<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>wlan profile-name wlan-id SSID_name</b> <b>Example:</b> Device(config)# <b>wlan wlan-test 3 ssid-test</b>	Enters WLAN configuration submode. <ul style="list-style-type: none"> <li>• <i>profile-name</i> - Profile name of the configured WLAN.</li> <li>• <i>wlan-id</i> - Wireless LAN identifier. Range is from 1 to 512.</li> <li>• <i>SSID_Name</i> - SSID, which can contain up to 32 alphanumeric characters.</li> </ul>
<b>Step 3</b>	<b>mac-filtering list-name</b> <b>Example:</b> Device(config-wlan)# <b>mac-filtering cat-radius</b>	Sets the MAC filtering parameters.
<b>Step 4</b>	<b>no security wpa akm dot1x</b> <b>Example:</b> Device(config-wlan)# <b>no security wpa akm dot1x</b>	Disables security Authenticated Key Management (AKM) for dot1x.
<b>Step 5</b>	<b>no security wpa wpa2 ciphers aes</b> <b>Example:</b> Device(config-wlan)# <b>no security wpa wpa2 ciphers aes</b>	Disables the WPA2 cipher. <b>aes:</b> Exryption type that specifies WPA/AES support.
<b>Step 6</b>	<b>security web-auth on-macfilter-failure</b> <b>Example:</b>	Configures the fallback policy with MAC filtering and web authentication.

	Command or Action	Purpose
	Device(config-wlan) # <b>security web-auth on-macfilter-failure wlan-id</b>	
<b>Step 7</b>	<b>security web-auth parameter-map</b> <i>parameter-map-name</i>  <b>Example:</b> Device(config-wlan) # <b>security web-auth parameter-map global</b>	Maps the parameter map.  <b>Note:</b> If the parameter map is not associated with a WLAN, the configuration is considered from the global parameter map.
<b>Step 8</b>	<b>no shutdown</b>  <b>Example:</b> Device(config-wlan) # <b>no shutdown</b>	Enables WLAN.

## Configuring a PSK + LWA in a WLAN

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>wlan profile-name wlan-id SSID_name</b>  <b>Example:</b> Device(config) # <b>wlan wlan-test 3 ssid-test</b>	Enters WLAN configuration submode. <ul style="list-style-type: none"> <li>• <i>profile-name</i> - Profile name of the configured WLAN.</li> <li>• <i>wlan-id</i> - Wireless LAN identifier. Range is from 1 to 512.</li> <li>• <i>SSID_Name</i> - SSID, which can contain up to 32 alphanumeric characters.</li> </ul>
<b>Step 3</b>	<b>no security wpa akm dot1x</b>  <b>Example:</b> Device(config-wlan) # <b>no security wpa akm dot1x</b>	Disables security AKM for dot1x.
<b>Step 4</b>	<b>security web-auth</b>  <b>Example:</b> Device(config-wlan) # <b>security web-auth</b>	Enables web authentication for a WLAN.
<b>Step 5</b>	<b>no security wpa wpa2 ciphers aes</b>  <b>Example:</b> Device(config-wlan) # <b>no security wpa wpa2 ciphers aes</b>	Disables the WPA2 cipher.  <b>aes:</b> Encryption type that specifies WPA/AES support.

	Command or Action	Purpose
<b>Step 6</b>	<b>security wpa psk set-key ascii</b> <i>ascii/hex key</i> <b>Example:</b> Device(config-wlan)# <b>security wpa psk set-key ascii 0 1234567</b>	Configures the preshared key on a WLAN.
<b>Step 7</b>	<b>security wpa akm psk</b> <b>Example:</b> Device(config-wlan)# <b>security wpa akm psk</b>	Configures PSK support.
<b>Step 8</b>	<b>security web-auth authentication-list</b> <i>authenticate-list-name</i> <b>Example:</b> Device(config-wlan)# <b>security web-auth authentication-list default</b>	Enables the authentication list for dot1x security.
<b>Step 9</b>	<b>security web-auth parameter-map</b> <i>parameter-map-name</i> <b>Example:</b> Device(config-wlan)# <b>security web-auth parameter-map global</b>	Maps the parameter map. <b>Note:</b> If the parameter map is not associated with a WLAN, the configuration is considered from the global parameter map.

## Configuring a Sleeping Client

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>parameter-map type webauth</b> <i>{parameter-map-name   global}</i> <b>Example:</b> Device(config)# <b>parameter-map type webauth MAP-2</b>	Creates a parameter map and enters <i>parameter-map-name</i> configuration mode. The specific configuration commands supported for a <b>global</b> parameter map defined with the global keyword differ from the commands supported for a named parameter map defined with the <i>parameter-map-name</i> argument.
<b>Step 3</b>	<b>sleeping client</b> [ <i>timeout time</i> ] <b>Example:</b> Device(config-params-parameter-map)# <b>sleeping-client timeout 60</b>	Configures the sleeping client timeout, in minutes. The available range for the <i>time</i> argument is from 10 to 43200.

	Command or Action	Purpose
		<b>Note:</b> If you do not use the <b>timeout</b> keyword, the sleeping client is configured with the default timeout value of 720 minutes.

## Verifying a Sleeping Client Configuration

To verify a sleeping client configuration, use the following command:

```
Device# show wireless client sleeping-client
Total number of sleeping-client entries: 1

MAC Address Remaining time (mm:ss)

2477.031b.aa18 59:56
```

## Multi Authentication Combination with 802.1X Authentication and Local Web Authentication

### Feature History for Multiauthentication Combination of 802.1X and Local Web Authentication

This table provides release and related information about the feature explained in this section.

This feature is also available in all the releases subsequent to the one in which they are introduced in, unless noted otherwise.

**Table 81: Feature History for Multiauthentication Combination of 802.1X and Local Web Authentication**

Release	Feature	Feature Information
Cisco IOS XE Dublin 17.11.1	Multiauthentication Combination of 802.1X and Local Web Authentication	This feature supports the merging of applied policies during multiauthentication of 802.1X or MAC authentication bypass (MAB) and local web authentication (LWA).

### Information About Multiauthentication Combination with 802.1X Authentication and Local Web Authentication

In a wireless setup, for example, in a university, clients authenticate through 802.1X authentication. Because the 802.1X (dot1X) authentication process is secure and does not require user intervention, the end-users are unaware of the network that their devices are connected to. This could lead to serious concerns if they connect to the university's wireless network and post inappropriate content or access restricted content.

To avoid this situation, web authentication (webauth) and 802.1X authentication are configured in the network. End-user consent is used as a part of webauth to inform users that they are connected to the university's Wi-Fi network.

When the end-users accept the credentials for consent, AAA policies are not applied. The AAA policies that were applied earlier are deleted, resulting in a VLAN change and client disconnection.

A new command is introduced in Cisco IOS XE Dublin 17.11.1 to fix this issue. When you run the **consent activation-mode merge** command, the policy that is applied through consent is merged with the policy applied for 802.1X or MAC Authentication Bypass (MAB) authentication, thereby allowing clients to access the network. This command is available in parameter-map mode, which is configured with **type consent** command.

## Limitations for Multi Authentication Combination of 802.1X and Local Web Authentication

The following are the limitations for multiauthentication combination of 802.1X authentication and LWA:

- It is not possible to configure this feature on the controller GUI.
- SNMP is not supported.
- When the **consent activation-mode merge** command is not configured on the webauth parameter map, the default activation mode is Replace. This means that the user profile for consent replaces all the user profile policies that were previously applied.

## Enabling the Multiauthentication Combination of 802.1X Authentication and Local Web Authentication (CLI)

### Before you begin

Ensure that you have working knowledge of multiauthentication concepts, LWA (consent), and AAA override.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# <code>configure terminal</code>	Enter global configuration mode.
<b>Step 2</b>	<b>parameter-map type webauth</b> <i>parameter-map-name</i>  <b>Example:</b> Device(config)# <code>parameter-map type webauth parameter-map1</code>	Configures the webauth type parameter. Enters the parameter map configuration mode.
<b>Step 3</b>	<b>type consent</b>  <b>Example:</b> Device(config-params-parameter-map)# <code>type consent</code>	Configures the type as <b>consent</b> .

	Command or Action	Purpose
<b>Step 4</b>	<p><b>[no] consent {activation-mode merge   email}</b></p> <p><b>Example:</b></p> <pre>Device(config-params-parameter-map) # consent activation-mode merge</pre>	Enables policy activation mode and merges the previous policy. Run the <b>no</b> form of this command to disable the feature.

## Verifying Multiauthentication Combination with 802.1X Authentication and Local Web Authentication

To verify the multiauthentication combination with 802.1X authentication and LWA, run the following command:

```
Device# show parameter-map type webauth lwa-consent
Parameter Map Name : lwa_consent
 Banner Title : Consent Title
 Banner Text : Please accept the consent
 Type : consent
 Auth-proxy Init State time : 300 sec
 Webauth max-http connection : 200
 Webauth logout-window : Enabled
 Webauth success-window : Enabled
 Consent Email : Disabled
 Activation Mode : Merge
 Sleeping-Client : Disabled
 Webauth login-auth-bypass:
```

## CHAPTER 97

# Central Web Authentication

- [Information About Central Web Authentication, on page 1083](#)
- [How to Configure ISE, on page 1084](#)
- [How to Configure Central Web Authentication on the Controller, on page 1086](#)
- [Authentication for Sleeping Clients, on page 1094](#)
- [Sleeping Clients with Multiple Authentications, on page 1096](#)

## Information About Central Web Authentication

Central web authentication offers the possibility to have a central device that acts as a web portal (in this example, the ISE). The major difference compared to the usual local web authentication is that it is shifted to Layer 2 along with MAC filtering or dot1x authentication. The concept also differs in that the radius server (ISE in this example) returns special attributes that indicate to the switch that a web redirection must occur. This solution eliminates any delay to start the web authentication.

The following are the different types of web authentication methods:

- **Local Web Authentication (LWA):** Configured as Layer 3 security on the controller, the web authentication page and the pre-authentication ACL are locally configured on the controller. The controller intercepts http(s) traffic and redirects the client to the internal web page for authentication. The credentials entered by the client on the login page is authenticated by the controller locally or through a RADIUS or LDAP server.
- **External Web Authentication (EWA):** Configured as Layer 3 security on the controller, the controller intercepts http(s) traffic and redirects the client to the login page hosted on the external web server. The credentials entered by the client on the login page is authenticated by the controller locally or through a RADIUS or LDAP server. The pre-authentication ACL is configured statically on the controller.
- **Central Web Authentication (CWA):** Configured mostly as Layer 2 security on the controller, the redirection URL and the pre-authentication ACL reside on ISE and are pushed during layer 2 authentication to the controller. The controller redirects all web traffic from the client to the ISE login page. ISE validates the credentials entered by the client through HTTPS and authenticates the user.

Globally, if the MAC address of the client station is not known by the radius server (but other criteria can also be used), the server returns the redirection attributes, and the controller authorizes the station (using the MAC filtering) but places an access list to redirect the web traffic to the portal.

Once the user logs into the guest portal, it is possible to re-authenticate the client so that a new Layer 2 MAC filtering occurs using the Change of Authorization (CoA). This way, the ISE remembers that it was a webauth user and pushes the necessary authorization attributes to the controller for accessing the network.

**Note**

- In Central Web Authentication (CWA) with dual VLAN posture scenario, Cisco AireOS and IOS-XE controller performs 2 and 3 EAPOL handshakes respectively. If a client is stuck in a quarantine VLAN because of any break in EAPOL handshake due to client or network issue, you need to analyze the client or network issue.
- However, you can manually disconnect or reconnect the client to come out of the quarantine loop (or) click the Scan Again on AnyConnect (Or) enable posture lease (Or) use the ISE posture sync feature.
- If the controller has no switch virtual interface (SVI) in the client subnet or VLAN, the controller has to use any of the other SVIs and send traffic as defined in the routing table. This means that the traffic is sent to another gateway in the core of the network; this traffic then reaches the client subnet. Firewalls typically block traffic from and to the same switch, as seen in this scenario, so redirection might not work properly. Workarounds are to allow this behavior on the firewall.

## Prerequisites for Central Web Authentication

- Cisco Identity Services Engine (ISE)

## How to Configure ISE

To configure ISE, proceed as follows:

1. Create an authorization profile.
2. Create an authentication rule.
3. Create an authorization rule.

## Creating an Authorization Profile

### Procedure

- Step 1** Click **Policy**, and click **Policy Elements**.
- Step 2** Click **Results**.
- Step 3** Expand **Authorization**, and click **Authorization Profiles**.
- Step 4** Click **Add** to create a new authorization profile for central webauth.
- Step 5** In the **Name** field, enter a name for the profile. For example, CentralWebauth.
- Step 6** Choose **ACCESS\_ACCEPT** from the Access Type drop-down list.

- Step 7** Check the **Web Redirection (CWA, MDM, NSP, CPP)** check box, and choose **Centralized Web Auth** from the drop-down list.
- Step 8** In the **ACL** field, enter the name of the ACL that defines the traffic to be redirected. For example, redirect.
- Step 9** In the **Value** field, choose the default or customized values.  
The Value attribute defines whether the ISE sees the default or a custom web portal that the ISE admin created.
- Step 10** Click **Save**.
- 

## Creating an Authentication Rule

Follow the procedure given below to use the authentication profile and create the authentication rule:

### Procedure

---

- Step 1** In the **Policy > Authentication** page, click **Authentication**.
- Step 2** Enter a name for your authentication rule. For example, MAB.
- Step 3** In the If condition field, select the plus (+) icon.
- Step 4** Choose **Compound condition**, and choose **Wireless\_MAB**.
- Step 5** Click the arrow located next to **and ...** in order to expand the rule further.
- Step 6** Click the + icon in the Identity Source field, and choose **Internal endpoints**.
- Step 7** Choose **Continue** from the 'If user not found' drop-down list.  
This option allows a device to be authenticated even if its MAC address is not known.
- Step 8** Click **Save**.
- 

## Creating an Authorization Rule

You can configure many rules in the authorization policy. The *MAC not known* rule is configured in this section:

### Procedure

---

- Step 1** Click **Policy > Authorization**.
- Step 2** In the Rule Name field, enter a name. For example: *Mac not known*.
- Step 3** In the Conditions field, click the plus (+) icon.
- Step 4** Choose **Compound Conditions**, and choose **Wireless\_MAB**.
- Step 5** From the settings icon, select **Add Attribute/Value** from the options.
- Step 6** In the Description field, choose **Network Access > AuthenticationStatus** as the attribute from the drop-down list.
- Step 7** Choose the **Equals** operator.

- Step 8** From the right-hand field, choose **UnknownUser**.
- Step 9** In the Permissions field, choose the authorization profile name that you had created earlier.
- The ISE continues even though the user (or MAC) is not known.
- Unknown users are now presented with the Login page. However, once they enter their credentials, they are presented again with an authentication request on the ISE; therefore, another rule must be configured with a condition that is met if the user is a guest user. For example, if `UseridentityGroup Equals Guest` is used then it is assumed that all guests belong to this group.
- Step 10** In the Conditions field, click the plus (+) icon.
- Step 11** Choose **Compound Conditions**, and choose to create a new condition.
- The new rule must come before the *MAC not known* rule.
- Step 12** From the settings icon, select **Add Attribute/Value** from the options.
- Step 13** In the Description field, choose **Network Access > UseCase** as the attribute from the drop-down list.
- Step 14** Choose the **Equals** operator.
- Step 15** From the right-hand field, choose **GuestFlow**.
- Step 16** In the Permissions field, click the plus (+) icon to select a result for your rule.
- You can choose **Standard > PermitAccess** option or create a custom profile to return the attributes that you like.
- When the user is authorized on the login page, the ISE triggers a COA that results in the restart of Layer 2 authentication. When the user is identified as a guest user, the user is authorized.
- 

## How to Configure Central Web Authentication on the Controller

To configure central web authentication on the controller, proceed as follows:

1. Configure WLAN.
2. Configure policy profile.
3. Configure redirect ACL.
4. Configure AAA for central web authentication.
5. Configure redirect ACL in Flex profile.

### Configuring WLAN (GUI)

#### Before you begin

You need to enable MAC filtering for Layer 2 authentication to download the redirect URL and ACL.

## Procedure

---

- Step 1** Choose **Configuration > Tags & Profiles > WLANs**.
- Step 2** In the **WLANs** window, click the name of the **WLAN** or click **Add** to create a new one.
- Step 3** In the **Add/Edit WLAN** window that is displayed, click the **General** tab to configure the following parameters.
- In the **Profile Name** field, enter or edit the name of the profile.
  - In the **SSID** field, enter or edit the SSID name.  
The SSID name can be alphanumeric, and up to 32 characters in length.
  - In the **WLAN ID** field, enter or edit the ID number. The valid range is between 1 and 512.
  - From the **Radio Policy** drop-down list, choose the **802.11** radio band.
  - Using the **Broadcast SSID** toggle button, change the status to either **Enabled** or **Disabled** .
  - Using the **Status** toggle button, change the status to either **Enabled** or **Disabled** .
- Step 4** Click the **Security** tab, and then **Layer 2** tab to configure the following parameters:
- From the **Layer 2 Security Mode** drop-down list, choose **None** . This setting disables Layer 2 security.
  - Enter the **Reassociation Timeout** value, in seconds. This is the time after which a fast transition reassociation times out.
  - Check the **Over the DS** check box to enable Fast Transition over a distributed system.
  - Choose OWE, Opportunistic Wireless Encryption (OWE) provides data confidentiality with encryption over the air between an AP radio and a wireless client. OWE Transition Mode is meant to provide a sort of backwards compatibility.
  - Choose Fast Transition, 802.11r which is the IEEE standard for fast roaming, introduces a new concept of roaming where the initial handshake with a new AP is done even before the corresponding client roams to the target access point. This concept is called Fast Transition.
  - Check the check box to enable MAC filtering in the WLAN.
  - Check the **Lobby Admin Access** check box to enable Lobby Admin access.
- Step 5** Click **Save & Apply to Device**.
- 

## Configuring WLAN (CLI)

Configure WLAN using commands.

**Note** You need to enable MAC filtering for Layer 2 authentication to download the redirect URL and ACL. After completing the WLAN configuration, if the changes are not pushed to all the APs, the following syslog message appears:

*2021/01/06 16:20:00.597927186 {wncd\_x\_R0-4}{1}: [wlanmgr-db] [20583]: UUID: 0, ra: 0, TID: 0 (note): Unable to push WLAN config changes to all APs, cleanup required for WlanId: 2, profile: wlan1 state: Delete pending*

If the above mentioned syslog message appears for more than six minutes, reload the controller.

If the controller does not reload and still the syslog message appears, then collect the archive logs, wncd core file, and raise a case by clicking the following link: [Support Case Manager](#).

**Procedure**

	Command or Action	Purpose
<b>Step 1</b>	<p><b>wlan wlan-name wlan-id SSID-name</b></p> <p><b>Example:</b></p> <pre>Device(config)# wlan wlanProfileName 1 ngwcSSID</pre>	<p>Enters the WLAN configuration sub-mode.</p> <p><b>wlan-name</b> is the name of the configured WLAN.</p> <p><b>wlan-id</b> is the wireless LAN identifier. The range is 1 to 512.</p> <p><b>SSID-name</b> is the SSID name which can contain 32 alphanumeric characters.</p> <p><b>Note</b> If you have already configured this command, enter <b>wlan wlan-name</b> command.</p>
<b>Step 2</b>	<p><b>mac-filtering [name]</b></p> <p><b>Example:</b></p> <pre>Device(config-wlan)# mac-filtering name</pre>	<p>Enables MAC filtering on a WLAN.</p> <p><b>Note</b> While configuring mac-filtering the default authentication list is considered, if the authentication list is not configured earlier.</p>
<b>Step 3</b>	<p><b>no security wpa</b></p> <p><b>Example:</b></p> <pre>Device(config-wlan)# no security wpa</pre>	<p>Disable WPA security.</p>
<b>Step 4</b>	<p><b>no shutdown</b></p> <p><b>Example:</b></p> <pre>Device(config-wlan)# no shutdown</pre>	<p>Enables the WLAN.</p>
<b>Step 5</b>	<p><b>end</b></p> <p><b>Example:</b></p> <pre>Device(config-wlan)# end</pre>	<p>Returns to privileged EXEC mode.</p>

**Example**

```

Device# config terminal
Device(config)# wlan wlanProfileName 1 ngwcSSID
Device(config-wlan)# mac-filtering default
Device(config-wlan)# no security wpa
Device(config-wlan)# no shutdown
Device(config-wlan)# end

```

## Configuring Policy Profile (CLI)

Configure Policy Profile using commands.

- Note** You need a AAA override to apply policies coming from the AAA or ISE servers. When a redirect URL and redirect ACL is received from the ISE server, NAC is used to trigger the Central Web Authentication (CWA). Both NAC and AAA override must be available in the policy profile to which the client is being associated. The default policy profile is associated to an AP, if the AP is not associated to any other policy profiles.

**Procedure**

	Command or Action	Purpose
<b>Step 1</b>	<b>wireless profile policy default-policy-profile</b> <b>Example:</b> Device(config)# wireless profile policy default-policy-profile	Sets the policy profile.
<b>Step 2</b>	<b>vlan vlan-id</b> <b>Example:</b> Device(config-wireless-policy)# vlan 41	Maps the VLAN to a policy profile. If vlan-id is not specified, the default native vlan 1 is applied. The valid range for vlan-id is 1 to 4096. Management VLAN is applied if no VLAN is configured on the policy profile.
<b>Step 3</b>	<b>aaa-override</b> <b>Example:</b> Device(config-wireless-policy)# aaa-override	Configures AAA override to apply policies coming from the AAA or ISE servers.
<b>Step 4</b>	<b>nac</b> <b>Example:</b> Device(config-wireless-policy)# nac	Configures Network Access Control in the policy profile. NAC is used to trigger the Central Web Authentication (CWA).
<b>Step 5</b>	<b>no shutdown</b> <b>Example:</b> Device(config-wireless-policy)# no shutdown	Enables the WLAN.

	Command or Action	Purpose
<b>Step 6</b>	<b>end</b>  <b>Example:</b> Device(config-wireless-policy)# end	Returns to privileged EXEC mode.

### Example

```

Device# configure terminal
Device(config)# wireless profile policy default-policy-profile
Device(config-wireless-policy)# vlan 41
Device(config-wireless-policy)# aaa-override
Device(config-wireless-policy)# nac
Device(config-wireless-policy)# no shutdown
Device(config-wireless-policy)# end

```

## Configuring a Policy Profile (GUI)

### Procedure

- 
- Step 1** Choose **Configuration** > **Tags & Profiles** > **Policy**.
- Step 2** On the **Policy Profile** page, click **Add**.
- Step 3** In the **Add Policy Profile** window, in **General Tab**, enter a name and description for the policy profile.
- Step 4** To enable the policy profile, set **Status** as **Enabled**.
- Step 5** Use the slider to enable or disable **Passive Client** and **Encrypted Traffic Analytics**.
- Step 6** (Optional) In the **CTS Policy** section, choose the appropriate status for the following:
- **Inline Tagging**—a transport mechanism using which a controller embedded wireless controller or access point understands the source SGT.
  - **SGACL Enforcement**
- Step 7** Specify a default **SGT**. The valid range is from 2 to 65519.
- Step 8** In the **WLAN Switching Policy** section, choose the following, as required:
- **Central Switching**
  - **Central Authentication**
  - **Central DHCP**
  - **Central Association Enable**
  - **Flex NAT/PAT**
- Step 9** Click **Save & Apply to Device**.
-

## Creating Redirect ACL

The redirect ACL is a punt ACL that needs to be predefined on the controller (or the AP in case of FlexConnect local switching): the AAA server returns the name of the ACL and not its definition. The redirect ACL defines traffic (matching “deny” statements, as it denies redirection for it) that will be allowed through on the data plane and traffic (matching “permit” statements) that will be sent to the control plane towards the CPU for further processing (that is, the web interception and redirection in this case). The ACL has implicit (that is, the invisible) statements allowing DHCP and DNS traffic towards all IPs, just like it is the case with LWA. It also ends with a statement that a security ACL implicit deny.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>ip access-list extended redirect</b> <b>Example:</b> Device(config)# ip access-list extended redirect	The HTTP and HTTPS browsing does not work without authentication (per the other ACL) as ISE is configured to use a redirect ACL (named <b>redirect</b> ).
<b>Step 2</b>	<b>deny ip any host ISE-IP-add</b> <b>Example:</b> Device(config)# deny ip any host 123.123.134.112	Allows traffic to ISE and all other traffic is blocked.
<b>Step 3</b>	<b>deny ip host ISE-IP-add any</b> <b>Example:</b> Device(config)# deny ip host 123.123.134.112 any	Allows traffic to ISE and all other traffic is blocked.  <b>Note</b> This ACL is applicable for both local and flex mode.
<b>Step 4</b>	<b>permit TCP any any eq web address/port-number</b> <b>Example:</b> In case of HTTP: Device(config)# permit TCP any any eq www Device(config)# permit TCP any any eq 80 <b>Example:</b> In case of HTTPS: Device(config)# permit TCP any any eq 443	Redirects all HTTP or HTTPS access to the ISE login page. port-number 80 is used for HTTP and port-number 443 is used for HTTPS.  For the ACE to allow traffic to ISE, ISE should be configured above the HTTP/HTTPS ACE.
<b>Step 5</b>	<b>end</b> <b>Example:</b> Device(config)# end	Returns to privileged EXEC mode.

## Configuring AAA for Central Web Authentication

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>aaa server radius dynamic-author</b>  <b>Example:</b> Device(config)# aaa server radius dynamic-author	Configures the Change of Authorization (CoA) on the controller.
<b>Step 2</b>	<b>client ISE-IP-add server-key radius-shared-secret</b>  <b>Example:</b> Device(config-locsvr-da-radius)# client 123.123.134.112 server-key 0 SECRET	Specifies a RADIUS client and the RADIUS key to be shared between a device and a RADIUS client.  <b>ISE-IP-add</b> is the IP address of the RADIUS client.  <b>server-key</b> is the radius client server-key.  <b>radius-shared-secret</b> covers the following: <ul style="list-style-type: none"> <li>• <b>0</b>—Specifies unencrypted key.</li> <li>• <b>6</b>—Specifies encrypted key.</li> <li>• <b>7</b>—Specifies HIDDEN key.</li> <li>• <b>Word</b>—Unencrypted (cleartext) server key.</li> </ul> The RADIUS shared secret should not exceed 240 characters while configuring WSMA data in GUI.  <b>Note</b> All these steps work only if the AAA configuration is in place. See the <i>Configuring AAA Authentication</i> for details.

### Example

```
Device# config terminal
Device(config)# aaa server radius dynamic-author
Device(config-locsvr-da-radius)# client 123.123.134.112 server-key 0 SECRET
Device(config-locsvr-da-radius)# end
```

## Configuring Redirect ACL in Flex Profile (GUI)

The redirect ACL definition must be sent to the access point in the FlexConnect profile. For this, the redirect ACL associated with an AP must be configured in the FlexConnect profile where the client is hosted. If an

access point is not configured with any of the FlexConnect profiles, the default FlexConnect profile is associated with it.

### Procedure

- 
- Step 1** Choose **Configuration > Tags & Profiles > Flex**.
  - Step 2** On the **Flex Profile** page, click the name of the FlexConnect profile or click **Add** to create a new FlexConnect profile.
  - Step 3** In the **Add/Edit Flex Profile** window that is displayed, click the **Policy ACL** tab.
  - Step 4** Click **Add** to map an ACL to the FlexConnect profile.
  - Step 5** Choose the ACL name, enable central web authentication, and specify the preauthentication URL filter.
  - Step 6** Click **Save**.
  - Step 7** Click **Update & Apply to Device**.
- 

## Configuring Redirect ACL in Flex Profile (CLI)

The redirect ACL definition must be sent to the access point in the Flex profile. For this, the redirect ACL associated to an AP must be configured in the Flex profile where the client is being hosted. If an access point is not configured with any of the Flex profiles, the default Flex profile is associated with it.

**Note** When the ACL is pushed down to the APs, the permission must change from **deny** to **permit** or vice-versa. This change does not occur if the ACL contains an object group, causing the ACL not to be fully translated, which may cause the redirection to fail.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>wireless profile flex default-flex-profile</b> <b>Example:</b> Device(config)# wireless profile flex default-flex-profile	Creates a new flex policy. The default flex profile name is <b>default-flex-profile</b> .
<b>Step 2</b>	<b>acl-policy <i>acl policy name</i></b> <b>Example:</b> Device(config-wireless-flex-profile)# acl-policy acl1	Configures ACL policy.
<b>Step 3</b>	<b>central-webauth</b> <b>Example:</b> Device (config-wireless-flex-profile-acl)# central-webauth	Configures central web authentication.

	Command or Action	Purpose
<b>Step 4</b>	<b>end</b>  <b>Example:</b> Device (config-wireless-flex-profile-acl) # end	Returns to privileged EXEC mode.

## Troubleshooting Central Web Authentication

Init-State timer running out

**Problem Issue:** The client devices are deauthenticated by the controller if users fail to enter their credentials in a limited time interval. The clients are deauthenticated after three times the time configured for the init-state timeout in the controller.

**Problem Explanation:** This is the expected functionality as the init-state timeout is not directly applicable for central web authentication; instead, it is the reap timer's value which is three times the init-state time plus five seconds ( $3 * \text{init-state timeout} + 5$ ) that determines the time interval in seconds for client deauthentication. For example, if you have configured the init-state timeout as 10 seconds, then the client devices are deauthenticated if users fail to enter their credentials after 35 seconds; that is  $(3 * 10 + 5) = 35$  seconds.

## Authentication for Sleeping Clients

### Information About Authenticating Sleeping Clients

Clients with guest access that have had successful web authentication are allowed to sleep and wake up without having to go through another authentication process through the login page. You can configure the duration for which sleeping clients should be remembered for before reauthentication becomes necessary. The valid range is 10 minutes to 43200 minutes, with the default being 720 minutes. You can also configure this duration on WebAuth parameter map that is mapped to a WLAN. Note that the sleeping client timer comes into effect due to instances such as idle timeout, session timeout, disabling of the WLAN, and the AP being nonoperational.

This feature is supported in the following FlexConnect scenario: local switching and central authentication.

---

**Caution** If the MAC address of a client that goes to sleep mode is spoofed, the fake device such as a laptop can be authenticated.

---

#### Mobility Scenarios

Following are some guidelines in a mobility scenario:

- L2 roaming in the same subnet is supported.
- Anchor sleeping timer is applicable.
- The sleeping client information is shared between multiple autoanchors when a sleeping client moves from one anchor to another.

A sleeping client does not require reauthentication in the following scenarios:

- Suppose there are two controller s in a mobility group. A client that is associated with one controller goes to sleep and then wakes up and gets associated with the other controller .
- Suppose there are three controller s in a mobility group. A client that is associated with the second controller that is anchored to the first controller goes to sleep, wakes up, and gets associated with the third controller .
- A client sleeps, wakes up and gets associated with the same or different export foreign controller that is anchored to the export anchor.

## Restrictions on Authenticating Sleeping Clients

- The sleep client feature works only for WLAN configured with WebAuth security.
- You can configure the sleeping clients only on a per WebAuth parameter-map basis.
- The authentication of sleeping clients feature is supported only on WLANs that have Layer 3 security enabled.
- With Layer 3 security, the Authentication, Passthrough, and On MAC Filter failure web policies are supported. The Conditional Web Redirect and Splash Page Web Redirect web policies are not supported.
- The central web authentication of sleeping clients is not supported.
- The authentication of sleeping clients feature is not supported on guest LANs and remote LANs.
- A guest access sleeping client that has a local user policy is not supported. In this case, the WLAN-specific timer is applied.

## Configuring Authentication for Sleeping Clients (GUI)

### Procedure

---

- Step 1** Choose **Configuration > Security > Web Auth**.
- Step 2** In the **Webauth Parameter Map** tab, click the parameter map name. The **Edit WebAuth Parameter** window is displayed.
- Step 3** Select **Sleeping Client Status** check box.
- Step 4** Click **Update & Apply to Device**.
-

## Configuring Authentication for Sleeping Clients (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<p>[no] <b>parameter-map type webauth</b> {<i>parameter-map-name</i>   <b>global</b>}</p> <p><b>Example:</b></p> <pre>Device(config)# parameter-map type webauth global</pre>	Creates a parameter map and enters parameter-map webauth configuration mode.
<b>Step 2</b>	<p><b>sleeping-client</b> [<b>timeout</b> <i>time</i>]</p> <p><b>Example:</b></p> <pre>Device(config-params-parameter-map)# sleeping-client timeout 100</pre>	<p>Configures the sleeping client timeout to 100 minutes. Valid range is between 10 minutes and 43200 minutes.</p> <p><b>Note</b> If you do not use the timeout keyword, the sleeping client is configured with the default timeout value of 720 minutes.</p>
<b>Step 3</b>	<b>end</b>	Exits parameter-map webauth configuration mode and returns to privileged EXEC mode.
<b>Step 4</b>	<p>(Optional) <b>show wireless client sleeping-client</b></p> <p><b>Example:</b></p> <pre>Device# show wireless client sleeping-client</pre>	Shows the MAC address of the clients and the time remaining in their respective sessions.
<b>Step 5</b>	<p>(Optional) <b>clear wireless client sleeping-client</b> [<b>mac-address</b> <i>mac-addr</i>]</p> <p><b>Example:</b></p> <pre>Device# clear wireless client sleeping-client mac-address 00e1.e1e1.0001</pre>	<ul style="list-style-type: none"> <li>• <b>clear wireless client sleeping-client</b>—Deletes all sleeping client entries from the sleeping client cache.</li> <li>• <b>clear wireless client sleeping-client mac-address</b> <i>mac-addr</i>—Deletes the specific MAC entry from the sleeping client cache.</li> </ul>

## Sleeping Clients with Multiple Authentications

### Mobility Support for Sleeping Clients

From Release 17.1.1 onwards, mobility support for guest and nonguest sleeping clients.

### Supported Combinations of Multiple Authentications

Multiple authentication feature supports sleeping clients configured in the WLAN profile.

The following table outlines the supported combination of multiple authentications:

**Table 82: Supported Combinations of Multiple Authentications**

Layer 2	Layer 3	Supported
MAB	LWA	Yes
MAB Failure	LWA	Yes
Dot1x	LWA	Yes
PSK	LWA	Yes

## Configuring Sleeping Clients with Multiple Authentications

### Configuring WLAN for Dot1x and Local Web Authentication

#### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>wlan profile-name wlan-id SSID_name</b> <b>Example:</b> Device(config)# <code>wlan wlan-test 3 ssid-test</code>	Enters WLAN configuration submode. <ul style="list-style-type: none"> <li>• <i>profile-name</i> - Profile name of the configured WLAN.</li> <li>• <i>wlan-id</i> - Wireless LAN identifier. Range is from 1 to 512.</li> <li>• <i>SSID_Name</i> - SSID, which can contain up to 32 alphanumeric characters.</li> </ul>
<b>Step 3</b>	<b>security dot1x authentication-list auth-list-name</b> <b>Example:</b> Device(config-wlan)# <code>security dot1x authentication-list default</code>	Enables security authentication list for dot1x security. The configuration is similar for all dot1x security WLANs.
<b>Step 4</b>	<b>security web-auth</b> <b>Example:</b> Device(config-wlan)# <code>security web-auth</code>	Configures web authentication.

	Command or Action	Purpose
<b>Step 5</b>	<b>security web-auth authentication-list</b> <i>authenticate-list-name</i>  <b>Example:</b> Device(config-wlan)# <b>security web-auth authentication-list default</b>	Enables authentication list for dot1x security.
<b>Step 6</b>	<b>security web-auth parameter-map</b> <i>parameter-map-name</i>  <b>Example:</b> Device(config-wlan)# <b>security web-auth parameter-map global</b>	Maps the parameter map.  <b>Note:</b> If the parameter map is not associated with a WLAN, the configuration is considered from the global parameter map.
<b>Step 7</b>	<b>no shutdown</b>  <b>Example:</b> Device(config-wlan)# <b>no shutdown</b>	Enables WLAN.

## Configuring a WLAN for MAC Authentication Bypass and Local Web Authentication

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>wlan profile-name wlan-id SSID_name</b>  <b>Example:</b> Device(config)# <b>wlan wlan-test 3 ssid-test</b>	Enters WLAN configuration submenu. <ul style="list-style-type: none"> <li>• <i>profile-name</i> - Profile name of the configured WLAN.</li> <li>• <i>wlan-id</i> - Wireless LAN identifier. Range is from 1 to 512.</li> <li>• <i>SSID_Name</i> - SSID, which can contain up to 32 alphanumeric characters.</li> </ul>
<b>Step 3</b>	<b>mac-filtering list-name</b>  <b>Example:</b> Device(config-wlan)# <b>mac-filtering cat-radius</b>	Sets the MAC filtering parameters.
<b>Step 4</b>	<b>no security wpa akm dot1x</b>  <b>Example:</b>	Disables security AKM for dot1x.

	Command or Action	Purpose
	Device(config-wlan) # <code>no security wpa akm dot1x</code>	
<b>Step 5</b>	<b>no security wpa wpa2 ciphers aes</b> <b>Example:</b> Device(config-wlan) # <code>no security wpa wpa2 ciphers aes</code>	Disables the WPA2 cipher. <b>aes</b> —Encryption type that specifies WPA/AES support.
<b>Step 6</b>	<b>security web-auth parameter-map parameter-map-name</b> <b>Example:</b> Device(config-wlan) # <code>security web-auth parameter-map global</code>	Maps the parameter map. <b>Note:</b> If parameter map is not associated with a WLAN, the configuration is considered from the global parameter map.
<b>Step 7</b>	<b>no shutdown</b> <b>Example:</b> Device(config-wlan) # <code>no shutdown</code>	Enables WLAN.

## Configuring a WLAN for Local Web Authentication and MAC Filtering

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>wlan profile-name wlan-id SSID_name</b> <b>Example:</b> Device(config) # <code>wlan wlan-test 3 ssid-test</code>	Enters WLAN configuration submode. <ul style="list-style-type: none"> <li>• <i>profile-name</i> - Profile name of the configured WLAN.</li> <li>• <i>wlan-id</i> - Wireless LAN identifier. Range is from 1 to 512.</li> <li>• <i>SSID_Name</i> - SSID, which can contain up to 32 alphanumeric characters.</li> </ul>
<b>Step 3</b>	<b>mac-filtering list-name</b> <b>Example:</b> Device(config-wlan) # <code>mac-filtering cat-radius</code>	Sets the MAC filtering parameters.
<b>Step 4</b>	<b>no security wpa akm dot1x</b> <b>Example:</b>	Disables security Authenticated Key Management (AKM) for dot1x.

	Command or Action	Purpose
	Device(config-wlan)# <b>no security wpa akm dot1x</b>	
<b>Step 5</b>	<b>no security wpa wpa2 ciphers aes</b> <b>Example:</b> Device(config-wlan)# <b>no security wpa wpa2 ciphers aes</b>	Disables the WPA2 cipher. <b>aes:</b> Excrption type that specifies WPA/AES support.
<b>Step 6</b>	<b>security web-auth on-macfilter-failure</b> <b>Example:</b> Device(config-wlan)# <b>security web-auth on-macfilter-failure wlan-id</b>	Configures the fallback policy with MAC filtering and web authentication.
<b>Step 7</b>	<b>security web-auth parameter-map parameter-map-name</b> <b>Example:</b> Device(config-wlan)# <b>security web-auth parameter-map global</b>	Maps the parameter map. <b>Note:</b> If the parameter map is not associated with a WLAN, the configuration is considered from the global parameter map.
<b>Step 8</b>	<b>no shutdown</b> <b>Example:</b> Device(config-wlan)# <b>no shutdown</b>	Enables WLAN.

## Configuring a PSK + LWA in a WLAN

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>wlan profile-name wlan-id SSID_name</b> <b>Example:</b> Device(config)# <b>wlan wlan-test 3 ssid-test</b>	Enters WLAN configuration submode. <ul style="list-style-type: none"> <li>• <i>profile-name</i> - Profile name of the configured WLAN.</li> <li>• <i>wlan-id</i> - Wireless LAN identifier. Range is from 1 to 512.</li> <li>• <i>SSID_Name</i> - SSID, which can contain up to 32 alphanumeric characters.</li> </ul>
<b>Step 3</b>	<b>no security wpa akm dot1x</b> <b>Example:</b> Device(config-wlan)# <b>no security wpa akm dot1x</b>	Disables security AKM for dot1x.

	Command or Action	Purpose
<b>Step 4</b>	<b>security web-auth</b> <b>Example:</b> Device(config-wlan)# <b>security web-auth</b>	Enables web authentication for a WLAN.
<b>Step 5</b>	<b>no security wpa wpa2 ciphers aes</b> <b>Example:</b> Device(config-wlan)# <b>no security wpa wpa2 ciphers aes</b>	Disables the WPA2 cipher. <b>aes:</b> Exryption type that specifies WPA/AES support.
<b>Step 6</b>	<b>security wpa psk set-key ascii <i>ascii/hex key</i></b> <b>Example:</b> Device(config-wlan)# <b>security wpa psk set-key ascii 0 1234567</b>	Configures the preshared key on a WLAN.
<b>Step 7</b>	<b>security wpa akm psk</b> <b>Example:</b> Device(config-wlan)# <b>security wpa akm psk</b>	Configures PSK support.
<b>Step 8</b>	<b>security web-auth authentication-list <i>authenticate-list-name</i></b> <b>Example:</b> Device(config-wlan)# <b>security web-auth authentication-list default</b>	Enables the authentication list for dot1x security.
<b>Step 9</b>	<b>security web-auth parameter-map <i>parameter-map-name</i></b> <b>Example:</b> Device(config-wlan)# <b>security web-auth parameter-map global</b>	Maps the parameter map. <b>Note:</b> If the parameter map is not associated with a WLAN, the configuration is considered from the global parameter map.

## Configuring a Sleeping Client

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>parameter-map type webauth <i>{parameter-map-name   global}</i></b> <b>Example:</b>	Creates a parameter map and enters <i>parameter-map-name</i> configuration mode.

	Command or Action	Purpose
	Device(config)# <b>parameter-map type</b> <b>webauth MAP-2</b>	The specific configuration commands supported for a <b>global</b> parameter map defined with the global keyword differ from the commands supported for a named parameter map defined with the <i>parameter-map-name</i> argument.
<b>Step 3</b>	<b>sleeping client [timeout time]</b>  <b>Example:</b> Device(config-params-parameter-map)# <b>sleeping-client timeout 60</b>	Configures the sleeping client timeout, in minutes. The available range for the <i>time</i> argument is from 10 to 43200.  <b>Note:</b> If you do not use the <b>timeout</b> keyword, the sleeping client is configured with the default timeout value of 720 minutes.

## Verifying a Sleeping Client Configuration

To verify a sleeping client configuration, use the following command:

```
Device# show wireless client sleeping-client
Total number of sleeping-client entries: 1
```

```
MAC Address Remaining time (mm:ss)

2477.031b.aa18 59:56
```

## CHAPTER 98

# Private Shared Key

---

- [Information About Private Preshared Key, on page 1103](#)
- [Configuring a PSK in a WLAN \(CLI\), on page 1104](#)
- [Configuring a PSK in a WLAN \(GUI\), on page 1105](#)
- [Applying a Policy Profile to a WLAN \(GUI\), on page 1106](#)
- [Applying a Policy Profile to a WLAN \(CLI\), on page 1106](#)
- [Verifying a Private PSK, on page 1107](#)

## Information About Private Preshared Key

With the advent of Internet of Things (IoT), the number of devices that connect to the internet has increased manifold. Not all of these devices support the 802.1x supplicant and need an alternate mechanism to connect to the internet. One of the security mechanisms, WPA-PSK, could be considered as an alternative. With the current configuration, the PSK is the same for all the clients that connect to the same WLAN. In certain deployments, such as educational institutions, this results in the key being shared to unauthorized users leading to security breach. This necessitates the need to provision unique PSKs for different clients on a large scale.

Identity PSKs are unique PSKs created for individuals or groups of users on the same SSID. No complex configuration is required for the clients. It provides the same simplicity of PSK, making it ideal for IoT, Bring your own device (BYOD), and guest deployments.

Identity PSKs are supported on most devices, in which 802.1X is not, enabling stronger security for IoT. It is possible to easily revoke access, for a single device or individual without affecting everyone else. Thousands of keys can easily be managed and distributed through the AAA server.

---

**Note** Special characters, such as '<' and '>' are supported in SSID Preshared key.

---

---

**Note** PSK supports whitespace in passwords (before or after or in-between) within double quotes only; single quotes for whitespaces are not supported.

---

### IPSK Solution

During client authentication, the AAA server authorizes the client MAC address and sends the passphrase (if configured) as part of the Cisco-AV pair list. The Cisco Wireless Controller (WLC) receives this as part of the RADIUS response and processes this further for the computation of PSKs.

When a client sends an association request to the SSID broadcast by the corresponding access point, the controller forms the RADIUS request packet with the particular mac address of the client and relays to the RADIUS server.

The RADIUS server performs the authentication and checks whether the client is allowed or not and sends either ACCESS-ACCEPT or ACCESS-REJECT as response to the WLC.

To support Identity PSKs, in addition to sending the authentication response, the authentication server also provides the AV pair passphrase for this specific client. This is used for the computation of the PMK.

The RADIUS server might also provide additional parameters, such as username, VLAN, Quality of Service (QoS), and so on, in the response, that is specific to this client. For multiple devices owned by a single user, the passphrase can remain the same.

**Note** When the PSK length is less than 15 characters in Federal Information Processing Standard (FIPS), the controller allows the WLAN configuration but displays the following error message on the console:

**"AP is allowed to join but corresponding WLAN will not be pushed to the access point"**

## Configuring a PSK in a WLAN (CLI)

Follow the procedure given below to configure a PSK in a WLAN:

### Before you begin

- Security should be configured for a pre-shared key (PSK) in a WLAN.
- If there is no override from the AAA server, the value on the corresponding WLAN is considered for authentication.
- In Federal Information Processing Standard (FIPS) and common criteria mode, ensure that the PSK WLAN has a minimum of 15 ASCII characters, else APs won't join the controller.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wlan wlan-name wlan-id ssid</b>  <b>Example:</b> Device(config)# wlan test-profile 4 abc	Configures the WLAN and SSID.

	Command or Action	Purpose
<b>Step 3</b>	<b>no security wpa akm dot1x</b> <b>Example:</b> Device(config-wlan)# no security wpa akm dot1x	Disables security AKM for dot1x.
<b>Step 4</b>	<b>security wpa akm psk</b> <b>Example:</b> Device(config-wlan)# security wpa akm psk	Configures the security type PSK.
<b>Step 5</b>	<b>security wpa akm psk set-key ascii/hex key</b> <b>Example:</b> Device(config-wlan)# security wpa akm psk set-key ascii 0	Configures the PSK authenticated key management (AKM) shared key. <b>Note</b> You must set the <b>psk set-key</b> before configuring AKM PSK.
<b>Step 6</b>	<b>security wpa akm psk</b> <b>Example:</b> Device(config-wlan)# security wpa akm psk	Configures PSK support.
<b>Step 7</b>	<b>security wpa wpa2 mpsk</b> <b>Example:</b> Device(config-wlan)# security wpa wpa2 mpsk	Configures multi-preshared key (MPSK) support. <b>Note</b> AKM PSK should be enabled for MPSK to work.
<b>Step 8</b>	<b>mac-filtering auth-list-name</b> <b>Example:</b> Device(config-wlan)# mac-filtering test1	Specifies MAC filtering in a WLAN.

## Configuring a PSK in a WLAN (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Tags & Profiles > WLANs**.
- Step 2** On the **Wireless Networks** page, click **Security** tab.
- Step 3** In the **Layer 2** window that is displayed, go to the **WPA Parameters** section.
- Step 4** From the **Auth Key Mgmt** drop-down, select the PSK format and type.
- Step 5** Enter the Pre-Shared Key in hexadecimal characters.
- If you selected the PSK format as HEX, the key length must be exactly 64 characters.
  - If you selected the PSK format as ASCII, the key length must be in the range of 8-63 characters.

Note that once you have configured the key, these details are not visible even if you click on the eye icon next to the preshared key box, due to security reasons.

**Step 6** Click **Save & Apply to Device**.

## Applying a Policy Profile to a WLAN (GUI)

### Procedure

- Step 1** Choose **Configuration > Tags & Profiles > Tags**.
- Step 2** On the **Manage Tags** page, click **Policy** tab.
- Step 3** Click **Add** to view the **Add Policy Tag** window.
- Step 4** Enter a name and description for the policy tag.
- Step 5** Click **Add** to map WLAN and policy.
- Step 6** Choose the WLAN profile to map with the appropriate policy profile, and click the tick icon.
- Step 7** Click **Save & Apply to Device**.

## Applying a Policy Profile to a WLAN (CLI)

Follow the procedure given below to a apply policy profile to a WLAN:

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wireless profile policy <i>policy-profile-name</i></b>  <b>Example:</b> Device(config)# wireless profile policy policy-iot	Configures the default policy profile.
<b>Step 3</b>	<b>aaa-override</b>  <b>Example:</b> Device(config-wireless-policy)# aaa-override	Configures AAA override to apply policies coming from the AAA server or ISE the Cisco Identify Services Engine (ISE) server.

## Verifying a Private PSK

Use the following **show** commands to verify the configuration of a WLAN and a client:

```
Device# show wlan id 2
```

```
WLAN Profile Name : test_ppsk
=====
Identifier : 2
Network Name (SSID) : test_ppsk

## CHAPTER 99

# Multi-Preshared Key

- [Information About Multi-Preshared Key, on page 1111](#)
- [Restrictions on Multi-PSK, on page 1112](#)
- [Configuring Multi-Preshared Key \(GUI\), on page 1112](#)
- [Configuring Multi-Preshared Key \(CLI\), on page 1115](#)
- [Verifying Multi-PSK Configurations, on page 1116](#)

## Information About Multi-Preshared Key

Multi-PSK feature supports multiple PSKs simultaneously on a single SSID. You can use any of the configured PSKs to join the network. This is different from the Identity PSK (iPSK), wherein unique PSKs are created for individuals or groups of users on the same SSID.

From 16.10 onwards, each SSID supports five PSKs, which can be extended

In a traditional PSK, all the clients joining the network use the same password as shown in the below figure.

**Figure 30: Traditional PSK**

But with multi-PSK, client can use any of the configured pre-shared keys to connect to the network as shown in the below figure.

Figure 31: Multi-PSK

In Multi-PSK, two passwords are configured (deadbeef and beefdead) for the same SSID. In this scenario, clients can connect to the network using either of the passwords.

## Restrictions on Multi-PSK

- Central authentication is supported in local, flex, and fabric modes only.
- In central authentication flex mode, the standalone AP allows client join with the highest priority PSK (*priority 0* key). New clients that do not use the highest priority PSK are rejected during the standalone mode.
- Multi-PSK does not support local authentication.
- Multi-PSK is different from iPSK. In iPSK, the PSK password comes from ISE authorization policy, so MAB is required. MPSK uses a pool of passwords locally configured in WLAN, so ISE is not used.

## Configuring Multi-Preshared Key (GUI)

### Procedure

- 
- Step 1** Choose **Configuration** > **Tags & Profiles** > **WLANs**.
  - Step 2** On the **Wireless Networks** page, click the name of the WLAN.
  - Step 3** In the **Edit WLAN** window, click the **Security** tab.
  - Step 4** In the **Layer2** tab, choose the **Layer2 Security Mode** from the following options:
    - None: No Layer 2 security
    - 802.1X: WEP 802.1X data encryption type

- WPA + WPA2: Wi-Fi Protected Access
- Static WEP: Static WEP encryption parameters
- Static WEP+802.1X: Both Static WEP and 802.1X parameters

Parameters	Description
<b>802.1X</b>	
WEP Key Size	Choose the key size. The available values are <i>None</i> , <i>40 bits</i> , and <i>104 bits</i> .
<b>WPA + WPA2</b>	
Protected Management Frame	Choose from the following options: <ul style="list-style-type: none"> <li>• Disabled</li> <li>• Optional</li> <li>• Required</li> </ul>
WPA Policy	Check the check box to enable WPA policy.
WPA Encryption	Choose the WPA encryption standard. A WPA encryption standard must be specified if you have enabled WPA policy.
WPA2 Policy	Check the check box to enable WPA2 policy.
WPA2 Encryption	Choose the WPA2 encryption standard. A WPA encryption standard must be specified if you have enabled WPA policy.
Auth Key Mgmt	Choose the rekeying mechanism from the following options: <ul style="list-style-type: none"> <li>• 802.1X</li> <li>• FT + 802.1X</li> <li>• PSK: You must specify the PSK format and a preshared key</li> <li>• Cisco Centralized Key Management: You must specify a Cisco Centralized Key Management Timestamp Tolerance value</li> <li>• 802.1X + Cisco Centralized Key Management: You must specify a Cisco Centralized Key Management Timestamp Tolerance value</li> <li>• FT + 802.1X + Cisco Centralized Key Management: You must specify a Cisco Centralized Key Management Timestamp Tolerance value</li> </ul>

Parameters	Description
<b>Static WEP</b>	
Key Size	Choose the key size from the following options: <ul style="list-style-type: none"> <li>• 40 bits</li> <li>• 104 bits</li> </ul>
Key Index	Choose a key index from 1 to 4. One unique WEP key index can be applied to each WLAN. As there are only four WEP key indexes, only four WLANs can be configured for static WEP Layer2 encryption.
Key Format	Choose the encryption key format as either ASCII or HEX.
Encryption Key	Enter an encryption key that is 13 characters long.
<b>Static WEP + 802.1X</b>	
Key Size	Choose the key size from the following options: <ul style="list-style-type: none"> <li>• 40 bits</li> <li>• 104 bits</li> </ul>
Key Index	Choose a key index from 1 to 4. One unique WEP key index can be applied to each WLAN. As there are only four WEP key indexes, only four WLANs can be configured for static WEP Layer2 encryption.
Key Format	Choose the encryption key format as either ASCII or HEX.
Encryption Key	Enter an encryption key that is 13 characters long.
WEP Key Size	Choose from the following options: <ul style="list-style-type: none"> <li>• None</li> <li>• 40 bits</li> <li>• 104 bits</li> </ul>

**Step 5** Click **Save & Apply to Device**.

---

# Configuring Multi-Preshared Key (CLI)

## Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>wlan wlan-name wlan-id ssid</b> <b>Example:</b> Device(config)# <code>wlan mywlan 1 SSID_name</code>	Configures WLAN and SSID.
<b>Step 3</b>	<b>no security wpa akm dot1x</b> <b>Example:</b> Device(config-wlan)# <code>no security wpa akm dot1x</code>	Disables security AKM for dot1x.
<b>Step 4</b>	<b>security wpa akm psk</b> <b>Example:</b> Device(config-wlan)# <code>security wpa akm psk</code>	Configures PSK.
<b>Step 5</b>	<b>security wpa wpa2 mpsk</b> <b>Example:</b> Device(config-wlan)# <code>security wpa wpa2 mpsk</code>	Configures multi-PSK.
<b>Step 6</b>	<b>priority priority_value set-key {ascii [0   8] pre-shared-key   hex [0   8] pre-shared-key}</b> <b>Example:</b> Device(config-mpsk)# <code>priority 0 set-key ascii 0 deadbeef</code>	Configures PSK priority and all its related passwords. The <i>priority_value</i> ranges from 0 to 4. <b>Note</b> You need to configure <b>priority 0</b> key for multi-PSK.
<b>Step 7</b>	<b>no shutdown</b> <b>Example:</b> Device(config-mpsk)# <code>no shutdown</code>	Enables WLAN.
<b>Step 8</b>	<b>exit</b> <b>Example:</b> Device(config-wlan)# <code>exit</code>	Exits WLAN configuration mode and returns to configuration mode.

	Command or Action	Purpose
<b>Step 9</b>	<b>end</b>  <b>Example:</b> Device(config)# <b>end</b>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Verifying Multi-PSK Configurations

To verify the configuration of a WLAN and a client, use the following command:

```
Device# show wlan id 8
WLAN Profile Name : wlan_8
=====
Identifier : 8
Network Name (SSID) : ssid_8
Status : Enabled
Broadcast SSID : Enabled
Universal AP Admin : Disabled
Max Associated Clients per WLAN : 0
Max Associated Clients per AP per WLAN : 0
Max Associated Clients per AP Radio per WLAN : 200
Number of Active Clients : 0
CHD per WLAN : Enabled
Multicast Interface : Unconfigured
WMM : Allowed
WifiDirect : Invalid
Channel Scan Defer Priority:
 Priority (default) : 5
 Priority (default) : 6
Scan Defer Time (msecs) : 100
Media Stream Multicast-direct : Disabled
CCX - AironetIe Support : Enabled
CCX - Diagnostics Channel Capability : Disabled
Peer-to-Peer Blocking Action : Disabled
Radio Policy : All
DTIM period for 802.11a radio : 1
DTIM period for 802.11b radio : 1
Local EAP Authentication : Disabled
Mac Filter Authorization list name : Disabled
Mac Filter Override Authorization list name : Disabled
Accounting list name :
802.1x authentication list name : Disabled
802.1x authorization list name : Disabled
Security
 802.11 Authentication : Open System
 Static WEP Keys : Disabled
 802.1X : Disabled
 Wi-Fi Protected Access (WPA/WPA2/WPA3) : Enabled
 WPA (SSN IE) : Disabled
 WPA2 (RSN IE) : Enabled
 MP SK : Enabled
 AES Cipher : Enabled
 CCMP256 Cipher : Disabled
 GCMP128 Cipher : Disabled
 GCMP256 Cipher : Disabled
 WPA3 (WPA3 IE) : Disabled
 Auth Key Management
 802.1x : Disabled
 PSK : Enabled
```

```

CCKM : Disabled
FT dot1x : Disabled
FT PSK : Disabled
FT SAE : Disabled
PMF dot1x : Disabled
PMF PSK : Disabled

no shutdown
```

# CHAPTER 100

## Multiple Authentications for a Client

- [Information About Multiple Authentications for a Client](#), on page 1119
- [Configuring Multiple Authentications for a Client](#), on page 1121
- [Configure WLAN for Web Authentication on MAC Authentication Bypass Failure with Pre-Shared Key \(CLI\)](#), on page 1127
- [Configure WLAN for Web Authentication on MAC Authentication Bypass Failure with OWE \(CLI\)](#), on page 1129
- [Configure WLAN for Web Authentication on MAC Authentication Bypass Failure with Secure Agile Exchange \(CLI\)](#), on page 1131
- [Configuring 802.1x and Central Web Authentication on Controller \(CLIs\)](#), on page 1132
- [Configuring ISE for Central Web Authentication with Dot1x \(GUI\)](#), on page 1139
- [Verifying Multiple Authentication Configurations](#), on page 1141

### Information About Multiple Authentications for a Client

Multiple Authentication feature is an extension of Layer 2 and Layer 3 security types supported for client join.

**Note** You can enable both L2 and L3 authentication for a given SSID.

**Note** The Multiple Authentication feature is applicable for regular clients only.

### Information About Supported Combination of Authentications for a Client

The Multiple Authentications for a Client feature supports multiple combination of authentications for a given client configured in the WLAN profile.

The following table outlines the supported combination of authentications:

Layer 2	Layer 3	Supported
MAB	CWA	Yes

MAB	LWA	Yes
MAB + PSK	-	Yes
MAB + 802.1X	-	Yes
MAB Failure	LWA	Yes
802.1X	CWA	Yes
802.1X	LWA	Yes
PSK	-	Yes
PSK	LWA	Yes
PSK	CWA	Yes
iPSK	-	Yes
iPSK	CWA	Yes
iPSK + MAB	CWA	Yes
iPSK	LWA	No
MAB Failure + PSK	LWA	Yes
MAB Failure + PSK	CWA	No
MAB Failure + OWE	LWA	Yes
MAB Failure + SAE	LWA	Yes

From 16.10.1 onwards, 802.1X configurations on WLAN support web authentication configurations with WPA or WPA2 configuration.

The feature also supports the following AP modes:

- Local
- FlexConnect
- Fabric

## Jumbo Frame Support for RADIUS Packets

This document describes how to configure IP Maximum Transmission Unit (MTU) size for RADIUS server. RADIUS packets will get fragmented based on IP MTU, if source interface is attached to RADIUS group. With the new design, the RADIUS packets get fragmented at interface IP MTU configured value.

---

**Note** Fragmentation size is fixed.

---

## Combination of Authentications on MAC Failure Not Supported on a Client

The following table outlines the combination of authentications on MAC failure that are not supported on a given client:

Authentication Types	Foreign	Anchor	Supported
WPA3-OWE+LWA	Cisco AireOS	Cisco Catalyst 9800 Controller	No
WPA3-SAE+LWA	Cisco AireOS	Cisco Catalyst 9800 Controller	No

## Configuring Multiple Authentications for a Client

### Configuring WLAN for 802.1X and Local Web Authentication (GUI)

#### Procedure

- 
- Step 1** Choose **Configuration > Tags & Profiles > WLANs**.
  - Step 2** Select the required WLAN from the list of WLANs displayed.
  - Step 3** Choose **Security > Layer2** tab.
  - Step 4** Select the security method from the **Layer 2 Security Mode** drop-down list.
  - Step 5** In the **Auth Key Mgmt**, check the **802.1x** check box.
  - Step 6** Check the **MAC Filtering** check box to enable the feature.
  - Step 7** After MAC Filtering is enabled, from the **Authorization List** drop-down list, choose an option.
  - Step 8** Choose **Security > Layer3** tab.
  - Step 9** Check the **Web Policy** check box to enable web authentication policy.
  - Step 10** From the **Web Auth Parameter Map** and the **Authentication List** drop-down lists, choose an option.
  - Step 11** Click **Update & Apply to Device**.
- 

### Configuring WLAN for 802.1X and Local Web Authentication (CLI)

#### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<code>configure terminal</code> <b>Example:</b> Device# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<code>wlan profile-name wlan-id SSID_Name</code>	Enters WLAN configuration sub-mode.

	Command or Action	Purpose
	<p><b>Example:</b></p> <pre>Device(config)# wlan wlan-test 3 ssid-test</pre>	<ul style="list-style-type: none"> <li>• <i>profile-name</i>: Profile name of the configured WLAN.</li> <li>• <i>wlan-id</i>: Wireless LAN identifier. Range is from 1 to 512.</li> <li>• <i>SSID_Name</i>: SSID that can contain 32 alphanumeric characters.</li> </ul> <p><b>Note</b> If you have already configured this command, enter the <b>wlan profile-name</b> command.</p>
<b>Step 3</b>	<p><b>security dot1x authentication-list</b> <i>auth-list-name</i></p> <p><b>Example:</b></p> <pre>Device(config-wlan)# security dot1x authentication-list default</pre>	<p>Enables security authentication list for dot1x security.</p> <p>The configuration is similar for all dot1x security WLANs.</p>
<b>Step 4</b>	<p><b>security web-auth</b></p> <p><b>Example:</b></p> <pre>Device(config-wlan)# security web-auth</pre>	<p>Enables web authentication.</p>
<b>Step 5</b>	<p><b>security web-auth authentication-list</b> <i>authenticate-list-name</i></p> <p><b>Example:</b></p> <pre>Device(config-wlan)# security web-auth authentication-list default</pre>	<p>Enables authentication list for dot1x security.</p>
<b>Step 6</b>	<p><b>security web-auth parameter-map</b> <i>parameter-map-name</i></p> <p><b>Example:</b></p> <pre>Device(config-wlan)# security web-auth parameter-map WLAN1_MAP</pre>	<p>Maps the parameter map.</p> <p><b>Note</b> If a parameter map is not associated with a WLAN, the configuration is considered from the global parameter map.</p>
<b>Step 7</b>	<p><b>no shutdown</b></p> <p><b>Example:</b></p> <pre>Device(config-wlan)# no shutdown</pre>	<p>Enables the WLAN.</p>

### Example

```
wlan wlan-test 3 ssid-test
security dot1x authentication-list default
security web-auth
security web-auth authentication-list default
security web-auth parameter-map WLAN1_MAP
no shutdown
```

## Configuring WLAN for Preshared Key (PSK) and Local Web Authentication (GUI)

### Procedure

- 
- Step 1** Choose **Configuration** > **Tags & Profiles** > **WLANs**.
- Step 2** Select the required WLAN.
- Step 3** Choose **Security** > **Layer2** tab.
- Step 4** Select the security method from the **Layer 2 Security Mode** drop-down list.
- Step 5** In the Auth Key Mgmt, uncheck the **802.1x** check box.
- Step 6** Check the **PSK** check box.
- Step 7** Enter the **Pre-Shared Key** and choose the PSK Format from the **PSK Format** drop-down list and the PSK Type from the **PSK Type** drop-down list.
- Step 8** Choose **Security** > **Layer3** tab.
- Step 9** Check the **Web Policy** checkbox to enable web authentication policy.
- Step 10** Choose the Web Auth Parameter Map from the **Web Auth Parameter Map** drop-down list and the authentication list from the **Authentication List** drop-down list.
- Step 11** Click **Update & Apply to Device**.
- 

## Configuring WLAN for Preshared Key (PSK) and Local Web Authentication

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>wlan <i>profile-name</i> <i>wlan-id</i> <i>SSID_Name</i></b> <b>Example:</b> Device(config)# <code>wlan wlan-test 3 ssid-test</code>	Enters WLAN configuration sub-mode. <ul style="list-style-type: none"> <li>• <i>profile-name</i> - Is the profile name of the configured WLAN.</li> <li>• <i>wlan-id</i> - Is the wireless LAN identifier. Range is from 1 to 512.</li> <li>• <i>SSID_Name</i> - Is the SSID which can contain 32 alphanumeric characters.</li> </ul> <p><b>Note</b> If you have already configured this command, enter <code>wlan <i>profile-name</i></code> command.</p>

	Command or Action	Purpose
<b>Step 3</b>	<b>security wpa psk set-key <i>ascii/hex key password</i></b>  <b>Example:</b> Device(config-wlan)# <b>security wpa psk set-key ascii 0 PASSWORD</b>	Configures the PSK shared key.
<b>Step 4</b>	<b>no security wpa akm dot1x</b>  <b>Example:</b> Device(config-wlan)# <b>no security wpa akm dot1x</b>	Disables security AKM for dot1x.
<b>Step 5</b>	<b>security wpa akm psk</b>  <b>Example:</b> Device(config-wlan)# <b>security wpa akm psk</b>	Configures the PSK support.
<b>Step 6</b>	<b>security web-auth</b>  <b>Example:</b> Device(config-wlan)# <b>security web-auth</b>	Enables web authentication for WLAN.
<b>Step 7</b>	<b>security web-auth authentication-list <i>authenticate-list-name</i></b>  <b>Example:</b> Device(config-wlan)# <b>security web-auth authentication-list webauth</b>	Enables authentication list for dot1x security.
<b>Step 8</b>	<b>security web-auth parameter-map <i>parameter-map-name</i></b>  <b>Example:</b> (config-wlan)# <b>security web-auth parameter-map WLAN1_MAP</b>	Configures the parameter map.  <b>Note</b> If parameter map is not associated with a WLAN, the configuration is considered from the global parameter map.

### Example

```
wlan wlan-test 3 ssid-test
 security wpa psk set-key ascii 0 PASSWORD
 no security wpa akm dot1x
 security wpa akm psk
 security web-auth
 security web-auth authentication-list webauth
 security web-auth parameter-map WLAN1_MAP
```

## Configuring WLAN for PSK or Identity Preshared Key (iPSK) and Central Web Authentication (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Tags & Profiles > WLANs**.
- Step 2** Select the required WLAN.
- Step 3** Choose **Security > Layer2** tab.
- Step 4** Select the security method from the **Layer 2 Security Mode** drop-down list.
- Step 5** In the **Auth Key Mgmt**, uncheck the **802.1x** check box.
- Step 6** Check the **PSK** check box.
- Step 7** Enter the **Pre-Shared Key** and choose the PSK Format from the **PSK Format** drop-down list and the PSK Type from the **PSK Type** drop-down list.
- Step 8** Check the **MAC Filtering** check box to enable the feature.
- Step 9** With MAC Filtering enabled, choose the Authorization List from the **Authorization List** drop-down list.
- Step 10** Choose **Security > Layer3** tab.
- Step 11** Check the **Web Policy** checkbox to enable web authentication policy.
- Step 12** Choose the Web Auth Parameter Map from the **Web Auth Parameter Map** drop-down list and the authentication list from the **Authentication List** drop-down list.
- Step 13** Click **Update & Apply to Device**.
- 

## Configuring WLAN for PSK or Identity Preshared Key (iPSK) and Central Web Authentication

### Configuring WLAN

#### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>wlan profile-name wlan-id SSID_Name</b>  <b>Example:</b> Device(config)# <code>wlan wlan-test 3 ssid-test</code>	Enters WLAN configuration sub-mode.  <ul style="list-style-type: none"> <li>• <i>profile-name</i> - Is the profile name of the configured WLAN.</li> <li>• <i>wlan-id</i> - Is the wireless LAN identifier. Range is from 1 to 512.</li> </ul>

	Command or Action	Purpose
		<ul style="list-style-type: none"> <li>• <i>SSID_Name</i> - Is the SSID which can contain 32 alphanumeric characters.</li> </ul> <p><b>Note</b> If you have already configured this command, enter <code>wlan profile-name</code> command.</p>
<b>Step 3</b>	<b>no security wpa akm dot1x</b>  <b>Example:</b> Device(config-wlan)# <code>no security wpa akm dot1x</code>	Disables security AKM for dot1x.
<b>Step 4</b>	<b>security wpa psk set-key ascii/hex key password</b>  <b>Example:</b> Device(config-wlan)# <code>security wpa psk set-key ascii 0 PASSWORD</code>	Configures the PSK AKM shared key.
<b>Step 5</b>	<b>mac-filtering auth-list-name</b>  <b>Example:</b> Device(config-wlan)# <code>mac-filtering test-auth-list</code>	Sets the MAC filtering parameters.

**Example**

```
wlan wlan-test 3 ssid-test
no security wpa akm dot1x
security wpa psk set-key ascii 0 PASSWORD
mac-filtering test-auth-list
```

**Applying Policy Profile to a WLAN****Procedure**

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>wireless profile policy policy-profile-name</b>  <b>Example:</b> Device(config)# <code>wireless profile policy policy-iot</code>	Configures the default policy profile.

	Command or Action	Purpose
Step 3	<b>aaa-override</b> <b>Example:</b> Device(config-wireless-policy) # <b>aaa-override</b>	Configures AAA override to apply policies coming from the AAA or ISE servers.
Step 4	<b>nac</b> <b>Example:</b> Device(config-wireless-policy) # <b>nac</b>	Configures NAC in the policy profile.
Step 5	<b>no shutdown</b> <b>Example:</b> Device(config-wireless-policy) # <b>no shutdown</b>	Shutdown the WLAN.
Step 6	<b>end</b> <b>Example:</b> Device(config-wireless-policy) # <b>end</b>	Returns to privileged EXEC mode.

**Example**

```
wireless profile policy policy-iot
aaa-override
nac
no shutdown
```

## Configure WLAN for Web Authentication on MAC Authentication Bypass Failure with Pre-Shared Key (CLI)

**Procedure**

	Command or Action	Purpose
Step 1	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
Step 2	<b>wlan profile-name wlan-id SSID_Name</b> <b>Example:</b> Device(config)# <b>wlan wlan-test 3 ssid-test</b>	Enters WLAN configuration submenu. <ul style="list-style-type: none"> <li>• <i>profile-name</i>: Profile name of the configured WLAN.</li> <li>• <i>wlan-id</i>: Wireless LAN identifier. Range is from 1 to 512.</li> </ul>

	Command or Action	Purpose
		<ul style="list-style-type: none"> <li>• <i>SSID_Name</i>: SSID that can contain 32 alphanumeric characters.</li> </ul> <p><b>Note</b> If you have already configured this command, enter the <b>wlan profile-name</b> command.</p>
<b>Step 3</b>	<b>mac-filtering</b> <i>auth-list-name</i> <b>Example:</b> Device (config-wlan) # <b>mac-filtering test-auth-list</b>	Sets the MAC filtering parameters.
<b>Step 4</b>	<b>security wpa psk set-key</b> <i>ascii/hex key password</i> <b>Example:</b> Device (config-wlan) # <b>security wpa psk set-key ascii 0 PASSWORD</b>	Configures the PSK AKM shared key.
<b>Step 5</b>	<b>no security wpa akm dot1x</b> <b>Example:</b> Device (config-wlan) # <b>no security wpa akm dot1x</b>	Disables security AKM for dot1x.
<b>Step 6</b>	<b>security wpa akm psk</b> <b>Example:</b> Device (config-wlan) # <b>security wpa akm psk</b>	Configures PSK support.
<b>Step 7</b>	<b>security web-auth authentication-list</b> <i>authenticate-list-name</i> <b>Example:</b> Device (config-wlan) # <b>security web-auth authentication-list default</b>	Enables authentication list for dot1x security.
<b>Step 8</b>	<b>security web-auth authorization-list</b> <i>authorize-list-name</i> <b>Example:</b> Device (config-wlan) # <b>security web-auth authorization-list default</b>	Enables authorization list for dot1x security.
<b>Step 9</b>	<b>security web-auth on-macfilter-failure</b> <b>Example:</b> Device (config-wlan) # <b>security web-auth on-macfilter-failure</b>	Enables web authentication on MAC filter failure.
<b>Step 10</b>	<b>security web-auth parameter-map</b> <i>parameter-map-name</i>	Configures the parameter map.

	Command or Action	Purpose
	<b>Example:</b> Device(config-wlan)# <b>security web-auth parameter-map WLAN1_MAP</b>	<b>Note</b> If a parameter map is not associated with a WLAN, the configuration is considered from the global parameter map.
<b>Step 11</b>	<b>no shutdown</b>  <b>Example:</b> Device(config-wlan)# <b>no shutdown</b>	Enables the WLAN.

## Configure WLAN for Web Authentication on MAC Authentication Bypass Failure with OWE (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>wlan profile-name wlan-id SSID_Name</b>  <b>Example:</b> Device(config)# <b>wlan wlan-test 3 ssid-test</b>	Enters WLAN configuration submode. <ul style="list-style-type: none"> <li>• <i>profile-name</i>: Profile name of the configured WLAN.</li> <li>• <i>wlan-id</i>: Wireless LAN identifier. Range is from 1 to 512.</li> <li>• <i>SSID_Name</i>: SSID that can contain 32 alphanumeric characters.</li> </ul> <b>Note</b> If you have already configured this command, enter the <b>wlan profile-name</b> command.
<b>Step 3</b>	<b>mac-filtering auth-list-name</b>  <b>Example:</b> Device(config-wlan)# <b>mac-filtering test-auth-list</b>	Sets the MAC filtering parameters.
<b>Step 4</b>	<b>no security wpa akm dot1x</b>  <b>Example:</b> Device(config-wlan)# <b>no security wpa akm dot1x</b>	Disables security AKM for dot1x.

	Command or Action	Purpose
<b>Step 5</b>	<b>security wpa wpa3</b> <b>Example:</b> Device(config-wlan)# security wpa wpa3	Enables WPA3 support.
<b>Step 6</b>	<b>security wpa akm owe</b> <b>Example:</b> Device(config-wlan)# security wpa akm owe	Enables WPA3 OWE support.
<b>Step 7</b>	<b>security web-auth authentication-list</b> <i>authenticate-list-name</i> <b>Example:</b> Device(config-wlan)# security web-auth authentication-list default	Enables authentication list for dot1x security.
<b>Step 8</b>	<b>security web-auth authorization-list</b> <i>authorize-list-name</i> <b>Example:</b> Device(config-wlan)# security web-auth authorization-list default	Enables authorization list for dot1x security.
<b>Step 9</b>	<b>security web-auth on-macfilter-failure</b> <b>Example:</b> Device(config-wlan)# security web-auth on-macfilter-failure	Enables web authentication on MAC filter failure.
<b>Step 10</b>	<b>security web-auth parameter-map</b> <i>parameter-map-name</i> <b>Example:</b> Device(config-wlan)# security web-auth parameter-map WLAN1_MAP	Configures the parameter map.  <b>Note</b> If a parameter map is not associated with a WLAN, the configuration is considered from the global parameter map.
<b>Step 11</b>	<b>no shutdown</b> <b>Example:</b> Device(config-wlan)# no shutdown	Enables the WLAN.

# Configure WLAN for Web Authentication on MAC Authentication Bypass Failure with Secure Agile Exchange (CLI)

## Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>wlan profile-name wlan-id SSID_Name</b> <b>Example:</b> Device(config)# <b>wlan wlan-test 3 ssid-test</b>	Enters WLAN configuration submode.  <ul style="list-style-type: none"> <li>• <i>profile-name</i>: Profile name of the configured WLAN.</li> <li>• <i>wlan-id</i>: Wireless LAN identifier. Range is from 1 to 512.</li> <li>• <i>SSID_Name</i>: SSID that can contain 32 alphanumeric characters.</li> </ul> <p><b>Note</b> If you have already configured this command, enter the <b>wlan profile-name</b> command.</p>
<b>Step 3</b>	<b>mac-filtering auth-list-name</b> <b>Example:</b> Device(config-wlan)# <b>mac-filtering test-auth-list</b>	Sets the MAC filtering parameters.
<b>Step 4</b>	<b>no security wpa akm dot1x</b> <b>Example:</b> Device(config-wlan)# <b>no security wpa akm dot1x</b>	Disables security AKM for dot1x.
<b>Step 5</b>	<b>security wpa wpa3</b> <b>Example:</b> Device(config-wlan)# <b>security wpa wpa3</b>	Enables WPA3 support.
<b>Step 6</b>	<b>security wpa akm sae</b> <b>Example:</b> Device(config-wlan)# <b>security wpa akm sae</b>	Enables AKM SAE support.
<b>Step 7</b>	<b>security web-auth authentication-list authenticate-list-name</b>	Enables authentication list for dot1x security.

	Command or Action	Purpose
	<b>Example:</b> Device(config-wlan)# <b>security web-auth authentication-list default</b>	
<b>Step 8</b>	<b>security web-auth authorization-list authorize-list-name</b>  <b>Example:</b> Device(config-wlan)# <b>security web-auth authorization-list default</b>	Enables authorization list for dot1x security.
<b>Step 9</b>	<b>security web-auth on-macfilter-failure</b>  <b>Example:</b> Device(config-wlan)# <b>security web-auth on-macfilter-failure</b>	Enables web authentication on MAC filter failure.
<b>Step 10</b>	<b>security web-auth parameter-map parameter-map-name</b>  <b>Example:</b> Device(config-wlan)# <b>security web-auth parameter-map WLAN1_MAP</b>	Configures the parameter map.  <b>Note</b> If a parameter map is not associated with a WLAN, the configuration is considered from the global parameter map.
<b>Step 11</b>	<b>no shutdown</b>  <b>Example:</b> Device(config-wlan)# <b>no shutdown</b>	Enables the WLAN.

## Configuring 802.1x and Central Web Authentication on Controller (CLIs)

### Creating AAA Authentication

#### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>aaa new-model</b>  <b>Example:</b> Device(config)# <b>aaa new-model</b>	Creates a AAA authentication model.

## Configuring AAA Server for External Authentication

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>radius-server attribute wireless authentication call-station-id ap-name-ssid</b> <b>Example:</b> Device(config)# radius-server attribute wireless authentication call-station-id ap-name-ssid	Configures a call station identifier sent in the RADIUS authentication messages.
<b>Step 3</b>	<b>radius server <i>server-name</i></b> <b>Example:</b> Device(config)# radius server ISE2	Sets the RADIUS server.
<b>Step 4</b>	<b>address ipv4 <i>radius-server-ip-address</i></b> <b>Example:</b> Device(config-radius-server)# address ipv4 111.111.111.111	Specifies the RADIUS server address.
<b>Step 5</b>	<b>timeout <i>seconds</i></b> <b>Example:</b> Device(config-radius-server)# timeout 10	Specify the time-out value in seconds. The range is between 10 and 1000 seconds.
<b>Step 6</b>	<b>retransmit <i>number-of-retries</i></b> <b>Example:</b> Device(config-radius-server)# retransmit 10	Specify the number of retries to the server. The range is between 0 and 100.
<b>Step 7</b>	<b>key <i>key</i></b> <b>Example:</b> Device(config-radius-server)# key cisco	Specifies the authentication and encryption key used between the device and the key string RADIUS daemon running on the RADIUS server.  <i>key</i> covers the following: <ul style="list-style-type: none"> <li>• 0—Specifies unencrypted key.</li> <li>• 6—Specifies encrypted key.</li> <li>• 7—Specifies HIDDEN key.</li> <li>• Word—Unencrypted (cleartext) server key.</li> </ul>

	Command or Action	Purpose
<b>Step 8</b>	<b>exit</b> <b>Example:</b> Device(config-radius-server)# exit	Returns to the configuration mode.
<b>Step 9</b>	<b>aaa group server radius <i>server-group</i></b> <b>Example:</b> Device(config)# aaa group server radius ISE2	Creates a RADIUS server-group identification.
<b>Step 10</b>	<b>server name <i>server-name</i></b> <b>Example:</b> Device(config)# server name ISE2	Configures the server name.
<b>Step 11</b>	<b>radius-server deadtime <i>time-in-minutes</i></b> <b>Example:</b> Device(config)# radius-server deadtime 5	<p>Defines the time in minutes when a server marked as DEAD is held in that state. Once the deadtime expires, the controller marks the server as UP (ALIVE) and notifies the registered clients about the state change. If the server is still unreachable after the state is marked as UP and if the DEAD criteria is met, then server is marked as DEAD again for the deadtime interval.</p> <p><i>time-in-mins</i>—Valid values range from 1 to 1440 minutes. Default value is zero. To return to the default value, use the <b>no radius-server deadtime</b> command.</p> <p>The <b>radius-server deadtime</b> command can be configured globally or per aaa group server level.</p> <p>You can use the <b>show aaa dead-criteria</b> or <b>show aaa servers</b> command to check for dead-server detection. If the default value is zero, deadtime is not configured.</p>

## Configuring AAA for Authentication

### Before you begin

Configure the RADIUS server and AAA group server.

**Procedure**

	Command or Action	Purpose
<b>Step 1</b>	<b>aaa authentication login</b> <b>Example:</b> Device# aaa authentication login ISE_GROUP group ISE2 local	Defines the authentication method at login.
<b>Step 2</b>	<b>aaa authentication dot1x</b> <b>Example:</b> Device(config)# aaa authentication network ISE_GROUP group ISE2 local	Defines the authentication method at dot1x.

## Configuring Accounting Identity List

**Before you begin**

Configure the RADIUS server and AAA group server.

**Procedure**

	Command or Action	Purpose
<b>Step 1</b>	<b>aaa accounting identity <i>named-list</i> start-stop group <i>server-group-name</i></b> <b>Example:</b> Device# aaa accounting identity ISE start-stop group ISE2	Enables accounting to send a start-record accounting notice when a client is authorized and a stop-record at the end.  <b>Note</b> You can also use the default list instead of the named list.

## Configuring AAA for Central Web Authentication

**Before you begin**

Configure the RADIUS server and AAA group server.

**Procedure**

	Command or Action	Purpose
<b>Step 1</b>	<b>aaa server radius dynamic-author</b> <b>Example:</b> Device# aaa server radius dynamic-author	Configures the Change of Authorization (CoA) on the controller.
<b>Step 2</b>	<b>client <i>client-ip-addr</i> server-key <i>key</i></b> <b>Example:</b>	Configures a server key for a RADIUS client.

	Command or Action	Purpose
	Device(config-locsvr-da-radius)# client 111.111.111.111 server-key ciscokey	

## Defining an Access Control List for Radius Server

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>ip access-list extended redirect</b>  <b>Example:</b> Device(config)# ip access-list extended redirect	The HTTP and HTTPS browsing does not work without authentication (per the other ACL) as ISE is configured to use a redirect ACL (named <b>redirect</b> ).
<b>Step 3</b>	<b>sequence-number deny icmp any</b>  <b>Example:</b> Device(config-ext-nacl)# 10 deny icmp any	Specifies packets to reject according to the sequence number.  <b>Note</b> You must have the DHCP, DNS, and ISE servers in the reject sequences. Refer to <a href="#">Configuration Example to Define an Access Control List for Radius Server</a> , wherein the <i>111.111.111.111</i> refers to the IP address of the ISE server.
<b>Step 4</b>	<b>permit TCP any any eq web-address</b>  <b>Example:</b> Device(config-ext-nacl)# permit TCP any any eq www	Redirects all HTTP or HTTPS access to the Cisco ISE login page.

## Configuration Example to Define an Access Control List for Radius Server

This example shows how to define an access control list for RADIUS server:

```
Device# configure terminal
Device(config-ext-nacl) # 10 deny icmp any
Device(config-ext-nacl) # 20 deny udp any any eq bootps
Device(config-ext-nacl) # 30 deny udp any any eq bootpc
Device(config-ext-nacl) # 40 deny udp any any eq domain
Device(config-ext-nacl) # 50 deny tcp any host 111.111.111.111 eq 8443
Device(config-ext-nacl) # 55 deny tcp host 111.111.111.111 eq 8443 any
Device(config-ext-nacl) # 40 deny udp any any eq domain
Device(config-ext-nacl) # end
```

## Configuring WLAN

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wlan <i>wlan-name</i></b> <b>Example:</b> Device(config)# wlan wlan30	Enters WLAN configuration mode.
<b>Step 3</b>	<b>security dot1x authentication-list ISE_GROUP</b> <b>Example:</b> Device(config-wlan)# security dot1x authentication-list ISE_GROUP	Configures 802.1X for a WLAN.
<b>Step 4</b>	<b>no shutdown</b> <b>Example:</b> Device(config-wlan)# no shutdown	Enables the WLAN.

## Configuring Policy Profile

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wireless profile policy <i>profile-name</i></b> <b>Example:</b> Device(config)# wireless profile policy wireless-profile1	Configures policy profile.
<b>Step 3</b>	<b>aaa-override</b> <b>Example:</b> Device(config-wireless-policy)# aaa-override	Configures AAA override to apply policies coming from the AAA or Cisco Identify Services Engine (ISE) server.
<b>Step 4</b>	<b>accounting-list <i>list-name</i></b> <b>Example:</b>	Sets the accounting list for IEEE 802.1x.

	Command or Action	Purpose
	<code>Device(config-wireless-policy)# accounting-list ISE</code>	
<b>Step 5</b>	<b>ipv4 dhcp required</b>  <b>Example:</b> <code>Device(config-wireless-policy)# ipv4 dhcp required</code>	Configures DHCP parameters for WLAN.
<b>Step 6</b>	<b>nac</b>  <b>Example:</b> <code>Device(config-wireless-policy)# nac</code>	Configures Network Access Control (NAC) in the policy profile. NAC is used to trigger the Central Web Authentication (CWA).
<b>Step 7</b>	<b>vlan 25</b>  <b>Example:</b> <code>Device(config-wireless-policy)# vlan 25</code>	Configures guest VLAN profile.
<b>Step 8</b>	<b>no shutdown</b>  <b>Example:</b> <code>Device(config-wireless-policy)# no shutdown</code>	Enables policy profile.

## Mapping WLAN and Policy Profile to Policy Tag

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> <code>Device# configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>wireless tag policy <i>policy-tag-name</i></b>  <b>Example:</b> <code>Device(config-policy-tag)# wireless tag policy xx-xre-policy-tag</code>	Configures policy tag and enters policy tag configuration mode.
<b>Step 3</b>	<b>wlan <i>wlan-name</i> policy <i>profile-policy-name</i></b>  <b>Example:</b> <code>Device(config-policy-tag)# wlan wlan30 policy wireless-profile1</code>	Maps a policy profile to a WLAN profile.
<b>Step 4</b>	<b>end</b>  <b>Example:</b> <code>Device(config-policy-tag)# end</code>	Saves the configuration and exits the configuration mode and returns to privileged EXEC mode.

# Configuring ISE for Central Web Authentication with Dot1x (GUI)

## Defining Guest Portal

### Before you begin

Define the guest portal or use the default guest portal.

### Procedure

---

- Step 1** Login to the Cisco Identity Services Engine (ISE).
  - Step 2** Choose **Work Centers > Guest Access > Portals & Components**.
  - Step 3** Click **Guest Portal**.
- 

## Defining Authorization Profile for a Client

### Before you begin

You can define the authorization profile to use guest portal and other additional parameters as per the requirement. Authorization profile redirects the client to the authentication portal. In the latest Cisco ISE version, Cisco\_Webauth authorization results exist already, and you can edit the same to modify the redirection ACL name to match the configuration in the controller.

### Procedure

---

- Step 1** Login to the Cisco Identity Services Engine (ISE).
  - Step 2** Choose **Policy > Policy Elements > Authorization > Authorization Profiles**.
  - Step 3** Click **Add** to create your own custom or edit the Cisco\_Webauth default result.
- 

## Defining Authentication Rule

### Procedure

---

- Step 1** Login to the Cisco Identity Services Engine (ISE).
- Step 2** Choose **Policy > Policy Sets** and click on the appropriate policy set.
- Step 3** Expand **Authentication** policy.

**Step 4** Expand **Options** and choose an appropriate **User ID**.

## Defining Authorization Rule

### Procedure

**Step 1** Login to the Cisco Identity Services Engine (ISE).

**Step 2** Choose **Policy > Policy Sets > Authorization Policy**.

**Step 3** Create a rule that matches the condition for 802.1x with a specific SSID (using Radius-Called-Station-ID).

**Note** You get to view the CWA redirect attribute.

**Step 4** Choose the already created authorization profile.

**Step 5** From the **Result/Profile** column, choose the already created authorization profile.

**Step 6** Click **Save**.

**Note** The following image depicts the working configuration sample for your reference.

**Figure 32: Working Configuration Sample**

## Creating Rules to Match Guest Flow Condition

### Before you begin

You must create a second rule that matches the guest flow condition and returns to network access details once the user completes authentication in the portal.

### Procedure

**Step 1** Login to the Cisco Identity Services Engine (ISE).

**Step 2** Choose **Policy > Policy Sets > Authorization Policy**.

**Step 3** Create a rule that matches the condition for 802.1x with, Network Access-UseCase EQUALS Guest, and a specific SSID (using Radius-Called-Station-ID).

**Note** You get to view the Permit Access.

**Step 4** From the **Result/Profile** column, choose the already created authorization profile.

**Step 5** Choose the default or customized Permit Access.

**Step 6** Click **Save**.

## Verifying Multiple Authentication Configurations

### Layer 2 Authentication

After L2 authentication (Dot1x) is complete, the client is moved to *Webauth Pending* state.

To verify the client state after L2 authentication, use the following commands:

```
Device# show wireless client summary
Number of Local Clients: 1
MAC Address AP Name WLAN State Protocol Method Role

58ef.68b6.aa60 ewlc1_ap_1 3 Webauth Pending 11n(5) Dot1x Local
Number of Excluded Clients: 0

Device# show wireless client mac-address <mac_address> detail

Auth Method Status List

Method: Dot1x
Webauth State: Init
Webauth Method: Webauth

### Layer 3 Authentication

Once L3 authentication is successful, the client is moved to *Run* state.

To verify the client state after L3 authentication, use the following commands:

```
Device# show wireless client summary
```

```

Number of Local Clients: 1
MAC Address AP Name WLAN State Protocol Method Role

## Simultaneous Authentication of Equals

WPA3 is the latest version of Wi-Fi Protected Access (WPA), which is a suite of protocols and technologies that provide authentication and encryption for Wi-Fi networks.

WPA3 leverages Simultaneous Authentication of Equals (SAE) to provide stronger protections for users against password guessing attempts by third parties. SAE employs a discrete logarithm cryptography to perform an efficient exchange in a way that performs mutual authentication using a password that is probably resistant to an offline dictionary attack. An offline dictionary attack is where an adversary attempts to determine a network password by trying possible passwords without further network interaction.

WPA3-Personal brings better protection to individual users by providing more robust password-based authentication making the brute-force dictionary attack much more difficult and time-consuming, while WPA3-Enterprise provides higher grade security protocols for sensitive data networks.

When the client connects to the access point, they perform an SAE exchange. If successful, they will each create a cryptographically strong key, from which the session key will be derived. Basically a client and access point goes into phases of commit and then confirm. Once there is a commitment, the client and access point can then go into the confirm states each time there is a session key to be generated. The method uses forward secrecy, where an intruder could crack a single key, but not all of the other keys.

---

**Note** Home SSIDs configured using OEAP GUI does not support WPA3 security in Cisco IOS-XE 17.6 and 17.7 releases.

---

---

**Note** Cisco Wave 2 APs do not support SAE. As a result, the AP clients are not able to connect to SAE SSID with these APs, as the clients fail to join back after receiving M3 from the APs.

The following are the Cisco Wave 2 APs that do not support SAE:

- Cisco Aironet 1815 Series APs (AP1815W, AP1815T, AP1815I, AP1815M)
  - Cisco Aironet 1815T OfficeExtend APs
  - Cisco Aironet 1800 Series APs (AP1800I, AP1800S)
  - Cisco Aironet 1542 Series Outdoor APs (AP1542D, AP1542I)
  - Cisco Aironet 1840 Series APs (AP1840I)
- 

## Opportunistic Wireless Encryption

Opportunistic Wireless Encryption (OWE) is an extension to IEEE 802.11 that provides encryption of the wireless medium. The purpose of OWE based authentication is avoid open unsecured wireless connectivity between the AP's and clients. The OWE uses the Diffie-Hellman algorithms based Cryptography to setup the wireless encryption. With OWE, the client and AP perform a Diffie-Hellman key exchange during the access procedure and use the resulting pairwise secret with the 4-way handshake. The use of OWE enhances wireless network security for deployments where Open or shared PSK based networks are deployed.

## Hash-to-Element (H2E)

Hash-to-Element (H2E) is a new SAE Password Element (PWE) method. In this method, the secret PWE used in the SAE protocol is generated from a password.

When a STA that supports H2E initiates SAE with an AP, it checks whether AP supports H2E. If yes, the AP uses the H2E to derive the PWE by using a newly defined Status Code value in the SAE Commit message.

If STA uses Hunting-and-Pecking, the entire SAE exchange remains unchanged.

While using the H2E, the PWE derivation is divided into the following components:

- Derivation of a secret intermediary element PT from the password. This can be performed offline when the password is initially configured on the device for each supported group.
- Derivation of the PWE from the stored PT. This depends on the negotiated group and MAC addresses of peers. This is performed in real-time during the SAE exchange.

**Note**

- 6-GHz supports only Hash-to-Element SAE PWE method.
- The H2E method also incorporates protection against the Group Downgrade man-in-the-middle attacks. During the SAE exchange, the peers exchange lists of rejected groups binded into the PMK derivation. Each peer compares the received list with the list of groups supported, any discrepancy detects a downgrade attack and terminates the authentication.

## YANG (RPC model)

To create an RPC for SAE Password Element (PWE) mode, use the following RPC model:

```
<nc:rpc xmlns:nc="urn:ietf:params:xml:ns:netconf:base:1.0"
message-id="urn:uuid:0a77124f-c563-469d-bd21-cc625a9691cc">
<nc:edit-config>
<nc:target>

---

**Note** The **delete** operation performs one action at a time due to the current infra limitation. That is, in YANG module, the **delete** operation on multiple nodes are not supported.

---

## Transition Disable

Transition Disable is an indication from an AP to an STA. This feature disables few transition modes for subsequent connections to the APs network.

An STA implementation might enable certain transition modes in a network profile. For example, a WPA3-Personal STA might enable the WPA3-Personal transition mode in a network profile by default. This enables a PSK algorithm. However, you can use the Transition Disable indication to disable transition modes for that network on a STA.

---

**Note** The Transition Disable indication provides protection against downgrade attacks.

---

An AP that uses Transition Disable indication does not necessarily disable the corresponding transition modes on its own BSS. For example, the APs in WPA3-Personal network might use the Transition Disable indication to ensure that all STAs supporting WPA3-Personal are protected against the downgrade attack. However, the WPA3-Personal transition mode is enabled on the BSS for the legacy STAs to connect.

## WPA3 SAE iPSK

A RADIUS server and Identity PSK (iPSK) create unique preshared keys for individuals or a group of users present in the same SSID. This kind of setup is useful in networks where end-client devices do not support 802.1X authentication. However, you will need a more secure and granular authentication. From a client perspective, the WLAN looks identical to the traditional PSK network. If one of the PSKs is compromised, only the affected individual or group needs to update their PSK. The rest of the devices connected to the WLAN remain unaffected.

The Simultaneous Authentication of Equals (SAE) H2E authentication mode uses a password token derived from the SAE authentication passphrase. You can configure the passphrase in the WLAN profile for client authentication during commit and confirm message exchanges.

From Cisco IOS-XE 17.9.2, the iPSK passphrase is supported for SAE H2E authentication in Local mode. The iPSK passphrase is configured in the client authorization policy in the RADIUS server. The passphrase pushes the policy to the controller during client MAB authentication.

---

**Note** The iPSK passphrase replaces the one in the WLAN profile to generate password token. If the iPSK passphrase is not configured in the authorization policy, the SAE H2E falls back to the passphrase in the WLAN profile.

---

## Configuring SAE (WPA3+WPA2 Mixed Mode)

Follow the procedure given below to configure WPA3+WPA2 mixed mode for SAE.

## Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wlan wlan-name wlan-id SSID-name</b> <b>Example:</b> Device(config)# wlan WPA3 1 WPA3	Enters the WLAN configuration sub-mode.
<b>Step 3</b>	<b>no security wpa akm dot1x</b> <b>Example:</b> Device(config-wlan)# no security wpa akm dot1x	Disables security AKM for dot1x.
<b>Step 4</b>	<b>no security ft over-the-ds</b> <b>Example:</b> Device(config-wlan)# no security ft over-the-ds	Disables fast transition over the data source on the WLAN.
<b>Step 5</b>	<b>no security ft</b> <b>Example:</b> Device(config-wlan)# no security ft	Disables 802.11r fast transition on the WLAN.
<b>Step 6</b>	<b>security wpa wpa2 ciphers aes</b> <b>Example:</b> Device(config-wlan)# security wpa wpa2 ciphers aes	Configures WPA2 cipher. <b>Note</b> You can check whether cipher is configured using <b>no security wpa wpa2 ciphers aes</b> command. If cipher is not reset, configure the cipher.
<b>Step 7</b>	<b>security wpa psk set-key ascii value preshared-key</b> <b>Example:</b> Device(config-wlan)# security wpa psk set-key ascii 0 Cisco123	Specifies a preshared key.
<b>Step 8</b>	<b>security wpa wpa3</b> <b>Example:</b> Device(config-wlan)# security wpa wpa3	Enables WPA3 support. <b>Note</b> If both WPA2 and WPA3 are supported (SAE and PSK together), it is optional to configure PMF. However, you cannot disable PMF. For WPA3, PMF is mandatory.
<b>Step 9</b>	<b>security wpa akm sae</b> <b>Example:</b>	Enables AKM SAE support.

	Command or Action	Purpose
	Device(config-wlan)# security wpa akm sae	
<b>Step 10</b>	<b>security wpa akm psk</b> <b>Example:</b> Device(config-wlan)# security wpa akm psk	Enables AKM PSK support.
<b>Step 11</b>	<b>no shutdown</b> <b>Example:</b> Device(config-wlan)# no shutdown	Enables the WLAN.
<b>Step 12</b>	<b>end</b> <b>Example:</b> Device(config-wlan)# end	Returns to the privileged EXEC mode.

## Configuring WPA3 Enterprise (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Tags & Profiles > WLANs**.
  - Step 2** Click **Add**.
  - Step 3** In the **General** tab, enter the **Profile Name**, the **SSID** and the **WLAN ID**.
  - Step 4** Choose **Security > Layer2** tab. Choose **WPA2+WPA3** in **Layer 2 Security Mode** drop-down list.
  - Step 5** Uncheck the **WPA2 Policy** and **802.1x** check boxes. Check the **WPA3 Policy** and **802.1x-SHA256** check boxes.
  - Step 6** Choose **Security > AAA** tab, choose the Authentication List from the **Authentication List** drop-down list.
  - Step 7** Click **Apply to Device**.
- 

## Configuring WPA3 Enterprise

Follow the procedure given below to configure WPA3 enterprise.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.

	Command or Action	Purpose
<b>Step 2</b>	<b>wlan wlan-name wlan-id SSID-name</b> <b>Example:</b> Device(config)# wlan wl-dot1x 4 wl-dot1x	Enters the WLAN configuration sub-mode.
<b>Step 3</b>	<b>no security wpa akm dot1x</b> <b>Example:</b> Device(config-wlan)# no security wpa akm dot1x	Disables security AKM for dot1x.
<b>Step 4</b>	<b>no security wpa wpa2</b> <b>Example:</b> Device(config-wlan)# no security wpa wpa2	Disables WPA2 security.
<b>Step 5</b>	<b>security wpa akm dot1x-sha256</b> <b>Example:</b> Device(config-wlan)# security wpa akm dot1x-sha256	Configures 802.1x support.
<b>Step 6</b>	<b>security wpa wpa3</b> <b>Example:</b> Device(config-wlan)# security wpa wpa3	Enables WPA3 support.
<b>Step 7</b>	<b>security dot1x authentication-list list-name</b> <b>Example:</b> Device(config-wlan)# security dot1x authentication-list ipv6_ircm_aaa_list	Configures security authentication list for dot1x security.
<b>Step 8</b>	<b>no shutdown</b> <b>Example:</b> Device(config-wlan)# no shutdown	Enables the WLAN.
<b>Step 9</b>	<b>end</b> <b>Example:</b> Device(config-wlan)# end	Returns to the privileged EXEC mode. <b>Note</b> A WLAN configured with WPA3 enterprise (SUITEB192-1X) is not supported on C9115/C9120 APs.

## Configuring the WPA3 OWE

Follow the procedure given below to configure WPA3 OWE.

### Before you begin

Configure PMF internally. The associated ciphers configuration can use the WPA2 ciphers.

## Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wlan wlan-name wlan-id SSID-name</b> <b>Example:</b> Device(config)# wlan WPA3 1 WPA3	Enters the WLAN configuration sub-mode.
<b>Step 3</b>	<b>no security ft over-the-ds</b> <b>Example:</b> Device(config-wlan)# no security ft over-the-ds	Disables fast transition over the data source on the WLAN.
<b>Step 4</b>	<b>no security ft</b> <b>Example:</b> Device(config-wlan)# no security ft	Disables 802.11r fast transition on the WLAN.
<b>Step 5</b>	<b>no security wpa akm dot1x</b> <b>Example:</b> Device(config-wlan)# no security wpa akm dot1x	Disables security AKM for dot1x.
<b>Step 6</b>	<b>no security wpa wpa2</b> <b>Example:</b> Device(config-wlan)# no security wpa wpa2	Disables WPA2 security. PMF is disabled now.
<b>Step 7</b>	<b>security wpa wpa2 ciphers aes</b> <b>Example:</b> Device(config-wlan)# security wpa wpa2 ciphers aes	Enables WPA2 ciphers for AES. <b>Note</b> The ciphers for WPA2 and WPA3 are common.
<b>Step 8</b>	<b>security wpa wpa3</b> <b>Example:</b> Device(config-wlan)# security wpa wpa3	Enables WPA3 support.
<b>Step 9</b>	<b>security wpa akm owe</b> <b>Example:</b> Device(config-wlan)# security wpa akm owe	Enables WPA3 OWE support.
<b>Step 10</b>	<b>no shutdown</b> <b>Example:</b> Device(config-wlan)# no shutdown	Enables the WLAN.

	Command or Action	Purpose
<b>Step 11</b>	<b>end</b>  <b>Example:</b> Device (config-wlan) # end	Returns to the privileged EXEC mode.

## Configuring WPA3 OWE Transition Mode (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Tags & Profiles > WLANs**.
  - Step 2** Click **Add**.
  - Step 3** In the **General** tab, enter the **Profile Name**, the **SSID** and the **WLAN ID**.
  - Step 4** Choose **Security > Layer2** tab. Choose **WPA2+WPA3** in **Layer 2 Security Mode** drop-down list.
  - Step 5** Uncheck the **WPA2 Policy, 802.1x, Over the DS, FT + 802.1x** and **FT + PSK** check boxes. Check the **WPA3 Policy, AES** and **OWE** check boxes.
  - Step 6** Enter the **Transition Mode WLAN ID**.
  - Step 7** Click **Apply to Device**.
- 

## Configuring WPA3 OWE Transition Mode

Follow the procedure given below to configure the WPA3 OWE transition mode.

---

**Note** Policy validation is not done between open WLAN and OWE WLAN. The operator is expected to configure them appropriately.

---

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wlan wlan-name wlan-id SSID-name</b>  <b>Example:</b> Device (config) # wlan WPA3 1 WPA3	Enters the WLAN configuration sub-mode.

	Command or Action	Purpose
<b>Step 3</b>	<b>no security wpa akm dot1x</b> <b>Example:</b> Device(config-wlan)# no security wpa akm dot1x	Disables security AKM for dot1x.
<b>Step 4</b>	<b>no security ft over-the-ds</b> <b>Example:</b> Device(config-wlan)# no security ft over-the-ds	Disables fast transition over the data source on the WLAN.
<b>Step 5</b>	<b>no security ft</b> <b>Example:</b> Device(config-wlan)# no security ft	Disables 802.11r fast transition on the WLAN.
<b>Step 6</b>	<b>no security wpa wpa2</b> <b>Example:</b> Device(config-wlan)# no security wpa wpa2	Disables WPA2 security. PMF is disabled now.
<b>Step 7</b>	<b>security wpa wpa2 ciphers aes</b> <b>Example:</b> Device(config-wlan)# security wpa wpa2 ciphers aes	Enables WPA2 ciphers for AES.
<b>Step 8</b>	<b>security wpa wpa3</b> <b>Example:</b> Device(config-wlan)# security wpa wpa3	Enables WPA3 support.
<b>Step 9</b>	<b>security wpa akm owe</b> <b>Example:</b> Device(config-wlan)# security wpa akm owe	Enables WPA3 OWE support.
<b>Step 10</b>	<b>security wpa transition-mode-wlan-id</b> <i>wlan-id</i> <b>Example:</b>	Configures the open or OWE transition mode WLAN ID.

	Command or Action	Purpose
	Device (config-wlan) # security wpa transition-mode-wlan-id 1	<p><b>Note</b> Validation is not performed on the transition mode WLAN. The operator is expected to configure it correctly with OWE WLAN having open WLAN identifier and the opposite way.</p> <p>You should configure OWE WLAN ID as transition mode WLAN in open WLAN. Similarly, open WLAN should be configured as transition mode WLAN in OWE WLAN configuration.</p>
<b>Step 11</b>	<p><b>no shutdown</b></p> <p><b>Example:</b></p> <pre>Device (config-wlan) # no shutdown</pre>	Enables the WLAN.
<b>Step 12</b>	<p><b>end</b></p> <p><b>Example:</b></p> <pre>Device (config-wlan) # end</pre>	Returns to the privileged EXEC mode.

## Configuring WPA3 SAE (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Tags & Profiles > WLANs**.
  - Step 2** Click **Add**.
  - Step 3** In the **General** tab, enter the **Profile Name**, the **SSID** and the **WLAN ID**.
  - Step 4** Choose **Security > Layer2** tab. Choose **WPA2+WPA3** in **Layer 2 Security Mode** drop-down list.
  - Step 5** Uncheck the **WPAPolicy**, **802.1x**, **Over the DS**, **FT + 802.1x** and **FT + PSK** check boxes. Check the **WPA3 Policy**, **AES** and **PSK** check boxes. Enter the **Pre-Shared Key** and choose the PSK Format from the **PSK Format** drop-down list and the PSK Type from the **PSK Type** drop-down list.
  - Step 6** Click **Apply to Device**.
- 

## Configuring WPA3 SAE

Follow the procedure given below to configure WPA3 SAE.

**Before you begin**

Configure PMF internally. The associated ciphers configuration can use the WPA2 ciphers.

**Procedure**

	<b>Command or Action</b>	<b>Purpose</b>
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wlan wlan-name wlan-id SSID-name</b> <b>Example:</b> Device(config)# wlan WPA3 1 WPA3	Enters the WLAN configuration sub-mode.
<b>Step 3</b>	<b>no security wpa akm dot1x</b> <b>Example:</b> Device(config-wlan)# no security wpa akm dot1x	Disables security AKM for dot1x.
<b>Step 4</b>	<b>no security ft over-the-ds</b> <b>Example:</b> Device(config-wlan)# no security ft over-the-ds	Disables fast transition over the data source on the WLAN.
<b>Step 5</b>	<b>no security ft</b> <b>Example:</b> Device(config-wlan)# no security ft	Disables 802.11r fast transition on the WLAN.
<b>Step 6</b>	<b>no security wpa wpa2</b> <b>Example:</b> Device(config-wlan)# no security wpa wpa2	Disables WPA2 security. PMF is disabled now.
<b>Step 7</b>	<b>security wpa wpa2 ciphers aes</b> <b>Example:</b> Device(config-wlan)# security wpa wpa2 ciphers aes	Configures WPA2 cipher. <b>Note</b> You can check whether cipher is configured using <b>no security wpa wpa2 ciphers aes</b> command. If cipher is not reset, configure the cipher.
<b>Step 8</b>	<b>security wpa psk set-key ascii value</b> <i>preshared-key</i> <b>Example:</b> Device(config-wlan)# security wpa psk set-key ascii 0 Cisco123	Specifies a preshared key.
<b>Step 9</b>	<b>security wpa wpa3</b> <b>Example:</b>	Enables WPA3 support.

	Command or Action	Purpose
	Device(config-wlan)# security wpa wpa3	<b>Note</b> If both WPA2 and WPA3 are supported (SAE and PSK together), it is optional to configure PMF. However, you cannot disable PMF. For WPA3, PMF is mandatory.
<b>Step 10</b>	<b>security wpa akm sae</b> <b>Example:</b> Device(config-wlan)# security wpa akm sae	Enables AKM SAE support.
<b>Step 11</b>	<b>no shutdown</b> <b>Example:</b> Device(config-wlan)# no shutdown	Enables the WLAN.
<b>Step 12</b>	<b>end</b> <b>Example:</b> Device(config-wlan)# end	Returns to the privileged EXEC mode.

## Configuring WPA3 SAE iPSK (CLI)

### Configuring a WPA3 SAE iPSK WLAN Profile (CLI)

#### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wlan wlan-name wlan-id SSID-name</b> <b>Example:</b> Device(config)# wlan wl-sae-ipsk 8 wl-sae-ipsk	Enters the WLAN configuration sub-mode.
<b>Step 3</b>	<b>mac-filtering mac-filter-name</b> <b>Example:</b> Device(config-wlan)# mac-filtering aaa_list	Sets MAC filtering support in WLAN.
<b>Step 4</b>	<b>no security ft adaptive</b> <b>Example:</b>	Disables adaptive 802.11r.

	Command or Action	Purpose
	Device(config-wlan)# no security ft adaptive	
<b>Step 5</b>	<b>no security wpa wpa2</b> <b>Example:</b> Device(config-wlan)# no security wpa wpa2	Disables WPA2 security.
<b>Step 6</b>	<b>security wpa psk set-key [ascii/hex] 0 [key]</b> <b>Example:</b> Device(config-wlan)# security wpa psk set-key ascii 0 123456789	Configures the preshared key in WLAN. <b>Note</b> WPA preshared keys must contain 8 to 63 ASCII text characters or 64 hexadecimal characters.
<b>Step 7</b>	<b>no security wpa akm dot1x</b> <b>Example:</b> Device(config-wlan)# no security wpa akm dot1x	Disables security AKM for 802.1X.
<b>Step 8</b>	<b>security wpa akm sae</b> <b>Example:</b> Device(config-wlan)# security wpa akm sae	Enables AKM SAE support.
<b>Step 9</b>	<b>security wpa akm sae pwe h2e</b> <b>Example:</b> Device(config-wlan)# security wpa akm sae pwe h2e	Enables AKM SAE PWE support (hash-to-element). <b>Note</b> This step is applicable to Hunting and Pecking (HnP) password element method as well.
<b>Step 10</b>	<b>security wpa wpa3</b> <b>Example:</b> Device(config-wlan)# security wpa wpa3	Enables WPA3 support.
<b>Step 11</b>	<b>security pmf mandatory</b> <b>Example:</b> Device(config-wlan)# security pmf mandatory	Makes clients negotiate Protected Management Frames (PMF) protection in WLAN.
<b>Step 12</b>	<b>no shutdown</b> <b>Example:</b> Device(config-wlan)# no shutdown	Enables the WLAN.

## Configuring a Policy Profile (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wireless profile policy <i>policy-profile-name</i></b>  <b>Example:</b> Device(config)# wireless profile policy po-sae-ipsk	Configures policy profile.
<b>Step 3</b>	<b>aaa-override</b>  <b>Example:</b> Device(config-wireless-policy)# aaa-override	Configures AAA override to apply to the policies coming from the AAA or Cisco Identity Services Engine (ISE) server.
<b>Step 4</b>	<b>vlan 166</b>  <b>Example:</b> Device(config-wireless-policy)# vlan 166	Configures VLAN.
<b>Step 5</b>	<b>no shutdown</b>  <b>Example:</b> Device(config-wireless-policy)# no shutdown	Enables policy profile.

## Configuring a Passphrase in a Client Authorization Policy in the RADIUS Server(GUI)

### Procedure

- 
- Step 1** Log in to the Cisco Identity Services Engine (ISE).
  - Step 2** Click **Policy** and then click **Policy Elements**.
  - Step 3** Click **Results**.
  - Step 4** Expand **Authorization** and click **Authorization Profiles**.
  - Step 5** Click **Add** to create a new authorization profile for the URL filter.
  - Step 6** In the **Name** field, enter a name for the profile, for example, *po-sae-ipsk*.
  - Step 7** From the **Access Type** drop-down list, choose **ACCESS\_ACCEPT**.
  - Step 8** From the **Termination-Action** drop-down list, choose **RADIUS-Request**.
  - Step 9** In the **Advanced Attributes Setting** section, from the drop-down list, choose **Cisco:cisco-av-pair**.

**Step 10** Enter the following one by one and click (+) icon after each of them:

- `cisco-av-pair = psk-mode=ascii`
- `cisco-av-pair = psk=123123123`

**Step 11** Verify the contents in the **Attributes Details** section and click **Save**.

## Configuring WPA3 SAE H2E (GUI)

### Procedure

- Step 1** Choose **Configuration > Tags & Profiles > WLANs**.
- Step 2** Click **Add**.
- Step 3** In the **General** tab, enter the **Profile Name**, the **SSID** and the **WLAN ID**.
- Step 4** Choose **Security > Layer2** tab. From the **Layer 2 Security Mode** drop-down list, choose **WPA2+WPA3** or **WPA3**.
- Step 5** Uncheck the **WPAPolicy**, **802.1x**, **Over the DS**, **FT + 802.1x** and **FT + PSK** check boxes. Check the **WPA3 Policy**, **AES** and **PSK** check boxes. Enter the **Pre-Shared Key** and from the **PSK Format** drop-down list, choose the PSK Format and from the **PSK Type** drop-down list, choose the PSK Type.
- Step 6** Check the **SAE** check box.
- Note** SAE is enabled only if the Fast Transition is disabled.
- Step 7** From the **SAE Password Element** drop-down list, choose **Hash to Element Only** to configure the WPA3 SAE H2E.
- Step 8** Click **Apply to Device**.

## Configuring WPA3 SAE H2E

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wlan wlan-name wlan-id SSID-name</b> <b>Example:</b> Device(config)# wlan WPA3 1 WPA3	Enters the WLAN configuration sub-mode.

	Command or Action	Purpose
Step 3	<b>no security wpa akm dot1x</b> <b>Example:</b> <pre>Device(config-wlan)# no security wpa akm dot1x</pre>	Disables security AKM for dot1x.
Step 4	<b>no security ft over-the-ds</b> <b>Example:</b> <pre>Device(config-wlan)# no security ft over-the-ds</pre>	Disables fast transition over the data source on the WLAN.
Step 5	<b>no security ft</b> <b>Example:</b> <pre>Device(config-wlan)# no security ft</pre>	Disables 802.11r fast transition on the WLAN.
Step 6	<b>no security wpa wpa2</b> <b>Example:</b> <pre>Device(config-wlan)# no security wpa wpa2</pre>	Disables WPA2 security. PMF is disabled now.
Step 7	<b>security wpa wpa2 ciphers aes</b> <b>Example:</b> <pre>Device(config-wlan)# security wpa wpa2 ciphers aes</pre>	Configures WPA2 cipher. <b>Note</b> You can check whether cipher is configured using <b>no security wpa wpa2 ciphers aes</b> command. If cipher is not reset, configure the cipher.
Step 8	<b>security wpa psk set-key ascii <i>value</i></b> <i>preshared-key</i> <b>Example:</b> <pre>Device(config-wlan)# security wpa psk set-key ascii 0 Cisco123</pre>	Specifies a preshared key.
Step 9	<b>security wpa wpa3</b> <b>Example:</b> <pre>Device(config-wlan)# security wpa wpa3</pre>	Enables WPA3 support.
Step 10	<b>security wpa akm sae</b> <b>Example:</b> <pre>Device(config-wlan)# security wpa akm sae</pre>	Enables AKM SAE support.
Step 11	<b>security wpa akm sae pwe {h2e   hnp   both-h2e-hnp}</b> <b>Example:</b> <pre>Device(config-wlan)# security wpa akm sae pwe</pre>	Enables AKM SAE PWE support. PWE supports the following options: <ul style="list-style-type: none"> <li>• h2e—Hash-to-Element only; disables HnP.</li> </ul>

	Command or Action	Purpose
		<ul style="list-style-type: none"> <li>• hnp—Hunting and Pecking only; disables H2E.</li> <li>• Both-h2e-hnp—Both Hash-to-Element and Hunting and Pecking support (Is the default option).</li> </ul>
<b>Step 12</b>	<b>no shutdown</b> <b>Example:</b> Device(config-wlan)# no shutdown	Enables the WLAN.
<b>Step 13</b>	<b>end</b> <b>Example:</b> Device(config-wlan)# end	Returns to the privileged EXEC mode.

## Configuring WPA3 WLAN for Transition Disable

### Before you begin

You can enable Transition Disable only when the **security wpa wpa3** is enabled.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wlan wlan-name wlan-id SSID-name</b> <b>Example:</b> Device(config)# wlan WPA3 1 WPA3	Enters the WLAN configuration sub-mode.
<b>Step 3</b>	<b>transition-disable</b> <b>Example:</b> Device(config-wlan)# transition-disable	Enables Transition Disable support.
<b>Step 4</b>	<b>end</b> <b>Example:</b> Device(config-wlan)# end	Returns to the privileged EXEC mode.

# Configuring Anti-Clogging and SAE Retransmission (GUI)

## Procedure

- 
- Step 1** Choose **Configuration > Tags & Profiles > WLANs**.
  - Step 2** Click **Add**.
  - Step 3** In the **General** tab, enter the **Profile Name**, the **SSID** and the **WLAN ID**.
  - Step 4** Enable or disable **Status** and **Broadcast SSID** toggle buttons.
  - Step 5** From the **Radio Policy** drop-down list, choose a policy.
  - Step 6** Choose **Security > Layer2** tab. Check the **SAE** check box.
  - Step 7** Enter the **Anti Clogging Threshold**, **Max Retries** and **Retransmit Timeout**.
  - Step 8** Click **Apply to Device**.
- 

# Configuring Anti-Clogging and SAE Retransmission

Follow the procedure given below to configure anti-clogging and SAE retransmission.

---

**Note** If the simultaneous SAE ongoing sessions are more than the configured anti-clogging threshold, then anti-clogging mechanism is triggered.

---

## Before you begin

Ensure that SAE WLAN configuration is in place, as the steps given below are incremental in nature, in addition to the SAE WLAN configuration.

## Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wlan wlan-name wlan-id SSID-name</b>  <b>Example:</b> Device(config)# wlan WPA3 1 WPA3	Enters the WLAN configuration sub-mode.
<b>Step 3</b>	<b>shutdown</b>  <b>Example:</b> Device(config-wlan)# no shutdown	Disables the WLAN.

	Command or Action	Purpose
<b>Step 4</b>	<b>security wpa akm sae</b> <b>Example:</b> Device(config-wlan)# security wpa akm sae	Enables simultaneous authentication of equals as a security protocol.
<b>Step 5</b>	<b>security wpa akm sae anti-clogging-threshold threshold</b> <b>Example:</b> Device(config-wlan)# security wpa akm sae anti-clogging-threshold 2000	Configures threshold on the number of open sessions to trigger the anti-clogging procedure for new sessions.
<b>Step 6</b>	<b>security wpa akm sae max-retries retry-limit</b> <b>Example:</b> Device(config-wlan)# security wpa akm sae max-retries 10	Configures the maximum number of retransmissions.
<b>Step 7</b>	<b>security wpa akm sae retransmit-timeout retransmit-timeout-limit</b> <b>Example:</b> Device(config-wlan)# security wpa akm sae retransmit-timeout 500	Configures SAE message retransmission timeout value.
<b>Step 8</b>	<b>no shutdown</b> <b>Example:</b> Device(config-wlan)# no shutdown	Enables the WLAN.
<b>Step 9</b>	<b>end</b> <b>Example:</b> Device(config-wlan)# end	Returns to the privileged EXEC mode.

## Verifying WPA3 SAE and OWE

To view the system level statistics for the client that has undergone successful SAE authentication, SAE authentication failures, SAE ongoing sessions, SAE commit and confirm message exchanges, use the following show command:

```
Device# show wireless stats client detail
```

```
Total Number of Clients : 0
```

```
client global statistics:
```

```

Total association requests received : 0
Total association attempts : 0
Total FT/LocalAuth requests : 0
Total association failures : 0
Total association response accepts : 0
Total association response rejects : 0
Total association response errors : 0
```

```

Total association failures due to blacklist : 0
Total association drops due to multicast mac : 0
Total association drops due to throttling : 0
Total association drops due to unknown bssid : 0
Total association drops due to parse failure : 0
Total association drops due to other reasons : 0

## CHAPTER 102

# IP Source Guard

---

- [Information About IP Source Guard, on page 1179](#)
- [Configuring IP Source Guard \(GUI\), on page 1179](#)
- [Configuring IP Source Guard, on page 1180](#)

## Information About IP Source Guard

IP Source Guard (IPSG) is a Layer 2 security feature in the Cisco Catalyst 9800 Series Wireless Controller . It supports both IPv4 and IPv6 wireless clients.

The IPSG feature prevents the wireless controller from forwarding the packets, with the source IP addresses that are not known to it. This security feature is not enabled by default and has to be explicitly configured. It is enabled on a per WLAN basis, and all the wireless clients joining that WLAN inherits this feature.

The wireless controller maintains an IP/MAC pair binding table for the IPSG feature. Using this table, the wireless controller keeps track of IP and MAC address combination (binding) information for all the wireless clients. This binding information is captured as part of the IP learning process. When the feature is enabled on a WLAN, the wireless controller forwards the incoming packets (from the wireless clients) only if it finds a matching binding table entry corresponding to the source IP and MAC address combination of those packets. Otherwise, the packets are dropped.

## Configuring IP Source Guard (GUI)

### Procedure

---

- Step 1** Choose **Configuration > Tags & Profiles > WLANs**.
  - Step 2** Click the WLAN.
  - Step 3** In the **Advanced** tab, check the **IP Source Guard** checkbox.
  - Step 4** Click **Update & Apply to Device**.
-

# Configuring IP Source Guard

Follow the procedure given below to configure IPSG:

## Before you begin

Cisco Catalyst 9800 Series Wireless Controller supports only one IPv4 address for a client and up to 8 IPv6 addresses (including link local addresses) per client.

## Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>wlan profile-name wlan-id ssid</b>  <b>Example:</b> Device(config)# wlan mywlan 34 mywlan-ssid	Specifies the WLAN name and ID to use.  <b>Note</b> If a WLAN is not already configured, this step creates the WLAN.
<b>Step 2</b>	<b>shutdown</b>  <b>Example:</b> Device(config-wlan)# shutdown	Disables the WLAN.
<b>Step 3</b>	<b>ip verify source mac-check</b>  <b>Example:</b> Device(config-wlan)# ip verify source mac-check	Enables the IP Source Guard feature.
<b>Step 4</b>	<b>no shutdown</b>  <b>Example:</b> Device(config-wlan)# no shutdown	Enables the WLAN.

## CHAPTER 103

### 802.11w

---

- [Information About 802.11w, on page 1181](#)
- [Prerequisites for 802.11w, on page 1184](#)
- [Restrictions for 802.11w, on page 1184](#)
- [How to Configure 802.11w, on page 1185](#)
- [Disabling 802.11w, on page 1186](#)
- [Monitoring 802.11w, on page 1187](#)

### Information About 802.11w

Wi-Fi is a broadcast medium that enables any device to eavesdrop and participate either as a legitimate or rogue device. Management frames such as authentication, de-authentication, association, disassociation, beacons, and probes are used by wireless clients to initiate and tear down sessions for network services. Unlike data traffic, which can be encrypted to provide a level of confidentiality, these frames must be heard and understood by all clients and therefore must be transmitted as open or unencrypted. While these frames cannot be encrypted, they must be protected from forgery to protect the wireless medium from attacks. For example, an attacker could spoof management frames from an AP to attack a client associated with the AP.

The 802.11w protocol applies only to a set of robust management frames that are protected by the Protected Management Frames (PMF) service. These include Disassociation, De-authentication, and Robust Action frames.

Management frames that are considered as robust action and therefore protected are the following:

- Spectrum Management
- QoS
- DLS
- Block Ack
- Radio Measurement
- Fast BSS Transition
- SA Query
- Protected Dual of Public Action
- Vendor-specific Protected

When 802.11w is implemented in the wireless medium, the following occur:

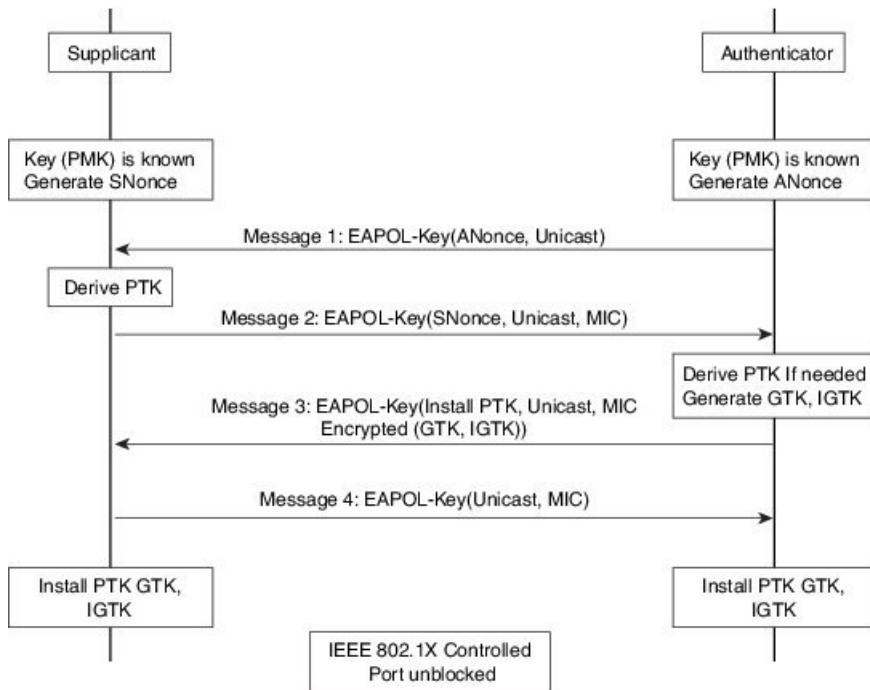

- Client protection is added by the AP adding cryptographic protection to de-authentication and disassociation frames preventing them from being spoofed in a DOS attack.
- Infrastructure protection is added by adding a Security Association (SA) tear down protection mechanism consisting of an Association Comeback Time and an SA-Query procedure preventing spoofed association request from disconnecting an already connected client.

802.11w has introduced a new IGTK Key, which is used to protect broadcast/multicast robust management frames:

- IGTK is a random value assigned by the authenticator STA (WLC) and used to protect MAC management protocol data units (MMPDUs) from that source STA.

When Management Frame Protection is negotiated, the AP encrypts the GTK and IGTK values in the EAPOL-Key frame, which is delivered in Message 3 of 4-way handshake.

**Figure 33: IGTK Exchange in 4-way Handshake**

- If the AP later changes the GTK, it sends the new GTK and IGTK to the client using the Group Key Handshake .

802.11w defines a new Broadcast/Multicast Integrity Protocol (BIP) that provides data integrity and replay protection for broadcast/multicast robust management frames after successful establishment of an IGTKSA - It adds a MIC that is calculated using the shared IGTK key.

### 802.11w Information Elements (IEs)

Figure 34: 802.11w Information Elements

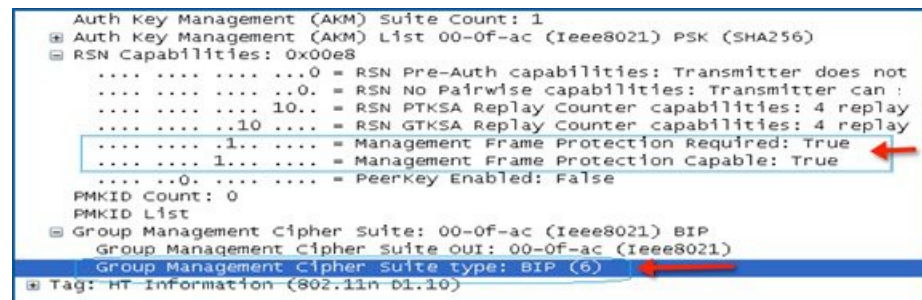

1. Modifications made in the RSN capabilities field of RSNIE.
  - a. Bit 6: Management Frame Protection Required (MFPR)
  - b. Bit 7: Management Frame Protection Capable (MFPC)
2. Two new AKM Suites, 5 and 6 are added for AKM Suite Selectors.
3. New Cipher Suite with type 6 is added to accommodate BIP.

The WLC adds this modified RSNIE in association and re-association responses and the APs add this modified RSNIE in beacons and probe responses.

The following Wireshark captures shows the RSNIE capabilities and the Group Management Cipher Suite elements.

Figure 35: 802.11w Information Elements

### Security Association (SA) Teardown Protection

SA teardown protection is a mechanism to prevent replay attacks from tearing down the session of an existing client. It consists of an Association Comeback Time and an SA-Query procedure preventing spoofed association requests from disconnecting an already connected client.

If a client has a valid security association, and has negotiated 802.11w, the AP shall reject another Association Request with status code 30. This status code stands for "Association request rejected temporarily; Try again later". The AP should not tear down or otherwise modify the state of the existing association until the SA-Query

procedure determines that the original SA is invalid and shall include in the Association Response an Association Comeback Time information element, specifying a comeback time when the AP would be ready to accept an association with this client.

The following capture shows the Association Reject message with status code 0x1e (30) and the Association comeback time set to 10 seconds.

**Figure 36: Association Reject with Comeback Time**

```

IEEE 802.11 wireless LAN management frame
 Fixed parameters (6 bytes)
 Capabilities Information: 0x0001
 status code: Association request rejected temporarily; try again later (0x001e)
 ..00 0000 0000 0000 = Association ID: 0x0000
 Tagged parameters (95 bytes)
 Tag: Supported Rates 6(B), 9, 12(B), 18, 24(B), 36, 48, 54, [Mbit/sec]
 Tag: HT Capabilities (802.11n D1.10)
 Tag: HT Information (802.11n D1.10)
 Tag: Vendor Specific: Microsoft: WMM/WME: Parameter Element
 Tag: Timeout Interval
 Tag Number: Timeout Interval (56)
 Tag length: 5
 Timeout Interval Type: Association comeback time (TUs) (3)
 Timeout Interval value: 10000

```

Following this, if the AP is not already engaged in an SA Query with the client, the AP shall issue an SA Query until a matching SA Query response is received or the Association Comeback time expires. An AP may interpret reception of a valid protected frame as an indication of a successfully completed SA Query.

If a SA QUERY response with a matching transaction identifier within the time period, the AP shall allow the association process to be started without starting additional SA Query procedures.

## Prerequisites for 802.11w

- To configure 802.11w feature for optional and mandatory, you must have WPA and AKM configured.

**Note** The RNS (Robust Secure Network) IE must be enabled with an AES Cipher.

## Restrictions for 802.11w

- 802.11w cannot be applied on an open WLAN, WEP-encrypted WLAN, or a TKIP-encrypted WLAN.
- Cisco Catalyst 9800 Series Wireless Controller supports 802.11w + PMF combination for non-Apple clients. But Apple iOS version 11 and earlier require fix from the Apple iOS side to resolve the association issues.
- The controller will ignore disassociation or deauthentication frames sent by the clients if they are not using 802.11w PMF. The client entry will only get deleted immediately upon reception of such a frame if the client uses PMF. This is to avoid denial of service by malicious device since there is no security on those frames without PMF.

# How to Configure 802.11w

## Configuring 802.11w (GUI)

### Before you begin

WPA and AKM must be configured.

### Procedure

- 
- Step 1** Choose **Configuration > Tags & Profiles > WLANs**.
- Step 2** Click **Add** to create WLANs.  
The **Add WLAN** page is displayed.
- Step 3** In the **Security > Layer2** tab, navigate to the **Protected Management Frame** section.
- Step 4** Choose **PMF** as *Disabled*, *Optional*, or *Required*. By default, the PMF is *disabled*.  
If you choose **PMF** as *Optional* or *Required*, you get to view the following fields:
- **Association Comeback Timer**—Enter a value between 1 and 10 seconds to configure 802.11w association comeback time.
  - **SA Query Time**—Enter a value between 100 to 500 (milliseconds). This is required for clients to negotiate 802.11w PMF protection on a WLAN.
- Step 5** Click **Save & Apply to Device**.
- 

## Configuring 802.11w (CLI)

### Before you begin

WPA and AKM must be configured.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wlan profile-name wlan-id ssid</b> <b>Example:</b> Device(config)# wlan wlan-test 12 alpha	Configures a WLAN and enters configuration mode.

	Command or Action	Purpose
<b>Step 3</b>	<b>security wpa akm dot1x-sha256</b> <b>Example:</b> Device(config-wlan)#security wpa akm dot1x-sha256	Configures 802.1x support.
<b>Step 4</b>	<b>security pmf association-comeback comeback-interval</b> <b>Example:</b> Device(config-wlan)# security pmf association-comeback 10	Configures the 802.11w association comeback time.
<b>Step 5</b>	<b>security pmf mandatory</b> <b>Example:</b> Device(config-wlan)# security pmf mandatory	Requires clients to negotiate 802.11w PMF protection on a WLAN.
<b>Step 6</b>	<b>security pmf saquery-retry-time timeout</b> <b>Example:</b> Device(config-wlan)# security pmf saquery-retry-time 100	Time interval identified in milliseconds before which the SA query response is expected. If the device does not get a response, another SQ query is tried.

## Disabling 802.11w

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wlan profile-name wlan-id ssid</b> <b>Example:</b> Device(config)# wlan wlan-test 12 alpha	Configures a WLAN and enters configuration mode.
<b>Step 3</b>	<b>no security wpa akm dot1x-sha256</b> <b>Example:</b> Device(config-wlan)# no security wpa akm dot1x-sha256	Disables 802.1x support.
<b>Step 4</b>	<b>no security pmf association-comeback comeback-interval</b> <b>Example:</b> Device(config-wlan)# no security pmf association-comeback 10	Disables the 802.11w association comeback time.

	Command or Action	Purpose
<b>Step 5</b>	<b>no security pmf mandatory</b> <b>Example:</b> Device(config-wlan)# no security pmf mandatory	Disables client negotiation of 802.11w PMF protection on a WLAN.
<b>Step 6</b>	<b>no security pmf saquery-retry-time <i>timeout</i></b> <b>Example:</b> Device(config-wlan)# no security pmf saquery-retry-time 100	Disables SQ query retry.

## Monitoring 802.11w

Use the following commands to monitor 802.11w.

### Procedure

#### Step 1 **show wlan name *wlan-name***

Displays the WLAN parameters on the WLAN. The PMF parameters are displayed.

```

.
.
Auth Key Management
 802.1x : Disabled
 PSK : Disabled
 CCKM : Disabled
 FT dot1x : Disabled
 FT PSK : Disabled
 FT SAE : Disabled
 Dot1x-SHA256 : Enabled
 PSK-SHA256 : Disabled
 SAE : Disabled
 OWE : Disabled
 SUITEB-1X : Disabled
 SUITEB192-1X : Disabled
CCKM TSF Tolerance : 1000
FT Support
 FT Reassociation Timeout : 20
 FT Over-The-DS mode : Enabled
PMF Support
 PMF Association Comeback Timeout : 1
 PMF SA Query Time : 500
.
.

```

#### Step 2 **show wireless client mac-address *mac-address* detail**

Displays the summary of the 802.11w authentication key management configuration on a client.

```

.
.
Policy Manager State: Run

```

```
NPU Fast Fast Notified : No
Last Policy Manager State : IP Learn Complete
Client Entry Create Time : 497 seconds
Policy Type : WPA2
Encryption Cipher : CCMP (AES)
Authentication Key Management : 802.1x-SHA256
Encrypted Traffic Analytics : No
Management Frame Protection : No
Protected Management Frame - 802.11w : Yes
EAP Type : LEAP
VLAN : 39
Multicast VLAN : 0
Access VLAN : 39
Anchor VLAN : 0
WFD capable : No
Manged WFD capable : No
. . . .
. . . .
```

## CHAPTER 104

# Management Frame Protection

- [Information About Management Frame Protection](#), on page 1189
- [Restrictions for Management Frame Protection](#), on page 1190
- [Configuring Management Frame Protection \(CLI\)](#), on page 1191
- [Verifying Management Frame Protection Settings](#), on page 1191

## Information About Management Frame Protection

By default, 802.11 management frames are unauthenticated and hence not protected against spoofing. Infrastructure management frame protection (MFP) and 802.11w protected management frames (PMF) provide protection against such attacks.

### Infrastructure MFP

Infrastructure MFP protects management frames by detecting adversaries that are invoking denial-of-service attacks, flooding the network with associations and probes, interjecting as rogue APs, and affecting network performance by attacking the QoS and radio measurement frames. Infrastructure MFP is a global setting that provides a quick and effective means to detect and report phishing incidents.

Specifically, infrastructure MFP protects 802.11 session management functions by adding message integrity check information elements (MIC IEs) to the management frames emitted by APs (and not those emitted by clients), which are then validated by other APs in the network. Infrastructure MFP is passive, can detect and report intrusions but has no means to stop them.

Infrastructure MFP consists of three main components:

- **Management frame protection:** The AP protects the management frames it transmits by adding a MIC IE to each frame. Any attempt to copy, alter, or replay the frame invalidates the MIC, causing any receiving AP configured to detect MFP frames to report the discrepancy. MFP is supported for use with Cisco Aironet lightweight APs.
- **Management frame validation:** In infrastructure MFP, the AP validates every management frame that it receives from other APs in the network. It ensures that the MIC IE is present (when the originator is configured to transmit MFP frames) and matches the content of the management frame. If it receives any frame that does not contain a valid MIC IE from a BSSID belonging to an AP that is configured to transmit MFP frames, it reports the discrepancy to the network management system. In order for the timestamps to operate properly, all controllers must be Network Time Protocol (NTP) synchronized.

- **Event reporting:** The AP notifies the controller when it detects an anomaly, and the controller aggregates the received anomaly events and can report the results through SNMP traps to the network management system.

Infrastructure MFP is disabled by default, and you can enable it globally. When you upgrade from a previous software release, infrastructure MFP is disabled globally if you have enabled AP authentication because the two features are mutually exclusive. When you enable infrastructure MFP globally, signature generation (adding MICs to outbound frames) can be disabled for selected WLANs, and validation can be disabled for selected APs.

---

**Note** CCXv5 client MFP is no longer supported. Client MFP is enabled as optional by default on WLANs that are configured for WPA2. However, client MFP is not supported on Wave 2 APs or 802.11ax Wi-Fi6 APs, and there exist no clients that support CCXv5.

---

### Supported Access Point Models

Cisco MFP is supported on the following AP models:

- Cisco Aironet 2802, 3802, and 4802 series access points
- Cisco Aironet 2800, 3800, 4800, and 1560 series access points

### Unsupported Access Point Models

Cisco MFP is not supported on the following AP models:

- Cisco Aironet 1800 series access points
- Cisco 802.11ax access points
- All Cisco IOS access points

## Restrictions for Management Frame Protection

- Lightweight access points support infrastructure MFP in local and monitor modes and in FlexConnect mode when the access point is connected to a controller.
- Client MFP is supported for use only with CCXv5 clients using WPA2 with TKIP or AES-CCMP.
- Client MFP is not supported on Cisco Wave 1 APs and Cisco Wave 2 APs.
- 802.11ax access points do not support MFP.
- Non-CCXv5 clients may associate to a WLAN, if client MFP is disabled or optional.
- Error reports generated on a FlexConnect access point in standalone mode cannot be forwarded to the controller and are dropped.
- Keys are generated using random number generator but you can improve the keys by changing to SHA.
- MFP key for each BSSID is not supported.

## Configuring Management Frame Protection (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wireless wps mfp</b>  <b>Example:</b> Device(config)# wireless wps mfp	Configures a management frame protection.
<b>Step 3</b>	<b>wireless wps mfp {ap-impersonation   key-refresh-interval}</b>  <b>Example:</b> Device(config)# wireless wps mfp ap-impersonation  Device(config)# wireless wps mfp key-refresh-interval	Configures ap impersonation detection (or) MFP key refresh interval in hours.  key-refresh-interval—Refers to the MFP key refresh interval in hours. The valid range is from 1 to 24. Default value is 24.
<b>Step 4</b>	<b>end</b>  <b>Example:</b> Device(config)# end	Saves the configuration and exits configuration mode and returns to privileged EXEC mode.

## Verifying Management Frame Protection Settings

To verify if the Management Frame Protection (MFP) feature is enabled or not, use the following command:

```
Device# show wireless wps summary
Client Exclusion Policy
 Excessive 802.11-association failures : unknown
 Excessive 802.11-authentication failures : unknown
 Excessive 802.1x-authentication : unknown
 IP-theft : unknown
 Excessive Web authentication failure : unknown
 Failed Qos Policy : unknown

Management Frame Protection
 Global Infrastructure MFP state : Enabled
 AP Impersonation detection : Disabled
 Key refresh interval : 15
```

To view the MFP details, use the following command:

```
Device# show wireless wps mfp summary
Management Frame Protection
 Global Infrastructure MFP state : Enabled
```

```

AP Impersonation detection : Disabled
Key refresh interval : 15

```

To view the MFP statistics details, use the following command:

```

Device# show wireless wps mfp statistics
BSSID Radio DetectorAP LastSourceAddr Error Count
 FrameTypes
aabb.ccdd.eeff a AP3800 aabb.ccdd.eeff Invalid MIC 10
 Beacon, Probe Response
 Invalid MIC 20
 Beacon, Probe Response

```

To verify if access points support MFP validation and protection, use the following command:

```

Device# show wireless wps mfp ap summary
AP Name Radio MAC Validation Protection

AP002A.1087.CBF4 00a2.eefd.bdc0 Enabled Enabled
AP58AC.78DE.9946 00a2.eeb8.4ae0 Enabled Enabled
APb4de.3196.caac 4c77.6d83.6b90 Enabled Enabled

```

## CHAPTER 105

# IPv4 ACLs

---

- [Information about Network Security with ACLs, on page 1193](#)
- [Restrictions for Configuring IPv4 Access Control Lists, on page 1201](#)
- [How to Configure ACLs, on page 1202](#)
- [Configuration Examples for ACLs, on page 1215](#)
- [Monitoring IPv4 ACLs, on page 1219](#)

## Information about Network Security with ACLs

This chapter describes how to configure network security on the switch by using access control lists (ACLs), which in commands and tables are also referred to as access lists.

### ACL Overview

Packet filtering can help limit network traffic and restrict network use by certain users or devices. ACLs filter traffic as it passes through a controller and permit or deny packets crossing specified interfaces. An ACL is a sequential collection of permit and deny conditions that apply to packets. When a packet is received on an interface, the switch compares the fields in the packet against any applied ACLs to verify that the packet has the required permissions to be forwarded, based on the criteria specified in the access lists. One by one, it tests packets against the conditions in an access list. The first match decides whether the controller accepts or rejects the packets. Because the controller stops testing after the first match, the order of conditions in the list is critical. If no conditions match, the controller rejects the packet. If there are no restrictions, the controller forwards the packet; otherwise, the controller drops the packet. The controller can use ACLs on all packets it forwards. There is implicit any host deny deny rule.

You configure access lists on a controller to provide basic security for your network. If you do not configure ACLs, all packets passing through the switch could be allowed onto all parts of the network. You can use ACLs to control which hosts can access different parts of a network or to decide which types of traffic are forwarded or blocked at router interfaces. For example, you can allow e-mail traffic to be forwarded but not Telnet traffic.

### Access Control Entries

An ACL contains an ordered list of access control entries (ACEs). Each ACE specifies *permit* or *deny* and a set of conditions the packet must satisfy in order to match the ACE. The meaning of *permit* or *deny* depends on the context in which the ACL is used.

---

**Note** The maximum number of ACEs that can be applied under an access policy (ACL) for central switching is 256 ACEs. The maximum number of ACEs applicable for Flex Mode or Local Switching is 64 ACEs.

---

## ACL Supported Types

The switch supports IP ACLs and Ethernet (MAC) ACLs:

- IP ACLs filter IPv4 traffic, including TCP, User Datagram Protocol (UDP), Internet Group Management Protocol (IGMP), and Internet Control Message Protocol (ICMP).
- Ethernet ACLs filter non-IP traffic.

This switch also supports quality of service (QoS) classification ACLs.

## Supported ACLs

The controller supports three types of ACLs to filter traffic:

- Port ACLs access-control traffic entering a Layer 2 interface. You can apply port ACLs to a Layer 2 interface in each direction to each access list type — IPv4 and MAC.
- Router ACLs access-control routed traffic between VLANs and are applied to Layer 3 interfaces in a specific direction (inbound or outbound).
- FQDN ACL: FQDN ACL is encoded along with IPv6 ACL and sent to AP. FQDN ACL is always a custom ACL. AP does DNS snooping and sends the IPv4 and IPv6 addresses to the controller.

## ACL Precedence

When Port ACLs, and router ACLs are configured on the same switch, the filtering precedence, from greatest to least for ingress traffic is port ACL, and then router ACL. For egress traffic, the filtering precedence is router ACL, and then port ACL.

The following examples describe simple use cases:

- When an input router ACL and input port ACL exist in a switch virtual interface (SVI), incoming packets received on ports to which a port ACL is applied are filtered by the port ACL. Incoming routed IP packets received on ports are filtered by the router ACL. Other packets are not filtered.
- When an output router ACL and input port ACL exist in an SVI, incoming packets received on the ports to which a port ACL is applied are filtered by the port ACL. Outgoing routed IP packets are filtered by the router ACL. Other packets are not filtered.

## Port ACLs

- Standard IP access lists using source addresses
- Extended IP access lists using source and destination addresses and optional protocol type information
- MAC extended access lists using source and destination MAC addresses and optional protocol type information

The switch examines ACLs on an interface and permits or denies packet forwarding based on how the packet matches the entries in the ACL. In this way, ACLs control access to a network or to part of a network.

**Figure 37: Using ACLs to Control Traffic in a Network**

This is an example of using port ACLs to control access to a network when all workstations are in the same VLAN. ACLs applied at the Layer 2 input would allow Host A to access the Human Resources network, but prevent Host B from accessing the same network. Port ACLs can only be applied to Layer 2 interfaces in the inbound direction.

When you apply a port ACL to a trunk port, the ACL filters traffic on all VLANs present on the trunk port. When you apply a port ACL to a port with voice VLAN, the ACL filters traffic on both data and voice VLANs.

With port ACLs, you can filter IP traffic by using IP access lists and non-IP traffic by using MAC addresses. You can filter both IP and non-IP traffic on the same Layer 2 interface by applying both an IP access list and a MAC access list to the interface.

**Note** You can't apply more than one IP access list and one MAC access list to a Layer 2 interface. If an IP access list or MAC access list is already configured on a Layer 2 interface and you apply a new IP access list or MAC access list to the interface, the new ACL replaces the previously configured one.

## Router ACLs

You can apply router ACLs on switch virtual interfaces (SVIs), which are Layer 3 interfaces to VLANs; on physical Layer 3 interfaces; and on Layer 3 EtherChannel interfaces. You apply router ACLs on interfaces for specific directions (inbound or outbound). You can apply one router ACL in each direction on an interface.

The switch supports these access lists for IPv4 traffic:

- Standard IP access lists use source addresses for matching operations.
- Extended IP access lists use source and destination addresses and optional protocol type information for matching operations.

As with port ACLs, the switch examines ACLs associated with features configured on a given interface. As packets enter the switch on an interface, ACLs associated with all inbound features configured on that interface are examined. After packets are routed and before they are forwarded to the next hop, all ACLs associated with outbound features configured on the egress interface are examined.

ACLs permit or deny packet forwarding based on how the packet matches the entries in the ACL, and can be used to control access to a network or to part of a network.

## ACEs and Fragmented and Unfragmented Traffic

IP packets can be fragmented as they cross the network. When this happens, only the fragment containing the beginning of the packet contains the Layer 4 information, such as TCP or UDP port numbers, ICMP type and code, and so on. All other fragments are missing this information.

Some access control entries (ACEs) do not check Layer 4 information and therefore can be applied to all packet fragments. ACEs that do test Layer 4 information cannot be applied in the standard manner to most of the fragments in a fragmented IP packet. When the fragment contains no Layer 4 information and the ACE tests some Layer 4 information, the matching rules are modified:

- Permit ACEs that check the Layer 3 information in the fragment (including protocol type, such as TCP, UDP, and so on) are considered to match the fragment regardless of what the missing Layer 4 information might have been.

---

**Note** For TCP ACEs with L4 Ops, the fragmented packets will be dropped per RFC 1858.

---

- Deny ACEs that check Layer 4 information never match a fragment unless the fragment contains Layer 4 information.

## ACEs and Fragmented and Unfragmented Traffic Examples

Consider access list 102, configured with these commands, applied to three fragmented packets:

```
Device(config)# access-list 102 permit tcp any host 10.1.1.1 eq smtp
Device(config)# access-list 102 deny tcp any host 10.1.1.2 eq telnet
Device(config)# access-list 102 permit tcp any host 10.1.1.2
Device(config)# access-list 102 deny tcp any any
```

---

**Note** In the first and second ACEs in the examples, the *eq* keyword after the destination address means to test for the TCP-destination-port well-known numbers equaling Simple Mail Transfer Protocol (SMTP) and Telnet, respectively.

---

- Packet A is a TCP packet from host 10.2.2.2., port 65000, going to host 10.1.1.1 on the SMTP port. If this packet is fragmented, the first fragment matches the first ACE (a permit) as if it were a complete packet because all Layer 4 information is present. The remaining fragments also match the first ACE, even though they do not contain the SMTP port information, because the first ACE only checks Layer 3 information when applied to fragments. The information in this example is that the packet is TCP and that the destination is 10.1.1.1.

- Packet B is from host 10.2.2.2, port 65001, going to host 10.1.1.2 on the Telnet port. If this packet is fragmented, the first fragment matches the second ACE (a deny) because all Layer 3 and Layer 4 information is present. The remaining fragments in the packet do not match the second ACE because they are missing Layer 4 information. Instead, they match the third ACE (a permit).

Because the first fragment was denied, host 10.1.1.2 cannot reassemble a complete packet, so packet B is effectively denied. However, the later fragments that are permitted will consume bandwidth on the network and resources of host 10.1.1.2 as it tries to reassemble the packet.

- Fragmented packet C is from host 10.2.2.2, port 65001, going to host 10.1.1.3, port ftp. If this packet is fragmented, the first fragment matches the fourth ACE (a deny). All other fragments also match the fourth ACE because that ACE does not check any Layer 4 information and because Layer 3 information in all fragments shows that they are being sent to host 10.1.1.3, and the earlier permit ACEs were checking different hosts.

## Standard and Extended IPv4 ACLs

This section describes IP ACLs.

An ACL is a sequential collection of permit and deny conditions. One by one, the switch tests packets against the conditions in an access list. The first match determines whether the switch accepts or rejects the packet. Because the switch stops testing after the first match, the order of the conditions is critical. If no conditions match, the switch denies the packet.

The software supports these types of ACLs or access lists for IPv4:

- Standard IP access lists use source addresses for matching operations.
- Extended IP access lists use source and destination addresses for matching operations and optional protocol-type information for finer granularity of control.

---

**Note** Only extended ACLs are supported while the standard ACLs are not supported.

---

### IPv4 ACL Switch Unsupported Features

Configuring IPv4 ACLs on the switch is the same as configuring IPv4 ACLs on other Cisco switches and routers.

The following ACL-related features are not supported:

- Non-IP protocol ACLs
- IP accounting
- Reflexive ACLs, URL Redirect ACLs and Dynamic ACLs are not supported.

### Access List Numbers

The number you use to denote your ACL shows the type of access list that you are creating.

This lists the access-list number and corresponding access list type and shows whether or not they are supported in the switch. The switch supports IPv4 standard and extended access lists, numbers 1 to 199 and 1300 to 2699.

**Table 83: Access List Numbers**

Access List Number	Type	Supported
1–99	IP standard access list	Yes
100–199	IP extended access list	Yes
200–299	Protocol type-code access list	No
300–399	DECnet access list	No
400–499	XNS standard access list	No
500–599	XNS extended access list	No
600–699	AppleTalk access list	No
700–799	48-bit MAC address access list	No
800–899	IPX standard access list	No
900–999	IPX extended access list	No
1000–1099	IPX SAP access list	No
1100–1199	Extended 48-bit MAC address access list	No
1200–1299	IPX summary address access list	No
1300–1999	IP standard access list (expanded range)	Yes
2000–2699	IP extended access list (expanded range)	Yes

In addition to numbered standard and extended ACLs, you can also create standard and extended named IP ACLs by using the supported numbers. That is, the name of a standard IP ACL can be 1 to 99; the name of an extended IP ACL can be 100 to 199. The advantage of using named ACLs instead of numbered lists is that you can delete individual entries from a named list.

## Numbered Standard IPv4 ACLs

When creating an ACL, remember that, by default, the end of the ACL contains an implicit deny statement for all packets that it did not find a match for before reaching the end. With standard access lists, if you omit the mask from an associated IP host address ACL specification, 0.0.0.0 is assumed to be the mask.

The switch always rewrites the order of standard access lists so that entries with **host** matches and entries with matches having a *don't care* mask of 0.0.0.0 are moved to the top of the list, above any entries with non-zero *don't care* masks. Therefore, in **show** command output and in the configuration file, the ACEs do not necessarily appear in the order in which they were entered.

After creating a numbered standard IPv4 ACL, you can apply it to terminal lines (virtual teletype (VTY) lines), or to interfaces.

## Numbered Extended IPv4 ACLs

Although standard ACLs use only source addresses for matching, you can use extended ACL source and destination addresses for matching operations and optional protocol type information for finer granularity of control. When you are creating ACEs in numbered extended access lists, remember that after you create the ACL, any additions are placed at the end of the list. You cannot reorder the list or selectively add or remove ACEs from a numbered list.

The switch does not support dynamic or reflexive access lists. It also does not support filtering based on the type of service (ToS) minimize-monetary-cost bit.

Some protocols also have specific parameters and keywords that apply to that protocol.

You can define an extended TCP, UDP, ICMP, IGMP, or other IP ACL. The switch also supports these IP protocols:

These IP protocols are supported:

- Authentication Header Protocol (**ahp**)
- Encapsulation Security Payload (**esp**)
- Enhanced Interior Gateway Routing Protocol (**eigrp**)
- generic routing encapsulation (**gre**)
- Internet Control Message Protocol (**icmp**)
- Internet Group Management Protocol (**igmp**)
- any Interior Protocol (**ip**)
- IP in IP tunneling (**ipinip**)
- KA9Q NOS-compatible IP over IP tunneling (**nos**)
- Open Shortest Path First routing (**ospf**)
- Payload Compression Protocol (**pcp**)
- Protocol-Independent Multicast (**pim**)
- Transmission Control Protocol (**tcp**)
- User Datagram Protocol (**udp**)

## Named IPv4 ACLs

You can identify IPv4 ACLs with an alphanumeric string (a name) rather than a number. You can use named ACLs to configure more IPv4 access lists in a router than if you were to use numbered access lists. If you identify your access list with a name rather than a number, the mode and command syntax are slightly different. However, at times, not all commands that use IP access lists accept a named access list.

---

**Note** The name you give to a standard or extended ACL can also be a number in the supported range of access list numbers. That is, the name of a standard IP ACL can be 1 to 99 and . The advantage of using named ACLs instead of numbered lists is that you can delete individual entries from a named list.

---

Consider these guidelines before configuring named ACLs:

- Numbered ACLs are also available.
- A standard ACL and an extended ACL cannot have the same name.

## ACL Logging

The controller software can provide logging messages about packets permitted or denied by a standard IP access list. That is, any packet that matches the ACL causes an informational logging message about the packet to be sent to the console. The level of messages logged to the console is controlled by the **logging console** commands controlling the syslog messages.

---

**Note** Because routing is done in hardware and logging is done in software, if a large number of packets match a *permit* or *deny* ACE containing a **log** keyword, the software might not be able to match the hardware processing rate, and not all packets will be logged.

---

The first packet that triggers the ACL causes a logging message right away, and subsequent packets are collected over 5-minute intervals before they appear or logged. The logging message includes the access list number, whether the packet was permitted or denied, the source IP address of the packet, and the number of packets from that source permitted or denied in the prior 5-minute interval.

---

**Note** The logging facility might drop some logging message packets if there are too many to be handled or if there is more than one logging message to be handled in 1 second. This behavior prevents the router from crashing due to too many logging packets. Therefore, the logging facility should not be used as a billing tool or an accurate source of the number of matches to an access list.

---

## Hardware and Software Treatment of IP ACLs

ACL processing is performed in hardware. If the hardware reaches its capacity to store ACL configurations, all packets on that interface are dropped.

The ACL scale for controllers is as follows:

- Cisco Catalyst 9800-40 Wireless Controller, Cisco Catalyst 9800-L Wireless Controller, Cisco Catalyst 9800-CL Wireless Controller (small and medium) support 128 ACLs with 128 Access List Entries (ACEs).
- Cisco Catalyst 9800-80 Wireless Controller and Cisco Catalyst 9800-CL Wireless Controller (large) support 256 ACLs and 256 ACEs.
- FlexConnect and Fabric mode APs support 96 ACLs.

---

**Note** If an ACL configuration cannot be implemented in the hardware due to an out-of-resource condition on the controller, then only the traffic in that VLAN arriving on that controller is affected.

---

When you enter the **show ip access-lists** privileged EXEC command, the match count displayed does not account for packets that are access controlled in hardware. Use the `show ip access-lists hardware` privileged EXEC command to obtain some basic hardware ACL statistics for switched and routed packets.

## IPv4 ACL Interface Considerations

For inbound ACLs, after receiving a packet, the controller checks the packet against the ACL. If the ACL permits the packet, the controller continues to process the packet. If the ACL rejects the packet, the controller discards the packet.

For outbound ACLs, after receiving and routing a packet to a controlled interface, the controller checks the packet against the ACL. If the ACL permits the packet, the controller sends the packet. If the ACL rejects the packet, the controller discards the packet.

If an undefined ACL has nothing listed in it, it is an empty access list.

## Restrictions for Configuring IPv4 Access Control Lists

The following are restrictions for configuring network security with ACLs:

### General Network Security

The following are restrictions for configuring network security with ACLs:

- A standard ACL and an extended ACL cannot have the same name.
- Though visible in the command-line help strings, **AppleTalk** is not supported as a matching condition for the **deny** and **permit** MAC access-list configuration mode commands.
- DNS traffic is permitted by default with or without ACL entries for clients that are awaiting web authentication.

### IPv4 ACL Network Interfaces

The following restrictions apply to IPv4 ACLs to network interfaces:

- When controlling access to an interface, you can use a named or numbered ACL.
- You do not have to enable routing to apply ACLs to Layer 2 interfaces.

### MAC ACLs on a Layer 2 Interface

After you create a MAC ACL, you can apply it to a Layer 2 interface to filter non-IP traffic coming in that interface. When you apply the MAC ACL, consider these guidelines:

- You can apply no more than one IP access list and one MAC access list to the same Layer 2 interface. The IP access list filters only IP packets, and the MAC access list filters non-IP packets.
- A Layer 2 interface can have only one MAC access list. If you apply a MAC access list to a Layer 2 interface that has a MAC ACL configured, the new ACL replaces the previously configured one.

---

**Note** The **mac access-group** interface configuration command is only valid when applied to a physical Layer 2 interface. You cannot use the command on EtherChannel port channels.

---

#### IP Access List Entry Sequence Numbering

- This feature does not support dynamic, reflexive, or firewall access lists.

## How to Configure ACLs

### Configuring IPv4 ACLs (GUI)

#### Procedure

---

- Step 1** Choose **Configuration > Security > ACL**.
- Step 2** Click **Add**.
- Step 3** In the **Add ACL Setup** dialog box, enter the following parameters.
- **ACL Name:** Enter the name for the ACL.
  - **ACL Type:** IPv4 Standard.
  - **Sequence:** Enter the sequence number.
  - **Action:** Choose **Permit** or **Deny** the packet flow from the drop-down list.
  - **Source Type:** Choose **any**, **Host** or **Network** from which the packet is sent.
  - **Log:** Enable or disable logging.
- Step 4** Click **Add**.
- Step 5** Add the rest of the rules and click **Apply to Device**.
- 

### Configuring IPv4 ACLs

Follow the procedure given below to use IP ACLs on the switch:

#### Procedure

---

- Step 1** Create an ACL by specifying an access list number or name and the access conditions.
- Step 2** Apply the ACL to interfaces or terminal lines.
-

## Creating a Numbered Standard ACL (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Security > ACL**.
- Step 2** On the **ACL** page, click **Add**.
- Step 3** In the **Add ACL Setup** window, enter the following parameters.
- **ACL Name:** Enter the name for the ACL.
  - **ACL Type:** IPv4 Standard.
  - **Sequence:** Enter the sequence number.
  - **Action:** Choose **Permit** or **Deny** access from the drop-down list.
  - **Source Type:** Choose **any**, **Host** or **Network**
  - **Log:** Enable or disable logging, this is limited to ACLs associated to Layer 3 interface only.
- Step 4** Click **Add**.
- Step 5** Click **Save & Apply to Device**.
- 

## Creating a Numbered Standard ACL (CLI)

Follow the procedure given below to create a numbered standard ACL:

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Device> <b>enable</b>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 3</b>	<b>access-list <i>access-list-number</i> {deny   permit} <i>source source-wildcard</i> ]</b> <b>Example:</b> Device(config)# <b>access-list 2 deny</b>	Defines a standard IPv4 access list by using a source address and wildcard. The <i>access-list-number</i> is a decimal number from 1 to 99 or 1300 to 1999.

	Command or Action	Purpose
	<code>your_host</code>	<p>Enter <b>deny</b> or <b>permit</b> to specify whether to deny or permit access if conditions are matched.</p> <p>The <i>source</i> is the source address of the network or host from which the packet is being sent specified as:</p> <ul style="list-style-type: none"> <li>• The 32-bit quantity in dotted-decimal format.</li> <li>• The keyword <b>any</b> as an abbreviation for <i>source</i> and <i>source-wildcard</i> of 0.0.0.0 255.255.255.255. You do not need to enter a source-wildcard.</li> <li>• The keyword <b>host</b> as an abbreviation for <i>source</i> and <i>source-wildcard</i> of <i>source</i> 0.0.0.0.</li> </ul> <p>(Optional) The <i>source-wildcard</i> applies wildcard bits to the source.</p> <p><b>Note</b> Logging is supported only on ACLs attached to Layer 3 interfaces.</p>
<b>Step 4</b>	<p><b>end</b></p> <p><b>Example:</b></p> <pre>Device(config)# end</pre>	Returns to privileged EXEC mode.
<b>Step 5</b>	<p><b>show running-config</b></p> <p><b>Example:</b></p> <pre>Device# show running-config</pre>	Verifies your entries.
<b>Step 6</b>	<p><b>copy running-config startup-config</b></p> <p><b>Example:</b></p> <pre>Device# copy running-config startup-config</pre>	(Optional) Saves your entries in the configuration file.

## Creating a Numbered Extended ACL (GUI)

### Procedure

**Step 1** Choose **Configuration > Security > ACL**.

- Step 2** On the **ACL** page, click **Add**.
- Step 3** In the **Add ACL Setup** window, enter the following parameters.
- **ACL Name:** Enter the name for the ACL.
  - **ACL Type:** IPv4 Extended.
  - **Sequence:** Enter the sequence number.
  - **Action:** Choose **Permit** or **Deny** the packet flow from the drop-down list.
  - **Source Type:** Choose **any**, **Host** or **Network** from which the packet is sent.
  - **Destination Type:** Choose **any**, **Host** or **Network** to which the packet is sent.
  - **Protocol:** Choose a protocol from the drop-down list.
  - **Log:** Enable or disable logging.
  - **DSCP:** Enter to match packets with the DSCP value
- Step 4** Click **Add**.
- Step 5** Click **Save & Apply to Device**.

## Creating a Numbered Extended ACL (CLI)

Follow the procedure given below to create a numbered extended ACL:

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>access-list</b> <i>access-list-number</i> {deny   permit} <i>protocol source source-wildcard destination</i> <i>destination-wildcard [precedence precedence]</i> <i>[tos tos] [fragments] [time-range</i> <i>time-range-name] [dscp dscp]</i> <b>Example:</b> Device(config)# <b>access-list 101 permit</b> <b>ip host 10.1.1.2 any precedence 0 tos 0</b> <b>log</b>	Defines an extended IPv4 access list and the access conditions. The <i>access-list-number</i> is a decimal number from 100 to 199 or 2000 to 2699. Enter <b>deny</b> or <b>permit</b> to specify whether to deny or permit the packet if conditions are matched. For <i>protocol</i> , enter the name or number of an P protocol: <b>ahp</b> , <b>eigrp</b> , <b>esp</b> , <b>gre</b> , <b>icmp</b> , <b>igmp</b> , <b>igrp</b> , <b>ip</b> , <b>ipinip</b> , <b>nos</b> , <b>ospf</b> , <b>pcp</b> , <b>pim</b> , <b>tcp</b> , or <b>udp</b> , or an integer in the range 0 to 255 representing an IP protocol number. To match

	Command or Action	Purpose
		<p>any Internet protocol (including ICMP, TCP, and UDP), use the keyword <b>ip</b>.</p> <p><b>Note</b> This step includes options for most IP protocols. For additional specific parameters for TCP, UDP, ICMP, and IGMP, see the following steps.</p> <p>The <i>source</i> is the number of the network or host from which the packet is sent.</p> <p>The <i>source-wildcard</i> applies wildcard bits to the source.</p> <p>The <i>destination</i> is the network or host number to which the packet is sent.</p> <p>The <i>destination-wildcard</i> applies wildcard bits to the destination.</p> <p>Source, source-wildcard, destination, and destination-wildcard can be specified as:</p> <ul style="list-style-type: none"> <li>• The 32-bit quantity in dotted-decimal format.</li> <li>• The keyword <b>any</b> for 0.0.0.0 255.255.255.255 (any host).</li> <li>• The keyword <b>host</b> for a single host 0.0.0.0.</li> </ul> <p>The other keywords are optional and have these meanings:</p> <ul style="list-style-type: none"> <li>• <b>precedence</b>—Enter to match packets with a precedence level specified as a number from 0 to 7 or by name: <b>routine</b> (0), <b>priority</b> (1), <b>immediate</b> (2), <b>flash</b> (3), <b>flash-override</b> (4), <b>critical</b> (5), <b>internet</b> (6), <b>network</b> (7).</li> <li>• <b>fragments</b>—Enter to check non-initial fragments.</li> <li>• <b>tos</b>—Enter to match by type of service level, specified by a number from 0 to 15 or a name: <b>normal</b> (0), <b>max-reliability</b> (2), <b>max-throughput</b> (4), <b>min-delay</b> (8).</li> <li>• <b>time-range</b>—Specify the time-range name.</li> <li>• <b>dscp</b>—Enter to match packets with the DSCP value specified by a number from 0 to 63, or use the question mark (?) to see a list of available values.</li> </ul>

	Command or Action	Purpose
		<p><b>Note</b> Your controller must support the ability to:</p> <ul style="list-style-type: none"> <li>• Mark DCSP</li> <li>• Mark UP</li> <li>• Map DSCP and UP</li> </ul> <p>For more information on <b>DSCP-to-UP Mapping</b>, see: <a href="https://tools.ietf.org/html/draft-ietf-tsvwg-ieee-802-11-01">https://tools.ietf.org/html/draft-ietf-tsvwg-ieee-802-11-01</a></p> <p><b>Note</b> If you enter a <b>dscp</b> value, you cannot enter <b>tos</b> or <b>precedence</b>. You can enter both a <b>tos</b> and a <b>precedence</b> value with no <b>dscp</b>.</p>
<b>Step 3</b>	<p><b>access-list</b> <i>access-list-number</i> {<b>deny</b>   <b>permit</b>}  <b>tcp</b> <i>source source-wildcard</i> [<i>operator port</i>]  <i>destination destination-wildcard</i> [<i>operator port</i>]  [<b>precedence</b> <i>precedence</i>] [<b>tos</b> <i>tos</i>] [<b>fragments</b>]  [<b>time-range</b> <i>time-range-name</i>] [<b>dscp</b> <i>dscp</i>]  [<i>flag</i>]</p> <p><b>Example:</b></p> <pre>Device(config)# access-list 101 permit tcp any any eq 500</pre>	<p>Defines an extended TCP access list and the access conditions.</p> <p>The parameters are the same as those described for an extended IPv4 ACL, with these exceptions:</p> <p>(Optional) Enter an <i>operator</i> and <i>port</i> to compare source (if positioned after <i>source source-wildcard</i>) or destination (if positioned after <i>destination destination-wildcard</i>) port. Possible operators include <b>eq</b> (equal), <b>gt</b> (greater than), <b>lt</b> (less than), <b>neq</b> (not equal), and <b>range</b> (inclusive range). Operators require a port number (range requires two port numbers separated by a space).</p> <p>Enter the <i>port</i> number as a decimal number (from 0 to 65535) or the name of a TCP port. Use only TCP port numbers or names when filtering TCP.</p> <p>The other optional keywords have these meanings:</p> <ul style="list-style-type: none"> <li>• <i>flag</i>—Enter one of these flags to match by the specified TCP header bits: <b>ack</b> (acknowledge), <b>fin</b> (finish), <b>psh</b> (push), <b>rst</b> (reset), <b>syn</b> (synchronize), or <b>urg</b> (urgent).</li> </ul>
<b>Step 4</b>	<p><b>access-list</b> <i>access-list-number</i> {<b>deny</b>   <b>permit</b>}  <b>udp</b> <i>source source-wildcard</i> [<i>operator port</i>]</p>	<p>(Optional) Defines an extended UDP access list and the access conditions.</p>

	Command or Action	Purpose
	<p><i>destination destination-wildcard</i> [<i>operator port</i>]  <pre>[precedence precedence] [tos tos] [fragments] [time-range time-range-name] [dscp dscp]</pre></p> <p><b>Example:</b></p> <pre>Device(config)# access-list 101 permit udp any any eq 100</pre>	<p>The UDP parameters are the same as those described for TCP except that the [<i>operator port</i>] port number or name must be a UDP port number or name, and the <b>flag</b> not valid for UDP.</p>
<b>Step 5</b>	<p><b>access-list</b> <i>access-list-number</i> {<b>deny</b>   <b>permit</b>}  <b>icmp</b> <i>source source-wildcard destination destination-wildcard</i> [<i>icmp-type</i>   [<i>icmp-type icmp-code</i>]   [<i>icmp-message</i>]] [<b>precedence precedence</b>] [<b>tos tos</b>] [<b>fragments</b>] [<b>time-range time-range-name</b>] [<b>dscp dscp</b>]</p> <p><b>Example:</b></p> <pre>Device(config)# access-list 101 permit icmp any any 200</pre>	<p>Defines an extended ICMP access list and the access conditions.</p> <p>The ICMP parameters are the same as those described for most IP protocols in an extended IPv4 ACL, with the addition of the ICMP message type and code parameters. These optional keywords have these meanings:</p> <ul style="list-style-type: none"> <li>• <i>icmp-type</i>—Enter to filter by ICMP message type, a number from 0 to 255.</li> <li>• <i>icmp-code</i>—Enter to filter ICMP packets that are filtered by the ICMP message code type, a number from 0 to 255.</li> <li>• <i>icmp-message</i>—Enter to filter ICMP packets by the ICMP message type name or the ICMP message type and code name.</li> </ul>
<b>Step 6</b>	<p><b>access-list</b> <i>access-list-number</i> {<b>deny</b>   <b>permit</b>}  <b>igmp</b> <i>source source-wildcard destination destination-wildcard</i> [<i>igmp-type</i>] [<b>precedence precedence</b>] [<b>tos tos</b>] [<b>fragments</b>] [<b>time-range time-range-name</b>] [<b>dscp dscp</b>]</p> <p><b>Example:</b></p> <pre>Device(config)# access-list 101 permit igmp any any 14</pre>	<p>(Optional) Defines an extended IGMP access list and the access conditions.</p> <p>The IGMP parameters are the same as those described for most IP protocols in an extended IPv4 ACL, with this optional parameter.</p> <p><i>igmp-type</i>—To match IGMP message type, enter a number from 0 to 15, or enter the message name: <b>dvmp</b>, <b>host-query</b>, <b>host-report</b>, <b>pim</b>, or <b>trace</b>.</p>
<b>Step 7</b>	<p><b>end</b></p> <p><b>Example:</b></p> <pre>Device(config)# end</pre>	<p>Returns to privileged EXEC mode.</p>

## Creating Named Standard ACLs (GUI)

### Procedure

- 
- Step 1** Click **Configuration > Security > ACL**.
- Step 2** Click **Add** to create a new ACL setup.
- Step 3** In the **Add ACL Setup** window, enter the following parameters.
- **ACL Name:** Enter the name for the ACL
  - **ACL Type:** IPv4 Standard
  - **Sequence:** The valid range is between 1 and 99 or 1300 and 1999
  - **Action:** Choose **Permit** or **Deny** access from the drop-down list.
  - **Source Type:** Choose **any**, **Host** or **Network**
  - **Log:** Enable or disable logging, this is limited to ACLs associated to Layer 3 interface only.
- Step 4** Click **Add** to add the rule.
- Step 5** Click **Save & Apply to Device**.
- 

## Creating Named Standard ACLs

Follow the procedure given below to create a standard ACL using names:

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Device> <b>enable</b>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 3</b>	<b>ip access-list standard <i>name</i></b> <b>Example:</b> Device(config)# <b>ip access-list standard</b> <b>20</b>	Defines a standard IPv4 access list using a name, and enter access-list configuration mode. The name can be a number from 1 to 99.

	Command or Action	Purpose
<b>Step 4</b>	<p>Use one of the following:</p> <ul style="list-style-type: none"> <li>• <b>deny</b> {<i>source</i> [<i>source-wildcard</i>]   <b>host</b> <i>source</i>   <b>any</b>} [<b>log</b>]</li> <li>• <b>permit</b> {<i>source</i> [<i>source-wildcard</i>]   <b>host</b> <i>source</i>   <b>any</b>} [<b>log</b>]</li> </ul> <p><b>Example:</b></p> <pre>Device(config-std-nacl)# deny 192.168.0.0 0.0.255.255 255.255.0.0 0.0.255.255</pre> <p>or</p> <pre>Device(config-std-nacl)# permit 10.108.0.0 0.0.0.0 255.255.255.0 0.0.0.0</pre>	<p>In access-list configuration mode, specify one or more conditions denied or permitted to decide if the packet is forwarded or dropped.</p> <ul style="list-style-type: none"> <li>• <b>host</b> <i>source</i>—A source and source wildcard of <i>source</i> 0.0.0.0.</li> <li>• <b>any</b>—A source and source wildcard of 0.0.0.0 255.255.255.255.</li> </ul>
<b>Step 5</b>	<p><b>end</b></p> <p><b>Example:</b></p> <pre>Device(config-std-nacl)# end</pre>	Returns to privileged EXEC mode.
<b>Step 6</b>	<p><b>show running-config</b></p> <p><b>Example:</b></p> <pre>Device# show running-config</pre>	Verifies your entries.
<b>Step 7</b>	<p><b>copy running-config startup-config</b></p> <p><b>Example:</b></p> <pre>Device# copy running-config startup-config</pre>	(Optional) Saves your entries in the configuration file.

## Creating Extended Named ACLs (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Security > ACL**.
- Step 2** Click **Add**.
- Step 3** In the **Add ACL Setup** window, enter the following parameters.
- **ACL Name:** Enter the name for the ACL.

- **ACL Type:** IPv4 Extended.
- **Sequence:** Enter the sequence number.
- **Action:** Choose **Permit** or **Deny** the packet flow from the drop-down list.
- **Source Type:** Choose **any**, **Host** or **Network** from which the packet is sent.
- **Destination Type:** Choose **any**, **Host** or **Network** to which the packet is sent.
- **Protocol:** Choose a protocol from the drop-down list.
- **Log:** Enable or disable logging.
- **DSCP:** Enter to match packets with the DSCP value

**Step 4** Click **Add**.

**Step 5** Add the rest of the rules and click **Apply to Device**.

## Creating Extended Named ACLs

Follow the procedure given below to create an extended ACL using names:

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b>  Device> <b>enable</b>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b>  Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 3</b>	<b>ip access-list extended</b> <i>name</i> <b>Example:</b>  Device(config)# <b>ip access-list extended</b> <b>150</b>	Defines an extended IPv4 access list using a name, and enter access-list configuration mode.  The name can be a number from 100 to 199.
<b>Step 4</b>	<b>{deny   permit} protocol {source [source-wildcard]   host source   any} {destination [destination-wildcard]   host destination   any} [precedence precedence] [tos tos] [log] [time-range time-range-name]</b>	In access-list configuration mode, specify the conditions allowed or denied. Use the <b>log</b> keyword to get access list logging messages, including violations.

	Command or Action	Purpose
	<b>Example:</b> Device(config-ext-nacl) # <b>permit 0 any any</b>	<ul style="list-style-type: none"> <li>• <b>host source</b>—A source and source wildcard of <i>source</i> 0.0.0.0.</li> <li>• <b>host destination</b>—A destination and destination wildcard of <i>destination</i> 0.0.0.0.</li> <li>• <b>any</b>—A source and source wildcard or destination and destination wildcard of 0.0.0.0 255.255.255.255.</li> </ul>
<b>Step 5</b>	<b>end</b> <b>Example:</b> Device(config-ext-nacl) # <b>end</b>	Returns to privileged EXEC mode.
<b>Step 6</b>	<b>show running-config</b> <b>Example:</b> Device# <b>show running-config</b>	Verifies your entries.
<b>Step 7</b>	<b>copy running-config startup-config</b> <b>Example:</b> Device# <b>copy running-config startup-config</b>	(Optional) Saves your entries in the configuration file.

When you are creating extended ACLs, remember that, by default, the end of the ACL contains an implicit deny statement for everything if it did not find a match before reaching the end. For standard ACLs, if you omit the mask from an associated IP host address access list specification, 0.0.0.0 is assumed to be the mask.

After you create an ACL, any additions are placed at the end of the list. You cannot selectively add ACL entries to a specific ACL. However, you can use **no permit** and **no deny** access-list configuration mode commands to remove entries from a named ACL.

Being able to selectively remove lines from a named ACL is one reason you might use named ACLs instead of numbered ACLs.

### What to do next

After creating a named ACL, you can apply it to interfaces or to VLANs.

## Applying an IPv4 ACL to an Interface (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Security > ACL**.
  - Step 2** Click **Associating Interfaces**.
  - Step 3** Choose the interface from the **Available Interfaces** list to view its ACL details on the right-hand side. You can change the ACL details, if required.
  - Step 4** Click **Save & Apply to Device**.
- 

## Applying an IPv4 ACL to an Interface (CLI)

This section describes how to apply IPv4 ACLs to network interfaces.

Beginning in privileged EXEC mode, follow the procedure given below to control access to an interface:

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b>  Device# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>interface <i>interface-id</i></b>  <b>Example:</b>  Device(config)#	Identifies a specific interface for configuration, and enter interface configuration mode.  The interface can be a Layer 2 interface (port ACL), or a Layer 3 interface (router ACL).
<b>Step 3</b>	<b>ip access-group {<i>access-list-number</i>   <i>name</i>} {in   out}</b>  <b>Example:</b>  Device(config-if)# <code>ip access-group 2 in</code>	Controls access to the specified interface.
<b>Step 4</b>	<b>end</b>  <b>Example:</b>  Device(config-if)# <code>end</code>	Returns to privileged EXEC mode.
<b>Step 5</b>	<b>show running-config</b>  <b>Example:</b>	Displays the access list configuration.

	Command or Action	Purpose
	Device# <code>show running-config</code>	
<b>Step 6</b>	<b>copy running-config startup-config</b> <b>Example:</b> Device# <code>copy running-config startup-config</code>	(Optional) Saves your entries in the configuration file.

## Applying ACL to Policy Profile (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Tags & Profiles > Policy**.
  - Step 2** On the **Policy Profile** page, click **Add**.
  - Step 3** In the **Add Policy Profile** window, click **Access Policies** tab.
  - Step 4** In the **WLAN ACL** area, choose the IPv4 ACL from the **IPv4 ACL** drop-down list.
  - Step 5** Click **Apply to Device**.
- 

## Applying ACL to Policy Profile

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>wireless profile policy <i>profile-policy</i></b> <b>Example:</b> Device(config)# <code>wireless profile policy profile-policy</code>	Configures a WLAN policy profile and enters wireless policy configuration mode.
<b>Step 3</b>	<b>ipv4 acl <i>acl-name</i></b> <b>Example:</b> Device(config-wireless-policy)# <code>ipv4 acl test-acl</code>	Configures an IPv4 ACL.

	Command or Action	Purpose
Step 4	<b>end</b> <b>Example:</b> Device(config-wireless-policy)# end	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Configuration Examples for ACLs

### Examples: Including Comments in ACLs

You can use the **remark** keyword to include comments (remarks) about entries in any IP standard or extended ACL. The remarks make the ACL easier for you to understand and scan. Each remark line is limited to 100 characters.

The remark can go before or after a permit or deny statement. You should be consistent about where you put the remark so that it is clear which remark describes which permit or deny statement. For example, it would be confusing to have some remarks before the associated permit or deny statements and some remarks after the associated statements.

To include a comment for IP numbered standard or extended ACLs, use the **access-list access-list number remark remark** global configuration command. To remove the remark, use the **no** form of this command.

In this example, the workstation that belongs to Jones is allowed access, and the workstation that belongs to Smith is not allowed access:

```
Device(config)# access-list 1 remark Permit only Jones workstation through
Device(config)# access-list 1 permit 171.69.2.88
Device(config)# access-list 1 remark Do not allow Smith through
Device(config)# access-list 1 deny 171.69.3.13
```

For an entry in a named IP ACL, use the **remark access-list** configuration command. To remove the remark, use the **no** form of this command.

In this example, the Jones subnet is not allowed to use outbound Telnet:

```
Device(config)# ip access-list extended telnetting
Device(config-ext-nacl)# remark Do not allow Jones subnet to telnet out
Device(config-ext-nacl)# deny tcp host 171.69.2.88 any eq telnet
```

### Examples: Applying an IPv4 ACL to a Policy Profile in a Wireless Environment

This example shows how to apply an IPv4 ACL to a Policy Profile in a Wireless environment.

**Note** All IPv4 ACLs must be associated to a policy profile.

This example uses extended ACLs to permit TCP traffic.

### 1. Creating an IPv4 ACL.

```
Device(config)# ip access-list extended <acl-name>
Device(config-ext-nacl)# 10 permit ip any 10.193.48.224 0.0.0.31
Device (config-ext-nacl)# 20 permit ip any any
```

### 2. Applying the IPv4 ACL to a policy profile.

```
Device(config)# wireless profile policy <policy-profile-name>
Device(config-wireless-policy)# shutdown
Device(config-wireless-policy)# ipv4 acl <acl-name>
Device(config-wireless-policy)# no shutdown
```

## IPv4 ACL Configuration Examples

This section provides examples of configuring and applying IPv4 ACLs. For detailed information about compiling ACLs, see the *Cisco IOS Security Configuration Guide, Release 12.4* and to the Configuring IP Services” section in the “IP Addressing and Services” chapter of the *Cisco IOS IP Configuration Guide, Release 12.4*.

### ACLs in a Small Networked Office

**Figure 38: Using Router ACLs to Control Traffic**

This shows a small networked office environment with routed Port 2 connected to Server A, containing benefits and other information that all employees can access, and routed Port 1 connected to Server B, containing confidential payroll data. All users can access Server A, but Server B has restricted access.

Use router ACLs to do this in one of two ways:

- Create a standard ACL, and filter traffic coming to the server from Port 1.
- Create an extended ACL, and filter traffic coming from the server into Port 1.

## Examples: ACLs in a Small Networked Office

This example uses a standard ACL to filter traffic coming into Server B from a port, permitting traffic only from Accounting's source addresses 172.20.128.64 to 172.20.128.95. The ACL is applied to traffic coming out of routed Port 1 from the specified source address.

```
Device(config)# access-list 6 permit 172.20.128.64 0.0.0.31
Device(config)# end
Device# show access-lists
Standard IP access list 6
 10 permit 172.20.128.64, wildcard bits 0.0.0.31
Device(config)# interface gigabitethernet1/0/1
Device(config-if)# ip access-group 6 out
```

This example uses an extended ACL to filter traffic coming from Server B into a port, permitting traffic from any source address (in this case Server B) to only the Accounting destination addresses 172.20.128.64 to 172.20.128.95. The ACL is applied to traffic going into routed Port 1, permitting it to go only to the specified destination addresses. Note that with extended ACLs, you must enter the protocol (IP) before the source and destination information.

```
Device(config)# access-list 106 permit ip any 172.20.128.64 0.0.0.31
Device(config)# end
Device# show access-lists
Extended IP access list 106
 10 permit ip any 172.20.128.64 0.0.0.31
Device(config)# interface gigabitethernet1/0/1
Device(config-if)# ip access-group 106 in
```

## Example: Numbered ACLs

In this example, network 10.0.0.0 is a Class A network whose second octet specifies a subnet; that is, its subnet mask is 255.255.0.0. The third and fourth octets of a network 10.0.0.0 address specify a particular host. Using access list 2, the switch accepts one address on subnet 48 and reject all others on that subnet. The last line of the list shows that the switch accepts addresses on all other network 10.0.0.0 subnets. The ACL is applied to packets entering a port.

```
Device(config)# access-list 2 permit 10.48.0.3
Device(config)# access-list 2 deny 10.48.0.0 0.0.255.255
Device(config)# access-list 2 permit 10.0.0.0 0.255.255.255
Device(config)#
Device(config-if)# ip access-group 2 in
```

## Examples: Extended ACLs

In this example, the first line permits any incoming TCP connections with destination ports greater than 1023. The second line permits incoming TCP connections to the Simple Mail Transfer Protocol (SMTP) port of host 128.88.1.2. The third line permits incoming ICMP messages for error feedback.

```
Device(config)# access-list 102 permit tcp any 128.88.0.0 0.0.255.255 gt 1023
Device(config)# access-list 102 permit tcp any host 128.88.1.2 eq 25
Device(config)# access-list 102 permit icmp any any
Device(config)#
```

```
Device(config-if)# ip access-group 102 in
```

In this example, suppose that you have a network connected to the Internet, and you want any host on the network to be able to form TCP connections to any host on the Internet. However, you do not want IP hosts to be able to form TCP connections to hosts on your network, except to the mail (SMTP) port of a dedicated mail host.

SMTP uses TCP port 25 on one end of the connection and a random port number on the other end. The same port numbers are used throughout the life of the connection. Mail packets coming in from the Internet have a destination port of 25. Because the secure system of the network always accepts mail connections on port 25, the incoming are separately controlled.

```
Device(config)# access-list 102 permit tcp any 128.88.0.0 0.0.255.255 eq 23
Device(config)# access-list 102 permit tcp any 128.88.0.0 0.0.255.255 eq 25
Device(config)#
Device(config-if)# ip access-group 102 in
```

## Examples: Named ACLs

### Creating named standard and extended ACLs

This example creates a standard ACL named *internet\_filter* and an extended ACL named *marketing\_group*. The *internet\_filter* ACL allows all traffic from the source address 1.2.3.4.

```
Device(config)# ip access-list standard Internet_filter
Device(config-ext-nacl)# permit 1.2.3.4
Device(config-ext-nacl)# exit
```

The *marketing\_group* ACL allows any TCP Telnet traffic to the destination address and wildcard 171.69.0.0 0.0.255.255 and denies any other TCP traffic. It permits ICMP traffic, denies UDP traffic from any source to the destination address range 171.69.0.0 through 179.69.255.255 with a destination port less than 1024, denies any other IP traffic, and provides a log of the result.

```
Device(config)# ip access-list extended marketing_group
Device(config-ext-nacl)# permit tcp any 171.69.0.0 0.0.255.255 eq telnet
Device(config-ext-nacl)# deny tcp any any
Device(config-ext-nacl)# permit icmp any any
Device(config-ext-nacl)# deny udp any 171.69.0.0 0.0.255.255 lt 1024
Device(config-ext-nacl)# deny ip any any log
Device(config-ext-nacl)# exit
```

The *Internet\_filter* ACL is applied to outgoing traffic and the *marketing\_group* ACL is applied to incoming traffic on a Layer 3 port.

```
Device(config)# interface gigabitethernet3/0/1

Device(config-if)# ip address 2.0.5.1 255.255.255.0
Device(config-if)# ip access-group Internet_filter out
Device(config-if)# ip access-group marketing_group in
```

### Deleting individual ACEs from named ACLs

This example shows how you can delete individual ACEs from the named access list *border-list*:

```
Device(config)# ip access-list extended border-list
Device(config-ext-nacl)# no permit ip host 10.1.1.3 any
```

## Monitoring IPv4 ACLs

You can monitor IPv4 ACLs by displaying the ACLs that are configured on the switch, and displaying the ACLs that have been applied to interfaces and VLANs.

When you use the **ip access-group** interface configuration command to apply ACLs to a Layer 2 or 3 interface, you can display the access groups on the interface. You can also display the MAC ACLs applied to a Layer 2 interface. You can use the privileged EXEC commands as described in this table to display this information.

**Table 84: Commands for Displaying Access Lists and Access Groups**

Command	Purpose
<b>show access-lists</b> [ <i>number</i>   <i>name</i> ]	Displays the contents of one or all current IP and MAC address access lists or a specific access list (numbered or named).
<b>show ip access-lists</b> [ <i>number</i>   <i>name</i> ]	Displays the contents of all current IP access lists or a specific IP access list (numbered or named).
<b>show ip interface</b> <i>interface-id</i>	Displays detailed configuration and status of an interface. If IP access lists and ACLs have been applied by using the <b>ip access-group</b> configuration command, the access groups are included in the display.
<b>show running-config</b> [ <b>interface</b> <i>interface-id</i> ]	Displays the contents of the configuration file for the switch or interface, including all configured MAC and IP access lists and access groups applied to an interface.

## CHAPTER 106

# Downloadable ACL

- [Feature History for Downloadable ACL, on page 1221](#)
- [Information About Downloadable ACL, on page 1222](#)
- [Guidelines and Restrictions for Downloadable ACL, on page 1222](#)
- [Configuring dACL Name and Definition in Cisco ISE, on page 1223](#)
- [Configuring dACL in a Controller \(CLI\), on page 1223](#)
- [Configuring Explicit Authorization Server List \(CLI\), on page 1224](#)
- [Verifying dACL Configuration, on page 1225](#)

## Feature History for Downloadable ACL

This table provides release and related information about the feature explained in this section.

This feature is also available in all the releases subsequent to the one in which they are introduced in, unless noted otherwise.

**Table 85: Feature History for Downloadable ACL**

Release	Feature	Feature Information
Cisco IOS XE Dublin 17.10.1	Downloadable ACL	<p>The Downloadable ACL (dACL) feature defines and updates access control lists (ACLs) in one place (Cisco ISE) and allows ACL download to all the applicable controllers.</p> <p>In Cisco IOS-XE 17.8 and earlier releases, you had to configure the name in Cisco ISE and define the ACL individually in each of the controllers.</p> <p>The dACL feature is supported only in a centralized controller with Local mode Access Points.</p> <p><b>Note</b> The dACL feature is not supported in RLAN environments.</p>

## Information About Downloadable ACL

ACLs are used to restrict network access to some users or devices based on predefined criteria. These criteria are specified as a list of Access Control Entries (ACEs).

Each ACE has a matching condition based on packet header fields as follows:

- IP addresses
- ports
- protocols
- combination of IP addresses, ports, and protocols
- Result (permit or deny)

ACLs are applied to a controller on a per wireless client basis. Typically, you can configure ACLs in a controller itself. However, you can also configure ACLs to a connected Cisco ISE server and download them to the controller when a wireless client joins. Such ACLs are referred to as downloadable ACLs, per-user Dynamic ACLs, or dACLs.

Downloadable ACLs are easy to maintain because they define or update ACLs in Cisco ISE and can be downloaded to all the applicable controllers. (In Cisco IOS-XE 17.8 and earlier releases, you had to configure the name in Cisco ISE and define the ACL individually in each of the controllers.)

## Scale Considerations for Downloadable ACL

The following table provides the ACL scale numbers for controllers.

**Table 86: ACL Scale for Controllers**

Controllers	ACL Scale
Cisco Catalyst 9800-40 Wireless Controller (small or medium)	Supports 128 ACLs with 128 ACEs.
Cisco Catalyst 9800-80 Wireless Controller (large)	Supports 256 ACLs and 256 ACEs.

## Guidelines and Restrictions for Downloadable ACL

- dACL does not support FlexConnect local switching.
- IPv6 dACLs are supported only in Cisco ISE 3.0 or a later release.
- The dACL feature is supported only in a centralized controller with Local mode Access Points.

**Note** The dACL feature is not supported in RLAN environments.

# Configuring dACL Name and Definition in Cisco ISE

Before you configure a dACL in a controller, you must configure the dACL name and definition in Cisco ISE. For more information, see [Configure Per-User Dynamic Access Control Lists in ISE](#).

## Configuring dACL in a Controller (CLI)

### Before you begin

- You should have configured the RADIUS server.
- You should have configured the **aaa-override** command in the policy profile. For more information, see [Configuring AAA for Local Authentication \(CLD\)](#).

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wireless profile policy <i>policy-profile-name</i></b>  <b>Example:</b> Device(config)# wireless profile policy named-policy-profile_4	Configures the wireless profile policy.
<b>Step 3</b>	<b>aaa-override</b>  <b>Example:</b> Device(config-wireless-policy)# aaa-override	Configures AAA override to apply policies coming from the Cisco ISE servers.
<b>Step 4</b>	<b>no shutdown</b>  <b>Example:</b> Device(config-wireless-policy)# no shutdown	Enables the profile policy.

# Configuring Explicit Authorization Server List (CLI)

## Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>radius server <i>server-name</i></b> <b>Example:</b> Device(config)# radius server Test-SERVER2	Specifies the RADIUS server name.
<b>Step 3</b>	<b>address ipv4 <i>ip-address</i></b> <b>Example:</b> Device(config-radius-server)# address ipv4 124.3.52.62	Specifies the RADIUS server parameters.
<b>Step 4</b>	<b>pac key <i>key</i></b> <b>Example:</b> Device(config-radius-server)# pack key cisco	Specify the authorization and encryption key used between the Device and the key string RADIUS daemon running on the RADIUS server.
<b>Step 5</b>	<b>exit</b> <b>Example:</b> Device(config-radius-server)# exit	Returns to the configuration mode.
<b>Step 6</b>	<b>aaa group server radius <i>server-group-name</i></b> <b>Example:</b> Device(config)# aaa group server radius authz-server-group	Creates a radius server-group identification. <b>Note</b> <i>server-group</i> refers to the server group name. The valid range is from 1 to 32 alphanumeric characters.
<b>Step 7</b>	<b>aaa authorization network <i>authorization-list</i> group <i>server-group-name</i></b> <b>Example:</b> Device(config)# aaa authorization network authZlist group authz-server-group	Creates an authorization method list for web-based authorization. <b>Note</b> You must use the already created authorization method list.
<b>Step 8</b>	<b>end</b> <b>Example:</b> Device(config)# end	Returns to privileged EXEC mode.

## Verifying dACL Configuration

To verify the dACL, use the following command:

```
Device# show wireless client mac-address <client_mac> detail
Local Policies:
 Service Template : wlan_svc_named-policy-profile_1_local (priority 254)
 VLAN : 16
 Absolute-Timer : 1800
Server Policies:
 ACS ACL : xACSACLx-IP-tftpv4_2-62de6299
 ACS ACL : xACSACLx-IPV6-tftpv6_2-62de8087
Resultant Policies:
 ACS ACL : xACSACLx-IP-tftpv4_2-62de6299
 ACS ACL : xACSACLx-IPV6-tftpv6_2-62de8087
 VLAN Name : VLAN0016
 VLAN : 16
 Absolute-Timer : 1800
```

To verify dACLs, use the following commands:

```
Device# show ip access-lists xACSACLx-IP-tftpv4_2-62de6299
Extended IP access list xACSACLx-IP-tftpv4_2-62de6299
 1 deny ip any host 9.8.29.13
 2 permit ip any any (58 matches)

Device# show ipv6 access-list xACSACLx-IPV6-tftpv6_2-62de8087
IPv6 access list xACSACLx-IPV6-tftpv6_2-62de8087
 deny ipv6 any host 2001:9:8:29:3AAD:A27A:973A:97CC sequence 1
 permit ipv6 any any (2 matches) sequence 2
```

To view all the downloaded dACLs, use the following command:

```
Device# show ip access-lists
```

## CHAPTER 107

# DNS-Based Access Control Lists

## Information About DNS-Based Access Control Lists

The DNS-based ACLs are used for wireless client devices. When using these devices, you can set pre-authentication ACLs on the Cisco Catalyst 9800 Series Wireless Controller to determine the data requests that are allowed or blocked.

To enable DNS-based ACLs on the controller, you need to configure the allowed URLs or denied URLs for the ACLs. The URLs need to be pre-configured on the ACL.

With DNS-based ACLs, the client when in registration phase is allowed to connect to the configured URLs. The controller is configured with the ACL name that is returned by the AAA server. If the ACL name is returned by the AAA server, then the ACL is applied to the client for web-redirection.

At the client authentication phase, the AAA server returns the pre-authentication ACL (url-redirect-acl, which is the attribute name given to the AAA server). The DNS snooping is performed on the AP for each client until the registration is complete and the client is in SUPPLICANT PROVISIONING state. When the ACL configured with the URLs is received on the controller, the CAPWAP payload is sent to the AP enabling DNS snooping for the URLs to be snooped.

With URL snooping in place, the AP learns the IP address of the resolved domain name in the DNS response. If the domain name matches the configured URL, then the DNS response is parsed for the IP address, and the IP address is sent to the controller as a CAPWAP payload. The controller adds the IP address to the allowed list of IP addresses and thus the client can access the URLs configured.

URL filtering allows access to the IP address for DNS ports 80 or 443.

During pre-authentication or post-authentication, DNS ACL is applied to the client in the access point. If the client roams from one AP to another AP, the DNS learned IP addresses on the old AP is valid on the new AP as well.

---

**Note** Standard URL filtering is used for local mode, whereas enhanced URL filtering is used for flex mode local switching.

---

---

**Note** URL filter needs to be attached to a policy profile in case of the local mode. In the flex mode, the URL filter is attached to the flex profile and it is not need to be attached to a policy profile.

---

---

**Note** DNS based URLs work with active DNS query from the client. Hence, for URL filtering, the DNS should be setup correctly.

---

---

**Note** URL filter takes precedence over punt or redirect ACL, and over custom or static pre-auth ACL.s

---

## Defining ACLs

Extended ACLs are like standard ACLs but identifies the traffic more precisely.

The following CLI allows you to define ACLs by name or by an identification number.

```
Device(config)#ip access-list extended ?
<100-199> Extended IP access-list number
<2000-2699> Extended IP access-list number (expanded range)
WORD Access-list name
```

The following is the structure of a CLI ACL statement:

```
<sequence number> [permit/deny] <protocol> <address or any> eq <port number> <subnet>
<wildcard>
```

For example:

```
1 permit tcp any eq www 192.168.1.0 0.0.0.255
```

The sequence number specifies where to insert the Access Control list Entry (ACE) in the ACL order of ACEs. You can define your statements with sequences of 10, 20, 30, 40, and so on.

The controller GUI allows you to write a complete ACL going to the **Configuration > Security > ACL** page. You can view a list of protocols to pick from, and make changes to an existing ACL.

## Applying ACLs

The following are the ways to apply ACLs:

- **Security ACL:** A security ACL defines the type of traffic that should be allowed through the device and that which should be blocked or dropped.

A security ACL is applied:

- **On SVI interfaces:** The ACL will only be evaluated against the traffic that is routed through the interface.

```
Device(config)# interface Vlan<number>
Device(config-if)# ip access-group myACL in/out
```

- **On a physical interface of the controller:** The ACL will be evaluated against all traffic that passes through the interface. Along with applying ACLs on SVI, this is another option for restricting traffic on the controller management plane.

```
Device(config)#interface GigabitEthernet1
Device(config-if)#ip access-group myACL in/out
```

- **In the wireless policy profile or WLAN:** This option includes several places where you can configure an ACL that will be applied to the wireless client traffic, in case of central switching or local switching of traffic. Such ACLs are only supported in the inbound direction.
- **On the AP:** In case of FlexConnect local switching, the ACL is configured and applied from the policy profile on the controller. This ACL has to be downloaded on to the AP through the Flex profile. ACLs must be downloaded to the AP before they can be applied. As an exception, fabric mode APs (in case of Software Defined Access) also use Flex ACLs even though the AP is not operating in Flex mode.
- **Punt ACL or Redirect ACL:** Punt ACL or redirect ACL refers to an ACL that specifies as to which traffic will be sent to the CPU (instead of its normal expected handling by the dataplane) for further processing. For example, the Central Web Authentication (CWA) redirect ACL defines as to which traffic is intercepted and redirected to the web login portal. The ACL does not define any traffic to be dropped or allowed, but follows the regular processing or forwarding rules, and what will be sent to the CPU for interception.

A redirect ACL has an invisible last statement which is an implicit deny. This implicit deny is applied as a security access list entry (and therefore drops traffic that is not explicitly allowed through or sent to the CPU).

## Types of URL Filters

The following are the two types of URL filters:

- **Standard:** Standard URL filters can be applied before client authentication (pre-auth) or after a successful client authentication (post-auth). Pre-auth filters are extremely useful in the case of external web authentication to allow access to the external login page, as well as, some internal websites before authentication takes place. Post-auth, they can work to block specific websites or allow only specific websites while all the rest is blocked by default. This type of URL filtering post-auth is better handled by using Cisco DNS Layer Security (formerly known as Umbrella) for more flexibility. The standard URL filters apply the same action (permit or deny) for the whole list of URLs. It is either all permit or all deny. Standard URL filter work on local mode APs only.

- **Enhanced:** Enhanced URL filters allow specification of a different action (deny or permit) for each URL inside the list and have per-URL hit counters. Enhanced URL filter work on FlexConnect mode APs only.

In both types of URL filters, you can use a wildcard sub-domain such as `*.cisco.com`. URL filters are standalone but always applied along with an IP-based ACL. A maximum of 20 URLs are supported in a given URL filter. Considering one URL can resolve multiple IP addresses, only up to 40 resolved IP addresses can be tracked for each client. Only DNS records are tracked by URL filters. The controller or APs do not track the resolved IP address of a URL if the DNS answer uses a CNAME alias record.

---

**Note** In a scenario where you have a URL filter of type POST and an ACL applied to a policy profile, traffic to the URL is blocked by the ACL if there are no permit statements regarding the URLs. This can occur if the URL filter is POST with permit statement and within the ACL there is no permit statement for the URLs. Therefore, we recommend that you create permit statements within the ACL, regarding the IP address of the URLs, instead of using the POST URL filter.

---

## Restrictions on DNS-Based Access Control Lists

The restriction for DNS-based ACLs is as follows:

- Pre-authentication and Post-authentication filters are supported in local modes. Only Pre-authentication filter is supported in Flex (Fabric) mode.
- ACL override pushed from ISE is not supported.
- FlexConnect Local Switching with External Web authentication using URL filtering is not supported until Cisco IOS XE Gibraltar 16.12.x.
- Fully qualified domain name (FQDN) or DNS based ACLs are not supported on Cisco Wave 1 Access Points.
- The URL filter considers only the first 20 URLs, though you can add more.
- The URL filter employs regular regex patterns and permits wildcard characters only at the beginning or at the end of an URL.
- The URL ACLs are defined and added to the FlexConnect policy profile in which they associate with a WLAN. The URL ACL creation follows a similar mechanism as that of local mode URL ACLs.
- In FlexConnect mode, the URL domain ACL works only if they are connected to a FlexConnect policy profile.
- The ACL can be attached to a WLAN by associating a policy profile with a WLAN or local policies. However, you can override it using "url-redirect-acl".
- For the Cisco AV pair received from ISE, the policy that needs to be applied for a particular client is pushed as part of ADD MOBILE message.
- When an AP joins or when an existing URL ACL is modified and applied on FlexConnect profile, the ACL definition along with mapped URL filter list is pushed to the AP.

- The AP stores the URL ACL definition with mapped ACL name and snoops the DNS packets for learning the first IP address for each URL in the ACL. When the AP learns the IP addresses, it updates the controller of the URL and IP bindings. The controller records this information in the client database for future use.
- When a client roams to another AP during the pre-authentication state, the learned IP addresses are pushed to a new AP. Otherwise, these learned IP addresses are purged when a client moves to a post-authentication state or when the TTL for the learned IP address expires.

### Restrictions on Wildcard Support in URLs

- The generic wildcard URL, such as \*.\* is not allowed.
- Wildcard between the domain names, such as \*a.cisco.com, a.cisco\*.com, a.b.c.test\*.apply.play are not allowed.
- Multiple wildcard, such as test.\*.cisco\*.com is not allowed in a URL.
- The wildcard such as \*.cisco.com is allowed in the URL.
- The wildcard with a suffix such as wpr.cisco.\* is a valid configuration.
- A maximum of 16 wildcard-based URLs must be configured for a given ACL.

## Flex Mode

### Defining URL Filter List

#### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>urlfilter enhanced-list <i>list-name</i></b>  <b>Example:</b> Device(config)# urlfilter enhanced-list urllist_flex_preauth	Configures the URL filter enhanced list.  Here, <i>list-name</i> refers to the URL filter list name. The list name must not exceed 32 alphanumeric characters.
<b>Step 3</b>	<b>url <i>url-name</i> preference 0-65535 action { deny   permit }</b>  <b>Example:</b> Device(config-urlfilter-enhanced-params)# url <i>url-name</i> preference 1 action permit	Configures the action: permit (allowed list) or deny (blocked list).
<b>Step 4</b>	<b>end</b>  <b>Example:</b>	Returns to privileged EXEC mode.

	Command or Action	Purpose
	Device (config-urlfilter-params) # <b>end</b>	

## Applying URL Filter List to Flex Profile

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>wireless profile flex</b> <i>default-flex-profile</i>  <b>Example:</b> Device (config) # <b>wireless profile flex default-flex-profile</b>	Creates a new flex policy.  The default flex profile name is <i>default-flex-profile</i> .
<b>Step 3</b>	<b>acl-policy</b> <i>acl policy name</i>  <b>Example:</b> Device (config-wireless-flex-profile) # <b>acl-policy acl_name</b>	Configures ACL policy.
<b>Step 4</b>	<b>urlfilter list</b> <i>name</i>  <b>Example:</b> Device (config-wireless-flex-profile-acl) # <b>urlfilter list</b> <b>urllist_flex_preauth</b>	Applies the URL list to the Flex profile.
<b>Step 5</b>	<b>end</b>  <b>Example:</b> Device (config-wireless-flex-profile-acl) # <b>end</b>	Returns to privileged EXEC mode.

## Configuring ISE for Central Web Authentication (GUI)

Perform the following steps to configure ISE for Central Web Authentication.

### Procedure

- 
- Step 1** Login to the Cisco Identity Services Engine (ISE).
  - Step 2** Click **Policy** and then click **Policy Elements**.
  - Step 3** Click **Results**.
  - Step 4** Expand **Authorization** and click **Authorization Profiles**.
  - Step 5** Click **Add** to create a new authorization profile for URL filter.

- Step 6** Enter a name for the profile in the **Name** field. For example, CentralWebauth.
- Step 7** Choose **ACCESS\_ACCEPT** option from the **Access Type** drop-down list.
- Step 8** Alternatively, in the **Common Tasks** section, check **Web Redirection**.
- Step 9** Choose the **Centralized Web Auth** option from the drop-down list.
- Step 10** Specify the ACL and choose the ACL value from the drop-down list.
- Step 11** In the **Advanced Attributes Setting** section, choose **Cisco:cisco-av-pair** from the drop-down list.

**Note** Multiple ACL can be applied on the controller based on priority. In L2 Auth + webauth multi-auth scenario, if the ISE returns ACL during L2 Auth then ISE ACL takes precedence over the default webauth redirect ACL. This leads to traffic running in webauth pending state, if ISE ACL has permit rule. To avoid this scenario, you need to set the precedence for L2 Auth ISE returned ACL. The default webauth redirect ACL priority is 100. To avoid traffic issue, you need to configure the redirect ACL priority above 100 for ACL returned by ISE.

- Step 12** Enter the following one by one and click (+) icon after each of them:

- url-redirect-acl=<sample\_name>
- url-redirect=<sample\_redirect\_URL>

For example,

```
Cisco:cisco-av-pair = priv-lvl=15
Cisco:cisco-av-pair = url-redirect-acl=ACL-REDIRECT2
Cisco:cisco-av-pair = url-redirect=
https://9.10.8.247:port/portal/gateway?
sessionId=SessionIdValue&portal=0ce17ad0-6d90-11e5-978e-005056bf2f0a&daysToExpiry=value&action=cwa
```

- Step 13** Verify contents in the **Attributes Details** section and click **Save**.

## Local Mode

### Defining URL Filter List

#### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>urlfilter list list-name</b>  <b>Example:</b> Device(config)# urlfilter list urllist_local_preauth	Configures the URL filter list.  Here, <i>list-name</i> refers to the URL filter list name. The list name must not exceed 32 alphanumeric characters.

	Command or Action	Purpose
<b>Step 3</b>	<b>action permit</b> <b>Example:</b> Device(config-urlfilter-params)# action permit	Configures the action: permit (allowed list) or deny (blocked list).
<b>Step 4</b>	<b>filter-type post-authentication</b> <b>Example:</b> Device(config-urlfilter-params)# filter-type post-authentication	<b>Note</b> This step is applicable while configuring post-authentication URL filter only.  Configures the URL list as post-authentication filter.
<b>Step 5</b>	<b>redirect-server-ip4 IPv4-address</b> <b>Example:</b> Device(config-urlfilter-params)# redirect-server-ipv4 9.1.0.101	Configures the IPv4 redirect server for the URL list.  Here, <i>IPv4-address</i> refers to the IPv4 address.
<b>Step 6</b>	<b>redirect-server-ip6 IPv6-address</b> <b>Example:</b> Device(config-urlfilter-params)# redirect-server-ipv6 2001:300:8::82	Configures the IPv6 redirect server for the URL list.  Here, <i>IPv6-address</i> refers to the IPv6 address.
<b>Step 7</b>	<b>url url</b> <b>Example:</b> Device(config-urlfilter-params)# url url1.dns.com	Configures an URL.  Here, <i>url</i> refers to the name of the URL.
<b>Step 8</b>	<b>end</b> <b>Example:</b> Device(config-urlfilter-params)# end	Returns to privileged EXEC mode.

## Applying URL Filter List to Policy Profile (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Tags & Profiles > Policy**.
  - Step 2** Click on the **Policy Name**.
  - Step 3** Go to **Access Policies** tab.
  - Step 4** In the **URL Filters** section, choose the filters from the **Pre Auth** and **Post Auth** drop-down lists.
  - Step 5** Click **Update & Apply to Device**.
-

## Applying URL Filter List to Policy Profile

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wireless profile policy <i>profile-policy</i></b> <b>Example:</b> Device(config)# wireless profile policy default-policy-profile	Configures wireless policy profile.  Here, <i>profile-policy</i> refers to the name of the WLAN policy profile.
<b>Step 3</b>	<b>urlfilter list {pre-auth-filter <i>name</i>   post-auth-filter <i>name</i>}</b> <b>Example:</b> Device(config-wireless-policy)# urlfilter list pre-auth-filter urllist_local_preauth Device(config-wireless-policy)# urlfilter list post-auth-filter urllist_local_postauth	Applies the URL list to the policy profile.  Here, <i>name</i> refers to the name of the pre-authentication or post-authentication URL filter list configured earlier.  <b>Note</b> During the client join, the URL filter configured on the policy will be applied.
<b>Step 4</b>	<b>end</b> <b>Example:</b> Device(config-wireless-policy)# end	Returns to privileged EXEC mode.

## Configuring ISE for Central Web Authentication

### Creating Authorization Profiles

#### Procedure

- Step 1** Login to the Cisco Identity Services Engine (ISE).
- Step 2** Click **Policy**, and click **Policy Elements**.
- Step 3** Click **Results**.
- Step 4** Expand **Authorization**, and click **Authorization Profiles**.
- Step 5** Click **Add** to create a new authorization profile for URL filter.
- Step 6** In the Name field, enter a name for the profile. For example, *CentralWebauth*.
- Step 7** Choose **ACCESS\_ACCEPT** from the Access Type drop-down list.
- Step 8** In the Advanced Attributes Setting section, choose **Cisco:cisco-av-pair** from the drop-down list.
- Step 9** Enter the following one by one and click (+) icon after each of them:

- url-filter-preauth=<preauth\_filter\_name>
- url-filter-postauth=<postauth\_filter\_name>

For example,

```
Cisco:cisco-av-pair = url-filter-preauth=urllist_pre_cwa
Cisco:cisco-av-pair = url-filter-postauth=urllist_post_cwa
```

- Step 10** Verify contents in the Attributes Details section and click **Save**.
- 

## Mapping Authorization Profiles to Authentication Rule

### Procedure

---

- Step 1** In the **Policy > Authentication** page, click **Authentication**.
- Step 2** Enter a name for your authentication rule.  
For example, *MAB*.
- Step 3** In the If condition field, select the plus (+) icon.
- Step 4** Choose **Compound condition**, and choose **WLC\_Web\_Authentication**.
- Step 5** Click the arrow located next to **and ...** in order to expand the rule further.
- Step 6** Click the + icon in the Identity Source field, and choose **Internal endpoints**.
- Step 7** Choose **Continue** from the 'If user not found' drop-down list.  
This option allows a device to be authenticated even if its MAC address is not known.
- Step 8** Click **Save**.
- 

## Mapping Authorization Profiles to Authorization Rule

### Procedure

---

- Step 1** Click **Policy > Authorization**.
- Step 2** In the Rule Name field, enter a name.  
For example, *CWA Post Auth*.
- Step 3** In the Conditions field, select the plus (+) icon.
- Step 4** Click the drop-down list to view the Identity Groups area.
- Step 5** Choose **User Identity Groups > user\_group**.
- Step 6** Click the plus (+) sign located next to **and ...** in order to expand the rule further.
- Step 7** In the Conditions field, select the plus (+) icon.
- Step 8** Choose **Compound Conditions**, and choose to create a new condition.

- Step 9** From the settings icon, select **Add Attribute/Value** from the options.
- Step 10** In the Description field, choose **Network Access > UseCase** as the attribute from the drop-down list.
- Step 11** Choose the **Equals** operator.
- Step 12** From the right-hand field, choose **GuestFlow**.
- Step 13** In the Permissions field, select the plus (+) icon to select a result for your rule.
- You can choose **Standard > PermitAccess** option or create a custom profile to return the attributes that you like.
- 

## Viewing DNS-Based Access Control Lists

To view details of a specified wireless URL filter, use the following command:

```
Device# show wireless urlfilter details <urllist_flex_preauth>
```

To view the summary of all wireless URL filters, use the following command:

```
Device# show wireless urlfilter summary
```

To view the URL filter applied to the client in the resultant policy section, use the following command:

```
Device# show wireless client mac-address <MAC_addr> detail
```

## Configuration Examples for DNS-Based Access Control Lists

### Flex Mode

*Example: Defining URL Filter List*

This example shows how to define URL list in Flex mode:

```
Device# configure terminal
Device(config)# urlfilter enhanced-list urllist_flex_pre
Device(config-urlfilter-params)# url www.dns.com preference 1 action permit
Device(config-urlfilter-params)# end
```

*Example: Applying URL Filter List to Flex Profile*

This example shows how to apply an URL list to the Flex profile in Flex mode:

```
Device# configure terminal
Device(config)# wireless profile flex default-flex-profile
Device(config-wireless-flex-profile)# acl-policy acl_name
Device(config-wireless-flex-profile-acl)# urlfilter list urllist_flex_preauth
Device(config-wireless-flex-profile-acl)# end
```

### Local Mode

*Example: Defining Preauth URL Filter List*

This example shows how to define URL filter list (pre-authentication):

```
Device# configure terminal
Device(config)# urlfilter list urllist_local_preauth
Device(config-urlfilter-params)# action permit
Device(config-urlfilter-params)# redirect-server-ipv4 9.1.0.101
Device(config-urlfilter-params)# redirect-server-ipv6 2001:300:8::82
Device(config-urlfilter-params)# url url1.dns.com
Device(config-urlfilter-params)# end
```

*Example: Defining Postauth URL Filter List*

This example shows how to define URL filter list (post-authentication):

```
Device# configure terminal
Device(config)# urlfilter list urllist_local_postauth
Device(config-urlfilter-params)# action permit
Device(config-urlfilter-params)# filter-type post-authentication
Device(config-urlfilter-params)# redirect-server-ipv4 9.1.0.101
Device(config-urlfilter-params)# redirect-server-ipv6 2001:300:8::82
Device(config-urlfilter-params)# url url1.dns.com
Device(config-urlfilter-params)# end
```

*Example: Applying URL Filter List to Policy Profile*

This example shows how to apply an URL list to the policy profile in local mode:

```
Device# configure terminal
Device(config)# wireless profile policy default-policy-profile
Device(config-wireless-policy)# urlfilter list pre-auth-filter urllist_local_preauth
Device(config-wireless-policy)# urlfilter list post-auth-filter urllist_local_postauth
Device(config-wireless-policy)# end
```

## Verifying DNS Snoop Agent (DSA)

To view details of the DNS snooping agent client, use the following command:

```
Device# show platform hardware chassis active qfp feature dns-snoop-agent client
```

To view details of the DSA enabled interface, use the following command:

```
Device# show platform hardware chassis active qfp feature dns-snoop-agent client enabled-intf
```

To view the pattern list in uCode memory, use the following command:

```
Device# show platform hardware chassis active qfp feature dns-snoop-agent client
hw-pattern-list
```

To view the OpenDNS string for the pattern list, use the following command:

```
Device# show platform hardware chassis active qfp feature dns-snoop-agent client
hw-pattern-list odns_string
```

To view the FQDN filter for the pattern list, use the following command:

```
Device#
show platform hardware chassis active qfp feature dns-snoop-agent client hw-pattern-list
fqdn-filter <fqdn_filter_ID>
```

---

**Note** The valid range of *fqdn\_filter\_ID* is from 1 to 16.

---

To view details of the DSA client, use the following command:

```
Device# show platform hardware chassis active qfp feature dns-snoop-agent client info
```

To view the pattern list in CPP client, use the following command:

```
Device# show platform hardware chassis active qfp feature dns-snoop-agent client pattern-list
```

To view the OpenDNS string for the pattern list, use the following command:

```
Device# show platform hardware chassis active qfp feature dns-snoop-agent client pattern-list
odns_string
```

To view the FQDN filter for the pattern list, use the following command:

```
Device# show platform hardware chassis active qfp feature dns-snoop-agent client pattern-list
fqdn-filter <fqdn_filter_ID>
```

---

**Note** The valid range of *fqdn\_filter\_ID* is from 1 to 16.

---

To view details of the DSA datapath, use the following command:

```
Device# show platform hardware chassis active qfp feature dns-snoop-agent datapath
```

To view details of the DSA IP cache table, use the following command:

```
Device# show platform hardware chassis active qfp feature dns-snoop-agent datapath ip-cache
```

To view details of the DSA address entry, use the following command:

```
Device# show platform hardware chassis active qfp feature dns-snoop-agent datapath ip-cache
address {ipv4 <IPv4_addr> | ipv6 <IPv6_addr>}
```

To view details of all the DSA IP cache address, use the following command:

```
Device# show platform hardware chassis active qfp feature dns-snoop-agent datapath ip-cache
all
```

To view details of the DSA IP cache pattern, use the following command:

```
Device# show platform hardware chassis active qfp feature dns-snoop-agent datapath ip-cache
pattern <pattern>
```

To view details of the DSA datapath memory, use the following command:

```
Device# show platform hardware chassis active qfp feature dns-snoop-agent datapath memory
```

To view the DSA regular expression table, use the following command:

```
Device# show platform hardware chassis active qfp feature dns-snoop-agent datapath
regexp-table
```

To view the DSA statistics, use the following command:

```
Device# show platform hardware chassis active qfp feature dns-snoop-agent datapath stats
```

## Information About Flex Client IPv6 Support with WebAuth Pre and Post ACL

IOS IPv6 ACLs is used to send webauth ACL to an AP. A change in the ACL policies of the Flex profile (new ACL, deleted ACL or modified ACL).

ACL definitions are pushed to AP in the following events:

- AP join.
- New ACL mapping in a new Flex profile.
- Configuring IPv6 ACL definition in Flex profile.

#### Default Local Web Authentication ACLs

The pre-defined default LWA IPv6 ACL is pushed to AP and plumbed to data plane.

#### Default External Web Authentication ACL

The default EWA ACLs are derived from the redirect portal address configured in the parameter map.

The following list covers the types of default EWA ACLs:

- Security ACL—Pushed and plumbed to AP.
- Intercept ACL—Pushed and plumbed to data plane.

#### FQDN ACL

- FQDN ACL is encoded along with IPv6 ACL and sent to AP.
- FQDN ACL is always a custom ACL.

The following applies to Flex and Local mode:

- If you are migrating from AireOS, you would explicitly need to execute the following commands:

```
redirect append ap-mac tag ap_mac
redirect append wlan-ssid tag wlan
redirect append client-mac tag client_mac
```
- If the login page has any resource that needs to be fetched from the server, you will need to include those resource URLs in URL filtering.
- If you are trying to access IPv6 URL and you have an IPv4 web server, the controller redirects the client to an internal page as domain redirection is not supported. It is recommended to have a dual-stack web server and configure virtual IPv6 address in the global parameter map.

## Enabling Pre-Authentication ACL for LWA and EWA (GUI)

### Procedure

---

- Step 1** Choose **Configuration > Tags & Profiles > WLANs**.
- Step 2** Click **Add**.
- Step 3** In the **General** tab, enter the **Profile Name**, the **SSID** and the **WLAN ID**.
- Step 4** Choose **Security > Layer2** tab. Uncheck the **WPAPolicy**, **AES** and **802.1x** check boxes.

- Step 5** Choose **Security > Layer3** tab. Choose the Web Auth Parameter Map from the **Web Auth Parameter Map** drop-down list and authentication list from the **Authentication List** drop-down list. Click **Show Advanced Settings** and under the **Preauthenticated ACL** settings, choose the IPv6 ACL from the **IPv6** drop-down list.
- Step 6** Choose **Security > AAA** tab. Choose the authentication list from the **Authentication List** drop-down list.
- Step 7** Click **Apply to Device**.

## Enabling Pre-Authentication ACL for LWA and EWA

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wlan wlan-name wlan-id SSID-name</b> <b>Example:</b> Device(config)# wlan wlan-demo 1 ssid-demo	Enters the WLAN configuration sub-mode. <ul style="list-style-type: none"> <li>• <i>wlan-name</i>—Enter the profile name. The range is from 1 to 32 alphanumeric characters.</li> <li>• <i>wlan-id</i>—Enter the WLAN ID. The range is from 1 to 512.</li> <li>• <i>SSID-name</i>—Enter the Service Set Identifier (SSID) for this WLAN. If the SSID is not specified, the WLAN profile name is set as the SSID.</li> </ul> <p><b>Note</b> If you have already configured WLAN, enter <b>wlan wlan-name</b> command.</p>
<b>Step 3</b>	<b>ipv6 traffic-filter web acl_name-preauth</b> <b>Example:</b> Device(config-wlan)# ipv6 traffic-filter web preauth_v6_acl	Creates a pre-authentication ACL for web authentication.
<b>Step 4</b>	<b>no security wpa</b> <b>Example:</b> Device(config-wlan)# no security wpa	Disables the WPA security.
<b>Step 5</b>	<b>no security wpa wpa2 ciphers aes</b> <b>Example:</b> Device(config-wlan)#no security wpa wpa2 ciphers aes	Disables WPA2 ciphers for AES.

	Command or Action	Purpose
<b>Step 6</b>	<b>no security wpa akm dot1x</b> <b>Example:</b> Device(config-wlan)#no security wpa akm dot1x	Disables security AKM for dot1x.
<b>Step 7</b>	<b>security web-auth</b> <b>Example:</b> Device(config-wlan)# security web-auth	Configures web authentication.
<b>Step 8</b>	<b>security web-auth authentication-list</b> <i>authenticate-list-name</i> <b>Example:</b> Device(config-wlan)# security web-auth authentication-list wcm_dot1x	Enables authentication list for WLAN.
<b>Step 9</b>	<b>security web-auth parameter-map</b> <i>parameter-map-name</i> <b>Example:</b> Device(config-wlan)# security web-auth parameter-map param-custom-webconsent	Maps the parameter map.
<b>Step 10</b>	<b>no shutdown</b> <b>Example:</b> Device(config-wlan)# no shutdown	Shutdown the WLAN.

## Enabling Post-Authentication ACL for LWA and EWA (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Tags & Profiles > WLANs**.
  - Step 2** Click **Add**.
  - Step 3** In the **General** tab, enter the **Profile Name**. The **Profile Name** is the profile name of the policy profile.
  - Step 4** Enter the **SSID** and the **WLAN ID**.
  - Step 5** Click **Apply to Device**.
-

## Enabling Post-Authentication ACL for LWA and EWA

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wireless profile policy <i>profile-name</i></b> <b>Example:</b> Device(config)# wireless profile policy test1	Creates policy profile for the WLAN. The <i>profile-name</i> is the profile name of the policy profile.
<b>Step 3</b>	<b>ipv6 acl <i>acl_name</i></b> <b>Example:</b> Device(config-wireless-policy)# ipv6 acl testacl	Creates a named WLAN ACL.
<b>Step 4</b>	<b>end</b> <b>Example:</b> Device(config-wireless-policy)# end	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Enabling DNS ACL for LWA and EWA (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Tags & Profiles > WLANs**.
  - Step 2** Click **Add**.
  - Step 3** In the **General** tab, enter the **Profile Name**. The **Profile Name** is the profile name of the policy profile.
  - Step 4** Enter the **SSID** and the **WLAN ID**.
  - Step 5** Click **Apply to Device**.
- 

## Enabling DNS ACL for LWA and EWA

**Note** Post-authentication DNS ACL is not supported.

**Procedure**

	<b>Command or Action</b>	<b>Purpose</b>
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wireless profile policy <i>profile-name</i></b> <b>Example:</b> Device(config)# wireless profile policy test1	Creates policy profile for the WLAN.  The <i>profile-name</i> is the profile name of the policy profile.
<b>Step 3</b>	<b>end</b> <b>Example:</b> Device(config)# end	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Verifying Flex Client IPv6 Support with WebAuth Pre and Post ACL

To verify the client state after L2 authentication, use the following command:

```
Device# show wireless client summary
Number of Local Clients: 1
```

MAC Address	AP Name	WLAN	State	Protocol	Method
1491.82b8.f8c1	AP4001.7A03.544C	4	Webauth Pending	11n(5)	None
-----					
Local					

```
Number of Excluded Clients: 0
```

To verify the IP state, discovery, and MAC, use the following command:

```
Device# show wireless dev da ip
IP STATE DISCOVERY MAC

15.30.0.4 Reachable ARP 1491.82b8.f8c1
2001:15:30:0:d1d7:ecf3:7940:af60 Reachable IPv6 Packet 1491.82b8.f8c1
fe80::595e:7c29:d7c:3c84 Reachable IPv6 Packet 1491.82b8.f8c1
```

## CHAPTER 108

# Allowed List of Specific URLs

- [Allowed List of Specific URLs, on page 1245](#)
- [Adding URL to Allowed List, on page 1245](#)
- [Verifying URLs on the Allowed List, on page 1247](#)

## Allowed List of Specific URLs

This feature helps you to add specific URLs to allowed list on the controller or the AP so that those specific URLs are available for use, even when there is no connectivity to the internet. You can add URLs to allowed list for web authentication of captive portal and walled garden. Authentication is not required to access the allowed list of URLs. When you try to access sites that are not in allowed list, you are redirected to the Login page.

## Adding URL to Allowed List

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>urlfilter list &lt;urlfilter-name&gt;</b> <b>Example:</b> Device(config)# urlfilter list url-allowedlist-nbn	Configures the URL filter profile.
<b>Step 3</b>	<b>action [deny   permit]</b> <b>Example:</b> Device(config-urlfilter-params)# action permit	Configures the list as allowed list. The <b>permit</b> command configures the list as allowed list and the <b>deny</b> command configures the list as blocked list.

	Command or Action	Purpose
<b>Step 4</b>	<b>{ redirect-server-ipv4   redirect-server-ipv6 }</b> <b>Example:</b> Device(config-urlfilter-params)# redirect-server-ipv4 X.X.X.X	Configures the IP address of the redirect servers to which the user requests will be redirected in case of denied requests.
<b>Step 5</b>	<b>url url-to-be-allowed</b> <b>Example:</b> Device(config-urlfilter-params)# url www.cisco.com	Configures the URL to be allowed.

**Note** The controller uses two IP addresses and the mechanism only allows for one portal IP to be allowed. To allow pre-authentication access to more HTTP resources, you need to use URL filters which will dynamically make holes in the intercept (redirect) and security (preauth) ACLs for the IPs related to the website whose URL you enter in the URL filter. DNS requests will be dynamically snooped for the controller to learn the IP address of those URLs and add it to the ACLs dynamically.

**Note** **redirect-server-ipv4** and **redirect-server-ipv6** is applicable only in the local mode, specifically in post-authentication. For any further tracking or displaying any warning messages, the denied user request is redirected to the configured server.

But the **redirect-server-ipv4** and **redirect-server-ipv6** configurations do not apply to pre-authentication scenario as you will be redirected to the controller for the redirect login URL for any denied access.

You can associate the allowed URL with the ACL policy in flex profile.

### Example

Associating the allowed URL with the ACL policy in flex profile:

```
Device(config)# wireless profile flex default-flex-profile
Device(config-wireless-flex-profile)# acl-policy user_v4_acl
Device(config-wireless-flex-profile-acl)# urlfilter list url_allowedlist_nbn
Device(config-wireless-flex-profile-acl)# exit
Device(config-wireless-flex-profile)# description "default flex profile"

Device(config)# urlfilter enhanced-list urllist_pre_cwa
Device(config-urlfilter-enhanced-params)# url url1.dns.com preference 1 action permit
Device(config-urlfilter-enhanced-params)# url url2.dns.com preference 2 action deny
Device(config-urlfilter-enhanced-params)# url url3.dns.com preference 3 action permit

Device(config)# wlan wlan5 5 wlan5
Device(config-wlan)#ip access-group web user_v4_acl
Device(config-wlan)#no security wpa
Device(config-wlan)#no security wpa
Device(config-wlan)#no security wpa wpa2 ciphers aes
Device(config-wlan)#no security wpa akm dot1x
Device(config-wlan)#security web-auth
Device(config-wlan)#security web-auth authentication-list default
```

```
Device(config-wlan)#security web-auth parameter-map global
Device(config-wlan)#no shutdown
```

## Verifying URLs on the Allowed List

Verify URLs on the Allowed List.

```
Device# show wireless urlfilter summary
Black-list - DENY
White-list - PERMIT
Filter-Type - Specific to Local Mode
```

URL-List	ID	Filter-Type	Action	Redirect-ipv4	Redirect-ipv6
url-whitelist	1	PRE-AUTH	PERMIT	1.1.1.1	

Device#

```
Device# show wireless urlfilter details url-whitelist
List Name..... : url-whitelist
Filter ID..... : 1
Filter Type..... : PRE-AUTH
Action..... : PERMIT
Redirect server ipv4..... : 1.1.1.1
Redirect server ipv6..... :
Configured List of URLs
URL..... : www.cisco.com
```

## CHAPTER 109

# Cisco Umbrella WLAN

---

- [Information About Cisco Umbrella WLAN, on page 1249](#)
- [Registering Controller to Cisco Umbrella Account, on page 1250](#)
- [Configuring Cisco Umbrella WLAN, on page 1251](#)
- [Configuring the Umbrella Flex Profile, on page 1257](#)

- [Configuring Umbrella Flex Parameters, on page 1258](#)
- [Configuring the Umbrella Flex Policy Profile \(GUI\), on page 1258](#)
- [Verifying the Cisco Umbrella Configuration, on page 1259](#)

## Information About Cisco Umbrella WLAN

The Cisco Umbrella WLAN provides a cloud-delivered network security service at the Domain Name System (DNS) level, with automatic detection of both known and emergent threats.

This feature allows you to block sites that host malware, bot networks, and phishing before they actually become malicious.

Cisco Umbrella WLAN provides the following:

- Policy configuration per user group at a single point.
- Policy configuration per network, group, user, device, or IP address.

The following is the policy priority order:

1. Local policy
2. AP group
3. WLAN

- Visual security activity dashboard in real time with aggregated reports.
- Schedule and send reports through email.
- Support up to 60 content categories, with a provision to add custom allowed list and blocked list entries.
- Supports custom parameter-type Umbrella profiles. One Global profile and 15 custom profiles are supported.

- Although IPv6 is supported, device registration will always be over IPv4. There is no support of device registration over IPv6.
- The communication from device to the Umbrella Cloud can be done over IPv6 also.
- In the Flexconnect mode, DNS handling takes place in the AP instead of the controller. Multiple profiles are supported in the Flex mode.

This feature does not work in the following scenarios:

- If an application or host use an IP address directly, instead of using DNS to query domain names.
- If a client is connected to a web proxy and does not send a DNS query to resolve the server address.

## Registering Controller to Cisco Umbrella Account

### Before you Begin

- You should have an account with Cisco Umbrella.
- You should have an API token from Cisco Umbrella.

This section describes the process followed to register the controller to the Cisco Umbrella account.

The controller is registered to Cisco Umbrella server using the Umbrella parameter map. Each of the Umbrella parameter map must have an API token. The Cisco Umbrella responds with the device ID for the controller. The device ID has a 1:1 mapping with the Umbrella parameter map name.

### Fetching API token for Controller from Cisco Umbrella Dashboard

From Cisco Umbrella dashboard, verify that your controller shows up under Device Name, along with their identities.

### Applying the API Token on Controller

Registers the Cisco Umbrella API token on the network.

### DNS Query and Response

Once the device is registered and Umbrella parameter map is configured on WLAN, the DNS queries from clients joining the WLAN are redirected to the Umbrella DNS resolver.

---

**Note** This is applicable for all domains not configured in the local domain RegEx parameter map.

---

The queries and responses are encrypted based on the DNSCrypt option in the Umbrella parameter map.

For more information on the Cisco Umbrella configurations, see the [Integration for ISR 4K and ISR 1100 – Security Configuration Guide](#).

### Limitations and Considerations

The limitations and considerations for this feature are as follows:

- You will be able to apply the wireless Cisco Umbrella profiles to wireless entities, such as, WLAN or AP groups, if the device registration is successful.
- In case of L3 mobility, the Cisco Umbrella must be applied on the anchor controller always.
- When two DNS servers are configured under DHCP, two Cisco Umbrella server IPs are sent to the client from DHCP option 6. If only one DNS server is present under DHCP, only one Cisco Umbrella server IP is sent as part of DHCP option 6.

## Configuring Cisco Umbrella WLAN

To configure Cisco Umbrella on the controller , perform the following:

- You must have the API token from the Cisco Umbrella dashboard.
- You must have the root certificate to establish HTTPS connection with the Cisco Umbrella registration server: [api.opendns.com](https://api.opendns.com). You must import the root certificate from **digicert.com** to the controller using the **crypto pki trustpool import terminal** command.

## Importing CA Certificate to the Trust Pool

### Before you begin

The following section covers details about how to fetch the root certificate and establish HTTPS connection with the Cisco Umbrella registration server:

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	Perform either of the following tasks: <ul style="list-style-type: none"> <li>• <b>crypto pki trustpool import url url</b></li> </ul> <pre>Device(config)# crypto pki trustpool import url http://www.cisco.com/security/pki/trs/ios.p7b</pre> Imports the root certificate directly from the Cisco website.	

	Command or Action	Purpose
	<p><b>Note</b> The Trustpool bundle contains the root certificate of <i>digicert.com</i> together with other CA certificates.</p> <ul style="list-style-type: none"> <li>• <b>crypto pki trustpool import terminal</b></li> </ul> <pre>Device(config)# crypto pki trustpool import terminal</pre> <p>Imports the root certificate by executing the import terminal command.</p> <ul style="list-style-type: none"> <li>• Enter PEM-formatted CA certificate from the following location: See the Related Information section to download the CA certificate.</li> </ul> <pre>-----BEGIN CERTIFICATE----- MIIECAIBAgEQAQIUMwYwK1wA3DBejchk9OABFHMbcQDQCE EwUeRMMGALKMRCraNrcQ5fHwWMDQEBBnZGanLrQ1Z9Mw HjDQDEdVq2VdHhG2Wgjr9dH2TavQMD9jOMAMB50MD9Mj MhNLAwSCABNVAAMTRGEMDQEBFavQ2VdHhMKAhBjNEMTRP Z1DXOIHmUjBjDg10BjZ1DwA9QEMIEFhEjchk9OABFROAQMIB GjCAwAIlZGwNIPNsCZUIMRNtjprB5w3BU3N5D3E0Gqcbpj EhEj9wIHIQIHSAH5M55HjLd55NQE9K0wDngf0hTCTR30ND VfR0L9qIhEj5DUNwRPAE/1hphJhWakTavG3h3Gd3NHzLDy7 muh9jRk3IhEj5GUBTQjG55j7k74hyR3UqB3Nsc06wVh9jkd K6/3h3h3h3Zheoricp7CRITTHk3f9DQRB4BjCAwMDR0BB Eldcupp3eef2y55W0MBALhQMazFAEDWUj7dC4h3h3EPM4C AllDEh/QAwBj3RjNFBFjUBgRjH3Q2KwRQhAwRjDFOUQh3y EjEjwEAEjgRjEj5QRjGyFVfKMBQhMAGG3Hh3j9A3NwRZ1j2C0 IhN5EjgRjEj5Ac0HR0aL2N2y4hMzGraNrcQ1Z9H5Z1XCR2v Yh5h9dNhmjDEBjNFRGEMjVh3jrdR0833BM54dQ32y45j20v RCraNrcH5W829QRB33BmEj3h3rdR0833BC54dQ32y45j20v RCraNrcH5W829QRB33BMDALhQMc0wEzBMAEACZ4MAQIMAg EwEACj3Ej5QDEj5QRZ1vAQEj5QjEh3h3E69j9l0hFRWEX 35Hh37UgA0wE3H0rjKfUSGQj35k3dEh3h3E3h34Gw0E2 U2HRQVtBopj3330HMLk3CjMBGMAwBwLwCj7/1h0K245Sre 50f668wKMBQj3OAH3CjMhWk3P3RMR0Cw3j20Cj7934Cj42x YRih36wAp39wZf3j3Qj3zK3p3f2UACh3Rt3w0E2B3S1E3 SaZMkE4f97Q= -----END CERTIFICATE-----</pre> <p>Imports the root certificate by pasting the CA certificate from the <b>digicert.com</b>.</p>	
<b>Step 3</b>	<p><b>quit</b></p> <p><b>Example:</b></p> <pre>Device(config)# quit</pre>	<p>Imports the root certificate by entering the <b>quit</b> command.</p> <p><b>Note</b> You will receive a message after the certificate has been imported.</p>

## Creating a Local Domain RegEx Parameter Map

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>parameter-map type regex</b> <i>parameter-map-name</i>  <b>Example:</b> Device(config)# <code>parameter-map type regex</code> <code>dns_wl</code>	Creates a regex parameter map.
<b>Step 3</b>	<b>pattern</b> <i>regex-pattern</i>  <b>Example:</b> Device(config-profile)# <code>pattern</code> <code>www.google.com</code>	Configures the regex pattern to match.  <b>Note</b> The following patterns are supported: <ul style="list-style-type: none"> <li>• Begins with <code>.*</code>. For example: <code>.*facebook.com</code></li> <li>• Begins with <code>.*</code> and ends with <code>*</code>. For example: <code>.*google*</code></li> <li>• Ends with <code>*</code>. For example: <code>www.facebook*</code></li> <li>• No special character. For example: <code>www.facebook.com</code></li> </ul>
<b>Step 4</b>	<b>end</b>  <b>Example:</b> Device(config-profile)# <code>end</code>	Returns to privileged EXEC mode.

## Configuring Parameter Map Name in WLAN (GUI)

### Procedure

- Step 1** Choose **Configuration > Tags & Profiles > Policy**.
- Step 2** Click on the Policy Profile Name. The **Edit Policy Profile** window is displayed.
- Step 3** Choose the **Advanced** tab.
- Step 4** In the **Umbrella** settings, from the **Umbrella Parameter Map** drop-down list, choose the parameter map.
- Step 5** Enable or disable **Flex DHCP Option for DNS** and **DNS Traffic Redirect** toggle buttons.

- Step 3** Enter the **Whitelist Domains** that you want to exclude from filtering.
- Step 4** Check or uncheck the **Enable DNS Packets Encryption** check box to encrypt or decrypt the DNS packets.
- Step 5** Click **Apply**.

## Enabling or Disabling DNScrypt

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>parameter-map type umbrella global</b> <b>Example:</b> Device(config)# <code>parameter-map type umbrella global</code>	Creates an umbrella global parameter map.
<b>Step 3</b>	<b>[no] dnsencrypt</b> <b>Example:</b> Device(config-profile)# <code>no dnsencrypt</code>	Enables or disables DNScrypt. By default, the DNScrypt option is enabled. <b>Note</b> Cisco Umbrella DNScrypt is not supported when DNS-encrypted responses are sent in the data-DTLS encrypted tunnel (either mobility tunnel or AP CAPWAP tunnel).
<b>Step 4</b>	<b>end</b> <b>Example:</b> Device(config-profile)# <code>end</code>	Returns to privileged EXEC mode.

## Configuring Timeout for UDP Sessions

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>parameter-map type umbrella global</b> <b>Example:</b> Device(config)# <code>parameter-map type umbrella global</code>	Creates an umbrella global parameter map.

	Command or Action	Purpose
<b>Step 3</b>	<b>udp-timeout</b> <i>timeout_value</i> <b>Example:</b> Device(config-profile)# <b>udp-timeout</b> 2	Configures timeout value for UDP sessions. The <i>timeout_value</i> ranges from 1 to 30 seconds. <b>Note</b> The <b>public-key</b> and <b>resolver</b> parameter-map options are automatically populated with the default values. So, you need not change them.
<b>Step 4</b>	<b>end</b> <b>Example:</b> Device(config-profile)# <b>end</b>	Returns to privileged EXEC mode.

## Configuring Parameter Map Name in WLAN (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Tags & Profiles > Policy**.
  - Step 2** Click on the Policy Profile Name. The **Edit Policy Profile** window is displayed.
  - Step 3** Choose the **Advanced** tab.
  - Step 4** In the **Umbrella** settings, from the **Umbrella Parameter Map** drop-down list, choose the parameter map.
  - Step 5** Enable or disable **Flex DHCP Option for DNS** and **DNS Traffic Redirect** toggle buttons.
  - Step 6** Click **Update & Apply to Device**.
- 

## Configuring Parameter Map Name in WLAN

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>wireless profile policy</b> <i>profile-name</i> <b>Example:</b> Device(config)# <b>wireless profile policy</b> <b>default-policy-profile</b>	Creates policy profile for the WLAN. The <i>profile-name</i> is the profile name of the policy profile.
<b>Step 3</b>	<b>umbrella-param-map</b> <i>umbrella-name</i> <b>Example:</b>	Configures the Umbrella OpenDNS feature for the WLAN.

	Command or Action	Purpose
	Device(config-wireless-policy) # umbrella-param-map global	
<b>Step 4</b>	<b>end</b> <b>Example:</b> Device(config-wireless-policy) # <b>end</b>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Configuring the Umbrella Flex Profile

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wireless profile flex <i>flex-profile-name</i></b> <b>Example:</b> Device(config) # <b>wireless profile flex default-flex-profile</b>	Creates a new flex policy. Enters the flex profile configuration mode.  The <i>flex-profile-name</i> is the flex profile name.
<b>Step 3</b>	<b>umbrella-profile <i>umbrella-profile-name</i></b> <b>Example:</b> Device(config-wireless-flex-profile) # <b>umbrella-profile global</b>	Configures the Umbrella flex feature. Use the <b>no</b> form of this command to negate the command or to set the command to its default.
<b>Step 4</b>	<b>end</b> <b>Example:</b> Device(config-wireless-policy) # <b>end</b>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Configuring the Umbrella Flex Profile (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Tags & Profiles > Flex**.
  - Step 2** Click a **Flex Profile Name**. The **Edit Flex Profile** dialog box appears.
  - Step 3** Under the **Umbrella** tab, click the **Add** button.
  - Step 4** Select a name for the parameter map from the **Parameter Map Name** drop-down list and click **Save**.
  - Step 5** Click the **Update & Apply to Device** button. The configuration changes are successfully applied.
-

# Configuring Umbrella Flex Parameters

## Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>wireless profile policy <i>profile-policy-name</i></b>  <b>Example:</b> Device(config)# <code>wireless profile policy default-policy-profile</code>	Configures the WLAN policy profile. Enters the wireless policy profile configuration mode.  The <i>policy-profile-name</i> is the WLAN policy profile name.
<b>Step 3</b>	<b>flex umbrella dhcp-dns-option</b>  <b>Example:</b> Device(config-wireless-policy-profile)# <code>[no] flex umbrella dhcp-dns-option</code>	Configures the Umbrella DHCP option for DNS. By default the option is enabled.
<b>Step 4</b>	<b>flex umbrella mode {force   ignore}</b>  <b>Example:</b> Device(config-wireless-policy-profile)# <code>[no] flex umbrella mode force</code>	Configures the DNS traffic to be redirected to Umbrella. You can either forcefully redirect the traffic or choose to ignore the redirected traffic to Umbrella. The default mode is <b>ignore</b> .
<b>Step 5</b>	<b>end</b>  <b>Example:</b> Device(config-wireless-policy)# <code>end</code>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

# Configuring the Umbrella Flex Policy Profile (GUI)

## Procedure

- 
- Step 1** Choose **Configuration > Tags & Profiles > Policy**.
  - Step 2** Click the **Add** button. The **Add Policy Profile** dialog box appears.
  - Step 3** In the **Advanced** tab, and under the **Umbrella** section, complete the following:
    - a) Select the parameter map from the **Umbrella Parameter Map** drop-down list. Click the **Clear** hyperlink to clear the selection.
    - b) Click the field adjacent to **Flex DHCP Option for DNS** to **Disable** the option. By default it is **Enabled**.
    - c) Click the field adjacent to **DNS Traffic Redirect** to set the option to **Force**. By default it is set to **Ignore**.
  - Step 4** Click the **Apply to Device** button.
-

## Verifying the Cisco Umbrella Configuration

To view the Umbrella configuration details, use the following command:

```
Device# show umbrella config
Umbrella Configuration
=====
Token: 5XXXXXXXXABXXXXXFXXXXXXXXDXXXXXXXXXABXX
API-KEY: NONE
OrganizationID: xxxxxxxx
Local Domain Regex parameter-map name: dns_bypass
DNSEncrypt: Not enabled
Public-key: NONE
UDP Timeout: 5 seconds
Resolver address:
1. 10.1.1.1
2. 5.5.5.5
3. XXXX:120:50::50
4. XXXX:120:30::30
```

To view the device registration details, use the following command:

```
Device# show umbrella deviceid
Device registration details
Param-Map Name Status Device-id
global 200 SUCCESS 010aa4eXXXXXXXX8d
vj-1 200 SUCCESS 01XXXXXXXXf4541e1
GUEST 200 SUCCESS 010a4f6XXXXXXXX42
EMP 200 SUCCESS 0XXXXXXXXd106ecd
```

To view the detailed description for the Umbrella device ID, use the following command:

```
Device# show umbrella deviceid detailed
Device registration details

1.global
 Tag : global
 Device-id : 010aa4eXXXXXXXX8d
 Description : Device Id recieved successfully
 WAN interface : None
2.vj-1
 Tag : vj-1
 Device-id : 01XXXXXXXXf4541e1
 Description : Device Id recieved successfully
 WAN interface : None
```

To view the Umbrella DNSEncrypt details, use the following command:

```
Device# show umbrella dnscrypt
DNSEncrypt: Enabled
 Public-key: B111:XXXX:XXXX:XXXX:3E2B:XXXX:XXXX:XXxE:XXX3:3XXX:DXXX:XXXX:BXXX:XXXB:XXXX:FXXX

Certificate Update Status: In Progress
```

To view the Umbrella global parameter map details, use the following command:

```
Device# show parameter-map type umbrella global
```

To view the regex parameter map details, use the following command:

```
Device# show parameter-map type regex <parameter-map-name>
```

To view the Umbrella statistical information, use the following command:

```
Device# show platform hardware chassis active qfp feature umbrella datapath stats
```

To view the wireless policy profile Umbrella configuration, use the following command:

```
Device#show wireless profile policy detailed vj-pol-profile | s Umbrella
Umbrella information
Cisco Umbrella Parameter Map : vj-2
DHCP DNS Option : ENABLED
Mode : force
```

To view the wireless flex profile Umbrella configuration, use the following command:

```
Device#show wireless profile flex detailed vj-flex-profile | s Umbrella
Umbrella Profiles :
vj-1
vj-2
global
```

To view the Umbrella details on the AP, use the following command:

```
AP#show client.opendns.summary
Server-IP role
208.67.220.220 Primary
208.67.222.222 Secondary

Server-IP role

## CHAPTER 110

# RADIUS Server Load Balancing

- [Information About RADIUS Server Load Balancing, on page 1261](#)
- [Prerequisites for RADIUS Server Load Balancing, on page 1263](#)
- [Restrictions for RADIUS Server Load Balancing, on page 1263](#)
- [Enabling Load Balancing for a Named RADIUS Server Group \(CLI\), on page 1263](#)

## Information About RADIUS Server Load Balancing

### RADIUS Server Load Balancing Overview

By default, if two RADIUS servers are configured in a server group, only one is used. The other server acts as standby, if the primary server is declared as dead, the secondary server receives all the load.

If you need both servers to perform transactions actively, you need to enable Load Balancing.

---

**Note** By default, load balancing is not enabled on the RADIUS server group.

---

If you enable load balancing in a RADIUS server group with two or more RADIUS servers, the Server A and Server B receives a AAA transaction. The transaction queues are checked in Server A and Server B. The server with less number of outstanding transactions are assigned the next batch of AAA transaction.

Load balancing distributes batches of transactions to RADIUS servers in a server group. Load balancing assigns each batch of transactions to the server with the lowest number of outstanding transactions in its queue. The process of assigning a batch of transactions is as follows:

1. The first transaction is received for a new batch.
2. All server transaction queues are checked.
3. The server with the lowest number of outstanding transactions is identified.
4. The identified server is assigned the next batch of transactions.

The batch size is a user-configured parameter. Changes in the batch size may impact CPU load and network throughput. As batch size increases, CPU load decreases, and network throughput increases. However, if a large batch size is used, all available server resources may not be fully utilized. As batch size decreases, CPU load increases and network throughput decreases.

---

**Note** There is no set number for large or small batch sizes. A batch with more than 50 transactions is considered large and a batch with fewer than 25 transactions is considered small.

---

---

**Note** If a server group contains ten or more servers, we recommend that you set a high batch size to reduce CPU load.

---

### Transaction Load Balancing Across RADIUS Server Groups

You can configure load balancing either per-named RADIUS server group or for the global RADIUS server group. The load balancing server group must be referred to as “radius” in the authentication, authorization, and accounting (AAA) method lists. All public servers that are part of the RADIUS server group are then load balanced.

You can configure authentication and accounting to use the same RADIUS server or different servers. In some cases, the same server can be used for preauthentication, authentication, or accounting transactions for a session. The preferred server, which is an internal setting and is set as the default, informs AAA to use the same server for the start and stop record for a session regardless of the server cost. When using the preferred server setting, ensure that the server that is used for the initial transaction (for example, authentication), the preferred server, is part of any other server group that is used for a subsequent transaction (for example, accounting).

The preferred server is not used if one of the following criteria is true:

- The **load-balance method least-outstanding ignore-preferred-server** command is used.
- The preferred server is dead.
- The preferred server is in quarantine.
- The want server flag has been set, overriding the preferred server setting.

The want server flag, an internal setting, is used when the same server must be used for all stages of a multistage transaction regardless of the server cost. If the want server is not available, the transaction fails.

You can use the **load-balance method least-outstanding ignore-preferred-server** command if you have either of the following configurations:

- Dedicated authentication server and a separate dedicated accounting server
- Network where you can track all call record statistics and call record details, including start and stop records and records that are stored on separate servers

If you have a configuration where authentication servers are a superset of accounting servers, the preferred server is not used.

**Note** If a third-party RADIUS load balancer is used and RADIUS packets are routed based on the NAS source port, it is recommended to move to any other rule based on the following Attribute-Value Pairs (AVPs):

- If the load balancer uses NAS source port in the Access-Request to load balance, rules may not work as expected as the source port in NAS might change during transaction.
- If the load balancer compares AVPs between Access-Challenge and Access-Request to route packets, you will need to use the AVP value of t-State.
- If the load balancer compares AVPs in Access-Request from NAS, you will need to use one or a combination of the following AVPs:
  - t-State value
  - Calling-Station-ID and NAS IP or Identifier

## Prerequisites for RADIUS Server Load Balancing

- Authentication, Authorization, and Accounting (AAA) must be configured on the RADIUS server.
- AAA RADIUS server groups must be configured.
- RADIUS must be configured for functions such as authentication, accounting, or static route download.

## Restrictions for RADIUS Server Load Balancing

- Incoming RADIUS requests, such as Packet of Disconnect (POD) requests are not supported.
- Load balancing is not supported on proxy RADIUS servers and private server groups.
- Load balancing is not supported on Central Web Authentication (CWA).

## Enabling Load Balancing for a Named RADIUS Server Group (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# <code>configure terminal</code>	Enters global configuration mode.

	Command or Action	Purpose
<b>Step 2</b>	<b>aaa group server radius</b> <i>group-name</i> <b>Example:</b> <pre>Device(config)# aaa group server radius rad-sg</pre>	Enters server group configuration mode.
<b>Step 3</b>	<b>server ip-address [auth-port port-number]</b> <b>[acct-port port-number]</b> <b>Example:</b> <pre>Device(config-sg-radius)# server 192.0.2.238 auth-port 2095 acct-port 2096</pre>	Configures the IP address of the RADIUS server for the group server.
<b>Step 4</b>	<b>load-balance method least-outstanding</b> <b>[batch-size number] [ignore-preferred-server]</b> <b>Example:</b> <pre>Device(config-sg-radius)# load-balance method least-outstanding batch-size 30</pre>	<p>Enables the least-outstanding load balancing for a named server group.</p> <p><b>Note</b> The session ownership change occurs multiple times when RADIUS server load balancing feature is configured with 802.1x authentication in Cisco ISE. This is because the RADIUS server load balancing feature distributes transactions of the same session in different RADIUS servers.</p> <p>Therefore, when the <b>Endpoint Owner Directory</b> is enabled in Cisco ISE, the RADIUS server load balancing feature is enabled in the controller and there is a high rate of 802.1x authentication or accounting requests resulting in the following:</p> <ul style="list-style-type: none"> <li>• High Authentication Latency for sessions in ISE.</li> <li>• Full RMQ queue (with size of 50000 endpoint profiler forwarder events).</li> <li>• Drop new endpoints sessions.</li> </ul>
<b>Step 5</b>	<b>end</b> <b>Example:</b> <pre>Device(config-sg)# end</pre>	Exits server group configuration mode and enters privileged EXEC mode.

## CHAPTER 111

# AAA Dead-Server Detection

- [Information About AAA Dead-Server Detection, on page 1265](#)
- [Prerequisites for AAA Dead-Server Detection, on page 1266](#)
- [Restrictions for AAA Dead-Server Detection, on page 1266](#)
- [Configuring AAA Dead-Server Detection \(CLI\), on page 1266](#)
- [Verifying AAA Dead-Server Detection, on page 1267](#)

## Information About AAA Dead-Server Detection

The AAA Dead-Server Detection feature allows you to configure the criteria to be used to mark a RADIUS server as dead.

If you have more than one RADIUS server, the following concepts come into picture:

- **Deadtime**—Defines the time in minutes a server marked as DEAD is held in that state. Once the deadtime expires, the controller marks the server as UP (ALIVE) and notifies the registered clients about the state change. If the server is still unreachable after the state is marked as UP and if the DEAD criteria is met, then server is marked as DEAD again for the deadtime interval.

---

**Note** You can configure deadtime for each server group or on a global level.

---

- **Dead-criteria**—To declare a server as DEAD, you need to configure **dead-criteria** and configure the conditions that determine when a RADIUS server is considered unavailable or dead.

Using this feature will result in less deadtime and quicker packet processing.

### Criteria for Marking a RADIUS Server As Dead

The AAA Dead-Server Detection feature allows you to determine the criteria that are used to mark a RADIUS server as dead. That is, you can configure the minimum amount of time, in seconds, that must elapse from the time that the controller last received a valid packet from the RADIUS server to the time the server is marked as dead. If a packet has not been received since the controller booted, and there is a timeout, the time criterion will be treated as though it has been met.

In addition, you can configure the number of consecutive timeouts that must occur on the controller before the RADIUS server is marked as dead. If the server performs both authentication and accounting, both types

of packets are included in the number. Improperly constructed packets are counted as though they are timeouts. Both initial packet transmission and retransmissions are counted. (Each timeout causes one retransmission to be sent.)

**Note** Both the time criterion and tries criterion must be met for the server to be marked as dead.

The RADIUS dead-server detection configuration will result in the prompt detection of RADIUS servers that have stopped responding. This configuration will also result in the avoidance of servers being improperly marked as dead when they are “swamped” (responding slowly) and the avoidance of the state of servers being rapidly changed from dead to live to dead again. This prompt detection of non-responding RADIUS servers and the avoidance of swamped and dead-to-live-to-dead-again servers will result in less deadtime and quicker packet processing.

## Prerequisites for AAA Dead-Server Detection

- You must have access to a RADIUS server.
- You should be familiar with configuring a RADIUS server.
- You should be familiar with configuring Authentication, Authorization, and Accounting (AAA).
- Before a server can be marked as dead, you must configure **radius-server dead-criteria time** *time-in-seconds* **tries** *number-of-tries* to mark the server as DOWN.

Also, you must configure the **radius-server deadtime** *time-in-mins* to retain the server in DEAD status.

## Restrictions for AAA Dead-Server Detection

- Original transmissions are not counted in the number of consecutive timeouts that must occur on the controller before the server is marked as dead--only the number of retransmissions are counted.

## Configuring AAA Dead-Server Detection (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>aaa new-model</b>  <b>Example:</b> Device(config)# aaa new-model	Enables the AAA access control model.

	Command or Action	Purpose
Step 3	<p><b>radius-server deadtime</b> <i>time-in-mins</i></p> <p><b>Example:</b></p> <pre>Device(config)# radius-server deadtime 5</pre>	<p>Defines the time in minutes when a server marked as DEAD is held in that state. Once the deadtime expires, the controller marks the server as UP (ALIVE) and notifies the registered clients about the state change. If the server is still unreachable after the state is marked as UP and if the DEAD criteria is met, then server is marked as DEAD again for the deadtime interval.</p> <p><i>time-in-mins</i>—Valid values range from 1 to 1440 minutes. Default value is zero. To return to the default value, use the <b>no radius-server deadtime</b> command.</p> <p>The <b>radius-server deadtime</b> command can be configured globally or per aaa group server level.</p> <p>You can use the <b>show aaa dead-criteria</b> or <b>show aaa servers</b> command to check for dead-server detection. If the default value is zero, deadtime is not configured.</p>
Step 4	<p><b>radius-server dead-criteria</b> [<b>time</b> <i>time-in-seconds</i>][<b>tries</b> <i>number-of-tries</i>]</p> <p><b>Example:</b></p> <pre>Device(config)# radius-server dead-criteria time 5 tries 4</pre>	<p>Declares a server as DEAD and configures the conditions that determine when a RADIUS server is considered unavailable or dead.</p> <p><i>time-in-seconds</i>—Time in seconds during which no response is received from the RADIUS server to consider it as dead. Valid values range from 1 to 120 seconds.</p> <p><i>number-of-tries</i>—Number of transmits to RADIUS server without responses before marking the server as dead. Valid values range from 1 to 100.</p>
Step 5	<p><b>end</b></p> <p><b>Example:</b></p> <pre>Device(config)# end</pre>	<p>Exits configuration mode and enters privileged EXEC mode.</p>

## Verifying AAA Dead-Server Detection

To verify dead-criteria, use the following command:

```
Device# show run | s dead-criteria

radius-server dead-criteria time 20 tries 20
```

To verify the dead-criteria details, use the following command:

```
Device# sh aaa dead-criteria radius <server>

sh aaa dead-criteria radius 8.109.0.55
RADIUS Server Dead Criteria:
Server Details:
Address : 8.109.0.55
Auth Port : 1645
Acct Port : 1646
Server Group : radius
Dead Criteria Details:
Configured Retransmits : 3
Configured Timeout : 5
Estimated Outstanding Access Transactions: 2
Estimated Outstanding Accounting Transactions: 0
Dead Detect Time : 30s
Computed Retransmit Tries: 6
Statistics Gathered Since Last Successful Transaction
Max Computed Outstanding Transactions: 3
Max Computed Dead Detect Time: 90s
Max Computed Retransmits : 18
```

To verify the state of servers, number of requests being processed, and so on, use the following command:

```
Device# show aaa servers | s WNCN

Platform State from WNCN (1) : current UP
Platform State from WNCN (2) : current UP
Platform State from WNCN (3) : current UP
Platform State from WNCN (4) : current UP
Platform State from WNCN (5) : current UP, duration 773s, previous duration 0s
Platform Dead: total time 0s, count 0
Quarantined: No
```

## CHAPTER 112

# ISE Simplification and Enhancements

- [Utilities for Configuring Security, on page 1269](#)
- [Configuring Captive Portal Bypassing for Local and Central Web Authentication, on page 1271](#)
- [Sending DHCP Options 55 and 77 to ISE, on page 1274](#)
- [Captive Portal, on page 1277](#)

## Utilities for Configuring Security

This chapter describes how to configure all the RADIUS server side configuration using the following command:

**wireless-default radius server *ip key secret***

This simplified configuration option provides the following:

- Configures AAA authorization for network services, authentication for web auth and Dot1x.
- Enables local authentication with default authorization.
- Configures the default redirect ACL for CWA.
- Creates global parameter map with virtual IP and enables captive bypass portal.
- Configures all the AAA configuration for a default case while configuring the RADIUS server.
- The method-list configuration is assumed by default on the WLAN.
- Enables the radius accounting by default.
- Disables the radius aggressive failovers by default.
- Sets the radius request timeouts to 5 seconds by default.
- Enables captive bypass portal.

This command configures the following in the background:

```
aaa new-model
aaa authentication webauth default group radius
aaa authentication dot1x default group radius
aaa authorization network default group radius
aaa accounting identity default start-stop group radius
!
aaa server radius dynamic-author
```

```

client <IP> server-key cisco123
!
radius server RAD_SRV_DEF_<IP>
description Configured by wireless-default
address ipv4 <IP> auth-port 1812 acct-port 1813
key <key>
!
aaa local authentication default authorization default
aaa session-id common
!
ip access-list extended CISCO-CWA-URL-REDIRECT-ACL-DEFAULT
remark " CWA ACL to be referenced from ISE "
deny udp any any eq domain
deny tcp any any eq domain
deny udp any any eq bootps any
deny udp any any eq bootpc
deny udp any eq bootpc any
deny ip any host <IP>
permit tcp any any eq www
!
parameter-map type webauth global
captive-bypass-portal
virtual-ip ipv4 192.0.2.1
virtual-ip ipv6 1001::1
!
wireless profile policy default-policy-profile
aaa-override
local-http-profiling
local-dhcp-profiling
accounting

```

Thus, you need not go through the entire Configuration Guide to configure wireless controller for a simple configuration requirement.

## Configuring Multiple Radius Servers

Use the following procedure to configure a RADIUS server.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wireless-default radius server ip key secret</b>  <b>Example:</b> Device(config)# wireless-default radius server 9.2.58.90 key cisco123	Configures a radius server.  <b>Note</b> You can configure up to ten RADIUS servers.
<b>Step 3</b>	<b>end</b>  <b>Example:</b> Device(config)# end	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Verifying AAA and Radius Server Configurations

To view details of AAA server, use the following command:

```
Device# show run aaa
!
aaa new-model
aaa authentication webauth default group radius
aaa authentication dot1x default group radius
aaa authorization network default group radius
aaa accounting Identity default start-stop group radius
!
aaa server radius dynamic-author
 client 9.2.58.90 server-key cisco123
!
radius server RAD_SRV_DEF_9.2.58.90
 description Configured by wireless-default
 address ipv4 9.2.58.90 auth-port 1812 acct-port 1813
 key cisco123
!
aaa local authentication default authorization default
aaa session-id common
!
!
ip access-list extended CISCO-CWA-URL-REDIRECT-ACL-DEFAULT
remark " CWA ACL to be referenced from ISE "
deny udp any any eq domain
deny tcp any any eq domain
deny udp any eq bootps any
deny udp any any eq bootpc
deny udp any eq bootpc any
deny ip any host 9.2.58.90
permit tcp any any eq www
!
parameter-map type webauth global
 captive-bypass-portal
 virtual-ip ipv4 192.0.2.1
 virtual-ip ipv6 1001::1
!
wireless profile policy default-policy-profile
 aaa-override
 local-http-profiling
 local-dhcp-profiling
 accounting
```

---

**Note** The `show run aaa` output may change when new commands are added to this utility.

---

## Configuring Captive Portal Bypassing for Local and Central Web Authentication

### Information About Captive Bypassing

WISPr is a draft protocol that enables users to roam between different wireless service providers. Some devices (For example, Apple iOS devices) have a mechanism using which they can determine if the device is connected

to Internet, based on an HTTP WISPr request made to a designated URL. This mechanism is used for the device to automatically open a web browser when a direct connection to the internet is not possible. This enables the user to provide his credentials to access the internet. The actual authentication is done in the background every time the device connects to a new SSID.

The client device (Apple iOS device) sends a WISPr request to the controller, which checks for the user agent details and then triggers an HTTP request with a web authentication interception in the controller. After verification of the iOS version and the browser details provided by the user agent, the controller allows the client to bypass the captive portal settings and provides access to the Internet.

This HTTP request triggers a web authentication interception in the controller as any other page requests are performed by a wireless client. This interception leads to a web authentication process, which will be completed normally. If the web authentication is being used with any of the controller splash page features (URL provided by a configured RADIUS server), the splash page may never be displayed because the WISPr requests are made at very short intervals, and as soon as one of the queries is able to reach the designated server, any web redirection or splash page display process that is performed in the background is cancelled, and the device processes the page request, thus breaking the splash page functionality.

For example, Apple introduced an iOS feature to facilitate network access when captive portals are present. This feature detects the presence of a captive portal by sending a web request on connecting to a wireless network. This request is directed to <http://www.apple.com/library/test/success.html> for Apple iOS version 6 and older, and to several possible target URLs for Apple iOS version 7 and later. If a response is received, then the Internet access is assumed to be available and no further interaction is required. If no response is received, then the Internet access is assumed to be blocked by the captive portal and Apple's Captive Network Assistant (CNA) auto-launches the pseudo-browser to request portal login in a controlled window. The CNA may break when redirecting to an ISE captive portal. The controller prevents this pseudo-browser from popping up.

You can now configure the controller to bypass WISPr detection process, so the web authentication interception is only done when a user requests a web page leading to splash page load in user context, without the WISPr detection being performed in the background.

## Configuring Captive Bypassing for WLAN in LWA and CWA (GUI)

### Procedure

---

- Step 1** Choose **Configuration > Security > Web Auth**.
  - Step 2** In the **Webauth Parameter Map** tab, click the parameter map name. The **Edit WebAuth Parameter** window is displayed.
  - Step 3** Select **Captive Bypass Portal** check box.
  - Step 4** Click **Update & Apply to Device**.
-

## Configuring Captive Bypassing for WLAN in LWA and CWA (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>parameter-map type webauth</b> <i>parameter-map-name</i> <b>Example:</b> Device(config)# parameter-map type webauth WLAN1_MAP	Creates the parameter map.  The <i>parameter-map-name</i> must not exceed 99 characters.
<b>Step 3</b>	<b>captive-bypass-portal</b> <b>Example:</b> Device(config)# captive-bypass-portal	Configures captive bypassing.
<b>Step 4</b>	<b>wlan profile-name wlan-id ssid-name</b> <b>Example:</b> Device(config)# wlan WLAN1_NAME 4 WLAN1_NAME	Specifies the WLAN name and ID. <ul style="list-style-type: none"> <li>• <i>profile-name</i> is the WLAN name which can contain 32 alphanumeric characters.</li> <li>• <i>wlan-id</i> is the wireless LAN identifier. The valid range is from 1 to 512.</li> <li>• <i>ssid-name</i> is the SSID which can contain 32 alphanumeric characters.</li> </ul>
<b>Step 5</b>	<b>security web-auth</b> <b>Example:</b> Device(config-wlan)# security web-auth	Enables the web authentication for the WLAN.
<b>Step 6</b>	<b>security web-auth parameter-map</b> <i>parameter-map-name</i> <b>Example:</b> Device(config-wlan)# security web-auth parameter-map WLAN1_MAP	Maps the parameter map.  <b>Note</b> If parameter map is not associated with a WLAN, the configuration is considered from the global parameter map.
<b>Step 7</b>	<b>end</b> <b>Example:</b> Device(config-wlan)# end	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

# Sending DHCP Options 55 and 77 to ISE

## Information about DHCP Option 55 and 77

The DHCP sensors use the following DHCP options on the ISE for native and remote profiling:

- **Option 12:** Hostname
- **Option 6:** Class Identifier

Along with this, the following options needs to be sent to the ISE for profiling:

- **Option 55:** Parameter Request List
- **Option 77:** User Class

## Configuration to Send DHCP Options 55 and 77 to ISE (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Tags & Profiles > Policy**.
  - Step 2** On the **Policy Profile** page, click **Add** to view the **Add Policy Profile** window.
  - Step 3** Click **Access Policies** tab, choose the **RADIUS Profiling** and **DHCP TLV Caching** check boxes to configure radius profiling and DHCP TLV Caching on a WLAN.
  - Step 4** Click **Save & Apply to Device**.
- 

## Configuration to Send DHCP Options 55 and 77 to ISE (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wireless profile policy <i>profile-policy</i></b>  <b>Example:</b> Device(config)# wireless profile policy rr-xyz-policy-1	Configures WLAN policy profile and enters the wireless policy configuration mode.
<b>Step 3</b>	<b>dhcp-tlv-caching</b>  <b>Example:</b>	Configures DHCP TLV caching on a WLAN.

	Command or Action	Purpose
	Device(config-wireless-policy) # dhcp-tlv-caching	
<b>Step 4</b>	<b>radius-profiling</b>  <b>Example:</b> Device(config-wireless-policy) # radius-profiling	Configures client radius profiling on a WLAN.
<b>Step 5</b>	<b>end</b>  <b>Example:</b> Device(config-wireless-policy) # end	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Configuring EAP Request Timeout (GUI)

Follow the steps given below to configure the EAP Request Timeout through the GUI:

### Procedure

- 
- Step 1** Choose **Configuration > Security > Advanced EAP**.
- Step 2** In the **EAP-Identity-Request Timeout** field, specify the amount of time (in seconds) in which the device attempts to send an EAP identity request to wireless clients using local EAP.
- Step 3** In the **EAP-Identity-Request Max Retries** field, specify the maximum number of times that the device attempts to retransmit the EAP identity request to wireless clients using local EAP.
- Step 4** Set **EAP Max-Login Ignore Identity Response** to **Enabled** state to limit the number of clients that can be connected to the device with the same username. You can log in up to eight times from different clients (PDA, laptop, IP phone, and so on) on the same device. The default state is **Disabled**.
- Step 5** In the **EAP-Request Timeout** field, specify the amount of time (in seconds) in which the device attempts to send an EAP request to wireless clients using local EAP.
- Step 6** In the **EAP-Request Max Retries** field, specify the maximum number of times that the device attempts to retransmit the EAP request to wireless clients using local EAP.
- Step 7** In the **EAPOL-Key Timeout** field, specify the amount of time (in seconds) in which the device attempts to send an EAP key over the LAN to wireless clients using local EAP.
- Step 8** In the **EAPOL-Key Max Retries** field, specify the maximum number of times that the device attempts to send an EAP key over the LAN to wireless clients using local EAP.
- Step 9** In the **EAP-Broadcast Key Interval** field, specify the time interval between rotations of the broadcast encryption key used for clients and click **Apply**.

**Note** After configuring the EAP-Broadcast key interval to a new time period, you must shut down or restart the WLAN for the changes to take effect. Once the WLAN is shut down or restarted, the M5 and M6 packets are exchanged when the configured timer value expires.

## Configuring EAP Request Timeout

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wireless wps client-exclusion dot1x-timeout</b>  <b>Example:</b> Device(config)# wireless wps client-exclusion dot1x-timeout	Enables exclusion on timeout and no response.  By default, this feature is enabled.  To disable, append a <b>no</b> at the beginning of the command.
<b>Step 3</b>	<b>end</b>  <b>Example:</b> Device(config)# end	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Configuring EAP Request Timeout in Wireless Security (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wireless security dot1x request {retries 0 - 20   timeout 1 - 120}</b>  <b>Example:</b> Device(config)# wireless security dot1x request timeout 60	Configures the EAP request retransmission timeout value in seconds.
<b>Step 3</b>	<b>end</b>  <b>Example:</b> Device(config)# end	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

# Captive Portal

## Captive Portal Configuration

This feature enables you to configure multiple web authentication URLs (including external captive URLs) for the same SSID based on an AP. The default setting is to use the Global URL for authentication. The override option is available at WLAN and AP level.

The order of precedence is:

- AP
- WLAN
- Global configuration

### Restrictions for Captive Portal Configuration

- This configuration is supported in a standalone controller only.
- Export-Anchor configuration is not supported.

## Configuring Captive Portal (GUI)

### Procedure

---

- Step 1** Choose **Configuration > Tags & Profiles > WLANs**.
- Step 2** Click **Add**.
- Step 3** In the **General** tab, enter the **Profile Name**, the **SSID**, and the **WLAN ID**.
- Step 4** In the **Security > Layer2** tab, uncheck the **WPA Policy**, **AES** and **802.1x** check boxes.
- Step 5** In the **Security > Layer3** tab, choose the parameter map from the **Web Auth Parameter Map** drop-down list and authentication list from the **Authentication List** drop-down list.
- Step 6** In the **Security > AAA** tab, choose the Authentication list from the **Authentication List** drop-down list.
- Step 7** Click **Apply to Device**.
- Step 8** Choose **Configuration > Security > Web Auth**.
- Step 9** Choose a **Web Auth Parameter Map**.
- Step 10** In the **General** tab, enter the **Maximum HTTP connections**, **Init-State Timeout(secs)** and choose **webauth** from the **Type** drop-down list.
- Step 11** In the **Advanced** tab, under the **Redirect to external server** settings, enter the **Redirect for log-in** server.
- Step 12** Click **Update & Apply**.
-

# Configuring Captive Portal

## Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wlan</b> { <i>profile-name</i>   <b>shutdown</b> } <i>network-name</i> <b>Example:</b> Device(config)# wlan edc6 6 edc	Configures the WLAN profile. Enables or Disables all WLANs and creates the WLAN identifier. The profile-name and the SSID network name should be up to 32 alphanumeric characters.
<b>Step 3</b>	<b>ip</b> { <b>access-group</b>   <b>verify</b> } <b>web</b> <i>IPv4-ACL-Name</i> <b>Example:</b> Device(config-wlan)# ip access-group web CPWebauth	Configures the WLAN web ACL. <b>Note</b> WLAN needs to be disabled before performing this operation.
<b>Step 4</b>	<b>no security wpa</b> <b>Example:</b> Device(config-wlan)# no security wpa	Disables WPA security.
<b>Step 5</b>	<b>no security wpa akm dot1x</b> <b>Example:</b> Device(config-wlan)# no security wpa akm dot1x	Disables security AKM for dot1x.
<b>Step 6</b>	<b>no security wpa wpa2 ciphers aes</b> <b>Example:</b> Device(config-wlan)# no security wpa wpa2 ciphers aes	Disables WPA2 ciphers for AES.
<b>Step 7</b>	<b>security web-auth</b> { <b>authentication-list</b> <i>authentication-list-name</i>   <b>authorization-list</b> <i>authorization-list-name</i>   <b>on-macfilter-failure</b>   <b>parameter-map</b> <i>parameter-map-name</i> } <b>Example:</b> Device(config-wlan)# security web-auth authentication-list cp-webauth Device(config-wlan)# security web-auth parameter-map parMap6	Enables web authentication for WLAN. Here, <ul style="list-style-type: none"> <li>• <b>authentication-list</b> <i>authentication-list-name</i>: Sets the authentication list for IEEE 802.1x.</li> <li>• <b>authorization-list</b> <i>authorization-list-name</i>: Sets the override-authorization list for IEEE 802.1x.</li> <li>• <b>on-macfilter-failure</b>: Enables Web authentication on MAC filter failure.</li> </ul>

	Command or Action	Purpose
		<ul style="list-style-type: none"> <li><b>parameter-map</b> <i>parameter-map-name</i>: Configures the parameter map.</li> </ul> <p><b>Note</b> When <b>security web-auth</b> is enabled, you get to map the default <b>authentication-list</b> and global <b>parameter-map</b>. This is applicable for authentication-list and parameter-map that are not explicitly mentioned.</p>
<b>Step 8</b>	<b>no shutdown</b> <b>Example:</b> Device(config-wlan)# no shutdown	Enables the WLAN.
<b>Step 9</b>	<b>exit</b> <b>Example:</b> Device(config-wlan)# exit	Exits from the WLAN configuration.
<b>Step 10</b>	<b>parameter-map type webauth</b> <i>parameter-map-name</i> <b>Example:</b> Device(config)# parameter-map type webauth parMap6	Creates a parameter map and enters parameter-map webauth configuration mode.
<b>Step 11</b>	<b>parameter-map type webauth</b> <i>parameter-map-name</i> <b>Example:</b> Device(config)# parameter-map type webauth parMap6	Creates a parameter map and enters parameter-map webauth configuration mode.
<b>Step 12</b>	<b>type webauth</b> <b>Example:</b> Device(config-params-parameter-map)# type webauth	Configures the webauth type parameter.
<b>Step 13</b>	<b>timeout init-state sec &lt;timeout-seconds&gt;</b> <b>Example:</b> Device(config-params-parameter-map)# timeout inti-state sec 3600	Configures the WEBAUTH timeout in seconds. Valid range for the time in sec parameter is 60 seconds to 3932100 seconds.
<b>Step 14</b>	<b>redirect for-login &lt;URL-String&gt;</b> <b>Example:</b> Device(config-params-parameter-map)# redirect for-login https://172.16.100.157/portal/login.html	Configures the URL string for redirect during login.

	Command or Action	Purpose
<b>Step 15</b>	<b>exit</b> <b>Example:</b> Device(config-params-parameter-map)# exit	Exits the parameters configuration.
<b>Step 16</b>	<b>wireless tag policy <i>policy-tag-name</i></b> <b>Example:</b> Device(config)# wireless tag policy policy_tag_edc6	Configures policy tag and enters policy tag configuration mode.
<b>Step 17</b>	<b>wlan <i>wlan-profile-name</i> policy <i>policy-profile-name</i></b> <b>Example:</b> Device(config-policy-tag)# wlan edc6 policy policy_profile_flex	Attaches a policy profile to a WLAN profile.
<b>Step 18</b>	<b>end</b> <b>Example:</b> Device(config-policy-tag)# end	Saves the configuration and exits configuration mode and returns to privileged EXEC mode.

## Captive Portal Configuration - Example

The following example shows how you can have APs at different locations, broadcasting the same SSID but redirecting clients to different redirect portals:

Configuring multiple parameter maps pointing to different redirect portal:

```
parameter-map type webauth parMap1
type webauth
timeout init-state sec 21600
redirect for-login
https://172.16.12.3:8080/portal/PortalSetup.action?portal=cfdbce00-2ce2-11e8-b83c-005056a06b27
redirect portal ipv4 172.16.12.3
!
!
parameter-map type webauth parMap11
type webauth
timeout init-state sec 21600
redirect for-login
https://172.16.12.4:8443/portal/PortalSetup.action?portal=094e7270-3808-11e8-9797-02421e4cae0c

```

Associating these parameter maps to different WLANs:

```
wlan edc1 1 edc
ip access-group web CPWebauth
no security wpa
no security wpa akm dot1x
no security wpa wpa2 ciphers aes
security web-auth
security web-auth authentication-list cp-webauth
security web-auth parameter-map parMap11
```

```
no shutdown
wlan edc2 2 edc
ip access-group web CPWebauth
no security wpa
no security wpa akm dot1x
no security wpa wpa2 ciphers aes
security web-auth
security web-auth authentication-list cp-webauth
security web-auth parameter-map parMap1
no shutdown
```

---

**Note** All WLANs have identical SSIDs.

---

Associating WLANs to different policy tags:

```
wireless tag policy policy_tag_edc1
wlan edc1 policy policy_profile_flex
wireless tag policy policy_tag_edc2
wlan edc2 policy policy_profile_flex
```

Assigning these policy tags to the desired APs:

```
ap E4AA.5D13.14DC
policy-tag policy_tag_edc1
site-tag site_tag_flex
ap E4AA.5D2C.3CAC
policy-tag policy_tag_edc2
site-tag site_tag_flex
```

## CHAPTER 113

# RADIUS DTLS

---

- [Information About RADIUS DTLS, on page 1283](#)
- [Prerequisites, on page 1285](#)
- [Configuring RADIUS DTLS Server, on page 1285](#)
- [Configuring DTLS Dynamic Author, on page 1290](#)
- [Enabling DTLS for Client, on page 1291](#)
- [Verifying the RADIUS DTLS Server Configuration, on page 1293](#)
- [Clearing RADIUS DTLS Specific Statistics, on page 1293](#)

## Information About RADIUS DTLS

The Remote Authentication Dial-In User Service (RADIUS) is a client or server protocol that provides centralized security for users attempting to gain management access to a network. The RADIUS protocol is a widely deployed authentication and authorization protocol that delivers a complete Authentication, Authorization, and Accounting (AAA) solution.

### RADIUS DTLS Port

The RADIUS port (DTLS server) is used for authentication and accounting. The default DTLS server port is 2083.

You can change the RADIUS DTLS port number using `dtls port port_number`. For more information, see the [Configuring RADIUS DTLS Port Number](#) section.

### Shared Secret

You can use `radius/dtls` as the shared secret, if you have enabled DTLS for a specific server.

### Handling PAC for CTS Communication

You can download PAC from ISE for CTS communication. Once the PAC is downloaded, you need to encrypt all the CTS attributes with the PAC key instead of the shared secret.

The ISE then decrypts these attributes using PAC.

### Session Management

The RADIUS client purely depends on the response from the DTLS server. If the session is ideal for ideal timeout, then the session must be closed.

In case of invalid responses, the sessions must be deleted.

If you need to send the radius packets over DTLS, the DTLS session needs to be re-established with the specific server.

### Load Balancing

Multiple DTLS servers and load balancing methods are configured.

You need to select the AAA server to which the request needs to be sent. Then use the DTLS context of the specific server to encrypt the RADIUS packet and send it back.

### Connection Timeout

After the encrypted RADIUS packet is sent, you need to start the retransmission timer. If you do not get a response before the retransmission timer expires, the packet is re-encrypted and re-transmitted.

You can continue for number of times as per the **dtls retries** configuration or till the default value. Once the number of tries exceeds the limit, the server becomes unavailable and responses are sent back to the AAA clients.

---

**Note** The default connection timeout is 5 seconds.

---

### Connection Retries

As the RADIUS DTLS is UDP based, you need to retry the connection after a specific timeout interval for a specific number of retries.

After all retries are exhausted, the DTLS connection performs the following:

- Is marked as unsuccessful.
- Looks up for the next available server for processing the RADIUS requests.

---

**Note** The default connection retries is 5.

---

### Idle Timeout

When the idle timer expires and no transactions exists since the last idle timeout, the DTLS session remains closed.

After you establish the DTLS session, you can start the idle timer. If you start the idle timer for 30 seconds and one of the RADIUS DTLS packet is sent, then after 30 seconds, the idle timer expires and checks for number of RADIUS DTLS transactions.

If the idle timer value exceeds zero, the idle timer resets the transaction counter and restarts the timer.

---

**Note** The default idle timeout is 60 seconds.

---

### Handling Server and Server Group Failover

You can configure RADIUS servers with and without DTLS. It is recommended to create AAA server groups with DTLS enabled servers and non-DTLS servers. However, you will not find any such restriction while configuring AAA server groups.

Suppose you choose a DTLS server, the DTLS server establishes connection and RADIUS request packet is sent to the DTLS server. If the DTLS server does not respond after all RADIUS retries, it would fall over to the next configured server in the same server group. If the next server is a DTLS server, the processing of the RADIUS request packet continues with the next server. If the next server is a non-DTLS server, the processing of RADIUS request packet does not happen in that server group. Then the server group failover occurs and the same sequence continues with the next server group, if the next server group is available.

---

**Note** You need to use either only DTLS or non-DTLS servers in a server group.

---

## Prerequisites

### Support for IOS and BINOS AAA

The AAA server runs in IOS and BINOS platforms. Once you complete the RADIUS DTLS support in IOS, the same needs to be ported to BINOS.

## Configuring RADIUS DTLS Server

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b>  <b>Example:</b> Device# enable	Enters privileged EXEC mode.
<b>Step 2</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 3</b>	<b>radius server</b> <i>server-name</i>  <b>Example:</b> Device(config)# radius server R1	Specifies the RADIUS server name.

	Command or Action	Purpose
<b>Step 4</b>	<b>dtls</b> <b>Example:</b> Device(config-radius-server) # <b>dtls</b>	Configures DTLS parameters.
<b>Step 5</b>	<b>end</b> <b>Example:</b> Device(config-radius-server) # <b>end</b>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Configuring RADIUS DTLS Connection Timeout

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Device# <b>enable</b>	Enters privileged EXEC mode.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 3</b>	<b>radius server</b> <i>server-name</i> <b>Example:</b> Device(config) # <b>radius server R1</b>	Specifies the RADIUS server name.
<b>Step 4</b>	<b>dtls connectiontimeout</b> <i>timeout</i> <b>Example:</b> Device(config-radius-server) # <b>dtls connectiontimeout 1</b>	Configures RADIUS DTLS connection timeout. Here, <i>timeout</i> refers to the DTLS connection timeout value. The valid range is from 1 to 65535.
<b>Step 5</b>	<b>end</b> <b>Example:</b> Device(config-radius-server) # <b>end</b>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Configuring RADIUS DTLS Idle Timeout

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b>	Enters privileged EXEC mode.

	Command or Action	Purpose
	Device# enable	
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 3</b>	<b>radius server</b> <i>server-name</i> <b>Example:</b> Device(config)# radius server R1	Specifies the RADIUS server name.
<b>Step 4</b>	<b>dtls idletimeout</b> <i>idle_timeout</i> <b>Example:</b> Device(config-radius-server)# dtls idletimeout 2	Configures RADIUS DTLS idle timeout. Here, <i>idle_timeout</i> refers to the DTLS idle timeout value. The valid range is from 1 to 65535.
<b>Step 5</b>	<b>end</b> <b>Example:</b> Device(config-radius-server)# end	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Configuring Source Interface for RADIUS DTLS Server

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Device# enable	Enters privileged EXEC mode.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 3</b>	<b>radius server</b> <i>server-name</i> <b>Example:</b> Device(config)# radius server R1	Specifies the RADIUS server name.
<b>Step 4</b>	<b>dtls ip</b> {radius source-interface <b>Ethernet-Internal</b> <i>interface_number</i> <b>Example:</b> Device(config-radius-server)# dtls ip radius source-interface Ethernet-Internal 0	Configures source interface for RADIUS DTLS server. Here, <ul style="list-style-type: none"> <li><i>interface_number</i> refers to the Ethernet-Internal interface number. The default value is 0.</li> </ul>

	Command or Action	Purpose
<b>Step 5</b>	<b>end</b> <b>Example:</b> Device(config-radius-server) # <b>end</b>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Configuring RADIUS DTLS Port Number

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Device# <b>enable</b>	Enters privileged EXEC mode.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 3</b>	<b>radius server</b> <i>server-name</i> <b>Example:</b> Device(config)# <b>radius server R1</b>	Specifies the RADIUS server name.
<b>Step 4</b>	<b>dtls port</b> <i>port_number</i> <b>Example:</b> Device(config-radius-server) # <b>dtls port</b> <b>2</b>	Configures RADIUS DTLS port number. Here, <i>port_number</i> refers to the DTLS port number.
<b>Step 5</b>	<b>end</b> <b>Example:</b> Device(config-radius-server) # <b>end</b>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Configuring RADIUS DTLS Connection Retries

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Device# <b>enable</b>	Enters privileged EXEC mode.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b>	Enters global configuration mode.

	Command or Action	Purpose
	Device# configure terminal	
<b>Step 3</b>	<b>radius server</b> <i>server-name</i>  <b>Example:</b> Device(config)# <b>radius server R1</b>	Specifies the RADIUS server name.
<b>Step 4</b>	<b>dtls retries</b> <i>retry_number</i>  <b>Example:</b> Device(config-radius-server)# <b>dtls retries 3</b>	Configures RADIUS connection retries.  Here, <i>retry_number</i> refers to the DTLS connection retries. The valid range is from 1 to 65535.
<b>Step 5</b>	<b>end</b>  <b>Example:</b> Device(config-radius-server)# <b>end</b>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Configuring RADIUS DTLS Trustpoint

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b>  <b>Example:</b> Device# enable	Enters privileged EXEC mode.
<b>Step 2</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 3</b>	<b>radius server</b> <i>server-name</i>  <b>Example:</b> Device(config)# <b>radius server R1</b>	Specifies the RADIUS server name.
<b>Step 4</b>	<b>dtls trustpoint</b> { <b>client</b> <i>LINE dtls</i>   <b>server</b> <i>LINE dtls</i> }  <b>Example:</b> Device(config-radius-server)# <b>dtls trustpoint client client1 dtls</b>  Device(config-radius-server)# <b>dtls trustpoint server server1 dtls</b>	Configures trustpoint for client and server.
<b>Step 5</b>	<b>end</b>  <b>Example:</b> Device(config-radius-server)# <b>end</b>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Configuring RADIUS DTLS Match-Server-Identity

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> <code>dtls match-server-identity hostname &lt;name&gt;</code>	Configure the RADSEC certification validation parameters.
<b>Step 2</b>	<b>enable</b> <b>Example:</b> <code>dtls match-server-identity ip-address &lt;IPv4 or IPv6&gt;</code>	Configure the RADSEC certification validation parameters.

## Configuring DTLS Dynamic Author

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> <code>Device# enable</code>	Enters privileged EXEC mode.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> <code>Device# configure terminal</code>	Enters global configuration mode.
<b>Step 3</b>	<b>aaa server radius dynamic-author</b> <b>Example:</b> <code>Device(config)# aaa server radius dynamic-author</code>	Configures local server profile for RFC 3576 support.
<b>Step 4</b>	<b>dtls</b> <b>Example:</b> <code>Device(config-locsvr-da-radius)# dtls</code>	Configures DTLS source parameters.
<b>Step 5</b>	<b>end</b> <b>Example:</b> <code>Device(config-locsvr-da-radius)# end</code>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Enabling DTLS for Client

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Device# enable	Enters privileged EXEC mode.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 3</b>	<b>aaa server radius dynamic-author</b> <b>Example:</b> Device(config)# <b>aaa server radius dynamic-author</b>	Configures local server profile for RFC 3576 support.
<b>Step 4</b>	<b>client IP_addr dtls</b> <b>Example:</b> Device(config-locsvr-da-radius)# <b>client 10.104.49.14 dtls</b>	Enables DTLS for the client.
<b>Step 5</b>	<b>end</b> <b>Example:</b> Device(config-locsvr-da-radius)# <b>end</b>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Configuring Client Trustpoint for DTLS

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Device# enable	Enters privileged EXEC mode.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 3</b>	<b>aaa server radius dynamic-author</b> <b>Example:</b>	Configures local server profile for RFC 3576 support.

	Command or Action	Purpose
	Device(config)# <b>aaa server radius dynamic-author</b>	
<b>Step 4</b>	<b>client <i>IP_addr</i> dtls {client-tp <i>client-tp-name</i>   server-tp <i>server-tp-name</i>}</b>  <b>Example:</b> Device(config-locsvr-da-radius)# <b>client 10.104.49.14 dtls client-tp client_tp_name</b>	Configures client trustpoint for DTLS.
<b>Step 5</b>	<b>end</b>  <b>Example:</b> Device(config-locsvr-da-radius)# <b>end</b>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Configuring DTLS Idle Timeout

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b>  <b>Example:</b> Device# <b>enable</b>	Enters privileged EXEC mode.
<b>Step 2</b>	<b>configure terminal</b>  <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 3</b>	<b>aaa server radius dynamic-author</b>  <b>Example:</b> Device(config)# <b>aaa server radius dynamic-author</b>	Configures local server profile for RFC 3576 support.
<b>Step 4</b>	<b>client <i>IP_addr</i> dtls idletimeout timeout-interval {client-tp <i>client_tp_name</i>   server-tp <i>server_tp_name</i>}</b>  <b>Example:</b> Device(config-locsvr-da-radius)# <b>client 10.104.49.14 dtls idletimeout 62 client-tp dtls_ise</b>	Configures DTLS idle time.  Here, <i>timeout-interval</i> refers to the idle timeout interval. The valid range is from 60 to 600.
<b>Step 5</b>	<b>end</b>  <b>Example:</b> Device(config-locsvr-da-radius)# <b>end</b>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Configuring Server Trustpoint for DTLS

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Device# enable	Enters privileged EXEC mode.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 3</b>	<b>aaa server radius dynamic-author</b> <b>Example:</b> Device(config)# <b>aaa server radius dynamic-author</b>	Configures local server profile for RFC 3576 support.
<b>Step 4</b>	<b>client IP_addr dtls server-tp server_tp_name</b> <b>Example:</b> Device(config-locsvr-da-radius)# <b>client 10.104.49.14 dtls server-tp dtls_client</b>	Configures server trust point.
<b>Step 5</b>	<b>end</b> <b>Example:</b> Device(config-locsvr-da-radius)# <b>end</b>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Verifying the RADIUS DTLS Server Configuration

To view information about the DTLS enabled servers, use the following command:

```
Device# show aaa servers
DTLS: Packet count since last idletimeout 1,
Send handshake count 3,
Handshake Success 1,
Total Packets Transmitted 1,
Total Packets Received 1,
Total Connection Resets 2,
Connection Reset due to idle timeout 0,
Connection Reset due to No Response 2,
Connection Reset due to Malformed packet 0,
```

## Clearing RADIUS DTLS Specific Statistics

To clear the radius DTLS specific statistics, use the following command:

```
Device# clear aaa counters servers radius {<server-id> | all}
```

---

**Note** Here, *server-id* refers to the server ID displayed by **show aaa servers**. The valid range is from 0 to 2147483647.

---

## CHAPTER 114

# Policy Enforcement and Usage Monitoring

- [Policy Enforcement and Usage Monitoring](#), on page 1295
- [Configuring Policy Enforcement and Enabling Change-of-Authorization \(CLI\)](#), on page 1295
- [Example: Configuring Policy Enforcement and Usage Monitoring](#), on page 1296
- [Verifying Policy Usage and Enforcement](#), on page 1297

## Policy Enforcement and Usage Monitoring

You can enforce dynamic QoS policies and upstream and downstream TCP or UDP data rates on 802.11 clients seamlessly without disrupting the client's ongoing sessions. The feature ensures that clients do not have to get dissociated from the network. All the authentication methods: 802.1X, PSK, web authentication, and so on, are supported.

The APs periodically send client statistics including bandwidth usage to the Controller. The AAA server receives Accounting-Interim messages which include the clients data utilization at the configured intervals. The AAA server accumulates information about data consumption for each client and when the client exhausts the data limit, the AAA server sends a change-of-authorization (CoA) message to the Controllers. Upon successful CoA handshakes, the Controllers apply and send new policies to the APs.

### Restrictions on Policy Enforcement and Usage Monitoring

- Only FlexConnect local switching mode is supported.

## Configuring Policy Enforcement and Enabling Change-of-Authorization (CLI)

For more information, follow the utility specified in Utilities for configuring Security section of this guide.

### Procedure

	Command or Action	Purpose
Step 1	<code>configure terminal</code> Example:	Enters global configuration mode.

	Command or Action	Purpose
	Device# configure terminal	
<b>Step 2</b>	<b>aaa server radius dynamic-author</b> <b>Example:</b> Device(config)# aaa server radius dynamic-author	Creates a local server RADIUS profile in the controller.
<b>Step 3</b>	<b>client client-ip-addr server-key key</b> <b>Example:</b> Device(config-locsvr-da-radius)# client 3.2.4.3 server-key testpwd	Configures a server key for a RADIUS client.
<b>Step 4</b>	<b>[Optional] show aaa command handler</b> <b>Example:</b> Device#show aaa command handler	Displays the AAA CoA packet statistics.

## Example: Configuring Policy Enforcement and Usage Monitoring

Policy enforcement and usage monitoring is applied on a group where a class-map is created for QoS policies. This is done via CoA.

Given below is a sample configuration for policy enforcement and usage monitoring:

```

aaa new-model
 radius server radius_free
 address ipv4 10.0.0.1 auth-port 1812 acct-port 1813
 key cisco123
 exit

aaa new-model
 aaa server radius dynamic-author
 client 10.0.0.1 server-key cisco123
aaa new-model
 aaa group server radius rad_eap
 server name radius_free
 exit
aaa new-model
 dot1x system-auth-control
 aaa authentication dot1x eap_methods group rad_eap
 dot1x system-auth-control
class-map client_dscp_clsmapout
match dscp af13
exit
class-map client_dscp_clsmapin
match dscp af13
exit
policy-map qos_new
 class client_dscp_clsmapout
 police 512000 conform-action transmit exceed-action drop
 policy-map qos_nbn
 class client_dscp_clsmapin
 police 1600000 conform-action transmit exceed-action drop
 wlan test1 3 test2

```

```
 broadcast-ssid
 security wpa wpa2 ciphers aes
 security dot1x authentication-list eap_methods
no shutdown
exit
wireless profile policy named-policy-profile
shutdown
 vlan 10
 aaa-override
 no central association
 no central dhcp
 no central switching
 no shutdown
wireless tag policy named-policy-tag
 wlan test1 policy named-policy-profile
wireless profile flex FP_name_001
 native-vlan-id 10
wireless tag site ST_name_001
 no local-site
 flex-profile FP_name_001
 exit
ap test-ap
 policy-tag named-policy-tag
 site-tag ST_name_001
 exit
aaa authorization network default group radius
exit
```

## Verifying Policy Usage and Enforcement

To view the detailed information about the policies applied to a specific client, use the following command:

```
Device# show wireless client mac-address mac-address detail
```

To view client-level mobility statistics, use the following command:

```
Device# show wireless client mac-address mac-address mobility statistics
```

To view client-level roaming history for an active client in a sub-domain, use the following command:

```
Device# show wireless client mac-address mac-address mobility history
```

To view detailed parameters of a given profile policy, use the following command:

```
Device# show wireless profile policy detailed policy-name
```

## CHAPTER 115

# Local Extensible Authentication Protocol

- [Deploy Policy Tag to Access Points \(GUI\)](#), on page 1306

## Information About Local EAP

Local Extensible Authentication Protocol (EAP) feature refers to the controller that acts as authenticator and authentication server. Local EAP allows 802.1x authentication on WPA Enterprise wireless clients without the use of any RADIUS server. The Local EAP refers to the EAP authentication server activity and not necessarily tied to the user credentials validation (for example) that can be delegated to an external LDAP database.

### Feature Scenarios

Local EAP is designed to allow administrators to use Enterprise-grade 802.1x authentication for a limited number of users in situations and branches where an external dedicated RADIUS server may not be available. It can also work as an emergency backup in case the RADIUS server is not available.

### Use Cases

You can implement Local EAP either with users local to the controller or use an external LDAP database to store the user credentials.

## Restrictions for Local EAP

- It is not possible to configure AAA attributes, such as per-user ACL or per-user session timeout using local EAP.
- Local EAP only allows user database either locally on the controller or on an external LDAP database.
- Local EAP supports TLS 1.2 as of 17.1 and later software release.
- Local EAP uses the trustpoint of your choice on the controller. You will either need to install a publicly trusted certificate on the controller or import it on the clients for the EAP session to be trusted by the client.
- Local EAP supports *EAP-FAST*, *EAP-TLS*, and *PEAP* as EAP authentication methods.

**Note** *PEAP-mschapv2* does not work when using certain external LDAP databases that only support clear text passwords.

## Configuring Local EAP Profile (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>eap profile name</b> <b>Example:</b> Device(config)# eap profile mylocapeap	Creates an EAP profile.
<b>Step 3</b>	<b>method peap</b> <b>Example:</b> Device(config-eap-profile)# method peap	Configures the PEAP method on the profile.
<b>Step 4</b>	<b>pki-trustpoint name</b> <b>Example:</b> Device(config-eap-profile)# pki-trustpoint admincert	Configures the PKI trustpoint on the profile.

## Configuring Local EAP profile (GUI)

### Procedure

---

**Step 1** Choose **Configuration** > **Security** > **Local EAP**.

**Step 2** Click **Add**.

**Step 3** In the **Create Local EAP Profiles** page, enter a profile name.

**Note** It is not advised to use LEAP EAP method due to its weak security. You can use any of the following EAP methods to configure a trustpoint:

- EAP-FAST
- EAP-TLS
- PEAP

Clients do not trust the default controller certificate, so you need to deactivate the server certificate validation on the client side or install a certificate trustpoint on the controller.

**Step 4** Click **Apply to Device**.

---

## Configuring AAA Authentication (GUI)

### Procedure

---

**Step 1** Choose **Configuration** > **Security** > **AAA**, and navigate to the **AAA Method List** > **Authentication** tabs.

**Step 2** Click **Add**.

**Step 3** Choose **dot1x** as the **Type** and **local** as the **Group Type**.

**Step 4** Click **Apply to Device**.

---

## Configuring AAA Authorization Method (GUI)

### Procedure

---

**Step 1** Navigate to **Authorization** sub-tab.

**Step 2** Create a new method for **credential-download** type and point it to local.

**Note** Perform the same for **network** authorization type.

## Configuring AAA Authorization Method (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>aaa new-model</b> <b>Example:</b> Device(config)# aaa new-model	Creates a AAA authentication model.
<b>Step 3</b>	<b>aaa authentication dot1x default local</b> <b>Example:</b> Device(config)# aaa authentication dot1x default local	Configures the default local RADIUS server.
<b>Step 4</b>	<b>aaa authorization credential-download default local</b> <b>Example:</b> Device(config)# aaa authorization credential-download default local	Configures default database to download credentials from local server.
<b>Step 5</b>	<b>aaa local authentication default authorization default</b> <b>Example:</b> Device(config)# aaa local authentication default authorization default	Configures the local authentication method list.
<b>Step 6</b>	<b>aaa authorization network default local</b> <b>Example:</b> Device(config)# aaa authorization network default local	Configures authorization for network services.

## Configuring Local Advanced Methods (GUI)

### Procedure

---

- Step 1** In the **Configuration > Security > AAA** window, perform the following:
- Navigate to **AAA Advanced** tab.
  - From the **Local Authentication** drop-down list, choose a default local authentication.
  - From the **Local Authorization** drop-down list, choose a default local authorization.
- Step 2** Click **Apply**.
- 

## Configuring WLAN (GUI)

### Procedure

---

- Step 1** Choose **Configuration > Tags & Profiles > WLANs**.
- Step 2** In the **WLANs** window, click the name of the **WLAN** or click **Add** to create a new one.
- Step 3** In the **Add/Edit WLAN** window that is displayed, click the **General** tab to configure the following parameters.
- In the **Profile Name** field, enter or edit the name of the profile.
  - In the **SSID** field, enter or edit the SSID name.  
The SSID name can be alphanumeric, and up to 32 characters in length.
  - In the **WLAN ID** field, enter or edit the ID number. The valid range is between 1 and 512.
  - From the **Radio Policy** drop-down list, choose the **802.11** radio band.
  - Using the **Broadcast SSID** toggle button, change the status to either **Enabled** or **Disabled**.
  - Using the **Status** toggle button, change the status to either **Enabled** or **Disabled**.
- Step 4** In the **AAA** tab, you can configure the following:
- Choose an authentication list from the drop-down.
  - Check the **Local EAP Authentication** check box to enable local EAP authentication on the WLAN. Also, choose the required **EAP Profile Name** from the drop-down list.
- Step 5** Click **Save & Apply to Device**.
-

## Configuring WLAN (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wlan wlan-name wlan-id SSID-name</b> <b>Example:</b> Device(config)# wlan localpeapssid 1 localpeapssid	Enters the WLAN configuration sub-mode.  <i>wlan-name</i> —Is the name of the configured WLAN.  <i>wlan-id</i> —Is the wireless LAN identifier. The range is 1 to 512.  <i>SSID-name</i> —Is the SSID name which can contain 32 alphanumeric characters.  <b>Note</b> If you have already configured this command, enter <b>wlan wlan-name</b> command.
<b>Step 3</b>	<b>security dot1x authentication-list auth-list-name</b> <b>Example:</b> Device(config-wlan)# security dot1x authentication-list default	Enables security authentication list for dot1x security. The configuration is similar for all dot1x security WLANs.
<b>Step 4</b>	<b>local-auth profile name</b> <b>Example:</b> Device(config-wlan)# local-auth mylocaleap	Sets EAP Profile on an WLAN.  <i>profile name</i> —Is the EAP profile on an WLAN.

## Creating a User Account (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.

	Command or Action	Purpose
<b>Step 2</b>	<b>user-name</b> <i>user-name</i> <b>Example:</b> Device(config)# user-name lxuser	Creates a user account.
<b>Step 3</b>	<b>creation-time</b> <i>time</i> <b>Example:</b> Device(config)# creation-time 1572730075	Creation time of the user account.
<b>Step 4</b>	<b>description</b> <i>user-name</i> <b>Example:</b> Device(config)# description lxuser	Adds a user-defined description to the new user account.
<b>Step 5</b>	<b>password 0</b> <i>password</i> <b>Example:</b> Device(config)# password 0 Cisco123	Creates a password for the user account.
<b>Step 6</b>	<b>type network-user description</b> <i>user-name</i> <b>Example:</b> Device(config)# type network-user description lxuser	Specifies the type of user account.

## Attaching a Policy Profile to a WLAN Interface (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Tags & Profiles > Tags**.
  - Step 2** On the **Manage Tags** page, click **Policy** tab.
  - Step 3** Click **Add** to view the **Add Policy Tag** window.
  - Step 4** Enter a name and description for the policy tag.
  - Step 5** Click **Add** to map the WLAN and policy.
  - Step 6** Choose the WLAN profile to map with the appropriate policy profile, and click the tick icon.
  - Step 7** Click **Save & Apply to Device**.
-

# Deploy Policy Tag to Access Points (GUI)

## Procedure

---

- Step 1** Choose **Configuration > Wireless > Access Points**.
- Step 2** On the **All Access Points** page, click the access point you want to configure.  
Make sure that the tags assigned are the ones you configured.
- Step 3** Click **Apply**.
-

## CHAPTER 116

# Local EAP Ciphersuite

- [Information About Local EAP Ciphersuite, on page 1307](#)
- [Restrictions for Local EAP Ciphersuite, on page 1308](#)
- [Configuring Local EAP Ciphersuite \(CLI\), on page 1309](#)

## Information About Local EAP Ciphersuite

Prior to Cisco IOS XE Cupertino 17.7.1 Release, the controller acts as an SSL server supporting a hardcoded list of ciphersuites for each EAP application. From Cisco IOS XE Cupertino 17.7.1 Release onwards, the controller is equipped with a knob that controls the list of ciphersuites when using local authentication.

The following table lists the hardcoded list of ciphersuites:

**Table 87: Hardcoded List of Ciphersuites**

Ciphersuites	Description
aes128-sha	Encryption Type <code>tls_rsa_with_aes_128_cbc_sha</code> .
aes256-sha	Encryption Type <code>tls_rsa_with_aes_256_cbc_sha</code> .
dhe-rsa-aes-gcm-sha2	Encryption Type <code>tls_dhe_rsa_with_aes_128_gcm_sha256</code> and <code>tls_dhe_rsa_with_aes_256_gcm_sha384</code> (TLS1.2 and above).
dhe-rsa-aes-sha2	Encryption Type <code>tls_dhe_rsa_with_aes_128_cbc_sha256</code> and <code>tls_dhe_rsa_with_aes_256_cbc_sha256</code> (TLS 1.2 and above).
dhe-rsa-aes128-sha	Encryption Type <code>tls_dhe_rsa_with_aes_128_cbc_sha</code> .
dhe-rsa-aes256-sha	Encryption Type <code>tls_dhe_rsa_with_aes_256_cbc_sha</code> .
ecdhe-ecdsa-aes-gcm-sha2	Encryption Type <code>tls_ecdhe_ecdsa_with_aes_128_gcm_sha256</code> and <code>tls_ecdhe_ecdsa_with_aes_256_gcm_sha384</code> (TLS1.2 and above).

Ciphersuites	Description
ecdhe-ecdsa-aes-sha	Encryption Type tls_ecdhe_ecdsa_with_aes_128_cbc_sha and tls_ecdhe_ecdsa_with_aes_256_cbc_sha.
ecdhe-ecdsa-aes-sha2	Encryption Type tls_ecdhe_ecdsa_with_aes_128_cbc_sha256 and tls_ecdhe_ecdsa_with_aes_256_cbc_sha384(TLS1.2 and above).
ecdhe-rsa-aes-gcm-sha2	Encryption Type tls_ecdhe_rsa_with_aes_128_gcm_sha256 and tls_ecdhe_rsa_with_aes_256_gcm_sha384(TLS1.2 and above).
ecdhe-rsa-aes-sha	Encryption Type tls_ecdhe_rsa_with_aes_128_cbc_sha and tls_ecdhe_rsa_with_aes_256_cbc_sha.
ecdhe-rsa-aes-sha2	Encryption Type tls_ecdhe_rsa_with_aes_128_cbc_sha256 and tls_ecdhe_rsa_with_aes_256_cbc_sha384(TLS1.2 and above).

When the Client and Server Hello messages are exchanged, the client sends a prioritized list of ciphersuites it supports in Client Hello. The server then responds with the ciphersuite selected from the list in Server Hello. The server needs to select a ciphersuite that is acceptable to both the client and server. Using this approach, only one ciphersuite is selected and sent to the client.

The Local EAP ciphersuite feature controls the list of ciphersuites the controller as SSL server supports.

---

**Note** By default, all the ciphersuites are supported. Using the Local EAP ciphersuite feature, you can enable or disable the ciphersuites based on your requirement.

---

## Restrictions for Local EAP Ciphersuite

- SNMP is not supported.
- Ciphersuites are specific to Dot1x.

# Configuring Local EAP Ciphersuite (CLI)

## Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Device# enable	Enables privileged EXEC mode. Enter your password, if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 3</b>	<b>eap profile <i>name</i></b> <b>Example:</b> Device(config)# eap profile local_EAP_TLSv1	Creates an EAP profile.
<b>Step 4</b>	<b>ciphersuite <i>cipher-suite</i></b> <b>Example:</b> Device(config-eap-profile)# ciphersuite <cipher-suite>	Select a ciphersuite.  <b>Note</b> Using this command, you will be able to configure only one ciphersuite. To configure more than one ciphersuite, you need to issue this command with various ciphersuites.  To remove the ciphersuites, you need to remove the ciphersuites one by one or all at once.  By default all ciphersuites are supported, if you issue the <b>no ciphersuite</b> command.
<b>Step 5</b>	<b>end</b> <b>Example:</b> Device(config-eap-profile)# end	Returns to privileged EXEC mode.  Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## CHAPTER 117

# Authentication and Authorization Between Multiple RADIUS Servers

---

- [Information About Authentication and Authorization Between Multiple RADIUS Servers](#), on page 1311
- [Configuring 802.1X Security for WLAN with Split Authentication and Authorization Servers](#), on page 1312
- [Configuring Web Authentication for WLAN with Split Authentication and Authorization Servers](#), on page 1317
- [Verifying Split Authentication and Authorization Configuration](#), on page 1319
- [Configuration Examples](#), on page 1320

## Information About Authentication and Authorization Between Multiple RADIUS Servers

Cisco Catalyst 9800 Series Wireless Controller uses the approach of request and response transaction with a single RADIUS server that combines both authentication and authorization. You can split the authentication and authorization on the controller between multiple RADIUS servers.

A RADIUS sever can assume the role of either an authentication server, authorization server, or both. In cases where there are disparate RADIUS servers for authentication and authorization, the Session Aware Networking (SANet) component on the controller now allows authentication on one server and authorization on another when a client joins the controller .

Authentication can be done using the Cisco ISE, Cisco Catalyst Center, Free RADIUS, or any third-party RADIUS Server. After successful authentication from an authentication server, the controller relays attributes received from the authentication server to another RADIUS sever designated as authorization server.

The authorization server then performs the following:

- Processes received attributes with the other policies or rules defined on the server.
- Derives attributes as part of the authorization response and returns it to the controller .

---

**Note**

In a split authentication and authorization configuration, both servers must be available and must successfully authenticate and authorize with an ACCESS-ACCEPT for a session to be accepted by the controller .

---

**Note** A maximum of 100 entries is supported in the Authentication/Authorization list created through Cisco Catalyst Center provisioning. The entries beyond 100 do not work even though they can be created.

# Configuring 802.1X Security for WLAN with Split Authentication and Authorization Servers

## Configuring Explicit Authentication and Authorization Server List (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Security > AAA**.
- Step 2** On the **Authentication Authorization and Accounting** page, click the **Servers/Groups** tab.
- Step 3** Click the type of AAA server you want to configure from the following options:
- RADIUS
  - TACACS+
  - LDAP
- In this procedure, the RADIUS server configuration is described.
- Step 4** With the **RADIUS** option selected, click **Add**.
- Step 5** Enter a name for the RADIUS server and the IPv4 or IPV6 address of the server.
- Step 6** Enter the authentication and encryption key to be used between the device and the key string RADIUS daemon running on the RADIUS server. You can choose to use either a PAC key or a non-PAC key.
- Step 7** Enter the server timeout value; valid range is 1 to 1000 seconds.
- Step 8** Enter a retry count; valid range is 0 to 100.
- Step 9** Leave the **Support for CoA** field in **Enabled** state.
- Step 10** Click **Save & Apply to Device**.
- Step 11** On the **Authentication Authorization and Accounting** page, with **RADIUS** option selected, click the **Server Groups** tab.
- Step 12** Click **Add**.
- Step 13** In the **Create AAA RADIUS Server Group** window that is displayed, enter a name for the RADIUS server group.
- Step 14** From the **MAC-Delimiter** drop-down list, choose the delimiter to be used in the MAC addresses that are sent to the RADIUS servers.
- Step 15** From the **MAC Filtering** drop-down list, choose a value based on which to filter MAC addresses.
- Step 16** To configure dead time for the server group and direct AAA traffic to alternative groups of servers that have different operational characteristics, in the **Dead-Time** field, enter the amount of time, in minutes, after which a server is assumed to be dead.

- Step 17** Choose the servers that you want to include in the server group from the **Available Servers** list and move them to the **Assigned Servers** list.
- Step 18** Click **Save & Apply to Device**.

## Configuring Explicit Authentication Server List (GUI)

### Procedure

- Step 1** Choose **Configuration > Security > AAA > Servers/Groups**.
- Step 2** Choose **RADIUS > Servers** tab.
- Step 3** Click **Add** to add a new server or click an existing server.
- Step 4** Enter the **Name**, the **Server Address**, **Key**, **Confirm Key**, **Auth Port** and **Acct Port**. Check the **PAC Key** checkbox and enter the **PAC key** and **Confirm PAC Key**.
- Step 5** Click **Apply to Device**.
- Step 6** Choose **RADIUS > Server Groups** and click **Add** to add a new server group or click an existing server group.
- Step 7** Enter the **Name** of the server group and choose the servers that you want to include in the server group, from the **Available Servers** list and move them to the **Assigned Servers** list.
- Step 8** Click **Apply to Device**.

## Configuring Explicit Authentication Server List (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b>  <b>Example:</b> Device> enable	Enables privileged EXEC mode.  Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 3</b>	<b>radius server</b> <i>server-name</i>  <b>Example:</b> Device(config)# <b>radius server</b> <b>free-radius-authc-server</b>	Specifies the RADIUS server name.
<b>Step 4</b>	<b>address ipv4</b> <i>address</i> <b>auth-port</b> <i>auth_port_number</i> <b>acct-port</b> <i>acct_port_number</i>  <b>Example:</b>	Specifies the RADIUS server parameters.

	Command or Action	Purpose
	Device(config-radius-server)# <b>address</b> ipv4 9.2.62.56 auth-port 1812 acct-port 1813	
<b>Step 5</b>	[pac] <b>key</b> <i>key</i> <b>Example:</b> Device(config-radius-server)# <b>key</b> cisco	Specify the authentication and encryption key used between the Device and the key string RADIUS daemon running on the RADIUS server.
<b>Step 6</b>	<b>exit</b> <b>Example:</b> Device(config-radius-server)# <b>exit</b>	Returns to the configuration mode.
<b>Step 7</b>	<b>aaa group server radius</b> <i>server-group</i> <b>Example:</b> Device(config)# <b>aaa group server radius</b> <b>authc-server-group</b>	Creates a radius server-group identification.  <i>server-group</i> refers to the server group name. The valid range is from 1 to 32 alphanumeric characters.  If the IP address of the RADIUS server is not added to the routes defined for the controller, the default route is used. We recommend that you define a specific route to source the traffic from the defined SVI in the AAA server group.
<b>Step 8</b>	<b>server name</b> <i>server-name</i> <b>Example:</b> Device(config)# <b>server name</b> <b>free-radius-authc-server</b>	Configures the server name.
<b>Step 9</b>	<b>end</b> <b>Example:</b> Device(config)# <b>end</b>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.  For more information, see <b>Configuring AAA for External Authentication</b> .

## Configuring Explicit Authorization Server List (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Security > AAA > Servers/Groups**.
  - Step 2** Choose **RADIUS > Servers** tab.
  - Step 3** Click **Add** to add a new server or click an existing server.
  - Step 4** Enter the **Name**, the **Server Address**, **Key**, **Confirm Key**, **Auth Port** and **Acct Port**. Check the **PAC Key** checkbox and enter the **PAC key** and **Confirm PAC Key**.
  - Step 5** Click **Apply to Device**.

- Step 6** Choose **RADIUS > Server Groups** and click **Add** to add a new server group or click an existing server group.
- Step 7** Enter the **Name** of the server group and choose the servers that you want to include in the server group, from the **Available Servers** list and move them to the **Assigned Servers** list.
- Step 8** Click **Apply to Device**.

## Configuring Explicit Authorization Server List (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Device> enable	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 3</b>	<b>radius server <i>server-name</i></b> <b>Example:</b> Device(config)# radius server cisco-catalyst-center-authz-server	Specifies the RADIUS server name.
<b>Step 4</b>	<b>address ipv4 <i>address</i> auth-port <i>auth_port_number</i> acct-port <i>acct_port_number</i></b> <b>Example:</b> Device(config-radius-server)# address ipv4 9.4.62.32 auth-port 1812 acct-port 1813	Specifies the RADIUS server parameters.
<b>Step 5</b>	<b>[pac] key <i>key</i></b> <b>Example:</b> Device(config-radius-server)# pac key cisco	Specify the authorization and encryption key used between the Device and the key string RADIUS daemon running on the RADIUS server.
<b>Step 6</b>	<b>exit</b> <b>Example:</b> Device(config-radius-server)# exit	Returns to the configuration mode.
<b>Step 7</b>	<b>aaa group server radius <i>server-group</i></b> <b>Example:</b> Device(config)# aaa group server radius authz-server-group	Creates a radius server-group identification. <b>Note</b> <i>server-group</i> refers to the server group name. The valid range is from 1 to 32 alphanumeric characters.
<b>Step 8</b>	<b>server name <i>server-name</i></b>	

	Command or Action	Purpose
	<b>Example:</b> Device(config)# <b>server name</b> <b>cisco-catalyst-center-authz-server</b>	
<b>Step 9</b>	<b>end</b> <b>Example:</b> Device(config)# <b>end</b>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Configuring Authentication and Authorization List for 802.1X Security (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Tags & Profiles > WLANs**.
- Step 2** Click **Add**.
- Step 3** In the **General** tab, enter the **Profile Name**, the **SSID**, and the **WLAN ID**.
- Step 4** In the **Security > AAA** tab, choose the Authentication list from the **Authentication List** drop-down list.
- Step 5** Click **Apply to Device**.
- 

## Configuring Authentication and Authorization List for 802.1X Security

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Device> <b>enable</b>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 3</b>	<b>wlan wlan-name wlan-id SSID-name</b> <b>Example:</b> Device(config)# <b>wlan wlan-foo 222</b> <b>foo-ssid</b>	Enters WLAN configuration sub-mode. <ul style="list-style-type: none"> <li>• <i>wlan-name</i>: Is the name of the configured WLAN.</li> <li>• <i>wlan-id</i>: Is the wireless LAN identifier. Range is from 1 to 512.</li> <li>• <i>SSID-name</i>: Is the SSID name which can contain 32 alphanumeric characters.</li> </ul>

	Command or Action	Purpose
		<b>Note</b> If you have already configured this command, enter <code>wlan wlan-name</code> command.
<b>Step 4</b>	<b>security dot1x authentication-list</b> <i>authenticate-list-name</i>  <b>Example:</b> Device(config-wlan) # <b>security dot1x authentication-list authc-server-group</b>	Enables authentication list for dot1x security.
<b>Step 5</b>	<b>security dot1x authorization-list</b> <i>authorize-list-name</i>  <b>Example:</b> Device(config-wlan) # <b>security dot1x authorization-list authz-server-group</b>	Specifies authorization list for dot1x security.  For more information on the <b>Cisco Catalyst Center</b> , see the <b>Cisco Catalyst Center documentation</b> .
<b>Step 6</b>	<b>end</b>  <b>Example:</b> Device(config-wlan) # <b>end</b>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Configuring Web Authentication for WLAN with Split Authentication and Authorization Servers

### Configuring Authentication and Authorization List for Web Authentication (GUI)

#### Procedure

- 
- Step 1** Choose **Configuration > Tags & Profiles > WLANs**.
  - Step 2** Click **Add**.
  - Step 3** In the **General** tab, enter the **Profile Name**, the **SSID**, and the **WLAN ID**.
  - Step 4** In the **Security > Layer2** tab, uncheck the **WPAPolicy**, **AES** and **802.1x** check boxes.
  - Step 5** Check the **MAC Filtering** check box to enable the feature. With MAC Filtering enabled, choose the Authorization list from the **Authorization List** drop-down list.
  - Step 6** In the **Security > AAA** tab, choose the Authentication list from the **Authentication List** drop-down list.
  - Step 7** Click **Apply to Device**.
-

## Configuring Authentication and Authorization List for Web Authentication

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Device> enable	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 3</b>	<b>wlan wlan-name wlan-id SSID-name</b> <b>Example:</b> Device(config)# wlan wlan-bar 1 bar-ssid	Enters WLAN configuration sub-mode. <ul style="list-style-type: none"> <li>• <i>wlan-name</i>: Is the name of the configured WLAN.</li> <li>• <i>wlan-id</i>: Is the wireless LAN identifier.</li> <li>• <i>SSID-name</i>: Is the SSID name which can contain 32 alphanumeric characters.</li> </ul> <b>Note</b> If you have already configured this command, enter <b>wlan wlan-name</b> command.
<b>Step 4</b>	<b>no security wpa</b> <b>Example:</b> Device(config-wlan)# no security wpa	Disables WPA security.
<b>Step 5</b>	<b>no security wpa akm dot1x</b> <b>Example:</b> Device(config-wlan)# no security wpa akm dot1x	Disables security AKM for dot1x.
<b>Step 6</b>	<b>no security wpa wpa2</b> <b>Example:</b> Device(config-wlan)# no security wpa wpa2	Disables WPA2 security.
<b>Step 7</b>	<b>security web-auth {authentication-list authenticate-list-name   authorization-list authorize-list-name}</b> <b>Example:</b> Device(config-wlan)# security web-auth authentication-list authc-server-group	Enables authentication or authorization list for dot1x security.  <b>Note</b> You get to view the following error, if you do not disable WPA security, AKM for dot1x, and WPA2 security:  <i>% switch-1:dbm:wireless:web-auth cannot be enabled. Invalid WPA/WPA2 settings.</i>

	Command or Action	Purpose
<b>Step 8</b>	<b>end</b> <b>Example:</b> Device(config-wlan) # <b>end</b>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Verifying Split Authentication and Authorization Configuration

To view the WLAN details, use the following command:

```
Device# show run wlan
wlan wlan-foo 2 foo-ssid
security dot1x authentication-list authc-server-group
security dot1x authorization-list authz-server-group

wlan wlan-bar 3 bar-ssid
security web-auth authentication-list authc-server-group
security web-auth authorization-list authz-server-group
```

To view the AAA authentication and server details, use the following command:

```
Device# show run aaa
!
aaa authentication dot1x default group radius
username cisco privilege 15 password 0 cisco
!
!
radius server free-radius-authc-server
 address ipv4 9.2.62.56 auth-port 1812 acct-port 1813
 key cisco
!
radius server cisco-catalyst-center-authz-server
 address ipv4 9.4.62.32 auth-port 1812 acct-port 1813
 pac key cisco
!
!
aaa new-model
aaa session-id common
!
```

To view the authentication and authorization list for 802.1X security, use the following command:

```
Device# show wlan name wlan-foo | sec 802.1x
802.1x authentication list name : authc-server-group
802.1x authorization list name : authz-server-group
 802.1x : Enabled
```

To view the authentication and authorization list for web authentication, use the following command:

```
Device# show wlan name wlan-bar | sec Webauth
Webauth On-mac-filter Failure : Disabled
Webauth Authentication List Name : authc-server-group
Webauth Authorization List Name : authz-server-group
Webauth Parameter Map : Disabled
```

# Configuration Examples

## Configuring Cisco Catalyst 9800 Series Wireless Controller for Authentication with a Third-Party RADIUS Server: Example

This example shows how to configure Cisco Catalyst 9800 Series Wireless Controller for authentication with a third-party RADIUS server:

```
Device(config)# radius server free-radius-authc-server
Device(config-radius-server)# address ipv4 9.2.62.56 auth-port 1812 acct-port 1813
Device(config-radius-server)# key cisco
Device(config-radius-server)# exit
Device(config)# aaa group server radius authc-server-group
Device(config)# server name free-radius-authc-server
Device(config)# end
```

## Configuring Cisco Catalyst 9800 Series Wireless Controller for Authorization with Cisco ISE or Cisco Catalyst Center: Example

This example shows how to configure Cisco Catalyst 9800 Series Wireless Controller for authorization with Cisco ISE or Cisco Catalyst Center:

```
Device(config)# radius server cisco-catalyst-center-authz-server
Device (config-radius-server)# address ipv4 9.4.62.32 auth-port 1812 acct-port 1813
Device (config-radius-server)# pac key cisco
Device (config-radius-server)# exit
Device(config)# aaa group server radius authz-server-group
Device(config)# server name cisco-catalyst-center-authz-server
Device(config)# end
```

## CHAPTER 118

# CUI Information in RADIUS Accounting

- [CUI Information in RADIUS Accounting Request, on page 1321](#)
- [Adding CUI Information in a RADIUS Accounting Request, on page 1322](#)
- [Verifying CUI Information in a RADIUS Accounting Request, on page 1322](#)

## CUI Information in RADIUS Accounting Request

Chargeable User Identity (CUI) is a unique identifier for a client visiting a network regardless of the outer identity or the device used for login. In other words, CUI is an obscured version of a username. A client must be authenticated and authorized before being allowed to the network. The CUI attribute can be used as an alternative for a client's username as part of the authentication process.

To handle RADIUS attribute 89 processing, a null value of CUI is attached an access-request sent to a AAA server. This is done using the **access-session wireless cui-enable** command. As part of an access-accept message, a CUI-capable AAA server sends the CUI string to the controller. The controller then sends this received CUI attribute in accounting packets and other access-request packets, if any.

### Prerequisites

Ensure that AAA override is enabled.

### Restrictions

- Only 802.1x network authentication protocol is supported.
- Inter-Release Controller Mobility (IRCM) is not supported.
- FlexConnect local authentication is not supported. Only local mode and FlexConnect central authentication mode is supported.

## Adding CUI Information in a RADIUS Accounting Request

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>access-session wireless cui-enable</b> <b>Example:</b> Device(config)# access-session wireless cui-enable	Adds CUI attribute in authentication and accounting messages sent to the AAA server.

## Verifying CUI Information in a RADIUS Accounting Request

To view the CUI attribute in an accounting request on a AAA server, use the following command:

```
Device# show wireless client mac-address aaa.bbb.ccc.ddd detail
.
.
.
Session Manager:
 Point of Attachment : capwap_90000005
 IIF ID : 0x90000005

## Information About SLDAP

### Transport Layer Security (TLS)

The Transport Layer Security (TLS) is an application-level protocol that enables secure transactions of data through privacy, authentication, and data integrity. TLS relies upon certificates, public keys, and private keys to prove the identity of clients.

The certificates are issued by the Certificate Authorities (CAs).

Each certificate includes the following:

- The name of the authority that issued it.
- The name of the entity to which the certificate was issued.
- The public key of the entity.
- The timestamps of the entity that indicate the expiration date of the certificate.

You can find the TLS support for LDAP in the RFC2830 which is an extension to the LDAP protocol.

### LDAP Operations

*Bind*

The bind operation is used to authenticate a user to the server. It is used to start a connection with the LDAP server. LDAP is a connection-oriented protocol. The client specifies the protocol version and authentication information.

LDAP supports the following binds:

- **Authenticated bind**—An authenticated bind is performed when a root Distinguished Name (DN) and password are available.
- **Anonymous bind**—In the absence of a root DN and password, an anonymous bind is performed.

In LDAP deployments, the search operation is performed first and the bind operation later. This is because, if a password attribute is returned as part of the search operation, the password verification can be done locally on an LDAP client. Thus, there is no need to perform an extra bind operation. If a password attribute is not returned, the bind operation can be performed later. Another advantage of performing a search operation first and a bind operation later is that the DN received in the search result can be used as the user DN instead of forming a DN by prefixing the username (cn attribute) with the base DN. All entries stored in an LDAP server have a unique DN.

The DN consists of two parts:

- **Relative Distinguished Name (RDN)**
- **Location in the LDAP server where the record resides.**

Most of the entries that you store in an LDAP server will have a name, and the name is frequently stored in the Common Name (cn) attribute. Because every object has a name, most objects you store in an LDAP will use their cn value as the basis for their RDN.

### *Search*

A search operation is used to search the LDAP server. The client specifies the starting point (base DN) of the search, the search scope (either the object, its children, or the subtree rooted at the object), and a search filter.

For authorization requests, the search operation is directly performed without a bind operation. The LDAP server can be configured with certain privileges for the search operation to succeed. This privilege level is established with the bind operation.

An LDAP search operation can return multiple user entries for a specific user. In such cases, the LDAP client returns an appropriate error code to AAA. To avoid these errors, you must configure appropriate search filters to match a single entry.

### *Compare*

The compare operation is used to replace a bind request with a compare request for an authentication. The compare operation helps to maintain the initial bind parameters for the connection.

## **LDAP Dynamic Attribute Mapping**

The Lightweight Directory Access Protocol (LDAP) is a powerful and flexible protocol for communication with AAA servers. LDAP attribute maps provide a method to cross-reference the attributes retrieved from a server to Cisco attributes supported by the security appliances.

When a user authenticates a security appliance, the security appliance, in turn, authenticates the server and uses the LDAP protocol to retrieve the record for that user. The record consists of LDAP attributes associated with fields displayed on the user interface of the server. Each attribute retrieved includes a value that was entered by the administrator who updates the user records.

## Prerequisite for Configuring SLDAP

If you are using a secure Transport Layer Security (TLS) secure connection, you must configure the X.509 certificates.

## Restrictions for Configuring SLDAP

- LDAP referrals are not supported.
- Unsolicited messages or notifications from the LDAP server are not handled.
- LDAP authentication is not supported for interactive (terminal) sessions.

## Configuring SLDAP

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Device# enable	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 3</b>	<b>ldap server <i>name</i></b> <b>Example:</b> Device(config)# ldap server server1	Defines a Lightweight Directory Access Protocol (LDAP) server and enters LDAP server configuration mode.
<b>Step 4</b>	<b>ipv4 <i>ipv4-address</i></b> <b>Example:</b> Device(config-ldap-server)# ipv4 9.4.109.20	Specifies the LDAP server IP address using IPv4.
<b>Step 5</b>	<b>timeout retransmit <i>seconds</i></b> <b>Example:</b> Device(config-ldap-server)# timeout retransmit 20	Specifies the number of seconds the Cisco Catalyst 9800 Series Wireless Controller embedded wireless controller waits for a reply to an LDAP request before retransmitting the request.
<b>Step 6</b>	<b>bind authenticate root-dn password [0 <i>string</i>   7 <i>string</i>] <i>string</i></b>	Specifies a shared secret text string used between the Cisco Catalyst 9800 Series

	Command or Action	Purpose
	<b>Example:</b> <pre>Device(config-ldap-server) # bind authenticate root-dn CN=ldapipv6user,CN=Users,DC=ca,DC=ssh2,DC=com password Cisco12345</pre>	Wireless Controller embedded wireless controller and an LDAP server.  Use the <b>0</b> line option to configure an unencrypted shared secret.  Use the <b>7</b> line option to configure an encrypted shared secret.
<b>Step 7</b>	<b>base-dn</b> <i>string</i>  <b>Example:</b> <pre>Device(config-ldap-server) # base-dn CN=Users,DC=ca,DC=ssh2,DC=com</pre>	Specifies the base Distinguished Name (DN) of the search.
<b>Step 8</b>	<b>mode secure</b> [ <b>no- negotiation</b> ]  <b>Example:</b> <pre>Device(config-ldap-server) # mode secure no- negotiation</pre>	Configures LDAP to initiate the TLS connection and specifies the secure mode.
<b>Step 9</b>	<b>end</b>  <b>Example:</b> <pre>Device(config-ldap-server) # end</pre>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Configuring an AAA Server Group (GUI)

Configuring a device to use AAA server groups helps you to group existing server hosts, select a subset of the configured server hosts and use them for a particular service. A server group is used with a global server-host list. The server group lists the IP addresses of the selected server hosts.

You can create the following server groups:

### Procedure

#### Step 1

#### RADIUS

- Choose **Services > Security > AAA > Server Groups > RADIUS**.
- Click the **Add** button. The **Create AAA Radius Server Group** dialog box appears.
- Enter a name for the RADIUS server group in the **Name** field.
- Choose a desired delimiter from the **MAC-Delimiter** drop-down list. The available options are colon, hyphen, and single-hyphen.
- Choose a desired filter from the **MAC-Filtering** drop-down list. The available options are mac and Key.
- Enter a value in the **Dead-Time (mins)** field to make a server non-operational. You must specify a value between 1 and 1440.
- Choose any of the available servers from the **Available Servers** list and move them to the **Assigned Servers** list by clicking the **>** button.
- Click the **Save & Apply to Device** button.

**Step 2** TACACS+

- a) Choose **Services > Security > AAA > Server Groups > TACACS+**.
- b) Click the **Add** button. The **Create AAA Tacacs Server Group** dialog box appears.
- c) Enter a name for the TACACS server group in the **Name** field.
- d) Choose any of the available servers from the **Available Servers** list and move them to the **Assigned Servers** list by clicking the **>** button.
- e) Click the **Save & Apply to Device** button.

**Step 3** LDAP

- a) Choose **Services > Security > AAA > Server Groups > LDAP**.
- b) Click the **Add** button. The **Create AAA Ldap Server Group** dialog box appears.
- c) Enter a name for the LDAP server group in the **Name** field.
- d) Choose any of the available servers from the **Available Servers** list and move them to the **Assigned Servers** list by clicking the **>** button.
- e) Click the **Save & Apply to Device** button.

## Configuring a AAA Server Group

**Procedure**

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Device# enable	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 3</b>	<b>aaa new-model</b> <b>Example:</b> Device(config)# aaa new-model	Enables AAA.
<b>Step 4</b>	<b>aaa group server ldap <i>group-name</i></b> <b>Example:</b> Device(config)# aaa group server ldap name1	Defines the AAA server group with a group name and enters LDAP server group configuration mode. All members of a group must be of the same type, that is, RADIUS, LDAP, or TACACS+.
<b>Step 5</b>	<b>server <i>name</i></b> <b>Example:</b> Device(config-ldap-sg)# server server1	Associates a particular LDAP server with the defined server group. Each security server is identified by its IP address and UDP port number.

	Command or Action	Purpose
<b>Step 6</b>	<b>exit</b> <b>Example:</b> Device(config-ldap-sg)# <b>exit</b>	Exits LDAP server group configuration mode.

## Configuring Search and Bind Operations for an Authentication Request

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Device# <b>enable</b>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 3</b>	<b>aaa new-model</b> <b>Example:</b> Device(config)# <b>aaa new-model</b>	Enables AAA.
<b>Step 4</b>	<b>ldap server <i>name</i></b> <b>Example:</b> Device(config)# <b>ldap server server1</b>	Defines a Lightweight Directory Access Protocol (LDAP) server and enters LDAP server configuration mode.
<b>Step 5</b>	<b>authentication bind-first</b> <b>Example:</b> Device(config-ldap-server)# <b>authentication bind-first</b>	Configures the sequence of search and bind operations for an authentication request.
<b>Step 6</b>	<b>authentication compare</b> <b>Example:</b> Device(config-ldap-server)# <b>authentication compare</b>	Replaces the bind request with the compare request for authentication.
<b>Step 7</b>	<b>exit</b> <b>Example:</b> Device(config-ldap-server)# <b>exit</b>	Exits LDAP server group configuration mode.

# Configuring a Dynamic Attribute Map on an SLDAP Server

You must create LDAP attribute maps that map your existing user-defined attribute names and values to Cisco attribute names and values that are compatible with the security appliance. You can then bind these attribute maps to LDAP servers or remove them as required.

**Note** To use the attribute mapping features correctly, you need to understand the Cisco LDAP and user-defined attribute names and values.

## Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Device# enable	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 3</b>	<b>ldap attribute-map <i>map-name</i></b> <b>Example:</b> Device(config)# ldap attribute-map map1	Configures a dynamic LDAP attribute map and enters attribute-map configuration mode.
<b>Step 4</b>	<b>map type <i>ldap-attr-type aaa-attr-type</i></b> <b>Example:</b> Device(config-attr-map)# map type department supplicant-group	Defines an attribute map.
<b>Step 5</b>	<b>exit</b> <b>Example:</b> Device(config-attr-map)# exit	Exits attribute-map configuration mode.

## Verifying the SLDAP Configuration

To view details about the default LDAP attribute mapping, use the following command:

```
Device# show ldap attributes
```

To view the LDAP server state information and various other counters for the server, use the following command:

```
Device# show ldap server
```

## CHAPTER 120

# Network Access Server Identifier

---

- [Information About Network Access Server Identifier, on page 1331](#)
- [Creating a NAS ID Policy\(GUI\), on page 1332](#)
- [Creating a NAS ID Policy, on page 1332](#)
- [Attaching a Policy to a Tag \(GUI\), on page 1333](#)
- [Attaching a Policy to a Tag \(CLI\), on page 1333](#)
- [Verifying the NAS ID Configuration, on page 1334](#)

## Information About Network Access Server Identifier

Network access server identifier (NAS-ID) is used to notify the source of a RADIUS access request, which enables the RADIUS server to choose a policy for that request. You can configure one on each WLAN profile, VLAN interface, or access point group. The NAS-ID is sent to the RADIUS server by the controller through an authentication request to classify users to different groups. This enables the RADIUS server to send a customized authentication response.

---

**Note** The acct-session-id is sent with the RADIUS access request only when accounting is enabled on the policy profile.

---

If you configure a NAS-ID for an AP group, it overrides the NAS-ID that is configured for a WLAN profile or the VLAN interface. Similarly, if you configure a NAS-ID for a WLAN profile, it overrides the NAS-ID that is configured for the VLAN interface.

Starting with Cisco IOS XE Cupertino 17.7.1, a new string named custom-string (custom string) is added.

The following options can be configured for a NAS ID:

- sys-name (System Name)
- sys-ip (System IP Address)
- sys-mac (System MAC Address)
- ap-ip (AP's IP address)
- ap-name (AP's Name)
- ap-mac (AP's MAC Address)

- ap-eth-mac (AP's Ethernet MAC Address)
- ap-policy-tag (AP's policy tag name)
- ap-site-tag (AP's site tag name)
- ssid (SSID Name)
- ap-location (AP's Location)
- custom-string (custom string)

## Creating a NAS ID Policy(GUI)

### Procedure

---

- Step 1** Choose **Configuration > Security > Wireless AAA Policy**.
- Step 2** On the **Wireless AAA Policy** page, click the name of the **Policy** or click **Add** to create a new one.
- Step 3** In the **Add/Edit Wireless AAA Policy** window that is displayed, enter the name of the policy in the **Policy Name** field.
- Step 4** Choose from one of the NAS ID options from the **Option 1** drop-down list.
- Step 5** Choose from one of the NAS ID options from the **Option 2** drop-down list.
- Step 6** Choose from one of the NAS ID options from the **Option 3** drop-down list.
- Step 7** Save the configuration.
- 

## Creating a NAS ID Policy

Follow the procedure given below to create NAS ID policy:

### Before you begin

- NAS ID can be a combination of multiple NAS ID options; the maximum options are limited to 3.
- The maximum length of the NAS ID attribute is 253. Before adding a new attribute, the attribute buffer is checked, and if there is no sufficient space, the new attribute is ignored.
- By default, a wireless aaa policy (default-aaa-policy) is created with the default configuration (sys-name). You can update this policy with various NAS ID options. However, the default-aaa-policy cannot be deleted.
- If a NAS ID is not configured, the default sys-name is considered as the NAS ID for all wireless-specific RADIUS packets (authentication and accounting) from the controller .
- Starting with Cisco IOS XE Cupertino 17.7.1, you can configure a custom string with various combinations of option1, option2 and option3 (**nas-id option3 custom-string *custom-string***) as NAS ID in RADIUS packets.

**Procedure**

	<b>Command or Action</b>	<b>Purpose</b>
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wireless aaa policy <i>policy-name</i></b> <b>Example:</b> Device(config)# wireless aaa policy test	Configures a new AAA policy.
<b>Step 3</b>	<b>nas-id option1 sys-name</b> <b>Example:</b> Device(config-aaa-policy)# nas-id option1 sys-name	Configures NAS ID for option1.
<b>Step 4</b>	<b>nas-id option2 sys-ip</b> <b>Example:</b> Device(config-aaa-policy)# nas-id option2 sys-ip	Configures NAS ID for option2.
<b>Step 5</b>	<b>nas-id option3 sys-mac</b> <b>Example:</b> Device(config-aaa-policy)# nas-id option3 sys-mac	Configures NAS ID for option3.

## Attaching a Policy to a Tag (GUI)

**Procedure**

- 
- Step 1** Choose **Configuration > Tags & Profiles > Tags** page, click **Policy** tab.
  - Step 2** Click **Add** to view the **Add Policy Tag** window.
  - Step 3** Enter a name and description for the policy tag.
  - Step 4** Click **Add** to map WLAN profile and Policy profile.
  - Step 5** Choose the **WLAN Profile** to map with the appropriate **Policy Profile**, and click the tick icon.
  - Step 6** Click **Save & Apply to Device**.
- 

## Attaching a Policy to a Tag (CLI)

Follow the procedure given below to attach a NAS ID policy to a tag:

**Procedure**

	<b>Command or Action</b>	<b>Purpose</b>
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wireless profile policy <i>policy-name</i></b> <b>Example:</b> Device(config)# wireless profile policy test1	Configures a WLAN policy profile.
<b>Step 3</b>	<b>aaa-policy <i>aaa-policy-name</i></b> <b>Example:</b> Device(config-wireless-policy)# aaa-policy policy-aaa	Configures a AAA policy profile.
<b>Step 4</b>	<b>exit</b> <b>Example:</b> Device(config-wireless-policy)# exit	Returns to global configuration mode.
<b>Step 5</b>	<b>wireless tag policy <i>policy-tag</i></b> <b>Example:</b> Device(config)# wireless tag policy policy-tag1	Configures a wireless policy tag.
<b>Step 6</b>	<b>wlan wlan1 policy <i>policy-name</i></b> <b>Example:</b> Device(config)# wlan wlan1 policy test1	Maps a WLAN profile to a policy profile.  <b>Note</b> You can also use the <b>ap-tag</b> option to configure a NAS ID for an AP group, which will override the NAS ID that is configured for a WLAN profile or the VLAN interface.

## Verifying the NAS ID Configuration

Use the following **show** command to verify the NAS ID configuration:

```
Device# show wireless profile policy detailed test1
```

```
Policy Profile Name : test1
Description :
Status : ENABLED
VLAN : 1
Client count : 0

:
:
AAA Policy Params
 AAA Override : DISABLED
```

```
NAC : DISABLED
AAA Policy name : test
```

## CHAPTER 121

# Locally Significant Certificates

- [Information About Locally Significant Certificates, on page 1337](#)
- [Restrictions for Locally Significant Certificates, on page 1339](#)
- [Provisioning Locally Significant Certificates, on page 1340](#)
- [Verifying LSC Configuration, on page 1351](#)
- [Configuring Management Trustpoint to LSC \(GUI\), on page 1352](#)
- [Configuring Management Trustpoint to LSC \(CLI\), on page 1352](#)
- [Information About MIC and LSC Access Points Joining the Controller, on page 1353](#)
- [LSC Fallback Access Points, on page 1357](#)
- [Configuring Controller Self-Signed Certificate for Wireless AP Join, on page 1358](#)

## Information About Locally Significant Certificates

This module explains how to configure the Cisco Catalyst 9800 Series Wireless Controller and Lightweight Access Points (LAPs) to use the Locally Significant Certificate (LSC). If you choose the Public Key Infrastructure (PKI) with LSC, you can generate the LSC on the APs and controllers. You can then use the certificates to mutually authenticate the controllers and the APs.

In Cisco controllers, you can configure the controller to use an LSC. Use an LSC if you want your own PKI to provide better security, have control of your Certificate Authority (CA), and define policies, restrictions, and usages on the generated certificates.

You need to provision the new LSC certificate on the controller and then the Lightweight Access Point (LAP) from the CA Server.

The LAP communicates with the controller using the CAPWAP protocol. Any request to sign the certificate and issue the CA certificates for LAP and controller itself must be initiated from the controller. The LAP does not communicate directly with the CA server. The CA server details must be configured on the controller and must be accessible.

The controller makes use of the Simple Certificate Enrollment Protocol (SCEP) to forward certReqs generated on the devices to the CA and makes use of SCEP again to get the signed certificates from the CA.

The SCEP is a certificate management protocol that the PKI clients and CA servers use to support certificate enrollment and revocation. It is widely used in Cisco and supported by many CA servers. In SCEP, HTTP is used as the transport protocol for the PKI messages. The primary goal of SCEP is the secure issuance of certificates to network devices. SCEP is capable of many operations, but for our release, SCEP is utilized for the following operations:

- CA and Router Advertisement (RA) Public Key Distribution
- Certificate Enrollment

## Certificate Provisioning in Controllers

The new LSC certificates, both CA and device certificates, must be installed on the controller.

With the help of SCEP, CA certificates are received from the CA server. During this point, there are no certificates in the controller. After the **get** operation of obtaining the CA certificates, are installed on the controller. The same CA certificates are also pushed to the APs when the APs are provisioned with LSCs.

---

**Note** We recommend that you use a new RSA keypair name for the newly configured PKI certificate. If you want to reuse an existing RSA keypair name (that is associated with an old certificate) for a new PKI certificate, do either of the following:

- Do not regenerate a new RSA keypair with an existing RSA keypair name, reuse the existing RSA keypair name. Regenerating a new RSA keypair with an existing RSA keypair name will make all the certificates associated with the existing RSA keypair invalid.
  - Manually remove the old PKI certificate configurations first, before reusing the existing RSA keypair name for the new PKI certificate.
- 

## Device Certificate Enrollment Operation

For both the LAP and the controller that request a CA-signed certificate, the certRequest is sent as a PKCS#10 message. The certRequest contains the Subject Name, Public Key, and other attributes to be included in the X.509 certificate, and must be digitally signed by the Private Key of the requester. These are then sent to the CA, which transforms the certRequest into an X.509 certificate.

The CA that receives a PKCS#10 certRequest requires additional information to authenticate the requester's identity and verify if the request is unaltered. (Sometimes, PKCS#10 is combined with other approaches, such as PKCS#7 to send and receive the certificate request or response.)

The PKCS#10 is wrapped in a PKCS#7 Signed Data message type. This is supported as part of the SCEP client functionality, while the PKCSReq message is sent to the controller. Upon successful enrollment operation, both the CA and device certificates are available on the controller.

## Certificate Provisioning on Lightweight Access Point

In order to provision a new certificate on LAP, while in CAPWAP mode, the LAP must be able to get the new signed X.509 certificate. In order to do this, it sends a certRequest to the controller, which acts as a CA proxy and helps obtain the certRequest signed by the CA for the LAP.

The certReq and the certResponses are sent to the LAP with the LWAPP payloads.

Both the LSC CA and the LAP device certificates are installed in the LAP, and the system reboots automatically. The next time when the system comes up, because it is configured to use LSCs, the AP sends the LSC device certificate to the controller as part of the JOIN Request. As part of the JOIN Response, the controller sends the new device certificate and also validates the inbound LAP certificate with the new CA root certificate.

### What to Do Next

To configure, authorize, and manage certificate enrollment with the existing PKI infrastructure for controller and AP, you need to use the LSC provisioning functionality.

## Restrictions for Locally Significant Certificates

- LSC workflow is different in FIPS+WLANCC mode. CA server must support Enrollment over Secure Transport (EST) protocol and should be capable of issuing EC certificates in FIPS+WLANCC mode.
- Elliptic Curve Digital Signature Algorithm (ECDSA) cipher works only if both AP and controller are having EC certificates, provisioned with LSC.
- EC certificates (LSC-EC) can be provisioned only if CA server supports EST (and not SCEP).
- FIPS + CC security modes is required to be configured in order to provision EC certificate.
- All AP misconfigurations should be corrected before enabling LSC. The count for misconfigured APs can be observed in the output of the following **show** command:

```
Device# show wireless summary
Priming controller : DISABLED
Max APs supported : 3000
Max clients supported : 32000
Access Point Summary

Total Up Down

802.11 2.4GHz 2 2 0
802.11 5GHz 5 2 3
802.11 6GHz 1 1 0
802.11 dual-band 2 0 2
802.11 dual-band(5/6GHz) 0 0 0
802.11 rx-dual-band 0 0 0
Client Serving(2.4GHz) 3 1 2
Client Serving(5GHz) 4 1 3
Client Serving(6GHz) 1 1 0
Monitor(Dual band) 0 0 0
Monitor(2.4GHz) 1 1 0
Monitor(5GHz) 1 1 0
Monitor(6GHz) 0 0 0
Sniffer(Dual band) 0 0 0
Sniffer(2.4GHz) 0 0 0
Sniffer(5GHz) 0 0 0
Sniffer(6GHz) 0 0 0
Misconfigured APs 1 (For more info use 'show ap tag summary')
```

```
Client Summary
 Total Clients : 0
 Excluded : 0
 Disabled : 0
 Foreign : 0
 Anchor : 0
 Local : 0
```

For more information about misconfigured APs, run the **wireless config validate** command. To view reported errors, run the **show wireless config validation status** command.

# Provisioning Locally Significant Certificates

## Configuring RSA Key for PKI Trustpoint

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>crypto key generate rsa [exportable]</b> <b>general-keys modulus <i>key_size</i> label <i>RSA_key</i></b>  <b>Example:</b> Device(config)# <code>crypto key generate rsa exportable general-keys modulus 2048 label lsc-tp</code>	Configures RSA key for PKI trustpoint. <b>exportable</b> is an optional keyword. You may or may not want to configure an exportable-key. If selected, you can export the key out of the box, if required <ul style="list-style-type: none"> <li>• <i>key_size</i>: Size of the key modulus. The valid range is from 2048 to 4096.</li> <li>• <i>RSA_key</i>: RSA key pair label.</li> </ul>
<b>Step 3</b>	<b>end</b>  <b>Example:</b> Device(config)# <code>end</code>	Returns to privileged EXEC mode.

## Configuring PKI Trustpoint Parameters

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>crypto pki trustpoint <i>trustpoint_name</i></b>  <b>Example:</b> Device(config)# <code>crypto pki trustpoint microsoft-ca</code>	Creates a new trustpoint for an external CA server. Here, <i>trustpoint_name</i> refers to the trustpoint name.
<b>Step 3</b>	<b>enrollment url <i>HTTP_URL</i></b>  <b>Example:</b>	Specifies the URL of the CA on which your router should send certificate requests.

	Command or Action	Purpose
	<pre>Device(ca-trustpoint)# enrollment url http://CA_server/certsrv/mscep/mscep.dll</pre>	<b>url url:</b> URL of the file system where your router should send certificate requests. An IPv6 address can be added in the URL enclosed in brackets. For example: http://[2001:DB8:1:1::1]:80. For more enrollment method options, see the enrollment url (ca-trustpoint) command page.
<b>Step 4</b>	<b>subject-name</b> <i>subject_name</i> <b>Example:</b> <pre>Device(ca-trustpoint)# subject-name C=IN, ST=KA, L=Bengaluru, O=Cisco, CN=eagle-eye/emailAddress=support@abc.com</pre>	Creates subject name parameters for the trustpoint.
<b>Step 5</b>	<b>rsakeypair</b> <i>RSA_key key_size</i> <b>Example:</b> <pre>Device(ca-trustpoint)# rsakeypair ewlc-tp1</pre>	Maps RSA key with that of the trustpoint. <ul style="list-style-type: none"> <li>• <i>RSA_key</i>: RSA key pair label.</li> <li>• <i>key_size</i>: Signature key length. Range is from 360 to 4096.</li> </ul>
<b>Step 6</b>	<b>revocation</b> {crl   none   oosp} <b>Example:</b> <pre>Device(ca-trustpoint)# revocation none</pre>	Checks revocation.
<b>Step 7</b>	<b>end</b> <b>Example:</b> <pre>Device(ca-trustpoint)# end</pre>	Returns to privileged EXEC mode.

## Authenticating and Enrolling a PKI Trustpoint (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Security > PKI Management**.
- Step 2** In the **PKI Management** window, click the **Trustpoints** tab.
- Step 3** In the **Add Trustpoint** dialog box, provide the following information:
- In the **Label** field, enter the RSA key label.
  - In the **Enrollment URL** field, enter the enrollment URL.
  - Check the **Authenticate** check box to authenticate the Public Certificate from the enrollment URL.
  - In the **Subject Name** section, enter the **Country Code**, **State**, **Location**, **Organization**, **Domain Name**, and **Email Address**.
  - Check the **Key Generated** check box to view the available RSA keypairs. Choose an option from the **Available RSA Keypairs** drop-down list.
  - Check the **Enroll Trustpoint** check box.

- g) In the **Password** field, enter the password.
- h) In the **Re-Enter Password** field, confirm the password.
- i) Click **Apply to Device**.

The new trustpoint is added to the trustpoint name list.

## Authenticating and Enrolling the PKI Trustpoint with CA Server (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>crypto pki authenticate <i>trustpoint_name</i></b>  <b>Example:</b> Device(config)# <code>crypto pki authenticate microsoft-ca</code>	Fetches the CA certificate.
<b>Step 3</b>	<b>yes</b>  <b>Example:</b> Device(config)# % Do you accept this certificate? [yes/no]: yes Trustpoint CA certificate accepted.	
<b>Step 4</b>	<b>crypto pki enroll <i>trustpoint_name</i></b>  <b>Example:</b> Device(config)# <code>crypto pki enroll microsoft-ca</code> % % Start certificate enrollment .. % Create a challenge password. You will need to verbally provide this password to the CA Administrator in order to revoke your certificate. For security reasons your password will not be saved in the configuration. Please make a note of it.	Enrolls the client certificate.
<b>Step 5</b>	<b>password</b>  <b>Example:</b> Device(config)# <code>abcd123</code>	Enters a challenge password to the CA server.
<b>Step 6</b>	<b>password</b>  <b>Example:</b> Device(config)# <code>abcd123</code>	Re-enters a challenge password to the CA server.

	Command or Action	Purpose
<b>Step 7</b>	<b>yes</b> <b>Example:</b> <pre>Device(config)# % Include the router serial number in the subject name? [yes/no]: yes</pre>	
<b>Step 8</b>	<b>no</b> <b>Example:</b> <pre>Device(config)# % Include an IP address in the subject name? [no]: no</pre>	
<b>Step 9</b>	<b>yes</b> <b>Example:</b> <pre>Device(config)# Request certificate from CA? [yes/no]: yes % Certificate request sent to Certificate Authority % The 'show crypto pki certificate verbose client' command will show the fingerprint.</pre>	
<b>Step 10</b>	<b>end</b> <b>Example:</b> <pre>Device(config)# end</pre>	Returns to privileged EXEC mode.

## Configuring AP Join Attempts with LSC Certificate (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Wireless > Access Points**.
  - Step 2** In the **All Access Points** window, click the LSC Provision name.
  - Step 3** From the **Status** drop-down list, choose a status to enable LSC.
  - Step 4** From the **Trustpoint Name** drop-down list, choose the trustpoint.
  - Step 5** In the **Number of Join Attempts** field, enter the number of retry attempts that will be permitted.
  - Step 6** Click **Apply**.
-

## Configuring AP Join Attempts with LSC Certificate (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>ap lsc-provision join-attempt</b> <i>number_of_attempts</i>  <b>Example:</b> Device(config)# ap lsc-provision join-attempt 10	Specifies the maximum number of AP join failure attempts with the newly provisioned LSC certificate.  When the number of AP joins exceed the specified limit, AP joins back with the Manufacturer Installed Certificate (MIC).
<b>Step 3</b>	<b>end</b>  <b>Example:</b> Device(config)# end	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Configuring Subject-Name Parameters in LSC Certificate

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>ap lsc-provision subject-name-parameter</b> <b>country</b> <i>country-str</i> <b>state</b> <i>state-str</i> <b>city</b> <i>city-str</i> <b>domain</b> <i>domain-str</i> <b>org</b> <i>org-str</i> <b>email-address</b> <i>email-addr-str</i>  <b>Example:</b> Device(config)# ap lsc-provision subject-name-parameter country India state Karnataka city Bangalore domain domain1 org Right email-address adc@gfe.com	Specifies the attributes to be included in the subject-name parameter of the certificate request generated by an AP.
<b>Step 3</b>	<b>end</b>  <b>Example:</b> Device(config)# end	Returns to privileged EXEC mode.

## Configuring Key Size for LSC Certificate

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>ap lsc-provision key-size { 2048   3072   4096 }</b> <b>Example:</b> Device(config)# <code>ap lsc-provision key-size 2048</code>	Specifies the size of keys to be generated for the LSC on AP.
<b>Step 3</b>	<b>end</b> <b>Example:</b> Device(config)# <code>end</code>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Configuring Trustpoint for LSC Provisioning on an Access Point

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>ap lsc-provision trustpoint <i>tp-name</i></b> <b>Example:</b> Device(config)# <code>ap lsc-provision trustpoint microsoft-ca</code>	Specifies the trustpoint with which the LCS is provisioned to an AP.  <i>tp-name</i> : The trustpoint name.
<b>Step 3</b>	<b>end</b> <b>Example:</b> Device(config)# <code>end</code>	Returns to privileged EXEC mode.

## Configuring an AP LSC Provision List (GUI)

### Procedure

- Step 1** Choose **Configuration > Wireless > Access Points**.

- Step 2** In the **All Access Points** window, click the corresponding LSC Provision name.
- Step 3** From the **Status** drop-down list, choose a status to enable LSC.
- Step 4** From the **Trustpoint Name** drop-down list, choose a trustpoint.
- Step 5** In the **Number of Join Attempts** field, enter the number of retry attempts that are allowed.
- Step 6** From the **Key Size** drop-down list, choose a key.
- Step 7** In the **Edit AP Join Profile** window, click the **CAPWAP** tab.
- Step 8** In the **Add APs to LSC Provision List** section, click **Select File** to upload the CSV file that contains AP details.
- Step 9** Click **Upload File**.
- Step 10** In the **AP MAC Address** field, enter the AP MAC address. and add them. (The APs added to the provision list are displayed in the **APs in provision List** .)
- Step 11** In the **Subject Name Parameters** section, enter the following details:
- **Country**
  - **State**
  - **City**
  - **Organization**
  - **Department**
  - **Email Address**
- Step 12** Click **Apply**.

## Configuring an AP LSC Provision List (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>ap lsc-provision mac-address <i>mac-addr</i></b>  <b>Example:</b> Device(config)# ap lsc-provision mac-address 001b.3400.02f0	Adds the AP to the LSC provision list.  <b>Note</b> You can provision a list of APs using the <b>ap lsc-provision provision-list</b> command.  (Or)  You can provision all the APs using the <b>ap lsc-provision</b> command.

	Command or Action	Purpose
<b>Step 3</b>	<b>end</b>  <b>Example:</b> Device(config)# end	Returns to privileged EXEC mode.

## Configuring LSC Provisioning for all the APs (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Wireless > Access Points**.
- Step 2** In the **Access Points** window, expand the **LSC Provision** section.
- Step 3** Set **Status** to **Enabled** state.
- Note** If you set **Status** to **Provision List**, LSC provisioning will be configured only for APs that are a part of the provision list.
- Step 4** From the **Trustpoint Name** drop-down list, choose the appropriate trustpoint for all APs.
- Step 5** In the **Number of Join Attempts** field, enter the number of retry attempts that the APs can make to join the controller.
- Step 6** From the **Key Size** drop-down list, choose the appropriate key size of the certificate:
- 2048
  - 3072
  - 4096
- Step 7** In the **Add APs to LSC Provision List** section, click **Select File** to upload the CSV file that contains the AP details.
- Step 8** Click **Upload File**.
- Step 9** In the **AP MAC Address** field, enter the AP MAC address. (The APs that are added to the provision list are displayed in the **APs in Provision List** section.)
- Step 10** In the **Subject Name Parameters** section, enter the following details:
- a. **Country**
  - b. **State**
  - c. **City**
  - d. **Organization**
  - e. **Department**
  - f. **Email Address**
- Step 11** Click **Apply**.
-

## Configuring LSC Provisioning for All APs (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>ap lsc-provision</b> <b>Example:</b> Device(config)# <code>ap lsc-provision</code>	Enables LSC provisioning for all APs.  By default, LSC provisioning is disabled for all APs.
<b>Step 3</b>	<b>end</b> <b>Example:</b> Device(config)# <code>end</code>	Returns to privileged EXEC mode.

## Configuring LSC Provisioning for the APs in the Provision List

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>ap lsc-provision provision-list</b> <b>Example:</b> Device(config)# <code>ap lsc-provision provision-list</code>	Enables LSC provisioning for a set of APs configured in the provision list.
<b>Step 3</b>	<b>end</b> <b>Example:</b> Device(config)# <code>end</code>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Importing a CA Certificate to the Trustpool (GUI)

PKI Trustpool Management is used to store a list of trusted certificates (either downloaded or built in) used by the different services on the controller. This is also used to authenticate a multilevel CA certificate. The built in CA certificate bundle in the PKI trustpool receives automatic updates from Cisco if they are not current, are corrupt, or if certain certificates need to be updated.

Perform this task to manually update the CA certificates in the PKI trustpool.

**Note** If your LSC has been issued by an intermediate CA, you must import the complete chain of CA certificates into the trustpool. Otherwise, you will not be able to provision the APs without the complete chain being present on the controller. The import step is not required if the certificate has been issued by a root CA.

### Procedure

- Step 1** Choose **Configuration > Security > PKI Management**.
- Step 2** In the **PKI Management** window, click the **Trustpool** tab.
- Step 3** Click **Import**.
- Step 4** In the **CA Certificate** field, copy and paste the CA certificate. Link together the multiple CA certificates in **.pem** format.
- Step 5** Click **Apply to Device**.

## Importing a CA Certificate to the Trustpool (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>crypto pki trust pool import terminal</b> <b>Example:</b> Device(config)# crypto pki trust pool import terminal % Enter PEM-formatted CA certificate. % End with a blank line or "quit" on a line by itself. -----BEGIN CERTIFICATE----- -----END CERTIFICATE----- -----BEGIN CERTIFICATE----- -----END CERTIFICATE----- -----BEGIN CERTIFICATE----- -----END CERTIFICATE----- Aug 23 02:47:33.450: %PKI-6-TRUSTPOOL_DOWNLOAD_SUCCESS: Trustpool Download is successful	Imports the root certificate. For this, you need to paste the CA certificate from the <b>digicert.com</b> .
<b>Step 3</b>	<b>end</b> <b>Example:</b> Device(config)# end	Returns to privileged EXEC mode.

## Cleaning the CA Certificates Imported in Trustpool (GUI)

### Procedure

**Step 1** Choose **Configuration > Security > PKI Management**.

**Step 2** In the **PKI Management** window, click the **Trustpool** tab.

**Step 3** Click **Clean**.

**Note** This erases the downloaded CA certificate bundles. However, it does not erase the built-in CA certificate bundles.

**Step 4** Click **Yes**.

## Cleaning CA Certificates Imported in Trustpool (CLI)

You cannot delete a specific CA certificate from the trustpool. However, you can clear all the CA certificates that are imported to the Trustpool.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>crypto pki trustpool clean</b>  <b>Example:</b> Device(config)# <code>crypto pki trustpool clean</code>	Erases the downloaded CA certificate bundles. However, it does not erase the built-in CA certificate bundles.
<b>Step 3</b>	<b>end</b>  <b>Example:</b> Device(config)# <code>end</code>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Creating a New Trustpoint Dedicated to a Single CA Certificate

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# <code>configure terminal</code>	Enters global configuration mode.

	Command or Action	Purpose
<b>Step 2</b>	<b>crypto pki trustpoint</b> <i>tp-name</i> <b>Example:</b> Device(config)# <b>crypto pki trustpoint</b> <b>tp_name</b>	Creates a trustpoint.
<b>Step 3</b>	<b>enrollment terminal</b> <b>Example:</b> Device(ca-trustpoint)# <b>enrollment</b> <b>terminal</b>	Creates an enrollment terminal for the trustpoint.
<b>Step 4</b>	<b>exit</b> <b>Example:</b> Device(ca-trustpoint)# <b>exit</b>	Exits from the trustpoint configuration.
<b>Step 5</b>	<b>crypto pki authenticate</b> <i>tp-name</i> <b>Example:</b> Device(config)# <b>crypto pki authenticate</b> <b>tp_name</b> <<< PASTE CA-CERT in PEM format followed by quit >>>	Authenticates the trustpoint.

## Verifying LSC Configuration

To view the details of the wireless management trustpoint, use the following command:

```
Device# show wireless management trustpoint
```

```
Trustpoint Name : microsoft-ca
Certificate Info : Available
Certificate Type : LSC
Certificate Hash : 9e5623adba5307facf778e6ea2f5082877ea4beb
Private key Info : Available
```

To view the LSC provision-related configuration details for an AP, use the following command:

```
Device# show ap lsc-provision summary
```

```
AP LSC-provisioning : Disabled
Trustpoint used for LSC-provisioning : lsc-root-tp
Certificate chain status : Available
Number of certs on chain : 2
Certificate hash : 7f9d05183deecac4e5a79db65d538245685e8e30
LSC Revert Count in AP reboots : 1
```

```
AP LSC Parameters :
Country : IN
State : KA
City : BLR
Orgn : ABC
Dept : ABC
Email : support@abc.com
Key Size : 2048
EC Key Size : 384 bit
```

```

AP LSC-provision List :

Total number of APs in provision list: 2

Mac Addresses :

1880.90f5.1540
2c5a.0f70.84dc

```

## Configuring Management Trustpoint to LSC (GUI)

### Procedure

- 
- Step 1** Choose **Administration > Management > HTTP/HTTPS**.
  - Step 2** In the **HTTP Trust Point Configuration** section, set **Enable Trust Point** to the **Enabled** state.
  - Step 3** From the **Trust Points** drop-down list, choose the appropriate trustpoint.
  - Step 4** Save the configuration.
- 

## Configuring Management Trustpoint to LSC (CLI)

After LSC provisioning, the APs will automatically reboot and join at the LSC mode after bootup. Similarly, if you remove the AP LSC provisioning, the APs reboot and join at non-LSC mode.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>wireless management trustpoint</b> <i>trustpoint_name</i>  <b>Example:</b> Device(config)# <code>wireless management trustpoint microsoft-ca</code>	Configures the management trustpoint to LSC.
<b>Step 3</b>	<b>end</b>  <b>Example:</b> Device(config)# <code>end</code>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

# Information About MIC and LSC Access Points Joining the Controller

## Overview of Support for MIC and LSC Access Points Joining the Controller

In Cisco IOS XE Bengaluru 17.4.1 and earlier releases, APs with a default certificate (Manufacturing Installed Certificates [MIC]) or Secure Unique Device Identifier [SUDI]) fail to join a Locally Significant Certificate-deployed (LSC-deployed) controller, where the management certificate of the controller is an LSC. To resolve this issue, you must provision LSC on these APs using the provisioning controller before moving them to the LSC-deployed controller.

From Cisco IOS XE Bengaluru 17.5.1 onwards, the new authorization policy configuration allows MIC APs to join the LSC-deployed controller, so that the LSC and MIC APs can coexist in the controller at the same time.

## Recommendations and Limitations

- When the CA server is configured with manual enrollment (manual intervention) to accept Certificate Signing Request (CSR), the controller waits for the CA server to send the pending response. If there is no response from the CA server for 10 minutes, the fallback mode comes into effect.
  - Cisco Wave 2 APs regenerate CSR, and a fresh CSR is sent to the CA server.
  - Cisco IOS APs restart, and then Cisco IOS APs send a fresh CSR, which is in turn sent to the CA server.
- Locally significant certificate (LSC) on the controller does not work on the password challenge. Therefore, for LSC to work, you must disable password challenge on the CA server.
- If you are using Microsoft CA, we recommend that you use Windows Server 2012 or later as the CA server.

## Configuration Workflow

1. [#unique\\_1724](#)
2. [#unique\\_1725](#)
3. [#unique\\_1726](#)
4. [#unique\\_1727](#)

## Configuring LSC on the Controller (CLI)

The server certificate used by the controller for CAPWAP-DTLS is based on the following configuration.

**Before you begin**

- Ensure that you enable LSC by setting the appropriate trustpoints for the following wireless management services:
  - AP join process: CAPWAP DTLS server certificate
  - Mobility connections: Mobility DTLS certificate
  - NMSP and CMX connections: NMSP TLS certificate

**Procedure**

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>[no] wireless management trustpoint</b> <i>trustpoint-name</i>  <b>Example:</b> Device(config)# <code>wireless management trustpoint trustpoint-name</code>	Configures the LSC trustpoint in the LSC-deployed controller.

**Enabling the AP Certificate Policy on the APs (CLI)**

- If the management trustpoint is an LSC, by default, MIC APs fail to join the controller. This configuration acts as an enable or disable configuration knob that allows MIC APs to join the controller.
- This configuration is a controller authorization to allow APs to join MIC at the time of DTLS handshake.

To prevent manufacturing installed certificate (MIC) expiry failures, ensure that you configure a policy, as shown here:

- Create a certificate map and add the rules:

```
configure terminal
crypto pki certificate map map1 1
issuer-name co Cisco Manufacturing CA
```

**Note** You can add multiple rules and filters under the same map. The rule mentioned in the example above specifies that any certificate whose issuer-name contains *Cisco Manufacturing CA* (case insensitive) is selected under this map.

- Use the certificate map under the trustpool policy:

```
configure terminal
crypto pki trustpool policy
match certificate map1 allow expired-certificate
```

## Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>ap auth-list ap-cert-policy allow-mic-ap trustpoint trustpoint-name</b> <b>Example:</b> Device(config)# ap auth-list ap-cert-policy allow-mic-ap trustpoint trustpoint-name	Configures the trustpoint name for the controller certificate chain. <b>Note</b> The <b>allow-mic-ap trustpoint</b> command is required only for the virtual controller (Cisco Catalyst 9800-CL Wireless Controller for Cloud). In all the other appliance controller platforms, the default certificate is selected. This default certificate is manufacturer-installed SUDI.
<b>Step 3</b>	<b>ap auth-list ap-cert-policy allow-mic-ap</b> <b>Example:</b> Device(config)# ap auth-list ap-cert-policy allow-mic-ap	Enables the AP certificate policy during CAPWAP-DTLS handshake.
<b>Step 4</b>	<b>ap auth-list ap-cert-policy {mac-address H.H.H   serial-number serial-number-ap} policy-type mic</b> <b>Example:</b> Device(config)# ap auth-list ap-cert-policy mac-address 1111.1111.1111 policy-type mic	Enables the AP certificate policy as MIC.

## Configuring the AP Policy Certificate (GUI)

## Procedure

- 
- Step 1** Choose **Configuration > Wireless > Access Points**
- Step 2** In the **All Access Points** window, click **AP Certificate Policy**.
- Step 3** In the **AP Policy Certificate** window, complete the following actions:
- Click the **Authorize APs joining with MIC** toggle button to enable AP authorization.
  - From the **Trustpoint Name** drop-down list, choose the required trustpoint.
  - Click **Add MAC or Serial Number** to add a MAC address or a serial number manually or through a .csv file.  
The **Add MAC or Serial Number** window is displayed.

```

Device# show ap auth-list ap-cert-policy mac-address
MAC address AP cert policy

1111.2222.3333 MIC

Device# show ap auth-list ap-cert-policy serial-number
Serial number AP cert policy

F1234567890 MIC

```

**Note** If you set an invalid trustpoint (not SSC), the **allow-mic-ap policy** is not enabled. If you set an invalid trustpoint, the following error is displayed on the console:

```

Device(config)# ap auth-list ap-cert-policy allow-mic-ap trustpoint lsc-root-tp
Dec 18 07:38:29.944: %CERT_MGR_ERRMSG-3-CERT_MGR_GENERAL_ERR: Chassis 1 R0/0: wncd: General
error: MIC AP Policy trustpoint: 'lsc-root-tp' cert-chain type is LSC, It must be either
MIC or vWLC-SSC

```

## LSC Fallback Access Points

### Information About LSC Fallback APs

When an AP is configured with LSC for CAPWAP but fails to establish DTLS connection, the AP reboots and retries for certain number of times. For information on how an AP configures with LSC, see [Configuring AP Join Attempts with LSC Certificate \(CLI\), on page 1344](#).

The AP falls back to its default certificate (MIC) for CAPWAP after maximum number of failures. This state is referred to as the LSC fallback.

**Note** MIC is also known as SUDI certificate.

### Troubleshooting LSC Fallback State

When an AP in **LSC fallback** state joins the controller, the following syslog is generated:

```

Jun 15 23:24:14.836: %APMGR_TRACE_MESSAGE-3-WLC_GEN_ERR: Chassis 1 R0/0: wncd: Error
in AP: 'AP2c5a.0f70.84dc' with address 70db.9888.cc20 is joined with MIC, while configuration
requires LSC. No WLANs will be pushed.

```

The controller allows such an AP to be joined with MIC (when AP certificate policy allows it) and AP is held in misconfigured state.

**Note** The AP does not broadcast WLAN or SSID configurations in such state. This permits the admin to examine the reason for previous failures and recover APs.

You can identify the **LSC fallback** APs using **show wireless summary** as follows:

```
Device# show wireless summary
...
Access Point Summary
...
DTLS LSC fallback APs 20 (No WLANs will be pushed to these APs)
...
For more information on DTLS LSC fallback APs,
execute 'wireless config validate' and look for reported errors in
'show wireless config validation status' CLI output.

Use 'show ap config general | inc AP Name | LSC fallback' to list DTLS LSC fallback APs.
Examine LSC fallback reasons / DTLS handshake failures with LSC then
issue 'ap lsc dtls-fallback clear-certificate / clear-flag' to recover APs
```

## Recovery Steps

- Use the **ap lsc dtls-fallback clear-flag** to clear the LSC fallback flag on AP and instruct AP to reload.

---

**Note** The AP reuses the LSC for CAPWAP DTLS connection post the reload.

---

- Use the **ap lsc dtls-fallback clear-certificate** to clear LSC and instruct AP to reload.

---

**Note** The AP uses MIC for CAPWAP-DTLS post the reload. If LSC is used for Dot1x port authentication then further recovery is needed on switch port for AP authentication.

---

---

**Note**

- The **ap lsc dtls-fallback clear-flag** command is sufficient to retain LSC on AP. Both **ap lsc dtls-fallback clear-flag** and **ap lsc dtls-fallback clear-certificate** commands are not required at the same time.
- APs must be in connected state when issuing the recovery command. You will need to reissue the command, if any **LSC fallback** AP joins afterwards.

---

# Configuring Controller Self-Signed Certificate for Wireless AP Join

## Use Cases

### Use Case-1

Cisco Catalyst 9800-CL platform does not contain manufacturer installed SUDI certificates. You will need to configure Self-Signed Certificates on your controller.

**Use Case-2**

APs running on earlier versions and having Manufacturer Installed Certificate (MIC) issued by a SHA1 Cisco Trusted CA cannot join the controller with SHA2 SUDI certificate. During CAPWAP join process, the AP displays a bad certificate error and tears down the DTLS handshake.

**Workaround:** To upgrade APs, configure controller Self-Signed certificates. Once done, you can delete the Self-Signed certificates and revert back to the SUDI certificate.

**Note** This workaround does not apply to the Embedded Wireless Controller running Catalyst 9k switches. But applies to other hardware appliance controllers, such as Cisco Catalyst 9800-40, Cisco Catalyst 9800-80, and Cisco Catalyst 9800-L.

**Note** Certificate used in DTLS connections (AP and mobility) must use RSA key of size equal or more than 2048 bits. Otherwise, the APs and mobility connections will fail after reload. Run the **show crypto pki certificate verbose \_tp-name\_** command to display the key size of the device certificate.

## Prerequisites

- Ensure that the VLAN interface is up and it's IP is reachable.
- Ensure that the **ip http server** is enabled. For more information, see [Enabling HTTP Server](#).
- Set the **clock calendar-valid** command appropriately. For more information, see [#unique\\_1742](#).
- Check if the PKI CA server is already configured or not. If configured, you will need to delete the existing CA server configuration.

**Note** The **show crypto pki server** command output should not display anything.

## Configuring Clock Calendar (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>clock calendar-valid</b> <b>Example:</b> Device(config)# <code>clock calendar-valid</code>	Enables clock calendar.

	Command or Action	Purpose
<b>Step 3</b>	<b>exit</b> <b>Example:</b> Device(config)# <b>exit</b>	Exits configuration mode.

## Enabling HTTP Server (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>ip http server</b> <b>Example:</b> Device(config)# <b>ip http server</b>	Enables the HTTP server on your IP or IPv6 system, including a Cisco web browser user interface. By default, the HTTP server uses the standard port 80.
<b>Step 3</b>	<b>ip http secure-server</b> <b>Example:</b> Device(config)# <b>ip http secure-server</b>	Enables the HTTP server on your IP or IPv6 system, including a Cisco web browser user interface. By default, the HTTP server uses the standard port 80.
<b>Step 4</b>	<b>exit</b> <b>Example:</b> Device(config)# <b>exit</b>	Exits configuration mode.

## Configuring CA Server (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>crypto key generate rsa general-keys modulus <i>size_of_key_module</i> label <i>keypair_name</i></b> <b>Example:</b> Device(config)# <b>crypto key generate rsa general-keys modulus 2048 label WLC_CA</b>	Configures a certificate for the controller.  When you generate RSA keys, you are prompted to enter a modulus length. A longer modulus length might be more secure, but it takes longer to generate and to use.

	Command or Action	Purpose
		<b>Note</b> The recommended key-pair name is <i>WLC_CA</i> and key modulus is 2048 bits.
<b>Step 3</b>	<b>crypto pki server</b> <i>certificate_server_name</i> <b>Example:</b> Device (config) # <b>crypto pki server</b> WLC_CA	Enables IOS certificate server. <b>Note</b> The <i>certificate_server_name</i> must be the same name as the <i>keypair_name</i> .
<b>Step 4</b>	<b>issuer-name</b> <b>Example:</b> Device (config) # <b>issuer-name</b> O=Cisco Virtual Wireless LAN Controller, CN=CA-vWLC	Configures X.509 distinguished name for the issuer CA certificate. <b>Note</b> You need to configure the same <b>issuer-name</b> as suggested for AP join.
<b>Step 5</b>	<b>grant auto</b> <b>Example:</b> Device (config) # <b>grant auto</b>	Grants certificate requests automatically.
<b>Step 6</b>	<b>hash sha256</b> <b>Example:</b> Device (config) # <b>hash sha256</b>	(Optional) Specifies the hash function for the signature used in the granted certificates.
<b>Step 7</b>	<b>lifetime ca-certificate</b> <i>time-interval</i> <b>Example:</b> Device (config) # <b>lifetime ca-certificate</b> 3650	(Optional) Specifies the lifetime in days of a CA certificate.
<b>Step 8</b>	<b>lifetime certificate</b> <i>time-interval</i> <b>Example:</b> Device (config) # <b>lifetime certificate</b> 3650	(Optional) Specifies the lifetime in days of a granted certificate.
<b>Step 9</b>	<b>database archive pkcs12 password</b> <i>password</i> <b>Example:</b> Device (config) # <b>database archive pkcs12</b> <b>password</b> 0 cisco123	Sets the CA key and CA certificate archive format and password to encrypt the file.
<b>Step 10</b>	<b>no shutdown</b> <b>Example:</b> Device (config) # <b>no shutdown</b>	Enables the certificate server. <b>Note</b> Issue this command only after you have completely configured your certificate server.
<b>Step 11</b>	<b>end</b> <b>Example:</b> Device (config) # <b>end</b>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Configuring Trustpoint (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>crypto key generate rsa exportable general-keys modulus size-of-the-key-modulus label label</b>  <b>Example:</b> Device (config)# <b>crypto key generate rsa exportable general-keys modulus 2048 label ewlc-tp1</b>	When you generate RSA keys, you are prompted to enter a modulus length. A longer modulus length might be more secure, but it takes longer to generate and to use.
<b>Step 3</b>	<b>crypto pki trustpoint trustpoint_name</b>  <b>Example:</b> Device (config)# <b>crypto pki trustpoint ewlc-tp1</b>	Creates a new trust point for an external CA server. Here, <i>trustpoint_name</i> refers to the trustpoint name.  <b>Note</b> Ensure that same names are used for key-pair ( <i>label</i> ) and <i>trustpoint_name</i> .
<b>Step 4</b>	<b>rsakeypair RSA_key key_size</b>  <b>Example:</b> Device (ca-trustpoint)# <b>rsakeypair ewlc-tp1</b>	Maps RSA key with that of the trustpoint.  <ul style="list-style-type: none"> <li>• <i>RSA_key</i>—Refers to the RSA key pair label.</li> <li>• <i>key_size</i>—Refers to the signature key length. The value ranges from 360 to 4096.</li> </ul>
<b>Step 5</b>	<b>subject-name subject_name</b>  <b>Example:</b> Device (ca-trustpoint)# <b>subject-name O=Cisco Virtual Wireless LAN Controller, CN=DEVICE-vWLC</b>	Creates subject name parameters for the trustpoint.
<b>Step 6</b>	<b>revocation-check none</b>  <b>Example:</b> Device (ca-trustpoint)# <b>revocation-check none</b>	Checks revocation.
<b>Step 7</b>	<b>hash sha256</b>  <b>Example:</b> Device (ca-trustpoint)# <b>hash sha256</b>	Specifies the hash algorithm.

	Command or Action	Purpose
<b>Step 8</b>	<b>serial-number</b> <b>Example:</b> Device(ca-trustpoint)# <b>serial-number</b>	Specifies the serial number.
<b>Step 9</b>	<b>eku request server-auth client-auth</b> <b>Example:</b> Device(ca-trustpoint)# <b>eku request server-auth client-auth</b>	(Optional) Sets certificate key-usage purpose.
<b>Step 10</b>	<b>password password</b> <b>Example:</b> Device(config)# <b>password 0 cisco123</b>	Enables password.
<b>Step 11</b>	<b>enrollment url url</b> <b>Example:</b> Device(config)# <b>enrollment url http://&lt;management-IPv4&gt;:80</b>	Enrolls the URL. <b>Note</b> Replace the dummy IP with management VLAN interface IP of the controller where CA server is configured.
<b>Step 12</b>	<b>exit</b> <b>Example:</b> Device(config)# <b>exit</b>	Exits the configuration.

## Authenticating and Enrolling the PKI TrustPoint with CA Server (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>crypto pki authenticate trustpoint_name</b> <b>Example:</b> Device(config)# <b>crypto pki authenticate ewlc-tp1</b> Certificate has the following attributes: Fingerprint MD5: 64C5FC9A C581D827 C25FC3CF 1A7F42AC Fingerprint SHA1: 6FAFF812 7C552783 6A8FB566 52D95849 CC2FC050 % Do you accept this certificate? [yes/no]: yes Trustpoint CA certificate accepted.	Fetches the CA certificate.

	Command or Action	Purpose
<b>Step 3</b>	<b>crypto pki enroll</b> <i>trustpoint_name</i> <b>Example:</b> Device(config)# <b>crypto pki enroll ewlc-tp1</b> Enter following answers for UI interaction: % Include an IP address in the subject name? [no]: no Request certificate from CA? [yes/no]: yes	Enrolls for client certificate.
<b>Step 4</b>	<b>end</b> <b>Example:</b> Device(config)# <b>end</b>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Tagging Wireless Management TrustPoint Name (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>wireless management trustpoint</b> <i>trustpoint_name</i> <b>Example:</b> Device(config)# <b>wireless management trustpoint ewlc-tp1</b>	Tags the wireless management trustpoint name.
<b>Step 3</b>	<b>end</b> <b>Example:</b> Device(config)# <b>end</b>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Verifying Controller Certificates for Wireless AP Join

To view the CA server details, use the following command:

```
Device# show crypto pki server
Certificate Server WLC_CA:
Status: enabled
State: enabled
Server's configuration is locked (enter "shut" to unlock it)
Issuer name: O=Cisco Virtual Wireless LAN Controller, CN=CA-vWLC
CA cert fingerprint: 79A3DBD5 59A7E384 73ABD152 C133F4E2
Granting mode is: auto
```

```
Last certificate issued serial number (hex): 1
CA certificate expiration timer: 12:04:00 UTC Mar 8 2029
CRL NextUpdate timer: 18:04:00 UTC Mar 11 2019
Current primary storage dir: nvram:
Database Level: Minimum - no cert data written to storage
```

To view the trustpoint details, use the following command:

```
Device# show crypto pki trustpoint ewlc-tp1 status
Trustpoint ewlc-tp1:
...
State:
Keys generated Yes (General Purpose, exportable)
Issuing CA authenticated Yes
Certificate request(s) Yes
```

To view the wireless management trustpoint details, use the following command:

```
Device# do show wireless management trustpoint
Trustpoint Name : ewlc-tp1
Certificate Info : Available
Certificate Type : SSC
Certificate Hash : 4a5d777c5b2071c17faef376feb08398702184e
Private key Info : Available
FIPS suitability : Not Applicable
```

To view the HTTP server status, use the following command:

```
Device# show ip http server status | include server status
HTTP server status: Enabled
HTTP secure server status: Enabled
```

## CHAPTER 122

# Certificate Management

---

- [About Public Key Infrastructure Management \(GUI\), on page 1367](#)
- [Authenticating and Enrolling a PKI Trustpoint \(GUI\), on page 1367](#)
- [Adding the Certificate Authority Server \(GUI\), on page 1368](#)
- [Adding an RSA or EC Key for PKI Trustpoint \(GUI\), on page 1369](#)
- [Adding and Managing Certificates , on page 1369](#)

## About Public Key Infrastructure Management (GUI)

The Public Key Infrastructure (PKI) Management page displays the following tabs:

**Trustpoints** tab: Used to add, create or enroll a new trustpoint. This page also displays the current trustpoints configured on the controller and other details of the trustpoint. You can also view if the trustpoint is in use for any of the features. For example, Webadmin or AP join (Wireless Management Interface ), and others.

**CA Server** tab: Used to enable or disable the Certificate Authority (CA) server functionality on the controller. The CA server functionality should be enabled for the controller to generate a Self Signed Certificate (SSC).

**Key Pair Generation** tab: Used to generate key pairs.

**Certificate Management** tab: Used to generate and manage certificates, and perform all certificate related operations, on the controller.

## Authenticating and Enrolling a PKI Trustpoint (GUI)

### Procedure

---

- Step 1** Choose **Configuration > Security > PKI Management**.
- Step 2** In the **PKI Management** window, click the **Trustpoints** tab.
- Step 3** In the **Add Trustpoint** dialog box, provide the following information:
- a) In the **Label** field, enter the RSA key label.
  - b) In the **Enrollment URL** field, enter the enrollment URL.
  - c) Check the **Authenticate** check box to authenticate the Public Certificate from the enrollment URL.

- d) In the **Subject Name** section, enter the **Country Code, State, Location, Organization, Domain Name,** and **Email Address**.
- e) Check the **Key Generated** check box to view the available RSA keypairs. Choose an option from the **Available RSA Keypairs** drop-down list.
- f) Check the **Enroll Trustpoint** check box.
- g) In the **Password** field, enter the password.
- h) In the **Re-Enter Password** field, confirm the password.
- i) Click **Apply to Device**.

The new trustpoint is added to the trustpoint name list.

## Generating an AP Self-Signed Certificate (GUI)

**Note** This section is valid only for virtual controllers (Cisco Catalyst 9800-CL Wireless Controller for Cloud) and not applicable for appliance based controllers (Cisco Catalyst 9800-40 Wireless Controller, Cisco Catalyst 9800-80 Wireless Controller, Cisco Catalyst 9800-L Wireless Controller (Copper Uplink), and Cisco Catalyst 9800-L Wireless Controller (Fiber Uplink)).

### Procedure

- Step 1** Choose **Configuration > Security > PKI Management**.
- Step 2** In the **AP SSC Trustpoint** area, click **Generate** to generate an AP SSC trustpoint.
- Step 3** From the **RSA Key-Size** drop-down list, choose a key size.
- Step 4** From the **Signature Algorithm** drop-down list, choose an option.
- Step 5** From the **Password Type** drop-down list, choose a password type.
- Step 6** In the **Password** field, enter a password. The valid range is between 8 and 32 characters.
- Step 7** Click **Apply to Device**.

## Adding the Certificate Authority Server (GUI)

### Procedure

- Step 1** Choose **Configuration > Security > PKI Management**.
- Step 2** In the **PKI Management** window, click the **CA Server** tab.
- Step 3** In the **CA Server** section, click the **Shutdown Status** toggle button, to enable the status. If you choose the shutdown status as **Enabled**, you must enter the password and confirm the same.
- Step 4** If you choose the shutdown status as **Disabled**, you must enter the **Country Code, State, Location, Organization, Domain Name,** and **Email Address**.

- Step 5** Click **Apply** to add the CA server.
- Step 6** Click **Remove CA Server** to delete the CA server.
- 

## Adding an RSA or EC Key for PKI Trustpoint (GUI)

### Procedure

---

- Step 1** Choose **Configuration > Security > PKI Management**.
- Step 2** In the **PKI Management** window, click the **Key Pair Generation** tab.
- Step 3** In the **Key Pair Generation** section, click **Add**.
- Step 4** In the dialog box that is displayed, provide the following information:
- In the **Key Name** field, enter the key name.
  - In the **Key Type** options, select either **RSA Key** or **EC Key**.
  - In the **Modulus Size** field, enter the modulus value for the RSA key or the EC key. The default modulus size for the RSA key is 4096 and the default value for the EC key is 521.
  - Check the **Key Exportable** check box to export the key. By default, this is checked.
  - Click **Generate**.
- 

## Adding and Managing Certificates

To add and manage certificates, use one of the following methods:

**Note** While configuring a password for the .pfx file, do not use the following ASCII characters: "\*", "^", "()", "[", "\", " ", and "+"

Using these ASCII characters results in error with bad configuration and does not import the certificate to the controller.

---

### Method 1

#### Procedure

---

- Step 1** Choose **Configuration > Security > PKI Management > Add Certificate**.
- Step 2** Click **Generate Certificate Signing Request**.
- In the **Certificate Name** field, enter the certificate name.
  - From the **Key Name** drop-down list, choose an RSA key pair. (Click the plus (+) icon under the **Key Pair Generation** tab to create new RSA key pairs.)

- c) Enter values the **Country Code**, **Location**, **Organization**, **State**, **Organizational Unit**, and the **Domain Name** fields.
- d) Click **Generate**.  
The generated Certificate Signing Request (CSR) is displayed on the right. Click **Copy** to copy and save a local copy. Click **Save to Device** to save the generated CSR to the /bootflash/csr directory.

**Step 3** Click **Authenticate Root CA** .

- a) From the **Trustpoint** drop-down list, choose the trustpoint label generated in Step 2, or any other trustpoint label that you want to authenticate.
- b) In the **Root CA Certificate (.pem)** field, copy and paste the certificate that you have received from the CA.

**Note** Ensure that you copy and paste the PEM Base64 certificate of the issuing CA of the device certificate.

- c) Click **Authenticate**.

**Step 4** Click **Import Device Certificate** .

- a) From the **Trustpoint** drop-down list, choose the trustpoint label that was generated in Step 2, or any other trustpoint label that you want to authenticate.
- b) In the **Signed Certificate (.pem)** field, copy and paste the signed certificate that you received, from your CA.
- c) Click **Import**.

This completes the device certificate import process and the certificate can now be assigned to features.

## Method 2

### Procedure

Click **Import PKCS12 Certificate** .

**Note** You can import an entire certificate chain in the PKCS12 format using different transport types.

- a) From the **Transport Type** drop-down list, choose either **FTP**, **SFTP**, **TFTP**, **SCP**, or **Desktop (HTTPS)**.  
For **FTP**, **SFTP**, and **SCP**, enter values in the **Server IP Address (IPv4/IPv6)**, **Username**, **Password**, **Certificate File Path**, **Certificate Destination File Name**, and **Certificate Password** fields.  
For **TFTP**, enter values in the **Server IP Address (IPv4/IPv6)**, **Certificate File Path**, **Certificate Destination File Name**, and **Certificate Password** fields.  
For **Desktop (HTTPS)**, enter values in the **Source File Path** and **Certificate Password** fields.
- b) Click **Import**.

## CHAPTER 123

# Controller Self-Signed Certificate for Wireless AP Join

---

- [Use Cases, on page 1371](#)
- [Prerequisites, on page 1372](#)
- [Configuring Clock Calendar \(CLI\), on page 1372](#)
- [Enabling HTTP Server \(CLI\), on page 1373](#)
- [Configuring CA Server \(CLI\), on page 1373](#)
- [Configuring Trustpoint \(CLI\), on page 1375](#)
- [Authenticating and Enrolling the PKI TrustPoint with CA Server \(CLI\), on page 1376](#)
- [Tagging Wireless Management TrustPoint Name \(CLI\), on page 1377](#)
- [Verifying Controller Certificates for Wireless AP Join, on page 1377](#)

## Use Cases

### Use Case-1

Cisco Catalyst 9800-CL platform does not contain manufacturer installed SUDI certificates. You will need to configure Self-Signed Certificates on your controller.

### Use Case-2

APs running on earlier versions and having Manufacturer Installed Certificate (MIC) issued by a SHA1 Cisco Trusted CA cannot join the controller with SHA2 SUDI certificate. During CAPWAP join process, the AP displays a bad certificate error and tears down the DTLS handshake.

**Workaround:** To upgrade APs, configure controller Self-Signed certificates. Once done, you can delete the Self-Signed certificates and revert back to the SUDI certificate.

---

**Note** This workaround does not apply to the Embedded Wireless Controller running Catalyst 9k switches. But applies to other hardware appliance controllers, such as Cisco Catalyst 9800-40, Cisco Catalyst 9800-80, and Cisco Catalyst 9800-L.

---

---

**Note** Certificate used in DTLS connections (AP and mobility) must use RSA key of size equal or more than 2048 bits. Otherwise, the APs and mobility connections will fail after reload. Run the **show crypto pki certificate verbose \_tp-name\_** command to display the key size of the device certificate.

---

## Prerequisites

- Ensure that the VLAN interface is up and it's IP is reachable.
- Ensure that the **ip http server** is enabled. For more information, see [Enabling HTTP Server](#).
- Set the **clock calendar-valid** command appropriately. For more information, see [#unique\\_1742](#).
- Check if the PKI CA server is already configured or not. If configured, you will need to delete the existing CA server configuration.

---

**Note** The **show crypto pki server** command output should not display anything.

---

## Configuring Clock Calendar (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>clock calendar-valid</b>  <b>Example:</b> Device(config)# <b>clock calendar-valid</b>	Enables clock calendar.
<b>Step 3</b>	<b>exit</b>  <b>Example:</b> Device(config)# <b>exit</b>	Exits configuration mode.

## Enabling HTTP Server (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>ip http server</b> <b>Example:</b> Device(config)# <code>ip http server</code>	Enables the HTTP server on your IP or IPv6 system, including a Cisco web browser user interface. By default, the HTTP server uses the standard port 80.
<b>Step 3</b>	<b>ip http secure-server</b> <b>Example:</b> Device(config)# <code>ip http secure-server</code>	Enables the HTTP server on your IP or IPv6 system, including a Cisco web browser user interface. By default, the HTTP server uses the standard port 80.
<b>Step 4</b>	<b>exit</b> <b>Example:</b> Device(config)# <code>exit</code>	Exits configuration mode.

## Configuring CA Server (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>crypto key generate rsa general-keys modulus <i>size_of_key_module</i> label <i>keypair_name</i></b> <b>Example:</b> Device(config)# <code>crypto key generate rsa general-keys modulus 2048 label WLC_CA</code>	Configures a certificate for the controller.  When you generate RSA keys, you are prompted to enter a modulus length. A longer modulus length might be more secure, but it takes longer to generate and to use.  <b>Note</b> The recommended key-pair name is <i>WLC_CA</i> and key modulus is <i>2048</i> bits.
<b>Step 3</b>	<b>crypto pki server <i>certificate_server_name</i></b> <b>Example:</b>	Enables IOS certificate server.

	Command or Action	Purpose
	Device (config) # <code>crypto pki server WLC_CA</code>	<b>Note</b> The <i>certificate_server_name</i> must be the same name as the <i>keypair_name</i> .
<b>Step 4</b>	<b>issuer-name</b> <b>Example:</b> Device (config) # <code>issuer-name O=Cisco Virtual Wireless LAN Controller, CN=CA-vWLC</code>	Configures X.509 distinguished name for the issuer CA certificate.  <b>Note</b> You need to configure the same <b>issuer-name</b> as suggested for AP join.
<b>Step 5</b>	<b>grant auto</b> <b>Example:</b> Device (config) # <code>grant auto</code>	Grants certificate requests automatically.
<b>Step 6</b>	<b>hash sha256</b> <b>Example:</b> Device (config) # <code>hash sha256</code>	(Optional) Specifies the hash function for the signature used in the granted certificates.
<b>Step 7</b>	<b>lifetime ca-certificate <i>time-interval</i></b> <b>Example:</b> Device (config) # <code>lifetime ca-certificate 3650</code>	(Optional) Specifies the lifetime in days of a CA certificate.
<b>Step 8</b>	<b>lifetime certificate <i>time-interval</i></b> <b>Example:</b> Device (config) # <code>lifetime certificate 3650</code>	(Optional) Specifies the lifetime in days of a granted certificate.
<b>Step 9</b>	<b>database archive pkcs12 password <i>password</i></b> <b>Example:</b> Device (config) # <code>database archive pkcs12 password 0 cisco123</code>	Sets the CA key and CA certificate archive format and password to encrypt the file.
<b>Step 10</b>	<b>no shutdown</b> <b>Example:</b> Device (config) # <code>no shutdown</code>	Enables the certificate server.  <b>Note</b> Issue this command only after you have completely configured your certificate server.
<b>Step 11</b>	<b>end</b> <b>Example:</b> Device (config) # <code>end</code>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

# Configuring Trustpoint (CLI)

## Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>crypto key generate rsa exportable general-keys modulus size-of-the-key-modulus label label</b>  <b>Example:</b> Device(config)# <code>crypto key generate rsa exportable general-keys modulus 2048 label ewlc-tp1</code>	When you generate RSA keys, you are prompted to enter a modulus length. A longer modulus length might be more secure, but it takes longer to generate and to use.
<b>Step 3</b>	<b>crypto pki trustpoint trustpoint_name</b>  <b>Example:</b> Device(config)# <code>crypto pki trustpoint ewlc-tp1</code>	Creates a new trust point for an external CA server. Here, <i>trustpoint_name</i> refers to the trustpoint name.  <b>Note</b> Ensure that same names are used for key-pair ( <i>label</i> ) and <i>trustpoint_name</i> .
<b>Step 4</b>	<b>rsakeypair RSA_key key_size</b>  <b>Example:</b> Device(ca-trustpoint)# <code>rsakeypair ewlc-tp1</code>	Maps RSA key with that of the trustpoint.  <ul style="list-style-type: none"> <li>• <i>RSA_key</i>—Refers to the RSA key pair label.</li> <li>• <i>key_size</i>—Refers to the signature key length. The value ranges from 360 to 4096.</li> </ul>
<b>Step 5</b>	<b>subject-name subject_name</b>  <b>Example:</b> Device(ca-trustpoint)# <code>subject-name O=Cisco Virtual Wireless LAN Controller, CN=DEVICE-vWLC</code>	Creates subject name parameters for the trustpoint.
<b>Step 6</b>	<b>revocation-check none</b>  <b>Example:</b> Device(ca-trustpoint)# <code>revocation-check none</code>	Checks revocation.
<b>Step 7</b>	<b>hash sha256</b>  <b>Example:</b> Device(ca-trustpoint)# <code>hash sha256</code>	Specifies the hash algorithm.

	Command or Action	Purpose
<b>Step 8</b>	<b>serial-number</b> <b>Example:</b> Device(ca-trustpoint)# <b>serial-number</b>	Specifies the serial number.
<b>Step 9</b>	<b>eku request server-auth client-auth</b> <b>Example:</b> Device(ca-trustpoint)# <b>eku request server-auth client-auth</b>	(Optional) Sets certificate key-usage purpose.
<b>Step 10</b>	<b>password password</b> <b>Example:</b> Device(config)# <b>password 0 cisco123</b>	Enables password.
<b>Step 11</b>	<b>enrollment url url</b> <b>Example:</b> Device(config)# <b>enrollment url http://&lt;management-IPv4&gt;:80</b>	Enrolls the URL. <b>Note</b> Replace the dummy IP with management VLAN interface IP of the controller where CA server is configured.
<b>Step 12</b>	<b>exit</b> <b>Example:</b> Device(config)# <b>exit</b>	Exits the configuration.

## Authenticating and Enrolling the PKI TrustPoint with CA Server (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>crypto pki authenticate trustpoint_name</b> <b>Example:</b> Device(config)# <b>crypto pki authenticate ewlc-tp1</b> Certificate has the following attributes: Fingerprint MD5: 64C5FC9A C581D827 C25FC3CF 1A7F42AC Fingerprint SHA1: 6FAFF812 7C552783 6A8FB566 52D95849 CC2FC050 % Do you accept this certificate?	Fetches the CA certificate.

	Command or Action	Purpose
	<pre>[yes/no]: yes Trustpoint CA certificate accepted.</pre>	
<b>Step 3</b>	<b>crypto pki enroll</b> <i>trustpoint_name</i> <b>Example:</b> Device(config)# <b>crypto pki enroll ewlc-tp1</b> Enter following answers for UI interaction: % Include an IP address in the subject name? [no]: no Request certificate from CA? [yes/no]: yes	Enrolls for client certificate.
<b>Step 4</b>	<b>end</b> <b>Example:</b> Device(config)# <b>end</b>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Tagging Wireless Management TrustPoint Name (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>wireless management trustpoint</b> <i>trustpoint_name</i> <b>Example:</b> Device(config)# <b>wireless management trustpoint ewlc-tp1</b>	Tags the wireless management trustpoint name.
<b>Step 3</b>	<b>end</b> <b>Example:</b> Device(config)# <b>end</b>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Verifying Controller Certificates for Wireless AP Join

To view the CA server details, use the following command:

```
Device# show crypto pki server
Certificate Server WLC_CA:
Status: enabled
```

```
State: enabled
Server's configuration is locked (enter "shut" to unlock it)
Issuer name: O=Cisco Virtual Wireless LAN Controller, CN=CA-vWLC
CA cert fingerprint: 79A3DBD5 59A7E384 73ABD152 C133F4E2
Granting mode is: auto
Last certificate issued serial number (hex): 1
CA certificate expiration timer: 12:04:00 UTC Mar 8 2029
CRL NextUpdate timer: 18:04:00 UTC Mar 11 2019
Current primary storage dir: nvram:
Database Level: Minimum - no cert data written to storage
```

To view the trustpoint details, use the following command:

```
Device# show crypto pki trustpoint ewlc-tp1 status
Trustpoint ewlc-tp1:
...
State:
Keys generated Yes (General Purpose, exportable)
Issuing CA authenticated Yes
Certificate request(s) Yes
```

To view the wireless management trustpoint details, use the following command:

```
Device# do show wireless management trustpoint
Trustpoint Name : ewlc-tp1
Certificate Info : Available
Certificate Type : SSC
Certificate Hash : 4a5d777c5b2071c17faef376feb08398702184e
Private key Info : Available
FIPS suitability : Not Applicable
```

To view the HTTP server status, use the following command:

```
Device# show ip http server status | include server status
HTTP server status: Enabled
HTTP secure server status: Enabled
```

## CHAPTER 124

# Managing Rogue Devices

- [Rogue Detection, on page 1379](#)
- [Rogue Detection Security Level, on page 1391](#)

- [Wireless Service Assurance Rogue Events, on page 1393](#)
- [Rogue Full Scale Quotas and Priorities, on page 1394](#)

## Rogue Detection

### Rogue Devices

Rogue access points can disrupt wireless LAN operations by hijacking legitimate clients and using plain-text or other denial-of-service or man-in-the-middle attacks. That is, a hacker can use a rogue access point to capture sensitive information, such as usernames and passwords. The hacker can then transmit a series of Clear to Send (CTS) frames. This action mimics an access point, informing a particular client to transmit, and instructing all the other clients to wait, which results in legitimate clients being unable to access network resources. Wireless LAN service providers have a strong interest in banning rogue access points from the air space.

Because rogue access points are inexpensive and readily available, employees sometimes plug unauthorized rogue access points into existing LANs and build ad hoc wireless networks without their IT department's knowledge or consent. These rogue access points can be a serious breach of network security because they can be plugged into a network port behind the corporate firewall. Because employees generally do not enable any security settings on the rogue access point, it is easy for unauthorized users to use the access point to intercept network traffic and hijack client sessions. There is an increased chance of enterprise security breach when wireless users connect to access points in the enterprise network.

The following are some guidelines to manage rogue devices:

- The access points are designed to serve associated clients. These access points spend relatively less time performing off-channel scanning: about 50 milliseconds on each channel. If you want to detect a large number of rogue APs and clients with high sensitivity, a monitor mode access point must be used. Alternatively, you can reduce the scan intervals from 180 seconds to a lesser value, for example, 120 or 60 seconds, ensuring that the radio goes off-channel more frequently, which improves the chances of rogue detection. However, the access point continues to spend about 50 milliseconds on each channel.

- Rogue detection is disabled by default for OfficeExtend access points because these access points, which are deployed in a home environment, are likely to detect many rogue devices.
- Client card implementation might mitigate the effectiveness of containment. This normally happens when a client might quickly reconnect to the network after receiving a "de-association/de-authentication" frame, so it might still be able to pass some traffic. However, the browsing experience of the rogue client would be badly affected when it is contained.
- It is possible to classify and report rogue access points by using rogue states and user-defined classification rules that enable rogues to automatically move between states.
- Each controller limits the number of rogue containments to three and six per radio for access points in the monitor mode.
- When manual containment is performed using configuration, the rogue entry is retained even after the rogue entry expires.
- When a rogue entry expires, the managed access points are instructed to stop any active containment on it.
- When Validate Rogue AP Against AAA is enabled, the controller requests the AAA server for rogue AP classification with the configured interval.
- To validate a Rogue AP against AAA, add the rogue AP MAC to the AAA user-database with relevant delimiter, username, and password being the MAC address with relevant delimiter. The Access-Accept contains the Cisco-AV-pair with one of the following keywords:

- **rogue-ap-state**=*state*

---

**Note** Here, **state** can be either of the types, namely: alert, contain, internal, external, or threat.

---

- **rogue-ap-class**=*class*

---

**Note** Here, **class** can be either of the types, namely: unclassified, malicious, or friendly.

---

The following are the allowed combinations of class or state:

- **unclassified**: alert, contain, or threat.
- **malicious**: alert, contain, or threat.
- **friendly**: alert, internal, or external.

The Radius Access-Reject for rogue AP AAA validation is ignored.

- When Validate Rogue Clients Against AAA is enabled, the controller requests the AAA server for rogue client validation only once. As a result, if rogue client validation fails on the first attempt then the rogue client will not be detected as a threat any more. To avoid this, add the valid client entries in the authentication server before enabling Validate Rogue Clients Against AAA.

### Restrictions on Rogue Detection

- Rogue containment is not supported on DFS channels.

A rogue access point is moved to a contained state either automatically or manually. The controller selects the best available access point for containment and pushes the information to the access point. The access point stores the list of containments per radio. For auto containment, you can configure the controller to use only the monitor mode access point. The containment operation occurs in the following two ways:

- The container access point goes through the list of containments periodically and sends unicast containment frames. For rogue access point containment, the frames are sent only if a rogue client is associated.
- Whenever a contained rogue activity is detected, containment frames are transmitted.

Individual rogue containment involves sending a sequence of unicast disassociation and deauthentication frames.

From 17.7.1 release onwards, Beacon DS Attack and Beacon Wrong Channel signatures were introduced.

**Beacon DS Attack**—When managed and rogue APs use the same BSSID, the rogue APs are termed as impersonators. An attacker can add the Direct-Sequence parameter set information element with any channel number. If the added channel number is different from the channel number used by the managed AP, the attack is termed as Beacon DS Attack.

**Beacon Wrong Channel**—When managed and rogue APs use the same BSSID, the rogue APs are termed as AP impersonators. If an AP impersonator uses a channel number that is different from the one used by the managed AP with the same BSSID, the attack is termed as Beacon Wrong Channel. In such a case, the Direct-Sequence Information Element might not even be present in the Beacon frame.

### Cisco Prime Infrastructure Interaction and Rogue Detection

Cisco Prime Infrastructure supports rule-based classification and uses the classification rules configured on the controller. The controller sends traps to Cisco Prime Infrastructure after the following events:

- If an unknown access point moves to the Friendly state for the first time, the controller sends a trap to Cisco Prime Infrastructure only if the rogue state is Alert. It does not send a trap if the rogue state is Internal or External.
- If a rogue entry is removed after the timeout expires, the controller sends a trap to Cisco Prime Infrastructure for rogue access points that are categorized as Malicious (Alert, Threat) or Unclassified (Alert). The controller does not remove rogue entries with the following rogue states: Contained, Contained Pending, Internal, and External.

## Information About Rogue Containment (Protected Management Frames (PMF) Enabled)

From Cisco IOS XE Amsterdam, 17.3.1 onwards, rogue devices that are enabled with 802.11w Protected Management Frames (PMF) are not contained. Instead, the rogue device is marked as *Contained Pending*, and a WSA alarm is raised to inform about the Contained Pending event. Because the device containment is not performed, access point (AP) resources are not consumed unnecessarily.

---

**Note** This feature is supported only on the Wave 2 APs.

---

Run the **show wireless wps rogue ap detailed** command to verify the device containment, when PMF is enabled on a rogue device.

## AP Impersonation Detection

The various methods to detect AP impersonation are:

- AP impersonation can be detected if a managed AP reports itself as Rogue. This method is always enabled and no configuration is required.
- AP impersonation detection is based on MFP.
- AP impersonation detection based on AP authentication.

Infrastructure MFP protects 802.11 session management functions by adding message integrity check (MIC) information elements, to the management frames sent by APs (and not those sent by clients), which are then validated by other APs in the network. If infrastructure MFP is enabled, the managed APs check if the MIC information elements are present and if MIC information elements are as expected. If either of these conditions is not fulfilled, the managed AP sends rogue AP reports with updated AP authentication failure counter.

The AP Authentication functionality allows you to detect AP impersonation. When you enable this functionality, the controller creates an AP domain secret and shares it with other APs in the same network. This allows the APs to authenticate each other.

An AP Authentication information element is attached to beacon and probe response frames. If the AP Authentication information element has an incorrect Signature field, or the timestamp is off, or if the AP Authentication information element is missing, then the AP that has detected such a condition increments the **AP authentication failure count** field. An impersonation alarm is raised after the **AP authentication failure count** field breaches its threshold. The rogue AP is classified as **Malicious** with state **Threat**.

Run the **show wireless wps rogue ap detail** command to see when the impersonation is detected due to authentication errors.

---

**Note** Ensure that the **ccx aironet-iesupport** command is run in all the WLAN procedures, else the BSSID will be detected as a rogue.

For AP impersonation detection, Network Time Protocol (NTP) must be enabled instead of CAPWAP based time, under the AP profile.

---

## Configuring Rogue Detection (GUI)

### Procedure

---

- Step 1** Choose **Configuration > Tags & Profiles > AP Join**.
- Step 2** Click the **AP Join Profile Name** to edit the AP join profile properties.
- Step 3** In the **Edit AP Join Profile** window, click the **Rogue AP** tab.
- Step 4** Check the **Rogue Detection** check box to enable rogue detection.
- Step 5** In the **Rogue Detection Minimum RSSI** field, enter the RSSI value.
- Step 6** In the **Rogue Detection Transient Interval** field, enter the interval in seconds.

- Step 7** In the **Rogue Detection Report Interval** field, enter the report interval value in seconds.
- Step 8** In the **Rogue Detection Client Number Threshold** field, enter the threshold for rogue client detection.
- Step 9** Check the **Auto Containment on FlexConnect Standalone** check box to enable auto containment.
- Step 10** Click **Update & Apply to Device**.

## Configuring Rogue Detection (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>ap profile <i>profile-name</i> rogue detection min-rssi <i>rss</i> in dBm</b>  <b>Example:</b> Device(config)# <code>ap profile profile1</code>  Device(config)# <code>rogue detection min-rssi -100</code>	Specify the minimum RSSI value that rogues should have for APs to detect and for rogue entry to be created in the device.  Valid range for the rssi in dBm parameter is -128 dBm to -70 dBm, and the default value is -128 dBm.  <b>Note</b> This feature is applicable to all the AP modes. There can be many rogues with very weak RSSI values that do not provide any valuable information in rogue analysis. Therefore, you can use this option to filter rogues by specifying the minimum RSSI value at which APs should detect rogues.
<b>Step 3</b>	<b>ap profile <i>profile-name</i> rogue detection containment {auto-rate   flex-rate}</b>  <b>Example:</b> Device(config)# <code>ap profile profile1</code>  Device(config)# <code>rogue detection containment flex-rate</code>	Specifies the rogue containment options. The <b>auto-rate</b> option enables auto-rate for containment of rogues. The <b>flex-rate</b> option enables rogue containment of standalone FlexConnect APs.
<b>Step 4</b>	<b>ap profile <i>profile-name</i> rogue detection enable</b>  <b>Example:</b> Device(config)# <code>ap profile profile1</code>  Device(config)# <code>rogue detection enable</code>	Enables rogue detection on all APs.
<b>Step 5</b>	<b>ap profile <i>profile-name</i> rogue detection report-interval <i>time</i> in seconds</b>  <b>Example:</b>	Configures rogue report interval for monitor mode Cisco APs.

	Command or Action	Purpose
	<pre>Device(config)# ap profile profile1 Device(config)# rogue detection report-interval 120</pre>	The valid range for reporting the interval in seconds is 10 seconds to 300 seconds.

## Configuring RSSI Deviation Notification Threshold for Rogue APs (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> <pre>Device# configure terminal</pre>	Enters global configuration mode.
<b>Step 2</b>	<b>wireless wps rogue ap notify-rssi-deviation</b> <b>Example:</b> <pre>Device(config)# wireless wps rogue ap notify-rssi-deviation</pre>	Configures RSSI deviation notification threshold for Rogue APs.
<b>Step 3</b>	<b>end</b> <b>Example:</b> <pre>Device(config)# end</pre>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Configuring Management Frame Protection (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Security > Wireless Protection Policies**.
  - Step 2** In the **Rogue Policy** tab, under the **MFP Configuration** section, check the **Global MFP State** check box and the **AP Impersonation Detection** check box to enable the global MFP state and the AP impersonation detection, respectively.
  - Step 3** In the **MFP Key Refresh Interval** field, specify the refresh interval in hours.
  - Step 4** Click **Apply**.
-

## Configuring Management Frame Protection (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wireless wps mfp</b> <b>Example:</b> Device(config)# wireless wps mfp	Configures a management frame protection.
<b>Step 3</b>	<b>wireless wps mfp {ap-impersonation   key-refresh-interval}</b> <b>Example:</b> Device(config)# wireless wps mfp ap-impersonation  Device(config)# wireless wps mfp key-refresh-interval	Configures ap impersonation detection (or) MFP key refresh interval in hours.  key-refresh-interval—Refers to the MFP key refresh interval in hours. The valid range is from 1 to 24. Default value is 24.
<b>Step 4</b>	<b>end</b> <b>Example:</b> Device(config)# end	Saves the configuration and exits configuration mode and returns to privileged EXEC mode.

## Enabling Access Point Authentication

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wireless wps ap-authentication</b> <b>Example:</b> Device(config)# wireless wps ap-authentication	Configures the wireless WPS AP authentication.
<b>Step 3</b>	<b>wireless wps ap-authentication threshold <i>threshold</i></b> <b>Example:</b> Device(config)# wireless wps ap-authentication threshold 100	Configures AP neighbor authentication and sets the threshold for AP authentication failures.

	Command or Action	Purpose
<b>Step 4</b>	<b>wlan</b> <i>wlan-name wlan-id SSID-name</i> <b>Example:</b> Device(config)# wlan wlan-demo 1 ssid-demo	Configures a WLAN.
<b>Step 5</b>	<b>ccx aironet-iesupport</b> <b>Example:</b> Device(config-wlan)# ccx aironet-iesupport	Enables support for Aironet Information Elements on this WLAN.
<b>Step 6</b>	<b>end</b> <b>Example:</b> Device# end	Returns to privileged EXEC mode.

## Verifying Management Frame Protection

To verify if the Management Frame Protection (MFP) feature is enabled or not, use the following command:

```
Device# show wireless wps summary
Client Exclusion Policy
 Excessive 802.11-association failures : unknown
 Excessive 802.11-authentication failures: unknown
 Excessive 802.1x-authentication : unknown
 IP-theft : unknown
 Excessive Web authentication failure : unknown
 Failed Qos Policy : unknown

Management Frame Protection
 Global Infrastructure MFP state : Enabled
 AP Impersonation detection : Disabled
 Key refresh interval : 15
```

To view the MFP details, use the following command:

```
Device# show wireless wps mfp summary
Management Frame Protection
 Global Infrastructure MFP state : Enabled
 AP Impersonation detection : Disabled
 Key refresh interval : 15
```

## Verifying Rogue Events

To verify the rogue event history, run the **show wireless wps rogue ap detailed** command:

```
Device# show wireless wps rogue ap detailed
Rogue Event history

Timestamp #Times Class/State Event Ctx
 RC

05/10/2021 13:56:46.657434 2 Mal/Threat FSM_GOTO
Threat 0x0
```

```

05/10/2021 13:56:46.654905 1 Unk/Init EXPIRE_TIMER_START
240s 0x0
05/10/2021 13:56:46.654879 1 Unk/Init AP_IMPERSONATION DS:1,ch:1,band_id:0

```

## Verifying Rogue Detection

This section describes the new command for rogue detection.

The following command can be used to verify rogue detection on the device.

**Table 88: Verifying Adhoc Rogues Information**

Command	Purpose
<b>show wireless wps rogue adhoc detailed</b> <i>mac_address</i>	Displays the detailed information for an Adhoc rogue.
<b>show wireless wps rogue adhoc summary</b>	Displays a list of all Adhoc rogues.

**Table 89: Verifying Rogue AP Information**

Command	Purpose
<b>show wireless wps rogue ap clients</b> <i>mac_address</i>	Displays the list of all rogue clients associated with a rogue.
<b>show wireless wps rogue ap custom summary</b>	Displays the custom rogue AP information.
<b>show wireless wps rogue ap detailed</b> <i>mac_address</i>	Displays the detailed information for a rogue AP.
<b>show wireless wps rogue ap friendly summary</b>	Displays the friendly rogue AP information.
<b>show wireless wps rogue ap list</b> <i>mac_address</i>	Displays the list of rogue APs detected by a given AP.
<b>show wireless wps rogue ap malicious summary</b>	Displays the malicious rogue AP information.

<b>show wireless wps rogue ap summary</b>	Displays a list of all Rogue APs.
<b>show wireless wps rogue ap unclassified summary</b>	Displays the unclassified rogue AP information.

Table 90: Verifying Rogue Auto-Containment Information

Command	Purpose
<b>show wireless wps rogue auto-contain</b>	Displays the rogue auto-containment information.

Table 91: Verifying Classification Rule Information

Command	Purpose
<b>show wireless wps rogue rule detailed</b> <i>rule_name</i>	Displays the detailed information for a classification rule.
<b>show wireless wps rogue rule summary</b>	Displays the list of all rogue rules.

Table 92: Verifying Rogue Statistics

Command	Purpose
<b>show wireless wps rogue stats</b>	Displays the rogue statistics.

Table 93: Verifying Rogue Client Information

Command	Purpose
<b>show wireless wps rogue client detailed</b> <i>mac_address</i>	Displays detailed information for a Rogue client.
<b>show wireless wps rogue client summary</b>	Displays a list of all the Rogue clients.

Table 94: Verifying Rogue Ignore List

Command	Purpose
<b>show wireless wps rogue ignore-list</b>	Displays the rogue ignore list.

## Examples: Rogue Detection Configuration

This example shows how to configure the minimum RSSI that a detected rogue AP needs to be at, to have an entry created in the device:

```
Device# configure terminal
Device(config)# ap profile profile1
Device(config)# rogue detection min-rssi -100
```

```
Device(config)# end
Device# show wireless wps rogue client summary/show wireless wps rogue ap summary
```

This example shows how to configure the classification interval:

```
Device# configure terminal
Device(config)# ap profile profile1
Device(config)# rogue detection min-transient-time 500
Device(config)# end
Device# show wireless wps rogue client summary/show wireless wps rogue ap summary
```

## Configuring Rogue Policies (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Security > Wireless Protection Policies**.
  - Step 2** In the **Rogue Policies** tab, use the **Rogue Detection Security Level** drop-down to select the security level.
  - Step 3** In the **Expiration timeout for Rogue APs (seconds)** field, enter the timeout value.
  - Step 4** Select the **Validate Rogue Clients against AAA** check box to validate rogue clients against AAA server.
  - Step 5** Select the **Validate Rogue APs against AAA** check box to validate rogue access points against AAA server.
  - Step 6** In the **Rogue Polling Interval (seconds)** field, enter the interval to poll the AAA server for rogue information.
  - Step 7** Select the **Detect and Report Adhoc Networks** check box to enable detection of rogue adhoc networks.
  - Step 8** In the **Rogue Detection Client Number Threshold** field, enter the threshold to generate SNMP trap.
  - Step 9** In the **Auto Contain** section, enter the following details.
  - Step 10** Use the **Auto Containment Level** drop-down to select the level.
  - Step 11** Select the **Auto Containment only for Monitor Mode APs** check box to limit the auto-containment only to monitor mode APs.
  - Step 12** Select the **Rogue on Wire** check box to limit the auto-containment only to rogue APs on wire.
  - Step 13** Select the **Using our SSID** check box to limit the auto-containment only to rogue APs using one of the SSID configured on the controller.
  - Step 14** Select the **Adhoc Rogue AP** check box to limit the auto-containment only to adhoc rogue APs.
  - Step 15** Click **Apply**.
- 

## Configuring Rogue Policies (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>Example:</b>	Configures the rogue detection security level.

	Command or Action	Purpose
	Device (config) # <b>wireless wps rogue security-level custom</b>	You can select <b>critical</b> for highly sensitive deployments, <b>custom</b> for customizable security level, <b>high</b> for medium-scale deployments, and <b>low</b> for small-scale deployments.
<b>Step 3</b>	<b>wireless wps rogue ap timeout</b> <i>number of seconds</i> <b>Example:</b> Device (config) # <b>wireless wps rogue ap timeout 250</b>	Configures the expiration time for rogue entries, in seconds. Valid range for the time in seconds 240 seconds to 3600 seconds.
<b>Step 4</b>	<b>Example:</b> Device (config) # <b>wireless wps rogue client aaa</b>	Configures the use of AAA or local database to detect valid MAC addresses.
<b>Step 5</b>	<b>Example:</b> Device (config) # <b>wireless wps rogue client mse</b>	Configures the use of MSE to detect valid MAC addresses.
<b>Step 6</b>	<b>wireless wps rogue client notify-min-rssi</b> <i>RSSI threshold</i> <b>Example:</b> Device (config) # <b>wireless wps rogue client notify-min-rssi -128</b>	Configures the minimum RSSI notification threshold for rogue clients. Valid range for the RSSI threshold in dB is -128 - dB to -70 dB.
<b>Step 7</b>	<b>wireless wps rogue client notify-min-deviation</b> <i>RSSI threshold</i> <b>Example:</b> Device (config) # <b>wireless wps rogue client notify-min-deviation 4</b>	Configures the RSSI deviation notification threshold for rogue clients. Valid range for the RSSI threshold in dB is 0 dB to 10 dB.
<b>Step 8</b>	<b>wireless wps rogue ap aaa</b> <b>Example:</b> Device (config) # <b>wireless wps rogue ap aaa</b>	Configures the use of AAA or local database to classify rogue AP based on rogue AP MAC addresses.
<b>Step 9</b>	<b>wireless wps rogue ap aaa polling-interval</b> <i>AP AAA Interval</i> <b>Example:</b> Device (config) # <b>wireless wps rogue ap aaa polling-interval 120</b>	Configures rogue AP AAA validation interval. The valid range for the AP AAA interval in seconds is 60 seconds to 86400 seconds.
<b>Step 10</b>	<b>wireless wps rogue adhoc</b> <b>Example:</b> Device (config) # <b>wireless wps rogue adhoc</b>	Enables detecting and reporting adhoc rogue (IBSS).

	Command or Action	Purpose
<b>Step 11</b>	<b>wireless wps rogue client client-threshold threshold</b>  <b>Example:</b> Device(config)# <b>wireless wps rogue client client-threshold 100</b>	Configures the rogue client per a rogue AP SNMP trap threshold. The valid range for the threshold is 0 to 256.
<b>Step 12</b>	<b>wireless wps rogue ap init-timer</b>  <b>Example:</b> Device(config)# <b>wireless wps rogue ap init-timer 180</b>	Configures the init timer for rogue APs. The default timer value is set to 180 seconds.  <b>Note</b> When a rogue AP is detected, an init timer is started and the rules are applied when this timer expires. This allows for rogue AP information to stabilize before applying any rules. However, you can change the value of this timer using this command. For instance, the init timer can be set to 0, if the rules need to be applied as soon as a new rogue AP is detected.

## Rogue Detection Security Level

The rogue detection security level configuration allows you to set rogue detection parameters.

The available security levels are:

- Critical: Basic rogue detection for highly sensitive deployments.
- High: Basic rogue detection for medium-scale deployments.
- Low: Basic rogue detection for small-scale deployments.
- Custom: Default security-level, where all detection parameters are configurable.

**Note** When in Critical, High or Low, some rogue parameters are fixed and cannot be configured.

The following table shows parameter details for the three predefined levels:

**Table 95: Rogue Detection: Predefined Levels**

Parameter	Critical	High	Low
Cleanup Timer	3600	1200	240
AAA Validate Clients	Disabled	Disabled	Disabled
AAA Validate AP	Disabled	Disabled	Disabled

Parameter	Critical	High	Low
Adhoc Reporting	Enabled	Enabled	Enabled
Monitor-Mode Report Interval	10 seconds	30 seconds	60 seconds
Minimum RSSI	-128 dBm	-80 dBm	-80 dBm
Transient Interval	600 seconds	300 seconds	120 seconds
Auto Contain Works only on Monitor Mode APs.	Disabled	Disabled	Disabled
Auto Contain Level	1	1	1
Auto Contain Same-SSID	Disabled	Disabled	Disabled
Auto Contain Valid Clients on Rogue AP	Disabled	Disabled	Disabled
Auto Contain Adhoc	Disabled	Disabled	Disabled
Containment Auto-Rate	Enabled	Enabled	Enabled
Validate Clients with CMX	Enabled	Enabled	Enabled
Containment FlexConnect	Enabled	Enabled	Enabled

## Setting Rogue Detection Security-level

Follow the procedure given below to set the rogue detection security-level:

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters the global configuration mode.
<b>Step 2</b>	<b>wireless wps rogue security-level custom</b>  <b>Example:</b> Device(config)# wireless wps rogue security-level custom	Configures rogue detection security level as custom.

	Command or Action	Purpose
<b>Step 3</b>	<b>wireless wps rogue security-level low</b> <b>Example:</b> Device(config)# wireless wps rogue security-level low	Configures rogue detection security level for basic rogue detection setup for small-scale deployments.
<b>Step 4</b>	<b>wireless wps rogue security-level high</b> <b>Example:</b> Device(config)# wireless wps rogue security-level high	Configures rogue detection security level for rogue detection setup for medium-scale deployments.
<b>Step 5</b>	<b>wireless wps rogue security-level critical</b> <b>Example:</b> Device(config)# wireless wps rogue security-level critical	Configures rogue detection security level for rogue detection setup for highly sensitive deployments.

## Wireless Service Assurance Rogue Events

Wireless Service Assurance (WSA) rogue events, supported in Release 16.12.x and later releases, consist of telemetry notifications for a subset of SNMP traps. WSA rogue events replicate the same information that is part of the corresponding SNMP trap.

For all the exported events, the following details are provided to the wireless service assurance (WSA) infrastructure:

- MAC address of the rogue AP
- Details of the managed AP and the radio that detected the rogue AP with strongest RSSI
- Event-specific data such as SSID, channel for potential honeypot event, and MAC address of the impersonating AP for impersonation event

The WSA rogue events feature can scale up to four times the maximum number of supported APs and half of the maximum number of supported clients.

The WSA rogue events feature is supported on Cisco Catalyst Center and other third-party infrastructure.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>network-assurance enable</b> <b>Example:</b> Device# network-assurance enable	Enables wireless service assurance.

	Command or Action	Purpose
<b>Step 3</b>	<b>wireless wps rogue network-assurance enable</b>  <b>Example:</b> Device# wireless wps rogue network-assurance enable	Enables wireless service assurance for rogue devices. This ensures that the WSA rogue events are sent to the event queue.

## Monitoring Wireless Service Assurance Rogue Events

### Procedure

- **show wireless wps rogue stats**

#### Example:

```
Device# show wireless wps rogue stats
```

```
WSA Events
 Total WSA Events Triggered : 9
 ROGUE_POTENTIAL_HONEYPOT_DETECTED : 2
 ROGUE_POTENTIAL_HONEYPOT_CLEARED : 3
 ROGUE_AP_IMPERSONATION_DETECTED : 4
 Total WSA Events Enqueued : 6
 ROGUE_POTENTIAL_HONEYPOT_DETECTED : 1
 ROGUE_POTENTIAL_HONEYPOT_CLEARED : 2
 ROGUE_AP_IMPERSONATION_DETECTED : 3
```

In this example, nine events have been triggered, but only six of them have been enqueued. This is because three events were triggered before the WSA rogue feature was enabled.

- **show wireless wps rogue stats internal**

```
show wireless wps rogue ap detailed rogue-ap-mac-addr
```

These commands show information related to WSA events into the event history.

## Rogue Full Scale Quotas and Priorities

### Feature History for Rogue Full Scale Quotas and Priorities

This table provides release and related information about the feature explained in this section.

This feature is also available in all the releases subsequent to the one in which they are introduced in, unless noted otherwise.

**Table 96: Feature History for Rogue Full Scale Quotas and Priorities**

Release	Feature	Feature Information
Cisco IOS XE Cupertino 17.9.1	Rogue Full Scale Quotas and Priorities	The Rogue Full Scale Quotas and Priorities feature helps you to improve the scalability, performance, manageability, and serviceability of rogue Access Points (APs).

## Rogue AP Scale Modes Per Class

The following are the modes that determine if a rogue AP is added to the database when it reaches maximum scale:

- **Quota:** Quotas are applied to each classification as a percentage of the maximum scale. This means that if a classification has quota X, then X percent of the rogue database is reserved for that classification. If the entire memory of the given classification is used up, the newly reported rogue APs under that classification are dropped.
- **Priority:** Priorities are applied to different classifications. When quotas are not configured, priority mode becomes the default mode.

The priority for each classification is configured as follows:

The default priority for malicious is **highest**. The default priority for custom is **high**. The default priority for unclassified is **medium**, and the default priority for friendly is **low**.

Priorities are only applied when the maximum scale is reached. If a new rogue AP is classified and the maximum scale is reached, it is added to the database only if there are lower-priority rogue APs in the database. In such a case, the newest rogue AP entry of the lowest priority is deleted. Else, if there are no lower-priority rogue APs, the new rogue AP is dropped.

- **Hybrid:** Hybrid mode enables the use of quotas and priorities as a combination. Unused quota reserved for higher priority rogue APs are used by rogue APs of lower priority when space is available.

After reaching the maximum scale, if a new rogue AP is classified, the following logic is applied:

- If the number of stored rogue APs (in the class of the new rogue AP), is below the quota, store the new rogue AP. Delete the newest rogue AP of the classification with the lowest priority that is above the quota.
- Alternatively, check if there is a class with lower priority and is above the quota than the newly classified rogue AP. If such a class exists, delete the newest rogue AP of that lower-priority classification and store the new rogue AP.
- If none of the above conditions apply, drop the new rogue AP.

**Table 97: Advantages and Disadvantages of Role-Scale Modes**

Mode	Advantages	Disadvantages
Quota	Simple to use and understand.	<ul style="list-style-type: none"> <li>• Memory is not used efficiently.</li> <li>• New rogue APs for a class that is already in its maximum quota are dropped. While the memory reserved for another class that does not have any rogue APs, stays empty.</li> </ul> <p>For example, this could lead to dropping malicious rogue APs, while there is still memory available.</p>

Mode	Advantages	Disadvantages
Priority	<ul style="list-style-type: none"> <li>• Simple to use and understand.</li> <li>• Utilizes the available memory.</li> <li>• Stores the important rogue APs.</li> </ul>	Some of the lower-priority rogue AP classes might not be represented in the rogue database, if higher-priority rogue APs utilize all the available memory.
Hybrid	Utilizes the available memory, while providing quotas so that all the classes are represented in the database.	Difficult for users to understand the exact behavior.

## Configuring Rogue AP Scale (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>[no] wireless wps rogue scale quota malicious percentage-malicious-rogue-AP custom percentage-custom-rogue-AP unclassified percentage-unclassified-rogue-AP friendly percentage-friendly-rogue-AP</b>  <b>Example:</b> Device(config)# wireless wps rogue scale quota malicious 5 custom 10 unclassified 3 friendly 5	Configures rogue scale quota for malicious, custom, unclassified, and friendly rogue APs. The default value for quota is 0. The sum of all the quotas must be less than or equal to 100 percent.  If the sum of all the configured quotas is equal to 0, then priority mode is used. If the sum of all the quotas is not equal to 0, then quota mode is used. If hybrid mode is configured, hybrid mode is used no matter what the quota configuration is. Hybrid mode with all the quotas equal to 0, is identical to the priority mode.  <b>Note</b> Hybrid mode is enabled after the maximum scale is reached. All the rogue APs are stored before the maximum scale is reached.
<b>Step 3</b>	<b>[no] wireless wps rogue scale priority malicious {high   highest   low   medium} custom {high   highest   low   medium} unclassified {high   highest   low   medium} friendly {high   highest   low   medium}</b>  <b>Example:</b>	Configures rogue scale priority for malicious, custom, unclassified, and friendly rogue APs. The default value for malicious is <b>highest</b> , the default value for custom is <b>high</b> , the default value for unclassified is <b>medium</b> , and the default value for friendly is <b>low</b> .

	Command or Action	Purpose
	Device(config)# wireless wps rogue scale priority malicious highest custom high unclassified medium friendly low	
<b>Step 4</b>	<b>[no] wireless wps rogue scale mode hybrid</b>  <b>Example:</b> Device(config)# wireless wps rogue scale mode hybrid	Configures rogue scale hybrid mode. Unused quota reserved for higher-priority rogue APs are used by rogue APs of lower priority when space is available.

## Verifying Rogue Scale Details

To verify the rogue scale details, run the following command:

```
Device# show wireless wps rogue stats
.
.
.
.
Total Post Init/Max : 0/4000
Total/Max : 0/4200
Init : 0
.
.
.
Classification
Friendly : 0/0/0 (Total/Init/Quota[%])
Malicious : 0/0/0 (Total/Init/Quota[%])
Custom : 0/0/0 (Total/Init/Quota[%])
Unclassified : 0/0/0 (Total/Init/Quota[%])
Unknown : 0/0 (Total/Init)
.
.
.
Configured Quotas by Classification
Custom : <% of max scale>
Friendly : <% of max scale>
Malicious : <% of max scale>
Unclassified : <% of max scale>

Configured Priorities by Classification
Custom : 2 (High)
Friendly : 4 (Low)
Malicious : 1 (Highest)
Unclassified : 3 (Medium)

Configured Rogue Scale Mode: [Priority|Quota|Hybrid]
```

To view the rogue ad hoc summary, run the following command:

```
Device# show wireless wps rogue adhoc summary
Detect and report Ad-Hoc Networks : Enabled
Auto-Contain Ad-Hoc Networks : Disabled
Total Number of Rogue Ad-Hoc : 0
Friendly Ad-Hoc Rogues : 0
Malicious Ad-Hoc Rogues : 0
Custom Ad-Hoc Rogues : 0
Unclassified Ad-Hoc Rogues : 0
Unknown Ad-Hoc Rogues : 0
Client MAC Address Adhoc BSSID Classification State # APs Last Heard
```

-----

## CHAPTER 125

# Classifying Rogue Access Points

- [Information About Classifying Rogue Access Points, on page 1399](#)
- [Guidelines and Restrictions for Classifying Rogue Access Points, on page 1401](#)
- [How to Classify Rogue Access Points, on page 1401](#)
- [Monitoring Rogue Classification Rules, on page 1407](#)
- [Examples: Classifying Rogue Access Points, on page 1407](#)

## Information About Classifying Rogue Access Points

The controller software enables you to create rules that can organize and display rogue access points as Friendly, Malicious, Custom, or Unclassified.

By default, none of the classification rules are used. You need to enable them. Therefore, all unknown access points are categorized as Unclassified. When you create or change a rule, configure conditions, and enable it, all rogue access points are then reclassified. Whenever you change a rule, it is applied to all the access points (friendly, malicious, and unclassified).

### Note

- Rule-based rogue classification does not apply to ad hoc rogues and rogue clients.
- You can configure up to 64 rogue classification rules per controller .

When the controller receives a rogue report from one of its managed access points, it responds as follows:

- If the unknown access point is in the friendly MAC address list, the controller classifies the access point as Friendly.
- If the unknown access point is not in the friendly MAC address list, the controller starts applying the rogue classification rules to the access point.
- If the rogue access point is manually classified, rogue rules are not applied to it.
- If the rogue access point matches the configured rules criteria, the controller classifies the rogue based on the classification type configured for that rule.
- If the rogue access point does not match any of the configured rules, the rogue remains unclassified.

The controller repeats the previous steps for all the rogue access points.

- If the rogue access point is detected on the same wired network, the controller marks the rogue state as Threat and classifies it as Malicious automatically, even if there are no configured rules. You can then manually contain the rogue to change the rogue state to Contained. If the rogue access point is not available on the network, the controller marks the rogue state as Alert. You can then manually contain the rogue.
- If desired, you can manually move the access point to a different classification type and rogue state.
- Before performing any classification, the rogue access points are temporarily marked as Pending.

Table 98: Classification Mapping

Rule-Based Classification Type	Rogue State
Custom	<ul style="list-style-type: none"> <li>• Alert—No action is taken other than notifying the management station. The management station in the controller manages the controller and wired networks.</li> <li>• Contained—The unknown access point is contained. If none of the managed access points are available for containment, the rogue is in Contained Pending state.</li> </ul>
Delete	Deletes the rogue access point.
Friendly	<ul style="list-style-type: none"> <li>• Internal—If the unknown access point poses no threat to WLAN security, you can manually configure it as Friendly, Internal. An example of this would be the access points in your lab network.</li> <li>• External—If the unknown access point is outside the network and poses no threat to WLAN security, you can manually configure it as Friendly, External. An example of this would be the access point in your neighboring coffee shop.</li> <li>• Alert—No action is taken other than notifying the management station. The management station manages the controller and wired networks.</li> </ul>
Malicious	<ul style="list-style-type: none"> <li>• Alert—No action is taken other than notifying the management station. The management station manages the controller and wired networks.</li> <li>• Threat—The unknown access point is found to be on the network and poses a threat to WLAN security.</li> <li>• Contained—The unknown access point is contained. If none of the managed access points are available for containment, the rogue is in Contained Pending state.</li> </ul>
Unclassified	<ul style="list-style-type: none"> <li>• Alert— No action is taken other than notifying the management station. The management station manages the controller and wired networks.</li> <li>• Contained—The unknown access point is contained. If none of the managed access points are available for containment, the rogue is in contained pending state.</li> </ul>

As mentioned earlier, the controller can automatically change the classification type and rogue state of an unknown access point based on user-defined rules. Alternatively, you can manually move the unknown access point to a different classification type and rogue state.

## Guidelines and Restrictions for Classifying Rogue Access Points

- Classifying Custom type rogues is tied to rogue rules. Therefore, it is not possible to manually classify a rogue as Custom. Custom class change can occur only when rogue rules are used.
- Some SNMP traps are sent for containment by rule and every 30 minutes for rogue classification change.
- Rogue rules are applied on every incoming new rogue report in the controller in the order of their priority.
- After a rogue satisfies a rule and is classified, it does not move down the priority list for the same report.
- The rogue classification rules are re-evaluated at every report received by the managed access points. Hence, a rogue access point can move from one state to another, if a different rule matches the last report.
- If a rogue AP is classified as friendly or ignored, all rogue clients associated with it are not tracked.
- Until the controller discovers all the APs through neighbor reports from APs, the rogue APs are kept in unconfigured state for three minutes after they are detected. After 3 minutes, the rogue policy is applied on the rogue APs and the APs are moved to unclassified, friendly, malicious, or custom class. Rogue APs kept in unconfigured state means that no rogue policy has yet been applied on them.
- When a rogue BSSID is submitted for a containment on Cisco Catalyst 9800 Series Wireless Controller, if the controller has enough resources, it will contain. The APs that detect the particular contained rogue AP starts broadcasting the DEAUTH packets.

Wireless client connected to the contained rogue BSSID will disconnect once DEAUTH packets are received. However, when the client assumes being in a connected state, repeatedly tries to reconnect and the wireless client's user browsing experience would be badly affected.

Also, in a high RF environment like that of a stadium, though DEAUTH packets are broadcasted, client does not receive all of them because of RF disturbance. In this scenario, the client may not be fully disconnected but will be affected badly.

- The rouge AP manual classification limit has been enhanced from 625 to 10,000 configurations at a time. The rouge client manual classification limit has been enhanced from 625 to 10,000 configurations at a time.

## How to Classify Rogue Access Points

### Classifying Rogue Access Points and Clients Manually (GUI)

#### Procedure

- Step 1** Choose **Monitoring > Wireless > Rogues**.
- Step 2** In the **Unclassified** tab, select an AP to view the detail in the lower pane.

**Step 3** Use the **Class Type** drop-down to set the status.

**Step 4** Click **Apply**.

## Classifying Rogue Access Points and Clients Manually (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>wireless wps rogue adhoc {alert mac-addr   auto-contain   contain mac-addr containment-level   internal mac-addr   external mac-addr}</b> <b>Example:</b> Device(config)# <code>wireless wps rogue adhoc alert 74a0.2f45.c520</code>	Detects and reports the ad hoc rogue. Enter one of these options after you enter the <b>adhoc</b> keyword: <ul style="list-style-type: none"> <li>• <b>alert</b>—Sets the ad hoc rogue access point to alert mode. If you choose this option, enter the MAC address for the <i>mac-addr</i> parameter.</li> <li>• <b>auto-contain</b>—Sets the automatically containing ad hoc rogue to auto-contain mode.</li> <li>• <b>contain</b>—Sets the containing ad hoc rogue access point to contain mode. If you choose this option, enter the MAC address for the <i>mac-addr</i> parameter and containment level for the <i>containment-level</i> parameter. The valid range for <i>containment-level</i> is from 1 to 4.</li> <li>• <b>external</b>—Sets the ad hoc rogue access point as <b>external</b>. If you choose this option, enter the MAC address for the <i>mac-addr</i> parameter.</li> <li>• <b>internal</b>—Sets the ad hoc rogue access point as <b>internal</b>. If you choose this option, enter the MAC address for the <i>mac-addr</i> parameter.</li> </ul>
<b>Step 3</b>	<b>wireless wps rogue ap {friendly mac-addr state [external   internal]   malicious mac-addr state [alert   contain containment-level]}</b> <b>Example:</b>	Configures the rogue access points. Enter one of the following options after the <b>ap</b> keyword:

	Command or Action	Purpose
	<pre>Device(config)# wireless wps rogue ap malicious 74a0.2f45.c520 state contain 3</pre>	<ul style="list-style-type: none"> <li>• <b>friendly</b>—Configures the friendly rogue access points. If you choose this option, enter the MAC address for the <i>mac-addr</i> parameter. After that enter the <b>state</b> keyword followed by either of these options: <b>internal</b> or <b>external</b>. If you select an <b>internal</b> option, it indicates that you trust a foreign access point. If you select an <b>external</b> option, it indicates that you acknowledge the presence of a rogue access point.</li> <li>• <b>malicious</b>—Configures the malicious rogue access points. If you choose this option, enter the MAC address for the <i>mac-addr</i> parameter. After that enter the <b>state</b> keyword followed by either of these options: <b>alert</b> or <b>contain</b>.</li> <li>• <b>alert</b>—Sets the malicious rogue access point to <b>alert</b> mode.</li> <li>• <b>contain</b>—Sets the malicious rogue access point to <b>contain</b> mode. If you choose this option, enter the containment level for the <i>containment-level</i> parameter. The valid range is from 1 to 4.</li> </ul>
<b>Step 4</b>	<pre>wireless wps rogue client {contain mac-addr containment-level}  <b>Example:</b>  Device(config)# wireless wps rogue client contain 74a0.2f45.c520 2</pre>	<p>Configures the rogue clients.</p> <p>Enter the following option after you enter the <b>client</b> keyword:</p> <ul style="list-style-type: none"> <li>• <b>contain</b>—Contains the rogue client. After you choose this option, enter the MAC address for the <i>mac-addr</i> parameter and the containment level for <i>containment-level</i> parameter. The valid range for <i>containment-level</i> is from 1 to 4.</li> </ul>
<b>Step 5</b>	<pre>end  <b>Example:</b>  Device(config)# end</pre>	<p>Returns to privileged EXEC mode.</p> <p>Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.</p>

## Configuring Rogue Classification Rules (GUI)

### Procedure

- Step 1** Choose **Configuration > Security > Wireless Protection Policies**.

- Step 2** In the **Wireless Protection Policies** page, choose **Rogue AP Rules** tab.
- Step 3** On the **Rogue AP Rules** page, click the name of the **Rule** or click **Add** to create a new one.
- Step 4** In the **Add/Edit Rogue AP Rule** window that is displayed, enter the name of the rule in the **Rule Name** field.
- Step 5** Choose the rule type from the following **Rule Type** drop-down list options:
- Friendly
  - Malicious
  - Unclassified
  - Custom

## Configuring Rogue Classification Rules (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>wireless wps rogue rule rule-name priority priority</b> <b>Example:</b> Device(config)# <b>wireless wps rogue rule rule_3 priority 3</b>	Creates or enables a rule. While creating a rule, you must enter the priority for the rule.  <b>Note</b> After creating a rule, you can edit the rule and change the priority only for the rogue rules that are disabled. You cannot change the priority for the rogue rules that are enabled. While editing, changing the priority for a rogue rule is optional.
<b>Step 3</b>	<b>classify {friendly state {alert   external   internal}   malicious state {alert   contained} }</b> <b>Example:</b> Device(config)# <b>wireless wps rogue rule rule_3 priority 3</b> Device(config-rule)# <b>classify friendly</b>	Specifies the classification that needs to be applied to the rogue access points matching this rule.  <ul style="list-style-type: none"> <li>• <b>friendly</b>—Configures the friendly rogue access points. After that enter the <b>state</b> keyword followed by either of these options: <b>alert</b>, <b>internal</b>, or <b>external</b>. If you select an <b>internal</b> option, it indicates that you trust a foreign access point. If you select an <b>external</b> option, it indicates that you acknowledge the presence of a rogue access point.</li> <li>• <b>malicious</b>—Configures the malicious rogue access points. After that enter the</li> </ul>

	Command or Action	Purpose
		<p>state keyword followed by either of these options: alert or contained.</p> <ul style="list-style-type: none"> <li>• <b>alert</b>—Sets the malicious rogue access point to alert mode.</li> <li>• <b>contained</b>—Sets the malicious rogue access point to contained mode.</li> </ul>
<b>Step 4</b>	<p><b>condition</b> {<b>client-count</b> <i>value</i>   <b>duration</b> <i>duration_value</i>   <b>encryption</b>   <b>infrastructure</b>   <b>rss</b>   <b>ssid</b> <i>ssid_name</i>   <b>wildcard-ssid</b>}</p> <p><b>Example:</b></p> <pre>Device(config)# wireless wps rogue rule rule_3 priority 3  Device(config-rule)# condition client-count 5</pre>	<p>Adds the following conditions to a rule, which the rogue access point must meet:</p> <ul style="list-style-type: none"> <li>• <b>client-count</b>—Requires that a minimum number of clients be associated to the rogue access point. For example, if the number of clients associated to the rogue access point is greater than or equal to the configured value, the access point could be classified as Malicious. If you choose this option, enter the minimum number of clients to be associated to the rogue access point for the <i>value</i> parameter. The valid range is from 1 to 10 (inclusive), and the default value is 0.</li> <li>• <b>duration</b>—Requires that the rogue access point be detected for a minimum period of time. If you choose this option, enter a value for the minimum detection period for the <i>duration_value</i> parameter. The valid range is from 0 to 3600 seconds (inclusive), and the default value is 0 seconds.</li> <li>• <b>encryption</b>—Requires that the advertised WLAN does not have encryption enabled. You can choose <b>any</b> for any type of encryption, <b>off</b> for no encryption, <b>wpa1</b> for WPA encryption, <b>wpa2</b> for WPA2 encryption, <b>wpa3-owe</b> for WPA3 OWE encryption, or <b>wpa3-sae</b> for WPA3 SAE encryption.</li> <li>• <b>infrastructure</b>—Requires the SSID to be known to the controller.</li> <li>• <b>rss</b>—Requires the rogue access point to be detected with a minimum RSSI value. If the classification is Friendly, the condition requires the rogue access point to be detected with a maximum RSSI</li> </ul>

	Command or Action	Purpose
		<p>value. The valid range is from -95 to -50 dBm (inclusive).</p> <ul style="list-style-type: none"> <li>• <b>ssid</b>—Requires the rogue access point to have a specific SSID. You could specify up to 25 different SSIDs. You should specify an SSID that is not managed by the controller. If you choose this option, enter the SSID for the <i>ssid_name</i> parameter. The SSID is added to the configured SSID list you just created.</li> <li>• <b>wildcard-ssid</b>—Allows you to specify an expression that could match an SSID string. You can specify up to 25 of these SSIDs.</li> </ul>
<b>Step 5</b>	<p><b>match {all   any}</b></p> <p><b>Example:</b></p> <pre>Device(config)# wireless wps rogue rule rule_3 priority 3 Device(config-rule)# match all</pre>	Specifies whether a detected rogue access point must meet all or any of the conditions specified by the rule for the rule to be matched and the rogue access point to adopt the classification type of the rule.
<b>Step 6</b>	<p><b>default</b></p> <p><b>Example:</b></p> <pre>Device(config)# wireless wps rogue rule rule_3 priority 3 Device(config-rule)# default</pre>	Sets a command to its default.
<b>Step 7</b>	<p><b>exit</b></p> <p><b>Example:</b></p> <pre>Device(config)# wireless wps rogue rule rule_3 priority 3 Device(config-rule)# exit Device(config)#</pre>	Exits the sub-mode.
<b>Step 8</b>	<p><b>shutdown</b></p> <p><b>Example:</b></p> <pre>Device(config)# wireless wps rogue rule rule_3 priority 3 Device(config-rule)# shutdown</pre>	Disables a particular rogue rule. In this example, the rule <b>rule_3</b> is disabled.
<b>Step 9</b>	<p><b>end</b></p> <p><b>Example:</b></p> <pre>Device(config)# end</pre>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

	Command or Action	Purpose
<b>Step 10</b>	<b>configure terminal</b> <b>Example:</b> Device# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 11</b>	<b>wireless wps rogue rule shutdown</b> <b>Example:</b> Device (config)# <code>wireless wps rogue rule shutdown</code>	Disables all the rogue rules.
<b>Step 12</b>	<b>end</b> <b>Example:</b> Device (config)# <code>end</code>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Monitoring Rogue Classification Rules

You can monitor the rogue classification rules using the following commands:

*Table 99: Commands for Monitoring Rogue Classification Rules*

Command	Purpose
<code>show wireless wps rogue rule detailed</code>	Displays detailed information of a classification rule.
<code>show wireless wps rogue rule summary</code>	Displays a summary of the classification rules.

## Examples: Classifying Rogue Access Points

This example shows how to classify a rogue AP with MAC address 00:11:22:33:44:55 as malicious and mark it for being contained by 2 managed APs:

```
Device# configure terminal
Device(config)# wireless wps rogue ap malicious 0011.2233.4455 state contain 2
```

This example shows how to create a rule that can categorize a rogue AP that is using SSID **my-friendly-ssid**, and it is seen for at least for 1000 seconds as friendly internal:

```
Device# configure terminal
Device(config)# wireless wps rogue rule ap1 priority 1
Device(config-rule)# condition ssid my-friendly-ssid
Device(config-rule)# condition duration 1000
Device(config-rule)# match all
Device(config-rule)# classify friendly state internal
Device(config-rule)# no shutdown
```

This example shows how to apply a condition that a rogue access point must meet:

```
Device# configure terminal
```

```
Device(config)# wireless wps rogue rule ap1 priority 1
Device(config-rule)# condition client-count 5
Device(config-rule)# condition duration 1000
Device(config-rule)# no shutdown
Device(config-rule)# end
```

This example shows a condition to classify rogue devices with the controller SSIDs as malicious:

```
Device# configure terminal
Device(config)# wireless wps rogue rule ap1 priority 1
Device(config-rule)# classify malicious state alert
Device(config-rule)# condition duration 30
Device(config-rule)# condition infrastructure ssid
Device(config-rule)# match all
Device(config-rule)# no shutdown
Device(config-rule)# end
```

# CHAPTER 126

- [Verifying Syslog Configuration for Advanced WIPS, on page 1418](#)

## Feature History for Advanced WIPS

This table provides release and related information for the features explained in this module.

These features are available on all releases subsequent to the one they were introduced in, unless noted otherwise.

**Table 100: Feature History for Advanced WIPS**

Release	Feature Name	Feature Information
Cisco IOS XE Bengaluru 17.5.1	Advanced WIPS Signatures	Up to 15 additional signatures are supported.
Cisco IOS XE Bengaluru 17.6.1	Syslog Support for Advanced WIPs	From 17.6.1 release onwards: <ul style="list-style-type: none"><li>• Two additional signatures are supported.</li><li>• Syslog support has been added to the controller for advanced WIPS.</li></ul>

## Information About Advanced WIPS

The Cisco Advanced Wireless Intrusion Prevention System (aWIPS) is a wireless intrusion threat detection and mitigation mechanism. The aWIPS uses an advanced approach to wireless threat detection and performance management. The AP detects threats and generates alarms. It combines network traffic analysis, network device and topology information, signature-based techniques, and anomaly detection to deliver highly accurate and complete wireless threat prevention.

With a fully infrastructure-integrated solution, you can continually monitor wireless traffic on both wired and wireless networks and use that network intelligence to analyze attacks from multiple sources to accurately pinpoint and proactively prevent attacks, rather than wait until damage or exposure has occurred.

The following table shows the alarms introduced from Cisco IOS XE Bengaluru 17.5.1 onwards:

**Table 101: Advanced WIPS Signatures and Definitions: From Cisco IOS XE Bengaluru 17.5.1 Onwards**

Advanced WIPS Signature	Definition
RTS Virtual Carrier Sense Attack	This is an addition to the existing RTS Flood alarm introduced in Cisco IOS XE Bengaluru 17.4.x. The alarm is triggered when an RTS with a large duration is detected. An attacker can use these frames to exhaust air time and disrupt wireless client service.
CTS Virtual Carrier Sense Attack	This is an addition to the existing CTS Flood alarm introduced in Cisco IOS XE Bengaluru 17.4.x. The alarm is triggered when a CTS with large duration is detected. An attacker can use these frames to exhaust air time and disrupt wireless client service.
Deauthentication Flood by Pair	In the enhanced context of threat, both the source (attacker) and the destination (victim) of attacks (Track by Pair) have visibility.
Fuzzed Beacon	Fuzzed beacon is when invalid, unexpected, or random data is introduced into the beacon and replays those modified frames into the air. This causes unexpected behavior on the destination device, including driver crashes, operating system crashes, and stack-based overflows. This in turn allows the execution of the arbitrary code of the affected system.
Fuzzed Probe Request	Fuzzed probe request is when invalid, unexpected, or random data is introduced into a probe request and replays those modified frames into the air.
Fuzzed Probe Response	Fuzzed probe response is when invalid, unexpected, or random data is introduced into a probe response and replays those modified frames into the air.

Advanced WIPS Signature	Definition
PS Poll Flood by Signature	PS poll flood is when a potential hacker spoofs a MAC address of a wireless client and sends out a flood of PS poll frames. The AP sends out buffered data frames to the wireless client. This results in the client missing the data frames because it could be in the power safe mode.
Eapol Start V1 Flood by Signature	Extensible Authentication Protocol over LAN (EAPOL) start flood is when an attacker attempts to bring down the AP by flooding the AP with EAPOL-start frames to exhaust the AP's internal resources.
Reassociation Request Flood by Destination	Reassociation request flood is when a specific device tries to flood the AP with a large number of emulated and spoofed client reassociations to exhaust the AP's resources, particularly the client association table. When the client association table overflows, legitimate clients are not able to associate, causing a DoS attack.
Beacon Flood by Signature	Beacon flood is when stations actively search for a network that is bombarded with beacons from the networks that are generated using different MAC addresses and SSIDs. This flood prevents a valid client from detecting the beacons sent by corporate APs, which in turn initiates a DoS attack.
Probe Response Flood by Destination	Probe response flood is when a device tries to flood clients with a large number of spoofed probe responses from the AP. This prevents clients from detecting the valid probe responses sent by the corporate APs.
Block Ack Flood by Signature	Block ack flood is when an attacker transmits an invalid Add Block Acknowledgement (ADDDBA) frame to the AP while spoofing the MAC address of the valid client. This process causes the AP to ignore any valid traffic transmitted from the client until it reaches the invalid frame range.
Airdrop Session	Airdrop session refers to the Apple feature called AirDrop. AirDrop is used to set up a peer-to-peer link for file sharing. This might create a security risk because of unauthorized peer-to-peer networks created dynamically in your WLAN environment.
Malformed Association Request	Malformed association request is when an attacker sends a malformed association request to trigger bugs in the AP. This results in a DoS attack.

Advanced WIPS Signature	Definition
Authentication Failure Flood by Signature	Authentication failure flood is when a specific device tries to flood the AP with invalid authentication requests spoofed from a valid client. This results in disconnection.
Invalid MAC OUI by Signature	Invalid MAC OUI is when a spoofed MAC address that does not have a valid OUI is used.
Malformed Authentication	Malformed authentication is when an attacker sends malformed authentication frames that can expose vulnerabilities in some drivers.

The following table shows the alarms introduced prior to Cisco IOS XE Bengaluru 17.5.1:

**Table 102: Advanced WIPS Signatures: Prior Cisco IOS XE Bengaluru 17.5.1**

Advanced WIPS Signatures
Authentication Flood Alarm
Association Flood Alarm
Broadcast Probe Flood Alarm
Disassociation Flood Alarm
Broadcast Dis-Association Flood Alarm
De-Authentication Flood Alarm
Broadcast De-Authentication Flood Alarm
EAPOL-Logoff Flood Alarm
CTS Flood Alarm
RTS Flood Alarm

## Guidelines and Restrictions

- In the aWIPS profile, Cisco Aironet 1850 Series Access Points, Cisco Catalyst 9117 Series Access Points, and Cisco Catalyst 9130AX Series Access Points can detect EAPOL logoff attack and raise alarms accordingly, only on off-channel. They can not detect EAPOL logoff attack and raise alarms on on-channel.
- aWIPS profile download is not supported when Cisco Catalyst Center is configured using the fully qualified domain name (FQDN).

## Enabling Advanced WIPS

From Cisco IOS XE Release 17.5.1 onwards, aWIPS security gets a higher priority over Hyperlocation/Fastlocate. The following are the possible scenarios.

All Catalyst APs supporting Fastlocate can be used together with aWIPS depending on the configuration and regardless of the AP mode.

In modes other than the Monitor mode for Cisco Aironet 4800 AP, if both aWIPS and Hyperlocation are enabled, only aWIPS is available.

Hyperlocation/Fastlocate	Advanced WIPS	Cisco Aironet 4800 AP Mode	Cisco Aironet 4800 AP Effective Feature
Enable	Enable	Any Non-Monitor	aWIPS <sup>9</sup>
Enable	Disable	Any Non-Monitor	Hyperlocation/Fastlocate
Disable	Disable	Any Non-Monitor	Hyperlocation/Fastlocate and aWIPS are disabled.
Disable	Enable	Any Non-Monitor	aWIPS
Enable	Enable	Monitor	aWIPS and Hyperlocation <sup>10</sup>
Disable	Enable	Monitor	aWIPS <sup>11</sup>
Enable	Disable	Monitor	Hyperlocation/Fastlocate
Disable	Disable	Monitor	Hyperlocation/Fastlocate and aWIPS are disabled.

<sup>9</sup> In modes other than the Monitor mode, if both aWIPS and Hyperlocation/Fastlocate are enabled, only aWIPS is available.

<sup>10</sup> In Monitor mode, if both aWIPS and Hyperlocation/Fastlocate are enabled, both aWIPS and Hyperlocation/Fastlocate are available.

<sup>11</sup> To monitor the status of aWIPS and Hyperlocation/Fastlocate simultaneously on AP, use the **show capwap client rcb** command.

## Syslog Support for Advanced WIPS

This feature adds syslog support to the controller for Advanced WIPS.

The controller raises syslog messages when it receives alarms from an AP. The syslog messages go through throttling. If the same signature is detected from the same AP in a configured throttling interval, you must generate the syslog message for that alarm. For instance, if there were 100 occurrences of the same signature from the same AP within the throttling interval, say, 1 minute, you get to view only one syslog message in the controller in that 1-minute period instead of 100 messages.

### Sample Syslog Format

The following is a sample syslog format:

```
Nov 18 20:45:23.746: %APMGR_AWIPS_SYSLOG-6-APMGR_AWIPS_MESSAGE: Chassis 1 R0/0: wncd: AWIPS
alarm:(AP00B0.E19A.5720) 00b0.e19a.5720 Radio MAC 00b0.e19b.c300 detected Probe Response
Flood by Destination (10019)
```

The format covers the AP name, AP Ethernet MAC address, AP Radio MAC address, description (signature ID).

---

**Note** The syslog messages do not display any client information or context.

---

## Advanced WIPS Solution Components

The aWIPS solution comprises the following components:

- Cisco Catalyst 9800 Series Wireless Controller
- Cisco Aironet Wave 2 APs
- Cisco Catalyst Center

Because the aWIPS functionality is integrated into Cisco Catalyst Center, the aWIPS can configure and monitor WIPS policies and alarms and report threats.

aWIPS supports the following capabilities:

- Static signatures
  - From Cisco IOS XE, 17.4.1 onwards Cisco Catalyst Center can change threshold values and push new signature files to the AP.
- Enable or disable signature forensic capture from Cisco Catalyst Center.
- Standalone signature detection only
- Alarms only
- GUI support
- CLIs to view alarms
- Static signature file packaged with controller and AP image
- Export alarms to Cisco Catalyst Center through WSA channel

---

**Note** aWIPS alarm details such as the AP MAC address, alarm ID, alarm string, and signature ID are displayed on the Cisco Catalyst 9800 series wireless controller GUI.

---

## Supported Modes and Platforms

aWIPS is supported on the following controllers:

- Cisco Catalyst 9800 Series Wireless Controllers
- Cisco Embedded Wireless Controller on Catalyst Access Points

**Note** aWIPS is not supported on Cisco IOS APs.

## Enabling Advanced WIPS(GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Tags & Profiles > AP Join**.
- Step 2** Click **Add**. The **Add AP Join Profile** window is displayed.
- Step 3** In the **Add AP Join Profile** window, click the **Security** tab.
- Step 4** Under the **aWIPS** section, check the **aWIPS Enable** check box.
- Step 5** Click **Apply to Device**. You will go back the to **General** tab.
- Step 6** Click the **Security** tab.
- Step 7** Under the **aWIPS** section, check the **Forensic Enable** check box.
- Step 8** Click **Apply to Device**.
- 

## Enabling Advanced WIPS (CLI)

To enable aWIPS from the controller and ensure that aWIPS has higher priority than Hyperlocation/Fastlocate, perform the following:

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>ap profile profile-name</b>  <b>Example:</b> Device(config)# ap profile ap-profile-name	Configures the default AP profile.
<b>Step 3</b>	<b>awips</b>  <b>Example:</b> Device(config-ap-profile)# awips	Enables aWIPS.  <b>Note</b> aWIPS is disabled by default on the controller.

	Command or Action	Purpose
<b>Step 4</b>	<b>awips forensic</b> <b>Example:</b> Device(conf-ap-profile)# awips forensic	Enables forensics for aWIPS alarms.
<b>Step 5</b>	<b>hyperlocation</b> <b>Example:</b> Device(config-ap-profile)# hyperlocation	Enables Hyperlocation/Fastlocate on all the supported APs that are associated with this AP profile.
<b>Step 6</b>	<b>end</b> <b>Example:</b> Device(config-ap-profile)# end	Returns to privileged EXEC mode.

## Configuring Syslog Threshold for Advanced WIPS (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>awips-syslog throttle period</b> <i>syslog-throttle-interval</i> <b>Example:</b> Device(config)# <b>awips-syslog throttle period 38</b>	Configures the syslog threshold for aWIPS. <i>syslog-throttle-interval</i> : Enter the syslog throttle interval, in seconds. The range is from 30 to 600. <b>Note</b> The default throttling interval is 60 seconds.
<b>Step 3</b>	<b>end</b> <b>Example:</b> Device(config)# <b>end</b>	Returns to privileged EXEC mode.

## Viewing Advanced WIPS Alarms (GUI)

### Procedure

- 
- Step 1** Navigate to **Monitoring > Security > aWIPS**.
- Step 2** To view the details of the alarms in the last 5 minutes, click the **Current Alarms** tab.

**Step 3** To view the alarm count over an extended period of time, either hourly, for a day (24 hours) or more, click the **Historical Statistics** tab.

**Step 4** Sort or filter the alarms based on the following parameters:

- **AP Radio MAC address**
- **Alarm ID**
- **Time Stamp**
- **Signature ID**
- **Alarm Description**
- **Alarm Message Index**

## Verifying Advanced WIPS

To view the aWIPS status, use the **show awips status** *radio\_mac* command:

```
Device# show awips status 0xx7.8xx8.2xx0

AP Radio MAC AWIPS Status Forensic Capture Status Alarm Message Count

0xx7.8xx8.2xx0 ENABLED CONFIG_NOT_ENABLED 14691
```

The various aWIPS status indicators are:

- **ENABLED:** aWIPS enabled.
- **NOT\_SUPPORTED:** The AP does not support AWIPS.
- **CONFIG\_NOT\_ENABLED:** aWIPS is not enabled on the AP.

To view details of specific alarm signatures, use the **show awips alarm signature** *signature\_id* command:

```
Device# show awips alarm signature 10001

AP Radio MAC AlarmID Timestamp SignatureID Alarm Description Message
Index

0xx7.8xx8.2f80 1714 11/02/2020 13:02:19 10001 Authentication Flood 3966
```

To view alarm message statistics, use the **show awips alarm statistics** command:

```
Device# show awips alarm statistics
```

To view a list of alarms since the last clear, use the **show awips alarm ap** *ap\_mac* **detailed** command:

```
Device# show awips alarm ap 0xx7.8xx8.2f80 detailed

AP Radio MAC AlarmID Timestamp SignatureID Alarm Description

0xx7.8xx8.2f80 2491 08/02/2022 17:44:40 10009 RTS Flood
```

To view detailed alarm information, use the **show awips alarm detailed** command:

```
Device# show awips alarm detailed
```

AP Radio MAC	AlarmID	Timestamp	SignatureID	Alarm Description
7xx3.5xxd.d360	1	10/29/2020	23:21:27	10001 Authentication Flood by Source
dxxc.3xx5.9460	71	10/29/2020	23:21:27	10001 Authentication Flood by Source
7xx3.5xxd.d360	2	10/29/2020	23:21:28	10002 Association Request Flood by Destination
dxxc.3xx5.9460	72	10/29/2020	23:21:28	10002 Association Request Flood by Destination

To view the alarms on a specific AP, use the **show awips alarm ap *radio\_mac* detailed** command:

## Verifying Syslog Configuration for Advanced WIPS

To verify the syslog configuration for a WIPS, use the following command:

```
Device# show awips syslog throttle
```

```
Syslog Throttle Interval (seconds)
```

```

```

```
38
```

## Information about Cisco TrustSec

Cisco TrustSec provides security improvements to Cisco network devices based on the capability to strongly identify users, hosts, and network devices within a network. TrustSec provides topology-independent and scalable access controls by uniquely classifying data traffic for a particular role. TrustSec ensures data confidentiality and integrity by establishing trust among authenticated peers and encrypting links with those peers.

The key component of Cisco TrustSec is the Cisco Identity Services Engine (ISE). Cisco ISE can provision switches with TrustSec Identities and Security Group ACLs (SGACLs), though these may be configured manually on the switch.

---

**Note** You should manually clear the CTS environment data using the **clear cts environment-data** command before changing CTS server to a new one. This ensures that you get the updated data while running **show cts environment-data** command.

---

## Cisco TrustSec Features

The table below lists the TrustSec features to be eventually implemented on TrustSec-enabled Cisco switches. Successive general availability releases of TrustSec will expand the number of switches supported and the number of TrustSec features supported per switch.

Cisco TrustSec Feature	Description
802.1AE Tagging (MACsec)	<p>Protocol for IEEE 802.1AE-based wire-rate hop-to-hop Layer 2 encryption.</p> <p>Between MACsec-capable devices, packets are encrypted on egress from the transmitting device, decrypted on ingress to the receiving device, and in the clear within the devices.</p> <p>This feature is only available between TrustSec hardware-capable devices.</p>
Endpoint Admission Control (EAC)	<p>EAC is an authentication process for an endpoint user or a device connecting to the TrustSec domain. Usually EAC takes place at the access level switch. Successful authentication and authorization in the EAC process results in Security Group Tag assignment for the user or device. Currently EAC can be 802.1X, MAC Authentication Bypass (MAB), and Web Authentication Proxy (WebAuth).</p>
Network Device Admission Control (NDAC)	<p>NDAC is an authentication process where each network device in the TrustSec domain can verify the credentials and trustworthiness of its peer device. NDAC utilizes an authentication framework based on IEEE 802.1X port-based authentication and uses EAP-FAST as its EAP method. Successful authentication and authorization in NDAC process results in Security Association Protocol negotiation for IEEE 802.1AE encryption.</p>
Security Group Access Control List (SGACL)	<p>A Security Group Access Control List (SGACL) associates a Security Group Tag with a policy. The policy is enforced upon SGT-tagged traffic egressing the TrustSec domain.</p>
Security Association Protocol (SAP)	<p>After NDAC authentication, the Security Association Protocol (SAP) automatically negotiates keys and the cipher suite for subsequent MACSec link encryption between TrustSec peers. SAP is defined in IEEE 802.11i.</p>
Security Group Tag (SGT)	<p>An SGT is a 16-bit single label indicating the security classification of a source in the TrustSec domain. It is appended to an Ethernet frame or an IP packet.</p>

Cisco TrustSec Feature	Description
SGT Exchange Protocol (SXP)	Security Group Tag Exchange Protocol (SXP). With SXP, devices that are not TrustSec-hardware-capable can receive SGT attributes for authenticated users and devices from the Cisco Identity Services Engine (ISE) or the Cisco Secure Access Control System (ACS). The devices can then forward a sourceIP-to-SGT binding to a TrustSec-hardware-capable device will tag the source traffic for SGACL enforcement.

When both ends of a link support 802.1AE MACsec, SAP negotiation occurs. An EAPOL-key exchange occurs between the supplicant and the authenticator to negotiate a cipher suite, exchange security parameters, and manage keys. Successful completion of these tasks results in the establishment of a security association (SA).

Depending on your software version and licensing and link hardware support, SAP negotiation can use one of these modes of operation:

- Galois Counter Mode (GCM)—authentication and encryption
- GCM authentication (GMAC)— GCM authentication, no encryption
- No Encapsulation—no encapsulation (clear text)
- Null—encapsulation, no authentication or encryption

## Security Group Access Control List

A security group is a group of users, end-point devices, and resources that share access control policies. Security groups are defined by the administrator in Cisco Identity Services Engine (ISE). As new users and devices are added to the Cisco TrustSec domain, the authentication server assigns these new entities to the appropriate security groups. Cisco TrustSec assigns each of the security group a unique 16-bit number whose scope is global in a Cisco TrustSec domain. The number of security groups in a wireless device is limited to the number of authenticated network entities. You do not have to manually configure the security group numbers.

After a device is authenticated, Cisco TrustSec tags any packet that originates from that device with an SGT that contains the security group number of the device. The packet carries this SGT everywhere in the network, in the Cisco TrustSec header.

As the SGT contains the security group of the source, the tag can be referred to as the source SGT (S-SGT). The destination device is also assigned to a security group (destination SG) that can be referred to as the destination SGT (D-SGT), even though the Cisco TrustSec packet does not contain the security group number of the destination device.

You can control the operations that users can perform based on the security group assignments of users and destination resources, using the Security Group Access Control Lists (SGACLs). Policy enforcement in a Cisco TrustSec domain is represented by a permission matrix, with the source security group numbers on one axis and the destination security group numbers on the other axis. Each cell in the matrix body contains an ordered list of SGACLs, which specify the permissions that must be applied to packets originating from the source security group and destined for the destination security group. When a wireless client is authenticated, the controller downloads all the SGACLs in the matrix cells.

When a wireless client connects to the network, the client pushes all the ACLs to the controller .

Cisco TrustSec achieves role-based topology-independent access control in a network by assigning users and devices in the network to security groups and applying access control between the security groups. The SGACLs define access control policies based on the device identities. As long as the roles and permissions remain the same, changes to the network topology do not change the security policy. When a user is added to the wireless group, you simply assign the user to an appropriate security group; the user immediately receives permissions to that group.

The size of ACLs are reduced and their maintenance is simplified with the use of role-based permissions. With Cisco TrustSec, the number of Access Control Entities (ACEs) that are configured is determined by the number of permissions specified, resulting in a much smaller number of ACEs.

To know the list of Cisco APs that support SGACL, see the release notes: <https://www.cisco.com/c/en/us/support/wireless/catalyst-9800-series-wireless-controllers/products-release-notes-list.html>

---

**Note** Clients receive zero SGT value and DHCP clients receive an Automatic Private IP Addressing (APIPA) address when TrustSec policy “unknown to unknown” is denied in TrustSec matrix.

Clients receive correct SGT values and DHCP clients receive an IP address when TrustSec policy “unknown to unknown” is permitted in TrustSec matrix.

---

The scenarios supported for SGACLs on the Cisco Catalyst 9800 Series Wireless Controller are:

- Wireless-to-wireless (within Enterprise network):
  - Flex mode with local switching—SGACL enforcement is done on the egress AP when a packet leaves from a source wireless network to a destination wireless network.
  - Flex mode with central switching—SGACL enforcement is done on the egress AP. To achieve this, controller should export IP address to security group tag (IP-SGT) binding over SGT Exchange Protocol (SXP).
- Wired-to-wireless (DC-to-Enterprise network)—Enforcement takes place when a packet reaches the destination AP.
- Wireless-to-wired (Enterprise network-to-DC)—Enforcement takes place on the uplink switch when a packet reaches the ingress of the wired network.

### Guidelines and Restrictions

- SGACL enforcement is carried out on the controller for local mode.
- SGACL enforcement is carried out on an AP for flex-mode APs performing local switching.
- SGACL enforcement for wireless clients is carried out either on the upstream switch or on the border gateway in a Branch-to-DC scenario.
- SGACL enforcement is not supported for non-IP or IP broadcast or multicast traffic.
- Per-WLAN SGT assignment is not supported.
- SGACL enforcement is not carried out for control-plane traffic between an AP and the wireless controller (for upstream or from upstream traffic).

- Non-static SGACL configurations are supported only for dynamic SGACL policies received from ISE.
- Static SGACL configuration on an AP is not supported.
- In case of Allow List model, you need to explicitly allow DHCP protocol for the client devices to get the DHCP IP address and then request the controller for SGACL policies.

## Inline Tagging

Inline tagging is a transport mechanism using which a controller or AP understands the source SGT.

Transport mechanism is of two types:

- Central switching—For centrally switched packets, the controller performs inline tagging of all the packets sourced from wireless clients that are associated with the controller, by tagging it with the Cisco Meta Data (CMD) tag. For packets that are inbound from the distribution system, inline tagging also involves the controller stripping off the CMD header from the packet to learn the S-SGT tag. Thereafter, the controller forwards the packet including the S-SGT, for SGACL enforcement.
- Local switching—To transmit locally switched traffic, an AP performs inline tagging for packets that are associated with the AP and sourced from clients. To receive traffic, the AP handles both locally switched packets and centrally switched packets, uses the S-SGT tag for packets, and applies the SGACL policy.

With wireless Cisco TrustSec enabled on the controller, the choice of enabling and configuring SXP to exchange tags with the switches is optional. Both wireless Cisco TrustSec and SXP modes are supported; however, there is no use case to have both wireless Cisco TrustSec (on an AP) and SXP to be in the enabled state concurrently.

### Consideration and Restriction for Inline Tagging over Port-Channel

- Configure the **cts manual** command on port-channel and its member interfaces to send or receive a tagged packet.
- If you downgrade to Cisco IOS XE releases that do not support inline tagging over port-channel, the port-channel may be suspended.

---

**Note** The inline tagging over port-channel is supported in Cisco IOS XE 17.3.517.6.317.8.1 release.

---

## Policy Enforcement

Cisco TrustSec access control is implemented using ingress tagging and egress enforcement. At the ingress point to the Cisco TrustSec domain, the traffic from the source is tagged with an SGT containing the security group number of the source entity. The SGT is propagated across the domain with the traffic. At the egress point of the Cisco TrustSec domain, an egress device uses the source SGT (S-SGT) and the security group of the destination entity (D-SGT) to determine the access policy to apply from the SGACL policy matrix.

Policy Enforcement Cisco TrustSec access control is implemented using ingress tagging and egress enforcement. At the ingress point to the Cisco TrustSec domain, the traffic from the source is tagged with an SGT containing the security group number of the source entity. The SGT is propagated across the domain with the traffic. At the egress point of the Cisco TrustSec domain, an egress device uses the source SGT (S-SGT) and the security group of the destination entity (D-SGT) to determine the access policy to apply from the SGACL policy matrix. Policy enforcement can be applied to both central and local switched traffic on an AP. If wired clients communicate with wireless clients, the AP enforces the downstream traffic. If wireless clients communicate with wired clients, the AP enforces the upstream traffic. This way, the AP enforces traffic in both downstream and wireless-to-wireless traffic. You require S-SGT, D-SGT, and ACLs for the enforcement to work. APs get the SGT information for all the wireless clients from the information available on the Cisco ISE server.

---

**Note** A Cisco AP must be in either Listener or Both (Listener and Speaker) mode to enforce traffic because the Listener mode maintains the complete set of IP-SGT bindings. After you enable the enforcement on a an AP, the corresponding policies are downloaded and pushed to the AP.

---

## SGACL Support for Wireless Guest Access

When a client joins the wireless network (WLAN), its session is managed by the Cisco Catalyst 9800 Series Wireless LAN Controller (WLC) that the AP is connected to is the foreign controller. Auto-Anchor Mobility allows a specific WLAN (for example, Guest WLAN) to be anchored to a particular controller, regardless of the client's entry point into the network. Auto-Anchor Mobility is the wireless Guest service where all guest traffic tunnels back to the DMZ controller irrespective of where they associate with the network.

In case of Auto-Anchor mobility, the following apply to Cisco TrustSec support:

- **Classification:** Occurs during authentication and hence on Foreign for Layer 2 security WLANs and on Anchor for Layer 3 security cases.
- **Propagation:** Always occurs at the Anchor where the client traffic enters the wired network.
- **Enforcement:** SGACL download and enforcement occurs on Anchor; the Anchor controller must have the connectivity to Cisco Identity Services Engine (ISE) and be registered as Network Access Server (NAS). Enforcement is not supported on foreign controller even when the enforcement CLI is configured on foreign controller.

This feature is supported in local mode and in Flex Central Switching of the controller. Flex mode with local switching and Fabric mode are not supported in guest scenarios as traffic does not go through the controller.

Roaming of a guest client occurs only at Guest Foreign controller and the Guest Anchor remains fixed. The different types of supported roam are Inter-Controller roaming and Intra-Controller roaming. Roaming under WebAuth pending is a special case which is also supported for Central Web Authentication (CWA) and Local Web Authentication (LWA).

## Enabling SGACL on the AP (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Tags & Profiles > Flex**.
- Step 2** Click **Add**.
- Step 3** In the **General** tab, check **Inline Tagging** and **SGACL Enforcement** check boxes and choose the CTS Profile Name from the **CTS Profile Name** drop-down list.
- Step 4** Click **Apply to Device**.
- 

## Enabling SGACL on the AP

**Note** Use the **no** form of the commands given below to disable the configuration. For example, **cts role-based enforcement** disables role-based access control enforcement for APs.

---

### Before you begin

- Security Group Access Control List (SGACL) on an AP can be enabled only when the wireless controller is in FlexConnect mode.
- Configure the **cts manual** command on the uplink port to send or receive a tagged packet.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wireless profile flex <i>flex-profile</i></b> <b>Example:</b> Device(config)# wireless profile flex xyz-flex-profile	Configures an RF profile and enters RF profile configuration mode.
<b>Step 3</b>	<b>cts role-based enforcement</b> <b>Example:</b> Device(config-wireless-flex-profile)# cts role-based enforcement	Enables role-based access control enforcement for the AP.

	Command or Action	Purpose
<b>Step 4</b>	<b>cts inline-tagging</b>  <b>Example:</b> Device(config-wireless-flex-profile)# cts inline-tagging	Enables inline tagging on the AP.
<b>Step 5</b>	<b>cts profile <i>profile-name</i></b>  <b>Example:</b> Device(config-wireless-flex-profile)# cts profile xyz-profile	Enables the CTS profile name.
<b>Step 6</b>	<b>exit</b>  <b>Example:</b> Device(config-wireless-flex-profile)# exit	Returns to global configuration mode.
<b>Step 7</b>	<b>wireless tag site <i>site-name</i></b>  <b>Example:</b> Device(config)# wireless tag site xyz-site	Configures a site tag and enters site tag configuration mode.
<b>Step 8</b>	<b>flex-profile <i>flex-profile-name</i></b>  <b>Example:</b> Device(config-site-tag)# flex-profile xyz-flex-profile	Configures a flex profile.
<b>Step 9</b>	<b>exit</b>  <b>Example:</b> Device(config-site-tag)# exit	Returns to global configuration mode.
<b>Step 10</b>	<b>ap <i>mac-address</i></b>  <b>Example:</b> Device(config)# ap F866.F267.7DFB	Configures an AP and enters AP profile configuration mode.
<b>Step 11</b>	<b>site-tag <i>site-tag-name</i></b>  <b>Example:</b> Device(config-ap-tag)# site-tag xyz-site	Maps a site tag to an AP.

### What to do next

Use the **show cts ap sgt-info *ap-name*** command to verify the SGACL configuration on the AP.

## Enabling SGACL Policy Enforcement Globally (CLI)

You must enable SGACL policy enforcement globally on Cisco Catalyst 9800 Series Wireless Controller. The same configuration commands that are used for enforcement of IPv4 traffic apply for IPv6 traffic as well.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>cts role-based enforcement</b>  <b>Example:</b> Device(config)# <code>cts role-based enforcement</code>	Enables Cisco TrustSec SGACL policy enforcement on routed interfaces.

## Enabling SGACL Policy Enforcement Per Interface (CLI)

After enabling the SGACL policy enforcement globally, you will have to enable Cisco TrustSec-on the uplink interfaces.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>interface gigabitethernet <i>interface number</i></b>  <b>Example:</b> Device(config)# <code>interface gigabitethernet 1</code>	Specifies interface on which to enable or disable SGACL enforcement.
<b>Step 3</b>	<b>cts role-based enforcement</b>  <b>Example:</b> Device(config-if)# <code>cts role-based enforcement</code>	Enables Cisco TrustSec SGACL policy enforcement on routed interfaces.
<b>Step 4</b>	<b>do show cts interface</b>  <b>Example:</b> Device(config-if)# <code>do show cts interface</code>	Verifies that SGACL enforcement is enabled.

## Manually Configure a Device SGT (CLI)

In normal Cisco TrustSec operation, the authentication server assigns an SGT to the device for packets originating from the device. You can manually configure an SGT to be used if the authentication server is not accessible, but an authentication server-assigned SGT will take precedence over a manually-assigned SGT.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>wireless profile policy <i>profile-policy</i></b>  <b>Example:</b> Device(config)# <code>wireless profile policy rr-xyz-policy-1</code>	Configures a WLAN policy profile and enters wireless policy configuration mode.
<b>Step 3</b>	<b>cts sgt <i>sgt-value</i></b>  <b>Example:</b> Device(config-wireless-policy)# <code>cts stg 200</code>	Specifies the Security Group Tag (SGT) number. Valid values are from 0 to 65,535.
<b>Step 4</b>	<b>exit</b>  <b>Example:</b> Device(config-wireless-policy)# <code>exit</code>	Returns to global configuration mode.

## Configuring SGACL, Inline Tagging, and SGT in Local Mode (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Tags & Profiles > Policy**.
  - Step 2** Click the Policy Profile Name. The **Edit Policy Profile** is displayed.
  - Step 3** Choose **General** tab.
  - Step 4** In the **CTS Policy** settings, check or uncheck the **Inline Tagging** and **SGACL Enforcement** check boxes, and enter the **Default SGT** value.
  - Step 5** Click **Update & Apply to Device**.
-

## Configuring SGACL, Inline Tagging, and SGT in Local Mode

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wireless profile policy <i>profile-name</i></b> <b>Example:</b> Device(config)# wireless profile policy xyz-policy-profile	Creates a policy profile for the WLAN.
<b>Step 3</b>	<b>cts inline-tagging</b> <b>Example:</b> Device(config-wireless-policy)# cts inline-tagging	Enables CTS inline tagging. <b>Note</b> You will also need to configure the <b>cts manual</b> in the physical interface. If the <b>cts manual</b> is configured in the physical interface and <b>cts inline-tagging</b> is skipped, the packets will still remain tagged at egress in the controller.
<b>Step 4</b>	<b>cts role-based enforcement</b> <b>Example:</b> Device(config-wireless-policy)# cts role-based enforcement	Enables CTS SGACL enforcement.
<b>Step 5</b>	<b>cts sgt <i>sgt-value</i></b> <b>Example:</b> Device(config-wireless-policy)# cts sgt 100	(Optional) Sets the default Security Group Tag (SGT). <b>Note</b> SGT is required for a user session only when the client uses open authentication, and not the ISE server.

## Configuring ISE for TrustSec

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.

	Command or Action	Purpose
<b>Step 2</b>	<b>radius server</b> <i>server-name</i> <b>Example:</b> Device(config)# radius server Test-SERVER1	Specifies the RADIUS server name.
<b>Step 3</b>	<b>address ipv4</b> <i>ip address</i> <b>Example:</b> Device(config-radius-server)# address ipv4 124.3.50.62	Specifies the primary RADIUS server parameters.
<b>Step 4</b>	<b>pac key</b> <i>key</i> <b>Example:</b> Device(config-radius-server)# pac key cisco	Specify the authentication and encryption key used between the Device and the key string RADIUS daemon running on the RADIUS server.
<b>Step 5</b>	<b>exit</b> <b>Example:</b> Device(config-radius-server)# exit	Returns to the configuration mode.
<b>Step 6</b>	<b>aaa group server radius</b> <i>server-group</i> <b>Example:</b> Device(config)# aaa group server radius authc-server-group	Creates a radius server-group identification. <b>Note</b> <i>server-group</i> refers to the server group name. The valid range is from 1 to 32 alphanumeric characters.
<b>Step 7</b>	<b>cts authorization list</b> <i>mlist-name</i> <b>Example:</b> Device(config)# cts authorization list authc-list	Creates a CTS authorization list.
<b>Step 8</b>	<b>aaa authorization network</b> <i>mlist-name group name</i> <b>Example:</b> Device(config)# aaa authorization network default group group1	Creates an authorization method list for web-based authorization. <b>Note</b> Ensure that the ISE IP address configured on your controller is the same as the IP address configured on ISE ( <b>Work Center &gt; TrustSec &gt; Components &gt; Trustsec AAA Servers</b> ) <b>Note</b> If the ISE version is 002.005(000.239), 002.004(000.357), 002.003(000.298), 002.002(000.470), 002.001(000.474), 002.000(001.130), or 002.000(000.306), use the <b>access-session tls-version 1.0</b> command to download PAC from ISE. For other ISE versions, the above command is not required.

# Verifying Cisco TrustSec Configuration

To display the wireless CTS SGACL configuration summary, use the following command:

```
Device# show wireless cts summary
```

```
Local Mode CTS Configuration
```

Policy Profile Name	SGACL Enforcement	Inline-Tagging	Default-Sgt
xyz-policy	DISABLED	ENABLED	0
wireless-policy1	DISABLED	DISABLED	0
w-policy-profile1	DISABLED	DISABLED	0
default-policy-profile	DISABLED	DISABLED	0

```
Flex Mode CTS Configuration
```

Flex Profile Name	SGACL Enforcement	Inline-Tagging
xyz-flex	DISABLED	ENABLED
demo-flex	DISABLED	DISABLED
flex-demo	DISABLED	DISABLED
xyz-flex-profile	DISABLED	DISABLED
default-flex-profile	DISABLED	DISABLED

To display CTS-specific configuration status for various wireless profiles, use the following command:

```
Device# show cts wireless profile policy xyz-policy
```

```
Policy Profile Name : xyz-policy
CTS
 Role-based enforcement : ENABLED
 Inline-tagging : ENABLED
 Default SGT : 100

Policy Profile Name : foo2
CTS
 Role-based enforcement : DISABLED
 Inline-tagging : ENABLED
 Default SGT : NOT-DEFINED

Policy Profile Name : foo3
CTS
 Role-based enforcement : DISABLED
 Inline-tagging : DISABLED
 Default SGT : 65001
```

To display CTS configuration for a given wireless profile, use the following command:

```
Device# show wireless profile policy detailed xyz-policy
```

```
Policy Profile Name : xyz-policy
Description :
Status : DISABLED
VLAN : 1
Client count : 0
Passive Client : DISABLED
ET-Analytics : DISABLED
StaticIP Mobility : DISABLED
!
```

```
.
.
.WGB Policy Params
 Broadcast Tagging : DISABLED
 Client VLAN : DISABLED
Mobility Anchor List
 IP Address Priority
CTS
 Role-based enforcement : ENABLED
 Inline-tagging : ENABLED
 Default SGT : NOT-DEFINED
```

## CHAPTER 128

# SGT Inline Tagging and SXPv4

- Introduction to SGT Inline Tagging on AP and SXPv4, on page 1433
- Creating an SXP Profile, on page 1433
- Configuring SGT Inline Tagging on Access Points, on page 1434
- Configuring an SXP Connection (GUI), on page 1434
- Configuring an SXP Connection, on page 1435
- Verifying SGT Push to Access Points, on page 1436

## Introduction to SGT Inline Tagging on AP and SXPv4

The Cisco TrustSec (CTS) builds secure networks by establishing domains of trusted network devices. Each device in the domain is authenticated by its peers. Communication on the links between devices in the domain is secured with a combination of encryption, message integrity check, and data-path replay protection mechanisms.

The Scalable Group Tag (SGT) Exchange Protocol (SXP) is one of the several protocols that support CTS. CTS SXP version 4 (SXPv4) enhances the functionality of SXP by adding a loop detection mechanism to prevent stale binding in the network. In addition, Cisco TrustSec supports SGT inline tagging which allows propagation of SGT embedded in clear-text (unencrypted) ethernet packets.

When a wireless client is connected and is authenticated by ISE, the IP-SGT binding is generated on the controller. The same SGT is pushed to the AP along with the other client details.

For more details on SGT inline tagging on the AP and SXPv4, see the **Cisco TrustSec Configuration Guide** at: [https://www.cisco.com/c/en/us/td/docs/ios-xml/ios/sec\\_usr\\_cts/configuration/xs-3s/sec-usr-cts-xe-3s-book/sec-cts-sxpv4.html](https://www.cisco.com/c/en/us/td/docs/ios-xml/ios/sec_usr_cts/configuration/xs-3s/sec-usr-cts-xe-3s-book/sec-cts-sxpv4.html)

## Creating an SXP Profile

### Procedure

	Command or Action	Purpose
Step 1	<b>configure terminal</b>  <b>Example:</b> Device# <code>configure terminal</code>	Enters global configuration mode.

	Command or Action	Purpose
<b>Step 2</b>	<b>wireless cts-sxp profile</b> <i>profile-name</i> <b>Example:</b> Device(config)# wireless cts-sxp profile rr-profile	Configures a wireless CTS profile and enters cts-sxp profile configuration mode.
<b>Step 3</b>	<b>cts sxp enable</b> <b>Example:</b> Device(config-cts-sxp-profile)# cts sxp enable	Enables SXP for Cisco TrustSec.

## Configuring SGT Inline Tagging on Access Points

Follow the procedure given below to configure SGT inline tagging on APs:

### Before you begin

- The SGTs pushed to the AP for inline tagging will only be from dynamic SGT allocation through ISE authentication. It is not supported for static bindings configured on the controller .
- SGTs will be pushed to an AP only when it is operating in flex mode.

To know the list of Cisco APs that support SGT inline tagging, see the release notes: <https://www.cisco.com/c/en/us/support/wireless/catalyst-9800-series-wireless-controllers/products-release-notes-list.html>

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters the global configuration mode.
<b>Step 2</b>	<b>wireless profile flex</b> <i>flex-profile</i> <b>Example:</b> Device(config)# wireless profile flex rr-xyz-flex-profile	Configures a wireless flex profile and enters the wireless flex profile configuration mode.
<b>Step 3</b>	<b>cts inline-tagging</b> <b>Example:</b> Device(config-wireless-flex-profile)# cts inline-tagging	Enables inline-tagging on the AP.

## Configuring an SXP Connection (GUI)

Perform the following steps to set SXP global configuration.

## Procedure

- 
- Step 1** In the **Global** section, select the **SXP Enabled** check box to enable SXP.
- Step 2** Enter an IP address in the **Default Source IP** field.
- Step 3** Enter a value in the **Reconciliation Period (sec)** field.
- Step 4** Enter a value in the **Retry Period (sec)** field.
- Step 5** Select the **Set New Default Password** check box. Selecting this check box displays the **Password Type** and **Enter Password** fields.
- Step 6** Choose any one of the available types from the **Password Type** drop-down list.
- Step 7** Enter a value in the **Enter Password** field.
- Step 8** Click the **Apply** button.
- Step 9** In the **Peer** section, click the **Add** button.
- Step 10** Enter an IP address in the **Peer IP** field.
- Step 11** Enter an IP address in the **Source IP** field.
- Step 12** Choose any one of the available types from the **Password** drop-down list.
- Step 13** Choose any one of the available types from the **Mode of Local Device** drop-down list.
- Step 14** Click the **Save & Apply to Device** button.
- Step 15** In the **AP** tab, click the **Add** button. The **Add SXP AP** dialog box appears.
- Step 16** Enter a name for the profile in the **Profile Name** field.
- Step 17** Set the **Status** field to **Enabled** to enable AP.
- Step 18** Enter a value in the **Default Password** field.
- Step 19** Enter a value (in seconds) for the **CTS Speaker Seconds**, **CTS Recon Period**, **CTS Retry Period**, **CTS Listener Maximum**, and **CTS Listener Minimum**
- Step 20** In the **CTS SXP Profile Connections** section, click **Add**.
- Step 21** Enter an IP address in the **Peer IP** field.
- Step 22** Choose any one of the modes from the **Connection Mode** drop-down list. The available modes are **Both**, **Listener**, and **Speaker**.
- Step 23** From the **Password Type** drop-down list, choose either **None** or **Default**.
- Step 24** Click the **Add** button.
- Step 25** Click the **Save & Apply to Device** button.
- 

## Configuring an SXP Connection

Follow the procedure given below to configure an SXP connection:

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b>	Enters global configuration mode.

	Command or Action	Purpose
	Device# configure terminal	
<b>Step 2</b>	<b>cts sxp enable</b> <b>Example:</b> Device(config)# cts sxp enable	Enables CTS SXP support.
<b>Step 3</b>	<b>cts sxp connection peer ipv4-address password none mode local speaker</b> <b>Example:</b> Device(config)# cts sxp connection peer 1.1.1.1 password none mode local speaker	Configures the CTS-SXP peer address connection.  <b>Note</b> The password need not be <i>none</i> always and the mode can either be Speaker or Listener, or Both.

### What to do next

Use the following command to verify the configuration:

```
Device# show running-config | inc sxp
```

## Verifying SGT Push to Access Points

When a wireless client is connected and authenticated by ISE, the IP-SGT binding is generated on the controller. This can be verified using the following commands:

```
Device# show cts role-based sgt-map all

Active IPv4-SGT Bindings Information

IP Address SGT Source
=====
1.1.1.1 100 CLI

IP-SGT Active Bindings Summary
=====
Total number of CLI bindings = 1
Total number of active bindings = 1
```

Use the following command to verify the SXP connections status:

```
Device# show cts sxp connections

SXP : Enabled
Highest Version Supported: 4
Default Password : Not Set
Default Source IP: Not Set
Connection retry open period: 120 secs
Reconcile period: 120 secs
Retry open timer is running
Peer-Sequence traverse limit for export: Not Set
Peer-Sequence traverse limit for import: Not Set

Peer IP : 40.1.1.1
Source IP : 40.1.1.2
Conn status : On
Conn version : 4
```

```

Conn capability : IPv4-IPv6-Subnet
Conn hold time : 120 seconds
Local mode : SXP Listener
Connection inst# : 1
TCP conn fd : 1
TCP conn password: none
Hold timer is running
Duration since last state change: 0:00:00:06 (dd:hr:mm:sec)

```

Total num of SXP Connections = 1

Use the following command to see the bindings learnt over SXP connection:

```
Device# show cts role-based sgt-map all
```

Active IPv4-SGT Bindings Information

```

IP Address SGT Source
=====
1.1.1.1 100 CLI

```

IP-SGT Active Bindings Summary

```

=====
Total number of CLI bindings = 1
Total number of active bindings = 1

```

Use the following commands on the AP to check the status of inline tagging on the AP and its IP-SGT bindings:

```
AP# show capwap client rcb
```

```

AdminState : ADMIN_ENABLED
OperationState : UP
Name : AP2C33.1185.C4D0
SwVer : 16.6.230.41
HwVer : 1.0.0.0
MwarApMgrIp : 9.3.72.38
MwarName : mohit-ewlc
MwarHwVer : 0.0.0.0
Location : default location
ApMode : FlexConnect
ApSubMode : Not Configured
CAPWAP Path MTU : 1485
CAPWAP UDP-Lite : Enabled
IP Prefer-mode : IPv4
AP Link DTLS Encryption : OFF
AP TCP MSS Adjust : Disabled
LinkAuditing : disabled
Efficient Upgrade State : Disabled
Flex Group Name : anrt-flex
AP Group Name : default-group
Cisco Trustsec Config
 AP Inline Tagging Mode : Enabled
! The status can be Enabled or Disabled and is based on the tag that is pushed to the AP.
 AP Sgacl Enforcement : Disabled
 AP Override Status : Disabled

```

```
AP# show cts role-based sgt-map all
```

Active IPv4-SGT Bindings Information

```

# CHAPTER 129

## Multiple Cipher Support

- [Default Ciphersuites Supported for CAPWAP-DTLS, on page 1439](#)
- [Configuring Multiple Ciphersuites, on page 1440](#)
- [Setting Server Preference, on page 1441](#)
- [Verifying Operational Ciphersuites and Priority, on page 1441](#)

## Default Ciphersuites Supported for CAPWAP-DTLS

From Cisco IOS XE Bengaluru 17.5.1, Elliptic Curve Diffie-Hellman Ephemeral (ECDHE)/Galois Counter Mode (GCM) ciphersuite with perfect forward secrecy (PFS) capability is added in the default list along with the existing AES128-SHA ciphersuite. All Cisco access point (AP) models, except the Cisco IOS APs, will prioritize this PFS ciphersuite for CAPWAP-DTLS under default configuration.

**Note** If link encryption is enabled for secure data channel traffic, then COS AP (DTLS client) will prioritize DHE-RSA-AES128-SHA over ECDHE/GCM ciphersuite.

During DTLS handshake, the preference order of the ciphersuites are important. This feature allows you to set the order of priority while configuring cipher suites.

When explicit ciphersuites are not configured, default ciphersuites that are listed in the table below are applied.

**Table 103: Default Ciphersuites**

Security Mode	Ciphersuite
FIPS and non-FIPS	<ul style="list-style-type: none"><li>• TLS_RSA_WITH_AES_128_CBC_SHA</li><li>• TLS_DHE_RSA_WITH_AES_128_CBC_SHA</li><li>• TLS_DHE_RSA_WITH_AES_256_CBC_SHA</li><li>• TLS_DHE_RSA_WITH_AES_256_CBC_SHA256</li><li>• TLS_ECDHE_ECDSA_WITH_AES_128_GCM_SHA256</li><li>• TLS_ECDHE_ECDSA_WITH_AES_256_GCM_SHA384</li><li>• TLS_ECDHE_RSA_WITH_AES_128_GCM_SHA256</li></ul>

Security Mode	Ciphersuite
WLANCC	<ul style="list-style-type: none"> <li>• TLS_DHE_RSA_WITH_AES_128_CBC_SHA</li> <li>• TLS_DHE_RSA_WITH_AES_256_CBC_SHA</li> <li>• TLS_DHE_RSA_WITH_AES_256_CBC_SHA256</li> <li>• TLS_ECDHE_ECDSA_WITH_AES_128_GCM_SHA256</li> <li>• TLS_ECDHE_ECDSA_WITH_AES_256_GCM_SHA384</li> <li>• TLS_ECDHE_RSA_WITH_AES_128_GCM_SHA256</li> </ul>

This feature is supported on all variants of the Cisco Catalyst 9800 Series Wireless Controllers and APs, except Cisco Industrial Wireless 3702 Access Point.

For a list of controllers and APs supported in a particular release, see the release notes available at: <https://www.cisco.com/c/en/us/support/wireless/catalyst-9800-series-wireless-controllers/products-release-notes-list.html>

## Configuring Multiple Ciphersuites

### Note

- If a controller is loaded with a startup configuration having a version of ciphersuite selection configuration that is earlier than Cisco IOS XE Bengaluru 17.5.1, it is auto converted to the latest version of ciphersuite selection configuration.
- Any change in the ciphersuite configuration results in AP flap.
- If you downgrade to a version earlier than Cisco IOS XE Bengaluru 17.5.1, ciphersuite configurations are lost.
- While downgrading to a version below 17.12.1 in FIPS mode or WLANCC mode, ensure ECDHE-RSA-AES128-GCM-SHA256 cipher suite is selected for AP DTLS (by default it is selected), else a downgrade will be impacted on all the COS APs.
- This can be verified by using the **show wireless certification config** command.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>ap dtls-ciphersuite priority <i>priority-num</i></b> <i>ciphersuite</i>  <b>Example:</b>	Sets priority for a particular cipher suite. Use zero (0) to set the highest priority.

	Command or Action	Purpose
	Device(config)# ap dtls-ciphersuite priority 2 TLS_DHE_RSA_WITH_AES_128_CBC_SHA	<b>Note</b> Configuration changes, if any, will automatically disconnect the existing APs.
<b>Step 3</b>	<b>exit</b>  <b>Example:</b> Device(config)# exit	Returns to privileged EXEC mode.

## Setting Server Preference

Ciphersuite configuration enforces the priority order in a DTLS handshake. To give equal priority for all the configured ciphersuites, then use **no ciphersuite server-preference** command in the corresponding AP join profile. By default, server preference is enabled.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>ap profile <i>profile-name</i></b>  <b>Example:</b> Device(config)# ap profile xxy	Configures an AP profile and enters AP profile configuration mode.
<b>Step 3</b>	<b>[no] ciphersuite server-preference</b>  <b>Example:</b> Device(config-ap-profile)# [no] ciphersuite server-preference	Sets the cipher suite server preference.  Use the <b>no</b> form of this command to disable server preference. By default, server preference is enabled.
<b>Step 4</b>	<b>exit</b>  <b>Example:</b> Device(config)# exit	Returns to global configuration mode.

## Verifying Operational Ciphersuites and Priority

To view the operational ciphersuites and their priority, use the following command:

```
Device# show wireless certification config

WLANCC : Not Configured
AP DTLS Version : DTLS v1.0 - v1.2

AP DTLS Cipher Suite List:
```

Priority	Ciphersuite
0	AES128-SHA
1	DHE-RSA-AES256-SHA256

## CHAPTER 130

# Configuring Secure Shell

- [Information About Configuring Secure Shell](#) , on page 1443
- [Prerequisites for Configuring Secure Shell](#), on page 1445
- [Restrictions for Configuring Secure Shell](#), on page 1446
- [How to Configure SSH](#), on page 1447
- [Monitoring the SSH Configuration and Status](#), on page 1449

## Information About Configuring Secure Shell

Secure Shell (SSH) is a protocol that provides a secure, remote connection to a device. SSH provides more security for remote connections than Telnet does by providing strong encryption when a device is authenticated. This software release supports SSH Version 1 (SSHv1) and SSH Version 2 (SSHv2).

### SSH and Device Access

Secure Shell (SSH) is a protocol that provides a secure, remote connection to a device. SSH provides more security for remote connections than Telnet does by providing strong encryption when a device is authenticated. This software release supports SSH Version 1 (SSHv1) and SSH Version 2 (SSHv2).

SSH functions the same in IPv6 as in IPv4. For IPv6, SSH supports IPv6 addresses and enables secure, encrypted connections with remote IPv6 nodes over an IPv6 transport.

### SSH Servers, Integrated Clients, and Supported Versions

The Secure Shell (SSH) Integrated Client feature is an application that runs over the SSH protocol to provide device authentication and encryption. The SSH client enables a Cisco device to make a secure, encrypted connection to another Cisco device or to any other device running the SSH server. This connection provides functionality similar to that of an outbound Telnet connection except that the connection is encrypted. With authentication and encryption, the SSH client allows for secure communication over an unsecured network.

The SSH server and SSH integrated client are applications that run on the switch. The SSH server works with the SSH client supported in this release and with non-Cisco SSH clients. The SSH client works with publicly and commercially available SSH servers. The SSH client supports the ciphers of Data Encryption Standard (DES), 3DES, and password authentication.

The switch supports an SSHv1 or an SSHv2 server.

The switch supports an SSHv1 client.

---

**Note** The SSH client functionality is available only when the SSH server is enabled.

---

User authentication is performed like that in the Telnet session to the device. SSH also supports the following user authentication methods:

- TACACS+
- RADIUS
- Local authentication and authorization

## SSH Configuration Guidelines

Follow these guidelines when configuring the switch as an SSH server or SSH client:

- An RSA key pair generated by a SSHv1 server can be used by an SSHv2 server, and the reverse.
- If the SSH server is running on an active switch and the active switch fails, the new active switch uses the RSA key pair generated by the previous active switch.
- If you get CLI error messages after entering the **crypto key generate rsa** global configuration command, an RSA key pair has not been generated. Reconfigure the hostname and domain, and then enter the **crypto key generate rsa** command.
- When generating the RSA key pair, the message No host name specified might appear. If it does, you must configure a hostname by using the **hostname** global configuration command.
- When generating the RSA key pair, the message No domain specified might appear. If it does, you must configure an IP domain name by using the **ip domain-name** global configuration command.
- When configuring the local authentication and authorization authentication method, make sure that AAA is disabled on the console.

## Secure Copy Protocol Overview

The Secure Copy Protocol (SCP) feature provides a secure and authenticated method for copying switch configurations or switch image files. SCP relies on Secure Shell (SSH), an application and a protocol that provides a secure replacement for the Berkeley r-tools.

For SSH to work, the switch needs an RSA public/private key pair. This is the same with SCP, which relies on SSH for its secure transport.

Because SSH also relies on AAA authentication, and SCP relies further on AAA authorization, correct configuration is necessary.

- Before enabling SCP, you must correctly configure SSH, authentication, and authorization on the switch.
- Because SCP relies on SSH for its secure transport, the router must have an Rivest, Shamir, and Adelman (RSA) key pair.

**Note** When using SCP, you cannot enter the password into the copy command. You must enter the password when prompted.

## Secure Copy Protocol

The Secure Copy Protocol (SCP) feature provides a secure and authenticated method for copying device configurations or switch image files. The behavior of SCP is similar to that of remote copy (rcp), which comes from the Berkeley r-tools suite, except that SCP relies on SSH for security. SCP also requires that authentication, authorization, and accounting (AAA) authorization be configured so the device can determine whether the user has the correct privilege level. To configure the Secure Copy feature, you should understand the SCP concepts.

## SFTP Support

SFTP client support is introduced from Cisco IOS XE Gibraltar 16.10.1 release onwards. SFTP client is enabled by default and no separate configuration required.

The SFTP procedures can be invoked using the **copy** command, which is similar to that of **scp** and **tftp** commands. A typical file download procedure using **sftp** command can be carried out as shown below:

```
copy sftp://user :password @server-ip/file-name flash0:// file-name
```

For more details on the **copy** command, see the following URL:

[https://www.cisco.com/c/m/en\\_us/techdoc/dc/reference/cli/nxos/commands/fund/copy.html](https://www.cisco.com/c/m/en_us/techdoc/dc/reference/cli/nxos/commands/fund/copy.html)

## Prerequisites for Configuring Secure Shell

The following are the prerequisites for configuring the switch for secure shell (SSH):

- For SSH to work, the switch needs an Rivest, Shamir, and Adleman (RSA) public/private key pair. This is the same with Secure Copy Protocol (SCP), which relies on SSH for its secure transport.
- Before enabling SCP, you must correctly configure SSH, authentication, and authorization on the switch.
- Because SCP relies on SSH for its secure transport, the router must have an Rivest, Shamir, and Adelman (RSA) key pair.
- SCP relies on SSH for security.
- SCP requires that authentication, authorization, and accounting (AAA) authorization be configured so the router can determine whether the user has the correct privilege level.
- A user must have appropriate authorization to use SCP.
- A user who has appropriate authorization can use SCP to copy any file in the Cisco IOS File System (IFS) to and from a switch by using the **copy** command. An authorized administrator can also do this from a workstation.
- The Secure Shell (SSH) server requires an IPsec (Data Encryption Standard [DES] or 3DES) encryption software image; the SSH client requires an IPsec (DES or 3DES) encryption software image.)

- Configure a hostname and host domain for your device by using the **hostname** and **ip domain-name** commands in global configuration mode.

---

**Note** While upgrading from 16.11 to a later version, if you encounter a host key change by SSH client, you need to know the following:

- Wave 2 AP now supports a third key type ED25519 along with the RSA and ECDSA keys.
  - The RSA and ECDSA keys are used for normal operations.
  - The ED25519 key is used for FIPS mode.
- 

## Restrictions for Configuring Secure Shell

The following are restrictions for configuring the device for secure shell.

- From Cisco IOS XE Dublin 17.10.x, Key Exchange and MAC algorithms like diffie-hellman-group14-sha1, hmac-sha1, hmac-sha2-256, and hmac-sha2-512 are not supported by default and it may impact some SSH clients that only support these algorithms. However, you can add them manually if required. For information on manually adding these algorithms, see the **SSH Algorithms for Common Criteria Certification** document available at: [https://www.cisco.com/c/en/us/td/docs/routers/ios/config/17-x/sec-vpn/b-security-vpn/m\\_sec-secure-shell-algorithm-ccc.html](https://www.cisco.com/c/en/us/td/docs/routers/ios/config/17-x/sec-vpn/b-security-vpn/m_sec-secure-shell-algorithm-ccc.html)
- The switch supports Rivest, Shamir, and Adelman (RSA) authentication.
- SSH supports only the execution-shell application.
- The SSH server and the SSH client are supported only on Data Encryption Standard (DES) (56-bit) and 3DES (168-bit) data encryption software. In DES software images, DES is the only encryption algorithm available. In 3DES software images, both DES and 3DES encryption algorithms are available.
- The device supports the Advanced Encryption Standard (AES) encryption algorithm with a 128-bit key, 192-bit key, or 256-bit key. However, symmetric cipher AES to encrypt the keys is not supported.
- When using SCP, you cannot enter the password into the **copy** command. You must enter the password when prompted.
- The login banner is not supported in Secure Shell Version 1. It is supported in Secure Shell Version 2.
- The **-l** keyword and **userid : {number} {ip-address}** delimiter and arguments are mandatory when configuring the alternative method of Reverse SSH for console access.
- To authenticate clients with FreeRADIUS over RADSEC, you should generate an RSA key longer than 1024 bit. Use the **crypto key generate rsa general-keys exportable label label-name** command to achieve this.

# How to Configure SSH

## Setting Up the Device to Run SSH

Follow the procedure given below to set up your device to run SSH:

### Before you begin

Configure user authentication for local or remote access.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# <b>Device# configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>hostname <i>hostname</i></b> <b>Example:</b> Device(config)# <b>hostname your_hostname</b>	Configures a hostname and IP domain name for your device.  <b>Note</b> Follow this procedure only if you are configuring the device as an SSH server.
<b>Step 3</b>	<b>ip domain name <i>domain_name</i></b> <b>Example:</b> Device(config)# <b>ip domain name your_domain</b>	Configures a host domain for your device.
<b>Step 4</b>	<b>crypto key generate rsa</b> <b>Example:</b> Device(config)# <b>crypto key generate rsa</b>	Enables the SSH server for local and remote authentication on the device and generates an RSA key pair. Generating an RSA key pair for the device automatically enables SSH.  We recommend that a minimum modulus size of 1024 bits.  When you generate RSA keys, you are prompted to enter a modulus length. A longer modulus length might be more secure, but it takes longer to generate and to use.  <b>Note</b> Follow this procedure only if you are configuring the device as an SSH server.

	Command or Action	Purpose
<b>Step 5</b>	<b>end</b>  <b>Example:</b> Device(config)# <b>end</b>	Exits configuration mode.

## Configuring the SSH Server

Follow the procedure given below to configure the SSH server:

**Note** This procedure is only required if you are configuring the device as an SSH server.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>ip ssh version [2]</b>  <b>Example:</b> Device(config)# <b>ip ssh version 2</b>	(Optional) Configures the device to run SSH Version 2.  If you do not enter this command or do not specify a keyword, the SSH server selects the latest SSH version supported by the SSH client.
<b>Step 3</b>	<b>ip ssh window-size</b>  <b>Example:</b> Device(config)# <b>ip ssh window-size</b>	Specifies the SSH window size. The recommended window size is 32K or lesser than that. The default window size is 8912.  Selecting <b>window-size</b> greater than 32K might have some impact on the CPU, until unless: <ul style="list-style-type: none"> <li>• The network bandwidth is good.</li> <li>• Client can accommodate this size.</li> <li>• No latency in network.</li> </ul> <b>Note</b> This CLI is recommended only for SCP operations and can be disabled once the copy is done.
<b>Step 4</b>	<b>ip ssh {timeout <i>seconds</i>   authentication-retries <i>number</i>}</b>  <b>Example:</b> Device(config)# <b>ip ssh timeout 90</b>	Configures the SSH control parameters: <ul style="list-style-type: none"> <li>• Specify the time-out value in seconds; the default is 120 seconds. The range is 0 to 120 seconds. This parameter applies to the SSH negotiation phase. After the</li> </ul>

	Command or Action	Purpose
	<code>authentication-retries 2</code>	<p>connection is established, the device uses the default time-out values of the CLI-based sessions.</p> <p>By default, up to five simultaneous, encrypted SSH connections for multiple CLI-based sessions over the network are available (session 0 to session 4). After the execution shell starts, the CLI-based session time-out value returns to the default of 10 minutes.</p> <ul style="list-style-type: none"> <li>Specify the number of times that a client can re-authenticate to the server. The default is 3; the range is 0 to 5.</li> </ul> <p>Repeat this step when configuring both parameters.</p>
<b>Step 5</b>	<p>Use one or both of the following:</p> <ul style="list-style-type: none"> <li><code>line vty line_number [ending_line_number]</code></li> <li><code>transport input ssh</code></li> </ul> <p><b>Example:</b></p> <pre>Device(config)# line vty 1 10</pre> <p>or</p> <pre>Device(config-line)# transport input ssh</pre>	<p>(Optional) Configures the virtual terminal line settings.</p> <ul style="list-style-type: none"> <li>Enters line configuration mode to configure the virtual terminal line settings. For <code>line_number</code> and <code>ending_line_number</code>, specify a pair of lines. The range is 0 to 15.</li> <li>Specifies that the device prevent non-SSH Telnet connections. This limits the router to only SSH connections.</li> </ul>
<b>Step 6</b>	<p><code>end</code></p> <p><b>Example:</b></p> <pre>Device(config-line)# end</pre>	Returns to privileged EXEC mode.

## Monitoring the SSH Configuration and Status

This table displays the SSH server configuration and status.

*Table 104: Commands for Displaying the SSH Server Configuration and Status*

Command	Purpose
<code>show ip ssh</code>	Shows the version and configuration information for the SSH server.

Command	Purpose
show ssh	Shows the status of the SSH server.

## Information About Encrypted Traffic Analytics

The Encrypted Traffic Analytics (ETA) leverages Flexible NetFlow (FNF) technology to export useful information about the flow to the collectors and gain visibility into the network.

Figure 39: Encrypted Traffic Analytics Deployed on Cisco Catalyst 9800 Series Wireless Controller in Local Mode

The wireless clients send data packets to the access point. The packets are then CAPWAP encapsulated and sent to the controller. This means that the actual client data is in the CAPWAP payload. To apply ETA on the client data, you need to strip the CAPWAP header before handing over the packet to the ETA module.

The ETA offers the following advantages:

- Enhanced telemetry based threat analytics.
- Analytics to identify malware.

Starting from Cisco IOS XE Amsterdam 17.1.1s, ETA inspection for IPv6 traffic is supported. ETA inspection for IPv6 traffic is enabled by default and no special configuration is required. This release also supports allowed list of IPv6 traffic, exporting ETA records to IPv4 or IPv6 export destination, exporting records over IPFIX (NetFlow v10), and configuring source interface for ETA exports. The records can be exported to IPv4 or IPv6 NetFlow collector.

## Exporting Records to IPv4 Flow Export Destination

Follow the procedure given below to enable encrypted traffic analytics and configure a flow export destination:

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters the global configuration mode.
<b>Step 2</b>	<b>et-analytics</b> <b>Example:</b> Device(config)# et-analytics	Enables encrypted traffic analytics.

	Command or Action	Purpose
<b>Step 3</b>	<b>ip flow-export destination</b> <i>ip_address</i> <i>port_number</i> <b>Example:</b> Device(config-et-analytics)# ip flow-export destination 120.0.0.1 2055	Configures the NetFlow record export. Here, <i>port_number</i> ranges from 1 to 65535.
<b>Step 4</b>	<b>end</b> <b>Example:</b> Device(config-et-analytics)# end	Returns to privileged EXEC mode.

## Exporting Records to IPv6 Flow Export Destination

Follow the procedure given below to enable encrypted traffic analytics and configure an IPv6 flow export destination.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters the global configuration mode.
<b>Step 2</b>	<b>et-analytics</b> <b>Example:</b> Device(config)# et-analytics	Enables encrypted traffic analytics.
<b>Step 3</b>	<b>ipv6 flow-export destination</b> <i>ipv6-address</i> <i>port-number</i> <b>Example:</b> Device(config-et-analytics)# ipv6 flow-export destination 2001:181:181::1 2055	Specifies netflow record export destination IPv6 address and port. <b>Note</b> The maximum configurable limit for flow-export destinations is four (both IPv4 and IPv6 combined).
<b>Step 4</b>	<b>exit</b> <b>Example:</b> Device(config-et-analytics)# exit	Returns to global configuration mode.

## Exporting Records to IPv4 and IPv6 Destination over IPFIX

This procedure provides efficient bandwidth utilization by allowing variable len fields for smaller data packets and also reduces the overall bandwidth requirements for transmission.

**Procedure**

	<b>Command or Action</b>	<b>Purpose</b>
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters the global configuration mode.
<b>Step 2</b>	<b>et-analytics</b> <b>Example:</b> Device(config)# et-analytics	Enables encrypted traffic analytics.
<b>Step 3</b>	<b>ip flow-export destination <i>ip-address</i>  <i>port-number</i> ipfix</b> <b>Example:</b> Device(config-et-analytics)# ip flow-export destination 192.168.19.2 2055 ipfix	Specifies NetFlow record export destination IP address, port and format.
<b>Step 4</b>	<b>ipv6 flow-export destination <i>ipv6-address</i>  <i>port-number</i> ipfix</b> <b>Example:</b> Device(config-et-analytics)# ipv6 flow-export destination 2001:181:181::1 2055 ipfix	Specifies NetFlow record export destination IPv6 address, port and format.  IPFIX allows you to collect flow information from network devices that support IPFIX protocol and analyze the traffic flow information by processing it through a netflow analyzer.  <b>Note</b> Maximum configurable limit for flow-export destinations is four (both IPv4 and IPv6 combined).
<b>Step 5</b>	<b>exit</b> <b>Example:</b> Device(config-et-analytics)# exit	Returns to global configuration mode.

## Allowed List of Traffic

You can add an allowed list of ACLs for both IPv4 and IPv6 traffic. Traffic from allowed list is skipped from ETA inspection and records are not generated for the matching traffic.

### Before you begin

Configure an IPv4 or IPv6 access list.

- IPv4 ACL: **ip access-list standard *acl\_name***

```
Device(config)# ip access-list standard eta-whitelist_ipv4
```

- IPv6 ACL: **ipv6 access-list *acl\_name***

```
Device(config)# ipv6 access-list eta-whitelist_ipv6
```

## Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters the global configuration mode.
<b>Step 2</b>	<b>et-analytics</b> <b>Example:</b> Device(config)# et-analytics	Enables encrypted traffic analytics.
<b>Step 3</b>	<b>whitelist acl <i>acl-name</i></b> <b>Example:</b> Device(config-et-analytics)# whitelist acl eta-whitelist	Configures an allowed list for IPv4 or IPv6. <b>Note</b> You cannot add both IPv4 and IPv6 client traffic simultaneously to an allowed list, as a single ACL cannot have both IPv4 and IPv6 terms.
<b>Step 4</b>	<b>exit</b> <b>Example:</b> Device(config-et-analytics)# exit	Returns to global configuration mode.
<b>Step 5</b>	<b>sequence <i>sequence-num</i> permit udp any any eq tftp</b> <b>Example:</b> Device(config-ipv6-acl)# sequence 10 permit udp any any eq tftp	(Optional) Configures a sequence number and the access conditions to add any IPv6 TFTP traffic to allowed list.

## Configuring Source Interface for Record Export

## Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters the global configuration mode.
<b>Step 2</b>	<b>et-analytics</b> <b>Example:</b> Device(config)# et-analytics	Enables encrypted traffic analytics.
<b>Step 3</b>	<b>ip flow-export destination <i>ip-address</i></b> <b>source-interface <i>interface-name</i></b> <b><i>interface-number</i> ipfix</b> <b>Example:</b>	Specifies NetFlow record export destination IP address, source interface and format.  This allows the ETA export to use the IP address of the specified interface, as against

	Command or Action	Purpose
	<pre>Device(config-et-analytics)# ip flow-export destination 192.168.19.2 2055  source-interface loopback0 ipfix</pre>	<p>using the IP address of the egress interface as the source address.</p> <p>The source interface is applicable for both IPv4 and IPv6 export destinations.</p> <p><b>Note</b> Only one source interface can be specified and all exports use this source address.</p>
<b>Step 4</b>	<p><b>ipv6 flow-export destination</b> <i>ipv6-address</i>  <b>source-interface</b> <i>interface-name</i>  <i>interface-number</i> <b>ipfix</b></p> <p><b>Example:</b></p> <pre>Device(config-et-analytics)# ipv6 flow-export destination 2001:181:181::1 2055 source-interface Vlan160 ipfix</pre>	Specifies NetFlow record export destination IPv6 address, source interface and format.
<b>Step 5</b>	<p><b>exit</b></p> <p><b>Example:</b></p> <pre>Device(config-et-analytics)# exit</pre>	Returns to global configuration mode.

## Configuring Source Interface for Record Export Without IPFIX

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<p><b>configure terminal</b></p> <p><b>Example:</b></p> <pre>Device# configure terminal</pre>	Enters the global configuration mode.
<b>Step 2</b>	<p><b>et-analytics</b></p> <p><b>Example:</b></p> <pre>Device(config)# et-analytics</pre>	Enables encrypted traffic analytics.
<b>Step 3</b>	<p><b>ip flow-export destination</b> <i>ip-address</i>  <b>source-interface</b> <i>interface-name</i>  <i>interface-number</i></p> <p><b>Example:</b></p> <pre>Device(config-et-analytics)# ip flow-export destination 192.168.19.2 2055  source-interface loopback0 ipfix</pre>	Specifies NetFlow record export destination IP address, source interface and format.

	Command or Action	Purpose
<b>Step 4</b>	<b>ipv6 flow-export destination</b> <i>ipv6-address</i> <b>source-interface</b> <i>interface-name</i> <i>interface-number</i> <b>ipfix</b>  <b>Example:</b> <pre>Device(config-et-analytics)# ipv6 flow-export destination 2001:181:181::1 2055 source-interface Vlan160</pre>	Specifies NetFlow record export destination IPv6 address, source interface and format.
<b>Step 5</b>	<b>exit</b>  <b>Example:</b> <pre>Device(config-et-analytics)# exit</pre>	Returns to global configuration mode.

## Configuring ETA Flow Export Destination (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Services > NetFlow**.
- Step 2** Click the **Add** button. The **Create NetFlow** dialog box appears.
- Step 3** Choose any one of the available templates from the **NetFlow Template** drop-down list.
- Step 4** Enter an IPv4 or IPv6 address in the **Collector Address** field.
- Step 5** From the **Whitelist ACL** drop-down list, choose the desired option.
- Note** To use this option, ensure that you select **Encrypted Traffic Analytics** from the **NetFlow Template** drop-down list.
- Step 6** Enter a port number in the **Exporter Port** field. You must specify a value between 1 and 65535.
- Step 7** Choose the desired option from the **Export Interface IP** drop-down list.
- Step 8** Choose any one of the sampling methods from the **Sampling Method** drop-down list. The available options are **Deterministic**, **Random**, and **Full Netflow**.
- Step 9** Enter a range for the sample. You must specify a value between 32 and 1032.
- Step 10** Select the required interfaces/profile from the **Available** pane and move it to the **Selected** pane.
- Step 11** Click the **Save & Apply to Device** button.
- 

## Enabling In-Active Timer

Follow the procedure given below to enable in-active timer:

**Procedure**

	<b>Command or Action</b>	<b>Purpose</b>
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters the global configuration mode.
<b>Step 2</b>	<b>et-analytics</b> <b>Example:</b> Device(config)# et-analytics	Configures the encrypted traffic analytics.
<b>Step 3</b>	<b>inactive-timeout <i>timeout-in-seconds</i></b> <b>Example:</b> Device(config-et-analytics)# inactive-timeout 15	Specifies the inactive flow timeout value.  Here, <i>timeout-in-seconds</i> ranges from 1 to 604800.
<b>Step 4</b>	<b>end</b> <b>Example:</b> Device(config-et-analytics)# end	Returns to privileged EXEC mode. Alternatively, you can also press Ctrl-Z to exit global configuration mode.

## Enabling ETA on WLAN Policy Profile

Follow the procedure given below to enable ETA on WLAN policy profile:

**Procedure**

	<b>Command or Action</b>	<b>Purpose</b>
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters the global configuration mode.
<b>Step 2</b>	<b>wireless profile policy <i>profile-name</i></b> <b>Example:</b> Device(config)# wireless profile policy default-policy-profile	Creates policy profile for the WLAN.  The <i>profile-name</i> is the profile name of the policy profile.
<b>Step 3</b>	<b>et-analytics enable</b> <b>Example:</b> Device(config-wireless-policy)# et-analytics enable	Enables encrypted traffic analytics on the policy.
<b>Step 4</b>	<b>end</b> <b>Example:</b> Device(config-wireless-policy)# end	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Attaching Policy Profile to VLAN (GUI)

Perform the following steps to attach a policy profile to VLAN.

### Procedure

- 
- Step 1** Check the **RADIUS Profiling** checkbox.
  - Step 2** From the **Local Subscriber Policy Name**, choose the required policy name.
  - Step 3** In the **WLAN Local Profiling** section, enable or disable the **Global State of Device Classification**, check the checkbox for **HTTP TLV Caching** and **DHCL TLV Caching**.
  - Step 4** In the **VLAN** section, choose the **VLAN/VLAN Group** from the drop-down list. Enter the Multicast VLAN.
  - Step 5** In the **WLAN ACL** section, choose the **IPv4 ACL** and **IPv6 ACL** from the drop-down list.
  - Step 6** In the **URL Filters** section, choose the **Pre Auth** and **Post Auth** from the drop-down list.
  - Step 7** Click **Save & Apply to Device**.
- 

## Attaching Policy Profile to VLAN

Follow the procedure given below to attach a policy profile to VLAN:

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters the global configuration mode.
<b>Step 2</b>	<b>wireless profile policy <i>profile-name</i></b>  <b>Example:</b> Device(config)# wireless profile policy default-policy-profile	Creates policy profile for the WLAN.  The <i>profile-name</i> is the profile name of the policy profile.
<b>Step 3</b>	<b>vlan <i>vlan-name</i></b>  <b>Example:</b> Device(config-wireless-policy)# vlan vlan-name	Assigns the policy profile to the VLANs.
<b>Step 4</b>	<b>no shutdown</b>  <b>Example:</b> Device(config-wireless-policy)# no shutdown	Enables the wireless policy profile.

# Verifying ETA Configuration

## Verifying ETA Globally

To view the ETA global and interface details, use the following command:

```
Device# show platform software utd chassis active F0 et-analytics global

ET Analytics Global Configuration
ID: 1
All Interfaces: Off
IP address and port and vrf: 192.168.5.2:2055:0
```

To view the ETA global configuration, use the following command:

```
Device# show platform software et-analytics global

ET-Analytics Global state
=====
All Interfaces : Off
IP Flow-record Destination: 192.168.5.2 : 2055
Inactive timer: 15
```

---

**Note** The `show platform software et-analytics global` command does not display the ETA enabled wireless client interfaces.

---

To view the ETA global state in datapath, use the following command:

```
Device# show platform hardware chassis active qfp feature et-analytics datapath runtime

ET-Analytics run-time information:

Feature state: initialized (0x00000004)
Inactive timeout : 15 secs (default 15 secs)
WhiteList information :
 flag: False
 cgacl w0 : n/a
 cgacl w1 : n/a
Flow CFG information :
 instance ID : 0x0
 feature ID : 0x1
 feature object ID : 0x1
 chunk ID : 0xC
```

To view the ETA memory details, use the following command:

```
Device# show platform hardware chassis active qfp feature et-analytics datapath memory

ET-Analytics memory information:

Size of FO : 3200 bytes
No. of FO allocs : 0
No. of FO frees : 0
```

To view the ETA flow export in datapath, use the following command:

```
Device# show platform hardware chassis active qfp feature et-analytics datapath stats export

ET-Analytics 192.168.5.2:2055 vrf 0 Stats:
```

```

Export statistics:
 Total records exported : 5179231
 Total packets exported : 3124873
 Total bytes exported : 3783900196
 Total dropped records : 0
 Total dropped packets : 0
 Total dropped bytes : 0
 Total IDP records exported :
 initiator->responder : 1285146
 responder->initiator : 979284
 Total SPLT records exported:
 initiator->responder : 1285146
 responder->initiator : 979284
 Total SALT records exported:
 initiator->responder : 0
 responder->initiator : 0
 Total BD records exported :
 initiator->responder : 0
 responder->initiator : 0
 Total TLS records exported :
 initiator->responder : 309937
 responder->initiator : 329469

```

To view the ETA flow statistics, use the following command:

```
Device# show platform hardware chassis active qfp feature et-analytics datapath stats flow
```

```

ET-Analytics Stats:
 Flow statistics:
 feature object allocs : 0
 feature object frees : 0
 flow create requests : 0
 flow create matching : 0
 flow create successful: 0
 flow create failed, CFT handle: 0
 flow create failed, getting FO: 0
 flow create failed, malloc FO : 0
 flow create failed, attach FO : 0
 flow create failed, match flow: 0
 flow create, aging already set: 0
 flow ageout requests : 0
 flow ageout failed, freeing FO: 0
 flow ipv4 ageout requests : 0
 flow ipv6 ageout requests : 0
 flow whitelist traffic match : 0

```

### Verifying ETA on Wireless Client Interface

To view if a policy is configured with ETA, use the following command:

```
Device# show wireless profile policy detailed default-policy-profile
```

```

Policy Profile Name : default-policy-profile
Description : default policy profile
Status : ENABLED
VLAN : 160
Multicast VLAN : 0
Passive Client : DISABLED
ET-Analytics : DISABLED
StaticIP Mobility : DISABLED
WLAN Switching Policy
 Central Switching : ENABLED
 Central Authentication : ENABLED
 Central DHCP : ENABLED

```

```
Flex NAT PAT : DISABLED
Central Assoc : ENABLED
```

To view the ETA status in the wireless client detail, use the following command:

```
Device# show platform hardware chassis active qfp feature wireless wlclient datapath
<client_mac>
```

```
Wlclient Details for Client mac: 0026.c635.ebf8
```

```

Input VlanId : 160
Point of Presence : 0
Wlclient Input flags : 9
Instance ID : 3
ETA enabled : True
client_mac_addr : 0026.c635.ebf8

bssid_mac_addr: 58ac.7843.037f
Point of Attachment : 65497
Output vlanId : 160
wlan_output_uidb : -1
Wlclient Output flags : 9
Radio ID : 1
cgacl w0 : 0x0
cgacl w1 : 0x0
IPv6 addr number : 0
IPv6 addr learning : 0
```

To view clients in the ETA pending wireless client tree, use the following command:

```
Device# show platform hardware chassis active qfp feature wireless et-analytics
eta-pending-client-tree
```

CPP	IF_H	DPIDX	MAC Address	VLAN	AS	MS WLAN	POA
0X2A	0XA0000001	2c33.7a5b.827b	160	RN	LC xyz_ssid	0x90000003	
0X2B	0XA0000002	2c33.7a5b.80fb	160	RN	LC xyz_ssid	0x90000003	

To view the QFP interface handle, use the following command:

```
Device# show platform hardware chassis active qfp interface if-handle <qfp_interface_handle>
```

```
show platform hardware chassis active qfp interface if-handle 0X29
FIA handle - CP:0x27f3ce8 DP:0xd7142000
LAYER2_IPV4_INPUT_ARL_SANITY
WLCLIENT_INGRESS_IPV4_FWD
IPV4_TVI_INPUT_FIA >>> ETA FIA Enabled
SWPORT_VLAN_BRIDGING
IPV4_INPUT_GOTO_OUTPUT_FEATURE (M)
Protocol 1 - ipv4_output
FIA handle - CP:0x27f3d30 DP:0xd7141780
IPV4_VFR_REFRAG (M)
IPV4_TVI_OUTPUT_FIA >>> ETA FIA Enabled
WLCLIENT_EGRESS_IPV4_FWD
IPV4_OUTPUT_DROP_POLICY (M)
DEF_IF_DROP_FIA (M)
```

**Note** The *qfp\_interface\_handle* ranges from 1 to 4294967295.

To view the ETA pending wireless client tree statistics, use the following command:

```
Device# show platform hardware chassis active qfp feature wireless et-analytics statistics
```

```
Wireless ETA cpp-client plumbing statistics
```

```
Number of ETA pending clients : 2
```

```
Counter Value
```

```

Enable ETA on wireless client called 0

# FIPS

---

- [FIPS, on page 1465](#)
- [Guidelines and Restrictions for FIPS, on page 1466](#)
- [FIPS Self-Tests, on page 1466](#)
- [Configuring FIPS, on page 1467](#)
- [Configuring FIPS in HA Setup, on page 1468](#)
- [Verifying FIPS Configuration, on page 1469](#)

## FIPS

Federal Information Processing Standard (FIPS) 140-2 is a security standard used to validate cryptographic modules. The cryptographic modules are produced by the private sector for use by the U.S. government and other regulated industries (such as financial and healthcare institutions) that collect, store, transfer, share and disseminate sensitive but unclassified (SBU) information.

---

**Note** Cisco TrustSec (CTS) is not supported when the controller is in FIPS mode.

---

For more information about FIPS, see

<https://www.cisco.com/c/en/us/solutions/industries/government/global-government-certifications/fips-140.html>.

With FIPS in enabled state, some passwords and pre-shared keys must have the following minimum lengths:

- For Software-Defined Access Wireless, between the controller and map server, a pre-shared key (for example, the LISP authentication key) is used in authentication of all TCP messages between them. This pre-shared key must be at least 14 characters long.
- The ISAKMP key (for example, the Crypto ISAKMP key) must be at least 14 characters long.

### Limitations for FIPS

- The console of APs get disabled when the controller is operating in FIPS mode.
- The weak or legacy cipher like SHA1 is not supported in FIPS mode.
- APs would not reload immediately, if you change the FIPS status.

---

**Note** We recommend a minimum RSA key size of 2048 bits under RADSEC when operating in FIPS mode. Otherwise, the RADSEC fails.

---

## Guidelines and Restrictions for FIPS

- In the controller switches, a legacy key is used to support the legacy APs. However, in FIPS mode, the crypto engine detects the legacy key as a weak key and rejects it by showing the following error message: "% **Error in generating keys: could not generate test signature.**" We recommend that you ignore such error messages that are displayed during the bootup of the controller (when operating in FIPS mode).
- SSH clients using SHA1 will not be able to access the controller when you enable FIPS.

---

**Note** You need to use FIPS compliant SSH clients to access the controller.

---

- While configuring WLAN ensure that the PSK length must be minimum of 15 characters. If not, the APs will not be able to join the controller after changing tags..
- TrustSec is not supported.
- PAC key configuration is not supported.
- FIPS is not compatible with level-6 encrypted passwords. Additionally, 802.1X authentications will fail if the RADIUS shared secret uses a type-6 encryption key.

## FIPS Self-Tests

A cryptographic module must perform power-up self-tests and conditional self-tests to ensure that it is functional.

Power-up self-tests run automatically after the device powers up. A device goes into FIPS mode only after all self-tests are successfully completed. If any self-test fails, the device logs a system message and moves into an error state. Also, if the power-up self test fails, the device fails to boot.

Using a known-answer test (KAT), a cryptographic algorithm is run on data for which the correct output is already known, and then the calculated output is compared to the previously generated output. If the calculated output does not equal the known answer, the known-answer test fails.

Power-up self-tests include the following:

- Software integrity
- Algorithm tests

Conditional self-tests must be run when an applicable security function or operation is invoked. Unlike the power-up self-tests, conditional self-tests are executed each time their associated function is accessed.

The device uses a cryptographic algorithm known-answer test (KAT) to test FIPS mode for each FIPS 140-2-approved cryptographic function (encryption, decryption, authentication, and random number generation) implemented on the device. The device applies the algorithm to data for which the correct output is already known. It then compares the calculated output to the previously generated output. If the calculated output does not equal the known answer, the KAT fails.

Conditional self-tests run automatically when an applicable security function or operation is invoked. Unlike the power-up self-tests, conditional self-tests are executed each time their associated function is accessed.

Conditional self-tests include the following:

- Pair-wise consistency test—This test is run when a public or private key-pair is generated.
- Continuous random number generator test—This test is run when a random number is generated.
- Bypass
- Software load

## Configuring FIPS

Ensure that both the active and standby controllers have the same FIPS authorization key.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>fips authorization-key key</b>  <b>Example:</b> Device(config)# <code>fips authorization-key 12345678901234567890123456789012</code>	Enables the FIPS mode. The key length should be of 32 hexadecimal characters.  <b>Note</b> When FIPS is enabled, you may need to trigger more than one factory reset using the reset button.  To disable FIPS mode on the device, use the <b>no</b> form of this command.
<b>Step 3</b>	<b>end</b>  <b>Example:</b> Device(config)# <code>end</code>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

### What to do next

You must reboot the controller whenever you enable or disable the FIPS mode.

## Configuring FIPS in HA Setup

While bringing up HA pair in FIPS mode, you need to configure both active and standby controllers with the same FIPS authorization key independently before forming HA pair.

If you configure FIPS authorization key after forming HA pair, the FIPS authorization key configuration will not be synced with the standby. Rebooting HA pair at this state causes reload loop. To avoid this, you need to perform the following:

- Break the HA pair.
- Configure the same FIPS authorization key independently on both the members.
- Pair up members.

To configure FIPS in HA setup, perform the following:

1. Power off both the members of the stack.
2. Power on only member1, and wait for the controller to come up and prompt for login from the console.
3. Login successfully with your valid credentials, and execute the following commands:

```
Show fips status
Show fips authorization-key
Show romvar
Show chassis
```

---

**Note** Keep the configured FIPS authorization key handy.

---

4. Configure the FIPS key, if you have not configured one earlier.

```
conf t
fips authorization-key <32 hex char>
```

5. Save and power off the member1.
6. Power on only member2 and wait for the controller to come up and prompt for login from the console.
7. Login successfully with your valid credentials, and execute the following commands:

```
Show fips status
Show fips authorization-key
Show romvar
Show chassis
```

---

**Note** Keep the configured FIPS authorization key handy.

---

8. Configure the FIPS key, if you have not configured one earlier.

---

**Note** The key value must be the same in both the members of the stack.

---

```
conf t
fips authorization-key <32 hex char>
```

9. Save and power off the member2.
10. Power on both the members together, and wait for the stack to form.
11. Monitor any crash or unexpected reload.

---

**Note** It is expected that members must not reload due to FIPS issue.

---

## Verifying FIPS Configuration

You can verify FIPS configuration using the following commands:

Use the following **show** command to display the installed authorization key:

```
Device# show fips authorization-key
FIPS: Stored key (16) : 12345678901234567890123456789012
```

Use the following **show** command to display the status of FIPS on the device:

```
Device# show fips status
Chassis is running in fips mode
```

## Information about Internet Protocol Security

Internet Protocol Security (IPsec) is a framework of open standards for ensuring secure private communications over the Internet. Based on standards developed by the Internet Engineering Task Force (IETF), IPsec ensures confidentiality, integrity, and authenticity of data communications across a public network. IPsec provides a necessary component of a standards-based, flexible solution for deploying a network-wide security policy.

Cisco Catalyst 9800 Series Wireless Controller supports IPsec configuration. The support for IPsec secures syslog traffic.

This section provides information about how to configure IPsec between Cisco Catalyst 9800 Series Wireless Controller and syslog (peer IP).

IPsec provides the following network security services:

- **Data confidentiality:** The IPsec sender can encrypt packets before transmitting them across a network.
- **Data integrity:** The IPsec receiver can authenticate packets sent by the IPsec sender to ensure that the data has not been altered during transmission.
- **Data origin authentication:** The IPsec receiver can authenticate the source of the sent IPsec packets. This service is dependent upon the data integrity service.
- **Anti-replay:** The IPsec receiver can detect and reject replayed packets.

IPsec provides secure *tunnels* between two peers, such as two devices. The administrator defines which packets are considered sensitive and should be sent through these secure tunnels and specifies the parameters that should be used to protect these sensitive packets by specifying the characteristics of these tunnels. When the IPsec peer recognizes a sensitive packet, the peer sets up the appropriate secure tunnel and sends the packet through the tunnel to the remote peer.

More accurately, these *tunnels* are sets of security associations (SAs) that are established between two IPsec peers. The SAs define the protocols and algorithms to be applied to sensitive packets and specify the keying material to be used by the two peers. SAs are unidirectional and are established per security protocol.

With IPsec, administrators can define the traffic that needs to be protected between two IPsec peers by configuring access lists and applying these access lists to interfaces using crypto map sets. Therefore, traffic may be selected on the basis of the source and destination address, and optionally the Layer 4 protocol and port. (The access lists used for IPsec are only used to determine the traffic that needs to be protected by IPsec, not the traffic that should be blocked or permitted through the interface. Separate access lists define blocking and permitting at the interface.)

A crypto map set can contain multiple entries, each with a different access list. The crypto map entries are searched in a sequence--the device attempts to match the packet to the access list specified in that entry.

When a packet matches a permit entry in a particular access list, and the corresponding crypto map entry is tagged as `cisco`, connections are established, if necessary. If the crypto map entry is tagged as `ipsec-isakmp`, IPsec is triggered. If there is no SA that the IPsec can use to protect this traffic to the peer, IPsec uses IKE to negotiate with the remote peer to set up the necessary IPsec SAs on behalf of the data flow. The negotiation uses information specified in the crypto map entry as well as the data flow information from the specific access list entry.

Once established, the set of SAs (outbound to the peer) is then applied to the triggering packet and to subsequent applicable packets as those packets exit the device. *Applicable* packets are packets that match the same access list criteria that the original packet matched. For example, all applicable packets could be encrypted before being forwarded to the remote peer. The corresponding inbound SAs are used when processing the incoming traffic from that peer.

Access lists associated with IPsec crypto map entries also represent the traffic that the device needs protected by IPsec. Inbound traffic is processed against crypto map entries--if an unprotected packet matches a permit entry in a particular access list associated with an IPsec crypto map entry, that packet is dropped because it was not sent as an IPsec-protected packet.

Crypto map entries also include transform sets. A transform set is an acceptable combination of security protocols, algorithms, and other settings that can be applied to IPsec-protected traffic. During the IPsec SA negotiation, the peers agree to use a particular transform set when protecting a particular data flow.

## Internet Key Exchange Version 1 Transform Sets

An Internet Key Exchange version 1 (IKEv1) transform set represents a certain combination of security protocols and algorithms. During the IPsec SA negotiation, the peers agree to use a particular transform set for protecting a particular data flow.

Privileged administrators can specify multiple transform sets and then specify one or more of these transform sets in a crypto map entry. The transform set defined in the crypto map entry is used in the IPsec SA negotiation to protect the data flows specified by that crypto map entry's access list.

During IPsec security association negotiations with IKE, peers search for a transform set that is the same at both peers. When such a transform set is found, it is selected and applied to the protected traffic as part of both peers' IPsec SAs.

**Note** If a transform set definition is changed during operation that the change is not applied to existing security associations, but is used in subsequent negotiations to establish new SAs. If you want the new settings to take effect sooner, you can clear all or part of the SA database by using the **clear crypto sa** command.

The following snippet helps to configure IPsec IKEv1 to use AES-CBC-128 for payload encryption. AES-CBC-256 can be selected with *encryption aes 256*:

```
device # conf t
device (config)#crypto isakmp policy 1
device (config-isakmp)# hash sha
device (config-isakmp)# encryption aes
```

## Configure IPsec Using Internet Key Exchange Version 1

Follow the procedure given below to configure IPsec IKEv1 to use AES-CBC-128 for payload encryption:

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>crypto isakmp policy <i>priority</i></b> <b>Example:</b> Device(config)# crypto isakmp policy 1	Defines an Internet Key Exchange (IKE) policy and assigns a priority to the policy. <ul style="list-style-type: none"> <li>• <i>priority</i>: Uniquely identifies the IKE policy and assigns a priority to the policy. Valid values: 1 to 10,000; 1 is the highest priority.</li> </ul>
<b>Step 3</b>	<b>hash sha</b> <b>Example:</b> Device(config-isakmp)# hash sha	Specifies the hash algorithm.
<b>Step 4</b>	<b>encryption aes</b> <b>Example:</b> Device(config-isakmp)# encryption aes	Configures IPsec IKEv1 to use AES-CBC-128 for payload encryption. AES-CBC-256 can be selected with 'encryption aes 256'.

	Command or Action	Purpose
		<p><b>Note</b> The authorized administrator must ensure that the keysize for this setting is greater than or equal to the keysize selected for ESP in section <a href="#">IPsec Transforms and Lifetimes</a>. If AES 128 is selected here, then the highest keysize that can be selected on the device for ESP is AES 128 (either CBC or GCM).</p> <p>Both confidentiality and integrity are configured with the <b>hash sha</b> and <b>encryption aes</b> commands respectively. As a result, confidentiality-only mode is disabled.</p>
<b>Step 5</b>	<p><b>authentication pre-share</b></p> <p><b>Example:</b></p> <pre>Device(config-isakmp)# authentication pre-share</pre>	Configures IPsec to use the specified preshared keys as the authentication method. Preshared keys require that you separately configure these preshared keys.
<b>Step 6</b>	<p><b>exit</b></p> <p><b>Example:</b></p> <pre>Device(config-isakmp)# exit</pre>	Exits config-isakmp configuration mode.
<b>Step 7</b>	<p><b>crypto isakmp key <i>keystring</i> address <i>peer-address</i></b></p> <p><b>Example:</b></p> <pre>Device(config)# crypto isakmp key cisco123!cisco123!CISC address 192.0.2.1</pre>	<p>Configures a preshared authentication key.</p> <p><b>Note</b> To ensure a secure configuration, we recommend that you enter the pre-shared keys with at least 22 characters in length and can be composed of any combination of upper and lower case letters, numbers, and special characters (that include: “!”, “@”, “#”, “\$”, “%”, “^”, “&amp;”, “*”, “(”, and “”).</p> <p>The device supports pre-shared keys up to 127 characters in length. While longer keys increase the difficulty of brute-force attacks, longer keys increase processing time.</p>
<b>Step 8</b>	<p><b>group 14</b></p> <p><b>Example:</b></p> <pre>Device(config-isakmp)# group 14</pre>	Specifies the Diffie-Hellman (DH) group identifier as 2048-bit DH group 14 and selects DH Group 14 (2048-bit MODP) for IKE. However, 19 (256-bit Random ECP), 24 (2048-bit MODP with 256-bit POS), 20 (384-bit Random ECP), 15 (3072 bit MODP),

	Command or Action	Purpose
		and 16 (4096-bit MODP) are also allowed and supported.
<b>Step 9</b>	<b>lifetime seconds</b> <b>Example:</b> Device(config-isakmp)# lifetime 86400	Specifies the lifetime of the IKE SA. The default time value for Phase 1 SAs is 24 hours (86400 seconds), but this setting can be changed using the command above with different values. <ul style="list-style-type: none"> <li>• <i>seconds</i>: Time, in seconds, before each SA expires. Valid values: 60 to 86,400; default value: 86,400.</li> </ul> <p><b>Note</b> The shorter the lifetime (up to a point), the more secure your IKE negotiations will be. However, with longer lifetimes, future IPsec SAs can be set up more quickly.</p>
<b>Step 10</b>	<b>crypto isakmp aggressive-mode disable</b> <b>Example:</b> Device(config-isakmp)# crypto isakmp aggressive-mode disable	Ensures all IKEv1 Phase 1 exchanges will be handled in the default main mode.
<b>Step 11</b>	<b>exit</b> <b>Example:</b> Device(config-isakmp)# exit	Exits config-isakmp configuration mode.

## Internet Key Exchange Version 2 Transform Sets

An Internet Key Exchange Version 2 (IKEv2) proposal is a set of transforms used in the negotiation of IKEv2 SA as part of the IKE\_SA\_INIT exchange. An IKEv2 proposal is regarded as complete only when it has at least an encryption algorithm, an integrity algorithm, and a Diffie-Hellman (DH) group configured. If no proposal is configured and attached to an IKEv2 policy, then the default proposal is used in the negotiation. The following snippet helps in configuring the IPsec with IKEv2 functionality for the device:

```
device # conf t
device(config)#crypto ikev2 proposal sample
device(config-ikev2-proposal)# integrity sha1
device (config-ikev2-proposal)# encryption aes-cbc-128
device(config-ikev2-proposal)# group 14
device(config-ikev2-proposal)# exit
device(config)# crypto ikev2 keyring keyring-1
device (config-ikev2-keyring)# peer peer1
device (config-ikev2-keyring-peer)# address 192.0.2.4 255.255.255.0
device (config-ikev2-keyring-peer)# pre-shared-key cisco123!cisco123!CISC
device (config-ikev2-keyring-peer)# exit
device(config)#crypto ikev2 keyring keyring-1
```

```

device (config-ikev2-keyring)# peer peer1
device (config-ikev2-keyring-peer)# address 192.0.2.4 255.255.255.0
device (config-ikev2-keyring-peer)# pre-shared-key cisco123!cisco123!CISC
device (config-ikev2-keyring-peer)# exit
device (config)#crypto logging ikev2

```

## Configure IPsec Using Internet Key Exchange Version 2

Follow the procedure given below to configure the IPsec with IKEv2:

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>crypto ikev2 proposal <i>name</i></b> <b>Example:</b> Device (config)# crypto ikev2 proposal name	Defines an IKEv2 proposal name.
<b>Step 3</b>	<b>integrity sha1</b> <b>Example:</b> Device (config-ikev2-proposal)# integrity sha1	Defines an IKEv2 proposal name.
<b>Step 4</b>	<b>encryption aes-cbc-128</b> <b>Example:</b> Device (config-ikev2-proposal)# encryption aes-cbc-128	<p>Configures IPsec IKEv2 to use AES-CBC-128 for payload encryption. AES-CBC-256 can be selected with encryption aes-cbc-256. AES-GCM-128 and AES-GCM-256 can also be selected similarly.</p> <p><b>Note</b> The authorized administrator must ensure that the keysize for this setting is greater than or equal to the keysize selected for ESP in section <a href="#">IPsec Transforms and Lifetimes</a>. If AES 128 is selected here, then the highest keysize that can be selected on the device for ESP is AES 128 (either CBC or GCM).</p> <p>Both confidentiality and integrity are configured with the <b>hash sha</b> and <b>encryption aes</b> commands respectively. As a result, confidentiality-only mode is disabled.</p>

	Command or Action	Purpose
<b>Step 5</b>	<b>group 14</b> <b>Example:</b> Device(config-ikev2-proposal)# group 14	Selects DH Group 14 (2048-bit MODP) for IKE. However, 19 (256-bit Random ECP), 24 (2048-bit MODP with 256-bit POS), 20 (384-bit Random ECP), 15 (3072 bit MODP), and 16 (4096-bit MODP) are also allowed and supported.
<b>Step 6</b>	<b>exit</b> <b>Example:</b> Device(config-ikev2-proposal)# exit	Exits IKEv2 proposal configuration mode.
<b>Step 7</b>	<b>crypto ikev2 keyring <i>keyring-name</i></b> <b>Example:</b> Device(config)# crypto ikev2 keyring keyring-1	Defines an IKEv2 keyring.
<b>Step 8</b>	<b>peer <i>peer-name</i></b> <b>Example:</b> Device(config-ikev2-keyring)# peer peer1	Defines the peer or peer group.
<b>Step 9</b>	<b>address {<i>ipv4-address</i> [<i>mask</i>]   <i>ipv6-address</i> <i>prefix</i>}</b> <b>Example:</b> Device(config-ikev2-keyring)# address 192.0.2.4 255.255.255.0	Specifies an IPv4 or IPv6 address or range for the peer.  <b>Note</b> This IP address is the IKE endpoint address and is independent of the identity address.
<b>Step 10</b>	<b>pre-shared-key <i>local</i></b> <b>Example:</b> Device(config-ikev2-keyring)# pre-shared-key cisco123!cisco123!CISC	Specifies the preshared key for the peer. You can enter the local or remote keyword to specify an asymmetric preshared key. By default, the preshared key is symmetric.

	Command or Action	Purpose
		<p><b>Note</b> To ensure a secure configuration, we recommend that you enter the pre-shared keys with at least 22 characters in length and can be composed of any combination of upper and lower case letters, numbers, and special characters (that include: “!”, “@”, “#”, “\$”, “%”, “^”, “&amp;”, “*”, “(”, and “)”).</p> <p>The device supports pre-shared keys up to 127 characters in length. While longer keys increase the difficulty of brute-force attacks, longer keys increase processing time.</p> <p>HEX keys generated off system can also be input for IKEv2 using the following instead of the pre-shared-key command above: <i>pre-shared-key hex [hex key]</i>. For example: <i>pre-shared-key hex 0x6A6B6C</i>. This configures IPsec to use pre-shared keys.</p>
<b>Step 11</b>	<b>exit</b> <b>Example:</b> <pre>Device(config-ikev2-keyring)# exit</pre>	Exits IKEv2 keyring peer configuration mode.
<b>Step 12</b>	<b>crypto logging ikev2</b> <b>Example:</b> <pre>Device(config)# crypto logging ikev2</pre>	<p>Enables IKEv2 syslog messages.</p> <p><b>Note</b> The configuration above is not a complete IKE v2 configuration, and that additional settings will be needed.</p>

## IPsec Transforms and Lifetimes

Regardless of the IKE version selected, the device must be configured with the proper transform for IPsec ESP encryption and integrity as well as IPsec lifetimes.

```
device (config)# crypto ipsec transform-set example esp-aes 128 esp-sha-hmac
```

Note that this configures IPsec ESP to use HMAC-SHA-1 and AES-CBC-128. To change this to the other allowed algorithms the following options can replace **esp-aes 128** in the command above:

Encryption Algorithm	Command
AES-CBC-256	<b>esp-aes 256</b>
AES-GCM-128	<b>esp-gcm 128</b>

Encryption Algorithm	Command
AES-GCM-256	esp-gcm 256

**Note** The size of the key selected here must be less than or equal to the key size selected for the IKE encryption setting. If AES-CBC-128 was selected there for use with IKE encryption, then only AES-CBC-128 or AES-GCM-128 may be selected here.

```
device(config-crypto)# mode tunnel
```

This configures tunnel mode for IPsec. Tunnel is the default, but by explicitly specifying tunnel mode, the device will request tunnel mode and will accept only tunnel mode.

```
device(config-crypto)# mode transport
```

This configures transport mode for IPsec.

```
device(config)# crypto ipsec security-association lifetime seconds 28800
```

The default time value for Phase 2 SAs is 1 hour. There is no configuration required for this setting since the default is acceptable. However to change the setting to 8 hours as claimed in the Security Target the crypto ipsec security-association lifetime command can be used as specified above.

```
device(config)# crypto ipsec security-association lifetime kilobytes 100000
```

This configures a lifetime of 100 MB of traffic for Phase 2 SAs. The default amount for this setting is 2560KB, which is the minimum configurable value for this command. The maximum configurable value for this command is 4GB.

## Use of X.509 With Internet Key Exchange Version

Cisco Catalyst 9800 Series Wireless Controller supports RSA and ECDSA based certificates.

Once X.509v3 keys are installed on the device, they can be set for use with IKEv1 with the commands:

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>crypto isakmp <i>policy-name</i></b> <b>Example:</b> Device(config)#crypto isakmp policy 1	Defines an Internet Key Exchange (IKE) policy and assigns a priority to the policy.
<b>Step 3</b>	<b>authentication [remote   local] rsa-sig</b> <b>Example:</b>	Uses RSA based certificates for IKEv1 authentication.

	Command or Action	Purpose
	Device (config-isakmp) #authentication rsa-sig	
<b>Step 4</b>	<b>authentication [remote   local] ecdsa-sig</b>  <b>Example:</b> Device (config-isakmp) #authentication ecdsa-sig	Uses ecdsa based certificates for IKEv1 authentication.

## For IKEv2 Commands

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>crypto ikev2 profile sample</b>  <b>Example:</b> Device (config) # crypto ikev2 profile sample	Defines an Internet Key Exchange (IKE) policy and assigns a profile.
<b>Step 3</b>	<b>authentication [remote   local] rsa-sig</b>  <b>Example:</b> Device (config-ikev2-profile) # authentication rsa-sig	Uses RSA based certificates for IKEv1 authentication.
<b>Step 4</b>	<b>authentication [remote   local] ecdsa-sig</b>  <b>Example:</b> Device (config-ikev2-profile) # authentication ecdsa-sig	Uses ecdsa based certificates for IKEv1 authentication.  Authentication fails if an invalid certificate is loaded.

## IPsec Session Interruption and Recovery

If an IPsec session with a peer is unexpectedly interrupted, the connection will be broken. In this scenario, no administrative interaction is required. The IPsec session will be reestablished (a new SA set up) once the peer is back online.

## Example: Configure IPsec Using ISAKMP

The following sample outputs display the IPsec **isakmp** configuration:

```
crypto isakmp policy 1
 encr aes 256
 hash sha256
```

```

authentication pre-share
group 14
lifetime 28800

crypto isakmp key 0 Cisco!123 address 192.0.2.4
crypto isakmp peer address 192.0.2.4

crypto ipsec transform-set aes-gcm-256 esp-gcm 256
mode tunnel

crypto map IPSEC_ewlc_to_syslog 1 ipsec-isakmp
set peer 192.0.2.4
set transform-set aes-gcm-256
match address acl_ewlc_to_syslog

interface Vlan15
crypto map IPSEC_ewlc_to_syslog
end

```

## Verifying IPSec Traffic

The following example shows how to verify the IPSec traffic configuration in isakmp configuration:

```

Device# show crypto map
Crypto Map IPv4 "IPSEC_ewlc_to_syslog" 1 ipsec-isakmp
 Peer = 192.0.2.4
 Extended IP access list acl_ewlc_to_syslog
 access-list acl_ewlc_to_syslog permit ip host 192.0.2.2 host 192.0.2.4
 Current peer: 192.0.2.4
 Security association lifetime: 4608000 kilobytes/3600 seconds
 Responder-Only (Y/N): N
 PFS (Y/N): N
 Mixed-mode : Disabled
 Transform sets={
 aes-gcm-256: { esp-gcm 256 } ,
 }
 Interfaces using crypto map IPSEC_ewlc_to_syslog:

## CHAPTER 134

# Transport Layer Security Tunnel Support

- [Information About Transport Layer Security Tunnel Support, on page 1487](#)
- [Configuring a Transport Layer Security Tunnel, on page 1488](#)
- [Verifying a Transport Layer Security Tunnel, on page 1489](#)

## Information About Transport Layer Security Tunnel Support

The Cisco Catalyst 9800 Series Wireless Controller requires direct access to a public cloud to implement the teleworker solution using Cisco OfficeExtend Access Points (OEAPs). With the introduction of Transport Layer Security (TLS) tunnel support from Cisco IOS XE Amsterdam 17.3.2 onwards, the controller can now reach a public cloud automatically. This helps Cisco Catalyst Center on Cloud to establish TLS communication channels with the controller to perform monitor and manage of wireless solutions.

The TLS connection ensures that the configuration and telemetry are reliably and securely communicated between the controller and the Digital Network Architecture (DNA) on Cloud. The TLS tunnel encrypts all the data that is sent over the TCP connection. The TLS tunnel provides a more secure protocol across the internet. After the controller discovery, the Cisco Catalyst Center on Cloud uses Cisco DNA Assurance and Automation features to manage the controller centrally.

### Cisco Plug and Play

The Cisco Plug and Play solution is a converged solution that provides a highly secure, scalable, seamless, and unified zero-touch deployment experience.

### Plug-n-Play Agent

The Cisco Plug and Play (PnP) agent is an embedded software component that is present in all the Cisco network devices that support simplified deployment architecture. The PnP agent understands and interacts only with a PnP server. The PnP agent, using DHCP, DNS, or other such methods, tries to acquire the IP address of the PnP server with which it wants to communicate. After a server is found and a connection is established, the agent communicates with the PnP server to perform deployment-related activities.

For more information on Cisco Plug and Play, see the [Cisco Plug and Play Feature Guide](#).

The Transport Layer Security Tunnel (TLS) over PnP feature is supported on the following controllers:

- Cisco Catalyst 9800-80 Wireless Controller
- Cisco Catalyst 9800-40 Wireless Controller
- Cisco Catalyst 9800-L Wireless Controller

# Configuring a Transport Layer Security Tunnel

## Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>crypto tls-tunnel <i>TLS-tunnel-name</i></b>  <b>Example:</b> Device(config)# crypto tls-tunnel cloud-primary	Configures a crypto TLS tunnel channel.
<b>Step 3</b>	<b>server {ipv4 &lt;A.B.C.D&gt; / ipv6 &lt;X.X.X.X::X&gt; / url &lt;url-name&gt;} port 443 &lt;1025-65535&gt;</b>  <b>Example:</b> Device(config-crypto-tls-tunnel)# server ipv4 172.31.255.255 port 4043	Specifies the server IPv4 address, IPv6 address, or URL name and the port number.
<b>Step 4</b>	<b>overlay interface <i>interface-name</i> <i>interface-num</i></b>  <b>Example:</b> Device(config-crypto-tls-tunnel)# overlay interface Loopback0	Specifies the overlay interface and interface number.  An overlay interface is a logical, multiaccess, multicast-capable interface. An overlay interface encapsulates Layer 2 frames in IP unicast or multicast headers.
<b>Step 5</b>	<b>local interface <i>interface-name</i> <i>interface-num</i> priority rank</b>  <b>Example:</b> Device(config-crypto-tls-tunnel)# local-interface vlan 1 priority 1	Specifies the LAN interface type, number, and the priority rank.  <b>Note</b> Currently, the tunnel supports only one WAN interface with priority 1 and does not support the list of WAN interfaces with multiple priorities.
<b>Step 6</b>	<b>psk id <i>identity</i> key options</b>  <b>Example:</b> Device(config-crypto-tls-tunnel)# psk id test key	Specifies a preshared key and password options.
<b>Step 7</b>	<b>pki trustpoint trustpoint trustpoint-label [sign   verify]</b>  <b>Example:</b> Device(config-crypto-tls-tunnel)# pki trustpoint tsp1 sign	Specifies the trustpoints for use with the RSA signature authentication method as follows: <ul style="list-style-type: none"> <li>• <b>sign:</b> Use the certificate from the trustpoint which is sent to the peer.</li> </ul>

	Command or Action	Purpose
		<ul style="list-style-type: none"> <li>• <b>verify</b>: Use the certificate from the trustpoint to verify the certificate received from the peer.</li> </ul> <p><b>Note</b></p> <ul style="list-style-type: none"> <li>• If the <b>sign</b> or <b>verify</b> keyword is not specified, the trustpoint is used for signing and verification.</li> <li>• In TLS Tunnel block, authentication can be done using either pre-shared key (PSK) or PKI (certificate based).</li> </ul>
<b>Step 8</b>	(Optional) <b>cc-mode</b> <b>Example:</b> Device(config-crypto-tls-tunnel)# cc-mode	Indicates a common criteria mode, which is a Federal Information Processing Standards (FIPS) mode.
<b>Step 9</b>	<b>no shutdown</b> <b>Example:</b> Device(config-crypto-tls-tunnel)# no shutdown	Enables the TLS tunnel.
<b>Step 10</b>	<b>end</b> <b>Example:</b> Device(config-crypto-tls-tunnel)# end	Returns to privileged EXEC mode.

## Verifying a Transport Layer Security Tunnel

The TLS client support includes BinOS processes using Linux Tun/Tap Interface. To verify the TLS client summary details, use the following command:

```
Device# show platform software tlsc client summary
TLS Client - Config Summary
```

Name	ID	Gateway	Port	Auth	Trustpoint	DPD Time	Rekey Time	Retry Time
fqdn	0		8443	PSK	N/A	60	300	20

To verify the TLS client session detail, session statistics, tunnel statistics, and DNS counters, use the following command:

```
Device# show platform software client detail <tls-name>
```

```
Session Name : fqdn
FQDN resolved IP : 10.255.255.255
ID : 0
Created : 04/20/21 00:36:42
Updated : 04/22/21 05:56:03
```

```

State : Up (Rekey)
Up Time : 04/21/21 20:30:21 (9 hours 25 minutes 45 seconds)
Down Time : 04/21/21 20:30:01
Rekey Time : 04/22/21 05:55:51 (15 seconds)

```

```

TLS Session Statistics

## Feature History for RFC 5580 Location Attributes

This table provides release and related information for the feature explained in this module.

This feature is also available in all the releases subsequent to the one in which they are introduced in, unless noted otherwise.

Table 105: Feature History for RFC 5580 Location Attributes

Release	Feature	Feature Information
Cisco IOS XE Cupertino 17.9.1	Support for RFC 5580 Location Attributes in the Controller	<p>This feature uses the RFC 5580 location attributes to convey location-related information for authentication and accounting exchanges.</p> <p>The controller supports the following RFC 5580-related attributes:</p> <ul style="list-style-type: none"> <li>• Location-Information</li> <li>• Location-Data CIVIC Profile: Country</li> <li>• Location-Data CIVIC Profile: CAtype 1 (State)</li> <li>• Location-Data CIVIC Profile: CAtype 3 (City)</li> <li>• Location-Data CIVIC Profile: CAtype 23 (Venue Name)</li> <li>• Location-Data CIVIC Profile: CAtype 24 (Zip Code)</li> <li>• Location-Data GEO Profile (Longitude, Latitude, and Altitude)</li> <li>• Operator Name</li> </ul>

## Information About RFC 5580 Location Attributes

The RFC 5580 location attributes convey location-related information for authentication and accounting exchanges.

The location information is useful in several scenarios. Wireless networks are deployed in public places, such as shopping malls, airports, hotels, and coffee shops by a diverse set of operators, such as wireless internet service providers (WISPs), cellular network operators, and fixed broadband networks. In all these scenarios, the network may need to know the user location to enable location-aware authorization, billing, or services.

To preserve user privacy, the location information must be protected against unauthorized access and distribution.

The RFC 5580 defines two types of location:

- **User location:** This location is more specific to users.

---

**Note** The user location is configured in AP.

---

- **NAS location:** This is the common location to host all the users. For instance, suppose you configure user location at AP1, other users connecting to AP1 will also have the same user location. Now other users coming from AP2 will have a different user location. Thus, if AP1 and AP2 are connected to the controller, and you configure a NAS location, then users from AP1 and AP2 are connected to the same NAS location.

---

**Note** The NAS location is configured in AAA.

---

You can define certain profiles in each location. Profile refers to the attributes used to define the location. Each location has two profiles, namely, Civic and Geo.

The following are the location profiles:

- **Civic Profile:** In this profile, the location is described in terms of attributes such as Country, State, City, Area, and Postal Code.
- **Geo Profile:** In this profile, the location is described in terms of attributes such as Latitude, Longitude, and Altitude.

For users with both user location and NAS location, you can set their location in both Civic and Geo profile formats. Such users have the following locations:

- Civic User location
- Civic NAS location
- Geo User location
- Geo NAS location

Each location information, for instance, the civic user location, is sent using the following attributes:

- Location-Information
- Location-Data

The controller supports the following RFC 5580-related attributes:

- Location-Information
- Location-Data CIVIC Profile: Country
- Location-Data CIVIC Profile: CAtype 1 (State)
- Location-Data CIVIC Profile: CAtype 3 (City)
- Location-Data CIVIC Profile: CAtype 23 (Venue Name)
- Location-Data CIVIC Profile: CAtype 24 (Zip Code)
- Location-Data GEO Profile (Longitude, Latitude, and Altitude)
- Operator Name

Thus, a user can have four locations and one operator name.

To transfer location information, the Out-of-Band Agreement (Flow 1) delivery method mentioned in RFC 5580 is supported.

This is applicable only if the feature is enabled and location information is configured.

## Information About Location-Capable Attribute

Cisco IOS-XE Dublin 17.11.1 supports the Location-Capable feature attribute from RFC 5580. This attribute is sent only in the network access requests. To enable the Location-Capable attribute, configure the **radius-server attribute wireless location delivery out-of-band include-location-capable** command. This attribute informs the RADIUS server that this device can send location information.

The RFC5580 supports three flows or modes of location delivery. As per the RFC, the Location-Capable attribute should be sent in Flow-2, which is location delivery based on Initial-Request. The above-mentioned configuration enables sending this attribute in Flow-1, which is Location delivery based on Out-of-Band agreement as well.

When an authentication or authorization request is received, the Location-Capable feature attribute is added to the request along with other location attributes as per the configuration (explained in the other section). This is applicable only for wireless clients. The RADIUS server might use this information to provide network access.

## Restriction for Configuring RFC 5580 Location Attributes

This feature is supported only for 802.1X users.

## Configuring Location Delivery Based on Out-of-Band Agreement (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>radius-server attribute wireless location delivery out-of-band</b>  <b>Example:</b> Device(config)# radius-server attribute wireless location delivery out-of-band	Configures RFC 5580 Out-of-Band location support.
<b>Step 3</b>	<b>end</b>  <b>Example:</b> Device(config)# end	Returns to privileged EXEC mode.

## Configuring Location-Capable Attribute (CLI)

Use the **radius-server attribute wireless location delivery out-of-band** command to enable the feature globally.

You can use the **radius-server attribute wireless location delivery out-of-band include-location-capable** command to include the location-capable attribute along with other location attributes.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>radius-server attribute wireless location delivery out-of-band include-location-capable</b>  <b>Example:</b> Device(config)# <code>radius-server attribute wireless location delivery out-of-band include-location-capable</code>	Configures RFC 5580 out-of-band location attributes along with enabling the location-capable attribute to be part of the access request.
<b>Step 3</b>	<b>end</b>  <b>Example:</b> Device(config)# <code>end</code>	Returns to privileged EXEC mode.

## Creating Location Attributes

### Configuring a Civic Profile (CLI)

#### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>location civic-location identifier</b> <i>civic_identifier</i>  <b>Example:</b> Device(config)# <code>location civic-location identifier USER_C_1</code>	Configures the civic profile for User location.  Here, <i>civic_identifier</i> refers to the civic location identifier string. It can take up to 215 characters. You can enter a total of 250 bytes to configure civic address attributes. Cisco reserves 50 bytes for internal information. Therefore, the

	Command or Action	Purpose
		<p>remaining 200 bytes can be used for user-configured civic location.</p> <p><b>Note</b> You can configure the following types of civic attributes and add them to the RADIUS requests:</p> <ul style="list-style-type: none"> <li>• Country</li> <li>• City</li> <li>• State</li> <li>• Postal Code</li> <li>• Name</li> </ul>
<b>Step 3</b>	<p><b>country</b> <i>country_ID</i></p> <p><b>Example:</b> Device(config-civic)# country IN</p>	<p>Sets the country ID.</p> <p><b>Note</b> Only two-letter ISO 3166 country codes are accepted.</p>
<b>Step 4</b>	<p><b>city</b> <i>city_name</i></p> <p><b>Example:</b> Device(config-civic)# city Bangalore</p>	Sets the city name.
<b>Step 5</b>	<p><b>state</b> <i>state_name</i></p> <p><b>Example:</b> Device(config-civic)# state Karnataka</p>	Sets the state name.
<b>Step 6</b>	<p><b>postal-code</b> <i>postal_code</i></p> <p><b>Example:</b> Device(config-civic)# postal-code 562016</p>	Sets the postal code.
<b>Step 7</b>	<p><b>name</b> <i>residence_name</i></p> <p><b>Example:</b> Device(config-civic)# name Nivas</p>	Sets the residence name.
<b>Step 8</b>	<p><b>end</b></p> <p><b>Example:</b> Device(config-civic)# end</p>	Returns to privileged EXEC mode.

## Configuring a Geo Profile (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>location geo-location identifier <i>geo_identifier</i></b> <b>Example:</b> Device(config)# location geo-location identifier USER_G_1	Configures a Geo profile for user location.  Here, <i>geo_identifier</i> refers to the geographic location identifier string. It can take up to 215 characters.
<b>Step 3</b>	<b>latitude <i>latitude_in_degrees</i> resolution [<i>resolution_value</i>]</b> <b>Example:</b> Device(config-geo)# latitude "34 12 15"	Sets the latitude information. The optional parameters are documented within square brackets.  While configuring the latitude, you can specify the resolution, in meters. If you do not specify any resolution, a default value of 10 meters is used.
<b>Step 4</b>	<b>longitude <i>longitude_in_degrees</i> resolution <i>resolution_value</i></b> <b>Example:</b> Device(config-geo)# longitude "111 59 44"	Sets the longitude information. The optional parameters are documented within square brackets.  While configuring the longitude, you can specify the resolution, in meters. If you do not specify any resolution, a default value of 10 meters is used.
<b>Step 5</b>	<b>altitude <i>altitude_value</i> {feet resolution <i>resolution_value</i>   floor   meters resolution <i>resolution_value</i>}</b> <b>Example:</b> Device(config-geo)# altitude 10 meters resolution 10	Configures the altitude for the geographic location. The optional parameters are documented within square brackets.  <ul style="list-style-type: none"> <li>• <i>altitude_value</i>: Refers to the altitude, in feet, floors, or meters.</li> <li>• <i>resolution_value</i>: Refers to the resolution, in feet or meters.</li> </ul> <p><b>Note</b> Both the altitude and the altitude resolution must be in the same unit.</p>
<b>Step 6</b>	<b>resolution <i>resolution_value</i></b> <b>Example:</b> Device(config-geo)# resolution 30	Specifies a single common resolution for latitude and longitude.

	Command or Action	Purpose
<b>Step 7</b>	<b>end</b>  <b>Example:</b> Device(config-geo) # end	Returns to privileged EXEC mode.

## Configuring an Operator Name (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>location operator identifier <i>identifier_name</i></b>  <b>Example:</b> Device(config)# location operator identifier USER_O_1	Configures an operator name for the user location.  Here, <i>identifier_name</i> supports strings up to 215 characters in length.
<b>Step 3</b>	<b>name <i>operator-name</i></b>  <b>Example:</b> Device(config-operator) # name ACT	Configures the location operator name.  Here, <i>operator-name</i> supports strings up to 248 characters in length.
<b>Step 4</b>	<b>namespace-id {E212   ICC   REALM   TADIG}</b>  <b>Example:</b> Device(config-operator) # namespace-id ICC	Configures the namespace for a location.  The following are the namespace options: <ul style="list-style-type: none"> <li>• <b>E212:</b> Refers to the Mobile Country Code (MCC) and Mobile Network Code (MNC).</li> <li>• <b>ICC:</b> Refers to the International Telecommunication Union Carrier Codes (ICC).</li> <li>• <b>REALM:</b> Refers to any registered domain name.</li> <li>• <b>TADIG:</b> Refers to the Transferred Account Data Interchange Group (TADIG) code.</li> </ul>

	Command or Action	Purpose
		<p><b>Note</b></p> <ul style="list-style-type: none"> <li>• If you have not configured any namespace, <b>REALM</b> is used as the default value.</li> <li>• The operator name can be associated with both NAS-Location and USER-Location. When an operator name is configured at both the locations, the operator name that is configured in USER-Location takes precedence.</li> </ul>
<b>Step 5</b>	<p><b>end</b></p> <p><b>Example:</b></p> <pre>Device(config-operator)# end</pre>	Returns to privileged EXEC mode.

## Associating Location Attributes with User Location (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<p><b>configure terminal</b></p> <p><b>Example:</b></p> <pre>Device# configure terminal</pre>	Enters global configuration mode.
<b>Step 2</b>	<p><b>ap location name</b> <i>location_name</i></p> <p><b>Example:</b></p> <pre>Device(config)# ap location name OFFICE</pre>	Configures a location name for an AP.
<b>Step 3</b>	<p><b>ap-eth-mac</b> <i>AP_Ethernet_MAC</i></p> <p><b>Example:</b></p> <pre>Device(config-ap-location)# ap-eth-mac 0a0b.0cf0.0001</pre>	<p>Adds the AP to the location.</p> <p>Here, <i>AP_Ethernet_MAC</i> refers to the AP Ethernet MAC address.</p>
<b>Step 4</b>	<p><b>location civic-location-id</b> <i>identifier_name</i></p> <p><b>Example:</b></p> <pre>Device(config-ap-location)# location civic-location-id USER_C_1</pre>	Associates the civic location attribute with the user location.
<b>Step 5</b>	<p><b>location geo-location-id</b> <i>identifier_name</i></p> <p><b>Example:</b></p> <pre>Device(config-ap-location)# location geo-location-id USER_G_1</pre>	Associates the geographic location attribute with the user location.

	Command or Action	Purpose
<b>Step 6</b>	<b>location operator-id</b> <i>identifier_name</i> <b>Example:</b> Device(config-ap-location)# location operator-id USER_O_1	Associates the operator location attribute with the user location.
<b>Step 7</b>	<b>end</b> <b>Example:</b> Device(config-ap-location)# end	Returns to privileged EXEC mode.

## Associating Location Attributes with the NAS Location (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>radius-server attribute wireless location civic-location-id</b> <i>identifier_name</i> <b>Example:</b> Device(config)# radius-server attribute wireless location civic-location-id NAS_C_1	Associates the civic location attribute with the NAS location.  Here, <i>identifier_name</i> supports strings up to 215 characters in length.
<b>Step 3</b>	<b>radius-server attribute wireless location geo-location-id</b> <i>identifier_name</i> <b>Example:</b> Device(config)# radius-server attribute wireless location geo-location-id NAS_G_1	Associates the geographic location attribute with the NAS location.  Here, <i>identifier_name</i> supports strings up to 215 characters in length. Enter a valid or existing identifier name.
<b>Step 4</b>	<b>radius-server attribute wireless location operator-id</b> <i>identifier_name</i> <b>Example:</b> Device(config)# radius-server attribute wireless location operator-id NAS_O_1	Associates the operator location attribute with the NAS location.
<b>Step 5</b>	<b>end</b> <b>Example:</b> Device(config)# end	Returns to privileged EXEC mode.

## Verifying RFC 5580 Location Attribute Configuration

To verify the location attributes associated with a given location, use the following command:

```
Device# show ap location details AAA_location
Location Name.....: AAA_location
Location description.....:
Policy tag.....: default-policy-tag
Site tag.....: default-site-tag
RF tag.....: default-rf-tag
AAA Location Status: Enabled
Civic Location Identifier : NAS_C_1
Geo Location Identifier : NAS_G_1
Operator Name Identifier : NAS_O_1
```

```
Configured list of APs
38ed.18ca.5a20
```

To verify the Cisco AP location, use the following command:

```
Device# show ap name AP38ED.18CA.5A20 config general
Cisco AP Name : AP38ED.18CA.5A20
```

```
=====
Cisco AP Identifier : 38ed.18cb.cf00
Country Code : Multiple Countries :
Regulatory Domain Allowed by Country : 802.11bg: 802.11a: 802.11 6GHz:
AP Country Code : US -
AP Regulatory Domain
 802.11bg : -A
 802.11a : -A
MAC Address : 38ed.18ca.5a20
IP Address Configuration : Static IP assigned
IP Address : 9.4.172.111
IP Netmask : 255.255.255.0
Gateway IP Address : 9.4.172.1
Fallback IP Address Being Used :
Domain :
Name Server :
CAPWAP Path MTU : 1485
Capwap Active Window Size : 1
Telnet State : Disabled
CPU Type : ARMv7 Processor rev 0 (v7l)
Memory Type : DDR3
Memory Size : 995328 KB
SSH State : Disabled
Cisco AP Location : AAA_location
-
-
-
```

To verify the location attributes associated with a given MAC address, use the following command:

```
Device# show wireless client mac 0080.5222.545c detail
```

```
Client MAC Address : 0080.5222.545c
Client MAC Type : Universally Administered Address
Client DUID: NA
Client IPv4 Address :
AP MAC Address : 38ed.18cb.cf00
AP Name: AP38ED.18CA.5A20
AP slot : 1
Client State : Associated
```

```

Policy Profile : default-policy-profile
Flex Profile : N/A
...
Civic Location Identifier : NAS_C_1
Geo Location Identifier : NAS_G_1
Operator Name Identifier : NAS_O_1

```

---

**Note** You will be able to view this output only if the RFC 5580 feature is enabled.

---

To verify the Civic location details, use the following command:

```

Device# show location civic-location identifier TEST1
Civic location information

Identifier : TEST1
Name : home
City : Morges
State : Vaud
Postal code : 1110
Country : CH

```

To verify the Geo location details, use the following command:

```

Device# show location geo-location identifier TEST4
Geo location information

Identifier : TEST4
Latitude : 46.5112700
Longitude : 6.4985400
Altitude : 380 meters Resolution : 10
Resolution : 100

```

To verify the Operator location details, use the following command:

```

Device# show location operator-location identifier myoperator
Operator location information

Operator Identifier : myoperator
Operator Name : myoperator
Operator Namespace : REALM

```

## CHAPTER 136

# IP MAC Binding

---

- [Information About IP MAC Binding, on page 1505](#)
- [Use Cases for No IP MAC Binding, on page 1505](#)
- [Disabling IP MAC Binding \(CLI\), on page 1506](#)
- [Verifying IP MAC Binding, on page 1506](#)

## Information About IP MAC Binding

The wireless device tracking features, such as, theft detection, proxy, DHCP relay, glean, and suppression are enabled with IP MAC address binding configuration.

---

**Note** The IP MAC address binding is enabled by default in the policy profile.

---

### No IP MAC Binding

It disables all the wireless device tracking features for wireless clients' IPv4 address.

---

**Note** It is not normally necessary to disable IP MAC binding, except for the following scenarios:

- When you have a single wireless station with multiple IP addresses.
  - When you intentionally have duplicate IP addresses across clients.
  - When you are using ARP-spoofing Network Access Control (NAC) devices.
- 

## Use Cases for No IP MAC Binding

The following are the use cases for No IP MAC binding:

- Disabling IP Learning in FlexConnect Mode
- Disabling Device Tracking to Support NAC Devices

- Disabling IP Learning in FlexConnect Mode

## Disabling IP MAC Binding (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wireless profile policy <i>profile-policy-name</i></b> <b>Example:</b> Device(config)# wireless profile policy test-profile-policy	Configures the wireless profile policy.
<b>Step 3</b>	<b>shutdown</b> <b>Example:</b> Device(config-wireless-policy)# shutdown	Disables the wireless policy profile. <b>Note</b> Disabling policy profile results in associated AP and client to rejoin.
<b>Step 4</b>	<b>no ip mac-binding</b> <b>Example:</b> Device(config-wireless-policy)# no ip mac-binding	Disables IP MAC binding.
<b>Step 5</b>	<b>no shutdown</b> <b>Example:</b> Device(config-wireless-policy)# no shutdown	Enables the wireless policy profile.
<b>Step 6</b>	<b>exit</b> <b>Example:</b> Device(config-wireless-policy)# exit	Returns to privileged EXEC mode.

## Verifying IP MAC Binding

To verify if the IP MAC binding is disabled or not, use the following command:

```
Device# show run | b wireless profile policy test-profile-policy
wireless profile policy test-profile-policy
no ip mac-binding
vlan VLAN0169
```

## CHAPTER 137

# Disabling IP Learning in FlexConnect Mode

- [Information About Disabling IP Learning in FlexConnect Mode, on page 1507](#)
- [Restrictions for Disabling IP Learning in FlexConnect Mode, on page 1507](#)
- [Disabling IP Learning in FlexConnect Mode \(CLI\), on page 1508](#)
- [Verifying MAC Entries from Database, on page 1508](#)

## Information About Disabling IP Learning in FlexConnect Mode

In FlexConnect local switching scenarios, where clients from the same sites may share the same address range, there is a possibility of multiple clients being allocated or registered with the same IP address. The controller receives IP address information from the AP, and if more than one client attempts to use the same IP address, the controller discards the last device trying to register an already-used address as an IP theft event, potentially resulting in client exclusion.

The Disabling IP learning in FlexConnect mode feature utilizes the **no ip mac-binding** command to ensure that no device tracking is done for clients, thus preventing the IP theft error.

### Note

- This feature is applicable only for IPv4 addresses.
- Configuring **ip overlap** in FlexConnect Profile assists overlapping IP address support for clients across different sites in FlexConnect local switching.

## Restrictions for Disabling IP Learning in FlexConnect Mode

- The **wireless client ip deauthenticate** command works by referring to the IP table binding entries directly. It does not work for client whose IPs are not learnt.
- Overlapping IP addresses within a single site tag and across different site tags require different settings. Furthermore, if a single site tag contains overlapping IP addresses, L3 web authentication is necessary. However, L3 web authentication relies on IP addresses, and ensuring the uniqueness of IP addresses cannot be guaranteed, making this combination incorrect.
- When IP Source Guard (IPSG) is enabled and multiple binding information is sent with the same IP and preference level (such as DHCP, ARP, and so on) to CPP, the CPP starts to ignore the later bindings

after the first binding creation. Hence, you should not configure IPSG and disable IP MAC binding together. If IPSG and **no ip mac-binding** are configured together then IPSG does not work.

## Disabling IP Learning in FlexConnect Mode (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wireless profile policy <i>profile-policy-name</i></b> <b>Example:</b> Device(config)# wireless profile policy test-profile-policy	Configures the wireless profile policy.
<b>Step 3</b>	<b>shutdown</b> <b>Example:</b> Device(config-wireless-policy)# shutdown	Disables the wireless policy profile. <b>Note</b> Disabling policy profile results in associated AP and client to rejoin.
<b>Step 4</b>	<b>no ip mac-binding</b> <b>Example:</b> Device(config-wireless-policy)# no ip mac-binding	Disables IP learning in FlexConnect mode.
<b>Step 5</b>	<b>no shutdown</b> <b>Example:</b> Device(config-wireless-policy)# no shutdown	Enables the wireless policy profile.
<b>Step 6</b>	<b>exit</b> <b>Example:</b> Device(config-wireless-policy)# exit	Returns to privileged EXEC mode.

## Verifying MAC Entries from Database

To verify the MAC details from database, use the following command:

```
Device# show wireless device-tracking database mac
MAC VLAN IF-HDL IP

6c96.cff2.889a 64 0x90000008 9.9.64.175
```

## CHAPTER 138

# Disabling Device Tracking to Support NAC Devices

- [Feature History for Disabling Device Tracking to Support NAC Devices, on page 1509](#)
- [Information About Disabling Device Tracking to Support NAC Devices, on page 1509](#)
- [Restrictions for Disabling Device Tracking to Support NAC Devices, on page 1510](#)
- [Disabling Device Tracking for Wireless Clients \(CLI\), on page 1510](#)
- [Verifying ARP Broadcast, on page 1511](#)

## Feature History for Disabling Device Tracking to Support NAC Devices

This table provides release and related information for the feature explained in this module.

*Table 106: Feature History for Disabling Device-Tracking to Support NAC Devices*

Release	Feature	Feature Information
Cisco IOS XE Cupertino 17.8.1	Disabling Device Tracking to Support NAC Devices	This feature helps to control the flow of traffic between wireless clients using network access control (NAC) device.

## Information About Disabling Device Tracking to Support NAC Devices

The feature helps to control the flow of traffic between wireless clients using a network access control (NAC) device. The NAC device blocks the direct traffic between wireless clients using ARP spoofing.

Use the **no ip mac-binding** command for ARP spoofing from the NAC and disabling the wireless client device tracking.

**Note** This feature is applicable only for IPv4 addresses.

## Restrictions for Disabling Device Tracking to Support NAC Devices

- The **wireless client ip deauthenticate** command works by referring to the IP table binding entries directly. It does not work for client whose IPs are not learnt.
- Layer 3 web authentication and other L3 policies are not supported.
- When IP Source Guard (IPSG) is enabled and multiple binding information is sent with the same address and preference level (such as DHCP, ARP, and so on) to Cisco Packet Processor (CPP), the CPP starts to ignore the later bindings after the first binding creation. Hence, you should not configure IPSG and **no ip mac-binding** together. If IPSG and **no ip mac-binding** are configured together then IPSG does not work.

## Disabling Device Tracking for Wireless Clients (CLI)

Disable device tracking for wireless clients using commands.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wireless profile policy <i>profile-policy-name</i></b>  <b>Example:</b> Device(config)# wireless profile policy test-profile-policy	Configures the wireless profile policy.
<b>Step 3</b>	<b>shutdown</b>  <b>Example:</b> Device(config-wireless-policy)# shutdown	Disables the wireless policy profile.  <b>Note</b> Disabling policy profile results in associated AP and client to rejoin.
<b>Step 4</b>	<b>no ip mac-binding</b>  <b>Example:</b> Device(config-wireless-policy)# no ip mac-binding	Disables the IP-MAC address binding.

	Command or Action	Purpose
<b>Step 5</b>	<b>no shutdown</b> <b>Example:</b> Device(config-wireless-policy)# no shutdown	Enables the wireless policy profile.
<b>Step 6</b>	<b>exit</b> <b>Example:</b> Device(config-wireless-policy)# exit	Returns to privileged EXEC mode.
<b>Step 7</b>	<b>vlan configuration <i>vlan-id</i></b> <b>Example:</b> Device(config)# vlan configuration 20	Configures a VLAN and enters VLAN configuration mode.
<b>Step 8</b>	<b>arp broadcast</b> <b>Example:</b> Device(config-vlan-config)# arp broadcast	Enables ARP broadcast on VLAN.
<b>Step 9</b>	<b>end</b> <b>Example:</b> Device(config-vlan-config)# end	Returns to privileged EXEC mode.

## Verifying ARP Broadcast

To verify the ARP broadcast, use the following command:

```
Device# show platform software arp broadcast
Arp broadcast is enabled on vlans:
20,50
```

## CHAPTER 139

# Disabling IP Learning in Local Mode

- [Information About Disabling IP Learning in Local Mode, on page 1513](#)
- [Restrictions for Disabling IP Learning in Local Mode, on page 1513](#)
- [Disabling IP Learning in Local Mode \(CLI\), on page 1514](#)
- [Verifying MAC Entries from Database , on page 1515](#)
- [Verifying ARP Broadcast, on page 1515](#)

## Information About Disabling IP Learning in Local Mode

In Local mode central switching scenarios, multiple clients may have an allocated or registered IP address. If the controller detects more than one client attempting to use the same IP address, it will discard one of the clients as an IP Theft event, potentially resulting in client exclusion.

The Disabling IP learning in Local mode feature utilizes the **no ip mac-binding** command to ensure that device tracking is not done for clients, thus preventing the IP Theft error.

To allow downstream broadcast ARP traffic to reach the wireless client in the VLAN, you should enable ARP broadcast and disable IP MAC binding. The controller replicates this traffic packet to all the APs belonging to the controller when Multicast over Multicast (MOM) is disabled.

To avoid this replication, you will need to enable the MOM.

---

**Note** This feature is applicable only for IPv4 addresses.

---

## Restrictions for Disabling IP Learning in Local Mode

- The **wireless client ip deauthenticate** command works by referring to the IP table binding entries directly. It does not work for client whose IPs are not learnt.
- The L3 web authentication and other L3 policies are not supported.
- When IP Source Guard (IPSG) is enabled and multiple binding information is sent with the same IP and preference level (such as DHCP, ARP, and so on) to CPP, the CPP starts to ignore the later bindings after the first binding creation. Hence, you should not configure IPSG and disable IP MAC binding together. If IPSG and **no ip mac-binding** are configured together then IPSG does not work.

## Disabling IP Learning in Local Mode (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wireless profile policy <i>profile-policy-name</i></b> <b>Example:</b> Device(config)# wireless profile policy test-profile-policy	Configures the wireless profile policy.
<b>Step 3</b>	<b>shutdown</b> <b>Example:</b> Device(config-wireless-policy)# shutdown	Disables the wireless policy profile. <b>Note</b> Disabling policy profile results in associated AP and client to rejoin.
<b>Step 4</b>	<b>no ip mac-binding</b> <b>Example:</b> Device(config-wireless-policy)# no ip mac-binding	Disables IP learning in Local mode.
<b>Step 5</b>	<b>no shutdown</b> <b>Example:</b> Device(config-wireless-policy)# no shutdown	Enables the wireless policy profile.
<b>Step 6</b>	<b>exit</b> <b>Example:</b> Device(config-wireless-policy)# exit	Returns to privileged EXEC mode.
<b>Step 7</b>	<b>vlan configuration <i>vlan-id</i></b> <b>Example:</b> Device(config-vlan-config)# vlan configuration 20	Configures a VLAN and enters VLAN configuration mode. <b>Note</b> To allow downstream broadcast ARP traffic to reach the wireless client in the VLAN, you should enable ARP broadcast and disable IP MAC binding.
<b>Step 8</b>	<b>arp broadcast</b> <b>Example:</b> Device(config-vlan-config)# arp broadcast	Enables ARP broadcast on VLAN.

	Command or Action	Purpose
<b>Step 9</b>	<b>end</b> <b>Example:</b> Device(config-vlan-config)# end	Returns to privileged EXEC mode.

## Verifying MAC Entries from Database

To verify the MAC details from database, use the following command:

```
Device# show wireless device-tracking database mac
MAC VLAN IF-HDL IP
```

```

6c96.cff2.889a 64 0x90000008 9.9.64.175
```

## Verifying ARP Broadcast

To verify the ARP broadcast, use the following command:

```
Device# show platform software arp broadcast
Arp broadcast is enabled on vlans:
20,50
```

## Introduction to Mobility

Mobility or roaming is a wireless LAN client's ability to maintain its association seamlessly from one access point to another access point securely and with as little latency as possible. This section explains how mobility works when controllers are included in a wireless network.

When a wireless client associates and authenticates to an access point, the access point's controller places an entry for that client in its client database. This entry includes the client's MAC and IP addresses, security context and associations, quality of service (QoS) contexts, the WLAN, and the associated access point. The controller uses this information to forward frames and manage traffic to and from a wireless client.

**Figure 40: Intracontroller Roaming**

This figure shows a wireless client that roams from one access point to another access point when both access points are joined to the same controller.

When a wireless client moves its association from one access point to another access point, the controller simply updates the client database with the newly associated access point. If necessary, new security context and associations are established as well.

The process becomes more complicated, however, when a client roams from an access point joined to one controller to an access point joined to a different controller. It also varies based on whether the controllers are operating on the same subnet.

**Figure 41: Intercontroller Roaming**

This figure shows intercontroller roaming, which occurs when the wireless LAN interfaces of controllers are on the same IP subnet.

When a client joins an access point associated with a new controller, the new controller exchanges mobility messages with the original controller, and the client database entry is moved to the new controller. New security context and associations are established if necessary, and the client database entry is updated for the new access point. This process remains transparent to the user.

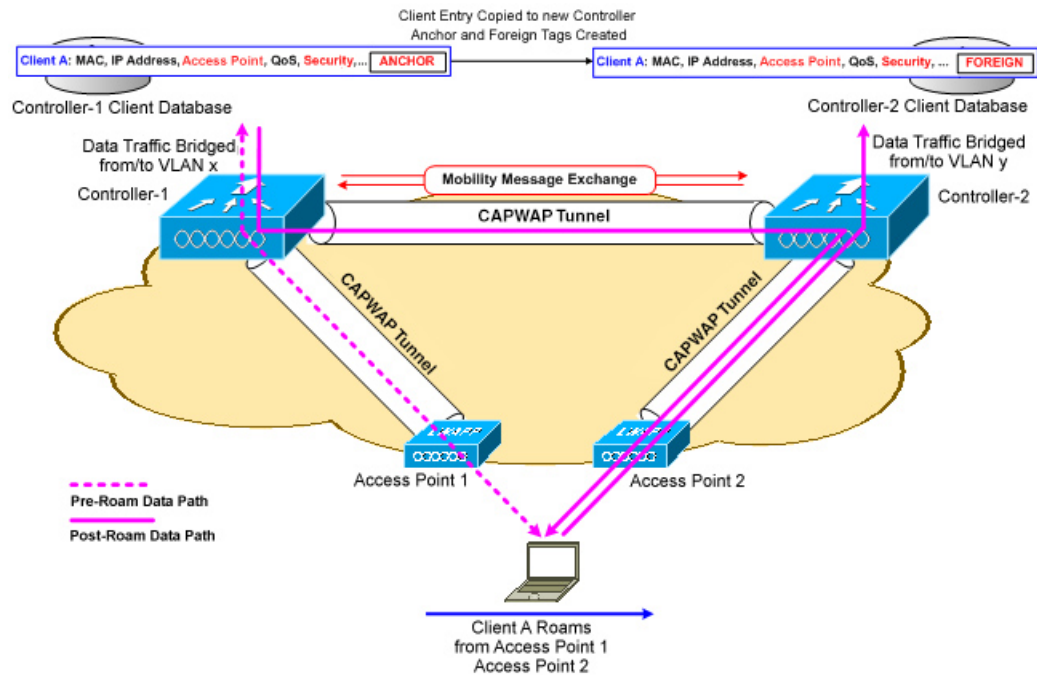

**Note** All clients configured with 802.1X/Wi-Fi Protected Access (WPA) security complete a full authentication in order to comply with the IEEE standard.

**Important** Intersubnet Roaming is not supported for SDA.

**Figure 42: Intersubnet Roaming**

This figure shows intersubnet roaming, which occurs when the wireless LAN interfaces of controllers are on different IP subnets.

Intersubnet roaming is similar to intercontroller roaming in that, controllers exchange mobility messages on the client roam. However, instead of moving the client database entry to the new controller, the original controller marks the client with an *anchor* entry in its own client database. The database entry is copied to the new controller client database and marked with a *foreign* entry in the new controller. The roam remains transparent to the wireless client, and the client maintains its original IP address.

In intersubnet roaming, WLANs on both anchor and foreign controllers should have the same network access privileges, and no source-based routing or source-based firewalls in place. Otherwise, the clients may have network connectivity issues after the handoff.

In a static anchor setup using controllers and a RADIUS server, if AAA override is enabled to dynamically assign VLAN and QoS, the foreign controller updates the anchor controller with the right VLAN after a Layer 2 authentication (802.1x). For Layer 3 RADIUS authentication, the RADIUS requests for authentication are sent by the anchor controller.

**Note** The Cisco Catalyst 9800 Series Wireless Controller mobility tunnel is a CAPWAP tunnel with control path (UDP 16666) and data path (UDP 16667). The control path is DTLS encrypted by default. Data path DTLS can be enabled when you add the mobility peer.

## SDA Roaming

SDA supports two additional types of roaming, which are Intra-xTR and Inter-xTR. In SDA, xTR stands for an access-switch that is a fabric edge node. It serves both as an ingress tunnel router as well as an egress tunnel router.

When a client on a fabric enabled WLAN, roams from an access point to another access point on the same access-switch, it is called Intra-xTR. Here, the local client database and client history table are updated with the information of the newly associated access point.

When a client on a fabric enabled WLAN, roams from an access point to another access point on a different access-switch, it is called Inter-xTR. Here, the map server is also updated with the client location (RLOC) information. Also, the local client database is updated with the information of the newly associated access point.

**Figure 43: SDA Roaming**

This figure shows inter-xTR and intra-xTR roaming, which occurs when the client moves from one access point to another access point on the same switch or to a different switch in a Fabric topology.

355781

## Definitions of Mobility-related Terms

- Point of Attachment—A station's point of attachment is where its data path is initially processed upon entry into the network.
- Point of Presence—A station's point of presence is the place in the network where the station is being advertised.
- Station—A user's device that connects to and requests service from a network.

## Mobility Groups

A mobility group is a set of controllers, identified by the same mobility group name, that defines the realm of seamless roaming for wireless clients. By creating a mobility group, you can enable multiple controllers

in a network to dynamically share information and forward data traffic when intercontroller or intersubnet roaming occurs. Controllers in the same mobility group can share the context and state of client devices as well as their list of access points so that they do not consider each other's access points as rogue devices. With this information, the network can support intercontroller wireless LAN roaming and controller redundancy.

**Note** While moving an AP from one controller to another (when both controllers are mobility peers), a client associated to controller-1 before the move might stay there even after the move. This is due to a timeout period on controller-1, where the client entry is maintained (for the purposes of roaming/re-association scenarios). To avoid the client being anchored in controller-1, remove the mobility peer configuration of the controller.

**Figure 44: Example of a Single Mobility Group**

355451

As shown in the figure above, each controller is configured with a list of the other members of the mobility group. Whenever a new client joins a controller, the controller sends out a unicast message (or multicast message if mobility multicast is configured) to all of the controllers in the mobility group. The controller to which the client was previously connected passes on the status of the client.

## Guidelines and Restrictions

The following AireOS and Cisco Catalyst 9800 Series Wireless Controller platforms are supported for SDA Inter-Controller Mobility (AireOS controller-to-Cisco Catalyst 9800 Series Wireless Controller):

- AireOS

- Cisco 3504
- Cisco 5520
- Cisco 8540
- **Cisco Catalyst 9800 Series Wireless Controller**
  - Cisco Catalyst 9800 Wireless Controller for Cloud
  - Cisco Catalyst 9800-80 Wireless Controller
  - Cisco Catalyst 9800-40 Wireless Controller
  - Cisco Catalyst 9800-L Wireless Controller

The following controller platforms are supported for SDA Inter-Controller Mobility:

- **Catalyst Switches**
    - Cisco 9300
  - **Cisco Catalyst 9800 Series Wireless Controller**
    - Cisco Catalyst 9800 Wireless Controller for Cloud
    - Cisco Catalyst 9800-40 Wireless Controller
- Ensure that the data DTLS configuration on the Cisco Catalyst 9800 Series Wireless Controller and AireOS are the same, as configuration mismatch is not supported on the Cisco Catalyst 9800 Series Wireless Controller and it causes the mobility data path to go down.
  - In intercontroller roaming scenarios, policy profiles having different VLANs is supported as a Layer 3 roaming.
  - In AireOS controller, L3 override is not supported in guest VLAN. Hence, the client does not trigger DHCP Discovery on the new VLAN automatically.
  - Policy profile name and client VLAN under policy profile can be different across the controllers with the same WLAN profile mapped.
  - In intracontroller roaming scenarios, client roaming is supported between same policy profiles, with WLAN mapped.

From Cisco IOS XE Amsterdam 17.3.x, The controller allows seamless roaming between same WLAN associated with different policy profile. For more information, see Client Roaming Policy Profile feature.
  - If a client roams in web authentication state, the client is considered as a new client on another controller instead of being identified as a mobile client.
  - Controllers that are mobility peers must use the same DHCP server to have an updated client mobility move count on intra-VLAN.
  - Data DTLS and SSC hash key must be same for mobility tunnels between members.
  - Mobility move count is updated under client detail only during inter-controller roaming. Intra-controller roaming can be verified under client stats and mobility history.

- Anchor VLAN in Cisco Catalyst 9800 Series Wireless Controller is represented as Access VLAN on the Cisco AireOS controller.
- When clients are roaming, their mobility role is shown as *Unknown*. This is because the roaming clients are in *IP learn* state, and in such a scenario, there are many client additions to the new instance and deletions in the old instance.
- In inter-controller roaming between 9800 and 9800/AireOS, client roaming is not supported, whenever there is a WLAN profile mismatch.
- Only IPv4 tunnel is supported between Cisco Catalyst 9800 Series Wireless Controller and Cisco AireOS controller.
- Ensure that you configure the mobility MAC address using the **wireless mobility mac-address** command for High-Availability to work.
- Mobility tunnel will not work if ECDSA based certificate or trustpoint is used for wireless management.
- If Anchor and Foreign controllers are put in the same Layer 2 network, it creates a loop topology (one path is Layer 3 mobility tunnel between Anchor and Foreign, another path is Layer 2 wired connection between Anchor and Foreign). In this topology, MAC\_CONFLICT warning message can be seen on both the Anchor and Foreign controllers. This MAC\_CONFLICT warning message is printed once every minute. However, it doesn't have any functionality and performance impact. As a best practice, do not use management VLAN as client VLAN.
- Mobility Tunnel will go down and come up if SSO is triggered due to gateway check failure.
- If the current AP has 5-GHz slot2 radio on L2 and L3 mobility 5-GHz slot2, the WLAN BSSID is only added to the 11k or 11v neighbor information. As a result, the AP does not have the information of radio properties of the APs belonging to the other controllers. Hence, it can be assumed that the radio properties of the APs belonging to the other controllers are similar to that of the current AP. If the current AP does not have slot2, the other APs cannot be added as a neighbor. In such a scenario, the validation fails and does not add this radio to the neighbor list.
- We recommend that you use the default keepalive count and interval values to reduce convergence time between the Cisco AireOS Wireless Controllers and Cisco Catalyst 9800 Series Wireless Controllers while setting up a mobility tunnel.
- A new client may take up to 3 seconds to join the network when the mobility tunnel is UP and mobility peers are configured. This is because the system sends three mobile messages (one second apart) to find out whether the client is already part of the network.

## Configuring Mobility (GUI)

### Procedure

---

- Step 1** Choose **Configuration > Wireless > Mobility**.  
The **Wireless Mobility** page is displayed on which you can perform global configuration and peer configuration.
- Step 2** In the **Global Configuration** section, perform the following tasks:
- a) Enter a name for the mobility group.
  - b) Enter the multicast IP address for the mobility group.

- c) In the **Keep Alive Interval** field, specify the number of times a ping request is sent to a mobility list member before the member is considered to be unreachable. The valid range is 3 to 20, and the default value is 3.
- d) Specify the **Mobility Keep Alive Count** amount of time (in seconds) between each ping request sent to a mobility list member. The valid range is 1 to 30 seconds.
- e) Enter the DSCP value for the mobility group.
- f) Enter the mobility MAC address.
- g) Click **Apply**.

**Step 3** In the **Peer Configuration** tab, perform the following tasks:

- a) In the **Mobility Peer Configuration** section, click **Add**.
- b) In the **Add Mobility Peer** window that is displayed, enter the MAC address and IP address for the mobility peer. The MAC address can be either in `xx:xx:xx:xx:xx:xx`, `xx-xx-xx-xx-xx-xx`, or `xxxx.xxxx.xxxx` format.
- c) Additionally, when NAT is used, enter the optional public IP address to enter the mobility peer's NATed address. When NAT is not used, the public IP address is not used and the device displays the mobility peer's direct IP address.
- d) Enter the mobility group to which you want to add the mobility peer.
- e) Select the required status for **Data Link Encryption**.
- f) Specify the **SSC Hash** as required.

SSC hash is required if the peer is a Cisco Catalyst 9800-CL Wireless Controller, which uses self-signed certificate and hence SSC hash is used as an additional validation. SSC hash is not required if peer is an appliance, which will have manufacturing installed certificates (MIC) or device certificates burned in the hardware.

- g) Click **Save & Apply to Device**.
- h) In the **Non-Local Mobility Group Multicast Configuration** section, click **Add**.
- i) Enter the mobility group name.
- j) Enter the multicast IP address for the mobility group.
- k) Click **Save**.

## Configuring Mobility (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>wireless mobility group name</b> <i>group-name</i> <b>Example:</b> Device(config)# <b>wireless mobility group name</b> Mygroup	Creates a mobility group named <b>Mygroup</b> .
<b>Step 2</b>	<b>wireless mobility mac-address</b> <i>mac-addr</i> <b>Example:</b> Device(config)# <b>wireless mobility mac-address</b> 00:0d:ed:dd:25:82	Configures the MAC address to be used in mobility messages.

	Command or Action	Purpose
<b>Step 3</b>	<b>wireless mobility dscp</b> <i>value-0-to-63</i> <b>Example:</b> Device(config)# <b>wireless mobility dscp</b> <b>10</b>	(Optional) Configures mobility intercontroller DSCP value.
<b>Step 4</b>	<b>wireless mobility group keepalive interval</b> <i>time-in-seconds</i> <b>Example:</b> Device(config)# <b>wireless mobility group</b> <b>keepalive interval 5</b>	(Optional) Configures the interval between two keepalives sent to a mobility member. Valid range is between 1 and 30 seconds.  <b>Note</b> For controllers connected through mobility tunnels, ensure that both controllers have the same keepalive interval value.
<b>Step 5</b>	<b>wireless mobility group keepalive count</b> <i>count</i> <b>Example:</b> Device(config)# <b>wireless mobility group</b> <b>keepalive count 3</b>	(Optional) Configures the keepalive retries before a member status is termed DOWN.
<b>Step 6</b>	Use the options given below to configure IPv4 or IPv6. <ul style="list-style-type: none"> <li>• <b>wireless mobility mac-address</b> <i>mac-address ip peer-ip-address group group-name data-link-encryption</i></li> <li>• <b>wireless mobility mac-address</b> <i>mac-address ip peer-ip-address public-ip public-ip-address group group-name</i></li> </ul> <b>Example:</b> Device(config)# wireless mobility mac-address 001E.BD0C.5AFF ip 9.12.32.10 group test-group data-link-encryption  Device(config)# wireless mobility mac-address 001E.BD0C.5AFF ip fd09:9:2:49::55 public-ip fd09:9:2:49::55 group scalemobility	Adds a peer IPv4 or IPv6 address to a specific group.  To remove the peer from the local group, use the <b>no</b> form of this command.
<b>Step 7</b>	<b>wireless mobility multicast</b> { <b>ipv4   ipv6</b> } <i>ip-address</i> or <b>wireless mobility group</b> <b>multicast-address</b> <i>group-name</i> { <b>ipv4   ipv6</b> } <i>ip-address</i> <b>Example:</b> Device(config)# <b>wireless mobility</b> <b>multicast ipv4 224.0.0.4</b>  <b>Example:</b> Device(config)# <b>wireless mobility group</b> <b>multicast-address Mygroup ipv4 224.0.0.5</b>	(Optional) Configures a multicast IPv4 or IPv6 address for a local mobility group or a nonlocal mobility group.  <b>Note</b> <b>Mobility Multicast</b> —The controller sends a multicast message instead of a unicast message to all the members in the mobility local group or a nonlocal group when a client joins or roams.  Configures the multicast IPv4 address as 224.0.0.4 for a local mobility group.

	Command or Action	Purpose
		Configures the multicast IPv4 address as 224.0.0.5 for a nonlocal mobility group.

## Configuring Inter-Release Controller Mobility (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Wireless > Mobility > Global Configuration**.
- Step 2** Enter the **Mobility Group Name**, **Multicast IPv4 Address**, **Multicast IPv6 Address**, **Keep Alive Interval (sec)**, **Mobility Keep Alive Count**, **Mobility DSCP Value** and **Mobility MAC Address**.
- Step 3** Click **Apply**.
- 

## Configuring Inter-Release Controller Mobility

Inter-Release Controller Mobility (IRCM) is a set of features and functionality that enable interworking between controllers running different software releases. IRCM enables seamless mobility and wireless services across controllers running Cisco AireOS and Cisco IOS (for example, Cisco 8540 WLC to Cisco Catalyst 9800 Series Wireless Controller) for features such as Layer 2 and Layer 3 roaming and guest access or termination.

---

**Note** To configure IRCM for different combination of AireOS and Catalyst 9800 controllers, see the [Cisco Catalyst 9800 Wireless Controller-Aireos IRCM Deployment Guide](#).

---

Follow the procedure described to configure mobility peers on the controller:

### Before you begin

The Inter-Release Controller Mobility (IRCM) feature is supported by the following Cisco Wireless Controllers.

- For IRCM deployment, we recommended that you configure:
  - Both Cisco AireOS and Cisco Catalyst 9800 Series Controllers as static RF leaders to avoid RF grouping between them.
  - Configure the same RF network name on both the controllers.
- Cisco Catalyst 9800 Series Wireless Controller platforms running Cisco IOS XE Software version 16.10.1 or later.
- Supports the following Cisco AireOS Wireless Controllers running Cisco AireOS 8.5.14x.x IRCM image based on the 8.5 Maintenance Release software:
  - Cisco 3504 Wireless Controllers

- Cisco 5508 Wireless Controllers
  - Cisco 5520 Wireless Controllers
  - Cisco 8510 Wireless Controllers
  - Cisco 8540 Wireless Controllers
- By design, Cisco Catalyst 9800 Wireless Controllers does not have the Primary Mode configuration exposed that is to be sent in the Discovery Response. The controller always sends the Discovery Response with the Primary Mode enabled.
  - Supported Cisco AireOS Wireless Controllers running AireOS 8.8.111.0 and later. The following controllers are supported:
    - Cisco 3504 Wireless Controllers
    - Cisco 5520 Wireless Controllers
    - Cisco 8540 Wireless Controllers

**Note** If the peer Cisco Catalyst 9800 Series Wireless Controller is virtual, configure the hash using command:

```
config mobility group member hash 172.20.227.73
3f93a86cee2039e9c3aada1822ad74b89fea30c1
```

```
config mobility group member hash 172.20.227.73
3f93a86cee2039e9c3aada1822ad74b89fea30c1
```

Optionally enable data tunnel encryption using command:

```
config mobility group member data-dtls 00:0c:29:a8:d5:77
enable/disable
```

The hash configure above can be obtained by running the following command on the Cisco Catalyst 9800 Series Wireless Controller:

```
show wireless management trustpoint
Trustpoint Name : ewlc-tp1
Certificate Info : Available
Certificate Type : SSC
Certificate Hash : 3f93a86cee2039e9c3aada1822ad74b89fea30c1
Private key Info : Available
```

- The IRCM feature is not supported on the following Cisco AireOS Wireless Controllers:
  - Cisco 2504 Wireless Controllers
  - Cisco Flex 7510 Wireless Controllers
  - Cisco WiSM 2

- IPv6 is not supported for SDA IRCM for fabric client roaming. IPv6 is supported for IRCM for non-fabric client roaming.
- Ensure that you use AireOS controller that supports Encrypted Mobility feature.
- AVC is not supported for IRCM.
- In mixed deployments (Catalyst 9800 and AireOS Controllers), the WLAN profile name and the policy profile name must be the same. This is due to AireOS not knowing about the policy profile and therefore only sends or receives the WLAN name as both the policy profile and WLAN profile.
- Mobility group multicast is not supported because AireOS does not support mobility multicast in encrypted mobility.
- There could be instances where the total number of clients count shown may be more than those supported on the roaming scale. This inconsistency is observed when the client roaming rate is very high, as the system requires time to update the records. Here, the clients presented on multiple WNCds for a very short time are counted more than once. We recommend that you provide sufficient time for the process to obtain a consistent data before using one of the following methods: show CLIs, WebUI, Cisco Catalyst Center, or SNMP.
- Link Local bridging is not supported. Ensure that you disable it also on the peer AireOS controller.
- IRCM is not supported in FlexConnect and FlexConnect+Bridge modes.

The following client features support IPv6 client mobility between AireOS controllers and Cisco Catalyst 9800 Series Wireless Controller: Accounting, L3 Security (Webauth), Policy (ACL and QoS), IP address assignment and learning through SLAAC and DHCPv6, IPv6 Source Guard, multiple IPv6 address learning, IPv6 multicast, and SISF IPv6 features (RA Guard, RA Throttling, DHCPv6 Guard, and ND Suppress).β

The following IPv6 features are not supported on Cisco Catalyst 9800 Series Wireless Controller:

- Configurable IPv6 timers
- RA Guard enabled on AP
- Global IPv6 disable

- Note**
- IPv6 CWA is not supported for both AireOS controllers and Cisco Catalyst 9800 Series Wireless Controller.
  - Only eight IPv6 addresses are supported per client.

**Procedure**

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	Use the options given below to configure IPv4 or IPv6.	Adds a peer IPv4 or IPv6 address to a specific group.

	Command or Action	Purpose
	<ul style="list-style-type: none"> <li>• <b>wireless mobility group member mac-address <i>mac-address</i> ip <i>peer-ip</i> group <i>group-name</i> data-link-encryption</b></li> <li>• <b>wireless mobility group member mac-address <i>mac-address</i> ip <i>peer-ip-address</i> public-ip <i>public-ip-address</i> group <i>group-name</i></b></li> </ul> <p><b>Example:</b></p> <pre>Device(config)# wireless mobility group member mac-address 001E.BD0C.5AFF ip 9.12.32.10 group test-group data-link-encryption  Device(config)# wireless mobility group member mac-address 001E.BD0C.5AFF ip fd09:9:2:49::55 public-ip fd09:9:2:49::55 group scalemobility</pre>	To remove the peer from the local group, use the <b>no</b> form of this command.
<b>Step 3</b>	<p><b>wireless mobility group name <i>group-name</i></b></p> <p><b>Example:</b></p> <pre>Device(config)# wireless mobility group name test-group</pre>	Adds a name for the local group. The default local group name is "default".
<b>Step 4</b>	<p><b>wireless mobility mac-address <i>mac-address</i></b></p> <p><b>Example:</b></p> <pre>Device(config)# wireless mobility mac-address 000d.bd5e.9f00</pre>	(Optional) Configures the MAC address to be used in mobility messages.
<b>Step 5</b>	<p><b>wireless mobility group member ip <i>peer-ip</i></b></p> <p><b>Example:</b></p> <pre>Device(config)# wireless mobility group member ip 9.12.32.15</pre>	Adds a peer in the local group.  To remove the peer from the local group, use the <b>no</b> form of this command.
<b>Step 6</b>	<p><b>wireless mobility dscp <i>dscp-value</i></b></p> <p><b>Example:</b></p> <pre>Device(config)# wireless mobility dscp 52</pre>	(Optional) Configures DSCP. The default value is 48.
<b>Step 7</b>	<p><b>wireless mobility group keepalive count <i>count</i></b></p> <p><b>Example:</b></p> <pre>Device(config)# wireless mobility group keepalive count 10</pre>	Configures the mobility control and data path keepalive count. The default value is 3.
<b>Step 8</b>	<p><b>wireless mobility group keepalive interval <i>interval</i></b></p> <p><b>Example:</b></p> <pre>Device(config)# wireless mobility group keepalive interval 30</pre>	Configures the mobility control and data path keepalive interval. The default value is 10.  <b>Note</b> For controllers connected through mobility tunnels, ensure that both controllers have the same keepalive interval value.

# Verifying Mobility

To display the summary of the mobility manager, use the following command:

```
Device# show wireless mobility summary
```

To display mobility peer information, use the following command:

```
Device# show wireless mobility peer ip 10.0.0.8
```

To display the list of access points known to the mobility group, use the following command:

```
Device# show wireless mobility ap-list
```

To display statistics for the mobility manager, use the following command:

```
Device# show wireless statistics mobility

```

To display mobility information of the client, use the following command:

```
Device# show wireless client mac-address 00:0d:ed:dd:35:80 detail
```

To display roaming history of the active client in the subdomain, use the following command:

```
Device# show wireless client mac-address 00:0d:ed:dd:35:80 mobility history
```

To display client-specific statistics for the mobility manager, use the following command:

```
Device# show wireless client mac-address 00:0d:ed:dd:35:80 stats mobility
```

To verify whether intercontroller roam is successful, use the following commands:

- **show wireless client mac *mac-address* detail**: (on the roamed-to Controller) Displays the roam type as L2 and the roam count is incremented by 1.
- **show wireless client summary** : (on the roamed-from controller) The client entry will not be there in the output.

### Verifying SDA Mobility

To verify whether intracontroller, intra-xTR roam is successful, use the following commands:

- **show wireless client summary**: Displays the new AP if the client has roamed across the APs on the same xTR.
- **show wireless client mac *mac-address* detail**: Displays the same RLOC as before the roam.

To verify whether intracontroller, inter-xTR roam is successful, use the following commands:

- **show wireless fabric client summary**: Displays the new AP if the client has roamed across the APs on a different xTR.
- **show wireless client mac *mac-address* detail**: Displays the RLOC of the new xTR to which the client has roamed to.

To check client status before and after intracontroller roaming, perform the following steps:

1. Check if client is on the old AP, using **show wireless client summary** command on the controller.
2. Check whether the client MAC is listed against the old AP, using **show mac addr dyn** command on the xTR1.
3. Check whether the client IP is registered from current xTR1, and client MAC is registered from both current xTR1, and WLC1, using **show lisp site detail** command on the MAP server.
4. After the intra-WLC roam, check whether the client is on the new AP, using the **show wireless client summary** and **show mac addr dyn** commands on the WLC1 and xTR1.

5. After the Inter-xTR Roam (old and new APs on different xTRs), check whether the client is on the new AP (connected to the new xTR2), using the **show wireless client summary** and **show mac addr dyn** commands on the WLC1 and xTR2.
6. Check whether the client is registered from the new xTR2, using the **show lisp site detail** command on the MAP server.

### Verifying Roaming on MAP Server for SDA

To verify roaming information for SDA, use the following commands:

Run the following command on the MAP server, before and after the roam, to check whether the client IP is registered from current xTR, and client MAC is registered from both current xTR, and WLC.

```
Device# show lisp site detail
```

# CHAPTER 141

## NAT Support on Mobility Groups

- [Information About NAT Support on Mobility Groups, on page 1539](#)
- [Restrictions for NAT Support on Mobility Groups, on page 1540](#)
- [Functionalities Supported on Mobility NAT, on page 1540](#)
- [Configuring a Mobility Peer, on page 1541](#)
- [Verifying NAT Support on Mobility Groups , on page 1541](#)

### Information About NAT Support on Mobility Groups

The Network Address Translation (NAT) on Mobility Groups feature supports the establishment of mobility tunnels between peer controllers when one or both peers are behind a NAT. This is achieved by translating the public and private IP addresses of the peers (see figure below). Depending on the placement and number of NATs, translation might be required at one or both ends of the tunnel.

**Figure 45: Mobility NAT**

When configuring a NATed mobility peer, both the private IP address (address in the network before the NAT device) and the public IP address (address in the public network) have to be configured. Also, if you are using a firewall, ensure that the ports listed below can be accessed through the firewall:

- Port 16666 for mobility control messages

- Port 16667 for mobility data messages

## Restrictions for NAT Support on Mobility Groups

- Only 1:1 (static) NAT entries can exist for the controller peers that form the mobility tunnels.
- Configuring multiple peers with the same public IP address is not supported.
- Private IP addresses of the configured peers must be unique.
- Port Address Translation (PAT) is not supported.
- If peer controllers of different types, for example, Cisco AireOS and Cisco Catalyst 9800 Series) are placed behind NAT, Inter-Release Controller Mobility (IRCM) is not supported for client roaming.
- IPv6 address translation is not supported.

## Functionalities Supported on Mobility NAT

The following table lists the functionalities supported on mobility NAT:

**Table 107: Functionalities Supported on Mobility NAT**

Two controllers, with the foreign controller behind a NAT device (1to1 NAT only)	Yes
Two controllers, with the anchor controller behind a NAT device (1to1 NAT only)	Yes
Two controllers, with the anchor and foreign controller behind a NAT device (1to1 NAT only)	Yes
Multiple foreign and anchor controllers behind NATs (1to1 NAT only)	Yes
Supported Cisco Catalyst 9800 Series Wireless Controllers	<ul style="list-style-type: none"> <li>• Cisco Catalyst 9800-40 Wireless Controller</li> <li>• Cisco Catalyst 9800-80 Wireless Controller</li> <li>• Catalyst 9800 Wireless Controller for Cloud</li> <li>• Cisco Catalyst 9800-L Wireless Controller</li> </ul>
Number of peers supported	72
Manageability using SNMP, Yang, and web UI	Yes
IRCM support for mobility	Yes

SSO	Yes
Client roaming (Layer 2 and Layer 3) between Cisco Catalyst 9800 Series Wireless Controllers	Yes
Client roaming (Layer 2 and Layer 3) between Cisco Catalyst 9800 Series Wireless Controller and AireOS controller	No
Supported applications on the mobility tunnel	<ul style="list-style-type: none"> <li>• Native profiling</li> <li>• AP list</li> <li>• PMK cache</li> <li>• Mesh AP</li> </ul>

## Configuring a Mobility Peer

### Before you begin

Ensure that the private and public IP addresses of a mobility peer are of the same type, either IPv4 or IPv6.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wireless mobility group member mac-address peer_mac ip peer_private_ip [public-ip peer_public_ip] group group_name</b> <b>Example:</b> Device(config)# wireless mobility group member mac-address 001e.494b.04ff ip 11.0.0.2 public-ip 4.0.0.112 group dom1	Adds a mobility peer to the list with an optional public IP address. <b>Note</b> You cannot configure multiple peers with the same private or public IP address.
<b>Step 3</b>	<b>exit</b> <b>Example:</b> Device(config)# exit	Returns to privileged EXEC mode.

## Verifying NAT Support on Mobility Groups

To display the mobility information of a client, use the following command:

```
Device# show wireless client mac-address 000a.bd15.0010 detail
```

```
Client MAC Address : 000a.bd15.0010
Client IPv4 Address : 100.100.0.2
Client Username: N/A
AP MAC Address : 000a.ad00.0800
AP Name: SIM-AP-7
AP slot : 1
.
.
.
```

To display mobility peer information using a private peer IP address, use the following command:

```
Device# show wireless mobility peer ip 21.0.0.2
```

```
Mobility Peer Info
=====
Ip Address : 21.0.0.2
Public Ip Address : 3.0.0.22
MAC Address : cc70.ed02.c3b0
Group Name : dom1
.
.
.
```

## CHAPTER 142

# Static IP Client Mobility

---

- [Information About Static IP Client Mobility, on page 1543](#)
- [Restrictions, on page 1543](#)
- [Configuring Static IP Client Mobility \(GUI\), on page 1544](#)
- [Configuring Static IP Client Mobility \(CLI\), on page 1544](#)
- [Verifying Static IP Client Mobility, on page 1545](#)

## Information About Static IP Client Mobility

At times, you may want to configure static IP addresses for wireless clients. When these wireless clients move about in a network, they might try associating with other controllers.

If the clients try to associate with a controller that does not support the same subnet as the static IP address, the clients fail to connect to the network. The controller inspects the ARP requests sent by the clients to determine if the clients are using static IP addresses or IP addresses that were previously assigned by DHCP. If the ARP requests contain IP addresses that do not exist on any of the controller's Switched Virtual Interfaces (SVIs), the clients are disconnected due to a "VLAN\_FAIL" error, resulting in client traffic backhauled without explicit disconnection.

The disconnection due to VLAN mismatch is a change in functionality introduced in the 17.9.1 release.

Static IP clients with static IP addresses can be associated with other controllers in which the client's subnet is supported by tunneling the traffic to another controller in the same mobility group. This feature enables you to configure your WLAN so that the network is serviced even though the clients use static IP addresses.

## Restrictions

- This feature is not supported on the Fabric and Cisco Catalyst 9800 Wireless Controller for Switch platforms.
- IPv6 is not supported.
- FlexConnect mode is not supported.
- WebAuth (LWA and CWA) is not supported.
- Supported only Open, Dot1x, and PSK authentication mechanisms.

- Supports only on the WLANs that are exclusive of the mobility anchor configuration. If the mobility anchor is already configured on a WLAN, and if static IP mobility is enabled, the feature is not supported.
- Supported only when all the peers are configured for the static IP mobility that is enabled.
- IRCM is not supported.

## Configuring Static IP Client Mobility (GUI)

### Procedure

- 
- Step 1** Choose **Configuration** > **Tags & Profiles** > **Policy**.
  - Step 2** On the **Policy** page, click the policy profile name or click **Add** to create a new one.
  - Step 3** Click the **Mobility** tab.
  - Step 4** Set the **Static IP Mobility** field to **Enabled** state.
  - Step 5** Click **Update & Apply to Device**.
- 

## Configuring Static IP Client Mobility (CLI)

Follow the procedure given below to configure static IP client mobility:

### Before you begin

- Configure the SVI interface (L3 VLAN interface) to service the static IP client on at least one of the peer controllers in the network.
- For clients to join a controller, the VLAN (based on the VLAN number in the policy profile configuration) should be configured on the device.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wireless profile policy</b> <i>profile-policy-name</i>  <b>Example:</b> Device(config)# wireless profile policy static-ip-policy	Configures a WLAN policy profile and enters wireless policy configuration mode.
<b>Step 3</b>	<b>static-ip-mobility</b>  <b>Example:</b>	Enables static IP mobility.

	Command or Action	Purpose
	Device(config-wireless-policy)# static-ip-mobility	

## Verifying Static IP Client Mobility

Use the following commands to verify the static IP client mobility configuration:

```
Device# show wireless profile policy detailed static-ip-policy

## CHAPTER 143

# Mobility Domain ID - Dot11i Roaming

- [Information about Mobility Domain ID - 802.11i Roaming, on page 1547](#)
- [Verifying Mobility Domain ID - 802.11i Roaming, on page 1548](#)

## Information about Mobility Domain ID - 802.11i Roaming

A mobility domain is a cluster of APs forming a continuous radio frequency space, where the Pairwise Master Key (PMK) can be synchronized, and fast roaming can be enabled for 802.11r (Fast Transition) or 802.11i (WPA).

In the releases prior to Cisco IOS XE 17.2.1, the PMK cache was shared across the FlexConnect APs using the AP site tag. All the APs that are a part of a site tag share the PMK cache. This is applicable only for central authentication.

From Cisco IOS XE 17.2.1, you can create a Mobility Domain ID (MDID) for each of the APs. All the APs with the same MDID share the PMK cache keys even if they are in different site tags. When MDID is configured for APs, the PMK cache keys are not shared with the APs that are not a part of the same MDID, even if they are a part of the same site tag. MDID supports PMK cache distribution for both central authentication and local authentication.

### Note

- The Mobility Domain ID - 802.11i Roaming feature does not work when the Flex APs are in standalone mode because the feature depends on the controller to share the keys.
- MDID is configured only through the open configuration model. There is no CLI or GUI support.
- In Cisco IOS XE Amsterdam 17.2.1, 100 APs per site-tag or per MDID are supported, and 1000 PMK entries are supported per AP.

The mobility domain can either be defined as a static configuration of clustered APs, all under a commonly configured MDID, or dynamically computed. You can implement a spatial clustering algorithm based on neighbor associations of APs. Each AP can only be a part of one roaming domain.

An MDID is used by 802.11r to define a network in which an 802.11r fast roam is supported. PMKs should be shared within mobility domains, allowing clients to support fast roaming. If defined, MDID takes precedence over a site tag.

MDID configurations are exercised only from open configuration models. For more information about open configuration models, see the [https://www.cisco.com/c/en/us/td/docs/ios-xml/ios/prog/configuration/172/b\\_172\\_programmability\\_cg.html](https://www.cisco.com/c/en/us/td/docs/ios-xml/ios/prog/configuration/172/b_172_programmability_cg.html).

## Verifying Mobility Domain ID - 802.11i Roaming

The following examples shows how to view and verify the 802.11i Roaming configuration:

```
Device# show running-config | section specific-config
ap specific-config 58ac.70dc.xxxx hostname AP58AC.70DC.XXXX
 roaming-domain roaming_domain_2
ap specific-config 78xc.f09d.xxxx hostname AP78XC.F09D.XXXX
 roaming-domain roaming_domain_3
```

## CHAPTER 144

# 802.11r Support for Flex Local Authentication

- [Information About 802.11r Support for FlexConnect Local Authentication](#), on page 1549
- [Verifying 802.11r Support for Flex Local Authentication](#), on page 1550

## Information About 802.11r Support for FlexConnect Local Authentication

In releases prior to Cisco IOS XE Amsterdam 17.2.1, the FlexConnect mode fast transition was supported only in centrally authenticated clients. This was achieved by sharing the Pairwise Master Key (PMK) to all the FlexConnect APs in the same site tag. From Cisco IOS XE Amsterdam 17.2.1, fast transition is supported even for locally authenticated clients.

The client PMK cache entries are shared and distributed to all the APs in the same site tag. From Cisco IOS XE Amsterdam 17.2.1, another grouping called Mobility Domain ID (MDID) is introduced, for sharing the PMK cache entries. MDID can be configured for APs using the open configuration model only. There is no CLI or GUI support.

The PMK cache distribution in a FlexConnect local site (using either the site tag or MDID) is restricted to 100 APs per group, with a maximum support for 1000 PMK entries per AP.

### Support Guidelines

The following are the 802.11r support guidelines:

- Supports 802.11r on FlexConnect local authentication only with Over-the-Air method of roaming. Over-the-DS (Distribution System) is not supported.
- Supports adaptive 11r for Apple clients.
- Supports both Fast Transition + 802.1x and Fast Transition + PSK.

---

**Note** This is supported only when clients join the standalone mode AP.

---

## Verifying 802.11r Support for Flex Local Authentication

To verify the number of PMK caches, use the **show wireless pmk-cache** command:

```
Device# show wireless pmk-cache
Number of PMK caches in total : 1
```

Type	Station	Entry Lifetime	VLAN Override	IP Override
Audit-Session-Id		Username		
DOT11R	74xx.bx5a.07xx	87	NA	
0000000000000000FF3562B5D		jey		

To verify the 802.11r flex roam attempts, use the **show wireless client mac-address 74xx.bx5a.07xx mobility history** command:

```
Device# show wireless client mac-address 74xx.bx5a.07xx mobility history
Recent association history (most recent on top):
```

AP Name	Instance	Mobility Role	Run Latency (ms)	BSSID	AP Slot	Assoc Time
				Dot11	Roam Type	
APM-9120-1-GCP	1	Local	2	d4xx.80xx.8fxx	1	12/11/2019 18:44:37
				802.11R		
APM-4800-3	1	Local	17547	f4xx.e6xx.08xx	1	12/11/2019 18:43:02
				N/A		

```
show wireless stats client detail | sec roam
Total 11r flex roam attempts : 1
```

## CHAPTER 145

# Opportunistic Key Caching

- [Information about Opportunistic Key Caching, on page 1551](#)
- [Enabling Opportunistic Key Caching, on page 1552](#)
- [Enabling Opportunistic Key Caching \(GUI\), on page 1552](#)
- [Verifying Opportunistic Key Caching, on page 1552](#)

## Information about Opportunistic Key Caching

Opportunistic Key Caching (OKC) is an enhancement of the WPA2 Pairwise Master Key ID (PMKID) caching method, which is why it is also named Proactive or Opportunistic PMKID Caching. Just like PMKID caching, OKC works with WPA2-EAP.

The OKC technique allows wireless clients and the WLAN infrastructure to cache only one PMK for client association with a WLAN, even when roaming between multiple APs because they all share the original PMK that is used for the WPA2 4-way handshake. This is required to generate new encryption keys every time a client reassociates with APs. For APs to share the original PMK from a client session, they must all be under a centralized device that caches and distributes the original PMK to all the APs.

Just as in PMKID caching, the initial association to an AP is a regular first-time authentication to the corresponding WLAN, where you must complete the entire 802.1X/EAP authentication for the authentication server, and the 4-way handshake for key generation, before sending data frames.

OKC is a fast roaming technique supported by Microsoft and some Android clients. Another fast roaming method is the use of 802.11r, which is supported by Apple and few Android clients. OKC is enabled by default on a WLAN. This configuration enables the control of OKC on a WLAN. Disabling OKC on a WLAN disables the OKC even for the OKC-supported clients.

A new configuration is introduced for each WLAN in the controller in Cisco IOS XE Amsterdam 17.2.1, to disable or enable fast and secure roaming with OKC at the corresponding AP.

# Enabling Opportunistic Key Caching

**Procedure**

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wlan profile-name wlan-identifier &lt;1-4096&gt; ssid-network-name</b>  <b>Example:</b> Device(config)# wlan wlan-profile-name 18 san-ssid	Enters WLAN configuration submode. <i>wlan-profile-name</i> : Profile name of the configured WLAN.
<b>Step 3</b>	<b>okc</b>  <b>Example:</b> Device(config-wlan)# okc	Enables Opportunistic Key Caching, if not enabled. By default, the OKC feature is enabled. (Use the <b>no</b> form of this command to disable the OKC feature.)

# Enabling Opportunistic Key Caching (GUI)

**Procedure**

- 
- Step 1** Choose **Configuration > Tags & Profiles > WLANs**.
  - Step 2** Click **Add**.  
The **Add WLAN** dialog box is displayed.
  - Step 3** In the **Add WLAN** dialog box, click the **Advanced** tab and complete the following procedure:
    - a) In the **11ax** section, check the **OKC** check box to disable or enable the feature. By default this feature is enabled.
    - b) Click **Update & Apply to Device**.
- 

# Verifying Opportunistic Key Caching

The following example shows how to verify whether OKC is disabled for a WLAN profile.

```

• Device# show wlan id 18
WLAN Profile Name : 18%wlanprofile
=====
Identifier : 18

```

```

Description :

## Feature History for High Availability

This table provides release and related information for the features explained in this module.

These features are available in all the releases subsequent to the one they were introduced in, unless noted otherwise.

**Table 108: Feature History for High Availability**

Release	Feature	Feature Information
Cisco IOS XE Amsterdam 17.1.1s	Redundant Management Interface	The Redundancy Management Interface (RMI) is used as a secondary link between the active and standby controllers. This interface is the same as the Wireless Management Interface and the IP address on this interface is configured in the same subnet as the Wireless Management Interface.
Cisco IOS XE Bengaluru 17.4.1	Gateway Reachability Detection	Gateway reachability feature minimizes the downtime on APs and clients when the gateway reachability is lost on the active controller.
Cisco IOS XE Bengaluru 17.5.1	Standby Monitoring Enhancements	The Standby Monitoring Enhancements feature monitors the standby CPU or memory information from the active controller. Also, this feature independently monitors the standby controller using SNMP for the interface MIB.  The cLHaPeerHotStandbyEvent and cLHaPeerHotStandbyEvent MIB objects in CISCO-HA-MIB are used to monitor the standby HA status.
Cisco IOS XE Bengaluru 17.5.1	Auto-Upgrade	The auto-upgrade feature enables the standby controller to upgrade to active controller's software image, so that both controllers can form an high availability (HA) pair.
Cisco IOS XE Bengaluru 17.6.1	Standby Interface Status using Active SNMP	This feature allows the standby controller interface status to be queried at the active using SNMP.

Release	Feature	Feature Information
Cisco IOS XE Cupertino 17.9.1	High Availability Deployment for Application Centric Infrastructure (ACI) Network	This feature avoids interleaving traffic between the old and new active controller using the following functionalities: <ul style="list-style-type: none"> <li>• Bringing down Wireless Management Interface (WMI) faster.</li> <li>• Disabling fast switchover notification.</li> </ul>
	Link Layer Discovery Protocol (LLDP) Support in the Standby Controller	From this release, the Link Layer Discovery Protocol (LLDP) process will be up and running in both active and standby controllers.

## Information About High Availability

High Availability (HA) allows you to reduce the downtime of wireless networks that occurs due to the failover of controllers. The HA Stateful Switch Over (SSO) capability on the controller allows AP to establish a CAPWAP tunnel with the active controller. The active controller shares a mirror copy of the AP and client database with the standby controller. The APs won't go into the discovery state and clients don't disconnect when the active controller fails. The standby controller takes over the network as the active controller. Only one CAPWAP tunnel is maintained between the APs and the controller that is in an active state.

HA supports full AP and client SSO. Client SSO is supported only for clients that have completed the authentication and DHCP phase, and have started passing traffic. With Client SSO, the client information is synced to the standby controller when the client associates to the controller or when the client parameters change. Fully authenticated clients, for example, the ones in RUN state, are synced to the standby. Thus, client reassociation is avoided on switchover making the failover seamless for the APs and clients, resulting in zero client service downtime and zero SSID outage. This feature reduces major downtime in wireless networks due to failure conditions such as box failover, network failover, or power outage on the primary site.

### Note

- In HA mode, the RP port shut or no shut should not be performed during the controller bootup.
- If the RP communication is lost between active and standby controller during HA sync, the standby controller crashes as the IPC communication fails. The crash is intentional.  
If RP link is restored, the standby controller gracefully reloads and forms an HA pair.

### Note

When the controller works as a host for spanning tree, ensure that you configure portfast trunk, using **spanning-tree port type edge trunk** or **spanning-tree portfast trunk** commands, in the uplink switch to ensure faster convergence.

### Note

You can configure FIPS in HA setup. For information, see the [Configuring FIPS in HA Setup](#).

---

**Note** The IPv4 secondary address is used internally for RMI purpose. So, it is not recommended to configure the secondary IPv4 address.

In case of IPv6, only one management IPv6 is allowed, secondary address is configured for RMI-IPv6 purpose. It is not recommended to have more than one IPv6 management on the Wireless Management Interface (WMI).

More than one management IPv4 and IPv6 addresses on WMI can result in unpredictable behavior.

---

## Prerequisites for High Availability

### External Interfaces and IPs

Because all the interfaces are configured only on the Active box, but are synchronized with the Standby box, the same set of interfaces are configured on both controllers. From external nodes, the interfaces connect to the same IP addresses, irrespective of the controllers they are connected to.

For this purpose, the APs, clients, DHCP, Cisco Prime Infrastructure, Cisco Catalyst Centre, and Cisco Identity Services Engine (ISE) servers, and other controller members in the mobility group always connect to the same IP address. The SSO switchover is transparent to them. But if there are TCP connections from external nodes to the controller, the TCP connections need to be reset and reestablished.

### HA Interfaces

The HA interface serves the following purposes:

- Provides connectivity between the controller pair before an IOSd comes up.
- Provides IPC transport across the controller pair.
- Enables redundancy across control messages exchanged between the controller pair. The control messages can be HA role resolution, keepalives, notifications, HA statistics, and so on.

You can select either SFP or RJ-45 connection for HA port. Supported Cisco SFPs are:

- GLC-SX-MMD
- GLC-LH-SMD

When either SFP or RJ-45 connection is present, HA works between the two controllers. The SFP HA connectivity takes priority over RJ-45 HA connectivity. If SFP is connected when RJ-45 HA is up and running, the HA pair reloads. The reload occurs even if the link between the SFPs isn't connected.

- 
- Note**
- It is recommended to have a dedicated physical NIC and Switch for RP when the HA pair is deployed across two host machines. This avoids any keep-alive loses and false HA switchovers or alarms.
  - Disable security scans on VMware virtual instances.
-

## Restrictions on High Availability

- For a fail-safe SSO, wait till you receive the switchover event after completing configuration synchronization on the standby controller. If the standby controller has just been booted up, we recommend that you wait  $x$  minutes before the controller can handle switchover events without any problem. The value of  $x$  can change based on the platform. For example, a Cisco 9800-80 Series Controller running to its maximum capacity can take up to 24 minutes to complete the configuration synchronization before being ready for SSO. You can use the **show wireless stats redundancy config database** command to view the database-related statistics.
- The flow states of the NBAR engine are lost during a switchover in an HA scenario in local mode. Because of this, the classification of flows will restart, leading to incorrect packet classification as the first packet of the flow is missed.
- The HA connection supports only IPv4.
- Switchover and an active reload and forces a high availability link down from the new primary.
- Hyper threading is not supported and if enabled HA keepalives will be lost in case of an HA system that results in stack merge.
- Standby RMI interface does not support Web UI access.
- Two HA interfaces (RMI and RP) must be configured on the same subnet, and the subnet cannot be shared with any other interfaces on the device.
- It is not possible to synchronize a TCP session state because a TCP session cannot survive after a switchover, and needs to be reestablished.
- The Client SSO does not address clients that have not reached the RUN state because they are removed after a switchover.
- Statistics tables are not synced from active to standby controller.
- Machine snapshot of a VM hosting controller HA interfaces is not supported. It may lead to a crash in the HA controller.
- Mobility-side restriction: Clients which are not in RUN state will be forcefully reauthenticated after switchover.
- The following application classification may not be retained after the SSO:
  - AVC limitation—After a switchover, the context transfer or synchronization to the Standby box does not occur and the new active flow needs to be relearned. The AVC QoS does not take effect during classification failure.
  - A voice call cannot be recognized after a switchover because a voice policy is based on RTP or RTCP protocol.
  - Auto QoS is not effective because of AVC limitation.
- The active controller and the standby controller must be paired with the same interface for virtual platforms. For hardware appliance, there is a dedicated HA port.
- Static IP addressing can synch to standby, but the IP address cannot be used from the standby controller.

- You can map a dedicated HA port to a 1 GB interface only.
- To use EtherChannels in HA mode in releases until, and including, Cisco IOS XE Gibraltar 16.12.x, ensure that the channel mode is set to On.
- EtherChannel Auto-mode is not supported in HA mode in releases until, and including, Cisco IOS XE Gibraltar 16.12.x.
- LACP and PAGP is not supported in HA mode in releases until, and including, Cisco IOS XE Gibraltar 16.12.x.
- When the controller works as a host for spanning tree, ensure that you configure portfast trunk in the uplink switch using **spanning-tree port type edge trunk** or **spanning-tree portfast trunk** command to ensure faster convergence.
- The **clear chassis redundancy** and **write erase** commands will not reset the chassis priority to the default value.
- While configuring devices in HA, the members must not have wireless trustpoint with the same name and different keys. In such a scenario, if you form an HA pair between the two standalone controllers, the wireless trustpoint does not come up after a subsequent SSO. The reason being the *rsa keypair* file exists but it is incorrect as the *nvrाम:private-config* file is not synched with the actual *WLC\_WLC\_TP* key pair.  
As a best practice, before forming an HA, it is recommended to delete the existing certificates and keys in each of the controllers which were previously deployed as standalone.
- After a switchover, when the recovery is in progress, do not configure the WLAN or WLAN policy. In case you configure, the controller can crash.
- After a switchover, clients that are not in RUN state and not connected to an AP are deleted after 300 seconds.

## Configuring High Availability (CLI)

### Before you begin

The active and standby controller should be in the same mode, either Install mode or Bundle mode, with same image version. We recommend that you use Install mode.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>chassis chassis-num priority chassis-priority</b> <b>Example:</b> Device# chassis 1 priority 1	(Optional) Configures the priority of the specified device.  <b>Note</b> From Cisco IOS XE Gibraltar 16.12.x onwards, device reload is not required for the chassis priority to become effective.

	Command or Action	Purpose
		<ul style="list-style-type: none"> <li>• <i>chassis-num</i>—Enter the chassis number. The range is from 1 to 2.</li> <li>• <i>chassis-priority</i>—Enter the chassis priority. The range is from 1 to 2. The default value is 1.</li> </ul> <p><b>Note</b> When both the devices boot up at the same time, the device with higher priority(2) becomes active, and the other one becomes standby. If both the devices are configured with the same priority value, the one with the smaller MAC address acts as active and its peer acts as standby.</p>
<b>Step 2</b>	<p><b>chassis redundancy ha-interface GigabitEthernet <i>num</i> local-ip <i>local-chassis-ip-addr</i> network-mask <i>remote-ip</i> remote-chassis-ip-addr</b></p> <p><b>Example:</b></p> <pre>Device# chassis redundancy ha-interface GigabitEthernet 2 local-ip 4.4.4.1 /24 remote-ip 4.4.4.2</pre>	<p>Configures the chassis high availability parameters.</p> <ul style="list-style-type: none"> <li>• <i>num</i>—GigabitEthernet interface number. The range is from 0 to 32.</li> <li>• <i>local-chassis-ip-addr</i>—Enter the IP address of the local chassis HA interface.</li> <li>• <i>network-mask</i>—Enter the network mask or prefix length in the <i>/nn</i> or <i>A.B.C.D</i> format.</li> <li>• <i>remote-chassis-ip-addr</i>—Enter the remote chassis IP address.</li> </ul>
<b>Step 3</b>	<p><b>chassis redundancy keep-alive timer <i>timer</i></b></p> <p><b>Example:</b></p> <pre>Device# chassis redundancy keep-alive timer 6</pre>	<p>Configures the peer keepalive timeout value.</p> <p>Time interval is set in multiple of 100 ms (enter 1 for default).</p>
<b>Step 4</b>	<p><b>chassis redundancy keep-alive retries <i>retry-value</i></b></p> <p><b>Example:</b></p> <pre>Device# chassis redundancy keep-alive retries 8</pre>	<p>Configures the peer keepalive retry value before claiming peer is down. Default value is 5.</p>

## Disabling High Availability

If the controller is configured using RP method of SSO configuration, use the following command to clear all the HA-related parameters, such as local IP, remote IP, HA interface, mask, timeout, and priority:

```
clear chassis redundancy
```

If the controller is configured using RMI method, use the following command:

**no redun-management interface vlan chassis**

**Note** Reload the devices for the changes to take effect.

After the HA unpairing, the standby controller startup configuration and the HA configuration will be cleared and standby will go to Day 0.

Before the command is executed, the user is prompted with the following warning on the active controller:

```
Device# clear chassis redundancy

WARNING: Clearing the chassis HA configuration will result in both the chassis move into
Stand Alone mode. This involves reloading the standby chassis after clearing its HA
configuration and startup configuration which results in standby chassis coming up as a
totally
clean after reboot. Do you wish to continue? [y/n]? [yes]:

*Apr 3 23:42:22.985: received clear chassis.. ha_supported:lyes
WLC#
*Apr 3 23:42:25.042: clearing peer startup config
*Apr 3 23:42:25.042: chkpt send: sent msg type 2 to peer..
*Apr 3 23:42:25.043: chkpt send: sent msg type 1 to peer..
*Apr 3 23:42:25.043: Clearing HA configurations
*Apr 3 23:42:26.183: Successfully sent Set chassis mode msg for chassis 1.chasfs file updated
*Apr 3 23:42:26.359: %IOSXE_REDUNDANCY-6-PEER_LOST: Active detected chassis 2 is no
longer standby
```

On the standby controller, the following messages indicate that the configuration is being cleared:

```
Device-stby#

*Apr 3 23:40:40.537: mcprp_handle_spa_oir_tsm_event: subslot 0/0 event=2
*Apr 3 23:40:40.537: spa_oir_tsm subslot 0/0 TSM: during state ready, got event 3(ready)
*Apr 3 23:40:40.537: @@@ spa_oir_tsm subslot 0/0 TSM: ready -> ready
*Apr 3 23:42:25.041: Removing the startup config file on standby

!Standby controller is reloaded after clearing the chassis.
```

## Copying a WebAuth Tar Bundle to the Standby Controller

Use the following procedure to copy a WebAuth tar bundle to the standby controller, in a high-availability configuration.

### Procedure

- Step 1** Choose **Administration > Management > Backup & Restore**.
- Step 2** From the **Copy** drop-down list, choose **To Device**.
- Step 3** From the **File Type** drop-down list, choose **WebAuth Bundle**.
- Step 4** From the **Transfer Mode** drop-down list, choose **TFTP, SFTP, FTP, or HTTP**.

The **Server Details** options change based on the file transfer option selected.

- **TFTP**

- **IP Address (IPv4/IPv6):** Enter the server IP address (IPv4 or IPv6) of the TFTP server that you want to use.
- **File Path:** Enter the file path. The file path should start with slash a (*/path*).
- **File Name:** Enter a file name.

The file name should not contain spaces. Underscores ( `_` ) and hyphen ( `-` ) are the only special characters that are supported. Ensure that file name ends with `.tar`, for example, `webauthbundle.tar`.

- **SFTP**

- **IP Address (IPv4/IPv6):** Enter the server IP address (IPv4 or IPv6) of the SFTP server that you want to use.
- **File Path:** Enter the file path. The file path should start with slash a (*/path*).
- **File Name:** Enter a file name.

The file name should not contain spaces. Underscores ( `_` ) and hyphen ( `-` ) are the only special characters that are supported. Ensure that file name ends with `.tar`, for example, `webauthbundle.tar`.

- **Server Login UserName:** Enter the SFTP server login user name.
- **Server Login Password:** Enter the SFTP server login passphrase.

- **FTP**

- **IP Address (IPv4/IPv6):** Enter the server IP address (IPv4 or IPv6) of the TFTP server that you want to use.
- **File Path:** Enter the file path. The file path should start with slash a (*/path*).
- **File Name:** Enter a file name.

The file name should not contain spaces. Underscores ( `_` ) and hyphen ( `-` ) are the only special characters that are supported. Ensure that file name ends with `.tar`, for example, `webauthbundle.tar`.

- **Logon Type:** Choose the login type as either **Anonymous** or **Authenticated**. If you choose **Authenticated**, the following fields are activated:
  - **Server Login UserName:** Enter the FTP server login user name.
  - **Server Login Password:** Enter the FTP server login passphrase.

- **HTTP**

- **Source File Path:** Click **Select File** to select the configuration file, and click **Open**.

**Step 5** Click the **Yes** or **No** radio button to back up the existing startup configuration to Flash.

Save the configuration to Flash to propagate the WebAuth bundle to other members, including the standby controller. If you do not save the configuration to Flash, the WebAuth bundle will not be propagated to other members, including the standby controller.

**Step 6** Click **Download File**.

## System and Network Fault Handling

If the standby controller crashes, it reboots and comes up as the standby controller. Bulk sync follows causing the standby to become hot. If the active controller crashes, the standby becomes active. The new active controller assumes the role of primary and tries to detect a dual active.

The following matrices provide a clear picture of the conditions the controller switchover would trigger:

**Table 109: System and Network Fault Handling**

System Issues					
Trigger	RP Link Status	Peer Reachability through RMI	Switchover	Result	
Critical process crash	Up	Reachable	Yes	Switchover happens	
Forced switchover	Up	Reachable	Yes	Switchover happens	
Critical process crash	Up	Unreachable	Yes	Switchover happens	
Forced switchover	Up	Unreachable	Yes	Switchover happens	
Critical process crash	Down	Reachable	No	No action. One controller in recovery mode.	
Forced switchover	Down	Reachable	N/A	No action. One controller in recovery mode.	
Critical process crash	Down	Unreachable	No	Double fault – as mentioned in Network Error handling	
Forced switchover	Down	Unreachable	N/A	Double fault – as mentioned in Network Error handling	

RP Link	Peer Reachability Through RMI	Gateway From Active	Gateway From Standby	Switchover	Result
Up	Reachable	Reachable	Reachable	No SSO	No action

RP Link	Peer Reachability Through RMI	Gateway From Active	Gateway From Standby	Switchover	Result
Up	Reachable	Reachable	Unreachable	No SSO	No action. Standby is not ready for SSO in this state, as it does not have gateway reachability. The standby is shown to be in standby-recovery mode. If the RP goes down, standby (in recovery mode) becomes active.
Up	Reachable	Unreachable	Reachable	SSO	Gateway reachability message is exchanged over the RMI + RP links. Active reboots so that the standby becomes active.
Up	Reachable	Unreachable	Unreachable	No SSO	With this, when the active SVI goes down, the standby SVI also goes down. A switchover is then triggered. If the new active discovers its gateway to be reachable, the system stabilizes in the Active - Standby Recovery mode. Otherwise, switchovers happen in a ping-pong fashion.
Up	Unreachable	Reachable	Reachable	No SSO	No action

RP Link	Peer Reachability Through RMI	Gateway From Active	Gateway From Standby	Switchover	Result
Up	Unreachable	Reachable	Unreachable	No SSO	Standby is not ready for SSO in this state as it does not have gateway reachability. Standby moves in to recovery mode as LMP messages are exchanged over the RP link.
Up	Unreachable	Unreachable	Reachable	SSO	Gateway reachability message is exchanged over RP link. Active reboots so that standby becomes active.
Up	Unreachable	Unreachable	Unreachable	No SSO	With this, when the active SVI goes down, the standby SVI also goes down. A switchover is then triggered. If the new active discovers its gateway to be reachable, the system stabilizes in Active - Standby Recovery mode. Otherwise, switchovers happen in a ping-pong fashion.

RP Link	Peer Reachability Through RMI	Gateway From Active	Gateway From Standby	Switchover	Result
Down	Reachable	Reachable	Reachable	No SSO	Standby detects the presence of the Active over the RMI link and avoids switchover when the RP link goes down. In such a case, the standby goes to recovery mode. This mode is represented through suffix <b>rp-rec-mode</b> in the hostname. The standby in recovery mode reloads when the RP link comes up. Single faults are gracefully handled in the system.
Down	Reachable	Reachable	Unreachable	No SSO	Same as above.

RP Link	Peer Reachability Through RMI	Gateway From Active	Gateway From Standby	Switchover	Result
Down	Reachable	Unreachable	Reachable	RP link down, then active loses GW, then there won't be any SSO. GW down, within 8 seconds, RP link goes down, then there would be a SSO.	Gateway reachability message is exchanged over RP+RMI links. Old-Active goes to active-recovery mode. The configuration mode is disabled in active-recovery mode. All interfaces will be ADMIN DOWN with the wireless management interface having RMI IP. The controller in active-recovery will reload to become standby (or standby-recovery if gateway reachability is still not available) when the RP link comes up.
Down	Reachable	Unreachable	Unreachable	No SSO	Standby goes to standby-recovery.

RP Link	Peer Reachability Through RMI	Gateway From Active	Gateway From Standby	Switchover	Result
Down	Unreachable	Reachable	Reachable	SSO	Double fault – this may result in a network conflict as there will be two active controllers. Standby becomes active. Old active also exists. Role negotiation has to happen once the connectivity is restored and keep the active that came up last.
Down	Unreachable	Reachable	Unreachable	SSO	Same as above.
Down	Unreachable	Unreachable	Reachable	SSO	Same as above.
Down	Unreachable	Unreachable	Unreachable	SSO	Same as above.

## Handling Recovery Mechanism

### Active to Active Recovery

- When RP is down and RMI is up at boot up, the Active Recovery occurs.
- When HA is stable (active - standby), if RMI is down first and then RP goes down next, and later if RMI comes up before RP comes up, the Active to Active Recovery occurs. Once the RP is up, the Active Recovery reloads and HA is formed.

### Standby to Standby Recovery

- When Standby goes to Standby Recovery for Gateway alone, once the Gateway is up, the HA comes up without any reboot.
- When Standby goes to Standby Recovery for RP down, once the RP is up, the standby recovery reboots automatically and HA is formed.

## Verifying High Availability Configurations

To view the HA configuration details, use the following command:

```
Device# show romvar
ROMMON variables:
LICENSE_BOOT_LEVEL =
MCP_STARTUP_TRACEFLAGS = 00000000:00000000
BOOTLDR =
CRASHINFO = bootflash:crashinfo_RP_00_00_20180202-034353-UTC
STACK_1_1 = 0_0
CONFIG_FILE =
BOOT =
bootflash:boot_image_test,1;bootflash:boot_image_good,1;bootflash:rp_super_universalk9.vwlc.bin,1;

RET_2_RTS =
SWITCH_NUMBER = 1
CHASSIS_HA_REMOTE_IP = 10.0.1.9
CHASSIS_HA_LOCAL_IP = 10.0.1.10
CHASSIS_HA_LOCAL_MASK = 255.255.255.0
CHASSIS_HA_IFNAME = GigabitEthernet2
CHASSIS_HA_IFMAC = 00:0C:29:C9:12:0B
RET_2_RCALTS =
BSI = 0
RANDOM_NUM = 647419395
```

## Verifying AP or Client SSO Statistics

To view the AP SSO statistics, use the following command:

```
Device# show wireless stat redundancy statistics ap-recovery wnc all
AP SSO Statistics
```

Inst	Timestamp	Dura (ms)	#APs	#Succ	#Fail	Avg (ms)	Min (ms)	Max (ms)
0	00:06:29.042	98	34	34	0	2	1	35
1	00:06:29.057	56	33	30	3	1	1	15
2	00:06:29.070	82	33	33	0	2	1	13

Statistics:

```
WNC Instance : 0
No. of AP radio recovery failures : 0
No. of AP BSSID recovery failures : 0
No. of CAPWAP recovery failures : 0
No. of DTLS recovery failures : 0
No. of reconcile message send failed : 0
No. of reconcile message successfully sent : 34
No. of Mesh BSSID recovery failures: 0
No. of Partial delete cleanup done : 0
.
.
.
```

To view the Client SSO statistics, use the following command:

```
Device# show wireless stat redundancy client-recovery wncd all
Client SSO statistics

```

```

WNCD instance : 1
Reconcile messages received from AP : 1
Reconcile clients received from AP : 1
Recreate attempted post switchover : 1
Recreate attempted by SANET Lib : 0
Recreate attempted by DOT1x Lib : 0
Recreate attempted by SISF Lib : 0
Recreate attempted by SVC CO Lib : 1
Recreate attempted by Unknown Lib : 0
Recreate succeeded post switchover : 1
Recreate Failed post switchover : 0
Stale client entries purged post switchover : 0

Partial delete during heap recreate : 0
Partial delete during force purge : 0
Partial delete post restart : 0
Partial delete due to AP recovery failure : 0
Partial delete during reconciliation : 0

Client entries in shadow list during SSO : 0
Client entries in shadow default state during SSO : 0
Client entries in poison list during SSO : 0

Invalid bssid during heap recreate : 0
Invalid bssid during force purge : 0
BSSID mismatch with shadow rec during reconciliation : 0
BSSID mismatch with shadow rec reconciliation(WGB client): 0
BSSID mismatch with dot11 rec during heap recreate : 0

AID mismatch with dot11 rec during force purge : 0
AP slotid mismatch during reconciliation : 0
Zero aid during heap recreate : 0
AID mismatch with shadow rec during reconciliation : 0
AP slotid mismatch shadow rec during reconciliation : 0
Client shadow record not present : 0

```

To view the mobility details, use the following command:

```

Device# show wireless stat redundancy client-recovery mobilityd
Mobility Client Deletion Reason Statistics

Mobility Incomplete State : 0
Inconsistency in WNCD & Mobility : 0
Partial Delete : 0

General statistics

Cleanup sent to WNCD, Missing Delete case : 0

```

To view the Client SSO statistics for SISF, use the following command:

```

Device# show wireless stat redundancy client-recovery sisf
Client SSO statistics for SISF

Number of recreate attempted post switchover : 1
Number of recreate succeeded post switchover : 1
Number of recreate failed because of no mac : 0
Number of recreate failed because of no ip : 0
Number of ipv4 entry recreate success : 1
Number of ipv4 entry recreate failed : 0
Number of ipv6 entry recreate success : 0
Number of ipv6 entry recreate failed : 0
Number of partial delete received : 0

```

```

Number of client purge attempted : 0
Number of heap and db entry purge success : 0
Number of purge success for db entry only : 0
Number of client purge failed : 0
Number of garp sent : 1
Number of garp failed : 0
Number of IP entries validated in cleanup : 0
Number of IP entry address errors in cleanup : 0
Number of IP entry deleted in cleanup : 0
Number of IP entry delete failed in cleanup : 0
Number of IP table create callbacks on standby : 0
Number of IP table modify callbacks on standby : 0
Number of IP table delete callbacks on standby : 0
Number of MAC table create callbacks on standby : 1
Number of MAC table modify callbacks on standby : 0
Number of MAC table delete callbacks on standby : 0

```

To view the HA redundancy summary, use the following command:

```

Device# show wireless stat redundancy summary
HA redundancy summary

```

```

AP recovery duration (ms) : 264
SSO HA sync timer expired : No

```

## Verifying High Availability

**Table 110: Commands for Monitoring Chassis and Redundancy**

Command Name	Description
<b>show chassis</b>	<p>Displays the chassis information.</p> <p><b>Note</b> When the peer timeout and retries are configured, the <b>show chassis ha-status</b> command output may show incorrect values.</p> <p>To check the peer keep-alive timer and retries, use the following commands:</p> <ul style="list-style-type: none"> <li>• <b>show platform software stack-mgr chassis active r0 peer-timeout</b></li> <li>• <b>show platform software stack-mgr chassis standby r0 peer-timeout</b></li> </ul>
<b>show redundancy</b>	Displays details about Active box and Standby box.
<b>show redundancy switchover history</b>	Displays the switchover counts, switchover reason, and the switchover time.

To start the packet capture in the redundancy HA port (RP), use the following commands:

- test wireless redundancy packet dump start
- test wireless redundancy packet dump stop

- test wireless redundancy packet dump start filter port 2300

```

Device# test wireless redundancy packetdump start
Redundancy Port PacketDump Start
Packet capture started on RP port.

Device# test wireless redundancy packetdump stop
Redundancy Port PacketDump Start
Packet capture started on RP port.
Redundancy Port PacketDump Stop
Packet capture stopped on RP port.
Device# dir bootflash:
Directory of bootflash:/

# High Availability Deployment for Application Centric Infrastructure (ACI) Network

## Information About Deploying ACI Network in Controller

Cisco Application Centric Infrastructure (ACI) technology integrates virtual and physical workloads in a programmable and multihypervisor fabric to build a multiservice or a cloud data center.

---

**Note** The Cisco ACI technology is supported only in a Redundancy Management Interface (RMI) high-availability network.

---

The following figure depicts the discrete components connected in a spine and leaf switch topology provisioned and managed as a single entity.

Figure 46: Cisco ACI Network Deployment

The following mechanisms help avoid interleaving traffic.

### Bringing Down Wireless Management Interface Faster

In case of a switchover in ACI deployments, APs and clients are dropped because of interleaving traffic between the old and the new active controller. To resolve this issue, bring down the traffic from the old active controller faster. You can do this by bringing down the wireless management interface as soon as a failure is detected. When the wireless management interface shuts down, the traffic that is sourced from the old active wireless management interface stops. This avoids conflicts in the management IP address. The standby controller transitions to the role of the active controller with a new IP-MAC binding.

**Note** The IP Data-Plane Learning feature in an ACI deployment tracks the following:

- A duplicate MAC address for the same IP.
- Alarm that blocks the IP address for a configured duration.

During failure detection, the controller sets up the chassis property **non-participant**. In IP Data-Plane Learning feature, listen to the property for bringing down the wireless management interface and shutting down traffic in the old active controller faster, thereby avoiding any kind of interleaving traffic between the old and new active controllers.

### Disabling Fast Switchover Notification

This mechanism provides more control to avoid interleaving traffic.

During failure handling, the active controller sends an explicit notification to the standby controller, stating that it is going down. This triggers the standby node to take over as the active node. In the event of failure, you can use the disable fast switchover notification option to control the explicit notification from active to standby. In the absence of explicit notification, the standby controller takes over as the active controller on the basis of keepalive timeout.

**Note** You can configure the keepalive timeout so that you have control over when the traffic from the new active controller begins if a failure occurs. In such a failure scenario, the switchover also gets delayed.

When you enable this option, the active controller cannot send an explicit failure notification message to the standby controller. The standby controller relies solely on the keepalive timeout failures to detect when the active controller went down.

This delays the keepalive timeout in the commencing traffic in the new active controller, thus avoiding the overlapping traffic from the old active controller. Therefore, disabling fast switchover notification increases the switchover duration by the additional keepalive timeout duration.

### GARP Burst

During a controller switchover event, the GARP traffic is generated in burst that overwhelms the ARP learning of ACI. This feature devises a way to retransmit the GARP packet at a much lower rate after a switchover from a new active controller.

## Prerequisite for Deploying the ACI Network in the Controller

Check the maximum supported clients in High Availability to ensure that Cisco ACI does not exceed the configured IPv4 and IPv6 end points.

## Disabling the Fast Switchover Notification Mechanism (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>no redun-management fast-switchover</b> <b>Example:</b> Device(config)# no redun-management fast-switchover	Disables explicit fast switchover notification. <b>Note</b> Configure the fast switchover notification mechanism in the primary controller. This configuration is not required in the secondary controller.
<b>Step 3</b>	<b>end</b> <b>Example:</b> Device(config)# end	Returns to privileged EXEC mode.

## Configuring Gratuitous ARP (GARP) Retransmit (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>redun-management garp-retransmit burst</b> <i>packet-burst-size interval time-interval</i>  <b>Example:</b> Device(config)# redun-management garp-retransmit burst 0 interval 0	Determines the rate at which the GARP resend is performed.  <b>Note</b> <ul style="list-style-type: none"> <li>• <i>packet-burst-size</i>: The valid range is from 0 to 1000. The value 0 refers to the disabled retransmit.</li> <li>• <i>time-interval</i>: Refers to the time interval, in seconds. The valid range is from 0 to 5 seconds. The value 0 refers to the disabled retransmit.</li> </ul>
<b>Step 3</b>	<b>end</b>  <b>Example:</b> Device(config)# end	Returns to privileged EXEC mode.

## Disabling Initial GARP (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>no redun-management garp-retransmit</b> <b>initial</b>  <b>Example:</b> Device(config)# no redun-management garp-retransmit initial	Disables the initial GARP.
<b>Step 3</b>	<b>end</b>  <b>Example:</b> Device(config)# end	Returns to privileged EXEC mode.

# Configuring a Switchover

## Procedure

	Command or Action	Purpose
<b>Step 1</b>	<p>To force a failover to the standby unit, use the following command:</p> <p><b>Example:</b></p> <pre>Device#redundancy force-switchover</pre>	<p>In this case, the standby controller will take the role of the active controller, and the active controller will reload and become the new standby controller. This command can be used to test the stability of the high availability cluster and see if switchovers are working as expected.</p> <p><b>Note</b> Do not use any other command to test switchovers between the Cisco Catalyst 9800 series wireless controllers. Command such as "reload slot X" (where X is the active controller) might lead to unexpected behaviour and should not be used to perform a switchover.</p>

## Information About Redundancy Management Interface

The Redundancy Management Interface (RMI) is used as a secondary link between the active and standby Cisco Catalyst 9800 Series Wireless Controllers. This interface is the same as the wireless management interface, and the IP address on this interface is configured in the same subnet as the Wireless Management IP. The RMI is used for the following purposes:

- Dual Active Detection
- Exchange resource health information between controllers, for instance, gateway reachability status from either controller.
- Gateway reachability is checked on the active and the standby controller through the RMI when the feature is enabled. It takes approximately the configured gateway monitoring interval to detect that a controller has lost gateway reachability. The default gateway monitoring interval value is 8 seconds.

**Note**

- The RMI might trigger a switchover based on the gateway status of the active controller.
- Cisco TrustSec is not supported on the RMI.

When the device SGT is used, the IP-SGT mapping for RMI address is also applied along with the WMI address. So, you need to ensure that the SGACL is defined appropriately to allow ICMP and ARP traffic between the active and standby RMI addresses.

- If the RP and RMI links are down, the HA setup breaks into two active controllers. This leads to IP conflict in the network. The HA setup forms again when the RP link comes up. Depending on the state of the external switch at this time, the ARP table may or may not be updated to point to the active controller. That is, the switch may fail to process the GARP packets from the controller. As a best practice, we recommend that you keep the ARP cache timeout value to a low value for faster recovery from multiple fault scenarios. You need to select a value that does not impact the network traffic, for instance, 30 minutes.

**Note**

The AAA packets originating from the controller may use either the wireless management IP or the RMI IP. Therefore, ensure that you add RMI IP as the source IP along with WMI IP in the AAA server.

**Active Controller**

The primary address on the active controller is the management IP address. The secondary IPv4 address on the management VLAN is the RMI IP address for the active controller. Do not configure the secondary IPv4 addresses explicitly because a single secondary IPv4 address is configured automatically by RMI under the RMI.

**Standby Controller**

The standby controller does not have the wireless management IP configured; it has the RMI IP address configured as the primary IP address. When the standby controller becomes active, the management IP address becomes the primary IP address and the RMI IP address becomes the secondary IP address. If the interface on the active controller is administratively down, the same state is reflected on the standby controller.

**Dual Stack Support on Management VLAN with RMI**

Dual stack refers to the fact that the wireless management interface can be configured with IPv4 and IPv6 addresses. If an RMI IPv4 address is configured along with an IPv4 management IP address, you can additionally configure an IPv6 management address on the wireless management interface. This IPv6 management IP address will not be visible on the standby controller.

If an RMI IPv6 address is configured along with an IPv6 management IP address, you can additionally configure an IPv4 management address on the wireless management interface. This IPv4 management IP address will not be visible on the standby controller.

Therefore, you can monitor only the IPv6 gateway when the RMI IPv6 address is configured, or only the IPv4 gateway when the RMI IPv4 address is configured.

---

**Note** The RMI feature supports the RMI IPv4 or IPv6 addresses.

---

### RMI-Based High-Availability Pairing

You should consider the following scenarios for HA pairing:

- Fresh Installation
- Already Paired Controllers
- Upgrade Scenario
- Downgrade Scenario

Dynamic HA pairing requires both the active controller and the standby controller to reload. However, dynamic HA pairing occurs on the Cisco Catalyst 9800-L Wireless Controller, Cisco Catalyst 9800-40 Wireless Controller, and the Cisco Catalyst 9800-80 Wireless Controller when one of them reloads and becomes the standby controller.

---

**Note** Chassis numbers identify individual controllers. Unique chassis numbers must be configured before forming an HA pair.

---

### HA Pairing Without Previous Configuration

When HA pairing is done for the first time, no ROMMON variables are found for the RP IP addresses. You can choose from the existing privileged EXEC mode RP-based commands or the RMI IP-based mechanisms. However, the privileged EXEC mode RP-based commands will be deprecated soon. If you use Cisco Catalyst Center, you can choose the privileged EXEC mode RP-based CLI mechanism till the Cisco Catalyst Center migrates to support the RMI.

The RP IPs are derived from the RMI IPs after an HA pair is formed. Also, the privileged EXEC mode RP-based CLI method of clearing and forming an HA pair is not allowed after the RMI IP-based HA mechanism is chosen.

---

**Note**

- Although you can choose RP or RMI for a fresh installation, we recommend that you use RMI install method.
- To view the ROMMON variables, use the **show romvars** command.

---

If you choose the privileged EXEC RP-based CLI mechanism, the RP IPs are configured the same way as in the 16.12 release.

The following occurs when the RMI-based HA pairing is done on a brand-new system:

- RP IPs are derived from RMI IPs and used in HA pairing.
- Privileged EXEC mode RP-based CLIs are blocked.

---

**Note** The RMI migration is supported from Cisco Catalyst Center, 2.3.3.x release version.

The following are the limitations observed during RMI migration:

- The negative cases fail due to the following reasons:
    - When devices are not reachable.
    - When non-Cisco Catalyst 9800 Series Wireless Controllers are in use.
    - When an earlier controller version (Cisco IOS XE 17.3) is in use.
    - When High Availability is not configured.
    - When High Availability RMI is already configured.
  - When High Availability is upgraded to RMI-based High Availability for Cisco IOS XE release version greater than or equal to 17.3.
  - When upgrading to an already failed High Availability paired controller.
  - The controller GUI prohibits applying RMI migration configuration to High Availability failed devices.
- 

### Paired Controllers

If the controllers are already in an HA pair, the existing EXEC mode RP-based commands will continue to be used. You can enable RMI to migrate to the RMI-based HA pairing.

If the controllers are already paired and RMI is configured, it will overwrite the RP IPs with the RMI-derived IPs. The HA pair will not be disturbed immediately, but the controllers will pick up the new IP when the next reload happens. The RMI feature mandates a reload for the feature to be effective. When both the controllers are reloaded, they come up as a pair with the new RMI-derived RP IPs.

The following occurs when the RMI configuration is done:

- The RP IPs derived from the RMI IPs are overwritten, and used for HA pairing.
- If the active and standby controller already exist prior to HA pairing through the EXEC mode RP-based command mechanism, the pair is not interrupted.
- When the pair reloads later, the new RP IPs are used.
- EXEC mode RP-based commands are blocked.

### Upgrading from Cisco IOS XE 16.1.x to a Later Release

A system that is being upgraded can choose to:

- Migrate with the existing RP IP configuration intact—In this case, the existing RP IP configuration will continue to be used. The EXEC mode RP-based commands are used for future modifications.
- Migrate after clearing the HA configuration—In this case, you can choose between the old (EXEC mode RP-based commands) and new RMI-based RP configuration methods.

---

**Note** In case the older configuration is retained, the RMI configuration updates the RP IPs with the IPs derived from the RMI IPs.

---

### Downgrade Scenario

---

**Note** The downgrade scenario given below is not applicable for Cisco IOS XE Amsterdam 17.1.x.

---

The downgrade scenario will have only the EXEC mode RP-based commands. The following are the two possibilities:

- If the upgraded system used the RMI-based RP configuration.
- If the upgraded system continued to use the EXEC mode RP-based commands.

---

**Note** In the above cases, the downgraded system uses the EXEC mode RP-based commands to modify the configuration. However, the downgraded system will continue to use the new derived RP IPs.

---

---

**Note** When you downgrade the Cisco Catalyst 9800 Series Wireless Controller to any version below 17.1 and if the mDNS gateway is enabled on the WLAN/RLAN/GLAN interfaces, the mdns-sd-interface gateway goes down after the downgrade.

To enable the mDNS gateway on the WLAN/RLAN/GLAN interfaces in 16.12 and earlier versions, use the following commands:

**wlan test 1 test**

**mdns-sd gateway**

To enable the mDNS gateway on the WLAN/RLAN/GLAN interfaces from version 17.1 onwards, use the following command:

**mdns-sd-interface gateway**

---

### Gateway Monitoring

From Cisco IOS XE Amsterdam 17.2.1 onwards, the method to configure the gateway IP has been modified. The **ip default-gateway gateway-ip** command is not used. Instead, the gateway IP is selected based on the static routes configured. From among the static routes configured, the gateway IP that falls in the same subnet as the RMI subnet (the broadest mask and least gateway IP) is chosen. If no matching static route is found, gateway failover will not work (even if management gateway-failover is enabled).

# Configuring Redundancy Management Interface (GUI)

## Before you begin

Before configuring RMI + RP using GUI, ensure that WMI is available.

## Procedure

---

### Step 1

In the **Administration > Device > Redundancy** window, perform the following:

- a. Set the **Redundancy Configuration** toggle button to **Enabled** to activate redundancy configuration.
- b. In the **Redundancy Pairing Type** field, select **RMI+RP** to perform RMI+RP redundancy pairing as follows:
  - In the **RMI IP for Chassis 1** field, enter RMI IP address for chassis 1.
  - In the **RMI IP for Chassis 2** field, enter RMI IP address for chassis 2.
  - From the **HA Interface** drop-down list, choose one of the HA interface.  
**Note** You can select the HA interface only for Cisco Catalyst 9800 Series Wireless Controllers.
  - Set the **Management Gateway Failover** toggle button to **Enabled** to activate management gateway failover.
  - In the **Gateway Failure Interval** field, enter an appropriate value. The valid range is between 6 and 12 (seconds). The default is 8 seconds.
- c. In the **Redundancy Pairing Type** field, select **RP** to perform RP redundancy pairing as follows:
  - In the **Local IP** field, enter an IP address for Local IP.
  - In the **Netmask** field, enter the subnet mask assigned to all wireless clients.
  - From the **HA Interface** drop-down list, choose one of the HA interface.  
**Note** You can select the HA interface only for Cisco Catalyst 9800 Series Wireless Controllers.
  - In the **Remote IP** field, enter an IP address for Remote IP.
- d. In the **Keep Alive Timer** field, enter an appropriate timer value. The valid range is between 1 and 10 (x100 milliseconds).
- e. In the **Keep Alive Retries** field, enter an appropriate retry value. The valid range is between 3 and 10 seconds.
- f. In the **Active Chassis Priority** field, enter a value.

### Step 2

Click **Apply** and reload controllers.

---

# Configuring Redundancy Management Interface (CLI)

## Procedure

	Command or Action	Purpose
<b>Step 1</b>	<p><b>chassis chassis-num priority chassis-priority</b></p> <p><b>Example:</b></p> <pre>Device# chassis 1 priority 1</pre>	<p>(Optional) Configures the priority of the specified device.</p> <p><b>Note</b> From Cisco IOS XE Gibraltar 16.12.x onwards, device reload is not required for the chassis priority to become effective.</p> <ul style="list-style-type: none"> <li>• <i>chassis-num</i>—Enter the chassis number. The range is from 1 to 2.</li> <li>• <i>chassis-priority</i>—Enter the chassis priority. The range is from 1 to 2. The default value is 1.</li> </ul> <p><b>Note</b> When both the devices boot up at the same time, the device with higher priority becomes active, and the other one becomes standby. If both the devices are configured with the same priority value, the one with the smaller MAC address acts as active and its peer acts as standby.</p>
<b>Step 2</b>	<p><b>chassis redundancy ha-interface GigabitEthernet interface-number</b></p> <p><b>Example:</b></p> <pre>Device# chassis redundancy ha-interface GigabitEthernet 3</pre>	<p>Creates an HA interface for your controller.</p> <ul style="list-style-type: none"> <li>• <i>interface-number</i>: GigabitEthernet interface number. The range is from 1 to 32.</li> </ul> <p><b>Note</b> This step is applicable only for Cisco Catalyst 9800-CL Series Wireless Controllers. The chosen interface is used as the dedicated interface for HA communication between the 2 controllers.</p>
<b>Step 3</b>	<p><b>configure terminal</b></p> <p><b>Example:</b></p> <pre>Device# configure terminal</pre>	<p>Enters global configuration mode.</p>
<b>Step 4</b>	<p><b>redun-management interface vlan vlan-interface-number chassis chassis-number</b></p>	<p>Configures Redundancy Management Interface.</p>

	Command or Action	Purpose
	<p><b>address</b> <i>ip-address</i> <b>chassis</b> <i>chassis-number</i>  <b>address</b> <i>ip-address</i></p> <p><b>Example:</b></p> <pre>Device(config)# redun-management interface Vlan 200 chassis 1 address 9.10.90.147 chassis 2 address 9.10.90.149</pre>	<ul style="list-style-type: none"> <li>• <i>vlan-interface-number</i> : VLAN interface number. The valid range is from 1 to 4094.</li> </ul> <p><b>Note</b> Here, the <i>vlan-interface-number</i> is the same VLAN as the Management VLAN. That is, both must be on the same subnet.</p> <ul style="list-style-type: none"> <li>• <i>chassis-number</i>: Chassis number. The valid range is from 1 to 2.</li> <li>• <i>ip-address</i>: Redundancy Management Interface IP address.</li> </ul> <p><b>Note</b> Each controller must have a unique chassis number for RMI to form the HA pair. The chassis number can be observed as SWITCH_NUMBER in the output of <b>show romvar</b> command. Modification of SWITCH_NUMBER is currently not available through the web UI.</p> <p>To disable the HA pair, use the <b>no redun-management interface vlan chassis</b> command.</p>
<b>Step 5</b>	<p><b>end</b></p> <p><b>Example:</b></p> <pre>Device(config)# end</pre>	Returns to privileged EXEC mode.
<b>Step 6</b>	<p><b>write memory</b></p> <p><b>Example:</b></p> <pre>Device# write memory</pre>	Saves the configuration.
<b>Step 7</b>	<p><b>reload</b></p> <p><b>Example:</b></p> <pre>Device# reload</pre>	<p>Reloads the controllers.</p> <p><b>Note</b> When the RMI configuration is done, you must reload the controllers for the configuration to take effect.</p> <p>For Cisco Catalyst 9800-CL Wireless Controller VM, both the active and standby controllers reload automatically. In the case of hardware platforms, you should reload the active controller manually, as only standby the controller reloads automatically.</p>

## Configuring Gateway Monitoring (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>[no] management gateway-failover enable</b> <b>Example:</b> Device(config)# management gateway-failover enable	Enables gateway monitoring. (Use the <b>no</b> form of this command to disable gateway monitoring.)
<b>Step 3</b>	<b>end</b> <b>Example:</b> Device(config)# end	Returns to privileged EXEC mode. <b>Note</b> To save the configuration, use the <b>write memory</b> command.

## Configuring Gateway Monitoring Interval (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>management gateway-failover interval</b> <i>interval-value</i> <b>Example:</b> Device(config)# management gateway-failover interval 6	Configures the gateway monitoring interval. <i>interval-value</i> - Refers to the gateway monitoring interval. The valid range is from 6 to 12. Default value is 8.
<b>Step 3</b>	<b>end</b> <b>Example:</b> Device(config)# end	Saves the configuration and exits configuration mode and returns to privileged EXEC mode.

# Gateway Reachability Detection

## Information About Gateway Reachability Detection

Gateway Reachability Detection feature minimizes the downtime on APs and clients when the gateway reachability is lost on the active controller.

Both active and standby controllers keep track of gateway reachability. The gateway reachability is detected by sending Internet Control Message Protocol (ICMP) and ARP requests periodically to the gateway.

Both active and standby controllers use the RMI IP as the source IP. The messages are sent at 1 second interval. If it takes 8 (or configured value) consecutive failures in reaching the gateway, the controller declares the gateway as non-reachable. It takes approximately 8 seconds to detect if a controller has lost gateway reachability.

Gateway monitoring with native IPv6 uses ICMP Neighbor Discovery protocols and ICMPv6 ECHO to check gateway reachability.

Therefore, you can monitor only the IPv6 gateway when RMI IPv6 is configured.

This means that only one IPv4 or IPv6 gateways can be monitored.

---

**Note** If the standby controller loses gateway, the standby moves to the standby recovery mode.  
If the active controller loses gateway, the active reloads and standby becomes active.

---

## Configuration Workflow

1. Configuring Redundancy Management Interface (GUI) (or) Configuring Redundancy Management Interface (CLI). For more information, see [Configuring Redundancy Management Interface \(GUI\), on page 1586](#).

---

**Note** For RMI configuration to take effect, ensure that you reload your controllers.

---

2. Configuring IPv6 Static Route. For information, see [Gateway Monitoring](#).
3. Configuring Gateway Monitoring Interval (CLI). For more information, see [Configuring Gateway Monitoring Interval \(CLI\), on page 1589](#).

## Migrating to RMI IPv6

### From RMI IPv4

1. Unconfigure the RMI IPv4 using the following CLIs:

```
Device# conf t
```

```
Device(config)# no redun-management interface <vlan_name> chassis 1 address <ip_address1>
chassis 2 address <ip_address2>
```

---

**Note** This CLI unconfigures RMI on both the controllers.

---

---

**Note** Take a backup of the running config on active before you reload the controller.

---

Reload the controller.

3. Copy the backed up config to the running config on the box which would have lost all the config.
4. Configure the RMI IPv6 on both the controllers. For information on the CLI, see [#unique\\_1960](#).
5. Reload the controller.

#### From HA Pairing (Without RMI)

For information on HA pairing, see [Configuring Redundancy Management Interface \(GUI\)](#).

## Monitoring the Health of the Standby Controller

The Standby Monitoring feature allows you to monitor the health of a system on a standby controller using programmatic interfaces and commands. This feature allows you to monitor parameters such as CPU, memory, interface status, power supply, fan failure, and the system temperature. Standby Monitoring is enabled when Redundancy Management Interface (RMI) is configured, no other configuration is required. The RMI itself is used to connect to the standby and perform standby monitoring. Standby Monitoring feature cannot be dynamically enabled or disabled.

---

**Note** The active controller uses the management or RMI IP to initiate AAA requests. Whereas, the standby controller uses the RMI IP to initiate AAA requests. Thus, the RMI IPs must be added in AAA servers for a seamless client authentication and standby monitoring.

---

To enable standby console, ensure that the following configuration is in place:

```
redundancy
main-cpu
secondary console enable
```

---

**Note** The Standby Monitoring feature is not supported on a controller in the active-recovery and the standby-recovery modes.

---

The Standby Monitoring feature supports only the following traffic on the RMI interface of the standby controller:

- Address Resolution Protocol (ARP)

- Internet Control Message Protocol (ICMP)
- TCP Traffic (to or from) ports: 22, 443, 830, and 3200
- UDP RADIUS ports: 1645 and 1646
- UDP Extended RADIUS ports: 21645 to 21844

### Feature Scenarios

- To monitor the health of the standby directly from the standby controller using Standby RMI IP.
- To get syslogs from the standby controller using the Standby RMI IP.

### Use Cases

- Enabling SNMP agent and programmatic interfaces on the standby controller: You can directly perform an SNMP query or programmatic interface query to the standby's RMI IP and active controller.
- Enabling syslogs on the standby controller: You can directly get the standby syslogs from the standby controller.

### RADIUS Accounting Support

Whenever you log in to a standby device, the RADIUS start record must be sent to the external RADIUS server. Similarly, when you log out of a device, the RADIUS stop record must be sent to the external RADIUS server.

### TACACS+ Authentication Support

Users are authenticated through the RMI using the external TACACS+ server. The username and password are evaluated in the TACACS+ server. Depending on the response received from the server, a user will be able to log in to the standby device.

### TACACS+ Accounting Support

Whenever you log in to the standby device, the TACACS+ accounting start record must be sent to the external TACACS+ server. Similarly, when you log out of a device, the TACACS+ accounting stop record must be sent to the external TACACS+ server.

---

**Note** The following configuration must be in place to configure AAA to send the accounting packets:

```
aaa accounting exec {default | named-list} start-stop group {RAD | tac-group-name}
```

---

---

**Note** The TACACS+ login to the standby device is not supported when TACACS+ server is configured with hostname.

---

# Monitoring the Health of Standby Parameters Using SNMP

## Standby Monitoring Using Standby RMI IP

When an SNMP agent is enabled on the standby controller, you can directly perform an SNMP query to the standby's RMI IP. From Release 17.5 onwards, you can query the following MIB on the standby controller:

*Table 111: MIB Name and Notes*

MIB Name	Notes
IF-MIB	This MIB is used to monitor the interface statistics of the standby controller using the standby RMI IP address.

**Note** If an SNMP agent is enabled on the active controller, by default, the SNMP is enabled on the standby controller.

## Standby Monitoring Using the Active Controller

### CISCO-LWAPP-HA-MIB

The CISCO-LWAPP-HA-MIB monitors the health parameters of the standby controller, that is, memory, CPU, port status, power statistics, peer gateway latencies, and so on.

You can query the following MIB objects of CISCO-LWAPP-HA-MIB.

*Table 112: MIB Objects and Notes*

MIB Objects	Notes
cLHaPeerHotStandbyEvent	This object can be used to check if the standby controller has turned hot-standby or not.
cLHaBulkSyncCompleteEvent	This object represents the time at which the bulksync is completed.

### CISCO-PROCESS-MIB

The CISCO-PROCESS-MIB monitors CPU and process statistics. Use it to monitor CPU-related or memory-related BINOS processes. The standby CISCO-PROCESS-MIB can be monitored using the active controller.

### ENTITY-MIB

The ENTITY-MIB is used to monitor hardware details of the active and standby controllers using the active controller.

---

**Note** The standby Route Processor (RP) sensors are appended in the active RP sensors.

---

## Standby IOS Linux Syslogs

The standby logs are relayed using the same method as on the active Cisco IOS for wireless controllers.

From Release 17.5 onwards, external logging of syslogs from the standby IOS is enabled. As BINOS processes on standby also forwards the syslogs to Cisco IOS, all the syslogs generated on the standby controller is forwarded to the configured external server.

---

**Note** RMI IP address is used for logging purpose.

---

The following is the expected behavior when an HA pair is configured with the RMI IPv6 address, the active controller has dual stack, and logging is configured on the IPv4 address:

The standby controller tries to send syslogs to the IPv4 server because logging is only configured on IPv4 even though IPv4 is not supported by standby.

## Standby Interface Status Using Active SNMP

The standby interface information is sent to the active controller using IPC in the following scenarios:

- When there is a change in the interface status.
- When a new interface is added or deleted on the standby controller.

When the active controller receives the interface information from the standby controller, the active controller's database is populated with the standby interface information.

When an SNMP query is received for the standby interface information, the SNMP handlers corresponding to the CISCO-LWAPP-HA-MIB reads them from the standby interface database on the active and populates the MIB objects in CISCO-LWAPP-HA-MIB.

You can query the following MIB objects of CISCO-LWAPP-HA-MIB.

**Table 113: MIB Objects of CISCO-LWAPP-HA-MIB**

MIB Object	Notes
stbyIfIndex	This is a unique value (greater than zero) for each interface of the standby controller.
stbyIfName	This is the name of the standby interface.
stbyIfPhysAddress	This is the interface address of the standby controller in the protocol sublayer.
stbyifOperStatus	This is the current operational state of the interface in the standby controller.

MIB Object	Notes
stbyifAdminStatus	This is the desired state of the interface of the standby controller.

To verify the logging on the active when the standby fails to send interface statistics, use the following command:

```
Device# debug snmp ha-chkpt
Device# debug snmp ha-intf_db
```

## Monitoring the Health of Standby Controller Using Programmatic Interfaces

You can monitor parameters such as CPU, memory, sensors, and interface status on a standby controller using programmatic interfaces such as NETCONF and RESTCONF. The RMI IP of the standby controller can be used for access to the following operational models:

The models can be accessed through .

- Cisco-IOS-XE-device-hardware-oper.yang
- Cisco-IOS-XE-process-cpu-oper.yang
- Cisco-IOS-XE-platform-software-oper.yang
- Cisco-IOS-XE-process-memory-oper.yang
- Cisco-IOS-XE-interfaces-oper.yang

For more information on the YANG models, see the *Programmability Configuration Guide, Cisco IOS XE Amsterdam 17.3.x*.

## Monitoring the Health of Standby Controller Using CLI

This section describes the different commands that can be used to monitor the standby device.

You can connect to the standby controller through SSH using the RMI IP of the standby controller. The user credentials must have been configured already. Both local authentication and RADIUS authentication are supported.

---

**Note** The **redun-management** command needs to be configured on both the controllers, primary and standby, prior to high availability (HA) pairing.

---

### Monitoring Port State

The following is a sample output of the **show interfaces interface-name** command:

```

Device-standby# show interfaces GigabitEthernet1

GigabitEthernet1 is down, line protocol is down
Shadow state is up, true line protocol is up
 Hardware is CSR vNIC, address is 000c.2909.33c2 (bia 000c.2909.33c2)
 MTU 1500 bytes, BW 1000000 Kbit/sec, DLY 10 usec,
 reliability 255/255, txload 1/255, rxload 1/255
 Encapsulation ARPA, loopback not set
 Keepalive set (10 sec)
 Full Duplex, 1000Mbps, link type is force-up, media type is Virtual
 output flow-control is unsupported, input flow-control is unsupported
 ARP type: ARPA, ARP Timeout 04:00:00
 Last input 00:00:06, output 00:00:24, output hang never
 Last clearing of "show interface" counters never
 Input queue: 30/375/0/0 (size/max/drops/flushes); Total output drops: 0
 Queueing strategy: fifo
 Output queue: 0/40 (size/max)
 5 minute input rate 389000 bits/sec, 410 packets/sec
 5 minute output rate 0 bits/sec, 0 packets/sec
 3696382 packets input, 392617128 bytes, 0 no buffer
 Received 0 broadcasts (0 multicasts)
 0 runts, 0 giants, 0 throttles
 0 input errors, 0 CRC, 0 frame, 0 overrun, 0 ignored
 0 watchdog, 0 multicast, 0 pause input
 18832 packets output, 1218862 bytes, 0 underruns
 Output 0 broadcasts (0 multicasts)
 0 output errors, 0 collisions, 2 interface resets
 3 unknown protocol drops
 0 babbles, 0 late collision, 0 deferred
 0 lost carrier, 0 no carrier, 0 pause output
 0 output buffer failures, 0 output buffers swapped out

```

The following is a sample output of the **show ip interface brief** command:

```

Device# show ip interface brief

Interface IP-Address OK? Method Status Protocol
GigabitEthernet1 unassigned YES unset down down
GigabitEthernet0 unassigned YES NVRAM administratively down down
Capwap1 unassigned YES unset up up
Capwap2 unassigned YES unset up up
Capwap3 unassigned YES unset up up
Capwap10 unassigned YES unset up up
Vlan1 unassigned YES NVRAM down down
Vlan56 unassigned YES unset down down
Vlan111 111.1.1.85 YES NVRAM up up

```

## Monitoring CPU or Memory

The following is a sample output of the **show process cpu sorted 5sec** command:

```

Device-standby# show process cpu sorted 5sec

CPU utilization for five seconds: 0%/0%; one minute: 0%; five minutes: 0%
PID Runtime(ms) Invoked uSecs 5Sec 1Min 5Min TTY Process
 10 1576556 281188 5606 0.15% 0.05% 0.05% 0 Check heaps

```

---

**Note** The command displays both active and standby hardware details.

---

---

**Note** The **show environment summary** command displays data only for physical appliances such as Cisco Catalyst 9800-80 Wireless Controller, Cisco Catalyst 9800-40 Wireless Controller, Cisco Catalyst 9800-L Wireless Controller, and Cisco Catalyst 9800 Embedded Wireless Controller for Switch. The command does not display data for Cisco Catalyst 9800 Wireless Controller for Cloud.

---

## Verifying the Gateway-Monitoring Configuration

To verify the status of the gateway-monitoring configuration on an active controller, run the following command:

```
Device# show redundancy states
```

```

my state = 13 -ACTIVE
peer state = 8 -STANDBY HOT
Mode = Duplex
Unit = Primary
Unit ID = 1

```

```

Redundancy Mode (Operational) = sso
Redundancy Mode (Configured) = sso
Redundancy State = sso
Maintenance Mode = Disabled
Manual Swact = enabled
Communications = Up

client count = 129
client_notification_TMR = 30000 milliseconds
RF debug mask = 0x0
Gateway Monitoring = Disabled
Gateway monitoring interval = 8 secs

```

To verify the status of the gateway-monitoring configuration on a standby controller, run the following command:

```

Device-stby# show redundancy states

my state = 8 -STANDBY HOT
peer state = 13 -ACTIVE
Mode = Duplex
Unit = Primary
Unit ID = 2

Redundancy Mode (Operational) = sso
Redundancy Mode (Configured) = sso
Redundancy State = sso
Maintenance Mode = Disabled
Manual Swact = cannot be initiated from this the standby unit
Communications = Up

client count = 129
client_notification_TMR = 30000 milliseconds
RF debug mask = 0x0
Gateway Monitoring = Disabled
Gateway monitoring interval = 8 secs

```

## Verifying the RMI IPv4 Configuration

Verify the RMI IPv4 configuration.

```

Device# show running-config interface vlan management-vlan

Building configuration...

Current configuration : 109 bytes
!
interface Vlan90
ip address 9.10.90.147 255.255.255.0 secondary
ip address 9.10.90.41 255.255.255.0
end

```

To verify the interface configuration for a standby controller, use the following command:

```

Device-stby# show running-config interface vlan 90

Building configuration...

Current configuration : 62 bytes
!
interface Vlan90

```

```
ip address 9.10.90.149 255.255.255.0
end
```

To verify the chassis redundancy management interface configuration for an active controller, use the following command:

```
Device# show chassis rmi

Chassis/Stack Mac Address : 000c.2964.1eb6 - Local Mac Address
Mac persistency wait time: Indefinite
 H/W Current
Chassis# Role Mac Address Priority Version State IP RMI-IP

*1 Active 000c.2964.1eb6 1 V02 Ready 169.254.90.147 9.10.90.147
2 Standby 000c.2975.3aa6 1 V02 Ready 169.254.90.149 9.10.90.149
```

To verify the chassis redundancy management interface configuration for a standby controller, use the following command:

```
Device-stby# show chassis rmi

Chassis/Stack Mac Address : 000c.2964.1eb6 - Local Mac Address
Mac persistency wait time: Indefinite
 H/W Current
Chassis# Role Mac Address Priority Version State IP RMI-IP

1 Active 000c.2964.1eb6 1 V02 Ready 169.254.90.147 9.10.90.147
*2 Standby 000c.2975.3aa6 1 V02 Ready 169.254.90.149 9.10.90.149
```

To verify the ROMMON variables on an active controller, use the following command:

```
Device# show romvar | include RMI

RMI_INTERFACE_NAME = Vlan90
RMI_CHASSIS_LOCAL_IP = 9.10.90.147
RMI_CHASSIS_REMOTE_IP = 9.10.90.149
```

To verify the ROMMON variables on a standby controller, use the following command:

```
Device-stby# show romvar | include RMI

RMI_INTERFACE_NAME = Vlan90
RMI_CHASSIS_LOCAL_IP = 9.10.90.149
RMI_CHASSIS_REMOTE_IP = 9.10.90.147
```

To verify the switchover reason, use the following command:

```
Device# show redundancy switchover history

Index Previous Current Switchover Switchover
----- active active reason time
----- -
 1 2 1 Active lost GW 17:02:29 UTC Mon Feb 3 2020
```

## Verifying the RMI IPv6 Configuration

To verify the chassis redundancy management interface configuration for both active and standby controllers, run the following command:

```
Device# show chassis rmi
```

```
Chassis/Stack Mac Address : 00a3.8e23.a540 - Local Mac Address
Mac persistency wait time: Indefinite
Local Redundancy Port Type: Twisted Pair
```

Chassis#	Role	Mac Address	Priority	H/W Version	Current State	IP	RMI-IP
1	Standby	706d.1536.23c0	1	V02	Ready	169.254.254.17	2020:0:0:1::211
*2	Active	00a3.8e23.a540	1	V02	Ready	169.254.254.18	2020:0:0:1::212

To verify the RMI related ROMMON variables for both active and standby controllers, run the following command

```
Device# show romvar | i RMI
```

```
RMI_INTERFACE_NAME = Vlan52
RMI_CHASSIS_LOCAL_IPV6 = 2020:0:0:1::212
RMI_CHASSIS_REMOTE_IPV6 = 2020:0:0:1::211
```

## Verifying Redundancy Port Interface Configuration

To verify the Redundancy Port Interface (RIF) resource status in an active instance, run the following command:

```
Device# show platform software rif-mgr chassis active R0 resource-status
RIF Resource Status
```

```
RP Status : Up
RMI Status : Up
Current Chassis State : Active
Peer Chassis State : Standby
```

To verify the RIF resource status in a standby instance, run the following command:

```
Device# show platform software rif-mgr chassis standby R0 resource-status
RIF Resource Status
```

```
RP Status : Up
RMI Status : Up
Current Chassis State : Standby
Peer Chassis State : Active
```

To verify the RMI link re-establishment count and the time since the RMI link is Up in the active instance, run the following command:

```
Device# show platform software rif-mgr chassis active R0 rmi-connection-details
```

```
RMI Connection Details
RMI Link re-establish count : 2
RMI Link Uptime : 21 hours 8 minutes 43 seconds
RMI Link Upsince : 08/05/2021 13:46:01
```

To verify the RMI link re-establishment count and the time since the RMI link is Down in the active instance, run the following command:

```
Device# show platform software rif-mgr chassis active R0 rmi-connection-details
RMI Connection Details
 RMI Link re-establish count : 1
 RMI Link Downtime : 28 seconds
 RMI Link Downsince : 07/16/2021 03:19:11
```

To verify the RMI link re-establishment count and the time since the RMI link is Up in the standby instance, run the following command:

```
Device# show platform software rif-mgr chassis standby R0 rmi-connection-details
RMI Connection Details
 RMI Link re-establish count : 1
 RMI Link Uptime : 1 hour 39 minute 9 seconds
 RMI Link Upsince : 07/16/2021 01:31:41
```

To verify the RMI link re-establishment count and the time since the RMI link is Down in the standby instance, run the following command:

```
Device# show platform software rif-mgr chassis standby R0 rmi-connection-details
RMI Connection Details
 RMI Link re-establish count : 1
 RMI Link Downtime : 22 seconds
 RMI Link Downsince : 07/16/2021 03:19:17
```

To verify the RP link re-establishment count and the time since the RP link is UP for days in the active instance, run the following command:

```
Device# show platform software rif-mgr chassis active R0 rp-connection-details
RP Connection Details
 RP Connection Uptime : 12 days 17 hours 1 minute 39 seconds
 RP Connection Upsince : 07/03/2021 07:06:20
```

To verify the RP link re-establishment count and the time since the RP link is Down in the active instance, run the following command:

```
Device# show platform software rif-mgr chassis active R0 rp-connection-details
RP Connection Details
 RP Connection Downtime : 4 seconds
 RP Connection Downsince : 07/16/2021 03:33:04
```

To verify the RP link re-establishment count and the time since the RP link is UP in the standby instance, run the following command:

```
Device# show platform software rif-mgr chassis standby R0 rp-connection-details
RP Connection Details
 RP Connection Uptime : 12 days 17 hours 2 minutes 1 second
 RP Connection Upsince : 07/03/2021 07:05:58
```

To verify the RP link re-establishment count and the time since the RP link is Down in the standby instance, run the following command:

```
Device# show platform software rif-mgr chassis standby R0 rp-connection-details
RP Connection Details
 RP Connection Downtime : 22 seconds
 RP Connection Downsince : 07/16/2021 03:19:17
```

To verify the RIF and stack manager internal statistics in the active instance, run the following command:

```
Device# show platform software rif-mgr chassis active R0 rif-stk-internal-stats
RIF Stack Manager internal stats

 Stack-mgr reported RP down : False
 DAD link status reported to Stack-Mgr : True
```

To verify the RIF and stack manager internal statistics in the standby instance, run the following command:

```
Device# show platform software rif-mgr chassis standby R0 rif-stk-internal-stats
RIF Stack Manager internal stats
```

```
Stack-mgr reported RP down : False
DAD link status reported to Stack-Mgr : True
```

To verify the number of packets sent or received for each type in the active instance, run the following command:

```
Device# show platform software rif-mgr chassis active R0 lmp-statistics
LMP Statistics
```

```
Info Type Sent : 6
Solicit Info Type Sent : 0
Unsolicit Info Type Sent : 6
Reload Type Sent : 0
Recovery Type Sent : 1
Gateway Info Type Sent : 0
Enquiry Type Sent : 0
Solicit Enquiry Type Sent : 0
Unsolicit Enquiry Type Sent : 0
```

```
Info Type Received : 5
Solicit Info Type Received : 2
Unsolicit Info Type Received : 3
Reload Type Received : 0
Recovery Type Received : 0
Gateway Info Type Received : 4
Enquiry Type Received : 0
Solicit Enquiry Type Received : 0
Unsolicit Enquiry Type Received : 0
```

To verify the number of packets sent or received for each type in the standby instance, run the following command:

```
Device# show platform software rif-mgr chassis standby R0 lmp-statistics
LMP Statistics
```

```
Info Type Sent : 6
Solicit Info Type Sent : 0
Unsolicit Info Type Sent : 6
Reload Type Sent : 0
Recovery Type Sent : 0

Solicit Enquiry Type Received : 0
Unsolicit Enquiry Type Received : 0
```

# Information About Auto-Upgrade

The Auto-Upgrade feature enables the standby controller to upgrade with the software image of the active controller so that both controllers form an HA pair.

---

**Note**

- This feature supports the active controller in INSTALL mode.
  - This feature supports Cisco Catalyst 9800 Series Wireless Controller software versions 17.5.1 and later.
  - This feature is triggered in the standby controller only when the active image is in committed state.
- 

## Use Cases

The following are the use cases and functionalities supported by the Auto-Upgrade feature:

- Handling software version mismatch: During an upgrade, if one of the redundancy port is upgraded to a newer version, and the other one is not upgraded at the same time, the active port tries to copy its packages to the other port using the Auto-Upgrade feature. You can enable Auto-Upgrade in this situation using configuration or by manually running the **software auto-upgrade enable** privileged EXEC command.

The auto-upgrade configuration is enabled by default.

---

**Note**

Auto-upgrade upgrades the mismatched redundancy port only when both the active redundancy port and the mismatched redundancy port are in INSTALL mode.

---

- HA pair: If one of the controller is not upgraded successfully, use Auto-Upgrade to upgrade the controller on the newly deployed HA pair, which can each be a different version.
- SMUs (APSP, APDP, and so on): If the SMUs that are successfully installed on the active controller when the standby controller was offline. In this scenario, when the standby controller comes up online, the Auto-Upgrade copies this SMU to the standby controller and installs it.

## Configuration Workflow

[#unique\\_1976](#)

## Configuring Auto-Upgrade (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>software auto-upgrade enable</b> <b>Example:</b> Device(config)# <code>software auto-upgrade enable</code>	Enables the Auto-Upgrade feature. (This feature is enabled by default.)  If you disable this feature using the <b>no</b> form of this command, you need to manually auto upgrade using the <b>install autoupgrade</b> command in privileged EXEC mode.
<b>Step 3</b>	<b>end</b> <b>Example:</b> Device(config)# <code>end</code>	Returns to privileged EXEC mode.

## Use Case for Link Layer Discovery Protocol (LLDP)

In a high-availability (HA) setup, when two wireless units act as active and standby, the LLDP still runs independently in both.

When you execute the LLDP neighbors command, the system name as the neighbor entry in the uplink switch is displayed as *hostname-stbdy*.

## Enabling LLDP (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>lldp run</b> <b>Example:</b> Device(config)# <code>lldp run</code>	Enables Link Layer Discovery Protocol (LLDP).

	Command or Action	Purpose
<b>Step 3</b>	<b>end</b>  <b>Example:</b> Device(config)# end	Returns to privileged EXEC mode.

## Enabling LLDP Timers (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>lldp holdtime <i>time_in_secs</i></b>  <b>Example:</b> Device(config)# lldp holdtime 100	Enables LLDP timers. The timer decides how long the receiver must keep the packet. Valid range is from 0 to 65535 seconds.
<b>Step 3</b>	<b>lldp reinit <i>delay_in_secs</i></b>  <b>Example:</b> Device(config)# lldp reinit 3	Specifies the delay, in seconds for LLDP to initialize. Valid range is from 2 to 5 seconds.
<b>Step 4</b>	<b>lldp timer <i>time_in_secs</i></b>  <b>Example:</b> Device(config)# lldp timer 7	Specifies the rate at which the LLDP packets are sent, in seconds. Valid range is from 5 to 65534 seconds.
<b>Step 5</b>	<b>end</b>  <b>Example:</b> Device(config)# end	Returns to privileged EXEC mode.

## Enabling LLDP TLV-Select (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>lldp tlv-select [mac-phy-cfg   management-address   port-description  </b>	Enables type, length, and value (TLV) selection for LLDP.

	Command or Action	Purpose
	<b>port-vlan   system-capabilities   system-description]</b>  <b>Example:</b> Device(config)# lldp tlv-select port-vlan	<ul style="list-style-type: none"> <li>• <b>mac-phy-cfg:</b> IEEE 802.3 MAC, physical configuration, or status TLV.</li> <li>• <b>management-address:</b> Management address TLV.</li> <li>• <b>port-description:</b> Port description TLV.</li> <li>• <b>port-vlan:</b> Port VLAN ID TLV.</li> <li>• <b>system-capabilities:</b> System capabilities TLV.</li> <li>• <b>system-description:</b> System description TLV.</li> </ul>
<b>Step 3</b>	<b>end</b>  <b>Example:</b> Device(config)# end	Returns to privileged EXEC mode.

## Verifying LLDP

Use the following **show** commands to view the LLDP details independently in the active and standby controller.

To verify the timer and status in the active and standby controller, use the following command:

```
Device# show lldp
Global LLDP Information:
 Status: ACTIVE
 LLDP advertisements are sent every 30 seconds
 LLDP hold time advertised is 120 seconds
 LLDP interface reinitialisation delay is 2 seconds
```

To verify the neighbor details in the active controller, use the following command:

```
Device# show lldp neighbors
Capability codes:
 (R) Router, (B) Bridge, (T) Telephone, (C) DOCSIS Cable Device
 (W) WLAN Access Point, (P) Repeater, (S) Station, (O) Other
Device ID Local Intf Hold-time Capability Port ID
9500-SW Tw0/0/0 120 B,R Twel/0/14
```

To verify the neighbor details in the standby controller, use the following command:

```
Device# show lldp neighbors
Capability codes:
 (R) Router, (B) Bridge, (T) Telephone, (C) DOCSIS Cable Device
 (W) WLAN Access Point, (P) Repeater, (S) Station, (O) Other
Device ID Local Intf Hold-time Capability Port ID
9500-SW Tw0/0/0 120 B,R Twel/0/13
Total entries displayed: 1
```

To verify the LLDP neighbor (TLV) detail, use the following command:

```
Device# show lldp neighbors detail

Local Intf: Te0/0/0
```

```
Chassis id: 2cd0.2d62.be80
Port id: Te1/1
Port Description: TenGigabitEthernet1/1
System Name: HSRP-ROUTER-1-15.cisco.com
```

```
System Description:
Cisco IOS Software, IOS-XE Software, Catalyst 4500 L3 Switch Software (cat4500e-UNIVERSAL-M),
Version 03.09.00.E RELEASE SOFTWARE (fc1)
Technical Support: http://www.cisco.com/techsupport
Copyright (c) 1986-2016 by Cisco Systems, Inc.
Compiled Tue 19-Jul
```

```
Time remaining: 99 seconds
System Capabilities: B,R
Enabled Capabilities: B,R
Management Addresses:
 IP: 8.109.0.1
 IPV6: 2001:12:1::2
Auto Negotiation - not supported
Physical media capabilities:
 Other/unknown
Media Attachment Unit type - not advertised
Vlan ID: 109
Peer Source MAC: 2cd0.2d62.be80
```

To verify the LLDP details in the uplink switch, use the following command:

```
Device# show lldp neighbors detail
```

```

Local Intf: Te1/1
Chassis id: d4e8.80b3.0420
Port id: Te0/0/0
Port Description: TenGigabitEthernet0/0/0
System Name: WLC-BGL15.cisco.com
```

```
System Description:

 IPV6: FD09:8:109::45
Auto Negotiation - not supported
Physical media capabilities - not advertised
Media Attachment Unit type - not advertised
Vlan ID: 109
```

To verify LLDP packet errors, use the following command:

```
Device# show lldp errors
LLDP errors/overflows:
Total memory allocation failures: 0
Total encapsulation failures: 0
Total input queue overflows: 0
Total table overflows: 0
```

To verify LLDP traffic statistics, use the following command:

```
Device# show lldp traffic
LLDP traffic statistics:
Total frames out: 18470
```

```

Total entries aged: 0
Total frames in: 6156
Total frames received in error: 0
Total frames discarded: 0
Total TLVs discarded: 0
Total TLVs unrecognized: 0

```

## Feature History for Reload Reason History

This table provides release and related information about the feature explained in this section.

This feature is also available in all the releases subsequent to the one in which they are introduced in, unless noted otherwise.

**Table 114: Feature History for Reload Reason History**

Release	Feature	Feature Information
Cisco IOS XE Dublin 17.11.1	Reload Reason History	The Reload Reason History feature tracks the reasons for controller reload. This is done for the last 10 reloads.  In Cisco IOS-XE Dublin 17.10.x and earlier releases, it was possible to track only the reason for the last reload.

## Information About Reload Reason History

The Reload Reason History feature tracks the reasons for controller reload. This is done for the last 10 reloads. You will be able to view the history using the show version and the Network Configuration Protocol (NETCONF). This history is useful for serviceability and troubleshooting.

## Verifying Reload Reason History

To view the reload history details, use the following command:

```
Device# show reload-history
```

```
Reload History:
```

```

Reload Index: 1
Reload Code: Reload

## Requesting Reload Reason History using YANG

Use YANG with NETCONF and RESTCONF to provide the desired solution for automated and programmable network operations.

Use the following RPC to create a NETCONF GET request for reload history data:

```
<nc:rpc xmlns:nc="urn:ietf:params:xml:ns:netconf:base:1.0"
message-id="urn:uuid:da15955f-5bb7-437c-aeb5-0fc7901a1e9e">
```

```

<nc:get>
 <nc:filter>
 <device-hardware-data
xmlns="http://cisco.com/ns/yang/Cisco-IOS-XE-device-hardware-oper">
 <device-hardware>
 <device-system-data>
 <reload-history/>
 </device-system-data>
 </device-hardware>
 </device-hardware-data>
 </nc:filter>
</nc:get>
</nc:rpc>

<rpc-reply message-id="urn:uuid:da15955f-5bb7-437c-aeb5-0fc7901a1e9e"
xmlns="urn:iETF:params:xml:ns:netconf:base:1.0"

## Wireless QoS Overview

Quality of Service (QoS), provides the ability to prioritize the traffic by giving preferential treatment to specific traffic over the other traffic types. Without QoS, the device offers best-effort service for each packet, regardless of the packet contents or size. The device sends the packets without any assurance of reliability, delay bounds, or throughput.

A target is the entity where the policy is applied. Wireless QoS policies for SSID and client are applied in the upstream and (or) downstream direction. The flow of traffic from a wired source to a wireless target is known as downstream traffic. The flow of traffic from a wireless source to a wired target is known as upstream traffic.

The following are some of the specific features provided by wireless QoS:

- SSID and client policies on wireless QoS targets
- Marking and Policing (also known as Rate Limiting ) of wireless traffic
- Mobility support for QoS

# Wireless QoS Targets

This section describes the various wireless QoS targets available on a device.

## SSID Policies

You can create QoS policies on SSID in both the ingress and egress directions. If not configured, there is no SSID policy applied.

The policy is applicable per AP per SSID.

You can configure policing and marking policies on SSID.

## Client Policies

Client policies are applicable in the ingress and egress direction. You can configure policing and marking policies on clients. AAA override is also supported.

## Supported QoS Features on Wireless Targets

This table describes the various features available on wireless targets.

**Table 115: QoS Features Available on Wireless Targets**

Target	Features	Direction Where Policies Are Applicable
SSID	<ul style="list-style-type: none"> <li>• Set</li> <li>• Police</li> <li>• Drop</li> </ul>	Upstream and downstream
Client	<ul style="list-style-type: none"> <li>• Set</li> <li>• Police</li> <li>• Drop</li> </ul>	Upstream and downstream

This table describes the various features available on wireless targets.

**Table 116: QoS Policy Actions**

Policy Action Types	Wireless Target Support	
	Local Mode	Flex Mode
Police	Supported	Supported
Set	Supported	Supported

This table describes the various features available on wireless targets.

**Table 117: QoS Policy Set Actions**

Set Action Types	Supported	
	Local Mode	Flex Mode
set dscp	Supported	Supported
set qos-group	Supported	Not Supported
set wlan user-priority (downstream only)	Supported (BSSID only)	Supported (BSSID only)

## Wireless QoS Mobility

Wireless QoS mobility enables you to configure QoS policies so that the network provides the same service anywhere in the network. A wireless client can roam from one location to another and as a result the client can get associated to different access points associated with a different device. Wireless client roaming can be classified into two types:

- Intra-device roaming
- Inter-device roaming

---

**Note** In a foreign WLC, client statistics are not displayed.

---

---

**Note** The client policies must be available on all of the devices in the mobility group. The same SSID policy must be applied to all devices in the mobility group so that the clients get consistent treatment.

---

## Precious Metal Policies for Wireless QoS

The precious metal policies are system-defined policies that are available on the controller. They cannot be removed or changed.

The following policies are available:

- Platinum—Used for VoIP clients.
- Gold—Used for video clients.
- Silver—Used for traffic that can be considered best-effort.
- Bronze—Used for NRT traffic.

These policies are pre-configured. They cannot be modified.

For client metal policies, they can be pushed using AAA.

Based on the policies applied, the 802.11e (WMM), and DSCP fields in the packets are affected.

For more information about metal policies see the [Metal Policy Map, on page 1621](#) section.

For more information about DSCP to UP mapping, see the [#unique\\_1993](#) table.

## Prerequisites for Wireless QoS

Before configuring wireless QoS, you must have a thorough understanding of these items:

- Wireless concepts and network topologies.
- Understanding of QoS implementation.
- Modular QoS CLI (MQC). For more information on Modular QoS, see the [MQC](#) guide
- The types of applications used and the traffic patterns on your network.
- Bandwidth requirements and speed of the network.

## Restrictions for QoS on Wireless Targets

### General Restrictions

A target is an entity where a policy is applied. A policy can be applied to a wireless target, which can be an SSID or client target, in the downstream and/or upstream direction. Downstream indicates that traffic is flowing from the controller to the wireless client. Upstream indicates that traffic is flowing from wireless client to the controller.

- Hierarchical (Parent policy and child policy) QoS is not supported.
- SSID and client targets can be configured only with marking and policing policies.
- One policy per target per direction is supported.
- Class maps in a policy map can have different types of filters. However, only one marking action (set dscp) is supported.
- Only one set action per class is supported.
- Access group matching is not supported.
- Access group (ACL) matching is not supported by access points in flex mode for local switching traffic.
- SIP Call Admission Control (CAC) is not supported on the central switching mode.
- From Cisco IOS XE Amsterdam 17.3.1 onwards, SIP Call Admission Control (CAC) is not supported.
- Applying QoS on the WMI interface is not supported, as it may reboot the controller.

### AP Side Restrictions

- In Cisco Embedded Wireless Controller, FlexConnect local switching, and SDA deployments, the QoS policies are enforced on the AP. Due to this AP-side restriction, police actions (e.g., rate limiting) are only enforced at a per flow (5-tuple) level and not per client.
- For FlexConnect local switching (local authentication) with AAA override enabled and external AAA server, only air space VLAN and ACL are supported as part of the AAA override and not the QoS override or other overrides.

### Control Plane Rate Limiting and Policing

You need not explicitly configure control plane rate limiting or policing on the controller. The controller has embedded mechanisms (like policers) to protect the CPU by policing control plane traffic directed towards it. If you're migrating from AireOS to IOS-XE, this change is taken care of at the code level.

## How to apply Bi-Directional Rate Limiting

### Information about Bi-Directional Rate Limiting

Bi-Directional Rate Limiting (BDRL) feature defines rate limits on both upstream and downstream traffic. These rate limits are individually configured. The rate limits can be configured on WLAN directly instead of QoS profiles, which will override QoS profile values. The WLAN rate limiting will always supersede Global QoS setting for controller and clients.

BDRL feature defines throughput limits for clients on their wireless networks and allows setting a priority service to a particular set of clients.

The following four QoS profiles are available to configure the rate limits:

- Gold
- Platinum
- Silver
- Bronze

The QoS profile is applied to all clients on the associated SSID. Therefore all clients connected to the same SSID will have the same rate limits.

To configure BDRL, select the QoS profile and configure the various rate limiting parameters. When rate limiting parameters are set to 0, the rate limiting feature is not functional. Each WLAN has a QoS profile associated with it in addition to the configuration in the QoS profile.

---

**Note** BDRL in a mobility Anchor-Foreign setup must be configured both on Anchor and Foreign controller. As a best practice, it is recommended to perform identical configuration on both the controllers to avoid breakage of any feature.

BDRL is supported on Guest anchor scenarios. The feature is supported on IRCM guest scenarios with AireOS as Guest anchor or Guest Foreign. Cisco Catalyst 9800 Series Wireless Controller uses **Policing** option to rate limit the traffic.

---

To apply metal policy with BDRL, perform the following tasks:

- [Configure Metal Policy on SSID](#)
- [Configure Metal Policy on Client](#)
- [#unique\\_2003](#)
- [#unique\\_2004](#)
- [#unique\\_2005](#)
- [#unique\\_2006](#)

## Prerequisites for Bi-Directional Rate Limiting

- Client metal policy is applied through AAA-override.
- You must specify the metal policy on ISE server.
- AAA-override must be enabled on policy profile.

## Configure Metal Policy on SSID

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wireless profile policy <i>policy-profile-name</i></b> <b>Example:</b> Device(config)# wireless profile policy policy-profile1	Configures WLAN policy profile and enters wireless policy configuration mode.
<b>Step 3</b>	<b>description <i>description</i></b> <b>Example:</b> Device(config-wireless-policy)# description policy-profile1	Adds a user defined description to the new wireless policy.
<b>Step 4</b>	<b>service-policy input <i>input-policy</i></b> <b>Example:</b> Device(config-wireless-policy)# service-policy input platinum-up	Sets platinum policy for input.
<b>Step 5</b>	<b>service-policy output <i>output-policy</i></b> <b>Example:</b> Device(config-wireless-policy)# service-policy output platinum	Sets platinum policy for output.

## Configure Metal Policy on Client

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wireless profile policy <i>policy-profile-name</i></b> <b>Example:</b> Device(config)# wireless profile policy policy-profile1	Configures WLAN policy profile and enters wireless policy configuration mode.
<b>Step 3</b>	<b>description <i>description</i></b> <b>Example:</b>	Adds a user defined description to the new wireless policy.

	Command or Action	Purpose
	Device(config-wireless-policy)# description profile with aaa override	
<b>Step 4</b>	<b>aaa-override</b>  <b>Example:</b> Device(config-wireless-policy)# aaa-override	Enables AAA override on the WLAN.  <b>Note</b> After AAA-override is enabled and ISE server starts sending policy, client policy defined in service-policy client will not take effect.

## Configure Bi-Directional Rate Limiting for All Traffic

Use the police action in the policy-map to configure BDRL.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>policy-map <i>policy-map</i></b>  <b>Example:</b> Device(config)# policy-map policy-sample 1	Creates a named object representing a set of policies that are to be applied to a set of traffic classes. Policy-map names can contain alphabetic, hyphen, or underscore characters, are case sensitive, and can be up to 40 characters.
<b>Step 3</b>	<b>class <i>class-map-name</i></b>  <b>Example:</b> Device(config-pmap)# class class-default	Associates a class map with the policy map, and enters policy-map class configuration mode.
<b>Step 4</b>	<b>police <i>rate</i></b>  <b>Example:</b> Device(config-pmap-c)# police 500000	Configures traffic policing (average rate, in bits per second). Valid values are 8000 to 200000000.

## Configure Bi-Directional Rate Limiting Based on Traffic Classification

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.

	<b>Command or Action</b>	<b>Purpose</b>
<b>Step 2</b>	<b>policy-map</b> <i>policy-map</i> <b>Example:</b> <pre>Device(config)# policy-map policy-sample2</pre>	Creates a named object representing a set of policies that are to be applied to a set of traffic classes. Policy-map names can contain alphabetic, hyphen, or underscore characters, are case sensitive, and can be up to 40 characters.
<b>Step 3</b>	<b>class</b> <i>class-map-name</i> <b>Example:</b> <pre>Device(config-pmap)# class class-sample-youtube</pre>	Associates a class map with the policy map, and enters policy-map class configuration mode.
<b>Step 4</b>	<b>police</b> <i>rate</i> <b>Example:</b> <pre>Device(config-pmap-c)# police 1000000</pre>	Configures traffic policing (average rate, in bits per second). Valid values are 8000 to 200000000.
<b>Step 5</b>	<b>conform-action</b> <b>drop</b> <b>Example:</b> <pre>Device(config-pmap-c-police)# conform-action drop</pre>	Specifies the drop action to take on packets that conform to the rate limit.
<b>Step 6</b>	<b>exceed-action</b> <b>drop</b> <b>Example:</b> <pre>Device(config-pmap-c-police)# exceed-action drop</pre>	Specifies the drop action to take on packets that exceeds the rate limit.
<b>Step 7</b>	<b>exit</b> <b>Example:</b> <pre>Device(config-pmap-c-police)# exit</pre>	Exits the policy-map class configuration mode.
<b>Step 8</b>	<b>set dscp default</b> <b>Example:</b> <pre>Device(config-pmap-c)# set dscp default</pre>	Sets the DSCP value to default.
<b>Step 9</b>	<b>police</b> <i>rate</i> <b>Example:</b> <pre>Device(config-pmap-c)# police 500000</pre>	Configures traffic policing (average rate, in bits per second). Valid values are 8000 to 200000000.
<b>Step 10</b>	<b>exit</b> <b>Example:</b> <pre>Device(config-pmap-c)# exit</pre>	Exits the policy-map class configuration mode.
<b>Step 11</b>	<b>exit</b> <b>Example:</b> <pre>Device(config-pmap)# exit</pre>	Exits the policy-map configuration mode.

	Command or Action	Purpose
<b>Step 12</b>	<b>class-map match-any</b> <i>class-map-name</i> <b>Example:</b> Device(config)# class-map match-any class-sample-youtube	Selects a class map.
<b>Step 13</b>	<b>match protocol</b> <i>protocol</i> <b>Example:</b> Device(config-cmap)# match protocol youtube	Configures the match criteria for a class map on the basis of the specified protocol.

## Apply Bi-Directional Rate Limiting Policy Map to Policy Profile

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wireless profile policy</b> <i>policy-profile-name</i> <b>Example:</b> Device(config)# wireless profile policy policy-profile3	Configures WLAN policy profile and enters wireless policy configuration mode.
<b>Step 3</b>	<b>description</b> <i>description</i> <b>Example:</b> Device(config-wireless-policy)# description policy-profile3	Adds a user defined description to the new wireless policy.
<b>Step 4</b>	<b>service-policy client input</b> <i>input-policy</i> <b>Example:</b> Device(config-wireless-policy)# service-policy client input platinum-up	Sets the input client service policy as platinum.
<b>Step 5</b>	<b>service-policy client output</b> <i>output-policy</i> <b>Example:</b> Device(config-wireless-policy)# service-policy client output platinum	Sets the output client service policy as platinum.
<b>Step 6</b>	<b>service-policy input</b> <i>input-policy</i> <b>Example:</b> Device(config-wireless-policy)# service-policy input platinum-up	Sets the input service policy as platinum.

	Command or Action	Purpose
<b>Step 7</b>	<b>service-policy output</b> <i>output-policy</i> <b>Example:</b> Device(config-wireless-policy)# service-policy output platinum	Sets the output service policy as platinum.

## Apply Metal Policy with Bi-Directional Rate Limiting

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wireless profile policy</b> <i>policy-profile-name</i> <b>Example:</b> Device(config)# wireless profile policy policy-profile3	Configures WLAN policy profile and enters wireless policy configuration mode.
<b>Step 3</b>	<b>description</b> <i>description</i> <b>Example:</b> Device(config-wireless-policy)# description policy-profile3	Adds a user defined description to the new wireless policy.
<b>Step 4</b>	<b>service-policy client input</b> <i>input-policy</i> <b>Example:</b> Device(config-wireless-policy)# service-policy client input platinum-up	Sets the input client service policy as platinum.
<b>Step 5</b>	<b>service-policy client output</b> <i>output-policy</i> <b>Example:</b> Device(config-wireless-policy)# service-policy client output platinum	Sets the output client service policy as platinum.
<b>Step 6</b>	<b>service-policy input</b> <i>input-policy</i> <b>Example:</b> Device(config-wireless-policy)# service-policy input platinum-up	Sets the input service policy as platinum.
<b>Step 7</b>	<b>service-policy output</b> <i>output-policy</i> <b>Example:</b> Device(config-wireless-policy)# service-policy output platinum	Sets the output service policy as platinum.

	Command or Action	Purpose
<b>Step 8</b>	<b>exit</b> <b>Example:</b> Device(config-wireless-policy)# exit	Exits the policy configuration mode.
<b>Step 9</b>	<b>policy-map <i>policy-map</i></b> <b>Example:</b> Device(config)# policy-map policy-sample 1	Creates a named object representing a set of policies that are to be applied to a set of traffic classes. Policy map names can contain alphabetic, hyphen, or underscore characters, are case sensitive, and can be up to 40 characters.
<b>Step 10</b>	<b>class <i>class-map-name</i></b> <b>Example:</b> Device(config-pmap)# class class-default	Associates a class map with the policy map, and enters configuration mode for the specified system class.
<b>Step 11</b>	<b>police <i>rate</i></b> <b>Example:</b> Device(config-pmap-c)# police 500000	Configures traffic policing (average rate, in bits per second). Valid values are 8000 to 200000000.

## How to apply Per Client Bi-Directional Rate Limiting

### Information About Per Client Bi-Directional Rate Limiting

The Per Client Bi-Directional Rate Limiting feature adds bi-directional rate limiting for each wireless clients on 802.11ac Wave 2 APs in a Flex local switching configuration. Earlier, the Wave 2 APs supported only per-flow rate limiting for a wireless client. When wireless client starts multiple streams of traffic, the client-based rate limiting does not work as expected. This limitation is addressed by this feature.

For instance, if the controller is configured with QoS policy and you expect each client to have a rate limiting cap of 1000 kbps. Due to per-flow rate limiting on the AP, if the wireless client starts a Youtube stream and FTP stream, each of them will be rate limited at 1000 Kbps, therefore the client will be 2000 Kbps rates. This is not desirable.

#### Use Cases

The following are the use cases supported by the Per Client Bi-Directional Rate Limiting feature:

##### Use Case -1

##### Configuring only default class map

If policy map is configured only with default class map and mapped only to QoS client policy, AP does a per client rate limit to the client connected to AP.

##### Use Case-2

##### Changing from per client rate limit to per flow rate limit

If policy map is configured with another different class map along with a default class map and mapped to QoS client policy, AP performs per flow rate limit to client. As policy map has different class map along with the default class map. The per client rate limit values are cleared, if the AP has previously configured per client rate limit.

If the policy map has more than one class map, then additional class map is configured along with the default class map. So, the rate limit is applied from per client to per flow. The per client rate limit value is deleted from the rate info token bucket.

### Use Case-3

#### Changing from per flow rate limit to per client limit

If different class map is removed from policy map and policy map has only one default class map, AP performs a per client rate limit to client.

The following covers the high-level steps for Per Client Bi-Directional Rate Limiting feature:

1. Configure a policy map to WLAN through policy profile.
2. Map the QoS related policy map to WLAN.
3. Configure policy map with the default class map.
4. Configure different police rate value for class Default map.

---

**Note** If policy map has class Default with valid police rate value, AP applies that rate limit to the overall client data traffic flow.

---

5. Apply the policy map with class Default to QoS client policy in WLAN policy profile.

## Prerequisites for Per Client Bi-Directional Rate Limiting

- This feature is exclusive to QoS client policy, that is, the policy profile must have only QoS Policy or policy target as client.
- If policy map has class default with valid police rate value, AP applies that rate limit value to the overall client data traffic flow.

## Restrictions on Per Client Bi-Directional Rate Limiting

- If policy map has class map other than the class Default map, the per client rate limit does not work in AP.
- From Cisco IOS XE Bengaluru 17.5.x onwards, AAA override can be leveraged to push the attributes to achieve per client rate limit.
- From Cisco IOS XE Bengaluru 17.6 onwards, per client bi-directional rate limit is supported on 802.11ac Wave 2 APs and 11ax APs in the Flex local switching configuration. However, due to the [CSCwh74415](#) defect, in order to avoid the latest QoS policy return (which needs to be applied to all the clients connected to the same AP, thereby overriding all other QoS policies), you must add the AV-pairs in the authorization profile on Cisco ISE.

## Configuring Per Client Bi-Directional Rate Limiting (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Tags & Profiles > Policy**.
- Step 2** Click the Policy Profile Name.  
The **Edit Policy Profile** window is displayed.  
**Note** The **Edit Policy Profile** window is displayed and configured in default class map only.
- Step 3** Choose the **QoS And AVC** tab.
- Step 4** In the **QoS Client Policy** settings, choose the policies from the **Egress** and **Ingress** drop-down lists.  
**Note** You need to apply the default policy map to the QoS Client Policy.
- Step 5** Click **Update & Apply to Device**.
- 

## Verifying Per Client Bi-Directional Rate Limiting

To verify whether per client is applied in AP, use the following command:

```
Device# show rate-limit client
Config:
 mac vap rt_rate_out rt_rate_in rt_burst_out rt_burst_in nrt_rate_out nrt_rate_in
nrt_burst_out nrt_burst_in
A0:D3:7A:12:6C:5E 0 0 0 0 0 0
0 0 0
Statistics:
 name up down
 Unshaped 0 0
 Client RT pass 697610 8200
 Client NRT pass 0 0
 Client RT drops 0 0
 Client NRT drops 0 16
 9 180 0
Per client rate limit:
 mac vap rate_out rate_in policy
A0:D3:7A:12:6C:5E 0 88 23 per_client_rate_2
```

## Configuring BDRL Using AAA Override

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.

	Command or Action	Purpose
<b>Step 2</b>	<b>wireless profile policy</b> <i>profile-name</i> <b>Example:</b> Device (config)# <b>wireless profile policy</b> <b>default-policy-profile</b>	Configures the WLAN policy profile and enters wireless policy configuration mode.
<b>Step 3</b>	<b>aaa-override</b> <b>Example:</b> Device (config-wireless-policy)# <b>aaa</b>	Configures AAA override to apply policies coming from the AAA server or ISE the Cisco Identify Services Engine (ISE) server.  The following attributes are available in the RADIUS server: <ul style="list-style-type: none"> <li>• Airespace-Data-Bandwidth-Average-Contract: 8001</li> <li>• Airespace-Real-Time-Bandwidth-Average-Contract: 8002</li> <li>• Airespace-Data-Bandwidth-Burst-Contract: 8003</li> <li>• Airespace-Real-Time-Bandwidth-Burst-Contract: 8004</li> <li>• Airespace-Data-Bandwidth-Average-Contract-Upstream: 8005</li> <li>• Airespace-Real-Time-Bandwidth-Average-Contract-Upstream: 8006</li> <li>• Airespace-Data-Bandwidth-Burst-Contract-Upstream: 8007</li> <li>• Airespace-Real-Time-Bandwidth-Burst-Contract-Upstream: 8008</li> </ul> <p><b>Note</b> 8001, 8002, 8003, 8004, 8005, 8006, 8007, and 8008 are the desired rate-limit values configured as an example.</p>

## Verifying Bi-Directional Rate-Limit

To verify the bi-directional rate limit, use the following command:

```
Device# show wireless client mac-address E8-8E-00-00-00-71 detail
Client MAC Address : e88e.0000.0071
Client MAC Type : Universally Administered Address
Client IPv4 Address : 100.0.7.94
Client Username : e88e00000071
AP MAC Address : 0a0b.0c00.0200
AP Name : AP6B8B4567-0002
AP slot : 0
```

```

Client State : Associated
Policy Profile : dnas_qos_profile_policy
Flex Profile : N/A
Wireless LAN Id : 10
WLAN Profile Name : QoS_wlan
Wireless LAN Network Name (SSID): QoS_wlan
BSSID : 0a0b.0c00.0200
Connected For : 28 seconds
Protocol : 802.11n - 2.4 GHz
Channel : 1
Client IIF-ID : 0xa0000034
Association Id : 10
Authentication Algorithm : Open System
Idle state timeout : N/A
Session Timeout : 1800 sec (Remaining time: 1777 sec)
Session Warning Time : Timer not running
Input Policy Name : None
Input Policy State : None
Input Policy Source : None
Output Policy Name : None
Output Policy State : None
Output Policy Source : None
WMM Support : Enabled
U-APSD Support : Disabled
Fastlane Support : Disabled
Client Active State : In-Active
Power Save : OFF
Supported Rates : 1.0,2.0,5.5,6.0,9.0,11.0,12.0,18.0,24.0,36.0,48.0,54.0

```

**AAA QoS Rate Limit Parameters:**

```

QoS Average Data Rate Upstream : 8005 (kbps)
QoS Realtime Average Data Rate Upstream : 8006 (kbps)
QoS Burst Data Rate Upstream : 8007 (kbps)
QoS Realtime Burst Data Rate Upstream : 8008 (kbps)
QoS Average Data Rate Downstream : 8001 (kbps)
QoS Realtime Average Data Rate Downstream : 8002 (kbps)
QoS Burst Data Rate Downstream : 80300 (kbps)
QoS Realtime Burst Data Rate Downstream : 8004 (kbps)

```

To verify the rate-limit details from the AP terminal, use the following command

```

Device# show rate-limit client
Config:
mac vap rt_rate_out rt_rate_in rt_burst_out rt_burst_in nrt_rate_out nrt_rate_in nrt_burst_out
 nrt_burst_in
00:1C:F1:09:85:E7 0 8001 8002 8003 8004 8005 8006 8007 8008
Statistics:
name up down
Unshaped 0 0
Client RT pass 0 0
Client NRT pass 0 0
Client RT drops 0 0
Client NRT drops 0 0
Per client rate limit:
mac vap rate_out rate_in policy

```

# How to Configure Wireless QoS

## Configuring a Policy Map with Class Map (GUI)

### Procedure

---

- Step 1** Choose **Configuration > Services > QoS**.
- Step 2** Click **Add** to view the **Add QoS** window.
- Step 3** In the text box next to the **Policy Name**, enter the name of the new policy map that is being added.
- Step 4** Click **Add Class-Maps**.
- Step 5** Configure **AVC** based policies or **User Defined** policies. To enable **AVC** based policies, and configure the following:
- Choose either **Match Any** or **Match All**.
  - Choose the required **Mark Type**. If you choose **DSCP** or **User Priority**, you must specify the appropriate **Mark Value**.
  - Check the **Drop** check box to drop traffic from specific sources.  
**Note** When **Drop** is enabled, the **Mark Type** and **Police(kbps)** options are disabled.
  - Based on the chosen **Match Type**, select the required protocols from the **Available Protocol(s)** list and move them to the **Selected Protocol(s)** list. These selected protocols are the ones from which traffic is dropped.
  - Click **Save**.
- Note** To add more Class Maps, repeat steps 4 and 5.
- Step 6** To enable **User-Defined** QoS policy, and the configure the following:
- Choose either **Match Any** or **Match All**.
  - Choose either **ACL** or **DSCP** as the **Match Type** from the drop-down list, and then specify the appropriate **Match Value**.
  - Choose the required **Mark Type** to associate with the mark label. If you choose **DSCP**, you must specify an appropriate **Mark Value**.
  - Check the **Drop** check box to drop traffic from specific sources.  
**Note** When **Drop** is enabled, the **Mark Type** and **Police(kbps)** options are disabled.
  - Click **Save**.
- Note** To define actions for all the remaining traffic, in the Class Default, choose **Mark** and/or **Police(kbps)** accordingly.
- Step 7** Click **Save & Apply to Device**.
-

## Configuring a Class Map (CLI)

Follow the procedure given below to configure class maps for voice and video traffic:

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b>  Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>class-map class-map-name</b> <b>Example:</b>  Device(config)# <b>class-map test</b>	Creates a class map.
<b>Step 3</b>	<b>match dscp dscp-value</b> <b>Example:</b>  Device(config-cmap)# <b>match dscp 46</b>	Matches the DSCP value in the IPv4 and IPv6 packets.  <b>Note</b> By default for the class map the value is match-all.
<b>Step 4</b>	<b>end</b> <b>Example:</b>  Device(config-cmap)# <b>end</b>	Exits the class map configuration and returns to the privileged EXEC mode.
<b>Step 5</b>	<b>show class-map class-map-name</b> <b>Example:</b>  Device# <b>show class-map class_map_name</b>	Verifies the class map details.

## Configuring Policy Profile to Apply QoS Policy (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Tags & Profiles > Policy**.
- Step 2** On the **Policy Profile** page, click the name of the policy profile.
- Step 3** In the **Edit Policy Profile** window, click the **QoS and AVC** tab.
- Step 4** Under **QoS SSID Policy**, choose the appropriate **Ingress** and **Egress** policies for WLANs.
- Note** The ingress policies can be differentiated from the egress policies by the suffix *-up*. For example, the Platinum ingress policy is named *platinum-up*.
- Step 5** Under **QoS Client Policy**, choose the appropriate **Ingress** and **Egress** policies for clients.
- Step 6** Click **Update & Apply to Device**.

**Note** Only custom policies are displayed under **QoS Client Policy**. AutoQoS policies are auto generated and not displayed for user selection.

## Configuring Policy Profile to Apply QoS Policy (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>wireless profile policy <i>profile-policy</i></b> <b>Example:</b> Device(config)# <b>wireless profile policy qostest</b>	Configures WLAN policy profile and enters the wireless policy configuration mode.
<b>Step 3</b>	<b>service-policy client {input   output} <i>policy-name</i></b> <b>Example:</b> Device(config-wireless-policy)# <b>service-policy client input policy-map-client</b>	Applies the policy. The following options are available. <ul style="list-style-type: none"> <li>• <b>input</b>—Assigns the client policy for ingress direction on the policy profile.</li> <li>• <b>output</b>—Assigns the client policy for egress direction on the policy profile.</li> </ul>
<b>Step 4</b>	<b>service-policy {input   output} <i>policy-name</i></b> <b>Example:</b> Device(config-wireless-policy)# <b>service-policy input policy-map-ssid</b>	Applies the policy to the BSSID. The following options are available. <ul style="list-style-type: none"> <li>• <b>input</b>—Assigns the policy-map to all clients in WLAN.</li> <li>• <b>output</b>—Assigns the policy-map to all clients in WLAN.</li> </ul>
<b>Step 5</b>	<b>no shutdown</b> <b>Example:</b> Device(config-wireless-policy)# <b>no shutdown</b>	Enables the wireless policy profile.

## Applying Policy Profile to Policy Tag (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Tags & Profiles > Tags**.
- Step 2** On the **Manage Tags** page in the **Policy** tab, click **Add**.
- Step 3** In the **Add Policy Tag** window that is displayed, enter a name and description for the policy tag.
- Step 4** Map the required WLAN IDs and WLAN profiles with appropriate policy profiles.
- Step 5** Click **Update & Apply to Device**.
- 

## Applying Policy Profile to Policy Tag (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b>  Device# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>wireless tag policy <i>policy-tag-name</i></b> <b>Example:</b> Device(config-policy-tag)# <code>wireless tag policy qostag</code>	Configures policy tag and enters the policy tag configuration mode.
<b>Step 3</b>	<b>wlan <i>wlan-name</i> policy <i>profile-policy-name</i></b> <b>Example:</b> Device(config-policy-tag)# <code>wlan test policy qostest</code>	Maps a policy profile to a WLAN profile.
<b>Step 4</b>	<b>end</b> <b>Example:</b> Device(config-policy-tag)# <code>end</code>	Saves the configuration and exits the configuration mode and returns to privileged EXEC mode.
<b>Step 5</b>	<b>show wireless tag policy summary</b> <b>Example:</b> Device# <code>show wireless tag policy summary</code>	Displays the configured policy tags.  <b>Note</b> To view the detailed information of a policy tag, use the <b>show wireless tag policy detailed <i>policy-tag-name</i></b> command.

## Attaching Policy Tag to an AP

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>ap mac-address</b> <b>Example:</b> Device(config)# ap F866.F267.7DFB	Configures Cisco APs and enters the ap profile configuration mode.
<b>Step 3</b>	<b>policy-tag policy-tag-name</b> <b>Example:</b> Device(config-ap-tag)# policy-tag qostag	Maps a Policy tag to the AP.
<b>Step 4</b>	<b>end</b> <b>Example:</b> Device(config-ap-tag)# end	Saves the configuration and exits the configuration mode and returns to privileged EXEC mode.
<b>Step 5</b>	<b>show ap tag summary</b> <b>Example:</b> Device# show ap tag summary	Displays the ap details and tags associated to it.

## Configuring Custom QoS Mapping

For interworking with IP networks, a map is devised between the 802.11e user priorities and the IP differentiated services code point (DSCP). Enable Hotspot 2.0 on the WLAN to support mapping exception.

**Note** Custom QoS mapping only applies to Hotspot 2.0.

Mapping is specified as DSCP ranges to individual user priority values, and as a set of exceptions with one-to-one mapping between DSCP values and UP values. If a QoS map is enabled and user-configurable mappings are not added, the default values are used.

**Note** Egress = Downstream = Output and Ingress = Upstream = Input

The following table shows a QoS map, where an AP provides a wireless client with the required mapping from IP DSCP to 802.11e user priority.

Table 122: Default DSCP-Range-to-User Priority Mapping

IP DSCP Range	802.11e User Priority
0-7	0
8-15	1
16-23	2
24-31	3
32-39	4
40-47	5
48-55	6
56-63	7

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>ap profile <i>profile-name</i></b> <b>Example:</b> Device(config)# ap profile hs2-profile	Configures an AP profile and enters AP profile configuration mode.
<b>Step 3</b>	<b>qos-map dscp-to-up-range <i>user-priority up-to-dscp dscp-start dscp-end</i></b> <b>Example:</b> Device(config-ap-profile)# qos-map dscp-to-up-range 6 52 23 62	Configures DSCP-to-user priority mapping. You can configure up to eight configuration entries; one for each <i>user-priority</i> value. If you do not configure a custom value, a non-configured value (0xFF) is sent to the AP. Use the <b>no</b> form of this command to disable the configuration. To delete all the custom mappings, use the <b>no dscp-to-up-range</b> command.

## Configuring DSCP-to-User Priority Mapping Exception

When you configure a QoS mapping or exception, a custom QoS map is created and sent to the corresponding AP.

If there are no DSCP-to-user priority mapping or exception entries, an empty QoS map is used.

The following table shows the set of exceptions with one-to-one mapping between DSCP values and user priority values.

**Table 123: Default DSCP-Range-to-User Priority Mapping Exceptions**

IP DSCP	802.11e User Priority
0	0
2	1
4	1
6	1
10	2
12	2
14	2
18	3
20	3
22	3
26	4
34	5
46	6
48	7
56	7

**Note** Voice admission control should be disabled for user priorities 6 and 7, from the controller GUI. To disable **Admission Control (ACM)**, choose **Configuration > Radio Configurations > Media Parameters**.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>ap profile <i>profile-name</i></b> <b>Example:</b> Device(config)# ap profile hs2-profile	Configures an AP profile and enters AP profile configuration mode.

	Command or Action	Purpose
<b>Step 3</b>	<b>qos-map dscp-to-up-exception</b> <i>dscp-num</i> <i>user-priority</i>  <b>Example:</b> Device(config-ap-profile)# qos-map dscp-to-up-exception 42 6	Configures DSCP-to-user priority exception.

## Configuring Trust Upstream DSCP Value

The controller marks the 802.11 user priority value in Traffic Identifier (TID) field based on the DSCP value in IP header.

**Note** The AP forwards the DSCP value to Air, if 802.11 user priority value is set.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>ap profile</b> <i>profile-name</i>  <b>Example:</b> Device(config)# ap profile hs2-profile	Configures an AP profile and enters AP profile configuration mode.
<b>Step 3</b>	<b>qos-map trust-dscp-upstream</b>  <b>Example:</b> Device(config-ap-profile)# qos-map trust-dscp-upstream	Configures the AP to trust upstream DSCP instead of user priority.  Use the <b>no</b> form of the command to disable the configuration.  <b>Note</b> From the Cisco IOS XE 17.4.x release onwards, the <b>qos-map trust-dscp-upstream</b> is the default setting so that client DSCP is, by default, maintained end to end.  <b>Note</b> When the <b>trust-dscp-upstream</b> command is enabled, the value of DSCP is 18. Silver is the default if nothing is configured.

# CHAPTER 148

## Wireless Auto-QoS

- [Information About Auto QoS, on page 1649](#)
- [How to Configure Wireless AutoQoS, on page 1650](#)

### Information About Auto QoS

Wireless Auto QoS automates deployment of wireless QoS features. It has a set of predefined profiles which can be further modified by the customer to prioritize different traffic flows. Auto-QoS matches traffic and assigns each matched packet to qos-groups. This allows the output policy map to put specific qos-groups into specific queues, including into the priority queue.

#### AutoQoS Policy Configuration

*Table 124: AutoQoS Policy Configuration*

Mode	Client Ingress	Client Egress	BSSID Ingress	BSSID Egress	Port Ingress	Port Egress	Radio
Voice	N/A	N/A	P3	P4	N/A	P7	ACM on
Guest	N/A	N/A	P5	P6	N/A	P7	
Fastlane	N/A	N/A	N/A	N/A	N/A	P7	edca-parameters fastlane
Enterprise-avc	N/A	N/A	P1	P2	N/A	P7	

P1	AutoQos-4.0-wlan-ET-SSID-Input-AVC-Policy
P2	AutoQos-4.0-wlan-ET-SSID-Output-Policy
P3	platinum-up
P4	platinum
P5	AutoQos-4.0-wlan-GT-SSID-Input-Policy

P6	AutoQos-4.0-wlan-GT-SSID-Output-Policy
P7	AutoQos-4.0-wlan-Port-Output-Policy

# How to Configure Wireless AutoQoS

## Configuring Wireless AutoQoS on Profile Policy

You can enable AutoQoS on a profile policy.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Device# <b>enable</b>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>wireless autoqos policy-profile <i>policy-name</i></b> <b>mode { enterprise-avc   fastlane   guest   voice}</b> <b>Example:</b> Device# <b>wireless autoqos policy-profile test-profile mode voice</b>	Configures AutoQoS wireless policy. <ul style="list-style-type: none"> <li>• <b>enterprise-avc</b>—Enables AutoQoS Wireless Enterprise AVC Policy.</li> <li>• <b>fastlane</b>—Enable AutoQoS Wireless Fastlane Policy.</li> <li>• <b>guest</b>—Enable AutoQoS Wireless Guest Policy.</li> <li>• <b>voice</b>—Enable AutoQoS Wireless Voice Policy.</li> </ul> <p><b>Note</b> AutoQoS MIB attribute does not support full functionality with service policy. Service policy must be configured manually. Currently, there is only support for AutoQoS mode.</p>

### What to do next

**Note** After enabling AutoQoS, we recommend that you wait for a few seconds for the policy to install and then try and modify the AutoQoS policy maps if required; or retry if the modification is rejected.

## Disabling Wireless AutoQoS

To globally disable Wireless AutoQoS:

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Device# <code>enable</code>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>shutdown</b> <b>Example:</b> Device# <code>shutdown</code>	Shuts down the policy profile.
<b>Step 3</b>	<b>wireless autoqos disable</b> <b>Example:</b> Device# <code>wireless autoqos disable</code>	Globally disables wireless AutoQoS.
<b>Step 4</b>	<b>[no] shutdown</b> <b>Example:</b> Device# <code>no shutdown</code>	Enables the wireless policy profile.  <b>Note</b> Disabling Auto QoS does not reset global radio configurations like CAC and EDCA parameters.

## Rollback AutoQoS Configuration (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Services > QoS**.
  - Step 2** Click **Disable AutoQoS**.
  - Step 3** Click **Yes** to confirm.
- 

## Rollback AutoQoS Configuration

### Before you begin

---

**Note** AutoQoS MIB attribute does not support the full functionality with service policy. Currently, there is only support for AutoQoS mode. Service policy must be configured manually.

---

**Procedure**

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Device <b>enable</b>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>clear platform software autoqos config template { enterprise_avc   guest}</b> <b>Example:</b> Device# <b>clear platform software autoqos config template guest</b>	Resets AutoQoS configuration. <ul style="list-style-type: none"> <li>• enterprise-avc—Resets AutoQoS Enterprise AVC Policy Template.</li> <li>• guest—Resets AutoQoS Guest Policy Template.</li> </ul>

## Clearing Wireless AutoQoS Policy Profile (GUI)

**Procedure**

- 
- Step 1** Choose **Configuration > Tags & Profiles > Policy**.
- Step 2** Click on the **Policy Profile Name**.
- Step 3** Go to **QoS and AVC** tab.
- Step 4** From the **Auto Qos** drop-down list, choose **None**.
- Step 5** Click **Update & Apply to Device**.
- 

## Clearing Wireless AutoQoS Policy Profile

**Procedure**

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Device# <b>enable</b>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>shutdown</b> <b>Example:</b> Device# <b>shutdown</b>	Shuts down the policy profile.
<b>Step 3</b>	<b>wireless autoqos policy-profile <i>policy-name</i> mode clear</b> <b>Example:</b>	Clears the configured AutoQoS wireless policy.

	Command or Action	Purpose
	Device# <code>wireless autoqos policy-profile test-profile mode clear</code>	
<b>Step 4</b>	<b>[no] shutdown</b>  <b>Example:</b> <code>no shutdown</code>	Enables the wireless policy profile.

## Viewing AutoQoS on policy profile

### Before you begin

AutoQoS is supported on the local mode and flex mode. AutoQoS configures a set of policies and radio configurations depending on the template. It is possible to override the service-policy that is configured by AutoQoS. The latest configuration takes effect, with AAA override policy being of highest priority.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b>  <b>Example:</b> <code>Device#enable</code>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>show wireless profile policy detailed</b> <i>policy-profile-name</i>  <b>Example:</b> <code>Device# show wireless profile policy detailed testqos</code>	Shows policy-profile detailed parameters.

## CHAPTER 149

# Native Profiling

---

- [Information About Native Profiling, on page 1655](#)
- [Creating a Class Map \(GUI\), on page 1656](#)
- [Creating a Class Map \(CLI\), on page 1657](#)
- [Creating a Service Template \(GUI\), on page 1659](#)
- [Creating a Service Template \(CLI\), on page 1660](#)
- [Creating a Parameter Map, on page 1661](#)
- [Creating a Policy Map \(GUI\), on page 1661](#)
- [Creating a Policy Map \(CLI\), on page 1662](#)
- [Configuring Native Profiling in Local Mode, on page 1664](#)
- [Verifying Native Profile Configuration, on page 1664](#)

## Information About Native Profiling

You can profile devices based on HTTP and DHCP to identify the end devices on the network. You can configure device-based policies and enforce these policies per user or per device policy on the network.

Policies allow profiling of mobile devices and basic onboarding of the profiled devices to a specific VLAN. They also assign ACL and QoS or configure session timeouts.

The policies are defined based on the following attributes:

- User group or user role
- Device type such as Windows clients, smartphones, tablets, and so on
- Service Set Identifier (SSID)
- Location, based on the access point group that the end point is connected to
- Time of the day
- Extensible Authentication Protocol (EAP) type, to check what EAP method that the client is getting connected to

When a wireless client joins an access point, certain QoS policies get enforced on the access point. One such feature is the native profiling for both upstream and downstream traffic at AP. The native profiling feature when clubbed with AAA override supports specific set of policies based on the time of day and day of week. The AAA override then applies these policies coming from a RADIUS server to the access point.

Let's consider a use case of time of the day in conjunction with user role. Usually, the user role is used as an extra matching criteria along with the time of day. You can club the time of day usage with any matching criteria to get the desired result. The matching will be performed when the client joins the controller .

You can configure policies as two separate components:

- Defining policy attributes as service templates that are specific to clients joining the network and applying policy match criteria
- Applying match criteria to the policy.

---

**Note** Before proceeding with the native profile configuration, ensure that HTTP Profiling and DHCP Profiling are enabled.

---

---

**Note** Native profiling is not supported with FlexConnect Local Authentication and Local Switching. Hence, do not configure **no central switching**, **no central authentication**, and **subscriber-policy-name name** commands together. ISSU will fail for this type of configuration. Ensure that you remove the configuration before attempting ISSU.

---

To configure Native Profiling, use one of the following procedures:

- Create a service template
- Create a class map

---

**Note** You can apply a service template using either a class map or parameter map.

---

- Create a parameter-map and associate the service template to parameter-map
  - Create a policy map
    1. If class-map has to be used: Associate the class-map to the policy-map and associate the service-template to the class-map.
    2. If parameter-map has to be used: Associate the parameter-map to the policy-map
  - Associate the policy-map to the policy profile.

## Creating a Class Map (GUI)

### Procedure

---

**Step 1** Click **Configuration > Services > QoS**.

**Step 2** In the **QoS – Policy** area, click **Add** to create a new QoS Policy or click the one you want to edit.

**Step 3** Add **Add Class Map** and enter the details.

**Step 4** Click **Save**.

**Step 5** Click **Update and Apply to Device**.

## Creating a Class Map (CLI)

**Note** Configuration of class maps via CLI offer more options and can be more granular than GUI.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>class-map type control subscriber match-any <i>class-map-name</i></b> <b>Example:</b> Device(config)# class-map type control subscriber match-any cls_user	Specifies the class map type and name.
<b>Step 3</b>	<b>match username <i>username</i></b> <b>Example:</b> Device(config-filter-control-classmap)# match username ciscoise	Specifies the class map attribute filter criteria.
<b>Step 4</b>	<b>class-map type control subscriber match-any <i>class-map-name</i></b> <b>Example:</b> Device(config)# class-map type control subscriber match-any cls_userrole	Specifies the class map type and name.
<b>Step 5</b>	<b>match user-role <i>user-role</i></b> <b>Example:</b> Device(config-filter-control-classmap)# match user-role engineer	Specifies the class map attribute filter criteria.
<b>Step 6</b>	<b>class-map type control subscriber match-any <i>class-map-name</i></b> <b>Example:</b> Device(config)# class-map type control subscriber match-any cls_oui	Specifies the class map type and name.

	Command or Action	Purpose
<b>Step 7</b>	<b>match oui</b> <i>oui-address</i> <b>Example:</b> <pre>Device(config-filter-control-classmap)# match oui 48.f8.b3</pre>	Specifies the class map attribute filter criteria.
<b>Step 8</b>	<b>class-map type control subscriber</b> <b>match-any</b> <i>class-map-name</i> <b>Example:</b> <pre>Device(config)# class-map type control subscriber match-any cls_mac</pre>	Specifies the class map type and name.
<b>Step 9</b>	<b>match mac-address</b> <i>mac-address</i> <b>Example:</b> <pre>Device(config-filter-control-classmap)# match mac-address 0040.96b9.4a0d</pre>	Specifies the class map attribute filter criteria.
<b>Step 10</b>	<b>class-map type control subscriber</b> <b>match-any</b> <i>class-map-name</i> <b>Example:</b> <pre>Device(config)# class-map type control subscriber match-any cls_devtype</pre>	Specifies the class map type and name.
<b>Step 11</b>	<b>match device-type</b> <i>device-type</i> <b>Example:</b> <pre>Device(config-filter-control-classmap)# match device-type windows</pre>	Specifies the class map attribute filter criteria.
<b>Step 12</b>	<b>class-map type control subscriber match-all</b> <i>class-map-name</i> <b>Example:</b> <pre>Device(config)# class-map type control subscriber match-all match_tod</pre>	Specifies the class map type and name.
<b>Step 13</b>	<b>match join-time-of-day</b> <i>start-time end-time</i> <b>Example:</b> <pre>Device(config-filter-control-classmap)# match join-time-of-day 10:30 12:30</pre>	<p>Specifies a match to the time of day.</p> <p>Here, join time is considered for matching. For example, if the match filter is set from 11:00 am to 2:00 pm, a device joining at 10:59 am is not considered, even if it acquires credentials after 11:00 am.</p> <p>Here,</p> <p><i>start-time</i> and <i>end-time</i> specifies the 24-hour format.</p> <p>Use the <b>show class-map type control subscriber name</b> <i>name</i> command to verify the configuration.</p>

	Command or Action	Purpose
		<b>Note</b> You should also disable AAA override for this command to work.
<b>Step 14</b>	<b>match day</b> <i>day-of-week</i> <b>Example:</b> Device(config-filter-control-classmap)# match day Monday	Matches day of the week.  Use the <b>show class-map type control subscriber name</b> <i>name</i> command to verify the configuration.
<b>Step 15</b>	<b>class-map type control subscriber match-all</b> <i>class-map-name</i> <b>Example:</b> Device(config)# class-map type control subscriber match-all match_eap	Specifies the class map type and filter as EAP.
<b>Step 16</b>	<b>match eap-type</b> <i>eap-type</i> <b>Example:</b> Device(config-filter-control-classmap)# match eap-type peap	Specifies the policy match with EAP type.  Use the <b>show class-map type control subscriber name</b> <i>name</i> command to verify the configuration.
<b>Step 17</b>	<b>class-map type control subscriber match-all</b> <i>class-map-name</i> <b>Example:</b> Device(config)# class-map type control subscriber match-all match_device	Specifies the class map type and filter as device.
<b>Step 18</b>	<b>match device-type</b> <i>device-name</i> <b>Example:</b> Device(config-filter-control-classmap)# match device-type android	Matches name using the device type. Type a question mark (?) after the device type and select the device from the list.  <b>Note</b> You should enable the device classifier for the device list to be populated.

## Creating a Service Template (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Security > Local Policy**.
- Step 2** On the **Local Policy** page, **Service Template** tab, click **ADD**.
- Step 3** In the **Create Service Template** window, enter the following parameters:
- **Service Template Name:** Enter a name for the template.
  - **VLAN ID:** Enter the VLAN ID for the template. Valid range is between 1 and 4094.

- **Session Timeout (secs):** Sets the timeout duration for the template. Valid range is between 1 and 65535.
- **Access Control List:** Choose the Access Control List from the drop-down list.
- **Ingress QoS:** Choose the input QoS policy for the client from the drop-down list
- **Egress QoS:** Choose the output QoS policy for the client from the drop-down list.

**Step 4** Click **Save & Apply to Device**.

## Creating a Service Template (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>service-template <i>service-template-name</i></b> <b>Example:</b> Device(config)# service-template svcl	Enters service template configuration mode.
<b>Step 3</b>	<b>vnid <i>vnid</i></b> <b>Example:</b> Device(config-service-template)# vnid test	Specifies the VXLAN network identifier (VNID).  Use the <b>show service-template <i>service-template-name</i></b> command to verify the configuration.
<b>Step 4</b>	<b>access-group <i>access-list-name</i></b> <b>Example:</b> Device(config-service-template)# access-group acl-auto	Specifies the access list to be applied.
<b>Step 5</b>	<b>vlan <i>vlan-id</i></b> <b>Example:</b> Device(config-service-template)# vlan 10	Specifies VLAN ID. Valid range is from 1-4094.
<b>Step 6</b>	<b>absolute-timer <i>timer</i></b> <b>Example:</b> Device(config-service-template)# absolute-timer 1000	Specifies session timeout value for a service template. Valid range is from 1-65535.
<b>Step 7</b>	<b>service-policy qos input <i>qos-policy</i></b> <b>Example:</b>	Configures an input QoS policy for the client.

	Command or Action	Purpose
	Device(config-service-template)# service-policy qos input in_qos	
<b>Step 8</b>	<b>service-policy qos output qos-policy</b>  <b>Example:</b> Device(config-service-template)# service-policy qos output out_qos	Configures an output QoS policy for the client.

## Creating a Parameter Map

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>parameter-map type subscriber</b> <b>attribute-to-service parameter-map-name</b>  <b>Example:</b> Device(config)# parameter-map type subscriber attribute-to-service param	Specifies the parameter map type and name.
<b>Step 3</b>	<b>map-index map device-type eq filter-name</b>  <b>Example:</b> Device(config-parameter-map-filter)# 1 map device-type eq "windows" mac-address eq 3c77.e602.2f91 username eq "cisco"	Specifies the parameter map attribute filter criteria. Multiple filters are used in the example provided here.
<b>Step 4</b>	<b>map-index service-template service-template-name</b> <b>precedence precedence-num</b>  <b>Example:</b> Device(config-parameter-map-filter-submode)# 1 service-template svcl precedence 150	Specifies the service template and its precedence.

## Creating a Policy Map (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Security > Local Policy > Policy Map** tab..
- Step 2** Enter a name for the Policy Map in the **Policy Map Name** text field.

- Step 3** Click **Add**
- Step 4** Choose the service template from the **Service Template** drop-down list.
- Step 5** For the following parameters select the type of filter from the drop-down list and enter the required match criteria
- Device Type
  - User Role
  - User Name
  - OUI
  - MAC Address
- Step 6** Click **Add Criteria**
- Step 7** Click **Update & Apply to Device**.
- 

## Creating a Policy Map (CLI)

### Before you begin

Before removing a policy map or parameter map, you should remove it from the target or shut down the WLAN profile or delete the session.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>policy-map type control subscriber</b> <i>policy-map-name</i>  <b>Example:</b> Device(config)# policy-map type control subscriber polmap5	Specifies the policy map type.
<b>Step 3</b>	<b>event identity-update match-all</b>  <b>Example:</b> Device(config-event-control-policymap)# event identity-update match-all	Specifies the match criteria to the policy map.
<b>Step 4</b>	You can apply a service template using either a class map or a parameter map, as shown here.  • <i>class-num</i> <b>class</b> <i>class-map-name</i> <b>do-until-failure</b>	Configures the local profiling policy class map number and specifies how to perform the action or activates the service template or maps an identity-update attribute to an auto-configured template.

	Command or Action	Purpose
	<ul style="list-style-type: none"> <li>• <i>action-index activate service-template service-template-name</i></li> <li>• <i>action-index map attribute-to-service table parameter-map-name</i></li> </ul> <p><b>Example:</b></p> <p>The following example shows how a class-map with a service-template has to be applied:</p> <pre>Device(config-class-control-policymap)#  10 class cls_mac do-until-failure Device(config-action-control-policymap)#  10 activate service-template svcl</pre> <p><b>Example:</b></p> <p>The following example shows how a parameter map has to be applied (service template is already associated with the parameter map 'param' while creating it):</p> <pre>Device(config-action-control-policymap)#1 map attribute-to-service table param</pre>	
<b>Step 5</b>	<p><b>end</b></p> <p><b>Example:</b></p> <pre>Device(config-action-control-policymap)# end</pre>	Exits configuration mode.
<b>Step 6</b>	<p><b>configure terminal</b></p> <p><b>Example:</b></p> <pre>Device# configure terminal</pre>	Enters global configuration mode.
<b>Step 7</b>	<p><b>wireless profile policy</b> <i>wlan-policy-profile-name</i></p> <p><b>Example:</b></p> <pre>Device(config)# wireless profile policy wlan-policy-profilename</pre>	<p>Configures a wireless policy profile.</p> <p><b>Caution</b> Do not configure aaa-override for native profiling under a named wireless profile policy. Native profiling is applied at a lower priority than AAA policy. If aaa-override is enabled, the AAA policies will override native profile policy.</p>
<b>Step 8</b>	<p><b>description</b> <i>profile-policy-description</i></p> <p><b>Example:</b></p> <pre>Device(config-wireless-policy)# description "default policy profile"</pre>	Adds a description for the policy profile.
<b>Step 9</b>	<p><b>dhcp-tlv-caching</b></p> <p><b>Example:</b></p> <pre>Device(config-wireless-policy)# dhcp-tlv-caching</pre>	Configures DHCP TLV caching on a WLAN.

	Command or Action	Purpose
<b>Step 10</b>	<b>http-tlv-caching</b> <b>Example:</b> Device(config-wireless-policy)# http-tlv-caching	Configures client HTTP TLV caching on a WLAN.
<b>Step 11</b>	<b>subscriber-policy-name <i>policy-name</i></b> <b>Example:</b> Device(config-wireless-policy)# subscriber-policy-name polmap5	Configures the subscriber policy name.
<b>Step 12</b>	<b>vlan <i>vlan-id</i></b> <b>Example:</b> Device(config-wireless-policy)# vlan 1	Configures a VLAN name or VLAN ID.
<b>Step 13</b>	<b>no shutdown</b> <b>Example:</b> Device(config-wireless-policy)# no shutdown	Saves the configuration.

## Configuring Native Profiling in Local Mode

To configure native profiling in the local mode, you must follow the steps described in [#unique\\_2050](#). In the policy profile, you must enable central switching as described in the step given below in order to configure native profiling.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>central switching</b> <b>Example:</b> Device(config-wireless-policy)# central switching	Enables central switching.

## Verifying Native Profile Configuration

Use the following **show** commands to verify the native profile configuration:

```
Device# show wireless client device summary
```

```
Active classified device summary
MAC Address Device-type User-role
Protocol-map

1491.82b8.f94b Microsoft-Workstation sales
9
```

```
1491.82bc.2fd5 Windows7-Workstation sales
41
```

```
Device# show wireless client device cache
```

```
Cached classified device info
```

```
MAC Address Device-type User-role
Protocol-map
```

```

2477.031b.aal8 Microsoft-Workstation
9
30a8.db3b.a753 Un-Classified Device
9
4400.1011.e8b5 Un-Classified Device
9
980c.a569.7dd0 Un-Classified Device
```

```
Device# show wireless client mac-address 4c34.8845.e32c detail | s
Session Manager:
```

```
Interface :
IIF ID : 0x90000002
Device Type : Microsoft-Workstation
Protocol Map : 0x000009
Authorized : TRUE
Session timeout : 1800
Common Session ID: 78380209000000174BF2B5B9
Acct Session ID : 0
Auth Method Status List
Method : MAB
 SM State : TERMINATE
 Authen Status : Success
Local Polices:
 Service Template : wlan_svc_C414.3CCA.0A51 (priority 254)
 Absolute-Timer : 1800
Server Polices:
Resultant Policies:
Filter-ID : acl-auto
Input QOS : in_qos
Output QOS : out_qos
Idle timeout : 60 sec
VLAN : 10
Absolute-Timer : 1000
```

Use the following **show** command to verify the class map details for a class map name:

```
Device# show class-map type control subscriber name test
Class-map Action Exec Hit Miss Comp

match-any test match day Monday 0 0 0 0
match-any test match join-time-of-day 8:00 18:00 0 0 0 0
```

Key:

```
"Exec" - The number of times this line was executed
"Hit" - The number of times this line evaluated to TRUE
"Miss" - The number of times this line evaluated to FALSE
"Comp" - The number of times this line completed the execution of its
 condition without a need to continue on to the end
```

## CHAPTER 150

# Air Time Fairness

---

- [Information About Air Time Fairness, on page 1667](#)
- [Restrictions on Cisco Air Time Fairness, on page 1669](#)
- [Cisco Air Time Fairness \(ATF\) Use Cases, on page 1670](#)
- [Configuring Cisco Air Time Fairness \(ATF\), on page 1670](#)
- [Verifying Cisco ATF Configurations, on page 1674](#)
- [Verifying Cisco ATF Statistics, on page 1674](#)

## Information About Air Time Fairness

Cisco Air Time Fairness (ATF) allows network administrators to group devices of a defined category and enables some groups to receive traffic from the WLAN more frequently than the other groups. Therefore, some groups are entitled to more air time than the other groups.

Cisco ATF has the following capabilities:

- Allocates Wi-Fi air time for user groups or device categories.
- Air time fairness is defined by the network administrator and not by the network.
- Provides a simplified mechanism for allocating air time.
- Dynamically adapts to changing conditions in a WLAN.
- Enables a more efficient fulfillment of service-level agreements.
- Augments standards-based Wi-Fi QoS mechanisms.

By enabling network administrators to define what fairness means in their environments with regards to the amount of air time per client group, the amount of traffic is also controlled.

To control air time on a percentage basis, the air time including both uplink and downlink transmissions of a client or SSID is continuously measured.

Only air time in the downlink direction, that is AP to client, can be controlled accurately by the AP. Although air time in the uplink direction, that is client to AP can be measured, it cannot be controlled. Although the AP can constrain air time for packets that it sends to clients, the AP can only measure air time for packets that it hears from clients because it cannot strictly limit their air time.

Cisco ATF establishes air time limits (defined as a percentage of total air time) and applies those limits on a per SSID basis, where the SSID is used as a parameter to define a client group. Other parameters can be used as well to define groups of clients. Furthermore, a single air time limit can be applied to individual clients.

If the air time limit for an SSID (or client) is exceeded, the packets in the downlink direction are dropped. Dropping downlink packets (AP to client) frees up air time whereas dropping uplink packets (client to AP) does not do anything to free up air time because the packet has already been transmitted over the air by the client.

### Client Fair Sharing

Cisco Air Time Fairness can be enforced on clients that are associated with an SSID or WLAN. This ensures that all clients in an SSID or WLAN are treated equally based on their utilization of the radio bandwidth. This feature is useful in scenarios where one or a few clients could use the complete air time allocated for an SSID or WLAN, thereby depriving Wi-Fi experience for other clients associated with the same SSID or WLAN.

- The percentage of air time to be given to each client is recomputed every time a client connects or disconnects.
- Client fair sharing is applicable only to downstream traffic.
- Clients can be categorized into usage groups at the policy level.
- Client-based ATF metrics accumulation is performed in the transmit complete routine. This allows the air time that is unused by clients in low-usage or medium-usage groups to be accumulated to a common share pool bucket where the high-usage clients can be replenished.

### Supported Access Point Platforms

Cisco ATF is supported on the following APs:

- Cisco Aironet 2700 Series Access Points
- Cisco Aironet 3700 Series Access Points
- Cisco Aironet 2800 Series Access Points
- Cisco Aironet 3800 Series Access Points
- Cisco Aironet 4800 Series Access Points
- Cisco Aironet 1540 Series Access Points
- Cisco Aironet 1560 Series Access Points

---

**Note** Cisco ATF is supported on MESH, if APs support ATF. ATF is supported on FlexConnect mode and the Local mode.

---

**Note** Cisco Catalyst APs offer capabilities that are equivalent to ATF by leveraging the enhancements in the Wi-Fi 6 and 6E protocols. 802.11ax features such as OFDMA, bidirectional MU-MIMO, and BSS coloring, combined with the advanced QoS features in the Cisco Catalyst 9800 Series Wireless Controllers, help resolve scheduling and congestion problems, accommodate multiple users at the same time, and allocate bandwidth more efficiently.

### Cisco ATF Modes

Cisco ATF operates in the following modes:

- Monitor mode in which users can do the following:
  - View the air time
  - Report air time usage for all AP transmissions
  - View reports
    - per SSID or WLAN
    - per site group/tag
  - Report air time usage at periodic intervals
  - No enforcement as part of Monitor mode
- Enforce Policy mode in which users can do the following:
  - Enforce air time based on configured policy
  - Enforce air time on the following:
    - A WLAN
    - All APs connected in a Cisco Catalyst 9800 Series Wireless Controller network
    - per site group/tag

## Restrictions on Cisco Air Time Fairness

- Cisco ATF can be implemented only on data frames in the downstream direction.
- When ATF is configured in per-SSID mode, all the WLANs are disabled before you enter any ATF configuration commands. The WLANs are enabled after you enter all the ATF commands.

# Cisco Air Time Fairness (ATF) Use Cases

## Public Hotspots (Stadium/Airport/Convention Center/Other)

In this instance, a public network is sharing a WLAN between two (or more) service providers and the venue. Subscribers to each service provider can be grouped and allocated a certain percentage of air time.

## Education

In this instance, a university is sharing a WLAN between students, faculty, and guests. The guest network can be further partitioned by the service provider, for distribution of bandwidth privileges to the guests. Each group can be assigned a certain percentage of air time.

## Enterprise/Hospitality/Retail

In this instance, the venue is sharing a WLAN between employees and guests. The guest network can be further partitioned by service provider. The guests could be sub-grouped by tier of service type with each subgroup being assigned a certain percentage of air time, for example a paid group is entitled for more air time than the free group.

## Time Shared Managed Hotspot

In this instance, the business entity managing the hotspot, such as a service provider or an enterprise, can allocate and subsequently lease air time to other business entities.

# Configuring Cisco Air Time Fairness (ATF)

## Configuring Cisco Air Time Fairness

The following are the high-level steps to configure Cisco ATF:

1. Enable Monitor mode to determine network usage (optional).
2. Create Cisco ATF policies.
3. Add WLAN ATF policies per network or per site group/tag.
4. Determine, if optimization must be enabled.
5. Periodically check the Cisco ATF statistics.

## Creating a Cisco ATF Profile (GUI)

### Procedure

---

- Step 1** Choose **Configuration > Wireless > Air Time Fairness**.

- Step 2** Click the **Profiles** tab and click the **Add** button, to create a new ATF policy. The **Add ATF Policy** window is displayed.
- Step 3** Specify a name, ID, and weight to the ATF policy. Weighted ratio is used instead of percentages so that the total can exceed 100. The minimum weight that you can set is 5. For example, if you configure the weight as 50, this means that the air time for this ATF profile is 50% when applied to an policy profile.
- Step 4** Use the slider to enable or disable the **Client Sharing** feature. When you enable this option in the Web UI, the default ATF configuration is set to **Enforce** and not **Monitor**.
- Step 5** Click **Apply to Device**.

## Creating Cisco ATF Profile (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>wireless profile airtime-fairness</b> <i>atf-policy-name atf-profile-id</i> <b>Example:</b> Device(config)# <code>wireless profile airtime-fairness atf-policy-name 1</code>	Creates a new Cisco ATF policy. <ul style="list-style-type: none"> <li>• <i>atf-policy-name</i>—Enters the ATF profile name.</li> <li>• <i>atf-profile-id</i>—Enters the ATF profile ID. Range is from 0 to 511.</li> </ul>
<b>Step 3</b>	<b>weight policy-weight</b> <b>Example:</b> Device(config-config-atf)# <code>weight 5</code>	Adds a weight to the Cisco ATF policy. <ul style="list-style-type: none"> <li>• <i>policy-weight</i>—Enters the policy weight. Range is from 5 to 100.</li> </ul>
<b>Step 4</b>	<b>client-sharing</b> <b>Example:</b> Device(config-config-atf)# <code>client-sharing</code>	Enables or disables the client sharing for Cisco ATF policy.
<b>Step 5</b>	<b>end</b> <b>Example:</b> Device(config-config-atf)# <code>end</code>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Attaching Cisco ATF Profile to a Policy Profile (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Tags & Profiles > Policy. Policy.**
- Step 2** Click **Add**.  
The **Add Policy Profile** window is displayed.
- Step 3** Click the **Advanced** tab.
- Step 4** Under the **Air Time Fairness Policies** section, select the required policy for 2.4 GHz and 5 GHz policies.
- Step 5** Click **Apply to Device**.
- 

## Attaching Cisco ATF Profile to a Policy Profile (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>wireless profile policy <i>profile-name</i></b>  <b>Example:</b> Device(config)# <code>wireless profile policy <i>profile-name</i></code>	Creates policy profile for the WLAN.  • <i>profile-name</i> —Is the profile name of the policy profile.
<b>Step 3</b>	<b>dot11 {24ghz   5ghz} airtime-fairness <i>atf-policy-name</i></b>  <b>Example:</b> Device(config-wireless-policy)# <code>dot11 24ghz airtime-fairness <i>atf-policy-name</i></code>	Configures air time fairness policy for 2.4- or 5-GHz radio.  • <i>atf-policy-name</i> —Is the name of the air time fairness policy. For more details on creating Cisco ATF policy, refer to the <a href="#">Creating Cisco ATF Policy</a> .  <b>Note</b> You can assign the same ATF policy to both 2.4-GHz and 5-GHz radios (or) have two different ATF policies as well.
<b>Step 4</b>	<b>end</b>  <b>Example:</b> Device(config-wireless-policy)# <code>end</code>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Enabling ATF in the RF Profile (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Tags & Profiles > RF**.
- Step 2** Click **Add**.  
The **Add RF Profile** window is displayed.
- Step 3** Click the **Advanced** tab.
- Step 4** Under the **ATF Configuration** section, complete the following :
- Use the slider to enable or disable the **Status**. The **Mode** field is displayed.
  - Click the **Monitor** mode or **Enforced** mode radio option. If you enable the **Enforced** mode, use the slider to enable or disable **Optimization**.
  - Use the slider to enable to disable **Bridge Client Access**. This is applicable for mesh mode APs. Bridge Client Access determines the percentage of the ATF policy weight that is allocated to clients connected to the mesh APs.
- Step 5** Specify the **Airtime Allocation** value between 5 and 90.
- Step 6** Click **Apply to Device**.
- 

## Enabling ATF in the RF Profile (CLI)

Cisco ATF must be enabled on 2.4 GHz or 5 GHz radios separately.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>ap dot11 {24ghz   5ghz} rf-profile rf-profile</b>  <b>Example:</b> Device(config)# <code>ap dot11 24ghz rf-profile rfprof24_1</code>	Configures an RF profile for 2.4- or 5-GHz radio.
<b>Step 3</b>	<b>airtime-fairness mode {enforce-policy   monitor}</b>  <b>Example:</b> Device(config-rf-profile)# <code>airtime-fairness mode enforce-policy</code>	Configures air time fairness in either of the modes: <ul style="list-style-type: none"> <li>Enforce-policy—This mode signifies that the ATF is operational.</li> <li>Monitor—This mode gathers information about air time and reports air time usage.</li> </ul>
<b>Step 4</b>	<b>airtime-fairness optimization</b>	Enables the air time fairness optimization.

	Command or Action	Purpose
	<b>Example:</b> Device (config-rf-profile) # <b>airtime-fairness optimization</b>	Optimization is effective when the current WLAN reaches the air time limit and the other available WLANs does not use air time to its full extent.
<b>Step 5</b>	<b>end</b>  <b>Example:</b> Device (config-rf-profile) # <b>end</b>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Verifying Cisco ATF Configurations

You can verify Cisco ATF configurations using the following commands:

*Table 125: Commands for Verifying Cisco ATF Configurations*

Commands	Description
<b>show wireless profile airtime-fairness summary</b>	Displays the summary of air time fairness profiles.
<b>show wireless profile airtime-fairness mapping</b>	Displays the ATF policy mapping with the wireless profiles.
<b>show ap airtime-fairness summary</b>	Displays the ATF configuration summary of all radios.
<b>show ap dot11 24ghz airtime-fairness</b>	Displays the ATF configuration for 2.4-GHz radio.
<b>show ap dot11 5ghz airtime-fairness</b>	Displays the ATF configuration for 5-GHz radio.
<b>show ap name <i>ap-name</i> airtime-fairness</b>	Displays the ATF configuration or statistics for an AP.
<b>show ap name <i>ap-name</i> dot11 {24ghz   5ghz} airtime-fairness statistics summary</b>	Displays the ATF statistics of 2.4- or 5GHz radio.

## Verifying Cisco ATF Statistics

*Table 126: ATF Statistics per WLAN*

Commands	Description
<b>show ap name <i>ap-name</i> dot11 {24ghz   5ghz} airtime-fairness wlan <i>wlan_name</i> statistics</b>	Displays the ATF statistics related to a WLAN.

*Table 127: ATF Statistics per ATF Policy*

Commands	Description
<b>show ap name <i>ap-name</i> dot11 {24ghz   5ghz} airtime-fairness policy <i>policy-name</i> statistics</b>	Displays the ATF statistics related to an ATF policy.

*Table 128: ATF Statistics per Client*

Commands	Description
<b>show ap airtime-fairness statistics client</b> <i>mac_address</i>	Displays the ATF statistics related to a client.

## CHAPTER 151

# IPv6 Non-AVC QoS Support

---

- [Information About IPv6 Non-AVC QoS Support, on page 1677](#)
- [Configuring IPv6 Non-AVC QoS, on page 1677](#)
- [Verifying IPv6 Non-AVC QoS, on page 1680](#)

## Information About IPv6 Non-AVC QoS Support

From Cisco IOS XE Amsterdam 17.2.1, the IPv6 Non-AVC QoS feature is supported on Fabric and FlexConnect local switching, where QoS is performed at the AP, on par with the IPv4 functionality.

---

**Note** This feature is not supported on Cisco Aironet 1700 Series Access Points, Cisco Aironet 2700 Series Access Points, and Cisco Aironet 3700 Series Access Points.

---

The following actions are supported for IPv6 Non-AVC QoS:

- Marking the DSCP value for IPv6 packets
- Dropping IPv6 packets based on the DSCP value
- Policing IPv6 traffic

## Configuring IPv6 Non-AVC QoS

The following sections contain information about the various configurations that comprise the configuration of IPv6 Non-AVC QoS:

## Marking DSCP Values for an IPv6 Packet

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>policy-map <i>policy-map-name</i></b> <b>Example:</b> Device(config)# policy-map testpolicy	Creates a policy map.
<b>Step 3</b>	<b>class <i>class-map-name</i></b> <b>Example:</b> Device(config-pmap)#class testmap	Creates a policy criteria.
<b>Step 4</b>	<b>set dscp &lt;0-63&gt;</b> <b>Example:</b> Device(config-pmap-c)#set dscp 34	Sets the DSCP value in an IPv6 packet between 0 and 63.

## Dropping an IPv6 Packet with DSCP Values

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>policy-map <i>policy-map-name</i></b> <b>Example:</b> Device(config)# policy-map drop_dscp	Creates a policy map.
<b>Step 3</b>	<b>class <i>class-map-name</i></b> <b>Example:</b> Device(config-pmap)#class drop_dscp_class	Creates a policy criteria.
<b>Step 4</b>	<b>police cir &lt;8000 - 10000000000&gt;</b> <b>Example:</b> Device(config-pmap-c)#police cir 8000	Polices the committed information rate between 8000 and 10000000000. Target bit rate (Bits per second).

	Command or Action	Purpose
<b>Step 5</b>	<b>conform-action drop</b> <b>Example:</b> Device(config-pmap-c-police)#conform action drop	Configures the <b>conform-action drop</b> command, the action when the rate is less than the conform burst.
<b>Step 6</b>	<b>exceed-action drop</b> <b>Example:</b> Device(config-pmap-c-police)#exceed-action drop	Configures the <b>exceed-action drop</b> command, the action when the rate is within the conform and conform plus exceed burst.

## Policing IPv6 Traffic

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>policy-map <i>policy-map-name</i></b> <b>Example:</b> Device(config)# policy-map drop_dscp	Creates a policy map.
<b>Step 3</b>	<b>class <i>class-map-name</i></b> <b>Example:</b> Device(config-pmap)#class drop_dscp_class	Creates a policy criteria.
<b>Step 4</b>	<b>police cir &lt;8000 - 10000000000&gt;</b> <b>Example:</b> Device(config-pmap-c)#police cir 8000	Polices the committed information rate between 8000 and 10000000000. Target bit rate (Bits per second).
<b>Step 5</b>	<b>conform-action transmit</b> <b>Example:</b> Device(config-pmap-c-police)#conform-action transmit	Configures the <b>conform-action transmit</b> command, for transmitting packets.
<b>Step 6</b>	<b>exceed-action drop</b> <b>Example:</b> Device(config-pmap-c-police)#exceed-action drop	Configures the <b>exceed-action drop</b> command, the action when the rate is within conform and conform plus exceed burst.

## Verifying IPv6 Non-AVC QoS

- To verify the DSCP values for IPv6 packets, IPv6 packets that are dropped, and the policing of IPv6 traffic, use the **show policy-map** command:

The following is a sample output of the **show** command that verifies the DSCP value for an IPv6 packet:

```
Device# show policy-map
1 policymaps
Policy Map Set-dscp type:qos client:default
 Class Set-dscp1_ADV_UI_CLASS
 set dscp af41 (34)
 Class class-default
 no actions
```

- The following is a sample output of the **show** command that verifies the IPv6 packets that are dropped:

```
Device# show policy-map
1 policymaps
Policy Map Drop-dscp type:qos client:default
 Class Drop-dscp1_ADV_UI_CLASS
 drop

 Class class-default
 no actions
```

- The following is a sample output of the **show** command that verifies the policing of IPv6 traffic:

```
Device# show policy-map
1 policymaps
Policy Map Drop-traffic type:qos client:default
 Class Drop-traffic1_ADV_UI_CLASS
 police rate 2000000 bps (250000Bytes/s)
 conform-action
 exceed-action

 Class class-default
 no actions
```

## CHAPTER 152

# QoS Basic Service Set Load

---

- [Information About QoS Basic Set Service Load, on page 1681](#)
- [Configuring QBSS Load, on page 1682](#)
- [Verifying QoS Basic Set Service Load, on page 1683](#)

## Information About QoS Basic Set Service Load

The QoS Basic Set Service (QBSS) information element (IE) knob is a per-WLAN configuration that is configured to include or exclude the QBSS IE, which is sent in beacon frames and probe responses. QBSS IE advertises the channel load information of an AP. The QBSS IE functionality is enabled by default.

Until Cisco IOS XE Amsterdam 17.1.1s, the enablement of Wi-Fi Multimedia (WMM) automatically enabled the QBSS load advertisement in the probes and beacons and there was no separate knob to turn on QBSS load IE. However, from Cisco IOS XE Amsterdam 17.2.1, this behavior has changed with the introduction of a separate configuration knob.

Until Cisco IOS XE Amsterdam 17.1.1s:

- When WMM was enabled on WLAN, QBSS load was advertised in the beacon and probe frames.
- When WMM was disabled on WLAN, QBSS IE was not advertised in the beacon and probe frames.

From Cisco IOS XE Amsterdam 17.2.1,

- When you enable WMM and QBSS ID on WLAN, QBSS IE is advertised in the beacon and probe frames.
- When you enable WMM on WLAN and disable QBSS load IE on WLAN, QBSS load is not advertised in the beacon and probe frames.
- When you disable WMM on WLAN and enable QBSS load IE on WLAN, QBSS IE is advertised in the beacon and probe frames.

---

**Note** By default, QBSS load IE is enabled. The behavior can be configured on policy profile.

---

# Configuring QBSS Load

The following sections contain information about the various configurations that comprise the configuration of QoS basic service set load.

## Configuring Wi-Fi Multimedia

Perform the procedure given below to create a WLAN and then enable WMM.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wlan profile-name wlan-id [ssid]</b> <b>Example:</b> Device(config)# wlan mywlan 34 mywlan-ssid	Specifies the WLAN name and ID: <ul style="list-style-type: none"> <li>• <i>profile-name</i>: Profile name of the WLAN. You can use between 1 to 32 alphanumeric characters.</li> <li>• <i>wlan-id</i>: WLAN ID. You can use between 1 to 512 alphanumeric characters.</li> <li>• <i>ssid</i>: Service Set Identifier (SSID) for this WLAN. If the SSID is not specified, the WLAN profile name is set as the SSID.</li> </ul> <b>Note</b> By default, the WLAN is disabled.
<b>Step 3</b>	<b>no security wpa wpa2 ciphers aes</b> <b>Example:</b> Device(config-wlan)# no security wpa wpa2 ciphers aes	Disables WPA2 ciphers for Advanced Encryption Standard (AES).
<b>Step 4</b>	<b>no security wpa akm dot1x</b> <b>Example:</b> Device(config-wlan)# no security wpa akm dot1x	Disables security AKM for dot1x.
<b>Step 5</b>	<b>wmm {allowed   require}</b> <b>Example:</b> Device(config-wlan)#wmm allowed	Configures WMM and allows WMM on the WLAN.
<b>Step 6</b>	<b>no shutdown</b> <b>Example:</b>	Enables WLAN.

	Command or Action	Purpose
	Device(config-wlan)#no shutdown	

## Enabling QoS Basic Set Service Load

Perform the procedure given below to enable QBSS load.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wireless profile policy <i>profile-policy</i></b> <b>Example:</b> Device(config)# wireless profile policy rr-xyz-policy-1	Configures WLAN policy profile and enters wireless policy configuration mode.
<b>Step 3</b>	<b>vlan <i>vlan-id</i></b> <b>Example:</b> Device(config-wireless-policy)# vlan 24	Configures VLAN name or VLAN ID.
<b>Step 4</b>	<b>[no] qbss-load</b> <b>Example:</b> Device(config-wireless-policy)#[no] qbss-load	Enables QoS enhanced basic service set information element. (Use the <b>no</b> form of this command to disable the feature.)
<b>Step 5</b>	<b>no shutdown</b> <b>Example:</b> Device(config-wireless-policy)# no shutdown	Saves the configuration and exits configuration mode and returns to privileged EXEC mode.

### What to do next

1. Create a policy tag. For more information about creating policy tags, refer to *Configuring a Policy Tag (CLI)*.
2. Map the policy tag to the AP. For more information about mapping a policy tag to the AP, refer to *Attaching a Policy Tag and Site Tag to an AP (CLI)*.

## Verifying QoS Basic Set Service Load

To verify if QBSS load is enabled, use the **show wireless profile policy detailed *named-policy-profile*** command:

```
Device# show wireless profile policy detailed named-policy-profile show wireless profile
policy detailed named-policy-profile
Policy Profile Name : named-policy-profile
Description :
Status : ENABLED
VLAN : 91
Multicast VLAN : 0
OSEN client VLAN :
Multicast Filter : DISABLED
QBSS Load : ENABLED
Passive Client : DISABLED
ET-Analytics : DISABLED
StaticIP Mobility : DISABLED
WLAN Switching Policy
 Flex Central Switching : ENABLED
 Flex Central Authentication : ENABLED
 Flex Central DHCP : ENABLED
 Flex NAT PAT : DISABLED
 Flex Central Assoc : ENABLED
```

## Information About IPv6 Client Address Learning

Client Address Learning is configured on device to learn the IPv4 and IPv6 address of wireless client, and the client's transition state maintained by the device on association and timeout.

There are three ways for an IPv6 client to acquire IPv6 addresses:

- Stateless Address Auto-Configuration (SLAAC)
- Stateful DHCPv6
- Static Configuration

In all of these methods, the IPv6 client always sends a neighbor solicitation Duplicate Address Detection (DAD) request to ensure that there is no duplicate IP address on the network. The device snoops on the Neighbor Discovery Protocol (NDP) and DHCPv6 packets of the client to learn about its client IP addresses.

## Address Assignment Using SLAAC

The most common method for IPv6 client address assignment is SLAAC, which provides simple plug-and-play connectivity, where clients self-assign an address based on the IPv6 prefix.

SLAAC is configured as follows:

- A host sends a Router Solicitation message.
- The host waits for a Router Advertisement message.
- The host takes the first 64 bits of the IPv6 prefix from the Router Advertisement message and combines it with the 64-bit EUI-64 address (in the case of Ethernet, this is created from the MAC address) to create a global unicast message. The host also uses the source IP address, in the IP header, of the Router Advertisement message, as its default gateway.
- Duplicate Address Detection is performed by the IPv6 clients to ensure that random addresses that are picked do not collide with other clients.

**Note** The last 64 bits of the IPv6 address can be learned by using one of the following algorithms:

- EUI-64, which is based on the MAC address of the interface
- Private addresses that are randomly generated

**Figure 47: Address Assignment Using SLAAC**

The following Cisco IOS configuration commands from a Cisco-capable IPv6 router are used to enable SLAAC addressing and router advertisements:

```

ipv6 unicast-routing
interface Vlan20
description IPv6-SLAAC
ip address 192.168.20.1 255.255.255.0
ipv6 address FE80:DB8:0:20::1 linklocal
ipv6 address 2001:DB8:0:20::1/64
ipv6 enable
end

```

## Stateful DHCPv6 Address Assignment

The use of DHCPv6 is not required for IPv6 client connectivity if SLAAC is already deployed. There are two modes of operation for DHCPv6, that is, Stateless and Stateful.

The DHCPv6 Stateless mode is used to provide clients with additional network information that is not available in the router advertisement, but not an IPv6 address, because this is already provided by SLAAC. This information includes the DNS domain name, DNS servers, and other DHCP vendor-specific options.

**Figure 48: Stateful DHCPv6 Address Assignment**

The following interface configuration is for a Cisco IOS IPv6 router implementing stateless DHCPv6 with SLAAC enabled:

```

ipv6 unicast-routing
ipv6 dhcp pool IPV6_DHCPPPOOL
address prefix 2001:db8:5:10::/64
domain-name cisco.com
dns-server 2001:db8:6:6::1
interface Vlan20
description IPv6-DHCP-Stateless
ip address 192.168.20.1 255.255.255.0
ipv6 nd other-config-flag
ipv6 dhcp server IPV6_DHCPPPOOL
ipv6 address 2001:DB8:0:20::1/64
end

```

## Router Solicitation

A Router Solicitation message is issued by a host controller to facilitate local routers to transmit a Router Advertisement from which the controller can obtain information about local routing, or perform stateless auto configuration. Router Advertisements are transmitted periodically and the host prompts with an immediate Router Advertisement using a Router Solicitation such as - when it boots or following a restart operation.

## Router Advertisement

A Router Advertisement message is issued periodically by a router or in response to a Router Solicitation message from a host. The information contained in these messages is used by a host to perform stateless auto configuration and to modify its routing table.

## Neighbor Discovery

IPv6 Neighbor Discovery is a set of messages and processes that determine relationships between neighboring nodes. Neighbor Discovery replaces the Address Resolution Protocol (ARP), Internet Control Message Protocol (ICMP) Router Discovery, and ICMP Redirect used in IPv4.

IPv6 Neighbor Discovery inspection analyzes neighbor discovery messages in order to build a trusted binding table database, and IPv6 Neighbor Discovery packets that do not comply, are dropped. The neighbor binding table in the tracks each IPv6 address and its associated MAC address. Clients are removed from the table according to neighbor-binding timers.

## Neighbor Discovery Suppression

The IPv6 addresses of wireless clients are cached by a device once the wireless client is in RUN state. When the device receives an NS multicast, it looks into the IPv6 addresses cached. If the target address is known to the device and belongs to one of its wireless clients, the device converts the NS from multicast to unicast and forward it to the wireless client. If the target address is not present in the cache, then device interprets that the Multicast NS is for a wired entity and forward it towards the wired side and not to the wireless client.

The same behavior is seen for ARP request in case of IPv4 address, where the device maintains IPv4 address of the wireless client in the cache.

When neither of the configuration is enabled, and when the device receives Non-DAD or DAD NS multicast looking for an IPv6 address, and if the target address is known to the device and belongs to one of its clients, the device will convert the multicast NS to unicast NS, with the destination MAC address, replaced with client's MAC and forward the unicast packet towards client.

When full-proxy is enabled, and when the device receives Non-DAD or DAD NS multicast, looking for an IPv6 address, and if the target address is known to the device and belongs to one of its clients, the device will reply with an NA message on behalf of the client.

You can use the **ipv6 nd proxy** command to enable or disable DAD or full proxy.

When the device receives an DAD-NS multicast looking for an IPv6 address, and if the target address is known to the device and belongs to one of its clients, the device will reply with an NA message on behalf of the client.

When the device receives Non-DAD NS multicast looking for an IPv6 address, and if the target address is known to the device and belongs to one of its clients, the device will convert the multicast NS to unicast NS, with the destination MAC address, replaced with client's MAC and forward the unicast packet towards client.

If the device does not have the IPv6 address of a wireless client, the device does not respond with NA; instead, it forwards the NS packet to the wired side. Reason for forwarding to Wired Side is due to the assumption that all wireless client IPv6 address and the its mapped MAC address should be available in the controller and if an IPv6 address required in the NS is not available, then that address is not a wireless client address, so forwarded to wired side.

## Router Advertisement Guard

The RA Guard feature increases the security of the IPv6 network by dropping router advertisements coming from wireless clients. Without this feature, misconfigured or malicious IPv6 clients could announce themselves as a router for the network, often with a high priority, which could take precedence over legitimate IPv6 routers. By default, RA guard is always enabled on the controller.

- Port on which the frame is received
- IPv6 source address
- Prefix list
- Trusted or Untrusted ports for receiving the router advertisement guard messages
- Trusted/Untrusted IPv6 source addresses of the router advertisement sender
- Trusted/Untrusted Prefix list and Prefix ranges
- Router preference

## Router Advertisement Throttling

RA throttling allows the controller to enforce limits to the RA packets headed toward the wireless network. By enabling RA throttling, routers that send multiple RA packets can be trimmed to a minimum frequency that will still maintain an IPv6 client connectivity. If a client sends an RS packet, an RA is sent back to the client. This RA is allowed through the controller and unicast to the client. This process ensures that the new clients or roaming clients are not affected by the RA throttling.

## Prerequisites for IPv6 Client Address Learning

Before configuring IPv6 client address learning, configure the clients to support IPv6.

To enable wireless IPv6 client connectivity, the underlying wired network must support IPv6 routing and an address assignment mechanism, such as SLAAC or DHCPv6. The wireless LAN controller must have L2 adjacency to the IPv6 router.

---

**Note** The AP learns IPv6 client address based on source IP address even though Neighbor Advertisements can hold rest of the IPv6 addresses. AP won't look into the Neighbor Advertisements to learn the IPv6 address learnt by the client. This behavior is seen only on Apple clients and not on Microsoft Windows clients.

---

## IPv6 Address Tracking for Wireless Clients

Until Cisco IOS XE 17.9.1, the controller supported a maximum of eight IPv6 addresses per wireless client. After eight IPv6 addresses were learnt for a wireless client, the controller dropped that wireless client's data traffic coming with new IPv6 source addresses.

However, in Cisco IOS XE 17.9.2 release, the controller allows data traffic of the wireless clients coming with new IPv6 source addresses even after eight addresses have been learnt for respective wireless clients. The controller continues to learn new IPv6 addresses of the wireless clients from the wireless clients' control traffic (IPv6 NS/NA and DHCPv6), and keeps track of only a maximum of eight addresses per wireless client.

To allow forwarding of the multicast neighbor solicitation (NS) queries for unknown IPv6 target addresses of wireless clients (the client addresses that are not tracked by the controller) to wireless clients, the **wireless ipv6 nd ns-forward** configuration must be enabled.

---

**Important** We recommend that you configure IPv6 Multicast over Multicast (MoM) tunnel along with the **wireless ipv6 nd ns-forward** configuration.

---

**Note** In Cisco IOS XE 17.9.2, since the controller allows IPv6 traffic without address tracking beyond the eight IPv6 address limit, some of the features such as, User Defined Network, iPSK Peer-to-Peer Blocking, Management over Wireless, Neighbor Discovery Suppression, IP Theft Detection, and so on, may not work for the wireless clients using more than eight addresses. You can disable the new behavior by enabling the IP Source Guard feature  
[https://www.cisco.com/c/en/us/td/docs/wireless/controller/9800/17-9/config-guide/b\\_wl\\_17\\_9\\_cg/m\\_ipsg\\_ewlc.html?bookSearch=true](https://www.cisco.com/c/en/us/td/docs/wireless/controller/9800/17-9/config-guide/b_wl_17_9_cg/m_ipsg_ewlc.html?bookSearch=true)

## Configuring Unknown Address Multicast Neighbor Solicitation Forwarding

To allow forwarding of the multicast neighbor solicitation (NS) queries for unknown IPv6 target addresses of wireless clients (the client addresses that are not tracked by the controller) to wireless clients, perform the following steps:

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>wireless ipv6 nd ns-forward</b>  <b>Example:</b> Device (config)# <code>wireless ipv6 nd ns-forward</code>	Enables forwarding of the multicast neighbor solicitation (NS) messages for unknown IPv6 target addresses of wireless clients (the client addresses that are not tracked by the controller) to wireless clients.  <b>Note</b> We recommend that you configure IPv6 Multicast over Multicast (MoM) tunnel along with this configuration.

## Configuring RA Throttle Policy (CLI)

Configure RA Throttle policy to allow the enforce the limits

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# <code>configure terminal</code>	Enters global configuration mode.

	Command or Action	Purpose
<b>Step 2</b>	<b>ipv6 nd ra-throttler policy ra-throttler1</b>  <b>Example:</b> Device(config)# ipv6 nd ra-throttler policy ra-throttler1	Define the router advertisement (RA) throttler policy name and enter IPv6 RA throttle policy configuration mode.
<b>Step 3</b>	<b>throttleperiod 500</b>  <b>Example:</b> Device(config-nd-ra-throttle)# throttle-period 500	Configures the throttle period in an IPv6 RA throttler policy. Throttle period is in seconds and it is the time while the controller will not forward RA to the wireless clients.
<b>Step 4</b>	<b>max-through 10</b>  <b>Example:</b> Device(config-nd-ra-throttle)# max-through 15	Limits multicast RAs per VLAN per throttle period.
<b>Step 5</b>	<b>allow-atleast 5 at-most 10</b>  <b>Example:</b> Device(config-nd-ra-throttle)# allow at-least 5 at-most 10	Limits the number of multicast RAs per device per throttle period in an RA throttler policy.

## Applying RA Throttle Policy on VLAN (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Services > RA Throttle Policy**.
- Step 2** Click **Add**. The **Add RA Throttle Policy** dialog box appears.
- Step 3** Enter a name for the policy in the **Name** field.
- Step 4** Choose the desired option from the **Medium Type** drop-down list.
- Step 5** Enter a value in the **Throttle Period** field. RA throttling takes place only after the Max Through limit is reached for the VLAN or the Allow At-Most value is reached for a particular router.
- Step 6** Enter a value for the **Max Through** field, which is the maximum number of RA packets on a VLAN that can be sent before throttling takes place. The **No Limit** option allows an unlimited number of RA packets through with no throttling.
- Step 7** Choose an **Interval Option**, which allows the device to act differently based on the RFC 3775 value set in IPv6 RA packets, from the following options:
- **Ignore**—Causes the RA throttle to treat packets with the interval option as a regular RA and subject to throttling if in effect.
  - **Passthrough**—Allows any RA messages with the RFC 3775 interval option to go through without throttling.

- Throttle—Causes the RA packets with the interval option to always be subject to rate limiting.

- Step 8** Enter the minimum number of RA packets per router that can be sent as multicast before throttling takes place in the **At Least Multicast RAs** field.
- Step 9** Enter the maximum number of RA packets per router that can be sent as multicast before throttling takes place in the **At Most Multicast RAs** field. The **No Limit** option allows an unlimited number of RA packets through the router.
- Step 10** Click the **Add & Apply to Device** button.

## Applying RA Throttle Policy on a VLAN (CLI)

Applying the RA Throttle policy on a VLAN. By enabling RA throttling, routers that send many RA packets can be trimmed to a minimum frequency that will still maintain an IPv6 client connectivity.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b>  Device# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>vlan configuration 1</b>  <b>Example:</b>  Device(config)# <code>vlan configuration 1</code>	Configures a VLAN or a collection of VLANs and enters VLAN configuration mode.
<b>Step 3</b>	<b>ipv6 nd ra throttler attach-policy ra-throttler1</b>  <b>Example:</b>  Device(config-vlan)# <code>ipv6 nd ra throttler attach-policy ra-throttler1</code>	Attaches an IPv6 RA throttler policy to a VLAN or a collection of VLANs.

## Configuring IPv6 Interface on a Switch (GUI)

### Procedure

- Step 1** Choose **Configuration > Layer2 > VLAN > SVI**.
- Step 2** Click **Add**.
- Step 3** Enter **VLAN Number**, **Description** and **MTU (Bytes)**.
- Step 4** Enable or disable the **Admin Status** toggle button.

- Step 5** In **IP Options**, check the **IPv6** check box.
- Step 6** Choose the type of **Static** address from the drop-down list and enter the Static Address.
- Step 7** Check or uncheck the **DHCP**, **Autoconfig** and **Act as an IPv6 DHCP client** check boxes.
- If you check the **DHCP** check box, the **Rapid Commit** check box is displayed. Check or uncheck the **Rapid Commit** check box.
- Step 8** Click **Apply to Device**.

## Configuring IPv6 on Interface (CLI)

Follow the procedure given below to configure IPv6 on an interface:

### Before you begin

Enable IPv6 on the client and IPv6 support on the wired infrastructure.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b>  Device> <b>enable</b>	Enables privileged EXEC mode.  Enter your password, if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b>  Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 3</b>	<b>interface vlan <i>vlan-id</i></b> <b>Example:</b>  Device(config)# <b>interface vlan 10</b>	Creates an interface and enters interface configuration mode.
<b>Step 4</b>	<b>ip address fe80::1 link-local</b> <b>Example:</b>  Device(config-if)# <b>ip address 198.51.100.1 255.255.255.0</b> Device(config-if)# <b>ipv6 address fe80::1 link-local</b> Device(config-if)# <b>ipv6 address 2001:DB8:0:1:FFFF:1234::5/64</b> Device(config-if)# <b>ipv6 address 2001:DB8:0:0:E000::F/64</b>	Configures IPv6 address on the GigabitEthernet interface using the link-local option.
<b>Step 5</b>	<b>ipv6 enable</b> <b>Example:</b>	(Optional) Enables IPv6 on the GigabitEthernet interface.

	Command or Action	Purpose
	Device (config)# <b>ipv6 enable</b>	
<b>Step 6</b>	<b>end</b>  <b>Example:</b> Device (config)# <b>end</b>	Exits interface mode.

## Configuring DHCP Pool on Switch (GUI)

### Procedure

- 
- Step 1** Choose **Administration > DHCP**.
  - Step 2** Click the **Add** button. The **Create DHCP Pool** dialog box appears.
  - Step 3** Enter a pool name in the **DHCP Pool Name** field. The name must not be greater than 236 characters in length.
  - Step 4** Choose either **IPv4** or **IPv6** from the **IP Type** drop-down list.
  - Step 5** Enter an IP address in the **Network** field.
  - Step 6** Choose any one of the available subnet masks from the **Subnet Mask** drop-down list.
  - Step 7** Enter an IP address in the **Starting ip** field.
  - Step 8** Enter an IP address in the **Ending ip** field.
  - Step 9** Optional, set the status of the **Reserved Only** field to **Enabled** if you wish to reserve the DHCP pool.
  - Step 10** Choose the desired option from the **Lease** drop-down list.
  - Step 11** Selecting the **User Defined** option from the **Lease** drop-down list enables the **(0-365 days)**, **(0-23 hours)**, and **(0-59 minutes)** fields. Enter appropriate values.
  - Step 12** Click the **Save & Apply to Device** button.
  - Step 13** For IPv6, Enter the **DNS Server**, **DNS Domain Name**, and **IPv6 Address Allocation**.
- 

## Configuring DHCP Pool on Switch (CLI)

Follow the procedure given below to configure DHCP Pool on an interface:

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b>  <b>Example:</b> Device> <b>enable</b>	Enables privileged EXEC mode.  Enter your password if prompted.

	Command or Action	Purpose
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b>  Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 3</b>	<b>ipv6 dhcp pool <i>vlan-id</i></b> <b>Example:</b>  Device(config)# <b>ipv6 dhcp pool 21</b>	Enters the configuration mode and configures the IPv6 DHCP pool on the Vlan.
<b>Step 4</b>	<b>address prefix</b> <b>2001:DB8:0:1:FFF:1234::/64</b> <b>lifetime 300 10</b> <b>Example:</b>  Device(config-dhcpv6)# <b>address prefix</b> <b>2001:DB8:0:1:FFF:1234::/64 lifetime 300</b> <b>10</b>	Enters the configuration-dhcp mode and configures the address pool and its lifetime on a Vlan.
<b>Step 5</b>	<b>dns-server 2001:100:0:1::1</b> <b>Example:</b>  Device(config-dhcpv6)# <b>dns-server</b> <b>2001:20:21::1</b>	Configures the DNS servers for the DHCP pool.
<b>Step 6</b>	<b>domain-name example.com</b> <b>Example:</b>  Device(config-dhcpv6)# <b>domain-name</b> <b>example.com</b>	Configures the domain name to complete unqualified host names.
<b>Step 7</b>	<b>end</b> <b>Example:</b>  Device(config)# <b>end</b>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Configuring Stateless Auto Address Configuration Without DHCP on Switch (CLI)

Follow the procedure given below to configure stateless auto address configuration without DHCP:

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b>	Enables privileged EXEC mode. Enter your password if prompted.

	Command or Action	Purpose
	Device> <b>enable</b>	
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 3</b>	<b>interface vlan 1</b> <b>Example:</b> Device(config)# <b>interface vlan 1</b>	Creates an interface and enters interface configuration mode.
<b>Step 4</b>	<b>ip address fe80::1 link-local</b> <b>Example:</b> Device(config-if)# <b>ip address</b> <b>198.51.100.1 255.255.255.0</b> Device(config-if)# <b>ipv6 address</b> <b>fe80::1 link-local</b> Device(config-if)# <b>ipv6 address</b> <b>2001:DB8:0:1:FFFF:1234::5/64</b> Device(config-if)# <b>ipv6 address</b> <b>2001:DB8:0:0:E000::F/64</b>	Configures IPv6 address on the GigabitEthernet interface using the link-local option.
<b>Step 5</b>	<b>ipv6 enable</b> <b>Example:</b> Device(config)# <b>ipv6 enable</b>	(Optional) Enables IPv6 on the GigabitEthernet interface.
<b>Step 6</b>	<b>no ipv6 nd managed-config-flag</b> <b>Example:</b> Device(config)# <b>interface vlan 1</b> Device(config-if)# <b>no ipv6 nd</b> <b>managed-config-flag</b>	Ensures the attached hosts do not use stateful autoconfiguration to obtain addresses.
<b>Step 7</b>	<b>no ipv6 nd other-config-flag</b> <b>Example:</b> Device(config-if)# <b>no ipv6 nd</b> <b>other-config-flag</b>	Ensures the attached hosts do not use stateful autoconfiguration to obtain non-address options from DHCP (domain etc).
<b>Step 8</b>	<b>end</b> <b>Example:</b> Device(config)# <b>end</b>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

# Configuring Stateless Auto Address Configuration With DHCP on Switch

Follow the procedure given below to configure stateless auto address configuration with DHCP:

## Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b>  Device> <b>enable</b>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b>  Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 3</b>	<b>interface vlan 1</b> <b>Example:</b>  Device(config)# <b>interface vlan 1</b>	Creates an interface and enters interface configuration mode.
<b>Step 4</b>	<b>ip address fe80::1 link-local</b> <b>Example:</b>  Device(config-if)# <b>ip address</b> <b>198.51.100.1 255.255.255.0</b> Device(config-if)# <b>ipv6 address</b> <b>fe80::1 link-local</b> Device(config-if)# <b>ipv6 address</b> <b>2001:DB8:0:1:FFFF:1234::5/64</b> Device(config-if)# <b>ipv6 address</b> <b>2001:DB8:0:0:E000::F/64</b>	Configures IPv6 address on the GigabitEthernet interface using the link-local option.
<b>Step 5</b>	<b>ipv6 enable</b> <b>Example:</b>  Device(config)# <b>ipv6 enable</b>	(Optional) Enables IPv6 on the GigabitEthernet interface.
<b>Step 6</b>	<b>ipv6 nd prefix ipaddress</b> <b>Example:</b>  ipv6 nd prefix 2001:9:3:54::/64 no-advertise	Specifies a subnet prefix.
<b>Step 7</b>	<b>no ipv6 nd managed-config-flag</b> <b>Example:</b>	Ensures the attached hosts do not use stateful autoconfiguration to obtain addresses.

	Command or Action	Purpose
	Device (config) # <b>interface vlan 1</b> Device (config-if) # <b>no ipv6 nd managed-config-flag</b>	
<b>Step 8</b>	<b>ipv6 nd other-config-flag</b> <b>Example:</b> Device (config-if) # <b>no ipv6 nd other-config-flag</b>	Ensures the attached hosts do not use stateful autoconfiguration to obtain non-address options from DHCP (domain etc).
<b>Step 9</b>	<b>ipv6 dhcp server servername</b> <b>Example:</b> ipv6 dhcp server VLAN54	Displays the configuration parameters.
<b>Step 10</b>	<b>end</b> <b>Example:</b> Device (config) # <b>end</b>	Exits interface mode.

## Configuring Stateless Address Auto Configuration Without DHCP on Switch (CLI)

Follow the procedure given below to configure stateless auto address configuration without DHCP:

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Device> <b>enable</b>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 3</b>	<b>interface vlan 1</b> <b>Example:</b> Device (config) # <b>interface vlan 1</b>	Creates an interface and enters interface configuration mode.
<b>Step 4</b>	<b>ip address fe80::1 link-local</b> <b>Example:</b> Device (config-if) # <b>ip address 198.51.100.1 255.255.255.0</b>	Configures IPv6 address on the GigabitEthernet interface using the link-local option.

	Command or Action	Purpose
	<pre>Device(config-if)# ipv6 address fe80::1 link-local Device(config-if)# ipv6 address 2001:DB8:0:1:FFFF:1234::5/64 Device(config-if)# ipv6 address 2001:DB8:0:0:E000::F/64</pre>	
<b>Step 5</b>	<p><b>ipv6 enable</b></p> <p><b>Example:</b></p> <pre>Device(config)# ipv6 enable</pre>	(Optional) Enables IPv6 on the GigabitEthernet interface.
<b>Step 6</b>	<p><b>no ipv6 nd managed-config-flag</b></p> <p><b>Example:</b></p> <pre>Device(config)# interface vlan 1 Device(config-if)# no ipv6 nd managed-config-flag</pre>	Ensures the attached hosts do not use stateful autoconfiguration to obtain addresses.
<b>Step 7</b>	<p><b>no ipv6 nd other-config-flag</b></p> <p><b>Example:</b></p> <pre>Device(config-if)# no ipv6 nd other-config-flag</pre>	Ensures the attached hosts do not use stateful autoconfiguration to obtain non-address options from DHCP (domain etc).
<b>Step 8</b>	<p><b>end</b></p> <p><b>Example:</b></p> <pre>Device(config)# end</pre>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Native IPv6

### Information About IPv6

IPv6 is a packet-based protocol used to exchange data, voice, and video traffic over digital networks. IPv6 is based on IP, but with a much larger address space, and improvements such as a simplified main header and extension headers. The architecture of IPv6 has been designed to allow existing IPv4 users to transition easily to IPv6 while continuing to use services such as end-to-end security, quality of service (QoS), and globally unique addresses. The larger IPv6 address space allows networks to scale and provide global reachability.

**Note** The features and functions that work on IPv4 networks with IPv4 addresses also work on IPv6 networks with IPv6 addresses.

#### General Guidelines

- For IPv6 functionality to work, ensure that you disable IPv6 multicast routing.
- The Wireless Management interface should have only one static IPv6 address.

- Router advertisement should be suppressed on the wireless management interface and client VLANs (if IPv6 is configured on the client VLAN).
- Preferred mode is part of an AP join profile. When you configure the preferred mode as IPv6, an AP attempts to join over IPv6 first. If it fails, the AP falls back to IPv4.
- You should use MAC addresses for RA tracing of APs and clients.
- APs can join IPv6 controllers only with an IPv6 static address. If you have a controller with auto configurations and multiple IPv6 addresses, APs cannot join the IPv6 controllers.

### Unsupported Features

- UDP Lite is not supported.
- AP sniffer over IPv6 is not supported.
- IPv6 is not supported for the HA port interface.
- Auto RF grouping over IPv6 is not supported. Only static RF grouping is supported.

## Configuring IPv6 Addressing

Follow the procedure given below to configure IPv6 addressing:

**Note** All the features and functions that work on IPv4 networks with IPv4 addresses will work on IPv6 networks with IPv6 addresses too.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>ipv6 unicast-routing</b> <b>Example:</b> Device(config)# <code>ipv6 unicast-routing</code>	Configures IPv6 for unicasting.
<b>Step 3</b>	<b>interface vlan 1</b> <b>Example:</b> Device(config)# <code>interface vlan 1</code>	Creates an interface and enters interface configuration mode.
<b>Step 4</b>	<b>ipv6 address <i>ipv6-address</i></b> <b>Example:</b> Device(config-if)# <code>ipv6 address FD09:9:2:49::53/64</code>	Specifies a global IPv6 address.

	Command or Action	Purpose
<b>Step 5</b>	<b>ipv6 enable</b> <b>Example:</b> Device(config-if)# ipv6 enable	Enables IPv6 on the interface.
<b>Step 6</b>	<b>ipv6 nd ra suppress all</b> <b>Example:</b> Device(config-if)# ipv6 nd ra suppress all	Suppresses IPv6 router advertisement transmissions on the interface.
<b>Step 7</b>	<b>exit</b> <b>Example:</b> Device(config-if)# exit	Returns to global configuration mode.
<b>Step 8</b>	<b>wireless management interface gigabitEthernet gigabitEthernet-interface-vlan 64</b> <b>Example:</b> Device(config)# wireless management interface gigabitEthernet vlan 64	Configures the ports that are connected to the supported APs with the wireless management interface.
<b>Step 9</b>	<b>ipv6 route ipv6-address</b> <b>Example:</b> Device(config)# ipv6 route ::/0 FD09:9:2:49::1	Specifies IPv6 static routes.

## Creating an AP Join Profile (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Tags & Profiles > AP Join**.
  - Step 2** On the **AP Join Profile** window, click the **General** tab and click **Add**.
  - Step 3** In the **Name** field enter, a name for the AP join profile.
  - Step 4** (Optional) Enter a description for the AP join profile.
  - Step 5** Choose **CAPWAP > Advanced**.
  - Step 6** Under the **Advanced** tab, from the **Preferred Mode** drop-down list, choose **IPv6**. This sets the preferred mode of APs as IPv6.
  - Step 7** Click **Save & Apply to Device**.
-

## Creating an AP Join Profile (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>ap profile <i>ap-profile</i></b>  <b>Example:</b> Device(config)# ap profile xyz-ap-profile	Configures an AP profile and enters AP profile configuration mode.
<b>Step 3</b>	<b>description <i>ap-profile-name</i></b>  <b>Example:</b> Device(config-ap-profile)# description "xyz ap profile"	Adds a description for the AP profile.
<b>Step 4</b>	<b>preferred-mode ipv6</b>  <b>Example:</b> Device(config-ap-profile)# preferred-mode ipv6	Sets the preferred mode of APs as IPv6.

## Configuring the Primary and Backup Controller (GUI)

### Before you begin

Ensure that you have configured an AP join profile prior to configuring the primary and backup controller s.

### Procedure

- 
- Step 1** Choose **Configuration > Tags & Profiles > AP Join**.
  - Step 2** On the **AP Join Profile** window, click the AP join profile name.
  - Step 3** In the **Edit AP Join Profile** window, click the **CAPWAP** tab.
  - Step 4** In the **High Availability** tab, under **Backup Controller Configuration**, check the **Enable Fallback** check box.
  - Step 5** Enter the primary and secondary controller names and IP addresses.
  - Step 6** Click **Update & Apply to Device**.
- 

## Configuring Primary and Backup Controller (CLI)

Follow the procedure given below to configure the primary and secondary controllers for a selected AP:

## Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>ap profile profile-name</b> <b>Example:</b> Device(config)# ap profile yy-ap-profile	Configures an AP profile and enters AP profile configuration mode.
<b>Step 3</b>	<b>capwap backup primary</b> <i>primary-controller-name primary-controller-ip</i> <b>Example:</b> Device(config)# capwap backup primary WLAN-Controller-A 2001:DB8:1::1	Configures AP CAPWAP parameters with the primary backup controller's name.  <b>Note</b> You need to enable fast heartbeat for <b>capwap backup primary</b> and <b>capwap backup secondary</b> to work.  AP disconnection may occur if the link between the controller and AP is not reliable and fast heartbeat is enabled.
<b>Step 4</b>	<b>ap capwap backup secondary</b> <i>secondary-controller-name secondary-controller-ip</i> <b>Example:</b> Device(config)# capwap backup secondary WLAN-Controller-B 2001:DB8:1::1	Configures AP CAPWAP parameters with the secondary backup controller's name.
<b>Step 5</b>	<b>syslog host ipaddress</b> <b>Example:</b> Device(config)# syslog host 2001:DB8:1::1	Configures the system logging settings for the APs.
<b>Step 6</b>	<b>tftp-downgrade tftp-server-ip imagename</b> <b>Example:</b> Device(config)# tftp-downgrade 2001:DB8:1::1 testimage	Initiates AP image downgrade from a TFTP server for all the APs.

## Verifying IPv6 Configuration

Use the following **show** command to verify the IPv6 configuration:

```
Device# show wireless interface summary
```

```
Wireless Interface Summary
```

```
Interface Name Interface Type VLAN ID IP Address IP Netmask MAC Address
```

```
Vlan49 Management 49 0.0.0.0 255.255.255.0 001e.f64c.1eff
 fd09:9:2:49::54/64
```

## CHAPTER 154

# IPv6 ACL

- [Information About IPv6 ACL, on page 1707](#)
- [Prerequisites for Configuring IPv6 ACL, on page 1708](#)
- [Restrictions for Configuring IPv6 ACL, on page 1708](#)
- [Configuring IPv6 ACLs , on page 1708](#)
- [How To Configure an IPv6 ACL, on page 1709](#)
- [Verifying IPv6 ACL, on page 1714](#)
- [Configuration Examples for IPv6 ACL, on page 1715](#)

## Information About IPv6 ACL

An access control list (ACL) is a set of rules used to limit access to a particular interface (for example, if you want to restrict a wireless client from pinging the management interface of the controller ). ACLs are configured on the device and applied to the management interface, the AP-manager interface, any of the dynamic interfaces, or a WLAN to control data traffic to and from wireless clients or to the controller central processing unit (CPU) to control all traffic destined for the CPU.

You can also create a preauthentication ACL for web authentication. Such an ACL is used to allow certain types of traffic before authentication is complete.

IPv6 ACLs support the same options as IPv4 ACLs including source, destination, source and destination ports.

---

**Note** You can enable only IPv4 traffic in your network by blocking IPv6 traffic. That is, you can configure an IPv6 ACL to deny all IPv6 traffic and apply it on specific or all WLANs.

---

## Understanding IPv6 ACLs

### Types of ACL

#### Per User IPv6 ACL

For the per-user ACL, the full access control entries (ACE) as the text strings are configured on the RADIUS server.

The ACE is not configured on the Cisco 9800 controller. The ACE is sent to the device in the `ACCESS-Accept` attribute and applies it directly for the client. When a wireless client roams into an foreign device, the ACEs are sent to the foreign device as an AAA attribute in the mobility Handoff message. Output direction, using per-user ACL is not supported.

## Filter ID IPv6 ACL

For the filter-Id ACL, the full ACEs and the `acl_name(filter-id)` is configured on the Cisco 9800 controller and only the `filter-id` is configured on the RADIUS Server.

The `filter-id` is sent to the device in the `ACCESS-Accept` attribute, and the device looks up the `filter-id` for the ACEs, and then applies the ACEs to the client. When the client L2 roams to the foreign device, only the `filter-id` is sent to the foreign device in the mobility Handoff message. Output filtered ACL, using per-user ACL is not supported. The foreign device has to configure the `filter-id` and ACEs beforehand.

# Prerequisites for Configuring IPv6 ACL

You can filter IP Version 6 (IPv6) traffic by creating IPv6 access control lists (ACLs) and applying them to interfaces similarly to the way that you create and apply IP Version 4 (IPv4) named ACLs. You can also create and apply input router ACLs to filter Layer 3 management traffic when the switch is running the Network Essentials license.

# Restrictions for Configuring IPv6 ACL

With IPv4, you can configure standard and extended numbered IP ACLs, named IP ACLs, and MAC ACLs. IPv6 supports only named ACLs. The IPv6 ACL does not support Flex connect mode.

The device supports most of the Cisco IOS-supported IPv6 ACLs with some exceptions:

- The device does not support matching on these keywords: **flowlabel**, **routing header**, and **undetermined-transport**.
- The device does not support reflexive ACLs (the **reflect** keyword).
- The device does not apply MAC-based ACLs on IPv6 frames.
- When configuring an ACL, there is no restriction on keywords entered in the ACL, regardless of whether or not they are supported on the platform. When you apply the ACL to an interface that requires hardware forwarding (physical ports or SVIs), the device checks to determine whether or not the ACL can be supported on the interface. If not, attaching the ACL is rejected.
- If an ACL is applied to an interface and you attempt to add an access control entry (ACE) with an unsupported keyword, the device does not allow the ACE to be added to the ACL that is currently attached to the interface

# Configuring IPv6 ACLs

Follow the procedure given below to filter IPv6 traffic:

1. Create an IPv6 ACL, and enter IPv6 access list configuration mode.

2. Configure the IPv6 ACL to block (deny) or pass (permit) traffic.
3. Apply the IPv6 ACL to the interface where the traffic needs to be filtered.
4. Apply the IPv6 ACL to an interface. For router ACLs, you must also configure an IPv6 address on the Layer 3 interface to which the ACL is applied.

## Default IPv6 ACL Configuration

There are no IPv6 ACLs configured or applied.

## Interaction with Other Features and Switches

- If a bridged frame is to be dropped due to a port ACL, the frame is not bridged.
- You can create both IPv4 and IPv6 ACLs on a switch or switch stack, and you can apply both IPv4 and IPv6 ACLs to the same interface. Each ACL must have a unique name; an error message appears if you try to use a name that is already configured.

You use different commands to create IPv4 and IPv6 ACLs and to attach IPv4 or IPv6 ACLs to the same Layer 2 or Layer 3 interface. If you use the wrong command to attach an ACL (for example, an IPv4 command to attach an IPv6 ACL), you receive an error message.

- You cannot use MAC ACLs to filter IPv6 frames. MAC ACLs can only filter non-IP frames.
- If the hardware memory is full, for any additional configured ACLs, packets are processed to the CPU, and the ACLs are applied in software. When the hardware is full a message is printed to the console indicating the ACL has been unloaded and the packets will be processed in software.

---

**Note** Only packets of the same type as the ACL that could not be added (ipv4, ipv6, MAC) will be processed in software.

---

- If the TCAM is full, for any additional configured ACLs, packets are forwarded to the CPU, and the ACLs are applied in software.

## How To Configure an IPv6 ACL

### Creating an IPv6 ACL (GUI)

#### Procedure

---

- Step 1** Choose **Configuration > Security > ACL**.
- Step 2** Click **Add**.
- Step 3** In the **Add ACL Setup** dialog box, enter the following parameters.

- **ACL Name:** Enter the name for the ACL
- **ACL Type:** IPv6
- **Sequence:** The valid range is between 100 and 199 or 2000 and 26991
- **Action:** Choose **Permit** or **Deny** the packet flow from the drop-down list.
- **Source Type:** Choose **any**, **Host** or **Network** from which the packet is sent.
- **Destination Type:** Choose **any**, **Host** or **Network** to which the packet is sent.
- **Protocol:** Choose a protocol from the drop-down list.
- **Log:** Enable or disable logging.
- **DSCP:** Enter to match packets with the DSCP value

**Step 4** Click **Add**.

**Step 5** Add the rest of the rules and click **Apply to Device**.

## Creating an IPv6 ACL

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Device> <b>enable</b>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 3</b>	<b>ipv6 access-list <i>acl_name</i></b> <b>Example:</b> Device# <b>ipv6 access-list access-list-name</b>	Use a name to define an IPv6 access list and enter IPv6 access-list configuration mode.
<b>Step 4</b>	<b>{deny permit} protocol</b> <b>Example:</b> <pre>{deny   permit} protocol {source-ipv6-prefix/prefix-length   any    host source-ipv6-address} [operator [port-number]] {destination-ipv6-prefix/prefix-length</pre>	Enter deny or permit to specify whether to deny or permit the packet if conditions are matched. These are the conditions: <ul style="list-style-type: none"> <li>• For protocol, enter the name or number of an Internet protocol: ahp, esp, icmp, ipv6, pcp, stcp, tcp, or udp, or an integer</li> </ul>

Command or Action	Purpose
<pre>  any  host destination-ipv6-address) [operator [port-number]][dscp value] [fragments][log] [log-input] [routing][sequence value] [time-range name]</pre>	<p>in the range 0 to 255 representing an IPv6 protocol number.</p> <ul style="list-style-type: none"> <li>• The source-ipv6-prefix/prefix-length or destination-ipv6-prefix/ prefix-length is the source or destination IPv6 network or class of networks for which to set deny or permit conditions, specified in hexadecimal and using 16-bit values between colons (see RFC 2373).</li> <li>• Enter any as an abbreviation for the IPv6 prefix ::/0.</li> <li>• For host source-ipv6-address or destination-ipv6-address, enter the source or destination IPv6 host address for which to set deny or permit conditions, specified in hexadecimal using 16-bit values between colons.</li> <li>• (Optional) For operator, specify an operand that compares the source or destination ports of the specified protocol. Operands are lt (less than), gt (greater than), eq (equal), neq (not equal), and range.</li> </ul> <p>If the operator follows the source-ipv6-prefix/prefix-length argument, it must match the source port. If the operator follows the destination-ipv6-prefix/prefix-length argument, it must match the destination port.</p> <ul style="list-style-type: none"> <li>• (Optional) The port-number is a decimal number from 0 to 65535 or the name of a TCP or UDP port. You can use TCP port names only when filtering TCP. You can use UDP port names only when filtering UDP.</li> <li>• (Optional) Enter dscp value to match a differentiated services code point value against the traffic class value in the Traffic Class field of each IPv6 packet header. The acceptable range is from 0 to 63.</li> <li>• (Optional) For packet fragmentation, enter fragments to check noninitial</li> </ul>

	Command or Action	Purpose
		<p>fragments. This keyword is visible only if the protocol is ipv6.</p> <ul style="list-style-type: none"> <li>• (Optional) Enter log to cause an logging message to be sent to the console about the packet that matches the entry. Enter log-input to include the input interface in the log entry. Logging is supported only for router ACLs.</li> <li>• (Optional) Enter routing to specify that IPv6 packets be routed.</li> <li>• (Optional) Enter sequence value to specify the sequence number for the access list statement. The acceptable range is from 1 to 4294967295</li> <li>• (Optional) Enter time-range name to specify the time range that applies to the deny or permit statement.</li> </ul>
<b>Step 5</b>	<p><b>{deny permit} tcp</b></p> <p><b>Example:</b></p> <pre>{deny   permit} tcp {source-ipv6-prefix/prefix-length   any    hostsource-ipv6-address} [operator [port-number]]{destination-ipv6-prefix/prefix-length    any   hostdestination-ipv6-address} [operator [port-number]][ack] [dscp value][established] [fin] [log][log-input] [neq {port   protocol}]  [psh] [range{port   protocol}] [rst][routing] [sequence value] [syn] [time-range name][urg]</pre>	<p>(Optional) Define a TCP access list and the access conditions.</p> <p>Enter tcp for Transmission Control Protocol. The parameters are the same as those described in Step 3, with these additional optional parameters:</p> <ul style="list-style-type: none"> <li>• ack—Acknowledgment bit set.</li> <li>• established—An established connection. A match occurs if the TCP datagram has the ACK or RST bits set.</li> <li>• fin—Finished bit set; no more data from sender.</li> <li>• neq {port   protocol}—Matches only packets that are not on a given port number.</li> <li>• psh—Push function bit set.</li> <li>• range {port   protocol}—Matches only packets in the port number range.</li> <li>• rst—Reset bit set.</li> <li>• syn—Synchronize bit set.</li> <li>• urg—Urgent pointer bit set.</li> </ul>

	Command or Action	Purpose
<b>Step 6</b>	<p><b>{deny permit} udp</b></p> <p><b>Example:</b></p> <pre>{deny   permit} udp {source-ipv6-prefix/prefix-length   any    hostsource-ipv6-address} [operator [port-number]]{destination-ipv6-prefix/prefix-length    any   hostdestination-ipv6-address} [operator [port-number]][dscp value] [log][log-input] [neq {port  protocol}] [range {port  protocol}] [routing][sequence value][time-range name]</pre>	<p>(Optional) Define a UDP access list and the access conditions.</p> <p>Enter udp for the User Datagram Protocol. The UDP parameters are the same as those described for TCP, except that the operator [port] port number or name must be a UDP port number or name, and the established parameter is not valid for UDP.</p>
<b>Step 7</b>	<p><b>{deny permit} icmp</b></p> <p><b>Example:</b></p> <pre>{deny   permit} icmp {source-ipv6-prefix/prefix-length   any    hostsource-ipv6-address} [operator [port-number]] {destination-ipv6-prefix/prefix-length    any   hostdestination-ipv6-address} [operator [port-number]][icmp-type [icmp-code]  icmp-message] [dscpvalue] [log] [log-input] [routing] [sequence value][time-range name]</pre>	<p>(Optional) Define an ICMP access list and the access conditions.</p> <p>Enter icmp for Internet Control Message Protocol. The ICMP parameters are the same as those described for most IP protocols in Step 3a, with the addition of the ICMP message type and code parameters. These optional keywords have these meanings:</p> <ul style="list-style-type: none"> <li>• icmp-type—Enter to filter by ICMP message type, a number from 0 to 255.</li> <li>• icmp-code—Enter to filter ICMP packets that are filtered by the ICMP message code type, a number from 0 to 255.</li> <li>• icmp-message—Enter to filter ICMP packets by the ICMP message type name or the ICMP message type and code name. To see a list of ICMP message type names and code names, use the ? key or see command reference for this release.</li> </ul>
<b>Step 8</b>	<p><b>end</b></p> <p><b>Example:</b></p> <pre>Device(config)# end</pre>	<p>Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.</p>
<b>Step 9</b>	<p><b>show ipv6 access-list</b></p> <p><b>Example:</b></p> <pre>show ipv6 access-list</pre>	<p>Verify the access list configuration.</p>
<b>Step 10</b>	<p><b>copy running-config startup-config</b></p> <p><b>Example:</b></p> <pre>copy running-config startup-config</pre>	<p>(Optional) Save your entries in the configuration file.</p>

## Creating WLAN IPv6 ACL (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Tags & Profiles > WLANs**.
  - Step 2** Click **Add**.
  - Step 3** In the **General** tab, enter the **Profile Name**, the **SSID** and the **WLAN ID**.
  - Step 4** Choose **Security > Layer3** tab, click **Show Advanced Settings** and under the **Preauthenticated ACL** settings, choose the ACL from the **IPv6** drop-down list.
  - Step 5** Click **Apply to Device**.
- 

## Creating WLAN IPv6 ACL

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> DeviceController # configure terminal	Configures the terminal.
<b>Step 2</b>	<b>wireless profile policy <i>profile-name</i></b>  <b>Example:</b> Device(config)# wireless profile policy test1	Creates policy profile for the WLAN.  The <i>profile-name</i> is the profile name of the policy profile.
<b>Step 3</b>	<b>ipv6 acl <i>acl_name</i></b>  <b>Example:</b> Device(config-wireless-policy)# ipv6 acl testacl	Creates a named WLAN ACL.
<b>Step 4</b>	<b>ipv6 traffic-filter web <i>acl_name-preauth</i></b>  <b>Example:</b> Device(config-wlan)# ipv6 traffic-filter web preauth1	Creates a pre-authentication ACL for web authentication.

## Verifying IPv6 ACL

### Displaying IPv6 ACLs

To display IPv6 ACLs, perform this procedure:

**Procedure**

	<b>Command or Action</b>	<b>Purpose</b>
<b>Step 1</b>	<b>enable</b> <b>Example:</b>  Device> <b>enable</b>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b>  Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 3</b>	<b>show access-list</b> <b>Example:</b>  Device# <b>show access-lists</b>	Displays all access lists configured on the device
<b>Step 4</b>	<b>show ipv6 access-list <i>acl_name</i></b> <b>Example:</b>  Device# <b>show ipv6 access-list</b> <i>[access-list-name]</i>	Displays all configured IPv6 access list or the access list specified by name.

## Configuration Examples for IPv6 ACL

### Example: Creating an IPv6 ACL

This example configures the IPv6 access list named CISCO. The first deny entry in the list denies all packets that have a destination TCP port number greater than 5000. The second deny entry denies packets that have a source UDP port number less than 5000. The second deny also logs all matches to the console. The first permit entry in the list permits all ICMP packets. The second permit entry in the list permits all other traffic. The second permit entry is necessary because an implicit deny -all condition is at the end of each IPv6 access list.

**Note** Logging is supported only on Layer 3 interfaces.

```
Device(config)# ipv6 access-list CISCO
Device(config-ipv6-acl)# deny tcp any any gt 5000
Device (config-ipv6-acl)# deny ::/0 lt 5000 ::/0 log
Device(config-ipv6-acl)# permit icmp any any
Device(config-ipv6-acl)# permit any any
```

### Example: Applying an IPv6 ACL to a Policy Profile in a Wireless Environment

This example shows how to apply an IPv6 ACL to a Policy Profile in a Wireless environment.

**Note** All IPv6 ACLs must be associated to a policy profile.

**1. Creating an IPv6 ACL.**

```
Device(config)# ipv6 access-list <acl-name>
Device(config-ipv6-acl)# permit tcp 2001:DB8::/32 any
Device(config-ipv6-acl)# permit udp 2001:DB8::/32 any
```

**2. Applying the IPv6 ACL to a policy profile.**

```
Device(config)# wireless profile policy <policy-profile-name>
Device(config-wireless-policy)# shutdown
Device(config-wireless-policy)# ipv6 acl <acl-name>
Device(config-wireless-policy)# no shutdown
```

## Displaying IPv6 ACLs

To display IPv6 ACLs, perform this procedure:

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>show access-list</b>  <b>Example:</b> Device# <b>show access-lists</b>	Displays all access lists configured on the device
<b>Step 2</b>	<b>show ipv6 access-list <i>acl_name</i></b>  <b>Example:</b> Device# <b>show ipv6 access-list</b> [ <i>access-list-name</i> ]	Displays all configured IPv6 access list or the access list specified by name.

## Example: Displaying IPv6 ACLs

This is an example of the output from the **show access-lists** privileged EXEC command. The output shows all access lists that are configured on the switch or switch stack.

```
Device #show access-lists
Extended IP access list hello
10 permit ip any any
IPv6 access list ipv6
permit ipv6 any any sequence 10
```

This is an example of the output from the **show ipv6 access-lists** privileged EXEC command. The output shows only IPv6 access lists configured on the switch or switch stack.

```
Device# show ipv6 access-list
IPv6 access list inbound
permit tcp any any eq bgp (8 matches) sequence 10
permit tcp any any eq telnet (15 matches) sequence 20
permit udp any any sequence 30

IPv6 access list outbound
```

```
deny udp any any sequence 10
deny tcp any any eq telnet sequence 20
```

## Example: Configuring RA Throttling

This task describes how to create an RA throttle policy in order to help the power-saving wireless clients from being disturbed by frequent unsolicited periodic RA's. The unsolicited multicast RA is throttled by the controller.

### Before you begin

Enable IPv6 on the client machine.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>ipv6 nd ra-throttler policy Mythrottle</b> <b>Example:</b> Device (config)# <code>ipv6 nd ra-throttler policy Mythrottle</code>	Creates a RA throttler policy called Mythrottle.
<b>Step 3</b>	<b>throttle-period 20</b> <b>Example:</b> Device (config-nd-ra-throttle)# <code>throttle-period 20</code>	Determines the time interval segment during which throttling applies.
<b>Step 4</b>	<b>max-through 5</b> <b>Example:</b> Device (config-nd-ra-throttle)# <code>max-through 5</code>	Determines how many initial RA's are allowed.
<b>Step 5</b>	<b>allow at-least 3 at-most 5</b> <b>Example:</b> Device (config-nd-ra-throttle)# <code>allow at-least 3 at-most 5</code>	Determines how many RA's are allowed after the initial RAs have been transmitted, until the end of the interval segment.
<b>Step 6</b>	<b>switch (config)# vlan configuration 100</b> <b>Example:</b> Device (config)# <code>vlan configuration 100</code>	Creates a per vlan configuration.
<b>Step 7</b>	<b>ipv6 nd ra-th attach-policy attach-policy_name</b> <b>Example:</b>	Enables the router advertisement throttling.

	Command or Action	Purpose
	Device (config)# ipv6 nd ra-throttle attach-policy attach-policy_name	
<b>Step 8</b>	<b>end</b>  <b>Example:</b> Device(config)# <b>end</b>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## CHAPTER 155

# IPv6 Client Mobility

- [Information About IPv6 Client Mobility, on page 1719](#)
- [Prerequisites for IPv6 Client Mobility, on page 1721](#)
- [Monitoring IPv6 Client Mobility, on page 1722](#)

## Information About IPv6 Client Mobility

Link layer mobility is not enough to make wireless client Layer 3 applications continue to work seamlessly while roaming. Cisco IOSd's wireless mobility module uses mobility tunneling to retain seamless connectivity for the client's Layer 3 PoP (point of presence) when the client roams across different subnets on different switches.

IPv6 is the next-generation network layer Internet protocol intended to replace IPv4 in the TCP/IP suite of protocols. This new version increases the internet global address space to accommodate users and applications that require unique global IP addresses. IPv6 incorporates 128-bit source and destination addresses, which provide significantly more addresses than the 32-bit IPv4 addresses.

To support IPv6 clients across controllers, ICMPv6 messages must be dealt with specially to ensure the IPv6 client remains on the same Layer 3 network. The device keeps track of IPv6 clients by intercepting the ICMPv6 messages to provide seamless mobility and protect the network from network attacks. The NDP (neighbor discovery packets) packets are converted from multicast to unicast and delivered individually per client. This unique solution ensures that Neighbor Discovery and Router Advertisement packets are not leaked across VLANs. Clients can receive specific Neighbor Discovery and Router Advertisement packets ensuring correct IPv6 addressing to avoid unnecessary multicast traffic.

The configuration for IPv6 mobility is the same as IPv4 mobility and requires no separate software on the client side to achieve seamless roaming. The device must be part of the same mobility group. Both IPv4 and IPv6 client mobility are enabled by default.

IPv6 client mobility is used for the following:

- Retaining the client IPv6 multiple addresses in Layer-2 and Layer-3 roaming.
- IPv6 Neighbor Discovery Protocol (NDP) packet management.
- Client IPv6 addresses learning.

**Note** The configuration for IPv6 mobility in SDA wireless and Local mode is the same as of IPv4 mobility and requires no different software configuration on the client side to achieve seamless roaming. Refer to IPv4 mobility section for configuration information.

**Note** If ipv6 address is configured on the SVI, you should configure **ipv6 nd ra suppress all** command on all client VLAN SVI interfaces on the controller. This prevents multiple devices from advertising themselves as the routers.

## Using Router Advertisement

The Neighbor Discovery Protocol (NDP) operates in the link-layer and is responsible for the discovery of other nodes on the link. It determines the link-layer addresses of other nodes, finds the available routers, and maintains reachability information about the paths to other active neighbor nodes.

Router Advertisement (RA) is one of the IPv6 Neighbor Discovery Protocol (NDP) packets that is used by the hosts to discover available routers, acquire the network prefix to generate the IPv6 addresses, link MTU, and so on. The routers send RA on a regular basis, or in response to hosts Router Solicitation messages.

IPv6 wireless client mobility manages the IPv6 RA packet. The device forwards the link-local all-nodes multicast RA packets to the local and roaming wireless nodes mapped on same VLAN the RA was received on.

Figure 1 illustrates how a roaming client “MN” receives RA from VLAN 200 in a foreign controller and how it acquires a new IP address and breaks into L3 mobility’s point of presence.

**Figure 49: Roaming Client Receives Valid RA from Router 1**

## Router Advertisement Throttling

RA throttling allows the controller to enforce limits to the RA packets headed toward the wireless network. By enabling RA throttling, routers that send multiple RA packets can be trimmed to a minimum frequency that will still maintain an IPv6 client connectivity. If a client sends an RS packet, an RA is sent back to the client. This RA is allowed through the controller and unicast to the client. This process ensures that the new clients or roaming clients are not affected by the RA throttling.

## IPv6 Address Learning

There are three ways for IPv6 client to acquire IPv6 addresses:

- Stateless Address Auto-Configuration (SLAAC)
- Stateful DHCPv6
- Static configuration

For these methods, the IPv6 client always sends NS DAD (duplicate address detection) to ensure that there is no duplicated IP address on the network. The device snoops the clients NDP and DHCPv6 packets to learn about its client IP addresses and then updates the controllers database. The database then informs the controller for the clients new IP address.

## Handling Multiple IP Addresses

In the case when the new IP address is received after RUN state, whether an addition or removal, the controller updates the new IP addresses on its local database for display purposes. Essentially, the IPv6 uses the existing or same PEM state machine code flow as in IPv4. When the IP addresses are requested by external entities, for example, from Prime Infrastructure, the controller will include all the available IP addresses, IPv4 and IPv6, in the API/SPI interface to the external entities.

An IPv6 client can acquire multiple IP addresses from stack for different purposes. For example, a link-local address for link local traffic, and a routable unique local or global address.

When the client is in the DHCP request state and the controller receives the first IP address notification from the database for either an IPv4 or IPv6 address, the PEM moves the client into the RUN state.

When a new IP address is received after the RUN state, either for addition or removal, the controller updates the new IP addresses on its local database for display purposes.

When the IP addresses are requested by external entities, for example, from Prime Infrastructure, the controller provides the available IP addresses, both IPv4 and IPv6, to the external entities.

## IPv6 Configuration

The device supports IPv6 client as seamlessly as the IPv4 clients. The administrator must manually configure the VLANs to enable the IPv6, IPv6's snooping and throttling functionality. This will enable the NDP packets to throttle between the device and its various clients.

## Prerequisites for IPv6 Client Mobility

- To enable wireless IPv6 client connectivity, the underlying wired network must support IPv6 routing and an address assignment mechanism such as SLAAC or DHCPv6. The device must have L2 adjacency to the IPv6 router, and the VLAN needs to be tagged when the packets enter the device. APs do not require connectivity on an IPv6 network, as all traffic is encapsulated inside the IPv4 CAPWAP tunnel between the AP and device.
- When using the IPv6 Client Mobility, clients must support IPv6 with either static stateless auto configuration or stateful DHCPv6 IP addressing .

- To allow smooth operation of stateful DHCPv6 IP addressing, you must have a switch or router that supports the DHCP for IPv6 feature that is configured to act like a DHCPv6 server, or you need a dedicated server such as a Windows 2008 server with a built-in DHCPv6 server.

## Monitoring IPv6 Client Mobility

The commands in Table 1 are used to monitor IPv6 Client mobility on the device.

*Table 129: Monitoring IPv6 Client Mobility Commands*

Commands	Description
<code>show wireless client summary</code>	Displays the wireless specific configuration of active clients.
<code>show wireless client mac-address (mac-addr-detail)</code>	Displays the wireless specific configuration of active clients based on their MAC address.

# CHAPTER 156

## IPv6 Support on Flex and Mesh

- [IPv6 Support on Flex + Mesh Deployment, on page 1723](#)
- [Configuring IPv6 Support for Flex + Mesh, on page 1723](#)
- [Verifying IPv6 on Flex+Mesh , on page 1725](#)

### IPv6 Support on Flex + Mesh Deployment

IPv6 is the backhaul transport of the Service Provider. The IPv6 support over flex + mesh feature is now supported on the Cisco Catalyst 9800 Series Wireless Controller . WLAN accepts IPv6 clients and forward the traffic.

### Configuring IPv6 Support for Flex + Mesh

Follow the procedure given below to enable the IPv6 routing on the controller :

#### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>interface vlan <i>vlan-interface-number</i></b> <b>Example:</b> Device(config)#interface vlan 89	Creates an interface and enters the interface configuration mode.
<b>Step 3</b>	<b>shutdown</b> <b>Example:</b> Device(config-if)#shutdown	Disables the interface configuration.
<b>Step 4</b>	<b>ipv6 enable</b> <b>Example:</b> Device(config-if)#ipv6 enable	Optional. Enables IPv6 on the interface.

	Command or Action	Purpose
<b>Step 5</b>	<b>ipv6 address</b> <i>X:X:X:X::X/&lt;0-128&gt;</i> <b>Example:</b> Device(config-if)#ipv6 address 1:1:1:1::1/64	Configures IPv6 address on the interface using the IPv6 prefix option.
<b>Step 6</b>	<b>no shutdown</b> <b>Example:</b> Device(config-if)#no shutdown	Enables the IPv6 address.
<b>Step 7</b>	<b>no shutdown</b> <b>Example:</b> Device(config-if)#no shutdown	Enables the PIM dense-mode operation.
<b>Step 8</b>	<b>end</b> <b>Example:</b> Device(config-if)#end	Returns to privileged EXEC mode.
<b>Step 9</b>	<b>show ipv6 interface brief</b> <b>Example:</b> Device#show ipv6 interface brief	Verifies your entries.
<b>Step 10</b>	<b>ping ipv6</b> <i>destination-address or hostname</i> <b>Example:</b> Device#ping ipv6 1:1:1:1::10	Checks the gateway connectivity.

## Configuring Preferred IP Address as IPv6 (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Tags & Profiles > AP Join**.
  - Step 2** Click the AP Join Profile Name. The **Edit AP Join Profile** window is displayed.
  - Step 3** Choose **CAPWAP > Advanced**.
  - Step 4** From the **Preferred Mode** drop-down list, select **IPv6**.
  - Step 5** Click **Update & Apply to Device**.
-

## Configuring Preferred IP Address as IPv6

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>Configure Terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>ap profile default-ap-profile</b> <b>Example:</b> Device(config)# ap profile default-ap-profile	Enters AP profile configuration mode.
<b>Step 3</b>	<b>preferred-mode ipv6</b> <b>Example:</b> Device(config-ap-profile)# preferred-mode ipv6	Uses IPv6 to join the controller .
<b>Step 4</b>	<b>end</b> <b>Example:</b> Device(config-ap-profile)# end	Exits the configuration mode and returns to privileged EXEC mode.

## Verifying IPv6 on Flex+Mesh

To verify the IPv6 configuration on the controller , use the following **show** command:

```
Device#show ip interface brief
Interface IP-Address OK? Method Status Protocol
GigabitEthernet2 unassigned YES unset up up
GigabitEthernet0 unassigned YES NVRAM administratively down down
Capwap1 unassigned YES unset up up
Capwap2 unassigned YES unset up up
Vlan1 unassigned YES NVRAM administratively down down
Vlan89 9.10.89.90 YES NVRAM up up
Ewlc-9.10.89.90#show running-config interface vlan 89
Building configuration...

Current configuration : 120 bytes
!
interface Vlan89
 ip address 9.10.89.90 255.255.255.0
 ip helper-address 9.1.0.100
 no mop enabled
 no mop sysid
end
```

## CHAPTER 157

# IPv6 CAPWAP UDP Lite Support

- [Information About UDP Lite, on page 1727](#)
- [Enabling UDP Lite Support, on page 1727](#)
- [Verifying UDP Lite Support Configuration, on page 1728](#)

## Information About UDP Lite

The UDP Lite Support feature, which is an enhancement to the existing IPv6 functionality, supports the UDP Lite protocol.

This feature is only applicable to the IPv6 addresses of the controller and APs. IPv6 mandates complete payload checksum for UDP. The UDP Lite Support feature minimizes the performance impact on the controller and AP by restricting the checksum calculation coverage for the UDP Lite header to 8 bytes only.

The use of the UDP Lite Support feature impacts intermediate firewalls to allow UDP Lite protocol (protocol ID of 136) packets. Existing firewalls might not provide the option to open specific ports on UDP Lite protocol. In such cases, the administrator must open up all the ports on UDP Lite.

### Restrictions for UDP Lite Support

- Mobility IPv6 tunnels do not support the UDP Lite Support feature.

## Enabling UDP Lite Support

The following procedure describes the steps involved in enabling UDP Lite for an AP profile.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>ap profile <i>ap-profile</i></b>  <b>Example:</b>	Configures an AP profile and enters AP profile configuration mode.

	Command or Action	Purpose
	Device(config)# ap profile default-ap-profile	
<b>Step 3</b>	<b>capwap udplite</b>  <b>Example:</b> Device(config-ap-profile)# capwap udplite	Enables IPv6 CAPWAP UDP Lite on the AP.  <b>Note</b> The following message is displayed after the configuration:  This feature is supported only for IPv6 data packets, APs will be rebooted.
<b>Step 4</b>	<b>end</b>  <b>Example:</b> Device(config-ap-profile)# end	Returns to privileged EXEC mode.  Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Verifying UDP Lite Support Configuration

To verify the CAPWAP UDP Lite status, use the following command:

```
Device# show ap profile name default-ap-profile detailed
CAPWAP UDP-Lite : ENABLED
Lawful-Interception : ENABLED
 LI timer : 60
AWIPS : DISABLED
AWIPS Forensic : Unknown
Client RSSI Statistics
 Reporting : ENABLED
 Reporting Interval : 30 seconds
```

## CHAPTER 158

# Neighbor Discovery Proxy

---

- [Information About Neighbor Discovery](#), on page 1729
- [Configure Neighbor Discovery Proxy \(CLI\)](#), on page 1729
- [Configure Duplicate Address Detection Proxy \(CLI\)](#), on page 1730

## Information About Neighbor Discovery

In IPv6 networks, Neighbor Discovery Protocol (NDP) uses ICMPv6 messages and solicited-node multicast addresses to track and discover the other IPv6 hosts present on the other side of connected interfaces. As part of this process, a host queries for other node link-layer addresses to verify neighbor reachability using Neighbor Solicitation (NS) messages. In response to the NS messages, a Neighbor Advertisement (NA) is sent to provide information to neighbors.

## Configure Neighbor Discovery Proxy (CLI)

Neighbor Discovery (ND) Proxy is the ability of the controller to respond to the Neighbor Solicitation packet destined for wireless clients. During Neighbor Discovery suppression, the controller checks if proxy is enabled for the destined wireless clients. If proxy is enabled, the controller drops the Neighbor Solicitation packet and generates a response to the Neighbor Solicitation source in such a way that the packet appears to be coming from a wireless client. This helps in limiting the traffic to the wireless clients.

If Neighbor Discovery Proxy is not enabled, the multicast Neighbor Solicitation is converted into unicast Neighbor Solicitation with the MAC address of the target client and is forwarded to that client.

---

**Note**

- Neighbor Discovery proxy is applicable only in central switching mode.
  - A controller does not proxy the Neighbor Solicitation packet if the destination address is not that of a wireless client.
-

**Procedure**

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wireless profile policy <i>policy-profile-name</i></b> <b>Example:</b> Device(config)# wireless profile policy policy-profile1	Configures WLAN policy profile and enters wireless policy configuration mode.
<b>Step 3</b>	<b>ipv6 nd proxy full-proxy</b> <b>Example:</b> Device(config-wireless-policy)# ipv6 nd proxy full-proxy	Enables ND proxy.

## Configure Duplicate Address Detection Proxy (CLI)

The IPv6 Duplicate Address Detection (DAD) feature ensures that all the IP addresses assigned on a particular segment are unique. A proxy is required to ensure that multicast and unicast packets are not sent towards the wireless device for which it is enabled.

DAD verifies whether the host address is unique. The IPv6 DAD Proxy feature responds on behalf of the address owner when an address is in use.

However, in a scenario where nodes are restricted from talking to each other at Layer 2, DAD cannot detect a duplicate address. If DAD proxy is disabled, the multicast packet is converted into unicast and is sent to the target client.

**Note**

- DAD proxy is applicable only in central switching mode.
- A controller does not proxy the DAD NS packet if the destination address is not that of a wireless client.

**Procedure**

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wireless profile policy <i>policy-profile-name</i></b> <b>Example:</b> Device(config)# wireless profile policy policy-profile1	Configures a WLAN policy profile and enters wireless policy configuration mode.

	Command or Action	Purpose
<b>Step 3</b>	<b>ipv6 nd proxy dad-proxy</b>  <b>Example:</b> Device(config-wireless-policy)# ipv6 nd proxy dad-proxy	Enables DAD proxy.  <b>Note</b> Full proxy configuration is a superset of ND proxy and DAD proxy configuration. Hence, use the <b>ipv6 nd proxy full-proxy</b> command also to enable DAD proxy.

## CHAPTER 159

# Address Resolution Protocol Proxy

- [Information About Address Resolution Protocol](#), on page 1733
- [Configure Address Resolution Protocol Proxy \(CLI\)](#), on page 1733

## Information About Address Resolution Protocol

The address resolution protocol (ARP) is a protocol used by the Internet Protocol (IP) [RFC826], specifically IPv4, to map IP network addresses to the hardware addresses used by a data link protocol. When a wireless client sends an ARP request for an IP address of interest, the controller performs a search for that address in its database. If an entry is found in the controller database, then the ARP is converted to unicast and forwarded to that particular client. If there is no entry in the controller's database, the ARP request is flooded out to the VLAN wired ports.

## Configure Address Resolution Protocol Proxy (CLI)

ARP Proxy is the ability of the controller to respond to the ARP request packet destined for the wireless clients. During broadcast suppression, the controller checks if proxy is enabled for the destined wireless clients. If proxy is enabled, the controller drops the ARP request packet and generates a response to the source of the ARP request in a way that the packet appears to be coming from the wireless client. This helps in limiting the traffic to the wireless clients.

If ARP Proxy is not enabled, the broadcast ARP request is converted into an unicast ARP request with the MAC address of the target client, and is forwarded to only that client.

- Note**
- Proxy ARP is applicable only in central switching mode.
  - A device will not proxy the ARP request if the destination address is not that of a wireless client.

### Procedure

	Command or Action	Purpose
Step 1	<b>configure terminal</b> Example:	Enters global configuration mode.

	<b>Command or Action</b>	<b>Purpose</b>
	Device# configure terminal	
<b>Step 2</b>	<b>wireless profile policy <i>policy-profile-name</i></b> <b>Example:</b> Device(config)# wireless profile policy policy-profile1	Configures a WLAN policy profile and enters wireless policy configuration mode.
<b>Step 3</b>	<b>ipv4 arp-proxy</b> <b>Example:</b> Device(config-wireless-policy)# ipv4 arp-proxy	Enables ARP proxy.

## CHAPTER 160

# IPv6 Ready Certification

- [Feature History for IPv6-Ready Certification, on page 1735](#)
- [IPv6 Ready Certification, on page 1735](#)
- [Configuring IPv6 Route Information, on page 1736](#)
- [Verifying IPv6 Route Information, on page 1736](#)

## Feature History for IPv6-Ready Certification

This table provides release and related information for the feature explained in this module.

This feature is available in all the releases subsequent to the one in which it is introduced in, unless noted otherwise.

*Table 130: Feature History for IPv6-Ready Certification*

Release	Feature	Feature Information
Cisco IOS XE Bengaluru 17.6.1	IPv6-Ready Certification	This feature is enhanced with the implementation of various IPv6 functionalities that are required to comply with the latest RFC specifications.

## IPv6 Ready Certification

Cisco IOS XE Bengaluru, 17.6.1 has implemented various IPv6 functionalities that are required for compliance with the latest RFC specifications for IPv6 Ready Certification. The newly implemented IPv6 functionalities are:

- **Fragment Processing and Reassembly (RFC8200):** The first fragment must contain the mandatory extension header up to the first upper level protocol (ULP) header as specified in RFC 8200.
- **Handling Atomic Fragments in Neighbor Discovery (RFC6980):** Fragmented neighbor discovery packets must be dropped.
- **Packet too Big (RFC8201):** Atomic fragmentation is not supported. Packets failing to meet the IPv6 MTU requirement of 1280 are dropped.

- **Route Information Options (RIO) in IPv6 Router Advertisements (RFC4191):** A new RIO is added to the IPv6 Router Advertisement message for communicating specific routes from routers to hosts. Explicit route configuration ensures that only necessary routes are advertised to the hosts.
- **IPv6 Hop-by-Hop Processing (RFC 8200):** This enhancement allows explicit configuration of the nodes, along the delivery path of the packets that require hop-by-hop options header processing.

## Configuring IPv6 Route Information

The Route Information Option (RIO) in the IPv6 router advertisement messages helps in communicating specific routes from routers to hosts. This improves a host's ability to pick up an appropriate default router, when the host is multihomed and the routers are on different links. The explicit route configuration ensures that only necessary routes are advertised to the hosts.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>interface interface</b>  <b>Example:</b> Device(config)# interface gigabitethernet1.1	Specifies the interface and enters interface configuration mode.
<b>Step 3</b>	<b>ipv6 nd ra specific-route prefix/length lifetime lifetime/infinity [preference preference ]</b>  <b>Example:</b> Device(config-if)# ipv6 nd ra specific-route 3::3/116 lifetime 11 preference medium	Configures RIO in IPv6 router advertisement messages.  For more information, see the <a href="#">ipv6 nd ra specific route</a> command.

## Verifying IPv6 Route Information

To identify the specific routes that are sent in the router advertisements, use the following command:

```
Device# show ipv6 nd ra specific-route
```

```
IPv6 Prefix/Length Lifetime Preference Interface
```

```

1234::12/127 1000 High GigabitEthernet2
```

### Feature History for CleanAir

This table provides release and related information about the feature explained in this section.

This feature is also available in all the releases subsequent to the one in which they are introduced in, unless noted otherwise.

**Table 131: Feature History for CleanAir**

Release	Feature	Feature Information
Cisco IOS XE 17.13.1	EDRRM Support for 6-GHz Band Radio	The Event-Driven Radio Resource Management (EDRRM) is enabled in 6-GHz band radio of AP.

### Information About Cisco CleanAir

Cisco CleanAir is a solution designed to proactively manage the challenges of a shared wireless spectrum. It allows you to see all the users of a shared spectrum (both native devices and foreign interferers). It also enables the network to act upon this information. For example, you can manually remove the interfering device, or the system can automatically change the channel away from the interference. CleanAir provides spectrum management and Radio Frequency (RF) visibility.

A Cisco CleanAir system consists of CleanAir-enabled access points and Cisco Catalyst 9800 Series Wireless Controller . These access points collect information about all the devices that operate in the industrial, scientific,

and medical (ISM) bands, identify and evaluate the information as a potential interference source, and forward it to the controller . The controller controls the access points and displays the interference devices.

For every device operating in the unlicensed band, Cisco CleanAir provides information about what it is, how it is impacting your wireless network, and what actions you or your network should take. It simplifies RF so that you do not have to be an RF expert.

Wireless LAN systems operate in unlicensed 2.4-GHz and 5-GHz ISM bands. Many devices, such as microwave ovens, cordless phones, and Bluetooth devices also operate in these bands and can negatively affect the Wi-Fi operations.

Some of the most advanced WLAN services, such as voice-over-wireless and IEEE 802.11 radio communications, might be significantly impaired by the interference caused by other legal users of the ISM bands. The integration of Cisco CleanAir functionality addresses this problem of RF interference.

## Cisco CleanAir-Related Terms

*Table 132: CleanAir-Related Terms*

Term	Description
AQI	Air Quality Index. The AQI is an indicator of air quality, based on the RF interferences. An AQI of 0 is bad and an AQI > 85 is good.
AQR	Air Quality Report. AQRs contain information about total interference from all the identified sources represented by AQI and the summary of the most severe interference categories. AQRs are sent every 15 minutes to the Mobility Controller and every 30 seconds in the Rapid mode.
DC	Duty Cycle. Percentage of time that the channel is utilized by a device.
EDRRM	Event-Driven RRM. EDRRM allows an access point in distress to bypass normal RRM intervals and immediately change channels.
IDR	Interference Device Reports that an access point sends to the controller .
ISI	Interference Severity Index. The ISI is an indicator of the severity of the interference.
RSSI	Received Signal Strength Indicator. RSSI is a measurement of the power present in a received radio signal. It is the power at which an access point sees the interferer device.

## Cisco CleanAir Components

The basic Cisco CleanAir architecture consists of Cisco CleanAir-enabled APs and device.

Figure 50: Cisco CleanAir Solution

An access point equipped with Cisco CleanAir technology collects information about Wi-Fi interference sources and processes it. The access point collects and sends the Air Quality Report (AQR) and Interference Device Report (IDR) to the controller.

The controller controls and configures CleanAir-capable access points, and collects and processes spectrum data. The controller provides local user interfaces (GUI and CLI) to configure basic CleanAir features and services and display current spectrum information. The controller also detects, merges, and mitigates interference devices using RRM TPC and DCA. For details, see *Interference Device Merging*.

The device performs the following tasks in a Cisco CleanAir system:

- Configures Cisco CleanAir capabilities on the access point.
- Provides interfaces (GUI and CLI) for configuring Cisco CleanAir features and retrieving data.
- Displays spectrum data.
- Collects and processes AQRs from the access point and stores them in the air quality database. AQRs contain information about the total interference from all the identified sources represented by the Air Quality Index (AQI) and the summary for the most severe interference categories. The CleanAir system can also include unclassified interference information under per-interference type reports that enable you to take action in scenarios where interference because of unclassified interfering devices is more.
- Collects and processes IDRs from the access point and stores them in the interference device database.

**Note** When Cisco CleanAir is disabled and Spectrum Intelligence (SI) is enabled in the controller, both CleanAir and Air Quality reporting are disabled. In spite of this, Air Quality is still populated for SI APs and viewed as disabled when **show ap dot11 5ghz/24ghz cleanair config** command is executed. This is an expected behavior as SI APs report Air Quality.

Here, Spectrum intelligence is a subset of CleanAir features. For more information on Spectrum Intelligence, see the *Spectrum Intelligence Deployment Guide*.

## Interference Types that Cisco CleanAir can Detect

Cisco CleanAir access points can detect and report severity of the interference. Spectrum event-driven RRM is one such mitigation strategy.

Wi-Fi chip-based RF management systems share these characteristics:

- Any RF energy that cannot be identified as a Wi-Fi signal is reported as noise.
- Noise measurements that are used to assign a channel plan tend to be averaged over a period of time to avoid instability or rapid changes that can be disruptive to certain client devices.
- Averaging measurements reduces the resolution of the measurement. As such, a signal that disrupts clients might not look like it needs to be mitigated after averaging.
- All RF management systems available today are reactive in nature.

Cisco CleanAir is different and can positively identify not only the source of the noise but also its potential impact to a WLAN. Having this information allows you to consider the noise within the context of the network and make intelligent and, where possible, proactive decisions. Spontaneous interference event is commonly used for CleanAir.

---

**Note** Spectrum event-driven RRM can be triggered only by Cisco CleanAir-enabled access points in local mode.

---

Spontaneous interference is interference that appears suddenly on a network, perhaps jamming a channel or a range of channels completely. The Cisco CleanAir spectrum event-driven RRM feature allows you to set a threshold for air quality (AQ) which, if exceeded, triggers an immediate channel change for the affected access point. Most RF management systems can avoid interference, but this information takes time to propagate through the system. Cisco CleanAir relies on AQ measurements to continuously evaluate the spectrum and can trigger a move within 30 seconds. For example, if an access point detects interference from a video camera, it can recover by changing channels within 30 seconds of the camera becoming active. Cisco CleanAir also identifies and locates the source of interference so that more permanent mitigation of the device can be performed at a later time.

Microwave Ovens, Outdoor Ethernet bridges are two classes of devices that qualify as persistent, since once detected, it is likely that these devices will continue to be a random problem and are not likely to move. For these types of devices we can tell RRM of the detection and Bias the affected channel so that RRM "remembers" that there is a high potential for client impacting interference for the Detecting AP on the detected channel. For more information, see [https://www.cisco.com/c/en/us/td/docs/wireless/controller/technotes/8-3/b\\_RRM\\_White\\_Paper/b\\_RRM\\_White\\_Paper\\_chapter\\_0100.html?bookSearch=true#id\\_15217](https://www.cisco.com/c/en/us/td/docs/wireless/controller/technotes/8-3/b_RRM_White_Paper/b_RRM_White_Paper_chapter_0100.html?bookSearch=true#id_15217).

CleanAir PDA devices include:

- Microwave Oven
- WiMax Fixed
- WiMax Mobile
- Motorola Canopy

In the case of Bluetooth devices, Cisco CleanAir-enabled access points can detect and report interference only if the devices are actively transmitting. Bluetooth devices have extensive power-save modes. For example, interference can be detected when data or voice is being streamed between the connected devices.

## EDRRM and AQR Update Mode

EDRRM is a feature that allows an access point that is in distress to bypass normal RRM intervals and immediately change channels. A CleanAir access point always monitors AQ and reports the AQ every 15 minutes. AQ only reports classified interference devices. The key benefit of EDRRM is fast action time. If an interfering device is operating on an active channel and causes enough AQ degradation to trigger an EDRRM, then no clients will be able to use that channel or the access point. You must remove the access point from the channel. EDRRM is not enabled by default, you must first enable CleanAir and then enable EDRRM.

## Prerequisites for CleanAir

You can configure Cisco CleanAir only on CleanAir-enabled access points.

Only Cisco CleanAir-enabled access points using the following access point modes can perform Cisco CleanAir spectrum monitoring:

- **Local**—In this mode, each Cisco CleanAir-enabled access point radio provides air quality and interference detection reports for the current operating channel only. An AP can only measure air quality and interference when the AP is not busy transmitting Wi-Fi frames. This implies that CleanAir detections will be drastically lower if the AP is having a high channel utilization.
- **FlexConnect**—When a FlexConnect access point is connected to the controller, its Cisco CleanAir functionality is identical to local mode.
- **Monitor**—When Cisco CleanAir is enabled in monitor mode, the access point provides air quality and interference detection reports for all monitored channels.

The following options are available:

- **All**—All channels
- **DCA**—Channel selection governed by the DCA list
- **Country**—All channels are legal within a regulatory domain

## Restrictions for CleanAir

- Access points in monitor mode do not transmit Wi-Fi traffic or 802.11 packets. They are excluded from radio resource management (RRM) planning and are not included in the neighbor access point list. IDR clustering depends on the device's ability to detect neighboring in-network access points. Correlating interference device detections from multiple access points is limited between monitor-mode access points.
- For 4800 AP slot 1 5 GHz is dedicated and cannot be individually moved to monitor mode. However, slot 0 is XOR and can be moved to monitor as well as 2.4/5 GHz. Slot 2 is dedicated monitor and will operate in 5GHz and in AP monitor mode, slot 2 will be disabled because a monitor radio is already available in both 2.4/5GHz. 3700 AP has dedicated 2.4GHz (slot0) and 5GHz (slot1).
- Do not connect access points in SE connect mode directly to any physical port on the controller.
- CleanAir is not supported wherein the channel width is 160 MHz.

# How to Configure CleanAir

## Enabling CleanAir for the 2.4-GHz Band (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Radio Configurations > CleanAir**
  - Step 2** On the **CleanAir** page, click the **me2.4 GHz Band > General** tab.
  - Step 3** Check the **Enable CleanAir** checkbox.
  - Step 4** Click **Apply**.
- 

## Enabling CleanAir for the 2.4-GHz Band (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>ap dot11 24ghz cleanair</b>  <b>Example:</b> Device(config)# <code>ap dot11 24ghz cleanair</code> Device(config)# <code>no ap dot11 24ghz cleanair</code>	Enables the CleanAir feature on the 802.11b network. Run the <b>no</b> form of this command to disable CleanAir on the 802.11b network.
<b>Step 3</b>	<b>end</b>  <b>Example:</b> Device(config)# <code>end</code>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Configuring Interference Reporting for a 2.4-GHz Device (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Radio Configurations > CleanAir**.
  - Step 2** Click the **2.4 GHz Band** tab.
  - Step 3** Choose the interference types and add them to the **Interference Types to detect** section.

The following interference types are available:

- BLE Beacon—Bluetooth low energy beacon
- Bluetooth Discovery
- Bluetooth Link
- Canopy
- Continuous Transmitter
- DECT-like Phone—Digital Enhanced Cordless Technology phone
- 802.11 FH—802.11 frequency hopping device
- WiFi Inverted—Device using spectrally inverted Wi-Fi signals
- Jammer
- Microwave Oven
- WiFi Invalid Channel—Device using nonstandard Wi-Fi channels
- TDD Transmitter
- Video Camera
- SuperAG—802.11 SuperAG device
- WiMax Mobile
- WiMax Fixed
- 802.15.4
- Microsoft Device
- SI\_FHSS

**Step 4** Click **Apply**.

## Configuring Interference Reporting for a 2.4-GHz Device (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>ap dot11 24ghz cleanair device {ble-beacon   bt-discovery   bt-link   canopy   cont-tx   dect-like   fh   inv   jammer   mw-oven   nonstd   report   superag   tdd-tx   video  </b>	Configures the 2.4-GHz interference devices to report to the device. Run the <b>no</b> form of this command to disable the configuration.

Command or Action	Purpose
<pre> <b>wimax-fixed   wimax-mobile   xbox   zigbee</b> <b>}</b>  <b>Example:</b>  Device(config)# <b>ap dot11 24ghz cleanair</b> <b>device ble-beacon</b>  Device(config)# <b>ap dot11 24ghz cleanair</b> <b>device bt-discovery</b>  Device(config)# <b>ap dot11 24ghz cleanair</b> <b>device bt-link</b>  Device(config)# <b>ap dot11 24ghz cleanair</b> <b>device canopy</b>  Device(config)# <b>ap dot11 24ghz cleanair</b> <b>device cont-tx</b>  Device(config)# <b>ap dot11 24ghz cleanair</b> <b>device dect-like</b>  Device(config)# <b>ap dot11 24ghz cleanair</b> <b>device fh</b>  Device(config)# <b>ap dot11 24ghz cleanair</b> <b>device inv</b>  Device(config)# <b>ap dot11 24ghz cleanair</b> <b>device jammer</b>  Device(config)# <b>ap dot11 24ghz cleanair</b> <b>device mw-oven</b>  Device(config)# <b>ap dot11 24ghz cleanair</b> <b>device nonstd</b>  Device(config)# <b>ap dot11 24ghz cleanair</b> <b>device report</b>  Device(config)# <b>ap dot11 24ghz cleanair</b> <b>device superag</b>  Device(config)# <b>ap dot11 24ghz cleanair</b> <b>device tdd-tx</b>  Device(config)# <b>ap dot11 24ghz cleanair</b> <b>device video</b>  Device(config)# <b>ap dot11 24ghz cleanair</b> <b>device wimax-fixed</b>  Device(config)# <b>ap dot11 24ghz cleanair</b> <b>device wimax-mobile</b>  Device(config)# <b>ap dot11 24ghz cleanair</b> <b>device xbox</b> </pre>	<p>The following is a list of the keyword descriptions:</p> <ul style="list-style-type: none"> <li>• <b>ble-beacon</b>—Bluetooth low energy beacon</li> <li>• <b>bt-discovery</b>—Bluetooth discovery</li> <li>• <b>bt-link</b>—Bluetooth link</li> <li>• <b>canopy</b>—Canopy device</li> <li>• <b>cont-tx</b>—Continuous transmitter</li> <li>• <b>dect-like</b>—Digital Enhanced Cordless Communication-like phone</li> <li>• <b>fh</b>—802.11-frequency hopping device</li> <li>• <b>inv</b>—Device using spectrally inverted Wi-Fi signals</li> <li>• <b>jammer</b>—Jammer</li> <li>• <b>mw-oven</b>—Microwave oven</li> <li>• <b>nonstd</b>—Device using nonstandard Wi-Fi channels</li> <li>• <b>report</b>—Interference device reporting</li> <li>• <b>superag</b>—802.11 SuperAG device</li> <li>• <b>tdd-tx</b>—TDD transmitter</li> <li>• <b>video</b>—Video camera</li> <li>• <b>wimax-fixed</b>—WiMax Fixed</li> <li>• <b>wimax-mobile</b>—WiMax Mobile</li> <li>• <b>microsoft xbox</b>—Microsoft Xbox device</li> <li>• <b>zigbee</b>—802.15.4 device</li> </ul>

	Command or Action	Purpose
	<pre>Device(config)# ap dot11 24ghz cleanair device zigbee  Device(config)# ap dot11 24ghz cleanair device alarm</pre>	
<b>Step 3</b>	<p><b>end</b></p> <p><b>Example:</b></p> <pre>Device(config)# end</pre>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Enabling CleanAir for the 5-GHz Band (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Radio Configurations > CleanAir**
  - Step 2** On the **CleanAir** page, click the **me5 GHz Band > General** tab.
  - Step 3** Check the **Enable CleanAir** checkbox.
  - Step 4** Click **Apply**.
- 

## Enabling CleanAir for the 5-GHz Band (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<p><b>configure terminal</b></p> <p><b>Example:</b></p> <pre>Device# configure terminal</pre>	Enters global configuration mode.
<b>Step 2</b>	<p><b>ap dot11 5ghz cleanair</b></p> <p><b>Example:</b></p> <pre>Device(config)#ap dot11 5ghz cleanair  Device(config)#no ap dot11 5ghz cleanair</pre>	Enables the CleanAir feature on a 802.11a network. Run the <b>no</b> form of this command to disable CleanAir on the 802.11a network.
<b>Step 3</b>	<p><b>end</b></p> <p><b>Example:</b></p> <pre>Device(config)# end</pre>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Configuring Interference Reporting for a 5-GHz Device (GUI)

### Procedure

- Step 1** Choose **Configuration** > **Radio Configurations** > **CleanAir**.
- Step 2** Click the **5 GHz Band** tab.
- Step 3** Choose the interference types and add them to the **Interference Types to detect** section.

The following interference types are available:

- Canopy
- Continuous Transmitter
- DECT-like Phone—Digital Enhanced Cordless Technology phone
- 802.11 FH—802.11 frequency hopping device
- WiFi Inverted—Device using spectrally inverted Wi-Fi signals
- Jammer
- WiFi Invalid Channel—Device using nonstandard Wi-Fi channels
- SuperAG—802.11 SuperAG device
- TDD Transmitter
- WiMax Mobile
- WiMax Fixed
- Video Camera

- Step 4** Click **Apply**.

## Configuring Interference Reporting for a 5-GHz Device (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<code>ap dot11 5ghz cleanair device {canopy   cont-tx   dect-like   inv   jammer   nonstd   report   superag   tdd-tx   video   wimax-fixed   wimax-mobile}</code>	Configures a 5-GHz interference device to report to the device. Run the <b>no</b> form of this command to disable interference device reporting.

	Command or Action	Purpose
	<p><b>Example:</b></p> <pre>Device(config)#ap dot11 5ghz cleanair device canopy  Device(config)#ap dot11 5ghz cleanair device cont-tx  Device(config)#ap dot11 5ghz cleanair device dect-like  Device(config)#ap dot11 5ghz cleanair device inv  Device(config)#ap dot11 5ghz cleanair device jammer  Device(config)#ap dot11 5ghz cleanair device nonstd  Device(config)#ap dot11 5ghz cleanair device report  Device(config)#ap dot11 5ghz cleanair device superag  Device(config)#ap dot11 5ghz cleanair device tdd-tx  Device(config)#ap dot11 5ghz cleanair device video  Device(config)#ap dot11 5ghz cleanair device wimax-fixed  Device(config)#ap dot11 5ghz cleanair device wimax-mobile  Device(config)#ap dot11 5ghz cleanair device si_fhss  Device(config)#ap dot11 5ghz cleanair device alarm</pre>	<p>The following is a list of the keyword descriptions:</p> <ul style="list-style-type: none"> <li>• <b>canopy</b>—Canopy device</li> <li>• <b>cont-tx</b>—Continuous transmitter</li> <li>• <b>dect-like</b>—Digital Enhanced Cordless Communication-like phone</li> <li>• <b>fh</b>—802.11-frequency hopping device</li> <li>• <b>inv</b>—Device using spectrally-inverted Wi-Fi signals</li> <li>• <b>jammer</b>—Jammer</li> <li>• <b>nonstd</b>—Device using nonstandard Wi-Fi channels</li> <li>• <b>superag</b>—802.11 SuperAG device</li> <li>• <b>tdd-tx</b>—TDD transmitter</li> <li>• <b>video</b>—Video camera</li> <li>• <b>wimax-fixed</b>—WiMax fixed</li> <li>• <b>wimax-mobile</b>—WiMax mobile</li> </ul>
<b>Step 3</b>	<p><b>end</b></p> <p><b>Example:</b></p> <pre>Device(config)# end</pre>	<p>Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.</p>

## Configuring Event Driven RRM for a CleanAir Event (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Radio Configurations > RRM**.  
The **Radio Resource Management** page is displayed.
- Step 2** Click the **DCA** tab.
- Step 3** In the **Event Driven RRM** section, check the **EDRRM** check box to run RRM when CleanAir-enabled AP detects a significant level of interference.
- Step 4** Configure the **Sensitivity Threshold** level at which RRM has to be invoked from the following options:
- **Low**: Represents a decreased sensitivity to changes in the environment and its value is set at 35.
  - **Medium**: Represents medium sensitivity to changes in the environment at its value is set at 50.
  - **High**: Represents increased sensitivity to changes in the environment at its value is set at 60.
  - **Custom**: If you choose this option, you must specify a custom value in the **Custom Threshold** box.
- Step 5** To configure rogue duty cycle, check the **Rogue Contribution** check box and then specify the **Rogue Duty-Cycle** in terms of percentage. The default value of rogue duty cycle is 80 percent.
- Note** Rogue Contribution is a new component included in ED-RRM functionality. Rogue Contribution allows ED-RRM to trigger based on identified Rogue Channel Utilization, which is completely separate from CleanAir metrics. Rogue Duty Cycle comes from normal off channel RRM metrics, and invokes a channel change based on neighboring rogue interference. Because this comes from RRM metrics and not CleanAir, the timing - assuming normal 180 second off channel intervals - would be within 3 minutes or 180 seconds worst case. It is configured separately from CleanAir ED-RRM and is disabled by default. This allows the AP to become reactive to Wi-Fi interference that is not coming from own network and is measured at each individual AP.
- Step 6** Save the configuration.
- 

## Configuring EDRRM for a CleanAir Event (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>ap dot11 {24ghz   5ghz   6ghz} rrm channel cleanair-event</b>  <b>Example:</b> Device (config) # <code>ap dot11 24ghz rrm channel cleanair-event</code>	Enables EDRRM CleanAir event. Run the <b>no</b> form of this command to disable EDRRM.

	Command or Action	Purpose
	Device(config)#no ap dot11 24ghz rrm channel cleanair-event	
<b>Step 3</b>	<p><b>ap dot11 {24ghz   5ghz   6ghz} rrm channel cleanair-event [sensitivity {custom   high   low   medium}]</b></p> <p><b>Example:</b></p> <pre>Device(config)#ap dot11 24ghz rrm channel cleanair-event sensitivity high</pre>	<p>Configures the EDRRM sensitivity of the CleanAir event.</p> <p>The following is a list of the keyword descriptions:</p> <ul style="list-style-type: none"> <li>• <b>Custom</b>—Specifies custom sensitivity to non-Wi-Fi interference as indicated by the AQ value.</li> <li>• <b>High</b>—Specifies the most sensitivity to non-Wi-Fi interference as indicated by the AQ value.</li> <li>• <b>Low</b>—Specifies the least sensitivity to non-Wi-Fi interference as indicated by the AQ value.</li> <li>• <b>Medium</b>—Specifies medium sensitivity to non-Wi-Fi interference as indicated by the AQ value.</li> </ul>
<b>Step 4</b>	<p><b>end</b></p> <p><b>Example:</b></p> <pre>Device(config)# end</pre>	<p>Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.</p>

## CleanAir Pro Scanning

### Feature History for CleanAir Pro Scanning

This table provides release and related information about the feature explained in this section.

This feature is also available in all the releases subsequent to the one in which they are introduced in, unless noted otherwise.

*Table 133: Feature History for CleanAir Pro Scanning*

Release	Feature	Feature Information
Cisco IOS XE Cupertino 17.9.1	CleanAir Pro Scanning	The CleanAir Pro Scanning feature monitors and reports the different categories of non-Wi-Fi interference in the 2.4-GHz and 5-GHz bands.
Cisco IOS XE Dublin 17.10.1	CleanAir Support for 6-GHz	The CleanAir is enabled in 6-GHz band radio of AP only if CleanAir is enabled globally in 6-GHz band in the controller and 6-GHz radio of individual AP.

## Information About CleanAir Pro Scanning

CleanAir Pro Scanning monitors and provides reports on the different categories of non-Wi-Fi interference, for the 2.4-GHz, 5-GHz, and 6-GHz band. The CleanAir Pro Scanning feature reports the type of interferer, the severity of the interference, and the impacted channels, to the controller, through the Interference Device Reports (IDRs). The air quality (AQ) metric report for each Dynamic Channel Assignment (DCA) channel, contains all the detected non-Wi-Fi interferers and the severity of each interferer.

---

**Note** The CleanAir Pro Scanning feature is applicable only for APs with CleanAir Pro-supported radios.

---

The controller maintains a database of the active interferers reported from each AP. The controller merges interferers across APs if the same interferer is observed across APs. The controller tracks the air quality for each channel and uses the air quality metric report in the channel selection for each AP.

CleanAir Pro Scanning scans channels in slots or bands that are currently enabled on an AP. Channel enablement under DCA is applicable only if you selected the **dca** keyword under the **ap dot11 rrm monitor channel-list** command. The **country** keyword monitors the regulatory channels, and the **all** keyword monitors all channels (everything that the radio can scan, regardless of regulatory constraints).

### Interference Device Reports (IDR)

Each AP detects non-Wi-Fi interferers, the duty cycle, Received Signal Strength Indicator (RSSI) in dBm, and a calculated metric known as Severity. These details are sent to the controller through the Interference Device Report (IDR) messages. The IDR event types, such as UP, UPDT, and DOWN, inform the controller about when each interferer was first detected (UP), when the interferer was updated (UPDT), and when it is no longer seen (DOWN). The controller keeps a list of these interferers along with key information, including the channels that are impacted by the interferer on a per-AP basis.

In an AP, interferers are merged with those that are detected on the same channel, same RSSI, and same device signature. This merge occurs on a controller across APs reporting the same type of interferer.

### Air Quality Index Reports

The Air Quality (AQ) metric is calculated for each AP, and is the inverse of the cumulative severity metrics. AQ starts at 100 (good) and is decremented by each reported interference source severity metric. For example, if three Bluetooth devices are reported by an AP, each with a severity of two, this will result in the overall cell AQ of 94 ( $2 \times 3 \text{ BT} = 6$ ,  $100 - 6 = \text{AQ of } 94$ ).

---

**Note** Cisco IOS XE Cupertino 17.9.1 supports 6-GHz only for spectral analysis on Cisco Catalyst Center. IDR and AQ are not supported for the 6-GHz band in Cisco IOS XE Cupertino 17.9.1.

---

## Enabling CleanAir Pro Scanning (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>ap dot11 {24ghz   5ghz   6ghz} cleanair</b> <b>Example:</b> Device(config)# ap dot11 24ghz cleanair	Configures the CleanAir features for the 2.4-GHz , 5-GHz, or 6-GHz radios.
<b>Step 3</b>	<b>ap dot11 {24ghz   5ghz   6ghz} cleanair alarm air-quality</b> <b>Example:</b> Device(config)# ap dot11 24ghz cleanair alarm air-quality	Configures CleanAir alarm for air quality in the 2.4-GHz , 5-GHz, or 6-GHz radios.
<b>Step 4</b>	<b>ap dot11 {24ghz   5ghz   6ghz} cleanair alarm air-quality threshold <i>threshold-value</i></b> <b>Example:</b> Device(config)# ap dot11 24ghz cleanair alarm air-quality threshold 25	Configures the air quality threshold value of CleanAir alarm in the 2.4-GHz , 5-GHz, or 6-GHz radios. The valid range is between 1 and 100.
<b>Step 5</b>	<b>ap dot11 {24ghz   5ghz   6ghz} cleanair alarm device cont-tx</b> <b>Example:</b> Device(config)# ap dot11 24ghz cleanair alarm device cont-tx	Configures the continuous transmitter as the interference device CleanAir alarm in the 2.4-GHz , 5-GHz, or 6-GHz radios.
<b>Step 6</b>	<b>ap dot11 {24ghz   5ghz   6ghz} cleanair alarm unclassified</b> <b>Example:</b> Device(config)# ap dot11 24ghz cleanair alarm unclassified	Configures the air quality alarm on exceeding unclassified category severity.
<b>Step 7</b>	<b>ap dot11 {24ghz   5ghz   6ghz} cleanair alarm unclassified threshold <i>threshold-value</i></b> <b>Example:</b> Device(config)# ap dot11 24ghz cleanair alarm unclassified threshold 15	Configures the air quality alarm on exceeding unclassified category severity threshold. The valid range is between 1 and 100.
<b>Step 8</b>	<b>ap dot11 {24ghz   5ghz   6ghz} cleanair device cont-tx</b> <b>Example:</b>	Configure continuous transmitter as the CleanAir interference device type.

	Command or Action	Purpose
	Device(config)# ap dot11 24ghz cleanair device cont-tx	

## Monitoring CleanAir Pro Statistics (GUI)

### Procedure

- 
- Step 1** Choose **Monitoring > Wireless > CleanAir Statistics**.  
The **CleanAir Statistics** window is displayed.
- Step 2** Click the **2.4 GHz Band**, **5 GHz Band**, or **6 GHz Band** tab.  
The **CleanAir Interference Devices** tab is selected by default. You can monitor and detect the cluster IDs, the interferer type, severity, the affected channels, and so on, for the listed APs.
- Step 3** Click the listed devices under the **CleanAir Interference Devices** tab to view the **CleanAir Interference Charts** that displays the **AQ Graph** and the **Interference Power**.
- Step 4** Click the **Air Quality** tab to monitor the channel, the average and minimum AQ, number of interferers, the time at which the interference was detected, and the spectrum AP type.
- Step 5** Click the **Worst Air Quality Report** tab to view the AQ report, with details of the AP that reported the worst AQ, the radio channel number with the worst-reported air quality, the minimum and the average AQ index, the interference device count, and the spectrum AP type.
- 

## Verifying CleanAir Pro Scanning Details

To view the CleanAir Air Quality (AQ) data, run the following command:

```
Device# show ap dot11 {24ghz | 5ghz | 6ghz} cleanair air-quality summary
```

To view the CleanAir Air Quality (AQ) worst data, run the following command:

```
Device# show ap dot11 {24ghz | 5ghz | 6ghz} cleanair air-quality worst
```

To view the CleanAir device cluster information, run the following command:

```
Device# show ap dot11 {24ghz | 5ghz | 6ghz} cleanair device cluster cluster-id
```

To view the CleanAir interferers of a device type, run the following command:

```
Device# show ap dot11 {24ghz | 5ghz | 6ghz} cleanair device type
```

To view the CleanAir configuration for a specific AP, run the following commands:

```
Device# show ap name ap-name dot11 {24ghz | 5ghz | 6ghz} cleanair air-quality
Device# show ap name ap-name dot11 {24ghz | 5ghz | 6ghz} cleanair device
```

To view the continuous transmitter as the CleanAir interference device type, run the following command:

```
Device# show ap dot11 6ghz cleanair device type cont-tx
```

# Verifying CleanAir Parameters

You can verify CleanAir parameters using the following commands:

**Table 134: Commands for verifying CleanAir**

Command Name	Description
show ap dot11 24ghz cleanair device type all	Displays all the CleanAir interferers for the 2.4-GHz band.
show ap dot11 24ghz cleanair device type ble-beacon	Displays all the Bluetooth BLE beacons for the 2.4-GHz band.
show ap dot11 24ghz cleanair device type bt-discovery	Displays CleanAir interferers of type BT Discovery for the 2.4-GHz band.
show ap dot11 24ghz cleanair device type bt-link	Displays CleanAir interferers of type BT Link for the 2.4-GHz band.
show ap dot11 24ghz cleanair device type canopy	Displays CleanAir interferers of type Canopy for the 2.4-GHz band.
show ap dot11 24ghz cleanair device type cont-tx	Displays CleanAir interferers of type Continuous transmitter for the 2.4-GHz band.
show ap dot11 24ghz cleanair device type dect-like	Displays CleanAir interferers of type DECT Like for the 2.4-GHz band.
show ap dot11 24ghz cleanair device type fh	Displays CleanAir interferers of type 802.11FH for the 2.4-GHz band.
show ap dot11 24ghz cleanair device type inv	Displays CleanAir interferers of type Wi-Fi Inverted for the 2.4-GHz band.
show ap dot11 24ghz cleanair device type jammer	Displays CleanAir interferers of type Jammer for the 2.4-GHz band.
show ap dot11 24ghz cleanair device type mw-oven	Displays CleanAir interferers of type MW Oven for the 2.4-GHz band.
show ap dot11 24ghz cleanair device type nonstd	Displays CleanAir interferers of type Wi-Fi inverted channel for the 2.4-GHz band.
show ap dot11 24ghz cleanair device type superag	Displays CleanAir interferers of type SuperAG for the 2.4-GHz band.
show ap dot11 24ghz cleanair device type tdd-tx	Displays CleanAir interferers of type TDD Transmit for the 2.4-GHz band.
show ap dot11 24ghz cleanair device type video	Displays CleanAir interferers of type Video Camera for the 2.4-GHz band.

Command Name	Description
show ap dot11 24ghz cleanair device type wimax-fixed	Displays CleanAir interferers of type WiMax Fixed for the 2.4-GHz band.

## Monitoring Interference Devices

When a CleanAir-enabled access point detects interference devices, detections of the same device from multiple sensors are merged together to create clusters. Each cluster is given a unique ID. Some devices conserve power by limiting the transmit time until actually needed, which results in the spectrum sensor to stop detecting the device temporarily. This device is then correctly marked as down. Such a device is correctly removed from the spectrum database. In cases when all the interferer detections for a specific device are reported, the cluster ID is kept alive for an extended period of time to prevent possible device-detection bouncing. If the same device is detected again, it is merged with the original cluster ID and the device-detection history is preserved.

For example, some Bluetooth headsets operate on battery power. These devices employ methods to reduce power consumption, such as turning off the transmitter when not actually needed. Such devices can appear to come and go from the classification. To manage these devices, CleanAir keeps the cluster IDs for longer and they are remerged into a single record upon detection. This process smoothens the user records and accurately represents the device history.

---

**Note** The following is a prerequisite for monitoring the interference devices:  
You can configure Cisco CleanAir only on CleanAir-enabled access points.

---

## Configuration Examples for CleanAir

This example shows how to enable CleanAir on the 2.4-GHz band and an access point operating in the channel:

```
Device#configure terminal
Device(config)#ap dot11 24ghz cleanair
Device(config)#exit
Device#ap name TAP1 dot11 24ghz cleanair
Device#end
```

This example shows how to enable an EDRRM CleanAir event in the 2.4-GHz band and configure high sensitivity to non-Wi-Fi interference:

```
Device#configure terminal
Device(config)#ap dot11 24ghz rrm channel cleanair-event
Device(config)#ap dot11 24ghz rrm channel cleanair-event sensitivity high
Device(config)#end
```

This example shows how to enable an access point in the monitor mode:

```
Device#ap name <ap-name> mode monitor
```

## CleanAir FAQs

- Q.** Multiple access points detect the same interference device. However, the device shows them as separate clusters or different suspected devices clustered together. Why does this happen?
- A.** Access points must be RF neighbors for the device to consider merging the devices that are detected by these access points. An access point takes time to establish neighbor relationships. A few minutes after the device reboots or after there is a change in the RF group, and similar events, clustering will not be very accurate.
- Q.** How do I view neighbor access points?
- A.** To view neighbor access points, use the **show ap ap\_name auto-rf dot11 {24ghz | 5ghz}** command.

This example shows how to display the neighbor access points:

```
Device#show ap name AS-5508-5-AP3 auto-rf dot11 24ghz
```

```
<snippet>
```

```
Nearby APs
```

```
AP 0C85.259E.C350 slot 0 : -12 dBm on 1 (10.10.0.5)
AP 0C85.25AB.CCA0 slot 0 : -24 dBm on 6 (10.10.0.5)
AP 0C85.25C7.B7A0 slot 0 : -26 dBm on 11 (10.10.0.5)
AP 0C85.25DE.2C10 slot 0 : -24 dBm on 6 (10.10.0.5)
AP 0C85.25DE.C8E0 slot 0 : -14 dBm on 11 (10.10.0.5)
AP 0C85.25DF.3280 slot 0 : -31 dBm on 6 (10.10.0.5)
AP 0CD9.96BA.5600 slot 0 : -44 dBm on 6 (10.0.0.2)
AP 24B6.5734.C570 slot 0 : -48 dBm on 11 (10.0.0.2)
```

```
<snippet>
```

- Q.** What are the AP debug commands available for CleanAir?
- A.** The AP debug commands for CleanAir are:
- **debug cleanair {bringup | event | logdebug | low | major | nsi | offchan}**
  - **debug rrm {neighbor | off-channel | reports}**

## CHAPTER 162

# Bluetooth Low Energy

- [Information About Bluetooth Low Energy, on page 1759](#)
- [Enabling Bluetooth Low Energy Beacon \(GUI\), on page 1760](#)
- [Enabling Bluetooth Low Energy Beacon, on page 1760](#)

## Information About Bluetooth Low Energy

**Note** This feature is not related to the Indoor IoT Services feature set that is part of Cisco Spaces.

This feature describes how Access Points and Catalyst 9800 can detect BLE devices as wireless interferers using Clean Air - not the BLE radio that is available on some Access Point models. This feature is not meant to be used for BLE-based asset tracking, environmental monitoring, or tag management use cases, which are powered using Cisco Spaces.

For full feature functionality of how BLE-related use cases are delivered in the Cisco solution, refer to Cisco Spaces configuration guides for [Indoor IoT services](#).

Bluetooth low energy (BLE) is a wireless personal area network technology aimed at enhancing location services for mobile devices. The small Bluetooth tag devices placed at strategic locations transmit universally unique identifiers (UUIDs) and, Major and Minor fields as their identity. These details are picked up by Bluetooth-enabled smartphones and devices. The location information of these devices are sent to the corresponding back-end server. Relevant advertisements and other important information are then pushed to the devices using this location-specific information.

By treating a tag device as an interferer and using the existing system capabilities, such as interference location, the tag device can be located on a map display in a wireless LAN deployment and its movement monitored. Besides this, information on missing tags can also be obtained. This feature can determine rogue and malicious tags using the unique identifier associated with each tag (or family of tags) against a predetermined allowed list from a customer. Using the management function, alerts can be displayed or emailed based on rogue tags, missing tags, or moved tags.

### Limitations of BLE Feature

- The wireless infrastructure must support Cisco CleanAir.
- Supports a maximum of only 250 unique BLE beacons (cluster entries) and 1000 device entries.

- Cisco CleanAir feature is only supported on Cisco Aironet 3700 Series Access Points with Hyperlocation module RM3010. The BLE feature on Wave 2 and Wi-Fi 6 APs works in a different manner (through cloud beacon center) and is not covered by this feature.

### Areas of Use

Since the BLE feature provides granular location details of devices (smart phones or bluetooth-enabled devices) that helps push context-sensitive advertising and other information to users. Possible areas of application include retail stores, museums, zoo, healthcare, fitness, security, advertising, and so on.

## Enabling Bluetooth Low Energy Beacon (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Radio Configurations > CleanAir > 2.4 GHz Band > General**.
  - Step 2** Check the **Enable CleanAir** check box.
  - Step 3** From the **Available Interference Types** list, select and move **BLE Beacon** to the **Interference Types to Detect** list.
  - Step 4** Click **Apply**.
- 

## Enabling Bluetooth Low Energy Beacon

Bluetooth low energy (BLE) detection is enabled by default. Use the procedure given below to enable BLE when it is disabled.

### Before you begin

- The wireless infrastructure must support Cisco CleanAir.
- Cisco CleanAir configuration and show commands are available only in Mobility Controller (MC) mode.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Controller# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>[no] ap dot11 24ghz cleanair device [ble-beacon]</b>  <b>Example:</b> Controller(config)# ap dot11 24ghz cleanair device ble-beacon	Enables the BLE feature on the 802.11b network. Use the <b>no</b> form of the command to disable BLE feature on the 802.11b network.

	Command or Action	Purpose																														
<b>Step 3</b>	<b>exit</b> <b>Example:</b> Controller(config)# exit	Returns to privileged EXEC mode.																														
<b>Step 4</b>	<b>show ap dot11 24ghz cleanair config</b> <b>Example:</b> Controller# show ap dot11 24ghz cleanair config  Interference Device Settings: Interference Device Reporting..... : Enabled Bluetooth Link..... : Enabled  Microwave Oven..... : Enabled  BLE Beacon..... : Enabled	(Optional) Displays the BLE beacon configuration.																														
<b>Step 5</b>	<b>show ap dot11 24ghz cleanair device type ble-beacon</b> <b>Example:</b> Controller# show ap dot11 24ghz cleanair device type ble-beacon  DC = Duty Cycle (%) ISI = Interference Severity Index (1-Low Interference, 100-High Interference) RSSI = Received Signal Strength Index (dBm) DevID = Device ID  <table border="1"> <thead> <tr> <th>No</th> <th>ClusterID</th> <th>DevID</th> <th>Type</th> <th>ISI</th> <th>RSSI</th> </tr> <tr> <th>DC</th> <th>AP Name</th> <th>Channel</th> <th></th> <th></th> <th></th> </tr> </thead> <tbody> <tr> <td>1</td> <td>2c:92:80:00:00:22</td> <td>0xa001</td> <td>BLE Beacon</td> <td>--</td> <td>-74</td> </tr> <tr> <td>0</td> <td>5508_3_AP3600_f839</td> <td></td> <td></td> <td></td> <td></td> </tr> <tr> <td></td> <td>unknown</td> <td></td> <td></td> <td></td> <td></td> </tr> </tbody> </table>	No	ClusterID	DevID	Type	ISI	RSSI	DC	AP Name	Channel				1	2c:92:80:00:00:22	0xa001	BLE Beacon	--	-74	0	5508_3_AP3600_f839						unknown					(Optional) Displays the BLE beacon device-type information.

## CHAPTER 163

# Persistent Device Avoidance

- [Information about Cisco Persistent Device Avoidance, on page 1763](#)
- [Configuring Persistent Device Avoidance \(GUI\), on page 1764](#)
- [Configuring Persistent Device Avoidance \(CLI\), on page 1764](#)
- [Verifying Persistent Device Avoidance, on page 1764](#)

## Information about Cisco Persistent Device Avoidance

The Cisco CleanAir Persistent device avoidance (PDA) feature is a part of spectrum management. Some interference devices, such as, outdoor bridges and microwave ovens, transmit signals only when required. These devices can cause significant interference to the local WLAN, because short-duration and periodic operations remain largely undetected by normal RF management metrics. With Cisco CleanAir (CleanAir), the RRM dynamic channel allocation (DCA) algorithm can detect, measure, register, and remember the impact, and adjust the RRM DCA algorithm. The PDA process minimizes the use of channels affected by persistent devices in the channel plan, local to the interference source. CleanAir detects and stores persistent device information in the controller. This information is used to mitigate the interfering channels.

**Persistent Devices Detection** - CleanAir-capable monitor mode APs collect information about persistent devices on all the configured channels and store the information in the controller. Local or bridge mode APs detect interference devices only on the serving channels.

The PDA feature works seamlessly on all platforms. All the AP models that are capable of CleanAir and Spectrum Intelligence support the PDA feature.

The supported platforms are:

- Cisco Aironet 1852 Access Points
- Cisco Aironet 1832 Access Points
- Cisco Aironet 2700 Series Access Points
- Cisco Aironet 2800 Series Access Points
- Cisco Aironet 3700 Series Access Points
- Cisco Aironet 3800 Series Access Points
- Cisco Aironet 4800 Series Access Points
- Cisco Catalyst 9115 Series Access Points

- Cisco Catalyst 9117 Series Access Points
- Cisco Catalyst 9120AX Series Access Points
- Cisco Catalyst 9124AX Series Access Points
- Cisco Catalyst 9130AX Access Points

## Configuring Persistent Device Avoidance (GUI)

### Procedure

- 
- Step 1** Choose **Configurations > Radio Configurations > RRM**
- Step 2** Click the **5 GHz Band** tab or the **2.4 GHz Band**, and click the **DCA** tab.
- Step 3** In the **DCA** window, under the **Dynamic Channel Assignment Algorithm** section, check the **Avoid Persistent Non-WiFi Interference** check box to enable the device to ignore persistent non-WiFi interference.
- Step 4** Click **Apply**.
- 

## Configuring Persistent Device Avoidance (CLI)

You can enable and disable the PDA feature and PDA propagation configuration mode through the RRM Manager.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>[no] ap dot11 {24ghz   5ghz} rrm channel device</b> <b>Example:</b> Device# [no] ap dot11 24ghz rrm channel device	Configures persistent non-WiFi device avoidance in the 802.11a or 802.11b channel assignment. Use the <b>no</b> form of this command to negate the command or to set its defaults.

## Verifying Persistent Device Avoidance

To verify the current state of **Device Aware** detail of the channel, use the following command:

```
Device#show ap dot11 24ghz channel
Leader Automatic Channel Assignment
Channel Assignment Mode : AUTO
```

```

Channel Update Interval : 600 seconds
Anchor time (Hour of the day) : 0
Channel Update Contribution
 Noise : Enable
 Interference : Enable
 Load : Disable
Device Aware : Enable
CleanAir Event-driven RRM option : Disabled
Channel Assignment Leader : cisco-vwlc (9.9.39.73)
Last Run : 166 seconds ago

DCA Sensitivity Level : MEDIUM : 10 dB
DCA Minimum Energy Limit : -95 dBm
Channel Energy Levels
 Minimum : -82 dBm
 Average : -82 dBm
 Maximum : -82 dBm
Channel Dwell Times
 Minimum : 8 days 0 hour 43 minutes 13 seconds
 Average : 8 days 0 hour 43 minutes 13 seconds
 Maximum : 8 days 0 hour 43 minutes 13 seconds
802.11b 2.4 GHz Auto-RF Channel List
 Allowed Channel List : 1,6,11
 Unused Channel List : 2,3,4,5,7,8,9,10

```

```
Device#show ap dot11 24ghz cleanair device type all
```

```

DC = Duty Cycle (%)
ISI = Interference Severity Index (1-Low Interference, 100-High Interference)
RSSI = Received Signal Strength Index (dBm)
DevID = Device ID
PD = Persistent Device

CA	10 -76 10 40			12/16/2020	18:32:42 UTC
9800.0000.0001	3400.0201.0005	0x0005	Continuous TX	No	RRM-TSIM-1
CA	30 -77 30 40			12/16/2020	18:32:42 UTC
9800.0000.0002	3400.0201.0007	0x0007	BT Link	No	RRM-TSIM-1
CA	10 -88 10 40			12/16/2020	18:32:42 UTC

To verify all the reported interferers along with the class type, use the following command:

```
Device# show ap dot11 24ghz cleanair device type wimax-mobile
DC = Duty Cycle (%)
ISI = Interference Severity Index (1-Low Interference, 100-High Interference)
RSSI = Received Signal Strength Index (dBm)
DevID = Device ID
```

ClusterID	Mac Address	DevID	Type	AP Name	ISI
RSSI DC Channel					
1900.0000.0006 -88 1	xxxx.xxxx.xxx1	0xc001	WiMax Mobile	Cisco-AP	4
1900.0000.0007 -88 1	xxxx.xxxx.xxx2	0xc002	WiMax Mobile	Cisco-AP	4

To verify the persistent device information under Auto-RF, use the following command:

```
Device#show ap auto-rf dot11 24ghz
Number of Slots : 2
AP Name : VANC-AP
MAC Address : d4c9.3ce5.c760
Slot ID : 0
Radio Type : 802.11n - 2.4 GHz

## CHAPTER 164

# Spectrum Intelligence

---

- [Spectrum Intelligence, on page 1767](#)
- [Configuring Spectrum Intelligence, on page 1768](#)
- [Verifying Spectrum Intelligence Information, on page 1768](#)
- [Debugging Spectrum Intelligence on Supported APs \(CLI\), on page 1769](#)

## Spectrum Intelligence

The Spectrum Intelligence feature scans for non-Wi-Fi radio interference on 2.4-GHz and 5-GHz bands. Spectrum intelligence provides basic functions to detect interferences of three types, namely microwave, continuous wave (like video bridge and baby monitor), wi-fi and frequency hopping (Bluetooth and frequency-hopping spread spectrum (FHSS) cordless phone).

The following Cisco access points (APs) support Spectrum Intelligence feature:

- Cisco Catalyst 9105 Series Wi-Fi 6 APs
- Cisco Catalyst 9115 Series Wi-Fi 6 APs
- Cisco Aironet 1852E/I APs
- Cisco Aironet 1832I APs
- Cisco Aironet 1815W/T/I/M APs
- Cisco Aironet 1810W/T APs
- Cisco Aironet 1800I/S APs
- Cisco Aironet 1542D/I APs

---

**Note** You must enable Spectrum Intelligence feature on the Cisco Aironet 1832 and 1852 series APs to get radio details, such as noise, air-quality, interference, and radio utilization on the Cisco Catalyst Center Assurance AP health.

---

### Restrictions

- SI APs only report a single interference type in Local mode.

- SI does not support high availability for air quality or interference reports. High Availability is not supported because interference report/device reported will not be copied to standby after switchover. We expect AP to send it again, if at all interferer is still there.
- Spectrum Intelligence detects only three types of devices:
  - Microwave
  - Continuous wave—(video recorder, baby monitor)
  - SI-FHSS—(Bluetooth, Frequency hopping Digital European Cordless Telecommunications (DECT) phones)

## Configuring Spectrum Intelligence

Follow the procedure given below to configure spectrum intelligence:

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>ap dot11 {24ghz   5ghz} SI</b> <b>Example:</b> Device(config)# ap dot11 24ghz SI	Configures the 2.4-GHz or 5-GHz Spectrum Intelligence feature on the 802.11a or 802.11b network.  Add <b>no</b> form of the command to disable SI on the 802.11a or 802.11b network.

## Verifying Spectrum Intelligence Information

Use the following commands to verify spectrum intelligence information:

To display the SI information for a 2.4-GHz or 5-GHz band, use the following command:

```
Device# show ap dot11 24ghz SI config
```

```
SI Solution..... : Enabled
Interference Device Settings:
 SI_FHSS..... : Enabled
Interference Device Types Triggering Alarms:
 SI_FHSS..... : Disabled
```

```
Device# show ap dot11 5ghz SI device type
RSSI = Received Signal Strength Index (dBm)
DevID = Device ID
PD = Persistent Device
```

```
Mac Address DevID Type PD AP Name RSSI Channel
 Last Update Time
```

```
3400.0401.0006 0x0006 BT Discovery No RRM-TSIM-3 -88 40
 12/16/2020 18:11:28 UTC
```

To display SI interferers of type Continuous transmitter for a 2.4-GHz band, use the following command:

```
Device# show ap dot11 24ghz SI device type cont_tx
RSSI = Received Signal Strength Index (dBm)
DevID = Device ID
```

Mac Address	DevID	Type	AP Name	RSSI	Channel
xxxx.xxxx.xxxx	0xf001	Continuous TX	Cisco-AP	-47	

To display 802.11a interference devices information for the given AP for 5-GHz, use the following command:

```
Device# show ap dot11 5ghz SI device type ap
```

```
DC = Duty Cycle (%)
ISI = Interference Severity Index (1-Low Interference, 100-High Interference)
RSSI = Received Signal Strength Index (dBm)
DevID = Device ID
AP type = CA, clean air, SI spectrum intelligence
```

No	ClusterID/BSSID	DevID	Type	AP Type	AP Name	ISI	RSSI	DC	Channel
-----	-----	-----	-----	-----	-----	-----	-----	-----	-----

To display SI interferers of type Continuous transmitter for a 5-GHz band, use the following command:

```
Device# show ap dot11 5ghz SI device type cont_tx
RSSI = Received Signal Strength Index (dBm)
DevID = Device ID
```

Mac Address	DevID	Type	AP Name	RSSI	Channel
xxxx.xxxx.xxx1	0xf001	Continuous TX	Cisco-AP	-88	
xxxx.xxxx.xxx2	0xf002	Continuous TX	Cisco-AP	-88	

To display all Cisco CleanAir interferers for a 2.4-GHz band, use the following command:

```
Device# show ap dot11 24ghz cleanair device type all
```

## Debugging Spectrum Intelligence on Supported APs (CLI)

You need to enter these commands in the AP console. For information about APs that support this feature see [https://www.cisco.com/c/en/us/td/docs/wireless/access\\_point/feature-matrix/ap-feature-matrix.html](https://www.cisco.com/c/en/us/td/docs/wireless/access_point/feature-matrix/ap-feature-matrix.html).

### Procedure

- Generate major Spectrum Intelligence logs for an AP by entering this command:  
**debug cleanair major**
- Verify the Spectrum Intelligence scan schedule of 5 seconds on an AP by entering this command:  
**debug cleanair event**

- Generate logs at 10-minute interval, when interference is not detected or reported by the AP, by entering this command:

**debug cleanair raw 10**

This command creates three files under **/tmp** directory from dev shell.

- spectrum.fft
- spectrum.dbg
- spectrum.int

- View the Spectrum Intelligence detected interfering devices by entering this command:

**show cleanair interferers**

- View the Spectrum Intelligence configuration status by entering this command:

**show cleanair status**

## CHAPTER 165

# Spectrum Analysis

- [Information About Spectrum Analysis, on page 1771](#)
- [Live Spectrum Analysis, on page 1772](#)
- [Performing AP Spectrum Analysis \(GUI\), on page 1772](#)
- [Configuring Spectrum Analysis, on page 1773](#)
- [Verifying Spectrum Analysis, on page 1773](#)

## Information About Spectrum Analysis

Cisco Catalyst Center receives a spectrogram stream from access points and visualizes spectrum analysis as a real-time spectrogram view. Network administrators receive RF violation issues from end users or radio frequency issue from the Catalyst Center. To analyze a violation, you should select the corresponding AP and analyze the spectrogram stream.

Based on whether a setting is global or is meant for a specific channel, every AP uses a specific channel to communicate with clients.

When a lot of clients join on the same AP, there is a high possibility of frames getting dropped off. When there is an issue of clients dropping quickly, or not getting onboarded, you should perform the spectrum analysis to check if the channels are clogged.

You can enable spectrum analysis on every AP listed in the web UI and view the graphs based on the corresponding AP. When enabled, the APs send spectrum data to Catalyst Center which then aggregates it into 3 distinct charts.

You can view the following charts while performing a spectrum analysis:

- **Persistence Charts:** Plot the amplitude-to-power ratio of each signal at each channel for a period of five minutes. The chart is color coded with blue color representing one signal and red representing many signals. This chart also plots the opacity that represents the age of the signal data within the five minute interval, with older data being more transparent.
- **Waterfall Charts:** Plot all the signals that are analyzed in the channel for a period of five minutes with intensity on X axis, and with time represented in the Y axis. The chart is color coded, with blue color representing a low value and red representing a high value.
- **Interference and Duty Charts:** Plot the severity of detected interference for each channel band, and list the interference type. Interference is plotted as a circle, where the center represents the severity, and the radius represents the section of the channel band that is affected. The impact of the interference is measured

as severity, with values ranging from 0 to 100. The interference type is determined from RF signature identified by Cisco CleanAir technology of the interference.

## Live Spectrum Analysis

You can perform a live spectrum analysis of the AP radios, and monitor the spectrum of frequencies generated by the radios of the corresponding AP using the web UI. The live spectrum capture uses radio 2 if it is available. Otherwise, both radio 0 and radio 1 are used. When you enable live spectrum analysis on radio 2, Cisco Catalyst Center displays a consolidated view of the interference in both the 2.4 Ghz and 5 Ghz range. However, if the feature is enabled on radio 0 or radio 1, you can only view the part of the spectrum that the radios are associated with. You can select a radio in the web UI and view a live spectrum associated with this radio, for 10 minutes, and later extend the duration based on your requirement.

## Performing AP Spectrum Analysis (GUI)

### Before you begin

Use the Cisco Catalyst Center Discovery functionality to locate an AP to perform a spectrum analysis. .

### Procedure

---

- Step 1** Choose **Provision > Inventory**.
- The **Inventory** window is displayed.
- Step 2** Click **AP Name** .
- The **360 degree Device** window is displayed.
- Step 3** Click **Intelligent Capture** .
- Step 4** Click **Spectrum Analysis** to view the graphs.
- Step 5** From the **Radio** drop-down list, choose a radio.
- Step 6** Click **Start Spectrum Analysis** .
- The graphs are displayed on the web UI for you to analyze.
- To stop the analysis, click **Stop Spectrum Analysis**.
-

# Configuring Spectrum Analysis

## Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>icap subscription ap rf spectrum enable</b>  <b>Example:</b> Device# icap subscription ap rf spectrum enable	Configures spectrum analysis on the AP.
<b>Step 3</b>	<b>icap subscription ap rf spectrum slotnumber</b>  <b>Example:</b> Device# icap subscription ap rf spectrum slot 0	Selects a radio slot to enable spectrum analysis.

## Verifying Spectrum Analysis

The following is a sample output of the **show ap icap subscription name** command that verifies spectrum analysis on a selected AP:

```
Device#show ap icap subscription name
Subscription list

Full Pkt Capture : Disabled
Partial Pkt Capture : Enabled
Anomaly Event : Enabled
Debug : Disabled
Stats : Disabled
Ap Operational Data : Disabled
Sensor Message : Enabled
RRM Operational Data : Disabled
Client Events : Disabled
aWIPS Forensic Pkts: Disabled

MAC and Filters subscription list

Full-packet-trace: None
Partial-packet-trace: None
Filters: None
Anomaly Detection: None

Client Stats

None

RF Spectrum
```

```

Radio Slot(s) : 1
```

## Introduction to the Mesh Network

Mesh networking employs Cisco Aironet outdoor mesh access points and indoor mesh access points along with Cisco Wireless Controller and Cisco Prime Infrastructure to provide scalability, central management, and mobility between indoor and outdoor deployments. Control and Provisioning of Wireless Access Points (CAPWAP) protocol manages the connection of mesh access points to the network.

End-to-end security within the mesh network is supported by employing Advanced Encryption Standard (AES) encryption between wireless mesh access points and Wi-Fi Protected Access 2 (WPA2) clients. For connections to a mesh access point (MAP) wireless client, such as MAP-to-MAP and MAP-to-root access point, WPA2 is applicable.

The wireless mesh terminates on two points on the wired network. The first location is where the root access point (RAP) is attached to the wired network, and where all bridged traffic connects to the wired network. The second location is where the CAPWAP controller connect to the wired network; this location is where the WLAN client traffic from the mesh network is connected to the wired network. The WLAN client traffic from CAPWAP is tunneled to Layer 2. Matching WLANs should terminate on the same switch VLAN on

which the wireless controllers are co-located. The security and network configuration for each of the WLANs on the mesh depend on the security capabilities of the network to which the wireless controller is connected.

In the new configuration model, the controller has a default mesh profile. This profile is mapped to the default AP-join profile, which is in turn is mapped to the default site tag. If you are creating a named mesh profile, ensure that these mappings are put in place, and the corresponding AP is added to the corresponding site-tag.

**Important** The following are the mesh supported scenarios in IRCM from Cisco IOS XE Amsterdam 17.3 release up to Cisco IOS XE Cupertino 17.9 release, for the Cisco Wave 1 APs that are not supported:

- Cisco Wave 1 APs are not supported in the releases post Cisco IOS XE Amsterdam 17.3. This includes mesh support as well. Therefore, it is not possible for a Cisco Wave 1 AP to join a Cisco Catalyst 9800 Series Wireless Controller (controller) with Cisco IOS XE Amsterdam 17.4 and later versions. We recommend the following deployment mode for Cisco Wave 1 APs.
- In the case of Cisco mesh deployments, the following are the deployment limitations to be aware of, when the system is deployed:
  - MAP roaming is not allowed between Cisco Catalyst 9800 Series Wireless Controllers, if the controllers run different Cisco IOS XE versions (running on versions Cisco IOS XE Amsterdam 17.3 or Cisco IOS XE Cupertino 17.9) for any of the Cisco Wave 1 APs and Cisco Wave 2 APs.
  - You cannot have Cisco Wave 1 APs and Cisco Catalyst 9124 Series APs in the same mesh tree, in the releases post Cisco IOS XE Amsterdam 17.3.x. This can be achieved in 17.3.x, beginning from the 17.3.6 (upcoming) release.
  - The whole mesh tree containing Cisco Wave 1 APs must be joined to the 17.3 controller, by running the **strict-bgn** and **mac filtering** commands.

**Note** The limitations mentioned above are not valid for the Cisco Industrial Wireless 3702 Series APs which are supported until the Cisco IOS XE Cupertino 17.9 release.

Cisco Catalyst 9130AXE Access Points support Serial Backhaul with omni antenna using dart connectors. Cisco Catalyst 9130AXI APs supports Serial Backhaul, as the second 5-GHz radio is for macro and micro cell (the transmission power of the second 5-GHz radio cannot be changed).

## Restrictions for Mesh Access Points

The Mesh feature is supported only on the following AP platforms:

- Outdoor APs
  - Cisco Industrial Wireless 3702 Access Points (supported from Cisco IOS XE Gibraltar 16.11.1b).
  - Cisco Aironet 1542 Access Points
  - Cisco Aironet 1562 Access Points
  - Cisco Aironet 1572 Access Points

- Cisco Catalyst IW6300 Heavy Duty Access Points
- Cisco 6300 Series Embedded Services Access Points
- Cisco Catalyst 9124AX Series Outdoor Access Points
- Cisco Catalyst IW9167 Series Heavy Duty Access Points
  
- Indoor APs
  - Cisco Aironet 1815i Access Points
  - Cisco Aironet 1815m Access Points
  - Cisco Aironet 1815w Access Points
  - Cisco Aironet 1832i Access Points
  - Cisco Aironet 1852i Access Points
  - Cisco Aironet 1852e Access Points
  - Cisco Aironet 2802i Access Points
  - Cisco Aironet 2802e Access Points
  - Cisco Aironet 3802i Access Points
  - Cisco Aironet 3802e Access Points
  - Cisco Aironet 3802p Access Points
  - Cisco Aironet 4800 Access Points
  - Cisco Catalyst 9130AX (I/E) Access Points

The following mesh features are not supported:

- Serial backhaul AP support with separate backhaul radios for uplink and downlink.
- Public Safety channels (4.9-GHz band) support.
- Passive Beaconing (Anti-Stranding)

---

**Note**

- Only Root APs support SSO. MAPs will disconnect and rejoin after SSO.

The AP Stateful Switch Over (SSO) feature allows the access point (AP) to establish a CAPWAP tunnel with the Active controller and share a mirror copy of the AP database with the Standby controller. The overall goal for the addition of AP SSO support to the controller is to reduce major downtime in wireless networks due to failure conditions that may occur due to box failover or network failover.

- In a mixed regulatory domain mesh AP deployment, ensure that the Dynamic Channel Assignment (DCA) allowed channel list is supported by MAPs.
  - When you disable the admin state on the 2.4-GHz radio of mesh APs, and the root AP (RAP) backhaul radio is switched to 2.4-GHz, RAP will still use 2.4-GHz radio to serve the mesh backhaul connections, inspite of 2.4-GHz radio being in the disabled state.
-

## MAC Authorization

You must enter the MAC address of an AP in the controller to make a MAP join the controller. The controller responds only to those CAPWAP requests from MAPs that are available in its authorization list. Remember to use the MAC address provided at the back of the AP.

MAC authorization for MAPs connected to the controller over Ethernet occurs during the CAPWAP join process. For MAPs that join the controller over radio, MAC authorization takes place when the corresponding AP tries to secure an adaptive wireless path protocol (AWPP) link with the parent MAP. The AWPP is the protocol used in Cisco mesh networks.

The Cisco Catalyst 9800 Series Wireless Controller supports MAC authorization internally as well as using an external AAA server.

## Preshared Key Provisioning

Customers with mesh deployments can see their MAPs moving out of their network and joining another mesh network when both these mesh deployments use AAA with wild card MAC filtering to allow the association of MAPs. Since MAPs might use EAP-FAST, this cannot be controlled because a security combination of MAC address and type of AP is used for EAP, and no controlled configuration is available. The preshared key (PSK) option with a default passphrase also presents a security risk.

This issue is prominently seen in overlapping deployments of two service providers when the MAPs are used in a moving vehicle (public transportation, ferry, ship, and so on.). This way, there is no restriction on MAPs to remain with the service providers' mesh network, and MAPs can get hijacked or getting used by another service provider's network and cannot serve the intended customers of the original service providers in the deployment.

The PSK key provisioning feature enables a PSK functionality from the controller which helps make a controlled mesh deployment and enhance MAPs security beyond the default one. With this feature the MAPs that are configured with a custom PSK, will use the PSK key to do their authentication with their RAPs and controller.

## EAP Authentication

Local EAP is an authentication method that allows users and wireless clients to be authenticated locally on the controller. It is designed for use in remote offices that want to maintain connectivity with wireless clients when the backend system gets disrupted or the external authentication server goes down. When you enable local EAP, the controller serves as the authentication server and the local user database, which in turn, removes dependence on an external authentication server. Local EAP retrieves user credentials from the local user database or the LDAP backend database to authenticate users. Local EAP supports only the EAP-FAST authentication method for MAP authentication between the controller and wireless clients.

Local EAP uses an LDAP server as its backend database to retrieve user credentials for MAP authentication between the controller and wireless clients. An LDAP backend database allows the controller to query an LDAP server for the credentials (username and password) of a particular user. These credentials are then used to authenticate the user.

---

**Note** If RADIUS servers are configured on the controller, the controller tries to authenticate the wireless clients using the RADIUS servers first. Local EAP is attempted only if RADIUS servers are not found, timed out, or were not configured.

---

### EAP Authentication with LSC

Locally significant certificate-based (LSC-based) EAP authentication is also supported for MAPs. To use this feature, you should have a public key infrastructure (PKI) to control certification authority, define policies, validity periods, and restrictions and usages on the certificates that are generated, and get these certificates installed on the APs and controller.

After these customer-generated certificates or LSCs are available on the APs and controller, the devices can start using these LSCs, to join, authenticate, and derive a session key.

LSCs do not remove any preexisting certificates from an AP. An AP can have both LSC and manufacturing installed certificates (MIC). However, after an AP is provisioned with an LSC, the MIC certificate is not used during boot-up. A change from an LSC to MIC requires the corresponding AP to reboot.

The controller also supports mesh security with EAP authentication to a designated server in order to:

- Authenticate the mesh child AP
- Generate a master session key (MSK) for packet encryption.

## Bridge Group Names

Bridge group names (BGNs) control the association of MAPs to the parent mesh AP. BGNs can logically group radios to avoid two networks on the same channel from communicating with each other. The setting is also useful if you have more than one RAP in your network in the same sector (area). BGN is a string comprising a maximum of 10 characters.

A BGN of *NULL VALUE* is assigned by default during manufacturing. Although not visible to you, it allows a MAP to join the network prior to your assignment of your network-specific BGN.

If you have two RAPs in your network in the same sector (for more capacity), we recommend that you configure the two RAPs with the same BGN, but on different channels.

When Strict Match BGN is enabled on a MAP, it will scan ten times to find a matching BGN parent. After ten scans, if the AP does not find the parent with matching BGN, it will connect to the nonmatched BGN and maintain the connection for 15 minutes. After 15 minutes, the AP will again scan ten times, and this cycle continues. The default BGN functionalities remain the same when Strict Match BGN is enabled.

In Cisco Catalyst 9800 Series Wireless Controller, the BGN is configured on the mesh profile. Whenever a MAP joins the controller, the controller pushes the BGN that is configured on the mesh profile to the AP.

### Preferred Parent Selection

The preferred parent for a MAP enables you to enforce a linear topology in a mesh environment. With this feature, you can override the Adaptive Wireless Path Protocol-defined (AWPP-defined) parent selection mechanism and force a MAP to go to a preferred parent.

For Cisco Wave 1 APs, when you configure a preferred parent, ensure that you specify the MAC address of the actual mesh neighbor for the desired parent. This MAC address is the base radio MAC address that has the letter "f" as the final character. For example, if the base radio MAC address is 00:24:13:0f:92:00, then you must specify 00:24:13:0f:92:0f as the preferred parent.

```
Device# ap name ap1 mesh parent preferred 00:24:13:0f:92:0f
```

For Cisco Wave 2 APs, when you configure a preferred parent, the MAC address is the base radio MAC address that has "0x11" added to the last two characters. For example, if the base radio MAC address is 00:24:13:0f:92:00, then you must specify 00:24:13:0f:92:11 as the preferred parent.

```
Device# ap name ap1 mesh parent preferred 00:24:13:0f:92:11
```

## Background Scanning

Mesh background scanning improves convergence time, and reliability and stability of parent selection. With the help of the Background Scanning feature, a MAP can find and connect with a better potential parent across channels, and maintain its uplink with the appropriate parent all the time.

When background scanning is disabled, a MAP has to scan all the channels of the regulatory domain after detecting a parent loss in order to find a new parent and go through the authentication process. This delays the time taken for the mesh AP to connect back to the controller.

When background scanning is enabled, a MAP can avoid scanning across the channels to find a parent after detecting a parent loss, and select a parent from the neighbor list and establish the AWPP link.

## Information About Background Scanning and MAP Fast Ancestor Find Mode

Cisco mesh access points (MAPs) are interconnected over wireless links in a tree topology. A MAP that is connected to a network through the Ethernet uplink is the root MAP, which is also known as a root access point (RAP). Adaptive Wireless Path Protocol (AWPP) is used to form the tree topology and maintain that topology. When a MAP comes up, it tries to look for another MAP (parent) to join and reach the gateway through a RAP. The same happens when a MAP loses connectivity with its existing parent. This procedure is known as mesh tree convergence.

A child MAP maintains uplink with its parent using the AWPP adjacency request/response messages that act as keepalive. If there is a consecutive loss of response messages, a parent is declared to be lost and the child MAP tries to find a new parent. A MAP maintains a list of neighbors of the current ON channel, and when the AP loses its current parent, it roams to the next best potential neighbor. If no other neighbors are found, the AP scans or seeks across all the channels or subset channels to find a parent. This is time consuming.

With the help of the Background Scanning feature, the AP avoids searching for a parent across the channel set by scanning or seeking. This feature helps the child MAP to be updated about its neighbors across all the channels, helps to switch to a neighbor of any channel, and uses that neighbor as its next parent for uplink.

Background scanning allows MAPs to save time during the scan-and-look phase while looking for a new parent, but it does not save time on the authentication to the parent.

Enabling the MAP Fast Ancestor Finding feature enables a novel method to reduce the need for sending or receiving beacons at the network formation, while starting or deploying a new mesh network.

**Note**

- The Background Scanning and MAP Fast Ancestor Finding feature support in Cisco IOS XE Dublin 17.11.1, is not compatible with the legacy Background Scanning feature that is supported in the Cisco Wave 1 APs.
- When you enable Background Scanning on the APs that are not equipped with RHL radio, a performance penalty is imposed in terms of the bandwidth available in the backhaul. This performance penalty is high at system startup and lower after the system reaches the steady-state.

## Mesh Backhaul at 2.4 GHz and 5 GHz

A backhaul is used to create only the wireless connection between MAPs. The backhaul interface is 802.11a/n/ac/g depending upon the AP. The default backhaul interface is 5-GHz. The rate selection is important for effective use of the available radio frequency spectrum. The rate can also affect the throughput of client devices. (Throughput is an important metric used by industry publications to evaluate vendor devices.)

Mesh backhaul is supported at 2.4-GHz and 5-GHz. However, in certain countries it is not allowed to use mesh network with a 5-GHz backhaul network. The 2.4-GHz radio frequencies allow you to achieve much larger mesh or bridge distances. When a RAP gets a slot-change configuration, it gets propagated from the RAP to all its child MAPs. All the MAPs get disconnected and join the new configured backhaul slot.

## Information About Mesh Backhaul

This section provides information about mesh backhaul at 2.4-GHz. By default, the backhaul interface for mesh APs is 802.11a/ac/ax. Certain countries do not allow the use of mesh network with a 5-GHz backhaul network. Even in countries where 5-GHz is permitted, we recommend that you use 2.4-GHz radio frequencies to achieve much larger mesh or bridge distances.

The Mesh backhaul at 2.4-GHz is supported on the following access points:

- Cisco Catalyst 9124AX Series Outdoor Access Point
- Cisco Aironet 1540 Series Outdoor Access Points
- Cisco Aironet 1542D Outdoor Access Points
- Cisco Aironet 1562D Outdoor Access Points
- Cisco Aironet 1562E Outdoor Access Points
- Cisco Aironet 1562I Outdoor Access Points
- Cisco Aironet 1562PS Access Points
- Cisco Aironet 1570 Series Outdoor Access Points
- Cisco Aironet 1815i Access Points
- Cisco Aironet 1815m Series Access Point
- Cisco Aironet 1830 Series Access Points

- Cisco Aironet 1850 Series Access Points
- Cisco Aironet 2800e Access Points
- Cisco Aironet 2800i Access Points
- Cisco Aironet 3800 Series Access Points
- Cisco Aironet 4800 Access Points
- Cisco Catalyst IW6300 DC Heavy Duty Access Point
- Cisco Catalyst IW6300 DCW Heavy Duty Access Point
- Cisco Catalyst IW6300 Series Heavy Duty Access Points
- Cisco 6300 Series Embedded Services Access Points

---

**Note** In Israel, you must ensure that you run the **ap country IO** command to enable the outdoor country code for the selected radio. After you configure using the **ap country IO** command, the 2.4-GHz radio is enabled and 5-GHz radio is disabled.

---

## Information About Mesh Serial Backhaul

The Mesh Serial Backhaul feature in a mesh access point (MAP), allows different channels for uplink and downlink access, thus improving backhaul bandwidth and extending universal access. One radio is used as the uplink radio and a different one is used as the downlink radio. This allows the in-bound and out-bound traffic to flow through exclusive communication channels, thereby improving performance and avoiding problems associated with a shared access medium.

The Mesh Serial Backhaul feature is supported in the controller from Cisco IOS XE Cupertino 17.7.1 onwards, for Cisco Catalyst 9124AXE outdoor APs. A new knob is introduced under the radio profile, and that radio profile is associated with a radio frequency (RF) tag to enable the Mesh Serial Backhaul feature. When you enable this feature, the mesh configuration is shared by all the APs that share the same mesh profile. Radio configuration is shared by all the APs that are configured with the same radio profile.

Basic client access functionality is offered on the 2.4-GHz radio and the 5-GHz radio, which are not used in serial backhaul. Universal access is made available on the downlink radio.

---

**Note** Slot 1 and slot 0 are supported as mesh backhaul. Slot 2 is not supported as a mesh backhaul. You can utilize slot 2 for client serving or for serial backhaul downlink.

---

### Channel Assignment

For the Mesh Serial Backhaul feature, channels are assigned according to the following rules:

- Uplink and downlink channels are different.
- All the 5-GHz radios maintain a frequency guard between their operating channels. For example, 100-MHz channel spacing between radios in Cisco Catalyst 9124AXE outdoor APs.

- Dynamic Frequency Selection (DFS) channels are supported.

In a root access point, because the uplink is wired, channels are assigned by the controller. On the other hand, a mesh access point uses the last channel configured by the controller for this radio, or uses the default channel. If the channel used by MAP is not compatible with the uplink, MAP picks a valid random channel and notifies the controller. In another scenario, MAP randomly picks a new downlink channel when it receives a channel change alert on the uplink radio. MAP checks the validity of the downlink radio and picks a random channel if the current channel is not compatible.

---

**Note** Ensure that the following prerequisites are met before channel assignment:

- Enable tri-radio globally by running the **Device# ap tri-radio** command.
  - Enable the dual radio on the APs by running the **Device# ap name ap-name dot11 5ghz dual-radio mode enable** command.
- 

### Use Cases

The following are some of the use cases for the Mesh Serial Backhaul feature.

- **Maximize Throughput:** Serial backhaul allows the 5-GHz backhaul to operate on different channels, thereby maximizing throughput over multiple mesh hops.
- **Network Segregation:** APs that have serial backhaul enabled, segregate backhaul channel on mesh topographies. This is efficient because it avoids localized link interferences.

## Information About Mesh Backhaul RRM

Root access points (RAPs) choose backhaul channels to operate in mesh networks. Until Cisco IOS XE Cupertino 17.8.1, this operation occurred by an explicit configuration, a least congested scan during RAP boot time, during the initial radio resource management (RRM) run without mesh access points (MAPs) connected, or a backhaul channel that was chosen at random. As a result, a poor backhaul channel selection resulted in poor performance.

From Cisco IOS XE Cupertino 17.9.1 onwards, RRM DCA is run on mesh backhaul, in auto mode, in FlexConnect or centralized networks. For APs that do not have dedicated (RHL) radios, DCA is triggered by running commands in the privilege EXEC mode.

RRM continuously evaluates the channel conditions to ensure that the network utilizes the least congested channels. The network uses the transmission static power if it is configured, or falls back to the default level. This is supported on APs that have dedicated radios to scan channel conditions, without any user perceptible interruption to the mesh network traffic.

In the mesh backhaul RRM feature, the RRM DCA decides all the downlink channels in a steady network. However, if an AP detects a change in its uplink roam or radar detection response, the AP chooses the best downlink to converge faster.

---

**Note** APs choosing the best possible downlink is limited to serial backhaul enabled APs only.

---

To avoid a poor channel backhaul selection, from Cisco IOS XE Dublin 17.14.1 onwards, the RRM DCA optimizes the RAP backhaul radio channel of a mesh subtree by considering the noise, interference, load, and the RF parameter measurements only from the RAP. The RRM DCA on Mesh Backhaul feature enables DCA to make better channel assignment for a mesh subtree, by having continuous measurements and inputs from the whole mesh tree required to run DCA.

To enable RRM DCA on a full mesh tree run the **wireless mesh backhaul rrm auto-dca** command. To trigger DCA once, run the **ap dot11 [5ghz | 2.4 ghz] rrm channel-update mesh** command.

To understand what happened during a DCA run on the mesh backhaul, use the **show wireless mesh rrm dca status** and **show wireless mesh rrm dca changed** commands.

**Note**

- In a topology with mixed APs (RF ASIC capable and non-capable APs), only inputs from the RF ASIC capable APs apply for **auto-dca**.
- All mesh APs in a subtree should be configured to belong to the same site-tag for DCA to work properly.
- This feature is limited to RF ASIC capable APs, such as Cisco Catalyst 9124 Series APs and Cisco Catalyst 9130 Series APs.

## Dynamic Frequency Selection

To protect the existing radar services, the regulatory bodies require that devices that have to share the newly opened frequency sub-band behave in accordance with the Dynamic Frequency Selection (DFS) protocol. DFS dictates that in order to be compliant, a radio device must be capable of detecting the presence of radar signals. When a radio detects a radar signal, the radio should stop transmitting for at least 30 minutes to protect that service. The radio should then select a different channel to transmit on, but only after monitoring it. If no radar is detected on the projected channel for at least one minute, the new radio service device can begin transmissions on that channel. The DFS feature allows mesh APs to immediately switch channels when a radar event is detected in any of the mesh APs in a sector.

## Country Codes

Controllers and APs are designed for use in many countries having varying regulatory requirements. The radios within the APs are assigned to a specific regulatory domain at the factory (such as -E for Europe), but the country code enables you to specify a particular country of operation (such as FR for France or ES for Spain). Configuring a country code ensures that each radio's broadcast frequency bands, interfaces, channels, and transmit power levels are compliant with country-specific regulations.

In certain countries, there is a difference in the following for indoor and outdoor APs:

- Regulatory domain code
- Set of channels supported
- Transmit power level

## Intrusion Detection System

The Cisco Intrusion Detection System/Intrusion Prevention System (CIDS/CIPS) instructs controllers to block certain clients from accessing a wireless network when attacks involving these clients are detected in Layer 3 through Layer 7. This system offers significant network protection by helping to detect, classify, and stop threats, including worms, spyware or adware, network viruses, and application abuse.

## Mesh Interoperability Between Controllers

Interoperability can be maintained between AireOS and the Cisco Catalyst 9800 Series Wireless Controller with the following support:

- MAPs can join an AireOS controller through a mesh network formed by APs connected to a Cisco Catalyst 9800 Series Wireless Controller.
- MAPs can join a Cisco Catalyst 9800 Series Wireless Controller through a mesh network formed by APs connected to as AireOS controller.
- MAP roaming is supported between parent mesh APs connected to AireOS and the Cisco Catalyst 9800 Series Wireless Controller by using PMK cache.

---

**Note** For seamless interoperability, AireOS controller and the Cisco Catalyst 9800 Series Wireless Controller should be in the same mobility group and use the image versions that support IRCM.

---

## Information About DHCP and NAT Functionality on Root AP (RAP)

---

**Note** This feature is applicable for Cisco Aironet 1542 series outdoor access points only.

---

The access points associated to a mesh network can play one of the two roles:

- Root Access Point (RAP) - An access point can be a root access point for multiple mesh networks.
- Mesh Access Point (MAP) - An access point can be a mesh access point for only one single mesh network at a time.

### DHCP and NAT Functionality on Root AP - IPv4 Scenario

This feature enables the controller to send a TLV to RAP when a new RAP joins the controller.

The following covers the workflow:

- Controller pushes TLV to RAP for enabling DHCP and NAT functionality.

- Client associates to an SSID.
- RAP executes DHCP functionality to assign private IPv4 address to the client.
- RAP executes NAT functionality to get the private IPv4 address of the client and allow access to the network.

## Mesh Convergence

Mesh convergence allows MAPs to reestablish connection with the controller, when it loses backhaul connection with the current parent. To improve the convergence time, each mesh AP maintains a subset of channels that is used for future scan-see and to identify a parent in the neighbor list subset.

The following convergence methods are supported.

*Table 135: Mesh Convergence*

Mesh Convergence	Parent Loss Detection / Keepalive Timers
Standard	21 / 3 seconds
Fast	7 / 3 seconds
Very Fast	4 / 2 seconds
Noise-tolerant-fast	21 / 3 seconds

## Noise-Tolerant Fast

Noise-tolerant fast detection is based on the failure to get a response for an AWPP neighbor request, which evaluates the current parent every 21 seconds in the standard method. Each neighbor is sent a unicast request every 3 seconds along with a request to the parent. Failure to get a response from the parent initiates either a roam if neighbors are available on the same channel or a full scan for a new parent.

## Ethernet Bridging

For security reasons, the Ethernet port on all the MAPs are disabled by default. They can be enabled only by configuring Ethernet bridging on the root and its respective MAP.

Both tagged and untagged packets are supported on secondary Ethernet interfaces.

In a point-to-point bridging scenario, a Cisco Aironet 1500 Series MAP can be used to extend a remote network by using the backhaul radio to bridge multiple segments of a switched network. This is fundamentally a wireless mesh network with one MAP and no WLAN clients. Just as in point-to-multipoint networks, client access can still be provided with Ethernet bridging enabled, although if bridging between buildings, MAP coverage from a high rooftop might not be suitable for client access. To use an Ethernet-bridged application, enable the bridging feature on the RAP and on all the MAPs in that sector.

Ethernet bridging should be enabled for the following scenarios:

- Use mesh nodes as bridges.
- Connect Ethernet devices, such as a video camera on a MAP using its Ethernet port.

---

**Note** Ensure that Ethernet bridging is enabled for every parent mesh AP taking the path from the mesh AP to the controller.

---

In a mesh environment with VLAN support for Ethernet bridging, the secondary Ethernet interfaces on MAPs are assigned a VLAN individually from the controller. All the backhaul bridge links, both wired and wireless, are trunk links with all the VLANs enabled. Non-Ethernet bridged traffic, as well as untagged Ethernet bridged traffic travels along the mesh using the native VLAN of the APs in the mesh. It is similar for all the traffic to and from the wireless clients that the APs are servicing. The VLAN-tagged packets are tunneled through AWPP over wireless backhaul links.

### VLAN Tagging for MAP Ethernet Clients

The backhaul interfaces of mesh APs are referred to as primary interfaces, and other interfaces are referred to as secondary interfaces.

Ethernet VLAN tagging allows specific application traffic to be segmented within a wireless mesh network and then forwarded (bridged) to a wired LAN (access mode) or bridged to another wireless mesh network (trunk mode).

## Multicast Over Mesh Ethernet Bridging Network

Mesh multicast modes determine how bridging-enabled APs such as MAP and RAP, send multicast packets among Ethernet LANs within a mesh network. Mesh multicast modes manage only non-CAPWAP multicast traffic. CAPWAP multicast traffic is governed by a different mechanism.

Three different mesh multicast modes are available to manage multicast and broadcast packets on all MAPs. When enabled, these modes reduce unnecessary multicast transmissions within the mesh network and conserve backhaul bandwidth.

The three mesh multicast modes are:

- **Regular mode:** Data is multicast across the entire mesh network and all its segments by bridging-enabled RAP and MAP.
- **In-only mode:** Multicast packets received from the Ethernet by a MAP are forwarded to the corresponding RAP's Ethernet network. No additional forwarding occurs, which ensures that non-CAPWAP multicasts received by the RAP are not sent back to the MAP Ethernet networks within the mesh network (their point of origin), and MAP to MAP multicasts do not occur because such multicasts are filtered out.
- **In-out mode:** The RAP and MAP both multicast but in a different manner.
  - If multicast packets are received at a MAP over Ethernet, they are sent to the RAP; however, they are not sent to other MAP over Ethernet, and the MAP-to-MAP packets are filtered out of the multicast.
  - If multicast packets are received at a RAP over Ethernet, they are sent to all the MAPs and their respective Ethernet networks. When the in-out mode is in operation, it is important to properly

partition your network to ensure that a multicast sent by one RAP is not received by another RAP on the same Ethernet segment and then sent back into the network.

## Radio Resource Management on Mesh

The Radio Resource Management (RRM) software embedded in the controller acts as a built-in RF engineer to consistently provide real-time RF management of your wireless network. RRM enables the controller to continually monitor the associated lightweight APs for information on traffic load, interference, noise, coverage, and other nearby APs:

The RRM measurement in the mesh AP backhaul is enabled based on the following conditions:

- Mesh AP has the Root AP role.
- Root AP has joined using Ethernet link.
- Root AP is not serving any child AP.

## Air Time Fairness on Mesh

The Air Time Fairness (ATF) on Mesh feature is conceptually similar to the ATF feature for local access points (APs). ATF is a form of wireless quality of service (QoS) that regulates downlink airtime (as opposed to egress bandwidth). Before a frame is transmitted, the ATF budget for that SSID is checked to ensure that there is sufficient airtime budget to transmit the frame. Each SSID can be thought of as having a token bucket (1 token = 1 microsecond of airtime). If the token bucket contains enough airtime to transmit the frame, it is transmitted over air. Otherwise, the frame can either be dropped or deferred. Deferring a frame means that the frame is not admitted into the Access Category Queue (ACQ). Instead, it remains in the Client Priority Queue (CPQ) and transmitted at a later time when the corresponding token bucket contains a sufficient number of tokens (unless the CPQ reaches full capacity, at which point, the frame is dropped). The majority of the work involved in the context of ATF takes place on the APs. The wireless controller is used to configure the ATF on Mesh and display the results.

In a mesh architecture, the mesh APs (parent and child MAPs) in a mesh tree access the same channel on the backhaul radio for mesh connectivity between parent and child MAPs. The root AP is connected by wire to the controller, and MAPs are connected wirelessly to the controller. Hence, all the CAPWAP and Wi-Fi traffic are bridged to the controller through the wireless backhaul radio and through RAP. In terms of physical locations, normally, RAPs are placed at the roof top and MAPs in multiple hops are placed some distance apart from each other based on the mesh network segmentation guidelines. Hence, each MAP in a mesh tree can provide 100 percent of its own radio airtime downstream to its users though each MAP accessing the same medium. Compare this to a non-mesh scenario, where neighboring local-mode unified APs in the arena next to each other in different rooms, serving their respective clients on the same channel, and each AP providing 100% radio airtime downstream. ATF has no control over clients from two different neighboring APs accessing the same medium. Similarly, it is applicable for MAPs in a mesh tree.

For outdoor or indoor mesh APs, ATF must be supported on client access radios that serve regular clients similarly to how it is supported on ATF on non-mesh unified local mode APs to serve the clients. Additionally, it must also be supported on backhaul radios which bridge the traffic to/from the clients on client access radios to RAPs (one hop) or through MAPs to RAPs (multiple hops). It is a bit tricky to support ATF on the backhaul radios using the same SSID/Policy/Weight/Client fair-sharing model. Backhaul radios do not have SSIDs and it always bridge traffic through their hidden backhaul nodes. Therefore, on the backhaul radios in a RAP or

a MAP, the radio airtime downstream is shared equally, based on the number of backhaul nodes. This approach provides fairness to users across a wireless mesh network, where clients associated to second-hop MAP can stall the clients associated to first-hop MAP where second-hop MAP is connected wireless to first-hop MAP through backhaul radio even though the Wi-Fi users in the MAPs are separated by a physical location. In a scenario where a backhaul radio has an option to serve normal clients through universal client access feature, ATF places the regular clients into a single node and groups them. It also enforces the airtime by equally sharing the radio airtime downstream, based on the number of nodes (backhaul nodes plus a single node for regular clients).

## Spectrum Intelligence for Mesh

The Spectrum Intelligence feature scans for non-Wi-Fi radio interference on 2.4-GHz and 5-GHz bands. The feature supports client serving mode and monitor mode. The Cisco CleanAir technology in mesh backhaul and access radios provides an Interference Device Report (IDR) and Air Quality Index (AQI). Two key mitigation features (Event-Driven Radio Resource Management [EDRRM] and Persistence Device Avoidance [PDA]) are present in CleanAir. Both rely directly on information that can only be gathered by CleanAir. In the client-access radio band, they work the same way in mesh networks as they do in non-mesh networks in the backhaul radio band, the CleanAir reports are only displayed on the controller. No action is taken through ED-RRM.

Note that no specific configuration options are available to enable or disable CleanAir for MAPs.

For more information about Spectrum Intelligence, see [#unique\\_2235](#) section.

## Indoor Mesh Interoperability with Outdoor Mesh

Interoperability of indoor MAPs with outdoor APs are supported. This helps to bring coverage from outdoors to indoors. However, we recommend that you use indoor MAPs for indoor use only, and deploy them outdoors only under limited circumstances such as a simple short-haul extension from an indoor WLAN to a hop in a parking lot.

Mobility groups can be shared between outdoor mesh networks and indoor WLAN networks. It is also possible for a single controller to control indoor and outdoor MAPs simultaneously. Not that the same WLANs are broadcast out of both indoor and outdoor MAPs.

## Workgroup Bridge

A workgroup bridge (WGB) is used to connect wired networks over a single wireless segment by informing the corresponding MAP of all the clients that the WGB has on its wired segment via IAPP messages. In addition to the IAPP control messages, the data packets for WGB clients contain an extra MAC address in the 802.11 header (four MAC headers, versus the normal three MAC data headers). The extra MAC in the header is the address of the workgroup bridge itself. This extra MAC address is used to route a packet to and from the corresponding clients.

APs can be configured as workgroup bridges. Only one radio interface is used for controller connectivity, Ethernet interface for wired client connectivity, and other radio interface for wireless client connectivity.

In Cisco Catalyst 9800 Series Wireless Controller, WGB acts as a client association, with the wired clients behind WGB supported for data traffic over the mesh network. Wired clients with different VLANs behind WGB are also supported.

## Link Test

A link test is used to determine the quality of the radio link between two devices. Two types of link-test packets are transmitted during a link test: request and response. Any radio receiving a link-test request packet fills in the appropriate text boxes and echoes the packet back to the sender with the response type set.

The radio link quality in the client-to-access point direction can differ from that in the access point-to-client direction due to the asymmetrical distribution of the transmit power and receive sensitivity on both sides. Two types of link tests can be performed: a ping test and a CCX link test.

With the ping link test, the controller can test link quality only in the client-to-access point direction. The RF parameters of the ping reply packets received by the access point are polled by the controller to determine the client-to-access point link quality.

With the CCX link test, the controller can also test the link quality in the access point-to-client direction. The controller issues link-test requests to the client, and the client records the RF parameters (received signal strength indicator [RSSI], signal-to-noise ratio [SNR], and so on) of the received request packet in the response packet. Both the link-test requestor and responder roles are implemented on the access point and controller. Not only can the access point or controller initiate a link test to a CCX v4 or v5 client, but a CCX v4 or v5 client can initiate a link test to the access point or controller.

## Mesh Daisy Chaining

Mesh APs have the capability to *daisy chain* APs when they function as MAPs. The *daisy chained* MAPs can either operate the APs as a serial backhaul, allowing different channels for uplink and downlink access, thus improving backhaul bandwidth, or extend universal access. Extending universal access allows you to connect a local mode or FlexConnect mode Mesh AP to the Ethernet port of a MAP, thus extending the network to provide better client access.

Daisy chained APs must be cabled differently depending on how the APs are powered. If an AP is powered using DC power, an Ethernet cable must be connected directly from the LAN port of the Primary AP to the PoE in a port of the Subordinate AP.

The following are the guidelines for the daisy chaining mode:

- Primary MAP should be configured as mesh AP.
- Subordinate MAP should be configured as root AP.
- Daisy chaining should be enabled on both primary and subordinate MAP.
- Ethernet bridging should be enabled on all the APs in the Bridge mode. Enable Ethernet bridging in the mesh profile and map all the bridge mode APs in the sector to the same mesh profile.
- VLAN support should be enabled on the wired root AP, subordinate MAP, and primary MAP along with proper native VLAN configuration.

## Mesh Leaf Node

You can configure a MAP with lower performance to work only as a leaf node. When the mesh network is formed and converged, the leaf node can only work as a child MAP, and cannot be selected by other MAPs as a parent MAP, thus ensuring that the wireless backhaul performance is not downgraded.

## Flex+Bridge Mode

Flex+Bridge mode is used to enable FlexConnect capabilities on mesh (bridge mode) APs. Mesh APs inherit VLANs from the root AP that is connected to it.

Any EWC capable AP in Flex mode connected to a MAP, should be in CAPWAP mode (AP-type CAPWAP).

You can enable or disable VLAN trunking and configure a native VLAN ID on each AP for any of the following modes:

- FlexConnect
- Flex+Bridge (FlexConnect+Mesh)

## Backhaul Client Access

When Backhaul Client Access is enabled, it allows wireless client association over the backhaul radio. The backhaul radio can be a 2.4-GHz or 5-GHz radio. This means that a backhaul radio can carry both backhaul traffic and client traffic.

When Backhaul Client Access is disabled, only backhaul traffic is sent over the backhaul radio, and client association is performed only over the access radio.

---

**Note** Backhaul Client Access is disabled by default. After the Backhaul Client Access is enabled, all the MAPs, except subordinate AP and its child APs in daisy-chained deployment, reboot.

---

## Mesh CAC

The Call Admission Control (CAC) enables a mesh access point to maintain controlled quality of service (QoS) on the controller to manage voice quality on the mesh network. Bandwidth-based, or static CAC enables the client to specify how much bandwidth or shared medium time is required to accept a new call. Each access point determines whether it is capable of accommodating a particular call by looking at the bandwidth available and compares it against the bandwidth required for the call. If there is not enough bandwidth available to maintain the maximum allowed number of calls with acceptable quality, the mesh access point rejects the call.

- When client roams from one MAP to another in same site, bandwidth availability is checked again in the new tree for the active calls.

- When MAP roams to new parent, the active calls are not terminated and it continues to be active with other active calls in the sub tree.
- High Availability (HA) for MAPs is not supported; calls attached to MAP's access radio are terminated on HA switchover.
- HA for RAP is supported, hence calls attached to RAP's access radio continues to be active in new controller after switchover.
- Mesh CAC algorithm is applicable only for voice calls.
- For Mesh backhaul radio bandwidth calculation, static CAC is applied. Load-based CAC is not used as the APs do not support load-based CAC in Mesh backhaul.
- Calls are allowed based on available bandwidth on a radio. Airtime Fairness (ATF) is not accounted for call admission and the calls that fall under ATF policy are given bandwidth as per ATF weight.

Mesh CAC is not supported for the following scenarios.

- APs in a Mesh tree assigned with different site tags.
- APs in a Mesh tree assigned with the default site tag.

## Prerequisites for Mesh Ethernet Daisy Chaining

- Ensure that you have configured the AP role as root AP.
- Ensure that you have enabled Ethernet Bridging and Strict Wired Uplink on the corresponding AP.
- Ensure that you have disabled VLAN transparency.
- To enable VLAN support on each root AP for bridge mode APs, use the **ap name name-of-rap mesh vlan-trunking [native] vlan-id** command to configure a trunk VLAN on the corresponding RAP.
- To enable VLAN support on each root AP, for Flex+Bridge APs, you must configure the native VLAN ID under the corresponding flex profile.
- Ensure that you use a 4-pair cables that support 1000 Mbps. This feature does not work properly with 2-pair cables supporting 100 Mbps.

## Restrictions for Mesh Ethernet Daisy Chaining

- This feature is applicable to the Cisco Industrial Wireless 3702 AP and Cisco Catalyst 9124 Series APs.
- This feature is applicable to APs operating in Bridge mode and Flex+Bridge mode only.
- In Flex+Bridge mode, if local switching WLAN is enabled, the work group bridge (WGB) multiple VLAN is not supported.
- To support the Ethernet daisy chain topology, you must not connect the Cisco Industrial Wireless 3702 PoE out port to other Cisco Industrial Wireless 3702 PoE in the port, and the power injector must be used as power supply for the AP.

- The network convergence time increases when the number of APs increase in the chain.
- Any EWC capable AP which is part of daisy chaining and has been assigned the RAP role, must be in CAPWAP mode (ap-type capwap).

## Speeding up Mesh Network Recovery Through Fast Detection of Uplink Gateway Reachability Failure

In all 802.11ac Wave 2 APs, the speed of mesh network recovery mechanism is increased through fast detection of uplink gateway reachability failure. The uplink gateway reachability of the mesh APs is checked using ICMP ping to the default gateway, either IPv4 or IPv6.

Mesh AP triggers the reachability check in the following two scenarios:

- After a new uplink is selected, until the mesh AP joins the controller

After a new uplink is selected, the mesh AP has a window of 45 seconds to reach gateway (via static IP or DHCP) through the selected uplink. If the mesh AP still fails to reach the gateway after 45 seconds, the current uplink is in blocked list and the uplink selection process is restarted. If the AP joins the controller within this 45-second window, the reachability check is stopped. Subsequently, there is no gateway reachability check during normal operations.

- As soon as the mesh AP times out its connection with the controller

After the mesh AP times out its connection with the controller and the AP fails to reach the gateway in 5 seconds, the current uplink is immediately added to the blocked list and the uplink selection process is restarted.

## Fast Teardown for a Mesh Deployment

In mesh deployments, sometimes a root access point connects to the controller through a nonreliable link such as a wireless microwave link. If a data uplink failure occurs, client loses connectivity to detect the cause of the failure. The feature allows you to detect the root access point uplink failure faster in a mesh deployment and address fast teardown of the mesh network when uplink failure occurs on the root access point.

---

**Note** Fast Teardown for Mesh APs is not supported on Cisco Industrial Wireless (IW) 3702 Access Points.

---

## Configuring MAC Authorization (GUI)

### Procedure

---

- Step 1** Choose **Configuration > Security > AAA > AAA Advanced > Device Authentication**.
- Step 2** Click **Add**.

The **Quick Step: MAC Filtering** window is displayed.

**Step 3**

In the **Quick Step: MAC Filtering** window, complete the following:

- Enter the **MAC Address**. The MAC address can be in either `xx:xx:xx:xx:xx:xx`, `xx-xx-xx-xx-xx-xx`, or `xxxx.xxxx.xxxx` format.
- Choose the **Attribute List Name** from the drop-down list.
- Choose the **WLAN Profile Name** from the drop-down list.
- Click **Apply to Device**.

Both WebUI and CLI support mac user configuration in one of these formats: `xxxxxxxxxxxx`, `xx:xx:xx:xx:xx:xx`, `xx-xx-xx-xx-xx-xx`, or `xxxx.xxxx.xxxx` where AP sends the default mac address without delimiter. If the mac address is configured with delimiter, then AP authorization will fail unless it is configured in the format: `xxxxxxxxxxxx`.

**Step 4**

Choose **Configuration > Security > AAA > AAA Method List > Authorization**.

**Step 5**

Click **Add**.

The **Quick Step: AAA Authorization** window is displayed.

**Step 6**

In the **Quick Step: AAA Authorization** window, complete the following:

- Enter the **Method List Name**.
- Choose the **Type** from the drop-down list.
- Choose the **Group Type** from the drop-down list.
- Check the **Fallback to Local** check box.
- Check the **Authenticated** check box.
- Move the required servers from the **Available Server Groups** to the **Assigned Server Groups**.
- Click **Apply to Device**.

**Step 7**

Choose **Configuration > Wireless > Mesh > Profiles**.

**Step 8**

Click the mesh profile.

The **Edit Mesh Profile** window is displayed.

**Step 9**

Click the **Advanced** tab.

**Step 10**

In the **Security** settings, from the **Method** drop-down list, choose **EAP**.

**Step 11**

Choose the **Authentication Method** from the drop-down list.

**Step 12**

Choose the **Authorization Method** from the drop-down list.

**Step 13**

Click **Update & Apply to Device**.

## Configuring MAC Authorization (CLI)

Follow the procedure given below to add the MAC address of a bridge mode AP to the controller.

### Before you begin

- MAC filtering for bridge mode APs are enabled by default on the controller. Therefore, only the MAC address need to be configured. The MAC address that is to be used is the one that is provided at the back of the corresponding AP.
- MAC authorization is supported internally, as well as using an external AAA server.

**Procedure**

	<b>Command or Action</b>	<b>Purpose</b>
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>username <i>user-name</i></b> <b>Example:</b> Device(config)# username username1	Configures user name authentication for MAC filtering where username is MAC address.
<b>Step 3</b>	<b>aaa authorization credential-download <i>method-name local</i></b> <b>Example:</b> Device(config)# aaa authorization credential-download list1 local	Sets an authorization method list to use local credentials.
<b>Step 4</b>	<b>aaa authorization credential-download <i>method-name radius group server-group-name</i></b> <b>Example:</b> Device(config)# aaa authorization credential-download auth1 radius group radius-server-1	Sets an authorization method list to use a RADIUS server group.
<b>Step 5</b>	<b>wireless profile mesh <i>profile-name</i></b> <b>Example:</b> Device(config)# wireless profile mesh mesh1	Configures a mesh profile and enters mesh profile configuration mode.
<b>Step 6</b>	<b>method authorization <i>method-name</i></b> <b>Example:</b> Device(config-wireless-mesh-profile)# method authorization auth1	Configures the authorization method for mesh AP authorization.

## Configuring MAP Authorization - EAP (GUI)

**Procedure**

- 
- Step 1** Choose **Configuration > Security > AAA > AAA Method List > Device Authentication**.
  - Step 2** Click **Add**.
  - Step 3** Enter **Method List Name**.
  - Step 4** Choose **Type** as dot1x and **Group Type** from the drop-down lists.  
dot1x

- Step 5** Check or uncheck the **Fallback to Local** check box.
- Step 6** Move the required servers from the **Available Server Groups** to the **Assigned Server Groups**.
- Step 7** Click **Apply to Device**.
- Step 8** Choose **Configuration > Wireless > Mesh > Profiles**.
- Step 9** Click the mesh profile. The **Edit Mesh Profile** window is displayed.
- Step 10** Choose the **Advanced** tab.
- Step 11** In the **Security** settings, from the **Method** drop-down list, choose **EAP**.
- Step 12** Choose the options from the **Authentication Method** and **Authorization Method** drop-down lists.
- Step 13** Click **Update & Apply to Device**.

## Configuring MAP Authorization (CLI)

Select and configure authentication method of EAP/PSK for MAP authentication.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>aaa authentication <i>method-name</i> radius group <i>server-group-name</i></b>  <b>Example:</b> Device(config)# aaa authentication dot1x auth1 radius group radius-server-1	For local authentication:  Device(config)# aaa authentication dot1x auth1 local  Sets an authentication method list to use a RADIUS server group. This is required for EAP authentication.
<b>Step 3</b>	<b>wireless profile mesh <i>profile--name</i> local</b>  <b>Example:</b> Device(config)# wireless profile mesh mesh1	Sets an authorization method list to use local credentials.
<b>Step 4</b>	<b>security eap <i>server-group-name</i></b>  <b>Example:</b> Device(config-wireless-mesh-profile)# security eap / psk	Configures the mesh security EAP/PSK for mesh AP.
<b>Step 5</b>	<b>method authentication <i>method-name</i></b>  <b>Example:</b> Device(config-wireless-mesh-profile)# method authentication auth1	Configures the authentication method for mesh AP authentication.

# Configuring PSK Provisioning (CLI)

When PSK provisioning is enabled, the APs join with default PSK initially. After that PSK provisioning key is set, the configured key is pushed to the newly joined AP.

Follow the procedure given below to configure a PSK:

## Before you begin

The provisioned PSK should have been pushed to all the APs that are configured with PSK as mesh security.

- Note**
- PSKs are saved across reboots in the controller as well as on the corresponding mesh AP.
  - A controller can have total of five PSKs and one default PSK.
  - A mesh AP deletes its provisioned PSK only on factory reset.
  - A mesh AP never uses the default PSK after receiving the first provisioned PSK.

## Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wireless mesh security psk provisioning</b>  <b>Example:</b> Device(config)# wireless mesh security psk provisioning	Configures the security method for wireless as PSK.  <b>Note</b> The provisioned PSK is pushed only to those APs that are configured with PSK as the mesh security method.
<b>Step 3</b>	<b>wireless mesh security psk provisioning key index {0   8} pre-shared-key description</b>  <b>Example:</b> Device(config)# wireless mesh security psk provisioning key 1 0 secret secret-key	Configures a new PSK for mesh APs.
<b>Step 4</b>	<b>wireless mesh security psk provisioning default-psk</b>  <b>Example:</b> Device(config)# wireless mesh security psk provisioning default-psk	Enables default PSK-based authentication.
<b>Step 5</b>	<b>wireless mesh security psk provisioning inuse index</b>	Specifies the PSK to be actively used.

	Command or Action	Purpose
	<b>Example:</b> <pre>Device(config)# wireless mesh security psk provisioning inuse 1</pre>	<b>Note</b> You should explicitly set the in-use key index in the global configuration pointing to the PSK index.

## Configuring a Bridge Group Name (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Wireless > Mesh > Profiles**
  - Step 2** Click **Add**.
  - Step 3** In the **Advanced** tab, under the **Bridge Group** settings, enter the **Bridge Group Name**.
  - Step 4** Under the **Bridge Group** settings, check the **Strict Match** check box to enable the feature. When Strict Match BGN is enabled on a MAP, it scans ten times to find a matching BGN parent.
  - Step 5** Click **Apply to Device**.
- 

## Configuring a Bridge Group Name (CLI)

- If a bridge group name (BGN) is configured on a mesh profile, whenever a MAP joins the controller, it pushes the BGN configured on the mesh profile to the AP.
- Whenever a mesh AP moves from AireOS controller to the Cisco Catalyst 9800 Series Wireless Controller, the BGN configured on the mesh profile is pushed to that AP and stored there.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> <pre>Device# configure terminal</pre>	Enters global configuration mode.
<b>Step 2</b>	<b>wireless profile mesh <i>profile-name</i></b>  <b>Example:</b> <pre>Device(config)# wireless profile mesh mesh1</pre>	Configures a mesh profile and enters mesh profile configuration mode.
<b>Step 3</b>	<b>bridge-group name <i>bridge-grp-name</i></b>  <b>Example:</b> <pre>Device(config-wireless-mesh-profile)# bridge-group name bgn1</pre>	Configures a bridge group name.

	Command or Action	Purpose
<b>Step 4</b>	<b>bridge-group strict-match</b> <b>Example:</b> Device(config-wireless-mesh-profile)# bridge-group strict-match	Configures bridge group strict matching.

## Configuring Background Scanning (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Wireless > Mesh > Profiles**
  - Step 2** Choose a profile.
  - Step 3** In **General** tab, check the **Background Scanning** check box.
  - Step 4** Click **Update & Apply to Device**.
- 

## Configuring Background Scanning

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wireless profile mesh <i>profile-name</i></b> <b>Example:</b> Device(config)# wireless profile mesh mesh1	Configures a mesh profile and enters mesh profile configuration mode.
<b>Step 3</b>	<b>background-scanning</b> <b>Example:</b> Device(config-wireless-mesh-profile)# background-scanning	Configures background scanning in mesh deployments.

# Configuring AP Fast Ancestor Find Mode (GUI)

## Procedure

- 
- Step 1** Choose **Configuration > Wireless > Mesh > Profiles**.
  - Step 2** Click **Add**.  
The **Add Mesh Profile** window is displayed.
  - Step 3** In the **Add Mesh Profile** window, click the **General** tab.
  - Step 4** In the **Name** field, enter the mesh profile name.
  - Step 5** In the **Description** field, enter a description for the mesh profile.
  - Step 6** Check the **MAP Fast Ancestor Find** check box to enable a MAP (child) to synchronize with any neighbor MAP (parent) across all channels.
  - Step 7** Click **Apply to Device** to save the configuration.
- 

# Configuring Background Scanning and MAP Fast Ancestor Find Mode (CLI)

## Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wireless profile mesh <i>profile-name</i></b>  <b>Example:</b> Device# wireless profile mesh default-mesh-profile	Configures a mesh profile and enters mesh profile configuration mode.
<b>Step 3</b>	<b>background-scanning</b>  <b>Example:</b> Device(config-wireless-mesh-profile)# background-scanning	Configures background scanning in mesh deployments.  <b>Note</b> In Cisco Catalyst 9124 Series Access Points, a dedicated RF ASIC radio is used for background scanning.
<b>Step 4</b>	<b>map-fast-ancestor-find</b>  <b>Example:</b> Device(config-wireless-mesh-profile)# map-fast-ancestor-find	Configures fast ancestor find mode.

## Configuring Backhaul Client Access (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Wireless > Mesh > Profiles**
  - Step 2** Choose a profile.
  - Step 3** In **General** tab, check the **Backhaul Client Access** check box.
  - Step 4** Click **Update & Apply to Device**.
- 

## Configuring Backhaul Client Access (CLI)

**Note** Backhaul client access is disabled by default. After it is enabled, all the MAPs, except subordinate AP and its child APs in daisy-chained deployment, reboot.

Follow the procedure given below to enable backhaul client access on a mesh profile:

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wireless profile mesh <i>profile-name</i></b>  <b>Example:</b> Device(config)# wireless profile mesh mesh1	Configures a mesh profile and enters mesh profile configuration mode.
<b>Step 3</b>	<b>client-access</b>  <b>Example:</b> Device(config-wireless-mesh-profile)# client-access	Configures backhaul with client access AP.

## Configuring Dot11ax Rates on Mesh Backhaul Per Access Point (GUI)

### Procedure

---

- Step 1** Choose **Configuration > Wireless > Access Points**.  
The **All Access Points** section, which lists all the configured APs in the network, is displayed with their corresponding details.
- Step 2** Click the configured mesh AP.  
The **Edit AP** window is displayed.
- Step 3** Choose the **Mesh** tab.
- Step 4** In the **General** section, under the **Backhaul** section, the default **Backhaul Radio Type**, **Backhaul Slot ID**, and **Rate Types** field details are displayed. Note that the values for **Backhaul Radio Type** and **Backhaul Slot ID** can be changed only for a root AP.
- Step 5** From the **Rate Types** drop-down list, choose the backhaul rate type.  
  
Based on the choice, enter the details for the corresponding fields that are displayed. The backhaul interface varies between auto and 802.11a/b/g/n/ac/ax rates depending upon the AP. Cisco Catalyst 9124AX Outdoor Access Point is the only AP that support 11ax backhaul rates on the mesh backhaul.
- Step 6** In the **Backhaul MCS Index** field, enter the Modulation Coding Scheme (MCS) rate, that can be transmitted between the APs. The valid range is from 0 to 11, on both the bands.
- Step 7** In the **Spatial Stream** field, enter the number of spatial streams that are supported. The maximum number of spatial streams supported on a single radio in a 5-GHz radio band is 8, while 2.4-GHz radio band supports 4 spatial streams.
- Step 8** Click **Update and Apply to Device**.
- 

## Configuring Dot11ax Rates on Mesh Backhaul in Mesh Profile (GUI)

### Procedure

---

- Step 1** Choose **Configuration > Wireless > Mesh > Profiles**.
- Step 2** Click **Add**.  
The **Add Mesh Profile** window is displayed.
- Step 3** In the **Add Mesh Profile** window, click the **General** tab.
- Step 4** In the **Name** field, enter the mesh profile name.
- Step 5** Click the **Advanced** tab.

- Step 6** In the **5 GHz Band Backhaul** section and the **2.4 GHz Band Backhaul** section, choose the **dot11ax** backhaul rate type from **Rate Types** the drop-down list.
- Note** Cisco Catalyst 9124AXI/D Series outdoor Access Point is the only AP to support 11ax backhaul rates on the mesh backhaul.
- Step 7** In the **Dot11ax MCS index** field, specify the MCS rate at which data can be transmitted between the APs. The value range is between 0 to 11, on both the radio bands.
- Step 8** In the **Spatial Stream** field, enter a value. The maximum number of spatial streams supported on a single radio in a 5-GHz radio band is 8, while 2.4- GHz radio band supports 4 spatial streams.
- Step 9** Click **Update and Apply to Device**.

## Configuring Wireless Backhaul Data Rate (CLI)

Backhaul is used to create a wireless connection between APs. A backhaul interface can be 802.11bg/a/n/ac depending on the AP. The rate selection provides for effective use of the available RF spectrum. Data rates can also affect the RF coverage and network performance. Lower data rates, for example, 6 Mbps, can extend farther from the AP than can have higher data rates, for example, 1300 Mbps. As a result, the data rate affects cell coverage, and consequently, the number of APs required.

**Note** You can configure backhaul data rate, preferably, through the mesh profile. In certain cases, where a specific data rate is needed, use the command to configure the data rate per AP.

Follow the procedure given below to configure wireless backhaul data rate in privileged EXEC mode or in mesh profile configuration mode.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b>  <b>Example:</b> Device> enable	Enters privileged EXEC mode.
<b>Step 2</b>	<b>ap name</b> <i>ap-name</i> <b>mesh backhaul rate</b> { <b>auto</b>   <b>dot11abg</b>   <b>dot11ac</b>   <b>dot11n</b> }  <b>Example:</b> Device# #ap name ap1 mesh backhaul rate auto	Configures backhaul transmission rate.
<b>Step 3</b>	<b>wireless profile mesh</b> <i>profile-name</i>  <b>Example:</b> Device(config)# wireless profile mesh mesh1	Configures a mesh profile and enters mesh profile configuration mode.

	Command or Action	Purpose
<b>Step 4</b>	<b>backhaul rate dot11 {24ghz   5ghz}dot11n RATE_6M</b>  <b>Example:</b> Device(config-wireless-mesh-profile)# backhaul rate dot11 5ghz dot11n mcs 31	Configures backhaul transmission rate.  <b>Note</b> Note that the rate configured on the AP (step 2) should match with the rate configured on the mesh profile (step4).

## Configuring Data Rate Per AP (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b>  <b>Example:</b> Device> enable	Enters privileged EXEC mode.
<b>Step 2</b>	<b>ap name <i>ap-name</i> mesh backhaul rate dot11ax mcs &lt;0-11&gt; ss &lt;1-8&gt;</b>  <b>Example:</b> Device# ap name ap1 mesh backhaul rate dot11ax 5 ss 4	Configures mesh backhaul 11ax rates for 2.4-GHz and 5-GHz bands.

## Configuring Data Rate Using Mesh Profile (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wireless profile mesh <i>profile-name</i></b>  <b>Example:</b> Device(config)# wireless profile mesh mesh1	Configures a mesh profile and enters mesh profile configuration mode.
<b>Step 3</b>	<b>backhaul rate dot11 {24ghz   5ghz}dot11ax mcs &lt;0-11&gt; spatial-stream &lt;1-8&gt;</b>  <b>Example:</b> Device(config-wireless-mesh-profile)# backhaul rate dot11 5ghz dot11ax mcs 5 spatial-stream 6	Configures backhaul transmission rate for 2.4-GHz band and 5-GHz band. The 802.11ax spatial stream value for 2.4-GHz band is from 1 to 4, and the spatial stream value for the 5-GHz band is from 1 to 8.

	Command or Action	Purpose
	Device(config-wireless-mesh-profile)# backhaul rate dot11 24ghz dot11ax mcs 5 spatial-stream 4	

## Configuring Mesh Backhaul (CLI)

This section describes how to configure mesh backhaul at 2.4 GHz.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>ap name</b> <i>ap_name</i> <b>mesh backhaul radio dot11 24ghz</b>  <b>Example:</b> Device # ap name test-ap mesh backhaul radio dot11 24ghz	Changes the mesh backhaul to 2.4 GHz.

## Configuring Dynamic Frequency Selection (CLI)

DFS specifies the types of radar waveforms that should be detected along with certain timers for an unlicensed operation in the DFS channel.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wireless profile mesh</b> <i>profile-name</i>  <b>Example:</b> Device(config)# wireless profile mesh mesh1	Configures a mesh profile and enters mesh profile configuration mode.
<b>Step 3</b>	<b>full-sector-dfs</b>  <b>Example:</b>	Enables DFS.

	Command or Action	Purpose
	Device(config-wireless-mesh-profile)# full-sector-dfs	<b>Note</b> DFS functionality allows a MAP that detects a radar signal to transmit that up to the RAP, which then acts as if it has experienced radar and moves the sector. This process is called the coordinated channel change. The coordinated channel change is always enabled for Cisco Wave 2 and the later versions. The coordinated channel change can be disabled only for Cisco Wave 1 APs.

## Configuring the Intrusion Detection System (CLI)

When enabled, the intrusion detection system generates reports for all the traffic on the client access. However, this is not applicable for the backhaul traffic.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wireless profile mesh <i>profile-name</i></b>  <b>Example:</b> Device(config)# wireless profile mesh mesh1	Configures a mesh profile and enters mesh profile configuration mode.
<b>Step 3</b>	<b>ids</b>  <b>Example:</b> Device(config-wireless-mesh-profile)# ids	Configures intrusion detection system reporting for mesh APs.

## Configuring Ethernet Bridging (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Wireless > Mesh > Profiles**
  - Step 2** Click **Add**.
  - Step 3** In **General** tab, enter the **Name** of the mesh profile.

- Step 4** In the **Advanced** tab, check the **VLAN Transparent** check box to enable VLAN transparency.
- Step 5** In **Advanced** tab, check the **Ethernet Bridging** check box.
- Step 6** Click **Apply to Device**.
- 

## Configuring Ethernet Bridging (CLI)

The Ethernet port on the MAPs are disabled by default. It can be enabled only by configuring Ethernet bridging on the Root AP and the other respective MAPs.

Ethernet bridging can be enabled for the following scenarios:

- To use the mesh nodes as bridges.
- To connect Ethernet devices, such as a video camera, on a MAP using the MAP's Ethernet port.

### Before you begin

- Ensure that you configure the following commands under the mesh profile configuration for Ethernet bridging to be enabled:
  - **ethernet-bridging**: Enables the Ethernet Bridging feature on an AP.
  - **no ethernet-vlan-transparent**: Makes the wireless mesh bridge VLAN aware. Allows VLAN filtering with the following AP command: **[no] mesh ethernet {0 | 1 | 2 | 3} mode trunk vlan allowed**.

---

**Note** If you wish to have all the VLANs bridged (where bridge acts like a piece of wire), then you must enable VLAN transparency, which allows all VLANs to pass. If you choose to use VLAN transparent mode, it is best to filter the VLANs on the wired side of the network to avoid unnecessary traffic from flooding the network.

---

- The switch port to which the Root AP is connected should be configured as the trunk port for Ethernet bridging to work.
- For Bridge mode APs, use the **ap name name-of-rap mesh vlan-trunking native vlan-id** command to configure a trunk VLAN on the corresponding RAP. The Ethernet Bridging feature will not be enabled on the AP without configuring this command.
- For FlexConnect+Bridge APs, configure the native VLAN ID under the corresponding flex profile.

**Note** To ensure that the MAPs apply the Ethernet VLAN configuration on the controller, configure the native VLAN on the RAP by running the following command:

```
Device# ap name ap-name no mesh vlan-trunking
Device# ap name ap-name mesh vlan-trunking native 247
```

Alternatively, you can configure native VLAN on the RAP and then the MAP in the following order:

```
Device# ap name ap-name no mesh vlan-trunking
Device# ap name ap-name mesh vlan-trunking native vlan_id
Device# ap name ap-name mesh ethernet 1 mode trunk vlan native native
Device# ap name ap-name mesh ethernet 0 mode trunk vlan allowed allowed
```

To verify the status of RAP and MAP, run the following command:

```
Device# show mesh forwarding all
```

**Procedure**

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b>  <b>Example:</b> Device# enable	Enables privileged EXEC mode.  Enter your password, if prompted.
<b>Step 2</b>	<b>ap name <i>ap-name</i> mesh ethernet {0   1   2   3} mode access <i>vlan-id</i></b>  <b>Example:</b> Device# ap name ap1 mesh ethernet 1 mode access 21	Configures the Ethernet port of the AP and sets the mode as trunk.
<b>Step 3</b>	<b>ap name <i>ap-name</i> mesh ethernet {0   1   2   3} mode trunk vlan <i>vlan-id</i></b>  <b>Example:</b> Device# ap name ap1 mesh ethernet 1 mode trunk vlan native 21	Sets the native VLAN for the trunk port.
<b>Step 4</b>	<b>ap name <i>ap-name</i> mesh ethernet {0   1   2   3} mode trunk vlan allowed <i>vlan-id</i></b>  <b>Example:</b> Device# ap name ap1 mesh ethernet 1 mode trunk vlan allowed 21	Configures the allowed VLANs for the trunk port.  Permits VLAN filtering on an ethernet port of any Mesh or Root Access Point. Active only when VLAN transparency is disabled in the mesh profile.

# Configuring Multicast Modes over Mesh

- If multicast packets are received at a MAP over Ethernet, they are sent to the RAP. However, they are not sent to other MAPs. MAP-to-MAP packets are filtered out of the multicast.

- If multicast packets are received at a RAP over Ethernet, they are sent to all the MAPs and their respective Ethernet networks.
- The *in-out* mode is the default mode. When this *in-out* mode is in operation, it is important to properly partition your network to ensure that a multicast sent by one RAP is not received by another RAP on the same Ethernet segment, and then sent back into the network.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wireless profile mesh <i>profile-name</i></b> <b>Example:</b> Device(config)# wireless profile mesh mesh1	Configures a mesh profile and enters mesh profile configuration mode.
<b>Step 3</b>	<b>multicast {in-only   in-out   regular}</b> <b>Example:</b> Device(config-wireless-mesh-profile)# multicast regular	Configures mesh multicast mode.

## Configuring RRM on Mesh Backhaul (CLI)

The RRM measurement in the mesh AP backhaul is enabled based on the following conditions:

- Mesh AP has the Root AP role.
- Root AP has joined using an Ethernet link.
- Root AP is not serving any child AP.

Follow the procedure given below to enable RRM in the mesh backhaul:

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wireless mesh backhaul rrm</b> <b>Example:</b> Device(config)# wireless mesh backhaul rrm	Configures RRM on the mesh backhaul.

# Configuring RRM Channel Assignment for Root Access Points Globally

## Before you begin

Ensure that you have configured RRM for mesh backhaul before RRM DCA is triggered.

## Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>wireless mesh backhaul rrm</b> <b>Example:</b> Device(config)# <code>wireless mesh backhaul rrm</code>	Configures RRM for mesh backhaul.
<b>Step 3</b>	(Optional) <b>wireless mesh backhaul rrm auto-dca</b> <b>Example:</b> Device(config)# <code>wireless mesh backhaul rrm auto-dca</code>	Configures auto DCA for RF Application Specific Integrated Circuit (ASIC) integrated RAPs.

To configure the initial channel assignment of the RAP in privileged EXEC mode through RRM, and to initiate channel selection for each bridge group, complete the following steps.

## Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Device# <code>enable</code>	Enters privileged EXEC mode.
<b>Step 2</b>	<b>ap dot11 {24ghz   5ghz   6ghz} rrm channel-update mesh</b> <b>Example:</b> Device# <code>ap dot11 5ghz rrm channel-update mesh</code>	Initiates update of the 802.11, 802.11a, or 802.11b channel selection for every mesh Cisco AP.

	Command or Action	Purpose
<b>Step 3</b>	<b>ap dot11 {24ghz   5ghz   6ghz} rrm channel-update mesh bridge-group <i>bridge-group-name</i></b>  <b>Example:</b> Device# <b>ap dot11 5ghz rrm channel-update mesh bridge-group <i>cisco-bridge-group</i></b>	Initiates update of the 802.11, 802.11a, or 802.11b channel selection for mesh AP in the bridge group.

## Configuring RRM Channel Assignment for an Access Point

To trigger RRM DCA for an AP, complete the following procedure:

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b>  <b>Example:</b> Device# <b>enable</b>	Enters privileged EXEC mode.
<b>Step 2</b>	<b>ap name <i>Cisco-ap-name</i> dot11 {24ghz   5ghz   6ghz} rrm channel update mesh</b>  <b>Example:</b> Device# <b>ap name <i>Cisco-ap-name</i> dot11 5ghz rrm channel update mesh</b>	Triggers RRM DCA for the specific AP.

## Selecting a Preferred Parent (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Wireless > Access Points**.
  - Step 2** Click the Access Point.
  - Step 3** In the **Mesh** tab, enter the **Preferred Parent MAC**.
  - Step 4** Click **Update & Apply to Device**.
- 

## Selecting a Preferred Parent (CLI)

Follow the procedure given below to configure a preferred parent for a MAP.

Using this mechanism, you can override the AWPP-defined parent selection mechanism and force a mesh AP to go to a preferred parent.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Device> enable	Enters privileged EXEC mode.
<b>Step 2</b>	<b>ap name <i>ap-name</i> mesh parent preferred <i>mac-address</i></b> <b>Example:</b> Device# ap name ap1 mesh parent preferred 00:0d:ed:dd:25:8F	Configures mesh parameters for the AP and sets the mesh-preferred parent MAC address.  <b>Note</b> Ensure that you use the radio MAC address of the preferred parent.  For Cisco Wave 1 APs, when you configure a preferred parent, ensure that you specify the MAC address of the actual mesh neighbor for the desired parent. This MAC address is the base radio MAC address that has the letter "f" as the final character. For example, if the base radio MAC address is 00:24:13:0f:92:00, then you must specify 00:24:13:0f:92:0f as the preferred parent.  <pre>Device# ap name ap1 mesh parent preferred 00:24:13:0f:92:0f</pre> For Cisco Wave 2 APs, when you configure a preferred parent, the MAC address is the base radio MAC address that has "0x11" added to the last two characters. For example, if the base radio MAC address is 00:24:13:0f:92:00, then you must specify 00:24:13:0f:92:11 as the preferred parent.  <pre>Device# ap name ap1 mesh parent preferred 00:24:13:0f:92:11</pre>

## Changing the Role of an AP (GUI)

### Procedure

**Step 1** Choose **Configuration > Wireless > Access Points**.

- Step 2** Click the **Access Point**.
- Step 3** In the **Mesh** tab, choose **Root** or **Mesh** from the **Role** drop-down list.
- Step 4** Click **Update & Apply to Device**.

After the role change is triggered, the AP reboots.

## Changing the Role of an AP (CLI)

Follow the procedure to change the AP from MAP to RAP or vice-versa.

By default, APs join the controller in a mesh AP role.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Device> enable	Enters privileged EXEC mode.
<b>Step 2</b>	<b>ap name <i>ap-name</i> role {mesh-ap   root-ap}</b> <b>Example:</b> Device# #ap name ap1 root-ap	Changes the role for the Cisco bridge mode APs. After the role change is triggered, the AP reboots.

## Configuring the Mesh Leaf Node (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Device> enable	Enters privileged EXEC mode.
<b>Step 2</b>	<b>ap name <i>ap-name</i> mesh block-child</b> <b>Example:</b> Device# #ap name ap1 mesh block-child	Sets the AP to work only as a leaf node. This AP cannot be selected by other MAPs as a parent MAP. <b>Note</b> Use the <b>no</b> form of this command to change it to a regular AP.

## Configuring the Mesh Leaf Node (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Wireless > Access Points**.
  - Step 2** Click the Access Point.
  - Step 3** In the **Mesh** tab, check the **Block Child** check box.
  - Step 4** Click **Update & Apply to Device**.
- 

## Configuring Subset Channel Synchronization

All the channels used by all the RAPs in a controller are sent to all the MAPs for future seek and convergence. The controller keeps a list of the subset channels for each Bridge Group Name (BGN). The list of subset channels are also shared across all the controllers in a mobility group.

Subset channel list is list of channels where RAP of particular BGN are operating. This list is communicated to all the MAPs within and across the controllers. The idea of subset channel list is for faster convergence of the Mesh APs. Convergence method can be selected in mesh profile. If the convergence method is not standard then subset channel list is pushed to MAPs.

Follow the procedure given below to configure subset channel synchronization for mobility group.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wireless mesh subset-channel-sync mac</b>  <b>Example:</b> Device(config)# wireless mesh subset-channel-sync	Configures subset channel synchronization for a mobility group.

## Provisioning LSC for Bridge-Mode and Mesh APs (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Wireless > Access Points > LSC Provision**.

- Step 2** In the **Add APs to LSC Provision List** settings, click the **Select File** option to upload a CSV file that contains AP details.
- Step 3** Click **Upload File**.
- Step 4** You can also use the **AP MAC Address** field to search for APs using the MAC address and add them. The APs added to the provision list are displayed in the **APs in Provision List** list.
- Step 5** Click **Apply**.
- Step 6** Choose **Configuration > Wireless > Mesh > Profiles**
- Step 7** Click **Add**.
- Step 8** In the **General** tab, enter the **Name** of the mesh profile and check the **LSC** check box.
- Step 9** In the **Advanced** tab, under the **Security** settings, choose the authorization method from the **Authorization Method** drop-down list.
- Step 10** Click **Apply to Device**.

## Provisioning LSC for Bridge-Mode and Mesh APs

- Configuring Locally Significant Certificate (LSC) will not remove pre-existing certificates from an AP.
- An AP can have both LSC and Message Integrity Check (MIC) certificates. However, when an AP is provisioned with LSC, the MIC certificate is not used on boot-up. A change from LSC to MIC requires the AP to reboot.

Follow the procedure given below to configure LSC for bridge-mode and mesh APs:

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>ap lsc-provision</b> <b>Example:</b> Device(config)# ap lsc-provision	Configures LSC provisioning on an AP. <b>Note</b> This step is applicable only for mesh APs.
<b>Step 3</b>	<b>ap lsc-provision provision-list</b> <b>Example:</b> Device(config)# ap lsc-provision provision-list	(Optional) Configures LSC provision for all the APs in the provision list.
<b>Step 4</b>	<b>aaa authentication dot1x auth-list radius group radius-server-grp</b> <b>Example:</b> Device(config)# aaa authentication dot1x list1 radius group sgl	Configures named authorization list for downloading EAP credential from radius group server.

	Command or Action	Purpose
<b>Step 5</b>	<b>wireless profile mesh</b> <i>profile-name</i> <b>Example:</b> Device(config)# wireless profile mesh mesh1	Configures a mesh profile and enters mesh profile configuration mode.
<b>Step 6</b>	<b>lsc-only-auth</b> <b>Example:</b> Device(config-wireless-mesh-profile)# lsc-only-auth	Configures mesh security to LSC-only MAP authentication.  After this command is run, all the mesh APs reboot.
<b>Step 7</b>	<b>method authorization</b> <i>local</i> <b>Example:</b> Device(config-wireless-mesh-profile)# method authorization list1	Configures an authorization method for mesh AP authorization.

## Specifying the Backhaul Slot for the Root AP (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Wireless > Mesh > Profiles**
  - Step 2** Click **Add**.
  - Step 3** In **General** tab, enter the **Name** of the mesh profile.
  - Step 4** In **Advanced** tab, choose the rate types from the **Rate Types** drop-down list for **5 GHz Band Backhaul** and **2.4 GHz Band Backhaul**.
  - Step 5** Click **Apply to Device**.
- 

## Specifying the Backhaul Slot for the Root AP (CLI)

Follow the procedure given below to set the mesh backhaul rate.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Device> enable	Enters privileged EXEC mode.
<b>Step 2</b>	<b>ap name</b> <i>rap-name</i> <b>mesh backhaul radio</b> <b>dot11</b> {24ghz   5ghz} [slot <i>slot-id</i> ]	Sets the mesh backhaul radio slot.

	Command or Action	Purpose
	<b>Example:</b> Device# ap name rap1 mesh backhaul radio dot11 24ghz slot 2	

## Using a Link Test on Mesh Backhaul (GUI)

### Procedure

- Step 1** Choose **Monitoring > Wireless > AP Statistics > General**.
- Step 2** Click the Access Point.
- Step 3** Choose **Mesh > Neighbor > Linktest**.
- Step 4** Choose the desired values from the **Date Rates**, **Packets to be sent (per second)**, **Packet Size (bytes)** and **Test Duration (seconds)** drop-down lists..
- Step 5** Click **Start**.

## Using a Link Test on Mesh Backhaul

Follow the procedure given below to trigger linktest between neighbor mesh APs.

**Note** Use the **test mesh linktest mac-address neighbor-ap-mac rate data-rate fps frames-per-second frame-size frame-size** command to perform link test from an AP.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b>  <b>Example:</b> Device> enable	Enters privileged EXEC mode.
<b>Step 2</b>	<b>ap name ap-name mesh linktest dest-ap-mac data-rate packet-per-sec packet-size test-duration</b>  <b>Example:</b> Device# #ap name ap1 mesh linktest F866.F267.7DFB 24 234 1200 200	Sets link test parameters.

## Configuring Battery State for Mesh AP (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Wireless > Mesh > Profiles**
  - Step 2** Choose a profile.
  - Step 3** In **General** tab, check the **Battery State for an AP** check box.
  - Step 4** Click **Update & Apply to Device**.
- 

## Configuring Battery State for Mesh AP

Some Cisco outdoor APs come with the option of battery backup. There is also a POE-out port that can power a video surveillance camera. The integrated battery can be used for temporary backup power during external power interruptions.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wireless profile mesh <i>profile-name</i></b>  <b>Example:</b> Device(config)# wireless profile mesh mesh1	Configures a mesh profile and enters mesh profile configuration mode.
<b>Step 3</b>	<b>battery-state</b>  <b>Example:</b> Device(config-wireless-mesh-profile)# battery-state	Configures the battery state for an AP.

## Configuring Mesh Convergence (CLI)

This section provides information about how to configure mesh convergence.

## Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wireless profile mesh <i>profile-name</i></b> <b>Example:</b> Device(config)# wireless profile mesh mesh1	Creates a mesh profile.
<b>Step 3</b>	<b>convergence {fast   noise-tolerant-fast   standard   very-fast}</b> <b>Example:</b> Device(config-wireless-mesh-profile)# convergence fast	Configures mesh convergence method in a mesh profile.

## Configuring DHCP Server on Root Access Point (RAP)

## Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>ap profile <i>ap-profile-name</i></b> <b>Example:</b> Device(config)# ap profile ap-profile-name	Configures an AP Profile.
<b>Step 3</b>	<b>dhcp-server</b> <b>Example:</b> Device(config-ap-profile)# dhcp-server	Configures DHCP server on the root access point.
<b>Step 4</b>	<b>end</b> <b>Example:</b> Device(config-ap-profile)# end	Saves the configuration and exits configuration mode and returns to privileged EXEC mode.

# Configuring Mesh Ethernet Daisy Chaining (CLI)

The following section provides information about how to configure the Mesh Ethernet Daisy Chaining feature on a mesh AP.

## Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>ap profile default-ap-profile</b>  <b>Example:</b> Device(config)# ap profile default-ap-profile	Specifies an AP profile.
<b>Step 3</b>	<b>ssid broadcast persistent</b>  <b>Example:</b> Device(config-ap-profile)# ssid broadcast persistent	Configures persistent SSID broadcast and ensures strict wired uplink. RAP will not switch to wireless backhaul when you configure this command.

# Enabling Mesh Ethernet Daisy Chaining

The following section provides information about how to enable the Mesh Ethernet Daisy Chaining feature on a Cisco IW 3702 AP.

## Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode
<b>Step 2</b>	<b>wireless profile mesh default-mesh-profile</b>  <b>Example:</b> Device(config)# wireless profile mesh default-mesh-profile	Creates a mesh profile.
<b>Step 3</b>	<b>ethernet-bridging</b>  <b>Example:</b> Device(config)# ethernet-bridging	Connects remote wired networks to each other.

	Command or Action	Purpose
<b>Step 4</b>	<b>no ethernet-vlan-transparent</b> <b>Example:</b> Device(config)# no ethernet-vlan-transparent	Disables VLAN transparency to ensure that the bridge is VLAN aware.

## Configuring Mesh CAC (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wireless mesh cac</b> <b>Example:</b> Device(config)# wireless mesh cac	Enables mesh CAC mode.

## Configuring ATF on Mesh (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Wireless > Airtime Fairness > Global Config**
  - Step 2** For **5 GHz Band** and **2.4 GHz Band**, enable the **Status** and the **Bridge Client Access** toggle button.
  - Step 3** To choose the **Mode**, click the **Monitor** or **Enforced** radio button.
  - Step 4** Enable or disable the **Optimization** toggle button.
  - Step 5** Enter the **Airtime Allocation**.
  - Step 6** Click **Apply to Device**.
-

## Configuring ATF on Mesh

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>ap dot11 {24ghz   5ghz} rf-profile rf-profile</b>  <b>Example:</b> Device(config)# ap dot11 24ghz rf-profile rfprof24_1	Configures an RF profile and enters RF profile configuration mode.
<b>Step 3</b>	<b>airtime-fairness bridge-client-access airtime-allocation allocation-weight-percentage</b>  <b>Example:</b> Device(config-rf-profile)# airtime-fairness bridge-client-access airtime-allocation 10	Configures airtime allocation weight percentage on mesh APs.

## Create an ATF Policy for a MAP

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wireless profile policy profile-policy</b>  <b>Example:</b> Device(config)# wireless profile policy rr-xyz-policy-1	Configures WLAN policy profile and enters wireless policy configuration mode.
<b>Step 3</b>	<b>dot11 24ghz airtime-fairness atf-policy</b>  <b>Example:</b> Device(config-wireless-policy)# dot11 24ghz airtime-fairness atf-policy	Enables ATF in the existing RF profile.

## Creating an ATF Policy (GUI)

### Procedure

---

- Step 1** Choose **Configuration > Air Time Fairness > Profiles**.
- Step 2** On the **Profiles** window, click **Add**.
- Step 3** In the **Add ATF Policy** window, specify a name, ID, and weight for the ATF policy.
- Note** Weighted ratio is used instead of percentages so that the total can exceed 100. The minimum weight that you can set is 5.
- Step 4** Use the slider to enable or disable the Client Sharing feature.
- Step 5** Click **Save & Apply to Device** to save your ATF configuration.
- Step 6** (Optional) To delete a policy, check the check box next to the appropriate policy and click **Delete**.
- Step 7** (Optional) To edit an existing ATF policy, select the check box next to the policy you want to edit.
- In the **Edit ATF Policy** window that is displayed, you can modify the weight and client sharing details for the policy.
- 

## Adding an ATF to a Policy Profile (GUI)

### Procedure

---

- Step 1** Choose **Configuration > Tags & Profiles > Policy**.
- Step 2** Click the name of the corresponding policy profile.
- Step 3** Click the **Advanced** tab.
- Step 4** In the **Air Time Fairness Policies** section, choose the appropriate status for the following: 2.4-GHz Policy and 5-GHz Policy.
- Step 5** Click **Update & Apply to Device**.
- 

## Enabling ATF Mode in an RF Profile (GUI)

### Procedure

---

- Step 1** Choose **Configuration > Tags & Profiles > RF**.
- Step 2** Click the name of the corresponding RF profile.

- Step 3** In the **RF Profile** window, click the **Advanced** tab.
- Step 4** In the **ATF Configuration** section, choose the appropriate status for the following:
- **Status**—If you choose **Enabled** as the status, select the **Mode** as either **Monitor** or **Enforced**. Also, you can enable or disable optimization for this mode.
  - **Bridge Client Access**
  - **Airtime Allocation**—Enter the allocation value. You can set the value only after you enable the **Bridge Client Access**.
- Step 5** Click **Update & Apply to Device**.

## Enabling Wireless Mesh Profile

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wireless profile mesh <i>profile-name</i></b>  <b>Example:</b> Device(config)# wireless profile mesh mesh1	Configures a mesh profile and enters mesh profile configuration mode.
<b>Step 3</b>	<b>fast-teardown</b>  <b>Example:</b> Device(config-wireless-profile-mesh)# fast-teardown	Enables the fast teardown of mesh network and configures the feature's parameter.

## Enabling Serial Backhaul in Radio Profile (GUI)

### Procedure

- Step 1** Choose **Configuration > Tags & Profiles > RF/Radio > Radio**.
- Step 2** Click **Add** to add a radio profile. The **Add Radio Profile** page is displayed.
- Step 3** In the **Add Radio Profile** page, enter the name and description.
- Step 4** In the **Mesh Backhaul** field, choose the **Enabled** radio button to enable the feature.
- Step 5** In the **Mesh Designated Downlink** field, choose the **Enabled** radio button to enable the feature.

**Note** Mesh Designated Downlink is supported only on slot number 2 of Mesh APs. You need to be careful while associating radio profiles to the RF tag slots.

**Step 6** Click **Apply to Device**.

## Enabling Mesh Configurations in Radio Profile (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wireless profile radio <i>radio-profile-name</i></b> <b>Example:</b> Device(config)# wireless profile radio <i>radio-profile-name</i>	Configures wireless radio profile and goes into radio profile configuration mode.
<b>Step 3</b>	<b>mesh backhaul</b> <b>Example:</b> Device(config-wireless-radio-profile)# mesh backhaul	Enables mesh backhaul. By default, this command is enabled. Mesh backhaul can be disabled on a specific slot, to stop the specific slot from being the backhaul candidate.
<b>Step 4</b>	<b>mesh designated downlink</b> <b>Example:</b> Device(config-wireless-radio-profile)# mesh designated downlink	Enables the radio slot as a designated downlink. By default, this command is disabled. This command is enabled only for slot 2 of the mesh APs. If a slot other than slot 2 is configured as the designated downlink, the following warning message is displayed: Designated downlink is supported only on slot 2 of mesh APs. Associate in the RF tag accordingly.  By default, all the radio slots are mesh-enabled and not designated as downlink.

# Enabling Serial Backhaul (CLI)

## Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wireless profile radio</b> <i>radio-profile-name</i>  <b>Example:</b> Device(config)# wireless profile radio <i>radio-mesh-downlink</i>	Configures wireless radio profile and goes into radio profile configuration mode.
<b>Step 3</b>	<b>mesh designated downlink</b>  <b>Example:</b> Device(config-wireless-radio-profile)# mesh designated downlink	Enables the specified radio as a designated mesh downlink backhaul. Uplink radio will not be used as downlink in the presence of designated downlinks.
<b>Step 4</b>	<b>exit</b>  <b>Example:</b> Device(config-wireless-radio-profile)# exit	Exits the submode and returns to global configuration mode.
<b>Step 5</b>	<b>wireless tag rf</b> <i>rf-profile-name</i>  <b>Example:</b> Device(config)# wireless tag rf <i>rf-map-tag</i>	Configures wireless RF tag and goes into wireless RF tag profile configuration mode. The associate designated downlink is enabled in the radio profile only for slot 2.
<b>Step 6</b>	<b>dot11 5ghz {slot1   slot2} radio-profile</b> <i>radio-profile-name</i>  <b>Example:</b> Device(config-wireless-rf-tag)# dot11 5ghz slot2 radio-profile <i>radio-mesh-downlink</i>	Configures serial backhaul with the designated downlink radio.  <b>Note</b> In mesh APs, the uplink and downlink are in the same slot by default. When you configure a designated downlink, the mesh AP is forced to use a specific radio as downlink.

## Fallback Mode

**Note** If at least one radio is configured to be a designated downlink, it means that it will not be used as a potential uplink. To prevent any configuration mistake, for example, configuring uplink radio as the designated downlink, a fallback timer is used in a mesh AP. If the mesh AP is not able to join the controller after the allocated 10 minutes, the designated configurations are cleared and all the radios become uplink-capable.

## Configuration Example for Mesh Serial Backhaul

The following example shows how to configure mesh APs with only slot 0 and slot 1 allowed for the mesh AP:

```
Device# configure terminal
Device(config)# wireless profile radio radio-mesh-downlink
Device(config-wireless-radio-profile)# no mesh backhaul
Device(config-wireless-radio-profile)# exit

Device(config)# wireless tag rf rf-map-tag
Device(config-wireless-rf-tag)# dot11 5ghz slot2 radio-profile mesh-disabled
```

## Associating Wireless Mesh to an AP Profile (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>ap profile <i>ap-profile-name</i></b>  <b>Example:</b> Device(config)# ap profile default-ap-profile	Configures the AP profile and enters AP profile configuration mode.
<b>Step 3</b>	<b>mesh-profile <i>mesh-profile-name</i></b>  <b>Example:</b> Device(config-ap-profile)# mesh-profile test1	Configures the mesh profile in AP profile configuration mode.

## Configuring Fast Teardown for a Mesh AP Profile (GUI)

### Procedure

- Step 1** Choose **Configuration > Wireless > Mesh > Profiles**.
- Step 2** Click **Add**.
- Step 3** In the **Add Mesh Profile** window, click **Advanced**.
- Step 4** Select a security mode, authentication method, and authorization method.
- Step 5** Enable **Ethernet bridging**, if required.
- Step 6** Enter the bridge group name and enable Strict Match BGN.
- Step 7** Select a band backhaul transmission rate for your radio.
- Step 8** Perform the following action in the **Fast Roaming** section:

- Check the **Fast Teardown** check box to detect the root access point uplink failure faster in a mesh deployment and to address fast teardown of the mesh network when an uplink failure occurs.
- In the **Number of Retries** field, enter the number of retries allowed until gateway is considered unreachable. The valid range is between 1 to 10.
- In the **Interval value** field, enter the retry value. The valid range is between 1 to 10 seconds.
- In the **Latency Threshold** field, enter the threshold for a round-trip latency between the AP and the controller. The valid range is between 1 and 500 milliseconds.
- In the **Latency Exceeded Threshold** field, enter the latency interval in which at least one ping must succeed in less than the specified time. The valid range is between 1 to 30 seconds.
- In the **Uplink Recovery Interval** field, enter the time during which root access point uplink must be stable in order to accept the child connections. The valid range is between 1 and 3600 seconds.

**Step 9** Click **Apply to Device**.

## Configuring Fast Teardown for a Mesh AP Profile (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wireless profile mesh <i>profile-name</i></b> <b>Example:</b> Device(config)# wireless profile mesh mesh1	Configures a mesh profile and enters the mesh profile configuration mode.
<b>Step 3</b>	<b>fast-teardown</b> <b>Example:</b> Device(config-wireless-mesh-profile)# fast-teardown	Enables the fast teardown of mesh network and configures the feature's parameter.
<b>Step 4</b>	<b>enabled</b> <b>Example:</b> Device(config-wireless-mesh-profile-fast-teardown)# enabled	Enables the fast teardown feature.
<b>Step 5</b>	<b>interval <i>duration</i></b> <b>Example:</b> Device(config-wireless-mesh-profile-fast-teardown)# interval 5	(Optional) Configures the retry interval. The valid values range between 1 and 10 seconds.

	Command or Action	Purpose
<b>Step 6</b>	<b>latency-exceeded-threshold</b> <i>duration</i> <b>Example:</b> Device (config-wireless-mesh-profile-fast-teardown)# latency-exceeded-threshold 20	(Optional) Specifies the latency interval at which at least one ping must succeed in less than threshold time. The valid values range between 1 and 30 seconds.
<b>Step 7</b>	<b>latency-threshold</b> <i>threshold range</i> <b>Example:</b> Device (config-wireless-mesh-profile-fast-teardown)# latency-threshold 20	(Optional) Specifies the latency threshold. The valid values range between 1 and 500 milliseconds.
<b>Step 8</b>	<b>retries</b> <i>retry limit</i> <b>Example:</b> Device (config-wireless-mesh-profile-fast-teardown)# retries 1	(Optional) Specifies the number of retries until the gateway is considered unreachable. The valid values range between 1 and 10.
<b>Step 9</b>	<b>uplink-recovery-intervals</b> <i>recovery interval</i> <b>Example:</b> Device (config-wireless-mesh-profile-fast-teardown)# uplink-recovery-intervals 1	(Optional) Specifies the time during which root access point uplink has to be stable to accept child connections. The valid values range between 1 and 3600 seconds.

## Flex Resilient with Flex and Bridge Mode Access Points

### Information About Flex Resilient with Flex and Bridge Mode Access Points

The Flex Resilient with Flex and Bridge Mode Access Points describe how to set up a controller with Flex+Bridge mode Access Points (APs) and Flex Resilient feature. The Flex Resilient feature works only in Flex+Bridge mode APs. The feature resides in Mesh link formed between RAP - MAP, once the link is UP and RAP loses connection to the CAPWAP controller, both RAP and MAP continue to bridge the traffic. A child Mesh AP (MAP) maintains its link to a parent AP and continues to bridge till the parent link is lost. A child MAP cannot establish a new parent or child link till it reconnects to the CAPWAP controller.

**Note** Existing wireless clients in locally switching WLAN can stay connected with their AP in this mode. No new or disconnected wireless client can associate to the Mesh AP in this mode. Client traffic in Flex+Bridge MAP is dropped at RAP switchport for the locally switched WLANs.

## Configuring a Flex Profile (GUI)

### Procedure

**Step 1** Choose **Configuration > Tags & Profiles > Flex**.

- Step 2** Click a **Flex Profile Name**. The **Edit Flex Profile** dialog box appears.
- Step 3** Under the **General** tab, choose the **Flex Resilient** check box to enable the Flex Resilient feature.
- Step 4** Under the **VLAN** tab, choose the required VLANs.
- Step 5** (Optionally) Under the **Local Authentication** tab, choose the desired server group from the **Local Accounting RADIUS Server Group** drop-down list. Also, choose the **RADIUS** check box.
- Step 6** Click **Update & Apply to Device**.

## Configuring a Flex Profile (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode
<b>Step 2</b>	<b>wireless profile flex</b> <i>flex-profile</i> <b>Example:</b> Device(config)# wireless profile flex new-flex-profile	Configures a Flex profile and enters Flex profile configuration mode.
<b>Step 3</b>	<b>arp-caching</b> <b>Example:</b> Device(config-wireless-flex-profile)# arp-caching	Enables ARP caching.
<b>Step 4</b>	<b>description</b> <i>description</i> <b>Example:</b> Device(config-wireless-flex-profile)# description "new flex profile"	Enables default parameters for the Flex profile.
<b>Step 5</b>	<b>native-vlan-id</b> <b>Example:</b> Device(config-wireless-flex-profile)# native-vlan-id 2660	Configures native vlan-id information.
<b>Step 6</b>	<b>resilient</b> <b>Example:</b> Device(config-wireless-flex-profile)# resilient	Enables the resilient feature.
<b>Step 7</b>	<b>vlan-name</b> <i>vlan_name</i> <b>Example:</b> Device(config-wireless-flex-profile)# vlan-name VLAN2659	Configures VLAN name.

	Command or Action	Purpose
<b>Step 8</b>	<b>vlan-id</b> <i>vlan_id</i> <b>Example:</b> Device(config-wireless-flex-profile)# vlan-id 2659	Configures VLAN ID. The valid VLAN ID ranges from 1 to 4096.
<b>Step 9</b>	<b>end</b> <b>Example:</b> Device(config-wireless-flex-profile)# end	Exits configuration mode and returns to privileged EXEC mode.

## Configuring a Site Tag (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode
<b>Step 2</b>	<b>wireless tag site</b> <i>site-name</i> <b>Example:</b> Device(config)# wireless tag site new-flex-site	Configures a site tag and enters site tag configuration mode.
<b>Step 3</b>	<b>flex-profile</b> <i>flex-profile-name</i> <b>Example:</b> Device(config-site-tag)# flex-profile new-flex-profile	Configures a flex profile.
<b>Step 4</b>	<b>no local-site</b> <b>Example:</b> Device(config-site-tag)# no local-site	<b>Local site</b> is not configured on the site tag.
<b>Step 5</b>	<b>site-tag</b> <i>site-tag-name</i> <b>Example:</b> Device(config-site-tag)# site-tag new-flex-site	Maps a site tag to an AP.
<b>Step 6</b>	<b>end</b> <b>Example:</b> Device(config-site-tag)# end	Exits configuration mode and returns to privileged EXEC mode.

## Configuring a Mesh Profile (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode
<b>Step 2</b>	<b>wireless profile mesh <i>profile-name</i></b> <b>Example:</b> Device(config)# wireless profile mesh Mesh_Profile	Configures a Mesh profile and enters the Mesh profile configuration mode.
<b>Step 3</b>	<b>no ethernet-vlan-transparent</b> <b>Example:</b> Device(config-wireless-profile-mesh)# no ethernet-vlan-transparent	Disables VLAN transparency to ensure that the bridge is VLAN aware.
<b>Step 4</b>	<b>end</b> <b>Example:</b> Device(config-wireless-profile-mesh)# end	Exits configuration mode and returns to privileged EXEC mode.

## Associating Wireless Mesh to an AP Profile (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode
<b>Step 2</b>	<b>ap profile <i>ap-profile-name</i></b> <b>Example:</b> Device(config)# ap profile new-ap-join-profile	Configures the AP profile and enters AP profile configuration mode.
<b>Step 3</b>	<b>mesh-profile <i>mesh-profile-name</i></b> <b>Example:</b> Device(config-ap-profile)# mesh-profile Mesh_Profile	Configures the Mesh profile in AP profile configuration mode.
<b>Step 4</b>	<b>ssh</b> <b>Example:</b>	Configures the Secure Shell (SSH).

	Command or Action	Purpose
	Device(config-ap-profile)# ssh	
<b>Step 5</b>	<b>mgmtuser username <i>username</i> password {0   8} <i>password</i></b> <b>Example:</b> Device(config-ap-profile)# mgmtuser username Cisco password 0 Cisco secret 0 Cisco	Specifies the AP management username and password for managing all of the access points configured to the controller. <ul style="list-style-type: none"> <li>• <b>0</b>: Specifies an UNENCRYPTED password.</li> <li>• <b>8</b>: Specifies an AES encrypted password.</li> </ul> <b>Note</b> While configuring an username, ensure that special characters are not used as it results in error with bad configuration.
<b>Step 6</b>	<b>end</b> <b>Example:</b> Device(config-ap-profile)# end	Exits configuration mode and returns to privileged EXEC mode.

## Attaching Site Tag to an Access Point (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode
<b>Step 2</b>	<b>ap <i>mac-address</i></b> <b>Example:</b> Device(config)# ap F866.F267.7DFB	Configures Cisco APs and enters ap-tag configuration mode.
<b>Step 3</b>	<b>site-tag <i>site-tag-name</i></b> <b>Example:</b> Device(config-ap-tag)# site-tag new-flex-site	Maps a site tag to the AP. <b>Note</b> Associating Site Tag causes the associated AP to reconnect.
<b>Step 4</b>	<b>end</b> <b>Example:</b> Device(config-ap-tag)# end	Exits configuration mode and returns to privileged EXEC mode.

## Configuring Switch Interface for APs (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode
<b>Step 2</b>	<b>interface <i>interface-id</i></b>  <b>Example:</b> Device(config)# interface <int-id>	Enters the interface to be added to the VLAN.
<b>Step 3</b>	<b>switchport trunk native vlan <i>vlan-id</i></b>  <b>Example:</b> Device(config-if)# switchport trunk native vlan 2660	Assigns the allowed VLAN ID to the port when it is in trunking mode.
<b>Step 4</b>	<b>switchport trunk allowed vlan <i>vlan-id</i></b>  <b>Example:</b> Device(config-if)# switchport trunk allowed vlan 2659,2660	Assigns the allowed VLAN ID to the port when it is in trunking mode.
<b>Step 5</b>	<b>switchport mode trunk</b>  <b>Example:</b> Device(config-if)# switchport mode trunk	Sets the trunking mode to trunk unconditionally.  <b>Note</b> When the controller works as a host for spanning tree, ensure that you configure portfast trunk, using <b>spanning-tree portfast trunk</b> command, in the uplink switch to ensure faster convergence.
<b>Step 6</b>	<b>end</b>  <b>Example:</b> Device(config-if)# end	Exits configuration mode and returns to privileged EXEC mode.

## Verifying Flex Resilient with Flex and Bridge Mode Access Points Configuration

To view the AP mode and model details, use the following command:

```
Device# show ap name <ap-name> config general | inc AP Mode
AP Mode : Flex+Bridge
AP Model : AIR-CAP3702I-A-K9
```

To view the MAP mode details, use the following command:

```
Device# show ap name MAP config general | inc AP Mode
AP Mode : Flex+Bridge
AP Model : AIR-CAP3702I-A-K9
```

To view the RAP mode details, use the following command:

```
Device# show ap name RAP config general | inc AP Mode
AP Mode : Flex+Bridge
AP Model : AIR-AP2702I-A-K9
```

To view if the Flex Profile - Resilient feature is enabled or not, use the following command:

```
Device# show wireless profile flex detailed FLEX_TAG | inc resilient
Flex resilient : ENABLED
```

## Verifying ATF Configuration on Mesh

You can verify Cisco ATF configurations on mesh APs using the following commands.

Use the following **show** command to display the ATF configuration summary of all the radios:

```
Device# show ap airtime-fairness summary
```

AP Name Optimization	MAC Address	Slot	Admin	Oper	Mode
ap1/2 Enabled	6c:99:89:0c:73:a0	0	ENABLED	DOWN	Enforce-Policy
ap1/2 Enabled	6c:99:89:0c:73:a0	1	ENABLED	UP	Enforce-Policy
ap1/3 Enabled	6c:99:89:0c:73:a1	0	ENABLED	DOWN	Enforce-Policy
ap1/3 Enabled	6c:99:89:0c:73:a1	1	ENABLED	UP	Enforce-Policy

Use the following **show** command to display the ATF configuration for a 2.4-GHz radio:

```
Device# show ap dot11 24ghz airtime-fairness
```

AP Name Optimization	MAC Address	Slot	Admin	Oper	Mode
ap1/2 Enabled	6c:99:89:0c:73:a0	1	ENABLED	UP	Enforce-Policy

Use the following **show** command to display the ATF WLAN statistics:

```
Device# show ap name ap1 dot11 24ghz airtime-fairness wlan 12 statistics
```

AP Name Optimization	MAC Address	Slot	Admin	Oper	Mode
ap1/2 Enabled	6c:99:89:0c:73:a0	0	ENABLED	DOWN	Enforce-Policy
ap1/2 Enabled	6c:99:89:0c:73:a0	1	ENABLED	UP	Enforce-Policy
Network level					

Use the following **show** command to display the wireless mesh summary:

```
Device# show wireless profile mesh summary
```

```
Number of Profiles: 2
```

Profile-Name	BGN	Security	Bh-access	Description
--------------	-----	----------	-----------	-------------

```

mesh1 EAP DISABLED

default-mesh-profile EAP DISABLED default mesh profile

Device# show mesh atf client-access

AP Name Client Access Allocation Override Current nodes
 Default % Current %

RAP 25 40 Enabled 4
RAP 33 40 Enabled 3

```

## Verifying Mesh Ethernet Daisy Chaining

- The following is a sample output of the **show ap config general** command that displays whether a persistent SSID is configured for an AP.

```

Device# show ap 3702-RAP config general

Persistent SSID Broadcast Enabled/Disabled

```

- The following is a sample output of the **show wireless mesh persistent-ssid-broadcast summary** command that displays the persistent SSID broadcast status of all the bridge RAPs.

```

Device# show wireless mesh persistent-ssid-broadcast summary

AP Name AP Model BVI MAC BGN AP Role Persistent SSID
state

3702-RAP 3702 5c71.0d07.db50 ap_name Root AP Enabled
1560-RAP 1562E 380e.4dbf.c6b0 ap_name Root AP Disabled

```

## Verifying Mesh Convergence

The following is a sample output of the **show wireless profile mesh detailed** command that displays the mesh convergence method used:

```

Device# show wireless profile mesh detailed default-mesh-profile

Mesh Profile Name : default-mesh-profile

Description : default mesh profile
Convergence Method : Fast

```

The following is a sample output of the **show wireless mesh convergence subset-channels** command that displays the subset channels of the selected bridge group name:

```

Device# show wireless mesh convergence subset-channels

Bridge group name Channel

Default 132

```

## Verifying DHCP Server for Root AP Configuration

To verify the DHCP server for root AP configuration, use the following command:

```
Device# show ap config general
Cisco AP Name : AP4C77.6DF2.D588
=====
<SNIP>
Dhcp Server : Enabled
```

## Verifying Mesh Backhaul

The following is a sample output of the **show ap name mesh backhaul** command that shows details of the mesh backhaul at 2.4 GHz:

```
Device# show ap name test-ap mesh backhaul

MAC Address : xxxx.xxxx.xxxx
Current Backhaul Slot: 0
Radio Type: 0
Radio Subband: All
Mesh Radio Role: DOWNLINK
Administrative State: Enabled
Operation State: Up
Current Tx Power Level:
Current Channel: (11)
Antenna Type: N/A
Internal Antenna Gain (in .5 dBm units): 0
```

The following is a sample output of the **show wireless mesh ap backhaul** command that shows the mesh backhaul details:

```
Device# show wireless mesh ap backhaul

MAC Address : xxxx.xxxx.0x11
Current Backhaul Slot: 1
Radio Type: Main
Radio Subband: All
Mesh Radio Role: Downlink
Administrative State: Enabled
Operation State: Up
Current Tx Power Level: 6
Current Channel: (100)*
Antenna Type: N/A
Internal Antenna Gain (in .5 dBm units): 10
```

The following is a sample output of the **show ap summary** command that shows the radio MAC address and the corresponding AP name:

```
Device# show ap summary
Number of APs: 1
AP Name Slots AP Model Ethernet MAC Radio MAC Location Country
IP Address State

AP-Cisco-1 2 AIR-APXXXXX-E-K9 xxxx.xxxx.xxd4 xxxx.xxxx.0x11 default location DE
10.11.70.170 Registered
```

# Verifying Mesh Configuration

Use the following **show** commands to verify the various aspects of mesh configuration.

- **show wireless mesh stats** *ap-name*
- **show wireless mesh security-stats** {*all* | *ap-name*}
- **show wireless mesh queue-stats** {*all* | *ap-name*}
- **show wireless mesh per-stats summary** {*all* | *ap-name*}
- **show wireless mesh neighbor summary** {*all* | *ap-name*}
- **show wireless mesh neighbor detail** *ap-name*
- **show wireless mesh ap summary**
- **show wireless mesh ap tree**
- **show wireless mesh ap backhaul**
- **show wireless mesh config**
- **show wireless mesh convergence detail** *bridge-group-name*
- **show wireless mesh convergence subset-channels**
- **show wireless mesh neighbor**
- **show wireless profile mesh detailed** *mesh-profile-name*
- **show wireless stats mesh security**
- **show wireless stats mesh queue**
- **show wireless stats mesh packet error**
- **show wireless mesh ap summary**
- **show ap name** *ap-name* **mesh backhaul**
- **show ap name** *ap-name* **mesh neighbor detail**
- **show ap name** *ap-name* **mesh path**
- **show ap name** *ap-name* **mesh stats packet error**
- **show ap name** *ap-name* **mesh stats queue**
- **show ap name** *ap-name* **mesh stats security**
- **show ap name** *ap-name* **mesh stats**
- **show ap name** *ap-name* **mesh bhrate**
- **show ap name** *ap-name* **config ethernet**
- **show ap name** *ap-name* **cablemodem**
- **show ap name** *ap-name* **environment**

- **show ap name *ap-name* gps location**
- **show ap name *ap-name* environment**
- **show ap name *ap-name* mesh linktest data *dest-mac***
- **show ap environment**
- **show ap gps location**

For details about these commands, see the [Cisco Catalyst 9800 Series Wireless Controller Command Reference](#) document.

### MAC Authorization

Use the following **show** command to verify the MAC authorization configuration:

```
Device# show run aaa
aaa authentication dot1x CENTRAL_LOCAL local
aaa authorization credential-download CENTRAL_AUTHOR local
username 002cc8de4f31 mac
username 00425a0a53b1 mac

ewlc_eft#sh wireless profile mesh detailed madhu-mesh-profile

Mesh Profile Name : abc-mesh-profile

Description :
Bridge Group Name : bgn-abbc
Strict match BGN : ENABLED
Amsdu : ENABLED
...
Battery State : ENABLED
Authorization Method : CENTRAL_AUTHOR
Authentication Method : CENTRAL_LOCAL
Backhaul tx rate(802.11bg) : auto
Backhaul tx rate(802.11a) : 802.11n mcs15
```

### PSK Provisioning

Use the following **show** command to verify PSK provisioning configuration:

```
Device# show wireless mesh config
Mesh Config
 Backhaul RRM : ENABLED
 Mesh CAC : DISABLED
 Outdoor Ext. UNII B Domain channels(for BH) : ENABLED
 Mesh Ethernet Bridging STP BPDU Allowed : ENABLED
 Rap Channel Sync : ENABLED

Mesh Alarm Criteria
 Max Hop Count : 4
 Recommended Max Children for MAP : 10
 Recommended Max Children for RAP : 20
 Low Link SNR : 12
 High Link SNR : 60
 Max Association Number : 10
 Parent Change Number : 3

Mesh PSK Config
 PSK Provisioning : ENABLED
 Default PSK : ENABLED
```

```

PSK In-use key number : 1
Provisioned PSKs (Maximum 5)

```

```

Index Description

1 key1

```

### Bridge Group Name

Use the following **show** command to verify the bridge group name configuration:

```

Device# show wireless profile mesh detailed abc-mesh-profile
Mesh Profile Name : abc-mesh-profile

Description :
Bridge Group Name : bgn-abc
Strict match BGN : ENABLED
Amsdu : ENABLED
Background Scan : ENABLED
Channel Change Notification : DISABLED
Backhaul client access : ENABLED
Ethernet Bridging : ENABLED
Ethernet Vlan Transparent : DISABLED
Full Sector DFS : ENABLED
IDS : ENABLED
Multicast Mode : In-Out
Range in feet : 12000
Security Mode : EAP
Convergence Method : Fast
LSC only Authentication : DISABLED
Battery State : ENABLED
Authorization Method : CENTRAL_AUTHOR
Authentication Method : CENTRAL_LOCAL
Backhaul tx rate(802.11bg) : auto
Backhaul tx rate(802.11a) : 802.11n mcs15

```

### Backhaul Client Access

Use the following **show** command to verify the backhaul client access configuration:

```

Device# show wireless profile mesh detailed abc-mesh-profile
Mesh Profile Name : abc-mesh-profile

Description :
Bridge Group Name : bgn-abc
Strict match BGN : ENABLED
Amsdu : ENABLED
Background Scan : ENABLED
Channel Change Notification : DISABLED
Backhaul client access : ENABLED
Ethernet Bridging : ENABLED
Ethernet Vlan Transparent : DISABLED
...
Backhaul tx rate(802.11bg) : auto
Backhaul tx rate(802.11a) : 802.11n mcs15

```

### Wireless Backhaul Data Rate

Use the following **show** command to verify the wireless backhaul data rate configuration:

```

Device# show wireless profile mesh detailed abc-mesh-profile
Mesh Profile Name : abc-mesh-profile

```

```

Description :
Bridge Group Name : bgn-abc
Strict match BGN : ENABLED
...
Authorization Method : CENTRAL_AUTHOR
Authentication Method : CENTRAL_LOCAL
Backhaul tx rate(802.11bg) : auto
Backhaul tx rate(802.11a) : 802.11n mcs15

```

### Dynamic Frequency Selection

Use the following **show** command to verify the dynamic frequency selection configuration:

```

Device# show wireless profile mesh detailed abc-mesh-profile
Mesh Profile Name : abc-mesh-profile

Description :
Bridge Group Name : bgn-abc
Strict match BGN : ENABLED
Amsdu : ENABLED
Background Scan : ENABLED
Channel Change Notification : DISABLED
Backhaul client access : ENABLED
Ethernet Bridging : ENABLED
Ethernet Vlan Transparent : DISABLED
Full Sector DFS : ENABLED
...
Backhaul tx rate(802.11a) : 802.11n mcs15

```

### Intrusion Detection System

Use the following **show** command to verify the wireless backhaul data rate configuration:

```

Device# show wireless profile mesh detailed abc-mesh-profile
Mesh Profile Name : abc-mesh-profile

Description :
Bridge Group Name : bgn-abc
Strict match BGN : ENABLED
Amsdu : ENABLED
Background Scan : ENABLED
Channel Change Notification : DISABLED
Backhaul client access : ENABLED
Ethernet Bridging : ENABLED
Ethernet Vlan Transparent : DISABLED
Full Sector DFS : ENABLED
IDS : ENABLED
Multicast Mode : In-Out
...
Backhaul tx rate(802.11a) : 802.11n mcs15

```

### Ethernet Bridging

Use the following **show** command to verify ethernet bridging configuration:

```

Device# show wireless profile mesh detailed abc-mesh-profile
Mesh Profile Name : abc-mesh-profile

Description :
Bridge Group Name : bgn-abc
Strict match BGN : ENABLED
Amsdu : ENABLED
Background Scan : ENABLED

```

```

Channel Change Notification : DISABLED
Backhaul client access : ENABLED
Ethernet Bridging : ENABLED
Ethernet Vlan Transparent : DISABLED
Full Sector DFS : ENABLED
IDS : ENABLED
Multicast Mode : In-Out
...
Backhaul tx rate(802.11a) : 802.11n mcs15

```

### Multicast over Mesh

Use the following **show** command to verify multicast over Mesh configuration:

```

Device# show wireless profile mesh detailed abc-mesh-profile
Mesh Profile Name : abc-mesh-profile

Description :
Bridge Group Name : bgn-abc
Strict match BGN : ENABLED
Amsdu : ENABLED
Background Scan : ENABLED
Channel Change Notification : DISABLED
Backhaul client access : ENABLED
Ethernet Bridging : ENABLED
Ethernet Vlan Transparent : DISABLED
Full Sector DFS : ENABLED
IDS : ENABLED
Multicast Mode : In-Out
...
Backhaul tx rate(802.11a) : 802.11n mcs15

```

### RRM on Mesh Backhaul

Use the following **show** command to verify RRM on Mesh backhaul configuration:

```

Device# show wireless mesh config
Mesh Config
 Backhaul RRM : ENABLED
 Mesh CAC : DISABLED
 Outdoor Ext. UNII B Domain channels(for BH) : ENABLED
 Mesh Ethernet Bridging STP BPDU Allowed : ENABLED
 Rap Channel Sync : ENABLED

Mesh Alarm Criteria
 Max Hop Count : 4
 Recommended Max Children for MAP : 10
 Recommended Max Children for RAP : 20
 Low Link SNR : 12
 High Link SNR : 60
 Max Association Number : 10
 Parent Change Number : 3

Mesh PSK Config
 PSK Provisioning : ENABLED
 Default PSK : ENABLED
 PSK In-use key number : 1
 Provisioned PSKs(Maximum 5)

 Index Description

 1 key1

```

### Preferred Parent Selection

Use the following **show** command to verify preferred parent configuration:

```
Device# show wireless mesh ap tree
=====
AP Name [Hop Ctr,Link SNR,BG Name,Channel,Pref Parent,Chan Util,Clients]
=====

[Sector 1]

1542-RAP [0, 0, bgn-madhu, (165), 0000.0000.0000, 1%, 0]
 |-MAP-2700 [1, 67, bgn-madhu, (165), 7070.8b7a.6fb8, 0%, 0]

Number of Bridge APs : 2
Number of RAPs : 1
Number of MAPs : 1

(*) Wait for 3 minutes to update or Ethernet Connected Mesh AP.
(**) Not in this Controller
```

### AP Role Change

Use the following **show** command to verify AP role change configuration:

```
Device# show wireless mesh ap summary
AP Name AP Model BVI MAC BGN AP Role
----- -
1542-RAP 1542D 002c.c8de.1338 bgn-abc Root AP
MAP-2700 2702I 500f.8095.01e4 bgn-abc Mesh AP

Number of Bridge APs : 2
Number of RAPs : 1
Number of MAPs : 1
Number of Flex+Bridge APs : 0
Number of Flex+Bridge RAPs : 0
Number of Flex+Bridge MAPs : 0
```

### Mesh Leaf Node

Use the following **show** command to verify mesh leaf node configuration:

```
Device# show ap name MAP-2700 config general
Cisco AP Name : MAP-2700
=====

Cisco AP Identifier : 7070.8bbc.d3e0
Country Code : Multiple Countries : IN,US,IO,J4
Regulatory Domain Allowed by Country : 802.11bg:-AEJQPQU 802.11a:-ABDUNPQU
AP Country Code : IN - India
AP Regulatory Domain
 Slot 0 : -A
 Slot 1 : -D
MAC Address : 500f.8095.01e4
...
AP Mode : Bridge
Mesh profile name : abc-mesh-profile
AP Role : Mesh AP
Backhaul radio type : 802.11a
Backhaul slot id : 1
Backhaul tx rate : auto
Ethernet Bridging : Enabled
Daisy Chaining : Disabled
```

```

Strict Daisy Rap : Disabled
Bridge Group Name : bgn-abc
Strict-Matching BGN : Enabled
Preferred Parent Address : 7070.8b7a.6fb8

EWC-AP Capability : Disabled
AWIPS Capability : Disabled
Proxy Hostname : Not Configured
Proxy Port : Not Configured
Proxy NO_PROXY list : Not Configured
GRPC server status : Disabled

```

### Subset Channel Synchronization

Use the following **show** command to verify the subset channel synchronization configuration:

```

Device# show wireless mesh config
Mesh Config
 Backhaul RRM : ENABLED
 Mesh CAC : DISABLED
 Outdoor Ext. UNII B Domain channels (for BH) : ENABLED
 Mesh Ethernet Bridging STP BPDU Allowed : ENABLED
 Rap Channel Sync : ENABLED

Mesh Alarm Criteria

### Provisioning LSC for Bridge-Mode and Mesh APs

Use the following **show** command to verify the provisioning LSC for Bridge-Mode and Mesh AP configuration:

```

Device# show wireless profile mesh detailed default-mesh-profile
Mesh Profile Name : default-mesh-profile

Description : default mesh profile
Bridge Group Name : bgn-abc
Strict match BGN : DISABLED
Amsdu : ENABLED
Background Scan : ENABLED
Channel Change Notification : ENABLED
Backhaul client access : ENABLED

```

```

Ethernet Bridging : DISABLED
Ethernet Vlan Transparent : ENABLED
Full Sector DFS : ENABLED
IDS : DISABLED
Multicast Mode : In-Out
Range in feet : 12000
Security Mode : EAP
Convergence Method : Fast
LSC only Authentication : DISABLED
Battery State : ENABLED
Authorization Method : default
Authentication Method : default
Backhaul tx rate(802.11bg) : auto
Backhaul tx rate(802.11a) : auto

```

### Specify the Backhaul Slot for the Root AP

Use the following **show** command to verify the backhaul slot for the Root AP configuration:

```

Device# show ap name 1542-RAP mesh backhaul
MAC Address : 380e.4d85.5e60
Current Backhaul Slot: 1
Radio Type: 0
Radio Subband: All
Mesh Radio Role: DOWNLINK
Administrative State: Enabled
Operation State: Up
Current Tx Power Level:
Current Channel: (165)
Antenna Type: N/A
Internal Antenna Gain (in .5 dBm units): 18

```

### Using a Link Test on Mesh Backhaul

Use the following **show** command to verify the use of link test on mesh backhaul configuration:

```

Device# show ap name 1542-RAP mesh linktest data 7070.8bbc.d3ef
380e.4d85.5e60 ==> 7070.8bbc.d3ef

Started at : 05/11/2020 20:56:28
Status: In progress

Configuration:
=====
Data rate: Mbps
Packets per sec: : 234
Packet Size: : 1200
Duration: : 200

```

### Mesh CAC

Use the following **show** command to verify mesh CAC configuration:

```

Device# show wireless mesh config
Mesh Config
 Backhaul RRM : ENABLED
 Mesh CAC : DISABLED
 Outdoor Ext. UNII B Domain channels(for BH) : ENABLED
 Mesh Ethernet Bridging STP BPDU Allowed : ENABLED
 Rap Channel Sync : ENABLED

Mesh Alarm Criteria
 Max Hop Count : 4

```

```

Recommended Max Children for MAP : 10
Recommended Max Children for RAP : 20
Low Link SNR : 12
High Link SNR : 60
Max Association Number : 10
Parent Change Number : 3

## Verifying Dot11ax Rates on Mesh Backhaul

To verify the 802.11ax rates on mesh backhaul in the mesh profile, use the following command:

```

Device# show wireless profile mesh detailed default-mesh-profile
Mesh Profile Name : default-mesh-profile

Description : default mesh profile
.
.
Backhaul tx rate(802.11bg) : 802.11ax mcs7 ss1
Backhaul tx rate(802.11a) : 802.11ax mcs9 ss2

```

To verify the 802.11ax rates on mesh backhaul in the general configuration of an AP, use the following command:

```

Device# show ap config general
Cisco AP Identifier : 5c71.0d17.49e0
.
.
Backhaul slot id : 1
Backhaul tx rate : 802.11ax mcs7 ss1

```

## Verifying Mesh Serial Backhaul

To verify mesh AP serial backhaul, run the following command:

```

Device# show ap name MAP-SB config slot 2 | inc Mesh
Mesh Radio Role : Downlink Access
Mesh Backhaul : Enabled
Mesh Designated Downlink : Enabled

```

To verify serial backhaul enabled on a specific AP, run the following command:

```

Device# show ap name MAP-SB mesh backhaul
MAC Address : 4cxx.4dxx.f4xx
Current Backhaul Slot: 1
Radio Type: Main
Radio Subband: All
Mesh Radio Role: Uplink Access <<<<<<
Administrative State: Enabled
Operation State: Up

```

```

Current Tx Power Level: 6
Current Channel: (104) <<<<<<
Antenna Type:
Internal Antenna Gain (in .5 dBm units): 1
MAC Address : 4cxx.4dxx.f4xx
Current Backhaul Slot: 2
Radio Type: Slave
Radio Subband: All
Mesh Radio Role: Downlink Access <<<<<<
Administrative State: Enabled
Operation State: Up
Current Tx Power Level: 8
Current Channel: (149) <<<<<<
Antenna Type:
Internal Antenna Gain (in .5 dBm units): 1

```

To verify mesh serial backhaul, run the following command:

```

Device# show wireless profile radio detailed radio-mesh-downlink
Radio Profile name : radio-mesh-downlink
Description :
Beam-Selection : Not configured
Number of antenna to be enabled : 0
Mesh Backhaul : Enabled
Mesh Designated Downlink : Enabled

```

## Verifying the RRM DCA Status

To view the status of the DCA that is run for mesh APs, run the following command:

```

Device# show ap name Cisco-AP config general | inc Mesh
Mesh profile name : default-mesh-profile
Mesh DCA Run Status: : Not Running
Last Mesh DCA Run : 02/07/2022 01:21:56

```

To verify the status of the last DCA run per radio, run the following command:

```

Device# show wireless mesh rrm dca status

```

**Note** The output for the **show ap config general | i Mesh** and the **show ap name <AP name> config general | i Mesh** commands, displays only the status for manual RRM DCA triggers that are done via the **ap name <AP name> dot11 rrm channel update mesh** command.

The output for the **show ap config general | i Mesh** and the **show ap name <AP name> config general | i Mesh** commands, does not update if only the global mesh RRM DCA is enabled (auto-dca).

## Verifying Fast Teardown with Default Mesh Profile

To verify the fast teardown with the default-mesh-profile, use the following command:

```

Device# show wireless profile mesh detailed default-mesh-profile
Mesh Profile Name default-mesh-profile

Fast Teardown : ENABLED
Number of Retries : 4
Interval in sec : 1

```

```
Latency Threshold in msec : 10
Latency Exceeded Threshold in sec : 8
Uplink Recovery Interval in sec : 60
```

## Verifying Background Scanning and MAP Fast Ancestor Find

To verify if the Background Scanning and MAP Fast Ancestor Find features are enabled, run the **show wireless profile mesh detailed** command:

```
Device# show wireless profile mesh detailed Mesh_Profile | i Background Scan
Background Scan : ENABLED
```

```
Device# show wireless profile mesh detailed Mesh_Profile | i MAP fast ancestor find
MAP fast ancestor find : ENABLED
```

## CHAPTER 167

# Redundant Root Access Point (RAP) Ethernet Daisy Chaining

---

- [Overview of Redundant RAP Ethernet Daisy Chaining, on page 1853](#)
- [Prerequisites for Redundant RAP Ethernet Daisy Chaining Support, on page 1854](#)
- [Configuring Redundant RAP Ethernet Daisy Chaining Support \(CLI\), on page 1854](#)
- [Verifying Daisy Chain Redundancy \(CLI\), on page 1854](#)

## Overview of Redundant RAP Ethernet Daisy Chaining

The Root Access Point (RAP) Ethernet Daisy Chaining is a feature where RAPs are chained using wired Ethernet to avoid latency in backhaul link failure recovery.

This feature proposes a redundancy in the daisy chain, wherein, two switches act as a redundant Designated Port (DP), each connected to either end of the daisy chain. In case of a link failure, the link direction is reversed using a new STP root.

A redundant RAP ethernet daisy chain has similar capabilities to the existing mesh daisy chain feature. In a redundant RAP ethernet daisy chain topology, the packet is encapsulated with CAPWAP header and forwarded to the controller from its wireless client for each AP. The packet is bridged to its primary ethernet interface from its secondary ethernet interface including the other AP's wireless client CAPWAP packets. Both 2.4G and 5G radio are used for client access.

---

**Note** The daisy chain strict RAP configuration is applicable to Cisco IOS access points only.

---

Redundant RAP ethernet daisy chain is supported on the IW6300 AP model.

In case of ethernet daisy chain topology, if a CAPWAP loss occurs on the first RAP connected to switch, the entire chain loses its uplink. This takes a long time to recover. Thereby, if the RAP ethernet daisy chain is enabled, the CAPWAP data keepalive is extended to three times.

---

**Note** Only wired uplink configuration is valid, if you configure an AP as Bridge or Flex Bridge mode Root AP.

---

## Prerequisites for Redundant RAP Ethernet Daisy Chaining Support

- Ethernet bridging on should be enabled.
- Strict-wired-uplink feature should be enabled.

## Configuring Redundant RAP Ethernet Daisy Chaining Support (CLI)

Follow the procedure given below to enable redundant RAP ethernet daisy chaining on a mesh profile:

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>wireless profile mesh <i>profile-name</i></b>  <b>Example:</b> Device(config)# <b>wireless profile mesh default-mesh-profile</b>	Configures a mesh profile and enters mesh profile configuration mode.
<b>Step 3</b>	<b>daisychain-stp-redundancy</b>  <b>Example:</b> Device(config-wireless-mesh-profile)# <b>daisychain-stp-redundancy</b>	Configures daisy chain STP redundancy.

## Verifying Daisy Chain Redundancy (CLI)

To verify the ethernet daisy chain summary, use the following command:

```
Device# show wireless mesh ethernet daisy-chain summary
```

AP Name	BVI MAC	BGN	Backhaul	Ethernet	STP Red
RAP4	683b.78bf.15f0	IOT	Ethernet0	Up Up Dn Dn	Enabled
RAP3	683b.78bf.1634	IOT	Ethernet0	Up Up Dn Dn	Enabled
RAP1	6c8b.d383.b4d4	IOT	Ethernet0	Up Up Dn Dn	Enabled
RAP2	6c8b.d383.b4e8	IOT	Ethernet0	Up Up Up Dn	Enabled

To verify the ethernet daisy chain Bridge Group Name (BGN) details, use the following command:

```
Device# show wireless mesh ethernet daisy-chain bgn <IOT>
```

AP Name	BVI MAC	BGN	Backhaul	Ethernet				STP Red
RAP4	683b.78bf.15f0	IOT	Ethernet0	Up	Up	Dn	Dn	Enabled
RAP3	683b.78bf.1634	IOT	Ethernet0	Up	Up	Dn	Dn	Enabled
RAP1	6c8b.d383.b4d4	IOT	Ethernet0	Up	Up	Dn	Dn	Enabled
RAP2	6c8b.d383.b4e8	IOT	Ethernet0	Up	Up	Up	Dn	Enabled

To verify the mesh profile, use the following command:

```
Device# show wireless profile mesh detailed default-mesh-profile
```

```
Mesh Profile Name : default-mesh-profile
```

```

Description : default mesh profile
Bridge Group Name : IOT
Strict match BGN : ENABLED
Amsdu : ENABLED
Background Scan : ENABLED
Channel Change Notification : ENABLED
Backhaul client access : ENABLED
Ethernet Bridging : ENABLED
Ethernet Vlan Transparent : DISABLED
Daisy Chain STP Redundancy : ENABLED
Full Sector DFS : ENABLED
IDS : ENABLED
Multicast Mode : In-Out

## Information about Media Stream

The IEEE 802.11 wireless multicast delivery mechanism does not provide a reliable way to acknowledge lost or corrupted packets. As a result, if any multicast packet is lost in the air, it is not sent again which may cause an IP multicast stream unviewable.

The Media Stream feature makes the delivery of the IP multicast stream reliable over air, by converting the multicast frame to a unicast frame over the air. Each Media Stream client acknowledges receiving a video IP multicast stream.

---

**Note** Support for IPv6 was added from Cisco IOS XE Gibraltar 16.12.1. You can use IPv6 multicast addresses in place of IPv4 multicast addresses to enable media stream on the IPv6 networks.

---

## Prerequisites for Media Stream

- Make sure that the Multicast feature is enabled. We recommend that you configure IP multicast on the controller in multicast-multicast mode.
- Check for the IP address on the client machine. The machine should have an IP address from the respective VLAN.
- Verify that the access points have joined the controllers .

## How to Configure Media Stream

### Configuring Multicast-Direct Globally for Media Stream (CLI)

#### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>wireless multicast</b> <b>Example:</b> Device(config)# <code>wireless multicast</code>	Enables multicast for wireless forwarding.
<b>Step 3</b>	<b>ip igmp snooping</b> <b>Example:</b> Device(config)# <code>ip igmp snooping</code>	Enables IGMP snooping on a per-VLAN basis. If the global setting is disabled, then all the VLANs are treated as disabled, whether they are enabled or not.
<b>Step 4</b>	<b>ip igmp snooping querier</b> <b>Example:</b> Device(config)# <code>ip igmp snooping querier</code>	Enables a snooping querier on an interface when there is no multicast router in the VLAN to generate queries.
<b>Step 5</b>	<b>wireless media-stream multicast-direct</b> <b>Example:</b> (config)# <code>wireless media-stream multicast-direct</code>	Configures the global multicast-direct on the controller.
<b>Step 6</b>	<b>wireless media-stream message</b> <b>Example:</b> (config)# <code>wireless media-stream message ?</code> Email Configure Session Announcement Email	Configures various message-configuration parameters such as phone, URL, email, and notes. That is, when a media stream is refused (due to bandwidth constraints), a message can be sent to the corresponding user. These parameters configure the messages that are to

	Command or Action	Purpose
	<pre>Notes Configure Session Announcement notes URL Configure Session Announcement URL phone Configure Session Announcement Phone number &lt;cr&gt;</pre>	be sent to the IT support email address, notes (message be displayed explaining why the stream was refused), URL to which the user can be redirected, and the phone number that the user can call about the refused stream.
<b>Step 7</b>	<p><b>wireless media-stream group</b> <i>name startIp endIp</i></p> <p><b>Example:</b></p> <pre>(config)#wireless media-stream group grp1 231.1.1.1 239.1.1.3      avg-packet-size Configure average packet size     default Set a command to its defaults      exit Exit sub-mode     max-bandwidth Configure maximum expected stream bandwidth in Kbps     no Negate a command or set its defaults     policy Configure media stream admission policy     priority Configure media stream priority, &lt;1:Lowest - 8:Highest&gt;     qos Configure over the air QoS class, &lt;'video'&gt; ONLY     rrc-evaluation Configure RRC re-evaluation admission     violation Configure stream violation policy on periodic re-evaluation</pre>	Configures each media stream and its parameters such as expected multicast destination addresses, stream bandwidth consumption, and stream-priority parameters.
<b>Step 8</b>	<p><b>end</b></p> <p><b>Example:</b></p> <pre>Device(config)# end</pre>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Configuring Media Stream for 802.11 Bands (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<p><b>configure terminal</b></p> <p><b>Example:</b></p> <pre>Device# configure terminal</pre>	Enters global configuration mode.
<b>Step 2</b>	<p><b>ap dot11</b> {24ghz   5ghz   6ghz} <b>media-stream multicast-direct</b></p>	Configures whether MediaStream (multicast to unicast ) is allowed for the 802.11 band.

	Command or Action	Purpose
	<b>Example:</b> <pre>Device(config)#ap dot11 24ghz media-stream multicast-direct</pre>	You must disable to 802.11 network to enable the MediaStream.
<b>Step 3</b>	<pre>ap dot11 {24ghz   5ghz   6ghz} media-stream video-redirect</pre> <b>Example:</b> <pre>Device(config)#ap dot11 24ghz media-stream video-redirect</pre>	Optional. Configures the redirection of unicast video traffic to the best-effort queue.
<b>Step 4</b>	<pre>ap dot11 {24ghz   5ghz   6ghz} media-stream multicast-direct admission-besteffort</pre> <b>Example:</b> <pre>Device(config)#ap dot11 24ghz media-stream multicast-direct admission-besteffort</pre>	Configures the media stream to be sent through the best-effort queue if that media stream cannot be prioritized due to bandwidth-availability limitations. Run the <b>no</b> form of the command to drop the stream, if the media stream cannot be prioritized due to bandwidth-availability limitations.
<b>Step 5</b>	<pre>ap dot11 {24ghz   5ghz   6ghz} media-stream multicast-direct client-maximum <i>value</i></pre> <b>Example:</b> <pre>Device(config)#ap dot11 24ghz media-stream multicast-direct client-max 15</pre>	Configures the maximum number of allowed media streams per individual client. The maximum is 15 and the default is 0. The value of 0 denotes unlimited streams.
<b>Step 6</b>	<pre>ap dot11 {24ghz   5ghz   6ghz} media-stream multicast-direct radio-maximum <i>value</i></pre> <b>Example:</b> <pre>Device(config)#ap dot11 24ghz media-stream multicast-direct radio-maximum 20</pre>	Configures maximum number of radio streams. The valid range is from 1 to 20. Default is 0. The value of 0 denotes unlimited streams.
<b>Step 7</b>	<pre>ap dot11 {24ghz   5ghz   6ghz} cac multimedia max-bandwidth <i>bandwidth</i></pre> <b>Example:</b> <pre>Device(config)#ap dot11 24ghz cac multimedia max-bandwidth 60</pre>	Configures maximum media (voice + video) bandwidth, in percent. The range is between 5-85%.
<b>Step 8</b>	<pre>ap dot11 {24ghz   5ghz   6ghz} cac media-stream multicast-direct min-client-rate <i>dot11_rate</i></pre> <b>Example:</b> <pre>Device(config)#ap dot11 24ghz cac media-stream multicast-direct min_client_rate</pre>	Configures the minimum PHY rate needed for a client to send a media stream as unicast. Clients communicating below this rate will not receive the media stream as a unicast flow. Typically, this PHY rate is equal to or higher than the rate at which multicast frames are sent.

	Command or Action	Purpose
<b>Step 9</b>	<b>ap dot11 {24ghz   5ghz   6ghz} cac media-stream</b>  <b>Example:</b> Device(config)# <b>ap dot11 5ghz cac media-stream</b>	Configures Call Admission Control (CAC) parameters for media stream access category.
<b>Step 10</b>	<b>ap dot11 {24ghz   5ghz   6ghz} cac multimedia</b>  <b>Example:</b> Device(config)# <b>ap dot11 5ghz cac multimedia</b>	Configures CAC parameters for media access category: used for voice and video.
<b>Step 11</b>	<b>ap dot11 {24ghz   5ghz   6ghz} cac voice</b>  <b>Example:</b> Device(config)# <b>ap dot11 5ghz cac voice</b>	Configures CAC parameters for voice access category.
<b>Step 12</b>	<b>end</b>  <b>Example:</b> Device(config)# <b>end</b>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Configuring a WLAN to Stream Video(GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Wireless > WLANs > Wireless Networks**.
  - Step 2** Select a **WLAN** to view the **Edit WLAN** window.
  - Step 3** Click **Advanced** tab.
  - Step 4** Check the **Media Stream Multicast-Direct** check box to enable the feature.
  - Step 5** Click **Update & Apply to Device**.
- 

## Configuring a WLAN to Stream Video (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.

	Command or Action	Purpose
<b>Step 2</b>	<b>wlan</b> <i>wlan_name</i>  <b>Example:</b> <code>(config)#wlan wlan50</code>	Enters WLAN configuration mode.
<b>Step 3</b>	<b>shutdown</b>  <b>Example:</b> <code>(config-wlan)#shutdown</code>	Disables the WLAN for configuring its parameters.
<b>Step 4</b>	<b>media-stream multicast-direct</b>  <b>Example:</b> <code>(config)#media-stream multicast-direct</code>	Configures the multicast-direct on media stream for the WLAN.
<b>Step 5</b>	<b>no shutdown</b>  <b>Example:</b> <code>(config-wlan)#no shutdown</code>	Enables the WLAN.
<b>Step 6</b>	<b>end</b>  <b>Example:</b> <code>Device(config)# end</code>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Deleting a Media Stream (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Wireless > Media Stream**.
  - Step 2** Click the **Streams** tab.
  - Step 3** Check the checkbox adjacent to the Stream Name you want to delete.  
To delete multiple streams, select multiple stream name checkboxes.
  - Step 4** Click **Delete**.
  - Step 5** Click **Yes** on the confirmation window to delete the VLAN.
- 

## Deleting a Media Stream (CLI)

### Before you begin

The media stream should be enabled and configured for it to be deleted.

**Procedure**

	<b>Command or Action</b>	<b>Purpose</b>
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>no wireless media-stream group</b> <i>media_stream_name</i> <b>Example:</b> Device(config)# <b>no wireless media-stream</b> <b>grp1</b>	Deletes the media stream that bears the name mentioned in the command.
<b>Step 3</b>	<b>end</b> <b>Example:</b> Device(config)# <b>end</b>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Monitoring Media Streams

*Table 136: Commands for monitoring media streams*

<b>Commands</b>	<b>Description</b>
show wireless media-stream client detail <i>group name</i>	Displays media stream client details of the particular group.
show wireless media-stream client summary	Displays the media stream information of all the clients.
show wireless media-stream group detail <i>group name</i>	Displays the media stream configuration details of the particular group.
show wireless media-stream group summary	Displays the media stream configuration details of all the groups.
show wireless media-stream message details	Displays the session announcement message details.
show wireless multicast	Displays the multicast-direct configuration state.
show ap dot11 {24ghz   5ghz} media-stream rrc	Displays 802.11 media Resource-Reservation-Control configurations.

## Configuring the General Parameters for a Media Stream (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Wireless > Media Stream**.
- Step 2** In the **General** tab, check the **Multicast Direct Enable** check box.
- Step 3** In the **Session Message Config** section, check the **Session Announcement State** check box to enable the session announcement mechanism. If the session announcement state is enabled, clients are informed each time a controller is not able to serve the multicast direct data to the client.
- Step 4** In the **Session Announcement URL** field, enter the URL where the client can find more information when an error occurs during the multicast media stream transmission.
- Step 5** In the **Session Announcement Email** field, enter the e-mail address of the person who can be contacted.
- Step 6** In the **Session Announcement Phone** field, enter the phone number of the person who can be contacted.
- Step 7** In the **Session Announcement Note** field, enter a reason as to why a particular client cannot be served with a multicast media.
- Step 8** Click **Apply**.
- 

## Adding Media Stream (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>wireless media-stream group</b> <i>groupName</i> <i>startIpAddr endIpAddr</i> <b>Example:</b> Device(config)# wireless media-stream group group1 224.0.0.0 224.0.0.223	Configures each media stream and its parameters, such as expected multicast destination addresses, stream bandwidth consumption, and stream priority parameters.
<b>Step 2</b>	<b>avg-packet-size</b> <i>packetsize</i> <b>Example:</b> Device(media-stream)# avg-packet-size 100	Configures the average packet size.
<b>Step 3</b>	<b>max-bandwidth</b> <i>bandwidth</i> <b>Example:</b> Device(media-stream)# max-bandwidth 80	Configures the maximum expected stream bandwidth, in Kbps.
<b>Step 4</b>	<b>policy {admit   deny }</b> <b>Example:</b> Device(media-stream)# policy admit	Configure the media stream admission policy.

	Command or Action	Purpose
<b>Step 5</b>	<b>qos video</b> <b>Example:</b> Device(media-stream)# qos video	Configures over-the-air QoS class, as 'video'.
<b>Step 6</b>	<b>violation { drop   fallback }</b> <b>Example:</b> Device(media-stream)# violation drop	Configures the violation mode.
<b>Step 7</b>	<b>rrc-evaluation { initial   periodic }</b> <b>Example:</b> Device(media-stream)# rrc-evaluation initial	Configure Resource Reservation Control (RRC) re-evaluation admission, which provides initial or periodic admission evaluation. The re-evaluation admission occurs at 2, 4, 8, and so on seconds.
<b>Step 8</b>	<b>priority priority-value</b> <b>Example:</b> Device(media-stream)# priority 6	Sets the priority value. The valid range is from 1-8, with 1 being the lowest.

## Enabling a Media Stream per WLAN (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Tags & Profiles > WLANs**.
  - Step 2** On the **WLANs** page, click the name of the **WLAN** or click **Add** to create a new one.
  - Step 3** In the **Add/Edit WLAN** window that is displayed, click the **Advanced** tab.
  - Step 4** Check the **Enabling a Media Stream for each WLAN** check box to enable Media Stream on the WLAN.
  - Step 5** Save the configuration.
- 

## Enabling a Media Stream per WLAN (CLI)

Follow the procedure given below to enable a media stream for each WLAN:

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.

	Command or Action	Purpose
<b>Step 2</b>	<b>wlan</b> <i>wlan_name</i>  <b>Example:</b> Device(config)# wlan wlan5	Enters WLAN configuration mode.
<b>Step 3</b>	<b>shutdown</b>  <b>Example:</b> Device(config-wlan)# shutdown	Disables the WLAN for configuring its parameters.
<b>Step 4</b>	<b>media-stream multicast-direct</b>  <b>Example:</b> Device(config-wlan)# media-stream multicast-direct	Configures multicast-direct for the WLAN.
<b>Step 5</b>	<b>no shutdown</b>  <b>Example:</b> Device(config-wlan)# no shutdown	Enables the WLAN.

## Configuring the General Parameters for a Media Stream (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Wireless > Media Stream**.
- Step 2** Check the **Multicast Direct Enable** check box to enable multicast direct globally on the local mode.
- Step 3** In the **Session Message Config** section, enter the values for the following parameters
- Session Announcement URL
  - Session Announcement Email
  - Session Announcement Phone
  - Session Announcement Note
- Step 4** Save the configuration.
- 

## Configuring the General Parameters for a Media Stream (CLI)

Follow the procedure given below to configure the general parameters for a media stream:

**Procedure**

	<b>Command or Action</b>	<b>Purpose</b>
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wireless media-stream message</b> { <b>URL</b> <i>url</i>   <b>email</b> <i>email-address</i>   <b>phone</b> <i>phone-no</i>   <b>notes</b> <i>notes</i> } <b>Example:</b> Device(config)# wireless media-stream message url www.xyz.com	Configures various message configuration parameters, such as phone, URL, email, and notes.
<b>Step 3</b>	<b>wireless media-stream multicast-direct</b> <b>Example:</b> Device(config)# wireless media-stream multicast-direct	Enables multicast direct globally for local mode. <b>Note</b> This configuration will not impact flex and fabric media-stream configurations.
<b>Step 4</b>	<b>exit</b> <b>Example:</b> Device(config)# exit	Returns to privileged EXEC mode.

## Configuring Multicast Direct Admission Control (GUI)

**Procedure**

- 
- Step 1** Choose **Configuration > Wireless > Media Stream**.
- Step 2** Check the **Media Stream Admission Control (ACM)** check box to enable multicast direct admission control.
- Step 3** In the **Maximum Media Stream RF bandwidth (%)** field, enter the percentage of the maximum bandwidth to be allocated for media applications on this radio band. Valid range is from 5 to 85. When the client reaches a specified value, the AP rejects new calls on this radio band.
- Step 4** In the **Maximum Media Bandwidth (%)** field, enter the bandwidth. Valid range is from 5 to 85%.
- Step 5** From the **Client Minimum Phy Rate** drop-down list, select the minimum transmission data rate or the rate in kilobits per second at which the client can operate. If the transmission data rate is below the physical rate, either the video will not start or the client may be classified as a bad client. The bad client video can be demoted for better effort QoS or subject to denial.
- Step 6** In the **Maximum Retry Percent (%)** field, enter the percentage of maximum retries that are allowed. The default value is 80. If it exceeds 80, either the video will not start or the client might be classified as a bad client. The bad client video can be demoted for better effort QoS or subject to denial.
- Step 7** Click **Apply**.
-

# Configuring Multicast Direct Admission Control (CLI)

Follow the procedure given below to configure multicast direct admission control:

## Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>ap dot11 {24ghz   5ghz   6ghz} shutdown</b>  <b>Example:</b> Device(config)# ap dot11 24ghz shutdown	Disables the 802.11 network.
<b>Step 3</b>	<b>ap dot11 {24ghz   5ghz   6ghz} media-stream video-redirect</b>  <b>Example:</b> Device(config)# ap dot11 24ghz media-stream video-redirect	Configures the redirection of the unicast video traffic to best-effort queue.
<b>Step 4</b>	<b>ap dot11 {24ghz   5ghz   6ghz} cac media-stream acm</b>  <b>Example:</b> Device(config)# ap dot11 24ghz cac media-stream acm	Enables admission control on the media-stream access category.
<b>Step 5</b>	<b>ap dot11 {24ghz   5ghz   6ghz} cac media-stream max-bandwidth <i>bandwidth</i></b>  <b>Example:</b> Device(config)# ap dot11 24ghz cac media-stream max-bandwidth 65	Configures the maximum media bandwidth, in percent. The range is between 5-85%.
<b>Step 6</b>	<b>ap dot11 {24ghz   5ghz   6ghz} cac multimedia max-bandwidth <i>bandwidth</i></b>  <b>Example:</b> Device(config)# ap dot11 24ghz cac multimedia max-bandwidth 65	Configures the maximum bandwidth allocated to Wi-Fi Multimedia (WMM) clients for media. The range is between 5-85%.
<b>Step 7</b>	<b>ap dot11 {24ghz   5ghz   6ghz} cac media-stream multicast-direct min-client-rate <i>dot11Rate</i></b>  <b>Example:</b> Device(config)# ap dot11 24ghz cac media-stream multicast-direct min-client-rate 800	Configures the minimum PHY rate needed for a client to receive media stream as unicast. Clients communicating below this rate will not receive the media stream as a unicast flow. Typically, this PHY rate is equal to or higher than the rate at which multicast frames are sent.

	Command or Action	Purpose
<b>Step 8</b>	<b>ap dot11 {24ghz   5ghz   6ghz} cac media-stream multicast-direct max-retry-percent <i>retryPercent</i></b>  <b>Example:</b> Device(config)# ap dot11 24ghz cac media-stream multicast-direct max-retry-percent 50	Configures CAC parameter maximum retry percent for multicast-direct streams.
<b>Step 9</b>	<b>ap dot11 {24ghz   5ghz   6ghz} media-stream multicast-direct radio-maximum <i>value</i></b>  <b>Example:</b> Device(config)# ap dot11 24ghz media-stream multicast-direct radio-maximum 10	Configures the maximum number of radio streams. The range is from 1 to 20. Default is 0. Value 0 denotes unlimited streams.
<b>Step 10</b>	<b>ap dot11 {24ghz   5ghz   6ghz} media-stream multicast-direct client-maximum <i>value</i></b>  <b>Example:</b> Device(config)# ap dot11 24ghz media-stream multicast-direct client-maximum 12	Configures the maximum number of allowed media streams per individual client. The maximum is 15 and the default is 0. Value 0 denotes unlimited streams.
<b>Step 11</b>	<b>ap dot11 {24ghz   5ghz   6ghz} media-stream multicast-direct admission-besteffort</b>  <b>Example:</b> Device(config)# ap dot11 24ghz media-stream multicast-direct admission-besteffort	Configures the media stream to still be sent through the best effort queue if a media stream cannot be prioritized due to bandwidth availability limitations. Add <b>no</b> in the command to drop the stream if the media stream cannot be prioritized due to bandwidth availability limitations.
<b>Step 12</b>	<b>no ap dot11 {24ghz   5ghz   6ghz} shutdown</b>  <b>Example:</b> Device(config)# no ap dot11 24ghz shutdown	Enables the 802.11 network.

## Create and Attach Policy-based QoS Profile

The high-level steps to create and attach policy-based QoS profile are as follows:

1. Create a QoS Profile
2. Create a Service Template
3. Map the Service Template to the Policy Map
4. Map the Policy Map to the Policy Profile

## Create a QoS Profile (GUI)

### Procedure

- 
- Step 1** Click **Configuration > Services > QoS**.
  - Step 2** Click **Add** to create a new QoS Policy.
  - Step 3** Enter a **Policy Name**.
  - Step 4** Enter a **Description** for the policy.
  - Step 5** In the **Class Default** section, choose a value in the **Mark** drop-down list.
  - Step 6** Enter the **Police(kbps)** value.
  - Step 7** Click **Apply to Device**.
- 

## Create a QoS Profile (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>policy-map <i>policy-map-name</i></b>  <b>Example:</b> Device(config)# policy-map QoS_Drop_Youtube	Creates a policy map.
<b>Step 3</b>	<b>description <i>description</i></b>  <b>Example:</b> Device(config-pmap)# description QoS_Drop_Youtube	Adds a description to the policy map.
<b>Step 4</b>	<b>class <i>class-map-name</i></b>  <b>Example:</b> Device(config-pmap)# class QoS_Drop_Youtube1_AVC_UI_CLASS	Creates a policy criteria.
<b>Step 5</b>	<b>police cir <i>committ-information-rate</i></b>  <b>Example:</b> Device(config-pmap-c)# police cir 8000	Polices the provided committed information rate.
<b>Step 6</b>	<b>conform-action drop</b>  <b>Example:</b>	Configures the action when the rate is less than the conform burst.

	Command or Action	Purpose
	<code>Device(config-pmap-c-police)# conform-action drop</code>	
<b>Step 7</b>	<b>exceed-action drop</b> <b>Example:</b> <code>Device(config-pmap-c-police)# exceed-action drop</code>	Configures the action when the rate is within the conform and conform plus exceed burst.
<b>Step 8</b>	<b>end</b> <b>Example:</b> <code>Device(config-pmap-c-police)# end</code>	Returns to privileged EXEC mode.

## Create a Service Template (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Security > Local Policy**.
- Step 2** On the **Local Policy** page, **Service Template** tab, click **Add**.
- Step 3** In the **Create Service Template** window, enter the following parameters:
- **Service Template Name:** Enter a name for the template.
  - **VLAN ID:** Enter the VLAN ID for the template. Valid range is between 1 and 4094.
  - **Session Timeout (secs):** Sets the timeout duration for the template. Valid range is between 1 and 65535.
  - **Access Control List:** Choose the Access Control List from the drop-down list.
  - **Ingress QoS:** Choose the input QoS policy for the client from the drop-down list
  - **Egress QoS:** Choose the output QoS policy for the client from the drop-down list.
- Step 4** Click **Apply to Device**.
- 

## Create a Service Template (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> <code>Device# configure terminal</code>	Enters global configuration mode.

	Command or Action	Purpose
<b>Step 2</b>	<b>service-template</b> <i>template-name</i> <b>Example:</b> Device(config)# service-template qos-template	Configures the service-template or identity policy.
<b>Step 3</b>	<b>vlan</b> <i>vlan-id</i> <b>Example:</b> Device(config-service-template)# vlan 87	Specifies VLAN ID.
<b>Step 4</b>	<b>absolute-timer</b> <i>timer</i> <b>Example:</b> Device(config-service-template)# absolute-timer 3600	Specifies session timeout value for a service template.
<b>Step 5</b>	<b>service-policy qos input</b> <i>qos-policy</i> <b>Example:</b> Device(config-service-template)# service-policy qos input QoS_Drop_Youtube	Configures an input QoS policy for the client.
<b>Step 6</b>	<b>service-policy qos output</b> <i>qos-policy</i> <b>Example:</b> Device(config-service-template)# service-policy qos output QoS_Drop_Youtube	Configures an output QoS policy for the client.
<b>Step 7</b>	<b>end</b> <b>Example:</b> Device(config-service-template)# end	Returns to privileged EXEC mode.

## Map the Service Template to the Policy Map (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Tags & Profiles > Policy**.
  - Step 2** On the **Policy Profile** page, select the **Policy Profile** to be mapped.
  - Step 3** In the **Edit Policy Profile** window, click **Access Policies** tab.
  - Step 4** Use the **Local Subscriber Policy Name** drop-down list to select the policy name.
  - Step 5** Click **Update & Apply to Device**.
-

## Map the Service Template to the Policy Map (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>parameter-map type subscriber</b> <b>attribute-to-service</b> <i>parameter-map-name</i> <b>Example:</b> Device(config)# parameter-map type subscriber attribute-to-service QoS-Policy_Map-param	Specifies the parameter map type and name.
<b>Step 3</b>	<b>map-index</b> <b>map device-type eq</b> <i>filter-name</i> <b>user-role eq</b> <i>user-name</i> <b>Example:</b> Device(config-parameter-map-filter)# 1 map device-type eq "Android" user-role eq "student"	Specifies the parameter map attribute filter criteria. Multiple filters are used in the example provided here.
<b>Step 4</b>	<b>map-index</b> <b>service-template</b> <i>service-template-name</i> <b>precedence</b> <i>precedence-num</i> <b>Example:</b> Device(config-parameter-map-filter-submode)# 1 service-template Qos_template	Specifies the service template.
<b>Step 5</b>	<b>end</b> <b>Example:</b> Device(config-parameter-map-filter-submode)# end	Returns to privileged EXEC mode.
<b>Step 6</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 7</b>	<b>policy-map type control subscriber</b> <i>policy-map-name</i> <b>Example:</b> Device(config)# policy-map type control subscriber QoS-Policy_Map	Specifies the policy map type.
<b>Step 8</b>	<b>event identity-update match-all</b> <b>Example:</b>	Specifies the match criteria to the policy map.

	Command or Action	Purpose
	Device (config-event-control-policymap) # event identity-update match-all	
<b>Step 9</b>	<b>class-num class always do-until-failure</b>  <b>Example:</b> Device (config-event-control-policymap) # 1 class always do-until-failure	Applies a class-map with a service-template.
<b>Step 10</b>	<b>action-index map attribute-to-service table</b> <i>parameter-map-name</i>  <b>Example:</b> Device (config-event-control-policymap) # 1 map attribute-to-service table QoS-Policy_Map-param	Applies a parameter map.

## Map the Policy Map (GUI)

### Procedure

- 
- Step 1** Choose **Configuration** > **Security** > **Local Policy** > **Policy Map** tab.
  - Step 2** Click **Add**.
  - Step 3** Enter a name in the **Policy Map Name** text field.
  - Step 4** Click **Add** to add the matching criteria information.
  - Step 5** Choose the service template from the **Service Template** drop-down list.
  - Step 6** Choose the filters from **Device Type**, **User Role**, **User Name**, **OUI** and **MAC Address** drop-down lists.
  - Step 7** Click **Add Criteria**
  - Step 8** Click **Apply to Device**.
- 

## Map the Policy Map (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wireless profile policy</b> <i>wlan-policy-profile-name</i>  <b>Example:</b>	Configures a wireless policy profile.

	Command or Action	Purpose
	Device(config)# wireless profile policy test-policy-profile	
<b>Step 3</b>	<b>description</b> <i>profile-policy-description</i> <b>Example:</b> Device(config-wireless-policy)# description "test policy profile"	Adds a description for the policy profile.
<b>Step 4</b>	<b>subscriber-policy-name</b> <i>policy-name</i> <b>Example:</b> Device(config-wireless-policy)# subscriber-policy-name QoS-Policy_Map	Configures the subscriber policy name.

## Viewing Media Stream Information

Use the following **show** commands to view the media stream information.

To view media stream general information and status, use the following commands:

```
Device# show wireless media-stream multicast-direct state

Multicast-direct State..... : enabled
Allowed WLANs:
WLAN-Name WLAN-ID

zsetup_mc 1
vwlc-mc_mo 3
mcuc_test1 4
mcuc_test2 5
```

```
Device# show wireless media-stream group summary
```

```
Number of Groups:: 4
```

```
Stream Name Start IP End IP Status

new2 231.2.2.3 231.2.4.4 Enabled
my234 234.0.0.0 234.10.10.10 Enabled
uttest2 235.1.1.20 235.1.1.25 Enabled
uttest3 235.1.1.40 235.1.1.200 Enabled
```

To view the details of a particular media stream, use the **show wireless media-stream client detail media\_stream\_name** command:

```
Device# show wireless media-stream group detail uttest2
```

```
Media Stream Name : uttest2
Start IP Address : 235.1.1.20
End IP Address : 235.1.1.25
RRC Parameters:
 Avg Packet Size(Bytes) : 1200
 Expected Bandwidth(Kbps) : 1000
```

```

Policy : Admitted
RRC re-evaluation : Initial
QoS : video
Status : Multicast-direct
Usage Priority : 4
Violation : Drop

```

To view RRC information for a dot11 band, use the **show ap dot11 {24ghz | 5ghz | 6ghz} mediastream rrc** command:

```
Device# show ap dot11 5ghz media-stream rrc
```

```

Multicast-direct : Enabled
Best Effort : Disabled
Video Re-Direct : Disabled
Max Allowed Streams Per Radio : Auto
Max Allowed Streams Per Client : 5
Max Media-Stream Bandwidth : 5
Max Voice Bandwidth : 50
Max Media Bandwidth : 43
Min PHY Rate (Kbps) : 6000
Max Retry Percentage : 5

```

To view session announcement message details, use the **show wireless media-stream message details** command:

```
Device# show wireless media-stream message details
```

```

URL :
Email : abc@cisc
Phone :
Note :
State : Disabled

```

To view the list of clients in the blocked list database, use the **show ip igmp snooping igmpv2-tracking** command:

```
Device# show ip igmp snooping igmpv2-tracking
```

```

Client to SGV mappings

Client: 10.10.10.215 Port: Ca1
 Group: 239.255.255.250 Vlan: 10 Source: 0.0.0.0 blacklisted: no

## Information to Software-Defined Access Wireless

The Enterprise Fabric provides end-to-end enterprise-wide segmentation, flexible subnet addressing, and controller-based networking with uniform enterprise-wide policy and mobility. It moves the enterprise network from current VLAN-centric architecture to a user group-based enterprise architecture, with flexible Layer 2 extensions within and across sites.

Enterprise fabric is a network topology where traffic is passed through inter-connected switches, while providing the abstraction of a single Layer 2 or Layer 3 device. This provides seamless connectivity, with policy application and enforcement at the edge of the fabric. Fabric uses IP overlay, which makes the network appear as a single virtual entity without using clustering technologies.

The following definitions are used for fabric nodes:

- **Enterprise Fabric:** A network topology where traffic is passed through inter-connected switches, while providing the abstraction of a single Layer 2 or Layer 3 device.
- **Fabric Domain:** An independent operation part of the network. It is administered independent of other fabric domains.
- **End Points:** Hosts or devices that connect to the fabric edge node are known as end points (EPs). They directly connect to the fabric edge node or through a Layer 2 network.

The following figure shows the components of a typical SD-Access Wireless. It consists of Fabric Border Nodes (BN), Fabric Edge Nodes (EN), Wireless Controller, Cisco Catalyst Center, and Host Tracking Database (HDB).

Figure 51: Software-Defined Access Wireless

The figure covers the following deployment topologies:

- All-in-one Fabric—When we have all Fabric Edge, Fabric Border, Control-Plane and controller functionality enabled on a Cat 9K switch. This topology is depicted in the mid part of the figure.
- Split topology—When we have Fabric Border, or Control Plane, or controller on a Cat 9K switch with separate Fabric Edge. This topology is depicted in the left-most part of the figure.
- Co-located Fabric Edge and Controller—When we have Fabric Edge and controller on a Cat 9K switch. This topology is depicted in the right-most part of the figure.

**Cisco Catalyst Center:** Is an open, software-driven architecture built on a set of design principles with the objective of configuring and managing Cisco Catalyst 9800 Series Wireless Controllers.

**Control Plane:** This database allows the network to determine the location of a device or user. When the EP ID of a host is learnt, other end points can query the database about the location of the host. The flexibility of tracking subnets helps in summarization across domains and improves the scalability of the database.

**Fabric Border Node (Proxy Egress Tunnel Router [PxTR or PITR/PETR] in LISP):** These nodes connect traditional Layer 3 networks or different fabric domains to the enterprise fabric domain. If there are multiple fabric domains, these nodes connect a fabric domain to one or more fabric domains, which could be of the same or different type. These nodes are responsible for translation of context from one fabric domain to another. When the encapsulation is the same across different fabric domains, the translation of fabric context is generally 1:1. The fabric control planes of two domains exchange reachability and policy information through this device.

**Fabric Edge Nodes (Egress Tunnel Router [ETR] or Ingress Tunnel Router [ITR] in LISP):** These nodes are responsible for admitting, encapsulating or decapsulating, and forwarding of traffic from the EPs. They lie at the perimeter of the fabric and are the first points of attachment of the policy. EPs could be directly or indirectly attached to a fabric edge node using an intermediate Layer 2 network that lies outside the fabric domain. Traditional Layer 2 networks, wireless access points, or end hosts are connected to fabric edge nodes.

**Wireless Controller:** The controller provides AP image and configuration management, client session management and mobility. Additionally, it registers the mac address of wireless clients in the host tracking database at the time of client join, as well as updates the location at the time of client roam.

**Access Points:** AP applies all the wireless media specific features. For example, radio and SSID policies, webauth punt, peer-to-peer blocking, and so on. It establishes CAPWAP control and data tunnel to controller. It converts 802.11 data traffic from wireless clients to 802.3 and sends it to the access switch with VXLAN encapsulation.

The SDA allows to simplify:

- Addressing in wireless networks
- Mobility in wireless networks
- Guest access and move towards multi-tenancy
- Leverage Sub-net extension (stretched subnet) in wireless network
- Provide consistent wireless policies

**Note** Role co-location between wireless controller and fabric edge is supported.

## Platform Support

*Table 137: Supported Platforms for Software-Defined Access Wireless*

Platforms	Support
Catalyst 9300	Yes
Catalyst 9400	Yes
Catalyst 9500H	Yes
Cisco Catalyst 9800 Series Wireless Controller for Cloud	Yes
Cisco Catalyst 9800-40 Series Wireless Controller	Yes
Cisco Catalyst 9800-80 Series Wireless Controller	Yes

*Table 138: Multi-Instance Support*

Multi-instance	Support
Multiple LISP sessions	Yes

Multi-instance	Support
Emulated database support	Yes
Client roaming between WNCd instances	Yes

Table 139: Feature Support

Feature	Support
Inter-WLC roam for IRCM	Only L2 mobility is supported as VLAN is stretched across the fabric.
DNS-IPv4-ACL	<ul style="list-style-type: none"> <li>• ACLs are enforced at AP.</li> <li>• Controller needs to push the DNS-ACL information to AP.</li> </ul>
IPv6 ACL for clients	Yes. Open, 802.11x, WebAuth, PSK WLANs, IPv6 address visibility are also supported.
Location tracking/Hyperlocation	Yes
Multicast Video-Stream (IPv4)	Yes
Smart Licensing	Yes

Table 140: Outdoor Access Points Support

AP	Support
1542	Yes
1560	Yes

## Information About SD-Access Wireless Mesh Inter Fabric Edge Switch Roaming Protection

When a Mesh AP (MAP) finds a Root AP (RAP) or other MAP with better adjacency, it roams to that RAP or MAP. However, a MAP cannot roam to another MAP or RAP connected to a different fabric edge switch due to wireless client connectivity loss. The reason being the VXLAN tunnels of the wireless client cannot be moved to another fabric edge switch.

However, if the current MAP link is much worse than the link to RAP or MAP connected to a different fabric edge switch, then the MAP roams and restart its CAPWAP tunnel.

Thus, all the MAPs connected to the MAP restarts the CAPWAP tunnels as well. This allows the wireless clients to connect again and creates wireless client VXLAN tunnels in the fabric edge.

---

**Note** The criteria for a MAP roaming to a RAP or MAP connected to a different fabric edge switch are the same as the mesh preferred parent. They are:

- If the current link SNR is worse than 12 dB and there is another better link. (Or)
- If the current link SNR is worse than 20 dB and there is another link with 20% or better SNR.

The mesh daisy chain roaming is not supported in RAP or MAP connected to different fabric edge switches.

---

### SDA IPv6 Underlay Support

This feature provides a wireless SDA IPv6 underlay support to enable IPv6-based communications in a fabric site. IPv6 is used to establish LISP connections between the controller and map server as well as between the map server and Fabric Edge. IPv6 underlay is also used to construct a VXLAN tunnel between the Fabric Edge and the AP.

The feature implementation is as follows:

- **Catalyst 9800 Controller:**
  - The controller manages IPv6-based LISP sessions to the map server
  - Encodes, decodes, and processes LISP messages through IPv6 TCP/UDP sockets.)
  - Communicates RLOC IPv6 address to the AP for VXLAN creation and client tunnel mapping
- **Fabric Edge:**
  - Processes map notification from map server
  - Creates IPv6 VXLAN tunnel
  - Maps client to IPv6 VXLAN tunnel
  - Encapsulates and decapsulates client traffic into and out of VXLAN tunnel
- **Access Points:**
  - Processes fabric TLV from the controller
  - Creates IPv6 VXLAN tunnel
  - Encapsulates and decapsulates client traffic into and out of VXLAN tunnel

The following figure shows the feature architecture:

**Note** For AP to join controller using IPv6 address, ensure that you configure the preferred mode in AP profile as IPv6.

### Restrictions

Embedded wireless controller (EWC) on Catalyst 9k switches is not supported.

## Configuring SD-Access Wireless

- To enable SD-Access wireless globally, you need to run the **wireless fabric** configuration command.
- During SD-Access Wireless provisioning, ensure that L2-VNID value is unique.

## Configuring Default Map Server (GUI)

### Procedure

- 
- Step 1** Click **Configuration > Wireless Plus > Fabric > Fabric Configuration**.
  - Step 2** In the **Map Server** section, specify the IP address and preshared key details for Server 1.
  - Step 3** Optionally, you can specify the IP address and preshared key details for Server 2.
  - Step 4** Click **Apply**.
- 

## Configuring Default Map Server (CLI)

Follow the procedure given below to configure default map server:

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters the global configuration mode.
<b>Step 2</b>	<b>wireless fabric control-plane <i>map-server-name</i></b>  <b>Example:</b> Device(config)# wireless fabric control-plane map-server-name	Configures the default map server.  Here, <i>map-server-name</i> defines a pair of map servers.
<b>Step 3</b>	<b>ip address <i>ip-address</i> key <i>user_password</i> <i>reenter_password</i></b>  <b>Example:</b> Device(config-wireless-cp)# ip address 200.0.0.0 key user-password user-password	Configures IP address for the default map server.
<b>Step 4</b>	<b>end</b>  <b>Example:</b> Device(config-wireless-cp)# end	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Configuring SD-Access Wireless Profile (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Wireless > Fabric**.
  - Step 2** On the **Fabric** page, click the **Profiles** tab and click **Add**.

**Step 3** In the **Add New Profile** window that is displayed, specify the following parameters:

- Profile name
- Description
- L2 VNID; valid range is between 0 and 16777215
- SGT tag; valid range is between 2 and 65519

**Step 4** Click **Save & Apply to Device**.

## Configuring SD-Access Wireless Profile (CLI)

Follow the procedure given below to configure SD-Access wireless profile:

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters the global configuration mode.
<b>Step 2</b>	<b>wireless profile fabric</b> <i>fabric-profile-name</i>  <b>Example:</b> Device(config)# wireless profile fabric fabric-profile-name	Configures the SD-Access wireless profile parameters.
<b>Step 3</b>	<b>sgt-tag</b> <i>sgt</i>  <b>Example:</b> Device(config-wireless-fabric)# sgt-tag 2	Configures SGT tag.  Here, <i>sgt</i> refers to the sgt tag value. The valid range is from 2-65519. The default value is 0.
<b>Step 4</b>	<b>client-l2-vnid</b> <i>client-l2-vnid</i>  <b>Example:</b> Device(config-wireless-fabric)# client-l2-vnid client-l2-vnid	Configures client L2-VNID.  Here, <i>client-l2-vnid</i> refers to the client L2-VNID value. The valid range is from 0-16777215.
<b>Step 5</b>	<b>end</b>  <b>Example:</b> Device(config-wireless-fabric)# end	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Configuring Map Server in Site Tag (GUI)

### Before you begin

Ensure that you have configured a control plane at the time of configuring Wireless Fabric.

### Procedure

- 
- Step 1** Choose **Configuration > Tags & Profiles > Tags**.
  - Step 2** On the **Manage Tags** page, click the **Site** tab.
  - Step 3** Click the name of the site tag.
  - Step 4** In the **Edit Site Tag** window, choose the Fabric control plane name from the **Control Plane Name** drop-down list.
  - Step 5** Save the configuration.
- 

## Configuring Map Server in Site Tag (CLI)

Follow the procedure given below to configure map server in site tag:

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters the global configuration mode.
<b>Step 2</b>	<b>wireless tag site <i>site-tag</i></b>  <b>Example:</b> Device(config)# wireless tag site default-site-tag	Configures site tag.  Here, <i>site-tag</i> refers to the site tag name.
<b>Step 3</b>	<b>fabric control-plane <i>map-server-name</i></b>  <b>Example:</b> Device(config-site-tag)# fabric control-plane map-server-name	Configures fabric control plane details.  Here, <i>map-server-name</i> refers to the fabric control plane name associated with the site tag.
<b>Step 4</b>	<b>end</b>  <b>Example:</b> Device(config-site-tag)# end	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Configuring Map Server per L2-VNID (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Wireless > Fabric**.
  - Step 2** On the **Fabric Configuration** page in the **Fabric VNID Mapping** section, click **Add**.
  - Step 3** In the **Add Client and AP VNID** window, specify a name for the Fabric, L2 VNID value (valid range is from 0 to 4294967295), control plane name.

**Step 4** Save the configuration.

## Configuring Map Server per L2-VNID (CLI)

Follow the procedure given below to configure map server in site tag:

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters the global configuration mode.
<b>Step 2</b>	<b>wireless fabric name name l2-vnid l2-vnid-value l3-vnid l3-vnid-value ip network-ip subnet-mask control-plane-name control-plane-name</b>  <b>Example:</b> Device(config)# wireless fabric name fabric_name l2-vnid 2 l3-vnid 2 ip 122.220.234.0 255.255.0.0 control-plane-name sample-control-plane	Configures the map server to the VNID map table. <ul style="list-style-type: none"> <li>• <i>name</i> refers to the fabric name.</li> <li>• <i>l2-vnid-value</i> refers to the L2 VNID value. The valid range is from 0 to 16777215.</li> <li>• <i>l3-vnid-value</i> refers to the L3 VNID value. The valid range is from 0 to 16777215.</li> <li>• <i>control-plane-name</i> refers to the control plane name.</li> </ul>
<b>Step 3</b>	<b>end</b>  <b>Example:</b> Device(config)# end	Returns to privileged EXEC mode.

## Verifying SD-Access Wireless

You can verify the SD-Access wireless configurations using the following commands:

**Table 141: Commands for Verifying SD-Access Wireless**

Commands	Description
<b>show wireless fabric summary</b>	Displays the fabric status.
<b>show wireless fabric vnid mapping</b>	Displays all the VNID mapping details.
<b>show wireless profile fabric detailed fabric_profile_name</b>	Displays the details of a given fabric profile name.
<b>show ap name AP_name config general</b>	Displays the general details of the Cisco AP.

Commands	Description
<b>show wireless client mac</b> <i>MAC_addr</i> <b>detail</b>	Displays the detailed information for a client by MAC address.
<b>show wireless tag site detailed</b> <i>site_tag</i>	Displays the detailed parameters for a site tag.

- [Enabling ARP Broadcast on VLAN \(CLI\)](#), on page 1897
- [Configuring Passive Client in Fabric Deployment](#), on page 1898
- [Verifying Passive Client Configuration](#), on page 1901

## Information About Passive Clients

Passive Clients are wireless devices, such as printers and devices configured using a static IP address. Such clients do not transmit any IP information after associating to an AP. That is why, the controller does not learn their IP address unless they perform the DHCP process.

In the controller, the clients just show up in the **Learn IP** state and get timed out because of the DHCP policy-timeout.

The Passive Client feature can be enabled on a per WLAN basis. Enabling this feature will change a few default behaviors in order to better accommodate passive clients. These changes include :

- No client will ever timeout in the IP\_LEARN phase. The controller will keep on waiting to learn their IP address. Note that the idle timeout remains active and will delete the client entry after the timeout period expiry, if the client remains silent all along.
- ARP coming from the wired side is broadcasted to all the APs, if the controller does not know the client IP address, to ensure that it reaches the passive client. After this, the controller learns the client IP from the ARP response.

**Note** In order to save air time, the controller transforms the ARP broadcast coming from the wired side or from other wireless clients and unicasts them to the wireless client it owns. This is only possible after the controller has learned the MAC-IP binding of its wireless client.

When the controller enables ARP broadcast, the controller does not transform the ARP broadcasts into unicasts but only forwards the broadcast, thereby wasting air time for other clients (with a frame that is not acknowledgeable and therefore less reliable). This pushes the passive client to respond to the ARP request and therefore every other client benefits from learning the MAC-IP binding of the wireless client.

**Note** Passive client feature is not supported on FlexConnect local switching mode.

## Enabling Passive Client on WLAN Policy Profile (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Tags & Profiles > Policy** page, click **Add** to open the **Add Policy Profile** page.
  - Step 2** In the **General** tab, use the slider to enable **Passive Client**.
  - Step 3** Click **Save & Apply to Device**.
- 

## Enabling Passive Client on WLAN Policy Profile (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wireless profile policy <i>policy-profile</i></b> <b>Example:</b> Device(config)# wireless profile policy rr-xyz-policy-1	Configures WLAN policy profile and enters wireless policy configuration mode.
<b>Step 3</b>	<b>[no] passive-client</b> <b>Example:</b> Device(config-wireless-policy)# [no] passive-client	Enables Passive Client.

	Command or Action	Purpose
<b>Step 4</b>	<b>end</b> <b>Example:</b> Device(config-wireless-policy)# end	Returns to privileged EXEC mode.

## Enabling ARP Broadcast on VLAN (GUI)

### Procedure

- Step 1** Choose **Configuration > Layer2 > VLAN** page, click **VLAN** tab.
- Step 2** Click **Add** to view the **Create VLAN** window.
- Step 3** Use the slider to enable **ARP Broadcast**.
- Step 4** Click **Save & Apply to Device**.

## Enabling ARP Broadcast on VLAN (CLI)

**Note** ARP Broadcast feature is not supported on VLAN groups.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>vlan configuration <i>vlan-id</i></b> <b>Example:</b> Device(config)# vlan configuration 1	Configures a VLAN or a collection of VLANs and enters VLAN configuration mode.
<b>Step 3</b>	<b>[no] arp broadcast</b> <b>Example:</b> Device(config-vlan)# [no] arp broadcast	Enables ARP broadcast on VLAN.
<b>Step 4</b>	<b>end</b> <b>Example:</b> Device(config-vlan)# end	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

# Configuring Passive Client in Fabric Deployment

You need to enable the following for passive client feature to work:

- ARP broadcast on VLANs
- LISP multicast. For information on LISP multicast, see:

[https://www.cisco.com/c/en/us/td/docs/ios-xml/ios/iproute\\_lisp/configuration/xe-3s/irl-xe-3s-book/irl-lisp-multicast.html](https://www.cisco.com/c/en/us/td/docs/ios-xml/ios/iproute_lisp/configuration/xe-3s/irl-xe-3s-book/irl-lisp-multicast.html)

For information on LISP (Locator ID Separation Protocol), see:

[https://www.cisco.com/c/en/us/td/docs/ios-xml/ios/iproute\\_lisp/configuration/xe-3s/irl-xe-3s-book/irl-cfg-lisp.html](https://www.cisco.com/c/en/us/td/docs/ios-xml/ios/iproute_lisp/configuration/xe-3s/irl-xe-3s-book/irl-cfg-lisp.html)

## Enabling Broadcast Underlay on VLAN

**Note** You can perform the following configuration tasks from Fabric Edge Node only and not from your controller.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> FabricEdge# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>router lisp</b>  <b>Example:</b> FabricEdge(config)# router lisp	Enters LISP configuration mode.
<b>Step 3</b>	<b>instance-id <i>instance</i></b>  <b>Example:</b> FabricEdge(config-router-lisp)# instance-id 3	Creates a LISP EID instance to group multiple services. Configurations under this instance-id are applicable to all services underneath it.
<b>Step 4</b>	<b>service ipv4</b>  <b>Example:</b> FabricEdge(config-router-lisp-instance)# service ipv4	Enables Layer 3 network services for the IPv4 address family and enters the service submode.
<b>Step 5</b>	<b>database-mapping <i>eid locator-set RLOC name</i></b>  <b>Example:</b>	Configures EID to RLOC mapping relationship.

	Command or Action	Purpose
	<pre>FabricEdge(config-router-lisp-instance-dynamic-eid)# database-mapping 66.66.66.64/32 locator-set rloc1</pre>	
<b>Step 6</b>	<b>map-cache destination-eid map-request</b> <b>Example:</b> <pre>FabricEdge(config-router-lisp-instance-service)# map-cache 0.0.0.0/0 map-request</pre>	Generates a static map request for the destination EID.
<b>Step 7</b>	<b>exit-service-ipv4</b> <b>Example:</b> <pre>FabricEdge(config-router-lisp-instance-service)# exit-service-ipv4</pre>	Exits service submode.
<b>Step 8</b>	<b>exit-instance-id</b> <b>Example:</b> <pre>FabricEdge(config-router-lisp-instance)# exit-instance-id</pre>	Exits instance submode.
<b>Step 9</b>	<b>instance-id instance</b> <b>Example:</b> <pre>FabricEdge(config-router-lisp)# instance-id 101</pre>	Creates a LISP EID instance to group multiple services.
<b>Step 10</b>	<b>service ethernet</b> <b>Example:</b> <pre>FabricEdge(config-router-lisp-instance)# service ethernet</pre>	Enables Layer 2 network services and enters service submode.
<b>Step 11</b>	<b>eid-table vlan vlan-number</b> <b>Example:</b> <pre>FabricEdge(config-router-lisp-instance-service)# eid-table vlan 101</pre>	Associates the LISP instance-id configured earlier with a VLAN through which the endpoint identifier address space is reachable.
<b>Step 12</b>	<b>broadcast-underlay multicast-group</b> <b>Example:</b> <pre>FabricEdge(config-router-lisp-instance-service)# broadcast-underlay 239.0.0.1</pre>	Specifies the multicast group used by the underlay to carry the overlay Layer 2 broadcast traffic.
<b>Step 13</b>	<b>exit-service-ethernet</b> <b>Example:</b> <pre>FabricEdge(config-router-lisp-instance-service)# exit-service-ethernet</pre>	Exits service sub mode.
<b>Step 14</b>	<b>exit-instance-id</b> <b>Example:</b> <pre>FabricEdge(config-router-lisp-instance)# exit-instance-id</pre>	Exits instance sub mode.

## Enabling ARP Flooding

**Note** You can perform the following configuration tasks from Fabric Edge Node only and not from your controller.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> FabricEdge# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>router lisp</b> <b>Example:</b> FabricEdge(config)# router lisp	Enters LISP configuration mode.
<b>Step 3</b>	<b>instance-id <i>instance</i></b> <b>Example:</b> FabricEdge(config-router-lisp)# instance-id 3	Creates a LISP EID instance to group multiple services. Configurations under this instance-id are applicable to all services underneath it.
<b>Step 4</b>	<b>service ipv4</b> <b>Example:</b> FabricEdge(config-router-lisp-instance)# service ipv4	Enables Layer 3 network services for the IPv4 address family and enters the service submode.
<b>Step 5</b>	<b>database-mapping <i>eid locator-set RLOC name</i></b> <b>Example:</b> FabricEdge(config-router-lisp-instance-dynamic-eid)# database-mapping 66.66.66.64/32 locator-set rloc1	Configures EID to RLOC mapping relationship.
<b>Step 6</b>	<b>map-cache <i>destination-eid map-request</i></b> <b>Example:</b> FabricEdge(config-router-lisp-instance-service)# map-cache 0.0.0.0/0 map-request	Generates a static map request for the destination EID.
<b>Step 7</b>	<b>exit-service-ipv4</b> <b>Example:</b> FabricEdge(config-router-lisp-instance-service)# exit-service-ipv4	Exits service submode.
<b>Step 8</b>	<b>exit-instance-id</b> <b>Example:</b>	Exits instance submode.

	Command or Action	Purpose
	<code>FabricEdge (config-router-lisp-instance) # exit-instance-id</code>	
<b>Step 9</b>	<b>instance-id</b> <i>instance</i>  <b>Example:</b> <code>FabricEdge (config-router-lisp) # instance-id 101</code>	Creates a LISP EID instance to group multiple services.
<b>Step 10</b>	<b>service ethernet</b>  <b>Example:</b> <code>FabricEdge (config-router-lisp-instance) # service ethernet</code>	Enables Layer 2 network services and enters service submenu.
<b>Step 11</b>	<b>eid-table vlan</b> <i>vlan-number</i>  <b>Example:</b> <code>FabricEdge (config-router-lisp-instance-service) # eid-table vlan 101</code>	Associates the LISP instance-id configured earlier with a VLAN through which the endpoint identifier address space is reachable.
<b>Step 12</b>	<b>flood arp-nd</b>  <b>Example:</b> <code>FabricEdge (config-router-lisp-instance-service) # flood arp-nd</code>	Enables ARP flooding.
<b>Step 13</b>	<b>database-mapping</b> <i>mac locator-set RLOC name</i>  <b>Example:</b> <code>FabricEdge (config-router-lisp-instance-service) # database-mapping mac locator-set rloc1</code>	Configures EID to RLOC mapping relationship.
<b>Step 14</b>	<b>exit-service-ethernet</b>  <b>Example:</b> <code>FabricEdge (config-router-lisp-instance-service) # exit-service-ethernet</code>	Exits service sub mode.
<b>Step 15</b>	<b>exit-instance-id</b>  <b>Example:</b> <code>FabricEdge (config-router-lisp-instance) # exit-instance-id</code>	Exits instance sub mode.

## Verifying Passive Client Configuration

To verify the status of the Passive Client, use the following command:

```
Device# show wireless profile policy detailed sample-profile-policy

Policy Profile Name : sample-profile-policy
Description : sample-policy
Status : ENABLED
```

```
VLAN : 20
Client count : 0
Passive Client : ENABLED <-----
WLAN Switching Policy
 Central Switching : ENABLED
 Central Authentication : ENABLED
 Central DHCP : DISABLED
 Override DNS : DISABLED
 Override NAT PAT : DISABLED
 Central Assoc : DISABLED
.
.
.
```

To verify VLANs that have ARP broadcast enabled, use the following command:

```
Device# show platform software arp broadcast
```

```
Arp broadcast is enabled on vlans:
20
```

### Introduction to Fabric in a Box with External Fabric Edge

From Cisco IOS XE Amsterdam 17.2.1, the Fabric in a Box (FiaB) topology supports external fabric edge nodes. In a fabric-enabled wireless environment using FiaB (border node, control plane, fabric edge, and wireless controller in the same box), you can expand the network by adding external fabric edge nodes. The external fabric edge helps to increase the port density and extend the wireless reach by adding more APs. The APs and clients can exist on both the FiaB and the external fabric edge nodes. Also, the clients can roam between the APs on the FiaB and the external fabric edge nodes.

### Configuring a Fabric Profile (CLI)

#### Procedure

	Command or Action	Purpose
Step 1	<b>configure terminal</b>  <b>Example:</b> Device# <code>configure terminal</code>	Enters global configuration mode.

	Command or Action	Purpose
<b>Step 2</b>	<b>wireless profile fabric</b> <i>fabric-profile-name</i> <b>Example:</b> Device(config)# wireless profile fabric test-fabric-profile	Configures the wireless fabric profile parameters.
<b>Step 3</b>	<b>client-l2-vnid</b> <i>client-l2-vnid</i> <b>Example:</b> Device(config-wireless-fabric)# client-l2-vnid 8189	Configures client L2-VNID.  Here, <i>client-l2-vnid</i> refers to the client L2-VNID value. The valid range is from 0 to 16777215.
<b>Step 4</b>	<b>description</b> <i>description</i> <b>Example:</b> Device(config-wireless-fabric)# description test-fabric-profile	Adds a description for the fabric profile.
<b>Step 5</b>	<b>end</b> <b>Example:</b> Device(config-wireless-fabric)# end	Returns to privileged EXEC mode.

## Configuring a Policy Profile (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wireless profile policy</b> <i>profile-policy</i> <b>Example:</b> Device(config)# wireless profile policy test-policy-profile	Configures wireless policy profile and enters wireless policy configuration mode.  <b>Note</b> In Fabric deployments, local mode, local authentication, and local association are not supported.
<b>Step 3</b>	<b>no central dhcp</b> <b>Example:</b> Device(config-wireless-policy)# no central dhcp	Configures local DHCP mode, where the DHCP is performed in an AP.
<b>Step 4</b>	<b>no central switching</b> <b>Example:</b> Device(config-wireless-policy)# no central switching	Configures a WLAN for local switching.

	Command or Action	Purpose
<b>Step 5</b>	<b>fabric</b> <i>fabric-name</i> <b>Example:</b> Device(config-wireless-fabric)# fabric test-fabric-profile	Applies the fabric profile.
<b>Step 6</b>	<b>no shutdown</b> <b>Example:</b> Device(config-wireless-fabric)# no shutdown	Enables the policy profile.
<b>Step 7</b>	<b>end</b> <b>Example:</b> Device(config-wireless-fabric)# end	Returns to privileged EXEC mode.

## Configuring a Site Tag (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters the global configuration mode.
<b>Step 2</b>	<b>wireless tag site</b> <i>site-tag</i> <b>Example:</b> Device(config)# wireless tag site default-site-tag-fabric	Configures site tag and enters site tag configuration mode.
<b>Step 3</b>	<b>ap-profile</b> <i>ap-profile-name</i> <b>Example:</b> Device(config-site-tag)# ap-profile default-ap-profile-fabric	Assigns an AP profile to the wireless site.
<b>Step 4</b>	<b>description</b> <i>description</i> <b>Example:</b> Device(config-site-tag)# description fabric-site	Adds a description to the AP profile.
<b>Step 5</b>	<b>end</b> <b>Example:</b> Device(config-site-tag)# end	Returns to privileged EXEC mode.

## Configuring a WLAN (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wlan wlan-name wlan-id SSID-name</b> <b>Example:</b> Device(config)# wlan test-wlan 1 test-wlan	Configures a WLAN and enters WLAN configuration submode.
<b>Step 3</b>	<b>no shutdown</b> <b>Example:</b> Device(config-wlan)# no shutdown	Enables the WLAN.

## Configuring a Policy Tag (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wireless tag policy policy-tag-name</b> <b>Example:</b> Device(config)# wireless tag policy test-policy-tag	Configures policy tag and enters policy tag configuration mode.
<b>Step 3</b>	<b>wlan wlan-name policy profile-policy-name</b> <b>Example:</b> Device(config-policy-tag)# wlan test-wlan policy test-policy-profile	Maps a policy profile to a WLAN profile.
<b>Step 4</b>	<b>end</b> <b>Example:</b> Device(config-site-tag)# end	Returns to privileged EXEC mode.

## Configuring an AP Profile

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters the global configuration mode.
<b>Step 2</b>	<b>ap profile <i>ap-profile-name</i></b> <b>Example:</b> Device(config)# ap profile test-ap-profile	Configures an AP profile and enters AP profile configuration mode.
<b>Step 3</b>	<b>ap <i>ap-ether-mac</i></b> <b>Example:</b> Device(config-ap-profile)# ap 006b.f126.036e	Enters AP configuration mode.
<b>Step 4</b>	<b>policy-tag <i>policy-tag</i></b> <b>Example:</b> Device(config-ap-profile)# policy-tag test-policy-tag	Specifies the policy tag that is to be attached to the AP.
<b>Step 5</b>	<b>end</b> <b>Example:</b> Device(config-ap-profile)# end	Returns to privileged EXEC mode.

## Configuring Map Server and AP Subnet (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wireless fabric</b> <b>Example:</b> Device(config)# wireless fabric	Enables SD-Access wireless globally.

	Command or Action	Purpose
<b>Step 3</b>	<b>wireless fabric name</b> <i>name</i> <b>l2-vnid</b> <i>l2-vnid-value</i> <b>l3-vnid</b> <i>l3-vnid-value</i> <b>ip</b> <i>network-ip</i> <i>subnet-mask</i>  <b>Example:</b> <pre>Device(config)# wireless fabric name 40_40_0_0-INFRA_VN l2-vnid 8188 l3-vnid 4097 ip 40.40.0.0 255.255.0.0</pre>	Configures AP subnet Layer 2 and Layer 3 VNIDs.
<b>Step 4</b>	<b>wireless fabric name</b> <i>name</i> <b>l2-vnid</b> <i>l2-vnid-value</i>  <b>Example:</b> <pre>Device(config)# wireless fabric name 41_41_0_0-DEFAULT_VN l2-vnid 8189</pre>	Defines client Layer 2 VNID AAA override.
<b>Step 5</b>	<b>wireless fabric control-plane</b> <i>name</i>  <b>Example:</b> <pre>Device(config)# wireless fabric control-plane default-control-plane</pre>	Configures the control plane name.
<b>Step 6</b>	<b>ip address</b> <i>ip-address</i> <b>key</b> <i>shared-key</i>  <b>Example:</b> <pre>Device((config-wireless-cp)# ip address 5.5.5.5 key 0 3a18df</pre>	Configures the map server IP address and authentication key shared with the map server.
<b>Step 7</b>	<b>end</b>  <b>Example:</b> <pre>Device(config)# end</pre>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Configuring Fabric on FiaB Node

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> <pre>FiaB# configure terminal</pre>	Enters global configuration mode.
<b>Step 2</b>	<b>router lisp</b>  <b>Example:</b> <pre>FiaB(config)# router lisp</pre>	Enters LISP configuration mode.
<b>Step 3</b>	<b>locator-table default</b>  <b>Example:</b>	Associates a default Virtual Routing and Forwarding (VRF) table through which the routing locator address space is reachable to a

	Command or Action	Purpose
	<code>FiaB(config-router-lisp)# locator-table default</code>	router Locator ID Separation Protocol (LISP) instantiation.
<b>Step 4</b>	<b>locator-set</b> <i>locator-set-name</i> <b>Example:</b> <code>FiaB(config-router-lisp)# locator-set WLC</code>	Specifies a named locator set and enters LISP locator-set configuration mode.
<b>Step 5</b>	<i>ip-address</i> <b>Example:</b> <code>FiaB(config-router-lisp-locator-set)# 5.5.5.5</code>	Specifies an IP address of loopback or other egress tunnel router (ETR) interface.
<b>Step 6</b>	<b>exit-locator-set</b> <b>Example:</b> <code>FiaB(config-router-lisp-locator-set)# exit-locator-set</code>	Exits LISP locator-set configuration mode.
<b>Step 7</b>	<b>locator-set rloc_loopback</b> <b>Example:</b> <code>FiaB(config-router-lisp)# locator-set rloc_loopback</code>	Specifies an existing locator set and enters LISP locator-set configuration mode.
<b>Step 8</b>	<b>ipv4-interface</b> <i>interface</i> <b>Example:</b> <code>FiaB(config-router-lisp-locator-set)# IPv4-interface Loopback0</code>	Configures a locator address by creating a locator entry.
<b>Step 9</b>	<b>auto-discover-rlocs</b> <b>Example:</b> <code>FiaB(config-router-lisp-locator-set)# auto-discover-rlocs</code>	Configures the ETR to auto discover the locators registered by other xTRs. (Ingress tunnel router (ITR) and an ETR are known as an xTR.)
<b>Step 10</b>	<b>exit-locator-set</b> <b>Example:</b> <code>FiaB(config-router-lisp-locator-set)# exit-locator-set</code>	Exits LISP locator-set configuration mode.
<b>Step 11</b>	<b>service ipv4</b> <b>Example:</b> <code>FiaB(config-router-lisp)# service ipv4</code>	Enables Layer 3 network services for the IPv4 address family and enters service submode.
<b>Step 12</b>	<b>encapsulation vxlan</b> <b>Example:</b> <code>FiaB(config-lisp-srv-ipv4)# encapsulation vxlan</code>	Configures VXLAN as encapsulation type for data packets.

	Command or Action	Purpose
<b>Step 13</b>	<b>itr map-resolver</b> <i>map-resolver-address</i> <b>Example:</b> FiaB(config-lisp-srv-ipv4)# itr map-resolver 5.5.5.5	Configures map resolver address for sending map requests.
<b>Step 14</b>	<b>etr map-server</b> <i>map-server-address key key-type authentication-key</i> <b>Example:</b> FiaB(config-lisp-srv-ipv4)# etr map-server 5.5.5.5 key 7 #####	Configures the map server for ETR registration.
<b>Step 15</b>	<b>etr</b> <b>Example:</b> FiaB(config-lisp-srv-ipv4)# etr	Configures a LISP ETR.
<b>Step 16</b>	<b>sgt</b> <b>Example:</b> FiaB(config-lisp-srv-ipv4)# sgt	Enables security group tag propagation in LISP-encapsulated traffic.
<b>Step 17</b>	<b>no map-cache away-eids send-map-request</b> <b>Example:</b> FiaB(config-lisp-srv-ipv4)# no map-cache away-eids send-map-request	Removes the address family-specific map cache configuration.
<b>Step 18</b>	<b>proxy-itr</b> <i>ip-address</i> <b>Example:</b> FiaB(config-lisp-srv-ipv4)# proxy-itr 5.5.5.5	Enables the Proxy Ingress Tunnel Router (PITR) functionality and specifies the address to use when LISP encapsulating packets to LISP sites.
<b>Step 19</b>	<b>map-server</b> <b>Example:</b> FiaB(config-lisp-srv-ipv4)# map-server	Configures a LISP map server.
<b>Step 20</b>	<b>map-resolver</b> <b>Example:</b> FiaB(config-lisp-srv-ipv4)# map-resolver	Configures a LISP map resolver.
<b>Step 21</b>	<b>map-cache away-eids send-map-request</b> <b>Example:</b> FiaB(config-lisp-srv-ipv4)# map-cache 40.40.0.0/16 send-map-request	Exports table entries into the map cache, with the action set to send-map-request.
<b>Step 22</b>	<b>route-export site-registrations</b> <b>Example:</b>	Exports LISP site registrations to the routing information base (RIB).

	Command or Action	Purpose
	<code>FiaB(config-lisp-srv-ipv4)# route-export site-registrations</code>	
<b>Step 23</b>	<b>distance site-registrations <i>num</i></b> <b>Example:</b> <code>FiaB(config-lisp-srv-ipv4)# distance site-registrations 250</code>	Configures LISP installed routes of type site registrations.
<b>Step 24</b>	<b>map-cache site-registration</b> <b>Example:</b> <code>FiaB(config-lisp-srv-ipv4)# map-cache site-registration</code>	Installs the map cache to a map request for site registrations.
<b>Step 25</b>	<b>exit-service-ipv4</b> <b>Example:</b> <code>FiaB(config-lisp-srv-ipv4)# exit-service-ipv4</code>	Exits LISP service-ipv4 configuration mode.
<b>Step 26</b>	<b>service ethernet</b> <b>Example:</b> <code>FiaB(config-router-lisp)# service ethernet</code>	Selects service type as Ethernet and enters service submode.
<b>Step 27</b>	<b>database-mapping limit dynamic <i>limit</i></b> <b>Example:</b> <code>FiaB(config-lisp-srv-eth)# database-mapping limit dynamic 5000</code>	Configures the maximum number of dynamic local endpoint identifier (EID) prefix database entries.
<b>Step 28</b>	<b>itr map-resolver <i>map-resolver-address</i></b> <b>Example:</b> <code>FiaB(config-lisp-srv-eth)# itr map-resolver 5.5.5.5</code>	Configures the map-resolver address for sending map requests.
<b>Step 29</b>	<b>itr</b> <b>Example:</b> <code>FiaB(config-lisp-srv-eth)# itr</code>	Enables the LISP ITR functionality.
<b>Step 30</b>	<b>etr map-server <i>map-server-address</i> <b>key</b> <i>key-type</i> <i>authentication-key</i></b> <b>Example:</b> <code>FiaB(config-lisp-srv-eth)# etr map-server 5.5.5.5 key 7 1234</code>	Configures a map server for ETR registration.
<b>Step 31</b>	<b>etr</b> <b>Example:</b> <code>FiaB(config-lisp-srv-eth)# etr</code>	Enables the LISP ETR functionality.

	Command or Action	Purpose
<b>Step 32</b>	<b>map-server</b> <b>Example:</b> FiaB(config-lisp-srv-eth)# map-server	Enables the LISP map server functionality.
<b>Step 33</b>	<b>map-resolver</b> <b>Example:</b> FiaB(config-lisp-srv-eth)# map-resolver	Enables the LISP map resolver functionality.
<b>Step 34</b>	<b>exit-service-ethernet</b> <b>Example:</b> FiaB(config-lisp-srv-eth)# exit-service-ethernet	Exits LISP service-ethernet configuration mode.
<b>Step 35</b>	<b>instance-id <i>instance</i></b> <b>Example:</b> FiaB(config-router-lisp)# instance-id 101	Creates a LISP EID instance to group multiple services.
<b>Step 36</b>	<b>remote-rloc-probe on-route-change</b> <b>Example:</b> FiaB(config-lisp-inst)# remote-rloc-probe on-route-change	Configures the parameters for probing of remote routing locators (RLOCs).
<b>Step 37</b>	<b>dynamic-eid <i>dynamic-eid-name</i></b> <b>Example:</b> FiaB(config-lisp-inst)# dynamic-eid 40_40_0_0-INFRA_VN-IPV4	Configures a dynamic EID and enters dynamic EID configuration mode.
<b>Step 38</b>	<b>database-mapping <i>eid locator-set rloc_loopback</i></b> <b>Example:</b> FiaB(config-router-lisp-dynamic-eid)# database-mapping 40.40.0.0/16 locator-set rloc_loopback	Configures EID prefix and locator-set for dynamic EID.
<b>Step 39</b>	<b>exit-dynamic-id</b> <b>Example:</b> FiaB(config-router-lisp-dynamic-eid)# exit-dynamic-eid	Exits LISP dynamic-eid configuration mode.
<b>Step 40</b>	<b>exit-instance-id</b> <b>Example:</b> FiaB(config-router-lisp-instance)# exit-instance-id	Exits LISP instance-id configuration mode.

	Command or Action	Purpose
<b>Step 41</b>	<b>instance-id</b> <i>instance</i> <b>Example:</b> FiaB(config-router-lisp)# instance-id 101	Creates a LISP EID instance to group multiple services.
<b>Step 42</b>	<b>remote-rloc-probe on-route-change</b> <b>Example:</b> FiaB(config-lisp-inst)# remote-rloc-probe on-route-change	Configures parameters for probing remote RLOCs.
<b>Step 43</b>	<b>service ethernet</b> <b>Example:</b> FiaB(config-lisp-inst)# service ethernet	Enables Layer 2 network services and enters service submenu.
<b>Step 44</b>	<b>eid-table vlan</b> <i>vlan-number</i> <b>Example:</b> FiaB(config-lisp-inst-srv-eth)# eid-table vlan 101	Binds an EID table to VLAN.
<b>Step 45</b>	<b>database-mapping mac locator-set rloc_loopbac</b> <b>Example:</b> FiaB(config-lisp-inst-srv-eth)# database-mapping mac locator-set rloc_loopbac	Configures an address family-specific local EID prefixes database.
<b>Step 46</b>	<b>exit-service-ethernet</b> <b>Example:</b> FiaB(config-lisp-inst-srv-eth)# exit-service-ethernet	Exits LISP service-ethernet configuration mode.
<b>Step 47</b>	<b>exit-instance-id</b> <b>Example:</b> FiaB(config-lisp-inst)# exit-instance-id	Exits LISP instance-id configuration mode.
<b>Step 48</b>	<b>map-server session passive-open</b> <i>server</i> <b>Example:</b> FiaB(config-router-lisp)# map-server session passive-open WLC	Configures a map server with open passive TCP sockets to listen for incoming connections.
<b>Step 49</b>	<b>site</b> <i>site-name</i> <b>Example:</b> FiaB(config-router-lisp)# site site_uci	Configures a LISP site on a map server.
<b>Step 50</b>	<b>description</b> <i>map-server-description</i> <b>Example:</b>	Specifies a description text for the LISP site.

	Command or Action	Purpose
	<code>FiaB(config-router-lisp-site)# description map-server configured from Cisco DNA-Center</code>	
<b>Step 51</b>	<b>authentication-key</b> <i>key</i> <b>Example:</b> <code>FiaB(config-router-lisp-site)# authentication-key 7 #####</code>	Configures the authentication key used by the LISP site.
<b>Step 52</b>	<b>eid-record instance-id</b> <i>instance-id address</i> <b>accept-more-specifics</b> <b>Example:</b> <code>FiaB(config-router-lisp-site)# eid-record instance-id 4097 0.0.0.0/0 accept-more-specifics</code>	Specifies that any EID prefix that is more specific than the EID prefix configured is accepted and tracked.
<b>Step 53</b>	<b>eid-record instance-id</b> <i>instance-id any-mac</i> <b>Example:</b> <code>FiaB(config-router-lisp-site)# eid-record instance-id 8188 any-mac</code>	Accepts registrations, if any, for Layer 2 EID records.
<b>Step 54</b>	<b>exit-site</b> <b>Example:</b> <code>FiaB(config-router-lisp-site)# exit-site</code>	Exits LISP site configuration mode.
<b>Step 55</b>	<b>ipv4 locator reachability exclude-default</b> <b>Example:</b> <code>FiaB(config-router-lisp)# ipv4 locator reachability exclude-default</code>	Configures the IPv4 locator address of the LISP.
<b>Step 56</b>	<b>ipv4 source-locator</b> <i>interface-name</i> <b>Example:</b> <code>FiaB(config-router-lisp)# ipv4 source-locator Loopback0</code>	Configures the IPv4 source locator address of the interface.
<b>Step 57</b>	<b>exit-router-lisp</b> <b>Example:</b> <code>FiaB(config-router-lisp)# exit-router-lisp</code>	Exits LISP router-lisp configuration mode.

## Configuring a Fabric Edge Node

**Note** You can perform the following configuration tasks only from Fabric Edge Node, and not from your controller.

## Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> FabricEdge# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>router lisp</b> <b>Example:</b> FabricEdge(config)# router lisp	Enters LISP configuration mode.
<b>Step 3</b>	<b>locator-table default</b> <b>Example:</b> FabricEdge(config-router-lisp)# locator-table default	Associates a default VRF table through which the routing locator address space is reachable to a router LISP instantiation.
<b>Step 4</b>	<b>locator-set rloc_loopback</b> <b>Example:</b> FabricEdge(config-router-lisp)# locator-set rloc_loopback	Specifies a named locator set and enters LISP locator-set configuration mode.
<b>Step 5</b>	<b>ipv4-interface interface-num priority priority weight weight</b> <b>Example:</b> FabricEdge(config-router-lisp-locator-set)# IPv4-interface Loopback 0 priority 10 weight 10	Configures the IPv4 address of the interface as locator.
<b>Step 6</b>	<b>exit-locator-set</b> <b>Example:</b> FabricEdge(config-router-lisp-locator-set)# exit-locator-set	Exits LISP locator-set configuration mode.
<b>Step 7</b>	<b>exit-router-lisp</b> <b>Example:</b> FabricEdge(config-router-lisp-)# exit-router-lisp	Exits LISP router-lisp configuration mode.
<b>Step 8</b>	<b>interface vlan interface-num</b> <b>Example:</b> FabricEdge(config)# interface Vlan 2045	Configures an interface.
<b>Step 9</b>	<b>description description</b> <b>Example:</b> FabricEdge(config-if)# description Configured from Cisco DNA-Center	Specifies a description text for the interface.

	Command or Action	Purpose
<b>Step 10</b>	<b>mac-address</b> <i>mac-address</i>  <b>Example:</b> FabricEdge(config-if)# mac-address 0000.0c9f.f85c	Sets an interface MAC address manually.
<b>Step 11</b>	<b>ip address</b> <i>ip-address mask</i>  <b>Example:</b> FabricEdge(config-if)# ip address 192.168.1.1 255.255.255.252	Configures an IP address for the interface.
<b>Step 12</b>	<b>ip helper-address</b> <i>ip-address</i>  <b>Example:</b> FabricEdge(config-if)# ip helper-address 9.9.9.9	Specifies a destination address for UDP broadcasts.
<b>Step 13</b>	<b>no ip redirects</b>  <b>Example:</b> FabricEdge(config-if)# no ip redirects	Disables sending of ICMP redirect messages.
<b>Step 14</b>	<b>ip route-cache same-interface</b>  <b>Example:</b> FabricEdge(config-if)# ip route-cache same-interface	Enables fast-switching cache for outgoing packets on the same interface.
<b>Step 15</b>	<b>no lisp mobility liveness test</b>  <b>Example:</b> FabricEdge(config-if)# no lisp mobility liveness test	Removes liveness test on dynamic EID discovered on this interface.
<b>Step 16</b>	<b>lisp mobility</b> <i>dynamic-eid-name</i>  <b>Example:</b> FabricEdge(config-if)# lisp mobility 40_40_0_0-INFRA_VN-IPV4	Allows EID mobility on the interface.
<b>Step 17</b>	<b>exit</b>  <b>Example:</b> FabricEdge(config-if)# exit	Exits from interface configuration mode.
<b>Step 18</b>	<b>router lisp</b>  <b>Example:</b> FabricEdge(config)# router lisp	Enters LISP configuration mode.
<b>Step 19</b>	<b>locator-set</b> <i>locator-set-name</i>  <b>Example:</b> FabricEdge(config-router-lisp)# locator-set rloc_824ecb7	Specifies a locator set and enters LISP locator-set configuration mode.

	Command or Action	Purpose
<b>Step 20</b>	<b>exit-locator-set</b> <b>Example:</b> FabricEdge(config-router-lisp-locator-set)# exit-locator-set	Exits LISP locator-set configuration mode.
<b>Step 21</b>	<b>service ipv4</b> <b>Example:</b> FabricEdge(config-router-lisp)# service ipv4	Enables Layer 3 network services for the IPv4 address family and enters service submode.
<b>Step 22</b>	<b>use-petr ip-address</b> <b>Example:</b> FabricEdge(config-lisp-srv-ipv4)# use-petr 5.5.5.5	Configures the loopback IP address of the Proxy Egress Tunnel Router (PETR).
<b>Step 23</b>	<b>encapsulation vxlan</b> <b>Example:</b> FabricEdge(config-lisp-srv-ipv4)# encapsulation vxlan	Selects the encapsulation type as VXLAN for data packets.
<b>Step 24</b>	<b>itr map-resolver map-resolver-address</b> <b>Example:</b> FabricEdge(config-lisp-srv-ipv4)# itr map-resolver 5.5.5.5	Configures the map resolver address for sending map requests.
<b>Step 25</b>	<b>etr map-server map-server-address key key-type authentication-key</b> <b>Example:</b> FabricEdge(config-lisp-srv-ipv4)# etr map-server 5.5.5.5 key 7 #####	Configures the map server for ETR registration.
<b>Step 26</b>	<b>etr map-server map-server-address proxy-reply authentication-key</b> <b>Example:</b> FabricEdge(config-lisp-srv-ipv4)# etr map-server 5.5.5.5 proxy-reply	Configures the locator address of the LISP map server and the authentication key that this router, acting as a LISP ETR, will use to register with the LISP mapping system.
<b>Step 27</b>	<b>etr</b> <b>Example:</b> FabricEdge(config-lisp-srv-ipv4)# etr	Configures a LISP Egress Tunnel Router (ETR).
<b>Step 28</b>	<b>sgt</b> <b>Example:</b> FabricEdge(config-lisp-srv-ipv4)# sgt	Enable security group tag propagation in LISP encapsulated traffic.

	Command or Action	Purpose
<b>Step 29</b>	<b>no map-cache away-eids send-map-request</b> <b>Example:</b> FabricEdge(config-lisp-srv-ipv4)# no map-cache away-eids send-map-request	Removes the address family-specific map cache configuration.
<b>Step 30</b>	<b>proxy-itr ip-address</b> <b>Example:</b> FabricEdge(config-lisp-srv-ipv4)# proxy-itr 5.5.5.5	Enables the Proxy Ingress Tunnel Router (PITR) functionality and specifies the address to use when LISP encapsulating packets to LISP sites.
<b>Step 31</b>	<b>exit-service-ipv4</b> <b>Example:</b> FabricEdge(config-lisp-srv-ipv4)# exit-service-ipv4	Exits LISP service-ipv4 configuration mode.
<b>Step 32</b>	<b>service ethernet</b> <b>Example:</b> FabricEdge(config-router-lisp)# service ethernet	Selects the service type as Ethernet.
<b>Step 33</b>	<b>itr map-resolver map-resolver-address</b> <b>Example:</b> FabricEdge(config-lisp-srv-eth)# itr map-resolver 5.5.5.5	Configures the map-resolver address for sending map requests.
<b>Step 34</b>	<b>itr</b> <b>Example:</b> FabricEdge(config-lisp-srv-eth)# itr	Enables the LISP ITR functionality.
<b>Step 35</b>	<b>etr map-server map-server-address key key-type authentication-key</b> <b>Example:</b> FabricEdge(config-lisp-srv-eth)# etr map-server 5.5.5.5 key 7 1234	Configures the map server for ETR registration.
<b>Step 36</b>	<b>etr</b> <b>Example:</b> FabricEdge(config-lisp-srv-eth)# etr	Enables the LISP ETR functionality.
<b>Step 37</b>	<b>exit-service-ethernet</b> <b>Example:</b> FabricEdge(config-lisp-srv-eth)# exit-service-ethernet	Exits LISP service-ethernet configuration mode.
<b>Step 38</b>	<b>instance-id instance</b> <b>Example:</b>	Creates a LISP EID instance to group multiple services.

	Command or Action	Purpose
	<pre>FabricEdge(config-router-lisp)# instance-id 101</pre>	
<b>Step 39</b>	<b>remote-rloc-probe on-route-change</b> <b>Example:</b> <pre>FabricEdge(config-lisp-inst)# remote-rloc-probe on-route-change</pre>	Configures the parameters for probing remote Routing locators (RLOCs).
<b>Step 40</b>	<b>dynamic-eid <i>dynamic-eid-name</i></b> <b>Example:</b> <pre>FabricEdge(config-lisp-inst)# dynamic-eid 40_40_0_0-INFRA_VN-IPV4</pre>	Configures a dynamic EID and enters dynamic EID configuration mode.
<b>Step 41</b>	<b>database-mapping <i>eid locator-set rloc_loopback</i></b> <b>Example:</b> <pre>FabricEdge(config-router-lisp-dynamic-eid)# database-mapping 40.40.0.0/16 locator-set rloc_loopback</pre>	Configures the EID prefix and locator set for the dynamic EID.
<b>Step 42</b>	<b>exit-dynamic-id</b> <b>Example:</b> <pre>FabricEdge(config-router-lisp-dynamic-eid)# exit-instance-id</pre>	Exits dynamic instance submenu.
<b>Step 43</b>	<b>service ipv4</b> <b>Example:</b> <pre>FabricEdge(config-lisp-inst)# service ipv4</pre>	Selects service type as IPv4.
<b>Step 44</b>	<b>eid-table default</b> <b>Example:</b> <pre>FabricEdge(config-lisp-inst-srv-ipv4)# eid-table default</pre>	Binds an EID table.
<b>Step 45</b>	<b>exit-service-ipv4</b> <b>Example:</b> <pre>FabricEdge(config-lisp-inst-srv-ipv4)# exit-service-ipv4</pre>	Exits LISP service-ipv4 configuration mode.
<b>Step 46</b>	<b>exit-instance-id</b> <b>Example:</b> <pre>FabricEdge(config-lisp-inst)# exit-instance-id</pre>	Exits LISP instance-id configuration mode.
<b>Step 47</b>	<b>service ipv4</b> <b>Example:</b>	Selects service type as IPv4.

	Command or Action	Purpose
	<code>FabricEdge(config-router-lisp)# service ipv4</code>	
<b>Step 48</b>	<b>map-cache away-eids map-request</b> <b>Example:</b> <code>FabricEdge(config-lisp-srv-ipv4)# map-cache 40.40.0.0/16 map-request</code>	Exports away table entries into the map cache, with the action set to send-map-request.
<b>Step 49</b>	<b>exit-service-ipv4</b> <b>Example:</b> <code>FabricEdge(config-lisp-srv-ipv4)# exit-service-ipv4</code>	Exits LISP service-ipv4 configuration mode.
<b>Step 50</b>	<b>instance-id <i>instance</i></b> <b>Example:</b> <code>FabricEdge(config-router-lisp)# instance-id 8188</code>	Creates a LISP EID instance to group multiple services.
<b>Step 51</b>	<b>remote-rloc-probe on-route-change</b> <b>Example:</b> <code>FabricEdge(config-lisp-inst)# remote-rloc-probe on-route-change</code>	Configures parameters for probing remote RLOCs.
<b>Step 52</b>	<b>service ethernet</b> <b>Example:</b> <code>FabricEdge(config-lisp-inst)# service ethernet</code>	Enables Layer 2 network services and enters service submode.
<b>Step 53</b>	<b>eid-table vlan <i>vlan-number</i></b> <b>Example:</b> <code>FabricEdge(config-lisp-inst-srv-eth)# eid-table vlan 101</code>	Binds an EID table to VLAN.
<b>Step 54</b>	<b>database-mapping maclocator-set rloc_loopbac</b> <b>Example:</b> <code>FabricEdge(config-lisp-inst-srv-eth)# database-mapping mac locator-set rloc_loopbac</code>	Configures address family-specific local EID prefixes database.
<b>Step 55</b>	<b>exit-service-ethernet</b> <b>Example:</b> <code>FabricEdge(config-lisp-inst-srv-eth)# exit-service-ethernet</code>	Exits LISP service-ethernet configuration mode.
<b>Step 56</b>	<b>exit-instance-id</b> <b>Example:</b>	Exits from LISP instance-id configuration mode.

	Command or Action	Purpose
	<code>FabricEdge(config-lisp-inst)# exit-instance-id</code>	
<b>Step 57</b>	<b>ipv4 locator reachability minimum-mask-length</b> <i>length</i>  <b>Example:</b> <code>FabricEdge(config-router-lisp)# ipv4 locator reachability minimum-mask-length 32</code>	Configures the IPv4 locator address of the LISP.
<b>Step 58</b>	<b>ipv4 source-locator</b> <i>interface-name</i>  <b>Example:</b> <code>FabricEdge(config-router-lisp)# ipv4 source-locator Loopback0</code>	Configures the IPv4 source locator address of the interface.
<b>Step 59</b>	<b>exit-router-lisp</b>  <b>Example:</b> <code>FabricEdge(config-router-lisp)# exit-router-lisp</code>	Exits LISP router-lisp configuration mode.

## Verifying Fabric Configuration

Use the following commands to verify the fabric configuration.

To verify the LISP configuration on a device, use the following command:

```
FabricEdge# show running-config | section router lisp
```

```
router lisp
 locator-table default
 locator-set default
 exit-locator-set
 !
 locator-set rloc_loopback
 IPv4-interface Loopback0 priority 10 weight 10
 exit-locator-set
 !
 locator default-set rloc_loopback
 service ipv4
 encapsulation vxlan
 itr map-resolver 21.21.21.21

loc-reach-algorithm lsb-reports ignore
exit-router-lisp

```

To verify the operational status of LISP as configured on a device, use the following command:

```
FabricEdge# show ip lisp
```

Information applicable to all EID instances:

```

Router-lisp ID: 0
Locator table: default
Ingress Tunnel Router (ITR): enabled
Egress Tunnel Router (ETR): enabled
Proxy-ITR Router (PITR): disabled
Proxy-ETR Router (PETR): disabled
NAT-traversal Router (NAT-RTR): disabled
Mobility First-Hop Router: disabled
Map Server (MS): disabled
Map Resolver (MR): disabled
Mr-use-petr: disabled
Delegated Database Tree (DDT): disabled
Publication-Subscription: enabled
 Publisher(s): *** NOT FOUND ***
ITR Map-Resolver(s): 21.21.21.21
ETR Map-Server(s): 21.21.21.21
xTR-ID: 0xD89893A6-0x98749B2C-0x89810431-0x92F33C9C
site-ID: unspecified
ITR local RLOC (last resort): *** NOT FOUND ***
ITR use proxy ETR RLOC(Encap IID): 21.21.21.21
ITR Solicit Map Request (SMR): accept and process
 Max SMRs per map-cache entry: 8 more specifics

```

```

Multiple SMR suppression time: 20 secs
ETR accept mapping data: disabled, verify disabled

## CHAPTER 172

# VLANs

---

- [Information About VLANs, on page 1929](#)
- [How to Configure VLANs, on page 1933](#)
- [Monitoring VLANs, on page 1937](#)

## Information About VLANs

### Logical Networks

A VLAN is a switched network that is logically segmented by function, project team, or application, without regard to the physical locations of the users. VLANs have the same attributes as physical LANs, but you can group end stations even if they are not physically located on the same LAN segment. Any controller port can belong to a VLAN, and unicast, broadcast, and multicast packets are forwarded and flooded only to end stations in the VLAN. Each VLAN is considered a logical network, and packets destined for stations that do not belong to the VLAN must be forwarded through a router or a controller supporting fallback bridging. Because a VLAN is considered a separate logical network, it contains its own bridge Management Information Base (MIB) information.

VLANs are often associated with IP subnet. For example, all the end stations in a particular IP subnet belong to the same VLAN. Interface VLAN membership on the controller is assigned manually on an interface-by-interface basis. When you assign controller interfaces to VLANs by using this method, it is known as interface-based, or static, VLAN membership.

### Supported VLANs

The controller supports VLANs in VTP client, server, and transparent modes. VLANs are identified by a number from 1 to 4094. VLAN 1 is the default VLAN and is created during system initialization. All of the VLANs except 1002 to 1005 are available for user configuration.

### VLAN Port Membership Modes

You configure a port to belong to a VLAN by assigning a membership mode that specifies the kind of traffic the port carries and the number of VLANs to which it can belong.

When a port belongs to a VLAN, the controller learns and manages the addresses associated with the port on a per-VLAN basis.

Table 142: Port Membership Modes and Characteristics

Membership Mode	VLAN Membership Characteristics	VTP Characteristics
Static-access	A static-access port can belong to one VLAN and is manually assigned to that VLAN.	VTP is not required. If you do not want VTP to globally propagate information, set the VTP mode to transparent. To participate in VTP, there must be at least one trunk port on the controller connected to a trunk port of a second controller.
Trunk IEEE 802.1Q) : <ul style="list-style-type: none"> <li>IEEE 802.1Q— Industry-standard trunking encapsulation.</li> </ul>	A trunk port is a member of all VLANs by default, including extended-range VLANs, but membership can be limited by configuring the allowed-VLAN list.	VTP is recommended but not required. VTP maintains VLAN configuration consistency by managing the addition, deletion, and renaming of VLANs on a network-wide basis. VTP exchanges VLAN configuration messages with other controller over trunk links.

**Note** If a client VLAN has two subnets, a primary subnet and a secondary subnet, the static IP address is not supported on the secondary subnet.

Consider the following SVI configuration example:

```
interface VlanX
ip address a.b.c.254 255.255.255.0 secondary
ip address a.d.e.254 255.255.255.0
```

In this scenario, you can't allocate the secondary subnet for clients with static IP addresses.

## VLAN Configuration Files

Configurations for VLAN IDs 1 to 1005 are written to the `vlan.dat` file (VLAN database), and you can display them by entering the **show vlan** privileged EXEC command. The `vlan.dat` file is stored in flash memory. If the VTP mode is transparent, they are also saved in the controller running configuration file.

You use the interface configuration mode to define the port membership mode and to add and remove ports from VLANs. The results of these commands are written to the running-configuration file, and you can display the file by entering the **show running-config** privileged EXEC command.

When you save VLAN and VTP information (including extended-range VLAN configuration information) in the startup configuration file and reboot the controller, the controller configuration is selected as follows:

- If the VTP mode is transparent in the startup configuration, and the VLAN database and the VTP domain name from the VLAN database matches that in the startup configuration file, the VLAN database is ignored (cleared), and the VTP and VLAN configurations in the startup configuration file are used. The VLAN database revision number remains unchanged in the VLAN database.

- If the VTP mode or domain name in the startup configuration does not match the VLAN database, the domain name and VTP mode and configuration for the VLAN IDs 1 to 1005 use the VLAN database information.
- In VTP versions 1 and 2, if VTP mode is server, the domain name and VLAN configuration for VLAN IDs 1 to 1005 use the VLAN database information. VTP version 3 also supports VLANs 1006 to 4094.

**Note** Ensure that you delete the `vlan.dat` file along with the configuration files before you reset the switch configuration using **write erase** command. This ensures that the switch reboots correctly on a reset.

## Normal-Range VLAN Configuration Guidelines

Follow these guidelines when creating and modifying normal-range VLANs in your network:

- Normal-range VLANs are identified with a number between 1 and 1001.
- VLAN configurations for VLANs 1 to 1005 are always saved in the VLAN database. If the VTP mode is transparent, VTP and VLAN configurations are also saved in the running configuration file.
- If the controller is in VTP server or VTP transparent mode, you can add, modify or remove configurations for VLANs 2 to 1001 in the VLAN database. (VLAN IDs 1 and 1002 to 1005 are automatically created and cannot be removed.)
- Extended-range VLANs created in VTP transparent mode are not saved in the VLAN database and are not propagated. VTP version 3 supports extended range VLAN (VLANs 1006 to 4094) database propagation in VTP server mode.

If clients are unable to connect to the controller due to a VLAN failure, try one of the following options:

- Configure `ip4 dhcp required` in the policy profile forcing the client to initiate a DHCP request.
- Configure the RADIUS server to send VLAN group (having the client's static IP VLAN) information allowing the client to use static IP.
- Configure `aaa-override vlan fallback` under the policy profile forcing the controller to check for the client's static IP VLAN in other VLAN groups as well. The client can join the network if the client's static IP VLAN is part of the configured VLAN group under the policy profile.

## Extended-Range VLAN Configuration Guidelines

Extended-range VLANs are VLANs with IDs from 1006 to 4094.

Follow these guidelines when creating extended-range VLANs:

- VLAN IDs in the extended range are not saved in the VLAN database and are not recognized by VTP unless the device is running VTP version 3.
- You cannot include extended-range VLANs in the pruning eligible range.
- For VTP version 1 or 2, you can set the VTP mode to transparent in global configuration mode. You should save this configuration to the startup configuration so that the device boots up in VTP transparent

mode. Otherwise, you lose the extended-range VLAN configuration if the device resets. If you create extended-range VLANs in VTP version 3, you cannot convert to VTP version 1 or 2.

## Prerequisites for VLANs

The following are prerequisites and considerations for configuring VLANs:

- To configure VLAN through the Web UI, you must change the number of available Virtual Terminal (VTY) sessions to 50. Web UI uses VTY lines for processing HTTP requests. At times, when multiple connections are open, the default VTY lines of 15 set by the device gets exhausted. Therefore, you must change the VTY lines to 50 before using the Web UI.

**Note** To increase the VTY lines in a device, run the following command in the configuration mode:

```
Device# configure terminal
Device(config)# service tcp-keepalives in
Device(config)# service tcp-keepalives out

Device# configure terminal
Device(config)# line vty 16-50
```

**Note** The maximum number of SSH VTY sessions supported on the standby controller is eight.

- Before you create VLANs, you must decide whether to use VLAN Trunking Protocol (VTP) to maintain global VLAN configuration for your network.
- Before adding a VLAN to a VLAN group, you should first create it on the device.

## Restrictions for VLANs

The following are restrictions for VLANs:

- You cannot delete a wireless management interface, if the associated VLAN interface is already deleted. To avoid this scenario, you should delete the wireless management interface before deleting the VLAN interface.
- The device supports IEEE 802.1Q trunking methods for sending VLAN traffic over Ethernet ports.
- When client VLAN is not configured for a policy profile, AP native VLAN is used.
- The behavior of VLAN 1 changes depending on the AP mode. These scenarios are described below:
  - **Local mode AP:** If you use *vlan-name*, clients are assigned to VLAN 1. However, if you use *vlan-id* 1, clients are assigned to the wireless management interface.
  - **FlexConnect mode AP:** If you use *vlan-name*, clients are assigned to VLAN 1. However, if you use *vlan-id* 1, clients are assigned to the native VLAN defined in the flex profile.

By default, the policy profile assigns vlan-id 1 so that clients can use the wireless management VLAN.

- You cannot use the same VLAN on the same SSID for local switching and central switching.

## How to Configure VLANs

### How to Configure Normal-Range VLANs

You can set these parameters when you create a new normal-range VLAN or modify an existing VLAN in the VLAN database:

- VLAN ID
- VLAN name
- VLAN type
  - Ethernet
  - TrBRF or TrCRF
- VLAN state (active or suspended)
- Parent VLAN number for TrCRF VLANs
- VLAN number to use when translating from one VLAN type to another

You can cause inconsistency in the VLAN database if you attempt to manually delete the *vlan.dat* file. If you want to modify the VLAN configuration, follow the procedures in this section.

### Creating or Modifying an Ethernet VLAN

#### Before you begin

With VTP version 1 and 2, if the controller is in VTP transparent mode, you can assign VLAN IDs greater than 1006, but they are not added to the VLAN database.

The controller supports only Ethernet interfaces.

#### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>vlan</b> <i>vlan-id</i>  <b>Example:</b>  Device(config)# <b>vlan 20</b>	Enters a VLAN ID, and enters VLAN configuration mode. Enter a new VLAN ID to create a VLAN, or enter an existing VLAN ID to modify that VLAN.  <b>Note</b> The available VLAN ID range for this command is 1 to 4094.

	Command or Action	Purpose
<b>Step 2</b>	<b>name</b> <i>vlan-name</i> <b>Example:</b> <pre>Device(config-vlan)# name test20</pre>	(Optional) Enters a name for the VLAN. If no name is entered for the VLAN, the default is to append the <i>vlan-id</i> value with leading zeros to the word VLAN. For example, VLAN0004 is a default VLAN name for VLAN 4.
<b>Step 3</b>	<b>media</b> { <b>ethernet</b>   <b>fd-net</b>   <b>trn-net</b> } <b>Example:</b> <pre>Device(config-vlan)# media ethernet</pre>	Configures the VLAN media type.
<b>Step 4</b>	<b>show vlan</b> { <b>name</b> <i>vlan-name</i>   <b>id</b> <i>vlan-id</i> } <b>Example:</b> <pre>Device# show vlan name test20 id 20</pre>	Verifies your entries.

## Assigning Static-Access Ports to a VLAN (GUI)

### Procedure

- 
- Step 1** Choose **Configuration** > **Layer2** > **VLAN** > **VLAN**
  - Step 2** Click the **VLAN** tab.
  - Step 3** To assign **Port Members**, click the interfaces that are to be included as port members from the **Available** list and click on the arrow to move it to the **Associated** list.
  - Step 4** Click **Update & Apply to Device**.
- 

## Assigning Static-Access Ports to a VLAN

You can assign a static-access port to a VLAN without having VTP globally propagate VLAN configuration information by disabling VTP (VTP transparent mode). For more information on static-access ports, see *VLAN Port Membership Modes*.

If you assign an interface to a VLAN that does not exist, the new VLAN is created.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> <pre>Device# configure terminal</pre>	Enters global configuration mode

	Command or Action	Purpose
<b>Step 2</b>	<b>interface</b> <i>interface-id</i> <b>Example:</b> Device(config)# <b>interface</b> <b>gigabitethernet2/0/1</b>	Enters the interface to be added to the VLAN.
<b>Step 3</b>	<b>switchport mode access</b> <b>Example:</b> Device(config-if)# <b>switchport mode access</b>	Defines the VLAN membership mode for the port (Layer 2 access port).
<b>Step 4</b>	<b>switchport access vlan</b> <i>vlan-id</i> <b>Example:</b> Device(config-if)# <b>switchport access vlan</b> <b>2</b>	Assigns the port to a VLAN. Valid VLAN IDs are 1 to 4094.
<b>Step 5</b>	<b>end</b> <b>Example:</b> Device(config-if)# <b>end</b>	Returns to privileged EXEC mode.
<b>Step 6</b>	<b>show running-config interface</b> <i>interface-id</i> <b>Example:</b> Device# <b>copy running-config</b> <b>startup-config</b>	Verifies the VLAN membership mode of the interface.
<b>Step 7</b>	<b>show interfaces</b> <i>interface-id</i> <b>switchport</b> <b>Example:</b> Device# <b>show interfaces</b> <b>gigabitethernet2/0/1</b>	Verifies your entries in the <i>Administrative Mode</i> and the <i>Access Mode VLAN</i> fields of the display.

## How to Configure Extended-Range VLANs

Extended-range VLANs enable service providers to extend their infrastructure to a greater number of customers. The extended-range VLAN IDs are allowed for any **switchport** commands that allow VLAN IDs.

With VTP version 1 or 2, extended-range VLAN configurations are not stored in the VLAN database, but because VTP mode is transparent, they are stored in the controller running configuration file, and you can

save the configuration in the startup configuration file. Extended-range VLANs created in VTP version 3 are stored in the VLAN database.

## Creating an Extended-Range VLAN (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Layer2 > VLAN**.
  - Step 2** In the VLAN page, click **ADD**.
  - Step 3** Enter the extended range VLAN ID in the **VLAN ID** field.  
The extended range is between range is 1006 and 4094.
  - Step 4** Enter a VLAN name in the **Name** field.
  - Step 5** Save the configuration.
- 

## Creating an Extended-Range VLAN

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>vlan <i>vlan-id</i></b> <b>Example:</b> Device(config)# <code>vlan 2000</code>	Enters an extended-range VLAN ID and enters VLAN configuration mode. The range is 1006 to 4094.
<b>Step 3</b>	<b>show vlan id <i>vlan-id</i></b> <b>Example:</b> Device# <code>show vlan id 2000</code>	Verifies that the VLAN has been created.

# Monitoring VLANs

Table 143: Privileged EXEC show Commands

Command	Purpose
<b>show interfaces</b> [vlan <i>vlan-id</i> ]	Displays characteristics for all interfaces or for the specified VLAN configured on the controller.
<b>show vlan</b> [ <b>access-map</b> <i>name</i>   <b>brief</b>   <b>group</b> <i>id</i> <i>vlan-id</i>   <b>ifindex</b>   <b>mtu</b>   <b>name</b> <i>name</i>   <b>summary</b> ]	<p>Displays parameters for all VLANs or the specified VLAN on the controller. The following command options are available:</p> <ul style="list-style-type: none"> <li>• <b>brief</b>—Displays VTP VLAN status in brief.</li> <li>• <b>group</b>—Displays the VLAN group with its name and the connected VLANs that are available.</li> <li>• <b>id</b>—Displays VTP VLAN status by identification number.</li> <li>• <b>ifindex</b>—Displays SNMP ifIndex.</li> <li>• <b>mtu</b>—Displays VLAN MTU information.</li> <li>• <b>name</b>—Displays the VTP VLAN information by specified name.</li> <li>• <b>summary</b>—Displays a summary of VLAN information.</li> </ul>

- [Adding a VLAN Group to Policy Profile \(GUI\), on page 1941](#)
- [Adding a VLAN Group to a Policy Profile, on page 1942](#)
- [Viewing the VLANs in a VLAN Group, on page 1942](#)
- [VLAN Group Support for DHCP and Static IP Clients, on page 1943](#)

## Information About VLAN Groups

Whenever a client connects to a wireless network (WLAN), the client is placed in a VLAN that is associated with the policy profile mapped to the WLAN. In a large venue, such as an auditorium, a stadium, or a conference room where there are numerous wireless clients, having only a single WLAN to accommodate many clients might be a challenge.

The VLAN group feature uses a single policy profile that can support multiple VLANs. The clients can get assigned to one of the configured VLANs. This feature maps a policy profile to a single VLAN or multiple VLANs using the VLAN groups. When a wireless client associates to the WLAN, the VLAN is derived by an algorithm based on the MAC address of the wireless client. A VLAN is assigned to the client and the client gets the IP address from the assigned VLAN.

The system marks VLAN as *Dirty* for 30 minutes when the clients are unable to receive IP addresses using DHCP. The system might not clear the *Dirty* flag from the VLAN even after 30 minutes for a VLAN group. After 30 minutes, when the VLAN is marked non-dirty, new clients in the IP Learn state can get assigned with IP addresses from the VLAN if free IPs are available in the pool and DHCP scope is defined correctly. This is the expected behavior because the timestamp of each interface has to be checked to see if it is greater than 30 minutes, due to which there is a lag of 5 minutes for the global timer to expire.

**Note** The Controller marks the VLAN interface as *Dirty* when three or more clients fail to receive IP addresses through DHCP. The VLAN interface is deemed *Dirty* using the Non-Aggressive method, which involves counting one failure per association per client that surpasses the predefined **IP\_LEARN\_TIMEOUT** duration of 120 seconds. If a client sends a new association request before the **IP\_LEARN\_TIMEOUT** elapses, it will not be considered a failed client.

In Non-Aggressive method, each client gets a unique hash value derived from its MAC address. This approach ensures that clients belonging to the same vendor, which may differ only by a few bits, do not mistakenly trigger the *Dirty* marking of a VLAN.

## Prerequisites for VLAN Groups

- A VLAN should be present in the device for it to be added to the VLAN group.

## Restrictions for VLAN Groups

- If the number of VLANs in a VLAN group exceeds 32, the mobility functionality might not work as expected and Layer 2 multicast might break for some VLANs. Therefore, it is the responsibility of network administrators to configure a feasible number of VLANs in a VLAN group.  
For the VLAN Groups feature to work as expected, the VLANs mapped in a group must be present in the controller.
- The VLAN Groups feature works for access points in local mode.
- The VLAN Groups feature works only in central switching mode and it cannot be used in FlexConnect local switching mode.
- ARP Broadcast feature is not supported on VLAN groups.
- VLAN group Multicast with VLAN group is only supported in local mode AP. Multicast VLAN is required when VLAN group is configured and uses multicast traffic.
- While you configure VLAN groups with multiple VLANs and each VLAN is used by a different subnet, clients having static IP addresses might be assigned to a wrong VLAN if SVIs are not present on the controller. Hence, for every VLAN that belongs to the VLAN group, ensure that you configure an SVI interface with a valid IP address.

## Creating a VLAN Group (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Layer2 > VLAN**
- Step 2** On the **VLAN > VLAN** page, click **Add**.

- Step 3** Enter the VLAN ID in the **VLAN ID** field.  
The valid range is between 2 and 4094.
- Step 4** Enter the VLAN name in the **Name** field.  
Configure the other parameters if required.
- Step 5** Click **Update & Apply to Device**.

## Creating a VLAN Group (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>vlan group WORD vlan-list vlan-ID</b>  <b>Example:</b> Device(config)# <b>vlan group vlangrp1</b> <b>vlan-list 91-95</b>	Creates a VLAN group with the given group name (vlangrp1) and adds all the VLANs listed in the command. The VLAN list ranges from 1 to 4096 and the maximum number of VLANs supported in a group is 64.
<b>Step 3</b>	<b>end</b>  <b>Example:</b> Device(config)# <b>end</b>	Exits the global configuration mode and returns to privileged EXEC mode. Alternatively, press <b>CTRL-Z</b> to exit the global configuration mode.

## Adding a VLAN Group to Policy Profile (GUI)

Policy profile broadly consists of network and switching policies. Policy profile is a reusable entity across tags. Anything that is a policy for the client that is applied on the AP or controller is moved to the policy profile. For example, VLAN, ACL, QoS, Session timeout, Idle timeout, AVC profile, Bonjour profile, Local profiling, Device classification, BSSID QoS, etc. However, all wireless related security attributes and features on the WLAN are grouped under the WLAN profile.

### Procedure

- Step 1** Choose **Configuration > Tags & Profiles > Policy**.
- Step 2** On the **Policy Profile** page, click on a policy profile name.
- Step 3** Click **Access Policies** tab.
- Step 4** Under **VLAN** section, use the **VLAN/VLAN Group** drop-down list to select a VLAN or VLAN Group.

**Step 5** Click **Update & Apply to Device**.

## Adding a VLAN Group to a Policy Profile

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wireless profile policy</b> <i>wlan-policy-profile-name</i> <b>Example:</b> Device(config)# wireless profile policy my-wlan-policy	Configures the WLAN policy profile.
<b>Step 3</b>	<b>vlan</b> <i>vlan-group1</i> <b>Example:</b> Device(config-wireless-policy)# vlan myvlan-group	Maps the VLAN group to the WLAN by entering the group name.
<b>Step 4</b>	<b>end</b> <b>Example:</b> Device(config-wlan)# end	Exits global configuration mode and returns to privileged EXEC mode.

## Viewing the VLANs in a VLAN Group

Command	Description
<b>show vlan group</b>	Displays the list of VLAN groups with name and the VLANs that are configured.
<b>show vlan group</b> <i>group-name</i> <i>group_name</i>	Displays the specified VLAN group details.
<b>show wireless client mac-address</b> <i>client-mac-addr</i> <b>detail</b>	Displays the VLAN group assigned to the client.
<b>show wireless vlan details</b>	Displays VLAN details.

## VLAN Group Support for DHCP and Static IP Clients

When a static IP client joins a VLAN group, the controller adds it to a VLAN based on VLAN computation logic. If the client's static IP address isn't part of the VLAN's IP list, the client fails to get internet access, even if the client is authenticated and authorized. The VLAN Group to Support DHCP and Static IP Clients feature aims to handle the network access of such clients. This feature only supports IPv4 clients and is enabled by default. However, ensure that the **ipv4 dhcp required** command is not configured on the wireless policy profile, because this disables the feature, causing the client to be stuck in the IP learn state.

### Prerequisites

- Ensure that a switch VLAN interface (SVI) is configured with the IP address.

### Restrictions

- FlexConnect local switching and FlexConnect local authentication are not supported. Only Local mode, FlexConnect central switching, and FlexConnect central authentication are supported.
- IPv6 is not supported.
- The peer controller cannot have a VLAN group in the policy profile, because a VLAN group with static IP mobility is not supported.

## Supported Features

Table 144: Supported Features

Feature	Support
Guest Anchor	Yes
Mobility	Yes
RLAN	Yes
SVI	Yes Ensure that you configure SVI with an IP address in the same subnet as that of the client's IP address.
IRCM support: Guest AireOS as anchor and Cisco Catalyst 9800 controller as foreign	Yes
IRCM support : Guest AireOS as foreign and Cisco Catalyst 9800 controller as anchor	Yes The client is excluded if there is no match for the SVI.

- [Verifying a WLAN Radio Policy, on page 1975](#)

### Information About WLANs

This feature enables you to control WLANs for lightweight access points. Each WLAN has a separate WLAN ID, a separate profile name, and a WLAN SSID. All access points can advertise up to 16 WLANs. However, you can create up to 4096 WLANs and then selectively advertise these WLANs (using profiles and tags) to different access points for better manageability.

You can configure WLANs with different SSIDs or with the same SSID. An SSID identifies the specific wireless network that you want the device to access.

---

**Note** The **wireless client max-user-login concurrent** command will work as intended even if the **no configure max-user-identity response** command is configured.

---

---

**Note** We recommend that you configure the **password encryption aes** and the **key config-key password-encrypt key** commands to encrypt your password.

---

---

**Note** From Cisco IOS XE Cupertino 17.7.1 release onwards, only 8 WLANs are broadcasted on 6-GHz band.

---

---

**Note** For C9105, C9115, and C9120 APs, when a new WLAN is pushed from the controller and if the existing WLAN functional parameters are changed, the other WLAN clients will disconnect and reconnect.

---

## Band Selection

Band select enables client radios that are capable of dual-band (2.4 and 5-GHz) operations to move to a less congested 5-GHz access point. The 2.4-GHz band is often congested. Clients on this band typically experience interference from Bluetooth devices, microwave ovens, and cordless phones as well as co-channel interference from other access points because of the 802.11b/g limit of 3 nonoverlapping channels. To prevent these sources of interference and improve overall network performance, configure band selection on the device.

## Off-Channel Scanning Deferral

A lightweight access point, in normal operational conditions, periodically goes off-channel and scans another channel. This is in order to perform RRM operations such as the following:

- Transmitting and receiving Neighbor Discovery Protocol (NDP) packets with other APs.
- Detecting rogue APs and clients.
- Measuring noise and interference.

During the off-channel period, which normally is about 70 milliseconds, the AP is unable to transmit or receive data on its serving channel. Therefore, there is a slight impact on its performance and some client transmissions might be dropped.

While the AP is sending and receiving important data, it is possible to configure off-channel scanning deferral so that the AP does not go off-channel and its normal operation is not impacted. You can configure off-channel scanning deferral on a per-WLAN basis, per WMM UP class basis, with a specified time threshold in milliseconds. If the AP sends or receives, on a particular WLAN, a data frame marked with the given UP class within the specified threshold, the AP defers its next RRM off-channel scan. For example, by default, off-channel scanning deferral is enabled for UP classes 4, 5, and 6, with a time threshold of 100 milliseconds. Therefore, when RRM is about to perform an off-channel scan, a data frame marked with UP 4, 5, or 6 is received within the last 100 milliseconds, RRM defers going off-channel. The AP radio does not go off-channel when a voice call sending and receiving audio samples is marked as UP class 6 for every active 20 milliseconds.

Off-channel scanning deferral does come with a tradeoff. Off-channel scanning can impact throughput by 2 percent or more, depending on the configuration, traffic patterns, and so on. Throughput can be slightly improved if you enable off-channel scanning deferral for all traffic classes and increase the time threshold. However, by not going off-channel, RRM can fail to identify AP neighbors and rogues, resulting in negative impact to security, DCA, TPC, and 802.11k messages.

## DTIM Period

In the 802.11 networks, lightweight access points broadcast a beacon at regular intervals, which coincides with the Delivery Traffic Indication Map (DTIM). After the access point broadcasts the beacon, it transmits any buffered broadcast and multicast frames based on the value set for the DTIM period. This feature allows power-saving clients to wake up at the appropriate time if they are expecting broadcast or multicast data.

Typically, the DTIM value is set to 1 (to transmit broadcast and multicast frames after every beacon) or 2 (to transmit broadcast and multicast frames after every other beacon). For instance, if the beacon period of the 802.11 network is 100 ms and the DTIM value is set to 1, the access point transmits buffered broadcast and multicast frames for 10 times every second. If the beacon period is 100 ms and the DTIM value is set to 2, the access point transmits buffered broadcast and multicast frames for 5 times every second. Either of these settings are suitable for applications, including Voice Over IP (VoIP), that expect frequent broadcast and multicast frames.

However, the DTIM value can be set as high as 255 (to transmit broadcast and multicast frames after every 255th beacon). The only recommended DTIM values are 1 and 2; higher DTIM values will likely cause communications problems.

---

**Note** A beacon period, which is specified in milliseconds on the device, is converted internally by the software to 802.11 Time Units (TUs), where 1 TU = 1.024 milliseconds. Depending on the AP model, the actual beacon period may vary slightly; for example, a beacon period of 100 ms may in practice equate to 104.448 ms.

---

## WLAN Radio Policy

The existing WLAN feature allows you to broadcast WLAN on a specified radio on all the applicable slots. With the WLAN Radio Policy feature, you can broadcast the WLAN on the corresponding slot. Note that this option is supported only on 5-GHz band.

## Restrictions for WLAN Radio Policy

- WLAN is pushed to all the radios only if the following configuration is used:
  - WPA3 + AES cipher + 802.1x-SHA256 AKM
  - WPA3 + AES cipher + OWE AKM
  - WPA3 + AES cipher + SAE AKM
  - WPA3 + CCMP256 cipher + SUITEB192-1X AKM
  - WPA3 + GCMP256 cipher + SUITEB-1X AKM
  - WPA3 + GCMP128 cipher + SUITEB192-1X AKM

## Prerequisites for Configuring Cisco Client Extensions

- The software supports CCX versions 1 through 5, which enables devices and their access points to communicate wirelessly with third-party client devices that support CCX. CCX support is enabled automatically for every WLAN on the device and cannot be disabled. However, you can configure Aironet information elements (IEs).
- If Aironet IE support is enabled, the access point sends an Aironet IE 0x85 (which contains the access point name, load, number of associated clients, and so on) in the beacon and probe responses of this WLAN, and the device sends Aironet IEs 0x85 and 0x95 (which contains the management IP address

of the device and the IP address of the access point) in the reassociation response if it receives Aironet IE 0x85 in the reassociation request.

## Peer-to-Peer Blocking

Peer-to-peer blocking is applied to individual WLANs, and each client inherits the peer-to-peer blocking setting of the WLAN to which it is associated. Peer-to-Peer enables you to have more control over how traffic is directed. For example, you can choose to have traffic bridged locally within the device, dropped by the device, or forwarded to the upstream VLAN.

Peer-to-peer blocking is supported for clients that are associated with local and central switching WLANs.

---

**Note** Peer-to-peer blocking feature is VLAN-based. WLANs using the same VLAN has an impact, if Peer-to-peer blocking feature is enabled.

---

## Diagnostic Channel

You can choose a diagnostic channel to troubleshoot why the client is having communication problems with a WLAN. You can test the client and access points to identify the difficulties that the client is experiencing and allow corrective measures to be taken to make the client operational on the network. You can use the device GUI or CLI to enable the diagnostic channel, and you can use the device **diag-channel** CLI to run the diagnostic tests.

---

**Note** We recommend that you enable the diagnostic channel feature only for non-anchored SSIDs that use the management interface. CCX Diagnostic feature has been tested only with clients having Cisco ADU card

---

## Prerequisites for WLANs

- You can associate up to 16 WLANs with each access point group and assign specific access points to each group. Each access point advertises only the enabled WLANs that belong to its access point group. The access point (AP) does not advertise disabled WLANs in its access point group or WLANs that belong to another group.
- We recommend that you assign one set of VLANs for WLANs and a different set of VLANs for management interfaces to ensure that devices properly route VLAN traffic.

## Restrictions for WLANs

- Do not configure PSK and CCKM in a WLAN, as this configuration is not supported and impacts client join flow.
- Ensure that TKIP or AES ciphers are enabled with WPA1 configuration, else ISSU may break during upgrade process.

- When you change the WLAN profile name, then FlexConnect APs (using AP-specific VLAN mapping) will become WLAN-specific. If FlexConnect Groups are configured, the VLAN mapping will become Group-specific.
- Do not enable IEEE 802.1X Fast Transition on Flex Local Authentication enabled WLAN, as client association is not supported with Fast Transition 802.1X key management.
- Peer-to-peer blocking does not apply to multicast traffic.
- In FlexConnect, peer-to-peer blocking configuration cannot be applied only to a particular FlexConnect AP or a subset of APs. It is applied to all the FlexConnect APs that broadcast the SSID.
- The WLAN name and SSID can have up to 32 characters.
- WLAN and SSID names support only the following ASCII characters:
  - Numerals: 48 through 57 hex (0 to 9)
  - Alphabets (uppercase): 65 through 90 hex (A to Z)
  - Alphabets (lowercase): 97 through 122 hex (a to z)
  - ASCII space: 20 hex
  - Printable special characters: 21 through 2F, 3A through 40, and 5B through 60 hex, that is: ! " # \$ % & ' ( ) \* + , - . / : ; < = > ? @ [ \ ] ^ \_ ` { | } ~
- WLAN name cannot be a keyword; for example, if you try to create a WLAN with the name as 's' by entering the **wlan s** command, it results in shutting down all WLANs because 's' is used as a keyword for shutdown.
- You cannot map a WLAN to VLAN 0. Similarly, you cannot map a WLAN to VLANs 1002 to 1006.
- Dual stack clients with a static-IPv4 address is not supported.
- In a dual-stack with IPv4 and IPv6 configured in the Cisco 9800 controller, if an AP tries to join controller with IPv6 tunnel before its IPv4 tunnel gets cleaned, you would see a traceback and AP join will fail.
- When creating a WLAN with the same SSID, you must create a unique profile name for each WLAN.
- When multiple WLANs with the same SSID get assigned to the same AP radio, you must have a unique Layer 2 security policy so that clients can safely select between them.
- The SSID that is sent as part of the user profile will work only if **aaa override** command is configured.
- RADIUS server overwrite is not configured on a per WLAN basis, but rather on a per AAA server group basis.
- Downloadable ACL (DAACL) is supported only on the central switching mode. It is not supported for Flex Local switching or on the Cisco Embedded Wireless Controller.
- You cannot mix open configuration models with CLI-based, GUI-based, or Catalyst Center-based configurations. However, if you decide to use multiple model types, they must remain independent of each other. For example, in open configuration models, you can only manage configurations that have been created using an open configuration model, not a CLI-based or GUI-based model. Configurations that are created using open configuration models cannot be modified using a GUI-based model, or CLI-based model, or any other model.

- When you are configuring **dot11bg 11g** command and **radio dot11bg** or **radio dot11g** command, the clients can still connect in 5GHz radio. In this scenario, the client association needs to be blocked. This option is only available on a 2.4-GHz radio.

**Caution** Some clients might not be able to connect to WLANs properly if they detect the same SSID with multiple security policies. Use this WLAN feature with care.

# How to Configure WLANs

## WLAN Wizard

A wireless local-area network (WLAN) is a group of devices that form a network based on radio transmissions rather than wired connections. The WLAN Wizard on the WebUI is a simplified workflow designed to help you quickly create a WLAN and setup some primary configurations for your specific deployment.

The Wizard supports the following wireless deployment modes:

- **Local mode:** In Local mode, the WLAN is broadcast in the campus locally.
- **Flex Connect mode:** In FlexConnect mode, the WLAN is broadcast remotely across the WAN in a branch.
- **Guest CWA mode:** In Guest CWA mode, the WLAN is created for guest access with Central Web Authentication (CWA).

There are different authentication methods supported for each deployment mode.

To configure a WLAN for your preferred wireless deployment mode using the WLAN wizard on the WebUI, go to **Configuration > Wireless Setup > WLAN Wizard**.

You can also navigate to the WLAN Wizard by the following paths:

- On the Toolbar, click on the **Wireless Setup** icon and select **WLAN Wizard** from the drop-down list.
- On the left navigation pane, go to **Configuration > Tags & Profiles > WLANs** and click on **WLAN Wizard** on the top-right corner.

On the **WLAN Wizard** page, select a wireless deployment mode for the WLAN to initiate steps for setting up the WLAN with profiles, authentication methods, tags, and APs and other configurations.

## Local Mode

The WLAN is deployed in Local mode when the WLAN is present in an office setup with no branch offices. In local mode, an AP creates two CAPWAP tunnels to the controller. One is for management, the other is data traffic. This behavior is known as "centrally switched" because the data traffic is tunneled (bridged) from the AP to the controller where it is then routed by some routing device. Locally switched means the traffic is terminated at the local switch adjacent to the access point.

## Authentication Method

To configure a WLAN for local mode, select the preferred authentication method from the left panel. The authentication method sets the method by which a client can access the WLAN and decides the level of security on the WLAN. The options are:

- **PSK:** A Pre-Shared Key (PSK) is a unique key created for individuals or groups of users on the same SSID. A client will have to enter the PSK to be authenticated and allowed to access the WLAN.
- **Dot1x:** The client must go through relevant EAP authentication model to start exchanging traffic in the WLAN.
- **Local Web Authentication:** The controller intercepts http(s) traffic and redirects the client to the internal web page for authentication.
- **External Web Authentication:** The controller intercepts http(s) traffic and redirects the client to the login page hosted on the external web server for authentication.
- **Central Web Authentication:** The controller redirects all web traffic from the client to the ISE login page for authentication.

## WLAN Profile and Policy

After selecting the Authentication method, click on **WLAN** on the left panel to enter the WLAN profile and policy details.

The WLAN profile defines the properties of a WLAN such as Profile Name, Status, WLAN ID, L2 and L3 Security parameters, AAA Server associated with this SSID and other parameters that are specific to a particular WLAN. The policy profile defines the network policies and the switching policies for a client (with the exception of QoS), which constitute the AP policies as well.

### Procedure

- 
- Step 1** In the **Network Name** section, enter a **WLAN profile name**, which is a unique name for your wireless network. The name can be ASCII characters from 32 to 126, without leading and trailing spaces.
  - Step 2** Enter a valid **SSID** for the WLAN. A valid SSID can be up to 32 characters and can contain spaces. A valid SSID can be ASCII characters from 0 to 31, with leading and trailing spaces. This is the broadcast name for your WLAN.
  - Step 3** Enter the **WLAN ID**.
  - Step 4** In the **WLAN Policy** section, enter the **Policy Profile name**. The name can be ASCII characters from 32 to 126, without leading and trailing spaces.
  - Step 5** Select the **VLAN** to be associated with the Policy Profile from the drop-down list..

- Step 6** To select an existing Policy Profile for the WLAN, click on **Select Existing** and choose a **Policy Profile** from the drop-down list..
- 

## Authentication Configurations

Set up the authentication configurations and filters for the WLAN depending on the method you have chosen. These include the keys, filters, ACLs, and parameter maps as applicable to the selected authentication method.

### Procedure

---

- Step 1** If you have selected **PSK** as the authentication method, configure the following:
- In the **WLAN > Pre-Shared Key (PSK)** section, select the PSK format. Choose between ASCII and Hexadecimal formats.
  - From the **PSK type** drop-down list, choose if you want the key to be unencrypted or AES encrypted.
  - In the **Pre-Shared Key** field, enter the pass key for the WLAN.
- Step 2** If you have selected **Dot1x** as the authentication method, configure the following:
- In the **WLAN > AAA** tab, configure the AAA server list for the WLAN.
  - Select any of the available AAA servers to add to the WLAN.
  - To add a new AAA server to the list, click on Add New Server and enter the IP address and server-key.
  - To use an already configured AAA server list, click on **Use Existing** and select the appropriate list from the drop-down.
- Step 3** If you have selected **Local Web Authentication** as the authentication method, configure the following:
- In the **WLAN > Parameter Map** tab, configure the parameter map for the WLAN. A parameter map sets parameters that can be applied to subscriber sessions during authentication.
    - In the **Global Configuration** section, configure the global parameter map.
    - Enter an IPv4 or IPv6 address to configure a virtual IP address for redirecting the clients to the login page of the controller.
    - From the Trustpoint drop-down list, select the trustpoint for HTTPS login page. The trustpoint corresponds to the device certificate the controller will use in conjunction with the virtual IP and hostname.
    - In the **WLAN Specific Configuration** section, either create a new parameter map for the WLAN, or select an existing parameter map from the drop-down list.
  - In the **WLAN > Local Users** tab, enter the username in the local database to establish a username-based authentication system.
    - Enter the user name to be saved.
    - From the **Password Encryption** drop-down list, choose if you want the password to be unencrypted or encrypted.
    - In the **Password** field, specify the password the user must enter to gain access to the switch. The password must be from 1 to 25 characters and can contain embedded spaces.
    - Click on the + sign to add the credentials to the database. Add as many user credentials as required.

- Step 4** If you have selected **External Web Authentication** as the authentication method, configure the following:
- a) In the **WLAN > Parameter Map** tab, configure the parameter map for the WLAN.
    1. In the **Global Configuration** section, configure the global parameter map.
    2. Enter an IPv4 or IPv6 address to configure the virtual IP address of the external web authentication login page to which the guest users are redirected.
    3. From the **Trustpoint** drop-down list, select the trustpoint for HTTPS login page. The trustpoint corresponds to the device certificate the controller will use in conjunction with the virtual IP and hostname.
    4. In the **WLAN Specific Configuration** section, either create a new parameter map for the WLAN, or select an existing parameter map from the drop-down list.
    5. To create a new parameter map, enter the parameter-map name.
    6. In the **Redirect URL for login** field, enter the URL of the external server that will host the authentication page for login.
    7. In the **Portal IPV4 Address** field, enter the IPv4 address of the external server to send redirects. If the external server uses an IPv6 address, in the **Portal IPV6 Address** field, enter the IPv6 address of the portal to send redirects.
  - b) In the **WLAN > ACL / URL Filter** tab, configure the ACL rules and the URL filter list.
    1. In the **Pre Auth ACL** section, enter the name of the ACL.
    2. In the **IP address** field, enter the source IP address and the destination IP address. This will configure the ACL to permit packet transfer from and to the specified IP address. You can add as many IP addresses as required.
    3. In the **URL Filter** section, enter a name for the URL Filter list that you are creating.
    4. Use the slider to set the list action to **Permit** or **Deny** the URLs.
    5. Specify the URLs in the **URLs** box. Enter every URL on a new line.
- Step 5** If you have selected Central Web Authentication as the authentication method, configure the following:
- a) In the **WLAN > AAA/ACL** tab, configure the AAA server list and ACL for the WLAN.
  - b) In the **AAA Configuration** section, select any of the available AAA servers to add to the WLAN. This will be the server where the clients will get authenticated.
  - c) To add a new AAA server to the list, click on **Add New Server** and enter the IP address and server-key.
  - d) To use an already configured AAA server list, click on **Use Existing** and select the appropriate list from the drop-down.
  - e) In the **ACL List** section, enter the name of the ACL. This ACL will contain the rules regarding URLs that can be accessed by the client and should match the name configured on the RADIUS server.

## Tags

To configure tags on the WLAN, click on **Tags** from the left panel.

A Tag's property is defined by the policies associated to it. This property is in turn inherited by an associated client/AP. There are various type of tags, each associated to different profiles.

### Procedure

---

- Step 1** In the **Site Configuration** section, either enter a site tag to be added, or select an existing site tag from the drop-down list. You can add as many tags as required. In the local mode, the site tag contains the AP join profile only.
  - Step 2** In the **Policy Tag** section, either enter a policy tag to be added, or select an existing policy tag from the drop-down list. You can add as many tags as required. The policy tag constitutes mapping of the WLAN profile to the policy profile. The WLAN profile defines the wireless characteristics of the WLAN. The policy profile defines the network policies and the switching policies for the client.
  - Step 3** In the **RF Tag** section, either enter an RF tag to be added, or select an existing RF tag from the drop-down list. You can add as many tags as required. The RF tag contains the 2.4 GHz and 5 GHz RF profiles.
- 

## AP Provisioning

Once the Wireless network and RF characteristics are set up, access points can be added to the local site either using static AP MAC address assignment or by assigning already joined APs to a specific location.

To add tags and associate APs to the WLAN, click on **AP Provisioning** from the left panel.

### Procedure

---

- Step 1** The APs already discovered by the controller are listed in the **Provision Joined APs** tab. You can select the APs to be associated to the WLAN from this table.
- Step 2** To add tags to the selected APs, select the appropriate Policy Tag, Site Tag, and RF Tag from the respective drop-down lists. Click on **Add** to apply the tags.
- Step 3** To add APs manually, click on the **Pre-provision APs** tab. You can either add individual MAC addresses of the APs or upload a CSV file with the AP MAC addresses listed. The added APs will be listed in the table below.
- Step 4** Select the APs to be associated to the WLAN from this table.
- Step 5** To add tags to the selected APs, select the appropriate Policy Tag, Site Tag, and RF Tag from the respective drop-down lists. Click on **Add** to apply the tags.

A table of all the APs and the tags added to them is displayed in the **Selected APs** tab.

- Step 6** Click **Apply**.

This will create a WLAN in local mode with the authentication method, authentication filters, tags, and APs configured on it.

---

## FlexConnect Mode

FlexConnect is a wireless solution for branch office and remote office deployments. It enables you to configure and control access points (AP) in a branch or remote office from the corporate office through a wide area network (WAN) link without deploying a controller in each office. The FlexConnect access points can switch client data traffic and perform client authentication locally when their connection to the controller is lost. An

AP in Flex mode offers network survivability in the event of a loss of connection to the centralized wireless controller.

## Authentication Method

To configure a WLAN for FlexConnect mode, select the preferred authentication method from the left panel. The authentication method sets the method by which a client can access the WLAN and decides the level of security on the WLAN.

The options are:

- **Local Web Authentication:** The controller intercepts http(s) traffic and redirects the client to the internal web page for authentication.
- **External Web Authentication:** The controller intercepts http(s) traffic and redirects the client to the login page hosted on the external web server for authentication.
- **Central Web Authentication:** The controller redirects all web traffic from the client to the ISE login page for authentication.

## WLAN Profile and Policy

After selecting the Authentication method, click on **WLAN** on the left panel to enter the WLAN profile and policy details.

The WLAN profile defines the properties of a WLAN such as Profile Name, Status, WLAN ID, L2 and L3 Security parameters, AAA Server associated with this SSID and other parameters that are specific to a particular WLAN. The policy profile defines the network policies and the switching policies for a client (with the exception of QoS), which constitute the AP policies as well.

### Procedure

- 
- Step 1** In the **Network Name** section, enter a **WLAN profile name**, which is a unique name for your wireless network. The name can be ASCII characters from 32 to 126, without leading and trailing spaces.
  - Step 2** Enter a valid **SSID** for the WLAN. A valid SSID can be up to 32 characters and can contain spaces. A valid SSID can be ASCII characters from 0 to 31, with leading and trailing spaces. This is the broadcast name for your WLAN.
  - Step 3** Enter the **WLAN ID**.
  - Step 4** In the **WLAN Policy** section, enter the **Policy Profile name**. The name can be ASCII characters from 32 to 126, without leading and trailing spaces.
  - Step 5** Select the **VLAN** to be associated with the Policy Profile from the drop-down list..
  - Step 6** To select an existing Policy Profile for the WLAN, click on **Select Existing** and choose a **Policy Profile** from the drop-down list..
-

## Authentication Configurations

Set up the authentication configurations and filters for the WLAN depending on the method you have chosen. These include the keys, filters, ACLs, and parameter maps as applicable to the selected authentication method.

### Procedure

#### Step 1

If you have selected **Local Web Authentication** as the authentication method, configure the following:

- a) In the **WLAN > Parameter Map** tab, configure the parameter map for the WLAN. A parameter map sets parameters that can be applied to subscriber sessions during authentication.
  1. In the **Global Configuration** section, configure the global parameter map.
  2. Enter an IPv4 or IPv6 address to configure a virtual IP address for redirecting the clients to the login page of the controller.
  3. From the **Trustpoint** drop-down list, select the trustpoint for HTTPS login page. The trustpoint corresponds to the device certificate the controller will use in conjunction with the virtual IP and hostname.
  4. In the **WLAN Specific Configuration** section, either create a new parameter map for the WLAN, or select an existing parameter map from the drop-down list.
- b) In the **WLAN > Local Users / Flex** tab, configure a Flex profile and enter the username in the local database to establish a username-based authentication system.
  1. In the **Flex Profile** section, enter the name of the new flex profile and the native VLAN ID.
  2. To use an already existing Flex profile, click on **Select Existing** to choose a profile from the drop-down list and enter the native VLAN ID.
  3. In the **Local Users** section, enter the user name to be saved.
  4. From the **Password Encryption** drop-down list, choose if you want the password to be unencrypted or encrypted.
  5. In the **Password** field, specify the password the user must enter to gain access to the switch. The password must be from 1 to 25 characters and can contain embedded spaces.
  6. Click on the + sign to add the credentials to the database. Add as many user credentials as required.

#### Step 2

If you have selected **External Web Authentication** as the authentication method, configure the following:

- a) In the **WLAN > Parameter Map** tab, configure the parameter map for the WLAN.
  1. In the **Global Configuration** section, configure the global parameter map.
  2. Enter an IPv4 or IPv6 address to configure the virtual IP address of the external web authentication login page to which the guest users are redirected.
  3. From the **Trustpoint** drop-down list, select the trustpoint for HTTPS login page. The trustpoint corresponds to the device certificate the controller will use in conjunction with the virtual IP and hostname.
  4. In the **WLAN Specific Configuration** section, either create a new parameter map for the WLAN, or select an existing parameter map from the drop-down list.

5. To create a new parameter map, enter the parameter-map name.
  6. In the **Redirect URL for login** field, enter the URL of the external server that will host the authentication page for login.
  7. In the **Portal IPv4 Address** field, enter the IPv4 address of the external server to send redirects. If the external server uses an IPv6 address, in the **Portal IPv6 Address** field, enter the IPv6 address of the portal to send redirects.
- b) In the **WLAN > ACL / URL Filter** tab, configure the ACL rules and the URL filter list.
1. In the **Flex Profile** section, enter the name of the new flex profile and the native VLAN ID.
  2. To use an already existing Flex profile, click on **Select Existing** to choose a profile from the drop-down list and enter the native VLAN ID.
  3. In the **Pre Auth ACL** section, enter the name of the ACL.
  4. In the **IP address** field, enter the source IP address and the destination IP address. This will configure the ACL to permit packet transfer from and to the specified IP address. You can add as many IP addresses as required.
  5. In the **URL Filter** section, enter a name for the URL Filter list that you are creating.
  6. Click on **Add** to add the URLs.
  7. Specify the URL to be added to the list and its preference.
  8. Use the slider to set the list action to **Permit** or **Deny** the URLs.
  9. Click **Save**.
- You can add as many URLs to the list as required.
- c) To add a new AAA server to the list, click on **Add New Server** and enter the IP address and server-key.
- d) To use an already configured AAA server list, click on **Use Existing** and select the appropriate list from the drop-down.

**Step 3**

If you have selected **Central Web Authentication** as the authentication method, configure the following:

- a) In the **WLAN > AAA/ACL** tab, configure the AAA server list and ACL for the WLAN.
- b) In the **AAA Configuration** section, select any of the available AAA servers to add to the WLAN. This will be the server where the clients will get authenticated.
- c) To add a new AAA server to the list, click on **Add New Server** and enter the IP address and server-key.
- d) To use an already configured AAA server list, click on **Use Existing** and select the appropriate list from the drop-down.
- e) In the **Flex Profile** section, enter the name of the new flex profile and the native VLAN ID.
- f) To use an already existing Flex profile, click on **Select Existing** to choose a profile from the drop-down list and enter the native VLAN ID.
- g) In the **ACL List** section, enter the name of the ACL. This ACL will contain the rules regarding URLs that can be accessed by the client and should match the name configured on the RADIUS server.

**Tags**

To configure tags on the WLAN, click on **Tags** from the left panel.

A Tag's property is defined by the policies associated to it. This property is in turn inherited by an associated client/AP. There are various type of tags, each associated to different profiles.

### Procedure

---

- Step 1** In the **Site Configuration** section, either enter a site tag to be added, or select an existing site tag from the drop-down list. You can add as many tags as required. In FlexConnect mode, the site tag contains the AP join profile and the Flex profile.
  - Step 2** In the **Policy Tag** section, either enter a policy tag to be added, or select an existing policy tag from the drop-down list. You can add as many tags as required. The policy tag constitutes mapping of the WLAN profile to the policy profile. The WLAN profile defines the wireless characteristics of the WLAN. The policy profile defines the network policies and the switching policies for the client.
  - Step 3** In the **RF Tag** section, either enter an RF tag to be added, or select an existing RF tag from the drop-down list. You can add as many tags as required. The RF tag contains the 2.4 GHz and 5 GHz RF profiles.
- 

## AP Provisioning

Once the Wireless network and RF characteristics are set up, access points can be added to the local site either using static AP MAC address assignment or by assigning already joined APs to a specific location.

To add tags and associate APs to the WLAN, click on **AP Provisioning** from the left panel.

### Procedure

---

- Step 1** The APs already discovered by the controller are listed in the **Provision Joined APs** tab. You can select the APs to be associated to the WLAN from this table.
  - Step 2** To add tags to the selected APs, select the appropriate Policy Tag, Site Tag, and RF Tag from the respective drop-down lists. Click on **Add** to apply the tags.
  - Step 3** To add APs manually, click on the **Pre-provision APs** tab. You can either add individual MAC addresses of the APs or upload a CSV file with the AP MAC addresses listed. The added APs will be listed in the table below.
  - Step 4** Select the APs to be associated to the WLAN from this table.
  - Step 5** To add tags to the selected APs, select the appropriate Policy Tag, Site Tag, and RF Tag from the respective drop-down lists. Click on **Add** to apply the tags.  
  
A table of all the APs and the tags added to them is displayed in the **Selected APs** tab.
  - Step 6** Click **Apply**.  
  
This will create a WLAN in FlexConnect mode with the authentication method, authentication filters, tags, and APs configured on it.
- 

## Guest CWA Mode

The Guest mode addresses the need to provide internet access to guests in a secure and accountable manner with Central Web Authentication as the security method. The implementation of a wireless guest network

uses the enterprise's existing wireless and wired infrastructure to the maximum extent. This solution comprises of two controllers - a Guest Foreign and a Guest Anchor.

## Controller Type

To configure a WLAN for Guest CWA mode, select the type of controller configuration you want to set up on the device from the left panel.

The options are:

- **Foreign:** A Foreign is a controller in the WLAN that exists in the enterprise. A client sends a connection request to a Foreign controller to join the WLAN. It is a dedicated guest WLAN or SSID and is implemented throughout the campus wireless network wherever guest access is required. The Foreign controller manages the anchor controllers.
- **Anchor:** An Anchor is a controller or group of controllers in a WLAN that manage traffic within the network for a guest client. It provides internal security by forwarding the traffic from a guest client to a Cisco Wireless Controller in the demilitarized zone (DMZ) network.

## WLAN Profile and Policy

After selecting the Authentication method, click on **WLAN** on the left panel to enter the WLAN profile and policy details.

The WLAN profile defines the properties of a WLAN such as Profile Name, Status, WLAN ID, L2 and L3 Security parameters, AAA Server associated with this SSID and other parameters that are specific to a particular WLAN. The policy profile defines the network policies and the switching policies for a client (with the exception of QoS), which constitute the AP policies as well.

### Procedure

- 
- Step 1** In the **Network Name** section, enter a **WLAN profile name**, which is a unique name for your wireless network. The name can be ASCII characters from 32 to 126, without leading and trailing spaces.
  - Step 2** Enter a valid **SSID** for the WLAN. A valid SSID can be up to 32 characters and can contain spaces. A valid SSID can be ASCII characters from 0 to 31, with leading and trailing spaces. This is the broadcast name for your WLAN.
  - Step 3** Enter the **WLAN ID**.
  - Step 4** In the **WLAN Policy** section, enter the **Policy Profile name**. The name can be ASCII characters from 32 to 126, without leading and trailing spaces.
  - Step 5** Select the **VLAN** to be associated with the Policy Profile from the drop-down list..
  - Step 6** To select an existing Policy Profile for the WLAN, click on **Select Existing** and choose a **Policy Profile** from the drop-down list..

- Step 7** If you have selected **Foreign**, in the **Mobility Anchors** section, select the IP address of an available controller to assign it as the mobility anchor for the WLAN. This will extend the configurations on the Foreign controller onto the anchor controllers as well.
- 

## Authentication Configurations

For the Guest access mode, the authentication method is Central Web Authentication.

### Procedure

---

- Step 1** In the **WLAN > AAA/ACL** tab, configure the AAA server list and ACL for the WLAN.
- Step 2** In the **AAA Configuration** section, select any of the available AAA servers to add to the WLAN. This will be the server where the clients will get authenticated.
- Step 3** To add a new AAA server to the list, click on **Add New Server** and enter the IP address and server-key.
- Step 4** To use an already configured AAA server list, click on **Use Existing** and select the appropriate list from the drop-down.
- Step 5** In the **ACL List** section, enter the name of the ACL. This ACL will contain the rules regarding URLs that can be accessed by the client and should match the name configured on the RADIUS server.
- 

## Tags

To configure tags on the WLAN, click on **Tags** from the left panel.

A Tag's property is defined by the policies associated to it. This property is in turn inherited by an associated client/AP. There are various type of tags, each associated to different profiles.

### Procedure

---

- Step 1** In the **Site Configuration** section, either enter a site tag to be added, or select an existing site tag from the drop-down list. You can add as many tags as required.
- Step 2** In the **Policy Tag** section, either enter a policy tag to be added, or select an existing policy tag from the drop-down list. You can add as many tags as required. The policy tag constitutes mapping of the WLAN profile to the policy profile. The WLAN profile defines the wireless characteristics of the WLAN. The policy profile defines the network policies and the switching policies for the client.
- Step 3** In the **RF Tag** section, either enter an RF tag to be added, or select an existing RF tag from the drop-down list. You can add as many tags as required. The RF tag contains the 2.4 GHz and 5 GHz RF profiles.
- 

## AP Provisioning

Once the Wireless network and RF characteristics are set up, access points can be added to the local site either using static AP MAC address assignment or by assigning already joined APs to a specific location.

If you have selected **Foreign**, click on **AP Provisioning** from the left panel to add tags and associate APs to the WLAN.

### Procedure

- 
- Step 1** The APs already discovered by the controller are listed in the **Provision Joined APs** tab. You can select the APs to be associated to the WLAN from this table.
- Step 2** To add tags to the selected APs, select the appropriate Policy Tag, Site Tag, and RF Tag from the respective drop-down lists. Click on **Add** to apply the tags.
- Step 3** To add APs manually, click on the **Pre-provision APs** tab. You can either add individual MAC addresses of the APs or upload a CSV file with the AP MAC addresses listed. The added APs will be listed in the table below.
- Step 4** Select the APs to be associated to the WLAN from this table.
- Step 5** To add tags to the selected APs, select the appropriate Policy Tag, Site Tag, and RF Tag from the respective drop-down lists. Click on **Add** to apply the tags.
- A table of all the APs and the tags added to them is displayed in the **Selected APs** tab.
- Step 6** Click **Apply**.
- This will create a WLAN in Guest CWA mode with the authentication method, mobility anchors, authentication filters, tags, and APs configured on it.
- 

## Creating WLANs (GUI)

### Procedure

- 
- Step 1** In the **Configuration > Tags & Profiles > WLANs** page, click **Add**.
- The **Add WLAN** window is displayed.
- Step 2** Under the **General** tab and **Profile Name** field, enter the name of the WLAN. The name can be ASCII characters from 32 to 126, without leading and trailing spaces.
- Step 3** Click **Save & Apply to Device**.
- 

## Creating WLANs (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<code>wlan profile-name wlan-id [ssid]</code>	Specifies the WLAN name and ID:

	Command or Action	Purpose
	<p><b>Example:</b></p> <pre>Device(config)# wlan mywlan 34 mywlan-ssid</pre>	<ul style="list-style-type: none"> <li>For the <i>profile-name</i>, enter the profile name. The range is from 1 to 32 alphanumeric characters.</li> <li>For the <i>wlan-id</i>, enter the WLAN ID. The range is from 1 to 512.</li> <li>For the <i>ssid</i>, enter the Service Set Identifier (SSID) for this WLAN. If the SSID is not specified, the WLAN profile name is set as the SSID.</li> </ul> <p><b>Note</b></p> <ul style="list-style-type: none"> <li>You can create SSID using GUI or CLI. However, we recommend that you use CLI to create SSID.</li> <li>By default, the WLAN is disabled.</li> </ul>
<b>Step 3</b>	<p><b>end</b></p> <p><b>Example:</b></p> <pre>Device(config)# end</pre>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Deleting WLANs (GUI)

### Procedure

- 
- Step 1** In the **Configuration > Tags & Profiles > WLANs** page, check the checkbox adjacent to the WLAN you want to delete.
- To delete multiple WLANs, select multiple WLANs checkboxes.
- Step 2** Click **Delete**.
- Step 3** Click **Yes** on the confirmation window to delete the WLAN.
- 

## Deleting WLANs

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<p><b>configure terminal</b></p> <p><b>Example:</b></p> <pre>Device# configure terminal</pre>	Enters global configuration mode.

	Command or Action	Purpose
<b>Step 2</b>	<b>no wlan</b> <i>wlan-name</i> <i>wlan-id</i> <i>ssid</i> <b>Example:</b> Device(config)# <b>no wlan test2</b>	Deletes the WLAN. The arguments are as follows: <ul style="list-style-type: none"> <li>• The <i>wlan-name</i> is the WLAN profile name.</li> <li>• The <i>wlan-id</i> is the WLAN ID.</li> <li>• The <i>ssid</i> is the WLAN SSID name configured for the WLAN.</li> </ul> <b>Note</b> If you delete a WLAN that is part of an AP group, the WLAN is removed from the AP group and from the AP's radio.
<b>Step 3</b>	<b>end</b> <b>Example:</b> Device(config)# <b>end</b>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Searching WLANs (CLI)

To verify the list of all WLANs configured on the controller, use the following show command:

```
Device# show wlan summary
Number of WLANs: 4
```

WLAN Profile Name	SSID	VLAN	Status
1 test1	test1-ssid	137	UP
3 test2	test2-ssid	136	UP
2 test3	test3-ssid	1	UP
45 test4	test4-ssid	1	DOWN

To use wild cards and search for WLANs, use the following show command:

```
Device# show wlan summary | include test-wlan-ssid
1 test-wlan test-wlan-ssid 137 UP
```

## Enabling WLANs (GUI)

### Procedure

- Step 1** Choose **Configuration > Tags & Profiles > WLANs**.
- Step 2** On the **WLANs** page, click the WLAN name.
- Step 3** In the **Edit WLAN** window, toggle the **Status** button to **ENABLED**.
- Step 4** Click **Update & Apply to Device**.

## Enabling WLANs (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>wlan <i>profile-name</i></b> <b>Example:</b> Device(config)# <code>wlan test4</code>	Enters WLAN configuration submode. The <i>profile-name</i> is the profile name of the configured WLAN.
<b>Step 3</b>	<b>no shutdown</b> <b>Example:</b> Device(config-wlan)# <code>no shutdown</code>	Enables the WLAN.
<b>Step 4</b>	<b>end</b> <b>Example:</b> Device(config-wlan)# <code>end</code>	Returns to privileged EXEC mode.

## Disabling WLANs (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Tags & Profiles > WLANs**.
  - Step 2** In the **WLANs** window, click the WLAN name.
  - Step 3** In the **Edit WLAN** window, set the **Status** toggle button as **DISABLED**.
  - Step 4** Click **Update & Apply to Device**.
- 

## Disabling WLANs (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# <code>configure terminal</code>	Enters global configuration mode.

	Command or Action	Purpose
<b>Step 2</b>	<b>wlan <i>profile-name</i></b> <b>Example:</b> Device(config)# wlan test4	Enters WLAN configuration submode. The <i>profile-name</i> is the profile name of the configured WLAN.
<b>Step 3</b>	<b>shutdown</b> <b>Example:</b> Device(config-wlan)# shutdown	Disables the WLAN.
<b>Step 4</b>	<b>end</b> <b>Example:</b> Device(config-wlan)# end	Returns to privileged EXEC mode.
<b>Step 5</b>	<b>show wlan summary</b> <b>Example:</b> Device# show wlan summary	Displays the list of all WLANs configured on the device. You can search for the WLAN in the output.

## Configuring General WLAN Properties (CLI)

You can configure the following properties:

- Media stream
- Broadcast SSID
- Radio

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wlan <i>profile-name</i></b> <b>Example:</b> Device(config)# wlan test4	Enters WLAN configuration submode. The <i>profile-name</i> is the profile name of the configured WLAN.
<b>Step 3</b>	<b>shutdown</b> <b>Example:</b> Device(config-wlan)# shutdown	Disables the WLAN.
<b>Step 4</b>	<b>broadcast-ssid</b> <b>Example:</b> Device(config-wlan)# broadcast-ssid	Broadcasts the SSID for this WLAN.

	Command or Action	Purpose
<b>Step 5</b>	<b>dot11bg 11g</b> <b>Example:</b> Device(config-wlan)# <b>dot11bg 11g</b>	Configures the WLAN radio policy for dot11 radios.  Also see the section: Configuring a WLAN Radio Policy.
<b>Step 6</b>	<b>media-stream multicast-direct</b> <b>Example:</b> Device(config-wlan)# <b>media-stream multicast-direct</b>	Enables multicast VLANs on this WLAN.
<b>Step 7</b>	<b>no shutdown</b> <b>Example:</b> Device(config-wlan)# <b>no shutdown</b>	Enables the WLAN.
<b>Step 8</b>	<b>end</b> <b>Example:</b> Device(config-wlan)# <b>end</b>	Returns to privileged EXEC mode.

## Configuring Advanced WLAN Properties (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>wlan <i>profile-name</i></b> <b>Example:</b> Device(config)# <b>wlan test4</b>	Enters WLAN configuration submode. The <i>profile-name</i> is the profile name of the configured WLAN.
<b>Step 3</b>	<b>chd</b> <b>Example:</b> Device(config-wlan)# <b>chd</b>	Enables coverage hole detection for this WLAN.
<b>Step 4</b>	<b>ccx aironet-iesupport</b> <b>Example:</b> Device(config-wlan)# <b>ccx aironet-iesupport</b>	Enables support for Aironet IEs for this WLAN.

	Command or Action	Purpose
Step 5	<p><b>client association limit</b> { <i>clients-per-wlan</i>   <b>ap</b> <i>clients-per-ap-per-wlan</i>   <b>radioclients-per-ap-radio--per-wlan</b> }</p> <p><b>Example:</b></p> <pre>Device(config-wlan)# client association limit ap 400</pre>	Sets the maximum number of clients, clients per AP, or clients per AP radio that can be configured on a WLAN.
Step 6	<p><b>ip access-group web</b> <i>acl-name</i></p> <p><b>Example:</b></p> <pre>Device(config-wlan)# ip access-group web test-acl-name</pre>	Configures the IPv4 WLAN web ACL. The variable <i>acl-name</i> specifies the user-defined IPv4 ACL name.
Step 7	<p><b>peer-blocking</b> [ <b>allow-private-group</b>   <b>drop</b>   <b>forward-upstream</b> ]</p> <p><b>Example:</b></p> <pre>Device(config-wlan)# peer-blocking drop</pre>	<p>Configures peer to peer blocking parameters. The keywords are as follows:</p> <ul style="list-style-type: none"> <li>• <b>allow-private-group</b>—Enables peer-to-peer blocking on the Allow Private Group action.</li> <li>• <b>drop</b>—Enables peer-to-peer blocking on the drop action.</li> <li>• <b>forward-upstream</b>—No action is taken and forwards packets to the upstream.</li> </ul> <p><b>Note</b> The <b>forward-upstream</b> option is not supported for Flex local switching. Traffic is dropped even if this option is configured. Also, peer to peer blocking for local switching SSIDs are available only for the clients on the same AP.</p>
Step 8	<p><b>channel-scan</b> { <b>defer-priority</b> { <b>0-7</b> }   <b>defer-time</b> { <b>0 - 6000</b> } }</p> <p><b>Example:</b></p> <pre>Device(config-wlan)# channel-scan defer-priority 6</pre>	<p>Sets the channel scan defer priority and defer time. The arguments are as follows:</p> <ul style="list-style-type: none"> <li>• <b>defer-priority</b>—Specifies the priority markings for packets that can defer off-channel scanning. The range is from 0 to 7. The default is 3.</li> <li>• <b>defer-time</b>—Deferral time in milliseconds. The range is from 0 to 6000. The default is 100.</li> </ul>
Step 9	<p><b>end</b></p> <p><b>Example:</b></p> <pre>Device(config-wlan)# end</pre>	Returns to privileged EXEC mode.

# Configuring Advanced WLAN Properties (GUI)

## Before you begin

Ensure that you have configured an AP Join Profile prior to configuring the primary and backup controllers.

## Procedure

---

- Step 1** Choose **Configuration > Tags & Profiles > WLANs** .
- Step 2** Click **Add**.
- Step 3** Under the **Advanced** tab, check the **Coverage Hole Detection** check box.
- Step 4** Check the **Aironet IE** check box to enable Aironet IE on the WLAN.
- Step 5** Check the **Diagnostic Channel** check box to enable diagnostic channel on the WLAN.
- Step 6** From the **P2P Blocking Action** drop-down list, choose the required value.
- Step 7** Set the **Multicast Buffer** toggle button as enabled or disabled.
- Step 8** Check the **Media Stream Multicast-Direct** check box to enable the feature.
- Step 9** In the **Max Client Connections** section, specify the maximum number of client connections for the following:
- In the **Per WLAN** field, enter a value. The valid range is between 0 and 10000.
  - In the **Per AP Per WLAN** field, enter a value. The valid range is between 0 and 400.
  - In the **Per AP Radio Per WLAN** field, enter a value. The valid range is between 0 and 200.
- Step 10** In the **11v BSS Transition Support** section, perform the following configuration tasks:
- a) Check the **BSS Transition** check box to enable 802.11v BSS Transition support.
  - b) In the **Disassociation Imminent** field, enter a value. The valid range is between 0 and 3000.
  - c) In the **Optimized Roaming Disassociation Timer** field, enter a value. The valid range is between 0 and 40.
  - d) Select the check box to enable the following:
    - BSS Max Idle Service
    - BSS Max Idle Protected
    - Disassociation Imminent Service
    - Directed Multicast Service
    - Universal Admin
    - Load Balance
    - Band Select
    - IP Source Guard
- Step 11** In the **11ax** section, perform the following configuration tasks:
- a) Select the check box to enable the following:
    - Check the **Enable 11ax** checkbox to enable 802.11ax operation status on the WLAN.

- Check the **Downlink OFDMA** and **Uplink OFDMA** check boxes to enable downlink and uplink connections that use OFDMA.

Orthogonal Frequency Division Multiple Access (OFDMA) is a channel access mechanism that assures contention-free transmission to multiple clients in both the downlink (DL) and uplink (UL) within a respective single transmit opportunity.

- Check the **Downlink MU-MIMO** and **Uplink MU-MIMO** check boxes to enable downlink and uplink connections that use MU-MIMO.

With Multiuser MIMO (MU-MIMO), an AP can use its antenna resources to transmit multiple frames to different clients, all at the same time and over the same frequency spectrum.

- Enable the target wake up time configuration on the WLAN by checking the **BSS Target Wake Up Time** checkbox.

Target wake up time allows an AP to manage activity in the Wi-Fi network to minimize medium contention between stations, and to reduce the required amount of time that a station in the power-save mode needs to be awake. This is achieved by allocating stations to operate at non-overlapping times, and/or frequencies, and concentrate the frame exchanges in predefined service periods.

- Check the **Universal Admin** check box to enable Universal Admin support for the WLAN.
- Enable OKC on the WLAN by checking the **OKC** check box. Opportunistic Key Caching (OKC) allows the wireless client and the WLAN infrastructure to cache only one Pairwise Master Key (PMK) for the lifetime of the client association with this WLAN, even when roaming between multiple APs. This is enabled by default.
- Check the **Load Balance** check box to enable Aggressive Client Load Balancing. This allows lightweight access points to load balance wireless clients across access points.
- Check the **Band Select** check box to enable band selection for the WLAN. Band selection enables client radios that are capable of dual-band (2.4 and 5-GHz) operations to move to a less congested 5-GHz access point. The 2.4-GHz band is often congested with interference from other electronic devices as well as co-channel interference from other access points. Band selection helps prevent these sources of interference and improve overall network performance.
- Enable IP Source Guard on the WLAN by checking the **IP Source Guard** check box. IP Source Guard (IPSG) is a Layer 2 security feature that prevents the wireless controller from forwarding the packets with source IP addresses that are not known to it.

- b) From the **WMM Policy** drop-down list, choose the policy as **Allowed**, **Disabled**, or **Required**. By default, the WMM policy is **Allowed**. Wi-Fi Multimedia (WMM) is used to prioritize different types of traffic.

- **Disabled**: Disables WMM on the WLAN.
- **Required**: Requires client devices to use WMM. Devices that do not support WMM cannot join the WLAN.
- **Allowed**: Devices that cannot support WMM can join the WLAN but will not benefit from the 802.11n rates.

- c) From the **mDNS** drop-down list, choose **Bridging**, **Gateway**, or **Drop**. Multicast DNS (mDNS) provides the ability to perform DNS-like operations on the local link in the absence of any conventional Unicast DNS server.

- **Bridging:** Packets with mDNS multicast IP and multicast mac will be sent on multicast CAPWAP tunnel.
- **Gateway:** All ingress mDNS packets received from the wired network on a L3 interface (SVI or physical) would be intercepted by the Controller software and processed.
- **Drop:** All ingress mDNS packets will be dropped.

- Step 12** In the **Off Channel Scanning Defer** section, choose the appropriate **Defer Priority** values and then specify the required Scan Defer Time value in milliseconds.
- Step 13** In the **Assisted Roaming (11k)** section, choose the appropriate status for the following:
- Prediction Optimization
  - Neighbor List
  - Dual-Band Neighbor List
- Step 14** In the **DTIM Period (in beacon intervals)** section, specify a value for 802.11a/n and 802.11b/g/n radios. The valid range is from 1 to 255.
- Step 15** Click **Apply to Device**.

## Configuring WLAN Radio Policy (GUI)

### Procedure

- Step 1** On the **Configuration > Tags & Profiles > WLANs** page, click **Add** to create WLANs.
- Step 2** In the **General** tab, enter a **Profile Name**, which is a unique name of the your wireless network. The name can be ASCII characters from 32 to 126, without leading and trailing spaces.
- Step 3** Enter a valid **SSID** for the WLAN.  
A valid SSID can be up to 32 characters and can contain spaces. A valid SSID can be ASCII characters from 0 to 31, with leading and trailing spaces. This is the broadcast name for your WLAN.
- Step 4** Enter the **WLAN ID**. The valid range for the different models are listed below:

Model	WLAN ID Range
Cisco Catalyst 9800-80 Wireless Controller	1-4096
Cisco Catalyst 9800-CL Wireless Controller	1-4096
Cisco Catalyst 9800-40 Wireless Controller	1-4096
Cisco Catalyst 9800-L Wireless Controller	1-4096
Cisco Embedded Wireless Controller for an AP	1-16

- Step 5** Set the **WLAN Status** to Enabled.
- Step 6** To broadcast the SSID of the WLAN, set the status of Broadcast SSID to enabled. By default, this is disabled.
- Step 7** In the **Radio Policy** section, enable the desired radio band for the WLAN.
- 2.4ghz – Configures the policy on the 2.4-GHz radio.
  - 5ghz – Configures the policy on the 5-GHz radio.
- Step 8** If you enable the 5ghz radio band, select the radio slot to broadcast the WLAN on. The options are slot 0, slot 1, and slot 2. You can select multiple slots for the WLAN.
- Step 9** From the 802.11b/g Policy drop-down list, choose the radio policy from the following options:
- 802.11g only
  - 802.11b/g

Click **Apply to Device**.

## Configuring a WLAN Radio Policy (CLI)

Configure WLAN radio policy using commands.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wlan <i>profile-name</i></b>  <b>Example:</b> Device(config)# wlan test4	Enters WLAN configuration submode. The <i>profile-name</i> is the profile name of the configured WLAN.
<b>Step 3</b>	<b>shutdown</b>  <b>Example:</b> Device(config-wlan)# shutdown	Disables the WLAN.
<b>Step 4</b>	<b>radio policy dot11{5ghz   24ghz   6ghz }</b>  <b>Example:</b> Device(config-wlan)# radio policy dot11 5ghz	Enables the corresponding radio policy on the WLAN. The options are: <ul style="list-style-type: none"> <li>• <b>2.4ghz:</b> Configures the WLAN on 2.4-GHz radio only.</li> <li>• <b>5ghz:</b> Configures the WLAN on 5-GHz radio only.</li> <li>• <b>6ghz:</b> Configures the WLAN on 6-GHz radio only.</li> </ul>

	Command or Action	Purpose
<b>Step 5</b>	<b>slot {0  1   2}</b> <b>Example:</b> Device(config-wlan-radio-5ghz)# slot 1	Configures the WLAN radio policy on the slot that you choose. The options are: <ul style="list-style-type: none"> <li>• <b>0</b>: Configures the WLAN on the 5GHz radio with radio slot 0 (if using 5GHz).</li> <li>• <b>1</b>: Configures the WLAN on the 5GHz radio with radio slot 1.</li> <li>• <b>2</b>: Configures the WLAN on the 5GHz radio with radio slot 2 (if present).</li> </ul>
<b>Step 6</b>	<b>no shutdown</b> <b>Example:</b> Device(config-wlan)# no shutdown	Enables the WLAN.
<b>Step 7</b>	<b>end</b> <b>Example:</b> Device(config-wlan)# end	Returns to privileged EXEC mode.

## Verifying WLAN Properties (CLI)

To verify the WLAN properties based on the WLAN ID, use the following `show` command:

```
Device# show wlan id wlan-id
```

To verify the WLAN properties based on the WLAN name, use the following `show` command:

```
Device# show wlan name wlan-name
```

To verify the WLAN properties of all the configured WLANs, use the following `show` command:

```
Device# show wlan all
```

To verify the summary of all WLANs, use the following `show` command:

```
Device# show wlan summary
```

To verify the running configuration of a WLAN based on the WLAN name, use the following `show` command:

```
Device# show running-config wlan wlan-name
```

To verify the running configuration of all WLANs, use the following `show` command:

```
Device# show running-config wlan
```

## Verifying WLAN-VLAN Information for an AP

To verify the operational WLAN-VLAN mappings per AP, use the following command:

```
Device# show ap name test wlan vlan
```

```
Policy tag mapping
```

```

WLAN Profile Name Name Policy VLAN Flex Central Switching IPv4 ACL IPv6 ACL

jey_cwa pp-local-1 46 Enabled jey_acl1 Not Configured
swaguest pp-local-1 46 Enabled jey_acl1 Not Configured

```

## Verifying a WLAN Radio Policy

To verify the WLAN radio policy configuration status, use the following command:

```

Device# show wlan id 6 | sec Radio Bands
wpa3 enabled wlan:
Configured Radio Bands: All
Operational State of Radio Bands : All Bands Operational

Configured Radio Bands : All
Operational State of Radio Bands
 2.4ghz : UP
 5ghz : UP
 6ghz : DOWN (Required config: Disable WPA2 and Enable WPA3 &
dot11ax)

wpa3 not enabled wlan :
Configured Radio Bands : All
Operational State of Radio Bands
2.4ghz : UP
5ghz : UP

5ghz specify slot is enabled :
Configured Radio Bands
5ghz : Enabled
Slot 0 : Enabled
Slot 1 : Disabled
Slot 2 : Disabled

Operational State of Radio Bands
5ghz : UP
Slot 0 : Enabled
Slot 1 : Disabled
Slot 2 : Disabled

```

## Information About WPA1 and WPA2

Wi-Fi Protected Access (WPA or WPA1) and WPA2 are standards-based security solutions from the Wi-Fi Alliance that provide data protection and access control for wireless LAN systems. WPA1 is compatible with the IEEE 802.11i standard but was implemented prior to the standard's ratification; WPA2 is the Wi-Fi Alliance's implementation of the ratified IEEE 802.11i standard.

By default, WPA1 uses Temporal Key Integrity Protocol (TKIP) and Message Integrity Check (MIC) for data protection while WPA2 uses the stronger Advanced Encryption Standard encryption algorithm using Counter Mode with Cipher Block Chaining Message Authentication Code Protocol (AES-CCMP). By default, both WPA1 and WPA2 use the 802.1X for authenticated key management. However, the following options are also available:

- **PSK**—When you choose PSK (also known as WPA preshared key or WPA passphrase), you need to configure a preshared key (or a passphrase). This key is used as the Pairwise Master Key (PMK) between clients and authentication server.
- **Cisco Centralized Key Management** uses a fast rekeying technique that enables clients to roam from one access point to another without going through the controller, typically in under 150 milliseconds (ms). Cisco Centralized Key Management reduces the time required by the client to mutually authenticate with the new access point and derive a new session key during reassociation. Cisco Centralized Key Management fast secure roaming ensures that there is no perceptible delay in time-sensitive applications, such as wireless Voice over IP (VoIP), Enterprise Resource Planning (ERP), or Citrix-based solutions. Cisco Centralized Key Management is a CCXv4-compliant feature. If Cisco Centralized Key Management is selected, only Cisco Centralized Key Management clients are supported.

When Cisco Centralized Key Management is enabled, the behavior of access points differs from the controller's for fast roaming in the following ways:

- If an association request sent by a client has Cisco Centralized Key Management enabled in a Robust Secure Network Information Element (RSN IE) but Cisco Centralized Key Management IE is not encoded and only PMKID is encoded in RSN IE, then the controller does not do a full authentication. Instead, the controller validates the PMKID and does a four-way handshake.
- If an association request sent by a client has Cisco Centralized Key Management enabled in RSN IE and Cisco Centralized Key Management IE is encoded and only PMKID is present in the RSN IE, then the AP does a full authentication. The access point does not use PMKID sent with the association request when Cisco Centralized Key Management is enabled in RSN IE.
- 802.1X+Cisco Centralized Key Management—During normal operation, 802.1X-enabled clients mutually authenticate with a new access point by performing a complete 802.1X authentication, including communication with the main RADIUS server. However, when you configure your WLAN for 802.1X and Cisco Centralized Key Management fast secure roaming, Cisco Centralized Key Management-enabled clients securely roam from one access point to another without the need to reauthenticate to the RADIUS server. 802.1X+Cisco Centralized Key Management is considered as an optional Cisco Centralized Key Management because both Cisco Centralized Key Management and non-Cisco Centralized Key Management clients are supported when this option is selected.

On a single WLAN, you can allow WPA1, WPA2, and 802.1X/PSK/Cisco Centralized Key Management/802.1X+Cisco Centralized Key Management clients to join. All of the access points on such a WLAN advertise WPA1, WPA2, and 802.1X/PSK/Cisco Centralized Key Management/ 802.1X+Cisco Centralized Key Management information elements in their beacons and probe responses. When you enable WPA1 and/or WPA2, you can also enable one or two ciphers, or cryptographic algorithms, designed to protect data traffic. Specifically, you can enable AES and/or TKIP data encryption for WPA1 and/or WPA2. TKIP is the default value for WPA1, and AES is the default value for WPA2.

## Information About AAA Override

The AAA Override option of a WLAN enables you to configure the WLAN for identity networking. It enables you to apply VLAN tagging, Quality of Service (QoS), and Access Control Lists (ACLs) to individual clients based on the returned RADIUS attributes from the AAA server.

## Configuring AAA Override

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>wireless profile policy <i>profile-policy</i></b>  <b>Example:</b>	Configures WLAN policy profile and enters the wireless policy configuration mode.

	Command or Action	Purpose
	Device(config)# wireless profile policy test-wgb	
<b>Step 3</b>	<b>aaa-override</b>  <b>Example:</b> Device(config-wireless-policy)# aaa-override	Configures AAA policy override.  <b>Note</b> If VLAN is not pushed from the RADIUS server, the VLAN Override feature can be disabled from the RADIUS server.
<b>Step 4</b>	<b>end</b>  <b>Example:</b> Device(config-wireless-policy)# end	Returns to privileged EXEC mode.  Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Information About VLAN Override

The VLAN override requires the AAA Override to be enabled under the Policy Profile.

You can assign VLAN from the RADIUS server in two ways:

- Using IEFY RADIUS attributes 64, 65, and 81—The attribute 81 can be a VLAN ID, VLAN name, or VLAN group name. Both VLAN name and VLAN group are supported. Therefore, VLAN ID does not need to be predetermined on RADIUS.

The RADIUS user attributes used for the VLAN ID assignment are:

- 64 (Tunnel-Type)—Must be set to VLAN (Integer = 13).
- 65 (Tunnel-Medium-Type)—Must be set to 802 (Integer = 6).
- 81 (Tunnel-Private-Group-ID)—Must be set to the corresponding VLAN ID, VLAN name, or VLAN group name.
- Using Aire-Interface-Name attribute—Use this attribute to assign a successfully authenticated user to a VLAN interface name (or VLAN ID) as per the user configuration. When you use this attribute, the VLAN name is returned as a string.

The VLAN ID is 12-bits, and takes a value between 1 and 4094, inclusive. Because the Tunnel-Private-Group-ID is of type string, as defined in [RFC2868](#) for use with IEEE 802.1X, the VLAN ID integer value is encoded as a string. When these tunnel attributes are sent, it is necessary to fill in the Tag field.

## Configuring Override VLAN for Central Switching

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b>	Enters global configuration mode.

	Command or Action	Purpose
	Device# configure terminal	
<b>Step 2</b>	<b>vlan</b> <i>vlan-id</i> <b>Example:</b> Device(config)# vlan 20	Defines VLANs that can be pushed from the RADIUS server. <b>Note</b> The valid VLAN ID ranges from 1 to 4094.
<b>Step 3</b>	<b>name</b> <i>vlan-name</i> <b>Example:</b> Device(config-vlan)# name vlan_ascii	(Optional) Changes the default name of the VLAN.
<b>Step 4</b>	<b>end</b> <b>Example:</b> Device(config-vlan)# end	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Configuring Override VLAN for Local Switching

If the VLAN name ID mapping under flex profile is newly added or updated, then the WLAN policy profiles having a matching VLAN name configured, must be shut and unshut. This is to ensure that the updated WLAN-VLAN mapping is pushed to the APs and the client receives the IP address from the intended VLAN.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wireless profile flex</b> <i>flex_profile_name</i> <b>Example:</b> Device(config)# wireless profile flex rr-xyz-flex-profile	Configures a Flex profile.
<b>Step 3</b>	<b>vlan-name</b> <i>vlan_name</i> <b>Example:</b> Device(config-wireless-flex-profile)# vlan-name vlan_123	Defines VLANs that can be pushed from the RADIUS server.
<b>Step 4</b>	<b>vlan-id</b> <i>vlan_id</i> <b>Example:</b> Device(config-wireless-flex-profile-vlan)# vlan-id 23	Configures VLAN ID. The valid VLAN ID ranges from 1 to 4096.
<b>Step 5</b>	<b>end</b> <b>Example:</b>	Returns to privileged EXEC mode.

	Command or Action	Purpose
	Device(config-wireless-flex-profile-vlan)# end	Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## VLAN Override on Layer 3 Web Authentication

The VLAN override can be pushed from the RADIUS server during Layer 3 authentication.

When a client gets connected to the controller and authenticated using the RADIUS server for Local Web Authentication (LWA) and Central Web Authentication (CWA), the RADIUS server pushes back in access-accept the new VLAN. If the RADIUS server pushes back a new VLAN in the access-accept, the client goes back to IP learn state on the controller. The controller de-associates the client while maintaining the client state for 30 seconds. Once the client re-associates, the client lands immediately to the new VLAN and re-triggers a new DHCP request. The client then learns a new IP and moves to the RUN state on the controller.

The VLAN Override on Layer 3 Web authentication supports the following:

- Local clients
- Anchored clients
- FlexConnect central authentication, central or local switching

## Verifying VLAN Override on Layer 3 Web Authentication

To display the VLAN override after L3 authentication, use the following command:

```
Device# show wireless client mac <mac> detail
[...]
 Vlan Override after L3 Auth: True
```

To display the statistics about client, use the following command:

```
Device# show wireless stats client detail
[...]
Total L3 VLAN Override vlan change received : 1
Total L3 VLAN Override disassociations sent : 1
Total L3 VLAN Override re-associations received : 1
Total L3 VLAN Override successful VLAN change : 1
[...]
L3 VLAN Override connection timeout : 0
```

## Prerequisites for Layer 2 Security

WLANs with the same SSID must have unique Layer 2 security policies so that clients can make a WLAN selection based on the information advertised in beacon and probe responses. The available Layer 2 security policies are as follows:

- None (open WLAN)
- WPA+WPA2

**Note**

- Although WPA and WPA2 cannot be used by multiple WLANs with the same SSID, you can configure two WLANs with the same SSID with WPA/TKIP with PSK and Wi-Fi Protected Access (WPA)/Temporal Key Integrity Protocol (TKIP) with 802.1X, or with WPA/TKIP with 802.1X or WPA/AES with 802.1X.
- A WLAN configured with TKIP support will not be enabled on an RM3000AC module.

- Static WEP (not supported on Wave 2 APs)

## Restrictions for WPA2 and WP3

- You cannot enable security ft or ft-adaptive without enabling WPA2 or WPA3.
- You cannot enable ft-dot1x or ft-psk without enabling WPA2 or WPA3.
- You cannot enable 802.1x or PSK simultaneously with SHA256 key derivation type without enabling WPA2 or WPA3 on a WLAN.
- You cannot configure PMF on WPA1 WLAN without WPA2 security.
- IOS APs do not support WPA3.

## Feature History for Fallback for AAA-Overridden VLAN

This table provides release and related information for the feature explained in this module.

This feature is available in all the releases subsequent to the one in which it is introduced in, unless noted otherwise.

Table 145: Feature History for Fallback for AAA-Overridden VLAN

Release	Feature	Feature Information
Cisco IOS XE Bengaluru 17.6.1	Fallback for AAA-Overridden VLAN	<p>In Cisco IOS XE Bengaluru 17.5.1 and earlier releases, if there is a network with a single AAA server dictating policies that need to be applied to a client; and this client moves across different sites that have different policy definitions. If these policy definitions are not defined on the site to which the client needs to connect, the client does not get access to the network.</p> <p>For example, if a client is to be given access in VLAN 1, and VLAN 1 is not defined on the site to which the client connects, the client is excluded and does not get any access to the network.</p> <p>The Fallback for AAA-Overridden VLAN feature is introduced to allow fallback to policy profile VLAN when the overridden VLAN is not available.</p>

## Information About Fallback for AAA- Overridden VLAN

From Cisco IOS XE Bengaluru 17.6.1, fallback for AAA-overridden VLAN or VLAN groups is supported on the wireless policy profile.

A new command is introduced in the wireless policy profile to configure the Fallback for AAA-Overridden VLAN feature. In Cisco IOS XE Bengaluru 17.6.1, you cannot configure the Fallback for AAA Overridden VLAN feature using the GUI.

## Central Switching and FlexConnect Mode Scenarios

If fallback is enabled for AAA-overridden VLAN or VLAN groups, you might encounter the following scenarios in Central Switching and FlexConnect modes.

### Central Switching:

If the AAA server gives a VLAN policy to a client, and the VLAN ID or the VLAN name is defined in the controller, the client is assigned to the VLAN specified by the AAA server. If the VLAN is not defined in the controller, the client is assigned to a VLAN that is configured on the wireless policy profile.

If a VLAN group is configured on a wireless policy profile, the VLAN, as computed by the existing VLAN group logic, is assigned to the client. In the VLAN group case, fallback to policy profile VLAN occurs only when all the VLANs in the group are not configured in the controller, or, if the VLAN group is not defined in the controller.

If both, AAA-overridden VLAN and the VLAN configured on the wireless policy profile are not defined in the controller, the configuration is termed as invalid, and the client is excluded.

If a VLAN policy is not configured, or, if the default wireless policy profile is configured, the client is assigned a VLAN from the management VLAN.

### FlexConnect Mode:

If the AAA server assigns a VLAN policy to a client configured in the FlexConnect profile, the VLAN is resolved by the controller. If the VLAN is not configured on the FlexConnect profile, the behavior of the

VLAN name and the VLAN ID is made consistent, with the help of the fallback feature, and the client receives the IP address from the wireless policy profile configuration.

The following points summarize the FlexConnect mode behavior:

- If AAA VLAN is defined in FlexConnect profile, the client is assigned the AAA VLAN.
- If AAA VLAN is not defined in the FlexConnect profile, FlexConnect VLAN Central Switching is configured, and VLAN is defined in the controller, and the client is assigned AAA VLAN and is centrally switched.
- If AAA VLAN is not defined in the FlexConnect profile, FlexConnect VLAN Central Switching is configured, the VLAN is not defined in the controller, and the client is assigned a VLAN from the wireless policy profile.
- If AAA VLAN is not defined in the FlexConnect profile, and FlexConnect VLAN Central Switching is not configured, the client is assigned a VLAN from the wireless policy profile.

## Configuring Fallback for AAA-Overridden VLAN (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wireless profile policy</b> <i>wlan-policy-profile-name</i>  <b>Example:</b> Device(config)# wireless profile policy <i>wlan-policy-profile-name</i>	Configures the WLAN policy profile. Enters the wireless policy profile configuration mode.
<b>Step 3</b>	<b>aaa-override vlan fallback</b>  <b>Example:</b> Device(config-wireless-policy)# aaa-override vlan fallback	Allows fallback to the policy profile VLAN when the overridden VLAN is not available.

## Verifying Fallback for AAA-Overridden VLAN

To verify if the fallback for AAA-overridden VLAN is enabled, use the following command:

```
Device# show wireless profile policy detailed default-policy-profile | sec AAA Policy Params
AAA Policy Params
 AAA Override : DISABLED
 NAC : DISABLED
 AAA Policy name : default-aaa-policy
 AAA Vlan Fallback : ENABLED
```

# How to Configure WLAN Security

## Configuring Static WEP Layer 2 Security Parameters (GUI)

### Procedure

- 
- Step 1** Choose **Configuration** > **Tags & Profiles** > **WLANs**.
- Step 2** On the **WLANs** page, click the name of the WLAN.
- Step 3** In the **Edit WLAN** window, click the **Security** tab.
- Step 4** From the **Layer 2 Security Mode** drop-down list, select the **Static WEP** option.
- Step 5** (Optional) Check the **Shared Key Authentication** check box to set the authentication type as shared. By leaving the check box unchecked, the authentication type is set to open.
- Step 6** Set the **Key Size** as either **40 bits** or **104 bits**.
- 40 bits: The keys with 40-bit encryption must contain 5 ASCII text characters or 10 hexadecimal characters.
  - 104 bits: The keys with 104-bit encryption must contain 13 ASCII text characters or 26 hexadecimal characters.
- Step 7** Set the appropriate **Key Index**; you can choose between 1 to 4.
- Step 8** Set the **Key Format** as either **ASCII** or **Hex**.
- Step 9** Enter a valid **Encryption Key**.
- 40 bits: The keys with 40-bit encryption must contain 5 ASCII text characters or 10 hexadecimal characters.
  - 104 bits: The keys with 104-bit encryption must contain 13 ASCII text characters or 26 hexadecimal characters.
- Step 10** Click **Update & Apply to Device**.
- 

## Configuring Static WEP Layer 2 Security Parameters (CLI)

### Before you begin

You must have administrator privileges.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# <code>configure terminal</code>	Enters global configuration mode.

	Command or Action	Purpose
Step 2	<p><b>wlan</b> <i>profile-name</i> <i>wlan-id</i> <i>SSID_Name</i></p> <p><b>Example:</b></p> <pre>Device# wlan test4 1 test4</pre>	<p>Enters the WLAN configuration submode.</p> <p><i>profile-name</i> is the profile name of the configured WLAN.</p> <p><i>wlan-id</i> is the wireless LAN identifier. The range is 1 to 512.</p> <p><i>SSID_Name</i> is the SSID which can contain 32 alphanumeric characters.</p> <p><b>Note</b> If you have already configured this command, enter <b>wlan</b> <i>profile-name</i> command.</p>
Step 3	<p><b>no security ft over-the-ds</b></p> <p><b>Example:</b></p> <pre>Device(config-wlan)# no security ft over-the-ds</pre>	<p>Disables fast transition over the data source on the WLAN.</p>
Step 4	<p><b>no security ft</b></p> <p><b>Example:</b></p> <pre>Device(config-wlan)# no security ft</pre>	<p>Disables 802.11r Fast Transition on the WLAN.</p>
Step 5	<p><b>no security wpa</b>{akm   wpa1   wpa2}</p> <p><b>Example:</b></p> <pre>Device(config-wlan)# no security wpa wpa1 ciphers tkip</pre>	<p>Disables the WPA/WPA2 support for a WLAN.</p>
Step 6	<p><b>security static-wep-key</b> [authentication {open   shared}]</p> <p><b>Example:</b></p> <pre>Device(config-wlan)# security static-wep-key authentication open</pre>	<p>The keywords are as follows:</p> <ul style="list-style-type: none"> <li>• <b>static-wep-key</b>—Configures Static WEP Key authentication.</li> <li>• <b>authentication</b>—Specifies the authentication type you can set. The values are open and shared.</li> </ul>
Step 7	<p><b>security static-wep-key</b> [encryption {104   40} {ascii   hex} [0   8]]</p> <p><b>Example:</b></p> <pre>Device(config-wlan)# security static-wep-key encryption 104 ascii 0 1234567890123 1</pre>	<p>The keywords are as follows:</p> <ul style="list-style-type: none"> <li>• <b>static-wep-key</b>—Configures Static WEP Key authentication.</li> <li>• <b>encryption</b>—Specifies the encryption type that you can set. The valid values are 104 and 40. 40-bit keys must contain 5 ASCII text characters or 10 hexadecimal characters. 104-bit keys must contain 13 ASCII text characters or 26 hexadecimal characters.</li> <li>• <b>ascii</b>—Specifies the key format as ASCII.</li> </ul>

	Command or Action	Purpose
		<ul style="list-style-type: none"> <li><b>hex</b>—Specifies the key format as HEX.</li> </ul>
<b>Step 8</b>	<b>end</b>  <b>Example:</b> Device(config)# <b>end</b>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Configuring WPA + WPA2 Layer 2 Security Parameters (GUI)

### Procedure

- 
- Step 1** Click **Configuration > Tags and Profiles > WLANs**.
  - Step 2** Click **Add** to add a new WLAN Profile or click the one you want to edit.
  - Step 3** In the **Edit WLAN** window, click **Security > Layer2**.
  - Step 4** From **Layer 2 Security Mode** drop-down menu, select **WPA + WPA2**.
  - Step 5** Configure the security parameters and then click **Save and Apply to Device**.
- 

## Configuring WPA + WPA2 Layer 2 Security Parameters (CLI)

- 
- Note** The default values for security policy WPA2 are:
- Encryption is AES.
  - Authentication Key Management (AKM) is dot1x.
- 

### Before you begin

You must have administrator privileges.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>wlan profile-name wlan-id SSID_Name</b>  <b>Example:</b> Device# <b>wlan test4 1 test4</b>	Enters the WLAN configuration submenu. <ul style="list-style-type: none"> <li><i>profile-name</i> is the profile name of the configured WLAN.</li> </ul>

	Command or Action	Purpose
		<ul style="list-style-type: none"> <li>• <i>wlan-id</i> is the wireless LAN identifier. The range is 1 to 512.</li> <li>• <i>SSID_Name</i> is the SSID that contains 32 alphanumeric characters.</li> </ul> <p><b>Note</b> If you have already configured this command, enter <b>wlan profile-name</b> command.</p>
<b>Step 3</b>	<b>security wpa {akm   wpa1   wpa2}</b> <b>Example:</b> Device(config-wlan)# <b>security wpa</b>	Enables WPA or WPA2 support for WLAN.
<b>Step 4</b>	<b>security wpa wpa1</b> <b>Example:</b> Device(config-wlan)# <b>security wpa wpa1</b>	Enables WPA.
<b>Step 5</b>	<b>security wpa wpa1 ciphers [aes   tkip]</b> <b>Example:</b> Device(config-wlan)# <b>security wpa wpa1 ciphers aes</b>	<p>Specifies the WPA1 cipher. Choose one of the following encryption types:</p> <ul style="list-style-type: none"> <li>• <b>aes</b>—Specifies WPA/AES support.</li> <li>• <b>tkip</b>—Specifies WPA/TKIP support.</li> </ul> <p>The default values are TKIP for WPA1 and AES for WPA2.</p> <p><b>Note</b> You can enable or disable TKIP encryption only using the CLI. Configuring TKIP encryption is not supported in GUI.</p> <p>When you have VLAN configuration on WGB, you need to configure the encryption cipher mode and keys for a particular VLAN, for example, <b>encryption vlan 80 mode ciphers tkip</b>. Then, you need to configure the encryption cipher mode globally on the multicast interface by entering the following command: <b>encryption mode ciphers tkip</b>.</p>
<b>Step 6</b>	<b>security wpa akm {cckm  dot1x   dot1x-sha256   ft   psk  psk-sha256}</b> <b>Example:</b> Device(config-wlan)# <b>security wpa akm psk-sha256</b>	Enable or disable Cisco Centralized Key Management, 802.1x, 802.1x with SHA256 key derivation type, Fast Transition, PSK or PSK with SHA256 key derivation type.

	Command or Action	Purpose
		<p><b>Note</b></p> <ul style="list-style-type: none"> <li>You cannot enable 802.1x and PSK with SHA256 key derivation type simultaneously.</li> <li>When you configure Cisco Centralized Key Management SSID, you must enable the <b>ccx aironet-iesupport</b> for Cisco Centralized Key Management to work.</li> <li>WPA3 Enterprise dot1x-sha256 is supported only in local mode.</li> </ul>
<b>Step 7</b>	<p><b>security wpa psk set-key {ascii   hex} {0   8} password</b></p> <p><b>Example:</b></p> <pre>Device(config-wlan)# security wpa psk set-key ascii 0 test</pre>	<p>Enter this command to specify a preshared key, if you have enabled PSK.</p> <p>WPA preshared keys must contain 8 to 63 ASCII text characters or 64 hexadecimal characters.</p>
<b>Step 8</b>	<p><b>security wpa akm ft {dot1x   psk  sae}</b></p> <p><b>Example:</b></p> <pre>Device(config-wlan)# security wpa akm ft psk</pre>	<p>Enable or disable authentication key management suite for fast transition.</p> <p><b>Note</b> You can now choose between PSK and fast transition PSK as the AKM suite.</p>
<b>Step 9</b>	<p><b>security wpa wpa2</b></p> <p><b>Example:</b></p> <pre>Device(config-wlan)# security wpa wpa2</pre>	<p>Enables WPA2.</p>
<b>Step 10</b>	<p><b>security wpa wpa2 ciphers aes</b></p> <p><b>Example:</b></p> <pre>Device(config-wlan)# security wpa wpa2</pre> <p><b>Example:</b></p>	<p>Configure WPA2 cipher.</p> <ul style="list-style-type: none"> <li><b>aes</b>—Specifies WPA/AES support.</li> </ul>
<b>Step 11</b>	<p><b>show wireless pmk-cache</b></p>	<p>Displays the remaining time before the PMK cache lifetime timer expires.</p> <p>If you have enabled WPA2 with 802.1X authenticated key management or WPA1 or WPA2 with Cisco Centralized Key Management authenticated key management, the PMK cache lifetime timer is used to trigger reauthentication with the client when necessary. The timer is based on the timeout value received from the AAA server or the WLAN session timeout setting.</p>

	Command or Action	Purpose
		<p>If you configure 802.1x with session timeout between 0 and 299, Pairwise Master Key (PMK) cache is created with a timer of 1 day 84600 seconds.</p> <p><b>Note</b></p> <ul style="list-style-type: none"><li>• The command will show VLAN ID with VLAN pooling feature in VLAN-Override field.</li><li>• Sticky key caching (SKC) is not supported.</li></ul>

## CHAPTER 176

# Remote LANs

---

- [Information About Remote LANs, on page 1991](#)
- [Configuring Remote LANs \(RLANs\), on page 1993](#)
- [Information About RLAN Authentication Fallback, on page 2006](#)
- [Configuring RLAN Authentication Fallback \(CLI\), on page 2006](#)
- [Modifying 802.1X EAP Timers for RLAN Clients, on page 2007](#)
- [Verifying RLAN Authentication Fallback, on page 2008](#)

## Information About Remote LANs

A Remote LAN (RLAN) is used for authenticating wired clients using the controller. Once the wired client successfully joins the controller, the LAN ports switch the traffic between central or local switching modes. The traffic from wired client is treated as wireless client traffic.

The RLAN in Access Point (AP) sends the authentication request to authenticate the wired client. The authentication of wired client in RLAN is similar to the central authenticated wireless client.

The supported AP models are:

- Cisco Catalyst 9124 Series Access Points
- Cisco Catalyst 9105AXW
- Cisco Aironet OEAP 1810 series
- Cisco Aironet 1815T series
- Cisco Aironet 1810W series
- Cisco Aironet 1815W
- Cisco Catalyst IW6300 Heavy Duty Series Access Points
- Cisco 6300 Series Embedded Services Access Points

### Information About Ethernet (AUX) Port

The second Ethernet port in Cisco Aironet 1850, 2800, and 3800 Series APs is used as a link aggregation (LAG) port, by default. It is possible to use this LAG port as an RLAN port when LAG is disabled.

The following APs use LAG port as an RLAN port:

- 1852E
- 1852I
- 2802E
- 2802I
- 3802E
- 3802I
- 3802P
- 4802

#### **Limitation for RLAN**

- RLAN supports only a maximum of four wired clients regardless of the AP model.
- RLAN support with Virtual Routing and Forwarding (VRF) is not available.

#### **Limitations for Using AUX port in Cisco 2700 Access Points**

- RLAN supports AUX port and non-native VLAN for this port.
- Local mode supports wired client traffic on central switch. Whereas, FlexConnect mode does not support central switch.
- FlexConnect mode supports wired client traffic on local switch and not on central switch.
- AUX port cannot be used as a trunk port. Even switches or bridges cannot be added behind the port.
- AUX port does not support dot1x.

#### **Role of Controller**

- The controller acts as an authenticator, and Extensible Authentication Protocol (EAP) over LAN (EAPOL) messages from the wired client reaching the controller through an AP.
- The controller communicates with the configured Authentication, Authorization, and Accounting (AAA) server.
- The controller configures the LAN ports for an AP and pushes them to the corresponding AP.

**Note**

- The RLAN feature is supported on Fabric.
- RLAN is supported in APs that have more than one Ethernet port.
- In RLAN (local mode - local switching mode), if you want to use the AP native VLAN for client IP, the VLAN should be configured as either **no vlan** or **vlan 1** in the RLAN policy profile. For example, if the native VLAN ID is 80, do not use the number 80 in the RLAN policy profile. Also, do not use VLAN name *VLANxxxx* to configure VLAN in the RLAN policy profile.  
  
When a new client is connected to an AP, the client's details are available in the controller initially. However, after the CAPWAP DOWN/UP state, the client details are no longer listed in the controller.
- APs in local mode central switching do not support VLAN tagged traffic from RLAN clients, and the traffic gets dropped.
- The VLAN name (without any numerals) configured in remote-lan-policy does not provide the mapped VLAN ID for central switching.

## Configuring Remote LANs (RLANs)

### Enabling or Disabling all RLANs

#### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>[no] ap remote-lan shutdown</b>  <b>Example:</b> Device(config)# <code>[no] ap remote-lan shutdown</code>	Enables or disables all RLANs.
<b>Step 3</b>	<b>end</b>  <b>Example:</b> Device(config)# <code>end</code>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Creating RLAN Profile (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Tags & Profiles > Remote LAN**.
- Step 2** Click **Add**.
- Step 3** Enter the **Profile Name**, **RLAN ID** and enable or disable the **Status** toggle button. The name can be ASCII characters from 32 to 126, without leading and trailing spaces.
- Step 4** Click **Apply to Device**.
- 

## Creating RLAN Profile (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>ap remote-lan profile-name</b> <i>remote-lan-profile-name rlan-id</i>  <b>Example:</b> Device(config)# ap remote-lan profile-name rlan_profile_name 3	Configures remote LAN profile. <ul style="list-style-type: none"> <li>• <i>remote-lan-profile</i>—Is the remote LAN profile name. Range is from 1 to 32 alphanumeric characters.</li> <li>• <i>rlan-id</i>—Is the remote LAN identifier. Range is from 1 to 128.</li> </ul> <p><b>Note</b> You can create a maximum of 128 RLANs. You cannot use the <i>rlan-id</i> of an existing RLAN while creating another RLAN.</p> <p>Both RLAN and WLAN profile cannot have the same names. Similarly, RLAN and WLAN policy profile cannot have the same names.</p>

## Configuring RLAN Profile Parameters (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Tags & Profiles > Remote LAN**.

- Step 2** On the **RLAN Profile** tab, click **Add**.  
The **Add RLAN Profile** window is displayed.
- Step 3** In the **General** tab:
- Enter a **Name** and **RLAN ID** for the RLAN profile. The name can be ASCII characters from 32 to 126, without leading and trailing spaces.
  - Set the number of client connections per RLAN in the **Client Association Limit** field.  
The range depends on the maximum number of clients supported by the platform.
  - To enable the profile, set the status as **Enable**.
- Step 4** In the **Security > Layer2** tab
- To enable 802.1x for an RLAN, set the **802.1x** status as **Enabled**.  
**Note** You can activate either web or 802.1x authentication list at a time.
  - Choose the authorization list name from the **MAC Filtering** drop-down list.
  - Choose the 802.1x for an RLAN authentication list name from the **Authentication List** drop-down list.
- Step 5** In the **Security > Layer3** tab
- To enable web authentication for an RLAN, set the **Web Auth** status as **Enabled**.  
**Note** You can activate either web or 802.1x authentication list at a time.
  - Choose the web authentication parameter map from the **Webauth Parameter Map** drop-down list.
  - Choose the web authentication list name from the **Authentication List** drop-down list.
- Step 6** In the **Security > AAA** tab
- Set the **Local EAP Authentication** to enabled. Also, choose the required **EAP Profile Name** from the drop-down list.
- Step 7** Save the configuration.

## Configuring RLAN Profile Parameters (CLI)

### Before you begin

The configurations in this section are not mandatory for an RLAN profile.

In case of central switching mode, you need to configure both central switching and central DHCP.

**Note** The fabric profile configuration is required only for fabric RLAN support.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>client association limit</b> <i>client-connections</i> <b>Example:</b>	Configures client connections per RLAN.

	Command or Action	Purpose
	Device(config-remote-lan)# <b>client association limit 1</b>	<i>client-connections</i> —Is the maximum client connections per RLAN. Range is from 0 to 10000. 0 refers to unlimited.
<b>Step 2</b>	<b>fabric-profile</b> <i>fabric-profile-name</i> <b>Example:</b> Device(config-remote-lan)# <b>fabric-profile sample-fabric-profile-name</b>	Configures fabric profile for RLAN.
<b>Step 3</b>	<b>ip access-group web</b> <i>IPv4-acl-name</i> <b>Example:</b> Device(config-remote-lan)# <b>ip access-group web acl_name</b>	Configures RLAN IP configuration commands. <i>IPv4-acl-name</i> —Refers to the IPv4 ACL name or ID.
<b>Step 4</b>	<b>local-auth</b> <i>profile name</i> <b>Example:</b> Device(config-remote-lan)# <b>local-auth profile_name</b>	Sets EAP Profile on an RLAN. <i>profile name</i> —Is the EAP profile on an RLAN.
<b>Step 5</b>	<b>mac-filtering</b> <i>mac-filter-name</i> <b>Example:</b> Device(config-remote-lan)# <b>mac-filtering mac_filter</b>	Sets MAC filtering support on an RLAN. <i>mac-filter-name</i> —Is the authorization list name.
<b>Step 6</b>	<b>security dot1x authentication-list</b> <i>list-name</i> <b>Example:</b> Device(config-remote-lan)# <b>security dot1x authentication-list dot1_auth_list</b>	Configures 802.1X for an RLAN. <i>list-name</i> —Is the authentication list name.
<b>Step 7</b>	<b>security web-auth authentication-list</b> <i>list-name</i> <b>Example:</b> Device(config-remote-lan)# <b>security web-auth authentication-list web_auth_list</b>	Configures web authentication for an RLAN. <i>list-name</i> —Is the authentication list name. <b>Note</b> You can activate either web or dot1x authentication list at a time.
<b>Step 8</b>	<b>[no] shutdown</b> <b>Example:</b> Device(config-remote-lan)# <b>shutdown</b>	Enables or disables RLAN profile.
<b>Step 9</b>	<b>end</b> <b>Example:</b> Device(config-remote-lan)# <b>end</b>	Returns to privileged EXEC mode.

## Creating RLAN Policy Profile (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Wireless > Remote LAN > RLAN Policy**
- Step 2** Click **Add**.
- Step 3** In the **General** tab, enter the **Policy Name**.
- Step 4** Click **Apply to Device**.
- 

## Creating RLAN Policy Profile (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>ap remote-lan-policy policy-name profile name</b>  <b>Example:</b> Device(config)# ap remote-lan-policy policy-name rlan_policy_prof_name	Configures RLAN policy profile and enters wireless policy configuration mode.

## Configuring RLAN Policy Profile Parameters (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Wireless > Remote LAN**.
- Step 2** On the **Remote LAN** page, click **RLAN Policy** tab.
- Step 3** On the **RLAN Policy** page, click the name of the **Policy** or click **Add** to create a new one.  
The **Add/Edit RLAN Policy** window is displayed.
- Step 4** In the **General** tab:
- Enter a **Name** and **Description** for the policy profile.
  - Set **Central Authentication** to **Enabled** state.
  - Set **Central DHCP** to **Enabled** state.
  - Set the **PoE** check box to enable or disable state.
  - To enable the policy, set the status as **Enable**.

**Step 5** In the **Access Policies** Tab, choose the VLAN name or number from the **VLAN** drop-down list.

**Note** When central switching is disabled, the VLAN in the RLAN policy cannot be configured as the AP's native VLAN. To use the AP's native VLAN for client IP, the VLAN should be configured as either **no vlan** or **vlan 1** in the RLAN policy profile.

**Step 6** From the **Host Mode** drop-down list, choose the **Host Mode** for the remote-LAN802.1x from the following options:

- **Single-Host Mode**—Is the default host mode. In this mode, the switch port allows only a single host to be authenticated and passes traffic one by one.
- **Multi-Host Mode**—The first device to authenticate opens up to the switch port, so that all other devices can use the port. You need not authenticate other devices independently, if the authenticated device becomes authorized the switch port is closed.
- **Multi-Domain Mode**—The authenticator allows one host from the data domain and another from the voice domain. This is a typical configuration on switch ports with IP phones connected.

**Note**

- For an RLAN profile with open-auth configuration, you must map the RLAN-policy with single host mode. Mapping RLAN-policy with multi-host or multi-domain mode is not supported.
- The controller does not assign data versus voice VLAN, based on traffic. RLAN only supports multiple VLAN assignments through 802.1x AAA override. You must create data and voice VLANs and then assign these VLANs to respective clients, based on their authentication through the 802.1x AAA override.

**Step 7** Configure IPv6 ACL or Flexible NetFlow.

- Under the **Access Policies > Remote LAN ACL** section, choose the **IPv6 ACL** from the drop-down list.
- Under the **Access Policies > AVC > Flow Monitor IPv6** section, check the **Egress Status** and **Ingress Status** check boxes and choose the policies from the drop-down lists.

**Step 8** Click the **Advanced** tab.

a) Configure the violation mode for Remote-LAN 802.1x from the **Violation Mode** drop-down list, choose the violation mode type from the following options:

- **Shutdown**—Disables the port
- **Replace**—Removes the current session and initiates authentication for the new host. This is the default behavior.
- **Protect**—Drops packets with unexpected MAC addresses without generating a system message.

b) Enter the **Session Timeout (sec)** value to define the client's duration of a session.

The range is between 20 and 86400 seconds.

c) Under **AAA Policy Params** section, check the **AAA Override** check box to enable AAA override.

d) Under the **Exclusionlist Params** section, check the **Exclusionlist** check box and enter the **Exclusionlist Timeout** value.

This sets the exclusion time for a client. The range is between 0 and 2147483647 seconds. 0 refers to no timeout.

**Step 9** Save the configuration.

## Configuring RLAN Policy Profile Parameters (CLI)

### Before you begin

RLAN does not support the following features:

- Central Web Authentication (CWA)
- Quality of Service (QoS)
- Bi-Directional Rate Limiting (BDRL)
- Identity PSK (iPSK)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>central switching</b> <b>Example:</b> Device(config-remote-lan-policy)# <b>central switching</b>	Configures central switching.
<b>Step 2</b>	<b>central dhcp</b> <b>Example:</b> Device(config-remote-lan-policy)# <b>central dhcp</b>	Configures central DHCP.
<b>Step 3</b>	<b>exclusionlist timeout <i>timeout</i></b> <b>Example:</b> Device(config-remote-lan-policy)# <b>exclusionlist timeout 200</b>	Sets exclusion-listing on RLAN.  <i>timeout</i> —Sets the time, up to which the client will be in excluded state. Range is from 0 to 2147483647 seconds. 0 refers to no timeout.
<b>Step 4</b>	<b>vlan <i>vlan</i></b> <b>Example:</b> Device(config-remote-lan-policy)# <b>vlan</b> <b>vlan1</b>	Configures VLAN name or ID.  - <i>vlan</i> —Is the vlan name.
<b>Step 5</b>	<b>aaa-override</b> <b>Example:</b> Device(config-remote-lan-policy)# <b>aaa-override</b>	Configures AAA policy override.
<b>Step 6</b>	<b>session-timeout <i>timeout in seconds</i></b> <b>Example:</b> Device(config-remote-lan-policy)# <b>session-timeout 21</b>	Configures client session timeout.  <i>timeout in seconds</i> —Defines the duration of a session. Range is from 20 to 86400 seconds.

	Command or Action	Purpose
		<p><b>Note</b> If the session timeout is less than 300 seconds for Dot1x clients, the session timeout is set as one day that is, equal to 86400 seconds.</p>
<b>Step 7</b>	<p><b>host-mode</b> {<b>multidomain</b> <i>voice domain</i>   <b>multihost</b>   <b>singlehost</b>}</p> <p><b>Example:</b></p> <pre>Device(config-remote-lan-policy)# host-mode multidomain</pre>	<p>Configures host mode for remote-LAN 802.1x.</p> <p><i>voice domain</i>—Is the RLAN voice domain VLAN ID. Range is from 0 to 65535.</p> <p>You can configure the following IEEE 802.1X authentication modes:</p> <ul style="list-style-type: none"> <li>• <b>Multi-Domain Mode</b>—The authenticator allows one host from the data domain and another from the voice domain. This is a typical configuration on switch ports with IP phones connected.</li> <li>• <b>Multi-Host Mode</b>—The first device to authenticate opens up to the switch port, so that all other devices can use the port. You need not authenticate other devices independently, if the authenticated device becomes authorized the switch port is closed.</li> <li>• <b>Single-Host Mode</b>—Is the default host mode. In this mode, the switch port allows only a single host to be authenticated and passes traffic one by one.</li> </ul>
<b>Step 8</b>	<p><b>violation-mode</b> {<b>protect</b>   <b>replace</b>   <b>shutdown</b>}</p> <p><b>Example:</b></p> <pre>Device(config-remote-lan-policy)# violation-mode protect</pre>	<p>Configures violation mode for Remote-LAN 802.1x.</p> <p>When a security violation occurs, a port is protected based on the following configured violation actions:</p> <ul style="list-style-type: none"> <li>• <b>Shutdown</b>—Disables the port.</li> <li>• <b>Replace</b>—Removes the current session and initiates authentication for the new host. This is the default behavior.</li> <li>• <b>Protect</b>—Drops packets with unexpected MAC addresses without generating a system message. In the single-host authentication mode, a violation is triggered when more than one device is detected in data VLAN. In a multi-host authentication mode, a violation is</li> </ul>

	Command or Action	Purpose
		triggered when more than one device is detected in data VLAN or voice VLAN.
<b>Step 9</b>	<b>[no] poe</b> <b>Example:</b> Device(config-remote-lan-policy)# <b>poe</b>	Enables or disables PoE.
<b>Step 10</b>	<b>[no] shutdown</b> <b>Example:</b> Device(config-remote-lan-policy)# <b>shutdown</b>	Enables or disables an RLAN policy profile.
<b>Step 11</b>	<b>end</b> <b>Example:</b> Device(config-remote-lan-policy)# <b>end</b>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Configuring Policy Tag and Mapping an RLAN Policy Profile to an RLAN Profile (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>wireless tag policy <i>policy-tag-name</i></b> <b>Example:</b> Device(config)# <b>wireless tag policy remote-lan-policy-tag</b>	Configures policy tag and enters policy tag configuration mode.
<b>Step 3</b>	<b>remote-lan <i>remote-lan-profile-name</i> policy <i>rlan-policy-profile-name</i> port-id <i>port-id</i></b> <b>Example:</b> Device(config-policy-tag)# <b>remote-lan rlan_profile_name policy rlan_policy_profile port-id 2</b>	Maps an RLAN policy profile to an RLAN profile. <ul style="list-style-type: none"> <li>• <i>remote-lan-profile-name</i>—Is the name of the RLAN profile.</li> <li>• <i>rlan-policy-profile-name</i>—Is the name of the policy profile.</li> <li>• <i>port-id</i>—Is the LAN port number on the access point. Range is from 1 to 4.</li> </ul>

	Command or Action	Purpose
<b>Step 4</b>	<b>end</b>  <b>Example:</b> Device(config-policy-tag)# <b>end</b>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Configuring LAN Port (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>ap name</b> <i>ap name</i> <b>lan port-id</b> <i>lan port id</i> { <b>disable</b>   <b>enable</b> }  <b>Example:</b> Device# <b>ap name</b> L2_1810w_2 <b>lan port-id</b> 1 <b>enable</b>	Configures a LAN port. <ul style="list-style-type: none"> <li>• <b>enable</b>—Enables the LAN port.</li> <li>• <b>disable</b>—Disables the LAN port.</li> </ul>

## Attaching Policy Tag to an Access Point (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Wireless > Access Points**.
- Step 2** Select the AP to attach the Policy Tag.
- Step 3** Under the **Tags** section, use the **Policy** drop-down to select a policy tag.
- Step 4** Click **Update & Apply to Device**.
- 

## Attaching Policy Tag to an Access Point (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>ap</b> <i>ap-ethernet-mac</i>  <b>Example:</b> Device(config)# <b>ap</b> 00a2.891c.21e0	Configures MAP address for an AP and enters AP configuration mode.
<b>Step 3</b>	<b>policy-tag</b> <i>policy-tag-name</i>	Attaches policy tag to the access point.

	Command or Action	Purpose
	<b>Example:</b> Device(config-ap-tag)# <b>policy-tag</b> <b>remote-lan-policy-tag</b>	<i>policy-tag-name</i> —Is the name of the policy tag defined earlier.
<b>Step 4</b>	<b>end</b> <b>Example:</b> Device(config-ap-tag)# <b>end</b>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Verifying RLAN Configuration

To view the summary of all RLANs, use the following command:

```
Device# show remote-lan summary
```

```
Number of RLANs: 1
```

```

RLAN Profile Name Status

1 rlan_test_1 Enabled

```

To view the RLAN configuration by ID, use the following command:

```
Device# show remote-lan id <id>
```

```

Remote-LAN Profile Name : rlan_test_1
=====
Identifier : 1
Status : Enabled
Mac-filtering : Not Configured
Number of Active Clients : 1
Security_8021X : Disabled
8021.x Authentication list name : Not Configured
Local Auth eap Profile Name : Not Configured
Web Auth Security : Disabled
Webauth Authentication list name : Not Configured
Web Auth Parameter Map : Not Configured
Client association limit : 0
Ipv4 Web Pre Auth Acl : Not Configured
Ipv6 Web Pre Auth Acl : Not Configured

```

To view the RLAN configuration by profile name, use the following command:

```
Device# show remote-lan name <profile-name>
```

```

Remote-LAN Profile Name : rlan_test_1
=====
Identifier : 1
Status : Enabled
Mac-filtering : mac-auth
Number of Active Clients : 0
Security_8021x_dot1x : Enabled
8021.x Authentication list name : Not Configured
Local Auth eap Profile Name : Not Configured
Web Auth Security : Disabled
Webauth Authentication list name : Not Configured
Web Auth Parameter Map : Not Configured
Client association limit : 0
Ipv4 Web Pre Auth Acl : Not Configured
Ipv6 Web Pre Auth Acl : Not Configured

```

```
mDNS Gateway Status : Bridge
Fabric Profile Name : rlan-fabric-profile
```

To view the detailed output of all RLANs, use the following command:

```
Device# show remote-lan all
```

```
Remote-LAN Profile Name : rlan_test_1
=====
Identifier : 1
Status : Enabled
Mac-filtering : Not Configured
Number of Active Clients : 1
Security_8021X : Disabled
8021.x Authentication list name : Not Configured
Local Auth eap Profile Name : Not Configured
Web Auth Security : Disabled
Webauth Authentication list name : Not Configured
Web Auth Parameter Map : Not Configured
Client association limit : 0
Ipv4 Web Pre Auth Acl : Not Configured
Ipv6 Web Pre Auth Acl : Not Configured
```

```
Remote-LAN Profile Name : rlan_test_2
=====
Identifier : 2
Status : Enabled
Mac-filtering : Not Configured
Number of Active Clients : 1
Security_8021X : Disabled
8021.x Authentication list name : Not Configured

Web Auth Security : Disabled
Webauth Authentication list name : Not Configured
Web Auth Parameter Map : Not Configured
Client association limit : 0
Ipv4 Web Pre Auth Acl : Not Configured
Ipv6 Web Pre Auth Acl : Not Configured
```

```
Device# show remote-lan policy summary
Number of Policy Profiles: 1
```

Profile Name	Description	Status
rlan_named_pp1	Testing RLAN policy profile	Enabled

To view the LAN port configuration of a Cisco AP, use the following command:

```
Device# show ap name <ap_name> lan port summary
LAN Port status for AP L2_1815w_1
Port ID status vlanId poe

LAN1 Enabled 20 Disabled
LAN2 Enabled 20 NA
LAN3 Disabled 0 NA
```

To view the summary of all clients, use the following command:

```
Device# show wireless client summary
Number of Local Clients: 1
```

MAC Address	AP Name	WLAN	State	Protocol	Method	Role
d8eb.97b6.fcc6	L2_1815w_1	1	* Run	Ethernet	None	Local

To view the client details with the specified username, use the following command:

```
Device# show wireless client username cisco
MAC Address AP Name Status WLAN Auth Protocol

0014.d1da.a977 L2_1815w_1 Run 1 * Yes Ethernet
d8eb.97b6.fcc6 L2_1815w_1 Run 1 * Yes Ethernet
```

To view the detailed information for a client by MAC address, use the following command:

```
Device# show wireless client mac-address 2cea.7f18.5bb3 detail
Client MAC Address : 2cea.7f18.5bb3
Client MAC Type : Universally Administered Address
Client DUID: NA
Client IPv4 Address : 10.56.33.21
Client IPv6 Addresses : fe80::d60:2e8:4cc2:6212
Client Username: N/A
AP MAC Address : 4ca6.4d22.1a80
AP Name: AP3C57.31C5.799C
AP slot : 16
Client State : Associated
Policy Profile : fabric-rlan-policy
Flex Profile : default-flex-profile
Remote LAN Id: 1 <-----
Remote LAN Name: fabric-rlan <-----
Wireless LAN Network Name (SSID): fabric-rlan <-----
BSSID : 4ca6.4d22.1a81
Connected For : 211 seconds
Protocol : Ethernet <-----
Channel : 0
Port ID: 1 <-----
Client IIF-ID : 0xa0000002
Association Id : 0
Authentication Algorithm : Open System
<-----o/p trimmed ----->
```

To view the summary of all AP tags, use the following command:

```
Device# show ap tag summary
Number of APs: 2
```

AP Name Tag Name	AP Mac Misconfigured	Site Tag Name Tag Source	Policy Tag Name	RF
L2_1810d_1	0008.3296.24c0	default-site-tag	default-policy-tag	
default-rf-tag	No	Default		
L2_1810w_2	00b0.e18c.5880	rlan-site-tag	rlan_pt_1	
default-rf-tag	No	Static		

To view the summary of all policy tags, use the following command:

```
Device# show wireless tag policy summary
Number of Policy Tags: 2
```

Policy Tag Name	Description
rlan_pt_1	
default-policy-tag	default policy-tag

To view details of a specific policy tag, use the following command:

```
Device# show wireless tag policy detailed <rlan_policy_tag_name>
Policy Tag Name : rlan_pt_1
Description :

Number of WLAN-POLICY maps: 0

Number of RLAN-POLICY maps: 2
```

REMOTE-LAN Profile Name	Policy Name	Port Id
rlan_test_1	rlan_named_pp1	1
rlan_test_1	rlan_named_pp1	2

To view the fabric client summary, use the following command:

```
Device# show wireless fabric client summary
```

```
Number of Fabric Clients : 0
```

MAC Address	AP Name	WLAN State	Protocol Method
L2 VNID	RLOC IP		

To view the RLAN client summary, use the following command:

```
Device# show wireless client summary
```

```
Number of Clients: 1
```

MAC Address	AP Name	Type	ID	State	Protocol	Method	Role
2cea.7f18.5bb3	AP3C57.31C5.799C	RLAN	1	Run	Ethernet	None	Local

```
Number of Excluded Clients: 0
```

## Information About RLAN Authentication Fallback

From Cisco IOS XE Cupertino 17.8.1, Remote LAN (RLAN) ports on OfficeExtend Access Points (OEAPs) support the fallback mechanism for authentication from 802.1X to MAC authentication bypass (MAB) and vice versa. If a client using 802.1X as an authentication method fails to authenticate within the timeout period, the client gets authenticated using the MAB method. Similarly, if the device MAC address is not registered for MAB authentication, the authentication fails, and the client gets authenticated using the 802.1X method.

By default, the RLAN fallback mechanism is disabled. You should explicitly enable it. When both 802.1X and MAB are enabled, the device should pass both authentication methods for successful authentication.

## Configuring RLAN Authentication Fallback (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>ap remote-lan profile-name</b> <i>rlan-profile-name</i> <i>rlan-id</i>  <b>Example:</b> Device(config)# ap remote-lan profile-name rlan_profile_name 3	Configures remote LAN profile.

	Command or Action	Purpose
<b>Step 3</b>	<b>security {dot1x on-macfilter-failure   mac-filter on-dot1x-failure}</b>  <b>Example:</b> Device(config-remote-lan)# security dot1x on-macfilter-failure	Enables 802.1X authentication on MAC filter failure.  <b>Note</b> You can either configure 802.1X authentication on MAC filter failure or MAC filter authentication on 802.1X failure. You cannot configure both.
<b>Step 4</b>	<b>end</b>  <b>Example:</b> Device(config-remote-lan)# end	Returns to privileged EXEC mode.

## Modifying 802.1X EAP Timers for RLAN Clients

To adapt the 802.1X EAP timers for RLAN clients, use the following procedure.

**Note** When you modify the 802.1X EAP timers, ensure that the timer is long enough to allow 802.1X-capable endpoints to authenticate. A timer that is too short may result in 802.1X-capable endpoints being subject to a fallback authentication or authorization technique.

If 802.1X EAP timers are not configured using this procedure, the timer configuration done using the **wireless security dot1x request** and **wireless security dot1x identity-request** commands are applied.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>ap remote-lan profile-name rlan-profile-name rlan-id</b>  <b>Example:</b> Device(config)# ap remote-lan profile-name rlan_profile_name 3	Configures the remote LAN profile.
<b>Step 3</b>	<b>security dot1x identity-request retries retry-num</b>  <b>Example:</b> Device(config-remote-lan)# security dot1x identity-request retries 20	Configures the maximum number of EAP ID request retransmissions. Valid values range from 1 to 20.

	Command or Action	Purpose
<b>Step 4</b>	<b>security dot1x identity-request timeout</b> <i>timeout-value</i> <b>Example:</b> Device(config-remote-lan)# security dot1x identity-request timeout 120	Configures the EAP ID request-timeout value, in seconds. Valid values range from 1 to 120.
<b>Step 5</b>	<b>security dot1x request retries</b> <i>retry-num</i> <b>Example:</b> Device(config-remote-lan)# security dot1x request retries 20	Configures the maximum number of EAP request retransmissions. Valid values range from 0 to 20.
<b>Step 6</b>	<b>security dot1x request timeout</b> <i>timeout-value</i> <b>Example:</b> Device(config-remote-lan)# security dot1x request timeout 120	Configures the EAP request retransmission timeout value, in seconds. Valid values range from 1 to 120.
<b>Step 7</b>	<b>end</b> <b>Example:</b> Device(config-remote-lan)# end	Returns to privileged EXEC mode.

## Verifying RLAN Authentication Fallback

To check the status of the fallback authentication mechanism, use the following command:

```
Device# show remote-lan all
```

```
Remote-LAN Profile Name : rlan_profile_name
=====
Identifier : 3
Status : Disabled
Mac-filtering : Not Configured
Number of Active Clients : 0
Security_8021x_dot1x : Enabled
8021.x Authentication list name : Not Configured
Local Auth eap Profile Name : Not Configured
Web Auth Security : Disabled
Webauth Authentication list name : Not Configured
Web Auth Parameter Map : Not Configured
Client association limit : 0
Ipv4 Web Pre Auth Acl : Not Configured
Ipv6 Web Pre Auth Acl : Not Configured
mDNS Gateway Status : Bridge
Authentication Fallback Status : MAC-filtering to Dot1X
```

## CHAPTER 177

# RLAN External Module

---

- [Information About External Module, on page 2009](#)
- [Prerequisites for Configuring External Module, on page 2009](#)
- [Configuring External Module \(GUI\), on page 2009](#)
- [Configuring External Module \(CLI\), on page 2010](#)
- [Verifying External Module, on page 2010](#)

## Information About External Module

The External Module feature enables traffic to flow in and out from the Cisco Aironet Developer Platform module when an access point (AP) is in both local and flex connect mode.

## Prerequisites for Configuring External Module

Before you begin, you must ensure the following:

- The external module is powered on.
- The RLAN status is enabled.

## Configuring External Module (GUI)

### Procedure

---

- Step 1** Choose **Configuration > Tags & Profiles > Tags**.
- Step 2** In the **Policy** tab, select one of the **Policy Tag Name** and click **Add**.
- Step 3** In **Add Policy Tag** page and **RLAN-POLICY Maps** section, click **Add**.
- Step 4** From the **Port ID** drop-down list, choose **ext-module**.
- Step 5** From the **RLAN Profile** drop-down list, choose an RLAN profile.
- Step 6** From the **RLAN Policy Profile** drop-down list, choose an RLAN policy profile.

**Step 7** Click the check mark icon.

## Configuring External Module (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wireless tag policy default-policy-tag</b> <b>Example:</b> Device(config)# wireless tag policy default-policy-tag	Configures a policy tag to the external module for the remote LAN.
<b>Step 3</b>	<b>remote-lan rlan-profile policy rlan-policy ext-module</b> <b>Example:</b> Device(default-policy-tag)# remote-lan rlan policy abc ext-module	Configures a remote LAN policy to the external module.

## Verifying External Module

To view the external module remote LAN configuration, use the following command:

```
Device# show ap name ap_name lan port summary
```

```
LAN Port status for AP ap_name
```

```
Port ID status vlanId poe power-level RLAN

ext-module Enabled 39 NA NA Enabled
```

To view the external module inventory details, use the following command:

```
Device# show ap name abc inventory
```

```
NAME: AP3800, DESCR: Cisco Aironet 3800 Series (IEEE 802.11ac) Access Point
PID: AIR-AP3802I-D-K9, VID: 01, SN: xxxxxxxxxxxx
```

```
MODULE NAME: Expansion Module, DESCR: Cisco HDK Module (rev2)
```

```
PID: Unknown, SN: xxxxxxxxxxxx, MaxPower: 2700mW
```

```
VersionID: V22, Capabilities: RLAN (UP)
```

## CHAPTER 178

# 802.11ax Per WLAN

---

- [Information About 802.11ax Mode Per WLAN](#), on page 2011
- [Configuring 802.11ax Mode Per WLAN \(GUI\)](#), on page 2011
- [Configuring 802.11ax Mode Per WLAN \(CLI\)](#), on page 2012
- [Verifying 802.11ax Mode Per WLAN](#), on page 2012

## Information About 802.11ax Mode Per WLAN

Prior to Cisco IOS XE Bengaluru Release 17.4.1, the 802.11ax mode was configured per radio band. In this configuration, the 11ax mode was either enabled or disabled for all WLANs (AP) that were configured per radio, all at once. When 11ax was enabled per radio, the 11ac clients were not able to scan or connect to the SSID if the beacon had 11ax information elements. Client could not probe an access point (AP), if the beacon has 11ax IE.

Therefore, a 11ax configuration knob per AP is introduced, from Cisco IOS XE Bengaluru Release 17.5.1. This knob is introduced under the WLAN profile. By default, the 11ax knob per WLAN is now enabled on the controller.

---

**Note** For 6-GHz radio, the 802.11ax parameters are taken from the multi BSSID profile tagged to the corresponding 6-GHz RF profile of the AP. So, the WLAN dot11ax parameters are overridden by multi BSSID profile parameters in the case of 6-GHz. There are no changes for 2.4 and 5-GHz band WLANs. They continue to use the WLAN parameters for 802.11ax.

---

## Configuring 802.11ax Mode Per WLAN (GUI)

### Procedure

---

- Step 1** Choose **Configuration > Tags & Profiles > WLANs**.
- Step 2** Click **Add**.  
The **Add WLAN** window is displayed.
- Step 3** Click the **Advanced** tab.

- Step 4** In the **11ax** section, check the **Enable 11ax** check box to enable 802.11ax operation status on the WLAN.
- Note** When 11ax is disabled, beacons will not display 11ax IE, and all the 11ax features will be operationally disabled on the WLAN.
- Step 5** Click **Apply to Device**.

## Configuring 802.11ax Mode Per WLAN (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wlan wlan-profile-name</b> <b>Example:</b> Device(config)# wlan wlan-profile	Specifies the WLAN name and enters the WLAN configuration mode.
<b>Step 3</b>	<b>dot11ax</b> <b>Example:</b> Device(config-wlan)# dot11ax	Configures 802.11ax on a WLAN.
<b>Step 4</b>	<b>no dot11ax</b> <b>Example:</b> Device(config-wlan)# no dot11ax	Disables 802.11ax on the WLAN profile.

## Verifying 802.11ax Mode Per WLAN

To display the status of the 11ax parameter, run the following command:

```
Device# show wlan id 6
WLAN Profile Name : power
=====
Identifier : 6
Description :
Network Name (SSID) : power
Status : Enabled
Broadcast SSID : Enabled
Advertise-Apname : Disabled
Universal AP Admin : Disabled
Max Associated Clients per WLAN : 0
Max Associated Clients per AP per WLAN : 0
Max Associated Clients per AP Radio per WLAN : 200
.
.
.
```

```
802.11ac MU-MIMO : Enabled
802.11ax parameters
 802.11ax Operation Status : Enabled
 OFDMA Downlink : Enabled
 OFDMA Uplink : Enabled
 MU-MIMO Downlink : Enabled
 MU-MIMO Uplink : Enabled
 BSS Target Wake Up Time : Enabled
 BSS Target Wake Up Time Broadcast Support : Enabled
.
.
.
```

## CHAPTER 179

# BSS Coloring

- [Information About BSS Coloring](#) , on page 2015
- [Configuring BSS Color on AP \(GUI\)](#), on page 2016
- [Configuring BSS Color in the Privileged EXEC Mode](#), on page 2017

- [Configuring OBSS-PD Spatial Reuse in the RF Profile Mode \(CLI\)](#), on page 2020
- [Verifying BSS Color and OBSS-PD](#), on page 2020

## Information About BSS Coloring

The 802.11 Wi-Fi standard minimizes the chance of multiple devices interfering with one another by transmitting at the same time. This carrier-sense multiple access with collision avoidance (CSMA/CA) technology is based on static thresholds that allow Wi-Fi devices to avoid interfering with each other on air. However, with an increase in density and the number of Wi-Fi devices, these static thresholds often lead to CSMA/CA causing devices to defer transmissions unnecessarily.

For example, if two devices that are associated with different BSS, can hear every transmission from each other at relatively low signal strengths, each device should defer its transmission when it receives a transmission from the other. But if both the devices were to transmit at the same time, it is likely that neither would cause enough interference at the other BSS' receiver to cause reception failure for either transmission.

Devices today must demodulate packets to look at the MAC header in order to determine whether or not a received packet belongs to their own BSS. This process of demodulation consumes power, which can be saved if devices can quickly identify the BSS by looking at the PHY header alone, and subsequently drop packets that are from a different BSS. Prior to Wi-Fi 6, there was no provision for devices to do this.

The new 802.11ax (Wi-Fi 6) standard addresses both of the issues discussed above, through the new BSS Coloring and Spatial Reuse mechanism. BSS Coloring is a new provision that allows devices operating in the same frequency space to quickly distinguish between packets from their own BSS and packets from an Overlapping BSS (OBSS), by simply looking at the BSS color value contained in the HE PHY header. In some scenarios, Spatial Reuse allows devices, to transmit at the same time as the OBSS packets they receive, instead of deferring transmissions because of legacy interference thresholds. Since every Wi-Fi 6 device understands the BSS color, it can be leveraged to increase power savings by dropping packets earlier, and to identify spatial reuse opportunities.

## BSS Coloring

BSS Coloring is a method used to differentiate between the BSS of access points and their clients on the same RF channel. Wi-Fi 6 enables each AP radio to assign a value (from 1 to 63), known as BSS color, to be included in the PHY header of all HE transmissions from devices in its BSS. With devices of each BSS transmitting a locally-unique color, a device can quickly and easily distinguish transmissions coming from its BSS from those of a neighboring BSS.

The following platforms support this feature:

- Cisco Catalyst 9800 Series Wireless Controllers
- Cisco Catalyst 9115 Access Points
- Cisco Catalyst 9120AX Series Access Points
- Cisco Catalyst 9124AX Series Access Points
- Cisco Catalyst 9130AX Access Points

## OBSS-PD and Spatial Reuse

Overlapping BSS Packet Detect (OBSS-PD) is a more aggressive Wi-Fi packet detect threshold for inter-BSS packets, which can be higher than the typical/legacy -82 dBm. Inter-BSS packets are easily identified by comparing the BSS color in the HE PHY header of the packets received with the BSS color of the device.

In OBSS-PD based Spatial Reuse, to improve throughput and network efficiency by increasing transmitting opportunities, a Wi-Fi 6 or 802.11ax device can transmit over an inter-BSS packet with an RSSI that is below the OBSS-PD threshold instead of deferring.

---

**Note** Cisco Catalyst 9120AX Series Access Points do not support OBSS-PD.

---

## Configuring BSS Color on AP (GUI)

### Procedure

---

- Step 1** Choose **Configuration > Wireless > Access Points**.
- Step 2** Click the **5 GHz Radios** section or the **2.4 GHz Radios** section.  
The list of the AP radios in the band is displayed.
- Step 3** Click the required AP name.  
The **Edit Radios** window is displayed.
- Step 4** From the **Edit Radios** window, select the **Configure** tab.  
The general information, Antenna Parameters, RF Channel Assignment, Tx Power Level Assignment, and BSS Color are displayed.
- Step 5** In the **BSS Color** area and from the **BSS Color Configuration** drop-down list, choose **Custom** configuration
  - **Custom**: To manually select the BSS color configuration for the AP radio.

- a. Click the **BSS Color Status** field to disable or enable the feature.
- b. In the **Current BSS Color** field, specify a corresponding BSS color for the AP radio. The valid range is between 1 and 63.

**Step 6** Click **Update & Apply to Device**.

## Configuring BSS Color in the Privileged EXEC Mode

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Device> enable	Enables privileged EXEC mode. Enter your password, if prompted.
<b>Step 2</b>	<b>ap name</b> <i>ap-name</i> <b>dot11</b> { <b>24ghz</b>   <b>5ghz</b>   <b>6ghz</b>   <b>dual-band</b> [ <b>slot slot-id</b> ] } <b>dot11ax bss-color</b> <1-63> <b>Example:</b> Device#ap name <i>apn</i> dot11 24ghz slot 0 dot11ax bss-color 12 <b>Example:</b> Device#ap name <i>apn</i> no dot11 24ghz slot 0 dot11ax bss-color	Sets the BSS color on the 2.4-GHz, 5-GHz, 6-GHz, or dual-band radio, for a specific access point on the following slots: <ul style="list-style-type: none"> <li>• 5 GHz: Slot 1 and 2</li> <li>• 2.4 GHz: Slot 0</li> <li>• 6-GHz: Slot 3</li> <li>• Dual-band: Slot 0</li> </ul> Use the <code>no</code> form of this command to disable BSS color.

## Configuring BSS Color Globally (GUI)

### Procedure

- Step 1** Choose **Configuration > Radio Configurations > Parameters**.
- Step 2** In the **11ax Parameters** section, enable BSS color globally for the 5 GHz and 2.4 GHz radios by checking the **BSS Color** check box.

## Configuring BSS Color in the Configuration Mode

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Device> enable	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 3</b>	<b>[no] ap dot11 { 24ghz   5ghz   6ghz } dot11ax bss-color</b> <b>Example:</b> Device(config)# [no] ap dot11 24ghz dot11ax bss-color	Enables the 802.11ax BSS color on all 2.4-GHz or 5-GHz or 6-GHz radios.  Use the <code>no</code> form of this command to disable BSS color.

## Configuring Overlapping BSS Packet Detect (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Radio Configurations > Parameters**.
- The parameters page is displayed where you can configure global parameters for 5 GHz Band and 2.4 GHz Band radios.
- Step 2** In the **11ax Parameters** section, check the **OBSS PD** check box to enable the overlapping BSS packet detect (OBSS PD) feature.
- Step 3** In the **Non-SRG OBSS PD Max Threshold** field, enter the threshold in decibel-milliwatts. Value range is between -82 dBm and -62 dBm.
-

## Configuring OBSS-PD Spatial Reuse Globally (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>[no] ap dot11 {24ghz   5ghz } dot11ax spatial-reuse obss-pd</b>  <b>Example:</b> Device(config)# [no] ap dot11 24ghz dot11ax spatial-reuse obss-pd	Configures 802.11ax OBSS PD based spatial reuse on all 2.4-GHz or 5-GHz radios.  Use the <code>no</code> form of this command to disable this feature.
<b>Step 3</b>	<b>ap dot11 {24ghz   5ghz } dot11ax spatial-reuse obss-pd non-srg-max -82 - -62</b>  <b>Example:</b> Device(config)# [no] ap dot11 24ghz dot11ax spatial-reuse obss-pd non-srg-max -62	Configure 802.11ax non-SRG OBSS PD max on all 2.4-GHz or 5-GHz radios. The default value is -62.

## Configuring OBSS PD in an RF Profile (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Tags & Profiles > RF**.
- Step 2** On the **RF Profile** page, click **Add** to configure the following:
- General
  - 802.11
  - RRM
  - Advanced
- Step 3** In the **Advanced** tab, under the **11ax Parameters** section, complete the following:
- a) Use the toggle button to enable or disable the **OBSS PD** field.
  - b) In the **Non-SRG OBSS PD Max Threshold (dBm)**, enter the threshold value. The default value is -62 dBm. Values range between -82 dBm and -62 dBm.
- Step 4** Click **Save & Apply to Device**.
-

# Configuring OBSS-PD Spatial Reuse in the RF Profile Mode (CLI)

## Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>ap dot11 {24ghz   5ghz   6ghz } rf-profile rf-profile-name</b>  <b>Example:</b> Device(config)# ap dot11 24ghz rf-profile rfprof24_1	Configures an RF profile and enters RF profile configuration mode.
<b>Step 3</b>	<b>[no] dot11ax spatial-reuse obss-pd</b>  <b>Example:</b> Device(config-rf-profile)#[no] dot11ax spatial-reuse obss-pd	Configures 802.11ax OBSS PD based spatial reuse in the RF profile configuration mode.  Use the <code>no</code> form of this command to disable this feature.
<b>Step 4</b>	<b>dot11ax spatial-reuse obss-pd non-srg-max -82 - -62</b>  <b>Example:</b> Device(config-rf-profile)# dot11ax spatial-reuse obss-pd non-srg-max -62	Configure 802.11ax non-SRG OBSS PD max on all 2.4-GHz or 5-GHz or 6-GHz radios. The default value is -62.

## Verifying BSS Color and OBSS-PD

To verify if the global per-band BSS color and OBSS-PD are enabled, use the following **show** command:

```
Device# show ap dot11 24ghz network
802.11b Network : Enabled
11gSupport : Enabled
11nSupport : Enabled
.
.
.
802.11ax : Enabled
 DynamicFrag : Enabled
 MultiBssid : Enabled
 Target Wakeup Time : Enabled
 Target Wakeup Time Broadcast : Enabled
 BSS Color : Enabled
 OBSS PD : Enabled
 Non-SRG OBSS PD Max : -62 dBm
802.11ax MCS Settings:
 MCS 7, Spatial Streams = 1 : Supported
.
.
.
```

To view the RF profile OBSS-PD configuration, use the following **show** command:

```
Device# show ap rf-profile name rf-profile-name detail
Description : pre configured rfprofile for 5gh radio
RF Profile Name : rf-profile-name
Band : 5 GHz
Transmit Power Threshold v1 : -65 dBm
Min Transmit Power : 7 dBm
Max Transmit Power : 30 dBm
.
.
.
802.11ax
 OBSS PD : Enabled
 Non-SRG OBSS PD Max : -62 dBm
 NDP mode : Auto
```

To view the BSS color configuration of all the AP radios on a band in the summary list, along with Channel, TX Power and so on, use the following **show** command:

```
Device# show ap dot11 24ghz summary extended
AP Name Txpwr Channel Mac Address Slot Admin State Oper State Width

Ed2-JFW-AP1 1/6 (17 dBm) (136,132)* 84b2.61ba.4730 1 Enabled Up 40
11AX-9120-AP1 1/8 (23 dBm) (36) d4ad.bda2.3fc0 1 Enabled Up 20
Ed2-JFW-AP2 1/5 (15 dBm) (40) f8c2.8885.59f0 1 Enabled Up 20
```

To view the BSS color configuration and the capability of an AP radio, use the following **show** commands:

```
Device# show ap name AP7069.5A74.816C config dot11 24ghz
Cisco AP Identifier : 502f.a876.1e60
Cisco AP Name : AP7069.5A74.816C
Attributes for Slot 0

## CHAPTER 180

# DHCP for WLANs

---

- [Information About Dynamic Host Configuration Protocol, on page 2023](#)
- [Restrictions for Configuring DHCP for WLANs, on page 2026](#)
- [Guidelines for DHCP Relay Configuration, on page 2026](#)
- [How to Configure DHCP for WLANs, on page 2027](#)
- [Configuring the Internal DHCP Server, on page 2029](#)
- [Configuring DHCP-Required for FlexConnect, on page 2039](#)

## Information About Dynamic Host Configuration Protocol

You can configure WLANs to use the same or different Dynamic Host Configuration Protocol (DHCP) servers or no DHCP server. Two types of DHCP servers are available—internal and external.

### Internal DHCP Servers

The device contains an internal DHCP server. This server is typically used in branch offices that do not have a DHCP server.

The internal server provides DHCP addresses to wireless clients, direct-connect APs, and DHCP requests that are relayed from APs. Only lightweight APs are supported. If you want to use the internal DHCP server, ensure that you configure SVI for the client VLAN, and set the IP address as DHCP server IP address.

DHCP option 43 is not supported on the internal server. Therefore, the APs must use an alternative method to locate the management interface IP address of the device, such as local subnet broadcast, Domain Name System (DNS), or priming.

When clients use the internal DHCP server of the device, IP addresses are not preserved across reboots. As a result, multiple clients can be assigned to the same IP address. To resolve any IP address conflicts, clients must release their existing IP address and request a new one.

---

**Note**

- VRF is supported in the internal DHCP servers.
  - DHCPv6 is not supported in the internal DHCP servers.
-

### General Guidelines

- Internal DHCP server serves both wireless client and wired client (wired client includes AP).
- To serve wireless client with internal DHCP server, a unicast DHCP server IP address must be configured for wireless client. Internal DHCP server IP address must be configured under the server facing interface, which can be loopback interface, SVI interface, or L3 physical interface.
- To use internal DHCP server for both wireless and wired client VLAN, an IP address must be configured under client VLAN SVI interface.
- For wireless client, in DHCP helper address configuration, the IP address of the internal DHCP server must be different from address of wireless client VLAN SVI interface.
- For wireless client with internal DHCP server support, the internal DHCP server can be configured using global configuration command, under the client VLAN SVI interface or under the wireless policy profile.
- An internal DHCP server pool can also serve clients of other controllers .

## External DHCP Servers

The operating system is designed to appear as a DHCP relay to the network and as a DHCP server to clients with industry-standard external DHCP servers that support DHCP Relay, which means that each controller appears as a DHCP relay agent to the DHCP server, and as a DHCP server in the virtual IP address to wireless clients.

Because the controller captures the client IP address that is obtained from a DHCP server, it maintains the same IP address for that client during intra controller, inter controller, and inter-subnet client roaming.

---

**Note** External DHCP servers support DHCPv6.

---

## DHCP Assignments

You can configure DHCP on a per-interface or per-WLAN basis. We recommend that you use the primary DHCP server address that is assigned to a particular interface.

You can assign DHCP servers for individual interfaces. You can configure the management interface, AP manager interface, and dynamic interface for a primary and secondary DHCP server, and configure the service-port interface to enable or disable DHCP servers. You can also define a DHCP server on a WLAN (in this case, the server overrides the DHCP server address on the interface assigned to the WLAN).

### Security Considerations

For enhanced security, we recommend that you ask all clients to obtain their IP addresses from a DHCP server. To enforce this requirement, you can configure all the WLANs with a DHCP Address Assignment Required setting, which disallows client static IP addresses. If DHCP Address Assignment Required is selected, clients must obtain an IP address through DHCP. Any client with a static IP address is not allowed on the network. The controller monitors DHCP traffic because it acts as a DHCP proxy for the clients.

- Note**
- WLANs that support management over wireless must allow management (device-servicing) clients to obtain an IP address from a DHCP server.
  - The operating system is designed to appear as a DHCP relay to the network and as a DHCP server to clients with industry-standard external DHCP servers that support DHCP relay. This means that each controller appears as a DHCP relay to the DHCP server and as a DHCP server at the virtual IP address to wireless clients.

You can create WLANs with DHCP Address Assignment Required disabled. If you do this, clients have the option of using a static IP address or obtaining an IP address from a designated DHCP server. However, note that this might compromise security.

- Note** DHCP Address Assignment Required is not supported for wired guest LANs.

You can create separate WLANs with DHCP Address Assignment Required configured as disabled. This is applicable only if DHCP proxy is enabled for the controller. You must not define the primary or secondary configuration DHCP server instead you should disable the DHCP proxy. These WLANs drop all the DHCP requests and force clients to use a static IP address. These WLANs do not support management over wireless connections.

## DHCP Option 82

DHCP option 82 provides additional security when DHCP is used to allocate network addresses. It enables the controller to act as a DHCP relay agent to prevent DHCP client requests from untrusted sources. You can configure the controller to add option 82 information to DHCP requests from clients before forwarding the requests to the DHCP server.

**Figure 52: DHCP Option 82**

The AP forwards all the DHCP requests from a client to the controller. The controller adds the DHCP option 82 payload and forwards the request to the DHCP server. The payload can contain the MAC address or the MAC address and SSID of the AP, depending on how you configure this option.

---

**Note** DHCP packets that already include a relay agent option are dropped at the controller.

---

For DHCP option 82 to operate correctly, DHCP proxy must be enabled.

## Restrictions for Configuring DHCP for WLANs

- If you override the DHCP server in a WLAN, you must ensure that you configure the underlying Cisco IOS configuration to make sure that the DHCP server is reachable.
- WLAN DHCP override works only if DHCP service is enabled on the controller.

You can configure DHCP service in either of the following ways:

- Configuring the DHCP pool on the controller.
- Configuring a DHCP relay agent on the SVI. Note that the VLAN of the SVI must be mapped to the WLAN where DHCP override is configured.

## Guidelines for DHCP Relay Configuration

### Relay Agent Source IP

- If you configure source interface VLAN in the SVI interface, the IP address of the VLAN interface configured as source is used.
- If the Relay Agent source IP is not mentioned, the IP address of the SVI interface created for the corresponding client's VLAN is used.
- If the Relay Agent source IP is not mentioned, the source address specified at the global level is used.

- 
- Note**
- The DHCP packets are sourced from the IP address of the Wireless Management Interface (WMI), if VLAN is not configured in the policy profile and AAA override.
  - The SVI interface configuration is mandatory to achieve the DHCP relay functionality in central DHCP or local switching.
  - Even though many interface options are available in the **ip dhcp relay source-interface <>** command, only VLAN interface is applicable.
- 

### DHCP Server

- If the DHCP server address is configured in the wireless policy profile, the server address configured in the policy profile takes precedence.

- If the DHCP server address is not configured in the policy profile, the server address configured in SVI takes precedence.

---

**Note** You can configure two server addresses in the SVI. In this case, the DHCP packets from the client are sent to both the servers.

The Option 82 configured in policy profile, SVI, and globally is considered and honored together.

---

# How to Configure DHCP for WLANs

## Configuring DHCP Scopes (GUI)

### Procedure

---

- Step 1** Choose **Administration > DHCP Pools**.
- Step 2** In the **Pools** section, click **Add** to add a new DHCP pool.  
The **Create DHCP Pool** dialog box is displayed.
- Step 3** In the **DHCP Pool Name** field, enter a name for the new DHCP pool.
- Step 4** From the **IP Type** drop-down list, choose the IP address type.
- Step 5** In the **Network** field, enter the network served by this DHCP scope. This IP address is used by the management interface with netmask applied, as configured in the **Interfaces** window.
- Step 6** In the **Subnet Mask** field, enter the subnet mask assigned to all the wireless clients.
- Step 7** In the **Starting ip** field, enter the starting IP address.
- Step 8** In the **Ending ip** field, enter the trailing IP address.
- Step 9** In the **Reserved Only** field, enable or disable it.
- Step 10** From the **Lease** drop-down list, choose the lease type as either **User Defined** or **Never Expires**. If you choose User Defined, you can enter the amount of time that an IP address is granted to a client.
- Step 11** To perform advanced configuration for DHCP scope, click **Advanced**.
- Step 12** Check the **Enable DNS Proxy** check box to enable DNS proxy.
- Step 13** In the **Default Router(s)** field, enter the IP address of the optional router or routers that connect to the device and click the + icon to add them to the list. Each router must include a DHCP forwarding agent that enables a single device to serve the clients of multiple devices.
- Step 14** In the **DNS Server(s)** field, enter the IP address of the optional DNS server or servers and click the + icon to add them to the list. Each DNS server must be able to update a client's DNS entry to match the IP address assigned by the DHCP scope.
- Step 15** In the **NetBios Name Server(s)** field, enter the IP address of the optional Microsoft NetBIOS name server or servers, such as Microsoft Windows Internet Naming Service (WINS) server, and click the + icon to add them to the list.

- Step 16** In the **Domain** field, enter the optional domain name of the DHCP scope for use with one or more DNS servers.
- Step 17** To add **DHCP** options, click **Add** in the **DHCP Options List** section. DHCP provides an internal framework for passing configuration parameters and other control information, such as DHCP options, to the clients on your network. DHCP options carry parameters as tagged data stored within protocol messages exchanged between the DHCP server and its clients.
- Step 18** Enter the **DHCP** option that you want to add.
- Step 19** Click **Save & Apply to Device**.

## Configuring DHCP Scopes (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>ip dhcp pool <i>pool-name</i></b> <b>Example:</b> Device(config)# ip dhcp pool test-pool	Configures the DHCP pool address.
<b>Step 3</b>	<b>network <i>network-name mask-address</i></b> <b>Example:</b> Device(dhcp-config)# network 209.165.200.224 255.255.255.0	Specifies the network number in dotted-decimal notation and the mask address.
<b>Step 4</b>	<b>dns-server <i>hostname</i></b> <b>Example:</b> Device(dhcp-config)# dns-server example.com	Specifies the DNS name server. You can specify an IP address or a hostname.
<b>Step 5</b>	<b>end</b> <b>Example:</b> Device(dhcp-config)# end	Returns to privileged EXEC mode.

# Configuring the Internal DHCP Server

## Configuring the Internal DHCP Server Under Client VLAN SVI (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Layer2 > VLAN > SVI**.
  - Step 2** Click an SVI.
  - Step 3** Click the **Advanced** tab.
  - Step 4** Under **DHCP Relay** settings, enter the **IPv4 Helper Address**.
  - Step 5** Click **Update & Apply to Device**.
- 

## Configuring the Internal DHCP Server Under Client VLAN SVI (CLI)

### Before you begin

- For wireless clients, only two DHCP servers are supported.
- To use the internal DHCP server for both wireless and wired client VLAN, an IP address must be configured under the client VLAN SVI.
- For wireless clients, the IP address of the internal DHCP server must be different from the address of the wireless client VLAN SVI (in the DHCP helper address configuration).
- For wireless clients, the internal DHCP server can be configured under the client VLAN SVI or under the wireless policy profile.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>interface loopback</b> <i>interface-number</i>  <b>Example:</b> Device(config)# interface Loopback0	Creates a loopback interface and enters interface configuration mode.
<b>Step 3</b>	<b>ip address</b> <i>ip-address</i>  <b>Example:</b> Device(config-if)# ip address 10.10.10.1 255.255.255.255	Configures the IP address for the interface.

	Command or Action	Purpose
<b>Step 4</b>	<b>exit</b> <b>Example:</b> Device(config-if)# exit	Exits interface configuration mode.
<b>Step 5</b>	<b>interface vlan <i>vlan-id</i></b> <b>Example:</b> Device(config)# interface vlan 32	Configures the VLAN ID.
<b>Step 6</b>	<b>ip address <i>ip-address</i></b> <b>Example:</b> Device(config-if)# ip address 192.168.32.100 255.255.255.0	Configures the IP address for the interface.
<b>Step 7</b>	<b>ip helper-address <i>ip-address</i></b> <b>Example:</b> Device(config-if)# ip helper-address 10.10.10.1	Configures the destination address for UDP broadcasts. <b>Note</b> If the IP address used in the <b>ip helper-address</b> command is an internal address of the controller an internal DHCP server is used. Otherwise, the external DHCP server is used.
<b>Step 8</b>	<b>no mop enabled</b> <b>Example:</b> Device(config-if)# no mop enabled	Disables the Maintenance Operation Protocol (MOP) for an interface.
<b>Step 9</b>	<b>no mop sysid</b> <b>Example:</b> Device(config-if)# no mop sysid	Disables the task of sending MOP periodic system ID messages.
<b>Step 10</b>	<b>exit</b> <b>Example:</b> Device(config-if)# exit	Exits interface configuration mode.
<b>Step 11</b>	<b>ip dhcp excluded-address <i>ip-address</i></b> <b>Example:</b> Device(config)# ip dhcp excluded-address 192.168.32.1	Specifies the IP address that the DHCP server should not assign to DHCP clients.
<b>Step 12</b>	<b>ip dhcp excluded-address <i>ip-address</i></b> <b>Example:</b> Device(config)# ip dhcp excluded-address 192.168.32.100	Specifies the IP addresses that the DHCP server should not assign to DHCP clients.

	Command or Action	Purpose
<b>Step 13</b>	<b>ip dhcp pool</b> <i>pool-name</i> <b>Example:</b> Device(config)# ip dhcp pool pool-vlan32	Configures the DHCP pool address.
<b>Step 14</b>	<b>network</b> <i>network-name mask-address</i> <b>Example:</b> Device(dhcp-config)# network 192.168.32.0 255.255.255.0	Specifies the network number in dotted-decimal notation, along with the mask address.
<b>Step 15</b>	<b>default-router</b> <i>ip-address</i> <b>Example:</b> Device(dhcp-config)# default-router 192.168.32.1	Specifies the IP address of the default router for a DHCP client.
<b>Step 16</b>	<b>exit</b> <b>Example:</b> Device(dhcp-config)# exit	Exits DHCP configuration mode.
<b>Step 17</b>	<b>wireless profile policy</b> <i>profile-policy</i> <b>Example:</b> Device(config)# wireless profile policy default-policy-profile	Configures the WLAN policy profile and enters wireless policy configuration mode.
<b>Step 18</b>	<b>central association</b> <b>Example:</b> Device(config-wireless-policy)# central association	Configures central association for locally switched clients.
<b>Step 19</b>	<b>central dhcp</b> <b>Example:</b> Device(config-wireless-policy)# central dhcp	Configures the central DHCP for locally switched clients.
<b>Step 20</b>	<b>central switching</b> <b>Example:</b> Device(config-wireless-policy)# central switching	Configures WLAN for central switching.
<b>Step 21</b>	<b>description</b> <i>policy-profile-name</i> <b>Example:</b> Device(config-wireless-policy)# description "default policy profile"	Adds a description for the policy profile
<b>Step 22</b>	<b>vlan</b> <i>vlan-name</i> <b>Example:</b> Device(config-wireless-policy)# vlan 32	Assigns the profile policy to the VLAN.

	Command or Action	Purpose
<b>Step 23</b>	<b>no shutdown</b>  <b>Example:</b> Device(config-wireless-policy)# no shutdown	Enables the wireless profile policy.

## Configuring the Internal DHCP Server Under a Wireless Policy Profile (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Tags & Profiles > Policy**.
  - Step 2** Click a policy name.
  - Step 3** Click the **Advanced** tab.
  - Step 4** Under **DHCP** settings, check or uncheck the **IPv4 DHCP Required** check box and enter the **DHCP Server IP Address**.
  - Step 5** Click **Update & Apply to Device**.
- 

## Configuring the Internal DHCP Server Under a Wireless Policy Profile

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>interface loopback <i>interface-number</i></b>  <b>Example:</b> Device(config)# interface Loopback0	Creates a loopback interface and enters interface configuration mode.
<b>Step 3</b>	<b>ip address <i>ip-address</i></b>  <b>Example:</b> Device(config-if)# ip address 10.10.10.1 255.255.255.255	Configures the IP address for the interface.
<b>Step 4</b>	<b>exit</b>  <b>Example:</b> Device(config-if)# exit	Exits interface configuration mode.
<b>Step 5</b>	<b>interface vlan <i>vlan-id</i></b>  <b>Example:</b>	Configures the VLAN ID.

	Command or Action	Purpose
	Device(config)# interface vlan 32	
<b>Step 6</b>	<b>ip address</b> <i>ip-address</i> <b>Example:</b> Device(config-if)# ip address 192.168.32.100 255.255.255.0	Configures the IP address for the interface.
<b>Step 7</b>	<b>no mop enabled</b> <b>Example:</b> Device(config-if)# no mop enabled	Disables the Maintenance Operation Protocol (MOP) for an interface.
<b>Step 8</b>	<b>no mop sysid</b> <b>Example:</b> Device(config-if)# no mop sysid	Disables the task of sending MOP periodic system ID messages.
<b>Step 9</b>	<b>exit</b> <b>Example:</b> Device(config-if)# exit	Exits interface configuration mode.
<b>Step 10</b>	<b>ip dhcp excluded-address</b> <i>ip-address</i> <b>Example:</b> Device(config)# ip dhcp excluded-address 192.168.32.100	Specifies the IP address that the DHCP server should not assign to DHCP clients.
<b>Step 11</b>	<b>ip dhcp pool</b> <i>pool-name</i> <b>Example:</b> Device(config)# ip dhcp pool pool-vlan32	Configures the DHCP pool address.
<b>Step 12</b>	<b>network</b> <i>network-name mask-address</i> <b>Example:</b> Device(dhcp-config)# network 192.168.32.0 255.255.255.0	Specifies the network number in dotted-decimal notation along with the mask address.
<b>Step 13</b>	<b>default-router</b> <i>ip-address</i> <b>Example:</b> Device(dhcp-config)# default-router 192.168.32.1	Specifies the IP address of the default router for a DHCP client.
<b>Step 14</b>	<b>exit</b> <b>Example:</b> Device(dhcp-config)# exit	Exits DHCP configuration mode.
<b>Step 15</b>	<b>wireless profile policy</b> <i>profile-policy</i> <b>Example:</b> Device(config)# wireless profile policy default-policy-profile	Configures a WLAN policy profile and enters wireless policy configuration mode.

	Command or Action	Purpose
<b>Step 16</b>	<b>central association</b> <b>Example:</b> Device(config-wireless-policy)# central association	Configures central association for locally switched clients.
<b>Step 17</b>	<b>central switching</b> <b>Example:</b> Device(config-wireless-policy)# central switching	Configures local switching.
<b>Step 18</b>	<b>description <i>policy-profile-name</i></b> <b>Example:</b> Device(config-wireless-policy)# description "default policy profile"	Adds a description for the policy profile.
<b>Step 19</b>	<b>ipv4 dhcp opt82</b> <b>Example:</b> Device(config-wireless-policy)# ipv4 dhcp opt82	Enables DHCP Option 82 for the wireless clients.
<b>Step 20</b>	<b>ipv4 dhcp opt82 ascii</b> <b>Example:</b> Device(config-wireless-policy)# ipv4 dhcp opt82 ascii	Enables ASCII on DHCP Option 82.
<b>Step 21</b>	<b>ipv4 dhcp opt82 format <i>vlan_id</i></b> <b>Example:</b> Device(config-wireless-policy)# ipv4 dhcp opt82 format vlan32	Enables VLAN ID.
<b>Step 22</b>	<b>ipv4 dhcp opt82 rid <i>vlan_id</i></b> <b>Example:</b> Device(config-wireless-policy)# ipv4 dhcp opt82 rid	Supports the addition of Cisco 2-byte Remote ID (RID) for DHCP Option 82.
<b>Step 23</b>	<b>ipv4 dhcp server <i>ip-address</i></b> <b>Example:</b> Device(config-wireless-policy)# ipv4 dhcp server 10.10.10.1	Configures the WLAN's IPv4 DHCP server.
<b>Step 24</b>	<b>vlan <i>vlan-name</i></b> <b>Example:</b> Device(config-wireless-policy)# vlan 32	Assigns the profile policy to the VLAN.
<b>Step 25</b>	<b>no shutdown</b> <b>Example:</b>	Enables the wireless profile policy.

	Command or Action	Purpose
	Device(config-wireless-policy)# no shutdown	

## Configuring the Internal DHCP Server Globally (GUI)

### Procedure

- 
- Step 1** Choose **Administration > DHCP Pools > Pools**.
- Step 2** Click **Add**.  
The **Create DHCP Pool** window is displayed.
- Step 3** Enter the **DHCP Pool Name**, **Network**, **Starting ip**, and **Ending ip**.
- Step 4** From the **IP Type**, **Subnet Mask**, and **Lease** drop-down lists, choose a value.
- Step 5** Click the **Reserved Only** toggle button.
- Step 6** Click **Apply to Device**.
- 

## Configuring the Internal DHCP Server Globally (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>interface loopback <i>interface-num</i></b> <b>Example:</b> Device(config)# interface Loopback0	Creates a loopback interface and enters interface configuration mode.
<b>Step 3</b>	<b>ip address <i>ip-address</i></b> <b>Example:</b> Device(config-if)# ip address 10.10.10.1 255.255.255.255	Configures the IP address for the interface.
<b>Step 4</b>	<b>exit</b> <b>Example:</b> Device(config-if)# exit	Exits interface configuration mode.
<b>Step 5</b>	<b>interface vlan <i>vlan-id</i></b> <b>Example:</b> Device(config)# interface vlan 32	Configures the VLAN ID.

	<b>Command or Action</b>	<b>Purpose</b>
<b>Step 6</b>	<b>ip address</b> <i>ip-address</i>  <b>Example:</b> Device(config-if)# ip address 192.168.32.100 255.255.255.0	Configures the IP address for the interface.
<b>Step 7</b>	<b>no mop enabled</b>  <b>Example:</b> Device(config-if)# no mop enabled	Disables the Maintenance Operation Protocol (MOP) for an interface.
<b>Step 8</b>	<b>no mop sysid</b>  <b>Example:</b> Device(config-if)# no mop sysid	Disables the task of sending the MOP periodic system ID messages.
<b>Step 9</b>	<b>exit</b>  <b>Example:</b> Device(config-if)# exit	Exits the interface configuration mode.
<b>Step 10</b>	<b>ip dhcp-server</b> <i>ip-address</i>  <b>Example:</b> Device(config)# ip dhcp-server 10.10.10.1	Specifies the target DHCP server parameters.
<b>Step 11</b>	<b>ip dhcp excluded-address</b> <i>ip-address</i>  <b>Example:</b> Device(config)# ip dhcp excluded-address 192.168.32.100	Specifies the IP address that the DHCP server should not assign to DHCP clients.
<b>Step 12</b>	<b>ip dhcp pool</b> <i>pool-name</i>  <b>Example:</b> Device(config)# ip dhcp pool pool-vlan32	Configures the DHCP pool address.
<b>Step 13</b>	<b>network</b> <i>network-name mask-address</i>  <b>Example:</b> Device(dhcp-config)# network 192.168.32.0 255.255.255.0	Specifies the network number in dotted-decimal notation along with the mask address.
<b>Step 14</b>	<b>default-router</b> <i>ip-address</i>  <b>Example:</b> Device(dhcp-config)# default-router 192.168.32.1	Specifies the IP address of the default router for a DHCP client.
<b>Step 15</b>	<b>exit</b>  <b>Example:</b> Device(dhcp-config)# exit	Exits DHCP configuration mode.

	Command or Action	Purpose
<b>Step 16</b>	<b>wireless profile policy</b> <i>profile-policy</i> <b>Example:</b> Device(config)# wireless profile policy default-policy-profile	Configures a WLAN policy profile and enters wireless policy configuration mode.
<b>Step 17</b>	<b>central association</b> <b>Example:</b> Device(config-wireless-policy)# central association	Configures central association for locally switched clients.
<b>Step 18</b>	<b>central dhcp</b> <b>Example:</b> Device(config-wireless-policy)# central dhcp	Configures central DHCP for locally switched clients.
<b>Step 19</b>	<b>central switching</b> <b>Example:</b> Device(config-wireless-policy)# central switching	Configures local switching.
<b>Step 20</b>	<b>description</b> <i>policy-profile-name</i> <b>Example:</b> Device(config-wireless-policy)# description "default policy profile"	Adds a description for the policy profile.
<b>Step 21</b>	<b>vlan</b> <i>vlan-name</i> <b>Example:</b> Device(config-wireless-policy)# vlan 32	Assigns the profile policy to the VLAN.
<b>Step 22</b>	<b>no shutdown</b> <b>Example:</b> Device(config-wireless-policy)# no shutdown	Enables the profile policy.

## Configuring IP Reservations in the Internal DHCP Server (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.

	Command or Action	Purpose
<b>Step 2</b>	<b>ip dhcp pool</b> <i>pool-name</i> <b>Example:</b> Device(config)# ip dhcp pool <i>dhcp-pool-add</i>	Configures the DHCP pool address.
<b>Step 3</b>	<b>network</b> <i>network-name mask-address</i> <b>Example:</b> Device(dhcp-config)# network 192.168.32.0 255.255.255.0	Specifies the network number in dotted-decimal notation along with the mask address.
<b>Step 4</b>	<b>address</b> <i>ip-address {client-id client-id   hardware-address client-mac-id}</i> <b>Example:</b> Device(dhcp-config)# address 209.165.200.224 client-id dhcp-client-id	Configures a reserved address using either the client ID or the MAC address.  <b>Note</b> The IP reservation is contingent on the type of identifier, be it the client ID or the MAC address that the client provides. If the client sends its DHCP DISCOVER or REQUEST using the client ID, set your IP reservation using the client ID and not the hardware address.

## Verifying Internal DHCP Configuration

To verify client binding, use the following command:

```
Device# show ip dhcp binding
```

```

Bindings from all pools not associated with VRF:
IP address Client-ID/ Lease expiration Type State
Interface
 Hardware address/
 User name
192.168.32.3 0130.b49e.491a.53 Mar 23 2018 06:42 PM Automatic Active
Loopback0

```

To verify the DHCP relay statistics for a wireless client, use the following command:

```
Device# show wireless dhcp relay statistics
```

```

DHCP Relay Statistics

DHCP Server IP : 10.10.10.1

Message Count

DHCPDISCOVER : 1
BOOTP FORWARD : 137
BOOTP REPLY : 0
DHCPOFFER : 0
DHCPREQUEST : 54
DHCPACK : 0
DHCPNAK : 0

```

```
DHCPDECLINE : 0
DHCPRELEASE : 0
DHCPINFORM : 82
```

```
Tx/Rx Time :

```

```
LastTxTime : 18:42:18
LastRxTime : 00:00:00
```

```
Drop Counter :

```

```
TxDropCount : 0
```

To verify the DHCP packet punt statistics in CPP, use the following command:

```
Device# show platform hardware chassis active qfp feature wireless punt statistics
```

```
CPP Wireless Punt stats:
```

App Tag	Packet Count
-----	-----
CAPWAP_PKT_TYPE_DOT11_PROBE_REQ	14442
CAPWAP_PKT_TYPE_DOT11_MGMT	50
CAPWAP_PKT_TYPE_DOT11_IAPP	9447
CAPWAP_PKT_TYPE_DOT11_RFID	0
CAPWAP_PKT_TYPE_DOT11_RRM	0
CAPWAP_PKT_TYPE_DOT11_DOT1X	0

## Configuring DHCP-Required for FlexConnect

### Information About FlexConnect DHCP-Required

The DHCP-Required knob on a policy profile forces a connected wireless client to get the IP address from DHCP. When the client completes the DHCP process and acquires an IP address, this IP address is learnt by the controller and only then the client traffic is switched on to the network. The DHCP-Required feature is already supported in central switching.

In Cisco IOS XE Amsterdam 17.2.1, the feature is supported on FlexConnect local switching clients. Prior to Release 17.2.1, DHCP-Required was not enforced on FlexConnect local switching clients. The IP address learnt by the AP or the controller for the wireless client is tracked to create an IP-MAC binding. As part of this feature, when a FlexConnect local switching client roams from one AP to another, the client need not do

the DHCP again in the same L2 network, because the controller tracks the IP address and pushes the binding to the newly roaming AP.

The FlexConnect DHCP-Required feature can be configured from open configuration models, CLI, and from the GUI. The CLI and GUI configurations are described in this chapter. For more information about the open configuration modes, see the [https://www.cisco.com/c/en/us/td/docs/ios-xml/ios/prog/configuration/172/b\\_172\\_programmability\\_cg.html](https://www.cisco.com/c/en/us/td/docs/ios-xml/ios/prog/configuration/172/b_172_programmability_cg.html).

## Restrictions and Limitations for FlexConnect DHCP-Required

The following are the restrictions and limitations for the FlexConnect DHCP-Required feature:

- The DHCP-Required feature is applicable for IPv4 addresses only.
- The IP-MAC binding can be pushed to other APs only through the custom policy profile. IP-MAC binding is not available in the default policy. The mapping is propagated to all the APs in the same custom policy profile.
- The DHCP-Required feature works on IP-MAC binding basis and is not supported with third party workgroup bridge (WGB), where WGB wired client information is not shared to AP by the WGB.
- Cisco Wave 2 APs take 180 seconds to remove a client entry with static IP, when DHCP-required is enabled.

## Configuring FlexConnect DHCP-Required (GUI)

Perform the steps given below to configure the FlexConnect DHCP-Required feature through the GUI:

### Procedure

- 
- Step 1** Choose **Configuration > Tags & Profiles > Policy**.
  - Step 2** On the **Policy** window, click the name of the corresponding Policy Profile. The **Edit Policy Profile** window is displayed.
  - Step 3** Click the **Advanced** tab.
  - Step 4** In the **DHCP** section, check the **IPv4 DHCP Required** check box to enable the feature.
  - Step 5** Click **Update & Apply to Device**.
- 

## Configuring FlexConnect DHCP-Required (CLI)

Perform the procedure given below to configure FlexConnect DHCP-Required through the CLI:

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b>	Enters global configuration mode.

	Command or Action	Purpose
	Device#configure terminal	
<b>Step 2</b>	<b>wireless profile policy</b> <i>profile-policy</i> <b>Example:</b> Device#wireless profile policy <i>rr-xyz-policy-1</i>	Configures WLAN policy profile and enters the wireless policy configuration mode.
<b>Step 3</b>	<b>ipv4 dhcp required</b> <b>Example:</b> Device(config-wireless-policy)#ipv4 dhcp required	Enables the FlexConnect DHCP-Required feature.
<b>Step 4</b>	<b>no shutdown</b> <b>Example:</b> Device(config-wireless-policy)#no shutdown	Saves the configuration.

## Verifying FlexConnect DHCP-Required

- To verify the IP address learnt for a client on an IP DHCP-Required policy-enabled WLAN, use the **show wireless client summary** command:

**Note** The controller or AP does not learn the IP address through other means such as ARP or data gleaning, when IPv4 DHCP-Required is enabled.

```
Device# show wireless client summary
Number of Clients: 1
MAC Address AP Name Type ID State Protocol Method
Role

1cXX.bXXX.59XX APXXXX.7XXX.4XXX WLAN 3 IP Learn 11ac Dot1x
Local
```

- This example shows that the client IP is in the **Run** state, indicating that the client has received the IP address from DHCP:

```
Device# show wireless client summary
Number of Clients: 1
MAC Address AP Name Type ID State Protocol
Method Role

5XXX.37XX.c3XX APXXXX.4XXX.4XXX WLAN 3 Run 11n (5)
None Local
```

## CHAPTER 181

# Aironet Extensions IE (CCX IE)

---

- [Information About Aironet Extensions Information Element](#) , on page 2043
- [Configuring Aironet Extensions IE \(GUI\)](#), on page 2043
- [Configuring Aironet Extensions IE \(CLI\)](#), on page 2043
- [Verifying the Addition of AP Name](#), on page 2044

## Information About Aironet Extensions Information Element

The Cisco Aironet Extensions Information Element (IE) is an attribute used by Cisco devices for better connectivity. It contains information such as the AP name, device type, radio type, AP load, and the number of associated clients, in the beacon and probe responses of the WLAN. The Cisco Client Extensions use this information to associate with the best AP.

The Aironet Extensions IE configuration is disabled by default. With this feature you can set the AP name not through enabling the whole IE extension, but by just inserting just the AP name.

## Configuring Aironet Extensions IE (GUI)

### Procedure

---

- Step 1** Choose **Configuration** > **Tags & Profiles** > **WLANs** .
  - Step 2** In the **WLANs** window, click **Add**.
  - Step 3** In the **Add WLAN** window, under the **Advanced** tab, check the **Aironet IE** check box to enable Aironet IE on the WLAN.
  - Step 4** Click **Apply to Device**.
- 

## Configuring Aironet Extensions IE (CLI)

Perform this procedure to create a WLAN and enable the Aironet Extensions IE feature on the WLAN:

**Note** For more information about the open configuration models, refer to the Programmability Configuration Guide, Cisco IOS XE Amsterdam 17.1.x.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wlan profile-name wlan-id [ssid]</b> <b>Example:</b> Device(config)# wlan mywlan 34 mywlan-ssid	Specifies the WLAN name and ID: <ul style="list-style-type: none"> <li>• <i>profile-name</i>: Profile name. The range is from 1 to 32 alphanumeric characters.</li> <li>• <i>wlan-id</i>: WLAN ID. The range is from 1 to 512.</li> <li>• <i>ssid</i>: Service Set Identifier (SSID) for this WLAN. If the SSID is not specified, the WLAN profile name is set as the SSID.</li> </ul> <p><b>Note</b> By default, the WLAN is disabled.</p>
<b>Step 3</b>	<b>[no] ccx aironet-iesupport</b> <b>Example:</b> Device(config-wlan)#ccx aironet-iesupport	Configures the Cisco Client Extensions option and sets the support of Aironet IE on the WLAN. (Use the <b>no</b> form of this command to disable the configuration.)

### What to do next

1. Create a policy tag. For more information about creating policy tags, refer to *Configuring a Policy Tag (CLI)*.
2. Map the policy tag to the AP. For more information about mapping a policy tag to the AP, refer to *Attaching a Policy Tag and Site Tag to an AP (CLI)*.

## Verifying the Addition of AP Name

The following example shows how to verify the addition of the AP Name (using Open Configuration) in the beacon without enabling IE:

```
Device# show wlan id 1
WLAN Profile Name : wlan-test
=====
Identifier : 1
```

```
Description :
Network Name (SSID) : wlan2
Status : Disabled
Broadcast SSID : Enabled
Advertise-Apname : Enabled
Universal AP Admin : Disabled
Max Associated Clients per WLAN : 0
Max Associated Clients per AP per WLAN : 0
Max Associated Clients per AP Radio per WLAN : 200
OKC : Enabled
Number of Active Clients : 0
CHD per WLAN : Enabled
WMM : Allowed
Channel Scan Defer Priority:
 Priority (default) : 5
 Priority (default) : 6
Scan Defer Time (msecs) : 100
Media Stream Multicast-direct : Disabled
CCX - AironetIe Support : Enabled
Peer-to-Peer Blocking Action : Disabled
```

## CHAPTER 182

# Device Analytics

---

- [Device Analytics](#), on page 2047
- [Adaptive 802.11r](#), on page 2051

## Device Analytics

### Information About Device Analytics

The Device Analytics feature enhances the enterprise Wi-Fi experience for client devices to ensure seamless connectivity. This feature provides a set of data analytics tools for analyzing wireless client device behavior. With device profiling enabled on the controller, information is exchanged between the client device and the controller and AP. This data is encrypted using AES-256-CBC to ensure device security.

Starting from Cisco IOS XE Bengaluru 17.6.1, this feature is supported on Intel devices with AC9560, AC8561, AX201, AX200, AX1650, AX210, AX211, and AX1675 chipsets. Device information and other information received from the Intel devices are shared with Cisco Catalyst Center. It will also be used to enhance device profiling on the controller.

---

**Note** From Cisco IOS XE Dublin 17.12.1, MacBook Analytics is supported on the controller when the MacBook device sends 11k action frames along with the model information.

---

---

**Note** Apple clients such as iPhones and iPads use 802.11k action frames to send device information to the controller. When they fail to send 802.11k action frames, the controller will not perform device classification based on the 802.11 protocol. Hence, this falls back to legacy device classification which is based on HTTP and DHCP protocols.

---

### Restrictions for Device Analytics

- This feature is applicable only for Cisco device ecosystem partners.
- This feature is supported only on the 802.11ax and Wave 2 APs.

- This feature is supported using central authentication in either local mode or FlexConnect mode.
- To support Intel devices, AP should have PMF capability and PMF should set to optional or required on the WLAN.

## Configuring Device Analytics (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Tags & Profiles > WLANs**.
- Step 2** On the **WLANs** page, click the name of the WLAN.
- Step 3** In the **Edit WLAN** window, click the **Advanced** tab.
- Step 4** In the **Device Analytics** section, select the **Advertise Support** check box.
- Step 5** Select the **Advertise PC Analytics Support** check box to enable PC analytics on the WLAN.
- Step 6** (Optional) In the **Device Analytics** section, select the **Share Data with Client** check box.
- Step 7** Click **Update & Apply to Device**.
- 

## Configuring Device Analytics (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wlan wlan-name wlan-id SSID-name</b>  <b>Example:</b> Device(config)# wlan device_analytics 1 device_analytics	Enters the WLAN configuration sub-mode. <ul style="list-style-type: none"> <li>• <i>wlan-name</i>—Enter the profile name. The range is from 1 to 32 alphanumeric characters.</li> <li>• <i>wlan-id</i>—Enter the WLAN ID. The range is from 1 to 512.</li> <li>• <i>SSID-name</i>—Enter the Service Set Identifier (SSID) for this WLAN. If the SSID is not specified, the WLAN profile name is set as the SSID.</li> </ul> <p><b>Note</b> If you have already configured WLAN, enter <b>wlan wlan-name</b> command.</p>

	Command or Action	Purpose
<b>Step 3</b>	<b>client association limit</b> { <i>clients-per-wlan</i>   <i>apclients-per-ap-per-wlan</i>   <b>radio</b> <i>clients-per-ap-radio-per-wlan</i> }  <b>Example:</b> <pre>Device(config)# client association limit 1 1</pre>	Sets the maximum number of clients, clients per AP, or clients per AP radio that can be configured on a WLAN.
<b>Step 4</b>	<b>[no] device-analytics</b>  <b>Example:</b> <pre>Device(config)# device-analytics</pre>	<p>This is enabled by default.</p> <p>Enables or disables device analytics. WLANs advertise analytics capability in beacons &amp; probe responses.</p>
<b>Step 5</b>	<b>[no] device-analytics [export]</b>  <b>Example:</b> <pre>Device(config)# device-analytics export</pre>	<p>When <b>export</b> option is set, the information from Cisco devices are shared with compatible clients (such as, Samsung devices). Here, information from Cisco devices refer to the Cisco controller details, AP version, and model number.</p> <p>This configuration is disabled by default.</p>
<b>Step 6</b>	<b>device-analytics pc-analytics</b>  <b>Example:</b> <pre>Device(config)# device-analytics pc-analytics</pre>	Enables PC analytics on the WLAN. WLANs advertise analytics capability in beacons & probe responses.
<b>Step 7</b>	<b>no shutdown</b>  <b>Example:</b> <pre>Device(config)# no shutdown</pre>	Enables the WLAN.
<b>Step 8</b>	<b>end</b>  <b>Example:</b> <pre>Device(config)# end</pre>	Returns to privileged EXEC mode.

## Verifying Device Analytics

### Procedure

- 
- Step 1** On the **Monitoring > Wireless > Clients** page, click on a client in the table to view its properties and statistics.
- Step 2** In the **General** tab, click on **Client Properties** to view the **PC Analytics** reports. This section displays the neighbor AP information, candidate BSSIDs, and reports for low RSSI, beacon miss, failed APs, and unknown APs.
-

## Verifying Device Analytics Configuration

To view the status of device analytics export, use the following command:

```
Device# show wlan 1 test-wlan

WLAN Profile Name : test-wlan
=====
Identifier : 1
Description :
Network Name (SSID) : test-open-ssid
Status : Enabled
Broadcast SSID : Enabled
Advertise-Apname : Disabled
Universal AP Admin : Disabled

Device Analytics
 Advertise Support : Enabled
 Share Data with Client : Disabled
```

To view client device information, use the following command:

```
Device# show device classifier mac-address 0040.96ae.xxx detail

Client Mac: 0040.96ae.xxxx
Device Type: Samsung Galaxy S10e(Phone)
Confidence Level: 40
Device Name: android-dhcp-9
Software Version(Carrier Code): SD7(TMB)
Device OS: Android 9
Device Vendor: android-dhcp-9
Country: US
```

To view the last disconnect reason, use the following command:

```
Device# show device classifier mac-address 0040.96ae.xxxx detail

Client MAC Address : 0040.96ae.xxxx
Client IPv4 Address : 12.1.0.52
Client IPv6 Addresses : fe80::631b:5b4f:f9b6:53cc
Client Username: N/A
AP MAC Address : 7069.5a51.53c0
AP Name: AP4C77.6D9E.61B2
AP slot : 1
Client State : Associated

Assisted Roaming Neighbor List
Nearby AP Statistics:
EoGRE : No/Simple client
Last Disconnect Reason : User initiated disconnection - Device was powered off or Wi-Fi
turned off
```

To view the per client pc-analytics reports, use the following command:

```
Device# show wireless client mac-address 3413.e8b6.xxxx stats pc-analytics

Neighbor APs Info:

Reported time:: 06/21/2021 18:50:34

Roaming Reasons:
```

```

Selected AP RSSI:: -67
Candidate BSSIDs:

```

```
Neighbor AP RSSI(dB)
a4b2.3903.d10e -70

```

```
PC Analytics report stats

```

```

Report Type Processed Reports Dropped Reports

```

```
STA Info 1 0
Neigh AP 1 0
Low RSSI 0 0
Beacon Miss 0 0
Failed AP 0 0
Unknown APs 0 0
```

## Adaptive 802.11r

### Information About Adaptive 802.11r

The Cisco device ecosystem partner now supports 11r functionality on an adaptive 802.11r SSID. Samsung is one of the partners.

---

**Note** The Adaptive 802.11r is enabled by default. This means that when you create a WLAN, the adaptive 802.11r is configured by default.

---

Client device information such as its model number, supported operating system is shared with the controller and AP while the device receives information such as controller and AP type, software release, etc. Also, this enables 802.11r-compatible devices to benefit from adaptive 802.11r on Cisco networks. This ecosystem comes handy especially for troubleshooting device disconnection from the AP as the controller receives information such as the disconnect reason code from the client device.

---

**Note** Devices without 11r support cannot join an SSID where 11r is enabled.

---

To use the 11r functionality on devices, you need to create a separate SSID with 11r enabled and another with 11r disabled to support the non-11r devices in the network.

Adaptive dot11r is supported by Apple iPad, Apple iPhone, and Samsung S10 devices. However; some software update creates a MIC mismatch error in these devices. But these errors are transient and clients will successfully be able to associate to the SSID in subsequent results.

---

## Configuring Adaptive 802.11r (GUI)

### Procedure

---

- Step 1** Choose **Configuration > Tags & Profiles > WLANs**.
  - Step 2** On the **WLANs** page, click the name of the WLAN.
  - Step 3** In the **Edit WLAN** window, click the **Security > Layer2** tab.
  - Step 4** In the **WPA Parameters** section and **Fast Transition** drop-down list, choose **Adaptive Enabled**.
  - Step 5** Click **Update & Apply to Device**.
- 

## Verifying Adaptive 802.11r

To view the details, use the following command:

```
Device# show running-config all
wlan test-psk 2 test-psk
 security ft adaptive
"adaptive" is optional
```

---

**Note** The following command is used to enable or disable adaptive 11r:

**[no] security ft adaptive**

The following command is used to enable or disable 802.11r:

**[no] security ft**

---

## CHAPTER **183**

# Device Classifier Dynamic XML Support

---

- [Feature History for Device Classifier Dynamic XML Support, on page 2053](#)
- [Information About Device Classifier Dynamic XML Support, on page 2054](#)
- [Enabling Device Classifier \(CLI\), on page 2057](#)
- [Updating Dynamic XML File, on page 2057](#)
- [Verifying TLV Values, on page 2058](#)
- [Clearing Old Classification Cache, on page 2058](#)

## Feature History for Device Classifier Dynamic XML Support

This table provides release and related information about the feature explained in this section.

This feature is also available in all the releases subsequent to the one in which they are introduced in, unless noted otherwise.

Table 146: Feature History for Device Classifier Dynamic XML Support

Release	Feature	Feature Information
Cisco IOS XE Dublin 17.10.1	Device Classifier Dynamic XML Support	<p>You can do the following:</p> <ul style="list-style-type: none"> <li>• Add rules, checks, and profile name to an XML file.</li> <li>• Upload the XML file to the device file system.</li> </ul> <p>This feature enables better device classification without upgrading the device to a new release.</p> <p><b>Note</b> Device classifier dynamic XML support is applicable for the following:</p> <ul style="list-style-type: none"> <li>• Devices that are not classified previously: The classification takes effect from the latest file without any reboot.</li> <li>• Devices that are already classified: The clients have to rejoin for the classification to take effect.</li> <li>• Client previously classified with higher protocol values such as DHCP + HTTP: If the same client wants to be classified with only DHCP, use the <b>clear wireless client device cache</b> command.</li> </ul>

## Information About Device Classifier Dynamic XML Support

The current device classifier uses static XML file wherein you define checks, rules, and profiles based on MAC, DHCP, and HTTP TLVs in wireless devices. The static XML file is converted to a text file and integrated with the image. When you enable the device classified functionality using **device classifier** command, the contents in the text file is read and populated into the device classifier structures.

**Note** The subsequent device classification is based on the populated device classifier structures.

Presently, if you find any unclassified devices in a controller, the static XML file is updated with the new rules, checks, and profiles to get the devices classified. You will need to wait till the subsequent release as the static XML file is integrated with the image and cannot be changed from the controller.

### Workflow: To Classify Unclassified Devices with Dynamic XML File

1. The dynamic XML filename must be **dc\_user\_profiles.xml**.

**Note** Files with any other name are not read and parsed even if they have the correct schema.

2. Copy the sample dynamic XML file to your system using the following command:

```
copy {flash:} {ftp: | tftp:}
```

3. Provide a new version for the dynamic XML file:

```
<Version>1.1</Version>
```

4. Edit the dynamic XML file with the new rules, checks, and profiles as defined in the schema after examining the TLV values of the unclassified devices.

---

**Note** To check the TLV values, use the following command:

```
show wireless client mac-address mac detail
```

---

5. Copy the dynamic XML file to the device flash using the following command:

```
copy {ftp: | tftp:} {flash:}
```

Once the file is copied to the device file system, the newly connected clients are classified according to the new profiles defined in the dynamic XML file. You need to reconnect the already unclassified devices to send the DHCP and HTTP TLVs, and then classify them according to the new profiles. The already classified devices remain as classified until they are reconnected.

### Dynamic XML File

The device classifier dynamic XML support enhancement addresses this problem for device classifier dynamic XML file.

With the introduction of dynamic XML support, you are provided with a new dynamic device classifier XML file support.

---

**Note** The filename will be **dc\_user\_profiles.xml** and you can update the dynamic XML file with the new rules, checks, and profiles based on the devices connected and according to the provided schema. You can then copy this XML file to the device file system to enable better device classification without the need to upgrade the device to a new release.

---

The static XML file support is still available. If a device is connected, its TLVs are checked with the dynamic XML user profiles first and if it matches it is classified as per that profile. If you search for non-static XML profiles and if it matches it is classified as per that profile.

**Note** The sample dynamic XML file is available in the device at *flash:dc\_profile\_dir/*. You can consider the following sample dynamic XML file schema and copy this to your system using `copy {flash:} {ftp: | tftp:}` command, and append or replace the content with your own profiles, rules, and checks:

```
<?xml version="1.0" encoding="UTF-8"?>
<DeviceList>
 <CopyRight>Copyright (c) 2021-2022 by Cisco Systems, Inc. All rights
reserved.</CopyRight>
 <Version>1.0</Version>
 <Device>
 <DeviceType>Sample_Profile_1</DeviceType>
 <RuleName>Sample_Rule_1</RuleName>
 <RuleOperator>OR</RuleOperator>
 <RuleCertaintyMetric>20</RuleCertaintyMetric>
 <Check>
 <Protocol>DHCP</Protocol>
 <TLV-Type>12</TLV-Type>
 <TLV-Value-Type>String</TLV-Value-Type>
 <TLV-Value>test</TLV-Value>
 </Check>
 <Check>
 <Protocol>HTTP</Protocol>
 <TLV-Type>3</TLV-Type>
 <TLV-Value-Type>Integer</TLV-Value-Type>
 <TLV-Value>23</TLV-Value>
 </Check>
 </Device>
 <Device>
 <DeviceType>Sample_Profile_2</DeviceType>
 <RuleName>Sample_Rule_2</RuleName>
 <RuleOperator>AND</RuleOperator>
 <RuleCertaintyMetric>30</RuleCertaintyMetric>
 <Check>
 <Protocol>DHCP</Protocol>
 <TLV-Type>12</TLV-Type>
 <TLV-Value-Type></TLV-Value-Type>
 <TLV-Value>test</TLV-Value>
 </Check>
 <Check>
 <Protocol>MAC</Protocol>
 <TLV-Value-Type>String</TLV-Value-Type>
 <TLV-Value>Cisco</TLV-Value>
 </Check>
 </Device>
</DeviceList>
```

Each time you copy a new dynamic XML file, the older user profiles are erased completely and newer profiles are populated. After copying the dynamic XML files, only the newly connected clients are classified based on the new dynamic file whereas the already classified devices still remain as classified with older profiles until they are reconnected.

### MAC OUI-Based Profiles

The Organizational Unique Identifier (OUI) of a MAC address is part of the MAC address that identifies the vendor of the network adapter. The OUI is the first three bytes of the six-byte field and administered by the IEEE.

To define MAC-based profiles in the dynamic XML file, see <https://standards-oui.ieee.org/>.

For example, if the Client MAC address is **7035.094d.000**, then OUI is **0x703509**. You can find the corresponding entry in the <https://standards-oui.ieee.org/> as follows:

```
70-35-09 (hex) Cisco Systems, Inc
703509 (base 16) Cisco Systems, Inc
80 West Tasman Drive
San Jose CA 94568
US
```

## Enabling Device Classifier (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>device classifier</b> <b>Example:</b> Device(config)# device classifier	Enables the classification of attached devices.
<b>Step 3</b>	<b>end</b> <b>Example:</b> Device(config)# end	Returns to privileged EXEC mode.

## Updating Dynamic XML File

To classify a device, add the following lines in the dynamic XML file:

```
<DeviceList>
 <Copyright>Copyright (c) 2021-2022 by Cisco Systems, Inc. All rights
reserved.</Copyright>
 <Version>1.1</Version>
 <Device>
 <DeviceType>Device-test</DeviceType>
 <RuleName>Rule-Test</RuleName>
 <RuleOperator>AND</RuleOperator>
 <RuleCertaintyMetric>20</RuleCertaintyMetric>
 <Check>
 <Protocol>DHCP</Protocol>
 <TLV-Type>12</TLV-Type>
 <TLV-Value-Type>String</TLV-Value-Type>
 <TLV-Value>test</TLV-Value>
 </Check>
 </Device>

</DeviceList>
```

## Verifying TLV Values

To verify the TLV values, use the following command:

```
Device# show wireless client mac-address 7035.094d.0001 detail
Client MAC Address : 7035.094d.0001

.....

Nearby AP Statistics:

EoGRE : Pending Classification

Device Classification Information:

Device Type : Un-Classified Device

Device Name : Unknown Device

Protocol Map : 0x000009 (OUI, DHCP)

Device Protocol : DHCP -> <Protocol>DHCP</Protocol>

Type : 12 14 --> <TLV-Type>12</TLV-Type>

Data : 0e

00000000 00 0c 00 0a 74 65 73 74 2d 30 30 30 30 31 |...test-00001 |
----><TLV-Value>test</TLV-Value>

Type : 60 8

Data : 08

00000000 00 3c 00 04 74 65 73 74 |...test |

Type : 55 11

Data : 0b

00000000 00 37 00 07 01 1c 02 03 0f 06 0c |.7..... |

Max Client Protocol Capability: Wi-Fi6 (802.11ax)
```

## Clearing Old Classification Cache

If an already classified client uses any of the three type-length-values (TLVs) [OUI, DHCP, or HTTP] and if the combination value is lower, the existing value is ignored. To avoid such a scenario, use the following command:

```
Device# clear wireless client device cache
```

---

**Note** The priority of the TLVs is as follows:

- OUI
- DHCP
- HTTP

After executing the clear command, you must rejoin the client to get it classified as per the latest XML file.

---

# CHAPTER 184

## BSSID Counters

- [BSSID Counters](#), on page 2061
- [Enabling BSSID Statistics and BSSID Neighbor Statistics](#), on page 2061
- [Verifying BSSID Statistics on the Controller](#), on page 2062

## BSSID Counters

This feature helps to retrieve the BSSID statistics when a client is associated with a WLAN for every configured interval. A new configuration is introduced in the controller per AP profile to enable or disable BSSID statistics on the access points. The feature is disabled by default.

**Note** BSSID counter is not supported on the Cisco Aironet 1800 series APs and Cisco Catalyst 9100 series APs.

## Enabling BSSID Statistics and BSSID Neighbor Statistics

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>ap profile</b> <i>ap-profile-name</i> <b>Example:</b> Device(config)# ap profile <i>ap-profile-name</i>	Enters the AP profile configuration submode. <i>ap-profile-name</i> is the profile name of the configured AP.
<b>Step 3</b>	<b>bssid-stats</b> <b>Example:</b> Device(config-ap-profile)#[no] bssid-stats	Enables BSSID statistics. Use the <b>no</b> form of the command to disable the feature.

	Command or Action	Purpose
<b>Step 4</b>	<b>bssid-stats bssid-stats-frequency</b> <i>bssid-timer-seconds</i>  <b>Example:</b> Device(config-ap-profile)# bssid-stats bssid-stats-frequency 40	Sets the BSSID stats frequency timer. BSSID statistics frequency timer is in the range of 1 to 180 seconds.
<b>Step 5</b>	<b>bssid-neighbor-stats</b>  <b>Example:</b> Device(config-ap-profile)# [no] bssid-neighbor-stats	Enables BSSID neighbor statistics. Use the <b>no</b> form of the command to disable the feature.
<b>Step 6</b>	<b>bssid-neighbor-stats interval</b> <i>bssid-interval</i> <i>&lt;1-180&gt;</i>  <b>Example:</b> Device(config-ap-profile)# [no] bssid-neighbor-stats interval 50	Sets the interval at which BSSID neighbor statistics is sent from the AP. The BSSID neighbor stats interval is in the range of 1 to 180 seconds.

## Verifying BSSID Statistics on the Controller

To verify the BSSID statistics on the controller, use the following command:

- **show wireless stats ap name** *ap-name* **dot11 24ghz slot** *0* **wlan-id** *<wlan-id>* **statistics**

```

Device# show wireless stats ap name APXXXX.6DXX.58XX dot11 24ghz slot 0 wlan-id 18 stat

## CHAPTER 185

# Fastlane+

- [Information About Fastlane+, on page 2065](#)
- [Configuring an Fastlane+ on a WLAN \(CLI\), on page 2065](#)
- [Configuring an Fastlane+ on a WLAN \(GUI\), on page 2066](#)
- [Monitoring Fastlane+, on page 2066](#)
- [Verifying Fastlane+, on page 2067](#)

## Information About Fastlane+

IEEE 802.11ax allows scheduled access-based uplink transmissions by periodically collecting buffer status reports from clients. The Fastlane+ feature improves the effectiveness of estimating the uplink buffer status for clients, thereby enhancing the user experience for latency-sensitive applications. The Fastlane+ feature can be enabled or disabled on a per-WLAN basis. Support for this feature is indicated in the beacons and probe responses transmitted by an AP.

**Note** This feature works only if Protected Management Frame (PMF) is configured as optional or mandatory for a WLAN.

## Configuring an Fastlane+ on a WLAN (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wlan profile-name wlan-id SSID_Name</b>  <b>Example:</b>	Configures a WLAN and enters WLAN configuration submode.

	Command or Action	Purpose
	Device(config)# wlan wlan-test 3 ssid-test	<b>Note</b> If you have already configured a WLAN, enter the <b>wlan profile-name</b> command.
<b>Step 3</b>	<b>scheduler asr</b>  <b>Example:</b> Device(config-wlan)# scheduler asr	Configures Fastlane+ feature on a WLAN.

## Configuring an Fastlane+ on a WLAN (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Tags & Profiles > WLANs**.
  - Step 2** Select a WLAN.
  - Step 3** Click **Advanced** tab.
  - Step 4** Check the **Advanced Scheduling Requests Handling** check box to enable the feature on a per-WLAN basis.
  - Step 5** Click **Update & Apply to Device**.
- 

## Monitoring Fastlane+

### Procedure

- 
- Step 1** Choose **Monitoring > Wireless > Clients**.
  - Step 2** Click a client name from the client list.  
  
The **Client** window with multiple tabs is activated.
  - Step 3** Click **General** tab.
  - Step 4** Click **Client Statistics** tab.  
  
The most recent uplink latency statistics received from the client is displayed in the **Uplink Latency Distribution** section.
  - Step 5** Click **Client Properties** tab.  
  
The Fastlane+ feature-related client capabilities information is displayed at the bottom of the window.
-

## Verifying Fastlane+

The following example shows how to verify whether Fastlane+ is enabled or disabled for a WLAN:

```
Device# show wlan 2 | include ASR

Advanced Scheduling Requests Handling : Enabled
```

The following example shows how to verify Fastlane+ capability information and the most recent client uplink latency statistics:

```
Device# show wireless client mac-address f45c.89b0.xxxx detail
.
.
.
Regular ASR support: : ENABLED
Non-default Fastlane Profile: : Active
Range Voice Video Background Best-Effort

[0-20ms] 400 300 200 100
[20-40ms] 401 301 201 101
[40-100ms] 402 302 202 102
[>100ms] 403 303 203 103
```

The following example shows how to verify Fastlane+ statistics along with Fastlane+ capability and uplink latency statistics for all the Fastlane+ clients on a WLAN.

**Note** `show interfaces dot11radio asr-info all` is an AP command, and does not work on the controller.

```
Device# show interfaces Dot11Radio 1 asr-info all

# CHAPTER 186

## Workgroup Bridges

- [Cisco Workgroup Bridges, on page 2069](#)
- [Configuring Workgroup Bridge on a WLAN, on page 2072](#)
- [Verifying the Status of a Workgroup Bridge on the Controller, on page 2074](#)
- [Configuring Access Points as Workgroup Bridge, on page 2074](#)
- [Information About Simplifying WGB Configuration, on page 2089](#)
- [Configuring Multiple WGBs \(CLI\), on page 2090](#)
- [Verifying WGB Configuration, on page 2090](#)

## Cisco Workgroup Bridges

A workgroup bridge (WGB) is an Access Point (AP) mode to provide wireless connectivity to wired clients that are connected to the Ethernet port of the WGB AP. A WGB connects a wired network over a single wireless segment by learning the MAC addresses of its wired clients on the Ethernet interface and reporting them to the WLC through infrastructure AP using Internet Access Point Protocol (IAPP) messaging. The WGB establishes a single wireless connection to the root AP, which in turn, treats the WGB as a wireless client.

**Figure 53: Example of a WGB**

357624

Starting from Cisco IOS XE Cupertino 17.8.1, WGB is supported on the following Cisco Catalyst 9100 Series Access Points.

- Cisco Catalyst 9105
- Cisco Catalyst 9115
- Cisco Catalyst 9120

Starting from Cisco IOS XE Dublin 17.10.1, WGB is supported on the following Cisco Catalyst 9100 Series Access Points.

- Cisco Catalyst 9124
- Cisco Catalyst 9130

From Cisco IOS XE Cupertino 17.9.1 onwards, WGB supports one radio for uplink (backhaul) connectivity and another radio for serving wireless clients. This feature is supported on the Cisco 11AX APs such as Cisco Catalyst 9105 APs, Cisco Catalyst 9115 APs, Cisco Catalyst 9120 APs.

OPEN and PSK security (WPA2 Personal) based wireless clients can be associated to WGB independent of its uplink connectivity, but they will not be able to pass traffic unless WGB has uplink connectivity. Radius server must be configured and the WGB should have uplink connectivity for authentication of wireless clients to 802.1x security (WPA2 Enterprise) WLAN. Both IPv4 and IPv6 traffic forwarding is supported for wireless clients. Static IP and Passive Client support is enabled by default on these WLANs.

The following features are supported for use with a WGB:

**Table 147: WGB Feature Matrix**

Feature	Cisco Wave 1 APs	Cisco Wave 2 and 11AX APs
802.11r	Supported	Supported
QOS	Supported	Supported
UWGB mode	Supported	Supported on Wave 2 APs Not supported on 11AX APs
IGMP Snooping or Multicast	Supported	Supported
802.11w	Supported	Supported
PI support (without SNMP)	Supported	Not supported
IPv6	Supported	Supported
VLAN	Supported	Supported
802.11i (WPAv2)	Supported	Supported
Broadcast tagging/replicate	Supported	Supported
Unified VLAN client	Implicitly supported (No CLI required)	Supported
WGB client	Supported	Supported

Feature	Cisco Wave 1 APs	Cisco Wave 2 and 11AX APs
802.1x – PEAP, EAP-FAST, EAP-TLS	Supported	Supported
NTP	Supported	Supported
Wired client support on all LAN ports	Supported in Wired-0 and Wired-1 interfaces	Supported in all Wired-0, 1 and LAN ports 1, 2, and 3
Second radio wireless client support	Supported	Supported on Cisco 11AX APs only.

The following table shows the supported and unsupported authentication and switching modes for Cisco APs when connecting to a WGB.

**Note** Workgroup Bridge mode is supported on the WiFi6 Pluggable Module from Cisco IOS XE Bengaluru 17.6.1.

**Table 148: Supported Access Points and Requirements**

Access Points	Requirements
Cisco Aironet 2700, 3700, and 1572 Series	Requires autonomous image.
Cisco Aironet 2800, 3800, 4800, 1562, and Cisco Catalyst 9105, 9115, 9120, 9124, and 9130, IW6300 and ESW6300 Series	CAPWAP image starting from Cisco AireOS 8.8 release.

- MAC filtering is not supported for wired clients.
- Idle timeout is not supported for both WGB and wired clients.
- Session timeout is not applicable for wired clients.
- Web authentication is not supported.
- The total number of clients supported by WGB (wired + wireless) is limited to 20 clients.
- If you want to use a chain of certificates, copy all the CA certificates to a file and install it under a trust point on the WGB, else server certificate validation may fail.
- Wired clients connected to a WGB inherit the WGB's QoS and AAA override attributes.
- To enable the WGB to communicate with the root AP, create a WLAN and make sure that Aironet IE is enabled under the Advanced settings.
- WPA2 Enterprise security works only if the uplink WLAN is enabled for FlexConnect local switching or Fabric enabled WLAN.
- Radius override is not supported for wireless clients that are associated with WGB WLANs.
- WGB does not support dot1x wired client authentication when used with power injector.

The power-injector drops all EAPOL packets received from the wired client and does not forward it to the WGB's wired0 interface. In such cases, use PoE plus hub behind the wired0 interface and connect the wired clients to the hub.

- After WGB reload, the WGB dot1x wired clients behind a hub do not trigger authentication automatically, unless done manually.

After WGB is reloaded the WGB dot1x wired clients which are behind a hub remain authenticated or connected on their side and do not get notified that the WGB is reloaded. Clients are also not shown on the WGB bridge table. The client interfaces must be manually disabled and enabled back to trigger authentication.

- When the dot1x wired client Ethernet interface is disabled and then enabled again, client authentication might fail for some of dot1x wired clients, at times.

## Configuring Workgroup Bridge on a WLAN

Follow the procedure given below to configure a WGB on a WLAN:

For WGB to join a wireless network there are specific settings on the WLAN and on the related policy profile.

**Note** For the configuration given below, it is assumed that the WLAN security is already configured.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wlan profile-name</b> <b>Example:</b> Device(config)# wlan WGB_Test	Enters WLAN configuration submenu. The <i>profile-name</i> is the profile name of the configured WLAN.
<b>Step 3</b>	<b>ccx aironet-iesupport</b> <b>Example:</b> Device(config-wlan)# ccx aironet-iesupport	Configures the Cisco Client Extensions option and sets the support of Aironet IE on the WLAN.
<b>Step 4</b>	<b>exit</b> <b>Example:</b> Device(config-wlan)# exit	Exits the WLAN configuration submenu.
<b>Step 5</b>	<b>wireless profile policy profile-policy</b> <b>Example:</b>	Configures WLAN policy profile and enters the wireless policy configuration mode.

	Command or Action	Purpose
	Device(config)# wireless profile policy test-wgb	
<b>Step 6</b>	<b>description</b> <i>description</i> <b>Example:</b> Device(config-wireless-policy)# description "test-wgb"	Adds a description for the policy profile.
<b>Step 7</b>	<b>vlan</b> <i>vlan-no</i> <b>Example:</b> Device(config-wireless-policy)# vlan 48	Assigns the profile policy to the VLAN.
<b>Step 8</b>	<b>wgb vlan</b> <b>Example:</b> Device(config-wireless-policy)# wgb vlan	Configures WGB VLAN client support.
<b>Step 9</b>	<b>wgb broadcast-tagging</b> <b>Example:</b> Device(config-wireless-policy)# wgb broadcast-tagging	Configures WGB broadcast tagging on a WLAN.
<b>Step 10</b>	<b>no shutdown</b> <b>Example:</b> Device(config-wireless-policy)# no shutdown	Restarts the policy profile.
<b>Step 11</b>	<b>exit</b> <b>Example:</b> Device(config-wireless-policy)# exit	Exits the wireless policy configuration mode.
<b>Step 12</b>	<b>wireless tag policy</b> <i>policy-tag</i> <b>Example:</b> Device(config)# wireless tag policy WGB_Policy	Configures policy tag and enters policy tag configuration mode.
<b>Step 13</b>	<b>wlan</b> <i>profile-name</i> <b>policy</b> <i>profile-policy</i> <b>Example:</b> Device(config-policy-tag)# wlan WGB_Test policy test-wgb	Maps a policy profile to a WLAN profile.
<b>Step 14</b>	<b>end</b> <b>Example:</b> Device(config-policy-tag)# end	Exits policy tag configuration mode, and returns to privileged EXEC mode.

## Verifying the Status of a Workgroup Bridge on the Controller

Use the following commands to verify the status of a WGB.

To display the wireless-specific configuration of active clients, use the following command:

```
Device# show wireless client summary
```

To display the WGBs on your network, use the following command:

```
Device# show wireless wgb summary
```

To display the details of wired clients that are connected to a particular WGB, use the following command:

```
Device# show wireless wgb mac-address 00:0d:ed:dd:25:82 detail
```

## Configuring Access Points as Workgroup Bridge

### Turning Cisco Aironet 2700/3700/1572 Series AP into Autonomous Mode

#### Before you begin

Download the autonomous image for the specific access point from [software.cisco.com](http://software.cisco.com) and place it on a TFTP server.

#### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>debug capwap console cli</b>  <b>Example:</b> Device# debug capwap console cli	Enables the console CLI.
<b>Step 2</b>	<b>archive download-sw force-reload overwrite tftp:ipaddress filepath filename</b>  <b>Example:</b> Device(config)# archive download-sw force-reload overwrite tftp://10.10.10.1/tftp/c1800.tar	Downloads the autonomous image to the access point.

## Configuring Cisco Wave 2 APs or 11AX APs in Workgroup Bridge or CAPWAP AP Mode (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Device# enable	Enters in to the privileged mode of the AP.
<b>Step 2</b>	<b>ap-type workgroup-bridge</b> <b>Example:</b> Device# ap-type workgroup-bridge	Moves the AP in to the Workgroup Bridge mode.
<b>Step 3</b>	<b>configure ap address ipv4 dhcp</b> or <b>configure ap address ipv4 static</b> <i>ip-address netmask gateway-ipaddress</i> <b>Example:</b> DHCP IP Address Device# configure ap address ipv4 dhcp Static IP Address Device# configure ap address ipv4 static 10.10.10.2 255.255.255.234 192.168.4.1	Configures DHCP or Static IP address.
<b>Step 4</b>	<b>configure ap management add username username password password secret secret</b> <b>Example:</b> Device# configure ap management add username xyz-user password ***** secret cisco	Configures an username for the AP management.
<b>Step 5</b>	<b>configure ap hostname</b> <i>host-name</i> <b>Example:</b> Device# configure ap hostname xyz-host	Configures the AP hostname.

## Configure an SSID Profile for Cisco Wave 2 and 11AX APs (CLI)

This procedure is an AP procedure. The CLIs listed in the procedure given below work only on the AP console and not on the controller.

## Procedure

	Command or Action	Purpose
<b>Step 1</b>	<p><b>configure ssid-profile</b> <i>ssid-profile-name</i> <b>ssid</b> <i>radio-serv-name</i> <b>authentication</b> {<b>open</b>   <b>psk</b> <i>preshared-key</i> <b>key-management</b> {<b>dot11r</b>   <b>wpa2</b>   <b>dot11w</b>   {<b>optional</b>   <b>required</b> }}}   <b>eap</b> <i>profile</i> <i>eap-profile-name</i> <b>key-management</b> {<b>dot11r</b>   <b>wpa2</b>   <b>dot11w</b>   {<b>optional</b>   <b>required</b>}}</p> <p><b>Example:</b></p> <p>SSID profile with open authentication.</p> <pre>Device# configure ssid-profile test WRT s1 authentication open</pre> <p>SSID profile with PSK authentication.</p> <pre>Device# configure ssid-profile test WRT s1 authentication psk 1234 key-management dot11r optional</pre> <p>SSID profile with EAP authentication.</p> <pre>Device# configure ssid-profile test WRT s1 authentication eap profile test2 key-management dot11r optional</pre>	Choose an authentication protocol (Open, PSK, or EAP) for the SSID profile.
<b>Step 2</b>	<p><b>configure dot11radio</b> <i>radio-interface</i> <b>mode</b> <i>wgb</i> <b>ssid-profile</b> <i>profile-name</i></p> <p><b>Example:</b></p> <pre>Device# configure dot11radio r1 mode wgb ssid-profile doc-test</pre>	Attaches an SSID profile to a radio interface.
<b>Step 3</b>	<p><b>configure ssid-profile</b> <i>profile-name</i> <b>ssid</b> <i>ssid-name</i> <b>dtim-period</b> <i>value in beacon intervals</i></p> <p><b>Example:</b></p> <pre>Device# configure ssid-profile test ssid s1 dtim-period 50</pre>	Configures the DTIM period. <b>Note</b> This command is supported for wireless clients from Cisco IOS XE Cupertino 17.9.1 onwards.
<b>Step 4</b>	<p><b>configure qos profile</b> <i>qos-profile-name</i> {<b>bronze</b>   <b>gold</b>   <b>platinum</b>   <b>silver</b>}</p> <p><b>Example:</b></p> <pre>Device# configure qos profile qos-profile gold</pre>	Creates a gold QoS profile.
<b>Step 5</b>	<p><b>configure ssid-profile</b> <i>profile-name</i> <b>ssid</b> <i>ssid-name</i> <b>qos profile</b> <i>qos-profile-name</i></p> <p><b>Example:</b></p> <pre>Device# configure ssid-profile test ssid s1 qos profile qos-profile</pre>	Maps the QoS profile to the SSID profile. <b>Note</b> This command is supported for wireless clients from Cisco IOS XE Cupertino 17.9.1 onwards.

	Command or Action	Purpose
<b>Step 6</b>	<b>configure ssid-profile</b> <i>profile-name</i> <b>delete</b>  <b>Example:</b> Device# configure ssid-profile doc-test delete	(Optional) Deletes an SSID profile.
<b>Step 7</b>	<b>show wgb ssid</b>  <b>Example:</b> Device# show wgb ssid	(Optional) Displays summary of configured and connected SSIDs.
<b>Step 8</b>	<b>show wgb packet statistics</b>  <b>Example:</b> Device# show wgb packet statistics	(Optional) Displays management, control, and data packet statistics.

## Configuring the Authentication Server (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure radius authentication</b> <primary   secondary> <b>add</b> <ipv4 ipv6> <b>address</b> <i>radius-server-ip-address</i> <b>port</b> <i>radius-server-port-number</i> <b>secret</b> <i>radius-secret</i>  <b>Example:</b> Device# configure radius authentication primary add ipv4 192.168.1.2 port 1812 secret Cisco123	Configures a primary and (or) secondary radius server with an IPv4 or IPv6 IP, port, and secret.

## Configuring a Dot1X Credential (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure dot1x credential</b> <i>profile-name</i> <b>username</b> <i>name</i> <b>password</b> <i>password</i>  <b>Example:</b> Device# configure dot1x credential test1 username XYZ password *****	Configures a dot1x credential.
<b>Step 2</b>	<b>configure dot1x credential</b> <i>profile-name</i> <b>delete</b>  <b>Example:</b> Device# configure dot1x credential test1 delete	Removes a dot1x profile.

	Command or Action	Purpose
<b>Step 3</b>	<b>clear wgb client</b> {all   single <i>mac-addr</i> }  <b>Example:</b> Device# clear wgb client single xxxx.xxxx.xxxx.xxxx	Deauthenticates a WGB client.

## Configuring an EAP Profile (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure eap-profile</b> <i>profile-name</i> <b>method</b> {fast   leap   peap   tls}  <b>Example:</b> Device# configure eap-profile test-eap method fast	Configures an EAP profile.
<b>Step 2</b>	<b>configure eap-profile</b> <i>profile-name</i> <b>trustpoint</b> <b>default</b> or <b>configure eap-profile</b> <i>profile-name</i> <b>trustpoint name</b> <i>trustpoint-name</i>  <b>Example:</b> EAP Profile to Trustpoint with MIC Certificate. Device# configure eap-profile test-eap trustpoint default  EAP Profile to Trustpoint with CA Certificate. Device# configure eap-profile test-eap trustpoint cisco	Configures an EAP profile with a trustpoint.
<b>Step 3</b>	<b>configure eap-profile</b> <i>profile-name</i> <b>trustpoint</b> {default   name <i>trustpoint-name</i> }  <b>Example:</b> Device# configure eap-profile test-eap trustpoint default	Attaches the CA trustpoint.  <b>Note</b> With the default profile, WGB uses the internal MIC certificate for authentication.
<b>Step 4</b>	<b>configure eap-profile</b> <i>profile-name</i> <b>dot1x-credential</b> <i>profile-name</i>  <b>Example:</b> Device# configure eap-profile test-eap dot1x-credential test-profile	Configures the 802.1X credential profile.
<b>Step 5</b>	<b>configure eap-profile</b> <i>profile-name</i> <b>delete</b>  <b>Example:</b> Device# configure eap-profile test-eap delete	(Optional) Deletes an EAP profile.

	Command or Action	Purpose
<b>Step 6</b>	<b>show wgb eap dot1x credential profile</b> <b>Example:</b> Device# show wgb eap dot1x credential profile	(Optional) Displays the WGB EAP dot1x profile summary.
<b>Step 7</b>	<b>show wgb eap profile</b> <b>Example:</b> Device# show wgb eap profile	(Optional) Displays the EAP profile summary.
<b>Step 8</b>	<b>show wgb eap profile all</b> <b>Example:</b> Device# show wgb eap profile all	(Optional) Displays the EAP and dot1x profiles.

## Configuring Manual-Enrollment of a Trustpoint for Workgroup Bridge (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure crypto pki trustpoint</b> <i>ca-server-name</i> <b>enrollment terminal</b> <b>Example:</b> Device# configure crypto pki trustpoint ca-server-US enrollment terminal	Configures a trustpoint in WGB.
<b>Step 2</b>	<b>configure crypto pki trustpoint</b> <i>ca-server-name</i> <b>authenticate</b> <b>Example:</b> Device# configure crypto pki trustpoint ca-server-US authenticate	Authenticates a trustpoint manually. Enter the base 64 encoded CA certificate and end the certificate by entering <b>quit</b> in a new line.
<b>Step 3</b>	<b>configure crypto pki trustpoint</b> <i>ca-server-name</i> <b>key-size</b> <i>key-length</i> <b>Example:</b> Device# configure crypto pki trustpoint ca-server-US key-size 60	Configures a private key size.
<b>Step 4</b>	<b>configure crypto pki trustpoint</b> <i>ca-server-name</i> <b>subject-name</b> <i>name</i> <i>[2ltr-country-code  state-name  locality</i> <i> org-name  org-unit  email]</i> <b>Example:</b>	Configures the subject name.

	Command or Action	Purpose
	Device# configure crypto pki trustpoint ca-server-US subject-name test US CA abc cisco AP test@cisco.com	
<b>Step 5</b>	<b>configure crypto pki trustpoint</b> <i>ca-server-name enrol</i>  <b>Example:</b> Device# configure crypto pki trustpoint ca-server-US enroll	Generates a private key and Certificate Signing Request (CSR).  Afterwards, create the digitally signed certificate using the CSR output in the CA server.
<b>Step 6</b>	<b>configure crypto pki trustpoint</b> <i>ca-server-name import certificate</i>  <b>Example:</b> Device# configure crypto pki trustpoint ca-server-US import certificate	Import the signed certificate in WGB.  Enter the base 64 encoded CA certificate and end the certificate by using <b>quit</b> command in a new line.
<b>Step 7</b>	<b>configure crypto pki trustpoint</b> <i>ca-server-name delete</i>  <b>Example:</b> Device# configure crypto pki trustpoint ca-server-US delete	(Optional) Delete a trustpoint.
<b>Step 8</b>	<b>show crypto pki trustpoint</b>  <b>Example:</b> Device# show crypto pki trustpoint	(Optional) Displays the trustpoint summary.
<b>Step 9</b>	<b>show crypto pki trustpoint</b> <i>trustpoint-name certificate</i>  <b>Example:</b> Device# show crypto pki trustpoint ca-server-US certificate	(Optional) Displays the content of the certificates that are created for a trustpoint.

## Configuring Auto-Enrollment of a Trustpoint for Workgroup Bridge (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure crypto pki trustpoint</b> <i>ca-server-name enrollment url ca-server-url</i>  <b>Example:</b> Device# configure crypto pki trustpoint	Enrolls a trustpoint in WGB using the server URL.

	Command or Action	Purpose
	<pre>ca-server-US enrollment url https://cisco/certsrv</pre>	
<b>Step 2</b>	<p><b>configure crypto pki trustpoint</b>  <i>ca-server-name</i> <b>authenticate</b></p> <p><b>Example:</b></p> <pre>Device# configure crypto pki trustpoint ca-server-US authenticate</pre>	Authenticates a trustpoint by fetching the CA certificate from CA server automatically.
<b>Step 3</b>	<p><b>configure crypto pki trustpoint</b>  <i>ca-server-name</i> <b>key-size</b> <i>key-length</i></p> <p><b>Example:</b></p> <pre>Device# configure crypto pki trustpoint ca-server-US key-size 60</pre>	Configures a private key size.
<b>Step 4</b>	<p><b>configure crypto pki trustpoint</b>  <i>ca-server-name</i> <b>subject-name</b> <i>name</i>  [<i>2ltr-country-code</i>  <i>state-name</i>  <i>locality</i>   <i>org-name</i>  <i>org-unit</i>  <i>email</i> ]</p> <p><b>Example:</b></p> <pre>Device# configure crypto pki trustpoint ca-server-US subject-name test US CA abc cisco AP test@cisco.com</pre>	Configures the subject name.
<b>Step 5</b>	<p><b>configure crypto pki trustpoint</b>  <i>ca-server-name</i> <b>enroll</b> <i>l</i></p> <p><b>Example:</b></p> <pre>Device# configure crypto pki trustpoint ca-server-US enroll</pre>	Enrolls the trustpoint.  Request the digitally signed certificate from the CA server.
<b>Step 6</b>	<p><b>configure crypto pki trustpoint</b>  <i>ca-server-name</i> <b>auto-enroll enable</b>  <i>renew-percentage</i></p> <p><b>Example:</b></p> <pre>Device# configure crypto pki trustpoint ca-server-US auto-enroll enable 10</pre>	Enables auto-enroll of the trustpoint.  You can disable auto-enrolling by using the <b>disable</b> option in the command.
<b>Step 7</b>	<p><b>configure crypto pki</b>  <b>trustpoint</b><i>trustpoint-name</i> <b>delete</b></p> <p><b>Example:</b></p> <pre>Device# configure crypto pki trustpoint ca-server-US delete</pre>	(Optional) Deletes a trustpoint.

	Command or Action	Purpose
<b>Step 8</b>	<b>show crypto pki trustpoint</b>  <b>Example:</b> Device# show crypto pki trustpoint	(Optional) Displays the trustpoint summary.
<b>Step 9</b>	<b>show crypto pki trustpoint</b> <i>trustpoint-name</i> <b>certificate</b>  <b>Example:</b> Device# show crypto pki trustpoint ca-server-US certificate	(Optional) Displays the content of the certificates that are created for a trustpoint.
<b>Step 10</b>	<b>show crypto pki timers</b>  <b>Example:</b> Device# show crypto pki timers	(Optional) Displays the PKI timer information.

## Configuring Manual Certificate Enrolment Using TFTP Server (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure crypto pki trustpoint</b> <i>ca-server-name</i> <b>enrollment tftp</b> <i>addr/file-name</i>  <b>Example:</b> Device# configure crypto pki trustpoint  ca-server-US enrollment tftp://10.8.0.6/all_cert.txt	Specifies the enrolment method to retrieve the CA certificate and client certificate for a trustpoint in WGB.
<b>Step 2</b>	<b>configure crypto pki trustpoint</b> <i>ca-server-name</i> <b>authenticate</b>  <b>Example:</b> Device# configure crypto pki trustpoint  ca-server-US authenticate	Retrieves the CA certificate and authenticates it from the specified TFTP server. If the file specification is included, the wgb will append the extension “.ca” to the specified filename.
<b>Step 3</b>	<b>configure crypto pki trustpoint</b> <i>ca-server-name</i> <b>key-size</b> <i>key-length</i>  <b>Example:</b> Device# configure crypto pki trustpoint  ca-server-Us key-size 60	Configures a private key size.
<b>Step 4</b>	<b>configure crypto pki trustpoint</b> <i>ca-server-name</i> <b>subject-name</b> <i>name</i> [ <i>2ltr-country-code</i>   <i>state-name</i>   <i>locality</i>   <i>org-name</i>   <i>org-unit</i>   <i>email</i> ]	Configures the subject name.

	Command or Action	Purpose
	<b>Example:</b> <pre>Device# configure crypto pki trustpoint ca-server-US subject-name test US CA abc cisco AP test@cisco.com</pre>	
<b>Step 5</b>	<b>configure crypto pki trustpoint</b> <i>ca-server-name</i> <b>enrol</b>  <b>Example:</b> <pre>Device# configure crypto pki trustpoint ca-server-US enroll</pre>	Generate a private key and Certificate Signing Request (CSR) and writes the request out to the TFTP server. The filename to be written is appended with the extension “.req”.
<b>Step 6</b>	<b>configure crypto pki trustpoint</b> <i>ca-server-name</i> <b>import certificate</b>  <b>Example:</b> <pre>Device# configure crypto pki trustpoint ca-server-US import certificate</pre>	Import the signed certificate in WGB using TFTP at the console terminal, which retrieves the granted certificate.  The WGB will attempt to retrieve the granted certificate using TFTP using the same filename and the file name append with “.crt” extension.
<b>Step 7</b>	<b>show crypto pki trustpoint</b>  <b>Example:</b> <pre>Device# show crypto pki trustpoint</pre>	(Optional) Displays the trustpoint summary.
<b>Step 8</b>	<b>show crypto pki trustpoint</b> <i>trustpoint-name</i> <b>certificate</b>  <b>Example:</b> <pre>Device# show crypto pki trustpoint ca-server-US certificate</pre>	(Optional) Displays the content of the certificates that are created for a trustpoint.

## Importing the PKCS12 Format Certificates from the TFTP Server (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure crypto pki trustpoint</b> <i>ca-server-name</i> <b>import pkcs12 tftp</b> <i>addr/file-name</i> <b>password</b> <i>pwd</i>  <b>Example:</b> <pre>Device# configure crypto pki trustpoint ca-server-US enrollment tftp://10.8.0.6/all_cert.txt password *****</pre>	Imports PKCS12 format certificate from the TFTP server.
<b>Step 2</b>	<b>show crypto pki trustpoint</b>  <b>Example:</b>	(Optional) Displays the trustpoint summary.

	Command or Action	Purpose
	Device# show crypto pki trustpoint	
<b>Step 3</b>	<b>show crypto pki trustpoint <i>trustpoint-name</i> certificate</b>  <b>Example:</b> Device# show crypto pki trustpoint ca-server-US certificate	(Optional) Displays the content of the certificates that are created for a trustpoint.

## Configuring Radio Interface for Workgroup Bridges (CLI)

From the available two radio interfaces, before configuring WGB or UWGB mode on one radio interface, configure the other radio interface to root AP mode.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure dot11radio <i>radio-int</i> mode root-ap</b>  <b>Example:</b> Device# configure dot11Radio 0/3/0 mode root-ap	Maps a radio interface as root AP.  <b>Note</b> When an active SSID or EAP profile is modified, you need to reassociate the profile to the radio interface for the updated profile to be active.
<b>Step 2</b>	<b>configure dot11Radio &lt;0 1&gt; wlan add <i>ssid-profile-name</i> <i>ssid-number</i></b>  <b>Example:</b> Device# configure dot11radio 1 wlan add ssid-profile-name ssid-number	Configures the WLAN at the root AP mode radio. Enter the SSID profile name and SSID number between 1 and 16.
<b>Step 3</b>	<b>configure dot11Radio &lt;0 1&gt; wlan delete <i>ssid-profile-name</i></b>  <b>Example:</b> Device# configure dot11radio 1 wlan delete ssid-profile-name	Deletes WLAN from the radio configuration. Enter the SSID profile name.
<b>Step 4</b>	<b>configure dot11Radio &lt;0 1&gt; channel <i>channel-number</i> <i>width</i></b>  <b>Example:</b> Device# configure dot11radio 1 channel 36 80	Configures a radio channel to broadcast the SSID. The channel numbers are between 1 and 173. The channel width values are 20, 40, 80, and 160.

	Command or Action	Purpose
		<p><b>Note</b></p> <ul style="list-style-type: none"> <li>• Only 20MHz channel width is supported on radio 0 (2.4-GHz band).</li> <li>• If radar is detected on a configured channel on radio 1, then the channel automatically changes to a non-DFS channel with a channel width of 20MHz. The administrator must reset the radio to bring it back to the configured channel.</li> </ul>
<b>Step 5</b>	<p><b>configure dot11Radio</b> &lt;0 1&gt; <b>beacon-period</b> <i>beacon-interval</i></p> <p><b>Example:</b></p> <pre>Device# configure dot11radio 1 beacon-period 120</pre>	Configures the periodic beacon interval in milli-seconds. The value range is between 2 and 2000 milli-seconds.
<b>Step 6</b>	<p><b>configure dot11Radio</b> <i>radio-int</i> <b>mode wgb</b> <b>ssid-profile</b> <i>ssid-profile-name</i></p> <p><b>Example:</b></p> <pre>Device# configure dot11Radio 0/3/0 mode wgb ssid-profile bgl18</pre>	Maps a radio interface to a WGB SSID profile.
<b>Step 7</b>	<p><b>configure dot11Radio</b> <i>radio-int</i> <b>mode uwgb</b> <b>mac-addr</b> <b>ssid-profile</b> <i>ssid-profile-name</i></p> <p><b>Example:</b></p> <pre>Device# configure dot11Radio 0/3/0 mode uwgb 0042.5AB6.0EF0 ssid-profile bgl18</pre>	Maps a radio interface to a WGB SSID profile.
<b>Step 8</b>	<p><b>configure dot11Radio</b> <i>radio-int</i> {<b>enable</b> <b>disable</b>}</p> <p><b>Example:</b></p> <pre>Device# configure dot11Radio 0/3/0 mode enable</pre>	<p>Configures a radio interface.</p> <p><b>Note</b> After configuring the uplink to the SSID profile, we recommend that you disable and enable the radio for the changes to be active.</p>
<b>Step 9</b>	<p><b>configure dot11Radio</b> <i>radio-int</i> <b>antenna</b> {<b>a-antenna</b>   <b>ab-antenna</b>   <b>abc-antenna</b>   <b>abcd-antenna</b>}</p> <p><b>Example:</b></p> <pre>Device# configure dot11Radio 0/3/0 antenna a-antenna</pre>	Configures a radio antenna.
<b>Step 10</b>	<p><b>configure dot11Radio</b> <i>radio-int</i> <b>encryption</b> <b>mode ciphers</b> <b>aes-ccm</b> {</p> <p><b>Example:</b></p>	Configures the radio interface.

	Command or Action	Purpose
	Device# configure dot11Radio radio-int encryption mode ciphers aes-ccm	
<b>Step 11</b>	<b>configure wgb mobile rate</b> {basic 6 9 18 24 36 48 54   mcs mcs-rate}  <b>Example:</b> Device# configure wgb mobile rate basic 6 9 18 24 36 48 54	Configures the device channel rate.
<b>Step 12</b>	<b>configure wgb mobile period</b> <i>secondsthres-signal</i>  <b>Example:</b> Device# configure wgb mobile period 30 -50	Configure the threshold duration and signal strength to trigger scanning.
<b>Step 13</b>	<b>configure wgb mobile station interface</b> <b>dot11Radio</b> <i>radio-int scan channel-number</i> <b>add</b>  <b>Example:</b> Device# configure wgb mobile station interface dot11Radio 0/3/0 scan 2 add	Configures the static roaming channel.
<b>Step 14</b>	<b>configure wgb mobile station interface</b> <b>dot11Radio</b> <i>radio-int scan channel-number</i> <b>delete</b>  <b>Example:</b> Device# configure wgb mobile station interface dot11Radio 0/3/0 scan 2 delete	(Optional) Delete the mobile channel.
<b>Step 15</b>	<b>configure wgb mobile station interface</b> <b>dot11Radio</b> <i>radio-int scan disable</i>  <b>Example:</b> Device# configure wgb mobile station interface dot11Radio 0/3/0 scan disable	(Optional) Disable the mobile channel.
<b>Step 16</b>	<b>configure wgb beacon miss-count</b> <i>value</i>  <b>Example:</b> Device# configure wgb beacon miss-count 12	(Optional) Configure the beacon miss-count. By default, this is set to disabled.  <b>Note</b> When you set the beacon miss-count value to 10 or lower, then the beacon miss-count gets disabled. Set the value to 11 or higher to enable this function.
<b>Step 17</b>	<b>show wgb wifi</b> <i>wifi-interface stats</i>  <b>Example:</b> Device# show wgb wifi 0/3/0 stats	(Optional) Displays the Wi-Fi station statistics.

	Command or Action	Purpose
<b>Step 18</b>	<b>show controllers dot11Radio radio-interface antenna</b>  <b>Example:</b> Device# show controllers dot11Radio 0/3/0 antenna	(Optional) Displays the radio antenna statistics.
<b>Step 19</b>	<b>show wgb mobile scan channel</b>  <b>Example:</b> Device# show wgb mobile scan channel	(Optional) Displays the mobile station channels scan configuration.
<b>Step 20</b>	<b>show configuration</b>  <b>Example:</b> Device# show configuration	(Optional) Displays the configuration that is stored in the NV memory.
<b>Step 21</b>	<b>show running-config</b>  <b>Example:</b> Device# show running-config	(Optional) Displays the running configuration in the device.

## Configuring Workgroup Bridge Timeouts (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure wgb association response timeout response-millisecs</b>  <b>Example:</b> Device# configure wgb association response timeout 4000	Configures the WGB association response timeout. The default value is 5000 milliseconds. The valid range is between 300 and 5000 milliseconds.
<b>Step 2</b>	<b>configure wgb authentication response timeout response-millisecs</b>  <b>Example:</b> Device# configure wgb authentication response timeout 4000	Configures the WGB authentication response timeout. The default value is 5000 milliseconds. The valid range is between 300 and 5000 milliseconds.
<b>Step 3</b>	<b>configure wgb uclient timeout timeout-secs</b>  <b>Example:</b> Device# configure wgb uclient timeout 70	Configure the Universal WGB client response timeout. The default timeout value is 60 seconds. The valid range is between 1 and 65535 seconds..
<b>Step 4</b>	<b>configure wgb eap timeout timeout-secs</b>  <b>Example:</b> Device# configure wgb eap timeout 20	Configures the WGB EAP timeout. The default timeout value is 3 seconds. The valid range is between 2 and 60 seconds.

	Command or Action	Purpose
<b>Step 5</b>	<b>configure wgb channel scan timeout</b> {fast medium   slow}  <b>Example:</b> Device# configure wgb channel scan timeout slow	Configures the WGB channel scan timeout.
<b>Step 6</b>	<b>configure wgb dhcp response timeout</b> <i>timeout-secs</i>  <b>Example:</b> Device# configure wgb dhcp response timeout 70	Configures the WGB DHCP response timeout. The default value is 60 seconds. The valid range is between 1000 and 60000 milliseconds.
<b>Step 7</b>	<b>show wgb dot11 association</b>  <b>Example:</b> Device# show wgb dot11 association	Displays the WGB association summary.

## Configuring Bridge Forwarding for Workgroup Bridge (CLI)

### Before you begin

The Cisco Wave 2 and 11AX APs as Workgroup Bridge recognizes the Ethernet clients only when the traffic has the bridging tag.

We recommend setting the WGB bridge client timeout value to default value of 300 seconds, or less in environment where change is expected, such as:

- Ethernet cable is unplugged and plugged back.
- Endpoint is changed.
- Endpoint IP is changed (static to DHCP and vice versa).

If you need to retain the client entry in the WGB table for a longer duration, we recommend you increase the client WGB bridge timeout duration.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure wgb bridge client add</b> <i>mac-address</i>  <b>Example:</b> Device# configure wgb bridge client add F866.F267.7DFB-	Adds a WGB client using the MAC address.
<b>Step 2</b>	<b>configure wgb bridge client timeout</b> <i>timeout-secs</i>  <b>Example:</b>	Configures the WGB bridge client timeout. Default timeout value is 300 seconds. The valid range is between 10 and 1000000 seconds.

	Command or Action	Purpose
	Device# configure wgb bridge client timeout 400	
<b>Step 3</b>	<b>show wgb bridge</b>  <b>Example:</b> Device# show wgb bridge	Displays the WGB wired clients over the bridge.
<b>Step 4</b>	<b>show wgb bridge wired gigabitEthernet interface</b>  <b>Example:</b> Device# show wgb bridge wired gigabitEthernet 0/1	Displays the WGB Gigabit wired clients over the bridge.
<b>Step 5</b>	<b>show wgb bridge dot11Radio interface-number</b>  <b>Example:</b> Device# show wgb bridge dot11Radio 0/3/1	Displays the WGB bridge radio interface summary.

## Information About Simplifying WGB Configuration

From Cisco IOS XE Cupertino 17.8.1, it is possible to configure WGB in multiple Cisco access points (APs) simultaneously. By importing a running configuration, you can deploy multiple WGBs in a network and make them operational quicker. When new Cisco APs are added to the network, you can transfer an existing or working configuration to the new Cisco APs to make them operational. This enhancement eliminates the need to configure multiple Cisco APs using CLIs, after logging into them.

A network administrator can onboard Cisco APs using either of the following methods:

- Upload the working configuration from an existing Cisco AP to a server and download it to the newly deployed Cisco APs.
- Send a sample configuration to all the Cisco APs in the deployment.

This feature is supported only on the following Cisco APs:

- Cisco Aironet 1562 Access Points
- Cisco Aironet 2800 Access Points
- Cisco Aironet 3800 Access Points
- Cisco Catalyst 9105 Access Points
- Cisco Catalyst 9115 Access Points
- Cisco Catalyst 9120 Access Points
- Cisco Catalyst IW6300 Series Heavy Duty Access Points

For latest support information on various features in Cisco Wave 2 and 802.11ax (Wi-Fi 6) Access Points in Cisco IOS XE releases, see the [Feature Matrix for Wave 2 and 802.11ax \(Wi-Fi 6\) Access Points](#) document.

## Configuring Multiple WGBs (CLI)

Perform the following procedure on the APs in WGB mode.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b>  <b>Example:</b> Device# enable	Enters privileged EXEC mode.
<b>Step 2</b>	<b>copy configuration upload {sftp  tftp:}</b> <i>ip-address [directory] [file-name]</i>  <b>Example:</b> Device# copy configuration upload sftp: 10.10.10.1 C:sample.txt	Creates upload configuration file and uploads to the SFTP or TFTP server using the specified path.
<b>Step 3</b>	<b>copy configuration download {sftp  tftp:}</b> <i>ip-address [directory] [file-name]</i>  <b>Example:</b> Device# copy configuration download sftp: 10.10.10.1 C:sample.txt	Downloads the configuration file and replaces the old configuration in the AP and reboots the WGB. When the device restarts, new configuration is applied.
<b>Step 4</b>	<b>show wgb dot11 association</b>  <b>Example:</b> Device# show wgb dot11 association	Lists the WGB uplink information.
<b>Step 5</b>	<b>show version</b>  <b>Example:</b> Device# show version	Displays the AP software information.

## Verifying WGB Configuration

After completing the configuration download and reboot of the AP, the WGB rejoins the network. Use the **show logging** command to list and verify the download events that are captured in the debug logs:

```
Device# show logging
```

```

## CHAPTER 187

# Peer-to-Peer Client Support

---

- [Information About Peer-to-Peer Client Support, on page 2093](#)
- [Configure Peer-to-Peer Client Support, on page 2093](#)

## Information About Peer-to-Peer Client Support

Peer-to-peer client support can be applied to individual WLANs, with each client inheriting the peer-to-peer blocking setting of the WLAN to which it is associated. The peer-to-Peer Client Support feature provides a granular control over how traffic is directed. For example, you can choose to have traffic bridged locally within a device, dropped by a device, or forwarded to the upstream VLAN.

Peer-to-peer blocking is supported for clients that are associated with local and central switching WLANs.

### Restrictions

- Peer-to-peer blocking does not apply to multicast traffic.
- Peer-to-peer blocking is not enabled by default.
- In FlexConnect, peer-to-peer blocking configuration cannot be applied only to a particular FlexConnect AP or a subset of APs. It is applied to all the FlexConnect APs that broadcast the SSID.
- FlexConnect central switching clients supports peer-to-peer upstream-forward. However, this is not supported in the FlexConnect local switching. This is treated as peer-to-peer drop and client packets are dropped.

FlexConnect central switching clients supports peer-to-peer blocking for clients associated with different APs. However, for FlexConnect local switching, this solution targets only clients connected to the same AP. FlexConnect ACLs can be used as a workaround for this limitation.

## Configure Peer-to-Peer Client Support

Follow the procedure given below to configure Peer-to-Peer Client Support:

## Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wlan <i>profile-name</i></b> <b>Example:</b> Device(config)# wlan wlan1	Enters WLAN configuration submenu. The <i>profile-name</i> is the profile name of the configured WLAN.
<b>Step 3</b>	<b>peer-blocking [allow-private-group   drop   forward-upstream]</b> <b>Example:</b> Device(config-wlan)# peer-blocking drop	Configures peer to peer blocking parameters. The keywords are as follows: <ul style="list-style-type: none"> <li>• <b>allow-private-group</b>—Enables peer-to-peer blocking on the Allow Private Group action.</li> <li>• <b>drop</b>—Enables peer-to-peer blocking on the drop action.</li> <li>• <b>forward-upstream</b>—No action is taken and forwards packets to the upstream.</li> </ul> <p><b>Note</b> The <b>forward-upstream</b> option is not supported for Flex local switching. Traffic is dropped even if this option is configured. Also, peer to peer blocking for local switching SSIDs are available only for the clients on the same AP.</p>
<b>Step 4</b>	<b>end</b> <b>Example:</b> Device(config)# end	Returns to privileged EXEC mode.
<b>Step 5</b>	<b>show wlan id <i>wlan-id</i></b> <b>Example:</b> Device# show wlan id 12	Displays the details of the selected WLAN.

## CHAPTER 188

# Deny Wireless Client Session Establishment Using Calendar Profiles

---

- [Information About Denial of Wireless Client Session Establishment, on page 2095](#)
- [Configuring Daily Calendar Profile, on page 2096](#)
- [Configuring Weekly Calendar Profile, on page 2097](#)
- [Configuring Monthly Calendar Profile, on page 2098](#)
- [Mapping a Daily Calendar Profile to a Policy Profile, on page 2099](#)
- [Mapping a Weekly Calendar Profile to a Policy Profile, on page 2100](#)
- [Mapping a Monthly Calendar Profile to a Policy Profile, on page 2101](#)
- [Verifying Calendar Profile Configuration, on page 2102](#)
- [Verifying Policy Profile Configuration, on page 2102](#)

## Information About Denial of Wireless Client Session Establishment

Denial of client session establishment feature allows the controller to stop client session establishment based on a particular time. This helps control the network in efficient and controlled manner without any manual intervention.

In Cisco Catalyst 9800 Series Wireless Controller , you can deny the wireless client session based on the following recurrences:

- Daily
- Weekly
- Monthly

The Calendar Profiles created are then mapped to the policy profile. By attaching the calendar profile to a policy profile, you will be able to create different recurrences for the policy profile using different policy tag.

**Note** You need to create separate Calendar Profile for Daily, Weekly, and Monthly sub-categories.

The following is the workflow for denial of wireless client session establishment feature:

- Create a calendar profile.
- Apply the calendar profile to a policy profile.

**Note** A maximum of 100 calendar profile configuration and 5 calendar profile association to policy profile is supported.

### Points to Remember

If you boot up your controller, the denial of client session establishment feature kicks in after a minute from the system boot up.

If you change the system time after the calendar profile is associated to a policy profile, you can expect a maximum of 30 second delay to adapt to the new clock timings.

**Note** You cannot use the **no action deny-client** command to disable action while associating the calendar profile to a policy profile.

If you want to disable the action command, you need to disassociate the calendar profile from the policy profile, and re-configure again.

## Configuring Daily Calendar Profile

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wireless profile calendar-profile name name</b>  <b>Example:</b> Device(config)# wireless profile calendar-profile name daily_calendar_profile	Configures a calendar profile.  Here, <i>name</i> refers to the name of the calendar profile.
<b>Step 3</b>	<b>start start_time end end_time</b>  <b>Example:</b>	Configures start and end time for the calendar profile.

	Command or Action	Purpose
	Device(config-calendar-profile)# start 09:00:00 end 17:00:00	Here,  <i>start_time</i> is the start time for the calendar profile. You need to enter start time in <b>HH:MM:SS</b> format.  <i>end_time</i> is the end time for the calendar profile. You need to enter end time in <b>HH:MM:SS</b> format.
<b>Step 4</b>	<b>recurrence daily</b>  <b>Example:</b> Device(config-calendar-profile)# recurrence daily	Configures daily recurrences for a calendar profile.
<b>Step 5</b>	<b>end</b>  <b>Example:</b> Device(config-calendar-profile)# end	Returns to privileged EXEC mode.  Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.  <b>Note</b> When the calendar profile kicks in, the AP power profile rules (for example, radio state and USB device state) that are defined for the Ethernet speed are not applied and continue to be as per the fixed power profile.

## Configuring Weekly Calendar Profile

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wireless profile calendar-profile name name</b>  <b>Example:</b> Device(config)# wireless profile calendar-profile name weekly_calendar_profile	Configures a calendar profile.  Here,  <i>name</i> refers to the name of the calendar profile.
<b>Step 3</b>	<b>start start_time end end_time</b>  <b>Example:</b> Device(config-calendar-profile)# start 18:00:00 end 19:00:00	Configures start and end time for the calendar profile.  Here,

	Command or Action	Purpose
		<p><i>start_time</i> is the start time for the calendar profile. You need to enter start time in <b>HH:MM:SS</b> format.</p> <p><i>end_time</i> is the end time for the calendar profile. You need to enter end time in <b>HH:MM:SS</b> format.</p>
<b>Step 4</b>	<p><b>recurrence weekly</b></p> <p><b>Example:</b></p> <pre>Device(config-calendar-profile)# recurrence weekly</pre>	Configures weekly recurrences for the calendar profile.
<b>Step 5</b>	<p><b>day {friday   monday   saturday   sunday   thursday   tuesday   wednesday}</b></p> <p><b>Example:</b></p> <pre>Device(config-calendar-profile)# day friday Device(config-calendar-profile)# day monday</pre>	<p>Configure days when the weekly calendar needs to be active.</p> <p><b>Note</b> You can configure multiple days using this command.</p>
<b>Step 6</b>	<p><b>end</b></p> <p><b>Example:</b></p> <pre>Device(config-calendar-profile)# end</pre>	<p>Returns to privileged EXEC mode.</p> <p>Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.</p>

## Configuring Monthly Calendar Profile

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<p><b>configure terminal</b></p> <p><b>Example:</b></p> <pre>Device# configure terminal</pre>	Enters global configuration mode.
<b>Step 2</b>	<p><b>wireless profile calendar-profile name name</b></p> <p><b>Example:</b></p> <pre>Device(config)# wireless profile calendar-profile name monthly_calendar_profile</pre>	<p>Configures a calendar profile.</p> <p>Here, <i>name</i> refers to the name of the calendar profile.</p>
<b>Step 3</b>	<p><b>start start_time end end_time</b></p> <p><b>Example:</b></p> <pre>Device(config-calendar-profile)# start 18:00:00 end 19:00:00</pre>	<p>Configures start and end time for the calendar profile.</p> <p>Here,</p>

	Command or Action	Purpose
		<p><i>start_time</i> is the start time for the calendar profile. You need to enter start time in <b>HH:MM:SS</b> format.</p> <p><i>end_time</i> is the end time for the calendar profile. You need to enter end time in <b>HH:MM:SS</b> format.</p>
<b>Step 4</b>	<p><b>recurrence monthly</b></p> <p><b>Example:</b></p> <pre>Device(config-calendar-profile)# recurrence monthly</pre>	Configures monthly recurrences for the calendar profile.
<b>Step 5</b>	<p><b>date value</b></p> <p><b>Example:</b></p> <pre>Device(config-calendar-profile)# date 25</pre>	<p>Configures a date for the calendar profile.</p> <p><b>Note</b> If the requirement is to perform denial of service in certain timing, such as, 2, 10, and 25 of every month, all three days need to be configured using the <b>date</b> command. There is no range for date. You need to configure the dates as per your requirement.</p>
<b>Step 6</b>	<p><b>end</b></p> <p><b>Example:</b></p> <pre>Device(config-calendar-profile)# end</pre>	<p>Returns to privileged EXEC mode.</p> <p>Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.</p>

## Mapping a Daily Calendar Profile to a Policy Profile

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<p><b>configure terminal</b></p> <p><b>Example:</b></p> <pre>Device# configure terminal</pre>	Enters global configuration mode.
<b>Step 2</b>	<p><b>wireless profile policy <i>profile-name</i></b></p> <p><b>Example:</b></p> <pre>Device(config)# wireless profile policy default-policy-profile</pre>	<p>Creates policy profile for the WLAN.</p> <p>The <i>profile-name</i> is the profile name of the policy profile.</p>
<b>Step 3</b>	<p><b>calender-profile name <i>calendar-profile-name</i></b></p> <p><b>Example:</b></p> <pre>Device(config-wireless-policy)# calender-profile name daily_calendar_profile</pre>	<p>Maps a calendar profile to a policy profile.</p> <p>The <i>calendar-profile-name</i> is the name of the calendar profile name created in <a href="#">#unique_2616</a>.</p>

	Command or Action	Purpose
		<p><b>Note</b> You need to disable Policy Profile before associating a calendar profile to a policy profile. The following needs to be done:</p> <pre>Device(config-wireless-policy)# shutdown</pre>
<b>Step 4</b>	<p><b>action deny-client</b></p> <p><b>Example:</b></p> <pre>Device(config-policy-profile-calender)# action deny-client</pre>	<p>Configures deny client session establishment during calendar profile interval.</p> <p><b>Note</b> Client associations are denied daily between timeslot 9:00:00 to 17:00:00. For start and end time details, see <a href="#">#unique_2616</a>.</p>
<b>Step 5</b>	<p><b>end</b></p> <p><b>Example:</b></p> <pre>Device(config-policy-profile-calender)# end</pre>	<p>Returns to privileged EXEC mode.</p> <p>Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.</p>

## Mapping a Weekly Calendar Profile to a Policy Profile

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<p><b>configure terminal</b></p> <p><b>Example:</b></p> <pre>Device# configure terminal</pre>	Enters global configuration mode.
<b>Step 2</b>	<p><b>wireless profile policy <i>profile-name</i></b></p> <p><b>Example:</b></p> <pre>Device(config)# wireless profile policy default-policy-profile</pre>	<p>Creates policy profile for the WLAN.</p> <p>The <i>profile-name</i> is the profile name of the policy profile.</p>
<b>Step 3</b>	<p><b>calender-profile name <i>calendar-profile-name</i></b></p> <p><b>Example:</b></p> <pre>Device(config-wireless-policy)# calender-profile name weekly_calendar_profile</pre>	<p>Maps a calender profile to a policy profile.</p> <p>The <i>calendar-profile-name</i> is the name of the calendar profile name created in <a href="#">#unique_2618</a>.</p> <p><b>Note</b> You need to disable Policy Profile before associating a calendar profile to a policy profile. The following needs to be done:</p> <pre>Device(config-wireless-policy)# shutdown</pre>

	Command or Action	Purpose
<b>Step 4</b>	<b>action deny-client</b> <b>Example:</b> <pre>Device(config-policy-profile-calender)# action deny-client</pre>	Configures deny client session establishment during calendar profile interval. <b>Note</b> Client associations are denied daily between timeslot 9:00:00 to 17:00:00. For start and end time details, see <a href="#">#unique_2618</a> .  On Monday and Tuesday, clients are denied between 17:30:00 and 19:00:00 besides regular time 9:00:00 to 17:00:00.  On 25th of every month, clients are denied between 18:00:00 and 19:00:00 besides regular time 9:00:00 to 17:00:00.
<b>Step 5</b>	<b>end</b> <b>Example:</b> <pre>Device(config-policy-profile-calender)# end</pre>	Returns to privileged EXEC mode.  Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Mapping a Monthly Calendar Profile to a Policy Profile

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> <pre>Device# configure terminal</pre>	Enters global configuration mode.
<b>Step 2</b>	<b>wireless profile policy <i>profile-name</i></b> <b>Example:</b> <pre>Device(config)# wireless profile policy default-policy-profile</pre>	Creates policy profile for the WLAN.  The <i>profile-name</i> is the profile name of the policy profile.
<b>Step 3</b>	<b>calender-profile name <i>calendar-profile-name</i></b> <b>Example:</b> <pre>Device(config-wireless-policy)# calender-profile name monthly_calendar_profile</pre>	Maps a calender profile to a policy profile.  The <i>calendar-profile-name</i> is the name of the calendar profile name created in <a href="#">#unique_2620</a> .
<b>Step 4</b>	<b>action deny-client</b> <b>Example:</b>	Configures deny client session establishment for the defined calendar profile interval.

	Command or Action	Purpose
	Device(config-policy-profile-calender)# action deny-client	<p><b>Note</b> Every day client associations are denied between timeslot 9:00:00 to 17:00:00. For start and end time details, see <a href="#">#unique_2620</a>.</p> <p>On Monday and Tuesday, clients are denied between 17:30:00 and 19:00:00 besides regular time 9:00:00 to 17:00:00.</p> <p>On 25th of every month, clients are denied between 18:00:00 and 19:00:00 besides regular time 9:00:00 to 17:00:00.</p>
<b>Step 5</b>	<p><b>end</b></p> <p><b>Example:</b></p> <pre>Device(config-policy-profile-calender)# end</pre>	<p>Returns to privileged EXEC mode.</p> <p>Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.</p>

## Verifying Calendar Profile Configuration

To view the summary of calendar profiles, use the following command:

```
Device# show wireless profile calendar-profile summary
Number of Calendar Profiles: 3

Profile-Name

monthly_25_profile
weekly_mon_profile
daily_calendar_profile
```

To view the calendar profile details for a specific profile name, use the following command:

```
Device# show wireless profile calendar-profile detailed daily_calendar_profile
Calendar profiles : daily_calendar_profile

Recurrence : DAILY
Start Time : 09:00:00
End Time : 17:00:00
```

## Verifying Policy Profile Configuration

To view the detailed parameters for a specific policy profile, use the following command:

```
Device# show wireless profile policy detailed default-policy-profile
Tunnel Profile
 Profile Name : Not Configured
Calendar Profile
 Profile Name : monthly_25_profile
Wlan Enable : Not Configured
```

```

Client Block : Client Block Configured

Profile Name : weekly_mon_profile
Wlan Enable : Not Configured
Client Block : Client Block Configured

Profile Name : daily_calendar_profile
Wlan Enable : Not Configured
Client Block : Client Block Configured

Fabric Profile
 Profile Name : Not Configured

```

To view the configured calendar profile information under policy profile, use the following command:

```

Device# show wireless profile policy all
Tunnel Profile
Profile Name : Not Configured
Calendar Profile
Profile Name : daily_calendar_profile
Wlan Enable : Not Configured
Client Block : Client Block Configured

Profile Name : weekly_calendar_profile
Wlan Enable : Not Configured
Client Block : Client Block Configured

Fabric Profile
Profile Name : Not Configured

```

---

**Note** The anchor priority is always displayed as local. Priorities can be assigned on the foreign controller.

---

## Introduction to EoGRE

Ethernet over GRE (EoGRE) is an aggregation solution for grouping Wi-Fi traffic from hotspots. This solution enables customer premises equipment (CPE) devices to bridge the Ethernet traffic coming from an end-host, and encapsulate the traffic in Ethernet packets over an IP Generic Routing Encapsulation (GRE) tunnel. When the IP GRE tunnels are terminated on a service provider's broadband network gateway, the end-host traffic is forwarded and subscriber sessions are initiated.

### Client IPv6

Client IPv6 traffic is supported on IPv4 EoGRE tunnels. A maximum of eight different client IPv6 addresses are supported per client. Wireless controller s send all the client IPv6 addresses that they have learned to the accounting server using the accounting update message. All RADIUS or accounting messages exchanged between controller s and tunnel gateways or RADIUS servers are outside the EoGRE tunnel.

### EoGRE for WLAN

To enable EoGRE for a WLAN, the wireless policy profile should be mapped to a tunnel profile, which may contain the following:

- AAA override: Allows you to bypass rule filtering for a client.
- Gateway RADIUS proxy: Allows forwarding of AAA requests to tunnel gateways.

- Tunnel rules: Defines the domain to use for each realm. They also define VLAN tagging for the client traffic towards tunnel gateways.
- DHCP option 82: Provides a set of predefined fields.

### EoGRE Deployment with Multiple Tunnel Gateways

The wireless controller embedded wireless controller sends keepalive pings to the primary and secondary tunnel gateways and keeps track of the missed pings. When a certain threshold level is reached for the missed pings, switchover is performed and the secondary tunnel is marked as active. This switchover deauthenticates all the clients to enable them to rejoin the access points (APs). When the primary tunnel come back online, all the client traffic are reverted to the primary tunnel. However, this behavior depends on the type of redundancy.

### Load Balancing in EtherChannels

Load balancing of tunneled traffic over Etherchannels works by hashing the source or destination IP addresses or mac addresses of the tunnel endpoint pair. Because the number of tunnels is very limited when compared to clients (each tunnel carries traffic for many clients), the spreading effect of hashing is highly reduced and optimal utilization of Etherchannel links can be hard to achieve.

Using the EoGRE configuration model, you can use the *tunnel source* option of each tunnel interface to adjust the load-balancing parameters and spread tunnels across multiple links.

You can use different source interfaces on each tunnel for load balancing based on the source or destination IP address. For that choose the source interface IP address in such a way that traffic flows take different links for each src-dest IP pair. The following is an example with four ports:

```
Client traffic on Tunnel1 - Src IP: 40.143.0.72 Dest IP: 40.253.0.2
Client traffic on Tunnel2 - Src IP: 40.146.0.94 Dest IP: 40.253.0.6
Client traffic on Tunnel3 - Src IP: 40.147.0.74 Dest IP: 40.253.0.10
```

Use the **show platform software port-channel link-select interface port-channel 4 ipv4 src\_ip dest\_ip** command to determine the link that a particular flow will take.

## EoGRE Configuration Overview

The EoGRE solution can be deployed in two different ways:

- Central-Switching: EoGRE tunnels connect the controller to the tunnel gateways.
- Flex or Local-Switching: EoGRE tunnels are initiated on the APs and terminated on the tunnel gateways.

To configure EoGRE, perform the following tasks:

1. Create a set of tunnel gateways.
2. Create a set of tunnel domains.
3. Create a tunnel profile with rules that define how to match clients to domains.
4. Create a policy profile and attach the tunnel profile to it.
5. Map the policy profile to WLANs using policy tags.

**Note** The EoGRE tunnel fallback to the secondary tunnel is triggered after the *max-skip-count* ping fails in the last measurement window. Based on the starting and ending instance of the measurement window, the fall-back may take more time than the duration that is configured.

**Table 149: EoGRE Authentication Methods**

Method Name	First Supported Release	Mode
PSK	17.2.1	Local/Flex (central authentication)
Open	16.12.1	Local/Flex (central authentication)
LWA	16.12.1	Local/Flex (central authentication)
Dot1x	16.12.1	Local/Flex (central authentication)
CWA	16.12.1	Local/Flex (central authentication)

## Create a Tunnel Gateway

**Note** In the Cisco Catalyst 9800 Series Wireless Controller , a tunnel gateway is modeled as a tunnel interface.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>interface tunnel <i>tunnel_number</i></b>  <b>Example:</b> Device(config)# interface tunnel 21	Configures a tunnel interface and enters interface configuration mode.
<b>Step 3</b>	<b>tunnel source <i>source_intf</i></b>  <b>Example:</b> Device(config-if)# tunnel source 22	Sets the source address of the tunnel interface. The source interface can be VLAN, Gigabit Ethernet or loopback.
<b>Step 4</b>	<b>tunnel destination <i>tunnel-address</i></b>  <b>Example:</b> Device(config-if)# tunnel destination 10.11.12.13	Sets the destination address of the tunnel.

	Command or Action	Purpose
<b>Step 5</b>	<b>tunnel mode ethernet gre { ipv4   ipv6 } p2p</b>  <b>Example:</b> Device(config-if)# tunnel mode ethernet gre ipv4 p2p	Sets the encapsulation mode of the tunnel to Ethernet over GRE IPv4 or Ethernet over GRE IPv6.

## Configuring the Tunnel Gateway (GUI)

Follow the steps given below to configure the tunnel gateway:

### Procedure

- 
- Step 1** Choose **Configuration > Tags & Profiles > EoGRE**.
  - Step 2** Click the **Gateways** tab.  
The **Add Gateway** window is displayed.
  - Step 3** In the **Tunnel Id** field, specify the tunnel ID.
  - Step 4** In the **Destination address(IPv4/IPv6)** field, specify the IPv4 or IPv6 address.
  - Step 5** From the **Source Interface** drop-down list, select an interface.
  - Step 6** In the **AAA Proxy** section, slide the **AAA Proxy** slider to **Enabled**. When AA Proxy is enabled, complete the following steps:
    - a) From the **Encryption Type** drop-down list, select either **UNENCRYPTED** or **AES ENCRYPTION**.
    - b) In the **Key Phrase** field, specify the key phrase.
  - Step 7** Click **Apply to Device**.
- 

## Configuring a Tunnel Domain

---

**Note** Tunnel domains are a redundancy grouping of tunnels. The following configuration procedure specifies a primary and a secondary tunnel, along with a redundancy model.

---

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.

	Command or Action	Purpose
<b>Step 2</b>	<b>tunnel eogre domain</b> <i>domain</i>  <b>Example:</b> Device(config)# tunnel eogre domain dom1	Configures EoGRE redundancy domain.
<b>Step 3</b>	<b>primary tunnel</b> <i>primary-tunnel_intf</i>  <b>Example:</b> Device(config-eogre-domain)# primary tunnel 21	Configures the primary tunnel.
<b>Step 4</b>	<b>secondary tunnel</b> <i>secondary-tunnel_intf</i>  <b>Example:</b> Device(config-eogre-domain)# secondary tunnel 22	Configures the secondary tunnel.
<b>Step 5</b>	<b>redundancy revertive</b>  <b>Example:</b> Device(config-eogre-domain)# redundancy revertive	Sets the redundancy model as revertive.  When redundancy is set to revertive and the primary tunnel goes down, a switchover to secondary tunnel is performed. When the primary tunnel comes back up, a switchover to the primary tunnel is performed, because the primary tunnel has priority over the secondary tunnel.  When redundancy is not set to revertive, tunnels will have the same priority, and a switchover to the primary tunnel is not performed if the active tunnel is the secondary tunnel and the primary tunnel comes back up.

## Configuring Tunnel Domain (GUI)

Follow the steps given below to configure the tunnel domain:

### Procedure

- 
- Step 1** Choose **Configuration > Tags & Profiles > EoGRE**.
  - Step 2** Click the **Domains** tab.  
The **Add Domain** window is displayed.
  - Step 3** In the **Name** field, specify the domain name. The name can be ASCII characters from 32 to 126, without leading and trailing spaces.
  - Step 4** From the **Primary Tunnel Gateway** drop-down list, choose an option.
  - Step 5** From the **Secondary Tunnel Gateway** drop-down list, choose an option.
  - Step 6** Slide the **Status** button to **Enabled**, to activate the domain status.
  - Step 7** Slide the **Revertive Redundancy** button to **Enabled**, to activate revertive redundancy.

**Step 8** Click **Apply to Device**.

## Configuring EoGRE Global Parameters

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>tunnel eogre heartbeat interval <i>interval-value</i></b>  <b>Example:</b> Device(config)# tunnel eogre heartbeat interval 600	Sets EoGRE tunnel heartbeat periodic interval.
<b>Step 3</b>	<b>tunnel eogre heartbeat max-skip-count <i>skip-count</i></b>  <b>Example:</b> Device(config)# tunnel eogre heartbeat max-skip-count 7	Sets the maximum number of tolerable dropped heartbeats.  After reaching the maximum number of heartbeats that can be dropped, the tunnel is declared as down and a switchover is performed.
<b>Step 4</b>	<b>tunnel eogre source loopback <i>tunnel_source</i></b>  <b>Example:</b> Device(config)# tunnel eogre source loopback 12	Sets the tunnel EoGRE source interface.
<b>Step 5</b>	<b>tunnel eogre interface tunnel <i>tunnel-intf</i> aaa proxy key <i>key</i> <i>key-name</i></b>  <b>Example:</b> Device(config)# tunnel eogre interface tunnel 21 aaa proxy key 0 mykey	(Optional) Configures AAA proxy RADIUS key for the AAA proxy setup.  <b>Note</b> When the tunnel gateway is behaving as the AAA proxy server, only this step is required for the configuration.

## Configuring EoGRE Global Parameters (GUI)

Follow the steps given below to configure the EoGRE global parameters:

### Procedure

**Step 1** Choose **Configuration > Tags & Profiles > EoGRE**.  
The EoGRE **Global Config** tab is displayed.

- Step 2** In the **Heartbeat Interval (seconds)** field, specify an appropriate timer value for heartbeat interval. The valid range is between 60 and 600 seconds.
- Step 3** In the **Max Heartbeat Skip Count** field, specify the maximum heartbeat skip count. The valid range is between 3 and 10.
- Step 4** From the **Interface Name** drop-down list, choose an interface name.
- Step 5** Click **Apply**.

## Configuring a Tunnel Profile

### Before you begin

Ensure that you define the destination VLAN on the controller. If you do not define the VLAN, clients will not be able to connect.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wireless profile policy <i>profile-policy-name</i></b> <b>Example:</b> Device(config)# wireless profile policy eogre_policy	Configures a WLAN policy profile.
<b>Step 3</b>	<b>tunnel-profile <i>tunnel-profile-name</i></b> <b>Example:</b> Device(config-wireless-policy)# tunnel-profile tunnell	Creates a tunnel profile.
<b>Step 4</b>	<b>exit</b> <b>Example:</b> Device(config-wireless-policy)# exit	Returns to global configuration mode.
<b>Step 5</b>	<b>wireless profile tunnel <i>tunnel-profile-name</i></b> <b>Example:</b> Device(config)# wireless profile tunnel wl-tunnel-1	Configures a wireless tunnel profile.
<b>Step 6</b>	<b>dhcp-opt82 enable</b> <b>Example:</b> Device(config-tunnel-profile)# dhcp-opt82 enable	Activates DHCP Option 82 for the tunneled clients.

	Command or Action	Purpose
<b>Step 7</b>	<b>dhcp-opt82 remote-id <i>remote-id</i></b> <b>Example:</b> Device(config-tunnel-profile)# dhcp-opt82 remote-id vlan	Configures Remote ID options.  Choose from the comma-separated list of options such as <b>ap-mac</b> , <b>ap-ethmac</b> , <b>ap-name</b> , <b>ap-group-name</b> , <b>flex-group-name</b> , <b>ap-location</b> , <b>vlan</b> , <b>ssid-name</b> , <b>ssid-type</b> , and <b>client-mac</b> .
<b>Step 8</b>	<b>aaa-override</b> <b>Example:</b> Device(config-tunnel-profile)# aaa-override	Enables AAA policy override.
<b>Step 9</b>	<b>gateway-radius-proxy</b> <b>Example:</b> Device(config-tunnel-profile)# gateway-radius-proxy	Enables the gateway RADIUS proxy.
<b>Step 10</b>	<b>gateway-accounting-radius-proxy</b> <b>Example:</b> Device(config-tunnel-profile)# gateway-accounting-radius-proxy	Enables the gateway accounting RADIUS proxy.
<b>Step 11</b>	<b>rule <i>priority</i> realm-filter <i>realm</i> domain <i>domain-name</i> vlan <i>vlan-id</i></b> <b>Example:</b> Device(config-tunnel-profile)# rule 12 realm-filter realm domain dom1 vlan 5	Creates a rule to choose a domain, using the realm filter, for client Network Access Identifier (NAI), tunneling domain name, and destination VLAN.

## Configuring the Tunnel Profile (GUI)

Follow the steps given below to configure the tunnel profile:

### Procedure

- 
- Step 1** Choose **Configuration > Tags & Profiles > EoGRE**.
  - Step 2** Click the **Tunnel Profiles** tab.
  - Step 3** Click the **Add** button.  
The **Add Tunnel Profile** window is displayed.
  - Step 4** Click the **General** tab and complete the following steps:
    - a) In the **Name** field, specify the tunnel profile name. The name can be ASCII characters from 32 to 126, without leading and trailing spaces.
    - b) In the **Status** field, slide the button to change the status to **Enabled**.
    - c) In the **Central Forwarding** field, slide the button to **Enabled**, to enable the feature.

- d) In the **DHCP Option-82** section, change the **Status** field and the **ASCII** field to **Enabled**, as per requirement.
- e) In the **Delimiter** field, specify the delimiter.
- f) From the **Circuit ID Available Services** list, select an available services and click the > sign to add the services to the assigned list.
- g) From the **Remote ID Available Services** list, select an available services and click the > sign to add the services to the assigned list.
- h) In the **AAA** section, choose an appropriate status for the **Radius Proxy** field, the **Accounting Proxy** field, and the **Override** field.

**Step 5** Click the **Rules** tab, and complete the following steps:

- a) Click the **Add Rules** button.
- b) In the **Priority** field, specify the priority of the rule from a range of 1 to 100.
- c) In the **Realm** field, specify a realm.
- d) From the **Domain** drop-down list, choose a domain.
- e) In the **VLAN Id** field, specify the VLAN ID that ranges between 1 and 4094.
- f) Click **Save**.

**Step 6** Click **Apply to Device**.

## Associating WLAN to a Wireless Policy Profile

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wireless tag policy <i>policy-tag-name</i></b> <b>Example:</b> Device(config)# wireless tag policy eogre_tag	Configures a policy tag and enters policy tag configuration mode.
<b>Step 3</b>	<b>wlan <i>wlan-name</i> policy <i>profile-policy-name</i></b> <b>Example:</b> Device(config-policy-tag)# wlan eogre_open_eogre policy eogre_policy	Maps an EoGRE policy profile to a WLAN profile.
<b>Step 4</b>	<b>end</b> <b>Example:</b> Device(config-policy-tag)# end	Saves the configuration, exits configuration mode, and returns to privileged EXEC mode.

## Attaching a Policy Tag and a Site Tag to an AP

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>ap mac-address</b>  <b>Example:</b> Device(config)# ap 80E8.6FD4.0BB0	Configures an AP and enters AP profile configuration mode.
<b>Step 3</b>	<b>policy-tag policy-tag-name</b>  <b>Example:</b> Device(config-ap-tag)# policy-tag eogre_tag	Maps the EoGRE policy tag to the AP.
<b>Step 4</b>	<b>site-tag site-tag-name</b>  <b>Example:</b> Device(config-ap-tag)# site-tag sp-flex-site	Maps a site tag to the AP.
<b>Step 5</b>	<b>end</b>  <b>Example:</b> Device(config-ap-tag)# end	Saves the configuration, exits configuration mode, and returns to privileged EXEC mode.

## Verifying the EoGRE Tunnel Configuration

The `show tunnel eogre` command displays the EoGRE clients, domains, gateways, global-configuration, and manager information in the local mode.

To display the EoGRE domain summary in the local mode, use the following command:

```
Device# show tunnel eogre domain summary
```

```
Domain Name Primary GW Secondary GW Active GW Redundancy

domain1 Tunnel1 Tunnel2 Tunnel1 Non-Revertive
eogre_domain Tunnel1 Tunnel2 Tunnel1 Non-Revertive
```

To display the details of an EoGRE domain in the local mode, use the following command:

```
Device# show tunnel eogre domain detailed domain-name
```

```
Domain Name : eogre_domain
Primary GW : Tunnel1
Secondary GW : Tunnel2
```

```
Active GW : Tunnell
Redundancy : Non-Revertive
```

To view the EoGRE tunnel gateway summary and statistics in the local mode, use the following command:

```
Device# show tunnel eogre gateway summary
```

Name	Type	Address	AdminState	State	Clients
Tunnell	IPv4	9.51.1.11	Up	Up	0
Tunnel2	IPv4	9.51.1.12	Up	Down	0
Tunnel10	IPv6	fd09:9:8:21::90	Down	Down	0
Tunnel11	IPv4	9.51.1.11	Up	Up	0
Tunnel12	IPv6	fd09:9:8:21::90	Up	Down	0
Tunnel100	IPv4	9.51.1.100	Up	Down	0

To view the details of an EoGRE tunnel gateway in the local mode, use the following command:

```
Device# show tunnel eogre gateway detailed gateway-name
```

```
Gateway : Tunnell
Mode : IPv4
IP : 9.51.1.11
Source : Vlan51 / 9.51.1.1
State : Up
SLA ID : 56
MTU : 1480
Up Time: 4 minutes 45 seconds

Clients
Total Number of Wireless Clients : 0
Traffic
Total Number of Received Packets : 0
Total Number of Received Bytes : 0

Transmitted Keepalives in last window : 2
Received Keepalives in last window : 2
```

To view the client summary of EoGRE in the local mode, use the following command:

```
Device# show tunnel eogre client summary
```

Client MAC	AP MAC	Domain	Tunnel	VLAN	Local
74da.3828.88b0	80e8.6fd4.9520	eogre_domain	N/A	2121	No

To view the details of an EoGRE global configuration in the local mode, use the following command:

```
Device# show tunnel eogre global-configuration
```

```

Heartbeat interval : 60
Max Heartbeat skip count : 3
Source Interface : (none)

```

To view the details of the global tunnel manager statistics in the local mode, use the following command:

```
Device# show tunnel eogre manager stats global
```

```

The `show ap tunnel eogre` command displays the tunnel domain information, EoGRE events, and the tunnel gateway status on the APs, in the flex mode.

To view the summary information of an EoGRE tunnel gateway in the flex mode, use the following command:

```
Device# show ap tunnel eogre domain summary
```

```
AP MAC Domain Active Gateway

80e8.6fd4.9520 eogre_domain Tunnel1
```

To view the wireless tunnel profile summary, use the following command:

```
Device# show wireless profile tunnel summary
```

```
Profile Name AAA-Override AAA-Proxy DHCP Opt82 Enabled

eogre_tunnel No No Yes Yes
eogre_tunnel_set No No Yes No
eogre_tunnel_snmp No No No No
```

To view a wireless tunnel profile's details, use the following command:

```
Device# show wireless profile tunnel detailed profile-name
```

```
Profile Name : eogre_tunnel
Status : Enabled
AAA-Proxy/Accounting-Proxy: Disabled / Disabled
AAA-Override : Disabled
DHCP Option82 : Enabled
Circuit-ID : ap-mac,ap-ethmac,ap-location,vlan
Remote-ID : ssid-name,ssid-type,client-mac,ap-name
```

Tunnel Rules

```
Priority Realm Vlan Domain (Status/Primary GW/Secondary GW)

1 * 2121 eogre_domain (Enabled/Tunnel1/Tunnel2)
```

To view detailed information about an EoGRE tunnel domain's status, use the following command:

```
Device# show ap tunnel eogre domain detailed
```

```
Domain : eogre_domain
AP MAC : 80e8.6fd4.9520
Active GW : Tunnel1
```

To view the EoGRE events on an AP, use the following command:

```
Device# show ap tunnel eogre events
```

```
AP 80e8.6fd4.9520 Event history
Timestamp #Times Event RC Context

```

```

## Wireless Guest Access

The Wireless Guest Access feature addresses the need to provide internet access to guests in a secure and accountable manner. The implementation of a wireless guest network uses the enterprise's existing wireless and wired infrastructure to the maximum extent. This reduces the cost and complexity of building a physical overlay network. Wireless Guest Access solution comprises of two controllers - a Guest Foreign and a Guest Anchor. An administrator can limit bandwidth and shape the guest traffic to avoid impacting the performance of the internal network.

---

**Note**

- When a client joins through a capwap tunnel from an AP, the RADIUS NAS-Port-Type is set as "wireless 802.11". Here, Point of Attachment (PoA) and Point of Presence (PoP) is the same.
- When a client joins through a mobility tunnel, the RADIUS NAS-Port-Type is set as "virtual". Here, PoA is the Foreign controller and PoP is the Anchor controller as the client is anchored. For information on the standard types, see the following link:

<https://www.iana.org/assignments/radius-types/radius-types.xhtml#radius-types-13>

---

Wireless Guest Access feature comprises the following functions:

- Guest Anchor controller is the point of presence for a client.

- Guest Anchor Controller provides internal security by forwarding the traffic from a guest client to a Cisco Wireless Controller in the demilitarized zone (DMZ) network through the anchor controller.
- Guest Foreign controller is the point of attachment of the client.
- Guest Foreign Controller is a dedicated guest WLAN or SSID and is implemented throughout the campus wireless network wherever guest access is required. A WLAN with mobility anchor (guest controller) configured on it identifies the guest WLAN.
- Guest traffic segregation implements Layer 2 or Layer 3 techniques across the campus network to restrict the locations where guests are allowed.
- Guest user-level QoS is used for rate limiting and shaping, although it is widely implemented to restrict the bandwidth usage for a guest user.
- Access control involves using embedded access control functionality within the campus network, or implementing an external platform to control guest access to the Internet from the enterprise network.
- Authentication and authorization of guests that are based on variables, including date, duration, and bandwidth.
- An audit mechanism to track who is currently using, or has used, the network.
- A wider coverage is provided by including areas such as lobbies and other common areas that are otherwise not wired for network connectivity.
- The need for designated guest access areas or rooms is removed.

**Note** To use IRCM with AireOS in your network, contact Cisco TAC for assistance.

**Table 150: Supported Controllers**

Controller Name	Supported as Guest Anchor	Supported as Guest Foreign
Cisco Catalyst 9800-40 Wireless Controller	Yes	Yes
Cisco Catalyst 9800-80 Wireless Controller	Yes	Yes
Cisco Catalyst 9800-CL Wireless Controller	Yes	Yes
Cisco Catalyst 9800-L Wireless Controller	Yes	Yes
Cisco Catalyst 9800 Embedded Wireless Controller for Switch	No	No
Cisco Catalyst 9800 Embedded Wireless Controller on Cisco Catalyst 9100 Series APs	No	No

Following is a list of features supported by Cisco Guest Access:

### Supported Features

- Sleeping Clients
- FQDN
- AVC (AP upstream and downstream)
- Native Profiling
- Open Authentication
- OpenDNS
- Supported Security Methods:
  - MAB Central Web Authentication (CWA)
  - Local Web Authentication (LWA)
  - LWA on MAB Failure
  - 802.1x + CWA
  - 802.1x
  - PSK
  - 802.1x + LWA
  - PSK + CWA
  - PSK + LWA
  - iPSK + CWA
  - MAB Failure + PSK
  - MAB Failure + OWE
  - MAB Failure + SAE
- SSID QoS Upstream and Downstream (Foreign)
- AP/ Client SSO
- Static IP Roaming
- Client IPv6
- Roaming across controllers
- RADIUS Accounting

---

**Note** In a guest access scenario, accounting is always performed at the foreign controller for all authentication methods.

---

- QoS: Client-Level Rate Limiting
- Guest Anchor Load Balancing
- Workgroup Bridges (WGB)

---

**Note** To enable the controller to support multiple VLANs from a WGB, use **wgb vlan** command.

---

## Foreign Map Overview

Guest Access supports Foreign Map using Policy Profile and WLAN Profile configuration models in Cisco Catalyst 9800 Series Wireless Controller.

Foreign Map support in Cisco Catalyst 9800 Series Wireless Controller is achieved with the following policy profile and WLAN profile config model.

- Guest Foreign commands:
  - **Foreign1: wlanProf1 PolicyProf1**
  - **Foreign2: wlanProf2 PolicyProf2**
- Guest Anchor commands:
  - **wlanProf1, wlanProf2**
  - **PolicyProf1: Vlan100 - subnet1**
  - **PolicyProf2: Vlan200 - subnet2**

### Foreign Map Roaming

Configure two different WLAN profiles on the two Guest Foreigns and seamless roaming is not allowed between them. This is expected configuration. However, seamless roaming is allowed if the same WLAN profile is configured on two Guest Foreigns, but it prevents Foreign Map feature from working.

## Wireless Guest Access: Use Cases

The wireless guest access feature can be used to meet different requirements. Some of the possibilities are shared here.

### Scenario One: Providing Secured Network Access During Company Merger

This feature can be configured to provide employees of **company A** who are visiting **company B** to access company A resources on company B network securely.

### Scenario Two: Shared Services over Existing Setup

Using this feature, you can provide multiple services using multiple vendors piggy backing on the existing network. A company can provide services on an SSID which is anchored on the existing controller. This is while the existing service continues to serve over the same controller and network.

## Load Balancing Among Multiple Guest Controllers

- You can configure export anchors to load balance large guest client volumes. For a single export foreign guest WLAN configuration, up to 72 controllers are allowed. To configure mobility guest controllers, use **mobility anchor ip address**.
- You can specify primary anchors with priority (1,3) and choose another anchor as backup in case of failure.
- In a multi-anchor scenario, when the primary anchor goes down, the clients get disconnected from the primary anchor and joins the secondary anchor.

## Guidelines and Limitations for Wireless Guest Access

- Match the security profiles under WLAN on both Guest Foreign, and Guest Anchor.
- Match the policy profile attributes such as NAC and AAA Override on both Guest Foreign, and Guest Anchor controllers.
- On Export Anchor, the WLAN profile name and Policy profile name is chosen when a client joins at runtime and the same should match with the Guest Foreign controller.

## Troubleshooting IPv6

When a guest export client cannot get a routable IPv6 address through SLAAC or cannot pass traffic when the IPv6 address is learned through DHCPv6, you can use the following workarounds:

- On IPv6 Routers: You can work around the RA multicast to unicast conversion by modifying behavior on the IPv6 gateway. Depending on the product, this may be the default behavior or may require configuration.
  - On Cisco IPv6 Routers
    - Cisco Nexus platform: Has solicited unicast RA enabled by default to help with wireless deployment.
    - Cisco IOS-XE platform: Use the following configuration command to turn on unicast RA to help with wireless deployment:  
**ipv6 nd ra solicited unicast**
  - On non-Cisco IPv6 Routers: If non-Cisco network devices do not support configuration command to enable solicited unicast RA then a work around does not exist.

## Configure Mobility Tunnel for Guest Access (GUI)

### Procedure

- 
- Step 1** Choose **Configure > Tags and Profiles > WLANs**.
  - Step 2** In the **Wireless Networks** area, click the relevant WLAN or RLAN and click **Mobility Anchor**.
  - Step 3** In the **Wireless Network Details** section, choose a device from the **Switch IP Address** drop-down list.
  - Step 4** Click **Apply**.
- 

## Configure Mobility Tunnel for Guest Access (CLI)

Follow the procedure given below to configure a mobility tunnel.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>wireless mobility group name</b> <i>group name</i> <b>Example:</b> Device(config)# wireless mobility group name mtunnelgrp	Configures a mobility group.
<b>Step 2</b>	<b>wireless mobility mac-address</b> <i>mac address</i> <b>Example:</b> Device(config)# wireless mobility mac-address 0d:4c:da:3a:f2:21	Configures a mobility MAC address.
<b>Step 3</b>	<b>wireless mobility group member mac</b> <i>mac address ip ip address group group name</i> <b>Example:</b> Device(config)# wireless mobility group member mac-address df:07:a1:a7:a8:55 ip 206.223.123.2 group mtgrp	Configures a mobility peer.

## Configuring Guest Access Policy (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Tags & Profiles > Policy**.
  - Step 2** Click **Add**.

- Step 3** In the **General** tab, enter the **Name** and enable the **Central Switching** toggle button.
- Step 4** In the **Access Policies** tab, under the **VLAN** settings, choose the vlans from the **VLAN/VLAN Group** drop-down list.
- Step 5** In the **Mobility** tab, under the **Mobility Anchors** settings, check the **Export Anchor** check box.
- Step 6** In the **Advanced** tab, under the **WLAN Timeout** settings, enter the **Idle Timeout (sec)**.
- Step 7** Click **Apply to Device**.

## Configuring Guest Access Policy (CLI)

Follow the procedure given below to create and configure the guest access profile policy. Alternately, you may use the existing default policy profile after configuring the mobility anchor to that policy.

You can only configure anchors which are peers. Ensure that the IP address that is used is a mobility peer and is included in the mobility group. The system shows an invalid anchor IP address error message when any other IP address is used.

To delete the mobility group, ensure that the mobility peer which is also a mobility anchor is removed from the policy profile.

- Note**
- No payload is sent to Guest Foreign to display the VLAN.
  - To avoid a client exclusion from occurring due to VLAN, Cisco Catalyst 9800 Series Controllers need to define VLAN along with the associated name being pushed from ISE.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wireless profile policy wlan_policy_profile</b> <b>Example:</b> Device(config)# wireless profile policy guest-test-policy	Configures the policy profile and enters wireless profile configuration mode. <b>Note</b> <ul style="list-style-type: none"> <li>• You can use the <b>default-policy-profile</b> to configure the profile policy.</li> </ul>
<b>Step 3</b>	<b>shutdown</b> <b>Example:</b> Device(config-wireless-policy)# shutdown	Shuts down the policy if it exists before configuring the anchor.
<b>Step 4</b>	<b>central switching</b> <b>Example:</b>	(Optional) Enables central switching.

	Command or Action	Purpose
	Device (config-wireless-policy)# central switching	
<b>Step 5</b>	<p>Choose the first option to configure the Guest Foreign or second option to configure the Guest Anchor:</p> <ul style="list-style-type: none"> <li>• <b>mobility anchor</b> <i>anchor-ip-address</i></li> <li>• <b>mobility anchor</b></li> </ul> <p><b>Example:</b></p> <p>For Guest Foreign:</p> <pre>Device (config-wireless-policy)# mobility anchor 19.0.2.1</pre> <p>For Guest Anchor:</p> <pre>Device (config-wireless-policy)# mobility anchor</pre>	Configures Guest Foreign or Guest Anchor.
<b>Step 6</b>	<p><b>idle-timeout</b> <i>timeout</i></p> <p><b>Example:</b></p> <pre>Device (config-wireless-policy)# idle-timeout 1000</pre>	(Optional) Configures duration of idle timeout, in seconds.
<b>Step 7</b>	<p><b>vlan</b> <i>vlan-id</i></p> <p><b>Example:</b></p> <pre>Device (config-wireless-policy)# vlan 2</pre>	<p>Configures VLAN name or VLAN Id.</p> <p><b>Note</b> VLAN is optional for a Guest Foreign controller.</p>
<b>Step 8</b>	<p><b>no shutdown</b></p> <p><b>Example:</b></p> <pre>Device (config-wireless-policy)# no shutdown</pre>	Enables policy profile.
<b>Step 9</b>	<p><b>end</b></p> <p><b>Example:</b></p> <pre>Device (config-wireless-policy)# end</pre>	Exits the configuration mode and returns to privileged EXEC mode.
<b>Step 10</b>	<p><b>show wireless profile policy summary</b></p> <p><b>Example:</b></p> <pre>Device# show wireless profile policy summary</pre>	(Optional) Displays the configured profiles.
<b>Step 11</b>	<p><b>show wireless profile policy detailed</b> <i>policy-profile-name</i></p> <p><b>Example:</b></p> <pre>Device# show wireless profile policy detailed guest-test-policy</pre>	(Optional) Displays detailed information of a policy profile.

## Viewing Guest Access Debug Information (CLI)

- To display client level detailed information about mobility state and the anchor IP address, use the following command:  
**show wireless client mac-add *mac-address* detail**
- To display the client mobility statistics, use the following command:  
**show wireless client mac-address *mac-address* mobility statistics**
- To display client level roam history for an active client in sub-domain, use the following command:  
**show wireless client mac-address *mac-address* mobility history**
- To display detailed parameters of a given profile policy, use the following command:  
**show wireless profile policy detailed *policy-name***
- To display the global level summary for all mobility messages, use the following command:  
**show wireless mobility summary**
- To display the statistics for the Mobility manager, use the following command:  
**show wireless stats mobility**

## Verifying Wireless Guest Access Enablement

To check if wireless guest access is enabled, run the following command.

```
Device# show platform hardware chassis active qfp feature sw client vlan all

Vlan : 666
Learning Enabled : true
DHCPDN Enabled : true
Non IP Multicast Enabled : false
Broadcast Enabled : false
Wireless Passive Client Enabled : false
Guest-Ian Enabled : true
MTU : 65535
Input UIDB : 65503
Output UIDB : 65497
Flood List : 0XB8658A0
```

## Configure Guest Access Using Different Security Methods

The following sections provide information about the following:

### Open Authentication

To configure the guest access with open authentication, follow the steps:

1. Configuring the WLAN Profile
2. [#unique\\_2650](#)

**Note** No tag is required unless AVC is enabled.

## Configure a WLAN Profile for Guest Access with Open Authentication (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Tags & Profiles > WLANs**.
- Step 2** Click **Add**.
- Step 3** In the **General** tab, enter the **Profile Name**, the **SSID** and the **WLAN ID**. Choose the radio policy from the **Radio Policy** drop-down list. Enable or disable the **Status** and **Broadcast SSID** toggle buttons.
- Step 4** Choose **Security > Layer2** tab. Uncheck the **WPA Policy**, **WPA2 Policy**, **AES** and **802.1x** check boxes.
- Step 5** Click **Apply to Device**.
- 

## Configure a WLAN Profile For Guest Access with Open Authentication (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wlan profile-name wlan-id ssid-name.</b>  <b>Example:</b> Device(config)# wlan mywlan 34 mywlan-ssid	Configures the WLAN and SSID.
<b>Step 3</b>	<b>no security wpa</b>  <b>Example:</b> Device(config-wlan)# no security wpa	Disables WPA security.
<b>Step 4</b>	<b>no security wpa akm dot1x</b>  <b>Example:</b> Device(config-wlan)# no security wpa akm dot1x	Disables security AKM for dot1x.
<b>Step 5</b>	<b>no security wpa wpa2</b>  <b>Example:</b>	Disables WPA2 security.

	Command or Action	Purpose
	Device(config-wlan)# no security wpa wpa2	
<b>Step 6</b>	<b>no security wpa wpa2 ciphers aes</b> <b>Example:</b> Device(config-wlan)# no security wpa wpa2 ciphers aes	Disables WPA2 ciphers for AES.
<b>Step 7</b>	<b>no shutdown</b> <b>Example:</b> Device(config-wlan)# no shutdown	Saves the configuration.

## Configuring a Policy Profile

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wireless profile policy <i>wlan-policy-profile</i></b> <b>Example:</b> Device(config)# wireless profile policy open_it	Configures WLAN policy profile and enters the wireless policy configuration mode.
<b>Step 3</b>	Choose the first option to configure a Guest Foreign or second option to configure a Guest Anchor: <ul style="list-style-type: none"> <li>• <b>mobility anchor <i>anchor-ip-address</i></b></li> <li>• <b>mobility anchor</b></li> </ul> <b>Example:</b> For Guest Foreign: Device (config-wireless-policy)# mobility anchor 19.0.2.1 For Guest Anchor: Device (config-wireless-policy)# mobility anchor	Configures Guest Foreign or Guest Anchor.
<b>Step 4</b>	<b>central switching.</b> <b>Example:</b> Device(config-wireless-policy)# central switching	Enables Central switching
<b>Step 5</b>	<b>vlan <i>id</i></b>	Configures a VLAN name or VLAN ID.

	Command or Action	Purpose
	<b>Example:</b> Device(config-wireless-policy)# vlan 16	<b>Note</b> VLAN is optional for a Guest Foreign controller.
<b>Step 6</b>	<b>no shutdown</b> <b>Example:</b> Device(config-wireless-policy)# no shutdown	Enables the policy profile.

## Local Web Authentication

To configure LWA, follow these steps:

1. [Configure a Parameter Map \(CLI\)](#)
2. [Configure a WLAN Profile for Guest Access with Local Web Authentication \(CLI\)](#)
3. [Applying Policy Profile on a WLAN](#)
4. [Configure an AAA Server for Local Web Authentication \(CLI\)](#)

### Configure a Parameter Map (GUI)

#### Procedure

- 
- Step 1** Choose **Configuration > Security > Web Auth**.
  - Step 2** Click **Add**.
  - Step 3** Enter the **Parameter-map name**, **Maximum HTTP connections**, **Init-State Timeout(secs)** and choose **webauth** in the **Type** drop-down list.
  - Step 4** Click **Apply to Device**.
- 

### Configure a Parameter Map (CLI)

#### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>parameter-map type webauth global</b> <b>Example:</b> Device(config)# parameter-map type webauth global	Creates a parameter map and enters parameter-map webauth configuration mode.

	Command or Action	Purpose
<b>Step 3</b>	<b>type webauth</b> <b>Example:</b> Device (config-params-parameter-map) #type webauth	Configures the webauth type parameter.
<b>Step 4</b>	<b>timeout init-state sec <i>timeout-seconds</i></b> <b>Example:</b> Device (config-params-parameter-map) # timeout inti-state sec 3600	Configures the WEBAUTH timeout in seconds. Valid range for the time in sec parameter is 60 to 3932100 seconds.
<b>Step 5</b>	<b>virtual-ip ipv4 <i>virtual_IP_address</i></b> <b>Example:</b> Device (config-params-parameter-map) #virtual-ip ipv4 209.165.201.1	Configures a VLAN name or VLAN ID.

## Configure a WLAN Profile for Guest Access with Local Web Authentication (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Tags & Profiles > WLANs**.
  - Step 2** Click on the **WLAN** name.
  - Step 3** Choose **Security > Layer3**.
  - Step 4** Check the **Web Policy** check box.
  - Step 5** Choose a parameter map from the **Web Auth Parameter Map** drop-down list.
  - Step 6** Choose an authentication list from the **Authentication List** drop-down list.
  - Step 7** Click **Update & Apply to Device**.
- 

## Configure a WLAN Profile for Guest Access with Local Web Authentication (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wlan <i>wlan-id ssid-name</i></b> <b>Example:</b> Device# Device (config) # wlan mywlan 38 mywlan-ssid1	Configures the WLAN and SSID.

	Command or Action	Purpose
<b>Step 3</b>	<b>security web-auth</b> <b>Example:</b> Device(config-wlan)# security web-auth	Enables web authentication for a WLAN.
<b>Step 4</b>	<b>security web-auth parameter-map default</b> <b>Example:</b> Device(config-wlan)# security web-auth parameter-map default	Configure the default parameter map. <b>Note</b> When <b>security web-auth</b> is enabled, you get to map the <b>default authentication-list</b> and global <b>parameter-map</b> . This is applicable for authentication-list and parameter-map that are not explicitly mentioned.
<b>Step 5</b>	<b>security web-auth parameter-map global</b> <b>Example:</b> Device(config-wlan)# security web-auth parameter-map global	Configure the global parameter map.
<b>Step 6</b>	<b>security web-auth authentication-list LWA-AUTHENTICATION</b> <b>Example:</b> Device(config-wlan)# security web-auth authentication-list LWA-AUTHENTICATION	Sets the authentication list for IEEE 802.1x.

## Configure an AAA Server for Local Web Authentication (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Security > AAA > AAA Advanced > Global Config**.
  - Step 2** Choose the options from the **Local Authentication, Authentication Method List, Local Authorization and Authorization Method List** drop-down lists.
  - Step 3** Enable or Disable the **Radius Server Load Balance** using toggle button.
  - Step 4** Check the **Interim Update** check box.
  - Step 5** Click **Apply**.
- 

## Configure an AAA Server for Local Web Authentication (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.

	Command or Action	Purpose
<b>Step 2</b>	<b>aaa authentication login</b> <i>LWA-AUTHENTICATION local</i>  <b>Example:</b> Device(config)#aaa authentication login lwa-authentication local	Defines the authentication method at login.
<b>Step 3</b>	<b>aaa authorization network default local</b> <b>if-authenticated</b>  <b>Example:</b> Device(config)#aaa authorization network default local if-authenticated	Sets the authorization method to local if the user has authenticated.

## Global Configuration

Follow the procedure given below for global configuration:

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>username name password 0</b> <i>clear-text-password</i>  <b>Example:</b> Device(config)# #username base password 0 pass1	Sets the clear text password for the user.
<b>Step 3</b>	<b>ip http server</b>  <b>Example:</b> Device(config)#ip http server	Enables the HTTP server.
<b>Step 4</b>	<b>ip http authentication local</b>  <b>Example:</b> Device(config)#ip http authentication local	Sets the HTTP server authentication method to local.  <b>Note</b> You will get the admin access rights regardless of the user privilege, if the <b>ip http authentication local</b> is disabled and username is the same as enable password.

## Central Web Authentication

To configure CWA, follow these steps:

1. [Configure a WLAN Profile for Guest Access with Central Web Authentication \(CLI\)](#)
2. [#unique\\_2664](#)
3. [AAA Server Configuration \(CLI\)](#)
4. [#unique\\_2666](#)

## Configure a WLAN Profile for Guest Access with Central Web Authentication (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Tags & Profiles > WLANs**.
- Step 2** Click **Add**.
- Step 3** In the **General** tab, enter the **Profile Name**, the **SSID**, and the **WLAN ID**.
- Step 4** To enable the WLAN, set **Status** as **Enabled**.
- Step 5** From the **Radio Policy** drop-down list, select the radio policy.
- Step 6** To enable the **Broadcast SSID**, set the status as **Enabled**.
- Step 7** Choose **Security > Layer2** tab. Uncheck the **WPA Policy**, **WPA2 Policy**, **AES** and **802.1x** check boxes.
- Step 8** Check the **MAC Filtering** check box to enable the feature. With MAC Filtering enabled, choose the Authorization list from the **Authorization List** drop-down list.
- Step 9** Click **Apply to Device**.
- 

## Configure a WLAN Profile for Guest Access with Central Web Authentication (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wlan wlan-id ssid-name</b>  <b>Example:</b> Device# Device(config)# wlan mywlan 38 mywlan-ssid1	Configures the WLAN and SSID.
<b>Step 3</b>	<b>mac-filtering remote_authorization_list_name</b>  <b>Example:</b> Device(config-wlan)# mac-filtering auth-list	Enables MAB authentication for the remote RADIUS server.
<b>Step 4</b>	<b>no security wpa</b>  <b>Example:</b>	Disables WPA security.

	Command or Action	Purpose
	<code>Device(config-wlan)# no security wpa</code>	
<b>Step 5</b>	<b>no security wpa akm dot1x</b> <b>Example:</b> <code>Device(config-wlan)# no security wpa akm dot1x</code>	Disables security AKM for dot1x.
<b>Step 6</b>	<b>no security wpa wpa2</b> <b>Example:</b> <code>Device(config-wlan)# no security wpa wpa2</code>	Disables WPA2 security.
<b>Step 7</b>	<b>no security wpa wpa2 ciphers aes</b> <b>Example:</b> <code>Device(config-wlan)# no security wpa wpa2 ciphers aes</code>	Disables WPA2 ciphers for AES.
<b>Step 8</b>	<b>no shutdown</b> <b>Example:</b> <code>Device(config-wlan)# no shutdown</code>	Saves the configuration.

## AAA Server Configuration (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Security > AAA > Servers/Groups > RADIUS > Server Groups**.
  - Step 2** Click the RADIUS server group.
  - Step 3** From the **MAC-Delimiter** drop-down list, choose an option.
  - Step 4** From the **MAC-Filtering** drop-down list, choose an option.
  - Step 5** Enter the **Dead-Time (mins)**.
  - Step 6** From the **Available Servers** on the left, move the servers you need to **Assigned Servers** on the right.
  - Step 7** Click **Update & Apply to Device**.
  - Step 8** Choose **Configuration > Security > AAA > Servers/Groups > RADIUS > Servers**.
  - Step 9** Click the RADIUS server.
  - Step 10** Enter the **IPv4/IPv6 Server Address**, **Auth Port**, **Acct Port**, **Server Timeout (seconds)** and **Retry Count**.
  - Step 11** Check or uncheck the **PAC Key** checkbox and choose the Key Type from the **Key Type** drop-down list. Enter the **Key** and **Confirm Key**.
  - Step 12** Enable or disable the **Support for CoA** toggle button.
  - Step 13** Click **Update & Apply to Device**.
-

## AAA Server Configuration (CLI)

**Note** Configure AAA server for Guest Foreign only.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>aaa authorization network <i>authorization-list</i></b> <b>local group <i>Server-group-name</i></b> <b>Example:</b> Device(config)#aaa authorization network cwa local group ise	Sets the authorization method to local.
<b>Step 3</b>	<b>aaa group server radius <i>server-group-name</i></b> <b>Example:</b> Device(config)#aaa group server radius ise	Configures RADIUS server group definition. <b>Note</b> <i>server-group-name</i> refers to the server group name. The valid range is from 1 to 32 alphanumeric characters.
<b>Step 4</b>	<b>server name <i>radius-server-name</i></b> <b>Example:</b> Device(config-sg-radius)#server name ise1	Configures the RADIUS server name.
<b>Step 5</b>	<b>subscriber mac-filtering security-mode mac</b> <b>Example:</b> Device(config-sg-radius)#\$mac-filtering security-mode mac	Sets the MAC address as the password.
<b>Step 6</b>	<b>mac-delimiter colon</b> <b>Example:</b> Device(config-sg-radius)#mac-delimiter colon	Sets the MAC address delimiter to colon.
<b>Step 7</b>	<b>end</b> <b>Example:</b> Device(config-sg-radius)#end	Saves the configuration, exits configuration mode, and returns to privileged EXEC mode.
<b>Step 8</b>	<b>radius server <i>name</i></b> <b>Example:</b> Device(config)#radius server ISE1	Sets the RADIUS server name

	Command or Action	Purpose
<b>Step 9</b>	<b>address ipv4</b> <i>radius-server-ipaddress</i> <b>auth-port</b> <i>port-number</i> <b>acct-port</b> <i>port-number</i> <b>Example:</b> Device(config-radius-server)#address ipv4 209.165.201.1 auth-port 1635 acct-port 33	Configures the RADIUS server IP address authentication and accounting ports.

## Configuring 802.1x with Local Web Authentication

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wlan</b> <i>wlan-profile wlan-id ssid</i> <b>Example:</b> Device(config)# wlan testwprofile 22 ssid-3	Configures the WLAN and SSID.
<b>Step 3</b>	<b>security dot1x authentication-list</b> <i>default</i> <b>Example:</b> Device(config-wlan)# security dot1x authentication-list default	Configures 802.1X for an WLAN.
<b>Step 4</b>	<b>security web-auth authentication-list</b> <i>authenticate-list-name</i> <b>Example:</b> Device(config-wlan)# security web-auth authentication-list default	Enables authentication list for 802.1x security on the WLAN.
<b>Step 5</b>	<b>security web-auth parameter-map</b> <i>global</i> <b>Example:</b> Device(config-wlan)# security web-auth parameter-map global	Configures the global parameter map.
<b>Step 6</b>	<b>no shutdown</b> <b>Example:</b> Device(config-wlan)# no shutdown	Enables the WLAN.

## Configuring Local Web Authentication with PSK Protocol

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wlan wlan-profile wlan-id ssid</b> <b>Example:</b> Device(config)# wlan psksec-profile 22 ssid-4	Configures the WLAN and SSID.
<b>Step 3</b>	<b>no security wpa</b> <b>Example:</b> Device(config-wlan)# no security wpa	Disables WPA security.
<b>Step 4</b>	<b>no security wpa wpa2</b> <b>Example:</b> Device(config-wlan)# no security wpa wpa2	Disables WPA2 security.
<b>Step 5</b>	<b>no security wpa akm dot1x</b> <b>Example:</b> Device(config-wlan)# no security wpa akm dot1x	Disables security AKM for dot1x.
<b>Step 6</b>	<b>security wpa psk</b> <b>Example:</b> Device(config-wlan)# security wpa akm psk	Enables the security type as PSK.
<b>Step 7</b>	<b>security wpa psk set-key {ascii hex} key</b> <b>Example:</b> Device(config-wlan)# security wpa akm psk set-key ascii 0	Configures the PSK shared key.
<b>Step 8</b>	<b>security web-auth</b> <b>Example:</b> Device(config-wlan)# security web-auth	Enables the web authentication for the WLAN.
<b>Step 9</b>	<b>security web-auth authentication-list default</b> <b>Example:</b> Device(config-wlan)# security web-auth authentication-list default	Enables authentication list for the WLAN.

	Command or Action	Purpose
<b>Step 10</b>	<b>security web-auth parameter-map <i>global</i></b> <b>Example:</b> Device(config-wlan)# security web-auth parameter-map global	Configure the global parameter map.

## Central Web Authentication with PSK Protocol

To configure the CWA with PSK security protocol, follow the steps:

1. [Configure WLAN Profile for Central Web Authentication with PSK Protocol](#)
2. [Applying Policy Profile on a WLAN](#)

### Configure WLAN Profile for Central Web Authentication with PSK Protocol

#### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wlan <i>wlan-profile wlan-id ssid</i></b> <b>Example:</b> Device(config)# wlan cwasec-profile 27 ssid-5	Configures the WLAN and SSID.
<b>Step 3</b>	<b>no security wpa</b> <b>Example:</b> Device(config-wlan)# no security wpa	Disables WPA security.
<b>Step 4</b>	<b>no security wpa wpa2</b> <b>Example:</b> Device(config-wlan)# no security wpa wpa2	Disables WPA2 security.
<b>Step 5</b>	<b>no security wpa akm dot1x</b> <b>Example:</b> Device(config-wlan)# no security wpa akm dot1x	Disables security AKM for dot1x.
<b>Step 6</b>	<b>security wpa psk</b> <b>Example:</b> Device(config-wlan)# security wpa psk	Enables the security type as PSK.

	Command or Action	Purpose
<b>Step 7</b>	<b>security wpa psk set-key</b> { <i>ascii</i>   <i>hex</i> } <i>key</i> <b>Example:</b> Device(config-wlan)# security wpa psk set-key ascii 0	Configures the PSK shared key.
<b>Step 8</b>	<b>mac-filtering</b> <i>authorization_list_name</i> <b>Example:</b> Device(config-wlan)# mac-filtering cwa-list	Enables MAC filtering for PSK web authentication.

## Central Web Authentication with iPSK Protocol

To configure the CWA with iPSK security protocol, follow the steps:

1. [Configure WLAN Profile for Central Web Authentication with iPSK Protocol](#)

### Configure WLAN Profile for Central Web Authentication with iPSK Protocol

#### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>wlan</b> <i>guest-wlan-name wlan-id ssid</i> <b>Example:</b> config# wlan ipsk-cwa-profile 28 ssid-6	Configures guest WLAN.
<b>Step 2</b>	<b>no security wpa akm dot1x</b> <b>Example:</b> Device(config-wlan)# no security wpa akm dot1x	Disables security AKM for 802.1x.
<b>Step 3</b>	<b>security wpa akm psk set-key</b> { <i>ascii</i>   <i>hex</i> } <i>key</i> <b>Example:</b> Device(config-wlan)# security wpa akm psk set-key ascii 0	Configures the PSK AKM shared key.
<b>Step 4</b>	<b>mac-filtering</b> <i>authorization_list_name</i> <b>Example:</b> Device(config-wlan)# mac-filtering cwa-list	Enables MAC filtering for iPSK authentication.

## Configure Web Authentication on MAC Address Bypass failure (GUI)

### Procedure

- Step 1** Click **Configuration > Tags and Profiles > WLANs**.
- Step 2** Click **Add** to add a new WLAN Profile or click the one you want to edit.
- Step 3** In the **Edit WLAN** window, complete the following steps:
- Choose **Security > Layer2** and check the **MAC Filtering** check box to enable MAC filtering.
  - From the **Authorization List** drop-down list, select a value.
  - Choose the **Layer3** tab.
  - Click **Show Advanced Settings** and check the **On MAC Filter Failure** checkbox.

## Configure Web Authentication on MAC Address Bypass Failure (CLI)

You can configure authentication to fall back to web authentication, if a client cannot authenticate using MAC filter (Local or RADIUS), while trying to connect to a WLAN. To enable this feature, configure both MAC filtering and Web Authentication on the device. This can also avoid disassociations that happen only because of MAC filter authentication failure. To configure this feature, follow the procedure:

### Configure a Policy Profile

#### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wireless profile policy <i>policy-name</i></b>  <b>Example:</b> Device(config)# wireless profile policy cwa	Configures WLAN policy profile and enters the wireless policy configuration mode.
<b>Step 3</b>	<b>central switching</b>  <b>Example:</b> Device(config-wireless-policy)# central switching	Enables Central switching.
<b>Step 4</b>	Choose the first option to configure a Guest Foreign or second option to configure a Guest Anchor:  <ul style="list-style-type: none"> <li>• <b>mobility anchor <i>anchor-ip-address</i></b></li> <li>• <b>mobility anchor</b></li> </ul>	Configures Guest Foreign or Guest Anchor.

	Command or Action	Purpose
	<b>Example:</b> For Guests Foreign: <pre>Device (config-wireless-policy)# mobility anchor 19.0.2.1</pre> For Guest Anchor: <pre>Device (config-wireless-policy)# mobility anchor</pre>	
<b>Step 5</b>	<b>vlan name</b> <b>Example:</b> <pre>Device(config-wireless-policy)# vlan 16</pre>	Configures a VLAN name or VLAN ID. <b>Note</b> VLAN is optional for a Guest Foreign controller.
<b>Step 6</b>	<b>no shutdown</b> <b>Example:</b> <pre>Device (config-wireless-policy)# no shutdown</pre>	Enables the policy profile.

## Configure a WLAN Profile

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>wlan guest-wlan-name wlan-id ssid</b> <b>Example:</b> <pre>config# wlan test-wlan-guest 10 wlan-ssid</pre>	Configures guest WLAN.
<b>Step 2</b>	<b>mac-filtering mac-auth-listname</b> <b>authorization-override override-auth-listname</b> <b>Example:</b> <pre>config-wlan# mac-filtering mac-auth-listname authorization-override</pre>	Configures MAC filtering support on WLAN.
<b>Step 3</b>	<b>security web-auth</b> <b>Example:</b> <pre>config-wlan# security web-auth</pre>	Enables web authentication.
<b>Step 4</b>	<b>security web-auth on-macfilter-failure</b> <b>Example:</b> <pre>config-wlan# security web-auth on-macfilter-failure</pre>	Enables web authentication if MAC filter authentication fails.

## Configure WLAN for Web Authentication on MAC Authentication Bypass Failure with Pre-Shared Key (CLI)

### Procedure

	Command or Action	Purpose
Step 1	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
Step 2	<b>wlan profile-name wlan-id SSID_Name</b> <b>Example:</b> Device (config)# <b>wlan wlan-test 3 ssid-test</b>	Enters WLAN configuration submode. <ul style="list-style-type: none"> <li>• <i>profile-name</i>: Profile name of the configured WLAN.</li> <li>• <i>wlan-id</i>: Wireless LAN identifier. Range is from 1 to 512.</li> <li>• <i>SSID_Name</i>: SSID that can contain 32 alphanumeric characters.</li> </ul> <p><b>Note</b> If you have already configured this command, enter the <b>wlan profile-name</b> command.</p>
Step 3	<b>mac-filtering auth-list-name</b> <b>Example:</b> Device (config-wlan)# <b>mac-filtering test-auth-list</b>	Sets the MAC filtering parameters.
Step 4	<b>security wpa psk set-key ascii/hex key password</b> <b>Example:</b> Device (config-wlan)# <b>security wpa psk set-key ascii 0 PASSWORD</b>	Configures the PSK AKM shared key.
Step 5	<b>no security wpa akm dot1x</b> <b>Example:</b> Device (config-wlan)# <b>no security wpa akm dot1x</b>	Disables security AKM for dot1x.
Step 6	<b>security wpa akm psk</b> <b>Example:</b> Device (config-wlan)# <b>security wpa akm psk</b>	Configures PSK support.
Step 7	<b>security web-auth authentication-list authenticate-list-name</b>	Enables authentication list for dot1x security.

	Command or Action	Purpose
	<b>Example:</b> Device(config-wlan)# <b>security web-auth authentication-list default</b>	
<b>Step 8</b>	<b>security web-auth authorization-list authorize-list-name</b>  <b>Example:</b> Device(config-wlan)# <b>security web-auth authorization-list default</b>	Enables authorization list for dot1x security.
<b>Step 9</b>	<b>security web-auth on-macfilter-failure</b>  <b>Example:</b> Device(config-wlan)# <b>security web-auth on-macfilter-failure</b>	Enables web authentication on MAC filter failure.
<b>Step 10</b>	<b>security web-auth parameter-map parameter-map-name</b>  <b>Example:</b> Device(config-wlan)# <b>security web-auth parameter-map WLAN1_MAP</b>	Configures the parameter map.  <b>Note</b> If a parameter map is not associated with a WLAN, the configuration is considered from the global parameter map.
<b>Step 11</b>	<b>no shutdown</b>  <b>Example:</b> Device(config-wlan)# <b>no shutdown</b>	Enables the WLAN.

## Configure WLAN for Web Authentication on MAC Authentication Bypass Failure with OWE (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>wlan profile-name wlan-id SSID_Name</b>  <b>Example:</b> Device(config)# <b>wlan wlan-test 3 ssid-test</b>	Enters WLAN configuration submode. <ul style="list-style-type: none"> <li>• <i>profile-name</i>: Profile name of the configured WLAN.</li> <li>• <i>wlan-id</i>: Wireless LAN identifier. Range is from 1 to 512.</li> <li>• <i>SSID_Name</i>: SSID that can contain 32 alphanumeric characters.</li> </ul>

	Command or Action	Purpose
		<b>Note</b> If you have already configured this command, enter the <b>wlan profile-name</b> command.
<b>Step 3</b>	<b>mac-filtering</b> <i>auth-list-name</i>  <b>Example:</b> Device(config-wlan)# <b>mac-filtering test-auth-list</b>	Sets the MAC filtering parameters.
<b>Step 4</b>	<b>no security wpa akm dot1x</b>  <b>Example:</b> Device(config-wlan)# <b>no security wpa akm dot1x</b>	Disables security AKM for dot1x.
<b>Step 5</b>	<b>security wpa wpa3</b>  <b>Example:</b> Device(config-wlan)# <b>security wpa wpa3</b>	Enables WPA3 support.
<b>Step 6</b>	<b>security wpa akm owe</b>  <b>Example:</b> Device(config-wlan)# <b>security wpa akm owe</b>	Enables WPA3 OWE support.
<b>Step 7</b>	<b>security web-auth authentication-list</b> <i>authenticate-list-name</i>  <b>Example:</b> Device(config-wlan)# <b>security web-auth authentication-list default</b>	Enables authentication list for dot1x security.
<b>Step 8</b>	<b>security web-auth authorization-list</b> <i>authorize-list-name</i>  <b>Example:</b> Device(config-wlan)# <b>security web-auth authorization-list default</b>	Enables authorization list for dot1x security.
<b>Step 9</b>	<b>security web-auth on-macfilter-failure</b>  <b>Example:</b> Device(config-wlan)# <b>security web-auth on-macfilter-failure</b>	Enables web authentication on MAC filter failure.
<b>Step 10</b>	<b>security web-auth parameter-map</b> <i>parameter-map-name</i>  <b>Example:</b> Device(config-wlan)# <b>security web-auth parameter-map WLAN1_MAP</b>	Configures the parameter map.  <b>Note</b> If a parameter map is not associated with a WLAN, the configuration is considered from the global parameter map.

	Command or Action	Purpose
Step 11	<b>no shutdown</b> <b>Example:</b> Device (config-wlan) # <b>no shutdown</b>	Enables the WLAN.

## Configure WLAN for Web Authentication on MAC Authentication Bypass Failure with Secure Agile Exchange (CLI)

### Procedure

	Command or Action	Purpose
Step 1	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
Step 2	<b>wlan profile-name wlan-id SSID_Name</b> <b>Example:</b> Device (config) # <b>wlan wlan-test 3 ssid-test</b>	Enters WLAN configuration submenu. <ul style="list-style-type: none"> <li>• <i>profile-name</i>: Profile name of the configured WLAN.</li> <li>• <i>wlan-id</i>: Wireless LAN identifier. Range is from 1 to 512.</li> <li>• <i>SSID_Name</i>: SSID that can contain 32 alphanumeric characters.</li> </ul> <p><b>Note</b> If you have already configured this command, enter the <b>wlan profile-name</b> command.</p>
Step 3	<b>mac-filtering auth-list-name</b> <b>Example:</b> Device (config-wlan) # <b>mac-filtering test-auth-list</b>	Sets the MAC filtering parameters.
Step 4	<b>no security wpa akm dot1x</b> <b>Example:</b> Device (config-wlan) # <b>no security wpa akm dot1x</b>	Disables security AKM for dot1x.
Step 5	<b>security wpa wpa3</b> <b>Example:</b> Device (config-wlan) # <b>security wpa wpa3</b>	Enables WPA3 support.
Step 6	<b>security wpa akm sae</b> <b>Example:</b>	Enables AKM SAE support.

	Command or Action	Purpose
	Device(config-wlan)# security wpa akm sae	
<b>Step 7</b>	<b>security web-auth authentication-list</b> <i>authenticate-list-name</i>  <b>Example:</b> Device(config-wlan)# security web-auth authentication-list default	Enables authentication list for dot1x security.
<b>Step 8</b>	<b>security web-auth authorization-list</b> <i>authorize-list-name</i>  <b>Example:</b> Device(config-wlan)# security web-auth authorization-list default	Enables authorization list for dot1x security.
<b>Step 9</b>	<b>security web-auth on-macfilter-failure</b>  <b>Example:</b> Device(config-wlan)# security web-auth on-macfilter-failure	Enables web authentication on MAC filter failure.
<b>Step 10</b>	<b>security web-auth parameter-map</b> <i>parameter-map-name</i>  <b>Example:</b> Device(config-wlan)# security web-auth parameter-map WLAN1_MAP	Configures the parameter map.  <b>Note</b> If a parameter map is not associated with a WLAN, the configuration is considered from the global parameter map.
<b>Step 11</b>	<b>no shutdown</b>  <b>Example:</b> Device(config-wlan)# no shutdown	Enables the WLAN.

## Configuring WLAN for Web Authentication on MAC Authentication Failure with Dot1x (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wlan profile-name wlan-id SSID_Name</b>  <b>Example:</b> Device(config)# wlan wlan-test 3 ssid-test	Enters WLAN configuration submode.  • <i>profile-name</i> : Profile name of the configured WLAN.

	Command or Action	Purpose
		<ul style="list-style-type: none"> <li>• <i>wlan-id</i>: Wireless LAN identifier. Range is from 1 to 512.</li> <li>• <i>SSID_Name</i>: SSID that can contain 32 alphanumeric characters.</li> </ul> <p><b>Note</b> If you have already configured a WLAN, enter the profile name of the configured WLAN in the command (<i>wlan profile-name</i>) and continue with the rest of the configuration steps.</p>
<b>Step 3</b>	<b>mac-filtering</b> <i>auth-list-name</i> <b>Example:</b> Device(config-wlan)# <b>mac-filtering test-auth-list</b>	Sets the MAC filtering parameters.
<b>Step 4</b>	<b>security dot1x authentication-list</b> <i>dot1x-authentication-list</i> <b>Example:</b> Device(config-wlan)# <b>security dot1x authentication-list dot1x-authentication-list</b>	Configures 802.1x.
<b>Step 5</b>	<b>security web-auth authentication-list</b> <i>authenticate-list-name</i> <b>Example:</b> Device(config-wlan)# <b>security web-auth authentication-list default</b>	Enables the authentication list.
<b>Step 6</b>	<b>security web-auth on-macfilter-failure</b> <b>Example:</b> Device(config-wlan)# <b>security web-auth on-macfilter-failure</b>	Enables web authentication on MAC filter failure.
<b>Step 7</b>	<b>security web-auth parameter-map</b> <i>parameter-map-name</i> <b>Example:</b> Device(config-wlan)# <b>security web-auth parameter-map WLAN1_MAP</b>	Configures the web authentication parameter map.  <p><b>Note</b> If a parameter map is not associated with a WLAN, the configuration is considered from the global parameter map.</p>
<b>Step 8</b>	<b>no shutdown</b> <b>Example:</b> Device(config-wlan)# <b>no shutdown</b>	Enables the WLAN.

## Information About Wired Guest Access

The Wired Guest Access feature enables guest users of an enterprise network that supports both wired and wireless access to connect to the guest access network. The wired guest clients can connect from the designated and configured wired Ethernet ports for the guest access after they complete the configured authentication methods. Wired session guests are directed to a wireless guest controller in a demilitarized zone (DMZ) through a Control And Provisioning of Wireless Access Points (CAPWAP) tunnel.

Wired guest access can be configured in a dual-controller configuration that uses both an anchor controller and a foreign controller. A dual-controller configuration isolates wired guest access traffic from the enterprise user traffic.

The wired session guests are provided open or web-authenticated access from the wireless controller.

Figure 54: Guest Access Architecture

### IPv6 Router Advertisement Forwarding for a Wired Guest

Wired clients get the IPv6 based connectivity when they receive the IPv6 Router Advertisement (RA) message. The IPv6 router sends these RA messages and it contains information such as IPv6 prefix and router link-local address.

These RA messages are sent as Unicast or Multicast messages. The Unicast RA messages are routed as same as the client directed traffic. The Multicast RA messages are forwarded to all the clients present in the intended VLAN. RA message forwarding is enabled by default and requires no specific configuration.

**Guest Anchor Controller:** Guest anchor controller forwards the RA packets, from the receiving VLAN, to all the foreign controllers using the mobility data tunnel. The RA packets are tagged with the anchor VLAN to ensure the message is forwarded to the correct clients using the foreign controller data path.

**Guest Foreign Controller:** Guest foreign controller forwards the received RAs from the guest anchor to the wired ports on which the wired guest clients are connected. To forward the RAs to the intended clients, the guest foreign controller keeps a track of the wired guest clients—per interface, access VLANs, and anchor VLANs.

### Supported Features

- Cisco Catalyst 9800 Series Wireless Controllers-Anchor
- Cisco AireOS Wireless Controllers-Anchor
- Cisco Catalyst 9800 Series Wireless Controllers-Foreign
- Cisco AireOS Wireless Controllers-Foreign
- Dual controller solution (foreign + anchor) and access switch
- Trunk Ports
- Open Authentication
- Local Web Authentication

To configure Web Authentication, see [Web-based Authentication](#) section of the Cisco Catalyst 9800 Series Wireless Controller Software Configuration Guide.

- Local Web Authentication (web consent).

---

**Note** In AireOS, this is referred to as **web pass-through**.

---

- Local Web Authentication + ISE (External Web Authentication).
- LWA (local web authentication), with a username and a password.
- Web consent (LWA + consent), that is with a username, a password and the check box of acceptance.
- Scale max 2k clients and 5 guest-LANs (5 VLANs max)
- Client IPv6 support
- Idle Timeout and Session Timeout
- Accounting on Foreign

---

**Note** Statistics computation not supported.

---

- Manageability (SNMP/Yang/WebUI)
- QoS Rate-Limiting and MQC Policies (Upstream at foreign, Upstream, and Downstream at the anchor)

---

**Note** QoS rate-limiting supports bps rate-limiting, pps rate-limiting is not supported.

---

- QoS support with AireOS Anchor setup
- Stateful Switch Over (SSO)
- Port Channel support on Anchor and Foreign with no restrictions to the controller's role.
- Access Port on Foreign
- Cisco Umbrella (not supported in AireOS Anchor)
- ACL support at anchor
- Fully Qualified Domain Name (FQDN) URL filtering is supported at Anchor controller.
- IP theft detection
- Sleeping Client

## Restrictions for Wired Guest Access

- A maximum of five guest LANs are supported on the foreign controller.
- A maximum of 2000 clients per foreign are supported.
- No Multicast or Broadcast support.
- You can map only one wired VLAN to a guest LAN.
- You can map only one guest LAN to one policy profile.
- Every guest LAN has a unique name and this name cannot be shared with RLAN or WLAN.
- Ensure that the Anchor VLAN ID and the wired VLAN ID configured on the Foreign controller is not the same.
- QoS is not supported on VLAN and on physical interfaces of the controller.

## Configuring Access Switch for Wired Guest Client

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>vlan <i>vlan-id</i></b> <b>Example:</b> Device(config)# <code>vlan 200</code>	Creates the VLAN ID.
<b>Step 3</b>	<b>exit</b> <b>Example:</b> Device(config)# <code>exit</code>	Returns to configuration mode.
<b>Step 4</b>	<b>interface GigabitEthernet<i>interface number</i></b> <b>Example:</b> Device(config)# <code>interface GigabitEthernet1/0/1</code>	Enters the interface to be added to the VLAN.
<b>Step 5</b>	<b>switchport access vlan <i>vlan-id</i></b> <b>Example:</b> Device(config-if)# <code>switchport access vlan 200</code>	Assigns the port to a VLAN. The valid VLAN IDs range is between 1 and 4094.

	Command or Action	Purpose
<b>Step 6</b>	<b>switchport mode access</b> <b>Example:</b> Device(config-if)#switchport mode access	Defines the VLAN membership mode for the port.
<b>Step 7</b>	<b>no cdp enable</b> <b>Example:</b> Device(config-if)#no cdp enable	Disables CDP on the interface.
<b>Step 8</b>	<b>end</b> <b>Example:</b> Device(config-if)#end	Saves the configuration and exits configuration mode and returns to privileged EXEC mode.

## Configuring Access Switch for Foreign Controller

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>vlan <i>vlan-id</i></b> <b>Example:</b> Device(config)#vlan 200	Creates the VLAN ID.
<b>Step 3</b>	<b>exit</b> <b>Example:</b> Device(config)#exit	Returns to configuration mode.
<b>Step 4</b>	<b>interface GigabitEthernet<i>interface number</i></b> <b>Example:</b> Device(config)#interface GigabitEthernet1/0/2	Enters the interface to be added to the VLAN.
<b>Step 5</b>	<b>switchport trunk allowed vlan <i>vlan-id</i></b> <b>Example:</b> Device(config-if)#switchport trunk allowed vlan 200	Assigns the allowed VLAN ID to the port when it is in trunking mode.
<b>Step 6</b>	<b>switchport mode trunk</b> <b>Example:</b> Device(config-if)#switchport mode trunk	Sets the trunking mode to trunk unconditionally.

	Command or Action	Purpose
<b>Step 7</b>	<b>end</b>  <b>Example:</b> Device(config-if)#end	Saves the configuration and exits configuration mode and returns to privileged EXEC mode.

## Configuring Foreign Controller with Open Authentication (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Tags & Profiles > Policy**.
  - Step 2** Click on a **Policy Name**.
  - Step 3** Go to the **Mobility** tab.
  - Step 4** In the **Mobility Anchors** section, check the **Export Anchor** check box.
  - Step 5** Click **Apply to Device**.
  - Step 6** Choose **Configuration > Wireless > Guest LAN > Guest LAN Configuration**
  - Step 7** Click **Add**.
  - Step 8** In the **General** tab, enter the **Profile Name**, **Guest LAN ID**, **Client Association Limit**.
  - Step 9** Choose the desired mode from the **mDNS Mode** drop-down list.
  - Step 10** Enable or disable the **Status** and **Wired VLAN Status** toggle button.
  - Step 11** In the **Security** tab, disable the **Web Auth** toggle button.
  - Step 12** Click **Apply to Device**.
  - Step 13** Choose **Configuration > Wireless > Guest LAN > Guest LAN Map Configuration**
  - Step 14** Click **Add Map**.
  - Step 15** In the Add Guest LAN Map window, enter the **Guest LAN Map**.
  - Step 16** Click **Apply to Device**.
  - Step 17** Click **Add**.
  - Step 18** Choose the values from the **Profile Name** and **Policy Name** drop-down lists.
  - Step 19** Click **Save**.
- 

## Configuring Foreign Controller with Open Authentication

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.

	Command or Action	Purpose
Step 2	<b>wireless profile policy</b> <i>wlan-policy-profile-name</i>  <b>Example:</b> <pre>Device(config)#wireless profile policy testpro-1</pre>	Configures the WLAN policy profile.
Step 3	<b>mobility anchor</b> <i>non-local-mobility-ctrlr-ip</i> <b>priority</b> <i>priority</i>  <b>Example:</b> <pre>Device(config-wireless-policy)#mobility anchor 192.168.201.111 priority 1</pre>	Configures the mobility anchor and sets its priority.
Step 4	<b>no shutdown</b>  <b>Example:</b> <pre>Device(config-wireless-policy)#no shutdown</pre>	Enables the configuration.
Step 5	<b>exit</b>  <b>Example:</b> <pre>Device(config-wireless-policy)#exit</pre>	Returns to configuration mode.
Step 6	<b>guest-lan profile-name</b> <i>guest-profile-name</i> <i>guest-lan-id</i> <b>wired-vlan</b> <i>wired-vlan-id</i>  <b>Example:</b> <pre>Device(config)#guest-lan profile-name gstpro-1 1 wired-vlan 25</pre>	Configures guest LAN profile with a wired VLAN.  <b>Note</b> Configure the wired VLAN only for the Guest Foreign controller.
Step 7	<b>no security web-auth</b>  <b>Example:</b> <pre>Device(config-guest-lan)#no security web-auth</pre>	Disables web-authentication.
Step 8	<b>no shutdown</b>  <b>Example:</b> <pre>Device(config-guest-lan)#no shutdown</pre>	Enables the guest LAN.
Step 9	<b>exit</b>  <b>Example:</b> <pre>Device(config-guest-lan)#exit</pre>	Returns to configuration mode.
Step 10	<b>wireless guest LAN map</b> <i>gst-map-name</i>  <b>Example:</b> <pre>Device(config)#wireless guest LAN map gstmap-1</pre>	Configures a guest LAN map.

	Command or Action	Purpose
<b>Step 11</b>	<b>guest-lan</b> <i>guest-profile-name</i> <b>policy</b> <i>wlan-policy-profile-name</i>  <b>Example:</b> Device (config-guest-lan-map) #guest-lan gstpro-1 policy testpro-1	Attaches a guest LAN map to the policy profile.
<b>Step 12</b>	<b>exit</b>  <b>Example:</b> Device (config-guest-lan-map) #exit	Returns to configuration mode.

## Configuring Foreign Controller with Local Web Authentication (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Tags & Profiles > Policy**.
  - Step 2** Select a **Policy Name**.
  - Step 3** Go to the **Mobility** tab.
  - Step 4** In the **Mobility Anchors** section, check the **Export Anchor** check box.
  - Step 5** Click **Update & Apply to Device**.
  - Step 6** Choose **Configuration > Wireless > Guest LAN > Guest LAN Configuration**
  - Step 7** Click **Add**.
  - Step 8** In the **General** tab, enter the **Profile Name**, **Guest LAN ID**, **Client Association Limit**.
  - Step 9** Choose the desired mode from the **mDNS Mode** drop-down list.
  - Step 10** Enable or disable the **Status** and **Wired VLAN Status** using toggle button.
  - Step 11** Go to the **Security** tab.
  - Step 12** Enable the **Web Auth** using toggle button.
  - Step 13** Choose the values from the **Web Auth Parameter Map**, **Authentication List** and **Authorization List** drop-down lists.
  - Step 14** Click **Apply to Device**.
  - Step 15** Choose **Configuration > Wireless > Guest LAN > Guest LAN Map Configuration**
  - Step 16** Click **Add Map**.
  - Step 17** In the Add Guest LAN Map window, enter the **Guest LAN Map**.
  - Step 18** Click **Apply to Device**.
  - Step 19** Click **Add**.
  - Step 20** Choose the values from the **Profile Name** and **Policy Name** drop-down lists.
  - Step 21** Click **Save**.
-

# Configuring Foreign Controller with Local WEB Authentication

## Procedure

	Command or Action	Purpose
Step 1	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
Step 2	<b>wireless profile policy</b> <i>wlan-policy-profile-name</i> <b>Example:</b> Device(config)#wireless profile policy testpro-1	Configures the WLAN policy profile.
Step 3	<b>mobility anchor</b> <i>non-local-mobility-cntlr-ip</i> <b>priority</b> <i>priority</i> <b>Example:</b> Device(config-wireless-policy)#mobility anchor 192.168.201.111 priority 1	Configures the mobility anchor and sets its priority.
Step 4	<b>no shutdown</b> <b>Example:</b> Device(config-wireless-policy)#no shutdown	Enables the configuration.
Step 5	<b>exit</b> <b>Example:</b> Device(config-wireless-policy)#exit	Returns to configuration mode.
Step 6	<b>guest-lan profile-name</b> <i>guest-profile-name</i> <i>guest-lan-id</i> <b>wired-vlan</b> <i>wired-vlan-id</i> <b>Example:</b> Device(config)#guest-lan profile-name gstpro-2 3 wired-vlan 26	Configures guest LAN profile with a wired VLAN.
Step 7	<b>security web-auth</b> <b>Example:</b> Device(config-guest-lan)#security web-auth	Enables web-authentication.
Step 8	<b>security web-auth authentication-list</b> <i>auth-list-name</i> <b>Example:</b> Device(config-guest-lan)#security web-auth authentication-list default	Configures the authentication list for a IEEE 802.1x network.

	Command or Action	Purpose
<b>Step 9</b>	<b>security web-auth parameter-map</b> <i>parameter-map-name</i>  <b>Example:</b> Device(config-guest-lan)#security web-auth parameter-map global	Configures the security web-auth parameter map.
<b>Step 10</b>	<b>no shutdown</b>  <b>Example:</b> Device(config-guest-lan)#no shutdown	Enables the guest LAN.
<b>Step 11</b>	<b>exit</b>  <b>Example:</b> Device(config-guest-lan)#exit	Returns to configuration mode.
<b>Step 12</b>	<b>wireless guest-lan map</b> <i>gst-map-name</i>  <b>Example:</b> Device(config)#wireless guest-lan map gstmap-2	Configures a guest LAN map.
<b>Step 13</b>	<b>guest-lan</b> <i>guest-lan-profile-name</i> <b>policy</b> <i>policy-profile-name</i>  <b>Example:</b> Device(config-guest-lan-map)#guest-lan gstpro-2 policy testpro-1	Attaches a guest LAN map to the policy profile.
<b>Step 14</b>	<b>exit</b>  <b>Example:</b> Device(config-guest-lan-map)#exit	Returns to configuration mode.

**What to do next**

For more information about Local Web Authentication, see [https://www.cisco.com/c/en/us/td/docs/wireless/controller/9800/config-guide/b\\_wl\\_16\\_10\\_cg/wireless-web-authentication.html](https://www.cisco.com/c/en/us/td/docs/wireless/controller/9800/config-guide/b_wl_16_10_cg/wireless-web-authentication.html)

## Configuring Anchor Controller with Open Authentication (GUI)

**Procedure**

- 
- Step 1** Choose **Configuration > Tags & Profiles > Policy**.
  - Step 2** Click **Add**.
  - Step 3** In the **General** tab, enter the **Name**.
  - Step 4** Go to the **Access Policies** tab.
  - Step 5** Under the **VLAN** settings, choose the vlans from the **VLAN/VLAN Group** drop-down list.

- Step 6** Go to the **Mobility** tab.
- Step 7** Under the **Mobility Anchors** settings, check the **Export Anchor** check box.
- Step 8** Click **Apply to Device**.
- Step 9** Choose **Configuration > Wireless > Guest LAN**.
- Step 10** Click **Add**.
- Step 11** In the **General** tab, enter the **Profile Name**, the **Guest LAN ID** and the **Client Association Limit**.
- Step 12** In the **Security** tab, under the **Layer3** settings, disable the **Web Auth** toggle button.
- Step 13** Click **Apply to Device**.

## Configuring Anchor Controller with Open Authentication

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wireless profile policy</b> <i>wlan-policy-profile-name</i> <b>Example:</b> Device(config)#wireless profile policy testpro-2	Configures the WLAN policy profile.
<b>Step 3</b>	<b>mobility anchor</b> <b>Example:</b> Device(config-wireless-policy)#mobility anchor	Configures the mobility anchor.
<b>Step 4</b>	<b>vlan <i>vlan-id</i></b> <b>Example:</b> Device(config-wireless-policy)#vlan 29	Configure a VLAN name or a VLAN ID.
<b>Step 5</b>	<b>no shutdown</b> <b>Example:</b> Device(config-wireless-policy)#no shutdown	Enables the configuration.
<b>Step 6</b>	<b>exit</b> <b>Example:</b> Device(config-wireless-policy)#exit	Returns to configuration mode.

	Command or Action	Purpose
<b>Step 7</b>	<b>guest-lan profile-name</b> <i>guest-profile-name</i> <i>guest-lan-id</i>  <b>Example:</b> Device (config) #guest-lan profile-name testpro-2 1	Configures the guest LAN profile with a wired VLAN.
<b>Step 8</b>	<b>client association limit</b> <i>guest-lan-client-limit</i>  <b>Example:</b> Device (config-guest-lan) #client association limit	Configures the maximum client connections per guest LAN. The valid range is between 1 and 2000.
<b>Step 9</b>	<b>no security web-auth</b>  <b>Example:</b> Device (config-guest-lan) #no security web-auth	Disables web authentication.
<b>Step 10</b>	<b>no shutdown</b>  <b>Example:</b> Device (config-guest-lan) #no shutdown	Enables the guest LAN.
<b>Step 11</b>	<b>exit</b>  <b>Example:</b> Device (config-guest-lan) #exit	Returns to configuration mode.

## Configuring Anchor Controller with Local Web Authentication (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Tags & Profiles > Policy**.
  - Step 2** Click **Add**.
  - Step 3** In the **General** tab, enter the **Name**.
  - Step 4** Go to the **Access Policies** tab.
  - Step 5** Under the **VLAN** settings, choose the vlans from the **VLAN/VLAN Group** drop-down list.
  - Step 6** Go to the **Mobility** tab.
  - Step 7** Under the **Mobility Anchors** settings, check the **Export Anchor** check box.
  - Step 8** Click **Apply to Device**.
  - Step 9** Choose **Configuration > Wireless > Guest LAN**.
  - Step 10** Click **Add**.
  - Step 11** In the **General** tab, enter the **Profile Name**, the **Guest LAN ID** and the **Client Association Limit**.

- Step 12** In the **Security** tab, under the **Layer3** settings, enable the **Web Auth** toggle button. Choose the Parameter map from the **Web Auth Parameter Map** drop-down list and the authentication list from the **Authentication List** drop-down list.
- Step 13** Click **Apply to Device**.

## Configuring Anchor Controller with Local Web Authentication

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wireless profile policy</b> <i>wlan-policy-profile-name</i> <b>Example:</b> Device(config)#wireless profile policy testpro-2	Configures the WLAN policy profile.
<b>Step 3</b>	<b>mobility anchor</b> <b>Example:</b> Device(config-wireless-policy)#mobility anchor	Configures the mobility anchor.
<b>Step 4</b>	<b>vlan</b> <i>vlan-id</i> <b>Example:</b> Device(config-wireless-policy)#vlan 30	Configure a VLAN name or a VLAN ID.
<b>Step 5</b>	<b>no shutdown</b> <b>Example:</b> Device(config-wireless-policy)#no shutdown	Enables the configuration.
<b>Step 6</b>	<b>exit</b> <b>Example:</b> Device(config-wireless-policy)#exit	Returns to configuration mode.
<b>Step 7</b>	<b>guest-lan profile-name</b> <i>guest-profile-name</i> <i>guest-lan-id</i> <b>Example:</b> Device(config)#guest-lan profile-name testpro-2 1	Configure a guest LAN profile with a wired VLAN.

	Command or Action	Purpose
<b>Step 8</b>	<b>client association limit</b> <i>guest-lan-client-limit</i> <b>Example:</b> Device (config-guest-lan) #client association limit	Configures the maximum client connections per guest LAN. The valid range is between 1 and 2000.
<b>Step 9</b>	<b>security web-auth</b> <b>Example:</b> Device (config-guest-lan) #security web-auth	Configures web authentication.
<b>Step 10</b>	<b>security web-auth parameter-map</b> <i>parameter-map-name</i> <b>Example:</b> Device (config-guest-lan) #security web-auth parameter-map testmap-1	Configures the security web-auth parameter map.
<b>Step 11</b>	<b>security web-auth authentication-list</b> <i>authentication-list-name</i> <b>Example:</b> Device (config-guest-lan) #security web-auth authentication-list testlwa-1	Configures the authentication list for the IEEE 802.1x network.
<b>Step 12</b>	<b>no shutdown</b> <b>Example:</b> Device (config-guest-lan) #no shutdown	Enables the guest-LAN.
<b>Step 13</b>	<b>exit</b> <b>Example:</b> Device (config-guest-lan) #exit	Returns to configuration mode.

## Configuring Session Timeout for a Profile Policy

Session Timeout for a wired guest is set to infinite by default. Perform the following procedure to configure the timeout values to the wired guest.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wireless profile policy</b> <i>wlan-policy-profile-name</i>	Configures the WLAN policy profile.

	Command or Action	Purpose
	<b>Example:</b> Device(config)#wireless profile policy testpol-1	
<b>Step 3</b>	<b>guest-lan enable-session-timeout</b>  <b>Example:</b> Device(config-wireless-policy)#guest-lan enable-session-timeout	Enables the client session timeout on the guest LAN.
<b>Step 4</b>	<b>session-timeout <i>timeout-duration</i></b>  <b>Example:</b> Device(config-wireless-policy)#session-timeout 1000	Configures the client session timeout in seconds. The valid range is between 0 and 86400 seconds.

## Global Configuration (GUI)

### Procedure

- 
- Step 1** Choose **Administration > User Administration**.
  - Step 2** Click **Add**.
  - Step 3** Enter the **Username**, **Password** and **Confirm Password**.
  - Step 4** Choose the desired value from the **Policy** and **Privilege** drop-down lists.
  - Step 5** Click **Apply to Device**.
  - Step 6** Choose **Administration > Management > HTTP/HTTPS/Netconf**.
  - Step 7** In the **HTTP/HTTPS Access Configuration** settings, enable or disable the **HTTP Access**, **HTTPS Access** and **Personal Identity Verification** toggle buttons.
  - Step 8** Enter the **HTTP Port** and **HTTPS Port**.
  - Step 9** Click **Apply**.
- 

## Verifying Wired Guest Configurations

To validate the wireless configuration, use the following command:

```
Device# wireless config validate
```

```
Wireless Management Trustpoint Name: 'WLC-29c_WLC_TP'
Trustpoint certificate type is WLC-SSC
Wireless management trustpoint config is valid
```

```
Jan 22 07:49:15.371: %CONFIG_VALIDATOR_MESSAGE-5-EWLC_GEN_ERR: Chassis 1 R0/0: wncmgrd:
Error in No record found for VLAN 9, needed by Guest-LAN open-wired
```

To display the summary of all Guest-LANs, use the following command:

Device# **show guest-lan summary**

Number of Guest LANs: 1

GLAN	GLAN Profile Name	Status
1	wired_guest_open	UP

To view the detailed output of all Guest-LANs, use the following command:

Device# **show guest-lan all**

```

Guest-LAN Profile Name : open
=====
Guest-LAN ID : 1
Wired-Vlan : 200
Status : Enabled
Number of Active Clients : 1
Max Associated Clients : 2000
Security
 WebAuth : Enabled
 Webauth Parameter Map : global
 Webauth Authentication List : LWA-AUTHENTICATION
 Webauth Authorization List : LWA-AUTHENTICATION

```

To view the guest-LAN configuration by ID, use the following command:

Device# **show guest-lan id 1**

```

Guest-LAN Profile Name : open
=====
Guest-LAN ID : 1
Wired-Vlan : 200
Status : Enabled
Number of Active Clients : 1
Max Associated Clients : 2000
Security
 WebAuth : Enabled
 Webauth Parameter Map : global
 Webauth Authentication List : LWA-AUTHENTICATION
 Webauth Authorization List : LWA-AUTHENTICATION

```

To view the guest-LAN configuration by profile name, use the following command:

Device# **show guest-lan name open**

```

Guest-LAN Profile Name : open
=====
Guest-LAN ID : 1
Wired-Vlan : 200
Status : Enabled
Number of Active Clients : 1
Max Associated Clients : 2000
Security
 WebAuth : Enabled
 Webauth Parameter Map : global
 Webauth Authentication List : LWA-AUTHENTICATION
 Webauth Authorization List : LWA-AUTHENTICATION

```

To view the guest-LAN map summary, use the following command:

Device# **show wireless guest-lan-map summary**

Number of Guest-Lan Maps: 2

WLAN Profile Name	Policy Name
open_wired_guest	open_wired_guest
lwa_wired_guest	lwa_wired_guest

To view the active clients, use the following command:

Device# **show wireless client summary**

Number of Local Clients: 1

MAC Address	AP Name	Type	ID	State
Protocol Method	Role			
000a.bd15.0001	N/A	GLAN	1	Run
802.3	Web Auth	Export		Foreign

To view the detailed information about a client by MAC address, use the following command:

Device# **show wireless client mac-address 3383.0000.0001 detail**

```
Client MAC Address : 3383.0000.0001
Client IPv4 Address : 155.165.152.151
Client Username: N/A
AP MAC Address: N/A
AP slot : N/A

## Wired Guest Access—Use Cases

This feature while performing as a guest access feature can be used to meet different requirements. Some of the possibilities are shared here.

### Scenario One—Equipment Software Update

This feature can be configured to allow the wired port to connect to the manufacture or vendor website for equipment maintenance, software, or firmware updates.

### Scenario Two—Video Streaming

This feature can be configured to allow devices that are connected to a wired port to stream video to visitor information screens.

## CHAPTER 192

# User Defined Network

---

- [Information About User Defined Network, on page 2173](#)
- [Restrictions for User Defined Network, on page 2175](#)
- [Configuring a User Defined Network, on page 2175](#)
- [Configuring a User Defined Network \(GUI\), on page 2177](#)
- [Verifying User Defined Network Configuration, on page 2177](#)

## Information About User Defined Network

A user defined network (UDN) is a solution that is aimed at providing secure and remote on-boarding of devices in shared service environments like dormitory rooms, resident halls, class rooms and auditoriums. This solution allows users to securely use Simple Discovery Protocols (SDP) like Apple Bonjour and mDNS-based protocols (Air Play, Air Print, Screen Cast, Print, and so on.), and UPnP based protocols to interact and share information with only their registered devices in a shared environment. It also enables the users to share their devices and resources with friends and roommates securely.

The UDN solution provides an easy way to create a virtual segment that allows user to create a private segment to add their devices. Traffic (unicast, non-Layer 3 multicast, or broadcast) to these devices can be seen only by other devices and users in the private segment. This feature also eliminates the security concern where users knowingly or unknowingly take control of devices that belong to other users in a shared environment. As of now, the UDN is supported only in local mode.

Figure 55: User Defined Network Topology

### User Defined Network Solution Workflow

- User Defined Network is enabled on the controller, using policy profile, and the policy configuration is pushed to all the WLANs on a site.
- User Defined Network association is automatically generated by the UDN cloud service and is inherited by all the devices belonging to an user.
- Users can add or modify devices to the User Defined Network assigned to them by using a web portal or a mobile application. Users can also add devices to another User Defined Network, if they are invited to join that User Defined Network.
- The controller is updated with the client or resource information assigned to the User Defined Network.

**Note** Cisco Identity Services Engine (ISE) policy infrastructure is not used to update User Defined Network information. Whenever, there is a change in the User Defined Network, the ISE updates the controller with an explicit or a separate Change of Authorization (CoA) containing only the change of the User Defined Network ID.

## Restrictions for User Defined Network

- A user can be associated to only one UDN.
- Roaming across controllers is not supported.
- This feature is not applicable for Cisco Mobility Express and Cisco AireOS platforms. Hence, IRCM is not supported.
- This feature is supported only in local mode on the Wave 2 access points and Cisco Catalyst 9100 series access points.
- This feature is supported only for centrally switched SSIDs.
- This feature is not supported for Flex mode APs.
- This feature is not supported for Fabric SSIDs.
- This feature is not supported for Guest Anchor scenario.
- Layer 2 and Layer 3 roaming is not supported.
- Layer 3 multicast (except SSDP/UPnP) containment using UDN is not supported, L3 multicast will continue to work as it is today.
- It is not recommended to enable user-defined **drop unicast** option in GUI if UDN is disabled.
- It is recommended to disable UDN from policy profile in SSIDs when integrating UDN+ solution with Cisco exclusive partner [Splash Access](#).

---

**Note** The UDN+ simplifies the solution and brings the same unique user experience for both Meraki and Cisco Catalyst 9800 Series Wireless Controller based deployments.

---

## Configuring a User Defined Network

The User Defined Network configuration is site based and is added as part of a policy profile. When applied, the policy is enforced to all the clients or devices in a network for a site, across WLANs.

When enabled, the policy profile also enforces the filtering of mDNS queries based on the UDN-ID.

### Before you begin

- RADIUS server should be configured for the UDN solution to work.
- Configure aaa-override in the policy profile.

**Procedure**

	<b>Command or Action</b>	<b>Purpose</b>
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wireless profile policy <i>profile-name</i></b> <b>Example:</b> Device(config)# wireless profile policy policy-wpn	Creates a policy profile. <i>profile-name</i> is the profile name of the policy profile.
<b>Step 3</b>	<b>user-defined-network</b> <b>Example:</b> Device(config-wireless-policy)# user-defined-network	Enables user defined private-network.
<b>Step 4</b>	<b>user-defined-network drop-unicast</b> <b>Example:</b> Device(config-wireless-policy)# user-defined-network drop-unicast	Sets action to drop unicast traffic. By default, unicast traffic is allowed across UDN.
<b>Step 5</b>	<b>exit</b> <b>Example:</b> Device(config-wireless-policy)# exit	Enters global configuration mode.
<b>Step 6</b>	<b>ap remote-lan-policy policy-name</b> <i>policy-name</i> <b>Example:</b> Device(config)# ap remote-lan-policy policy-name policy-wpn	Configures a remote LAN policy profile.
<b>Step 7</b>	<b>user-defined-network</b> <b>Example:</b> Device(config-remote-lan-policy)# user-defined-network	Enables user defined private-network.
<b>Step 8</b>	<b>user-defined-network drop-unicast</b> <b>Example:</b> Device(config-remote-lan-policy)# user-defined-network drop-unicast	Sets action to drop unicast traffic.

# Configuring a User Defined Network (GUI)

## Procedure

- 
- Step 1** Choose **Configuration > Tags & Profiles > Policy**.
  - Step 2** In the **Policy Profile** window, select a policy profile.
  - Step 3** In the **Edit Policy Profile** window, click the **Advanced** tab.
  - Step 4** In the **User Defined Network** section, check the **Status** check box to enable a user personal network.
  - Step 5** Check the **Drop Unicast** check box to set the action to Drop Unicast traffic.  
By default, unicast traffic is not contained.
- 

## Verifying User Defined Network Configuration

To view the status of the UDN feature (either enabled or disabled) and also information about the drop unicast flag, use the following command:

```
Device# show wireless profile policy detailed default-policy-profile

User Defined (Private) Network : Enabled
User Defined (Private) Network Unicast Drop : Enabled
```

To view the name of the UDN to which the client belongs, use the following command:

```
Device# show wireless client mac-address 00:0d:ed:dd:35:80 detailed

User Defined (Private) Network : Enabled
User Defined (Private) Network Drop Unicast : Enabled
 Private group name: upn*group*7
 Private group id : 7777
 Private group owner: 1
 Private group name: upn*group*7
 Private group id : 7777
 Private group owner:
```

To view the UDN payload sent from an AP to the controller, use the following command:

```
Device# show wireless stats client detail | inc udn

Total udn payloads sent : 1
```

When mDNS gateway is enabled on the controller, the mDNS services are automatically filtered based on the user private network ID for all the clients on the WLANs where user private network is enabled.

To view the service instances of a private network, use the following command:

```
Device# show mdns-sd cache udn 7777 detail

Name: _services._dns-sd._udp.local
Type: PTR
TTL: 4500
WLAN: 2
```

```

WLAN Name: mdns-psk
VLAN: 16
Client MAC: f4f9.51e2.a6a6
AP Ethernet MAC: 002a.1087.d68a
Remaining-Time: 4486
Site-Tag: default-site-tag
mDNS Service Policy: madhu-mDNS-Policy
Overriding mDNS Service Policy: NO
UDN-ID: 7777
UDN-Status: Enabled
Rdata: _airplay._tcp.local
.
.
.

```

To view the service instances that are learnt from a shared UDN ID, use the following command:

```
Device# show mdns-sd cache udn shared
```

```

## CHAPTER 193

# Hotspot 2.0

---

- [Introduction to Hotspot 2.0, on page 2181](#)
- [Open Roaming, on page 2183](#)
- [Configuring Hotspot 2.0, on page 2185](#)

## Introduction to Hotspot 2.0

The Hotspot 2.0 feature enables IEEE 802.11 devices to interwork with external networks. The interworking service aids network discovery and selection, enabling information transfer from external networks. It provides information to the stations about the networks before association.

Interworking not only helps users within the home, enterprise, and public access domains, but also assists manufacturers and operators to provide common components and services for IEEE 802.11 customers. These services are configured on a per-WLAN basis on the Cisco Wireless Controller (controller).

Hotspot 2.0, also known as HS2 and Wi-Fi Certified Passpoint, is based on the IEEE 802.11u and Wi-Fi Alliance Hotspot 2.0 standards. It seeks to provide better bandwidth and services-on-demand to end users. The Hotspot 2.0 feature allows mobile devices to join a Wi-Fi network automatically, including during roaming, when the devices enter the Hotspot 2.0 area.

The Hotspot 2.0 feature has four distinct parts:

- **Hotspot 2.0 Beacon Advertisement:** Allows a mobile device to discover Hotspot 2.0-compatible and 802.11u-compatible WLANs.
- **Access Network Query Protocol (ANQP) Queries:** Sends queries about the networks from IEEE 802.11 devices, such as network type (private or public); connectivity type (local network, internet connection, and so on), or the network providers supported by a given network.
- **Online Sign-up:** Allows a mobile device to obtain credentials to authenticate itself with the Hotspot 2.0 or WLAN.
- **Authentication and Session Management:** Provides authentication (802.1x) and management of the STA session (session expiration, extension, and so on).

In order to mark a WLAN as Hotspot 2.0-compatible, the 802.11u-mandated information element and the Hotspot 2.0 information element is added to the basic service set (BSS) beacon advertised by the corresponding AP, and in WLAN probe responses.

**Note** The Hotspot 2.0 feature supports only local mode or FlexConnect mode (central switching and central authentication).

FlexConnect local switching is only supported when the Open Roaming configuration template is set up using the **wireless hotspot anqp-server server-name type open-roaming** command. If the configuration diverges from this template, FlexConnect local switching will not be supported.

The following figure shows a standard deployment of the Hotspot 2.0 network architecture:

**Figure 56: Hotspot 2.0 Deployment Topology**

## Hotspot 2.0 Enhancements

From Cisco IOS XE Amsterdam 17.3.1, the Hotspot 2.0 feature has been enhanced with the following options:

- New ANQP elements:
  - Advice of charge: Provides information on the financial charges for using the SSID of the NAI realm
  - Operator icon metadata
  - Venue URL: Defines an optional URL for each of the configured venue names
- Introduction of Terms and Conditions: This requires a user to accept certain Terms and Conditions before being allowed internet access, after connecting to a Hotspot SSID.
- Integration of OSEN security and WPA2 security on the same SSID.

From Cisco IOS XE Amsterdam 17.3.1 onwards, two encryption methods are supported on a single SSID, namely WPA2 802.1x for Hotspot 2.0 and OSEN for online sign-up. Based on the type of encryption selected during client association, the client will be put on Hotspot 2.0 VLAN or online sign-up VLAN.

In WPA2 802.1x authentication, a client should match the credentials provisioned on a device. In online sign-up, a service provider WLAN is used by a client to perform online sign-up. For Hotspot 2.0 SSIDs, the RADIUS server enforces the terms and conditions before allowing internet connectivity to clients.

This release also supports OSEN-specific VLAN in a policy profile. If an OSEN VLAN is defined in a policy profile, OSEN clients are added to the VLAN. Otherwise, clients are added to the regular policy profile VLAN.

or to the default VLAN. If OSEN is enabled with WPA2 on an SSID, it is mandatory to define an OSEN VLAN in the policy profile. Otherwise, clients cannot join the VLAN.

In FlexConnect mode, if an OSEN VLAN is defined in a policy profile, the same VLAN needs to be added to the flex profile. Failing to do so excludes the clients from the VLAN.

**Note** When Hotspot 2.0 is enabled in a WLAN, the Wi-Fi direct clients that support cross-connect feature should not be allowed to associate to the Hotspot 2.0 WLAN. To make sure this policy is enforced, ensure that the following configuration is in place:

```
wlan <wlan-name> <wlan-name> <ssid>
wifi-direct policy xconnect-not-allow
```

### Restrictions

- Clients are excluded if an OSEN VLAN is not added to a flex profile.
- In FlexConnect mode, clients are excluded if an OSEN VLAN is not added in a flex profile.
- In FlexConnect deployments, the URL filter should reference an existing URL filter (configured using the **urlfilter list** *urlfilter-name* command). Otherwise, a client is added to the excluded list, after authentication.
- Only central authentication is supported.
- Fragmented ANQP replies are not synchronized to the standby controller in high-availability mode. Therefore, clients have to re-issue a query if there is a switchover.

## Open Roaming

From Cisco IOS XE Amsterdam Release 17.2.1, the controller supports open roaming configuration, which enables mobile users to automatically and seamlessly roam across Wi-Fi and cellular networks.

The new configuration template of the open roaming ANQP server simplifies the task of setting up a Hotspot 2.0 ANQP server. When you configure open roaming, fixed ANQP parameters are automatically populated.

You can configure different identity types by defining roaming organizational identifiers. The organizational unique identifier (OUI) is a three-octet number that identifies the type of organizations available in a given roaming consortium. The OUI list determines the type of identities allowed to roam into the network. The default configuration allows all the identities on the access network. However, access networks can customize the Roaming Consortium Organization Identifier (RCOI) they advertise.

You can configure three types of policies for access networks:

- Allow all: Accepts users from any identity provider (IDP), with any privacy policy.
- Real ID: Accepts users from any IDP, but only with a privacy policy that shares real identity (anonymous not accepted).
- Custom: Accepts users of select identity types and privacy policies associated with the identity types; basically all the other RCOIs.

Users can select the following privacy modes:

- Anonymous
- Share real identity

The list of currently defined organizational identifiers and their aliases are given in the following table.

**Table 151: Roaming Organizational Identifiers and Aliases**

Description	Roaming Organizational Identifier	WBA Value	Display Name
All	004096	5A03BA0000	All
All with real ID	00500b	5A03BA1000	All with real-id only
All paid members	00500f	BAA2D00000	All paid
Device manufacturer all ID	00502a	5A03BA0A00	Device Manufacturer
Device manufacturer real ID only	0050a7	5A03BA1A00	Device Manufacturer real-id
Cloud or Social ID	005014	5A03BA0200	Cloud ID

## Configuring Hotspot 2.0

### Configuring an Access Network Query Protocol Server

The Access Network Query Protocol Server (ANQP) is a query and response protocol that defines the services offered by an AP, usually at a Wi-Fi Hotspot 2.0.

**Note** When configuring roaming-oi in the ANQP server, ensure that you set the **beacon** keyword for at least one roaming-oi, as mandated by the 802.11u standard.

#### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wireless hotspot anqp-server <i>server-name</i></b> <b>Example:</b> Device(config)# wireless hotspot anqp-server my_server	Configures a Hotspot 2.0 ANQP server.
<b>Step 3</b>	<b>description <i>description</i></b> <b>Example:</b> Device(config-wireless-anqp-server) # description "My Hotspot 2.0"	Adds a description for the ANQP server.
<b>Step 4</b>	<b>3gpp-info <i>mobile-country-code</i></b> <b><i>mobile-network-code</i></b>	Configures a 802.11u Third Generation Partnership Project (3GPP) cellular network.

	Command or Action	Purpose
	<b>Example:</b> <pre>Device(config-wireless-anqp-server)# 3gpp-info us mcc</pre>	The <i>mobile-country-code</i> should be a 3-digit decimal number. The <i>mobile-network-code</i> should be a 2-digit or 3-digit decimal number.
<b>Step 5</b>	<b>anqp fragmentation-threshold</b> <i>threshold-value</i>  <b>Example:</b> <pre>Device(config-wireless-anqp-server)# anqp fragmentation-threshold 100</pre>	<p>Configures the ANQP reply fragmentation threshold, in bytes.</p> <p>The ANQP protocol can be customized by setting the fragmentation threshold, after which the ANQP reply is split into multiple messages.</p> <p><b>Note</b> We recommend that you use the default values for the deployment.</p>
<b>Step 6</b>	<b>anqp-domain-id</b> <i>domain-id</i>  <b>Example:</b> <pre>Device(config-wireless-anqp-server)# anqp-domain-id 100</pre>	Configures the Hotspot 2.0 ANQP domain identifier.
<b>Step 7</b>	<b>authentication-type</b> { <b>dns-redirect</b>   <b>http-https-redirect</b>   <b>online-enrollment</b>   <b>terms-and-conditions</b> }  <b>Example:</b> <pre>Device(config-wireless-anqp-server)# authentication-type online-enrollment</pre>	Configures the 802.11u network authentication type. Depending on the authentication type, a URL is needed for HTTP and HTTPS.
<b>Step 8</b>	<b>connection-capability</b> <i>ip-protocol</i> <i>port-number</i> { <b>closed</b>   <b>open</b>   <b>unknown</b> }  <b>Example:</b> <pre>Device(config-wireless-anqp-server)# connection-capability 12 40 open</pre>	<p>Configures the Hotspot 2.0 protocol and port capabilities.</p> <p><b>Note</b> Hotspot 2.0 specifications require that you predefine some open ports and protocols. Ensure that you meet these requirements in order to comply with the Hotspot 2.0 specifications. See the <b>connection-capability</b> command in the <a href="#">Cisco Catalyst 9800 Series Wireless Controller Command Reference</a> document for a list of open ports and protocols.</p>
<b>Step 9</b>	<b>domain</b> <i>domain-name</i>  <b>Example:</b> <pre>Device(config-wireless-anqp-server)# domain my-domain</pre>	Configures an 802.11u domain name. You can configure up to 32 domain names. The <i>domain-name</i> should not exceed 220 characters.
<b>Step 10</b>	<b>ipv4-address-type</b> <i>ipv4-address-type</i>  <b>Example:</b> <pre>Device(config-wireless-anqp-server)# ipv4-address-type public</pre>	Configures an 802.11u IPv4 address type in the Hotspot 2.0 network.

	Command or Action	Purpose
<b>Step 11</b>	<b>ipv6-address-type</b> <i>ipv6-address-type</i> <b>Example:</b> Device(config-wireless-anqp-server) # ipv6-address-type available	Configures an 802.11u IPv6 address type in the Hotspot 2.0 network.
<b>Step 12</b>	<b>nai-realm</b> <i>realm-name</i> <b>Example:</b> Device(config-wireless-anqp-server) # nai cisco.com	Configures an 802.11u NAI realm profile that identifies the realm that is accessible using the AP.
<b>Step 13</b>	<b>operating-class</b> <i>class-id</i> <b>Example:</b> Device(config-wireless-anqp-server) # operating-class 25	Configures a Hotspot 2.0-operating class identifier.
<b>Step 14</b>	<b>operator</b> <i>operator-name language-code</i> <b>Example:</b> Device(config-wireless-anqp-server) # operator XYZ-operator eng	Configures a Hotspot 2.0 operator-friendly name in a given language. Use only the first three letters of the language, in lower case, for the language code. For example, use <i>eng</i> for English.  To see the full list of language codes, go to: <a href="http://www.loc.gov/standards/iso639-2/php/code_list.php">http://www.loc.gov/standards/iso639-2/php/code_list.php</a> .  <b>Note</b> You can configure only one operator per language.
<b>Step 15</b>	<b>osu-ssid</b> <i>SSID</i> <b>Example:</b> Device(config-wireless-anqp-server) # osu-ssid test	Configures the SSID that wireless clients will use for OSU.  The SSID length can be up to 32 characters.
<b>Step 16</b>	<b>roaming-oi</b> <i>OI-value</i> [ <b>beacon</b> ] <b>Example:</b> Device(config-wireless-anqp-server) # roaming-oi 24 beacon	Configures the 802.11u roaming organization identifier.  If the <b>beacon</b> keyword is specified, the roaming OUI is advertised in the AP WLAN beacon or probe response. Otherwise, it will only be returned while performing the roaming OUI ANQP query.  <b>Note</b> The hex string of a roaming OUI should contain only lowercase letters.
<b>Step 17</b>	<b>venue</b> <i>venue-name language-code</i> <b>Example:</b> Device(config-wireless-anqp-server) # venue bank eng	Configures the 802.11u venue information.  The <i>venue-name</i> should not exceed 220 characters and the <i>language-code</i> should only be 2 or 3 lowercase letters (a-z) in length.

## Configuring ANQP Global Server Settings (GUI)

### Procedure

---

- Step 1** Choose **Configuration > Wireless > Hotspot/OpenRoaming**.
- Step 2** Select an existing server from the list of servers.
- Step 3** Click the **Server Settings** tab.
- Step 4** Go to the **Global Server Settings** section.
- Step 5** From the **IPv4 Type** drop-down list, choose an IPv4 type.
- Step 6** From the **IPv6 Type** drop-down list, choose an IPv6 type.
- Step 7** In the **OSU SSID** field, enter the SSID that wireless clients will use for Online Sign-Up (OSU).
- Step 8** Click the **Show Advanced Configuration** link to view the advanced options.
- In the **Fragmentation Threshold (bytes)** field, enter the fragmentation threshold.  
**Note** Packets that are larger than the size you specify here will be fragmented.
  - In the **GAS Request Timeout (ms)** field, enter the number of Generic Advertisement Services (GAS) request action frames sent that can be sent to the controller by an AP in a given interval.
- Step 9** Click **Apply to Device**.
- 

## Configuring Open Roaming (CLI)

The new configuration template of the open roaming ANQP server simplifies the task of setting up a Hotspot 2.0 ANQP server. When you configure open roaming using this template, default ANQP parameters are automatically populated. The default values defined in the template always override any user-defined configuration values. For example, these are the default values enforced with the type open-roaming template:

- nai-realm open.openroaming.org
- eap-method eap-tls
- eap-method eap-ttls
- inner-auth-non-eap mschap-v2
- inner-auth-non-eap pap
- eap-method eap-aka

You can add more fields to the existing template, but ensure that they do not overlap with the existing default values. Also, if you change any of these default values, you will need to re-configure every time you enter in anqp type open-roaming config.

**Procedure**

	<b>Command or Action</b>	<b>Purpose</b>
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wireless hotspot anqp-server <i>server-name</i> type open-roaming</b> <b>Example:</b> Device(config)# wireless hotspot anqp-server my-server type open-roaming	Configures a Hotspot 2.0 ANQP server with open roaming.
<b>Step 3</b>	<b>open-roaming-oi <i>alias</i></b> <b>Example:</b> Device(config-wireless-anqp-server)# open-roaming-oi allow-all	Sets the open roaming element alias.
<b>Step 4</b>	<b>domain <i>domain-name</i></b> <b>Example:</b> Device(config)# domain my-domain	Configures a preferred domain name to ensure that clients roam into a preferred network.  You can configure up to 32 domain names. The <i>domain-name</i> should not exceed 220 characters.

## Configuring Open Roaming (GUI)

**Procedure**

- 
- Step 1** Choose **Configuration > Wireless > Hotspot/OpenRoaming**.
- Step 2** Click **Add**.  
The **Add New ANQP Server** window is displayed.
- Step 3** In the **Name** field, enter a name for the server.
- Step 4** In the **Description** field, enter a description for the server.
- Step 5** Check the **OpenRoaming Server** check box to use the server as an open roaming server.  
**Note** You can set the server as an open roaming server only at the time of server creation.
- Step 6** Check the **Internet Access** check box to enable internet access for the server.
- Step 7** From the **Network Type** drop-down list, choose the network type.
- Step 8** Click **Apply to Device**.
-

## Configuring NAI Realms (GUI)

### Procedure

---

**Step 1** Choose **Configuration > Wireless > Hotspot/OpenRoaming**.

**Step 2** Select an existing server from the list of servers.

**Step 3** Go to the **NAI Realms** section.

**Step 4** Click **Add**.

The **Add NAI Realm** window is displayed.

**Step 5** In the **NAI Realm Name** field, enter an 802.11u NAI realm of the OSU operator.

**Step 6** In the **EAP Methods** section, use the toggle button to enable the required EAP methods.

After an EAP method is enabled, a pane is displayed to configure the details. Users are shown a configuration section where they can enable *credential*, *inner-auth-eap*, *inner-auth-non-eap*, *tunneled-eap-credential*. The user can select multiple options for each of the configuration.

- The **Credential** window has options such as certificate, hw-token, nfc, none, sim, softoken, username-password, and usim. Check the corresponding check box.
- The **inner-auth-eap** window has options such as eap-aka, eap-fast, eap-sim, eap-tls, eap-ttls, eap-leap, and eap-peap. Check the corresponding check box.
- The **inner-auth-eap** window has options such as eap-aka, eap-fast, eap-sim, eap-tls, eap-ttls, eap-leap, and eap-peap. Check the corresponding check box.
- The **tunneled-eap-credential** window has options such as anonymous, certificate, hw-token, nfc, sim, softoken, username-password, and usim. Check the corresponding check box.
- Click **Save**.

**Step 7** Click **Apply to Device**.

---

## Configuring Organizational Identifier Alias (GUI)

### Procedure

---

**Step 1** Choose **Configuration > Wireless > Hotspot/OpenRoaming**.

**Step 2** Select an existing server from the list of servers.

**Step 3** In the **Roaming OIs** area, enter an 802.11u roaming organization identifier in the **Roaming OI** field.

**Step 4** Check the **Beacon State** check box to enable the beacon.

If the beacon is specified, the roaming OUI is advertised in the AP WLAN beacon or probe response. Otherwise, it will only be returned while performing the roaming OUI ANQP query.

**Note** Only three OUIs can be enabled in the beacon state.

- Step 5** Click **Add** to add a roaming OI.
- Step 6** In the **Available OpenRoaming OI** window, a list of organizational identifiers are displayed, along with the ones you have added. Select an organizational identifier and click the right arrow to add an **OpenRoaming OI**.
- Step 7** In the **Domains** area, enter an 802.11u domain name in the **Domain Name** field.
- Step 8** Click **Add** to use the domain name that you have entered as the preferred domain.
- Step 9** Click **Apply to Device**.

## Configuring WAN Metrics (GUI)

### Procedure

- Step 1** Choose **Configuration > Wireless > Hotspot/OpenRoaming**.
- Step 2** Select an existing server from the list of servers.
- Step 3** Click the **Server Settings** tab.
- Step 4** Go to the **WAN Metrics** area.
- Step 5** In the **Downlink Load** field, enter the WAN downlink load.
- Step 6** In the **Downlink Speed (kbps)** field, enter the WAN downlink speed, in kbps.
- Step 7** In the **Load Duration (100ms)** field, enter the load duration.
- Step 8** In the **Upload Load** field, enter the WAN upload load.
- Step 9** In the **Upload Speed (kbps)** field, enter the WAN upload speed, in kbps.
- Step 10** From the **Link Status** drop-down list, choose the link status.
- Step 11** Use the **Full Capacity Link** toggle button to enable the WAN link to operate at its maximum capacity.
- Step 12** Click **Apply to Device**.

## Configuring WAN Metrics

This procedure shows you how to configure the Wide Area Network (WAN) parameters such as uplink and downlink speed, link status, load, and so on.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wireless hotspot anqp-server <i>server-name</i></b>  <b>Example:</b>	Configures a Hotspot 2.0 ANQP server.

	Command or Action	Purpose
	Device(config)# wireless hotspot anqp-server my_server	
<b>Step 3</b>	<b>wan-metrics downlink-load</b> <i>load-value</i>  <b>Example:</b> Device(config-wireless-anqp-server)# wan-metrics downlink-load 100	Configures the WAN downlink load.
<b>Step 4</b>	<b>wan-metrics downlink-speed</b> <i>speed</i>  <b>Example:</b> Device(config-wireless-anqp-server)# wan-metrics downlink-speed 1000	Configures the WAN downlink speed, in kbps.
<b>Step 5</b>	<b>wan-metrics full-capacity-link</b>  <b>Example:</b> Device(config-wireless-anqp-server)# wan-metrics full-capacity-link	Configures the WAN link to operate at its maximum capacity.
<b>Step 6</b>	<b>wan-metrics link-status</b> { <b>down</b>   <b>not-configured</b>   <b>test-state</b>   <b>up</b> }  <b>Example:</b> Device(config-wireless-anqp-server)# wan-metrics link-status down	Sets the WAN link status.
<b>Step 7</b>	<b>wan-metrics load-measurement-duration</b> <i>duration</i>  <b>Example:</b> Device(config-wireless-anqp-server)# wan-metrics load-measurement-duration 100	Configures the uplink or downlink load measurement duration.
<b>Step 8</b>	<b>wan-metrics uplink-load</b> <i>load-value</i>  <b>Example:</b> Device(config-wireless-anqp-server)# wan-metrics uplink-load 100	Configures the WAN uplink load.
<b>Step 9</b>	<b>wan-metrics uplink-speed</b> <i>speed</i>  <b>Example:</b> Device(config-wireless-anqp-server)# wan-metrics uplink-speed 1000	Configures the WAN uplink speed, in kbps.

## Configuring Beacon Parameters (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Wireless > Hotspot/OpenRoaming**.

- Step 2** Select an existing server from the list of servers.
- Step 3** Click **Server Settings** tab.
- Step 4** Go to the **Beacon Parameters** section.
- Step 5** In the **Hess id** field, enter the homogenous extended service set identifier. The Hess ID can be either in `xx:xx:xx:xx:xx:xx`, `xx-xx-xx-xx-xx-xx`, or `xxxx.xxxx.xxxx` format.
- Step 6** In the **Domain id** field, enter the domain's identifier.
- Step 7** From the **Venue Type** drop-down list, select the venue.  
Choosing a venue activates the subvenue type.
- Step 8** From the **subvenue-type** drop-down list, select the sub-venue.
- Step 9** Click **Apply to Device**.
- 

## Configuring Authentication and Venue (GUI)

### Procedure

---

- Step 1** Choose **Configuration > Wireless > Hotspot/OpenRoaming**.
- Step 2** Select an existing server from the list of servers.
- Step 3** Click the **Authentication/Venue** tab.
- Step 4** Under the **Network Auth Types** section, check the **DNS Redirect**, **Online Enrolment**, **HTTP/HTTPS Redirect**, **Terms and Conditions** check boxes.  
For **HTTP/HTTPS Redirect** and **Terms and Conditions**, the URL field is enabled after selecting them.
- Step 5** Add the URL for the corresponding authentication type.
- Step 6** Click **Apply**.
- Step 7** Go to the **Venues** section and click **Add**.  
The **Venue Details** pane is displayed.
- Step 8** In the **Language Code** field, enter the language code.  
Use the first two or three letters of the language, in lower case, for the language code. For example, use *eng* for English. To see the full list of language codes, go to:  
[http://www.loc.gov/standards/iso639-2/php/code\\_list.php](http://www.loc.gov/standards/iso639-2/php/code_list.php).
- Step 9** In the **Venue URL** field, enter the URL of the venue.
- Step 10** In the **Venue Name** field, enter the name of the venue.
- Step 11** Click check mark icon to add the venue details.
- Step 12** Go to the **Connection Capability** section and click **Add**.  
The **Connection Capabilities** pane is displayed. See the **connection-capability** command in the [Cisco Catalyst 9800 Series Wireless Controller Command Reference](#) document for a list of open ports and protocols.
- Step 13** In the **Port Number** field, enter the port number.
- Step 14** From the **Connection Status** drop-down list, choose a connection status.

- Step 15** In the **IP Protocol** field, enter the IP protocol number.
- Hotspot 2.0 specifications require that you predefine some open ports and protocols. Ensure that you meet these requirements in order to comply with the Hotspot 2.0 specifications. See the **connection-capability** command in the [Cisco Catalyst 9800 Series Wireless Controller Command Reference](#) document for a list of open ports and protocols.
- Step 16** Click the check mark icon to add the connection details.
- Step 17** Click **Apply to Device**.
- 

## Configuring 3GPP/Operator (GUI)

### Procedure

---

- Step 1** Choose **Configuration > Wireless > Hotspot/OpenRoaming**.
- Step 2** Select an existing server from the list of servers.
- Step 3** Go to the **3GPP/Operator** tab.
- Step 4** In the **Operating Class Indicator** field, enter the operating class identifier and click the + icon.
- The operating class identifier is added and displayed in the pane below. Use the delete icon to delete them, if required.
- Note** Class IDs should be in the following ranges: 81-87, 94-96, 101-130, 180, and 192-254.
- Step 5** Go to the **3GPP Cellular Networks** section and click **Add**.
- The **3GPP Network Details** pane is displayed.
- Step 6** In the **Mobile Country Code (MCC)** field, enter the mobile country code, which should be a 3-digit decimal number.
- Step 7** In the **Mobile Network Code (MNC)** field, enter the mobile network code, which should be a 2 or 3-digit decimal number.
- For the list of Mobile Country Codes (MCC) and Mobile Network Codes (MNC), see the following links: <https://www.itu.int/pub/T-SP-E.212B-2018> or <https://www.mcc-mnc.com>.
- Step 8** Click check mark icon to add the network details.
- Step 9** Go to the **Hotspot 2.0 Operators** section and click **Add**.
- The **Operator Details** pane is displayed.
- Step 10** In the **Language Code** field, enter the language code.
- Use only the first three letters of the language, in lower case, for the language code. For example, use *eng* for English. To see the full list of language codes, go to: [http://www.loc.gov/standards/iso639-2/php/code\\_list.php](http://www.loc.gov/standards/iso639-2/php/code_list.php).
- Step 11** In the **Name** field, enter the name of the OSU operator.
- Step 12** Click check mark icon to add the operator details.

**Step 13** Click **Apply to Device**.

---

## Configuring OSU Provider (GUI)

### Procedure

---

- Step 1** Choose **Configuration > Wireless > Hotspot/OpenRoaming**.
- Step 2** Select an existing server from the list of servers.
- Step 3** Go to the **OSU Provider** tab.
- Step 4** Click **Add**.
- The **General Config** pane is displayed.
- Step 5** In the **Provider Name** field, enter the OSU provider name.
- Step 6** In the **NAI Realm** field, enter the Network Access Identifier (NAI) realm of the OSU operator.
- Step 7** From the **Primary Method** drop-down list, choose the primary supported OSU method of the OSU operator. This activates the **Secondary Method** drop-down list. If you choose *None* as the primary supported OSU method, you will not get the secondary method.
- Step 8** (Optional) From the **Secondary Method** drop-down list, choose the secondary supported OSU method of the OSU operator.
- Step 9** In the **Server URI** field, enter the server Uniform Resource Identifier (URI) of the OSU operator.
- Step 10** Click **Icon Config** tab.
- Step 11** Click **Add**.
- Step 12** From the **Icon Name** drop-down list, choose the icon name.
- Step 13** Click **Save**.
- Step 14** Click **Friendly Names** tab.
- Step 15** Click **Add**.
- Step 16** In the **Language** field, enter the language code.
- Step 17** In the **Name** field, enter the name of the OSU operator.
- Step 18** In the **Description** field, enter the description for the OSU operator.
- Step 19** Click **Save**.
- Step 20** Click the check mark icon to save.
- Step 21** Click **Apply to Device**.
-

## Configuring an Online Sign-Up Provider

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wireless hotspot icon</b> <b>bootflash:system-file-name media-type language-code icon-width icon-height</b>  <b>Example:</b> Device(config)# wireless hotspot icon bootflash:logol image eng 100 200	Configures an icon for Hotspot 2.0 and its parameters, such as media type, language code, icon width, and icon height.
<b>Step 3</b>	<b>wireless hotspot anqp-server server-name</b>  <b>Example:</b> Device(config)# wireless hotspot anqp-server my_server	Configures a Hotspot 2.0 ANQP server.
<b>Step 4</b>	<b>osu-provider osu-provider-name</b>  <b>Example:</b> Device(config-wireless-anqp-server)# osu-provider my-osu	Configures a Hotspot 2.0 OSU provider name.
<b>Step 5</b>	<b>name osu-operator-name lang-code description</b>  <b>Example:</b> Device(config-anqp-osu-provider)# name xyz-oper eng xyz-operator	Configures the name of the OSU operator in a given language.  The <i>osu-operator-name</i> and <i>description</i> should not exceed 220 characters. The language code should be 2 or 3 lower-case letters (a-z).
<b>Step 6</b>	<b>server-uri server-uri</b>  <b>Example:</b> Device(config-anqp-osu-provider)# server-uri cisco.com	Configures the server Uniform Resource Identifier (URI) of the OSU operator.
<b>Step 7</b>	<b>method { oma-dm   soap-xml-spp }</b>  <b>Example:</b> Device(config-anqp-osu-provider)# method oma-dm	Configures the primary supported OSU method of the OSU operator.
<b>Step 8</b>	<b>nai-realm nai-realm</b>  <b>Example:</b> Device(config-anqp-osu-provider)# nai-realm cisco.com	Configures the Network Access Identifier (NAI) realm of the OSU operator.  The <i>nai-realm</i> should not exceed 220 characters.
<b>Step 9</b>	<b>icon file-name</b>	Configures the icon for the OSU provider.

	Command or Action	Purpose
	<b>Example:</b> Device(config-anqp-osu-provider)# icon xyz.jpeg	The <i>file-name</i> should not exceed 100 characters.

## Configuring Hotspot 2.0 WLAN

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wlan wlan-name wlan-id ssid</b>  <b>Example:</b> Device(config)# wlan hs2 1 hs2	Configures a WLAN and enters WLAN configuration mode.
<b>Step 3</b>	<b>security wpa wpa2 gtk-randomize</b>  <b>Example:</b> Device(config-wlan)# security wpa wpa2 gtk-randomize	Configures random GTK for hole 196 mitigation.  Hole 196 is the name of WPA2 vulnerability.
<b>Step 4</b>	<b>no shutdown</b>  <b>Example:</b> Device(config-wlan)# no shutdown	Enables the WLAN.

## Configuring an Online Subscription with Encryption WLAN

Online subscription with Encryption (OSEN) WLAN is used to onboard a Hotspot 2.0 network (to get the necessary credentials) in a secure manner.

**Note** You cannot apply a policy profile to the OSEN WLAN if a Hotspot 2.0 server is enabled on the WLAN.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.

	Command or Action	Purpose
<b>Step 2</b>	<b>wlan</b> <i>wlan-name wlan-id ssid</i> <b>Example:</b> Device(config)# wlan hs2 1 hs2	Configures a WLAN and enters WLAN configuration mode.
<b>Step 3</b>	<b>security wpa osen</b> <b>Example:</b> Device(config-wlan)# security wpa osen	Enables WPA OSEN security support. <b>Note</b> OSEN and robust security network (RSN) are mutually exclusive. If RSN is enabled on a WLAN, OSEN cannot be enabled on the same WLAN.
<b>Step 4</b>	<b>no shutdown</b> <b>Example:</b> Device(config-wlan)# no shutdown	Enables the WLAN.

## Attaching an ANQP Server to a Policy Profile

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wireless profile policy</b> <i>policy-profile-name ssid</i> <b>Example:</b> Device(config)# wireless profile policy policy-hotspot	Configures a policy profile.
<b>Step 3</b>	<b>shutdown</b> <b>Example:</b> Device(config-wireless-policy)# shutdown	Disables the policy profile.
<b>Step 4</b>	<b>hotspot anqp-server</b> <i>server-name</i> <b>Example:</b> Device(config-wireless-policy)# hotspot anqp-server my-server	Attaches the Hotspot 2.0 ANQP server to the policy profile.
<b>Step 5</b>	<b>no shutdown</b> <b>Example:</b> Device(config-wireless-policy)# no shutdown	Enables the policy profile.

**What to do next**

Attach the policy profile to the WLAN to make the WLAN Hotspot 2.0 enabled.

## Configuring Interworking for Hotspot 2.0

**Procedure**

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wireless hotspot anqp-server <i>server-name</i></b> <b>Example:</b> Device(config)# wireless hotspot anqp-server my_server	Configures a Hotspot 2.0 ANQP server.
<b>Step 3</b>	<b>network-type allowed <i>network-type</i></b> <b>internet-access { allowed   forbidden }</b> <b>Example:</b> Device(config-wireless-anqp-server) # network-type guest-private internet-access allowed	Configures a 802.11u network type.
<b>Step 4</b>	<b>hessid <i>HESSID-value</i></b> <b>Example:</b> Device(config-wireless-anqp-server) # hessid 12.13.14	(Optional) Configures a homogenous extended service set.
<b>Step 5</b>	<b>group <i>venue-group venue-type</i></b> <b>Example:</b> Device(config-wireless-anqp-server) # group business bank	Selects a group type and venue type from the list of available options.

## Configuring the Generic Advertisement Service Rate Limit

**Procedure**

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>ap profile <i>profile-name</i></b> <b>Example:</b>	Configures an AP profile and enters AP profile configuration mode.

	Command or Action	Purpose
	<code>Device(config)# ap profile hs2-profile</code>	
<b>Step 3</b>	<b>gas-ap-rate-limit</b> <i>request-number interval</i> <b>Example:</b> <code>Device(config-ap-profile)#  gas-ap-rate-limit 20 120</code>	Configures the number of Generic Advertisement Services (GAS) request action frames sent to the controller by an AP in a given interval.
<b>Step 4</b>	<b>exit</b> <b>Example:</b> <code>Device(config-ap-profile)# exit</code>	Returns to global configuration mode.
<b>Step 5</b>	<b>wireless hotspot gas-rate-limit</b> <i>gas-requests-to-process</i> <b>Example:</b> <code>Device(config)# wireless hotspot  gas-rate-limit 100</code>	Configures the number of GAS request action frames to be processed by the controller.

## Configuring Global Settings

### Procedure

- 
- Step 1** Choose **Configuration > Wireless > Hotspot/OpenRoaming > Global Settings**.
- Step 2** In the **Gas Rate Limit (Requests per sec)** field, enter the number of GAS request action frames to be processed by the controller.
- Step 3** Go to the **Icons Configuration** area.
- Step 4** Click **Add**.
- The **Add Global Icon** window is displayed.
- Step 5** From the **System Path** drop-down list, choose the path.
- Step 6** In the **Icon Name** field, enter the icon name.
- Step 7** In the **Icon Type** field, enter the icon type.
- Step 8** In the **Language Code** field, enter the language code.
- Step 9** In the **Icon Height** field, enter the icon height.
- Step 10** In the **Icon Width** field, enter the icon width.
- Step 11** Click **Apply to Device**.
- 

## Configuring Advice of Charge

Use the following procedure to configure the advice of charge information for using the SSID of the Network Access Identifier (NAI) realm.

**Procedure**

	<b>Command or Action</b>	<b>Purpose</b>
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wireless hotspot anqp-server <i>server-name</i></b> <b>Example:</b> Device(config)# wireless hotspot anqp-server my_server	Configures a Hotspot 2.0 ANQP server.
<b>Step 3</b>	<b>advice-charge <i>type</i></b> <b>Example:</b> Device(config-wireless-anqp-server)# advice-charge data	Configures advice of charge for data usage.  Advice of charge provides information on the financial charges for using the SSID of the NAI realm.
<b>Step 4</b>	<b>plan <i>language currency info plan-info-file</i></b> <b>Example:</b> Device(config-anqp-advice-charge)# plan eng eur info bootflash:plan_eng.xml	Configures advice of charge information, which includes language, currency, and plan information.  <b>Note</b> You can configure up to 32 plans.
<b>Step 5</b>	<b>nai-realm <i>nai-realm</i></b> <b>Example:</b> Device(config-anqp-advice-charge)# nai-realm cisco	Configures NAI realm for this advice of charge.  <b>Note</b> You can configure up to 32 realms.

## Configuring Terms and Conditions

**Before you begin**

Define a URL filter list, as shown in the following example:

```
urlfilter list <url-filter-name>
 action permit
 filter-type post-authentication
 url <allow-url>
```

For information on configuring an URL list, see the *Defining URL Filter List* section.

**Procedure**

	<b>Command or Action</b>	<b>Purpose</b>
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.

	Command or Action	Purpose
<b>Step 2</b>	<b>wireless hotspot anqp-server</b> <i>server-name</i> <b>Example:</b> Device(config)# wireless hotspot anqp-server my_server	Configures a Hotspot 2.0 ANQP server.
<b>Step 3</b>	<b>terms-conditions filename</b> <i>file-name</i> <b>Example:</b> Device(config-wireless-anqp-server)# terms-conditions filename xyz-file	Configures the terms and conditions filename for the clients.
<b>Step 4</b>	<b>terms-conditions timestamp</b> <i>date time</i> <b>Example:</b> Device(config-wireless-anqp-server)# terms-conditions timestamp 2020-02-20 20:20:20	Configures the terms and conditions timestamp.
<b>Step 5</b>	<b>terms-conditions urlfilter list</b> <i>url-filter-list</i> <b>Example:</b> Device(config-wireless-anqp-server)# terms-conditions urlfilter list filter-yy	Configures the terms and conditions URL filter list name.

## Defining ACL and URL Filter in AP for FlexConnect

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<i>sequence-number</i> <b>permit udp any eq bootpc any eq bootps</b> <b>Example:</b> Device(config-ext-nacl)# 10 permit udp any eq bootpc any eq bootps	Defines an extended UDP access list and sets the access conditions to match only the packets on a given port number of bootstrap protocol (BOOTP) clients from any source host to match only the packets on a given port number of the bootstrap protocol (BOOTP) server of a destination host.
<b>Step 3</b>	<i>sequence-number</i> <b>permit udp any eq bootps any eq bootpc</b> <b>Example:</b> Device(config-ext-nacl)# 20 permit udp any eq bootps any eq bootpc	Defines an extended UDP access list to forward packets and sets the access conditions to match only the packets on a given port number of bootstrap protocol (BOOTP) server from any source host to match only the packets of a given port number of the bootstrap protocol (BOOTP) clients of a destination host.

	Command or Action	Purpose
<b>Step 4</b>	<b><i>sequence-number</i> permit udp any eq domain any eq domain</b> <b>Example:</b> Device(config-ext-nacl)# 30 permit udp any eq domain any eq domain	Defines an extended UDP access list to forward packets and sets the access conditions to match a destination host Domain Name Service (DNS) with only the packets from a given port number of the source DNS.
<b>Step 5</b>	<b><i>sequence-number</i> permit ip any host dest-address</b> <b>Example:</b> Device(config-ext-nacl)# 40 permit ip any host 10.10.10.8	Defines an extended IP access list to forward packets from a source host to a single destination host.
<b>Step 6</b>	<b><i>sequence-number</i> permit ip host dest-address any</b> <b>Example:</b> Device(config-ext-nacl)# 50 permit ip host 10.10.10.8 any	Defines an extended IP access list to forward packets from a single source host to a destination host.
<b>Step 7</b>	<b>exit</b> <b>Example:</b> Device(config-ext-nacl)# exit	Returns to global configuration mode.
<b>Step 8</b>	<b>wireless profile flex flex-profile-name</b> <b>Example:</b> Device(config)# wireless profile flex test-flex-profile	Configures a new FlexConnect policy and enters wireless flex profile configuration mode.
<b>Step 9</b>	<b>acl-policy acl-policy-name</b> <b>Example:</b> Device(config-wireless-flex-profile)# acl-policy acl_name	Configures an ACL policy.
<b>Step 10</b>	<b>urlfilter list url-filter-name</b> <b>Example:</b> Device(config-wireless-flex-profile)# urlfilter list urllist_flex	Applies the URL filter list to the FlexConnect profile.
<b>Step 11</b>	<b>vlan-name prod-vlanID</b> <b>Example:</b> Device(config-wireless-flex-profile)# vlan-name test-vlan	Configures a production VLAN.  Ensure that <b>filter-type post-authentication</b> configuration is in place for the URL filter to work. For information on configuring URL filter list, see the <i>Defining URL Filter List</i> section of the chapter DNS-Based Access Control Lists.
<b>Step 12</b>	<b>vlan-id prod-vlanID</b> <b>Example:</b>	Creates a new production VLAN ID.

	Command or Action	Purpose
	Device(config-wireless-flex-profile-vlan)# vlan-id 10	
<b>Step 13</b>	<b>vlan-name</b> <i>OSU-vlanID</i> <b>Example:</b> vlan-name test-vlan	Configures an OSU VLAN.
<b>Step 14</b>	<b>vlan-id</b> <i>OSU-vlanID</i> <b>Example:</b> vlan-id 20	Creates an OSU VLAN ID.

## Configuring an OSEN WLAN (Single SSID)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wlan</b> <i>wlan-name wlan-id ssid</i> <b>Example:</b> Device(config)# wlan hs2 1 hs2	Configures a WLAN and enters WLAN configuration mode.
<b>Step 3</b>	<b>no security ft over-the-ds</b> <b>Example:</b> Device(config-wlan)# no security ft over-the-ds	Disables fast transition over the data source on the WLAN.
<b>Step 4</b>	<b>no security ft adaptive</b> <b>Example:</b> Device(config-wlan)# no security ft adaptive	Disables adaptive 11r.
<b>Step 5</b>	<b>security wpa wpa2</b> <b>Example:</b> Device(config-wlan)# security wpa wpa2	Enables WPA2 security.
<b>Step 6</b>	<b>security wpa wpa2 ciphers aes</b> <b>Example:</b> Device(config-wlan)# security wpa wpa2 ciphers aes	Enables WPA2 ciphers for AES.
<b>Step 7</b>	<b>security wpa osen</b> <b>Example:</b>	Enables WPA OSEN security support.

	Command or Action	Purpose
	<code>Device(config-wlan)# security wpa osen</code>	
<b>Step 8</b>	<b>no shutdown</b> <b>Example:</b> <code>Device(config-wlan)# no shutdown</code>	Enables the WLAN.
<b>Step 9</b>	<b>exit</b> <b>Example:</b> <code>Device(config-wlan)# exit</code>	Returns to global configuration mode.
<b>Step 10</b>	<b>wireless profile policy <i>policy-profile-name</i> <i>ssid</i></b> <b>Example:</b> <code>Device(config)# wireless profile policy policy-hotspot</code>	Configures a policy profile.
<b>Step 11</b>	<b>hotspot anqp-server <i>server-name</i></b> <b>Example:</b> <code>Device(config-wireless-policy)# hotspot anqp-server my-server</code>	Attaches the Hotspot 2.0 ANQP server to the policy profile.
<b>Step 12</b>	<b>vlan <i>vlan</i> encryption osen</b> <b>Example:</b> <code>Device(config-wireless-policy)# vlan 10 encryption osen</code>	Configures the VLAN ID with OSEN encryption for single SSID.

## Verifying Hotspot 2.0 Configuration

Use the following **show** commands to verify the quality of service (QoS) and AP GAS rate limit.

To view whether a QoS map ID is user configured or the default one, use the following command:

```
Device# show ap profile <profile name> detailed
```

```
QoS Map : user-configured
```

To view the QoS map values used and their source, use the following command:

```
Device# show ap profile <profile name> qos-map
```

```
QoS Map : default
DSCP ranges to User Priorities
 User Priority DSCP low DSCP high Upstream UP to DSCP

 0 0 7 0
 2 16 23 10
 3 24 31 18
 4 32 39 26
 5 40 47 34
 6 48 55 46
 7 56 63 48
```

```
DSCP to UP mapping exceptions
```

DSCP	User Priority
0	0
2	1
4	1
6	1
10	2
12	2
14	2
18	3
20	3
22	3

To view the AP rate limiter configuration, use the following command:

```
Device# show ap name AP0462.73e8.f2c0 config general | i GAS

GAS rate limit Admin status : Enabled
Number of GAS request per interval : 30
GAS rate limit interval (msec) : 100
```

## Verifying Client Details

To verify the wireless-specific configuration of active clients based on their MAC address, use the following command:

```
Device# show wireless client mac 001e.f64c.1eff detail
.
.
.
Hotspot version : Hotspot 2.0 Release 2
Hotspot PPS MO ID :
Hotspot Terms and Conditions URL :
http://host1.ciscohspot.com/terms.php?addr=b8:27:eb:5a:dc:39&ap=123
.
.
.
Policy Type : OSEN (within RSN)
Resultant Policies:
 VLAN Name : VLAN0010
 VLAN : 10
```

## CHAPTER 194

# Client Roaming Across Policy Profile

- [Information about Client Roaming Policy Profile, on page 2207](#)
- [Configuring Client Roaming Across Policy Profile, on page 2208](#)
- [Verifying Client Roaming Across Policy Profiles, on page 2209](#)

## Information about Client Roaming Policy Profile

In Cisco Catalyst 9800 Series Wireless controller, each WLAN must be associated to a policy profile using a policy tag. Since the policy profile represent the policy defined by the administrator, the general rule is that the controller will not allow seamless roaming between same WLAN associated with different policy profile. The client will be disconnected hence disrupting seamless roaming and client will be required to join again and the new policy can be evaluated and implemented.

When you enable roaming across policy profile, if the two policy profiles differ only in the settings as listed, then client seamless roaming is allowed to same wlan associated to different policy profiles.

A typical use case is when clients roaming across two APs that belong to different policy tag and have WLAN associated with different policy profiles with different VLAN setting for each policy profile. If roaming across policy profile is enabled, the controller allows seamless roaming to another policy profile even if the VLAN is different and the client retains the original IP address. The controller applies all other attributes except VLAN from the new policy profile to which client has joined.

Client roaming across policy profiles is not allowed if there are different policy profile configurations. However; the following are the exceptions:

- Accounting list
- CTS
- DHCP-TLV-caching
- Dot11 5 Ghz airtime-fairness
- Dot11 24 Ghz airtime-fairness
- ET-analytics enable
- http-TLV-caching
- Idle-threshold
- Idle-timeout

- MDnS-SD service policy
- IPv4 ACL
- IPv6 ACL
- QBSS load
- RADIUS profiling
- Session timeout
- SIP CAC disassociation client
- SIP CAC send-486busy
- VLAN

You must execute the configuration in the global configuration mode. When a client roam across policy profile is attempted, the roam is either a success or a failure. However; the total roam across policy profiles counter under client global statistics section increments. But when the roam across policy profile is denied then roam across policy profile deny delete reason counter is incremented.

**Note** This feature is not supported on fabric and on Cisco 9800 FlexConnect.

The following is an example in which case a client roams across policy profiles PP1 and PP2 will be denied.

```
wireless profile policy PP1
vlan 42
no shutdown
wireless profile policy PP2
aaa-override
vlan 43
no shutdown
```

## Configuring Client Roaming Across Policy Profile

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enables configuration mode
<b>Step 2</b>	<b>wireless client vlan-persistent</b> <b>Example:</b> Device(config) # wireless client vlan-persistent	Enables client roaming across different policy profiles.
<b>Step 3</b>	<b>end</b> <b>Example:</b>	Ends the session.

	Command or Action	Purpose
	Device(config) # end	

## Verifying Client Roaming Across Policy Profiles

The following shows the client roaming from policy profile PP1 configured with VLAN 42 to policy profile PP2 configured with VLAN 43.

The following is the sample output of the **show wireless client mac-address xxxx.xxxx.xxxx detail** command that shows the client is connected to policy profile PP1.

```

Device#show wireless client mac-address xxxx.xxxx.xxxx detail

## CHAPTER 195

# Assisted Roaming

---

- [802.11k Neighbor List and Assisted Roaming, on page 2215](#)
- [Restrictions for Assisted Roaming, on page 2216](#)
- [How to Configure Assisted Roaming, on page 2216](#)
- [Verifying Assisted Roaming, on page 2218](#)
- [Configuration Examples for Assisted Roaming, on page 2218](#)

## 802.11k Neighbor List and Assisted Roaming

The 802.11k standard allows an AP to inform 802.11k-capable clients of neighboring BSSIDs (APs in the same SSID). This can help the client to optimize its scanning and roaming behavior. Additionally, the Assisted Roaming Prediction Optimization feature can be used with non-802.11k clients, to discourage them from roaming to suboptimal APs.

---

**Note** We recommend not configuring two SSIDs with the same name in the controller, which may cause roaming issues.

---

### Prediction Based Roaming - Assisted Roaming for Non-802.11k Clients

You can optimize roaming for non-802.11k clients by generating a prediction neighbor list for each client without sending an 802.11k neighbor list request. When prediction based roaming enables a WLAN, after each successful client association/re-association, the same neighbor list optimization applies on the non-802.11k client to generate and store the neighbor list in the mobile station software data structure. Clients at different locations have different lists because the client probes are seen with different RSSI values by the different neighbors as the clients usually probe before any association or re-association. This list is created with the most updated probe data and predicts the next AP that the client is likely to roam to.

The wireless infrastructure discourages clients from roaming to those less desirable neighbors by denying association if the association request to an AP does not match the entries on the stored prediction neighbor list.

- Denial count: Maximum number of times a client is refused association.
- Prediction threshold: Minimum number of entries required in the prediction list for the assisted roaming feature to activate.

For more information, see [https://www.cisco.com/c/en/us/td/docs/wireless/controller/8-5/Enterprise-Mobility-8-5-Design-Guide/Enterprise\\_Mobility\\_8-5\\_Deployment\\_Guide/Chapter-11.html#pgfld-1140097](https://www.cisco.com/c/en/us/td/docs/wireless/controller/8-5/Enterprise-Mobility-8-5-Design-Guide/Enterprise_Mobility_8-5_Deployment_Guide/Chapter-11.html#pgfld-1140097).

## Restrictions for Assisted Roaming

- This feature is supported only on 802.11n capable indoor access points. For a single band configuration, a maximum of 6 neighbors are visible in a neighbor list. For dual band configuration, a maximum of 12 neighbors are visible.
- You can configure assisted roaming only using the device CLI.

## How to Configure Assisted Roaming

### Configuring Assisted Roaming (GUI)

Assisted roaming allows clients to request neighbor reports containing information about known neighbor access points that are candidates for a service set transition.

#### Before you begin

Ensure that you have configured an AP Join Profile prior to configuring the primary and backup controllers.

#### Procedure

- 
- Step 1** Choose **Configuration** > **Tags & Profiles** > **WLAN** and click **Add** to add a WLAN or select an existing WLAN.
  - Step 2** On the **Advanced** tab, go to the **Assisted Roaming (11K)** and select the **Prediction Optimization** checkbox to optimize roaming for non 802.11k clients by generating a prediction neighbor list for each client without sending an 802.11k neighbor list request.
  - Step 3** Select the **Neighbor List** checkbox to optimize roaming for 802.11K clients by generating a neighbor list for each client without sending an 802.11k neighbor list request. By default, the neighbor list contains only neighbors in the same band with which the client is associated. However, if you select the **Dual Band Neighbor List** checkbox, it allows 802.11k to return neighbors in both bands.
  - Step 4** Click **Apply to Device**.
-

## Configuring Assisted Roaming (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>wireless assisted-roaming floor-bias dBm</b> <b>Example:</b> Device(config)# <code>wireless assisted-roaming floor-bias 20</code>	Configures neighbor floor label bias. The valid range is from 5 to 25 dBm, and the default value is 15 dBm.
<b>Step 3</b>	<b>wlan wlan-id</b> <b>Example:</b> Device(config)# <code>wlan wlan1</code>	Enters the WLAN configuration submode. The <i>wlan-name</i> is the profile name of the configured WLAN.
<b>Step 4</b>	<b>assisted-roaming neighbor-list</b> <b>Example:</b> Device(wlan)# <code>assisted-roaming neighbor-list</code>	Configures an 802.11k neighbor list for a WLAN. By default, assisted roaming is enabled on the neighbor list when you create a WLAN. The <b>no</b> form of the command disables assisted roaming neighbor list.
<b>Step 5</b>	<b>assisted-roaming dual-list</b> <b>Example:</b> Device(wlan)# <code>assisted-roaming dual-list</code>	Configures a dual-band 802.11k dual list for a WLAN. By default, assisted roaming is enabled on the dual list when you create a WLAN. The <b>no</b> form of the command disables assisted roaming dual list.
<b>Step 6</b>	<b>assisted-roaming prediction</b> <b>Example:</b> Device(wlan)# <code>assisted-roaming prediction</code>	Configures assisted roaming prediction list feature for a WLAN. By default, the assisted roaming prediction list is disabled. <b>Note</b> A warning message is displayed and load balancing is disabled for the WLAN if load balancing is already enabled for the WLAN.
<b>Step 7</b>	<b>wireless assisted-roaming prediction-minimum count</b> <b>Example:</b> Device# <code>wireless assisted-roaming prediction-minimum</code>	Configures the minimum number of predicted APs required for the prediction list feature to be activated. The default value is 3. <b>Note</b> If the number of the AP in the prediction assigned to the client is less than the number that you specify, the assisted roaming feature will not apply on this roam.

	Command or Action	Purpose
<b>Step 8</b>	<b>wireless assisted-roaming denial-maximum</b> <i>count</i>  <b>Example:</b> Device# <b>wireless assisted-roaming</b> <b>denial-maximum 8</b>	Configures the maximum number of times a client can be denied association if the association request is sent to an AP does not match any AP on the prediction. The valid range is from 1 to 10, and the default value is 5.
<b>Step 9</b>	<b>end</b>  <b>Example:</b> Device(config)# <b>end</b>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Verifying Assisted Roaming

The following command can be used to verify assisted roaming configured on a WLAN:

Command	Description
<b>show wlan id</b> <i>wlan-id</i>	Displays the WLAN parameters on the WLAN.

## Configuration Examples for Assisted Roaming

This example shows how to configure the neighbor floor label bias:

```
Device# configure terminal
Device(config)# wireless assisted-roaming floor-bias 10
Device(config)# end
Device# show wlan id 23
```

This example shows how to disable neighbor list on a specific WLAN:

```
Device# configure terminal
Device(config)# wlan test1
Device(config) (wlan)# no assisted-roaming neighbor-list
Device(config) (wlan)# end
Device# show wlan id 23
```

This example shows how to configure the prediction list on a specific WLAN:

```
Device# configure terminal
Device(config)# wlan test1
Device(config) (wlan)# assisted-roaming prediction
Device(config) (wlan)# end
Device# show wlan id 23
```

This example shows how to configure the prediction list based on assisted roaming prediction threshold and maximum denial count on a specific WLAN:

```
Device# configure terminal
Device(config)# wireless assisted-roaming prediction-minimum 4
```

```
Device(config)# wireless assisted-roaming denial-maximum 4
Device(config)(wlan)# end
Device# show wlan id 23
```

## Feature History for 802.11r Fast Transition

This table provides release and related information about the feature explained in this section.

This feature is also available in all the releases subsequent to the one in which they are introduced in, unless noted otherwise.

**Table 152: Feature History for 802.11r Fast Transition**

Release	Feature	Feature Information
Cisco IOS XE Cupertino 17.9.1	802.11r Fast Transition for SAE (FT-SAE) Authenticated Clients	From Cisco-IOS XE 17.9.1 release onwards, the Fast Transition supports SAE-based Fast Roaming support along with PMK caching.  This feature is an addition to the existing PMK caching-based fast roam support.

# Information About 802.11r Fast Transition

802.11r, which is the IEEE standard for fast roaming, introduces a new concept of roaming where the initial handshake with a new AP is done even before the corresponding client roams to the target access point. This concept is called Fast Transition. The initial handshake allows a client and the access points to do the Pairwise Transient Key (PTK) calculation in advance. These PTK keys are applied to the client and the access points after the client responds to the reassociation request or responds to the exchange with new target AP.

The FT key hierarchy is designed to allow clients to make fast BSS transitions between APs without requiring reauthentication at every AP. WLAN configuration contains a new Authenticated Key Management (AKM) type called FT (Fast Transition).

## Client Roaming

For a client to move from its current AP to a target AP using the FT protocols, message exchanges are performed using one of the following methods:

- **Over-the-Air**—The client communicates directly with the target AP using IEEE 802.11 authentication with the FT authentication algorithm.
- **Over-the-Distribution System (DS)**—The client communicates with the target AP through the current AP. The communication between the client and the target AP is carried in FT action frames between the client and the current AP and is then sent through the device.

**Figure 57: Message Exchanges when Over-the-Air Client Roaming is Configured**

351714

**Figure 58: Message Exchanges when Over-the-DS Client Roaming is Configured**

**Note** The 802.11r Fast Transition for SAE (FT-SAE) is not restricted to inter controller roaming.

## Information About 802.11r Fast Transition for SAE (FT-SAE) Authenticated Clients

From Cisco-IOS XE 17.9.1 release onwards, the Fast Transition feature supports Simultaneous Authentication of Equals-based (SAE-based) fast roaming support along with Pairwise Master Key (PMK) caching.

This feature is an addition to the existing PMK caching-based fast roaming support.

### Fast Transition Protocol

During a Base Station Subsystem (BSS) transition, the Fast BSS transition feature reduces the connectivity time loss between an Station (STA) and Direct Switching. The Fast Transition protocols are part of the reassociation service, and apply to the STA transitions between the APs in the same mobility domain and Extended Service Set (ESS). The Fast Transition protocols need information to be exchanged during the initial association (or a later reassociation) between an STA and an AP. The initial exchange is referred to as the *FT initial mobility domain association*. Similarly, subsequent reassociations to the APs in the same mobility domain use the Fast Transition protocols.

---

**Note** STA is known as Fast Transition Originator.

The following are the FT protocols:

- **Fast Transition Protocol:** This protocol is executed when a Fast Transition Originator makes a transition to a target AP and does not require a resource request before its transition.
- **Fast Transition Resource Request Protocol:** This protocol is executed when a Fast Transition Originator requires a resource request prior to its transition.
- **Over-the-Air:** The Fast Transition Originator communicates with the target AP using IEEE 802.11 authentication with Fast Transition authentication algorithm.
- **Over-the-DS:** The Fast Transition Originator communicates with the target AP using the current AP. The communication between the Fast Transition Originator and target AP is carried in Fast Transition action frames between the Fast Transition Originator and the current AP.

The Fast Transition feature supports a new AKM for FT-SAE, specifically the **00-0F-AC:9**.

---

### Fast Transition Initial Mobility Domain Association

An STA includes Mobility Domain Element (MDE) and Robust Security Network Element (RSNE) in the (re)association request frame. The AP responds by including FTE, MDE, and RSNE in the (re)association response frame.

That is, an STA initiates the Fast Transition initial mobility domain association procedures by performing an IEEE 802.11 authentication using the SAE algorithm.

After successful SAE authentication, the STA and AP perform a Fast Transition four-way handshake.

- 
- Note**
- If the MDE that is received by an AP or a controller does not match the contents advertised in the beacon and probe response frames, the AP or controller rejects the (re)association request frame with the STATUS\_INVALID\_MDE code.
  - If an MDE is available in the (re)association request frame and the contents of RSNE do not indicate a negotiated SAE AKM of Fast BSS Transition (00-0F-AC:9 suite type), the AP rejects with STATUS\_INVALID\_AKMP code.

After an SAE authentication, the controller receives the PMK, resulting in the successful completion of SAE.

---

## Restrictions for 802.11r Fast Transition

- EAP LEAP method is not supported.
- Traffic Specification (TSPEC) is not supported for 802.11r fast roaming. Therefore, RIC IE handling is not supported.

- If WAN link latency exists, fast roaming is also delayed. Voice or data maximum latency should be verified. The Cisco WLC handles 802.11r Fast Transition authentication requests during roaming for both Over-the-Air and Over-the-DS methods.
- Legacy clients cannot associate with a WLAN that has 802.11r enabled if the driver of the supplicant that is responsible for parsing the Robust Security Network Information Exchange (RSN IE) is old and not aware of the additional AKM suites in the IE. Due to this limitation, clients cannot send association requests to WLANs. These clients, however, can still associate with non-802.11r WLANs. Clients that are 802.11r-capable can associate as 802.11i clients on WLANs that have both 802.11i and 802.11r Authentication Key Management Suites enabled.

The workaround is to enable or upgrade the driver of the legacy clients to work with the new 802.11r AKMs, after which the legacy clients can successfully associate with 802.11r-enabled WLANs.

Another workaround is to have two SSIDs with the same name, but with different security settings (FT and non-FT).

- Fast Transition resource-request protocol is not supported because clients do not support this protocol. Also, the resource-request protocol is an optional protocol.
- To avoid any Denial of Service (DoS) attack, each Cisco WLC allows a maximum of three Fast Transition handshakes with different APs.
- Non-802.11r-capable devices will not be able to associate with FT-enabled WLAN.
- We do not recommend 802.11r FT + PMF.
- We recommend 802.11r FT Over-the-Air roaming for FlexConnect deployments.
- FT-SAE Over-the-DS roam is not supported in FlexConnect local authentication mode.
- 802.11r ft-over-ds is enabled by default, when a WLAN is created in the controller . In Cisco Wave 2 APs, local switching local authentication with 802.11r is not supported. To make the local switching local authentication work with Cisco Wave 2 APs, explicitly disable 802.11r in WLAN. A sample configuration is given below:

```
wlan local-dot1x 24 local-dot1x
no security ft over-the-ds
no security ft adaptive
security dot1x authentication-list spwifi_dot1x
no shutdown
```

## Monitoring 802.11r Fast Transition (CLI)

The following command can be used to monitor 802.11r Fast Transition:

Command	Description
<code>show wlan name <i>wlan-name</i></code>	Displays a summary of the configured parameters on the WLAN.

Command	Description
<code>show wireless client mac-address mac-address</code>	<p>Displays the summary of the 802.11r authentication key management configuration on a client.</p> <pre> . . . . . . Client Capabilities   CF Pollable : Not implemented   CF Poll Request : Not implemented   Short Preamble : Not implemented   PBCC : Not implemented   Channel Agility : Not implemented   Listen Interval : 15   Fast BSS Transition : Implemented Fast BSS Transition Details : Client Statistics:   Number of Bytes Received : 9019   Number of Bytes Sent : 3765   Number of Packets Received : 130   Number of Packets Sent : 36   Number of EAP Id Request Msg Timeouts : 0   Number of EAP Request Msg Timeouts : 0   Number of EAP Key Msg Timeouts : 0   Number of Data Retries : 1   Number of RTS Retries : 0   Number of Duplicate Received Packets : 1   Number of Decrypt Failed Packets : 0   Number of Mic Failed Packets : 0   Number of Mic Missing Packets : 0   Number of Policy Errors : 0   Radio Signal Strength Indicator : -48 dBm   Signal to Noise Ratio : 40 dB . . . . . . </pre>

## Configuring 802.11r BSS Fast Transition on a Dot1x Security Enabled WLAN (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>wlan profile-name</b> <b>Example:</b> Device# <code>wlan test4</code>	Enters WLAN configuration submenu. The <i>profile-name</i> is the profile name of the configured WLAN.

	Command or Action	Purpose
<b>Step 3</b>	<b>client vlan</b> <i>vlan-name</i> <b>Example:</b> Device(config-wlan)# <b>client vlan 0120</b>	Associates the client VLAN to this WLAN.
<b>Step 4</b>	<b>local-auth</b> <i>local-auth-profile-eap</i> <b>Example:</b> Device(config-wlan)# <b>local-auth</b>	Enables the local auth EAP profile.
<b>Step 5</b>	<b>security dot1x authentication-list default</b> <b>Example:</b> Device(config-wlan)# <b>security dot1x authentication-list default</b>	Enables security authentication list for dot1x security. The configuration is similar for all dot1x security WLANs.
<b>Step 6</b>	<b>security ft</b> <b>Example:</b> Device(config-wlan)# <b>security ft</b>	Enables 802.11r Fast Transition on the WLAN.
<b>Step 7</b>	<b>security wpa akm ft dot1x</b> <b>Example:</b> Device(config-wlan)# <b>security wpa akm ft dot1x</b>	Enables 802.1x security on the WLAN.
<b>Step 8</b>	<b>no shutdown</b> <b>Example:</b> Device(config-wlan)# <b>no shutdown</b>	Enables the WLAN.
<b>Step 9</b>	<b>end</b> <b>Example:</b> Device(config-wlan)# <b>end</b>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-z</b> to exit global configuration mode

## Configuring 802.11r Fast Transition in an Open WLAN (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>wlan</b> <i>profile-name</i> <b>Example:</b> Device# <b>wlan test4</b>	Enters WLAN configuration submode. The <i>profile-name</i> is the profile name of the configured WLAN.

	Command or Action	Purpose
<b>Step 3</b>	<b>client vlan</b> <i>vlan-id</i> <b>Example:</b> Device(config-wlan)# <b>client vlan 0120</b>	Associates the client VLAN to the WLAN.
<b>Step 4</b>	<b>no security wpa</b> <b>Example:</b> Device(config-wlan)# <b>no security wpa</b>	Disables WPA security.
<b>Step 5</b>	<b>no security wpa akm dot1x</b> <b>Example:</b> Device(config-wlan)# <b>no security wpa akm dot1x</b>	Disables security AKM for dot1x.
<b>Step 6</b>	<b>no security wpa wpa2</b> <b>Example:</b> Device(config-wlan)# <b>no security wpa wpa2</b>	Disables WPA2 security.
<b>Step 7</b>	<b>no wpa wpa2 ciphers aes</b> <b>Example:</b> Device(config-wlan)# <b>no security wpa wpa2 ciphers aes</b>	Disables WPA2 ciphers for AES.
<b>Step 8</b>	<b>security ft</b> <b>Example:</b> Device(config-wlan)# <b>security ft</b>	Specifies the 802.11r Fast Transition parameters.
<b>Step 9</b>	<b>no shutdown</b> <b>Example:</b> Device(config-wlan)# <b>shutdown</b>	Shuts down the WLAN.
<b>Step 10</b>	<b>end</b> <b>Example:</b> Device(config-wlan)# <b>end</b>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-z</b> to exit global configuration mode

# Configuring 802.11r Fast Transition on a PSK Security–Enabled WLAN (CLI)

## Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>wlan <i>profile-name</i></b> <b>Example:</b> Device# <code>wlan test4</code>	Enters WLAN configuration submode. The <i>profile-name</i> is the profile name of the configured WLAN.
<b>Step 3</b>	<b>client vlan <i>vlan-name</i></b> <b>Example:</b> Device(config-wlan)# <code>client vlan 0120</code>	Associates the client VLAN to this WLAN.
<b>Step 4</b>	<b>no security wpa akm dot1x</b> <b>Example:</b> Device(config-wlan)# <code>no security wpa akm dot1x</code>	Disables security AKM for dot1x.
<b>Step 5</b>	<b>security wpa akm ft psk</b> <b>Example:</b> Device(config-wlan)# <code>security wpa akm ft psk</code>	Configures Fast Transition PSK support.
<b>Step 6</b>	<b>security wpa akm psk set-key {ascii {0   8}   hex {0   8}}</b> <b>Example:</b> Device(config-wlan)# <code>security wpa akm psk set-key ascii 0 test</code>	Configures PSK AKM shared key.
<b>Step 7</b>	<b>security ft</b> <b>Example:</b> Device(config-wlan)# <code>security ft</code>	Configures 802.11r Fast Transition.
<b>Step 8</b>	<b>no shutdown</b> <b>Example:</b> Device(config-wlan)# <code>no shutdown</code>	Enables the WLAN.

	Command or Action	Purpose
<b>Step 9</b>	<b>end</b>  <b>Example:</b> Device(config-wlan)# <b>end</b>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-z</b> to exit global configuration mode

## Configuring 802.11r Fast Transition on a SAE Security-Enabled WLAN (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Tags & Profiles > WLANs**.
  - Step 2** Click **Add**.
  - Step 3** In the **General** tab, enter the **Profile Name**, the **SSID**, and the **WLAN ID**.
  - Step 4** Choose **Security > Layer2** tab.
  - Step 5** Click the **WPA3** radio button as security mode.
  - Step 6** Check the required **WPA Parameters** check boxes and the **AES(CCMP128)** check box.
  - Step 7** From the **Status** drop-down list, choose **Enabled**.
  - Step 8** Check the **FT+SAE** check box.
  - Step 9** Enter the **Pre-Shared Key**.
  - Step 10** From the **PSK Format** drop-down list, choose **PSK Format** and from the **PSK Type** drop-down list, choose **PSK Type**.
  - Step 11** Click **Apply to Device**.
- 

## Configuring 802.11r Fast Transition on an SAE Security-Enabled WLAN (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b>  <b>Example:</b> Device> <b>enable</b>	Enables privileged EXEC mode. Enter your password, if prompted.
<b>Step 2</b>	<b>configure terminal</b>  <b>Example:</b> Device# <b>configure terminal</b>	Enables configuration mode.

	Command or Action	Purpose
<b>Step 3</b>	<b>wlan wlan-name wlan-id ssid</b> <b>Example:</b> Device(config)# wlan wlan-ft-sae 10 wlan-ft-sae	Configures the WLAN and SSID.
<b>Step 4</b>	<b>security ft</b> <b>Example:</b> Device(config-wlan)# security ft	Enables 802.11r Fast Transition on the WLAN.
<b>Step 5</b>	<b>no security wpa wpa2</b> <b>Example:</b> Device(config-wlan)# no security wpa wpa2	Disables WPA2 security.
<b>Step 6</b>	<b>security wpa psk set-key ascii ascii/hex key</b> <b>Example:</b> Device(config-wlan)# security wpa psk set-key ascii 0 123456789	Configures the preshared key on a WLAN. <b>Note</b> WPA preshared keys must contain 8 to 63 ASCII text characters or 64 hexadecimal characters.
<b>Step 7</b>	<b>no security wpa akm dot1x</b> <b>Example:</b> Device(config-wlan)# no security wpa akm dot1x	Disables security AKM for dot1x.
<b>Step 8</b>	<b>security wpa akm ft sae</b> <b>Example:</b> Device(config-wlan)# security wpa akm ft sae	Configures 802.11r Fast Transition on an SAE security-enabled WLAN.
<b>Step 9</b>	<b>security wpa wpa3</b> <b>Example:</b> Device(config-wlan)# security wpa wpa3	Enables WPA3 support.
<b>Step 10</b>	<b>security pmf mandatory</b> <b>Example:</b> Device(config-wlan)# security pmf mandatory	Requires clients to negotiate 802.11w PMF protection on a WLAN.
<b>Step 11</b>	<b>no shutdown</b> <b>Example:</b> Device(config-wlan)# no shutdown	Enables the WLAN.

## Disabling 802.11r Fast Transition (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Tags & Profiles > WLANs**.
  - Step 2** On the **WLANs** page, click the WLAN name.
  - Step 3** In the **Edit WLAN** window, click the **Security > Layer2** tab.
  - Step 4** From the **Fast Transition** drop-down list, choose **Disabled**. Note that you cannot enable or disable Fast Transition, if you have configured an SSID with Open Authentication.
  - Step 5** Click **Update & Apply to Device**.
- 

## Disabling 802.11r Fast Transition (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>wlan <i>profile-name</i></b>  <b>Example:</b> Device# <code>wlan test4</code>	Enters WLAN configuration submenu. The <i>profile-name</i> is the profile name of the configured WLAN.
<b>Step 3</b>	<b>no security ft [over-the-ds   reassociation-timeout <i>timeout-in-seconds</i>]</b>  <b>Example:</b> Device(config-wlan)# <code>no security ft over-the-ds</code>	Disables 802.11r Fast Transition on the WLAN.
<b>Step 4</b>	<b>end</b>  <b>Example:</b> Device(config)# <code>end</code>	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Verifying 802.11r Fast Transition SAE

To view the Fast Transition SAE details, use the following command:

```
Device# show wireless client summary
Number of Clients: 1
```

```
MAC Address AP Name Type ID State Protocol Method Role

## CHAPTER 197

### 802.11v

---

- [Information About 802.11v, on page 2237](#)
- [Prerequisites for Configuring 802.11v, on page 2238](#)
- [Restrictions for 802.11v, on page 2238](#)
- [Enabling 802.11v BSS Transition Management, on page 2238](#)
- [Configuring 802.11v BSS Transition Management \(GUI\), on page 2239](#)
- [Configuring 802.11v BSS Transition Management \(CLI\), on page 2239](#)

## Information About 802.11v

The controller supports 802.11v amendment for wireless networks, which describes numerous enhancements to wireless network management.

One such enhancement is Network assisted Power Savings which helps clients to improve the battery life by enabling them to sleep longer. As an example, mobile devices typically use a certain amount of idle period to ensure that they remain connected to access points and therefore consume more power when performing the following tasks while in a wireless network.

Another enhancement is Network assisted Roaming which enables the WLAN to send requests to associated clients, advising the clients as to better APs to associate to. This is useful for both load balancing and in directing poorly connected clients.

### Enabling 802.11v Network Assisted Power Savings

Wireless devices consume battery to maintain their connection to the clients, in several ways:

- By waking up at regular intervals to listen to the access point beacons containing a DTIM, which indicates buffered broadcast or multicast traffic that the access point delivers to the clients.
- By sending null frames to the access points, in the form of keepalive messages— to maintain connection with access points.
- Devices also periodically listen to beacons (even in the absence of DTIM fields) to synchronize their clock to that of the corresponding access point.

All these processes consume battery and this consumption particularly impacts devices (such as Apple), because these devices use a conservative session timeout estimation, and therefore, wake up often to send keepalive messages. The 802.11 standard, without 802.11v, does not include any mechanism for the controller or the access points to communicate to wireless clients about the session timeout for the local client.

To save the power of clients due to the mentioned tasks in wireless network, the following features in the 802.11v standard are used:

- Directed Multicast Service
- Base Station Subsystem (BSS) Max Idle Period

### Directed Multicast Service

Using Directed Multicast Service (DMS), the client requests the access point to transmit the required multicast packet as unicast frames. This allows the client to receive the multicast packets it has ignored while in sleep mode and also ensures Layer 2 reliability. Furthermore, the unicast frame is transmitted to the client at a potentially higher wireless link rate which enables the client to receive the packet quickly by enabling the radio for a shorter duration, thus also saving battery power. Since the wireless client also does not have to wake up at each DTIM interval in order to receive multicast traffic, longer sleeping intervals are allowed.

### BSS Max Idle Period

The BSS Max Idle period is the timeframe during which an access point (AP) does not disassociate a client due to nonreceipt of frames from the connected client. This helps ensure that the client device does not send keepalive messages frequently. The idle period timer value is transmitted using the association and reassociation response frame from the access point to the client. The idle time value indicates the maximum time that a client can remain idle without transmitting any frame to an access point. As a result, the clients remain in sleep mode for a longer duration without transmitting the keepalive messages often. This in turn contributes to saving battery power.

## Prerequisites for Configuring 802.11v

- Applies for Apple clients like Apple iPad, iPhone, and so on, that run on Apple iOS version 7 or later.
- Supports local mode; also supports FlexConnect access points in central authentication modes only.

## Restrictions for 802.11v

Client needs to support 802.11v BSS Transition.

## Enabling 802.11v BSS Transition Management

802.11v BSS Transition is applied in the following three scenarios:

- Solicited request—Client can send an 802.11v Basic Service Set (BSS) Transition Management Query before roaming for a better option of AP to reassociate with.
- Unsolicited Load Balancing request—If an AP is heavily loaded, it sends out an 802.11v BSS Transition Management Request to an associated client.
- Unsolicited Optimized Roaming request—If a client's RSSI and rate do not meet the requirements, the corresponding AP sends out an 802.11v BSS Transition Management Request to this client.

**Note** 802.11v BSS Transition Management Request is a suggestion (or advice) given to a client, which the client can choose to follow or ignore. To force the task of disassociating a client, turn on the disassociation-imminent function. This disassociates the client after a period if the client is not reassociated to another AP.

## Configuring 802.11v BSS Transition Management (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Tags & Profiles > WLANs**.
- Step 2** Click **Add** to create WLANs.  
The **Add WLAN** page is displayed.
- Step 3** In the **Advanced** tab and **11v BSS Transition Support** section, select the **BSS Transition** check box to enable BSS transition per WLAN.
- Step 4** Enable the **Dual Neighbor List** check box to include the neighbors of other radio slots of the same AP in the BSS transition response.  
**Note** This is applicable only for 2.4 GHz and 5 GHz radio slots.
- Step 5** Enable the **BSS Max Idle Service** check box to help clients and APs efficiently decide how long to remain associated when no traffic is being transmitted. The device uses this information to preserve device battery life.
- Step 6** Enable the **BSS Max Idle Protected** check box to enable the AP to accept only authenticated frames (encrypted with Robust Security Network (RSN) information) from the client to reset the BSS Max Idle period counter. Without protected mode, any data or management frame (encrypted or unencrypted) sent by the client will reset the idle timer for the client.
- Step 7** Enable the **Directed Multicast Service** check box to request the AP to send a multicast stream as unicast, to any DMS capable client on this WLAN.
- Step 8** Click **Save & Apply to Device**.
- 

## Configuring 802.11v BSS Transition Management (CLI)

802.11v BSS Transition is applied in the following three scenarios:

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters the global configuration mode.

	<b>Command or Action</b>	<b>Purpose</b>
<b>Step 2</b>	<b>wlan</b> <i>profile-name</i> <b>Example:</b> Device(config)# wlan test-wlan	Configures WLAN profile and enters the WLAN profile configuration mode.
<b>Step 3</b>	<b>shut</b> <b>Example:</b> Device(config-wlan)# shut	Shutdown the WLAN profile.
<b>Step 4</b>	<b>bss-transition</b> <b>Example:</b> Device(config-wlan)# bss-transition	Configure BSS transition per WLAN.
<b>Step 5</b>	<b>bss-transition disassociation-imminent</b> <b>Example:</b> Device(config-wlan)# bss-transition disassociation-imminent	Configure BSS transition disassociation Imminent per WLAN.
<b>Step 6</b>	<b>no shutdown</b> <b>Example:</b> Device(config-wlan)# no shutdown	Enables the WLAN profile.
<b>Step 7</b>	<b>end</b> <b>Example:</b> Device(config-wlan)# end	Return to privilege EXEC mode. Alternatively, you can press <b>CTRL + Z</b> to exit global configuration mode.

## CHAPTER 198

# Virtual Routing and Forwarding

---

- [Information About VRF Support, on page 2241](#)
- [Use Cases, on page 2242](#)
- [Guidelines and Restrictions for VRF Support, on page 2242](#)
- [Create a VRF Instance, on page 2243](#)
- [Map VRF to SVI, on page 2243](#)

- [Adding VRF Name to DHCP Server for DHCP Relay, on page 2245](#)
- [Verify VRF Support, on page 2246](#)

## Information About VRF Support

Virtual Routing and Forwarding (VRF) is a logical representation or grouping of Layer 3 entities, such as IP address, routes, and so on. The VRF Support feature provides the controller with the capability to split the control plane and data plane into multiple segregated logical instances within the same controller platform and make these planes VRF aware.

VRF plays a crucial role in the following use cases:

- Enabling flexible routing in infrastructure services such as AAA, DHCP, DNS, and more.
- Facilitating support for overlapping IP addresses.

---

**Note** Direct route leakage between VRFs is not permitted. It should proceed from VRF A to GRT, then to the intended destination, VRF B.

---

For a multitenant network such as an airport, this allows you to provide wireless services to different tenants (including airlines and shops) at the airport by supporting two clients with different MAC addresses using the same IP address. With VRF support, AP in local mode or AP in FlexConnect mode with central switching policy can have two clients with the same IP even if they belong to different VRFs.

- 
- Note**
- From Cisco IOS XE Dublin 17.12.1, overlapping IP address can be supported without disabling device tracking, by using VRF.
  - The configuration of VRF is not exclusive to this release, but its effectiveness begins from this release.
- 

#### VRFs Supported Per Platform

- Cisco Catalyst 9800-80 Wireless Controller: 8181
- Cisco Catalyst 9800-40 Wireless Controller: 8181
- Cisco Catalyst 9800-L Wireless Controller: 8181
- Cisco Catalyst 9800 Wireless Controller for Cloud: 4096

## Use Cases

Route leak between two VRFs (VRF-A and VRF-B) is possible using a Global Routing Table (GRT). That is, you can permit the traffic from VRF-A to VRF-B using GRT.

- 
- Note** The direct route leak between VRFs are not supported.
- 

## Guidelines and Restrictions for VRF Support

- Supports only Local mode and FlexConnect mode (central DHCP and central switching).
- Supports only one VRF per WLAN.

- 
- Note** The maximum number of VRFs supported on a platform depends on the number of WLANs supported on the hardware platform.
- 

- Supports static VRF ID allocation. All the configured VRFs should be associated with an SVI.
- Supports switch virtual interfaces (SVI) other than Wireless Management Interface (WMI).
- Supports only external DHCP servers.
- mDNS gateway is not supported.
- We recommend using commands to configure the feature because all VRF configurations are currently not supported through GUI.

## Create a VRF Instance

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>vrf definition <i>vrf-name</i></b> <b>Example:</b> Device(config)# vrf definition red-vrf	Configures a VRF instance and enters VRF configuration mode.
<b>Step 3</b>	<b>address-family ipv4</b> <b>Example:</b> Device(config-vrf)# address-family ipv4	Sets an IPv4 address family.
<b>Step 4</b>	<b>exit-address-family</b> <b>Example:</b> Device((config-vrf-af)# exit-address-family	Exits from VRF address-family configuration submode.
<b>Step 5</b>	<b>address-family ipv6</b> <b>Example:</b> Device(config-vrf)# address-family ipv6	Sets an IPv6 address family.
<b>Step 6</b>	<b>exit-address-family</b> <b>Example:</b> Device((config-vrf-af)# exit-address-family	Exits from VRF address-family configuration submode.
<b>Step 7</b>	<b>end</b> <b>Example:</b> Device(config-vrf)# end	Returns to privileged EXEC mode.

## Map VRF to SVI

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b>	Enters global configuration mode.

	Command or Action	Purpose
	Device# <code>configure terminal</code>	
<b>Step 2</b>	<b>interface</b> <i>interface-type-number</i> <b>Example:</b> Device(config)# <code>interface vlan181</code>	Configures VLAN to be associated with the VRF and enters the interface configuration mode.
<b>Step 3</b>	<b>vrf forwarding</b> <i>vrf-name</i> <b>Example:</b> Device(config-if)# <code>vrf forwarding red-vrf</code>	Associates the VRF with the Layer 3 interface. This command activates multiprotocol VRF on an interface.
<b>Step 4</b>	<b>no ip proxy-arp</b> <b>Example:</b> Device(config-if)# <code>no ip proxy-arp</code>	Disables proxy ARP.
<b>Step 5</b>	<b>no shutdown</b> <b>Example:</b> Device(config-if)# <code>no shutdown</code>	Enables the interface.
<b>Step 6</b>	<b>end</b> <b>Example:</b> Device(config-if)# <code>end</code>	Returns to privileged EXEC mode.

## Adding VRF Name Through Option 82 for DHCP Relay

To enable the transmission of VRF name through Option 82 during DHCP relay, follow this procedure.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>wireless profile policy</b> <i>policy-name</i> <b>Example:</b> Device(config)# <code>wireless profile policy red-vrf</code>	Enables configuration for the specified profile policy.
<b>Step 3</b>	<b>shutdown</b> <b>Example:</b> Device(config-wireless-policy)# <code>shutdown</code>	Shuts down the wireless profile policy.
<b>Step 4</b>	<b>ipv4 dhcp opt82 VRF</b> <b>Example:</b>	Enables VRF based Sub Option 151.

	Command or Action	Purpose
	Device(config-wireless-policy)# ipv4 dhcp opt82 VRF	
<b>Step 5</b>	<b>no shutdown</b>  <b>Example:</b> Device(config-wireless-policy)# no shutdown	Enables the wireless profile policy.
<b>Step 6</b>	<b>end</b>  <b>Example:</b> Device(config-wireless-policy)# end	Returns to privileged EXEC mode.

## Adding VRF Name to DHCP Server for DHCP Relay

When implementing DHCP relay, this procedure allows you to configure the DHCP server's VRF separately from the VRF of the client.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wireless profile policy <i>policy-name</i></b>  <b>Example:</b> Device(config)# wireless profile policy red-vrf	Enables configuration for the specified profile policy.
<b>Step 3</b>	<b>shutdown</b>  <b>Example:</b> Device(config-wireless-policy)# shutdown	Shuts down the wireless profile policy.
<b>Step 4</b>	<b>ipv4 dhcp server <i>ip-address vrf vrf-name</i></b>  <b>Example:</b> Device(config-wireless-policy)# ipv4 dhcp server 1.2.3.4 vrf red-vrf	Configures the WLAN's IPv4 DHCP server IP address and VRF name.
<b>Step 5</b>	<b>no shutdown</b>  <b>Example:</b> Device(config-wireless-policy)# no shutdown	Enables the wireless profile policy.
<b>Step 6</b>	<b>end</b>  <b>Example:</b>	Returns to privileged EXEC mode.

	Command or Action	Purpose
	Device(config-wireless-policy)# end	

## Verify VRF Support

Use the following commands to verify the VRF support.

```
Device# show wireless client mac-address aaaa.facc.cccc detail
```

```
Client MAC Address : aaaa.facc.cccc
Client MAC Type : Locally Administered Address
Client DUID: NA
Client IPv4 Address : 10.240.128.1
Client IPv6 Addresses : 2010::1:200:axx:fe04:68a
Client Username: N/A
Client VRF Name: red-vrf
AP MAC Address : 0j0b.0b00.0100
AP Name: AP6B8B4567-0001
AP slot : 0
Client State : Associated
Policy Profile : flex-central-auth-policy-profile
Flex Profile : default-flex-profile
Wireless LAN Id: 8
WLAN Profile Name: wpa3sae
Wireless LAN Network Name (SSID): wpa3sae
BSSID : 0a0b.0c00.0100
Connected For : 1055 seconds
```

```
Device# show wireless device-tracking database mac
```

```

## About the Cisco DNA Service for Bonjour Solution

The Apple Bonjour protocol is a zero-configuration solution that simplifies rich services and enables intuitive experience between connected devices, services, and applications. Using Bonjour, you can discover and use IT-managed, peer-to-peer, audio and video, or Internet of Things (IoT) services with minimal intervention and technical knowledge. Bonjour is originally designed for single Layer 2 small to mid-size networks, such as home or branch networks. The Cisco DNA Service for Bonjour solution eliminates the single Layer 2 domain constraint and expands the matrix to enterprise-grade traditional wired and wireless networks, including overlay networks such as Cisco Software-Defined Access (SD-Access) and industry-standard BGP EVPN with VXLAN. The Cisco Catalyst 9000 Series LAN switches, Cisco Nexus 9300 Series Switches, and Cisco Catalyst 9800 Series Wireless Controller follow the industry standard, RFC 6762-based multicast DNS (mDNS) specification to support interoperability with various compatible wired and wireless consumer products in enterprise networks.

The Cisco Wide Area Bonjour application on Catalyst Center enables mDNS service routing to advertise and discover services across enterprise-grade wired and wireless networks. The new-distributed architecture is designed to eliminate mDNS flood boundaries and transition to unicast-based service routing, providing policy enforcement points and enabling the management of Bonjour services.

The following figure illustrates how the Cisco Wide Area Bonjour application operates across two integrated service-routing domains.

Figure 59: Cisco Wide Area Bonjour Solution Architecture

- Local Area Service Discovery Gateway Domain - Unicast Mode:** The new enhanced Layer 2 unicast policy-based deployment model. The new mDNS service discovery and distribution using the Layer 2 unicast address enables flood-free LAN and wireless networks. Cisco Catalyst 9000 Series Switches and Cisco Catalyst 9800 Series Wireless Controller in Layer 2 mode introduce a new service-peer role, replacing the classic flood-n-learn, for new unicast-based service routing support in the network. The service-peer switch and wireless controller also replace mDNS flood-n-learn with unicast-based communication with any RFC 6762 mDNS-compatible wired and wireless endpoints.
- Wide-Area Service Discovery Gateway Domain:** The Wide Area Bonjour domain is a controller-based solution. The Bonjour gateway role and responsibilities of Cisco Catalyst and Cisco Nexus 9300 Series Switches are extended from a single SDG switch to an SDG agent, enabling Wide Area Bonjour service routing beyond a single IP gateway. The network-wide distributed SDG agent devices establish a lightweight, stateful, and reliable communication channel with a centralized Catalyst Center controller running the Cisco Wide Area Bonjour application. The SDG agents route locally discovered services based on the export policy.

**Note** The classic Layer 2 multicast flood-n-learn continues to be supported on wired and wireless networks with certain restrictions to support enhanced security and location-based policy enforcement. The Cisco Catalyst and Cisco Nexus 9300 Series Switches at Layer 3 boundary function as an SDG to discover and distribute services between local wired or wireless VLANs based on applied policies.

## Solution Components

The Cisco DNA Service for Bonjour solution is an end-to-end solution that includes the following key components and system roles to enable unicast-based service routing across the local area and Wide Area Bonjour domain:

- Cisco Service Peer:** Cisco Catalyst Switches and Cisco Wireless Controllers in Layer 2 access function in service peer mode to support unicast-based communication with local attached endpoints and export service information to the upstream Cisco Catalyst SDG agent in the distribution layer.

**Note** Cisco Nexus 9300 Series Switches don't support unicast-based service routing with downstream Layer 2 access network devices.

- **Cisco SDG Agent:** Cisco Catalyst and Cisco Nexus 9300 Series Switches function as an SDG agent and communicate with the Bonjour service endpoints in Layer 3 access mode. At the distribution layer, the SDG agent aggregates information from the downstream Cisco service peer switch and wireless controller, or local Layer 2 networks, and exports information to the central Catalyst Center controller.

**Note** Cisco Nexus 9300 Series Switches don't support multilayer LAN-unicast deployment mode.

- **Catalyst Center controller:** The Catalyst Center controller builds the Wide Area Bonjour domain with network-wide and distributed trusted SDG agents using a secure communication channel for centralized services management and controlled service routing.
- **Endpoints:** A Bonjour endpoint is any device that advertises or queries Bonjour services conforming to RFC 6762. The Bonjour endpoints can be in either LANs or WLANs. The Cisco Wide Area Bonjour application is designed to integrate with RFC 6762-compliant Bonjour services, including AirPlay, Google Chrome cast, AirPrint, and so on.

## Supported Platforms

The following table lists the supported controllers, along with the supported hardware and software versions.

*Table 153: Supported Controllers with Supported Hardware and Software Versions*

Supported Controller	Hardware	Software Version
Catalyst Center appliance	DN2-HW-APL DN2-HW-APL-L DN2-HW-APL-XL	Catalyst Center, Release 2.3.6
Cisco Wide Area Bonjour application	—	2.4.660.75403

The following table lists the supported SDG agents along with their licenses and software requirements.

*Table 154: Supported SDG Agents with Supported License and Software Requirements*

Supported Platform	Supported Role	Local Area SDG	Wide Area SDG	Minimum Software
Cisco Catalyst 9200 Series Switches	SDG agent Service peer	Cisco DNA Advantage	Cisco DNA Advantage	Cisco IOS XE Release 17.11.1

Supported Platform	Supported Role	Local Area SDG	Wide Area SDG	Minimum Software
Cisco Catalyst 9200L Series Switches	SDG agent Service peer	Cisco DNA Advantage	Cisco DNA Advantage	Cisco IOS XE Release 17.11.1
Cisco Catalyst 9300 and 9300-X Series Switches	Service peer SDG agent	Cisco DNA Advantage	Cisco DNA Advantage	Cisco IOS XE Release 17.11.1
Cisco Catalyst 9400 and 9400-X Series Switches	Service peer SDG agent	Cisco DNA Advantage	Cisco DNA Advantage	Cisco IOS XE Release 17.11.1

Cisco Nexus 9300 Series Switches	SDG agent	Cisco DNA Advantage	Cisco DNA Advantage	Cisco NX-OS Release 10.2(3)F

## Supported Network Design

The Cisco DNA Service for Bonjour supports a broad range of enterprise-grade networks. The end-to-end unicast-based Bonjour service routing is supported on traditional, Cisco SD-Access, and BGP EVPN-enabled wired and wireless networks.

### Traditional Wired and Wireless Networks

Traditional networks are classic Layer 2 or Layer 3 networks for wired and wireless modes deployed in enterprise networks. Cisco DNA Service for Bonjour supports a broad range of network designs to enable end-to-end service routing and replace flood-n-learn-based deployment with a unicast mode-based solution.

The following figure illustrates traditional LAN and central-switching wireless local mode network designs that are commonly deployed in an enterprise.

**Figure 60: Enterprise Traditional LAN and Wireless Local Mode Network Design**

## Wired Networks

The following figure shows the supported traditional LAN network designs that are commonly deployed in an enterprise.

Figure 61: Enterprise Wired Multilayer and Routed Access Network Design

The Cisco Catalyst or Cisco Nexus 9300 Series Switches in SDG agent role that provide Bonjour gateway functions are typically IP gateways for wired endpoints that could reside in the distribution layer in multilayer network designs, or in the access layer in Layer 3 routed access network designs:

- **Multilayer LAN—Unicast Mode:** In this deployment mode, the Layer 2 access switch provides the first-hop mDNS gateway function to locally attached wired endpoints. In unicast mode, the mDNS services are routed to the distribution layer systems providing IP gateway and SDG agent mode. The policy-based service routing between the SDG agents is performed by the Catalyst Center controller.
- **Multilayer LAN—Flood-n-Learn Mode:** In this deployment mode, the Layer 2 access switch or wireless controller are in mDNS passthrough modes with the Cisco Catalyst or Cisco Nexus 9300 Series Switches operating in the SDG agent mode. The mDNS gateway function at distribution layer in a network enables inter-VLAN mDNS local proxy. It also builds stateful Wide Area Bonjour unicast service routing with the Catalyst Center to discover or distribute mDNS services beyond a single IP gateway.
- **Routed Access:** In this deployment mode, the first-hop Cisco Catalyst or Cisco Nexus 9300 Series Switch is an IP gateway boundary and, therefore, it must also perform the SDG agent role. The policy-based service routing between the SDG agents is performed by the Catalyst Center controller.

## Wireless Networks

The Cisco DNA Service for Bonjour extends the single wireless controller mDNS gateway function into the Wide Area Bonjour solution. The mDNS gateway on Cisco Catalyst 9800 Series Wireless Controller can be deployed in an enhanced mode as a service peer. In this mode, the wireless controller builds unicast service routing with an upstream Cisco Catalyst gateway switch for end-to-end mDNS service discovery. It replaces the classic flood-n-learn mDNS services from wired network using mDNS AP or other methods.

The following figure shows the supported traditional wireless LAN network designs that are commonly deployed in an enterprise. Based on the wireless network design, the mDNS gateway function may be on the wireless controller, or first-hop Layer 2 or Layer 3 Ethernet switch of an Access Point in local-switching mode.

**Figure 62: Enterprise Traditional Wireless LAN Network Design**

The Cisco DNA Service for Bonjour supports the following modes for wireless LAN networks:

- **Local Mode:** In the central switching wireless deployment mode, the m-DNS traffic from local mode Cisco access points is terminated on the Cisco Catalyst 9800 Series Wireless Controller. The Cisco Catalyst 9800 Series Wireless Controller extends the mDNS gateway function to the new service peer mode. The wireless controller can discover and distribute services to local wireless users and perform unicast service routing over a wireless management interface to the upstream Cisco Catalyst Switch in the distribution layer, which acts as the IP gateway and the SDG agent.
- **FlexConnect—Central:** The mDNS gateway function for Cisco access point in FlexConnect central switch SSID functions consistently as described in **Local Mode**. The new extended mDNS gateway mode on the Cisco Wireless Controller and upstream service routing with SDG agent operate consistently to discover services across network based on policies and locations.
- **FlexConnect—Local:** In FlexConnect local switching mode, the Layer 2 access switch in mDNS gateway service peer mode provides the policy-based mDNS gateway function to locally attached wired and wireless users. The Cisco Catalyst Switches in the distribution layer function as SDG agents and enable

mDNS service-routing across all Layer 2 ethernet switches to support unicast-based service routing to LAN and wireless LAN user groups.

- **Embedded Wireless Controller—Access Point:** The Layer 2 access switch in service peer mode provides unified mDNS gateway function to wired and wireless endpoints associated with Cisco Embedded Wireless Controller on Cisco Catalyst 9100 Series Access Points. The SDG agent in the distribution layer provides unicast service routing across all Layer 2 service peer switches in the Layer 2 network block without any mDNS flooding.

## Cisco SD-Access Wired and Wireless Networks

Cisco SD-Access-enabled wired and wireless networks support Cisco DNA Service for Bonjour across fabric networks. The Cisco Catalyst 9000 Series Switches support VRF-aware Wide Area Bonjour service routing to provide secure and segmented mDNS service discovery and distribution management for virtual networks. The VRF-aware unicast service routing eliminates the need to extend Layer 2 flooding, and improves the scale and performance of the fabric core network and endpoints.

**Figure 63: Cisco SD-Access Wired and Wireless Network Design**

Cisco SD-Access supports flexible wired and wireless network design alternatives to manage fully distributed, integrated, and backward-compatible traditional network infrastructure. Wide Area Bonjour service routing is supported in all network designs providing intuitive user experience. The following figure illustrates the various SD-Access enabled wired and wireless network design alternatives.

Figure 64: Cisco SD-Access Wired and Wireless Network Design Alternatives

The Cisco DNA Service for Bonjour for SD-Access enabled wired and fabric, or traditional mode-wireless networks use two-tier service routing providing end-to-end unicast-based mDNS solution. Based on the network design, each solution component is enabled in a unique role to support the Wide Area Bonjour domain:

- Fabric Edge SDG Agent:** The Layer 3 Cisco Catalyst Fabric Edge switch in the access layer configured as SDG agent provides unicast-based mDNS gateway function to the locally attached wired and wireless endpoints. The VRF-aware mDNS service policy provides network service security and segmentation in a virtual network environment. The mDNS services can be locally distributed and routed through centralized Catalyst Center.
- Policy Extended Node:** The Layer 2 Cisco Catalyst access layer switch enables first-hop mDNS gateway function without flooding across the Layer 2 broadcast domain. The unicast-based service routing with upstream Fabric Edge switch in the distribution layer enables mDNS service routing within the same Layer 2 network block. It can also perform remote service discovery and distribution from centralized Catalyst Center.
- Cisco Wireless Controller:** Based on the following wireless deployment modes, Cisco Wireless Controller supports unique function to enable mDNS service routing in Cisco SD-Access enabled network:
  - Fabric-Enabled Wireless:** Cisco Wireless Controller doesn't require any mDNS gateway capability to be enabled in distributed fabric-enabled wireless deployments.
  - Local Mode Wireless:** As Cisco Wireless Controller provides central control and data plane termination, it provides mDNS gateway in service peer mode for wireless endpoints. The wireless controller provides mDNS gateway between locally associated wireless clients. The wireless controller builds service routing with upstream SDG agent Catalyst switch providing IP gateway and service routing function for wireless endpoints.
  - Embedded Wireless Controller—Switch:** The Cisco Embedded Wireless Controller solution enables the lightweight integrated wireless controller function within the Cisco Catalyst 9300 Series

Switch. The Cisco Catalyst switches in the distribution layer function as SDG agents to the wired and wireless endpoints. The SDG agent in the distribution layer provides unicast service routing across all wireless access points and Layer 2 service peer switches without mDNS flooding.

- **Catalyst Center Controller:** The Cisco Wide Area Bonjour application on Catalyst Center supports policy and location-based service discovery, and distribution between network-wide distributed Fabric Edge switches in SDG agent mode.

The Wide Area Bonjour communication between the SDG agent and controller takes place through the network underlay. Based on policies, the SDG agent forwards the endpoint announcements or queries to the Catalyst Center. After discovering a service, the endpoints can establish direct unicast communication through the fabric overlay in the same virtual network. The inter-virtual network unicast communication takes place through the Fusion router or external Firewall system. This communication is subject to the configured overlay IP routing and Security Group Tag (SGT) policies.

## BGP EVPN Networks

The BGP EVPN-based technology provides a flexible Layer 3 segmentation and Layer 2 extension overlay network. The VRF and EVPN VXLAN-aware Wide Area Bonjour service routing provides secure and segmented mDNS service solution. The overlay networks eliminate mDNS flooding over EVPN-enabled Layer 2 extended networks and solve the service reachability challenges for Layer 3 segmented routed networks in the fabric.

The following figure shows the BGP EVPN leaf switch in the distribution layer, supporting overlay Bonjour service routing for a BGP EVPN-enabled traditional Layer 2 wired access switch and traditional wireless local mode enterprise network interconnected through various types of Layer 2 networks and Layer 3 segmented VRF-enabled networks.

**Figure 65: Overlay Bonjour Service for a BGP EVPN-Enabled Enterprise Network**

Cisco DNA Service for Bonjour supports all the industry-standard overlay network designs enabling end-to-end unicast-based mDNS service routing, and preventing flooding and service boundary limitation across wired and wireless networks.

The following figure illustrates the various BGP EVPN VXLAN reference overlay network design alternatives. This network design enables end-to-end mDNS service discovery and distribution based on overlay network policies.

Figure 66: BGP EVPN VXLAN Wired and Wireless Design Alternatives

The Cisco Catalyst and Cisco Nexus 9000 Series Switches can be deployed in Layer 2 or Layer 3 leaf roles supporting mDNS service routing for a broad range of overlay networks. In any role, the mDNS communication is limited locally and supports end-to-end unicast-based service routing across Wide Area Bonjour domain:

- **Layer 2 Leaf SDG Agent:** The Cisco Catalyst or Cisco Nexus switches can be deployed as Layer 2 leaf supporting end-to-end bridged network with IP gateway within or beyond BGP EVPN VXLAN fabric network. By default, the mDNS is flooded as Broadcast, Unknown Unicast, Multicast (BUM) over the fabric-enabled core network. This mDNS flooding may impact network performance and security. The Layer 2 leaf, enabled as SDG agent, prevents mDNS flooding over VXLAN and supports unicast-based service routing.
- **Layer 3 Leaf SDG Agent:** The Cisco Catalyst or Cisco Nexus switches can be deployed as SDG agent supporting Layer 3 overlay network in BGP EVPN VXLAN fabric. The IP gateway and mDNS service boundary is terminated at the SDG agent switches and remote services can be discovered or distributed through centralized Catalyst Center.
- **Local Mode Wireless:** The centralized wireless local mode network can be terminated within or outside the EVPN VXLAN fabric domain to retain network segmentation and service discovery for wireless endpoints. The Cisco Catalyst 9800 Series Wireless Controller in service peer mode can build unicast service routing with distribution layer IP and SDG agent Cisco Catalyst switch to discover services from BGP EVPN VXLAN fabric overlay network.
- **Catalyst Center:** Catalyst Center supports Wide Area Bonjour capability to dynamically discover and distribute mDNS services based on Layer 2 or Layer 3 Virtual Network ID (VNID) policies to route the mDNS services between SDG agent switches in the network.

For more information about BGP EVPN networks, see [Cisco DNA Service for Bonjour Configuration Guide, Cisco IOS XE Bengaluru 17.6.x \(Catalyst 9600 Switches\)](#).

## Cisco DNA Service for Bonjour Solution Overview

### Restrictions

- Cisco Service Discovery Gateway (SDG) and Wide Area Bonjour gateway function is supported on Cisco Catalyst Switch and Cisco ISR 4000 series routers. See [Solution Components](#), on page 2252 for the complete list of supporting platforms, software versions and license levels.
- Cisco IOS supports classic and new method of building local Bonjour configuration policies. The classic method is based on **service-list mdns-sd** CLI whereas the new method is based on **mdns-sd gateway**. We recommend using the new **mdns-sd gateway** method since the classic configuration support will be deprecated in near future releases.
- The classic to new method CLI migration is manual procedure to convert the configuration.
- The Bonjour service policies on Cisco SDG Gateways are effective between local VLANs. In addition to these, a specific egress policy controls the type of services to be exported to the controller. The Layer 2 Multicast-DNS Bonjour communication between two end-points on same broadcast domain is transparent to gateway.
- To enable end-to-end Wide Area Bonjour solution on Wireless networks, the Cisco WLC controller must not enable mDNS Snooping function. The upstream IP gateway on the dedicated Cisco Catalyst switch must have the Bonjour gateway function enabled for wireless clients.

- Cisco Wireless LAN Controller must enable AP Multicast with unique Multicast group. Without AP joining WLC Multicast group the mDNS messages will not be processed between client and gateway switch. Multicast on Client SSID or VLAN is optional for other multicast applications and not mandatory or required for Bonjour solution.
- Cisco Catalyst 9800 WLC can be configured as mDNS Gateway. In this mode, the Cisco Catalyst 9800 WLC supports Local-Area Bonjour gateway solution limited to Wireless only networks. Cisco Catalyst 9800 does not support Wide Area Bonjour. For end-to-end Wired and Wireless Bonjour support, we recommend using upstream Cisco Catalyst Switch as IP and Bonjour gateway.

## Cisco Wide Area Bonjour Service Workflow

The Cisco Wide Area Bonjour solution follows a client-server model. The SDG Agent functions as a client and the Cisco Wide Area Bonjour application Cisco Catalyst Center functions as a server.

The following sections describe the workflow of service announcement and discovery in the IP network.

### Announcing Services to the Network

- The endpoint devices (Source) in the Local Area Bonjour domain send service announcements to the SDG Agent and specify what services they offer. For example, `_airplay._tcp.local`, `_raop._tcp.local`, `_ipp._tcp.local`, and so on.
- The SDG Agent listens to these announcements and matches them against the configured Local Area SDG Agent policies. If the announcement matches the configured policies, the SDG Agent accepts the service announcement and routes the service to the controller.

### Discovering Services Available in the Network

- The endpoint device (Receiver) connected to the Local Area SDG Agent sends a Bonjour query to discover the services available, using the mDNS protocol.
- If the query conforms to configured policies, SDG Agent responds with the services obtained from appropriate service routing via the Wide Area Bonjour Controller.

### Wide Area Bonjour Multi-Tier Policies

The various policies that can be used to control the Bonjour announcements and queries are classified as the following:

- **Local Area SDG Agent Filters:** Enforced on the SDG Agent in Layer-2 Network Domain. These bi-directional policies control the Bonjour announcements or queries between the SDG Agents and the Bonjour endpoints.
- **Wide Area SDG Agent Filters:** Enforced on the SDG Agent for export control to the Controller. This egress unidirectional policy controls the service routing from the SDG Agent to the controller.
- **Cisco Wide Area Bonjour Policy:** Enforced on Controller for global service discovery and distribution. Policy enforcement, between the controller and the IP network is bi-directional.

# Cisco Wide Area Bonjour Supported Network Design

## Traditional Wired and Wireless Networks

The Cisco DNA Service for Bonjour supports various LAN network designs commonly deployed in the enterprise. The SDG Agent providing Bonjour gateway functions is typically an IP gateway for wired end-points that could be residing in the distribution layer in multilayer network designs, or in the access layer in routed access network designs.

The following figure shows various topologies which are explained further in the section.

- **Multilayer LAN:** In this deployment mode, the Layer 2 Access switch provides the transparent bridging function of Bonjour services to Distribution-layer systems that act as the IP gateway and SDG Agent. There is no additional configuration or new requirement to modify the existing Layer-2 trunk settings between the Access and Distribution Layer Cisco Catalyst Switches.
- **Routed Access:** In this deployment mode, the first-hop switch is an IP gateway boundary and therefore, it must be combined with the SDG Agent role.

The Cisco DNA Service for Bonjour also supports various Wireless LAN network designs commonly deployed in the Enterprise. The SDG Agent provides consistent Bonjour gateway functions for the wireless endpoints as in wired networks. In general, the IP gateway of the wireless clients is also a Bonjour gateway. However, the placement of the SDG Agent may vary depending on the Wireless LAN deployment mode.

## Cisco SD Access Wired and Wireless Networks

In Cisco SD-Access network, the Fabric Edge switch is configured as the SDG Agent for fabric-enabled wired and wireless networks. Wide Area Bonjour policies need to be aligned with the SD-Access network policies with respect to Virtual Networks and SGT policies, if any.

Wide Area Bonjour uses two logical components in a network:

- **SDG Agent:** The Fabric Edge switch is configured as the SDG Agent, and the configuration is added only after the SD-Access is configured.
- **Wide Area Bonjour Controller:** The Wide Area Bonjour application in the Cisco Catalyst Center acts as the Controller.

The Wide Area Bonjour communication between the SDG Agent and the Controller takes place through the network underlay. The SDG Agent forwards the endpoint announcements or queries to the Controller through the fabric underlay. After discovering a service, a Bonjour-enabled application establishes direct unicast communication with the discovered device through the fabric overlay. This communication is subject to any configured routing and SDG policies.

## Local and Wide Area Bonjour Policies

The Cisco Wide Area Bonjour policy is divided into four unique function to enable policy based Bonjour services discovery and distribution in two-tier domains. The network administrator must identify the list of Bonjour services that needs to be enabled and set the discovery boundary that can be limited to local or global based on requirements. Figure below illustrates enforcement point and direction of all four types of Bonjour policies at the SDG Agent level and in Cisco Catalyst Center Wide Area Bonjour application:

350304

## Local Area Bonjour Policy

The Cisco IOS Bonjour policy structure is greatly simplified and scalable with the new configuration mode. The services can be enabled with intuitive user-friendly service-type instead individual mDNS PoinTeR (PTR) records types, for example select AirPlay that automatically enables video and audio service support from Apple TV or equivalent capable devices. Several common types of services in Enterprise can be enabled with built-in service-types. If built-in service type is limited, network administrator can create custom service-type and enable the service distribution in the network.

The policy configuration for the Local Area Bonjour domain is mandatory, and is a three step process. Figure below illustrates the step-by-step procedure to build the Local-Area Bonjour policy, and apply to enable the gateway function on selected local networks:

Figure 67: Local Area Bonjour Policy Hierarchy

To configure local area Bonjour policies, enable mDNS globally. For the device to receive mDNS packets on the interface, configure mDNS gateway on the interface. Create a service-list by using filter options within it allow services into or out of a device or interface. After enabling mDNS gateway globally and on the interface, you can apply filters (IN-bound filtering or OUT-bound filtering) on service discovery information by using **service-policy** commands.

### Built-In Service List

The Cisco IOS software includes built-in list of services that may consist of one more Bonjour service-type. A single service-list may contain more than one service-type entries with default rule to accept service announcement from service-provider and the service query request from receiver end-points. If selected service-type contains more than one Bonjour service-types (PTR), then a service announcement or a service query is honored when the announcement/query is for any one of these included Bonjour service-types. For example, Apple Time Capsule Data service-type consists of both `_adisk` and `_afpovertcp` built-in PTRs, however if any end-point announces or requests for only `_afpovertcp` service, then SDG Agent will successfully classify and process the announcement or request. The service-list contains implicit-deny for all un-defined built-in or custom services entries.

Table below illustrates complete list of built-in Bonjour services that can be used to create policies in local area Bonjour.

**Table 155: Cisco IOS Built-In Bonjour Service Database**

Service	Service Name	mDNS PTRs
Airplay	airplay	_airplay._tcp.local
Apple TV	apple-tv	_airplay._tcp.local _raop._tcp.local
Audinate	audinate	_dante-safe._udp.local _dante-upgr._udp.local _netaudio-arc._udp.local _netaudio-chan._udp.local _netaudio-cmc._udp.local _netaudio-dbc._udp.local
AirServer Mirroring Service	airserver	_airplay._tcp.local _airserver._tcp.local
Apple AirTunes	airtunes	_raop._tcp.local
Amazon Fire TV	amazon-fire-tv	_amzn-wplay._tcp.local
Apple AirPrint	apple-airprint	_ipp._tcp.local _universal._sub._ipp._tcp.local
Apple TV 2	apple-continuity	_companion-link._tcp.local
Apple File Share	apple-file-share	_afpovertcp._tcp.local
Apple HomeKit	apple-homekit	_homekit._ipp.local _hap._tcp.local
Apple iTunes Library	apple-itunes-library	_atc._tcp.local
Apple iTunes Music	apple-itunes-music	_daap._tcp.local
Apple iTunes Photo	apple-itunes-photo	_dpap._tcp.local
Apple KeyNote Remote Control	apple-keynote	_keynotecontrol._tcp.local _keynotepair._tcp.local
Apple Remote Desktop	apple-rdp	_afpovertcp._tcp.local _net-assistant._tcp.local
Apple Remote Event	apple-remote-events	_eppc._tcp.local

Service	Service Name	mDNS PTRs
Apple Remote Login	apple-remote-login	_sftp-ssh._tcp.local _ssh._tcp.local
Apple Screen Share	apple-screen-share	_rfb._tcp.local
Google Expeditions	google-expeditions	_googexpeditions._tcp.local
Apple Time Capsule Data	apple-timecapsule	_adisk._tcp.local _afpovertcp._tcp.local
Apple Time Capsule Management	apple-timecapsule-mgmt	_airport._tcp.local
Apple MS Window File Share	apple-windows-fileshare	_smb._tcp.local
Fax	fax	_fax-ipp._tcp.local
Google ChromeCast	google-chromecast	_googlecast._tcp.local _googlerpc._tcp.local _googlezone._tcp.local
Apple HomeSharing	homesharing	_home-sharing._tcp.local
Apple iTunes Data Sync	itunes-wireless-devicesharing2	_apple-mobdev2._tcp.local
Multifunction Printer	multifunction-printer	_ipp._tcp.local _scanner._tcp.local _fax-ipp._tcp.local
Phillips Hue Lights	phillips-hue-lights	_hap._tcp.local
Printer – Internet Printing Protocol	printer-ipp	_ipp._tcp.local
Printer – IPP over SSL	printer-ipp	_ipp._tcp.local
Linux Printer – Line Printer Daemon	printer-lpd	_printer._tcp.local
Printer Socket	printer-socket	_pdl-datastream._tcp.local
Roku Media Player	roku	_rsp._tcp.local
Scanner	scanner	_scanner._tcp.local
Spotify Music Service	spotify	_spotify-connect._tcp.local
Web-Server	web-server	_http._tcp.local
WorkStation	workstation	_workstation._tcp.local

### Custom Service List

The Custom service list allows network administrator to configure service if built-in Bonjour database does not support specific service or bundled service types. For example, the file-sharing requirement demands to support Apple Filing Protocol (AFP) between macOS users and Server Message Block (SMB) file transfer capability between macOS and Microsoft Windows devices. For such requirements the network administrator can create a custom service list combining AFP (`_afpovertcp_tcp.local`) and SMB (`_smb_tcp.local`).

The Service-List provides flexibility to network administrator to combine built-in and custom service definition under single list. There is no restriction on numbers of custom service definitions list and association to single service-list.

### Policy Direction

The Local Area Bonjour policy in Cisco IOS provides flexibility to network administrator to construct service policies that can align service announcement and query management in same or different local networks. The service-policies can be tied to either ingress or egress direction to enforce service control in both directions. The following sub-sections provide more details on service policy configuration.

#### Ingress Service Policy

The ingress service policy is a mandatory configuration element that is used to permit the processing of incoming mDNS service announcement and query requests. Without ingress service policy, the Bonjour gateway function on a targeted Wired or Wireless network is not enabled. The ingress service policy provides flexibility to permit service announcement and query on each user-defined service-types, i.e. permit accepting AirPlay service announcement and query request, but enable Printer service query request only.

#### Egress Service Policy

The egress service policy is an optional configuration and not required in following two conditions:

- The egress service policy is not applicable in local VLAN where the expected Bonjour end-points are service-provider only, i.e. Service-VLAN network may contain only IT managed service-provider end-points such as Apple TV, Printers etc. as these end-points do not query for other service-types in the network.
- The Wired or Wireless users must receive services only from Wide Area Bonjour domain by Cisco Catalyst Center, and not from other Bonjour end points connected to the same SDG Agent.. The egress service policy configuration is only required when an SDG-Agent must distribute locally discovered Bonjour services information from one VLAN to other. For example, based on ingress service policy the SDG-Agent discovered and cache the AirPrint capable Printer from VLAN-A, if the receiver endpoint in VLAN-B wants to discover Printer information from VLAN-A then the SDG-Agent must have ingress and egress service policy permitting AirPrint service on both VLANs.

#### Conditional Egress Service Policy

The network administrator can optionally customize the egress service policy to enable conditional service response from sourced from specific VLAN network. For example, based on ingress service policy the SDG-Agent may discover AirPrint capable Printers from VLAN-A and VLAN-C networks. With conditional Local Area Bonjour egress service policy rule, the network administrator may limit distributing Printer information discovered from VLAN-A to the receivers in VLAN-B network and automatically filters VLAN-C Printers. The conditional egress service policy support is optional setting and only applicable on out direction service policy.

### Service Status Timer Management

The Bonjour service-provider end-points may announce one or more services in the network combining mDNS records and time-to-live (TTL) service timers for each record. The TTL value provides assurance of end-point availability and serviceability in the network. The SDG Agent ensures that it contains up to date information in its local and updates global services in Controller based on TTL and other events in Local Area Bonjour domain. The network administrator must configure the service status timer where service-provider endpoint discovery is permitted.

## Wide Area Bonjour Policy

The SDG-Agent mandatorily requires the controller bound Wide Area Bonjour service export policy to control routing local services and discover remote services from Cisco Catalyst Center. As the Cisco Catalyst Center and SDG-Agent builds trusted communication channel the remote service response from Wide Area Bonjour App is implicitly permitted at SDG-Agent. Hence the Wide Area Bonjour policy is unidirectional it only requires egress service policy towards controller.

The Wide Area Bonjour policy hierarchy and structure is identical as described in Local Area Bonjour Policy structure section. Following sub-section provides step-by-step reference configuration to build and enforce the policy to enable the successful communication with Wide Area Bonjour App in Cisco Catalyst Center.

### Service List – Built-In and Custom

The network administrator must create new controller bound egress service list for the Wide Area Bonjour domain. In most common network deployment model, the Wide Area Bonjour service list may contain same service-types as the Local Area Bonjour to implement common services between both domains. Based on requirements, certain services can be limited to Local Area and prevent routed in Wide Area Domain, then by default only allowed service list entries are permitted and rest are dropped with implicit deny rule.

### Ingress Policy Direction

The ingress service policy for Wide Area Bonjour domain is not required and cannot be associated to the controller.

### Egress Policy Direction

As described the Bonjour policy structure between Local Area and Wide Area is consistent, however the enforcement point is different. We recommend configuring separate Service-List and Service-Policy for Wide Area Bonjour domain as it may help building unique policy set for each domain.

### Conditional Egress Service List

The Wide Area Bonjour egress service list configuration can be customized to conditionally route the service or query request to the Cisco Catalyst Center. With this alternative configuration settings, the network administrator can route the service or query the request in Wide Area Bonjour domain from specific local source VLAN network instead globally from entire system.

### Wide Area Bonjour Service Status Timer Management

The Cisco Catalyst Center centralizes the services information from large scale distributed SDG-Agents across the network. To maintain a scale and performance of controller the services routing information is transmitted and synchronized periodically by each SDG-Agent network devices. To protect system and network performance the scheduler base service information exchange allows graceful and reliable way to discover and distribute Bonjour services across Wide Area Bonjour domain.

In most large-scale network environment, the default Bonjour service timers on SDG-Agents are by default fine-tuned and may not need any further adjustments. Cisco recommends retaining the interval timer values to default and adjust only based on any user experience issue and consider modified parameters do not introduce scale and performance impact.

## Default mDNS Service Configurations

Starting with Cisco IOS XE Bengaluru 17.6.1, an intuitive approach to configuring mDNS services, known as the default mDNS service configuration is introduced. The default service configuration contains a default service policy that creates a service list with default service-types that is automatically enforced in the ingress or egress direction. The following figure illustrates the default mDNS service configurations:

**Figure 68: Default mDNS Service Configurations**

The default mDNS service configurations accelerates solution adoption, increases user productivity, and reduces operation overhead. Additionally, you can define a custom policy and service list with custom-defined service types, and enforce it in the ingress or egress direction.

## HSRP-Aware mDNS Service-Routing

Starting from Cisco IOS XE Bengaluru 17.6.1, Hot Standby Router Protocol-aware (HSRP-aware) mDNS Service-Routing is supported between Service Peers and SDG agents in a multilayer network. During a changeover, that is when the primary SDG agent fails and the secondary SDG agent becomes the new primary, the service-routing session between the Service Peer and the SDG agent remains uninterrupted. The new primary SDG agent establishes a session with the Service Peer and cache information is resynced.

The HSRP virtual IP address of the management VLAN is enabled on the SDG agent using the **standby group\_number ip ip\_address** command. The HSRP virtual IP address needs to be configured on the Service Peer as the IP address of the SDG agent.

**Note** The HSRP virtual IP address must be reachable and in active state during a changeover.

The following figure illustrates a wired and wireless network that supports HSRP-aware mDNS Service-Routing:

Figure 69: HSRP-Aware mDNS Service-Routing

The HSRP offers the following advantages:

- Automatic gateway selection.
- Rapid switchover.
- Reduces service convergence.

## mDNS Service-Gateway SSO Support

Starting from Cisco IOS XE Bengaluru 17.6.1, mDNS Stateful Switchover (SSO) is supported on network devices configured in Service Peer role. In SSO-enabled devices, one device is selected as an active device and the other as a standby device. The cache information learnt by the active device is synced with the standby device. When the active device fails, the standby device becomes the new active device and continues the mDNS service discovery process.

Figure 70: mDNS Service-Gateway SSO

# Configuring Local and Wide Area Bonjour Domains

## How to configure Multicast DNS Mode for LAN and Wired Networks

This section provides information about how to configure Local Area Bonjour in multicast DNS mode.

### Enabling mDNS Gateway on the Device

To configure mDNS on the device, follow these steps:

#### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Device> <b>enable</b>	Enables privileged EXEC mode. Enter your password, if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 3</b>	<b>mdns-sd gateway</b> <b>Example:</b> Device(config)# <b>mdns-sd gateway</b>	Enables mDNS on the device and enters mDNS gateway configuration mode. Enter the following commands in mDNS gateway configuration mode to enable the respective functionalities: <ul style="list-style-type: none"> <li>• <b>air-print-helper</b>: Enables IOS devices like iPADS to discover and use older printers that support Bonjour</li> <li>• <b>cache-memory-max</b>: Configures the percentage memory for cache</li> <li>• <b>ingress-client</b>: Configures Ingress Client Packet Tuners</li> <li>• <b>rate-limit</b>: Enables rate limiting of incoming mDNS packets</li> <li>• <b>service-announcement-count</b>: Configures maximum service advertisement count</li> <li>• <b>service-announcement-timer</b>: Configures advertisements announce timer periodicity</li> <li>• <b>service-query-count</b>: Configures maximum query count</li> </ul>

	Command or Action	Purpose
		<ul style="list-style-type: none"> <li>• <b>service-query-timer</b>: Configures query forward timer periodicity</li> </ul> <p>The following CLIs are effective only in service-peer mode:</p> <ul style="list-style-type: none"> <li>• <b>query-response</b></li> <li>• <b>sdg-agent</b></li> <li>• <b>service-announcement-count</b></li> <li>• <b>service-announcement-timer</b></li> <li>• <b>service-mdns-query</b></li> <li>• <b>service-query-count</b></li> <li>• <b>service-query-timer</b></li> <li>• <b>service-receiver-purge</b></li> <li>• <b>active-response</b></li> </ul> <p><b>Note</b> For <b>cache-memory-max</b>, <b>ingress-client</b>, <b>rate-limit</b>, <b>service-announcement-count</b>, <b>service-announcement-timer</b>, <b>service-query-count</b>, and <b>service-query-timer</b> commands, you can retain the default value of the respective parameter for general deployments. Configure a different value, if required, for a specific deployment.</p>
<b>Step 4</b>	<b>exit</b> <b>Example:</b> Device(config-mdns-sd)# exit	Exits mDNS gateway configuration mode.

## Creating Custom Service Definition (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Services > mDNS > Service Policy > Service Definition**.
  - Step 2** Click **Add**.
  - Step 3** Enter the **Service Definition Name** and **Description**.
  - Step 4** Enter the **Service Type** and click the + icon.

**Step 5** Click **Apply to Device**.

## Creating Custom Service Definition

Service definition is a construct that provides an admin friendly name to one or more mDNS service types or PTR Resource Record Name. By default, a few built-in service definitions are already predefined and available for admin to use. In addition to built-in service definitions, admin can also define custom service definitions.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Device> <b>enable</b>	Enables privileged EXEC mode. Enter your password, if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 3</b>	<b>mdns-sd service-definition</b> <i>service-definition-name</i> <b>Example:</b> Device(config)# <b>mdns-sd</b> <b>service-definition CUSTOM1</b>	Configures mDNS service definition. <b>Note</b> All the created custom service definitions are added to the primary service list. Primary service list comprises of a list of custom and built-in service definitions.
<b>Step 4</b>	<b>service-type</b> <i>string</i> <b>Example:</b> Device(config-mdns-ser-def)# <b>service-type</b> <b>_custom1._tcp.local</b>	Configures mDNS service type.
<b>Step 5</b>	Repeat step 4 to configure more than one service type in the custom service definition.	
<b>Step 6</b>	<b>exit</b> <b>Example:</b> Device(config-mdns-ser-def)# <b>exit</b>	Exit mDNS service definition configuration mode.

## Creating Service List (GUI)

### Procedure

- Step 1** Choose **Configuration > Services > mDNS > Service Policy > Service List**.
- Step 2** Click **Add**.
- Step 3** Enter the **Service List Name** and choose the direction from the **Direction** drop-down list.

- Step 4** Click **Add Service**.
- Step 5** Choose the service from the **Available Services** drop-down list and the message type from the **Message Type** drop-down list.
- Step 6** Click **Save**.
- Step 7** Click **Apply to Device**.

## Creating Service List

mDNS service list is a collection of service definitions. To create a service list, follow these steps:

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Device> <b>enable</b>	Enables privileged EXEC mode. Enter your password, if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 3</b>	<b>mdns-sd service-list</b> <i>service-list-name</i> { <b>in</b>   <b>out</b> } <b>Example:</b> Device(config)# <b>mdns-sd service-list</b> <b>VLAN100-list in</b>	Configures mDNS service list.
<b>Step 4</b>	<b>match</b> <i>service-definition-name</i> [ <b>message-type</b> { <b>any</b>   <b>announcement</b>   <b>query</b> }] <b>Example:</b> Device(config-mdns-sl-in)# <b>match</b> <b>PRINTER-IPPS message-type announcement</b>	Matches the service to the message type. Here, <i>service-definition-name</i> refers to the names of services, such as, airplay, airserver, airtunes, and so on. <b>Note</b> To add a service, the service name must be part of the primary service list. If the mDNS service list is set to IN, the applicable command syntax is: <b>match</b> <i>service-definition-name</i> [ <b>message-type</b> { <b>any</b>   <b>announcement</b>   <b>query</b> }]. If the mDNS service list is set to OUT, the applicable command syntax is: <b>match</b> <i>service-definition-name</i> [ <b>message-type</b> { <b>any</b>   <b>announcement</b>   <b>query</b> }] [ <b>location-filter</b> <i>location-filter-name</i> ] [ <b>source-interface</b> { <i>mDNS-VLAN-number</i>   <i>mDNS-VLAN-range</i> }].

	Command or Action	Purpose
<b>Step 5</b>	<b>exit</b>  <b>Example:</b> Device(config-mdns-sl-in) # exit	Exits mDNS service list configuration mode.

## Creating Service Policy (GUI)

### Procedure

- 
- Step 1** Choose **Configuration** > **Services** > **mDNS** > **Service Policy** > **Service Policy**.
  - Step 2** Click **Add**.
  - Step 3** Enter the **Service Policy Name**.
  - Step 4** Choose the service list input from the **Service List Input** drop-down list.
  - Step 5** Choose the service list output from the **Service List Output** drop-down list.
  - Step 6** Choose the location from the **Location** drop-down list.
  - Step 7** Click **Apply to Device**.
- 

## Creating Service Policy

A Service Policy that is applied to an interface specifies the allowed Bonjour service announcements or the queries of specific service types that should be processed, in ingress direction or egress direction or both. For this, the service policy specifies two service-lists, one each for ingress and egress directions. In the Local Area Bonjour domain, the same service policy can be attached to one or more Bonjour client VLANs; however, different VLANs may have different service policies.

To configure service policy with service lists, follow these steps:

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b>  <b>Example:</b> Device> enable	Enables privileged EXEC mode.  Enter your password, if prompted.
<b>Step 2</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 3</b>	<b>mdns-sd service-policy <i>service-policy-name</i></b>  <b>Example:</b> Device(config)# mdns-sd service-policy mdns-policy1	Configures mDNS service policy.

	Command or Action	Purpose
<b>Step 4</b>	<b>service-list</b> <i>service-list-name</i> { <b>in</b>   <b>out</b> } <b>Example:</b> Device(config-mdns-ser-pol)# <b>service-list</b> <b>VLAN100-list in</b> Device(config-mdns-ser-pol)# <b>service-list</b> <b>VLAN300-list out</b>	Configures service lists for IN and OUT directions.
<b>Step 5</b>	<b>exit</b> <b>Example:</b> Device(config-mdns-ser-pol)# <b>exit</b>	Exits mDNS service policy configuration mode.

## Associating Service Policy to an Interface

To configure mDNS on the device, follow these steps:

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Device> <b>enable</b>	Enables privileged EXEC mode. Enter your password, if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 3</b>	<b>interface</b> <i>interface-name</i> <b>Example:</b> Device(config)# <b>interface Vlan 601</b>	Enters interface mDNS configuration mode and enables interface configuration.
<b>Step 4</b>	<b>mdns-sd gateway</b> <b>Example:</b> Device(config-if)# <b>mdns-sd gateway</b>	Configures mDNS gateway on the interface. Enter the following commands in the interface mDNS gateway configuration mode to enable the respective functionalities: <ul style="list-style-type: none"> <li>• <b>active-query</b>: Sets the time interval for SDG agent to refresh the active status of connected Bonjour client services. The timer value ranges from 60 to 3600 seconds.</li> </ul>

	Command or Action	Purpose
		<p><b>Note</b> This configuration is mandatory only on VLANs whose Bonjour policy is configured to accept Bonjour service announcements from connected Bonjour clients. If the VLAN is configured to only accept Bonjour queries but not Bonjour service announcements, this configuration is optional.</p> <ul style="list-style-type: none"> <li>• <b>service-instance-suffix</b>(Optional) : Appends the service instance suffix to any announced service name that is forwarded to the controller.</li> <li>• <b>service-mdns-query [ptr   all]</b> : Configures mDNS query request message processing for the specified query types. This command is applicable when the controller is in service-peer mode.</li> </ul> <p><b>Note</b> By default, the <b>service-mdns-query</b> command allows only PTR queries. If you need to respond to all (PTR, SRV, and TXT) queries, you need to execute the following command:</p> <p style="padding-left: 40px;"><b>service-mdns-query all</b></p> <ul style="list-style-type: none"> <li>• <b>service-policy <i>policy-name</i></b>: Attaches the specified service policy to the VLAN. Bonjour announcements, and queries received by and sent from the VLAN are governed by the policies configured in the service policy. This configuration is mandatory for all VLANs.</li> </ul> <p><b>Note</b> Service policies can only be attached at interface level.</p> <ul style="list-style-type: none"> <li>• <b>transport [all   ipv4   ipv6]</b> (Optional): Configures BCP parameter.</li> </ul> <p>It is recommended to use <b>transport ipv4</b> command, except in those networks where the Bonjour clients send only IPv6 announcements and queries.</p>
<b>Step 5</b>	<b>exit</b>  <b>Example:</b>	Exits mDNS gateway configuration mode.

	Command or Action	Purpose
	Device(config-if-mdns-sd)# exit	

## How to Configure Local Area Bonjour in Multicast DNS Mode for Wireless Networks

The configuration of local area Bonjour on a switch that acts as the SDG Agent in a wireless network involves the same set of procedures that are used to configure local area Bonjour on a switch that acts as the SDG Agent in a wired network.

The Bonjour protocol operates on service announcements and queries. Each query or advertisement is sent to the mDNS IPv4 address 224.0.0.251 and IPv6 address FF02::FB. The mDNS messages are carried over well-known industry standard UDP port 5353, over both Layer 3 transport types.

The Layer 2 address used by the Bonjour protocol is link-local multicast address and therefore it's only forwarded to the same Layer 2 network. As multicast DNS (mDNS) is limited to a Layer 2 domain, for a client to discover a service, it has to be a part of the same Layer 2 domain. This isn't always possible in a large-scale deployment or enterprise.

To enable mDNS communication between Wireless endpoints and Cisco Catalyst switch that acts as an SDG Agent, the intermediate WLC must transparently allow the network to transmit and receive mDNS messages.

Hence, for a Multicast DNS Mode Wireless network deployment, disable the mDNS Snooping on Cisco AireOS based WLC and enable mDNS Gateway feature on Cisco Catalyst 9800 series WLC and set the AP Multicast Mode to Multicast.

Figure below illustrates a prerequisite configuration for Wireless network to enable seamless communication between SDG-Agent switches and Wireless endpoints.

The Cisco WLC and Access Points by default prevent the forwarding of Layer 2 or Layer 3 Multicast frames between Wireless and Wired network infrastructure. The forwarding is supported with stateful capabilities enabled using AP Multicast. The network administrator must globally enable Multicast and configure a unique Multicast Group to advertise in the network. This multicast group is only required for Cisco Access Points to enable Multicast over Multicast (MCMC) capabilities across the LAN network. The Bonjour solution doesn't require any Multicast requirements on Wireless Client VLAN; thus, it's optional and applicable only for other Layer 3 Multicast applications.

The core network must be configured with appropriate Multicast routing to allow the Access Points to join WLC Multicast Group. The Multicast configuration must be enabled on Cisco WLC management VLAN and on the Cisco Access Points of their respective distribution layer switch.

## Enabling mDNS Gateway on the Device

To configure mDNS on the device, follow these steps:

## Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Device> <b>enable</b>	Enables privileged EXEC mode. Enter your password, if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 3</b>	<b>mdns-sd gateway</b> <b>Example:</b> Device(config)# <b>mdns-sd gateway</b>	Enables mDNS on the device and enters mDNS gateway configuration mode. Enter the following commands in mDNS gateway configuration mode to enable the respective functionalities: <ul style="list-style-type: none"> <li>• <b>air-print-helper</b>: Enables IOS devices like iPADS to discover and use older printers that support Bonjour</li> <li>• <b>cache-memory-max</b>: Configures the percentage memory for cache</li> <li>• <b>ingress-client</b>: Configures Ingress Client Packet Tuners</li> <li>• <b>rate-limit</b>: Enables rate limiting of incoming mDNS packets</li> <li>• <b>service-announcement-count</b>: Configures maximum service advertisement count</li> <li>• <b>service-announcement-timer</b>: Configures advertisements announce timer periodicity</li> <li>• <b>service-query-count</b>: Configures maximum query count</li> <li>• <b>service-query-timer</b>: Configures query forward timer periodicity</li> </ul> The following CLIs are effective only in service-peer mode: <ul style="list-style-type: none"> <li>• <b>query-response</b></li> <li>• <b>sdg-agent</b></li> <li>• <b>service-announcement-count</b></li> <li>• <b>service-announcement-timer</b></li> <li>• <b>service-mdns-query</b></li> </ul>

	Command or Action	Purpose
		<ul style="list-style-type: none"> <li>• <b>service-query-count</b></li> <li>• <b>service-query-timer</b></li> <li>• <b>service-receiver-purge</b></li> <li>• <b>active-response</b></li> </ul> <p><b>Note</b> For <b>cache-memory-max</b>, <b>ingress-client</b>, <b>rate-limit</b>, <b>service-announcement-count</b>, <b>service-announcement-timer</b>, <b>service-query-count</b>, and <b>service-query-timer</b> commands, you can retain the default value of the respective parameter for general deployments. Configure a different value, if required, for a specific deployment.</p>
<b>Step 4</b>	<b>exit</b> <b>Example:</b> Device(config-mdns-sd)# exit	Exits mDNS gateway configuration mode.

## Creating Custom Service Definition

Service definition is a construct that provides an admin friendly name to one or more mDNS service types or PTR Resource Record Name. By default, a few built-in service definitions are already predefined and available for admin to use. In addition to built-in service definitions, admin can also define custom service definitions.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Device> enable	Enables privileged EXEC mode. Enter your password, if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 3</b>	<b>mdns-sd service-definition</b> <i>service-definition-name</i> <b>Example:</b> Device(config)# mdns-sd <b>service-definition</b> CUSTOM1	Configures mDNS service definition. <p><b>Note</b> All the created custom service definitions are added to the primary service list. Primary service list comprises of a list of custom and built-in service definitions.</p>

	Command or Action	Purpose
<b>Step 4</b>	<b>service-type</b> <i>string</i> <b>Example:</b> Device (config-mdns-ser-def) # <b>service-type</b> <b>_custom1._tcp.local</b>	Configures mDNS service type.
<b>Step 5</b>	Repeat step 4 to configure more than one service type in the custom service definition.	
<b>Step 6</b>	<b>exit</b> <b>Example:</b> Device (config-mdns-ser-def) # <b>exit</b>	Exit mDNS service definition configuration mode.

## Creating Service List

mDNS service list is a collection of service definitions. To create a service list, follow these steps:

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Device> <b>enable</b>	Enables privileged EXEC mode. Enter your password, if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 3</b>	<b>mdns-sd service-list</b> <i>service-list-name</i> { <b>in</b>   <b>out</b> } <b>Example:</b> Device (config) # <b>mdns-sd service-list</b> <b>VLAN100-list in</b>	Configures mDNS service list.
<b>Step 4</b>	<b>match</b> <i>service-definition-name</i> [ <b>message-type</b> { <b>any</b>   <b>announcement</b>   <b>query</b> }] <b>Example:</b> Device (config-mdns-sl-in) # <b>match</b> <b>PRINTER-IPPS message-type announcement</b>	Matches the service to the message type. Here, <i>service-definition-name</i> refers to the names of services, such as, airplay, airserver, airtunes, and so on.

	Command or Action	Purpose
		<p><b>Note</b> To add a service, the service name must be part of the primary service list.</p> <p>If the mDNS service list is set to IN, the applicable command syntax is:  <b>match</b> <i>service-definition-name</i> [message-type {any   announcement   query}].</p> <p>If the mDNS service list is set to OUT, the applicable command syntax is:  <b>match</b> <i>service-definition-name</i> [message-type {any   announcement   query}] [location-filter <i>location-filter-name</i>] [source-interface {mDNS-VLAN-number   mDNS-VLAN-range}].</p>
<b>Step 5</b>	<p><b>exit</b></p> <p><b>Example:</b></p> <pre>Device(config-mdns-sl-in)# exit</pre>	Exits mDNS service list configuration mode.

## Creating Service Policy

A Service Policy that is applied to an interface specifies the allowed Bonjour service announcements or the queries of specific service types that should be processed, in ingress direction or egress direction or both. For this, the service policy specifies two service-lists, one each for ingress and egress directions. In the Local Area Bonjour domain, the same service policy can be attached to one or more Bonjour client VLANs; however, different VLANs may have different service policies.

To configure service policy with service lists, follow these steps:

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<p><b>enable</b></p> <p><b>Example:</b></p> <pre>Device&gt; enable</pre>	<p>Enables privileged EXEC mode.</p> <p>Enter your password, if prompted.</p>
<b>Step 2</b>	<p><b>configure terminal</b></p> <p><b>Example:</b></p> <pre>Device# configure terminal</pre>	Enters global configuration mode.
<b>Step 3</b>	<p><b>mdns-sd service-policy</b> <i>service-policy-name</i></p> <p><b>Example:</b></p> <pre>Device(config)# mdns-sd service-policy mdns-policy1</pre>	Configures mDNS service policy.

	Command or Action	Purpose
<b>Step 4</b>	<b>service-list</b> <i>service-list-name</i> {in   out} <b>Example:</b> Device(config-mdns-ser-pol)# <b>service-list</b> <b>VLAN100-list in</b> Device(config-mdns-ser-pol)# <b>service-list</b> <b>VLAN300-list out</b>	Configures service lists for IN and OUT directions.
<b>Step 5</b>	<b>exit</b> <b>Example:</b> Device(config-mdns-ser-pol)# <b>exit</b>	Exits mDNS service policy configuration mode.

## Associating Service Policy with Wireless Profile Policy

A default mDNS service policy is already attached once the wireless profile policy is created. Use the following steps to override the default mDNS service policy with any of your service policy:

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Device> <b>enable</b>	Enables privileged EXEC mode. Enter your password, if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 3</b>	<b>wireless profile policy</b> <i>profile-policy-name</i> <b>Example:</b> Device(config)# <b>wireless profile policy</b> <b>default-policy-profile</b>	Configures wireless profile policy.
<b>Step 4</b>	<b>mdns-sd service-policy</b> <i>custom-mdns-service-policy</i> <b>Example:</b> Device(config-wireless-policy)# <b>mdns-sd</b> <b>service-policy</b> <b>custom-mdns-service-policy</b>	Associates an mDNS service policy with the wireless profile policy. The default mDNS service policy name is <b>default-mdns-service-policy</b> .
<b>Step 5</b>	<b>exit</b> <b>Example:</b> Device(config-wireless-policy)# <b>exit</b>	Exits wireless profile policy configuration mode.

## Configuring Wide Area Bonjour Domain

The Wide Area Bonjour domain configuration specifies the parameters of the controller, that is the Wide Area Bonjour Application running on Cisco Catalyst Center, as well as the service types that need to be exported to it from the SDG Agent. Configuring Wide Area Bonjour Domain involves creating service-lists and service policy similar to those created in Local Area Bonjour configuration; however, only egress policy from SDG Agent to controller is applicable.

### Enabling mDNS Gateway on the Device

To configure mDNS on the device, follow these steps:

#### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Device> <b>enable</b>	Enables privileged EXEC mode. Enter your password, if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 3</b>	<b>mdns-sd gateway</b> <b>Example:</b> Device(config)# <b>mdns-sd gateway</b>	Enables mDNS on the device and enters mDNS gateway configuration mode. Enter the following commands in mDNS gateway configuration mode to enable the respective functionalities: <ul style="list-style-type: none"> <li>• <b>air-print-helper</b>: Enables IOS devices like iPADS to discover and use older printers that support Bonjour</li> <li>• <b>cache-memory-max</b>: Configures the percentage memory for cache</li> <li>• <b>ingress-client</b>: Configures Ingress Client Packet Tuners</li> <li>• <b>rate-limit</b>: Enables rate limiting of incoming mDNS packets</li> <li>• <b>service-announcement-count</b>: Configures maximum service advertisement count</li> <li>• <b>service-announcement-timer</b>: Configures advertisements announce timer periodicity</li> <li>• <b>service-query-count</b>: Configures maximum query count</li> </ul>

	Command or Action	Purpose
		<ul style="list-style-type: none"> <li>• <b>service-query-timer</b>: Configures query forward timer periodicity</li> </ul> <p>The following CLIs are effective only in service-peer mode:</p> <ul style="list-style-type: none"> <li>• <b>query-response</b></li> <li>• <b>sdg-agent</b></li> <li>• <b>service-announcement-count</b></li> <li>• <b>service-announcement-timer</b></li> <li>• <b>service-mdns-query</b></li> <li>• <b>service-query-count</b></li> <li>• <b>service-query-timer</b></li> <li>• <b>service-receiver-purge</b></li> <li>• <b>active-response</b></li> </ul> <p><b>Note</b> For <b>cache-memory-max</b>, <b>ingress-client</b>, <b>rate-limit</b>, <b>service-announcement-count</b>, <b>service-announcement-timer</b>, <b>service-query-count</b>, and <b>service-query-timer</b> commands, you can retain the default value of the respective parameter for general deployments. Configure a different value, if required, for a specific deployment.</p>
<b>Step 4</b>	<b>exit</b> <b>Example:</b> Device(config-mdns-sd)# exit	Exits mDNS gateway configuration mode.

## Creating Custom Service Definition

Service definition is a construct that provides an admin friendly name to one or more mDNS service types or PTR Resource Record Name. By default, a few built-in service definitions are already predefined and available for admin to use. In addition to built-in service definitions, admin can also define custom service definitions.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b>	Enables privileged EXEC mode. Enter your password, if prompted.

	Command or Action	Purpose
	Device> <b>enable</b>	
<b>Step 2</b>	<b>configure terminal</b>  <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 3</b>	<b>mdns-sd service-definition</b> <i>service-definition-name</i>  <b>Example:</b> Device(config)# <b>mdns-sd</b> <b>service-definition CUSTOM1</b>	Configures mDNS service definition.  <b>Note</b> All the created custom service definitions are added to the primary service list. Primary service list comprises of a list of custom and built-in service definitions.
<b>Step 4</b>	<b>service-type</b> <i>string</i>  <b>Example:</b> Device(config-mdns-ser-def)# <b>service-type</b> <b>_custom1._tcp.local</b>	Configures mDNS service type.
<b>Step 5</b>	Repeat step 4 to configure more than one service type in the custom service definition.	
<b>Step 6</b>	<b>exit</b>  <b>Example:</b> Device(config-mdns-ser-def)# <b>exit</b>	Exit mDNS service definition configuration mode.

## Creating Service List

mDNS service list is a collection of service definitions. To create a service list, follow these steps:

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b>  <b>Example:</b> Device> <b>enable</b>	Enables privileged EXEC mode.  Enter your password, if prompted.
<b>Step 2</b>	<b>configure terminal</b>  <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 3</b>	<b>mdns-sd service-list</b> <i>service-list-name</i> { <b>in</b>   <b>out</b> }  <b>Example:</b> Device(config)# <b>mdns-sd service-list</b> <b>VLAN100-list in</b>	Configures mDNS service list.

	Command or Action	Purpose
<b>Step 4</b>	<p><b>match</b> <i>service-definition-name</i> [<b>message-type</b> {<b>any</b>   <b>announcement</b>   <b>query</b>}]</p> <p><b>Example:</b></p> <pre>Device(config-mdns-sl-in)# match PRINTER-IPPS message-type announcement</pre>	<p>Matches the service to the message type. Here, <i>service-definition-name</i> refers to the names of services, such as, airplay, airserver, airtunes, and so on.</p> <p><b>Note</b> To add a service, the service name must be part of the primary service list.</p> <p>If the mDNS service list is set to IN, the applicable command syntax is:  <b>match</b> <i>service-definition-name</i> [<b>message-type</b> {<b>any</b>   <b>announcement</b>   <b>query</b>}].</p> <p>If the mDNS service list is set to OUT, the applicable command syntax is:  <b>match</b> <i>service-definition-name</i> [<b>message-type</b> {<b>any</b>   <b>announcement</b>   <b>query</b>}] [<b>location-filter</b> <i>location-filter-name</i>] [<b>source-interface</b> {<i>mDNS-VLAN-number</i>   <i>mDNS-VLAN-range</i>}].</p>
<b>Step 5</b>	<p><b>exit</b></p> <p><b>Example:</b></p> <pre>Device(config-mdns-sl-in)# exit</pre>	Exits mDNS service list configuration mode.

## Creating Service Policy

A Service Policy that is applied to an interface specifies the allowed Bonjour service announcements or the queries of specific service types that should be processed, in ingress direction or egress direction or both. For this, the service policy specifies two service-lists, one each for ingress and egress directions. In the Local Area Bonjour domain, the same service policy can be attached to one or more Bonjour client VLANs; however, different VLANs may have different service policies.

To configure service policy with service lists, follow these steps:

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<p><b>enable</b></p> <p><b>Example:</b></p> <pre>Device&gt; enable</pre>	<p>Enables privileged EXEC mode.</p> <p>Enter your password, if prompted.</p>
<b>Step 2</b>	<p><b>configure terminal</b></p> <p><b>Example:</b></p> <pre>Device# configure terminal</pre>	Enters global configuration mode.

	Command or Action	Purpose
<b>Step 3</b>	<b>mdns-sd service-policy</b> <i>service-policy-name</i>  <b>Example:</b> Device(config)# <b>mdns-sd service-policy</b> <b>mdns-policy1</b>	Configures mDNS service policy.
<b>Step 4</b>	<b>service-list</b> <i>service-list-name</i> { <b>in</b>   <b>out</b> }  <b>Example:</b> Device(config-mdns-ser-pol)# <b>service-list</b> <b>VLAN100-list in</b>  Device(config-mdns-ser-pol)# <b>service-list</b> <b>VLAN300-list out</b>	Configures service lists for IN and OUT directions.
<b>Step 5</b>	<b>exit</b>  <b>Example:</b> Device(config-mdns-ser-pol)# <b>exit</b>	Exits mDNS service policy configuration mode.

## Associating Service Policy with the Controller in Wide Area Bonjour Domain

In Wide Area Bonjour, the service policy is configured globally and does not get associated with a VLAN as in the case of Local Area Bonjour.

To configure service policy globally, follow these steps:

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b>  <b>Example:</b> Device> <b>enable</b>	Enables privileged EXEC mode.  Enter your password, if prompted.
<b>Step 2</b>	<b>configure terminal</b>  <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 3</b>	<b>service-export mdns-sd controller</b> <i>controller name</i>  <b>Example:</b> Device(Config)# <b>service-export mdns-sd</b> <b>controller</b> Cisco Catalyst Center- <b>BONJOUR-CONTROLLER</b>	Specifies a name for the controller and enters service-export mode
<b>Step 4</b>	<b>controller-address</b> <i>ipv4-address</i>  <b>Example:</b> Device(config-mdns-sd-se)# <b>controller-address 199.245.1.7</b>	Specifies the controller address.

	Command or Action	Purpose
<b>Step 5</b>	<b>controller-port</b> <i>port-number</i> <b>Example:</b> Device (config-mdns-sd-se) # <b>controller-port 9991</b>	Specifies the port number on which the controller is listening.
<b>Step 6</b>	<b>controller-source-interface</b> <i>interface-name</i> <b>Example:</b> Device (config-mdns-sd-se) # <b>controller-source-interface Loopback0</b>	Specifies the source-interface for the controller.
<b>Step 7</b>	<b>controller-service-policy</b> <i>service-policy-name</i> <b>out</b> <b>Example:</b> Device (config-mdns-sd-se) # <b>controller-service-policy policy1 OUT</b>	Specifies the service policy to be used by the controller. <b>Note</b> Only OUT policy is applicable for Wide Area Bonjour.
<b>Step 8</b>	<b>exit</b> <b>Example:</b> Device (config-mdns-sd) # <b>exit</b>	Exits controller service export configuration mode.
<b>Step 9</b>	<b>mdns-sd gateway</b> <b>Example:</b> Device (config) # <b>mdns-sd gateway</b>	Enters mDNS gateway configuration mode.
<b>Step 10</b>	<b>ingress-client query-suppression enable</b> <b>Example:</b> Device (config-mdns-sd) # <b>ingress-client query-suppression enable</b>	Enables ingress query suppression for better scale and performance.
<b>Step 11</b>	<b>exit</b> <b>Example:</b> Device (config-mdns-sd) # <b>exit</b>	Exits mDNS gateway configuration mode.

## Configuring Hot Standby Router Protocol-aware (HSRP-aware) mDNS Service-Routing on SDG

For information, see the following guides:

- [Software Configuration Guide, Cisco IOS XE Bengaluru 17.6.x \(Catalyst 9300 Switches\)](#)
- [Software Configuration Guide, Cisco IOS XE Bengaluru 17.6.x \(Catalyst 9400 Switches\)](#)
- [Software Configuration Guide, Cisco IOS XE Bengaluru 17.6.x \(Catalyst 9600 Switches\)](#)

# Configuring Hot Standby Router Protocol-aware (HSRP-aware) mDNS Service-Routing on Service-Peer (CLI)

## Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>mdns-sd gateway</b> <b>Example:</b> Device(config)# <code>mdns-sd gateway</code>	Enables mDNS on the device and enters mDNS gateway configuration mode.
<b>Step 3</b>	<b>mode service-peer</b> <b>Example:</b> Device(config-mdns-sd)# <code>mode service-peer</code>	Enables mDNS gateway in service-peer mode.
<b>Step 4</b>	<b>source-interface vlan</b> <i>vlan-interface-number</i> <b>Example:</b> Device(config-mdns-sd)# <code>source-interface vlan 23</code>	Configures source interface to communicate between SDG Agent and service-peer. <b>Note</b> <i>vlan-interface-number</i> - The valid range is from 1 to 4094.
<b>Step 5</b>	<b>sdg-agent</b> <i>ip-address</i> <b>Example:</b> Device(config-mdns-sd)# <code>sdg-agent 9.6.16.10</code>	Configures SDG agent IPv4 or IPv6 address. <b>Note</b> The <i>ip-address</i> refers to the HSRP-enabled IP address.
<b>Step 6</b>	<b>end</b> <b>Example:</b> Device(config-mdns-sd)# <code>end</code>	Exits server group configuration mode and enters privileged EXEC mode.

## Verifying Local Area Bonjour in Multicast DNS Mode for LAN and Wireless Networks

This section shows how to verify Local Area Bonjour in Multicast DNS mode for LAN and Wireless networks.

### Verifying SDG-Agent Status

The following is a sample output of the `show mdns-sd service-list service-list-name {in | out}` command.

Name	Direction	Service	Message-Type	Source
VLAN100-list	In	Printer	Announcement	-
	In	Airplay	Query	-
	In	CUSTOM1	Any	-
VLAN300-list	Out	Printer	Announcement	V1200

The following is a sample output of the **show mdns-sd service-definition** *service-definition-name* **service-type** {*custom* | *built-in*} command.

Service	PTR	Type
apple-tv	_airplay._tcp.local	Built-In
	_raop._tcp.local	
apple-file-share	_afpovertcp._tcp.local	Built-In
CUSTOM1	_custom1._tcp.local	Custom
CUSTOM2	_customA._tcp.local	Custom
	_customA._tcp.local	

The following is a sample output of the **show mdns-sd service-policy-name** **interface** *interface-name* command.

Name	Service-List-In	Service-List-Out
mdns-policy-1	VLAN100-list	VLAN300-list
mdns-policy-2	VLAN400-list	VLAN400-list

The following is a sample output of the **show mdns-sd summary** command.

```

mDNS Gateway: Enabled
Mode: Service Peer
Service Announcement Periodicity(in seconds): 30
Service Announcement Count: 50
Service Query Periodicity(in seconds): 15
Service Query Count: 50
Active Response Timer (in seconds): Disabled
ANY Query Forward: Disabled
SDG Agent IP: 9.8.57.10
Active Query Periodicity (in minutes): 30
mDNS Query Type: PTR only
Transport Type: IPv4
mDNS AP service policy: default-mdns-service-policy

```

The following is a sample output of the **show mdns-sd sp-sdg statistics** command.

```

mDNS SP Statistics
last reset time: 07/27/21 15:36:33
Messages sent:
Query : 122
ANY query : 35
Advertisements : 12

```

```

Advertisement Withdraw : 1
Service-peer cache clear : 0
Resync response : 3
Srvc Discovery response : 0
Keep-Alive : 2043
Messages received:
Query response : 0
ANY Query response : 0
Cache-sync : 9
Get service-instance : 0
Srvc Discovery request : 0
Keep-Alive Response : 2042

```

## Verifying Wide Area Bonjour Controller Status

The following is a sample output of the **show mdns controller summary** command.

```
Device# show mdns controller summary
```

```
Controller Summary
```

```

=====
Controller Name : Cisco Catalyst Center-BONJOUR-CONTROLLER
Controller IP : 10.104.52.241
State : UP
Port : 9991
Interface : Loopback0
Filter List : policy1
Dead Time : 00:01:00

```

The following is a sample output of the **show mdns controller export-summary** command.

```
Device# show mdns controller export-summary
```

```
Controller Export Summary
```

```

=====
Controller IP : 10.104.52.241
State : UP
Filter List : policy1
Count : 100
Delay Timer : 30 seconds
Export : 300
Drop : 0
Next Export : 00:00:01

```

The following is a sample output of the **show mdns controller statistics** command.

```
Device# show mdns controller statistics
```

```

Total BCP message sent : 47589
Total BCP message received : 3
Interface WITHDRAW messages sent : 0
Clear cache messages sent : 0
Total RESYNC state count : 0
Last successful RESYNC : Not-Applicable

```

```

Service Advertisements:
 IPv6 advertised : 0
 IPv4 advertised : 300
 Withdraws sent : 0
 Advertisements Filtered : 0
 Total service resynced : 0

Service Queries:
 IPv6 queries sent : 0
 IPv6 query responses received : 0
 IPv4 queries sent : 0
 IPv4 query responses received : 0

```

The following is a sample output of the **show mdns controller detail** command.

```

Device# show mdns controller detail

Controller : Cisco Catalyst Center-BONJOUR-CONTROLLER
IP : 10.104.52.241, Dest Port : 9991, Src Port : 0, State : UP
Source Interface : Loopback0, MD5 Disabled
Hello Timer 0 sec, Dead Timer 0 sec, Next Hello 00:00:00
Uptime 00:00:00
Service Announcement :
 Filter : policy1
 Count 100, Delay Timer 30 sec, Pending Announcement 0, Pending Withdraw
 0
 Total Export Count 300, Next Export in 00:00:16
Service Query :
 Query Suppression Disabled
 Query Count 50, Query Delay Timer 15 sec, Pending 0
 Total Query Count 0, Next Query in 00:00:01

```

## Verifying mDNS Cache Configurations

The following show commands display cache from both Active and Standby devices using the chassis option:

```

Device# show mdns-sd cache chassis active R0

----- PTR Records -----

```

## Verifying Additional mDNS Cache Configurations

To verify the cache from the Active DB, use the following commands:

```
show mdns-sd cache ap-mac 0a0b.0cf0.000e chassis active R0
```

```

show mdns-sd cache client-mac 0269.fe06.0023 chassis active R0
show mdns-sd cache detail chassis active R0
show mdns-sd cache glan-id <> chassis active R0
show mdns-sd cache glan-id <> detail chassis active R0
show mdns-sd cache location-group <> chassis active R0
show mdns-sd cache location-group <> detail chassis active R0
show mdns-sd cache mdns-ap <> detail chassis active R0
show mdns-sd cache mdns-ap <> chassis active R0
show mdns-sd cache rlan-id <> detail chassis active R0
show mdns-sd cache rlan-id <> chassis active R0
show mdns-sd cache type TXT chassis active R0
show mdns-sd cache type A-AAAA detail chassis active R0
show mdns-sd cache wired chassis active R0
show mdns-sd cache wired detail chassis active R0
show mdns-sd cache wlan-id 10 chassis active R0
show mdns-sd cache wlan-id 1 detail chassis active R0

```

To verify the cache from the Standby DB, use the following commands:

```

show mdns-sd cache ap-mac <> chassis standby R0
show mdns-sd cache client-mac <> chassis standby R0
show mdns-sd cache detail chassis standby R0
show mdns-sd cache glan-id <> chassis standby R0
show mdns-sd cache glan-id <> detail chassis standby R0
show mdns-sd cache location-group <> chassis standby R0
show mdns-sd cache location-group <> detail chassis standby R0
show mdns-sd cache mdns-ap <> detail chassis standby R0
show mdns-sd cache mdns-ap <> chassis standby R0
show mdns-sd cache rlan-id <> detail chassis standby R0
show mdns-sd cache rlan-id <> chassis standby R0
show mdns-sd cache type [A-AAAA|PTR|SRV|TXT] chassis standby R0
show mdns-sd cache type [A-AAAA|PTR|SRV|TXT] detail chassis standby R0
show mdns-sd cache wired chassis standby R0
show mdns-sd cache wired detail chassis standby R0
show mdns-sd cache wlan-id <> chassis standby R0
show mdns-sd cache wlan-id <> detail chassis standby R0

```

## Verifying Local Area Bonjour Configuration for LAN and Wireless Networks

The following is a sample output of the **show run** command.

```

mdns-sd gateway

mdns-sd service-definition custom1
 service-type _airplay._tcp.local
 service-type _raop._tcp.local

mdns-sd service-list list1 IN
 match custom1
mdns-sd service-list list2 OUT
 match custom1

mdns-sd service-policy policy1
 service-list list1 IN

```

```
service-list list2 OUT
```

```
service-export mdns-sd controller Cisco Catalyst Center-CONTROLLER-POLICY
controller-address 99.99.99.10
controller-service-policy policy1 OUT
controller-source-interface Loopback0
```

CISCO-SDG-MDNS-MIB	This MIB module defines objects describing the statistics of 63 local area and wide area mDNS SDG agent. Statistics could be 64 either global or per interface specific.

## Feature History for Cisco DNA Service for Bonjour

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Release	Modification
Cisco IOS 15.2(6) E2	Cisco DNA Service for Local Area Bonjour and Wide Area Bonjour was introduced on the following platforms: <ul style="list-style-type: none"> <li>• Cisco Catalyst 2960-X Series Switches</li> <li>• Cisco Catalyst 2960-XR Series Switches</li> </ul>
Cisco IOS 15.5(1)SY4	Cisco DNA Service for Local Area Bonjour and Wide Area Bonjour was introduced on Cisco Catalyst 6800 Series Switches.

Release	Modification
Cisco IOS XE 3.11.0 E	Cisco DNA Service for Local Area Bonjour and Wide Area Bonjour was introduced on the following platforms: <ul style="list-style-type: none"> <li>• Cisco Catalyst 4500-E Series Switches</li> <li>• Cisco Catalyst 4500-X Series Switches</li> </ul>
Cisco IOS XE Gibraltar 16.11.1	Cisco DNA Service for Local Area Bonjour and Wide Area Bonjour was introduced on the following platforms: <ul style="list-style-type: none"> <li>• Cisco Catalyst 3650 Series Switches</li> <li>• Cisco Catalyst 3850 Series Switches</li> <li>• Cisco Catalyst 9300 Series Switches</li> <li>• Cisco Catalyst 9400 Series Switches</li> <li>• Cisco Catalyst 9500 Series Switches</li> <li>• Cisco Catalyst 9500 Series Switches - High Performance</li> <li>• Cisco Catalyst 9600 Series Switches</li> <li>• Cisco Catalyst 9800 Series Wireless Controllers</li> <li>• Cisco 5500 Series Wireless Controllers</li> <li>• Cisco 8540 Wireless Controllers</li> <li>• Cisco 4000 Series Integrated Services Routers (ISR)</li> </ul>
Cisco IOS XE Amsterdam 17.1.1	Cisco DNA Service for Local Area Bonjour and Wide Area Bonjour was introduced on Cisco Catalyst 9200 Series Switches.
Cisco IOS XE Amsterdam 17.2.1	Introduced Cisco DNA Service for Bonjour support for the following: <ul style="list-style-type: none"> <li>• SD-Access network</li> <li>• Unicast mode for LAN network</li> </ul>
Cisco IOS XE Amsterdam 17.3.2a	Introduced Cisco DNA Service for Bonjour support for the following: <ul style="list-style-type: none"> <li>• Multilayer networks</li> <li>• Location grouping in wired networks</li> <li>• mDNS AP group in wireless networks</li> </ul>

Release	Modification
Cisco IOS XE Bengaluru 17.6.1	<p>Introduced support for the following features for Local Area Bonjour in Unicast Mode for LAN networks:</p> <ul style="list-style-type: none"><li>• Default mDNS Service Configurations</li><li>• HSRP-Aware mDNS Service-Routing</li><li>• mDNS Service-Gateway SSO Support</li></ul>

- [Verifying mDNS Gateway Configuration, on page 2321](#)
- [Reference, on page 2323](#)

## Overview of Local Area Bonjour for Wireless Local Mode

The Cisco Catalyst 9800 series controller introduces unicast mode function in Local Area Bonjour network domain. The enhanced gateway function at the first hop of Wired and Wireless networks communicates directly with any industry standard RFC 6762 compliant Multicast DNS (mDNS) end point in Layer 2 Unicast mode. The controller also introduces new service-peer mode expanding classic single-gateway controller to end-to-end service-routing with upstream SDG agent switch to enable unicast-mode, increased scale, performance and resiliency in the network.

## Prerequisites for Local Area Bonjour for Wireless Local Mode

The Cisco Catalyst 9800 series controller must be successfully configured and be operational before implementing Cisco Local Area Bonjour for local mode wireless networks.

The following list provides the prerequisites for the controller that is to be deployed in service-peer mode:

- Ensure that the targeted controller for the service-peer role has the required Cisco IOS-XE software version. See *Supported SDG Agents with Supported Licenses and Software Requirements* table in Cisco DNA Service for Bonjour Solution Overview chapter.
- Ensure that the controller runs a valid Cisco DNA-Advantage license.
- Ensure that the upstream distribution-layer Cisco Catalyst switch in SDG agent mode runs a valid Cisco DNA-Advantage license.

- Ensure that the controller is interconnected as Layer 2 trunk in static 802.1Q mode, when Layer 2 Unicast service-routing is running between SDG agent in distribution-layer and the controller service-peer.
- Ensure that the controller has IP reachability to upstream Cisco Catalyst 9000 series switches in SDG agent mode over same the IPv4 wireless management subnet.
- Ensure that global multicast is enabled on the controller and AP is set to multicast mode. All local mode APs must join the multicast group in the network to successfully process mDNS messages.

## Restrictions for Local Area Bonjour for Wireless Local Mode

- Controller management port is not supported for service-routing with upstream Catalyst SDG Agent switch.
- The controller in service peer mode supports location-based service for access points in local mode and FlexConnect central switching mode.
- The controller supports location-based capabilities only between wireless connected service provider and the receiver.
- The controller does not support service-routing configuration using GUI.

## Understanding Local Area Bonjour for Wireless Local Mode

The traditional wireless controller supported mDNS snooping function with various advancements for wireless networks. As the enterprise requirements expands, it drives the IT organization to introduce new network deployment models, supporting mobile devices and distributed zero-configuration services following increased scale, granular security control and resiliency for mission critical networks. The unified Cisco IOS-XE operating system across Cisco Catalyst 9000 series LAN switches and Cisco Catalyst 9800 series controller enables distributed Bonjour gateway function at the network edge. With end-to-end Wide Area Bonjour service-routing, the new solution enables service-oriented enterprise networks with intuitive user-experience.

The following figure illustrates the controller platform supporting mDNS gateway function to wireless users in local mode and builds service-routing peering with upstream Cisco Catalyst 9000 series switch for network-wide services discovery and distribution based on IT-managed granular policies and locations. The unicast based service-routing between the controller in service-peer mode and upstream SDG-Agent switch eliminates mDNS flooding over Layer 2 trunk ports and provide increase bandwidth and eliminates mDNS flood over wireless networks and Layer 2 trunk to upstream network.

Figure 71: Cisco Catalyst 9800 Series Controller Local Area Bonjour for Wireless Local Mode

## Configuring Wireless AP Multicast

The controller and AP by default prevents forwarding of Layer 2 or Layer 3 Multicast frames between wireless and wired network infrastructure. The forwarding is supported with stateful capabilities enabled using AP multicast. To allow mDNS message processing over a wireless network, multicast must be enabled and unique AP multicast group must be configured on the controller to advertise in IP core network. This AP multicast group is only required for APs to enable Multicast over Multicast (MCMC) capabilities in the network. The Bonjour solution do not require any other multicast requirements on wireless client VLAN; thus, it is optional and applicable only for other Layer 3 multicast applications.

The figure given below illustrates end-to-end wireless multicast configuration requirement to ensure wireless APs successfully join the controller-announced multicast group.

Figure 72: Multicast Routing in IP Core Network

## Configuring Wireless AP Multicast (GUI)

This procedure configures wireless AP multicast on a controller in service-peer mode.

### Procedure

- Step 1** Choose **Configuration > Services > Multicast**.
- Step 2** Set the **Global Wireless Multicast Mode** to **Enabled**.
- Step 3** From the AP Capwap Multicast drop-down list, select **Multicast**.
- Step 4** Enter a unique IP address at **AP Capwap IPv4 Multicast group Address**.
- Step 5** Click **Apply**.
- Step 6** Click **Save**.

## Configuring Wireless AP Multicast (CLI)

This procedure configures wireless AP multicast on a controller in service-peer mode.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wireless multicast</b> <b>Example:</b> Device(config)# wireless multicast	Enable global IP multicast processing.

	Command or Action	Purpose
<b>Step 3</b>	<b>wireless multicast</b> <i>IPv4-multicast-address</i> <b>Example:</b> Device(config)# wireless multicast 239.254.254.1	Enables AP CAPWAP mode to Multicast with unique IPv4 multicast address configurations.
<b>Step 4</b>	<b>exit</b> <b>Example:</b> Device(config-mdns-sd)# exit	Exits mDNS gateway configuration mode.

## Configuring Multicast in IP Network (CLI)

This procedure configures IP Multicast under AP VLAN, Management VLAN and IP core interfaces on upstream Catalyst LAN distribution-layer switch.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>ip multicast-routing</b> <b>Example:</b> Device(config)# ip multicast-routing	Enables IP multicast processing.
<b>Step 3</b>	<b>interface</b> <i>interface-id</i> <b>Example:</b> Device(config)# interface TenGigabitEthernet 1/0	Selects an interface that is connected to hosts and network devices on which PIM can be enabled.
<b>Step 4</b>	<b>ip pim sparse-mode</b> <b>Example:</b> Device(config-if)# ip pim sparse-mode	Enables IP Multicast on Layer 3 interfaces of distribution and core layer network switches: <ul style="list-style-type: none"> <li>• <b>AP VLAN</b>– Enables IP multicast on SVI interface on VLAN assigned to wireless APs of wireless AP distribution layer switch.</li> <li>• <b>Management VLAN</b>– Enables IP multicast on SVI interface on VLAN assigned to controller management VLAN of wireless distribution layer switch.</li> <li>• <b>Layer 3 Interface</b>– Enable IP multicast routing on all core network devices and Layer 3 interfaces.</li> </ul>

	Command or Action	Purpose
<b>Step 5</b>	<b>exit</b>  <b>Example:</b> Device(config-if)# exit	Exits interface configuration mode.
<b>Step 6</b>	<b>ip pim rp-address rp-address</b>  <b>Example:</b> Device(config)# ip pim rp-address 239.254.254.100	Configures IP Multicast RP address on core and distribution network switches. IP network may have alternate multicast routing method.

## Configuring Local Area Bonjour for Wireless Local Mode

This section provides configuration guidelines to implement Cisco Catalyst 9800 series controller as mDNS gateway and enable service-peer mode to enable service-routing with upstream distribution-layer Cisco Catalyst 9000 series switch in SDG-Agent mode to build Local Area Bonjour.

### Configuring mDNS Service Policy (GUI)

The mDNS service policy consists of creating a service-list to permit built-in or user-defined custom service-types, associate service-list to a service-policy to enforce in ingress or egress direction and apply the service-policy to targeted Wireless Profile. This configuration is common on the controller in service peer or single-gateway solution for wireless networks.

This procedure configures mDNS Service-Policy on a controller in service-peer mode.

#### Procedure

- 
- Step 1** Choose **Configuration > Services > mDNS**.
- Step 2** Set the mDNS Gateway button to **Enabled**.
- Step 3** Click **Service Policy** Tab.
- Step 4** Click **Service List** and click **Add**.  
This activates the Service List window.
- Step 5** In the **Service List Name** field, enter a unique name with alphanumeric value.
- Step 6** From the **Direction** drop-down list, select service list policy direction. Use **IN** for ingress or **OUT** for egress mDNS message matching policy.
- Step 7** Click **+Add Services** to add mDNS service-types in selected service list.
- Step 8** From the **Available Services** drop-down list, select built-in or custom mDNS service-type.
- Step 9** From the **Message Type** drop-down list, select **Announcement** to accept service advertisement or **Query** to permit service discovery from the network. Default message-type is **any**.
- Step 10** Click **Save** button to add mDNS service-type entry.
- Note** Repeat Step-7 to Step-9 to add more mDNS service-types in selected service list.

- Step 11** Click **Apply to Device**.  
This creates a new mDNS Service List for selected direction.  
**Note** Repeat Step-5 to Step-11 for bi-directional service list.
- Step 12** Click **Service-Policy** tab.
- Step 13** Click **+Add** to create new mDNS service-policy.
- Step 14** In the **Service Policy Name** field, enter a unique mDNS service policy name.
- Step 15** From the **Service List Input** drop-down list, select ingress mDNS service list input to enforce mDNS policies on ingress direction from wireless networks.
- Step 16** From the **Service List Output** drop-down list, select mDNS policies on egress direction to wireless networks.
- Step 17** Click **Apply to Device**.  
This creates a new mDNS service policy.
- Step 18** Choose **Configuration > Tags & Profiles > Policy**
- Step 19** Choose or create a new **Policy Profile**.
- Step 20** Click **Advanced** tab.
- Step 21** From the **mDNS Service Policy** drop-down list, select an mDNS service policy.  
Refer to Cisco Catalyst 9800 Series Configuration Guide to configure other policy profile parameters.
- Step 22** Click **Apply to Device** button.  
This creates a new policy profile or updates an existing policy profile with mDNS service policy.
- Step 23** Click **Save**.

## Configuring mDNS Service Policy (CLI)

This procedure builds and applies service-policies on target wireless profile in service-peer mode.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>mdns-sd service-list</b> <i>service-list-name</i> {in   out}  <b>Example:</b> Device(config)# mdns-sd service-list VLAN100-LIST-IN in Device(config)# mdns-sd service-list VLAN100-LIST-OUT out	Configures mDNS service-list to classify one or more service-types. Unique service-list is required to process incoming mDNS message and outbound response to requesting end points.

	Command or Action	Purpose
<b>Step 3</b>	<b>match service-definition-name</b> [message-type {any   announcement   query}]  <b>Example:</b> <pre>Device(config)# mdns-sd service-list VLAN100-LIST-IN in Device(config-mdns-sl-in)# match APPLE-TV Device(config-mdns-sl-in)# match PRINTER-IPPS message-type announcement</pre>	Matches inbound service-list. The controller validates to accept or drop incoming mDNS service-type (for example, Apple TV) advertisement or query matching message type. The service-list contains implicit deny at the end. Default message-type is “any”.
<b>Step 4</b>	<b>match service-definition-name</b> [message-type {any   announcement   query}]  <b>Example:</b> <pre>Device(config)# mdns-sd service-list VLAN100-LIST-OUT out Device(config-mdns-sl-in)# match APPLE-TV Device(config-mdns-sl-in)# match PRINTER-IPPS</pre>	Matches an outbound service-list. The controller provides local service proxy function by responding matching service-type to the requesting end points. For example, the Apple-TV and Printer learnt from VLAN 100 will be distributed to receiver in same VLAN 100. The service-list contains implicit deny at the end.  The message-type for outbound service-list is not required.
<b>Step 5</b>	<b>exit</b>  <b>Example:</b> <pre>Device(config-mdns-sl-in)# exit</pre>	Returns to global configuration mode.
<b>Step 6</b>	<b>mdns-sd service-policy service-policy-name</b>  <b>Example:</b> <pre>Device(config)# mdns-sd service-policy VLAN100-POLICY</pre>	Creates a unique mDNS service-policy.
<b>Step 7</b>	<b>service-list service-list-name {in   out}</b>  <b>Example:</b> <pre>Device(config-mdns-ser-policy)# service-list VLAN100-LIST-IN in Device(config-mdns-ser-policy)# service-list VLAN100-LIST-OUT out</pre>	Configure mDNS service-policy to associate service-list for each direction.
<b>Step 8</b>	<b>exit</b>  <b>Example:</b> <pre>Device(config-mdns-ser-policy)# exit</pre>	Exits mDNS service policy configuration mode.
<b>Step 9</b>	<b>wireless profile policy policy-name</b>  <b>Example:</b> <pre>Device(config)# wireless profile policy WLAN-PROFILE</pre>	Configures unique wireless profile policy name to associate mDNS service-policy.

	Command or Action	Purpose
<b>Step 10</b>	<b>mdns-sd service-policy</b> <i>service-policy</i> <b>Example:</b> Device(config-wireless-policy) # mdns-sd service-policy VLAN100-POLICY	Associates mDNS service-policy to configured VLAN IDs. <b>Note</b> This step requires wireless profile policy to be administratively shutdown prior association service-policy and re-activate with no shutdown to make service-policy effective.
<b>Step 11</b>	<b>exit</b> <b>Example:</b> Device(config-mdns-sd) # exit	Exits mDNS gateway configuration mode.

## Configuring Custom Service Definition (GUI)

The Cisco IOS-XE supports various built-in well-known mDNS service-definition types mapping to key mDNS PTR records to user-friendly names. For example, built-in Apple-TV service-type is associated with `_airplay._tcp.local` and `_raop._tcp.local` PTR records to successfully enable service in the network. The network administrator can create custom service-definition with matching mDNS PTR records to enable end mDNS service-routing in the network.

This procedure configures custom mDNS service definition and applies it to policy.

### Procedure

- 
- Step 1** Choose **Configuration > Services > mDNS**.
  - Step 2** Set the mDNS Gateway button to **Enabled**.
  - Step 3** Click **Service Policy** Tab.
  - Step 4** Click **Add** to create new custom mDNS service-list definition.  
This activates Service Definition window.
  - Step 5** In the **Service Definition Name** field, enter a unique alphanumeric value.
  - Step 6** (Optional) In the **Description** field, enter a description for the service definition.
  - Step 7** In the **Service Type** field, enter single mDNS PoinTeR (PTR) record entry in `_service-type>._<protocol>.local` regular expression format. For example, `_airplay._tcp.local`
  - Step 8** Click **+** to add custom mDNS service-type in selected definition list.  
**Note** Repeat Steps 7 and Step 8 to add more custom service-type in selected definition list.
  - Step 9** Click **Apply**.
  - Step 10** Perform steps give in *Configuring mDNS Service Policy (GUI)* by selecting built-in or custom service-type to configure service list.
  - Step 11** Click **Save**.
-

## Configuring Custom Service Definition (CLI)

This procedure creates custom service-definition configuration to discover mDNS services from local wireless networks.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>mdns-sd service-definition-name</b> <i>service-definition-name</i>  <b>Example:</b> Device(config)# mdns-sd service-definition APPLE-CLASSROOM	Creates unique service-definition name for custom service-types.
<b>Step 3</b>	<b>service-type</b> <i>custom-mDNS-PTR</i>  <b>Example:</b> Device(config-mdns-ser-def)# service-type _classroom._tcp.local	Configure an regular-expression string for custom mDNS PoinTeR(PTR) record.
<b>Step 4</b>	<b>exit</b>  <b>Example:</b> Device(config-mdns-ser-def)# exit	Returns to global configuration mode.

## Configuring mDNS Gateway on WLAN (GUI)

The mDNS gateway activation on targeted WLAN is required to start processing incoming mDNS messages from associated wireless clients. To activate mDNS gateway the WLAN must be administratively shutdown and re-enable thus it may require network downtime planning.

This procedure configures custom mDNS gateway and required policies.

### Procedure

- 
- Step 1** Choose **Configuration > Tags & Profiles > WLANs**.
  - Step 2** Click to enable the mDNS Gateway on existing **WLAN** row of Catalyst 9800 controller. Click + **Add** button to create new WLAN if required. Refer to Catalyst 9800 Series Wireless Controller Configuration Guide for step-by-step WLAN configuration.
  - Step 3** Click **Advanced** tab.
  - Step 4** From the **mDNS Mode** drop-down list, select **Gateway** to activate mDNS Gateway on the selected WLAN.
  - Step 5** Click **Apply to Device**.

**Step 6** Click Save.

## Configuring mDNS Gateway on WLAN (CLI)

This procedure implements mDNS gateway on a targeted WLAN of the controller in service-peer mode.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wlan profile-name WLAN-ID SSID-name</b>  <b>Example:</b> Device(config)# wlan WLAN-PROFILE 1 blizzard	Creates a unique WLAN.
<b>Step 3</b>	<b>mdns-sd-interface gateway</b>  <b>Example:</b> Device(config-wlan)# mdns-sd-interface gateway	Configure mDNS gateway on targeted WLAN.  <b>Note</b> This step requires wireless profile policy to be administratively shutdown prior association service-policy and re-activate with no shutdown to make service-policy effective.
<b>Step 4</b>	<b>exit</b>  <b>Example:</b> Device(config-wlan)# exit	Returns to global configuration mode.

## Configuring Service-Routing on Service-Peer

The controller deployed in Service-Peer mode extends mDNS service discovery and distribution boundary beyond single controller to global IP network using on unicast based service-routing. The controller service peer must establish IP based unicast service-routing with Cisco Catalyst 9000 series switch in distribution layer network for global service-routing.

This procedure configures the controller in service peer mode.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.

	Command or Action	Purpose
Step 2	<p><b>mdns-sd gateway</b></p> <p><b>Example:</b></p> <pre>Device(config)# mdns-sd gateway</pre>	<p>Enables mDNS and enters in mDNS gateway configuration mode. The following optional parameters are available:</p> <ul style="list-style-type: none"> <li>• <b>active-query</b>: Periodic mDNS query to refresh dynamic cache.</li> <li>• <b>active-response</b>: Periodic active mDNS response instead per request processing.</li> <li>• <b>mode</b>: Set Catalyst 9800 in service-peer mode.</li> <li>• <b>sdg-agent</b>: Unicast service-routing with targeted SDG-Agent.</li> <li>• <b>service-announcement-count</b>: Configures maximum advertisements in service-routing to SDG-Agent.</li> <li>• <b>service-announcement-timer</b>: Configures advertisements announce timer periodicity in service-routing to SDG-Agent.</li> <li>• <b>service-query-count</b>: Configures maximum queries in service-routing to SDG-Agent.</li> <li>• <b>service-query-timer</b>: Configures query forward timer periodicity in service-routing to SDG-Agent.</li> <li>• <b>service-type-enumeration</b>: Configures service enumeration.</li> <li>• <b>source-interface</b>: Configures the source interface. If the source interface is configured, it will be used for all mDNS transactions. By default, wireless management interface will be used.</li> <li>• <b>transport</b>: Use IPv4 (default) or IPv6 transport for mDNS messaging to end points.</li> </ul>

	Command or Action	Purpose
		<b>Note</b> For <b>rate-limit</b> , <b>service-announcement-count</b> , <b>service-announcement-timer</b> , <b>service-query-count</b> and <b>service-query-timer</b> commands, you can retain the default value of the respective parameter for general deployments. Configure a different value, if required, for a specific deployment.
<b>Step 3</b>	<b>mode [service-peer]</b> <b>Example:</b> Device(config-mdns-sd)# mode service-peer	Configure mDNS gateway in service-peer mode.
<b>Step 4</b>	<b>sdg-agent [IPv4 Address]</b> <b>Example:</b> Device(config-mdns-sd)# sdg-agent 10.0.2.254	Configure SDG Agent IPv4 address. Typically, the management VLAN gateway address. If FHRP mode, then use FHRP Virtual-IP address of management VLAN.
<b>Step 5</b>	<b>exit</b> <b>Example:</b> Device(config-mdns-sd)# exit	Returns to global configuration mode.

## Configuring Location-Based mDNS on Service-Peer (GUI)

Cisco Catalyst 9800 series controller supports location-based mDNS service discovery and distribution between wireless service provider and receiver endpoints. The location-based mDNS service support can be implemented using multiple supporting AP classification methods to implement policy-based service distributions in wireless networks. The location-based mDNS service is effective and supported on wireless APs in Local-Mode or FlexConnect Central Switching modes.

The figure given below illustrates various LSS based mDNS service mode discovery and distribution support:

Figure 73: Location-Based mDNS Gateway

This procedure configures location-based mDNS service policy.

## Procedure

- Step 1** Choose **Configuration > Services > mDNS**.
- Step 2** Set the mDNS Gateway button to **Enabled**.
- Step 3** Click **Service Policy** Tab.
- Step 4** Click **Service List** and click **Add**.  
This activates the Service List window.
- Step 5** In the **Service List Name** field, enter a unique name with alphanumeric value.
- Step 6** From the **Direction** drop-down list, select service list policy direction. Use **IN** for ingress or **OUT** for egress mDNS message matching policy.
- Step 7** Click **+Add Services** to add mDNS service-types in selected service list.
- Step 8** From the **Available Services** drop-down list, select built-in or custom mDNS service-type.

- Step 9** From the **Message Type** drop-down list, select **Announcement** to accept service advertisement or **Query** to permit service discovery from the network. Default message-type is **any**.
- Step 10** Click **Save** button to add mDNS service-type entry.
- Note** Repeat Step-7 to Step-9 to add more mDNS service-types in selected service list.
- Step 11** Click **Apply to Device**.
- This creates a new mDNS Service List for selected direction.
- Note** Repeat Step-5 to Step-11 for bi-directional service list.
- Step 12** Click **Service-Policy** tab.
- Step 13** Click **+Add** to create new mDNS service-policy.
- Step 14** In the **Service Policy Name** field, enter a unique mDNS service policy name.
- Step 15** From the **Service List Input** drop-down list, select ingress mDNS service list input to enforce mDNS policies on ingress direction from wireless networks.
- Step 16** From the **Service List Output** drop-down list, select mDNS policies on egress direction to wireless networks.
- Step 17** Click **Apply to Device**.
- This creates a new mDNS service policy.
- Step 18** Choose **Configuration > Tags & Profiles > Policy**
- Step 19** Choose or create a new **Policy Profile**.
- Step 20** Click **Advanced** tab.
- Step 21** From the **mDNS Service Policy** drop-down list, select an mDNS service policy.
- Refer to Cisco Catalyst 9800 Series Configuration Guide to configure other policy profile parameters.
- Step 22** Click **Apply to Device** button.
- This creates a new policy profile or updates an existing policy profile with mDNS service policy.
- Step 23** Click **Save**.

## Configuring Location-Based mDNS on Service-Peer (CLI)

This procedure implements LSS based mDNS service discovery and distribution between wireless endpoints on the targeted WLAN of the controller in service-peer mode.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# <code>configure terminal</code>	Enters global configuration mode.

	Command or Action	Purpose
Step 2	<b>mdns-sd service-policy</b> <i>service-policy-name</i> <b>Example:</b> <pre>Device(config)# mdns-sd service-policy VLAN100-POLICY</pre>	Creates a unique mDNS service-policy.
Step 3	<b>location</b> { <b>ap-location</b>   <b>ap-name</b>   <b>lss</b>   <b>regex</b>   <b>site-tag</b>   <b>ssid</b> } <b>Example:</b> <pre>Device(config-mdns-ser-policy)# location ap-location</pre>	<p>Creates a unique mDNS service-policy.</p> <ul style="list-style-type: none"> <li>• <b>ap-location:</b> Enables mDNS service discovery and distribution between wireless service provider and receiver connected to one or more AP configured in the same location name. The mDNS services from non-matching AP location is automatically filtered.</li> <li>• <b>ap-name:</b> Enables mDNS service discovery and distribution between wireless service provider and receiver connected to single AP matching same AP name. The mDNS services from non-matching AP name is automatically filtered.</li> <li>• <b>lss:</b> Enables mDNS service discovery and distribution between wireless service provider and receiver connected to same and neighboring one or more AP based on RRM. The mDNS services from non-matching AP neighbor-list is automatically filtered.</li> <li>• <b>regex:</b> Enables mDNS service discovery and distribution between wireless service provider and receiver connected to one or more AP configured within matching AP name or AP Location name using regular-expression string. The mDNS services from non-matching AP names is automatically filtered.</li> <li>• <b>site-tag:</b> Enables mDNS service discovery and distribution between wireless service provider and receiver connected to one or more AP configured same site tag name. The mDNS services from non-matching site tag is automatically filtered.</li> <li>• <b>ssid:</b> Enables mDNS service discovery and distribution between wireless service provider and receiver connected to one or more AP configured same SSID name. The</li> </ul>

	Command or Action	Purpose
		mDNS services from non-matching SSID is automatically filtered.
<b>Step 4</b>	<b>exit</b> <b>Example:</b> Device(config-mdns-ser-policy)# exit	Exits mDNS service policy configuration mode.

## Verifying mDNS Gateway Configuration

This section provides guidelines to verify various Local Area Bonjour domain mDNS service configuration parameters, cache records, statistics and more on the controller in service peer mode.

Table 156:

Command or Action	Purpose
<pre>show mdns-sd cache { ap-mac   client-mac   detail   glan-ID   mdns-ap   rlan-id   statistics   type   udn   wired   wlan-id }</pre>	<p>Displays available mDNS cache records supporting multiple following variables providing granular source details:</p> <ul style="list-style-type: none"> <li>• <b>ap-mac</b>: Displays one or more mDNS service instance cache records discovered from provided AP MAC address.</li> <li>• <b>client-mac</b>: Displays one or more mDNS service instance(s) cache records discovered from service provider wireless client MAC address.</li> <li>• <b>detail</b>: Displays mDNS record detail information combined with client and network attributes and other service parameters.</li> <li>• <b>glan-ID</b>: Displays one or more mDNS service instance(s) cache records discovered from provided Wired Guest LAN ID MAC address.</li> <li>• <b>mdns-ap</b>: Displays one or more mDNS service instance(s) cache records discovered from provided Wireless mDNS AP MAC address.</li> <li>• <b>rlan-id</b>: Displays one or more mDNS service instances(s) cache records discovered from provided Wired Remote LAN ID. Range 1-128.</li> <li>• <b>statistics</b>: Displays detail global bi-directional mDNS statistics for IPv4 and IPv6 transports with packet processing count for each mDNS record-type.</li> <li>• <b>type</b>: Displays one or more service-instance(s) cache records matching mDNS record-type, i.e., A-AAAA, PTR, SRV and TXT.</li> <li>• <b>udn</b>: Displays one or more mDNS service instance(s) cache records discovered from segmented Wireless service provider in User-Defined-Group (UDN) or shared-services.</li> <li>• <b>wired</b>: Displays one or more mDNS service instance(s) cache records discovered from upstream Layer 2 wired network.</li> <li>• <b>wlan-id</b>: Displays one or more mDNS service instance(s) cache records discovered from matching provided wlan-ID. Range 1-4096.</li> </ul>

Command or Action	Purpose
<b>show mdns-sd statistics</b> { <b>debug</b>   <b>flexconnect</b>   <b>glan-id</b>   <b>rlan-id</b>   <b>wired</b>   <b>wlan-id</b> }	Displays detailed mdns statistics processed bi-directionally by system on each mDNS gateway enabled VLAN configured mDNS in Unicast mode. The expanded keyword of mDNS statistics can provide detail view on interface, policy, service-list and services.
<b>show mdns-sd summary</b>	Displays brief information about mDNS gateway and key configuration status on all VLANs and interfaces of the system.

### Verifying Catalyst WLC Service-Peer Configuration

This section provides guidelines to verify service peer service configuration and statistics.

*Table 157:*

Command or Action	Purpose
<b>show mdns-sd sp-sdg statistics</b>	Displays mDNS service-routing statistics between Catalyst 9800 service-peer and upstream SDG Agent switch for global service discovery and distribution.
<b>show mdns-sd summary</b>	Displays brief information about mDNS gateway and key configuration status and parameters of the system.

## Overview of Local Area Bonjour for Wireless FlexConnect Mode

The Cisco Catalyst 9800 series controller introduces unicast mode function in Local Area Bonjour network domain. The enhanced gateway function at the first hop of Wired and Wireless networks communicates directly with any industry standard RFC 6762 compliant Multicast DNS (mDNS) end point in Layer 2 Unicast mode. The controller also introduces new service-peer mode expanding single-gateway to end-to-end service-routing with upstream SDG-Agent switch to enable unicast-mode, increased scale, performance and resiliency in the network.

## Restrictions for Local Area Bonjour for Wireless FlexConnect Mode

- In FlexConnect mode network deployments, the mDNS gateway and service-peer mode on the controller must not be configured and must be in disabled state.

# Prerequisites for Local Area Bonjour for Wireless FlexConnect Mode

The Cisco Catalyst 9800 series controller must be successfully configured and operational before implementing Cisco Local Area Bonjour for FlexConnect mode wireless networks.

The following list provides the prerequisites for the controller that is to be deployed to enable successful mDNS gateway solution for Wireless FlexConnect:

- Ensure that the targeted Layer 2 Catalyst 9000 Series Ethernet switch is configured in service-peer role and running the required Cisco IOS-XE software version.
- Ensure that the Catalyst 9000 Series Ethernet switch runs a valid Cisco DNA-Advantage license.
- Ensure that the upstream distribution-layer Cisco Catalyst switch for Wired and FlexConnect Local Switching Wireless networks is configured in SDG-Agent mode and runs a valid Cisco DNA-Advantage license.

## Understanding mDNS Gateway Alternatives for Wireless FlexConnect Mode

The controller continues to innovate mDNS gateway function to address evolving business and technical requirements in the Enterprise networks. The FlexConnect Local Switching based wireless networks implement mDNS gateway using the following two methods depicted in the figure:

Figure 74: mDNS Gateway Alternatives for FlexConnect Mode

Based on the operating network environment, the mDNS gateway for FlexConnect mode wireless network can be implemented in one of the following modes to address service discovery and distribution:

- **Switch Based mDNS Gateway**—In Layer 2 access, the Cisco Catalyst 9000 series Ethernet switch must be implemented as mDNS gateway in Service-Peer role. The following are the key benefits:
  - Replaces flood-n-learn with the new enhanced Unicast-based mDNS communication with FlexConnect mode wireless users.
  - Eliminates mDNS flood with Unicast service-routing to LAN distribution. The Unicast service-routing between LAN distribution and Layer 2 access layer switches forms Local Area Bonjour domain to enable policy and location-based service discovery and distribution. The Unicast based service-routing over Layer 2 trunk eliminates mDNS flood-free and enables service-oriented wireless networks.
  - Eliminates the requirement to forward wired network traffic to wireless Access Points improving wireless scale, performance, and network reliability.
- **AP Based mDNS Gateway**—The Cisco FlexConnect mode wireless access points can alternatively be implemented as mDNS gateway when connected to unsupported LAN access switch. In this method, the mDNS service discovery and distribution follows flood-n-learn mechanism over the Layer 2 wireless network. To implement AP based mDNS gateway, see the [Multicast Domain Name System](#) chapter.

# Understanding Local Area Bonjour for Wireless FlexConnect Mode

The controller supports mDNS gateway function with various advancements for broad range of wireless networks. As the enterprise requirements expands it drives IT organization to introduce new network deployment models, supporting mobile devices and distributed zero-configuration services following increased scale, granular security control and resiliency for mission critical networks. The common unified Cisco IOS-XE operating system across Cisco Catalyst 9000 series LAN switches and Cisco Catalyst 9800 series controller enables distributed Bonjour gateway function at network edge. With end-to-end Wide Area Bonjour service-routing, the new solution enables service-oriented enterprise networks with intuitive user-experience.

The following figure illustrates how the controller connected to wireless access points support mDNS gateway function to wireless users in FlexConnect Local Switching mode.

Figure 75: Cisco Catalyst 9800 Series Controller Local Area Bonjour for Wireless - FlexConnect Mode

The Cisco Catalyst 9000 series switches in the Layer 2 access layer and Layer 3 distribution layer must be configured in the following mDNS gateway mode to enable Unicast-based mDNS service-routing between wired and FlexConnect Local Switching mode wireless users within the same Layer 2 network block:

- **Service-Peer** - The Layer 2 access switch connecting wireless access point in FlexConnect Local Switching mode must be configured with mDNS gateway in Service-Peer mode. Each Layer 2 access switch provides mDNS gateway function between locally attached wired and FlexConnect mode wireless users. The Unicast-based mDNS service discovery and distribution within same or different VLANs is supported with bi-directional mDNS policies on single Layer 2 access switch.
- **SDG Agent** - The mDNS flood-n-learn based method in Layer 2 network is replaced with simple Unicast based service-routing between Layer 2 access switch in Service-Peer mode and upstream distribution-layer

in mDNS gateway SDG Agent mode. The Unicast based mDNS service-routing eliminates mDNS flood over Layer 2 trunk ports providing increased bandwidth, enhanced security, location-based services, and flood control management in wired and FlexConnect wireless network.

## Configuring Local Area Bonjour for Wireless FlexConnect Mode

This section provides configuration guidelines to implement Cisco Catalyst 9000 series Ethernet switch as mDNS gateway and enable service-peer and SDG Agent mode to enable service-routing with upstream distribution-layer Cisco Catalyst 9000 series switch in SDG Agent mode to build Local Area Bonjour.

### Configuring mDNS Gateway Mode (CLI)

To enable mDNS gateway and Service-Peer mode on Layer 2 access switch and SDG Agent mode on Layer 3 distribution layer switch, perform the following:

#### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Device# <b>enable</b>	Enables privileged EXEC mode. Enter your password, if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 3</b>	<b>mdns-sd gateway</b> <b>Example:</b> Device(config)# <b>mdns-sd gateway</b>	Enables mDNS on the Layer 2 Catalyst switch and enters the mDNS gateway configuration mode. (Optional) You can configure the following additional parameters: <ul style="list-style-type: none"> <li>• <b>air-print-helper</b>: Enables communication between Apple iOS devices like iPhone or iPad to discover and use older printers that does not support driverless AirPrint function.</li> <li>• <b>cache-memory-max</b>: Configures the percentage memory for cache.</li> <li>• <b>ingress-client</b>: Configures Ingress client packet tuners.</li> <li>• <b>rate-limit</b>: Enables rate limiting of incoming mDNS packets.</li> <li>• <b>service-announcement-count</b>: Configures maximum advertisements.</li> </ul>

	Command or Action	Purpose
		<ul style="list-style-type: none"> <li>• <b>service-announcement-timer</b>: Configures advertisements announcement timer periodicity.</li> <li>• <b>service-query-count</b>: Configures maximum queries.</li> <li>• <b>service-query-timer</b>: Configures query forward timer periodicity.</li> <li>• <b>service-type-enumeration</b>: Configures service enumeration.</li> </ul> <p><b>Note</b> For <b>cache-memory-max</b>, <b>ingress-client</b>, <b>rate-limit</b>, <b>service-announcement-count</b>, <b>service-announcement-timer</b>, <b>service-query-count</b>, <b>service-query-timer</b>, and <b>service-type-enumeration</b> commands, you can retain the default value of the respective parameter for general deployments. Configure a different value, if required, for a specific deployment.</p>
<b>Step 4</b>	<b>mode {service-peer   sdg-agent}</b> <b>Example:</b> Device(config-mdns-sd) # <b>mode service-peer</b> Device(config-mdns-sd) # <b>mode sdg-agent</b>	Configure mDNS gateway in one of the following modes based on the system settings: <ul style="list-style-type: none"> <li>• <b>service-peer</b>– Enables Layer 2 Catalyst access switch in mDNS Service-Peer mode.</li> <li>• <b>sdg-agent</b>– Default. Enables Layer 3 distribution layer Catalyst switch in SDG Agent mode to peer with central Cisco Catalyst Center controller for Wide Area Bonjour service routing.</li> </ul>
<b>Step 5</b>	<b>exit</b> <b>Example:</b> Device(config-mdns-sd) # <b>exit</b>	Exits mDNS gateway configuration mode.

## Configuring mDNS Service Policy (CLI)

You need to perform the following to configure an mDNS service policy:

1. Create service-list to permit built-in or user-defined custom service types.
2. Associate service-list to a service-policy to enforce ingress or egress direction.

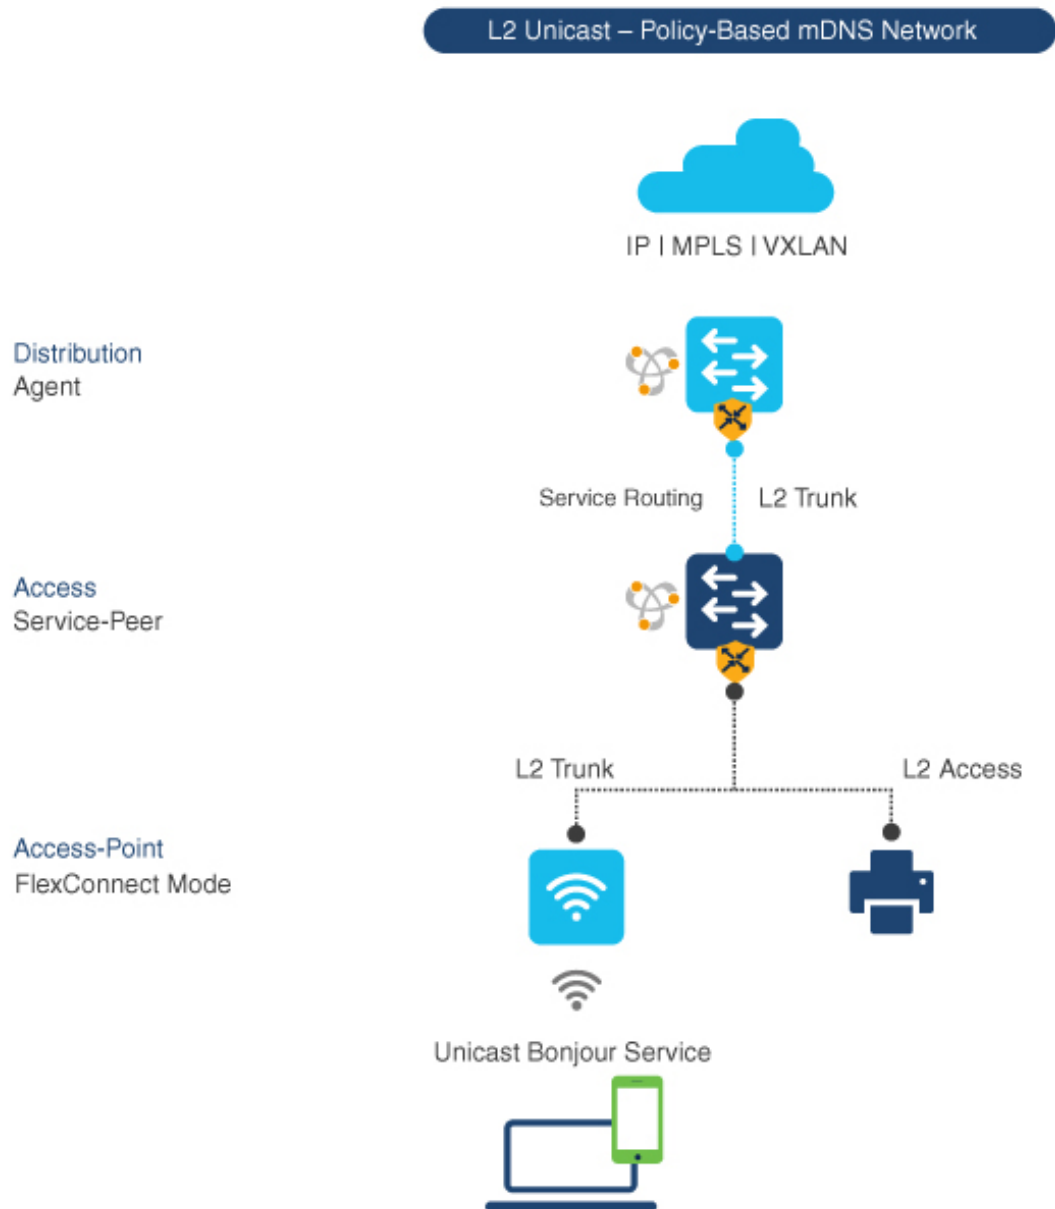

3. Apply the service policy to the new VLAN configuration mode.

**Note** You will need this configuration in Service-Peer mode for Layer 2 Catalyst switch and SDG agent mode for Layer 3 Catalyst switch.

The following figure shows how to configure mDNS policies on Catalyst switch in Service-Peer and SDG agent modes.

**Figure 76: mDNS Service Policy Configuration on Catalyst Switch in Service-Peer and SDG Agent Modes**

357161

This procedure builds and applies service-policies on target VLAN in service-peer and SDG agent modes.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Device# <b>enable</b>	Enables privileged EXEC mode. Enter your password, if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 3</b>	<b>mdns-sd service-list <i>service-list-name</i> {in   out}</b> <b>Example:</b> Device (config)# <b>mdns-sd service-list VLAN100-LIST-IN in</b> Device (config)# <b>mdns-sd service-list VLAN100-LIST-OUT out</b>	Configure mDNS service-list to classify one or more service types. Unique service-list is required to process incoming mDNS message and outbound response to request locally connected wired or FlexConnect wireless end points.
<b>Step 4</b>	<b>match <i>service-definition-name</i> [message-type {any   announcement   query}]</b> <b>Example:</b> Device (config)# <b>mdns-sd service-list VLAN100-LIST-IN in</b> Device (config-mdns-sl-in) # <b>match APPLE-TV</b> Device (config-mdns-sl-in) # <b>match PRINTER-IPPS message-type announcement</b>	Matches inbound service-list. The Catalyst switch validates to accept or drop incoming mDNS service-type (such as, Apple TV) advertisement or query matching message type from locally connected wired or FlexConnect wireless end points. The service-list contains implicit deny at the end. The default message-type used is <b>any</b> .
<b>Step 5</b>	<b>match <i>service-definition-name</i> [message-type {any   announcement   query}]</b> <b>Example:</b> Device (config)# <b>mdns-sd service-list VLAN100-LIST-OUT out</b> Device (config-mdns-sl-in) # <b>match APPLE-TV</b> Device (config-mdns-sl-in) # <b>match PRINTER-IPPS</b>	Matches outbound service-list. The Catalyst switch provides local service proxy function by responding matching service-type to the requesting end point(s). For example, the Apple-TV and Printer learnt from VLAN 100 will be distributed to FlexConnect wireless receiver in same VLAN 100. The service-list contains implicit deny at the end. The message-type for outbound service-list is not required.
<b>Step 6</b>	<b>mdns-sd service-policy <i>service-policy-name</i></b> <b>Example:</b> Device (config)# <b>mdns-sd service-policy VLAN100-POLICY</b>	Creates unique mDNS service-policy in global configuration mode.

	Command or Action	Purpose
<b>Step 7</b>	<b>service-list</b> <i>service-list-name</i> { <b>in</b>   <b>out</b> } <b>Example:</b> Device (config) # <b>mdns-sd service-policy</b> <b>VLAN100-POLICY</b> Device (config-mdns-ser-policy) # <b>service-list VLAN100-LIST-IN in</b> Device (config-mdns-ser-policy) # <b>service-list VLAN100-LIST-OUT out</b>	Configures mDNS service-policy to associate service-list for each direction.
<b>Step 8</b>	<b>vlan configuration</b> <i>ID</i> <b>Example:</b> Device (config) # <b>vlan configuration 100</b>	Enables wired or wireless FlexConnect user VLAN configuration for advanced service parameters. One or more VLANs can be created for the same settings. Here, <i>ID</i> refers to the VLAN configuration ID. The range is from 101 to 110 and 200. This range allows to configure consecutive and non-consecutive VLAN ID(s).
<b>Step 9</b>	<b>mdns-sd gateway</b> <b>Example:</b> Device (config-vlan) # <b>mdns-sd gateway</b>	Enables mDNS gateway on configured wired or FlexConnect wireless user VLAN ID(s).
<b>Step 10</b>	<b>service-policy</b> <i>service-policy-name</i> <b>Example:</b> Device (config-vlan-mdns) # <b>service-policy</b> <b>VLAN100-POLICY</b>	Associates mDNS service-policy to the configured wired or FlexConnect wireless user VLAN ID(s).
<b>Step 11</b>	<b>exit</b> <b>Example:</b> Device (config-vlan-mdns) # <b>exit</b>	Exits mDNS gateway configuration mode.

## Configuring mDNS Location-Filter (CLI)

Optionally, you can configure mDNS location-filter to allow service discovery and distribution between locally configured VLAN IDs associated to FlexConnect wireless user networks.

The following figure illustrates and references location-filter policy on Catalyst switch in Service-Peer mode permitting to discover and distribute mDNS services between wired and FlexConnect wireless user VLANs.

Figure 77: Catalyst Service-Peer mDNS Location-Filter Configuration

To enable local service proxy on Cisco Catalyst switch in Service-Peer mode and discover mDNS services between local wired and wireless FlexConnect user VLANs, perform the following:

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Device# <b>enable</b>	Enables privileged EXEC mode. Enter your password, if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 3</b>	<b>mdns-sd location-filter</b> <i>location-filter-name</i> <b>Example:</b> Device(config)# <b>mdns-sd location-filter</b> <b>LOCAL-PROXY</b>	Configures a unique location-filter in global configuration mode.
<b>Step 4</b>	<b>match location-group</b> {all   default   ID} vlan [ID] <b>Example:</b>	Configures the match criteria to mutually distribute the permitted services between grouped VLANs. For example, mDNS services can be discovered and distributed using the

	Command or Action	Purpose
	<pre>Device (config-mdns-loc-filter)# match location-group default vlan 100  Device (config-mdns-loc-filter)# match location-group default vlan 101</pre>	Unicast mode between wireless FlexConnect user VLAN ID 100 and wired user VLAN ID 101.
<b>Step 5</b>	<p><b>mdns-sd service-list</b> <i>service-list-name</i> {in   out}</p> <p><b>Example:</b></p> <pre>Device (config)# mdns-sd service-list VLAN100-LIST-OUT out</pre>	<p>Configures the mDNS service-list to classify one or more service types.</p> <p>The <b>service-list</b> configuration is required to process any incoming or outgoing mDNS messages.</p>
<b>Step 6</b>	<p><b>match</b> <i>service-definition-name</i> [message-type {any   announcement   query}]</p> <p><b>Example:</b></p> <pre>Device (config)# mdns-sd service-list VLAN100-LIST-OUT out  Device (config-mdns-sl-out)# match APPLE-TV location-filter LOCAL-PROXY</pre>	<p>Associates location-filter to one or more service types to enable local proxy between local VLANs. For example, the Apple-TV learnt from VLAN 100 and VLAN 101 will be distributed to receiver in VLAN 100.</p> <p><b>Note</b> You do not require a <b>message-type</b> for the outbound service-list.</p>
<b>Step 7</b>	<p><b>mdns-sd service-policy</b> <i>service-policy-name</i></p> <p><b>Example:</b></p> <pre>Device (config)# mdns-sd service-policy VLAN100-POLICY</pre>	Creates unique mDNS service-policy in global configuration mode.
<b>Step 8</b>	<p><b>service-list</b> <i>service-list-name</i> {in   out}</p> <p><b>Example:</b></p> <pre>Device (config)# mdns-sd service-policy VLAN100-POLICY  Device (config-mdns-ser-policy)# service-list VLAN100-LIST-OUT out</pre>	Configures mDNS service-policy to associate service-list for each direction.
<b>Step 9</b>	<p><b>vlan configuration</b> <i>ID</i></p> <p><b>Example:</b></p> <pre>Device (config)# vlan configuration 100</pre>	<p>Enables VLAN configuration for advanced service parameters. You can create one or more VLANs with the same settings.</p> <p>Here, <i>ID</i> refers to the VLAN configuration ID. The range is from 101 to 110 and 200. This range allows to configure consecutive and non-consecutive VLAN ID(s).</p>
<b>Step 10</b>	<p><b>mdns-sd gateway</b></p> <p><b>Example:</b></p> <pre>Device (config-vlan-config)# mdns-sd gateway</pre>	Enables mDNS gateway on configured VLAN ID(s).
<b>Step 11</b>	<p><b>service-policy</b> <i>service-policy-name</i></p> <p><b>Example:</b></p>	Associates mDNS service-policy to the configured VLAN ID(s).

	Command or Action	Purpose
	Device (config-vlan-mdns-sd) # <b>service-policy VLAN100-POLICY</b>	
<b>Step 12</b>	<b>exit</b>  <b>Example:</b> Device (config-vlan-mdns-sd) # <b>exit</b>	Exits mDNS gateway configuration mode.

## Configuring Custom Service Definition (CLI)

The Cisco IOS-XE supports mapping of various built-in well-known mDNS service-definition types to key mDNS PTR records and user-friendly names. For example, built-in Apple-TV service-type is associated with `_airplay._tcp.local` and `_raop._tcp.local` PTR records to successfully enable service in the network. Network administrators create custom service-definition with matching mDNS PTR records to enable end mDNS service-routing in the network.

The custom service-definition can be associated to the service-list as described in the following steps:

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b>  <b>Example:</b> Device# <b>enable</b>	Enables privileged EXEC mode.  Enter your password, if prompted.
<b>Step 2</b>	<b>configure terminal</b>  <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 3</b>	<b>mdns-sd service-definition</b> <i>service-definition-name</i>  <b>Example:</b> Device (config) # <b>mdns-sd</b> <b>service-definition APPLE-CLASSROOM</b>	Creates a unique service-definition name for custom service-types.
<b>Step 4</b>	<b>service-type</b> <i>custom-mDNS-PTR</i>  <b>Example:</b> Device (config-mdns-ser-def) # <b>service-type</b> <b>_classroom._tcp.local</b>	Configures a regular-expression string for custom mDNS PoinTeR(PTR) record.
<b>Step 5</b>	<b>exit</b>  <b>Example:</b> Device (config-mdns-ser-def) # <b>exit</b>	Exits mDNS gateway configuration mode.

## Configuring Service-Routing on Service-Peer (CLI)

The Layer 2 Cisco Catalyst switch in Service-Peer mode builds a service-routing with an upstream distribution-layer switch in the SDG Agent mode. To build service-routing, the Layer 2 Cisco Catalyst switch requires at least one interface with valid IP address to reach the upstream SDG Agent Catalyst switch. The switch management port is unsupported.

The following figure illustrates the topology to enable unicast-based service-routing over Layer 2 trunk between access-layer Catalyst switch in the Service-Peer mode and distribution-layer Catalyst switch in SDG Agent mode.

**Figure 78: Catalyst Service-Peer Service-Routing Configuration**

To enable service-routing on Cisco Catalyst switch in Service-Peer mode and setup mDNS trust interface settings, follow the procedure given below:

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Device# <b>enable</b>	Enables Privileged EXEC mode. Enter your password, if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b>	Enters the global configuration mode.

	Command or Action	Purpose
	Device# <code>configure terminal</code>	
<b>Step 3</b>	<p><b>vlan configuration <i>ID</i></b></p> <p><b>Example:</b></p> <pre>Device(config)# vlan configuration 100</pre>	<p>Enables Wired and FlexConnect user VLAN configuration for advanced service parameters. One or more VLANs can be created for the same settings.</p> <p>Here, <i>ID</i> refers to the VLAN configuration ID. For example, <i>vlan configuration 101-110, 200</i> range, allows to configure consecutive and non-consecutive VLAN ID(s).</p>
<b>Step 4</b>	<p><b>mdns-sd gateway</b></p> <p><b>Example:</b></p> <pre>Device(config-vlan-config)# mdns-sd gateway</pre>	<p>Enables mDNS gateway on configured VLAN ID(s).</p> <p>To enable the respective functionalities, enter the following commands in the mDNS gateway configuration mode:</p> <ul style="list-style-type: none"> <li>• <b>active-query timer [sec]:</b> Configure to enable refresh discovered services and their records with periodic mDNS Query message for permitted service types. The valid range is from 60 to 3600 seconds. The recommended value is 3600 seconds.</li> <li>• <b>service-mdns-query {ptr   srv   txt}:</b> Permits processing specific Query type. The default query type is PTR.</li> <li>• <b>transport {ipv4   ipv6   both}:</b> Permits processing for IPv4, IPv6, or both. It is recommended to use one network type to reduce redundant processing and respond with the same information over two network types. The default network type is IPv4.</li> </ul>
<b>Step 5</b>	<p><b>source-interface <i>ID</i></b></p> <p><b>Example:</b></p> <pre>Device(config-vlan-mdns-sd)# source-interface vlan 4094</pre>	<p>Selects the interface with a valid IP address to source service-routing session with the upstream Cisco Catalyst SDG Agent switch. Typically, the management VLAN interface can be used.</p>
<b>Step 6</b>	<p><b>sdg-agent [<i>IPv4_address</i>]</b></p> <p><b>Example:</b></p> <pre>Device(config-vlan-mdns-sd)# sdg-agent 10.0.0.254</pre>	<p>Configures the SDG Agent IPv4 address, typically, the management VLAN gateway address. If FHRP mode, then use the FHRP virtual IP address of the management VLAN.</p>
<b>Step 7</b>	<p><b>exit</b></p> <p><b>Example:</b></p> <pre>Device(config-vlan-mdns-sd)# exit</pre>	<p>Exits the mDNS gateway configuration mode.</p>

## Configuring Location-Based mDNS

By default, the Layer 2 Catalyst switch in the Service-Peer mode enables per-switch mDNS discovery and distribution in FlexConnect wireless users attached locally to the switch. This default per-switch location-based mDNS is supported even when the FlexConnect user VLANs may be extended between multiple Layer 2 Catalyst switches for user mobility purpose. The mDNS service-policy configuration SDG Agent is required to accept policy-based mDNS service provider and receiver information from downstream Service-Peer access-layer switch.

**Figure 79: Per-Switch Location-Based FlexConnect Configuration**

**Note** Configure the mDNS service policy on the distribution layer SDG Agent switch before proceeding to the next configuration step. For more information, see the [Configuring mDNS Service Policy](#) section.

## Configuring Service-Routing on SDG Agent (CLI)

The Cisco Catalyst 9000 series switches support SDG Agent mode automatically at the distribution layer and enables Unicast mode Bonjour service-routing with the downstream Layer 2 access-layer Ethernet switches connected to the FlexConnect wireless users. The SDG Agent must be configured with mDNS service-policy on wireless FlexConnect user VLAN to accept mDNS service cache from downstream Service-Peer switches.

This section provides step-by-step configuration guidelines to enable policy-based service discovery and distribution between locally paired Layer 2 access network switches in the Service-Peer mode.

The following figure illustrates unicast service-routing on SDG Agent and downstream Layer 2 access network switches in the Service-Peer mode.

**Figure 80: Catalyst SDG Agent Service-Routing Configuration**

**Note** Configure the mDNS service policy on the distribution layer SDG Agent switch before proceeding to the next configuration step. For more information, see the [Configuring mDNS Service Policy](#) section.

To enable the mDNS service policy and peer-group on SDG Agent switch, and enable Unicast mode service-routing with Layer 2 access network switches in Service-Peer mode, perform the following:

#### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Device# <b>enable</b>	Enables privileged EXEC mode. Enter your password, if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b>	Enters global configuration mode.

	Command or Action	Purpose
	Device# <code>configure terminal</code>	
<b>Step 3</b>	<b>mdns-sd service-peer group</b> <i>service-peer-group-name</i>  <b>Example:</b> Device(config)# <code>mdns-sd service-peer group group_1</code>	Configures a unique Service-Peer group.
<b>Step 4</b>	<b>peer-group [ID]</b>  <b>Example:</b> Device(config-mdns-svc-peer)# <code>peer-group 1</code>	Assigns a unique peer-group ID to the Service-Peers pair permitting mDNS service discovery and distribution within the assigned group list.  The valid peer-group range is from 1 to 1000 for each SDG Agent switch.
<b>Step 5</b>	<b>service-policy service-policy-name</b>  <b>Example:</b> Device(config-mdns-svc-peer-grp)# <code>service-policy VLAN100-POLICY</code>	Associates an mDNS service policy to accept service advertisements and query from the paired Service-Peers.
<b>Step 6</b>	<b>service-peer [IPv4_address] location-group {all   default   id}</b>  <b>Example:</b> Device(config-mdns-svc-peer-grp)# <code>service-peer 10.0.0.1 location-group default</code>  Device(config-mdns-svc-peer-grp)# <code>service-peer 10.0.0.2 location-group default</code>	Configures at least one Service-Peer to accept the mDNS service advertisement or query message. When a group has more than one Service-Peers, the SDG Agent provides Layer 2 Unicast mode routing between the configured peers.  For example, the SDG Agent provides Unicast based service gateway function between three (10.0.0.1 and 10.0.0.2) Layer 2 Service-Peer switches matching the associated service-policy.  The mDNS service information from the unpaired Layer 2 Service-Peer (10.0.0.3) cannot announce or receive mDNS services with the other grouped Service-Peers (10.0.0.1 and 10.0.0.2).
<b>Step 7</b>	<b>exit</b>  <b>Example:</b> Device(config-mdns-svc-peer-grp)# <code>exit</code>	Exits mDNS gateway configuration mode.

## Verifying Local Area Bonjour in Service-Peer Mode

This section provides guidelines to verify various Local Area Bonjour domain mDNS service configuration parameters, cache records, statistics and more on the controller in service-peer mode

Table 159:

Command or Action	Purpose
<b>show mdns-sd cache {all   interface   mac   name   service-peer   static   type   vlan}</b>	<p>Displays available mDNS cache records supporting multiple variables providing granular source details received from wired or wireless FlexConnect user VLANs. The variables are as follows:</p> <ul style="list-style-type: none"> <li>• all – Displays all available cache records discovered from multiple source connections of a system.</li> <li>• interface – Displays available cache records discovered from the specified Layer 3 interface.</li> <li>• mac - Displays available cache records discovered from the specified MAC address.</li> <li>• name - Displays available cache records based on the service provider announced name.</li> <li>• service-peer - Displays available cache records discovered from the specified Layer 2 Service-Peer.</li> <li>• static – Displays locally configured static mDNS cache entry.</li> <li>• type – Displays available cache records based on the specific mDNS record type, such as, PTR, SRV, TXT, A or AAAA.</li> <li>• vlan - Displays available cache records discovered from the specified Layer 2 VLAN ID in the Unicast mode.</li> </ul>
<b>show mdns-sd service-definition {name   type}</b>	<p>Displays built-in and user-defined custom service-definition that maps service name to the mDNS PTR records. The service-definition can be filtered by name or type.</p>
<b>show mdns-sd service-list {direction   name}</b>	<p>Displays inbound or outbound direction list of configured service-list to classify matching service-types for service-policy. The list can be filtered by name or specific direction.</p>
<b>show mdns-sd service-policy {interface   name}</b>	<p>Displays list of mDNS service-policy mapped with inbound or outbound service-list. The service-policy list can be filtered by an associated specified interface or name.</p>

Command or Action	Purpose
<b>show mdns-sd statistics</b> {all   cache   debug   interface   service-list   service-policy   services   vlan}	<p>Displays detailed mDNS statistics processed bi-directionally by the system on each mDNS gateway enabled VLAN configured mDNS in Unicast mode. The expanded keyword for mDNS statistics can provide detailed view on interface, policy, service-list, and services.</p> <p><b>Note</b> This command displays all mDNS packets received from directly connected (Local Mode) or Flex clients in WLAN.</p>
<b>show mdns-sd summary</b> {interface   vlan}	<p>Displays brief information about mDNS gateway and key configuration status on all wired and wireless FlexConnect user VLANs, and interfaces of the system.</p>

## Verifying Local Area Bonjour in SDG Agent Mode

This section provides guidelines to verify various Local Area Bonjour domain mDNS service configuration parameters, cache records, statistics and more on the controller in SDG Agent mode

Table 160:

Command or Action	Purpose
<b>show mdns-sd cache {all   interface   mac   name   service-peer   static   type   vlan   vrf}</b>	Displays available mDNS cache records supporting multiple variables providing granular source details. The variables are as follows: <ul style="list-style-type: none"> <li>• all – Displays all available cache records discovered from multiple source connections of a system.</li> <li>• interface – Displays available cache records discovered from the specified Layer 3 interface.</li> <li>• mac - Displays available cache records discovered from the specified MAC address.</li> <li>• name - Displays available cache records based on the service provider announced name.</li> <li>• service-peer - Displays available cache records discovered from the specified Layer 2 Service-Peer.</li> <li>• static – Displays locally configured static mDNS cache entry.</li> <li>• type – Displays available cache records based on the specific mDNS record type, such as, PTR, SRV, TXT, A or AAAA.</li> <li>• vlan - Displays available cache records discovered from the specified Layer 2 VLAN ID in the Unicast mode.</li> <li>• vrf - Displays per-VRF available cache records based on specific mDNS record type, i.e., PTR, SRV, TXT, A or AAAA.</li> </ul>
<b>show mdns-sd service-definition {name   type}</b>	Displays built-in and user-defined custom service-definition that maps service name to the mDNS PTR records. The service-definition can be filtered by name or type.
<b>show mdns-sd service-list {direction   name}</b>	Displays inbound or outbound direction list of the configured service-list to classify matching service-types for service-policy. The list can be filtered by name or specific direction.
<b>show mdns-sd service-policy {interface   name}</b>	Displays list of mDNS service-policy mapped with inbound or outbound service-list. The service-policy list can be filtered by an associated specified interface or name.

Command or Action	Purpose
<b>show mdns-sd statistics</b> {all   cache   debug   interface   service-list   service-policy   services   vlan}	Displays detailed mDNS statistics processed bi-directionally by the system on each mDNS gateway enabled VLAN configured mDNS in Unicast mode. The expanded keyword for mDNS statistics can provide detailed view on interface, policy, service-list, and services.
<b>show mdns-sd summary</b> {interface   vlan}	Displays brief information about mDNS gateway and key configuration status on all VLANs and interfaces of the system.

## Overview

This chapter provides configuration guidelines to implement Wide Area Bonjour enabling end-to-end policy-based mDNS service discovery and distribution across multilayer wired and wireless local mode. The first hop mDNS gateway at Layer 2 access switch and the controller must be implemented in service peer mode and paired with LAN and wireless distribution-layer switch in SDG agent role. The network-wide distributed SDG agent must be paired with the Cisco Catalyst Center to enable mDNS service-routing across IP core network based on multiple services and network attributes.

The following figure illustrates unicast mode Bonjour network environment with AirPrint capable printer and user computer (macOS, Microsoft Windows, etc.) connected to same Ethernet switch. The computers and mobile devices of the wireless user are associated to wireless AP in local mode across multi-hop IP boundary from printers.

Figure 81: Wide Area Bonjour Service-Routing Multilayer Wired and Wireless Local Mode

## Configuring Wireless AP Multicast Mode

This procedure configures wireless AP multicast on the controller for local mode APs and IP network.

The controller must be configured with unique IP multicast address for wireless AP in local mode to permit mDNS communication across wired and wireless networks.

Step	Controller Service Peer Configuration
<b>Step-1</b> Enable global IP Multicast on Cisco Catalyst 9800 series controller.	<pre>! wireless multicast !</pre>
<b>Step-2</b> Configure Wireless AP mode to Multicast with unique IP Multicast address.	<pre>! wireless multicast 239.254.254.1 !</pre>

The following table provides step-by-step IP multicast configuration guidelines on SDG agent (SDG-1 and SDG-2) at the distribution layer network.

Step	Switch SDG Agent Configuration	WLC SDG Agent Configuration
<b>Step-1</b> Enable IP multicast-routing on distribution layer switches connecting Cisco Wireless Local Mode Access Point and Cisco Wireless LAN Controller.	<pre>! ip multicast-routing !</pre>	<pre>! ip multicast-routing !</pre>
<b>Step-2</b> Configure IP PIM Rendezvous-Point (RP) on distribution layer switches.	<pre>! ip pim rp-address 10.150.255.1 !</pre>	<pre>! ip pim rp-address 10.150.255.1 !</pre>
<b>Step-3</b> Enable IP PIM on SVI Interface of distribution layer switches connected Cisco Wireless Local Mode Access Point and Cisco WLC Management VLAN.	<pre>! interface Vlan 101  description CONNECTED TO WIRELESS AP - LOCAL MODE  ip pim sparse-mode !</pre>	<pre>! interface Vlan 4094  description CONNECTED TO WIRELESS MGMT - WLC  ip pim sparse-mode !</pre>
<b>Step-4</b> Enable IP PIM on Layer 3 uplink Interface of distribution layer switches connected Cisco Wireless Local Mode Access Point and Cisco WLC Management VLAN.	<pre>! interface range FortyGigabitEthernet 1/1/1 - 2  description CONNECTED TO IP CORE NETWORK  ip pim sparse-mode !</pre>	<pre>! interface range FortyGigabitEthernet 1/1/1 - 2  description CONNECTED TO IP CORE NETWORK  ip pim sparse-mode !</pre>

**Note** IP Multicast must be enabled in the Layer 3 core network to allow Cisco wireless APs in local mode to successfully join the WLC announced multicast group. For more information, refer to the Cisco online documentation to implement IP multicast networks.

## Configuration Example for Default Service List and Policy in Wide Area Bonjour Between Multilayer Wired and Wireless Endpoints

This section provides guidance on configuring Service-Peer, SDG Agent, and Cisco Catalyst Center, allowing the wired and wireless endpoints to dynamically discover default service list using Layer 2 unicast and policy.

### Example: Wired and Wireless Access Layer Service Peer Configuration

The following table provides a sample configuration of wired and wireless controller access layer service peer.

Table 162: Configuring Wired and Wireless Access Layer Service Peer

Configuration Step	Sample Configuration: SP-1 Service-Peer Configuration	Sample Configuration: SP-2 Service-Peer Configuration
<b>Step-1:</b> Enable mDNS gateway and set the gateway mode.  <b>Note</b> In wireless controller, service peer mode is enabled by default with mDNS gateway configuration.	<pre>! mdns-sd gateway mode service-peer !</pre>	<pre>! mdns-sd gateway mode service-peer !</pre>
<b>Step-2:</b> Activate unicast mDNS gateway and attach service policy on wired VLAN and wireless FlexConnect user VLAN of SP-1 and SP-2 Layer 2 access switch.	<pre>! vlan configuration 10, 30 mdns-sd gateway service-policy LOCAL-AREA-POLICY active-query timer 3600 !</pre>	<pre>! vlan configuration 20, 30 mdns-sd gateway service-policy LOCAL-AREA-POLICY active-query timer 3600 !</pre>
<b>Step-3:</b> Enable unicast service routing between wired and wireless service peer and SDG agent using wired management source VLAN ID and IP address.	<pre>vlan configuration 10, 30 mdns-sd gateway source-interface vlan 4094 sdg-agent 10.1.1.254 !</pre>	<pre>! vlan configuration 20, 30 mdns-sd gateway source-interface vlan 4094 sdg-agent 10.1.1.254 !</pre>

## Example: Wired and Wireless Distribution Layer SDG Agent Configuration

The following table provides a sample configuration of distribution layer SDG agent.

Table 163: Configuring Wired and Wireless Distribution Layer SDG Agent

Configuration Step	Sample Configuration: SDG-1 – SDG Agent
<b>Step-1:</b> Enable mDNS gateway and set the gateway mode. The default mode is sdg-agent.	<pre>! mdns-sd gateway !</pre>
<b>Step-2:</b> Activate unicast mDNS gateway on wired VLAN and wireless user VLAN on SDG agents.	<pre>! vlan configuration 10, 20, 30 mdns-sd gateway !</pre>
<b>Step-3:</b> Configure the service peer-group and attach service-policy on the SDG agent distribution switch and enable service-routing between the assigned Service Peer switch group.	<pre>! mdns-sd service-peer group peer-group 1 service-policy LOCAL-AREA-POLICY service-peer 10.1.1.1 location-group default  service-peer 10.1.1.2 location-group default !</pre>

Configuration Step	Sample Configuration: SDG-1 – SDG Agent
<b>Step-4:</b> Associate outbound service-list to a unique service-policy.	<pre>! mdns-sd service-policy WIDE-AREA-POLICY   service-list WIDE-AREA-SERVICES-OUT !</pre>
<b>Step-5:</b> Enable Wide Area Bonjour service-routing with service export configuration association controller IP Address, source interface for stateful connection, and mandatory egress policy for Wide Area service-routing.	<pre>! service-export mdns-sd controller DNAC-CONTROLLER-POLICY   controller-address 100.0.0.1   controller-source-interface LOOPBACK 0   controller-service-policy WIDE-AREA-POLICY !</pre>

## Configuration Example for Customized Service List and Policy in Wide Area Bonjour Between Multilayer Wired and Wireless Endpoints

This section provides guidance on configuring Service-Peer, SDG Agent and Cisco Catalyst Center, allowing the wired and wireless endpoints to dynamically discover printer using Layer 2 unicast and policy.

### Example: Wired and Wireless Access Layer Service Peer Configuration

The following table provides a sample configuration of wired and wireless controller access layer service peer.

**Table 164: Configuring Wired and Wireless Access Layer Service Peer**

Configuration Step	Sample Configuration: Switch Service Peer	Sample Configuration: Wireless Controller Service Peer
<b>Step-1:</b> Enable mDNS gateway and set the gateway mode.  <b>Note</b> In wireless controller, service peer mode is enabled by default with mDNS gateway configuration.	<pre>! mdns-sd gateway   mode service-peer !</pre>	<pre>! mdns-sd gateway !</pre>
<b>Step-2:</b> Create unique mDNS inbound policy to permit ingress AirPrint service announcement on the Catalyst Switch and wireless controller in service peer mode.	<pre>! mdns-sd service-list LOCAL-AREA-SERVICES-IN in   match printer-ipp !</pre>	<pre>! mdns-sd service-list LOCAL-AREA-SERVICES-IN in   match printer-ipp !</pre>

Configuration Step	Sample Configuration: Switch Service Peer	Sample Configuration: Wireless Controller Service Peer
<p><b>Step-3:</b> Create unique mDNS outbound policy to permit egress AirPrint service response on the Catalyst Switch and wireless controller in service peer mode</p>	<pre>! mdns-sd service-list LOCAL-AREA-SERVICES-OUT out match printer-ipp !</pre>	<pre>! mdns-sd service-list LOCAL-AREA-SERVICES-OUT out match printer-ipp !</pre>
<p><b>Step-4:</b> Associate inbound and outbound service list to a unique service policy.</p>	<pre>! mdns-sd service-policy LOCAL-AREA-POLICY service-list LOCAL-AREA-SERVICES-IN service-list LOCAL-AREA-SERVICES-OUT !</pre>	<pre>mdns-sd service-policy LOCAL-AREA-POLICY service-list LOCAL-AREA-SERVICES-IN service-list LOCAL-AREA-SERVICES-OUT !</pre>
<p><b>Step-5:</b> Activate unicast mDNS gateway and attach service policy on wired VLAN and WLAN.</p> <ul style="list-style-type: none"> <li>• <b>Switch:</b> Activate mDNS gateway per VLAN.</li> <li>• <b>Controller:</b> Activate mDNS gateway per WLAN policy profile and SSID</li> </ul>	<pre>! vlan configuration 10, 20 mdns-sd gateways service-policy LOCAL-AREA-POLICY active-query timer 3600 !</pre>	<pre>! wireless profile policy WLAN-PROFILE shutdown mdns-sd service-policy LOCAL-AREA-POLICY no shutdown ! wlan WLAN-PROFILE 1 blizzard shutdown mdns-sd-interface gateway no shutdown !</pre>
<p><b>Step-6:</b> (Optional) Enable service routing on wired service peer mDNS between local VLANs. Also, enable location-based wireless service on the controller.</p> <ul style="list-style-type: none"> <li>• <b>Switch:</b> Configure location filter group to discover and distribute between paired local VLAN.</li> <li>• <b>Controller:</b> Configure wireless location-based services.</li> </ul>	<pre>! mdns-sd location-filter LOCAL-PROXY match location-group default vlan 10 match location-group default vlan 20 ! mdns-sd service-list LOCAL-AREA-SERVICES-OUT OUT match printer-ipps location-filter LOCAL-PROXY !</pre>	<pre>! mdns-sd service-policy LOCAL-AREA-POLICY location ap-location !</pre>

Configuration Step	Sample Configuration: Switch Service Peer	Sample Configuration: Wireless Controller Service Peer
<p><b>Step-7:</b> Enable unicast service routing between wired and wireless service peer and SDG agent.</p> <ul style="list-style-type: none"> <li>• <b>Switch:</b> Configure SDG agent IP and wired management source VLAN ID and IP address.</li> <li>• <b>Controller:</b> Configure SDG Agent IP and wireless management source VLAN ID and IP address.</li> </ul>	<pre>vlan configuration 10, 20 mdns-sd gateways source-interface vlan 4094 sdg-agent 10.1.1.254 !</pre>	<pre>! mdns-sd gateway source-interface vlan 4094 sdg-agent 10.2.1.254 !</pre>

## Example: Wired and Wireless Distribution Layer SDG Agent Configuration

The following table provides a sample configuration of distribution layer SDG agent.

**Table 165: Configuring Distribution Layer SDG Agent**

Configuration Step	Sample Configuration: Wired SDG Agent	Sample Configuration: Wireless SDG Agent
Step-1: Enable mDNS gateway and set the gateway mode.	<pre>! mdns-sd gateway !</pre>	<pre>! mdns-sd gateway !</pre>
Step-2: Activate unicast mDNS gateway on wired VLAN and wireless user VLAN on respective SDG agents.	<pre>! vlan configuration 10, 20 mdns-sd gateway !</pre>	<pre>! vlan configuration 30 mdns-sd gateway !</pre>
Step-3: Create unique controller bound mDNS policy to permit egress AirPrint service discovery and distribution from Catalyst Switch in SDG agent mode. Inbound policy towards controller is not required.	<pre>! mdns-sd service-list WIDE-AREA-SERVICES-OUT out match printer-ipp !</pre>	<pre>! mdns-sd service-list WIDE-AREA-SERVICES-OUT out match printer-ipp !</pre>
Step-4: Associate outbound service-list to a unique service-policy.	<pre>! mdns-sd service-policy WIDE-AREA-POLICY service-list WIDE-AREA-SERVICES-OUT !</pre>	<pre>! mdns-sd service-policy WIDE-AREA-POLICY service-list WIDE-AREA-SERVICES-OUT !</pre>

Configuration Step	Sample Configuration: Wired SDG Agent	Sample Configuration: Wireless SDG Agent
Step-5: Enable Wide Area Bonjour service-routing with service export configuration association controller IP Address, source interface for stateful connection and mandatory egress policy for Wide Area service-routing.	<pre>! service-export mdns-sd controller DNAC-CONTROLLER-POLICY   controller-address 100.0.0.1   controller-source-interface   LOOPBACK 0   controller-service-policy   WIDE-AREA-POLICY !</pre>	<pre>! service-export mdns-sd controller DNAC-CONTROLLER-POLICY   controller-address 100.0.0.1   controller-source-interface   LOOPBACK 0   controller-service-policy   WIDE-AREA-POLICY !</pre>

# Cisco Catalyst Center Traditional Multilayer Wired and Wireless Configuration

## Configuring Service Filters for Traditional Multilayer Wired and Wireless - Local Mode (GUI)

This procedure implements global service filters, which permit the Cisco Wide Area Bonjour application to dynamically discover and distribute service information between trusted Cisco Catalyst SDG agent switches across the IP network.

### Procedure

- 
- Step 1** Navigate to the **Configuration** tab in the Wide Area Bonjour application.
  - Step 2** From the sidebar, select the subdomain for which you want to create the service filter.
  - Step 3** Check the **Service Filter** box.
  - Step 4** Click **Service Filter** icon from the topology to view a list of the service filters for the selected domain. You can also manually edit existing service filters from this list.
  - Step 5** Click **Create Service Filter**.
  - Step 6** From the **Network Mode** drop-down list, choose **Traditional** (the default mode).
  - Step 7** Enter a unique name for the service filter.
  - Step 8** (Optional) Enter a description for the service filter.
  - Step 9** Select one or more service types to permit announcements and queries.
  - Step 10** Enable or disable service filters after creating them. By default, service filters are enabled.
-

## Configuring Source SDG Agents in Traditional Multilayer Wired and Wireless - Local Mode (GUI)

This procedure configures discovery of wired printer sources from the LAN distribution switches paired with Layer 2 Catalyst Switches in a service peer role. The wireless distribution switches paired with a controller in a service peer role receive query responses for wired printers and distribute the responses to querying devices over the wireless local mode network.

### Procedure

---

- Step 1** Click **Add** in the upper-right portion of the Catalyst Center Policy screen.
  - Step 2** Select the **Query SDG agent** radio button. By default, the **Source** radio button is selected.
  - Step 3** From the **SDG Agent/IP** drop-down list, select an SDG agent (100.0.0.101) which announces the services, for example, Printer.
  - Step 4** Select **Peer** from the **Service Layer** drop-down list.
  - Step 5** Uncheck the box **Any**. By default, this is enabled.
  - Step 6** Select the query **VLAN** (Vlan-10) to distribute services (Printer) from a specific network.
  - Step 7** Enable or disable services from the selected query IPv4 subnet. By default, this is enabled.
  - Step 8** Enable or disable services from the selected query IPv6 subnet. By default, this is enabled.
  - Step 9** Enter the **service peer IPv4 address** (10.1.1.1).
  - Step 10** Click the + icon to add more service peers, if any. Select **Any** to accept services from any peer on a selected VLAN.
  - Step 11** (Optional) Click **Add Next** to add more source SDG agents. (Repeat the preceding steps.)
  - Step 12** Click **DONE**.
  - Step 13** Click **CREATE**.
- 

## Configuring Query SDG Agents in Traditional Multilayer Wired and Wireless - Local Mode (GUI)

This procedure configures distributed services to query SDG agents connected to a controller in service peer mode, based on a policy.

### Procedure

---

- Step 1** Click **Add** in the upper-right portion of the DNA-Center Policy screen.
- Step 2** Select the **Query SDG agent** radio button. By default, the **Source** radio button is selected.
- Step 3** From the **SDG Agent/IP** drop-down list, select an SDG agent (100.0.0.102) that receives queries for the services (Printer).
- Step 4** Select **Peer** from the **Service Layer** drop-down list.
- Step 5** Uncheck the box **Any**. By default, this is enabled.
- Step 6** Select the query **VLAN** (Vlan-30) to distribute services (Printer) to a specific network.

- Step 7** Enable or disable services from the selected query IPv4 subnet. By default, this is enabled.
- Step 8** Enable or disable services from the selected query IPv6 subnet. By default, this is enabled.
- Step 9** Enter the **service peer IPv4 address** (10.2.1.254).
- Step 10** Click the + icon to add more service-peers, if any. Select **Any** to accept services from any peer on a selected VLAN.
- Step 11** (Optional) Click **Add Next** to add more query agents. (Repeat the preceding steps.)
- Step 12** Click **DONE**.
- Step 13** Click **CREATE**.

## Verifying Wide Area Bonjour Between Multilayer Wired and Wireless Local Mode

This section provides step-by-step mDNS configuration and service discovery and distribution status based on applied policy on Wired Layer 2 access switch in service peer and SDG agent mode.

### Verifying Wired Service-Peer Configuration

Use the following commands on the Cisco Catalyst switch in service peer (SP-1) mode to determine the operational status after applying configuration and discovering the AirPrint service from the local network.

```
Device# show mdns-sd summary vlan 10

VLAN: 10
=====
mDNS Gateway: Enabled
mDNS Service Policy: LOCAL-AREA-POLICY
Active Query: Enabled
 : Periodicity 3600 Seconds
Transport Type: IPv4
Service Instance Suffix: Not Configured
mDNS Query Type: ALL
SDG Agent IP: 10.1.1.254
Source Interface: Vlan4094

Device# show mdns-sd service-policy name LOCAL-AREA-POLICY

Service Policy Name Service List IN Name Service List Out Name

## Verifying Cisco Catalyst Center Configuration and Service-Routing Status

The Cisco Wide Area Bonjour application supports comprehensive assurance capabilities to manage service-routing with network-wide distributed Cisco Catalyst switches in SDG-Agent role and mDNS services discovered over Wide Area Bonjour domain. The assurance capabilities in Cisco Wide Area Bonjour provides ability to determine service-routing state, mDNS service state and many more information at various levels for day-2 operations, analysis and troubleshooting. Each category serves unique function to manage and troubleshoot Wide Area Bonjour service-routing for day-2 operation.

This sub-section provides brief overview for each category of monitor function:

- **Dashboard:** The landing page of Cisco Wide Area Bonjour application provides key statistics in various formats to quickly determine service-routing health across the network. The network administrator can monitor operational status of service-routing with SDG Agent devices, historical chart of service discovery request, processing and drops from network-wide distributed devices and top five talkers across the network.
- **Sub-Domain 360°:** The network administrator can briefly collect statistics and status counts in 360° view. The left-panel monitoring, and configuration bar is automatically open upon clicking selected sub-domain to verify configured policies, discovered service-instances on per sub domain basis of the configuration section.
- **Monitor:** A comprehensive 3-tier monitoring and troubleshooting function of Cisco Wide Area Bonjour application for various day-2 operations. The detail view of SDG Agent, Service-Instance and advanced Troubleshooting capabilities allows network administrator to manage and troubleshoot Wide Area Bonjour domain with single of glass on Cisco Catalyst Center.

For more information, see [Cisco Wide Area Bonjour on Cisco Catalyst Center User Guide, Release 2.1.2](#) guide. The assurance capabilities and operation details are explained in Monitor the Cisco Wide Area Bonjour Application chapter to manage Cisco Wide Area Bonjour application with various supporting service-routing assurance function.

## Overview

This chapter provides configuration guidelines to implement Local Area Bonjour enabling end-to-end policy-based mDNS service discovery and distribution across multilayer wired and wireless FlexConnect local-switching mode. The first hop mDNS gateway at Layer 2 access switch must be implemented in service peer mode and paired with common distribution-layer switch in SDG agent role IP gateway function to wired and wireless clients. The network-wide distributed SDG agent can be paired alternatively with the Cisco Catalyst Center to enable mDNS service-routing across IP core network providing mDNS service assurance, monitoring and troubleshooting.

The following figure illustrates unicast mode Bonjour network environment with AirPrint capable printer and wireless user computer (macOS, Microsoft Windows, and so on.) connected to the same Ethernet switch. The network administrator implements the policy permitting additional endpoints associated to nearby location Ethernet switch to discover and use remote AirPrint capable Printer without flooding mDNS over wired and wireless networks.

## Configuration Example for Default Service List and Policy in FlexConnect Mode - Wireless and Wired

This section provides guidance on configuring Service-Peer, SDG Agent, and Cisco Catalyst Center, allowing the wired and wireless endpoints to dynamically discover the default service list using Layer 2 unicast and policy.

### Example: Wired and Wireless Access Layer Service Peer Configuration

The following table provides a sample configuration of wired and wireless controller access layer service peer.

Table 167: Configuring Wired and Wireless Access Layer Service Peer

Configuration Step	Sample Configuration: SP-1 Service-Peer Configuration	Sample Configuration: SP-2 Service-Peer Configuration
<b>Step-1:</b> Enable mDNS gateway and set the gateway mode.	! <pre>mdns-sd gateway mode service-peer !</pre>	! <pre>mdns-sd gateway mode service-peer !</pre>
<b>Step-2:</b> Create unique mDNS inbound policy to permit ingress AirPrint service announcement and query on the Catalyst Switch in service peer mode.	! <pre>mdns-sd service-list LOCAL-AREA-SERVICES-IN in match printer-ipp !</pre>	! <pre>mdns-sd service-list LOCAL-AREA-SERVICES-IN in match printer-ipp !</pre>
<b>Step-3:</b> Create unique mDNS outbound policy to permit egress AirPrint service response on the Catalyst Switch in service peer mode	! <pre>mdns-sd service-list LOCAL-AREA-SERVICES-OUT out match printer-ipp !</pre>	! <pre>mdns-sd service-list LOCAL-AREA-SERVICES-OUT out match printer-ipp !</pre>
<b>Step-4:</b> Associate inbound and outbound service list to a unique service policy.	! <pre>mdns-sd service-policy LOCAL-AREA-POLICY service-list LOCAL-AREA-SERVICES-IN service-list LOCAL-AREA-SERVICES-OUT !</pre>	! <pre>mdns-sd service-policy LOCAL-AREA-POLICY service-list LOCAL-AREA-SERVICES-IN service-list LOCAL-AREA-SERVICES-OUT !</pre>
<b>Step-5:</b> Activate unicast mDNS gateway and attach service policy on wired VLAN and wireless FlexConnect user VLAN of SP-1 and SP-2 Layer 2 access switch.	! <pre>vlan configuration 10, 30 mdns-sd gateway service-policy LOCAL-AREA-POLICY active-query timer 3600 !</pre>	! <pre>vlan configuration 20, 30 mdns-sd gateway service-policy LOCAL-AREA-POLICY active-query timer 3600 !</pre>
<b>Step-6:</b> Enable service routing on wired service peer mDNS between mDNS source and receiver local VLANs.  <b>Note</b> This step is optional for SP-2 switch as it does not have local mDNS service provider endpoints or VLANs.	! <pre>mdns-sd location-filter LOCAL-PROXY match location-group default vlan 10 match location-group default vlan 30 ! mdns-sd service-list LOCAL-AREA-SERVICES-OUT OUT match printer-ipps location-filter LOCAL-PROXY !</pre>	
<b>Step-7:</b> Enable unicast service routing between wired and wireless service peer and SDG agent using wired management source VLAN ID and IP address.	! <pre>vlan configuration 10, 30 mdns-sd gateway source-interface vlan 4094 sdg-agent 10.1.1.254 !</pre>	! <pre>vlan configuration 20, 30 mdns-sd gateway source-interface vlan 4094 sdg-agent 10.1.1.254 !</pre>

## Example: Wired and Wireless Distribution Layer SDG Agent Configuration

The following table provides a sample configuration of distribution layer SDG agent.

**Table 168: Configuring Wired and Wireless Distribution Layer SDG Agent**

Configuration Step	Sample Configuration: SDG-1 – SDG Agent
<b>Step-1:</b> Enable mDNS gateway and set the gateway mode. The default mode is sdg-agent.	<pre>! mdns-sd gateway !</pre>
<b>Step-2:</b> Create a unique mDNS inbound policy to permit ingress AirPrint service announcement and query the Catalyst Switch in Service-Peer mode.	<pre>! mdns-sd service-list LOCAL-AREA-SERVICES-IN in   match printer-ipp !</pre>
<b>Step-3:</b> Create a unique mDNS outbound policy to permit egress AirPrint service response on Catalyst Switch in Service-Peer mode.	<pre>! mdns-sd service-list LOCAL-AREA-SERVICES-OUT out   match printer-ipp !</pre>
<b>Step-4:</b> Associate the inbound and outbound service-list to a unique service-policy.	<pre>! mdns-sd service-policy LOCAL-AREA-POLICY service-list LOCAL-AREA-SERVICES-IN service-list LOCAL-AREA-SERVICES-OUT !</pre>
<b>Step-5:</b> Activate unicast mDNS gateway on wired VLAN and wireless user VLAN on SDG agents.	<pre>! vlan configuration 10, 20, 30 mdns-sd gateway !</pre>
<b>Step-6:</b> Configure the service peer-group and attach service-policy on the SDG agent distribution switch and enable service-routing between the assigned Service Peer switch group.	<pre>! mdns-sd service-peer group peer-group 1   service-policy LOCAL-AREA-POLICY   service-peer 10.1.1.1 location-group default    service-peer 10.1.1.2 location-group default !</pre>
<b>Step-7:</b> Create a unique controller bound mDNS policy to permit egress AirPrint service discovery and distribution from Catalyst Switch in SDG agent mode. Inbound policy towards controller is not required.	<pre>! mdns-sd service-list WIDE-AREA-SERVICES-OUT out   match printer-ipp !</pre>
<b>Step-8:</b> Associate outbound service-list to a unique service-policy.	<pre>! mdns-sd service-policy WIDE-AREA-POLICY service-list WIDE-AREA-SERVICES-OUT !</pre>

Configuration Step	Sample Configuration: SDG-1 – SDG Agent
<b>Step-9:</b> Enable Wide Area Bonjour service-routing with service export configuration association controller IP Address, source interface for stateful connection, and mandatory egress policy for Wide Area service-routing.	<pre>! service-export mdns-sd controller DNAC-CONTROLLER-POLICY controller-address 100.0.0.1 controller-source-interface LOOPBACK 0 controller-service-policy WIDE-AREA-POLICY !</pre>

## Configuration Example for Customized Service List and Policy in FlexConnect Mode - Wireless and Wired

This section provides guidance on configuring Service-Peer, SDG Agent, and Cisco Catalyst Center, allowing the wired and wireless endpoints to dynamically discover printer using Layer 2 unicast and policy.

### Example: Wired and Wireless Access Layer Service Peer Configuration

The following table provides a sample configuration of wired and wireless controller access layer service peer.

**Table 169: Configuring Wired and Wireless Access Layer Service Peer**

Configuration Step	Sample Configuration: SP-1 Service-Peer Configuration	Sample Configuration: SP-2 Service-Peer Configuration
<b>Step-1:</b> Enable mDNS gateway and set the gateway mode.	<pre>! mdns-sd gateway mode service-peer !</pre>	<pre>! mdns-sd gateway mode service-peer !</pre>
<b>Step-2:</b> Create unique mDNS inbound policy to permit ingress AirPrint service announcement and query on the Catalyst Switch in service peer mode.	<pre>! mdns-sd service-list LOCAL-AREA-SERVICES-IN in match printer-ipp !</pre>	<pre>! mdns-sd service-list LOCAL-AREA-SERVICES-IN in match printer-ipp !</pre>
<b>Step-3:</b> Create unique mDNS outbound policy to permit egress AirPrint service response on the Catalyst Switch in service peer mode	<pre>! mdns-sd service-list LOCAL-AREA-SERVICES-OUT out match printer-ipp !</pre>	<pre>! mdns-sd service-list LOCAL-AREA-SERVICES-OUT out match printer-ipp !</pre>
<b>Step-4:</b> Associate inbound and outbound service list to a unique service policy.	<pre>! mdns-sd service-policy LOCAL-AREA-POLICY service-list LOCAL-AREA-SERVICES-IN service-list LOCAL-AREA-SERVICES-OUT !</pre>	<pre>mdns-sd service-policy LOCAL-AREA-POLICY service-list LOCAL-AREA-SERVICES-IN service-list LOCAL-AREA-SERVICES-OUT !</pre>

Configuration Step	Sample Configuration: SP-1 Service-Peer Configuration	Sample Configuration: SP-2 Service-Peer Configuration
<b>Step-5:</b> Activate unicast mDNS gateway and attach service policy on wired VLAN and wireless FlexConnect user VLAN of SP-1 and SP-2 Layer 2 access switch.	<pre>! vlan configuration 10, 30 mdns-sd gateway   service-policy     LOCAL-AREA-POLICY   active-query timer 3600 !</pre>	<pre>! vlan configuration 20, 30 mdns-sd gateway   service-policy     LOCAL-AREA-POLICY   active-query timer 3600 !</pre>
<b>Step-6:</b> Enable service routing on wired service peer mDNS between mDNS source and receiver local VLANs.  <b>Note</b> This step is optional for SP-2 switch as it does not have local mDNS service provider endpoints or VLANs.	<pre>! mdns-sd location-filter LOCAL-PROXY   match location-group default   vlan 10   match location-group default   vlan 30 ! mdns-sd service-list LOCAL-AREA-SERVICES-OUT OUT   match printer-ipps location-filter LOCAL-PROXY !</pre>	
<b>Step-7:</b> Enable unicast service routing between wired and wireless service peer and SDG agent using wired management source VLAN ID and IP address.	<pre>vlan configuration 10, 30 mdns-sd gateway   source-interface vlan 4094   sdg-agent 10.1.1.254 !</pre>	<pre>! vlan configuration 20, 30 mdns-sd gateway   source-interface vlan 4094   sdg-agent 10.1.1.254 !</pre>

## Example: Wired and Wireless Distribution Layer SDG Agent Configuration

The following table provides a sample configuration of distribution layer SDG agent.

**Table 170: Configuring Wired and Wireless Distribution Layer SDG Agent**

Configuration Step	Sample Configuration: SDG-1 – SDG Agent
<b>Step-1:</b> Enable mDNS gateway and set the gateway mode. The default mode is sdg-agent.	<pre>! mdns-sd gateway !</pre>
<b>Step-2:</b> Create a unique mDNS inbound policy to permit ingress AirPrint service announcement and query the Catalyst Switch in Service-Peer mode.	<pre>! mdns-sd service-list LOCAL-AREA-SERVICES-IN in   match printer-ipp !</pre>
<b>Step-3:</b> Create a unique mDNS outbound policy to permit egress AirPrint service response on Catalyst Switch in Service-Peer mode.	<pre>! mdns-sd service-list LOCAL-AREA-SERVICES-OUT out   match printer-ipp !</pre>

Configuration Step	Sample Configuration: SDG-1 – SDG Agent
<b>Step-4:</b> Associate the inbound and outbound service-list to a unique service-policy.	<pre>! mdns-sd service-policy LOCAL-AREA-POLICY service-list LOCAL-AREA-SERVICES-IN service-list LOCAL-AREA-SERVICES-OUT !</pre>
<b>Step-5:</b> Activate unicast mDNS gateway on wired VLAN and wireless user VLAN on SDG agents.	<pre>! vlan configuration 10, 20, 30 mdns-sd gateway !</pre>
<b>Step-6:</b> Configure the service peer-group and attach service-policy on the SDG agent distribution switch and enable service-routing between the assigned Service Peer switch group.	<pre>! mdns-sd service-peer group peer-group 1 service-policy LOCAL-AREA-POLICY service-peer 10.1.1.1 location-group default  service-peer 10.1.1.2 location-group default !</pre>
<b>Step-7:</b> Create a unique controller bound mDNS policy to permit egress AirPrint service discovery and distribution from Catalyst Switch in SDG agent mode. Inbound policy towards controller is not required.	<pre>! mdns-sd service-list WIDE-AREA-SERVICES-OUT out match printer-ipp !</pre>
<b>Step-8:</b> Associate outbound service-list to a unique service-policy.	<pre>! mdns-sd service-policy WIDE-AREA-POLICY service-list WIDE-AREA-SERVICES-OUT !</pre>
<b>Step-9:</b> Enable Wide Area Bonjour service-routing with service export configuration association controller IP Address, source interface for stateful connection, and mandatory egress policy for Wide Area service-routing.	<pre>! service-export mdns-sd controller DNAC-CONTROLLER-POLICY controller-address 100.0.0.1 controller-source-interface LOOPBACK 0 controller-service-policy WIDE-AREA-POLICY !</pre>

## Cisco Catalyst Center Traditional Multilayer Wired and Wireless Configuration

### Configuring Service Filters for Traditional Multilayer Wired and Wireless FlexConnect Local-Switching Mode (GUI)

This procedure implements global service filters, which permit the Cisco Wide Area Bonjour application to dynamically discover and distribute service information between trusted Cisco Catalyst SDG agent switches across the IP network.

#### Procedure

- Step 1** Navigate to the **Configuration** tab in the Wide Area Bonjour application.

- Step 2** From the sidebar, select the sub-domain for which you want to create the service filter.
  - Step 3** Check the **Service Filter** box.
  - Step 4** Click **Service Filter** icon from the topology to view a list of the service filters for the selected domain. You can also manually edit existing service filters from this list.
  - Step 5** Click **Create Service Filter**.
  - Step 6** From the **Network Mode** drop-down list, choose **Traditional** (the default mode).
  - Step 7** Enter a unique name for the service filter.
  - Step 8** (Optional) Enter a description for the service filter.
  - Step 9** Select one or more service types to permit announcements and queries.
  - Step 10** Enable or disable service filters after creating them. By default, service filters are enabled.
- 

## Configuring Source SDG Agents in Traditional Multilayer Wired and Wireless FlexConnect Local-Switching Mode (GUI)

This procedure configures discovery of wired printer sources from the LAN distribution switches paired with Layer 2 Catalyst Switches in a service peer role. The wireless distribution switches paired with a controller in a service peer role receive query responses for wired printers and distribute the responses to querying devices over the wireless FlexConnect local switching mode network.

### Procedure

---

- Step 1** Click **Add** on the upper-right of Cisco Catalyst Center.
  - Step 2** Click the **Source** radio button to select a source SDG agent. By default, this radio button is selected.
  - Step 3** From the **SDG Agent/IP** drop-down list, select an SDG agent (100.0.0.101) which announces the services, for example, Printer.
  - Step 4** Select **Peer** from the **Service Layer** drop-down list.
  - Step 5** Uncheck the box **Any**. By default, this is unchecked.
  - Step 6** Select the query **VLAN** (Vlan-10) to distribute services (Printer) from a specific network.
  - Step 7** Enable or disable services from the selected query IPv4 subnet. By default, this is enabled.
  - Step 8** Enable or disable services from the selected query IPv6 subnet. By default, this is enabled.
  - Step 9** Enter the **service peer IPv4 address** (10.1.1.1).
 

**Note** Select **Any** to accept services from any peer on a selected VLAN.
  - Step 10** (Optional) Click **Add Next** to add more source SDG agents. (Repeat the preceding steps.)
  - Step 11** Click **DONE**.
  - Step 12** Click **CREATE**.
-

## Configuring Query SDG Agents in Traditional Multilayer Wired and Wireless FlexConnect Local-Switching Mode (GUI)

This procedure configures distributed services to query SDG agents connected to a controller in service peer mode, based on a policy.

If the network environment is different, see the [Cisco Wide Area Bonjour on Cisco Catalyst Center User Guide, Release 2.1.2](#).

### Procedure

- 
- Step 1** Click **Add** on the upper-right of Cisco Catalyst Center.
  - Step 2** Select the **Query SDG agent** radio button. By default, the **Source** radio button is selected.
  - Step 3** From the **SDG Agent/IP** drop-down list, select an SDG agent (100.0.0.102) that receives queries for the services (Printer).
  - Step 4** Select **Peer** from the **Service Layer** drop-down list.
  - Step 5** Uncheck the box **Any**. By default, this is enabled.
  - Step 6** Select the query **VLAN** (Vlan-30) to distribute services (Printer) to a specific network.
  - Step 7** Enable or disable services from the selected query IPv4 subnet. By default, this is enabled.
  - Step 8** Enable or disable services from the selected query IPv6 subnet. By default, this is enabled.
  - Step 9** Enter the **service peer IPv4 address** (10.2.1.254).
  - Step 10** Click the + icon to add more service-peers, if any. Select **Any** to accept services from any peer on a selected VLAN.
  - Step 11** (Optional) Click **Add Next** to add more query agents. (Repeat the preceding steps.)
  - Step 12** Click **DONE**.
  - Step 13** Click **CREATE**.
- 

## Verifying Configuration Example for FlexConnect Mode - Wireless and Wired

This section provides step-by-step mDNS configuration and service discovery and distribution status based on applied policy on Wired Layer 2 access switch in service peer and SDG agent mode.

### Verifying Wired Service-Peer Configuration

Use the following commands on the Cisco Catalyst switch in service peer (SP-1 and SP-2) mode to determine the operational status after applying configuration and discovering the AirPrint service from the local network.

```
Device# show mdns-sd summary vlan 10

VLAN: 10
=====
mDNS Gateway: Enabled
mDNS Service Policy: LOCAL-AREA-POLICY
```

## Verifying Wired Service-Peer Configuration

```

Active Query: Enabled
 : Periodicity 3600 Seconds
Transport Type: IPv4
Service Instance Suffix: Not Configured
mDNS Query Type: ALL
SDG Agent IP: 10.1.1.254
Source Interface: Vlan4094

```

```
Device# show mdns-sd service-policy name LOCAL-AREA-POLICY
```

```

Service Policy Name Service List IN Name Service List Out Name
=====

```

## Verifying Cisco Catalyst Center Configuration and Service Routing Status

The Cisco Wide Area Bonjour application supports comprehensive assurance capabilities to manage service routing with network-wide distributed Cisco Catalyst switches in SDG Agent role and mDNS services discovered over Wide Area Bonjour domain. The assurance capabilities in Cisco Wide Area Bonjour provides the ability to determine service routing state, mDNS service state, and many more information at various levels for day-2 operations, analysis and troubleshooting. Each category serves unique function to manage and troubleshoot Wide Area Bonjour service routing for day-2 operation.

This sub-section provides brief overview for each category of monitor function:

- **Dashboard:** The landing page of Cisco Wide Area Bonjour application provides key statistics in various formats to quickly determine service routing health across the network. The network administrator can monitor operational status of service routing with SDG Agent devices, historical chart of service discovery request, processing and drops from network-wide distributed devices and top five talkers across the network.
- **Sub-Domain 360°:** The network administrator can briefly collect statistics and status counts in 360° view. The left-panel monitoring, and configuration bar is automatically open upon clicking selected sub-domain to verify configured policies, discovered service-instances on per sub-domain basis of the configuration section.
- **Monitor:** A comprehensive 3-tier monitoring and troubleshooting function of Cisco Wide Area Bonjour application for various day-2 operations. The detail view of SDG Agent, Service-Instance, and advanced Troubleshooting capabilities allows network administrator to manage and troubleshoot Wide Area Bonjour domain with a single pane of glass on Cisco Catalyst Center.

For more information, see [Cisco Wide Area Bonjour on Cisco Catalyst Center User Guide, Release 2.1.2](#) guide. The assurance capabilities and operation details are explained in **Monitor the Cisco Wide Area Bonjour Application** chapter to manage Cisco Wide Area Bonjour application with various supporting service routing assurance function.

# Introduction to mDNS Gateway

Multicast Domain Name System (mDNS) is an Apple service discovery protocol which locates devices and services on a local network with the use of mDNS service records.

The Bonjour protocol operates on service announcements and queries. Each query or advertisement is sent to the Bonjour multicast address ipv4 224.0.0.251 (ipv6 FF02::FB). This protocol uses mDNS on UDP port 5353.

The address used by the Bonjour protocol is link-local multicast address and therefore is only forwarded to the local L2 network. As, multicast DNS is limited to an L2 domain for a client to discover a service it has to be part of the same L2 domain, This is not always possible in any large scale deployment or enterprise.

In order to address this issue, the Cisco Catalyst 9800 Series Wireless Controller acts as a Bonjour Gateway. The controller then listens for Bonjour services, caches these Bonjour advertisements (AirPlay, AirPrint, and so on) from the source or host. For example, Apple TV responds back to Bonjour clients when asked or requested for a service. This way you can have sources and clients in different subnets.

By default, the mDNS gateway is disabled on the controller. To enable mDNS gateway functionality, you must explicitly configure mDNS gateway using CLI or Web UI.

The source IP address of all outgoing mDNS packets use the mDNS source interface VLAN SVI IP address. By default, wireless management interface will be the source interface.

## Guidelines and Restrictions for Configuring mDNS AP

- Cisco recommends deploying scalable Wide Area Bonjour to route mDNS service between Wired and Wireless networks. Cisco Catalyst 9800 Series Wireless LAN Controller (WLC) introduces a new mDNS gateway called Service-Peer mode to replace the classic mDNS flood-n-learn to support Enterprise-grade scalable, stateful, and reliable complete unicast-based mDNS service-routing with upstream gateway Cisco Catalyst 9000 Series Switches. For more information, see [Cisco DNA Service for Bonjour](#).
- The mDNS AP (classic flood-n-learn based feature) is enhanced with complete unicast-based service-routing using Cisco Wide Area Bonjour supporting flood-free Wired and Wireless networks to overcome several operational, scalable, and service resiliency challenges.
- The mDNS AP extends the mDNS flood from Wired VLANs to AP and further extends over the CAPWAP tunnel to WLC for central processing across Core network. Cisco recommends that the mDNS AP must be considered only for small network environments.
- The mDNS AP is supported only in Local and Monitor modes. If Cisco Wireless AP is in FlexConnect mode, the Fabric mode AP does not support mDNS AP feature. For more information on how to enable the mDNS service-routing for various distributed Wireless modes, see [Cisco DNA Service for Bonjour](#).
- Wireless users connected to mDNS AP may not be able to browse the Wired mDNS services across flooded Wired VLAN to mDNS AP.
- The Wired mDNS service-provider VLANs must be extended to flood the mDNS traffic up to mDNS AP ethernet port in trunk mode settings. The Wired VLAN extension to mDNS AP may include other Wired flood traffic, such as Broadcast, Unknown Unicast, and Layer 2 Multicast that impacts the mDNS AP scale and performance.

- It is recommended to have minimum one mDNS AP for each Layer 3 Access switch. All Wired mDNS traffic is flooded using alternate L2 methods, if single mDNS AP is shared between multiple Layer 3 Access switch.
- The maximum mDNS AP scale limit for each Cisco Catalyst 9800 Series Wireless LAN Controller (WLC) is limited.
- The maximum mDNS Wired VLAN count for each WLC is limited.
- The old Wired mDNS service entry continues to be advertised to all Wireless users up to 4500 seconds based on the mDNS cache timers on WLC. The stale entries require manual clearing from local cache in WLC.
- The mDNS AP does not support mDNS Query packet suppression or rate-limiter in AP. The Wired mDNS flood from all Wired VLAN is extended to WLC for central processing of policy enforcement.
- The maximum number of flooded packets for each second processing from Wired VLANs to mDNS AP is limited. The mDNS AP performance and reliability may get compromised in large network environments.
- A maximum of 10 Wired VLANs' mDNS flood can be extended to mDNS AP. Combined large Wired VLAN and mDNS AP scale may impact scale and performance in AP and WLC.
- Only one mDNS AP is supported for each Wired VLAN. Multiple mDNS APs cannot be configured to map the same Wired VLAN ID as it causes service instability and duplicate processing.
- High Availability is not supported in multiple mDNS AP. The mDNS services across Wired and Wireless network gets disrupted when connectivity to mDNS AP is lost due to any kinds of failures.
- Only one Wired mDNS service-policy is supported for all network-wide mDNS AP.
- The following limitations hold true when mDNS AP introduces LSS-based mDNS service filtering between flooded Wired VLANs to Wireless:
  - A single mDNS AP with LSS enabled can distribute Wired mDNS services only to nearby limited APs in neighbor list. The Wireless users connected to the non-neighbor list may not be able to discover any Wired mDNS services.
  - Only one mDNS AP can be deployed in each Wired VLAN. The Wired VLANs need to be reconfigured across LAN network to enable unique LSS-based mDNS AP in locations. For instance, to achieve mDNS service discovery in each floor, the Wired VLAN or Subnet must be on each floor with one mDNS AP per floor to discover all other APs as neighbor in the same floor.
- The mDNS AP do not support IPv6 for Wired mDNS service-provider or service-receiver. Only IPv4 is supported.
- The mDNS AP do not support role-based mDNS service filtering between Wired and Wireless networks.
- The mDNS AP do not detect and auto-resolve duplicate mDNS service-instance names across Wired VLANs. The Cisco Catalyst 9800 Series Wireless LAN Controller (WLC) discovers and records the first service instance with unique name in its local cache database. If a duplicate service instance name is discovered, the WLC rejects the duplicate name and does not distribute it to the Wireless clients.
- Wireless multicast link-local is enabled by default. When wireless link-local is enabled, only mDNS Bridging mode is supported. If you require mDNS Gateway for wired services, disable wireless link-local.

- In the mDNS gateway mode, controller does not support service discovery from the mDNS messages using multiple IP fragments.
- If you have a FlexConnect AP as an mDNS gateway, ensure that you do not use "." in the service provider name, as it is not supported.

## Enabling mDNS Gateway (GUI)

### Procedure

---

- Step 1** Choose **Configuration > Services > mDNS**.
- Step 2** In the **Global** section, toggle the slider to enable or disable the **mDNS Gateway**.
- Step 3** From the **Transport** drop-down list, choose one of the following types:
- **ipv4**
  - **ipv6**
  - **both**
- Step 4** Enter an appropriate timer value in **Active-Query Timer**. The valid range is between 1 to 120 minutes. The default is 30 minutes.
- Step 5** From the **mDNS-AP Service Policy** drop-down list, choose an mDNS service policy.
- Note** Service policy is optional only if mDNS-AP is configured. If mDNS-AP is not configured, the system uses default-service-policy.
- Step 6** Click **Apply**.
- 

## Enabling or Disabling mDNS Gateway (GUI)

### Procedure

---

- Step 1** Choose **Configuration > Services > mDNS > Global**.
- Step 2** Enable or disable the **mDNS Gateway** toggle button.
- Step 3** Choose **ipv4** or **ipv6** or **both** from the **Transport** drop-down list.
- Step 4** Enter the **Active-Query Timer**.
- Step 5** Click **Apply**.
-

# Enabling or Disabling mDNS Gateway (CLI)

- Note**
- mDNS gateway is disabled by default globally on the controller.
  - You need both global and WLAN configurations to enable mDNS gateway.

## Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Device> enable	Enables privileged EXEC mode. Enter your password, if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 3</b>	<b>mdns-sd gateway</b> <b>Example:</b> Device(config)# mdns-sd gateway	Enables mDNS gateway.
<b>Step 4</b>	<b>location {ap-location   ap-name   location-group   lss   regex   site-tag   ssid}</b> <b>Example:</b> Device(config-mdns-sd)# location site-tag	Filters mDNS gateway based on location. Here, <ul style="list-style-type: none"> <li>• <b>ap-location</b> signifies location-based filtering using AP location.</li> <li>• <b>ap-name</b> signifies location-based filtering using AP name.</li> <li>• <b>location-group</b> signifies location-based filtering using location group.</li> <li>• <b>lss</b> signifies location-based filtering using Location Specific Services (LSS).</li> <li>• <b>regex</b> signifies location-based filtering using Regular Expression.</li> <li>• <b>site-tag</b> signifies location-based filtering using site tag.</li> <li>• <b>ssid</b> signifies location-based filtering using SSID.</li> </ul> <p><b>Note</b> The <b>lss</b> is the default location filter, if mDNS gateway is configured globally.</p>

	Command or Action	Purpose
<b>Step 5</b>	<b>transport {ipv4   ipv6   both}</b> <b>Example:</b> <pre>Device(config-mdns-sd)# transport ipv4</pre>	Processes mDNS message on a specific transport. Here, <b>ipv4</b> signifies that the IPv4 mDNS message processing is enabled. This is the default value. <b>ipv6</b> signifies that the IPv6 mDNS message processing is enabled. <b>both</b> signifies that the IPv4 and IPv6 mDNS message is enabled for each network.
<b>Step 6</b>	<b>active-query timer <i>active-query-periodicity</i></b> <b>Example:</b> <pre>Device(config-mdns-sd)# active-query timer 15</pre>	Changes the periodicity of mDNS multicast active query. <b>Note</b> An active query is a periodic mDNS query to refresh dynamic cache. Here, <i>active-query-periodicity</i> refers to the active query periodicity in Minutes. The valid range is from 1 to 120 minutes. Active query runs with a default periodicity of 30 minutes.
<b>Step 7</b>	<b>source-interface vlan <i>vlan-id</i></b> <b>Example:</b> <pre>Device(config-mdns-sd)# source-interface vlan 101</pre>	Configures the source interface to communicate between SDG agent and service peer. By default, wireless management interface is used. The interface that you configure will be used for all mDNS transactions.
<b>Step 8</b>	<b>exit</b> <b>Example:</b> <pre>Device(config-mdns-sd)# exit</pre>	Returns to global configuration mode.

## Creating Default Service Policy

When the mdns gateway is enabled on any of the WLANs by default, mdns-default-service-policy is associated with it. Default service policy consists of default-service-list and their details are explained in this section. You can override the default service policy with a custom service policy.

### Procedure

- 
- Step 1** Create a service-definition if the service is not listed in the preconfigured services.
  - Step 2** Create a service list for IN and OUT by using the service-definitions.
  - Step 3** Use the existing service list to create a new service. For more information, refer to *Creating Service Policy* section.

- Step 4** Attach the mdns-service-policy to the profile or VLAN that needs to be enforced.
- Step 5** To check the default-mdns-service list, use the following command:  
**show mdns-sd default-service-list**

## Creating Custom Service Definition (GUI)

### Procedure

- Step 1** Choose **Configuration > Services > mDNS**.
- Step 2** In the **Service Definition** section, click **Add**.
- Step 3** In the **Quick Setup: Service Definition** page that is displayed, enter a name and description for the service definition.
- Step 4** Enter a service type and click + to add the service type.
- Step 5** Click **Apply to Device**.

## Creating Custom Service Definition

Service definition is a construct that provides an admin friendly name to one or more mDNS service types or A pointer (PTR) Resource Record Name.

By default, few built-in service definitions are already predefined and available for admin to use.

In addition to built-in service definitions, admin can also define custom service definitions.

You can execute the following command to view the list of all the service definitions (built-in and custom):

```
Device# show mdns-sd master-service-list
```

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b>  <b>Example:</b> Device> enable	Enables privileged EXEC mode.  Enter your password, if prompted.
<b>Step 2</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 3</b>	<b>mdns-sd service-definition</b> <i>service-definition-name</i>	Configures mDNS service definition.

	Command or Action	Purpose
	<b>Example:</b> <pre>Device(config)# mdns-sd service-definition CUSTOM1</pre>	<b>Note</b> <ul style="list-style-type: none"> <li>• All the created custom service definitions are added to the primary service list.</li> <li>• Primary service list comprises of a list of custom and built-in service definitions.</li> </ul>
<b>Step 4</b>	<b>service-type</b> <i>string</i>  <b>Example:</b> <pre>Device(config-mdns-ser-def)# service-type _custom1._tcp.local</pre>	Configures mDNS service type.
<b>Step 5</b>	<b>exit</b>  <b>Example:</b> <pre>Device(config-mdns-ser-def)# exit</pre>	Returns to global configuration mode.

## Creating Service List (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Services > mDNS**.
- Step 2** In the **Service List** section, click **Add**.
- Step 3** In the **Quick Setup: Service List** page that is displayed, enter a name for the service list.
- Step 4** From the **Direction** drop-down list, choose **IN** for inbound filtering or **OUT** for outbound filtering.
- Step 5** From the **Available Services** drop-down list, choose a service type to match the service list.
- Note** To allow all services, choose the **all** option.
- Step 6** Click **Add Services**.
- Step 7** From the **Message Type** drop-down list, choose the message type to match from the following options:
- **any**—To allow all messages.
  - **announcement**—To allow only service advertisements or announcements for the device.
  - **query**—To allow only a query from the client for a service in the network.
- Step 8** Click **Save** to add services.
- Step 9** Click **Apply to Device**.
-

# Creating Service List

mDNS service list is a collection of service definitions.

## Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Device> enable	Enables privileged EXEC mode. Enter your password, if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 3</b>	<b>mdns-sd service-list</b> <i>service-list-name</i> { <b>IN</b>   <b>OUT</b> } <b>Example:</b> Device(config)# mdns-sd service-list Basic-In IN Device(config)# mdns-sd service-list Basic-Out OUT	Configures mDNS service list. <ul style="list-style-type: none"> <li>• <b>IN</b>: Provides inbound filtering.</li> <li>• <b>Out</b>: Provides outbound filtering.</li> </ul>
<b>Step 4</b>	<b>match</b> <i>service-definition-name</i> <b>message-type</b> { <b>announcement</b>   <b>any</b>   <b>query</b> } <b>Example:</b> Device(config-mdns-sl-in)# match CUSTOM1 message-type query	Matches the service to the message type. Here, <i>service-definition-name</i> refers to the names of services, such as, airplay, airserver, airtunes, and so on. <b>Note</b> To add a service, the service name must be part of the primary service list. If the mDNS service list is set to IN, you get to view the following command: <b>match service-definition-name message-type {announcement   any   query}</b> . If the mDNS service list is set to Out, you get to view the following command: <b>match service-definition-name</b> . (OR)
<b>Step 5</b>	<b>match all message-type</b> { <b>announcement</b>   <b>any</b>   <b>query</b> }	Matches all services to the message type.

	Command or Action	Purpose
	<b>Example:</b> <pre>Device(config-mdns-sl-in)# match all message-type query</pre>	<b>Note</b> To add a service, the service name must be part of the primary service list.  If the mDNS service list is set to IN, you get to view the following command: <b>match all message-type {announcement   any   query}</b> .  If the mDNS service list is set to OUT, you get to view the following command: <b>match all</b> .  In case of IN or OUT filter, if any of the service contains the same or subset of the message type (query or announcement), the <b>match all</b> is not allowed unless the existing services are removed.
<b>Step 6</b>	<b>show mdns-sd service-list {direction   name }</b>	Displays inbound or outbound direction list of the configured service-list to classify matching service-types for service-policy. The list can be filtered by name or specific direction.
<b>Step 7</b>	<b>exit</b>  <b>Example:</b> <pre>Device(config-mdns-sl-in)# exit</pre>	Returns to global configuration mode.

## Creating Service Policy (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Services > mDNS**.
  - Step 2** In the **Service Policy** section, click **Add**.
  - Step 3** In the **Quick Setup: Service Policy** page that is displayed, enter a name for the service policy.
  - Step 4** From the **Service List Input** drop-down list, choose one of the types.
  - Step 5** From the **Service List Output** drop-down list, choose one of the types.
  - Step 6** From the **Location** drop-down list, choose the location you want to associate with the service list.
  - Step 7** Click **Apply to Device**.
- 

## Creating Service Policy

mDNS service policy is used for service filtering while learning services or responding to queries.

## Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Device> enable	Enables privileged <b>EXEC</b> mode. Enter your password, if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 3</b>	<b>mdns-sd service-policy <i>service-policy-name</i></b> <b>Example:</b> Device(config)# mdns-sd service-policy mdns-policy1	Enables mDNS service policy.
<b>Step 4</b>	<b>location {ap-location   ap-name   location-group   lss   regex   site-tag   ssid}</b> <b>Example:</b> Device(config-mdns-ser-pol)# location lss	Filters mDNS service types based on location filter. <b>Note</b> <ul style="list-style-type: none"> <li>• If location filter is not applied during service policy, the global location filter (default=<b>lss</b>) will be considered.</li> <li>• The location filter from the service policy takes precedence even if the global location filter is configured.</li> <li>• In Location Specific Services (LSS) based filtering, the mDNS gateway responds with the service instances learnt from the neighboring APs of the querying client AP. Other service instances for the rest of APs are filtered.</li> <li>• In Site tag based filtering, the mDNS gateway responds with the service instances that belong to the same site-tag as that of querying client.</li> <li>• The mDNS gateway responds back with wired services even if the location based filtering is configured.</li> </ul>
<b>Step 5</b>	<b>service-list <i>service-list-name</i> {IN   OUT}</b> <b>Example:</b>	Configures various service-list names for IN and OUT directions.

	Command or Action	Purpose
	Device(config-mdns-ser-pol)# service-list VLAN100-list IN	<b>Note</b> If an administrator decides to create or use a custom service policy, then the custom service policy must be configured with service-lists for both directions (IN and OUT); otherwise, the mDNS Gateway will not work (will not learn services if there is no IN service-list, or will not reply or announce services learned if there is no OUT service-list).
<b>Step 6</b>	<b>exit</b>  <b>Example:</b> Device(config-mdns-ser-pol)# exit	Returns to global configuration mode.

## Configuring a Local or Native Profile for an mDNS Policy

When an administrator configures local authentication and authorization and does not expect to get any mDNS policy from the AAA server, the administrator can configure a local or native profile to select a mDNS policy based on user, role, or device type. When this local or native profile is mapped to the wireless profile policy, mDNS service policy is applied on the mDNS packets that are processed on that WLAN.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>service-template</b> <i>template-name</i>  <b>Example:</b> Device(config)# service-template mdns	Configures the service-template or identity policy.
<b>Step 3</b>	<b>mdns-service-policy</b> <i>mdns-policy-name</i>  <b>Example:</b> Device(config-service-template)# mdns-service-policy mdnsTV	Configures the mDNS policy.
<b>Step 4</b>	<b>exit</b>  <b>Example:</b> Device(config-service-template)# exit	Returns to global configuration mode.

## Configuring an mDNS Flex Profile (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Services > mDNS**.
- Step 2** In the **mDNS Flex Profile** section, click **Add**.  
The **Add mDNS Flex Profile** window is displayed.
- Step 3** In the **Profile Name** field, enter the flex mDNS profile name.
- Step 4** In the **Service Cache Update Timer** field, specify the service cache update time. The default value is 1 minute. The valid range is from 1 to 100 minutes.
- Step 5** In the **Statistics Update Timer** field, specify the statistics update timer. The default value is 1 minute. The valid range is from 1 to 100 minutes.
- Step 6** In the **VLANs** field, specify the VLAN ID. You can enter multiple VLAN IDs separated by commas, or enter a range of VLAN IDs. Maximum number of VLANs allowed is 16.
- Step 7** Click **Apply to Device**.
- 

## Configuring an mDNS Flex Profile (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>mdns-sd flex-profile <i>mdns-flex-profile-name</i></b>  <b>Example:</b> Device(config)# mdns-sd flex-profile <i>mdns-flex-profile-name</i>	Enters the mDNS Flex Profile mode.
<b>Step 3</b>	<b>update-timer service-cache <i>service-cache timer-value &lt;1-100&gt;</i></b>  <b>Example:</b> Device(config-mdns-flex-profile)# update-timer service-cache 60	Configures the mDNS update service cache timer for the flex profile.  The default value is 1 minute. Value range is between 1 minute and 100 minutes.
<b>Step 4</b>	<b>update-timer statistics <i>statistics timer-value &lt;1-100&gt;</i></b>  <b>Example:</b> Device(config-mdns-flex-profile)# update-timer statistics 65	Configures the mDNS update statistics timer for the flex profile.  The default value is 1 minute. The valid range is from 1 to 100 minutes.

	Command or Action	Purpose
<b>Step 5</b>	<b>wired-vlan-range</b> <i>wired-vlan-range value</i> <b>Example:</b> Device (config-mdns-flex-profile) # wired-vlan-range 10 - 20	Configures the mDNS wired VLAN range for the flex profile.  The default value is 1 minute. The valid range is from 1 minute to 100 minutes.

## Applying an mDNS Flex Profile to a Wireless Flex Connect Profile (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Tags & Profiles > Flex**.
  - Step 2** Click **Add**.  
The **Add Flex Profile** window is displayed.
  - Step 3** Under the **General** tab, from the **mDNS Flex Profile** drop-down list, choose a flex profile name from the list.
  - Step 4** Click **Apply to Device**.
- 

## Applying an mDNS Flex Profile to a Wireless Flex Connect Profile (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wireless profile flex</b> <i>wireless-flex-profile-name</i> <b>Example:</b> Device# wireless profile flex wireless-flex-profile-name	Enters wireless flex profile configuration mode.
<b>Step 3</b>	<b>mdns-sd</b> <i>mdns-flex-profile</i> <b>Example:</b> Device (config-wireless-flex-profile) # mdns-sd mdns-flex-profile-name	Enables the mDNS features for all the APs in the profile

# Enabling the mDNS Gateway on the VLAN Interface

This procedure configures the mDNS service policy for a specific VLAN. This allows the administrator to configure different settings to the mDNS packets on per VLAN interface basis and not on per WLAN basis.

## Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>interface vlan <i>vlan-interface-number</i></b>  <b>Example:</b> Device(config)# interface vlan 200	Configures a VLAN ID and enters interface configuration mode.
<b>Step 3</b>	<b>ip address <i>ip-address subnet-mask</i></b>  <b>Example:</b> Device(config-if)# ip address 111.1.1.1 255.255.255.0	Configures the IP address for the interface.
<b>Step 4</b>	<b>mdns-sd gateway</b>  <b>Example:</b> Device(config-if)# mdns-sd gateway	Enables mDNS configuration on a VLAN interface.
<b>Step 5</b>	<b>service-policy <i>service-policy-name</i></b>  <b>Example:</b> Device(config-if-mdns-sd)# service-policy test-mDNS-service-policy	Configures the service policy.  <b>Note</b> If specific <i>service-policy-name</i> is not defined, the VLAN will use the <b>default-mdns-service-policy</b> by default.  By default, <b>default-mDNS-service-policy</b> gets created in the system and it will use <b>default-mDNS-service-list</b> configuration for filtering mDNS service announcement and queries.
<b>Step 6</b>	<b>end</b>  <b>Example:</b> Device(config-if-mdns-sd)# end	Returns to privileged EXEC mode.  Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

# Location-Based Service Filtering

## Prerequisite for Location-Based Service Filtering

You need to create the Service Definition and Service Policy. For more information, see [Creating Custom Service Definition](#) section and [Creating Service Policy](#) section.

## Configuring mDNS Location-Based Filtering Using SSID

When a service policy is configured with the SSID as the location name, the response to the query will be the services that were learnt on that SSID.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>mdns-sd service-policy service-policy-name</b> <b>Example:</b> Device(config)# mdns-sd service-policy mdns-policy1	Configures the service policy.
<b>Step 3</b>	<b>location ssid</b> <b>Example:</b> Device(config-mdns-ser-pol)# location ssid	Configures location-based filtering using SSID.
<b>Step 4</b>	<b>end</b> <b>Example:</b> Device(config-mdns-ser-pol)# end	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Configuring mDNS Location-Based Filtering Using AP Name

When a service policy is configured with the AP name as the location, the response to the query will be the services that were learnt on that AP.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b>	Enters global configuration mode.

	Command or Action	Purpose
	Device# configure terminal	
<b>Step 2</b>	<b>mdns-sd service-policy</b> <i>service-policy-name</i> <b>Example:</b> Device(config)# mdns-sd service-policy mdns-policy1	Configures the service policy.
<b>Step 3</b>	<b>location ap-name</b> <b>Example:</b> Device(config-mdns-ser-pol)# location ap-name	Configures location-based filtering using an AP name.
<b>Step 4</b>	<b>end</b> <b>Example:</b> Device(config-mdns-ser-pol)# end	Returns to privileged EXEC mode.  Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Configuring mDNS Location-Based Filtering Using AP Location

When a service policy is configured with location as the AP-location, the response to the query will be the services that were learnt on all the APs using the same AP "location" name (not to be confused with "site-tag").

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>mdns-sd service-policy</b> <i>service-policy-name</i> <b>Example:</b> Device(config)# mdns-sd service-policy mdns-policy1	Configures the service policy.
<b>Step 3</b>	<b>location ap-location</b> <b>Example:</b> Device(config-mdns-ser-pol)# location ap-location	Configures location-based filtering using the AP location.
<b>Step 4</b>	<b>end</b> <b>Example:</b> Device(config-mdns-ser-pol)# end	Returns to privileged EXEC mode.  Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Configuring mDNS Location-Based Filtering Using Regular Expression

- When a service policy is configured with the location as a regular expression that matches the corresponding AP name, the response to the query will be the services that were learnt on a group of APs based on the AP name.
- When a service policy is configured with the location as a regular expression that matches the corresponding AP location, the response to the query will be the services that were learnt on a group of APs based on the AP location.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>mdns-sd service-policy service-policy-name</b> <b>Example:</b> Device(config)# mdns-sd service-policy mdns-policy1	Configures the service policy.
<b>Step 3</b>	<b>location regex {ap-location regular-expression   ap-name regular-expression}</b> <b>Example:</b> Device(config-mdns-ser-pol)# location regex ap-location dns_location Device(config-mdns-ser-pol)# location regex ap-name dns_name	Configures location-based filtering using regular expression.
<b>Step 4</b>	<b>end</b> <b>Example:</b> Device(config-mdns-ser-pol)# end <b>Note</b> To filter the services for which AP names have the specific keyword such as <i>AP-2FLR-SJC-123</i> , you can use the regex AP name as <i>AP-2FLR-</i> to match the services that are learnt from the set of access points.	Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Configuring mDNS Location-Based Filtering Using Location Group

### Feature History for mDNS Location-Based Filtering Using Location Group (Microlocation)

This table provides release and related information for the feature explained in this module.

This feature is also available in all the releases subsequent to the one in which they are introduced in, unless noted otherwise.

**Table 172: Feature History for mDNS Location-Based Filtering Using Location Group (Microlocation)**

Release	Feature	Feature Information
Cisco IOS XE Cupertino 17.9.1	mDNS Location-Based Filtering Using Location Group (Microlocation)	The controller is enhanced to support microlocation from wireless clients tagged with the location group (mDNS Group ID) tag. From Cisco IOS-XE 17.3 onwards, location grouping is done based on AP names.  From Cisco IOS-XE 17.9 onwards, location grouping is extended to AP location.

## Information About mDNS Location-Based Filtering Using Location Group (Microlocation)

In the context of Apple Bonjour, Microlocation refers to the smaller subset of a wireless location. This is also referred to as mDNS AP Group or Location Group.

To create an mDNS AP location group, perform the following procedure:

1. Define multiple rules with priority in the wireless rule-based mDNS application.

---

**Note** The rules have AP microlocation grouping as AP name or AP location.

---

2. Match the highest priority rule-based on the configured regular expression with AP name and AP location-based grouping.
3. Map an AP to a location group (mDNS Group ID).

---

**Note** When you delete or modify a rule, the corresponding APs are revalidated (using the **capwap restart** command) to apply the updated configuration.

---

### AP Microlocation Support Based on AP Location

From Cisco IOS-XE 17.3 onwards, AP location is configured using the **ap name name location location** command.

From Cisco IOS-XE 17.9 onwards, AP location is leveraged to group APs belonging to a location to form a location group.

By default, AP microlocation, based on either AP name or AP location, is disabled.

## Use Cases for mDNS Location-Based Filtering Using Location Group (Microlocation)

- Restricts services across departments.
- Shares files across building or sites.

- Teachers or students, doctors or patients, employees or groups need service visibility in contained environment without intervening with IT to change to L2 or L3 networks.

## Prerequisites for mDNS Location-Based Filtering Using Location Group (Microlocation)

You must have configured the mDNS rule. By default, the AP name-based microlocation grouping is used.

### Enabling Location Group (CLI)

#### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>mdns-sd service-policy <i>service-policy-name</i></b>  <b>Example:</b> Device(config)# mdns-sd service-policy mdns-policy1	Configures mDNS service policy.
<b>Step 3</b>	<b>service-list <i>service-list-name</i> {in   out}</b>  <b>Example:</b> Device(config-mdns-ser-pol)# service-list VLAN100-list in  Device(config-mdns-ser-pol)# service-list VLAN300-list out	Configures service lists for IN and OUT directions.
<b>Step 4</b>	<b>location location-group</b>  <b>Example:</b> Device(config-mdns-ser-pol)# location location-group	Configures location-based filtering using location group.
<b>Step 5</b>	<b>end</b>  <b>Example:</b> Device(config-mdns-ser-pol)# end	Returns to privileged EXEC mode.

### Adding APs to a Location Group (CLI)

#### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.

	Command or Action	Purpose
<b>Step 2</b>	<b>wireless rule application mdns</b> <b>Example:</b> <pre>Device(config)# wireless rule application mdns</pre>	Configures wireless rule-based MDNS application.
<b>Step 3</b>	<b>rule-priority rule_priority rule-name rule_name</b> <b>Example:</b> <pre>Device(config-app-rule)# rule-priority 2011 rule-name R2011</pre>	Configures rule priority. Here, <ul style="list-style-type: none"> <li>• <i>rule_priority</i>: The valid range is from 0 to 4096.</li> </ul> <p><b>Note</b> 0 is the lower priority number and 4096 is the higher priority number.</p> <ul style="list-style-type: none"> <li>• <i>rule_name</i>: The rule name can be between 1 to 32 characters.</li> </ul> <p><b>Note</b> When you configure the rule priority, you will be prompted as follows:</p> <pre>Changing regex string or other rule configuration may cause associated APs to rejoin</pre> <p>When you see this prompt, enter <b>Y</b> to continue with the configuration.</p>
<b>Step 4</b>	<b>regex regular_expression_string</b> <b>Example:</b> <pre>Device(config-rule-params)# regex AP_Name</pre>	Configures rule-based on AP name or AP location to match the regular expression.
<b>Step 5</b>	<b>action-type grouping</b> <b>Example:</b> <pre>Device(config-rule-params)# action-type grouping</pre>	Groups APs based on the filter string.
<b>Step 6</b>	<b>group-id location_group_identifier</b> <b>Example:</b> <pre>Device(config-rule-action-mdns)# group-id 44</pre>	Configures the mDNS location group identifier. Valid range for <i>location_group_identifier</i> is 1 to 4096.
<b>Step 7</b>	<b>group-method ap location</b> <b>Example:</b> <pre>Device(config-rule-action-mdns)# group-method ap location</pre>	Configures AP location-based grouping. <p><b>Note</b> If you consider <b>group-method</b> as <b>ap location</b>, the regex captures the <i>AP_LOC_NAME</i>. By default, the <b>group-method</b> is configured with <i>AP_NAME</i>.</p>

	Command or Action	Purpose
<b>Step 8</b>	<b>group-name</b> <i>location_group_name</i> <b>Example:</b> Device(config-rule-action-mdns)# group-name G2011	Configures mDNS location group name.
<b>Step 9</b>	<b>end</b> <b>Example:</b> Device(config-rule-action-mdns)# end	Returns to privileged EXEC mode.

## Verifying AP Location

To verify the mDNS location Group ID associated with an AP, use the following command:

```
Device# show ap config general | sec MDNS | AP Name
Cisco AP Name : AP2800
MDNS Group Id : 101
MDNS Rule Name : R101
MDNS Group Method : AP Location
```

To verify all the APs associated with the configured mDNS rule name, use the following command:

```
Device# show wireless associated-ap mdns-rule-name R1
AP MAC AP Name

0cd0.f894.a840 AP0CD0.F894.083C
4001.7a03.8560 APA023.9F66.4F96

```

To verify all the APs associated with the configured mDNS location group ID, use the following command:

```
Device# show wireless associated-ap mdns-group-id 1
AP MAC AP Name

0cd0.f894.a840 AP0CD0.F894.083C
4001.7a03.8560 APA023.9F66.4F96

```

To verify the mDNS group method detail for each AP, use the following command:

```
Device# show ap config general | inc MDNS|AP Name|Location
Cisco AP Name : AP-1
MDNS Group Id : 100
MDNS Rule Name : R100
MDNS Group Method : AP Location
```

To verify the mDNS group method detail for each rule, use the following command:

```
Device# show wireless rule application mdns
Rule Name : R100
Rule Priority : 100
Regular Expression : AP0
Action Type : MDNS Grouping
 MDNS Group ID : 100
MDNS Group Name : G100
MDNS Group Method : AP Location
```

# Nearest mDNS-Based Wired Service Filtering

## Feature History for Nearest mDNS-Based Wired Service Filtering

This table provides release and related information for features explained in this module.

These features are available on all releases subsequent to the one they were introduced in, unless noted otherwise.

*Table 173: Feature History for Nearest mDNS-Based Wired Service Filtering*

Release	Feature	Feature Information
Cisco IOS XE Cupertino 17.8.1	Nearest mDNS-Based Wired Service Filtering	<p>This feature supports the following functionalities:</p> <ul style="list-style-type: none"> <li>• Nearest mDNS based wired service filtering. (Supported in Central switched Local mode.)</li> <li>• Custom wired service policy support for FlexConnect mode.</li> <li>• VLAN and MAC based wired service filtering. (Supported in Central switched Local mode.)</li> </ul>

## Information About Nearest mDNS-Based Wired Service Filtering

Prior to Cisco IOS XE 17.8.1 release, the wireless clients discover the following:

- All wired services from mDNS-AP.
- Service providers on VLANs visible to the controller.

---

**Note** The current filtering is supported only for wireless services.

---

From Cisco IOS XE 17.8.1 onwards, the wireless clients are enhanced to support filter-based on the nearest wired service provider.

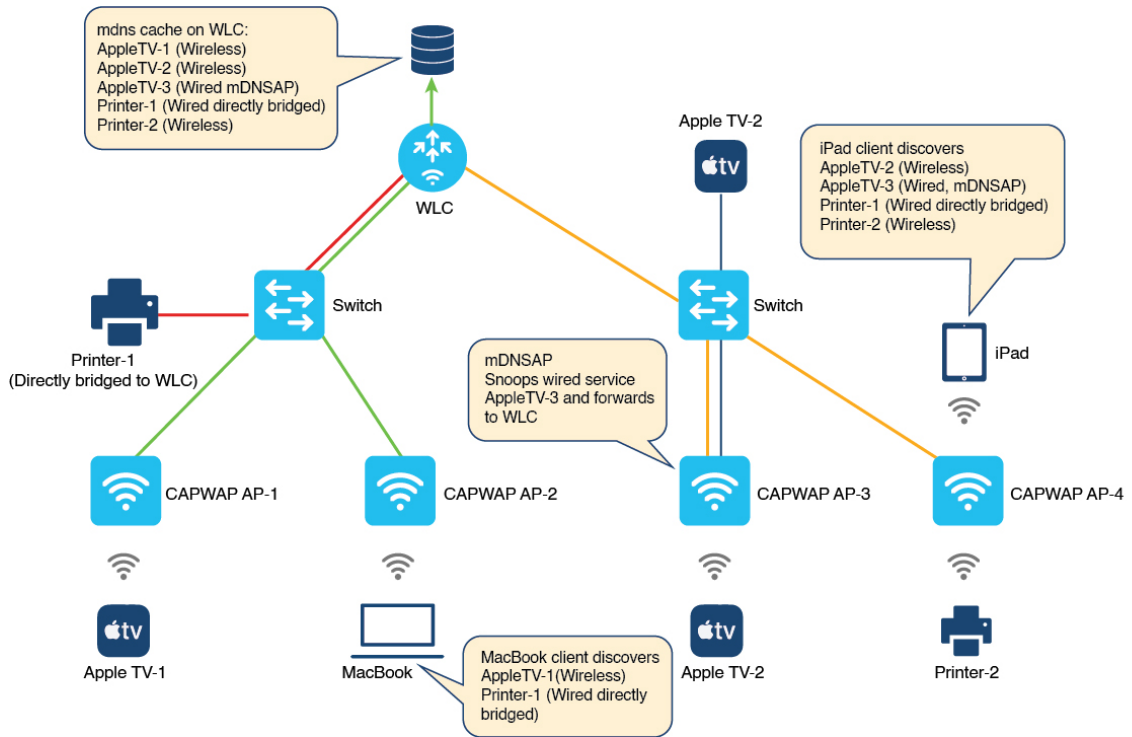

---

**Note** The controller classifies the wired services as the nearest wired services once the LSS is enabled. The mDNS-AP forwards or advertises the nearest wired services.

---

The following figure illustrates the nearest wired service provider and discovery:

**Figure 83: Nearest Wired Service Provider and Discovery**

As per the figure, the controller is associated with the following four APs:

- CAPWAP AP-1
- CAPWAP AP-2
- CAPWAP AP-3
- CAPWAP AP-4

The client connected to CAPWAP AP-1 is wireless and advertises the service Apple TV-1.

Similarly, the client connected to CAPWAP AP-2 is wireless and advertises the service MacBook query client.

The CAPWAP AP-3 is enabled as an mDNS-AP. This AP then discovers the wired services on VLANs and forwards them to the controller. In this case, the client advertising the service AppleTV-3 is a wired service. The client is then discovered by CAPWAP AP-3 and forwarded to the controller. You will also view another client connected to CAPWAP AP-3 that is wireless and advertises the service AppleTV-2.

The client connected to CAPWAP AP-4 is wireless and advertises the service Printer-2 and iPad query client.

Also, a client is connected directly to the controller, which advertises the Printer-1.

The controller covers cache populated from both wireless and wired service providers.

The controller populates the following cache:

- AppleTV-1 (Wireless service from CAPWAP AP-1)
- AppleTV-2 (Wireless service from CAPWAP AP-3)

- AppleTV-3 (Wired service from mDNS-AP enabled AP-3)
- Printer-1 (Wired service from directly bridged service provider)
- Printer-2 (Wireless service from AP-4)

When LSS is enabled, AP-1 and AP-2 discover each other as LSS neighbors. Similarly, AP-3 and AP-4 discover each other as LSS neighbors.

MacBook discovers the following services:

- AppleTV-1 (Wireless service from AP-1)
- Printer-1 (Wired service from the directly bridged service provider)

---

**Note** MacBook does not discover the wired service AppleTV-3 (forwarded by mDNS-AP AP-3). The AP-2 does not see AP-3 as the LSS neighbor. Thus, the controller does not classify the wired service AppleTV-3 as nearby.

---

iPad discovers the following services:

- AppleTV-2 (Wireless service from AP-3)
- AppleTV-3 (Wired service from mDNS-AP enabled AP-3)
- Printer-1 (Wired service from directly bridged service provider)
- Printer-2 (Wireless service from AP-4)

---

**Note** iPad discovers the wired service AppleTV-3 (forwarded by mDNS-AP AP-3). The AP-4 sees AP-3 as the LSS neighbor. Thus, the controller classifies the wired service AppleTV-3 as nearby.

---

---

**Note** This feature supports only the wired services advertised by mDNS-AP in centrally switched local mode.

---

## Information About Custom Wired Service Policy Support for FlexConnect Mode

From Cisco IOS XE 17.8.1 release onwards, the custom service policy for wired services is supported in a Flex profile. Here, the service policy refers to the mDNS service policy.

## Information About VLAN and MAC Based Wired Service Filtering

Prior to Cisco IOS XE 17.8.1 release, service filtering was based on service types, location type, and location filter. These filters are applicable for wireless services. However, they are not supported for wired services.

From Cisco IOS XE 17.8.1 release onwards, the VLAN and MAC based filtering is supported for wired services.

**Note**

- In case of wired services, the VLAN and MAC based filtering is applicable for OUT direction filter advertised by mDNS-AP and directly bridged wired services.
- The VLAN and MAC based filtering is applicable for centrally switched local mode.

## Prerequisite for Nearest mDNS-Based Wired Service Filtering

- Enable the mDNS gateway on the controller.

## Use Cases

The following are the use cases:

- Nearest mDNS-Based Wired Service Filtering.
- Custom Wired Service Policy Support for FlexConnect Mode.
- VLAN and MAC Based Wired Service Filtering.

While migrating from AireOS wireless controllers to the Cisco Catalyst 9800 Series Wireless Controllers, the following limitations occur:

- The wireless clients discover all the wired services and not just the nearby service from the wired service provider when central switched local mode and LSS is enabled.

The wired services belong to the forwarded mDNS-AP and directly bridged ones.

- There is no provision to apply the custom service policy for wired services when locally switched FlexConnect mode is enabled.

The mDNS flex profile must have the custom wired service policy as well.

- There is no provision to filter based on the VLAN and MAC address for wired services in centrally switched local mode.

## Configuring Wired Service Policy Support in Flex Profile

### Creating Service List (CLI)

#### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b>  <b>Example:</b> Device> enable	Enables privileged EXEC mode. Enter your password, if prompted.

	Command or Action	Purpose
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 3</b>	<b>mdns-sd service-list <i>service-list-name</i> IN</b> <b>Example:</b> Device(config)# mdns-sd service-list srvc_list_in IN	Configures mDNS service list for inbound filtering.
<b>Step 4</b>	<b>match <i>service-definition-name</i></b> <b>Example:</b> Device(config)# match airplay <b>Example:</b> Device(config)# match printer_ipp	Matches the service to the service definition name. Here, <i>service-definition-name</i> refers to the names of services, such as, airplay, airserver, airtunes, and so on. <b>Note</b> To add a service, the service name must be part of the primary service list. The same set of service list will be used for both IN and OUT filters.
<b>Step 5</b>	<b>mdns-sd service-list <i>service-list-name</i> OUT</b> <b>Example:</b> Device(config)# mdns-sd service-list srvc_lst_out OUT	Configures mDNS service list for outbound filtering.
<b>Step 6</b>	<b>match <i>service-definition-name</i></b> <b>Example:</b> Device(config-mdns-sl-out)# match airplay	Matches the service to the service definition name. Here, <i>service-definition-name</i> refers to the names of services, such as, airplay, airserver, airtunes, and so on. <b>Note</b> To add a service, the service name must be part of the primary service list. The same set of service list will be used for both IN and OUT filters.
<b>Step 7</b>	<b>exit</b> <b>Example:</b> Device(config-mdns-sl-out)# exit	Exits mDNS service list configuration mode.

## Creating Service Policy (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b>	Enables privileged EXEC mode. Enter your password, if prompted.

	Command or Action	Purpose
	Device> enable	
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 3</b>	<b>mdns-sd service-policy service-policy-name</b> <b>Example:</b> Device(config)# mdns-sd service-policy custom_wired_policy	Configures mDNS service policy.
<b>Step 4</b>	<b>service-list service-list-name {in   out}</b> <b>Example:</b> Device(config-mdns-ser-pol)# service-list srvc_list_in IN Device(config-mdns-ser-pol)# service-list srvc_list_out OUT	Configures service lists for IN and OUT directions.
<b>Step 5</b>	<b>location lss</b> <b>Example:</b> Device(config-mdns-ser-pol)# location lss	Enables Location Specific Services (LSS) for the mDNS service.
<b>Step 6</b>	<b>exit</b> <b>Example:</b> Device(config-mdns-ser-pol)# exit	Exits mDNS service policy configuration mode.

## Configuring an mDNS Flex Profile (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Services > mDNS**.
  - Step 2** In the **mDNS Flex Profile** section, click **Add**.
  - Step 3** In the **Add mDNS Flex Profile** window that is displayed, enter the Flex mDNS profile name in the **Profile Name** field.
  - Step 4** In the **Service Cache Update Timer** field, specify the service cache update time. The value range is between 1 and 100 minutes.
  - Step 5** In the **Statistics Update Timer** field, specify the statistics update timer. The value range is between 1 and 100 minutes.
  - Step 6** In the **VLANs** field, specify the VLAN ID. You can enter multiple VLAN IDs separated by commas or enter a range of VLAN IDs. Maximum number of VLANs allowed is 16.
  - Step 7** Enter or select a **Wired Service Policy** from the drop-down list to associate a Wired filter to mDNS Flex-Profile. In addition to filtering mDNS service queries based on the static default service list, wired filter will support filtering based on custom service lists.

The new wired service-policy will be added to flex-profile construct to support the custom wired service-policy. The AP will apply this configuration for wired services and the respective IN and OUT filters will be used for advertisements and queries only if the custom wired service-policy is configured in mDNS flex-profile.

In case a custom service-policy is removed from the mDNS flex-profile, the AP will remove the custom service-policy and apply the default service-policy for wired services. This feature is supported only in locally switched FlexConnect mode.

**Step 8** Click **Apply to Device**.

## Configuring an mDNS Flex Profile (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Device> enable	Enables privileged EXEC mode. Enter your password, if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 3</b>	<b>mdns-sd flex-profile</b> <i>mdns-flex-profile-name</i> <b>Example:</b> Device(config)# mdns-sd flex-profile custom_flex_profile	Configures an mDNS Flex profile.
<b>Step 4</b>	<b>update-timer service-cache</b> <i>timer-value</i> <1-100> <b>Example:</b> Device(config-mdns-flex-prof)# update-timer service-cache 15	Configures the mDNS update service cache timer for the flex profile.  The default value is 1 minute. Value range is between 1 minute and 100 minutes.
<b>Step 5</b>	<b>update-timer statistics</b> <i>statistics timer-value</i> <1-100> <b>Example:</b> Device(config-mdns-flex-prof)# update-timer statistics 10	Configures the mDNS update statistics timer for the flex profile.  The default value is 1 minute. The valid range is from 1 to 100 minutes.
<b>Step 6</b>	<b>wired-vlan-range</b> <i>wired-vlan-range value</i> <b>Example:</b> Device(config-mdns-flex-prof)# wired-vlan-range 30	Configures the mDNS wired VLAN range for the flex profile.  The default value is 1 minute. The valid range is from 1 minute to 100 minutes.
<b>Step 7</b>	<b>wired-service-policy</b> <i>service-policy-name</i> <b>Example:</b>	Associates the wired service policy with mDNS flex profile.

	Command or Action	Purpose
	Device(config-mdns-flex-prof)# wired-service-policy custom_wired_policy	<b>Note</b> Here, <i>service-policy-name</i> refers to the mDNS service policy created earlier. For more information, refer to Creating Service Policy (CLI).
<b>Step 8</b>	<b>end</b>  <b>Example:</b> Device(config-mdns-flex-prof)# end	Returns to privileged EXEC mode.  Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Configuring VLAN and MAC Based Wired Service Filtering (CLI)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b>  <b>Example:</b> Device> enable	Enables privileged EXEC mode. Enter your password, if prompted.
<b>Step 2</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 3</b>	<b>mdns-sd wired-filter</b> <i>wired-filter-name</i>  <b>Example:</b> Device(config)# mdns-sd wired-filter WIRED_FILTER_APPLE_TV	Configures an mDNS wired filter.
<b>Step 4</b>	<b>match mac</b> <i>service-provider-mac-address/</i>  <b>Example:</b> Device(config-mdns-wired-filter)# match mac a886.ddb2.05e9	Matches the wired filter with the MAC address of the wired service.
<b>Step 5</b>	<b>match vlan</b> <i>range</i>  <b>Example:</b> Device(config-mdns-wired-filter)# match vlan 100	Matches the wired filter with the VLAN of the wired service.
<b>Step 6</b>	<b>exit</b>  <b>Example:</b> Device(config-mdns-wired-filter)# exit	Exits mDNS gateway configuration mode.
<b>Step 7</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.

	Command or Action	Purpose
<b>Step 8</b>	<b>mdns-sd service-list</b> <i>service-list-name</i> <b>IN</b> <b>Example:</b> <pre>Device(config)# mdns-sd service-list svrc_lst_in IN</pre>	Configures mDNS service list for inbound filtering.
<b>Step 9</b>	<b>match</b> <i>service-definition-name</i> <b>Example:</b> <pre>Device(config)# match airplay</pre>	Matches the service to the names of the services. Here, <i>service-definition-name</i> refers to the names of services, such as, airplay, airserver, airtunes, and so on.
<b>Step 10</b>	<b>mdns-sd service-list</b> <i>service-list-name</i> <b>OUT</b> <b>Example:</b> <pre>Device(config)# mdns-sd service-list svrc_lst_out OUT</pre>	Configures mDNS service list for outbound filtering.
<b>Step 11</b>	<b>match apple-tv wired-filter</b> <i>wired-filter-name</i> <b>Example:</b> <pre>Device(config-mdns-sl-out)# match apple-tv wired-filter WIRED_FILTER_APPLE_TV</pre>	Matches the Apple TV related wired filter.
<b>Step 12</b>	<b>mdns-sd service-policy</b> <i>service-policy-name</i> <b>Example:</b> <pre>Device(config)# mdns-sd service-policy custom_policy</pre>	Enables mDNS service policy.
<b>Step 13</b>	<b>service-list</b> <i>service-list-name</i> { <b>IN</b>   <b>OUT</b> } <b>Example:</b> <pre>Device(config-mdns-ser-pol)# service-list svrc_lst_in IN  Device(config-mdns-ser-pol)# service-list svrc_lst_in OUT</pre>	Configures various service-list names for IN and OUT directions.  <b>Note</b> If an administrator decides to create or use a custom service policy, then the custom service policy must be configured with service-lists for both directions (IN and OUT); otherwise, the mDNS Gateway will not work (will not learn services if there is no IN service-list, or will not reply or announce services learned if there is no OUT service-list).
<b>Step 14</b>	<b>location ap-group</b> <b>Example:</b> <pre>Device(config-mdns-ser-pol)# location ap-group</pre>	Configures AP location based filtering.
<b>Step 15</b>	<b>end</b> <b>Example:</b> <pre>Device(config-mdns-ser-pol)# end</pre>	Returns to privileged EXEC mode.  Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Verifying mDNS-Based Wired Service Filtering

To view the wired service list IN and OUT details, use the following command:

```
Device# show mdns status

Global mDNS gateway:Enabled

vap_id ssid mdns_mode
 0 myFisaiC Bridge
 1 rquestcpC Bridge
 2 RK-FLEX Bridge
 3 RK-MDNS Gateway
 4 GUHOAsaiC Bridge
 5 - Bridge
 6 - Bridge
 7 - Bridge
 8 - Bridge
 9 - Bridge
 10 - Bridge
 11 - Bridge
 12 - Bridge
 13 - Bridge
 14 - Bridge
 15 - Bridge

Active query interval:30
vap service_list_in service_list_out location
 0 default-mdns-service-list_IN default-mdns-service-list_OUT 0
 1 default-mdns-service-list_IN default-mdns-service-list_OUT 0
 2 default-mdns-service-list_IN default-mdns-service-list_OUT 0
 3 default-mdns-service-list_IN default-mdns-service-list_OUT 0
 4 default-mdns-service-list_IN default-mdns-service-list_OUT 0

Wired vlan configuration:
mdns stats timer: 1
mdns cache timer: 1
AP Sync VLAN: 1
Wired service list IN: RK-IN_IN
Wired service list OUT: RK-OUT_OUT
```

**Note** This command must be executed on the Flex AP. Also, this applies to the custom wired service policy support in FlexConnect mode.

To verify the VLAN and MAC based wired service filtering, use the following command:

```
Device# show running-config mdns-sd wired-filter
mdns-sd wired-filter WIRED_FILTER_APPLE_TV
match mac a886.ddb2.05e9
match vlan 100
!
```

To verify the wired service policy support in Flex Profile, use the following command:

```
Device# show running-config mdns-sd flex-profile
mdns-sd flex-profile custom_flex_profile
update-timer service-cache 15
update-timer statistics 10
wired-vlan-range 30
wired-service-policy custom_wired_policy
!
```

To verify whether LSS is configured or not, use the following command:

```

Device# show running-config mdns-sd service-policy
mdns-sd service-policy custom_policy
service-list srvc_lst_in IN
service-list srvc_lst_out OUT
location lss
!
mdns-sd service-list srvc_lst_in IN
match apple-tv
!

mdns-sd service-list srvc_lst_out OUT
match apple-tv wired-filter WIRED_FILTER_APPLE_TV
!

```

## Configuring mDNS AP

In most of the deployments, the services may be available in VLANs that the APs can hear in the wired side (allowed in the switchport where the AP is directly connected: its own VLAN, or even more VLANs if switchport is a trunk).

The following procedure shows how to configure mDNS AP:

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>mdns-sd gateway</b> <b>Example:</b> Device(config)# mdns-sd gateway	Configures the mDNS gateway.
<b>Step 3</b>	<b>ap name <i>ap-name</i> mdns-ap enable vlan <i>vlan-id</i></b> <b>Example:</b> Device# ap name ap1 mdns-ap enable vlan 22	Enables mDNS on the AP, and configures a VLAN for the mDNS AP.
<b>Step 4</b>	<b>ap name <i>ap-name</i> mdns-ap vlan add <i>vlan-id</i></b> <b>Example:</b> Device# ap name ap1 mdns-ap vlan add 200	Adds a VLAN to the mDNS AP. <i>vlan-id</i> ranges from 1 to 4096.
<b>Step 5</b>	<b>ap name <i>ap-name</i> mdns-ap vlan del <i>vlan-id</i></b> <b>Example:</b> Device# ap name ap1 mdns-ap vlan del 2	Deletes a VLAN from the mDNS AP.
<b>Step 6</b>	<b>ap name <i>ap-name</i> mdns-ap disable</b> <b>Example:</b> Device# ap name ap1 mdns-ap disable	(Optional) Disables the mDNS AP.

	Command or Action	Purpose
<b>Step 7</b>	<b>end</b>  <b>Example:</b> Device# end	Returns to privileged EXEC mode.  Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.  <b>Note</b> You can configure a maximum of 10 VLANs per AP.

## Enabling mDNS Gateway on the RLAN Interface

By configuring the mDNS gateway mode on the RLAN interface, you can configure the mDNS service policy for a specific RLAN.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>ap remote-lan profile-name</b> <i>remote-lan-profile-name rlan-id</i>  <b>Example:</b> Device(config)# ap remote-lan profile-name rlan_test_1 1	Configures a remote LAN profile. <ul style="list-style-type: none"> <li>• <i>remote-lan-profile</i>: Remote LAN profile name. Range is from 1 to 32 alphanumeric characters.</li> <li>• <i>rlan-id</i>: Remote LAN identifier. Range is from 1 to 128.</li> </ul> <b>Note</b> You can create a maximum of 128 RLANs. Also, you cannot use the <i>rlan-id</i> of an existing RLAN while creating another RLAN.
<b>Step 3</b>	<b>mdns-sd-interface {gateway   drop}</b>  <b>Example:</b> mdns-sd-interface  Device(config-remote-lan)# mdns-sd-interface gateway	Enables mDNS configuration on an RLAN interface.
<b>Step 4</b>	<b>no shutdown</b>  <b>Example:</b> Device(config-remote-lan)# no shutdown	Restarts the RLAN profile.
<b>Step 5</b>	<b>exit</b>  <b>Example:</b>	Exits remote LAN configuration mode.

	Command or Action	Purpose
	<code>Device(config-remote-lan)# exit</code>	
<b>Step 6</b>	<p><b>ap remote-lan-policy policy-name profile name</b></p> <p><b>Example:</b></p> <pre>Device(config)# ap remote-lan-policy policy-name rlan_named_pp1</pre>	Configures the RLAN policy profile and enters wireless policy configuration mode.
<b>Step 7</b>	<p><b>mdns-sd service-policy service-policy-name</b></p> <p><b>Example:</b></p> <pre>Device(config-remote-lan-policy)# mdns-sd service-policy mdnsTV6</pre>	Enables an mDNS service policy.
<b>Step 8</b>	<p><b>central switching</b></p> <p><b>Example:</b></p> <pre>Device(config-remote-lan-policy)# central switching</pre>	Configures the RLAN for central switching.
<b>Step 9</b>	<p><b>central dhcp</b></p> <p><b>Example:</b></p> <pre>Device(config-remote-lan-policy)# central dhcp</pre>	Configures the central DHCP for centrally switched clients.
<b>Step 10</b>	<p><b>vlan vlan-name</b></p> <p><b>Example:</b></p> <pre>Device(config-remote-lan-policy)# vlan 141</pre>	Assigns the profile policy to a VLAN.
<b>Step 11</b>	<p><b>no shutdown</b></p> <p><b>Example:</b></p> <pre>Device(config-remote-lan-policy)# no shutdown</pre>	Restarts the RLAN profile.
<b>Step 12</b>	<p><b>wireless tag policy policy-tag-name</b></p> <p><b>Example:</b></p> <pre>Device(config)# wireless tag policy rlan_pt_1</pre>	Configures a policy tag.
<b>Step 13</b>	<p><b>remote-lan remote-lan-profile-name policy rlan-policy-profile-name port-id port-id</b></p> <p><b>Example:</b></p> <pre>Device(config-policy-tag)# remote-lan rlan_test_1 policy rlan_named_pp1 port-id 1  Device(config-policy-tag)# remote-lan rlan_test_1 policy rlan_named_pp1 port-id 2</pre>	<p>Maps the RLAN policy profile to the RLAN profile.</p> <ul style="list-style-type: none"> <li>• <i>remote-lan-profile-name</i>: Name of the RLAN profile.</li> <li>• <i>rlan-policy-profile-name</i>: Name of the policy profile.</li> <li>• <i>port-id</i>: LAN port number on the access point. Range is from 1 to 4.</li> </ul>

	Command or Action	Purpose
	<pre>Device(config-policy-tag)# remote-lan rlan_test_1 policy rlan_named_pp1 port-id 3  Device(config-policy-tag)# remote-lan rlan_test_1 policy rlan_named_pp1 port-id 4</pre>	
<b>Step 14</b>	<b>exit</b> <b>Example:</b> <pre>Device(config-policy-tag)# exit</pre>	Returns to global configuration mode.
<b>Step 15</b>	<b>ap mac-address</b> <b>Example:</b> <pre>Device (config)# ap 0042.5AB6.0EF0</pre>	Configures the AP and enters the AP tag configuration mode. <b>Note</b> Use the Ethernet MAC address.
<b>Step 16</b>	<b>policy-tag policy-tag-name</b> <b>Example:</b> <pre>Device (config-ap-tag)# policy-tag rlan_pt_1</pre>	Maps a policy tag to the AP.
<b>Step 17</b>	<b>end</b> <b>Example:</b> <pre>Device(config-guest-lan)# end</pre>	Returns to privileged EXEC mode.

## Enabling mDNS Gateway on Guest LAN Interface

By configuring the mDNS gateway mode on a Guest LAN interface, you can configure the mDNS service policy for a specific Guest LAN interface.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> <pre>Device# configure terminal</pre>	Enters global configuration mode.
<b>Step 2</b>	<b>guest-lan profile-name</b> <i>guest_lan_profile_name num wired-vlan</i> <i>wired_vlan_num</i> <b>Example:</b> <pre>Device(config)# guest-lan profile-name open 1 wired-vlan 666</pre>	Configures guest LAN profile with a wired VLAN. <b>Note</b> Configures the wired VLAN only for the Guest Foreign controller. <ul style="list-style-type: none"> <li>• <i>num</i>: Guest LAN identifier. The valid range is from 1 to 5.</li> </ul>

	Command or Action	Purpose
		<ul style="list-style-type: none"> <li><i>wired_vlan_num</i>: Wired VLAN number. The valid range is from 1 to 4094.</li> </ul>
<b>Step 3</b>	<b>guest-lan profile-name</b> <i>guest_lan_profile_name num</i>  <b>Example:</b> <pre>Device(config)# guest-lan profile-name open 1</pre>	Configures the guest LAN profile without a VLAN for the Guest Anchor controller.
<b>Step 4</b>	<b>mdns-sd-interface {gateway   drop}</b>  <b>Example:</b> <pre>Device(config-guest-lan)# mdns-sd gateway</pre>	Configures the mDNS gateway for a Guest LAN.  <b>Note</b> You need to enable mDNS gateway globally for the Guest LAN to work.
<b>Step 5</b>	<b>end</b>  <b>Example:</b> <pre>Device(config-guest-lan)# end</pre>	Returns to privileged EXEC mode.  Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.

## Associating mDNS Service Policy with Wireless Profile Policy (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Tags & Profiles > Policy**.
  - Step 2** Click the **policy profile** name.
  - Step 3** In the **Advanced** tab, choose the mDNS service policy from the **mDNS Service Policy** drop-down list.
  - Step 4** Click **Update & Apply to Device**.
- 

## Associating mDNS Service Policy with Wireless Profile Policy

**Note** You must globally configure the mDNS service policy before associating it with the wireless profile policy.

A default mDNS service policy is already attached once the wireless profile policy is created. You can use the following commands to override the default mDNS service policy with any of your service policy:

## Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wireless profile policy <i>profile-policy</i></b> <b>Example:</b> Device(config)# wireless profile policy default-policy-profile	Configures wireless profile policy. Here, <i>profile-policy</i> refers to the name of the WLAN policy profile.
<b>Step 3</b>	<b>mdns-sd service-policy <i>custom-mdns-service-policy</i></b> <b>Example:</b> Device(config-wireless-policy)# mdns-sd service-policy custom-mdns-service-policy	Associates an mDNS service policy with the wireless profile policy. The default mDNS service policy name is <b>default-mdns-service-policy</b> .

	Command or Action	Purpose
		Note

	Command or Action	Purpose																				
		<p>The <b>default-mdns-profile-policy</b> uses <b>default-mdns-service-list</b> configuration for filtering mDNS service announcement and queries.</p> <p>In wireless network, the mDNS packets are consumed by the mDNS gateway and clients or device is deprived of learning this service. To share the service with the device and provide ease of configuration to the administrator, a list of few standard service types are shared by default on the wireless network. The list of such standard service types is termed as default service policy that comprises a set of service types.</p> <p>The table covers a sample service list in the default service policy.</p> <p><b>Table 174: Default Name and mDNS Service Type</b></p> <table border="1" data-bbox="1068 961 1479 1869"> <thead> <tr> <th data-bbox="1068 961 1271 1045">Default Name</th> <th data-bbox="1274 961 1479 1045">mDNS Service Type</th> </tr> </thead> <tbody> <tr> <td data-bbox="1068 1047 1271 1152">Apple TV</td> <td data-bbox="1274 1047 1479 1152">_airplay._tcp.local _raop._tcp.local</td> </tr> <tr> <td data-bbox="1068 1155 1271 1239">Apple HomeSharing</td> <td data-bbox="1274 1155 1479 1239">_home-sharing._tcp.local</td> </tr> <tr> <td data-bbox="1068 1241 1271 1293">Printer-IPPS</td> <td data-bbox="1274 1241 1479 1293">_ipp._tcp.local</td> </tr> <tr> <td data-bbox="1068 1295 1271 1400">Apple-airprint</td> <td data-bbox="1274 1295 1479 1400">_ipp._tcp.local <del>_universal._ipp._tcp.local</del></td> </tr> <tr> <td data-bbox="1068 1402 1271 1549">Google-chromecast</td> <td data-bbox="1274 1402 1479 1549">_googlecast._tcp.local _googlerpc._tcp.local _googlezone._tcp.local</td> </tr> <tr> <td data-bbox="1068 1551 1271 1656">Apple-remote-login</td> <td data-bbox="1274 1551 1479 1656">_sftp-ssh._tcp.local _ssh._tcp.local</td> </tr> <tr> <td data-bbox="1068 1659 1271 1711">Apple-screen-share</td> <td data-bbox="1274 1659 1479 1711">_rfb._tcp.local</td> </tr> <tr> <td data-bbox="1068 1713 1271 1766">Google-expeditions</td> <td data-bbox="1274 1713 1479 1766"><del>_google-expeditions._tcp.local</del></td> </tr> <tr> <td data-bbox="1068 1768 1271 1873">Multifunction-printer</td> <td data-bbox="1274 1768 1479 1873">_fax-ipp._tcp.local _ipp._tcp.local</td> </tr> </tbody> </table>	Default Name	mDNS Service Type	Apple TV	_airplay._tcp.local _raop._tcp.local	Apple HomeSharing	_home-sharing._tcp.local	Printer-IPPS	_ipp._tcp.local	Apple-airprint	_ipp._tcp.local <del>_universal._ipp._tcp.local</del>	Google-chromecast	_googlecast._tcp.local _googlerpc._tcp.local _googlezone._tcp.local	Apple-remote-login	_sftp-ssh._tcp.local _ssh._tcp.local	Apple-screen-share	_rfb._tcp.local	Google-expeditions	<del>_google-expeditions._tcp.local</del>	Multifunction-printer	_fax-ipp._tcp.local _ipp._tcp.local
Default Name	mDNS Service Type																					
Apple TV	_airplay._tcp.local _raop._tcp.local																					
Apple HomeSharing	_home-sharing._tcp.local																					
Printer-IPPS	_ipp._tcp.local																					
Apple-airprint	_ipp._tcp.local <del>_universal._ipp._tcp.local</del>																					
Google-chromecast	_googlecast._tcp.local _googlerpc._tcp.local _googlezone._tcp.local																					
Apple-remote-login	_sftp-ssh._tcp.local _ssh._tcp.local																					
Apple-screen-share	_rfb._tcp.local																					
Google-expeditions	<del>_google-expeditions._tcp.local</del>																					
Multifunction-printer	_fax-ipp._tcp.local _ipp._tcp.local																					

	Command or Action	Purpose	
		Default Name	mDNS Service Type
			_scanner._tcp.local
		Apple-windows-fileshare	_smb._tcp.local
		<b>Note</b> <ul style="list-style-type: none"> <li>• Location would be disabled on mDNS default service policy.</li> <li>• You cannot change the contents of the mDNS default service policy. However, you can create separate mDNS service policies and associate them under the wireless policy profile.</li> </ul>	
<b>Step 4</b>	<b>exit</b> <b>Example:</b> Device(config-wireless-policy)# exit	Returns to global configuration mode.	

## Enabling or Disabling mDNS Gateway for WLAN (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Tags & Profiles > WLANs**.
- Step 2** Click on the WLAN.
- Step 3** In the **Advanced** tab, choose the mode in **mDNS Mode** drop-down list.
- Step 4** Click **Update & Apply to Device**.
- 

## Enabling or Disabling mDNS Gateway for WLAN

---

**Note** Bridging is the default behaviour. This means that the mDNS packets are always bridged.

---

## Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wlan profile-name wlan-id ssid-name</b> <b>Example:</b> Device(config)# wlan test 24 ssid1	Specifies the WLAN name and ID. <ul style="list-style-type: none"> <li>• <i>profile-name</i> is the WLAN name which can contain 32 alphanumeric characters</li> <li>• <i>wlan-id</i> is the wireless LAN identifier. The valid range is from 1 to 4096.</li> <li>• <i>ssid-name</i> is the SSID which can contain 32 alphanumeric characters.</li> </ul> <b>Note</b> Global configuration must be in place for mDNS gateway to work.
<b>Step 3</b>	<b>mdns-sd-interface {gateway   drop}</b> <b>Example:</b> Device(config-wlan)# mdns-sd gateway Device(config-wlan)# mdns-sd drop	Enables or disables mDNS gateway and bridge functions on WLAN.
<b>Step 4</b>	<b>exit</b> <b>Example:</b> Device(config-wlan)# exit	Returns to global configuration mode.
<b>Step 5</b>	<b>show wlan name wlan-name   show wlan all</b> <b>Example:</b> Device# show wlan name test   show wlan all	Verifies the status of mDNS on WLAN.
<b>Step 6</b>	<b>show wireless profile policy</b> <b>Example:</b> Device# show wireless profile policy	Verifies the service policy configured in WLAN.

## mDNS Gateway with Guest Anchor Support and mDNS Bridging

When mDNS Gateway is enabled on both Anchor and Foreign controller, the mDNS gateway functionality is supported in guest anchor deployment where clients on guest LAN or WLAN with guest anchor enabled will be responded with any services or cache from export foreign controller itself. All advertisements received on Guest LAN or WLAN on export foreign are learnt on the export foreign itself. All queries received on guest LAN or WLAN are responded by the export foreign itself.

When mDNS Gateway is enabled on Anchor and Disabled on Foreign controller [Bridging Mode], the mDNS gateway functionality is supported in guest anchor deployment where clients on guest LAN or WLAN with guest anchor enabled will be responded with any services or cache from export Anchor even though the clients are connected on Foreign. All advertisements received on guest LAN or WLAN on export foreign is forwarded to Anchor and the cache is stored on the Anchor itself. All queries received on guest LAN or WLAN are responded by the export Anchor itself.

- Note**
- You must configure the guest-LAN to a wireless profile policy which is configured with the required mDNS service-policy.
  - To configure non guest LAN mDNS gateway, see the [mDNS Gateway](#) chapter.

## Configuring mDNS Gateway on Guest Anchor

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>guest-lan profile-name</b> <i>guest-lan-profile-name</i> <i>guest-lan-id</i>  <b>Example:</b> Device(config)# guest-lan profile-name g-lanpro 2	Configures the guest LAN profile with a wired VLAN.
<b>Step 3</b>	<b>mdns-sd gateway</b>  <b>Example:</b> Device(config-guest-lan)# mdns-sd gateway	Enables mDNS gateway on the guest LAN.

## Configuring mDNS Gateway on Guest Foreign (Guest LAN)

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.

	Command or Action	Purpose
<b>Step 2</b>	<b>guest-lan profile-name</b> <i>guest-lan-profile-name</i> <i>guest-lan-id</i> <b>wired-vlan</b> <i>vlan-id</i>  <b>Example:</b> Device(config)# guest-lan profile-name g-lanpro 2 wired-vlan 230	Configures guest LAN profile with a wired VLAN.  <b>Note</b> Configure the wired VLAN only for the Guest Foreign controller.
<b>Step 3</b>	<b>mdns-sd gateway</b>  <b>Example:</b> Device(config-guest-lan)# mdns-sd gateway	Enables mDNS gateway on the guest LAN.
<b>Step 4</b>	<b>exit</b>  <b>Example:</b> Device(config-wireless-policy)# exit	Returns to global configuration mode.

## Configuring mDNS Gateway on Guest Anchor

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>guest-wlan profile-name</b> <i>guest-lan-profile-name</i> <i>guest-wlan-id</i>  <b>Example:</b> Device(config)# guest-wlan profile-name g-lanpro 2	Configures the guest WLAN profile with a wired VLAN.
<b>Step 3</b>	<b>mdns-sd gateway</b>  <b>Example:</b> Device(config-guest-wlan)# mdns-sd gateway	Enables mDNS gateway on the guest WLAN.

# Configuring mDNS Gateway on Guest Foreign (Guest WLAN)

## Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>guest-wlan profile-name</b> <i>guest-lan-profile-name guest-wlan-id</i> <b>wired-vlan</b> <i>vlan-id</i>  <b>Example:</b> Device(config)# guest-wlan profile-name g-lanpro 2 wired-vlan 230	Configures guest WLAN profile with a wired VLAN.  <b>Note</b> Configure the wired VLAN only for the Guest Foreign controller.
<b>Step 3</b>	<b>mdns-sd gateway</b>  <b>Example:</b> Device(config-guest-wlan)# mdns-sd gateway	Enables mDNS gateway on the guest WLAN.
<b>Step 4</b>	<b>exit</b>  <b>Example:</b> Device(config-wireless-policy)# exit	Returns to global configuration mode.

## Verifying mDNS Gateway Configurations

To verify the mDNS summary, use the following command:

```
Device# show mdns-sd summary
mDNS Gateway: Enabled
Active Query: Enabled
 Periodicity (in minutes): 30
Transport Type: IPv4
```

To verify the mDNS cache, use the following command:

```
Device# show mdns-sd cache
----- PTR Records

RECORD-NAME TTL WLAN CLIENT-MAC RR-RECORD-DATA

_airplay._tcp.local 4500 30 07c5.a4f2.dc01 CUST1._airplay._tcp.local
_ipp._tcp.local 4500 30 04c5.a4f2.dc01 CUST3._ipp._tcp.local2
_ipp._tcp.local 4500 15 04c5.a4f2.dc01 CUST3._ipp._tcp.local4
```

```

_ipp._tcp.local 4500 10 04c5.a4f2.dc01 CUST3._ipp._tcp.local6
_veer_custom._tcp.local 4500 10 05c5.a4f2.dc01
CUST2._veer_custom._tcp.local8

```

To verify the mDNS cache from wired service provider, use the following command:

```
Device# show mdns-sd cache wired
```

```

----- PTR Records

RECORD-NAME TTL VLAN CLIENT-MAC RR-RECORD-DATA

_wiredapple._airplay._tcp.local 4500 16 0866.98ec.97af

```

To verify the mdns-sd cache with respect to the RLAN ID, use the following command:

```
Device# show mdns-sd cache rlan-id 1 detail
```

```

Name: _printer._tcp.local

Type: PTR
TTL: 4500
RLAN: 1
RLAN Name: rlan_test_1
VLAN: 141
Client MAC: 000e.c688.3942
AP Ethernet MAC: 0042.5ab6.0ef0
Remaining-Time: 4485
Site-Tag: default-site-tag
mDNS Service Policy: mdnsTV6
Overriding mDNS Service Policy: NO
UPN-Status: Disabled
Rdata: printer._printer._tcp.local

Name: lab-47-187.local
Type: A/AAAA
TTL: 4500
RLAN: 1
RLAN Name: rlan_test_1
VLAN: 141

```

```

Client MAC: 000e.c688.3942
AP Ethernet MAC: 0042.5ab6.0ef0
Remaining-Time: 4485
Site-Tag: default-site-tag
mDNS Service Policy: mdnsTV6
Overriding mDNS Service Policy: NO
UPN-Status: Disabled
Rdata: 10.15.141.124

```

To verify the mdns-sd cache with respect to mDNS-AP, use the following command:

```

Device# show mdns-sd cache mdns-ap 706b.b97d.b060 detail
Name: _printer._tcp.local

```

```

Type: PTR
TTL: 4500
VLAN: 145
Client MAC: 0050.b626.5bfa
mDNS AP Radio MAC: 706b.b97d.b060
mDNS AP Ethernet MAC: 706b.b97c.5208
Remaining-Time: 4480
mDNS Service Policy: mdnsTV
Rdata: printer._printer._tcp.local

```

```

Name: Client-46-153.local
Type: A/AAAA
TTL: 4500
VLAN: 145
Client MAC: 0050.b626.5bfa
mDNS AP Radio MAC: 706b.b97d.b060
mDNS AP Ethernet MAC: 706b.b97c.5208
Remaining-Time: 4480
mDNS Service Policy: mdnsTV
Rdata: 10.15.145.103

```

To verify the mdns-sd cache in detail, use the following command:

```

Device# show mdns-sd cache detail

```

```

Name: _custom1._tcp.local
Type: PTR
TTL: 4500
WLAN: 2
WLAN Name: mdns120
VLAN: 120
Client MAC: c869.cda8.77d6
AP Ethernet MAC: 7069.5ab8.33d0
Expiry-Time: 09/09/18 21:50:47
Site-Tag: default-site-tag
Rdata: service_t1._custom1._tcp.local

```

To verify the mdns-sd cache statistics, use the following command:

```

Device# show mdns-sd cache statistics

```

```

mDNS Cache Stats

```

```

Total number of Services: 4191

```

To verify the mdns-sd statistics, use the following command:

```

Device# show mdns-sd statistics

```

```

```

## Consolidated mDNS Packet Statistics

```

mDNS stats last reset time: 03/11/19 04:17:35
mDNS packets sent: 61045
 IPv4 sent: 30790
 IPv4 advertisements sent: 234
 IPv4 queries sent: 30556
 IPv6 sent: 30255
 IPv6 advertisements sent: 17
 IPv6 queries sent: 30238
 Multicast sent: 57558

 IPv6 advertisements received: 6542
 IPv6 queries received: 5307
mDNS packets dropped: 24

```

To verify the default service list details, use the following command:

```

Device# show mdns-sd default-service-list

mDNS Default Service List

Service Definition: apple-tv
Service Names: _airplay._tcp.local
 _raop._tcp.local

Service Definition: homesharing
Service Names: _home-sharing._tcp.local

Service Definition: printer-ipp
Service Names: _ipp._tcp.local

Service Definition: apple-airprint
Service Names: _ipp._tcp.local
 _universal._sub._ipp._tcp.local

Service Definition: google-chromecast
Service Names: _googlecast._tcp.local
 _googlerpc._tcp.local
 _googlezone._tcp.local

Service Definition: apple-remote-login
Service Names: _sftp-ssh._tcp.local
 _ssh._tcp.local

Service Definition: apple-screen-share
Service Names: _rfb._tcp.local

Service Definition: google-expeditions
Service Names: _googexpeditions._tcp.local

Service Definition: multifunction-printer
Service Names: _fax-ipp._tcp.local
 _ipp._tcp.local
 _scanner._tcp.local

Service Definition: apple-windows-fileshare
Service Names: _smb._tcp.local

```

To verify the primary service list details, use the following command:

```

Device# show mdns-sd master-service-list

mDNS Master Service List

Service Definition: fax
Service Names: _fax-ipp._tcp.local

```

```

Service Definition: roku
Service Names: _rsp._tcp.local

Service Definition: airplay
Service Names: _airplay._tcp.local

Service Definition: scanner
Service Names: _scanner._tcp.local

Service Definition: spotify
Service Names: _spotify-connect._tcp.local

Service Definition: airtunes
Service Names: _raop._tcp.local

Service Definition: airserver
Service Names: _airplay._tcp.local
 _airserver._tcp.local

.
.
.

```

```

Service Definition: itune-wireless-devicesharing2
Service Names: _apple-mobdev2._tcp.local

```

To verify the mdns-sd service statistics on the controller, use the following command:

```
Device# show mdns-sd service statistics
```

Service Name	Service Count
_atc._tcp.local	137
_hap._tcp.local	149
_ipp._tcp.local	149
_rfb._tcp.local	141
_smb._tcp.local	133
_ssh._tcp.local	142
_daap._tcp.local	149
_dpap._tcp.local	149
_eppc._tcp.local	138
_adisk._tcp.local	149

To verify the mDNS-AP configured on the controller and VLAN(s) associated with it, use the following command:

```
Device# show mdns-sd ap
```

```
Number of mDNS APs..... 1
```

AP Name	Ethernet MAC	Number of Vlans	Vlanidentifiers
AP3600-1	7069.5ab8.33d0	1	300

### Further Debug

To debug mDNS further, use the following procedure:

1. Run this command at the controller:

```
set platform software trace wncd <0-7> chassis active R0 mdns debug
```

2. Reproduce the issue.

3. Run this command to gather the traces enabled:

```
show wireless loadbalance ap affinity wncd 0
```

AP MAC	Discovery Timestamp	Join Timestamp	Tag	Vlanidentifiers
0cd0.f894.0600	06/30/21 12:39:48	06/30/21 12:40:02	default-site-tag	300
