setting        | Description                                                                                                                                               | See                                                                                     |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------|
| External Authentication | Set the default user role for any 7000/8000 series device user who is authenticated by an external RADIUS, LDAP or Microsoft Active Directory repository. | <a href="#">Enable External Authentication to 7000/8000 Series Devices, on page 936</a> |
| Language                | Specify a different language for the web interface on a 7000/8000 series device.                                                                          | <a href="#">Set the Language for the 7000/8000 Series Web Interface, on page 938</a>    |
| Login Banner            | Create a custom login banner that appears when users log in.                                                                                              | <a href="#">Customize the Login Banner for Classic Devices , on page 938</a>            |
| Shell Timeout           | Configure the amount of idle time, in minutes, before a user's login session times out due to inactivity.                                                 | <a href="#">Configure Session Timeouts for Classic Devices, on page 940</a>             |
| SNMP                    | Enable Simple Network Management Protocol (SNMP) polling.                                                                                                 | <a href="#">Configure SNMP Polling on Classic Devices, on page 940</a>                  |
| Time Synchronization    | Manage time synchronization on the system.                                                                                                                | <a href="#">Synchronize Time on Classic Devices with an NTP Server, on page 939</a>     |
| UCAPL/CC Compliance     | Enable compliance with specific requirements set out by the United States Department of Defense.                                                          | <a href="#">Enable Security Certifications Compliance, on page 911</a>                  |

## Requirements for Platform Settings for Classic Devices

### License Requirements

None.

### Model Requirements

You can apply a Firepower platform settings policy to any Classic device.

Some platform settings apply only to 7000/8000 series devices because those devcies have a web interface: external authentication settings, display language, session timeouts, and so on. Applying these settings to ASA FirePOWER or NGIPSv has no effect.

You can also log into the local web interface on 7000/8000 series devices for non-policy based system configurations. See [Local System Configuration for 7000/8000 Series Devices, on page 941](#).

### Domain Requirements

None.

You can apply a Firepower platform setting policy at any Domain level.

## Configure Platform Settings for Classic Devices

Platform settings for managed devices are policy-based so that you can apply the same configuration to multiple devices. Use a Firepower platform settings policy with Classic devices.

### Procedure

---

- Step 1** Choose **Devices > Platform Settings** and create or edit a Firepower policy.  
See [About Platform Settings for Classic Devices, on page 931](#) and [Create a Platform Settings Policy, on page 929](#).
  - Step 2** Choose the **Available Devices** where you want to deploy the policy by clicking **Policy Assignment**.
  - Step 3** Click **Add to Policy** (or drag and drop) to add the selected devices.
  - Step 4** Click **Save**.
- 

### What to do next

Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## Configure Access Lists for Classic Devices

By default, access to Firepower devices is not restricted. Port 22 (SSH) is open for CLI access. For 7000/8000 series devices, port 443 (HTTPS) is also open for web interface access.

To operate in a more secure environment, consider adding access for specific IP addresses. You can also add access to poll for SNMP information over port 161.

### Procedure

---

- Step 1** Choose **Devices > Platform Settings** and create or edit a Firepower policy.
  - Step 2** Click **Access List**.
  - Step 3** To add access for one or more IP addresses, click **Add Rules**.
  - Step 4** In the **IP Address** field, enter an IP address or address range, or *any*.
  - Step 5** Choose **SSH, HTTPS, SNMP**, or a combination of these options to specify which ports you want to enable for these IP addresses.
  - Step 6** Click **Add**.
  - Step 7** Click **Save**.
- 

### What to do next

Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## Stream Audit Logs from Classic Devices

Firepower appliances generate records (or *audit logs*) of user interactions. You can stream these audit logs to a syslog or HTTP server. Note that sending audit information to an external URL may affect system performance.

**Tip** On 7000/8000 series devices, you can also review audit logs on the device's web interface: [Auditing the System, on page 2415](#).

Optionally, you can use Transport Layer Security (TLS) certificates to secure communications between Firepower devices and a trusted audit log server. For *each device* (client certificates are unique), you must generate a certificate signing request (CSR), submit it to a Certificate Authority (CA) for signing, then import the signed certificate onto the device. You cannot use the FMC to import audit log certificates onto its managed devices. These certificates are unique to each device, and you must log into *each device* to import them.

To ensure security, use a globally recognized and trusted CA. The same CA must sign:

- Both the client certificate and the server certificate, if you plan to require mutual authentication between the device and the audit log server.
- Any intermediate certificates in the certificate chain. If the signing CA requires you to trust an intermediate CA, you must provide the necessary certificate chain (or certificate path).

Audit logs have the following format:

```
timestamp host [tag] appliance_name: username@ip_address, subsystem, action
```

For example:

```
Mar 01 14:45:24 localhost [FIREPOWER] MyFirepowerAppliance: admin@10.1.1.2, System > Configuration, Page View
```

Note that the tag is optional and user-configurable. Syslog events also have an optional facility and severity..

### Before you begin

Make sure your devices can communicate with the server or servers where you plan to stream audit logs. For syslog streaming, the system uses port 7/UDP to verify that the syslog server is reachable when you save the configuration. Then, the system uses port 514/UDP to stream audit logs. If you secure the channel, you must manually configure port 1470 for TCP.

### Procedure

**Step 1** (Optional) Set up secure communications with the audit log server.

For ASA FirePOWER and NGIPSv, you can generate a CSR with a tool like OpenSSL, then use the CLI to import the signed certificate: **configure audit\_cert import**. For 7000/8000 series devices, use the system configuration (**System > Configuration**) on the device's web interface: [Obtain a Signed Client Certificate for Secure Audit Log Streaming on a 7000/8000 Series Device, on page 942](#).

To verify that the certificate imported correctly, use the 7000/8000 series device's web interface, or the CLI: **show audit\_cert**.

**Step 2** On the FMC, choose **Devices > Platform Settings** and create or edit a Firepower policy.

**Step 3** Click **Audit Log** to configure audit log streaming.

Syslog streaming:

- a) Set **Send Audit Log to Syslog** to **Enabled**.
- b) Provide **Host** information for the syslog server: IP address or fully qualified name.
- c) Choose a **Facility** ([Syslog Alert Facilities, on page 2079](#)) and **Severity** ([Syslog Severity Levels, on page 2080](#)).

HTTP streaming:

- a) Set **Send Audit Log to HTTP Server** to **Enabled**.
- b) Provide a **URL to Post Audit** where you want to send audit logs. HTTPS is supported.

The URL must correspond to a Listener program that expects the following HTTP POST variables:  
subsystem, actor, event\_type, message, action\_source\_ip, action\_destination\_ip, result, time,  
tag (if provided).

**Step 4** (Optional) Enter a **Tag** in include in each message. For example, you might want to tag Firepower audit logs with **FIREPOWER**.

**Step 5** Click **Save**.

If you configured syslog streaming, the system verifies that the syslog server is reachable.

---

### What to do next

- (Optional) If you configured secure communications, we recommend you also require mutual authentication between the device and the audit log server: [Require Valid Audit Log Server Certificates for Classic Devices, on page 935](#).
- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## Require Valid Audit Log Server Certificates for Classic Devices

For additional security, we recommend you require mutual authentication between Firepower appliances and the audit log server. To accomplish this, load one or more certificate revocation lists (CRLs). You cannot stream audit logs to servers with revoked certificates listed in those CRLs.

Firepower supports CRLs encoded in Distinguished Encoding Rules (DER) format. Note that these are the same CRLs that the system uses to validate HTTPS client certificates for the FMC web interface.

### Before you begin

Obtain and import a signed client certificate onto each device.

- For ASA FirePOWER and NGIPSv, you can generate a CSR with a tool like OpenSSL, then use the CLI to import the signed certificate: **configure audit\_cert import**.
- For 7000/8000 series devices, use the system configuration (**System > Configuration**) on the device's web interface: [Obtain a Signed Client Certificate for Secure Audit Log Streaming on a 7000/8000 Series Device, on page 942](#).

Use a globally recognized and trusted CA. The same CA must sign the client certificates you imported *and* the server certificate you will require with this procedure.

### Procedure

---

**Step 1** Choose **Devices > Platform Settings** and create or edit a Firepower policy.

**Step 2** Click **Audit Log Certificate**.

**Step 3** Select **Enable TLS**, then **Enable Mutual Authentication**.

We recommend you enable mutual authentication. If you do not, the device will accept server certificates without verification.

**Step 4** Select **Enable Fetching of CRL**, provide the URL to a CRL file, and click **Add CRL**.

You can add up to 25 CRLs. When you deploy, the system will schedule CRL updates. To set the update frequency, see [Configuring Certificate Revocation List Downloads, on page 182](#).

**Step 5** Click **Save**.

---

### What to do next

Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## Enable External Authentication to 7000/8000 Series Devices

Use device platform settings to allow users of 7000/8000 series devices to authenticate to an LDAP or RADIUS server, rather than using the local database.

### Before you begin

Configure external authentication objects. See [External Authentication, on page 71](#).

### Procedure

---

**Step 1** Choose **Devices > Platform Settings** and create or edit a Firepower policy.

**Step 2** Click **External Authentication**.

**Step 3** From the **Status** drop-down list, choose **Enabled**.

**Step 4** From the **Default User Role** drop-down list, choose user roles to define the default permissions you want to grant to externally authenticated users.

**Step 5** If you want to use the external server to authenticate CLI or shell access accounts, choose **Enabled** from the **Shell Authentication** drop-down list.

**Step 6** If you want to enable CAC authentication and authorization, choose an available CAC authentication object from the **CAC Authentication** drop-down list.

For more information, see [CAC Authentication, on page 74](#).

**Step 7** Check the check boxes next to the each external authentication object that you want to use. If you enable more than 1 object, then users are checked against servers in the order specified. See the next step to reorder servers.

If you enable shell authentication, you must enable an external authentication object that includes a **Shell Access Filter**. CLI/shell access users can only authenticate against the server whose authentication object is highest in the list.

If you need both CLI and CAC authentication, you must use separate authentication objects for each purpose.

**Step 8** (Optional) Use the up and down arrows to change the order in which authentication servers are accessed when an authentication request occurs.

**Step 9** Click **Save**.

---

### What to do next

Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## About External Authentication for 7000/8000 Series Devices

If you create an authentication object referencing an external authentication server, you can enable external authentication to let users logging into the managed device authenticate to that server, rather than using the local database.

When you enable external authentication, the system verifies the user credentials against users on an LDAP or RADIUS server. In addition, if a user has local, internal authentication enabled and the user credentials are not found in the internal database, the system then checks the external server for a set of matching credentials. If a user has the same username on multiple systems, all passwords across all servers work. Note, however, that if authentication fails on the available external authentication servers, the system does not revert to checking the local database.

When you enable external authentication, you can set the default user role for any user whose account is externally authenticated. You can select multiple roles, as long as those roles can be combined. For example, if you enable external authentication that retrieves only users in the Network Security group in your company, you may set the default user role to include the Security Analyst role so users can access collected event data without any additional user configuration on your part. However, if your external authentication retrieves records for other personnel in addition to the security group, you would probably want to leave the default role unselected.

If no access role is selected, users can log in but cannot access any functionality. After a user attempts to log in, their account is listed on the user management page (**System > Users**), where you can edit the account settings to grant additional permissions.

---

**Tip** If you configure the system to use one user role and apply the policy, then later modify the configuration to use different default user roles, any user accounts created before the modification retain the first user role until you modify the accounts, or delete and recreate them.

---

If you want to specify the set of users who can authenticate against the LDAP server for CLI/shell access or for CAC authentication and authorization, you must create separate authentication objects for each and enable the objects separately.

If a user with internal authentication attempts to log in, the system first checks if that user is in the local user database. If the user exists, the system then checks the username and password against the local database. If a match is found, the user logs in successfully. If the login fails, however, and external authentication is enabled, the system checks the user against each external authentication server in the authentication order

shown in the configuration. If the username and password match results from an external server, the system changes the user to an external user with the default privileges for that authentication object.

If an external user attempts to log in, the system checks the username and password against the external authentication server. If a match is found, the user logs in successfully. If the login fails, the user login attempt is rejected. External users cannot authenticate against the user list in the local database. If the user is a new external user, an external user account is created in the local database with the default privileges from the external authentication object.

## Set the Language for the 7000/8000 Series Web Interface

The language you specify here is used for the web interface for every user who logs in. You can choose from:

- English
- Chinese (simplified)
- Japanese
- Korean

### Procedure

---

- Step 1** Choose **Devices > Platform Settings** and create or edit a Firepower policy.
  - Step 2** Click **Language**.
  - Step 3** Choose the language you want to use.
  - Step 4** Click **Save**.
- 

### What to do next

Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## Customize the Login Banner for Classic Devices

You can customize the CLI login banner for Classic devices. For 7000/8000 series devices, the login banner also appears in the web interface. Note that if the banner is too large or causes errors, CLI sessions can fail when the system attempts to display the banner.

### Procedure

---

- Step 1** Choose **Devices > Platform Settings** and create or edit a Firepower policy.
- Step 2** Choose **Login Banner**.
- Step 3** In the **Custom Login Banner** field, enter the login banner text you want to use.  
The system will not preserve tab spacing.

**Step 4** Click **Save**.

---

#### What to do next

Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## Synchronize Time on Classic Devices with an NTP Server

Synchronizing the system time on your FMC and all its managed devices is essential to successful operations. If your deployment includes the Firepower Threat Defense devices, see [Configure NTP Time Synchronization for Threat Defense, on page 976](#).

The device supports NTPv4.

---

**Caution** Unintended consequences can occur when time is not synchronized between the FMC and managed devices.

---

After you deploy, it may take a few minutes for managed devices to synchronize with the configured NTP servers.

#### Before you begin

Make sure the device can communicate with the NTP server or servers you plan to use. You can either:

- (Recommended.) Use the same NTP servers as the FMC: [Synchronize Time on the FMC with an NTP Server, on page 913](#).

If you choose this option, the device gets its time directly from the configured NTP server. If the device's configured NTP servers are not reachable for any reason, it synchronizes its time with the FMC.

- If your device cannot reach an NTP server or your organization does not have one, you must use the **Via NTP from Management Center** option discussed in the following procedure.

#### Procedure

---

**Step 1** Choose **Devices > Platform Settings** and create or edit a Firepower policy.

**Step 2** Click **Time Synchronization**.

**Step 3** Specify how time is synchronized:

- **Via NTP from:** If your Firepower Management Center is using NTP servers on the network, select this option and enter the fully-qualified DNS name (such as ntp.example.com), or IPv4 or IPv6 address, of the same NTP servers you specified in **System > Configuration > Time Synchronization**. If the NTP servers are not reachable, the Firepower Management Center acts as an NTP server.
- **Via NTP from Management Center:** (Default). The managed device gets time from the NTP servers you configured for the Firepower Management Center (except for authenticated NTP servers) and synchronizes time with those servers directly. However, if any of the following are true, the managed device synchronizes time from the Firepower Management Center:
  - The Firepower Management Center's NTP servers are not reachable by the device.

- The Firepower Management Center has no unauthenticated servers.

**Step 4** Click **Save**.

---

#### What to do next

Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## Configure Session Timeouts for Classic Devices

Unattended login sessions may be security risks. You can configure the amount of idle time before a user's login session times out due to inactivity. The maximum value is 24 hours, or 1440 minutes.

#### Procedure

---

**Step 1** Choose **Devices > Platform Settings** and create or edit a Firepower policy.

**Step 2** Click **Shell Timeout**.

**Step 3** Configure session timeouts:

- Web interface (7000/8000 series only): Enter a **Browser Session Timeout (Minutes)**.

You can exempt specific web interface users from timeout, for scenarios where you plan to passively, securely monitor the system for long periods of time. For more information, see [User Account Login Options, on page 64](#).

- CLI: Enter a **Shell Timeout (Minutes)**.

**Step 4** Click **Save**.

---

#### What to do next

Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## Configure SNMP Polling on Classic Devices

Simple Network Management Protocol (SNMP) polling allows access to the standard management information base (MIB) on Firepower devices, which includes system details such as contact, administrative, location, service information, IP addressing and routing information, and transmission protocol usage statistics. Additional MIBs for 7000/8000 series devices include statistics on traffic passing through physical interfaces, logical interfaces, virtual interfaces, ARP, NDP, virtual bridges, and virtual routers. Note that enabling SNMP polling does not cause the system to send SNMP traps; it only makes the information in the MIBs available for polling by your network management system.

The system supports SNMPv1, v2, and v3. SNMPv2 only supports read-only communities and SNMPv3 only supports read-only users. SNMPv3 also supports encryption with AES128.

### Before you begin

Add SNMP access for each computer you plan to use to poll the system. See [Configure Access Lists for Classic Devices](#), on page 933.

---

**Note** The SNMP MIB contains information that could be used to attack your deployment. We recommend that you restrict your access list for SNMP access to the specific hosts that will be used to poll for the MIB. We also recommend you use SNMPv3 and use strong passwords for network management access.

---

### Procedure

---

- Step 1** Choose **Devices > Platform Settings** and create or edit a Firepower policy.
- Step 2** Click **SNMP**.
- Step 3** From the **SNMP Version** drop-down list, choose the SNMP version you want to use:
- **Version 1** or **Version 2**: Enter a read-only SNMP community name in the **Community String** field, then skip to the end of the procedure.
- Note** Do not include special characters (<> / % # & ? ', etc.) in the SNMP community string name.
- **Version 3**: Click **Add User** to display the user definition page. SNMPv3 only supports read-only users and encryption with AES128.
- Step 4** Enter a **Username**.
- Step 5** Choose the protocol you want to use for authentication from the **Authentication Protocol** drop-down list.
- Step 6** Enter the password required for authentication with the SNMP server in the **Authentication Password** field.
- Step 7** Re-enter the authentication password in the **Verify Password** field.
- Step 8** Choose the privacy protocol you want to use from the **Privacy Protocol** list, or choose **None** to not use a privacy protocol.
- Step 9** Enter the SNMP privacy key required by the SNMP server in the **Privacy Password** field.
- Step 10** Re-enter the privacy password in the **Verify Password** field.
- Step 11** Click **Add**.
- Step 12** Click **Save**.
- 

### What to do next

Deploy configuration changes; see [Deploy Configuration Changes](#), on page 346.

## Local System Configuration for 7000/8000 Series Devices

You can log into the local web interface on 7000/8000 series devices for non-policy based system configurations. Many of these configurations parallel FMC system configurations, and are documented in the FMC system configuration chapter: [System Configuration](#), on page 867.

Table 75: Local System Configurations for 7000/8000 Series Devices

| System Configuration     | Description                                                                                                        | See                                                                                                                         |
|--------------------------|--------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------|
| Audit Log Certificate    | As part of audit log secure streaming, obtain and import a signed client certificate for 7000/8000 series devices. | <a href="#">Obtain a Signed Client Certificate for Secure Audit Log Streaming on a 7000/8000 Series Device, on page 942</a> |
| Change Reconciliation    | Send a detailed report of changes to the system over the last 24 hours.                                            | <a href="#">Change Reconciliation, on page 893</a>                                                                          |
| Console Configuration    | Configure console access via VGA or serial port, or via Lights-Out Management (LOM).                               | <a href="#">Remote Console Access Management, on page 918</a>                                                               |
| HTTPS Certificate        | Request an HTTPS server certificate, if needed, from a trusted authority and upload certificates to the system.    | <a href="#">HTTPS Certificates, on page 871</a>                                                                             |
| Information              | View current information about the appliance and edit the display name.                                            | <a href="#">Appliance Information, on page 870</a>                                                                          |
| Management Interfaces    | Change options such as the IP address, hostname, and proxy settings of the appliance.                              | <a href="#">Configure Management Interfaces on a 7000/8000 Series Device, on page 944</a>                                   |
| Process                  | Shut down, reboot, or restart Firepower processes.                                                                 | <a href="#">Shut Down or Restart a 7000/8000 Series Device, on page 947</a>                                                 |
| Prohibit Packet Transfer | Disable sending packet data from 7000/8000 series devices to the FMC in a low-bandwidth deployment.                | <a href="#">Prohibit Packet Transfer to FMC, on page 944</a>                                                                |
| Time                     | View the current time settings.                                                                                    | <a href="#">View System Time for 7000/8000 Series Devices, on page 947</a>                                                  |

## Obtain a Signed Client Certificate for Secure Audit Log Streaming on a 7000/8000 Series Device

Optionally, you can use Transport Layer Security (TLS) certificates to secure communications between Firepower devices and a trusted audit log server. For *each device* (client certificates are unique), you must generate a certificate signing request (CSR), submit it to a Certificate Authority (CA) for signing, then import the signed certificate onto the device. You cannot use the FMC to import audit log certificates onto its managed devices. These certificates are unique to each device, and you must log into *each device* to import them.

To ensure security, use a globally recognized and trusted CA. The same CA must sign:

- Both the client certificate and the server certificate, if you plan to require mutual authentication between the device and the audit log server.

- Any intermediate certificates in the certificate chain. If the signing CA requires you to trust an intermediate CA, you must provide the necessary certificate chain (or certificate path).

The system generates certificate request keys in Base-64 encoded PEM format.

## Procedure

---

- Step 1** Log into the device's web interface and choose **System > Configuration**.
- Step 2** Click **Audit Log Certificate**.
- Step 3** Generate a CSR.
- a) Click **Generate New CSR**.
  - b) Fill out the required location and organizational information.
  - c) Enter the fully qualified domain name of the server for which you want to request a certificate in the **Common Name** field. If the common name and the DNS hostname do not match, audit log streaming will fail.
  - d) Click **Generate**.
- Step 4** Create a text file for the CSR.
- a) Copy and paste the entire block of text in the certificate request, including the `BEGIN CERTIFICATE REQUEST` and `END CERTIFICATE REQUEST` lines.
  - b) Save the file as `clientname.csr`, where `clientname` is the name of the device where you plan to use the certificate.
- Step 5** Submit the CSR to the CA and wait to receive the signed certificate.
- Step 6** Import the signed certificate onto the device.
- If you left the page, browse back to **System > Configuration > Audit Log Certificate**, then click **Import Audit Client Certificate**. Copy and paste the following:
- **Client Certificate:** All of the text in the signed certificate, including the `BEGIN CERTIFICATE` and `END CERTIFICATE` lines.
  - **Private Key:** All of the text in the private key file, including the `BEGIN RSA PRIVATE KEY` and `END RSA PRIVATE KEY` lines.
  - **Certificate Chain:** All of the text in each required intermediate certificate.
- Make sure you import the correct certificate. Client certificates are unique.
- Step 7** Click **Save**.
- 

## What to do next

If you have not already, use the device platform settings on the FMC to configure audit log streaming: [Stream Audit Logs from Classic Devices, on page 934](#).

## Prohibit Packet Transfer to FMC

| Smart License | Classic License | Supported Devices  | Supported Domains | Access |
|---------------|-----------------|--------------------|-------------------|--------|
| N/A           | Any             | 7000 & 8000 Series | N/A               | Admin  |

You may want to disable sending packet data from 7000 or 8000 Series devices to the Firepower Management Center in a low-bandwidth deployment if you are not concerned about the specific content of the packet that triggered an intrusion policy violation.

### Procedure

- 
- Step 1** In the local web interface of your 7000 or 8000 Series device, choose **System > Configuration**.
- Step 2** Click **Information**.
- Step 3** Select **Prohibit Packet Transfer to the Management Center**.
- Step 4** Click **Save**.
- 

## Configure Management Interfaces on a 7000/8000 Series Device

| Smart License | Classic License | Supported Devices  | Supported Domains | Access |
|---------------|-----------------|--------------------|-------------------|--------|
| N/A           | Any             | 7000 & 8000 Series | Global only       | Admin  |

Modify the management interface settings on the managed device using the web interface. You can optionally enable an event interface if your model supports it. For more information on management interfaces, see [About Device Management Interfaces, on page 221](#).

---

**Caution** Be careful when making changes to the management interface; if you cannot re-connect because of a configuration error, you will need to access the device console port and reconfigure the settings at the CLI.

---

### Procedure

- 
- Step 1** Choose **System > Configuration**, and then choose **Management Interfaces**.
- Step 2** In the **Interfaces** area, click **Edit** next to the interface that you want to configure.
- All available interfaces are listed in this section. You cannot add more interfaces.
- You can configure the following options on each management interface:
- **Enabled**—Enable the management interface. Do **not** disable the default eth0 management interface. Some processes require the eth0 interface.
  - **Channels**—(8000 series only) Configure an event-only interface. You can enable the eth1 management interface on your 8000 series device to act as an event interface. To do so, uncheck the **Management**

**Traffic** check box, and leave the **Event Traffic** check box checked. For the eth0 management interface, leave both check boxes checked.

The Firepower Management Center event-only interface cannot accept management channel traffic, so you should simply disable the management channel on the device event interface.

You can optionally disable **Event Traffic** for the management interface. In either case, the device will try to send events on the event-only interface, and if that interface is down, it will send events on the management interface even if you disable the event channel.

You cannot disable both event and management channels on an interface.

- **Mode**—Specify a link mode. Note that any changes you make to auto-negotiation are ignored for GigabitEthernet interfaces.
- **MTU**—Set the maximum transmission unit (MTU). The default is 1500. The range within which you can set the MTU can vary depending on the model and interface type.  
Because the system automatically trims 18 bytes from the configured MTU value, any value below 1298 does not comply with the minimum IPv6 MTU setting of 1280, and any value below 594 does not comply with the minimum IPv4 MTU setting of 576. For example, the system automatically trims a configured value of 576 to 558.
- **MDI/MDIX**—Set the **Auto-MDIX** setting.
- **IPv4 Configuration**—Set the IPv4 IP address. Choose:
  - **Static**—Manually enter the **IPv4 Management IP** address and **IPv4 Netmask**.
  - **DHCP**—Set the interface to use DHCP (eth0 only).
  - **Disabled**—Disable IPv4. Do **not** disable both IPv4 and IPv6.
- **IPv6 Configuration**—Set the IPv6 IP address. Choose:
  - **Static**—Manually enter the **IPv6 Management IP** address and **IPv6 Prefix Length**.
  - **DHCP**—Set the interface to use DHCPv6 (eth0 only).
  - **Router Assigned**—Enable stateless autoconfiguration.
  - **Disabled**—Disable IPv6. Do **not** disable both IPv4 and IPv6.

**Step 3** In the **Routes** area, edit a static route by clicking **Edit** () , or add a route by clicking **Add** (). View the route statistics by clicking **View** ().

**Note** You need to add a static route for the event-only interface if the Firepower Management Center is on a remote network; otherwise, all traffic will match the default route through the management interface. For the default route, you can change only the gateway IP address. The default route always uses the eth0 interface. For information about routing, see [Network Routes on Device Management Interfaces, on page 222](#).

You can configure the following settings for a static route:

- **Destination**—Set the destination address of the network to which you want to create a route.
- **Netmask or Prefix Length**—Set the netmask (IPv4) or prefix length (IPv6) for the network.

- **Interface**—Set the egress management interface.
- **Gateway**—Set the gateway IP address.

**Step 4** In the **Shared Settings** area, set network parameters shared by all interfaces.

**Note** If you selected **DHCP** for the eth0 interface, you cannot manually specify some shared settings derived from the DHCP server.

You can configure the following shared settings:

- **Hostname**—Set the device hostname. If you change the hostname, reboot the device if you want the new hostname reflected in syslog messages. Syslog messages do not reflect a new hostname until after a reboot.
- **Domains**—Set the search domain(s) for the device, separated by commas. These domains are added to hostnames when you do not specify a fully-qualified domain name in a command, for example, **ping system**. The domains are used only on the management interface, or for commands that go through the management interface.
- **Primary DNS Server, Secondary DNS Server, Tertiary DNS Server**—Set the DNS servers to be used in order of preference.
- **Remote Management Port**—Set the remote management port for communication with the FMC. The FMC and managed devices communicate using a two-way, SSL-encrypted communication channel, which by default is on port 8305.

**Note** Cisco **strongly** recommends that you keep the default settings for the remote management port, but if the management port conflicts with other communications on your network, you can choose a different port. If you change the management port, you must change it for **all** devices in your deployment that need to communicate with each other.

**Step 5** In the **LCD Panel** area, check the **Allow reconfiguration of network settings** check box to enable changing network settings using the device's LCD panel.

You can use the LCD panel to edit the IP address for the device. Confirm that any changes you make are reflected on the managing Firepower Management Center. In some cases, you may need to update the data manually on the Firepower Management Center as well.

**Caution** Allowing reconfiguration using the LCD panel can present a security risk. You need only physical access, not authentication, to configure network settings using the LCD panel. The web interface warns you that enabling this option is a potential security issue.

**Step 6** In the **Proxy** area, configure HTTP proxy settings.

The device is configured to directly-connect to the internet on ports TCP/443 (HTTPS) and TCP/80 (HTTP). You can use a proxy server, to which you can authenticate via HTTP Digest.

**Note** Proxies that use NT LAN Manager (NTLM) authentication are not supported.

- Check the **Enabled** check box.
- In the **HTTP Proxy** field, enter the IP address or fully-qualified domain name of your proxy server.
- In the **Port** field, enter a port number.
- Supply authentication credentials by choosing **Use Proxy Authentication**, and then provide a **User Name** and **Password**.

**Step 7** Click **Save**.

**Step 8** If you changed the management IP address, it might affect communication between the FMC and the managed device.

Changing the IP address will not affect the current connection. However, if the device or FMC reloads, then the connection needs to be reestablished. You need at least one of the devices (FMC or managed device) to have the correct IP address of the peer. For example, if you specified a NAT ID (instead of an IP address) for the FMC during device setup, then the device IP address that you defined on the FMC when you added the device will be wrong, and the FMC will not be able to reestablish communications. In this case, you must change the management IP address of the device in the FMC; see [Update the Hostname or IP Address in FMC, on page 234](#).

## Shut Down or Restart a 7000/8000 Series Device

### Procedure

**Step 1** On the device's web interface, choose **System > Configuration**.

**Step 2** Choose **Process**.

**Step 3** Do one of the following:

|                           |                                                                                                                                                                                                                                                                                                                                                                   |
|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Shut down                 | Click <b>Run Command</b> next to <b>Shutdown Appliance</b> .<br><br><b>Caution</b> Do <b>not</b> shut off Firepower appliances using the power button; it may cause a loss of data. Using the web interface (or CLI) prepares the system to be safely powered off and restarted without losing configuration data.                                                |
| Reboot                    | Click <b>Run Command</b> next to <b>Reboot Appliance</b> .<br><br><b>Note</b> Rebooting logs you out, and the system runs a database check that can take up to an hour to complete.                                                                                                                                                                               |
| Restart the console       | Click <b>Run Command</b> next to <b>Restart Appliance Console</b> .                                                                                                                                                                                                                                                                                               |
| Restart the Snort process | Click <b>Run Command</b> next to <b>Restart Snort</b> .<br><br><b>Caution</b> Restarting the Snort process temporarily interrupts traffic inspection. Whether traffic drops during this interruption or passes without inspection depends on how the device is configured. See <a href="#">Snort® Restart Traffic Behavior, on page 350</a> for more information. |

## View System Time for 7000/8000 Series Devices

Time settings are displayed on most pages in local time using the time zone you set on the Time Zone page in User Preferences, but are stored on the appliance using UTC time. In addition, the current time appears in

UTC at the top of the Time Synchronization page (local time is displayed in the Manual clock setting option, if enabled).

---

**Restriction** The Time Zone function (in User Preferences) assumes that the default system clock is set to UTC time. ***Do not change this.*** Changing the system time from UTC is ***not*** supported, and you will have to reimage the device.

---

Use this procedure to verify system time information on 7000 and 8000 Series devices.

### Procedure

---

**Step 1** Log into the device's web interface and choose **System > Configuration**.

**Step 2** Click **Time**.

If you are using NTP, see [NTP Server Status, on page 916](#).

---

## CHAPTER 47

# Platform Settings for Firepower Threat Defense

Platform settings for Firepower Threat Defense devices configure a range of unrelated features whose values you might want to share among several devices. Even if you want different settings per device, you must create a shared policy and apply it to the desired device.

- [Configure ARP Inspection, on page 949](#)
- [Configure Banners, on page 950](#)
- [Configure Fragment Handling, on page 951](#)
- [Configure HTTP, on page 952](#)
- [Configure ICMP Access Rules, on page 953](#)
- [Configure Secure Shell, on page 954](#)
- [Configure SMTP, on page 956](#)
- [Configure SNMP for Threat Defense, on page 956](#)
- [About Configuring Syslog, on page 962](#)
- [Configure Global Timeouts, on page 974](#)
- [Configure NTP Time Synchronization for Threat Defense, on page 976](#)
- [History for Firepower Threat Defense Platform Settings, on page 977](#)

## Configure ARP Inspection

By default, all ARP packets are allowed between bridge group members. You can control the flow of ARP packets by enabling ARP inspection.

ARP inspection prevents malicious users from impersonating other hosts or routers (known as ARP spoofing). ARP spoofing can enable a “man-in-the-middle” attack. For example, a host sends an ARP request to the gateway router; the gateway router responds with the gateway router MAC address. The attacker, however, sends another ARP response to the host with the attacker MAC address instead of the router MAC address. The attacker can now intercept all the host traffic before forwarding it on to the router.

ARP inspection ensures that an attacker cannot send an ARP response with the attacker MAC address, so long as the correct MAC address and the associated IP address are in the static ARP table.

When you enable ARP inspection, the FTD device compares the MAC address, IP address, and source interface in all ARP packets to static entries in the ARP table, and takes the following actions:

- If the IP address, MAC address, and source interface match an ARP entry, the packet is passed through.
- If there is a mismatch between the MAC address, the IP address, or the interface, then the FTD device drops the packet.

- If the ARP packet does not match any entries in the static ARP table, then you can set the FTD device to either forward the packet out all interfaces (flood), or to drop the packet.

---

**Note** The dedicated interface never floods packets even if this parameter is set to flood.

---

### Procedure

---

- Step 1** Select **Devices > Platform Settings** and create or edit the Firepower Threat Defense policy.
- Step 2** Select **ARP Inspection**.
- Step 3** Add entries to the ARP inspection table.
- a) Click **Add** to create a new entry, or click **Edit** if the entry already exists.
  - b) Select the desired options.
    - **Inspect Enabled**—To perform ARP inspection on the selected interfaces and zones.
    - **Flood Enabled**—Whether to flood ARP requests that do not match static ARP entries out all interfaces other than the originating interface or the dedicated management interface. This is the default behavior.  
If you do not elect to flood ARP requests, then only those requests that exactly match static ARP entries are allowed.
    - **Security Zones**—Add the zones that contain the interfaces on which to perform the selected actions. The zones must be switched zones. For interfaces not in a zone, you can type the interface name into the field below the Selected Security Zone list and click **Add**. These rules will be applied to a device only if the device includes the selected interfaces or zones.
  - c) Click **OK**.
- Step 4** Add static ARP entries according to [Add a Static ARP Entry, on page 647](#).
- Step 5** Click **Save**.
- You can now click **Deploy** and deploy the policy to assigned devices. The changes are not active until you deploy them.
- 

## Configure Banners

You can configure messages to show users when they connect to the device command line interface (CLI).

### Procedure

---

- Step 1** Select **Devices > Platform Settings** and create or edit the Firepower Threat Defense policy.
- Step 2** Select **Banner**.
- Step 3** Configure the banner.

Following are some tips and requirements for banners.

- Only ASCII characters are allowed. You can use line returns (press Enter), but you cannot use tabs.
- You can dynamically add the hostname or domain name of the device by including the variables `$(hostname)` or `$(domain)`.
- Although there is no absolute length restriction on banners, Telnet or SSH sessions will close if there is not enough system memory available to process the banner messages.
- From a security perspective, it is important that your banner discourage unauthorized access. Do not use the words "welcome" or "please," as they appear to invite intruders in. The following banner sets the correct tone for unauthorized access:

```
You have logged in to a secure device.
If you are not authorized to access this device,
log out immediately or risk criminal charges.
```

**Step 4** Click **Save**.

You can now click **Deploy** and deploy the policy to assigned devices. The changes are not active until you deploy them.

---

## Configure Fragment Handling

By default, the Firepower Threat Defense device allows up to 24 fragments per IP packet, and up to 200 fragments awaiting reassembly. You might need to let fragments on your network if you have an application that routinely fragments packets, such as NFS over UDP. However, if you do not have an application that fragments traffic, we recommend that you do not allow fragments by setting **Chain** to 1. Fragmented packets are often used as Denial of Service (DoS) attacks.

---

**Note** These settings establish the defaults for devices assigned this policy. You can override these settings for specific interfaces on a device by selecting **Override Default Fragment Setting** in the interface configuration. When you edit an interface, you can find the option on **Advanced > Security Configuration**. Select **Devices > Device Management**, edit a Firepower Threat Defense device, and select **Interfaces** to edit interface properties..

---

### Procedure

---

- Step 1** Select **Devices > Platform Settings** and create or edit the Firepower Threat Defense policy.
- Step 2** Select **Fragment Settings**.
- Step 3** Configure the following options. Click **Reset to Defaults** if you want to use the default settings.
- **Size (Block)**—The maximum number of packet fragments from all connections collectively that can be waiting for reassembly. The default is 200 fragments.

- **Chain (Fragment)**—The maximum number of packets into which a full IP packet can be fragmented. The default is 24 packets. Set this option to 1 to disallow fragments.
- **Timeout (Sec)**—The maximum number of seconds to wait for an entire fragmented packet to arrive. The default is 5 seconds. If all fragments are not received within this time, all fragments are discarded.

**Step 4** Click **Save**.

You can now click **Deploy** and deploy the policy to assigned devices. The changes are not active until you deploy them.

## Configure HTTP

If you want to allow HTTPS connections to one or more interfaces on the Firepower Threat Defense device, configure HTTPS settings. You can use HTTPS to download packet captures for troubleshooting.

### Before you begin

- When you manage the Firepower Threat Defense using the FMC, HTTPS access to the Firepower Threat Defense is only for viewing packet capture files. The Firepower Threat Defense does not have a web interface for configuration in this management mode.
- HTTPS local users can only be configured at the CLI using the **configure user add** command. By default, there is an **admin** user for which you configured the password during initial setup. AAA external authentication is not supported.
- The physical management interface is shared between the Diagnostic logical interface and the Management logical interface; this configuration applies only to the Diagnostic logical interface, if used, or to other data interfaces. The Management logical interface is separate from the other interfaces on the device. It is used to set up and register the device to the FMC. It has a separate IP address and static routing.
- To use HTTPS, you do not need an access rule allowing the host IP address. You only need to configure HTTPS access according to this section.
- You can only use HTTPS to a reachable interface; if your HTTPS host is located on the outside interface, you can only initiate a management connection directly to the outside interface.
- The device allows a maximum of 5 concurrent HTTPS connections.
- You need network objects that define the hosts or networks you will allow to make HTTPS connections to the device. Select **Objects > Object Management** to configure objects.

### Procedure

- Step 1** Select **Devices > Platform Settings** and create or edit the Firepower Threat Defense policy.
- Step 2** Select **HTTP**.
- Step 3** Enable the HTTPS server by clicking **Enable HTTP server**.
- Step 4** (Optional) Change the HTTPS port. The default is 443.
- Step 5** Identify the interfaces and IP addresses that allow HTTPS connections.

Use this table to limit which interfaces will accept HTTPS connections, and the IP addresses of the clients who are allowed to make those connections. You can use network addresses rather than individual IP addresses.

- a) Click **Add** to add a new rule, or click **Edit** to edit an existing rule.
- b) Configure the rule properties:
  - **IP Address**—The network object that identifies the hosts or networks you are allowing to make HTTPS connections. Choose an object from the drop-down menu, or add a new network object by clicking +.
  - **Security Zones**—Add the zones that contain the interfaces to which you will allow HTTPS connections. For interfaces not in a zone, you can type the interface name into the field below the Selected Security Zone list and click **Add**. These rules will be applied to a device only if the device includes the selected interfaces or zones.
- c) Click **OK**.

**Step 6** Click **Save**.

You can now click **Deploy** and deploy the policy to assigned devices. The changes are not active until you deploy them.

---

## Configure ICMP Access Rules

By default, you can send ICMP packets to any interface using either IPv4 or IPv6, with these exceptions:

- The FTD does not respond to ICMP echo requests directed to a broadcast address.
- The FTD only responds to ICMP traffic sent to the interface that traffic comes in on; you cannot send ICMP traffic through an interface to a far interface.

To protect the device from attacks, you can use ICMP rules to limit ICMP access to interfaces to particular hosts, networks, or ICMP types. ICMP rules function like access rules, where the rules are ordered, and the first rule that matches a packet defines the action.

If you configure any ICMP rule for an interface, an implicit deny ICMP rule is added to the end of the ICMP rule list, changing the default behavior. Thus, if you want to simply deny a few message types, you must include a permit any rule at the end of the ICMP rule list to allow the remaining message types.

We recommend that you always grant permission for the ICMP unreachable message type (type 3). Denying ICMP unreachable messages disables ICMP path MTU discovery, which can halt IPsec and PPTP traffic. Additionally ICMP packets in IPv6 are used in the IPv6 neighbor discovery process.

### Before you begin

Ensure that the objects needed in the rules already exist. Select **Objects > Object Management** to configure objects. You need network objects that define the desired hosts or networks, and port objects that define the ICMP message types you want to control.

## Procedure

---

- Step 1** Select **Devices > Platform Settings** and create or edit the Firepower Threat Defense policy.
- Step 2** Select **ICMP**.
- Step 3** Configure ICMP rules.
- Click **Add** to add a new rule, or click **Edit** to edit an existing rule.
  - Configure the rule properties:
    - Action**—Whether to permit (allow) or deny (drop) matching traffic.
    - ICMP Service**—The port object that identifies the ICMP message type.
    - Network**—The network object that identifies the hosts or networks whose access you are controlling.
    - Security Zones**—Add the zones that contain the interfaces that you are protecting. For interfaces not in a zone, you can type the interface name into the field below the Selected Security Zone list and click **Add**. These rules will be applied to a device only if the device includes the selected interfaces or zones.
  - Click **OK**.
- Step 4** (Optional.) Set rate limits on ICMPv4 Unreachable messages.
- Rate Limit**—Sets the rate limit of unreachable messages, between 1 and 100 messages per second. The default is 1 message per second.
  - Burst Size**—Sets the burst rate, between 1 and 10. The system sends this number of replies, but subsequent replies are not sent until the rate limit is reached.
- Step 5** Click **Save**.
- You can now click **Deploy** and deploy the policy to assigned devices. The changes are not active until you deploy them.
- 

# Configure Secure Shell

This section describes how to enable SSH connections to one or more *data* interfaces on the Firepower Threat Defense. SSH is not supported to the Diagnostic logical interface.

---

**Note** SSH is enabled by default on the Management interface; however, this screen does not affect Management SSH access.

---

The Management interface is separate from the other interfaces on the device. It is used to set up and register the device to the FMC. SSH for data interfaces shares the internal user list with SSH for the Management interface. Other settings are configured separately: for data interfaces, enable SSH and access lists using this screen; SSH traffic for data interfaces uses the regular routing configuration, and not any static routes configured at setup or at the CLI.

For the Management interface, to configure an SSH access list, see the **configure ssh-access-list** command in the [Firepower Threat Defense Command Reference](#). To configure a static route, see the **configure network static-routes** command. By default, you configure the default route through the Management interface at initial setup.

To use SSH, you do not also need an access rule allowing the host IP address. You only need to configure SSH access according to this section.

You can only SSH to a reachable interface; if your SSH host is located on the outside interface, you can only initiate a management connection directly to the outside interface.

The device allows a maximum of 5 concurrent SSH connections.

### Before you begin

- SSH local users can only be configured at the CLI using the **configure user add** command; see [Creating Local User Accounts for the FTD CLI, on page 67](#). By default, there is an **admin** user for which you configured the password during initial setup. AAA external authentication is not supported.
- You need network objects that define the hosts or networks you will allow to make SSH connections to the device. Select **Objects > Object Management** to configure objects.

---

**Note** You cannot use the system-provided **any** network object. Instead, use **any-ipv4** or **any-ipv6**.

---

### Procedure

**Step 1** Select **Devices > Platform Settings** and create or edit the Firepower Threat Defense policy.

**Step 2** Select **Secure Shell**.

**Step 3** Identify the interfaces and IP addresses that allow SSH connections.

Use this table to limit which interfaces will accept SSH connections, and the IP addresses of the clients who are allowed to make those connections. You can use network addresses rather than individual IP addresses.

- Click **Add** to add a new rule, or click **Edit** to edit an existing rule.
- Configure the rule properties:
  - **IP Address**—The network object that identifies the hosts or networks you are allowing to make SSH connections. Choose an object from the drop-down menu, or add a new network object by clicking **+**.
  - **Security Zones**—Add the zones that contain the interfaces to which you will allow SSH connections. For interfaces not in a zone, you can type the interface name into the field below the Selected Security Zone list and click **Add**. These rules will be applied to a device only if the device includes the selected interfaces or zones.
- Click **OK**.

**Step 4** Click **Save**.

You can now click **Deploy** and deploy the policy to assigned devices. The changes are not active until you deploy them.

---

## Configure SMTP

You must identify an SMTP server if you configure email alerts in the Syslog settings. The source email address you configure for Syslog must be a valid account on the SMTP servers.

### Before you begin

Ensure that the network objects that define the host address of the primary and secondary SMTP servers exist. Select **Objects > Object Management** to define the objects. Alternatively, you can create the objects while editing the policy.

### Procedure

---

- Step 1** Select **Devices > Platform Settings** and create or edit the Firepower Threat Defense policy.
- Step 2** Click **SMTP Server**.
- Step 3** Select the network objects that identify the **Primary Server IP Address** and optionally, the **Secondary Server IP Address**.
- Step 4** Click **Save**.

You can now click **Deploy** and deploy the policy to assigned devices. The changes are not active until you deploy them.

---

## Configure SNMP for Threat Defense

Simple Network Management Protocol (SNMP) defines a standard way for network management stations running on PCs or workstations to monitor the health and status of many types of devices, including switches, routers, and security appliances. You can use the SNMP page to configure a firewall device for monitoring by SNMP management stations.

The Simple Network Management Protocol (SNMP) enables monitoring of network devices from a central location. Cisco security appliances support network monitoring using SNMP versions 1, 2c, and 3, as well as traps and SNMP read access; SNMP write access is not supported.

SNMPv3 supports read-only users and encryption with DES, 3DES, AES256, AES192, and AES128.

---

**Note** To create an alert to an external SNMP server, access **Policies > Action > Alerts**

---

## Procedure

- 
- Step 1** Select **Devices > Platform Settings** and create or edit the Firepower Threat Defense policy.
- Step 2** Select **SNMP**.
- Step 3** Enable SNMP and configure basic options.
- **Enable SNMP Servers**—Whether to provide SNMP information to the configured SNMP hosts. You can deselect this option to disable SNMP monitoring while retaining the configuration information.
  - **Read Community String, Confirm**—Enter the password used by a SNMP management station when sending requests to the Firepower Threat Defense device. The SNMP community string is a shared secret among the SNMP management stations and the network nodes being managed. The security device uses the password to determine if the incoming SNMP request is valid. The password is a case-sensitive alphanumeric string of up to 32 characters; spaces and special characters are not permitted.
  - **System Administrator Name**—Enter the name of the device administrator or other contact person. This string is case-sensitive and can be up to 127 characters. Spaces are accepted, but multiple spaces are shortened to a single space.
  - **Location**—Enter the location of this security device (for example, Building 42, Sector 54). This string is case-sensitive and can be up to 127 characters. Spaces are accepted, but multiple spaces are shortened to a single space.
  - **Port**—Enter the UDP port on which incoming requests will be accepted. The default is 161.
- Step 4** (SNMPv3 only.) [Add SNMPv3 Users, on page 957](#).
- Step 5** [Add SNMP Hosts, on page 959](#).
- Step 6** [Configure SNMP Traps, on page 960](#).
- Step 7** Click **Save**.

You can now click **Deploy** and deploy the policy to assigned devices. The changes are not active until you deploy them.

---

## Add SNMPv3 Users

---

**Note** You create users for SNMPv3 only. These steps are not applicable for SNMPv1 or SNMPv2c.

---

Note that SNMPv3 only supports read-only users.

SNMP users have a specified username, an authentication password, an encryption password, and authentication and encryption algorithms to use. The authentication algorithm options are MD5 and SHA. The encryption algorithm options are DES, 3DES, AES256, AES192, and AES128.

---

**Note** When using SNMPv3 with clustering or High Availability, if you add a new cluster unit after the initial cluster formation or you replace a High Availability unit, then SNMPv3 users are not replicated to the new unit. You must remove the users, re-add them, and then redeploy your configuration to force the users to replicate to the new unit.

---

## Procedure

---

- Step 1** Select **Devices > Platform Settings** and create or edit the Firepower Threat Defense policy.
- Step 2** Click **SNMP > Users**.
- Step 3** Click **Add**.
- Step 4** Select the security level for the user from the **Security Level** drop-down list.
- **Auth**—Authentication but No Privacy, which means that messages are authenticated.
  - **No Auth**—No Authentication and No Privacy, which means that no security is applied to messages.
  - **Priv**—Authentication and Privacy, which means that messages are authenticated and encrypted.
- Step 5** Enter the name of the SNMP user in the **Username** field. Usernames must be 32 characters or less.
- Step 6** Select the type of password, you want to use in the **Encryption Password Type** drop-down list.
- **Clear text**—The Firepower Threat Defense device will still encrypt the password when deploying to the device.
  - **Encrypted**—The Firepower Threat Defense device will directly deploy the encrypted password.
- Step 7** In the **Auth Algorithm Type** drop-down list, select the type of authentication you want to use: MD5, SHA.
- Step 8** In the **Authentication Password** field, enter the password to use for authentication. If you selected Encrypted as the Encrypt Password Type, the password must be formatted as xx:xx:xx..., where xx are hexadecimal values.
- Note** The length of the password will depend on the authentication algorithm selected. For all passwords, the length must be 256 characters or less.
- If you selected Clear Text as the Encrypt Password Type, repeat the password in the **Confirm** field.
- Step 9** In the **Encryption Type** drop-down list, select the type of encryption you want to use: AES128, AES192, AES256, 3DES, or DES.
- Note** To use AES or 3DES encryption, you must have the appropriate license installed on the device.
- Step 10** Enter the password to use for encryption in the **Encryption Password** field. If you selected Encrypted as the Encrypt Password Type, the password must be formatted as xx:xx:xx..., where xx are hexadecimal values. For encrypted passwords, the length of the password depends on the encryption type selected. The password sizes are as follows (where each xx is one octal):
- AES 128 requires 16 octals
  - AES 192 requires 24 octals
  - AES 256 requires 32 octals
  - 3DES requires 32 octals
  - DES can be any size
- Note** For all passwords, the length must be 256 characters or less.
- If you selected Clear Text as the Encrypt Password Type, repeat the password in the **Confirm** field.

**Step 11** Click **OK**.

**Step 12** Click **Save**.

You can now click **Deploy** and deploy the policy to assigned devices. The changes are not active until you deploy them.

---

## Add SNMP Hosts

Use Host to add or edit entries in the SNMP Hosts table on the SNMP page. These entries represent SNMP management stations allowed to access the Firepower Threat Defense device.

### Before you begin

Ensure that the network objects that define the SNMP management stations exist. Select **Device > Object Management** to configure network objects.

---

**Note** Only IPv4 addresses are supported.

---

### Procedure

---

**Step 1** Select **Devices > Platform Settings** and create or edit the Firepower Threat Defense policy.

**Step 2** Click **SNMP > Hosts**.

**Step 3** Click **Add**.

**Step 4** In the **IP Address** field, either enter a valid IPv6 or IPv4 host or select the network object that defines the SNMP management station's host address.

**Step 5** Select the appropriate SNMP version from the **SNMP version** drop-down list.

**Step 6** (SNMPv3 only.) Select the username of the SNMP user that you configured from the **User Name** drop-down list.

**Note** You can associate up to 23 SNMP users per SNMP host.

**Step 7** (SNMPv1, 2c only.) In the **Read Community String** field, enter the community string that you have already configured, for read access to the device. Re-enter the string to confirm it.

**Note** This string is required, only if the string used with this SNMP station is different from the one already defined in the **Enable SNMP Server** section.

**Step 8** Select the type of communication between the device and the SNMP management station. You can select both types.

- **Poll**—The management station periodically requests information from the device.
- **Trap**—The device sends trap events to the management station as they occur.

**Step 9** In the **Port** field, enter a UDP port number for the SNMP host. The default value is 162. The valid range is 1 to 65535.

**Step 10** Click **Add** to enter or select the interface on which this SNMP management station contacts the device.

**Step 11** In the **Zones/Interfaces** list, add the zones that contain the interfaces through which the device communicates with the management station. For interfaces not in a zone, you can type the interface name into the field below the **Selected Zone/Interface** list and click **Add**. The host will be configured on a device only if the device includes the selected interfaces or zones.

**Step 12** Click **OK**.

**Step 13** Click **Save**.

You can now click **Deploy** and deploy the policy to assigned devices. The changes are not active until you deploy them.

## Configure SNMP Traps

Use SNMP Traps to configure SNMP traps (event notifications) for the Firepower Threat Defense device. Traps are different from browsing; they are unsolicited “comments” from the Firepower Threat Defense device to the management station for certain events, such as linkup, linkdown, and syslog event generated. An SNMP object ID (OID) for the device appears in SNMP event traps sent from the device.

Some traps are not applicable to certain hardware models. These traps will be ignored if you apply the policy to one of these models. For example, not all models have field-replaceable units, so the **Field Replaceable Unit Insert/Delete** trap will not be configured on those models.

SNMP traps are defined in either standard or enterprise-specific MIBs. Standard traps are created by the IETF and documented in various RFCs. SNMP traps are compiled into the Firepower Threat Defense software.

If needed, you can download RFCs, standard MIBs, and standard traps from the following location:

<http://www.ietf.org/>

Browse the complete list of Cisco MIBs, traps, and OIDs from the following location:

[SNMP Object Navigator](#)

In addition, download Cisco OIDs by FTP from the following location:

<ftp://ftp.cisco.com/pub/mibs/oid/oid.tar.gz>

### Procedure

**Step 1** Select **Devices > Platform Settings** and create or edit the Firepower Threat Defense policy.

**Step 2** Click **SNMP > SNMP Traps** to configure SNMP traps (event notifications) for the Firepower Threat Defense device.

**Step 3** Select the appropriate Enable Traps options. You can select either or both options.

- a) Check **Enable All SNMP Traps** to quickly select all traps in the subsequent four sections.
- b) Check **Enable All Syslog Traps** to enable transmission of trap-related syslog messages.

**Note** SNMP traps are of higher priority than other notification messages from the Firepower Threat Defense as they are expected to be near real-time. When you enable all SNMP or syslog traps, it is possible for the SNMP process to consume excess resources in the agent and in the network, causing the system to hang. If you notice system delays, unfinished requests, or timeouts, you can selectively enable SNMP and syslog traps. You can also limit the rate at which syslog messages are generated by severity level or message ID. For example, all syslog message IDs that begin with the digits 212 are associated with the SNMP class; see [Limit the Rate of Syslog Message Generation, on page 971](#).

- Step 4** The event-notification traps in the **Standard** section are enabled by default for an existing policy:
- **Authentication** – Unauthorized SNMP access. This authentication failure occurs for packets with an incorrect community string.
  - **Link Up** – One of the device’s communication links has become available (it has “come up”), as indicated in the notification.
  - **Link Down** – One of the device’s communication links has failed, as indicated in the notification.
  - **Cold Start** – The device is reinitializing itself such that its configuration or the protocol entity implementation may be altered.
  - **Warm Start** – The device is reinitializing itself such that its configuration and the protocol entity implementation is unaltered.
- Step 5** Select the desired event-notification traps in the **Entity MIB** section:
- **Field Replaceable Unit Insert** – A Field Replaceable Unit (FRU) has been inserted, as indicated. (FRUs include assemblies such as power supplies, fans, processor modules, interface modules, etc.)
  - **Field Replaceable Unit Delete** – A Field Replaceable Unit (FRU) has been removed, as indicated in the notification
  - **Configuration Change** – There has been a hardware change, as indicated in the notification
- Step 6** Select the desired event-notification traps in the **Resource** section:
- **Connection Limit Reached** – This trap indicates that a connection attempt was rejected because the configured connections limit has been reached.
- Step 7** Select the desired event-notification traps in the **Other** section:
- **NAT Packet Discard** – This notification is generated when IP packets are discarded by the NAT function. Available Network Address Translation addresses or ports have fallen below configured threshold.
- Step 8** Click **Save**.
- You can now click **Deploy** and deploy the policy to assigned devices. The changes are not active until you deploy them.
-

# About Configuring Syslog

You can enable system logging (syslog) for Firepower Threat Defense devices. Logging information can help you identify and isolate network or device configuration problems. The following topics explain logging and how to configure it.

## About Syslog

System logging is a method of collecting messages from devices to a server running a syslog daemon. Logging to a central syslog server helps in aggregation of logs and alerts. Cisco devices can send their log messages to a UNIX-style syslog service. A syslog service accepts messages and stores them in files, or prints them according to a simple configuration file. This form of logging provides protected long-term storage for logs. Logs are useful both in routine troubleshooting and in incident handling.

**Table 76: System Logs for Firepower Threat Defense**

| Logs Related To                                 | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Configure In             |
|-------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------|
| Device and system health, network configuration | This syslog configuration generates messages for features running on the data plane, that is, features that are defined in the CLI configuration that you can view with the <b>show running-config</b> command. This includes features such as routing, VPN, data interfaces, DHCP server, NAT, and so forth. Data plane syslog messages are numbered, and they are the same as those generated by devices running ASA software. However, Firepower Threat Defense does not necessarily generate every message type that is available for ASA Software. For information on these messages, see <i>Cisco Firepower Threat Defense Syslog Messages</i> at <a href="https://www.cisco.com/c/en/us/td/docs/security/firepower/Syslogs/b_ftd_syslog_guide.html">https://www.cisco.com/c/en/us/td/docs/security/firepower/Syslogs/b_ftd_syslog_guide.html</a> . This configuration is explained in the following topics. | <b>Platform Settings</b> |
| Policies, rules, and events                     | This syslog configuration generates alerts for access control rules, intrusion rules, and other advanced services as described in <a href="#">Configurations Supporting Alert Responses, on page 2076</a> . These messages are not numbered. For information on configuring this type of syslog, see <a href="#">Creating a Syslog Alert Response, on page 2078</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | <b>Alert Responses</b>   |

You can configure more than one syslog server, and control the messages and events sent to each server. You can also configure different destinations, such as console, email, internal buffer, and so forth.

## Severity Levels

The following table lists the syslog message severity levels.

**Table 77: Syslog Message Severity Levels**

| Level Number | Severity Level     | Description         |
|--------------|--------------------|---------------------|
| 0            | <b>emergencies</b> | System is unusable. |

| Level Number | Severity Level | Description                                                                                                                                                                              |
|--------------|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1            | alert          | Immediate action is needed.                                                                                                                                                              |
| 2            | critical       | Critical conditions.                                                                                                                                                                     |
| 3            | error          | Error conditions.                                                                                                                                                                        |
| 4            | warning        | Warning conditions.                                                                                                                                                                      |
| 5            | notification   | Normal but significant conditions.                                                                                                                                                       |
| 6            | informational  | Informational messages only.                                                                                                                                                             |
| 7            | debugging      | Debugging messages only.<br>Log at this level only temporarily, when debugging issues. This log level can potentially generate so many messages that system performance can be affected. |

**Note** ASA and FTD do not generate syslog messages with a severity level of zero (emergencies).

## Syslog Message Filtering

You can filter generated syslog messages so that only certain syslog messages are sent to a particular output destination. For example, you could configure the FTD device to send all syslog messages to one output destination and to send a subset of those syslog messages to a different output destination.

Specifically, you can direct syslog messages to an output destination according to the following criteria:

- Syslog message ID number
- Syslog message severity level
- Syslog message class (equivalent to a functional area)

You customize these criteria by creating a message list that you can specify when you set the output destination. Alternatively, you can configure the FTD device to send a particular message class to each type of output destination independently of the message list.

## Syslog Message Classes

You can use syslog message classes in two ways:

- Specify an output location for an entire category of syslog messages.
- Create a message list that specifies the message class.

The syslog message class provides a method of categorizing syslog messages by type, equivalent to a feature or function of the device. For example, the rip class denotes RIP routing.

All syslog messages in a particular class share the same initial three digits in their syslog message ID numbers. For example, all syslog message IDs that begin with the digits 611 are associated with the vpnc (VPN client) class. Syslog messages associated with the VPN client feature range from 611101 to 611323.

In addition, most of the ISAKMP syslog messages have a common set of prepended objects to help identify the tunnel. These objects precede the descriptive text of a syslog message when available. If the object is not known at the time that the syslog message is generated, the specific heading = value combination does not appear.

The objects are prefixed as follows:

Group = *groupname*, Username = *user*, IP = *IP\_address*

Where the group is the tunnel-group, the username is the username from the local database or AAA server, and the IP address is the public IP address of the remote access client or Layer 2 peer.

The following table lists the message classes and the range of message IDs in each class.

**Table 78: Syslog Message Classes and Associated Message ID Numbers**

| Class        | Definition                                   | Syslog Message ID Numbers              |
|--------------|----------------------------------------------|----------------------------------------|
| auth         | User Authentication                          | 109, 113                               |
| —            | Access Lists                                 | 106                                    |

## Guidelines for Logging

This section includes guidelines and limitations that you should review before configuring logging.

### IPv6 Guidelines

- IPv6 is supported. Syslogs can be sent using TCP or UDP.
- Ensure that the interface configured for sending syslogs is enabled, IPv6 capable, and the syslog server is reachable through the designated interface.
- Secure logging over IPv6 is not supported.

### Additional Guidelines

- The syslog server must run a server program called syslogd. Windows provides a syslog server as part of its operating system.
- To view logs generated by the FTD device, you must specify a logging output destination. If you enable logging without specifying a logging output destination, the FTD device generates messages but does not save them to a location from which you can view them. You must specify each different logging output destination separately.
- It is not possible to have two different lists or classes being assigned to different syslog servers or same locations.

- You can configure up to 16 syslog servers.
- The syslog server should be reachable through the FTD device. You should configure the device to deny ICMP unreachable messages on the interface through which the syslog server is reachable and to send syslogs to the same server. Make sure that you have enabled logging for all severity levels. To prevent the syslog server from crashing, suppress the generation of syslogs 313001, 313004, and 313005.
- The number of UDP connections for syslog is directly related to the number of CPUs on the hardware platform and the number of syslog servers you configure. At any point in time, there can be as many UDP syslog connections as there are CPUs times the number of configured syslog servers. This is the expected behavior. Note that the global UDP connection idle timeout applies to these sessions, and the default is 2 minutes. You can adjust that setting if you want to close these session more quickly, but the timeout applies to all UDP connections, not just syslog.
- When the FTD device sends syslogs via TCP, the connection takes about one minute to initiate after the syslogd service restarts.

## Configure Syslog Logging for FTD Devices

To configure syslog settings, perform the following steps:

### Before you begin

See requirements in [Guidelines for Logging, on page 966](#).

### Procedure

---

- Step 1** Select **Devices > Platform Settings** and create or edit the Firepower Threat Defense policy.
- Step 2** Click **Syslog** from the table of contents.
- Step 3** Click **Logging Setup** to enable logging, specify FTP Server settings, and specify Flash usage. For more information, see [Enable Logging and Configure Basic Settings, on page 968](#)
- Step 4** Click **Logging Destinations** to enable logging to specific destinations and to specify filtering on message severity level, event class, or on a custom event list. For more information, see [Enable Logging Destinations, on page 969](#)  
  
You must enable a logging destination to see messages at that destination.
- Step 5** Click **E-mail Setup** to specify the e-mail address that is used as the source address for syslog messages that are sent as e-mail messages. For more information, see [Send Syslog Messages to an E-mail Address, on page 970](#)
- Step 6** Click **Events List** to define a custom event list that includes an event class, a severity level, and an event ID. For more information, see [Create a Custom Event List, on page 970](#)
- Step 7** Click **Rate Limit** to specify the volume of messages being sent to all configured destinations and define the message severity level to which you want to assign rate limits. For more information, see [Limit the Rate of Syslog Message Generation, on page 971](#)
- Step 8** Click **Syslog Settings** to specify the logging facility, enable the inclusion of a time stamp, and enable other settings to set up a server as a syslog destination. For more information, see [Configure Syslog Settings, on page 972](#)

- Step 9** Click **Syslog Servers** to specify the IP address, protocol used, format, and security zone for the syslog server that is designated as a logging destination. For more information, see [Configure a Syslog Server, on page 973](#)

## Enable Logging and Configure Basic Settings

You must enable logging for the system to generate syslog messages for data plane events.

You can also set up archiving on flash or an FTP server as a storage location when the local buffer becomes full. You can manipulate logging data after it is saved. For example, you could specify actions to be executed when certain types of syslog messages are logged, extract data from the log and save the records to another file for reporting, or track statistics using a site-specific script.

The following procedure explains some of the basic syslog settings.

### Procedure

- Step 1** Select **Devices > Platform Settings** and create or edit the Firepower Threat Defense policy.
- Step 2** Select **Syslog > Logging Setup**.
- Step 3** Enable logging and configure basic logging settings.
- **Enable Logging**—Turns on data plane system logging for the Firepower Threat Defense device.
  - **Enable Logging on the Failover Standby Unit**—Turns on logging for the standby for the Firepower Threat Defense device, if available.
  - **Send syslogs in EMBLEM format**—Enables EMBLEM format logging for every logging destination. If you enable EMBLEM, you must use the UDP protocol to publish syslog messages; EMBLEM is not compatible with TCP.
- Note** Syslog messages in RFC5424 format, typically displays the priority value (PRI). However, in FMC, if you want to display the PRI value in the syslog messages of the managed FTD, ensure to enable the EMBLEM format. For more information on PRI, see [RFC5424](#).
- **Send debug messages as syslogs**—Redirects all the debug trace output to the syslog. The syslog message does not appear in the console if this option is enabled. Therefore, to see debug messages, you must enable logging at the console and configure it as the destination for the debug syslog message number and logging level. The syslog message number used is 71101. Default logging level for this syslog is debug.
  - **Memory Size of Internal Buffer**—Specify the size of the internal buffer to which syslog messages are saved if the logging buffer is enabled. When the buffer fills up, it is overwritten. The default is 4096 bytes. The range is 4096 to 52428800.
- Step 4** (Optional) Configure an FTP server if you want to save log buffer contents to the server before the buffer is overwritten. Specify the FTP Server information.
- **FTP Server Buffer Wrap**— To save the buffer contents to the FTP server before it is overwritten, check this box and enter the necessary destination information in the following fields. To remove the FTP configuration, deselect this option.
  - **IP Address**—Select the host network object that contains the IP address of the FTP server.
  - **User Name**—Enter the user name to use when connecting to the FTP server.
  - **Path**—Enter the path, relative to the FTP root, where the buffer contents should be saved.

- **Password/ Confirm**—Enter and confirm the password used to authenticate the user name to the FTP server.

**Step 5** (Optional) Specify Flash size if you want to save log buffer contents to flash before the buffer is overwritten.

- **Flash**—To save the buffer contents to the flash memory before it is overwritten, check this box.
- **Maximum flash to be used by logging (KB)**—Specify the maximum space to be used in the flash memory for logging(in KB). The range is 4-8044176 kilobytes.
- **Minimum free space to be preserved (KB)**—Specifies the minimum free space to be preserved in flash memory (in KB). The range is 0-8044176 kilobytes.

**Step 6** Click **Save**.

You can now click **Deploy** and deploy the policy to assigned devices. The changes are not active until you deploy them.

## Enable Logging Destinations

You must enable a logging destination to see messages at that destination. When enabling a destination, you must also specify the message filter for the destination.

### Procedure

**Step 1** Select **Devices > Platform Settings** and create or edit the Firepower Threat Defense policy.

**Step 2** Select **Syslog > Logging Destinations**.

**Step 3** Click **Add** to enable a destination and apply a logging filter, or edit an existing destination.

**Step 4** In the **Logging Destinations** dialog box, select a destination and configure the filter to use for a destination:

- Choose the destination you are enabling in the **Logging Destination** drop-down list. You can create one filter per destination: Console, E-Mail, Internal buffer, SNMP trap, SSH Sessions, and Syslog servers.

**Note** Console and SSH session logging works in the diagnostic CLI only. Enter **system support diagnostic-cli**.

- In **Event Class**, choose the filter that will apply to all classes not listed in the table.

You can configure these filters:

- **Filter on severity** —Select the severity level. Messages at this level or higher are sent to the destination
- **Use Event List** —Select the event list that defines the filter. You create these lists on the **Event Lists** page.
- **Disable Logging** —Prevents messages from being sent to this destination.

- If you want to create filters per event class, click **Add** to create a new filter, or edit an existing filter, and select the event class and severity level to limit messages in that class. Click **OK** to save the filter.

For an explanation of the event classes, see [Syslog Message Classes, on page 963](#).

- Click **OK**.

**Step 5** Click **Save**.

You can now click **Deploy** and deploy the policy to assigned devices. The changes are not active until you deploy them.

---

## Send Syslog Messages to an E-mail Address

You can set up a list of recipients for syslog messages to be sent as e-mails.

### Before you begin

- Configure an SMTP server on the SMTP Server platform settings page
- [Enable Logging and Configure Basic Settings, on page 968](#)
- [Enable Logging Destinations](#)

### Procedure

---

**Step 1** Select **Devices > Platform Settings** and create or edit the Firepower Threat Defense policy.

**Step 2** Select **Syslog > Email Setup**.

**Step 3** Specify the e-mail address that is used as the source address for syslog messages that are sent as e-mail messages.

**Step 4** Click **Add** to enter a new e-mail address recipient of the specified syslog messages.

**Step 5** Choose the severity level of the syslog messages that are sent to the recipient from the drop-down list.

The syslog message severity filter used for the destination e-mail address causes messages of the specified severity level and higher to be sent. For information on the levels, see [Severity Levels, on page 962](#).

**Step 6** Click **OK**.

**Step 7** Click **Save**.

You can now click **Deploy** and deploy the policy to assigned devices. The changes are not active until you deploy them.

---

## Create a Custom Event List

An event list is a custom filter you can apply to a logging destination to control which messages are sent to the destination. Normally, you filter messages for a destination based on severity only, but you can use an event list to fine-tune which messages are sent based on a combination of event class, severity, and message identifier (ID).

Creating a custom event list is a two-step process. You create a custom list in the **Event Lists**, and then use the event list to define the logging filter for the various types of destination, in the **Logging Destinations**.

## Procedure

---

- Step 1** Select **Devices > Platform Settings** and create or edit the Firepower Threat Defense policy.
- Step 2** Select **Syslog > Events List**.
- Step 3** Configure an event list.
- Click **Add** to add a new list, or edit an existing list.
  - Enter a name for the event list in the **Name** field. Spaces are not allowed.
  - To identify messages based on severity or event class, select the **Severity/Event Class** tab and add or edit entries.  
  
For information on the available classes see [Syslog Message Classes, on page 963](#).  
  
For information on the levels, see [Severity Levels, on page 962](#).  
  
Certain event classes are not applicable for the device in transparent mode. If such options are configured then they will be bypassed and not deployed.
  - To identify messages specifically by message ID, select the **Message ID** and add or edit the IDs.  
  
You can enter a range of IDs using a hyphen, for example, 100000-200000. IDs are six digits. For information on how the initial three digits map to features, see [Syslog Message Classes, on page 963](#).  
  
For specific message numbers, see [Cisco ASA Series Syslog Messages](#).
  - Click **OK** to save the event list.
- Step 4** Click **Logging Destinations** and add or edit the destination that should use the filter.  
  
See [Enable Logging Destinations, on page 969](#).
- Step 5** Click **Save**.  
  
You can now click **Deploy** and deploy the policy to assigned devices. The changes are not active until you deploy them.
- 

## Limit the Rate of Syslog Message Generation

You can limit the rate at which syslog messages are generated by severity level or message ID. You can specify individual limits for each logging level and each Syslog message ID. If the settings conflict, the Syslog message ID limits take precedence.

### Procedure

---

- Step 1** Select **Devices > Platform Settings** and create or edit the Firepower Threat Defense policy.
- Step 2** Select **Syslog > Rate Limit**.
- Step 3** To limit message generation by severity level, click **Logging Level > Add** and configure the following options:
- Logging Level**—The severity level you are rate limiting. For information on the levels, see [Severity Levels, on page 962](#).
  - Number of messages**—The maximum number of messages of the specified type allowed in the specified time period.

- **Interval**—The number of seconds before the rate limit counter resets.

**Step 4** Click **OK**.

**Step 5** To limit message generation by syslog message ID, click **Syslog Level > Add** and configure the following options:

- **Syslog ID**—The syslog message ID you are rate limiting. For specific message numbers, see [Cisco ASA Series Syslog Messages](#).
- **Number of messages**—The maximum number of messages of the specified type allowed in the specified time period.
- **Interval**—The number of seconds before the rate limit counter resets.

**Step 6** Click **OK**.

**Step 7** Click **Save**.

You can now click **Deploy** and deploy the policy to assigned devices. The changes are not active until you deploy them.

## Configure Syslog Settings

You can configure general syslog settings to set the facility code to be included in syslog messages that are sent to syslog servers, specify whether a timestamp is included in each message, specify the device ID to include in messages, view and modify the severity levels for messages, and disable the generation of specific messages.

### Procedure

**Step 1** Select **Devices > Platform Settings** and create or edit the Firepower Threat Defense policy.

**Step 2** Select **Syslog > Syslog Settings**.

**Step 3** Select a system log facility for syslog servers to use as a basis to file messages in the **Facility** drop-down list.

The default is LOCAL4(20), which is what most UNIX systems expect. However, because your network devices share available facilities, you might need to change this value for system logs.

**Step 4** Select the **Enable timestamp on each syslog message** check box to include the date and time a message was generated in the syslog message.

Timestamp timezone is always UTC.

**Step 5** If you want to add a device identifier to syslog messages (which is placed at the beginning of the message), check the **Enable Syslog Device ID** check box and then select the type of ID.

- **Interface**—To use the IP address of the selected interface, regardless of the interface through which the appliance sends the message. Select the security zone that identifies the interface. The zone must map to a single interface.
- **User Defined ID**—To use a text string (up to 16 characters) of your choice.
- **Host Name**—To use the hostname of the device.

**Step 6** Use the Syslog Message table to alter the default settings for specific syslog messages. You need to configure rules in this table only if you want to change the default settings. You can change the severity assigned to a message, or you can disable the generation of a message.

By default, Netflow is enabled and the entries are shown in the table.

a) To suppress syslog messages that are redundant because of Netflow, select **Netflow Equivalent Syslogs**.

This adds the messages to the table as suppressed messages.

**Note** If any of these syslog equivalents are already in the table, your existing rules are not overwritten.

b) To add a rule, click **Add**.

c) You select the message number whose configuration you want to change, from the **Syslog ID** drop down list and then select the new severity level from the **Logging Level** drop down list, or select **Suppressed** to disable the generation of the message. Typically, you would not change the severity level and disable the message, but you can make changes to both fields if desired.

d) Click **OK** to add the rule to the table.

**Step 7** Click **Save**.

You can now click **Deploy** and deploy the policy to assigned devices. The changes are not active until you deploy them.

---

#### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## Configure a Syslog Server

To configure a syslog server to handle messages generated from your system, perform the following steps.

#### Before you begin

- See requirements in [Guidelines for Logging, on page 966](#).
- Make sure your devices can reach your syslog collector on the network.

#### Procedure

---

**Step 1** Select **Devices > Platform Settings** and create or edit the Firepower Threat Defense policy.

**Step 2** Select **Syslog > Syslog Server**.

**Step 3** Check the **Allow user traffic to pass when TCP syslog server is down** check box, to allow traffic if any syslog server that is using the TCP protocol is down.

**Step 4** Enter a size of the queue for storing syslog messages on the security appliance when syslog server is busy in the **Message queue size (messages)** field. The minimum is 1 message. The default is 512. Specify 0 to allow an unlimited number of messages to be queued (subject to available block memory).

**Step 5** Click **Add** to add a new syslog server.

- a) In the **IP Address** drop-down list, select a network host object that contains the IP address of the syslog server.
- b) Choose the protocol (either TCP or UDP) and enter the port number for communications between the Firepower Threat Defense device and the syslog server.

UDP is faster and uses less resources on the device than TCP.

The default ports are 514 for UDP, 1470 for TCP. Valid non-default port values for either protocol are 1025 through 65535.

- c) Check the **Log messages in Cisco EMBLEM format (UDP only)** check box to specify whether to log messages in Cisco EMBLEM format (available only if UDP is selected as the protocol).

**Note** Syslog messages in RFC5424 format, typically displays the priority value (PRI). However, in FMC, only when you enable logging in Cisco EMBLEM format, the PRI value in the syslog messages of the managed FTD is displayed. For more information on PRI, see [RFC5424](#).

- d) Check the **Enable Secure Syslog** check box to encrypt the connection between the device and server using SSL/TLS over TCP.
- e) Add the zones that contain the interfaces used to communicate with the syslog server. For interfaces not in a zone, you can type the interface name into the field below the **Selected Zones/Interface** list and click **Add**. These rules will be applied to a device only if the device includes the selected interfaces or zones.

**Note** If the syslog server is on the network attached to the physical Management interface, you must type the name of that interface into the **Interface Name** field below the **Selected Security Zones** list and click **Add**. You must also configure this name (if not already configured), and an IP address, for the Diagnostic interface (edit the device from the Device Management page and select the Interfaces tab). For more information about the management/diagnostic interface, see [Diagnostic Interface, on page 609](#).

- f) Click **OK**.

### Step 6

Click **Save**.

You can now click **Deploy** and deploy the policy to assigned devices. The changes are not active until you deploy them.

---

### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## Configure Global Timeouts

You can set the global idle timeout durations for the connection and translation slots of various protocols. If the slot has not been used for the idle time specified, the resource is returned to the free pool.

You can also set a time out for console sessions with the device.

## Procedure

---

**Step 1** Select **Devices > Platform Settings** and create or edit the Firepower Threat Defense policy.

**Step 2** Select **Timeouts**.

**Step 3** Configure the timeouts you want to change.

For any given setting, select **Custom** to define your own value, **Default** to return to the system default value. In most cases, the maximum timeout is 1193 hours.

You can disable some timeouts by selecting **Disable**.

- **Console Timeout**—The idle time until a connection to the console is closed, range is 0 to 60 minutes. The default is 0, which means the session does not time out. If you change the value, existing console sessions use the old timeout value. The new value applies to new connections only.
- **Translation Slot (xlate)**—The idle time until a NAT translation slot is freed. This duration must be at least 1 minute. The default is 3 hours.
- **Connection (Conn)**—The idle time until a connection slot is freed. This duration must be at least 5 minutes. The default is 1 hour.
- **Half-Closed**—The idle time until a TCP half-closed connection closes. A connection is considered half-closed if both the FIN and FIN-ACK have been seen. If only the FIN has been seen, the regular connection timeout applies. The minimum is 30 seconds. The default is 10 minutes.
- **UDP**—The idle time until a UDP connection closes. This duration must be at least 1 minute. The default is 2 minutes.
- **ICMP**—The idle time after which general ICMP states are closed. The default (and minimum) is 2 seconds.
- **RPC/Sun RPC**—The idle time until a SunRPC slot is freed. This duration must be at least 1 minute. The default is 10 minutes.
- **H.225**—The idle time until an H.225 signaling connection closes. The default is 1 hour. To close a connection immediately after all calls are cleared, a timeout of 1 second (0:0:1) is recommended.
- **H.323**—The idle time after which H.245 (TCP) and H.323 (UDP) media connections close. The default (and minimum) is 5 minutes. Because the same connection flag is set on both H.245 and H.323 media connections, the H.245 (TCP) connection shares the idle timeout with the H.323 (RTP and RTCP) media connection.
- **SIP**—The idle time until a SIP signaling port connection closes. This duration must be at least 5 minutes. The default is 30 minutes.
- **SIP Media**—The idle time until a SIP media port connection closes. This duration must be at least 1 minute. The default is 2 minutes. The SIP media timer is used for SIP RTP/RTCP with SIP UDP media packets, instead of the UDP inactivity timeout.
- **SIP Disconnect**—The idle time after which SIP session is deleted if the 200 OK is not received for a CANCEL or a BYE message, between 0:0:1 and 0:10:0. The default is 2 minutes (0:2:0).
- **SIP Invite**—The idle time after which pinholes for PROVISIONAL responses and media xlates will be closed, between 0:1:0 and 00:30:0. The default is 3 minutes (0:3:0).

- **SIP Provisional Media**—The timeout value for SIP provisional media connections, between 1 and 30 minutes. The default is 2 minutes.
- **Floating Connection**—When multiple routes exist to a network with different metrics, the system uses the one with the best metric at the time of connection creation. If a better route becomes available, then this timeout lets connections be closed so a connection can be reestablished to use the better route. The default is 0 (the connection never times out). To make it possible to use better routes, set the timeout to a value between 0:0:30 and 1193:0:0.
- **Xlate PAT**—The idle time until a PAT translation slot is freed, between 0:0:30 and 0:5:0. The default is 30 seconds. You may want to increase the timeout if upstream routers reject new connections using a freed PAT port because the previous connection might still be open on the upstream device.
- **TCP Proxy Reassembly**—The idle timeout after which buffered packets waiting for reassembly are dropped, between 0:0:10 and 1193:0:0. The default is 1 minute (0:1:0).
- **ARP Timeout**—(Transparent mode only.) The number of seconds between ARP table rebuilds, from 60 to 4294967. The default is 14,400 seconds (4 hours).

**Step 4** Click **Save**.

You can now click **Deploy** and deploy the policy to assigned devices. The changes are not active until you deploy them.

## Configure NTP Time Synchronization for Threat Defense

Use a Network Time Protocol (NTP) server to synchronize the clock settings on your devices. We recommend you configure all Firepower Threat Defenses managed by an FMC to use the same NTP server as the FMC. The Firepower Threat Defense gets its time directly from the configured NTP server. If the Firepower Threat Defense's configured NTP servers are not reachable for any reason, it synchronizes its time with the FMC.

The device supports NTPv4.

**Note** If you are deploying Firepower Threat Defense on the Firepower 4100/9300 chassis, you must configure NTP on the Firepower 4100/9300 chassis so that Smart Licensing will work properly and to ensure proper timestamps on device registrations. You should use the same NTP server for the Firepower 4100/9300 chassis and the FMC.

### Before you begin

- If your organization has one or more NTP servers that your FTD can reach, use the same NTP server or servers for your devices that you have configured for Time Synchronization on the **System > Configuration** page on your FMC. Copy the specified value.
- If your device cannot reach an NTP server or your organization does not have one, you must use the **Via NTP from Defense Center** option as discussed in the following procedure.

## Procedure

- 
- Step 1** Select **Devices > Platform Settings** and create or edit the Firepower Threat Defense policy.
- Step 2** Select **Time Synchronization**.
- Step 3** Configure one of the following clock options:
- **Via NTP from Defense Center**—(Default). The managed device gets time from the NTP servers you configured for the FMC (except for authenticated NTP servers) and synchronizes time with those servers directly. However, if any of the following are true, the managed device synchronizes time from the FMC:
    - The FMC’s NTP servers are not reachable by the device.
    - The FMC has no unauthenticated servers.
  - **Via NTP from**—If your FMC is using NTP servers on the network, select this option and enter the fully-qualified DNS name (such as ntp.example.com), or IPv4 or IPv6 address, of the same NTP servers you specified in **System > Configuration > Time Synchronization**. If the NTP servers are not reachable, the FMC acts as an NTP server.
- Step 4** Click **Save**.
- 

## What to do next

- Make sure the policy is assigned to your devices. See [Setting Target Devices for a Platform Settings Policy, on page 929](#).
- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).
- If your system includes Classic devices, set up time synchronization for those devices. See [Synchronize Time on Classic Devices with an NTP Server, on page 939](#).

# History for Firepower Threat Defense Platform Settings

## PART **XIII**

# Network Address Translation (NAT)

- [NAT Policy Management, on page 981](#)
- [NAT for 7000 and 8000 Series Devices, on page 987](#)
- [Network Address Translation \(NAT\) for Firepower Threat Defense, on page 1005](#)

## CHAPTER 48

# NAT Policy Management

---

The following topics describe how to manage NAT policies for your Firepower System:

- [Requirements and Prerequisites for NAT Policies, on page 981](#)
- [Managing NAT Policies, on page 981](#)
- [Creating NAT Policies, on page 982](#)
- [Configuring NAT Policies, on page 983](#)
- [Configuring NAT Policy Targets, on page 984](#)
- [Copying NAT Policies, on page 985](#)

## Requirements and Prerequisites for NAT Policies

### Model Support

Any, but you must select the correct type of policy for the device model:

- **Firepower NAT** for 7000 & 8000 Series devices.
- **Threat Defense NAT** for FTD devices.

### Supported Domains

Any

### User Roles

Admin

Access Admin

Network Admin

## Managing NAT Policies

In a multidomain deployment, the system displays policies created in the current domain, which you can edit. It also displays policies created in ancestor domains, which you cannot edit. To view and edit policies created in a lower domain, switch to that domain.

Administrators in ancestor domains can target NAT policies to devices in descendant domains, which descendant domains can use or replace with customized local policies. If a NAT policy targets devices in different descendant domains, administrators in the descendant domains can view information about target devices belonging to their domain only.

### Procedure

---

**Step 1** Choose **Devices > NAT** .

**Step 2** Manage your NAT policies:

- Copy — Click **Copy** () next to the policy you want to copy; see [Copying NAT Policies, on page 985](#).
- Create — Click **New Policy**; see [Creating NAT Policies, on page 982](#).

- Delete — Click **Delete** () next to the policy you want to delete, then click **OK**. When prompted whether to continue, you are also informed if another user has unsaved changes in the policy.

**Caution** After you have deployed a NAT policy to a managed device, you cannot delete the policy from the device. Instead, you must deploy a NAT policy with no rules to remove the NAT rules already present on the managed device. You also cannot delete a policy that is the last deployed policy on any of its target devices, even if it is out of date. Before you can delete the policy completely, you must deploy a different policy to those targets.

- Deploy—Click **Deploy**; see [Deploy Configuration Changes, on page 346](#).
  - Edit — Click **Edit** () ; see [Configuring NAT Policies, on page 983](#).
  - Report—Click **Report** () ; see [Generating Current Policy Reports, on page 356](#).
- 

## Creating NAT Policies

When you create a new NAT policy you must, at minimum, give it a unique name. Although you are not required to identify policy targets at policy creation time, you must perform this step before you can deploy the policy. If you apply a NAT policy with no rules to a device, the system removes all NAT rules from that device.

In a multidomain deployment, the system displays policies created in the current domain, which you can edit. It also displays policies created in ancestor domains, which you cannot edit. To view and edit policies created in a lower domain, switch to that domain.

Administrators in ancestor domains can target NAT policies to devices in descendant domains, which descendant domains can use or replace with customized local policies. If a NAT policy targets devices in different descendant domains, administrators in the descendant domains can view information about target devices belonging to their domain only.

## Procedure

---

- Step 1** Choose **Devices > NAT**.
- Step 2** From the **New Policy** drop-down list, choose one of the following:
- **Firepower NAT** for 7000 & 8000 Series devices.
  - **Threat Defense NAT** for Firepower Threat Defense devices.
- Step 3** Enter a unique **Name**.
- In a multidomain deployment, policy names must be unique within the domain hierarchy. The system may identify a conflict with the name of a policy you cannot view in your current domain.
- Step 4** Optionally, enter a **Description**.
- Step 5** Choose the devices where you want to deploy the policy:
- Choose a device in the **Available Devices** list, and click **Add to Policy**.
  - Click and drag a device from the **Available Devices** list to the **Selected Devices** list.
  - Remove a device from the **Selected Devices** list by clicking **Delete** () next to the device.
- Step 6** Click **Save**.
- 

## What to do next

Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

# Configuring NAT Policies

In a multidomain deployment, the system displays policies created in the current domain, which you can edit. It also displays policies created in ancestor domains, which you cannot edit. To view and edit policies created in a lower domain, switch to that domain.

Administrators in ancestor domains can target NAT policies to devices in descendant domains, which descendant domains can use or replace with customized local policies. If a NAT policy targets devices in different descendant domains, administrators in the descendant domains can view information about target devices belonging to their domain only.

If you change the type of an interface to a type that is not valid for use with a NAT policy that targets a device with that interface, the policy labels the interface as deleted. Click **Save** in the NAT policy to automatically remove the interface from the policy.

---

**Note** Rule attributes differ by NAT policy type. When adding or editing rules, click ? in the dialog box for more information, or see the relevant chapter: [Network Address Translation \(NAT\) for Firepower Threat Defense, on page 1005](#) or [NAT for 7000 and 8000 Series Devices, on page 987](#).

---

## Procedure

---

**Step 1** Choose **Devices > NAT** .

**Step 2** Click **Edit** () next to the NAT policy you want to modify.

If **View** () appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

**Step 3** Configure your NAT policies:

- To modify the policy name or description, click the **Name** or **Description** field, delete any characters as needed, then enter the new name or description. In a multidomain deployment, policy names must be unique within the domain hierarchy. The system may identify a conflict with the name of a policy you cannot view in your current domain.
  - To manage policy targets, see [Configuring NAT Policy Targets, on page 984](#).
  - To save your policy changes, click **Save**.
  - To add a rule to a policy, click **Add Rule**.
  - To edit an existing rule, click **Edit** () next to the rule.
  - To delete a rule, click **Delete** () next to the rule, then click **OK**.
  - To enable or disable an existing rule, right-click a rule, choose **State**, and choose **Disable** or **Enable**.
  - (Firepower NAT only) To display the configuration page for a specific rule attribute, click the name or value in the column for the condition on the row for the rule. For example, click the name or value in the **Source Networks** column to display the Source Network page for the selected rule.
- 

### What to do next

Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## Configuring NAT Policy Targets

You can identify the managed devices you want to target with your policy while creating or editing a policy. You can search a list of available devices, 7000 or 8000 Series stacks, and high-availability pairs, and add them to a list of selected devices.

You cannot target stacked devices running different versions of the Firepower System (for example, if an upgrade on one of the devices fails).

In a multidomain deployment, the system displays policies created in the current domain, which you can edit. It also displays policies created in ancestor domains, which you cannot edit. To view and edit policies created in a lower domain, switch to that domain.

Administrators in ancestor domains can target NAT policies to devices in descendant domains, which descendant domains can use or replace with customized local policies. If a NAT policy targets devices in different descendant domains, administrators in the descendant domains can view information about target devices belonging to their domain only.

### Procedure

---

- Step 1** Choose **Devices > NAT** .
- Step 2** Click **Edit** () next to the NAT policy you want to modify.
- If **View** () appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.
- Step 3** Click **Policy Assignments**.
- Step 4** Do any of the following:
- To assign a device, stack, high-availability pair, or device group to the policy, select it in the **Available Devices** list and click **Add to Policy**. You can also drag and drop.
  - To remove a device assignment, click **Delete** () next to a device, stack, high-availability pair, or device group in the **Selected Devices** list.
- Step 5** Click **OK**.
- 

### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## Copying NAT Policies

You can make a copy of a NAT policy. The copy includes all policy rules and configurations.

In a multidomain deployment, you can copy policies from current and ancestor domains.

### Procedure

---

- Step 1** Choose **Devices > NAT** .
- Step 2** Click **Copy** () next to the NAT policy you want to copy.
- Step 3** Enter a unique **Name** for the policy.
- In a multidomain deployment, policy names must be unique within the domain hierarchy. The system may identify a conflict with the name of a policy you cannot view in your current domain.
- Step 4** Click **OK**.
-

## CHAPTER 49

# NAT for 7000 and 8000 Series Devices

The following topics describe how to configure NAT for 7000 and 8000 Series devices:

- [NAT Policy Configuration, on page 987](#)
- [Rule Organization in a NAT Policy, on page 988](#)
- [Organizing NAT Rules, on page 989](#)
- [NAT Policy Rules Options, on page 990](#)

## NAT Policy Configuration

You can configure NAT policies in different ways to manage specific network needs. You can:

- *Expose an internal server to an external network.*

In this configuration, you define a static translation from an external IP address to an internal IP address so the system can access an internal server from outside the network. Traffic sent to the server targets the external IP address or IP address and port, and is translated into the internal IP address or IP address and port. Return traffic from the server is translated back to the external address.

- *Allow an internal host/server to connect to an external application.*

In this configuration, you define a static translation from an internal address to an external address. This definition allows the internal host or server to initiate a connection to an external application that is expecting the internal host or server to have a specific IP address and port. Therefore, the system cannot dynamically allocate the address of the internal host or server.

- *Hide private network addresses from an external network.*

You can obscure your internal network addresses using either of the following configurations:

- If you have a sufficient number of external IP addresses to satisfy your internal network needs, you can use a block of IP addresses. In this configuration, you create a dynamic translation that automatically converts the source IP address of any outgoing traffic to an unused IP address from your externally facing IP addresses.
- If you have an insufficient number of external IP addresses to satisfy your internal network needs, you can use a limited block of IP addresses and port translation. In this configuration, you create a dynamic translation that automatically converts the source IP address and port of outgoing traffic to an unused IP address and port from your externally facing IP addresses.

---

**Caution** In 7000 or 8000 Series device high-availability pairs, only select an individual peer interface for a static NAT rule on a paired device if all networks affected by the NAT translations are private. Do **not** use configurations for static NAT rules affecting traffic between public and private networks.

---

## NAT Policies Configuration Guidelines

To configure a NAT policy, you must give the policy a unique name and identify the devices, or *targets*, where you want to deploy the policy. You can also add, edit, delete, enable, and disable NAT rules. After you create or modify a NAT policy, you can deploy the policy to all or some targeted devices.

You can deploy NAT policies to a 7000 or 8000 Series device high-availability pair, including paired stacks, as you would a standalone device. However, you can define static NAT rules for interfaces on individual paired devices or the entire high-availability pair and use the interfaces in source zones. For dynamic rules, you can use only the interfaces on the whole high-availability pair in source or destination zones.

---

**Caution** In 7000 or 8000 Series device high-availability pairs, only select an individual peer interface for a static NAT rule on a paired device if all networks affected by the NAT translations are private. Do **not** use this configuration for static NAT rules affecting traffic between public and private networks.

---

If you configure dynamic NAT on a device high-availability pair without HA link interfaces established, both paired devices independently allocate dynamic NAT entries, and the system cannot synchronize the entries between devices.

You can deploy NAT policies to a device stack as you would a standalone device. If you establish a device stack from devices that were included in a NAT policy and had rules associated with interfaces from the secondary device that was a member of the stack, the interfaces from the secondary device remain in the NAT policy. You can save and deploy policies with the interfaces, but the rules do not provide any translation.

In a multidomain deployment, the system displays policies created in the current domain, which you can edit. It also displays policies created in ancestor domains, which you cannot edit. To view and edit policies created in a lower domain, switch to that domain. Administrators in ancestor domains can target NAT policies to devices in descendant domains, which descendant domains can use or replace with customized local policies.

## Rule Organization in a NAT Policy

The Edit page for the NAT policy lists static NAT rules and dynamic NAT rules separately. The system sorts static rules alphabetically by name, and you cannot change the display order. You cannot create static rules with identical matching values. The system inspects static translations for a match before it inspects any dynamic translations.

Dynamic rules are processed in numerical order. The numeric position of each dynamic rule appears on the left side of the page next to the rule. You can move or insert dynamic rules and otherwise change the rule order. For example, if you move dynamic rule 10 under dynamic rule 3, rule 10 becomes rule 4 and all subsequent numbers increment accordingly.

A dynamic rule's position is important because the system compares packets to dynamic rules in the rules' numeric order on the policy Edit page. When a packet meets all the conditions of a dynamic rule, the system applies the conditions of that rule to the packet and ignores all subsequent rules for that packet.

You can specify a dynamic rule's numeric position when you add or edit a dynamic rule. You can also highlight a dynamic rule before adding a new dynamic rule to insert the new rule below the rule you highlighted.

You can select one or more dynamic rules by clicking a blank space in the row for the rule. You can drag and drop selected dynamic rules into a new location, thereby changing the position of the rules you moved and all subsequent rules.

You can cut or copy selected rules and paste them above or below an existing rule. You can only paste static rules in the Static Translations list and only dynamic rules in the Dynamic Translations list. You can also delete selected rules and insert new rules into any location in the list of existing rules.

You can display explanatory warnings to identify rules that will never match because they are preempted by preceding rules.

If you have access control policies in your deployment, the system does not translate traffic until it has passed through access control.

## Organizing NAT Rules

| Smart License | Classic License | Supported Devices  | Supported Domains | Access              |
|---------------|-----------------|--------------------|-------------------|---------------------|
| N/A           | Control         | 7000 & 8000 Series | Any               | Admin/Network Admin |

### Procedure

**Step 1** Choose **Devices > NAT** .

**Step 2** Click the edit icon () next to the NAT policy you want to modify.

If **View** () appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

**Step 3** Organize your NAT rules:

- To choose a rule, click a blank area in the row for a rule.
- To clear rule selections, click the reload icon () on the lower right side of the page. To clear individual rules, click a blank area in a rule's row while holding the Ctrl key.
- To cut or copy selected rules, right-click a blank area in the row for a selected rule, then select **Cut** or **Copy**.
- To paste rules you have cut or copied into the rule list, right-click a blank area in the row for a rule where you want to paste selected rules, then select **Paste above** or **Paste below**.
- To move selected rules, drag and drop selected rules beneath a new location, indicated by a horizontal blue line that appears above your pointer as you drag.
- To delete a rule, click the delete icon () next to the rule, then click **OK**.
- To show warnings, click **Show Warnings**.

## NAT Rule Warnings and Errors

The conditions of a NAT rule may preempt a subsequent rule from matching traffic. Any type of rule condition can preempt a subsequent rule.

A rule also preempts an identical subsequent rule where all configured conditions are the same. A subsequent rule would not be preempted if any condition were different.

If you create a rule that causes the NAT policy to fail upon deploy, an error icon () appears next to the rule. An error occurs if there is a conflict in the static rules, or if you edit a network object used in the policy that now makes the policy invalid. For example, an error occurs if you change a network object to use only IPv6 addresses and the rule that uses that object no longer has any valid networks where at least one network is required. Error icons appear automatically; you do not have to click **Show Warnings**.

### Showing and Hiding NAT Rule Warnings

| Smart License | Classic License | Supported Devices  | Supported Domains | Access              |
|---------------|-----------------|--------------------|-------------------|---------------------|
| N/A           | Control         | 7000 & 8000 Series | Any               | Admin/Network Admin |

#### Procedure

- 
- Step 1** Choose **Devices > NAT** .
- Step 2** Click the edit icon () next to the NAT policy you want to modify.
- If **View** () appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.
- Step 3** To show warnings, click **Show Warnings**.
- The page updates with a warning icon () next to each preempted rule.
- Step 4** To display the warning for a rule, hover your pointer over the warning icon () next to a rule. A message indicates which rule preempts the rule.
- Step 5** To clear warnings, click **Hide Warnings**.
- The page refreshes and the warnings disappear.
- 

## NAT Policy Rules Options

A NAT rule is simply a set of configurations and conditions that:

- qualifies network traffic
- specifies how the traffic that matches those qualifications is translated

You create and edit NAT rules from within an existing NAT policy. Each rule belongs to only one policy.

The web interface for adding or editing a rule is similar. You specify the rule name, state, type, and position (if dynamic) at the top of the page. You build conditions using the tabs on the left side of the page; each condition type has its own tab.

The following list summarizes the configurable components of a NAT rule.

### Name

Give each rule a unique name. For static NAT rules, use a maximum of 22 characters. For dynamic NAT rules, use a maximum of 30 characters. You can use printable characters, including spaces and special characters, with the exception of the colon (:).

### Rule State

By default, rules are enabled. If you disable a rule, the system does not use it to evaluate network traffic for translation. When viewing the list of rules in a NAT policy, disabled rules are grayed out, although you can still modify them.

### Type

A rule's type determines how the system handles traffic that matches the rule's conditions. When you create and edit NAT rules, the configurable components vary according to rule type.

### Position (Dynamic Rules Only)

Dynamic rules in a NAT policy are numbered, starting at 1. The system matches traffic to NAT rules in top-down order by ascending rule number.

When you add a rule to a policy, you specify its position by placing it **above** or **below** a specific rule, using rule numbers as a reference point. When editing an existing rule, you can **Move** the rule in a similar fashion.

### Conditions

Rule conditions identify the specific traffic you want to translate. Conditions can match traffic by any combination of multiple attributes, including security zone, network, and transport protocol port.

### Related Topics

[Creating and Editing NAT Rules](#), on page 991

## Creating and Editing NAT Rules

| Smart License | Classic License | Supported Devices  | Supported Domains | Access              |
|---------------|-----------------|--------------------|-------------------|---------------------|
| N/A           | Control         | 7000 & 8000 Series | Any               | Admin/Network Admin |

In a multidomain deployment, the system displays policies and rules created in the current domain, which you can edit. It also displays policies and rules created in ancestor domains, which you cannot edit. To view and edit rules created in a lower domain, switch to that domain.

## Procedure

---

**Step 1** Choose **Devices > NAT** .

**Step 2** Click the edit icon (✎) next to the NAT policy where you want to add a rule.

If **View** (👁) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

**Step 3** Add a new rule or edit an existing rule:

- To add a new rule, click **Add Rule**.
- To edit an existing rule, click the edit icon (✎) next to the rule you want to edit.

**Step 4** Enter a unique rule **Name**.

**Step 5** Configure the following rule components:

- Specify whether the rule is **Enabled**.
- Specify a rule **Type**.
- Specify the rule position (dynamic rules only).
- Configure the rule's conditions.

**Note** Static rules must include an original destination network. Dynamic rules must include a translated source network.

**Step 6** Click **Add**.

**Step 7** Click **Save**.

---

## What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## NAT Rule Types

Every NAT rule has an associated type that:

- qualifies network traffic
- specifies how the traffic that matches those qualifications is translated

The following list summarizes the NAT rule types.

### Static

Static rules provide one-to-one translations on destination networks and optionally port and protocol. When configuring static translations, you can configure source zones, destination networks, and destination ports. You cannot configure destination zones or source networks.

You **must** specify an original destination network. For destination networks, you can only select network objects and groups containing a single IP address or enter literal IP addresses that represent a single IP address. You can only specify a single original destination network and a single translated destination network.

**Note** The system builds a separate network map for each leaf domain. In a multidomain deployment, using literal IP addresses to constrain this configuration can have unexpected results. Using override-enabled objects allows descendant domain administrators to tailor Global configurations to their local environments.

You can specify a single original destination port and a single translated destination port. You must specify an original destination network before you can specify an original destination port. In addition, you cannot specify a translated destination port unless you also specify an original destination port, and the translated value must match the protocol of the original value.

**Caution** For static NAT rules on a 7000 or 8000 Series device in a high-availability pair, only select an individual peer interface if all networks affected by the NAT translations are private. Do **not** use this configuration for static NAT rules affecting traffic between public and private networks.

### Dynamic IP Only

Dynamic IP Only rules translate many-to-many source networks, but maintain port and protocol. When configuring dynamic IP only translations, you can configure zones, source networks, original destination networks, and original destination ports. You cannot configure translated destination networks or translated destination ports.

You **must** specify at least one translated source network. If the number of translated source network values is less than the number of original source networks, the system displays a warning on the rule that it is possible to run out of translated addresses before all original addresses are matched.

If there are multiple rules with conditions that match the same packet, the low priority rules become dead, meaning they can never be triggered. The system also displays warnings for dead rules. You can view tooltips to determine which rule supersedes the dead rule.

**Note** You can save and deploy policies with dead rules, but the rules cannot provide any translation.

In some instances, you may want to create rules with limited scope preceding rules with a broader scope. For example:

```
Rule 1: Match on address A and port A/Translate to address B
Rule 2: Match on address A/Translate to Address C
```

In this example, rule 1 matches some packets that also match rule 2. Therefore, rule 2 is not completely dead.

If you specify only original destination ports, you cannot specify translated destination ports.

### Dynamic IP + Port

Dynamic IP and port rules translate many-to-one or many-to-many source networks and port and protocol. When configuring dynamic IP and port translations, you can configure zones, source networks, original

destination networks, and original destination ports. You cannot configure translated destination networks or translated destination ports.

You **must** specify at least one translated source network. If there are multiple rules with conditions that match the same packet, the low priority rules become dead, meaning they can never be triggered. The system also displays warnings for dead rules. You can view tool tips to determine which rule supersedes the dead rule.

**Note** You can save and deploy policies with dead rules, but the rules cannot provide any translation.

If you specify only original destination ports, you cannot specify translated destination ports.

**Note** If you create a dynamic IP and port rule, and the system passes traffic that does not use a port, no translation occurs for the traffic. For example, a ping (ICMP) from an IP address that matches the source network does not map, because ICMP does not use a port.

## NAT Rule Condition Types

The following table summarizes the NAT rule condition types that can be configured based on the specified NAT rule type:

**Table 79: Available NAT Rule Condition Types per NAT Rule Type**

| Condition                       | Static                                                                                      | Dynamic (IP Only or IP + Port) |
|---------------------------------|---------------------------------------------------------------------------------------------|--------------------------------|
| Source Zones                    | Optional                                                                                    | Optional                       |
| Destination Zones               | Not allowed                                                                                 | Optional                       |
| Original Source Networks        | Not allowed                                                                                 | Optional                       |
| Translated Source Networks      | Not allowed                                                                                 | <b>Required</b>                |
| Original Destination Networks   | <b>Required</b>                                                                             | Optional                       |
| Translated Destination Networks | Optional; single address only                                                               | Not allowed                    |
| Original Destination Ports      | Optional; single port only, and only allowed if you define the original destination network | Optional                       |
| Translated Destination Ports    | Optional; single port only, and only allowed if you define the original destination port    | Not allowed                    |

## NAT Rule Conditions and Condition Mechanics

You can add conditions to NAT rules to identify the type of traffic that matches the rule. For each condition type, you select conditions you want to add to a rule from a list of available conditions. When applicable, condition filters allow you to constrain available conditions. Lists of available and selected conditions may

be as short as a single condition or many pages long. You can search available conditions and display only those matching a typed name or value in a list that updates as you type.

Depending on the type of condition, lists of available conditions may be comprised of a combination of conditions provided directly by Cisco or configured using other Firepower System features, including objects created using the object manager (**Objects > Object Management**), objects created directly from individual conditions pages, and literal conditions.

## NAT Rule Conditions

You can set a NAT rule to match traffic meeting any of the conditions described in the following table:

*Table 80: NAT Rule Condition Types*

| Condition         | Description                                                                                                                                                                                                                                  |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Zones             | A configuration of one or more routed interfaces where you can deploy NAT policies. Zones provide a mechanism for classifying traffic on source and destination interfaces, and you can add source and destination zone conditions to rules. |
| Networks          | Any combination of individual IP addresses, CIDR blocks, and prefix lengths, either specified explicitly or using network objects and groups. You can add source and destination network conditions to NAT rules.                            |
| Destination Ports | Transport protocol ports, including individual and group port objects you create based on transport protocols.                                                                                                                               |

## Adding Conditions to NAT Rules

| Smart License | Classic License | Supported Devices  | Supported Domains | Access              |
|---------------|-----------------|--------------------|-------------------|---------------------|
| N/A           | Control         | 7000 & 8000 Series | Any               | Admin/Network Admin |

Adding conditions to NAT rules is essentially the same for each type of condition. You choose from a list of available conditions on the left, and add the conditions you chose to one or two lists of selected conditions on the right.

For all condition types, you choose one or more individual available conditions by clicking on them to highlight them. You can either click a button between the two types of lists to add available conditions that you choose to your lists of selected conditions, or drag and drop available conditions that you choose into the list of selected conditions.

You can add up to 50 conditions of each type to a list of selected conditions. For example, you can add up to 50 source zone conditions, up to 50 destination zone conditions, up to 50 source network conditions, and so on, until you reach the upper limit for the appliance.

## Procedure

---

**Step 1** Choose **Devices > NAT** .

**Step 2** Click the edit icon () next to the NAT policy you want to modify.

If **View** () appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

**Step 3** Click **Add Rule**.

**Step 4** Enter a **Name** for the rule.

**Step 5** Specify a **Type** for the rule.

**Step 6** Click the tab for the type of condition you want to add to the rule.

**Step 7** Take any of the following actions:

- To choose available conditions to add to a list of selected conditions, click the available condition.
- To choose all listed available conditions, right-click the row for any available condition, then click **Select All**.
- To choose a list of available conditions or filters, click inside the **Search** field and enter a search string. The list updates as you type to display matching items.

You can search on object names and on the values configured for objects. For example, if you have an individual network object named `Texas Office` with the configured value `192.168.3.0/24`, and the object is included in the group object `US Offices`, you can display both objects by entering a partial or complete search string such as `Tex`, or by entering a value such as `3`.

- To clear a search when searching available conditions or filters, click the reload icon () above the Search field or the clear icon () in the Search field.
- To add selected zone conditions from a list of available conditions to a list of selected source or destination conditions, click **Add to Source** or **Add to Destination**.
- To add selected network and port conditions from a list of available conditions to a list of selected original or translated conditions, click **Add to Original** or **Add to Translated**.
- To drag and drop selected available conditions into a list of selected conditions, click a selected condition, then drag and drop into the list of selected conditions.
- To add a literal condition to a list of selected conditions using a literal field, click to remove the prompt from the literal field, enter the literal condition, and click **Add**. Network conditions provide a field for adding literal conditions.
- To add a literal condition to a list of selected conditions using a drop-down list, choose a condition from the drop-down list, then click **Add**. Port conditions provide a drop-down list for adding literal conditions.
- To add an individual object or condition filter so you can then choose it from the list of available conditions, click the add icon () .
- To delete a single condition from a list of selected conditions, click the delete icon () next to the condition.
- To delete a condition from a list of selected conditions, right-click to highlight the row for a selected condition, then click **Delete**.

**Step 8** Click **Add** to save your configuration.

---

## Literal Conditions in NAT Rules

You can add a literal value to the list of original and translated conditions for the following condition types:

- Networks
- Ports

For network conditions, you type the literal value in a configuration field below the list of original or translated conditions.

In the case of port conditions, you choose a protocol from a drop-down list. When the protocol is `ALL`, or `TCP` or `UDP`, you enter a port number in a configuration field.

Each relevant conditions page provides the controls needed to add literal values. Values you enter in a configuration field appear as red text if the value is invalid, or until it is recognized as valid. Values change to blue text as you type when they are recognized as valid. A grayed **Add** button activates when a valid value is recognized. Literal values you add appear immediately in the list of selected conditions.

---

**Note** The system builds a separate network map for each leaf domain. In a multidomain deployment, using literal IP addresses to constrain this configuration can have unexpected results. Using override-enabled objects allows descendant domain administrators to tailor Global configurations to their local environments.

---

## Objects in NAT Rule Conditions

Objects that you create in the object manager (**Objects > Object Management**) are immediately available for you to select from relevant lists of available NAT rule conditions.

You can also create objects on-the-fly from the NAT policy. A control on relevant conditions pages provides access to the same configuration controls that you use in the object manager.

Individual objects created on-the-fly appear immediately in the list of available objects. You can add them to the current rule, and to other existing and future rules. On the relevant conditions page, and also on the policy Edit page, you can hover your pointer over an individual object to display the contents of the object, and over a group object to display the number of individual objects in the group.

## Zone Conditions in NAT Rules

The security zones on your system are comprised of interfaces on your managed devices. Zones that you add to a NAT rule target the rule to devices on your network that have routed or hybrid interfaces in those zones. You can only add security zones with routed or hybrid interfaces as conditions for NAT rules.

You can add either zones or standalone interfaces that are currently assigned to a virtual router to NAT rules.

If there are devices with un-deployed device configurations, the Zones page displays a warning icon (⚠) at the top of the available zones list, indicating that only deployed zones and interfaces are displayed. You can click the arrow icon (▾) next to a zone to collapse or expand the zone to hide or view its interfaces.

If an interface is on a 7000 or 8000 Series device in a high-availability pair, the available zones list displays an additional branch from that interface with the other interfaces in the high-availability pair as children of

the primary interface on the active device in the high-availability pair. You can also click the arrow icon (  ) to collapse or expand the paired device interfaces to hide or view its interfaces.

**Note** You can save and deploy policies with disabled interfaces, but the rules cannot provide any translation until the interfaces are enabled.

The two lists on the right are the source and destination zones used for matching purposes by the NAT rules. If the rule already has values configured, these lists display the existing values when you edit the rule. If the source zones list is empty, the rule matches traffic *from* any zone or interface. If the destination zones list is empty, the rule matches traffic *to* any zone or interface.

The system displays warnings for rules with zone combinations that never trigger on a targeted device.

**Note** You can save and deploy policies with these zone combinations, but the rules will not provide any translation.

You can add individual interfaces by selecting an item in a zone or by selecting a standalone interface. You can only add interfaces in a zone if the zone it is assigned to has not already been added to a source zones or destination zones list. These individually selected interfaces are not affected by changes to zones, even if you remove them and add them to a different zone. If an interface is the primary member of a high-availability pair and you are configuring a dynamic rule, you can add only the primary interface to the source zones or destination zones list. For static rules, you can add individual high-availability pair member interfaces to the source zones list. You can only add a primary high-availability pair interface to a list if none of its children have been added, and you can only add individual high-availability pair interfaces if the primary has not been added.

If you add a zone, the rule uses all interfaces associated with the zone. If you add or remove an interface from the zone, the rule will not use the updated version of the zone until the device configuration has been re-deployed to the devices where the interfaces reside.

**Note** In a static NAT rule, you can add only source zones. In a dynamic NAT rule, you can add both source and destination zones.

## Adding Zone Conditions to NAT Rules

| Smart License | Classic License | Supported Devices  | Supported Domains | Access              |
|---------------|-----------------|--------------------|-------------------|---------------------|
| N/A           | Control         | 7000 & 8000 Series | Any               | Admin/Network Admin |

### Procedure

- Step 1** Choose **Devices > NAT** .
- Step 2** Click the edit icon (  ) next to the NAT policy you want to modify.

If **View** () appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

**Step 3** Click **Add Rule**.

**Step 4** Enter a **Name** for the rule.

**Step 5** Specify a **Type** for the rule.

**Step 6** Click the **Zones** tab.

**Step 7** Click a zone or interface in the **Available Zones** list.

**Step 8** You have the following choices:

- To match traffic by source zone, click **Add to Source**.
- To match traffic by destination zone, click **Add to Destination**.

**Note** You can add only source zones to static NAT rules. Additionally, while you can add disabled interfaces to a NAT rule, the rule does not provide any translation.

**Step 9** Click **Add** to save the new rule.

**Step 10** Click **Save** to save the changed policy.

---

### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## Source Network Conditions in Dynamic NAT Rules

You configure the matching values and translation values of the source IP address for packets. If the original source network is not configured, then any source IP address matches the dynamic NAT rule. Note that you cannot configure source networks for static NAT rules. If a packet matches the NAT rule, the system uses the values in the translated source network to assign the new value for the source IP address. For dynamic rules, you must configure a translated source network with at least one value.

---

**Caution** If a network object or object group is being used by a NAT rule, and you change or delete the object or group, it can cause the rule to become invalid.

---

You can add any of the following kinds of source network conditions to a dynamic NAT rule:

- individual and group network objects that you have created using the object manager
- individual network objects that you add from the Source Network conditions page, and can then add to your rule and to other existing and future rules
- literal, single IP addresses, ranges, or address blocks

**Note** The system builds a separate network map for each leaf domain. In a multidomain deployment, using literal IP addresses to constrain this configuration can have unexpected results. Using override-enabled objects allows descendant domain administrators to tailor Global configurations to their local environments.

## Adding Network Conditions to a Dynamic NAT Rule

| Smart License | Classic License | Supported Devices  | Supported Domains | Access              |
|---------------|-----------------|--------------------|-------------------|---------------------|
| N/A           | Control         | 7000 & 8000 Series | Any               | Admin/Network Admin |

When you update the network conditions in a dynamic rule in use in a deployed policy, the system drops any network sessions using the existing translated address pool.

### Procedure

- 
- Step 1** Choose **Devices > NAT** .
- Step 2** Click the edit icon () next to the NAT policy you want to modify.
- If **View** () appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.
- Step 3** Click **Add Rule**.
- Step 4** Enter a **Name** for the rule.
- Step 5** Specify a dynamic **Type** for the rule:
- **Dynamic IP Only**
  - **Dynamic IP + Port**
- Step 6** Click the **Source Networks** tab.
- Step 7** Optionally, add an individual network object to the **Available Networks** list by clicking the add icon () above the list.
- You can add multiple IP addresses, CIDR blocks, and prefix lengths to each network object.
- Step 8** Click a condition in the **Available Networks** list.
- Step 9** You have the following choices:
- To match traffic by original source network, click **Add to Original**.
  - To specify the translation value for traffic that matches the translated source network, click **Add to Translated**.
- Step 10** To add a literal IP address, range, or address block:
- a) Click the **Enter an IP address** prompt below the **Original Source Network** or **Translated Source Network** list.
  - b) Enter an IP address, range, or address block.

You add ranges in the following format: lower IP address-upper IP address. For example:  
179.13.1.1-179.13.1.10.

**Note** The system builds a separate network map for each leaf domain. In a multidomain deployment, using literal IP addresses to constrain this configuration can have unexpected results. Using override-enabled objects allows descendant domain administrators to tailor Global configurations to their local environments.

c) Click **Add** next to the value you entered.

**Step 11** Click **Add** to save the rule.

**Step 12** Click **Save** to save the changed policy.

---

### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## Destination Network Conditions in NAT Rules

You configure the matching values and translation values of the destination IP address for packets. Note that you cannot configure translated destination networks for dynamic NAT rules.

Because static NAT rules are one-to-one translations, the **Available Networks** list contains only network objects and groups that contain only a single IP address. For static translations, you can add only a single object or literal value to both the **Original Destination Network** or **Translated Destination Network** lists.

---

**Caution** If a network object or object group is being used by a NAT rule, and you change or delete the object or group, it can cause the rule to become invalid.

---

You can add any of the following kinds of destination network conditions to a NAT rule:

- individual and group network objects that you have created using the object manager
- individual network objects that you add from the Destination Network conditions page, and can then add to your rule and to other existing and future rules
- literal, single IP addresses, range, or address blocks

For static NAT rules, you can add only a CIDR with subnet mask /32, and only if there is not already a value in the list.

---

**Note** The system builds a separate network map for each leaf domain. In a multidomain deployment, using literal IP addresses to constrain this configuration can have unexpected results. Using override-enabled objects allows descendant domain administrators to tailor Global configurations to their local environments.

---

## Adding Destination Network Conditions to NAT Rules

| Smart License | Classic License | Supported Devices  | Supported Domains | Access              |
|---------------|-----------------|--------------------|-------------------|---------------------|
| N/A           | Control         | 7000 & 8000 Series | Any               | Admin/Network Admin |

When you update the network conditions in a dynamic rule in use in a deployed policy, the system drops any network sessions using the existing translated address pool.

### Procedure

- 
- Step 1** Choose **Devices > NAT** .
- Step 2** Click the edit icon (✎) next to the NAT policy you want to modify.
- If **View** (👁) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.
- Step 3** Click **Add Rule**.
- Step 4** Enter a **Name** for the rule.
- Step 5** Specify a **Type** for the rule.
- Step 6** Click the **Destination Network** tab.
- Step 7** Optionally, add an individual network object to the **Available Networks** list by clicking the add icon (+) above the list.
- For dynamic rules, you can add multiple IP addresses, CIDR blocks, and prefix lengths to each network object. For static rules, you can add only a single IP address.
- Step 8** Click a condition or object in the **Available Networks** list.
- Step 9** You have the following choices:
- To match traffic by original destination network, click **Add to Original**.
  - To specify the translation value for traffic that matches the translated destination network, click **Add to Translated**.
- Step 10** Optionally, click the **Enter an IP address** prompt below the **Original Destination Network** or **Translated Destination Network** list, enter an IP address or address block, and click **Add**.
- Step 11** Click **Add**.
- Step 12** Click **Save** to save the changes to the policy.
- 

### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## Port Conditions in NAT Rules

You can add a port condition to a rule to match network traffic based on the original and translated destination port and transport protocol for translation. If the original port is not configured, any destination port matches the rule. If a packet matches the NAT rule and a translated destination port is configured, the system translates the port into that value. Note that for dynamic rules, you can specify only the original destination port. For static rules, you can define a translated destination port, but only with an object with the same protocol as the original destination port object or literal value.

The system matches the destination port against the value of the port object or literal port in the original destination port list for static rules, or multiple values for dynamic rules.

Because static NAT rules are one-to-one translations, the **Available Ports** list contains only port objects and groups that contain only a single port. For static translations, you can add only a single object or literal value to both the **Original Port** or **Translated Port** lists.

For dynamic rules, you can add a range of ports. For example, when specifying the original destination port, you can add 1000-1100 as a literal value.

**Caution** If a port object or object group is being used by a NAT rule, and you change or delete the object or group, it can cause the rule to become invalid.

You can add any of the following kinds of port conditions to a NAT rule:

- individual and group port objects that you have created using the object manager
- individual port objects that you add from the Destination Ports conditions page, and can then add to your rule and to other existing and future rules
- literal port values, consisting of a TCP, UDP, or All (TCP and UDP) transport protocol and a port

## Adding Port Conditions to NAT Rules

| Smart License | Classic License | Supported Devices  | Supported Domains | Access              |
|---------------|-----------------|--------------------|-------------------|---------------------|
| N/A           | Control         | 7000 & 8000 Series | Any               | Admin/Network Admin |

### Procedure

**Step 1** Choose **Devices > NAT** .

**Step 2** Click the edit icon (✎) next to the NAT policy you want to modify.

If **View** (👁) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

**Step 3** Click **Add Rule**.

**Step 4** Enter a **Name** for the rule.

**Step 5** Specify a **Type** for the rule.

- Step 6** Click the **Destination Port** tab.
- Step 7** Optionally, add an individual port object to the **Available Ports** list by clicking the add icon (+) above the list.
- You can identify a single port or a port range in each port object that you add. You can then choose objects you added as conditions for your rule. For static rules, you can use only port objects with single ports.
- Step 8** Click a condition in the **Available Ports** list.
- Step 9** You have the following choices:
- Click **Add to Original**.
  - Click **Add to Translated**.
  - Drag and drop available ports into a list.
- Step 10** To add a literal port:
- a) Choose an entry from the **Protocol** drop-down list beneath the **Original Port** or **Translated Port** lists.
  - b) Enter a port.
  - c) Click **Add**.
- For dynamic rules, you can specify a single port or a range.
- Step 11** Click **Add**.
- Step 12** Click **Save** to save the changes to the policy.
- 

**What to do next**

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## CHAPTER 50

# Network Address Translation (NAT) for Firepower Threat Defense

---

The following topics explain Network Address Translation (NAT) and how to configure it on Firepower Threat Defense devices.

- [Why Use NAT?, on page 1005](#)
- [NAT Basics, on page 1006](#)
- [Guidelines for NAT, on page 1014](#)
- [Configure NAT for Threat Defense, on page 1019](#)
- [Translating IPv6 Networks, on page 1053](#)
- [Monitoring NAT, on page 1063](#)
- [Examples for NAT, on page 1063](#)
- [History for FTD NAT, on page 1101](#)

## Why Use NAT?

Each computer and device within an IP network is assigned a unique IP address that identifies the host. Because of a shortage of public IPv4 addresses, most of these IP addresses are private, not routable anywhere outside of the private company network. RFC 1918 defines the private IP addresses you can use internally that should not be advertised:

- 10.0.0.0 through 10.255.255.255
- 172.16.0.0 through 172.31.255.255
- 192.168.0.0 through 192.168.255.255

One of the main functions of NAT is to enable private IP networks to connect to the Internet. NAT replaces a private IP address with a public IP address, translating the private addresses in the internal private network into legal, routable addresses that can be used on the public Internet. In this way, NAT conserves public addresses because it can be configured to advertise at a minimum only one public address for the entire network to the outside world.

Other functions of NAT include:

- Security—Keeping internal IP addresses hidden discourages direct attacks.
- IP routing solutions—Overlapping IP addresses are not a problem when you use NAT.

- Flexibility—You can change internal IP addressing schemes without affecting the public addresses available externally; for example, for a server accessible to the Internet, you can maintain a fixed IP address for Internet use, but internally, you can change the server address.
- Translating between IPv4 and IPv6 (Routed mode only) —If you want to connect an IPv6 network to an IPv4 network, NAT lets you translate between the two types of addresses.

---

**Note** NAT is not required. If you do not configure NAT for a given set of traffic, that traffic will not be translated, but will have all of the security policies applied as normal.

---

## NAT Basics

The following topics explain some of the basics of NAT.

## NAT Terminology

This document uses the following terminology:

- Real address/host/network/interface—The real address is the address that is defined on the host, before it is translated. In a typical NAT scenario where you want to translate the inside network when it accesses the outside, the inside network would be the “real” network. Note that you can translate any network connected to the device, not just an inside network. Therefore if you configure NAT to translate outside addresses, “real” can refer to the outside network when it accesses the inside network.
- Mapped address/host/network/interface—The mapped address is the address that the real address is translated to. In a typical NAT scenario where you want to translate the inside network when it accesses the outside, the outside network would be the “mapped” network.

---

**Note** During address translation, IP addresses configured for the device interfaces are not translated.

---

- Bidirectional initiation—Static NAT allows connections to be initiated *bidirectionally*, meaning both to the host and from the host.
- Source and destination NAT—For any given packet, both the source and destination IP addresses are compared to the NAT rules, and one or both can be translated/untranslated. For static NAT, the rule is bidirectional, so be aware that “source” and “destination” are used in commands and descriptions throughout this guide even though a given connection might originate at the “destination” address.

## NAT Types

You can implement NAT using the following methods:

- Dynamic NAT—A group of real IP addresses are mapped to a (usually smaller) group of mapped IP addresses, on a first come, first served basis. Only the real host can initiate traffic. See [Dynamic NAT, on page 1023](#).
- Dynamic Port Address Translation (PAT)—A group of real IP addresses are mapped to a single IP address using a unique source port of that IP address. See [Dynamic PAT, on page 1028](#).
- Static NAT—A consistent mapping between a real and mapped IP address. Allows bidirectional traffic initiation. See [Static NAT, on page 1035](#).
- Identity NAT—A real address is statically translated to itself, essentially bypassing NAT. You might want to configure NAT this way when you want to translate a large group of addresses, but then want to exempt a smaller subset of addresses. See [Identity NAT, on page 1043](#).

## NAT in Routed and Transparent Mode

You can configure NAT in both routed and transparent firewall mode. You cannot configure NAT for interfaces operating in inline, inline tap, or passive modes. The following sections describe typical usage for each firewall mode.

### NAT in Routed Mode

The following figure shows a typical NAT example in routed mode, with a private network on the inside.

**Figure 32: NAT Example: Routed Mode**

1. When the inside host at 10.1.2.27 sends a packet to a web server, the real source address of the packet, 10.1.2.27, is translated to a mapped address, 209.165.201.10.
2. When the server responds, it sends the response to the mapped address, 209.165.201.10, and the FTD device receives the packet because the FTD device performs proxy ARP to claim the packet.

- The FTD device then changes the translation of the mapped address, 209.165.201.10, back to the real address, 10.1.1.27, before sending it to the host.

## NAT in Transparent Mode or Within a Bridge Group

Using NAT in transparent mode eliminates the need for the upstream or downstream routers to perform NAT for their networks. It can perform a similar function within a bridge group in routed mode.

NAT in transparent mode, or in routed mode between members of the same bridge group, has the following requirements and limitations:

- You cannot configure interface PAT when the mapped address is a bridge group member interface, because there is no IP address attached to the interface.
- ARP inspection is not supported. Moreover, if for some reason a host on one side of the FTD sends an ARP request to a host on the other side of the FTD, and the initiating host real address is mapped to a different address on the same subnet, then the real address remains visible in the ARP request.
- Translating between IPv4 and IPv6 networks is not supported. Translating between two IPv6 networks, or between two IPv4 networks is supported.

The following figure shows a typical NAT scenario in transparent mode, with the same network on the inside and outside interfaces. The transparent firewall in this scenario is performing the NAT service so that the upstream router does not have to perform NAT.

**Figure 33: NAT Example: Transparent Mode**

- When the inside host at 10.1.1.75 sends a packet to a web server, the real source address of the packet, 10.1.1.75, is changed to a mapped address, 209.165.201.15.

2. When the server responds, it sends the response to the mapped address, 209.165.201.15, and the FTD receives the packet because the upstream router includes this mapped network in a static route directed to the FTD management IP address.
3. The FTD then undoes the translation of the mapped address, 209.165.201.15, back to the real address, 10.1.1.1.75. Because the real address is directly-connected, the FTD sends it directly to the host.
4. For host 192.168.1.2, the same process occurs, except for returning traffic, the FTD looks up the route in its routing table and sends the packet to the downstream router at 10.1.1.3 based on the FTD static route for 192.168.1.0/24.

## Auto NAT and Manual NAT

You can implement address translation in two ways: *auto NAT* and *manual NAT*.

We recommend using auto NAT unless you need the extra features that manual NAT provides. It is easier to configure auto NAT, and it might be more reliable for applications such as Voice over IP (VoIP). (For VoIP, you might see a failure in the translation of indirect addresses that do not belong to either of the objects used in the rule.)

### Auto NAT

All NAT rules that are configured as a parameter of a network object are considered to be *auto NAT* rules. This is a quick and easy way to configure NAT for a network object. You cannot create these rules for a group object, however.

Although these rules are configured as part of the object itself, you cannot see the NAT configuration in the object definition through the object manager.

When a packet enters an interface, both the source and destination IP addresses are checked against the auto NAT rules. The source and destination address in the packet can be translated by separate rules if separate matches are made. These rules are not tied to each other; different combinations of rules can be used depending on the traffic.

Because the rules are never paired, you cannot specify that sourceA/destinationA should have a different translation than sourceA/destinationB. Use manual NAT for that kind of functionality, where you can identify the source and destination address in a single rule.

### Manual NAT

Manual NAT lets you identify both the source and destination address in a single rule. Specifying both the source and destination addresses lets you specify that sourceA/destinationA can have a different translation than sourceA/destinationB.

---

**Note** For static NAT, the rule is bidirectional, so be aware that “source” and “destination” are used in commands and descriptions throughout this guide even though a given connection might originate at the “destination” address. For example, if you configure static NAT with port address translation, and specify the source address as a Telnet server, and you want all traffic going to that Telnet server to have the port translated from 2323 to 23, then you must specify the *source* ports to be translated (real: 23, mapped: 2323). You specify the source ports because you specified the Telnet server address as the source address.

---

The destination address is optional. If you specify the destination address, you can either map it to itself (identity NAT), or you can map it to a different address. The destination mapping is always a static mapping.

## Comparing Auto NAT and Manual NAT

The main differences between these two NAT types are:

- How you define the real address.
  - Auto NAT—The NAT rule becomes a parameter for a network object. The network object IP address serves as the original (real) address.
  - Manual NAT—You identify a network object or network object group for both the real and mapped addresses. In this case, NAT is not a parameter of the network object; the network object or group is a parameter of the NAT configuration. The ability to use a network object *group* for the real address means that manual NAT is more scalable.
- How source and destination NAT is implemented.
  - Auto NAT— Each rule can apply to either the source or destination of a packet. So two rules might be used, one for the source IP address, and one for the destination IP address. These two rules cannot be tied together to enforce a specific translation for a source/destination combination.
  - Manual NAT—A single rule translates both the source and destination. A packet matches one rule only, and further rules are not checked. Even if you do not configure the optional destination address, a matching packet still matches one manual NAT rule only. The source and destination are tied together, so you can enforce different translations depending on the source/destination combination. For example, sourceA/destinationA can have a different translation than sourceA/destinationB.
- Order of NAT Rules.
  - Auto NAT—Automatically ordered in the NAT table.
  - Manual NAT—Manually ordered in the NAT table (before or after auto NAT rules).

## NAT Rule Order

Auto NAT and manual NAT rules are stored in a single table that is divided into three sections. Section 1 rules are applied first, then section 2, and finally section 3, until a match is found. For example, if a match is found in section 1, sections 2 and 3 are not evaluated. The following table shows the order of rules within each section.

Table 81: NAT Rule Table

| Table Section | Rule Type  | Order of Rules within the Section                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Section 1     | Manual NAT | <p>Applied on a first match basis, in the order they appear in the configuration. Because the first match is applied, you must ensure that specific rules come before more general rules, or the specific rules might not be applied as desired. By default, manual NAT rules are added to section 1.</p> <p>By "specific rules first," we mean:</p> <ul style="list-style-type: none"> <li>• Static rules should come before dynamic rules.</li> <li>• Rules that include destination translation should come before rules with source translation only.</li> </ul> <p>If you cannot eliminate overlapping rules, where more than one rule might apply based on the source or destination address, be especially careful to follow these recommendations.</p>                                                               |
| Section 2     | Auto NAT   | <p>If a match in section 1 is not found, section 2 rules are applied in the following order:</p> <ol style="list-style-type: none"> <li>1. Static rules.</li> <li>2. Dynamic rules.</li> </ol> <p><b>Within each rule type, the following ordering guidelines are used:</b></p> <ol style="list-style-type: none"> <li>1. Quantity of real IP addresses—From smallest to largest. For example, an object with one address will be assessed before an object with 10 addresses.</li> <li>2. For quantities that are the same, then the IP address number is used, from lowest to highest. For example, 10.1.1.0 is assessed before 11.1.1.0.</li> <li>3. If the same IP address is used, then the name of the network object is used, in alphabetical order. For example, abracadabra is assessed before catwoman.</li> </ol> |
| Section 3     | Manual NAT | <p>If a match is still not found, section 3 rules are applied on a first match basis, in the order they appear in the configuration. This section should contain your most general rules. You must also ensure that any specific rules in this section come before general rules that would otherwise apply.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

For section 2 rules, for example, you have the following IP addresses defined within network objects:

- 192.168.1.0/24 (static)
- 192.168.1.0/24 (dynamic)
- 10.1.1.0/24 (static)

- 192.168.1.1/32 (static)
- 172.16.1.0/24 (dynamic) (object def)
- 172.16.1.0/24 (dynamic) (object abc)

The resultant ordering would be:

- 192.168.1.1/32 (static)
- 10.1.1.0/24 (static)
- 192.168.1.0/24 (static)
- 172.16.1.0/24 (dynamic) (object abc)
- 172.16.1.0/24 (dynamic) (object def)
- 192.168.1.0/24 (dynamic)

## NAT Interfaces

Except for bridge group member interfaces, you can configure a NAT rule to apply to any interface (in other words, all interfaces), or you can identify specific real and mapped interfaces. You can also specify any interface for the real address, and a specific interface for the mapped address, or vice versa.

For example, you might want to specify any interface for the real address and specify the outside interface for the mapped address if you use the same private addresses on multiple interfaces, and you want to translate them all to the same global pool when accessing the outside.

**Figure 34: Specifying Any Interface**

However, the concept of “any” interface does not apply to bridge group member interfaces. When you specify “any” interface, all bridge group member interfaces are excluded. Thus, to apply NAT to bridge group members, you must specify the member interface. This could result in many similar rules where only one interface is different. You cannot configure NAT for the Bridge Virtual Interface (BVI) itself, you can configure NAT for member interfaces only.

**Note** You cannot configure NAT for interfaces operating in inline, inline tap, or passive modes. When specifying interfaces, you do so indirectly by selecting the interface object that contains the interface.

## Configuring Routing for NAT

The Firepower Threat Defense device needs to be the destination for any packets sent to the translated (mapped) address.

When sending packets, the device uses the destination interface if you specify one, or a routing table lookup if you do not, to determine the egress interface. For identity NAT, you have the option to use a route lookup even if you specify a destination interface.

The type of routing configuration needed depends on the type of mapped address, as explained in the following topics.

### Addresses on the Same Network as the Mapped Interface

If you use addresses on the same network as the destination (mapped) interface, the FTD device uses proxy ARP to answer any ARP requests for the mapped addresses, thus intercepting traffic destined for a mapped address. This solution simplifies routing because the FTD device does not have to be the gateway for any additional networks. This solution is ideal if the outside network contains an adequate number of free addresses, a consideration if you are using a 1:1 translation like dynamic NAT or static NAT. Dynamic PAT greatly extends the number of translations you can use with a small number of addresses, so even if the available addresses on the outside network is small, this method can be used. For PAT, you can even use the IP address of the mapped interface.

---

**Note** If you configure the mapped interface to be any interface, and you specify a mapped address on the same network as one of the mapped interfaces, then if an ARP request for that mapped address comes in on a *different* interface, then you need to manually configure an ARP entry for that network on the ingress interface, specifying its MAC address. Typically, if you specify any interface for the mapped interface, then you use a unique network for the mapped addresses, so this situation would not occur. Configure the ARP table in the ingress interface's **Advanced** settings.

---

### Addresses on a Unique Network

If you need more addresses than are available on the destination (mapped) interface network, you can identify addresses on a different subnet. The upstream router needs a static route for the mapped addresses that points to the FTD device.

Alternatively for routed mode, you can configure a static route on the FTD device for the mapped addresses using any IP address on the destination network as the gateway, and then redistribute the route using your routing protocol. For example, if you use NAT for the inside network (10.1.1.0/24) and use the mapped IP address 209.165.201.5, then you can configure a static route for 209.165.201.5 255.255.255.255 (host address) to the 10.1.1.99 gateway that can be redistributed.

For transparent mode, if the real host is directly-connected, configure the static route on the upstream router to point to the FTD device: specify the bridge group IP address. For remote hosts in transparent mode, in the static route on the upstream router, you can alternatively specify the downstream router IP address.

### The Same Address as the Real Address (Identity NAT)

The default behavior for identity NAT has proxy ARP enabled, matching other static NAT rules. You can disable proxy ARP if desired. You can also disable proxy ARP for regular static NAT if desired, in which case you need to be sure to have proper routes on the upstream router.

Normally for identity NAT, proxy ARP is not required, and in some cases can cause connectivity issues. For example, if you configure a broad identity NAT rule for “any” IP address, then leaving proxy ARP enabled can cause problems for hosts on the network directly connected to the mapped interface. In this case, when a host on the mapped network wants to communicate with another host on the same network, then the address in the ARP request matches the NAT rule (which matches “any” address). The FTD device will then proxy ARP for the address, even though the packet is not actually destined for the FTD device. (Note that this problem occurs even if you have a manual NAT rule; although the NAT rule must match both the source and destination addresses, the proxy ARP decision is made only on the “source” address). If the FTD device ARP response is received before the actual host ARP response, then traffic will be mistakenly sent to the FTD device.

## Guidelines for NAT

The following topics provide detailed guidelines for implementing NAT.

### Firewall Mode Guidelines for NAT

NAT is supported in routed and transparent firewall mode.

However, configuring NAT on bridge group member interfaces (interfaces that are part of a Bridge Group Virtual Interface, or BVI) has the following restrictions:

- When configuring NAT for the members of a bridge group, you specify the member interface. You cannot configure NAT for the bridge group interface (BVI) itself.
- When doing NAT between bridge group member interfaces, you must specify the real and mapped addresses. You cannot specify “any” as the interface.
- You cannot configure interface PAT when the mapped address is a bridge group member interface, because there is no IP address attached to the interface.
- You cannot translate between IPv4 and IPv6 networks (NAT64/46) when the source and destination interfaces are members of the same bridge group. Static NAT/PAT 44/66, dynamic NAT44/66, and dynamic PAT44 are the only allowed methods; dynamic PAT66 is not supported. However, you can do NAT64/46 between members of different bridge groups, or between a bridge group member (source) and standard routed interface (destination).

---

**Note** You cannot configure NAT for interfaces operating in inline, inline tap, or passive modes.

---

### IPv6 NAT Guidelines

NAT supports IPv6 with the following guidelines and restrictions.

- For standard routed mode interfaces, you can also translate between IPv4 and IPv6.
- You cannot translate between IPv4 and IPv6 for interfaces that are members of the same bridge group. You can translate between two IPv6 or two IPv4 networks only. This restriction does not apply when the interfaces are members of different bridge groups, or between a bridge group member and a standard routed interface.

- You cannot use dynamic PAT for IPv6 (NAT66) when translating between interfaces in the same bridge group. This restriction does not apply when the interfaces are members of different bridge groups, or between a bridge group member and a standard routed interface.
- For static NAT, you can specify an IPv6 subnet up to /64. Larger subnets are not supported.
- When using FTP with NAT46, when an IPv4 FTP client connects to an IPv6 FTP server, the client must use either the extended passive mode (EPSV) or extended port mode (EPRT); PASV and PORT commands are not supported with IPv6.

## IPv6 NAT Best Practices

You can use NAT to translate between IPv6 networks, and also to translate between IPv4 and IPv6 networks (routed mode only). We recommend the following best practices:

- NAT66 (IPv6-to-IPv6)—We recommend using static NAT. Although you can use dynamic NAT or PAT, IPv6 addresses are in such large supply, you do not have to use dynamic NAT. If you do not want to allow returning traffic, you can make the static NAT rule unidirectional (manual NAT only).
- NAT46 (IPv4-to-IPv6)—We recommend using static NAT. Because the IPv6 address space is so much larger than the IPv4 address space, you can easily accommodate a static translation. If you do not want to allow returning traffic, you can make the static NAT rule unidirectional (manual NAT only). When translating to an IPv6 subnet (/96 or lower), the resulting mapped address is by default an IPv4-embedded IPv6 address, where the 32-bits of the IPv4 address is embedded after the IPv6 prefix. For example, if the IPv6 prefix is a /96 prefix, then the IPv4 address is appended in the last 32-bits of the address. For example, if you map 192.168.1.0/24 to 201b::0/96, then 192.168.1.4 will be mapped to 201b::0.192.168.1.4 (shown with mixed notation). If the prefix is smaller, such as /64, then the IPv4 address is appended after the prefix, and a suffix of 0s is appended after the IPv4 address. You can also optionally translate the addresses net-to-net, where the first IPv4 address maps to the first IPv6 address, the second to the second, and so on.
- NAT64 (IPv6-to-IPv4)—You may not have enough IPv4 addresses to accommodate the number of IPv6 addresses. We recommend using a dynamic PAT pool to provide a large number of IPv4 translations.

## NAT Support for Inspected Protocols

Some application layer protocols that open secondary connections, or that embedded IP addresses in packets, are inspected to provide the following services:

- Pinhole creation—Some application protocols open secondary TCP or UDP connections either on standard or negotiated ports. Inspection opens pinholes for these secondary ports so that you do not need to create access control rules to allow them.
- NAT rewrite—Protocols such as FTP embed IP addresses and ports for the secondary connections in packet data as part of the protocol. If there is NAT translation involved for either of the endpoints, the inspection engines rewrite the packet data to reflect the NAT translation of the embedded addresses and ports. The secondary connections would not work without NAT rewrite.
- Protocol enforcement—Some inspections enforce some degree of conformance to the RFCs for the inspected protocol.

The following table lists the inspected protocols that apply NAT rewrite and their NAT limitations. Keep these limitations in mind when writing NAT rules that include these protocols. Inspected protocols not listed here do not apply NAT rewrite. These inspections include GTP, HTTP, IMAP, POP, SMTP, SSH, and SSL.

**Note** NAT rewrite is supported on the listed ports only. For some of these protocols, you can extend inspection to other ports using Network Analysis Policies, but NAT rewrite is not extended to those ports. This includes DCERPC, DNS, FTP, and Sun RPC inspection. If you use these protocols on non-standard ports, do not use NAT on the connections.

**Table 82: NAT Supported Application Inspection**

| Application                               | Inspected Protocol, Port                                                  | NAT Limitations                                               | Pinholes Created |
|-------------------------------------------|---------------------------------------------------------------------------|---------------------------------------------------------------|------------------|
| DCERPC                                    | TCP/135                                                                   | No NAT64.                                                     | Yes              |
| DNS over UDP                              | UDP/53                                                                    | No NAT support is available for name resolution through WINS. | No               |
| ESMTP                                     | TCP/25                                                                    | No NAT64.                                                     | No               |
| FTP                                       | TCP/21                                                                    | (Clustering) No static PAT.                                   | Yes              |

## Additional Guidelines for NAT

- For interfaces that are members of a bridge group, you write NAT rules for the member interfaces. You cannot write NAT rules for the Bridge Virtual Interface (BVI) itself.
- (Auto NAT only.) You can only define a single NAT rule for a given object; if you want to configure multiple NAT rules for an object, you need to create multiple objects with different names that specify the same IP address.
- If a VPN is defined on an interface, inbound ESP traffic on the interface is not subject to the NAT rules. The system allows the ESP traffic for established VPN tunnels only, dropping traffic not associated with an existing tunnel. This restriction applies to ESP and UDP ports 500 and 4500.
- If you define a site-to-site VPN on a device that is behind a device that is applying dynamic PAT, so that UDP ports 500 and 4500 are not the ones actually used, you must initiate the connection from the device that is behind the PAT device. The responder cannot initiate the security association (SA) because it does not know the correct port numbers.
- If you change the NAT configuration, and you do not want to wait for existing translations to time out before the new NAT configuration is used, you can clear the translation table using the **clear xlate** command in the device CLI. However, clearing the translation table disconnects all current connections that use translations.

If you create a new NAT rule that should apply to an existing connection (such as a VPN tunnel), you need to use **clear conn** to end the connection. Then, the attempt to re-establish the connection should hit the NAT rule and the connection should be NAT'ed correctly.

---

**Note** If you remove a dynamic NAT or PAT rule, and then add a new rule with mapped addresses that overlap the addresses in the removed rule, then the new rule will not be used until all connections associated with the removed rule time out or are cleared using the **clear xlate** or **clear conn** commands. This safeguard ensures that the same address is not assigned to multiple hosts.

---

- You cannot use an object group with both IPv4 and IPv6 addresses; the object group must include only one type of address.
- (Manual NAT only.) When using **any** as the source address in a NAT rule, the definition of “any” traffic (IPv4 vs. IPv6) depends on the rule. Before the FTD device performs NAT on a packet, the packet must be IPv6-to-IPv6 or IPv4-to-IPv4; with this prerequisite, the FTD device can determine the value of **any** in a NAT rule. For example, if you configure a rule from “any” to an IPv6 server, and that server was mapped from an IPv4 address, then **any** means “any IPv6 traffic.” If you configure a rule from “any” to “any,” and you map the source to the interface IPv4 address, then **any** means “any IPv4 traffic” because the mapped interface address implies that the destination is also IPv4.
- You can use the same mapped object or group in multiple NAT rules.
- The mapped IP address pool cannot include:
  - The mapped interface IP address. If you specify “any” interface for the rule, then all interface IP addresses are disallowed. For interface PAT (routed mode only), specify the interface name instead of the interface address.
  - The failover interface IP address.
  - (Transparent mode.) The management IP address.
  - (Dynamic NAT.) The standby interface IP address when VPN is enabled.
- Avoid using overlapping addresses in static and dynamic NAT policies. For example, with overlapping addresses, a PPTP connection can fail to get established if the secondary connection for PPTP hits the static instead of dynamic xlate.
- You cannot use overlapping addresses in the source address of a NAT rule and a remote access VPN address pool.
- If you specify a destination interface in a rule, then that interface is used as the egress interface rather than looking up the route in the routing table. However, for identity NAT, you have the option to use a route lookup instead.
- If you use PAT on Sun RPC traffic, which is used to connect to NFS servers, be aware that the NFS server might reject connections if the PAT'ed port is above 1024. The default configuration of NFS servers is to reject connections from ports higher than 1024. The error is typically "Permission Denied." Mapping ports above 1024 might happen if you use the "flat range" option to use the higher port numbers if a port in the lower range is not available, especially if you do not select the option to include the lower range in the flat range. You can avoid this problem by changing the NFS server configuration to allow all port numbers.

- NAT applies to through traffic only. Traffic generated by the system is not subject to NAT.
- Do not name a network object or group pat-pool, using any combination of upper- or lower-case letters.
- The unidirectional option is mainly useful for testing purposes and might not work with all protocols. For example, SIP requires protocol inspection to translate SIP headers using NAT, but this will not occur if you make the translation unidirectional.
- You cannot use NAT on the internal payload of Protocol Independent Multicast (PIM) registers.
- (Manual NAT) When writing NAT rules for a dual ISP interface setup (primary and backup interfaces using service level agreements in the routing configuration), do not specify destination criteria in the rule. Ensure the rule for the primary interface comes before the rule for the backup interface. This allows the device to choose the correct NAT destination interface based on the current routing state when the primary ISP is unavailable. If you specify destination objects, the NAT rule will always select the primary interface for the otherwise duplicate rules.
- If you get the ASP drop reason nat-no-xlate-to-pat-pool for traffic that should not match the NAT rules defined for the interface, configure identity NAT rules for the affected traffic so the traffic can pass untranslated.
- If you configure NAT for GRE tunnel endpoints, you must disable keepalives on the endpoints or the tunnel cannot be established. The endpoints send keepalives to the original addresses.

## Configure NAT for Threat Defense

Network address translation can be very complex. We recommend that you keep your rules as simple as possible to avoid translation problems and difficult troubleshooting situations. Careful planning before you implement NAT is critical. The following procedure provides the basic approach.

The NAT policy is a shared policy. You assign the policy to devices that should have similar NAT rules.

Whether a given rule in the policy applies to an assigned device is determined by the interface objects (security zones or interface groups) used in the rule. If the interface objects include one or more interface for the device, the rule is deployed to the device. Thus, you can configure rules that apply to subsets of devices within a single shared policy by carefully designing your interface objects. Rules that apply to “any” interface object are deployed to all devices.

You can configure multiple NAT policies if groups of your devices require significantly different rules.

### Procedure

---

**Step 1** Select **Devices > NAT**.

- Click **New Policy > Threat Defense NAT** to create a new policy. Give the policy a name, optionally assign devices to it, and click **Save**.

You can change device assignments later by editing the policy and clicking **Policy Assignments**.

- Click **Edit** () to edit an existing Threat Defense NAT policy. Note that the page also shows Firepower NAT policies, which are not used by Firepower Threat Defense devices.

**Step 2** Decide what kinds of rules you need.

You can create dynamic NAT, dynamic PAT, static NAT, and identity NAT rules. For an overview, see [NAT Types, on page 1006](#).

**Step 3** Decide which rules should be implemented as manual or auto NAT.

For a comparison of these two implementation options, see [Auto NAT and Manual NAT, on page 1009](#).

**Step 4** Decide which rules should be custom per device.

Because you can assign a NAT policy to multiple devices, you can configure a single rule on many devices. However, you might have rules that should be interpreted differently by each device, or some rules that should apply to a subset of devices only.

Use interface objects to control on which devices a rule is configured. Then, use object overrides on network objects to customize the addresses used per device.

For detailed information, see [Customizing NAT Rules for Multiple Devices, on page 1021](#).

**Step 5** Create the rules as explained in the following sections.

- [Dynamic NAT, on page 1023](#)
- [Dynamic PAT, on page 1028](#)
- [Static NAT, on page 1035](#)
- [Identity NAT, on page 1043](#)

**Step 6** Manage the NAT policy and rules.

You can do the following to manage the policy and its rules.

- To edit the policy name or description, click in those fields, type in your changes, and click outside the fields.
- To view only those rules that apply to a specific device, click **Filter by Device** and select the desired device. A rule applies to a device if it uses an interface object that includes an interface on the device.
- To change the devices to which the policy is assigned, click the **Policy Assignments** link and modify the selected devices list as desired.
- To change whether a rule is enabled or disabled, right click the rule and select the desired option from the **State** command. You can temporarily disable a rule without deleting it using these controls.
- To edit a rule, click **Edit** () for the rule.
- To delete a rule, click **Delete** () for the rule.

**Step 7** Click **Save**.

You can now click **Deploy** and deploy the policy to assigned devices. The changes are not active until you deploy them.

---

## Customizing NAT Rules for Multiple Devices

Because the NAT policy is shared, you can assign a given policy to more than one device. However, you can configure at most one auto NAT rule for a given object. Thus, if you want to configure different translations for an object based on the specific device doing the translation, you need to carefully configure the interface objects (security zones or interface groups) and define network object overrides for the translated address.

The interface objects determine on which devices a rule gets configured. The network object overrides determine what IP addresses are used by a given device for that object.

Consider the following scenario:

- FTD-A and FTD-B have inside networks 192.168.1.0/24 attached to the interface named “inside.”
- On FTD-A, you want to translate all 192.168.1.0/24 addresses to a NAT pool in the 10.100.10.10 - 10.100.10.200 range when going to the “outside” interface.
- On FTD-B, you want to translate all 192.168.1.0/24 addresses to a NAT pool in the 10.200.10.10 - 10.200.10.200 range when going to the “outside” interface.

To accomplish the above, you would do the following. Although this example rule is for dynamic auto NAT, you can generalize the technique for any type of NAT rule.

### Procedure

- 
- Step 1** Create the security zones for the inside and outside interfaces.
- a) Choose **Objects > Object Management**.
  - b) Select **Interface Objects** from the table of contents and click **Add > Security Zone**. (You can use interface groups instead of zones.)
  - c) Configure the inside zone properties.
    - **Name**—Enter a name, for example, **inside-zone**.
    - **Type**—Select **Routed** for routed-mode devices, **Switched** for transparent mode.
    - **Selected Interfaces**—Add the FTD-A/inside and FTD-B/inside interfaces to the selected list.
  - d) Click **Save**.
  - e) Click **Add > Security Zone** and define the outside zone properties.
    - **Name**—Enter a name, for example, **outside-zone**.
    - **Interface Type**—Select **Routed** for routed-mode devices, **Switched** for transparent mode.
    - **Selected Interfaces**—Add the FTD-A/outside and FTD-B/outside interfaces to the selected list.
  - f) Click **Save**.
- Step 2** Create the network object for the original inside network on the Object Management page.
- a) Select **Network** from the table of contents and click **Add Network > Add Object**.
  - b) Configure the inside network properties.
    - **Name**—Enter a name, for example, **inside-network**.
    - **Network**—Enter the network address, for example, **192.168.1.0/24**.

c) Click **Save**.

**Step 3** Create the network object for the translated NAT pool and define overrides.

a) Click **Add Network > Add Object**.

b) Configure the NAT pool properties for FTD-A.

- **Name**—Enter a name, for example, **NAT-pool**.
- **Network**—Enter the range of addresses to include in the pool for FTD-A, for example, **10.100.10.10-10.100.10.200**.

c) Select **Allow Overrides**.

d) Click the **Overrides** heading to open the list of object overrides.

e) Click **Add** to open the Add Object Override dialog box.

f) Select FTD-B and **Add** it to the Selected Devices list.

g) Click **Override** and change **Network** to **10.200.10.10-10.200.10.200**

h) Click **Add** to add the override to the device.

By defining an override for FTD-B, whenever the system configures this object on FTD-B, it will use the override value instead of the value defined in the original object.

i) Click **Save**.

**Step 4** Configure the NAT rule.

a) Select **Devices > NAT** and create or edit an Firepower Threat Defense NAT policy.

b) Click **Add Rule**.

c) Configure the following properties:

- **NAT Rule** = Auto NAT Rule.
- **Type** = Dynamic.

d) On **Interface Objects**, configure the following:

- **Source Interface Objects** = inside-zone.
- **Destination Interface Objects** = outside-zone.

**Note** The interface objects control on which devices the rule is configured. Because in this example the zones contain interfaces for FTD-A and FTD-B only, even if the NAT policy were assigned to additional devices, the rule would be deployed to those 2 devices only.

e) On **Translation**, configure the following:

- **Original Source** = inside-network object.
- **Translated Source > Address**= NAT-pool object.

f) Click **Save**.

You now have a single rule that will be interpreted differently for FTD-A and FTD-B, providing unique translations for the inside networks protected by each firewall.

## Dynamic NAT

The following topics explain dynamic NAT and how to configure it.

### About Dynamic NAT

Dynamic NAT translates a group of real addresses to a pool of mapped addresses that are routable on the destination network. The mapped pool typically includes fewer addresses than the real group. When a host you want to translate accesses the destination network, NAT assigns the host an IP address from the mapped pool. The translation is created only when the real host initiates the connection. The translation is in place only for the duration of the connection, and a given user does not keep the same IP address after the translation times out. Users on the destination network, therefore, cannot initiate a reliable connection to a host that uses dynamic NAT, even if the connection is allowed by an access rule.

**Note** For the duration of the translation, a remote host can initiate a connection to the translated host if an access rule allows it. Because the address is unpredictable, a connection to the host is unlikely. Nevertheless, in this case you can rely on the security of the access rule.

The following figure shows a typical dynamic NAT scenario. Only real hosts can create a NAT session, and responding traffic is allowed back.

**Figure 35: Dynamic NAT**

The following figure shows a remote host attempting to initiate a connection to a mapped address. This address is not currently in the translation table; therefore, the packet is dropped.

Figure 36: Remote Host Attempts to Initiate a Connection to a Mapped Address

## Dynamic NAT Disadvantages and Advantages

Dynamic NAT has these disadvantages:

- If the mapped pool has fewer addresses than the real group, you could run out of addresses if the amount of traffic is more than expected.

Use PAT or a PAT fall-back method if this event occurs often because PAT provides over 64,000 translations using ports of a single address.

- You have to use a large number of routable addresses in the mapped pool, and routable addresses may not be available in large quantities.

The advantage of dynamic NAT is that some protocols cannot use PAT. PAT does not work with the following:

- IP protocols that do not have a port to overload, such as GRE version 0.
- Some multimedia applications that have a data stream on one port, the control path on another port, and are not open standard.

## Configure Dynamic Auto NAT

Use dynamic auto NAT rules to translate addresses to different IP addresses that are routable on the destination network.

### Before you begin

Select **Objects > Object Management** and create the network objects or groups needed in the rule. Alternatively, you can create the objects while defining the NAT rule. The objects must meet the following requirements:

- **Original Source**—This must be a network object (not a group), and it can be a host, range, or subnet.

- **Translated Source**—This can be a network object or group, but it cannot include a subnet. The group cannot contain both IPv4 and IPv6 addresses; it must contain one type only. If a group contains both ranges and host IP addresses, then the ranges are used for dynamic NAT, and then the host IP addresses are used as a PAT fallback.

## Procedure

---

- Step 1** Select **Devices** > **NAT** and create or edit an Firepower Threat Defense NAT policy.
- Step 2** Do one of the following:
- Click the **Add Rule** button to create a new rule.
  - Click **Edit** () to edit an existing rule.
- The right click menu also has options to cut, copy, paste, insert, and delete rules.
- Step 3** Configure the basic rule options:
- **NAT Rule**—Select **Auto NAT Rule**.
  - **Type**—Select **Dynamic**.
- Step 4** On **Interface Objects**, configure the following options:
- **Source Interface Objects, Destination Interface Objects**—(Required for bridge group member interfaces.) The interface objects (security zones or interface groups) that identify the interfaces where this NAT rule applies. **Source** is the object containing the real interface, the one through which the traffic enters the device. **Destination** is the object containing the mapped interface, the one through which traffic exits the device. By default, the rule applies to all interfaces (**Any**) except for bridge group member interfaces.
- Step 5** On **Translation**, configure the following options:
- **Original Source**—The network object that contains the addresses you are translating.
  - **Translated Source**—The network object or group that contains the mapped addresses.
- Step 6** (Optional.) On **Advanced**, select the desired options:
- **Translate DNS replies that match this rule**—Whether to translate the IP address in DNS replies. For DNS replies traversing from a mapped interface to a real interface, the Address (the IPv4 A or IPv6 AAAA) record is rewritten from the mapped value to the real value. Conversely, for DNS replies traversing from a real interface to a mapped interface, the record is rewritten from the real value to the mapped value. This option is used in specific circumstances, and is sometimes needed for NAT64/46 translation, where the rewrite also converts between A and AAAA records. For more information, see [Rewriting DNS Queries and Responses Using NAT, on page 1089](#).
  - **Fallthrough to Interface PAT (Destination Interface)**—Whether to use the IP address of the destination interface as a backup method when the other mapped addresses are already allocated (interface PAT fallback). This option is available only if you select a destination interface that is not a member of a bridge group. To use the IPv6 address of the interface, also check the **IPv6** option.
  - **IPv6**—Whether to use the IPv6 address of the destination interface for interface PAT.
- Step 7** Click **Save** to add the rule.

**Step 8** Click **Save** on the NAT page to save your changes.

---

## Configure Dynamic Manual NAT

Use dynamic manual NAT rules when auto NAT does not meet your needs. For example, if you want to do different translations based on the destination. Dynamic NAT translates addresses to different IP addresses that are routable on the destination network.

### Before you begin

Select **Objects > Object Management** and create the network objects or groups needed in the rule. Groups cannot contain both IPv4 and IPv6 addresses; they must contain one type only. Alternatively, you can create the objects while defining the NAT rule. The objects must also meet the following requirements:

- **Original Source**—This can be a network object or group, and it can contain a host, range, or subnet. If you want to translate all original source traffic, you can skip this step and specify **Any** in the rule.
- **Translated Source**—This can be a network object or group, but it cannot include a subnet. If a group contains both ranges and host IP addresses, then the ranges are used for dynamic NAT, and then the host IP addresses are used as a PAT fallback.

You can also create network objects for the **Original Destination** and **Translated Destination** if you are configuring a static translation for those addresses in the rule.

For dynamic NAT, you can also perform port translation on the destination. In the Object Manager, ensure that there are port objects you can use for the **Original Destination Port** and **Translated Destination Port**. If you specify the source port, it will be ignored.

### Procedure

---

**Step 1** Select **Devices > NAT** and create or edit an Firepower Threat Defense NAT policy.

**Step 2** Do one of the following:

- Click the **Add Rule** button to create a new rule.
- Click **Edit** () to edit an existing rule.

The right click menu also has options to cut, copy, paste, insert, and delete rules.

**Step 3** Configure the basic rule options:

- **NAT Rule**—Select **Manual NAT Rule**.
- **Type**—Select **Dynamic**. This setting only applies to the source address. If you define a translation for the destination address, the translation is always static.
- **Enable**—Whether you want the rule to be active. You can later activate or deactivate the rule using the right-click menu on the rules page.
- **Insert**—Where you want to add the rule. You can insert it in a category (before or after auto NAT rules), or above or below the rule number you specify.

**Step 4** On **Interface Objects**, configure the following options:

- **Source Interface Objects, Destination Interface Objects**—(Required for bridge group member interfaces.) The interface objects (security zones or interface groups) that identify the interfaces where this NAT rule applies. **Source** is the object containing the real interface, the one through which the traffic enters the device. **Destination** is the object containing the mapped interface, the one through which traffic exits the device. By default, the rule applies to all interfaces (**Any**) except for bridge group member interfaces.

**Step 5** (On the **Translation** page.) Identify the original packet addresses, either IPv4 or IPv6; namely, the packet addresses as they appear in the original packet.

See the following figure for an example of the original packet vs. the translated packet.

- **Original Source**—The network object or group that contains the addresses you are translating.
- **Original Destination**—(Optional.) The network object that contains the addresses of the destinations. If you leave this blank, the source address translation applies regardless of destination. If you do specify the destination address, you can configure a static translation for that address or just use identity NAT for it.

You can select **Source Interface IP** to base the original destination on the source interface (which cannot be Any). If you select this option, you must also select a translated destination object. To implement a static interface NAT with port translation for the destination addresses, select this option and also select the appropriate port objects for the destination ports.

**Step 6** Identify the translated packet addresses, either IPv4 or IPv6; namely, the packet addresses as they appear on the destination interface network. You can translate between IPv4 and IPv6 if desired.

- **Translated Source**—The network object or group that contains the mapped addresses.
- **Translated Destination**—(Optional.) The network object or group that contains the destination addresses used in the translated packet. If you selected an object for **Original Destination**, you can set up identity NAT (that is, no translation) by selecting the same object.

**Step 7** (Optional.) Identify the destination service ports for service translation: **Original Destination Port, Translated Destination Port**.

Dynamic NAT does not support port translation, so leave the **Original Source Port** and **Translated Source Port** fields empty. However, because the destination translation is always static, you can perform port translation for the destination port.

NAT only supports TCP or UDP. When translating a port, be sure the protocols in the real and mapped service objects are identical (both TCP or both UDP). For identity NAT, you can use the same service object for both the real and mapped ports.

**Step 8** (Optional.) On **Advanced**, select the desired options:

- (For source translation only.) **Translate DNS replies that match this rule**—Whether to translate the IP address in DNS replies. For DNS replies traversing from a mapped interface to a real interface, the Address (the IPv4 A or IPv6 AAAA) record is rewritten from the mapped value to the real value. Conversely, for DNS replies traversing from a real interface to a mapped interface, the record is rewritten from the real value to the mapped value. This option is used in specific circumstances, and is sometimes needed for NAT64/46 translation, where the rewrite also converts between A and AAAA records. For more information, see [Rewriting DNS Queries and Responses Using NAT, on page 1089](#).
- **Fallthrough to Interface PAT (Destination Interface)**—Whether to use the IP address of the destination interface as a backup method when the other mapped addresses are already allocated (interface PAT fallback). This option is available only if you select a destination interface that is not a member of a bridge group. To use the IPv6 address of the interface, also check the **IPv6** option.
- **IPv6**—Whether to use the IPv6 address of the destination interface for interface PAT.

**Step 9** Click **Save** to add the rule.

**Step 10** Click **Save** on the NAT page to save your changes.

## Dynamic PAT

The following topics describe dynamic PAT.

### About Dynamic PAT

Dynamic PAT translates multiple real addresses to a single mapped IP address by translating the real address and source port to the mapped address and a unique port.

Each connection requires a separate translation session because the source port differs for each connection. For example, 10.1.1.1:1025 requires a separate translation from 10.1.1.1:1026.

The following figure shows a typical dynamic PAT scenario. Only real hosts can create a NAT session, and responding traffic is allowed back. The mapped address is the same for each translation, but the port is dynamically assigned.

**Figure 37: Dynamic PAT**

For the duration of the translation, a remote host on the destination network can initiate a connection to the translated host if an access rule allows it. Because the port address (both real and mapped) is unpredictable, a connection to the host is unlikely. Nevertheless, in this case you can rely on the security of the access rule.

After the connection expires, the port translation also expires.

---

**Note** We recommend that you use different PAT pools for each interface. If you use the same pool for multiple interfaces, especially if you use it for "any" interface, the pool can be quickly exhausted, with no ports available for new translations.

---

## Dynamic PAT Disadvantages and Advantages

Dynamic PAT lets you use a single mapped address, thus conserving routable addresses. You can even use the FTD device interface IP address as the PAT address.

You cannot use dynamic PAT for IPv6 (NAT66) when translating between interfaces in the same bridge group. This restriction does not apply when the interfaces are members of different bridge groups, or between a bridge group member and a standard routed interface.

Dynamic PAT does not work with some multimedia applications that have a data stream that is different from the control path. For more information, see [NAT Support for Inspected Protocols, on page 1015](#).

Dynamic PAT might also create a large number of connections appearing to come from a single IP address, and servers might interpret the traffic as a DoS attack. You can configure a PAT pool of addresses and use a round-robin assignment of PAT addresses to mitigate this situation.

## PAT Pool Object Guidelines

When creating network objects for a PAT pool, follow these guidelines.

### For a PAT pool

- If available, the real source port number is used for the mapped port. However, if the real port is *not* available, by default the mapped ports are chosen from the same range of ports as the real port number: 0 to 511, 512 to 1023, and 1024 to 65535. Therefore, ports below 1024 have only a small PAT pool that can be used. If you have a lot of traffic that uses the lower port ranges, you can specify a flat range of ports to be used instead of the three unequal-sized tiers: either 1024 to 65535, or 1 to 65535.
- If you use the same PAT pool object in two separate rules, then be sure to specify the same options for each rule. For example, if one rule specifies extended PAT, then the other rule must also specify extended PAT.
- If a host has an existing connection, then subsequent connections from that host use the same PAT IP address. If no ports are available, this can prevent the connection. Use the round robin option to avoid this problem.
- For best performance, limit the number of IP addresses within a PAT pool to 10,000.

### For extended PAT for a PAT pool

- Many application inspections do not support extended PAT.
- If you enable extended PAT for a dynamic PAT rule, then you cannot also use an address in the PAT pool as the PAT address in a separate static NAT with port translation rule. For example, if the PAT pool includes 10.1.1.1, then you cannot create a static NAT-with-port-translation rule using 10.1.1.1 as the PAT address.
- If you use a PAT pool and specify an interface for fallback, you cannot specify extended PAT.

- For VoIP deployments that use ICE or TURN, do not use extended PAT. ICE and TURN rely on the PAT binding to be the same for all destinations.
- Extended PAT increases memory usage on the device.

### For round robin for a PAT pool

- If a host has an existing connection, then subsequent connections from that host will use the same PAT IP address if ports are available. However, this “stickiness” does not survive a failover. If the device fails over, then subsequent connections from a host might not use the initial IP address.
- IP address “stickiness” is also impacted if you mix PAT pool/round robin rules with interface PAT rules on the same interface. For any given interface, choose either a PAT pool or interface PAT; do not create competing PAT rules.
- Round robin, especially when combined with extended PAT, can consume a large amount of memory. Because NAT pools are created for every mapped protocol/IP address/port range, round robin results in a large number of concurrent NAT pools, which use memory. Extended PAT results in an even larger number of concurrent NAT pools.

## Configure Dynamic Auto PAT

Use dynamic auto PAT rules to translate addresses to unique IP address/port combinations, rather than to multiple IP addresses only. You can translate to a single address (either the destination interface's address or another address), or use a PAT pool of addresses to provide a larger number of possible translations.

### Before you begin

Select **Objects > Object Management** and create the network objects or groups needed in the rule. Alternatively, you can create the objects while defining the NAT rule. The objects must meet the following requirements:

- **Original Source**—This must be a network object (not a group), and it can be a host, range, or subnet.
- **Translated Source**—You have the following options to specify the PAT address:
  - **Destination Interface**—To use the destination interface address, you do not need a network object.
  - **Single PAT address**—Create a network object containing a single host.
  - **PAT pool**—Create a network object that includes a range, or create a network object group that contains hosts, ranges, or both. You cannot include subnets. The group cannot contain both IPv4 and IPv6 addresses; it must contain one type only.

### Procedure

**Step 1** Select **Devices > NAT** and create or edit an Firepower Threat Defense NAT policy.

**Step 2** Do one of the following:

- Click the **Add Rule** button to create a new rule.
- Click **Edit** () to edit an existing rule.

The right click menu also has options to cut, copy, paste, insert, and delete rules.

**Step 3** Configure the basic rule options:

- **NAT Rule**—Select **Auto NAT Rule**.
- **Type**—Select **Dynamic**.

**Step 4** On **Interface Objects**, configure the following options:

- **Source Interface Objects, Destination Interface Objects**—(Required for bridge group member interfaces.) The interface objects (security zones or interface groups) that identify the interfaces where this NAT rule applies. **Source** is the object containing the real interface, the one through which the traffic enters the device. **Destination** is the object containing the mapped interface, the one through which traffic exits the device. By default, the rule applies to all interfaces (**Any**) except for bridge group member interfaces.

**Step 5** On **Translation**, configure the following options:

- **Original Source**—The network object that contains the addresses you are translating.
- **Translated Source**—One of the following:
  - (Interface PAT.) To use the address of the destination interface, select **Destination Interface IP**. You must also select a specific destination interface object. To use the IPv6 address of the interface, you must also select the **IPv6** option on **Advanced**. Skip the step for configuring a PAT pool.
  - To use a single address other than the destination interface address, select the host network object you created for this purpose. Skip the step for configuring a PAT pool.
  - To use a PAT pool, leave **Translated Source** empty.

**Step 6** If you are using a PAT pool, select the **PAT Pool** page and do the following:

- a) Select **Enable PAT pool**.
- b) Select the network object group that contains the addresses for the pool in the **PAT > Address** field.  
You can alternatively select **Destination Interface IP**, which is another way to implement interface PAT.
- c) (Optional) Select the following options as needed:
  - **Use Round Robin Allocation**—To assign addresses/ports in a round-robin fashion. By default without round robin, all ports for a PAT address will be allocated before the next PAT address is used. The round-robin method assigns one address/port from each PAT address in the pool before returning to use the first address again, and then the second address, and so on.
  - **Extended PAT Table**—To use extended PAT. Extended PAT uses 65535 ports per *service*, as opposed to per IP address, by including the destination address and port in the translation information. Normally, the destination port and address are not considered when creating PAT translations, so you are limited to 65535 ports per PAT address. For example, with extended PAT, you can create a translation of 10.1.1.1:1027 when going to 192.168.1.7:23 as well as a translation of 10.1.1.1:1027 when going to 192.168.1.7:80. You cannot use this option with interface PAT or interface PAT fallback.
  - **Flat Port Range, Include Reserved Ports**—To use the 1024 to 65535 port range as a single flat range when allocating TCP/UDP ports. When choosing the mapped port number for a translation, PAT uses the real source port number if it is available. However, without this option, if the real port is *not* available, by default the mapped ports are chosen from the same range of ports as the real port number: 1 to 511, 512 to 1023, and 1024 to 65535. To avoid running out of ports at the low ranges,

configure this setting. To use the entire range of 1 to 65535, also check the **Include Reserved Ports** option.

**Step 7** (Optional.) On **Advanced**, select the desired options:

- **Fallthrough to Interface PAT (Destination Interface)**—Whether to use the IP address of the destination interface as a backup method when the other mapped addresses are already allocated (interface PAT fallback). This option is available only if you select a destination interface that is not a member of a bridge group. To use the IPv6 address of the interface, also check the **IPv6** option. You cannot select this option if you already configured interface PAT as the translated address or PAT pool.
- **IPv6**—Whether to use the IPv6 address of the destination interface for interface PAT.

**Step 8** Click **Save** to add the rule.

**Step 9** Click **Save** on the NAT page to save your changes.

---

## Configure Dynamic Manual PAT

Use dynamic manual PAT rules when auto PAT does not meet your needs. For example, if you want to do different translations based on the destination. Dynamic PAT translates addresses to unique IP address/port combinations, rather than to multiple IP addresses only. You can translate to a single address (either the destination interface's address or another address), or use a PAT pool of addresses to provide a larger number of possible translations.

### Before you begin

Select **Objects > Object Management** and create the network objects or groups needed in the rule. Groups cannot contain both IPv4 and IPv6 addresses; they must contain one type only. Alternatively, you can create the objects while defining the NAT rule. The objects must also meet the following requirements:

- **Original Source**—This can be a network object or group, and it can contain a host, range, or subnet. If you want to translate all original source traffic, you can skip this step and specify **Any** in the rule.
- **Translated Source**—You have the following options to specify the PAT address:
  - **Destination Interface**—To use the destination interface address, you do not need a network object.
  - **Single PAT address**—Create a network object containing a single host.
  - **PAT pool**—Create a network object that includes a range, or create a network object group that contains hosts, ranges, or both. You cannot include subnets.

You can also create network objects for the **Original Destination** and **Translated Destination** if you are configuring a static translation for those addresses in the rule.

For dynamic NAT, you can also perform port translation on the destination. In the Object Manager, ensure that there are port objects you can use for the **Original Destination Port** and **Translated Destination Port**. If you specify the source port, it will be ignored.

### Procedure

---

**Step 1** Select **Devices > NAT** and create or edit an Firepower Threat Defense NAT policy.

**Step 2** Do one of the following:

- Click the **Add Rule** button to create a new rule.
- Click **Edit** (✎) to edit an existing rule.

The right click menu also has options to cut, copy, paste, insert, and delete rules.

**Step 3** Configure the basic rule options:

- **NAT Rule**—Select **Manual NAT Rule**.
- **Type**—Select **Dynamic**. This setting only applies to the source address. If you define a translation for the destination address, the translation is always static.
- **Enable**—Whether you want the rule to be active. You can later activate or deactivate the rule using the right-click menu on the rules page.
- **Insert**—Where you want to add the rule. You can insert it in a category (before or after auto NAT rules), or above or below the rule number you specify.

**Step 4** On **Interface Objects**, configure the following options:

- **Source Interface Objects, Destination Interface Objects**—(Required for bridge group member interfaces.) The interface objects (security zones or interface groups) that identify the interfaces where this NAT rule applies. **Source** is the object containing the real interface, the one through which the traffic enters the device. **Destination** is the object containing the mapped interface, the one through which traffic exits the device. By default, the rule applies to all interfaces (**Any**) except for bridge group member interfaces.

**Step 5** (On the **Translation** page.) Identify the original packet addresses, either IPv4 or IPv6; namely, the packet addresses as they appear in the original packet.

See the following figure for an example of the original packet vs. the translated packet.

- **Original Source**—The network object or group that contains the addresses you are translating.
- **Original Destination**—(Optional.) The network object that contains the addresses of the destinations. If you leave this blank, the source address translation applies regardless of destination. If you do specify the destination address, you can configure a static translation for that address or just use identity NAT for it.

You can select **Source Interface IP** to base the original destination on the source interface (which cannot be Any). If you select this option, you must also select a translated destination object. To implement a static interface NAT with port translation for the destination addresses, select this option and also select the appropriate port objects for the destination ports.

**Step 6** Identify the translated packet addresses, either IPv4 or IPv6; namely, the packet addresses as they appear on the destination interface network. You can translate between IPv4 and IPv6 if desired.

- **Translated Source**—One of the following:
  - (Interface PAT.) To use the address of the destination interface, select **Destination Interface IP**. You must also select a specific destination interface object. To use the IPv6 address of the interface, you must also select the **IPv6** option on **Advanced**. Skip the step for configuring a PAT pool.
  - To use a single address other than the destination interface address, select the host network object you created for this purpose. Skip the step for configuring a PAT pool.
  - To use a PAT pool, leave **Translated Source** empty.
- **Translated Destination**—(Optional.) The network object or group that contains the destination addresses used in the translated packet. If you selected an object for **Original Destination**, you can set up identity NAT (that is, no translation) by selecting the same object.

**Step 7** (Optional.) Identify the destination service ports for service translation: **Original Destination Port**, **Translated Destination Port**.

Dynamic NAT does not support port translation, so leave the **Original Source Port** and **Translated Source Port** fields empty. However, because the destination translation is always static, you can perform port translation for the destination port.

NAT only supports TCP or UDP. When translating a port, be sure the protocols in the real and mapped service objects are identical (both TCP or both UDP). For identity NAT, you can use the same service object for both the real and mapped ports.

**Step 8** If you are using a PAT pool, select the **PAT Pool** page and do the following:

- a) Select **Enable PAT pool**.
- b) Select the network object group that contains the addresses for the pool in the **PAT > Address** field.  
You can alternatively select **Destination Interface IP**, which is another way to implement interface PAT.
- c) (Optional) Select the following options as needed:
  - **Use Round Robin Allocation**—To assign addresses/ports in a round-robin fashion. By default without round robin, all ports for a PAT address will be allocated before the next PAT address is used. The round-robin method assigns one address/port from each PAT address in the pool before returning to use the first address again, and then the second address, and so on.
  - **Extended PAT Table**—To use extended PAT. Extended PAT uses 65535 ports per *service*, as opposed to per IP address, by including the destination address and port in the translation information. Normally, the destination port and address are not considered when creating PAT translations, so you are limited to 65535 ports per PAT address. For example, with extended PAT, you can create a translation of 10.1.1.1:1027 when going to 192.168.1.7:23 as well as a translation of 10.1.1.1:1027 when going to 192.168.1.7:80. You cannot use this option with interface PAT or interface PAT fallback.
  - **Flat Port Range, Include Reserved Ports**—To use the 1024 to 65535 port range as a single flat range when allocating TCP/UDP ports. When choosing the mapped port number for a translation, PAT uses the real source port number if it is available. However, without this option, if the real port is *not* available, by default the mapped ports are chosen from the same range of ports as the real port number: 1 to 511, 512 to 1023, and 1024 to 65535. To avoid running out of ports at the low ranges,

configure this setting. To use the entire range of 1 to 65535, also check the **Include Reserved Ports** option.

**Step 9** (Optional.) On **Advanced**, select the desired options:

- **Fallthrough to Interface PAT (Destination Interface)**—Whether to use the IP address of the destination interface as a backup method when the other mapped addresses are already allocated (interface PAT fallback). This option is available only if you select a destination interface that is not a member of a bridge group. To use the IPv6 address of the interface, also check the **IPv6** option.
- **IPv6**—Whether to use the IPv6 address of the destination interface for interface PAT.

**Step 10** Click **Save** to add the rule.

**Step 11** Click **Save** on the NAT page to save your changes.

## Static NAT

The following topics explain static NAT and how to implement it.

### About Static NAT

Static NAT creates a fixed translation of a real address to a mapped address. Because the mapped address is the same for each consecutive connection, static NAT allows bidirectional connection initiation, both to and from the host (if an access rule exists that allows it). With dynamic NAT and PAT, on the other hand, each host uses a different address or port for each subsequent translation, so bidirectional initiation is not supported.

The following figure shows a typical static NAT scenario. The translation is always active so both real and remote hosts can initiate connections.

*Figure 38: Static NAT*

**Note** You can disable bidirectionality if desired.

### Static NAT with Port Translation

Static NAT with port translation lets you specify a real and mapped protocol and port.

When you specify the port with static NAT, you can choose to map the port and/or the IP address to the same value or to a different value.

The following figure shows a typical static NAT with port translation scenario showing both a port that is mapped to itself and a port that is mapped to a different value; the IP address is mapped to a different value in both cases. The translation is always active so both translated and remote hosts can initiate connections.

**Figure 39: Typical Static NAT with Port Translation Scenario**

Static NAT-with-port-translation rules limit access to the destination IP address for the specified port only. If you try to access the destination IP address on a different port not covered by a NAT rule, then the connection is blocked. In addition, for manual NAT, traffic that does not match the source IP address of the NAT rule will be dropped if it matches the destination IP address, regardless of the destination port. Therefore, you must add additional rules for all other traffic allowed to the destination IP address. For example, you can configure a static NAT rule for the IP address, without port specification, and place it after the port translation rule.

**Note** For applications that require application inspection for secondary channels (for example, FTP and VoIP), NAT automatically translates the secondary ports.

Following are some other uses of static NAT with port translation.

#### Static NAT with Identity Port Translation

You can simplify external access to internal resources. For example, if you have three separate servers that provide services on different ports (such as FTP, HTTP, and SMTP), you can give external users a single IP address to access those services. You can then configure static NAT with identity port translation to map the single external IP address to the correct IP addresses of the real servers based on the port they are trying to access. You do not need to change the port, because the servers are using the standard ones (21, 80, and 25 respectively).

#### Static NAT with Port Translation for Non-Standard Ports

You can also use static NAT with port translation to translate a well-known port to a non-standard port or vice versa. For example, if inside web servers use port 8080, you can allow outside users to connect to port 80, and then undo translation to the original port 8080. Similarly, to provide extra security, you can tell web users to connect to non-standard port 6785, and then undo translation to port 80.

#### Static Interface NAT with Port Translation

You can configure static NAT to map a real address to an interface address/port combination. For example, if you want to redirect Telnet access for the device's outside interface to an inside host, then you can map the inside host IP address/port 23 to the outside interface address/port 23.

### One-to-Many Static NAT

Typically, you configure static NAT with a one-to-one mapping. However, in some cases, you might want to configure a single real address to several mapped addresses (one-to-many). When you configure one-to-many

static NAT, when the real host initiates traffic, it always uses the first mapped address. However, for traffic initiated to the host, you can initiate traffic to any of the mapped addresses, and they will be untranslated to the single real address.

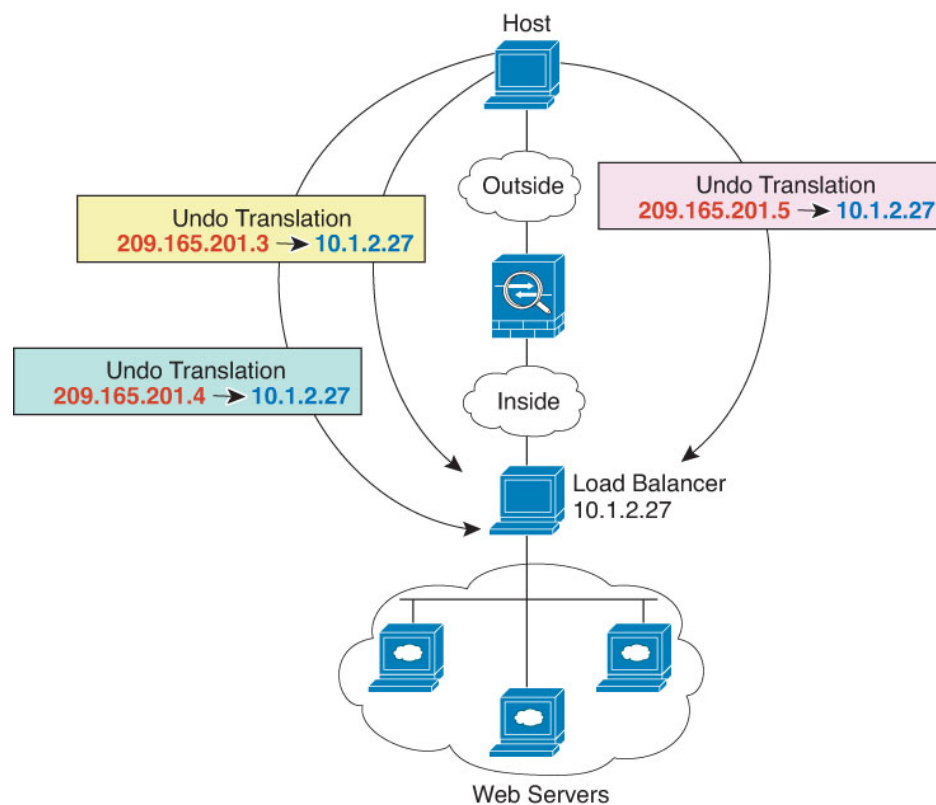

The following figure shows a typical one-to-many static NAT scenario. Because initiation by the real host always uses the first mapped address, the translation of real host IP/first mapped IP is technically the only bidirectional translation.

**Figure 40: One-to-Many Static NAT**

For example, you have a load balancer at 10.1.2.27. Depending on the URL requested, it redirects traffic to the correct web server.

**Figure 41: One-to-Many Static NAT Example**

## Other Mapping Scenarios (Not Recommended)

NAT has the flexibility to allow any kind of static mapping scenario: one-to-one, one-to-many, but also few-to-many, many-to-few, and many-to-one mappings. We recommend using only one-to-one or one-to-many mappings. These other mapping options might result in unintended consequences.

Functionally, few-to-many is the same as one-to-many; but because the configuration is more complicated and the actual mappings may not be obvious at a glance, we recommend creating a one-to-many configuration for each real address that requires it. For example, for a few-to-many scenario, the few real addresses are mapped to the many mapped addresses in order (A to 1, B to 2, C to 3). When all real addresses are mapped, the next mapped address is mapped to the first real address, and so on until all mapped addresses are mapped (A to 4, B to 5, C to 6). This results in multiple mapped addresses for each real address. Just like a one-to-many configuration, only the first mappings are bidirectional; subsequent mappings allow traffic to be initiated *to* the real host, but all traffic *from* the real host uses only the first mapped address for the source.

The following figure shows a typical few-to-many static NAT scenario.

**Figure 42: Few-to-Many Static NAT**

For a many-to-few or many-to-one configuration, where you have more real addresses than mapped addresses, you run out of mapped addresses before you run out of real addresses. Only the mappings between the lowest real IP addresses and the mapped pool result in bidirectional initiation. The remaining higher real addresses can initiate traffic, but traffic cannot be initiated to them (returning traffic for a connection is directed to the correct real address because of the unique 5-tuple (source IP, destination IP, source port, destination port, protocol) for the connection).

**Note** Many-to-few or many-to-one NAT is not PAT. If two real hosts use the same source port number and go to the same outside server and the same TCP destination port, and both hosts are translated to the same IP address, then both connections will be reset because of an address conflict (the 5-tuple is not unique).

The following figure shows a typical many-to-few static NAT scenario.

**Figure 43: Many-to-Few Static NAT**

Instead of using a static rule this way, we suggest that you create a one-to-one rule for the traffic that needs bidirectional initiation, and then create a dynamic rule for the rest of your addresses.

## Configure Static Auto NAT

Use static auto NAT rules to translate addresses to different IP addresses that are routable on the destination network. You can also do port translation with the static NAT rule.

### Before you begin

Select **Objects** > **Object Management** and create the network objects or groups needed in the rule. Alternatively, you can create the objects while defining the NAT rule. The objects must meet the following requirements:

- **Original Source**—This must be a network object (not a group), and it can be a host, range, or subnet.
- **Translated Source**—You have the following options to specify the translated address:
  - **Destination Interface**—To use the destination interface address, you do not need a network object. This configures static interface NAT with port translation: the source address/port is translated to the interface's address and the same port number.
  - **Address**—Create a network object or group containing hosts, ranges, or subnets. A group cannot contain both IPv4 and IPv6 addresses; it must contain one type only. Typically, you configure the same number of mapped addresses as real addresses for a one-to-one mapping. You can, however, have a mismatched number of addresses.

### Procedure

---

**Step 1** Select **Devices** > **NAT** and create or edit an Firepower Threat Defense NAT policy.

**Step 2** Do one of the following:

- Click the **Add Rule** button to create a new rule.
- Click **Edit** () to edit an existing rule.

The right click menu also has options to cut, copy, paste, insert, and delete rules.

**Step 3** Configure the basic rule options:

- **NAT Rule**—Select **Auto NAT Rule**.
- **Type**—Select **Static**.

**Step 4** On **Interface Objects**, configure the following options:

- **Source Interface Objects, Destination Interface Objects**—(Required for bridge group member interfaces.) The interface objects (security zones or interface groups) that identify the interfaces where this NAT rule applies. **Source** is the object containing the real interface, the one through which the traffic enters the device. **Destination** is the object containing the mapped interface, the one through which traffic exits the device. By default, the rule applies to all interfaces (**Any**) except for bridge group member interfaces.

**Step 5** On **Translation**, configure the following options:

- **Original Source**—The network object that contains the addresses you are translating.
- **Translated Source**—One of the following:
  - To use a set group of addresses, select **Address** and the network object or group that contains the mapped addresses. Typically, you configure the same number of mapped addresses as real addresses for a one-to-one mapping. You can, however, have a mismatched number of addresses.
  - (Static interface NAT with port translation.) To use the address of the destination interface, select **Destination Interface IP**. You must also select a specific destination interface object. To use the IPv6 address of the interface, you must also select the **IPv6** option on **Advanced**. This configures static interface NAT with port translation: the source address/port is translated to the interface's address and the same port number.
- (Optional.) **Original Port, Translated Port**—If you need to translate a TCP or UDP port, select the protocol in **Original Port**, and type the original and translated port numbers. For example, you can translate TCP/80 to 8080 if necessary.

**Step 6** (Optional.) On **Advanced**, select the desired options:

- **Translate DNS replies that match this rule**—Whether to translate the IP address in DNS replies. For DNS replies traversing from a mapped interface to a real interface, the Address (the IPv4 A or IPv6 AAAA) record is rewritten from the mapped value to the real value. Conversely, for DNS replies traversing from a real interface to a mapped interface, the record is rewritten from the real value to the mapped value. This option is used in specific circumstances, and is sometimes needed for NAT64/46 translation, where the rewrite also converts between A and AAAA records. For more information, see [Rewriting DNS Queries and Responses Using NAT, on page 1089](#). This option is not available if you are doing port translation.
- **IPv6**—Whether to use the IPv6 address of the destination interface for interface PAT.
- **Net to Net Mapping**—For NAT 46, select this option to translate the first IPv4 address to the first IPv6 address, the second to the second, and so on. Without this option, the IPv4-embedded method is used. For a one-to-one translation, you must use this option.
- **Do not proxy ARP on Destination Interface**—Disables proxy ARP for incoming packets to the mapped IP addresses. If you use addresses on the same network as the mapped interface, the system uses proxy ARP to answer any ARP requests for the mapped addresses, thus intercepting traffic destined for a mapped address. This solution simplifies routing because the device does not have to be the gateway for any additional networks. You can disable proxy ARP if desired, in which case you need to be sure to have proper routes on the upstream router. Normally for identity NAT, proxy ARP is not required, and in some cases can cause connectivity issues.

**Step 7** Click **Save** to add the rule.

**Step 8** Click **Save** on the NAT page to save your changes.

## Configure Static Manual NAT

Use static manual NAT rules when auto NAT does not meet your needs. For example, if you want to do different translations based on the destination. Static NAT translates addresses to different IP addresses that are routable on the destination network. You can also do port translation with the static NAT rule.

### Before you begin

Select **Objects > Object Management** and create the network objects or groups needed in the rule. Groups cannot contain both IPv4 and IPv6 addresses; they must contain one type only. Alternatively, you can create the objects while defining the NAT rule. The objects must also meet the following requirements:

- **Original Source**—This can be a network object or group, and it can contain a host, range, or subnet. If you want to translate all original source traffic, you can skip this step and specify **Any** in the rule.
- **Translated Source**—You have the following options to specify the translated address:
  - **Destination Interface**—To use the destination interface address, you do not need a network object. This configures static interface NAT with port translation: the source address/port is translated to the interface's address and the same port number.
  - **Address**—Create a network object or group containing hosts, range, or subnets. Typically, you configure the same number of mapped addresses as real addresses for a one-to-one mapping. You can, however, have a mismatched number of addresses.

You can also create network objects for the **Original Destination** and **Translated Destination** if you are configuring a static translation for those addresses in the rule. If you want to configure destination static interface NAT with port translation only, you can skip adding an object for the destination mapped addresses and specify the interface in the rule.

You can also perform port translation on the source, destination, or both. In the Object Manager, ensure that there are port objects you can use for the original and translated ports.

### Procedure

---

**Step 1** Select **Devices > NAT** and create or edit an Firepower Threat Defense NAT policy.

**Step 2** Do one of the following:

- Click the **Add Rule** button to create a new rule.
- Click **Edit** () to edit an existing rule.

The right click menu also has options to cut, copy, paste, insert, and delete rules.

**Step 3** Configure the basic rule options:

- **NAT Rule**—Select **Manual NAT Rule**.
- **Type**—Select **Static**. This setting only applies to the source address. If you define a translation for the destination address, the translation is always static.
- **Enable**—Whether you want the rule to be active. You can later activate or deactivate the rule using the right-click menu on the rules page.
- **Insert**—Where you want to add the rule. You can insert it in a category (before or after auto NAT rules), or above or below the rule number you specify.

**Step 4** On **Interface Objects**, configure the following options:

- **Source Interface Objects, Destination Interface Objects**—(Required for bridge group member interfaces.) The interface objects (security zones or interface groups) that identify the interfaces where this NAT rule applies. **Source** is the object containing the real interface, the one through which the traffic enters the device. **Destination** is the object containing the mapped interface, the one through which traffic

exits the device. By default, the rule applies to all interfaces (**Any**) except for bridge group member interfaces.

**Step 5** (On the **Translation** page.) Identify the original packet addresses, either IPv4 or IPv6; namely, the packet addresses as they appear in the original packet.

See the following figure for an example of the original packet vs. the translated packet.

- **Original Source**—The network object or group that contains the addresses you are translating.
- **Original Destination**—(Optional.) The network object that contains the addresses of the destinations. If you leave this blank, the source address translation applies regardless of destination. If you do specify the destination address, you can configure a static translation for that address or just use identity NAT for it.

You can select **Source Interface IP** to base the original destination on the source interface (which cannot be Any). If you select this option, you must also select a translated destination object. To implement a static interface NAT with port translation for the destination addresses, select this option and also select the appropriate port objects for the destination ports.

**Step 6** Identify the translated packet addresses, either IPv4 or IPv6; namely, the packet addresses as they appear on the destination interface network. You can translate between IPv4 and IPv6 if desired.

- **Translated Source**—One of the following:
  - To use a set group of addresses, select **Address** and the network object or group that contains the mapped addresses. Typically, you configure the same number of mapped addresses as real addresses for a one-to-one mapping. You can, however, have a mismatched number of addresses.
  - (Static interface NAT with port translation.) To use the address of the destination interface, select **Destination Interface IP**. You must also select a specific destination interface object. To use the IPv6 address of the interface, you must also select the **IPv6** option on **Advanced**. This configures static interface NAT with port translation: the source address/port is translated to the interface's address and the same port number.
- **Translated Destination**—(Optional.) The network object or group that contains the destination addresses used in the translated packet. If you selected an object for **Original Destination**, you can set up identity NAT (that is, no translation) by selecting the same object.

**Step 7** (Optional.) Identify the source or destination service ports for service translation.

If you are configuring static NAT with port translation, you can translate ports for the source, destination, or both. For example, you can translate between TCP/80 and TCP/8080.

NAT only supports TCP or UDP. When translating a port, be sure the protocols in the real and mapped service objects are identical (both TCP or both UDP). For identity NAT, you can use the same service object for both the real and mapped ports.

- **Original Source Port, Translated Source Port**—Defines a port translation for the source address.
- **Original Destination Port, Translated Destination Port**—Defines a port translation for the destination address.

**Step 8** (Optional.) On **Advanced**, select the desired options:

- **Translate DNS replies that match this rule**—Whether to translate the IP address in DNS replies. For DNS replies traversing from a mapped interface to a real interface, the Address (the IPv4 A or IPv6 AAAA) record is rewritten from the mapped value to the real value. Conversely, for DNS replies traversing from a real interface to a mapped interface, the record is rewritten from the real value to the mapped value. This option is used in specific circumstances, and is sometimes needed for NAT64/46 translation, where the rewrite also converts between A and AAAA records. For more information, see [Rewriting DNS Queries and Responses Using NAT, on page 1089](#). This option is not available if you are doing port translation.
- **IPv6**—Whether to use the IPv6 address of the destination interface for interface PAT.
- **Net to Net Mapping**—For NAT 46, select this option to translate the first IPv4 address to the first IPv6 address, the second to the second, and so on. Without this option, the IPv4-embedded method is used. For a one-to-one translation, you must use this option.
- **Do not proxy ARP on Destination Interface**—Disables proxy ARP for incoming packets to the mapped IP addresses. If you use addresses on the same network as the mapped interface, the system uses proxy ARP to answer any ARP requests for the mapped addresses, thus intercepting traffic destined for a mapped address. This solution simplifies routing because the device does not have to be the gateway for any additional networks. You can disable proxy ARP if desired, in which case you need to be sure to have proper routes on the upstream router. Normally for identity NAT, proxy ARP is not required, and in some cases can cause connectivity issues.
- **Unidirectional**—Select this option to prevent the destination addresses from initiating traffic to the source addresses. The unidirectional option is mainly useful for testing purposes and might not work with all protocols. For example, SIP requires protocol inspection to translate SIP headers using NAT, but this will not occur if you make the translation unidirectional.

**Step 9** Click **Save** to add the rule.

**Step 10** Click **Save** on the NAT page to save your changes.

---

## Identity NAT

You might have a NAT configuration in which you need to translate an IP address to itself. For example, if you create a broad rule that applies NAT to every network, but want to exclude one network from NAT, you can create a static NAT rule to translate an address to itself.

The following figure shows a typical identity NAT scenario.

Figure 44: Identity NAT

The following topics explain how to configure identity NAT.

## Configure Identity Auto NAT

Use static identity auto NAT rules to prevent the translation of an address. That is, to translate the address to itself.

### Before you begin

Select **Objects > Object Management** and create the network objects or groups needed in the rule. Alternatively, you can create the objects while defining the NAT rule. The objects must meet the following requirements:

- **Original Source**—This must be a network object (not a group), and it can be a host, range, or subnet.
- **Translated Source**—A network object or group with the exact same contents as the original source object. You can use the same object.

### Procedure

**Step 1** Select **Devices > NAT** and create or edit an Firepower Threat Defense NAT policy.

**Step 2** Do one of the following:

- Click the **Add Rule** button to create a new rule.
- Click **Edit** (🔧) to edit an existing rule.

The right click menu also has options to cut, copy, paste, insert, and delete rules.

**Step 3** Configure the basic rule options:

- **NAT Rule**—Select **Auto NAT Rule**.
- **Type**—Select **Static**.

**Step 4** On **Interface Objects**, configure the following options:

- **Source Interface Objects, Destination Interface Objects**—(Required for bridge group member interfaces.) The interface objects (security zones or interface groups) that identify the interfaces where this NAT rule applies. **Source** is the object containing the real interface, the one through which the traffic enters the device. **Destination** is the object containing the mapped interface, the one through which traffic exits the device. By default, the rule applies to all interfaces (**Any**) except for bridge group member interfaces.

**Step 5** On **Translation**, configure the following options:

- **Original Source**—The network object that contains the addresses you are translating.
- **Translated Source**—The same object as the original source. Optionally, you can select a different object that has the exact same contents.

Do not configure the **Original Port** and **Translated Port** options for identity NAT.

**Step 6** (Optional.) On **Advanced**, select the desired options:

- **Translate DNS replies that match this rule**—Do not configure this option for identity NAT.
- **IPv6**—Do not configure this option for identity NAT.
- **Net to Net Mapping**—Do not configure this option for identity NAT.
- **Do not proxy ARP on Destination Interface**—Disables proxy ARP for incoming packets to the mapped IP addresses. If you use addresses on the same network as the mapped interface, the system uses proxy ARP to answer any ARP requests for the mapped addresses, thus intercepting traffic destined for a mapped address. This solution simplifies routing because the device does not have to be the gateway for any additional networks. You can disable proxy ARP if desired, in which case you need to be sure to have proper routes on the upstream router. Normally for identity NAT, proxy ARP is not required, and in some cases can cause connectivity issues.
- **Perform Route Lookup for Destination Interface**— If you select source and destination interfaces when selecting the same object for original and translated source address, you can select this option to have the system determine the destination interface based on the routing table rather than using the destination interface configured in the NAT rule.

**Step 7** Click **Save** to add the rule.

**Step 8** Click **Save** on the NAT page to save your changes.

---

## Configure Identity Manual NAT

Use static identity manual NAT rules when auto NAT does not meet your needs. For example, if you want to do different translations based on the destination. Use static identity NAT rules to prevent the translation of an address. That is, to translate the address to itself.

### Before you begin

Select **Objects > Object Management** and create the network objects or groups needed in the rule. Groups cannot contain both IPv4 and IPv6 addresses; they must contain one type only. Alternatively, you can create the objects while defining the NAT rule. The objects must also meet the following requirements:

- **Original Source**—This can be a network object or group, and it can contain a host, range, or subnet. If you want to translate all original source traffic, you can skip this step and specify **Any** in the rule.
- **Translated Source**—The same object as the original source. Optionally, you can select a different object that has the exact same contents.

You can also create network objects for the **Original Destination** and **Translated Destination** if you are configuring a static translation for those addresses in the rule. If you want to configure destination static interface NAT with port translation only, you can skip adding an object for the destination mapped addresses and specify the interface in the rule.

You can also perform port translation on the source, destination, or both. In the Object Manager, ensure that there are port objects you can use for the original and translated ports. You can use the same object for identity NAT.

## Procedure

**Step 1** Select **Devices > NAT** and create or edit an Firepower Threat Defense NAT policy.

**Step 2** Do one of the following:

- Click the **Add Rule** button to create a new rule.
- Click **Edit** (✎) to edit an existing rule.

The right click menu also has options to cut, copy, paste, insert, and delete rules.

**Step 3** Configure the basic rule options:

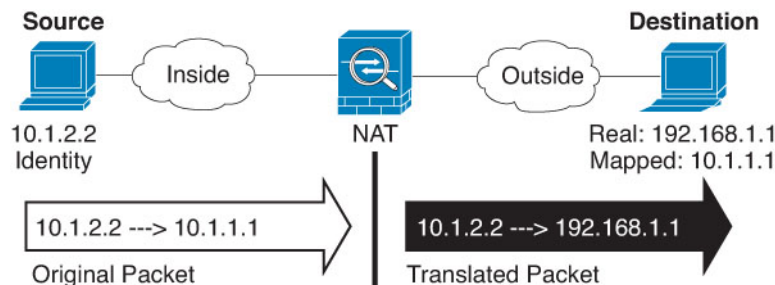

- **NAT Rule**—Select **Manual NAT Rule**.
- **Type**—Select **Static**. This setting only applies to the source address. If you define a translation for the destination address, the translation is always static.
- **Enable**—Whether you want the rule to be active. You can later activate or deactivate the rule using the right-click menu on the rules page.
- **Insert**—Where you want to add the rule. You can insert it in a category (before or after auto NAT rules), or above or below the rule number you specify.

**Step 4** On **Interface Objects**, configure the following options:

- **Source Interface Objects, Destination Interface Objects**—(Required for bridge group member interfaces.) The interface objects (security zones or interface groups) that identify the interfaces where this NAT rule applies. **Source** is the object containing the real interface, the one through which the traffic enters the device. **Destination** is the object containing the mapped interface, the one through which traffic exits the device. By default, the rule applies to all interfaces (**Any**) except for bridge group member interfaces.

**Step 5** Identify the original packet addresses, either IPv4 or IPv6; namely, the packet addresses as they appear in the original packet.

See the following figure for an example of the original packet vs. the translated packet where you perform identity NAT on the inside host but translate the outside host.

- **Original Source**—The network object or group that contains the addresses you are translating.
- **Original Destination**—(Optional.) The network object that contains the addresses of the destinations. If you leave this blank, the source address translation applies regardless of destination. If you do specify

the destination address, you can configure a static translation for that address or just use identity NAT for it.

You can select **Interface Object** to base the original destination on the source interface (which cannot be Any). If you select this option, you must also select a translated destination object. To implement a static interface NAT with port translation for the destination addresses, select this option and also select the appropriate port objects for the destination ports.

**Step 6** Identify the translated packet addresses, either IPv4 or IPv6; namely, the packet addresses as they appear on the destination interface network. You can translate between IPv4 and IPv6 if desired.

- **Translated Source**—The same object as the original source. Optionally, you can select a different object that has the exact same contents.
- **Translated Destination**—(Optional.) The network object or group that contains the destination addresses used in the translated packet. If you selected an object for **Original Destination**, you can set up identity NAT (that is, no translation) by selecting the same object.

**Step 7** (Optional.) Identify the source or destination service ports for service translation.

If you are configuring static NAT with port translation, you can translate ports for the source, destination, or both. For example, you can translate between TCP/80 and TCP/8080.

NAT only supports TCP or UDP. When translating a port, be sure the protocols in the real and mapped service objects are identical (both TCP or both UDP). For identity NAT, you can use the same service object for both the real and mapped ports.

- **Original Source Port, Translated Source Port**—Defines a port translation for the source address.
- **Original Destination Port, Translated Destination Port**—Defines a port translation for the destination address.

**Step 8** (Optional.) On **Advanced**, select the desired options:

- **Translate DNS replies that match this rule**—Do not configure this option for identity NAT.
- **IPv6**—Whether to use the IPv6 address of the destination interface for interface PAT.
- **Do not proxy ARP on Destination Interface**—Disables proxy ARP for incoming packets to the mapped IP addresses. If you use addresses on the same network as the mapped interface, the system uses proxy ARP to answer any ARP requests for the mapped addresses, thus intercepting traffic destined for a mapped address. This solution simplifies routing because the device does not have to be the gateway for any additional networks. You can disable proxy ARP if desired, in which case you need to be sure to have proper routes on the upstream router. Normally for identity NAT, proxy ARP is not required, and in some cases can cause connectivity issues.
- **Perform Route Lookup for Destination Interface**— If you select source and destination interfaces when selecting the same object for original and translated source address, you can select this option to have the system determine the destination interface based on the routing table rather than using the destination interface configured in the NAT rule.
- **Unidirectional**—Select this option to prevent the destination addresses from initiating traffic to the source addresses. The unidirectional option is mainly useful for testing purposes and might not work with all protocols. For example, SIP requires protocol inspection to translate SIP headers using NAT, but this will not occur if you make the translation unidirectional.

**Step 9** Click **Save** to add the rule.

**Step 10** Click **Save** on the NAT page to save your changes.

## NAT Rule Properties for Firepower Threat Defense

Use Network Address Translation (NAT) rules to translate IP addresses to other IP addresses. You would typically use NAT rules to convert private addresses to publically routable addresses. The translation can be from one address to another, or you can use Port Address Translation (PAT) to translate many addresses to one or a few addresses, using port numbers to distinguish among the source addresses.

NAT rules include the following basic properties. The properties are the same for auto NAT and manual NAT rules except where indicated.

### NAT Type

Whether you want to configure a **Manual NAT Rule** or an **Auto NAT Rule**. Auto NAT translates the source address only, and you cannot make different translations based on the destination address. Because auto NAT is more simple to configure, use it unless you need the added features of manual NAT. For more information on the differences, see [Auto NAT and Manual NAT, on page 1009](#).

### Type

Whether the translation rule is **Dynamic** or **Static**. Dynamic translation automatically chooses the mapped address from a pool of addresses, or an address/port combination when implementing PAT. Use static translation if you want to precisely define the mapped address/port.

### Enable (Manual NAT only.)

Whether you want the rule to be active. You can later activate or deactivate the rule using the right-click menu on the rules page. You cannot disable auto NAT rules.

### Insert (Manual NAT only.)

Where you want to add the rule. You can insert it in a category (before or after auto NAT rules), or above or below the rule number you specify.

### Description (Optional. Manual NAT only.)

A description of the purpose of the rule.

The following topics describe the tabs for the NAT rules properties.

## Interface Objects NAT Properties

Interface objects (security zones or interface groups) define the interfaces to which a NAT rule applies. In routed mode, you can use the default "any" for both source and destination to apply to all interfaces of all assigned devices. However, you typically want to select specific source and destination interfaces.

---

**Note** The concept of “any” interface does not apply to bridge group member interfaces. When you specify “any” interface, all bridge group member interfaces are excluded. Thus, to apply NAT to bridge group members, you must specify the member interface. You cannot configure NAT for the Bridge Virtual Interface (BVI) itself, you can configure NAT for member interfaces only.

---

If you select interface objects, a NAT rule will be configured on an assigned device only if the device has interfaces included in all selected objects. For example, if you select both source and destination security zones, both zones must contain one or more interface for a given device.

### Source Interface Objects, Destination Interface Objects

(Required for bridge group member interfaces.) The interface objects (security zones or interface groups) that identify the interfaces where this NAT rule applies. **Source** is the object containing the real interface, the one through which the traffic enters the device. **Destination** is the object containing the mapped interface, the one through which traffic exits the device. By default, the rule applies to all interfaces (**Any**) except for bridge group member interfaces.

## Translation Properties for Auto NAT

Use the options on **Translation** to define the source addresses and the mapped translated addresses. The following properties apply to auto NAT only.

### Original Source (Always required.)

The network object that contains the addresses you are translating. This must be a network object (not a group), and it can be a host, range, or subnet.

You cannot create auto NAT rules for the system-defined any-ipv4 or any-ipv6 objects.

### Translated Source (Usually required.)

The mapped addresses, the ones to which you are translating. What you select here depends on the type of translation rule you are defining.

- **Dynamic NAT**—The network object or group that contains the mapped addresses. This can be a network object or group, but it cannot include a subnet. The group cannot contain both IPv4 and IPv6 addresses; it must contain one type only. If a group contains both ranges and host IP addresses, then the ranges are used for dynamic NAT, and then the host IP addresses are used as a PAT fallback.
- **Dynamic PAT**—One of the following:
  - (Interface PAT.) To use the address of the destination interface, select **Destination Interface IP**. You must also select a specific destination interface object. To use the IPv6 address of the interface, you must also select the **IPv6** option on **Advanced**. Do not configure a PAT pool.
  - To use a single address other than the destination interface address, select the host network object you created for this purpose. Do not configure a PAT pool.
  - To use a PAT pool, leave **Translated Source** empty. Select the PAT pool object on **PAT Pool**.
- **Static NAT**—One of the following:
  - To use a set group of addresses, select **Address** and the network object or group that contains the mapped addresses. The object or group can contain hosts, ranges, or subnets. Typically, you configure the same number of mapped addresses as real addresses for a one-to-one mapping. You can, however, have a mismatched number of addresses.
  - (Static interface NAT with port translation.) To use the address of the destination interface, select **Destination Interface IP**. You must also select a specific destination interface object. To use the IPv6 address of the interface, you must also select the **IPv6** option on the **Advanced** tab. This configures static interface NAT with port translation: the source address/port is translated to the interface's address and the same port number.
- **Identity NAT**—The same object as the original source. Optionally, you can select a different object that has the exact same contents.

**Original Port, Translated Port (Static NAT only.)**

If you need to translate a TCP or UDP port, select the protocol in **Original Port**, and type the original and translated port numbers. For example, you can translate TCP/80 to 8080 if necessary. Do not configure these options for identity NAT.

**Translation Properties for Manual NAT**

Use the options on **Translation** to define the source addresses and the mapped translated addresses. The following properties apply to manual NAT only. All are optional except as indicated.

**Original Source (Always required.)**

The network object or group that contains the addresses you are translating. This can be a network object or group, and it can contain a host, range, or subnet. If you want to translate all original source traffic, you can specify **Any** in the rule.

**Translated Source (Usually required.)**

The mapped addresses, the ones to which you are translating. What you select here depends on the type of translation rule you are defining.

- **Dynamic NAT**—The network object or group that contains the mapped addresses. This can be a network object or group, but it cannot include a subnet. The group cannot contain both IPv4 and IPv6 addresses; it must contain one type only. If a group contains both ranges and host IP addresses, then the ranges are used for dynamic NAT, and then the host IP addresses are used as a PAT fallback.
- **Dynamic PAT**—One of the following:
  - (Interface PAT.) To use the address of the destination interface, select **Destination Interface IP**. You must also select a specific destination interface object. To use the IPv6 address of the interface, you must also select the **IPv6** option on **Advanced**. Do not configure a PAT pool.
  - To use a single address other than the destination interface address, select the host network object you created for this purpose. Do not configure a PAT pool.
  - To use a PAT pool, leave **Translated Source** empty. Select the PAT pool object on **PAT Pool**.
- **Static NAT**—One of the following:
  - To use a set group of addresses, select **Address** and the network object or group that contains the mapped addresses. The object or group can contain hosts, ranges, or subnets. Typically, you configure the same number of mapped addresses as real addresses for a one-to-one mapping. You can, however, have a mismatched number of addresses.
  - (Static interface NAT with port translation.) To use the address of the destination interface, select **Destination Interface IP**. You must also select a specific destination interface object. To use the IPv6 address of the interface, you must also select the **IPv6** option on the **Advanced** tab. This configures static interface NAT with port translation: the source address/port is translated to the interface's address and the same port number.
- **Identity NAT**—The same object as the original source. Optionally, you can select a different object that has the exact same contents.

### Original Destination

The network object that contains the addresses of the destinations. If you leave this blank, the source address translation applies regardless of destination. If you do specify the destination address, you can configure a static translation for that address or just use identity NAT for it.

You can select **Source Interface IP** to base the original destination on the source interface (which cannot be Any). If you select this option, you must also select a translated destination object. To implement a static interface NAT with port translation for the destination addresses, select this option and also select the appropriate port objects for the destination ports.

### Translated Destination

The network object or group that contains the destination addresses used in the translated packet. If you selected an object for **Original Destination**, you can set up identity NAT (that is, no translation) by selecting the same object.

### Original Source Port, Translated Source Port, Original Destination Port, Translated Destination Port

The port objects that define the source and destination services for the original and translated packets. You can translate the ports, or select the same object to make the rule sensitive to the service without translating the ports. Keep the following rules in mind when configuring services:

- (Dynamic NAT or PAT.) You cannot do translation on the **Original Source Port** and **Translated Source Port**. You can do translation on the destination port only.
- NAT only supports TCP or UDP. When translating a port, be sure the protocols in the real and mapped service objects are identical (both TCP or both UDP). For identity NAT, you can use the same service object for both the real and mapped ports.

## PAT Pool NAT Properties

When you configure dynamic NAT, you can define a pool of addresses to use for Port Address Translation using the properties on the **PAT Pool** tab.

### Enable PAT Pool

Select this option to configure a pool of addresses for PAT.

### PAT

The addresses to use for the PAT pool, one of the following:

- **Address**—The object that defines the PAT pool addresses, either a network object that includes a range, or a network object group that contains hosts, ranges, or both. You cannot include subnets. The group cannot contain both IPv4 and IPv6 addresses; it must contain one type only.
- **Destination Interface IP**—Indicates that you want to use the destination interface as the PAT address. For this option, you must select a specific **Destination Interface Object**; you cannot use **Any** as the destination interface. This is another way to implement interface PAT.

### Round Robin

To assign addresses/ports in a round-robin fashion. By default without round robin, all ports for a PAT address will be allocated before the next PAT address is used. The round-robin method assigns one address/port from each PAT address in the pool before returning to use the first address again, and then the second address, and so on.

### Extended PAT Table

To use extended PAT. Extended PAT uses 65535 ports per *service*, as opposed to per IP address, by including the destination address and port in the translation information. Normally, the destination port and address are not considered when creating PAT translations, so you are limited to 65535 ports per PAT address. For example, with extended PAT, you can create a translation of 10.1.1.1:1027 when going to 192.168.1.7:23 as well as a translation of 10.1.1.1:1027 when going to 192.168.1.7:80. You cannot use this option with interface PAT or interface PAT fallback.

### Flat Port Range; Include Reserved Ports

To use the 1024 to 65535 port range as a single flat range when allocating TCP/UDP ports. When choosing the mapped port number for a translation, PAT uses the real source port number if it is available. However, without this option, if the real port is *not* available, by default the mapped ports are chosen from the same range of ports as the real port number: 1 to 511, 512 to 1023, and 1024 to 65535. To avoid running out of ports at the low ranges, configure this setting. To use the entire range of 1 to 65535, also check the **Include Reserved Ports** option.

## Advanced NAT Properties

When you configure NAT, you can configure properties that provide specialized services in the **Advanced** options. All of these properties are optional: configure them only if you need the service.

### Translate DNS replies that match this rule

Whether to translate the IP address in DNS replies. For DNS replies traversing from a mapped interface to a real interface, the Address (the IPv4 A or IPv6 AAAA) record is rewritten from the mapped value to the real value. Conversely, for DNS replies traversing from a real interface to a mapped interface, the record is rewritten from the real value to the mapped value. This option is used in specific circumstances, and is sometimes needed for NAT64/46 translation, where the rewrite also converts between A and AAAA records. For more information, see [Rewriting DNS Queries and Responses Using NAT, on page 1089](#). This option is not available if you are doing port translation in a static NAT rule.

### Fallthrough to Interface PAT (Destination Interface) (Dynamic NAT only.)

Whether to use the IP address of the destination interface as a backup method when the other mapped addresses are already allocated (interface PAT fallback). This option is available only if you select a destination interface that is not a member of a bridge group. To use the IPv6 address of the interface, also check the **IPv6** option. You cannot select this option if you already configured interface PAT as the translated address. You also cannot select the option if you configure a PAT pool.

### IPv6

Whether to use the IPv6 address of the destination interface for interface PAT.

### Net to Net Mapping (Static NAT only.)

For NAT 46, select this option to translate the first IPv4 address to the first IPv6 address, the second to the second, and so on. Without this option, the IPv4-embedded method is used. For a one-to-one translation, you must use this option.

### Do not proxy ARP on Destination Interface (Static NAT only.)

Disables proxy ARP for incoming packets to the mapped IP addresses. If you use addresses on the same network as the mapped interface, the system uses proxy ARP to answer any ARP requests for the mapped addresses, thus intercepting traffic destined for a mapped address. This solution simplifies routing because the device does not have to be the gateway for any additional networks. You can disable proxy ARP if

desired, in which case you need to be sure to have proper routes on the upstream router. Normally for identity NAT, proxy ARP is not required, and in some cases can cause connectivity issues.

**Perform Route Lookup for Destination Interface (Static Identity NAT only. Routed mode only.)**

If you select source and destination interfaces when selecting the same object for original and translated source address, you can select this option to have the system determine the destination interface based on the routing table rather than using the destination interface configured in the NAT rule.

**Unidirectional (Manual NAT only, static NAT only.)**

Select this option to prevent the destination addresses from initiating traffic to the source addresses. The unidirectional option is mainly useful for testing purposes and might not work with all protocols. For example, SIP requires protocol inspection to translate SIP headers using NAT, but this will not occur if you make the translation unidirectional.

## Translating IPv6 Networks

In cases where you need to pass traffic between IPv6-only and IPv4-only networks, you need to use NAT to convert between the address types. Even with two IPv6 networks, you might want to hide internal addresses from the outside network.

You can use the following translation types with IPv6 networks:

- NAT64, NAT46—Translates IPv6 packets into IPv4 and vice versa. You need to define two policies, one for the IPv6 to IPv4 translation, and one for the IPv4 to IPv6 translation. Although you can accomplish this with a single manual NAT rule, if the DNS server is on the external network, you probably need to rewrite the DNS response. Because you cannot enable DNS rewrite on a manual NAT rule when you specify a destination, creating two auto NAT rules is the better solution.

---

**Note** NAT46 supports static mappings only.

---

- NAT66—Translates IPv6 packets to a different IPv6 address. We recommend using static NAT. Although you can use dynamic NAT or PAT, IPv6 addresses are in such large supply, you do not have to use dynamic NAT.

---

**Note** NAT64 and NAT 46 are possible on standard routed interfaces only. NAT66 is possible on both routed and bridge group member interfaces.

---

## NAT64/46: Translating IPv6 Addresses to IPv4

When traffic goes from an IPv6 network to an IPv4-only network, you need to convert the IPv6 address to IPv4, and return traffic from IPv4 to IPv6. You need to define two address pools, an IPv4 address pool to bind IPv6 addresses in the IPv4 network, and an IPv6 address pool to bind IPv4 addresses in the IPv6 network.

- The IPv4 address pool for the NAT64 rule is normally small and typically might not have enough addresses to map one-to-one with the IPv6 client addresses. Dynamic PAT might more easily meet the possible large number of IPv6 client addresses compared to dynamic or static NAT.

- The IPv6 address pool for the NAT46 rule can be equal to or larger than the number of IPv4 addresses to be mapped. This allows each IPv4 address to be mapped to a different IPv6 address. NAT46 supports static mappings only, so you cannot use dynamic PAT.

You need to define two policies, one for the source IPv6 network, and one for the destination IPv4 network. Although you can accomplish this with a single manual NAT rule, if the DNS server is on the external network, you probably need to rewrite the DNS response. Because you cannot enable DNS rewrite on a manual NAT rule when you specify a destination, creating two auto NAT rules is the better solution.

## NAT64/46 Example: Inside IPv6 Network with Outside IPv4 Internet

Following is a straight-forward example where you have an inside IPv6-only network, and you want to convert to IPv4 for traffic sent to the Internet. This example assumes you do not need DNS translation, so you can perform both the NAT64 and NAT46 translations in a single manual NAT rule.

In this example, you translate the inside IPv6 network to IPv4 using dynamic interface PAT with the IP address of the outside interface. Outside IPv4 traffic is statically translated to addresses on the 2001:db8::/96 network, allowing transmission on the inside network.

### Procedure

**Step 1** Create the network object that defines the inside IPv6 network.

- Choose **Objects > Object Management**.
- Select **Network** from the table of contents and click **Add Network > Add Object**.
- Define the inside IPv6 network.

Name the network object (for example, `inside_v6`) and enter the network address, `2001:db8::/96`.

## New Network Object

|                 |                                                                                                                            |
|-----------------|----------------------------------------------------------------------------------------------------------------------------|
| Name            | inside_v6                                                                                                                  |
| Description     |                                                                                                                            |
| Network         | <input type="radio"/> Host <input type="radio"/> Range <input checked="" type="radio"/> Network <input type="radio"/> FQDN |
|                 | 2001:db8::/96                                                                                                              |
| Allow Overrides | <input type="checkbox"/>                                                                                                   |

d) Click **Save**.

**Step 2**

Create the manual NAT rule to translate the IPv6 network to IPv4 and back again.

a) Select **Devices > NAT** and create or edit an Firepower Threat Defense NAT policy.

b) Click **Add Rule**.

c) Configure the following properties:

- **NAT Rule** = Manual NAT Rule.
- **Type** = Dynamic.

d) On **Interface Objects**, configure the following:

- **Source Interface Objects** = inside.
- **Destination Interface Objects** = outside.

e) On **Translation**, configure the following:

- **Original Source** = inside\_v6 network object.
- **Translated Source** = **Destination Interface IP**.
- **Original Destination** = inside\_v6 network object.
- **Translated Destination** = any-ipv4 network object.

## Add NAT Rule

|                                                                  |                 |                                            |                                                                                                              |                  |
|------------------------------------------------------------------|-----------------|--------------------------------------------|--------------------------------------------------------------------------------------------------------------|------------------|
| NAT Rule:                                                        | Manual NAT Rule | Insert:                                    | In Category                                                                                                  | NAT Rules Before |
| Type:                                                            | Dynamic         | <input checked="" type="checkbox"/> Enable |                                                                                                              |                  |
| Description:                                                     |                 |                                            |                                                                                                              |                  |
| <b>Interface Objects</b> <b>Translation</b> PAT Pool    Advanced |                 |                                            |                                                                                                              |                  |
| <b>Original Packet</b>                                           |                 | <b>Translated Packet</b>                   |                                                                                                              |                  |
| Original Source:*                                                | inside_v6       | Translated Source:                         | Destination Interface IP                                                                                     |                  |
| Original Destination:                                            | Address         | Translated Destination:                    | any-ipv4                                                                                                     |                  |
|                                                                  | inside_v6       |                                            | <small>The values selected for Destination Interface Objects in 'Interface Objects' tab will be used</small> |                  |

f) Click **OK**.

With this rule, any traffic from the 2001:db8::/96 subnet on the inside interface going to the outside interface gets a NAT64 PAT translation using the IPv4 address of the outside interface. Conversely, any IPv4 address on the outside network coming to the inside interface is translated to an address on the 2001:db8::/96 network using the embedded IPv4 address method.

g) Click **Save** on the NAT rules page.

## NAT64/46 Example: Inside IPv6 Network with Outside IPv4 Internet and DNS Translation

Following is a typical example where you have an inside IPv6-only network, but there are some IPv4-only services on the outside Internet that internal users need.

In this example, you translate the inside IPv6 network to IPv4 using dynamic interface PAT with the IP address of the outside interface. Outside IPv4 traffic is statically translated to addresses on the 2001:db8::/96 network, allowing transmission on the inside network. You enable DNS rewrite on the NAT46 rule, so that replies from the external DNS server can be converted from A (IPv4) to AAAA (IPv6) records, and the addresses converted from IPv4 to IPv6.

Following is a typical sequence for a web request where a client at 2001:DB8::100 on the internal IPv6 network tries to open www.example.com.

- The client's computer sends a DNS request to the DNS server at 2001:DB8::D1A5:CA81. The NAT rules make the following translations to the source and destination in the DNS request:
  - 2001:DB8::100 to a unique port on 209.165.201.1 (The NAT64 interface PAT rule.)
  - 2001:DB8::D1A5:CA81 to 209.165.202.129 (The NAT46 rule. D1A5:CA81 is the IPv6 equivalent of 209.165.202.129.)

2. The DNS server responds with an A record indicating that `www.example.com` is at `209.165.200.225`. The NAT46 rule, with DNS rewrite enabled, converts the A record to the IPv6-equivalent AAAA record, and translates `209.165.200.225` to `2001:db8:D1A5:C8E1` in the AAAA record. In addition, the source and destination addresses in the DNS response are untranslated:
  - `209.165.202.129` to `2001:DB8::D1A5:CA81`
  - `209.165.201.1` to `2001:db8::100`
3. The IPv6 client now has the IP address of the web server, and makes an HTTP request to `www.example.com` at `2001:db8:D1A5:C8E1`. (`D1A5:C8E1` is the IPv6 equivalent of `209.165.200.225`.) The source and destination of the HTTP request are translated:
  - `2001:DB8::100` to a unique port on `209.156.101.54` (The NAT64 interface PAT rule.)
  - `2001:db8:D1A5:C8E1` to `209.165.200.225` (The NAT46 rule.)

The following procedure explains how to configure this example.

### Before you begin

Ensure that you have interface objects (security zones or interface groups) that contain the interfaces for the device. In this example, we will assume the interface objects are security zones named **inside** and **outside**. To configure interface objects, select **Objects > Object Management**, then select **Interface**.

### Procedure

#### Step 1

Create the network objects that define the inside IPv6 and outside IPv4 networks.

- a) Choose **Objects > Object Management**.
- b) Select **Network** from the table of contents and click **Add Network > Add Object**.
- c) Define the inside IPv6 network.

Name the network object (for example, `inside_v6`) and enter the network address, `2001:db8::/96`.

**New Network Objects** ? x

Name:

Description:

Network:

Format: ipaddr or ipaddr/len or range (ipaddr-ipaddr)

Allow Overrides:

- d) Click **Save**.
- e) Click **Add Network > Add Object** and define the outside IPv4 network.

Name the network object (for example, `outside_v4_any`) and enter the network address `0.0.0.0/0`.

**New Network Objects** ? x

Name:

Description:

Network:   
 Format: ipaddr or ipaddr/len or range (ipaddr-ipaddr)

Allow Overrides:

f) Click **Save**.

**Step 2** Configure the NAT64 dynamic PAT rule for the inside IPv6 network.

**Step 3** Configure the static NAT46 rule for the outside IPv4 network.

a) Click **Add Rule**.

b) Configure the following properties:

- **NAT Rule** = Auto NAT Rule.
- **Type** = Static.

c) On **Interface Objects**, configure the following:

- **Source Interface Objects** = outside.
- **Destination Interface Objects** = inside.

d) On **Translation**, configure the following:

- **Original Source** = outside\_v4\_any network object.
- **Translated Source > Address** = inside\_v6 network object.

e) On **Advanced**, select **Translate DNS replies that match this rule**.

**Add NAT Rule**

NAT Rule:

Type:   Enable

Interface Objects | **Translation** | PAT Pool | Advanced

**Original Packet**

Original Source: \*

Original Port:

**Translated Packet**

Translated Source:

f) Click **OK**.

With this rule, any IPv4 address on the outside network coming to the inside interface is translated to an address on the 2001:db8::/96 network using the embedded IPv4 address method. In addition, DNS responses are converted from A (IPv4) to AAAA (IPv6) records, and the addresses converted from IPv4 to IPv6.

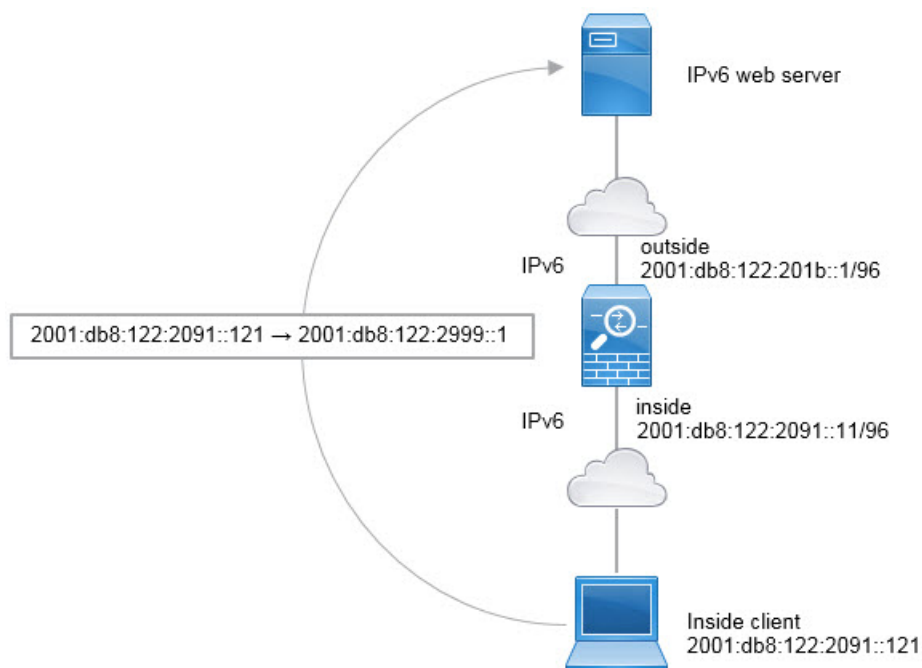

## NAT66: Translating IPv6 Addresses to Different IPv6 Addresses

When going from an IPv6 network to another IPv6 network, you can translate the addresses to different IPv6 addresses on the outside network. We recommend using static NAT. Although you can use dynamic NAT or PAT, IPv6 addresses are in such large supply, you do not have to use dynamic NAT.

Because you are not translating between different address types, you need a single rule for NAT66 translations. You can easily model these rules using auto NAT. However, if you do not want to allow returning traffic, you can make the static NAT rule unidirectional using manual NAT only.

### NAT66 Example, Static Translation between Networks

You can configure a static translation between IPv6 address pools using auto NAT. The following example explains how to convert inside addresses on the 2001:db8:122:2091::/96 network to outside addresses on the 2001:db8:122:2999::/96 network.

#### Before you begin

Ensure that you have interface objects (security zones or interface groups) that contain the interfaces for the device. In this example, we will assume the interface objects are security zones named **inside** and **outside**. To configure interface objects, select **Objects > Object Management**, then select **Interface**.

#### Procedure

- Step 1** Create the network objects that define the inside IPv6 and outside IPv6 NAT networks.
- Choose **Objects > Object Management**.
  - Select **Network** from the table of contents and click **Add Network > Add Object**.
  - Define the inside IPv6 network.

Name the network object (for example, `inside_v6`) and enter the network address, `2001:db8:122:2091::/96`.

**New Network Objects** ? x

Name:

Description:

Network:   
 Format: ipaddr or ipaddr/len or range (ipaddr-ipaddr)

Allow Overrides:

- d) Click **Save**.
- e) Click **Add Network > Add Object** and define the outside IPv6 NAT network.

Name the network object (for example, `outside_nat_v6`) and enter the network address `2001:db8:122:2999::/96`.

**New Network Objects** ? x

Name:

Description:

Network:   
 Format: ipaddr or ipaddr/len or range (ipaddr-ipaddr)

Allow Overrides:

- f) Click **Save**.

## Step 2

Configure the static NAT rule for the inside IPv6 network.

- a) Select **Devices > NAT** and create or edit an Firepower Threat Defense NAT policy.
- b) Click **Add Rule**.
- c) Configure the following properties:
  - **NAT Rule** = Auto NAT Rule.
  - **Type** = Static.
- d) On **Interface Objects**, configure the following:
  - **Source Interface Objects** = inside.
  - **Destination Interface Objects** = outside.
- e) On **Translation**, configure the following:
  - **Original Source** = `inside_v6` network object.
  - **Translated Source > Address** = `outside_nat_v6` network object.

## Add NAT Rule

NAT Rule:

Type:    Enable

Interface Objects: **Translation** PAT Pool Advanced

**Original Packet**

Original Source:\*

**Translated Packet**

Translated Source:

f) Click **OK**.

With this rule, any traffic from the 2001:db8:122:2091::/96 subnet on the inside interface going to the outside interface gets a static NAT66 translation to an address on the 2001:db8:122:2999::/96 network.

## NAT66 Example, Simple IPv6 Interface PAT

A simple approach for implementing NAT66 is to dynamically assign internal addresses to different ports on the outside interface IPv6 address.

When you configure an interface PAT rule for NAT66, all the global addresses that are configured on that interface are used for PAT mapping. Link-local or site-local addresses for the interface are not used for PAT.

### Before you begin

Ensure that you have interface objects (security zones or interface groups) that contain the interfaces for the device. In this example, we will assume the interface objects are security zones named **inside** and **outside**. To configure interface objects, select **Objects > Object Management**, then select **Interface**.

## Procedure

**Step 1** Create the network object that defines the inside IPv6 network.

- a) Choose **Objects > Object Management**.
- b) Select **Network** from the table of contents and click **Add Network > Add Object**.
- c) Define the inside IPv6 network.

Name the network object (for example, `inside_v6`) and enter the network address, `2001:db8:122:2091::/96`.

**New Network Objects** ? x

Name:

Description:

Network:

*Format: ipaddr or ipaddr/len or range (ipaddr-ipaddr)*

Allow Overrides:

- d) Click **Save**.

**Step 2** Configure the dynamic PAT rule for the inside IPv6 network.

- a) Select **Devices > NAT** and create or edit an Firepower Threat Defense NAT policy.
- b) Click **Add Rule**.
- c) Configure the following properties:
  - **NAT Rule** = Auto NAT Rule.
  - **Type** = Dynamic.
- d) On **Interface Objects**, configure the following:
  - **Source Interface Objects** = inside.
  - **Destination Interface Objects** = outside.
- e) On **Translation**, configure the following:
  - **Original Source** = `inside_v6` network object.
  - **Translated Source** = **Destination Interface IP**.
- f) On **Advanced**, select **IPv6**, which indicates that the IPv6 address of the destination interface should be used.

## Add NAT Rule

NAT Rule: Auto NAT Rule

Type: Dynamic  Enable

Interface Objects **Translation** PAT Pool Advanced

**Original Packet**

Original Source:\* inside\_v6

Original Port: TCP

**Translated Packet**

Translated Source: Destination Interface IP

The values selected for Destination Interface Objects in 'Interface Objects' tab will be used

g) Click **OK**.

With this rule, any traffic from the 2001:db8:122:2091::/96 subnet on the inside interface going to the outside interface gets a NAT66 PAT translation to one of the IPv6 global addresses configured for the outside interface.

## Monitoring NAT

To monitor and troubleshoot NAT connections, log into the device CLI and use the following commands.

- **show nat** displays the NAT rules and per-rule hit counts. There are additional keywords to show other aspects of NAT.
- **show xlate** displays the actual NAT translations that are currently active.
- **clear xlate** lets you remove an active NAT translation. You might need to remove active translations if you alter NAT rules, because existing connections continue to use the old translation slot until the connection ends. Clearing a translation allows the system to build a new translation for a client on the client's next connection attempt based on your new rules.

## Examples for NAT

The following topics provide examples for configuring NAT on Threat Defense devices.

### Providing Access to an Inside Web Server (Static Auto NAT)

The following example performs static NAT for an inside web server. The real address is on a private network, so a public address is required. Static NAT is necessary so hosts can initiate traffic to the web server at a fixed address.

Figure 45: Static NAT for an Inside Web Server

### Before you begin

Ensure that you have interface objects (security zones or interface groups) that contain the interfaces for the device that protects the web server. In this example, we will assume the interface objects are security zones named **inside** and **outside**. To configure interface objects, select **Objects > Object Management**, then select **Interface**.

### Procedure

**Step 1** Create the network objects that define the server's private and public host addresses.

- Choose **Objects > Object Management**.
- Select **Network** from the table of contents and click **Add Network > Add Object**.
- Define the web server's private address.

Name the network object (for example, WebServerPrivate) and enter the real host IP address, 10.1.2.27.

**Edit Network Objects**

Name:

Description:

Network:

Allow Overrides:

**Override (0)**

- d) Click **Save**.
- e) Click **Add Network > Add Object** and define the public address.

Name the network object (for example, WebServerPublic) and enter the host address 209.165.201.10.

#### New Network Objects

The screenshot shows a configuration window titled "New Network Objects". It contains the following fields and controls:

- Name:** Text box containing "WebServerPublic".
- Description:** Empty text box.
- Network:** Text box containing "209.165.201.10".
- Allow Overrides:** Checkmark icon.
- Override (0):** A blue button at the bottom of the window.

- f) Click **Save**.

### Step 2

Configure static NAT for the object.

- a) Select **Devices > NAT** and create or edit an Firepower Threat Defense NAT policy.
- b) Click **Add Rule**.
- c) Configure the following properties:
  - **NAT Rule** = Auto NAT Rule.
  - **Type** = Static.
- d) On **Interface Objects**, configure the following:
  - **Source Interface Objects** = inside.
  - **Destination Interface Objects** = outside.
- e) On **Translation**, configure the following:
  - **Original Source** = WebServerPrivate network object.
  - **Translated Source > Address** = WebServerPublic network object.

#### Add NAT Rule

The screenshot shows the "Add NAT Rule" configuration window with the following settings:

- NAT Rule:** Auto NAT Rule (dropdown)
- Type:** Static (dropdown) with an **Enable** checkbox checked.
- Interface Objects:** Translation (selected), PAT Pool, Advanced
- Original Packet:**
  - Original Source:\*** WebServerPrivate (dropdown)
  - Original Port:** TCP (dropdown) with an empty text box.
- Translated Packet:**
  - Translated Source:** Address (dropdown) with WebServerPublic (text box) below it.
  - Translated Port:** Empty text box.

- f) Click **Save**.

**Step 3** Click **Save** on the NAT rule page.

## Dynamic Auto NAT for Inside Hosts and Static NAT for an Outside Web Server

The following example configures dynamic NAT for inside users on a private network when they access the outside. Also, when inside users connect to an outside web server, that web server address is translated to an address that appears to be on the inside network.

*Figure 46: Dynamic NAT for Inside, Static NAT for Outside Web Server*

### Before you begin

Ensure that you have interface objects (security zones or interface groups) that contain the interfaces for the device that protects the web server. In this example, we will assume the interface objects are security zones named **inside** and **outside**. To configure interface objects, select **Objects > Object Management**, then select **Interface**.

### Procedure

- Step 1** Create a network object for the dynamic NAT pool to which you want to translate the inside addresses.
- Choose **Objects > Object Management**.
  - Select **Network** from the table of contents and click **Add Network > Add Object**.
  - Define the dynamic NAT pool.

Name the network object (for example, myNATpool) and enter the network range 209.165.201.20-209.165.201.30.

**New Network Objects** ? x

Name: myNATpool

Description:

Network: 209.165.201.20-209.165.201.30  
Format: ipaddr or ipaddr/len or range (2.2.2.10-2.2.2.20)

Allow Overrides:

d) Click **Save**.

**Step 2** Create a network object for the inside network.

- a) Click **Add Network > Add Object**.
- b) Name the network object (for example, MyInsNet) and enter the network address 10.1.2.0/24.

**New Network Objects**

Name: MyInsNet

Description:

Network: 10.1.2.0/24

Allow Overrides:

c) Click **Save**.

**Step 3** Create a network object for the outside web server.

- a) Click **Add Network > Add Object**.
- b) Name the network object (for example, MyWebServer) and enter the host address 209.165.201.12.

**New Network Objects**

Name: myWebServer

Description:

Network: 209.165.201.12

Allow Overrides:

c) Click **Save**.

**Step 4** Create a network object for the translated web server address.

- a) Click **Add Network > Add Object**.
- b) Name the network object (for example, TransWebServer) and enter the host address 10.1.2.20.

## New Network Objects

|                  |                                     |
|------------------|-------------------------------------|
| Name:            | TransWebServer                      |
| Description:     |                                     |
| Network:         | 10.1.2.20                           |
| Allow Overrides: | <input checked="" type="checkbox"/> |

c) Click **Save**.

**Step 5**

Configure dynamic NAT for the inside network using the dynamic NAT pool object.

a) Select **Devices > NAT** and create or edit an Firepower Threat Defense NAT policy.

b) Click **Add Rule**.

c) Configure the following properties:

- **NAT Rule** = Auto NAT Rule.
- **Type** = Dynamic.

d) On **Interface Objects**, configure the following:

- **Source Interface Objects** = inside.
- **Destination Interface Objects** = outside.

e) On **Translation**, configure the following:

- **Original Source** = myInsNet network object.
- **Translated Source > Address** = myNATpool network group.

## Add NAT Rule

|                                                                                                                                                                                                                                                                                                                                                                      |                                                    |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------|
| NAT Rule:                                                                                                                                                                                                                                                                                                                                                            | Auto NAT Rule                                      |

| Translated Source:                                                                                                                                                                                                                                                                                                                                                   | Address                                            |
|                                                                                                                                                                                                                                                                                                                                                                      | myNATpool                                          |
| Translated Port:                                                                                                                                                                                                                                                                                                                                                     |                                                    |

f) Click **Save**.

**Step 6**

Configure static NAT for the web server.

a) Click **Add Rule**.

b) Configure the following properties:

- **NAT Rule** = Auto NAT Rule.
- **Type** = Static.

- c) On **Interface Objects**, configure the following:
- **Source Interface Objects** = outside.
  - **Destination Interface Objects** = inside.
- d) On **Translation**, configure the following:
- **Original Source** = myWebServer network object.
  - **Translated Source > Address**= TransWebServer network object.

### Add NAT Rule

NAT Rule: Auto NAT Rule

Type: Static  Enable

Interface Objects **Translation** PAT Pool Advanced

**Original Packet**

Original Source: \* myWebServer

Original Port: TCP

**Translated Packet**

Translated Source: Address

Translated Port:

- e) Click **Save**.

**Step 7** Click **Save** on the NAT rule page.

## Inside Load Balancer with Multiple Mapped Addresses (Static Auto NAT, One-to-Many)

The following example shows an inside load balancer that is translated to multiple IP addresses. When an outside host accesses one of the mapped IP addresses, it is untranslated to the single load balancer address. Depending on the URL requested, it redirects traffic to the correct web server.

Figure 47: Static NAT with One-to-Many for an Inside Load Balancer

### Before you begin

Ensure that you have interface objects (security zones or interface groups) that contain the interfaces for the device that protects the web server. In this example, we will assume the interface objects are security zones named **inside** and **outside**. To configure interface objects, select **Objects > Object Management**, then select **Interface**.

### Procedure

**Step 1** Create a network object for the addresses to which you want to map the load balancer.

- Choose **Objects > Object Management**.
- Select **Network** from the table of contents and click **Add Network > Add Object**.
- Define the addresses.

Name the network object (for example, myPublicIPs) and enter the network range 209.165.201.3-209.165.201.5.

**New Network Objects** ? X

Name:

Description:

Network:   
 Format: ipaddr or ipaddr/len  
 or range (2.2.2.10-2.2.2.20)

Allow Overrides:

d) Click **Save**.

**Step 2** Create a network object for the load balancer.

- a) Click **Add Network > Add Object**.
- b) Name the network object (for example, myLBHost), enter the host address 10.1.2.27.

**New Network Objects**

Name:

Description:

Network:

Allow Overrides:

c) Click **Save**.

**Step 3** Configure static NAT for the load balancer.

- a) Select **Devices > NAT** and create or edit an Firepower Threat Defense NAT policy.
- b) Click **Add Rule**.
- c) Configure the following properties:
  - **NAT Rule** = Auto NAT Rule.
  - **Type** = Static.
- d) On **Interface Objects**, configure the following:
  - **Source Interface Objects** = inside.
  - **Destination Interface Objects** = outside.
- e) On **Translation**, configure the following:
  - **Original Source** = myLBHost network object.
  - **Translated Source > Address** = myPublicIPs network group.

## Add NAT Rule

NAT Rule:  ▾

Type:  ▾  Enable

Interface Objects: **Translation** PAT Pool Advanced

| Original Packet                                                        | Translated Packet                                       |
|------------------------------------------------------------------------|---------------------------------------------------------|
| Original Source:* <input type="text" value="myLBHost"/> ▾ ⊕            | Translated Source: <input type="text" value="Address"/> |
| Original Port: <input type="text" value="TCP"/> ▾ <input type="text"/> | <input type="text" value="myPublicIPs"/>                |
|                                                                        | Translated Port: <input type="text"/>                   |

f) Click **Save**.

**Step 4** Click **Save** on the NAT rule page.

## Single Address for FTP, HTTP, and SMTP (Static Auto NAT-with-Port-Translation)

The following static NAT-with-port-translation example provides a single address for remote users to access FTP, HTTP, and SMTP. These servers are actually different devices on the real network, but for each server, you can specify static NAT-with-port-translation rules that use the same mapped IP address, but different ports.

Figure 48: Static NAT-with-Port-Translation

### Before you begin

Ensure that you have interface objects (security zones or interface groups) that contain the interfaces for the device that protects the servers. In this example, we will assume the interface objects are security zones named **inside** and **outside**. To configure interface objects, select **Objects > Object Management**, then select **Interface**.

### Procedure

- Step 1** Create a network object for the FTP server.
- Choose **Objects > Object Management**.
  - Select **Network** from the table of contents and click **Add Network > Add Object**.
  - Name the network object (for example, FTPserver), and enter the real IP address for the FTP server, 10.1.2.27.

#### New Network Objects

|                  |                                     |
|------------------|-------------------------------------|
| Name:            | FTPserver                           |
| Description:     |                                     |
| Network:         | 10.1.2.27                           |
| Allow Overrides: | <input checked="" type="checkbox"/> |

d) Click **Save**.

**Step 2** Create a network object for the HTTP server.

- a) Click **Add Network > Add Object**.
- b) Name the network object (for example, HTTPserver), enter the host address 10.1.2.28.

#### New Network Objects

|                  |                                     |
|------------------|-------------------------------------|
| Name:            | HTTPserver                          |
| Description:     |                                     |
| Network:         | 10.1.2.28                           |
| Allow Overrides: | <input checked="" type="checkbox"/> |

c) Click **Save**.

**Step 3** Create a network object for the SMTP server.

- a) Click **Add Network > Add Object**.
- b) Name the network object (for example, SMTPserver), enter the host address 10.1.2.29.

#### Edit Network Objects

|                  |                                     |
|------------------|-------------------------------------|
| Name:            | SMTPserver                          |
| Description:     |                                     |
| Network:         | 10.1.2.29                           |
| Allow Overrides: | <input checked="" type="checkbox"/> |

c) Click **Save**.

**Step 4** Create a network object for the public IP address used for the three servers.

- a) Click **Add Network > Add Object**.
- b) Name the network object (for example, ServerPublicIP) and enter the host address 209.165.201.3.

#### New Network Objects

|                  |                                     |
|------------------|-------------------------------------|
| Name:            | ServerPublicIP                      |
| Description:     |                                     |
| Network:         | 209.165.201.3                       |
| Allow Overrides: | <input checked="" type="checkbox"/> |

c) Click **Save**.

**Step 5** Configure static NAT with port translation for the FTP server, mapping the FTP port to itself.

- a) Select **Devices > NAT** and create or edit an Firepower Threat Defense NAT policy.
- b) Click **Add Rule**.
- c) Configure the following properties:
  - **NAT Rule** = Auto NAT Rule.

- **Type** = Static.
- d) On **Interface Objects**, configure the following:
- **Source Interface Objects** = inside.
  - **Destination Interface Objects** = outside.
- e) On **Translation**, configure the following:
- **Original Source** = FTPserver network object.
  - **Translated Source > Address** = ServerPublicIP network object.
  - **Original Port > TCP** = 21.
  - **Translated Port** = 21.

## Add NAT Rule

The screenshot shows the 'Add NAT Rule' configuration interface. At the top, 'NAT Rule' is set to 'Auto NAT Rule' and 'Type' is 'Static'. An 'Enable' checkbox is checked. Below this are tabs for 'Interface Objects', 'Translation', 'PAT Pool', and 'Advanced'. The 'Translation' tab is selected. It is divided into two sections: 'Original Packet' and 'Translated Packet'. In the 'Original Packet' section, 'Original Source' is set to 'FTPserver' and 'Original Port' is set to 'TCP' with the value '21'. In the 'Translated Packet' section, 'Translated Source' is set to 'Address' and 'Translated Port' is set to '21'.

- f) Click **Save**.

**Step 6** Configure static NAT with port translation for the HTTP server, mapping the HTTP port to itself.

- a) Click **Add Rule**.
- b) Configure the following properties:
- **NAT Rule** = Auto NAT Rule.
  - **Type** = Static.
- c) On **Interface Objects**, configure the following:
- **Source Interface Objects** = inside.
  - **Destination Interface Objects** = outside.
- d) On **Translation**, configure the following:
- **Original Source** = HTTPserver network object.
  - **Translated Source > Address** = ServerPublicIP network object.
  - **Original Port > TCP** = 80.
  - **Translated Port** = 80.

## Add NAT Rule

|                                                                                                                                                                                                                                                                                                                                       |               |                                 |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|---------------------------------|
| NAT Rule:                                                                                                                                                                                                                                                                                                                             | Auto NAT Rule | <input type="checkbox"/> Enable |

e) Click **Save**.

**Step 7** Configure static NAT with port translation for the SMTP server, mapping the SMTP port to itself.

a) Click **Add Rule**.

b) Configure the following properties:

- **NAT Rule** = Auto NAT Rule.
- **Type** = Static.

c) On **Interface Objects**, configure the following:

- **Source Interface Objects** = inside.
- **Destination Interface Objects** = outside.

d) On **Translation**, configure the following:

- **Original Source** = SMTPserver network object.
- **Translated Source** > **Address**= ServerPublicIP network object.
- **Original Port** > **TCP** = 25.
- **Translated Port** = 25.

## Add NAT Rule

|                                                                                                                                                                                                                                                                                                                                       |               |                                 |

e) Click **Save**.

**Step 8** Click **Save** on the NAT rule page.

## Different Translation Depending on the Destination (Dynamic Manual PAT)

The following figure shows a host on the 10.1.2.0/24 network accessing two different servers. When the host accesses the server at 209.165.201.11, the real address is translated to 209.165.202.129:port. When the host accesses the server at 209.165.200.225, the real address is translated to 209.165.202.130:port.

**Figure 49: Manual NAT with Different Destination Addresses**

### Before you begin

Ensure that you have interface objects (security zones or interface groups) that contain the interfaces for the device that protects the servers. In this example, we will assume the interface objects are security zones named **inside** and **dmz**. To configure interface objects, select **Objects > Object Management**, then select **Interface**.

### Procedure

- Step 1** Create a network object for the inside network.
- Choose **Objects > Object Management**.
  - Select **Network** from the table of contents and click **Add Network > Add Object**.
  - Name the network object (for example, myInsideNetwork), and enter the real network address, 10.1.2.0/24.

## New Network Objects

|                  |                                     |
|------------------|-------------------------------------|
| Name:            | myInsideNetwork                     |
| Description:     |                                     |
| Network:         | 10.1.2.0/24                         |
| Allow Overrides: | <input checked="" type="checkbox"/> |

d) Click **Save**.

**Step 2** Create a network object for the DMZ network 1.

- Click **Add Network > Add Object**.
- Name the network object (for example, DMZnetwork1) and enter the network address 209.165.201.0/27 (subnet mask of 255.255.255.224).

## New Network Objects

|                  |                                     |
|------------------|-------------------------------------|
| Name:            | DMZnetwork1                         |
| Description:     |                                     |
| Network:         | 209.165.201.0/27                    |
| Allow Overrides: | <input checked="" type="checkbox"/> |

c) Click **Save**.

**Step 3** Create a network object for the PAT address for DMZ network 1.

- Click **Add Network > Add Object**.
- Name the network object (for example, PATaddress1) and enter the host address 209.165.202.129.

## New Network Objects

|                  |                                     |
|------------------|-------------------------------------|
| Name:            | PATaddress1                         |
| Description:     |                                     |
| Network:         | 209.165.202.129                     |
| Allow Overrides: | <input checked="" type="checkbox"/> |

c) Click **Save**.

**Step 4** Create a network object for the DMZ network 2.

- Click **Add Network > Add Object**.
- Name the network object (for example, DMZnetwork2) and enter the network address 209.165.200.224/27 (subnet mask of 255.255.255.224).

## New Network Objects

|                  |                                     |
|------------------|-------------------------------------|
| Name:            | DMZnetwork2                         |
| Description:     |                                     |
| Network:         | 209.165.200.224/27                  |
| Allow Overrides: | <input checked="" type="checkbox"/> |

c) Click **Save**.

**Step 5**

Create a network object for the PAT address for DMZ network 2.

- a) Click **Add Network > Add Object**.
- b) Name the network object (for example, PATaddress2) and enter the host address 209.165.202.130.

## New Network Objects

|                  |                                     |
|------------------|-------------------------------------|
| Name:            | PATaddress2                         |
| Description:     |                                     |
| Network:         | 209.165.202.130                     |
| Allow Overrides: | <input checked="" type="checkbox"/> |

c) Click **Save**.

**Step 6**

Configure dynamic manual PAT for DMZ network 1.

- a) Select **Devices > NAT** and create or edit an Firepower Threat Defense NAT policy.
- b) Click **Add Rule**.
- c) Configure the following properties:
  - **NAT Rule** = Manual NAT Rule.
  - **Type** = Dynamic.
- d) On **Interface Objects**, configure the following:
  - **Source Interface Objects** = inside.
  - **Destination Interface Objects** = dmz.
- e) On **Translation**, configure the following:
  - **Original Source** = myInsideNetwork network object.
  - **Translated Source > Address** = PATaddress1 network object.
  - **Original Destination > Address** = DMZnetwork1 network object.
  - **Translated Destination** = DMZnetwork1 network object.

**Note** Because you do not want to translate the destination address, you need to configure identity NAT for it by specifying the same address for the original and translated destination addresses. Leave all of the port fields blank.

## Add NAT Rule

|                                                                                                                                                                                                                                                                                                                                       |                 |                                            |             |                  |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|--------------------------------------------|-------------|------------------|
| NAT Rule:                                                                                                                                                                                                                                                                                                                             | Manual NAT Rule | Insert:                                    | In Category | NAT Rules Before |

| Original Destination:                                                                                                                                                                                                                                                                                                                 | Address         |                                            | PATaddress1 |                  |
|                                                                                                                                                                                                                                                                                                                                       | DMZNetwork1     | Translated Destination:                    | DMZNetwork1 |                  |

f) Click **Save**.

**Step 7** Configure dynamic manual PAT for DMZ network 2.

a) Click **Add Rule**.

b) Configure the following properties:

- **NAT Rule** = Manual NAT Rule.
- **Type** = Dynamic.

c) On **Interface Objects**, configure the following:

- **Source Interface Objects** = inside.
- **Destination Interface Objects** = dmz.

d) On **Translation**, configure the following:

- **Original Source** = myInsideNetwork network object.
- **Translated Source** > **Address** = PATaddress2 network object.
- **Original Destination** > **Address** = DMZnetwork2 network object.
- **Translated Destination** = DMZnetwork2 network object.

## Add NAT Rule

| Original Destination:                                                                                                                                                                                                                                                                                                                 | Address         |                                            | PATaddress2 |                  |
|                                                                                                                                                                                                                                                                                                                                       | DMZNetwork2     | Translated Destination:                    | DMZNetwork2 |                  |

e) Click **Save**.

**Step 8** Click **Save** on the NAT rule page.

## Different Translation Depending on the Destination Address and Port (Dynamic Manual PAT)

The following figure shows the use of source and destination ports. The host on the 10.1.2.0/24 network accesses a single host for both web services and Telnet services. When the host accesses the server for Telnet services, the real address is translated to 209.165.202.129:port. When the host accesses the same server for web services, the real address is translated to 209.165.202.130:port.

**Figure 50: Manual NAT with Different Destination Ports**

### Before you begin

Ensure that you have interface objects (security zones or interface groups) that contain the interfaces for the device that protects the servers. In this example, we will assume the interface objects are security zones named **inside** and **dmz**. To configure interface objects, select **Objects > Object Management**, then select **Interface**.

### Procedure

- Step 1** Create a network object for the inside network.
- Choose **Objects > Object Management**.
  - Select **Network** from the table of contents and click **Add Network > Add Object**.
  - Name the network object (for example, myInsideNetwork) and enter the real network address, 10.1.2.0/24.

## New Network Objects

|                  |                                     |
|------------------|-------------------------------------|
| Name:            | myInsideNetwork                     |
| Description:     |                                     |
| Network:         | 10.1.2.0/24                         |
| Allow Overrides: | <input checked="" type="checkbox"/> |

d) Click **Save**.

**Step 2**

Create a network object for the Telnet/Web server.

a) Click **Add Network > Add Object**.

b) Name the network object (for example, TelnetWebServer) and enter the host address 209.165.201.11.

## New Network Objects

|                  |                                     |
|------------------|-------------------------------------|
| Name:            | TelnetWebServer                     |
| Description:     |                                     |
| Network:         | 209.165.201.11                      |
| Allow Overrides: | <input checked="" type="checkbox"/> |

## New Network Object

|                 |                                                                                                                            |
|-----------------|----------------------------------------------------------------------------------------------------------------------------|
| Name            | TelnetWebServer                                                                                                            |
| Description     |                                                                                                                            |
| Network         | <input checked="" type="radio"/> Host <input type="radio"/> Range <input type="radio"/> Network <input type="radio"/> FQDN |
|                 | 209.165.201.11                                                                                                             |
| Allow Overrides | <input type="checkbox"/>                                                                                                   |

c) Click **Save**.

**Step 3**

Create a network object for the PAT address when using Telnet.

a) Click **Add Network > Add Object**.

b) Name the network object (for example, PATaddress1) and enter the host address 209.165.202.129.

## New Network Objects

|                  |                                     |
|------------------|-------------------------------------|
| Name:            | PATaddress1                         |
| Description:     |                                     |
| Network:         | 209.165.202.129                     |
| Allow Overrides: | <input checked="" type="checkbox"/> |

c) Click **Save**.

**Step 4**

Create a network object for the PAT address when using HTTP.

a) Click **Add Network > Add Object**.

- b) Name the network object (for example, PATAddress2) and enter the host address 209.165.202.130.

**New Network Objects**

|                  |                                     |
|------------------|-------------------------------------|
| Name:            | PATAddress2                         |
| Description:     |                                     |
| Network:         | 209.165.202.130                     |
| Allow Overrides: | <input checked="" type="checkbox"/> |

- c) Click **Save**.

### Step 5

Configure dynamic manual PAT for Telnet access.

- Select **Devices > NAT** and create or edit an Firepower Threat Defense NAT policy.
- Click **Add Rule**.
- Configure the following properties:
  - **NAT Rule** = Manual NAT Rule.
  - **Type** = Dynamic.
- On **Interface Objects**, configure the following:
  - **Source Interface Objects** = inside.
  - **Destination Interface Objects** = dmz.
- On **Translation**, configure the following:
  - **Original Source** = myInsideNetwork network object.
  - **Translated Source > Address** = PATAddress1 network object.
  - **Original Destination > Address** = TelnetWebServer network object.
  - **Translated Destination** = TelnetWebServer network object.
  - **Original Destination Port** = TELNET port object (system-defined).
  - **Translated Destination Port** = TELNET port object (system-defined).

**Note** Because you do not want to translate the destination address or port, you need to configure identity NAT for them by specifying the same address for the original and translated destination addresses, and the same port for the original and translated port.

## Add NAT Rule

|                                                                                                                                                                                                                                                                                                                                               |                 |                                            |                 |                  |

|                                                                                                                                                                                                                                                                                                                                               | TelnetWebServer | Translated Destination:                    | TelnetWebServer |                  |
| Original Source Port:                                                                                                                                                                                                                                                                                                                         |                 | Translated Source Port:                    |                 |                  |
| Original Destination Port:                                                                                                                                                                                                                                                                                                                    | TELNET          | Translated Destination Port:               | TELNET          |                  |

f) Click **Save**.

**Step 6** Configure dynamic manual PAT for web access.

- a) Click **Add Rule**.
- b) Configure the following properties:
  - **NAT Rule** = Manual NAT Rule.
  - **Type** = Dynamic.
- c) On **Interface Objects**, configure the following:
  - **Source Interface Objects** = inside.
  - **Destination Interface Objects** = dmz.
- d) On **Translation**, configure the following:
  - **Original Source** = myInsideNetwork network object.
  - **Translated Source > Address** = PATaddress2 network object.
  - **Original Destination > Address** = TelnetWebServer network object.
  - **Translated Destination** = TelnetWebServer network object.
  - **Original Destination Port** = HTTP port object (system-defined).
  - **Translated Destination Port** = HTTP port object (system-defined).

## Add NAT Rule

|                                                                                                                                                                                                                                                                                                                                       |                 |                                            |                 |                  |

e) Click **Save**.

**Step 7** Click **Save** on the NAT rule page.

## NAT and Site-to-Site VPN

The following figure shows a site-to-site tunnel connecting the Boulder and San Jose offices. For traffic that you want to go to the Internet (for example from 10.1.1.6 in Boulder to www.example.com), you need a public IP address provided by NAT to access the Internet. The below example uses interface PAT rules. However, for traffic that you want to go over the VPN tunnel (for example from 10.1.1.6 in Boulder to 10.2.2.78 in San Jose), you do not want to perform NAT; you need to exempt that traffic by creating an identity NAT rule. Identity NAT simply translates an address to the same address.

Figure 51: Interface PAT and Identity NAT for Site-to-Site VPN

The following example explains the configuration for Firewall1 (Boulder).

### Before you begin

Ensure that you have interface objects (security zones or interface groups) that contain the interfaces for the devices in the VPN. In this example, we will assume the interface objects are security zones named **inside-boulder** and **outside-boulder** for the Firewall1 (Boulder) interfaces. To configure interface objects, select **Objects > Object Management**, then select **Interfaces**.

### Procedure

**Step 1** Create the objects to define the various networks.

- Choose **Objects > Object Management**.
- Select **Network** from the table of contents and click **Add Network > Add Object**.
- Identify the Boulder inside network.

Name the network object (for example, boulder-network) and enter the network address, 10.1.1.0/24.

**New Network Objects** ? x

Name:

Description:

Network:   
Format: ipaddr or ipaddr/len or range (2.2.2.10-2.2.2.20)

Allow Overrides:

- d) Click **Save**.
- e) Click **Add Network > Add Object** and define the inside San Jose network.

Name the network object (for example, sanjose-network) and enter the network address 10.2.2.0/24.

**New Network Objects** ? x

Name:

Description:

Network:

*Format: ipaddr or ipaddr/len or range (2.2.2.10-2.2.2.20)*

Allow Overrides:

- f) Click **Save**.

## Step 2

Configure manual identity NAT for the Boulder network when going over the VPN to San Jose on Firewall1 (Boulder).

- a) Select **Devices > NAT** and create or edit an Firepower Threat Defense NAT policy.
- b) Click **Add Rule**.
- c) Configure the following properties:

- **NAT Rule** = Manual NAT Rule.
- **Type** = Static.

- d) On **Interface Objects**, configure the following:
  - **Source Interface Objects** = inside-boulder.
  - **Destination Interface Objects** = outside-boulder.

- e) On **Translation**, configure the following:
  - **Original Source** = boulder-network object.
  - **Translated Source > Address** = boulder-network object.
  - **Original Destination > Address** = sanjose-network object.
  - **Translated Destination** = sanjose-network object.

**Note** Because you do not want to translate the destination address, you need to configure identity NAT for it by specifying the same address for the original and translated destination addresses. Leave all of the port fields blank. This rule configures identity NAT for both source and destination.

- f) On **Advanced**, select **Do not proxy ARP on Destination interface**.

## Add NAT Rule

|                                                                                                                                                                                                                                                                                                                                               |                 |                                            |                 |                  |

| Original Destination:                                                                                                                                                                                                                                                                                                                         | Address         |                                            | boulder-network |                  |
|                                                                                                                                                                                                                                                                                                                                               | sanjose-network | Translated Destination:                    | sanjose-network |                  |

g) Click **Save**.

**Step 3** Configure manual dynamic interface PAT when going to the Internet for the inside Boulder network on Firewall1 (Boulder).

a) Click **Add Rule**.

b) Configure the following properties:

- **NAT Rule** = Manual NAT Rule.
- **Type** = Dynamic.
- **Insert Rule** = any position after the first rule. Because this rule will apply to any destination address, the rule that uses sanjose-network as the destination must come before this rule, or the sanjose-network rule will never be matched. The default is to place new manual NAT rules at the end of the "NAT Rules Before Auto NAT" section.

c) On **Interface Objects**, configure the following:

- **Source Interface Objects** = inside-boulder.
- **Destination Interface Objects** = outside-boulder.

d) On **Translation**, configure the following:

- **Original Source** = boulder-network object.
- **Translated Source** = **Destination Interface IP**. This option configures interface PAT using the interface contained in the destination interface object.
- **Original Destination** > **Address** = any (leave blank).
- **Translated Destination** = any (leave blank).

## Add NAT Rule

e) Click **Save**.

**Step 4** If you are also managing Firewall2 (San Jose), you can configure similar rules for that device.

- The manual identity NAT rule would be for sanjose-network when the destination is boulder-network. Create new interface objects for the Firewall2 inside and outside networks.
- The manual dynamic interface PAT rule would be for sanjose-network when the destination is "any."

## Rewriting DNS Queries and Responses Using NAT

You might need to configure the FTD device to modify DNS replies by replacing the address in the reply with an address that matches the NAT configuration. You can configure DNS modification when you configure each translation rule. DNS modification is also known as DNS doctoring.

This feature rewrites the address in DNS queries and replies that match a NAT rule (for example, the A record for IPv4, the AAAA record for IPv6, or the PTR record for reverse DNS queries). For DNS replies traversing from a mapped interface to any other interface, the record is rewritten from the mapped value to the real value. Inversely, for DNS replies traversing from any interface to a mapped interface, the record is rewritten from the real value to the mapped value. This feature works with NAT44, NAT 66, NAT46, and NAT64.

Following are the main circumstances when you would need to configure DNS rewrite on a NAT rule.

- The rule is NAT64 or NAT46, and the DNS server is on the outside network. You need DNS rewrite to convert between DNS A records (for IPv4) and AAAA records (for IPv6).
- The DNS server is on the outside, clients are on the inside, and some of the fully-qualified domain names that the clients use resolve to other inside hosts.
- The DNS server is on the inside and responds with private IP addresses, clients are on the outside, and the clients access fully-qualified domain names that point to servers that are hosted on the inside.

### DNS Rewrite Limitations

Following are some limitations with DNS rewrite:

- DNS rewrite is not applicable for PAT because multiple PAT rules are applicable for each A or AAAA record, and the PAT rule to use is ambiguous.

- If you configure a manual NAT rule, you cannot configure DNS modification if you specify the destination address as well as the source address. These kinds of rules can potentially have a different translation for a single address when going to A vs. B. Therefore, they cannot accurately match the IP address inside the DNS reply to the correct NAT rule; the DNS reply does not contain information about which source/destination address combination was in the packet that prompted the DNS request.
- You must enable DNS application inspection with DNS NAT rewrite enabled for NAT rules to rewrite DNS queries and responses. By default, DNS inspection with DNS NAT rewrite enabled is globally applied, so you probably do not need to change the inspection configuration.
- DNS rewrite is actually done on the xlate entry, not the NAT rule. Thus, if there is no xlate for a dynamic rule, rewrite cannot be done correctly. The same problem does not occur for static NAT.
- DNS rewrite does not rewrite DNS Dynamic Update messages (opcode 5).

The following topics provide examples of DNS rewrite in NAT rules.

## DNS64 Reply Modification

The following figure shows an FTP server and DNS server on the outside IPv4 network. The system has a static translation for the outside server. In this case, when an inside IPv6 user requests the address for ftp.cisco.com from the DNS server, the DNS server responds with the real address, 209.165.200.225.

Because you want inside users to use the mapped address for ftp.cisco.com (2001:DB8::D1A5:C8E1, where D1A5:C8E1 is the IPv6 equivalent of 209.165.200.225) you need to configure DNS reply modification for the static translation. This example also includes a static NAT translation for the DNS server, and a PAT rule for the inside IPv6 hosts.

### Before you begin

Ensure that you have interface objects (security zones or interface groups) that contain the interfaces for the device. In this example, we will assume the interface objects are security zones named **inside** and **outside**. To configure interface objects, select **Objects > Object Management**, then select **Interface**.

### Procedure

- Step 1** Create the network objects for the FTP server, DNS server, inside network, and PAT pool.
- Choose **Objects > Object Management**.
  - Select **Network** from the table of contents and click **Add Network > Add Object**.
  - Define the real FTP server address.
- Name the network object (for example, ftp\_server) and enter the host address, 209.165.200.225.

**New Network Objects** ? x

Name:

Description:

Network:   
 Format: ipaddr or ipaddr/len or range (ipaddr-ipaddr)

Allow Overrides:

- d) Click **Save**.
- e) Click **Add Network > Add Object** and define the FTP server's translated IPv6 address.  
 Name the network object (for example, ftp\_server\_v6) and enter the host address, 2001:DB8::D1A5:C8E1.

**New Network Objects** ? x

Name:

Description:

Network:   
 Format: ipaddr or ipaddr/len or range (ipaddr-ipaddr)

Allow Overrides:

- f) Click **Save**.
- g) Click **Add Network > Add Object** and define the DNS server's real address.  
 Name the network object (for example, dns\_server) and enter the host address, 209.165.201.15.

**New Network Objects** ? x

Name:

Description:

Network:   
 Format: ipaddr or ipaddr/len or range (ipaddr-ipaddr)

Allow Overrides:

- h) Click **Save**.
- i) Click **Add Network > Add Object** and define the DNS server's translated IPv6 address.  
 Name the network object (for example, dns\_server\_v6) and enter the host address, 2001:DB8::D1A5:C90F (where D1A5:C90F is the IPv6 equivalent of 209.165.201.15).

**New Network Objects** ? x

Name:

Description:

Network:   
 Format: ipaddr or ipaddr/len or range (ipaddr-ipaddr)

Allow Overrides:

j) Click **Save**.

k) Click **Add Network > Add Object** and define the inside IPv6 network.

Name the network object (for example, inside\_v6) and enter the network address, 2001:DB8::/96.

**New Network Objects** ? x

Name:

Description:

Network:   
 Format: ipaddr or ipaddr/len or range (ipaddr-ipaddr)

Allow Overrides:

l) Click **Save**.

m) Click **Add Network > Add Object** and define the IPv4 PAT pool for the inside IPv6 network.

Name the network object (for example, ipv4\_pool) and enter the range 209.165.200.230-209.165.200.235.

**New Network Objects** ? x

Name:

Description:

Network:   
 Format: ipaddr or ipaddr/len or range (ipaddr-ipaddr)

Allow Overrides:

n) Click **Save**.

## Step 2

Configure the static NAT rule with DNS modification for the FTP server.

a) Select **Devices > NAT** and create or edit an Firepower Threat Defense NAT policy.

b) Click **Add Rule**.

c) Configure the following properties:

- **NAT Rule** = Auto NAT Rule.
- **Type** = Static.

- d) On **Interface Objects**, configure the following:
- **Source Interface Objects** = outside.
  - **Destination Interface Objects** = inside.
- e) On **Translation**, configure the following:
- **Original Source** = ftp\_server network object.
  - **Translated Source > Address** = ftp\_server\_v6 network object.

## Add NAT Rule

The screenshot shows the 'Add NAT Rule' configuration window. At the top, 'NAT Rule' is set to 'Auto NAT Rule' and 'Type' is 'Static'. The 'Enable' checkbox is checked. Below this, there are four tabs: 'Interface Objects', 'Translation', 'PAT Pool', and 'Advanced'. The 'Translation' tab is selected. Under 'Original Packet', 'Original Source' is 'ftp\_server' and 'Original Port' is 'TCP'. Under 'Translated Packet', 'Translated Source' is 'Address' and 'ftp\_server\_v6'.

- f) On **Advanced**, select the following options:
- **Translate DNS replies that match this rule.**
  - **Net to Net Mapping**, because this is a one-to-one NAT46 translation.
- g) Click **OK**.

**Step 3** Configure the static NAT rule for the DNS server.

- a) Click **Add Rule**.
- b) Configure the following properties:
- **NAT Rule** = Auto NAT Rule.
  - **Type** = Static.
- c) On **Interface Objects**, configure the following:
- **Source Interface Objects** = outside.
  - **Destination Interface Objects** = inside.
- d) On **Translation**, configure the following:
- **Original Source** = dns\_server network object.
  - **Translated Source > Address** = dns\_server\_v6 network object.
- e) On **Advanced**, select **Net to Net Mapping**, because this is a one-to-one NAT46 translation.

## Add NAT Rule

NAT Rule: Auto NAT Rule

Type: Static  Enable

Interface Objects: Translation | PAT Pool | Advanced

**Original Packet**

Original Source:\* dns\_server

Original Port: TCP

**Translated Packet**

Translated Source: Address  
dns\_server\_v6

f) Click **OK**.

**Step 4** Configure the dynamic NAT with a PAT pool rule for the inside IPv6 network.

- a) Click **Add Rule**.
- b) Configure the following properties:
  - **NAT Rule** = Auto NAT Rule.
  - **Type** = Dynamic.
- c) On **Interface Objects**, configure the following:
  - **Source Interface Objects** = inside.
  - **Destination Interface Objects** = outside.
- d) On **Translation**, configure the following:
  - **Original Source** = inside\_v6 network object.
  - **Translated Source** > **Address** = leave this field empty.

## Add NAT Rule

NAT Rule: Auto NAT Rule

Type: Dynamic  Enable

Interface Objects: Translation | PAT Pool | Advanced

**Original Packet**

Original Source:\* inside\_v6

Original Port: TCP

**Translated Packet**

Translated Source: Address

- e) On **PAT Pool**, configure the following:
  - **Enable PAT Pool** = select this option.
  - **Translated Source** > **Address** = ipv4\_pool network object.

**Add NAT Rule**

NAT Rule:  ▾

Type:  ▾  Enable

Interface Objects Translation **PAT Pool** Advanced

Enable PAT Pool

PAT:  ▾  ▾

Use Round Robin Allocation

Extended PAT Table

Flat Port Range

Include Reserve Ports

f) Click **OK**.

## DNS Reply Modification, DNS Server on Outside

The following figure shows a DNS server that is accessible from the outside interface. A server, ftp.cisco.com, is on the inside interface. You configure NAT to statically translate the ftp.cisco.com real address (10.1.3.14) to a mapped address (209.165.201.10) that is visible on the outside network.

In this case, you want to enable DNS reply modification on this static rule so that inside users who have access to ftp.cisco.com using the real address receive the real address from the DNS server, and not the mapped address.

When an inside host sends a DNS request for the address of ftp.cisco.com, the DNS server replies with the mapped address (209.165.201.10). The system refers to the static rule for the inside server and translates the address inside the DNS reply to 10.1.3.14. If you do not enable DNS reply modification, then the inside host attempts to send traffic to 209.165.201.10 instead of accessing ftp.cisco.com directly.

### Before you begin

Ensure that you have interface objects (security zones or interface groups) that contain the interfaces for the device. In this example, we will assume the interface objects are security zones named **inside** and **outside**. To configure interface objects, select **Objects > Object Management**, then select **Interface**.

### Procedure

- 
- Step 1** Create the network objects for the FTP server.
- Choose **Objects > Object Management**.
  - Select **Network** from the table of contents and click **Add Network > Add Object**.
  - Define the real FTP server address.  
Name the network object (for example, ftp\_server) and enter the host address, 10.1.3.14.

**New Network Objects** ? x

Name:

Description:

Network:   
 Format: ipaddr or ipaddr/len or range (ipaddr-ipaddr)

Allow Overrides:

- d) Click **Save**.
- e) Click **Add Network > Add Object** and define the FTP server's translated address.  
 Name the network object (for example, ftp\_server\_outside) and enter the host address, 209.165.201.10.

**New Network Objects** ? x

Name:

Description:

Network:   
 Format: ipaddr or ipaddr/len or range (ipaddr-ipaddr)

Allow Overrides:

- f) Click **Save**.

## Step 2

Configure the static NAT rule with DNS modification for the FTP server.

- a) Select **Devices > NAT** and create or edit an Firepower Threat Defense NAT policy.
- b) Click **Add Rule**.
- c) Configure the following properties:
  - **NAT Rule** = Auto NAT Rule.
  - **Type** = Static.
- d) On **Interface Objects**, configure the following:
  - **Source Interface Objects** = inside.
  - **Destination Interface Objects** = outside.
- e) On **Translation**, configure the following:
  - **Original Source** = ftp\_server network object.
  - **Translated Source > Address** = ftp\_server\_outside network object.
- f) On **Advanced**, select **Translate DNS replies that match this rule**.

## Add NAT Rule

NAT Rule:  ▼

Type:  ▼  Enable

Interface Objects: **Translation** | PAT Pool | Advanced

**Original Packet**

Original Source:\*  +

Original Port:  ▼

**Translated Packet**

Translated Source:  ▼

g) Click **OK**.

## DNS Reply Modification, DNS Server on Host Network

The following figure shows an FTP server and DNS server on the outside. The system has a static translation for the outside server. In this case, when an inside user requests the address for ftp.cisco.com from the DNS server, the DNS server responds with the real address, 209.165.201.10. Because you want inside users to use the mapped address for ftp.cisco.com (10.1.2.56) you need to configure DNS reply modification for the static translation.

### Before you begin

Ensure that you have interface objects (security zones or interface groups) that contain the interfaces for the device. In this example, we will assume the interface objects are security zones named **inside** and **outside**. To configure interface objects, select **Objects > Object Management**, then select **Interface**.

### Procedure

**Step 1** Create the network objects for the FTP server.

- Choose **Objects > Object Management**.
- Select **Network** from the table of contents and click **Add Network > Add Object**.
- Define the real FTP server address.

Name the network object (for example, ftp\_server) and enter the host address, 209.165.201.10.

**New Network Objects** ? x

Name: ftp\_server

Description:

Network: 209.165.201.10  
Format: ipaddr or ipaddr/len or range (ipaddr-ipaddr)

Allow Overrides:

- Click **Save**.
- Click **Add Network > Add Object** and define the FTP server's translated address.

Name the network object (for example, ftp\_server\_translated) and enter the host address, 10.1.2.56.

**New Network Objects** ? x

Name: ftp\_server\_translated

Description:

Network: 10.1.2.56  
Format: ipaddr or ipaddr/len or range (ipaddr-ipaddr)

Allow Overrides:

- Click **Save**.

**Step 2** Configure the static NAT rule with DNS modification for the FTP server.

- Select **Devices > NAT** and create or edit an Firepower Threat Defense NAT policy.
- Click **Add Rule**.
- Configure the following properties:
  - **NAT Rule** = Auto NAT Rule.
  - **Type** = Static.

- d) On **Interface Objects**, configure the following:
- **Source Interface Objects** = outside.
  - **Destination Interface Objects** = inside.
- e) On **Translation**, configure the following:
- **Original Source** = ftp\_server network object.
  - **Translated Source > Address** = ftp\_server\_translated network object.
- f) On **Advanced**, select **Translate DNS replies that match this rule**.

## Add NAT Rule

- g) Click **OK**.

- [Gateway VPNs, on page 1165](#)

# CHAPTER 51

## Setting Up Virtual Switches

The following topics describe how to set up virtual switches in the Firepower System:

- [Virtual Switches, on page 1105](#)
- [Switched Interface Configuration, on page 1105](#)
- [Virtual Switch Configuration, on page 1110](#)

### Virtual Switches

You can configure a 7000 or 8000 Series device in a Layer 2 deployment so that it provides packet switching between two or more networks. In a Layer 2 deployment, you can configure virtual switches to operate as standalone broadcast domains, dividing your network into logical segments. A virtual switch uses the media access control (MAC) address from a host to determine where to send packets.

When you configure a virtual switch, the switch initially broadcasts packets through every available port on the switch. Over time, the switch uses tagged return traffic to learn which hosts reside on the networks connected to each port.

A virtual switch must contain two or more switched interfaces to handle traffic. For each virtual switch, traffic becomes limited to the set of ports configured as switched interfaces. For example, if you configure a virtual switch with four switched interfaces, packets sent in through one port for broadcast can only be sent out of the remaining three ports on the switch.

When you configure a physical switched interface, you must assign it to a virtual switch. You can also define additional logical switched interfaces on a physical port as needed. You can group multiple physical interfaces into a single logical switched interface called a link aggregation group (LAG). This single aggregate logical link provides higher bandwidth, redundancy, and load-balancing between two endpoints.

---

**Caution** If a Layer 2 deployment fails for any reason, the device no longer passes traffic.

---

### Switched Interface Configuration

You can set up switched interfaces to have either physical or logical configurations. You can configure physical switched interfaces for handling untagged VLAN traffic. You can also create logical switched interfaces for handling traffic with designated VLAN tags.

In a Layer 2 deployment, the system drops any traffic received on an external physical interface that does not have a switched interface waiting for it. If the system receives a packet with no VLAN tag and you have not configured a physical switched interface for that port, it drops the packet. If the system receives a VLAN-tagged packet and you have not configured a logical switched interface, it also drops the packet.

The system handles traffic that has been received with VLAN tags on switched interfaces by stripping the outermost VLAN tag on ingress before any rules evaluation or forwarding decisions. Packets leaving the device through a VLAN-tagged logical switched interface are encapsulated with the associated VLAN tag on egress.

Note that if you change the parent physical interface to inline or passive, the system deletes all the associated logical interfaces.

## Switched Interface Configuration Notes

You can configure one or more physical ports on a managed device as switched interfaces. You must assign a physical switched interface to a virtual switch before it can handle traffic. You can configure link mode settings and MDI/MDIX settings only for copper interfaces.

---

**Note** Interfaces on 8000 Series appliances do not support half-duplex options.

---

For each physical switched interface, you can add multiple logical switched interfaces. You must associate each logical interface with a VLAN tag to handle traffic received by the physical interface with that specific tag. You must assign a logical switched interface to a virtual switch to handle traffic.

When configuring a switched interface, the range within which you can set the MTU can vary depending on the Firepower System device model and interface type.

The range of MTU values can vary depending on the model of the managed device and the interface type.

---

**Caution** Changing the highest MTU value among all non-management interfaces on the device restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Inspection is interrupted on all non-management interfaces, not just the interface you modified. Whether this interruption drops traffic or passes it without further inspection depends on the model of the managed device and the interface type. See [Snort® Restart Traffic Behavior, on page 350](#) for more information.

---

To edit an existing logical switched interface, click the edit icon (✎) next to the interface.

When you delete a logical switched interface, you remove it from the physical interface where it resides, as well as the virtual switch and security zone it is associated with.

## Configuring Physical Switched Interfaces

| Smart License | Classic License | Supported Devices  | Supported Domains | Access              |
|---------------|-----------------|--------------------|-------------------|---------------------|
| Any           | Control         | 7000 & 8000 Series | Leaf only         | Admin/Network Admin |

### Procedure

- Step 1** Choose **Devices > Device Management**.
- Step 2** Next to the device where you want to configure the switched interface, click **Edit** (✎).  
In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.
- Step 3** Next to the interface you want to configure as a switched interface, click **Edit** (✎).
- Step 4** Click the **Switched** tab.
- Step 5** If you want to associate the switched interface with a security zone, do one of the following:
- Choose an existing security zone from the **Security Zone** drop-down list.
  - Choose **New** to add a new security zone; see [Creating Security Zone and Interface Group Objects, on page 411](#).
- Step 6** If you want to associate the switched interface with a virtual switch, do one of the following:
- Choose an existing virtual switch from the **Virtual Switch** drop-down list.
  - Choose **New** to add a new virtual switch; see [Adding Virtual Switches, on page 1111](#).
- Step 7** Check the **Enabled** check box to allow the switched interface to handle traffic.
- Note** If you clear the check box, the interface becomes disabled so that users cannot access it for security purposes.
- Step 8** From the **Mode** drop-down list, choose an option to designate the link mode, or choose **Autonegotiation** to specify that the interface is configured to auto negotiate speed and duplex settings.  
Mode settings are available only for copper interfaces.  
Interfaces on 8000 Series appliances do not support half-duplex options.
- Step 9** From the **MDI/MDIX** drop-down list, choose an option to designate whether the interface is configured for MDI (medium dependent interface), MDIX (medium dependent interface crossover), or Auto-MDIX.  
By default, MDI/MDIX is set to Auto-MDIX, which automatically handles switching between MDI and MDIX to attain link.
- Step 10** In the **MTU** field, enter a maximum transmission unit (MTU), which designates the largest size packet allowed.  
The range of MTU values can vary depending on the model of the managed device and the interface type.

**Caution** Changing the highest MTU value among all non-management interfaces on the device restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Inspection is interrupted on all non-management interfaces, not just the interface you modified. Whether this interruption drops traffic or passes it without further inspection depends on the model of the managed device and the interface type. See [Snort® Restart Traffic Behavior, on page 350](#) for more information.

**Step 11** Click **Save**.

### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

### Related Topics

[MTU Ranges for 7000 and 8000 Series Devices and NGIPSv](#), on page 500  
[Snort® Restart Scenarios](#), on page 348

## Adding Logical Switched Interfaces

| Smart License | Classic License | Supported Devices  | Supported Domains | Access              |
|---------------|-----------------|--------------------|-------------------|---------------------|
| Any           | Control         | 7000 & 8000 Series | Leaf only         | Admin/Network Admin |

### Procedure

- Step 1** Choose **Devices > Device Management**.
- Step 2** Next to the device where you want to add the switched interface, click the edit icon (✎).  
 In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.
- Step 3** Choose **Add Logical Interface** from the **Add** drop-down menu.
- Step 4** Click **Switched**.
- Step 5** From the **Interface** drop-down list, choose the physical interface that will receive the VLAN-tagged traffic.
- Step 6** In the **VLAN Tag** field, enter a tag value that gets assigned to inbound and outbound traffic on this interface.  
 The tag value can be any integer from 1 to 4094.
- Step 7** If you want to associate the switched interface with a security zone, do one of the following:
- Choose an existing security zone from the **Security Zone** drop-down list.
  - Choose **New** to add a new security zone; see [Creating Security Zone and Interface Group Objects, on page 411](#).
- Step 8** If you want to associate the switched interface with a virtual switch, do one of the following:
- Choose an existing virtual switch from the **Virtual Switch** drop-down list.
  - Choose **New** to add a new virtual switch; see [Adding Virtual Switches, on page 1111](#).

- Step 9** Check the **Enabled** check box to allow the switched interface to handle traffic.
- If you clear the check box, the interface becomes disabled and administratively taken down. If you disable a physical interface, you also disable all of the logical interfaces associated with it.
- Step 10** In the **MTU** field, enter a maximum transmission unit (MTU), which designates the largest size packet allowed. The range of MTU values can vary depending on the model of the managed device and the interface type.
- Caution** Changing the highest MTU value among all non-management interfaces on the device restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Inspection is interrupted on all non-management interfaces, not just the interface you modified. Whether this interruption drops traffic or passes it without further inspection depends on the model of the managed device and the interface type. See [Snort® Restart Traffic Behavior, on page 350](#) for more information.
- Step 11** Click **Save**.

---

#### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

#### Related Topics

## Deleting Logical Switched Interfaces

| Smart License | Classic License | Supported Devices  | Supported Domains | Access              |
|---------------|-----------------|--------------------|-------------------|---------------------|
| Any           | Control         | 7000 & 8000 Series | Leaf only         | Admin/Network Admin |

---

#### Procedure

- Step 1** Choose **Devices > Device Management**.
- Step 2** Next to the managed device that contains the switched interface you want to delete, click the edit icon ().
- In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.
- Step 3** Next to the logical switched interface you want to delete, click the delete icon (.
- Step 4** When prompted, confirm that you want to delete the interface.

---

#### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

# Virtual Switch Configuration

Before you can use switched interfaces in a Layer 2 deployment, you must configure virtual switches and assign switched interfaces to them. A virtual switch is a group of switched interfaces that process inbound and outbound traffic through your network.

## Virtual Switch Configuration Notes

You can add virtual switches from the Virtual Switches tab of the Device Management page. The Virtual Switches tab displays a list of all the virtual switches you have configured on a device. The page includes summary information about each switch.

**Table 83: Virtual Switches Table View Fields**

| Field             | Description                                                                                                                                                                                                                                                |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name              | The name of the virtual switch.                                                                                                                                                                                                                            |
| Interfaces        | All switched interfaces that are assigned to the virtual switch. Interfaces that you have disabled from the Interfaces tab are not available.                                                                                                              |
| Hybrid Interface  | The optionally configured hybrid interface that ties the virtual switch to a virtual router.                                                                                                                                                               |
| Unicast Packets   | Unicast packet statistics for the virtual switch, including: <ul style="list-style-type: none"> <li>• Unicast packets received</li> <li>• Unicast packets forwarded (excludes drops by host)</li> <li>• Unicast packets unintentionally dropped</li> </ul> |
| Broadcast Packets | Broadcast packet statistics for the virtual switch, including: <ul style="list-style-type: none"> <li>• Broadcast packets received</li> <li>• Broadcast packets forwarded</li> <li>• Broadcast packets unintentionally dropped</li> </ul>                  |

You can also add switches as you configure switched interfaces. You can assign only switched interfaces to a virtual switch. If you want to create a virtual switch before you configure the switched interfaces on your managed devices, you can create an empty virtual switch and add interfaces to it later.

**Tip**

To edit an existing virtual switch, click the edit icon (🖋️) next to the switch.

## Adding Virtual Switches

| Smart License | Classic License | Supported Devices  | Supported Domains | Access              |
|---------------|-----------------|--------------------|-------------------|---------------------|
| Any           | Control         | 7000 & 8000 Series | Leaf only         | Admin/Network Admin |

### Procedure

**Step 1** Choose **Devices > Device Management**.

**Step 2** Next to the device where you want to add the virtual switch, click **Edit** ().

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

**Step 3** Click the **Virtual Switches** tab.

**Step 4** Click **Add Virtual Switch**.

**Step 5** Enter a name in the **Name** field.

**Step 6** From the **Available** list, choose one or more switched interfaces to add to the virtual switch.

**Tip** Interfaces that you have disabled from the Interfaces tab are not available; disabling an interface after you add it removes it from the configuration.

**Step 7** Click **Add**.

**Step 8** If you want to tie the virtual switch to a virtual router, choose a hybrid interface from the **Hybrid Interface** drop-down list.

**Step 9** Optionally, configure advanced settings for the switch; see [Advanced Virtual Switch Settings, on page 1111](#)

**Step 10** Click **Save**.

### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## Advanced Virtual Switch Settings

### Adding Static MAC Entries

Over time, a virtual switch learns MAC addresses by tagging return traffic from the network. You can manually add a static MAC entry, which designates that a MAC address resides on a specific port. Regardless of whether you ever receive traffic from that port, the MAC address remains static in the table. You can specify one or more static MAC addresses for each virtual switch.

### Enabling Spanning Tree Protocol (STP) and Dropping Bridge Protocol Data Units (BPDU)

STP is a network protocol used to prevent network loops. BPDUs are exchanged through the network, carrying information about network bridges. The protocol uses BPDUs to identify and select the fastest network links, if there are redundant links in the network. If a network link fails, Spanning Tree fails over to an existing alternate link.

**Note** Cisco strongly recommends that you enable STP when configuring a virtual switch that you plan to deploy in a 7000 or 8000 Series device high-availability pair. Only enable STP if your virtual switch switches traffic between multiple network interfaces.

If your virtual switch routes traffic between VLANs, similar to a router on a stick, BPDUs enter and exit the device through different logical switched interfaces, but the same physical switched interface. As a result, STP identifies the device as a redundant network loop, which can cause issues in certain Layer 2 deployments. To prevent this, you can configure the virtual switch at the domain level to have the device drop BPDUs when monitoring traffic. You can only drop BPDUs if you disable STP.

**Note** Drop BPDUs only if your virtual switch routes traffic between VLANs on a single physical interface.

### Enabling Strict TCP Enforcement

To maximize TCP security, you can enable strict enforcement, which blocks connections where the three-way handshake was not completed. Strict enforcement also blocks:

- non-SYN TCP packets for connections where the three-way handshake was not completed
- non-SYN/RST packets from the initiator on a TCP connection before the responder sends the SYN-ACK
- non-SYN-ACK/RST packets from the responder on a TCP connection after the SYN but before the session is established
- SYN packets on an established TCP connection from either the initiator or the responder

Note that if you associate the virtual switch with a logical hybrid interface, the switch uses the same strict TCP enforcement setting as the virtual router associated with the logical hybrid interface. You cannot specify strict TCP enforcement on the switch in this case.

## Configuring Advanced Virtual Switch Settings

| Smart License | Classic License | Supported Devices  | Supported Domains | Access              |
|---------------|-----------------|--------------------|-------------------|---------------------|
| Any           | Control         | 7000 & 8000 Series | Leaf only         | Admin/Network Admin |

### Procedure

**Step 1** Choose **Devices > Device Management**.

- Step 2** Next to the device that contains the virtual switch you want to edit, click the edit icon (✎).  
In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.
- Step 3** Click the **Virtual Switches** tab.
- Step 4** Next to the virtual switch that you want to edit, click the edit icon (✎).
- Step 5** Click the **Advanced** tab.
- Step 6** To add a static MAC entry, click **Add**.
- Step 7** In the **MAC Address** field, enter the address using the standard format of six groups of two hexadecimal digits separated by colons (for example, 01:23:45:67:89:AB).
- Note** Broadcast addresses (00:00:00:00:00:00 and FF:FF:FF:FF:FF:FF) cannot be added as static MAC addresses.
- Step 8** From the **Interface** drop-down list, choose the interface where you want to assign the MAC address.
- Step 9** Click **OK**.
- Step 10** If you want to enable the Spanning Tree Protocol, check the **Enable Spanning Tree Protocol** check box.
- Step 11** If you want to enable strict TCP enforcement, check the **Strict TCP Enforcement** check box.  
If you associate the virtual switch with a logical hybrid interface, this option does not appear and the switch uses the same setting as the virtual router associated with the logical hybrid interface.
- Step 12** If you want to drop BPDUs at the domain level, check the **Drop BPDUs** check box.
- Step 13** Click **Save**.

---

### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## Deleting Virtual Switches

| Smart License | Classic License | Supported Devices  | Supported Domains | Access              |
|---------------|-----------------|--------------------|-------------------|---------------------|
| Any           | Control         | 7000 & 8000 Series | Leaf only         | Admin/Network Admin |

When you delete a virtual switch, any switched interfaces assigned to the switch become available for inclusion in another switch.

### Procedure

---

- Step 1** Choose **Devices > Device Management**.
- Step 2** Next to the managed device that contains the virtual switch you want to delete, click the edit icon (✎).  
In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

- Step 3** Click the **Virtual Switches** tab.
- Step 4** Next to the virtual switch that you want to delete, click the delete icon (  ).
- Step 5** When prompted, confirm that you want to delete the virtual switch.
- 

**What to do next**

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## CHAPTER 52

# Setting Up Virtual Routers

---

The following topics describe how to set up virtual routers in the Firepower System:

- [Virtual Routers, on page 1115](#)
- [Routed Interfaces, on page 1116](#)
- [Configuring Physical Routed Interfaces, on page 1117](#)
- [Adding Logical Routed Interfaces, on page 1119](#)
- [Deleting Logical Routed Interfaces, on page 1121](#)
- [Configuring SFRP, on page 1122](#)
- [Virtual Router Configuration, on page 1123](#)
- [Adding Virtual Routers, on page 1124](#)
- [DHCP Relay, on page 1125](#)
- [Static Routes, on page 1127](#)
- [Dynamic Routing, on page 1129](#)
- [Virtual Router Filters, on page 1141](#)
- [Adding Virtual Router Authentication Profiles, on page 1143](#)
- [Viewing Virtual Router Statistics, on page 1144](#)
- [Deleting Virtual Routers, on page 1145](#)

## Virtual Routers

You can configure a managed device in a Layer 3 deployment so that it routes traffic between two or more interfaces. To route traffic, you must assign an IP address to each interface and assign the interfaces to the virtual router. The interfaces assigned to virtual routers can be physical, logical, or link aggregation group (LAG) interfaces.

You can configure the system to route packets by making packet forwarding decisions according to the destination address. Interfaces configured as routed interfaces receive and forward the Layer 3 traffic. Routers obtain the destination from the outgoing interface based on the forwarding criteria, and access control rules designate the security policies to be applied.

In Layer 3 deployments, you can define static routes. In addition, you can configure Routing Information Protocol (RIP) and Open Shortest Path First (OSPF) dynamic routing protocols. You can also configure a combination of static routes and RIP or static routes and OSPF.

Note that you can only configure virtual routers, physical routed interfaces, or logical routed interfaces on a 7000 or 8000 Series device.

---

**Caution** If a Layer 3 deployment fails for any reason, the device no longer passes traffic.

---

**Related Topics**

[LAG Configuration](#), on page 1148

## Routed Interfaces

You can set up routed interfaces with either physical or logical configurations. You can configure physical routed interfaces for handling untagged VLAN traffic. You can also create logical routed interfaces for handling traffic with designated VLAN tags.

In a Layer 3 deployment, the system drops any traffic received on an external physical interface that does not have a routed interface waiting for it. The system drops a packet if:

- It receives a packet with no VLAN tag, and you have not configured a physical routed interface for that port.
- It receives a VLAN-tagged packet, and you have not configured a logical routed interface for that port.

The system handles traffic that has been received with VLAN tags on switched interfaces by stripping the outermost VLAN tag on ingress prior to any rules evaluation or forwarding decisions. Packets leaving the device through a VLAN-tagged logical routed interface are encapsulated with the associated VLAN tag on egress. The system drops any traffic received with a VLAN tag after the stripping process completes.

You can add static Address Resolution Protocol (ARP) entries to a routed interface. If an external host needs to know the MAC address of the destination IP address it needs to send traffic to on your local network, it sends an ARP request. When you configure static ARP entries, the virtual router responds with an IP address and associated MAC address.

Note that disabling the **ICMP Enable Responses** option for logical routed interfaces does not prevent ICMP responses in all scenarios. You can add network-based rules to an access control policy to drop packets where the destination IP is the routed interface's IP and the protocol is ICMP.

If you have enabled the **Inspect Local Router Traffic** option on the managed device, the system drops the packets before they reach the host, thereby preventing any response.

The range of MTU values can vary depending on the model of the managed device and the interface type.

---

**Caution** Changing the highest MTU value among all non-management interfaces on the device restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Inspection is interrupted on all non-management interfaces, not just the interface you modified. Whether this interruption drops traffic or passes it without further inspection depends on the model of the managed device and the interface type. See [Snort® Restart Traffic Behavior, on page 350](#) for more information.

---

If you change the parent physical interface to inline or passive, the system deletes all the associated logical interfaces.

**Related Topics**

[Advanced Settings](#), on page 251

[MTU Ranges for 7000 and 8000 Series Devices and NGIPSv](#), on page 500

[Snort® Restart Scenarios](#), on page 348

## Configuring Physical Routed Interfaces

| Smart License | Classic License | Supported Devices  | Supported Domains | Access              |
|---------------|-----------------|--------------------|-------------------|---------------------|
| N/A           | Control         | 7000 & 8000 Series | Leaf only         | Admin/Network Admin |

You can configure one or more physical ports on a managed device as routed interfaces. You must assign a physical routed interface to a virtual router before it can route traffic.

**Caution** Adding a routed interface pair on a 7000 or 8000 Series device restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See [Snort® Restart Traffic Behavior](#), on page 350 for more information.

### Procedure

- 
- Step 1** Choose **Devices > Device Management**.
- Step 2** Next to the device you want to modify, click **Edit** ()  
In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.
- Step 3** Next to the interface you want to modify, click **Edit** ()  
**Step 4** Click **Routed** to display the routed interface options.
- Step 5** If you want to apply a security zone, do one of the following:
- Choose an existing security zone from the **Security Zone** drop-down list.
  - Choose **New** to add a new security zone; see [Creating Security Zone and Interface Group Objects](#), on page 411.
- Step 6** If you want to specify a virtual router, do one of the following:
- Choose an existing virtual router from the **Virtual Router** drop-down list.
  - Choose **New** to add a new virtual router; [Adding Virtual Routers](#), on page 1124.
- Step 7** Check the **Enabled** check box to allow the routed interface to handle traffic. If you clear the check box, the interface becomes disabled so that users cannot access it for security purposes.
- Step 8** From the **Mode** drop-down list, choose an option to designate the link mode, or choose **Autonegotiation** to specify that the interface is configured to auto negotiate speed and duplex settings.
- Mode settings are available only for copper interfaces.
- Interfaces on 8000 Series appliances do not support half-duplex options.

- Step 9** From the **MDI/MDIX** drop-down list, choose an option to designate whether the interface is configured for MDI (medium dependent interface), MDIX (medium dependent interface crossover), or Auto-MDIX.
- Normally, MDI/MDIX is set to Auto-MDIX, which automatically handles switching between MDI and MDIX to attain link.
- MDI/MDIX settings are available only for copper interfaces.
- Step 10** In the **MTU** field, choose a maximum transmission unit (MTU), which designates the largest size packet allowed.
- The MTU is the Layer 2 MTU/MRU and not the Layer 3 MTU.
- The range of MTU values can vary depending on the model of the managed device and the interface type.
- Caution** Changing the highest MTU value among all non-management interfaces on the device restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Inspection is interrupted on all non-management interfaces, not just the interface you modified. Whether this interruption drops traffic or passes it without further inspection depends on the model of the managed device and the interface type. See [Snort® Restart Traffic Behavior, on page 350](#) for more information.
- Step 11** Next to **ICMP**, check the **Enable Responses** check box to allow the interface to respond to ICMP traffic such as pings and traceroute.
- Step 12** Next to **IPv6 NDP**, check the **Enable Router Advertisement** check box to enable the interface to broadcast router advertisements.
- Step 13** To add an IP address, click **Add**.
- Step 14** In the **Address** field, enter the routed interface's IP address and subnet mask using CIDR notation.
- Note the following:
- You cannot add network and broadcast addresses, or the static MAC addresses 00:00:00:00:00:00 and FF:FF:FF:FF:FF:FF.
  - You cannot add identical IP addresses, regardless of subnet mask, to interfaces in virtual routers.
- Step 15** If your organization uses IPv6 addresses and you want to set the IP address of the interface automatically, check the **Address Autoconfiguration** check box next to the **IPv6** field.
- Step 16** For **Type**, choose either **Normal** or **SFRP**.
- For SFRP options, see [Configuring SFRP, on page 1122](#) for more information.
- Step 17** Click **OK**.
- To edit an IP address, click **Edit** (.
  - To delete an IP address, click **Delete** (.
- When adding an IP address to a routed interface of a 7000 or 8000 Series device in a high-availability pair, you must add a corresponding IP address to the routed interface on the high-availability pair peer.
- Step 18** To add a static ARP entry, click **Add**.
- Step 19** In the **IP Address** field, enter an IP address for the static ARP entry.

- Step 20** In the **MAC Address** field, enter a MAC address to associate with the IP address. Use the standard address format of six groups of two hexadecimal digits separated by colons (for example, 01:23:45:67:89:AB).
- Step 21** Click **OK**.
- Step 22** Click **Save**.

### What to do next

Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

### Related Topics

## Adding Logical Routed Interfaces

| Smart License | Classic License | Supported Devices  | Supported Domains | Access              |
|---------------|-----------------|--------------------|-------------------|---------------------|
| N/A           | Control         | 7000 & 8000 Series | Leaf only         | Admin/Network Admin |

For each physical routed interface, you can add multiple logical routed interfaces. You must associate each logical interface with a VLAN tag to handle traffic received by the physical interface with that specific tag. You must assign a logical routed interface to a virtual router to route traffic.

- Caution** Adding a routed interface pair on 7000 or 8000 Series devices restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See [Snort® Restart Traffic Behavior, on page 350](#) for more information.

### Procedure

- Step 1** Choose **Devices > Device Management**.
- Step 2** Next to the device you want to modify, click the edit icon (✎).  
In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.
- Step 3** Click **Add Interface**.
- Step 4** Click **Routed** to display the routed interface options.
- Step 5** From the **Interface** drop-down list, choose the physical interface where you want to add the logical interface.
- Step 6** In the **VLAN Tag** field, enter a tag value that gets assigned to inbound and outbound traffic on this interface. The value can be any integer from 1 to 4094.
- Step 7** If you want to apply a security zone, do one of the following:
- Choose an existing security zone from the **Security Zone** drop-down list.

- Choose **New** to add a new security zone; see [Creating Security Zone and Interface Group Objects, on page 411](#).

**Step 8** If you want to specify a virtual router, do one of the following:

- Choose an existing virtual router from the **Virtual Router** drop-down list.
- Choose **New** to add a new virtual router; [Adding Virtual Routers, on page 1124](#).

**Step 9** Check the **Enabled** check box to allow the routed interface to handle traffic.

If you clear the check box, the interface becomes disabled and administratively taken down. If you disable a physical interface, you also disable all of the logical interfaces associated with it.

**Step 10** In the **MTU** field, enter a maximum transmission unit (MTU), which designates the largest size packet allowed. The MTU is the Layer 2 MTU/MRU and not the Layer 3 MTU.

The range of MTU values can vary depending on the model of the managed device and the interface type.

**Caution** Changing the highest MTU value among all non-management interfaces on the device restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Inspection is interrupted on all non-management interfaces, not just the interface you modified. Whether this interruption drops traffic or passes it without further inspection depends on the model of the managed device and the interface type. See [Snort® Restart Traffic Behavior, on page 350](#) for more information.

**Step 11** Next to **ICMP**, check the **Enable Responses** check box to communicate updates or error information to other routers, intermediary devices, or hosts.

**Step 12** Next to **IPv6 NDP**, check the **Enable Router Advertisement** check box to enable the interface to broadcast router advertisements.

**Step 13** To add an IP address, click **Add**.

**Step 14** In the **Address** field, enter the IP address in CIDR notation.

Note the following:

- You cannot add network and broadcast addresses, or the static MAC addresses 00:00:00:00:00:00 and FF:FF:FF:FF:FF:FF.
- You cannot add identical IP addresses, regardless of subnet mask, to interfaces in virtual routers.

**Step 15** If your organization uses IPv6 addresses and you want to set the IP address of the interface automatically, choose the **Address Autoconfiguration** check box next to the **IPv6** field.

**Step 16** For **Type**, choose either **Normal** or **SFRP**.

For SFRP options, see [Configuring SFRP, on page 1122](#) for more information.

**Step 17** Click **OK**.

- To edit an IP address, click the edit icon (.
- To delete an IP address, click the delete icon (.

When you add an IP address to a routed interface of a 7000 or 8000 Series device in a high-availability pair, you must add a corresponding IP address to the routed interface on the high-availability pair peer.

- Step 18** To add a static ARP entry, click **Add**.
- Step 19** In the **IP Address** field, enter an IP address for the static ARP entry.
- Step 20** In the **MAC Address** field, enter a MAC address to associate with the IP address. Use the standard address format of six groups of two hexadecimal digits separated by colons (for example, 01:23:45:67:89:AB).
- Step 21** Click **OK**. The static ARP entry is added.
- Step 22** Click **Save**.

---

### What to do next

Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

### Related Topics

[MTU Ranges for 7000 and 8000 Series Devices and NGIPSv](#), on page 500

## Deleting Logical Routed Interfaces

| Smart License | Classic License | Supported Devices  | Supported Domains | Access              |
|---------------|-----------------|--------------------|-------------------|---------------------|
| Any           | Control         | 7000 & 8000 Series | Leaf only         | Admin/Network Admin |

When you delete a logical routed interface, you remove it from the physical interface where it resides, as well as its assigned virtual router and security zone.

### Procedure

---

- Step 1** Choose **Devices > Device Management**.
- Step 2** Next to the device you want to modify, click the edit icon **Edit** ().
- In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.
- Step 3** Next to the logical routed interface you want to delete, click **Delete** (.
- Step 4** When prompted, confirm that you want to delete the interface.

---

### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

# Configuring SFRP

| Smart License | Classic License | Supported Devices  | Supported Domains | Access              |
|---------------|-----------------|--------------------|-------------------|---------------------|
| Any           | Control         | 7000 & 8000 Series | Leaf only         | Admin/Network Admin |

You can configure Cisco Redundancy Protocol (SFRP) to achieve network redundancy for high availability on either a 7000 or 8000 Series device high-availability pair or individual devices. SFRP provides gateway redundancy for both IPv4 and IPv6 addresses. You can configure SFRP on routed and hybrid interfaces.

If the interfaces are configured on individual devices, they must be in the same broadcast domain. You must designate at least one of the interfaces as primary and an equal number as backup. The system supports only one primary and one backup per IP address. If network connectivity is lost, the system automatically promotes the backup to primary to maintain connectivity.

The options you set for SFRP must be the same on all interfaces in a group of SFRP interfaces. Multiple IP addresses in a group must be in the same primary/backup state. Therefore, when you add or edit an IP address, the state you set for that address propagates to all the addresses in the group. For security purposes, you must enter values for **Group ID** and **Shared Secret** that are shared among the interfaces in the group.

To enable SFRP IP addresses on a virtual router, you must also configure one non-SFRP IP address. Note that only one non-SFRP address should be configured per interface.

As all SFRPs in a group failover together, all SFRPs on the same virtual router should be in the same SFRP group. In addition, you should also set up an HA link interface on each device in a high-availability pair when using NAT, HA state sharing, or VPN. For more information on HA link interfaces, see [Configuring HA Link Interfaces, on page 498](#).

For 7000 or 8000 Series devices in a high-availability pair, you designate the shared secret and the system copies it to the high-availability pair peer along with the SFRP IP configuration. The shared secret authenticates peer data.

---

**Note** We do not recommend enabling more than one non-SFRP IP address on a 7000 or 8000 Series device high-availability pair's routed or hybrid interface where one SFRP IP address is already configured. The system does not perform NAT if a 7000 or 8000 Series device high-availability pair fails over while in standby mode.

---

## Procedure

---

- Step 1** Choose **Devices > Device Management**.
- Step 2** Next to the device you want to modify, click **Edit** ().  
In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.
- Step 3** Next to the interface where you want to configure SFRP, click **Edit** (.
- Step 4** Choose the type of interface where you want to configure SFRP, either **Routed** or **Hybrid**.

- Step 5** You can configure SFRP while adding or editing an IP address. Click **Add** to add an IP address. To edit an IP address, click **Edit** (✎).
- Step 6** For **Type**, choose **SFRP** to display the SFRP options.
- Step 7** In the **Group ID** field, enter a value that designates a group of primary or backup interfaces configured for SFRP.
- Step 8** For **Priority**, choose either primary or backup to designate the preferred interface:
- For individual devices, you must set one interface to primary on one device and the other to backup on a second device.
  - For 7000 or 8000 Series device high-availability pairs, when you set one interface as primary, the other automatically becomes the backup.
- Step 9** In the **Shared Secret** field, enter a shared secret.
- The Shared Secret field populates automatically for a group in a 7000 or 8000 Series device high-availability pair.
- Step 10** In the **Adv. Interval (seconds)** field, enter an interval for route advertisements for Layer 3 traffic.
- Step 11** Click **OK**.
- Step 12** Click **Save**.

---

### What to do next

Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

### Related Topics

[About 7000 and 8000 Series Device High Availability, on page 517](#)

## Virtual Router Configuration

**Caution** Adding a virtual router on a 7000 or 8000 Series device restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See [Snort® Restart Traffic Behavior, on page 350](#) for more information.

Before you can use routed interfaces in a Layer 3 deployment, you must configure virtual routers and assign routed interfaces to them. A virtual router is a group of routed interfaces that route Layer 3 traffic.

You can assign only routed and hybrid interfaces to a virtual router.

To maximize TCP security, you can enable strict enforcement, which blocks connections where the three-way handshake was not completed. Strict enforcement also blocks:

- non-SYN TCP packets for connections where the three-way handshake was not completed
- non-SYN/RST packets from the initiator on a TCP connection before the responder sends the SYN-ACK

- non-SYN-ACK/RST packets from the responder on a TCP connection after the SYN but before the session is established
- SYN packets on an established TCP connection from either the initiator or the responder

Note that if you change the configuration of a Layer 3 interface to a non-Layer 3 interface or remove a Layer 3 interface from the virtual router, the router may fall into an invalid state. For example, if it is used in DHCPv6, it may cause an upstream and downstream mismatch.

## Adding Virtual Routers

| Smart License | Classic License | Supported Devices  | Supported Domains | Access              |
|---------------|-----------------|--------------------|-------------------|---------------------|
| Any           | Control         | 7000 & 8000 Series | Leaf only         | Admin/Network Admin |

You can add virtual routers from the **Virtual Routers** tab of the device management page. You can also add routers as you configure routed interfaces.

If you want to create a virtual router before you configure the interfaces on your managed devices, you can create an empty virtual router and add interfaces to it later.

**Caution** Adding a virtual router on a 7000 or 8000 Series device restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See [Snort® Restart Traffic Behavior, on page 350](#) for more information.

### Procedure

- Step 1** Choose **Devices > Device Management**.
- Step 2** Next to the device you want to modify, click **Edit** ().  
In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.
- Step 3** Click the **Virtual Routers** tab.  
**Tip** If your devices are in a stack in a high-availability pair, choose the stack you want to modify from the **Selected Device** drop-down list.
- Step 4** Click **Add Virtual Router**.
- Step 5** In the **Name** field, enter a name for the virtual router. You can use alphanumeric characters and spaces.
- Step 6** Configure IPv6 static routing, OSPFv3, and RIPng on your virtual router by checking or clearing the **IPv6 Support** check box.
- Step 7** If you do not want to enable strict TCP enforcement, clear the **Strict TCP Enforcement** check box. This option is enabled by default.
- Step 8** Choose one or more interfaces from the **Available** list under **Interfaces**, and click **Add**.

The **Available** list contains all enabled Layer 3 interfaces, routed and hybrid, on the device that you can assign to the virtual router.

**Tip**

To remove a routed or hybrid interface from the virtual router, click **Delete** (). Disabling a configured interface from the Interfaces tab also removes it.

**Step 9** Click **Save**.

**What to do next**

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## DHCP Relay

DHCP provides configuration parameters to Internet hosts. A DHCP client that has not yet acquired an IP address cannot communicate directly with a DHCP server outside its broadcast domain. To allow DHCP clients to communicate with DHCP servers, you can configure DHCP relay instances to handle cases where the client is not on the same broadcast domain as the server.

You can set up DHCP relay for each virtual router you configure. By default, this feature is disabled. You can enable either DHCPv4 relay or DHCPv6 relay.

**Note** You cannot run a DHCPv6 Relay chain through two or more virtual routers running on the same device.

## Setting Up DHCPv4 Relay

| Smart License | Classic License | Supported Devices  | Supported Domains | Access              |
|---------------|-----------------|--------------------|-------------------|---------------------|
| Any           | Control         | 7000 & 8000 Series | Leaf only         | Admin/Network Admin |

The following procedure explains how to set up DHCPv4 relay on a virtual router.

**Procedure**

- Step 1** Choose **Devices > Device Management**.
- Step 2** Next to the device you want to modify, click the edit icon ().  
In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.
- Step 3** Click the **Virtual Routers** tab.
- Step 4** Next to the virtual router you want to modify, click the edit icon ().
- Step 5** Check the **DHCPv4** check box.

- Step 6** Under the **Servers** field, enter a server IP address.
- Step 7** Click **Add**.  
You can add up to four DHCP servers.
- Step 8** In the **Max Hops** field, enter the maximum number of hops from 1 to 255.
- Step 9** Click **Save**.

---

#### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## Setting Up DHCPv6 Relay

| Smart License | Classic License | Supported Devices  | Supported Domains | Access              |
|---------------|-----------------|--------------------|-------------------|---------------------|
| Any           | Control         | 7000 & 8000 Series | Leaf only         | Admin/Network Admin |

You cannot run a DHCPv6 Relay chain through two or more virtual routers running on the same device.

#### Procedure

---

- Step 1** Choose **Devices > Device Management**.
- Step 2** Next to the device you want to modify, click the edit icon (✎).  
In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.
- Step 3** Click the **Virtual Routers** tab.
- Step 4** Next to the virtual router where you want to set up DHCP relay, click the edit icon (✎).
- Step 5** Check the **DHCPv6** check box.
- Step 6** In the **Interfaces** field, check the check boxes next to one or more interfaces that have been assigned to the virtual router.
- Tip** You cannot disable an interface from the **Interfaces** tab while it is configured for DHCPv6 Relay. You must first clear the DHCPv6 Relay interfaces check box and save the configuration.
- Step 7** Next to a selected interface, click the drop-down icon and choose whether the interface relays DHCP requests **Upstream**, **Downstream**, or **Both**.
- Note** You must include at least one downstream interface and one upstream interface. Choosing both means that the interface is both downstream and upstream.
- Step 8** In the **Max Hops** field, enter the maximum number of hops from 1 to 255
- Step 9** Click **Save**.
-

**What to do next**

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## Static Routes

Static routing allows you to write rules about the IP addresses of traffic passing through a router. It is the simplest way of configuring path selection of a virtual router because there is no communication with other routers regarding the current topology of the network.

Do not configure routing to IP interfaces for DHCPv4 servers that the assigned virtual router cannot route packets to. Doing so will render previously specified routable DHCPv4 servers unroutable.

The Static Routes table includes summary information about each route, as described in the following table.

**Table 84: Static Routes Table View Fields**

| Field       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enabled     | Specifies whether this route is currently enabled or disabled.                                                                                                                                                                                                                                                                                                                                                                                                      |
| Name        | The name of the static route.                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Destination | The destination network where traffic is routed.                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Type        | Specifies the action that is taken for this route, which will be one of the following: <ul style="list-style-type: none"> <li>• IP — designates that the route forwards packets to the address of a neighboring router.</li> <li>• Interface — designates that the route forwards packets to an interface through which traffic is routed to hosts on a directly connected network.</li> <li>• Discard — designates that the static route drops packets.</li> </ul> |
| Gateway     | The target IP address if you selected IP as the static route type or the interface if you selected Interface as the static route type.                                                                                                                                                                                                                                                                                                                              |
| Preference  | Determines the route selection. If you have multiple routes to the same destination, the system selects the route with the higher preference.                                                                                                                                                                                                                                                                                                                       |

## Viewing the Static Routes Table

| Smart License | Classic License | Supported Devices  | Supported Domains | Access              |
|---------------|-----------------|--------------------|-------------------|---------------------|
| Any           | Control         | 7000 & 8000 Series | Any               | Admin/Network Admin |

**Procedure**

- Step 1** Choose **Devices > Device Management**.

- Step 2** Next to the device you want to view, click the edit icon (✎).  
In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.
- Step 3** Click the **Virtual Routers** tab.
- Step 4** Next to the virtual router where you want to view static routes, click the edit icon (✎).  
If a view icon (🔍) appears instead, the configuration belongs to a descendant domain, or you do not have permission to modify the configuration.
- Step 5** Click the **Static** tab.

## Adding Static Routes

| Smart License | Classic License | Supported Devices  | Supported Domains | Access              |
|---------------|-----------------|--------------------|-------------------|---------------------|
| Any           | Control         | 7000 & 8000 Series | Leaf only         | Admin/Network Admin |

### Procedure

- Step 1** Choose **Devices > Device Management**.
- Step 2** Next to the device where you want to add the static route, click the edit icon (✎).  
In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.
- Step 3** Click the **Virtual Routers** tab.
- Step 4** Next to the virtual router where you want to add the static route, click the edit icon (✎).
- Step 5** Click **Static** to display the static route options.
- Step 6** Click **Add Static Route**.
- Step 7** In the **Route Name** field, enter a name for the static route. You can use alphanumeric characters and spaces.
- Step 8** For **Enabled**, check the check box to specify that the route is currently enabled.
- Step 9** In the **Preference** field, enter a numerical value between 1 and 65535 to determine the route selection.
- Note** If you have multiple routes to the same destination, the system uses the route with the higher preference.
- Step 10** From the **Type** drop-down list, choose the type of static route you are configuring.
- Step 11** In the **Destination** field, enter the IP address for the destination network where traffic should be routed.
- Step 12** In the **Gateway** field, you have two options:
- If you chose **IP** as the selected static route type, choose an IP address.
  - If you chose **Interface** as the selected static route type, choose an enabled interface from the drop-down list.

**Tip** Interfaces you have disabled from the **Interfaces** tab are not available; disabling an interface you have added removes it from the configuration.

**Step 13** Click **OK**.

**Step 14** Click **Save**.

### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## Dynamic Routing

Dynamic, or adaptive, routing uses a routing protocol to alter the path that a route takes in response to a change in network conditions. The adaptation is intended to allow as many routes as possible to remain valid, that is, have destinations that can be reached in response to the change. This allows the network to “route around” damage, such as loss of a node or a connection between nodes, so long as other path choices are available. You can configure a router with no dynamic routing, or you can configure the Routing Information Protocol (RIP) or the Open Shortest Path First (OSPF) routing protocol.

## RIP Configuration

Routing Information Protocol (RIP) is a dynamic routing protocol, designed for small IP networks, that relies on hop count to determine routes. The best routes use the fewest number of hops. The maximum number of hops allowed for RIP is 15. This hop limit also limits the size of the network that RIP can support.

### Adding Interfaces for RIP Configuration

| Smart License | Classic License | Supported Devices  | Supported Domains | Access              |
|---------------|-----------------|--------------------|-------------------|---------------------|
| Any           | Control         | 7000 & 8000 Series | Leaf only         | Admin/Network Admin |

While configuring RIP, you must choose interfaces from those already included in the virtual router, where you want to configure RIP. Disabled interfaces are not available.

### Procedure

**Step 1** Choose **Devices > Device Management**.

**Step 2** Next to the device you want to modify, click the edit icon (✎).

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

**Step 3** Click the **Virtual Routers** tab.

**Step 4** Next to the virtual router you want to modify, click the edit icon (✎).

**Step 5** Click **Dynamic Routing** to display the dynamic routing options.

**Step 6** Click **RIP** to display the RIP options.

**Step 7** Under **Interfaces**, click the add icon (+).

**Step 8** From the **Name** drop-down list, choose the interface where you want to configure RIP.

**Tip** Interfaces you have disabled from the Interfaces tab are not available; disabling an interface you have added removes it from the configuration.

**Step 9** In the **Metric** field, enter a metric for the interface. When routes from different RIP instances are available and all of them have the same preference, the route with the lowest metric becomes the preferred route.

**Step 10** From the **Mode** drop-down list, choose one of the following options:

- **Multicast** — default mode where RIP multicasts the entire routing table to all adjacent routers at a specified address.
- **Broadcast** — forces RIP to use broadcast (for example, RIPv1) even though multicast mode is possible.
- **Quiet** — RIP will not transmit any periodic messages to this interface.
- **No Listen** — RIP will send to this interface but not listen to it.

**Step 11** Click **Save**.

#### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## Configuring Authentication Settings for RIP Configuration

| Smart License | Classic License | Supported Devices  | Supported Domains | Access              |
|---------------|-----------------|--------------------|-------------------|---------------------|
| Any           | Control         | 7000 & 8000 Series | Leaf only         | Admin/Network Admin |

RIP authentication uses one of the authentication profiles you configured on the virtual router.

#### Procedure

**Step 1** Choose **Devices > Device Management**.

**Step 2** Next to the device you want to modify, click the edit icon (✎).

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

**Step 3** Click the **Virtual Routers** tab.

**Step 4** Next to the virtual router where you want to add the RIP authentication profile, click the edit icon (✎).

**Step 5** Click **Dynamic Routing** to display the dynamic routing options.

**Step 6** Click **RIP** to display the RIP options.

- Step 7** Under **Authentication**, choose an existing virtual router authentication profile from the **Profile** drop-down list, or choose **None**.
- Step 8** Click **Save**.

---

### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## Configuring Advanced Settings for RIP Configuration

| Smart License | Classic License | Supported Devices  | Supported Domains | Access              |
|---------------|-----------------|--------------------|-------------------|---------------------|
| Any           | Control         | 7000 & 8000 Series | Leaf only         | Admin/Network Admin |

You can configure several advanced RIP settings pertaining to various timeout values and other features that affect the behavior of the protocol.

---

**Caution** Changing any of the advanced RIP settings to incorrect values can prevent the router from communicating successfully with other RIP routers.

---

### Procedure

- 
- Step 1** Choose **Devices > Device Management**.
- Step 2** Next to the device you want to modify, click the edit icon (✎).  
In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.
- Step 3** Click the **Virtual Routers** tab.
- Step 4** Next to the virtual router you want to modify, click the edit icon (✎).
- Step 5** Click **Dynamic Routing** to display the dynamic routing options.
- Step 6** Click **RIP** to display the RIP options.
- Step 7** In the **Preference** field, enter a numerical value (higher is better) for the preference of the routing protocol. The system prefers routes learned through RIP over static routes.
- Step 8** In the **Period** field, enter the interval, in seconds, between periodic updates. A lower number determines faster convergence, but larger network load.
- Step 9** In the **Timeout Time** field, enter a numerical value that specifies how old routes must be, in seconds, before being considered unreachable.
- Step 10** In the **Garbage Time** field, enter a numerical value that specifies how old routes must be, in seconds, before being discarded.
- Step 11** In the **Infinity** field, enter a numerical value that specifies a value for infinity distance in convergence calculations. Larger values will make protocol convergence slower.

**Step 12** From the **Honor** drop-down list, choose one of the following options to designate when requests for dumping routing tables should be honored:

- **Always** — always honor requests
- **Neighbor** — only honor requests sent from a host on a directly connected network
- **Never** — never honor requests

**Step 13** Click **Save**.

#### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## Adding Import Filters for RIP Configuration

| Smart License | Classic License | Supported Devices  | Supported Domains | Access              |
|---------------|-----------------|--------------------|-------------------|---------------------|
| Any           | Control         | 7000 & 8000 Series | Leaf only         | Admin/Network Admin |

You can add an import filter to designate which routes are accepted or rejected from RIP into the route table. Import filters are applied in the order they appear in the table.

When adding an import filter, you use one of the filters you configured on the virtual router.

**Tip** To edit a RIP import filter, click the edit icon (✎). To delete a RIP import filter, click the delete icon (🗑).

#### Before you begin

- Add a virtual router as described in [Adding Virtual Routers, on page 1124](#).
- Configure a filter on the virtual router as described in [Setting Up Virtual Router Filters, on page 1142](#).

#### Procedure

**Step 1** Choose **Devices > Device Management**.

**Step 2** Next to the device you want to modify, click the edit icon (✎).

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

**Step 3** Click the **Virtual Routers** tab.

**Step 4** Next to the virtual router where you want to add the RIP virtual router filter, click the edit icon (✎).

**Step 5** Click **Dynamic Routing** to display the dynamic routing options.

**Step 6** Click **RIP** to display the RIP options.

- Step 7** Under **Import Filters**, click the add icon (  ).
- Step 8** From the **Name** drop-down list, choose the filter you want to add as an import filter.
- Step 9** Next to **Action**, choose **Accept** or **Reject**.
- Step 10** Click **OK**.

**Tip**

To change the order of the import filters, click the move up (  ) and move down (  ) icons as needed. You can also drag the filters up or down in the list.

- Step 11** Click **Save**.

**What to do next**

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## Adding Export Filters for RIP Configuration

| Smart License | Classic License | Supported Devices  | Supported Domains | Access                 |
|---------------|-----------------|--------------------|-------------------|------------------------|
| Any           | Control         | 7000 & 8000 Series | Leaf only         | Admin/Network<br>Admin |

You can add an export filter to define which routes will be accepted or rejected from the route table to RIP. Export filters are applied in the order they appear in the table.

When adding an export filter, you use one of the filters you configured on the virtual router.

**Procedure**

- Step 1** Choose **Devices > Device Management**.
- Step 2** Next to the device you want to modify, click the edit icon (  ).  
In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.
- Step 3** Click the **Virtual Routers** tab.
- Step 4** Next to the virtual router where you want to add the RIP virtual router filter, click the edit icon (  ).
- Step 5** Click **Dynamic Routing** to display the dynamic routing options.
- Step 6** Click **RIP** to display the RIP options.
- Step 7** Under **Export Filters**, click the add icon (  ).
- Step 8** From the **Name** drop-down list, choose the filter you want to add as an export filter.
- Step 9** Next to **Action**, choose **Accept** or **Reject**.
- Step 10** Click **OK**.

**Tip**

To change the order of the export filters, click the move up (  ) and move down (  ) icons as needed. You can also drag the filters up or down in the list.

**Step 11** Click **Save**.

---

#### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## OSPF Configuration

Open Shortest Path First (OSPF) is an adaptive routing protocol that defines routes dynamically by obtaining information from other routers and advertising routes to other routers using link state advertisements. The router keeps information about the links between it and the destination to make routing decisions. OSPF assigns a cost to each routed interface, and considers the best routes to have the lowest costs.

### OSPF Routing Areas

An OSPF network may be structured, or subdivided, into routing areas to simplify administration and optimize traffic and resource use. Areas are identified by 32-bit numbers, expressed either simply in decimal or often in octet-based dot-decimal notation.

By convention, area zero or 0.0.0.0 represents the core or backbone region of an OSPF network. You may choose to identify other areas. Often, administrators select the IP address of a main router in an area as the area's identification. Each additional area must have a direct or virtual connection to the backbone OSPF area. Such connections are maintained by an interconnecting router, known as the area border router (ABR). An ABR maintains separate link state databases for each area it serves and maintains summarized routes for all areas in the network.

#### Adding OSPF Areas

| Smart License | Classic License | Supported Devices  | Supported Domains | Access              |
|---------------|-----------------|--------------------|-------------------|---------------------|
| Any           | Control         | 7000 & 8000 Series | Leaf only         | Admin/Network Admin |

#### Procedure

---

- Step 1** Choose **Devices > Device Management**.
- Step 2** Next to the device you want to modify, click the edit icon (✎).  
In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.
- Step 3** Click the **Virtual Routers** tab.
- Step 4** Next to the virtual router you want to modify, click the edit icon (✎).
- Step 5** Click **Dynamic Routing** to display the dynamic routing options.
- Step 6** Click **OSPF** to display the OSPF options.
- Step 7** Under **Areas**, click the add icon (+).
- Step 8** In the **Area Id** field, enter a numerical value for the area. This value can be either an integer or an IPv4 address.

- Step 9** Optionally, check the **Stubnet** check box to designate that the area does not receive router advertisements external to the autonomous system and routing from within the area is based entirely on a default route. If you clear the check box, the area becomes a backbone area or otherwise non-stub area.
- Step 10** In the **Default cost** field, enter a cost associated with the default route for the area.
- Step 11** Under **Stubnets**, click the add icon (+).
- Step 12** In the **IP Address** field, enter an IP address in CIDR notation.
- Step 13** Choose the **Hidden** check box to indicate that the stubnet is hidden.  
Hidden stubnets are not propagated into other areas.
- Step 14** Choose the **Summary** check box to designate that default stubnets that are subnetworks of this stubnet are suppressed.
- Step 15** In the **Stub cost** field, enter a value that defines the cost associated with routing to this stub network.
- Step 16** Click **OK**.
- Step 17** If you want to add a network, click the add icon (+) under **Networks**.
- Step 18** In the **IP Address** field, enter an IP address in CIDR notation for the network.
- Step 19** Check the **Hidden** check box to indicate that the network is hidden. Hidden networks are not propagated into other areas.
- Step 20** Click **OK**.
- Step 21** Click **Save**.

---

### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## OSPF Area Interfaces

You can configure a subset of the interfaces assigned to the virtual router for OSPF. The following list describes the options you can specify on each interface.

### Interfaces

Select the interface where you want to configure OSPF. Interfaces you have disabled from the Interfaces tab are not available.

### Type

Select the type of OSPF interface from the following choices:

- **Broadcast** — On broadcast networks, flooding and hello messages are sent using multicasts, a single packet for all the neighbors. The option designates a router to be responsible for synchronizing the link state databases and originating network link state advertisements. This network type cannot be used on physically non-broadcast multiple-access (NBMP) networks and on unnumbered networks without proper IP prefixes.
- **Point-to-Point (PtP)** — Point-to-point networks connect just two routers together. No election is performed and no network link state advertisement is originated, which makes it simpler and faster to establish.

This network type is useful not only for physically PtP interfaces, but also for broadcast networks used as PtP links. This network type cannot be used on physically NBMP networks.

- **Non-Broadcast** — On NBMP networks, the packets are sent to each neighbor separately because of the lack of multicast capabilities. Similar to broadcast networks, the option designates a router, which plays a central role in the propagation of link state advertisements. This network type cannot be used on unnumbered networks.
- **Autodetect** — The system determines the correct type based on the specified interface.

### **Cost**

Specify the output cost of the interface.

### **Stub**

Specify whether the interface should listen for OSPF traffic and transmit its own traffic.

### **Priority**

Enter a numerical value that specifies the priority value used in designated router election. On every multiple access network, the system designates a router and backup router. These routers have some special functions in the flooding process. Higher priority increases preferences in this election. You cannot configure a router with a priority of 0.

### **Nonbroadcast**

Specify whether hello packets are sent to any undefined neighbors. This switch is ignored on any NBMA network.

### **Authentication**

Select the OSPF authentication profile that this interface uses from one of the authentication profiles you configured on the virtual router or select **None**. For more information about configuring authentication profiles, see [Adding Virtual Router Authentication Profiles, on page 1143](#).

### **Hello Interval**

Type the interval, in seconds, between the sending of hello messages.

### **Poll**

Type the interval, in seconds, between the sending of hello messages for some neighbors on NBMA networks.

### **Retrans Interval**

Type the interval, in seconds, between retransmissions of unacknowledged updates.

### **Retrans Delay**

Type the estimated number of seconds it takes to transmit a link state update packet over the interface.

**Wait Time**

Type the number of seconds that the router waits between starting election and building adjacency.

**Dead Interval**

Type the number of seconds that the router waits before declaring a neighbor down when not receiving messages from it. If this value is defined, it overrides the value calculated from dead count.

**Dead Count**

Type a numerical value that when multiplied by the hello interval specifies the number of seconds that the router waits before declaring a neighbor down when not receiving messages from it.

To edit an OSPF area interface, click the edit icon (✎). To delete an OSPF area interface, click the delete icon (🗑). Disabling a configured interface from the Interfaces tab also deletes it.

**Adding OSPF Area Interfaces**

| Smart License | Classic License | Supported Devices  | Supported Domains | Access              |
|---------------|-----------------|--------------------|-------------------|---------------------|
| Any           | Control         | 7000 & 8000 Series | Leaf only         | Admin/Network Admin |

You can configure a subset of the interfaces assigned to the virtual router for OSPF.

You can choose only one interface for use in an OSPF area.

**Procedure**

- 
- Step 1** Choose **Devices > Device Management**.
  - Step 2** Next to the device where you want to add the OSPF interface, click the edit icon (✎).  
In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.
  - Step 3** Click the **Virtual Routers** tab.
  - Step 4** Next to the virtual router where you want to add the OSPF interface, click the edit icon (✎).
  - Step 5** Click **Dynamic Routing** to display the dynamic routing options.
  - Step 6** Click **OSPF** to display the OSPF options.
  - Step 7** Under **Areas**, click the add icon (+).
  - Step 8** Click **Interfaces**.
  - Step 9** Click the add icon (+).
  - Step 10** Take any of the actions as described in [OSPF Area Interfaces, on page 1135](#).
  - Step 11** If you want to add a network, click the add icon (+) under **Networks**.
  - Step 12** In the **IP address** field, enter an IP address for the neighbor receiving hello messages on non-broadcast networks from this interface.
  - Step 13** Check the **Eligible** check box to indicate that the neighbor is eligible to receive messages.

**Step 14** Click **OK**.

**Tip** To edit a neighbor, click the edit icon (). To delete a neighbor, click the delete icon (.

**Step 15** Click **OK**.

**Step 16** Click **Save**.

**Step 17** Click **Save**.

### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## Adding OSPF Area Vlinks

| Smart License | Classic License | Supported Devices  | Supported Domains | Access              |
|---------------|-----------------|--------------------|-------------------|---------------------|
| Any           | Control         | 7000 & 8000 Series | Leaf only         | Admin/Network Admin |

All areas in an OSPF autonomous system must be physically connected to the backbone area. In some cases where this physical connection is not possible, you can use a vlink to connect to the backbone through a non-backbone area. Vlinks can also be used to connect two parts of a partitioned backbone through a non-backbone area.

You must add a minimum of two OSPF areas before you can add a vlink.

### Procedure

**Step 1** Choose **Devices > Device Management**.

**Step 2** Next to the device you want to modify, click the edit icon (.

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

**Step 3** Click the **Virtual Routers** tab.

**Step 4** Next to the virtual router you want to modify, click the edit icon (.

**Step 5** Click **Dynamic Routing** to display the dynamic routing options.

**Step 6** Click **OSPF** to display the OSPF options.

**Step 7** Under **Areas**, click the add icon (.

**Step 8** Click **Vlinks**.

**Step 9** Click the add icon (.

**Step 10** In the **Router ID** field, enter an IP address for the router.

**Step 11** From the **Authentication** drop-down list, choose the authentication profile the vlink will use.

**Step 12** In the **Hello Interval** field, enter the interval, in seconds, between sending of hello messages.

- Step 13** In the **Retrans Interval** field, enter the interval, in seconds, between retransmissions of unacknowledged updates.
- Step 14** In the **Wait Time** field, enter the number of seconds that the router waits between starting election and building adjacency.
- Step 15** In the **Dead Interval** field, enter the number of seconds that the router waits before declaring a neighbor down when not receiving messages from it. If this value is defined, it overrides the value calculated from dead count.
- Step 16** In the **Dead Count** field, enter a numerical value that when multiplied by the hello interval, specifies the number of seconds that the router waits before declaring a neighbor down when not receiving messages from it.
- Step 17** Click **OK**.
- Step 18** Click **Save**.
- Step 19** Click **Save**.

#### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## Adding Import Filters for OSPF Configuration

| Smart License | Classic License | Supported Devices  | Supported Domains | Access                 |
|---------------|-----------------|--------------------|-------------------|------------------------|
| Any           | Control         | 7000 & 8000 Series | Leaf only         | Admin/Network<br>Admin |

You can add an import filter to define which routes are accepted or rejected from OSPF into the route table. Import filters are applied in the order they appear in the table.

When adding an import filter, you use one of the filters you configured on the virtual router.

#### Procedure

- Step 1** Choose **Devices > Device Management**.
- Step 2** Next to the device you want to modify, click the edit icon (✎).  
In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.
- Step 3** Click **Virtual Routers**.
- Step 4** Next to the virtual router you want to modify, click the edit icon (✎).
- Step 5** Click **Dynamic Routing** to display the dynamic routing options.
- Step 6** Click **OSPF** to display the OSPF options.
- Step 7** Under **Import Filters**, click the add icon (+).
- Step 8** From the **Name** drop-down list, choose the filter you want to add as an import filter.
- Step 9** Next to **Action**, choose **Accept** or **Reject**.
- Step 10** Click **OK**.

**Tip**

To change the order of the import filters, click the move up (  ) and move down (  ) icons as needed. You can also drag the filters up or down in the list.

**Step 11** Click **Save**.

---

**What to do next**

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## Adding Export Filters for OSPF Configuration

| Smart License | Classic License | Supported Devices  | Supported Domains | Access              |
|---------------|-----------------|--------------------|-------------------|---------------------|
| Any           | Control         | 7000 & 8000 Series | Leaf only         | Admin/Network Admin |

You can add an export filter to define which routes will be accepted or rejected from the route table to OSPF. Export filters are applied in the order they appear in the table.

When adding an export filter, you use one of the filters you configured on the virtual router.

**Procedure**

**Step 1** Choose **Devices > Device Management**.

**Step 2** Next to the device you want to modify, click the edit icon (  ).

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

**Step 3** Click the **Virtual Routers** tab.

**Step 4** Next to the virtual router where you want to add the OSPF virtual router filter, click the edit icon (  ).

**Step 5** Click the **Dynamic Routing** tab to display the dynamic routing options.

**Step 6** Click **OSPF** to display the OSPF options.

**Step 7** Under **Export Filters**, click the add icon (  ).

**Step 8** From the **Name** drop-down list, choose the filter you want to add as an export filter.

**Step 9** Next to **Action**, choose **Accept** or **Reject**.

**Step 10** Click **OK**.

**Tip**

To change the order of the export filters, click the move up (  ) and move down (  ) icons as needed. You can also drag the filters up or down in the list.

**Step 11** Click **Save**.

---

**What to do next**

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## Virtual Router Filters

Filters provide a way to match routes for importing into the virtual router's route table and for exporting routes to dynamic protocols. You can create and manage a list of filters. Each filter defines specific criteria to look for in routes that are defined statically or received from a dynamic protocol.

The Virtual Routers Filters table includes summary information about each filter you have configured on a virtual router, as described in the following table.

**Table 85: Virtual Router Filters Table View Fields**

| Field               | Description                                                                                                                                                                                                                                                                                               |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name                | The name of the filter.                                                                                                                                                                                                                                                                                   |
| Protocol            | The protocol that the route originates from: <ul style="list-style-type: none"> <li>• Static — The route originates as a local static route.</li> <li>• RIP — The route originates from a dynamic RIP configuration.</li> <li>• OSPF — The route originates from a dynamic OSPF configuration.</li> </ul> |
| From Router         | The router IP addresses that this filter attempts to match in a router. You must enter this value for OSPF and RIP filters.                                                                                                                                                                               |
| Next Hop            | The next hop where packets using this route are forwarded. You must enter this value for static filters.                                                                                                                                                                                                  |
| Destination Type    | The type of destination where packets are sent: <ul style="list-style-type: none"> <li>• Router</li> <li>• Device</li> <li>• Discard</li> </ul>                                                                                                                                                           |
| Destination Network | The networks that this filter attempts to match in a route.                                                                                                                                                                                                                                               |
| OSPF Path Type      | Applies only to OSPF protocol. The path type can be one of the following: <ul style="list-style-type: none"> <li>• Ext-1</li> <li>• Ext-2</li> <li>• Inter Area</li> <li>• Intra Area</li> </ul>                                                                                                          |
| OSPF Router ID      | Applies only to OSPF protocol. The router ID of the router advertising that route/network.                                                                                                                                                                                                                |

## Viewing Virtual Router Filters

| Smart License | Classic License | Supported Devices  | Supported Domains | Access                 |
|---------------|-----------------|--------------------|-------------------|------------------------|
| Any           | Control         | 7000 & 8000 Series | Any               | Admin/Network<br>Admin |

The **Filter** tab of the virtual router editor displays a table listing of all the filters you have configured on a virtual router. The table includes summary information about each filter.

### Procedure

- 
- Step 1** Choose **Devices > Device Management**.
  - Step 2** Next to the device you want to view, click the edit icon (✎).  
In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.
  - Step 3** Click the **Virtual Routers** tab.
  - Step 4** Next to the virtual router where you want to view the filters, click the edit icon (✎).
  - Step 5** Click the **Filter** tab.
- 

## Setting Up Virtual Router Filters

| Smart License | Classic License | Supported Devices  | Supported Domains | Access                 |
|---------------|-----------------|--------------------|-------------------|------------------------|
| Any           | Control         | 7000 & 8000 Series | Leaf only         | Admin/Network<br>Admin |

### Procedure

- 
- Step 1** Choose **Devices > Device Management**.
  - Step 2** Next to the device you want to modify, click the edit icon (✎).  
In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.
  - Step 3** Click the **Virtual Routers** tab.
  - Step 4** Next to the virtual router you want to modify, click the edit icon (✎).
  - Step 5** Click the **Filter** tab.
  - Step 6** Click **Add Filter**.
  - Step 7** In the **Name** field, enter a name for the filter. You can use alphanumeric characters only.
  - Step 8** Under **Protocol**, choose **All** or choose the protocol that applies to the filter.
  - Step 9** If you chose All, Static, or RIP as the **Protocol**, under **From Router**, enter the router IP addresses that this filter will attempt to match in a route.

**Note** You can also enter a /32 CIDR block for IPv4 addresses and a /128 prefix length for IPv6 addresses. All other address blocks are invalid for this field.

**Step 10** Click **Add**.

**Step 11** If you chose All, Static, or RIP as the **Protocol**, under **Next Hop**, enter the IP addresses for the gateways that this filter will attempt to match in a route.

**Note** You can also enter a /32 CIDR block for IPv4 addresses and a /128 prefix length for IPv6 addresses. All other address blocks are invalid for this field.

**Step 12** Click **Add**.

**Step 13** Under **Destination Type**, choose the options that apply to the filter.

**Step 14** Under **Destination Network**, enter the IP address of the network that this filter will attempt to match in a route.

**Step 15** Click **Add**.

**Step 16** If you chose All or OSPF as the **Protocol**, under **Path Type**, choose the options that apply to the filter. You must choose at least one path type.

**Step 17** If you chose OSPF as the **Protocol**, under **Router ID**, enter the IP address that serves as the router ID of the router advertising the route/network.

**Step 18** Click **Add**.

**Step 19** Click **OK**.

**Step 20** Click **Save**.

#### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## Adding Virtual Router Authentication Profiles

| Smart License | Classic License | Supported Devices  | Supported Domains | Access                 |
|---------------|-----------------|--------------------|-------------------|------------------------|
| Any           | Control         | 7000 & 8000 Series | Leaf only         | Admin/Network<br>Admin |

You can set up Authentication Profiles for use in RIP and OSPF configurations. You can configure a simple password or specify a shared cryptographic key. Simple passwords allow for every packet to carry eight bytes of the password. The system ignores received packets lacking this password. Cryptographic keys allow for validation, a 16-byte long digest generated from a password to be appended to every packet.

Note that for OSPF, each area can have a different authentication method. Therefore, you create authentication profiles that can be shared among many areas. You cannot add authentication for OSPFv3.

#### Procedure

**Step 1** Choose **Devices > Device Management**.

- Step 2** Next to the device you want to modify, click the edit icon (✎).  
In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.
- Step 3** Click the **Virtual Routers** tab.
- Step 4** Next to the virtual router you want to modify, click the edit icon (✎).
- Step 5** Click **Authentication Profile**.
- Step 6** Click **Add Authentication Profile**.
- Step 7** In the **Authentication Profile Name** field, enter a name for the authentication profile.
- Step 8** From the **Authentication Type** drop down list, choose **simple** or **cryptographic**.
- Step 9** In the **Password** field, enter a secure password.
- Step 10** In the **Confirm Password** field, enter the password again to confirm it.
- Step 11** Click **OK**.
- Step 12** Click **Save**.

---

#### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## Viewing Virtual Router Statistics

| Smart License | Classic License | Supported Devices  | Supported Domains | Access              |
|---------------|-----------------|--------------------|-------------------|---------------------|
| Any           | Control         | 7000 & 8000 Series | Any               | Admin/Network Admin |

You can view runtime statistics for each virtual router. The statistics display unicast packets, packets dropped, and separate routing tables for IPv4 and IPv6 addresses.

#### Procedure

---

- Step 1** Choose **Devices > Device Management**.
- Step 2** Next to the device where you want to view statistics, click the edit icon (✎).  
In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.
- Step 3** Click the **Virtual Routers** tab.
- Step 4** Next to the virtual router where you want to view the router statistics, click the view icon (👁).
-

## Deleting Virtual Routers

| Smart License | Classic License | Supported Devices  | Supported Domains | Access              |
|---------------|-----------------|--------------------|-------------------|---------------------|
| Any           | Control         | 7000 & 8000 Series | Leaf only         | Admin/Network Admin |

When you delete a virtual router, any routed interfaces assigned to the router become available for inclusion in another router.

### Procedure

- 
- Step 1** Choose **Devices > Device Management**.
- Step 2** Next to the device you want to modify, click the edit icon ().  
In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.
- Step 3** Click the **Virtual Routers** tab.
- Step 4** Next to the virtual router that you want to delete, click the delete icon ().
- Step 5** When prompted, confirm that you want to delete the virtual router.
- 

### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## CHAPTER 53

# Aggregate Interfaces and LACP

The following topics explain aggregate interface configuration and how LACP functions on managed devices:

- [About Aggregate Interfaces, on page 1147](#)
- [LAG Configuration, on page 1148](#)
- [Link Aggregation Control Protocol \(LACP\), on page 1152](#)
- [Adding Aggregate Switched Interfaces, on page 1153](#)
- [Adding Aggregate Routed Interfaces, on page 1155](#)
- [Adding Logical Aggregate Interfaces, on page 1158](#)
- [Viewing Aggregate Interface Statistics, on page 1159](#)
- [Deleting Aggregate Interfaces, on page 1159](#)

## About Aggregate Interfaces

In the Firepower System, you can group multiple physical Ethernet interfaces into a single logical link on managed devices configured in either a Layer 2 deployment that provides packet switching between networks, or a Layer 3 deployment that routes traffic between interfaces. This single aggregate logical link provides higher bandwidth, redundancy, and load-balancing between two endpoints.

You create aggregate links by creating a switched or routed link aggregation group, or LAG. When you create an aggregation group, a logical interface called an aggregate interface is created. To an upper layer entity a LAG looks like a single logical link and data traffic is transmitted through the aggregate interface. The aggregate link provides increased bandwidth by adding the bandwidth of multiple links together. It also provides redundancy by load-balancing traffic across all available links. If one link fails, the system automatically load-balances traffic across all remaining links.

The endpoints in a LAG can be two 7000 or 8000 Series devices, as shown in the illustration above, or a 7000 or 8000 Series device connected to a third-party access switch or router. The two devices do not have to match, but they must have the same physical configuration and they must support the IEEE 802.ad link aggregation standard. A typical deployment for a LAG might be to aggregate access links between two managed devices, or to create a point-to-point connection between a managed device and an access switch or a router.

Note that you cannot configure aggregate interfaces on NGIPSv devices or ASA FirePOWER modules.

# LAG Configuration

There are two types of aggregate interfaces:

- switched — Layer 2 aggregate interfaces
- routed — Layer 3 aggregate interfaces

You implement link aggregation through the use of link aggregation groups (LAGs). You configure a LAG by creating an aggregate switched or routed interface and then associating a set of physical interfaces with the link. All of the physical interfaces must be of the same speed and medium.

You create aggregate links either dynamically or statically. Dynamic link aggregation uses Link Aggregation Control Protocol (LACP), a component of the IEEE 802.3ad link aggregation standard, while static link aggregation does not. LACP enables each device on either end of the LAG to exchange link and system information to determine which links will be actively used in the aggregation. A static LAG configuration requires you to manually maintain link aggregations and deploy load-balancing and link selection policies.

When you create a switched or routed aggregate interface, a link aggregation group of the same type is created and numbered automatically. For example, when you create your first LAG (switched or routed), the aggregate interface can be identified by the **lag0** label in the **Interfaces** tab for your managed device. When you associate physical and logical interfaces with this LAG, they appear nested below the primary LAG in a hierarchical tree menu. Note that a switched LAG can only contain switched physical interfaces, and a routed LAG can only contain routed physical interfaces.

Consider the following requirements when you configure a LAG:

- The Firepower System supports a maximum of 14 LAGs, and assigns a unique ID to each LAG interface in the range of 0 to 13. The LAG ID is not configurable.
- You must configure the LAG on both sides of the link, and you must set the interfaces on either side of the link to the same speed.
- You must associate at least two physical interfaces per LAG, up to a maximum of eight. A physical interface cannot belong to more than one LAG.
- Physical interfaces in a LAG cannot be used in any other mode of operation, either as inline or passive, or be used as part of another logical interface for tagged traffic.
- Physical interfaces in a LAG can span multiple NetMods, but cannot span multiple sensors (i.e. all physical interfaces must reside on the same device).
- A LAG cannot contain a stacking NetMod.

## Aggregate Switched Interfaces

You can combine between two and eight physical ports on a managed device to create a switched LAG interface. You must assign a switched LAG interface to a virtual switch before it can handle traffic. A managed device can support up to 14 LAG interfaces.

The range of MTU values can vary depending on the model of the managed device and the interface type.

**Caution**

Changing the highest MTU value among all non-management interfaces on the device restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Inspection is interrupted on all non-management interfaces, not just the interface you modified. Whether this interruption drops traffic or passes it without further inspection depends on the model of the managed device and the interface type. See [Snort® Restart Traffic Behavior, on page 350](#) for more information.

**Related Topics**

[MTU Ranges for 7000 and 8000 Series Devices and NGIPSv](#), on page 500

[Snort® Restart Scenarios](#), on page 348

## Aggregate Routed Interfaces

You can combine between two and eight physical ports on a 7000 or 8000 Series device to create a routed LAG interface. You must assign a routed LAG interface to a virtual router before it can route traffic. A managed device can support up to 14 LAG interfaces.

You can add static Address Resolution Protocol (ARP) entries to a routed LAG interface. If an external host needs to know the MAC address of the destination IP address it needs to send traffic to on your local network, it sends an ARP request. When you configure static ARP entries, the virtual router responds with an IP address and associated MAC address.

Disabling the **ICMP Enable Responses** option for routed LAG interfaces does not prevent ICMP responses in all scenarios. You can still use access control rules to handle connections where the destination IP is the routed interface's IP and the protocol is ICMP; see [Port and ICMP Code Conditions, on page 373](#).

If you enable the **Inspect Local Router Traffic** option, the system blocks packets before they reach the host, thereby preventing any response. For more information about inspecting local router traffic, see [Advanced Settings, on page 251](#).

The range of MTU values can vary depending on the model of the managed device and the interface type.

**Caution**

Changing the highest MTU value among all non-management interfaces on the device restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Inspection is interrupted on all non-management interfaces, not just the interface you modified. Whether this interruption drops traffic or passes it without further inspection depends on the model of the managed device and the interface type. See [Snort® Restart Traffic Behavior, on page 350](#) for more information.

**Related Topics**

[MTU Ranges for 7000 and 8000 Series Devices and NGIPSv](#), on page 500

[Snort® Restart Scenarios](#), on page 348

## Logical Aggregate Interfaces

For each switched or routed aggregate interface, you can add multiple logical interfaces. You must associate each logical LAG interface with a VLAN tag to handle traffic received by the LAG interface with that specific tag. You add logical interfaces to switched or routed aggregate interfaces in the same way you would add them to physical switched or routed interfaces.

**Note** When you create a LAG interface you also create an “untagged” logical interface by default, which is identified by the **lag $n$ .0** label, where  $n$  is an integer from 0 to 13. To be operational, each LAG requires this one logical interface at a minimum. You can associate additional logical interfaces with any LAG to handle VLAN-tagged traffic. Each additional logical interface requires a unique VLAN tag. The Firepower System supports VLAN tags in the range of 1 through 4094.

You can also configure the Cisco Redundancy Protocol (SFRP) on a logical routed interface. SFRP allows devices to act as redundant gateways for specified IP addresses.

Note that disabling the **ICMP Enable Responses** option for logical routed interfaces does not prevent ICMP responses in all scenarios. You can add network-based rules to an access control policy to drop packets where the destination IP is the routed interface’s IP and the protocol is ICMP.

If you have enabled the **Inspect Local Router Traffic** option, which is an advanced setting on the managed device, it drops the packets before they reach the host, thereby preventing any response.

The range of MTU values can vary depending on the model of the managed device and the interface type.

**Caution** Changing the highest MTU value among all non-management interfaces on the device restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Inspection is interrupted on all non-management interfaces, not just the interface you modified. Whether this interruption drops traffic or passes it without further inspection depends on the model of the managed device and the interface type. See [Snort® Restart Traffic Behavior, on page 350](#) for more information.

## Load-Balancing Algorithms

You assign an egress load-balancing algorithm to the LAG that determines how to distribute traffic to the LAG bundle’s member links. The load-balancing algorithm makes hashing decisions based on values in various packet fields, such as Layer 2 MAC addresses, Layer 3 IP addresses, and Layer 4 port numbers (TCP/UDP traffic). The load-balancing algorithm you select applies to all of the LAG bundle’s member links.

Choose the load-balancing algorithm that supports your deployment scenario from the following options when you configure a LAG:

- Destination IP
- Destination MAC
- Destination Port
- Source IP
- Source MAC

- Source Port
- Source and Destination IP
- Source and Destination MAC
- Source and Destination Port

---

**Note** You should configure both ends of the LAG to have the same load-balancing algorithm. Higher layer algorithms will back off to lower layer algorithms as necessary (such as a Layer 4 algorithm backing off to Layer 3 for ICMP traffic).

---

## Link Selection Policies

Link aggregation requires the speed and medium of each link to be the same at both endpoints. Because link properties can change dynamically, the link selection policy helps determine how the system manages the link selection process. A link selection policy that maximizes the highest port count supports link redundancy, while a link selection policy that maximizes total bandwidth supports overall link speed. A stable link selection policy attempts to minimize excessive changes in link states.

---

**Note** You should configure both ends of the LAG to have the same link selection policy.

---

Choose the link selection policy that supports your deployment scenario from the following options:

- Highest Port Count — Choose this option for the highest total active port count to provide added redundancy.
- Highest Total Bandwidth — Choose this option to provide the highest total bandwidth for the aggregated link.
- Stable — Choose this option if your primary concern is link stability and reliability. Once you configure a LAG, the active links change only when absolutely necessary (such as link failure) rather than doing so for added port count or bandwidth.
- LACP Priority — Choose this option to use the LACP algorithm to determine which links are active in the LAG. This setting is appropriate if you have undefined deployment goals, or if the device at the other end of the LAG is not managed by the Firepower Management Center.

LACP is a key aspect of automating the link selection method that supports dynamic link aggregation. When LACP is enabled, a link selection policy based on LACP priority uses the following properties of LACP:

### LACP system priority

You configure this value on each partnered device running LACP to determine which one is superior in link aggregation. The system with the lower value has the higher system priority. In dynamic link aggregation, the system with the higher LACP system priority sets the selected state of member links on its side first, then the system with the lower priority sets its member links accordingly. You can specify 0 to 65535. If you do not specify a value, the default priority is 32768.

### LACP link priority

You configure this value on each link belonging to the aggregation group. The link priority determines the active and standby links in the LAG. Links with lower values have higher priority. If an active link goes down, the standby link with the highest priority is selected to replace the downed link. However, if two or more links have the same LACP link priority, the link with the lowest physical port number is selected as the standby link. You can specify 0 to 65535. If you do not specify a value, the default priority is 32768.

## Link Aggregation Control Protocol (LACP)

Link Aggregation Control Protocol (LACP), a component of IEEE 802.3ad, is a method of exchanging system and port information to create and maintain LAG bundles. When you enable LACP, each device on either end of the LAG uses LACP to determine which links will be actively used in the aggregation. LACP provides availability and redundancy by exchanging LACP packets (or control messages) between links. It learns the capabilities of the links dynamically and informs the other links. Once LACP identifies correctly matched links, it facilitates grouping the links into the LAG. If a link fails, traffic continues on the remaining links. LACP must be enabled at both ends of the LAG for the link to be operational.

## LACP

When you enable LACP, you need to specify a transmission mode for each end of the LAG that determines how LACP packets are exchanged between partnered devices. There are two options for LACP mode:

- **Active** — Choose this mode to place a device into an active negotiating state, in which the device initiates negotiations with remote links by sending LACP packets.
- **Passive** — Choose this mode to place a device into a passive negotiating state, in which the device responds to LACP packets it receives but does not initiate LACP negotiation.

---

**Note** Both modes allow LACP to negotiate between links to determine if they can form a link bundle based on criteria such as port speed. However, you should avoid a passive-passive configuration, which essentially places both ends of the LAG in listening mode.

---

LACP has a timer which defines how often LACP packets are sent between devices. LACP exchanges packets at these rates:

- **Slow** — 30 seconds
- **Fast** — 1 second

The device where this option is applied expects to receive LACP packets with this frequency from the partner device on the other side of the LAG.

**Note** When a LAG is configured on a managed device that is part of a device stack, only the primary device participates in LACP communication with the partner system. All secondary devices forward LACP messages to the primary device. The primary device relays any dynamic LAG modifications to the secondary devices.

## Adding Aggregate Switched Interfaces

| Smart License | Classic License | Supported Devices  | Supported Domains | Access              |
|---------------|-----------------|--------------------|-------------------|---------------------|
| Any           | Control         | 7000 & 8000 Series | Leaf only         | Admin/Network Admin |

You can combine between two and eight physical ports on a managed device to create a switched LAG interface. You must assign a switched LAG interface to a virtual switch before it can handle traffic. A managed device can support up to 14 LAG interfaces.

### Procedure

- 
- Step 1** Choose **Devices > Device Management**.
- Step 2** Click **Edit** () next to the device where you want to configure the switched LAG interface.  
In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.
- Step 3** Choose **Add Aggregate Interface** from the **Add** drop-down menu.
- Step 4** Click **Switched** to display the switched LAG interface options.
- Step 5** If you want to apply a security zone, do one of the following:
- Choose an existing security zone from the **Security Zone** drop-down list.
  - Choose **New** to add a new security zone; see [Creating Security Zone and Interface Group Objects, on page 411](#).
- Step 6** Specify a virtual switch:
- Choose an existing virtual switch from the **Virtual Switch** drop-down list.
  - Choose **New** to add a new virtual switch; see [Adding Virtual Switches, on page 1111](#).
- Step 7** Check the **Enabled** check box to allow the switched LAG interface to handle traffic.  
If you clear the check box, the interface becomes disabled so that users cannot access it for security purposes.
- Step 8** From the **Mode**, choose an option to designate the link mode, or choose **Autonegotiation** to specify that the interface is configured to auto negotiate speed and duplex settings.  
Mode settings are available only for copper interfaces.  
Interfaces on 8000 Series appliances do not support half-duplex options. When links auto negotiate speed, all active links are selected for the LAG based on the same speed setting.

- Step 9** From the **MDI/MDIX** drop-down list, choose an option to designate whether the interface is configured for MDI (medium dependent interface), MDIX (medium dependent interface crossover), or Auto-MDIX.
- MDI/MDIX settings are available only for copper interfaces.
- By default, MDI/MDIX is set to Auto-MDIX, which automatically handles switching between MDI and MDIX to attain link.
- Step 10** Enter a maximum transmission unit (MTU) in the **MTU** field.
- The range within which you can set the MTU can vary depending on the Firepower System device model and interface type. See [MTU Ranges for 7000 and 8000 Series Devices and NGIPSv](#), on page 500 for more information.
- Step 11** Under **Link Aggregation**, choose one or more physical interfaces from **Available Interfaces** to add to the LAG bundle.
- Tip** To remove physical interfaces from the LAG bundle, choose one or more physical interfaces and click the **Remove Selected icon**. To remove all physical interfaces from the LAG bundle, click the **Remove All icon**. Deleting the LAG interface from the Interfaces tab also removes the interfaces.
- Step 12** Choose an option from the **Load-Balancing Algorithm** drop-down list.
- Step 13** Choose a **Link Selection Policy** from the drop-down list.
- Tip** Choose **LACP Priority** if you are configuring an aggregate interface between a Firepower System device and a third-party network device.
- Step 14** If you chose **LACP Priority** as the **Link Selection Policy**, assign a value for **System Priority** and click the **Configure Interface Priority** link to assign a priority value for each interface in the LAG.
- Step 15** Choose either **Inner** or **Outer** from the **Tunnel Level** drop-down list.
- Note** The tunnel level only applies to IPv4 traffic when Layer 3 load balancing is configured. The outer tunnel is always used for Layer 2 and IPv6 traffic. If the **Tunnel Level** is not explicitly set, the default is **Outer**.
- Step 16** Under **LACP**, check the **Enabled** check box to allow the switched LAG interface to handle traffic using the Link Aggregation Control Protocol.
- If you clear the check box, the LAG interface becomes a static configuration and the Firepower System will use all of the physical interfaces selected for the aggregation.
- Step 17** Click a **Rate** radio button to set the frequency that determines how often LACP control messages are received from the partner device:
- Click **Slow** to receive packets every 30 seconds.
  - Click **Fast** to receive packets every 1 second.
- Step 18** Click a **Mode** radio button to establish the listening mode of the device:
- Click **Active** to initiate negotiations with remote links by sending LACP packets to the partner device.
  - Click **Passive** to respond to LACP packets received.
- Step 19** Click **Save**.
-

**What to do next**

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

**Related Topics**

[MTU Ranges for 7000 and 8000 Series Devices and NGIPSv](#), on page 500

[Snort® Restart Scenarios](#), on page 348

## Adding Aggregate Routed Interfaces

| Smart License | Classic License | Supported Devices  | Supported Domains | Access                 |
|---------------|-----------------|--------------------|-------------------|------------------------|
| Any           | Control         | 7000 & 8000 Series | Leaf only         | Admin/Network<br>Admin |

You can combine between two and eight physical ports on a managed device to create a routed LAG interface. You must assign a routed LAG interface to a virtual router before it can route traffic. A managed device can support up to 14 LAG interfaces.

**Caution**

Adding a routed interface pair on 7000 or 8000 Series devices restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See [Snort® Restart Traffic Behavior, on page 350](#) for more information.

**Procedure**

- 
- Step 1** Choose **Devices > Device Management**.
- Step 2** Click **Edit** () next to the device where you want to configure the routed LAG interface.  
In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.
- Step 3** Choose **Add Aggregate Interface** from the **Add** drop-down menu.
- Step 4** Click **Routed** to display the routed LAG interface options.
- Step 5** If you want to apply a security zone, do one of the following:
- Choose an existing security zone from the **Security Zone** drop-down list.
  - Choose **New** to add a new security zone; see [Creating Security Zone and Interface Group Objects, on page 411](#).
- Step 6** Specify a virtual router:
- Choose an existing virtual router from the **Virtual Router** drop-down list.
  - Choose **New** to add a new virtual router; [Adding Virtual Routers, on page 1124](#).
- Step 7** Check the **Enabled** check box to allow the routed LAG interface to handle traffic.  
If you clear the check box, the interface becomes disabled so that users cannot access it for security purposes.

- Step 8** From the **Mode** drop-down list, choose an option to designate the link mode, or choose **Autonegotiation** to specify that the LAG interface is configured to auto negotiate speed and duplex settings.
- Mode settings are available only for copper interfaces.
- Interfaces on 8000 Series appliances do not support half-duplex options. When links auto negotiate speed, all active links are selected for the LAG based on the same speed setting.
- Step 9** Choose an option from the **MDI/MDIX** drop-down list to designate whether the interface is configured for MDI (medium dependent interface), MDIX (medium dependent interface crossover), or Auto-MDIX.
- MDI/MDIX settings are available only for copper interfaces.
- By default, MDI/MDIX is set to Auto-MDIX, which automatically handles switching between MDI and MDIX to attain link.
- Step 10** Enter a maximum transmission unit (MTU) in the **MTU** field.
- The range of MTU values can vary depending on the model of the managed device and the interface type.
- Caution** Changing the highest MTU value among all non-management interfaces on the device restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Inspection is interrupted on all non-management interfaces, not just the interface you modified. Whether this interruption drops traffic or passes it without further inspection depends on the model of the managed device and the interface type. See [Snort® Restart Traffic Behavior, on page 350](#) for more information.
- Step 11** If you want to allow the LAG interface to respond to ICMP traffic such as pings and traceroute, check the **Enable Responses** check box next to **ICMP**.
- Step 12** If you want to enable the LAG interface to broadcast router advertisements, check the **Enable Router Advertisement** check box next to **IPv6 NDP**.
- Step 13** Click **Add** to add an IP address.
- Step 14** In the **Address** field, enter the routed LAG interface's IP address and subnet mask using CIDR notation.
- Note the following:
- You cannot add network and broadcast addresses, or the static MAC addresses 00:00:00:00:00:00 and FF:FF:FF:FF:FF:FF.
  - You cannot add identical IP addresses, regardless of subnet mask, to interfaces in virtual routers.
- Step 15** If your organization uses IPv6 addresses and you want to set the IP address of the LAG interface automatically, check the **Address Autoconfiguration** check box next to the **IPv6** field.
- Step 16** For **Type**, choose either Normal or SFRP.
- Step 17** If you chose SFRP for **Type**, set options as described in [SFRP](#).
- Step 18** Click **OK**.
- Note** When adding an IP address to a routed interface of a 7000 or 8000 Series device in a high-availability pair, you must add a corresponding IP address to the routed interface on the high-availability peer.
- Step 19** Click **Add** to add a static ARP entry.
- Step 20** Enter an IP address the **IP Address** field.

- Step 21** Enter a MAC address to associate with the IP address in the **MAC Address** field. Use the standard format (for example, 01:23:45:67:89:AB).
- Step 22** Click **OK**.
- Step 23** Under **Link Aggregation**, choose one or more physical interfaces from **Available Interfaces** to add to the LAG bundle.
- Tip** To remove physical interfaces from the LAG bundle, choose one or more physical interfaces and click the **Remove Selected icon** . To remove all physical interfaces from the LAG bundle, click the **Remove All icon**. Deleting the LAG interface from the **Interfaces** tab also removes the interfaces.
- Step 24** Choose a **Load-Balancing Algorithm** from the drop-down list.
- Step 25** Choose a **Link Selection Policy** from the drop-down list.
- Tip** Choose **LACP Priority** if you are configuring an aggregate interface between a Firepower System device and a third-party network device.
- Step 26** If you chose **LACP Priority** as the **Link Selection Policy**, assign a value for **System Priority** and click the **Configure Interface Priority** link to assign a priority value for each interface in the LAG.
- Step 27** Choose either **Inner** or **Outer** from the **Tunnel Level** drop-down list.
- Note** The tunnel level only applies to IPv4 traffic when Layer 3 load balancing is configured. The outer tunnel is always used for Layer 2 and IPv6 traffic. If the **Tunnel Level** is not explicitly set, the default is **Outer**.
- Step 28** Under **LACP**, check the **Enabled** check box to allow the routed LAG interface to handle traffic using the Link Aggregation Control Protocol.
- If you clear the check box, the LAG interface becomes a static configuration and the Firepower System will use all of the physical interfaces for the aggregation.
- Step 29** Click a **Rate** radio button to set the frequency that determines how often LACP control messages are received from the partner device.
- Click **Slow** to receive packets every 30 seconds.
  - Click **Fast** to receive packets every 1 second.
- Step 30** Click a **Mode** radio button to establish the listening mode of the device.
- Click **Active** to initiate negotiations with remote links by sending LACP packets to the partner device.
  - Click **Passive** to respond to LACP packets received.
- Step 31** Click **Save**.

---

### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

### Related Topics

## Adding Logical Aggregate Interfaces

| Smart License | Classic License | Supported Devices  | Supported Domains | Access              |
|---------------|-----------------|--------------------|-------------------|---------------------|
| Any           | Control         | 7000 & 8000 Series | Leaf only         | Admin/Network Admin |

For each switched or routed aggregate interface, you can add multiple logical interfaces. You must associate each logical LAG interface with a VLAN tag to handle traffic received by the LAG interface with that specific tag. You add logical interfaces to switched or routed aggregate interfaces in the same way you would add them to physical switched or routed interfaces.

**Note** When you create a LAG interface you also create an “untagged” logical interface by default, which is identified by the **lag $n$ .0** label, where  $n$  is an integer from 0 to 13. To be operational, each LAG requires this one logical interface at a minimum. You can associate additional logical interfaces with any LAG to handle VLAN-tagged traffic. Each additional logical interface requires a unique VLAN tag. The Firepower System supports VLAN tags in the range of 1 through 4094.

**Caution** Adding a routed interface pair on 7000 or 8000 Series devices restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See [Snort® Restart Traffic Behavior, on page 350](#) for more information.

### Procedure

- Step 1** Choose **Devices > Device Management**.
- Step 2** Next to the device where you want to add the logical LAG interface, click the edit icon (✎).  
In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.
- Step 3** From the **Add** drop-down menu, choose **Add Logical Interface**.
- Step 4** Click **Switched** to display the switched interface options, or click **Routed** to display the routed interface options.
- Step 5** Choose an available LAG from the **Interface** drop-down list. The aggregate interface is identified by the **lag $n$**  label, where  $n$  is an integer from 0 to 13.
- Step 6** Configure the remaining settings appropriate to the interface type you chose:
  - Switched — See [Adding Logical Switched Interfaces, on page 1108](#) for more information on adding a logical interface to a switched interface.
  - Routed — See [Adding Logical Routed Interfaces, on page 1119](#) for more information on adding a logical interface to a routed interface.

## Viewing Aggregate Interface Statistics

| Smart License | Classic License | Supported Devices  | Supported Domains | Access              |
|---------------|-----------------|--------------------|-------------------|---------------------|
| Any           | Control         | 7000 & 8000 Series | Leaf only         | Admin/Network Admin |

You can view protocol and traffic statistics for each aggregate interface. The statistics show LACP protocol information such as LACP key and partner information, packets received, packets transmitter, and packets dropped. Statistics are further refined per member interface to show traffic and link information on a per-port basis.

Aggregate interface information is also presented to the dashboard via predefined dashboard widgets. The Current Interface Status widget shows the status of all interfaces on the appliance, enabled or unused. The Interface Traffic widget shows the rate of traffic received (Rx) and transmitted (Tx) on the appliance's interfaces over the dashboard time range. See [Predefined Dashboard Widgets](#), on page 258.

**Procedure**

- 
- Step 1** Choose **Devices > Device Management**.
- Step 2** Next to the device where you want to view the logical aggregate interface statistics, click the edit icon (✎). In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.
- Step 3** Next to the interface where you want to view the interface statistics, click the view icon (🔍).
- 

## Deleting Aggregate Interfaces

| Smart License | Classic License | Supported Devices  | Supported Domains | Access              |
|---------------|-----------------|--------------------|-------------------|---------------------|
| Any           | Control         | 7000 & 8000 Series | Leaf only         | Admin/Network Admin |

The aggregate interface can be identified by the **lag $n$**  label, where  **$n$**  can be an integer from 0 to 13.

**Procedure**

- 
- Step 1** Choose **Devices > Device Management**.

- Step 2** Next to the device where you want to delete the aggregate interface, click the edit icon ().
- In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.
- Step 3** Next to the aggregate interface you want to delete, click the delete icon ().
- Step 4** When prompted, confirm that you want to delete the aggregate interface.
- 

**What to do next**

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## CHAPTER 54

# Hybrid Interfaces

---

The following topics describe how to configure local hybrid interfaces:

- [About Hybrid Interfaces, on page 1161](#)
- [Logical Hybrid Interfaces, on page 1161](#)
- [Adding Logical Hybrid Interfaces, on page 1162](#)
- [Deleting Logical Hybrid Interfaces, on page 1164](#)

## About Hybrid Interfaces

You can configure logical hybrid interfaces on managed devices that allow the Firepower System to bridge traffic between virtual routers and virtual switches. If IP traffic received on interfaces in a virtual switch is addressed to the MAC address of an associated hybrid logical interface, the system handles it as Layer 3 traffic and either routes or responds to the traffic depending on the destination IP address. If the system receives any other traffic, it handles it as Layer 2 traffic and switches it appropriately. You cannot configure logical hybrid interfaces on an NGIPSv device.

Note that hybrid interfaces that are not associated with both a virtual switch and a virtual router are not available for routing, and do not generate or respond to traffic.

## Logical Hybrid Interfaces

You must associate a logical hybrid interface with a virtual router and virtual switch to bridge traffic between Layer 2 and Layer 3. You can only associate a single hybrid interface with a virtual switch. However, you can associate multiple hybrid interfaces with a virtual router.

You can also configure the Cisco Redundancy Protocol (SFRP) on a logical hybrid interface. SFRP allows devices to act as redundant gateways for specified IP addresses.

Note that disabling the **ICMP Enable Responses** option for hybrid interfaces does not prevent ICMP responses in all scenarios. You can add network-based rules to an access control policy to drop packets where the destination IP is the hybrid interface's IP and the protocol is ICMP.

If you have enabled the **Inspect Local Router Traffic** option on the managed device, it drops the packets before they reach the host, thereby preventing any response.

The range of MTU values can vary depending on the model of the managed device and the interface type.

**Caution** Changing the highest MTU value among all non-management interfaces on the device restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Inspection is interrupted on all non-management interfaces, not just the interface you modified. Whether this interruption drops traffic or passes it without further inspection depends on the model of the managed device and the interface type. See [Snort® Restart Traffic Behavior, on page 350](#) for more information.

#### Related Topics

[Configuring SFRP](#), on page 1122

[Advanced Settings](#), on page 251

[MTU Ranges for 7000 and 8000 Series Devices and NGIPSv](#), on page 500

[Snort® Restart Scenarios](#), on page 348

## Adding Logical Hybrid Interfaces

| Smart License | Classic License | Supported Devices  | Supported Domains | Access              |
|---------------|-----------------|--------------------|-------------------|---------------------|
| Any           | Control         | 7000 & 8000 Series | Leaf only         | Admin/Network Admin |

**Caution** Adding a routed interface pair on 7000 or 8000 Series devices restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See [Snort® Restart Traffic Behavior, on page 350](#) for more information.

#### Procedure

**Step 1** Choose **Devices > Device Management**.

**Step 2** Next to the device where you want to add the hybrid interface, click the edit icon (✎).

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

**Step 3** From the **Add** drop-down menu, choose **Add Logical Interface**.

**Step 4** Click **Hybrid** to display the hybrid interface options.

**Step 5** In the **Name** field, enter a name for the interface.

**Step 6** From the **Virtual Router** drop-down list, choose an existing virtual router, choose **None**, or choose **New** to add a new virtual router.

**Note** If you add a new virtual router, you must configure it on the Device Management page after you finish setting up the hybrid interface. See [Adding Virtual Routers, on page 1124](#).

**Step 7** From the **Virtual Switch** drop-down list, choose an existing virtual switch, choose **None**, or choose **New** to add a new virtual switch.

**Note** If you add a new virtual switch, you must configure it on the Device Management page after you finish setting up the hybrid interface. See [Adding Virtual Switches, on page 1111](#).

**Step 8** Check the **Enabled** check box to allow the hybrid interface to handle traffic.

**Note** If you clear the check box, the interface becomes disabled and administratively taken down.

**Step 9** In the **MTU** field, enter a maximum transmission unit (MTU), which designates the largest size packet allowed. The range of MTU values can vary depending on the model of the managed device and the interface type.

**Caution** Changing the highest MTU value among all non-management interfaces on the device restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Inspection is interrupted on all non-management interfaces, not just the interface you modified. Whether this interruption drops traffic or passes it without further inspection depends on the model of the managed device and the interface type. See [Snort® Restart Traffic Behavior, on page 350](#) for more information.

**Step 10** Next to **ICMP**, check the **Enable Responses** check box to allow the interface to respond to ICMP traffic such as pings and traceroute.

**Step 11** Next to **IPv6 NDP**, check the **Enable Router Advertisement** check box to enable the interface to broadcast router advertisements. You can only enable this option if you added IPv6 addresses.

**Step 12** To add an IP address, click **Add**.

**Step 13** In the **Address** field, enter the IP address and subnet mask. Note the following:

- You cannot add network and broadcast addresses, or the static MAC addresses 00:00:00:00:00:00 and FF:FF:FF:FF:FF:FF.
- You cannot add identical IP addresses, regardless of subnet mask, to interfaces in virtual routers.

**Step 14** Optionally if you have IPv6 addresses, next to the **IPv6** field, check the **Address Autoconfiguration** check box to set the IP address of the interface automatically.

**Step 15** For **Type**, choose either Normal or SFRP.

**Step 16** If you chose SFRP for **Type**, set options as described in [SFRP](#).

**Step 17** Click **OK**.

**Step 18** Click **Save**.

---

### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## Deleting Logical Hybrid Interfaces

| Smart License | Classic License | Supported Devices  | Supported Domains | Access              |
|---------------|-----------------|--------------------|-------------------|---------------------|
| Any           | Control         | 7000 & 8000 Series | Leaf only         | Admin/Network Admin |

### Procedure

---

- Step 1** Choose **Devices > Device Management**.
- Step 2** Next to the device where you want to delete the logical hybrid interface, click the edit icon (✎).  
In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.
- Step 3** Next to the logical hybrid interface you want to delete, click the delete icon (🗑️).
- Step 4** When prompted, confirm that you want to delete the interface.
- 

### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## CHAPTER 55

# Gateway VPNs

The following topics describe how to manage your VPN deployment:

- [Gateway VPN Basics, on page 1165](#)
- [VPN Deployments, on page 1166](#)
- [VPN Deployment Management, on page 1168](#)
- [VPN Deployment Status, on page 1179](#)
- [VPN Statistics and Logs, on page 1179](#)

## Gateway VPN Basics

A virtual private network (VPN) is a network connection that establishes a secure tunnel between endpoints via a public source, such as the internet or other network. You can configure the Firepower System to build secure VPN tunnels between the virtual routers of Firepower managed devices. The system builds tunnels using the Internet Protocol Security (IPsec) protocol suite.

After the VPN connection is established, the hosts behind the local gateway can connect to the hosts behind the remote gateway through the secure VPN tunnel. A connection consists of the IP addresses and host names of the two gateways, the subnets behind them, and the shared secrets for the two gateways to authenticate to each other.

The VPN endpoints authenticate to each other with either the Internet Key Exchange (IKE) version 1 or version 2 protocol to create a security association for the tunnel. The system uses either the IPsec authentication header (AH) protocol or the IPsec encapsulating security payload (ESP) protocol to authenticate the data entering the tunnel. The ESP protocol encrypts the data as well as providing the same functionality as AH.

If you have access control policies in your deployment, the system does not send VPN traffic until it has passed through access control. In addition, the system does not send tunnel traffic to the public source when the tunnel is down.

To configure and deploy VPN for Firepower, you must have a VPN license enabled on each of your target managed devices. Additionally, VPN features are only available on 7000 and 8000 Series devices.

## IPsec

The IPsec protocol suite defines how IP packets across a VPN tunnel are hashed, encrypted, and encapsulated in the ESP or AH security protocol. The Firepower System uses the hash algorithm and encryption key of the Security Association (SA), which becomes established between the two gateways by the Internet Key Exchange (IKE) protocol.

Security associations (SA) establish shared security attributes between two devices and allow VPN endpoints to support secure communication. An SA allows two VPN endpoints to handle the parameters for how the VPN tunnel is secured between them.

The system uses the Internet Security Association and Key Management Protocol (ISAKMP) during the initial phase of negotiating the IPsec connection to establish the VPN between endpoints and the authenticated key exchange. The IKE protocol resides within ISAKMP.

The AH security protocol provides protection for packet headers and data, but it cannot encrypt them. ESP provides encryption and protection for packets, but it cannot secure the outermost IP header. In many cases, this protection is not required, and most VPN deployments use ESP more frequently than AH because of its encryption capabilities. Since VPN only operates in tunnel mode, the system encrypts and authenticates the entire packet from Layer 3 and up in the ESP protocol. ESP in tunnel mode encrypts the data as well as providing the latter's encryption capabilities.

## IKE

The Firepower System uses the IKE protocol to mutually authenticate the two gateways against each other as well as to negotiate the SA for the tunnel. The process consists of two phases.

IKE phase 1 establishes a secure authenticated communication channel by using the Diffie-Hellman key exchange to generate a pre-shared key to encrypt further IKE communications. This negotiation results in a bidirectional ISAKMP security association. The system allows you to perform the authentication using a pre-shared key. Phase 1 operates in main mode, which seeks to protect all data during the negotiation, while also protecting the identity of the peers.

During IKE phase 2, the IKE peers use the secure channel established in phase 1 to negotiate security associations on behalf of IPsec. The negotiation results in a minimum of two unidirectional security associations, one inbound and one outbound.

## VPN Deployments

A VPN deployment specifies the endpoints and networks that are included in a VPN and how they connect to each other. After you configure a VPN deployment on the Firepower Management Center, you can then deploy it to your managed devices or devices managed by another Firepower Management Center.

The system supports three types of VPN deployments: point-to-point, star, and mesh.

### Point-to-Point VPN Deployments

In a point-to-point VPN deployment, two endpoints communicate directly with each other. You configure the two endpoints as peer devices, and either device can start the secured connection. Each of the devices in this configuration must be a VPN-enabled managed device.

The following diagram displays a typical point-to-point VPN deployment.

## Star VPN Deployments

In a star VPN deployment, a central endpoint (hub node) establishes a secure connection with multiple remote endpoints (leaf nodes). Each connection between the hub node and an individual leaf node is a separate VPN tunnel. The hosts behind any of the leaf nodes can communicate with each other through the hub node.

Star deployments commonly represent a VPN that connects an organization's main and branch office locations using secure connections over the Internet or other third-party network. Star VPN deployments provide all employees with controlled access to the organization's network.

In a typical star deployment, the hub node is located at the main office. Leaf nodes are located at branch offices and start most of the traffic. Each of the nodes must be a VPN-enabled managed device.

Star deployments only support IKE version 2.

The following diagram displays a typical star VPN deployment.

## Mesh VPN Deployments

In a mesh VPN deployment, all endpoints can communicate with every other endpoint by an individual VPN tunnel. The mesh deployment offers redundancy so that when one endpoint fails, the remaining endpoints can still communicate with each other. This type of deployment commonly represents a VPN that connects a group of decentralized branch office locations. The number of VPN-enabled managed devices you deploy in this configuration depends on the level of redundancy you require. Each of the endpoints must be a VPN-enabled managed device.

The following diagram displays a typical mesh VPN deployment.

## VPN Deployment Management

On the VPN page (**Devices > VPN > Site to Site**), you can view all of your current VPN deployments by name and the endpoints contained in the deployment. Options on this page allow you to view the status of a VPN deployment, create a new deployment, deploy to managed devices, and edit or delete a deployment.

Note that when you register a device to a Firepower Management Center, deployed VPN deployments sync to the Firepower Management Center during registration.

### Related Topics

[Managing VPN Deployments](#), on page 1174

## VPN Deployment Options

When you create a new VPN deployment you must, at minimum, give it a unique name, specify a deployment type, and designate a preshared key. You can select from three types of deployment, each containing a group of VPN tunnels:

- Point-to-point (PTP) deployments establish a VPN tunnel between two endpoints.
- Star deployments establish a group of VPN tunnels connecting a hub endpoint to a group of leaf endpoints.
- Mesh deployments establish a group of VPN tunnels among a set of endpoints.

Only Cisco managed devices can be used as endpoints in VPN deployments. Third-party endpoints are not supported.

You must define a pre-shared key for VPN authentication. You can specify a default key to use in all of the VPN connections you generate in a deployment. For point-to-point deployments, you can specify a preshared key for each endpoint pair.

In a multidomain deployment, you can configure a VPN deployment across domains; that is, you can assign endpoints to devices that belong to different domains. In such cases, you can view but not modify the ancestor deployment in the related descendant domains. When you drill down for deployment details, the system displays information for devices that belong to the current domain only.

### Point-to-Point VPN Deployment Options

When configuring a point-to-point VPN deployment, you define a group of endpoint pairs and then create a VPN between the two nodes in each pair.

The following list describes the options you can specify in your deployment.

#### Name

Specify a unique name for the deployment.

#### Type

Click **PTP** to specify that you are configuring a point-to-point deployment.

#### Pre-shared Key

Define a unique pre-shared key for authentication. The system uses this key for all the VPNs in your deployment, unless you specify a pre-shared key for each endpoint pair.

#### Device

You can choose a managed device, including a device stack or device high-availability pair, as an endpoint for your deployment. For Cisco-managed devices not managed by the Firepower Management Center you are using, choose **Other** and then specify an IP address for the endpoint.

#### Virtual Router

If you chose a managed device as your endpoint, choose a virtual router that is currently applied to the selected device. You cannot choose the same virtual router for more than one endpoint.

#### Interface

If you chose a managed device as your endpoint, choose a routed interface that is assigned to the virtual router you specified.

**IP Address**

- If you chose a managed device as an endpoint, choose an IP address that is assigned to the specified routed interface.
- If the managed device is a device high-availability pair, you can choose only from a list of SFRP IP addresses.
- If you choose a managed device **not** managed by the Firepower Management Center, specify an IP address for the endpoint.

**Protected Networks**

Specify the networks in your deployment that are encrypted. Enter a subnet with CIDR block for each network. IKE version 1 only supports a single protected network.

Note that VPN endpoints cannot have the same IP address and that protected networks in a VPN endpoint pair cannot overlap. If a list of protected networks for an endpoint contains one or more IPv4 or IPv6 entry, the other endpoint's protected network must have at least one entry of the same type (i.e., IPv4 or IPv6). If it does not, then the other endpoint's IP address must be of the same type and must not overlap with the entries in the protected network. (Use /32 CIDR address blocks for IPv4 and /128 CIDR address blocks for IPv6). If both of these checks fail, the endpoint pair is invalid.

**Internal IP**

Check the check box if the endpoint resides behind a firewall with network address translation.

**Public IP**

If you checked the **Internal IP** check box, specify a public IP address for the firewall. If the endpoint is a responder, you must specify this value.

**Public IKE Port**

If you checked the **Internal IP** check box, specify a single numerical value from 1 to 65535 for the UDP port on the firewall that is being port-forwarded to the internal endpoint. If the endpoint is a responder and the port on the firewall being forwarded is not 500 or 4500, you must specify this value.

**Use Deployment Key**

Check the check box to use the pre-shared key defined for the deployment. Clear the check box to specify a pre-shared key for VPN authentication for this endpoint pair.

**Pre-shared Key**

If you cleared the **Use Deployment Key** check box, specify a pre-shared key in this field.

**Related Topics**

[Configuring Point-to-Point VPN Deployments](#), on page 1175

**Star VPN Deployment Options**

When configuring a star VPN deployment, you define a single hub node endpoint and a group of leaf node endpoints. You must define the hub node endpoint and at least one leaf node endpoint to configure the deployment.

The following list describes the options you can specify in your deployment.

**Name**

Specify a unique name for the deployment.

### Type

Click **Star** to specify that you are configuring a star deployment.

### Pre-shared Key

Define a unique pre-shared key for authentication.

### Device

You can choose a managed device, including a device stack or device high-availability pair, as an endpoint for your deployment. For Cisco-managed devices not managed by the Firepower Management Center you are using, choose **Other** and then specify an IP address for the endpoint.

### Virtual Router

If you chose a managed device as your endpoint, choose a virtual router that is currently applied to the selected device. You cannot choose the same virtual router for more than one endpoint.

### Interface

If you chose a managed device as your endpoint, choose a routed interface that is assigned to the selected virtual router.

### IP Address

- If you chose a managed device as an endpoint, choose an IP address that is assigned to the specified routed interface.
- If the managed device is a device high-availability pair, you can choose only from a list of SFRP IP addresses.
- If you chose a managed device **not** managed by the Firepower Management Center, specify an IP address for the endpoint.

### Protected Networks

Specify the networks in your deployment that are encrypted. Enter a subnet with CIDR block for each network.

Note that VPN endpoints cannot have the same IP address and that protected networks in a VPN endpoint pair cannot overlap. If a list of protected networks for an endpoint contains one or more IPv4 or IPv6 entry, the other endpoint's protected network must have at least one entry of the same type (i.e., IPv4 or IPv6). If it does not, then the other endpoint's IP address must be of the same type and must not overlap with the entries in the protected network. (Use /32 CIDR address blocks for IPv4 and /128 CIDR address blocks for IPv6). If both of these checks fail, the endpoint pair is invalid.

### Internal IP

Check the check box if the endpoint resides behind a firewall with network address translation.

### Public IP

If you checked the **Internal IP** check box, specify a public IP address for the firewall. If the endpoint is a responder, you must specify this value.

### Public IKE Port

If you checked the **Internal IP** check box, specify a single numerical value from 1 to 65535 for the UDP port on the firewall that is being port-forwarded to the internal endpoint. If the endpoint is a responder and the port on the firewall being forwarded is not 500 or 4500, you must specify this value.

### Related Topics

[Configuring Star VPN Deployments](#), on page 1175

## Mesh VPN Deployment Options

When configuring a mesh VPN deployment, you define a group of VPNs to link any two points for a given set of endpoints.

The following list describes the options you can specify in your deployment.

### Name

Specify a unique name for the deployment.

### Type

Click **Mesh** to specify that you are configuring a mesh deployment.

### Pre-shared Key

Define a unique pre-shared key for authentication.

### Device

You can choose a managed device, including a device stack or device high-availability pair, as an endpoint for your deployment. For Cisco-managed devices not managed by the Firepower Management Center you are using, choose **Other** and then specify an IP address for the endpoint.

### Virtual Router

If you chose a managed device as your endpoint, choose a virtual router that is currently applied to the specified device. You cannot choose the same virtual router for more than one endpoint.

### Interface

If you chose a managed device as your endpoint, choose a routed interface that is assigned to the specified virtual router.

### IP Address

- If you chose a managed device as an endpoint, choose an IP address that is assigned to the selected routed interface.
- If the managed device is a device high-availability pair, you can choose only from a list of SFRP IP addresses.
- If you chose a managed device **not** managed by the Firepower Management Center, specify an IP address for the endpoint.

### Protected Networks

Specify the networks in your deployment that are encrypted. Enter a subnet with CIDR block for each network. IKE version 1 only supports a single protected network.

Note that VPN endpoints cannot have the same IP address and that protected networks in a VPN endpoint pair cannot overlap. If a list of protected networks for an endpoint contains one or more IPv4 or IPv6 entry, the other endpoint's protected network must have at least one entry of the same type (i.e., IPv4 or IPv6). If it does not, then the other endpoint's IP address must be of the same type and must not overlap with the entries in the protected network. (Use /32 CIDR address blocks for IPv4 and /128 CIDR address blocks for IPv6). If both of these checks fail, the endpoint pair is invalid.

**Internal IP**

Check the check box if the endpoint resides behind a firewall with network address translation.

**Public IP**

If you checked the **Internal IP** check box, specify a public IP address for the firewall. If the endpoint is a responder, you must specify this value.

**Public IKE Port**

If you checked the **Internal IP** check box, specify a single numerical value from 1 to 65535 for the UDP port on the firewall that is being port-forwarded to the internal endpoint. If the endpoint is a responder and the port on the firewall being forwarded is not 500 or 4500, you must specify this value.

**Related Topics**

[Configuring Mesh VPN Deployments](#), on page 1176

## Advanced VPN Deployment Options

VPN deployments contain some common settings that can be shared among the VPNs in a deployment. Each VPN can use the default settings or you can override the default settings. Advanced settings typically require little or no modification and are not common to every deployment.

The following list describes the advanced options you can specify in your deployment.

**Other Algorithm Allowed**

Check the check box to enable auto negotiation to an algorithm not listed in the Algorithm list, but proposed by the remote peer.

**Algorithm**

Specify the phase one and phase two algorithm proposals to secure data in your deployment. Choose **Cipher**, **Hash**, and Diffie-Hellman (**DH**) group authentication messages for both phases.

**IKE Life Time**

Specify a numerical value and choose a time unit for the maximum IKE SA renegotiation interval. You can specify a minimum of 15 minutes and a maximum of 30 days.

**IKE v2**

Check the check box to specify that the system uses IKE version 2. This version supports the star deployment and multiple protected networks.

**Life Time**

Specify a numerical value and select a time unit for the maximum SA renegotiation interval. You can specify a minimum of 5 minutes and a maximum of 24 hours.

**Life Packets**

Specify the number of packets that can be transmitted over an IPsec SA before it expires. You can use any integer between 0 and 18446744073709551615.

**Life Bytes**

Specify the number of bytes that can be transmitted over an IPsec SA before it expires. You can use any integer between 0 and 18446744073709551615.

**AH**

Check the check box to specify that the system uses the authentication header security protocol for the data to be protected. Clear the check box to use encryption service payload (ESP) protocol.

## Managing VPN Deployments

| Smart License | Classic License | Supported Devices  | Supported Domains | Access              |
|---------------|-----------------|--------------------|-------------------|---------------------|
| N/A           | VPN             | 7000 & 8000 Series | Any               | Admin/Network Admin |

**Caution**

Adding or removing a VPN on a 7000 or 8000 Series device restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See [Snort® Restart Traffic Behavior](#), on page 350 for more information.

**Procedure**

**Step 1** Choose **Devices > VPN > Site to Site**.

**Step 2** Manage your VPN deployments:

- Add — To create a new VPN deployment, click **Add VPN > Firepower Device**, and continue as follows depending on deployment type:
  - [Configuring Mesh VPN Deployments](#), on page 1176
  - [Configuring Point-to-Point VPN Deployments](#), on page 1175
  - [Configuring Star VPN Deployments](#), on page 1175
- Edit — To modify the settings in an existing VPN deployment, click the edit icon (); see [Editing VPN Deployments](#), on page 1178.
- Delete — To delete a VPN deployment, click the delete icon ().
- Deploy—Click **Deploy**; see [Deploy Configuration Changes](#), on page 346.
- View VPN status — To view the status of an existing VPN deployment, click the status icon; see [Viewing VPN Status](#), on page 1179.

## Configuring Point-to-Point VPN Deployments

| Smart License | Classic License | Supported Devices  | Supported Domains | Access              |
|---------------|-----------------|--------------------|-------------------|---------------------|
| N/A           | VPN             | 7000 & 8000 Series | Any               | Admin/Network Admin |

### Before you begin

If you are using managed devices as endpoints, create a virtual router and apply it to the appropriate device.

**Note** You cannot use the same virtual router for more than one endpoint. For more information, see [Setting Up Virtual Routers, on page 1115](#)

### Procedure

- Step 1** Choose **Devices > VPN > Site to Site**.
- Step 2** Click **Add VPN > Firepower Device**.
- Step 3** Enter a unique **Name**.
- Step 4** Verify that **PTP** is chosen as the **Type**.
- Step 5** Enter a unique **Pre-shared Key**.
- Step 6** Next to **Node Pairs**, click the add icon (+).
- Step 7** Configure the VPN deployment options described in [Point-to-Point VPN Deployment Options, on page 1169](#).
- Step 8** Under **Node A**, next to **Protected Networks**, click the add icon (+).
- Step 9** Enter a CIDR block for the protected network.
- Step 10** Click **OK**.
- Step 11** Repeat step 8 through step 10 for **Node B**.
- Step 12** Click **Save**.  
The endpoint pair is added to your deployment.
- Step 13** Click **Save** to finish configuring your deployment.

### What to do next

## Configuring Star VPN Deployments

| Smart License | Classic License | Supported Devices  | Supported Domains | Access              |
|---------------|-----------------|--------------------|-------------------|---------------------|
| N/A           | VPN             | 7000 & 8000 Series | Any               | Admin/Network Admin |

**Before you begin**

If you are using managed devices as endpoints, create a virtual router and apply it to the appropriate device.

**Note** You cannot use the same virtual router for more than one endpoint. For more information, see [Setting Up Virtual Routers, on page 1115](#)

**Procedure**

- 
- Step 1** Choose **Devices > VPN > Site to Site**.
- Step 2** Click **Add VPN > Firepower Device**.
- Step 3** Enter a unique **Name**.
- Step 4** Click **Star** to specify the **Type**.
- Step 5** Enter a unique **Pre-shared Key**.
- Step 6** Next to **Hub Node**, click the edit icon (✎).
- Step 7** Configure the VPN deployment options described in [Star VPN Deployment Options, on page 1170](#).
- Step 8** Next to **Protected Networks**, click the add icon (+).
- Step 9** Enter an IP address for the protected network.
- Step 10** Click **OK**.
- Step 11** Click **Save**. The hub node is added to your deployment.
- Step 12** Next to **Leaf Nodes**, click the add icon (+).
- Step 13** Repeat step 7 through step 10 to complete the leaf node, which has the same options as the hub node.
- Step 14** Click **Save**.  
The leaf node is added to your deployment.
- Step 15** Click **Save** to finish configuring your deployment.
- 

**What to do next**

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

**Configuring Mesh VPN Deployments**

| Smart License | Classic License | Supported Devices  | Supported Domains | Access              |
|---------------|-----------------|--------------------|-------------------|---------------------|
| N/A           | VPN             | 7000 & 8000 Series | Any               | Admin/Network Admin |

**Before you begin**

If you are using managed devices as endpoints, create a virtual router and apply it to the appropriate device.

**Note** You cannot use the same virtual router for more than one endpoint. For more information, see [Setting Up Virtual Routers, on page 1115](#)

### Procedure

- 
- Step 1** Choose **Devices > VPN > Site to Site**.
- Step 2** Click **Add VPN > Firepower Device**.
- Step 3** Enter a unique **Name**.
- Step 4** Click **Mesh** to specify the **Type**.
- Step 5** Enter a unique **Pre-shared Key**.
- Step 6** Next to **Nodes**, click the add icon (+).
- Step 7** Configure the VPN deployment options described in [Mesh VPN Deployment Options, on page 1172](#).
- Step 8** Next to **Protected Networks**, click the add icon (+).
- Step 9** Enter a CIDR block for the protected network.
- Step 10** Click **OK**.  
The protected network is added.
- Step 11** Click **Save**.  
The endpoint is added to your deployment.
- Step 12** Repeat step 6 through step 11 to add more endpoints.
- Step 13** Click **Save** to complete your deployment.
- 

### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## Configuring Advanced VPN Deployment Settings

| Smart License | Classic License | Supported Devices  | Supported Domains | Access              |
|---------------|-----------------|--------------------|-------------------|---------------------|
| N/A           | VPN             | 7000 & 8000 Series | Any               | Admin/Network Admin |

In a multidomain deployment, the system displays VPN deployments created in the current domain, which you can edit. It also displays VPN deployments created in ancestor domains if one of the endpoint devices belongs to your domain. You cannot edit VPN deployments created in ancestor domains. To view and edit VPN deployments created in a lower domain, switch to that domain.

### Procedure

- 
- Step 1** Choose **Devices > VPN > Site to Site**.

**Step 2** Click the edit icon (.

If **View** () appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

**Step 3** Click the **Advanced** tab.

**Step 4** Configure the advanced settings, as described in [Advanced VPN Deployment Options, on page 1173](#).

**Step 5** Next to **Algorithms**, click the add icon (.

**Step 6** Chose **Cipher**, **Hash**, and Diffie-Hellman (**DH**) group authentication messages for both phases.

**Step 7** Click **OK**.

**Step 8** Click **Save**.

### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## Editing VPN Deployments

**Caution** Two users should **not** edit the same deployment simultaneously; however, note that the web interface does not prevent simultaneous editing.

In a multidomain deployment, the system displays VPN deployments created in the current domain, which you can edit. It also displays VPN deployments created in ancestor domains if one of the endpoint devices belongs to your domain. You cannot edit VPN deployments created in ancestor domains. To view and edit VPN deployments created in a lower domain, switch to that domain.

### Procedure

**Step 1** Choose **Devices > VPN > Site to Site**.

**Step 2** Click the edit icon (.

If **View** () appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

**Step 3** Modify the desired settings:

- Advanced settings; see [Configuring Advanced VPN Deployment Settings, on page 1177](#).
- Mesh deployment settings; see [Configuring Mesh VPN Deployments, on page 1176](#).
- Point-to-point deployment settings; see [Configuring Point-to-Point VPN Deployments, on page 1175](#).
- Star deployment settings; see [Configuring Star VPN Deployments, on page 1175](#).

**Tip** You cannot edit the deployment type after you initially save the deployment. To change the deployment type, you must delete the deployment and create a new one.

**What to do next**

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## VPN Deployment Status

After you configure a VPN deployment, you can view the status of your configured VPN tunnels. The VPN page displays a status icon for each VPN deployment once it has been deployed:

- The  icon designates that all VPN endpoints are up.
- The  icon designates that all VPN endpoints are down.
- The  icon designates that some endpoints are up, while others are down.

You can click a status icon to view the deployment status along with basic information about the endpoints in the deployment, such as endpoint name and IP address. The VPN status updates every minute or when a status change occurs, such as an endpoint going down or coming up.

**Related Topics**

[Viewing VPN Status](#), on page 1179

## Viewing VPN Status

| Smart License | Classic License | Supported Devices  | Supported Domains | Access              |
|---------------|-----------------|--------------------|-------------------|---------------------|
| N/A           | VPN             | 7000 & 8000 Series | Any               | Admin/Network Admin |

In a multidomain deployment, the system displays VPN deployments created in the current domain. It also displays VPN deployments created in ancestor domains if one of the endpoint devices belongs to your domain. To view VPN deployments created in a lower domain, switch to that domain.

**Procedure**

- 
- Step 1** Choose **Devices > VPN > Site to Site**.
- Step 2** Click the VPN status icon next to the deployment where you want to view the status.
- Step 3** Click **OK**.
- 

## VPN Statistics and Logs

After you configure a VPN deployment, you can view statistics about the data traversing your configured VPN tunnels. In addition, you can view the latest VPN system and IKE logs for each endpoint.

The system displays the following statistics:

**Endpoint**

The device path to the routed interface and IP address designated as the VPN endpoint.

**Status**

Whether the VPN connection is up or down.

**Protocol**

The protocol used for encryption, either ESP or AH.

**Packets Received**

The number of packets per interface the VPN tunnel receives during an IPsec SA negotiation.

**Packets Forwarded**

The number of packets per interface the VPN tunnel transmits during an IPsec SA negotiation.

**Bytes Received**

The number of bytes per interface the VPN tunnel receives during an IPsec SA negotiation.

**Bytes Forwarded**

The number of bytes per interface the VPN tunnel transmits during an IPsec SA negotiation.

**Time Created**

The date and time the VPN connection was created.

**Time Last Used**

The last time a user initiated a VPN connection.

**NAT Traversal**

If "Yes" is displayed, at least one of the VPN endpoints resides behind a device with network address translation.

**IKE State**

The state of the IKE SA: connecting, established, deleting, or destroying.

**IKE Event**

The IKE SA event: reauthentication or rekeying.

**IKE Event Time**

The time in seconds the next event should occur.

**IKE Algorithm**

The IKE algorithm being used by the VPN deployment.

**IPsec State**

The state of the IPsec SA: installing, installed, updating, rekeying, deleting, and destroying.

**IPsec Event**

Notification of when the IPsec SA event is rekeying.

**IPsec Event Time**

The time in seconds until the next event should occur.

**IPsec Algorithm**

IPsec algorithm being used by the VPN deployment.

**Related Topics**

- [Access Control Policy Default Action, on page 1185](#)
- [Deep Inspection Using File and Intrusion Policies, on page 1187](#)
- [Access Control Policy Inheritance, on page 1191](#)

## Introduction to Access Control

Access control is a hierarchical policy-based feature that allows you to specify, inspect, and log (non-fast-pathed) network traffic.

Each managed device can be targeted by one access control policy. The data that the policy's *target devices* collect about your network traffic can be used to filter and control that traffic based on:

- simple, easily determined transport and network layer characteristics: source and destination, port, protocol, and so on
- the latest contextual information on the traffic, including characteristics such as reputation, risk, business relevance, application used, or URL visited
- realm, user, user group, or ISE attribute
- custom Security Group Tag (SGT)
- characteristics of encrypted traffic; you can also decrypt this traffic for further analysis
- whether unencrypted or decrypted traffic contains a prohibited file, detected malware, or intrusion attempt

Each type of traffic inspection and control occurs where it makes the most sense for maximum flexibility and performance. For example, reputation-based blocking uses simple source and destination data, so it can block prohibited traffic early in the process. In contrast, detecting and blocking intrusions and exploits is a last-line defense.

## Access Control Policy Default Action

A newly created access control policy directs its target devices to handle all traffic using its *default action*.

In a simple access control policy, the default action specifies how target devices handle all traffic. In a more complex policy, the default action handles traffic that:

- is not trusted by Intelligent Application Bypass
- is not on a Security Intelligence Block list
- is not blocked by SSL inspection (encrypted traffic only)
- matches none of the rules in the policy (except Monitor rules, which match and log—but do not handle or inspect—traffic)

The access control policy default action can block or trust traffic without further inspection, or inspect traffic for intrusions and discovery data.

**Note** You **cannot** perform file or malware inspection on traffic handled by the default action. Logging for connections handled by the default action is initially disabled, though you can enable it.

If you are using policy inheritance, the default action for the lowest-level descendant determines final traffic handling. Although an access control policy can inherit its default action from its base policy, you cannot enforce this inheritance.

The following table describes the types of inspection you can perform on traffic handled by each default action.

**Table 86: Access Control Policy Default Actions**

| Default Action                    | Effect on Traffic                                                  | Inspection Type and Policy                                                                                                        |
|-----------------------------------|--------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| Access Control: Block All Traffic | block without further inspection                                   | none                                                                                                                              |
| Access Control: Trust All Traffic | trust (allow to its final destination without further inspection)  | none                                                                                                                              |
| Intrusion Prevention              | allow, as long as it is passed by the intrusion policy you specify | intrusion, using the specified intrusion policy and associated variable set, and<br>discovery, using the network discovery policy |
| Network Discovery Only            | allow                                                              | discovery only, using the network discovery policy                                                                                |
| Inherit from base policy          | defined in base policy                                             | defined in base policy                                                                                                            |

The following diagram illustrates the table.

The following diagrams illustrate the **Block All Traffic** and **Trust All Traffic** default actions.

The following diagrams illustrate the **Intrusion Prevention** and **Network Discovery Only** default actions.

**Tip** The purpose of **Network Discovery Only** is to improve performance in a discovery-only deployment. Different configurations can disable discovery if you are only interested in intrusion detection and prevention.

## Deep Inspection Using File and Intrusion Policies

Deep inspection uses intrusion and file policies as the last line of defense before traffic is allowed to its destination.

- *Intrusion policies* govern the system’s intrusion prevention capabilities.  
For complete information, see [Intrusion Detection and Prevention](#), on page 1445.
- *File policies* govern the system’s file control and AMP for Networks capabilities.  
For complete information, see [File Policies and Malware Protection](#), on page 1401.

Access control occurs before deep inspection; access control rules and the access control default action determine which traffic is inspected by intrusion and file policies.

By associating an intrusion or file policy with an access control rule, you are telling the system that before it passes traffic that matches the access control rule's conditions, you first want to inspect the traffic with an intrusion policy, a file policy, or both.

In an access control policy, you can associate one intrusion policy with each Allow and Interactive Block rule, as well as with the default action. Every unique **pair** of intrusion policy and variable set counts as one policy.

To associate intrusion and file policies with an access control rule, see:

- [Access Control Rule Configuration to Perform Intrusion Prevention, on page 1484](#)
- [Configuring an Access Control Rule to Perform Malware Protection, on page 1409](#)

**Note** By default, the system disables intrusion and file inspection of encrypted payloads. This helps reduce false positives and improve performance when an encrypted connection matches an access control rule that has intrusion and file inspection configured.

[File Policies, on page 1401](#)

## Access Control Traffic Handling with Intrusion and File Policies

The following diagram shows the flow of traffic in an inline intrusion prevention and AMP for Networks deployment, as governed by an access control policy that contains four different types of access control rules and a default action.

In the scenario above, the first three access control rules in the policy—Monitor, Trust, and Block—cannot inspect matching traffic. Monitor rules track and log but do not inspect network traffic, so the system continues to match traffic against additional rules to determine whether to permit or deny it. (However, see an important exception and caveat at [Access Control Rule Monitor Action, on page 1223](#).) Trust and Block rules handle matching traffic without further inspection of any kind, while traffic that does not match continues to the next access control rule.

The fourth and final rule in the policy, an Allow rule, invokes various other policies to inspect and handle matching traffic, in the following order:

- **Discovery: Network Discovery Policy**—First, the network discovery policy inspects traffic for discovery data. Discovery is passive analysis and does not affect the flow of traffic. Although you do not explicitly enable discovery, you can enhance or disable it. However, allowing traffic does not automatically guarantee discovery data collection. The system performs discovery only for connections involving IP addresses that are explicitly monitored by your network discovery policy.
- **AMP for Networks and File Control: File Policy**—After traffic is inspected by discovery, the system can inspect it for prohibited files and malware. AMP for Networks detects and optionally blocks malware in many types of files, including PDFs, Microsoft Office documents, and others. If your organization wants to block not only the transmission of malware files, but all files of a specific type (regardless of whether the files contain malware), *file control* allows you to monitor network traffic for transmissions of specific file types, then either block or allow the file.
- **Intrusion Prevention: Intrusion Policy**—After file inspection, the system can inspect traffic for intrusions and exploits. An intrusion policy examines decoded packets for attacks based on patterns, and can block or alter malicious traffic. Intrusion policies are paired with *variable sets*, which allow you to use named values to accurately reflect your network environment.
- **Destination**—Traffic that passes all the checks described above passes to its destination.

An Interactive Block rule (not shown in the diagram) has the same inspection options as an Allow rule. This is so you can inspect traffic for malicious content when a user bypasses a blocked website by clicking through a warning page.

Traffic that does not match any access control rules in the policy with an action other than Monitor is handled by the default action. In this scenario, the default action is an Intrusion Prevention action, which allows traffic to its final destination as long as it is passed by the intrusion policy you specify. In a different deployment, you might have a default action that trusts or blocks all traffic without further inspection. Note that the system can inspect traffic allowed by the default action for discovery data and intrusions, but not prohibited files or malware. You **cannot** associate a file policy with the access control default action.

---

**Note** Sometimes, when a connection is analyzed by an access control policy, the system must process the first few packets in that connection, **allowing them to pass**, before it can decide which access control rule (if any) will handle the traffic. However, so these packets do not reach their destination uninspected, you can specify an intrusion policy (in the Advanced settings for the access control policy) to inspect these packets and generate intrusion events.

---

## File and Intrusion Inspection Order

In your access control policy, you can associate multiple Allow and Interactive Block rules with different intrusion and file policies to match inspection profiles to various types of traffic.

---

**Note** Traffic allowed by an Intrusion Prevention or Network Discovery Only default action can be inspected for discovery data and intrusions, but cannot be inspected for prohibited files or malware. You **cannot** associate a file policy with the access control default action.

---

You do not have to perform both file and intrusion inspection in the same rule. For a connection matching an Allow or Interactive Block rule:

- without a file policy, traffic flow is determined by the intrusion policy
- without an intrusion policy, traffic flow is determined by the file policy
- without either, allowed traffic is inspected by network discovery only

**Tip** The system does not perform any kind of inspection on trusted traffic. Although configuring an Allow rule with neither an intrusion nor file policy passes traffic like a Trust rule, Allow rules let you perform discovery on matching traffic.

The diagram below illustrates the types of inspection you can perform on traffic that meets the conditions of either an Allow or user-bypassed Interactive Block access control rule. For simplicity, the diagram displays traffic flow for situations where both (or neither) an intrusion and a file policy are associated with a single access control rule.

For any single connection handled by an access control rule, file inspection occurs before intrusion inspection. That is, the system does not inspect files blocked by a file policy for intrusions. Within file inspection, simple blocking by type takes precedence over malware inspection and blocking.

For example, consider a scenario where you normally want to allow certain network traffic as defined in an access control rule. However, as a precaution, you want to block the download of executable files, examine downloaded PDFs for malware and block any instances you find, and perform intrusion inspection on the traffic.

You create an access control policy with a rule that matches the characteristics of the traffic you want to provisionally allow, and associate it with both an intrusion policy and a file policy. The file policy blocks the download of all executables, and also inspects and blocks PDFs containing malware:

- First, the system blocks the download of all executables, based on simple type matching specified in the file policy. Because they are immediately blocked, these files are subject to neither malware nor intrusion inspection.
- Next, the system performs malware cloud lookups for PDFs downloaded to a host on your network. Any PDFs with a malware disposition are blocked, and are not subject to intrusion inspection.
- Finally, the system uses the intrusion policy associated with the access control rule to inspect any remaining traffic, including files not blocked by the file policy.

**Note** Until a file is detected and blocked in a session, packets from the session may be subject to intrusion inspection.

## Access Control Policy Inheritance

Especially useful in multidomain deployments, you can nest access control policies, where each policy inherits the rules and settings from an ancestor (or *base*) policy. You can enforce this inheritance, or allow lower-level policies to override their ancestors.

Access control uses a hierarchical policy-based implementation. Just as you create a domain hierarchy, you can create a corresponding hierarchy of access control policies. A *descendant*, or *child*, access control policy inherits rules and settings from its direct *parent*, or *base*, policy. That base policy may have its own parent policy from which it inherits rules and settings, and so on.

An access control policy's rules are nested between its parent policy's Mandatory and Default rule sections. This implementation enforces Mandatory rules from ancestor policies, but allows the current policy to write rules that preempt Default rules from ancestor policies.

You can lock the following settings to enforce them in all descendant policies. Descendant policies can override unlocked settings.

- Security Intelligence — connections that are allowed or blocked based on the latest reputation intelligence for IP addresses, URLs, and domain names.
- HTTP Response pages — Displaying a custom or system-provided response page when you block a user's website request.
- Advanced settings — Specifying associated subpolicies, network analysis settings, performance settings, and other general options.

When using policy inheritance, the default action for the lowest-level descendant determines final traffic handling. Although an access control policy can inherit its default action from an ancestor policy, you cannot enforce this inheritance.

### Policy Inheritance and Multitenancy

Access control's hierarchical policy-based implementation complements multitenancy.

In a typical multidomain deployment, access control policy hierarchy corresponds to domain structure, and you apply the lowest-level access control policy to managed devices. This implementation allows selective access control enforcement at a higher domain level, while lower-level domain administrators can tailor deployment-specific settings. (You must use roles, not policy inheritance and enforcement alone, to restrict administrators in descendant domains.)

For example, as a Global domain administrator for your organization, you can create an access control policy at the Global level. You can then require that all your devices, which are divided into subdomain by function, use that Global-level policy as a base policy.

When subdomain administrators log into the Firepower Management Center to configure access control, they can deploy the Global-level policy as-is. Or, they can create and deploy a descendant access control policy within the boundaries of the Global-level policy.

---

**Note** Although the most useful implementation of access control inheritance and enforcement complements multitenancy, you can create a hierarchy of access control policies within a single domain. You can also assign and deploy access control policies at any level.

## CHAPTER 57

# Best Practices for Access Control

---

- [General Best Practices for Access Control, on page 1193](#)
- [Best Practices for Access Control Rules, on page 1194](#)

## General Best Practices for Access Control

Review the following requirements and general best practices:

- Use a prefilter policy to provide early blocking for unwanted traffic, and to fastpath traffic that does not benefit from access control inspection. For more information, see [Best Practices for Prefiltering, on page 1276](#).
- Although you can configure the system without licensing your deployment, many features require that you enable the appropriate licenses before you deploy.
- For the system to affect traffic, you must deploy relevant configurations to managed devices using routed, switched, or transparent interfaces, or inline interface pairs.

Sometimes, the system prevents you from deploying inline configurations to passively deployed devices, including inline devices in tap mode.

In other cases, the policy may deploy successfully, but attempting to block or alter traffic using passively deployed devices can have unexpected results. For example, the system may report multiple beginning-of-connection events for each blocked connection, because blocked connections are not blocked in passive deployments.

- Certain features, including URL filtering, application detection, rate limiting, and Intelligent Application Bypass, must allow some packets to pass in order for the system to identify the traffic.

To prevent these packets from reaching their destination uninspected, see [Best Practices for Handling Packets That Pass Before Traffic Identification, on page 1670](#) and [Specify a Policy to Handle Packets That Pass Before Traffic Identification, on page 1670](#).

- You cannot perform file or malware inspection on traffic handled by the access control policy's default action.
- Some features are only available on certain device models. Warning icons and confirmation dialog boxes designate unsupported features.

- If you will use syslog or store events externally, avoid special characters in object names such as policy and rule names. Object names should not contain special characters, such as commas, that the receiving application may use as separators.
- Logging for connections handled by the default action is initially disabled, though you can enable it.
- Best practices for creating, ordering, and implementing access control rules are detailed in [Best Practices for Access Control Rules, on page 1194](#) and subtopics.

## Best Practices for Access Control Rules

Properly configuring and ordering rules is essential to building an effective deployment. The following topics summarize rule performance guidelines.

---

**Note** When you deploy configuration changes, the system evaluates all rules together and creates an expanded set of criteria that target devices use to evaluate network traffic. If these criteria exceed the resources (physical memory, processors, and so on) of a target device, you cannot deploy to that device.

---

### Related Topics

- [Best Practices for Application Control, on page 379](#)
- [Best Practices for URL Filtering, on page 1230](#)

## Best Practices for Ordering Rules

General guidelines:

- In general, place top-priority rules that must apply to all traffic near the top of the policy.
- Specific rules should come before general rules, especially when the specific rules are exceptions to general rules.  
Otherwise, traffic will match the general rule first and never hit the applicable specific rule.
- Whenever possible, put specific drop rules near the top of the policy. This ensures the earliest possible decision on undesirable traffic.
- Rules that drop traffic based on layer-3/4 criteria only (such as IP address, security zone, and port number) should come as early as possible.
- URL filtering rules and application rules and others that require inspection should come after rules that drop traffic based on layer-3/4 criteria only (such as IP address, security zone, and port number), but before rules that specify file and intrusion policies.
- Put URL filtering rules above application rules, and follow application rules with micro-application rules and Common Industrial Protocol (CIP) sub-classification application filtering rules.
- Rules that specify file policies and intrusion policies should come at the bottom of the rule order. These rules require resource-intensive deep inspection, and you should eliminate as many threats as possible using less-intensive methods first, for performance reasons, in order to minimize the number of potential threats that require deep inspection.

- Always order rules to suit your organization's needs.

Exceptions and additions to the above guidelines are noted in the sections below.

## Rule Preemption

Rule preemption occurs when a rule will never match traffic because a rule earlier in the evaluation order matches the traffic first. A rule's conditions govern whether it preempts other rules. In the following example, the second rule cannot block Admin traffic because the first rule allows it:

Access Control Rule 1: allow Admin users

Access Control Rule 2: block Admin users

Any type of rule condition can preempt a subsequent rule. The VLAN range in the first SSL rule includes the VLAN in the second rule, so the first rule preempts the second:

SSL Rule 1: do not decrypt VLAN 22-33

SSL Rule 2: block VLAN 27

In the following example, Rule 1 matches any VLAN because no VLANs are configured, so Rule 1 preempts Rule 2, which attempts to match VLAN 2:

Access Control Rule 1: allow Source Network 10.4.0.0/16

Access Control Rule 2: allow Source Network 10.4.0.0/16, VLAN 2

A rule also preempts an identical subsequent rule where all configured conditions are the same:

QoS Rule 1: rate limit VLAN 1 URL www.netflix.com

QoS Rule 2: rate limit VLAN 1 URL www.netflix.com

A subsequent rule would not be preempted if any condition is different:

QoS Rule 1: rate limit VLAN 1 URL www.netflix.com

QoS Rule 2: rate limit VLAN 2 URL www.netflix.com

### Example: Ordering SSL Rules to Avoid Preemption

Consider a scenario where a trusted CA (Good CA) mistakenly issued a CA certificate to a malicious entity (Bad CA), but has not yet revoked that certificate. You want to use an SSL policy to block traffic encrypted with certificates issued by the untrusted CA, but otherwise allow traffic within the trusted CA's chain of trust. After you upload the CA certificates and all intermediate CA certificates, configure an SSL policy with rules in the following order:

SSL Rule 1: Block issuer CN=www.badca.com

SSL Rule 2: Do not decrypt issuer CN=www.goodca.com

If you reverse the rules, you first match all traffic trusted by Good CA, including traffic trusted by Bad CA. Because no traffic ever matches the subsequent Bad CA rule, malicious traffic may be allowed instead of blocked.

## Rule Actions and Rule Order

A rule's action determines how the system handles matching traffic. Improve performance by placing rules that do not perform or ensure further traffic handling before the resource-intensive rules that do. Then, the system can divert traffic that it might otherwise have inspected.

The following examples show how you might order rules in various policies, given a set of rules where none is more critical and preemption is not an issue.

If your rules include application conditions, also see [Best Practices for Configuring Application Control](#), on page 381.

### Optimum Order: SSL Rules

Not only does decryption require resources, but so does further analysis of the decrypted traffic. Place SSL rules that decrypt traffic last.

1. Monitor—Rules that log matching connections, but take no other action on traffic.
2. Block, Block with reset—Rules that block traffic without further inspection.
3. Do not decrypt—Rules that do not decrypt encrypted traffic, passing the encrypted session to access control rules. The payloads of these sessions are not subject to deep inspection.
4. Decrypt - Known Key—Rules that decrypt incoming traffic with a known private key.
5. Decrypt - Resign—Rules that decrypt outgoing traffic by re-signing the server certificate.

### Optimum Order: Access Control Rules

Intrusion, file, and malware inspection requires resources, especially if you use multiple custom intrusion policies and variable sets. Place access control rules that invoke deep inspection last.

1. Monitor—Rules that log matching connections, but take no other action on traffic. (However, see the important exception and caveat at [Access Control Rule Monitor Action](#), on page 1223.)
2. Trust, Block, Block with reset—Rules that handle traffic without further inspection. Note that trusted traffic is subject to authentication requirements imposed by an identity policy, and to rate limiting.
3. Allow, Interactive Block (no deep inspection)—Rules that do not inspect traffic further, but allow discovery. Note that allowed traffic is subject to authentication requirements imposed by an identity policy, and to rate limiting.
4. Allow, Interactive Block (deep inspection)—Rules associated with file or intrusion policies that perform deep inspection for prohibited files, malware, and exploits.

## Content Restriction Rule Order

To avoid rule preemption in both SSL and access control policies, position rules governing YouTube restriction above rules governing Safe Search restriction.

When you enable Safe Search for an access control rule, the system adds the `search engine` category to the **Selected Applications and Filters** list. This application category includes YouTube. As a result, YouTube traffic matches to the Safe Search rule unless YouTube EDU is enabled in a rule with a higher evaluation priority.

A similar rule preemption occurs if you position an SSL rule with the `safesearch supported` filter higher in the evaluation order than an SSL rule with specific YouTube application conditions.

### Related Topics

[About Content Restriction](#), on page 1297

## Application Rule Order

Rules with application conditions are more likely to match traffic if you move them to a lower order in your list of rules.

Access control rules that use *specific* conditions (such as networks and IP addresses) should be ordered *before* rules that use general conditions (such as applications). If you're familiar with the Open Systems Interconnect (OSI) model, use similar numbering in concept. Rules with conditions for layers 1, 2, and 3 (physical, data link, and network) should be ordered first in your access control rules. Conditions for layers 5, 6, and 7 (session, presentation, and application) should be ordered later in your access control rules. For more information about the OSI model, see this [Wikipedia article](#).

For more information and an example, see [Best Practices for Configuring Application Control, on page 381](#) and [Best Practices for Application Control, on page 379](#).

## SSL Rule Order

In general, order your rules with specific conditions (such as IP addresses and networks) *before* rules with general conditions (such as applications).

### Allow Traffic from Certificate Pinned Sites

Some applications use a technique referred to as *TLS/SSL pinning* or *certificate pinning*, which embeds the fingerprint of the original server certificate in the application itself. As a result, if you configured a TLS/SSL rule with a **Decrypt - Resign** action, when the application receives a resigned certificate from a managed device, validation fails and the connection is aborted.

To confirm that TLS/SSL pinning is occurring, attempt to log in to a mobile application like Facebook. If a network connection error is displayed, log in using a web browser. (For example, you *cannot* log in to a Facebook mobile application but *can* log in to Facebook using Safari or Chrome.) You can use Firepower Management Center connection events as further proof of TLS/SSL pinning

---

**Note** TLS/SSL pinning is not limited to mobile applications.

---

To allow this traffic, configure an SSL rule with the **Do Not Decrypt** action to match the server certificate common name or distinguished name. In the SSL policy, order this rule before all **Decrypt - Resign** rules that also match the traffic. You can retrieve the pinned certificate from the client's browser after a successful connection to the website. You can also view the certificate from the logged connection event, regardless of whether the connection succeeded or failed.

### Prioritize ClientHello Modifications

To prioritize ClientHello modifications, place rules that match on conditions that are available in the ClientHello message before rules that match on ServerHello or server Certificate conditions.

When a managed device processes an SSL handshake, it can modify the ClientHello message to increase the likelihood of decryption. For example, it may remove compression methods because the Firepower System cannot decrypt compressed sessions.

The system modifies ClientHello messages only if it can conclusively match them to an SSL rule with a **Decrypt - Resign** action. The first time the system detects an encrypted session to a new server, server Certificate data is not available for ClientHello processing, which can result in an undecrypted first session.

For subsequent connections from the same client, the system can match the ClientHello message conclusively to rules with server Certificate conditions and process the message to maximize decryption potential.

If you place rules that match on ServerHello or server Certificate conditions (certificate, distinguished names, certificate status, cipher suites, version) before rules that match on ClientHello conditions (zones, networks, VLAN tags, ports, users, applications, URL categories), you can preempt ClientHello modification and increase the number of undecrypted sessions.

### Situation Where SSL Policy is Bypassed

The SSL policy is bypassed for any connections that match access control rules with actions of **Trust**, **Block**, or **Block with reset** if those rules:

- Use security zone, network, geolocation, and port only as the traffic matching criteria.
- Precede other rules that require inspection, such as rules that match connections based on application or URL, or allow rules that apply intrusion or file inspection.

## URL Rule Order

For the most effective URL matching, place rules that include URL conditions before other rules, particularly if the URL rules are block rules and the other rules meet both of the following criteria:

- They include application conditions.
- The traffic to be inspected is encrypted.

If you configure exceptions to a rule, put the exception above the other rule.

## Best Practices for Simplifying and Focusing Rules

### Simplify: Do Not Overconfigure

If one condition is enough to match the traffic you want to handle, do not use two.

Minimize individual rule criteria. Use as few individual elements in rule conditions as possible. For example, in network conditions use IP address blocks rather than individual IP addresses.

Combining elements into objects does **not** improve performance. For example, using a network object that contains 50 individual IP addresses gives you only an organizational—not a performance—benefit over including those IP addresses in the condition individually.

For recommendations related to application detection, see [Best Practices for Configuring Application Control, on page 381](#).

### Focus: Narrowly Constrain Resource-Intensive Rules, Especially by Interface

As much as possible, use rule conditions to narrowly define the traffic handled by resource-intensive rules. Focused rules are also important because rules with broad conditions can match many different types of traffic, and can preempt later, more specific rules. Examples of resource-intensive rules include:

- SSL rules that decrypt traffic—Not only the decryption, but further analysis of the decrypted traffic, requires resources. Narrow focus, and where possible, block or choose not to decrypt encrypted traffic.

- Access control rules that invoke deep inspection—Intrusion, file, and malware inspection requires resources, especially if you use multiple custom intrusion policies and variable sets. Make sure you only invoke deep inspection where required.

For maximum performance benefit, constrain rules by interface. If a rule excludes all of a device's interfaces, that rule does not affect that device's performance.

## Maximum Number of Access Control Rules and Intrusion Policies

The maximum number of access control rules or intrusion policies that are supported by a target device depends on many factors, including policy complexity, physical memory, and the number of processors on the device.

If you exceed the maximum supported by your device, you cannot deploy your access control policy and must reevaluate.

Guidelines for intrusion policies:

In an access control policy, you can associate one intrusion policy with each Allow and Interactive Block rule, as well as with the default action. Every unique **pair** of intrusion policy and variable set counts as one policy.

You may want to consolidate intrusion policies or variable sets so you can associate a single intrusion policy-variable set pair with multiple access control rules. On some devices you may find you can use only a single variable set for all your intrusion policies, or even a single intrusion policy-variable set pair for the whole device.

# CHAPTER 58

## Access Control Policies

The following topics describe how to work with access control policies:

- [Access Control Policy Components, on page 1201](#)
- [Requirements and Prerequisites for Access Control Policies, on page 1203](#)
- [Managing Access Control Policies, on page 1203](#)
- [System-Created Access Control Policies, on page 1204](#)
- [Creating a Basic Access Control Policy, on page 1204](#)
- [Editing an Access Control Policy, on page 1205](#)
- [Managing Access Control Policy Inheritance, on page 1207](#)
- [Setting Target Devices for an Access Control Policy, on page 1210](#)
- [Access Control Policy Advanced Settings, on page 1211](#)
- [History for Access Control Policies, on page 1214](#)

## Access Control Policy Components

In the following graphic, the default action uses the Balanced Security and Connectivity intrusion policy to inspect traffic before allowing it to its final destination.

### Simple Access Control Policy

inspects all traffic with a balanced intrusion policy

Identity Policy: [None](#)

| #                                                                                                                                              | Name | Src Zone | Dest Zone | Src Net | Dest Net | URL | App | Src | Dest | Action                                                   |

## Name and Description

Each access control policy must have a unique name. A description is optional.

## Inheritance Settings

Policy inheritance allows you to create a hierarchy of access control policies. A parent (or *base*) policy defines and enforces default settings for its descendants, which is especially useful in multidomain deployments.

A policy's inheritance settings allow you to select its base policy. You can also lock settings in the current policy to force any descendants to inherit them. Descendant policies can override unlocked settings.

## Policy Assignment

Each access control policy identifies the devices that use it. Each device can be targeted by only one access control policy. In a multidomain deployment, you can require that all the devices in a domain use the same base policy.

## Rules

Access control rules provide a granular method of handling network traffic. Rules in an access control policy are numbered, starting at 1, including rules inherited from ancestor policies. The system matches traffic to access control rules in top-down order by ascending rule number.

Usually, the system handles network traffic according to the *first* access control rule where *all* the rule's conditions match the traffic. Conditions can be simple or complex, and their use often depends on certain licenses.

## Default Action

The default action determines how the system handles and logs traffic that is not handled by any other access control configuration. The default action can block or trust all traffic without further inspection, or inspect traffic for intrusions and discovery data.

Although an access control policy can inherit its default action from an ancestor policy, you cannot enforce this inheritance.

## Security Intelligence

Security Intelligence is a first line of defense against malicious internet content. This feature allows you to block connections based on the latest IP address, URL, and domain name reputation intelligence. To ensure continual access to vital resources, you can override Block list entries with custom Do Not Block list entries.

## HTTP Responses

When the system blocks a user's website request, you can either display a generic system-provided response page, or a custom page. You can also display a page that warns users, but also allows them to continue to the originally requested site.

## Advanced Access Control Options

Advanced access control policy settings typically require little or no modification. Often, the default settings are appropriate. Advanced settings you can modify include traffic preprocessing, SSL inspection, identity, and various performance options.

## Managing Access Control Policies

The Firepower System allows you to edit system-provided access control policies and create custom access control policies.

In a multidomain deployment, the system displays policies created in the current domain, which you can edit. It also displays policies created in ancestor domains, which you cannot edit. To view and edit policies created in a lower domain, switch to that domain.

### Procedure

---

**Step 1** Choose **Policies > Access Control** .

**Step 2** Manage access control policies:

- Copy—Click **Copy** ()..
- Create—Click **New Policy**; see [Creating a Basic Access Control Policy, on page 1204](#).
- Delete—Click **Delete** ().
- Deploy—Click **Deploy**; see [Deploy Configuration Changes, on page 346](#).
- Edit—Click **Edit** (); see [Editing an Access Control Policy, on page 1205](#)
- Inheritance—Click **Plus** next to a policy with descendants to expand your view of the policy's hierarchy.
- Import/Export—Click **Import/Export**; see [Configuration Import and Export, on page 173](#).

- Report—Click **Report** (); see [Generating Current Policy Reports, on page 356](#).

---

### Related Topics

[Out-of-Date Policies](#), on page 357

## System-Created Access Control Policies

Depending on your devices' initial configurations, system-provided policies can include:

- Default Access Control—Blocks all traffic without further inspection.
- Default Intrusion Prevention—Allows all traffic, but also inspects with the Balanced Security and Connectivity intrusion policy and default intrusion variable set.
- Default Network Discovery—Allows all traffic while inspecting it for discovery data but not intrusions or exploits.

## Creating a Basic Access Control Policy

When you create a new access control policy, you must, at minimum, choose a default action.

In most cases, logging of connections handled by a default action is initially disabled. An exception occurs if you create a subpolicy in a multidomain deployment. In that case, the system enables connection logging according to the logging configuration of the inherited default action.

### Before you begin

Make sure you've addressed the steps up to this point in [Setting Up Basic Policies and Configurations, on page 4](#).

### Procedure

---

**Step 1** Choose **Policies > Access Control**.

**Step 2** Click **New Policy**.

**Step 3** Enter a unique **Name** and, optionally, a **Description**.

**Step 4** Optionally, choose a base policy from the **Select Base Policy** drop-down list.

If an access control policy is enforced on your domain, this step is not optional. You must choose the enforced policy or one of its descendants as the base policy.

**Step 5** Specify the initial **Default Action**:

- If you chose a base policy, your new policy inherits its default action. You cannot change it here.
- **Block all traffic** creates a policy with the **Access Control: Block All Traffic** default action.
- **Intrusion Prevention** creates a policy with the **Intrusion Prevention: Balanced Security and Connectivity** default action, associated with the default intrusion variable set.
- **Network Discovery** creates a policy with the **Network Discovery Only** default action.

**Tip** If you want to trust all traffic by default, or if you chose a base policy and do not want to inherit the default action, you can change the default action later.

**Caution** Changing the total number of intrusion policies used by an access control policy restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See [Snort® Restart Traffic Behavior, on page 350](#) for more information. You change the the total number of intrusion policies by adding an intrusion policy that is not currently used, or by removing the last instance of an intrusion policy. You can use an intrusion policy in an access control rule, as the default action, or as the default intrusion policy.

**Step 6** Optionally, choose the **Available Devices** where you want to deploy the policy, then click **Add to Policy** (or drag and drop) to add the selected devices. To narrow the devices that appear, type a search string in the **Search** field.

If you want to deploy this policy immediately, you must perform this step.

**Step 7** Click **Save**.

---

#### What to do next

- Optionally, further configure the new policy as described in [Editing an Access Control Policy, on page 1205](#).
- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

---

**Note** When you deploy an access control policy, its rules are not applied on the existing tunnel sessions. Hence, traffic on an existing connection is not bound by the new policy that is deployed. In addition, the policy hit count is incremented only for the first packet of a connection that matches a policy. Thus, the traffic of an existing connection that could match a policy is omitted from the hit count. To have the policy rules effectively applied, clear the existing tunnel sessions, and then deploy the policy.

---

#### Related Topics

[Access Control Policy Default Action, on page 1185](#)

[Setting Target Devices for an Access Control Policy, on page 1210](#)

## Editing an Access Control Policy

Only one person should edit a policy at a time, using a single browser window. If multiple users save the same policy, the last saved changes are retained. For your convenience, the system displays information on who (if anyone) is currently editing each policy. To protect the privacy of your session, a warning appears after 30 minutes of inactivity on the policy editor. After 60 minutes, the system discards your changes.

---

**Note** You can only edit access control policies that were created in the current domain. Also, you cannot edit settings that are locked by an ancestor access control policy.

---

## Procedure

---

**Step 1** Choose **Policies > Access Control**.

**Step 2** Click **Edit** () next to the access control policy you want to edit.

If **View** () appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

**Step 3** Edit your access control policy.

Settings:

- Name and Description—Click either field and enter new information.
- Default Action—Choose a value from the **Default Action** drop-down list.

**Caution** Changing the total number of intrusion policies used by an access control policy restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See [Snort® Restart Traffic Behavior, on page 350](#) for more information. You change the the total number of intrusion policies by adding an intrusion policy that is not currently used, or by removing the last instance of an intrusion policy. You can use an intrusion policy in an access control rule, as the default action, or as the default intrusion policy.

- Default Action Variable Set—To change the variable set associated with an **Intrusion Prevention** default action, click **Variables** (). In the popup window that appears, select a new variable set and click **OK**.

You can also click **Edit** () to edit the selected variable set in a new window. For more information, see [Managing Variables, on page 424](#).

- Default Action Logging—To configure logging for connections handled by the default action, click **Logging** () ; see [Logging Connections with a Policy Default Action, on page 2221](#).
- HTTP Responses—To specify what the user sees in a browser when the system blocks a website request, click **HTTP Responses**; see [Choosing HTTP Response Pages, on page 1245](#).
- Inheritance: Change Base Policy—To change the base access control policy for this policy, click **Inheritance Settings**; see [Choosing a Base Access Control Policy, on page 1208](#).
- Inheritance: Lock Settings in Descendants—To enforce this policy's settings in its descendant policies, click **Inheritance Settings**; see [Locking Settings in Descendant Access Control Policies, on page 1209](#).
- Policy Assignment: Targets—To identify the managed devices targeted by this policy, click **Policy Assignment**; see [Setting Target Devices for an Access Control Policy, on page 1210](#).
- Policy Assignment: Required in Domains—To enforce this policy in a subdomain, click **Policy Assignment**; see [Requiring an Access Control Policy in a Domain, on page 1209](#).
- Rules—To manage access control rules, and to inspect and block malicious traffic using intrusion and file policies, click **Rules**; see [Create and Edit Access Control Rules, on page 1220](#).
- Security Intelligence—To immediately block connections based on the latest reputation intelligence using a Block list, click **Security Intelligence**; see [Configure Security Intelligence, on page 1252](#).

- **Advanced Options**—To set preprocessing, SSL inspection, identity, performance, and other advanced options, click **Advanced**; see [Access Control Policy Advanced Settings, on page 1211](#).
- **Warnings**—To view a list of warnings or errors in your access control policy (and its descendant and associated policies), click **Show Warnings**. Warnings and errors mark configurations that could adversely affect traffic analysis and flow or prevent the policy from deploying. If there are no warnings, show warnings does not appear.

**Step 4** Click **Save**.

---

#### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

#### Related Topics

[Rule and Other Policy Warnings, on page 392](#)

## Managing Access Control Policy Inheritance

#### Before you begin

Understand how inheritance works. See [Access Control Policy Inheritance, on page 1191](#) and subtopics.

#### Procedure

---

**Step 1** Edit the access control policy whose inheritance settings you want to change; see [Editing an Access Control Policy, on page 1205](#).

**Step 2** Manage policy inheritance:

- **Change Base Policy** — To change the base access control policy for this policy, click **Inheritance Settings** and proceed as described in [Choosing a Base Access Control Policy, on page 1208](#).
  - **Lock Settings in Descendants** — To enforce this policy's settings in its descendant policies, click **Inheritance Settings** and proceed as described in [Locking Settings in Descendant Access Control Policies, on page 1209](#).
  - **Required in Domains** — To enforce this policy in a subdomain, click **Policy Assignment** and proceed as described in [Requiring an Access Control Policy in a Domain, on page 1209](#).
  - **Inherit Settings from Base Policy** — To inherit settings from a base access control policy, click **Security Intelligence**, **HTTP Responses**, or **Advanced** and proceed as directed in [Inheriting Access Control Policy Settings from the Base Policy, on page 1208](#).
- 

#### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## Choosing a Base Access Control Policy

| Smart License | Classic License | Supported Devices | Supported Domains | Access                              |
|---------------|-----------------|-------------------|-------------------|-------------------------------------|
| Any           | Any             | Any               | Any               | Admin/Access<br>Admin/Network Admin |

You can use one access control policy as the base (parent) for another. By default, a child policy inherits its settings from its base policy, though you can change unlocked settings.

When you change the base policy for the current access control policy, the system updates the current policy with any locked settings from the new base policy.

### Procedure

---

**Step 1** In the access control policy editor, click **Inheritance Settings**.

**Step 2** Choose a policy from the **Select Base Policy** drop-down list.

In a multidomain deployment, an access control policy may be required in the current domain. You can choose only the enforced policy or one of its descendants as the base policy.

**Step 3** Click **Save**.

---

### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## Inheriting Access Control Policy Settings from the Base Policy

A new child policy inherits many settings from its base policy. If these settings are unlocked in the base policy, you can override them.

If you later reinherit the settings from the base policy, the system displays the base policy's settings and dims the controls. However, the system saves the overrides you made, and restores them if you disable inheritance again.

### Procedure

---

**Step 1** In the access control policy editor, click **Security Intelligence**, **HTTP Responses**, or **Advanced**.

**Step 2** Check the **Inherit from base policy** check box for each setting you want to inherit.

If the controls are dimmed, settings are inherited from an ancestor policy, or you do not have permission to modify the configuration.

**Step 3** Click **Save**.

---

**What to do next**

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## Locking Settings in Descendant Access Control Policies

Lock a setting in an access control policy to enforce the setting in all descendant policies. Descendant policies can override unlocked settings.

When you lock settings, the system saves overrides already made in descendant policies so that the overrides can be restored if you unlock settings again.

**Procedure**

- 
- Step 1** In the access control policy editor, click **Inheritance Settings**.
- Step 2** In the Child Policy Inheritance Settings area, check the settings you want to lock.
- If the controls are dimmed, settings are inherited from an ancestor policy, or you do not have permission to modify the configuration.
- Step 3** Click **OK** to save the inheritance settings.
- Step 4** Click **Save** to save the access control policy.
- 

**What to do next**

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## Requiring an Access Control Policy in a Domain

You can require that every device in a domain use the same base access control policy or one of its descendant policies.

**Before you begin**

- Configure at least one domain other than the Global domain.

**Procedure**

- 
- Step 1** In the access control policy editor, click **Policy Assignments**.
- Step 2** Click **Required on Domains**.
- Step 3** Build your domain list:
- Add — Select the domains where you want to enforce the current access control policy, then click **Add** or drag and drop into the list of selected domains.

- Delete — Click **Delete** () next to a leaf domain, or right-click an ancestor domain and choose **Delete Selected**.
- Search — Type a search string in the search field. Click **Clear** () to clear the search.

**Step 4** Click **OK** to save the domain enforcement settings.

**Step 5** Click **Save** to save the access control policy.

---

#### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## Setting Target Devices for an Access Control Policy

An access control policy specifies the devices that use it. Each device can be targeted by only one access control policy. In multidomain deployments, you can require that all the devices in a domain use the same base policy.

#### Procedure

---

**Step 1** In the access control policy editor, click **Policy Assignments**.

**Step 2** On **Targeted Devices**, build your target list:

- Add — Select one or more **Available Devices**, then click **Add to Policy** or drag and drop into the list of **Selected Devices**.
- Delete — Click **Delete** () next to a single device, or select multiple devices, right-click, then choose **Delete Selected**.
- Search — Type a search string in the search field. Click **Clear** () to clear the search.

Under **Impacted Devices**, the system lists the devices whose assigned access control policies are children of the current policy. Any change to the current policy affects these devices.

**Step 3** Optionally, click **Required on Domains** to require that all the devices in the subdomains you choose use the same base policy. See [Requiring an Access Control Policy in a Domain, on page 1209](#).

**Step 4** Click **OK** to save your targeted device settings.

**Step 5** Click **Save** to save the access control policy.

---

#### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

# Access Control Policy Advanced Settings

Advanced access control policy settings typically require little or no modification. The default settings are appropriate for most deployments. Note that many of the advanced preprocessing and performance options in access control policies may be modified by rule updates as described in [Update Intrusion Rules, on page 143](#).

If **View** (🔒) appears instead, settings are inherited from an ancestor policy, or you do not have permission to modify the settings. If the configuration is unlocked, uncheck **Inherit from base policy** to enable editing.

**Caution** See [Configurations that Restart the Snort Process When Deployed or Activated, on page 352](#) for a list of advanced setting modifications that restart the Snort process, temporarily interrupting traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See [Snort® Restart Traffic Behavior, on page 350](#) for more information.

## General Settings

| Option                                                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <b>Retry URL cache miss lookup</b>                                 | The first time the system encounters a URL that does not have a locally stored category and reputation, it looks up that URL in the cloud and adds the result to the local data store, for faster processing of that URL in future.<br><br>This setting determines what the system does when it needs to look up a URL's category and reputation in the cloud.<br><br>By default, this setting is enabled: The system momentarily delays the traffic while it checks the cloud for the URL's reputation and category, and uses the cloud verdict to handle the traffic.<br><br>If you disable this setting: When the system encounters a URL that is not in its local cache, the traffic is immediately passed and handled according to the rules configured for Uncategorized traffic.<br><br>In passive deployments, the system does not retry the lookup, as it cannot hold packets. |

| Option                                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Inspect traffic during policy apply</b> | <p>To inspect traffic when you deploy configuration changes unless specific configurations require restarting the Snort process, ensure that <b>Inspect traffic during policy apply</b> is set to its default value (enabled).</p> <p>When this option is enabled, resource demands could result in a small number of packets dropping without inspection. Additionally, deploying some configurations restarts the Snort process, which interrupts traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See <a href="#">Snort® Restart Scenarios, on page 348</a> for more information.</p> |

### Associated Policies

Use advanced settings to associate subpolicies (SSL, identity, prefilter) with access control; see [Associating Other Policies with Access Control, on page 1213](#).

### Network Analysis and Intrusion Policies

Advanced network analysis and intrusion policy settings allow you to:

- Specify the intrusion policy and associated variable set that are used to inspect packets that must pass before the system can determine exactly how to inspect that traffic.
- Change the access control policy's default network analysis policy, which governs many preprocessing options.
- Use custom network analysis rules and network analysis policies to tailor preprocessing options to specific security zones, networks, and VLANs.

For more information, see [Advanced Access Control Settings for Network Analysis and Intrusion Policies, on page 1669](#).

### File and Malware Settings

[File and Malware Inspection Performance and Storage Tuning, on page 1441](#) provides information on performance options for file control and AMP for Networks.

### Intelligent Application Bypass Settings

Intelligent Application Bypass (IAB) is an expert-level configuration that specifies applications to bypass or test for bypass if traffic exceeds a combination of inspection performance and flow thresholds. For more information, see [Intelligent Application Bypass, on page 1289](#).

### Transport/Network Layer Preprocessor Settings

Advanced transport and network preprocessor settings apply globally to all networks, zones, and VLANs where you deploy your access control policy. You configure these advanced settings in an access control policy rather than in a network analysis policy. For more information, see [Advanced Transport/Network Preprocessor Settings, on page 1758](#).

### Detection Enhancement Settings

Advanced detection enhancement settings allow you to configure adaptive profiles so you can:

- Use file policies and applications in access control rules.
- Use service metadata in intrusion rules.
- In passive deployments, improve reassembly of packet fragments and TCP streams based on your network's host operating systems.

For more information, see [Adaptive Profiles, on page 1811](#).

### Performance Settings and Latency-Based Performance Settings

[About Intrusion Prevention Performance Tuning, on page 1655](#) provides information on improving the performance of your system as it analyzes traffic for attempted intrusions.

For information specific to latency-based performance settings, see [Packet and Intrusion Rule Latency Threshold Configuration, on page 1659](#).

## Associating Other Policies with Access Control

Use an access control policy's advanced settings to associate one of each of the following subpolicies with the access control policy:

- SSL policy—Monitors, decrypts, blocks, or allows application layer protocol traffic encrypted with Secure Socket Layer (SSL) or Transport Layer Security (TLS).

---

**Caution** Adding or removing an SSL policy restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See [Snort® Restart Traffic Behavior, on page 350](#) for more information.

---

- Identity policy—Performs user authentication based on the realm and authentication method associated with the traffic.
- Prefilter policy—Performs early traffic handling using limited network (layer 4) outer-header criteria.

### Procedure

---

**Step 1** In the access control policy editor, click **Advanced Settings**.

**Step 2** Click **Edit** () in the appropriate Policy Settings area.

If **View** () appears instead, settings are inherited from an ancestor policy, or you do not have permission to modify the settings. If the configuration is unlocked, uncheck **Inherit from base policy** to enable editing.

**Step 3** Choose a policy from the drop-down list.

If you choose a user-created policy, you can click edit that appears to edit the policy.

- Step 4** Click **OK**.
- Step 5** Click **Save** to save the access control policy.

---

#### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## CHAPTER 59

# Access Control Rules

---

The following topics describe how to configure access control rules:

- [Introduction to Access Control Rules, on page 1215](#)
- [Requirements and Prerequisites for Access Control Rules, on page 1219](#)
- [Adding an Access Control Rule Category, on page 1220](#)
- [Create and Edit Access Control Rules, on page 1220](#)
- [Enabling and Disabling Access Control Rules, on page 1222](#)
- [Positioning an Access Control Rule, on page 1223](#)
- [Access Control Rule Actions, on page 1223](#)
- [Access Control Rule Comments, on page 1226](#)

## Introduction to Access Control Rules

Within an access control policy, *access control rules* provide a granular method of handling network traffic across multiple managed devices.

---

**Note** Prefilter evaluation/8000 series fastpathing, Security Intelligence filtering, SSL inspection, user identification, and some decoding and preprocessing occur before access control rules evaluate network traffic.

---

The system matches traffic to access control rules in the order you specify. In most cases, the system handles network traffic according to the *first* access control rule where *all* the rule's conditions match the traffic.

Each rule also has an *action*, which determines whether you monitor, trust, block, or allow matching traffic. When you allow traffic, you can specify that the system first inspect it with intrusion or file policies to block any exploits, malware, or prohibited files before they reach your assets or exit your network.

The following scenario summarizes the ways that traffic can be evaluated by access control rules in an inline, intrusion prevention deployment.

In this scenario, traffic is evaluated as follows:

- **Rule 1: Monitor** evaluates traffic first. Monitor rules track and log network traffic. The system continues to match traffic against additional rules to determine whether to permit or deny it. (However, see an important exception and caveat at [Access Control Rule Monitor Action, on page 1223](#).)
- **Rule 2: Trust** evaluates traffic next. Matching traffic is allowed to pass to its destination without further inspection, though it is still subject to identity requirements and rate limiting. Traffic that does not match continues to the next rule.
- **Rule 3: Block** evaluates traffic third. Matching traffic is blocked without further inspection. Traffic that does not match continues to the final rule.
- **Rule 4: Allow** is the final rule. For this rule, matching traffic is allowed; however, prohibited files, malware, intrusions, and exploits within that traffic are detected and blocked. Remaining non-prohibited, non-malicious traffic is allowed to its destination, though it is still subject to identity requirements and rate limiting. You can configure Allow rules that perform only file inspection, or only intrusion inspection, or neither.
- **Default Action** handles all traffic that does not match any of the rules. In this scenario, the default action performs intrusion prevention before allowing non-malicious traffic to pass. In a different deployment, you might have a default action that trusts or blocks all traffic, without further inspection. (You cannot perform file or malware inspection on traffic handled by the default action.)

Traffic you allow, whether with an access control rule or the default action, is automatically eligible for inspection for host, application, and user data by the network discovery policy. You do not explicitly enable discovery, although you can enhance or disable it. However, allowing traffic does not automatically guarantee discovery data collection. The system performs discovery only for connections involving IP addresses that are explicitly monitored by your network discovery policy; additionally, application discovery is limited for encrypted sessions.

Note that access control rules handle encrypted traffic when your SSL inspection configuration allows it to pass, or if you do not configure SSL inspection. However, some access control rule conditions require unencrypted traffic, so encrypted traffic may match fewer rules. Also, by default, the system disables intrusion and file inspection of encrypted payloads. This helps reduce false positives and improve performance when an encrypted connection matches an access control rule that has intrusion and file inspection configured.

## Access Control Rule Management

The **Rules** tab of the access control policy editor allows you to add, edit, categorize, search, move, enable, disable, delete, and otherwise manage access control rules in the current policy.

For each access control rule, the policy editor displays its name, a summary of its conditions, the rule action, and icons that communicate the rule's inspection options or status. These icons represent:

- **Intrusion policy** (🛡️)
- **File policy** (📁)
- **Safe search** (🔒)
- **YouTube EDU** (📺)
- **Logging** (📄)
- **Original Client option**
- **Comment** (💬)
- **Warning** (⚠️)
- **Errors** (🚫)
- important **Information** (ℹ️)

Disabled rules are dimmed and marked `(disabled)` beneath the rule name.

To create or edit a rule, use the access control rule editor. You can:

- Configure basic properties such as the rule's name, state, position, and action in the upper portion of the editor.
- Add conditions using the tabs on the left side of the lower portion of the editor.
- Use the tabs on the right side of the lower portion to configure inspection and logging options, and also to add comments to the rule. For your convenience, the editor lists the rule's inspection and logging options regardless of which tab you are viewing.

---

**Note** Properly creating and ordering access control rules is a complex task, but one that is essential to building an effective deployment. If you do not plan your policy carefully, rules can preempt other rules, require additional licenses, or contain invalid configurations. To help ensure that the system handles traffic as you expect, the access control policy interface has a robust warning and error feedback system for rules.

---

- [Best Practices for Access Control Rules](#), on page 1194

## Access Control Rule Components

In addition to its unique name, each access control rule has the following basic components:

### State

By default, rules are enabled. If you disable a rule, the system does not use it and stops generating warnings and errors for that rule.

### Position

Rules in an access control policy are numbered, starting at 1. If you are using policy inheritance, rule 1 is the first rule in the outermost policy. The system matches traffic to rules in top-down order by ascending rule number. With the exception of Monitor rules, the first rule that traffic matches is the rule that handles that traffic.

Rules can also belong to a section and a category, which are organizational only and do not affect rule position. Rule position goes across sections and categories.

### Section and Category

To help you organize access control rules, every access control policy has two system-provided rule sections, Mandatory and Default. To further organize access control rules, you can create custom rule categories inside the Mandatory and Default sections.

If you are using policy inheritance, the current policy's rules are nested between its parent policy's Mandatory and Default sections.

### Conditions

Conditions specify the specific traffic the rule handles. Conditions can be simple or complex; their use often depends on license.

Traffic must meet all of the conditions specified in all of the tabs in a rule. For example, if the Applications tab specifies HTTP but not HTTPS, the URL category and reputation conditions in the URLs tab will not apply to HTTPS traffic.

### Action

A rule's action determines how the system handles matching traffic. You can monitor, trust, block, or allow (with or without further inspection) matching traffic. The system does **not** perform deep inspection on trusted, blocked, or encrypted traffic.

### Inspection

Deep inspection options govern how the system inspects and blocks malicious traffic you would otherwise allow. When you allow traffic with a rule, you can specify that the system first inspect it with intrusion or file policies to block any exploits, malware, or prohibited files before they reach your assets or exit your network.

### Logging

A rule's logging settings govern the records the system keeps of the traffic it handles. You can keep a record of traffic that matches a rule. In general, you can log sessions at the beginning or end of a connection, or both. You can log connections to the database, as well as to the system log (syslog) or to an SNMP trap server.

## Comments

Each time you save changes to an access control rule, you can add comments.

## Access Control Rule Order

Rules in an access control policy are numbered, starting at 1. The system matches traffic to access control rules in top-down order by ascending rule number.

In most cases, the system handles network traffic according to the *first* access control rule where *all* the rule's conditions match the traffic. Except for Monitor rules, the system does not continue to evaluate traffic against additional, lower-priority rules after that traffic matches a rule.

To help you organize access control rules, every access control policy has two system-provided rule sections, Mandatory and Default. To further organize, you can create custom rule categories inside the Mandatory or Default sections. After you create a category, you cannot move it, although you can delete it, rename it, and move rules into, out of, within, and around it. The system assigns rule numbers across sections and categories.

If you use policy inheritance, the current policy's rules are nested between its parent policy's Mandatory and Default rule sections. Rule 1 is the first rule in the outermost policy, not the current policy, and the system assigns rule numbers across policies, sections, and categories.

Any predefined user role that allows you to modify access control policies also allows you to move and modify access control rules within and among rules categories. You can, however, create custom roles that restrict users from moving and modifying rules. Any user who is allowed to modify access control policies can add rules to custom categories and modify rules in them without restriction.

---

**Tip** Proper access control rule order reduces the resources required to process network traffic, and prevents rule preemption. Although the rules you create are unique to every organization and deployment, there are a few general guidelines to follow when ordering rules that can optimize performance while still addressing your needs.

## Adding an Access Control Rule Category

You can divide an access control policy's Mandatory and Default rule sections into custom categories. After you create a category, you cannot move it, although you can delete it, rename it, and move rules into, out of, within, and around it. The system assigns rule numbers across sections and categories.

### Procedure

---

**Step 1** In the access control policy editor, click **Add Category**.

**Tip** If your policy already contains rules, you can click a blank area in the row for an existing rule to set the position of the new category before you add it. You can also right-click an existing rule and select **Insert new category**.

**Step 2** Enter a **Name**.

**Step 3** From the **Insert** drop-down list, choose where you want to add the category:

- To insert a category below all existing categories in a section, choose **into Mandatory** or **into Default**.
- To insert a category above an existing category, choose **above category**, then choose a category.
- To insert a category above or below an access control rule, choose **above rule** or **below rule**, then enter an existing rule number.

**Step 4** Click **OK**.

**Step 5** Click **Save** to save the policy.

---

### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## Create and Edit Access Control Rules

If you edit an access control rule that is actively in use, the changes do not apply to established connections at deploy-time. The updated rule is used to match against future connections. However, if the system is actively

inspecting a connection (for example, with an intrusion policy), it *will* apply changed matching or action criteria to existing connections.

For Firepower Threat Defense, you can ensure that your changes apply to all current connections by using the FTD **clear conn** CLI command to end established connections. Note that you should only do this if it is OK to end those connections, on the assumption that the sources for the connections will then attempt to reestablish the connection and thus be matched appropriately against the new rule.

**Caution** Changing the total number of intrusion policies used by an access control policy restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See [Snort® Restart Traffic Behavior, on page 350](#) for more information. You change the total number of intrusion policies by adding an intrusion policy that is not currently used, or by removing the last instance of an intrusion policy. You can use an intrusion policy in an access control rule, as the default action, or as the default intrusion policy.

## Procedure

**Step 1** In the access control policy editor, you have the following options:

- To add a new rule, click **Add Rule**.
- To edit an existing rule, click **Edit** ()

If **View** () appears next to a rule instead, the rule belongs to an ancestor policy, or you do not have permission to modify the rule.

**Step 2** If this is a new rule, enter a **Name**.

**Step 3** Configure the rule components, or accept the defaults.

- Enabled—Specify whether the rule is **Enabled**.
- Position—Specify the rule position; see [Access Control Rule Order, on page 1219](#).
- Action—Choose a rule **Action**; see [Access Control Rule Actions, on page 1223](#).

**Note** For FTD, VLAN tags in access rules only apply to inline sets; they cannot be used in access rules applied to firewall interfaces.

- Conditions—Click the corresponding condition you want to add. See [Rule Condition Types, on page 363](#) for more information.
- Deep Inspection—For Allow and Interactive Block rules, click **Intrusion policy** () or **File policy** () to configure the rule's **Inspection** options. If the option is dimmed, no policy of that type is selected for the rule. See [Understanding Access Control, on page 1185](#) for more information.
- Content Restriction—Click **Safe search** () or **YouTube EDU** () to configure content restriction settings on **Applications** of the rule editor. If the option are dimmed, content restriction is disabled for the rule. See [About Content Restriction, on page 1297](#) for more information.

- Logging—Click **Logging** () to specify **Logging** options. If the option is dimmed, connection logging is disabled for the rule. See [Best Practices for Connection Logging, on page 2216](#) for more information.
- Comments—Click the number in the comment column to add **Comments**. The number indicates how many comments the rule already contains. See [Access Control Rule Comments, on page 1226](#) for more information.

**Step 4** Save the rule.

**Step 5** Click **Save** to save the policy.

---

### What to do next

Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

[Best Practices for Access Control Rules](#), on page 1194

## Enabling and Disabling Access Control Rules

When you create an access control rule, it is enabled by default. If you disable a rule, the system does not use it to evaluate network traffic and stops generating warnings and errors for that rule. When viewing the list of rules in an access control policy, disabled rules are grayed out, although you can still modify them.

---

**Tip** You can also enable or disable an access control rule using the rule editor.

---

### Procedure

**Step 1** In the access control policy editor, right-click the rule and choose a rule state.

If **View** () appears next to a rule instead, the rule belongs to an ancestor policy, or you do not have permission to modify the rule.

**Step 2** Click **Save**.

---

### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

[Access Control Rule Components](#), on page 1218

# Positioning an Access Control Rule

You can move an existing rule within an access control policy. When you add or move a rule to a category, the system places it last in the category.

---

**Tip** You can move multiple rules at once by selecting the rules then cutting and pasting using the right-click menu.

---

## Before you begin

Review rule order guidelines in [Best Practices for Access Control Rules, on page 1194](#).

## Procedure

---

- Step 1** In the access control rule editor, you have the following options:
- If you are adding a new rule, use the **Insert** drop-down list.
  - If you are editing an existing rule, click **Move**.
- Step 2** Choose where you want to move or insert the rule:
- Choose **into Mandatory** or **into Default**.
  - Choose a **into Category**, then choose the user-defined category.
  - Choose **above rule** or **below rule**, then type the appropriate rule number.
- Step 3** Click **Save**.
- Step 4** Click **Save** to save the policy.
- 

## What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

# Access Control Rule Actions

Every access control rule has an *action* that determines how the system handles and logs matching traffic. You can monitor, trust, block, or allow (with or without further inspection).

The access control policy's *default action* handles traffic that does not meet the conditions of any access control rule with an action other than Monitor.

## Access Control Rule Monitor Action

The **Monitor** action is not designed to permit or deny traffic. Rather, its primary purpose is to force connection logging, regardless of how matching traffic is eventually handled.

If a connection matches a Monitor rule, the next non-Monitor rule that the connection matches should determine traffic handling and any further inspection. If there are no additional matching rules, the system should use the default action.

There is an exception, however. If a Monitor rule contains layer 7 conditions—such as an application condition—the system *allows early packets to pass* and the connection to be established (or the SSL handshake to complete). This occurs even if the connection should be blocked by a subsequent rule; this is because these early packets *are not evaluated against subsequent rules*. So that these packets do not reach their destination completely uninspected, you can specify an intrusion policy for this purpose in the access control policy's Advanced settings; see [Inspection of Packets That Pass Before Traffic Is Identified, on page 1670](#). After the system completes its layer 7 identification, it applies the appropriate action to the remaining session traffic.

**Caution** As a best practice, *avoid placing layer 7 conditions on broadly-defined monitor rules high in your rule priority order*, to prevent inadvertently allowing traffic into your network. Also, if locally bound traffic matches a Monitor rule in a Layer 3 deployment, that traffic may bypass inspection. To ensure inspection of the traffic, enable **Inspect Local Router Traffic** in the advanced device settings for the managed device routing the traffic.

#### Related Topics

[Logging for Monitored Connections](#), on page 2210

## Access Control Rule Trust Action

The **Trust** action allows traffic to pass without deep inspection or network discovery. Trusted traffic is still subject to identity requirements and rate limiting.

**Note** Some protocols, such as FTP and SIP, use secondary channels, which the system opens through the process of inspection. In some cases, trusted traffic can bypass all inspection, and these secondary channels cannot be opened properly. If you run into this problem, change the trust rule to **Allow**.

#### Related Topics

[Logging for Trusted Connections](#), on page 2210

## Access Control Rule Blocking Actions

The **Block** and **Block with reset** actions deny traffic without further inspection of any kind.

Block with reset rules reset the connection, with the exception of web requests met with an *HTTP response page*. This is because the response page, which you configure to appear when the system blocks web requests, cannot display if the connection is immediately reset. For more information, see [HTTP Response Pages and Interactive Blocking, on page 1243](#).

#### Related Topics

[Logging for Blocked Connections, on page 2211](#)

[About HTTP Response Pages, on page 1243](#)

## Access Control Rule Interactive Blocking Actions

For more information, see [HTTP Response Pages and Interactive Blocking, on page 1243](#).

If a user bypasses the block, the rule mimics an allow rule. Therefore, you can associate interactive block rules with file and intrusion policies, and matching traffic is also eligible for network discovery.

If a user does not (or cannot) bypass the block, the rule mimics a block rule. Matching traffic is denied without further inspection.

Note that if you enable interactive blocking, you cannot reset *all* blocked connections. This is because the response page cannot display if the connection is immediately reset. Use the **Interactive Block with reset** action to (non-interactively) block-with-reset all non-web traffic, while still enabling interactive blocking for web requests.

For more information, see [HTTP Response Pages and Interactive Blocking, on page 1243](#).

#### Related Topics

[Logging for Allowed Connections, on page 2212](#)

[TLS/SSL Rule Blocking Actions, on page 1360](#)

## Access Control Rule Allow Action

The **Allow** action allows matching traffic to pass, though it is still subject to identity requirements and rate limiting.

Optionally, you can use deep inspection to further inspect and block unencrypted or decrypted traffic before it reaches its destination:

- You can use an intrusion policy to analyze network traffic according to intrusion detection and prevention configurations, and drop offending packets depending on the configuration.
- You can perform file control using a file policy. File control allows you to detect and block your users from uploading (sending) or downloading (receiving) files of specific types over specific application protocols.
- You can perform network-based advanced malware protection (AMP), also using a file policy. AMP for Networks can inspect files for malware, and block detected malware depending on the configuration.

The following diagram illustrates the types of inspection performed on traffic that meets the conditions of an Allow rule (or a user-bypassed Interactive Block rule). Notice that file inspection occurs before intrusion inspection; blocked files are not inspected for intrusion-related exploits.

For simplicity, the diagram displays traffic flow for situations where both (or neither) an intrusion and a file policy are associated with an access control rule. You can, however, configure one without the other. Without a file policy, traffic flow is determined by the intrusion policy; without an intrusion policy, traffic flow is determined by the file policy.

Regardless of whether the traffic is inspected or dropped by an intrusion or file policy, the system can inspect it using network discovery. However, allowing traffic does not automatically guarantee discovery inspection. The system performs discovery only for connections involving IP addresses that are explicitly monitored by your network discovery policy; additionally, application discovery is limited for encrypted sessions.

## Access Control Rule Comments

When you create or edit an access control rule, you can add a comment. For example, you might summarize the overall configuration for the benefit of other users, or note when you change a rule and the reason for the

change. You can display a list of all comments for a rule along with the user who added each comment and the date the comment was added.

When you save a rule, all comments made since the last save become read-only.

## CHAPTER 60

# URL Filtering

---

- [URL Filtering Overview, on page 1229](#)
- [Best Practices for URL Filtering, on page 1230](#)
- [License Requirements for URL Filtering, on page 1233](#)
- [Requirements and Prerequisites for URL Filtering, on page 1233](#)
- [How to Configure URL Filtering with Category and Reputation, on page 1234](#)
- [Manual URL Filtering, on page 1238](#)
- [Troubleshoot URL Filtering, on page 1241](#)

## URL Filtering Overview

Use the URL filtering feature to control the websites that users on your network can access:

- **Category and reputation-based URL filtering**—With a URL Filtering license, you can control access to websites based on the URL's general classification (category) and risk level (reputation). This is the recommended option.
- **Manual URL filtering**—With any license, you can manually specify individual URLs, groups of URLs, and URL lists and feeds to achieve granular, custom control over web traffic. For more information, see [Manual URL Filtering, on page 1238](#).

See also [Blocking Traffic with Security Intelligence, on page 1249](#), a similar but different feature for blocking malicious URLs, domains, and IP addresses.

## About URL Filtering with Category and Reputation

With a URL Filtering license, you can control access to websites based on the category and reputation of requested URLs:

- **Category**—A general classification for the URL. For example, ebay.com belongs to the Auctions category, and monster.com belongs to the Job Search category.  
A URL can belong to more than one category.
- **Reputation**—How likely the URL is to be used for purposes that might be against your organization's security policy. Reputations range from High Risk (level 1) to Well Known (level 5).

### Benefits of Category and Reputation-Based URL Filtering

URL categories and reputations help you quickly configure URL filtering. For example, you can use access control to block high-risk URLs in the Hacking category. Or, you can use QoS to rate limit traffic from sites in the Streaming Media category. There are also categories for types of threats, such as a Spyware and Adware category.

Using category and reputation data simplifies policy creation and administration. It grants you assurance that the system controls web traffic as expected. Because Cisco continually updates its threat intelligence with new URLs, as well as new categories and risks for existing URLs, the system uses up-to-date information to filter requested URLs. Sites that (for example) represent security threats, or that serve undesirable content, may appear and disappear faster than you can update and deploy new policies.

Some examples of how the system can adapt include:

- If an access control rule blocks all gaming sites, as new domains get registered and classified as Games, the system can block those sites automatically. Similarly, if a QoS rule rate limits all streaming media sites, the system can automatically limit traffic to new Streaming Media sites.
- If an access control rule blocks all malware sites and a shopping page gets infected with malware, the system can recategorize the URL from Shopping to Malware Sites and block that site.
- If an access control rule blocks high-risk social networking sites and somebody posts a link on their profile page that contains links to malicious payloads, the system can change the reputation of that page from Benign Sites to High Risk and block it.

## Best Practices for URL Filtering

Keep in mind the following guidelines and limitations for URL filtering:

### Filter by Category and Reputation

Follow the instructions in [How to Configure URL Filtering with Category and Reputation](#), on page 1234.

### Configure Your Policy to Inspect Packets That Must Pass Before a URL Can Be Identified

The system cannot filter URLs before:

- A monitored connection is established between a client and server.
- The system identifies the HTTP or HTTPS application in the session.
- The system identifies the requested URL (for encrypted sessions, from the ClientHello message or the server certificate).

This identification should occur within 3 to 5 packets, or after the server certificate exchange in the TLS/SSL handshake if the traffic is encrypted.

**Important!** To ensure that your system examines these initial packets that would otherwise pass, see [Inspection of Packets That Pass Before Traffic Is Identified](#), on page 1670 and subtopics.

If early traffic matches all other rule conditions but identification is incomplete, the system allows the packet to pass and the connection to be established (or the TLS/SSL handshake to complete). After the system completes its identification, the system applies the appropriate rule action to the remaining session traffic.

### URL Conditions and Rule Order

- Position URL rules after all other rules that *must* be hit.
- URLs can belong to more than one category. It is possible to want to allow one category of websites and block another—whether explicitly or by relying on the default action. In this case, make sure you create and order URL rules so you get the desired effect, depending on whether the allow or the block should take precedence.

For additional guidelines for rules, see the following topics: [Best Practices for Access Control Rules, on page 1194](#) and [Rule Condition Mechanics, on page 365](#).

### Uncategorized or Reputationless URLs

When you build a URL rule, you first choose the category you want to match. If you explicitly choose **Uncategorized** URLs, you cannot further constrain by reputation.

You cannot manually assign categories and reputations to URLs, but in access control and QoS policies, you can manually block specific URLs. See [Manual URL Filtering, on page 1238](#).

### URL Filtering for Encrypted Web Traffic

When performing URL filtering on encrypted web traffic, the system:

- Disregards the encryption protocol; a rule matches both HTTPS and HTTP traffic if the rule has a URL condition but not an application condition that specifies the protocol.
- Does not use URL lists. You must use URL objects and groups instead.
- Matches HTTPS traffic based on the subject common name in the public key certificate used to encrypt the traffic, and also evaluates the reputation of any other URLs presented at any time during the transaction, including the post-decryption HTTP URL.
- Disregards subdomains within the subject common name.
- Does not display an HTTP response page for encrypted connections blocked by access control rules (or any other configuration); see [Limitations to HTTP Response Pages, on page 1243](#).

### HTTP/2

The system can extract HTTP/2 URLs from TLS certificates, but not from a payload.

### Manual URL Filtering

- Specify URLs using a custom Security Intelligence list or feed object. Do not use a URL object or directly enter a URL into the rule. For details, see [Manual URL Filtering Options, on page 1239](#).
- If you manually filter specific URLs using URL objects or by entering URLs directly into the rule, carefully consider other traffic that might be affected. To determine whether network traffic matches a URL condition, the system performs a simple substring match. If the requested URL matches any part of the string, the URLs are considered to match.

- If you use manual URL filtering to create exceptions to other rules, position the specific rule with the exceptions above the general rule that would otherwise apply.

### Search Query Parameters in URLs

The system does not use search query parameters in the URL to match URL conditions. For example, consider a scenario where you block all shopping traffic. In that case, using a web search to search for amazon.com is not blocked, but browsing to amazon.com is.

### URL Filtering in High Availability Deployments

For guidelines for URL filtering with Firepower Management Centers in high availability, see [URL Filtering and Security Intelligence](#), on page 202.

### Memory Limitations for Selected Device Models

- If you are using NGIPSv, see the [Cisco Firepower NGIPSv Quick Start Guide for VMware](#) for information on allocating the correct amount of memory to perform category and reputation-based URL filtering.
- Device models with less memory store less URL data locally, and the system may therefore check the cloud more frequently to determine category and reputation for sites that are not in the local database.

Lower-memory devices include:

- Virtual FTD (FTDv) with 8 GB of RAM
- ASA 5506-X, ASA 5506H-X, ASA 5506W-X, ASA 5508-X and ASA 5516-X
- ASA 5512-X, ASA 5515-X and ASA 5525-X
- 7100 series

### Related Topics

[Inspection of Packets That Pass Before Traffic Is Identified](#), on page 1670

## Filtering HTTPS Traffic

To filter encrypted traffic, the system determines the requested URL based on information passed during the TLS/SSL handshake: the subject common name in the public key certificate used to encrypt the traffic.

HTTPS filtering, unlike HTTP filtering, disregards subdomains within the subject common name. Do not include subdomain information when manually filtering HTTPS URLs in access control or QoS policies. For example, use example.com rather than www.example.com.

HTTPS filtering also does not support URL lists. You must use URL objects and groups instead.

---

**Tip** In an SSL policy, you can handle and decrypt traffic to specific URLs by defining a distinguished name SSL rule condition. The common name attribute in a certificate's subject distinguished name contains the site's URL. Decrypting HTTPS traffic allows access control rules to evaluate the decrypted session, which improves URL filtering.

---

### Controlling Traffic by Encryption Protocol

The system disregards the encryption protocol (HTTP vs HTTPS) when performing URL filtering in access control or QoS policies. This occurs for both manual and reputation-based URL conditions. In other words, URL filtering treats traffic to the following websites identically:

- http://example.com/
- https://example.com/

To configure a rule that matches only HTTP or HTTPS traffic, add an application condition to the rule. For example, you could allow HTTPS access to a site while disallowing HTTP access by constructing two access control rules, each with an application and URL condition.

The first rule allows HTTPS traffic to the website:

Action: Allow  
Application: HTTPS  
URL: example.com

The second rule blocks HTTP access to the same website:

Action: Block  
Application: HTTP  
URL: example.com

| Step | Ensure that you have the correct licenses.                                                                               | <p><a href="#">Licensing the Firepower System, on page 105</a>, including:</p> <ul style="list-style-type: none"> <li>• <a href="#">URL Filtering Licenses for Firepower Threat Defense Devices, on page 112</a></li> <li>• <a href="#">URL Filtering Licenses for Classic Devices, on page 128</a></li> </ul> <p>Assign the URL Filtering license to each managed device that will filter URLs.</p> <p>In order to enable the feature, at least one managed device must have a URL Filtering license assigned to it.</p> |
| Step | Ensure that your Firepower Management Center can communicate with the cloud to obtain URL filtering data.                | <a href="#">Internet Access Requirements, on page 2426</a> and <a href="#">Communication Port Requirements, on page 2427</a> .                                                                                                                                                                                                                                                                                                                                                                                            |
| Step | Understand limitations and guidelines and take any necessary actions.                                                    | <a href="#">Best Practices for URL Filtering, on page 1230</a>                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Step | Enable the URL Filtering feature.                                                                                        | <a href="#">Enable URL Filtering Using Category and Reputation, on page 1235</a>                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Step | Configure rules to filter URLs by category and reputation.                                                               | <p><a href="#">Configuring URL Conditions, on page 1236</a></p> <p>For the best protection against malicious sites, you must block sites by reputation AND block URLs in all Threat categories.</p> <p>(Optional) <a href="#">Supplement or Selectively Override Category and Reputation-Based URL Filtering, on page 1240</a></p>                                                                                                                                                                                        |
| Step | (Optional) Allow users to bypass a website block by clicking through a warning page.                                     | <a href="#">HTTP Response Pages and Interactive Blocking, on page 1243</a>                                                                                                                                                                                                                                                                                                                                                                                                                                                |

|      | Do This                                                                                          | More Information                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------|--------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step | Order your rules so that traffic hits key rules first.                                           | <a href="#">URL Rule Order, on page 1198</a>                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Step | (Optional) Modify advanced options related to URL filtering.                                     | <p>Generally, use the defaults unless you have a specific reason to change them.</p> <p>For information about advanced options, including the following, see <a href="#">Access Control Policy Advanced Settings, on page 1211</a>.</p> <ul style="list-style-type: none"> <li>• <b>Maximum URL characters to store in connection events</b></li> <li>• <b>Allow an Interactive Block to bypass blocking for (seconds)</b></li> <li>• <b>Retry URL cache miss lookup</b></li> </ul> |
| Step | Deploy your changes.                                                                             | <a href="#">Deploy Configuration Changes, on page 346</a>                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Step | Be sure you have enabled other Firepower features that protect your network from malicious sites | See <a href="#">Blocking Traffic with Security Intelligence, on page 1249</a> .                                                                                                                                                                                                                                                                                                                                                                                                     |

## Enable URL Filtering Using Category and Reputation

You must be an Admin user to perform this task.

### Before you begin

Complete prerequisites described in [How to Configure URL Filtering with Category and Reputation, on page 1234](#).

### Procedure

- 
- Step 1** Choose **System > Integration**.
  - Step 2** Click **Cisco CSI**.
  - Step 3** Configure [URL Filtering Options, on page 1235](#).
  - Step 4** Click **Save**.
- 

## URL Filtering Options

The following options are on the **System > Integration** page:

### Enable URL Filtering

Allows traffic filtering based on a website's general classification, or category, and risk level, or reputation. Adding a URL Filtering license automatically enables **Enable URL Filtering**. URL filtering must be enabled before you can choose other URL filtering options.

When you enable URL filtering, depending on how long since URL filtering was last enabled, or if this is the first time you are enabling URL filtering, the Firepower Management Center downloads URL data from Cisco Collective Security Intelligence (Cisco CSI). This process may take some time.

### Enable Automatic Updates

Options for updating URL filtering threat data:

- If you enable the **Enable Automatic Updates** option on the **System > Integration** page, the Firepower Management Center checks the cloud every 30 minutes for updates. This option is enabled by default when you add a URL filtering license.
- If you need strict control over when the system contacts external resources, disable automatic updates on this page and instead create a recurring task using the scheduler. See [Automating URL Filtering Updates Using a Scheduled Task](#), on page 193.

### Update Now

You can perform a one-time, on-demand update by clicking the **Update Now** button at the top of this dialog box, but you should also either enable automatic updates or create a recurring task using the scheduler. You cannot start an on-demand update if an update is already in progress.

Although daily updates tend to be small, if it has been more than five days since your last update, new URL data may take up to 20 minutes to download, depending on your bandwidth. Then, it may take up to 30 minutes to perform the update itself.

### Query Cisco CSI for Unknown URLs

Allows the system to submit URLs to the cloud for threat intelligence evaluation when users browse to a website whose category and reputation are not in the local dataset. Disable this option if you do not want to submit your uncategorized URLs, for example, for privacy reasons.

Connections to uncategorized URLs do **not** match rules with category or reputation-based URL conditions. You cannot assign categories or reputations to URLs manually.

## Configuring URL Conditions

Protect your network by controlling access to sites based on URL category and reputation.

---

**Caution**

Adding the first or removing the last URL or Category category/reputation condition in an access control or SSL (but not a QoS) rule restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See [Snort® Restart Traffic Behavior](#), on page 350 for more information.

---

## Procedure

**Step 1** In the rule editor, click the following for URL conditions:

- Access control or QoS—Click **URLs**.
- SSL—Click **Category**.

**Step 2** Find and choose the URL categories that you want to control:

In an access control or QoS rule, click **Category**.

**Step 3** (Optional) Constrain URL categories by choosing a **Reputation**.

Note that if you explicitly match **Uncategorized** URLs, you cannot further constrain by reputation, because uncategorized URLs do not have reputations. Choosing a reputation level also includes other reputations either more or less severe than the level you choose, depending on the rule action:

- Includes less severe reputations—If the rule allows or trusts web traffic. For example, if you configure an access control rule to allow Benign Sites (level 4), it also automatically allows Well Known (level 5) sites.
- Includes more severe reputations—If the rule rate limits, decrypts, blocks, or monitors web traffic. For example, if you configure an access control rule to block Suspicious Sites (level 2), it also blocks High Risk (level 1) sites.

If you change the rule action, the system automatically changes the reputation levels in URL conditions.

**Step 4** Click **Add to Rule**, or drag and drop.

**Step 5** Save or continue editing the rule.

### Example: URL Condition in an Access Control Rule

The following graphic shows the URL condition for an access control rule that blocks all malware sites, all High Risk sites, and all non-benign social networking sites.

The following table summarizes how you build the condition.

| Blocked URL                             | Category      | Reputation    |
|-----------------------------------------|---------------|---------------|
| Malware sites, regardless of reputation | Malware Sites | Any           |
| Any URL with a high risk (level 1)      | Any           | 1 - High Risk |

| Blocked URL                                                                  | Category       | Reputation                           |
|------------------------------------------------------------------------------|----------------|--------------------------------------|
| Social networking sites with a risk greater than benign (levels 1 through 3) | Social Network | 3 - Benign sites with security risks |

### What to do next

- (Optional) [Supplement or Selectively Override Category and Reputation-Based URL Filtering](#), on page 1240
- Return to [How to Configure URL Filtering with Category and Reputation](#), on page 1234.
- If you are done making changes, Deploy configuration changes; see [Deploy Configuration Changes](#), on page 346.

## Rules with URL Conditions

The following table lists rules that support URL conditions, and the types of filtering that each rule type supports.

| Rule Type      | Supports Category and Reputation Filtering? | Supports Manual Filtering?                    |
|----------------|---------------------------------------------|-----------------------------------------------|
| Access control | Yes                                         | Yes                                           |
| SSL            | Yes                                         | No; use distinguished name conditions instead |
| QoS            | Yes                                         | Yes                                           |

## URL Rule Order

For the most effective URL matching, place rules that include URL conditions before other rules, particularly if the URL rules are block rules and the other rules meet both of the following criteria:

- They include application conditions.
- The traffic to be inspected is encrypted.

If you configure exceptions to a rule, put the exception above the other rule.

## Manual URL Filtering

In access control and QoS rules, you can supplement or selectively override category and reputation-based URL filtering by manually filtering individual URLs, groups of URLs, or URL lists and feeds.

For example, you might use access control to block a category of websites that are not appropriate for your organization. However, if the category contains a website that is appropriate, and to which you want to provide access, you can create a manual Allow rule for that site and place it before the Block rule for the category.

You can perform this type of URL filtering without a special license.

Manual URL filtering is not supported in SSL rules; instead, use distinguished name conditions.

**Caution** Depending on how you implement manual URL filtering, URL matching may not be what you intend. See [Manual URL Filtering Options, on page 1239](#).

| Option                                                                                                                                                                                                                                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Use URL objects, individually or as groups. (URL objects are described at <a href="#">URL Objects, on page 408.</a> )<br>Or<br>Enter URLs directly into the access control rule. (The <b>Enter URL</b> option on the rule page in the web interface.) | If you do not include a path (that is, there is no / character in the URL), the match is based on the server's hostname only. The hostname is considered a match if it comes after the // separator, or after any dot in the hostname. For example, ign.com matches ign.com and www.ign.com, but it does not match verisign.com.<br>If you include one or more / character, the entire URL string is used for a substring match, including the server name, path, and any query parameters. However, we recommend that you do not use manual URL filtering to block or allow individual web pages or parts of sites, as servers can be reorganized and pages moved to new paths. Substring matching can also lead to unexpected matches, where the string you include in the URL object also matches paths on unintended servers or strings within query parameters.<br>The <b>Enter URL</b> option does not support wildcards. |

## Supplement or Selectively Override Category and Reputation-Based URL Filtering

In access control or QoS rules, you can use Security Intelligence URL lists and feeds to supplement, or to specify exceptions to, your category and reputation-based URL filtering rules.

(In SSL rules, use distinguished name conditions to serve this purpose.)

### Before you begin

- Configure URL filtering using category and reputation. See [Configuring URL Conditions, on page 1236.](#)
- Understand important best practices for manual URL filtering. See [Best Practices for URL Filtering, on page 1230](#) and [Manual URL Filtering Options, on page 1239.](#)
- Configure one or more Security Intelligence objects (lists or feeds) containing the URLs that you want to use for manual filtering. See [Custom Security Intelligence Lists and Feeds, on page 432.](#)

### Procedure

- 
- Step 1** Navigate to the access control or QoS policy in which you will define your rule.
- Step 2** Create or edit the rule in which you will add your new condition:
- If you are supplementing a category- or reputation-based URL filtering rule, edit the existing rule.
  - If you are overriding or creating exceptions to a category- or reputation-based URL filtering rule, create a new rule.
- Step 3** If you are creating a new rule, configure the rule name, position, action, and other options at the top of the rule.

**Important!** If the list or feed you are configuring in this procedure contains exceptions to category- or reputation-based rules, put this rule above those rules in the rule order.

- Step 4** Click **URLs**.
- Step 5** Click **URLs** (beside the **Category** tab.)
- Step 6** Select the list or feed you created in the prerequisite to this task.
- Step 7** Click **Add to Rule**.
- Step 8** Click **Add** or continue editing the rule.
- 

#### What to do next

(Optional) In SSL rules, use distinguished name conditions to configure parallel behavior.

## Troubleshoot URL Filtering

### Expected URL Category is Missing from the Categories List

The URL filtering feature uses a different set of categories than the Security Intelligence feature; the category that you expect to see may be a Security Intelligence category. To see those categories, look at the **URLs** tab on the **Security Intelligence** tab in an access control policy.

### Initial Packets Are Passing Uninspected

See [Inspection of Packets That Pass Before Traffic Is Identified, on page 1670](#) and subtopics.

### How can I find the category and reputation of a particular URL?

Do a manual lookup. See [Finding URL Category and Reputation, on page 2136](#).

### Error when attempting a manual lookup: "Cloud Lookup Failure for <URL>"

Make sure the feature is properly enabled. See the prerequisites in [Finding URL Category and Reputation, on page 2136](#).

### URL appears to be incorrectly handled based on its URL category and reputation

**Problem:** The system does not handle the URL correctly based on its URL category and reputation.

#### Solutions:

- Verify that the URL category and reputation associated with the URL are what you think they are. See [Finding URL Category and Reputation, on page 2136](#).
- The following issues may be addressed by settings described in [URL Filtering Options, on page 1235](#), accessible using [Enable URL Filtering Using Category and Reputation, on page 1235](#).
  - The URL cache may hold stale information. Contact Cisco TAC.
  - The local data set may not be updated with current information from the cloud. See information about the **Enable Automatic Updates** setting in [URL Filtering Options, on page 1235](#).
  - The system may be configured to *not* check the cloud for current data. See information about the **Query Cisco CSI for Unknown URLs** setting in [URL Filtering Options, on page 1235](#).

- Your access control policy may be configured to pass traffic to the URL without checking the cloud. See information about the **Retry URL cache miss lookup** setting in [Access Control Policy Advanced Settings, on page 1211](#).
- See also [Best Practices for URL Filtering, on page 1230](#).
- Verify that the URL is being handled using the access control rule that you think it is being handled by, and that the rule does what you think it does. Consider rule order.
- Verify that the local URL category and reputation database on the Firepower Management Center is successfully being updated from the cloud and that managed devices are successfully being updated from the Firepower Management Center.

Status of these processes are reported in the Health Monitor, in the **URL Filtering Monitor** module. For details, see [Health Monitoring, on page 275](#).

If you want to immediately update the local URL category and reputation database, go to **System > Integration**, click **Cisco CSI**, then click **Update Now**. For more information, see [URL Filtering Options, on page 1235](#).

#### **A URL category or reputation is not correct**

For access control or QoS rules: Use manual filtering, paying careful attention to rule order. See [Manual URL Filtering, on page 1238](#) and [Configuring URL Conditions, on page 1236](#).

For SSL rules: Manual filtering is not supported. Instead, use distinguished name conditions.

#### **Events Do Not Include URL Category and Reputation**

- Make sure you have included applicable URL rules in an access control policy, the rules are active, and the policies have been deployed to the relevant devices.
- URL category and reputation do not appear in an event if the connection is processed before it matches a URL rule.
- The rule that handles the connection must be configured for URL category and reputation.
- Even if you have configured URL categories in the Categories tab in an SSL rule, you must also configure the URLs tab in a rule in your access control policy.

## CHAPTER 61

# HTTP Response Pages and Interactive Blocking

The following topics describe how to configure custom pages to display when the system blocks web requests:

- [About HTTP Response Pages, on page 1243](#)
- [Requirements and Prerequisites for HTTP Response Pages, on page 1244](#)
- [Choosing HTTP Response Pages, on page 1245](#)
- [Interactive Blocking with HTTP Response Pages, on page 1245](#)

## About HTTP Response Pages

As part of access control, you can configure an *HTTP response page* to display when the system blocks web requests, using either access control rules or the access control policy default action.

The response page displayed depends on how you block the session:

- **Block Response Page:** Overrides the default browser or server page that explains that the connection was denied.
- **Interactive Block Response Page:** Warns users, but also allows them to click a button (or refresh the page) to load the originally requested site. Users may have to refresh after bypassing the response page to load page elements that did not load.

If you do not choose a response page, the system blocks sessions without interaction or explanation.

## Limitations to HTTP Response Pages

### Response Pages are for Access Control Rules/Default Action Only

The system displays a response page only for unencrypted or decrypted HTTP/HTTPS connections blocked (or interactively blocked) either by access control rules or by the access control policy default action. The system does not display a response page for connections blocked by any other policy or mechanism.

### Displaying the Response Page Disables Connection Reset

The system cannot display a response page if the connection is reset (RST packet sent). If you enable response pages, the system prioritizes that configuration. Even if you choose **Block with reset** or **Interactive Block with reset** as the rule action, the system displays the response page and does not reset matching web connections. To ensure that blocked web connections reset, you must disable response pages.

Note that all non-web traffic that matches the rule *is* blocked with reset.

### **No Response Page for Encrypted Connections (Must Decrypt)**

The system does not display a response page for encrypted connections blocked by access control rules (or any other configuration). Access control rules evaluate encrypted connections if you did not configure an SSL policy, or your SSL policy passes encrypted traffic.

For example, the system cannot decrypt HTTP/2 or SPDY sessions. If web traffic encrypted using one of these protocols reaches access control rule evaluation, the system does not display a response page if the session is blocked.

However, the system does display a response page for connections decrypted by the SSL policy, then blocked (or interactively blocked) either by access control rules or by the access control policy default action. In these cases, the system encrypts the response page and sends it at the end of the reencrypted SSL stream.

### **No Response Page for "Promoted" Connections**

The system does not display a response page when web traffic is blocked as a result of a promoted access control rule (an early-placed blocking rule with only simple network conditions).

### **No Response Page for Certain Redirected Connections**

If a URL is entered without specifying "http" or "https", and the browser initiates the connection on port 80, and the user clicks through a response page, and the connection is subsequently redirected to port 443, the user will not see a second interactive response page because the response to this URL is already cached.

### **No Response Page Before URL Identification**

The system does not display a response page when web traffic is blocked before the system identifies the requested URL; see [Best Practices for URL Filtering, on page 1230](#).

## **Requirements and Prerequisites for HTTP Response Pages**

### **Supported Domains**

Any

### **User Roles**

- Admin
- Access Admin
- Network Admin

# Choosing HTTP Response Pages

Reliable display of HTTP response pages depends on your network configuration, traffic loads, and size of the page. Smaller pages are more likely to display successfully.

## Procedure

- 
- Step 1** In the access control policy editor, click **HTTP Responses**.
- If the controls are dimmed, settings are inherited from an ancestor policy, or you do not have permission to modify the configuration. If the configuration is unlocked, uncheck **Inherit from base policy** to enable editing.
- Step 2** Choose the **Block Response Page** and **Interactive Block Response Page**:
- System-provided—Displays a generic response. Click **View** (🔍) to view the code for this page.
  - Custom—Create a custom response page. A pop-up window appears, prepopulated with system-provided code that you can replace or modify by clicking **Edit** (✎). A counter shows how many characters you have used.
  - None—Disables the response page and blocks sessions without interaction or explanation. To quickly disable interactive blocking for the whole access control policy, choose this option.
- Step 3** Click **Save** to save the policy.
- 

## What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

# Interactive Blocking with HTTP Response Pages

When you configure interactive blocking, users can load an originally requested site after reading a warning. Users may have to refresh after bypassing the response page to load page elements that did not load.

---

**Tip** To quickly disable interactive blocking for the whole access control policy, display neither the system-provided page nor a custom page. The system then blocks all connections without interaction.

---

If a user does not bypass an interactive block, matching traffic is denied without further inspection. If a user bypasses an interactive block, the access control rule allows the traffic, although the traffic may still be subject to deep inspection and blocking.

By default, a user bypass is in effect for 10 minutes (600 seconds) without displaying the warning page on subsequent visits. You can set the duration to as long as a year, or you can force the user to bypass the block every time. This limit applies to every Interactive Block rule in the policy. You cannot set the limit per rule.

Logging options for interactively blocked traffic are identical to those in allowed traffic, but if a user does not bypass the interactive block, the system can log only beginning-of-connection events. When the system

initially warns the user, it marks any logged beginning-of-connection event with the `Interactive Block` or `Interactive Block with reset` action. If the user bypasses the block, additional connection events logged for the session have an action of `Allow`.

## Configuring Interactive Blocking

### Procedure

- 
- Step 1** As part of access control, configure an access control rule that matches web traffic; see [Create and Edit Access Control Rules](#), on page 1220:
- Action—Set the rule action to **Interactive Block** or **Interactive Block with reset**; see [Access Control Rule Interactive Blocking Actions](#), on page 1225.
  - Conditions—Use URL conditions to specify the web traffic to interactively block; see [URL Conditions \(URL Filtering\)](#), on page 384.
  - Logging—Assume users will bypass the block and choose logging options accordingly; see [Logging for Allowed Connections](#), on page 2212.
  - Inspection—Assume users will bypass the block and choose deep inspection options accordingly; see [Understanding Access Control](#), on page 1185.
- Step 2** (Optional) On access control policy **HTTP Responses**, choose a custom interactive-block HTTP response page; see [Choosing HTTP Response Pages](#), on page 1245.
- Step 3** (Optional) On access control policy **Advanced**, change the user bypass timeout; see [Setting the User Bypass Timeout for a Blocked Website](#), on page 1246.
- After a user bypasses a block, the system allows the user to browse to that page without warning until the timeout period elapses.
- Step 4** Save the access control policy.
- Step 5** Deploy configuration changes; see [Deploy Configuration Changes](#), on page 346.
- 

## Setting the User Bypass Timeout for a Blocked Website

### Procedure

- 
- Step 1** Log in to the FMC if you haven't already done so.
- Step 2** Click **Policies > Access Control**.
- Step 3** Click **Edit** () .
- Step 4** Click **Edit** () next to General Settings.
- If **View** () appears instead, settings are inherited from an ancestor policy, or you do not have permission to modify the settings. If the configuration is unlocked, uncheck **Inherit from base policy** to enable editing.

- Step 5** In the **Allow an Interactive Block to bypass blocking for (seconds)** field, type the number of seconds that must elapse before the user bypass expires. Setting this value to **0** means the interactive block response is displayed once and the user bypass never expires.
- Step 6** Click **OK**.
- Step 7** Click **Save** to save the policy.
- 

#### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## CHAPTER 62

# Blocking Traffic with Security Intelligence

The following topics provide an overview of Security Intelligence, including use of lists for blocking and allowing traffic and basic configuration.

- [About Security Intelligence, on page 1249](#)
- [Best Practices for Security Intelligence, on page 1250](#)
- [License Requirements for Security Intelligence, on page 1250](#)
- [Requirements and Prerequisites for Security Intelligence, on page 1251](#)
- [Security Intelligence Sources, on page 1251](#)
- [Configure Security Intelligence, on page 1252](#)
- [Security Intelligence Monitoring, on page 1258](#)
- [Override Security Intelligence Blocking, on page 1259](#)
- [Troubleshooting Security Intelligence, on page 1259](#)
- [History for Security Intelligence Block Listing, on page 1260](#)

## About Security Intelligence

As an early line of defense against malicious internet content, Security Intelligence uses reputation intelligence to quickly block connections to or from IP addresses, URLs, and domain names. This is called *Security Intelligence block listing*.

Security Intelligence is an early phase of access control, before the system performs more resource-intensive evaluation. Using a Block list improves performance by quickly excluding traffic that does not require inspection.

---

**Note** You cannot use a Block list to block fastpathed traffic. 8000 Series fastpathing and prefilter evaluation occur before Security Intelligence filtering. Fastpathed traffic bypasses all further evaluation, including Security Intelligence.

---

Although you can configure custom Block lists, Cisco provides access to regularly updated intelligence feeds. Sites representing security threats such as malware, spam, botnets, and phishing appear and disappear faster than you can update and deploy custom configurations.

You can refine Security Intelligence Block listing with Do Not Block lists and monitor-only Block lists. These mechanisms exempt traffic from being blocked by a Block list, but do **not** automatically trust or fastpath

matching traffic. Traffic added to a Do Not Block list or monitored at the Security Intelligence stage is intentionally subject to further analysis with the rest of access control.

[Other Connections You Can Log](#), on page 2209

[Using Connection and Security Intelligence Event Tables](#), on page 2245

## Best Practices for Security Intelligence

- Configure your access control policies to block threats detected by Cisco-provided Security Intelligence feeds. See [Configuration Example: Security Intelligence Blocking](#), on page 1257.
- If you want to supplement the Cisco-provided Security Intelligence feeds with custom threat data, or manually block emerging threats:
  - For IP addresses, use custom Security Intelligence lists and feeds, or Network objects or groups. To create these, see [Security Intelligence Lists and Feeds](#), on page 427 and [Network Objects](#), on page 402, and their subtopics. To use them for Security Intelligence, see [Configure Security Intelligence](#), on page 1252.
  - For URLs and domains, use custom Security Intelligence lists and feeds, *not* objects or groups. See details at [Manual URL Filtering Options](#), on page 1239.
  - You can also add entries to a Block list from events. See [Global and Domain Security Intelligence Lists](#), on page 428.
- To test new feeds, or for passive deployments, set the action from block to monitor only. See [Security Intelligence Monitoring](#), on page 1258.
- If you need to exclude specific sites or addresses from Security Intelligence blocking, see [Override Security Intelligence Blocking](#), on page 1259.
- System-provided Security Intelligence categories may change over time and without notification; you should plan to check periodically for changes, and modify your policies accordingly.
- You should also configure URL filtering, a separate feature with separate licensing requirements, for further protection against malicious sites. See [URL Filtering](#), on page 1229.

# Requirements and Prerequisites for Security Intelligence

## Model Support

Any

## Supported Domains

Any

## User Roles

- Admin
- Access Admin
- Network Admin

## Security Intelligence Sources

- System-provided feeds

Cisco provides access to regularly updated intelligence feeds for domains, URLs and IP addresses. For more information, see [Security Intelligence Lists and Feeds, on page 427](#).

- Third-party feeds

Optionally, supplement Cisco-provided feeds with third-party reputation feeds, which are dynamic lists that the Firepower Management Center downloads from the internet on a regular basis. See [Custom Security Intelligence Feeds, on page 434](#).

- Custom Block lists or feeds (or objects or groups)

Block specific IP addresses, URLs, or domain names using a manually-created list or feed (for IP addresses, you can also use network objects or groups.)

For example, if you become aware of malicious sites or addresses that are not yet blocked by a feed, add these sites to a custom Security Intelligence list and add this custom list to the Block list in the Security Intelligence tab of your access control policy, as described in [Custom Security Intelligence Lists, on page 436](#) and [Configure Security Intelligence, on page 1252](#).

For IP addresses, you can optionally use network objects rather than lists or feeds for this purpose; for information, see [Network Objects, on page 402](#). (For URLs, using lists and feeds is strongly recommended over other methods.)

- Custom Do Not Block lists or feeds

Override Security Intelligence blocking for specific sites or addresses. See [Override Security Intelligence Blocking, on page 1259](#).

- Global Block lists (one each for Network, URL and DNS)

While reviewing events, you can immediately add an event's IP address, URL, or domain to the applicable Global Block List so that Security Intelligence will handle future traffic from that source. See [Global and Domain Security Intelligence Lists, on page 428](#).

- Global Do Not Block lists (one each for Network, URL and DNS)

While reviewing events, you can immediately add an event's IP address, URL, or domain to the applicable Global Do Not Block List if you do not want Security Intelligence to block future traffic from that source. See [Global and Domain Security Intelligence Lists, on page 428](#).

## Configure Security Intelligence

Each access control policy has Security Intelligence options. You can add network objects, URL objects and lists, and Security Intelligence feeds and lists to a Block list or Do Not Block list, and constrain any of these by security zone. You can also associate a DNS policy with your access control policy, and add domain names to a Block or Do Not Block list.

The number of objects in the Do Not Block lists plus the number in the Block lists cannot exceed 125 network objects, or 32767 URL objects and lists.

---

**Note** The system builds a separate network map for each leaf domain. In a multidomain deployment, using literal IP addresses to constrain this configuration can have unexpected results. Using override-enabled objects allows descendant domain administrators to tailor Global configurations to their local environments.

---

---

**Caution** From Security Intelligence in an access control policy, adding multiple objects to a Block or Do Not Block list, or deleting multiple objects, sometimes restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See [Snort® Restart Traffic Behavior, on page 350](#) for more information. Note that whether the Snort process restarts can vary by device, depending on the memory available for inspection.

---

### Before you begin

- Tip: For guidance on minimum configuration recommendations, see also [Configuration Example: Security Intelligence Blocking, on page 1257](#).
- To ensure that all options are available to select, add at least one managed device to your management center.
- In passive deployments, or if you want to set Security Intelligence filtering to monitor-only, enable logging; see [Logging Connections with Security Intelligence, on page 2220](#).
- Configure a DNS policy to take Security Intelligence action for domains. For more information, see [DNS Policies, on page 1261](#).

## Procedure

---

- Step 1** In the access control policy editor, click **Security Intelligence**.
- If the controls are dimmed, settings are inherited from an ancestor policy, or you do not have permission to modify the configuration. If the configuration is unlocked, uncheck **Inherit from base policy** to enable editing.
- Step 2** You have the following options:
- Click **Networks** to add network objects (IP addresses).
  - Click **URLs** to add URL objects.
- Step 3** Find the **Available Objects** you want to add to the Block or Do Not Block list. You have the following options:
- Search the available objects by typing in the **Search by name or value** field. Clear the search string by clicking **Reload** (🔄) or **Clear** (✕).
  - If no existing list or feed meets your needs, click **Add** (+), select **New Network List** or **New URL List**, and proceed as described in [Creating Security Intelligence Feeds, on page 434](#) or [Uploading New Security Intelligence Lists to the Firepower Management Center, on page 436](#).
  - If no existing object meets your needs, click **Add** (+), select **New Network Object** or **New URL Object**, and proceed as described in [Creating Network Objects, on page 403](#).
- Security Intelligence ignores IP address blocks using a /0 netmask.
- Step 4** Choose one or more **Available Objects** to add.
- Step 5** (Optional) Choose an **Available Zone** to constrain the selected objects by zone.
- You cannot constrain system-provided Security Intelligence lists by zone.
- Step 6** Click **Add to Do Not Block list** or **Add to Block list**, or click and drag the selected objects to either list.
- To remove an object from a Block or Do Not Block list, click **Delete** (🗑️). To remove multiple objects, choose the objects and right-click to **Delete Selected**.
- Step 7** (Optional) Set objects on the Block list to monitor-only by right-clicking the object under **Block List**, then choosing **Monitor-only (do not block)**.
- You cannot set system-provided global Security Intelligence lists to monitor only.
- Step 8** Choose a DNS policy from the **DNS Policy** drop-down list.
- Step 9** Click **Save**.
- 

## What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## Related Topics

[Security Intelligence Lists and Feeds, on page 427](#)

[Snort® Restart Scenarios, on page 348](#)

## Security Intelligence Options

Use the Security Intelligence tab in the access control policy editor to configure network (IP address) and URL Security Intelligence, and to associate the access control policy with a DNS policy in which you have configured Security Intelligence for domains.

### Available Objects

Available objects include:

- Security Intelligence categories populated by the system-provided feed.  
For details, see [Security Intelligence Categories, on page 1255](#).
- System-provided Global Block and Do Not Block lists.  
For descriptions, see [Security Intelligence Sources, on page 1251](#).
- Security Intelligence lists and feeds that you create under Object > Object Management > Security Intelligence.  
For descriptions, see [Security Intelligence Sources, on page 1251](#).
- Network and URL objects and groups that are configured on the respective pages under Object > Object Management. These are different from the Security Intelligence objects in the previous bullet.  
For details about network objects, see [Network Objects, on page 402](#). (For URLs, use Security Intelligence lists or feeds rather than objects or groups.)

### Available Zones

Except for the system-provided Global lists, you can constrain Security Intelligence filtering by zone.

For example: To improve performance, you may want to target enforcement. As a more specific example, you can block spam only for a security zone that handles email traffic.

To enforce Security Intelligence filtering for an object on multiple zones, you must add the object to the Block or Do Not Block list separately for each zone.

### DNS Policy

In order to match DNS traffic using Security Intelligence, you must select a DNS policy for your Security Intelligence configuration.

Using Block or Do Not Block lists, or monitoring traffic based on a DNS list or feed, also requires that you:

- Configure DNS Security Intelligence lists and feeds. See [Security Intelligence Lists and Feeds, on page 427](#).
- Create a DNS policy. See [Creating Basic DNS Policies, on page 1264](#) for more information.
- Configure DNS rules that reference your DNS lists or feeds. See [Creating and Editing DNS Rules, on page 1266](#) for more information.
- Because you deploy the DNS policy as part of your access control policy, you must associate both policies. See [DNS Policy Deploy, on page 1272](#) for more information.

**Do Not Block List**

See [Override Security Intelligence Blocking, on page 1259](#).

To select all objects in the list, right-click an object.

**Block List**

See [Configuration Example: Security Intelligence Blocking, on page 1257](#) and other topics in this chapter.

For explanations of the visual indicators in the Block list, see [Block List Icons, on page 1256](#).

To select all objects in the list, right-click an object.

**Logging**

Security Intelligence logging, enabled by default, logs all blocked and monitored connections handled by an access control policy's target devices. However, the system does not log Do Not Block list matches; logging of connections on the Do Not Block list depends on their eventual disposition. Logging must be enabled for connections on the Block list before you can set objects on that list to monitor-only.

To enable, disable, or view logging settings, right-click an object in the Block list.

## Security Intelligence Categories

Security Intelligence categories are determined by the system-provided feeds described in [Security Intelligence Lists and Feeds, on page 427](#).

These categories are used in the following locations:

- The Networks sub-tab on the Security Intelligence tab of an access control policy
- The URLs sub-tab beside the Networks tab on the Security Intelligence tab of an access control policy
- In a DNS policy on the DNS tab in the DNS rule configuration page
- In events generated when traffic matches Block or Monitor configurations in the above locations

Categories are updated by Talos from the cloud, and this list may change independently of Firepower releases.

**Table 87: Cisco Talos Intelligence Group (Talos) Feed Categories**

| Security Intelligence Category | Description                                                                  |
|--------------------------------|------------------------------------------------------------------------------|
| Attackers                      | Active scanners and hosts known for outbound malicious activity              |
| Banking_fraud                  | Sites that engage in fraudulent activities that relate to electronic banking |
| Bogon                          | Bogon networks and unallocated IP addresses                                  |
| Bots                           | Sites that host binary malware droppers                                      |

| Security Intelligence Category | Description                                                                                                                                                                           |
|--------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CnC                            | Sites that host command-and-control servers for botnets                                                                                                                               |
| Cryptomining                   | Hosts providing remote access to pools and wallets for the purpose of mining cryptocurrency                                                                                           |
| Dga                            | Malware algorithms used to generate a large number of domain names acting as rendezvous points with their command-and-control servers                                                 |
| Exploitkit                     | Software kits designed to identify software vulnerabilities in clients                                                                                                                |
| High_risk                      | Domains and hostnames that match against the OpenDNS predictive security algorithms from security graph                                                                               |
| Ioc                            | Hosts that have been observed to engage in Indicators of Compromise (IOC)                                                                                                             |
| Link_sharing                   | Websites that share copyrighted files without permission                                                                                                                              |
| Malicious                      | Sites exhibiting malicious behavior that do not necessarily fit into another, more granular, threat category                                                                          |
| Malware                        | Sites that host malware binaries or exploit kits                                                                                                                                      |
| Newly_seen                     | Domains that have recently been registered, or not yet seen via telemetry.<br><b>Attention</b> Currently, this category does not have any active feed and is reserved for future use. |
| Open_proxy                     | Open proxies that allow anonymous web browsing                                                                                                                                        |
| Open_relay                     | Open mail relays that are known to be used for spam                                                                                                                                   |
| Phishing                       | Sites that host phishing pages                                                                                                                                                        |
| Response                       | IP addresses and URLs that are actively participating in malicious or suspicious activity                                                                                             |
| Spam                           | Mail hosts that are known for sending spam                                                                                                                                            |
| Spyware                        | Sites that are known to contain, serve, or support spyware and adware activities                                                                                                      |
| Suspicious                     | Files that appear to be suspicious and have characteristics that resemble known malware                                                                                               |
| Tor_exit_node                  | Hosts known to offer exit node services for the Tor Anonymizer network                                                                                                                |

## Block List Icons

The following visual indicators may appear in the Block list on the Security Intelligence tab in an access control policy:

| Icon or Visual Indicator                     | Description                                                                                              |
|----------------------------------------------|----------------------------------------------------------------------------------------------------------|
| Block (✘)                                    | The object is set to block.                                                                              |
| Monitor (📺)                                  | The object is set to monitor-only.<br>See <a href="#">Security Intelligence Monitoring, on page 1258</a> |
| An object is displayed in strikethrough text | The same object is also on the Do Not Block list, which overrides the block.                             |

## Configuration Example: Security Intelligence Blocking

Configure your access control policy to block all threats detectable by the system's regularly updated Security Intelligence feeds.

The number of objects in the Block lists plus the number in the Do Not Block lists cannot exceed 125 network objects, or 32767 URL objects and lists.

**Note** The system builds a separate network map for each leaf domain. In a multidomain deployment, using literal IP addresses to constrain this configuration can have unexpected results. Using override-enabled objects allows descendant domain administrators to tailor Global configurations to their local environments.

**Caution** From Security Intelligence in an access control policy, adding multiple objects to a Do Not Block list or Block list, or deleting multiple objects, sometimes restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See [Snort® Restart Traffic Behavior, on page 350](#) for more information. Note that whether the Snort process restarts can vary by device, depending on the memory available for inspection.

### Before you begin

- To ensure that all options are available to select, add at least one managed device to your management center.
- Configure a DNS policy to block all Security Intelligence threat categories for domains. For more information, see [DNS Policies, on page 1261](#).
- If you have, or will have, custom lists of entities to block, create a Security Intelligence object of each type (URLs, DNS, Networks.) See [Security Intelligence Lists and Feeds, on page 427](#).

### Procedure

- Step 1** Click **Policies > Access Control**.
- Step 2** Create a new access control policy or edit an existing policy.
- Step 3** In the access control policy editor, click **Security Intelligence**.

If the controls are dimmed, settings are inherited from an ancestor policy, or you do not have permission to modify the configuration. If the configuration is unlocked, uncheck **Inherit from base policy** to enable editing.

- Step 4** Click **Networks** to add blocking criteria for IP addresses.
- Scroll down in the Networks list and select all of the threat categories listed below the Global lists.
  - If applicable, select the security zones for which you want to block these threats.
  - Click **Add to Block List**.
  - If you have created custom lists or feeds with addresses to block, add those to the Block List using the same steps as above.
- Step 5** Click **URLs** to add blocking criteria for URLs, and repeat the steps you followed for Networks.
- Step 6** Choose a DNS policy from the **DNS Policy** drop-down list; see [DNS Policy Overview, on page 1261](#).
- Step 7** Click **Save**.

---

#### What to do next

- Enable logging for these connections; see [Logging Connections with Security Intelligence, on page 2220](#).
- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).
- For additional protection, configure URL filtering to block malicious URLs. See [URL Filtering, on page 1229](#).

## Security Intelligence Monitoring

Monitoring logs connection events for traffic that would have been blocked by Security Intelligence, but does not block the traffic. Monitoring is especially useful for:

- Testing feeds before you implement them.

Consider a scenario where you want to test a third-party feed before you implement blocking using that feed. When you set the feed to monitor-only, the system allows connections that would have been blocked to be further analyzed by the system, but also logs a record of each of those connections for your evaluation.

- Passive deployments, to optimize performance.

Managed devices that are deployed passively cannot affect traffic flow; there is no advantage to configuring the system to block traffic. Additionally, because blocked connections are not actually blocked in passive deployments, the system may report multiple beginning-of-connection events for each blocked connection.

#### To Configure Security Intelligence Monitoring:

After you configure Security Intelligence blocking following the instructions in [Configuration Example: Security Intelligence Blocking, on page 1257](#), right-click each applicable object in the Block list and choose **Monitor-only**. You cannot set system-provided Security Intelligence lists to monitor only.

# Override Security Intelligence Blocking

Optionally, you can use Do Not Block lists to exempt specific domains, URLs, or IP addresses from being blocked by Security Intelligence lists or feeds.

For example, you can:

- Override the occasional false-positive block in a reputable Security Intelligence feed
- Inspect specific traffic in depth instead of blocking it early based on reputation
- Exempt otherwise-restricted transactions based on zone from Security Intelligence blocking

For example, you can add an improperly classified URL to a Do Not Block list, but then restrict the Do Not Block list object using a security zone used by those in your organization who need to access those URLs. That way, only those with a business need can access the URLs on the Do Not Block list.

---

**Note** Entries on a Do Not Block list are *not* automatically trusted or fastpathed; this traffic is intentionally subject to further analysis with the rest of access control.

---

## Procedure

- 
- Step 1** Option 1: Add an IP address, URL, or domain from an event to the Global Do Not Block List. See [Global and Domain Security Intelligence Lists, on page 428](#).
- Step 2** Option 2: Use a custom Security Intelligence list or feed.
- a) Create the custom Security Intelligence list or feed. See [Custom Security Intelligence Lists, on page 436](#) or [Creating Security Intelligence Feeds, on page 434](#).
  - b) For IP addresses (Networks) and URLs: Edit your access control policy, click the Security Intelligence tab, then click the custom list or feed in the Networks or URLs sub-tab, then click **Add to Do Not Block List**.
  - c) Save your changes.
  - d) For domains (DNS): See the "DNS Policy" section in the [Security Intelligence Options, on page 1254](#) topic.
  - e) Deploy your changes.
- 

## Troubleshooting Security Intelligence

### Security Intelligence Categories Are Missing from the Available Options List

**Symptoms:** On the Security Intelligence tab of the access control policy, Security Intelligence categories (such as CnC or Exploitkit) are not displayed in the Networks tab under Available Options.

**Cause:**

- These categories do not appear until you have added at least one managed device to your management center. You must add a device in order to pull all TALOS feeds.
- The URL filtering feature uses a different set of categories than the Security Intelligence feature; the category that you expect to see may be a URL filtering category. To see URL filtering categories, look at the **URLs** tab in an access control rule.

## Troubleshooting Memory Use

**Symptoms:** Connections that should be blocked by a Security Intelligence Block list are instead evaluated by access control rules. The Security Intelligence health module alerts that it is out of memory.

**Cause:** Memory limitations. Cisco Intelligence Feeds are based on the latest threat intelligence from Cisco Talos Intelligence Group (Talos). These feeds tend to get larger as time passes. When a Firepower device receives a feed update, it loads as many entries as it can into the memory it has allocated for Security Intelligence. When a device cannot load all the entries, it may not block traffic as expected. Some connections that should be blocked by a Block list instead continue to be evaluated by access control rules.

**Affected platforms:** Lower-memory devices are most likely to have this issue, especially if your Block list includes a lot of Security Intelligence categories or you also filter URLs based on category and reputation. These devices include Firepower 7010, 7020, and 7030; ASA 5506-X, 5508-X, 5516-X, 5512-X, 5515-X, and 5525-X; NGIPSv.

**Workaround:** If you think this is happening, redeploy configurations to the affected devices. This can allocate more memory to Security Intelligence. If the issue persists, contact Cisco Technical Assistance Center (TAC), who can help you verify the issue and propose a solution appropriate to your deployment.

## History for Security Intelligence Block Listing

| Feature                              | Version | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## CHAPTER 63

# DNS Policies

---

The following topics explain DNS policies, DNS rules, and how to deploy DNS policies to managed devices.

- [DNS Policy Overview, on page 1261](#)
- [DNS Policy Components, on page 1262](#)
- [License Requirements for DNS Policies, on page 1263](#)
- [Requirements and Prerequisites for DNS Policies, on page 1263](#)
- [Managing DNS Policies, on page 1263](#)
- [DNS Rules, on page 1265](#)
- [DNS Policy Deploy, on page 1272](#)

## DNS Policy Overview

DNS-based Security Intelligence allows you to block traffic based on the domain name requested by a client, using a Security Intelligence Block list. Cisco provides domain name intelligence you can use to filter your traffic; you can also configure custom lists and feeds of domain names tailored to your deployment.

Traffic on a DNS policy Block list is immediately blocked and therefore is not subject to any further inspection—not for intrusions, exploits, malware, and so on, but also not for network discovery. You can use a Security Intelligence Do Not Block list to override a Block list and force access control rule evaluation, and, recommended in passive deployments, you can use a “monitor-only” setting for Security Intelligence filtering. This allows the system to analyze connections that would have been blocked by a Block list, but also logs the match to the Block list and generates an end-of-connection Security Intelligence event.

---

**Note** DNS-based Security Intelligence may not work as intended for a domain name unless the DNS server deletes a domain cache entry due to expiration, or a client’s DNS cache or the local DNS server’s cache is cleared or expires.

---

You configure DNS-based Security Intelligence using a DNS policy and associated DNS rules. To deploy it to your devices, you must associate your DNS policy with an access control policy, then deploy your configuration to managed devices.

# DNS Policy Components

A DNS policy allows you to block connections based on domain name, using a Block list, or exempt such connections from this type of blocking using a Do Not Block list. The following list describes the configurations you can change after creating a DNS policy.

## Name and Description

Each DNS policy must have a unique name. A description is optional.

In a multidomain deployment, policy names must be unique within the domain hierarchy. The system may identify a conflict with the name of a policy you cannot view in your current domain.

## Rules

Rules provide a granular method of handling network traffic based on the domain name. Rules in a DNS policy are numbered, starting at 1. The system matches traffic to DNS rules in top-down order by ascending rule number.

When you create a DNS policy, the system populates it with a default Global Whitelist for DNS rule and a default Global Block List for DNS rule. Both rules are fixed to the first position in their respective categories. You cannot modify these rules, but you can disable them.

In a multidomain deployment, the system also adds Descendant DNS Whitelists and Descendant DNS Block Lists rules to DNS policies in ancestor domains. These rules are fixed to the second position in their respective categories.

---

**Note** If multitenancy is enabled for your Firepower Management Center, the system is organized into a hierarchy of domains, including ancestor and descendant domains. These domains are distinct and separate from the domain names used in DNS management.

---

A descendant list contains the domains on the Block or Do Not Block lists of Firepower System subdomain users. From an ancestor domain, you cannot view the contents of descendant lists. If you do not want subdomain users to add domains to a Block or Do Not Block list:

- disable the descendant list rules, and
- enforce Security Intelligence using the access control policy inheritance settings

The system evaluates rules in the following order:

- Global Whitelist for DNS rule (if enabled)
- Descendant DNS Whitelists rule (if enabled)
- Rules with a Whitelist action
- Global Block List for DNS rule (if enabled)
- Descendant DNS Block Lists rule (if enabled)
- Rules with an action other than Whitelist

Usually, the system handles DN-based network traffic according to the *first* DNS rule where *all* the rule's conditions match the traffic. If no DNS rules match the traffic, the system continues evaluating the traffic based on the associated access control policy's rules. DNS rule conditions can be simple or complex.

- Network Admin

## Managing DNS Policies

Use the DNS Policy page (**Policies > Access Control > DNS**) to manage custom DNS policies. In addition to custom policies that you create, the system provides the Default DNS Policy, which uses the default Block list and Do Not Block list. You can edit and use this system-provided custom policy. In a multidomain deployment, this default policy uses the default Global DNS Block List, Global DNS Do Not Block List, Descendant DNS Block lists, and Descendant DNS Do Not Block lists, and can only be edited in the Global domain.

In a multidomain deployment, the system displays policies created in the current domain, which you can edit. It also displays policies created in ancestor domains, which you cannot edit. To view and edit policies created in a lower domain, switch to that domain.

### Procedure

---

- Step 1** Choose **Policies > Access Control > DNS**.
- Step 2** Manage your DNS policy:
- Compare—To compare DNS policies, click **Compare Policies** and proceed as described in [Comparing Policies, on page 355](#).
  - Copy—To copy a DNS policy, click **Copy** () and proceed as described in [Editing DNS Policies, on page 1264](#).
  - Create—To create a new DNS policy, click **Add DNS Policy** and proceed as described in [Creating Basic DNS Policies, on page 1264](#).
  - Delete—To delete a DNS policy, click **Delete** () , then confirm you want to delete the policy.
  - Edit—To modify an existing DNS policy, click **Edit** () ) and proceed as described in [Editing DNS Policies, on page 1264](#).
- 

## Creating Basic DNS Policies

### Procedure

---

- Step 1** Choose **Policies > Access Control > DNS**.
- Step 2** Click **Add DNS Policy**.
- Step 3** Give the policy a unique **Name** and, optionally, a **Description**.
- Step 4** Click **Save**.
- 

### What to do next

Configure the policy. See [Editing DNS Policies, on page 1264](#).

## Editing DNS Policies

Only one person should edit a DNS policy at a time, using a single browser window. If multiple users attempt to save the same policy, only the first set of saved changes are retained.

To protect the privacy of your session, after thirty minutes of inactivity on the policy editor, a warning appears. After sixty minutes, the system discards your changes.

### Procedure

---

- Step 1** Choose **Policies > Access Control > DNS**.
- Step 2** Click **Edit** () next to the DNS policy you want to edit.

If **View** (👁) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

**Step 3** Edit your DNS policy:

- **Name and Description**—To change the name or description, click the field and type the new information.
- **Rules**—To add, categorize, enable, disable, or otherwise manage DNS rules, click **Rules** and proceed as described in [Creating and Editing DNS Rules, on page 1266](#).

**Step 4** Click **Save**.

---

#### What to do next

- Optionally, further configure the new policy as described in [Logging Connections with Security Intelligence, on page 2220](#).
- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## DNS Rules

DNS rules handle traffic based on the domain name requested by a host. As part of Security Intelligence, this evaluation happens after any traffic decryption, and before access control evaluation.

The system matches traffic to DNS rules in the order you specify. In most cases, the system handles network traffic according to the *first* DNS rule where *all* the rule's conditions match the traffic.

In addition to its unique name, each DNS rule has the following basic components:

#### State

By default, rules are enabled. If you disable a rule, the system does not use it to evaluate network traffic, and stops generating warnings and errors for that rule.

#### Position

Rules in a DNS policy are numbered, starting at 1. The system matches traffic to rules in top-down order by ascending rule number. With the exception of Monitor rules, the first rule that traffic matches is the rule that handles that traffic.

#### Conditions

Conditions specify the specific traffic the rule handles. A DNS rule must contain a DNS feed or list condition, and can also match traffic by security zone, network, or VLAN.

#### Action

A rule's action determines how the system handles matching traffic:

- Traffic with a **Whitelist** action is allowed, subject to further access control inspection.

- Monitored traffic is subject to further evaluation by remaining rules on the DNS Block list. If the traffic does not match a DNS Block list rule, it is inspected with access control rules. The system logs a Security Intelligence event for the traffic.
- Traffic on a Block list is dropped without further inspection. You can also return a Domain Not Found response, or redirect the DNS query to a sinkhole server.

### Related Topics

[About Security Intelligence](#), on page 1249

## Creating and Editing DNS Rules

In a DNS policy, you can add up to a total of 32767 DNS lists to the Block list and Do Not Block list rules; that is, the number of lists in the DNS policy cannot exceed 32767.

### Procedure

- 
- Step 1** In the DNS policy editor, you have the following options:
- To add a new rule, click **Add DNS Rule**.
  - To edit an existing rule, click **Edit** (.
- Step 2** Enter a **Name**.
- Step 3** Configure the rule components, or accept the defaults:
- Action—Choose a rule **Action**; see [DNS Rule Actions, on page 1268](#).
  - Conditions—Configure the rule's conditions; see [DNS Rule Conditions, on page 1269](#).
  - Enabled—Specify whether the rule is **Enabled**.
- Step 4** Click **Save**.
- 

### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## DNS Rule Management

The **Rules** tab of the DNS policy editor allows you to add, edit, move, enable, disable, delete, and otherwise manage DNS rules within your policy.

For each rule, the policy editor displays its name, a summary of its conditions, and the rule action. Other icons represent **Warning** () , **Error** () , and other important **Information** (). Disabled rules are dimmed and marked *(disabled)* beneath the rule name.

### Enabling and Disabling DNS Rules

When you create a DNS rule, it is enabled by default. If you disable a rule, the system does not use it to evaluate network traffic and stops generating warnings and errors for that rule. When viewing the list of rules

in a DNS policy, disabled rules are dimmed, although you can still modify them. Note that you can also enable or disable a DNS rule using the DNS rule editor.

### Procedure

---

- Step 1** In the DNS policy editor, right-click the rule and choose a rule state.  
**Step 2** Click **Save**.
- 

### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## DNS Rule Order Evaluation

Rules in a DNS policy are numbered, starting at 1. The system matches traffic to DNS rules in top-down order by ascending rule number. In most cases, the system handles network traffic according to the *first* DNS rule where *all* the rule's conditions match the traffic:

- For Monitor rules, the system logs the traffic, then continues evaluating traffic against lower-priority DNS Block list rules.
- For non-Monitor rules, the system does **not** continue to evaluate traffic against additional, lower-priority DNS rules after that traffic matches a rule.

Note the following regarding rule order:

- The Global Whitelist for DNS is always first, and takes precedence over all other rules.
- The Descendant DNS Whitelists rule only appears in multidomain deployments, in non-leaf domains. It is always second, and takes precedence over all other rules except the Global Whitelist for DNS.
- The Do-Not-Block List section precedes the Block List section; Do-Not-Block List rules always take precedence over other rules.
- The Global Block List for DNS is always first in the Block List section, and takes precedence over all other Monitor and Block list rules.
- The Descendant DNS Block Lists rule only appears in multidomain deployments, in non-leaf domains. It is always second in the Block List section, and takes precedence over all other Monitor and Block list rules except the Global Block List.
- The Block List section contains Monitor and Block list rules.
- When you first create a DNS rule, the system positions it last in the Do-Not-Block List section if you assign a **Do Not Block** action, or last in the Block List section if you assign any other action.

You can drag and drop rules to reorder them.

## DNS Rule Actions

Every DNS rule has an *action* that determines the following for matching traffic:

- **handling**—foremost, the rule action governs whether the system will block, not block, or monitor traffic that matches the rule's conditions, based on a Block or Do Not Block list
- **logging**—the rule action determines when and how you can log details about matching traffic

### Whitelist Action

The **Whitelist** action allows traffic to pass to the next phase of inspection, which is access control rules.

The system does not log whitelist matches. Logging of these connections depends on their eventual disposition.

### Monitor Action

The **Monitor** action is designed to force connection logging; matching traffic is neither immediately allowed nor blocked. Rather, traffic is matched against additional rules to determine whether to permit or deny it. The first non-Monitor DNS rule matched determines whether the system blocks the traffic. If there are no additional matching rules, the traffic is subject to access control evaluation.

For connections monitored by a DNS policy, the system logs end-of-connection Security Intelligence and connection events to the Firepower Management Center database.

### Block Actions

These actions block traffic without further inspection of any kind:

- The **Drop** action drops the traffic.
- The **Domain Not Found** action returns a non-existent internet domain response to the DNS query, which prevents the client from resolving the DNS request.
- The **Sinkhole** action returns a sinkhole object's IPv4 or IPv6 address in response to the DNS query (A and AAAA records only). The sinkhole server can log, or log and block, follow-on connections to the IP address. If you configure a **Sinkhole** action, you must also configure a sinkhole object.

For a connection blocked based on the **Drop** or **Domain Not Found** actions, the system logs beginning-of-connection Security Intelligence and connection events. Because blocked traffic is immediately denied without further inspection, there is no unique end of connection to log.

For a connection blocked based on the **Sinkhole** action, logging depends on the sinkhole object configuration. If you configure your sinkhole object to only log sinkhole connections, the system logs end-of-connection connection events for the follow-on connection. If you configure your sinkhole object to log and block sinkhole connections, the system logs beginning-of-connection connection events for the follow-on connection, then blocks that connection.

**Note** On an ASA FirePOWER device, if you configure a DNS rule with a sinkhole action, and traffic matches the rule, the ASA blocks the follow-on sinkhole connection by default. As a workaround, run the following commands from the ASA command line:

```
asa(config)# policy-map global_policy
asa(config-pmap)# class inspection_default
asa(config-pmap-c)# no inspect dns preset_dns_map
```

If the ASA continues to block the connection, contact Support.

## DNS Rule Conditions

A DNS rule's conditions identify the type of traffic that rule handles. Conditions can be simple or complex. You must define a DNS feed or list condition within a DNS rule. You can also optionally control traffic by security zone, network, or VLAN.

When adding conditions to a DNS rule:

- If you do not configure a particular condition for a rule, the system does not match traffic based on that criterion.
- You can configure multiple conditions per rule. Traffic must match **all** the conditions in the rule for the rule to apply to traffic. For example, a rule with a DNS feed or list condition and network condition but no VLAN tag condition evaluates traffic based on the domain name and source or destination, regardless of any VLAN tagging in the session.
- For each condition in a rule, you can add up to 50 criteria. Traffic that matches **any** of a condition's criteria satisfies the condition. For example, you can use a single rule to block traffic based on up to 50 DNS lists and feeds.

## Controlling Traffic Based on DNS and Security Zone

Zone conditions in DNS rules allow you to control traffic by its source security zone. A *security zone* is a grouping of one or more interfaces, which may be located across multiple devices.

### Procedure

- 
- Step 1** In the DNS rule editor, click **Zones**.
  - Step 2** Find and select the zones you want to add from the **Available Zones**. To search for zones to add, click the **Search by name** prompt above the **Available Zones** list, then type a zone name. The list updates as you type to display matching zones.
  - Step 3** Click to select a zone, or right-click and then select **Select All**.
  - Step 4** Click **Add to Source**, or drag and drop.
  - Step 5** Save or continue editing the rule.
-

**What to do next**

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## Controlling Traffic Based on DNS and Network

Network conditions in DNS rules allow you to control traffic by its source IP address. You can explicitly specify the source IP addresses for the traffic you want to control.

**Procedure**

- 
- Step 1** In the DNS rule editor, click **Networks**.
- Step 2** Find and select the networks you want to add from the **Available Networks**, as follows:
- To add a network object on the fly, which you can then add to the condition, click **Add (+)** above the **Available Networks** list and proceed as described in [Creating Network Objects, on page 403](#).
  - To search for network objects to add, click the **Search by name or value** prompt above the **Available Networks** list, then type an object name or the value of one of the object's components. The list updates as you type to display matching objects.
- Step 3** Click **Add to Source**, or drag and drop.
- Step 4** Add any source IP addresses or address blocks that you want to specify manually. Click the **Enter an IP address** prompt below the **Source Networks** list; then type an IP address or address block and click **Add**.
- The system builds a separate network map for each leaf domain. In a multidomain deployment, using literal IP addresses to constrain this configuration can have unexpected results. Using override-enabled objects allows descendant domain administrators to tailor Global configurations to their local environments.
- Step 5** Save or continue editing the rule.
- 

**What to do next**

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## Controlling Traffic Based on DNS and VLAN

VLAN conditions in DNS rules allow you to control VLAN-tagged traffic. The system uses the innermost VLAN tag to identify a packet by VLAN.

When you build a VLAN-based DNS rule condition, you can manually specify VLAN tags. Alternately, you can configure VLAN conditions with VLAN tag *objects*, which are reusable and associate a name with one or more VLAN tags.

**Procedure**

- 
- Step 1** In the DNS rule editor, select **VLAN Tags**.
- Step 2** Find and select the VLANs you want to add from the **Available VLAN Tags**, as follows:

- To add a VLAN tag object on the fly, which you can then add to the condition, click **Add** (+) above the Available VLAN Tags list and proceed as described in [Creating VLAN Tag Objects, on page 406](#).
- To search for VLAN tag objects and groups to add, click the **Search by name or value** prompt above the **Available VLAN Tags** list, then type either the name of the object, or the value of a VLAN tag in the object. The list updates as you type to display matching objects.

**Step 3** Click **Add to Rule**, or drag and drop.

**Step 4** Add any VLAN tags that you want to specify manually. Click the **Enter a VLAN Tag** prompt below the **Selected VLAN Tags** list; then type a VLAN tag or range and click **Add**. You can specify any VLAN tag from 1 to 4094; use a hyphen to specify a range of VLAN tags.

The system builds a separate network map for each leaf domain. In a multidomain deployment, using literal VLAN tags to constrain this configuration can have unexpected results. Using override-enabled objects allows descendant domain administrators to tailor Global configurations to their local environments.

**Step 5** Save or continue editing the rule.

---

#### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## Controlling Traffic Based on DNS List, Feed, or Category

DNS conditions in DNS rules allow you to control traffic if a DNS list, feed, or category contains the domain name requested by the client. You must define a DNS condition in a DNS rule.

Regardless of whether you add a global or custom Block or Do Not Block list to a DNS condition, the system applies the configured rule action to the traffic. For example, if you add the Global Do Not Block List to a rule, and configure a **Drop** action, the system blocks all traffic that should have been allowed to pass to the next phase of inspection.

#### Procedure

---

**Step 1** In the DNS rule editor, click **DNS**.

**Step 2** Find and select the DNS lists and feeds you want to add from the **DNS Lists and Feeds**, as follows:

- To add a DNS list or feed on the fly, which you can then add to the condition, click **Add** (+) above the **DNS Lists and Feeds** list and proceed as described in [Creating Security Intelligence Feeds, on page 434](#).
- To search for DNS lists, feeds, or categories to add, click the **Search by name or value** prompt above the **DNS Lists and Feeds** list, then type an object name or the value of one of the object's components. The list updates as you type to display matching objects.
- For descriptions of the system-provided threat categories, see [Security Intelligence Categories, on page 1255](#).

**Step 3** Click **Add to Rule**, or drag and drop.

**Step 4** Save or continue editing the rule.

---

**What to do next**

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## DNS Policy Deploy

After you finish updating your DNS policy configuration, you must deploy it as part of access control configuration.

- Associate your DNS policy with an access control policy, as described in [Configure Security Intelligence, on page 1252](#).
- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## CHAPTER 64

# Prefiltering and Prefilter Policies

- [About Prefiltering, on page 1273](#)
- [Best Practices for Prefiltering, on page 1276](#)
- [Encapsulated Traffic Handling Best Practices, on page 1277](#)
- [Requirements and Prerequisites for Prefilter Policies, on page 1277](#)
- [Configure Prefiltering, on page 1278](#)
- [Tunnel Zones and Prefiltering, on page 1282](#)
- [Large Flow Offloads, on page 1286](#)

## About Prefiltering

Prefiltering is the first phase of access control, before the system performs more resource-intensive evaluation. Prefiltering is simple, fast, and early. Prefiltering uses limited outer-header criteria to quickly handle traffic. Compare this to subsequent evaluation, which uses inner headers and has more robust inspection capabilities.

Configure prefiltering to:

- **Improve performance**— The sooner you exclude traffic that does not require inspection, the better. You can fastpath or block certain types of plaintext, passthrough tunnels based on their outer encapsulation headers, without inspecting their encapsulated connections. You can also fastpath or block any other connections that benefit from early handling.
- **Tailor deep inspection to encapsulated traffic**—You can rezone certain types of tunnels, so that you can later handle their encapsulated connections using the same inspection criteria. Rezoning is necessary because after prefiltering, access control uses inner headers.

## Prefiltering vs Access Control

Prefilter and access control policies both allow you to block and trust traffic, though the prefiltering "trust" functionality is called "fastpathing" because it skips more inspection. The following table explains this and other differences between prefiltering and access control, to help you decide whether to configure custom prefiltering.

If you do not configure custom prefiltering, you can only approximate—not replicate—prefilter functionality with early-placed Block and Trust rules in the access control policy.

| Characteristic                 | Prefiltering                                                                                                                                                                                                                                                                                                                                                                                                                                 | Access Control                                                                                                                                                             | For more information, see...                                                                                                                      |
|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|

## Passthrough Tunnels and Access Control

Plaintext (nonencrypted) tunnels can encapsulate multiple connections, often flowing between discontinuous networks. These tunnels are especially useful for routing custom protocols over IP networks, IPv6 traffic over IPv4 networks, and so on.

An outer *encapsulation header* specifies the source and destination IP addresses of the *tunnel endpoints*—the routed interfaces of the network devices on either side of the tunnel. Inner *payload headers* specify the source and destination IP addresses of the encapsulated connections' actual endpoints.

Often, network security devices handle plaintext tunnels as *passthrough* traffic. That is, the device is not one of the tunnel endpoints. Instead, it is deployed between the tunnel endpoints and monitors the traffic flowing between them.

Some network security devices, such as Cisco ASA firewalls running Cisco ASA Software (rather than Firepower Threat Defense), enforce security policies using outer IP headers. Even for plaintext tunnels, these devices have no control over or insight into individual encapsulated connections and their payloads.

By contrast, the Firepower System leverages access control as follows:

- Outer header evaluation—First, prefiltering uses outer headers to handle traffic. You can block or fastpath entire plaintext, passthrough tunnels at this stage.
- Inner header evaluation—Next, the rest of access control (and other features such as QoS) use the innermost detectable level of headers to ensure the most granular level of inspection and handling possible.

If a passthrough tunnel is not encrypted, the system acts on its individual encapsulated connections at this stage. You must *rezone* a tunnel (see [Tunnel Zones and Prefiltering, on page 1282](#)) to act on all its encapsulated connections.

Access control has no insight into encrypted passthrough tunnels. For example, access control rules see a passthrough VPN tunnel as one connection. The system handles the entire tunnel using only the information in its outer, encapsulation header.

## Best Practices for Prefiltering

Consider the following guidelines and limitations for prefiltering:

### Best Practices for Fastpath Prefiltering

When you use the fastpath action in a prefilter rule, the matching traffic bypasses inspection and is simply transmitted through the device. Use this action for traffic that you can trust and that would not benefit from any of the security features available.

The following types of traffic are ideal for fastpathing. For example, you could configure the rules to fastpath any traffic from or to the IP addresses of the endpoints or servers. You can further limit the rule based on ports used.

- Site-to-site VPN traffic that is going through the device. That is, the device is not an endpoint in the VPN topology.
- Scanner traffic. Scanner probes can create a lot of false-positive responses from intrusion policies.
- Voice/video.
- Backups.
- Management traffic (sftunnel) that traverses Firepower Threat Defense devices. Performing deep inspection on management traffic (using access control policies) can cause issues. You can prefilter based on port TCP/8305 between the management center and managed devices.

### Model Requirements

Prefiltering is supported on Firepower Threat Defense devices only. Prefilter configurations have no effect on other devices.

### Prefilter-like Capabilities on Non-FTD Devices

For Classic devices (7000/8000 series, ASA FirePOWER, NGIPSv):

- Use early-placed Trust and Block access control rules to approximate prefilter functionality, keeping in mind the differences between the two features. See [Prefiltering vs Access Control, on page 1273](#).
- Match entire GRE-encapsulated tunnels using access control rules, with some limitations. See [Port and ICMP Code Conditions, on page 373](#).
- (8000 series only) Device-specific fastpath rules can bypass access control, but cannot block traffic. See [Configure Fastpath Rules \(8000 Series\), on page 243](#).

## Encapsulated Traffic Handling Best Practices

This topic discusses guidelines for the following types of encapsulated traffic:

- Generic Routing Encapsulation (GRE)
- Point-to-Point Protocol (PPTP)
- IPinIP
- IPv6inIP
- Teredo

### Devices cannot set reserved bits in the GRE packet header

Traffic is dropped if any device sets the values of bits 5 through 12 in the packet header to something other than 0 (zero) and if a signature is configured for Snort. For more information about the GRE packet header, see the introduction to RFC 1701.

### How tunnels work with interfaces

Prefilter and access control policy rules are applied to all tunnel types on routed, transparent, inline-set, inline-tap, and passive interfaces.

### References

For more information about the GRE and PPTP protocols, see the following:

- [RFC 1701](#), [RFC 2784](#), and [RFC 2890](#) (GRE protocol v0)
- [RFC 2637](#) (PPTP and GRE protocol v1)

## Configure Prefiltering

To perform custom prefiltering, configure and deploy prefilter policies to managed devices, as a part of access control.

Only one person should edit a policy at a time, using a single browser window. If multiple users save the same policy, the last saved changes are retained. For your convenience, the system displays information on who (if anyone) is currently editing each policy. To protect the privacy of your session, a warning appears after 30 minutes of inactivity on the policy editor. After 60 minutes, the system discards your changes.

### Procedure

**Step 1** Choose **Policies > Access Control > Prefilter**.

**Step 2** Click **New Policy** to create a custom prefilter policy.

A new prefilter policy has no rules and a default action of Analyze all tunnel traffic. It performs no logging or tunnel rezoning. You can also **Copy** (📄) or **Edit** (🔧) an existing policy.

**Step 3** Configure the prefilter policy's default action and its logging options.

- Default action—Choose a default action for supported plaintext, passthrough tunnels: **Analyze all tunnel traffic** (with access control) or **Block all tunnel traffic**.
- Default action logging—Click **Logging** (📄) next to the default action; see [Logging Connections with a Policy Default Action, on page 2221](#). You can configure default action logging for blocked tunnels only.

**Step 4** Configure tunnel and prefilter rules.

In a custom prefilter policy, you can use both kinds of rule, in any order. Create rules depending on the specific type of traffic you want to match and the actions or further analysis you want to perform; see [Tunnel vs Prefilter Rules, on page 1280](#).

**Caution** Exercise caution when using tunnel rules to assign tunnel zones. Connections in rezoned tunnels may not match security zone constraints in later evaluation. For more information, see [Tunnel Zones and Prefiltering, on page 1282](#).

For detailed information on configuring rule components, see [Tunnel and Prefilter Rule Components, on page 1281](#) and [Rule Management: Common Characteristics, on page 361](#).

**Step 5** Evaluate rule order. To move a rule, click and drag or use the right-click menu to cut and paste.

Properly creating and ordering rules is a complex task, but one that is essential to building an effective deployment. If you do not plan carefully, rules can preempt other rules or contain invalid configurations. For more information, see [Best Practices for Access Control Rules, on page 1194](#).

- Step 6** Save the prefilter policy.
- Step 7** For configurations that support tunnel zone constraints, appropriately handle rezoned tunnels. Match connections in rezoned tunnels by using tunnel zones as source zone constraints; see [Configuring Interface Conditions, on page 367](#).
- Step 8** Associate the prefilter policy with the access control policy deployed to your managed devices. See [Associating Other Policies with Access Control, on page 1213](#).
- Step 9** Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).
- Note** When you deploy a prefilter policy, its rules are not applied on the existing tunnel sessions. Hence, traffic on an existing connection is not bound by the new policy that is deployed. In addition, the policy hit count is incremented only for the first packet of a connection that matches a policy. Thus, the traffic of an existing connection that could match a policy is omitted from the hit count. To have the policy rules effectively applied, clear the existing tunnel sessions, and then deploy the policy.

---

## About Prefilter Policies

Prefiltering is a policy-based feature. In the Firepower System, an access control policy is a main configuration that invokes subpolicies and other configurations, including a prefilter policy.

### Policy Components: Rules and Default Action

In a prefilter policy, *tunnel rules*, *prefilter rules*, and a *default action* handle network traffic:

- Tunnel and prefilter rules—First, rules in a prefilter policy handle traffic in the order you specify. Tunnel rules match specific tunnels only and support rezoning. Prefilter rules have a wider range of constraints and do not support rezoning. For more information, see [Tunnel vs Prefilter Rules, on page 1280](#).
- Default action (tunnels only)—If a tunnel does not match any rules, the default action handles it. The default action can block these tunnels, or continue access control on their individual encapsulated connections. You cannot rezone tunnels with the default action.

There is no default action for nonencapsulated traffic. If a nonencapsulated connection does not match any prefilter rules, the system continues with access control.

### Connection Logging

You can log connections fastpathed and blocked by the prefilter policy; see [Other Connections You Can Log, on page 2209](#).

Connection events contain information on whether and how logged connections—including entire tunnels—were prefiltered. You can view this information in event views (workflows), dashboards, and reports, and use it as correlation criteria. Keep in mind that because fastpathed and blocked connections are not subject to deep inspection, associated connection events contain limited information.

### Default Prefilter Policy

Every access control policy has an associated prefilter policy.

The system uses a default policy if you do not configure custom prefiltering. Initially, this system-provided policy passes all traffic to the next phase of access control. You can change the policy's default action and configure its logging options, but you cannot add rules to it or delete it.

### Prefilter Policy Inheritance and Multitenancy

Access control uses a hierarchical implementation that complements multitenancy. Along with other advanced settings, you can lock a prefilter policy association, enforcing that association in all descendant access control policies. For more information, see [Access Control Policy Inheritance, on page 1191](#).

In a multidomain deployment, the system displays policies created in the current domain, which you can edit. It also displays policies created in ancestor domains, which you cannot edit. To view and edit policies created in a lower domain, switch to that domain. The default prefilter policy belongs to the Global domain.

## Tunnel vs Prefilter Rules

Whether you configure a tunnel or prefilter rule depends on the specific type of traffic you want to match and the actions or further analysis you want to perform.

| Characteristic                           | Tunnel Rules                                                                                                                                               | Prefilter Rules                                                                                                                                            |

| Rezone sessions for further analysis     | Supported, using tunnel zones; see <a href="#">Tunnel Zones and Prefiltering, on page 1282</a> .                                                           | Not supported.                                                                                                                                             |

# Tunnel and Prefilter Rule Components

## State (Enabled/Disabled)

By default, rules are enabled. If you disable a rule, the system does not use it and stops generating warnings and errors for that rule.

## Position

Rules are numbered, starting at 1. The system matches traffic to rules in top-down order by ascending rule number. The first rule that traffic matches is the rule that handles that traffic, regardless of rule type (tunnel vs prefilter).

## Action

A rule's action determines how the system handles and logs matching traffic:

- **Fastpath**—Exempts matching traffic from all further inspection and control, including access control, identity requirements, and rate limiting. Fastpathing a tunnel fastpaths all encapsulated connections.
- **Block**—Blocks matching traffic without further inspection of any kind. Blocking a tunnel blocks all encapsulated connections.
- **Analyze**—Allows traffic to continue to be analyzed by the rest of access control, using inner headers. If passed by access control and any related deep inspection, this traffic may also be rate limited. For tunnel rules, enables rezoning with the Assign Tunnel Zone option.

## Direction (Tunnel Rules Only)

A tunnel rule's direction determines how the system source and destination criteria:

- **Match tunnels only from source (unidirectional)**—Match source-to-destination traffic only. Matching traffic must originate from one of the specified source interfaces or tunnel endpoints, and leave through one of the destination interfaces or tunnel endpoints.
- **Match tunnels from source and destination (bidirectional)**—Match both source-to-destination traffic and destination-to-source traffic. The effect is identical to writing two unidirectional rules, one the mirror of the other.

Prefilter rules are always unidirectional.

## Assign Tunnel Zone (Tunnel Rules Only)

In a tunnel rule, assigning a tunnel zone (whether existing or created on the fly), *rezones* matching tunnels. Rezoning requires the Analyze action.

Rezoning a tunnel allows other configurations—such as access control rules—to recognize all the tunnel's encapsulated connections as belonging together. By using a tunnel's assigned tunnel zone as an interface constraint, you can tailor inspection to its encapsulated connections. For more information, see [Tunnel Zones and Prefiltering, on page 1282](#).

---

**Caution** Exercise caution when assigning tunnel zones. Connections in rezoned tunnels may not match security zone constraints in later evaluation. See [Using Tunnel Zones, on page 1283](#) for a brief walkthrough of a tunnel zone implementation, and a discussion of the implications of rezoning without explicitly handling rezoned traffic.

---

### Conditions

Conditions specify the specific traffic the rule handles. Traffic must match all a rule's conditions to match the rule. Each condition type has its own tab in the rule editor.

You can prefilter traffic using the following *outer-header* constraints:

- Interface—[Interface Conditions, on page 366](#)
- Network—[Tunnel Endpoint Conditions, on page 370](#) or [Network Conditions, on page 368](#)
- Port—[Encapsulation Conditions, on page 375](#) or [Port and ICMP Code Conditions, on page 373](#)
- VLAN—[VLAN Conditions, on page 372](#)

You must constrain tunnel rules by encapsulation protocol.

### Logging

A rule's logging settings govern the records the system keeps of the traffic it handles.

In tunnel and prefilter rules, you can log fastpathed and blocked traffic (the Fastpath and Block actions). For traffic subject to further analysis (the Analyze action), logging in the prefilter policy is disabled, although matching connections may still be logged by other configurations. For more information, see [Logging Connections with Tunnel and Prefilter Rules, on page 2218](#).

### Comments

Each time you save changes to a rule you can add comments. For example, you might summarize the overall configuration for the benefit of other users, or note when you change a rule and the reason for the change.

You cannot edit or delete these comments after you save the rule.

[Best Practices for Access Control Rules, on page 1194](#)

## Tunnel Zones and Prefiltering

Tunnel zones allow you to use prefiltering to tailor subsequent traffic handling to encapsulated connections.

A special mechanism is required because usually, the system handles traffic using the innermost detectable level of headers. This ensures the most granular level of inspection possible. But it also means that if a passthrough tunnel is not encrypted, the system acts on its individual encapsulated connections; see [Passthrough Tunnels and Access Control, on page 1275](#).

Tunnel zones solve this problem. During the first phase of access control (prefiltering) you can use outer headers to identify certain types of plaintext, passthrough tunnels. Then, you can *rezone* those tunnels by assigning a custom *tunnel zone*.

Rezoning a tunnel allows other configurations—such as access control rules—to recognize all the tunnel's encapsulated connections as belonging together. By using a tunnel's assigned tunnel zone as an interface constraint, you can tailor inspection to its encapsulated connections.

Despite its name, a tunnel zone is not a security zone. A tunnel zone does not represent a set of interfaces. It is more accurate to think of a tunnel zone as a tag that, in some cases, replaces the security zone associated with an encapsulated connection.

---

**Caution** For configurations that support tunnel zone constraints, connections in rezoned tunnels do **not** match security zone constraints. For example, after you rezone a tunnel, access control rules can match its encapsulated connections with their newly assigned *tunnel* zone, but not with any original *security* zone.

---

See [Using Tunnel Zones, on page 1283](#) for a brief walkthrough of a tunnel zone implementation, and a discussion of the implications of rezoning without explicitly handling rezoned traffic.

### Configurations Supporting Tunnel Zone Constraints

Only access control rules support tunnel zone constraints.

No other configurations support tunnel zone constraints. For example, you cannot use QoS to rate limit a plaintext tunnel as a whole; you can only rate limit its individual encapsulated sessions.

## Using Tunnel Zones

This example procedure summarizes how you might rezone GRE tunnels for further analysis, using tunnel zones. You can adapt the concepts described in this example to other scenarios where you need to tailor traffic inspection to connections encapsulated in plaintext, passthrough tunnels.

Consider a Firepower System deployment where your organization's internal traffic flows through the Trusted security zone. The Trusted security zone represents a set of sensing interfaces across multiple managed devices deployed in various locations. Your organization's security policy requires that you allow internal traffic after deep inspection for exploits and malware.

Internal traffic sometimes includes plaintext, passthrough, GRE tunnels between particular endpoints. Because the traffic profile of this encapsulated traffic is different from your "normal" interoffice activity—perhaps it is known and benign—you can limit inspection of certain encapsulated connections while still complying with your security policy.

In this example, after you deploy configuration changes:

- Plaintext, passthrough, GRE-encapsulated tunnels detected in the Trusted zone have their individual encapsulated connections evaluated by one set of intrusion and file policies.
- All other traffic in the Trusted zone is evaluated with a different set of intrusion and file policies.

You accomplish this task by *rezoning* GRE tunnels. Rezoning ensures that access control associates GRE-encapsulated connections with a custom *tunnel* zone, rather than their original Trusted *security* zone. Rezoning is required due to the way the Firepower System and access control handle encapsulated traffic; see [Passthrough Tunnels and Access Control, on page 1275](#) and [Tunnel Zones and Prefiltering, on page 1282](#).

## Procedure

- Step 1** Configure custom intrusion and file policies that tailor deep inspection to encapsulated traffic, and another set of intrusion and file policies tailored to nonencapsulated traffic.
- Step 2** Configure custom prefiltering to rezone GRE tunnels flowing through the Trusted security zone.
- Create a custom prefilter policy and associate it with access control. In that custom prefilter policy, create a tunnel rule (in this example, **GRE\_tunnel\_rezone**) and a corresponding tunnel zone (**GRE\_tunnel**). For more information, see [Configure Prefiltering, on page 1278](#).

**Table 88: GRE\_tunnel\_rezone Tunnel Rule**

| Rule Component             | Description                                                                                                                                                                                                                                                                                    |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface object condition | Match internal-only tunnels by using the Trusted security zone as both a Source Interface Object and Destination Interface Object constraint.                                                                                                                                                  |
| Tunnel endpoint condition  | Specify the source and destination endpoints for the GRE tunnels used in your organization.<br><br>Tunnel rules are bidirectional by default. If you do not change the <b>Match tunnels from...</b> option, it does not matter which endpoints you specify as source and which as destination. |
| Encapsulation condition    | Match GRE traffic.                                                                                                                                                                                                                                                                             |
| Assign Tunnel Zone         | Create the <b>GRE_tunnel</b> tunnel zone, and assign it to tunnels that match the rule.                                                                                                                                                                                                        |
| Action                     | Analyze (with the rest of access control).                                                                                                                                                                                                                                                     |

- Step 3** Configure access control to handle connections in rezoned tunnels.
- In the access control policy deployed to your managed devices, configure a rule (in this example, **GRE\_inspection**) that handles the traffic you rezoned. For more information, see [Create and Edit Access Control Rules, on page 1220](#).

**Table 89: GRE\_inspection Access Control Rule**

| Rule Component          | Description                                                                                                                                      |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| Security zone condition | Match rezoned tunnels by using the GRE_tunnel security zone as a Source Zone constraint; see <a href="#">Interface Conditions, on page 366</a> . |
| Action                  | Allow, with deep inspection enabled.<br><br>Choose the file and intrusion policies tailored to inspect encapsulated internal traffic.            |

- Caution** If you skip this step, the rezoned connections may match **any** access control rule not constrained by security zone. If the rezoned connections do not match any access control rules, they are handled by the access control policy default action. Make sure this is your intent.

- Step 4** Configure access control to handle nonencapsulated connections flowing through the Trusted security zone. In the same access control policy, configure a rule (in this example, `internal_default_inspection`) that handles non-rezoned traffic in the Trusted security zone.

*Table 90: internal\_default\_inspection Access Control Rule*

| Rule Component          | Description                                                                                                                          |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------|
| Security zone condition | Match non-rezoned internal-only traffic by using the Trusted security zone as both a Source Zone and Destination Zone constraint.    |
| Action                  | Allow, with deep inspection enabled.<br>Choose the file and intrusion policies tailored to inspect nonencapsulated internal traffic. |

- Step 5** Evaluate the position of the new access control rules relative to preexisting rules. Change rule order if necessary. If you place the two new access control rules next to each other, it does not matter which you place first. Because you rezoned GRE tunnels, the two rules cannot preempt each other.
- Step 6** Save all changed configurations.

#### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## Creating Tunnel Zones

### Procedure

- Step 1** Choose **Objects > Object Management**.
- Step 2** Chose **Tunnel Zone** from the list of object types.
- Step 3** Click **Add Tunnel Zone**.
- Step 4** Enter a **Name** and, optionally, a **Description**.
- Step 5** Click **Save**.

#### What to do next

- Assign tunnel zones to plaintext, passthrough tunnels as part of custom prefiltering; see [Configure Prefiltering, on page 1278](#).

# Large Flow Offloads

On devices that run FXOS (such as Firepower 4100/9300 chassis), certain traffic that you configure to be fastpathed by a prefilter policy is handled by the hardware (specifically, in the NIC), not by your Firepower Threat Defense software. Offloading these connection flows results in higher throughput and lower latency, especially for data-intensive applications such as large file transfers. This feature is especially useful for data centers. This is called *static flow offload*.

Offloaded flows continue to receive limited stateful inspection, such as basic TCP flag and option checking. The system can selectively escalate packets to the firewall system for further processing if necessary.

Examples of applications that can benefit from offloading large flows are:

- High Performance Computing (HPC) Research sites, where the Firepower Threat Defense device is deployed between storage and high compute stations. When one research site backs up using FTP file transfer or file sync over NFS, the large amount of data traffic affects all connections. Offloading FTP file transfer and file sync over NFS reduces the impact on other traffic.
- High Frequency Trading (HFT), where the Firepower Threat Defense device is deployed between workstations and the Exchange, mainly for compliance purposes. Security is usually not a concern, but latency is a major concern.

The following flows can be offloaded:

- Connections that are fastpathed by the prefilter policy.
- Standard or 802.1Q tagged Ethernet frames only.

---

**Important** For details, exceptions, and limitations to the above, see [Flow Offload Limitations, on page 1286](#).

---

## Use Static Flow Offload

To offload eligible traffic to hardware, create a prefilter policy rule that applies the **Fastpath** action. Use prefilter rules for TCP/UDP, and tunnel rules for GRE.

(Not recommended.) To disable static flow offload and as a by-product, dynamic flow-offload, use FlexConfig to run the **no flow-offload enable** command. After deployment, you will have to reload the device to implement the change. For information about this command, see the *Cisco ASA Series Command Reference*, available from <https://www.cisco.com/c/en/us/support/security/asa-5500-series-next-generation-firewalls/products-command-reference-list.html>.

## Flow Offload Limitations

Not all flows can be offloaded. Even after offload, a flow can be removed from being offloaded under certain conditions. Following are some of the limitations:

### Device Limitations

The feature is supported on the following devices:

- Firepower 9300 running FXOS 1.1.3 or higher.

### Flows that cannot be offloaded

The following types of flows cannot be offloaded.

- Any flows that do not use IPv4 addressing, such as IPv6 addressing.
- Flows for any protocol other than TCP, UDP, and GRE.

---

**Note** PPTP GRE connections cannot be offloaded.

---

- Flows on interfaces configured in passive, inline, or inline tap mode. Routed and switched interfaces are the only types supported.
- Flows that require inspection by Snort or other inspection engines. In some cases, such as FTP, the secondary data channel can be offloaded although the control channel cannot be offloaded.
- IPsec and TLS/DTLS VPN connections that terminate on the device.
- Multicast flows in routed mode. They are supported in transparent mode if there are only two member interfaces in a bridge group.
- TCP state bypass flows. You cannot configure flow offload and TCP state bypass on the same traffic.
- Flows tagged with security groups.
- Reverse flows that are forwarded from a different cluster node, in case of asymmetric flows in a cluster.
- Centralized flows in a cluster, if the flow owner is not the control unit.

### Additional Limitations

- Flow offload and Dead Connection Detection (DCD) are not compatible. Do not configure DCD on connections that can be offloaded.
- If more than one flow that matches flow offload conditions are queued to be offloaded at the same time to the same location on the hardware, only the first flow is offloaded. The other flows are processed normally. This is called a *collision*. Use the **show flow-offload flow** command in the CLI to display statistics for this situation.
- Although offloaded flows pass through FXOS interfaces, statistics for these flows do not appear on the logical device interface. Thus, logical device interface counters and packet rates do not reflect offloaded flows.

### Conditions for reversing offload

After a flow is offloaded, packets within the flow are returned to the FTD for further processing if they meet the following conditions:

- They include TCP options other than Timestamp.
- They are fragmented.
- They are subject to Equal-Cost Multi-Path (ECMP) routing, and ingress packets move from one interface to another.

## CHAPTER 65

# Intelligent Application Bypass

---

The following topics describe how to configure access control policies to use Intelligent Application Bypass (IAB)

- [Introduction to IAB, on page 1289](#)
- [IAB Options, on page 1290](#)
- [Requirements and Prerequisites for Intelligent Application Bypass, on page 1292](#)
- [Configuring Intelligent Application Bypass, on page 1292](#)
- [IAB Logging and Analysis, on page 1293](#)

## Introduction to IAB

IAB identifies applications that you trust to traverse your network without further inspection if performance and flow thresholds are exceeded. For example, if a nightly backup significantly impacts system performance, you can configure thresholds that, if exceeded, trust traffic generated by your backup application. Optionally, you can configure IAB so that, when an inspection performance threshold is exceeded, IAB trusts all traffic that exceeds any flow bypass threshold, regardless of the application type. This option requires Version 6.2.0.1 or a subsequent 6.2.0.x patch.

The system implements IAB on traffic allowed by access control rules or the access control policy's default action, before the traffic is subject to deep inspection. A test mode allows you to determine whether thresholds are exceeded and, if so, to identify the application flows that would have been bypassed if you had actually enabled IAB (called *bypass mode*).

The following graphic illustrates the IAB decision-making process:

## IAB Options

### State

Enables or disables IAB.

### Performance Sample Interval

Specifies the time in seconds between IAB performance sampling scans, during which the system collects system performance metrics for comparison to IAB performance thresholds. A value of **0** disables IAB.

### Bypassable Applications and Filters

This feature provides two mutually exclusive options:

**Applications/Filters**

Provides an editor where you can specify bypassable applications and sets of applications (filters). See [Application Conditions \(Application Control\)](#), on page 375.

**All applications including unidentified applications**

When an inspection performance threshold is exceeded, trusts all traffic that exceeds any flow bypass threshold, regardless of the application type. This option requires Version 6.2.0.1 or a subsequent 6.2.0.x patch.

**Performance and Flow Thresholds**

You must configure at least one inspection performance threshold and one flow bypass threshold. When a performance threshold is exceeded, the system examines flow thresholds and, if one threshold is exceeded, trusts the specified traffic. If you enable more than one of either, only one of each must be exceeded.

**Inspection performance thresholds** provide intrusion inspection performance limits that, if exceeded, trigger the inspection of flow thresholds. IAB does not use inspection performance thresholds set to 0. You can configure one or more of the following inspection performance thresholds:

**Drop Percentage**

Average packets dropped as a percentage of total packets, when packets are dropped because of performance overloads caused by expensive intrusion rules, file policies, decompression, and so on. This does not refer to packets dropped by normal configurations such as intrusion rules. Note that specifying an integer greater than 1 activates IAB when the specified percentage of packets is dropped. When you specify 1, any percentage from 0 through 1 activates IAB. This allows a small number of packets to activate IAB.

**Processor Utilization Percentage**

Average percentage of processor resources used.

**Package Latency**

Average packet latency in microseconds.

**Flow Rate**

The rate at which the system processes flows, measured as the number of flows per second. Note that this option configures IAB to measure flow *rate*, not flow *count*.

**Flow bypass thresholds** provide flow limits that, if exceeded, trigger IAB to trust bypassable application traffic in bypass mode or allow application traffic subject to further inspection in test mode. IAB does not use flow bypass thresholds set to 0. You can configure one or more of the following flow bypass thresholds:

**Bytes per Flow**

The maximum number of kilobytes a flow can include.

**Packets per Flow**

The maximum number of packets a flow can include.

**Flow Duration**

The maximum number of seconds a flow can remain open.

**Flow Velocity**

The maximum transfer rate in kilobytes per second.

# Requirements and Prerequisites for Intelligent Application Bypass

## Model Support

Any

## Supported Domains

Any

## User Roles

- Admin
- Access Admin
- Network Admin

## Configuring Intelligent Application Bypass

---

**Caution** Not all deployments require IAB, and those that do might use it in a limited fashion. Do not enable IAB unless you have expert knowledge of your network traffic, especially application traffic, and system performance, including the causes of predictable performance issues. Before you run IAB in bypass mode, make sure that trusting the specified traffic does not expose you to risk.

---

### Before you begin

For Classic devices, you must have the Control license.

### Procedure

---

**Step 1** In the access control policy editor, click **Advanced**, then click **Edit** () next to **Intelligent Application Bypass Settings**.

If **View** () appears instead, settings are inherited from an ancestor policy, or you do not have permission to modify the settings. If the configuration is unlocked, uncheck **Inherit from base policy** to enable editing.

**Step 2** Configure IAB options:

- State—Turn IAB **Off** or **On**, or enable IAB in **Test** mode.
- Performance Sample Interval—Enter the time in seconds between IAB performance-sampling scans. If you enable IAB, even in test mode, enter a non-zero value. Entering **0** disables IAB.
- Bypassable Applications and Filters—Choose from:

- Click the number of bypassed applications and filters and specify the applications whose traffic you want to bypass; see [Configuring Application Conditions and Filters, on page 376](#).
- Click **All applications including unidentified applications** so that, when an inspection performance threshold is exceeded, IAB trusts all traffic that exceeds any flow bypass threshold, regardless of the application type. This option requires Version 6.2.0.1 or a subsequent 6.2.0.x patch.
- Inspection Performance Thresholds—Click **Configure** and enter at least one threshold value.
- Flow Bypass Thresholds—Click **Configure** and enter at least one threshold value.

You must specify at least one inspection performance threshold and one flow bypass threshold; both must be exceeded for IAB to trust traffic. If you enter more than one threshold of each type, only one of each type must be exceeded. For detailed information, see [IAB Options, on page 1290](#).

**Step 3** Click **OK** to save IAB settings.

**Step 4** Click **Save** to save the policy.

---

### What to do next

- Because some packets must be allowed to pass before an application can be detected, you must configure your system to examine those packets.  
See [Best Practices for Handling Packets That Pass Before Traffic Identification, on page 1670](#) and [Specify a Policy to Handle Packets That Pass Before Traffic Identification, on page 1670](#).
- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## IAB Logging and Analysis

IAB forces an end-of-connection event that logs bypassed flows and flows that would have been bypassed, regardless of whether you have enabled connection logging. Connection events indicate flows that are bypassed in bypass mode or that would have been bypassed in test mode. Custom dashboard widgets and reports based on connection events can display long-term statistics for bypassed and would-have-bypassed flows.

### IAB Connection Events

#### Action

When **Reason** includes `Intelligent App Bypass`:

#### **Allow -**

indicates that the applied IAB configuration was in test mode and traffic for the application specified by **Application Protocol** remains available for inspection.

#### **Trust -**

indicates that the applied IAB configuration was in bypass mode and traffic for the application specified by **Application Protocol** has been trusted to traverse the network without further inspection.

#### Reason

`Intelligent App Bypass` indicates that IAB triggered the event in bypass or test mode.

## Application Protocol

This field displays the application protocol that triggered the event.

### Example

In the following truncated graphic, some fields are omitted. The graphic shows the **Action**, **Reason**, and **Application Protocol** fields for two connection events resulting from different IAB settings in two separate access control policies.

For the first event, the `Trust` action indicates that IAB was enabled in bypass mode and Bonjour protocol traffic was trusted to pass without further inspection.

For the second event, the `Allow` action indicates that IAB was enabled in test mode, so Ubuntu Update Manager traffic was subject to further inspection but would have been bypassed if IAB had been in bypass mode.

| Action × | Reason ×               | Application × Protocol                         |
|----------|------------------------|------------------------------------------------|
| Trust    | Intelligent App Bypass | <input type="checkbox"/> Bonjour               |
| Allow    | Intelligent App Bypass | <input type="checkbox"/> Ubuntu Update Manager |

404483

### Example

In the following truncated graphic, some fields are omitted. The flow in the second event was both bypassed (**Action:** `Trust`; **Reason:** `Intelligent App Bypass`) and inspected by an intrusion rule (**Reason:** `Intrusion Monitor`). The `Intrusion Monitor` reason indicates that an intrusion rule set to **Generate Events** detected but did not block an exploit during the connection. In the example, this happened before the application was detected. After the application was detected, IAB recognized the application as bypassable and trusted the flow.

| Last Packet ×       | Action × | Reason ×                                  | Application × Protocol               |
|---------------------|----------|-------------------------------------------|--------------------------------------|
| 2015-06-12 10:53:09 | Trust    | Intelligent App Bypass                    | <input type="checkbox"/> Skype Probe |
| 2015-06-12 10:53:08 | Trust    | Intelligent App Bypass, Intrusion Monitor | <input type="checkbox"/> HTTP        |

404541

## IAB Custom Dashboard Widgets

You can create a Custom Analysis dashboard widget to display long-term IAB statistics based on connection events. Specify the following when creating the widget:

- **Preset:** None
- **Table:** Application Statistics
- **Field:** any
- **Aggregate:** either of:
  - IAB Bypassed Connections
  - IAB Would Bypass Connections

- **Filter:** any

## Examples

In the following Custom Analysis dashboard widget examples:

- The *Bypassed* example shows statistics for application traffic bypassed because the applications were specified as bypassable and IAB was enabled in bypass mode in the deployed access control policy.
- The *Would Have Bypassed* example shows statistics for application traffic that would have been bypassed because the applications were specified as bypassable and IAB was enabled in test mode in the deployed access control policy.

## IAB Custom Reports

You can create a custom report to display long-term IAB statistics based on connection events. Specify the following when creating the report:

- **Table:** Application Statistics
- **Preset:** None
- **Filter:** any
- **X-Axis:** any
- **Y-Axis:** either of:
  - IAB Bypassed Connections
  - IAB Would Bypass Connections

## Examples

The following graphic shows two abbreviated report examples:

- The *Bypassed* example shows statistics for application traffic bypassed because the applications were specified as bypassable and IAB was enabled in bypass mode in the deployed access control policy.
- The *Would Have Bypassed* example shows statistics for application traffic that would have been bypassed because the applications were specified as bypassable and IAB was enabled in test mode in the deployed access control policy.

## CHAPTER 66

# Access Control Using Content Restriction

The following topics describe how to configure access control policies to use content restriction features:

- [About Content Restriction, on page 1297](#)
- [Requirements and Prerequisites for Content Restriction, on page 1298](#)
- [Using Access Control Rules to Enforce Content Restriction, on page 1299](#)
- [Using a DNS Sinkhole to Enforce Content Restriction, on page 1301](#)

## About Content Restriction

Major search engines and content delivery services provide features that allow you to restrict search results and website content. For example, schools use content restriction features to comply with the Children's Internet Protection Act (CIPA).

When implemented by search engines and content delivery services, you can enforce content restriction features only for individual browsers or users. The Firepower System allows you to extend these features to your entire network.

The system allows you to enforce:

- *Safe Search*—Supported in many major search engines, this service filters out explicit and adult-oriented content that business, government, and education environments classify as objectionable. The system does not restrict a user's ability to access the home pages for supported search engines.
- *YouTube EDU*—This service filters YouTube content for an educational environment. It allows schools to set access for educational content while limiting access to noneducational content. YouTube EDU is a different feature than YouTube Restricted Mode, which enforces restrictions on YouTube searches as part of Google's Safe Search feature. YouTube Restricted Mode is a subfeature of Safe Search. With YouTube EDU, users access the YouTube EDU home page, rather than the standard YouTube home page.

You can use two methods to configure the system to enforce these features:

### Method: Access Control Rules

Content restriction features communicate the restricted status of a search or content query via an element in the request URI, an associated cookie, or a custom HTTP header element. You can configure access control rules to modify these elements as the system processes traffic.

### Method: DNS Sinkhole

For Google searches, you can configure the system to redirect traffic to the Google SafeSearch Virtual IP Address (VIP), which imposes filters for Safe Search (including YouTube Restricted Mode).

The table below describes the differences between these enforcement methods.

**Table 91: Comparison of Content Restriction Methods**

| Attribute                         | Method: Access Control Rules                                                                   | Method: DNS Sinkhole          |
|-----------------------------------|------------------------------------------------------------------------------------------------|-------------------------------|
| Supported devices                 | Any                                                                                            | Firepower Threat Defense only |
| Search engines supported          | Any tagged <code>safesearch</code> supported in the <b>Applications</b> tab of the rule editor | Google only                   |
| YouTube Restricted Mode supported | Yes                                                                                            | Yes                           |
| YouTube EDU supported             | Yes                                                                                            | No                            |
| SSL policy required               | Yes                                                                                            | No                            |
| Hosts must be using IPv4          | No                                                                                             | Yes                           |
| Connection event logging          | Yes                                                                                            | Yes                           |

When determining which method to use, consider the following limitations:

- The access control rules method requires an SSL policy, which impacts performance.
- The Google SafeSearch VIP supports IPv4 traffic only. If you configure a DNS sinkhole to manage Google searches, any hosts on the affected network must be using IPv4.

The system logs different values for the **Reason** field in connection events, depending on the method:

- Access Control Rules—Content Restriction
- DNS Sinkhole—DNS Block

## Requirements and Prerequisites for Content Restriction

### Model Support

Any, or as indicated in the procedure.

### Supported Domains

Any

### User Roles

- Admin
- Access Admin
- Network Admin

# Using Access Control Rules to Enforce Content Restriction

**Caution** To avoid rule preemption, position rules governing YouTube EDU above rules governing Safe Search in both SSL and access control policies; see [Content Restriction Rule Order, on page 1196](#).

**Note** When safe search or YouTube EDU is enabled in an access control rule, inline normalization is enabled automatically. For more information, see [The Inline Normalization Preprocessor, on page 1762](#).

## Before you begin

For Classic devices, you must have the Control license.

## Procedure

- Step 1** Create an SSL policy; see [Create Basic SSL Policies, on page 1341](#).
- Step 2** Add SSL rules for handling Safe Search and YouTube EDU traffic:
  - Choose **Decrypt - Resign** as the **Action** for the rules. The system does not support any other action for content restriction handling.
  - In **Applications**, add selections to the **Selected Applications and Filters** list:
    - YouTube EDU—Add the `YouTube` and `YouTube Upload` applications.
    - Safe Search—Add the `Category: search engine` filter.

For more information, see [Adding an Application Condition to a TLS/SSL Rule, on page 1377](#).
- Step 3** Set rule positions for the SSL rules you added. Click and drag, or use the right-click menu to cut and paste. To avoid preemption, position the Safe Search rule after the YouTube EDU rule.
- Step 4** Create or edit an access control policy, and associate the SSL policy with the access control policy. For more information, see [Associating Other Policies with Access Control, on page 1213](#).
- Step 5** In the access control policy, add rules for handling Safe Search and YouTube EDU traffic:
  - Choose **Allow** as the **Action** for the rules. The system does not allow any other action for content restriction handling.
  - In **Applications**, click dimmed for either **Safe search** (🔒) or **YouTube EDU** (🔒), and set related options; see [Safe Search Options for Access Control Rules, on page 1300](#) and [YouTube EDU Options for Access Control Rules, on page 1300](#).

These options are disabled, rather than dimmed, if you choose any **Action** other than **Allow** for the rule. You cannot enable Safe Search and YouTube EDU restrictions for the same access control rule.

- In **Applications**, refine application selections in the **Selected Applications and Filters** list.

In most cases, enabling Safe Search or YouTube EDU populates the **Selected Applications and Filters** list with the appropriate values. The system does not automatically populate the list if a Safe Search or YouTube application is already present in the list when you enable the feature. If applications do not populate as expected, manually add them as follows:

- YouTube EDU—Add the `YouTube` and `YouTube Upload` applications.
- Safe Search—Add the `Category: search engine` filter.

For more information, see [Configuring Application Conditions and Filters, on page 376](#).

**Step 6** Set rule positions for the access control rules you added. Click and drag, or use the right-click menu to cut and paste.

To avoid preemption, position the Safe Search rule after the YouTube EDU rule.

**Step 7** Configure the HTTP response page that the system displays when it blocks restricted content; see [Choosing HTTP Response Pages, on page 1245](#).

**Step 8** Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## Safe Search Options for Access Control Rules

The Firepower System supports Safe Search filtering for specific search engines only. For a list of supported search engines, see applications tagged `safesearch supported` in the **Applications** tab of the access control rule editor. For a list of unsupported search engines, see applications tagged `safesearch unsupported`.

When enabling Safe Search for an access control rule, set the following parameters:

### Enable Safe Search

Enables Safe Search filtering for traffic that matches this rule.

### Unsupported Search Traffic

Specifies the action you want the system to take when it processes traffic from unsupported search engines. If you choose **Block** or **Block with Reset**, you must also configure the HTTP response page that the system displays when it blocks restricted content; see [Choosing HTTP Response Pages, on page 1245](#).

## YouTube EDU Options for Access Control Rules

When enabling YouTube EDU for an access control rule, set the following parameters:

### Enable YouTube EDU

Enables YouTube EDU filtering for traffic that matches this rule.

### Custom ID

Specifies the value that uniquely identifies a school or district network in the YouTube EDU initiative. YouTube provides this ID when a school or district registers for a YouTube EDU account.

---

**Note** If you check **Enable YouTube EDU**, you must enter a **Custom ID**. This ID is defined externally by YouTube. The system does not validate what you enter against the YouTube system. If you enter an invalid ID, YouTube EDU restrictions may not perform as expected.

---

## Using a DNS Sinkhole to Enforce Content Restriction

Typically, a DNS sinkhole directs traffic away from a particular target. This procedure describes how to configure a DNS sinkhole to redirect traffic to the Google SafeSearch Virtual IP Address (VIP), which imposes content filters on Google and YouTube search results.

Because Google SafeSearch uses a single IPv4 address for the VIP, hosts must use IPv4 addressing.

---

**Caution** If your network includes proxy servers, this content restriction method is not effective unless you position your Firepower Threat Defense devices between the proxy servers and the Internet.

---

This procedure describes enforcing content restriction for Google searches only. To enforce content restriction for other search engines, see [Using Access Control Rules to Enforce Content Restriction, on page 1299](#).

### Before you begin

This procedure applies to Firepower Threat Defense only, and requires the Threat license.

### Procedure

- 
- Step 1** Obtain a list of supported Google domains via the following URL: [https://www.google.com/supported\\_domains](https://www.google.com/supported_domains).
- Step 2** Create a custom DNS list on your local computer, and add the following entries:
- To enforce Google SafeSearch, add an entry for each supported Google domain.
  - To enforce YouTube Restricted Mode, add a "youtube.com" entry.
- The custom DNS list must be in text file (.txt) format. Each line of the text file must specify an individual domain name, stripped of any leading periods. For example, the supported domain ".google.com" must appear as "google.com".
- Step 3** Upload the custom DNS list to the Firepower Management Center; see [Uploading New Security Intelligence Lists to the Firepower Management Center, on page 436](#).
- Step 4** Determine the IPv4 address for the Google SafeSearch VIP. For example, run `nslookup` on `forcesafesearch.google.com`.
- Step 5** Create a sinkhole object for the SafeSearch VIP; see [Creating Sinkhole Objects, on page 438](#).
- Use the following values for this object:
- IPv4 Address—Enter the SafeSearch VIP address.
  - IPv6 Address—Enter the IPv6 loopback address (: : 1).

- Log Connections to Sinkhole—Click Log Connections.
- Type—Choose **None**.

**Step 6** Create a basic DNS policy; see [Creating Basic DNS Policies, on page 1264](#).

**Step 7** Add a DNS rule for the sinkhole; see [Creating and Editing DNS Rules, on page 1266](#).

For this rule:

- Check the **Enabled** check box.
- Choose `Sinkhole` from the **Action** drop-down list.
- Choose the sinkhole object you created from the **Sinkhole** drop-down list.
- Add the custom DNS list you created to the **Selected Items** list on **DNS**.
- (Optional) Choose a network in **Networks** to limit content restriction to specific users. For example, if you want to limit content restriction to student users, assign students to a different subnet than faculty, and specify that subnet in this rule.

**Step 8** Associate the DNS policy with an access control policy; see [Associating Other Policies with Access Control, on page 1213](#).

**Step 9** Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

---

## CHAPTER 67

# Understanding Traffic Decryption

The following topics provide an overview of Transport Layer Security/Secure Sockets Layer (TLS/SSL) inspection, discuss the prerequisites for TLS/SSL inspection configuration, and detail deployment scenarios.

**Note** Because TLS and SSL are often used interchangeably, we use the expression *TLS/SSL* to indicate that either protocol is being discussed. The SSL protocol has been deprecated by the IETF in favor of the more secure TLS protocol, so you can usually interpret *TLS/SSL* as referring to TLS only.

The exception is SSL policies. Because the FMC configuration option is **Policies > Access Control > SSL**, we use the term *SSL policies* although these policies are used to define rules for TLS and SSL traffic.

For more information about SSL and TLS protocols, see a resource such as [SSL vs. TLS - What's the Difference?](#).

- [Traffic Decryption Explained, on page 1305](#)
- [TLS/SSL Handshake Processing, on page 1307](#)
- [TLS/SSL Best Practices, on page 1310](#)
- [How to Configure TLS/SSL Policies and Rules, on page 1319](#)
- [TLS/SSL Inspection Appliance Deployment Scenarios, on page 1321](#)
- [History for TLS/SSL, on page 1334](#)

## Traffic Decryption Explained

By default, the Firepower System cannot inspect traffic encrypted with the Secure Socket Layer (SSL) protocol or its successor, the Transport Layer Security (TLS) protocol. *TLS/SSL inspection* enables you to either block encrypted traffic without inspecting it, or inspect encrypted or decrypted traffic with access control. As the system handles encrypted sessions, it logs details about the traffic. The combination of inspecting encrypted traffic and analyzing encrypted session data allows greater awareness and control of the encrypted applications and traffic in your network.

TLS/SSL inspection is a policy-based feature. In the Firepower System, an access control policy is a main configuration that invokes subpolicies and other configurations, including an SSL policy. If you associate an SSL policy with access control, the system uses that SSL policy to handle encrypted sessions before it evaluates them with access control rules. If you do not configure TLS/SSL inspection, or your devices do not support it, access control rules handle all encrypted traffic.

Access control rules also handle encrypted traffic when your TLS/SSL inspection configuration allows it to pass. However, some access control rule conditions require unencrypted traffic, so encrypted traffic might match fewer rules. Also, by default, the system disables intrusion and file inspection of encrypted payloads. This helps reduce false positives and improves performance when an encrypted connection matches an access control rule that has intrusion and file inspection configured.

If the system detects a TLS/SSL handshake over a TCP connection, it determines whether it can decrypt the detected traffic. If it cannot, it applies a configured action:

- Block the encrypted traffic
- Block the encrypted traffic and reset the TCP connection
- Not decrypt the encrypted traffic

If the system cannot decrypt the traffic, it blocks the traffic without further inspection, evaluates undecrypted traffic with access control; otherwise, the system decrypts it using one of the following methods:

- Decrypt with a known private key. When an external host initiates a TLS/SSL handshake with a server on your network, the system matches the exchanged server certificate with a server certificate previously uploaded to the system. It then uses the uploaded private key to decrypt the traffic.
- Decrypt by resigning the server certificate. When a host on your network initiates a TLS/SSL handshake with an external server, the system resigns the exchanged server certificate with a previously uploaded certificate authority (CA) certificate. It then uses the uploaded private key to decrypt the traffic.

---

**Note** The Firepower System does not support mutual authentication; that is, you cannot upload a [client certificate](#) to the FMC and use it for either **Decrypt - Resign** or **Decrypt - Known Key** TLS/SSL rule actions. For more information, see [Decrypt and Resign \(Outgoing Traffic\)](#), on page 1313. and [Known Key Decryption \(Incoming Traffic\)](#), on page 1313.

---

Decrypted traffic is subject to the same traffic handling and analysis as originally unencrypted traffic: network, reputation, and user-based access control; intrusion detection and prevention; Cisco Advanced Malware Protection (Cisco AMP); and discovery. If the system does not block the decrypted traffic post-analysis, it re-encrypts the traffic before passing it to the destination host.

---

**Note** Set up decrypt rules *only* if your managed device handles encrypted traffic. Decryption rules require processing overhead that can impact performance.

---

The Firepower System does not currently support TLS version 1.3 encryption or decryption. When users visit a web site that negotiates TLS 1.3 encryption, users might see errors similar to the following in their web browser:

- **ERR\_SSL\_PROTOCOL\_ERROR**
- **SEC\_ERROR\_BAD\_SIGNATURE**
- **ERR\_SSL\_VERSION\_INTERFERENCE**

For more information about how to control this behavior, contact Cisco TAC.

If you set the value of TCP maximum segment size (MSS) using FlexConfig, the observed MSS could be less than your setting. For more information, see [About the TCP MSS, on page 643](#).

## TLS/SSL Handshake Processing

In this documentation, the term *TLS/SSL handshake* represents the two-way handshake that initiates encrypted sessions in both the SSL protocol and its successor protocol, TLS.

In a passive deployment, the Firepower System observes a copy of the handshake, but does not process the actual handshake.

In an inline deployment, the Firepower System processes the TLS/SSL handshake, potentially modifying the ClientHello message and acting as a TCP proxy server for the session.

After the client establishes a TCP connection with the server (after it successfully completes the TCP three-way handshake), the managed device monitors the TCP session for any attempt to initiate an encrypted session. The TLS/SSL handshake establishes an encrypted session via the exchange of specialized packets between client and server. In the SSL and TLS protocols, these specialized packets are called *handshake messages*. The handshake messages communicate which encryption attributes both the client and server support:

- ClientHello—The client specifies multiple supported values for each encryption attribute.
- ServerHello—The server specifies a single supported value for each encryption attribute, which determines which encryption method the system uses during the secure session.

Although the data transmitted in the session is encrypted, the handshake messages are not.

After a TLS/SSL handshake completes, the managed device caches encrypted session data, which allows session resumption without requiring the full handshake. The managed device also caches server certificate data, which allows faster handshake processing in subsequent sessions.

## ClientHello Message Handling

The client sends the ClientHello message to the server that acts as the packet destination if a secure connection can be established. The client sends the message to initiate the TLS/SSL handshake or in response to a Hello Request message from the destination server.

If you configure TLS/SSL decryption, when a managed device receives a ClientHello message, the system attempts to match the message to TLS/SSL rules that have the **Decrypt - Resign** action. The match relies on data from the ClientHello message and from cached server certificate data. Possible data includes:

**Table 92: Data Availability for TLS/SSL Rule Conditions**

| TLS/SSL Rule Condition | Data Present In |
|------------------------|-----------------|
| Zones                  | ClientHello     |
| Networks               | ClientHello     |
| VLAN Tags              | ClientHello     |
| Ports                  | ClientHello     |
| Users                  | ClientHello     |

| TLS/SSL Rule Condition | Data Present In                               |
|------------------------|-----------------------------------------------|
| Applications           | ClientHello (Server Name Indicator extension) |
| Categories             | ClientHello (Server Name Indicator extension) |
| Certificate            | server Certificate (potentially cached)       |
| Distinguished Names    | server Certificate (potentially cached)       |
| Certificate Status     | server Certificate (potentially cached)       |
| Cipher Suites          | ServerHello                                   |
| Versions               | ServerHello                                   |

If the ClientHello message does not match a **Decrypt - Resign** rule, the system does not modify the message. It then determines whether the message passes access control evaluation (which can include deep inspection). If the message passes, the system transmits it to the destination server.

If the message matches a **Decrypt - Resign** rule, the system modifies the ClientHello message as follows:

- Compression methods—Strips the `compression_methods` element, which specifies the compression methods the client supports. The Firepower System cannot decrypt compressed sessions. This modification reduces the Compressed Session type of undecryptable traffic.
- Cipher suites—Strips cipher suites from the `cipher_suites` element if the Firepower System does not support them. If the Firepower System does not support any of the specified cipher suites, the system transmits the original, unmodified element. This modification reduces the Unknown Cipher Suite and Unsupported Cipher Suite types of undecryptable traffic.
- Session identifiers—Strips any value from the `Session Identifier` element and the SessionTicket extension that does not match cached session data. If a ClientHello value matches cached data, an interrupted session can resume without the client and server performing the full TLS/SSL handshake. This modification increases the chances of session resumption and reduces the Session Not Cached type of undecryptable traffic.
- Elliptic curves—Strips elliptic curves from the Supported Elliptic Curves extension if the Firepower System does not support them. If the Firepower System does not support any of the specified elliptic curves, the managed device removes the extension and strips any related cipher suites from the `cipher_suites` element.
- ALPN extensions—The Firepower System strips the Application-Layer Protocol Negotiation (ALPN) extension, which is used in protocols the system does not support (for example, the SPDY and HTTP/2 protocols) *only* if the message matches an SSL rule associated with content restriction features. For more information about content restriction, see [About Content Restriction, on page 1297](#).

If content restriction is not being enforced, you can use the **system support ssl-client-hello-enabled ALPN true** command to strip the ALPN extension. Stripping the ALPN extension increases the likelihood of traffic decryption and inspection.

- Other Extensions—Strips the Extended Master Secret, Next Protocol Negotiation (NPN), and TLS Channel IDs extensions.

SSL rules with a **Decrypt - Resign** or **Decrypt - Known Key** action now natively support the Extended Master Secret (EMS) extension during ClientHello negotiation, enabling more secure communications. The EMS extension is defined by [RFC 7627](#).

---

**Note** The system performs these ClientHello modifications by default. If your SSL policy is configured correctly, this default behavior results in more frequent decryption of traffic. To tune the default behavior for your individual network, contact Cisco TAC.

---

---

**Note** Use the **Cipher Suite** and **Version** rule conditions *only* in rules with either the **Block** or **Block with reset** rule actions. The use of these conditions in rules with other rule actions can interfere with the system's ClientHello processing, resulting in unpredictable performance.

---

After the system modifies the ClientHello message, it determines whether the message passes access control evaluation (which can include deep inspection). If the message passes, the system transmits it to the destination server.

Direct communication between the client and server is no longer possible during the TLS/SSL handshake, because after message modification the Message Authentication Codes (MACs) computed by the client and server no longer match. For all subsequent handshake messages (and for the encrypted session once established), the managed device acts as a man-in-the-middle (MITM). It creates two TLS/SSL sessions, one between client and managed device, one between managed device and server. As a result, each session contains different cryptographic session details.

---

**Note** The cipher suites that the Firepower System can decrypt are frequently updated and do not correspond directly to the cipher suites you can use in TLS/SSL rule conditions. For the current list of decryptable cipher suites, contact Cisco TAC.

---

## ServerHello and Server Certificate Message Handling

The ServerHello message is the response to a ClientHello message in a successful TLS/SSL handshake.

After a managed device processes a ClientHello message and transmits it to the destination server, the server determines whether it supports the decryption attributes the client specified in the message. If it does not support those attributes, the server sends a handshake failure alert to the client. If it supports those attributes, the server sends the ServerHello message. If the agreed-upon key exchange method uses certificates for authentication, the server Certificate message immediately follows the ServerHello message.

When the managed device receives these messages, it attempts to match them with TLS/SSL rules. These messages contain information that was absent from either the ClientHello message or the session data cache. Specifically, the system can potentially match these messages on Distinguished Names, Certificate Status, Cipher Suites, and Versions conditions.

If the messages do not match any TLS/SSL rules, the managed device performs the default action for the SSL policy. For more information, see [SSL Policy Default Actions, on page 1338](#).

If the messages match an SSL rule, the managed device continues as appropriate:

**Action: Monitor**

The TLS/SSL handshake continues to completion. The managed device tracks and logs but does not decrypt encrypted traffic.

**Action: Block or Block with Reset**

The managed device blocks the TLS/SSL session. If appropriate, it also resets the TCP connection.

**Action: Do Not Decrypt**

The TLS/SSL handshake continues to completion. The managed device does not decrypt the application data exchanged during the TLS/SSL session.

**Action: Decrypt - Known Key**

The managed device attempts to match the server certificate data to an Internal Certificate object previously imported into the Firepower Management Center. Because you cannot generate an Internal Certificate object, and you must possess its private key, we assume you own the server on which you're using known key decryption.

If the certificate matches a known certificate, the TLS/SSL handshake continues to completion. The managed device uses the uploaded private key to decrypt and reencrypt the application data exchanged during the TLS/SSL session.

If the server changes its certificate between the initial connection with the client and subsequent connections, you must import the new server certificate in the Firepower Management Center for future connections to be decrypted.

---

**Note** Because the Firepower System does not support the Extended Master Secret extension defined by [RFC 7627](#), you must disable this extension on the server for which you're decrypting with a known key; otherwise, the connection is reset during decryption, resulting in connection errors.

---

**Action: Decrypt - Resign**

The managed device processes the server certificate message and re-signs the server certificate with the previously imported or generated certificate authority (CA). The TLS/SSL handshake continues to completion. The managed device then uses the uploaded private key to decrypt and reencrypt the application data exchanged during the TLS/SSL session.

---

**Note** The Firepower System does not support mutual authentication; that is, you cannot upload a [client certificate](#) to the FMC and use it for either **Decrypt - Resign** or **Decrypt - Known Key** TLS/SSL rule actions. For more information, see [Decrypt and Resign \(Outgoing Traffic\), on page 1313](#). and [Known Key Decryption \(Incoming Traffic\), on page 1313](#).

---

## TLS/SSL Best Practices

This section discusses information you should keep in mind when creating your decryption policies and rules.

**Note** Because TLS and SSL are often used interchangeably, we use the expression *TLS/SSL* to indicate that either protocol is being discussed. The SSL protocol has been deprecated by the IETF in favor of the more secure TLS protocol, so you can usually interpret *TLS/SSL* as referring to TLS only.

The exception is SSL policies. Because the FMC configuration option is **Policies > Access Control > SSL**, we use the term *SSL policies* although these policies are used to define rules for TLS and SSL traffic.

For more information about SSL and TLS protocols, see a resource such as [SSL vs. TLS - What's the Difference?](#).

---

[The Case for Decryption](#), on page 1311

[When to Decrypt Traffic, When Not to Decrypt](#), on page 1312

[Other TLS/SSL Rule Actions](#), on page 1314

[TLS/SSL Rule Components](#), on page 1316

[TLS/SSL Rule Order Evaluation](#), on page 1317

## The Case for Decryption

Only decrypted traffic takes advantage of the Firepower System's threat defense and policy enforcement features. Traffic that is encrypted when it passes through the Firepower System can be allowed or blocked only but it *cannot* be subjected to deep inspection or the full range of policy enforcement (such as intrusion prevention).

All encrypted connections are:

- Sent through the TLS/SSL decryption policy to determine if they should be decrypted or blocked.

You can also configure TLS/SSL decryption rules to block encrypted traffic of types you know you do not want on your network, such as traffic that uses the nonsecure SSL protocol or traffic with an expired or invalid certificate.

- Any unblocked connections, whether or not decrypted, then go through the access control policy for a final allow or block decision.

Keep in mind that decrypting and then re-encrypting traffic adds a processing load on the device, which can reduce overall system performance.

In summary:

- Encrypted traffic can be allowed or blocked by policy; encrypted traffic *cannot* be inspected
- Decrypted traffic is subject to threat defense and policy enforcement; decrypted traffic can be allowed or blocked by policy

#### Related Topics

[Deep Inspection Using File and Intrusion Policies](#), on page 1187

## When to Decrypt Traffic, When Not to Decrypt

This section provides guidelines on when you should decrypt traffic and when you should allow it to pass through the firewall encrypted.

### When not to decrypt traffic

You should not decrypt traffic if doing so is forbidden by:

- Law; for example, some jurisdictions forbid decrypting financial information
- Company policy; for example, your company might forbid decrypting privileged communications
- Privacy regulations
- Traffic that uses certificate pinning (also referred to as *TLS/SSL pinning*) must remain encrypted to prevent breaking the connection

If you elect to bypass decryption for certain types of traffic, no processing is done on the traffic. The encrypted traffic is first evaluated by SSL policy and then proceeds to the access control policy, where a final allow or block decision is made. Encrypted traffic can be allowed or blocked on any TLS/SSL rule condition, including, but not limited to:

- Certificate status (for example, expired or invalid certificate)
- Protocol (for example, the nonsecure SSL protocol)
- Network (security zone, IP address, VLAN tag, and so on)
- Exact URL or URL category
- Port
- User group

SSL policies provide a **Do Not Decrypt** action for this traffic; for more information, see [TLS/SSL Rule Do Not Decrypt Action, on page 1360](#).

---

**Note** Neither TLS server identity discovery nor the decryption of TLS 1.3 traffic is supported on 8000 Series devices.

---

---

**Note** The related information links at the end of this topic explain how some aspects of rule evaluation work. Conditions such as URL and application filtering have limitations with respect to encrypted traffic. Make sure you understand those limitations.

---

### When to decrypt traffic

All encrypted traffic must be decrypted to take advantage of the Firepower System's threat protection and policy enforcement features. To the extent your managed device allows traffic to be decrypted (subject to its memory and processing power), you should decrypt traffic that is not protected by law or regulation. If you must decide what traffic to decrypt, base your decision on the risk of allowing the traffic on your network.

The Firepower System provides a flexible framework for classifying traffic using rule conditions, which include URL reputation, cipher suite, protocol, and many other factors.

The Firepower System provides two methods of decryption, which are discussed in the following sections.

## Decrypt and Resign (Outgoing Traffic)

The **Decrypt - Resign** TLS/SSL rule action enables the Firepower System to act as a man in the middle, intercepting, decrypting, and (if the traffic is allowed) inspecting, and re-encrypting it. The **Decrypt - Resign** rule action is used with outgoing traffic; that is, the destination server is outside your protected network.

The FTD device negotiates with the client using an internal Certificate Authority (CA) object specified in the rule and builds an SSL tunnel between the client and the FTD device. At the same time, the device connects to the destination web site and creates an SSL tunnel between the server and the FTD device.

Thus, the client sees the CA certificate configured for the SSL decryption rule instead of the certificate from the destination server. The client must trust the certificate to complete the connection. The FTD device then performs decryption/re-encryption in both directions for traffic between the client and the destination server.

#### Prerequisite

To use the **Decrypt - Resign** rule action, you must create an internal CA object using a CA file and paired private key file. You can generate a CA and private key in the Firepower System if you don't already have them.

---

**Note** The Firepower System does not support mutual authentication; that is, you cannot upload a [client certificate](#) to the FMC and use it for either **Decrypt - Resign** or **Decrypt - Known Key** TLS/SSL rule actions. For more information, see [Decrypt and Resign \(Outgoing Traffic\)](#), on page 1313. and [Known Key Decryption \(Incoming Traffic\)](#), on page 1313.

---

#### Related Topics

## Known Key Decryption (Incoming Traffic)

The **Decrypt - Known Key** TLS/SSL rule action uses a server's private key to decrypt traffic. The **Decrypt - Known Key** rule action is used with incoming traffic; that is, the destination server is inside your protected network.

The main purpose of decrypting with a known key is to protect your servers from external attacks.

#### Prerequisite

To use the **Decrypt - Known Key** rule action, you must create an internal certificate object using the server's certificate file and paired private key file.

**Note** The Firepower System does not support mutual authentication; that is, you cannot upload a [client certificate](#) to the FMC and use it for either **Decrypt - Resign** or **Decrypt - Known Key** TLS/SSL rule actions. For more information, see [Decrypt and Resign \(Outgoing Traffic\)](#), on page 1313. and [Known Key Decryption \(Incoming Traffic\)](#), on page 1313.

## TLS/SSL Rule Examples

The following sections provide examples of setting up recommended TLS/SSL rules.

#### Related Topics

[Block Nonsecure Protocols](#), on page 1314

## Block Nonsecure Protocols

This example shows how to block TLS and SSL protocols on your network that are no longer considered secure, such as TLS 1.0, TLS 1.1, and SSLv3.

You should exclude nonsecure protocols from your network because they are all exploitable. In this example:

- You can block some protocols using **Version** page on the SSL rule.
- Because the Firepower System considers SSLv2 as undecryptable, you can block it using the **Undecryptable Actions** on the SSL policy.

#### Procedure

- 
- Step 1** Log in to the Firepower Management System if you have not already done so.
  - Step 2** Click **Policies > Access Control > SSL**.
  - Step 3** Add or edit an SSL policy.
  - Step 4** Click **Add Rule**.
  - Step 5** In the **Name** field, enter a name for the rule.
  - Step 6** From the **Action** list, click **Block** or **Block with reset**.

**Step 7** Click **Version** page.

**Step 8** Check the check boxes for protocols that are no longer secure, such as **SSL v3.0**, **TLS 1.0**, and **TLS 1.1**. Clear the check boxes for any protocols that are still considered secure.

The following figure shows an example.

The screenshot shows the 'Add Rule' configuration window. The rule name is 'Block old protocols', it is enabled, and the action is 'Block'. The 'Version' tab is selected, showing a list of protocols with checkboxes: SSL v3.0 (checked), TLS v1.0 (checked), TLS v1.1 (unchecked), and TLS v1.2 (unchecked). The 'Add' and 'Cancel' buttons are at the bottom right.

**Step 9** Choose other rule conditions as needed.

**Step 10** Save the rule.

**Step 11** On the SSL policy page, click **Undecryptable Actions**.

**Step 12** From the **SSLv2 Session** list, click **Block** or **Block with reset**. The following figure shows an example.

The screenshot shows the 'SSL Policy' configuration page. The 'Undecryptable Actions' tab is selected, showing a list of actions with dropdown menus: Compressed Session (Inherit Default Action), SSLv2 Session (Block), Unknown Cipher Suite (Inherit Default Action), Unsupported Cipher Suite (Inherit Default Action), Session not cached (Inherit Default Action), Handshake Errors (Inherit Default Action), and Decryption Errors (Block). The 'SSLv2 Session' dropdown is highlighted with a red box.

**Step 13** Click **Save**.

**Step 14** Because this is a specific rule, order it earlier in your policy than more general rules such as application-matching rules.

### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## TLS/SSL Rule Components

Each TLS/SSL rule has the following components.

### State

By default, rules are enabled. If you disable a rule, the system does not use it to evaluate network traffic, and stops generating warnings and errors for that rule.

### Position

Rules in an SSL policy are numbered, starting at 1. The system matches traffic to rules in top-down order by ascending rule number. With the exception of Monitor rules, the first rule that traffic matches is the rule that handles that traffic.

### Conditions

Conditions specify the specific traffic the rule handles. Conditions can match traffic by security zone, network or geographical location, VLAN, port, application, requested URL, user, certificate, certificate subject or issuer, certificate status, cipher suite, or encryption protocol version. The use of conditions can depend on target device licenses.

### Action

A rule's action determines how the system handles matching traffic. You can monitor, allow, block, or decrypt encrypted matching traffic. Decrypted and allowed encrypted traffic is subject to further inspection. Note that the system does **not** perform inspection on blocked encrypted traffic.

### Logging

A rule's logging settings govern the records the system keeps of the traffic it handles. You can keep a record of traffic that matches a rule. You can log a connection when the system blocks an encrypted session or allows it to pass without decryption, according to the settings in an SSL policy. You can also force the system to log connections that it decrypts for further evaluation by access control rules, regardless of how the system later handles or inspects the traffic. You can log connections to the Firepower Management Center database, as well as to the system log (syslog) or to an SNMP trap server.

For more information about logging, see [Best Practices for Connection Logging](#), on page 2216.

---

**Tip** Properly creating and ordering TLS/SSL rules is a complex task. If you do not plan your policy carefully, rules can preempt other rules, require additional licenses, or contain invalid configurations. To help ensure that the system handles traffic as you expect, the SSL policy interface has a robust warning and error feedback system for rules.

## TLS/SSL Rule Order Evaluation

When you create the TLS/SSL rule in an SSL policy, you specify its position using the **Insert** list in the rule editor. TLS/SSL rules in an SSL policy are numbered, starting at 1. The system matches traffic to TLS/SSL rules in top-down order by ascending rule number.

In most cases, the system handles network traffic according to the *first* TLS/SSL rule where *all* the rule's conditions match the traffic. Except in the case of Monitor rules (which log traffic but do not affect traffic flow), the system does *not* continue to evaluate traffic against additional, lower-priority rules after that traffic matches a rule. Conditions can be simple or complex; you can control traffic by security zone, network or geographical location, VLAN, port, application, requested URL, user, certificate, certificate distinguished name, certificate status, cipher suite, or encryption protocol version.

Each rule also has an *action*, which determines whether you monitor, block, or inspect matching encrypted or decrypted traffic with access control. Note that the system does *not* further inspect encrypted traffic it blocks. It does subject encrypted and undecryptable traffic to access control. However, access control rule conditions require unencrypted traffic, so encrypted traffic matches fewer rules.

Rules that use *specific* conditions (such as network and IP addresses) should be ordered *before* rules that use general conditions (such as applications). If you're familiar with the Open Systems Interconnect (OSI) model, use similar numbering in concept. Rules with conditions for layers 1, 2, and 3 (physical, data link, and network) should be ordered first in your rules. Conditions for layers 5, 6, and 7 (session, presentation, and application) should be ordered later in your rules. For more information about the OSI model, see this [Wikipedia article](#).

---

**Tip** Proper TLS/SSL rule order reduces the resources required to process network traffic, and prevents rule preemption. Although the rules you create are unique to every organization and deployment, there are a few general guidelines to follow when ordering rules that can optimize performance while still addressing your needs.

---

In addition to ordering rules by number, you can group rules by category. By default the system provides three categories: Administrator, Standard, and Root. You can add custom categories, but you cannot delete the system-provided categories or change their order.

[Default Handling Options for Undecryptable Traffic](#), on page 1339

[SSL Rule Order](#), on page 1197

## Multi-Rule Example

The following scenario summarizes the ways that SSL rules handle traffic in an inline deployment.

In this scenario, traffic is evaluated as follows:

- **Undecryptable Traffic Action** evaluates encrypted traffic first. For traffic the system cannot decrypt, the system either blocks it without further inspection or passes it for access control inspection. Encrypted traffic that does not match continues to the next rule.
- **TLS/SSL Rule 1: Monitor** evaluates encrypted traffic next. Monitor rules track and log encrypted traffic but do not affect traffic flow. The system continues to match traffic against additional rules to determine whether to permit or deny it.
- **TLS/SSL Rule 2: Do Not Decrypt** evaluates encrypted traffic third. Matching traffic is not decrypted; the system inspects this traffic with access control, but not file or intrusion inspection. Traffic that does not match continues to the next rule.
- **TLS/SSL Rule 3: Block** evaluates encrypted traffic fourth. Matching traffic is blocked without further inspection. Traffic that does not match continues to the next rule.
- **TLS/SSL Rule 4: Decrypt - Known Key** evaluates encrypted traffic fifth. Matching traffic incoming to your network is decrypted using a private key you upload. The decrypted traffic is then evaluated against access control rules. Access control rules handle decrypted and unencrypted traffic identically. The system can block traffic as a result of this additional inspection. All remaining traffic is reencrypted before being allowed to the destination. Traffic that does not match the SSL rule continues to the next rule.
- **TLS/SSL Rule 5: Decrypt - Resign** is the final rule. If traffic matches this rule, the system re-signs the server certificate with an uploaded CA certificate, then acts as a man-in-the-middle to decrypt traffic. The decrypted traffic is then evaluated against access control rules. Access control rules treat decrypted and unencrypted traffic identically. The system can block traffic as a result of this additional inspection. All remaining traffic is reencrypted before being allowed to the destination. Traffic that does not match the SSL rule continues to the next rule.
- **SSL Policy Default Action** handles all traffic that does not match any of the TLS/SSL rules. The default action either blocks encrypted traffic without further inspection or does not decrypt it, passing it for access control inspection.

## How to Configure TLS/SSL Policies and Rules

This topic provides a high-level overview of tasks you must complete to configure SSL policies and TLS/SSL rules in those policies to block, monitor, or allow TLS/SSL traffic on your network.

You must be an Admin, Access Admin, or Network Admin to perform this task. You can configure SSL policies on any device type except NGIPSv.

### Procedure

|               | Command or Action     | Purpose                                                                                                                                                                                                                                                               |
|---------------|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | Create an SSL policy. | An SSL policy is a container for one or more rules. To use an SSL policy and its rules for access control, you must later associate the SSL policy with an access control policy. For more information, see <a href="#">Create Basic SSL Policies, on page 1341</a> . |

|               | Command or Action                                                                                                                                                  | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 2</b> | Set a default action for your SSL policy.                                                                                                                          | The default action is taken when traffic matches no rules defined by the SSL policy. See <a href="#">SSL Policy Default Actions</a> , on page 1338.                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Step 3</b> | Specify how undecryptable traffic should be handled.                                                                                                               | Traffic can be undecryptable for a number of reasons, including unsecure protocols, uses and unknown cipher suite, or in the event of errors with the handshake or decryption. See <a href="#">Default Handling Options for Undecryptable Traffic</a> , on page 1339.                                                                                                                                                                                                                                                                                                                                       |
| <b>Step 4</b> | For <b>Decrypt - Known Key</b> (to decrypt inbound traffic to a server in your network) TLS/SSL rules, create an internal certificate object.                      | The internal certificate object uses your server's certificate and private key. See <a href="#">Internal Certificate Objects</a> , on page 455.                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Step 5</b> | For <b>Decrypt - Resign</b> (to decrypt outbound traffic to a server outside of your network) TLS/SSL rules, create an internal certificate authority (CA) object. | The internal CA object uses a CA and private key. See <a href="#">Internal Certificate Authority Objects</a> , on page 448.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Step 6</b> | Create your TLS/SSL rules:                                                                                                                                         | <ul style="list-style-type: none"> <li>• <b>Block, Block with reset, Interactive block:</b> <a href="#">Configuring TLS/SSL Rule Actions</a>, on page 1361.</li> <li>• <b>Do Not Decrypt</b>, see <a href="#">Configuring TLS/SSL Rule Actions</a>, on page 1361.</li> <li>• <b>Decrypt - Resign</b>, see <a href="#">Configuring a Decrypt - Resign Action</a>, on page 1362.</li> <li>• <b>Decrypt - Known Key</b>, see <a href="#">Configuring a Decrypt - Known Key Action</a>, on page 1362.</li> <li>• <b>Monitor</b>, see <a href="#">Configuring TLS/SSL Rule Actions</a>, on page 1361.</li> </ul> |
| <b>Step 7</b> | Associate the SSL policy with an access control policy.                                                                                                            | Unless you associate your SSL policy with an access control policy, it has no effect. After you do this, you can choose to allow or block traffic that matches the access control rule and take other actions. See <a href="#">Associating Other Policies with Access Control</a> , on page 1213.                                                                                                                                                                                                                                                                                                           |
| <b>Step 8</b> | Configure your access control rules to allow or block decrypted traffic.                                                                                           | See <a href="#">Access Control Policy Components</a> , on page 1201.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Step 9</b> | Deploy the access control policy to managed devices.                                                                                                               | Before your policy can take effect, it must be deployed to managed devices. See <a href="#">Deploy Configuration Changes</a> , on page 346.                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

# TLS/SSL Inspection Appliance Deployment Scenarios

This section presents several scenarios in which the Life Insurance Example, Inc. life insurance company (LifeIns) uses SSL inspection on encrypted traffic to help audit their processes. Based on their business processes, LifeIns plans to deploy:

- one FTD device in a passive deployment for the Customer Service department
- one FTD device in an inline deployment for the Underwriting Department
- one Firepower Management Center to manage both devices

## Customer Service Business Processes

LifeIns created a customer-facing website for their customers. LifeIns receives encrypted questions and requests regarding policies from prospective customers through their website and through e-mail. LifeIns's Customer Service department processes them and returns the requested information within 24 hours. Customer Service wants to expand its incoming contact metrics collection. LifeIns has an established internal audit review for Customer Service.

LifeIns also receives encrypted applications online. The Customer Service department processes the applications within 24 hours before sending the case file to the Underwriting department. Customer Service filters out any obvious false applications sent through the online form, which consumes a fair portion of their time.

## Underwriting Business Processes

LifeIns's underwriters submit encrypted medical information requests online to the Medical Repository Example, LLC medical data repository (MedRepo). MedRepo reviews the requests and transmits the encrypted records to LifeIns within 72 hours. The underwriters subsequently underwrite an application and submit policy and rate decisions. Underwriting wants to expand its metrics collection.

Lately, an unknown source has been sending spoofed responses to LifeIns. Though LifeIns's underwriters receive training on proper Internet use, LifeIns's IT department first wants to analyze all encrypted traffic that takes the form of medical responses, then wants to block all spoof attempts.

LifeIns places junior underwriters on six-month training periods. Lately, these underwriters have been incorrectly submitting encrypted medical regulation requests to MedRepo's customer service department. MedRepo has submitted multiple complaints to LifeIns in response. LifeIns plans on extending their new underwriter training period to also audit underwriter requests to MedRepo.

## Traffic Decryption in a Passive Deployment

LifeIns's business requirements state that Customer Service must:

- process all requests and applications within 24 hours
- improve its incoming contact metrics collection process
- identify and discard incoming false applications

Customer Service does not require additional audit review.

LifeIns plans to passively deploy a Customer Service managed device.

Traffic from an external network goes to LifeIns's router. The router routes traffic to the Customer Service department, and mirrors a copy of the traffic to the managed device for inspection.

On the managing Firepower Management Center, a user in the access control configures TLS/SSL inspection to:

- log all encrypted traffic sent to the Customer Service department
- decrypt encrypted traffic sent using the online application form to Customer Service
- not decrypt all other encrypted traffic sent to Customer service, including traffic sent using the online request form

The user also configures access control to inspect the decrypted application form traffic for fake application data and log when fake data is detected.

In the following scenarios, the user submits an online form to Customer Service. The user's browser establishes a TCP connection with the server, then initiates a TLS/SSL handshake. The managed device receives a copy of this traffic. The client and server complete the TLS/SSL handshake, establishing the encrypted session. Based on handshake and connection details, the system logs the connection and acts upon the copy of the encrypted traffic.

## Encrypted Traffic Monitoring in a Passive Deployment

For all TLS/SSL-encrypted traffic sent to Customer Service, the managed device logs the connection.

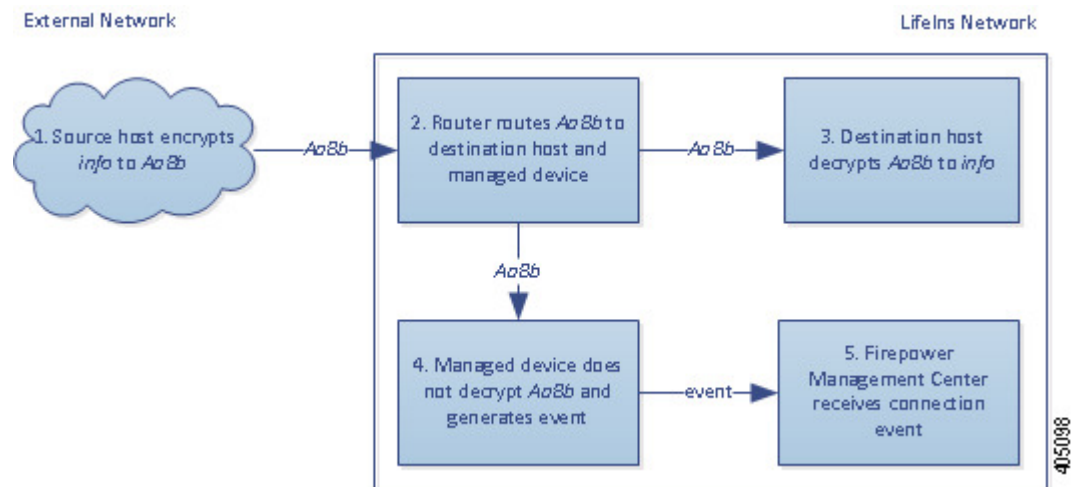

#### The following steps occur:

1. The user submits the plain text request (*info*). The client encrypts this (*AaBb*) and sends the encrypted traffic to Customer Service.
2. LifeIns's router receives the encrypted traffic and routes it to the Customer Service department server. It also mirrors a copy to the managed device.
3. The Customer Service department server receives the encrypted information request (*AaBb*) and decrypts it to plain text (*info*).
4. The managed device does not decrypt the traffic.  
The access control policy continues to process the encrypted traffic and allows it. The device generates a connection event after the session ends.
5. The Firepower Management Center receives the connection event.

## Undecrypted Encrypted Traffic in a Passive Deployment

For all TLS/SSL-encrypted traffic that contains requests about policies, the managed device allows the traffic without decrypting it and logs the connection.

### The following steps occur:

1. The user submits the plain text request (*info*). The client encrypts this (*AaBb*) and sends the encrypted traffic to Customer Service.
2. LifeIns's router receives the encrypted traffic and routes it to the Customer Service department server. It also mirrors a copy to the managed device.
3. The Customer Service department server receives the encrypted information request (*AaBb*) and decrypts it to plain text (*info*).
4. The managed device does not decrypt the traffic.  
The access control policy continues to process the encrypted traffic and allows it. The device generates a connection event after the session ends.
5. The Firepower Management Center receives the connection event.

## Encrypted Traffic Inspection with a Private Key in a Passive Deployment

For all TLS/SSL-encrypted traffic that contains application form data, the system decrypts the traffic and logs the connection.

**Note** In a passive deployment, if traffic is encrypted with either the DHE or ECDHE cipher suite, you cannot decrypt it with a known private key.

For traffic with legitimate application form information, the system logs the connection.

**The following steps occur:**

1. The user submits the plain text request (*form*). The client encrypts this (*AaBb*) and sends the encrypted traffic to Customer Service.
2. LifeIns's router receives the encrypted traffic and routes it to the Customer Service department server. It also mirrors a copy to the managed device.
3. The Customer Service department server receives the encrypted information request (*AaBb*) and decrypts it to plain text (*form*).
4. The managed device uses the session key obtained with the uploaded known private key to decrypt the encrypted traffic to plain text (*form*).  
The access control policy continues to process the decrypted traffic and does not find fake application information. The device generates a connection event after the session ends.
5. The Firepower Management Center receives a connection event with information about the encrypted and decrypted traffic.

In contrast, if the decrypted traffic contains fake application data, the system logs the connection and the fake data.

### The following steps occur:

1. The user submits the plain text request (*fake*). The client encrypts this (*CcDd*) and sends the encrypted traffic to Customer Service.
2. LifeIns's router receives the encrypted traffic and routes it to the Customer Service department server. It also mirrors a copy to the managed device.
3. The Customer Service department server receives the encrypted information request (*CcDd*) and decrypts it to plain text (*fake*).
4. The managed device uses the session key obtained with the uploaded known private key to decrypt the encrypted traffic to plain text (*fake*).  
The access control policy continues to process the decrypted traffic and finds fake application information. The device generates an intrusion event. After the session ends, it generates a connection event.
5. The Firepower Management Center receives a connection event with information about the encrypted and decrypted traffic, and an intrusion event for the fake application data.

## Traffic Decryption in an Inline Deployment

LifeIns's business requirements state that Underwriting must:

- audit new and junior underwriters, verifying that their information requests to MedRepo comply with all applicable regulations
- improve its underwriting metrics collection process
- examine all requests that appear to come from MedRepo, then drop any spoofing attempts
- drop all improper regulatory requests to MedRepo's Customer Service department from the Underwriting department
- not audit senior underwriters

LifeIns plans to deploy a device in an inline deployment for the Underwriting department.

Traffic from MedRepo's network goes to MedRepo's router. It routes traffic to LifeIns's network. The managed device receives the traffic, passes allowed traffic to LifeIns's router, and sends events to the managing Firepower Management Center. LifeIns's router routes traffic to the destination host.

On the managing Firepower Management Center, a user in the Access Control and SSL Editor custom role configures an SSL access control rule to:

- log all encrypted traffic sent to the Underwriting department
- block all encrypted traffic incorrectly sent from LifeIns's underwriting department to MedRepo's customer service department
- decrypt all encrypted traffic sent from MedRepo to LifeIns's underwriting department, and from LifeIns's junior underwriters to MedRepo's requests department
- not decrypt encrypted traffic sent from the senior underwriters

The user also configures access control to inspect decrypted traffic with a custom intrusion policy and:

- block decrypted traffic if it contains a spoof attempt, and log the spoof attempt
- block decrypted traffic that contains information not compliant with regulations, and log the improper information
- allow all other encrypted and decrypted traffic

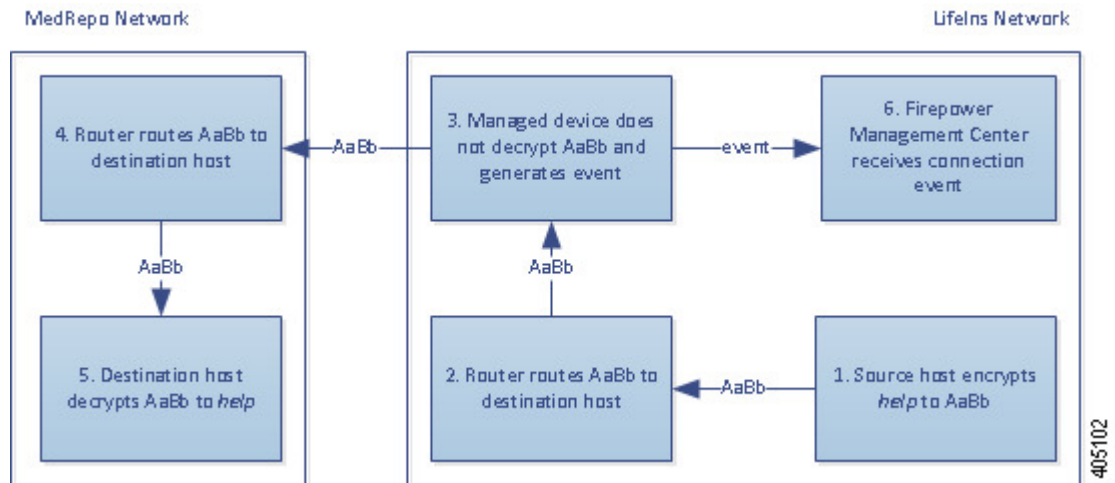

The system reencrypts allowed decrypted traffic before sending it to the destination host.

You can also cause the system to decrypt and resign the traffic using a TLS/SSL control rule with the action **Decrypt - Resign**. If traffic matches the TLS/SSL rule, after the system modifies the ClientHello message, it determines whether the message passes access control evaluation (which can include deep inspection). If the message passes, the system transmits it to the destination server. For more information, see [ClientHello Message Handling, on page 1307](#)

In the following scenarios, the user submits information online to a remote server. The user's browser establishes a TCP connection with the server, then initiates an SSL handshake. The managed device receives this traffic; based on handshake and connection details, the system logs the connection and acts on the traffic. If the system blocks the traffic, it also closes the TCP connection. Otherwise, the client and server complete the SSL handshake, establishing the encrypted session.

## Encrypted Traffic Monitoring in an Inline Deployment

For all SSL-encrypted traffic sent to and from the Underwriting department, the system logs the connection.

### The following steps occur:

1. The user submits the plain text request (`help`). The client encrypts this (`AaBb`) and sends the encrypted traffic to MedRepo's Requests department server.
2. LifeIns's router receives the encrypted traffic and routes it to the Requests department server.
3. The managed device does not decrypt the traffic.  
The access control policy continues to process the encrypted traffic and allows it, then generates a connection event after the session ends.
4. The external router receives the traffic and routes it to the Requests department server.
5. The Underwriting department server receives the encrypted information request (`AaBb`) and decrypts it to plain text (`help`).
6. The Firepower Management Center receives the connection event.

## Undecrypted Encrypted Traffic in an Inline Deployment

For all TLS/SSL-encrypted traffic originating from the senior underwriters, the managed device allows the traffic without decrypting it and logs the connection.

#### The following steps occur:

1. The user submits the plain text request (`help`). The client encrypts this (`AaBb`) and sends the encrypted traffic to MedRepo's Requests department server.
2. LifeIns's router receives the encrypted traffic and routes it to the Requests department server.
3. The managed device does not decrypt this traffic.  
The access control policy continues to process the encrypted traffic and allows it, then generates a connection event after the session ends.
4. The external router receives the traffic and routes it to the Requests department server.
5. The Requests department server receives the encrypted information request (`AaBb`) and decrypts it to plain text (`help`).
6. The Firepower Management Center receives the connection event.

## Encrypted Traffic Blocking in an Inline Deployment

For all SMTPS email traffic improperly sent from LifeIns's underwriting department to MedRepo's Customer Service department, the system blocks the traffic during the SSL handshake without further inspection and logs the connection.

**The following steps occur:**

1. Having received the request to establish a TLS/SSL handshake from a client's browser, the Customer Service department server sends the server certificate (*cert*) as the next step in the TLS/SSL handshake to the LifeIns underwriter.
2. MedRepo's router receives the certificate and routes it to the LifeIns underwriter.
3. The managed device blocks the traffic without further inspection and ends the TCP connection. It generates a connection event.
4. The internal router does not receive the blocked traffic.
5. The underwriter does not receive the blocked traffic.
6. The Firepower Management Center receives the connection event.

## Encrypted Traffic Inspection with a Private Key in an Inline Deployment

For all TLS/SSL-encrypted traffic sent from MedRepo to LifeIns's underwriting department, the system uses an uploaded server private key to obtain session keys, then decrypts the traffic and logs the connection. Legitimate traffic is allowed and reencrypted before being sent to the Underwriting department.

**The following steps occur:**

1. The user submits the plain text request (*stats*). The client encrypts this (*AaBbC*) and sends the encrypted traffic to the Underwriting department server.
2. The external router receives the traffic and routes it to the Underwriting department server.
3. The managed device uses the session key obtained with the uploaded known private key to decrypt this traffic to plain text (*stats*).  
The access control policy continues to process the decrypted traffic with the custom intrusion policy and does not find a spoof attempt. The device passes the encrypted traffic (*AaBbC*), then generates a connection event after the session ends.
4. The internal router receives the traffic and routes it to the Underwriting department server.
5. The Underwriting department server receives the encrypted information (*AaBbC*) and decrypts it to plain text (*stats*).
6. The Firepower Management Center receives the connection event with information about the encrypted and decrypted traffic.

In contrast, any decrypted traffic that is a spoof attempt is dropped. The system logs the connection and the spoof attempt.

### The following steps occur:

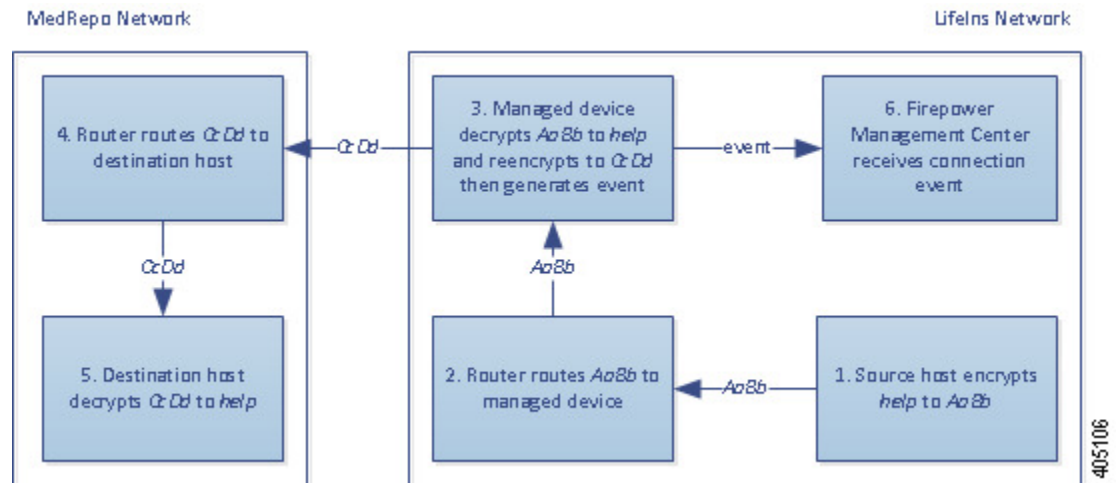

1. The user submits the plain text request (*spoof*), altering the traffic to appear to originate from MedRepo, LLC. The client encrypts this (*FfGgH*) and sends the encrypted traffic to the Underwriting department server.
2. The managed device uses the session key obtained with the uploaded known private key to decrypt this traffic to plain text (*spoof*).  
The access control policy continues to process the decrypted traffic with the custom intrusion policy and finds a spoof attempt. The device blocks the traffic, then generates an intrusion event. It generates a connection event after the session ends.
3. The internal router does not receive the blocked traffic.
4. The Underwriting department server does not receive the blocked traffic.
5. The Firepower Management Center receives a connection event with information about the encrypted and decrypted traffic, and an intrusion event for the spoofing attempt.

## Encrypted Traffic Inspection with a Re-signed Certificate in an Inline Deployment

For all TLS/SSL-encrypted traffic sent from the new and junior underwriters to MedRepo's requests department, the system uses a re-signed server certificate to obtain session keys, then decrypts the traffic and logs the connection. Legitimate traffic is allowed and reencrypted before being sent to MedRepo.

**Note** When decrypting traffic in an inline deployment by re-signing the server certificate, the device acts as a man-in-the-middle. It creates two TLS/SSL sessions, one between client and managed device, one between managed device and server. As a result, each session contains different cryptographic session details.

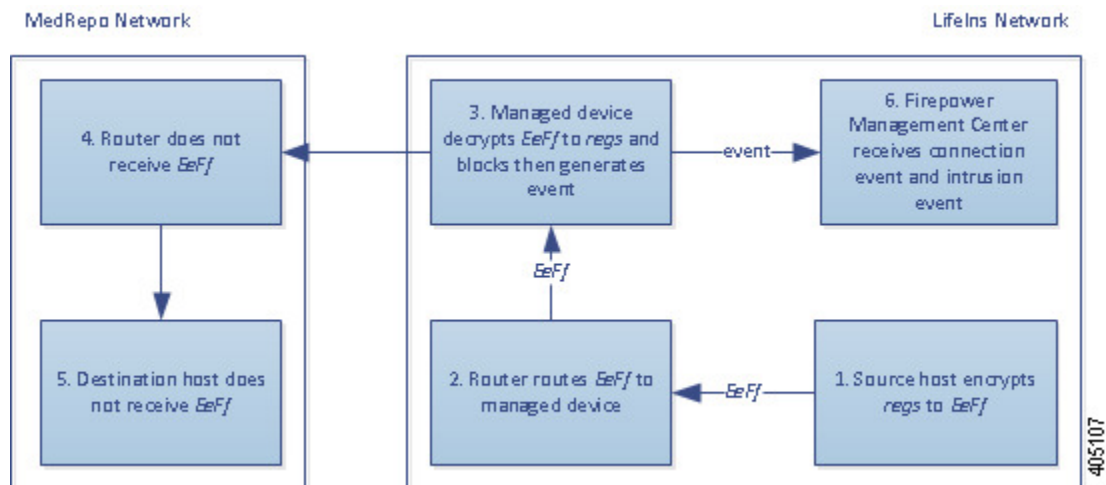

#### The following steps occur:

1. The user submits the plain text request (*help*). The client encrypts this ( $AaBb$ ) and sends the encrypted traffic to the Requests department server.
2. The internal router receives the traffic and routes it to the Requests department server.
3. The managed device uses the session key obtained with a re-signed server certificate and private key to decrypt this traffic to plain text (*help*).  
The access control policy continues to process the decrypted traffic with the custom intrusion policy and does not find an improper request. The device reencrypts the traffic ( $CcDd$ ), allowing it to pass. It generates a connection event after the session ends.
4. The external router receives the traffic and routes it to the Requests department server.
5. The Requests department server receives the encrypted information ( $CcDd$ ) and decrypts it to plain text (*help*).
6. The Firepower Management Center receives the connection event with information about the encrypted and decrypted traffic.

**Note** Traffic encrypted with a re-signed server certificate causes client browsers to warn that the certificate is not trusted. To avoid this, add the CA certificate to the organization's domain root trusted certificates store or the client trusted certificates store.

In contrast, any decrypted traffic that contains information that does not meet regulatory requirements is dropped. The system logs the connection and the non-conforming information.

### The following steps occur:

1. The user submits the plain text request (*regs*), which does not comply with regulatory requirements. The client encrypts this (*EeFf*) and sends the encrypted traffic to the Requests department server.
2. The internal router receives the traffic and routes it to the Requests department server.
3. The managed device uses the session key obtained with a re-signed server certificate and private key to decrypt this traffic to plain text (*regs*).  
The access control policy continues to process the decrypted traffic with the custom intrusion policy and finds an improper request. The device blocks the traffic, then generates an intrusion event. It generates a connection event after the session ends.
4. The external router does not receive the blocked traffic.
5. The Requests department server does not receive the blocked traffic.
6. The Firepower Management Center receives a connection event with information about the encrypted and decrypted traffic, and an intrusion event for the improper request.

## History for TLS/SSL

| Feature                                                                    | Version | Details                                                                                                                                                                      |

## CHAPTER 68

# Start Creating SSL Policies

The following topics provide an overview of SSL policy creation, configuration, management, and logging.

- [SSL Policies Overview, on page 1337](#)
- [SSL Policy Default Actions, on page 1338](#)
- [Default Handling Options for Undecryptable Traffic, on page 1339](#)
- [Requirements and Prerequisites for SSL Policies, on page 1340](#)
- [Manage SSL Policies, on page 1340](#)
- [Create Basic SSL Policies, on page 1341](#)
- [Set Default Handling for Undecryptable Traffic, on page 1342](#)
- [Editing an SSL Policy, on page 1343](#)

## SSL Policies Overview

An *SSL policy* determines how the system handles encrypted traffic on your network. You can configure one or more SSL policies, associate an SSL policy with an access control policy, then deploy the access control policy to a managed device. When the device detects a TCP handshake, the access control policy first handles and inspects the traffic. If it subsequently identifies a TLS/SSL-encrypted session over the TCP connection, the SSL policy takes over, handling and decrypting the encrypted traffic.

**Caution** Adding or removing an SSL policy restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See [Snort® Restart Traffic Behavior, on page 350](#) for more information.

The simplest SSL policy, as shown in the following diagram, directs the device where it is deployed to handle encrypted traffic with a single default action. You can set the default action to block decryptable traffic without further inspection, or to inspect undecrypted decryptable traffic with access control. The system can then either allow or block the encrypted traffic. If the device detects undecryptable traffic, it either blocks the traffic without further inspection or does not decrypt it, inspecting it with access control.

A more complex SSL policy can handle different types of undecryptable traffic with different actions, control traffic based on whether a certificate authority (CA) issued or trusts the encryption certificate, and use SSL rules to exert granular control over encrypted traffic logging and handling. These rules can be simple or complex, matching and inspecting encrypted traffic using multiple criteria.

**Note** Because TLS and SSL are often used interchangeably, we use the expression *TLS/SSL* to indicate that either protocol is being discussed. The SSL protocol has been deprecated by the IETF in favor of the more secure TLS protocol, so you can usually interpret *TLS/SSL* as referring to TLS only.

The exception is SSL policies. Because the FMC configuration option is **Policies > Access Control > SSL**, we use the term *SSL policies* although these policies are used to define rules for TLS and SSL traffic.

For more information about SSL and TLS protocols, see a resource such as [SSL vs. TLS - What's the Difference?](#).

### Related Topics

[TLS/SSL Rule Conditions](#), on page 1357

## SSL Policy Default Actions

The default action for an SSL policy determines how the system handles decryptable encrypted traffic that does not match any non-monitor rule in the policy. When you deploy an SSL policy that does not contain any TLS/SSL rules, the default action determines how all decryptable traffic on your network is handled. Note that the system does not perform any kind of inspection on encrypted traffic blocked by the default action.

**Table 93: SSL Policy Default Actions**

| Default Action   | Effect on Encrypted Traffic                                                                                                                                                                                                                                                                                                                                                                 |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Block            | Block the TLS/SSL session without further inspection.                                                                                                                                                                                                                                                                                                                                       |
| Block with reset | Block the TLS/SSL session without further inspection and reset the TCP connection. Choose this option if traffic uses a connectionless protocol like UDP. In that case, the connectionless protocol tries to reestablish the connection until it is reset.<br><br>This action also displays a connection reset error in the browser so the user is informed that the connection is blocked. |
| Do not decrypt   | Inspect the encrypted traffic with access control.                                                                                                                                                                                                                                                                                                                                          |

## Default Handling Options for Undecryptable Traffic

Table 94: Undecryptable Traffic Types

| Type                     | Description                                                                                                                                                                          | Default Action         | Available Action                                                      |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------|-----------------------------------------------------------------------|
| Compressed Session       | The TLS/SSL session applies a data compression method.                                                                                                                               | Inherit default action | Do not decrypt<br>Block<br>Block with reset<br>Inherit default action |
| SSLv2 Session            | The session is encrypted with SSL version 2.<br><br>Note that traffic is decryptable if the ClientHello message is SSL 2.0, and the remainder of the transmitted traffic is SSL 3.0. | Inherit default action | Do not decrypt<br>Block<br>Block with reset<br>Inherit default action |
| Unknown Cipher Suite     | The system does not recognize the cipher suite.                                                                                                                                      | Inherit default action | Do not decrypt<br>Block<br>Block with reset<br>Inherit default action |
| Unsupported Cipher Suite | The system does not support decryption based on the detected cipher suite.                                                                                                           | Inherit default action | Do not decrypt<br>Block<br>Block with reset<br>Inherit default action |
| Session not cached       | The TLS/SSL session has session reuse enabled, the client and server reestablished the session with the session identifier, and the system did not cache that session identifier.    | Inherit default action | Do not decrypt<br>Block<br>Block with reset<br>Inherit default action |
| Handshake Errors         | An error occurred during TLS/SSL handshake negotiation.                                                                                                                              | Inherit default action | Do not decrypt<br>Block<br>Block with reset<br>Inherit default action |
| Decryption Errors        | An error occurred during traffic decryption.                                                                                                                                         | Block                  | Block<br>Block with Reset                                             |

When you first create an SSL policy, logging connections that are handled by the default action is disabled by default. Because the logging settings for the default action also apply to undecryptable traffic handling, logging connections handled by the undecryptable traffic actions is disabled by default.

Note that if your browser uses certificate pinning to verify a server certificate, you cannot decrypt this traffic by re-signing the server certificate.

## Requirements and Prerequisites for SSL Policies

**Model Support**

Any except NGIPSv.

**Supported Domains**

Any

**User Roles**

- Admin
- Access Admin
- Network Admin

## Manage SSL Policies

In the SSL policy editor, you can:

- Configure your policy.
- Add, edit, delete, enable, disable, and organize TLS/SSL rules.
- Add trusted CA certificates.
- Determine the handling for encrypted traffic the system cannot decrypt.
- Log traffic that is handled by the default action and undecryptable traffic actions.

In a multidomain deployment, the system displays policies created in the current domain, which you can edit. It also displays policies created in ancestor domains, which you cannot edit. To view and edit policies created in a lower domain, switch to that domain.

**Procedure**

---

**Step 1** Choose **Policies > Access Control > SSL**.

**Step 2** Manage SSL policies:

- Associate—To associate an SSL policy with an access control policy, see [Associating Other Policies with Access Control, on page 1213](#).
- Compare—Click **Compare Policies**; see [Comparing Policies, on page 355](#).
- Copy—Click **Copy** (.
- Create—Click **New Policy**; see [Create Basic SSL Policies, on page 1341](#).
- Delete—Click **Delete** (). If the controls are dimmed, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.
- Deploy—Click **Deploy**; see [Deploy Configuration Changes, on page 346](#).
- Edit—Click **Edit** (); see [Editing an SSL Policy, on page 1343](#). If **View** () appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.
- Import/Export—See [About Configuration Import/Export, on page 173](#).
- Report—Click **Report** (); see [Generating Current Policy Reports, on page 356](#).

---

## Create Basic SSL Policies

To configure an SSL policy, you must give the policy a unique name and specify a default action.

### Procedure

---

- Step 1** Choose **Policies > Access Control > SSL**.
- Step 2** Click **New Policy**.
- Step 3** Give the policy a unique **Name** and, optionally, a **Description**.
- Step 4** Specify the **Default Action**; see [SSL Policy Default Actions, on page 1338](#).
- Step 5** Configure logging options for the default action as described in [Logging Connections with a Policy Default Action, on page 2221](#).
- Step 6** Click **Save**.

---

### What To Do Next

- Configure rules to add to your SSL policy; see [Creating and Modifying TLS/SSL Rules, on page 1354](#).
- Set the default handling for undecryptable traffic; see [Set Default Handling for Undecryptable Traffic, on page 1342](#).
- Configure logging options for default handling of undecryptable traffic; see [Logging Connections with a Policy Default Action, on page 2221](#).

- Associate the SSL policy with an access control policy as described in [Associating Other Policies with Access Control](#), on page 1213.
- Deploy configuration changes; see [Deploy Configuration Changes](#), on page 346.

## Set Default Handling for Undecryptable Traffic

You can set undecryptable traffic actions at the SSL policy level to handle certain types of encrypted traffic the system cannot decrypt or inspect. When you deploy an SSL policy that contains no TLS/SSL rules, the undecryptable traffic actions determine how all undecryptable encrypted traffic on your network is handled.

Depending on the type of undecryptable traffic, you can choose to:

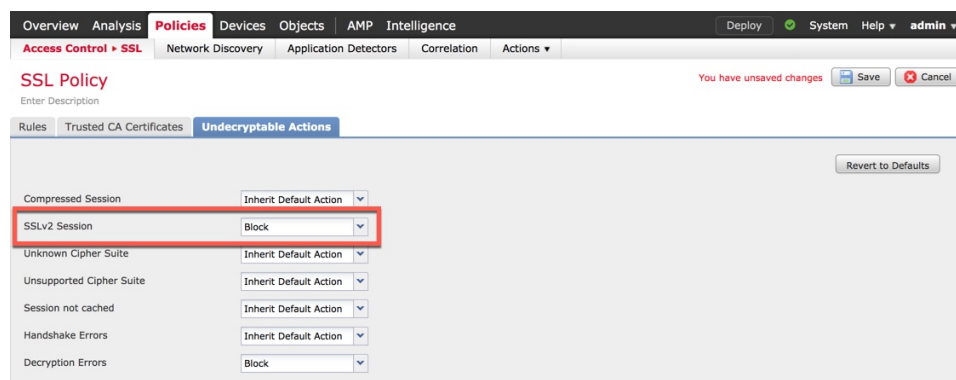

- Block the connection.
- Block the connection, then reset it. This option is preferable for connectionless protocols like UDP, which keep trying to connect until the connection is blocked.
- Inspect the encrypted traffic with access control.
- Inherit the default action from the SSL policy.

### Procedure

- Step 1** In the SSL policy editor, click **Undecryptable Actions**.
- Step 2** For each field, choose either the SSL policy's default action or another action you want to take on the type of undecryptable traffic. See [Default Handling Options for Undecryptable Traffic](#), on page 1339 and [SSL Policy Default Actions](#), on page 1338 for more information.
- Step 3** Click **Save** to save the policy.

### Example

For example, to block all SSLv2 traffic, set the options as follows:

**What to do next**

- Configure default logging for connections handled by the undecryptable traffic actions; see [Logging Connections with a Policy Default Action, on page 2221](#).
- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## Editing an SSL Policy

Only one person should edit a policy at a time, using a single browser window. If multiple users save the same policy, the last saved changes are retained. For your convenience, the system displays information on who (if anyone) is currently editing each policy. To protect the privacy of your session, a warning appears after 30 minutes of inactivity on the policy editor. After 60 minutes, the system discards your changes.

**Procedure**

**Step 1** Choose **Policies > Access Control > SSL**.

**Step 2** Click **Edit** () next to the SSL policy you want to configure.

If **View** () appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

**Step 3** Configure the SSL policy:

- Describe—If you want to update your SSL policy description, click the **Description** field and enter the new description.
- Log—If you want to log connections for undecryptable traffic handling and traffic that does not match SSL rules, see [Logging Connections with a Policy Default Action, on page 2221](#).
- Rename—If you want to rename your SSL policy, click the **Name** field and enter the new name.
- Set the default action—If you want to configure how your SSL policy handles traffic that does not match SSL rules, see [SSL Policy Default Actions, on page 1338](#).
- Set the default action for undecryptable traffic—If you want to configure how your SSL policy handles undecryptable traffic, see [Set Default Handling for Undecryptable Traffic, on page 1342](#).
- Trust—If you want to add trusted CA certificates to your SSL policy, see [Trusting External Certificate Authorities, on page 1386](#).

**Step 4** Edit the rules in your SSL policy:

- Add—If you want to add a rule, click **Add Rule**.
- Copy—If you want to copy a rule, right-click a selected rule and choose **Copy**.
- Cut—If you want to cut a rule, right-click a selected rule and choose **Cut**.
- Delete—To delete a rule, click **Delete** () next to the rule, then click **OK**.
- Disable—To disable an enabled rule, right-click a selected rule, choose **State**, then choose **Disable**.

- **Display**—To display the configuration page for a specific rule attribute, click the name or value in the column for the condition on the row for the rule. For example, click the name or value in the **Source Networks** column to display the Networks page for the selected rule. See [Network-Based TLS/SSL Rule Conditions, on page 1366](#) for more information.
- **Edit**—To edit a rule, click **Edit** () next to the rule.
- **Enable**—To enable a disabled rule, right-click a selected rule, choose **State**, then choose **Enable**. Disabled rules are dimmed and marked *(disabled)* beneath the rule name.
- **Paste**—To paste a cut or copied rule, right-click a selected rule and choose **Paste Above** or **Paste Below**.

**Step 5** Save or discard your configuration:

- To save your changes and continue editing, click **Save**.
- To discard your changes, click **Cancel** and, if prompted, click **OK**.

---

### What to do next

- If the SSL policy is not already associated with an access control policy, associate it as described in [Associating Other Policies with Access Control, on page 1213](#).
- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## CHAPTER 69

# Get Started with TLS/SSL Rules

The following topics provide an overview of creating, configuring, managing, and troubleshooting TLS/SSL rules:

**Note** Because TLS and SSL are often used interchangeably, we use the expression *TLS/SSL* to indicate that either protocol is being discussed. The SSL protocol has been deprecated by the IETF in favor of the more secure TLS protocol, so you can usually interpret *TLS/SSL* as referring to TLS only.

The exception is SSL policies. Because the FMC configuration option is **Policies > Access Control > SSL**, we use the term *SSL policies* although these policies are used to define rules for TLS and SSL traffic.

For more information about SSL and TLS protocols, see a resource such as [SSL vs. TLS - What's the Difference?](#).

- [TLS/SSL Rules Overview, on page 1345](#)
- [TLS/SSL Rule Guidelines and Limitations, on page 1345](#)
- [Requirements and Prerequisites for TLS/SSL Rules, on page 1352](#)
- [Encrypted Traffic Inspection Configuration, on page 1353](#)
- [Creating and Modifying TLS/SSL Rules, on page 1354](#)
- [TLS/SSL Rule Conditions, on page 1357](#)
- [TLS/SSL Rule Actions, on page 1359](#)
- [TLS/SSL Rules Management, on page 1363](#)

## TLS/SSL Rules Overview

*TLS/SSL rules* provide a granular method of handling encrypted traffic across multiple managed devices, whether blocking the traffic without further inspection, not decrypting the traffic and inspecting it with access control, or decrypting the traffic for access control analysis.

## TLS/SSL Rule Guidelines and Limitations

Keep the following points in mind when setting up your TLS/SSL rules. Properly configuring TLS/SSL rules is a complex task, but one that is essential to building an effective deployment that handles encrypted traffic. Many factors influence how you configure rules, including certain application behavior that you cannot control.

In addition, rules can preempt each other, require additional licenses, or contain invalid configurations. Thoughtfully configured rules can also reduce the resources required to process network traffic. Creating overly complex rules and ordering rules the wrong way can adversely affect performance.

For detailed information, see [Best Practices for Access Control Rules, on page 1194](#).

## Guideline for Using TLS/SSL Decryption

Set up **Decrypt - Resign** or **Decrypt - Known Key** rules *only* if your managed device handles encrypted traffic. Decryption rules require processing overhead that can impact performance.

## TLS/SSL Rule Unsupported Features

### Zone conditions and passive interfaces

If you create a **Decrypt - Resign** rule, and later add a security zone with passive interfaces to a zone condition, the system displays a warning icon next to the rule. Because you cannot decrypt traffic by re-signing a certificate in a passive deployment, the rule has no effect until you remove the passive interfaces from the rule or change the rule action.

### Unsupported characters in rule names

Do not use accented characters (for example, Comunicación) in TLS/SSL rule rule names; doing so prevents the policy from being deployed to managed devices.

### TLS 1.3 not supported

The Firepower System does not currently support TLS version 1.3 encryption or decryption. When users visit a web site that negotiates TLS 1.3 encryption, users might see errors similar to the following in their web browser:

- **ERR\_SSL\_PROTOCOL\_ERROR**
- **SEC\_ERROR\_BAD\_SIGNATURE**
- **ERR\_SSL\_VERSION\_INTERFERENCE**

For more information about how to control this behavior, contact Cisco TAC.

## TLS/SSL Do Not Decrypt Guidelines

You should not decrypt traffic if doing so is forbidden by:

- Law; for example, some jurisdictions forbid decrypting financial information
- Company policy; for example, your company might forbid decrypting privileged communications
- Privacy regulations
- Traffic that uses certificate pinning (also referred to as *TLS/SSL pinning*) must remain encrypted to prevent breaking the connection

If you elect to bypass decryption for certain types of traffic, no processing is done on the traffic. The encrypted traffic is first evaluated by SSL policy and then proceeds to the access control policy, where a final allow or block decision is made. Encrypted traffic can be allowed or blocked on any TLS/SSL rule condition, including, but not limited to:

- Certificate status (for example, expired or invalid certificate)
- Protocol (for example, the nonsecure SSL protocol)
- Network (security zone, IP address, VLAN tag, and so on)
- Exact URL or URL category
- Port
- User group

## TLS/SSL Decrypt - Resign Guidelines

You can associate one internal Certificate Authority (CA) certificate and private key with the **Decrypt - Resign** action. If traffic matches this rule, the system re-signs the server certificate with the CA certificate, then acts as a man-in-the-middle. It creates two TLS/SSL sessions, one between client and managed device, one between managed device and server. Each session contains different cryptographic session details, and allows the system to decrypt and reencrypt traffic.

### Best practices

We recommend the following:

- Use the **Decrypt - Resign** rule action for decrypting *outgoing* traffic, as opposed to incoming traffic for which we recommend the **Decrypt - Known Key** rule action.

For more information about **Decrypt - Known Key**, see [TLS/SSL Decrypt - Known Key Guidelines](#), on page 1349.

- Always check the **Replace Key Only** check box when you set up a **Decrypt - Resign** rule action.

When a user browses to a web site that uses a *self-signed* certificate, the user sees a security warning in the web browser and is aware that they are communicating with an unsecure site.

When a user browses to a web site that uses a trusted certificate, the user does not see a security warning.

## Details

If you configure a rule with the **Decrypt - Resign** action, the rule matches traffic based on the referenced internal CA certificate's signature algorithm type, in addition to any configured rule conditions. Because you associate one CA certificate with a **Decrypt - Resign** action, you cannot create a TLS/SSL rule that decrypts multiple types of outgoing traffic encrypted with different signature algorithms. In addition, any external certificate objects and cipher suites you add to the rule must match the associated CA certificate encryption algorithm type.

For example, outgoing traffic encrypted with an elliptic curve (EC) algorithm matches a **Decrypt - Resign** rule only if the action references an EC-based CA certificate; you must add EC-based external certificates and cipher suites to the rule to create certificate and cipher suite rule conditions.

Similarly, a **Decrypt - Resign** rule that references an RSA-based CA certificate matches only outgoing traffic encrypted with an RSA algorithm; outgoing traffic encrypted with an EC algorithm does not match the rule, even if all other configured rule conditions match.

## Guidelines and limitations

Also note the following:

### Anonymous cipher suite unsupported

By nature, anonymous cipher suites are not used for authentication and do not use key exchanges. There are limited uses for anonymous cipher suites; for more information, see [RFC 5246, appendix F.1.1.1](#). (Replaced for TLS 1.3 by [RFC 8446 appendix C.5](#).)

You cannot use the **Decrypt - Resign** or **Decrypt - Known Key** action in the rule because anonymous cipher suites are not used for authentication.

### Inline or tap mode limitation

You cannot use the **Decrypt - Resign** action in a passive or inline (tap mode) deployment because the device does not directly inspect traffic. If you create a rule with the **Decrypt - Resign** action that contains passive or inline (tap mode) interfaces within a security zone, the policy editor displays a **Warning** (⚠) next to the rule.

If your SSL policy targets a device with passive or inline (tap mode) interfaces, and contains a **Decrypt - Resign** rule, the system displays an **Information** (ℹ) next to the rule. If you later add a zone condition to the TLS/SSL rule that contains passive or inline (tap mode) interfaces, the system displays a **Warning** (⚠). If you deploy an SSL policy that contains a **Decrypt - Resign** rule to a device with passive or inline (tap mode) interfaces, any TLS/SSL sessions that match the rule fail.

### Decrypt - Resign rule action and a Certificate Signing Request

To use a **Decrypt - Resign** rule action, you should create a Certificate Signing Request (CSR) and have it signed by a trusted certificate authority. (You can use the FMC to create a CSR: **Objects > Object Management > PKI > Internal CAs**.)

To be used in a **Decrypt - Resign** rule, your certificate authority (CA) must have at least one of the following extensions:

- **CA: TRUE**  
For more information, see the discussion of Basic Constraints in [RFC3280, section 4.2.1.10](#).
- **KeyUsage=CertSign**

For more information see [RFC 5280, section 4.2.1.3](#).

To verify your CSR or CA has at least one of the preceding extensions, you can use the **openssl** command as discussed in a reference such as the [openssl documentation](#).

This is necessary because for **Decrypt - Resign** inspection to work, the certificate that used in the TLS/SSL policy generates certificates on-the-fly and signs them so as to act as man-in-the middle and proxy all TLS/SSL connections.

### Non-matching cipher suite

The following error is displayed if you attempt to save a TLS/SSL rule with a cipher suite that does not match the certificate. To resolve the issue, see [Verify TLS/SSL Cipher Suites, on page 1397](#).

```
Traffic cannot match this rule; none of your selected cipher suites contain a signature algorithm that the resigning CA's signature algorithm
```

### Untrusted Certificate Authority

If the client does not trust the Certificate Authority (CA) used to re-sign the server certificate, it warns the user that the certificate should not be trusted. To prevent this, import the CA certificate into the client trusted CA store. Alternatively, if your organization has a private PKI, you can issue an intermediate CA certificate signed by the root CA which is automatically trusted by all clients in the organization, then upload that CA certificate to the device.

### HTTP proxy limitation

The system cannot decrypt traffic if an HTTP proxy is positioned between a client and your managed device, and the client and server establish a tunneled TLS/SSL connection using the CONNECT HTTP method. The **Handshake Errors** undecryptable action determines how the system handles this traffic.

### Upload signed CA

If you create an internal CA object and choose to generate a certificate signing request (CSR), you cannot use this CA for a **Decrypt - Resign** action until you upload the signed certificate to the object.

### Use of certain rule conditions

---

**Note** Use the **Cipher Suite** and **Version** rule conditions *only* in rules with either the **Block** or **Block with reset** rule actions. The use of these conditions in rules with other rule actions can interfere with the system's ClientHello processing, resulting in unpredictable performance.

---

## TLS/SSL Decrypt - Known Key Guidelines

When you configure the **Decrypt - Known Key** action, you can associate one or more server certificates and paired private keys with the action. If traffic matches the rule, and the certificate used to encrypt the traffic matches the certificate associated with the action, the system uses the appropriate private key to obtain the session encryption and decryption keys. Because you must have access to the private key, this action is best suited to decrypt traffic incoming to servers your organization controls.

Also note the following:

### Limitation for DHE and ECDHE key exchanges

You cannot use the **Decrypt - Known Key** action in a passive deployment if the cipher suite used to establish the TLS/SSL connection applies either the Diffie-Hellman ephemeral (DHE) or the elliptic

curve Diffie-Hellman ephemeral (ECDHE) key exchange algorithm. If your SSL policy targets a device with passive or inline (tap mode) interfaces, and contains a **Decrypt - Known Key** rule with a cipher suite condition containing either a DHE or an ECDHE cipher suite, the system displays an **Information** (i) next to the rule. If you later add a zone condition to the TLS/SSL rule that contains passive or inline (tap mode) interfaces, the system displays a **Warning** (⚠).

#### Anonymous cipher suite unsupported

By nature, anonymous cipher suites are not used for authentication and do not use key exchanges. There are limited uses for anonymous cipher suites; for more information, see [RFC 5246, appendix F.1.1.1](#). (Replaced for TLS 1.3 by [RFC 8446 appendix C.5](#).)

You cannot use the **Decrypt - Resign** or **Decrypt - Known Key** action in the rule because anonymous cipher suites are not used for authentication.

#### Cannot match on Distinguished Name or Certificate

You cannot match on **Distinguished Name** or **Certificate** conditions when creating a TLS/SSL rule with a **Decrypt - Known Key** action. The assumption is that if this rule matches traffic, the certificate, subject DN, and issuer DN already match the certificate associated with the rule.

#### Mismatched signature algorithm

If you configure a rule with the **Decrypt - Resign** action, and mismatch signature algorithm type for one or more external certificate objects or cipher suites, the policy editor displays an **Information** (i) next to the rule. If you mismatch signature algorithm type for all external certificate objects, or all cipher suites, the policy displays a warning icon **Warning** (⚠) next to the rule, and you cannot deploy the access control policy associated with the SSL policy.

#### Certificate pinning

If the customer's browser uses certificate pinning to verify a server certificate, you cannot decrypt this traffic by re-signing the server certificate. To allow this traffic, configure a TLS/SSL rule with the **Do not decrypt** action to match the server certificate common name or distinguished name.

#### Use of certain rule conditions

---

**Note** Use the **Cipher Suite** and **Version** rule conditions *only* in rules with either the **Block** or **Block with reset** rule actions. The use of these conditions in rules with other rule actions can interfere with the system's ClientHello processing, resulting in unpredictable performance.

---

## TLS/SSL Block Guidelines

If decrypted traffic matches an access control rule with an action of **Interactive Block** or **Interactive Block with reset**, the system displays a customizable response page.

Provided you enabled logging in your rule, two connection events are displayed (in **Analysis** > **Events** > **Connections**): One event for the interactive block and another event to indicate whether or not the user chose to continue to the site or not.

## TLS/SSL Certificate Pinning Guidelines

Some applications use a technique referred to as *TLS/SSL pinning* or *certificate pinning*, which embeds the fingerprint of the original server certificate in the application itself. As a result, if you configured a TLS/SSL rule with a **Decrypt - Resign** action, when the application receives a resigned certificate from a managed device, validation fails and the connection is aborted.

Because TLS/SSL pinning is used to avoid man-in-the-middle attacks, there is no way to prevent or work around it. You have the following options:

- Create a **Do Not Decrypt** for those applications rule ordered before **Decrypt - Resign** rules.
- Instruct users to access the applications using a web browser.

For more information about rule ordering, see [SSL Rule Order, on page 1197](#).

## TLS/SSL Heartbeat Guidelines

Some applications use the *TLS heartbeat* extension to the Transport Layer Security (TLS) and Datagram Transport Layer Security (DTLS) protocols defined by [RFC6520](#). TLS heartbeat provides a way to confirm the connection is still alive—either the client or server sends a specified number of bytes of data and requests the other party echo the response. If this is successful, encrypted data is sent.

You can configure a **Max Heartbeat Length** in a Network Analysis Policy (NAP) to determine how to handle TLS heartbeats. For more information, see [The SSL Preprocessor, on page 1746](#).

## TLS/SSL Anonymous Cipher Suite Limitation

By nature, anonymous cipher suites are not used for authentication and do not use key exchanges. There are limited uses for anonymous cipher suites; for more information, see [RFC 5246, appendix F.1.1.1](#). (Replaced for TLS 1.3 by [RFC 8446 appendix C.5](#).)

You cannot use the **Decrypt - Resign** or **Decrypt - Known Key** action in the rule because anonymous cipher suites are not used for authentication.

You can add an anonymous cipher suite to the **Cipher Suite** condition in a TLS/SSL rule, but the system automatically strips anonymous cipher suites during ClientHello processing. For the system to use the rule, you must also configure your TLS/SSL rules in an order that prevents ClientHello processing. For more information, see [SSL Rule Order, on page 1197](#).

## TLS/SSL Normalizer Guidelines

If you enable the **Normalize Excess Payload** option in the inline normalization preprocessor, when the preprocessor normalizes decrypted traffic, it might drop a packet and replace it with a trimmed packet. This does not end the TLS/SSL session. If the traffic is allowed, the trimmed packet is encrypted as part of the TLS/SSL session.

## Other TLS/SSL Rule Guidelines

### Users and groups

If you add a group or user to a rule, then change your realm settings to exclude that group or user, the rule has no effect. (The same applies to disabling the realm.) For more information about realms, see [Create a Realm, on page 1949](#).

### Categories in TLS/SSL rules

If your SSL policy has a **Decrypt - Resign** action but web sites are not being decrypted, check **Category** page on rules associated with that policy.

In some cases, a web site redirects to another site for authentication or other purposes and the redirected site might have a different URL categorization than the site you're trying to decrypt. For example, `gmail.com` (**Web based email** category) redirects to `accounts.gmail.com` (**Internet Portals** category) for authentication. Be sure to include all relevant categories in the SSL rule.

---

**Note** In order to fully process traffic based on URL category, you must also configure URL filtering. See the [URL Filtering, on page 1229](#) chapter.

---

### Query for URLs not in the local database

If you create a **Decrypt - Resign** rule and users browse to a web site whose category and reputation are not in the local database, data might not be decrypted. Some web sites are not categorized in the local database and, if not, data from those web sites is not decrypted by default.

You can control this behavior with the setting **System > Integration > Cisco CSI**, and check **Query Cisco CSI for Unknown URLs**.

For more information about this option, see [Cisco Clouds, on page 2425](#).

## Requirements and Prerequisites for TLS/SSL Rules

### Model Support

# Encrypted Traffic Inspection Configuration

You must create reusable public key infrastructure (PKI) objects to control encrypted traffic based on encrypted session characteristics and decrypt encrypted traffic. You can add this information on the fly when uploading trusted certificate authority (CA) certificates to the SSL policy and creating SSL rule conditions, creating the associated object in the process. However, configuring these objects ahead of time reduces the chance of improper object creation.

## Decrypting Encrypted Traffic with Certificates and Paired Keys

The system can decrypt incoming encrypted traffic if you configure an internal certificate object by uploading the server certificate and private key used to encrypt the session. If you reference that object in an SSL rule with an action of **Decrypt - Known Key** and traffic matches that rule, the system uses the uploaded private key to decrypt the session.

The system can also decrypt outgoing traffic if you configure an internal CA object by uploading a CA certificate and private key. If you reference that object in a TLS/SSL rule with an action of **Decrypt - Resign** and traffic matches that rule, the system re-signs the server certificate passed to the client browser, then acts as a man-in-the-middle to decrypt the session. You can optionally replace the self-signed certificate key only and not the entire certificate, in which case users see a self-signed certificate key notice in the browser.

## Controlling Traffic Based on Encrypted Session Characteristics

The system can control encrypted traffic based on the cipher suite or server certificate used to negotiate the session. You can configure one of several different reusable objects and reference the object in a TLS/SSL rule condition to match traffic. The following table describes the different types of reusable objects you can configure:

| If you configure...                                                                       | You can control encrypted traffic based on whether...                                                                                                                                                                                                                         |
|-------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| A cipher suite list containing one or more cipher suites                                  | The cipher suite used to negotiate the encrypted session matches a cipher suite in the cipher suite list                                                                                                                                                                      |
| A trusted CA object by uploading a CA certificate your organization trusts                | The trusted CA trusts the server certificate used to encrypt the session, whether: <ul style="list-style-type: none"> <li>• The CA issued the certificate directly</li> <li>• The CA issued a certificate to an intermediate CA that issued the server certificate</li> </ul> |
| An external certificate object by uploading a server certificate                          | The server certificate used to encrypt the session matches the uploaded server certificate                                                                                                                                                                                    |
| A distinguished name object containing a certificate subject or issuer distinguished name | The subject or issuer common name, country, organization, or organizational unit on the certificate used to encrypt the session matches the configured distinguished name                                                                                                     |

# Creating and Modifying TLS/SSL Rules

## Procedure

---

- Step 1** Log in to the Firepower Management Center.
- Step 2** Click **Policies > Access Control > SSL**.
- Step 3** Click **Edit** () next to the SSL policy.
- If **View** () appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.
- Step 4** You have the following choices:
- To add a new rule, click **Add Rule**.
  - To edit an existing rule, click **Edit** ()
- Step 5** Enter a **Name** for the rule.
- Do not use accented characters (for example, Comunicación) in TLS/SSL rule rule names; doing so prevents the policy from being deployed to managed devices.
- Step 6** Specify whether the rule is **Enabled**.
- Step 7** Specify the rule position; see [TLS/SSL Rule Order Evaluation, on page 1317](#).
- Step 8** Click a rule **Action**; see [Configuring TLS/SSL Rule Actions, on page 1361](#).
- Step 9** Configure the rule's conditions; see [TLS/SSL Rule Condition Types, on page 1358](#).
- Step 10** Click **Save**.
- If the following error displays, see [Verify TLS/SSL Cipher Suites, on page 1397](#): **Traffic cannot match this rule; none of your selected cipher suites contain a signature algorithm that the resigning CA's signature algorithm.**
- 

## What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

# Adding a TLS/SSL Rule to a Rule Category

## Procedure

---

- Step 1** In the SSL rule editor, from the **Insert** drop-down list, select **Into Category**, then select the category you want to use.
- Step 2** Click **Save**.

**Tip** When you save the rule, it is placed last in that category.

---

#### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## Positioning a TLS/SSL Rule by Number

### Procedure

---

**Step 1** In the SSL rule editor, from the **Insert** drop-down list, select **above rule** or **below rule**, then type the appropriate rule number.

**Step 2** Click **Save**.

**Tip** When you save the rule, it is placed where you specified.

---

#### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## TLS/SSL Rule Search

You can search the list of TLS/SSL rules for matching values using an alphanumeric string, including spaces and printable, special characters. The search inspects the rule name and any rule condition you have added to the rule. For rule conditions, the search matches any name or value you can add for each condition type (zone, network, application, and so on). This includes individual object names or values, group object names, individual object names or values within a group, and literal values.

You can use complete or partial search strings. The column for matching values is highlighted for each matching rule. For example, if you search on all or part of the string `100Bao`, at a minimum, the Applications column is highlighted for each rule where you have added the `100Bao` application. If you also have a rule named `100Bao`, both the Name and Applications columns are highlighted.

You can navigate to each previous or next matching rule. A status message displays the current match and the total number of matches.

Matches may occur on any page of a multi-page rule list. When the first match is not on the first page, the page where the first match occurs is displayed. Selecting the next match when you are at the last match takes you to the first match, and selecting the previous match when you are at the first match takes you to the last match.

## Searching TLS/SSL Rules

### Procedure

---

**Step 1** In the SSL policy editor, click the **Search Rules** prompt, type a search string, then press Enter.

**Tip** Columns for rules with matching values are highlighted, with differentiated highlighting for the indicated (first) match.

**Step 2** Find the rules you are interested in:

- To navigate between matching rules, click **Next-Match** or **Previous-Match**.
  - To refresh the page and clear the search string and any highlighting, click **Clear** (✕).
- 

## Enabling and Disabling TLS/SSL Rules

When you create a TLS/SSL rule, it is enabled by default. If you disable a rule, the system does not use it to evaluate network traffic and stops generating warnings and errors for that rule. When viewing the list of rules in an SSL policy, disabled rules are grayed out, although you can still modify them. Note that you can also enable or disable a TLS/SSL rule using the rule editor.

### Procedure

---

**Step 1** In the SSL policy editor, right-click a rule and choose a rule state.

**Step 2** Click **Save**.

---

### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## Moving a TLS/SSL Rule

### Procedure

---

**Step 1** In the SSL policy editor, select the rules by clicking in a blank area for each rule.

**Step 2** Right-click the rule and select **Cut**.

**Step 3** Right-click a blank area for a rule next to where you want to paste the cut rules and select **Paste above** or **Paste below**.

**Tip** You cannot copy and paste TLS/SSL rules between two different SSL policies.

**Step 4** Click **Save**.

---

#### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## Adding a New TLS/SSL Rule Category

You can create custom categories between the Standard Rules and Root Rules categories to further organize your rules without having to create additional policies. You can rename and delete categories that you add. You cannot move these categories, but you can move rules into, within, and out of them.

#### Procedure

---

**Step 1** In the policy editor, click **Add Category**.

**Tip** If your policy already contains rules, you can click a blank area in the row for an existing rule to set the position of the new category before you add it. You can also right-click an existing rule and select **Insert new category**.

**Step 2** Type a **Name**.

**Step 3** You have the following choices:

- Select **above Category** from the first **Insert** drop-down list, then select the category above which you want to position the rule from the second drop-down list.
- Select **below rule** from the drop-down list, then enter an existing rule number. This option is valid only when at least one rule exists in the policy.
- Select **above rule** from the drop-down list, then, enter an existing rule number. This option is valid only when at least one rule exists in the policy.

**Step 4** Click **OK**.

**Tip** Rules in a category you delete are added to the category above.

**Step 5** Click **Save**.

---

## TLS/SSL Rule Conditions

An SSL rule's conditions identify the type of encrypted traffic the rule handles. Conditions can be simple or complex, and you can specify more than one condition type per rule. Only if traffic meets all the conditions in a rule does the rule apply to the traffic.

If you do not configure a particular condition for a rule, the system does not match traffic based on that criterion. For example, a rule with a certificate condition but no version condition evaluates traffic based on the server certificate used to negotiate the session, regardless of the session SSL or TLS version.

Every TLS/SSL rule has an associated action that determines the following for matching encrypted traffic:

- **Handling:** Most importantly, the rule action governs whether the system will monitor, trust, block, or decrypt encrypted traffic that matches the rule's conditions
- **Logging:** The rule action determines when and how you can log details about matching encrypted traffic.

Your TLS/SSL inspection configuration handles, inspects, and logs decrypted traffic:

- The SSL policy's undecryptable actions handle traffic that the system cannot decrypt.
- The policy's default action handles traffic that does not meet the condition of any non-Monitor TLS/SSL rule.

You can log a connection event when the system blocks or trusts an encrypted session. You can also force the system to log connections that it decrypts for further evaluation by access control rules, regardless of how the system later handles or inspects the traffic. Connection logs for encrypted sessions contain details about the encryption, such as the certificate used to encrypt that session. You can log only end-of-connection events, however:

- For blocked connections (Block, Block with reset), the system immediately ends the sessions and generates an event
- For trusted connections (Do not decrypt), the system generates an event when the session ends

## TLS/SSL Rule Condition Types

When you add or edit an SSL rule, use the tabs on the left side of the lower portion of the rule editor to add and edit rule conditions.

**Table 95: TLS/SSL Rule Condition Types**

| This Condition... | Matches Encrypted Traffic...                                              | Details                                                                                                                                                                                                                                  |
|-------------------|---------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Zones             | Entering or leaving a device via an interface in a specific security zone | A security zone is a logical grouping of one or more interfaces according to your deployment and security policies. Interfaces in a zone may be located across multiple devices.                                                         |
| Networks          | By its source or destination IP address, country, or continent            | You can explicitly specify IP addresses. The geolocation feature also allows you to control traffic based on its source or destination country or continent.                                                                             |
| VLAN Tags         | Tagged by VLAN                                                            | The system uses the innermost VLAN tag to identify a packet by VLAN.                                                                                                                                                                     |
| Ports             | By its source or destination port                                         | You can control encrypted traffic based on the TCP port.                                                                                                                                                                                 |
| Users             | By the user involved in the session                                       | You can control encrypted traffic based on the LDAP user logged into a host involved in an encrypted, monitored session. You can control traffic based on individual users or groups retrieved from a Microsoft Active Directory server. |

| This Condition...   | Matches Encrypted Traffic...                                                                                                                                     | Details                                                                                                                                                                       |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Applications        | By the application detected in a session                                                                                                                         | You can control access to individual applications in encrypted sessions, or filter access according to basic characteristics: type, risk, business relevance, and categories. |
| Categories          | By the URL requested in the session, based on the certificate subject distinguished name                                                                         | You can limit the websites that users on your network can access based on the URL's general classification and risk level.                                                    |
| Distinguished Names | The URL the user enters in the browser matches the Common Name (CN), or the URL is contained in the certificate's <a href="#">Subject Alternative Name (SAN)</a> | You can control encrypted traffic based on the CA that issued a server certificate, or the server certificate holder.                                                         |
| Certificates        | By the server certificate used to negotiate the encrypted session                                                                                                | You can control encrypted traffic based on the server certificate passed to the user's browser in order to negotiate the encrypted session.                                   |
| Certificate Status  | By properties of the server certificate used to negotiate the encrypted session                                                                                  | You can control encrypted traffic based on a server certificate's status.                                                                                                     |
| Cipher Suites       | By the cipher suite used to negotiate the encrypted session                                                                                                      | You can control encrypted traffic based on the cipher suite selected by the server to negotiate the encrypted session.                                                        |
| Versions            | By the version of SSL or TLS used to encrypt the session                                                                                                         | You can control encrypted traffic based on the version of SSL or TLS used to encrypt the session.                                                                             |

- [TLS/SSL Rule Monitor Action](#), on page 1359

## TLS/SSL Rule Monitor Action

The **Monitor** action is not designed to permit or deny traffic. Rather, its primary purpose is to force connection logging, regardless of how matching traffic is eventually handled. Traffic is then matched against additional rules, if present, to determine whether to trust, block, or decrypt it. The first non-Monitor rule matched

determines traffic flow and any further inspection. If there are no additional matching rules, the system uses the default action.

Because the primary purpose of Monitor rules is to track network traffic, the system automatically logs end-of-connection events for monitored traffic to the Firepower Management Center database, regardless of the logging configuration of the rule or default action that later handles the connection.

## TLS/SSL Rule Do Not Decrypt Action

The **Do Not Decrypt** action passes encrypted traffic for evaluation by the access control policy's rules and default action. Because some access control rule conditions require unencrypted traffic, this traffic may match fewer rules. The system cannot perform deep inspection on encrypted traffic, such as intrusion or file inspection.

Typical reasons for a **Do Not Decrypt** rule action include:

- When decrypting TLS/SSL traffic is prohibited by law.
- Sites you know you can trust.
- Sites you can disrupt by inspecting traffic (such as Windows Update).
- To view the values of TLS/SSL fields using connection events. (You do not need to decrypt traffic to view connection event fields.) For more information, see [Requirements for Populating Connection Event Fields](#), on page 2240.

For more information, see [Default Handling Options for Undecryptable Traffic](#), on page 1339

## TLS/SSL Rule Blocking Actions

The Firepower System provides the following TLS/SSL rule actions for traffic you do not want to pass through the system:

- **Block** to terminate the connection, resulting in an error in the client browser.

The error message does not indicate the site was blocked due to policy. Instead, errors might indicate that there are no common encryption algorithms. It is not obvious from this message that you blocked the connection on purpose.

- **Block with reset** to terminate and reset the connection, resulting in an error in the client browser.

The error indicates the connection was reset but does not indicate why.

---

**Tip** You cannot use the **Block** or **Block with reset** action in a passive or inline (tap mode) deployment because the device does not directly inspect the traffic. If you create a rule with the **Block** or **Block with reset** action that contains passive or inline (tap mode) interfaces within a security zone condition, the policy editor displays a warning (⚠) next to the rule.

---

### Related Topics

[About HTTP Response Pages](#), on page 1243

## TLS/SSL Rule Decrypt Actions

The **Decrypt - Known Key** and **Decrypt - Resign** actions decrypt encrypted traffic. The system inspects decrypted traffic with access control. Access control rules handle decrypted and unencrypted traffic identically — you can inspect it for discovery data as well as detect and block intrusions, prohibited files, and malware. The system reencrypts allowed traffic before passing it to its destination.

We recommend you use a certificate from a trusted Certificate Authority (CA) to decrypt traffic. This prevents **Invalid Issuer** from being displayed in the SSL Certificate Status column in connection events.

For more information about adding trusted objects, see [Trusted Certificate Authority Objects, on page 452](#).

## Configuring TLS/SSL Rule Actions

### Before you begin

See:

- [TLS/SSL Rule Blocking Actions, on page 1360](#)
- [TLS/SSL Rule Do Not Decrypt Action, on page 1360](#)
- [TLS/SSL Rule Monitor Action, on page 1359](#)

### Procedure

---

- Step 1** In the SSL policy editor, you have the following options:
- To add a new rule, click **Add Rule**.
  - To edit an existing rule, click **Edit** ().
- Step 2** Select a rule action from the **Action** drop-down list.
- To block encrypted traffic, select **Block**.
  - To block encrypted traffic and reset the connection, select **Block with reset**.
  - To decrypt incoming traffic, see [Configuring a Decrypt - Known Key Action, on page 1362](#) for more information.
  - To decrypt outgoing traffic, see [Configuring a Decrypt - Resign Action, on page 1362](#) for more information.
  - To log encrypted traffic, select **Monitor**.
  - To not decrypt encrypted traffic, select **Do not decrypt**.
- Step 3** Click **Add**.
-

**What to do next**

- Configure rule conditions, as described in [Network-Based TLS/SSL Rule Conditions, on page 1366](#), [User-Based TLS/SSL Rule Conditions, on page 1372](#), [Reputation-Based TLS/SSL Rule Conditions, on page 1373](#), and [Server Certificate-Based TLS/SSL Rule Conditions, on page 1379](#).
- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## Configuring a Decrypt - Resign Action

**Before you begin**

See [TLS/SSL Decrypt - Resign Guidelines, on page 1347](#).

**Procedure**

---

**Step 1** In the SSL rule editor, select **Decrypt - Resign** from the **Action** list.

**Step 2** Select an internal CA certificate object from the list.

**Step 3** Check **Replace Key Only**.

Always check the **Replace Key Only** check box when you set up a **Decrypt - Resign** rule action.

When a user browses to a web site that uses a *self-signed* certificate, the user sees a security warning in the web browser and is aware that they are communicating with an unsecure site.

When a user browses to a web site that uses a trusted certificate, the user does not see a security warning.

**Step 4** Click **Add**.

**Step 5** *Optional.* To use a Trusted CA certificate in your SSL policy so you can avoid **Invalid Issuer** in the SSL Certificate Status column in connection events, add the certificate to the policy:

- In the SSL policy editor page, click **Trusted CA Certificates**.
  - Add the CA certificate corresponding to your known key to the SSL policy.
- 

**What to do next**

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## Configuring a Decrypt - Known Key Action

**Before you begin**

See [TLS/SSL Decrypt - Known Key Guidelines, on page 1349](#).

**Procedure**

---

**Step 1** In the SSL rule editor, select **Decrypt - Known Key** from the **Action** drop-down list.

**Step 2** Click the **Click to select decryption certs** field.

- Step 3** Select one or more internal certificate objects in the **Available Certificates** list, then click **Add to Rule**.
- Step 4** Click **OK**.
- Step 5** Click **Add**.
- Step 6** *Optional.* To use a Trusted CA certificate in your SSL policy so you can avoid **Invalid Issuer** in the SSL Certificate Status column in connection events, add the certificate to the policy:
- In the SSL policy editor page, click **Trusted CA Certificates**.
  - Add the CA certificate corresponding to your known key to the SSL policy.
- 

#### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## TLS/SSL Rules Management

The **Rules** page of the SSL policy editor allows you to add, edit, search, move, enable, disable, delete, and otherwise manage TLS/SSL rules in your policy.

## CHAPTER 70

# Decryption Tuning Using TLS/SSL Rules

The following topics provide an overview of how to configure TLS/SSL rule conditions:

- [TLS/SSL Rule Conditions Overview](#), on page 1365
- [Requirements and Prerequisites for Decryption Tuning](#), on page 1366
- [Network-Based TLS/SSL Rule Conditions](#), on page 1366
- [User-Based TLS/SSL Rule Conditions](#), on page 1372
- [Reputation-Based TLS/SSL Rule Conditions](#), on page 1373
- [Server Certificate-Based TLS/SSL Rule Conditions](#), on page 1379

## TLS/SSL Rule Conditions Overview

A basic TLS/SSL rule applies its rule action to all encrypted traffic inspected by the device. To better control and decrypt encrypted traffic, you can configure rule conditions to handle and log specific types of traffic. Each TLS/SSL rule can contain 0, 1, or more rule conditions; a rule matches traffic only if the traffic matches every condition in that TLS/SSL rule.

---

**Note** When traffic matches a rule, the device applies the configured rule action to the traffic. When the connection ends, the device logs the traffic if configured to do so.

---

Each rule condition allows you to specify one or more properties of traffic you want to match against; these properties include details of:

- The flow of traffic, including the security zone through which it travels, IP address and port, country of origin or destination, and origin or destination VLAN.
- The user associated with a detected IP address.
- The traffic payload, including the application detected in the traffic.
- The connection encryption, including the TLS/SSL protocol version and cipher suite and server certificate used to encrypt the connection.
- The category and reputation of the URL specified in the server certificate's distinguished name..

## Network-Based TLS/SSL Rule Conditions

TLS/SSL *rules* in *SSL policies* exert granular control over encrypted traffic logging and handling.

Network-based conditions allow you to manage which encrypted traffic can traverse your network, using one or more of the following criteria:

- Zone conditions in TLS/SSL rules allow you to control encrypted traffic by its source and destination security zones. A *security zone* is a grouping of one or more interfaces, which might be located across multiple devices.
- Network conditions in TLS/SSL rules allow you to control and decrypt encrypted traffic by its source and destination IP address. You can either explicitly specify the source and destination IP addresses for the encrypted traffic you want to control, or use the geolocation feature, which associates IP addresses with geographical locations, to control encrypted traffic based on its source or destination country or continent.
- VLAN conditions in TLS/SSL rules allow you to control VLAN-tagged traffic. The system uses the innermost VLAN tag to identify a packet by VLAN.
- Port conditions in TLS/SSL rules allow you to control encrypted traffic by its source and destination TCP port.

You can combine network-based conditions with each other and with other types of conditions to create a TLS/SSL rule. These TLS/SSL rules can be simple or complex, matching and inspecting traffic using multiple conditions.

### Related Topics

[Firepower System IP Address Conventions](#), on page 15

## Network Zone TLS/SSL Rule Conditions

You can add a maximum of 50 zones to each of the **Sources Zones** and **Destination Zones** in a single zone condition:

- To match encrypted traffic *leaving* the device from an interface in the zone, add that zone to the **Destination Zones**.  
Because devices deployed passively do not transmit traffic, you cannot use a zone comprised of passive interfaces in a **Destination Zone** condition.
- To match encrypted traffic *entering* the device from an interface in the zone, add that zone to the **Source Zones**.

If you add both source and destination zone conditions to a rule, matching traffic must originate from one of the specified source zones *and* egress through one of the destination zones.

Note that just as all interfaces in a zone must be of the same type (all inline, all passive, all switched, or all routed), all zones used in a zone condition for a TLS/SSL rule must be of the same type. That is, you cannot write a single rule that matches encrypted traffic to or from zones of different types.

Warning icons indicate invalid configurations, such as zones that contain no interfaces. For details, hover your pointer over the icon.

## Controlling Encrypted Traffic by Network Zone

### Procedure

---

- Step 1** In the SSL rule editor, select the Zones tab.
- Step 2** Find the zones you want to add from the **Available Zones**. To search for zones to add, click the **Search by name** prompt above the **Available Zones** list, then type a zone name. The list updates as you type to display matching zones.
- Step 3** Click to select a zone. To select all zones, right-click and then select **Select All**.
- Step 4** Click **Add to Source** or **Add to Destination**.
- Tip** You can also drag and drop selected zones.
- Step 5** Save or continue editing the rule.
- 

### Example

For example, you could deploy additional identically configured devices—managed by the same Firepower Management Center—to protect similar resources in several different locations. Like the first device, each of these devices protects the assets in an **Internal** security zone.

---

**Note** You are not required to group all internal (or external) interfaces into a single zone. Choose the grouping that makes sense for your deployment and security policies.

---

In this deployment, you may decide that although you want these hosts to have unrestricted access to the Internet, you nevertheless want to protect them by decrypting and inspecting incoming encrypted traffic.

To accomplish this, configure a TLS/SSL rule with a zone condition where the **Destination Zone** is set to **Internal**. This simple SSL rule matches traffic that leaves the device from any interface in the Internal zone.

#### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

#### Related Topics

[Interface Objects: Interface Groups and Security Zones](#), on page 410

## Network or Geolocation TLS/SSL Rule Conditions

When you build a network-based TLS/SSL rule condition, you can manually specify IP address and geographical locations. Alternately, you can configure network conditions with network and geolocation *objects*, which are reusable and associate a name with one or more IP addresses, address blocks, countries, continents, and so on.

---

**Note** If you want to write rules to control traffic by geographical location, to ensure you are using up-to-date geolocation data to filter your traffic, Cisco **strongly** recommends you regularly update the geolocation database (GeoDB) on your Firepower Management Center.

---

You can add a maximum of 50 items to each of the **Source Networks** and **Destination Networks** in a single network condition, and you can mix network and geolocation-based configurations:

- To match encrypted traffic *from* an IP address or geographical location, configure the **Source Networks**.
- To match encrypted traffic *to* an IP address or geographical location, configure the **Destination Networks**.

If you add both source and destination network conditions to a rule, matching encrypted traffic must originate from one of the specified IP addresses *and* be destined for one of the destination IP addresses.

When building a network condition, warning icons indicate invalid configurations. For details, hover your pointer over the icon.

[Firepower System IP Address Conventions](#), on page 15

# Controlling Encrypted Traffic by Network or Geolocation

## Before you begin

- Update the geolocation database (GeoDB) on your Firepower Management Center as described in [Update the Geolocation Database, on page 141](#).

## Procedure

- 
- Step 1** In the SSL rule editor, select the Networks tab.
- Step 2** Find the networks you want to add from the **Available Networks**, as follows:
- Click the Networks tab to display network objects and groups to add; click the Geolocation tab to display geolocation objects.
  - To add a network object on the fly, which you can then add to the condition, click the add icon (+) above the Available Networks list.
  - To search for network or geolocation objects to add, select the appropriate tab, click the **Search by name or value** prompt above the **Available Networks** list, then type an object name or the value of one of the object's components. The list updates as you type to display matching objects.
- Step 3** To select an object, click it. To select all objects, right-click and then select **Select All**.
- Step 4** Click **Add to Source** or **Add to Destination**.
- Tip** You can also drag and drop selected objects.
- Step 5** Add any source or destination IP addresses or address blocks that you want to specify manually. Click the **Enter an IP address** prompt below the **Source Networks** or **Destination Networks** list; then type an IP address or address block and click **Add**.
- Step 6** Save or continue editing the rule.
- 

## Example

The following graphic shows the network condition for a TLS/SSL rule that blocks encrypted connections originating from your internal network and attempting to access resources either in the Cayman Islands or an offshore holding corporation server at 182.16.0.3.

The example manually specifies the offshore holding corporation's server IP address, and uses a system-provided Cayman Islands geolocation object to represent Cayman Island IP addresses.

**What to do next**

- Deploy configuration changes; see [Deploy Configuration Changes](#), on page 346.

**Related Topics**

[Network Objects](#), on page 402

[Firepower System IP Address Conventions](#), on page 15

## VLAN TLS/SSL Rule Conditions

When you build a VLAN-based TLS/SSL rule condition, you can manually specify a VLAN tag from 1 to 4094. Alternately, you can configure VLAN conditions with VLAN tag *objects*, which are reusable and associate a name with one or more VLAN tags.

---

**Tip** After you create a VLAN tag object, you can use it not only to build TLS/SSL rules, but also to represent VLAN tags in various other places in the system's web interface. You can create VLAN tag objects either using the object manager or on-the-fly while you are configuring access control rules.

---

You can add a maximum of 50 items to the **Selected VLAN Tags** in a single VLAN tag condition. When building a VLAN tag condition, warning icons indicate invalid configurations. For details, hover your pointer over the icon.

## Controlling Encrypted VLAN Traffic

### Procedure

---

**Step 1** In the SSL rule editor, select the VLAN Tags tab.

**Step 2** Find the VLANs you want to add from the **Available VLAN Tags**, as follows:

- To add a VLAN tag object on the fly, which you can then add to the condition, click the add icon () above the Available VLAN Tags list.
- To search for VLAN tag objects and groups to add, click the **Search by name or value** prompt above the **Available VLAN Tags** list, then type either the name of the object, or the value of a VLAN tag in the object. The list updates as you type to display matching objects.

**Step 3** To select an object, click it. To select all objects, right-click and then select **Select All**.

**Step 4** Click **Add to Rule**.

**Tip** You can also drag and drop selected objects.

**Step 5** Add any VLAN tags that you want to specify manually. Click the **Enter a VLAN Tag** prompt below the **Selected VLAN Tags** list; then type a VLAN tag or range and click **Add**. You can specify any VLAN tag from 1 to 4094; use a hyphen to specify a range of VLAN tags.

**Step 6** Save or continue editing the rule.

---

### Example

The following graphic shows a VLAN tag condition for an SSL rule that matches encrypted traffic on public-facing VLANs (represented by a VLAN tag object group), as well as the manually added VLAN 42.

### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

### Related Topics

[VLAN Tag Objects](#), on page 406

## Port TLS/SSL Rule Conditions

When you build a port-based TLS/SSL rule condition, you can manually specify TCP ports. Alternately, you can configure port conditions with port *objects*, which are reusable and associate a name with one or more ports.

You can add a maximum of 50 items to each of the **Selected Source Ports** and **Selected Destination Ports** lists in a single network condition:

- To match encrypted traffic *from* a TCP port, configure the **Selected Source Ports**.
- To match encrypted traffic *to* a TCP port, configure the **Selected Destination Ports**.
- To match encrypted traffic both originating from TCP **Selected Source Ports** and destined for TCP **Selected Destination Ports**, configure both.

You can only configure the **Selected Source Ports** and **Selected Destination Ports** lists with TCP ports. Port objects containing non-TCP ports are greyed out in the **Available Ports** list.

When building a port condition, warning icons indicate invalid configurations. For example, you can use the object manager to edit in-use port objects so that the rules that use those object groups become invalid. For details, hover your pointer over the icon.

## Controlling Encrypted Traffic by Port

### Procedure

---

- Step 1** In the SSL rule editor, select the Ports tab.
- Step 2** Find the TCP ports you want to add from the **Available Ports**, as follows:
- To add a TCP port object on the fly, which you can then add to the condition, click the add icon (+) above the Available Ports list.
  - To search for TCP-based port objects and groups to add, click the **Search by name or value** prompt above the **Available Ports** list, then type either the name of the object, or the value of a port in the object. The list updates as you type to display matching objects. For example, if you type 443, the Firepower Management Center displays the system-provided HTTPS port object.
- Step 3** To select a TCP-based port object, click it. To select all TCP-based port objects, right-click and then select **Select All**. If the object includes non-TCP-based ports, you cannot add it to your port condition.
- Step 4** Click **Add to Source** or **Add to Destination**.
- Tip** You can also drag and drop selected objects.
- Step 5** Enter a **Port** under the **Selected Source Ports** or **Selected Destination Ports** list to manually specify source or destination ports. You can specify a single port with a value from 0 to 65535.
- Step 6** Click **Add**.
- Note** The Firepower Management Center will not add a port to a rule condition that results in an invalid configuration.
- Step 7** Save or continue editing the rule.
- 

### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

### Related Topics

[Port Objects](#), on page 404

## User-Based TLS/SSL Rule Conditions

You can configure TLS/SSL rules to match traffic based on realm, group, or user. Realm, group, and user conditions in TLS/SSL rules allow you perform *user control* to manage which traffic can traverse your network by associating authoritative users with IP addresses.

For traffic to match a TLS/SSL rule with a user condition, the IP address of either the source or destination host in the monitored session must be associated with a logged in authoritative user. You can control traffic based on realms, individual users, or the groups those users belong to.

## Controlling Encrypted Traffic Based on User

### Before you begin

- Configure one or more authoritative user identity sources as described in [User Identity Sources, on page 1891](#).
- Configure a realm as described in [Create a Realm, on page 1949](#).

### Procedure

---

- Step 1** In the SSL rule editor, select Users.
- Step 2** Search by name or value above the **Available Realms** list and select a realm.
- Step 3** Search by name or value above the **Available Users** list and select a user or group.
- Step 4** Click **Add to Rule**.
- Tip** You can also drag and drop selected users and groups.
- Step 5** Save or continue editing the rule.
- 

### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## Reputation-Based TLS/SSL Rule Conditions

Reputation-based conditions in TLS/SSL rules allow you to manage which encrypted traffic can traverse your network, by contextualizing your network traffic and limiting it where appropriate. SSL rules govern the following types of reputation-based control:

- Application conditions allow you to perform *application control*. When the system analyzes encrypted IP traffic, it can identify and classify commonly used encrypted applications on your network prior to decrypting the encrypted session. The system uses this discovery-based *application awareness* feature to allow you to control encrypted application traffic on your network.  
  
In a single TLS/SSL rule, you can select individual applications, including custom applications. You can use system-provided *application filters*, which are named sets of applications organized according to its basic characteristics: type, risk, business relevance, and categories.
- URL conditions allow you to control web traffic based on a websites' assigned category and reputation.

## Selected Applications and Filters in TLS/SSL Rules

Cisco frequently updates and adds additional detectors via system and vulnerability database (VDB) updates. You can also create your own detectors and assign characteristics (risk, relevance, and so on) to the applications

they detect. By using filters based on application characteristics, you can ensure that the system uses the most up-to-date detectors to monitor application traffic.

For traffic to match a TLS/SSL rule with an application condition, the traffic must match one of the filters or applications that you add to a **Selected Applications and Filters** list.

**Note** When you filter application traffic using access control rules, you can use application tags as a criterion. to filter. However, you cannot use application tags to filter encrypted traffic because there is no benefit. All applications that the system can detect in encrypted traffic are tagged **SSL Protocol**; applications without this tag can only be detected in unencrypted or decrypted traffic.

In a single application condition, you can add a maximum of 50 items to the **Selected Applications and Filters** list. Each of the following counts as an item:

- One or more filters from the **Application Filters** list, individually or in custom combination. This item represents set of applications, grouped by characteristic.
- A filter created by saving search of the applications in the **Available Applications** list. This item represents a set of applications, grouped by substring match.
- An individual application from the **Available Applications** list.

In the web interface, filters added to a condition are listed above and separately from individually added applications.

Note that when you deploy an SSL policy, for each rule with an application condition, the system generates a list of unique applications to match. In other words, you may use overlapping filters and individually specified applications to ensure complete coverage.

## Application Filters in TLS/SSL Rules

When building an application condition in a TLS/SSL rule, use the **Application Filters** list to create a set of applications, grouped by characteristic, whose traffic you want to match.

For your convenience, the system characterizes each application by type, risk, business relevance, category, and tag. You can use these criteria as filters or create custom combinations of filters to perform application control.

Note that the mechanism for filtering applications in a TLS/SSL rule is the same as that for creating reusable, custom application filters using the object manager. You can also save many filters you create on-the-fly in access control rules as new, reusable filters. You cannot save a filter that includes another user-created filter because you cannot nest user-created filters.

### Understanding How Filters Are Combined

When you select filters, singly or in combination, the **Available Applications** list updates to display only the applications that meet your criteria. You can select system-provided filters in combination, but not custom filters.

The system links multiple filters of the same filter type with an OR operation. For example, if you select the Medium and High filters under the Risks type, the resulting filter is:

```
Risk: Medium OR High
```

If the Medium filter contained 110 applications and the High filter contained 82 applications, the system displays all 192 applications in the **Available Applications** list.

The system links different types of filters with an AND operation. For example, if you select the Medium and High filters under the Risks type, and the Medium and High filters under the Business Relevance type, the resulting filter is:

```
Risk: Medium OR High
AND
Business Relevance: Medium OR High
```

In this case, the system displays only those applications that are included in both the Medium or High Risk type AND the Medium or High Business Relevance type.

### Finding and Selecting Filters

To select filters, click the arrow next to a filter type to expand it, then select or clear the check box next to each filter whose applications you want to display or hide. You can also right-click a Cisco-provided filter type (**Risks**, **Business Relevance**, **Types**, or **Categories**) and select **Check All** or **Uncheck All**.

To search for filters, click the **Search by name** prompt above the **Available Filters** list, then type a name. The list updates as you type to display matching filters.

After you are done selecting filters, use the **Available Applications** list to add those filters to the rule.

### Related Topics

[Application Filters](#), on page 406

## Available Applications in TLS/SSL Rules

When building an application condition in a TLS/SSL rule, use the **Available Applications** list to select the applications whose traffic you want to match.

### Browsing the List of Applications

When you first start to build the condition the list is unconstrained, and displays every application the system detects, 100 at a time:

- To page through the applications, click the arrows underneath the list.
- To display a pop-up window with summary information about the application's characteristics, as well as Internet search links that you can follow, click **Information** (i) next to an application.

### Finding Applications to Match

To help you find the applications you want to match, you can constrain the **Available Applications** list in the following ways:

- To search for applications, click the **Search by name** prompt above the list, then type a name. The list updates as you type to display matching applications.
- To constrain the applications by applying a filter, use the **Application Filters** list. The **Available Applications** list updates as you apply filters.

Once constrained, an **All apps matching the filter** option appears at the top of the **Available Applications** list.

**Note** If you select one or more filters in the Application Filters list and also search the **Available Applications** list, your selections and the search-filtered **Available Applications** list are combined using an AND operation. That is, the **All apps matching the filter** condition includes all the individual conditions currently displayed in the **Available Applications** list as well as the search string entered above the **Available Applications** list.

### Selecting Single Applications to Match in a Condition

After you find an application you want to match, click to select it. To select all applications in the current constrained view, right-click and select **Select All**.

In a single application condition, you can match a maximum of 50 applications by selecting them individually; to add more than 50 you must either create multiple TLS/SSL rules or use filters to group applications.

### Selecting All Applications Matching a Filter for a Condition

Once constrained by either searching or using the filters in the **Application Filters** list, the **All apps matching the filter** option appears at the top of the **Available Applications** list.

This option allows you to add the entire set of applications in the constrained **Available Applications** list to the **Selected Applications and Filters** list, at once. In contrast to adding applications individually, adding this set of applications counts as only one item against the maximum of 50, regardless of the number of individual application that comprise it.

When you build an application condition this way, the name of the filter you add to the **Selected Applications and Filters** list is a concatenation of the filter types represented in the filter plus the names of up to three filters for each type. More than three filters of the same type are followed by an ellipsis (...). For example, the following filter name includes two filters under the Risks type and four under Business Relevance:

Risks: Medium, High Business Relevance: Low, Medium, High,...

Filter types that are not represented in a filter you add with **All apps matching the filter** are not included in the name of the filter you add. The instructional text that is displayed when you hover your pointer over the filter name in the **Selected Applications and Filters** list indicates that these filter types are set to *any*; that is, these filter types do not constrain the filter, so any value is allowed for these.

You can add multiple instances of **All apps matching the filter** to an application condition, with each instance counting as a separate item in the **Selected Applications and Filters** list. For example, you could add all high risk applications as one item, clear your selections, then add all low business relevance applications as another item. This application condition matches applications that are high risk OR have low business relevance.

## Application-Based TLS/SSL Rule Condition Requirements

For encrypted traffic to match a TLS/SSL rule with an application condition, the traffic must match one of the filters or applications that you add to a **Selected Applications and Filters** list.

You can add a maximum of 50 items per condition, and filters added to a condition are listed above and separately from individually added applications. When building an application condition, warning icons indicate invalid configurations. For details, hover your pointer over the icon.

## Adding an Application Condition to a TLS/SSL Rule

For Classic device models, you must have the Control license to use this feature.

### Procedure

---

- Step 1** In the SSL rule editor, select the Applications tab.
- Step 2** If you want to constrain the list of applications displayed in the **Available Applications** list, you must select one or more filters in the **Application Filters** list. For more information, see [Application Filters in TLS/SSL Rules, on page 1374](#).
- Step 3** Find and select the applications you want to add from the **Available Applications** list. You can search for and select individual applications, or, when the list is constrained, **All apps matching the filter**. For more information, see [Available Applications in TLS/SSL Rules, on page 1375](#).
- Step 4** Click **Add to Rule**.
- Tip** Click **Clear All Filters** to clear your existing selections. You can also drag and drop selected applications and filters.
- Step 5** Save or continue editing the rule.
- 

### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## Limitations to Encrypted Application Control

### Encrypted Application Identification

The system can identify unencrypted applications that become encrypted using StartTLS. This includes such applications as SMTPS, POPS, FTPS, TelnetS, and IMAPS. In addition, it can identify certain encrypted applications based on the Server Name Indication in the TLS ClientHello message, or the server certificate subject distinguished name value.

### Speed of Application Identification

The system cannot perform application control on encrypted traffic before:

- An encrypted connection is established between a client and server, and
- The system identifies the application in the encrypted session

This identification occurs after the server certificate exchange. If traffic exchanged during the TLS/SSL handshake matches all other conditions in a TLS/SSL rule containing an application condition but the identification is not complete, the SSL policy allows the packet to pass. This behavior allows the handshake to complete so that applications can be identified. For your convenience, affected rules are marked with an

**Information** (i).

After the system completes its identification, the system applies the TLS/SSL rule action to the remaining session traffic that matches its application condition.

### Automatically Enabling Application Detectors

At least one detector must be enabled for each application rule condition in the policy. If no detector is enabled for an application, the system automatically enables all system-provided detectors for the application; if none exist, the system enables the most recently modified user-defined detector for the application.

## Reputation-Based URL Blocking in Encrypted Traffic

With a URL Filtering license, URL conditions in TLS/SSL rules can control access to encrypted websites, based on the category and reputation of the requested URLs. For detailed information, see [URL Conditions \(URL Filtering\)](#), on page 384.

---

**Tip** URL conditions in TLS/SSL rules do not support manual URL filtering. Instead, use a distinguished name condition matching on the subject common name.

---

## Block Encrypted Traffic Based on URL Reputation

You must have the URL filtering license to use this feature.

### Procedure

- 
- Step 1** In the SSL rule editor, select the Category tab.
- Step 2** Find the categories of URL you want to add from the **Categories** list. To match encrypted web traffic regardless of category, select **Any** category. To search for categories to add, click the **Search by name or value** prompt above the **Categories** list, then type the category name. The list updates as you type to display matching categories.
- Step 3** To select a category, click it.
- Tip** Although you can right-click and **Select All** categories, adding all categories this way exceeds the 50-item maximum for a TLS/SSL rule. Instead, use **Any**.
- Step 4** If you want to qualify your category selections, you must click a reputation level from the **Reputations** list. You can only select one reputation level. If you do not specify a reputation level, the system defaults to **Any**, meaning all levels.
- If the rule blocks web access or decrypts traffic (the rule action is **Block**, **Block with reset**, **Decrypt - Known Key**, **Decrypt - Resign**, or **Monitor**) selecting a reputation level also selects all reputations more severe than that level. For example, if you configure a rule to block **Suspicious sites** (level 2), it also automatically blocks **High Risk** (level 1) sites.
  - If the rule allows web access, subject to access control (the rule action is **Do not decrypt**), selecting a reputation level also selects all reputations less severe than that level. For example, if you configure a rule to allow **Benign sites** (level 4), it also automatically allows **Well known** (level 5) sites.

**Note** If you change the rule action for a rule, the system automatically changes the reputation levels in URL conditions according to the above points.

**Step 5** Click **Add to Rule** to add the selected items to the **Selected Categories** list.

**Tip** You can also drag and drop selected items.

**Step 6** Save or continue editing the rule.

### Example

The following graphic shows the URL condition for an example access control rule that blocks: all malware sites, all high-risk sites, and all non-benign social networking sites.

The following table summarizes how you build the condition shown in the graphic above.

**Table 96: Example: Building A URL Condition**

| To block...                                                                  | Select this Category or URL Object... | And this Reputation...               |
|------------------------------------------------------------------------------|---------------------------------------|--------------------------------------|
| malware sites, regardless of reputation                                      | Malware Sites                         | Any                                  |
| any URL with a high risk (level 1)                                           | Any                                   | 1 - High Risk                        |
| social networking sites with a risk greater than benign (levels 1 through 3) | Social Network                        | 3 - Benign sites with security risks |

### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## Server Certificate-Based TLS/SSL Rule Conditions

TLS/SSL rules can handle and decrypt encrypted traffic based on server certificate characteristics. You can configure TLS/SSL rules based on the following server certificate attributes:

- Distinguished name conditions allow you to handle and inspect encrypted traffic based on the CA that issued a server certificate, or the certificate holder. Based on the issuer distinguished name, you can handle traffic based on the CA that issued a site's server certificate.

- Certificate conditions in TLS/SSL rules allow you to handle and inspect encrypted traffic based on the server certificate used to encrypt that traffic. You can configure a condition with one or more certificates; traffic matches the rule if the certificate matches any of the condition's certificates.
- Certificate status conditions in TLS/SSL rules allow you to handle and inspect encrypted traffic based on the status of the server certificate used to encrypt the traffic, including whether a certificate is valid, revoked, expired, not yet valid, self-signed, signed by a trusted CA, whether the Certificate Revocation List (CRL) is valid; whether the Server Name Indication (SNI) in the certificate matches the server in the request.
- Cipher suite conditions in TLS/SSL rules allow you to handle and inspect encrypted traffic based on the cipher suite used to negotiate the encrypted session.
- Session conditions in TLS/SSL rules allow you to inspect encrypted traffic based on the SSL or TLS version used to encrypt the traffic.

To detect multiple cipher suites in a rule, the certificate issuer, or the certificate holder, you can create reusable cipher suite list and distinguished name objects and add them to your rule. To detect the server certificate and certain certificate statuses, you must create external certificate and external CA objects for the rule.

## Certificate Distinguished Name TLS/SSL Rule Conditions

When configuring the rule condition, you can manually specify a literal value, reference a distinguished name object, or reference a distinguished name group containing multiple objects.

---

**Note** You cannot configure a distinguished name condition if you also choose the **Decrypt - Known Key** action. Because that action requires you to choose a server certificate to decrypt traffic, the certificate already matches the traffic.

---

You can match against multiple subject and issuer distinguished names in a single certificate status rule condition; only one common or distinguished name needs to match to match the rule.

If you add a distinguished name manually, it can contain the common name attribute (**CN**). If you add a common name without **CN=**, the system prepends **CN=** before saving the object.

You can also add a distinguished name with one each of the following attributes, separated by commas: **C**, **CN**, **O**, **OU**.

In a single DN condition, you can add a maximum of 50 literal values and distinguished name objects to the **Subject DNs**, and 50 literal values and distinguished name objects to the **Issuer DNs**.

The system-provided DN object group, Cisco-Undecryptable-Sites, contains websites whose traffic the system cannot decrypt. You can add this group to a DN condition to block or not decrypt traffic to or from these websites, without wasting system resources attempting to decrypt that traffic. You can modify individual entries in the group. You cannot delete the group. System updates can modify the entries on this list, but the system preserves user changes.

The first time the system detects an encrypted session to a new server, DN data is not available for ClientHello processing, which can result in an undecrypted first session. After the initial session, the managed device caches data from the server Certificate message. For subsequent connections from the same client, the system can match the ClientHello message conclusively to rules with DN conditions and process the message to maximize decryption potential.

## Controlling Encrypted Traffic by Certificate Distinguished Name

### Procedure

- Step 1** In the SSL rule editor, select DN.
- Step 2** Find the distinguished names you want to add from the **Available DNs**, as follows:
- To add a distinguished name object on the fly, which you can then add to the condition, click **Add** (+) above the **Available DNs** list.
  - To search for distinguished name objects and groups to add, click the **Search by name or value** prompt above the **Available DNs** list, then type either the name of the object, or a value in the object. The list updates as you type to display matching objects.
- Step 3** To select an object, click it. To select all objects, right-click and then select **Select All**.
- Step 4** Click **Add to Subject** or **Add to Issuer**.
- Tip** You can also drag and drop selected objects.
- Step 5** Add any literal common names or distinguished names that you want to specify manually. Click the **Enter DN or CN** prompt below the **Subject DNs** or **Issuer DNs** list; then type a common name or distinguished name and click **Add**.
- Step 6** Add or continue editing the rule.

### Example

The following figure shows a distinguished name rule condition searching for certificates issued to goodbakery.example.com or issued by goodca.example.com. Traffic encrypted with these certificates is allowed, subject to access control.

The following figure shows a distinguished name rule condition searching for certificates issued to badbakery.example.com and associated domains, or certificates issued by badca.example.com. Traffic encrypted with these certificates is decrypted using a re-signed certificate.

## Certificate TLS/SSL Rule Conditions

When you build a certificate-based TLS/SSL rule condition, you can upload a server certificate; you save the certificate as an external certificate *object*, which is reusable and associates a name with a server certificate. Alternately, you can configure certificate conditions with existing external certificate objects and object groups.

You can search the **Available Certificates** field in the rule condition based for external certificate objects and object groups based on the following certificate distinguished name characteristics:

- Subject or issuer common name (CN)
- Subject or issuer organization (O)
- Subject or issuer organizational unit (OU)

You can choose to match against multiple certificates in a single certificate rule condition; if the certificate used to encrypt the traffic matches any of the uploaded certificates, the encrypted traffic matches the rule.

You can add a maximum of 50 external certificate objects and external certificate object groups to the **Selected Certificates** in a single certificate condition.

Note the following:

- You cannot configure a certificate condition if you also select the **Decrypt - Known Key** action. Because that action requires you to select a server certificate to decrypt traffic, the implication is that the certificate already matches the traffic.
- If you configure a certificate condition with an external certificate object, any cipher suites you add to a cipher suite condition, or internal CA objects you associate with the **Decrypt - Resign** action, must match the external certificate's signature algorithm type. For example, if your rule's certificate condition references an EC-based server certificate, any cipher suites you add, or CA certificates you associate with the **Decrypt - Resign** action, must also be EC-based. If you mismatch signature algorithm types in this case, the policy editor displays a warning next to the rule.
- The first time the system detects an encrypted session to a new server, certificate data is not available for ClientHello processing, which can result in an undecrypted first session. After the initial session, the managed device caches data from the server Certificate message. For subsequent connections from the same client, the system can match the ClientHello message conclusively to rules with certificate conditions and process the message to maximize decryption potential.

## Controlling Encrypted Traffic by Certificate

### Procedure

---

- Step 1** In the SSL rule editor, select **Certificate**.
- Step 2** Find the server certificates you want to add from the **Available Certificates**, as follows;
- To add an external certificate object on the fly, which you can then add to the condition, click **Add** (+) above the **Available Certificates** list.
  - To search for certificate objects and groups to add, click the **Search by name or value** prompt above the **Available Certificates** list, then type either the name of the object, or a value in the object. The list updates as you type to display matching objects.
- Step 3** To select an object, click it. To select all objects, right-click and then select **Select All**.
- Step 4** Click **Add to Rule**.
- Tip** You can also drag and drop selected objects.
- Step 5** Add or continue editing the rule.
-

## Certificate Status TLS/SSL Rule Conditions

For each certificate status TLS/SSL rule condition you configure, you can match traffic against the presence or absence of a given status. You can select several statuses in one rule condition; if the certificate matches any of the selected statuses, the rule matches the traffic.

You can choose to match against the presence or absence of multiple certificate statuses in a single certificate status rule condition; the certificate needs to match only one of the criteria to match the rule.

You should consider, when setting this parameter, whether you're configuring a decrypt rule or a block rule. Typically, you should click **Yes** for a block rule and **No** for a decrypt rule. Examples:

- If you're configuring a **Decrypt - Resign** rule, the default behavior is to decrypt traffic with an expired certificate. To change that behavior, click **No** for **Expired** so traffic with an expired certificate is not decrypted and resigned.
- If you're configuring a **Block** rule, the default behavior is to allow traffic with an expired certificate. To change that behavior click **Yes** for **Expired** so traffic with an expired certificate is blocked.

The following table describes how the system evaluates encrypted traffic based on the encrypting server certificate's status.

Table 97: Certificate Status Rule Condition Criteria

| Status Check      | Status Set to Yes                                                                                                                                                                                                                                                                                                                                                     | Status Set to No                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Revoked           | The policy trusts the CA that issued the server certificate, and the CA certificate uploaded to the policy contains a CRL that revokes the server certificate.                                                                                                                                                                                                        | The policy trusts the CA that issued the server certificate, and the CA certificate uploaded to the policy does not contain a CRL that revokes the server certificate.                                                                                                                                                                                                                                                                    |
| Self-signed       | The detected server certificate contains the same subject and issuer distinguished name.                                                                                                                                                                                                                                                                              | The detected server certificate contains different subject and issuer distinguished names.                                                                                                                                                                                                                                                                                                                                                |
| Valid             | All of the following are true: <ul style="list-style-type: none"> <li>• The policy trusts the CA that issued the certificate.</li> <li>• The signature is valid.</li> <li>• The issuer is valid.</li> <li>• None of the policy's trusted CAs revoked the certificate.</li> <li>• The current date is between the certificate Valid From and Valid To date.</li> </ul> | At least one of the following is true: <ul style="list-style-type: none"> <li>• The policy does not trust the CA that issued the certificate.</li> <li>• The signature is invalid.</li> <li>• The issuer is invalid.</li> <li>• A trusted CA in the policy revoked the certificate.</li> <li>• The current date is before the certificate Valid From date.</li> <li>• The current date is after the certificate Valid To date.</li> </ul> |
| Invalid signature | The certificate's signature cannot be properly validated against the certificate's content.                                                                                                                                                                                                                                                                           | The certificate's signature is properly validated against the certificate's content.                                                                                                                                                                                                                                                                                                                                                      |
| Invalid issuer    | The issuer CA certificate is not stored in the policy's list of trusted CA certificates.                                                                                                                                                                                                                                                                              | The issuer CA certificate is stored in the policy's list of trusted CA certificates.                                                                                                                                                                                                                                                                                                                                                      |
| Expired           | The current date is after the certificate Valid To date.                                                                                                                                                                                                                                                                                                              | The current date is before or on the certificate Valid To date.                                                                                                                                                                                                                                                                                                                                                                           |
| Not yet valid     | The current date is before the certificate Valid From date.                                                                                                                                                                                                                                                                                                           | The current date is after or on the certificate Valid From date.                                                                                                                                                                                                                                                                                                                                                                          |

| Status Check        | Status Set to Yes                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | Status Set to No                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

Note that even though a certificate might match more than one status, the rule causes an action to be taken on the traffic only once.

Checking whether a CA issued or revoked a certificate requires uploading root and intermediate CA certificates and associated CRLs as objects. You then add these trusted CA objects to an SSL policy's list of trusted CA certificates.

## Trusting External Certificate Authorities

You can trust CAs by adding root and intermediate CA certificates to your SSL policy, then use these trusted CAs to verify server certificates used to encrypt traffic.

If a trusted CA certificate contains an uploaded certificate revocation list (CRL), you can also verify whether a trusted CA revoked the encryption certificate.

### Procedure

**Step 1** In the SSL rule editor, select **Trusted CA Certificates**.

**Step 2** Find the trusted CAs you want to add from the **Available Trusted CAs**, as follows:

- To add a trusted CA object on the fly, which you can then add to the condition, click **Add** (+) above the **Available Trusted CAs** list.
- To search for trusted CA objects and groups to add, click the **Search by name or value** prompt above the **Available Trusted CAs** list, then type either the name of the object, or a value in the object. The list updates as you type to display matching objects.

**Step 3** To select an object, click it. To select all objects, right-click and then select **Select All**.

**Step 4** Click **Add to Rule**.

**Tip** You can also drag and drop selected objects.

**Step 5** Add or continue editing the rule.

---

#### What to do next

- Add a certificate status TLS/SSL rule condition to your SSL rule. See [Matching Traffic on Certificate Status, on page 1387](#) for more information.
- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

### Trusted External Certificate Authority Configuration

Verified server certificates include certificates signed by trusted CAs. After you add trusted CA certificates to the SSL policy, you can configure a TLS/SSL rule with certificate status conditions to match against this traffic.

**Tip** Upload all certificates within a root CA's chain of trust to the list of trusted CA certificates, including the root CA certificate and all intermediate CA certificates. Otherwise, it is more difficult to detect trusted certificates issued by intermediate CAs. Also, if you configure certificate status conditions to trust traffic based on the root issuer CA, all traffic within a trusted CA's chain of trust can be allowed without decryption, rather than unnecessarily decrypting it.

---

When you create an SSL policy, the system populates the Trusted CA Certificates tab with a default Trusted CA object group, Cisco Trusted Authorities.

You can modify individual entries in the group, and choose whether to include this group in your SSL policy. You cannot delete the group. System updates can modify the entries on this list, but user changes are preserved.

## Matching Traffic on Certificate Status

#### Before you begin

- Add a trusted CA object or group to your SSL policy. See [Trusting External Certificate Authorities, on page 1386](#) for more information.

#### Procedure

---

**Step 1** In the Firepower Management Center, choose **Policies > Access Control > SSL**.

**Step 2** Add a new policy or edit an existing policy.

**Step 3** Add a new TLS/SSL rule or edit an existing rule.

**Step 4** In the Add Rule or Editing Rule dialog box, choose **Cert Status**.

**Step 5** For each certificate status, you have the following options:

- Choose **Yes** to match against the presence of that certificate status.
- Choose **No** to match against the absence of that certificate status.
- Choose **Any** to skip the condition when matching the rule. In other words, choosing **Any** means the rule matches whether the certificate status is present or absent.

**Step 6** Add or continue editing the rule.

### Example

The organization trusts the Verified Authority certificate authority. The organization does not trust the Spammer Authority certificate authority. The system administrator uploads the Verified Authority certificate and an intermediate CA certificate issued by Verified Authority to the system. Because Verified Authority revoked a certificate it previously issued, the system administrator uploads the CRL that Verified Authority provided.

The following figure shows a certificate status rule condition checking for valid certificates, those issued by a Verified Authority, are not on the CRL, and still within the Valid From and Valid To date. Because of the configuration, traffic encrypted with these certificates is not decrypted and inspected with access control.

|                 |                                                                                         |                      |                                                                                         |
|-----------------|-----------------------------------------------------------------------------------------|----------------------|-----------------------------------------------------------------------------------------|
| Revoked:        | <input type="radio"/> Yes <input type="radio"/> No <input checked="" type="radio"/> Any | Self Signed:         | <input type="radio"/> Yes <input type="radio"/> No <input checked="" type="radio"/> Any |
| Valid:          | <input type="radio"/> Yes <input type="radio"/> No <input checked="" type="radio"/> Any | Invalid Signature:   | <input type="radio"/> Yes <input type="radio"/> No <input checked="" type="radio"/> Any |
| Invalid Issuer: | <input type="radio"/> Yes <input type="radio"/> No <input checked="" type="radio"/> Any | Expired:             | <input type="radio"/> Yes <input type="radio"/> No <input checked="" type="radio"/> Any |
| Not Yet Valid:  | <input type="radio"/> Yes <input type="radio"/> No <input checked="" type="radio"/> Any | Invalid Certificate: | <input type="radio"/> Yes <input type="radio"/> No <input checked="" type="radio"/> Any |
| Invalid CRL:    | <input type="radio"/> Yes <input type="radio"/> No <input checked="" type="radio"/> Any | Server Mismatch:     | <input type="radio"/> Yes <input type="radio"/> No <input checked="" type="radio"/> Any |

The following figure shows a certificate status rule condition checking for the absence of a status. In this case, because of the configuration, it matches against traffic encrypted with a certificate that has not expired and monitors that traffic.

|                 |                                                                                         |                      |                                                                                         |
|-----------------|-----------------------------------------------------------------------------------------|----------------------|-----------------------------------------------------------------------------------------|
| Revoked:        | <input type="radio"/> Yes <input type="radio"/> No <input checked="" type="radio"/> Any | Self Signed:         | <input type="radio"/> Yes <input type="radio"/> No <input checked="" type="radio"/> Any |
| Valid:          | <input type="radio"/> Yes <input type="radio"/> No <input checked="" type="radio"/> Any | Invalid Signature:   | <input type="radio"/> Yes <input type="radio"/> No <input checked="" type="radio"/> Any |
| Invalid Issuer: | <input type="radio"/> Yes <input type="radio"/> No <input checked="" type="radio"/> Any | Expired:             | <input type="radio"/> Yes <input type="radio"/> No <input checked="" type="radio"/> Any |
| Not Yet Valid:  | <input type="radio"/> Yes <input type="radio"/> No <input checked="" type="radio"/> Any | Invalid Certificate: | <input type="radio"/> Yes <input type="radio"/> No <input checked="" type="radio"/> Any |
| Invalid CRL:    | <input type="radio"/> Yes <input type="radio"/> No <input checked="" type="radio"/> Any | Server Mismatch:     | <input type="radio"/> Yes <input type="radio"/> No <input checked="" type="radio"/> Any |

The following graphic illustrates a certificate status rule condition that matches on the presence or absence of several statuses. Because of the configuration, if the rule matches incoming traffic encrypted with a certificate issued by an invalid user, self-signed, invalid, or expired, it decrypts the traffic with a known key.

|                 |                                                                                         |                      |                                                                                         |
|-----------------|-----------------------------------------------------------------------------------------|----------------------|-----------------------------------------------------------------------------------------|
| Revoked:        | <input type="radio"/> Yes <input type="radio"/> No <input checked="" type="radio"/> Any | Self Signed:         | <input type="radio"/> Yes <input type="radio"/> No <input checked="" type="radio"/> Any |
| Valid:          | <input type="radio"/> Yes <input type="radio"/> No <input checked="" type="radio"/> Any | Invalid Signature:   | <input type="radio"/> Yes <input type="radio"/> No <input checked="" type="radio"/> Any |
| Invalid Issuer: | <input type="radio"/> Yes <input type="radio"/> No <input checked="" type="radio"/> Any | Expired:             | <input type="radio"/> Yes <input type="radio"/> No <input checked="" type="radio"/> Any |
| Not Yet Valid:  | <input type="radio"/> Yes <input type="radio"/> No <input checked="" type="radio"/> Any | Invalid Certificate: | <input type="radio"/> Yes <input type="radio"/> No <input checked="" type="radio"/> Any |
| Invalid CRL:    | <input type="radio"/> Yes <input type="radio"/> No <input checked="" type="radio"/> Any | Server Mismatch:     | <input type="radio"/> Yes <input type="radio"/> No <input checked="" type="radio"/> Any |

The following graphic illustrates a certificate status rule condition that matches if the SNI of the request matches the server name or if the CRL is not valid. Because of the configuration, if the rule matches either condition, traffic is blocked.

|                 |                                                                              |                      |                                                                              |
|-----------------|------------------------------------------------------------------------------|----------------------|------------------------------------------------------------------------------|
| Revoked:        | <input type="radio"/> Yes <input type="radio"/> No <input type="radio"/> Any | Self Signed:         | <input type="radio"/> Yes <input type="radio"/> No <input type="radio"/> Any |
| Valid:          | <input type="radio"/> Yes <input type="radio"/> No <input type="radio"/> Any | Invalid Signature:   | <input type="radio"/> Yes <input type="radio"/> No <input type="radio"/> Any |
| Invalid Issuer: | <input type="radio"/> Yes <input type="radio"/> No <input type="radio"/> Any | Expired:             | <input type="radio"/> Yes <input type="radio"/> No <input type="radio"/> Any |
| Not Yet Valid:  | <input type="radio"/> Yes <input type="radio"/> No <input type="radio"/> Any | Invalid Certificate: | <input type="radio"/> Yes <input type="radio"/> No <input type="radio"/> Any |
| Invalid CRL:    | <input type="radio"/> Yes <input type="radio"/> No <input type="radio"/> Any | Server Mismatch:     | <input type="radio"/> Yes <input type="radio"/> No <input type="radio"/> Any |

### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## Cipher Suite TLS/SSL Rule Conditions

The system provides predefined cipher suites you can add to a cipher suite rule condition. You can also add cipher suite list objects containing multiple cipher suites.

**Note** You cannot add new cipher suites. You can neither modify nor delete predefined cipher suites.

You can add a maximum of 50 cipher suites and cipher suite lists to the **Selected Cipher Suites** in a single cipher suite condition. The system supports adding the following cipher suites to a cipher suite condition:

- SSL\_RSA\_FIPS\_WITH\_3DES\_EDE\_CBC\_SHA
- SSL\_RSA\_FIPS\_WITH\_DES\_CBC\_SHA
- TLS\_DHE\_RSA\_WITH\_3DES\_EDE\_CBC\_SHA
- TLS\_DHE\_RSA\_WITH\_AES\_128\_CBC\_SHA
- TLS\_DHE\_RSA\_WITH\_AES\_128\_CBC\_SHA256
- TLS\_DHE\_RSA\_WITH\_AES\_128\_GCM\_SHA256
- TLS\_DHE\_RSA\_WITH\_AES\_256\_CBC\_SHA
- TLS\_DHE\_RSA\_WITH\_AES\_256\_CBC\_SHA256
- TLS\_DHE\_RSA\_WITH\_AES\_256\_GCM\_SHA384
- TLS\_DHE\_RSA\_WITH\_CAMELLIA\_128\_CBC\_SHA
- TLS\_DHE\_RSA\_WITH\_CAMELLIA\_128\_CBC\_SHA256
- TLS\_DHE\_RSA\_WITH\_CAMELLIA\_256\_CBC\_SHA
- TLS\_DHE\_RSA\_WITH\_CAMELLIA\_256\_CBC\_SHA256
- TLS\_DHE\_RSA\_WITH\_DES\_CBC\_SHA
- TLS\_DH\_Annon\_WITH\_AES\_128\_GCM\_SHA256
- TLS\_DH\_Annon\_WITH\_AES\_256\_GCM\_SHA384

- TLS\_DH\_Anon\_WITH\_CAMELLIA\_128\_CBC\_SHA
- TLS\_DH\_anon\_WITH\_CAMELLIA\_128\_CBC\_SHA256
- TLS\_DH\_Anon\_WITH\_CAMELLIA\_256\_CBC\_SHA
- TLS\_DH\_anon\_WITH\_CAMELLIA\_256\_CBC\_SHA256
- TLS\_ECDHE\_ECDSA\_WITH\_3DES\_EDE\_CBC\_SHA
- TLS\_ECDHE\_ECDSA\_WITH\_AES\_128\_CBC\_SHA
- TLS\_ECDHE\_ECDSA\_WITH\_AES\_128\_CBC\_SHA256
- TLS\_ECDHE\_ECDSA\_WITH\_AES\_128\_GCM\_SHA256
- TLS\_ECDHE\_ECDSA\_WITH\_AES\_256\_CBC\_SHA
- TLS\_ECDHE\_ECDSA\_WITH\_AES\_256\_CBC\_SHA384
- TLS\_ECDHE\_ECDSA\_WITH\_AES\_256\_GCM\_SHA384
- TLS\_ECDHE\_ECDSA\_WITH\_NULL\_SHA
- TLS\_ECDHE\_ECDSA\_WITH\_RC4\_128\_SHA
- TLS\_ECDHE\_RSA\_WITH\_3DES\_EDE\_CBC\_SHA
- TLS\_ECDHE\_RSA\_WITH\_AES\_128\_CBC\_SHA
- TLS\_ECDHE\_RSA\_WITH\_AES\_128\_CBC\_SHA256
- TLS\_ECDHE\_RSA\_WITH\_AES\_128\_GCM\_SHA256
- TLS\_ECDHE\_RSA\_WITH\_AES\_256\_CBC\_SHA
- TLS\_ECDHE\_RSA\_WITH\_AES\_256\_CBC\_SHA384
- TLS\_ECDHE\_RSA\_WITH\_AES\_256\_GCM\_SHA384
- TLS\_ECDHE\_RSA\_WITH\_NULL\_SHA
- TLS\_ECDHE\_RSA\_WITH\_RC4\_128\_SHA
- TLS\_RSA\_WITH\_3DES\_EDE\_CBC\_SHA
- TLS\_RSA\_WITH\_AES\_128\_CBC\_SHA
- TLS\_RSA\_WITH\_AES\_128\_CBC\_SHA256
- TLS\_RSA\_WITH\_AES\_128\_GCM\_SHA256
- TLS\_RSA\_WITH\_AES\_256\_CBC\_SHA
- TLS\_RSA\_WITH\_AES\_256\_CBC\_SHA256
- TLS\_RSA\_WITH\_AES\_256\_GCM\_SHA384
- TLS\_RSA\_WITH\_CAMELLIA\_128\_CBC\_SHA
- TLS\_RSA\_WITH\_CAMELLIA\_128\_CBC\_SHA256
- TLS\_RSA\_WITH\_CAMELLIA\_256\_CBC\_SHA

- TLS\_RSA\_WITH\_CAMELLIA\_256\_CBC\_SHA256
- TLS\_RSA\_WITH\_DES\_CBC\_SHA
- TLS\_RSA\_WITH\_NULL\_MD5
- TLS\_RSA\_WITH\_NULL\_SHA
- TLS\_RSA\_WITH\_RC4\_128\_MD5
- TLS\_RSA\_WITH\_RC4\_128\_SHA

Note the following:

- If you add cipher suites not supported for your deployment, you cannot deploy your configuration. For example, passive deployments do not support decrypting traffic with any of the ephemeral Diffie-Hellman (DHE) or ephemeral elliptic curve Diffie-Hellman (ECDHE) cipher suites. Creating a rule with these cipher suites prevents you from deploying your access control policy.
- If you configure a cipher suite condition with a cipher suite, any external certificate objects you add to a certificate condition, or internal CA objects you associate with the **Decrypt - Resign** action, must match the cipher suite's signature algorithm type. For example, if your rule's cipher suite condition references an EC-based cipher suite, any server certificates you add, or CA certificates you associate with the **Decrypt - Resign** action, must also be EC-based. If you mismatch signature algorithm types in this case, the policy editor displays a warning icon next to the rule.
- You can add an anonymous cipher suite to the **Cipher Suite** condition in an SSL rule, but keep in mind:
  - The system automatically strips anonymous cipher suites during ClientHello processing. For the system to use the rule, you must also configure your TLS/SSL rules in an order that prevents ClientHello processing. For more information, see [SSL Rule Order, on page 1197](#).
  - You cannot use either the **Decrypt - Resign** or **Decrypt - Known Key** action in the rule, because the system cannot decrypt traffic encrypted with an anonymous cipher suite.
- When specifying a cipher suite as a rule condition, consider that the rule matches on the negotiated cipher suite in the ServerHello message, rather than on the full list of cipher suites specified in the ClientHello message. During ClientHello processing, the managed device strips unsupported cipher suites from the ClientHello message. However, if this results in all specified cipher suites being stripped, the system retains the original list. If the system retains unsupported cipher suites, subsequent evaluation results in an undecrypted session.

## Controlling Encrypted Traffic by Cipher Suite

### Procedure

---

- Step 1** In the SSL rule editor, select Cipher Suite.
- Step 2** Find the cipher suites you want to add from the **Available Cipher Suites**, as follows:
- To add a cipher suite list on the fly, which you can then add to the condition, click **Add** (+) above the **Available Cipher Suites** list.

- To search for cipher suites and lists to add, click the **Search by name or value** prompt above the **Available Cipher Suites** list, then type either the name of the cipher suite, or a value in the cipher suite. The list updates as you type to display matching cipher suites.

**Step 3** To select a cipher suite, click it. To select all cipher suites, right-click and then select **Select All**.

**Step 4** Click **Add to Rule**.

**Tip** You can also drag and drop selected cipher suites.

**Step 5** Add or continue editing the rule.

---

#### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

#### Related Topics

[Cipher Suite Lists](#), on page 443

## Encryption Protocol Version TLS/SSL Rule Conditions

You can choose to match against traffic encrypted with SSL version 3.0, or TLS version 1.0, 1.1, or 1.2. By default, all protocol versions are selected when you create a rule; if you select multiple versions, encrypted traffic that matches any of the selected versions matches the rule. You must select at least one protocol version when saving the rule condition.

You cannot select SSL v2.0 in a version rule condition; the system does not support decrypting traffic encrypted with SSL version 2.0. You can configure an undecryptable action to allow or block this traffic without further inspection.

## Controlling Traffic by Encryption Protocol Version

#### Procedure

---

**Step 1** In the SSL rule editor, select Version.

**Step 2** Select the protocol versions you want to match against.

**Step 3** Add or continue editing the rule.

---

#### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## CHAPTER 71

# Troubleshoot TLS/SSL Rules

You can diagnose whether or not applications on your network use TLS/SSL pinning with connection events. If applications are using TLS/SSL pinning, see [TLS/SSL Rule Guidelines and Limitations, on page 1345](#).

- [About TLS/SSL Pinning, on page 1393](#)
- [Verify TLS/SSL Cipher Suites, on page 1397](#)

## About TLS/SSL Pinning

Some applications use a technique referred to as *TLS/SSL pinning* or *certificate pinning*, which embeds the fingerprint of the original server certificate in the application itself. As a result, if you configured a TLS/SSL rule with a **Decrypt - Resign** action, when the application receives a resigned certificate from a managed device, validation fails and the connection is aborted.

To confirm that TLS/SSL pinning is occurring, attempt to log in to a mobile application like Facebook. If a network connection error is displayed, log in using a web browser. (For example, you *cannot* log in to a Facebook mobile application but *can* log in to Facebook using Safari or Chrome.) You can use Firepower Management Center connection events as further proof of TLS/SSL pinning

---

**Note** TLS/SSL pinning is not limited to mobile applications.

---

### Related Topics

[Troubleshoot TLS/SSL Pinning, on page 1393](#)

## Troubleshoot TLS/SSL Pinning

You can view connection events to determine whether or not the devices are experiencing SSL pinning. You must add at least the **SSL Flow Flags** and **SSL Flow Messages** columns to the table view of connection events.

### Before you begin

- Enable logging for your TLS/SSL rules as discussed in [Logging Decryptable Connections with SSL Rules, on page 2219](#).

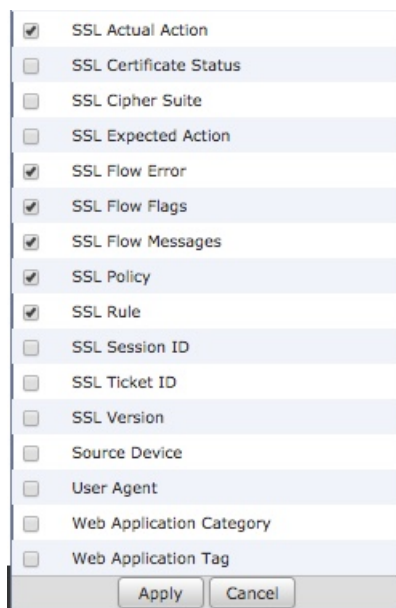

- Log in to a mobile application like Facebook; if a network connection error displays, log in to Facebook using Chrome or Safari. If you *can* log in using a web browser but not the native application, SSL pinning is likely occurring.

## Procedure

- 
- Step 1** If you haven't done so already, log in to the Firepower Management Center.
- Step 2** Click **Analysis > Connections > Events**.
- Step 3** Click **Table View of Connection Events**.
- Step 4** Click **x** on any column in the connection events table to add additional columns for at least **SSL Flow Flags** and **SSL Flow Messages**.

The following example shows adding the **SSL Actual Action**, **SSL Flow Error**, **SSL Flow Flags**, **SSL Flow Messages**, **SSL Policy**, and **SSL Rule** columns to the table of connection events.

The columns are added in the order discussed in [Connection and Security Intelligence Event Fields](#), on page 2225.

- Step 5** Click **Apply**.
- Step 6** The following paragraphs discuss how you can identify SSL pinning behavior.
- Step 7** If you determine that applications in your network use SSL pinning, see [TLS/SSL Rule Guidelines and Limitations](#), on page 1345.
-

### What to do next

You can use TLS/SSL connection events to confirm TLS/SSL pinning is occurring by looking for any of the following:

- Applications that send an SSL ALERT Message as soon as the client receives the SERVER\_HELLO, SERVER\_CERTIFICATE, SERVER\_HELLO\_DONE message from the server, followed by a TCP Reset, exhibit the following symptoms. (The alert, Unknown CA (48), can be viewed using a packet capture.)
  - The SSL Flow Flags column displays ALERT\_SEEN but *not* APP\_DATA\_C2S or APP\_DATA\_S2C.
  - The SSL Flow Messages column typically displays: CLIENT\_HELLO, SERVER\_HELLO, SERVER\_CERTIFICATE, SERVER\_KEY\_EXCHANGE, SERVER\_HELLO\_DONE.
  - Success is displayed in the SSL Flow Error column.
- Applications that send no alerts but instead send TCP Reset after the SSL handshake is finished exhibit the following symptoms:
  - The SSL Flow Flags column does *not* display ALERT\_SEEN, APP\_DATA\_C2S, or APP\_DATA\_S2C.
  - The SSL Flow Messages column typically displays: CLIENT\_HELLO, SERVER\_HELLO, SERVER\_CERTIFICATE, SERVER\_KEY\_EXCHANGE, SERVER\_HELLO\_DONE, CLIENT\_KEY\_EXCHANGE, CLIENT\_CHANGE\_CIPHER\_SPEC, CLIENT\_FINISHED, SERVER\_CHANGE\_CIPHER\_SPEC, SERVER\_FINISHED.
  - Success is displayed in the SSL Flow Error column.

[Information Available in Connection Event Fields](#), on page 2242

[Event Searches](#), on page 2177

[Troubleshoot Unknown or Bad Certificates or Certificate Authorities](#), on page 1395

## Troubleshoot Unknown or Bad Certificates or Certificate Authorities

You can view connection events to determine whether or not the devices are experiencing unknown certificate authorities, bad certificates, or unknown certificates. This procedure can also be used if a TLS/SSL certificate has been pinned. You must add at least the **SSL Flow Flags** and **SSL Flow Messages** columns to the table view of connection events.

### Before you begin

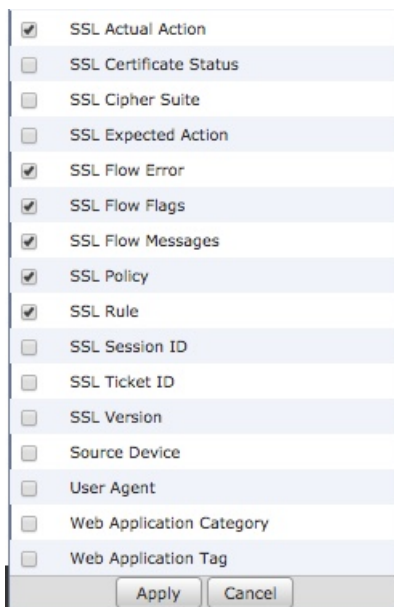

- Set up a TLS/SSL decryption rule.
- Enable logging for your TLS/SSL rules as discussed in [Logging Decryptable Connections with SSL Rules](#), on page 2219.

## Procedure

- Step 1** If you haven't done so already, log in to the Firepower Management Center.
- Step 2** Click **Analysis > Connections > Events**.
- Step 3** Click **Table View of Connection Events**.
- Step 4** Click **x** on any column in the connection events table to add additional columns for at least **SSL Flow Flags** and **SSL Flow Messages**.

The following example shows adding the **SSL Actual Action**, **SSL Flow Error**, **SSL Flow Flags**, **SSL Flow Messages**, **SSL Policy**, and **SSL Rule** columns to the table of connection events.

The columns are added in the order discussed in [Connection and Security Intelligence Event Fields, on page 2225](#).

- Step 5** Click **Apply**.
- Step 6** The following table discusses how you can determine if a certificate or certificate authority is bad or missing.

| SSL flow flag                     | Meaning                                                                                                                                                                                                                                                                                      |
|-----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CLIENT_ALERT_SEEN_UNKNOWN_CA      | Indicates a valid certificate chain or partial chain was received by an SSL client application, but the certificate was not accepted because the CA certificate could not be located or could not be matched with a known, trusted CA. This message always indicates an unrecoverable error. |
| CLIENT_ALERT_SEEN_BAD_CERTIFICATE | A certificate was corrupt, contained signatures that did not verify correctly, or had other problems.                                                                                                                                                                                        |

| SSL flow flag                         | Meaning                                                                                        |
|---------------------------------------|------------------------------------------------------------------------------------------------|
| CLIENT_ALERT_SEEN_CERTIFICATE_UNKNOWN | Some other (unspecified) issue arose in processing the certificate, rendering it unacceptable. |

## Verify TLS/SSL Cipher Suites

### Before you begin

This topic discusses actions you must take if you see the following error when saving a TLS/SSL rule that has cipher suite conditions:

```
Traffic cannot match this rule; none of your selected cipher suites contain a signature algorithm that the resigning CA's signature algorithm
```

The error indicates that one or more of the cipher suites you chose for the TLS/SSL rule condition are incompatible with the certificate used in the TLS/SSL rule. To resolve the issue, you must have access to the certificate you're using.

**Note** The tasks in this topic assume knowledge of how TLS/SSL encryption works.

### Procedure

**Step 1** When you attempt to save an SSL rule with either **Decrypt - Resign** or **Decrypt - Known Key** with specified cipher suites, the following error is displayed:

#### Example:

```
Traffic cannot match this rule; none of your selected cipher suites contain a signature algorithm that the resigning CA's signature algorithm
```

**Step 2** Locate the certificate you're using to decrypt traffic and, if necessary, copy the certificate to a system that can run openssl commands.

**Step 3** Run the following command to display the signature algorithm used by the certificate:

```
openssl x509 -in CertificateName -text -noout
```

The first few lines of output are displayed similar to the following:

```
Certificate:
 Data:
 Version: 3 (0x2)
 Serial Number: 4105 (0x1009)
 Signature Algorithm: ecdsa-with-SHA256
```

**Step 4** The **Signature algorithm** tells you the following:

- The cryptographic function used (in the preceding example, **ECDSA** means Elliptic Curve Digital Signature Algorithm).

- The hash function used to create a digest of the encrypted message (in the preceding example, **SHA256**).

**Step 5** Search a resource such as [OpenSSL at University of Utah](#) for cipher suites that match those values. The cipher suite must be in RFC format.

You can also search a variety of other sites, such as [Server Side TLS](#) at the Mozilla wiki or [Appendix C of RFC 5246. Cipher Suites in TLS/SSL \(Schannel SSP\)](#) in Microsoft documentation has a detailed explanation of cipher suites.

**Step 6** If necessary, translate the OpenSSL name to an RFC name that the Firepower Management System uses. See the [RFC mapping list](#) on the <https://testssl.sh> site.

**Step 7** The previous example, **ecdsa-with-SHA256**, can be found in the [Modern Compatibility List](#) on the Mozilla wiki.

- a) Choose only cipher suites that have **ECDSA** and **SHA-256** in the name. These cipher suites follow:

```
ECDHE-ECDSA-AES128-GCM-SHA256
ECDHE-ECDSA-AES128-SHA256
```

- b) Find the corresponding RFC cipher suite on [RFC mapping list](#). These cipher suites follow:

```
TLS_ECDHE_ECDSA_WITH_AES_128_GCM_SHA256
TLS_ECDHE_ECDSA_WITH_AES_128_CBC_SHA256
```

**Step 8** Add the preceding cipher suites to your TLS/SSL rule.

---

- [File and Malware Inspection Performance and Storage Tuning, on page 1441](#)

## CHAPTER 72

# File Policies and Malware Protection

The following topics provide an overview of file control, file policies, file rules, Advanced Malware Protection (AMP), cloud connections, and dynamic analysis connections.

- [About File Policies and Advanced Malware Protection, on page 1401](#)
- [Requirements and Prerequisites for File Policies, on page 1402](#)
- [License Requirements for File and Malware Policies, on page 1403](#)
- [Best Practices for File Policies and Malware Detection, on page 1403](#)
- [How to Configure Malware Protection, on page 1406](#)
- [Cloud Connections for Malware Protection, on page 1410](#)
- [File Policies and File Rules, on page 1419](#)
- [Retrospective Disposition Changes, on page 1434](#)
- [\(Optional\) Malware Protection with AMP for Endpoints, on page 1434](#)
- [History for File Policies and Malware Protection, on page 1439](#)

## About File Policies and Advanced Malware Protection

To detect and block malware, use file policies. You can also use file policies to detect and control traffic by file type.

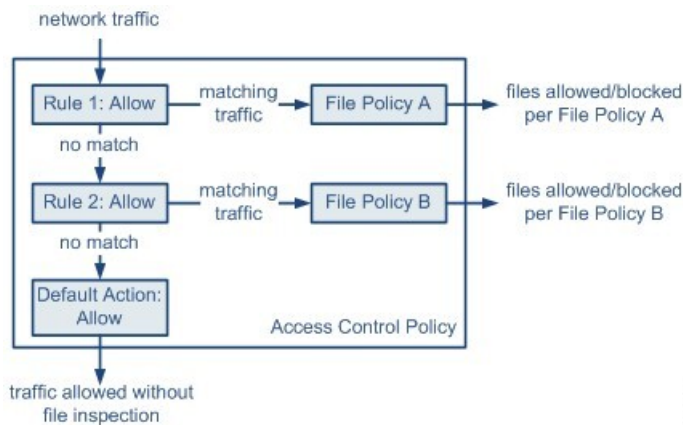

Advanced Malware Protection (AMP) for Firepower can detect, capture, track, analyze, log, and optionally block the transmission of malware in network traffic. In the Firepower Management Center web interface, this feature is called *AMP for Networks*, formerly called *AMP for Firepower*. Advanced Malware Protection identifies malware using managed devices deployed inline and threat data from the Cisco cloud.

You associate file policies with access control rules that handle network traffic as part of your overall access control configuration.

When the system detects malware on your network, it generates file and malware events. To analyze file and malware event data, see [File/Malware Events and Network File Trajectory, on page 2295](#).

## File Policies

A file policy is a set of configurations that the system uses to perform malware protection and file control, as part of your overall access control configuration. This association ensures that before the system passes a file in traffic that matches an access control rule's conditions, it first inspects the file. Consider the following diagram of a simple access control policy in an inline deployment.

371859

The policy has two access control rules, both of which use the Allow action and are associated with file policies. The policy's default action is also to allow traffic, but without file policy inspection. In this scenario, traffic is handled as follows:

- Traffic that matches Rule 1 is inspected by File Policy A.
- Traffic that does not match Rule 1 is evaluated against Rule 2. Traffic that matches Rule 2 is inspected by File Policy B.
- Traffic that does not match either rule is allowed; you cannot associate a file policy with the default action.

By associating different file policies with different access control rules, you have granular control over how you identify and block files transmitted on your network.

## License Requirements for File and Malware Policies

| To Do This                                                                                            | License Required                                                        | File Rule Action                                      |
|-------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------|-------------------------------------------------------|
| Block or allow all files of a particular type (for example, block all .exe files)                     | Threat (for FTD devices)<br>Protection (for Classic devices)            | Allow, Block, Block with Reset                        |
| Selectively allow or block files based on a judgment that it contains or is likely to contain malware | Threat (for FTD devices)<br>Protection (for Classic devices)<br>Malware | Malware Cloud Lookup, Block Malware                   |
| Store files                                                                                           | Threat (for FTD devices)<br>Protection (for Classic devices)<br>Malware | Any file rule action with <b>Store Files</b> selected |

For details about Malware licenses, see:

- [Malware Licenses for Firepower Threat Defense Devices, on page 111](#)
- [Malware Licenses for Classic Devices, on page 128](#)

## Best Practices for File Policies and Malware Detection

In addition to the items described below, follow the steps in [How to Configure Malware Protection, on page 1406](#) and referenced topics.

### File Rule Best Practices

Note the following guidelines and limitations when configuring file rules:

- A rule configured to block files in a passive deployment does not block matching files. Because the connection continues to transmit the file, if you configure the rule to log the beginning of the connection, you may see multiple events logged for this connection.
- A policy can include multiple rules. When you create the rules, ensure that no rule is "shadowed" by a previous rule.
- The file types supported for dynamic analysis are a subset of the file types supported for other types of analysis. To view the file types supported for each type of analysis, navigate to the file rule configuration page, select the **Block Malware** action, and select the checkboxes of interest.

To ensure that the system examines all file types, create separate rules (within the same policy) for dynamic analysis and for other types of analysis.

- If a file rule is configured with a **Malware Cloud Lookup** or **Block Malware** action and the Firepower Management Center cannot establish connectivity with the AMP cloud, the system cannot perform any configured rule action options until connectivity is restored.
- Cisco recommends that you enable **Reset Connection** for the **Block Files** and **Block Malware** actions to prevent blocked application sessions from remaining open until the TCP connection resets. If you do not reset connections, the client session will remain open until the TCP connection resets itself.
- If you are monitoring high volumes of traffic, do **not** store all captured files, or submit all captured files for dynamic analysis. Doing so can negatively impact system performance.
- You cannot perform malware analysis on all file types detected by the system. After you select values from the **Application Protocol**, **Direction of Transfer**, and **Action** drop-down lists, the system constrains the list of file types.

## File Detection Best Practices

Consider the following notes and limitations for file detection:

- If adaptive profiling is not enabled, access control rules cannot perform file control, including AMP.
- If a file matches a rule with an application protocol condition, file event generation occurs after the system successfully identifies a file's application protocol. Unidentified files do not generate file events.
- FTP transfers commands and data over different channels. In a passive or inline tap mode deployment, the traffic from an FTP data session and its control session may not be load-balanced to the same internal resource.
- If the total number of bytes for all file names for files in a POP3, POP, SMTP, or IMAP session exceeds 1024, file events from the session may not reflect the correct file names for files that were detected after the file name buffer filled.
- When transmitting text-based files over SMTP, some mail clients convert newlines to the CRLF newline character standard. Since Mac-based hosts use the carriage return (CR) character and Unix/Linux-based hosts use the line feed (LF) character, newline conversion by the mail client can modify the size of the file. Note that some mail clients default to newline conversion when processing an unrecognizable file type.
- To detect ISO files, set the "Limit the number of bytes inspected when doing file type detection" option to a value greater than 36870, as described in [File and Malware Inspection Performance and Storage Options, on page 1441](#).
- .Exe files inside some .rar archives cannot be detected, including possibly rar5.

## File Blocking Best Practices

Consider the following notes and limitations for file blocking:

- If an end-of-file marker is not detected for a file, regardless of transfer protocol, the file will not be blocked by a **Block Malware** rule or the custom detection list. The system waits to block the file until

the entire file has been received, as indicated by the end-of-file marker, and blocks the file after the marker is detected.

- If the end-of-file marker for an FTP file transfer is transmitted separately from the final data segment, the marker will be blocked and the FTP client will indicate that the file transfer failed, but the file will actually completely transfer to disk.
- File rules with **Block Files** and **Block Malware** actions block automatic resumption of file download via HTTP by blocking new sessions with the same file, URL, server, and client application detected for 24 hours after the initial file transfer attempt occurs.
- In rare cases, if traffic from an HTTP upload session is out of order, the system cannot reassemble the traffic correctly and therefore will not block it or generate a file event.
- If you transfer a file over NetBIOS-ssn (such as an SMB file transfer) that is blocked with a **Block Files** rule, you may see a file on the destination host. However, the file is unusable because it is blocked after the download starts, resulting in an incomplete file transfer.
- If you create file rules to detect or block files transferred over NetBIOS-ssn (such as an SMB file transfer), the system does not inspect files transferred in an established TCP or SMB session started before you deploy an access control policy invoking the file policy so those files will not be detected or blocked.
- If you configure Firepower Threat Defense high availability, and failover occurs while the original active device is identifying the file, the file type is not synced. Even if your file policy blocks that file type, the new active device downloads the file.

## File Policy Best Practices

Note the following general guidelines and limitations when configuring file policies.

- You can associate a single file policy with an access control rule whose action is **Allow**, **Interactive Block**, or **Interactive Block with reset**.
- You **cannot** use a file policy to inspect traffic handled by the access control default action.
- For a new policy, the web interface indicates that the policy is not in use. If you are editing an in-use file policy, the web interface tells you how many access control policies use the file policy. In either case, you can click the text to jump to the Access Control Policies page.
- For file blocking to work, the NAP policy you apply to the access control policy must be operating in Protection mode, also known as Inline mode.
- Based on your configuration, you can either inspect a file the first time the system detects it, and wait for a cloud lookup result, or pass the file on this first detection without waiting for the cloud lookup result.
- By default, file inspection of encrypted payloads is disabled. This helps reduce false positives and improve performance when an encrypted connection matches an access control rule that has file inspection configured.

# How to Configure Malware Protection

This topic summarizes the steps you must take to set up your Firepower system to protect your network from malicious software.

## Procedure

---

- Step 1** [Plan and Prepare for Malware Protection, on page 1406](#)
- Step 2** [Configure File Policies, on page 1407](#)
- Step 3** [Add File Policies to Your Access Control Configuration, on page 1408](#)
- Step 4** Configure network discovery policies to associate file and malware events with hosts on your network.  
(Do not simply turn on network discovery; you must configure it to discover hosts on your network to build a network map of your organization.)  
See [Network Discovery Policies, on page 1917](#) and subtopics.
- Step 5** Deploy policies to managed devices.  
See [Deploy Configuration Changes, on page 346](#).
- Step 6** Test your system to be sure it is processing malicious files as you expect it to.
- Step 7** [Set Up Maintenance and Monitoring of Malware Protection, on page 1410](#)
- 

## What to do next

- (Optional) To further enhance detection of malware in your network, deploy and integrate Cisco's AMP for Endpoints product. See [\(Optional\) Malware Protection with AMP for Endpoints, on page 1434](#) and subtopics.
- Understand how to investigate file and malware events.  
See [File/Malware Events and Network File Trajectory, on page 2295](#).

## Plan and Prepare for Malware Protection

This procedure is the first set of steps in the complete process for configuring your system to provide malware protection.

## Procedure

---

- Step 1** Purchase and install licenses.  
See [License Requirements for File and Malware Policies, on page 1403](#) and [Licensing the Firepower System, on page 105](#).
- Step 2** Understand how file policies and malware protection fit into your access control plan.

See the chapter [Understanding Access Control, on page 1185](#).

- Step 3** Understand the file analysis and malware protection tools.  
See [File Rule Actions, on page 1426](#) and subtopics.  
Consider also [Advanced and Archive File Inspection Options, on page 1420](#).
- Step 4** Determine whether you will use public clouds or private (on-premises) clouds for malware protection (file analysis and dynamic analysis.)  
See [Cloud Connections for Malware Protection, on page 1410](#) and subtopics.
- Step 5** If you will use private (on-premises) clouds for malware protection: Purchase, deploy, and test those products.  
For information, contact your Cisco sales representative or authorized reseller.
- Step 6** Configure your firewall to allow communications with your chosen clouds.  
See [Security, Internet Access, and Communication Ports, on page 2425](#).
- Step 7** Configure connections between Firepower and the malware protection clouds (public or private).
- For the AMP cloud, see [Change AMP Options, on page 1415](#).
  - If you deployed an on-premises Cisco Threat Grid appliance, see [Connect to an On-Premises Dynamic Analysis Appliance, on page 1417](#). (Access to the public Threat Grid cloud does not require configuration.)
- 

### What to do next

Continue with the next step in the malware protection workflow:

See [How to Configure Malware Protection, on page 1406](#).

## Configure File Policies

### Before you begin

Complete the tasks up to this point in the malware protection workflow:

See [How to Configure Malware Protection, on page 1406](#).

### Procedure

---

- Step 1** Review file policy and file rule restrictions.  
See [Best Practices for File Policies and Malware Detection, on page 1403](#) and subtopics.
- Step 2** Create a file policy.  
See [Create or Edit a File Policy, on page 1419](#).
- Step 3** Create rules within your file policy.  
See [File Rules, on page 1424](#) and subtopics.

- Step 4** Configure advanced options.  
See [Advanced and Archive File Inspection Options, on page 1420](#).
- 

**What to do next**

Continue with the next step in the malware protection workflow:  
See [How to Configure Malware Protection, on page 1406](#).

## Add File Policies to Your Access Control Configuration

An access control policy can have multiple access control rules associated with file policies. You can configure file inspection for any Allow or Interactive Block access control rule, which permits you to match different file and malware inspection profiles against different types of traffic on your network before it reaches its final destination.

**Before you begin**

Complete the tasks up to this point in the malware protection workflow:  
See [How to Configure Malware Protection, on page 1406](#).

**Procedure**

- 
- Step 1** Review guidelines for file policies in access control policies. (These are different from the file rule and file policy guidelines that you looked at previously.)  
Review [File and Intrusion Inspection Order, on page 1189](#).
- Step 2** Associate the file policy with an access control policy.  
See [Configuring an Access Control Rule to Perform Malware Protection, on page 1409](#)
- Step 3** Assign the access control policy to managed devices.  
See [Setting Target Devices for an Access Control Policy, on page 1210](#).
- 

**What to do next**

Continue with the next step in the malware protection workflow:  
See [How to Configure Malware Protection, on page 1406](#).

## Configuring an Access Control Rule to Perform Malware Protection

**Caution** Selecting **Detect Files** or **Block Files**, enabling or disabling **Store files** in a **Detect Files** or **Block Files** rule, or adding the first or removing the last file rule that combines the **Malware Cloud Lookup** or **Block Malware** file rule action with an analysis option (**Spero Analysis** or **MSEXE**, **Dynamic Analysis**, or **Local Malware Analysis**) or a store files option (**Malware**, **Unknown**, **Clean**, or **Custom**), restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See [Snort® Restart Traffic Behavior, on page 350](#) for more information.

**Note** Inline normalization is enabled automatically when a file policy is included in an access control rule. For more information, see [The Inline Normalization Preprocessor, on page 1762](#).

### Before you begin

- Adaptive profiling **must** be enabled (its default state) as described in [Configuring Adaptive Profiles, on page 1814](#) for access control rules to perform file control, including AMP.
- You must be an Admin, Access Admin, or Network Admin user to perform this task.

### Procedure

- Step 1** In the access control rule editor (from **Policies > Access Control**), choose an **Action** of **Allow**, **Interactive Block**, or **Interactive Block with reset**.
- Step 2** Click **Inspection**.
- Step 3** Choose a **File Policy** to inspect traffic that matches the access control rule, or choose **None** to disable file inspection for matching traffic.
- Step 4** (Optional) Disable logging of file or malware events for matching connections by clicking **Logging** and unchecking **Log Files**.
- Note** Cisco recommends that you leave file and malware event logging enabled.
- Step 5** Save the rule.
- Step 6** Click **Save** to save the policy.

### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

### Related Topics

- [Create or Edit a File Policy, on page 1419](#)
- [Snort® Restart Scenarios, on page 348](#)

## Set Up Maintenance and Monitoring of Malware Protection

Ongoing maintenance is essential for protecting your network.

### Before you begin

Configure your system to protect your network from malware.

See [How to Configure Malware Protection, on page 1406](#) and referenced procedures.

### Procedure

---

- Step 1** Ensure that your system always has the most current and effective protection.  
See [Maintain Your System: Update File Types Eligible for Dynamic Analysis, on page 1419](#).
- Step 2** Configure alerts for malware-related events and health monitoring.  
See [Configuring AMP for Networks Alerting, on page 2082](#) and information in [Health Monitoring, on page 275](#) about the following modules:
- Local Malware Analysis
  - Security Intelligence
  - Intrusion and File Event Rate
  - AMP for Firepower Status
  - AMP for Endpoints Status
- 

### What to do next

Review "What to do next items" in the malware protection workflow:

See [How to Configure Malware Protection, on page 1406](#).

## Cloud Connections for Malware Protection

Connections to public or private clouds are required in order to protect your network from malware.

### AMP Clouds

The Advanced Malware Protection (AMP) cloud is a Cisco-hosted server that uses big data analytics and continuous analysis to provide intelligence that the system uses to detect and block malware on your network.

The AMP cloud provides dispositions for possible malware detected in network traffic by managed devices, as well as data updates for local malware analysis and file pre-classification.

If your organization has deployed AMP for Endpoints and configured Firepower to import its data, the system imports this data from the AMP cloud, including scan records, malware detections, quarantines, and indications of compromise (IOC).

Cisco offers the following options for obtaining data from the Cisco cloud about known malware threats:

- **AMP public cloud**

Your Firepower Management Center communicates directly with the public Cisco cloud.

- **An AMP private cloud**

An AMP private cloud is deployed on your network and acts as a compressed, on-premises AMP cloud, as well as an anonymized proxy to connect to the public AMP cloud. For details, see [Cisco AMP Private Cloud, on page 1413](#).

If you integrate with AMP for Endpoints, the AMP private cloud has some limitations. See [AMP for Endpoints and AMP Private Cloud, on page 1436](#).

### **Dynamic Analysis Cloud**

- **Cisco Threat Grid cloud**

Public cloud that processes eligible files that you send for dynamic analysis, and provides threat scores and dynamic analysis reports. Firepower supports 200 samples/day for Cisco Threat Grid analysis.

- **On-premises Cisco Threat Grid appliance**

If your organization's security policy does not allow the Firepower System to send files outside of your network, you can deploy an on-premises appliance. This appliance does not contact the public Cisco Threat Grid cloud.

For more information, see [Dynamic Analysis On-Premises Appliance \(Cisco Threat Grid\), on page 1417](#).

### **Configure Connections to AMP and Threat Grid Clouds**

- [AMP Cloud Connection Configurations, on page 1411](#)
- [Dynamic Analysis Connections, on page 1416](#)

## **AMP Cloud Connection Configurations**

The following topics describe AMP cloud connection configurations for different scenarios:

- [Choose an AMP Cloud, on page 1412](#)
- [Connecting to an AMP Private Cloud, on page 1413](#)
- [Integrate Firepower and AMP for Endpoints, on page 1437](#)

The following topics are also relevant:

- [Cisco AMP Private Cloud, on page 1413](#)
- [Requirements and Best Practices for AMP Cloud Connections, on page 1412](#)
- [Managing Connections to the AMP Cloud \(Public or Private\), on page 1414](#)

## Requirements and Best Practices for AMP Cloud Connections

### Requirements for AMP Cloud Connections

You must be an Admin user to set up the AMP cloud.

To ensure your FMC can communicate with the AMP cloud, see the topics under [Security, Internet Access, and Communication Ports, on page 2425](#).

To use the legacy port for AMP communications, see [Communication Port Requirements, on page 2427](#).

### AMP and High Availability

Although they share file policies and related configurations, Firepower Management Centers in a high availability pair share neither cloud connections nor captured files, file events, and malware events. To ensure continuity of operations, and to ensure that detected files' malware dispositions are the same on both Firepower Management Centers, both Active and Standby Firepower Management Centers must have access to the cloud.

In high availability configurations, you must configure AMP cloud connections independently on the Active and Standby instances of the Firepower Management Center; these configurations are not synchronized.

These requirements apply to both public and private AMP clouds.

### AMP Cloud Connections and Multitenancy

In a multidomain deployment, you configure the AMP for Networks connection at the Global level only. Each Firepower Management Center can have only one AMP for Networks connection.

## Choose an AMP Cloud

By default, a connection to the United States (US) AMP public cloud is configured and enabled for your Firepower system. (This connection appears in the web interface as AMP for Networks and sometimes AMP for Firepower.) You cannot delete or disable an AMP for Networks cloud connection, but you can switch between different geographical AMP clouds, or configure an AMP private cloud connection.

### Before you begin

- If you will use an AMP private cloud, see [Connecting to an AMP Private Cloud, on page 1413](#) instead of this topic.
- Unless Firepower is integrated with AMP for Endpoints, you can configure only one AMP cloud connection. This connection is labeled **AMP for Networks** or **AMP for Firepower**.
- If you have deployed AMP for Endpoints and you want to add one or more AMP clouds to integrate that application with Firepower, see [Integrate Firepower and AMP for Endpoints, on page 1437](#).
- See [Requirements and Best Practices for AMP Cloud Connections, on page 1412](#).

### Procedure

---

- Step 1** Choose **AMP > AMP Management**.
- Step 2** Click pencil to edit the existing cloud connection.

- Step 3** From the **Cloud Name** drop-down list, choose the regional cloud nearest to your Firepower Management Center.
- Step 4** Click **Save**.

---

#### What to do next

- If your deployment is a high-availability configuration, see [Requirements and Best Practices for AMP Cloud Connections](#), on page 1412.
- (Optional) [Change AMP Options](#), on page 1415.

## Cisco AMP Private Cloud

The Firepower Management Center must connect to the AMP cloud for disposition queries for files detected in network traffic and receipt of retrospective malware events. This cloud can be public or private.

Your organization may have privacy or security concerns that make frequent or direct connections between your monitored network and the AMP cloud difficult or impossible. In these situations, you can set up a Cisco AMP Private Cloud, a proprietary Cisco product that acts as a compressed, on-premises version of the AMP cloud, as well as a secure mediator between your network and the AMP cloud. Connecting a Firepower Management Center to an AMP private cloud disables existing direct connections to the public AMP cloud.

All connections to the AMP cloud funnel through the AMP private cloud, which acts as an anonymized proxy to ensure the security and privacy of your monitored network. This includes disposition queries for files detected in network traffic, receiving of retrospective malware events, and so on. The AMP private cloud does not share any of your endpoint data over an external connection.

---

**Note** The AMP private cloud does **not** perform dynamic analysis, nor does it support anonymized retrieval of threat intelligence for other features that rely on Cisco Collective Security Intelligence (CSI), such as URL and Security Intelligence filtering.

---

For information about AMP private cloud (sometimes referred to as "AMPv"), see <https://www.cisco.com/c/en/us/products/security/fireamp-private-cloud-virtual-appliance/index.html>.

## Connecting to an AMP Private Cloud

### Before you begin

- Configure your Cisco AMP private cloud or clouds according to the directions in the documentation for that product. During configuration, note the private cloud host name. You will need this host name in order to to configure the connection on the Firepower Management Center.
- Make sure the Firepower Management Center can communicate with the AMP private cloud, and confirm that the private cloud has internet access so it can communicate with the public AMP cloud. See the topics under [Security, Internet Access, and Communication Ports](#), on page 2425.
- Unless your deployment is integrated with AMP for Endpoints, each Firepower Management Center can have only one AMP cloud connection. This connection is labeled **AMP for Networks** or **AMP for Firepower**.

If you integrate with AMP for Endpoints, you can configure multiple AMP for Endpoints cloud connections.

### Procedure

---

- Step 1** Choose **AMP > AMP Management**.
- Step 2** Click **Add AMP Cloud Connection**.
- Step 3** From the **Cloud Name** drop-down list, choose **Private Cloud**.
- Step 4** Enter a **Name**.
- This information appears in malware events that are generated or transmitted by AMP private cloud.
- Step 5** In the **Host** field, enter the private cloud host name that you configured when you set up the private cloud.
- Step 6** Click **Browse** next to the **Certificate Upload Path** field to browse to the location of a valid TLS or SSL encryption certificate for the private cloud. For more information, see the AMP private cloud documentation.
- Step 7** If you want to use this private cloud for both AMP for Networks and AMP for Endpoints, select the **Use for AMP for Firepower** check box.
- If you configured a different private cloud to handle AMP for Networks communications, you can clear this check box; if this is your only AMP private cloud connection, you cannot.
- In a multidomain deployment, this check box appears only in the Global domain. Each Firepower Management Center can have only one AMP for Networks connection.
- Step 8** To communicate with the AMP private cloud using a proxy, check the **Use Proxy for Connection** check box.
- Step 9** Click **Register**, confirm that you want to disable existing direct connections to the AMP cloud, and finally confirm that you want to continue to the AMP private cloud management console to complete registration.
- Step 10** Log into the management console and complete the registration process. For further instructions, see the AMP private cloud documentation.
- 

### What to do next

In high availability configurations, you must configure AMP cloud connections independently on the Active and Standby instances of the Firepower Management Center; these configurations are not synchronized.

## Managing Connections to the AMP Cloud (Public or Private)

Use the Firepower Management Center to manage connections to public and private AMP clouds used for AMP for Networks or AMP for Endpoints or both.

You can delete a connection to a public or private AMP cloud if you no longer want to receive malware-related information from the cloud. Note that deregistering a connection using the AMP for Endpoints or AMP private cloud management console does not remove the connection from the system. Deregistered connections display a failed state on the Firepower Management Center web interface.

You can also temporarily disable a connection. When you reenables a cloud connection, the cloud resumes sending data to the system, including queued data from the disabled period.

**Caution** For disabled connections, the public or private AMP cloud can store malware events, indications of compromise, and so on until you re-enable the connection. In rare cases—for example, with a very high event rate or a long-term disabled connection—the cloud may not be able to store all information generated while the connection is disabled.

In a multidomain deployment, the system displays connections created in the current domain, which you can manage. It also displays connections created in ancestor domains, which you cannot manage. To manage connections in a lower domain, switch to that domain. Each Firepower Management Center can have only one AMP for Networks connection, which belongs to the Global domain.

### Procedure

**Step 1** Select **AMP > AMP Management**.

**Step 2** Manage your AMP cloud connections:

- Delete — Click **Delete** () , then confirm your choice.
- Enable or Disable — Click the slider, then confirm your choice.

### What to do next

In high availability configurations, you must configure AMP cloud connections independently on the Active and Standby instances of the Firepower Management Center; these configurations are not synchronized.

## Change AMP Options

### Procedure

**Step 1** Choose **System > Integration**.

**Step 2** Click **Cisco CSI**.

**Step 3** Select options:

*Table 98: AMP for Networks Options*

| Option                                           | Description                                                                                                                                                                                                                       |
|--------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Automatic Local Malware Detection Updates | The local malware detection engine statically analyzes and preclassifies files using signatures provided by Cisco. If you enable this option, the Firepower Management Center checks for signature updates once every 30 minutes. |

| Option                                     | Description                                                                                                                                                                                                                                                                                                                                                  |
|--------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Share URI from Malware Events with Cisco   | The system can send information about the files detected in network traffic to the AMP cloud. This information includes URI information associated with detected files and their SHA-256 hash values. Although sharing is opt-in, transmitting this information to Cisco helps future efforts to identify and track malware.                                 |
| Use Legacy Port 32137 for AMP for Networks | By default, Firepower uses port 443/HTTPS to communicate with the AMP public or private cloud to obtain file disposition data. This option allows the system to use port 32137.<br><br>If you updated from a previous version of the system, this option may be enabled.<br><br>This option will be greyed out if the FMC is configured with Proxy settings. |

**Step 4** Click **Save**.

## Dynamic Analysis Connections

### Requirements for Dynamic Analysis

You must be an Admin, Access Admin, or Network Admin user, and be in the global domain, to use dynamic analysis.

With the appropriate license, the Firepower system automatically has access to the Cisco Threat Grid public cloud.

Dynamic analysis requires that managed devices have direct or proxied access to the Cisco Threat Grid public cloud or an on-premises Cisco Threat Grid appliance on port 443.

See also [Which Files Are Eligible for Dynamic Analysis?](#), on page 1430.

If you will connect to an on-premises Threat Grid appliance, see also the prerequisites in [Connect to an On-Premises Dynamic Analysis Appliance](#), on page 1417.

### Viewing the Default Dynamic Analysis Connection

By default, the Firepower Management Center can connect to the public Cisco Threat Grid cloud for file submission and report retrieval. You can neither configure nor delete this connection.

#### Procedure

**Step 1** Choose **AMP > Dynamic Analysis Connections**.

**Step 2** Click **Edit** ()

**Note**

For information about **Associate** (🔗) **Associate** (🔗) on the **AMP > Dynamic Analysis Connections** page, see [Enabling Access to Dynamic Analysis Results in the Public Cloud](#), on page 1418.

## Dynamic Analysis On-Premises Appliance (Cisco Threat Grid)

If your organization has privacy or security concerns around submitting files to the public Cisco Threat Grid cloud, you can deploy an on-premises Cisco Threat Grid appliance. Like the public cloud, the on-premises appliance runs eligible files in a sandbox environment, and returns a threat score and dynamic analysis report to the Firepower System. However, the on-premises appliance does not communicate with the public cloud, or any other system external to your network.

For more information about on-premises Cisco Threat Grid appliances, see <https://www.cisco.com/c/en/us/products/security/threat-grid/index.html>.

### Connect to an On-Premises Dynamic Analysis Appliance

If you install an on-premises Cisco Threat Grid appliance on your network, you can configure a dynamic analysis connection to submit files and retrieve reports from the appliance. When configuring the on-premises appliance dynamic analysis connection, you register the Firepower Management Center to the on-premises appliance.

#### Before you begin

- Set up your on-premises Cisco Threat Grid appliance; see the *Cisco Threat Grid Appliance Setup and Configuration Guide*.

Documentation for this appliance is available from <https://www.cisco.com/c/en/us/support/security/amp-threat-grid-appliances/tsd-products-support-series-home.html>.

- If your Cisco Threat Grid appliance uses a self-signed public-key certificate, download the certificate from the Threat Grid appliance; see the *Cisco Threat Grid Appliance Administrator's Guide* for information.

If you use a certificate signed by a Certificate Authority (CA), the certificate must meet the following requirements:

- The server key and signed certificate must be installed on the Threat Grid appliance. Follow the upload instructions in the *Threat Grid Administrator's Guide*.
  - If there is a multi-level signing chain of CAs, all required intermediate certificates and the root certificate must be contained in a single file that will be uploaded to the FMC.
  - All certificates must be PEM-encoded.
  - The file's newlines must be UNIX, not DOS.
- If you want to connect to the on-premises appliance using a proxy, configure the proxy; see [Modify FMC Management Interfaces](#), on page 886.
  - Managed devices must have direct or proxied access to the Cisco Threat Grid appliance on port 443.

## Procedure

---

- Step 1** Choose **AMP > Dynamic Analysis Connections**.
- Step 2** Click **Add New Connection**.
- Step 3** Enter a **Name**.
- Step 4** Enter a **Host**.
- Step 5** Next to **Certificate Upload**, click **Browse** to upload the certificate for the on-premises appliance.
- If the Threat Grid appliance will present a self-signed certificate, upload the certificate you downloaded from that appliance.
- If the Threat Grid appliance will present a CA-signed certificate, upload the file containing the certificate signing chain.
- Step 6** If you want to use a configured proxy to establish the connection, select **Use Proxy When Available**.
- Step 7** Click **Register**.
- Step 8** Click **Yes** to display the on-premises Cisco Threat Grid appliance login page.
- Step 9** Enter your username and password to the on-premises Cisco Threat Grid appliance.
- Step 10** Click **Sign in**.
- Step 11** You have the following options:
- If you previously registered the Firepower Management Center to the on-premises appliance, click **Return**.
  - If you did not register the Firepower Management Center, click **Activate**.
- 

## Enabling Access to Dynamic Analysis Results in the Public Cloud

Cisco Threat Grid offers more detailed reporting on analyzed files than is available in the Firepower Management Center. If your organization has an account in the Cisco Threat Grid public cloud, you can access the Cisco Threat Grid portal directly to view additional details about files sent for analysis from your managed devices. However, for privacy reasons, file analysis details are available only to the organization that submitted the files. Therefore, before you can view this information, you must associate your Firepower Management Center with the files submitted by its managed devices.

### Before you begin

You must have an account on the Cisco Threat Grid public cloud, and have your account credentials ready.

## Procedure

---

- Step 1** Select **AMP > Dynamic Analysis Connections**.
- Step 2** Click **Associate** () in the table row corresponding to the Cisco Threat Grid public cloud. A Cisco Threat Grid portal window opens.
- Step 3** Sign in to the Cisco Threat Grid public cloud.
- Step 4** Click **Submit Query**.

**Note** Do not change the default value in the **Devices** field.

If you have difficulties with this process, contact your Cisco Threat Grid representative at Cisco TAC. It may take up to 24 hours for this change to take effect.

---

#### What to do next

After the association is activated, see [Viewing Dynamic Analysis Results in the Cisco Threat Grid Public Cloud, on page 2313](#).

## Maintain Your System: Update File Types Eligible for Dynamic Analysis

The list of file types eligible for Dynamic Analysis is determined by the vulnerability database (VDB), which is updated periodically (but no more than once per day.) If you are an Admin user, you can update file types eligible for dynamic analysis.

To ensure that your system has the current list:

#### Procedure

---

- Step 1** Do one of the following:
- (Recommended) See [Vulnerability Database Update Automation, on page 191](#)
  - Regularly check for new VDB updates, and [Manually Update the VDB, on page 140](#) when needed.
- If you choose this option, we recommend that you schedule regular reminders to do this.
- Step 2** If your file policies specify individual file types instead of the **Dynamic Analysis Capable** file type category, update your file policies to use the newly supported file types.
- Step 3** If the list of eligible file types changes, deploy to managed devices.
- 

## File Policies and File Rules

### Create or Edit a File Policy

#### Before you begin

If you are configuring policies for malware protection, see all required procedures in [Configure File Policies, on page 1407](#).

#### Procedure

---

- Step 1** Select **Policies > Access Control > Malware & File** .

**Step 2** Create a new policy, or edit an existing policy.

If you are editing an existing policy: If **View** (🔍) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

**Tip** To make a copy of an existing file policy, click **Copy** (📄), then type a unique name for the new policy in the dialog box that appears. You can then modify the copy.

**Step 3** Add one or more rules to the file policy as described in [Creating File Rules, on page 1433](#).

**Step 4** Optionally, select Advanced and configure advanced options as described in [Advanced and Archive File Inspection Options, on page 1420](#).

**Step 5** Save the file policy.

### What to do next

- If you are configuring policies for malware protection, see other required procedures in [Configure File Policies, on page 1407](#).
- Otherwise:
  - Add the file policy to an access control rule as described in [Add File Policies to Your Access Control Configuration, on page 1408](#).
  - Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## Advanced and Archive File Inspection Options

The Advanced Settings in the file policy editor has the following general options:

- **First Time File Analysis**—Select this option to analyze first-seen files while AMP cloud disposition is pending. The file must match a rule configured to perform a malware cloud lookup and Spero, local malware, or dynamic analysis. If you deselect this option, files detected for the first time are marked with an Unknown disposition
- **Enable Custom Detection List**—Block files on the custom detection list.
- **Enable Clean List**—If enabled, this policy will allow files that are on the clean list.
- **Override AMP Cloud Disposition Based upon Threat Score**—Select an option:
  - If you select **Disabled**, the system will not override the disposition provided by the AMP Cloud.
  - If you set a threshold threat score, files with an AMP cloud verdict of Unknown are considered malware if their Dynamic Analysis score is equal to or worse than the threshold.
  - If you select a lower threshold value, you increase the number of files treated as malware. Depending on the action selected in your file policy, this can result in an increase of blocked files.
  - For numeric threat score ranges, see [Threat Scores and Dynamic Analysis Summary Reports, on page 2312](#).

The Advanced Settings in the file policy editor has the following archive file inspection options:

- **Inspect Archives**—Enables inspection of the contents of archive files, for archive files as large as the **Maximum file size to store** advanced access control setting.

**Caution** Enabling or disabling **Inspect Archives** restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See [Snort® Restart Traffic Behavior, on page 350](#) for more information.

- **Block Encrypted Archives**—Blocks archive files that have encrypted contents.
- **Block Uninspectable Archives**—Blocks archive files with contents that the system is unable to inspect for reasons other than encryption. This usually applies to corrupted files, or those that exceed your specified maximum archive depth.
- **Max Archive Depth**—Blocks nested archive files that exceed the specified depth. The top-level archive file is not considered in this count; depth begins at 1 with the first nested file .

## Archive Files

Archive files are files that contain other files, such as `.zip` or `.rar` files.

If any individual file in an archive matches a file rule with a block action, the system blocks the entire archive, not just the individual file.

For details about options for archive file inspection, see [Advanced and Archive File Inspection Options, on page 1420](#).

### Archive Files That Can Be Inspected

- **File types**

A complete list of inspectable archive file types appears in the FMC web interface on the file rule configuration page. To view that page, see [Creating File Rules, on page 1433](#).

Contained files that can be inspected appears in the same page.

- **File size**

You can inspect archive files as large as the **Maximum file size to store** file policy advanced access control setting.

- **Nested archives**

Archive files can contain other archive files, which can in turn contain archive files. The level at which a file is nested is its *archive file depth*. Note that the top-level archive file is not included in the depth count; depth begins at 1 with the first nested file.

The system can inspect up to three levels of nested files beneath the outermost archive file (level 0). You can configure your file policy to block archive files that exceed that depth (or a lower maximum depth that you specify).

If you choose not to block files that exceed the maximum archive file depth of 3, when archive files that contain some extractable contents and some contents nested at a depth of 3 or greater appear in monitored traffic, the system examines and reports data only for the files it was able to inspect.

## Override File Disposition Using Custom Lists

All features applicable to uncompressed files (such as dynamic analysis and file storage) are available for nested files inside archive files.

- **Encrypted files**

You can configure the system to block archives whose contents are encrypted or otherwise cannot be inspected.

- **Archives that are not inspected**

If traffic that contains an archive file is on a Security Intelligence Block list or Do Not Block list, or if the top-level archive file's SHA-256 value is on the custom detection list, the system does not inspect the contents of the archive file.

If a nested file is blocked, the entire archive is blocked; however, if a nested file is allowed, the archive is not automatically passed (depending on any other nested files and characteristics).

.Exe files inside some .rar archives cannot be detected, including possibly rar5.

### Archive File Dispositions

Archive file dispositions are based on the dispositions assigned to the files inside the archive. **All** archives that contain identified malware files receive a disposition of `Malware`. Archives without identified malware files receive a disposition of `Unknown` if they contain any unknown files, and a disposition of `Clean` if they contain only clean files.

**Table 99: Archive File Disposition by Contents**

| Archive File Disposition | Number of Unknown Files | Number of Clean Files | Number of Malware Files |
|--------------------------|-------------------------|-----------------------|-------------------------|
| Unknown                  | 1 or more               | Any                   | 0                       |
| Clean                    | 0                       | 1 or more             | 0                       |
| Malware                  | Any                     | Any                   | 1 or more               |

Archive files, like other files, may have dispositions of `Custom Detection` or `Unavailable` if the conditions for those dispositions apply.

### Viewing Archive Contents and Details

If your file policy is configured to inspect archive file contents, you can use the context menu in a table on pages under the Analysis > Files menu, and the network file trajectory viewer to view information about the files inside an archive when the archive file appears in a file event, malware event, or as a captured file.

All file contents of the archive are listed in table form, with a short summary of their relevant information: name, SHA-256 hash value, type, category, and archive depth. A network file trajectory icon appears by each file, which you can click to view further information about that specific file.

## Override File Disposition Using Custom Lists

If a file has a disposition in the AMP cloud that you know to be incorrect, you can add the file's SHA-256 value to a file list that overrides the disposition from the cloud:

- To treat a file as if the AMP cloud assigned a clean disposition, add the file to the *clean list*.

- To treat a file as if the AMP cloud assigned a malware disposition, add the file to the *custom detection list*.

On subsequent detection, the device either allows or blocks the file without reevaluating the file's disposition. You can use the clean list or custom detection list per file policy.

---

**Note** To calculate a file's SHA-256 value, you must configure a rule in the file policy to either perform a malware cloud lookup or block malware on matching files.

---

For complete information about using file lists in Firepower, see [File Lists, on page 438](#).

Alternatively, if applicable, use [Centralized File Lists from AMP for Endpoints, on page 1423](#).

### Centralized File Lists from AMP for Endpoints

If your organization has deployed AMP for Endpoints, Firepower can use Block and Allow lists created in AMP for Endpoints when it queries the AMP cloud for file dispositions.

Requirements:

- Your organization must be using the AMP public cloud.
- Your organization has deployed AMP for Endpoints.
- You have registered your Firepower system to AMP for Endpoints using the procedure in [Integrate Firepower and AMP for Endpoints, on page 1437](#).

To create and deploy these lists, see the documentation or online help for AMP for Endpoints.

---

**Note** File lists created in Firepower override file lists created in AMP for Endpoints.

---

## Managing File Policies

The File Policies page displays a list of existing file policies along with their last-modified dates. You can use this page to manage your file policies.

In a multidomain deployment, the system displays policies created in the current domain, which you can edit. It also displays policies created in ancestor domains, which you cannot edit. To view and edit policies created in a lower domain, switch to that domain.

---

**Note** The system checks for updates to the list of file types eligible for dynamic analysis (no more than once a day). If the list of eligible file types changes, this constitutes a change in the file policy; any access control policy using the file policy is marked out-of-date if deployed to any devices. You must deploy policies before the updated file policy can take effect on the device. See [Maintain Your System: Update File Types Eligible for Dynamic Analysis, on page 1419](#).

---

## Procedure

---

**Step 1** Select **Policies > Access Control > Malware & File** .

**Step 2** Manage your file policies:

- Compare—Click **Compare Policies**; see [Comparing Policies, on page 355](#).
  - Create — To create a file policy, click **New File Policy** and proceed as described in [Create or Edit a File Policy, on page 1419](#).
  - Copy — To copy a file policy, click **Copy** ().  
If **View** () appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.
  - Delete — If you want to delete a file policy, click **Delete** () , then click **Yes** and **OK** as prompted.  
If the controls are dimmed, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.
  - Deploy—Click **Deploy**; see [Deploy Configuration Changes, on page 346](#).
  - Edit — If you want to modify an existing file policy, click **Edit** ().
  - Report—Click **Report** (); see [Generating Current Policy Reports, on page 356](#).
- 

## File Rules

A file policy, like its parent access control policy, contains rules that determine how the system handles files that match the conditions of each rule. You can configure separate file rules to take different actions for different file types, application protocols, or directions of transfer.

For example, when a file matches a rule, the rule can:

- allow or block files based on simple file type matching
- block files based on disposition (whether or not evaluation indicates that it is malicious)
- store files to the device (For information, see [Captured Files and File Storage, on page 1431](#))
- submit stored (captured) files for local malware, Spero, or dynamic analysis

In addition, the file policy can:

- automatically treat a file as if it is clean or malware based on entries in the clean list or custom detection list
- treat a file as if it is malware if the file's threat score exceeds a configurable threshold
- inspect the contents of archive files (such as `.zip` or `.rar`)

- block archive files whose contents are encrypted, nested beyond a specified maximum archive depth, or otherwise uninspectable

## File Rule Components

*Table 100: File Rule Components*

| File Rule Component       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| application protocol      | The system can detect and inspect files transmitted via FTP, HTTP, SMTP, IMAP, POP3, and NetBIOS-ssn (SMB). <b>Any</b> , the default, detects files in HTTP, SMTP, IMAP, POP3, FTP, and NetBIOS-ssn (SMB) traffic. To improve performance, you can restrict file detection to only one of those application protocols on a per-file rule basis.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| direction of transfer     | You can inspect incoming FTP, HTTP, IMAP, POP3, and NetBIOS-ssn (SMB) traffic for downloaded files; you can inspect outgoing FTP, HTTP, SMTP, and NetBIOS-ssn (SMB) traffic for uploaded files.<br><br><b>Tip</b> Use <b>Any</b> to detect files over multiple application protocols, regardless of whether users are sending or receiving.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| file categories and types | The system can detect various types of files. These file types are grouped into basic categories, including multimedia (swf, mp3), executables (exe, torrent), and PDFs. You can configure file rules that detect individual file types, or on entire categories of file types.<br><br>For example, you could block all multimedia files, or just ShockWave Flash (swf) files. Or, you could configure the system to alert you when a user downloads a BitTorrent (torrent) file.<br><br>Note that executables include file types that can run macros and scripts, since these can contain malware.<br><br>For a list of file types the system can inspect, select <b>Policies &gt; Access Control &gt; Malware &amp; File</b> , create a temporary new file policy, then click <b>Add Rule</b> . Select a file type category and the file types that the system can inspect appear in the <b>File Types</b> list.<br><br><b>Note</b> Frequently triggered file rules can affect system performance. For example, detecting multimedia files in HTTP traffic (YouTube, for example, transmits significant Flash content) could generate an overwhelming number of events. |

| File Rule Component | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| file rule action    | <p>A file rule's action determines how the system handles traffic that matches the conditions of the rule.</p> <p>Depending on the selected action, you can configure whether the system stores the file or performs Spero, local malware, or dynamic analysis on a file. If you select a Block action, you can also configure whether the system also resets the blocked connection.</p> <p>For descriptions of these actions and options, see <a href="#">File Rule Actions, on page 1426</a>.</p> <p>File rules are evaluated in rule-action, not numerical, order. For details, see <a href="#">File Rule Actions: Evaluation Order, on page 1432</a>.</p> |

## File Rule Actions

File rules give you granular control over which file types you want to log, block, or scan for malware. Each file rule has an associated action that determines how the system handles traffic that matches the conditions of the rule. To be effective, a file policy must contain one or more rules. You can use separate rules within a file policy to take different actions for different file types, application protocols, or directions of transfer.

### File Rule Actions

- *Detect Files* rules allow you to log the detection of specific file types to the database, while still allowing their transmission.
- *Block Files* rules allow you to block specific file types. You can configure options to reset the connection when a file transfer is blocked, and store captured files to the managed device.
- *Malware Cloud Lookup* rules allow you to obtain and log the disposition of files traversing your network, while still allowing their transmission.
- *Block Malware* rules allow you to calculate the SHA-256 hash value of specific file types, query the AMP cloud to determine if files traversing your network contain malware, then block files that represent threats.

### File Rule Action Options

Depending on the action you select, you have different options:

| File Rule Action Option   | Block Files capable? | Block Malware capable?                                              | Detect Files capable? | Malware Cloud Lookup capable?                                       |
|---------------------------|----------------------|---------------------------------------------------------------------|-----------------------|---------------------------------------------------------------------|
| Spero Analysis* for MSEXE | no                   | yes, you can submit executable files                                | no                    | yes, you can submit executable files                                |
| Dynamic Analysis*         | no                   | yes, you can submit executable files with Unknown file dispositions | no                    | yes, you can submit executable files with Unknown file dispositions |
| Capacity Handling         | no                   | yes                                                                 | no                    | yes                                                                 |

| File Rule Action Option | Block Files capable?                       | Block Malware capable?                                                  | Detect Files capable?                      | Malware Cloud Lookup capable?                                           |
|-------------------------|--------------------------------------------|-------------------------------------------------------------------------|--------------------------------------------|-------------------------------------------------------------------------|
| Local Malware Analysis* | no                                         | yes                                                                     | no                                         | yes                                                                     |
| Reset Connection        | yes (recommended)                          | yes (recommended)                                                       | no                                         | no                                                                      |
| Store files             | yes, you can store all matching file types | yes, you can store file types matching the file dispositions you select | yes, you can store all matching file types | yes, you can store file types matching the file dispositions you select |

\* For complete information about these options, see [Malware Protection Options \(in File Rule Actions\)](#), on [page 1427](#) and its subtopics.

**Caution** Selecting **Detect Files** or **Block Files**, enabling or disabling **Store files** in a **Detect Files** or **Block Files** rule, or adding the first or removing the last file rule that combines the **Malware Cloud Lookup** or **Block Malware** file rule action with an analysis option (**Spero Analysis** or **MSEXE**, **Dynamic Analysis**, or **Local Malware Analysis**) or a store files option (**Malware**, **Unknown**, **Clean**, or **Custom**), restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See [Snort® Restart Traffic Behavior](#), on [page 350](#) for more information.

## Malware Protection Options (in File Rule Actions)

The Firepower system applies several methods of file inspection and analysis to determine whether a file contains malware.

Depending on the options you enable in a file rule, the system inspects files using the following tools, in order:

1. [Spero Analysis](#), on [page 1429](#) and [AMP Cloud Lookup](#), on [page 1429](#)
2. [Local Malware Analysis](#), on [page 1429](#)
3. [Dynamic Analysis](#), on [page 1430](#)

For a comparison of these tools, see [Comparison of Malware Protection Options](#), on [page 1427](#).

(You can also, if you choose, block all files based on their file type. For more information, see [Block All Files by Type](#), on [page 1432](#).)

See also information about Cisco's AMP for Endpoints product at [\(Optional\) Malware Protection with AMP for Endpoints](#), on [page 1434](#) and subtopics.

### Comparison of Malware Protection Options

The following table details the benefits and drawbacks of each type of file analysis, as well as the way each malware protection method determines a file's disposition.

| Analysis Type                               | Benefit                                                                                                                                          | Limitations                                                                                                          | Malware Identification                                                                                                                                                                                                                                          |
|---------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Spero analysis                              | Structural analysis of executable files, submits Spero signature to the AMP Cloud for analysis                                                   | Less thorough than local malware analysis or dynamic analysis, only for executable files                             | Disposition changes from Unknown to Malware only on positive identification of malware.                                                                                                                                                                         |
| Local malware analysis                      | Consumes fewer resources than dynamic analysis, and returns results more quickly, especially if the detected malware is common                   | Less thorough results than dynamic analysis                                                                          | Disposition changes from Unknown to Malware only on positive identification of malware.                                                                                                                                                                         |
| Dynamic analysis                            | Thorough analysis of unknown files using Cisco Threat Grid                                                                                       | Eligible files are uploaded to the public cloud or an on-premises appliance. It takes some time to complete analysis | Threat score determines maliciousness of a file. Disposition can be based on the threat score threshold configured in the file policy.                                                                                                                          |
| Spero analysis and local malware analysis   | Consumes fewer resources than configuring local malware analysis and dynamic analysis, while still using AMP cloud resources to identify malware | Less thorough than dynamic analysis, Spero analysis only for executable files                                        | Disposition changes from Unknown to Malware only on positive identification of malware.                                                                                                                                                                         |
| Spero analysis and dynamic analysis         | Uses full capabilities of AMP cloud in submitting files and Spero signatures                                                                     | Results obtained less quickly than if using local malware analysis                                                   | Threat score changes based on dynamic analysis results for files preclassified as possible malware. Disposition changes based on configured threat score threshold in the file policy, and from Unknown to Malware if the Spero analysis identifies malware.    |
| Local malware analysis and dynamic analysis | Thorough results in using both types of file analysis                                                                                            | Consumes more resources than either alone                                                                            | Threat score changes based on dynamic analysis results for files preclassified as possible malware. Disposition changes from Unknown to Malware if local malware analysis identifies malware, or based on configured threat score threshold in the file policy. |

| Analysis Type                                               | Benefit                                                                                                 | Limitations                                                         | Malware Identification                                                                                                                                                                                                                                                            |
|-------------------------------------------------------------|---------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Spero analysis, local malware analysis and dynamic analysis | Most thorough results                                                                                   | Consumes most resources in running all three types of file analysis | Threat score changes based on dynamic analysis results for files preclassified as possible malware. Disposition changes from Unknown to Malware if Spero analysis or local malware analysis identifies malware, or based on configured threat score threshold in the file policy. |
| (Block transmission of all files of a specified file type)  | Does not require a Malware license<br><br>(This option is not technically a malware protection option.) | Legitimate files will also be blocked                               | (No analysis is performed.)                                                                                                                                                                                                                                                       |

**Note** Preclassification does not itself determine a file's disposition; it is merely one of the factors that determine whether a file is eligible for Dynamic Analysis.

### Spero Analysis

Spero analysis examines structural characteristics such as metadata and header information in executable files. After generating a Spero signature based on this information, if the file is an eligible executable file, the device submits it to the Spero heuristic engine in the AMP cloud. Based on the Spero signature, the Spero engine determines whether the file is malware. You can also configure rules to submit files for Spero analysis without also submitting them to the AMP cloud.

Note that you cannot manually submit files for Spero analysis.

### AMP Cloud Lookup

For files that are eligible for assessment using Advanced Malware Protection, the Firepower Management Center performs a *malware cloud lookup*, querying the AMP cloud for the file's disposition based on its SHA-256 hash value.

To improve performance, the system caches dispositions returned by the cloud and uses the cached disposition for known files rather than querying the AMP cloud. For more information about this cache, see [Cached Disposition Longevity](#), on page 1430.

### Local Malware Analysis

Local malware analysis allows a managed device to locally inspect executables, PDFs, office documents, and other types of files for the most common types of malware, using a detection rule set provided by the Cisco Talos Intelligence Group (Talos). Because local analysis does not query the AMP cloud, and does not run the file, local malware analysis saves time and system resources.

If the system identifies malware through local malware analysis, it updates the existing file disposition from Unknown to Malware. The system then generates a new malware event. If the system does not identify malware, it does not update the file disposition from Unknown to Clean. After the system runs local malware

analysis, it caches file information such as SHA-256 hash value, timestamp, and disposition, so that if detected again within a certain period of time, the system can identify malware without additional analysis. For more information about the cache, see [Cached Disposition Longevity, on page 1430](#).

Local malware analysis does not require establishing communications with the Cisco Threat Grid cloud. However, you must configure communications with the cloud to submit files for dynamic analysis, and to download updates to the local malware analysis ruleset.

### Cached Disposition Longevity

Dispositions returned from an AMP cloud query, associated threat scores, and dispositions assigned by local malware analysis, have a time-to-live (TTL) value. After a disposition has been held for the duration specified in the TTL value without update, the system purges the cached information. Dispositions and associated threat scores have the following TTL values:

- Clean — 4 hours
- Unknown — 1 hour
- Malware — 1 hour

If a query against the cache identifies a cached disposition that timed out, the system re-queries the local malware analysis database and the AMP cloud for a new disposition.

### Dynamic Analysis

You can configure your file policy to automatically submit files for dynamic analysis using Cisco Threat Grid (formerly AMP Threat Grid), Cisco's file analysis and threat intelligence platform.

Devices submit eligible files to Cisco Threat Grid (either the public cloud or to an on-premises appliance, whichever you have specified) regardless of whether the device stores the file.

Cisco Threat Grid runs the file in a sandbox environment, analyzes the file's behavior to determine whether the file is malicious, and returns a threat score that indicates the likelihood that a file contains malware. From the threat score, you can view a dynamic analysis summary report with the reasons for the assigned threat score. You can also look in Cisco Threat Grid to view detailed reports for files that your organization submitted, as well as scrubbed reports with limited data for files that your organization did not submit.

For more information about Cisco Threat Grid, see <https://www.cisco.com/c/en/us/products/security/threat-grid/index.html>

To configure your system to perform dynamic analysis, see the topics under [Dynamic Analysis Connections, on page 1416](#).

### Which Files Are Eligible for Dynamic Analysis?

A file's eligibility for dynamic analysis depends on:

- the file type
- the file size
- the file rule's action

Additionally:

- The system submits only files that match the file rules you configure.

- The file must have a malware cloud lookup disposition of Unknown or Unavailable at the time the file is sent for analysis.
- The system must preclassify the file as potential malware.

### Dynamic Analysis and Capacity Handling

Capacity handling allows you to temporarily store files that are otherwise eligible for dynamic analysis if the system is temporarily unable to submit files to the cloud, either because the device cannot communicate with the cloud or because the maximum number of submissions has been reached. The system submits the stored files when the hindering condition has passed.

Some devices can store files on the device hard drive or in a malware storage pack. See also [Malware Storage Pack, on page 1432](#).

### Captured Files and File Storage

The file storage feature allows you to capture selected files detected in traffic, and automatically store a copy of the file temporarily to a device's hard drive, or, if installed, to the malware storage pack.

After your device captures the files, you can:

- Store captured files on the device's hard drive for later analysis.
- Download the stored file to a local computer for further manual analysis or archival purposes.
- Manually submit eligible captured files for AMP cloud lookup or dynamic analysis.

Note that once a device stores a file, it will not re-capture it if the file is detected in the future and the device still has that file stored.

---

**Note** When a file is detected for the first time on your network, you can generate a file event that represents the file's detection. However, if your file rule performs a malware cloud lookup, the system requires additional time to query the AMP cloud and return a disposition. Due to this delay, the system cannot store this file until the second time it is seen on your network, and the system can immediately determine the file's disposition.

---

Whether the system captures or stores a file, you can:

- Review information about the captured file from Analysis > Files > Captured Files, including whether the file was stored or submitted for dynamic analysis, file disposition, and threat score, allowing you to quickly review possible malware threats detected on your network.
- View the file's trajectory to determine how it traversed your network and which hosts have a copy.
- Add the file to the clean list or custom detection list to always treat the file as if it had a clean or malware disposition on future detection.

You configure file rules in a file policy to capture and store files of a specific type, or with a particular file disposition, if available. After you associate the file policy with an access control policy and deploy it to your devices, matching files in traffic are captured and stored. You can also limit the minimum and maximum file sizes to store.

Stored files are not included in system backups.

You can view captured file information under Analysis > Files > Captured Files, and download a copy for offline analysis.

## Malware Storage Pack

Based on your file policy configuration, your device may store a substantial amount of file data to the hard drive. You can install a malware storage pack in the device; the system stores files to the malware storage pack, allowing more room on the primary hard drive to store events and configuration files. The system periodically deletes older files. If the device's primary hard drive does not have enough available space, and does not have an installed malware storage pack, you cannot store files.

---

**Caution** Do not attempt to install a hard drive that was not supplied by Cisco in your device. Installing an unsupported hard drive may damage the device. Malware storage pack kits are available for purchase **only** from Cisco, and are for use **only** with 8000 Series devices. Contact Support if you require assistance with the malware storage pack. See the *Firepower System Malware Storage Pack Guide* for more information.

---

Without a malware storage pack installed, when you configure a device to store files, it allocates a set portion of the primary hard drive's space to captured file storage. If you configure capacity handling to temporarily store files for dynamic analysis, the system uses the same hard drive allocation to store these files until it can resubmit them to the cloud.

When you install a malware storage pack in a device and configure file storage or capacity handling, the device allocates the entire malware storage pack for storing these files. The device cannot store any other information on the malware storage pack.

When the allocated space for captured file storage fills to capacity, the system deletes the oldest stored files until the allocated space reaches a system-defined threshold. Based on the number of files stored, you may see a substantial drop in disk usage after the system deletes files.

If a device has already stored files when you install a malware storage pack, the next time you restart the device, any captured files or capacity handling files stored on the primary hard drive are moved to the malware storage pack. Any future files the device stores are stored to the malware storage pack.

## Block All Files by Type

If your organization wants to block not only the transmission of malware files, but all files of a specific type, regardless of whether the files contain malware, you can do so.

File control is supported for all file types where the system can detect malware, plus many additional file types. These file types are grouped into basic categories, such as multimedia (swf, mp3), executables (exe, torrent), and PDFs.

Blocking all files based on their type is not technically a malware protection feature; it does not require a Malware license and does not query the AMP cloud.

## File Rule Actions: Evaluation Order

A file policy will likely contain multiple rules with different actions for different situations. If more than one rule can apply to a particular situation, the evaluation order described in this topic applies. In general, simple blocking takes precedence over malware inspection and blocking, which takes precedence over simple detection and logging.

The order of precedence of file-rule actions is:

- *Block Files*

- *Block Malware*
- *Malware Cloud Lookup*
- *Detect Files*

## Creating File Rules

**Caution** Selecting **Detect Files** or **Block Files**, enabling or disabling **Store files** in a **Detect Files** or **Block Files** rule, or adding the first or removing the last file rule that combines the **Malware Cloud Lookup** or **Block Malware** file rule action with an analysis option (**Spero Analysis** or **MSEXE**, **Dynamic Analysis**, or **Local Malware Analysis**) or a store files option (**Malware**, **Unknown**, **Clean**, or **Custom**), restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See [Snort® Restart Traffic Behavior](#), on page 350 for more information.

### Before you begin

If you are configuring rules for malware protection, see [Configure File Policies](#), on page 1407.

### Procedure

- Step 1** In the file policy editor, click **Add File Rule**.
- Step 2** Select an **Application Protocol** and **Direction of Transfer** as described in [File Rule Components](#), on page 1425.
- Step 3** Select one or more **File Types**.
- The file types you see depend on the selected application protocol, direction of transfer, and action.
- You can filter the list of file types in the following ways:
- Select one or more **File Type Categories**, then click **All types in selected Categories**.
  - Search for a file type by its name or description. For example, type **windows** in the **Search name and description** field to display a list of Microsoft Windows-specific files.
- Tip** Hover your pointer over a file type to view its description.
- Step 4** Select a file rule **Action** as described in [File Rule Actions](#), on page 1426, with consideration for [File Rule Actions: Evaluation Order](#), on page 1432.
- The actions available to you depend on the licenses you have installed. See [License Requirements for File and Malware Policies](#), on page 1403.
- Step 5** Depending on the action you selected, configure options:
- reset the connection after blocking the file
  - store files that match the rule
  - enable Spero analysis\*

- enable local malware analysis\*
- enable dynamic analysis\* and capacity handling

\* For information about these options, see [File Rule Actions, on page 1426](#) and [Malware Protection Options \(in File Rule Actions\), on page 1427](#) and its subtopics.

**Step 6** Click **Add**.

**Step 7** Click **Save** to save the policy.

---

#### What to do next

- If you are configuring policies for malware protection, return to [Configure File Policies, on page 1407](#).
- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## Access Control Rule Logging for Malware Protection

When the system detects a prohibited file (including malware) according to the settings in the file policy, it automatically logs an event to the Firepower Management Center database. If you do not want to log file or malware events, you can disable this logging on a per-access-control-rule basis.

The system also logs the end of the associated connection to the Firepower Management Center database, regardless of the logging configuration of the invoking access control rule.

## Retrospective Disposition Changes

File dispositions can change. For example, as new information is discovered, the AMP cloud can determine that a file that was previously thought to be clean is now identified as malware, or the reverse—that a malware-identified file is actually clean. When the disposition changes for a file you queried in the past week, the AMP cloud notifies the system so it can automatically take action the next time it detects that file being transmitted. A changed disposition is called a *retrospective* disposition.

## (Optional) Malware Protection with AMP for Endpoints

Cisco's AMP for Endpoints is a separate malware-protection product that can supplement malware protection provided by the Firepower system and be integrated with your Firepower deployment.

AMP for Endpoints is Cisco's enterprise-class Advanced Malware Protection solution that runs as a lightweight connector on individual users' *endpoints* (computers and mobile devices) to discover, understand, and block advanced malware outbreaks, advanced persistent threats, and targeted attacks.

Benefits of AMP for Endpoints include:

- configure custom malware detection policies and profiles for your entire organization, as well as perform flash and full scans on all your users' files
- perform malware analysis, including view heat maps, detailed file information, network file trajectory, and threat root causes

- configure multiple aspects of outbreak control, including automatic quarantines, application blocking to stop non-quarantined executables from running, and exclusion lists
- create custom protections, block execution of certain applications based on group policy, and create custom Allowed Applications lists
- use the AMP for Endpoints management console to help you mitigate the effect of malware. The management console provides a robust, flexible web interface where you control all aspects of your AMP for Endpoints deployment and manage all phases of an outbreak.

For detailed information about AMP for Endpoints, see:

- <https://www.cisco.com/c/en/us/products/security/amp-for-endpoints/index.html>.
- Online help in the AMP for Endpoints management console.
- AMP for Endpoints documentation available from: <http://docs.amp.cisco.com>.

## Comparison of Malware Protection: Firepower vs. AMP for Endpoints

**Table 101: Advanced Malware Protection Differences by Detecting Product**

| Feature                                                | Firepower Malware Protection (AMP for Networks)                                                    | AMP for Endpoints                                                                                                       |
|--------------------------------------------------------|----------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------|
| File type detection and blocking method (file control) | In network traffic, using access control and file policies                                         | Not supported                                                                                                           |
| Malware detection and blocking method                  | In network traffic, using access control and file policies                                         | On individual endpoints (end-user computers and mobile devices), using a connector that communicates with the AMP cloud |
| Network traffic inspected                              | Traffic passing through a managed device                                                           | None; connectors installed on endpoints directly inspect files                                                          |
| Malware intelligence data source                       | AMP cloud (public or private)                                                                      | AMP cloud (public or private)                                                                                           |
| Malware detection robustness                           | Limited file types                                                                                 | All file types                                                                                                          |
| Malware analysis choices                               | FMC-based, plus analysis in the AMP cloud                                                          | FMC-based, plus additional options on the AMP for Endpoints management console                                          |
| Malware mitigation                                     | Malware blocking in network traffic, FMC-initiated remediations                                    | AMP for Endpoints-based quarantine and outbreak control options, FMC-initiated remediations                             |
| Events generated                                       | File events, captured files, malware events, and retrospective malware events                      | Malware events                                                                                                          |
| Information in malware events                          | Basic malware event information, plus connection data (IP address, port, and application protocol) | In-depth malware event information; no connection data                                                                  |

| Feature                            | Firepower Malware Protection (AMP for Networks)                | AMP for Endpoints                                                                                      |
|------------------------------------|----------------------------------------------------------------|--------------------------------------------------------------------------------------------------------|
| Network file trajectory            | FMC-based                                                      | FMC and the AMP for Endpoints management console each have a network file trajectory. Both are useful. |
| Required licenses or subscriptions | Licenses required to perform file control and AMP for Networks | AMP for Endpoints subscription. No license is required to bring AMP for Endpoints data into FMC.       |

## About Integrating Firepower with AMP for Endpoints

If your organization has deployed AMP for Endpoints, you can optionally integrate that product with your Firepower deployment.

Integration with AMP for Endpoints does not require a dedicated Firepower license.

### Benefits of Integrating Firepower and AMP for Endpoints

Integrating your AMP for Endpoints deployment with your Firepower system offers the following benefits:

- Centralized Blocked Applications and Allowed Applications lists configured in AMP for Endpoints can determine verdicts for file SHAs sent from Firepower to the AMP cloud for disposition.

See [Centralized File Lists from AMP for Endpoints, on page 1423](#).

- The system can import malware events detected by AMP for Endpoints into Firepower Management Center so you can manage these events along with malware events generated by the Firepower system. Imported data for these events includes scans, malware detections, quarantines, blocked executions, and cloud recalls, as well as indications of compromise (IOCs) that FMC displays for hosts that it monitors.

For more information, see [Malware Event Analysis with AMP for Endpoints, on page 2298](#).

- You can view file trajectory and other details in the AMP for Endpoints console.

For details, see [Work with Event Data in the AMP for Endpoints Console, on page 2323](#).

#### Important

If you use a Cisco AMP Private Cloud, see limitations at [AMP for Endpoints and AMP Private Cloud, on page 1436](#).

## AMP for Endpoints and AMP Private Cloud

If you configure a Cisco AMP private cloud to collect AMP endpoint data on your network, all AMP for Endpoints connectors send data to the private cloud, which forwards that data to the Firepower Management Center. The private cloud does not share any of your endpoint data over an external connection.

If your organization has deployed an AMP private cloud, all connections to the AMP cloud funnel through the private cloud, which acts as an anonymized proxy to ensure the security and privacy of your monitored network. This includes importing AMP for Endpoints data. The private cloud does not share any of your endpoint data over an external connection.

The following integration features are not available if you use an AMP private cloud:

- Use of Blocked Applications and Allowed Applications lists configured in AMP for Endpoints. (These lists are used to block or allow files.)
- Visibility in AMP for Endpoints of malware events generated from Firepower.

You can configure multiple private clouds to support the capacity you require.

## Integrate Firepower and AMP for Endpoints

If your organization has deployed Cisco's AMP for Endpoints product, you can integrate that application with Firepower to achieve the benefits described in [Benefits of Integrating Firepower and AMP for Endpoints](#), on page 1436.

When you integrate with AMP for Endpoints, you must configure an AMP for Endpoints connection even if you already have an AMP for Networks (AMP for Firepower) connection configured. You can configure multiple AMP for Endpoints cloud connections.

### Caution

In a multidomain deployment, configure AMP for Endpoints connections at the leaf level only, especially if your leaf domains have overlapping IP space. If multiple subdomains have hosts with the same IP-MAC address pair, the system could save malware events that are generated by AMP for Endpoints to the wrong leaf domain, or associate IOCs with the wrong hosts.

However, you can configure AMP for Endpoints connections at any domain level, provided you use a separate AMP for Endpoints account for each connection. For example, each client of an MSSP might have its own AMP for Endpoints deployment.

### Note

An AMP for Endpoints connection that has not registered successfully does not affect AMP for Networks.

### Before you begin

- You must be an Admin user to perform this task.
- If your deployment uses Cisco AMP Private Cloud, see limitations at [AMP for Endpoints and AMP Private Cloud](#), on page 1436.
- AMP for Endpoints must be set up and working properly on your network.
- The Firepower Management Center must have direct access to the Internet.
- Make sure your FMC and AMP for Endpoints can communicate with each other. See the topics under [Security, Internet Access, and Communication Ports](#), on page 2425.
- If you are connecting to the AMP cloud after either restoring your Firepower Management Center to factory defaults or reverting to a previous version, use the AMP for Endpoints management console to remove the previous connection.
- You will need your AMP for Endpoints credentials to log in to the AMP for Endpoints console during this procedure.

## Procedure

---

- Step 1** Choose **AMP > AMP Management**.
- Step 2** Click **Add AMP Cloud Connection**.
- Step 3** From the **Cloud Name** drop-down list, choose the cloud you want to use:
- The AMP cloud closest to the geographical location of your Firepower Management Center.
  - For AMP private cloud (AMPv), choose **Private Cloud** and proceed as described in [Cisco AMP Private Cloud, on page 1413](#).
- Step 4** If you want to use this cloud for both AMP for Networks and AMP for Endpoints, select the **Use for AMP for Firepower** check box.
- If you configured a different cloud to handle AMP for Networks (AMP for Firepower) communications, you can clear this check box; if this is your only AMP cloud connection, you cannot.
- In a multidomain deployment, this check box appears only in the Global domain. Each Firepower Management Center can have only one AMP for Networks connection.
- Step 5** Click **Register**.
- A spinning state icon indicates that a connection is pending, for example, after you configure a connection on the Firepower Management Center, but before you authorize it using the AMP for Endpoints management console. A **Denied** (🚫) indicates that the cloud denied the connection or the connection failed for another reason.
- Step 6** Confirm that you want to continue to the AMP for Endpoints management console, then log into the management console.
- Step 7** Using the management console, authorize the AMP cloud to send AMP for Endpoints data to the Firepower Management Center.
- Step 8** If you want to restrict the data that the FMC receives, select specific groups within your organization for which you want to receive information.
- By default, the AMP cloud sends data for all groups. To manage groups, choose **Management > Groups** on the AMP for Endpoints management console. For detailed information, see the management console online help.
- Step 9** Click **Allow** to enable the connection and start the transfer of data.
- Clicking **Deny** returns you to the Firepower Management Center, where the connection is marked as denied. If you navigate away from the Applications page on the AMP for Endpoints management console, and neither deny nor allow the connection, the connection is marked as pending on the Firepower Management Center's web interface. The health monitor does **not** alert you of a failed connection in either of these situations. If you want to connect to the AMP cloud later, delete the failed or pending connection, then recreate it.
- Incomplete registration of an AMP for Endpoints connection does not disable the AMP for Networks connection.
- Step 10** To verify that the connection is correctly configured:
- a) On the **AMP > AMP Management** page, click the Cloud Name that includes **AMP for Endpoints** in the **Cisco AMP Solution Type** column.
  - b) In the AMP for Endpoints console window that displays, choose **Accounts > Applications**.
  - c) Verify that your Firepower Management Center is on the list.

- d) In the AMP for Endpoints console window, choose **Manage > Computers**.
- e) Verify that your Firepower Management Center is on the list.

---

### What to do next

- In the AMP for Endpoints console window, configure settings as needed. For example, define group membership for your management center and assign policies. For information, see the AMP for Endpoints online help or other documentation.
- In high availability configurations, you must configure AMP cloud connections independently on the Active and Standby instances of the Firepower Management Center; these configurations are not synchronized.
- The default health policy warns you if the Firepower Management Center cannot connect to the AMP for Endpoints portal after an initial successful connection, or if the connection is deregistered using the AMP portal.

Verify that the **AMP for Endpoints Status** monitor is enabled under **System > Health > Policy**.

## History for File Policies and Malware Protection

| Feature                                                          | Version                         | Details                                                                                                                                                                                     |
|------------------------------------------------------------------|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Chapter restructure                                              | any version that is republished | Restructured this chapter's content to reduce confusion.<br>Some content was moved to or from the chapter for <a href="#">File/Malware Events and Network File Trajectory</a> on page 2295. |
| Moved URL Filtering information to the new URL Filtering chapter | 6.3                             | Moved information about configuring cloud communications for URL Filtering to the new URL Filtering chapter. Made related changes to the structure of the Cisco CSI topics in the chapter.  |

# CHAPTER 73

## File and Malware Inspection Performance and Storage Tuning

The following topics describe how to configure file and malware inspection performance and storage:

- [File and Malware Inspection Performance and Storage Options, on page 1441](#)
- [Tuning File and Malware Inspection Performance and Storage, on page 1443](#)

### File and Malware Inspection Performance and Storage Options

Increasing the file sizes can affect the performance of the system.

**Caution**

Configuring a non-default value under Files and Malware Settings restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See [Snort® Restart Traffic Behavior, on page 350](#) for more information.

*Table 102: Advanced Access Control File and AMP for Networks Options*

| Field                                                                     | Description                                                                  | Guidelines and Restrictions                                                                                                                                                                                                                                                  |
|---------------------------------------------------------------------------|------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Limit the number of bytes inspected when doing file type detection</b> | Specifies the number of bytes inspected when performing file type detection. | 0 - 4294967295 (4GB)<br>0 removes the restriction.<br>The default value is the maximum segment size of a TCP packet (1460 bytes). In most cases, the system can identify common file types using the first packet.<br>To detect ISO files, enter a value greater than 36870. |

| Field                                                                           | Description                                                                                                                                                                                                                                                                                                                       | Guidelines and Restrictions                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Allow file if cloud lookup for Block Malware takes longer than (seconds)</b> | Specifies how long the system will hold the last byte of a file that matches a <b>Block Malware</b> rule and that does not have a cached disposition, while malware cloud lookup occurs. If the time elapses without the system obtaining a disposition, the file passes. Dispositions of Unavailable are not cached.             | 0 - 30 seconds<br><br>Do <i>not</i> set this option to 0 without contacting Support.<br><br>Cisco recommends that you use the default value to avoid blocking traffic because of connection failures.                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Do not calculate SHA-256 hash values for files larger than (in bytes)</b>    | Prevents the system from storing files larger than a certain size, performing a malware cloud lookup on the files, or blocking the files if added to the custom detection list.                                                                                                                                                   | 0 - 4294967295 (4GB)<br><br>0 removes the restriction.<br><br>This value must be greater than or equal to <b>Maximum file size to store (bytes)</b> and <b>Maximum file size for dynamic analysis testing (bytes)</b> .                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Minimum file size to store (bytes)</b>                                       | These settings specify: <ul style="list-style-type: none"> <li>The file size that the system can inspect using the following detectors: <ul style="list-style-type: none"> <li>Spero analysis</li> <li>Sandboxing and preclassification</li> </ul> </li> <li>Local malware analysis/ClamAV</li> <li>Archive inspection</li> </ul> | 0 - 10485760 (10MB)<br><br>0 disables file storage.<br><br>Must be less than or equal to <b>Maximum file size to store (bytes)</b> and <b>Do not calculate SHA-256 hash values for files larger than (in bytes)</b> .                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Maximum file size to store (bytes)</b>                                       | <ul style="list-style-type: none"> <li>The file size that the system can store using a file rule.</li> </ul>                                                                                                                                                                                                                      | 0 - 10485760 (10MB)<br><br>0 disables file storage.<br><br>Must be greater than or equal to <b>Minimum file size to store (bytes)</b> , and less than or equal to <b>Do not calculate SHA-256 hash values for files larger than (in bytes)</b> .                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Minimum file size for dynamic analysis testing (bytes)</b>                   | Specifies the minimum file size the system can submit to the AMP cloud for dynamic analysis.                                                                                                                                                                                                                                      | 0 -10485760 (10MB)<br><br>Must be less than or equal to <b>Maximum file size for dynamic analysis testing (bytes)</b> and <b>Do not calculate SHA-256 hash values for files larger than (in bytes)</b> .<br><br>The file size for dynamic analysis must be within the limits defined by the minimum and maximum settings for file analysis.<br><br>The system checks the AMP cloud for updates to the minimum file size you can submit (no more than once a day). If the new minimum size is larger than your current value, your current value is updated to the new minimum, and your policy is marked out-of-date. |

| Field                                                         | Description                                                                                  | Guidelines and Restrictions                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## Tuning File and Malware Inspection Performance and Storage

You must be an Admin, Access Admin, or Network Admin user to perform this task.

**Caution** Configuring a non-default value under Files and Malware Settings restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See [Snort® Restart Traffic Behavior, on page 350](#) for more information.

### Procedure

- 
- Step 1** In the access control policy editor, click **Advanced Settings**.
- Step 2** Click **Edit** () next to **Files and Malware Settings**.
- If **View** () appears instead, settings are inherited from an ancestor policy, or you do not have permission to modify the settings. If the configuration is unlocked, uncheck **Inherit from base policy** to enable editing.
- Step 3** Set any of the options described in [File and Malware Inspection Performance and Storage Options, on page 1441](#).
- Step 4** Click **OK**.
- Step 5** Click **Save** to save the policy.
- 

### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

**Related Topics**

## Network Analysis and Intrusion Policy Basics

Network analysis and intrusion policies work together as part of the Firepower System's intrusion detection and prevention feature.

- The term *intrusion detection* generally refers to the process of passively monitoring and analyzing network traffic for potential intrusions and storing attack data for security analysis. This is sometimes referred to as "IDS."
- The term *intrusion prevention* includes the concept of intrusion detection, but adds the ability to block or alter malicious traffic as it travels across your network. This is sometimes referred to as "IPS."

In an intrusion prevention deployment, when the system examines packets:

- A **network analysis policy** governs how traffic is *decoded* and *preprocessed* so it can be further evaluated, especially for anomalous traffic that might signal an intrusion attempt.
- An **intrusion policy** uses *intrusion and preprocessor rules* (sometimes referred to collectively as *intrusion rules*) to examine the decoded packets for attacks based on patterns. Intrusion policies are paired with *variable sets*, which allow you to use named values to accurately reflect your network environment.

Both network analysis and intrusion policies are invoked by a parent access control policy, but at different times. As the system analyzes traffic, the network analysis (decoding and preprocessing) phase occurs before and separately from the intrusion prevention (additional preprocessing and intrusion rules) phase. Together, network analysis and intrusion policies provide broad and deep packet inspection. They can help you detect,

alert on, and protect against network traffic that could threaten the availability, integrity, and confidentiality of hosts and their data.

The Firepower System is delivered with several similarly named network analysis and intrusion policies (for example, Balanced Security and Connectivity) that complement and work with each other. By using system-provided policies, you can take advantage of the experience of the Cisco Talos Intelligence Group (Talos). For these policies, Talos sets intrusion and preprocessor rule states, as well as provides the initial configurations for preprocessors and other advanced settings.

You can also create custom network analysis and intrusion policies. You can tune settings in custom policies to inspect traffic in the way that matters most to you so that you can improve both the performance of your managed devices and your ability to respond effectively to the events they generate.

You create, edit, save, and manage network analysis and intrusion policies using similar policy editors in the web interface. When you are editing either type of policy, a navigation panel appears on the left side of the web interface; the right side displays various configuration pages.

## How Policies Examine Traffic For Intrusions

When the system analyzes traffic as part of your access control deployment, the network analysis (decoding and preprocessing) phase occurs before and separately from the intrusion prevention (intrusion rules and advanced settings) phase.

The following diagram shows, in a simplified fashion, the order of traffic analysis in an inline, intrusion prevention and AMP for Networks deployment. It illustrates how the access control policy invokes other policies to examine traffic, and in which order those policies are invoked. The network analysis and intrusion policy selection phases are highlighted.

In an inline deployment (that is, where relevant configurations are deployed to devices using routed, switched, or transparent interfaces, or inline interface pairs), the system can block traffic without further inspection at almost any step in the illustrated process. Security Intelligence, the SSL policy, network analysis policies, file policies, and intrusion policies can all either drop or modify traffic. Only the network discovery policy, which passively inspects packets, cannot affect the flow of traffic.

Similarly, at each step of the process, a packet could cause the system to generate an event. Intrusion and preprocessor events (sometimes referred to collectively as *intrusion events*) are indications that a packet or its contents may represent a security risk.

---

**Tip** The diagram does not reflect that access control rules handle encrypted traffic when your SSL inspection configuration allows it to pass, or if you do not configure SSL inspection. By default, the system disables intrusion and file inspection of encrypted payloads. This helps reduce false positives and improve performance when an encrypted connection matches an access control rule that has intrusion and file inspection configured.

---

Note that for a single connection, although the system selects a network analysis policy before an access control rule as shown in the diagram, some preprocessing (notably application layer preprocessing) occurs after access control rule selection. This does **not** affect how you configure preprocessing in custom network analysis policies.

## Decoding, Normalizing, and Preprocessing: Network Analysis Policies

Without decoding and preprocessing, the system could not appropriately evaluate traffic for intrusions because protocol differences would make pattern matching impossible. Network analysis policies govern these traffic-handling tasks:

- **after** traffic is filtered by Security Intelligence
- **after** encrypted traffic is decrypted by an optional SSL policy
- **before** traffic can be inspected by file or intrusion policies

A network analysis policy governs packet processing in phases. First the system decodes packets through the first three TCP/IP layers, then continues with normalizing, preprocessing, and detecting protocol anomalies:

- The packet decoder converts packet headers and payloads into a format that can be easily used by the preprocessors and later, intrusion rules. Each layer of the TCP/IP stack is decoded in turn, beginning with the data link layer and continuing through the network and transport layers. The packet decoder also detects various anomalous behaviors in packet headers.
- In inline deployments, the inline normalization preprocessor reformats (normalizes) traffic to minimize the chances of attackers evading detection. It prepares packets for examination by other preprocessors and intrusion rules, and helps ensure that the packets the system processes are the same as the packets received by the hosts on your network.

---

**Note** In a passive deployment, Cisco recommends that you enable adaptive profile updates at the access control policy level, instead of inline normalization at the network analysis level.

---

- Various network and transport layers preprocessors detect attacks that exploit IP fragmentation, perform checksum validation, and perform TCP and UDP session preprocessing.

Note that some advanced transport and network preprocessor settings apply globally to all traffic handled by the target devices of an access control policy. You configure these in the access control policy rather than in a network analysis policy.

- Various application-layer protocol decoders normalize specific types of packet data into formats that the intrusion rules engine can analyze. Normalizing application-layer protocol encodings allows the system to effectively apply the same content-related intrusion rules to packets whose data is represented differently, and to obtain meaningful results.

- The Modbus and DNP3 SCADA preprocessors detect traffic anomalies and provide data to intrusion rules. Supervisory Control and Data Acquisition (SCADA) protocols monitor, control, and acquire data from industrial, infrastructure, and facility processes such as manufacturing, production, water treatment, electric power distribution, airport and shipping systems, and so on.
- Several preprocessors allow you to detect specific threats, such as Back Orifice, portscans, SYN floods and other rate-based attacks.

Note that you configure the sensitive data preprocessor, which detects sensitive data such as credit card numbers and Social Security numbers in ASCII text, in intrusion policies.

In a newly created access control policy, one default network analysis policy governs preprocessing for *all* traffic for *all* intrusion policies invoked by the same parent access control policy. Initially, the system uses the Balanced Security and Connectivity network analysis policy as the default, but you can change it to another system-provided or custom network analysis policy. In a more complex deployment, advanced users can tailor traffic preprocessing options to specific security zones, networks, and VLANs by assigning different custom network analysis policies to preprocess matching traffic.

## Access Control Rules: Intrusion Policy Selection

After initial preprocessing, access control rules (when present) evaluate traffic. In most cases, the first access control rule that a packet matches is the rule that handles that traffic; you can monitor, trust, block, or allow matching traffic.

When you allow traffic with an access control rule, the system can inspect the traffic for discovery data, malware, prohibited files, and intrusions, in that order. Traffic not matching any access control rule is handled by the access control policy's default action, which can also inspect for discovery data and intrusions.

---

**Note** All packets, **regardless** of which network analysis policy preprocesses them, are matched to configured access control rules—and thus are potentially subject to inspection by intrusion policies—in top-down order.

---

The diagram in [How Policies Examine Traffic For Intrusions, on page 1448](#) shows the flow of traffic through a device in an inline, intrusion prevention and AMP for Networks deployment, as follows:

- Access Control Rule A allows matching traffic to proceed. The traffic is then inspected for discovery data by the network discovery policy, for prohibited files and malware by File Policy A, and then for intrusions by Intrusion Policy A.
- Access Control Rule B also allows matching traffic. However, in this scenario, the traffic is not inspected for intrusions (or files or malware), so there are no intrusion or file policies associated with the rule. Note that by default, traffic that you allow to proceed is inspected by the network discovery policy; you do not need to configure this.
- In this scenario, the access control policy's default action allows matching traffic. The traffic is then inspected by the network discovery policy, and then by an intrusion policy. You can (but do not have to) use a different intrusion policy when you associate intrusion policies with access control rules or the default action.

The example in the diagram does not include any blocking or trusting rules because the system does not inspect blocked or trusted traffic.

## Intrusion Inspection: Intrusion Policies, Rules, and Variable Sets

You can use intrusion prevention as the system's last line of defense before traffic is allowed to proceed to its destination. Intrusion policies govern how the system inspects traffic for security violations and, in inline deployments, can block or alter malicious traffic. The main function of intrusion policies is to manage which intrusion and preprocessor rules are enabled and how they are configured.

### Intrusion and Preprocessor Rules

An intrusion rule is a specified set of keywords and arguments that detects attempts to exploit vulnerabilities on your network; the system uses an intrusion rule to analyze network traffic to check if it matches the criteria in the rule. The system compares packets against the conditions specified in each rule and, if the packet data matches all the conditions specified in a rule, the rule triggers.

The system includes the following types of rules created by Cisco Talos Intelligence Group (Talos):

- *shared object intrusion rules*, which are compiled and cannot be modified (except for rule header information such as source and destination ports and IP addresses)
- *standard text intrusion rules*, which can be saved and modified as new custom instances of the rule.
- *preprocessor rules*, which are rules associated with preprocessors and packet decoder detection options in the network analysis policy. You cannot copy or edit preprocessor rules. Most preprocessor rules are disabled by default; you must enable them to use preprocessors to generate events and, in an inline deployment, drop offending packets.

When the system processes packets according to an intrusion policy, first a rule optimizer classifies all activated rules in subsets based on criteria such as: transport layer, application protocol, direction to or from the protected network, and so on. Then, the intrusion rules engine selects the appropriate rule subsets to apply to each packet. Finally, a multi-rule search engine performs three different types of searches to determine if the traffic matches the rule:

- The protocol field search looks for matches in particular fields in an application protocol.
- The generic content search looks for ASCII or binary byte matches in the packet payload.
- The packet anomaly search looks for packet headers and payloads that, rather than containing specific content, violate well-established protocols.

In a custom intrusion policy, you can tune detection by enabling and disabling rules, as well as by writing and adding your own standard text rules. You can also use Firepower recommendations to associate the operating systems, servers, and client application protocols detected on your network with rules specifically written to protect those assets.

### Variable Sets

Whenever the system uses an intrusion policy to evaluate traffic, it uses an associated *variable set*. Most variables in a set represent values commonly used in intrusion rules to identify source and destination IP addresses and ports. You can also use variables in intrusion policies to represent IP addresses in rule suppressions and dynamic rule states.

The system provides a single default variable set, which is comprised of predefined default variables. Most system-provided shared object rules and standard text rules use these predefined default variables to define networks and port numbers. For example, the majority of the rules use the variable `$HOME_NET` to specify the protected network and the variable `$EXTERNAL_NET` to specify the unprotected (or outside) network. In addition,

specialized rules often use other predefined variables. For example, rules that detect exploits against web servers use the `$HTTP_SERVERS` and `$HTTP_PORTS` variables.

---

**Tip** Even if you use system-provided intrusion policies, Cisco **strongly** recommends that you modify key default variables in the default set. When you use variables that accurately reflect your network environment, processing is optimized and the system can monitor relevant systems for suspicious activity. Advanced users can create and use custom variable sets for pairing with one or more custom intrusion policies.

---

## Intrusion Event Generation

When the system identifies a possible intrusion, it generates an *intrusion or preprocessor event* (sometimes collectively called *intrusion events*). Managed devices transmit their events to the Firepower Management Center, where you can view the aggregated data and gain a greater understanding of the attacks against your network assets. In an inline deployment, managed devices can also drop or replace packets that you know to be harmful.

Each intrusion event in the database includes an event header and contains information about the event name and classification; the source and destination IP addresses; ports; the process that generated the event; and the date and time of the event, as well as contextual information about the source of the attack and its target. For packet-based events, the system also logs a copy of the decoded packet header and payload for the packet or packets that triggered the event.

The packet decoder, the preprocessors, and the intrusion rules engine can all cause the system to generate an event. For example:

- If the packet decoder (configured in the network analysis policy) receives an IP packet that is less than 20 bytes, which is the size of an IP datagram without any options or payload, the decoder interprets this as anomalous traffic. If, later, the accompanying decoder rule in the intrusion policy that examines the packet is enabled, the system generates a preprocessor event.
- If the IP defragmentation preprocessor encounters a series of overlapping IP fragments, the preprocessor interprets this as a possible attack and, when the accompanying preprocessor rule is enabled, the system generates a preprocessor event.
- Within the intrusion rules engine, most standard text rules and shared object rules are written so that they generate intrusion events when triggered by packets.

As the database accumulates intrusion events, you can begin your analysis of potential attacks. The system provides you with the tools you need to review intrusion events and evaluate whether they are important in the context of your network environment and your security policies.

# System-Provided and Custom Network Analysis and Intrusion Policies

Creating a new access control policy is one of the first steps in managing traffic flow using the Firepower System. By default, a newly created access control policy invokes system-provided network analysis and intrusion policies to examine traffic.

The following diagram shows how a newly created access control policy in an inline, intrusion-prevention deployment initially handles traffic. The preprocessing and intrusion prevention phases are highlighted.

Note how:

- A default network analysis policy governs the preprocessing of *all* traffic handled by the access control policy. Initially, the system-provided *Balanced Security and Connectivity network analysis policy* is the default.
- The default action of the access control policy allows all non-malicious traffic, as determined by the system-provided *Balanced Security and Connectivity intrusion policy*. Because the default action allows traffic to pass, the discovery feature can examine it for host, application, and user data before the intrusion policy can examine and potentially block malicious traffic.
- The policy uses default Security Intelligence options (global Block and Do Not Block lists only), does not decrypt encrypted traffic with an SSL policy, and does not perform special handling and inspection of network traffic using access control rules.

A simple step you can take to tune your intrusion prevention deployment is to use a different set of system-provided network analysis and intrusion policies as your defaults. Cisco delivers several pairs of these policies with the Firepower System.

Or, you can tailor your intrusion prevention deployment by creating and using custom policies. You may find that the preprocessor options, intrusion rule, and other advanced settings configured in those policies do not address the security needs of your network. By tuning your network analysis and intrusion policies you can configure, at a very granular level, how the system processes and inspects the traffic on your network for intrusions.

## System-Provided Network Analysis and Intrusion Policies

Cisco delivers several pairs of network analysis and intrusion policies with the Firepower System. By using system-provided network analysis and intrusion policies, you can take advantage of the experience of the Cisco Talos Intelligence Group (Talos). For these policies, Talos provides intrusion and preprocessor rule states as well as initial configurations for preprocessors and other advanced settings.

No system-provided policy covers every network profile, traffic mix, or defensive posture. Each covers common cases and network setups that provide a starting point for a well-tuned defensive policy. Although you can use system-provided policies as-is, Cisco strongly recommends that you use them as the base for custom policies that you tune to suit your network.

---

**Tip** Even if you use system-provided network analysis and intrusion policies, you should configure the system's intrusion variables to accurately reflect your network environment. At a minimum, modify key default variables in the default set.

---

As new vulnerabilities become known, Talos releases intrusion rule updates (also known as *Snort Rule Updates*). These rule updates can modify any system-provided network analysis or intrusion policy, and can provide new and updated intrusion rules and preprocessor rules, modified states for existing rules, and modified default policy settings. Rule updates may also delete rules from system-provided policies and provide new rule categories, as well as modify the default variable set.

If a rule update affects your deployment, the web interface marks affected intrusion and network analysis policies as out of date, as well as their parent access control policies. You must re-deploy an updated policy for its changes to take effect.

For your convenience, you can configure rule updates to automatically re-deploy affected intrusion policies, either alone or in combination with affected access control policies. This allows you to easily and automatically keep your deployment up-to-date to protect against recently discovered exploits and intrusions.

To ensure up-to-date preprocessing settings, you **must** re-deploy access control policies, which also deploys any associated SSL, network analysis, and file policies that are different from those currently running, and can also update default values for advanced preprocessing and performance options.

Cisco delivers the following network analysis and intrusion policies with the Firepower System:

#### **Balanced Security and Connectivity network analysis and intrusion policies**

These policies are built for both speed and detection. Used together, they serve as a good starting point for most organizations and deployment types. The system uses the Balanced Security and Connectivity policies and settings as defaults in most cases.

#### **Connectivity Over Security network analysis and intrusion policies**

These policies are built for organizations where connectivity (being able to get to all resources) takes precedence over network infrastructure security. The intrusion policy enables far fewer rules than those enabled in the Security over Connectivity policy. Only the most critical rules that block traffic are enabled.

#### **Security Over Connectivity network analysis and intrusion policies**

These policies are built for organizations where network infrastructure security takes precedence over user convenience. The intrusion policy enables numerous network anomaly intrusion rules that could alert on or drop legitimate traffic.

#### **Maximum Detection network analysis and intrusion policies**

These policies are built for organizations where network infrastructure security is given even more emphasis than is given by the Security Over Connectivity policies, with the potential for even greater operational impact. For example, the intrusion policy enables rules in a large number of threat categories including malware, exploit kit, old and common vulnerabilities, and known in-the-wild exploits.

#### **No Rules Active intrusion policy**

In the No Rules Active intrusion policy, all intrusion rules, and all advanced settings except intrusion rule thresholds, are disabled. This policy provides a starting point if you want to create your own intrusion policy instead of basing it on the enabled rules in one of the other system-provided policies.

---

**Note** Depending on the system-provided base policy that is selected, the settings of the policy vary. To view the policy settings, click the **Edit** icon next to the policy and then click the **Manage Base Policy** link.

---

## Benefits of Custom Network Analysis and Intrusion Policies

You may find that the preprocessor options, intrusion rules, and other advanced settings configured in the system-provided network analysis and intrusion policies do not fully address the security needs of your organization.

Building custom policies can improve the performance of the system in your environment and can provide a focused view of the malicious traffic and policy violations occurring on your network. By creating and tuning custom policies you can configure, at a very granular level, how the system processes and inspects the traffic on your network for intrusions.

All custom policies have a base policy, also called a base layer, which defines the default settings for all configurations in the policy. A layer is a building block that you can use to efficiently manage multiple network analysis or intrusion policies.

In most cases, you base custom policies on system-provided policies, but you can use another custom policy. However, all custom policies have a system-provided policy as the eventual base in a policy chain. Because rule updates can modify system-provided policies, importing a rule update may affect you even if you are using a custom policy as your base. If a rule update affects your deployment, the web interface marks affected policies as out of date.

## Benefits of Custom Network Analysis Policies

By default, one network analysis policy preprocesses all unencrypted traffic handled by the access control policy. That means that all packets are decoded and preprocessed according to the same settings, regardless of the intrusion policy (and therefore intrusion rule set) that later examines them.

Initially, the system-provided Balanced Security and Connectivity network analysis policy is the default. A simple way to tune preprocessing is to create and use a custom network analysis policy as the default.

Tuning options available vary by preprocessor, but some of the ways you can tune preprocessors and decoders include:

- You can disable preprocessors that do not apply to the traffic you are monitoring. For example, the HTTP Inspect preprocessor normalizes HTTP traffic. If you are confident that your network does not include any web servers using Microsoft Internet Information Services (IIS), you can disable the preprocessor option that looks for IIS-specific traffic and thereby reduce system processing overhead.

---

**Note** If you disable a preprocessor in a custom network analysis policy, but the system needs to use that preprocessor to later evaluate packets against an enabled intrusion or preprocessor rule, the system automatically enables and uses the preprocessor although the preprocessor remains disabled in the network analysis policy web interface.

---

- Specify ports, where appropriate, to focus the activity of certain preprocessors. For example, you can identify additional ports to monitor for DNS server responses or encrypted SSL sessions, or ports on which you decode telnet, HTTP, and RPC traffic.

For advanced users with complex deployments, you can create multiple network analysis policies, each tailored to preprocess traffic differently. Then, you can configure the system to use those policies to govern the preprocessing of traffic using different security zones, networks, or VLANs. (Note that ASA FirePOWER modules cannot restrict preprocessing by VLAN.)

---

**Note** Tailoring preprocessing using custom network analysis policies—especially multiple network analysis policies—is an advanced task. Because preprocessing and intrusion inspection are so closely related, you **must** be careful to allow the network analysis and intrusion policies examining a single packet to complement each other.

---

## Benefits of Custom Intrusion Policies

In a newly created access control policy initially configured to perform intrusion prevention, the default action allows all traffic, but first inspects it with the system-provided Balanced Security and Connectivity intrusion policy. Unless you add access control rules or change the default action, all traffic is inspected by that intrusion policy.

To customize your intrusion prevention deployment, you can create multiple intrusion policies, each tailored to inspect traffic differently. Then, configure an access control policy with rules that specify which policy inspects which traffic. Access control rules can be simple or complex, matching and inspecting traffic using multiple criteria including security zone, network or geographical location, VLAN, port, application, requested URL, or user.

The main function of intrusion policies is to manage which intrusion and preprocessor rules are enabled and how they are configured, as follows:

- Within each intrusion policy, you should verify that all rules applicable to your environment are enabled, and improve performance by disabling rules that are not applicable to your environment. In an inline deployment, you can specify which rules should drop or modify malicious packets.
- Firepower recommendations allow you to associate the operating systems, servers, and client application protocols detected on your network with rules specifically written to protect those assets.
- You can modify existing rules and write new standard text rules as needed to catch new exploits or to enforce your security policies.

Other customizations you might make to an intrusion policy include:

- The sensitive data preprocessor detects sensitive data such as credit card numbers and Social Security numbers in ASCII text. Note that other preprocessors that detect specific threats (back orifice attacks, several portscan types, and rate-based attacks that attempt to overwhelm your network with excessive traffic) are configured in network analysis policies.
- Global thresholds cause the system to generate events based on how many times traffic matching an intrusion rule originates from or is targeted to a specific address or address range within a specified time period. This helps prevent the system from being overwhelmed with a large number of events.
- Suppressing intrusion event notifications and setting thresholds for individual rules or entire intrusion policies can also prevent the system from being overwhelmed with a large number of events.
- In addition to the various views of intrusion events within the web interface, you can enable logging to syslog facilities or send event data to an SNMP trap server. Per policy, you can specify intrusion event notification limits, set up intrusion event notification to external logging facilities, and configure external

responses to intrusion events. Note that in addition to these per-policy alerting configurations, you can globally enable or disable email alerting on intrusion events for each rule or rule group. Your email alert settings are used regardless of which intrusion policy processes a packet.

## Limitations of Custom Policies

Because preprocessing and intrusion inspection are so closely related, you **must** be careful that your configuration allows the network analysis and intrusion policies processing and examining a single packet to complement each other.

By default, the system uses one network analysis policy to preprocess all traffic handled by managed devices using a single access control policy. The following diagram shows how a newly created access control policy in an inline, intrusion-prevention deployment initially handles traffic. The preprocessing and intrusion prevention phases are highlighted.

Notice how a default network analysis policy governs the preprocessing of *all* traffic handled by the access control policy. Initially, the system-provided Balanced Security and Connectivity network analysis policy is the default.

A simple way to tune preprocessing is to create and use a custom network analysis policy as the default. However, if you disable a preprocessor in a custom network analysis policy but the system needs to evaluate preprocessed packets against an enabled intrusion or preprocessor rule, the system automatically enables and uses the preprocessor although it remains disabled in the network analysis policy web interface.

**Note** In order to get the performance benefits of disabling a preprocessor, you **must** make sure that none of your intrusion policies have enabled rules that require that preprocessor.

An additional challenge arises if you use multiple custom network analysis policies. For advanced users with complex deployments, you can tailor preprocessing to specific security zones, networks, and VLANs by assigning custom network analysis policies to preprocess matching traffic. (Note that ASA FirePOWER cannot restrict preprocessing by VLAN.) To accomplish this, you add custom *network analysis rules* to your access control policy. Each rule has an associated network analysis policy that governs the preprocessing of traffic that matches the rule.

**Tip** You configure network analysis rules as an advanced setting in an access control policy. Unlike other types of rules in the Firepower System, network analysis rules invoke—rather than being contained by—network analysis policies.

The system matches packets to any configured network analysis rules in top-down order by rule number. Traffic that does not match any network analysis rule is preprocessed by the default network analysis policy. While this allows you a great deal of flexibility in preprocessing traffic, keep in mind that all packets, **regardless** of which network analysis policy preprocessed them, are subsequently matched to access control rules—and thus to potential inspection by intrusion policies—in their own process. In other words, preprocessing a packet with a particular network analysis policy does **not** guarantee that the packet will be examined with any

particular intrusion policy. You **must** carefully configure your access control policy so it invokes the correct network analysis and intrusion policies to evaluate a particular packet.

The following diagram shows in focused detail how the network analysis policy (preprocessing) selection phase occurs before and separately from the intrusion prevention (rules) phase. For simplicity, the diagram eliminates the discovery and file/malware inspection phases. It also highlights the default network analysis and default-action intrusion policies.

In this scenario, an access control policy is configured with two network analysis rules and a default network analysis policy:

- Network Analysis Rule A preprocesses matching traffic with Network Analysis Policy A. Later, you want this traffic to be inspected by Intrusion Policy A.
- Network Analysis Rule B preprocesses matching traffic with Network Analysis Policy B. Later, you want this traffic to be inspected by Intrusion Policy B.
- All remaining traffic is preprocessed with the default network analysis policy. Later, you want this traffic to be inspected by the intrusion policy associated with the access control policy's default action.

After the system preprocesses traffic, it can examine the traffic for intrusions. The diagram shows an access control policy with two access control rules and a default action:

- Access Control Rule A allows matching traffic. The traffic is then inspected by Intrusion Policy A.
- Access Control Rule B allows matching traffic. The traffic is then inspected by Intrusion Policy B.
- The access control policy's default action allows matching traffic. The traffic is then inspected by the default action's intrusion policy.

Each packet's handling is governed by a network analysis policy and intrusion policy pair, but the system does **not** coordinate the pair for you. Consider a scenario where you misconfigure your access control policy so that Network Analysis Rule A and Access Control Rule A do not process the same traffic. For example, you could intend the paired policies to govern the handling of traffic on a particular security zone, but you mistakenly use different zones in the two rules' conditions. This could cause traffic to be incorrectly preprocessed. For this reason, tailoring preprocessing using network analysis rules and custom policies is an **advanced** task.

Note that for a single connection, although the system selects a network analysis policy before an access control rule, some preprocessing (notably application layer preprocessing) occurs after access control rule selection. This does **not** affect how you configure preprocessing in custom network analysis policies.

# The Navigation Panel: Network Analysis and Intrusion Policies

Network analysis and intrusion policies use similar web interfaces to edit and save changes to their configurations.

A navigation panel appears on the left side of the web interface when you are editing either type of policy. The following graphic shows the navigation panel for the network analysis policy (left) and the intrusion policy (right).

A dividing line separates the navigation panel into links to policy settings you can configure with (below) or without (above) direct interaction with policy layers. To navigate to any settings page, click its name in the navigation panel. Dark shading of an item in the navigation panel highlights your current settings page. For example, in the illustration above the Policy Information page would be displayed to the right of the navigation panel.

### Policy Information

The Policy Information page provides configuration options for commonly used settings. As shown in the illustration for the network analysis policy panel above, a **Policy Change icon** appears next to **Policy Information** in the navigation panel when the policy contains unsaved changes. The icon disappears when you save your changes.

### Rules (intrusion policy only)

The Rules page in an intrusion policy allows you to configure rule states and other settings for shared object rules, standard text rules, and preprocessor rules.

### Firepower Recommendations (intrusion policy only)

The Firepower Recommendations page in an intrusion policy allows you to associate the operating systems, servers, and client application protocols detected on your network with intrusion rules specifically written to protect those assets. This allows you to tailor your intrusion policy to the specific needs of your monitored network.

### Settings (network analysis policy) and Advanced Settings (intrusion policy)

The Settings page in a network analysis policy allows you to enable or disable preprocessors and access preprocessor configuration pages. Expanding the **Settings** link displays sublinks to individual configuration pages for all enabled preprocessors in the policy.

The Advanced Settings page in an intrusion policy allows you to enable or disable advanced settings and access configuration pages for those advanced settings. Expanding the **Advanced Settings** link displays sublinks to individual configuration pages for all enabled advanced settings in the policy.

### Policy Layers

The Policy Layers page displays a summary of the layers that comprise your network analysis or intrusion policy. Expanding the Policy Layers link displays sublinks to summary pages for the layers in your policy. Expanding each layer sublink displays further sublinks to the configuration pages for all rules, preprocessors, or advanced settings that are enabled in the layer.

## Conflicts and Changes: Network Analysis and Intrusion Policies

When you edit a network analysis or intrusion policy, a **Policy Change icon** appears next to **Policy Information** in the navigation panel to indicate that the policy contains unsaved changes. You must save (or *commit*) your changes before the system recognizes them.

---

**Note** After you save, you must deploy the network analysis or intrusion policy for your changes to take effect. If you deploy a policy without saving, the system uses the most recently saved configuration.

---

### Resolving Editing Conflicts

The Network Analysis Policy page (**Policies > Access Control**, then click **Network Analysis Policies or Policies > Access Control > Intrusion**, then click **Network Analysis Policies**) and Intrusion Policy page (**Policies > Access Control > Intrusion**) display whether each policy has unsaved changes, as well as information about who is currently editing the policy. Cisco recommends that only one person edit a policy at a time. If you are performing simultaneous editing, the consequences are as follows:

- If you are editing a network analysis or intrusion policy at the same time another user is editing the same policy, and the other user saves their changes to the policy, you are warned when you commit the policy that you will overwrite the other user's changes.
- If you are editing the same network analysis or intrusion policy via multiple web interface instances as the same user, and you save your changes for one instance, you cannot save your changes for the other instance.

### Resolving Configuration Dependencies

To perform their particular analysis, many preprocessors and intrusion rules require that traffic first be decoded or preprocessed in a certain way, or have other dependencies. When you save a network analysis or intrusion policy, the system either automatically enables required settings, or warns you that disabled settings will have no effect on traffic, as follows:

- You cannot save an intrusion policy if you added an SNMP rule alert but did not configure SNMP alerting. You must either configure SNMP alerting or disable the rule alert, then save again.
- You cannot save an intrusion policy if it includes enabled sensitive data rules but you have not enabled the sensitive data preprocessor. You must either allow the system to enable the preprocessor and save the policy, or disable the rules and save again.
- If you disable a required preprocessor in a network analysis policy, you can still save the policy. However, the system automatically uses the disabled preprocessor with its current settings, even though the preprocessor remains disabled in the web interface.

- If you disable inline mode in a network analysis policy but enable the Inline Normalization preprocessor, you can still save the policy. However, the system warns you that normalization settings will be ignored. Disabling inline mode also causes the system to ignore other settings that allow preprocessors to modify or block traffic, including checksum verification and rate-based attack prevention.

### Committing, Discarding, and Caching Policy Changes

While editing a network analysis or intrusion policy, if you exit the policy editor without saving your changes, the system caches those changes. Your changes are cached even when you log out of the system or experience a system crash. The system cache can store unsaved changes for one network analysis and one intrusion policy per user; you must commit or discard your changes before editing another policy of the same type. The system discards the cached changes when you edit another policy without saving your changes to the first policy, or when you import an intrusion rule update.

You can commit or discard policy changes on the Policy Information page of either the network analysis or intrusion policy editor.

In the Firepower Management Center configuration, you can control:

- whether you are prompted (or required) to comment on your network analysis or intrusion policy changes when you commit them
- whether changes and comments are recorded in the audit log

## Exiting a Network Analysis or Intrusion Policy

### Procedure

---

If you want to exit the network analysis or intrusion policy advanced editor, you have the following choices:

- Cache — To exit the policy and cache changes, choose any menu or other path to another page. On exiting, click **Leave page** when prompted, or click **Stay on page** to remain in the advanced editor.
  - Discard — To discard unsaved changes, click **Discard Changes** on the Policy Information page, then click **OK**.
  - Save — To save changes to the policy, click **Commit Changes** on the Policy Information page. If prompted, enter a comment, and then click **OK**.

## CHAPTER 75

# Layers in Intrusion and Network Analysis Policies

---

The following topics explain how to use layers in intrusion and network analysis policies:

- [Layer Basics, on page 1463](#)
- [License Requirements for Network Analysis and Intrusion Policy Layers, on page 1463](#)
- [Requirements and Prerequisites for Network Analysis and Intrusion Policy Layers, on page 1464](#)
- [The Layer Stack, on page 1464](#)
- [Layer Management, on page 1468](#)

## Layer Basics

Larger organizations with many managed devices may have many intrusion policies and network analysis policies to support the unique needs of different departments, business units or, in some instances, different companies. Configurations in both policy types are contained in building blocks called *layers*, which you can use to efficiently manage multiple policies.

Layers in intrusion and network analysis policies work in essentially the same way. You can create and edit either policy type without consciously using layers. You can modify your policy configurations and, if you have not added user layers to your policy, the system automatically includes your changes in a single configurable layer that is initially named *My Changes*. You can also add up to 200 layers where you can configure any combination of settings. You can copy, merge, move, and delete user layers and, most important, share individual user layers with other policies of the same type.

## The Layer Stack

Layer stacks are composed of the following:

### User Layers

User-configurable layers. You can copy, merge, move, or delete any user-configurable layer and set any user-configurable layer to be shared by other policies of the same type. This layer includes the automatically-generated layer initially named My Changes.

### Built-in Layers

The read-only base policy layer. The policy in this layer can be either a system-provided policy or a custom policy you created.

By default, a network analysis or intrusion policy includes a base policy layer and a My Changes layer. You can add user layers as necessary.

Each policy layer contains complete configurations for either all preprocessors in a network analysis policy or all intrusion rules and advanced settings in an intrusion policy. The lowest, base policy layer includes all the settings from the base policy you selected when you created the policy. A setting in a higher layer takes precedence over the same setting in a lower layer. Features not explicitly set in a layer *inherit* their settings from the next highest layer where they are explicitly set. The system *flattens* the layers, that is, it applies only the cumulative effect of all settings, when it handles network traffic.

---

**Tip** You can create an intrusion or network analysis policy based solely on the default settings in the base policy. In the case of an intrusion policy, you can also use Firepower rule state recommendations if you want to tailor your intrusion policy to the specific needs of your monitored network.

---

The following figure shows an example layer stack that, in addition to the base policy layer and the initial My Changes layer, also includes two additional user-configurable layers, *User Layer 1* and *User Layer 2*. Note

in the figure that each user-configurable layer that you add is initially positioned as the highest layer in the stack; thus, User Layer 2 in the figure was added last and is highest in the stack.

|                         |        |
|-------------------------|--------|
| User Layer 2            | 372756 |
| User Layer 1            |        |
| User Layer (My Changes) |        |
| Base Policy Layer       |        |

Regardless of whether you allow rule updates to modify your policy, changes in a rule update never override changes you make in a layer. This is because changes in a rule update are made in the base policy, which determines the default settings in your base policy layer; your changes are always made in a higher layer, so they override any changes that a rule update makes to your base policy.

## The Base Layer

The base layer, also referred to as the base policy, of an intrusion or network analysis policy defines the default settings for all configurations in the policy, and is the lowest layer in the policy. When you create a new policy and change a setting without adding new layers, the change is stored in the My Changes layer, and overrides—but does not change—the setting in the base policy.

## System-Provided Base Policies

The Firepower System provides several pairs of network analysis and intrusion policies. By using system-provided network analysis and intrusion policies, you can take advantage of the experience of the Cisco Talos Intelligence Group (Talos). For these policies, Talos sets intrusion and preprocessor rule states, as well as provides the initial configurations for preprocessors and other advanced settings. You can use these system-provided policies as-is, or you can use them as the base for custom policies.

If you use a system-provided policy as your base, importing rule updates may modify settings in your base policy. However, you can configure a custom policy so that the system does not automatically make these changes to its system-provided base policy. This allows you to update system-provided base policies manually, on a schedule independent of rule updates. In either case, changes that a rule update makes to your base policy do not change or override settings in your My Changes or any other layer.

System-provided intrusion and network analysis policies are similarly named but contain different configurations. For example, the Balanced Security and Connectivity network analysis policy and the Balanced Security and Connectivity intrusion policy work together and can both be updated in intrusion rule updates.

## Custom Base Policies

You can use a custom policy as your base. You can tune settings in custom policies to inspect traffic in ways that matter most to you so you can improve both the performance of your managed devices and your ability to respond effectively to the events they generate.

If you change the custom policy that you use as the base for another policy, those changes are automatically used as the default settings of the policy that uses the base.

In addition, a rule update may affect your policy even if you use a custom base policy, because all policies have a system-provided policy as the eventual base in a policy chain. If the first custom policy in a chain (the one that uses the system-provided policy as its base) allows rule updates to modify its base policy, your policy may be affected.

Regardless of how changes are made to your base policy—whether by a rule update or when you modify a custom policy that you use as a base policy—they do not change or override settings in your My Changes or any other layer.

## The Effect of Rule Updates on Base Policies

When you import rule updates, the system modifies system-provided intrusion, access control, and network analysis policies. Rule updates can include:

- modified network analysis preprocessor settings
- modified advanced settings in intrusion and access control policies
- new and updated intrusion rules
- modified states for existing rules
- new rule categories and default variables

Rule updates can also delete existing rules from system-provided policies.

Changes to default variables and rule categories are handled at the system level.

When you use a system-provided policy as your intrusion or network analysis base policy, you can allow rule updates to modify your base policy which, in this case, is a copy of the system-provided policy. If you allow rule updates to update your base policy, a new rule update makes the same changes in your base policy that it makes to the system-provided policy that you use as your base policy. If you have not modified the corresponding setting, a setting in your base policy determines the setting in your policy. However, rule updates do not override changes you make in your policy.

If you do not allow rule updates to modify your base policy, you can manually update your base policy after importing one or more rule updates.

Rule updates always delete intrusion rules that Talos deletes, regardless of the rule state in your intrusion policy or whether you allow rule updates to modify your base intrusion policy.

Until you re-deploy your changes to network traffic, rules in your currently deployed intrusion policies behave as follows:

- Disabled intrusion rules remain disabled.
- Rules set to **Generate Events** continue to generate events when triggered.
- Rules set to **Drop and Generate Events** continue to generate events and drop offending packets when triggered.

Rule updates do not modify a custom base policy unless both of the following conditions are met:

- You allow rule updates to modify the system-provided base policy of the parent policy, that is, the policy that originated the custom base policy.
- You have not made changes in the parent policy that override the corresponding settings in the parent's base policy.

When both conditions are met, changes in the rule update are passed to the child policy, that is, the policy using the custom base policy, when you save the parent policy.

For example, if a rule update enables a previously disabled intrusion rule, and you have not modified the rule's state in the parent intrusion policy, the modified rule state is passed to the base policy when you save the parent policy.

Likewise, if a rule update modifies a default preprocessor setting and you have not modified the setting in the parent network analysis policy, the modified setting is passed to the base policy when you save the parent policy.

## Changing the Base Policy

You can choose a different system-provided or custom policy as your base policy.

You can chain up to five custom policies, with four of the five using one of the other four previously created policies as its base policy; the fifth must use a system-provided policy as its base.

### Procedure

---

**Step 1** While editing your policy, click **Policy Information** in the navigation panel.

**Step 2** You can configure the following choices:

- Choose a base policy — Choose from the **Base Policy** drop-down list.
- Allow rule updates to modify the base policy — Click **Manage Base Policy**, then check the **Update when a new Rule Update is installed** check box.

**Tip** When you save your policy with the check box cleared and then import a rule update, an **Update Now** appears on the Base Policy summary page and the status message on the page updates to inform you that the policy is out of date. If you want to update your base policy with the changes in the most recently imported rule update, click **Update Now**.

**Step 3** To save changes you made in this policy since the last policy commit, click **Policy Information**, then click **Commit Changes**.

If you leave the policy without committing changes, changes since the last commit are discarded if you edit a different policy.

---

### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

### Related Topics

## The Firepower Recommendations Layer

When you generate rule state recommendations in an intrusion policy, you can choose whether to automatically modify rule states based on the recommendations.

As seen in the following figure, using recommended rule states inserts a read-only, built-in Firepower Recommendations layer immediately above the base layer.

|                                 |
|---------------------------------|
| User Layer 2                    |
| User Layer 1                    |
| User Layer (My Changes)         |
| Firepower Recommendations Layer |
| Basic Policy Layer              |

Note that this layer is unique to intrusion policies.

If you subsequently choose not to use recommended rule states, the system removes the Firepower Recommendations layer. You cannot manually delete this layer, but you can add and remove it by choosing to use or not use recommended rule states.

Adding the Firepower Recommendations layer adds a Firepower Recommendations link under Policy Layers in the navigation panel. This link leads you to a read-only view of the Firepower Recommendations layer page where you can access a recommendation-filtered view of the Rules page in read-only mode.

Using recommended rule states also adds a Rules sublink beneath the Firepower Recommendations link in the navigation panel. The Rules sublink provides access to a read-only display of the Rules page in the Firepower Recommendations layer. Note the following in this view:

- When there is no rule state icon in the state column, the state is inherited from the base policy.
- When there is no rule state icon in the Firepower Recommendation column in this or other Rules page views, there is no recommendation for this rule.

## Layer Management

The Policy Layers page provides a single-page summary of the complete layer stack for your network analysis or intrusion policy. On this page you can add shared and unshared layers, copy, merge, move, and delete layers, access the summary page for each layer, and access configuration pages for enabled, disabled, and overridden configurations within each layer.

For each layer, you can view the following information:

- whether the layer is a built-in, shared user, or unshared user layer
- which layers contain the highest, that is the effective, preprocessor or advanced setting configurations, by feature name
- in an intrusion policy, the number of intrusion rules whose states are set in the layer, and the number of rules set to each rule state.

The Policy Layers page also provides a summary of the net effect of all enabled preprocessors (network analysis) or advanced settings (intrusion) and, for intrusion policies, intrusion rules.

The feature name in the summary for each layer indicates which configurations are enabled, disabled, overridden, or inherited in the layer, as follows:

| When the feature is...                            | The feature name is... |
|---------------------------------------------------|------------------------|
| enabled in the layer                              | written in plain text  |
| disabled in the layer                             | struck out             |
| overridden by the configuration in a higher layer | written in italic text |
| inherited from a lower layer                      | not present            |

You can add up to 200 layers to a network analysis or intrusion policy. When you add a layer, it appears as the highest layer in your policy. The initial state is Inherit for all features and, in an intrusion policy, no event filtering, dynamic state, or alerting rule actions are set.

You give a user-configurable layer a unique name when you add the layer to your policy. Later, you can change the name and, optionally, add or modify a description that is visible when you edit the layer.

You can copy a layer, move a layer up or down within the User Layers page area, or delete a user layer, including the initial My Changes layer. Note the following considerations:

- When you copy a layer, the copy appears as the highest layer.
- Copying a shared layer creates a layer that is initially unshared and which you can then share if you choose.
- You cannot delete a shared layer; a layer with sharing enabled that you have not shared with another policy is not a shared layer.

You can merge a user-configurable layer with another user-configurable layer immediately beneath it. A merged layer retains all settings that were unique to either layer, and accepts the settings from the higher layer if both layers included settings for the same preprocessor, intrusion rule, or advanced setting. The merged layer retains the name of the lower layer. In the policy where you create a sharable layer that you can add to other policies, you can merge an unshared layer immediately above the sharable layer with the sharable layer, but you cannot merge the sharable layer with an unshared layer beneath it. In a policy where you add a shared layer that you created in another policy, you can merge the shared layer into an unshared layer immediately beneath it and the resulting layer is no longer shared; you cannot merge an unshared layer into a shared layer beneath it.

## Shared Layers

A *shared layer* is a layer you add to your policy after creating the layer in another policy where you allow it to be shared. A *sharable layer* is a layer you allow to be shared.

The following figure shows an example primary policy where you create the company-wide layer and site-specific layers for sites A and B, and allow these to be shared. You then add these as shared layers to the policies for sites A and B.

The company-wide layer in the primary policy includes settings applicable to sites A and B. The site-specific layers include settings specific to each site. For example, in the case of a network analysis policy Site A might not have web servers on the monitored network and would not require the protection or processing overhead of the HTTP Inspect preprocessor, but both sites would likely require TCP stream preprocessing. You could enable TCP stream processing in the company-wide layer that you share with both sites, disable the HTTP Inspect preprocessor in the site-specific layer that you share with Site A, and enable the HTTP Inspect preprocessor in the site-specific layer that you share with Site B. By editing configurations in a higher layer in the site-specific policies, you could also further tune the policy for each site if necessary with any configuration adjustments.

It is unlikely that the flattened net settings in the example primary policy would be useful for monitoring traffic, but the time saved in configuring and updating the site-specific policies makes this a useful application of policy layers.

Many other layer configurations are possible. For example, you could define policy layers by company, by department, by network, or even by user. In the case of an intrusion policy, you could also include advanced settings in one layer and rule settings in another.

You can allow a user-configurable layer to be shared with other policies of the same type (intrusion or network analysis). When you modify a configuration within a sharable layer and then commit your changes, the system updates all policies that share the layer and provides you with a list of all affected policies. You can only change feature configurations in the policy where you created the layer.

You cannot disable sharing for a layer that you have added to another policy; you must first delete the layer from the other policy or delete the other policy.

You cannot add a shared layer to a policy when your base policy is a custom policy where the layer you want to share was created. To do so would give the policy a circular dependency.

In a multidomain deployment, you can add shared layers from ancestor policies to policies in descendant domains.

## Managing Layers

### Procedure

**Step 1** While editing your policy, click **Policy Layers** in the navigation panel.

**Step 2** You can take any of the following management actions on the Policy Layers page:

- Add a shared layer from another policy — Click add shared layer **Add** (+) next to User Layers, choose the layer from the **Add Shared Layer** drop-down list, then click **OK**.
- Add an unshared layer — Click add layer **Add** (+) next to User Layers, enter a **Name**, and click **OK**.
- Add or change the layer description — Click **Edit** (✎) next to the layer, then add or change the **Description**.
- Allow a layer to be shared with another policy — Click **Edit** (✎) next to the layer, then clear the **Sharing** check box.
- Change the layer name — Click **Edit** (✎) next to the layer, then change the **Name**.
- Copy a layer — Click **Copy** (📄) for the layer.

- Delete a layer — Click **Delete** () for the layer, then click **OK**.
- Merge two layers — Click **Merge** () for the upper of the two layers, then click **OK**.
- Move a layer — Click any open area in the layer summary and drag until the **Position Arrow** points to a line above or below a layer where you want to move the layer.

**Step 3** To save changes you made in this policy since the last policy commit, click **Policy Information**, then click **Commit Changes**.

If you leave the policy without committing changes, changes since the last commit are discarded if you edit a different policy.

---

### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## Navigating Layers

---

### Procedure

**Step 1** While editing your policy, click **Policy Layers** in the navigation panel.

**Step 2** You can take any of the following actions to navigate through your layers:

- Access a preprocessor or advanced settings page — If you want to access a layer-level preprocessor or advanced setting configuration page, click the feature name in the row for the layer. Configuration pages are read-only in the base policy and in shared layers.
- Access a rule page — If you want to access a layer-level rule configuration page filtered by rule state type, click **Drop and Generate Events**, **Generate Events**, or **Disabled** in the summary for the layer. No rules are displayed if the layer contains no rules set to the selected rule state.
- Display the Policy Information page — If you want to display the Policy Information page, click **Policy Summary** in the navigation panel.
- Display a layer summary page — If you want to display the summary page for a layer, click the layer name in the row for the layer or, alternately, click **Edit** () next to a user layer. You can also click **View** () to access the read-only summary page for a shared layer.

**Step 3** To save changes you made in this policy since the last policy commit, click **Policy Information**, then click **Commit Changes**.

If you leave the policy without committing changes, changes since the last commit are discarded if you edit a different policy.

---

**What to do next**

- Deploy configuration changes; see [Deploy Configuration Changes](#), on page 346.

## Intrusion Rules in Layers

You can view individual layer settings on the Rules page for the layer, or view the net effect of all settings on the policy view of the Rules page. When you modify rule settings on the policy view of the Rules page, you are modifying the highest user-configurable layer in the policy. You can switch to another layer using the layer drop-down list on any Rules page.

The following table describes the effects of configuring the same type of setting in multiple layers.

**Table 103: Layer Rule Settings**

| You can set... | Of this setting type...           | To...                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------|-----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| one            | rule state                        | override a rule state set for the rule in a lower layer, and ignore all thresholds, suppressions, rate-based rule states, and alerts for that rule configured in lower layers.<br><br>If you want a rule to inherit its state from the base policy or a lower layer, set the rule state to Inherit. Note that when you are working on the intrusion policy Rules page, you cannot set a rule state to Inherit because the intrusion policy Rules page is a composite view of the net effect of all rule settings. |
| one            | threshold SNMP alert              | override a setting of the same type for the rule in a lower layer. Note that setting a threshold overwrites any existing threshold for the rule in the layer.                                                                                                                                                                                                                                                                                                                                                     |
| one or more    | suppression rate-based rule state | cumulatively combine settings of the same type for each selected rule down to the first layer where a rule state is set for the rule. Settings below the layer where a rule state is set are ignored.                                                                                                                                                                                                                                                                                                             |
| one or more    | comment                           | add a comment to a rule. Comments are rule-specific, not policy- or layer-specific. You can add one or more comments to a rule in any layer.                                                                                                                                                                                                                                                                                                                                                                      |

For example, if you set a rule state to Drop and Generate Events in one layer and to Disabled in a higher layer, the intrusion policy Rules page shows that the rule is disabled.

In another example, if you set a source-based suppression for a rule to 192.168.1.1 in one layer, and you also set a destination-based suppression for the rule to 192.168.1.2 in another layer, the Rules page shows that the cumulative effect is to suppress events for the source address 192.168.1.1 and the destination address 192.168.1.2. Note that suppression and rate-based rule state settings cumulatively combine settings of the same type for each selected rule down to the first layer where a rule state is set for the rule. Settings below the layer where a rule state is set are ignored.

Color-coding on each Rules page for a specific layer indicates whether the effective state is in a higher, lower, or the current layer, as follows:

- red—the effective state is in a higher layer
- yellow—the effective state is in a lower layer

- unshaded—the effective state is in the current layer

Because the intrusion policy Rules page is a composite view of the net effect of all rule settings, rule states are not color-coded on this page.

## Configuring Intrusion Rules in Layers

In an intrusion policy, you can set the rule state, event filtering, dynamic state, alerting, and rule comments for a rule in any user-configurable layer. After accessing the layer where you want to make your changes, you add settings on the Rules page for the layer the same as you would on the intrusion policy Rules page.

### Procedure

---

- Step 1** While editing your intrusion policy, expand **Policy Layers** in the navigation panel.
- Step 2** Expand the policy layer you want to modify.
- Step 3** Click **Rules** immediately beneath the policy layer you want to modify.
- Step 4** Modify any of the settings described in [Tuning Intrusion Policies Using Rules, on page 1489](#).
- Tip** To delete an individual setting from an editable layer, double-click the rule message on the Rules page for the layer to display rule details. Click **Delete** next to the setting you want to delete, then click **OK** twice.
- Step 5** To save changes you made in this policy since the last policy commit, click **Policy Information**, then click **Commit Changes**.
- If you leave the policy without committing changes, changes since the last commit are discarded if you edit a different policy.
- 

### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

### Related Topics

[Conflicts and Changes: Network Analysis and Intrusion Policies](#), on page 1461

## Removing Rule Settings from Multiple Layers

You can simultaneously remove a specific type of event filter, dynamic state, or alerting from multiple layers in your intrusion policy. The system removes the selected setting and copies the remaining settings for the rule to the highest editable layer in the policy.

The system removes the setting type downward through each layer where it is set until it removes all the settings or encounters a layer where a rule state is set for the rule. In the latter case, it removes the setting from that layer and stops removing the setting type.

When the system encounters the setting type in a shared layer or in the base policy, and if the highest layer in the policy is editable, the system copies the remaining settings and rule state for the rule to that editable layer. Otherwise, if the highest layer in the policy is a shared layer, the system creates a new editable layer above the shared layer and copies the remaining settings and rule state for the rule to that editable layer.

---

**Note** Removing rule settings derived from a shared layer or the base policy causes any changes to this rule from lower layers or the base policy to be ignored. To stop ignoring changes from lower layers or the base policy, set the rule state to **Inherit** on the summary page for the topmost layer.

---

### Procedure

---

**Step 1** While editing your intrusion policy, click **Rules** immediately beneath **Policy Information** in the navigation panel.

**Tip** You can also choose **Policy** from the layer drop-down list on the Rules page for any layer, or click **Manage Rules** on the Policy Information page.

**Step 2** Choose the rule or rules from which you want to remove multiple settings:

- Choose specific — If you want to choose specific rules, check the check box next to each rule.
- Choose all — If you want to choose all the rules in the current list, check the check box at the top of the column.

**Step 3** Choose one of the following options:

- **Event Filtering > Remove Thresholds**
- **Event Filtering > Remove Suppressions**
- **Dynamic State > Remove Rate-Based Rule States**
- **Alerting > Remove SNMP Alerts**

**Note** Removing rule settings derived from a shared layer or the base policy causes any changes to this rule from lower layers or the base policy to be ignored. To stop ignoring changes from lower layers or the base policy, set the rule state to **Inherit** on the summary page for the topmost layer.

**Step 4** Click **OK**.

**Step 5** To save changes you made in this policy since the last policy commit, click **Policy Information**, then click **Commit Changes**.

If you leave the policy without committing changes, changes since the last commit are discarded if you edit a different policy.

---

### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

### Related Topics

[Conflicts and Changes: Network Analysis and Intrusion Policies](#), on page 1461

## Accepting Rule Changes from a Custom Base Policy

When a custom network analysis or intrusion policy where you have not added layers uses another custom policy as its base policy, you must set a rule to inherit its rule state if:

- you delete an event filter, dynamic state, or SNMP alert that is set for the rule in the base policy, *and*
- you want the rule to accept subsequent changes that you make to it in the other custom policy that you use as your base policy

### Procedure

---

- Step 1** While editing your intrusion policy, expand **Policy Layers** in the navigation panel.
- Step 2** Expand **My Changes**.
- Step 3** Click the **Rules** link immediately beneath **My Changes**.
- Step 4** Choose the rule or rules whose settings you want to accept. You have the following choices:
- Choose specific rules — If you want to choose specific rules, check the check box next to each rule.
  - Choose all rules — If you want to choose all the rules in the current list, check the check box at the top of the column.
- Step 5** Choose **Inherit** from the **Rule State** drop-down list.
- Step 6** To save changes you made in this policy since the last policy commit, click **Policy Information**, then click **Commit Changes**.

If you leave the policy without committing changes, changes since the last commit are discarded if you edit a different policy.

---

### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

### Related Topics

[Conflicts and Changes: Network Analysis and Intrusion Policies](#), on page 1461

## Preprocessors and Advanced Settings in Layers

You use similar mechanisms to configure preprocessors in a network analysis policy and advanced settings in an intrusion policy. You can enable and disable preprocessors on the network analysis Settings page and intrusion policy advanced settings on the intrusion policy Advanced Settings page. These pages also provide summaries of the effective states for all relevant features. For example, if the network analysis SSL preprocessor is disabled in one layer and enabled in a higher layer, the Settings page shows it as enabled. Changes made on these pages appear in the top layer of the policy. Note that the Back Orifice preprocessor has no user-configurable options.

You can also enable or disable preprocessors or advanced settings and access their configuration pages on the summary page for a user-configurable layer. On this page you can modify the layer name and description and configure whether to share the layer with other policies of the same type. You can switch to the summary page for another layer by selecting the layer name beneath **Policy Layers** in the navigation panel.

When you enable a preprocessor or advanced setting, a sublink to the configuration page for that feature appears beneath the layer name in the navigation panel, and an **Edit** () appears next to the feature on the summary page for the layer; these disappear when you disable the feature in the layer or set it to **Inherit**.

Setting the state (enabled or disabled) for a preprocessor or advanced setting overrides the state and configuration settings for that feature in lower layers. If you want a preprocessor or advanced setting to inherit its state and configuration from the base policy or a lower layer, set it to **Inherit**. Note that the **Inherit** selection is not available when you are working in the Settings or Advanced Settings page. Note also that if you inherit a feature that is currently enabled, the feature sublink in the navigation panel and the edit icon on the configuration page no longer appear.

The system uses the configuration in the highest layer where the feature is enabled. Unless you explicitly modify the configuration, the system uses the default configuration. For example, if you enable and modify the network analysis DCE/RPC preprocessor in one layer, and you also enable but do not modify it in a higher layer, the system uses the default configuration in the higher layer.

Color-coding on each layer summary page indicates whether the effective configuration is in a higher, lower, or the current layer, as follows:

- red—the effective configuration is in a higher layer
- yellow—the effective configuration is in a lower layer
- unshaded—the effective configuration is in the current layer

Because the Settings and Advanced Settings pages are composite views of all relevant settings, these page do not use color coding to indicate the positions of effective configurations.

## Configuring Preprocessors and Advanced Settings in Layers

### Procedure

- 
- Step 1** While editing your policy, expand **Policy Layers** in the navigation panel, then click the name of the layer you want to modify.
- Step 2** You have the following choices:
- Change the layer **Name**.
  - Add or change the **Description**.
  - Check or clear the **Sharing** check box to specify whether a layer can be shared with another policy.
  - To access the configuration page for an enabled preprocessor/advanced setting, click **Edit** () or the feature sublink.
  - To disable a preprocessor/advanced setting in the current layer, click **Disabled** next to the feature.
  - To enable a preprocessor/advanced setting in the current layer, click **Enabled** next to the feature.
  - To inherit the preprocessor/advanced setting state and configuration from the settings in the highest layer below the current layer, click **Inherit**.
- Step 3** To save changes you made in this policy since the last policy commit, click **Policy Information**, then click **Commit Changes**.

If you leave the policy without committing changes, changes since the last commit are discarded if you edit a different policy.

---

**What to do next**

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## CHAPTER 76

# Getting Started with Intrusion Policies

---

The following topics explain how to get started with intrusion policies:

- [Intrusion Policy Basics, on page 1479](#)
- [License Requirements for Intrusion Policies, on page 1480](#)
- [Requirements and Prerequisites for Intrusion Policies, on page 1481](#)
- [Managing Intrusion Policies, on page 1481](#)
- [Custom Intrusion Policy Creation, on page 1482](#)
- [Editing Snort 2 Intrusion Policies, on page 1483](#)
- [Access Control Rule Configuration to Perform Intrusion Prevention, on page 1484](#)
- [Drop Behavior in an Inline Deployment, on page 1486](#)
- [Drop Behavior in a Dual System Deployment, on page 1487](#)
- [Intrusion Policy Advanced Settings, on page 1487](#)
- [Optimizing Performance for Intrusion Detection and Prevention, on page 1488](#)

## Intrusion Policy Basics

*Intrusion policies* are defined sets of intrusion detection and prevention configurations that inspect traffic for security violations and, in inline deployments, can block or alter malicious traffic. Intrusion policies are invoked by your access control policy and are the system's last line of defense before traffic is allowed to its destination.

At the heart of each intrusion policy are the intrusion rules. An enabled rule causes the system to generate intrusion events for (and optionally block) traffic matching the rule. Disabling a rule stops processing of the rule.

The Firepower System delivers several base intrusion policies, which enable you to take advantage of the experience of the Cisco Talos Intelligence Group (Talos). For these policies, Talos sets intrusion and preprocessor rule states (enabled or disabled), as well as provides the initial configurations for other advanced settings.

---

**Tip** System-provided intrusion and network analysis policies are similarly named but contain different configurations. For example, the Balanced Security and Connectivity network analysis policy and the Balanced Security and Connectivity intrusion policy work together and can both be updated in intrusion rule updates. However, the network analysis policy governs mostly preprocessing options, whereas the intrusion policy governs mostly intrusion rules.

---

If you create a custom intrusion policy, you can:

- Tune detection by enabling and disabling rules, as well as by writing and adding your own rules.
- Use Firepower recommendations to associate the operating systems, servers, and client application protocols detected on your network with rules specifically written to protect those assets.
- Configure various advanced settings such as external alerting, sensitive data preprocessing, and global rule thresholding.
- Use layers as building blocks to efficiently manage multiple intrusion policies.

In an inline deployment, an intrusion policy can block and modify traffic:

- *Drop rules* can drop matching packets and generate intrusion events. To configure an intrusion or preprocessor drop rule, set its state to Drop and Generate Events.
- Intrusion rules can use the `replace` keyword to replace malicious content.

For intrusion rules to affect traffic, you must correctly configure drop rules and rules that replace content, as well as correctly deploy managed devices inline, that is, with inline interface sets. Finally, you must enable the intrusion policy's *drop behavior*, or **Drop when Inline** setting.

When tailoring your intrusion policy, especially when enabling and adding rules, keep in mind that some intrusion rules require that traffic first be decoded or preprocessed in a certain way. Before an intrusion policy examines a packet, the packet is preprocessed according to configurations in a network analysis policy. If you disable a required preprocessor, the system automatically uses it with its current settings, although the preprocessor remains disabled in the network analysis policy web interface.

---

**Caution** Because preprocessing and intrusion inspection are so closely related, the network analysis and intrusion policies examining a single packet **must** complement each other. Tailoring preprocessing, especially using multiple custom network analysis policies, is an **advanced** task.

---

After you configure a custom intrusion policy, you can use it as part of your access control configuration by associating the intrusion policy with one or more access control rules or an access control policy's default action. This forces the system to use the intrusion policy to examine certain allowed traffic before the traffic passes to its final destination. A variable set that you pair with the intrusion policy allows you to accurately reflect your home and external networks and, as appropriate, the servers on your network.

Note that by default, the system disables intrusion inspection of encrypted payloads. This helps reduce false positives and improve performance when an encrypted connection matches an access control rule that has intrusion inspection configured.

- Intrusion Admin

## Managing Intrusion Policies

On the Intrusion Policy page (**Policies > Access Control > Intrusion**) you can view your current custom intrusion policies, along with the following information:

- the time and date the policy was last modified (in local time) and the user who modified it
- whether the **Drop when Inline** setting is enabled, which allows you to drop and modify traffic in an inline deployment
- which access control policies and devices are using the intrusion policy to inspect traffic
- whether a policy has unsaved changes, as well as information about who (if anyone) is currently editing the policy
- in a multidomain deployment, the domain where the policy was created

In a multidomain deployment, the system displays policies created in the current domain, which you can edit. It also displays policies created in ancestor domains, which you cannot edit. To view and edit policies created in a lower domain, switch to that domain.

## Procedure

---

**Step 1** Choose **Policies > Access Control > Intrusion**.

**Step 2** Manage your intrusion policy:

- Compare—Click **Compare Policies**; see [Comparing Policies, on page 355](#).
- Create — Click **Create Policy**; see [Creating a Custom Intrusion Policy, on page 1482](#).
- Delete — Click **Delete** () next to the policy you want to delete. The system prompts you to confirm and informs you if another user has unsaved changes in the policy. Click **OK** to confirm.

If the controls are dimmed, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

- **Edit** — Click **Edit** () next to the policy you want to edit; see [Editing Snort 2 Intrusion Policies, on page 1483](#).
- If **View** () appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.
- **Export** — If you want to export an intrusion policy to import on another Firepower Management Center, click **YouTube EDU** () ; see [Exporting Configurations, on page 175](#).
- **Deploy**—Click **Deploy**; see [Deploy Configuration Changes, on page 346](#).
- **Report**—Click **Report** () ; see [Generating Current Policy Reports, on page 356](#).

## Custom Intrusion Policy Creation

When you create a new intrusion policy you must give it a unique name, specify a base policy, and specify drop behavior.

The base policy defines the intrusion policy's default settings. Modifying a setting in the new policy overrides—but does not change—the settings in the base policy. You can use either a system-provided or custom policy as your base policy.

The intrusion policy's drop behavior, or **Drop when Inline** setting, determines how the system handles drop rules (intrusion or preprocessor rules whose rule state is set to Drop and Generate Events) and other intrusion policy configurations that affect traffic. You should enable drop behavior in inline deployments when you want to drop or replace malicious packets. Note that in passive deployments, the system cannot affect traffic flow regardless of the drop behavior.

## Creating a Custom Intrusion Policy

### Procedure

- Step 1** Choose **Policies > Access Control > Intrusion**.
- Step 2** Click **Create Policy**. If you have unsaved changes in another policy, click **Cancel** when prompted to return to the Intrusion Policy page.
- Step 3** Enter a unique **Name** and, optionally, a **Description**.
- Step 4** Choose the initial **Base Policy**.  
You can use either a system-provided or another custom policy as your base policy.
- Step 5** Set the system's drop behavior in an inline deployment as described in [Setting Drop Behavior in an Inline Deployment, on page 1486](#).
- Step 6** Create the policy:

- Click **Create Policy** to create the new policy and return to the Intrusion Policy page. The new policy has the same settings as its base policy.
- Click **Create and Edit Policy** to create the policy and open it for editing in the advanced intrusion policy editor; see [Intrusion Policy Changes, on page 1484](#).

---

### Related Topics

## Editing Snort 2 Intrusion Policies

---

### Procedure

- Step 1** Choose **Policies > Access Control > Intrusion**.
- Step 2** Click **Edit** () next to the intrusion policy you want to configure.
- If **View** () appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.
- Step 3** Edit your policy:
- Change the base policy—Choose a base policy from the **Base Policy** drop-down list; see [Changing the Base Policy, on page 1467](#).
  - Configure advanced settings—Click **Advanced Settings** in the navigation panel; see [Intrusion Policy Advanced Settings, on page 1487](#).
  - Configure Firepower recommended intrusion rules—Click **Firepower Recommendations** in the navigation panel; see [Generating and Applying Firepower Recommendations, on page 1520](#).
  - Drop behavior in an inline deployment—Check or clear **Drop when Inline**; see [Setting Drop Behavior in an Inline Deployment, on page 1486](#).
  - Filter rules by recommended rule state—After you generate recommendations, click **View** next to each recommendation type. Click **View Recommended Changes** to view all recommendations.
  - Filter rules by current rule state—Click **View** next to each rule state type (generate events, drop and generate events); see [Intrusion Rule Filters in an Intrusion Policy, on page 1497](#).
  - Manage policy layers—Click **Policy Layers** in the navigation panel; see [Layer Management, on page 1468](#).
  - Manage intrusion rules—Click **Manage Rules**; see [Viewing Intrusion Rules in an Intrusion Policy, on page 1491](#).
  - View settings in base policy—Click **Manage Base Policy**; see [The Base Layer, on page 1465](#).
- Step 4** To save changes you made in this policy since the last policy commit, choose **Policy Information**, then click **Commit Changes**.
- If you leave the policy without committing changes, changes since the last commit are discarded if you edit a different policy.
-

### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes](#), on page 346.

[Configuring Intrusion Rules in Layers](#), on page 1473

[Conflicts and Changes: Network Analysis and Intrusion Policies](#), on page 1461

## Intrusion Policy Changes

When you create a new intrusion policy, it has the same intrusion rule and advanced settings as its base policy.

The system caches one intrusion policy per user. While editing an intrusion policy, if you choose any menu or other path to another page, your changes stay in the system cache even if you leave the page.

## Access Control Rule Configuration to Perform Intrusion Prevention

An access control policy can have multiple access control rules associated with intrusion policies. You can configure intrusion inspection for any Allow or Interactive Block access control rule, which permits you to match different intrusion inspection profiles against different types of traffic on your network before it reaches its final destination.

Whenever the system uses an intrusion policy to evaluate traffic, it uses an associated *variable set*. Variables in a set represent values commonly used in intrusion rules to identify source and destination IP addresses and ports. You can also use variables in intrusion policies to represent IP addresses in rule suppressions and dynamic rule states.

---

**Tip** Even if you use system-provided intrusion policies, Cisco **strongly** recommends you configure the system's intrusion variables to accurately reflect your network environment. At a minimum, modify default variables in the default set.

---

### Understanding System-Provided and Custom Intrusion Policies

Cisco delivers several intrusion policies with the Firepower System. By using system-provided intrusion policies, you can take advantage of the experience of the Cisco Talos Intelligence Group (Talos). For these policies, Talos sets intrusion and preprocessor rule states, as well as provides the initial configurations for advanced settings. You can use system-provided policies as-is, or you can use them as the base for custom policies. Building custom policies can improve the performance of the system in your environment and provide a focused view of the malicious traffic and policy violations occurring on your network.

### Connection and Intrusion Event Logging

When an intrusion policy invoked by an access control rule detects an intrusion and generates an intrusion event, it saves that event to the Firepower Management Center. The system also automatically logs the end of the connection where the intrusion occurred to the Firepower Management Center database, regardless of the logging configuration of the access control rule.

### Related Topics

[Predefined Default Variables](#), on page 414

## Access Control Rule Configuration and Intrusion Policies

The number of unique intrusion policies you can use in a single access control policy depends on the model of the target devices; more powerful devices can handle more. Every unique **pair** of intrusion policy and variable set counts as one policy. Although you can associate a different intrusion policy-variable set pair with each Allow and Interactive Block rule (as well as with the default action), you cannot deploy an access control policy if the target devices have insufficient resources to perform inspection as configured.

## Configuring an Access Control Rule to Perform Intrusion Prevention

You must be an Admin, Access Admin, or Network Admin to perform this task.

### Caution

Changing the total number of intrusion policies used by an access control policy restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See [Snort® Restart Traffic Behavior, on page 350](#) for more information. You change the the total number of intrusion policies by adding an intrusion policy that is not currently used, or by removing the last instance of an intrusion policy. You can use an intrusion policy in an access control rule, as the default action, or as the default intrusion policy.

### Procedure

- Step 1** In the access control policy editor, create a new rule or edit an existing rule; see [Access Control Rule Components, on page 1218](#).
- Step 2** Ensure the rule action is set to **Allow**, **Interactive Block**, or **Interactive Block with reset**.
- Step 3** Click .
- Step 4** Choose a system-provided or custom **Intrusion Policy**, or choose **None** to disable intrusion inspection for traffic that matches the access control rule.
- Step 5** If you want to change the variable set associated with the intrusion policy, choose a value from the **Variable Set** drop-down list.
- Step 6** Click **Save** to save the rule.
- Step 7** Click **Save** to save the policy.

### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

### Related Topics

[Variable Sets](#), on page 412

[Snort® Restart Scenarios](#), on page 348

## Drop Behavior in an Inline Deployment

If you want to assess how your configuration would function in an inline deployment (that is, where relevant configurations are deployed to devices using routed, switched, or transparent interfaces, or inline interface pairs) without actually affecting traffic, you can disable drop behavior. In this case, the system generates intrusion events but does not drop packets that trigger the drop rules. When you are satisfied with the results, you can enable drop behavior.

Note that in passive deployments or inline deployments in tap mode, the system cannot affect traffic regardless of the drop behavior. In a passive deployment, rules set to **Drop and Generate Events** behave identically to rules set to **Generate Events**. The system generates intrusion events but cannot drop packets.

---

**Note** Suppose a file Block action causes a Block or Pending file policy verdict on a packet, and later, an IPS event is generated on the same packet. In that case, the IPS event is marked as Dropped instead of Would have dropped even if the IPS policy is in detection mode (IDS).

---

---

**Note** To block the transfer of malware over FTP, you must not only correctly configure AMP for Networks, but also enable **Drop when Inline** in your access control policy's default intrusion policy.

---

When you view intrusion events, workflows can include the *inline result*, which indicates whether traffic was actually dropped, or whether it only would have dropped.

## Setting Drop Behavior in an Inline Deployment

### Procedure

---

**Step 1** Choose **Policies > Access Control > Intrusion**.

**Step 2** Click **Snort 2 Version** next to the policy you want to edit.

If **View** (🔍) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

**Step 3** Set the policy's drop behavior:

- Check the **Drop when Inline** check box to allow intrusion rules to affect traffic and generate events.
- Clear the **Drop when Inline** check box to prevent intrusion rules from affecting traffic while still generating events.

**Step 4** Click **Commit Changes** to save changes you made in this policy since the last policy commit.

If you leave the policy without committing changes, changes since the last commit are discarded if you edit a different policy.

---

### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## Drop Behavior in a Dual System Deployment

When there are two systems connected back to back in a network, it is normal to see the first system drop events and still record a drop or "would have dropped" event on the second system. The first system decides to drop the packets by the time it scans the last packet of the file, while the second system also investigates and identifies the traffic as "to be dropped".

For example, a 5 packet HTTP GET request whose first packet triggers a rule is blocked by the first system and only the last packet is dropped. The second system receives only 4 packets and the connection gets dropped, but when the second system finally flushes the partial GET request while it is pruning the session, it triggers the same rule with "would have dropped" as the inline result.

## Intrusion Policy Advanced Settings

An intrusion policy's *advanced settings* require specific expertise to configure. The base policy for your intrusion policy determines which advanced settings are enabled by default and the default configuration for each.

When you choose **Advanced Settings** in the navigation panel of an intrusion policy, the policy lists its advanced settings by type. On the Advanced Settings page, you can enable or disable advanced settings in your intrusion policy, as well as access advanced setting configuration pages. An advanced setting must be enabled for you to configure it.

When you disable an advanced setting, the sublink and **Edit** link no longer appear, but your configurations are retained. Note that some intrusion policy configurations (sensitive data rules, SNMP alerts for intrusion rules) require enabled and correctly configured advanced settings.

Modifying the configuration of an advanced setting requires an understanding of the configuration you are modifying and its potential impact on your network.

### Specific Threat Detection

The sensitive data preprocessor detects sensitive data such as credit card numbers and Social Security numbers in ASCII text.

Note that other preprocessors that detect specific threats (back orifice attacks, several portscan types, and rate-based attacks that attempt to overwhelm your network with excessive traffic) are configured in network analysis policies.

### Intrusion Rule Thresholds

Global rule thresholding can prevent your system from being overwhelmed with a large number of events by allowing you to use thresholds to limit the number of times the system logs and displays intrusion events.

### External Responses

In addition to the various views of intrusion events in the web interface, you can enable logging to system log (syslog) facilities or send event data to an SNMP trap server. Per policy, you can specify intrusion event

notification limits, set up intrusion event notification to external logging facilities, and configure external responses to intrusion events.

Note that in addition to these per-policy alerting configurations, you can globally enable or disable email alerting on intrusion events for each rule or rule group. Your email alert settings are used regardless of which intrusion policy processes a packet.

## Optimizing Performance for Intrusion Detection and Prevention

If you want the Firepower System to perform intrusion detection and prevention but do not need to take advantage of discovery data, you can optimize performance by disabling new discovery as described below.

#### Before you begin

To perform this task, you must have one of the following user roles:

- Admin, Access Admin, or Network Admin for access control.
- Admin or Discovery Admin for network discovery.

#### Procedure

- 
- |               |                                                                                                                                                                                                                                                                                      |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | Modify or delete rules associated with the access control policy deployed at the target device. None of the access control rules associated with that device can have user, application, or URL conditions; see <a href="#">Create and Edit Access Control Rules, on page 1220</a> . |
| <b>Step 2</b> | Delete all rules from the network discovery policy for the target device; see <a href="#">Configuring Network Discovery Rules, on page 1920</a> .                                                                                                                                    |
| <b>Step 3</b> | Deploy the changed configuration to the target device; see <a href="#">Deploy Configuration Changes, on page 346</a> .                                                                                                                                                               |

## CHAPTER 77

# Tuning Intrusion Policies Using Rules

The following topics explain how to use rules to tune intrusion policies:

- [Intrusion Rule Tuning Basics, on page 1489](#)
- [Intrusion Rule Types, on page 1489](#)
- [License Requirements for Intrusion Rules, on page 1490](#)
- [Requirements and Prerequisites for Intrusion Rules, on page 1491](#)
- [Viewing Intrusion Rules in an Intrusion Policy, on page 1491](#)
- [Intrusion Rule Filters in an Intrusion Policy, on page 1497](#)
- [Intrusion Rule States, on page 1503](#)
- [Intrusion Event Notification Filters in an Intrusion Policy, on page 1505](#)
- [Dynamic Intrusion Rule States, on page 1511](#)
- [Adding Intrusion Rule Comments, on page 1514](#)

## Intrusion Rule Tuning Basics

You can use the Rules page in an intrusion policy to configure rule states and other settings for shared object rules, standard text rules, and preprocessor rules.

You enable a rule by setting its rule state to Generate Events or to Drop and Generate Events. Enabling a rule causes the system to generate events on traffic matching the rule. Disabling a rule stops processing of the rule. You can also set your intrusion policy so that a rule set to Drop and Generate Events in an inline deployment generates events on, and drops, matching traffic. In a passive deployment, a rule set to Drop and Generate Events just generates events on matching traffic.

You can filter rules to display a subset of rules, enabling you to select the exact set of rules where you want to change rule states or rule settings.

When an intrusion rule or rule argument requires a disabled preprocessor, the system automatically uses it with its current configuration even though it remains disabled in the network analysis policy's web interface.

## Intrusion Rule Types

An intrusion rule is a specified set of keywords and arguments that the system uses to detect attempts to exploit vulnerabilities in your network. As the system analyzes network traffic, it compares packets against the conditions specified in each rule, and triggers the rule if the data packet meets all the conditions specified in the rule.

An intrusion policy contains:

- *intrusion rules*, which are subdivided into *shared object rules* and *standard text rules*
- *preprocessor rules*, which are associated with a detection option of the packet decoder or with one of the preprocessors included with the Firepower System

The following table summarizes attributes of these rule types:

**Table 104: Intrusion Rule Types**

| Type               | Generator ID (GID)                | Snort ID (SID)     | Source                                              | Can Copy? | Can Edit? |
|--------------------|-----------------------------------|--------------------|-----------------------------------------------------|-----------|-----------|
| shared object rule | 3                                 | lower than 1000000 | Cisco Talos Intelligence Group (Talos)              | yes       | limited   |
| standard text rule | 1                                 | lower than 1000000 | Talos                                               | yes       | limited   |
|                    |                                   | 1000000 or higher  | Created or imported by user                         | yes       | yes       |
| preprocessor rule  | decoder- or preprocessor-specific | lower than 1000000 | Talos                                               | no        | no        |
|                    |                                   | 1000000 or higher  | Generated by the system during option configuration | no        | no        |

You cannot save changes to any rule created by Talos, but you can save a copy of a modified rule as a custom rule. You can modify either variables used in the rule or rule header information (such as source and destination ports and IP addresses). In a multidomain deployment, rules created by Talos belong to the Global domain. Administrators in descendant domains can save local copies of the rules, which they can then edit.

For the rules it creates, Talos assigns default rule states in each default intrusion policy. Most preprocessor rules are disabled by default and must be enabled if you want the system to generate events for preprocessor rules and, in an inline deployment, drop offending packets.

In a multidomain deployment, the system prepends a domain number to the SID of any custom rule created in or imported into a descendant domain. For example, a rule added in the Global domain would have a SID of 1000000 or greater, and rules added in descendant domains would have SIDs of [domain number]000000 or greater.

## Viewing Intrusion Rules in an Intrusion Policy

You can adjust how rules are displayed in the intrusion policy, and can sort rules by several criteria. You can also display the details for a specific rule to see rule settings, rule documentation, and other rule specifics.

### Procedure

---

**Step 1** Choose **Policies > Access Control > Intrusion**.

**Step 2** Click **Edit** () next to the policy you want to edit.

If **View** () appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

**Step 3** Click **Rules** under **Policy Information** in the navigation panel.

**Step 4** While viewing the rules, you can:

- Filter the rules as described in [Setting a Rule Filter in an Intrusion Policy, on page 1502](#).
  - Sort the rules by clicking the title in the top of the column you want to sort by.
  - View an intrusion rule's details as described in [Viewing Intrusion Rule Details, on page 1493](#).
  - View rules in different policy layers by choosing a layer from the **Policy** drop-down list.
- 

## Intrusion Rules Page Columns

The Intrusion Rules page uses the same icons in its menu bar and column headers. For example, the Rule State menu uses the same **Generate Events** as the Rule State column in the rule listing.

Table 105: Rules Page Columns

| Heading                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GID                              | Integer that indicates the Generator ID (GID) for the rule.                                                                                                                                                                                                                                                                                                                                                                                                                     |
| SID                              | Integer that indicates the Snort ID (SID), which acts a unique identifier for the rule.<br>For custom rules, the SID is 1000000 or higher.<br>In a multidomain deployment, the system prepends a domain number to the SID of any custom rule created in or imported into a descendant domain. For example, a rule added in the Global domain would have a SID of 1000000 or greater, and rules added in descendant domains would have SIDs of [domain number]000000 or greater. |
| Message                          | Message included in events generated by this rule, which also acts as the name of the rule.                                                                                                                                                                                                                                                                                                                                                                                     |
| Generate Events                  | The rule state for the rule: <ul style="list-style-type: none"> <li>• Drop and Generate Events</li> <li>• Generate Events</li> <li>• Disabled</li> </ul> <p>Note the icon for a disabled rule is a dimmed version of the icon for a rule that is set to generate events without dropping traffic. Also, clicking the rule state icon for a rule allows you to change the rule state.</p>                                                                                        |
| Firepower Recommended rule state | Firepower recommended rule state for the rule.                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Event Filter                     | Event filter, including event thresholds and event suppression, applied to the rule.                                                                                                                                                                                                                                                                                                                                                                                            |
| Dynamic state                    | Dynamic rule state for the rule, which goes into effect if specified rate anomalies occur.                                                                                                                                                                                                                                                                                                                                                                                      |
| Errors (🔴)                       | Alerts configured for the rule (currently SNMP alerts only).                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Comment (💬)                      | Comments added to the rule.                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

You can also use the layer drop-down list to switch to the Rules page for other layers in your policy. Note that, unless you add layers to your policy, the only editable views listed in the drop-down list are the policy Rules page and the Rules page for a policy layer that is originally named *My Changes*; note also that making changes in one of these views is the same as making the changes in the other. The drop-down list also lists the Rules page for the read-only base policy.

## Intrusion Rule Details

You can view rule documentation, Firepower recommendations, and rule overhead from the Rule Detail view. You can also view and add rule-specific features.

Table 106: Rule Details

| Item                     | Description                                                                                                                                                                                                                                                                                                           |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Summary                  | The rule summary. For rule-based events, this row appears when the rule documentation contains summary information.                                                                                                                                                                                                   |
| Rule State               | The current rule state for the rule. Also indicates the layer where the rule state is set.                                                                                                                                                                                                                            |
| Firepower Recommendation | If Firepower recommendations have been generated, an icon that represents the recommended rule state; see <a href="#">Intrusion Rules Page Columns, on page 1491</a> . If the recommendation is to enable the rule, the system also indicates the network assets or configurations that triggered the recommendation. |
| Rule Overhead            | The rule's potential impact on system performance and the likelihood that the rule might generate false positives. Local rules do not have an assigned overhead, unless they are mapped to a vulnerability.                                                                                                           |
| Thresholds               | Thresholds currently set for this rule, as well as the facility to add a threshold for the rule.                                                                                                                                                                                                                      |
| Suppressions             | Suppression settings currently set for this rule, as well as the facility to add suppressions for the rule.                                                                                                                                                                                                           |
| Dynamic State            | Rate-based rule states currently set for this rule, as well as the facility to add dynamic rule states for the rule.                                                                                                                                                                                                  |
| Alerts                   | SNMP alerts set for this rule, as well as the facility to add an alert for the rule.                                                                                                                                                                                                                                  |
| Comments                 | Comments added to this rule, as well as the facility to add comments for the rule.                                                                                                                                                                                                                                    |
| Documentation            | The rule documentation for the current rule, supplied by the Cisco Talos Intelligence Group (Talos).                                                                                                                                                                                                                  |

## Viewing Intrusion Rule Details

### Procedure

- 
- Step 1** Choose **Policies > Access Control > Intrusion**.
- Step 2** Click **Edit** () next to the policy you want to edit.
- If **View** () appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.
- Step 3** On the navigation pane, click **Rules**.
- Step 4** Click the rule whose rule details you want to view, then click **Show details** at the bottom of the page. Rule details appear, as described in [Intrusion Rule Details, on page 1492](#).
- Step 5** From the rule details, you can configure:
- Alerts—See [Setting an SNMP Alert for an Intrusion Rule, on page 1496](#).

- Comments—See [Adding a Comment to an Intrusion Rule](#), on page 1496.
- Dynamic rule states—See [Setting a Dynamic Rule State from the Rule Details Page](#), on page 1495.
- Thresholds—See [Setting a Threshold for an Intrusion Rule](#), on page 1494.
- Suppressions—See [Setting Suppression for an Intrusion Rule](#), on page 1494.

---

## Setting a Threshold for an Intrusion Rule

You can set a single threshold for a rule from the Rule Detail page. Adding a threshold overwrites any existing threshold for the rule.

Note that a **Revert** appears in a field when you enter an invalid value; click it to revert to the last valid value for that field or to clear the field if there was no previous value.

### Procedure

---

- Step 1** From an intrusion rule's details, click **Add** next to **Thresholds**.
- Step 2** From the **Type** drop-down list, choose the type of threshold you want to set:
- Choose **Limit** to limit notification to the specified number of event instances per time period.
  - Choose **Threshold** to provide notification for each specified number of event instances per time period.
  - Choose **Both** to provide notification once per time period after a specified number of event instances.
- Step 3** From the **Track By** drop-down list, choose **Source** or **Destination** to indicate whether you want the event instances tracked by source or destination IP address.
- Step 4** In the **Count** field, enter the number of event instances you want to use as your threshold.
- Step 5** In the **Seconds** field, enter a number that specifies the time period, in seconds, for which event instances are tracked.
- Step 6** Click **OK**.
- Tip** The system displays an **Event Filter** next to the rule in the Event Filtering column. If you add multiple event filters to a rule, the system includes an indication of the number of event filters.
- 

## Setting Suppression for an Intrusion Rule

You can set one or more suppressions for a rule in your intrusion policy.

Note that a **Revert** appears in a field when you type an invalid value; click it to revert to the last valid value for that field or to clear the field if there was no previous value.

### Procedure

---

- Step 1** From an intrusion rule's details, click **Add** next to **Suppressions**.
- Step 2** From the **Suppression Type** drop-down list, choose one of the following options:
- Choose **Rule** to completely suppress events for a selected rule.

- Choose **Source** to suppress events generated by packets originating from a specified source IP address.
- Choose **Destination** to suppress events generated by packets going to a specified destination IP address.

- Step 3** If you chose **Source** or **Destination** for the suppression type, in the **Network** field enter the IP address, an address block, or a comma-separated list comprised of any combination of these.
- If the intrusion policy is associated with the default action of an access control policy, you can also specify or list a network variable in the default action variable set.
- The system builds a separate network map for each leaf domain. In a multidomain deployment, using literal IP addresses to constrain this configuration can have unexpected results.

- Step 4** Click **OK**.

**Tip** The system displays an **Event Filter** next to the rule in the Event Filtering column next the suppressed rule. If you add multiple event filters to a rule, a number over the filter indicates the number of filters.

---

## Setting a Dynamic Rule State from the Rule Details Page

You can set one or more dynamic rule states for a rule. The first dynamic rule state listed has the highest priority. When two dynamic rule states conflict, the action of the first is carried out.

Dynamic rule states are policy-specific.

Note that a **Revert** appears in a field when you enter an invalid value; click it to revert to the last valid value for that field or to clear the field if there was no previous value.

### Procedure

---

- Step 1** From an intrusion rule's details, click **Add** next to **Dynamic State**.
- Step 2** From the **Track By** drop-down list, choose an option to indicate how you want the rule matches tracked:
- Choose **Source** to track the number of hits for that rule from a specific source or set of sources.
  - Choose **Destination** to track the number of hits for that rule to a specific destination or set of destinations.
  - Choose **Rule** to track all matches for that rule.
- Step 3** If you set **Track By** to **Source** or **Destination**, enter the IP address of each host you want to track in the **Network** field.
- The system builds a separate network map for each leaf domain. In a multidomain deployment, using literal IP addresses to constrain this configuration can have unexpected results.
- Step 4** Next to **Rate**, specify the number of rule matches per time period to set the attack rate:
- In the **Count** field, specify the number of rule matches you want to use as your threshold.
  - In the **Seconds** field, specify the number of seconds that make up the time period for which attacks are tracked.
- Step 5** From the **New State** drop-down list, choose the new action to be taken when the conditions are met.
- Step 6** Enter a value in the **Timeout** field.

After the timeout occurs, the rule reverts to its original state. Enter 0 to prevent the new action from timing out.

**Step 7** Click **OK**.

**Tip** The system displays a dynamic state () next to the rule in the Dynamic State column. If you add multiple dynamic rule state filters to a rule, a number over the filters indicates the number of filters.

---

## Setting an SNMP Alert for an Intrusion Rule

You can set an SNMP alert for a rule from the Rule Detail page.

### Procedure

---

From an intrusion rule's details, click **Add SNMP Alert** next to **Alerts**.

**Tip** The system displays an alert **Errors** () next to the rule in the Alerting column. If you add multiple alerts to a rule, the system includes an indication of the number of alerts.

---

## Adding a Comment to an Intrusion Rule

### Procedure

---

**Step 1** From an intrusion rule's details, click **Add** next to **Comments**.

**Step 2** In the **Comment** field, enter the rule comment.

**Step 3** Click **OK**.

**Tip** The system displays a **Comment** () next to the rule in the Comments column. If you add multiple comments to a rule, a number over the comment indicates the number of comments.

**Step 4** To delete a rule comment, click **Delete** in the rule comments section. You can only delete a comment if the comment is cached with uncommitted intrusion policy changes.

---

### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

# Intrusion Rule Filters in an Intrusion Policy

You can filter the rules you display on the Rules page by a single criteria, or a combination of one or more criteria.

Rule filter keywords help you find the rules for which you want to apply rule settings, such as rule states or event filters. You can filter by a keyword and simultaneously select the argument for the keyword by selecting the argument you want from the Rules page filter panel.

## Intrusion Rule Filters Notes

The filter you construct is shown in the Filter text box. You can click keywords and keyword arguments in the filter panel to construct a filter. When you choose multiple keywords, the system combines them using AND logic to create a compound search filter. For example, if you choose **preprocessor** under **Category** and then choose **Rule Content > GID** and enter 116, you get a filter of `Category: "preprocessor" GID:"116"`, which retrieves all rules that are preprocessor rules **and** have a GID of 116.

The Category, Microsoft Vulnerabilities, Microsoft Worms, Platform Specific, Preprocessor, and Priority filter groups allow you to submit more than one argument for a keyword, separated by commas. For example, you can choose **os-linux** and **os-windows** from **Category** to produce the filter `Category:"os-windows,os-linux"`, which retrieves any rules in the `os-linux` category or in the `os-windows` category.

To show the filter panel, click the **Show icon**.

To hide the filter panel, click the **Hide icon**.

## Intrusion Policy Rule Filters Construction Guidelines

In most cases, when you are building a filter, you can use the filter panel to the left of the Rules page in the intrusion policy to choose the keywords/arguments you want to use.

Rule filters are grouped into rule filter groups in the filter panel. Many rule filter groups contain sub-criteria so that you can more easily find the specific rules you are looking for. Some rule filters have multiple levels that you can expand to drill down to individual rules.

Items in the filter panel sometimes represent filter type groups, sometimes represent keywords, and sometimes represent the argument to a keyword. Note the following:

- When you choose a filter type group heading that is not a keyword (Rule Configuration, Rule Content, Platform Specific, and Priority), it expands to list the available keywords.

When you choose a keyword by clicking on a node in the criteria list, a pop-up window appears, where you supply the argument you want to filter by.

If that keyword is already used in the filter, the argument you supply replaces the existing argument for that keyword.

For example, if you click **Drop and Generate Events** under **Rule Configuration > Recommendation** in the filter panel, `Recommendation:"Drop and Generate Events"` is added to the filter text box. If you then click **Generate Events** under **Rule Configuration > Recommendation**, the filter changes to `Recommendation:"Generate Events"`.

- When you choose a filter type group heading that is a keyword (Category, Classifications, Microsoft Vulnerabilities, Microsoft Worms, Priority, and Rule Update), it lists the available arguments.

When you choose an item from this type of group, the argument and the keyword it applies to are immediately added to the filter. If the keyword is already in the filter, it replaces the existing argument for the keyword that corresponds to that group.

For example, if you click **os-linux** under **Category** in the filter panel, `Category:"os-linux"` is added to the filter text box. If you then click **os-windows** under **Category**, the filter changes to `Category:"os-windows"`.

- Reference under Rule Content is a keyword, and so are the specific reference ID types listed below it. When you choose any of the reference keywords, a pop-up window appears, where you supply an argument and the keyword is added to the existing filter. If the keyword is already in use in the filter, the new argument you supply replaces the existing argument.

For example, if you click **Rule Content > Reference > CVE ID** in the filter panel, a pop-up window prompts you to supply the CVE ID. If you enter 2007, then `CVE:"2007"` is added to the filter text box. In another example, if you click **Rule Content > Reference** in the filter panel, a pop-up window prompts you to supply the reference. If you enter 2007, then `Reference:"2007"` is added to the filter text box.

- When you choose rule filter keywords from different groups, each filter keyword is added to the filter and any existing keywords are maintained (unless overridden by a new value for the same keyword).

For example, if you click **os-linux** under **Category** in the filter panel, `Category:"os-linux"` is added to the filter text box. If you then click **MS00-006** under **Microsoft Vulnerabilities**, the filter changes to `Category:"os-linux" MicrosoftVulnerabilities:"MS00-006"`.

- When you choose multiple keywords, the system combines them using AND logic to create a compound search filter. For example, if you choose **preprocessor** under **Category** and then choose **Rule Content > GID** and enter 116, you get a filter of `Category: "preprocessor" GID:"116"`, which retrieves all rules that are preprocessor rules **and** have a GID of 116.

- The Category, Microsoft Vulnerabilities, Microsoft Worms, Platform Specific, and Priority filter groups allow you to submit more than one argument for a keyword, separated by commas. For example, you can choose **os-linux** and **os-windows** from **Category** to produce the filter

`Category:"os-windows,app-detect"`, which retrieves any rules in the `os-linux` category or in the `os-windows` category.

The same rule may be retrieved by more than one filter keyword/argument pair. For example, the DOS Cisco attempt rule (SID 1545) appears if rules are filtered by the **dos** category, and also if you filter by the **High** priority.

---

**Note** The Cisco Talos Intelligence Group (Talos) may use the rule update mechanism to add and remove rule filters.

---

Note that the rules on the Rules page may be either shared object rules (generator ID 3) or standard text rules (generator ID 1). The following table describes the different rule filters.

Table 107: Rule Filter Groups

| Filter Group              | Description                                                                                                                                                                                                                                                                                                        | Multiple Argument Support? | Heading is... | Items in List are...                                                                                           |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------|---------------|----------------------------------------------------------------------------------------------------------------|
| Rule Configuration        | Finds rules according to the configuration of the rule.                                                                                                                                                                                                                                                            | No                         | A grouping    | keywords                                                                                                       |
| Rule Content              | Finds rules according to the content of the rule.                                                                                                                                                                                                                                                                  | No                         | A grouping    | keywords                                                                                                       |
| Category                  | Finds rules according to the rule categories used by the rule editor. Note that local rules appear in the local sub-group.                                                                                                                                                                                         | Yes                        | A keyword     | arguments                                                                                                      |
| Classifications           | Finds rules according to the attack classification that appears in the packet display of an event generated by the rule.                                                                                                                                                                                           | No                         | A keyword     | arguments                                                                                                      |
| Microsoft Vulnerabilities | Finds rules according to Microsoft bulletin number.                                                                                                                                                                                                                                                                | Yes                        | A keyword     | arguments                                                                                                      |
| Microsoft Worms           | Finds rules based on specific worms that affect Microsoft Windows hosts.                                                                                                                                                                                                                                           | Yes                        | A keyword     | arguments                                                                                                      |
| Platform Specific         | Finds rules according to their relevance to specific versions of operating systems.<br><br>Note that a rule may affect more than one operating system or more than one version of an operating system. For example, enabling SID 2260 affects multiple versions of Mac OS X, IBM AIX, and other operating systems. | Yes                        | A keyword     | arguments<br><br>Note that if you pick one of the items from the sub-list, it adds a modifier to the argument. |
| Preprocessors             | Finds rules for individual preprocessors.<br><br>Note that you must enable preprocessor rules associated with a preprocessor option to generate events and, in an inline deployment, drop offending packets for the option when the preprocessor is enabled.                                                       | Yes                        | A grouping    | sub-groupings                                                                                                  |
| Priority                  | Finds rules according to high, medium, and low priorities.<br><br>The classification assigned to a rule determines its priority. These groups are further grouped into rule categories. Note that local rules (that is, rules that you import or create) do not appear in the priority groups.                     | Yes                        | A keyword     | arguments<br><br>Note that if you pick one of the items from the sub-list, it adds a modifier to the argument. |
| Rule Update               | Finds rules added or modified through a specific rule update. For each rule update, view all rules in the update, only new rules imported in the update, or only existing rules changed by the update.                                                                                                             | No                         | A keyword     | arguments                                                                                                      |

## Intrusion Rule Configuration Filters

You can filter the rules listed in the Rules page by several rule configuration settings. For example, if you want to view the set of rules whose rule state does not match the recommended rule state, you can filter on rule state by selecting **Does not match recommendation**.

When you choose a keyword by clicking on a node in the criteria list, you can supply the argument you want to filter by. If that keyword is already used in the filter, the argument you supply replaces the existing argument for that keyword.

For example, if you click **Drop and Generate Events** under **Rule Configuration > Recommendation** in the filter panel, `Recommendation:"Drop and Generate Events"` is added to the filter text box. If you then click **Generate Events** under **Rule Configuration > Recommendation**, the filter changes to

`Recommendation:"Generate Events"`.

## Intrusion Rule Content Filters

You can filter the rules listed in the Rules page by several rule content items. For example, you can quickly retrieve a rule by searching for the rule's SID. You can also find all rules that inspect traffic going to a specific destination port.

When you select a keyword by clicking on a node in the criteria list, you can supply the argument you want to filter by. If that keyword is already used in the filter, the argument you supply replaces the existing argument for that keyword.

For example, if you click **SID** under **Rule Content** in the filter panel, a pop-up window appears, prompting you to supply a SID. If you type 1045, then `SID:"1045"` is added to the filter text box. If you then click **SID** again and change the SID filter to 1044, the filter changes to `SID:"1044"`.

Table 108: Rule Content Filters

| This filter... | Finds rules that...                                                                                                                                                                                                                               |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Message        | contain the supplied string in the message field.                                                                                                                                                                                                 |
| SID            | have the specified SID.                                                                                                                                                                                                                           |
| GID            | have the specified GID.                                                                                                                                                                                                                           |
| Reference      | contain the supplied string in the reference field. You can also filter by a specific type of reference and supplied string.                                                                                                                      |
| Action         | start with <code>alert</code> or <code>pass</code> .                                                                                                                                                                                              |
| Protocol       | include the selected protocol.                                                                                                                                                                                                                    |
| Direction      | are based on whether the rule includes the indicated directional setting.                                                                                                                                                                         |
| Source IP      | use the specified addresses or variables for the source IP address designation in the rule. You can filter by a valid IP address, a CIDR block/prefix length, or using variables such as <code>\$HOME_NET</code> or <code>\$EXTERNAL_NET</code> . |
| Destination IP | use the specified addresses or variables for the source IP address designation in the rule. You can filter by a valid IP address, a CIDR block/prefix length, or using variables such as <code>\$HOME_NET</code> or <code>\$EXTERNAL_NET</code> . |

| This filter...   | Finds rules that...                                                                                                                                                                          |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Source port      | include the specified source port. The port value must be an integer between 1 and 65535 or a port variable.                                                                                 |
| Destination port | include the specified destination port. The port value must be an integer between 1 and 65535 or a port variable.                                                                            |
| Rule Overhead    | have the selected rule overhead.                                                                                                                                                             |
| Metadata         | have metadata containing the matching <i>key value</i> pair. For example, type <code>metadata:"service http"</code> to locate rules with metadata relating to the HTTP application protocol. |

## Intrusion Rule Categories

The Firepower System places rules in categories based on the type of traffic the rule detects. On the Rules page, you can filter by rule category, so you can set a rule attribute for all rules in a category. For example, if you do not have Linux hosts on your network, you could filter by the **os-linux** category, then disable all the rules showing to disable the entire **os-linux** category.

You can hover your pointer over a category name to display the number of rules in that category.

---

**Note** The Cisco Talos Intelligence Group (Talos) may use the rule update mechanism to add and remove rule categories.

---

## Intrusion Rule Filter Components

You can edit your filter to modify the special keywords and their arguments that are supplied when you click on a filter in the filter panel. Custom filters on the Rules page function like those used in the rule editor, but you can also use any of the keywords supplied in the Rules page filter, using the syntax displayed when you select the filter through the filter panel. To determine a keyword for future use, click on the appropriate argument in the filter panel on the right. The filter keyword and argument syntax appear in the filter text box. Remember that comma-separated multiple arguments for a keyword are only supported for the Category and Priority filter types.

You can use keywords and arguments, character strings, and literal character strings in quotes, with spaces separating multiple filter conditions. A filter cannot include regular expressions, wild card characters, or any special operator such as a negation character (!), a greater than symbol (>), less than symbol (<), and so on. When you type in search terms without a keyword, without initial capitalization of the keyword, or without quotes around the argument, the search is treated as a string search and the category, message, and SID fields are searched for the specified terms.

Except for the `gid` and `sid` keywords, all arguments and strings are treated as partial strings. Arguments for `gid` and `sid` return only exact matches.

Each rule filter can include one or more keywords in the format:

```
keyword:"argument"
```

where keyword is one of the keywords in the intrusion rule filter groups and argument is enclosed in double quotes and is a single, case-insensitive, alphanumeric string to search for in the specific field or fields relevant to the keyword. Note that keywords should be typed with initial capitalization.

Arguments for all keywords except `gid` and `sid` are treated as partial strings. For example, the argument `123` returns `"12345"`, `"41235"`, `"45123"`, and so on. The arguments for `gid` and `sid` return only exact matches; for example, `sid:3080` returns only `SID 3080`.

Each rule filter can also include one or more alphanumeric character strings. Character strings search the rule Message field, Snort ID (SID), and Generator ID (GID). For example, the string `123` returns the strings `"Lotus123"`, `"123mania"`, and so on in the rule message, and also returns `SID 6123`, `SID 12375`, and so on. You can search for a partial SID by filtering with one or more character strings.

All character strings are case-insensitive and are treated as partial strings. For example, any of the strings `ADMIN`, `admin`, or `Admin` return `"admin"`, `"CFADMIN"`, `"Administrator"` and so on.

You can enclose character strings in quotes to return exact matches. For example, the literal string `"overflow attempt"` in quotes returns only that exact string, whereas a filter comprised of the two strings `overflow` and `attempt` without quotes returns `"overflow attempt"`, `"overflow multipacket attempt"`, `"overflow with evasion attempt"`, and so on.

You can narrow filter results by entering any combination of keywords, character strings, or both, separated by spaces. The result includes any rule that matches all the filter conditions.

You can enter multiple filter conditions in any order. For example, each of the following filters returns the same rules:

- `url:at login attempt cve:200`
- `login attempt cve:200 url:at`
- `login cve:200 attempt url:at`

## Intrusion Rule Filter Usage

You can select predefined filter keywords from the filter panel on the left side of the Rules page in the intrusion policy. When you select a filter, the page displays all matching rules, or indicates when no rules match.

You can add keywords to a filter to further constrain it. Any filter you enter searches the entire rules database and returns all matching rules. When you enter a filter while the page still displays the result of a previous filter, the page clears and returns the result of the new filter instead.

You can also type a filter using the same keyword and argument syntax supplied when you select a filter, or modify argument values in a filter after you select it. When you type in search terms without a keyword, without initial capitalization of the keyword, or without quotes around the argument, the search is treated as a string search and the category, message, and SID fields are searched for the specified terms.

## Setting a Rule Filter in an Intrusion Policy

You can filter the rules on the Rules page to display a subset of rules. You can then use any of the page features, including choosing any of the features available in the context menu. This can be useful, for example, when you want to set a threshold for all the rules in a specific category. You can use the same features with rules in a filtered or unfiltered list. For example, you can apply new rule states to rules in a filtered or unfiltered list.

All filter keywords, keyword arguments, and character strings are case-insensitive. If you click an argument for a keyword already in the filter, it replaces the existing argument.

### Procedure

---

- Step 1** Choose **Policies > Access Control > Intrusion**.
- Step 2** Click **Edit** () next to the policy you want to edit.
- If **View** () appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.
- Step 3** Click **Rules**.
- Step 4** Construct a filter using any of the following methods, separately or in combination:
- Enter a value in the **Filter** text box, and press Enter.
  - Expand any of the predefined keywords. For example, click **Rule Configuration**.
  - Click a keyword, and specify an argument value if prompted. For example:
    - Under **Rule Configuration**, you could click **Rule State**, choose `Generate Events` from the drop-down-list, and click **OK**.
    - Under **Rule Configuration**, you could click **Comment**, enter the string of comment text to filter by, and click **OK**.
    - Under **Category**, you could click **app-detect**, which the system uses as the argument value.
  - Expand a keyword, and click an argument value. For example, expand **Rule State** and click **Generate Events**.
- 

## Intrusion Rule States

Intrusion rule states allow you to enable or disable the rule within an individual intrusion policy, as well as specify which action the system takes if monitored conditions trigger the rule.

The Cisco Talos Intelligence Group (Talos) sets the default state of each intrusion and preprocessor rule in each default policy. For example, a rule may be enabled in the Security over Connectivity default policy and disabled in the Connectivity over Security default policy. Talos sometimes uses a rule update to change the default state of one or more rules in a default policy. If you allow rule updates to update your base policy, you also allow the rule update to change the default state of a rule in your policy when the default state changes in the default policy you used to create your policy (or in the default policy it is based on). Note, however, that if you have changed the rule state, the rule update does not override your change.

When you create an intrusion rule, it inherits the default states of the rules in the default policy you use to create your policy.

## Intrusion Rule State Options

In an intrusion policy, you can set a rule's state to the following values:

### Generate Events

You want the system to detect a specific intrusion attempt and generate an intrusion event when it finds matching traffic. When a malicious packet crosses your network and triggers the rule, the packet is sent to its destination and the system generates an intrusion event. The malicious packet reaches its target, but you are notified via the event logging.

### Drop and Generate Events

You want the system to detect a specific intrusion attempt, drop the packet containing the attack, and generate an intrusion event when it finds matching traffic. The malicious packet never reaches its target, and you are notified via the event logging.

Note that rules set to this rule state generate events but do not drop packets in a passive deployment, including deployments where a 7000 or 8000 Series device inline interface set is in tap mode. For the system to drop packets, **Drop when Inline** must also be enabled (the default setting) in your intrusion policy and you must deploy your device inline.

### Disable

You do not want the system to evaluate matching traffic.

---

**Note** Choosing either the **Generate Events** or **Drop and Generate Events** options enables the rule. Choosing **Disable** disables the rule.

Cisco **strongly** recommends that you **do not** enable all the intrusion rules in an intrusion policy. The performance of your managed device is likely to degrade if all rules are enabled. Instead, tune your rule set to match your network environment as closely as possible.

---

## Setting Intrusion Rule States

Intrusion rule states are policy-specific.

### Procedure

---

**Step 1** Choose **Policies > Access Control > Intrusion**.

**Step 2** Click **Edit** () next to the policy you want to edit.

If **View** () appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

**Tip** This page indicates the total number of enabled rules, the total number of enabled rules set to Generate Events, and the total number set to Drop and Generate Events. Note also that in a passive deployment, rules set to Drop and Generate Events only generate events.

**Step 3** Click **Rules** immediately under **Policy Information** in the navigation panel.

**Step 4** Choose the rule or rules where you want to set the rule state.

**Step 5** Choose one of the following:

- **Rule State > Generate Events**

- **Rule State > Drop and Generate Events**
- **Rule State > Disable**

**Step 6** To save changes you made in this policy since the last policy commit, click **Policy Information** in the navigation panel, then click **Commit Changes**.

If you leave the policy without committing changes, changes since the last commit are discarded if you edit a different policy.

---

#### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## Intrusion Event Notification Filters in an Intrusion Policy

The importance of an intrusion event can be based on frequency of occurrence, or on source or destination IP address. In some cases you may not care about an event until it has occurred a certain number of times. For example, you may not be concerned if someone attempts to log into a server until they fail a certain number of times. In other cases, you may only need to see a few occurrences to know there is a widespread problem. For example, if a DoS attack is launched against your web server, you may only need to see a few occurrences of an intrusion event to know that you need to address the situation. Seeing hundreds of the same event only overwhelms your system.

### Intrusion Event Thresholds

You can set thresholds for individual rules, per intrusion policy, to limit the number of times the system logs and displays an intrusion event based on how many times the event is generated within a specified time period. This can prevent you from being overwhelmed with a large number of identical events. You can set thresholds per shared object rule, standard text rule, or preprocessor rule.

### Intrusion Event Thresholds Configuration

To set a threshold, first specify the thresholding type.

*Table 109: Thresholding Options*

| Option | Description                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Limit  | Logs and displays events for the specified number of packets (specified by the Count argument) that trigger the rule during the specified time period. For example, if you set the type to <b>Limit</b> , the <b>Count</b> to 10, and the <b>Seconds</b> to 60, and 14 packets trigger the rule, the system stops logging events for the rule after displaying the first 10 that occur within the same minute. |

| Option    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Threshold | Logs and displays a single event when the specified number of packets (specified by the Count argument) trigger the rule during the specified time period. Note that the counter for the time restarts after you hit the threshold count of events and the system logs that event. For example, you set the type to <b>Threshold</b> , <b>Count</b> to 10, and <b>Seconds</b> to 60, and the rule triggers 10 times by second 33. The system generates one event, then resets the Seconds and Count counters to 0. The rule then triggers another 10 times in the next 25 seconds. Because the counters reset to 0 at second 33, the system logs another event.                                                                                                                       |
| Both      | Logs and displays an event once per specified time period, after the specified number (count) of packets trigger the rule. For example, if you set the type to <b>Both</b> , <b>Count</b> to two, and <b>Seconds</b> to 10, the following event counts result: <ul style="list-style-type: none"> <li>• If the rule is triggered once in 10 seconds, the system does not generate any events (the threshold is not met)</li> <li>• If the rule is triggered twice in 10 seconds, the system generates one event (the threshold is met when the rule triggers the second time)</li> <li>• If the rule is triggered four times in 10 seconds, the system generates one event (the threshold is met when the rule triggers the second time, and following events are ignored)</li> </ul> |

Next, specify tracking, which determines whether the event threshold is calculated per source or destination IP address.

**Table 110: Thresholding IP Options**

| Option      | Description                                                 |
|-------------|-------------------------------------------------------------|
| Source      | Calculates event instance count per source IP address.      |
| Destination | Calculates event instance count per destination IP address. |

Finally, specify the number of instances and time period that define the threshold.

**Table 111: Thresholding Instance/Time Options**

| Option  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Count   | The number of event instances per specified time period per tracking IP address required to meet the threshold.                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Seconds | The number of seconds that elapse before the count resets. If you set the threshold type to <b>limit</b> , the tracking to <b>Source IP</b> , the <b>count</b> to 10, and the <b>seconds</b> to 10, the system logs and displays the first 10 events that occur in 10 seconds from a given source port. If only 7 events occur in the first 10 seconds, the system logs and displays those; if 40 events occur in the first 10 seconds, the system logs and displays 10, then begins counting again when the 10-second time period elapses. |

Note that you can use intrusion event thresholding alone or in any combination with rate-based attack prevention, the `detection_filter` keyword, and intrusion event suppression.

**Tip** You can also add thresholds from within the packet view of an intrusion event.

[The `detection\_filter` Keyword](#), on page 1638

[Setting Threshold Options within the Packet View](#), on page 2278

## Adding and Modifying Intrusion Event Thresholds

You can set a threshold for one or more specific rules in an intrusion policy. You can also separately or simultaneously modify existing threshold settings. You can set a single threshold for each. Adding a threshold overwrites any existing threshold for the rule.

You can also modify the global threshold that applies by default to all rules and preprocessor-generated events associated with the intrusion policy.

A **Revert** appears in a field when you enter an invalid value; click it to revert to the last valid value for that field or to clear the field if there was no previous value.

**Tip** A global or individual threshold on a managed device with multiple CPUs may result in a higher number of events than expected.

#### Procedure

- Step 1** Choose **Policies > Access Control > Intrusion**.
- Step 2** Click **Edit** () next to the policy you want to edit.  
If **View** () appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.
- Step 3** Click **Rules** immediately under **Policy Information** in the navigation pane.
- Step 4** Choose the rule or rules where you want to set a threshold.
- Step 5** Choose **Event Filtering > Threshold**.
- Step 6** Choose a threshold type from the **Type** drop-down list.
- Step 7** From the **Track By** drop-down list, choose whether you want the event instances tracked by **Source** or **Destination** IP address.
- Step 8** Enter a value in the **Count** field.
- Step 9** Enter a value in the **Seconds** field.
- Step 10** Click **OK**.  
**Tip** The system displays an **Event Filter** next to the rule in the Event Filtering column. If you add multiple event filters to a rule, a number over the filter indicates the number of event filters.
- Step 11** To save changes you made in this policy since the last policy commit, click **Policy Information**, then click **Commit Changes**.

If you leave the policy without committing changes, changes since the last commit are discarded if you edit a different policy.

---

#### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

#### Related Topics

[Global Rule Thresholding Basics](#), on page 1537

## Viewing and Deleting Intrusion Event Thresholds

You may want to view or delete an existing threshold setting for a rule. You can use the Rules Details view to display the configured settings for a threshold to see if they are appropriate for your system. If they are not, you can add a new threshold to overwrite the existing values.

Note that you can also modify the global threshold that applies by default to all rules and preprocessor-generated events logged by the intrusion policy.

#### Procedure

---

**Step 1** Choose **Policies > Access Control > Intrusion**.

**Step 2** Click **Edit** () next to the policy you want to edit.

If **View** () appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

**Step 3** Click **Rules** immediately under **Policy Information** in the navigation pane.

**Step 4** Choose the rule or rules with a configured threshold you want to view or delete.

**Step 5** To remove the threshold for each selected rule, choose **Event Filtering > Remove Thresholds**.

**Step 6** Click **OK**.

**Step 7** To save changes you made in this policy since the last policy commit, click **Policy Information**, then click **Commit Changes**.

If you leave the policy without committing changes, changes since the last commit are discarded if you edit a different policy.

---

#### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

#### Related Topics

[Global Rule Thresholding Basics](#), on page 1537

## Intrusion Policy Suppression Configuration

You can suppress intrusion event notification when a specific IP address or range of IP addresses triggers a specific rule or preprocessor. This is useful for eliminating false positives. For example, if you have a mail server that transmits packets that look like a specific exploit, you might suppress event notification for that event when it is triggered by your mail server. The rule triggers for all packets, but you only see events for legitimate attacks.

### Intrusion Policy Suppression Types

Note that you can use intrusion event suppression alone or in any combination with rate-based attack prevention, the `detection_filter` keyword, and intrusion event thresholding.

**Tip** You can add suppressions from within the packet view of an intrusion event. You can also access suppression settings by using the right-click context menu on the intrusion rules editor page (**Objects > Intrusion Rules**) and on any intrusion event page (if the event was triggered by an intrusion rule).

#### Related Topics

[The `detection\_filter` Keyword](#), on page 1638

[Setting Threshold Options within the Packet View](#), on page 2278

### Suppressing Intrusion Events for a Specific Rule

You can suppress intrusion event notification for a rule or rules in your intrusion policy. When notification is suppressed for a rule, the rule triggers but events are not generated. You can set one or more suppressions for a rule. The first suppression listed has the highest priority. When two suppressions conflict, the action of the first is carried out.

Note that a **Revert** appears in a field when you enter an invalid value; click it to revert to the last valid value for that field or to clear the field if there was no previous value.

#### Procedure

- Step 1** Choose **Policies > Access Control > Intrusion**.
- Step 2** Click **Edit** () next to the policy you want to edit.  
If **View** () appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.
- Step 3** Click **Rules** immediately under **Policy Information** in the navigation panel.
- Step 4** Choose the rule or rules for which you want to configure suppression conditions.
- Step 5** Choose **Event Filtering > Suppression**.
- Step 6** Choose a **Suppression Type**.
- Step 7** If you chose **Source** or **Destination** for the suppression type, in the **Network** field enter the IP address, address block, or variable you want to specify as the source or destination IP address, or a comma-separated list comprised of any combination of these.

The system builds a separate network map for each leaf domain. In a multidomain deployment, using literal IP addresses to constrain this configuration can have unexpected results.

**Step 8** Click **OK**.

**Tip** The system displays an **Event Filter** next to the rule in the Event Filtering column next the suppressed rule. If you add multiple event filters to a rule, a number over the filter indicates the number of event filters.

**Step 9** To save changes you made in this policy since the last policy commit, click **Policy Information**, then click **Commit Changes**.

If you leave the policy without committing changes, changes since the last commit are discarded if you edit a different policy.

---

### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## Viewing and Deleting Suppression Conditions

You may want to view or delete an existing suppression condition. For example, you can suppress event notification for packets originating from a mail server IP address because the mail server normally transmits packets that look like exploits. If you then decommission that mail server and reassign the IP address to another host, you should delete the suppression conditions for that source IP address.

### Procedure

---

**Step 1** Choose **Policies > Access Control > Intrusion**.

**Step 2** Click **Edit** () next to the policy you want to edit.

If **View** () appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

**Step 3** Click **Rules** immediately under **Policy Information** in the navigation panel.

**Step 4** Choose the rule or rules for which you want to view or delete suppressions.

**Step 5** You have the following choices:

- To remove all suppression for a rule, choose **Event Filtering > Remove Suppressions**.
- To remove a specific suppression setting, click the rule, then click **Show details**. Expand the suppression settings and click **Delete** next to the suppression settings you want to remove.

**Step 6** Click **OK**.

**Step 7** To save changes you made in this policy since the last policy commit, click **Policy Information**, then click **Commit Changes**.

If you leave the policy without committing changes, changes since the last commit are discarded if you edit a different policy.

---

#### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## Dynamic Intrusion Rule States

Rate-based attacks attempt to overwhelm a network or host by sending excessive traffic toward the network or host, causing it to slow down or deny legitimate requests. You can use rate-based prevention to change the action of a rule in response to excessive rule matches for specific rules.

You can configure your intrusion policies to include a rate-based filter that detects when too many matches for a rule occur in a given time period. You can use this feature on managed devices deployed inline to block rate-based attacks for a specified time, then revert to a rule state where rule matches only generate events and do not drop traffic.

Rate-based attack prevention identifies abnormal traffic patterns and attempts to minimize the impact of that traffic on legitimate requests. You can identify excessive rule matches in traffic going to a particular destination IP address or addresses or coming from a particular source IP address or addresses. You can also respond to excessive matches for a particular rule across all detected traffic.

In some cases, you may not want to set a rule to the Drop and Generate Events state because you do not want to drop every packet that matches the rule, but you do want to drop packets matching the rule if a particular rate of matches occurs in a specified time. Dynamic rule states let you configure the rate that should trigger a change in the action for a rule, what the action should change to when the rate is met, and how long the new action should persist.

The following diagram shows an example where an attacker is attempting to access a host. Repeated attempts to find a password trigger a rule which has rate-based attack prevention configured. The rate-based settings change the rule attribute to Drop and Generate Events after rule matches occur five times in a 10-second span. The new rule attribute times out after 15 seconds.

After the timeout, note that packets are still dropped in the rate-based sampling period that follows. If the sampled rate is above the threshold in the current or previous sampling period, the new action continues. The new action reverts to Generate Events only after a sampling period completes where the sampled rate was below the threshold rate.

372204

## Dynamic Intrusion Rule State Configuration

In the intrusion policy, you can configure a rate-based filter for any intrusion or preprocessor rule. The rate-based filter contains three components:

- the rule matching rate, which you configure as a count of rule matches within a specific number of seconds
- a new action to be taken when the rate is exceeded, with three available actions: Generate Events, Drop and Generate Events, and Disable
- the duration of the action, which you configure as a timeout value

Note that when started, the new action occurs until the timeout is reached, even if the rate falls below the configured rate during that time period. When the timeout is reached, if the rate has fallen below the threshold, the action for the rule reverts to the action initially configured for the rule.

You can configure rate-based attack prevention in an inline deployment to block attacks, either temporarily or permanently. Without rate-based configuration, rules set to Generate Events do generate events, but the system does not drop packets for those rules. However, if the attack traffic matches rules that have rate-based criteria configured, the rate action may cause packet dropping to occur for the period of time that the rate action is active, even if those rules are not initially set to Drop and Generate Events.

**Note** Rate-based actions cannot enable disabled rules or drop traffic that matches disabled rules.

You can define multiple rate-based filters on the same rule. The first filter listed in the intrusion policy has the highest priority. Note that when two rate-based filter actions conflict, the action of the first rate-based filter is carried out.

## Setting a Dynamic Rule State from the Rules Page

You can set one or more dynamic rule states for a rule. The first dynamic rule state listed has the highest priority. When two dynamic rule states conflict, the action of the first is carried out.

Dynamic rule states are policy-specific.

A **Revert** appears in a field when you enter an invalid value; click it to revert to the last valid value for that field or to clear the field if there was no previous value.

---

**Note** Dynamic rule states cannot enable disabled rules or drop traffic that matches disabled rules.

---

### Procedure

- 
- Step 1** Choose **Policies > Access Control > Intrusion**.
- Step 2** Click **Edit** () next to the policy you want to edit.
- If **View** () appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.
- Step 3** Click **Rules** immediately under **Policy Information** in the navigation pane.
- Step 4** Choose the rule or rules where you want to add a dynamic rule state.
- Step 5** Choose **Dynamic State > Add Rate-Based Rule State**.
- Step 6** Choose a value from the **Track By** drop-down list.
- Step 7** If you set **Track By** to **Source** or **Destination**, enter the address of each host you want to track in the **Network** field. You can specify a single IP address, address block, variable, or a comma-separated list comprised of any combination of these.
- The system builds a separate network map for each leaf domain. In a multidomain deployment, using literal IP addresses to constrain this configuration can have unexpected results.
- Step 8** Next to **Rate**, specify the number of rule matches per time period to set the attack rate:
- Enter a value in the **Count** field.
  - Enter a value in the **Seconds** field.
- Step 9** From the **New State** drop-down list, specify the new action to be taken when the conditions are met.
- Step 10** Enter a value in the **Timeout** field.
- After the timeout occurs, the rule reverts to its original state. Specify 0 or leave the **Timeout** field blank to prevent the new action from timing out.
- Step 11** Click **OK**.
- Tip** The system displays a **Dynamic State** next to the rule in the Dynamic State column. If you add multiple dynamic rule state filters to a rule, a number over the filter indicates the number of filters.
- Tip** To delete all dynamic rule settings for a set of rules, choose the rules on the Rules page, then choose **Dynamic State > Remove Rate-Based States**. You can also delete individual rate-based rule state filters from the rule details for the rule by choosing the rule, clicking **Show details**, then clicking **Delete** by the rate-based filter you want to remove.

**Step 12** To save changes you made in this policy since the last policy commit, click **Policy Information**, then click **Commit Changes**.

If you leave the policy without committing changes, changes since the last commit are discarded if you edit a different policy.

---

#### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## Adding Intrusion Rule Comments

You can add comments to rules in your intrusion policy. Comments added this way are policy-specific; that is, comments you add to a rule in one intrusion policy are not visible in other intrusion policies. Any comments you add can be seen in the Rule Details view on the Rules page for the intrusion policy.

After you commit the intrusion policy changes containing the comment, you can also view the comment by clicking **Rule Comment** on the rule Edit page.

#### Procedure

---

**Step 1** Choose **Policies > Access Control > Intrusion**.

**Step 2** Click **Edit** () next to the policy you want to edit.

If **View** () appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

**Step 3** Click **Rules** immediately under **Policy Information** in the navigation panel.

**Step 4** Choose the rule or rules where you want to add a comment.

**Step 5** Choose **Comments > Add Rule Comment**.

**Step 6** In the **Comment** field, enter the rule comment.

**Step 7** Click **OK**.

**Tip** The system displays a **Comment** () next to the rule in the Comments column. If you add multiple comments to a rule, a number over the comment indicates the number of comments.

**Step 8** Optionally, delete a rule comment by clicking **Delete** next to the comment.

You can only delete a comment if the comment is cached with uncommitted intrusion policy changes. After intrusion policy changes are committed, the rule comment is permanent.

**Step 9** To save changes you made in this policy since the last policy commit, click **Policy Information**, then click **Commit Changes**.

If you leave the policy without committing changes, changes since the last commit are discarded if you edit a different policy.

---

**What to do next**

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## CHAPTER 78

# Tailoring Intrusion Protection to Your Network Assets

---

The following topics describe how to use Firepower recommended rules:

- [About Firepower Recommended Rules, on page 1517](#)
- [Default Settings for Firepower Recommendations, on page 1518](#)
- [Advanced Settings for Firepower Recommendations, on page 1519](#)
- [Generating and Applying Firepower Recommendations, on page 1520](#)

## About Firepower Recommended Rules

You can use Firepower intrusion rule recommendations to associate the operating systems, servers, and client application protocols detected on your network with rules specifically written to protect those assets. This allows you to tailor your intrusion policy to the specific needs of your monitored network.

The system makes an individual set of recommendations for each intrusion policy. It typically recommends rule state changes for standard text rules and shared object rules. However, it can also recommend changes for preprocessor and decoder rules.

When you generate rule state recommendations, you can use the default settings or configure advanced settings. Advanced settings allow you to:

- Redefine which hosts on your network the system monitors for vulnerabilities
- Influence which rules the system recommends based on rule overhead
- Specify whether to generate recommendations to disable rules

You can also choose either to use the recommendations immediately or to review the recommendations (and affected rules) before accepting them.

Choosing to use recommended rule states adds a read-only Firepower Recommendations layer to your intrusion policy, and subsequently choosing not to use recommended rule states removes the layer.

You can schedule a task to generate recommendations automatically based on the most recently saved configuration settings in your intrusion policy.

The system does not change rule states that you set manually:

- Manually setting the states of specified rules *before* you generate recommendations prevents the system from modifying the states of those rules in the future.
- Manually setting the states of specified rules *after* you generate recommendations overrides the recommended states of those rules.

**Tip** The intrusion policy report can include a list of rules with rule states that differ from the recommended state.

While displaying the recommendation-filtered Rules page, or after accessing the Rules page directly from the navigation panel or the Policy Information page, you can manually set rule states, sort rules, and take any of the other actions available on the Rules page, such as suppressing rules, setting rule thresholds, and so on.

**Note** The Cisco Talos Intelligence Group (Talos) determines the appropriate state of each rule in the system-provided policies. If you use a system-provided policy as your base policy, and you allow the system to set your rules to the Firepower recommended rule state, the rules in your intrusion policy match the settings recommended by Cisco for your network assets.

### Recommended Rules and Multitenancy

The system builds a separate network map for each leaf domain. In a multidomain deployment, if you enable this feature in an intrusion policy in an ancestor domain, the system generates recommendations using data from all descendant leaf domains. This can enable intrusion rules tailored to assets that may not exist in all leaf domains, which can affect performance.

## Default Settings for Firepower Recommendations

When you generate Firepower recommendations, the system searches your base policy for rules that protect against vulnerabilities associated with your network assets, and identifies the current state of rules in your base policy. The system then recommends rule states and, if you choose to, sets the rules to the recommended states.

The system performs the following basic analysis to generate recommendations:

**Table 112: Rule State Recommendations Based on Vulnerabilities**

| Rule Protects Discovered Assets? | Base Policy Rule State   | Recommend Rule State     |
|----------------------------------|--------------------------|--------------------------|
| Yes                              | Disabled                 | Generate Events          |
|                                  | Generate Events          | Generate Events          |
|                                  | Drop and Generate Events | Drop and Generate Events |
| No                               | Any                      | Disabled                 |

Note the following in the table:

- If a rule is disabled in the base policy, or set to Generate Events, the recommended state is always Generate Events.

For example, if the base policy is No Rules Active, in which all rules are disabled, there will be no recommendations to Drop and Generate Events.

- Recommendations to Drop and Generate Events are made only for rules already set to Drop and Generate Events in the base policy.

If you want a rule to be set to Drop and Generate events and the rule was disabled or set to Generate Events in the base policy, you must manually reset the rule state.

When you generate recommendations without changing the advanced settings for Firepower recommended rules, the system recommends rule state changes for all hosts in your entire discovered network.

By default, the system generates recommendations only for rules with low or medium overhead, and generates recommendations to disable rules.

The system does not recommend a rule state for an intrusion rule that is based on a vulnerability that you disable using the Impact Qualification feature.

The system always recommends that you enable a local rule associated with a third-party vulnerability mapped to a host.

The system does not make state recommendations for unmapped local rules.

[Third-Party Product Mappings](#), on page 1846

## Advanced Settings for Firepower Recommendations

### Include all differences between recommendations and rule states in policy reports

By default, an intrusion policy report lists the policy's enabled rules, that is, rules set to either Generate Events or Drop and Generate Events. Enabling the **Include all differences** option also lists the rules whose recommended states differ from their saved states. For information on policy reports, see [Policy Reports, on page 356](#).

### Networks to Examine

Specifies the monitored networks or individual hosts to examine for recommendations. You can specify a single IP address or address block, or a comma-separated list comprised of either or both.

Lists of addresses within the hosts that you specify are linked with an OR operation except for negations, which are linked with an AND operation after all OR operations are calculated.

If you want to dynamically adapt active rule processing for specific packets based on host information, you can also enable adaptive profile updates.

### Recommendation Threshold (By Rule Overhead)

Prevents the system from recommending or automatically enabling intrusion rules with a higher overhead than the threshold you choose.

Overhead is based on the rule's potential impact on system performance and the likelihood that the rule may generate false positives. Permitting rules with higher overhead usually results in more recommendations, but can affect system performance. You can view the overhead rating for a rule in the rule detail view on the intrusion Rules page.

Note that the system does not factor rule overhead into recommendations to disable rules. Also, local rules are considered to have no overhead, unless they are mapped to a third-party vulnerability.

Generating recommendations for rules with the overhead rating at a particular setting does not preclude you from generating recommendations with different overhead, then generating recommendations again for the original overhead setting. You get the same rule state recommendations for each overhead setting each time you generate recommendations for the same rule set, regardless of the number of times you generate recommendations or how many different overhead settings you generate with. For example, you can generate recommendations with overhead set to medium, then to high, then finally to medium again; if the hosts and applications on your network have not changed, both sets of recommendations with overhead set to medium are then the same for that rule set.

### Accept Recommendations to Disable Rules

Specifies whether the system disables intrusion rules based on Firepower recommendations.

Accepting recommendations to disable rules restricts your rule coverage. Omitting recommendations to disable rules augments your rule coverage.

### Related Topics

[Adaptive Profile Updates and Firepower Recommended Rules](#), on page 1813

# Generating and Applying Firepower Recommendations

Starting or stopping use of Firepower recommendations may take several minutes, depending on the size of your network and intrusion rule set.

The system builds a separate network map for each leaf domain. In a multidomain deployment, if you enable this feature in an intrusion policy in an ancestor domain, the system generates recommendations using data from all descendant leaf domains. This can enable intrusion rules tailored to assets that may not exist in all leaf domains, which can affect performance.

### Before you begin

- Firepower recommendations have the following requirements:
  - FTD License—Threat
  - Classic License—Protection
  - User Roles—Admin or Intrusion Admin
- Configure a network discovery policy before you begin with the steps. Configure the network discovery policy to define internal hosts so that the Firepower recommendations are suitable. See, [Network Discovery Customization, on page 1918](#).

## Procedure

---

- Step 1** In the intrusion policy editor's navigation pane, click **Firepower Recommendations**.
- Step 2** (Optional) Configure advanced settings; see [Advanced Settings for Firepower Recommendations](#), on page 1519.
- Step 3** Generate and apply recommendations.
- **Generate and Use Recommendations**—Generates recommendations and changes rule states to match. Only available if you have never generated recommendations.
  - **Generate Recommendations**—Regardless of whether you are using recommendations, generates new recommendations but does not change rule states to match.
  - **Update Recommendations**—If you are using recommendations, generates recommendations and changes rule states to match. Otherwise, generates new recommendations without changing rule states.
  - **Use Recommendations**—Changes rule states to match any unimplemented recommendations.
  - **Do Not Use Recommendations**—Stops use of recommendations. If you manually changed a rule's state before you applied recommendations, the rule state returns to the value you gave it. Otherwise, the rule state returns to its default value.

When you generate recommendations, the system displays a summary of the recommended changes. To view a list of rules where the system recommends a state change, click **View** next to the newly proposed rule state.

- Step 4** Evaluate and adjust the recommendations you implemented.
- Even if you accept most Firepower recommendations, you can override individual recommendations by setting rule states manually; see [Setting Intrusion Rule States](#), on page 1504.
- Step 5** To save changes you made in this policy since the last policy commit, click **Policy Information**, then click **Commit Changes**.
- If you leave the policy without committing changes, changes since the last commit are discarded if you edit a different policy.

---

### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes](#), on page 346.

# Sensitive Data Detection

---

The following topics explain sensitive data detection and how to configure it:

- [Sensitive Data Detection Basics](#), on page 1523
- [Global Sensitive Data Detection Options](#), on page 1524
- [Individual Sensitive Data Type Options](#), on page 1525
- [System-Provided Sensitive Data Types](#), on page 1526
- [License Requirements for Sensitive Data Detection](#), on page 1527
- [Requirements and Prerequisites for Sensitive Data Detection](#), on page 1527
- [Configuring Sensitive Data Detection](#), on page 1527
- [Monitored Application Protocols and Sensitive Data](#), on page 1529
- [Selecting Application Protocols to Monitor](#), on page 1529
- [Special Case: Sensitive Data Detection in FTP Traffic](#), on page 1530
- [Custom Sensitive Data Types](#), on page 1531

## Sensitive Data Detection Basics

Sensitive data such as Social Security numbers, credit card numbers, driver's license numbers, and so on may be leaked onto the Internet, intentionally or accidentally. The system provides a sensitive data preprocessor that can detect and generate events on sensitive data in ASCII text, which can be particularly useful in detecting accidental data leaks.

Global sensitive data preprocessor options control how the preprocessor functions. You can modify global options that specify the following:

- whether the preprocessor replaces all but the last four credit card or Social Security numbers in triggering packets
- which destination hosts on your network to monitor for sensitive data
- how many total occurrences of all data types in a single session result in an event

Individual data types identify the sensitive data you can detect and generate events on in your specified destination network traffic. You can modify default settings for data type options that specify the following:

- a threshold that must be met for a detected data type to generate a single per-session event
- the destination ports to monitor for each data type

- the application protocols to monitor for each data type

You can create and modify custom data types to detect data patterns that you specify. For example, a hospital might create a data type to protect patient numbers, or a university might create a data type to detect student numbers that have a unique numbering pattern.

The system detects sensitive data per TCP session by matching individual data types against traffic. You can modify the default settings for each data type and for global options that apply to all data types in your intrusion policy. The Firepower System provides predefined, commonly used data types. You can also create custom data types.

A sensitive data preprocessor rule is associated with each data type. You enable sensitive data detection and event generation for each data type by enabling the corresponding preprocessor rule for the data type. A link on the configuration page takes you to a filtered view of sensitive data rules on the Rules page, where you can enable and disable rules and configure other rule attributes.

When you save changes to your intrusion policy, you are given the option to automatically enable the sensitive data preprocessor if the rule associated with a data type is enabled and sensitive data detection is disabled.

---

**Tip** The sensitive data preprocessor can detect sensitive data in unencrypted Microsoft Word files that are uploaded and downloaded using FTP or HTTP; this is possible because of the way Word files group ASCII text and formatting commands separately.

---

The system does not detect encrypted or obfuscated sensitive data, or sensitive data in a compressed or encoded format such as a Base64-encoded email attachment. For example, the system would detect the phone number (555)123-4567, but not an obfuscated version where each number is separated by spaces, as in (5 5 5) 1 2 3 - 4 5 6 7, or by intervening HTML code, such as `<b>(555)</b>-<i>123-4567</i>`. However, the system would detect, for example, the HTML coded number `<b>(555)-123-4567</b>` where no intervening codes interrupt the numbering pattern.

## Global Sensitive Data Detection Options

Global sensitive data options are policy-specific and apply to all data types.

### Mask

Replaces with Xs all but the last four digits of credit card numbers and Social Security numbers in the triggering packet. The masked numbers appear in the intrusion event packet view in the web interface and in downloaded packets.

### Networks

Specifies the destination host or hosts to monitor for sensitive data. You can specify a single IP address, address block, or a comma-separated list of either or both. The system interprets a blank field as `any`, meaning any destination IP address.

The system builds a separate network map for each leaf domain. In a multidomain deployment, using literal IP addresses to constrain this configuration can have unexpected results. Using override-enabled objects allows descendant domain administrators to tailor Global configurations to their local environments.

### Global Threshold

Specifies the total number of all occurrences of all data types during a single session that the preprocessor must detect in any combination before generating a global threshold event. You can specify 1 through 65535.

Cisco recommends that you set the value for this option higher than the highest threshold value for any individual data type that you enable in your policy.

Note the following points regarding global thresholds:

- You must enable preprocessor rule 139:1 to detect and generate events and, in an inline deployment, drop offending packets on combined data type occurrences.
- The preprocessor generates up to one global threshold event per session.
- Global threshold events are independent of individual data type events; that is, the preprocessor generates an event when the global threshold is reached, regardless of whether the event threshold for any individual data type has been reached, and vice versa.

### Related Topics

[Firepower System IP Address Conventions](#), on page 15

## Individual Sensitive Data Type Options

At a minimum, each custom data type must specify an event threshold and at least one port or application protocol to monitor.

Each system-provided data type uses an otherwise inaccessible `sd_pattern` keyword to define a built-in data pattern to detect in traffic. You can also create custom data types for which you use simple regular expressions to specify your own data patterns.

Sensitive data types display in all intrusion policies where Sensitive Data Detection is enabled. System-provided data types display as read-only. For custom data types, the name and pattern fields display as read-only, but you can set the other options to policy-specific values.

In a multidomain deployment, the system displays sensitive data types created in the current domain, which you can edit. It also displays data types created in ancestor domains, which you can edit in a limited way. For ancestor data types, the name and pattern fields display as read-only, but you can set the other options to policy-specific values.

**Table 113: Individual Data Type Options**

| Option    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Data Type | Specifies the unique name for the data type.                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Threshold | Specifies the number of occurrences of the data type when the system generates an event. You can specify 1 through 255.<br><br>Note that the preprocessor generates one event for a detected data type per session. Note also that global threshold events are independent of individual data type events; that is, the preprocessor generates an event when the data type event threshold is reached, regardless of whether the global event threshold has been reached, and vice versa. |

| Option                | Description                                                                                                                                                                                                                                     |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Destination Ports     | Specifies destination ports to monitor for the data type. You can specify a single port, a comma-separated list of ports, or <code>any</code> , meaning any destination port.                                                                   |
| Application Protocols | Specifies up to eight application protocols to monitor for the data type. You must activate application detectors to identify application protocols to monitor.<br><br>Note that, for Classic devices, this feature requires a Control license. |
| Pattern               | Specifies the pattern to detect. This field is only present for custom data types.                                                                                                                                                              |

### Related Topics

[Activating and Deactivating Detectors](#), on page 1889

## System-Provided Sensitive Data Types

Each intrusion policy includes system-provided data types for detecting commonly used data patterns such as credit card numbers, email addresses, U.S. phone numbers, and U.S. Social Security numbers with and without dashes.

Each system-provided data type is associated with a single sensitive data preprocessor rule that has a generator ID (GID) of 138. You must enable the associated sensitive data rule in the intrusion policy to generate events and, in an inline deployment, drop offending packets for each data type that you want to use in your policy.

The following table describes each data type and lists the corresponding preprocessor rule.

**Table 114: System-Provided Sensitive Data Types**

| Data Type                                   | Description                                                                                                                                                                                                                            | Preprocessor GID:SID |
|---------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|
| Credit Card Numbers                         | Matches Visa®, MasterCard®, Discover® and American Express® fifteen- and sixteen-digit credit card numbers, with or without their normal separating dashes or spaces; also uses the Luhn algorithm to verify credit card check digits. | 138:2                |
| Email Addresses                             | Matches email addresses.                                                                                                                                                                                                               | 138:5                |
| U.S. Phone Numbers                          | Matches U.S. phone numbers adhering to the pattern <code>(\d{3}) ?\d{3}-\d{4}</code> .                                                                                                                                                 | 138:6                |
| U.S. Social Security Numbers Without Dashes | Matches 9-digit U.S. Social Security numbers that have valid 3-digit area numbers, valid 2-digit group numbers, and do not have dashes.                                                                                                | 138:4                |
| U.S. Social Security Numbers With Dashes    | Matches 9-digit U.S. Social Security numbers that have valid 3-digit area numbers, valid 2-digit group numbers, and dashes.                                                                                                            | 138:3                |

To reduce false positives from 9-digit numbers other than Social Security numbers, the preprocessor uses an algorithm to validate the 3-digit area number and 2-digit group number that precede the 4-digit serial number in each Social Security number. The preprocessor validates Social Security group numbers through November 2009.

# Configuring Sensitive Data Detection

Because sensitive data detection can have a high impact on the performance of your Firepower System, Cisco recommends that you adhere to the following guidelines:

- Choose the No Rules Active default policy as your base intrusion policy.
- Ensure that the following settings are enabled in the corresponding network analysis policy:
  - **FTP and Telnet Configuration** under **Application Layer Preprocessors**
  - **IP Defragmentation** and **TCP Stream Configuration** under **Transport/Network Layer Preprocessors**.

In a multidomain deployment, the system displays policies created in the current domain, which you can edit. It also displays policies created in ancestor domains, which you cannot edit. To view and edit policies created in a lower domain, switch to that domain.

## Before you begin

For classic devices, this procedure requires the Protection or Control license.

## Procedure

---

- Step 1** Choose **Policies > Access Control > Intrusion**
- Step 2** Click **Edit** () next to the policy you want to edit.
- If **View** () appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.
- Step 3** Click **Advanced Settings** in the navigation panel.
- Step 4** If **Sensitive Data Detection** under **Specific Threat Detection** is disabled, click **Enabled**.
- Step 5** Click **Edit** () next to **Sensitive Data Detection**.
- Step 6** You have the following choices:
- Modify the global settings as described in [Global Sensitive Data Detection Options, on page 1524](#).
  - Choose a data type in the **Targets** section, and modify the data type configuration as described in [Individual Sensitive Data Type Options, on page 1525](#).
  - If you want to inspect custom sensitive data, create a custom data type; see [Custom Sensitive Data Types, on page 1531](#).
- Step 7** Add or remove application protocols to monitor for a data type; see [Monitored Application Protocols and Sensitive Data, on page 1529](#).
- Note** To detect sensitive data in FTP traffic, you must add the `FTP_data` application protocol.
- Step 8** Optionally, to display sensitive data preprocessor rules, click **Configure Rules for Sensitive Data Detection**.
- You can enable or disable any of the listed rules. You can also configure sensitive data rules for any of the other actions available on the Rules page, such as rule suppression, rate-based attack prevention, and so on; see [Intrusion Rule Types, on page 1489](#) for more information.
- Step 9** To save changes you made in this policy since the last policy commit, click **Policy Information** in the navigation panel, then click **Commit Changes**.
- If you enable sensitive data preprocessor rules in your policy without enabling sensitive data detection, you are prompted to enable sensitive data detection when you save changes to your policy.
- If you leave the policy without committing changes, changes since the last commit are discarded if you edit a different policy.
- 

## What to do next

- If you want to generate intrusion events, enable Sensitive Data Detection rules 138:2, 138:3, 138:4, 138:5, 138:6, 138:>999999, or 139:1. For more information, see [Intrusion Rule States, on page 1503](#), [Global Sensitive Data Detection Options, on page 1524](#), [System-Provided Sensitive Data Types, on page 1526](#), and [Custom Sensitive Data Types, on page 1531](#).
- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

### Related Topics

[Special Case: Sensitive Data Detection in FTP Traffic](#), on page 1530

## Monitored Application Protocols and Sensitive Data

You can specify up to eight application protocols to monitor for each data type. At least one detector must be enabled for each application protocol you select. By default, all system-provided detectors are activated. If no detector is enabled for an application protocol, the system automatically enables all system-provided detectors for the application; if none exist, the system enables the most recently modified user-defined detector for the application.

You must specify at least one application protocol or port to monitor for each data type. However, except in the case where you want to detect sensitive data in FTP traffic, Cisco recommends for the most complete coverage that you specify corresponding ports when you specify application protocols. For example, if you specify HTTP, you might also configure the well-known HTTP port 80. If a new host on your network implements HTTP, the system monitors port 80 during the interval when it is discovering the new HTTP application protocol.

In the case where you want to detect sensitive data in FTP traffic, you must specify the `FTP data` application protocol; there is no advantage in specifying a port number.

[Special Case: Sensitive Data Detection in FTP Traffic](#), on page 1530

## Selecting Application Protocols to Monitor

You can specify application protocols to monitor in both system-provided and custom sensitive data types. The application protocols you select are policy-specific.

### Before you begin

For classic devices, this procedure requires the Control license.

### Procedure

- 
- Step 1** Choose **Policies** > **Access Control** > **Intrusion**.
  - Step 2** Click **Edit** () next to the policy you want to edit.  
If **View** () appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.
  - Step 3** Click **Advanced Settings** in the navigation panel.
  - Step 4** If **Sensitive Data Detection** under **Specific Threat Detection** is disabled, click **Enabled**.
  - Step 5** Click **Edit** () next to **Sensitive Data Detection**.
  - Step 6** Click the name of a data type under **Data Types**.

**Step 7** Click **Edit** () next to the **Application Protocols** field.

**Step 8** You have the following choices:

- To add application protocols for monitoring, choose one or more application protocols from the **Available** list, then click right arrow (>). You can add up to eight application protocols for monitoring.
- To remove an application protocol from monitoring, choose it from the **Enabled** list, then click left arrow (<).

**Step 9** Click **OK**.

**Step 10** To save changes you made in this policy since the last policy commit, click **Policy Information** in the navigation pane, then click **Commit Changes**.

If you leave the policy without committing changes, changes since the last commit are discarded if you edit a different policy.

---

#### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

#### Related Topics

[Special Case: Sensitive Data Detection in FTP Traffic](#), on page 1530

## Special Case: Sensitive Data Detection in FTP Traffic

You usually determine which traffic to monitor for sensitive data by specifying the ports to monitor or specifying application protocols in deployments.

However, specifying ports or application protocols is not sufficient for detecting sensitive data in FTP traffic. Sensitive data in FTP traffic is found in traffic for the FTP application protocol, which occurs intermittently and uses a transient port number, making it difficult to detect. To detect sensitive data in FTP traffic, you **must** include the following in your configuration:

- Specify the `FTP_data` application protocol to enable detection of sensitive data in FTP traffic.  
In the special case of detecting sensitive data in FTP traffic, specifying the `FTP_data` application protocol does not invoke detection; instead, it invokes the rapid processing of the FTP/Telnet processor to detect sensitive data in FTP traffic.
- Ensure that the FTP Data detector, which is enabled by default, is enabled.
- Ensure that your configuration includes at least one port to monitor for sensitive data.
- Ensure that the file policy is enabled for the Access Control Policy.

Note that it is not necessary to specify an FTP port except in the unlikely case where you only want to detect sensitive data in FTP traffic. Most sensitive data configurations will include other ports such as HTTP or email ports. In the case where you do want to specify only one FTP port and no other ports to monitor, Cisco recommends that you specify the FTP command port 23.

## Custom Sensitive Data Types

Each custom data type you create also creates a single sensitive data preprocessor rule that has a Generator ID (GID) of 138 and a Snort ID (SID) of 1000000 or greater, that is, a SID for a local rule. In a multidomain deployment, the system prepends a domain number to the SID of any custom rule created in or imported into a descendant domain. For example, a rule added in the Global domain would have a SID of 1000000 or greater, and rules added in descendant domains would have SIDs of [domain number]000000 or greater.

You must enable the associated sensitive data rule to enable detection, generate events and, in an inline deployment, drop offending packets for each custom data type that you want to use in your policy.

To help you enable sensitive data rules, a link on the configuration page takes you to a filtered view of the intrusion policy Rules page that displays all system-provided and custom sensitive data rules. You can also display custom sensitive data rules along with any custom local rules by choosing the local filtering category on the intrusion policy Rules page. Note that custom sensitive data rules are not listed on the intrusion rules editor page (**Objects > Intrusion Rules**).

Once you create a custom data type, you can enable it in any intrusion policy in the system or, for multidomain deployments, in the current domain. To enable a custom data type, you must enable the associated sensitive data rule in any policy that you want to use to detect that custom data type.

## Data Patterns in Custom Sensitive Data Types

You define the data pattern for a custom data type using a simple set of regular expressions comprised of the following:

- three metacharacters
- escaped characters that allow you to use the metacharacters as literal characters
- six character classes

Metacharacters are literal characters that have special meaning within regular expressions.

**Table 115: Sensitive Data Pattern Metacharacters**

| Metacharacter | Description                                                                                                                                    | Example                                                                                                                                                                                                                                                                                     |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ?             | Matches zero or one occurrence of the preceding character or escape sequence; that is, the preceding character or escape sequence is optional. | <code>colou?r</code> matches <code>color</code> or <code>colour</code>                                                                                                                                                                                                                      |
| {n}           | Matches the preceding character or escape sequence n times.                                                                                    | For example, <code>\d{2}</code> matches <code>55</code> , <code>12</code> , and so on; <code>\l{3}</code> matches <code>AbC</code> , <code>www</code> , and so on; <code>\w{3}</code> matches <code>a1B</code> , <code>25C</code> , and so on; <code>x{5}</code> matches <code>xxxxx</code> |

| Metacharacter | Description                                                                                                     | Example                                                                                      |
|---------------|-----------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------|
| \             | Allows you to use metacharacters as actual characters and is also used to specify a predefined character class. | \? matches a question mark, \\ matches a backslash, \d matches numeric characters, and so on |

You must use a backslash to escape certain characters for the sensitive data preprocessor to interpret them correctly as literal characters.

**Table 116: Escaped Sensitive Data Pattern Characters**

| Use this escaped character... | To represent this literal character... |
|-------------------------------|----------------------------------------|
| \?                            | ?                                      |
| \{                            | {                                      |
| \}                            | }                                      |
| \\                            | \                                      |

When defining a custom sensitive data pattern, you can use character classes.

**Table 117: Sensitive Data Pattern Character Classes**

| Character Class      | Description                                                                                                                      | Character Class Definition |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------|----------------------------|
| \d                   | Matches any numeric ASCII character 0-9                                                                                          | 0-9                        |
| \D                   | Matches any byte that is not a numeric ASCII character                                                                           | not 0-9                    |
| \l (lowercase “ell”) | Matches any ASCII letter                                                                                                         | a-zA-Z                     |
| \L                   | Matches any byte that is not an ASCII letter                                                                                     | not a-zA-Z                 |
| \w                   | Matches any ASCII alphanumeric character<br>Note that, unlike PCRE regular expressions, this does not include an underscore (_). | a-zA-Z0-9                  |
| \W                   | Matches any byte that is not an ASCII alphanumeric character                                                                     | not a-zA-Z0-9              |

The preprocessor treats characters entered directly, instead of as part of a regular expression, as literal characters. For example, the data pattern 1234 matches 1234.

The following data pattern example, which is used in system-provided sensitive data rule 138:4, uses the escaped digits character class, the multiplier and option-specifier metacharacters, and the literal dash (-) and left and right parentheses () characters to detect U.S. phone numbers:

```
(\d{3}) ?\d{3}-\d{4}
```

Exercise caution when creating custom data patterns. Consider the following alternative data pattern for detecting phone numbers which, although using valid syntax, could cause many false positives:

```
(?\d{3})? ?\d{3}-?\d{4}
```

Because the second example combines optional parentheses, optional spaces, and optional dashes, it would detect, among others, phone numbers in the following desirable patterns:

- (555) 123-4567
- 555123-4567
- 5551234567

However, the second example pattern would also detect, among others, the following potentially invalid patterns, resulting in false positives:

- (555 1234567
- 555) 123-4567
- 555) 123-4567

Consider finally, for illustration purposes only, an extreme example in which you create a data pattern that detects the lowercase letter `a` using a low event threshold in all destination traffic on a small company network. Such a data pattern could overwhelm your system with literally millions of events in only a few minutes.

## Configuring Custom Sensitive Data Types

In a multidomain deployment, the system displays sensitive data types created in the current domain, which you can edit. It also displays data types created in ancestor domains, which you can edit in a limited way. For ancestor data types, the name and pattern fields display as read-only, but you can set the other options to policy-specific values.

You cannot delete a data type if the sensitive data rule for that data type is enabled in any intrusion policy.

### Procedure

- 
- Step 1** Choose **Policies > Access Control > Intrusion**
  - Step 2** Click **Edit** () next to the policy you want to edit.  
If **View** () appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.
  - Step 3** Click **Advanced Settings** in the navigation panel.
  - Step 4** If **Sensitive Data Detection** under **Specific Threat Detection** is disabled, click **Enabled**.
  - Step 5** Click **Edit** () next to **Sensitive Data Detection**.
  - Step 6** Click **Add** () next to **Data Types**.
  - Step 7** Enter a name for the data type.
  - Step 8** Enter the pattern you want to detect with this data type; see [Data Patterns in Custom Sensitive Data Types, on page 1531](#).
  - Step 9** Click **OK**.

- Step 10** Optionally, click the data type name, and modify the options described in [Individual Sensitive Data Type Options, on page 1525](#).
- Step 11** Optionally, delete a custom data type by clicking **Delete** () , then **OK** to confirm.
- Note** If the sensitive data rule for that data type is enabled in any intrusion policy, the system warns that you cannot delete the data type. You must disable the sensitive data rule in affected policies before attempting the deletion again; see [Setting Intrusion Rule States, on page 1504](#).
- Step 12** To save changes you made in this policy since the last policy commit, click **Policy Information** in the navigation panel, then click **Commit Changes**.
- If you leave the policy without committing changes, changes since the last commit are discarded if you edit a different policy.

---

### What to do next

- Enable the associated custom sensitive data preprocessing rule in each policy where you want to use that data type; see [Setting Intrusion Rule States, on page 1504](#).
- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

### Related Topics

[Editing Custom Sensitive Data Types, on page 1534](#)

## Editing Custom Sensitive Data Types

You can edit all fields in custom sensitive data types. Note, however, that when you modify the name or pattern field, these settings change in all intrusion policies on the system. You can set the other options to policy-specific values.

In a multidomain deployment, the system displays sensitive data types created in the current domain, which you can edit. It also displays data types created in ancestor domains, which you can edit in a limited way. For ancestor data types, the name and pattern fields display as read-only, but you can set the other options to policy-specific values.

### Procedure

---

- Step 1** Choose **Policies > Access Control > Intrusion**
- Step 2** Click **Edit** () next to the policy you want to edit.
- If **View** () appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.
- Step 3** Click **Advanced Settings** in the navigation panel.
- Step 4** If **Sensitive Data Detection** under **Specific Threat Detection** is disabled, click **Enabled**.
- Step 5** Click **Edit** next to **Sensitive Data Detection**.
- Step 6** In the **Targets** section, click the name of the custom data type.

- Step 7** Click **Edit Data Type Name and Pattern**.
- Step 8** Modify the data type name and pattern; see [Data Patterns in Custom Sensitive Data Types, on page 1531](#).
- Step 9** Click **OK**.
- Step 10** Set the remaining options to policy-specific values; see [Individual Sensitive Data Type Options, on page 1525](#).
- Step 11** To save changes you made in this policy since the last policy commit, click **Policy Information** in the navigation panel, then click **Commit Changes**.

If you leave the policy without committing changes, changes since the last commit are discarded if you edit a different policy.

---

#### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## CHAPTER 80

# Globally Limiting Intrusion Event Logging

The following topics describe how to globally limit intrusion event logging:

- [Global Rule Thresholding Basics, on page 1537](#)
- [Global Rule Thresholding Options, on page 1538](#)
- [License Requirements for Global Thresholds, on page 1539](#)
- [Requirements and Prerequisites for Global Thresholds, on page 1540](#)
- [Configuring Global Thresholds, on page 1540](#)
- [Disabling the Global Threshold, on page 1541](#)

## Global Rule Thresholding Basics

The global rule threshold sets limits for event logging by an intrusion policy. You can set a global rule threshold across all traffic to limit how often the policy logs events from a specific source or destination and displays those events per specified time period. You can also set thresholds per shared object rule, standard text rule, or preprocessor rule in the policy. When you set a global threshold, that threshold applies for each rule in the policy that does not have an overriding specific threshold. Thresholds can prevent you from being overwhelmed with a large number of events.

Every intrusion policy contains a default global rule threshold that applies by default to all intrusion rules and preprocessor rules. This default threshold limits the number of events on traffic going to a destination to one event per 60 seconds.

You can:

- Change the global threshold.
- Disable the global threshold.
- Override the global threshold by setting individual thresholds for specific rules.

For example, you might set a global limit threshold of five events every 60 seconds, but then set a specific threshold of ten events for every 60 seconds for SID 1315. All other rules generate no more than five events in each 60-second period, but the system generates up to ten events for each 60-second period for SID 1315.

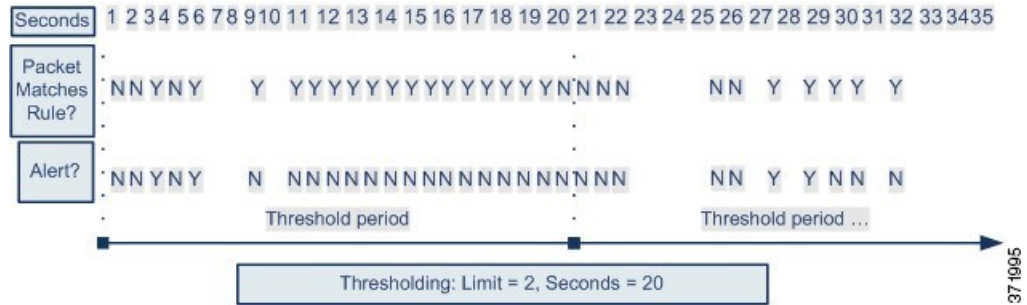

---

**Tip** A global or individual threshold on a managed device with multiple CPUs may result in a higher number of events than expected.

---

The following diagram demonstrates how the global rule thresholding works. In this example, an attack is in progress for a specific rule. The global limit threshold is set to limit event generation for each rule to two events every 20 seconds. Note that the period starts at one second and ends at 21 seconds. After the period ends, the cycle starts again and the next two rule matches generate events, then the system does not generate any more events during that period.

## Global Rule Thresholding Options

The default threshold limits event generation for each rule to one event every 60 seconds on traffic going to the same destination. The default values for the global rule thresholding options are:

- **Type** — Limit
- **Track By** — Destination
- **Count** — 1
- **Seconds** — 60

You can modify these default values as follows:

Table 118: Thresholding Types

| Option    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Limit     | <p>Logs and displays events for the specified number of packets (specified by the count argument) that trigger the rule during the specified time period.</p> <p>For example, if you set the type to <b>Limit</b>, the <b>Count</b> to 10, and the <b>Seconds</b> to 60, and 14 packets trigger the rule, the system stops logging events for the rule after displaying the first 10 that occur within the same minute.</p>                                                                                                                                                                                                                                                  |
| Threshold | <p>Logs and displays a single event when the specified number of packets (specified by the count argument) trigger the rule during the specified time period. Note that the counter for the time restarts after you hit the threshold count of events and the system logs that event.</p> <p>For example, you set the type to <b>Threshold</b>, <b>Count</b> to 10, and <b>Seconds</b> to 60, and the rule triggers 10 times by second 33. The system generates one event, then resets the Seconds and Count counters to 0. The rule then triggers another 10 times in the next 25 seconds. Because the counters reset to 0 at second 33, the system logs another event.</p> |

| Option | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Both   | <p>Logs and displays an event once per specified time period, after the specified number (count) of packets trigger the rule.</p> <p>For example, if you set the type to <b>Both</b>, <b>Count</b> to 2, and <b>Seconds</b> to 10, the following event counts result:</p> <ul style="list-style-type: none"> <li>• If the rule is triggered once in 10 seconds, the system does not generate any events (the threshold is not met)</li> <li>• If the rule is triggered twice in 10 seconds, the system generates one event (the threshold is met when the rule triggers the second time)</li> <li>• If the rule is triggered four times in 10 seconds, the system generates one event (the threshold is met when the rule triggered the second time and following events are ignored)</li> </ul> |

The **Track By** option determines whether the event instance count is calculated per source or destination IP address.

You can also specify the number of instances and time period that define the threshold, as follows:

**Table 119: Thresholding Instance/Time Options**

| Option  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Count   | <p>For a <b>Limit</b> threshold, the number of event instances per specified time period per tracking IP address or address range required to meet the threshold.</p> <p>For a <b>Threshold</b> threshold, the number of rule matches you want to use as your threshold.</p>                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Seconds | <p>For a <b>Limit</b> threshold, the number of seconds that make up the time period when attacks are tracked.</p> <p>For a <b>Threshold</b> threshold, the number of seconds that elapse before the count resets. If you set the threshold type to <b>Limit</b>, the tracking to <b>Source</b>, <b>Count</b> to 10, and <b>Seconds</b> to 10, the system logs and displays the first 10 events that occur in 10 seconds from a given source port. If only seven events occur in the first 10 seconds, the system logs and displays those, if 40 events occur in the first 10 seconds, the system logs and displays 10, then begins counting again when the 10-second time period elapses.</p> |

## Configuring Global Thresholds

In a multidomain deployment, the system displays policies created in the current domain, which you can edit. It also displays policies created in ancestor domains, which you cannot edit. To view and edit policies created in a lower domain, switch to that domain.

**Procedure**

- 
- Step 1** Choose **Policies > Access Control > Intrusion**.
- Step 2** Click **Edit** () next to the policy you want to edit.
- If **View** () appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.
- Step 3** Click **Advanced Settings** in the navigation panel.
- Step 4** If **Global Rule Thresholding** under **Intrusion Rule Thresholds** is disabled, click **Enabled**.
- Step 5** Click **Edit** () next to **Global Rule Thresholding**.
- Step 6** Using **Type**, specify the type of threshold that will apply over the time you specify in the **Seconds** field.
- Step 7** Using **Track By**, specify the tracking method.
- Step 8** Enter a value in the **Count** field.
- Step 9** Enter a value in the **Seconds** field.
- Step 10** To save changes you made in this policy since the last policy commit, click **Policy Information**, then click **Commit Changes**.

If you leave the policy without committing changes, changes since the last commit are discarded if you edit a different policy.

---

## Disabling the Global Threshold

You can disable global thresholding in the highest policy layer if you want to threshold events for specific rules rather than applying thresholding to every rule by default.

In a multidomain deployment, the system displays policies created in the current domain, which you can edit. It also displays policies created in ancestor domains, which you cannot edit. To view and edit policies created in a lower domain, switch to that domain.

#### Procedure

---

**Step 1** Choose **Policies > Access Control > Intrusion**

**Step 2** Click **Edit** () next to the policy you want to edit.

If **View** () appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

**Step 3** Click **Advanced Settings** in the navigation panel.

**Step 4** Next to **Global Rule Thresholding** under **Intrusion Rule Thresholds**, click **Disabled**.

**Step 5** To save changes you made in this policy since the last policy commit, click **Policy Information**, then click **Commit Changes**.

If you leave the policy without committing changes, changes since the last commit are discarded if you edit a different policy.

- [Custom Rule Creation, on page 1556](#)
- [Searching for Rules, on page 1561](#)
- [Rule Filtering on the Intrusion Rules Editor Page, on page 1562](#)
- [Keywords and Arguments in Intrusion Rules, on page 1565](#)

## An Introduction to Intrusion Rule Editing

An *intrusion rule* is a set of keywords and arguments that the system uses to detect attempts to exploit vulnerabilities on your network. As the system analyzes network traffic, it compares packets against the conditions specified in each rule. If the packet data matches all the conditions specified in a rule, the rule triggers. If a rule is an *alert rule*, it generates an intrusion event. If it is a *pass rule*, it ignores the traffic. For a *drop* rule in an inline deployment, the system drops the packet and generates an event. You can view and evaluate intrusion events from the Firepower Management Center web interface.

The Firepower System provides two types of intrusion rules: shared object rules and standard text rules. The Cisco Talos Intelligence Group (Talos) can use shared object rules to detect attacks against vulnerabilities in ways that traditional standard text rules cannot. You cannot create shared object rules. When you write your own intrusion rule, you create a standard text rule.

You can write custom standard text rules to tune the types of events you are likely to see. Note that while this documentation sometimes discusses rules targeted to detect specific exploits, the most successful rules target traffic that may attempt to exploit known vulnerabilities rather than specific known exploits. By writing rules and specifying the rule's event message, you can more easily identify traffic that indicates attacks and policy evasions.

When you enable a custom standard text rule in a custom intrusion policy, keep in mind that some rule keywords and arguments require that traffic first be decoded or preprocessed in a certain way. This chapter explains the options you must configure in your network analysis policy, which governs preprocessing. Note that if you disable a required preprocessor, the system automatically uses it with its current settings, although the preprocessor remains disabled in the network analysis policy web interface.

---

**Caution** Make sure you use a controlled network environment to test any intrusion rules that you write before you use the rules in a production environment. Poorly written intrusion rules may seriously affect the performance of the system.

---

In a multidomain deployment, the system displays rules created in the current domain, which you can edit. It also displays rules created in ancestor domains, which you cannot edit. To view and edit rules created in a lower domain, switch to that domain. The system-provided intrusion rules belong to the Global domain. Administrators in descendant domains can make local editable copies of these system rules.

## Rule Anatomy

All standard text rules contain two logical sections: the rule header and the rule options. The rule header contains:

- the rule's action or type
- the protocol
- the source and destination IP addresses and netmasks
- direction indicators showing the flow of traffic from source to destination

- the source and destination ports

The rule options section contains:

- event messages
- keywords and their parameters and arguments
- patterns that a packet’s payload must match to trigger the rule
- specifications of which parts of the packet the rules engine should inspect

The following diagram illustrates the parts of a rule:

**Rule Header**

```
alert tcp $EXTERNAL_NET any -> $HTTP_SERVERS $HTTP_PORTS
```

**Rule Keywords and Arguments**

```
(msg:"WEB-IIS newdsn.exe access";
flow:to_server,established; uricontent:"/scripts/
tools/newdsn.exe"; nocase; metadata:service http;
reference:bugtraq,1818; reference:cve,1999-0191;
reference:nessus,10360; classtype:web-application-
activity; sid:1024; rev:10;)
```

372214

Note that the options section of a rule is the section enclosed in parentheses. The intrusion rules editor provides an easy-to-use interface to help you build standard text rules.

## The Intrusion Rule Header

Every standard text rule and shared object rule has a rule header containing parameters and arguments. The following illustrates parts of a rule header:

372215

The following table describes each part of the rule header shown above.

**Table 120: Rule Header Values**

| Rule Header Component | Example Value  | This Value...                                                            |
|-----------------------|----------------|--------------------------------------------------------------------------|
| Action                | alert          | Generates an intrusion event when triggered.                             |
| Protocol              | tcp            | Tests TCP traffic only.                                                  |
| Source IP Address     | \$EXTERNAL_NET | Tests traffic coming from any host that is not on your internal network. |

| Rule Header Component  | Example Value  | This Value...                                                                                 |
|------------------------|----------------|-----------------------------------------------------------------------------------------------|
| Source Ports           | any            | Tests traffic coming from any port on the originating host.                                   |
| Operator               | ->             | Tests external traffic (destined for the web servers on your network).                        |
| Destination IP Address | \$HTTP_SERVERS | Tests traffic to be delivered to any host specified as a web server on your internal network. |
| Destination Ports      | \$HTTP_PORTS   | Tests traffic delivered to an HTTP port on your internal network.                             |

**Note** The previous example uses default variables, as do most intrusion rules.

#### Related Topics

[Variable Sets](#), on page 412

## Intrusion Rule Header Action

Each rule header includes a parameter that specifies the action the system takes when a packet triggers a rule. Rules with the action set to *alert* generate an intrusion event against the packet that triggered the rule and log the details of that packet. Rules with the action set to *pass* do not generate an event against, or log the details of, the packet that triggered the rule.

**Note** In an inline deployment, rules with the rule state set to *Drop and Generate Events* generate an intrusion event against the packet that triggered the rule. Also, if you apply a drop rule in a passive deployment, the rule acts as an alert rule.

By default, pass rules override alert rules. You can create pass rules to prevent packets that meet criteria defined in the pass rule from triggering the alert rule in specific situations, rather than disabling the alert rule. For example, you might want a rule that looks for attempts to log into an FTP server as the user “anonymous” to remain active. However, if your network has one or more legitimate anonymous FTP servers, you could write and activate a pass rule that specifies that, for those specific servers, anonymous users do not trigger the original rule.

Within the intrusion rules editor, you select the rule type from the **Action** list.

## Intrusion Rule Header Protocol

In each rule header, you must specify the protocol of the traffic the rule inspects. You can specify the following network protocols for analysis:

- ICMP (Internet Control Message Protocol)
- IP (Internet Protocol)

---

**Note** The system ignores port definitions in an intrusion rule header when the protocol is set to `ip`.

---

- TCP (Transmission Control Protocol)
- UDP (User Datagram Protocol)

Use **IP** as the protocol type to examine all protocols assigned by IANA, including TCP, UDP, ICMP, IGMP, and many more.

---

**Note** You cannot currently write rules that match patterns in the next header (for example, the TCP header) in an IP payload. Instead, content matches begin with the last decoded protocol. As a workaround, you can match patterns in TCP headers by using rule options.

---

Within the Intrusion Rules editor, you select the protocol type from the **Protocol** list.

#### Related Topics

[Intrusion Rule Header Protocol](#), on page 1546

## Intrusion Rule Header Direction

Within the rule header, you can specify the direction that the packet must travel for the rule to inspect it. The following table describes these options.

*Table 121: Directional Options in Rule Headers*

| Use...        | To Test...                                                                                |
|---------------|-------------------------------------------------------------------------------------------|
| Directional   | only traffic from the specified source IP address to the specified destination IP address |
| Bidirectional | all traffic traveling between the specified source and destination IP addresses           |

## Intrusion Rule Header Source and Destination IP Addresses

Restricting packet inspection to the packets originating from specific IP addresses or destined to a specific IP address reduces the amount of packet inspection the system must perform. This also reduces false positives by making the rule more specific and removing the possibility of the rule triggering against packets whose source and destination IP addresses do not indicate suspicious behavior.

---

**Tip** The system recognizes only IP addresses and does not accept host names for source or destination IP addresses.

---

Within the intrusion rules editor, you specify source and destination IP addresses in the **Source IPs** and **Destination IPs** fields.

When writing standard text rules, you can specify IPv4 and IPv6 addresses in a variety of ways, depending on your needs. You can specify a single IP address, `any`, IP address lists, CIDR notation, prefix lengths, or a

network variable. Additionally, you can indicate that you want to exclude a specific IP address or set of IP addresses. When specifying IPv6 addresses, you can use any addressing convention defined in RFC 4291.

## IP Address Syntax in Intrusion Rules

The following table summarizes the various ways you can specify source and destination IP addresses.

**Table 122: Source/Destination IP Address Syntax**

| To Specify...                                                                | Use...                                                                                                                                                                                       | Example                                                                                            |
|------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------|

| anything except a specific IP address or set of addresses                    | the ! character before the IP address or addresses you want to negate                                                                                                                        | !192.168.1.15<br><br>!2001:db8::0202:b3ff:fe1e                                                     |
| anything in a block of IP addresses except one or more specific IP addresses | a block of addresses followed by a list of negated addresses or blocks                                                                                                                       | [10.0.0/8,<br>!10.2.3.4, !10.1.0.0/16]<br><br>[2001:db8::/32, !2001:db8::8329,<br>!2001:db8::0202] |
| IP addresses defined by a network variable                                   | the variable name, in uppercase letters, preceded by \$<br><br>Note that preprocessor rules can trigger events regardless of the hosts defined by network variables used in intrusion rules. | \$HOME_NET                                                                                         |
| all IP addresses except addresses defined by an IP address variable          | the variable name, in uppercase letters, preceded by !\$                                                                                                                                     | !\$HOME_NET                                                                                        |

The following descriptions provide additional information on some of the IP address entry methods.

### Any IP Address

You can specify the word `any` as a rule source or destination IP address to indicate any IPv4 or IPv6 address.

For example, the following rule uses the argument **any** in the **Source IPs** and **Destination IPs** fields and evaluates packets with any IPv4 or IPv6 source or destination address:

```
alert tcp any any -> any any
```

You can also specify `::` to indicate any IPv6 address.

### Multiple IP Addresses

You can list individual IP addresses by separating the IP addresses with commas and, optionally, by surrounding non-negated lists with brackets, as shown in the following example:

```
[192.168.1.100,192.168.1.103,192.168.1.105]
```

You can list IPv4 and IPv6 addresses alone or in any combination, as shown in the following example:

```
[192.168.1.100,2001:db8::1234,192.168.1.105]
```

Note that surrounding an IP address list with brackets, which was required in earlier software releases, is not required. Note also that, optionally, you can enter lists with a space before or after each comma.

---

**Note** You must surround negated lists with brackets.

---

You can also use IPv4 Classless Inter-Domain Routing (CIDR) notation or IPv6 prefix lengths to specify address blocks. For example:

- 192.168.1.0/24 specifies the IPv4 addresses in the 192.168.1.0 network with a subnet mask of 255.255.255.0, that is, 192.168.1.0 through 192.168.1.255.
- 2001:db8::/32 specifies the IPv6 addresses in the 2001:db8:: network with a prefix length of 32 bits, that is, 2001:db8:: through 2001:db8:fff:fff:fff:fff:fff:fff.

---

**Tip** If you need to specify a block of IP addresses but cannot express it using CIDR or prefix length notation alone, you can use CIDR blocks and prefix lengths in an IP address list.

---

### IP Addresses Negation

You can use an exclamation point (!) to negate a specified IP address. That is, you can match any IP address with the exception of the specified IP address or addresses. For example, `!192.168.1.1` specifies any IP address other than 192.168.1.1, and `!2001:db8:ca2e::fa4c` specifies any IP address other than 2001:db8:ca2e::fa4c.

To negate a list of IP addresses, place ! before a bracketed list of IP addresses. For example, `![192.168.1.1,192.168.1.5]` would define any IP address other than 192.168.1.1 or 192.168.1.5.

---

**Note** You must use brackets to negate a list of IP addresses.

---

Be careful when using the negation character with IP address lists. For example, if you use `![192.168.1.1,!192.168.1.5]` to match any address that is not 192.168.1.1 or 192.168.1.5, the system interprets this syntax as “anything that is not 192.168.1.1, **or** anything that is not 192.168.1.5.”

Because 192.168.1.5 is not 192.168.1.1, and 192.168.1.1 is not 192.168.1.5, both IP addresses match the IP address value of `![192.168.1.1,!192.168.1.5]`, and it is essentially the same as using “any.”

Instead, use `![192.168.1.1,192.168.1.5]`. The system interprets this as “**not** 192.168.1.1 **and not** 192.168.1.5,” which matches any IP address other than those listed between brackets.

Note that you cannot logically use negation with `any` which, if negated, would indicate no address.

## Intrusion Rule Header Source and Destination Ports

Within the intrusion rules editor, you specify source and destination ports in the **Source Port** and **Destination Port** fields.

### Port Syntax in Intrusion Rules

The Firepower System uses a specific type of syntax to define the port numbers used in rule headers.

**Note** The system ignores port definitions in an intrusion rule header when the protocol is set to `ip`.

You can list ports by separating the ports with commas, as shown in the following example:

```
80, 8080, 8138, 8600-9000, !8650-8675
```

Optionally, the following example shows how you can surround a port list with brackets, which was required in previous software versions but is no longer required:

```
[80, 8080, 8138, 8600-9000, !8650-8675]
```

Note that you **must** surround negated port lists in brackets, as shown in the following example:

```
![20, 22, 23]
```

The following table summarizes the syntax you can use:

**Table 123: Source/Destination Port Syntax**

| To Specify...                                      | Use                                                                                                                                                                                                                                                 | Example                   |
|----------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------|
| any port                                           | <code>any</code>                                                                                                                                                                                                                                    | <code>any</code>          |
| a specific port                                    | the port number                                                                                                                                                                                                                                     | <code>80</code>           |
| a range of ports                                   | a dash between the first and last port number in the range                                                                                                                                                                                          | <code>80-443</code>       |
| all ports less than or equal to a specific port    | a dash before the port number                                                                                                                                                                                                                       | <code>-21</code>          |
| all ports greater than or equal to a specific port | a dash after the port number                                                                                                                                                                                                                        | <code>80-</code>          |
| all ports except a specific port or range of ports | the <code>!</code> character before the port, port list, or range of ports you want to negate<br><br>Note that you can logically use negation with all port designations except <code>any</code> , which if negated would indicate <i>no port</i> . | <code>!20</code>          |
| all ports defined by a port variable               | the variable name, in uppercase letter, preceded by <code>\$</code>                                                                                                                                                                                 | <code>\$HTTP_PORTS</code> |

| To Specify...                                     | Use                                                     | Example       |
|---------------------------------------------------|---------------------------------------------------------|---------------|
| all ports except ports defined by a port variable | the variable name, in uppercase letter, preceded by !\$ | !\$HTTP_PORTS |

## Intrusion Event Details

As you construct a standard text rule, you can include contextual information that describes the vulnerability that the rule detects in exploit attempts. You can also include external references to vulnerability databases and define the priority that the event holds in your organization. When analysts see the event, they then have information about the priority, exploit, and known mitigation readily available.

### Message

You can specify meaningful text that appears as a message when the rule triggers. The message gives immediate insight into the nature of the vulnerability that the rule detects attempts to exploit. You can use any printable standard ASCII characters except curly braces (`{}`). The system strips quotes that completely surround the message.

**Tip** You must specify a rule message. Also, the message cannot consist of white space only, one or more quotation marks only, one or more apostrophes only, or any combination of just white space, quotation marks, or apostrophes.

To define the event message in the intrusion rules editor, you enter the event message in the **Message** field.

### Classification

For each rule, you can specify an attack classification that appears in the packet display of the event. The following table lists the name and number for each classification.

**Table 124: Rule Classifications**

| Number | Classification Name         | Description                   |
|--------|-----------------------------|-------------------------------|
| 1      | not-suspicious              | Not Suspicious Traffic        |
| 2      | unknown                     | Unknown Traffic               |
| 3      | bad-unknown                 | Potentially Bad Traffic       |
| 4      | attempted-recon             | Attempted Information Leak    |
| 5      | successful-recon-limited    | Information Leak              |
| 6      | successful-recon-largescale | Large Scale Information Leak  |
| 7      | attempted-dos               | Attempted Denial of Service   |
| 8      | successful-dos              | Denial of Service             |
| 9      | attempted-user              | Attempted User Privilege Gain |

| Number | Classification Name            | Description                                                 |
|--------|--------------------------------|-------------------------------------------------------------|
| 10     | unsuccessful-user              | Unsuccessful User Privilege Gain                            |
| 11     | successful-user                | Successful User Privilege Gain                              |
| 12     | attempted-admin                | Attempted Administrator Privilege Gain                      |
| 13     | successful-admin               | Successful Administrator Privilege Gain                     |
| 14     | rpc-portmap-decode             | Decode of an RPC Query                                      |
| 15     | shellcode-detect               | Executable Code was Detected                                |
| 16     | string-detect                  | A Suspicious String was Detected                            |
| 17     | suspicious-filename-detect     | A Suspicious Filename was Detected                          |
| 18     | suspicious-login               | An Attempted Login Using a Suspicious Username was Detected |
| 19     | system-call-detect             | A System Call was Detected                                  |
| 20     | tcp-connection                 | A TCP Connection was Detected                               |
| 21     | trojan-activity                | A Network Trojan was Detected                               |
| 22     | unusual-client-port-connection | A Client was Using an Unusual Port                          |
| 23     | network-scan                   | Detection of a Network Scan                                 |
| 24     | denial-of-service              | Detection of a Denial of Service Attack                     |
| 25     | non-standard-protocol          | Detection of a Non-Standard Protocol or Event               |
| 26     | protocol-command-decode        | Generic Protocol Command Decode                             |
| 27     | web-application-activity       | Access to a Potentially Vulnerable Web Application          |
| 28     | web-application-attack         | Web Application Attack                                      |
| 29     | misc-activity                  | Misc Activity                                               |
| 30     | misc-attack                    | Misc Attack                                                 |
| 31     | icmp-event                     | Generic ICMP Event                                          |
| 32     | inappropriate-content          | Inappropriate Content was Detected                          |
| 33     | policy-violation               | Potential Corporate Privacy Violation                       |
| 34     | default-login-attempt          | Attempt to Login By a Default Username and Password         |
| 35     | sdf                            | Sensitive Data                                              |
| 36     | malware-cnc                    | Known malware command and control traffic                   |

| Number | Classification Name | Description                                |
|--------|---------------------|--------------------------------------------|
| 37     | client-side-exploit | Known client side exploit attempt          |
| 38     | file-format         | Known malicious file or file based exploit |

### Custom Classification

If you want more customized content for the packet display description of the events generated by a rule you define, you can create a custom classification.

| Argument                   | Description                                                                                                                                                                                |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Classification Name        | The name of the classification. The page is difficult to read if you use more than 40 characters. The following characters are not supported: <> ( ) \ ' " & \$ ; and the space character. |
| Classification Description | A description of the classification. You can use alphanumeric characters and spaces. The following characters are not supported: <> ( ) \ ' " & \$ ;                                       |
| Priority                   | High, medium, or low.                                                                                                                                                                      |

### Custom Priority

By default, the priority of a rule derives from the event classification for the rule. However, you can override the classification priority for a rule by adding the `priority` keyword to the rule and selecting a high, medium, or low priority. For example, to assign a high priority for a rule that detects web application attacks, add the `priority` keyword to the rule and select **high** as the priority.

### Custom Reference

You can use the `reference` keyword to add references to external web sites and additional information about the event. Adding a reference provides analysts with an immediately available resource to help them identify why the packet triggered a rule. The following table lists some of the external systems that can provide data on known exploits and attacks.

**Table 125: External Attack Identification Systems**

| System ID | Description                            | Example ID                 |
|-----------|----------------------------------------|----------------------------|
| bugtraq   | Bugtraq page                           | 8550                       |
| cve       | Common Vulnerabilities and Exposure ID | 2020-9607                  |
| mcafee    | McAfee page                            | 98574                      |
| url       | Website reference                      | www.example.com?exploit=14 |
| msb       | Microsoft security bulletin            | MS11-082                   |

| System ID  | Description                            | Example ID                                                                                             |
|------------|----------------------------------------|--------------------------------------------------------------------------------------------------------|
| nessus     | Nessus page                            | 10039                                                                                                  |
| secure-url | Secure Website Reference (https://...) | intranet/exploits/exploit=14<br>Note that you can use <code>secure-url</code> with any secure website. |

You specify a reference by entering a reference value, as follows:

```
id_system,id
```

where `id_system` is the system being used as a prefix, and `id` is the CVE ID number, Arachnids ID, or URL (without `http://`).

For example, to specify the Adobe Acrobat and Reader issue documented in CVE-2020-9607, enter the value:

```
cve,2020-9607
```

Note the following when adding references to a rule:

- Do not use a space after the comma.
- Do not use uppercase letters in the system ID.

## Adding a Custom Classification

In a multidomain deployment, the system displays custom classifications created in the current domain, and you can set the priorities for these classifications. It also displays custom classifications created in ancestor domains, but you cannot set the priorities for these classifications. To view and edit custom classifications created in a lower domain, switch to that domain.

### Procedure

- 
- Step 1** While creating or editing a rule, choose **Edit Classifications** from the **Classification** drop-down list. If **View Classifications** displays instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.
- Step 2** Enter a **Classification Name** and **Classification Description** as described in [Intrusion Event Details](#), on page 1551.
- Step 3** Choose a priority for the classification from the **Priority** drop-down list.
- Step 4** Click **Add**.
- Step 5** Click **Done**.
-

**What to do next**

- Continue with creating or editing the rule. See [Writing New Rules, on page 1557](#) or [Modifying Existing Rules, on page 1558](#) for more information.

# Custom Rule Creation

You can create a custom intrusion rule by:

- creating your own standard text rules
- saving existing standard text rules as new
- saving system-provided shared object rules as new
- in a multidomain deployment, saving ancestor rules as new in a descendant domain
- importing a local rule file

The system saves the custom rule in the local rule category, regardless of the method you used to create it.

When you create a custom intrusion rule, the system assigns it a unique rule number, which has the format `GID:SID:Rev`. The elements of this number are:

## **GID**

Generator ID. For all standard text rules, this value is 1. For all shared object rules you save as new, this value is 3.

## **SID**

Snort ID. Indicates whether the rule is a local rule or a system rule. When you create a new rule, the system assigns the next available SID for a local rule.

SID numbers for local rules start at 1000000, and the SID for each new local rule is incremented by one. In a multidomain deployment, the system prepends a domain number to the SID of any custom rule created in or imported into a descendant domain. For example, a rule added in the Global domain would have a SID of 1000000 or greater, and rules added in descendant domains would have SIDs of [domain number]000000 or greater.

## **Rev**

The revision number. For a new rule, the revision number is one. Each time you modify a custom rule the revision number increments by one.

In a custom standard text rule, you set the rule header settings and the rule keywords and arguments. You can use the rule header settings to focus the rule to only match traffic using a specific protocol and traveling to or from specific IP addresses or ports.

In a custom system-provided standard text rule or shared object rule, you are limited to modifying rule header information such as the source and destination ports and IP addresses. You cannot modify the rule keywords or arguments.

Modifying header information for a shared object rule and saving your changes creates a new instance of the rule with a generator ID (GID) of 3 and the next available SID for a custom rule. The system links the new instance of the shared object rule to the reserved `soid` keyword, which maps the rule you create to the rule created by the Cisco Talos Intelligence Group (Talos). You can delete instances of a shared object rule that you create, but you cannot delete shared object rules created by Talos.

# Writing New Rules

## Procedure

---

- Step 1** Access the intrusion rules using either of the following methods:
- Choose **Policies > Access Control > Intrusion**, and click **Intrusion Rules**.
  - Choose **Objects > Intrusion Rules**.
- Step 2** Click **Create Rule**.
- Step 3** Enter a value in the **Message** field.
- Step 4** Choose a value from each of the following drop-down lists:
- **Classification**
  - **Action**
  - **Protocol**
  - **Direction**
- Step 5** Enter values in the following fields:
- **Source IPs**
  - **Destination IPs**
  - **Source Port**
  - **Destination Port**
- The system uses the value `any` if you do not specify a value for these fields.
- Note** The system builds a separate network map for each leaf domain. In a multidomain deployment, using literal IP addresses to constrain this configuration can have unexpected results.
- Step 6** Choose a value from the **Detection Options** drop-down list.
- Step 7** Click **Add Option**.
- Step 8** Enter any arguments for the keyword you added.
- Step 9** Optionally, repeat steps 6 to 8.
- Step 10** If you added multiple keywords, you can:
- Reorder keywords — Click the up or down arrow next to the keyword you want to move.
  - Delete a keyword — Click the **X** next to that keyword.
- Step 11** Click **Save As New**.
- 

## What to do next

- Enable your new or changed rules within the appropriate intrusion policy; see [Viewing Intrusion Rules in an Intrusion Policy, on page 1491](#).
- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## Modifying Existing Rules

You can modify custom intrusion rules. In a multidomain deployment, you can modify custom intrusion rules that belong to the current domain only.

You can save system-provided rules and rules belonging to ancestor domains as new custom rules in the local rule category, which you can then modify.

### Procedure

---

- Step 1** Access the intrusion rules using either of the following methods:
- Choose **Policies > Access Control > Intrusion**, and click **Intrusion Rules**.
  - Choose **Objects > Intrusion Rules**.
- Step 2** Locate the rule you want to modify. You have the following choices:
- Navigate through the folders to the rule.
  - Search for the rule; see [Searching for Rules, on page 1561](#).
  - Filter for the group to which the rule belongs; see [Filtering Rules, on page 1565](#).
- Step 3** Click **Edit** () next to the rule or, in the case of search results, click the rule message. If **View** () appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.
- Step 4** Modify the rule as appropriate for the rule type.
- Note** Do not modify the protocol for a shared object rule; doing so would render the rule ineffective.
- Step 5** You have the following choices:
- Click **Save** if you are editing a custom rule and want to overwrite the current version of that rule.
  - Click **Save As New** if you are editing a system-provided rule or any rule belonging to an ancestor domain, or if you are editing a custom rule and want to save the changes as a new rule.
- 

### What to do next

- If you want to use the local modification of the rule instead of the system-provided rule, deactivate the system-provided rule by using the procedures at [Intrusion Rule States, on page 1503](#) and activate the local rule.
- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

### Related Topics

- [Searching for Rules, on page 1561](#)
- [Rule Filtering on the Intrusion Rules Editor Page, on page 1562](#)

## Viewing Rule Documentation

From the Rule Edit page, you can view rule documentation supplied by the Cisco Talos Intelligence Group (Talos). While viewing, you can click external references to view additional information provided by Talos. You can also click **Context Explorer** to view contextual information for events generated by the rule.

### Procedure

---

- Step 1** Access an intrusion rule using either of the following methods:
- Choose **Policies > Access Control > Intrusion**, and click **Intrusion Rules**.
  - Choose **Objects > Intrusion Rules**.
- Step 2** Locate the rule you want to view. You have the following choices:
- Navigate through the folders to the rule.
  - Search for the rule; see [Searching for Rules, on page 1561](#).
  - Filter for the group to which the rule belongs; see [Filtering Rules, on page 1565](#).
- Step 3** Click **Edit** () next to the rule or, in the case of search results, click the rule message.
- If **View** () appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.
- Step 4** Click **View Documentation**.
- Step 5** Optionally, click either of the following links:
- References—see [Keyword Filtering, on page 1563](#) and *Custom Reference* in [Intrusion Event Details, on page 1551](#) for information on available external references.
  - **Context Explorer**—see for information on viewing event data for the rule in the context explorer.
- Tip** Selecting an external link closes the documentation pop-up window; to exit the rule edit page without modifying the rule, select any menu path.
- 

## Adding Comments to Intrusion Rules

You can add comments to any intrusion rule. Such comments can be helpful to provide context and additional information about the rule and the exploit or policy violation it identifies.

In a multidomain deployment, the system displays comments created in the current domain, which you can delete. It also displays comments created in ancestor domains, which you cannot delete. To view comments created in a lower domain, switch to that domain.

### Procedure

---

- Step 1** Access the intrusion rules using either of the following methods:
- Choose **Policies > Access Control > Intrusion**, and click **Intrusion Rules**.

- Choose **Objects > Intrusion Rules**.

**Step 2** Locate the rule you want to annotate. You have the following choices:

- Navigate through the folders to the rule.
- Search for the rule; see [Searching for Rules, on page 1561](#).
- Filter for the group where the rule belongs; see [Filtering Rules, on page 1565](#).

**Step 3** Click **Edit** () next to the rule or, in the case of search results, click the rule message.

If **View** () appears next to a rule instead, the rule belongs to an ancestor policy, or you do not have permission to modify the rule.

**Step 4** Click **Rule Comment**.

**Step 5** Enter your comment in the text box.

**Step 6** Click **Add Comment**.

**Tip** You can also add and view rule comments in an intrusion event's packet view.

### What to do next

- Continue with creating or editing the rule. See [Writing New Rules, on page 1557](#) or [Modifying Existing Rules, on page 1558](#) for more information.

### Related Topics

[Searching for Rules, on page 1561](#)

[Event Information Fields, on page 2273](#)

## Deleting Custom Rules

You can delete custom rules if the rules are not currently enabled in an intrusion policy. You cannot delete either standard text rules or shared object rules provided by the system. In a multidomain deployment, you can delete local rules created in the current domain only.

The system stores deleted rules in the deleted category, and you can use a deleted rule as the basis for a new rule. The Rules page in an intrusion policy does not display the deleted category, so you cannot enable deleted custom rules.

**Tip** Custom rules include shared object rules that you save with modified header information. The system also saves these in the local rule category and lists them with a GID of 3. You can delete your modified version of a shared object rule, but you cannot delete the original shared object rule.

### Procedure

**Step 1** Access the intrusion rules using either of the following methods:

- Choose **Policies > Access Control > Intrusion**, and click **Intrusion Rules**.
- Choose **Objects > Intrusion Rules**.

**Step 2** You have two choices:

- Delete all local rules — Click **Delete Local Rules**, then click **OK**.
- Delete a single rule — Choose `Local Rules` from the **Group Rules By** drop-down, click **Delete** () next to a rule you want to delete, and click **OK** to confirm the deletion.

---

## Searching for Rules

The Firepower System provides thousands of standard text rules, and the Cisco Talos Intelligence Group (Talos) continues to add rules as new vulnerabilities and exploits are discovered. You can easily search for specific rules so that you can activate, deactivate, or edit them.

### Procedure

- 
- Step 1** Access the intrusion rules using either of the following methods:
- Choose **Policies > Access Control > Intrusion**, and click **Intrusion Rules**.
  - Choose **Objects > Intrusion Rules**.
- Step 2** Click **Search** on the toolbar.
- Step 3** Add search criteria.
- Step 4** Click **Search**.
- 

### What to do next

- If you want to view or edit a located rule (or a copy of the rule, if it is a system rule), click the hyperlinked rule message. See [Writing New Rules, on page 1557](#) or [Modifying Existing Rules, on page 1558](#) for more information.

## Search Criteria for Intrusion Rules

The following table describes the available search options:

*Table 126: Rule Search Criteria*

| Option       | Description                                                                                                                                                                                |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Signature ID | To search for a single rule based on Snort ID (SID), enter an SID number. To search for multiple rules, enter a comma-separated list of SID numbers. This field has an 80-character limit. |

| Option           | Description                                                                                                                                                                                                                                                                         |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Generator ID     | To search for standard text rules, select <b>1</b> . To search for shared object rules, select <b>3</b> .                                                                                                                                                                           |
| Message          | To search for a rule with a specific message, enter a single word from the rule message in the <b>Message</b> field. For example, to search for DNS exploits, you would enter <code>DNS</code> , or to search for buffer overflow exploits, enter <code>overflow</code> .           |
| Protocol         | To search rules that evaluate traffic of a specific protocol, select the protocol. If you do not select a protocol, search results contain rules for all protocols.                                                                                                                 |
| Source Port      | To search for rules that inspect packets originating from a specified port, enter a source port number or a port-related variable.                                                                                                                                                  |
| Destination Port | To search for rules that inspect packets destined for a specific port, enter a destination port number or a port-related variable.                                                                                                                                                  |
| Source IP        | To search for rules that inspect packets originating from a specified IP address, enter a source IP address or an IP address-related variable.                                                                                                                                      |
| Destination IP   | To search for rules that inspect packets destined for a specified IP address, enter a destination IP address or an IP address-related variable.                                                                                                                                     |
| Keyword          | To search for specific keywords, you can use the keyword search options. You select a keyword and enter a keyword value for which to search. You can also precede the keyword value with an exclamation point (!) to match any value other than the specified value.                |
| Category         | To search for rules in a specific category, select the category from the <b>Category</b> list.                                                                                                                                                                                      |
| Classification   | To search for rules that have a specific classification, select the classification name from the <b>Classification</b> list.                                                                                                                                                        |
| Rule State       | To search for rules within a specific policy and a specific rule state, select the policy from the first <b>Rule State</b> list, and choose a state from the second list to search for rules set to <b>Generate Events</b> , <b>Drop and Generate Events</b> , or <b>Disabled</b> . |

## Rule Filtering on the Intrusion Rules Editor Page

You can filter the rules on the intrusion rules editor page to display a subset of rules. This can be useful, for example, when you want to modify a rule or change its state but have difficulty finding it among the thousands of rules available.

When you enter a filter, the page displays any folder that includes at least one matching rule, or a message when no rule matches.

### Filtering Guidelines

Your filter can include special keywords and their arguments, character strings, and literal character strings in quotes, with spaces separating multiple filter conditions. A filter cannot include regular expressions, wild card characters, or any special operator such as a negation character (!), a greater than symbol (>), less than symbol (<), and so on.

All keywords, keyword arguments, and character strings are case-insensitive. Except for the `gid` and `sid` keywords, all arguments and strings are treated as partial strings. Arguments for `gid` and `sid` return only exact matches.

You can expand a folder on the original, unfiltered page and the folder remains expanded when the subsequent filter returns matches in that folder. This can be useful when the rule you want to find is in a folder that contains a large number of rules.

You cannot constrain a filter with a subsequent filter. Any filter you enter searches the entire rules database and returns all matching rules. When you enter a filter while the page still displays the result of a previous filter, the page clears and returns the result of the new filter instead.

You can use the same features with rules in a filtered or unfiltered list. For example, you can edit rules in a filtered or unfiltered list on the intrusion rules editor page. You can also use any of the options in the context menu for the page.

**Tip** Filtering may take significantly longer when the combined total of rules in all sub-groups is large because rules appear in multiple categories, even when the total number of unique rules is much smaller.

## Keyword Filtering

Each rule filter can include one or more keywords in the format:

```
keyword:argument
```

where `keyword` is one of the keywords in the following table and `argument` is a single, case-insensitive, alphanumeric string to search for in the specific field or fields relevant to the keyword.

Arguments for all keywords except `gid` and `sid` are treated as partial strings. For example, the argument `123` returns "12345", "41235", "45123", and so on. The arguments for `gid` and `sid` return only exact matches; for example, `sid:3080` returns only SID 3080.

**Tip** You can search for a partial SID by filtering with one or more character strings.

The following table describes the specific filtering keywords and arguments you can use to filter rules.

**Table 127: Rule Filter Keywords**

| Keyword                | Description                                                                             | Example                    |
|------------------------|-----------------------------------------------------------------------------------------|----------------------------|
| <code>arachnids</code> | Returns one or more rules based on all or part of the Arachnids ID in a rule reference. | <code>arachnids:181</code> |
| <code>bugtraq</code>   | Returns one or more rules based on all or part of the Bugtraq ID in a rule reference.   | <code>bugtraq:2120</code>  |
| <code>cve</code>       | Returns one or more rules based on all or part of the CVE number in a rule reference.   | <code>cve:2003-0109</code> |

| Keyword | Description                                                                                                                      | Example      |
|---------|----------------------------------------------------------------------------------------------------------------------------------|--------------|
| gid     | The argument 1 returns standard text rules. The argument 3 returns shared object rules.                                          | gid:3        |
| mcafee  | Returns one or more rules based on all or part of the McAfee ID in a rule reference.                                             | mcafee:10566 |
| msg     | Returns one or more rules based on all or part of the rule Message field, also known as the event message.                       | msg:chat     |
| nessus  | Returns one or more rules based on all or part of the Nessus ID in a rule reference.                                             | nessus:10737 |
| ref     | Returns one or more rules based on all or part of a single alphanumeric string in a rule reference or in the rule Message field. | ref:MS03-039 |
| sid     | Returns the rule with the exact Snort ID.                                                                                        | sid:235      |
| url     | Returns one or more rules based on all or part of the URL in a rule reference.                                                   | url:faqs.org |

## Character String Filtering

Each rule filter can include one or more alphanumeric character strings. Character strings search the rule **Message** field, Snort ID (SID), and Generator ID (GID). For example, the string 123 returns the strings "Lotus123", "123mania", and so on in the rule message, and also returns SID 6123, SID 12375, and so on.

All character strings are case-insensitive and are treated as partial strings. For example, any of the strings ADMIN, admin, or Admin return "admin", "CFADMIN", "Administrator" and so on.

You can enclose character strings in quotes to return exact matches. For example, the literal string "overflow attempt" in quotes returns only that exact string, whereas a filter comprised of the two strings overflow and attempt without quotes returns "overflow attempt", "overflow multipacket attempt", "overflow with evasion attempt", and so on.

## Combination Keyword and Character String Filtering

You can narrow filter results by entering any combination of keywords, character strings, or both, separated by spaces. The result includes any rule that matches all the filter conditions.

You can enter multiple filter conditions in any order. For example, each of the following filters returns the same rules:

- url:at login attempt cve:200
- login attempt cve:200 url:at
- login cve:200 attempt url:at

## Filtering Rules

On the Intrusion Rules page, you can filter rules into subsets so you can more easily find specific rules. You can then use any of the page features, including choosing any of the features available in the context menu.

Rule filtering can be particularly useful to locate a specific rule to edit.

### Procedure

- 
- Step 1** Access the intrusion rules using either of the following methods:
- Choose **Policies > Access Control > Intrusion**, and click **Intrusion Rules**.
  - Choose **Objects > Intrusion Rules**.
- Step 2** Prior to filtering, you have the following choices:
- Expand any rule group you want to expand. Some rule groups also have sub-groups that you can expand. Expanding a group on the original, unfiltered page can be useful when you expect that a rule might be in that group. The group remains expanded when the subsequent filter results in a match in that folder, and when you return to the original, unfiltered page by clicking filter **Clear (✕)**.
  - Choose a different grouping method from the **Group Rules By** drop-down list.
- Step 3** Enter filter constraints in the text box next to **Filter** (🔍) under the **Group Rules By** list.
- Step 4** Press Enter.
- Note** Clear the current filtered list by clicking filter **Clear (✕)**.
- 

## Keywords and Arguments in Intrusion Rules

Using the rules language, you can specify the behavior of a rule by combining keywords. Keywords and their associated values (called *arguments*) dictate how the system evaluates packets and packet-related values that the rules engine tests. The Firepower System currently supports keywords that allow you to perform inspection functions, such as content matching, protocol-specific pattern matching, and state-specific matching. You can define up to 100 arguments per keyword, and combine any number of compatible keywords to create highly specific rules. This helps decrease the chance of false positives and false negatives and focus the intrusion information you receive.

Note that you can also use adaptive profile updates in passive deployments to dynamically adapt active rule processing for specific packets based on rule metadata and host information.

Keywords described in this section are listed under Detection Options in the rules editor.

**Related Topics**

[About Adaptive Profiles](#), on page 1811

## The content and protected\_content Keywords

Use the `content` keyword or the `protected_content` keyword to specify content that you want to detect in a packet.

You should almost always follow a `content` or `protected_content` keyword by modifiers that indicate where the content should be searched for, whether the search is case sensitive, and other options.

Note that all content matches must be true for the rule to trigger an event, that is, each content match has an AND relationship with the others.

Note also that, in an inline deployment, you can set up rules that match malicious content and then replace it with your own text string of equal length.

**content**

When you use the `content` keyword, the rules engine searches the packet payload or stream for that string. For example, if you enter `/bin/sh` as the value for one of the `content` keywords, the rules engine searches the packet payload for the string `/bin/sh`.

Match content using either an ASCII string, hexadecimal content (binary byte code), or a combination of both. Surround hexadecimal content with pipe characters (`|`) in the keyword value. For example, you can mix hexadecimal content and ASCII content using something that looks like `|90C8 C0FF FFFF|/bin/sh`.

You can specify multiple content matches in a single rule. To do this, use additional instances of the `content` keyword. For each content match, you can indicate that content matches must be found in the packet payload or stream for the rule to trigger.

---

**Caution** You may invalidate your intrusion policy if you create a rule that includes only one `content` keyword and that keyword has the **Not** option selected.

---

**protected\_content**

The `protected_content` keyword allows you to encode your search content string before configuring the rule argument. The original rule author uses a hash function (SHA-512, SHA-256, or MD5) to encode the string before configuring the keyword.

When you use the `protected_content` keyword instead of the `content` keyword, there is no change to how the rules engine searches the packet payload or stream for that string and most of the keyword options function as expected. The following table summarizes the exceptions, where the `protected_content` keyword options differ from the `content` keyword options.

**Table 128: protected\_content Option Exceptions**

| Option           | Description                                                     |
|------------------|-----------------------------------------------------------------|
| Hash Type        | New option for the <code>protected_content</code> rule keyword. |
| Case Insensitive | Not supported                                                   |

| Option                                 | Description                                        |
|----------------------------------------|----------------------------------------------------|
| Within                                 | Not supported                                      |
| Depth                                  | Not supported                                      |
| Length                                 | New option for the protected_content rule keyword. |
| Use Fast Pattern Matcher               | Not supported                                      |
| Fast Pattern Matcher Only              | Not supported                                      |
| Fast Pattern Matcher Offset and Length | Not supported                                      |

Cisco recommends that you include at least one content keyword in rules that include a protected\_content keyword to ensure that the rules engine uses the fast pattern matcher, which increases processing speed and improves performance. Position the content keyword before the protected\_content keyword in the rule. Note that the rules engine uses the fast pattern matcher when a rule includes at least one content keyword, regardless of whether you enable the content keyword Use Fast Pattern Matcher argument.

**Caution** You may invalidate your intrusion policy if you create a rule that includes only one protected\_content keyword and that keyword has the **Not** option selected.

[Custom Rule Creation](#), on page 1556

[Basic content and protected\\_content Keyword Arguments](#), on page 1567

[The replace Keyword](#), on page 1577

## Basic content and protected\_content Keyword Arguments

You can constrain the location and case-sensitivity of content searches with parameters that modify the content or protected\_content keyword. Configure options that modify the content or protected\_content keyword to specify the content for which you want to search.

#### Case Insensitive

**Note** This option is **not** supported when configuring the protected\_content keyword.

You can instruct the rules engine to ignore case when searching for content matches in ASCII strings. To make your search case-insensitive, check **Case Insensitive** when specifying a content search.

#### Hash Type

**Note** This option is **only** configurable with the protected\_content keyword.

Use the **Hash Type** drop-down to identify the hash function you used to encode your search string. The system supports SHA-512, SHA-256, and MD5 hashing for `protected_content` search strings. If the length of your hashed content does not match the selected hash type, the system does **not** save the rule.

The system automatically selects the Cisco-set default value. When **Default** is selected, no specific hash function is written into the rule and the system assumes SHA-512 for the hash function.

### Raw Data

The **Raw Data** option instructs the rules engine to analyze the original packet payload before analyzing the normalized payload data (decoded by a network analysis policy) and does not use an argument value. You can use this keyword when analyzing telnet traffic to check the telnet negotiation options in the payload before normalization.

You cannot use the **Raw Data** option together in the same `content` or `protected_content` keyword with any HTTP content option.

---

**Tip** You can configure the HTTP Inspect preprocessor **Client Flow Depth** and **Server Flow Depth** options to determine whether raw data is inspected in HTTP traffic, and how much raw data is inspected.

---

### Not

Select the **Not** option to search for content that does not match the specified content. If you create a rule that includes a `content` or `protected_content` keyword with the **Not** option selected, you must also include in the rule at least one other `content` or `protected_content` keyword without the **Not** option selected.

---

**Caution** Do not create a rule that includes only one `content` or `protected_content` keyword if that keyword has the **Not** option selected. You may invalidate your intrusion policy.

---

For example, SMTP rule 1:2541:9 includes three `content` keywords, one of which has the **Not** option selected. A custom rule based on this rule would be invalid if you removed all of the `content` keywords except the one with the **Not** option selected. Adding such a rule to your intrusion policy could invalidate the policy.

---

**Tip** You cannot select the **Not** check box and the **Use Fast Pattern Matcher** check box with the same `content` keyword.

---

## content and protected\_content Keyword Search Locations

You can use search location options to specify where to begin searching for the specified content and how far to continue searching.

### Permitted Combinations: content Search Location Arguments

You can use either of two `content` location pairs to specify where to begin searching for the specified content and how far to continue searching, as follows:

- Use **Offset** and **Depth** together to search relative to the beginning of the packet payload.
- Use **Distance** and **Within** together to search relative to the current search location.

When you specify only one of a pair, the default for the other option in the pair is assumed.

You cannot mix the **Offset** and **Depth** options with the **Distance** and **Within** options. For example, you cannot pair **Offset** and **Within**. You can use any number of location options in a rule.

When no location is specified, the defaults for **Offset** and **Depth** are assumed; that is, the content search starts at the beginning of the packet payload and continues to the end of the packet.

You can also use an existing `byte_extract` variable to specify the value for a location option.

---

**Tip** You can use any number of location options in a rule.

---

#### Related Topics

[The `byte\_extract` Keyword](#), on page 1582

### Permitted Combinations: `protected_content` Search Location Arguments

Use the required **Length** `protected_content` location option in combination with either the **Offset** or **Distance** location option to specify where to begin searching for the specified content and how far to continue searching, as follows:

- Use **Length** and **Offset** together to search for the protected string relative to the beginning of the packet payload.
- Use **Length** and **Distance** together to search for the protected string relative to the current search location.

---

**Tip** You cannot mix the **Offset** and **Distance** options within a single keyword configuration, but you can use any number of location options in a rule.

---

When no location is specified, the defaults are assumed; that is, the content search starts at the beginning of the packet payload and continues to the end of the packet.

You can also use an existing `byte_extract` variable to specify the value for a location option.

#### Related Topics

[The `byte\_extract` Keyword](#), on page 1582

### content and `protected_content` Search Location Arguments

#### Depth

---

**Note** This option is **only** supported when configuring the `content` keyword.

---

Specifies the maximum content search depth, in bytes, from the beginning of the offset value, or if no offset is configured, from the beginning of the packet payload.

For example, in a rule with a `content` value of `cgi-bin/phf`, and `offset` value of 3, and a `depth` value of 22, the rule starts searching for a match to the `cgi-bin/phf` string at byte 3, and stops after processing 22 bytes (byte 25) in packets that meet the parameters specified by the rule header.

You must specify a value that is greater than or equal to the length of the specified content, up to a maximum of 65535 bytes. You cannot specify a value of 0.

The default depth is to search to the end of the packet.

### Distance

Instructs the rules engine to identify subsequent content matches that occur a specified number of bytes after the previous successful content match.

Because the distance counter starts at byte 0, specify one less than the number of bytes you want to move forward from the last successful content match. For example, if you specify 4, the search begins at the fifth byte.

You can specify a value of -65535 to 65535 bytes. If you specify a negative `Distance` value, the byte you start searching on may fall outside the beginning of a packet. Any calculations will take into account the bytes outside the packet, even though the search actually starts on the first byte in the packet. For example, if the current location in the packet is the fifth byte, and the next content rule option specifies a `Distance` value of -10 and a `Within` value of 20, the search starts at the beginning of the payload and the `Within` option is adjusted to 15.

The default distance is 0, meaning the current location in the packet subsequent to the last content match.

### Length

---

**Note** This option is **only** supported when configuring the `protected_content` keyword.

---

The **Length** `protected_content` keyword option indicates the length, in bytes, of the unhashed search string. For example, if you used the content `Sample1` to generate a secure hash, use 7 for the **Length** value. You **must** enter a value in this field.

### Offset

Specifies in bytes where in the packet payload to start searching for content relative to the beginning of the packet payload. You can specify a value of 65535 to 65535 bytes.

Because the offset counter starts at byte 0, specify one less than the number of bytes you want to move forward from the beginning of the packet payload. For example, if you specify 7, the search begins at the eighth byte.

The default offset is 0, meaning the beginning of the packet.

### Within

---

**Note** This option is **only** supported when configuring the `content` keyword.

---

The **Within** option indicates that, to trigger the rule, the next content match must occur within the specified number of bytes after the end of the last successful content match. For example, if you specify a **Within** value of 8, the next content match must occur within the next eight bytes of the packet payload or it does not meet the criteria that triggers the rule.

You can specify a value that is greater than or equal to the length of the specified content, up to a maximum of 65535 bytes.

The default for **Within** is to search to the end of the packet.

## Overview: HTTP content and protected\_content Keyword Arguments

`HTTP content` or `protected_content` keyword options let you specify where to search for content matches within an HTTP message decoded by the HTTP Inspect preprocessor.

Two options search status fields in HTTP responses:

- **HTTP Status Code**
- **HTTP Status Message**

Note that although the rules engine searches the raw, unnormalized status fields, these options are listed here separately to simplify explanation below of the restrictions to consider when combining other raw HTTP fields and normalized HTTP fields.

Five options search normalized fields in HTTP requests, responses, or both, as appropriate :

- **HTTP URI**
- **HTTP Method**
- **HTTP Header**
- **HTTP Cookie**
- **HTTP Client Body**

Three options search raw (unnormalized) non-status fields in HTTP requests, responses, or both, as appropriate:

- **HTTP Raw URI**
- **HTTP Raw Header**
- **HTTP Raw Cookie**

Use the following guidelines when selecting `HTTP content` options:

- `HTTP content` options apply only to TCP traffic.
- To avoid a negative impact on performance, select only those parts of the message where the specified content might appear.  
  
For example, when traffic is likely to include large cookies such as those in shopping cart messages, you might search for the specified content in the HTTP header but not in HTTP cookies.
- To take advantage of HTTP Inspect preprocessor normalization, and to improve performance, any HTTP-related rule you create should at a minimum include at least one `content` or `protected_content` keyword with an **HTTP URI**, **HTTP Method**, **HTTP Header**, or **HTTP Client Body** option selected.
- You cannot use the `replace` keyword in conjunction with `HTTP content` or `protected_content` keyword options.

You can specify a single normalized HTTP option or status field, or use normalized HTTP options and status fields in any combination to target a content area to match. However, note the following restrictions when using HTTP field options:

- You cannot use the **Raw Data** option together in the same `content` or `protected_content` keyword with any HTTP option.
- You cannot use a raw HTTP field option (**HTTP Raw URI**, **HTTP Raw Header**, or **HTTP Raw Cookie**) together in the same `content` or `protected_content` keyword with its normalized counterpart (**HTTP URI**, **HTTP Header**, or **HTTP Cookie**, respectively).
- You cannot select **Use Fast Pattern Matcher** in combination with one or more of the following HTTP field options:

**HTTP Raw URI**, **HTTP Raw Header**, **HTTP Raw Cookie**, **HTTP Cookie**, **HTTP Method**, **HTTP Status Message**, or **HTTP Status Code**

However, you can include the options above in a `content` or `protected_content` keyword that also uses the fast pattern matcher to search one of the following normalized fields:

**HTTP URI**, **HTTP Header**, or **HTTP Client Body**

For example, if you select **HTTP Cookie**, **HTTP Header**, and **Use Fast Pattern Matcher**, the rules engine searches for content in both the HTTP cookie and the HTTP header, but the fast pattern matcher is applied only to the HTTP header, not to the HTTP cookie.

- When you combine restricted and unrestricted options, the fast pattern matcher searches only the unrestricted fields you specify to test whether to pass the rule to the intrusion rules editor for complete evaluation, including evaluation of the restricted fields.

### Related Topics

[content Keyword Fast Pattern Matcher Arguments](#), on page 1575

## HTTP content and protected\_content Keyword Arguments

### HTTP URI

Select this option to search for content matches in the normalized request URI field.

Note that you cannot use this option in combination with the `pcr` keyword HTTP URI (U) option to search the same content.

---

**Note** A pipelined HTTP request packet contains multiple URIs. When **HTTP URI** is selected and the rules engine detects a pipelined HTTP request packet, the rules engine searches all URIs in the packet for a content match.

---

### HTTP Raw URI

Select this option to search for content matches in the normalized request URI field.

Note that you cannot use this option in combination with the `pcr` keyword HTTP URI (U) option to search the same content.

**Note** A pipelined HTTP request packet contains multiple URIs. When **HTTP URI** is selected and the rules engine detects a pipelined HTTP request packet, the rules engine searches all URIs in the packet for a content match.

### HTTP Method

Select this option to search for content matches in the request method field, which identifies the action such as GET and POST to take on the resource identified in the URI.

### HTTP Header

Select this option to search for content matches in the normalized header field, except for cookies, in HTTP requests; also in responses when the HTTP Inspect preprocessor **Inspect HTTP Responses** option is enabled.

Note that you cannot use this option in combination with the `pcr` keyword HTTP header (H) option to search the same content.

### HTTP Raw Header

Select this option to search for content matches in the raw header field, except for cookies, in HTTP requests; also in responses when the HTTP Inspect preprocessor **Inspect HTTP Responses** option is enabled.

Note that you cannot use this option in combination with the `pcr` keyword HTTP raw header (D) option to search the same content.

### HTTP Cookie

Select this option to search for content matches in any cookie identified in a normalized HTTP client request header; also in response set-cookie data when the HTTP Inspect preprocessor **Inspect HTTP Responses** option is enabled. Note that the system treats cookies included in the message body as body content.

You must enable the HTTP Inspect preprocessor **Inspect HTTP Cookies** option to search only the cookie for a match; otherwise, the rules engine searches the entire header, including the cookie.

Note the following:

- You cannot use this option in combination with the `pcr` keyword HTTP cookie (C) option to search the same content.
- The `Cookie:` and `Set-Cookie:` header names, leading spaces on the header line, and the `CRLF` that terminates the header line are inspected as part of the header and not as part of the cookie.

### HTTP Raw Cookie

Select this option to search for content matches in any cookie identified in a raw HTTP client request header; also in response set-cookie data when the HTTP Inspect preprocessor **Inspect HTTP Responses** option is enabled; note that the system treats cookies included in the message body as body content.

You must enable the HTTP Inspect preprocessor **Inspect HTTP Cookies** option to search only the cookie for a match; otherwise, the rules engine searches the entire header, including the cookie.

Note the following:

- You cannot use this option in combination with the `pcr` keyword HTTP raw cookie (K) option to search the same content.

- The `Cookie:` and `Set-Cookie:` header names, leading spaces on the header line, and the `CRLF` that terminates the header line are inspected as part of the header and not as part of the cookie.

### HTTP Client Body

Select this option to search for content matches in the message body in an HTTP client request.

Note that for this option to function, you must specify a value of 0 to 65535 for the HTTP Inspect preprocessor **HTTP Client Body Extraction Depth** option.

### HTTP Status Code

Select this option to search for content matches in the 3-digit status code in an HTTP response.

You must enable the HTTP Inspect preprocessor **Inspect HTTP Responses** option for this option to return a match.

### HTTP Status Message

Select this option to search for content matches in the textual description that accompanies the status code in an HTTP response.

You must enable the HTTP Inspect preprocessor **Inspect HTTP Responses** option for this option to return a match.

## Overview: content Keyword Fast Pattern Matcher

---

**Note** These options are **not** supported when configuring the `protected_content` keyword.

---

The fast pattern matcher quickly determines which rules to evaluate before passing a packet to the rules engine. This initial determination improves performance by significantly reducing the number of rules used in packet evaluation.

By default, the fast pattern matcher searches packets for the longest content specified in a rule; this is to eliminate as much as possible needless evaluation of a rule. Consider the following example rule fragment:

```
alert tcp any any -> any 80 (msg:"Exploit"; content:"GET";
http_method; nocase; content:"/exploit.cgi"; http_uri;
nocase;)
```

Almost all HTTP client requests contain the content `GET`, but few will contain the content `/exploit.cgi`. Using `GET` as the fast pattern content would cause the rules engine to evaluate this rule in most cases and would rarely result in a match. However, most client `GET` requests would not be evaluated using `/exploit.cgi`, thus increasing performance.

The rules engine evaluates the packet against the rule only when the fast pattern matcher detects the specified content. For example, if one `content` keyword in a rule specifies the content `short`, another specifies `longer`, and a third specifies `longest`, the fast pattern matcher will use the content `longest` and the rule will be evaluated only if the rules engine finds `longest` in the payload.

## content Keyword Fast Pattern Matcher Arguments

### Use Fast Pattern Matcher

Use this option to specify a shorter search pattern for the fast pattern matcher to use. Ideally, the pattern you specify is less likely to be found in the packet than the longest pattern and, therefore, more specifically identifies the targeted exploit.

Note the following restrictions when selecting **Use Fast Pattern Matcher** and other options in the same `content` keyword:

- You can specify **Use Fast Pattern Matcher** only one time per rule.
- You cannot use **Distance**, **Within**, **Offset**, or **Depth** when you select **Use Fast Pattern Matcher** in combination with **Not**.
- You cannot select Use Fast Pattern Matcher in combination with any of the following HTTP field options: **HTTP Raw URI**, **HTTP Raw Header**, **HTTP Raw Cookie**, **HTTP Cookie**, **HTTP Method**, **HTTP Status Message**, or **HTTP Status Code**

However, you can include the options above in a `content` keyword that also uses the fast pattern matcher to search one of the following normalized fields:

### **HTTP URI**, **HTTP Header**, or **HTTP Client Body**

For example, if you select **HTTP Cookie**, **HTTP Header**, and **Use Fast Pattern Matcher**, the rules engine searches for content in both the HTTP cookie and the HTTP header, but the fast pattern matcher is applied only to the HTTP header, not to the HTTP cookie.

Note that you cannot use a raw HTTP field option (**HTTP Raw URI**, **HTTP Raw Header**, or **HTTP Raw Cookie**) together in the same `content` keyword with its normalized counterpart (**HTTP URI**, **HTTP Header**, or **HTTP Cookie**, respectively).

When you combine restricted and unrestricted options, the fast pattern matcher searches only the unrestricted fields you specify to test whether to pass the packet to the rules engine for complete evaluation, including evaluation of the restricted fields.

- Optionally, when you select **Use Fast Pattern Matcher** you can also select **Fast Pattern Matcher Only** or **Fast Pattern Matcher Offset and Length**, but not both.
- You cannot use the fast pattern matcher when inspecting Base64 data.

### Fast Pattern Matcher Only

This option allows you to use the `content` keyword only as a fast pattern matcher option and not as a rule option. You can use this option to conserve resources when rules engine evaluation of the specified content is not necessary. For example, consider a case where a rule requires only that the content `12345` be anywhere in the payload. When the fast pattern matcher detects the pattern, the packet can be evaluated against additional keywords in the rule. There is no need for the rules engine to reevaluate the packet to determine if it includes the pattern `12345`.

You would not use this option when the rule contains other conditions relative to the specified content. For example, you would not use this option to search for the content `1234` if another rule condition sought to determine if `abcd` occurs before `1234`. In this case, the rules engine could not determine the relative location because specifying **Fast Pattern Matcher Only** instructs the rules engine not to search for the specified content.

Note the following conditions when using this option:

- The specified content is location-independent; that is, it may occur anywhere in the payload; thus, you cannot use positional options (**Distance**, **Within**, **Offset**, **Depth**, or **Fast Pattern Matcher Offset and Length**).
- You cannot use this option in combination with **Not**.
- You cannot use this option in combination with **Fast Pattern Matcher Offset and Length**.
- The specified content will be treated as case-insensitive, because all patterns are inserted into the fast pattern matcher in a case-insensitive manner; this is handled automatically, so it is not necessary to select **Case Insensitive** when you select this option.
- You should not immediately follow a `content` keyword that uses the **Fast Pattern Matcher Only** option with the following keywords, which set the search location relative to the current search location:

- `isdataat`
- `pcre`
- `content` when **Distance** or **Within** is selected
- `content` when **HTTP URI** is selected
- `asn1`
- `byte_jump`
- `byte_test`
- `byte_math`
- `byte_extract`
- `base64_decode`

### Fast Pattern Matcher Offset and Length

The **Fast Pattern Matcher Offset and Length** option allows you to specify a portion of the content to search. This can reduce memory consumption in cases where the pattern is very long and only a portion of the pattern is sufficient to identify the rule as a likely match. When a rule is selected by the fast pattern matcher, the entire pattern is evaluated against the rule.

You determine the portion for the fast pattern matcher to use by specifying in bytes where to begin the search (offset) and how far into the content (length) to search, using the syntax:

```
offset,length
```

For example, for the content:

```
1234567
```

if you specify the number of offset and length bytes as:

```
1,5
```

the fast pattern matcher searches only for the content `23456`.

Note that you cannot use this option together with **Fast Pattern Matcher Only**.

## The replace Keyword

You can use the `replace` keyword in an inline deployment to replace specified content or to replace content in SSL traffic detected by the Cisco SSL Appliance.

To use the `replace` keyword, construct a custom standard text rule that uses the `content` keyword to look for a specific string. Then use the `replace` keyword to specify a string to replace the content. The replace value and content value must be the same length.

---

**Note** You **cannot** use the `replace` keyword to replace hashed content in a `protected_content` keyword.

---

Optionally, you can enclose the replacement string in quotation marks for backward compatibility with previous Firepower System software versions. If you do not include quotation marks, they are added to the rule automatically so the rule is syntactically correct. To include a leading or trailing quotation mark as part of the replacement text, you must use a backslash to escape it, as shown in the following example:

```
"replacement text plus \"quotation\" marks"
```

A rule can contain multiple `replace` keywords, but only one per `content` keyword. Only the first instance of the content found by the rule is replaced.

The following are example uses of the `replace` keyword:

- If the system detects an incoming packet that contains an exploit, you can replace the malicious string with a harmless one. Sometimes this technique is more successful than simply dropping the offending packet. In some attack scenarios, the attacker simply resends the dropped packet until it bypasses your network defenses or floods your network. By substituting one string for another rather than dropping the packet, you may trick the attacker into believing that the attack was launched against a target that was not vulnerable.
- If you are concerned about reconnaissance attacks that try to learn whether you are running a vulnerable version of, for example, a web server, then you can detect the outgoing packet and replace the banner with your own text.

---

**Note** Make sure that you set the rule state to Generate Events in the inline intrusion policy where you want to use the replace rule; setting the rule to Drop and Generate events would cause the packet to drop, which would prevent replacing the content.

---

As part of the string replacement process, the system automatically updates the packet checksums so that the destination host can receive the packet without error.

Note that you cannot use the `replace` keyword in combination with HTTP request message `content` keyword options.

## The byte\_jump Keyword

The `byte_jump` keyword calculates the number of bytes defined in a specified byte segment, and then skips that number of bytes within the packet, either forward from the end of the specified byte segment, or from the beginning or end of the packet payload, or from a point relative to the last content match, depending on the options you specify. This is useful in packets where a specific segment of bytes describe the number of bytes included in variable data within the packet.

The following table describes the arguments required by the `byte_jump` keyword.

**Table 129: Required byte\_jump Arguments**

| Argument | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Bytes    | <p>The number of bytes to pick up from the packet.</p> <p>If used without DCE/RPC, the allowed values are 0 to 10, with the following restrictions:</p> <ul style="list-style-type: none"> <li>• If used with the <code>From End</code> argument, bytes can be 0. If Bytes is 0, the extracted value is 0.</li> <li>• If you specify a number of bytes other than 1, 2, or 4, you must specify a Number Type (hexadecimal, octal, or decimal.)</li> </ul> <p>If used with DCE/RPC, allowed values are 1, 2, and 4.</p> |
| Offset   | <p>The number of bytes into the payload to start processing. The <code>offset</code> counter starts at byte 0, so calculate the <code>offset</code> value by subtracting 1 from the number of bytes you want to jump forward from the beginning of the packet payload or the last successful content match.</p> <p>You can specify -65535 to 65535 bytes.</p> <p>You can also use an existing <code>byte_extract</code> variable or <code>byte_math</code> result to specify the value for this argument.</p>          |

The following table describes options you can use to define how the system interprets the values you specified for the required arguments.

**Table 130: Additional Optional byte\_jump Arguments**

| Argument | Description                                                                               |
|----------|-------------------------------------------------------------------------------------------|
| Relative | Makes the offset relative to the last pattern found in the last successful content match. |
| Align    | Rounds the number of converted bytes up to the next 32-bit boundary.                      |

| Argument         | Description                                                                                                                                                                                                                                                                                                                                                                        |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Multiplier       | Indicates the value by which the rules engine should multiply the <code>byte_jump</code> value obtained from the packet to get the final <code>byte_jump</code> value.<br><br>That is, instead of skipping the number of bytes defined in a specified byte segment, the rules engine skips that number of bytes multiplied by an integer you specify with the Multiplier argument. |
| Post Jump Offset | The number of bytes -65535 through 65535 to skip forward or backward after applying other <code>byte_jump</code> arguments. A positive value skips forward and a negative value skips backward. Leave the field blank or enter 0 to disable.<br><br>Note that some <code>byte_jump</code> arguments do not apply when you select the <b>DCE/RPC</b> argument.                      |
| From Beginning   | Indicates that the rules engine should skip the specified number of bytes in the payload starting from the beginning of the packet payload, instead of from the current position in the packet.                                                                                                                                                                                    |
| From End         | The jump will originate from the byte that follows the last byte of the buffer.                                                                                                                                                                                                                                                                                                    |
| Bitmask          | Applies the specified hexadecimal bitmask using the AND operator to the bytes extracted from the Bytes argument.<br><br>A bitmask can be 1 to 4 bytes.<br><br>The result will be right-shifted by the number of bits equal to the number of trailing zeros in the mask.                                                                                                            |

You can specify only one of **DCE/RPC**, **Endian**, or **Number Type**.

If you want to define how the `byte_jump` keyword calculates the bytes, you can choose from the arguments described in the following table. If you do not select a byte-ordering argument, the rules engine uses big endian byte order.

**Table 131: Byte-Ordering `byte_jump` Arguments**

| Argument      | Description                                                                                                                                                                                                                                                                                                                                                                              |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Big Endian    | Processes data in big endian byte order, which is the default network byte order.                                                                                                                                                                                                                                                                                                        |
| Little Endian | Processes data in little endian byte order.                                                                                                                                                                                                                                                                                                                                              |
| DCE/RPC       | Specifies a <code>byte_jump</code> keyword for traffic processed by the DCE/RPC preprocessor.<br><br>The DCE/RPC preprocessor determines big endian or little endian byte order, and the <b>Number Type</b> and <b>Endian</b> arguments do not apply.<br><br>When you enable this argument, you can also use <code>byte_jump</code> in conjunction with other specific DCE/RPC keywords. |

Define how the system views string data in a packet by using one of the arguments in the following table.

Table 132: Number Type Arguments

| Argument           | Description                                             |
|--------------------|---------------------------------------------------------|
| Hexadecimal String | Represents converted string data in hexadecimal format. |
| Decimal String     | Represents converted string data in decimal format.     |
| Octal String       | Represents converted string data in octal format.       |

For example, if the values you set for `byte_jump` are as follows:

- Bytes = 4
- Offset = 12
- Relative enabled
- Align enabled

the rules engine calculates the number described in the four bytes that appear 13 bytes after the last successful content match, and skips ahead that number of bytes in the packet. For instance, if the four calculated bytes in a specific packet were `00 00 00 1F`, the rules engine would convert this to 31. Because `align` is specified (which instructs the engine to move to the next 32-bit boundary), the rules engine skips ahead 32 bytes in the packet.

Alternately, if the values you set for `byte_jump` are as follows:

- Bytes = 4
- Offset = 12
- From Beginning enabled
- Multiplier = 2

the rules engine calculates the number described in the four bytes that appear 13 bytes after the beginning of the packet. Then, the engine multiplies that number by two to obtain the total number of bytes to skip. For instance, if the four calculated bytes in a specific packet were `00 00 00 1F`, the rules engine would convert this to 31, then multiply it by two to get 62. Because `From Beginning` is enabled, the rules engine skips the first 63 bytes in the packet.

## The `byte_test` Keyword

The `byte_test` keyword tests the specified byte segment against the Value argument and its operator.

The following table describes the required arguments for the `byte_test` keyword.

Table 133: Required `byte_test` Arguments

| Argument | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Bytes    | <p>The number of bytes to calculate from the packet.</p> <p>If used without DCE/RPC, the allowed values are 1 to 10. However, if you specify a number of bytes other than 1, 2, or 4, you must specify a Number Type (hexadecimal, octal, or decimal).</p> <p>If used with DCE/RPC, allowed values are 1, 2, and 4.</p>                                                                                                                                                                                                                                                                                                                                                                                           |
| Value    | <p>Value to test, including its operator.</p> <p>Supported operators: <code>&lt;</code>, <code>&gt;</code>, <code>=</code>, <code>!</code>, <code>&amp;</code>, <code>^</code>, <code>!&gt;</code>, <code>!&lt;</code>, <code>!=</code>, <code>!&amp;</code>, or <code>!^</code>.</p> <p>For example, if you specify <code>!1024,byte_test</code> would convert the specified number, and if it did not equal 1024, it would generate an event (if all other keyword parameters matched).</p> <p>Note that <code>!</code> and <code>!=</code> are equivalent.</p> <p>You can also use an existing <code>byte_extract</code> variable or <code>byte_math</code> result to specify the value for this argument.</p> |
| Offset   | <p>The number of bytes into the payload to start processing. The <code>offset</code> counter starts at byte 0, so calculate the <code>offset</code> value by subtracting 1 from the number of bytes you want to count forward from the beginning of the packet payload or the last successful content match.</p> <p>You can use an existing <code>byte_extract</code> variable or <code>byte_math</code> result to specify the value for this argument.</p>                                                                                                                                                                                                                                                       |

You can further define how the system uses `byte_test` arguments with the arguments described in the following table.

Table 134: Additional Optional `byte_test` Arguments

| Argument | Description                                                                                                                                                                                                                                                                    |
|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Bitmask  | <p>Applies the specified hexadecimal bitmask using the AND operator to the bytes extracted from the Bytes argument.</p> <p>A bitmask can be 1 to 4 bytes.</p> <p>The result will be right-shifted by the number of bits equal to the number of trailing zeros in the mask.</p> |
| Relative | Makes the offset relative to the last successful pattern match.                                                                                                                                                                                                                |

You can specify only one of **DCE/RPC**, **Endian**, or **Number Type**.

To define how the `byte_test` keyword calculates the bytes it tests, choose from the arguments in the following table. If you do not select a byte-ordering argument, the rules engine uses big endian byte order.

Table 135: Byte-Ordering `byte_test` Arguments

| Argument      | Description                                                                                                                                                                                                                                                                                                                                                                       |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Big Endian    | Processes data in big endian byte order, which is the default network byte order.                                                                                                                                                                                                                                                                                                 |
| Little Endian | Processes data in little endian byte order.                                                                                                                                                                                                                                                                                                                                       |
| DCE/RPC       | Specifies a <code>byte_test</code> keyword for traffic processed by the DCE/RPC preprocessor. The DCE/RPC preprocessor determines big endian or little endian byte order, and the <b>Number Type</b> and <b>Endian</b> arguments do not apply.<br><br>When you enable this argument, you can also use <code>byte_test</code> in conjunction with other specific DCE/RPC keywords. |

You can define how the system views string data in a packet by using one of the arguments in the following table.

Table 136: Number Type `byte-test` Arguments

| Argument           | Description                                             |
|--------------------|---------------------------------------------------------|
| Hexadecimal String | Represents converted string data in hexadecimal format. |
| Decimal String     | Represents converted string data in decimal format.     |
| Octal String       | Represents converted string data in octal format.       |

For example, if the value for `byte_test` is specified as the following:

- Bytes = 4
- Operator and Value > 128
- Offset = 8
- Relative enabled

The rules engine calculates the number described in the four bytes that appear 9 bytes away from (relative to) the last successful content match, and, if the calculated number is larger than 128 bytes, the rule is triggered.

## The `byte_extract` Keyword

You can use the `byte_extract` keyword to read a specified number of bytes from a packet into a variable. You can then use the variable later in the same rule as the value for specific arguments in certain other detection keywords.

This is useful, for example, for extracting data size from packets where a specific segment of bytes describes the number of bytes included in data within the packet. For example, a specific segment of bytes might say that subsequent data is comprised of four bytes; you can extract the data size of four bytes to use as your variable value.

You can use `byte_extract` to create up to two separate variables in a rule concurrently. You can redefine a `byte_extract` variable any number of times; entering a new `byte_extract` keyword with the same variable name and a different variable definition overwrites the previous definition of that variable.

The following table describes the arguments required by the `byte_extract` keyword.

**Table 137: Required `byte_extract` Arguments**

| Argument         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Bytes to Extract | The number of bytes to pick up from the packet.<br>If you specify a number of bytes other than 1, 2, or 4, you must specify a Number Type (hexadecimal, octal, or decimal.)                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Offset           | The number of bytes into the payload to begin extracting data. You can specify -65535 to 65535 bytes. The offset counter starts at byte 0, so calculate the offset value by subtracting 1 from the number of bytes you want to count forward. For example, specify 7 to count forward 8 bytes. The rules engine counts forward from the beginning of the packet payload or, if you also specify <b>Relative</b> , after the last successful content match. Note that you can specify negative numbers only when you also specify <b>Relative</b> .<br>You can use an existing <code>byte_math</code> result to specify the value for this argument. |
| Variable Name    | The variable name to use in arguments for other detection keywords. You can specify an alphanumeric string that must begin with a letter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

To further define how the system locates the data to extract, you can use the arguments described in the following table.

**Table 138: Additional Optional `byte_extract` Arguments**

| Argument   | Description                                                                                                                                                                                                                                                                |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Multiplier | A multiplier for the value extracted from the packet. You can specify 0 to 65535. If you do not specify a multiplier, the default value is 1.                                                                                                                              |
| Align      | Rounds the extracted value to the nearest 2-byte or 4-byte boundary. When you also select <b>Multiplier</b> , the system applies the multiplier before the alignment.                                                                                                      |
| Relative   | Makes <b>Offset</b> relative to the end of the last successful content match instead of the beginning of the payload.                                                                                                                                                      |
| Bitmask    | Applies the specified hexadecimal bitmask using the AND operator to the bytes extracted from the Bytes to Extract argument.<br>A bitmask can be 1 to 4 bytes.<br>The result will be right-shifted by the number of bits equal to the number of trailing zeros in the mask. |

You can specify only one of **DCE/RPC**, **Endian**, or **Number Type**.

To define how the `byte_extract` keyword calculates the bytes it tests, you can choose from the arguments in the following table. If you do not select a byte-ordering argument, the rules engine uses big endian byte order.

**Table 139: Byte-Ordering `byte_extract` Arguments**

| Argument      | Description                                                                                                                                                                                                                                                                                                                                                                             |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Big Endian    | Processes data in big endian byte order, which is the default network byte order.                                                                                                                                                                                                                                                                                                       |
| Little Endian | Processes data in little endian byte order.                                                                                                                                                                                                                                                                                                                                             |
| DCE/RPC       | Specifies a <code>byte_extract</code> keyword for traffic processed by the DCE/RPC preprocessor. The DCE/RPC preprocessor determines big endian or little endian byte order, and the <b>Number Type</b> and <b>Endian</b> arguments do not apply.<br><br>When you enable this argument, you can also use <code>byte_extract</code> in conjunction with other specific DCE/RPC keywords. |

You can specify a number type to read data as an ASCII string. To define how the system views string data in a packet, you can select one of the arguments in the following table.

**Table 140: Number Type `byte_extract` arguments**

| Argument           | Description                                        |
|--------------------|----------------------------------------------------|
| Hexadecimal String | Reads extracted string data in hexadecimal format. |
| Decimal String     | Reads extracted string data in decimal format.     |
| Octal String       | Reads extracted string data in octal format.       |

For example, if the value for `byte_extract` is specified as the following:

- Bytes to Extract = 4
- Variable Name = `var`
- Offset = 8
- Relative = enabled

the rules engine reads the number described in the four bytes that appear 9 bytes away from (relative to) the last successful content match into a variable named `var`, which you can specify later in the rule as the value for certain keyword arguments.

The following table lists the keyword arguments where you can specify a variable defined in the `byte_extract` keyword.

**Table 141: Arguments Accepting a `byte_extract` Variable**

| Keyword                | Argument                        |
|------------------------|---------------------------------|
| <code>content</code>   | Depth, Offset, Distance, Within |
| <code>byte_jump</code> | Offset                          |
| <code>byte_test</code> | Offset, Value                   |
| <code>byte_math</code> | RValue, Offset                  |

| Keyword               | Argument |
|-----------------------|----------|
| <code>isdataat</code> | Offset   |

## The `byte_math` Keyword

The `byte_math` keyword performs a mathematical operation on an extracted value and a specified value or existing variable, and stores the outcome in a new resulting variable. You can then use the resulting variable as an argument in other keywords.

You can use multiple `byte_math` keywords in a rule to perform multiple `byte_math` operations.

The following table describes the arguments required by the `byte_math` keyword.

**Table 142: Required `byte_math` Arguments**

| Argument | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Bytes    | <p>The number of bytes to calculate from the packet.</p> <p>If used without DCE/RPC, the allowed values are 1 to 10:</p> <ul style="list-style-type: none"> <li>• Bytes can be 1 to 10 when the operator is <code>+</code>, <code>-</code>, <code>*</code>, or <code>/</code>.</li> <li>• Bytes can be 1 to 4 when the operator is <code>&lt;&lt;</code> or <code>&gt;&gt;</code>.</li> <li>• If you specify a number of bytes other than 1, 2, or 4, you must specify a Number Type (hexadecimal, octal, or decimal.)</li> </ul> <p>If used with DCE/RPC, allowed values are 1, 2, and 4.</p> |
| Offset   | <p>The number of bytes into the payload to start processing. The <code>offset</code> counter starts at byte 0, so calculate the <code>offset</code> value by subtracting 1 from the number of bytes you want to jump forward from the beginning of the packet payload or (if you specified Relative) from the last successful content match.</p> <p>You can specify -65535 to 65535 bytes.</p> <p>You can also specify the <code>byte_extract</code> variable here.</p>                                                                                                                        |
| Operator | <code>+</code> , <code>-</code> , <code>*</code> , <code>/</code> , <code>&lt;&lt;</code> , or <code>&gt;&gt;</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| RValue   | The value following the operator. This can be an unsigned integer or a variable passed from <code>byte_extract</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| Argument        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Result Variable | <p>The name of the variable into which the result of the <code>byte_math</code> calculation will be stored. You can use this variable as an argument in other keywords.</p> <p>This value is stored as an unsigned integer.</p> <p>This variable name:</p> <ul style="list-style-type: none"> <li>• Must use alphanumeric characters</li> <li>• Must not begin with a number</li> <li>• May include special characters supported by the Microsoft filename/variable name convention</li> <li>• Cannot consist entirely of special characters</li> </ul> |

The following table describes options you can use to define how the system interprets the values you specified for the required arguments.

**Table 143: Additional Optional `byte_math` Arguments**

| Argument | Description                                                                                                                                                                                                                                                                    |
|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Relative | Makes the offset relative to the last pattern found in the last successful content match instead of the beginning of the payload.                                                                                                                                              |
| Bitmask  | <p>Applies the specified hexadecimal bitmask using the AND operator to the bytes extracted from the Bytes argument.</p> <p>A bitmask can be 1 to 4 bytes.</p> <p>The result will be right-shifted by the number of bits equal to the number of trailing zeros in the mask.</p> |

You can specify only one of **DCE/RPC**, **Endian**, or **Number Type**.

If you want to define how the `byte_math` keyword calculates the bytes, you can choose from the arguments described in the following table. If you do not select a byte-ordering argument, the rules engine uses big endian byte order.

**Table 144: Byte-Ordering `byte_math` Arguments**

| Argument      | Description                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Big Endian    | Processes data in big endian byte order, which is the default network byte order.                                                                                                                                                                                                                                                                                                               |
| Little Endian | Processes data in little endian byte order.                                                                                                                                                                                                                                                                                                                                                     |
| DCE/RPC       | <p>Specifies a <code>byte_math</code> keyword for traffic processed by the DCE/RPC preprocessor.</p> <p>The DCE/RPC preprocessor determines big endian or little endian byte order, and the <b>Number Type</b> and <b>Endian</b> arguments do not apply.</p> <p>When you enable this argument, you can also use <code>byte_math</code> in conjunction with other specific DCE/RPC keywords.</p> |

Define how the system views string data in a packet by using one of the arguments in the following table.

**Table 145: Number Type Arguments**

| Argument           | Description                                   |
|--------------------|-----------------------------------------------|
| Hexadecimal String | Represents string data in hexadecimal format. |
| Decimal String     | Represents string data in decimal format.     |
| Octal String       | Represents string data in octal format.       |

For example, if the values you set for `byte_math` are as follows:

- Bytes = 2
- Offset = 0
- Operator = \*
- RValue = height
- Result Variable = area

the rules engine extracts the number described in the first two bytes in the packet and multiplies it by the RValue (which uses the existing variable, `height`) to create the new variable, `area`.

**Table 146: Arguments Accepting a byte\_math Variable**

| Keyword                   | Argument      |
|---------------------------|---------------|
| <code>byte_jump</code>    | Offset        |
| <code>byte_test</code>    | Offset, Value |
| <code>byte_extract</code> | Offset        |
| <code>isdataat</code>     | Offset        |

## Overview: The pcre Keyword

The `pcre` keyword allows you to use Perl-compatible regular expressions (PCRE) to inspect packet payloads for specified content. You can use PCRE to avoid writing multiple rules to match slight variations of the same content.

Regular expressions are useful when searching for content that could be displayed in a variety of ways. The content may have different attributes that you want to account for in your attempt to locate it within a packet's payload.

Note that the regular expression syntax used in intrusion rules is a subset of the full regular expression library and varies in some ways from the syntax used in commands in the full library. When adding a `pcre` keyword using the intrusion rules editor, enter the full value in the following format:

```
!/pcre/ ismxAEGRBUIPHDMCKSY
```

where:

- `!` is an optional negation (use this if you want to match patterns that **do not** match the regular expression).
- `/pcre/` is a Perl-compatible regular expression.
- `iSmxAEGRBUIPHDMCKSY` is any combination of modifier options.

Also note that you must escape the characters listed in the following table for the rules engine to interpret them correctly when you use them in a PCRE to search for specific content in a packet payload.

**Table 147: Escaped PCRE Characters**

| You must escape... | with a backslash... | or Hex code... |
|--------------------|---------------------|----------------|
| # (hash mark)      | \#                  | \x23           |
| ;(semicolon)       | \;                  | \x3B           |
| (vertical bar)     | \                   | \x7C           |
| :(colon)           | \:                  | \x3A           |

You can also use `m?regex?`, where `?` is a delimiter other than `/`. You may want to use this in situations where you need to match a forward slash within a regular expression and do not want to escape it with a backslash. For example, you might use `m?regex? iSmxAEGRBUIPHDMCKSY` where `regex` is your Perl-compatible regular expression and `iSmxAEGRBUIPHDMCKSY` is any combination of modifier options.

**Tip** Optionally, you can surround your Perl-compatible regular expression with quote characters, for example, `pcre_expression` or `"pcre_expression"`. The option of using quotes accommodates experienced users accustomed to previous versions when quotes were required instead of optional. The intrusion rules editor does not display quotation marks when you display a rule after saving it.

## pcre Syntax

The `pcre` keyword accepts standard Perl-compatible regular expression (PCRE) syntax. The following sections describe that syntax.

**Tip** While this section describes the basic syntax you may use for PCRE, you may want to consult an online reference or book dedicated to Perl and PCRE for more advanced information.

### Metacharacters

Metacharacters are literal characters that have special meaning within regular expressions. When you use them within a regular expression, you must “escape” them by preceding them with a backslash.

The following table describes the metacharacters you can use with PCRE and gives examples of each.

Table 148: PCRE Metacharacters

| Metacharacter | Description                                                                                                                                                                   | Example                                                                                                                                                                                                                           |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| .             | Matches any character except newlines. If <code>s</code> is used as a modifying option, it also includes newline characters.                                                  | <code>abc.</code> matches <code>abcd</code> , <code>abc1</code> , <code>abc#</code> , and so on.                                                                                                                                  |
| *             | Matches zero or more occurrences of a character or expression.                                                                                                                | <code>abc*</code> matches <code>abc</code> , <code>abcc</code> , <code>abccc</code> , <code>abccccc</code> , and so on.                                                                                                           |
| ?             | Matches zero or one occurrence of a character or expression.                                                                                                                  | <code>abc?</code> matches <code>abc</code> .                                                                                                                                                                                      |
| +             | Matches one or more occurrences of a character or expression.                                                                                                                 | <code>abc+</code> matches <code>abc</code> , <code>abcc</code> , <code>abccc</code> , <code>abccccc</code> , and so on.                                                                                                           |
| ()            | Groups expressions.                                                                                                                                                           | <code>(abc)+</code> matches <code>abc</code> , <code>abcabc</code> , <code>abcabcabc</code> and so on.                                                                                                                            |
| { }           | Specifies a limit for the number of matches for a character or expression. If you want to set a lower and upper limit, separate the lower limit and upper limit with a comma. | <code>a{4,6}</code> matches <code>aaaa</code> , <code>aaaaa</code> , or <code>aaaaaa</code> .<br><code>(ab){2}</code> matches <code>abab</code> .                                                                                 |
| [ ]           | Allows you to define character classes, and matches any character or combination of characters described in the set.                                                          | <code>[abc123]</code> matches <code>a</code> or <code>b</code> or <code>c</code> , and so on.                                                                                                                                     |
| ^             | Matches content at the beginning of a string. Also used for negation, if used within a character class.                                                                       | <code>^in</code> matches the “in” in <code>info</code> , but not in <code>bin</code> . <code>[^a]</code> matches anything that does not contain <code>a</code> .                                                                  |
| \$            | Matches content at the end of a string.                                                                                                                                       | <code>ce\$</code> matches the “ce” in <code>announce</code> , but not <code>cent</code> .                                                                                                                                         |
|               | Indicates an OR expression.                                                                                                                                                   | <code>(MAILTO HELP)</code> matches <code>MAILTO</code> or <code>HELP</code> .                                                                                                                                                     |
| \             | Allows you to use metacharacters as actual characters and is also used to specify a predefined character class.                                                               | <code>\.</code> matches a period, <code>\*</code> matches an asterisk, <code>\\</code> matches a backslash and so on. <code>\d</code> matches the numeric characters, <code>\w</code> matches alphanumeric characters, and so on. |

### Character Classes

Character classes include alphabetic characters, numeric characters, alphanumeric characters, and white space characters. While you can create your own character classes within brackets, you can use the predefined classes as shortcuts for different types of character types. When used without additional qualifiers, a character class matches a single digit or character.

The following table describes and provides examples of the predefined character classes accepted by PCRE.

Table 149: PCRE Character Classes

| Character Class | Description                                       | Character Class Definition |
|-----------------|---------------------------------------------------|----------------------------|
| <code>\d</code> | Matches a numeric character (“digit”).            | <code>[0-9]</code>         |
| <code>\D</code> | Matches anything that is not a numeric character. | <code>[^0-9]</code>        |

| Character Class | Description                                                                                         | Character Class Definition |
|-----------------|-----------------------------------------------------------------------------------------------------|----------------------------|
| \w              | Matches an alphanumeric character (“word”).                                                         | [a-zA-Z0-9_]               |
| \W              | Matches anything that is not an alphanumeric character.                                             | [^a-zA-Z0-9_]              |
| \s              | Matches white space characters, including spaces, carriage returns, tabs, newlines, and form feeds. | [\r\t\n\f]                 |
| \S              | Matches anything that is not a white space character.                                               | [^\r\t\n\f]                |

## pcre Modifier Options

You can use modifying options after you specify regular expression syntax in the `pcre` keyword’s value. These modifiers perform Perl, PCRE, and Snort-specific processing functions. Modifiers always appear at the end of the PCRE value, and appear in the following format:

```
/pcre/ismxAEGRBUIPHDMCKSY
```

where `ismxAEGRBUPHMC` can include any of the modifying options that appear in the following tables.

**Tip** Optionally, you can surround the regular expression and any modifying options with quotes, for example, `"/pcre/ismxAEGRBUIPHDMCKSY"`. The option of using quotes accommodates experienced users accustomed to previous versions when quotes were required instead of optional. The intrusion rules editor does not display quotation marks when you display a rule after saving it.

The following table describes options you can use to perform Perl processing functions.

**Table 150: Perl-Related Post Regular Expression Options**

| Option | Description                                                                                                                                                                                                                                                                                                |
|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| i      | Makes the regular expression case-insensitive.                                                                                                                                                                                                                                                             |
| s      | The dot character (.) describes all characters except the newline or \n character. You can use "s" as an option to override this and have the dot character match all characters, including the newline character.                                                                                         |
| m      | By default, a string is treated as a single line of characters, and ^ and \$ match the beginning and ending of a specific string. When you use "m" as an option, ^ and \$ match content immediately before or after any newline character in the buffer, as well as at the beginning or end of the buffer. |
| x      | Ignores white space data characters that may appear within the pattern, except when escaped (preceded by a backslash) or included inside a character class.                                                                                                                                                |

The following table describes the PCRE modifiers you can use after the regular expression.

Table 151: PCRE-Related Post Regular Expression Options

| Option | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| A      | The pattern must match at the beginning of the string (same as using <code>^</code> in a regular expression).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| E      | Sets <code>\$</code> to match only at the end of the subject string. (Without <code>E</code> , <code>\$</code> also matches immediately before the final character if it is a newline, but not before any other newline characters).                                                                                                                                                                                                                                                                                                                                                                |
| G      | By default, <code>*</code> , <code>+</code> and <code>?</code> are “greedy,” which means that if two or more matches are found, they will choose the longest match. Use the <code>G</code> character to change this so that these characters always choose the first match unless followed by a question mark character ( <code>?</code> ). For example, <code>*?+?</code> and <code>??</code> would be greedy in a construct using the <code>G</code> modifier, and any incidences of <code>*</code> , <code>+</code> , or <code>?</code> without the additional question mark will not be greedy. |

The following table describes the Snort-specific modifiers that you can use after the regular expression.

Table 152: Snort-Specific Post Regular Expression Modifiers

| Option | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| R      | Searches for matching content relative to the end of the last match found by the rules engine.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| B      | Searches for the content within data before it is decoded by a preprocessor (this option is similar to using the <code>Raw Data</code> argument with the <code>content</code> or <code>protected_content</code> keyword).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| U      | Searches for the content within the URI of a normalized HTTP request message decoded by the HTTP Inspect preprocessor. Note that you cannot use this option in combination with the <code>content</code> or <code>protected_content</code> keyword <b>HTTP URI</b> option to search the same content.<br><br>Note that a pipelined HTTP request packet contains multiple URIs. A PCRE expression that includes the <code>U</code> option causes the rules engine to search for a content match only in the first URI in a pipelined HTTP request packet. To search all URIs in the packet, use the <code>content</code> or <code>protected_content</code> keyword with <b>HTTP URI</b> selected, either with or without an accompanying PCRE expression that uses the <code>U</code> option. |
| I      | Searches for the content within the URI of a raw HTTP request message decoded by the HTTP Inspect preprocessor. Note that you cannot use this option in combination with the <code>content</code> or <code>protected_content</code> keyword <b>HTTP Raw URI</b> option to search the same content                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| P      | Searches for the content within the body of a normalized HTTP request message decoded by the HTTP Inspect preprocessor.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Option | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| H      | Searches for the content within the header, excluding cookies, of an HTTP request or response message decoded by the HTTP Inspect preprocessor. Note that you cannot use this option in combination with the <code>content</code> or <code>protected_content</code> keyword <b>HTTP Header</b> option to search the same content.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| D      | Searches for the content within the header, excluding cookies, of a raw HTTP request or response message decoded by the HTTP Inspect preprocessor. Note that you cannot use this option in combination with the <code>content</code> or <code>protected_content</code> keyword <b>HTTP Raw Header</b> option to search the same content.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| M      | Searches for the content within the method field of a normalized HTTP request message decoded by the HTTP Inspect preprocessor; the method field identifies the action such as GET, PUT, CONNECT, and so on to take on the resource identified in the URI.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| C      | <p>When the HTTP Inspect preprocessor <b>Inspect HTTP Cookies</b> option is enabled, searches for the normalized content within any cookie in an HTTP request header, and also within any set-cookie in an HTTP response header when the preprocessor <b>Inspect HTTP Responses</b> option is enabled. When <b>Inspect HTTP Cookies</b> is not enabled, searches the entire header, including the cookie or set-cookie data.</p> <p>Note the following:</p> <ul style="list-style-type: none"> <li>• Cookies included in the message body are treated as body content.</li> <li>• You cannot use this option in combination with the <code>content</code> or <code>protected_content</code> keyword <b>HTTP Cookie</b> option to search the same content.</li> <li>• The <code>Cookie:</code> and <code>Set-Cookie:</code> header names, leading spaces on the header line, and the <code>CRLF</code> that terminates the header line are inspected as part of the header and not as part of the cookie.</li> </ul> |
| K      | <p>When the HTTP Inspect preprocessor <b>Inspect HTTP Cookies</b> option is enabled, searches for the raw content within any cookie in an HTTP request header, and also within any set-cookie in an HTTP response header when the preprocessor <b>Inspect HTTP Responses</b> option is enabled. When <b>Inspect HTTP Cookies</b> is not enabled, searches the entire header, including the cookie or set-cookie data.</p> <p>Note the following:</p> <ul style="list-style-type: none"> <li>• Cookies included in the message body are treated as body content.</li> <li>• You cannot use this option in combination with the <code>content</code> or <code>protected_content</code> keyword <b>HTTP Raw Cookie</b> option to search the same content.</li> <li>• The <code>Cookie:</code> and <code>Set-Cookie:</code> header names, leading spaces on the header line, and the <code>CRLF</code> that terminates the header line are inspected as part of the header and not as part of the cookie.</li> </ul>    |
| S      | Searches the 3-digit status code in an HTTP response.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Y      | Searches the textual description that accompanies the status code in an HTTP response.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

**Note** Do not use the U option in combination with the R option. This could cause performance problems. Also, do not use the U option in combination with any other HTTP content option (I, P, H, D, M, C, K, S, or Y).

## pcre Example Keyword Values

The following examples show values that you could enter for `pcre`, with descriptions of what each example would match.

- `/feedback[ (\d{0,1}) ]?\.cgi/U`

This example searches packet payload for `feedback`, followed by zero or one numeric character, followed by `.cgi`, and located only in URI data.

This example would match:

- `feedback.cgi`
- `feedback1.cgi`
- `feedback2.cgi`
- `feedback3.cgi`

This example would **not** match:

- `feedbacka.cgi`
- `feedback11.cgi`
- `feedback21.cgi`
- `feedbackzb.cgi`
- `/^ez (\w{3,5}) \.cgi/iU`

This example searches packet payload for `ez` at the beginning of a string, followed by a word of 3 to 5 letters, followed by `.cgi`. The search is case-insensitive and only searches URI data.

This example would match:

- `EZBoard.cgi`
- `ezman.cgi`
- `ezadmin.cgi`
- `EZAdmin.cgi`

This example would **not** match:

- `ezez.cgi`
- `fez.cgi`

- abcezboard.cgi
- ezboardman.cgi
- **/mail(file|seek)\.cgi/U**

This example searches packet payload for `mail`, followed by either `file` or `seek`, in URI data.

This example would match:

- mailfile.cgi
- mailseek.cgi

This example would **not** match:

- MailFile.cgi
- mailfilefile.cgi
- **m?http\ \x3a\x2f\x2f.\* (\n|\t)+?U**

This example searches packet payload for URI content for a tab or newline character in an HTTP request, after any number of characters. This example uses `m?regex?` to avoid using `http:\ \/\` in the expression. Note that the colon is preceded by a backslash.

This example would match:

- http://www.example.com?scriptvar=x&othervar=\n\...\
- http://www.example.com?scriptvar=\t

This example would **not** match:

- ftp://ftp.example.com?scriptvar=&othervar=\n\...\
- http://www.example.com?scriptvar=|/bin/sh -i|
- **m?http\ \x3a\x2f\x2f.\*=\|.\*\|+?sU**

This example searches packet payload for a URL with any number of characters, including newlines, followed by an equal sign, and pipe characters that contain any number of characters or white space. This example uses `m?regex?` to avoid using `http:\ \/\` in the expression.

This example would match:

- http://www.example.com?value=|/bin/sh/ -i|
- http://www.example.com?input=|cat /etc/passwd|

This example would **not** match:

- ftp://ftp.example.com?value=|/bin/sh/ -i|
- http://www.example.com?value=x&input?|cat /etc/passwd|
- **/[0-9a-f]{2}\:[0-9a-f]{2}\:[0-9a-f]{2}\:[0-9a-f]{2}\:[0-9a-f]{2}\:[0-9a-f]{2}/i**

This example searches packet payload for any MAC address. Note that it escapes the colon characters with backslashes.

## The metadata Keyword

You can use the `metadata` keyword to add your own descriptive information to a rule. You can also use the `metadata` keyword with `service` arguments to identify applications and ports in network traffic. You can use the information you add to organize or identify rules in ways that suit your needs, and you can search rules for information you add and for `service` arguments.

The system validates metadata based on the argument format:

*key value*

where *key* and *value* provide a combined description separated by a space. This is the format used by the Cisco Talos Intelligence Group (Talos) for adding metadata to rules provided by Cisco.

Alternatively, you can also use the format:

*key = value*

For example, you could use the *key value* format to identify rules by author and date, using a category and sub-category as follows:

```
author SnortGuru_20050406
```

You can use multiple `metadata` keywords in a rule. You can also use commas to separate multiple *key value* arguments in a single `metadata` keyword, as seen in the following example:

```
author SnortGuru_20050406, revised_by SnortUser1_20050707,
revised_by SnortUser2_20061003,
revised_by SnortUser1_20070123
```

You are not limited to using a *key value* or *key=value* format; however, you should be aware of limitations resulting from validation based on these formats.

### Restricted Characters to Avoid

Note the following character restrictions:

- Do not use a semicolon (;) or colon (:).
- The system interprets a comma as a separator for multiple *key value* or *key=value* arguments. For example:  
*key value, key value, key value*
- The system interprets the equal to (=) character or space character as separators between *key* and *value*. For example:

*key value*

*key=value*

All other characters are permitted.

### Reserved Metadata to Avoid

Avoid using the following words in a `metadata` keyword, either as a single argument or as the *key* in a *key value* argument; these are reserved for use by Talos:

```
application
engine
impact_flag
os
policy
rule-type
rule-flushing
soid
```

---

**Note** Contact Support for assistance in adding restricted metadata to local rules that might not otherwise function as expected.

---

### Impact Level 1

You can use the following reserved *key value* argument in a `metadata` keyword:

```
impact_flag red
```

This *key value* argument sets the impact flag to red (level 1) for a local rule you import or a custom rule you create using the intrusion rules editor.

Note that when Talos includes the `impact_flag red` argument in a rule provided by Cisco, Talos has determined that a packet triggering the rule indicates that the source or destination host is potentially compromised by a virus, trojan, or other piece of malicious software.

## Service Metadata

The system detects applications running on the hosts in your network and inserts application protocol information into your network traffic; it does this regardless of the configuration of your discovery policy. You can use `metadata` keyword `service` arguments in a TCP or UDP rule to match application protocols and ports in your network traffic. You can combine one or more `service` application arguments in a rule with a single port argument.

### Service Applications

You can use the `metadata` keyword with `service` as the *key* and an application as the *value* to match packets with the identified application protocol. For example, the following *key value* argument in a `metadata` keyword associates the rule with HTTP traffic:

```
service http
```

You can identify multiple applications separated by commas. For example:

```
service http, service smtp, service ftp
```

**Caution** Adaptive profiling **must** be enabled (its default state) as described in [Configuring Adaptive Profiles, on page 1814](#) for intrusion rules to use service metadata.

The following table describes the most common application values used with the `service` keyword.

**Note** Contact Support for assistance if you have difficulty identifying applications not in the table.

**Table 153: service Values**

| Value       | Description                                                     |
|-------------|-----------------------------------------------------------------|
| cvs         | Concurrent Versions System                                      |
| dcerpc      | Distributed Computing Environment/Remote Procedure Calls System |
| dns         | Domain Name System                                              |
| finger      | Finger user information protocol                                |
| ftp         | File Transfer Protocol                                          |
| ftp-data    | File Transfer Protocol (Data Channel)                           |
| http        | Hypertext Transfer Protocol                                     |
| imap        | Internet Message Access Protocol                                |
| isakmp      | Internet Security Association and Key Management Protocol       |

| shell       | OS Shell                                                        |
| pop2        | Post Office Protocol, version 2                                 |
| pop3        | Post Office Protocol, version 3                                 |
| smtp        | Simple Mail Transfer Protocol                                   |
| snmp        | Simple Network Management Protocol                              |

| Value  | Description                        |
|--------|------------------------------------|
| ssh    | Secure Shell network protocol      |
| sunrpc | Sun Remote Procedure Call Protocol |
| telnet | Telnet network protocol            |
| tftp   | Trivial File Transfer Protocol     |
| x11    | X Window System                    |

### Service Ports

You can use the `metadata` keyword with `service` as the *key* and a specified port argument as the *value* to define how the rule matches ports in combination with applications.

You can specify any of the port values in the table below, one value per rule.

**Table 154: service Port Values**

| Value                                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>else-ports</code> or <code>unknown</code> | <p>The system applies the rule if either of the following conditions is met:</p> <ul style="list-style-type: none"> <li>• The packet application is known and matches the rule application.</li> <li>• The packet application is unknown and packet ports match the rule ports.</li> </ul> <p>The <code>else-ports</code> and <code>unknown</code> values produce the default behavior that the system uses when <code>service</code> specifies an application protocol with no port modifier.</p> |
| <code>and-ports</code>                          | <p>The system applies the rule if the packet application is known and matches the rule application, and the packet port matches the ports in the rule header. You cannot use <code>and-ports</code> in a rule that does not specify an application.</p>                                                                                                                                                                                                                                            |
| <code>or-ports</code>                           | <p>The system applies the rule if any of the following conditions are met:</p> <ul style="list-style-type: none"> <li>• The packet application is known and matches the rule application.</li> <li>• The packet application is unknown and packet port matches the rule ports.</li> <li>• The packet application does not match the rule application and packet ports match the rule ports.</li> <li>• The rule does not specify an application and packet ports match the rule ports.</li> </ul>  |

Note the following:

- You must include a `service` application argument with the `service and-ports` argument.
- If a rule specifies more than one of the values in the table above, the system applies the last one that appears in the rule.
- Port and application arguments can be in any order.

Except for the `and-ports` value, you can include a `service` port argument with or without one or more `service` application arguments. For example:

```
service or-ports, service http, service smtp
```

### Applications and Ports in Traffic

The diagrams below illustrate the application and port combinations that intrusion rules support, and the results of applying these rule constraints to packet data.

#### Host application protocol else source/destination ports:

#### Host application protocol and source/destination ports:

**Host application protocol or source/destination ports:****Example Matches**

The following sample rules using the `metadata` keyword with `service` arguments are shown with examples of data they match and do not match:

- `alert tcp any any -> any [80,8080] (metadata:service and-ports, service http, service smtp;)`

| Example Matches                                                                                                                                                                                                  | Example Non-Matches                                                                                                                                                                     |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ul style="list-style-type: none"> <li>• HTTP traffic over TCP port 80</li> <li>• HTTP traffic over TCP port 8080</li> <li>• SMTP traffic over TCP port 80</li> <li>• SMTP traffic over TCP port 8080</li> </ul> | <ul style="list-style-type: none"> <li>• POP3 traffic on ports 80 or 8080</li> <li>• Traffic of unknown application on ports 80 or 8080</li> <li>• HTTP traffic on port 9999</li> </ul> |

- `alert tcp any any -> any [80,8080] (metadata:service or-ports, service http;)`

| Example Matches                                                                                                                                                                                                    | Example Non-Matches                                                                                              |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------|
| <ul style="list-style-type: none"> <li>• HTTP traffic on any port</li> <li>• SMTP traffic on port 80</li> <li>• SMTP traffic on port 8080</li> <li>• Traffic of unknown application on port 80 and 8080</li> </ul> | <ul style="list-style-type: none"> <li>• Non-HTTP and non-SMTP traffic on ports other than 80 or 8080</li> </ul> |

- Any of the following rules:

- `alert tcp any any -> any [80,8080] metadata:service else-ports, service http;)`
- `alert tcp any any -> any [80,8080] metadata:service unknown, service http;)`
- `alert tcp any any -> any [80,8080] metadata:service http;)`

| Example Matches                                                                                                                                                                        | Example Non-Matches                                                                                                              |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <ul style="list-style-type: none"> <li>• HTTP traffic on any port</li> <li>• port 80 if packet application is unknown</li> <li>• port 8080 if packet application is unknown</li> </ul> | <ul style="list-style-type: none"> <li>• SMTP traffic on ports 80 or 8080</li> <li>• POP3 traffic on ports 80 or 8080</li> </ul> |

## Metadata Search Guidelines

To search for rules that use the `metadata` keyword, select the `metadata` keyword on the rules Search page and, optionally, type any portion of the metadata. For example, you can type:

- `search` to display all rules where you have used `search` for *key*.
- `search http` to display all rules where you have used `search` for *key* and `http` for *value*.
- `author snortguru` to display all rules where you have used `author` for *key* and `SnortGuru` for *value*.
- `author s` to display all rules where you have used `author` for *key* and any terms such as `SnortGuru` or `SnortUser1` or `SnortUser2` for *value*.

**Tip** When you search for both *key* and *value*, use the same connecting operator (equal to [=] or a space character) in searches that is used in the *key value* argument in the rule; searches return different results depending on whether you follow *key* with equal to (=) or a space character.

Note that regardless of the format you use to add metadata, the system interprets your metadata search term as all or part of a *key value* or *key=value* argument. For example, the following would be valid metadata that does not follow a *key value* or *key=value* format:

```
ab cd ef gh
```

However, the system would interpret each space in the example as a separator between a *key* and *value*. Thus, you could successfully locate a rule containing the example metadata using any of the following searches for juxtaposed and single terms:

```
cd ef
ef gh
ef
```

but you would not locate the rule using the following search, which the system would interpret as a single *key value* argument:

```
ab ef
```

## IP Header Values

You can use keywords to identify possible attacks or security policy violations in the IP headers of packets.

**fragbits**

The `fragbits` keyword inspects the fragment and reserved bits in the IP header. You can check each packet for the Reserved Bit, the More Fragments bit, and the Don't Fragment bit in any combination.

**Table 155: Fragbits Argument Values**

| Argument | Description        |
|----------|--------------------|
| R        | Reserved bit       |
| M        | More Fragments bit |
| D        | Don't Fragment bit |

To further refine a rule using the `fragbits` keyword, you can specify any operator described in the following table after the argument value in the rule.

**Table 156: Fragbit Operators**

| Operator              | Description                                                          |
|-----------------------|----------------------------------------------------------------------|
| plus sign (+)         | The packet must match against all specified bits.                    |
| asterisk (*)          | The packet can match against any of the specified bits.              |
| exclamation point (!) | The packet meets the criteria if none of the specified bits are set. |

For example, to generate an event against packets that have the Reserved Bit set (and possibly any other bits), use `R+` as the `fragbits` value.

**id**

The `id` keyword tests the IP header fragment identification field against the value you specify in the keyword's argument. Some denial-of-service tools and scanners set this field to a specific number that is easy to detect. For example, in SID 630, which detects a Synscan portscan, the `id` value is set to `39426`, the static value used as the ID number in packets transmitted by the scanner.

---

**Note** `id` argument values must be numeric.

---

**ipopts**

The `IPopts` keyword allows you to search packets for specified IP header options. The following table lists the available argument values.

Table 157: IPoption Arguments

| Argument | Description           |
|----------|-----------------------|
| rr       | record route          |
| eol      | end of list           |
| nop      | no operation          |
| ts       | time stamp            |
| sec      | IP security option    |
| lsrr     | loose source routing  |
| ssrr     | strict source routing |
| satid    | stream identifier     |

Analysts most frequently watch for strict and loose source routing because these options may be an indication of a spoofed source IP address.

### ip\_proto

The `ip_proto` keyword allows you to identify packets with the IP protocol specified as the keyword's value. You can specify the IP protocols as a number, 0 through 255. You can combine these numbers with the following operators: `<`, `>`, or `!`. For example, to inspect traffic with any protocol that is not ICMP, use `!1` as a value to the `ip_proto` keyword. You can also use the `ip_proto` keyword multiple times in a single rule; note, however, that the rules engine interprets multiple instances of the keyword as having a Boolean AND relationship. For example, if you create a rule containing `ip_proto:!3; ip_proto:!6`, the rule ignores traffic using the GGP protocol AND the TCP protocol.

### tos

Some networks use the type of service (ToS) value to set precedence for packets traveling on that network. The `tos` keyword allows you to test the packet's IP header ToS value against the value you specify as the keyword's argument. Rules using the `tos` keyword will trigger on packets whose ToS is set to the specified value and that meet the rest of the criteria set forth in the rule.

---

**Note** Argument values for `tos` must be numeric.

---

The ToS field has been deprecated in the IP header protocol and replaced with the Differentiated Services Code Point (DSCP) field.

### ttl

A packet's time-to-live (ttl) value indicates how many hops it can make before it is dropped. You can use the `ttl` keyword to test the packet's IP header ttl value against the value, or range of values, you specify as the keyword's argument. It may be helpful to set the `ttl` keyword parameter to a low value such as 0 or 1, as low time-to-live values are sometimes indicative of a traceroute or intrusion evasion attempt. (Note, though, that

the appropriate value for this keyword depends on your managed device placement and network topology.) Use syntax as follows:

- Use an integer from 0 to 255 to set a specific value for the TTL value. You can also precede the value with an equal (=) sign (for example, you can specify 5 or =5).
- Use a hyphen (-) to specify a range of TTL values (for example, 0-2 specifies all values 0 through 2, -5 specifies all values 0 through 5, and 5- specifies all values 5 through 255).
- Use the greater than (>) sign to specify TTL values greater than a specific value (for example, >3 specifies all values greater than 3).
- Use the greater than and equal to signs (>=) to specify TTL values greater than or equal to a specific value (for example, >=3 specifies all values greater than or equal to 3).
- Use the less than (<) sign to specify TTL values less than a specific value (for example, <3 specifies all values less than 3).
- Use the less than and equal to signs (<=) to specify TTL values less than or equal to a specific value (for example, <=3 specifies all values less than or equal to 3).

## ICMP Header Values

The Firepower System supports keywords that you can use to identify attacks and security policy violations in the headers of ICMP packets. Note, however, that predefined rules exist that detect most ICMP types and codes. Consider enabling an existing rule or creating a local rule based on an existing rule; you may be able to find a rule that meets your needs more quickly than if you build an ICMP rule from scratch.

### icmp\_id and icmp\_seq

The ICMP identification and sequence numbers help associate ICMP replies with ICMP requests. In normal traffic, these values are dynamically assigned to packets. Some covert channel and Distributed Denial of Server (DDoS) programs use static ICMP ID and sequence values. The following keywords allow you to identify ICMP packets with static values.

| Keyword  | Definition                                                                                                                                                                                                                 |
|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| icmp_id  | Inspects an ICMP echo request or reply packet's ICMP ID number. Use a numeric value that corresponds with the ICMP ID number as the argument for the <code>icmp_id</code> keyword.                                         |
| icmp_seq | The <code>icmp_seq</code> keyword inspects an ICMP echo request or reply packet's ICMP sequence. Use a numeric value that corresponds with the ICMP sequence number as the argument for the <code>icmp_seq</code> keyword. |

### itype

Use the `itype` keyword to look for packets with specific ICMP message type values. You can specify either a valid ICMP type value or an invalid ICMP type value to test for different types of traffic. For example, attackers may set ICMP type values out of range to cause denial of service and flooding attacks.

You can specify a range for the `itype` argument value using less than (<) and greater than (>).

For example:

- <35
- >36
- 3<>55

### icode

ICMP messages sometimes include a code value that provides details when a destination is unreachable.

You can use the `icode` keyword to identify packets with specific ICMP code values. You can choose to specify either a valid ICMP code value or an invalid ICMP code value to test for different types of traffic.

You can specify a range for the `icode` argument value using less than (<) and greater than (>).

For example:

- to find values less than 35, specify <35.
- to find values greater than 36, specify >36.
- to find values between 3 and 55, specify 3<>55.

**Tip** You can use the `icode` and `itype` keywords together to identify traffic that matches both. For example, to identify ICMP traffic that contains an ICMP Destination Unreachable code type with an ICMP Port Unreachable code type, specify an `itype` keyword with a value of 3 (for Destination Unreachable) and an `icode` keyword with a value of 3 (for Port Unreachable).

## TCP Header Values and Stream Size

The Firepower System supports keywords that are designed to identify attacks attempted using TCP headers of packets and TCP stream size.

### ack

You can use the `ack` keyword to compare a value against a packet's TCP acknowledgment number. The rule triggers if a packet's TCP acknowledgment number matches the value specified for the `ack` keyword.

Argument values for `ack` must be numeric.

### flags

You can use the `flags` keyword to specify any combination of TCP flags that, when set in an inspected packet, cause the rule to trigger.

**Note** In situations where you would traditionally use `A+` as the value for `flags`, you should instead use the `flow` keyword with a value of `established`. Generally, you should use the `flow` keyword with a value of `stateless` when using `flags` to ensure that all combinations of flags are detected.

You can either check for or ignore the values described in the following table for the `flag` keyword.

Table 158: flag Arguments

| Argument | TCP Flag                                                                                                                           |
|----------|------------------------------------------------------------------------------------------------------------------------------------|
| Ack      | Acknowledges data.                                                                                                                 |
| Psh      | Data should be sent in this packet.                                                                                                |
| Syn      | A new connection.                                                                                                                  |
| Urg      | Packet contains urgent data.                                                                                                       |
| Fin      | A closed connection.                                                                                                               |
| Rst      | An aborted connection.                                                                                                             |
| CWR      | An ECN congestion window has been reduced. This was formerly the R1 argument, which is still supported for backward compatibility. |
| ECE      | ECN echo. This was formerly the R2 argument, which is still supported for backward compatibility.                                  |

When using the `flags` keyword, you can use an operator to indicate how the system performs matches against multiple flags. The following table describes these operators.

Table 159: Operators Used with flags

| Operator | Description                                                | Example                                                                                                                                                                                                                             |
|----------|------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| all      | The packet must contain all specified flags.               | Select <code>Urg</code> and <code>all</code> to specify that a packet must contain the Urgent flag and may contain any other flags.                                                                                                 |
| any      | The packet can contain any of the specified flags.         | Select <code>Ack</code> , <code>Psh</code> , and <code>any</code> to specify that either or both the <code>Ack</code> and <code>Psh</code> flags must be set to trigger the rule, and that other flags may also be set on a packet. |
| not      | The packet must <b>not</b> contain the specified flag set. | Select <code>Urg</code> and <code>not</code> to specify that the Urgent flag is <b>not</b> set on packets that trigger this rule.                                                                                                   |

## flow

You can use the `flow` keyword to select packets for inspection by a rule based on session characteristics. The `flow` keyword allows you to specify the direction of the traffic flow to which a rule applies, applying rules to either the client flow or server flow. To specify how the `flow` keyword inspects your packets, you can set the direction of traffic you want analyzed, the state of packets inspected, and whether the packets are part of a rebuilt stream.

Stateful inspection of packets occurs when rules are processed. If you want a TCP rule to ignore stateless traffic (traffic without an established session context), you must add the `flow` keyword to the rule and select the **Established** argument for the keyword. If you want a UDP rule to ignore stateless traffic, you must add the `flow` keyword to the rule and select either the **Established** argument or a directional argument, or both. This causes the TCP or UDP rule to perform stateful inspection of a packet.

When you add a directional argument, the rules engine inspects only those packets that have an established state with a flow that matches the direction specified. For example, if you add the `flow` keyword with the `established` argument and the `From Client` argument to a rule that triggers when a TCP or UDP connection is detected, the rules engine only inspects packets that are sent from the client.

**Tip** For maximum performance, always include a `flow` keyword in a TCP rule or a UDP session rule.

The following table describes the stream-related arguments you can specify for the `flow` keyword:

**Table 160: State-Related flow Arguments**

| Argument    | Description                                               |
|-------------|-----------------------------------------------------------|
| Established | Triggers on established connections.                      |
| Stateless   | Triggers regardless of the state of the stream processor. |

The following table describes the directional options you can specify for the `flow` keyword:

**Table 161: flow Directional Arguments**

| Argument    | Description                   |
|-------------|-------------------------------|
| To Client   | Triggers on server responses. |
| To Server   | Triggers on client responses. |
| From Client | Triggers on client responses. |
| From Server | Triggers on server responses. |

Notice that `From Server` and `To Client` perform the same function, as do `To Server` and `From Client`. These options exist to add context and readability to the rule. For example, if you create a rule designed to detect an attack from a server to a client, use `From Server`. But, if you create a rule designed to detect an attack from the client to the server, use `From Client`.

The following table describes the stream-related arguments you can specify for the `flow` keyword:

**Table 162: Stream-Related flow Arguments**

| Argument              | Description                                 |
|-----------------------|---------------------------------------------|
| Ignore Stream Traffic | Does not trigger on rebuilt stream packets. |
| Only Stream Traffic   | Triggers only on rebuilt stream packets.    |

For example, you can use `To Server`, `Established`, `Only Stream Traffic` as the value for the `flow` keyword to detect traffic, traveling from a client to the server in an established session, that has been reassembled by the stream preprocessor.

**seq**

The `seq` keyword allows you to specify a static sequence number value. Packets whose sequence number matches the specified argument trigger the rule containing the keyword. While this keyword is used rarely, it is helpful in identifying attacks and network scans that use generated packets with static sequence numbers.

**window**

You can use the `window` keyword to specify the TCP window size you are interested in. A rule containing this keyword triggers whenever it encounters a packet with the specified TCP window size. While this keyword is used rarely, it is helpful in identifying attacks and network scans that use generated packets with static TCP window sizes.

**stream\_size**

You can use the `stream_size` keyword in conjunction with the stream preprocessor to determine the size in bytes of a TCP stream, using the format:

```
direction,operator,bytes
```

where bytes is number of bytes. You must separate each option in the argument with a comma (,).

The following table describes the case-insensitive directional options you can specify for the `stream_size` keyword:

**Table 163: stream\_size Keyword Directional Arguments**

| Argument | Description                                                                                                                                                                                                                                                                                                     |
|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| client   | triggers on a stream from the client matching the specified stream size.                                                                                                                                                                                                                                        |
| server   | triggers on a stream from the server matching the specified stream size.                                                                                                                                                                                                                                        |
| both     | triggers on traffic from the client and traffic from the server both matching the specified stream size.<br><br>For example, the argument <code>both, &gt;, 200</code> would trigger when traffic from the client is greater than 200 bytes AND traffic from the server is greater than 200 bytes.              |
| either   | triggers on traffic from either the client or the server matching the specified stream size, whichever occurs first.<br><br>For example, the argument <code>either, &gt;, 200</code> would trigger when traffic from the client is greater than 200 bytes OR traffic from the server is greater than 200 bytes. |

The following table describes the operators you can use with the `stream_size` keyword:

**Table 164: stream\_size Keyword Argument Operators**

| Operator | Description  |
|----------|--------------|
| =        | equal to     |
| !=       | not equal to |
| >        | greater than |

| Operator | Description              |
|----------|--------------------------|
| <        | less than                |
| >=       | greater than or equal to |
| <=       | less than or equal to    |

For example, you could use `client, >=, 5001216` as the argument for the `stream_size` keyword to detect a TCP stream traveling from a client to a server and greater than or equal to 5001216 bytes.

## The stream\_reassembly Keyword

You can use the `stream_reassemble` keyword to enable or disable TCP stream reassembly for a single connection when inspected traffic on the connection matches the conditions of the rule. Optionally, you can use this keyword multiple times in a rule.

Use the following syntax to enable or disable stream reassembly:

```
enable|disable, server|client|both, option, option
```

The following table describes the optional arguments you can use with the `stream_reassemble` keyword.

**Table 165: stream\_reassemble Optional Arguments**

| Argument | Description                                                                         |
|----------|-------------------------------------------------------------------------------------|
| noalert  | Generate no events regardless of any other detection options specified in the rule. |
| fastpath | Ignore the rest of the connection traffic when there is a match.                    |

For example, the following rule disables TCP client-side stream reassembly without generating an event on the connection where a 200 OK status code is detected in an HTTP response:

```
alert tcp any 80 -> any any (flow:to_client, established; content: "200 OK";
stream_reassemble:disable, client, noalert
```

## SSL Keywords

You can use SSL rule keywords to invoke the Secure Sockets Layer (SSL) preprocessor and extract information about SSL version and session state from packets in an encrypted session.

When a client and server communicate to establish an encrypted session using SSL or Transport Layer Security (TLS), they exchange handshake messages. Although the data transmitted in the session is encrypted, the handshake messages are not.

The SSL preprocessor extracts state and version information from specific handshake fields. Two fields within the handshake indicate the version of SSL or TLS used to encrypt the session and the stage of the handshake.

### ssl\_state

The `ssl_state` keyword can be used to match against state information for an encrypted session. To check for two or more SSL versions used simultaneously, use multiple `ssl_version` keywords in a rule.

When a rule uses the `ssl_state` keyword, the rules engine invokes the SSL preprocessor to check traffic for SSL state information.

For example, to detect an attacker's attempt to cause a buffer overflow on a server by sending a `ClientHello` message with an overly long challenge length and too much data, you could use the `ssl_state` keyword with `client_hello` as an argument then check for abnormally large packets.

Use a comma-separated list to specify multiple arguments for the SSL state. When you list multiple arguments, the system evaluates them using the OR operator. For example, if you specify `client_hello` and `server_hello` as arguments, the system evaluates the rule against traffic that has a `client_hello` OR a `server_hello`.

You can also negate any argument; for example:

```
!client_hello, !unknown
```

To ensure the connection has reached each of a set of states, multiple rules using the `ssl_state` rule option should be used. The `ssl_state` keyword takes the following identifiers as arguments:

**Table 166: `ssl_state` Arguments**

| Argument                  | Purpose                                                                                                                                                                                  |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>client_hello</code> | Matches against a handshake message with <code>ClientHello</code> as the message type, where the client requests an encrypted session.                                                   |
| <code>server_hello</code> | Matches against a handshake message with <code>ServerHello</code> as the message type, where the server responds to the client's request for an encrypted session.                       |
| <code>client_keyx</code>  | Matches against a handshake message with <code>ClientKeyExchange</code> as the message type, where the client transmits a key to the server to confirm receipt of a key from the server. |
| <code>server_keyx</code>  | Matches against a handshake message with <code>ServerKeyExchange</code> as the message type, where the client transmits a key to the server to confirm receipt of a key from the server. |
| <code>unknown</code>      | Matches against any handshake message type.                                                                                                                                              |

### **ssl\_version**

The `ssl_version` keyword can be used to match against version information for an encrypted session. When a rule uses the `ssl_version` keyword, the rules engine invokes the SSL preprocessor to check traffic for SSL version information.

For example, if you know there is a buffer overflow vulnerability in SSL version 2, you could use the `ssl_version` keyword with the `sslv2` argument to identify traffic using that version of SSL.

Use a comma-separated list to specify multiple arguments for the SSL version. When you list multiple arguments, the system evaluates them using the OR operator. For example, if you wanted to identify any encrypted traffic that was not using SSLv2, you could add `ssl_version:ssl_v3,tls1.0,tls1.1,tls1.2` to a rule. The rule would evaluate any traffic using SSL Version 3, TLS Version 1.0, TLS Version 1.1, or TLS Version 1.2.

The `ssl_version` keyword takes the following SSL/TLS version identifiers as arguments:

Table 167: *ssl\_version Arguments*

| Argument | Purpose                                                                           |
|----------|-----------------------------------------------------------------------------------|
| sslV2    | Matches against traffic encoded using Secure Sockets Layer (SSL) Version 2.       |
| sslV3    | Matches against traffic encoded using Secure Sockets Layer (SSL) Version 3.       |
| tlS1.0   | Matches against traffic encoded using Transport Layer Security (TLS) Version 1.0. |
| tlS1.1   | Matches against traffic encoded using Transport Layer Security (TLS) Version 1.1. |
| tlS1.2   | Matches against traffic encoded using Transport Layer Security (TLS) Version 1.2. |

## The appid Keyword

You can use the `appid` keyword to identify the application protocol, client application, or web application in a packet. For example, you could target a specific application that you know is susceptible to a specific vulnerability.

Within the `appid` keyword of an intrusion rule, click **Configure AppID** to select one or more applications that you want to detect.

### Browsing the Available Applications

When you first start to build the condition, the **Available Applications** list is unconstrained and displays every application the system detects, 100 per page:

- To page through the applications, click the arrows underneath the list.
- To display a pop-up window with summary information about the application's characteristics, as well as Internet search links that you can follow, click **Information** (📘) next to an application.

### Using Application Filters

To help you find the applications you want to match, you can constrain the **Available Applications** list in the following ways:

- To search for applications, click the **Search by name** prompt above the list, then type a name. The list updates as you type to display matching applications.
- To constrain the applications by applying a filter, use the **Application Filters** list. The **Available Applications** list updates as you apply filters. For your convenience, the system uses an **Unlock icon** to mark applications that the system can identify only in decrypted traffic—not encrypted or unencrypted.

**Note** If you select one or more filters in the Application Filters list and also search the **Available Applications** list, your selections and the search-filtered **Available Applications** list are combined using an AND operation.

### Selecting Applications

To select a single application, select it and click **Add to Rule**. To select all applications in the current constrained view, right-click and select **Select All**.

## Application Layer Protocol Values

Although preprocessors perform most of the normalization and inspection of application layer protocol values, you can continue to inspect application layer values using various preprocessor options.

### The RPC Keyword

The `rpc` keyword identifies Open Network Computing Remote Procedure Call (ONC RPC) services in TCP or UDP packets. This allows you to detect attempts to identify the RPC programs on a host. Intruders can use an RPC portmapper to determine if any of the RPC services running on your network can be exploited. They can also attempt to access other ports running RPC without using portmapper. The following table lists the arguments that the `rpc` keyword accepts.

**Table 168: rpc Keyword Arguments**

| Argument    | Description                |
|-------------|----------------------------|
| application | The RPC application number |
| procedure   | The RPC procedure invoked  |
| version     | The RPC version            |

To specify the arguments for the `rpc` keyword, use the following syntax:

```
application,procedure,version
```

where `application` is the RPC application number, `procedure` is the RPC procedure number, and `version` is the RPC version number. You must specify all arguments for the `rpc` keyword — if you are not able to specify one of the arguments, replace it with an asterisk (\*).

For example, to search for RPC portmapper (which is the RPC application indicated by the number 100000), with any procedure or version, use `100000,*,*` as the arguments.

### The ASN.1 Keyword

The `asn1` keyword allows you to decode a packet or a portion of a packet, looking for various malicious encodings.

The following table describes the arguments for the `asn1` keyword.

**Table 169: asn.1 Keyword Arguments**

| Argument           | Description                                                                                                                                                                                                |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Bitstring Overflow | Detects invalid, remotely exploitable bitstring encodings.                                                                                                                                                 |
| Double Overflow    | Detects a double ASCII encoding that is larger than a standard buffer. This is known to be an exploitable function in Microsoft Windows, but it is unknown at this time which services may be exploitable. |

| Argument        | Description                                                                                                                                                                                                                                                                                                                              |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Oversize Length | Detects ASN.1 type lengths greater than the supplied argument. For example, if you set the Oversize Length to 500, any ASN.1 type greater than 500 triggers the rule.                                                                                                                                                                    |
| Absolute Offset | Sets an absolute offset from the beginning of the packet payload. (Remember that the offset counter starts at byte 0.) For example, if you want to decode SNMP packets, set Absolute Offset to 0 and do not set a Relative Offset. Absolute Offset may be positive or negative.                                                          |
| Relative Offset | This is the relative offset from the last successful content match, <code>pcre</code> , or <code>byte_jump</code> . To decode an ASN.1 sequence right after the content "foo", set Relative Offset to 0, and do not set an Absolute Offset. Relative Offset may be positive or negative. (Remember that the offset counter starts at 0.) |

For example, there is a known vulnerability in the Microsoft ASN.1 Library that creates a buffer overflow, allowing an attacker to exploit the condition with a specially crafted authentication packet. When the system decodes the asn.1 data, exploit code in the packet could execute on the host with system-level privileges or could cause a DoS condition. The following rule uses the `asn1` keyword to detect attempts to exploit this vulnerability:

```

alert tcp $EXTERNAL_NET any -> $HOME_NET 445
(flow:to_server, established; content:"|FF|SMB|73|";
nocase; offset:4; depth:5;
asn1:bitstring_overflow,double_overflow,oversize_length 100,
relative_offset 54;)

```

The above rule generates an event against TCP traffic traveling from any IP address defined in the `$EXTERNAL_NET` variable, from any port, to any IP address defined in the `$HOME_NET` variable using port 445. In addition, it only executes the rule on established TCP connections to servers. The rule then tests for specific content in specific locations. Finally, the rule uses the `asn1` keyword to detect bitstring encodings and double ASCII encodings and to identify asn.1 type lengths over 100 bytes in length starting 55 bytes from the end of the last successful content match. (Remember that the `offset` counter starts at byte 0.)

## The urilen Keyword

You can use the `urilen` keyword in conjunction with the HTTP Inspect preprocessor to inspect HTTP traffic for URIs of a specific length, less than a maximum length, greater than a minimum length, or within a specified range.

After the HTTP Inspect preprocessor normalizes and inspects the packet, the rules engine evaluates the packet against the rule and determines whether the URI matches the length condition specified by the `urilen` keyword. You can use this keyword to detect exploits that attempt to take advantage of URI length vulnerabilities, for example, by creating a buffer overflow that allows the attacker to cause a DoS condition or execute code on the host with system-level privileges.

Note the following when using the `urilen` keyword in a rule:

- In practice, you always use the `urilen` keyword in combination with the `flow:established` keyword and one or more other keywords.
- The rule protocol is always TCP.
- Target ports are always HTTP ports.

You specify the URI length using a decimal number of bytes, less than (<) and greater than (>).

For example:

- specify `5` to detect a URI 5 bytes long.
- specify `< 5` (separated by one space character) to detect a URI less than 5 bytes long.
- specify `> 5` (separated by one space character) to detect a URI greater than 5 bytes long.
- specify `3 <> 5` (with one space character before and after `<>`) to detect a URI between 3 and 5 bytes long inclusive.

For example, there is a known vulnerability in Novell's server monitoring and diagnostics utility iMonitor version 2.4, which comes with eDirectory version 8.8. A packet containing an excessively long URI creates a buffer overflow, allowing an attacker to exploit the condition with a specially crafted packet that could execute on the host with system-level privileges or could cause a DoS condition. The following rule uses the `urilen` keyword to detect attempts to exploit this vulnerability:

```
alert tcp $EXTERNAL_NET any -> $HOME_NET $HTTP_PORTS
(msg:"EXPLOIT eDirectory 8.8 Long URI iMonitor buffer
overflow attempt"; flow:to_server,established;
urilen:> 8192; uricontent:"/nds/"; nocase;
classtype:attempted-admin; sid:x; rev:1;)
```

The above rule generates an event against TCP traffic traveling from any IP address defined in the `$EXTERNAL_NET` variable, from any port, to any IP address defined in the `$HOME_NET` variable using the ports defined in the `$HTTP_PORTS` variable. In addition, packets are evaluated against the rule only on established TCP connections to servers. The rule uses the `urilen` keyword to detect any URI over 8192 bytes in length. Finally, the rule searches the URI for the specific case-insensitive content `/nds/`.

## DCE/RPC Keywords

The three DCE/RPC keywords described in the following table allow you to monitor DCE/RPC session traffic for exploits. When the system processes rules with these keywords, it invokes the DCE/RPC preprocessor.

**Table 170: DCE/RPC Keywords**

| Use...                     | In this way...                                              | To detect...                                                |
|----------------------------|-------------------------------------------------------------|-------------------------------------------------------------|
| <code>dce_iface</code>     | alone                                                       | packets identifying a specific DCE/RPC service              |
| <code>dce_opnum</code>     | preceded by <code>dce_iface</code>                          | packets identifying specific DCE/RPC service operations     |
| <code>dce_stub_data</code> | preceded by <code>dce_iface</code> + <code>dce_opnum</code> | stub data defining a specific operation request or response |

Note in the table that you should always precede `dce_opnum` with `dce_iface`, and you should always precede `dce_stub_data` with `dce_iface` + `dce_opnum`.

You can also use these DCE/RPC keywords in combination with other rule keywords. Note that for DCE/RPC rules, you use the `byte_jump`, `byte_test`, and `byte_extract` keywords with their **DCE/RPC** arguments selected.

Cisco recommends that you include at least one `content` keyword in rules that include DCE/RPC keywords to ensure that the rules engine uses the fast pattern matcher, which increases processing speed and improves performance. Note that the rules engine uses the fast pattern matcher when a rule includes at least one `content` keyword, regardless of whether you enable the `content` keyword **Use Fast Pattern Matcher** argument.

You can use the DCE/RPC version and adjoining header information as the matching content in the following cases:

- the rule does not include another `content` keyword
- the rule contains another `content` keyword, but the DCE/RPC version and adjoining information represent a more unique pattern than the other content

For example, the DCE/RPC version and adjoining information are more likely to be unique than a single byte of content.

You should end qualifying rules with one of the following version and adjoining information content matches:

- For connection-oriented DCE/RPC rules, use the content `|05 00 00|` (for major version 05, minor version 00, and the request PDU (protocol data unit) type 00).
- For connectionless DCE/RPC rules, use the content `|04 00|` (for version 04, and the request PDU type 00).

In either case, position the `content` keyword for version and adjoining information as the last keyword in the rule to invoke the fast pattern matcher without repeating processing already completed by the DCE/RPC preprocessor. Note that placing the `content` keyword at the end of the rule applies to version content used as a device to invoke the fast pattern matcher, and not necessarily to other content matches in the rule.

## dce\_iface

You can use the `dce_iface` keyword to identify a specific DCE/RPC service.

Optionally, you can also use `dce_iface` in combination with the `dce_opnum` and `dce_stub_data` keywords to further limit the DCE/RPC traffic to inspect.

A fixed, sixteen-byte Universally Unique Identifier (UUID) identifies the application interface assigned to each DCE/RPC service. For example, the UUID `4b324fc8-670-01d3-1278-5a47bf6ee188` identifies the DCE/RPC lanmanserver service, also known as the `srvsvc` service, which provides numerous management functions for sharing peer-to-peer printers, files, and SMB named pipes. The DCE/RPC preprocessor uses the UUID and associated header values to track DCE/RPC sessions.

The interface UUID is comprised of five hexadecimal strings separated by hyphens:

```
<4hexbytes>-<2hexbytes>-<2hexbytes>-<2hexbytes>-<6hexbytes>
```

You specify the interface by entering the entire UUID including hyphens, as seen in the following UUID for the netlogon interface:

```
12345678-1234-abcd-ef00-01234567cffb
```

Note that you must specify the first three strings in the UUID in big endian byte order. Although published interface listings and protocol analyzers typically display UUIDs in the correct byte order, you might encounter a need to rearrange the UUID byte order before entering it. Consider the following messenger service UUID shown as it might sometimes be displayed in raw ASCII text with the first three strings in little endian byte order:

```
f8 91 7b 5a 00 ff d0 11 a9 b2 00 c0 4f b6 e6 fc
```

You would specify the same UUID for the `dce_iface` keyword by inserting hyphens and putting the first three strings in big endian byte order as follows:

```
5a7b91f8-ff00-11d0-a9b2-00c04fb6e6fc
```

Although a DCE/RPC session can include requests to multiple interfaces, you should include only one `dce_iface` keyword in a rule. Create additional rules to detect additional interfaces.

DCE/RPC application interfaces also have interface version numbers. You can optionally specify an interface version with an operator indicating that the version equals, does not equal, is less than, or greater than the specified value.

Both connection-oriented and connectionless DCE/RPC can be fragmented in addition to any TCP segmentation or IP fragmentation. Typically, it is not useful to associate any DCE/RPC fragment other than the first with the specified interface, and doing so may result in a large number of false positives. However, for flexibility you can optionally evaluate all fragments against the specified interface.

The following table summarizes the `dce_iface` keyword arguments.

**Table 171: dce\_iface Arguments**

| Argument       | Description                                                                                                                                                                                                                                                                                                                                                                           |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface UUID | The UUID, including hyphens, that identifies the application interface of the specific service that you want to detect in DCE/RPC traffic. Any request associated with the specified interface would match the interface UUID.                                                                                                                                                        |
| Version        | Optionally, the application interface version number 0 to 65535 and an operator indicating whether to detect a version greater than (>), less than (<), equal to (=), or not equal to (!) the specified value.                                                                                                                                                                        |
| All Fragments  | Optionally, enable to match against the interface in all associated DCE/RPC fragments and, if specified, on the interface version. This argument is disabled by default, indicating that the keyword matches only if the first fragment or the entire unfragmented packet is associated with the specified interface. Note that enabling this argument may result in false positives. |

## The dce\_opnum Keyword

You can use the `dce_opnum` keyword in conjunction with the DCE/RPC preprocessor to detect packets that identify one or more specific operations that a DCE/RPC service provides.

Client function calls request specific service functions, which are referred to in DCE/RPC specifications as *operations*. An operation number (opnum) identifies a specific operation in the DCE/RPC header. It is likely that an exploit would target a specific operation.

For example, the UUID 12345678-1234-abcd-ef00-01234567cffb identifies the interface for the netlogon service, which provides several dozen different operations. One of these is operation 6, the NetrServerPasswordSet operation.

You should precede a `dce_opnum` keyword with a `dce_iface` keyword to identify the service for the operation.

You can specify a single decimal value 0 to 65535 for a specific operation, a range of operations separated by a hyphen, or a comma-separated list of operations and ranges in any order.

Any of the following examples would specify valid netlogon operation numbers:

```
15
15-18
15, 18-20
15, 20-22, 17
15, 18-20, 22, 24-26
```

### The `dce_stub_data` Keyword

You can use the `dce_stub_data` keyword in conjunction with the DCE/RPC preprocessor to specify that the rules engine should start inspection at the beginning of the stub data, regardless of any other rule options. Packet payload rule options that follow the `dce_stub_data` keyword are applied relative to the stub data buffer.

DCE/RPC stub data provides the interface between a client procedure call and the DCE/RPC run-time system, the mechanism that provides the routines and services central to DCE/RPC. DCE/RPC exploits are identified in the stub data portion of the DCE/RPC packet. Because stub data is associated with a specific operation or function call, you should always precede `dce_stub_data` with `dce_iface` and `dce_opnum` to identify the related service and operation.

The `dce_stub_data` keyword has no arguments.

## SIP Keywords

Four SIP keywords allow you to monitor SIP session traffic for exploits.

Note that the SIP protocol is vulnerable to denial of service (DoS) attacks. Rules addressing these attacks can benefit from rate-based attack prevention.

### The `sip_header` Keyword

You can use the `sip_header` keyword to start inspection at the beginning of the extracted SIP request or response header and restrict inspection to header fields.

The `sip_header` keyword has no arguments.

The following example rule fragment points to the SIP header and matches the CSeq header field:

```
alert udp any any -> any 5060 (sip_header; content:"CSeq";)
```

### Related Topics

[Dynamic Intrusion Rule States](#), on page 1511

[Rate-Based Attack Prevention](#), on page 1800

## The sip\_body Keyword

You can use the `sip_body` keyword to start inspection at the beginning of the extracted SIP request or response message body and restrict inspection to the message body.

The `sip_body` keyword has no arguments.

The following example rule fragment points to the SIP message body and matches a specific IP address in the `c` (connection information) field in extracted SDP data:

```
alert udp any any -> any 5060 (sip_body; content:"c=IN 192.168.12.14";)
```

Note that rules are not limited to searching for SDP content. The SIP preprocessor extracts the entire message body and makes it available to the rules engine.

## The sip\_method Keyword

A *method* field in each SIP request identifies the purpose of the request. You can use the `sip_method` keyword to test SIP requests for specific methods. Separate multiple methods with commas.

You can specify any of the following currently defined SIP methods:

```
ack, benotify, bye, cancel, do, info, invite, join, message, notify, options, prack,
publish, quath, refer, register, service, sprack, subscribe, unsubscribe, update
```

Methods are case-insensitive. You can separate multiple methods with commas.

Because new SIP methods might be defined in the future, you can also specify a custom method, that is, a method that is not a currently defined SIP method. Accepted field values are defined in RFC 2616, which allows all characters except control characters and separators such as `=`, `(`, and `)`. See RFC 2616 for the complete list of excluded separators. When the system encounters a specified custom method in traffic, it will inspect the packet header but not the message.

The system supports up to 32 methods, including the 21 currently defined methods and an additional 11 methods. The system ignores any undefined methods that you might configure. Note that the 32 total methods includes methods specified using the **Methods to Check** SIP preprocessor option.

You can specify only one method when you use negation. For example:

```
!invite
```

Note, however, that multiple `sip_method` keywords in a rule are linked with an **AND** operation. For example, to test for all extracted methods except `invite` and `cancel`, you would use two negated `sip_method` keywords:

```
sip_method: !invite
sip_method: !cancel
```

Cisco recommends that you include at least one `content` keyword in rules that include the `sip_method` keyword to ensure that the rules engine uses the fast pattern matcher, which increases processing speed and improves performance. Note that the rules engine uses the fast pattern matcher when a rule includes at least one `content` keyword, regardless of whether you enable the `content` keyword **Use Fast Pattern Matcher** argument.

## The sip\_stat\_code Keyword

A three-digit status code in each SIP response indicates the outcome of the requested action. You can use the `sip_stat_code` keyword to test SIP responses for specific status codes.

You can specify a one-digit response-type number 1-9, a specific three-digit number 100-999, or a comma-separated list of any combination of either. A list matches if any single number in the list matches the code in the SIP response.

The following table describes the SIP status code values you can specify.

**Table 172: sip\_stat\_code Values**

| To detect...                                                   | Specify...                                                          | For example... | Detects...                             |
|----------------------------------------------------------------|---------------------------------------------------------------------|----------------|----------------------------------------|
| a specific status code                                         | the three-digit status code                                         | 189            | 189                                    |
| any three-digit code that begins with a specified single digit | the single digit                                                    | 1              | 1xx; that is, 100, 101, 102, and so on |
| a list of values                                               | any comma-separated combination of specific codes and single digits | 222, 3         | 222 plus 300, 301, 302, and so on      |

Note also that the rules engine does not use the fast pattern matcher to search for the value specify using the `sip_stat_code` keyword, regardless of whether your rule includes a `content` keyword.

## GTP Keywords

Three GSRP Tunneling Protocol (GTP) keywords allow you to inspect the GTP command channel for GTP version, message type, and information elements. You cannot use GTP keywords in combination with other intrusion rule keywords such as `content` or `byte_jump`. You **must** use the `gtp_version` keyword in each rule that uses the `gtp_info` or `gtp_type` keyword.

### The gtp\_version Keyword

You can use the `gtp_version` keyword to inspect GTP control messages for GTP version 0, 1, or 2.

Because different GTP versions define different message types and information elements, you must use `gtp_version` when you use the `gtp_type` or `gtp_info` keyword. You can specify the value 0, 1, or 2.

### The gtp\_type Keyword

Each GTP message is identified by a message type, which is comprised of both a numeric value and a string. You can use the `gtp_type` keyword to inspect traffic for specific GTP message types. Because different GTP versions define different message types and information elements, you must also use `gtp_version` when you use the `gtp_type` or `gtp_info` keyword.

You can specify a defined decimal value for a message type, a defined string, or a comma-separated list of either or both in any combination, as seen in the following example:

```
10, 11, echo_request
```

The system uses an OR operation to match each value or string that you list. The order in which you list values and strings does not matter. Any single value or string in the list matches the keyword. You receive an error if you attempt to save a rule that includes an unrecognized string or an out-of-range value.

The `gtp_type` Keyword

Note in the table that different GTP versions sometimes use different values for the same message type. For example, the `sgsn_context_request` message type has a value of 50 in GTPv0 and GTPv1, but a value of 130 in GTPv2.

The `gtp_type` keyword matches different values depending on the version number in the packet. In the example above, the keyword matches the message type value 50 in a GTPv0 or GTPv1 packet and the value 130 in a GTPv2 packet. The keyword does not match a packet when the message type value in the packet is not a known value for the version specified in the packet.

If you specify an integer for the message type, the keyword matches if the message type in the keyword matches the value in the GTP packet, regardless of the version specified in the packet.

The following table lists the defined values and strings recognized by the system for each GTP message type.

Table 173: GTP Message Types

| Value | Version 0                                   | Version 1                                         | Version 2                          |
|-------|---------------------------------------------|---------------------------------------------------|------------------------------------|
| 1     | <code>echo_request</code>                   | <code>echo_request</code>                         | <code>echo_request</code>          |
| 2     | <code>echo_response</code>                  | <code>echo_response</code>                        | <code>echo_response</code>         |
| 3     | <code>version_not_supported</code>          | <code>version_not_supported</code>                | <code>version_not_supported</code> |
| 4     | <code>node_alive_request</code>             | <code>node_alive_request</code>                   | N/A                                |
| 5     | <code>node_alive_response</code>            | <code>node_alive_response</code>                  | N/A                                |
| 6     | <code>redirection_request</code>            | <code>redirection_request</code>                  | N/A                                |
| 7     | <code>redirection_response</code>           | <code>redirection_response</code>                 | N/A                                |
| 16    | <code>create_pdp_context_request</code>     | <code>create_pdp_context_request</code>           | N/A                                |
| 17    | <code>create_pdp_context_response</code>    | <code>create_pdp_context_response</code>          | N/A                                |
| 18    | <code>update_pdp_context_request</code>     | <code>update_pdp_context_request</code>           | N/A                                |
| 19    | <code>update_pdp_context_response</code>    | <code>update_pdp_context_response</code>          | N/A                                |
| 20    | <code>delete_pdp_context_request</code>     | <code>delete_pdp_context_request</code>           | N/A                                |
| 21    | <code>delete_pdp_context_response</code>    | <code>delete_pdp_context_response</code>          | N/A                                |
| 22    | <code>create_aa_pdp_context_request</code>  | <code>init_pdp_context_activation_request</code>  | N/A                                |
| 23    | <code>create_aa_pdp_context_response</code> | <code>init_pdp_context_activation_response</code> | N/A                                |
| 24    | <code>delete_aa_pdp_context_request</code>  | N/A                                               | N/A                                |

## The gtp\_info Keyword

A GTP message can include multiple information elements, each of which is identified by both a defined numeric value and a defined string. You can use the `gtp_info` keyword to start inspection at the beginning of a specified information element, and restrict inspection to the specified information element. Because different GTP versions define different message types and information elements, you must also use `gtp_version` when you use this keyword.

You can specify either the defined decimal value or the defined string for an information element. You can specify a single value or string, and you can use multiple `gtp_info` keywords in a rule to inspect multiple information elements.

When a message includes multiple information elements of the same type, all are inspected for a match. When information elements occur in an invalid order, only the last instance is inspected.

Note that different GTP versions sometimes use different values for the same information element. For example, the `cause` information element has a value of 1 in GTPv0 and GTPv1, but a value of 2 in GTPv2.

The `gtp_info` keyword matches different values depending on the version number in the packet. In the example above, the keyword matches the information element value 1 in a GTPv0 or GTPv1 packet and the value 2 in a GTPv2 packet. The keyword does not match a packet when the information element value in the packet is not a known value for the version specified in the packet.

If you specify an integer for the information element, the keyword matches if the message type in the keyword matches the value in the GTP packet, regardless of the version specified in the packet.

The following table lists the values and strings recognized by the system for each GTP information element.

**Table 174: GTP Information Elements**

| Value | Version 0             | Version 1          | Version 2 |
|-------|-----------------------|--------------------|-----------|
| 1     | cause                 | cause              | imsi      |
| 2     | imsi                  | imsi               | cause     |
| 3     | rai                   | rai                | recovery  |
| 4     | tlli                  | tlli               | N/A       |
| 5     | p_tmsi                | p_tmsi             | N/A       |
| 6     | qos                   | N/A                | N/A       |
| 8     | recording_required    | recording_required | N/A       |
| 9     | authentication        | authentication     | N/A       |
| 11    | map_cause             | map_cause          | N/A       |
| 12    | p_tmsi_sig            | p_tmsi_sig         | N/A       |

## SCADA Keywords

The rules engine uses Modbus and DNP3 rules to access certain protocol fields.

### Modbus Keywords

You can use Modbus keywords alone or in combination with other keywords such as `content` and `byte_jump`.

#### **modbus\_data**

You can use the `modbus_data` keyword to point to the beginning of the Data field in a Modbus request or response.

#### **modbus\_func**

You can use the `modbus_func` keyword to match against the Function Code field in a Modbus application layer request or response header. You can specify either a single defined decimal value or a single defined string for a Modbus function code.

The following table lists the defined values and strings recognized by the system for Modbus function codes.

**Table 175: Modbus Function Codes**

| Value | String                 |
|-------|------------------------|
| 1     | read_coils             |
| 2     | read_discrete_inputs   |
| 3     | read_holding_registers |
| 4     | read_input_registers   |
| 5     | write_single_coil      |
| 6     | write_single_register  |
| 7     | read_exception_status  |
| 8     | diagnostics            |
| 11    | get_comm_event_counter |
| 12    | get_comm_event_log     |
| 15    | write_multiple_coils   |

| Value | String                           |
|-------|----------------------------------|
| 16    | write_multiple_registers         |
| 17    | report_slave_id                  |
| 20    | read_file_record                 |
| 21    | write_file_record                |
| 22    | mask_write_register              |
| 23    | read_write_multiple_registers    |
| 24    | read_fifo_queue                  |
| 43    | encapsulated_interface_transport |

### modbus\_unit

You can use the `modbus_unit` keyword to match a single decimal value against the Unit ID field in a Modbus request or response header.

## DNP3 Keywords

You can use DNP3 keywords alone or in combination with other keywords such as `content` and `byte_jump`.

### dnp3\_data

You can use the `dnp3_data` keyword to point to the beginning of reassembled DNP3 application layer fragments.

The DNP3 preprocessor reassembles link layer frames into application layer fragments. The `dnp3_data` keyword points to the beginning of each application layer fragment; other rule options can match against the reassembled data within fragments without separating the data and adding checksums every 16 bytes.

### dnp3\_func

You can use the `dnp3_func` keyword to match against the Function Code field in a DNP3 application layer request or response header. You can specify either a single defined decimal value or a single defined string for a DNP3 function code.

The following table lists the defined values and strings recognized by the system for DNP3 function codes.

**Table 176: DNP3 Function Codes**

| Value | String  |
|-------|---------|
| 0     | confirm |
| 1     | read    |
| 2     | write   |
| 3     | select  |

| Value | String              |
|-------|---------------------|
| 4     | operate             |
| 5     | direct_operate      |
| 6     | direct_operate_nr   |
| 7     | immed_freeze        |
| 8     | immed_freeze_nr     |
| 9     | freeze_clear        |
| 10    | freeze_clear_nr     |
| 11    | freeze_at_time      |
| 12    | freeze_at_time_nr   |
| 13    | cold_restart        |
| 14    | warm_restart        |
| 15    | initialize_data     |
| 16    | initialize_appl     |
| 17    | start_appl          |
| 18    | stop_appl           |
| 19    | save_config         |
| 20    | enable_unsolicited  |
| 21    | disable_unsolicited |
| 22    | assign_class        |
| 23    | delay_measure       |
| 24    | record_current_time |
| 25    | open_file           |
| 26    | close_file          |
| 27    | delete_file         |
| 28    | get_file_info       |
| 29    | authenticate_file   |
| 30    | abort_file          |
| 31    | activate_config     |

| Value | String               |
|-------|----------------------|
| 32    | authenticate_req     |
| 33    | authenticate_err     |
| 129   | response             |
| 130   | unsolicited_response |
| 131   | authenticate_resp    |

### **dnp3\_ind**

You can use the `dnp3_ind` keyword to match against flags in the Internal Indications field in a DNP3 application layer response header.

You can specify the string for a single known flag or a comma-separated list of flags, as seen in the following example:

```
class_1_events, class_2_events
```

When you specify multiple flags, the keyword matches against any flag in the list. To detect a combination of flags, use the `dnp3_ind` keyword multiple times in a rule.

The following list provides the string syntax recognized by the system for defined DNP3 internal indications flags.

```
class_1_events
class_2_events
class_3_events
need_time
local_control
device_trouble
device_restart
no_func_code_support
object_unknown
parameter_error
event_buffer_overflow
already_executing
config_corrupt
reserved_2
reserved_1
```

### **dnp3\_obj**

You can use the `dnp3_obj` keyword to match against DNP3 object headers in a request or response.

DNP3 data is comprised of a series of DNP3 objects of different types such as analog input, binary input, and so on. Each type is identified with a *group* such as analog input group, binary input group, and so on, each of which can be identified by a decimal value. The objects in each group are further identified by an *object variation* such as 16-bit integers, 32-bit integers, short floating point, and so on, each of which specifies the data format of the object. Each type of object variation can also be identified by a decimal value.

You identify object headers by specifying the decimal number for the type of object header group and the decimal number for the type of object variation. The combination of the two defines a specific type of DNP3 object.

## Packet Characteristics

You can write rules that only generate events against packets with specific packet characteristics.

### **dsize**

The `dsize` keyword tests the packet payload size. With it, you can use the greater than and less than operators (< and >) to specify a range of values. You can use the following syntax to specify ranges:

```
>number_of_bytes
<number_of_bytes
number_of_bytes<>number_of_bytes
```

For example, to indicate a packet size greater than 400 bytes, use `>400` as the `dtype` value. To indicate a packet size of less than 500 bytes, use `<500`. To specify that the rule trigger against any packet between 400 and 500 bytes inclusive, use `400<>500`.

**Caution** The `dsize` keyword tests packets before they are decoded by any preprocessors.

### **isdataat**

The `isdataat` keyword instructs the rules engine to verify that data resides at a specific location in the payload.

The following table lists the arguments you can use with the `isdataat` keyword.

**Table 177: isdataat Arguments**

| Argument | Type     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Offset   | Required | The specific location in the payload. For example, to test that data appears at byte 50 in the packet payload, you would specify <code>50</code> as the offset value. A <code>!</code> modifier negates the results of the <code>isdataat</code> test; it alerts if a certain amount of data is not present within the payload.<br><br>You can also use an existing <code>byte_extract</code> variable or <code>byte_math</code> result to specify the value for this argument. |
| Relative | Optional | Makes the location relative to the last successful content match. If you specify a relative location, note that the counter starts at byte 0, so calculate the location by subtracting 1 from the number of bytes you want to move forward from the last successful content match. For example, to specify that the data must appear at the ninth byte after the last successful content match, you would specify a relative offset of <code>8</code> .                         |
| Raw Data | Optional | Specifies that the data is located in the original packet payload before decoding or application layer normalization by any Firepower System preprocessor. You can use this argument with <b>Relative</b> if the previous content match was in the raw packet data.                                                                                                                                                                                                             |

For example, in a rule searching for the content `foo`, if the value for `isdataat` is specified as the following:

- `Offset = !10`
- `Relative = enabled`

The system alerts if the rules engine does not detect 10 bytes after `foo` before the payload ends.

**sameip**

The `sameip` keyword tests that a packet's source and destination IP addresses are the same. It does not take an argument.

**fragoffset**

The `fragoffset` keyword tests the offset of a fragmented packet. This is useful because some exploits (such as WinNuke denial-of-service attacks) use hand-generated packet fragments that have specific offsets.

For example, to test whether the offset of a fragmented packet is 31337 bytes, specify `31337` as the `fragoffset` value.

You can use the following operators when specifying arguments for the `fragoffset` keyword.

**Table 178: fragoffset Keyword Argument Operators**

| Operator | Description  |
|----------|--------------|
| !        | not          |
| >        | greater than |
| <        | less than    |

Note that you cannot use the not (!) operator in combination with < or >.

**cvsv**

The `cvsv` keyword tests Concurrent Versions System (CVS) traffic for malformed CVS entries. An attacker can use a malformed entry to force a heap overflow and execute malicious code on the CVS server. This keyword can be used to identify attacks against two known CVS vulnerabilities: CVE-2004-0396 (CVS 1.11.x up to 1.11.15, and 1.12.x up to 1.12.7) and CVS-2004-0414 (CVS 1.12.x through 1.12.8, and 1.11.x through 1.11.16). The `cvsv` keyword checks for a well-formed entry, and generates alerts when a malformed entry is detected.

Your rule should include the ports where CVS runs. In addition, any ports where traffic may occur should be added to the list of ports for stream reassembly in your TCP policies so state can be maintained for CVS sessions. The TCP ports 2401 (`pserver`) and 514 (`rsh`) are included in the list of client ports where stream reassembly occurs. However, note that if your server runs as an `xinetd` server (i.e., `pserver`), it can run on any TCP port. Add any non-standard ports to the stream reassembly **Client Ports** list.

## Active Response Keywords

The **resp** and **react** keywords provide two approaches to initiating active responses. An intrusion rule that contains either keyword initiates a single active response when a packet triggers the rule. Active response keywords initiate active responses to close TCP connections in response to triggered TCP rules or UDP sessions in response to triggered UDP rules. See [Active Responses in Intrusion Drop Rules, on page 1759](#). Active responses are not intended to take the place of a firewall for a number of reasons, including that an attacker may have chosen to ignore or circumvent active responses.

Active responses are supported in inline, including routed or transparent, deployments. For example, in response to the `react` keyword in an inline deployment, the system can insert a TCP reset (RST) packet directly into the traffic for each end of the connection, which normally should close the connection. Active responses are not supported or suited for passive deployments.

Because active responses can be routed back, the system does not allow TCP resets to initiate TCP resets; this prevents an unending sequence of active responses. The system also does not allow ICMP unreachable packets to initiate ICMP unreachable packets in keeping with standard practice.

You can configure the TCP stream preprocessor to detect additional traffic on a TCP connection after an intrusion rule has triggered an active response. When the preprocessor detects additional traffic, it sends additional active responses up to a specified maximum to both ends of the connection or session. See **Maximum Active Responses** and **Minimum Response Seconds** in [Advanced Transport/Network Preprocessor Options](#), on page 1759.

## The resp Keyword

You can use the `resp` keyword to actively respond to TCP connections or UDP sessions, depending on whether you specify the TCP or UDP protocol in the rule header.

Keyword arguments allow you to specify the packet direction and whether to use TCP reset (RST) packets or ICMP unreachable packets as active responses.

You can use any of the TCP reset or ICMP unreachable arguments to close TCP connections. You should use only ICMP unreachable arguments to close UDP sessions.

Different TCP reset arguments also allow you to target active responses to the packet source, destination, or both. All ICMP unreachable arguments target the packet source and allow you to specify whether to use an ICMP network, host, or port unreachable packet, or all three.

The following table lists the arguments you can use with the `resp` keyword to specify exactly what you want the Firepower System to do when the rule triggers.

**Table 179: resp Arguments**

| Argument                  | Description                                                                                                                                                                                                 |
|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>reset_source</code> | Directs a TCP reset packet to the endpoint that sent the packet that triggered the rule. Alternatively, you can specify <code>rst_snd</code> , which is supported for backward compatibility.               |
| <code>reset_dest</code>   | Directs a TCP reset packet to the intended destination endpoint of the packet that triggered the rule. Alternatively, you can specify <code>rst_rcv</code> , which is supported for backward compatibility. |
| <code>reset_both</code>   | Directs a TCP reset packet to both the sending and receiving endpoints. Alternatively, you can specify <code>rst_all</code> , which is supported for backward compatibility.                                |
| <code>icmp_net</code>     | Directs an ICMP network unreachable message to the sender.                                                                                                                                                  |
| <code>icmp_host</code>    | Directs an ICMP host unreachable message to the sender.                                                                                                                                                     |
| <code>icmp_port</code>    | Directs an ICMP port unreachable message to the sender. This argument is used to terminate UDP traffic.                                                                                                     |

| Argument | Description                                                                                                                                                                        |
|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| icmp_all | Directs the following ICMP messages to the sender: <ul style="list-style-type: none"> <li>• network unreachable</li> <li>• host unreachable</li> <li>• port unreachable</li> </ul> |

For example, to configure a rule to reset both sides of a connection when a rule is triggered, use `reset_both` as the value for the `resp` keyword.

You can use a comma-separated list to specify multiple arguments as follows:

```
argument, argument, argument
```

[The config response Command](#)

## The react Keyword

You can use the `react` keyword to send a default HTML page to the TCP connection client when a packet triggers the rule; after sending the HTML page, the system uses TCP reset packets to initiate active responses to both ends of the connection. The `react` keyword does not trigger active responses for UDP traffic.

Optionally, you can specify the following argument:

```
msg
```

When a packet triggers a `react` rule that uses the `msg` argument, the HTML page includes the rule event message.

If you do not specify the `msg` argument, the HTML page includes the following message:

```
You are attempting to access a forbidden site.
Consult your system administrator for details.
```

---

**Note** Because active responses can be routed back, ensure that the HTML response page does not trigger a `react` rule; this could result in an unending sequence of active responses. Cisco recommends that you test `react` rules extensively before activating them in a production environment.

## The detection\_filter Keyword

You can use the `detection_filter` keyword to prevent a rule from generating events unless a specified number of packets trigger the rule within a specified time. This can stop the rule from prematurely generating

events. For example, two or three failed login attempts within a few seconds could be expected behavior, but a large number of attempts within the same time could indicate a brute force attack.

The `detection_filter` keyword requires arguments that define whether the system tracks the source or destination IP address, the number of times the detection criteria must be met before triggering an event, and how long to continue the count.

Use the following syntax to delay the triggering of events:

```
track by_src/by_dst, count count, seconds number_of_seconds
```

The `track` argument specifies whether to use the packet's source or destination IP address when counting the number of packets that meet the rule's detection criteria. Select from the argument values described in the following table to specify how the system tracks event instances.

**Table 180: `detection_filter` Track Arguments**

| Argument            | Description                                         |
|---------------------|-----------------------------------------------------|
| <code>by_src</code> | Detection criteria count by source IP address.      |
| <code>by_dst</code> | Detection criteria count by destination IP address. |

The `count` argument specifies the number of packets that must trigger the rule for the specified IP address within the specified time before the rule generates an event.

The `seconds` argument specifies the number of seconds within which the specified number of packets must trigger the rule before the rule generates an event.

Consider the case of a rule that searches packets for the content `foo` and uses the `detection_filter` keyword with the following arguments:

```
track by_src, count 10, seconds 20
```

In the example, the rule will not generate an event until it has detected `foo` in 10 packets within 20 seconds from a given source IP address. If the system detects only 7 packets containing `foo` within the first 20 seconds, no event is generated. However, if `foo` occurs 40 times in the first 20 seconds, the rule generates 30 events and the count begins again when 20 seconds have elapsed.

### Comparing the `threshold` and `detection_filter` Keywords

The `detection_filter` keyword replaces the deprecated `threshold` keyword. The `threshold` keyword is still supported for backward compatibility and operates the same as thresholds that you set within an intrusion policy.

The `detection_filter` keyword is a detection feature that is applied before a packet triggers a rule. The rule does not generate an event for triggering packets detected before the specified packet count and, in an inline deployment, does not drop those packets if the rule is set to drop packets. Conversely, the rule does generate events for packets that trigger the rule and occur after the specified packet count and, in an inline deployment, drops those packets if the rule is set to drop packets.

Thresholding is an event notification feature that does not result in a detection action. It is applied after a packet triggers an event. In an inline deployment, a rule that is set to drop packets drops all packets that trigger the rule, independent of the rule threshold.

Note that you can use the `detection_filter` keyword in any combination with the intrusion event thresholding, intrusion event suppression, and rate-based attack prevention features in an intrusion policy. Note also that

policy validation fails if you enable an imported local rule that uses the deprecated `threshold` keyword in combination with the intrusion event thresholding feature in an intrusion policy.

## The tag Keyword

Use the `tag` keyword to tell the system to log additional traffic for the host or session. Use the following syntax when specifying the type and amount of traffic you want to capture using the `tag` keyword:

```
tagging_type, count, metric, optional_direction
```

The next three tables describe the other available arguments.

You can choose from two types of tagging. The following table describes the two types of tagging. Note that the session tag argument type causes the system to log packets from the same session as if they came from different sessions if you configure only rule header options in the intrusion rule. To group packets from the same session together, configure one or more rule options (such as a `flag` keyword or `content` keyword) within the same intrusion rule.

**Table 181: Tag Arguments**

| Argument | Description                                                                                                                                                                                                              |
|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| session  | Logs packets in the session that triggered the rule.                                                                                                                                                                     |
| host     | Logs packets from the host that sent the packet that triggered the rule. You can add a directional modifier to log only the traffic coming from the host ( <code>src</code> ) or going to the host ( <code>dst</code> ). |

To indicate how much traffic you want to log, use the following argument:

**Table 182: Count Argument**

| Argument | Description                                                                                                                                                                    |
|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| count    | The number of packets or seconds you want to log after the rule triggers.<br><br>This unit of measure is specified with the metric argument, which follows the count argument. |

Select the metric you want to use to log by time or volume of traffic from those described in the following table.

**Caution** High-bandwidth networks can see thousands of packets per second, and tagging a large number of packets may seriously affect performance, so make sure you tune this setting for your network environment.

Table 183: Logging Metrics Arguments

| Argument | Description                                                                            |
|----------|----------------------------------------------------------------------------------------|
| packets  | Logs the number of packets specified by the count after the rule triggers.             |
| seconds  | Logs traffic for the number of seconds specified by the count after the rule triggers. |

For example, when a rule with the following `tag` keyword value triggers:

```
host, 30, seconds, dst
```

all packets that are transmitted from the client to the host for the next 30 seconds are logged.

## The flowbits Keyword

Use the `flowbits` keyword to assign state names to sessions. By analyzing subsequent packets in a session according to the previously named state, the system can detect and alert on exploits that span multiple packets in a single session.

The `flowbits` state name is a user-defined label assigned to packets in a specific part of a session. You can label packets with state names based on packet content to help distinguish malicious packets from those you do not want to alert on. You can define up to 1024 state names per managed device. For example, if you want to alert on malicious packets that you know only occur after a successful login, you can use the `flowbits` keyword to filter out the packets that constitute an initial login attempt so you can focus only on the malicious packets. You can do this by first creating a rule that labels all packets in the session that have an established login with a `logged_in` state, then creating a second rule where `flowbits` checks for packets with the state you set in the first rule and acts only on those packets.

An optional *group name* allows you to include a state name in a group of states. A state name can belong to several groups. States not associated with a group are not mutually exclusive, so a rule that triggers and sets a state that is not associated with a group does not affect other currently set states.

## flowbits Keyword Options

The following table describes the various combinations of operators, states, and groups available to the `flowbits` keyword. Note that state names can contain alphanumeric characters, periods (`.`), underscores (`_`), and dashes (`-`).

Table 184: flowbits Options

| Operator          | State Option                           | Group     | Description                                                                                              |
|-------------------|----------------------------------------|-----------|----------------------------------------------------------------------------------------------------------|
| <code>set</code>  | <code>state_name</code>                | optional  | Sets the specified state for a packet. Sets the state in the specified group if a group is defined.      |
| <code>set</code>  | <code>state_name&amp;state_name</code> | optional  | Sets the specified states for a packet. Sets the states in the specified group if a group is defined.    |
| <code>setx</code> | <code>state_name</code>                | mandatory | Sets the specified state in the specified group for a packet, and unsets all other states in the group.  |
| <code>setx</code> | <code>state_name&amp;state_name</code> | mandatory | Sets the specified states in the specified group for a packet, and unsets all other states in the group. |

| Operator | State Option          | Group     | Description                                                                                     |
|----------|-----------------------|-----------|-------------------------------------------------------------------------------------------------|
| unset    | state_name            | no group  | Unsets the specified state for a packet.                                                        |
| unset    | state_name&state_name | no group  | Unsets the specified states for a packet.                                                       |
| unset    | all                   | mandatory | Unsets all the states in the specified group.                                                   |
| toggle   | state_name            | no group  | Unsets the specified state if it is set, and sets the specified state if it is unset.           |
| toggle   | state_name&state_name | no group  | Unsets the specified states if they are set, and sets the specified states if they are unset.   |
| toggle   | all                   | mandatory | Unsets all states set in the specified group, and sets all states unset in the specified group. |
| isset    | state_name            | no group  | Determines if the specified state is set in the packet.                                         |
| isset    | state_name&state_name | no group  | Determines if the specified states are set in the packet.                                       |
| isset    | state_name state_name | no group  | Determines if any of the specified states are set in the packet.                                |
| isset    | any                   | mandatory | Determines if any state is set in the specified group.                                          |
| isset    | all                   | mandatory | Determines if all states are set in the specified group.                                        |
| isnotset | state_name            | no group  | Determines if the specified state is not set in the packet.                                     |
| isnotset | state_name&state_name | no group  | Determines if the specified states are not set in the packet.                                   |
| isnotset | state_name state_name | no group  | Determines if any of the specified states is not set in the packet.                             |
| isnotset | any                   | mandatory | Determines if any state is not set in the packet.                                               |
| isnotset | all                   | mandatory | Determines if all states are not set in the packet.                                             |
| reset    | (no state)            | optional  | Unsets all states for all packets. Unsets all states in a group if a group is specified.        |
| noalert  | (no state)            | no group  | Use this in conjunction with any other operator to suppress event generation.                   |

## Guidelines for Using the flowbits Keyword

Note the following when using the `flowbits` keyword:

- When using the `setx` operator, the specified state can only belong to the specified group, and not to any other group.
- You can define the `setx` operator multiple times, specifying different states and the same group with each instance.
- When you use the `setx` operator and specify a group, you cannot use the `set`, `toggle`, or `unset` operators on that specified group.
- The `isset` and `isnotset` operators evaluate for the specified state regardless of whether the state is in a group.
- During intrusion policy saves, intrusion policy reapplies, and access control policy applies (regardless of whether the access control policy references one intrusion policy or multiple intrusion policies), if you enable a rule that contains the `isset` or `isnotset` operator **without** a specified group, and you do not enable at least one rule that affects `flowbits` assignment (`set`, `setx`, `unset`, `toggle`) for the corresponding state name and protocol, all rules that affect `flowbits` assignment for the corresponding state name are enabled.
- During intrusion policy saves, intrusion policy reapplies, and access control policy applies (regardless of whether the access control policy references one intrusion policy or multiple intrusion policies), if you enable a rule that contains the `isset` or `isnotset` operator **with** a specified group, all rules that affect `flowbits` assignment (`set`, `setx`, `unset`, `toggle`) and define a corresponding group name are also enabled.

## flowbits Keyword Examples

This section provides three examples that use the `flowbits` keyword.

### flowbits Keyword Example: A Configuration Using `state_name`

This is an example of a `flowbits` configuration using `state_name`.

Consider the IMAP vulnerability described in CVE ID 2000-0284. This vulnerability exists in an implementation of IMAP, specifically in the `LIST`, `LSUB`, `RENAME`, `FIND`, and `COPY` commands. However, to take advantage of the vulnerability, the attacker must be logged into the IMAP server. Because the `LOGIN` confirmation from the IMAP server and the exploit that follows are necessarily in different packets, it is difficult to construct non-flow-based rules that catch this exploit. Using the `flowbits` keyword, you can construct a series of rules that track whether the user is logged into the IMAP server and, if so, generate an event if one of the attacks is detected. If the user is not logged in, the attack cannot exploit the vulnerability and no event is generated.

The two rule fragments that follow illustrate this example. The first rule fragment looks for an IMAP login confirmation from the IMAP server:

```
alert tcp any 143 -> any any (msg:"IMAP login"; content:"OK
LOGIN"; flowbits:set,logged_in; flowbits:noalert;)
```

The following diagram illustrates the effect of the `flowbits` keyword in the preceding rule fragment:

371863

Note that `flowbits:set` sets a state of `logged_in`, while `flowbits:noalert` suppresses the alert because you are likely to see many innocuous login sessions on an IMAP server.

The next rule fragment looks for a LIST string, but does not generate an event unless the `logged_in` state has been set as a result of some previous packet in the session:

```

alert tcp any any -> any 143 (msg:"IMAP LIST";
content:"LIST"; flowbits:isset,logged_in;)

```

The following diagram illustrates the effect of the `flowbits` keyword in the preceding rule fragment:

371863

In this case, if a previous packet has caused a rule containing the first fragment to trigger, then a rule containing the second fragment triggers and generates an event.

**flowbits Keyword Example: A Configuration Resulting in False Positive Events**

Including different state names that are set in different rules in a group can prevent false positive events that might otherwise occur when content in a subsequent packet matches a rule whose state is no longer valid. The following example illustrates how you can get false positives when you do not include multiple state names in a group.

Consider the case where the following three rule fragments trigger in the order shown during a single session:

```
(msg:"JPEG transfer";
content:"image/";pcre:"/^Content-Type\x3a(\s*|\s*\r?\n\s+)image\x2fp?jpe?g/smi";
?flowbits:set,http.jpeg; flowbits:noalert;)
```

The following diagram illustrates the effect of the `flowbits` keyword in the preceding rule fragment:

The `content` and `pcrc` keywords in the first rule fragment match a JPEG file download, `flowbits:set,http.jpeg` sets the `http.jpeg` flowbits state, and `flowbits:noalert` stops the rule from generating events. No event is generated because the rule's purpose is to detect the file download and set the flowbits state so one or more companion rules can test for the state name in combination with malicious content and generate events when malicious content is detected.

The next rule fragment detects a GIF file download subsequent to the JPEG file download above:

```
(msg:"GIF transfer"; content:"image/";
pcrc:"/^Content-Type\x3a(\s*|\s*\r?\n\s+)image\x2fgif/smi";
?flowbits:set,http.jpg,image_downloads; flowbits:noalert;)
```

The following diagram illustrates the effect of the `flowbits` keyword in the preceding rule fragment:

The `content` and `pcrc` keywords in the second rule match the GIF file download, `flowbits:set,http.jpg` sets the `http.jpg` flowbit state, and `flowbits:noalert` stops the rule from generating an event. Note that the `http.jpeg` state set by the first rule fragment is still set even though it is no longer needed; this is because the JPEG download must have ended if a subsequent GIF download has been detected.

The third rule fragment is a companion to the first rule fragment:

```
(msg:"JPEG exploit";?flowbits:isset,http.jpeg;content:"|FF|";
pcrc:"?/\xFF[\xE1\xE2\xED\xFE]\x00[\x00\x01]/");
```

The following diagram illustrates the effect of the `flowbits` keyword in the preceding rule fragment:

In the third rule fragment, `flowbits:isset,http.jpeg` determines that the now-irrelevant `http.jpeg` state is set, and `content` and `pcrc` match content that would be malicious in a JPEG file but not in a GIF file. The third rule fragment results in a false positive event for a nonexistent exploit in a JPEG file.

## flowbits Keyword Example: A Configuration for Preventing False Positive Events

The following example illustrates how including state names in a group and using the `setx` operator can prevent false positives.

Consider the same case as the previous example, except that the first two rules now include their two different state names in the same state group.

```
(msg:"JPEG transfer";
content:"image/";pcr:"/^Content-Type\x3a(\s*|\s*\r?\n\s+)image\x2fp?jpe?g/smi";
?flowbits:setx,http.jpeg,image_downloads; flowbits:noalert;)
```

The following diagram illustrates the effect of the `flowbits` keyword in the preceding rule fragment:

When the first rule fragment detects a JPEG file download, the `flowbits:setx,http.jpeg,image_downloads` keyword sets the `flowbits` state to `http.jpeg` and includes the state in the `image_downloads` group.

The next rule then detects a subsequent GIF file download:

```
(msg:"GIF transfer"; content:"image/";
pcr:"/^Content-Type\x3a(\s*|\s*\r?\n\s+)image\x2fgif/smi";
?flowbits:setx,http.jpg,image_downloads; flowbits:noalert;)
```

The following diagram illustrates the effect of the `flowbits` keyword in the preceding rule fragment:

When the second rule fragment matches the GIF download, the `flowbits:setx,http.jpg,image_downloads` keyword sets the `http.jpg` `flowbits` state and unsets `http.jpeg`, the other state in the group.

The third rule fragment does not result in a false positive:

```
(msg:"JPEG exploit"; ?flowbits:isset,http.jpeg;content:"|FF|";
pcr:"/?\xFF[\xE1\xE2\xED\xFE]\x00[\x00\x01]/");)
```

The following diagram illustrates the effect of the `flowbits` keyword in the preceding rule fragment:

Because `flowbits:isset,http.jpeg` is false, the rules engine stops processing the rule and no event is generated, thus avoiding a false positive even in a case where content in the GIF file matches exploit content for a JPEG file.

## The http\_encode Keyword

You can use the `http_encode` keyword to generate events on the type of encoding in an HTTP request or response before normalization, either in the HTTP URI, in non-cookie data in an HTTP header, in cookies in HTTP requests headers, or set-cookie data in HTTP responses.

You must configure the HTTP Inspect preprocessor to inspect HTTP responses and HTTP cookies to return matches for rules using the `http_encode` keyword.

Also, you must enable both the decoding and alerting option for each specific encoding type in your HTTP Inspect preprocessor configuration so the `http_encode` keyword in an intrusion rule can trigger events on that encoding type.

The following table describes the encoding types this option can generate events for in HTTP URIs, headers, cookies, and set-cookies:

**Table 185: http\_encode Encoding Types**

| Encoding Type | Description                                                                                                                                  |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| utf8          | Detects UTF-8 encoding in the specified location when this encoding type is enabled for decoding by the HTTP Inspect preprocessor.           |
| double_encode | Detects double encoding in the specified location when this encoding type is enabled for decoding by the HTTP Inspect preprocessor.          |
| non_ascii     | Detects non-ASCII characters in the specified location when non-ASCII characters are detected but the detected encoding type is not enabled. |
| uencode       | Detects Microsoft %u encoding in the specified location when this encoding type is enabled for decoding by the HTTP Inspect preprocessor.    |
| bare_byte     | Detects bare byte encoding in the specified location when this encoding type is enabled for decoding by the HTTP Inspect preprocessor.       |

## http\_encode Keyword Syntax

### Encoding Location

Specifies whether to search for the specified encoding type in an HTTP URI, header, or cookie, including a set-cookie.

### Encoding Type

Specifies one or more encoding types using one of the following formats:

```
encode_type
encode_type|encode_type|encode_type...
```

where `encode_type` is one of the following:

```
utf8
double_encode
non_ascii
uencode
bare_byte.
```

Note that you cannot use the negation (!) and OR (|) operators together.

## http\_encode Keyword example: Using Two http\_encode Keywords to Search for Two Encodings

The following example uses two `http_encode` keywords in the same rule to search the HTTP URI for UTF-8 AND Microsoft IIS %u encoding:

First, the `http_encode` keyword:

- **Encoding Location:** HTTP URI
- **Encoding Type:** utf8

Then, the additional `http_encode` keyword:

- **Encoding Location:** HTTP URI
- **Encoding Type:** uencode

## Overview: The file\_type and file\_group Keywords

The `file_type` and `file_group` keywords allow you to detect files transmitted via FTP, HTTP, SMTP, IMAP, POP3, and NetBIOS-ssn (SMB) based on their type and version. Do **not** use more than one `file_type` or `file_group` keyword in a single intrusion rule.

---

**Tip** Updating your vulnerability database (VDB) populates the intrusion rules editor with the most up-to-date file types, versions, and groups.

---

**Note** The system does not automatically enable preprocessors to accommodate the `file_type` and `file_group` keywords.

You **must** enable specific preprocessors if you want to generate events and, in an inline deployment, drop offending packets for traffic matching your `file_type` or `file_group` keywords.

**Table 186: file\_type and file\_group Intrusion Event Generation**

| Protocol          | Required Preprocessor or Preprocessor Option                                                          |
|-------------------|-------------------------------------------------------------------------------------------------------|
| FTP               | FTP/Telnet preprocessor and the <b>Normalize TCP Payload</b> inline normalization preprocessor option |
| HTTP              | HTTP Inspect preprocessor to generate intrusion events in HTTP traffic                                |
| SMTP              | SMTP preprocessor to generate intrusion events in HTTP traffic                                        |
| IMAP              | IMAP preprocessor                                                                                     |
| POP3              | POP preprocessor                                                                                      |
| Netbios-ssn (SMB) | The DCE/RPC preprocessor and the <b>SMB File Inspection</b> DCE/RPC preprocessor option               |

## The file\_type and file\_group Keywords

### file\_type

The `file_type` keyword allows you to specify the file type and version of a file detected in traffic. File type arguments (for example, **JPEG** and **PDF**) identify the format of the file you want to find in traffic.

**Note** Do **not** use the `file_type` keyword with another `file_type` or `file_group` keyword in the same intrusion rule.

The system selects **Any Version** by default, but some file types allow you to select version options (for example, PDF version **1.7**) to identify specific file type versions you want to find in traffic.

### file\_group

The `file_group` keyword allows you to select a Cisco-defined group of similar file types to find in traffic (for example, **multimedia** or **audio**). File groups also include Cisco-defined versions for each file type in the group.

---

**Note** Do **not** use the `file_group` keyword with another `file_group` or `file_type` keyword in the same intrusion rule.

---

## The file\_data Keyword

The `file_data` keyword provides a pointer that serves as a reference for the positional arguments available for other keywords such as `content`, `byte_jump`, `byte_test`, and `pcre`. The detected traffic determines the type of data the `file_data` keyword points to. You can use the `file_data` keyword to point to the beginning of the following payload types:

- HTTP response body

To inspect HTTP response packets, the HTTP Inspect preprocessor must be enabled and you must configure the preprocessor to inspect HTTP responses. The `file_data` keyword matches if the HTTP Inspect preprocessor detects HTTP response body data.

- Uncompressed gzip file data

To inspect uncompressed gzip files in the HTTP response body, the HTTP Inspect preprocessor must be enabled and you must configure the preprocessor to inspect HTTP responses and to decompress gzip-compressed files in the HTTP response body. For more information, see the **Inspect HTTP Responses** and **Inspect Compressed Data** Server-Level HTTP Normalization options. The `file_data` keyword matches if the HTTP Inspect preprocessor detects uncompressed gzip data in the HTTP response body.

- Normalized JavaScript

To inspect normalized JavaScript data, the HTTP Inspect preprocessor must be enabled and you must configure the preprocessor to inspect HTTP responses. The `file_data` keyword matches if the HTTP Inspect preprocessor detects JavaScript in response body data.

- SMTP payload

To inspect the SMTP payload, the SMTP preprocessor must be enabled. The `file_data` keyword matches if the SMTP preprocessor detects SMTP data.

- Encoded email attachments in SMTP, POP, or IMAP traffic

To inspect email attachments in SMTP, POP, or IMAP traffic, the SMTP, POP, or IMAP preprocessor, respectively, must be enabled, alone or in any combination. Then, for each enabled preprocessor, you must ensure that the preprocessor is configured to decode each attachment encoding type that you want decoded. The attachment decoding options that you can configure for each preprocessor are: **Base64 Decoding Depth**, **7-Bit/8-Bit/Binary Decoding Depth**, **Quoted-Printable Decoding Depth**, and **Unix-to-Unix Decoding Depth**.

You can use multiple `file_data` keywords in a rule.

- [The IMAP Preprocessor](#), on page 1730

## The `pkt_data` Keyword

The `pkt_data` keyword provides a pointer that serves as a reference for the positional arguments available for other keywords such as `content`, `byte_jump`, `byte_test`, and `pcre`.

When normalized FTP, telnet, or SMTP traffic is detected, the `pkt_data` keyword points to the beginning of the normalized packet payload. When other traffic is detected, the `pkt_data` keyword points to the beginning of the raw TCP or UDP payload.

The following normalization options must be enabled for the system to normalize the corresponding traffic for inspection by intrusion rules:

- Enable the FTP & Telnet preprocessor **Detect Telnet Escape codes within FTP commands** option to normalize FTP traffic for inspection.
- Enable the FTP & Telnet preprocessor **Normalize** telnet option to normalize telnet traffic for inspection.
- Enable the SMTP preprocessor **Normalize** option to normalize SMTP traffic for inspection.

You can use multiple `pkt_data` keywords in a rule.

## The `base64_decode` and `base64_data` Keywords

You can use the `base64_decode` and `base64_data` keywords in combination to instruct the rules engine to decode and inspect specified data as Base64 data. This can be useful, for example, for inspecting Base64-encoded HTTP Authentication request headers and Base64-encoded data in HTTP PUT and POST requests.

These keywords are particularly useful for decoding and inspecting Base64 data in HTTP requests. However, you can also use them with any protocol such as SMTP that uses the space and tab characters the same way HTTP uses these characters to extend a lengthy header line over multiple lines. When this line extension, which is known as folding, is not present in a protocol that uses it, inspection ends at any carriage return or line feed that is not followed with a space or tab.

**`base64_decode`**

The `base64_decode` keyword instructs the rules engine to decode packet data as Base64 data. Optional arguments let you specify the number of bytes to decode and where in the data to begin decoding.

You can use the `base64_decode` keyword once in a rule; it must precede at least one instance of the `base64_data` keyword.

Before decoding Base64 data, the rules engine unfolds lengthy headers that are folded across multiple lines. Decoding ends when the rules engine encounters any the following:

- the end of a header line
- the specified number of bytes to decode
- the end of the packet

The following table describes the arguments you can use with the `base64_decode` keyword.

**Table 187: Optional base64\_decode Arguments**

| Argument | Description                                                                                                                                                                                                      |
|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Bytes    | Specifies the number of bytes to decode. When not specified, decoding continues to the end of a header line or the end of the packet payload, whichever comes first. You can specify a positive, non-zero value. |
| Offset   | Determines the offset relative to the start of the packet payload or, when you also specify <b>Relative</b> , relative to the current inspection location. You can specify a positive, non-zero value.           |
| Relative | Specifies inspection relative to the current inspection location.                                                                                                                                                |

### base64\_data

The `base64_data` keyword provides a reference for inspecting Base64 data decoded using the `base64_decode` keyword. The `base64_data` keyword sets inspection to begin at the start of the decoded Base64 data. Optionally, you can then use the positional arguments available for other keywords such as `content` or `byte_test` to further specify the location to inspect.

You must use the `base64_data` keyword at least once after using the `base64_decode` keyword; optionally, you can use `base64_data` multiple times to return to the beginning of the decoded Base64 data.

Note the following when inspecting Base64 data:

- You cannot use the fast pattern matcher.
- If you interrupt Base64 inspection in a rule with an intervening HTTP content argument, you must insert another `base64_data` keyword in the rule before further inspecting Base64 data.

- [Configuring Intrusion Performance Statistic Logging, on page 1666](#)

## About Intrusion Prevention Performance Tuning

Cisco provides several features for improving the performance of your system as it analyzes traffic for attempted intrusions. You can:

- specify the number of packets to allow in the event queue. You can also, before and after stream reassembly, enable or disable inspection of packets that will be rebuilt into larger streams.
- override default match and recursion limits on PCRE that are used in intrusion rules to examine packet payload content.
- elect to have the rules engine log more than one event per packet or packet stream when multiple events are generated, allowing you to collect information beyond the reported event.
- balance security with the need to maintain device latency at an acceptable level with packet and rule latency thresholding.
- configure the basic parameters of how devices monitor and report their own performance. This allows you to specify the intervals at which the system updates performance statistics on your devices.

You configure these performance settings on a per-access-control-policy basis, and they apply to all intrusion policies invoked by that parent access control policy.

# Limiting Pattern Matching for Intrusions

## Procedure

---

- Step 1** In the access control policy editor, click **Advanced**.
- Step 2** Click **Edit** () next to **Performance Settings**.
- If **View** () appears instead, settings are inherited from an ancestor policy, or you do not have permission to modify the settings. If the configuration is unlocked, uncheck **Inherit from base policy** to enable editing.
- Step 3** Click **Pattern Matching Limits** in the **Performance Settings** pop-up window.
- Step 4** Enter a value for the maximum number of events to queue in the **Maximum Pattern States to Analyze Per Packet** field.

- Step 5** To disable the inspection of packets that will be rebuilt into larger streams of data before and after stream reassembly, check the **Disable Content Checks on Traffic Subject to Future Reassembly** check box. Inspection before and after reassembly requires more processing overhead and may decrease performance.
- Step 6** Click **OK**.
- Step 7** Click **Save** to save the policy.

---

#### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## Regular Expression Limits Overrides for Intrusion Rules

The default regular expression limits ensure a minimum level of performance. Overriding these limits could increase security, but could also significantly impact performance by permitting packet evaluation against inefficient regular expressions.

**Caution** Do not override default PCRE limits unless you are an experienced intrusion rule writer with knowledge of the impact of degenerative patterns.

---

*Table 188: Regular Expression Constraint Options*

| Option                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Match Limit State           | Specifies whether to override <b>Match Limit</b> . You have the following options: <ul style="list-style-type: none"> <li>• select <b>Default</b> to use the value configured for <b>Match Limit</b></li> <li>• select <b>Unlimited</b> to permit an unlimited number of attempts</li> <li>• select <b>Custom</b> to specify either a limit of 1 or greater for <b>Match Limit</b>, or to specify 0 to completely disable PCRE match evaluations</li> </ul>                                                                                                                                          |
| Match Limit                 | Specifies the number of times to attempt to match a pattern defined in a PCRE regular expression.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Match Recursion Limit State | Specifies whether to override <b>Match Recursion Limit</b> . You have the following options: <ul style="list-style-type: none"> <li>• select <b>Default</b> to use the value configured for <b>Match Recursion Limit</b></li> <li>• select <b>Unlimited</b> to permit an unlimited number of recursions</li> <li>• select <b>Custom</b> to specify either a limit of 1 or greater for <b>Match Recursion Limit</b>, or to specify 0 to completely disable PCRE recursions</li> </ul> <p>Note that for <b>Match Recursion Limit</b> to be meaningful, it must be smaller than <b>Match Limit</b>.</p> |

| Option                | Description                                                                                              |
|-----------------------|----------------------------------------------------------------------------------------------------------|
| Match Recursion Limit | Specifies the number of recursions when evaluating a PCRE regular expression against the packet payload. |

## Overriding Regular Expression Limits for Intrusion Rules

**Procedure**

- 
- Step 1** In the access control policy editor, click **Advanced**.
- Step 2** Click **Edit** () next to **Performance Settings**.  
If **View** () appears instead, settings are inherited from an ancestor policy, or you do not have permission to modify the settings. If the configuration is unlocked, uncheck **Inherit from base policy** to enable editing.
- Step 3** Click **Regular Expression Limits** in the **Performance Settings** pop-up window.
- Step 4** You can modify any of the options as described in [Regular Expression Limits Overrides for Intrusion Rules](#), on page 1657.
- Step 5** Click **OK**.
- Step 6** Click **Save** to save the policy.
- 

**What to do next**

- Deploy configuration changes; see [Deploy Configuration Changes](#), on page 346.

## Per Packet Intrusion Event Generation Limits

When the intrusion rules engine evaluates traffic against rules, it places the events generated for a given packet or packet stream in an event queue, then reports the top events in the queue to the user interface. When configuring the intrusion event logging limits, you can specify how many events can be placed in the queue and how many are logged, and select the criteria for determining event order within the queue.

*Table 189: Intrusion Event Logging Limits Options*

| Option                           | Description                                                                                                                            |
|----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------|
| Maximum Events Stored Per Packet | The maximum number of events that can be stored for a given packet or packet stream.                                                   |
| Maximum Events Logged Per Packet | The number of events logged for a given packet or packet stream. This cannot exceed the <b>Maximum Events Stored Per Packet</b> value. |

| Option                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Prioritize Event Logging By | The value used to determine event ordering within the event queue. The highest ordered event is reported through the user interface. You can select from: <ul style="list-style-type: none"> <li><code>priority</code>, which orders events in the queue by the event priority.</li> <li><code>content_length</code>, which orders events by the longest identified content match. When events are ordered by content length, rule events always take precedence over decoder and preprocessor events.</li> </ul> |

## Limiting Intrusion Events Generated Per Packet

### Procedure

**Step 1** In the access control policy editor, click **Advanced**.

**Step 2** Click **Edit** () next to **Performance Settings**.

If **View** () appears instead, settings are inherited from an ancestor policy, or you do not have permission to modify the settings. If the configuration is unlocked, uncheck **Inherit from base policy** to enable editing.

**Step 3** Click **Intrusion Event Logging Limits** in the **Performance Settings** pop-up window.

**Step 4** You can modify any of the options in [Per Packet Intrusion Event Generation Limits, on page 1658](#).

**Step 5** Click **OK**.

**Step 6** Click **Save** to save the policy.

### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## Packet and Intrusion Rule Latency Threshold Configuration

Each access control policy has latency-based settings that use thresholding to manage packet and rule processing performance.

Packet latency thresholding measures the total elapsed time taken to process a packet by applicable decoders, preprocessors, and rules, and ceases inspection of the packet if the processing time exceeds a configurable threshold.

Rule latency thresholding measures the elapsed time each rule takes to process an individual packet, suspends the violating rule along with a group of related rules for a specified time if the processing time exceeds the rule latency threshold a configurable consecutive number of times, and restores the rules when the suspension expires.

## Latency-Based Performance Settings

By default, the system takes latency-based performance settings from the latest intrusion rule update deployed on your system.

The latency settings that are actually applied depend on the security level of the network analysis policy (NAP) associated with the access control policy. Generally, this is the default NAP policy. However, if custom network analysis rules are configured, and if any of these specify a NAP policy that is more secure than the default NAP policy, then latency settings are based on the most secure NAP policy among the custom rules. If the default NAP policy or any custom rules invoke a custom NAP policy, then the security level used in the evaluation is the system-provided base policy on which each custom NAP policy is based.

The above is true regardless of whether the effective threshold and/or network analysis configurations are inherited or configured directly in the policy.

## Packet Latency Thresholding

Packet latency thresholding measures elapsed time, not just processing time, in order to more accurately reflect the actual time required for the rule to process a packet. However, latency thresholding is a software-based latency implementation that does not enforce strict timing.

The trade-off for the performance and latency benefits derived from latency thresholding is that uninspected packets could contain attacks. A timer starts for each packet when decoder processing begins. Timing continues either until all processing ends for the packet or until the processing time exceeds the threshold at a timing test point.

As illustrated in the above figure, packet latency timing is tested at the following test points:

- after the completion of all decoder and preprocessor processing and before rule processing begins
- after processing by each rule

If the processing time exceeds the threshold at any test point, packet inspection ceases.

**Tip** Total packet processing time does not include routine TCP stream or IP fragment reassembly times.

Packet latency thresholding has no effect on events triggered by a decoder, preprocessor, or rule processing the packet. Any applicable decoder, preprocessor, or rule triggers normally until a packet is fully processed,

or until packet processing ends because the latency threshold is exceeded, whichever comes first. If a drop rule detects an intrusion in an inline deployment, the drop rule triggers an event and the packet is dropped.

**Note** No packets are evaluated against rules after processing for that packet ceases because of a packet latency threshold violation. A rule that would have triggered an event cannot trigger that event, and for drop rules, cannot drop the packet.

Packet latency thresholding can improve system performance in both passive and inline deployments, and can reduce latency in inline deployments, by stopping inspection of packets that require excessive processing time. These performance benefits might occur when, for example:

- for both passive and inline deployments, sequential inspection of a packet by multiple rules requires an excessive amount of time
- for inline deployments, a period of poor network performance, such as when someone downloads an extremely large file, slows packet processing

In a passive deployment, stopping the processing of packets might not contribute to restoring network performance because processing simply moves to the next packet.

## Packet Latency Thresholding Notes

By default, latency-based performance settings for both packet and rule handling are automatically populated by the latest deployed intrusion rule update, and Cisco recommends that you do not change the default.

The information in this topic applies only if you choose to specify custom values.

**Table 190: Packet Latency Thresholding Option**

| Option                   | Description                                                              |
|--------------------------|--------------------------------------------------------------------------|
| Threshold (microseconds) | Specifies the time, in microseconds, when inspection of a packet ceases. |

You can enable rule 134:3 to generate an event and, in an inline deployment, drop offending packets when the system stops inspecting a packet because the packet latency threshold is exceeded. For more information, see [Intrusion Rule State Options, on page 1503](#).

## Configuring Packet Latency Thresholding

**Note** By default, latency-based performance settings for both packet and rule handling are automatically populated by the latest deployed intrusion rule update, and Cisco recommends that you do not change the default.

### Procedure

- Step 1** In the access control policy editor, click **Advanced**.
- Step 2** Click **Edit** () next to **Latency-Based Performance Settings**.

**System > Monitoring > Statistics**

- Step 3** If the configuration is unlocked, uncheck **Inherit from base policy** to enable editing.
- Step 4** Click **Packet Handling** in the **Latency-Based Performance Settings** pop-up window.
- By default, **Installed Rule Update** is selected. Cisco recommends using this default.
- The values displayed do not reflect the automated settings.
- Step 5** If you choose to specify custom values:
- See [Packet Latency Thresholding Notes, on page 1661](#) for recommended minimum **Threshold** settings.
  - You must specify custom values in both the packet handling tab and the rule handling tab.
- Step 6** Click **OK**.
- Step 7** Click **Save** to save the policy.
- 

**What to do next**

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## Rule Latency Thresholding

Rule latency thresholding measures elapsed time, not just processing time, in order to more accurately reflect the actual time required for the rule to process a packet. However, latency thresholding is a software-based latency implementation that does not enforce strict timing.

The trade-off for the performance and latency benefits derived from latency thresholding is that uninspected packets could contain attacks. A timer measures the processing time each time a packet is processed against a group of rules. Any time the rule processing time exceeds a specified rule latency threshold, the system increments a counter. If the number of consecutive threshold violations reaches a specified number, the system takes the following actions:

- suspends the rules for the specified period
- triggers an event indicating the rules have been suspended
- re-enables the rules when the suspension expires
- triggers an event indicating the rules have been re-enabled

The system zeroes the counter when the group of rules has been suspended, or when rule violations are not consecutive. Permitting some consecutive violations before suspending rules lets you ignore occasional rule violations that might have negligible impact on performance and focus instead on the more significant impact of rules that repeatedly exceed the rule latency threshold.

The following example shows five consecutive rule processing times that do not result in rule suspension.

In the above example, the time required to process each of the first three packets violates the rule latency threshold of 1000 microseconds, and the violations counter increments with each violation. Processing of the fourth packet does not violate the threshold, and the violations counter resets to zero. The fifth packet violates the threshold and the violations counter restarts at one.

The following example shows five consecutive rule processing times that do result in rule suspension.

In the second example, the time required to process each of the five packets violates the rule latency threshold of 1000 microseconds. The group of rules is suspended because the rule processing time of 1100 microseconds for each packet violates the threshold of 1000 microseconds for the specified five consecutive violations. Any subsequent packets, represented in the figure as packets 6 through n, are not examined against suspended rules until the suspension expires. If more packets occur after the rules are re-enabled, the violations counter begins again at zero.

Rule latency thresholding has no effect on intrusion events triggered by the rules processing the packet. A rule triggers an event for any intrusion detected in the packet, regardless of whether the rule processing time exceeds the threshold. If the rule detecting the intrusion is a drop rule in an inline deployment, the packet is dropped. When a drop rule detects an intrusion in a packet that results in the rule being suspended, the drop rule triggers an intrusion event, the packet is dropped, and that rule and all related rules are suspended.

**Note** Packets are not evaluated against suspended rules. A suspended rule that would have triggered an event cannot trigger that event and, for drop rules, cannot drop the packet.

Rule latency thresholding can improve system performance in both passive and inline deployments, and can reduce latency in inline deployments, by suspending rules that take the most time to process packets. Packets are not evaluated again against suspended rules until a configurable time expires, giving the overloaded device time to recover. These performance benefits might occur when, for example:

- hastily written, largely untested rules require an excessive amount of processing time
- a period of poor network performance, such as when someone downloads an extremely large file, causes slow packet inspection

## Rule Latency Thresholding Notes

By default, latency-based performance settings for both packet and rule handling are automatically populated by the latest deployed intrusion rule update, and Cisco recommends that you do not change the default.

The information in this topic applies only if you choose to specify custom values.

Rule latency thresholding suspends rules for the time specified by **Suspension Time** when the time rules take to process a packet exceeds **Threshold** for the consecutive number of times specified by **Consecutive Threshold Violations Before Suspending Rule**.

You can enable rule 134:1 to generate an event when rules are suspended, and rule 134:2 to generate an event when suspended rules are enabled. See [Intrusion Rule State Options, on page 1503](#).

**Table 191: Rule Latency Thresholding Options**

| Option                                                  | Description                                                                                                                                           |
|---------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| Threshold                                               | Specifies the time in microseconds that rules should not exceed when examining a packet.                                                              |
| Consecutive Threshold Violations Before Suspending Rule | Specifies the consecutive number of times rules can take longer than the time set for <b>Threshold</b> to inspect packets before rules are suspended. |
| Suspension Time                                         | Specifies the number of seconds to suspend a group of rules.                                                                                          |

## Configuring Rule Latency Thresholding

**Note** By default, latency-based performance settings for both packet and rule handling are automatically populated by the latest deployed intrusion rule update, and Cisco recommends that you do not change the default.

### Procedure

- Step 1** In the access control policy editor, click **Advanced**.
- Step 2** Click **Edit** (  ) next to **Latency-Based Performance Settings**.  
If **View** (  ) appears instead, settings are inherited from an ancestor policy, or you do not have permission to modify the settings. If the configuration is unlocked, uncheck **Inherit from base policy** to enable editing.
- Step 3** Click **Rule Handling** in the **Latency-Based Performance Settings** pop-up window.  
By default, **Installed Rule Update** is selected. Cisco recommends using this default.  
The values displayed do not reflect the automated settings.
- Step 4** If you choose to specify custom values:
  - You can configure any of the options in [Rule Latency Thresholding Notes, on page 1664](#).
  - You must specify custom values in both the packet handling tab and the rule handling tab.

- Step 5** Click **OK**.
- Step 6** Click **Save** to save the policy.
- 

#### What to do next

- If you want to generate events, enable latency rules 134:1 and 134:2. For more information, see [Intrusion Rule State Options, on page 1503](#).
- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## Intrusion Performance Statistic Logging Configuration

#### Sample time (seconds) and Minimum number of packets

When the number of seconds specified elapses between performance statistics updates, the system verifies it has analyzed the specified number of packets. If it has, the system updates performance statistics. Otherwise, the system waits until it analyzes the specified number of packets.

#### Troubleshooting Options: Log Session/Protocol Distribution

Support might ask you during a troubleshooting call to log protocol distribution, packet length, and port statistics.

---

**Caution** Do not enable **Log Session/Protocol Distribution** unless instructed to by Support. Note that enabling or disabling **Log Session/Protocol Distribution** restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See [Snort® Restart Traffic Behavior, on page 350](#) for more information.

---

#### Troubleshooting Options: Summary

Support might ask you during a troubleshooting call to configure the system to calculate the performance statistics only when the Snort process is shut down or restarted. To enable this option, you must also enable the **Log Session/Protocol Distribution** troubleshooting option.

---

**Caution** Do not enable **Summary** unless instructed to do so by Support.

---

# Configuring Intrusion Performance Statistic Logging

## Procedure

---

- Step 1** In the access control policy editor, click **Advanced**, then click **Edit** () next to **Performance Settings**.  
If **View** () appears instead, settings are inherited from an ancestor policy, or you do not have permission to modify the settings. If the configuration is unlocked, uncheck **Inherit from base policy** to enable editing.
- Step 2** Click **Performance Statistics** in the pop-up window that appears.
- Step 3** Modify the **Sample time** or **Minimum number of packets** as described above.
- Step 4** Optionally, expand the **Troubleshoot Options** section and modify those options only if asked to do so by Support.
- Caution** Enabling or disabling **Log Session/Protocol Distribution** restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See [Snort® Restart Traffic Behavior, on page 350](#) for more information.
- Step 5** Click **OK**.
- 

## What to do next

# Advanced Access Control Settings for Network Analysis and Intrusion Policies

---

The following topics describe how to configure advanced settings for network analysis and intrusion policies:

- [About Advanced Access Control Settings for Network Analysis and Intrusion Policies, on page 1669](#)
- [Requirements and Prerequisites for Advanced Access Control Settings for Network Analysis and Intrusion Policies, on page 1669](#)
- [Inspection of Packets That Pass Before Traffic Is Identified, on page 1670](#)
- [Advanced Settings for Network Analysis Policies, on page 1672](#)

## About Advanced Access Control Settings for Network Analysis and Intrusion Policies

Many of the advanced settings in an access control policy govern intrusion detection and prevention configurations that require specific expertise to configure. Advanced settings typically require little or no modification and are not common to every deployment.

## Requirements and Prerequisites for Advanced Access Control Settings for Network Analysis and Intrusion Policies

### Model Support

Any.

### Supported Domains

- Network Admin

## Inspection of Packets That Pass Before Traffic Is Identified

For some features, including URL filtering, application detection, rate limiting, and Intelligent Application Bypass, a few packets must pass in order for the connection to be established, and to enable the system to identify the traffic and determine which access control rule (if any) will handle that traffic.

You must explicitly configure your access control policy to inspect these packets, prevent them from reaching their destination, and generate any events. See [Specify a Policy to Handle Packets That Pass Before Traffic Identification, on page 1670](#).

As soon as the system identifies the access control rule or default action that should handle the connection, the remaining packets in the connection are handled and inspected accordingly.

### Best Practices for Handling Packets That Pass Before Traffic Identification

- The default action specified for an access control policy is NOT applied to these packets.
- Instead, use the following guidelines to choose a value for the **Intrusion Policy used before Access Control rule is determined** setting in the Advanced settings of the access control policy.
  - You can choose a system-created or custom intrusion policy. For example, you can choose **Balanced Security and Connectivity**.
  - For performance reasons, unless you have good reason to do otherwise, this setting should match the default action set for your access control policy.
  - If your system does not perform intrusion inspection (for example, in a discovery-only deployment), select **No Rules Active**. The system will not inspect these initial packets, and they will be allowed to pass.
  - By default, this setting uses the default variable set. Ensure that this is suitable for your purposes. For information, see [Variable Sets, on page 412](#).
  - The network analysis policy associated with the first matching network analysis rule preprocesses traffic for the policy you select. If there are no network analysis rules, or none match, the default network analysis policy is used.

### Specify a Policy to Handle Packets That Pass Before Traffic Identification

---

**Note** This setting is sometimes referred to as the *default intrusion policy*. (This is distinct from the default action for an access control policy.)

---

**Caution**

Changing the total number of intrusion policies used by an access control policy restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See [Snort® Restart Traffic Behavior, on page 350](#) for more information. You change the the total number of intrusion policies by adding an intrusion policy that is not currently used, or by removing the last instance of an intrusion policy. You can use an intrusion policy in an access control rule, as the default action, or as the default intrusion policy.

**Before you begin**

Review best practices for these settings. See [Best Practices for Handling Packets That Pass Before Traffic Identification, on page 1670](#).

**Procedure**

**Step 1** In the access control policy editor, click **Advanced**, then click **Edit** () next to the **Network Analysis and Intrusion Policies** section.

If **View** () appears instead, settings are inherited from an ancestor policy, or you do not have permission to modify the settings. If the configuration is unlocked, uncheck **Inherit from base policy** to enable editing.

**Step 2** Select an intrusion policy from the **Intrusion Policy used before Access Control rule is determined** drop-down list.

If you choose a user-created policy, you can click **Edit** () to edit the policy in a new window. You cannot edit system-provided policies.

**Step 3** Optionally, select a different variable set from the **Intrusion Policy Variable Set** drop-down list. You can also select **Edit** () next to the variable set to create and edit variable sets. If you do not change the variable set, the system uses a default set.

**Step 4** Click **OK**.

**Step 5** Click **Save** to save the policy.

**What to do next**

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

**Related Topics**

[Variable Sets](#), on page 412

# Advanced Settings for Network Analysis Policies

*Network analysis policies* govern how traffic is decoded and preprocessed so that it can be further evaluated, especially for anomalous traffic that might signal an intrusion attempt. This traffic preprocessing occurs after Security Intelligence matching and traffic decryption, but before intrusion policies inspect packets in detail. By default, the system-provided Balanced Security and Connectivity network analysis policy is the default network analysis policy.

---

**Tip** The system-provided Balanced Security and Connectivity network analysis policy and the Balanced Security and Connectivity intrusion policy work together and can both be updated in intrusion rule updates. However, the network analysis policy governs mostly preprocessing options, whereas the intrusion policy governs mostly intrusion rules.

---

A simple way to tune preprocessing is to create and use a custom network analysis policy as the default. For advanced users with complex deployments, you can create multiple network analysis policies, each tailored to preprocess traffic differently. Then, you can configure the system to use those policies to govern the preprocessing of traffic using different security zones, networks, or VLANs.

To accomplish this, you add custom *network analysis rules* to your access control policy. A network analysis rule is simply a set of configurations and conditions that specifies how you preprocess traffic that matches those qualifications. You create and edit network analysis rules in the advanced options in an existing access control policy. Each rule belongs to only one policy.

Each rule has:

- a set of rule conditions that identifies the specific traffic you want to preprocess
- an associated network analysis policy that you want to use to preprocess traffic that meets all the rules' conditions

When it is time for the system to preprocess traffic, it matches packets to network analysis rules in top-down order by rule number. Traffic that does not match any network analysis rules is preprocessed by the default network analysis policy.

## Setting the Default Network Analysis Policy

You can choose a system- or user-created policy.

---

**Note** If you disable a preprocessor but the system needs to evaluate preprocessed packets against an enabled intrusion or preprocessor rule, the system automatically enables and uses the preprocessor although it remains disabled in the network analysis policy web interface. Tailoring preprocessing, especially using multiple custom network analysis policies, is an **advanced** task. Because preprocessing and intrusion inspection are so closely related, you **must** be careful that you allow the network analysis and intrusion policies examining a single packet to complement each other.

---

## Procedure

---

**Step 1** In the access control policy editor, click **Advanced**, then click **Edit** () next to the Network Analysis and Intrusion Policies section.

If **View** () appears instead, settings are inherited from an ancestor policy, or you do not have permission to modify the settings. If the configuration is unlocked, uncheck **Inherit from base policy** to enable editing.

**Step 2** From the **Default Network Analysis Policy** drop-down list, select a default network analysis policy.

If you choose a user-created policy, you can click **Edit** () to edit the policy in a new window. You cannot edit system-provided policies.

**Caution** Changing the total number of network analysis policies used by an access control policy restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See [Snort® Restart Traffic Behavior, on page 350](#) for more information. You change the total number of network analysis policies by adding a policy that is not currently used, or by removing the last instance of a network analysis policy. You can use a network analysis policy with network analysis rules or as the default network analysis policy.

**Step 3** Click **OK**.

**Step 4** Click **Save** to save the policy.

---

### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

### Related Topics

[Limitations of Custom Policies, on page 1457](#)

## Network Analysis Rules

Within your access control policy's advanced settings, you can use network analysis rules to tailor preprocessing configurations to network traffic.

Network analysis rules are numbered, starting at 1. When it is time for the system to preprocess traffic, it matches packets to network analysis rules in top-down order by ascending rule number, and preprocesses traffic according to the first rule where all the rule's conditions match.

You can add zone, network, and VLAN tag conditions to a rule. If you do not configure a particular condition for a rule, the system does not match traffic based on that criterion. For example, a rule with a network condition but no zone condition evaluates traffic based on its source or destination IP address, regardless of its ingress or egress interface. Traffic that does not match any network analysis rules is preprocessed by the default network analysis policy.

## Configuring Network Analysis Rules

### Procedure

---

**Step 1** In the access control policy editor, click **Advanced**, then click **Edit** () next to the Network Analysis and Intrusion Policies section.

If **View** () appears instead, settings are inherited from an ancestor policy, or you do not have permission to modify the settings. If the configuration is unlocked, uncheck **Inherit from base policy** to enable editing.

**Tip** Click **Network Analysis Policy List** to view and edit existing custom network analysis policies.

**Step 2** Next to **Network Analysis Rules**, click the statement that indicates how many custom rules you have.

**Step 3** Click **Add Rule**.

**Step 4** Configure the rule's conditions by clicking the conditions you want to add; see [Rule Condition Types, on page 363](#).

**Step 5** Click **Network Analysis** and choose the **Network Analysis Policy** you want to use to preprocess the traffic matching this rule.

Click **Edit** () to edit a custom policy in a new window. You cannot edit system-provided policies.

**Caution** Changing the total number of network analysis policies used by an access control policy restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See [Snort® Restart Traffic Behavior, on page 350](#) for more information. You change the total number of network analysis policies by adding a policy that is not currently used, or by removing the last instance of a network analysis policy. You can use a network analysis policy with network analysis rules or as the default network analysis policy.

**Step 6** Click **Add**.

---

### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## Managing Network Analysis Rules

A network analysis rule is simply a set of configurations and conditions that specifies how you preprocess traffic that matches those qualifications. You create and edit network analysis rules in the advanced options in an existing access control policy. Each rule belongs to only one policy.

## Procedure

---

**Step 1** In the access control policy editor, click **Advanced**, then click **Edit** () next to the Intrusion and Network Analysis Policies section.

If **View** () appears instead, settings are inherited from an ancestor policy, or you do not have permission to modify the settings. If the configuration is unlocked, uncheck **Inherit from base policy** to enable editing.

**Step 2** Next to **Network Analysis Rules**, click the statement that indicates how many custom rules you have.

**Step 3** Edit your custom rules. You have the following options:

- To edit a rule's conditions, or change the network analysis policy invoked by the rule, click **Edit** () next to the rule.
- To change a rule's order of evaluation, click and drag the rule to the correct location. To select multiple rules, use the Shift and Ctrl keys.
- To delete a rule, click **Delete** () next to the rule.

**Tip** Right-clicking a rule displays a context menu that allows you to cut, copy, paste, edit, delete, and add new network analysis rules.

**Step 4** Click **OK**.

**Step 5** Click **Save** to save the policy.

---

## What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## CHAPTER 84

# Getting Started with Network Analysis Policies

The following topics describe how to get started with network analysis policies:

- [Network Analysis Policy Basics, on page 1677](#)
- [License Requirements for Network Analysis Policies, on page 1678](#)
- [Requirements and Prerequisites for Network Analysis Policies, on page 1678](#)
- [Managing Network Analysis Policies, on page 1678](#)

## Network Analysis Policy Basics

*Network analysis policies* govern many traffic preprocessing options, and are invoked by advanced settings in your access control policy. Network analysis-related preprocessing occurs after Security Intelligence matching and SSL decryption, but before intrusion or file inspection begins.

By default, the system uses the *Balanced Security and Connectivity* network analysis policy to preprocess all traffic handled by an access control policy. However, you can choose a different default network analysis policy to perform this preprocessing. For your convenience, the system provides a choice of several non-modifiable network analysis policies, which are tuned for a specific balance of security and connectivity by the Cisco Talos Intelligence Group (Talos). You can also create a custom network analysis policy with custom preprocessing settings.

---

**Tip** System-provided intrusion and network analysis policies are similarly named but contain different configurations. For example, the Balanced Security and Connectivity network analysis policy and the Balanced Security and Connectivity intrusion policy work together and can both be updated in intrusion rule updates. However, the network analysis policy governs mostly preprocessing options, whereas the intrusion policy governs mostly intrusion rules. Network analysis and intrusion policies work together to examine your traffic.

---

You can also tailor traffic preprocessing options to specific security zones, networks, and VLANs by creating multiple custom network analysis policies, then assigning them to preprocess different traffic. (Note that ASA FirePOWER cannot restrict preprocessing by VLAN.)

# Managing Network Analysis Policies

In a multidomain deployment, the system displays policies created in the current domain, which you can edit. It also displays policies created in ancestor domains, which you cannot edit. To view and edit policies created in a lower domain, switch to that domain.

## Procedure

---

**Step 1** Choose **Policies > Access Control**, then click **Network Analysis Policies** or **Policies > Access Control > Intrusion**, then click **Network Analysis Policies**.

**Note** If your custom user role limits access to the first path listed here, use the second path to access the policy.

**Step 2** Manage your network analysis policy:

- Compare—Click **Compare Policies**; see [Comparing Policies, on page 355](#).
- Create — If you want to create a new network analysis policy, click **Create Policy**.

- Delete — If you want to delete a network analysis policy, click **Delete** () , then confirm that you want to delete the policy. You cannot delete a network analysis policy if an access control policy references it.  
If the controls are dimmed, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.
- Deploy—Click **Deploy**; see [Deploy Configuration Changes, on page 346](#).
- Edit — If you want to edit an existing network analysis policy, click **Edit** () and proceed as described in [Network Analysis Policy Settings and Cached Changes, on page 1681](#).  
If **View** () appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.
- Report—Click **Report** () ; see [Generating Current Policy Reports, on page 356](#).

---

## Custom Network Analysis Policy Creation for Snort 2

When you create a new network analysis policy you must give it a unique name, specify a base policy, and choose an *inline mode*.

The base policy defines the network analysis policy's default settings. Modifying a setting in the new policy overrides—but does not change—the settings in the base policy. You can use either a system-provided or custom policy as your base policy.

The network analysis policy's inline mode allows preprocessors to modify (normalize) and drop traffic to minimize the chances of attackers evading detection. Note that in passive deployments, the system cannot affect traffic flow regardless of the inline mode.

### Related Topics

[The Base Layer, on page 1465](#)

[Preprocessor Traffic Modification in Inline Deployments, on page 1683](#)

[Creating a Custom Network Analysis Policy, on page 1679](#)

[Editing Network Analysis Policies, on page 1681](#)

## Creating a Custom Network Analysis Policy

In a multidomain deployment, the system displays policies created in the current domain, which you can edit. It also displays policies created in ancestor domains, which you cannot edit. To view and edit policies created in a lower domain, switch to that domain.

### Procedure

- 
- Step 1** Choose **Policies > Access Control**, then click **Network Analysis Policies** or **Policies > Access Control > Intrusion**, then click **Network Analysis Policies**.

**Note** If your custom user role limits access to the first path listed here, use the second path to access the policy.

**Step 2** Click **Create Policy**. If you have unsaved changes in another policy, click **Cancel** when prompted to return to the **Network Analysis Policy** page.

**Step 3** Enter a unique **Name**.

In a multidomain deployment, policy names must be unique within the domain hierarchy. The system may identify a conflict with the name of a policy you cannot view in your current domain.

**Step 4** Optionally, enter a **Description**.

**Step 5** Choose the initial **Base Policy**. You can use either a system-provided or custom policy as your base policy.

**Step 6** If you want to allow preprocessors to affect traffic in an inline deployment, enable **Inline Mode**.

**Step 7** To create the policy:

- Click **Create Policy** to create the new policy and return to the **Network Analysis Policy** page. The new policy has the same settings as its base policy.
- Click **Create and Edit Policy** to create the policy and open it for editing in the advanced network analysis policy editor.

---

#### Related Topics

[Creating Custom User Roles](#), on page 57

## Network Analysis Policy Management for Snort 2

On the Network Analysis Policy page (or **Policies** > **Access Control**, then click **Network Analysis Policies** or **Policies** > **Access Control** > **Intrusion**, then click **Network Analysis Policies**), you can view your current custom network analysis policies, along with the following information:

- the time and date the policy was last modified (in local time) and the user who modified it
- whether the **Inline Mode** setting is enabled, which allows preprocessors to affect traffic
- which access control policies and devices are using the network analysis policy to preprocess traffic
- whether a policy has unsaved changes, as well as information about who (if anyone) is currently editing the policy

In addition to custom policies that you create, the system provides two custom policies: Initial Inline Policy and Initial Passive Policy. These two network analysis policies use the Balanced Security and Connectivity network analysis policy as their base. The only difference between them is their inline mode, which allows preprocessors to affect traffic in the inline policy and disables it in the passive policy. You can edit and use these system-provided custom policies.

Note that you can create and edit network analysis as well as intrusion policies if your Firepower System user account's role is restricted to Intrusion Policy or Modify Intrusion Policy.

#### Related Topics

[Editing Network Analysis Policies](#), on page 1681

## Network Analysis Policy Settings and Cached Changes

When you create a new network analysis policy, it has the same settings as its base policy.

When tailoring a network analysis policy, especially when disabling preprocessors, keep in mind that some preprocessors and intrusion rules require that traffic first be decoded or preprocessed in a certain way. If you disable a required preprocessor, the system automatically uses it with its current settings, although the preprocessor remains disabled in the network analysis policy web interface.

**Note** Because preprocessing and intrusion inspection are so closely related, the network analysis and intrusion policies examining a single packet **must** complement each other. Tailoring preprocessing, especially using multiple custom network analysis policies, is an **advanced** task.

The system caches one network analysis policy per user. While editing a network analysis policy, if you select any menu or other path to another page, your changes stay in the system cache even if you leave the page.

## Editing Network Analysis Policies

In a multidomain deployment, the system displays policies created in the current domain, which you can edit. It also displays policies created in ancestor domains, which you cannot edit. To view and edit policies created in a lower domain, switch to that domain.

### Procedure

**Step 1** Choose **Policies > Access Control**, then click **Network Analysis Policies** or **Policies > Access Control > Intrusion**, then click **Network Analysis Policies**.

**Note** If your custom user role limits access to the first path listed here, use the second path to access the policy.

**Step 2** Click **Edit** () next to the network analysis policy you want to configure.

If **View** () appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

**Step 3** Edit your network analysis policy:

- Change the base policy — If you want to change the base policy, choose a base policy from the **Base Policy** drop-down list on the Policy Information page.
- Manage policy layers — If you want to manage policy layers, click **Policy Layers** in the navigation panel.
- Modify a preprocessor — If you want to enable, disable, or edit the settings for a preprocessor, click **Settings** in the navigation panel.
- Modify traffic — If you want to allow preprocessors to modify or drop traffic, check the **Inline Mode** check box on the Policy Information page.

- View settings — If you want to view the settings in the base policy, click **Manage Base Policy** on the Policy Information page.

**Step 4** To save changes you made in this policy since the last policy commit, choose **Policy Information**, then click **Commit Changes**. If you leave the policy without committing changes, changes since the last commit are discarded if you edit a different policy.

---

#### What to do next

- If you want a preprocessor to generate events and, in an inline deployment, drop offending packets, enable rules for the preprocessor. For more information, see [Setting Intrusion Rule States, on page 1504](#).
- Deploy configuration changes; see [Deploy Configuration Changes, on page 346](#).

## Preprocessor Configuration in a Network Analysis Policy for Snort 2

*Preprocessors* prepare traffic to be further inspected by normalizing traffic and identifying protocol anomalies. Preprocessors can generate preprocessor events when packets trigger preprocessor options that you configure. The base policy for your network analysis policy determines which preprocessors are enabled by default and the default configuration for each.

---

**Note** In most cases, preprocessors require specific expertise to configure and typically require little or no modification. Tailoring preprocessing, especially using multiple custom network analysis policies, is an **advanced** task. Because preprocessing and intrusion inspection are so closely related, the network analysis and intrusion policies examining a single packet **must** complement each other.

---

Modifying a preprocessor configuration requires an understanding of the configuration and its potential impact on your network.

Note that some advanced transport and network preprocessor settings apply globally to all networks, zones, and VLANs where you deploy your access control policy. You configure these advanced settings in an access control policy rather than in a network analysis policy.

Note also that you configure the sensitive data preprocessor, which detects sensitive data such as credit card numbers and Social Security numbers in ASCII text, in intrusion policies.

## Preprocessor Traffic Modification in Inline Deployments

In an inline deployment (that is, where relevant configurations are deployed to devices using routed, switched, or transparent interfaces, or inline interface pairs), some preprocessors can modify and block traffic. For example:

- The inline normalization preprocessor normalizes packets to prepare them for analysis by other preprocessors and the intrusion rules engine. You can also use the preprocessor's **Allow These TCP Options** and **Block Unresolvable TCP Header Anomalies** options to block certain packets.
- The system can drop packets with invalid checksums.
- The system can drop packets matching rate-based attack prevention settings.

For a preprocessor configured in the network analysis policy to affect traffic, you must enable and correctly configure the preprocessor, as well as correctly deploy managed devices inline. Finally, you must enable the network analysis policy's **Inline Mode** setting.

## Preprocessor Configuration in a Network Analysis Policy Notes

When you select **Settings** in the navigation panel of a network analysis policy, the policy lists its preprocessors by type. On the Settings page, you can enable or disable preprocessors in your network analysis policy, as well as access preprocessor configuration pages.

A preprocessor must be enabled for you to configure it. When you enable a preprocessor, a sublink to the configuration page for the preprocessor appears beneath the **Settings** link in the navigation panel, and an **Edit** link to the configuration page appears next to the preprocessor on the Settings page.

---

**Tip** To revert a preprocessor's configuration to the settings in the base policy, click **Revert to Defaults** on a preprocessor configuration page. When prompted, confirm that you want to revert.

---

When you disable a preprocessor, the sublink and **Edit** link no longer appear, but your configurations are retained. Note that to perform their particular analysis, many preprocessors and intrusion rules require that traffic first be decoded or preprocessed in a certain way. If you disable a required preprocessor, the system automatically uses it with its current settings, although the preprocessor remains disabled in the network analysis policy web interface.

If you want to assess how your configuration would function in an inline deployment without actually modifying traffic, you can disable inline mode. In passive deployments or inline deployments in tap mode, the system cannot affect traffic regardless of the inline mode setting.

---

**Note** Disabling inline mode can affect intrusion event performance statistics graphs. With inline mode enabled in an inline deployment, the Intrusion Event Performance page (**Overview** > **Summary** > **Intrusion Event Performance**) displays graphs that represent normalized and blocked packets. If you disable inline mode, or in a passive deployment, many of the graphs display data about the traffic the system would have normalized or dropped.

---

---

**Note** In an inline deployment, Cisco recommends that you enable inline mode and configure the inline normalization preprocessor with the **Normalize TCP Payload** option enabled. In a passive deployment, Cisco recommends that you use adaptive profile updates.

## Introduction to Application Layer Preprocessors

Application layer protocols can represent the same data in a variety of ways. The Firepower System provides application layer protocol decoders that normalize specific types of packet data into formats that the intrusion rules engine can analyze. Normalizing application-layer protocol encodings allows the rules engine to effectively apply the same content-related rules to packets whose data is represented differently and obtain meaningful results.

When an intrusion rule or rule argument requires a disabled preprocessor, the system automatically uses it with its current configuration even though it remains disabled in the network analysis policy's web interface.

Note that preprocessors do not generate events in most cases unless you enable the accompanying preprocessor rules in an intrusion policy.

## The DCE/RPC Preprocessor

The DCE/RPC protocol allows processes on separate network hosts to communicate as if the processes were on the same host. These inter-process communications are commonly transported between hosts over TCP and UDP. Within the TCP transport, DCE/RPC might also be further encapsulated in the Windows Server Message Block (SMB) protocol or in Samba, an open-source SMB implementation used for inter-process communication in a mixed environment comprised of Windows and UNIX- or Linux-like operating systems. In addition, Windows IIS web servers on your network might use IIS RPC over HTTP, which provides distributed communication through a firewall, to proxy TCP-transported DCE/RPC traffic.

Note that descriptions of DCE/RPC preprocessor options and functionality include the Microsoft implementation of DCE/RPC known as MSRPC; descriptions of SMB options and functionality refer to both SMB and Samba.

Although most DCE/RPC exploits occur in DCE/RPC client requests targeted for DCE/RPC servers, which could be practically any host on your network that is running Windows or Samba, exploits can also occur in server responses. The DCE/RPC preprocessor detects DCE/RPC requests and responses encapsulated in TCP, UDP, and SMB transports, including TCP-transported DCE/RPC using version 1 RPC over HTTP. The preprocessor analyzes DCE/RPC data streams and detects anomalous behavior and evasion techniques in DCE/RPC traffic. It also analyzes SMB data streams and detects anomalous SMB behavior and evasion techniques.

The DCE/RPC preprocessor also desegments SMB and defragments DCE/RPC in addition to the IP defragmentation provided by the IP defragmentation preprocessor and the TCP stream reassembly provided by the TCP stream preprocessor.

Finally, the DCE/RPC preprocessor normalizes DCE/RPC traffic for processing by the rules engine.

## Connectionless and Connection-Oriented DCE/RPC Traffic

DCE/RPC messages comply with one of two distinct DCE/RPC Protocol Data Unit (PDU) protocols:

### connection-oriented DCE/RPC PDU protocol

The DCE/RPC preprocessor detects connection-oriented DCE/RPC in the TCP, SMB, and RPC over HTTP transports.

### connectionless DCE/RPC PDU protocol

The DCE/RPC preprocessor detects connectionless DCE/RPC in the UDP transport.

The two DCE/RPC PDU protocols have their own unique headers and data characteristics. For example, the connection-oriented DCE/RPC header length is typically 24 bytes and the connectionless DCE/RPC header length is fixed at 80 bytes. Also, correct fragment order of fragmented connectionless DCE/RPC cannot be handled by a connectionless transport and, instead, must be ensured by connectionless DCE/RPC header values; in contrast, the transport protocol ensures correct fragment order for connection-oriented DCE/RPC. The DCE/RPC preprocessor uses these and other protocol-specific characteristics to monitor both protocols for anomalies and other evasion techniques, and to decode and defragment traffic before passing it to the rules engine.

The following diagram illustrates the point at which the DCE/RPC preprocessor begins processing DCE/RPC traffic for the different transports.

Note the following in the figure:

- The well-known TCP or UDP port 135 identifies DCE/RPC traffic in the TCP and UDP transports.
- The figure does not include RPC over HTTP.

For RPC over HTTP, connection-oriented DCE/RPC is transported directly over TCP as shown in the figure after an initial setup sequence over HTTP.

- The DCE/RPC preprocessor typically receives SMB traffic on the well-known TCP port 139 for the NetBIOS Session Service or the similarly implemented well-known Windows port 445.

Because SMB has many functions other than transporting DCE/RPC, the preprocessor first tests whether the SMB traffic is carrying DCE/RPC traffic and stops processing if it is not or continues processing if it is.

- IP encapsulates all DCE/RPC transports.
- TCP transports all connection-oriented DCE/RPC.
- UDP transports connectionless DCE/RPC.

## DCE/RPC Target-Based Policies

Windows and Samba DCE/RPC implementations differ significantly. For example, all versions of Windows use the DCE/RPC context ID in the first fragment when defragmenting DCE/RPC traffic, and all versions of Samba use the context ID in the last fragment. As another example, Windows Vista uses the `opnum` (operation number) header field in the first fragment to identify a specific function call, and Samba and all other Windows versions use the `opnum` field in the last fragment.

There are also significant differences in Windows and Samba SMB implementations. For example, Windows recognizes the SMB OPEN and READ commands when working with named pipes, but Samba does not recognize these commands.

When you enable the DCE/RPC preprocessor, you automatically enable a default target-based policy. Optionally, you can add target-based policies that target other hosts running different Windows or Samba versions. The default target-based policy applies to any host not included in another target-based policy.

In each target-based policy, you can:

- enable one or more transports and specify *detection ports* for each
- enable and specify *auto-detection ports*
- set the preprocessor to detect when there is an attempt to connect to one or more shared SMB resources that you identify
- configure the preprocessor to detect files in SMB traffic and to inspect a specified number of bytes in a detected file
- modify an advanced option that should be modified only by a user with SMB protocol expertise; this option lets you set the preprocessor to detect when a number of chained SMB AndX commands exceed a specified maximum number

In addition to enabling SMB traffic file detection in the DCE/RPC preprocessor, you can configure a file policy to optionally capture and block these files, or submit them to the Cisco AMP cloud for dynamic analysis. Within that policy, you must create a file rule with an **Action** of **Detect Files** or **Block Files** and a selected **Application Protocol** of **Any** or **NetBIOS-ssn (SMB)**.

## RPC over HTTP Transport

Microsoft RPC over HTTP allows you to tunnel DCE/RPC traffic through a firewall as shown in the following diagram. The DCE/RPC preprocessor detects version 1 of Microsoft RPC over HTTP.

The Microsoft IIS proxy server and the DCE/RPC server can be on the same host or on different hosts. Separate proxy and server options provide for both cases. Note the following in the figure:

- The DCE/RPC server monitors port 593 for DCE/RPC client traffic, but the firewall blocks port 593. Firewalls typically block port 593 by default.
- RPC over HTTP transports DCE/RPC over HTTP using well-known HTTP port 80, which firewalls are likely to permit.
- Example 1 shows that you would choose the **RPC over HTTP proxy** option to monitor traffic between the DCE/RPC client and the Microsoft IIS RPC proxy server.
- Example 2 shows that you would choose the **RPC over HTTP server** option when the Microsoft IIS RPC proxy server and the DCE/RPC server are located on different hosts and the device monitors traffic between the two servers.
- Traffic is comprised solely of connection-oriented DCE/RPC over TCP after RPC over HTTP completes the proxied setup between the DCE/RPC client and server.

## DCE/RPC Global Options

Global DCE/RPC preprocessor options control how the preprocessor functions. Note that, except for the **Memory Cap Reached** and **Auto-Detect Policy on SMB Session** options, modifying these options could have a negative impact on performance or detection capability. You should not modify them unless you have a thorough understanding of the preprocessor and the interaction between the preprocessor and enabled DCE/RPC rules.

If no preprocessor rule is mentioned in the following descriptions, the option is not associated with a preprocessor rule.

### Maximum Fragment Size

When **Enable Defragmentation** is selected, specifies the maximum DCE/RPC fragment length allowed. The preprocessor truncates larger fragments for processing purposes to the specified size before defragmenting but does not alter the actual packet. A blank field disables this option.

Make sure that the **Maximum Fragment Size** option is greater than or equal to the depth to which the rules need to detect.

### Reassembly Threshold

When **Enable Defragmentation** is selected, 0 disables this option, or specifies a minimum number of fragmented DCE/RPC bytes and, if applicable, segmented SMB bytes to queue before sending a reassembled packet to the rules engine. A low value increases the likelihood of early detection but could have a negative impact on performance. You should test for performance impact if you enable this option.

Make sure that the **Reassembly Threshold** option is greater than or equal to the depth to which the rules need to detect.

### Enable Defragmentation

Specifies whether to defragment fragmented DCE/RPC traffic. When disabled, the preprocessor still detects anomalies and sends DCE/RPC data to the rules engine, but at the risk of missing exploits in fragmented DCE/RPC data.

Although this option provides the flexibility of not defragmenting DCE/RPC traffic, most DCE/RPC exploits attempt to take advantage of fragmentation to hide the exploit. Disabling this option would bypass most known exploits, resulting in a large number of false negatives.

### Memory Cap Reached

Detects when the maximum memory limit allocated to the preprocessor is reached or exceeded. When the maximum memory cap is reached or exceeded, the preprocessor frees all pending data associated with the session that caused the memory cap event and ignores the rest of that session.

You can enable rule 133:1 to generate events and, in an inline deployment, drop offending packets for this option. See [Setting Intrusion Rule States, on page 1504](#).

### Auto-Detect Policy on SMB Session

Detects the Windows or Samba version that is identified in SMB `Session Setup AndX` requests and responses. When the detected version is different from the Windows or Samba version configured for the **Policy** configuration option, the detected version overrides the configured version for that session only.

For example, if you set **Policy** to Windows XP and the preprocessor detects Windows Vista, the preprocessor uses a Windows Vista policy for that session. Other settings remain in effect.

When the DCE/RPC transport is not SMB (that is, when the transport is TCP or UDP), the version cannot be detected and the policy cannot be automatically configured.

To enable this option, choose one of the following from the drop-down list:

- Choose **Client** to inspect server-to-client traffic for the policy type.
- Choose **Server** to inspect client-to-server traffic for the policy type.
- Choose **Both** to inspect server-to-client and client-to-server traffic for the policy type.

### Legacy SMB Inspection Mode

Specifies which SMB versions to inspect. When **Legacy SMB Inspection Mode** is enabled, the DCE/RPC preprocessor inspects only SMB Version 1 traffic. When this option is disabled, the DCE/RPC preprocessor inspects traffic that uses SMB Versions 1, 2, and 3.

### Related Topics

[Basic content and protected\\_content Keyword Arguments](#), on page 1567

[Overview: The byte\\_jump and byte\\_test Keywords](#)

## DCE/RPC Target-Based Policy Options

In each target-based policy, you can enable one or more of the TCP, UDP, SMB, and RPC over HTTP transports. When you enable a transport, you must also specify one or more *detection ports*, that is, ports that are known to carry DCE/RPC traffic.

Cisco recommends that you use the default detection ports, which are either well-known ports or otherwise commonly-used ports for each protocol. You would add detection ports only if you detected DCE/RPC traffic on a non-default port.

You can specify ports for one or more transports in any combination in a Windows target-based policy to match the traffic on your network, but you can only specify ports for the SMB transport in a Samba target-based policy.

---

**Note** You must enable at least one DCE/RPC transport in the default target-based policy except when you have added a DCE/RPC target-based policy that has at least one transport enabled. For example, you might want to specify the hosts for all DCE/RPC implementations and not have the default target-based policy deploy to unspecified hosts, in which case you would not enable a transport for the default target-based policy.

---

Optionally, you can also enable and specify *auto-detection ports*, that is, ports that the preprocessor tests first to determine if they carry DCE/RPC traffic and continues processing only when it detects DCE/RPC traffic.

When you enable auto-detection ports, ensure that they are set to the port range from 1025 to 65535 to cover the entire ephemeral port range.

Note that auto-detection occurs only for ports not already identified by transport detection ports.

It is unlikely that you would enable or specify auto-detection ports for the RPC over HTTP Proxy Auto-Detect Ports option or the SMB Auto-Detect Ports option because there is little likelihood that traffic for either would occur or even be possible except on the specified default detection ports.

Each target-based policy allows you to specify the various options below. If no preprocessor rule is mentioned in the following descriptions, the option is not associated with a preprocessor rule.

### Networks

The host IP addresses where you want to deploy the DCE/RPC target-based server policy. Also named the **Server Address** field in the Add Target pop-up window when you add a target-based policy.

You can specify a single IP address or address block, or a comma-separated list of either or both. You can configure up to 255 total profiles including the default policy.

---

**Note** The system builds a separate network map for each leaf domain. In a multidomain deployment, using literal IP addresses to constrain this configuration can have unexpected results. Using override-enabled objects allows descendant domain administrators to tailor Global configurations to their local environments.

---

Note that the `default` setting in the default policy specifies all IP addresses on your monitored network segment that are not covered by another target-based policy. Therefore, you cannot and do not need to specify an IP address or CIDR block/prefix length for the default policy, and you cannot leave this setting blank in another policy or use address notation to represent `any` (for example, `0.0.0.0/0` or `::/0`).

### Policy

The Windows or Samba DCE/RPC implementation used by the targeted host or hosts on your monitored network segment.

Note that you can enable the **Auto-Detect Policy on SMB Session** global option to automatically override the setting for this option on a per session basis when SMB is the DCE/RPC transport.

### SMB Invalid Shares

Identifies one or more SMB shared resources the preprocessor will detect when there is an attempt to connect to a shared resource that you specify. You can specify multiple shares in a comma-separated list and, optionally, you can enclose shares in quotes, which was required in previous software versions but is no longer required; for example:

```
"C$", D$, "admin", private
```

The preprocessor detects invalid shares in SMB traffic when you have enabled **SMB Ports**.

Note that in most cases you should append a dollar sign to a drive named by Windows that you identify as an invalid share. For example, identify drive C as `C$` or `"C$"`.

Note also that to detect SMB invalid shares, you must also enable **SMB Ports** or **SMB Auto-Detect Ports**.

You can enable rule 133:26 to generate events and, in an inline deployment, drop offending packets for this option. See [Setting Intrusion Rule States, on page 1504](#).

### SMB Maximum AndX Chain

The maximum number of chained SMB AndX commands to permit. Typically, more than a few chained AndX commands represent anomalous behavior and could indicate an evasion attempt. Specify 1 to permit no chained commands or 0 to disable detecting the number of chained commands.

Note that the preprocessor first counts the number of chained commands and generates an event if accompanying SMB preprocessor rules are enabled and the number of chained commands equals or exceeds the configured value. It then continues processing.

---

**Caution** Only someone who is expert in the SMB protocol should modify the setting for the **SMB Maximum AndX Chains** option.

---

You can enable rule 133:20 to generate events and, in an inline deployment, drop offending packets for this option. See [Setting Intrusion Rule States, on page 1504](#).

### RPC proxy traffic only

Enabling **RPC over HTTP Proxy Ports** indicates whether detected client-side RPC over HTTP traffic is proxy traffic only or might include other web server traffic. For example, port 80 could carry both proxy and other web server traffic.

When this option is disabled, both proxy and other web server traffic are expected. Enable this option, for example, if the server is a dedicated proxy server. When enabled, the preprocessor tests traffic to determine if it carries DCE/RPC, ignores the traffic if it does not, and continues processing if it does. Note that enabling this option adds functionality only if the **RPC over HTTP Proxy Ports** check box is also enabled.

### RPC over HTTP Proxy Ports

Enables detection of DCE/RPC traffic tunneled by RPC over HTTP over each specified port when your managed device is positioned between the DCE/RPC client and the Microsoft IIS RPC proxy server.

When enabled, you can add any ports where you see DCE/RPC traffic, although this is unlikely to be necessary because web servers typically use the default port for both DCE/RPC and other traffic. When enabled, you would not enable **RPC over HTTP Proxy Auto-Detect Ports**, but you would enable the **RPC Proxy Traffic Only** when detected client-side RPC over HTTP traffic is proxy traffic only and does not include other web server traffic.

---

**Note** You would rarely, if ever, select this option.

---

### RPC over HTTP Server Ports

Enables detection of DCE/RPC traffic tunneled by RPC over HTTP on each specified port when the Microsoft IIS RPC proxy server and the DCE/RPC server are located on different hosts and the device monitors traffic between the two servers.

Typically, when you enable this option you should also enable **RPC over HTTP Server Auto-Detect Ports** with a port range from 1025 to 65535 for that option even if you are not aware of any proxy web servers on your network. Note that the RPC over HTTP server port is sometimes reconfigured, in which case you should add the reconfigured server port to port list for this option.

### TCP Ports

Enables detection of DCE/RPC traffic in TCP on each specified port.

Legitimate DCE/RPC traffic and exploits might use a wide variety of ports, and other ports above port 1024 are common. Typically, when this option is enabled you should also enable **TCP Auto-Detect Ports** with a port range from 1025 to 65535 for that option.

### UDP Ports

Enables detection of DCE/RPC traffic in UDP on each specified port.

Legitimate DCE/RPC traffic and exploits might use a wide variety of ports, and other ports above port 1024 are common. Typically, when this option is enabled you should also enable **UDP Auto-Detect Ports** with a port range from 1025 to 65535 for that option.

### SMB Ports

Enables detection of DCE/RPC traffic in SMB on each specified port.

You could encounter SMB traffic using the default detection ports. Other ports are rare. Typically, use the default settings.

Note that you can enable the **Auto-Detect Policy on SMB Session** global option to automatically override the policy type configured for a targeted policy on a per session basis when SMB is the DCE/RPC transport.

### RPC over HTTP Proxy Auto-Detect Ports

Enables auto-detection of DCE/RPC traffic tunneled by RPC over HTTP on the specified ports when your managed device is positioned between the DCE/RPC client and the Microsoft IIS RPC proxy server.

When enabled, you would typically specify a port range from 1025 to 65535 to cover the entire range of ephemeral ports.

### RPC over HTTP Server Auto-Detect Ports

Enables auto-detection of DCE/RPC traffic tunneled by RPC over HTTP on the specified ports when the Microsoft IIS RPC proxy server and the DCE/RPC server are located on different hosts and the device monitors traffic between the two servers.

### TCP Auto-Detect Ports

Enables auto-detection of DCE/RPC traffic in TCP on the specified ports.

### UDP Auto-Detect Ports

Enables auto-detection of DCE/RPC traffic in UDP on each specified port.

### SMB Auto-Detect Ports

Enables auto-detection of DCE/RPC traffic in SMB.

---

**Note** You would rarely, if ever, select this option.

---

### SMB File Inspection

Enables inspection of SMB traffic for file detection. You have the following options:

- Select **Off** to disable file inspection.
- Select **Only** to inspect file data without inspecting the DCE/RPC traffic in SMB. Selecting this option can improve performance over inspecting both files and DCE/RPC traffic.
- Select **On** to inspect both files and the DCE/RPC traffic in SMB. Selecting this option can impact performance.

Inspection of SMB traffic for the following is not supported:

- files transferred in an established TCP or SMB session before this option is enabled and the policy applied
- files transferred concurrently in a single TCP or SMB session

- files transferred across multiple TCP or SMB sessions
- files transferred with non-contiguous data, such as when message signing is negotiated
- files transferred with different data at the same offset, overlapping the data
- files opened on a remote client for editing that the client saves to the file server

### SMB File Inspection Depth

If **SMB File Inspection** is set to **Only** or **On**, the number of bytes inspected when a file is detected in SMB traffic. Specify one of the following:

- a positive value
- 0 to inspect the entire file
- -1 to disable file inspection

Enter a value in this field equal to or smaller than the one defined in the File and Malware Settings section of the Advanced tab in your access control policy. If you set a value for this option larger than the one defined for **Limit the number of bytes inspected when doing file type detection**, the system uses the access control policy setting as the functional maximum.

If **SMB File Inspection** is set to **Off**, this field is disabled.

## Traffic-Associated DCE/RPC Rules

Most DCE/RPC preprocessor rules trigger against anomalies and evasion techniques detected in SMB, connection-oriented DCE/RPC, or connectionless DCE/RPC traffic. The following table identifies the rules that you can enable for each type of traffic.

**Table 192: Traffic-Associated DCE/RPC Rules**

| Traffic                       | Preprocessor Rule GID:SID                       |
|-------------------------------|-------------------------------------------------|
| SMB                           | 133:2 through 133:26, and 133:48 through 133:59 |
| Connection-Oriented DCE/RPC   | 133:27 through 133:39                           |
| Detect Connectionless DCE/RPC | 133:40 through 133:43                           |

## Configuring the DCE/RPC Preprocessor
