CHAPTER 1

Introduction to Cisco ISE Syslogs

Cisco ISE Message Catalog

Cisco Identity Services Engine (ISE) provides a logging mechanism that is used for auditing, fault management, and troubleshooting. The logging mechanism helps you to identify fault conditions in deployed services and troubleshoot issues efficiently. It also produces logging output from the monitoring and troubleshooting primary node in a consistent fashion.

In Cisco ISE, system logs (syslogs) are collected at locations called logging targets. Targets refer to the IP addresses of the servers that collect and store logs. You can generate and store logs locally, or you can use the FTP facility to transfer them to an external server.

You can use the Message Catalog page of the Cisco ISE dashboard to view all possible log messages and the descriptions. Choose **Administration** > **System** > **Logging** > **Message Catalog**.

The Log Message Catalog page appears, from which you can view all possible log messages that can appear in your log files. The data available in this page are for display only. If you are using Cisco ISE 2.3 and greater releases, choose **Export** to export all the syslog messages in the form of a CSV file .

For more information on the Cisco ISE logging mechanism, configuring syslog purge, configuring remote syslog collection locations, and other tasks, see the Chapter Maintain and Monitor in the *Cisco ISE Administrator Guide* for your release.

Local Store Syslog Message Format

Cisco ISE log messages are sent to the local store with this syslog message format:

timestamp sequence_num msg_ode msg_sev msg_class msg_text attr =value

Field	Description
timestamp	Date of the message generation, according to the local clock of the originating the Cisco ISE node, in the following format : *YYYY- MM-DD hh:mm:ss:xxx +/-zh:zm*. Possible values are: • YYYY = Numeric representation of the year. • MM = Numeric representation of the month. For single-digit months (1 to 9) a zero precedes the number. • DD = Numeric representation of the day of the month. For single-digit days (1 to 9), a zero precedes the number. • hh = The hour of the day—00 to 23. • mm = The minute of the hour—00 to 59. • ss = The second of the minute—00 to 59. • xxx = The millisecond of the second—000 to 999. • +/-zh:zm = The time zone offset from the Cisco ISE server's time zone, where zh is the number of offset hours and zm is the number of minutes of the offset hour, all of which is preceded by a minus or plus sign to indicate the direction of the offset. For example, +02:00 indicates that the message occurred at the time indicated by the time stamp, and on a Cisco ISE node that is two hours ahead of the Cisco ISE server's time zone.
sequence_num	Global counter of each message. If one message is sent to the local store and the next to the syslog server target, the counter increments by 2. Possible values are 0000000001 to 999999999.
msg_ode	Message code as defined in the logging categories.
msg_sev	Message severity level of a log message. See **Administration** > **System** > **Logging** > **Logging Categories**.
msg_class	Message class, which identifies groups of messages with the same context.
msg_text	English language descriptive text message.
attr=value	Set of attribute-value pairs that provides details about the logged event. A comma (,) separates each pair. Attribute names are as defined in the Cisco ISE dictionaries. Values of the Response direction AttributesSet are bundled to one attribute called Response and are enclosed in curly brackets {}. In addition, the attribute-value pairs within the Response are separated by semicolons. For example, Response={RadiusPacketType=AccessAccept; AuthenticationResult=UnknownUser; cisco-av-pair=sga:security-group-tag=0000-00;}

Remote Syslog Message Format

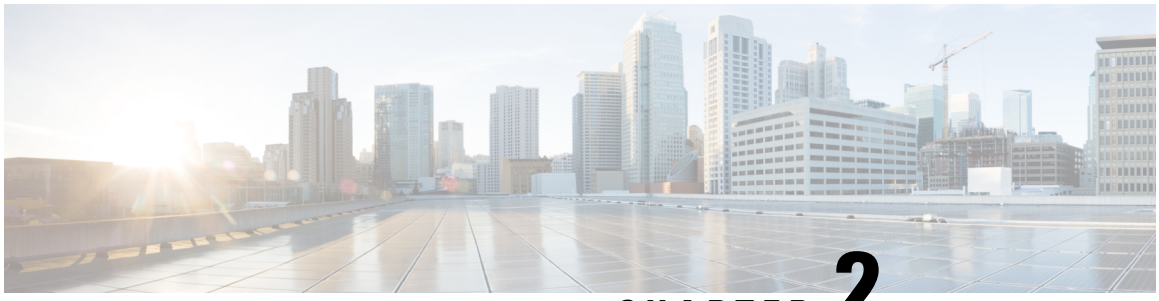
Cisco ISE log messages are sent to the remote syslog server with this syslog message header format, which precedes the local store syslog message format:

pri_num Mmm DD hh:mm:ss xx:xx:xx:xx/host_name cat_name msg_id total_seg seg_num

Field	Description
pri_num	Priority value of the message; a combination of the facility value and the severity value of the message. Priority value = (facility value* 8) + severity value. Refer the relevant Cisco ISE Administrator Guide for your release to set security levels for message codes. The facility code valid options are: • LOCAL0 (Code = 16) • LOCAL1 (Code = 17) • LOCAL2 (Code = 18) • LOCAL3 (Code = 19) • LOCAL4 (Code = 20) • LOCAL5 (Code = 21) • LOCAL6 (Code = 22; default) • LOCAL7 (Code = 23)
time	Date of the message generation, according to the local clock of the originating Cisco ISE server, in the format Mmm DD hh:mm:ss. Possible values are: • Mmm = Representation of the month—Jan, Feb, Mar, Apr, May, Jun, Jul, Aug, Sep, Oct, Nov, Dec. • DD = Numeric representation of the day of the month. For single-digit days (1 to 9), a space precedes the number. • hh = The hour of the day—00 to 23. • mm = The minute of the hour—00 to 59. • ss = The second of the minute—00 to 59. Some devices send messages that specify a time zone in the format -/+hhmm, where - and + identifies the directional offset from the Cisco ISE server's time zone, hh is the number of offset hours, and mm is the number of minutes of the offset hour. For example, +02:00 indicates that the message occurred at the time indicated by the time stamp, and on a Cisco ISE node that is two hours ahead of the Cisco ISE server's time zone.
xx:xx:xx:xx/host_name	IP address of the originating Cisco ISE node, or the hostname.

Field	Description
cat_name	Logging category name preceded by the CSCOxxx string.
msg_id	Unique message ID; 1 to 4294967295. The message ID increases by 1 with each new message. Message IDs restart at 1 each time the application is restarted.
total_seg	Total number of segments in a log message. Long messages are divided into more than one segment. **Note** The *total_seg* depends on the Maximum Length setting in the remote logging targets page. See *Remote Logging Target Settings*.
seg_num	Segment sequence number within a message. Use this number to determine what segment of the message you are viewing.

The syslog message data or payload is the same as the Local Store Syslog Message Format. The remote syslog server targets are identified by the facility code names LOCAL0 to LOCAL7 (LOCAL6 is the default logging location.) Log messages that you assign to the remote syslog server are sent to the default location for Linux syslog (/var/log/messages), however; you can configure a different location on the server.



CHAPTER 2

List of Cisco ISE Syslogs

This document contains the syslogs generated in all Cisco ISE releases, including Cisco ISE Release 3.3.

List of Cisco ISE Syslogs

The following sections include a comprehensive list of syslogs generated, what each of them means, and the format of the message in local and remote logging targets.

Cisco ISE Release 3.4: New System Messages

Category Name	Message Codes
AD Connector	25059
	25060
	25061
Administrative and Operational Audit	63001
	63002
	63003
	63004
	63005

- **Message Code:** 11514

  Severity: WARN

Message Text: Unexpectedly received empty TLS message; treating as a rejection by the client

Message Description: While trying to negotiate a TLS handshake with the client, ISE expected to receive a non-empty TLS message or TLS alert message, but instead received an empty TLS message. This could be due to an inconformity in the implementation of the protocol between ISE and the supplicant. For example, it is a known issue that the XP supplicant sends an empty TLS message instead of a non-empty TLS alert message. It might also involve the supplicant not trusting the ISE server certificate for some reason. ISE treated the unexpected message as a sign that the client rejected the tunnel establishment.

Local Target Message Format: <timestamp> <seq_num> 11514 WARN EAP: Unexpectedly received empty TLS message; treating as a rejection by the client, <log details>

  Message Text: Rejected PAC provisioning request because supplicant failed to adhere to protocol

  Message Description: Rejected the PAC provisioning request because the client's supplicant failed to properly adhere to the TEAP protocol. Not only did it fail to send an ACK for the almost-provisioned PAC, but it also failed to properly follow up by sending a valid additional request for a Tunnel PAC or a Machine PAC.

  Local Target Message Format: <timestamp> <seq_num>11578 WARN EAP Rejected PAC provisioning request because supplicant failed to adhere to protocol, <log details>

  Remote Target Message Format: <pri_num> <timestamp> <IP address/hostname> <CISE_logging category> <msg_id> <total seg> <seg num><timestamp> <seq_num>11578 WARN EAP Rejected PAC provisioning request because supplicant failed to adhere to protocol, <log details>

- **Message Code:** 11579

  Severity: WARN

  Message Text: No valid PAC requests on provisioning

  Message Description: Client did not send valid PAC request at the end of TEAP provisioning conversation. Provisioning conversation should always finish with sending requested one or more PACs to the client. Legacy client may not ask for specific PAC since in initial draft of TEAP protocol there was only one PAC type and it was unnecessary to specify it. ISE provides legacy Tunnel V1 PAC in such case. More advanced client may reequest several PAC types but they need to conform certain rules. For example, ISE cannot provide User Authorization PAC if Tunnel PAC was not requested.

  Local Target Message Format: <timestamp> <seq_num>11579 WARN EAP No valid PAC requests on provisioning, <log details>

  Remote Target Message Format: <pri_num> <timestamp> <IP address/hostname> <CISE_logging category> <msg_id> <total seg> <seg num><timestamp> <seq_num>11579 WARN EAP No valid PAC requests on provisioning, <log details>

- **Message Code:** 11617

  Severity: WARN

  Message Text: Client didn't provide suitable ciphers for anonymous PAC-provisioning

  Message Description: The TEAP in-band PAC-provisioning request issued by the client's supplicant has internally specified a cipher. This cipher is not compatible with the provisioning method currently allowed by Allowed Protocols configuration: Anonymous In-Band PAC provisioning. If you need this provisioning method, this message indicates that the supplicant is either configured incorrectly or that it cannot be used to perform Anonymous provisioning using the current version of ISE. If you need Authenticated provisioning, this message indicates that the Allowed Protocols configuration currently does not allow Authenticated In-Band PAC provisioning.

  Local Target Message Format: <timestamp> <seq_num>11617 WARN EAP Client didn't provide suitable ciphers for anonymous PAC-provisioning, <log details>

  Remote Target Message Format: <pri_num> <timestamp> <IP address/hostname> <CISE_logging category> <msg_id> <total seg> <seg num><timestamp> <seq_num>11617 WARN EAP Client didn't provide suitable ciphers for anonymous PAC-provisioning, <log details>

- **Message Code:** 11618

  Severity: WARN

  Message Text: Client didn't provide suitable ciphers for authenticated PAC provisioning

Message Description: The TEAP in-band PAC-provisioning request issued by the client's supplicant internally specified a cipher that is not compatible with the only provisioning method currently allowed by Allowed Protocols configuration: Authenticated In-Band PAC Provisioning. If this is indeed the desired provisioning method, then this message indicates that the supplicant is either configured improperly or that it cannot be used to perform authenticated provisioning with the current version of ISE. Alternatively, if anonymous provisioning is the method actually desired, then this message indicates that Allowed Protocols configuration currently does not allow Anonymous In-Band PAC Provisioning.

Local Target Message Format: <timestamp> <seq_num>11618 WARN EAP Client didn't provide suitable ciphers for authenticated PAC provisioning, <log details>

Remote Target Message Format: <pri_num> <timestamp> <IP address/hostname> <CISE_logging category> <msg_id> <total seg> <seg num><timestamp> <seq_num>11618 WARN EAP Client didn't provide suitable ciphers for authenticated PAC provisioning, <log details>

Message Text: Client didn't provide suitable ciphers for anonymous PAC-provisioning

Message Description: The EAP-FAST in-band PAC-provisioning request issued by the client's supplicant has internally specified a cipher. This cipher is not compatible with the provisioning method currently allowed by Allowed Protocols configuration: Anonymous In-Band PAC provisioning. If you need this provisioning method, this message indicates that the supplicant is either configured incorrectly or that it cannot be used to perform Anonymous provisioning using the current version of ISE. If you need Authenticated provisioning, this message indicates that the Allowed Protocols configuration currently does not allow Authenticated In-Band PAC provisioning.

Local Target Message Format: <timestamp> <seq_num> 12121 WARN EAP: Client didn't provide suitable ciphers for anonymous PAC-provisioning, <log details>

Remote Target Message Format: <pri_num> <timestamp> <IP address/hostname> <CISE_logging category> <msg_id> <total seg> <seg num><timestamp> <seq_num> 12121 WARN EAP: Client didn't provide suitable ciphers for anonymous PAC-provisioning, <log details>

- **Message Code:** 12122

  Severity: WARN

  Message Text: Client didn't provide suitable ciphers for authenticated PAC provisioning

  Message Description: The EAP-FAST in-band PAC-provisioning request issued by the client's supplicant internally specified a cipher that is not compatible with the only provisioning method currently allowed by Allowed Protocols configuration: Authenticated In-Band PAC Provisioning. If this is indeed the desired provisioning method, then this message indicates that the supplicant is either configured improperly or that it cannot be used to perform authenticated provisioning with the current version of ISE. Alternatively, if anonymous provisioning is the method actually desired, then this message indicates that Allowed Protocols configuration currently does not allow Anonymous In-Band PAC Provisioning.

  Local Target Message Format: <timestamp> <seq_num> 12122 WARN EAP: Client didn't provide suitable ciphers for authenticated PAC provisioning, <log details>

  Remote Target Message Format: <pri_num> <timestamp> <IP address/hostname> <CISE_logging category> <msg_id> <total seg> <seg num><timestamp> <seq_num> 12122 WARN EAP: Client didn't provide suitable ciphers for authenticated PAC provisioning, <log details>

Message Text: Prepared EAP-Request proposing LEAP with challenge

Message Description: Created an EAP-Request packet to propose to use the LEAP protocol, and also providing a LEAP challenge, for attachment to a RADIUS message. The LEAP protocol was proposed because it was one of the EAP-based protocols allowed in Allowed Protocols.

Local Target Message Format: <timestamp> <seq_num> 12700 INFO EAP: Prepared EAP-Request proposing LEAP with challenge, <log details>

Remote Target Message Format: <pri_num> <timestamp> <IP address/hostname> <CISE_logging category> <msg_id> <total seg> <seg num><timestamp> <seq_num> 12700 INFO EAP: Prepared EAP-Request proposing LEAP with challenge, <log details>

- **Message Code:** 12701

  Severity: INFO

  Message Text: Extracted EAP-Response/NAK requesting to use LEAP instead

  Message Description: Extracted from the RADIUS message an EAP-Response/NAK packet, rejecting the previously-proposed EAP-based protocol, and requesting to use LEAP instead, per the configuration of the client's supplicant.

  Local Target Message Format: <timestamp> <seq_num> 12701 INFO EAP: Extracted EAP-Response/NAK requesting to use LEAP instead, <log details>

  Remote Target Message Format: <pri_num> <timestamp> <IP address/hostname> <CISE_logging category> <msg_id> <total seg> <seg num><timestamp> <seq_num> 12701 INFO EAP: Extracted EAP-Response/NAK requesting to use LEAP instead, <log details>

- **Message Code:** 12702

  Severity: WARN

  Message Text: EAP-TTLS inner method PAP is not allowed in Allowed Protocols

  Message Description: EAP-TTLS inner method PAP is not allowed in Allowed Protocols

Local Target Message Format: <timestamp> <seq_num> 12997 WARN EAP: EAP-TTLS inner method PAP is not allowed in Allowed Protocols, <log details>

Remote Target Message Format: <pri_num> <timestamp> <IP address/hostname> <CISE_logging category> <msg_id> <total seg> <seg num><timestamp> <seq_num> 12997 WARN EAP: EAP-TTLS inner method PAP is not allowed in Allowed Protocols, <log details>

- **Message Code:** 12998

  Severity: WARN

  Message Text: Failed to negotiate EAP for inner method because EAP-MD5 not allowed under EAP-TTLS configuration in the Allowed Protocols

  Message Description: The client's supplicant sent an EAP-Response/NAK packet rejecting the EAP-based protocol that was previously proposed for the inner method, and requested to use EAP-MD5 instead. However, ISE does not allow EAP-MD5 under EAP-TTLS configuration in Allowed Protocols.

  Local Target Message Format: <timestamp> <seq_num> 12998 WARN EAP: Failed to negotiate EAP for inner method because EAP-MD5 not allowed under EAP-TTLS configuration in the Allowed Protocols, <log details>

  Message Text: RADIUS DTLS: OCSP server response is invalid

  Message Description: RADIUS DTLS: OCSP server returned a response that cannot be parsed by ISE.

  Local Target Message Format: <timestamp> <seq_num> 91083 WARN RADIUS: RADIUS DTLS: OCSP server response is invalid, <log details>

  Remote Target Message Format: <pri_num> <timestamp> <IP address/hostname> <CISE_logging category> <msg_id> <total seg> <seg num><timestamp> <seq_num> 91083 WARN RADIUS: RADIUS DTLS: OCSP server response is invalid, <log details>

- **Message Code:** 91084

  Severity: WARN

  Message Text: RADIUS DTLS: OCSP server returned an error

  Message Description: RADIUS DTLS: OCSP server returned an error in response to the ISE OCSP request.

  Local Target Message Format: <timestamp> <seq_num> 91084 WARN RADIUS: RADIUS DTLS: OCSP server returned an error, <log details>

  Remote Target Message Format: <pri_num> <timestamp> <IP address/hostname> <CISE_logging category> <msg_id> <total seg> <seg num><timestamp> <seq_num> 91084 WARN RADIUS: RADIUS DTLS: OCSP server returned an error, <log details>

- **Message Code:** 91085

  Severity: WARN

  Message Text: RADIUS DTLS: OCSP server did not provide the required nonce in response

  Message Description: RADIUS DTLS: Specific OCSP service in ISE is configured to use nonce for OCSP server verification but the OCSP server did not provide a nonce in response.

  Local Target Message Format: <timestamp> <seq_num> 91085 WARN RADIUS: RADIUS DTLS: OCSP server did not provide the required nonce in response, <log details>

  Remote Target Message Format: <pri_num> <timestamp> <IP address/hostname> <CISE_logging category> <msg_id> <total seg> <seg num><timestamp> <seq_num> 91085 WARN RADIUS: RADIUS DTLS: OCSP server did not provide the required nonce in response, <log details>

- **Message Code:** 91086

  Severity: WARN

  Message Text: RADIUS DTLS: OCSP server response nonce verification failed

  Message Description: RADIUS DTLS: Cryptographic verification of nonce returned in OCSP server response failed.

  Local Target Message Format: <timestamp> <seq_num> 91086 WARN RADIUS: RADIUS DTLS: OCSP server response nonce verification failed, <log details>

  Remote Target Message Format: <pri_num> <timestamp> <IP address/hostname> <CISE_logging category> <msg_id> <total seg> <seg num><timestamp> <seq_num> 91086 WARN RADIUS: RADIUS DTLS: OCSP server response nonce verification failed, <log details>

- **Message Code:** 91087

  Severity: WARN

  Message Text: RADIUS DTLS: OCSP server response time verification failed

  Message Description: RADIUS DTLS: In the OCSP server response verification of 'This Update' or 'Next Update' fields failed.

  Local Target Message Format: <timestamp> <seq_num> 91087 WARN RADIUS: RADIUS DTLS: OCSP server response time verification failed, <log details>
