Variables Used in Syslog Messages

Syslog messages often include variables. The following table lists most variables that are used in this guide to describe syslog messages. Some variables that appear in only one syslog message are not listed.

Variable Fields in Syslog Messages

Variable	Description
<i>acl_ID</i>	An ACL name.
<i>bytes</i>	The number of bytes.
<i>code</i>	A decimal number returned by the syslog message to indicate the cause or source of the error, according to the syslog message generated.
<i>command</i>	A command name.
<i>command_modifier</i>	The command_modifier is one of the following strings: <ul style="list-style-type: none"> • cmd (this string means the command has no modifier) • clear • no • show
<i>connections</i>	The number of connections.

Variable	Description
<i>connection_type</i>	The connection type: <ul style="list-style-type: none"> • SIGNALLING UDP • SIGNALLING TCP • SUBSCRIBE UDP • SUBSCRIBE TCP • Via UDP • Route • RTP • RTCP
<i>dec</i>	Decimal number.
<i>dest_address</i>	The destination address of a packet.
<i>dest_port</i>	The destination port number.
