Preface

This preface includes the following sections:

- [Audience, page iii](#)
- [Organization, page iii](#)
- [Related Documentation, page iii](#)
- [Obtaining Documentation and Submitting a Service Request, page iv](#)

Audience

This troubleshooting guide is designed for users who are responsible for troubleshooting issues that arise in the Cisco Firepower eXtensible Operating System.

Organization

This reference guide is organized into the following parts and chapters:

- Cisco Firepower eXtensible Operating System Faults
 - [Chapter 1, “Introduction to Cisco Firepower eXtensible Operating System Faults”](#)
 - [Chapter 2, “FXOS Faults”](#)
 - [Chapter 3, “FSM Faults”](#)
 - [Chapter 4, “Troubleshooting Transient Faults”](#)
- Cisco Firepower eXtensible Operating System SEL Messages
 - [Chapter 5, “Introduction to System Event Log Messages”](#)
 - [Chapter 6, “Baseboard Management Controller Messages”](#)

Related Documentation

A roadmap that lists all documentation for the Cisco Firepower eXtensible Operating System is available at the following URL:

<http://www.cisco.com/go/firepower9300-docs>

Obtaining Documentation and Submitting a Service Request

For information on obtaining documentation, using the Cisco Bug Search Tool (BST), submitting a service request, and gathering additional information, see [What's New in Cisco Product Documentation](#).

To receive new and revised Cisco technical content directly to your desktop, you can subscribe to the [What's New in Cisco Product Documentation RSS feed](#). The RSS feeds are a free service.

Introduction to Cisco Firepower eXtensible Operating System Faults

This chapter provides an overview of Cisco Firepower eXtensible Operating System faults. This chapter contains the following sections:

- [Overview of Faults, page 1-1](#)
- [Overview of the Finite State Machine, page 1-5](#)

Overview of Faults

This section includes the following topics:

- [About Faults in FXOS, page 1-1](#)
- [Fault Severities, page 1-2](#)
- [Fault Types, page 1-2](#)
- [Properties of Faults, page 1-3](#)
- [Lifecycle of Faults, page 1-4](#)
- [Fault Collection Policy, page 1-4](#)
- [Faults in Cisco Firepower eXtensible Operating System, page 1-5](#)

About Faults in FXOS

A fault is a mutable object that is managed by the Cisco Firepower eXtensible Operating System. Each fault represents a failure or an alarm threshold that has been raised. During the lifecycle of a fault, it can change from one state or severity to another.

Each fault includes information about the operational state of the affected object at the time the fault was raised. If the fault is transitional and the failure is resolved, then the object transitions to a functional state.

A fault remains in FXOS until the fault is cleared and deleted according to the settings in the fault collection policy.

You can view all faults from either the FXOS CLI or the Firepower Chassis Manager. You can also configure the fault collection policy to determine how a FXOS instance collects and retains faults.

**Note**

All Cisco Firepower eXtensible Operating System faults can be trapped by SNMP.

Fault Severities

A fault can transition through more than one severity during its lifecycle. [Table 1-1](#) describes the possible fault severities in alphabetical order.

Table 1-1 *Fault Severities in FXOS*

Severity	Description
Cleared	A notification that the condition that caused the fault has been resolved, and the fault has been cleared.
Condition	An informational message about a condition, possibly independently insignificant.
Critical	A service-affecting condition that requires immediate corrective action. For example, this severity could indicate that the managed object is out of service and its capability must be restored.
Info	A basic notification or informational message, possibly independently insignificant.
Major	A service-affecting condition that requires urgent corrective action. For example, this severity could indicate a severe degradation in the capability of the managed object and that its full capability must be restored.
Minor	A non-service-affecting fault condition that requires corrective action to prevent a more serious fault from occurring. For example, this severity could indicate that the detected alarm condition is not currently degrading the capacity of the managed object.
Warning	A potential or impending service-affecting fault that currently has no significant effects in the system. Action should be taken to further diagnose, if necessary, and correct the problem to prevent it from becoming a more serious service-affecting fault.

Fault Types

A fault can be one of the types described in [Table 1-2](#).

Table 1-2 *Types of Faults in FXOS*

Type	Description
fsm	An FSM task has failed to complete successfully, or the FXOS is retrying one of the stages of the FSM.
equipment	FXOS has detected that a physical component is inoperable or has another functional issue.
server	FXOS is unable to complete a server task, such as associating a service profile with a server.

Table 1-2 *Types of Faults in FXOS*

Type	Description
configuration	FXOS is unable to successfully configure a component.
environment	FXOS has detected a power problem, thermal problem, voltage problem, or a loss of CMOS settings.
management	FXOS has detected a serious management issue, such as one of the following: <ul style="list-style-type: none"> • Critical services could not be started. • The primary switch could not be identified. • Components in the instance include incompatible firmware versions.
connectivity	FXOS has detected a connectivity problem, such as an unreachable adapter.
network	FXOS has detected a network issue, such as a link down.
operational	FXOS has detected an operational problem, such as a log capacity issue or a failed server discovery.

Properties of Faults

FXOS provides detailed information about each fault raised on the security appliance. [Table 1-3](#) describes the fault properties that can be viewed in the FXOS CLI or the Firepower Chassis Manager.

Table 1-3 *Fault Properties*

Property Name	Description
Severity	The current severity level of the fault. This can be any of the severities described in Table 1-1 on page 1-2 .
Last Transition	The day and time on which the severity for the fault last changed. If the severity has not changed since the fault was raised, this property displays the original creation date.
Affected Object	The component that is affected by the condition that raised the fault.
Description	The description of the fault.
ID	The unique identifier assigned to the fault.
Status	Additional information about the fault state. This can be any of the states described in Table 1-4 on page 1-4 .
Type	The type of fault that has been raised. This can be any of the types described in Table 1-2 on page 1-2 .
Cause	The unique identifier associated with the condition that caused the fault.
Created at	The day and time when the fault occurred.
Code	The unique identifier assigned to the fault.
Number of Occurrences	The number of times the event that raised the fault occurred.
Original Severity	The severity assigned to the fault on the first time that it occurred.

Table 1-3 *Fault Properties*

Property Name	Description
Previous Severity	If the severity has changed, this is the previous severity.
Highest Severity	The highest severity encountered for this issue.

Lifecycle of Faults

FXOS faults are stateful, and a fault transitions through more than one state during its lifecycle. In addition, only one instance of a given fault can exist on each object. If the same fault occurs a second time, FXOS increases the number of occurrences by one.

A fault has the following lifecycle:

1. A condition occurs in the system and FXOS raises a fault in the active state.
2. If the fault is alleviated within a short period of time known as the flap interval, the fault severity remains at its original active value but the fault enters the soaking state. The soaking state indicates that the condition that raised the fault has cleared, but the system is waiting to see whether the fault condition reoccurs.
3. If the condition reoccurs during the flap interval, the fault enters the flapping state. Flapping occurs when a fault is raised and cleared several times in rapid succession. If the condition does not reoccur during the flap interval, the fault is cleared.
4. Once cleared, the fault enters the retention interval. This interval ensures that the fault reaches the attention of an administrator even if the condition that caused the fault has been alleviated, and that the fault is not deleted prematurely. The retention interval retains the cleared fault for the length of time specified in the fault collection policy.
5. If the condition reoccurs during the retention interval, the fault returns to the active state. If the condition does not reoccur, the fault is deleted.

When a fault is active, the additional lifecycle state information listed in [Table 1-4](#) may be provided in the Status field of the fault notification.

Table 1-4 *Fault Lifecycle States*

State	Description
Soaking	A fault was raised and then cleared within a short time known as the flap interval. Since this may be a flapping condition, the fault severity remains at its original active value, but this state indicates that the condition that raised the fault has cleared. If the fault does not reoccur, the fault moves into the cleared state. Otherwise, the fault moves into the flapping state.
Flapping	A fault was raised, cleared, and then raised again within a short time known as the flap interval.

Fault Collection Policy

The fault collection policy controls the lifecycle of a fault, including the length of time that each fault remains in the flapping and retention intervals.

Faults in Cisco Firepower eXtensible Operating System

This section includes the following topics:

- [Faults in Firepower Chassis Manager, page 1-5](#)
- [Faults in FXOS CLI, page 1-5](#)

Faults in Firepower Chassis Manager

To view the faults for all objects in the system, navigate to the Overview page in the Firepower Chassis Manager. Each fault severity is represented by a different icon. Above the fault listing you can see how many critical and major faults have occurred in the system. When you double-click a specific fault, Firepower Chassis Manager opens the Faults Properties dialog box and displays details for that fault.

Faults in FXOS CLI

If you want to view the faults for all objects in the system, at the top-level scope, enter the **show fault** command. If you want to view faults for a specific object, scope to that object and then enter the **show fault** command.

If you want to view all of the available details about a fault, enter the **show fault detail** command.

Overview of the Finite State Machine

This section includes the following topics:

- [About the Finite State Machine in Cisco Firepower eXtensible Operating System, page 1-5](#)
- [FSM Stage Names, page 1-6](#)
- [FSM in Cisco Firepower eXtensible Operating System, page 1-6](#)

About the Finite State Machine in Cisco Firepower eXtensible Operating System

A finite state machine (FSM) is a workflow model, similar to a flow chart, that is composed of the following:

- Finite number of stages (states)
- Transitions between those stages
- Operations

The current stage in the FSM is determined by past stages and the operations performed to transition between the stages. A transition from one stage to another stage is dependent on the success or failure of an operation.

FXOS uses FSM tasks that run in the Data Management Engine (DME) to manage end points in the Firepower object model, including the following:

- Physical components (chassis, I/O module, servers)
- Logical components (LAN cloud, policies)

- Workflows (server discovery, service profile management, downloads, upgrades, backups)

The DME manages the FSM stages and transition, and instructs the Application Gateway (AG) to perform operations on the managed end points. Therefore, each stage can be considered to be an interaction between the DME, the AG, and the managed end point. The AGs do the real work of interacting with managed end points.

When all of the FSM stages have run successfully, the FXOS considers that the FSM operation is successful.

If the FSM encounters an error or a timeout at a stage, the FSM retries that stage at scheduled intervals. When the retry count has been reached for that stage, the FSM stops and the FXOS declares that the change has failed. If an FSM task fails, the FXOS raises the appropriate faults and alarms.

Multiple FSM tasks can be associated to an end point. However, only one FSM task at a time can run. Additional FSM tasks for the same end point are placed in a queue and are scheduled to be run when the previous FSM task is either successfully completed or the task fails.

You can view the FSM details for a particular end point to determine if a task succeeded or failed. You can also use the FSM to troubleshoot any failures.

FSM Stage Names

The FSM stage names are constructed using the following notation

FsmObjectWorkflowOperationWhere-is-it-executed

where:

- *Object* is the object that the FSM is running, such as the Blade or Chassis.
- *Workflow* is the overall task being performed by the FSM, such as Discover or Association.
- *Operation* is the task being performed at a particular stage, such as Pnuos-Config.
- *Where-is-it-executed* is generally “”, or “A” or “B” or “Local” or “Peer”. If this is not specified, it is executed on the managingInst node.

Each FSM stage name has a prefix that identifies the FSM and a suffix that identifies a stage within the FSM. The prefix notation is **FsmObjectWorkflow** and the suffix notation is **OperationWhere-is-it-executed**. For example, if the FSM name is

FsmComputeBladeDiscoverBmcInventory:

- The prefix is **FsmComputeBladeDiscover**
- The suffix is **BmcInventory**

FSM in Cisco Firepower eXtensible Operating System

The FXOS CLI can display the FSM information for an end point when you are in the command mode for that end point.

Enter the **show fsm status** command in the appropriate mode to view the current FSM task for an end point. The information displayed about a current FSM task in the CLI is static. You must re-enter the command to see the progress updates. The following example displays the information about the current FSM task for the server in chassis 1, slot 6:

```
Firepower# scope server 1/1
Firepower /chassis/server # show fsm status
Slot: 1
```

```

Server: sys/chassis-1/blade-1
  FSM 1:
    Remote Result: Not Applicable
    Remote Error Code: None
    Remote Error Description:
    Status: Discover Blade Boot Wait
    Previous Status: Discover Blade Boot Wait
    Timestamp: 2006-01-26T23:31:36
    Try: 0
    Flags: 0
    Progress (%): 33
    Current Task: Waiting for system reset on server 1/1
    (FSM-STAGE:sam:dme:ComputeBladeDiscover:BladeBootWait)

```

Enter the **show fsm task** command in the appropriate mode to view all of the pending tasks in the FSM queue. The following example displays the FSM task queue for chassis 1, slot 1:

```

Firepower# scope server 1/1
Firepower /chassis/server # show fsm task

FSM Task:
  Item             ID           Completion  FSM Flags
  -----
  Powercycle       1154858    Scheduled
  BiosRecovery     1154860    Scheduled

```

FXOS Faults

This chapter provides information about the faults that may be raised in FXOS.

fltFabricComputeSlotEpMisplacedInChassisSlot

Fault Code: F0156

Message

Server, vendor([vendor]), model([model]), serial([serial]) in slot [chassisId]/[slotId] presence: [presence]

Explanation

This fault typically occurs when Cisco FPR Manager detects a server in a chassis slot that does not match what was previously equipped in the slot.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** If the previous server was intentionally removed and a new one was inserted, reacknowledge the server.
 - Step 2** If the above actions did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

Fault Details

```
Severity: warning
Cause: server-moved
mibFaultCode: 156
mibFaultName: fltFabricComputeSlotEpMisplacedInChassisSlot
moClass: fabric:ComputeSlotEp
Type: equipment
Callhome: none
Auto Cleared: true
Is Implemented: true
Affected MO: fabric/server/chassis-[chassisId]/slot-[slotId]
```

fltFabricComputeSlotEpServerIdentificationProblem

Fault Code: F0157

Message

Problem identifying server in slot [chassisId]/[slotId]

Explanation

This fault typically occurs when Cisco FPR Manager encountered a problem identifying the server in a chassis slot.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Remove and reinsert the server.
 - Step 2** Reacknowledge the server.
 - Step 3** If the above actions did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

Fault Details

```
Severity: warning
Cause: server-identification-problem
mibFaultCode: 157
mibFaultName: fltFabricComputeSlotEpServerIdentificationProblem
moClass: fabric:ComputeSlotEp
Type: equipment
Callhome: none
Auto Cleared: true
Is Implemented: true
Affected MO: fabric/server/chassis-[chassisId]/slot-[slotId]
```

fltVnicEtherConfig-failed

Fault Code: F0169

Message

Eth vNIC [name], service profile [name] failed to apply configuration

Explanation

This fault typically occurs when Cisco FPR Manager could not place the vNIC on the vCon.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Verify that the server was successfully discovered.
 - Step 2** Verify that the correct type of adapters are installed on the server.
 - Step 3** Confirm that the vCon assignment is correct.
 - Step 4** If the above actions did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

Fault Details

```

Severity: minor
Cause: configuration-failed
mibFaultCode: 169
mibFaultName: fltVnicEtherConfigFailed
moClass: vnic:Ether
Type: configuration
Callhome: none
Auto Cleared: true
Is Implemented: true
Affected MO: org- [name]/lan-conn-pol- [name]/ether- [name]
Affected MO: org- [name]/ls- [name]/ether- [name]
Affected MO: org- [name]/tier- [name]/ls- [name]/ether- [name]

```

fltProcessorUnitInoperable**Fault Code: F0174****Message**

Processor [id] on server [chassisId]/[slotId] operability: [operability]

Explanation

This fault occurs in the unlikely event that processor is inoperable.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** If the fault occurs on a blade server processor, remove the server from the chassis and then reinsert it.
 - Step 2** In Cisco FPR Manager, decommission and then recommission the server.
 - Step 3** If the above actions did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

Fault Details

```

Severity: major
Cause: equipment-inoperable
mibFaultCode: 174
mibFaultName: fltProcessorUnitInoperable
moClass: processor:Unit
Type: equipment
Callhome: diagnostic
Auto Cleared: true
Is Implemented: true
Affected MO: sys/chassis- [id]/blade- [slotId]/board/cpu- [id]
Affected MO: sys/rack-unit- [id]/board/cpu- [id]

```

fltProcessorUnitThermalNonCritical**Fault Code: F0175****Message**

Processor [id] on server [chassisId]/[slotId] temperature: [thermal]Processor [id] on server [id] temperature: [thermal]

Explanation

This fault occurs when the processor temperature on a blade or rack server exceeds a non-critical threshold value, but is still below the critical threshold. Be aware of the following possible contributing factors:

- Temperature extremes can cause Cisco FPR equipment to operate at reduced efficiency and cause a variety of problems, including early degradation, failure of chips, and failure of equipment. In addition, extreme temperature fluctuations can cause CPUs to become loose in their sockets.
- Cisco FPR equipment should operate in an environment that provides an inlet air temperature not colder than 50F (10C) nor hotter than 95F (35C).
- If sensors on a CPU reach 179.6F (82C), the system will take that CPU offline.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Review the product specifications to determine the temperature operating range of the server.
- Step 2** Review the Cisco FPR Site Preparation Guide to ensure the servers have adequate airflow, including front and back clearance.
- Step 3** Verify that the air flows on the Cisco FPR chassis or rack server are not obstructed.
- Step 4** Verify that the site cooling system is operating properly.
- Step 5** Power off unused blade servers and rack servers.
- Step 6** Clean the installation site at regular intervals to avoid buildup of dust and debris, which can cause a system to overheat.
- Step 7** Use the Cisco FPR power capping capability to limit power usage. Power capping can limit the power consumption of the system, including blade and rack servers, to a threshold that is less than or equal to the system's maximum rated power. Power-capping can have an impact on heat dissipation and help to lower the installation site temperature.
- Step 8** If the above actions did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

Fault Details

```
Severity: info

```

fltProcessorUnitThermalThresholdNonRecoverable

Fault Code: F0177

Message

Processor [id] on server [chassisId]/[slotId] temperature: [thermal]Processor [id] on server [id] temperature: [thermal]

Explanation

This fault occurs when the processor temperature on a blade or rack server has been out of the operating range, and the issue is not recoverable. Be aware of the following possible contributing factors:

- Temperature extremes can cause Cisco FPR equipment to operate at reduced efficiency and cause a variety of problems, including early degradation, failure of chips, and failure of equipment. In addition, extreme temperature fluctuations can cause CPUs to become loose in their sockets.
- Cisco FPR equipment should operate in an environment that provides an inlet air temperature not colder than 50F (10C) nor hotter than 95F (35C).
- If sensors on a CPU reach 179.6F (82C), the system will take that CPU offline.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Review the product specifications to determine the temperature operating range of the server.
- Step 2** Review the Cisco FPR Site Preparation Guide to ensure the servers have adequate airflow, including front and back clearance.
- Step 3** Verify that the air flows on the Cisco FPR chassis or rack server are not obstructed.
- Step 4** Verify that the site cooling system is operating properly.
- Step 5** Power off unused blade servers and rack servers.
- Step 6** Clean the installation site at regular intervals to avoid buildup of dust and debris, which can cause a system to overheat.
- Step 7** Use the Cisco FPR power capping capability to limit power usage. Power capping can limit the power consumption of the system, including blade and rack servers, to a threshold that is less than or equal to the system's maximum rated power. Power-capping can have an impact on heat dissipation and help to lower the installation site temperature.
- Step 8** If the above actions did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

fltProcessorUnitVoltageThresholdNonCritical

Fault Code: F0178

Message

Processor [id] on server [chassisId]/[slotId] voltage: [voltage]Processor [id] on server [id] voltage: [voltage]

Explanation

This fault occurs when the processor voltage is out of normal operating range, but hasn't yet reached a critical stage. Normally the processor recovers itself from this situation

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Monitor the processor for further degradation.
 - Step 2** If the fault occurs on a blade server processor, remove the server from the chassis and then reinsert it.
 - Step 3** In Cisco FPR Manager, decommission and then recommission the server.
 - Step 4** If the above actions did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

fltProcessorUnitVoltageThresholdCritical**Fault Code: F0179****Message**

Processor [id] on server [chassisId]/[slotId] voltage: [voltage]Processor [id] on server [id] voltage: [voltage]

Explanation

This fault occurs when the processor voltage has exceeded the specified hardware voltage rating.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** If the fault occurs on a blade server processor, remove the server from the chassis and then reinsert it.
 - Step 2** In Cisco FPR Manager, decommission and then recommission the server.
 - Step 3** If the above actions did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

fltStorageItemCapacityExceeded

Fault Code: F0182

Message

Disk usage for partition [name] on fabric interconnect [id] exceeded 70%

Explanation

This fault occurs when the partition disk usage exceeds 70% but is less than 90%.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Reduce the partition disk usage to less than 70% by deleting unused and unnecessary files.
 - Step 2** If the above action did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

Fault Details

fltMemoryUnitDegraded

Fault Code: F0184

Message

DIMM [location] on server [chassisId]/[slotId] operability: [operability]DIMM [location] on server [id] operability: [operability]

Explanation

This fault occurs when a DIMM is in a degraded operability state. This state typically occurs when an excessive number of correctable ECC errors are reported on the DIMM by the server BIOS.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Monitor the error statistics on the degraded DIMM through Cisco FPR Manager. If the high number of errors persists, there is a high possibility of the DIMM becoming inoperable.
 - Step 2** If the DIMM becomes inoperable, replace the DIMM.
 - Step 3** If the above actions did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

Fault Details

fltMemoryUnitThermalThresholdNonCritical**Fault Code: F0186****Message**

DIMM [location] on server [chassisId]/[slotId] temperature: [thermal]DIMM [location] on server [id] temperature: [thermal]

Explanation

This fault occurs when the temperature of a memory unit on a blade or rack server exceeds a non-critical threshold value, but is still below the critical threshold. Be aware of the following possible contributing factors:

- Temperature extremes can cause Cisco FPR equipment to operate at reduced efficiency and cause a variety of problems, including early degradation, failure of chips, and failure of equipment. In addition, extreme temperature fluctuations can cause CPUs to become loose in their sockets.
- Cisco FPR equipment should operate in an environment that provides an inlet air temperature not colder than 50F (10C) nor hotter than 95F (35C).
- If sensors on a CPU reach 179.6F (82C), the system will take that CPU offline.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Review the product specifications to determine the temperature operating range of the server.
- Step 2** Review the Cisco FPR Site Preparation Guide to ensure the servers have adequate airflow, including front and back clearance.
- Step 3** Verify that the air flows on the Cisco FPR chassis or rack server are not obstructed.
- Step 4** Verify that the site cooling system is operating properly.
- Step 5** Power off unused blade servers and rack servers.
- Step 6** Clean the installation site at regular intervals to avoid buildup of dust and debris, which can cause a system to overheat.
- Step 7** Use the Cisco FPR power capping capability to limit power usage. Power capping can limit the power consumption of the system, including blade and rack servers, to a threshold that is less than or equal to the system's maximum rated power. Power-capping can have an impact on heat dissipation and help to lower the installation site temperature.
- Step 8** If the above actions did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

fltMemoryArrayVoltageThresholdNonCritical

Fault Code: F0189

Message

Memory array [id] on server [chassisId]/[slotId] voltage: [voltage]Memory array [id] on server [id] voltage: [voltage]

Explanation

This fault occurs when the memory array voltage is out of normal operating range, but hasn't yet reached a critical stage. Typically the memory array recovers itself from this situation.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** If the SEL is enabled, look at the SEL statistics on the DIMM to determine which threshold was crossed.
 - Step 2** Monitor the memory array for further degradation.
 - Step 3** If the fault occurs on a blade server memory array, remove the blade and re-insert into the chassis.
 - Step 4** In Cisco FPR Manager, decommission and recommission the server.
 - Step 5** If the above actions did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

fltAdaptorUnitUnidentifiable-fru

Fault Code: F0200

Message

Adapter [id] in server [id] has unidentified FRUAdapter [id] in server [chassisId]/[slotId] has
unidentified FRU

Explanation

This fault typically occurs because Cisco FPR Manager has detected an unsupported adapter. For example, the model, vendor, or revision is not recognized.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Verify that a supported adapter is installed.
 - Step 2** Verify that the capability catalog in Cisco FPR Manager is up to date. If necessary, update the catalog.
 - Step 3** If the above actions did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

fltAdaptorUnitMissing

Fault Code: F0203**Message**

Adapter [id] in server [id] presence: [presence]Adapter [id] in server [chassisId]/[slotId] presence: [presence]

Explanation

The adaptor is missing. Cisco FPR Manager raises this fault when any of the following scenarios occur:

- The endpoint reports there is no adapter in the adaptor slot.
- The endpoint cannot detect or communicate with the adapter in the adaptor slot.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Make sure an adapter is inserted in the adaptor slot in the server.
 - Step 2** Check whether the adaptor is connected and configured properly and is running the recommended firmware version.
 - Step 3** If the above actions did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

fltAdaptorUnitAdaptorReachability

Fault Code: F0206

Message

Adapter [id]/[id] is unreachableAdapter [chassisId]/[slotId]/[id] is unreachable

Explanation

Cisco FPR Manager cannot access the adapter. This fault typically occurs as a result of one of the following issues:

- The server does not have sufficient power.
- The I/O module is not functional.
- The adapter firmware has failed.
- The adapter is not functional

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Check the POST results for the server. In Cisco FPR Manager GUI, you can access the POST results from the General tab for the server. In Cisco FPR Manager CLI, you can access the POST results through the **show post** command under the scope for the server.
- Step 2** In Cisco FPR Manager, check the power state of the server.
- Step 3** Verify that the physical server has the same power state.
- Step 4** If the server is off, turn the server on.
- Step 5** If the above actions did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

fltAdaptorHostIfLink-down

Fault Code: F0207

Message

Adapter [transport] host interface [id]/[id]/[id] link state: [linkState]Adapter [transport] host interface [chassisId]/[slotId]/[id]/[id] link state: [linkState]

Explanation

This fault typically occurs as a result of one of the following issues:

- The fabric interconnect is in End-Host mode, and all uplink ports failed.
- The server port to which the adapter is pinned failed.
- A transient error caused the link to fail.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** If an associated port is disabled, enable the port.
- Step 2** Reacknowledge the server with the adapter that has the failed link.
- Step 3** If the above actions did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

Fault Details

fltAdaptorExtIfLink-down

Fault Code: F0209

Message

Adapter uplink interface [id]/[id]/[id] link state: [linkState]. Please verify connectivity to Fabric Interconnect. Acknowledging FEX might be required.Adapter uplink interface [chassisId]/[slotId]/[id]/[id] on security module [slotId] link state: [linkState]. Please check switch blade-facing port status. Resetting security module might be required.

Explanation

The link for a network facing adapter interface is down. Cisco FPR Manager raises this fault when any of the following scenarios occur:

- Cisco FPR Manager cannot establish and/or validate the adapter's connectivity to any of the fabric interconnects.
- The endpoint reports a link down or vNIC down event on the adapter link.
- The endpoint reports an errored link state or errored vNIC state event on the adapter link.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Verify that the adapter is connected, configured properly, and is running the recommended firmware version.
- Step 2** If the server is stuck at discovery, decommission the server and reacknowledge the server slot.
- Step 3** If the above actions did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

[stateQual][transport] port [slotId]/[portId] on fabric interconnect [id] oper state: [operState], reason:
[stateQual]
```

Explanation

This fault occurs when a fabric interconnect port is in link-down state. This state impacts the traffic destined for the port.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Verify that the physical link is properly connected between the fabric interconnect and the peer component.

- Step 2** Verify that the configuration on the peer entity is properly configured and matches the fabric interconnect port configuration.
- Step 3** Unconfigure and re-configure the port.
- Step 4** If the above actions did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

fltPortPIoFailed

Fault Code: F0277

Message

```
[transport] port [portId] on chassis [id] oper state: [operState], reason: [stateQual][transport] port
[slotId]/[aggrPortId]/[portId] on fabric interconnect [id] oper state: [operState], reason:
[stateQual][transport] port [slotId]/[portId] on fabric interconnect [id] oper state: [operState], reason:
[stateQual]
```

Explanation

This fault is raised on fabric interconnect ports and on server-facing ports on an IOM or a FEX module when FPRM detects that the port is not up and in failed state while it is expected to be up since it has been enabled by user and there is no known hardware failure or missing SFP issue and port license is valid. Additional reason is displayed by the fault description string.

Recommended Action

If you see this fault, Corrective action maybe taken based on reason information in the fault description whenever such a reason is displayed. If the fault description displays reason as "ENM source pinning failed" then it means that the fabric interconnect is operating in End-host Node Mode and the uplink port that this server facing port is pinned to is down or does not have appropriate VLAN configured. In case of such an error for an appliance port check the VLAN configuration on uplink port. A VLAN with same id as the one on the appliance port will also need to be configured on the uplink port. After setting the configuration right if you still see the fault then create a **show tech-support** file for Cisco FPR Manager and the chassis or FEX module, and then contact Cisco TAC.

fltPortPIOHardware-failure

Fault Code: F0278

Message

[transport] port [portId] on chassis [id] oper state: [operState], reason: hardware-failure[transport] port [slotId]/[aggrPortId]/[portId] on fabric interconnect [id] oper state: [operState], reason: hardware-failure[transport] port [slotId]/[portId] on fabric interconnect [id] oper state: [operState], reason: hardware-failure

Explanation

This fault is raised on fabric interconnect ports and server-facing ports on an IOM or a FEX module when the system detects a hardware failure.

Recommended Action

If you see this fault, create a **show tech-support** file for Cisco FPR Manager and the chassis or FEX module, and then contact Cisco TAC.

Fault Details

```

fltPortPIoSfp-not-present

Fault Code: F0279

Message

[transport] port [portId] on chassis [id] oper state: [operState][transport] port
[slotId]/[aggrPortId]/[portId] on fabric interconnect [id] oper state: [operState][transport] port
[slotId]/[portId] on fabric interconnect [id] oper state: [operState]

Explanation

When a fabric interconnect port is not in an unconfigured state, an SFP is required for its operation. This fault is raised to indicate that the SFP is missing from a configured port.

Recommended Action

If you see this fault, insert a supported SFP into the port on the fabric interconnect. A list of supported SFPs can be found on www.Cisco.com.

fltFabricExternalPcDown

Fault Code: F0282

Message

[type] port-channel [portId] on fabric interconnect [switchId] oper state: [operState], reason:
[stateQual][type] port-channel [portId] on fabric interconnect [switchId] oper state: [operState], reason:
[stateQual]

Explanation

This fault typically occurs when a fabric interconnect reports that a fabric port channel is operationally down.

Recommended Action

If you see this fault, take the following actions:

- Step 1** Verify that the member ports in the fabric port channel are administratively up and operational. Check the link connectivity for each port.
- Step 2** If connectivity seems correct, check the operational states on the peer switch ports of the port channel members.
- Step 3** If the above actions did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

fltDcxVcDown

Fault Code: F0283

Message

```
[transport] VIF [id] on server [chassisId] / [slotId] of switch [switchId] down, reason:
[stateQual][transport] VIF [id] on server [id] of switch [switchId] down, reason: [stateQual]
```

Explanation

This fault typically occurs when a fabric interconnect reports one of the following connectivity states for a virtual interface:

- Down
- Errored
- Unavailable

Recommended Action

If you see this fault, take the following actions:

- Step 1** Verify that the uplink physical interface is up.
- Step 2** If the vNIC/vHBA is configured for a pin group, verify that the pin group targets are configured correctly.
- Step 3** In the Network Control Policy for the vNIC, verify that the 'Action on Uplink Fail' field is set to 'warning'.
- Step 4** If the above actions did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

fltNetworkElementInoperable

Fault Code: F0291

Message

Fabric Interconnect [id] operability: [operability]

Explanation

This fault typically occurs when the fabric interconnect cluster controller reports that the membership state of the fabric interconnect is down, indicating that the fabric interconnect is inoperable.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Verify that both fabric interconnects in the cluster are running the same Kernel and System software versions.
 - Step 2** Verify that the fabric interconnects software version and the Cisco FPR Manager software versions are the same.
 - Step 3** If the above actions did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

Fault Details

fltMgmtEntityDegraded

Fault Code: F0293

Message

Fabric Interconnect [id], HA Cluster interconnect link failure

Explanation

This fault occurs when one of the cluster links (either L1 or L2) of a fabric interconnect is not operationally up. This issue impacts the full HA functionality of the fabric interconnect cluster.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Verify that both L1 and L2 links are properly connected between the fabric interconnects.
 - Step 2** If the above action did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

fltDcxNsFailed

Fault Code: F0304

Message

Server [chassisId]/[slotId] (service profile: [assignedToDn]) virtual network interface allocation failed. Server [id] (service profile: [assignedToDn]) virtual network interface allocation failed.

Explanation

The adapter's vif-namespaces activation failed due to insufficient resources. Cisco FPR Manager raises this fault when the number of deployed VIF resources exceeds the maximum VIF resources available on the adapter connected to the fabric interconnect.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Check the NS "size" and "used" resources to determine by how many vNICs the adapter exceeded the maximum.
 - Step 2** Unconfigure or delete all vNICs on the adapter above the maximum number.
 - Step 3** Add additional fabric uplinks from the IOM to the corresponding fabric interconnect and reacknowledge the chassis. This increases the "NS size" on the adapter.
 - Step 4** If the above actions did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

Fault Details

```

fltComputePhysicalInsufficientlyEquipped

Fault Code: F0305

Message

Server [id] (service profile: [assignedToDn]) has insufficient number of DIMMs, CPUs and/or adapters
Server [chassisId]/[slotId] (service profile: [assignedToDn]) has insufficient number of DIMMs, CPUs and/or adapters

Explanation

This fault typically occurs because Cisco FPR Manager has detected that the server has an insufficient number of DIMMs, CPUs, and/or adapters.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Verify that the DIMMs are installed in a supported configuration.
 - Step 2** Verify that an adapter and CPU are installed.
 - Step 3** Reacknowledge the server.
 - Step 4** If the above actions did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

Fault Code: F0306

Message

Server [id] (service profile: [assignedToDn]) has an invalid FRU
Server [chassisId]/[slotId] (service profile: [assignedToDn]) has an invalid FRU

Explanation

This fault typically occurs because Cisco FPR Manager has detected an unsupported server or CPU.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Verify that a supported server and/or CPU is installed.

- Step 2** Verify that the Cisco FPR Manager capability catalog is up to date.
- Step 3** Reacknowledge the server.
- Step 4** If the above actions did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

fltComputePhysicalDiscoveryFailed

Fault Code: F0314

Message

Server [id] (service profile: [assignedToDn]) discovery: [discovery]Server [chassisId]/[slotId] (service profile: [assignedToDn]) discovery: [discovery]

Explanation

This fault typically occurs for one of the following reasons:

- The shallow discovery that occurs when the server associated with service profile failed.
- The server is down.
- The data path is not working.
- Cisco FPR Manager cannot communicate with the CIMC on the server.
- The server cannot communicate with the fabric interconnect.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Check the FSM tab and the current state of the server and any FSM operations.
- Step 2** Check the error descriptions and see if any server components indicate a failure.
- Step 3** If the server or a server component has failed, do the following:
- a. Check the operational state of the server.
 - b. If the server is not operable, re-acknowledge the server.
- Step 4** If the above actions did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

fltComputePhysicalAssociationFailed

Fault Code: F0315

Message

Service profile [assignedToDn] failed to associate with server [id]Service profile [assignedToDn] failed to associate with server [chassisId]/[slotId]

Explanation

This fault typically occurs for one of the following reasons:

- The service profile could not be associated with the server.
- The server is down.
- The data path is not working.
- Cisco FPR Manager cannot communicate with one or more of the fabric interconnect, the server, or a component on the server.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Check the FSM tab and the current state of the server and any FSM operations.
- Step 2** If the server is stuck in an inappropriate state, such as booting, power cycle the server.
- Step 3** If the above actions did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

fltComputePhysicalUnidentified**Fault Code: F0320****Message**

Server [id] (service profile: [assignedToDn]) has an invalid FRU: [presence]Server [chassisId]/[slotId] (service profile: [assignedToDn]) has an invalid FRU: [presence]

Explanation

This fault typically occurs because Cisco FPR Manager has detected an unsupported server or CPU.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Verify that a supported server and/or CPU is installed.
 - Step 2** Verify that the Cisco FPR Manager capability catalog is up to date.
 - Step 3** Reacknowledge the server.
 - Step 4** If the above actions did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

fltComputePhysicalUnassignedInaccessible

Fault Code: F0321

Message

Server [id] (no profile) inaccessibleServer [chassisId]/[slotId] (no profile) inaccessible

Explanation

This fault typically occurs when the server, which is not associated with a service profile, has lost connection to the fabric interconnects. This fault occurs if there are communication issues between the server CIMC and the fabric interconnects.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Wait a few minutes to see if the fault clears. This is typically a temporary issue, and can occur after a firmware upgrade.
 - Step 2** If the fault does not clear after a brief time, remove the server and then reinsert it.
 - Step 3** Reacknowledge the server.
 - Step 4** If the above actions did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

fltLsServerFailed**Fault Code: F0324****Message**

Service profile [name] failed

Explanation

Server has failed. This fault typically occurs if the adapter power on self-test results in major and critical errors.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Check the POST results for the server. In Cisco FPR Manager GUI, you can access the POST results from the General tab for the server. In Cisco FPR Manager CLI, you can access the POST results through the **show post** command under the scope for the server.
 - Step 2** If the above action did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

fltLsServerDiscoveryFailed

Fault Code: F0326

Message

Service profile [name] discovery failed

Explanation

The shallow discovery that occurs when the server associated with service profile fails. If the server is up and the data path is working, this fault typically occurs as a result of one of the following issues:

- Cisco FPR Manager cannot communicate with the CIMC on the server.
- The server cannot communicate with the fabric interconnect.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Check the FSM tab and view the current state of the server and any FSM operations.
- Step 2** Check the error descriptions and see if any server components indicate a failure.
- Step 3** If the server or a server component has failed, do the following:
- a. Check the operational state of the server.
 - b. If the server is not operable, reacknowledge the server.
- Step 4** If the above actions did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

fltLsServerConfigFailure

Fault Code: F0327

Message

Service profile [name] configuration failed due to [configQualifier]

Explanation

The named configuration qualifier is not available. This fault typically occurs because Cisco FPR Manager cannot successfully deploy the service profile due to a lack of resources that meet the named qualifier. For example, this fault can occur if the following occurs:

- The service profile is configured for a server adapter with vHBAs, and the adapter on the server does not support vHBAs.
- The service profile is created from a template which includes a server pool, and the server pool is empty.
- The local disk configuration policy in the service profile specifies the No Local Storage mode, but the server contains local disks.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Check the status of the server pool associated with the service profile. If the pool is empty, add more blade servers to it.
- Step 2** Check the state of the server and ensure that it is in either the discovered or unassociated state.
- Step 3** If the server is associated or undiscovered, do one of the following:
- Discover the server.
 - Disassociate the server from the current service profile.
 - Select another server to associate with the service profile.
- Step 4** Review each policy in the service profile and verify that the selected server meets the requirements in the policy.
- Step 5** If the server does not meet the requirements of the service profile, do one of the following:
- Modify the service profile to match the server.
 - Select another server that does meet the requirements to associate with the service profile.
- Step 6** If you can verify that the server meets the requirements of the service profile, create a **show tech-support** file and contact Cisco TAC.

fltLsServerRemoved

Fault Code: F0330

Message

Service profile [name] underlying resource removed

Explanation

Cisco FPR Manager cannot access the server associated with the service profile. This fault typically occurs as a result of one of the following issues:

- The server has been physically removed from the slot.
- The server is not available.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** If the server was removed from the slot, reinsert the server in the slot.
- Step 2** If the server was not removed, remove and reinsert the server.**NOTE:** If the server is operable, this action can be disruptive to current operations.
- Step 3** If the above actions did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

Fault Details

fltLsServerInaccessible**Fault Code: F0331****Message**

Service profile [name] cannot be accessed

Explanation

Cisco FPR Manager cannot communicate with the CIMC on the server. This fault typically occurs as a result of one of the following issues:

- The server port or ports have failed.
- The I/O module is offline.
- The BMC has failed.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** If Cisco FPR Manager shows that the CIMC is down, physically reseal the server.
- Step 2** If Cisco FPR Manager shows that the server ports have failed, attempt to enable them.
- Step 3** If the I/O module is offline, check for faults on that component.
- Step 4** If the above actions did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

fltLsServerAssociationFailed

Fault Code: F0332

Message

Service profile [name] association failed for [pnDn]

Explanation

The service profile could not be associated with the server. This fault typically occurs because Cisco FPR Manager cannot communicate with one or more of the following:

- Fabric interconnect
- CIMC on the server
- SAS controller driver
- Server

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Check the FSM tab for the server and service profile to determine why the association failed.
- Step 2** If the server is stuck in an inappropriate state, such as booting, power cycle the server.
- Step 3** If the above actions did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

Fault Details

```

fltLsServerUnassociated

Fault Code: F0334

Message

Service profile [name] is not associated

Explanation

The service profile has not yet been associated with a server or a server pool. This fault typically occurs as a result of one of the following issues:

- There is no acceptable server in the server pool.
- The association failed.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** If you did not intend to associate the service profile, ignore the fault.
- Step 2** If you did intend to associate the service profile, check the association failure fault.
- Step 3** If the above actions did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

Fault Details

fltLsServerServer-unfulfilled

Fault Code: F0337

Message

Server [pnDn] does not fulfill Service profile [name] due to [configQualifier]

Explanation

The server no longer meets the qualification requirements of the service profile. This fault typically occurs as a result of one of the following issues:

- The server has been physically changed.
- A required component of the server has failed.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Check the server inventory compare to the service profile qualifications.
- Step 2** If the server inventory does not match the service profile qualifications, do one of the following:
- Associate the server with a different service profile.
 - Ensure the server has sufficient resources to qualify for the current service profile.
- Step 3** If the above actions did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

fltEtherSwitchIntFioSatellite-connection-absent

Fault Code: F0367

Message

No link between IOM port [chassisId]/[slotId]/[portId] and fabric interconnect [switchId]:[peerSlotId]/[peerPortId]

Explanation

This fault is raised when an I/O module fabric port, which links the I/O module port and the fabric interconnect, is not functional

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Verify the fabric interconnect-chassis topology. Make sure each I/O module is connected to only one fabric interconnect.
 - Step 2** Ensure that the fabric interconnect server port is configured and enabled.
 - Step 3** Ensure that the links are plugged in properly and reacknowledge the chassis.
 - Step 4** If the above actions did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

fltEtherSwitchIntFioSatellite-wiring-problem

Fault Code: F0368

Message

Invalid connection between IOM port [chassisId]/[slotId]/[portId] and fabric interconnect [switchId]:[peerSlotId]/[peerPortId]

Explanation

This fault typically occurs as a result of a satellite wiring problem on the network-facing interface of an I/O module and Cisco FPR Manager detects that at least one IOM uplink is misconnected to one of the fabric interconnect ports.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Verify the fabric interconnect-chassis topology. Make sure each I/O module is connected to only one fabric interconnect.
 - Step 2** Ensure that the links are plugged in properly and re-acknowledge the chassis.
 - Step 3** If the above actions did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

fltEquipmentPsuPowerSupplyProblem

Fault Code: F0369

Message

Power supply [id] in chassis [id] power: [power]Power supply [id] in fabric interconnect [id] power: [power]Power supply [id] in fex [id] power: [power]Power supply [id] in server [id] power: [power]

Explanation

This fault typically occurs when Cisco FPR Manager detects a problem with a power supply unit in a chassis, fabric interconnect or a FEX. For example, the PSU is not functional.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Verify that the power cord is properly connected to the PSU and the power source.
 - Step 2** Verify that the power source is 220 volts.
 - Step 3** Verify that the PSU is properly installed in the chassis or fabric interconnect.
 - Step 4** Remove the PSU and reinstall it.
 - Step 5** Replace the PSU.
 - Step 6** If the above actions did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

fltEquipmentFanDegraded**Fault Code: F0371****Message**

Fan [id] in Fan Module [tray]-[id] under chassis [id] operability: [operability]Fan [id] in fabric interconnect [id] operability: [operability]Fan [id] in fex [id] operability: [operability]Fan [id] in Fan Module [tray]-[id] under server [id] operability: [operability]

Explanation

This fault occurs when one or more fans in a fan module are not operational, but at least one fan is operational.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Review the product specifications to determine the temperature operating range of the fan module.
 - Step 2** Review the Cisco FPR Site Preparation Guide and ensure the fan module has adequate airflow, including front and back clearance.
 - Step 3** Verify that the air flows are not obstructed.
 - Step 4** Verify that the site cooling system is operating properly.
 - Step 5** Power off unused blade servers and rack servers.
 - Step 6** Clean the installation site at regular intervals to avoid buildup of dust and debris, which can cause a system to overheat.
 - Step 7** Replace the faulty fan modules.
 - Step 8** Use the Cisco FPR power capping capability to limit power usage. Power capping can limit the power consumption of the system, including blade and rack servers, to a threshold that is less than or equal to the system's maximum rated power. Power-capping can have an impact on heat dissipation and help to lower the installation site temperature.
 - Step 9** If the above actions did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

fltEquipmentIOCardRemoved

Fault Code: F0376

Message

[side] IOM [chassisId]/[id] ([switchId]) is removed

Explanation

This fault typically occurs because an I/O module is removed from the chassis. In a cluster configuration, the chassis fails over to the other I/O module. For a standalone configuration, the chassis associated with the I/O module loses network connectivity. This is a critical fault because it can result in the loss of network connectivity and disrupt data traffic through the I/O module.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Reinsert the I/O module and configure the fabric-interconnect ports connected to it as server ports and wait a few minutes to see if the fault clears.
- Step 2** If the above actions did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

fltEquipmentIOCardThermalProblem

Fault Code: F0379

Message

[side] IOM [chassisId]/[id] ([switchId]) operState: [operState]

Explanation

This fault occurs when there is a thermal problem on an I/O module. Be aware of the following possible contributing factors:

- Temperature extremes can cause Cisco FPR equipment to operate at reduced efficiency and cause a variety of problems, including early degradation, failure of chips, and failure of equipment. In addition, extreme temperature fluctuations can cause CPUs to become loose in their sockets.
- Cisco FPR equipment should operate in an environment that provides an inlet air temperature not colder than 50F (10C) nor hotter than 95F (35C).

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Review the product specifications to determine the temperature operating range of the I/O module.
 - Step 2** Review the Cisco FPR Site Preparation Guide to ensure the I/O modules have adequate airflow, including front and back clearance.
 - Step 3** Verify that the air flows on the Cisco FPR chassis are not obstructed.
 - Step 4** Verify that the site cooling system is operating properly.
 - Step 5** Power off unused blade servers and rack servers.
 - Step 6** Clean the installation site at regular intervals to avoid buildup of dust and debris, which can cause a system to overheat.
 - Step 7** Replace faulty I/O modules.
 - Step 8** Use the Cisco FPR power capping capability to limit power usage. Power capping can limit the power consumption of the system, including blade and rack servers, to a threshold that is less than or equal to the system's maximum rated power. Power-capping can have an impact on heat dissipation and help to lower the installation site temperature.
 - Step 9** If the above actions did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

fltEquipmentFanModuleThermalThresholdNonCritical

Fault Code: F0380

Message

Fan module [tray]-[id] in chassis [id] temperature: [thermal]Fan module [tray]-[id] in server [id] temperature: [thermal]Fan module [tray]-[id] in fabric interconnect [id] temperature: [thermal]

Explanation

This fault occurs when the temperature of a fan module has exceeded a non-critical threshold value, but is still below the critical threshold. Be aware of the following possible contributing factors:

- Temperature extremes can cause Cisco FPR equipment to operate at reduced efficiency and cause a variety of problems, including early degradation, failure of chips, and failure of equipment. In addition, extreme temperature fluctuations can cause CPUs to become loose in their sockets.
- Cisco FPR equipment should operate in an environment that provides an inlet air temperature not colder than 50F (10C) nor hotter than 95F (35C).

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Review the product specifications to determine the temperature operating range of the fan module.
 - Step 2** Review the Cisco FPR Site Preparation Guide to ensure the fan modules have adequate airflow, including front and back clearance.
 - Step 3** Verify that the air flows are not obstructed.
 - Step 4** Verify that the site cooling system is operating properly.
 - Step 5** Power off unused blade servers and rack servers.
 - Step 6** Clean the installation site at regular intervals to avoid buildup of dust and debris, which can cause a system to overheat.
 - Step 7** Replace faulty fan modules.
 - Step 8** Use the Cisco FPR power capping capability to limit power usage. Power capping can limit the power consumption of the system, including blade and rack servers, to a threshold that is less than or equal to the system's maximum rated power. Power-capping can have an impact on heat dissipation and help to lower the installation site temperature.
 - Step 9** If the above actions did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

Power supply [id] in chassis [id] voltage: [voltage]Power supply [id] in fabric interconnect [id] voltage: [voltage]Power supply [id] in fex [id] voltage: [voltage]Power supply [id] in server [id] voltage: [voltage]

Explanation

This fault occurs when the PSU voltage is out of normal operating range, but hasn't reached to a critical stage yet. Normally the PSU will recover itself from this situation.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Monitor the PSU for further degradation.
- Step 2** Remove and reseal the PSU.
- Step 3** If the above actions did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

Fan [id] in Fan Module [tray]-[id] under chassis [id] speed: [perf]Fan [id] in fabric interconnect [id] speed: [perf]Fan [id] in Fan Module [tray]-[id] under server [id] speed: [perf]

Explanation

This fault occurs when the fan speed reading from the fan controller does not match the desired fan speed and is outside of the normal operating range. This can indicate a problem with a fan or with the reading from the fan controller.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Monitor the fan status.
 - Step 2** If the problem persists for a long period of time or if other fans do not show the same problem, reseal the fan.
 - Step 3** Replace the fan module.

- Step 4** If the above actions did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

fltEquipmentIOCardFirmwareUpgrade

Fault Code: F0398

Message

Chassis controller in IOM [chassisId]/[id] ([switchId]) firmware upgrade problem: [upgradeStatus]

Explanation

This fault typically occurs when an IOM upgrade fails.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** On the FSM tab for the IOM, verify whether FSM for the upgrade completed successfully or failed.

- Step 2** If the FSM failed, review the error message in the FSM.
- Step 3** If the error message is self explanatory, verify the physical connectivity. For example, an error message could be No Connection to Endpoint or Link Down.
- Step 4** If the above action did not resolve the issue and the fault persists, create a **show tech-support** file and contact Cisco TAC.

fltEquipmentIOCardPeerDisconnected

Fault Code: F0403

Message

IOM [chassisId]/[id] ([switchId]) peer connectivity: [peerCommStatus]

Explanation

This fault typically occurs when an I/O module is unable to communicate with its peer I/O module.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Wait a few minutes to see if the fault clears. This is typically a temporary issue, and can occur after a firmware upgrade.
 - Step 2** If the fault does not clear after a few minutes, remove and reinsert the I/O module.
 - Step 3** If the above action did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

fltEquipmentChassisThermalThresholdCritical**Fault Code: F0409****Message**

Thermal condition on chassis [id]. [thermalStateQualifier]

Explanation

This fault occurs under the following conditions:

-
- Step 1** If a component within a chassis is operating outside the safe thermal operating range.
 - Step 2** If the chassis controller in the IOM is unable to determine the thermal condition of a blade server, the **show tech-support** file for the chassis provides a more detailed report of the most severe thermal conditions currently applicable for that chassis.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Check the temperature readings for the blade servers and IOM and ensure they are within the recommended thermal safe operating range.
 - Step 2** If the fault reports a "Thermal Sensor threshold crossing in blade" error for one or more blade servers, check if DIMM or processor temperature related faults have been raised against that blade.

- Step 3** If the fault reports a "Thermal Sensor threshold crossing in IOM" error for one or both the IOMs, check if thermal faults have been raised against that IOM. Those faults include details of the thermal condition.
- Step 4** If the fault reports a "Missing or Faulty Fan" error, check on the status of that fan. If it needs replacement, create a **show tech-support** file for the chassis and contact Cisco TAC.
- Step 5** If the fault reports a "No connectivity between IOM and blade" or "Thermal Sensor readings unavailable from blade" error, check if that blade server is operational and whether any faults have been raised against that blade server. In this situation, the chassis controller may go into a fail-safe operating mode and the fan speeds may increase as a precautionary measure.
- Step 6** If the above actions did not resolve the issue and the condition persists, create a **show tech-support** file for Cisco FPR Manager and the chassis and contact Cisco TAC.

Fault Details

fltMgmtEntityHa-not-ready

Fault Code: F0429

Message

Fabric Interconnect [id], HA functionality not ready

Explanation

This fault occurs if Cisco FPR Manager cannot discover or communicate with one or more chassis or rack servers to write the HA Cluster state. This impacts the full HA functionality of the fabric interconnect cluster.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Verify that the initial setup configuration is correct on both fabric interconnects.
 - Step 2** Verify that the L1 and L2 links are properly connected between the fabric interconnects.
 - Step 3** Verify that the IOMs and/or FEXes are reachable and the server ports are enabled and operationally up.
 - Step 4** Verify that the chassis and/or rack servers are powered up and reachable
 - Step 5** If the above actions did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

Fault Code: F0430

Message

Fabric Interconnect [id], management services, incompatible versions

Explanation

This fault occurs if the Cisco FPR Manager software on the subordinate fabric interconnect is not the same release as that of the primary fabric interconnect. This impacts the full HA functionality of the fabric interconnect cluster.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Upgrade the Cisco FPR Manager software on the subordinate fabric interconnect to the same release as the primary fabric interconnect and verify that both fabric interconnects are running the same release of Cisco FPR Manager.
- Step 2** If the above action did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

fltEquipmentIOCardAutoUpgradingFirmware

Fault Code: F0435

Message

IOM [chassisId]/[id] ([switchId]) is auto upgrading firmware

Explanation

This fault typically occurs when an I/O module is auto upgrading. Auto-upgrade occurs when the firmware version on the IOM is incompatible with the firmware version on the fabric interconnect.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** If the IOM and fabric interconnects are not running the same firmware version, wait for the auto-upgrade to complete.
 - Step 2** When the IOM upgrade is completed, verify that Cisco FPR Manager has cleared this fault.
 - Step 3** If you see this fault after the IOM overall status changes to operable, create a **show tech-support** file and contact Cisco TAC.

fltFirmwarePackItemImageMissing

Fault Code: F0436

Message

[type] image with vendor [hwVendor], model [hwModel] and version [version] is deleted

Explanation

This fault typically occurs when the image to which a firmware package item refers is missing.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** In Cisco FPR Manager GUI, navigate to the Firmware Management Images tab and determine whether the missing image is available or not.
 - Step 2** If the image is present, click on it to verify the model and vendor.
 - Step 3** If the image for the required model and vendor is not present, download that image or bundle from the Cisco.com website.
 - Step 4** If the image is present and the fault persists, create a **show tech-support** file and contact Cisco TAC.

fltEtherSwitchIntFioSatellite-wiring-numbers-unexpected

Fault Code: F0440

Message

Chassis discovery policy conflict: Link IOM [chassisId]/[slotId]/[portId] to fabric interconnect [switchId]:[peerSlotId]/[peerPortId] not configured

Explanation

The configuration of the chassis discovery policy conflicts with the physical IOM uplinks. Cisco FPR Manager raises this fault when the chassis discovery policy is configured for more links than are physically cabled between the IOM uplinks on the chassis and the fabric interconnect.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Ensure that you cable at least the same number of IOM uplinks as are configured in the chassis discovery policy, and that you configure the corresponding server ports on the fabric interconnect.
 - Step 2** Reacknowledge the chassis.
 - Step 3** If the above actions did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

fltDcxVcMgmt-vif-down

Fault Code: F0459

Message

IOM [chassisId] / [slotId] ([switchId]) management VIF [id] down, reason [stateQual]

Explanation

This fault occurs when the transport VIF for an I/O module is down. Cisco FPR Manager raises this fault when a fabric interconnect reports the connectivity state on virtual interface as one of the following:

- Down
- Errored
- Unavailable

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Verify that the chassis discovery has gone through successfully. Check the states on all communicating ports from end to end.
- Step 2** If connectivity seems correct, decommission and recommission the chassis.
- Step 3** If the above actions did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

fltSysdebugMEpLogMEpLogLog

Fault Code: F0460

Message

Log capacity on [side] IOM [chassisId]/[id] is [capacity]Log capacity on Management Controller on server [chassisId]/[slotId] is [capacity]Log capacity on Management Controller on server [id] is [capacity]

Explanation

This fault typically occurs because Cisco FPR Manager has detected that the system event log (SEL) on the server is approaching full capacity. The available capacity in the log is low. This is an info-level fault and can be ignored if you do not want to clear the SEL at this time.

Recommended Action

If you see this fault, you can clear the SEL in Cisco FPR Manager if desired.

Fault Code: F0462

Message

Log capacity on [side] IOM [chassisId]/[id] is [capacity]Log capacity on Management Controller on server [chassisId]/[slotId] is [capacity]Log capacity on Management Controller on server [id] is [capacity]

Explanation

This fault typically occurs because Cisco FPR Manager could not transfer the SEL file to the location specified in the SEL policy. This is an info-level fault and can be ignored if you do not want to clear the SEL at this time.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Verify the configuration of the SEL policy to ensure that the location, user, and password provided are correct.
- Step 2** If you do want to transfer and clear the SEL and the above action did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

fltComputePoolEmpty

Fault Code: F0463

Message

server pool [name] is empty

Explanation

This fault typically occurs when the selected server pool does not contain any servers.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Verify the qualifier settings in the server pool policy qualifications. If the policy was modified after the server was discovered, reacknowledge the server.
 - Step 2** Manually associate the service profile with a server.
 - Step 3** If the server pool is not used, ignore the fault.
 - Step 4** If the above actions did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

Fault Details

```

fltFirmwareUpdatableImageUnusable

Fault Code: F0470

Message

backup image is unusable. reason: [operStateQual]

Explanation

This fault typically occurs when the backup firmware image on an endpoint is unusable.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Review the fault and the error message on the FSM tab for the endpoint to determine why the firmware image is unusable.
- Step 2** If the firmware image is bad or corrupted, download another copy from the Cisco website and update the backup version on the endpoint with the new image.
- Step 3** If the image is present and the fault persists, create a **show tech-support** file and contact Cisco TAC.

Fault Details

fltFirmwareBootUnitCantBoot

Fault Code: F0471

Message

unable to boot the startup image. End point booted with backup image

Explanation

This fault typically occurs when the startup firmware image on an endpoint is corrupted or invalid, and the endpoint cannot boot from that image.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Review the fault and the error message on the FSM tab for the endpoint to determine why the firmware image is unusable. The error message usually includes an explanation for why the endpoint could not boot from the startup image, such as Bad-Image or Checksum Failed.
 - Step 2** If the firmware image is bad or corrupted, download another copy from the Cisco website and update the startup version on the endpoint with the new image.
 - Step 3** If the fault persists, create a **show tech-support** file and contact Cisco TAC.

Affected MO: org-[name]/wwn-pool-[name]
```

fltEquipmentIOCardInaccessible

Fault Code: F0478

Message

[side] IOM [chassisId]/[id] ([switchId]) is inaccessible

Explanation

This fault typically occurs because an I/O module has lost its connection to the fabric interconnects. In a cluster configuration, the chassis fails over to the other I/O module. For a standalone configuration, the chassis associated with the I/O module loses network connectivity. This is a critical fault because it can result in the loss of network connectivity and disrupt data traffic through the I/O module.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Wait a few minutes to see if the fault clears. This is typically a temporary issue, and can occur after a firmware upgrade.
- Step 2** If the above action did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

Fault Details

```

fltEquipmentFanModuleDegraded

Fault Code: F0480

Message

Fan module [tray]-[id] in chassis [id] operability: [operability]Fan module [tray]-[id] in server [id] operability: [operability]Fan module [tray]-[id] in fabric interconnect [id] operability: [operability]

Explanation

This fault occurs when a fan module is not operational.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Review the product specifications to determine the temperature operating range of the fan module.
 - Step 2** Review the Cisco FPR Site Preparation Guide to ensure the fan module has adequate airflow, including front and back clearance.
 - Step 3** Verify that the air flows for the fan module are not obstructed.
 - Step 4** Verify that the site cooling system is operating properly.
 - Step 5** Power off unused blade servers and rack servers.
 - Step 6** Clean the installation site at regular intervals to avoid buildup of dust and debris, which can cause a system to overheat.
 - Step 7** Use the Cisco FPR power capping capability to limit power usage. Power capping can limit the power consumption of the system, including blade and rack servers, to a threshold that is less than or equal to the system's maximum rated power. Power-capping can have an impact on heat dissipation and help to lower the installation site temperature.
 - Step 8** If the above actions did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

Fault Details

```

```

fltEquipmentIOCardPost-failure

Fault Code: F0481

Message

[side] IOM [chassisId]/[id] ([switchId]) POST failure

Explanation

This fault typically occurs when an I/O module encounters errors during the Power On Self Test (POST). The impact of this fault varies according to the errors that were encountered during POST.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Check the POST results for the I/O module. In Cisco FPR Manager GUI, you can access the POST results from the General tab for the I/O module. In Cisco FPR Manager CLI, you can access the POST results through the show post command under the scope for the I/O module.

- Step 2** If the POST results indicate FRU error, check if FPR manager has raised fault for the FRU and follow recommended action for the fault.
- Step 3** Otherwise, reboot the I/O module.
- Step 4** If the above actions did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

Fault Details

Is Implemented: true
Affected MO: sys/chassis-[id]/slot-[id]
Affected MO: sys/fex-[id]/slot-[id]
```

fltEquipmentFanPerfThresholdLowerNonRecoverable

Fault Code: F0484

Message

Fan [id] in Fan Module [tray]-[id] under chassis [id] speed: [perf]Fan [id] in fabric interconnect [id] speed: [perf]Fan [id] in Fan Module [tray]-[id] under server [id] speed: [perf]

Explanation

This fault occurs when the fan speed reading from the fan controller is far below the desired fan speed, and the fan has likely failed.

Recommended Action

If you see this fault, create a detailed **show tech-support** file for the chassis and replace the fan module. If necessary, contact Cisco TAC.

Fault Details

```
Severity: critical
Cause: performance-problem
mibFaultCode: 484

Affected MO: sys/switch-[id]/fan-[id]
Affected MO: sys/switch-[id]/fan-module-[tray]-[id]/fan-[id]
```

fltMemoryUnitIdentity-unestablishable

Fault Code: F0502

Message

DIMM [location] on server [chassisId]/[slotId] has an invalid FRUDIMM [location] on server [id] has an invalid FRU

Explanation

This fault typically occurs because Cisco FPR Manager has detected unsupported DIMM in the server. For example, the model, vendor, or revision is not recognized.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Verify that the capability catalog in Cisco FPR Manager is up to date. If necessary, update the catalog.
 - Step 2** If the above action did not resolve the issue, you may have unsupported DIMMs or DIMM configuration in the server. Create a **show tech-support** file and contact Cisco TAC.

Fault Details

fltComputePhysicalPost-failure

Fault Code: F0517

Message

Server [id] POST or diagnostic failureServer [chassisId]/[slotId] POST or diagnostic failure

Explanation

This fault typically occurs when the server has encountered a diagnostic failure or an error during POST.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Check the POST results for the server. In Cisco FPR Manager GUI, you can access the POST results from the General tab for the server. In Cisco FPR Manager CLI, you can access the POST results through the show post command under the scope for the server.
 - Step 2** Reboot the server.

- Step 3** If the above actions did not resolve the issue, execute the **show tech-support** command and contact Cisco Technical Support.

Fault Details

```
Severity: major

fltEquipmentPsuOffline

Fault Code: F0528

Message

Power supply [id] in chassis [id] power: [power]Power supply [id] in fabric interconnect [id] power: [power]Power supply [id] in fex [id] power: [power]Power supply [id] in server [id] power: [power]

Explanation

This fault typically occurs when Cisco FPR Manager detects that a power supply unit in a chassis, fabric interconnect, or FEX is offline.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Verify that the power cord is properly connected to the PSU and the power source.
- Step 2** Verify that the power source is 220 volts.
- Step 3** Verify that the PSU is properly installed in the chassis or fabric interconnect.
- Step 4** Remove the PSU and reinstall it.
- Step 5** Replace the PSU.
- Step 6** If the above actions did not resolve the issue, note down the type of PSU, execute the **show tech-support** command, and contact Cisco Technical Support.

Fault Details

Is Implemented: true
Affected MO: sys/chassis-[id]/blade-[slotId]/board/rtc-battery
```

Affected MO: `sys/rack-unit-[id]/board/rtc-battery`

fltMemoryBufferUnitThermalThresholdNonCritical

Fault Code: F0535

Message

Buffer Unit [id] on server [chassisId]/[slotId] temperature: [thermal] Buffer Unit [id] on server [id] temperature: [thermal]

Explanation

This fault occurs when the temperature of a memory buffer unit on a blade or rack server exceeds a non-critical threshold value, but is still below the critical threshold. Be aware of the following possible contributing factors:

- Temperature extremes can cause Cisco FPR equipment to operate at reduced efficiency and cause a variety of problems, including early degradation, failure of chips, and failure of equipment. In addition, extreme temperature fluctuations can cause CPUs to become loose in their sockets.
- Cisco FPR equipment should operate in an environment that provides an inlet air temperature not colder than 50F (10C) nor hotter than 95F (35C).
- If sensors on a CPU reach 179.6F (82C), the system will take that CPU offline.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Review the product specifications to determine the temperature operating range of the server.
 - Step 2** Review the Cisco FPR Site Preparation Guide to ensure the servers have adequate airflow, including front and back clearance.
 - Step 3** Verify that the air flows on the Cisco FPR chassis or rack server are not obstructed.
 - Step 4** Verify that the site cooling system is operating properly.
 - Step 5** Power off unused blade servers and rack servers.
 - Step 6** Clean the installation site at regular intervals to avoid buildup of dust and debris, which can cause a system to overheat.
 - Step 7** Use the Cisco FPR power capping capability to limit power usage. Power capping can limit the power consumption of the system, including blade and rack servers, to a threshold that is less than or equal to the system's maximum rated power. Power-capping can have an impact on heat dissipation and help to lower the installation site temperature.
 - Step 8** If the above actions did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

Fault Details

```

fltMemoryBufferUnitThermalThresholdNonRecoverable

Fault Code: F0537

Message

Buffer Unit [id] on server [chassisId]/[slotId] temperature: [thermal] Buffer Unit [id] on server [id] temperature: [thermal]

Explanation

This fault occurs when the temperature of a memory buffer unit on a blade or rack server has been out of the operating range, and the issue is not recoverable. Be aware of the following possible contributing factors:

- Temperature extremes can cause Cisco FPR equipment to operate at reduced efficiency and cause a variety of problems, including early degradation, failure of chips, and failure of equipment. In addition, extreme temperature fluctuations can cause CPUs to become loose in their sockets.
- Cisco FPR equipment should operate in an environment that provides an inlet air temperature not colder than 50F (10C) nor hotter than 95F (35C).
- If sensors on a CPU reach 179.6F (82C), the system will take that CPU offline.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Review the product specifications to determine the temperature operating range of the server.
 - Step 2** Review the Cisco FPR Site Preparation Guide to ensure the servers have adequate airflow, including front and back clearance.
 - Step 3** Verify that the air flows on the Cisco FPR chassis or rack server are not obstructed.
 - Step 4** Verify that the site cooling system is operating properly.
 - Step 5** Power off unused blade servers and rack servers.
 - Step 6** Clean the installation site at regular intervals to avoid buildup of dust and debris, which can cause a system to overheat.
 - Step 7** Use the Cisco FPR power capping capability to limit power usage. Power capping can limit the power consumption of the system, including blade and rack servers, to a threshold that is less than or equal to the system's maximum rated power. Power-capping can have an impact on heat dissipation and help to lower the installation site temperature.

fltSwVlanPortNsResourceStatus**Fault Code: F0549****Message**

Vlan-Port Resource exceeded

Explanation

This fault occurs when the total number of configured VLANs in the Cisco FPR instance has exceeded the allowed maximum number of configured VLANs on the fabric interconnect.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** In the Cisco FPR Manager CLI or Cisco FPR Manager GUI, check the port VLAN count to determine by how many VLANs the system is over the maximum.
- Step 2** Reduce the VLAN port count in one of the following ways:
- Delete VLANs configured on the LAN cloud.
 - Delete VLANs configured on vNICs.
 - Unconfigure one or more vNICs.
 - Unconfigure one or more uplink Ethernet ports on the fabric interconnect.
- Step 3** If the above actions did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

fltAdaptorExtEthIfMisConnect

Fault Code: F0625

Message

Adapter [id] eth interface [id] in server [id] mis-connected

Explanation

The link for a network-facing adapter interface is misconnected. Cisco FPR Manager raises this fault when any of the following scenarios occur:

- Cisco FPR Manager detects a new connectivity between a previously configured switch port or FEX port and the adapter's external interface.
- Cisco FPR Manager detects a misconnected link between a fabric interconnect or FEX and its non-peer adapter's interface.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Check whether the adapter link is connected to a port that belongs to its peer fabric interconnect or FEX.
- Step 2** If that connectivity seems correct, reacknowledge the server.

Step 3 If the above actions did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

fltAdaptorHostEthIfMisConnect

Fault Code: F0626

Message

Adapter [id] eth interface [id] in server [id] mis-connected

Explanation

The link for a network-facing host interface is misconnected. Cisco FPR Manager raises this fault when any of the following scenarios occur:

- Cisco FPR Manager detects a new connectivity between a previously configured switch port and the host Ethernet interface.
- Cisco FPR Manager detects a misconnected link between the host interface and its non-peer fabric interconnect.

Recommended Action

If you see this fault, take the following actions:

Step 1 Check whether the host Ethernet interface is connected to a port belonging to its peer fabric interconnect.

Step 2 If connectivity seems correct, reacknowledge the server.

Step 3 If the above actions did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

fltPowerBudgetPowerBudgetCmcProblem

Fault Code: F0635

Message

Power cap application failed for chassis [id]

Explanation

This fault typically occurs when the server CIMC has failed to enforce the configured power cap.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Check the power consumption of the chassis. If the chassis is consuming significantly more power than configured in the power cap, consider reducing the group cap so that the power consumption of other chassis consumption can be reduced to make up for the increase.
- Step 2** If the above action did not resolve the issue, create a **show tech-support** file for Cisco FPR Manager and the chassis and then contact Cisco TAC.

Fault Code: F0643

Message

admin committed insufficient for power group [name], using previous value [operCommitted]

Explanation

This fault typically occurs when the group cap is insufficient to meet the minimum hardware requirements. Under these circumstances, Cisco FPR Manager uses the previously entered group cap for provisioning.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Consider increasing the group cap.
- Step 2** Reduce the number of blade servers or chassis in the Cisco FPR instance.
- Step 3** If the above actions did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

fltMgmtIfMisConnect

Fault Code: F0688

Message

Management Port [id] in server [id] is mis connected

Explanation

This fault occurs when the server and FEX connectivity changes.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Check the connectivity between the server and FEX.
- Step 2** If the connectivity was changed by mistake, restore it to its previous configuration.
- Step 3** If the connectivity change was intentional, reacknowledge the server.
- Step 4** If the above actions did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

fltLsComputeBindingAssignmentRequirementsNotMet

Fault Code: F0689

Message

Assignment of service profile [name] to server [pnDn] failed

Explanation

The server could not be assigned to the selected service profile. This fault typically occurs as a result of one of the following issues:

- The selected server does not meet the requirements of the service profile.
- If the service profile was configured for restricted migration, the selected server does not match the currently or previously assigned server.

Recommended Action

If you see this fault, select a different server that meets the requirements of the service profile or matches the currently or previously assigned server.

Fault Details

fltEquipmentFexPost-failure

Fault Code: F0702

Message

fex [id] POST failure

Explanation

This fault typically occurs when a FEX encounters errors during the Power On Self Test (POST). The impact of this fault varies depending on which errors were encountered during POST.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Check the POST results for the FEX. In the Cisco FPR Manager GUI, you can access the POST results from the General tab for the FEX. In the Cisco FPR Manager CLI, you can access the POST results by entering the **show post** command under the scope for the FEX.
 - Step 2** Reboot the FEX.
 - Step 3** If the above actions did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

Fault Details

```

fltAdaptorHostEthIfMissing

Fault Code: F0708

Message

Connection to Adapter [id] eth interface [id] in server [id] missing

Explanation

The link for a network-facing host interface is missing. Cisco FPR Manager raises this fault when it detects missing connectivity between a previously configured switch port and its previous peer host interface.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Check whether the adapter link is connected to a port that belongs to its non-peer fabric interconnect.
 - Step 2** If that connectivity seems correct, reacknowledge the server.
 - Step 3** If the above actions did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

Fault Details

fltEquipmentIOCardThermalThresholdNonCritical

Fault Code: F0729

Message

[side] IOM [chassisId]/[id] ([switchId]) temperature: [thermal]

Explanation

This fault occurs when the temperature of an I/O module has exceeded a non-critical threshold value, but is still below the critical threshold. Be aware of the following possible contributing factors:

- Temperature extremes can cause Cisco FPR equipment to operate at reduced efficiency and cause a variety of problems, including early degradation, failure of chips, and failure of equipment. In addition, extreme temperature fluctuations can cause CPUs to become loose in their sockets.
- Cisco FPR equipment should operate in an environment that provides an inlet air temperature not colder than 50F (10C) nor hotter than 95F (35C).
- If sensors on a CPU reach 179.6F (82C), the system will take that CPU offline.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Review the product specifications to determine the temperature operating range of the I/O module.
- Step 2** Review the Cisco FPR Site Preparation Guide to ensure the chassis and I/O modules have adequate airflow, including front and back clearance.
- Step 3** Verify that the air flows on the Cisco FPR chassis and I/O module are not obstructed.
- Step 4** Verify that the site cooling system is operating properly.
- Step 5** Power off unused blade servers and rack servers.
- Step 6** Clean the installation site at regular intervals to avoid buildup of dust and debris, which can cause a system to overheat.

- Step 7** Use the Cisco FPR power capping capability to limit power usage. Power capping can limit the power consumption of the system, including blade and rack servers, to a threshold that is less than or equal to the system's maximum rated power. Power-capping can have an impact on heat dissipation and help to lower the installation site temperature.
- Step 8** If the above actions did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

fltEquipmentIOCardThermalThresholdNonRecoverable

Fault Code: F0731

Message

[side] IOM [chassisId]/[id] ([switchId]) temperature: [thermal]

Explanation

This fault occurs when the temperature of an I/O module has been out of the operating range, and the issue is not recoverable. Be aware of the following possible contributing factors:

- Temperature extremes can cause Cisco FPR equipment to operate at reduced efficiency and cause a variety of problems, including early degradation, failure of chips, and failure of equipment. In addition, extreme temperature fluctuations can cause CPUs to become loose in their sockets.
- Cisco FPR equipment should operate in an environment that provides an inlet air temperature not colder than 50F (10C) nor hotter than 95F (35C).
- If sensors on a CPU reach 179.6F (82C), the system will take that CPU offline.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Review the product specifications to determine the temperature operating range of the I/O module.
- Step 2** Review the Cisco FPR Site Preparation Guide to ensure the chassis and I/O modules have adequate airflow, including front and back clearance.
- Step 3** Verify that the air flows on the Cisco FPR chassis and I/O module are not obstructed.

fltSysdebugAutoCoreFileExportTargetAutoCoreTransferFailure

Fault Code: F0747

Message

Auto core transfer failure at remote server [hostname]:[path] [exportFailureReason]

Explanation

This fault occurs when Cisco Firepower Manager cannot transfer a core file to a remote TFTP server. This is typically the result of one of the following issues:

- The remote TFTP server is not accessible.
- One or more of the parameters for the TFTP server that are specified for the core export target, such as path, port, and server name, are incorrect.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Verify the connectivity to the remote server.
 - Step 2** Verify the path information of the remote server.
 - Step 3** If the above actions did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

fltPowerBudgetTStateTransition

Fault Code: F0765

Message

Blade [chassisId]/[slotId] has been severely throttled. CIMC can recover if budget is redeployed to the blade or by rebooting the blade. If problem persists, please ensure that OS is ACPI compliant. Rack server [id] has been severely throttled. CIMC can recover if budget is redeployed to the blade or by rebooting the blade. If problem persists, please ensure that OS is ACPI compliant.

Explanation

This fault typically occurs when the processor T-state is used to severely throttle the CPU.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Redeploy the power budget for the affected power group, blade server, or chassis.
 - Step 2** If the problem persists, reboot the blade server.
 - Step 3** If the above actions did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

fltPowerPolicyPowerPolicyApplicationFail

Fault Code: F0766

Message

Insufficient budget to apply no-cap priority through policy [name]. Blades will continue to be capped.

Explanation

This fault occurs when a power policy cannot be applied to one or more blade servers. The affected blade servers cannot operate normally without power capping due to the limited power budget for those servers.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Increase the power budget for the blade servers in the power policy.
- Step 2** If the above action did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

Fault Details

fltMgmtIfNew

Fault Code: F0772

Message

New connection discovered on Management Port [id] in server [id]

Explanation

This fault occurs when the connectivity between a server and a FEX is added or changed.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Check the connectivity between the server and FEX.
- Step 2** If the connectivity was changed by mistake, restore it to its previous configuration.
- Step 3** If the connectivity change was intentional, reacknowledge the server.
- Step 4** If the above actions did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

fltAdaptorExtEthIfMissing

Fault Code: F0775

Message

Connection to Adapter [id] eth interface [id] in server [id] missing

Explanation

The link for a network-facing adapter interface is misconnected. Cisco FPR Manager raises this fault when it detects that the connectivity between a previously configured port on a fabric interconnect or FEX and its prior peer network-facing adapter interface is misconnected or missing.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Check whether the adapter interface is connected to a port belonging to its peer fabric interconnect or FEX.
 - Step 2** If the connectivity seems correct, reacknowledge the server.
 - Step 3** If the above actions did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

Fault Details

fltStorageLocalDiskSlotEpUnusable

Fault Code: F0776

Message

Local disk [id] on server [serverId] is not usable by the operating system

Explanation

This fault occurs when the server disk drive is in a slot that is not supported by the storage controller.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Insert the server disk drive in a supported slot.
- Step 2** If the above action did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

fltEquipmentFexIdentity-unestablishable

Fault Code: F0778

Message

Fex [id] has an invalid FRU

Explanation

This fault typically occurs because Cisco FPR Manager detected an unsupported chassis. For example, the model, vendor, or revision is not recognized.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Verify that the capability catalog in Cisco FPR Manager is up to date. If necessary, update the catalog.
 - Step 2** If the above action did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

fltLsmaintMaintPolicyUnresolvableScheduler

Fault Code: F0795

Message

Schedule [schedName] referenced by maintenance policy [name] does not exist

Explanation

The schedule that is referenced by the maintenance policy does not exist. This fault typically occurs as a result of one of the following issues:

- The schedule does not exist.
- The schedule was deleted.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Check if the named schedule exists. If it is deleted or missing, try to create it.

- Step 2** If the named schedule is deleted or missing, recreate it.
- Step 3** If the above action did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

fltPowerBudgetFirmwareMismatch

Fault Code: F0798

Message

Firmware on blade [chassisId]/[slotId] does not allow chassis level power capping. Please consider upgrading to at least 1.4 version

Explanation

This fault typically occurs when the CIMC or BIOS firmware on a server is an earlier release than Cisco FPR, Release 1.4.

Recommended Action

If you see this fault, consider upgrading the CIMC firmware, and the entire Cisco FPR instance if necessary, to Cisco FPR, Release 1.4 or later.

fltFabricEpMgrEpTransModeFail

Fault Code: F0832

Message

Port constraint violation on switch [id]: [confQual]

Explanation

This fault occurs when at least one logical interface is misconfigured. This can happen when upgrading to a different type or series of fabric interconnect or when importing a configuration. The configuration must meet the following constraints:

- There must be at most one logical port per fabric interconnect ID/module ID/port ID.

Recommended Action

If you see this fault, take the following action:

-
- Step 1** Create a list of all logical interfaces that are misconfigured and have caused an 'error-misconfigured' fault.
 - Step 2** For each logical interface, note the reason listed in the fault for the misconfiguration.
 - Step 3** Log into Cisco FPR Manager and correct each misconfigured logical interface. If you used the Cisco FPR Manager CLI, commit all changes.
 - Step 4** Review any faults or error messages that describe additional misconfigurations and correct those errors.
 - Step 5** If the above actions did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

Fault Details

fltFabricEthLanEpMissingPrimaryVlan

Fault Code: F0835

Message

Primary vlan missing from fabric: [switchId], port: [slotId]/[aggrPortId]/[portId]. Primary vlan missing from fabric: [switchId], port: [slotId]/[portId].

Explanation

This fault occurs when an uplink port or port channel is configured with a primary VLAN that does not exist in the Cisco FPR instance.

Recommended Action

If you see this fault, take the following action:

-
- Step 1** Update the configuration of the port or port channel to include a primary VLAN.
- Step 2** If the above action did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

fltFabricEthLanPcMissingPrimaryVlan

Fault Code: F0836

Message

Primary vlan missing from fabric: [switchId], port-channel: [portId].

Explanation

This fault occurs when an uplink port or port channel is configured with a primary VLAN that does not exist in the Cisco FPR instance.

Recommended Action

If you see this fault, take the following action:

-
- Step 1** Update the configuration of the port or port channel to include a primary VLAN.
 - Step 2** If the above action did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

fltVnicEtherPinningMismatch**Fault Code: F0840****Message**

Hard pinning target for eth vNIC [name], service profile [name] does not have all the required vlans configured

Explanation

This fault occurs when one or more VLANs required by vNIC in a service profile are not configured on the target uplink port or port channel for a hard-pinned LAN pin group.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** In the LAN Uplinks Manager of the Cisco FPR Manager GUI, configure all of the VLANs in the vNIC in the target uplink port or port channel for the LAN pin group. If you prefer to use the Cisco FPR Manager CLI, navigate to scope **/eth-uplink/vlan** and create the required member ports for the LAN pin group.
 - Step 2** If the above action did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

fltVnicEtherPinningMisconfig

Fault Code: F0841

Message

Hard pinning target for eth vNIC [name], service profile [name] is missing or misconfigured

Explanation

This fault occurs when one or more vNIC target uplink ports or port channels for a hard-pinned LAN pin group are either missing or misconfigured as the wrong port type.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Review the LAN pin group configuration.
 - Step 2** Correct the configuration of the port and port channels in the pin group.
 - Step 3** Ensure that all required vLANs are allowed on the target ports or port channels.
 - Step 4** If the above actions did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

fltProcessorUnitDisabled

Fault Code: F0842

Message

Processor [id] on server [chassisId]/[slotId] operState: [operState]Processor [id] on server [id] operState: [operState]

Explanation

This fault occurs in the unlikely event that a processor is disabled.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** If this fault occurs on a blade server, remove and reinsert the server into the chassis.
 - Step 2** In Cisco FPR Manager, decommission and recommission the blade server.
 - Step 3** If the above actions did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

Fault Details

```

```

fltMemoryUnitDisabled

Fault Code: F0844

Message

DIMM [location] on server [chassisId]/[slotId] operState: [operState]DIMM [location] on server [id] operaState: [operState]

Explanation

This fault is raised when the server BIOS disables a DIMM. The BIOS could disable a DIMM for several reasons, including incorrect location of the DIMM or incompatible speed.

Recommended Action

If you see this fault, refer to the Cisco FPR B-Series Troubleshooting Guide for information on how to resolve the DIMM issues.

Fault Details

```

```

fltFirmwareBootUnitActivateStatusFailed

Fault Code: F0856

Message

Activation failed and Activate Status set to failed.

Explanation

This fault typically occurs for the following reasons: when firmware activation fails, or if the after activation running image is not the corresponding startup image.

- Firmware activation failed.
- The version of firmware running on the server after activation is not the version listed in Cisco FPR Manager as the startup image.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Go to FSM tab for the endpoint on which the fault is raised and review the error description for the reason that the activation failed.
- Step 2** If the FSM failed, review the error message in the FSM.
- Step 3** If possible, correct the problem described in the error message.
- Step 4** If the problem persists, create a **show tech-support** file and contact Cisco TAC.

fltFabricInternalPcDown

Fault Code: F0858

Message

[type] port-channel [portId] on fabric interconnect [id] oper state: [operState], reason: [stateQual]

Explanation

This fault occurs when the transport VIF for a server is down. Cisco FPR Manager raises this fault when a fabric interconnect reports the connectivity state on virtual interface as one of the following:

- Down
- Errored
- Unavailable

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Verify that the blade server discovery was successful.
 - Step 2** Check the states on all communicating ports from end to end.
 - Step 3** If connectivity seems correct, decommission and recommission the server.
 - Step 4** If the above actions did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

Fault Details

fltMgmtEntityDevice-1-shared-storage-error**Fault Code: F0863****Message**

device [chassis1], error accessing shared-storage

Explanation

This fault occurs in an unlikely event that the shared storage selected for writing the cluster state is not accessible. This fault is typically a transient fault. You might see this fault when one of the following occurs: (a) the Fabric Interconnect boots, (b) the IO Module is reset, (c) the rack server is reboot, or (d) system is upgraded/downgraded. If this fault is not cleared after the system returns to normal operation following the reboot/reset/upgrade/downgrade, then it may affect the full HA functionality of the Fabric Interconnect cluster.

Recommended Action

If this fault is not cleared even after the system returns to normal operation, create a **show tech-support** file and contact Cisco TAC.

Fault Details

```

fltMgmtEntityHa-ssh-keys-mismatched

Fault Code: F0866

Message

Fabric Interconnect [id], management services, mismatched SSH keys

Explanation

This fault indicates that one of the following scenarios has occurred:

- The internal SSH keys used for HA in the cluster configuration are mismatched. This causes certain operations to fail.
- Another fabric interconnect is connected to the primary fabric interconnect in the cluster without first erasing the existing configuration in the primary.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Log into the Cisco FPR Manager CLI on the subordinate fabric interconnect.
 - Step 2** Enter **connect local-mgmt**
 - Step 3** Enter **erase configuration** to erase the configuration on the subordinate fabric interconnect and reboot it.
 - Step 4** When the secondary fabric interconnect has rebooted, reconfigure it for the cluster.
 - Step 5** If the above actions did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

Fault Details

```

fltEquipmentPsuPowerSupplyShutdown

Fault Code: F0881

Message

Power supply [id] in chassis [id] shutdown reason:[powerStateQualifier]

Explanation

This fault typically occurs when a power supply unit in a chassis, fabric interconnect, or a FEX is shut down, either due to higher than expected power current, higher than expected temperatures, or the failure of a fan.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Review the product specifications to determine the temperature operating range of the server.
 - Step 2** Review the Cisco FPR Site Preparation Guide to ensure the servers have adequate airflow, including front and back clearance.
 - Step 3** Verify that the air flows on the Cisco FPR chassis or rack server are not obstructed.
 - Step 4** Verify that the site cooling system is operating properly.
 - Step 5** Power off unused blade servers and rack servers.
 - Step 6** Verify that the power cord is properly connected to the PSU and the power source.
 - Step 7** Verify that the power source is 220 volts.
 - Step 8** Verify that the PSU is properly installed in the chassis or fabric interconnect.
 - Step 9** Remove the PSU and reinstall it.
 - Step 10** Replace the PSU.
 - Step 11** If the above actions did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

Fault Details

fltNetworkElementInventoryFailed

Fault Code: F0885

Message

Fabric Interconnect [id] inventory is not complete [inventoryStatus]

Explanation

Cisco FPR Manager raises this fault when the management subsystem is unable to perform an inventory of the physical components, such as I/O cards or physical ports.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Ensure that both fabric interconnects in an HA cluster are running the same software versions.
 - Step 2** Ensure that the fabric interconnect software is a version that is compatible with the Cisco FPR Manager software.
 - Step 3** If the above actions did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

fltAdaptorUnitExtnUnidentifiable-fru**Fault Code: F0900****Message**

Adapter extension [id] in server [chassisId]/[slotId] has unidentified FRU

Explanation

This fault typically occurs because Cisco FPR Manager has detected an unsupported adapter unit extension, such as a pass-through adaptor. For example, the model, vendor, or revision is not recognized.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Verify that a supported adapter unit extension is installed.
 - Step 2** Verify that the capability catalog in Cisco FPR Manager is up to date. If necessary, update the catalog.
 - Step 3** If the above action did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

fltAdaptorUnitExtnMissing**Fault Code: F0901****Message**

Adapter extension [id] in server [chassisId]/[slotId] presence: [presence]

Explanation

This fault typically occurs when an I/O adapter unit extension, such as a pass-through adapter, is missing. Cisco FPR Manager raises this fault when any of the following scenario occur:

- The endpoint reports there is no adapter unit extension, such as a pass-through adapter, plugged into the adapter slot.
- The endpoint cannot detect or communicate with the adapter unit extension plugged into the adapter slot.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Ensure the adapter unit extension is properly plugged into an adapter slot in the server.
- Step 2** If the above action did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

fltComputePhysicalDisassociationFailed**Fault Code: F0915****Message**

Failed to disassociate server [id]Failed to disassociate server [chassisId]/[slotId]

Explanation

This fault typically occurs for one of the following reasons:

- The server is down.
- The data path is not working.
- Cisco FPR Manager cannot communicate with one or more of the fabric interconnect, the server, or a component on the server.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Check the communication path to the server including fabric interconnect server ports, IOM link and the current state of the server
- Step 2** If the server is stuck in an inappropriate state, such as booting, power cycle the server.
- Step 3** If the above actions did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

Fault Details

fltVnicEtherIfInvalidVlan

Fault Code: F0934

Message

Invalid Vlan in the allowed vlan list

Explanation

This fault typically occurs when a vnic of a service profile or a port profile contains an invalid vlan. an invalid vlan can be any one of the following:

-
- Step 1** an isolated vlan or a community vlan that is not associated to a valid primary vlan
 - Step 2** a primary vlan without any of its associated secondary vlans allowed on the vnic
 - Step 3** a vlan which has sharing-type or primary vlan name not matching to that of vlan in lan-side/appliance-side

Recommended Action

This fault will be removed if you perform one of the following actions:

-
- Step 1** if invalid vlan is an isolated or community vlan then make sure it is mapped to a valid primary vlan.
 - Step 2** if invalid vlan is a primary vlan then either allow any of its secondary vlans or delete it from vnic or port profile.
 - Step 3** if invalid vlan is a vlan that does not match the sharing properties with the vlan of same vlan id in the lan-side/appliance-side, change the properties of this vlan to be the same as the other.

fltFabricVlanVlanConflictPermit

Fault Code: F0935

Message

There are multiple vlans with id [id] have different accessibility configured.

Explanation

This fault occurs when multiple global vlans with the same id have different access configurations.

Recommended Action

Change the access configuration by configuring VLAN/VLAN Group Permits.

Fault Details

Severity: warning
Cause: vlan-conflict-permit
mibFaultCode: 935
mibFaultName: fltFabricVlanVlanConflictPermit
moClass: fabric:Vlan
Type: configuration
Callhome: none
Auto Cleared: true
Is Implemented: true
Affected MO: fabric/eth-estc/[id]/net-[name]
Affected MO: fabric/eth-estc/net-[name]
Affected MO: fabric/lan/[id]/net-[name]
Affected MO: fabric/lan/net-[name]

fltFabricVlanReqVlanPermitUnresolved

Fault Code: F0936

Message

The VLAN permit does not reference any existing vlans.

Explanation

This fault occurs when a VLAN permit exists but there are no vnics by the name.

Recommended Action

Delete the VLAN permit, create the referenced VLAN (or ignore).

Fault Details

Severity: warning

```

Cause: vlan-permit-unresolved
mibFaultCode: 936
mibFaultName: fltFabricVlanReqVlanPermitUnresolved
moClass: fabric:VlanReq
Type: configuration
Callhome: none
Auto Cleared: true
Is Implemented: true
Affected MO: org- [name]/vlan-req- [name]

```

fltFabricVlanGroupReqVlanGroupPermitUnresolved

Fault Code: F0937

Message

The VLAN permit does not reference any existing net groups.

Explanation

This fault occurs when a VLAN group permit exists but there are no referenced network groups.

Recommended Action

Delete the VLAN permit, create the referenced VLAN (or ignore).

Fault Details

```

Severity: warning
Cause: group-permit-unresolved
mibFaultCode: 937
mibFaultName: fltFabricVlanGroupReqVlanGroupPermitUnresolved
moClass: fabric:VlanGroupReq
Type: configuration
Callhome: none
Auto Cleared: true
Is Implemented: true
Affected MO: org- [name]/vlan-group-req- [name]

```

fltExtpolClientClientLostConnectivity

Fault Code: F0988

Message

FPRM has lost connectivity with Firepower Central

Explanation

None set.

Recommended Action

Copy the message exactly as it appears on the console or in the system log. Research and attempt to resolve the issue using the tools and utilities provided at <http://www.cisco.com/tac>. If you cannot resolve the issue, create a **show tech-support** file and contact Cisco Technical Support.

Fault Details

```

Severity: major

```

```

Cause: client-lost-connectivity
mibFaultCode: 988
mibFaultName: fltExtpolClientClientLostConnectivity
moClass: extpol:Client
Type: network
Callhome: none
Auto Cleared: true
Is Implemented: true
Affected MO: extpol/reg/clients/client-[id]

```

fltStorageLocalDiskDegraded

Fault Code: F0996

Message

Local disk [id] on server [chassisId]/[slotId] operability: [operability]. Reason: [operQualifierReason]Local disk [id] on server [id] operability: [operability]. Reason: [operQualifierReason]

Explanation

This fault occurs when the local disk has become degraded. The fault description will contain the physical drive state, which indicates the reason for the degradation.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** If the drive state is "rebuild" or "copyback", wait for the rebuild or copyback operation to complete.
 - Step 2** If the drive state is "predictive-failure", replace the disk.

Fault Details

```

Severity: warning
Cause: equipment-degraded
mibFaultCode: 996
mibFaultName: fltStorageLocalDiskDegraded
moClass: storage:LocalDisk
Type: equipment
Callhome: diagnostic
Auto Cleared: true
Is Implemented: true
Affected MO: sys/chassis-[id]/blade-[slotId]/board/storage-[type]-[id]/disk-[id]
Affected MO: sys/rack-unit-[id]/board/storage-[type]-[id]/disk-[id]

```

fltStorageRaidBatteryDegraded

Fault Code: F0997

Message

RAID Battery on server [chassisId]/[slotId] operability: [operability]. Reason: [operQualifierReason]RAID Battery on server [id] operability: [operability]. Reason: [operQualifierReason]

Explanation

This fault occurs when the RAID backup unit is degraded.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** If the fault reason indicates the backup unit is in a relearning cycle, wait for relearning to complete.
 - Step 2** If the fault reason indicates the backup unit is about to fail, replace the backup unit.
 - Step 3** If the above action did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

Fault Details

```
Severity: minor
Cause: equipment-degraded
mibFaultCode: 997
mibFaultName: fltStorageRaidBatteryDegraded

```

fltStorageInitiatorConfiguration-error

Fault Code: F1001

Message

Initiator [name] either cannot be resolved or does not match with one of the storage targets. No zones are deployed for this initiator and the target.

Explanation

Initiator either cannot be resolved or does not match with one of the targets.

Recommended Action

If you see this fault, take the following action:

- Step 1** Check if vhba interface referenced by this Initiator exists.
- Step 2** Check if switch id or vsan name of the vhba interface referenced by this Initiator matches one of the targets.

Fault Details

```
Severity: warning
Cause: configuration-error

```

fltPolicyControlEpSuspendModeActive

Fault Code: F1057

Message

FPRM is suspended from receiving updates from FPR Central.

Explanation

This fault occurs when FPRM enters into suspend state from receiving updates from FPR Central that it is registered with.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Please check if FPR Central is restored to a previous version or a policy roll-back has occurred. You may have brought FPR in to manual suspension mode by using **set suspendstate on** command under the system-control-ep policy scope.
- Step 2** Please confirm the suspend state by using **show control-ep policy detail** under system scope. If you still want to receive the updates from FPR Central, you need to restore it back to a version compatible with FPRM or set the suspend state to off by acknowledging it by using **set ackstate acked** under policy-control scope.
- Step 3** If the above action did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

fltNetworkElementThermalThresholdCritical

Fault Code: F1080

Message

Fabric Interconnect [id] temperature: [thermal]

Explanation

This fault occurs when the temperature of a Fabric Interconnect exceeds a critical threshold value. Be aware of the following possible contributing factors:

- Temperature extremes can cause Cisco FPR equipment to operate at reduced efficiency and cause a variety of problems, including early degradation, failure of chips, and failure of equipment.
- Cisco FPR equipment should operate in an environment that provides an inlet air temperature not colder than 50F (10C) nor hotter than 95F (35C).

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Review the product specifications to determine the temperature operating range of the Fabric Interconnect.
- Step 2** Review the Cisco FPR Site Preparation Guide to ensure the Fabric Interconnects have adequate airflow, including front and back clearance.
- Step 3** Verify that the air flows are not obstructed.
- Step 4** Verify that the site cooling system is operating properly.

- Step 5** Clean the installation site at regular intervals to avoid buildup of dust and debris, which can cause a system to overheat.
- Step 6** Replace faulty Fabric Interconnects.
- Step 7** If the above actions did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

Fault Details

fltFabricPinTargetDown

Fault Code: F1088

Message

Pin target is a non-existent interface

Explanation

This fault typically occurs when a PinGroup has an unresolvable target.

Recommended Action

If you see this fault, take the following action:

-
- Step 1** Check whether the PinGroup target is correctly provisioned.
- Step 2** If the above action did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

Fault Details

fltFabricVlanMisconfigured-mcast-policy

Fault Code: F1095

Message

VLAN [name] multicast policy [mcastPolicyName] is non-default.

Explanation

This fault is raised when VLAN belonging to a Springfield fabric has a non-default multicast policy assigned to it.

Recommended Action

If you see this fault, take the following action:

-
- Step 1** Un-assign multicast policy for the this vlan or change the multicast policy to default.
 - Step 2** If the above actions did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

Fault Details

fltMgmtConnectionDisabled

Fault Code: F1097

Message

Management Connection [type] in server [id] is not operational

Explanation

This fault occurs when multiple management connections are acknowledged.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Disable the management connection which is unused.
 - Step 2** If new management connection needs to be used, decommission and recommission server.
 - Step 3** If the above actions did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

fltExtpolClientGracePeriodWarning

Fault Code: F1211

Message

FPR domain [name] registered with FPR Central has entered into the grace period.

Explanation

A FPR domain is registered with FPR Central without having a license. This fault typically occurs if this FPR domain is registered with FPR Central after all default (and procured) licenses are assigned to other FPR domains.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Check the number of licenses installed and consumed on FPR Central. In the Cisco FPR Central GUI, you can access the licensing information from the Operations Management tab for the FPR Central. In the Cisco FPR Central CLI, you can access the licensing information by entering the **show usage detail** command under license scope from **service-reg** session.

- Step 2** If the above action did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

fltNetworkOperLevelExtraprimaryvlans

Fault Code: F1229

Message

Fabric Interconnect [id]: Number of primary vlans exceeds the max limit on the FI: Number of Primary Vlans: [primaryVlanCount] and Max primary vlans allowed: [maxPrimaryVlanCount]

Explanation

This fault occurs when the fabric interconnect has more number of primary vlans than what is supported.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** It is recommended that operator should delete the extra primary vlans than are there in the FI. System may appear to be normally functioning even with these extra primary vlans in place. However there may be performance issues observed as the system is operating above the recommended scale limits..
- Step 2** If the above actions did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

Fault Details

```
Severity: major
Cause: extra-primary-vlans

```

fltVnicEtherVirtualization-conflict

Fault Code: F1251

Message

Multiple connection policies cannot be assigned to the same Eth vNIC

Explanation

This fault occurs when multiple connection policies are assigned to the same vNIC.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Check on the vNIC if different types of connection policies (dynamic/VMQ) are assigned. Keep only one type.
 - Step 2** Check on the vNIC through CLI if more than one connection policy of the same type is assigned. Keep only one connection policy.

Fault Details

fltLsIssuesIscsi-config-failed

Fault Code: F1252

Message

Service Profile [name] configuration failed due to iSCSI issue [iscsiConfigIssues]

Explanation

This fault typically occurs when Cisco FPR Manager Service Profile configuration failed due to iSCSI Config Issues.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Correct the Service Profile iSCSI Configuration as per the issue reported.
 - Step 2** If the above actions did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

Fault Details

fltAaaProviderGroupProvidergroupsize

Fault Code: F1279

Message

For [dn]: Server Group [name] has [size] provider references. Authentication might fail, if this provider group is used with auth-domain.

Explanation

This fault typically occurs because Cisco FPR Manager has detected provider-group with 0 provider references..

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Need to delete the provider group which does not have any provider references.
- Step 2** Or Add provider references to provider group.

Fault Details

```

Severity: warning
Cause: provider-group-size-empty

```

fltFirmwareAutoSyncPolicyDefaultHostPackageMissing

Fault Code: F1284

Message

Default host firmware package is missing or deleted.

Explanation

This fault typically occurs for the following reasons: when Auto Firmware Sync Policy is set Auto-acknowledge or User-acknowledge and default host firmware pack is not available.

- Auto Firmware Sync is not happening.
- Default host firmware package is missing or deleted.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Go to Servers tab and expand policies node. Select Host Firmware Packages under policies node.
 - Step 2** If the FSM failed, review the error message in the FSM.
 - Step 3** Create a host firmware package with name 'default'. If the problem persists, create a **show tech-support** file and contact Cisco TAC.

Fault Details

fltFabricEthLanEpUdldLinkDown

Fault Code: F1358

Message

UDLD state for ether port [slotId]/[aggrPortId]/[portId] on fabric interconnect [switchId] is: [udldOperState].UDLD state for ether port [slotId]/[portId] on fabric interconnect [switchId] is: [udldOperState].

Explanation

This fault occurs when an ethernet uplink port is unidirectional connected.

Recommended Action

If you see this fault, take the following action:

-
- Step 1** Check the tx and rx connection of the uplink port.
 - Step 2** If the above action did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

Fault Details

fltFabricEthLanPcEpUdldLinkDown

Fault Code: F1359

Message

UDLD state for ether port [slotId]/[aggrPortId]/[portId] on fabric interconnect [switchId] is: [udldOperState].UDLD state for ether port [slotId]/[portId] on fabric interconnect [switchId] is: [udldOperState].

Explanation

This fault occurs when an ethernet uplink port-channel member is unidirectional connected.

Recommended Action

If you see this fault, take the following action:

-
- Step 1** Check the tx and rx connection of the uplink port.
 - Step 2** If the above action did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

fltEquipmentChassisInvalid-fru

Fault Code: F1407

Message

Chassis [id] has a empty value for FRU identity reported by CMC.

Explanation

This fault typically occurs when the FRU information for a chassis has empty value.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Verify that the capability catalog in Cisco FPR Manager is up to date. If necessary, update the catalog.
 - Step 2** If the above action did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

Fault Details

Affected MO: sys/chassis-[id]

```

fltEquipmentSwitchIOCardRemoved

Fault Code: F1408

Message

[side] FI IOM [chassisId]/[id] ([switchId]) is removed

Explanation

This fault typically occurs because an FI I/O module is removed from the chassis. In a cluster configuration, the chassis fails over to the other FI I/O module. For a standalone configuration, the chassis associated with the FI I/O module loses network connectivity. This is a critical fault because it can result in the loss of network connectivity and disrupt data traffic through the FI I/O module.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Reinsert the FI I/O module and configure the fabric-interconnect ports connected to it as server ports and wait a few minutes to see if the fault clears.
- Step 2** If the above actions did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

Fault Details

```

fltEquipmentSwitchIOCardThermalProblem**Fault Code: F1409****Message**

[side] FI IOM [chassisId]/[id] ([switchId]) operState: [operState]

Explanation

This fault occurs when there is a thermal problem on an FI I/O module. Be aware of the following possible contributing factors:

- Temperature extremes can cause Cisco FPR equipment to operate at reduced efficiency and cause a variety of problems, including early degradation, failure of chips, and failure of equipment. In addition, extreme temperature fluctuations can cause CPUs to become loose in their sockets.
- Cisco FPR equipment should operate in an environment that provides an inlet air temperature not colder than 50F (10C) nor hotter than 95F (35C).

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Review the product specifications to determine the temperature operating range of the FI I/O module.
- Step 2** Review the Cisco FPR Site Preparation Guide to ensure the FI I/O modules have adequate airflow, including front and back clearance.
- Step 3** Verify that the air flows on the Cisco FPR chassis are not obstructed.
- Step 4** Verify that the site cooling system is operating properly.
- Step 5** Power off unused blade servers and rack servers.
- Step 6** Clean the installation site at regular intervals to avoid buildup of dust and debris, which can cause a system to overheat.
- Step 7** Replace faulty FI I/O modules.

- Step 8** Use the Cisco FPR power capping capability to limit power usage. Power capping can limit the power consumption of the system, including blade and rack servers, to a threshold that is less than or equal to the system's maximum rated power. Power-capping can have an impact on heat dissipation and help to lower the installation site temperature.
- Step 9** If the above actions did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

fltEquipmentSwitchIOCardThermalThresholdNonCritical

Fault Code: F1410

Message

[side] FI IOM [chassisId]/[id] ([switchId]) temperature: [thermal]

Explanation

This fault occurs when the temperature of an FI I/O module has exceeded a non-critical threshold value, but is still below the critical threshold. Be aware of the following possible contributing factors:

- Temperature extremes can cause Cisco FPR equipment to operate at reduced efficiency and cause a variety of problems, including early degradation, failure of chips, and failure of equipment. In addition, extreme temperature fluctuations can cause CPUs to become loose in their sockets.
- Cisco FPR equipment should operate in an environment that provides an inlet air temperature not colder than 50F (10C) nor hotter than 95F (35C).
- If sensors on a CPU reach 179.6F (82C), the system will take that CPU offline.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Review the product specifications to determine the temperature operating range of the FI I/O module.
- Step 2** Review the Cisco FPR Site Preparation Guide to ensure the chassis and FI I/O modules have adequate airflow, including front and back clearance.
- Step 3** Verify that the air flows on the Cisco FPR chassis and FI I/O module are not obstructed.
- Step 4** Verify that the site cooling system is operating properly.
- Step 5** Power off unused blade servers and rack servers.
- Step 6** Clean the installation site at regular intervals to avoid buildup of dust and debris, which can cause a system to overheat.

- Step 7** Use the Cisco FPR power capping capability to limit power usage. Power capping can limit the power consumption of the system, including blade and rack servers, to a threshold that is less than or equal to the system's maximum rated power. Power-capping can have an impact on heat dissipation and help to lower the installation site temperature.
- Step 8** If the above actions did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

fltEquipmentSwitchIOCardThermalThresholdNonRecoverable

Fault Code: F1412

Message

[side] FI IOM [chassisId]/[id] ([switchId]) temperature: [thermal]

Explanation

This fault occurs when the temperature of an FI I/O module has been out of the operating range, and the issue is not recoverable. Be aware of the following possible contributing factors:

- Temperature extremes can cause Cisco FPR equipment to operate at reduced efficiency and cause a variety of problems, including early degradation, failure of chips, and failure of equipment. In addition, extreme temperature fluctuations can cause CPUs to become loose in their sockets.
- Cisco FPR equipment should operate in an environment that provides an inlet air temperature not colder than 50F (10C) nor hotter than 95F (35C).
- If sensors on a CPU reach 179.6F (82C), the system will take that CPU offline.

fltEquipmentSwitchIOCardCpuThermalThresholdCritical

Fault Code: F1415

Message

[side] FI IOM [chassisId]/[id] ([switchId]) processor temperature exceeded the limit

Explanation

This fault typically occurs when the processor temperature in FI-IOM exceeds the limit.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Review the product specifications to determine the temperature operating range of the FI I/O module.
 - Step 2** Review the Cisco FPR Site Preparation Guide to ensure the chassis and FI I/O modules have adequate airflow, including front and back clearance.
 - Step 3** Verify that the air flows on the Cisco FPR chassis and FI I/O module are not obstructed.
 - Step 4** Verify that the site cooling system is operating properly.

fltNetworkElementRemoved

Fault Code: F1426

Message

Fabric Interconnect [id] operability: [operability]

Explanation

This fault occurs when the fabric interconnect is removed in a clustering setup.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Reinsert the removed fabric interconnect back into the chassis (applicable to FPR-Mini only).
 - Step 2** If the above action did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

fltNetworkOperLevelExtrasecondaryvlans

Fault Code: F1432

Message

Fabric Interconnect [id]: Number of secondary vlans exceeds the max limit on the FI: Number of secondary vlans: [secondaryVlanCount] and Max secondary vlans allowed: [maxSecondaryVlanCount]

Explanation

This fault occurs when the fabric interconnect has more number of secondary vlans than what is supported.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** It is recommended that operator should delete the extra secondary vlans that are there in the FI. System may appear to be normally functioning even with these extra secondary vlans in place. However there may be performance issues observed as the system is operating above the recommended scale limits..
- Step 2** If the above actions did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

Fault Details

fltSysdebugLogExportStatusLogExportFailure**Fault Code: F1444****Message**

Log export to remote server failed from [switchId]:[exportFailureReason]

Explanation

This fault occurs when Cisco Firepower Manager cannot transfer a log file to a remote server. This is typically the result of one of the following issues:

- The remote server is not accessible.
- One or more of the parameters for the remote server that are specified for the log export target, such as path, username, password, ssh-key and server name, are incorrect.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Verify the connectivity to the remote server.
- Step 2** Verify the path information of the remote server.
- Step 3** If the above actions did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

Fault Details

fltLsServerSvnicNotPresent

Fault Code: F1459

Message

Service profile [name] does not contain service vnics for netflow.

Explanation

The service profile does not have service vnics, hence netflow will not function on this server. This fault typically occurs as a result of one of the following issues:

- Service profile has maximum number of vnics already created, hence cannot accommodate service vnics required for netflow.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** If you have already enabled netflow, please reduce the number of vnics on the SP to accommodate service vnics.
- Step 2** If the above actions did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

Fault Details

```

fltFabricVlanPrimaryVlanMissingForIsolated

Fault Code: F1468

Message

Primary Vlan can not be resolved for isolated vlan [name]

Explanation

This fault typically occurs when Cisco FPR Manager encounters a problem resolving the primary VLAN ID corresponding to a particular isolated VLAN.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Associate the isolated VLAN with a valid primary VLAN.
 - Step 2** If the above action did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

fltFabricVlanMismatch-a

Fault Code: F1470

Message

VLAN [name] has [overlapStateForA] with another vlan under lan-cloud/appliance-cloud for the fabric interconnect A

Explanation

This fault typically occurs when private vlan properties of VLAN under one cloud conflicts with the private vlan properties of VLAN under another cloud for the fabric interconnect A. The cloud here means either a LAN cloud or an appliance cloud. This issue can stop the usage of this vlan.

Recommended Action

If you see this fault, take the following action:

-
- Step 1** Check the sharing property of the VLAN under both clouds and fabric A referred by its VLAN ID.
 - Step 2** If the sharing property of the VLAN does not match with the VLAN on the other cloud, then change the sharing property of either of the VLANs, so that it matches with each other.
 - Step 3** If the VLAN is a isolated/community vlan, check the pubnwnname property of the VLAN under both clouds referred by its VLAN ID.
 - Step 4** If the pubnwnname property of the isolated/community VLAN does not match with the isolated/community VLAN on the other cloud, then change the pubnwnname property of either of the VLANs, so that it matches with each other.
 - Step 5** If the above actions did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

fltFabricVlanErrorAssocPrimary

Fault Code: F1472

Message

VLAN [name] is in error state because the associated primary vlan [assocPrimaryVlanState]

Explanation

This fault typically occurs when there is an error in associated primary vlan of a secondary VLAN. This issue can stop the usage of this vlan.

Recommended Action

If you see this fault, take the following action:

-
- Step 1** Check the pubnwnname property of the VLAN.
- Step 2** If the pubnwnname is not given or refers to a non-existing primary vlan, give a name of a primary vlan which is in good state.
- Step 3** If the pubnwnname refers to a vlan which is not a primary vlan, then either change the referred vlan to be a primary vlan or give a different primary vlan.
- Step 4** If the pubnwnname refers to a valid primary vlan, then check the state of the primary VLAN.
- Step 5** If the above actions did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

fltStorageMezzFlashLifeDegraded

Fault Code: F1495

Message

Flash Life on server [chassisId]/[slotId] flashStatus: [flashStatus]

Explanation

This fault occurs when the Fusion-io life left is 10 percent or less.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Continue to monitor the the Fusion-io life left and if it reaches 0 percent, the adapter might revert to read-only.

Fault Details

```

Severity: warning
Cause: equipment-degraded

fltComputePhysicalAdapterMismatch

Fault Code: F1509

Message

Server [id] (service profile: [assignedToDn]) has invalid adapter combinatonServer [chassisId]/[slotId] (service profile: [assignedToDn]) has invalid adapter combination

Explanation

This fault typically occurs because Cisco FPR Manager has detected that the server has an invalid combination of Cisco VICs.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Verify that the valid adapter combinations are installed configuration.
 - Step 2** Reacknowledge the server.
 - Step 3** If the above actions did not resolve the issue, create a **show tech-support** file and contact Cisco TAC.

Fault Details

fltEquipmentSwitchCardAct2LiteFail

Fault Code: F1510

Message

Failed Identification Test in slot - [id] ([descr]). The module in this slot may not be a genuine Cisco product. Cisco warranties and support programs only apply to genuine Cisco products. If Cisco determines that your insertion of non-Cisco modules into a Cisco product is the cause of a support issue, Cisco may deny support under your warranty or under a Cisco support program such as SmartNet.

Explanation

This fault occurs when the ACT2 chip fails.

Recommended Action

Copy the message exactly as it appears on the console or in the system log. Research and attempt to resolve the issue using the tools and utilities provided at <http://www.cisco.com/tac>. If you cannot resolve the issue, create a **show tech-support** file and contact Cisco Technical Support.

fltSmAppLicenseAgreementNotAccepted

Fault Code: F1636

Message

End User License Agreement not accepted for Application [name].[version]

Explanation

This fault occurs when an application requiring End User License Agreement(EULA) is downloaded but EULA is yet to be accepted.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Accept the license agreement for this application

Fault Details

```
Severity: major
Cause: license-agreement-not-accepted
mibFaultCode: 1636
mibFaultName: fltSmAppLicenseAgreementNotAccepted
moClass: sm:App
Type: server
Callhome: none
Auto Cleared: true
Is Implemented: true
Affected MO: sec-svc/app- [name] - [version]
Affected MO: sys-secsvc/slot- [slotId] /app-inst- [appInstId] /app- [name] - [version]
```

fltSmAppInstanceAppInstanceUnsupported

Fault Code: F1637

Message

App Instance [appName] on slot [slotId] is not supported in the current bundle. Error: [errorMsg]

Explanation

This fault occurs when an app instance is not supported in the current platform bundle

Recommended Action

Copy the message exactly as it appears on the console or in the system log. Research and attempt to resolve the issue using the tools and utilities provided at <http://www.cisco.com/tac>. If you cannot resolve the issue, create a **show tech-support** file and contact Cisco Technical Support.

Fault Details

```
Severity: major
Cause: appinstance-unsupported
mibFaultCode: 1637
mibFaultName: fltSmAppInstanceAppInstanceUnsupported
moClass: sm:AppInstance
Type: server
Callhome: none
```

```

Auto Cleared: true
Is Implemented: true
Affected MO: sec-svc/slot- [slotId]/app-inst- [appName]

```

fltSmAppAppMetaCorrupted

Fault Code: F1638

Message

The application [appId] cannot be reloaded.

Explanation

This fault occurs when an application meta data cannot be reloaded.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Re-download the application from a trusted source

Fault Details

```

Severity: major
Cause: app-meta-corrupted
mibFaultCode: 1638
mibFaultName: fltSmAppAppMetaCorrupted
moClass: sm:App
Type: server
Callhome: none
Auto Cleared: true
Is Implemented: true
Affected MO: sec-svc/app- [name] - [version]
Affected MO: sys-secsvc/slot- [slotId]/app-inst- [appInstId]/app- [name] - [version]

```

fltSmAppInstanceSoftwareIncompatible

Fault Code: F1639

Message

[versionIncompatibleErrorMgr]

Explanation

This fault occurs when this main app version is not compatible with decorator version or this decorator version is not compatible with main app version.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Remove data port decorator from logical device

Fault Details

```

Severity: major
Cause: software-version-incompatible

```

```
mibFaultCode: 1639
mibFaultName: fltSmAppInstanceSoftwareIncompatible
moClass: sm:AppInstance
Type: server
Callhome: none
Auto Cleared: true
Is Implemented: true
Affected MO: sec-svc/slot-[slotId]/app-inst-[appName]
```

FSM Faults

This chapter provides information about the faults that may be raised during one or more stages of an FSM task.

Note

Unless an FSM fault appears on the Overview page, you do not need to take any action to resolve the fault. FSM stages fail and retry for many reasons. These faults do not always indicate an issue with a component or the FSM.

fsmStFailEquipmentChassisRemoveChassis:DisableEndPoint

Fault Code: F16407

Message

[FSM:STAGE:FAILED|RETRY]: unconfiguring access to chassis
[id](FSM-STAGE:sam:dme:EquipmentChassisRemoveChassis:DisableEndPoint)

Explanation

None set.

Recommended Action

Copy the message exactly as it appears on the console or in the system log. Research and attempt to resolve the issue using the tools and utilities provided at <http://www.cisco.com/tac>. If you cannot resolve the issue, create a **show tech-support** file and contact Cisco Technical Support.

Fault Details

```
Severity: warning
Cause: disable-end-point-failed
mibFaultCode: 16407
mibFaultName: fsmStFailEquipmentChassisRemoveChassisDisableEndPoint
moClass: equipment:Chassis
Type: fsm
Callhome: none
Auto Cleared: true
Is Implemented: true
Affected MO: sys/chassis-[id]
```

fsmStFailEquipmentChassisRemoveChassis:UnIdentifyLocal

Fault Code: F16407

Message

[FSM:STAGE:FAILEDIRETRY]: erasing chassis identity [id] from primary(FSM-STAGE:sam:dme:EquipmentChassisRemoveChassis:UnIdentifyLocal)

Explanation

None set.

Recommended Action

Copy the message exactly as it appears on the console or in the system log. Research and attempt to resolve the issue using the tools and utilities provided at <http://www.cisco.com/tac>. If you cannot resolve the issue, create a **show tech-support** file and contact Cisco Technical Support.

Fault Details

```
Severity: warning
Cause: un-identify-local-failed
mibFaultCode: 16407
mibFaultName: fsmStFailEquipmentChassisRemoveChassisUnIdentifyLocal
moClass: equipment:Chassis
Type: fsm
Callhome: none
Auto Cleared: true
Is Implemented: true
Affected MO: sys/chassis-[id]
```

fsmStFailEquipmentChassisRemoveChassis:UnIdentifyPeer

Fault Code: F16407

Message

[FSM:STAGE:FAILEDIRETRY]: erasing chassis identity [id] from secondary(FSM-STAGE:sam:dme:EquipmentChassisRemoveChassis:UnIdentifyPeer)

Explanation

None set.

Recommended Action

Copy the message exactly as it appears on the console or in the system log. Research and attempt to resolve the issue using the tools and utilities provided at <http://www.cisco.com/tac>. If you cannot resolve the issue, create a **show tech-support** file and contact Cisco Technical Support.

Fault Details

```
Severity: warning
Cause: un-identify-peer-failed
mibFaultCode: 16407
mibFaultName: fsmStFailEquipmentChassisRemoveChassisUnIdentifyPeer
moClass: equipment:Chassis
Type: fsm
Callhome: none
```

```

Auto Cleared: true
Is Implemented: true
Affected MO: sys/chassis-[id]

```

fsmStFailEquipmentChassisRemoveChassis:Wait

Fault Code: F16407

Message

[FSM:STAGE:FAILED|RETRY]: waiting for clean up of resources for chassis [id] (approx. 2 min)(FSM-STAGE:sam:dme:EquipmentChassisRemoveChassis:Wait)

Explanation

None set.

Recommended Action

Copy the message exactly as it appears on the console or in the system log. Research and attempt to resolve the issue using the tools and utilities provided at <http://www.cisco.com/tac>. If you cannot resolve the issue, create a **show tech-support** file and contact Cisco Technical Support.

Fault Details

```

Severity: warning
Cause: wait-failed
mibFaultCode: 16407
mibFaultName: fsmStFailEquipmentChassisRemoveChassisWait
moClass: equipment:Chassis
Type: fsm
Callhome: none
Auto Cleared: true
Is Implemented: true
Affected MO: sys/chassis-[id]

```

fsmStFailEquipmentChassisRemoveChassis:decomission

Fault Code: F16407

Message

[FSM:STAGE:FAILED|RETRY]: decomissioning chassis [id](FSM-STAGE:sam:dme:EquipmentChassisRemoveChassis:decomission)

Explanation

None set.

Recommended Action

Copy the message exactly as it appears on the console or in the system log. Research and attempt to resolve the issue using the tools and utilities provided at <http://www.cisco.com/tac>. If you cannot resolve the issue, create a **show tech-support** file and contact Cisco Technical Support.

Fault Details

```

Severity: warning
Cause: decomission-failed
mibFaultCode: 16407

```

```

mibFaultName: fsmStFailEquipmentChassisRemoveChassisDecomission
moClass: equipment:Chassis
Type: fsm
Callhome: none
Auto Cleared: true
Is Implemented: true
Affected MO: sys/chassis-[id]

```

fsmStFailEquipmentLocatorLedSetLocatorLed:Execute

Fault Code: F16408

Message

```
[FSM:STAGE:FAILEDIRETRY]: setting locator led to
[adminState](FSM-STAGE:sam:dme:EquipmentLocatorLedSetLocatorLed:Execute)
```

Explanation

None set.

Recommended Action

Copy the message exactly as it appears on the console or in the system log. Research and attempt to resolve the issue using the tools and utilities provided at <http://www.cisco.com/tac>. If you cannot resolve the issue, create a **show tech-support** file and contact Cisco Technical Support.

Fault Details

```

fsmStFailSysdebugAutoCoreFileExportTargetConfigure:Peer**Fault Code: F16605****Message**

[FSM:STAGE:FAILEDIRETRY]: configuring automatic core file export service on peer(FSM-STAGE:sam:dme:SysdebugAutoCoreFileExportTargetConfigure:Peer)

Explanation

Cisco Firepower Manager could not set the configurations in the subordinate Fabric Interconnect (FI) for auto core transfer to remote TFTP server. This fault typically appears for one of the following reasons:

- The subordinate FI is not reachable.
- The subordinate FI is experiencing an internal system error on applying the configuration.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Check the FI cluster state to ensure that the subordinate FI is reachable and functioning correctly. If the subordinate FI is down, take appropriate corrective actions so that the Firepower cluster goes into HA ready state.
- Step 2** If the HA state of the primary and subordinate FIs are good, execute the show tech-support command and contact Cisco Technical Support.

fsmStFailComputePhysicalDecommission:CleanupPortConfigLocal

Fault Code: F16976

Message

[FSM:STAGE:FAILED|RETRY]: Cleaning up local port config for server
[dn](FSM-STAGE:sam:dme:ComputePhysicalDecommission:CleanupPortConfigLocal)

Explanation

None set.

Recommended Action

Copy the message exactly as it appears on the console or in the system log. Research and attempt to resolve the issue using the tools and utilities provided at <http://www.cisco.com/tac>. If you cannot resolve the issue, create a **show tech-support** file and contact Cisco Technical Support.

Fault Details

```

fsmStFailSysdebugLogExportPolicyConfigure:Local

Fault Code: F17830

Message

[FSM:STAGE:FAILED|RETRY]: configuring log file export service on local(FSM-STAGE:sam:dme:SysdebugLogExportPolicyConfigure:Local)

Explanation

Cisco Firepower Manager could not set the configurations in the primary Fabric Interconnect for log file transfer to remote server.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Execute the show tech-support command and contact Cisco Technical Support.

Fault Details

```

Severity: warning
Cause: local-failed

Affected MO: sys/sysdebug/log-export-policy

```

fsmStFailSysdebugLogExportPolicyConfigure:Peer

Fault Code: F17830

Message

[FSM:STAGE:FAILED|RETRY]: configuring log file export service on peer(FSM-STAGE:sam:dme:SysdebugLogExportPolicyConfigure:Peer)

Explanation

Cisco Firepower Manager could not set the configurations in the subordinate Fabric Interconnect (FI) for log file transfer to remote server. This fault typically appears for one of the following reasons:

- The subordinate FI is not reachable.
- The subordinate FI is experiencing an internal system error on applying the configuration.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Check the FI cluster state to ensure that the subordinate FI is reachable and functioning correctly. If the subordinate FI is down, take appropriate corrective actions so that the Firepower cluster goes into HA ready state.
- Step 2** If the HA state of the primary and subordinate FIs are good, execute the show tech-support command and contact Cisco Technical Support.

Fault Details

```

Fault Code: F77975

Message

[FSM:STAGE:REMOTE-ERROR]: Configuring external user access to server
[chassisId]/[slotId](FSM-STAGE:sam:dme:ComputeBladeDiag:ConfigUserAccess)

Explanation

None set.

Recommended Action

Copy the message exactly as it appears on the console or in the system log. Research and attempt to resolve the issue using the tools and utilities provided at <http://www.cisco.com/tac>. If you cannot resolve the issue, create a **show tech-support** file and contact Cisco Technical Support.

Fault Details

```

Severity: warning
Cause: config-user-access-failed
mibFaultCode: 77975
mibFaultName: fsmRmtErrComputeBladeDiagConfigUserAccess
moClass: compute:Blade
Type: fsm
Callhome: none
Auto Cleared: true
Is Implemented: true
Affected MO: sys/chassis-[id]/blade-[slotId]

```

fsmRmtErrComputeBladeDiag:DebugWait

Fault Code: F77975

Message

[FSM:STAGE:REMOTE-ERROR]: Waiting for debugging for server
[chassisId]/[slotId](FSM-STAGE:sam:dme:ComputeBladeDiag:DebugWait)

Explanation

None set.

Recommended Action

Copy the message exactly as it appears on the console or in the system log. Research and attempt to resolve the issue using the tools and utilities provided at <http://www.cisco.com/tac>. If you cannot resolve the issue, create a **show tech-support** file and contact Cisco Technical Support.

Fault Details

fsmRmtErrSysdebugAutoCoreFileExportTargetConfigure:Peer**Fault Code: F78045****Message**

[FSM:STAGE:REMOTE-ERROR]: configuring automatic core file export service on peer(FSM-STAGE:sam:dme:SysdebugAutoCoreFileExportTargetConfigure:Peer)

Explanation

Cisco Firepower Manager could not set the configurations in the subordinate Fabric Interconnect (FI) for auto core transfer to remote TFTP server. This fault typically appears for one of the following reasons:

- The subordinate FI is not reachable.
- The subordinate FI is experiencing an internal system error on applying the configuration.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Check the FI cluster state to ensure that the subordinate FI is reachable and functioning correctly. If the subordinate FI is down, take appropriate corrective actions so that the Firepower cluster goes into HA ready state.
- Step 2** If the HA state of the primary and subordinate FIs are good, execute the show tech-support command and contact Cisco Technical Support.

Severity: warning
Cause: nic-unconfig-service-infra-local-failed
mibFaultCode: 78414
mibFaultName: fsmRmtErrComputePhysicalDisassociateNicUnconfigServiceInfraLocal
moClass: compute:Physical
Type: fsm
Callhome: none
Auto Cleared: true
Is Implemented: true
Affected MO: sys/chassis-[id]/blade-[slotId]
Affected MO: sys/rack-unit-[id]

```

fsmRmtErrComputePhysicalDisassociate:NicUnconfigServiceInfraPeer**Fault Code: F78414****Message**

[FSM:STAGE:REMOTE-ERROR]: Unconfigure service infra connectivity from server adapter(FSM-STAGE:sam:dme:ComputePhysicalDisassociate:NicUnconfigServiceInfraPeer)

Explanation

None set.

Recommended Action

Copy the message exactly as it appears on the console or in the system log. Research and attempt to resolve the issue using the tools and utilities provided at <http://www.cisco.com/tac>. If you cannot resolve the issue, create a **show tech-support** file and contact Cisco Technical Support.

Fault Details

```

Severity: warning
Cause: nic-unconfig-service-infra-peer-failed
mibFaultCode: 78414
mibFaultName: fsmRmtErrComputePhysicalDisassociateNicUnconfigServiceInfraPeer
moClass: compute:Physical
Type: fsm
Callhome: none

Severity: warning
Cause: storage-ctrlr-img-update-failed
mibFaultCode: 78767
mibFaultName: fsmRmtErrComputePhysicalFwUpgradeStorageCtrlrImgUpdate
moClass: compute:Physical
Type: fsm
Callhome: none
Auto Cleared: true
Is Implemented: true
Affected MO: sys/chassis- [id]/blade- [slotId]
Affected MO: sys/rack-unit- [id]
```

fsmRmtErrComputePhysicalFwUpgrade:SwConfigPnuOSLocal

Fault Code: F78767

Message

[FSM:STAGE:REMOTE-ERROR]: Configure primary fabric interconnect for pre-boot environment(FSM-STAGE:sam:dme:ComputePhysicalFwUpgrade:SwConfigPnuOSLocal)

Explanation

None set.

Recommended Action

Copy the message exactly as it appears on the console or in the system log. Research and attempt to resolve the issue using the tools and utilities provided at <http://www.cisco.com/tac>. If you cannot resolve the issue, create a **show tech-support** file and contact Cisco Technical Support.

Fault Details

```

fsmRmtErrSysdebugLogExportPolicyConfigure:Local

Fault Code: F79270

Message

[FSM:STAGE:REMOTE-ERROR]: configuring log file export service on local(FSM-STAGE:sam:dme:SysdebugLogExportPolicyConfigure:Local)

Explanation

Cisco Firepower Manager could not set the configurations in the primary Fabric Interconnect for log file transfer to remote server.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Execute the show tech-support command and contact Cisco Technical Support.

Fault Details

```

Severity: warning
Cause: local-failed
mibFaultCode: 79270

Callhome: none
Auto Cleared: true
Is Implemented: true
Affected MO: sys/sysdebug/log-export-policy

```

fsmRmtErrSysdebugLogExportPolicyConfigure:Peer

Fault Code: F79270

Message

[FSM:STAGE:REMOTE-ERROR]: configuring log file export service on peer(FSM-STAGE:sam:dme:SysdebugLogExportPolicyConfigure:Peer)

Explanation

Cisco Firepower Manager could not set the configurations in the subordinate Fabric Interconnect (FI) for log file transfer to remote server. This fault typically appears for one of the following reasons:

- The subordinate FI is not reachable.
- The subordinate FI is experiencing an internal system error on applying the configuration.

Recommended Action

If you see this fault, take the following actions:

-
- Step 1** Check the FI cluster state to ensure that the subordinate FI is reachable and functioning correctly. If the subordinate FI is down, take appropriate corrective actions so that the Firepower cluster goes into HA ready state.
- Step 2** If the HA state of the primary and subordinate FIs are good, execute the show tech-support command and contact Cisco Technical Support.

Fault Details

```

Troubleshooting Transient Faults

Transient faults can occur during initial set up and discovery or when a server or virtual machine starts up. You can typically ignore these transient faults, as FXOS clears them automatically.

This chapter includes the following sections:

- [Initial Setup and Discovery Faults, page 4-1](#)
- [Virtual Machine Startup Faults, page 4-5](#)

Initial Setup and Discovery Faults

[Table 4-1](#) describes the transient faults that you may see during the initial setup and discovery process. The FXOS clears these faults. If you see them during the initial setup or discovery process, you can safely ignore these faults.

Table 4-1 Transient Faults that Occur during Initial Setup and Discovery Process

Fault Code	Fault Text	Description
F16581	[FSM:STAGE:RETRY:]: user configuration to secondary (FSM-STAGE:sam:dme:AaaUserEpUpdateUserEp:SetUserPeer)	The FSM could not send the user configuration to the subordinate fabric interconnect during the initial cluster configuration or the setup.
F16745	[FSM:STAGE:RETRY:]: QoS Classification Definition classification configuration on secondary (FSM-STAGE:sam:dme:QosclassDefinitionConfigGlobalQoS:SetPeer)	The FSM could not send the quality of the service configuration to the subordinate fabric interconnect during the initial cluster configuration or the setup.
F16725	[FSM:STAGE:RETRY:]: VM profile configuration on external VM manager (FSM-STAGE:sam:dme:VnicProfileSetConfigVmm:SetLocal)	The FSM could not send the VM profile configuration to the subordinate fabric interconnect during the initial cluster configuration or the setup.
F16580	[FSM:STAGE:RETRY:]: realm configuration to secondary (FSM-STAGE:sam:dme:AaaRealmUpdateRealm:SetRealmPeer)	The FSM could not send the security configuration to the subordinate fabric interconnect during the initial cluster configuration or the setup.

Table 4-1 Transient Faults that Occur during Initial Setup and Discovery (continued)Process

Fault Code	Fault Text	Description (continued)
F16724	[FSM:STAGE:RETRY:]: external VM manager configuration on local fabric (FSM-STAGE:sam:dme:ExtvmmEpConfig:SetLocal)	The FSM could not send the VM manager configuration to the primary fabric interconnect during the initial cluster configuration or the setup.
F16579	[FSM:STAGE:RETRY:]: external aaa server configuration to secondary (FSM-STAGE:sam:dme:AaaEpUpdateEp:SetEpPeer)	The FSM could not send the security configuration to the subordinate fabric interconnect during the initial cluster configuration or the setup.
F16749	[FSM:STAGE:RETRY:]: Uplink eth port configuration on B (FSM-STAGE:sam:dme:SwEthLanBorderDeploy:UpdateConnectivity)	The FSM could not send the eth-uplink configuration to the fabric interconnects during the initial cluster configuration or the setup.
F16749	[FSM:STAGE:RETRY:]: internal network configuration on B (FSM-STAGE:sam:dme:SwAccessDomainDeploy:UpdateConnectivity)	The FSM could not send the internal network configuration to the fabric interconnects during the initial cluster configuration or the setup.
F16749	[FSM:STAGE:RETRY:]: Uplink fc port configuration on B (FSM-STAGE:sam:dme:SwFcSanBorderDeploy:UpdateConnectivity)	The FSM could not send the fibre channel uplink configuration to the fabric interconnects during the initial cluster configuration or the setup.
F16680	[FSM:STAGE:RETRY:]: Enable virtual interface on local fabric interconnect (FSM-STAGE:sam:dme:MgmtIfEnableVip:Local)	The FSM could not send the virtual interface configuration to the fabric interconnects during the initial cluster configuration or the setup.
F16579	[FSM:STAGE:RETRY:]: keyring configuration on secondary (FSM-STAGE:sam:dme:PkiEpUpdateEp:SetKeyRingPeer)	The FSM could not send the security configuration to the subordinate fabric interconnect during the initial cluster configuration or the setup.
F16539	[FSM:STAGE:RETRY:]: Fabric interconnect mode configuration to primary (FSM-STAGE:sam:dme:FabricLanCloudSwitchMode:SwConfigPeer)	The FSM could not send the end-host mode configuration on to the primary fabric interconnect during the initial cluster configuration or the setup.
F0429	Fabric Interconnect A, HA functionality not ready	The cluster configuration cannot be completed until the chassis discovery is completed.
F0400	Chassis 1 connectivity configuration: un-acknowledged	FXOS discovered the chassis with only one link in the first attempt although the chassis discovery policy is configured for four links. FXOS reacknowledges the chassis to activate the other links.

Table 4-1 Transient Faults that Occur during Initial Setup and Discovery (continued)Process

Fault Code	Fault Text	Description (continued)
F0401	IOM 1/2 (B) current connectivity does not match discovery policy: unsupported-connectivity	<p>FXOS discovered the chassis with only one link in the first attempt although the chassis discovery policy is configured for four links.</p> <p>FXOS can clear this fault when the communication is established between the chassis and the fabric interconnect with that link.</p>
F0440	Chassis discovery policy conflict: Link IOM 1/2/2 to fabric interconnect B:1/1 not configured	<p>FXOS discovered the chassis with only one link in the first attempt although the chassis discovery policy is configured for four links. Until the discovery is successful with that link, the remaining links cannot be marked as active.</p> <p>FXOS can clear this fault when the communication is established between the chassis and the fabric interconnect with that link.</p>
F0332	AssociatePnuOSLocalDiskConfig fails with Service-Unavailable	<p>During discovery, the server association failed due to an error when configuring the local disk controller.</p> <p>The associated remote invocation error code is 4106.</p>
F0277	ether port 1 on fabric interconnect B oper state: link-up, reason: FEX not configured	<p>FXOS discovered the chassis with only one link in the first attempt although the chassis discovery policy is configured for four links. Until the discovery is successful with that link, the remaining links cannot be marked as active.</p>
F0276	ether port 4 on fabric interconnect B oper state: link-down, reason: Link failure or not-connected	<p>One or more of the links on the chassis flapped during the initial discovery. This fault is generated when the link is down during the flapping.</p>
F0206	Adapter 1/2/1 is unreachable	<p>During discovery, the adapter information cannot be accessed from the server. This fault clears as soon as the information is available.</p>
F0283	VIF 1 / 2 B-42/44 down, reason: Bound Physical Interface Down	<p>The internal VIF that the FXOS uses during discovery failed.</p>

Table 4-1 Transient Faults that Occur during Initial Setup and Discovery (continued)Process

Fault Code	Fault Text	Description (continued)
F0367	No link between IOM port 1/1/2 and fabric interconnect A:1/2	The ethernet server ports flapped on the fabric interconnect during the initial discovery, because the discovery policy was configured for more than one link. FXOS clears this fault when the initial discovery succeeds with one link and the other links can be marked as active.
F0399	Current connectivity for chassis 1 does not match discovery policy: unsupported-connectivity	FXOS discovered the chassis with only one link in the first attempt although the chassis discovery policy is configured for four links. Until the discovery is successful with that link, the remaining links cannot be marked as active.
F16520	[FSM:STAGE:RETRY:]: Identify pre-boot environment agent on server 1/2 (FSM-STAGE:sam:dme:ComputeBladeDiscover:PnuOSIdent)	The FSM failed to identify the pre-boot environment on the server during discovery.
F77960	[FSM:STAGE:REMOTE-ERROR]: Result: end-point-unavailable Code: unspecified Message: Waiting for BIOS POST Completion information from IBMC (sam:dme:ComputeBladeDiscover: BiosPostCompletion)	The FSM did not receive a response from the server during discovery and is waiting for the BIOS POST completion information.
F0320	Server 1/1 (service profile:) has an invalid FRU: mismatch-identity-unestablishable	FXOS could not identify the FRUs from the servers during initial discovery.
F77959	[FSM:STAGE:REMOTE-ERROR]: Result: unidentified-fail Code: ERR-0505-IBMC-fru-retrieval-error Message: Could not get Fru from 7f060101, dn=fabric/server/chassis-1/slot-1 (sam:dme:FabricComputeSlotEpIdentify:ExecuteLocal)	FXOS could not identify the FRUs from the servers during initial discovery.
F16406	[FSM:STAGE:RETRY:]: triggering chassis discovery via IOM 1/2 (right) (FSM-STAGE:sam:dme:EquipmentIOCardFeConn:DiscoverChassis)	In a cluster configuration, after the FXOS discovers the chassis through the I/O module connected to the primary fabric interconnect, it raises discovery through the I/O module connected to the secondary fabric interconnect.

Virtual Machine Startup Faults

When you power on a virtual machine on a server that has network adaptors connected to a distributed virtual switch through a port profile, the Events tab of the VMware vCenter may display the following event:

```
Virtual machine powered On with vNICs connected to dvPorts that have a port level configuration, which might be different from the dvPort group configuration.
```

If you see this event, you can safely ignore it.

Introduction to System Event Log Messages

This chapter provides general information about System Event Log Messages. The following sections are included:

- [Information about System Event Log Messages, page 5-1](#)
- [SEL File, page 5-1](#)
- [SEL Policy, page 5-2](#)

Information about System Event Log Messages

The system event log (SEL) resides on the CIMC in NVRAM. It records most server-related events, such as over- and under-voltage, temperature events, fan events, events from the BIOS, and so on. It also records platform errors such as memory errors, CPU errors, and so on.

The SEL is mainly used for troubleshooting purposes. FXOS uses SEL records to provide mechanisms for proactive health monitoring of the system (for example, faults and error statistics).

SEL File

The SEL file is approximately 40 KB in size, and no further events are recorded when it is full. It must be cleared before additional events can be recorded.

SEL Policy

The SEL policy can be configured to backup the SEL to a remote server, and, optionally to clear the SEL after a backup operation occurs. A back up operation can be triggered based upon the following actions defined by the user as a part of SEL backup policy.

- On SEL log full
- On change of server association
- On expiration of timer interval, and so on.

You can also manually backup or clear the SEL.

Baseboard Management Controller Messages

The Baseboard Management Controller (BMC) provides the interface to the System Event Log (SEL). The SEL can be accessed from the system side as well as from other external interfaces. The BMC uses a message handler to route messages between the different interfaces. It also monitors and manages the system board, including temperatures and voltages.

The following sections are included:

- [SEL Device, page 6-1](#)
- [Sensor Data Record Device, page 6-2](#)
- [Event Receiver Device, page 6-3](#)
- [BMC Commands, page 6-3](#)
- [SEL Record Examples, page 6-8](#)

SEL Device

The SEL is a nonvolatile repository for system events. The SEL device is separate from the event receiver device and accepts commands to manage the contents.

This section includes the following topics:

- [SEL Event Record Format, page 6-1](#)
- [Sensor Initialization Agent, page 6-2](#)

SEL Event Record Format

The SEL messages are logged as a 16 byte string that contains the information about the change that triggered the message.

- Byte 1 and 2 is the record ID.
- Byte 3 is the record type.
- Bytes 4, 5, 6, and 7 is the timestamp
- Bytes 8 and 9 is the generator ID.
- Byte 10 is the version of the event message format.
- Byte 11 is the sensor type.
- Byte 12 is the sensor number.

- Byte 13 is either the event dir (assertion/deassertion event) or the event type.
- Byte 14, 15, and 16 are links to the event data field contents and determines whether the sensor class is about threshold, discrete, or original equipment manufacturer (OEM) settings.

Sensor Initialization Agent

The Sensor Initialization Agent is not a logical device, but a collection of functions and services specific to handling SDR information. The Sensor Initialization Agent works directly with the content of SDRs, in particular, with the sensor data records and the device locator records.

The agent uses the SDR information for sensor and IPMB device initialization during system startup. The agent interprets sensor data records and is directed by the *init required* fields to load thresholds to sensors that have the *threshold initialization required* bit set in the SDR records. Other bits in the record direct the agent to enable sensors and devices that come up with sensors, events, or both disabled.

The agent function runs at system power-up and at any system hard resets. We recommend that you run the agent function when the BMC first receives standby power.

In systems that implement power management, the system management software takes additional steps to restore intermediate settings after the system has powered up.

Sensor Data Record Device

The Sensor Data Record (SDR) device provides the interface to the sensor data records. A set of commands store and retrieve sensor data records. The SDR device provides a set of commands for discovering, configuring, and accessing sensors.

This section includes the following topics:

- [SDR Repository Interface, page 6-2](#)
- [Modal and Nonmodal SDR Repositories, page 6-2](#)

SDR Repository Interface

The SDR repository holds sensor, device locator, and entity association records for all sensors in the platform management subsystem. The BMC provides this interface to the SDR repository. The sensor data records can be accessed by using SDR commands.

Modal and Nonmodal SDR Repositories

There are two SDR repository implementations: modal and nonmodal.

A modal SDR repository is only updated when the controller is in SDR repository update mode. SDR information is kept in nonvolatile storage devices. Lengthy write operations during update can be required, which can interfere with other controller operations. For example, the SDR repository can be stored in a flash device that also holds a portion of the management controller code. A modal SDR repository implementation allows the functions associated with that code to be temporarily unavailable during the update process.

A nonmodal SDR repository can be written to at any time. Writing to the SDR does not impact the operation of other commands in the management controller.

Event Receiver Device

Event messages are special messages sent to management controllers when they detect significant or critical system management events. This includes messages for events such as temperature threshold exceeded, voltage threshold exceeded, power fault, and so on. The device generating an event message notifies the system by sending the message to the event receiver device.

Messages from the event receiver device are directly written into the system event log. The appropriate **Add SEL Entry** command is sent directly to the SEL device.

BMC Commands

SEL, SDR, and event commands are designed so that the devices that implement those command sets are isolated from the contents of the message. The devices do not interpret the messages. The event receiver device receives and routes event messages. The SEL devices retrieve and store log entries. The SDR devices retrieve and store sensor data records.

This section includes the following topics:

- [SEL Device Commands, page 6-3](#)
- [SDR Repository Device Commands, page 6-5](#)
- [Event Receiver Commands, page 6-7](#)

SEL Device Commands

These are the available SEL device commands:

- [Get SEL Info, page 6-3](#)
- [Get SEL Allocation Info, page 6-4](#)
- [Reserve SEL, page 6-4](#)
- [Get SEL Entry, page 6-4](#)
- [Add SEL Entry, page 6-4](#)
- [Partial Add SEL Entry, page 6-4](#)
- [Delete SEL Entry, page 6-4](#)
- [Clear SEL, page 6-4](#)
- [Get SEL Time, page 6-4](#)
- [Set SEL Time, page 6-5](#)
- [Get Auxiliary Log Status, page 6-5](#)
- [Set Auxiliary Log Status, page 6-5](#)

Get SEL Info

This command returns the number of entries in the SEL, the SEL command version, and the timestamp for the most recent entry and delete or clear.

Get SEL Allocation Info

This command returns the number of possible allocation units, the amount of usable free space (in allocation units), the allocation unit size (in bytes), and the size of the largest contiguous free region (in allocation units). The allocation unit size is the number of bytes in which storage is allocated. For example, if a 16 byte record is to be added, and the SEL has a 32 byte allocation unit size, the record takes up 32 bytes of storage.

Reserve SEL

This command sets the present owner of the SEL, as identified by the software ID or by the requester slave address from the command. The reservation process provides a limited amount of protection at repository access from the Intelligent Platform Management Interface (IPMB) when records are being deleted or incrementally read.

Get SEL Entry

This command retrieves entries from the SEL. The record data field in the response returns the 16 bytes of data from the SEL event record.

Add SEL Entry

This command enables the BIOS to add records to the system event log. Normally, the SEL device and the event receiver service are incorporated into the same management controller. In this case, BIOS or the system SMI handler adds its own events to the SEL by formatting an event message and sending it to the SEL device rather than by using this command.

Partial Add SEL Entry

This command is a version of the **Add SEL Entry** command. It allows the record to be incrementally added to the SEL. This command must be preceded by a **Reserve SEL** command. The first partial add must be to offset 0000h, and subsequent partial adds must be done sequentially, with no gaps or overlap between the adds.

Delete SEL Entry

This command deletes the specified entry in the SEL.

Clear SEL

This command erases the SEL contents. This process can take several seconds, based on the type of storage device. The command also shows the status of the erasure.

Get SEL Time

This command returns the time from the SEL device, which uses it for event timestamps.

Set SEL Time

This command initializes the time setting in the SEL device, which uses it for event timestamps.

Get Auxiliary Log Status

This command allows remote software to know whether new information has been added to machine check architecture (MCA) log. The MCA log is a storage area that can be implemented in Intel Itanium-based computer systems and holds information from an MCA handler running from system firmware.

Set Auxiliary Log Status

This command can be used by system software or firmware to set the status returned by the **Get Auxiliary Log Status** command. Some implementations might use a private mechanism to set this status, in which case this command can not be provided even if the **Get Auxiliary Log Status** command is provided.

SDR Repository Device Commands

The following commands control the SDR repository device actions:

- [Get SDR Repository Info, page 6-5](#)
- [Get SDR Repository Allocation Info, page 6-6](#)
- [Reserve SDR Repository, page 6-6](#)
- [Get SDR, page 6-6](#)
- [Add SDR, page 6-6](#)
- [Partial Add SDR, page 6-6](#)
- [Delete SDR, page 6-6](#)
- [Clear SDR Repository, page 6-6](#)
- [Get SDR Repository Time, page 6-7](#)
- [Set SDR Repository Time, page 6-7](#)
- [Enter SDR Repository Update Mode, page 6-7](#)
- [Exit SDR Repository Update Mode, page 6-7](#)
- [Run Initialization Agent, page 6-7](#)

Get SDR Repository Info

This command returns the SDR command version for the SDR repository. It also returns a timestamp for the last add, delete, or clear commands.

Get SDR Repository Allocation Info

This command returns the number of possible allocation units, the amount of usable free space (in allocation units), the allocation unit size (in bytes), and the size of the largest contiguous free region (in allocation units). The allocation unit size is the number of bytes in which storage is allocated. For example, if a 20 byte record is to be added, and the SDR repository has a 16 byte allocation unit size, then the record would take up 32 bytes of storage.

Reserve SDR Repository

This command sets the present owner of the repository, as identified by the software ID or the requester slave address from the command. The reservation process provides a limited amount of protection on repository access from the IPMB when records are being deleted or incrementally read.

Get SDR

This command returns the sensor record specified by the record ID. The command also accepts a byte range specification that allows a selected portion of the record to be retrieved (incremental read). The **Reserve SDR Repository** command must be issued first for an incremental read to an offset other than 0000h. (The **Get SDR Repository Info** command should be used to verify the version of the SDR repository before sending other SDR repository commands. The command format and operation could change between versions.)

Add SDR

This command adds the specified sensor record to the SDR repository and returns its record ID. The data passed in the request must contain all of the SDR data.

Partial Add SDR

This command is a version of the **Add SDR** command that allows the record to be incrementally added to the repository. This command must be preceded by a **Reserve SDR Repository** command. The first partial add must be to offset 0000h, and partial adds must be done sequentially, with no gaps or overlap between the adds.

Delete SDR

This command deletes the sensor record specified by record ID. The requester ID and the reservation ID must also match the owner of the SDR repository.

Clear SDR Repository

This command clears all records from the SDR repository and reinitializes the SDR repository subsystem. The requestor ID and reservation ID information must match the present owner of the SDR repository. We recommend that this command not be used within your utilities and system management software.

Get SDR Repository Time

This command returns the time setting from the SDR repository device, which the SDR repository devices uses for tracking when changes to the SDR repository are made.

Set SDR Repository Time

This command initializes the time setting in the SDR repository device, which the SDR repository devices uses for tracking when changes to the SDR repository are made.

Enter SDR Repository Update Mode

This command enters a mode that allows a subset of normal commands. Available commands are **Get Device ID**, **Get SDR**, **Add SDR**, **Partial Add SDR** and **Clear SDR Repository**.

Exit SDR Repository Update Mode

This command exits the SDR repository update mode and restores normal use of all commands.

Run Initialization Agent

This command runs the initialization agent and can also check the status of the agent.

Event Receiver Commands

The following commands can be executed on the event receiver device:

- [Set Event Receiver, page 6-7](#)
- [Get Event Receiver, page 6-7](#)
- [Platform Event Message, page 6-7](#)

Set Event Receiver

This is a global command to tell a controller where to send event messages. The slave address and LUN of the event receiver must be provided. A value FFh for the event receiver slave address disables the generation of event messages.

Get Event Receiver

This is a global command to retrieve the present setting for the event receiver slave address and LUN.

Platform Event Message

This command is a request for the BMC to process event data that the command contains. The data is logged to the SEL.

SEL Record Examples

Examples that are reported to the SEL Repository are provided here. The raw record contains 16 bytes and are displayed in the examples as hexadecimal values. Following the arrow is the translation of the data. The l-pipes are separators for ease of reading the translation.

The following topics are included:

- [Device Presence Changes, page 6-8](#)
- [LED Color Changes, page 6-9](#)
- [Voltage Changes, page 6-9](#)
- [Temperature Changes, page 6-9](#)

Device Presence Changes

These are examples of presence assertions. This shows a boot-up process.
