Release Notes for NBAR2 Protocol Pack 19.1.0 for Cisco Wireless Controllers

- Overview, on page 2
- Supported Platforms, on page 3
- New Protocols in NBAR2 Protocol Pack 19.1.0, on page 4
- Updated Protocols in NBAR2 Protocol Pack 19.1.0, on page 5
- Deprecated Protocols in NBAR2 Protocol Pack 19.1.0, on page 8
- Caveats in NBAR2 Protocol Pack 19.1.0, on page 9
- Downloading NBAR2 Protocol Pack 19.1.0, on page 11
- Special Notes and Limitations, on page 12

Overview

NBAR2 Protocol Pack 19.1.0 provides classification improvements and bug fixes.

- Early DNS decision: Uses DNS traffic to learn server IP addresses and efficiently classify future flows from the first packet.
- New protocols: Mongo and OCSP
- Fixed a DNS socket cache issue to resolve DNS customization issue CSCuz39567.
- Enhanced Web Classification feature supporting multi-transactions export of URLs.
- Automatic Local Services Discovery feature.

  As a part of this feature, to handle business-relevant generic local network traffic, two protocols are added:

  - http-local-net
  - ssl-local-net

Supported Platforms

NBAR2 Protocol Pack 19.1.0 is supported on the following platforms:

- Cisco 5508 Wireless Controller
- Cisco 5520 Wireles Controller
- Cisco Flex 7500 Series Wireless Controllers
- Cisco 8510 Wireless Controller
- Cisco 8540 Wireless Controller
- Cisco Wireless Services Module 2 (WiSM2)

New Protocols in NBAR2 Protocol Pack 19.1.0

The table below lists the new protocols added in NBAR2 Protocol Pack 19.1.0 (protocols added since 14.0.0).

Protocol Name	Common Name	Long Description
mongo	Mongo	Mongo is a leading NoSQL database designed with both scalability and developer agility in mind. Instead of storing your data in tables and rows as you would with a relational database, MongoDB stores JSON-like documents with dynamic schemas.
ocsp	OCSP	OCSP - Online Certificate Status Protocol
http-local-net	Local Net HTTP	Local network generic HTTP traffic.
ssl-local-net	Local Net SSL	Local network generic SSL traffic.
crashplan	Crashplan	Online data backup software. Silently and continuously backs up end-user data for complete visibility and control on a single, secure platform.
cisco-collaboration	Cisco Collaboration Media	Cisco Collaboration Media - Voice, video, and desktop sharing by various Cisco Unified Communications clients.
cisco-spark	Cisco Spark	Cisco Spark - unified communications client and SaaS with mobile team communication: group chat, private chat, video calls with screen sharing, and file sharing.
https	Hypertext Transfer Protocol Secure (HTTPS)	Hypertext Transfer Protocol Secure (HTTPS)
pearson	Pearson	Pearson - education content provider.
statistical-conf-audio	Statistical Conference Audio	Statistical Conference Audio based on machine learning.
statistical-conf-video	Statistical Conference Video	Statistical Conference Video based on machine learning.
statistical-download	Statistical Download	Statistical Download based on machine learning.
statistical-p2p	Statistical Peer-To-Peer	Statistical Peer-To-Peer based on machine learning.
wifi-calling	Wi-Fi Calling	Wi-Fi Calling uses WiFi to provide better mobile phone coverage for a mobile carrier.
ms-services	Microsoft Services	Microsoft Services is a set of tools, APIs and web services used by Microsoft applications.

Deprecated Protocols in NBAR2 Protocol Pack 19.1.0

In this release, the following protocol has changed status to deprecated:

- secure-http

Caveats in NBAR2 Protocol Pack 19.1.0

Note If you have an account on Cisco.com, you can view information on select caveats, using the Bug Search Tool (https://tools.cisco.com/bugsearch/search).

Resolved Caveats in NBAR2 Protocol Pack 19.1.0

The following table lists the caveats resolved in NBAR2 Protocol Pack 19.1.0 (since 14.0.0):

Resolved Caveat	Description
CSCuz39567	DNS customization does not work under some conditions
CSCuy06350	Changed teredo to generic protocol
CSCuy09714	mysql traffic is mis-classified as webthunder
CSCuy11306	RTP audio traffic is mis-classified as Second Life
CSCux74649	RTP-based mis-classifications: Cisco collaboration and vanilla rtp
CSCuy68203	Amazon-web-services traffic is classified as SSL
CSCux67672	Fix CLI chopped protocol names.
CSCux81395	Some cisco-jabber traffic may not be classified (in Protocol Pack 14.0.0)
CSCux62325	Traffic from Polycom device may be misclassified as cisco-jabber-audio
CSCuu61615	Traffic generated by SIP based protocols (such as telepresence) might be classified as RTP
CSCuu99278	Traffic generated by capwap-data protocol might be misclassified
CSCuv56693	Traffic generated by Cisco Telepresence MX300 might be misclassified as RTP

Known Caveats in NBAR2 Protocol Pack 19.1.0

The following table lists the known caveats in NBAR2 Protocol Pack 19.1.0 (since 14.0.0):

Known Caveat	Description
CSCuh49380	PCoIP session-priority configuration limitation.
CSCuh53623	Segmented packets are not classified when using NBAR sub classification.
CSCun61772	IPv4 bundles might be used in IPv6 traffic.
CSCuz48467	CPUHOG message appears when loading Protocol Pack on Cisco ISR 800 Series routers

Known Caveat	Description
CSCux33859	(Applies only to Cisco IOS XE 3.16.1S Version 15.5(3)S1, and IOS Version 15.5(3)M1) Microsoft Lync audio/video is not classified correctly in some cases. If your organization uses Microsoft Lync and one of these releases, it is not recommended to upgrade to Protocol Pack 16.0.0. Use a later release (such as 3.16.2S and above) for full Protocol Pack 16.0.0 support of Microsoft Lync audio/video.

Downloading NBAR2 Protocol Pack 19.1.0

NBAR2 Protocol Packs are available for download on the Cisco.com software download page (http://www.cisco.com/cisco/software/navigator.html). On the download page, specify a platform model to display software available for download. One software option will be **NBAR2 Protocol Packs**.

Example

To display protocol packs available for the Cisco ASR 1001 platform, the navigation path is:

Products > Routers > Service Provider Edge Routers > ASR 1000 Series Aggregation Services Routers > ASR 1001 Router

Special Notes and Limitations

Protocol Name	Special Note or Limitation
apple-app-store	Login and a few encrypted sessions are classified as iTunes.
bittorrent	HTTP traffic generated by the bitcomet bittorrent client might be classified as HTTP.
capwap-data	For capwap-data to be classified correctly, capwap-control must also be enabled.
cisco-phone	Cisco WLC upgraded to NBAR Protocol Pack 24 resolves traffic clasification issues faced using PP 19.1.
cisco-jabber-audio	Cisco WLC upgraded to NBAR Protocol Pack 24 resolves traffic clasification issues faced using PP 19.1.
ftp	During configuring QoS class-map with ftp-data, the FTP protocol must be selected. As an alternative, the FTP application group can be selected.
hulu	Encrypted video streaming generated by hulu may be classified as its underlying protocol rtmpe.
logmein	Traffic generated by the logmein android app may be classified incorrectly as ssl.
ms-lync	Login and chat traffic generated by the ms-lync client may be classified incorrectly as ssl.
pcanywhere	Traffic generated by pcanywhere for mac may be classified as unknown.
perfect-dark	Some perfect-dark sessions may be classified as unknown.
qq-accounts	Login to QQ applications which is not via the internet may not be classified as qq-accounts.
secondlife	Voice traffic generated by secondlife may be classified incorrectly as ssl.
ssl	The Sub Classification (SC) mechanism was modified to include search for wildcard. **Note** The SC rule for the part of the Server Name Indication (SNI) or the common name (CN) can now include a wildcard. If a wildcard is not used, the complete SNI or the CN is required. For example, you can either use, "*.pqr.com" or "abc.pqr.com" to classify abc.pqr.com.

Working with Protocol Packs

- Loading an NBAR2 Protocol Pack, on page 16
- Viewing the Protocol Pack and AVC Engine Details, on page 17

NBAR2 Protocol Pack Overview

NBAR2 Protocol Pack 19.1.0 contains the Enhanced Web Classification feature that supports multi-transactions export of URLs. For more information on this feature, see Classifying Network Traffic Using NBAR

Bittorrent blocking capability has been improved with the newly supported uTorrent and transmission clients.

Protocol Pack Compatibility

NBAR2 Protocol packs are released for specific NBAR engine versions. You can load an NBAR2 protocol pack only if the NBAR engine version used in the Wireless controller (WLC) software platform is the same as or higher than the engine version that the protocol pack is released for. However, you are strongly recommended to use the protocol pack that is the exact match for the engine.

Table 1: Compatibility Table

WLC Software Release	NBAR Engine Used	Protocol packs released for the NBAR engine used
8.7	NBAR engine 23	• 19.1.0 (built-in) • 24.0.0 (Optional upgrade)
8.6	NBAR engine 23	• 19.1.0 (built-in) • 24.0.0 (Optional upgrade)
8.5	NBAR engine 23	• 19.1.0 (built-in) • 24.0.0 (Optional upgrade)
8.4	NBAR engine 23	• 19.1.0 (built-in) • 24.0.0 (Optional upgrade)
8.3	NBAR engine 23	• 19.1.0 (built-in) • 24.0.0 (Optional upgrade)
8.2	NBAR engine 23	• 14.0.0
8.1	NBAR engine 16	• Protocol packs compatible with NBAR engine 13 • 9.0.0 (comes only built-in, in 8.0) • 11.0.0 • 12.0.0
8.0		

WLC Software Release	NBAR Engine Used	Protocol packs released for the NBAR engine used
7.6	NBAR engine 13	• 4.1.1 • 6.3.0 • 6.4.0
7.5		

Note Consider a WLC running a 7.6 or older software release, loaded with a compatible protocol pack. If this controller is upgraded to software release 8.0 , then it will start using protocol pack 9.0.0, which comes in-built in 8.0 release. Additionally you can choose to download protocol pack 11.0.0, which in turn will be loaded instead of 9.0.0. However, if you revert back to the older software release, then the older protocol pack loaded for that release will be loaded again.

Note If you try to load an incompatible protocol pack on a controller, it will be rejected with an error message stating that the protocol pack is incompatible with the underlying NBAR software version. Any existing protocol pack on the controller, will remain active.

Cisco Access Points NBAR Support

The NBAR engine and Protocol Pack supported on the Cisco Access Points are listed in the table.

Table 2: Support for NBAR Engine and Protocol Pack On Cisco APs

Cisco Access Points	NBAR Engine Version	Protocol Pack Version
Cisco Wave 1 Access Points	23	14
Cisco Wave 2 Access Points	35	33

Downloading NBAR2 Protocol Packs

Use only the tested and certified protocol packs which are released on cisco.com. You can download these protocol packs from this location:

http://software.cisco.com/download/navigator.html

A protocol pack is numbered in a format that is similar to this:

pp-AIR-8.3-**(NBAR Engine Number)-(Protocol Pack Version)**.pack

For example, the Wireless Controller Release 8.3 uses NBAR engine version 23. Hence, protocol packs released for Release 8.3 will have a numbering that is similar to this:

pp-AIR-8.3-**23**-19.1.0.pack

Loading an NBAR2 Protocol Pack

Using FTP or TFTP, you can download newer versions of protocol packs into the controller.

Note You are recommended to download protocol packs into the controller only during maintenance. This is because during download the CPU usage will be quite high, which may cause disruptions in the network. It takes no more than three minutes for the download to complete and for the protocol pack to become operational. You do not need to reboot the controller after the download.

Step 1 Enter this command to download a protocol pack:

transfer download datatype *avc-protocol-pack*

Information that is similar to the following is displayed:

```
Mode.......................................... FTP
Data Type..................................... AVC Protocol Pack
FTP Server IP................................. xx.xxx.xxx.xx
FTP Server Port............................... 21
FTP Path...................................... <directory path>
FTP Filename.................................. pp-AIR-8.3-23-19.1.0.pack
FTP Username.................................. cisco
FTP Password.................................. *********

Starting transfer of AVC Protocol Pack

This may take some time.
Are you sure you want to start? (y/N)
```

Step 2 Answer **y** at the prompt to start the download.

Viewing the Protocol Pack and AVC Engine Details

Protocol Pack Details

To view the name and version of the loaded protocol pack, enter this command:

show avc protocol-pack version

Information that is similar to the following is displayed:

```
AVC Protocol Pack Name: Advanced Protocol Pack
AVC Protocol Pack Version: 19.1.0
```

AVC Engine Details

Note An NBAR2 protocol pack can be installed on a device only if the NBAR engine version on the platform is the same as or later than the version required by the NBAR2 protocol pack.

To view the AVC engine version which the controller is using, enter this command:

show avc engine version

Information that is similar to the following is displayed:

```
AVC Engine Version: 23
```

ACCESSBUILDER

Name/CLI Keyword	accessbuilder
Full Name	AccessBuilder
Description	AccessBuilder (Access Builder) is a family of dial-in remote access servers that give mobile computer users and remote office workers full access to workgroup, departmental, and enterprise network resources. Remote users dial into AccessBuilder via analog or digital connections to get direct, transparent links to Ethernet and Token Ring LANs-just as if they were connected locally. AccessBuilder products support a broad range of computing platforms, network operating systems, and protocols to fit a variety of network environments. They provide multi-protocol bridging and routing for wide area Client-to-LAN connections and remote LAN extensions to the central site.

Full Name	Core-Based Trees
Description	The Core-Based Trees protocol (CBT) is designed to build and maintain a shared multicast distribution tree that spans only those networks and links leading to interested receivers. CBT builds a shared multicast distribution tree per group, and is suited for inter- and intra-domain multicast routing. CBT may use a separate multicast routing table, or it may use that of an underlying unicast routing table, to establish paths between senders and receivers.

CFDPTKT

Name/CLI Keyword	cfdptkt
Full Name	Coherent File Distribution Protocol
Description	The Coherent File Distribution Protocol (CFDP) has been designed to speed up one-to-many file transfer operations that exhibit traffic coherence on media with broadcast capability. Examples of such coherent file transfers are identical diskless workstations booting simultaneously, software upgrades being distributed to more than one machines at a site, a certain "object" (bitmap, graph, plain text, etc.) that is being discussed in a real-time electronic conference or class being sent to all participants, and so on. A CFDP client that wants to receive a file first contacts a server to acquire a "ticket" for the file in question. This server could be a suitably modified BOOTP server, the equivalent of the tftpd daemon, etc. The server responds with a 32-bit ticket that will be used in the actual file transfers.

CORBA-IIOP

Name/CLI Keyword	corba-iiop
Full Name	CORBA Internet Inter-ORB Protocol
Description	The Common Object Request Broker Architecture (CORBA) and the Internet Inter-ORB Protocol (IIOP) are two technologies that enable distributed computing across heterogeneous systems. CORBA defines the total architecture required for communication between distributed objects and IIOP is the most important specification of CORBA. IIOP focuses on interoperability of distributed objects in heterogeneous environments. CORBA enables an application's components to communicate without regard for their locations on a network. A CORBA-compliant object is guaranteed to be able to communicate with other distributed objects because the technology defines a common interface.

DHCPV6-CLIENT

Name/CLI Keyword	dhcpv6-client
Full Name	DHCPv6 Client
Description	DHCPv6 is a network protocol that is used for configuring IPv6 hosts with IP addresses, IP prefixes and/or other configuration required to operate on an IPv6 network. IPv6 hosts can acquire IP addresses using stateless address autoconfiguration, or by using DHCPv6. DHCP tends to be preferred at sites where central management of hosts is valued; stateless autoconfiguration does not require any sort of central management, and is therefore preferable in networks where no management is readily available, such as a typical home network.

DIXIE

Name/CLI Keyword	dixie
Full Name	DIXIE Protocol Specification
Description	OSI Directory Service defines a powerful mechanism for storing and retrieving information about objects, and for arranging those objects in a hierarchical structure. Many types of objects and information can be stored in The Directory, including white pages information, application information, service information, etc. The OSI protocol defined to allow access to this information is the Directory Access Protocol (DAP). The DAP, being an OSI application-layer program, is fairly heavy-weight and requires a substantial amount of computing power and coding investment to implement. The DIXIE protocol is designed for use by smaller hosts (e.g., Macintoshes and PCs) that do not have the computing power or necessary software to implement a full OSI protocol stack. The DIXIE protocol is also useful for any Internet application that wants a simple interface to X.500 that requires very little coding investment.

DMP

Name/CLI Keyword	dmp
Full Name	Digital Media Player
Description	Digital Media Player is an IP-based integrated component of the Cisco Digital Media Suite. It controls the display and playback of rich digital media. DMP is fully manageable as a standalone device, however, when it is a part of the integrated Cisco Digital Signs and Cisco Cast systems, it functions as a digital media publishing endpoint. Managing the DMP can be achieved with using the Cisco Digital Media Manager (DMM), the centralized management system component of the Cisco Digital Media Suite. The underlying protocols are FTP (for transferring files), HTTP and HTTPS for browsing, RTP and RTSP for unicast streaming. The classification is for the traffic between DMM and DMP.

DNP

Name/CLI Keyword	dnp
Full Name	DNP3
Description	Distributed Network Protocol (DNP3) is a set of open source and public communications protocols managed by DNP3 Users Group. It is developed for communications between various types of data acquisition and control equipment mainly in utilities such as electric and water companies. It is very important in SCADA systems. It was originally developed for serial connections, hence its architecture has a data link layer, a pseudo transport layer and an application layer, but with the advent of TCP/IP networks, it was ported to IP networks.

DSP3270

Name/CLI Keyword	dsp3270
Full Name	Display Systems Protocol
Description	DSP3270 was created in 1980 in order to allow bisynchronous (BSC) 3270 terminals to communicate through an X.25 network. A PAD (packet assembler-disassembler) connected to a BSC 3270 type device communicates over the packet switched network with another PAD connected to a host computer. The protocol defines the communication between the two PADs, it is carried above the X.25 level 3 layer and so it could be called a level 4 protocol although it is not compatible with the OSI Transport layer.

GGP

Name/CLI Keyword	ggp
Full Name	Gateway-to-Gateway Protocol
Description	The Gateway-to-Gateway Protocol (GGP) is an obsolete protocol defined for routing datagrams between internet gateways. The Gateway-to-Gateway Protocol was designed as an Internet Protocol (IP) datagram service similar to the Transmission Control Protocol (TCP) and the User Datagram Protocol (UDP). However, it is classified as an Internet Layer protocol. GGP uses a minimum hop algorithm, by which it measures distance in router hops. A router is defined to be zero hops from directly connected networks and one hop from networks that are reachable through one other gateway. The protocol implements a distributed shortest-path methodology, and therefore requires global convergence of the routing tables after any change of link connectivity in the network.

Description	The Host Identity Protocol (HIP) is a host identification technology for use on Internet Protocol (IP) networks. The Internet has two main name spaces, IP addresses and the Domain Name System. HIP separates the end-point identifier and locator roles of IP addresses. It introduces a Host Identity (HI) name space, based on a public key security infrastructure.

IRTP

Name/CLI Keyword	irtp
Full Name	Internet Reliable Transaction
Description	The Internet Reliable Transaction Protocol (IRTP) is a transport level host-to-host protocol designed for an internet environment. It provides reliable, sequenced delivery of packets of data between hosts and multiplexer/demultiplexer streams of packets from/to user processes representing ports. It is simple to implement, with a minimum of connection management, at the possible expense of efficiency.

ISATAP-IPV6-TUNNELED

Name/CLI Keyword	isatap-ipv6-tunneled
Full Name	Isatap IPv6 Tunneled
Description	ISATAP is an automatic overlay tunneling mechanism that uses the underlying IPv4 network as an non-broadcast multiple access network (NBMA) link layer for IPv6. ISATAP is designed for transporting IPv6 packets within a site where a native IPv6 infrastructure is not yet available; for example, when sparse IPv6 hosts are deployed for testing. ISATAP tunnels allow individual IPv4 or IPv6 dual-stack hosts within a site to communicate with other such hosts on the same virtual link, basically creating an IPv6 network using the IPv4 infrastructure.

LOCKD

Name/CLI Keyword	lockd
Full Name	NFS Lock Daemon Manager
Description	NFS file locking is mainly provided by the RPC-based network lock manager (NLM) service. The program implementing NLM is usually called rpc.lockd, and must be running on both the NFS client and server machine. When a user process wants to lock a part or the whole of a file from an NFS-mounted volume, the kernel sends the lock request to the local lock daemon. This is usually done using the KLM (Kernel Lock Manager) protocol.

Description	A set of proocols used for Mobile Ad hoc Networking. With recent performance advancements in computer and wireless communications technologies, advanced mobile wireless computing is expected to see increasingly widespread use and application, much of which will involve the use of the Internet Protocol (IP) suite. The vision of mobile ad hoc networking is to support robust and efficient operation in mobile wireless networks by incorporating routing functionality into mobile nodes. Such networks are envisioned to have dynamic, sometimes rapidly-changing, random, multihop topologies which are likely composed of relatively bandwidth-constrained wireless links.

MTP

Name/CLI Keyword	mtp
Full Name	Multicast Transport Protocol
Description	Media Transfer Protocol is a set of custom extensions to the Picture Transfer Protocol (PTP). PTP is used for downloading photographs from digital cameras, whereas MTP adds support for the transfer of music files on digital audio players, media files on portable media players and personal information on personal digital assistants. Media Transfer Protocol (commonly referred to as MTP) is part of the "Windows Media" framework and thus closely related to Windows Media Player. Windows Vista has built-in support for MTP. Support for Media Transfer Protocol in Windows XP requires the installation of Windows Media Player 10 or higher. Mac and Linux systems have software packages to support it.

NETBIOS

Name/CLI Keyword	netbios
Full Name	Netbios
Description	Network Basic Input/Output System (NetBIOS) provides services related to the session layer of the OSI model allowing applications on separate computers to communicate over a local area network. As strictly an API, NetBIOS is not a networking protocol. In modern networks, NetBIOS normally runs over TCP/IP via the NetBIOS over TCP/IP (NBT) protocol. This results in each computer in the network having both an IP address and a NetBIOS name corresponding to a (possibly different) host name.

NETBIOS-NS

Name/CLI Keyword	netbios-ns
Full Name	NetBIOS Naming Service
Description	NetBIOS Name Service is part of the NetBIOS-over-TCP/UDP protocol suite for name registration and resolution. It provides services related to the session layer of the OSI model allowing applications on separate computers to communicate over a local area network. In NetBIOS, each participant must register on the network using a unique name. NetBIOS over TCP/IP can implement a central repository or Name Service that records all name registrations. It only supports IPV4 addresses and typically works on TCP/UDP port 137.

OLSR

Name/CLI Keyword	olsr
Full Name	Optimized Link State Routing Protocol
Description	The Optimized Link State Routing Protocol (OLSR) is an IP routing protocol optimized for mobile ad-hoc networks, which can also be used on other wireless ad-hoc networks. OLSR is a proactive link-state routing protocol, which uses hello and topology control (TC) messages to discover and then disseminate link state information throughout the mobile ad-hoc network. Individual nodes use this topology information to compute next hop destinations for all nodes in the network using shortest hop forwarding paths.

PING

Name/CLI Keyword	ping
Full Name	Ping
Description	Ping is a computer network administration utility used to test the reachability of a host on a network and to measure the round-trip time for messages sent from the host to the destination. Ping operates by sending ICMP echo request packets to the target host and waiting for an ICMP response. In the process it measures the round-trip time and records any packet loss. It prints a statistical summary when finished. Note that Ping will not classify any ICMP packet, only those used for echo.

RSVP-ENCAP-2

Name/CLI Keyword	rsvp-encap-2
Full Name	Resource Reservation Protocol
Description	Resource Reservation Protocol (RSVP) is a Transport Layer protocol designed to reserve resources across a network for an integrated services internet. RSVP operates over an IPv4 or IPv6 internet Layer and provides receiver-initiated setup of resource reservations for multicast or unicast data flows with scaling and robustness. It does not transport application data but is similar to a control protocol, like ICMP or IGMP.

SCHEDULE-TRANSFER

Name/CLI Keyword	schedule-transfer
Full Name	Schedule Transfer Protocol
Description	Scheduled Transfer Protocol (STP) is a new ANSI specifed connection-oriented data transfer protocol. In STP small control messages are used to allocate bufers on the remote host before any data transfer. This reduces the workload of the receiver considerably and makes hardware acceleration relatively simple to implement.

SIFT-UFT

Name/CLI Keyword	sift-uft
Full Name	Sender-Initiated/Unsolicited File Transfer
Description	Sender-Initiated File Transfer (SIFT) protocol, also commonly called Unsolicited File Transfer (UFT) protocol is a file transfer protocol. It's method contrasts with other file transfer methods in that the sender need not have an account or any registration on the target host system, and the receiving user may have less steps to take to retrieve the file(s) sent. Unlike traditional file transfer, UFT lends itself handily to background ordeferred operation, though it may be carried out immediately, eveninteractively.

SSH

Name/CLI Keyword	ssh
Full Name	Secure Shell
Description	Secure Shell Protocol (SSH) is a protocol used to secure login and other secure network services over an unsecure network. The protocol based on a client-server architecture has three steps for the connection: First the server has to be authenticated to the client over a reliable transport connection (usually TCP/IP), then the client side is authenticated-only then the connection is established and the client-server encrypted connection can transfer data between them. Typically the protocol uses TCP port 22.

STUNS

Name/CLI Keyword	stuns
Full Name	STUN over TLS
Description	Session Traversal Utilities for NAT provides a means for an endpoint to determine the IP address and port allocated by a NAT that corresponds to its private IP address and port. It also provides a way for an endpoint to keep a NAT binding alive. With some extensions, the protocol can be used to do connectivity checks between two endpoints [MMUSIC-ICE], or to relay packets between two endpoints.

SUN-DR

Name/CLI Keyword	sun-dr
Full Name	SUNDR
Description	SUNDR is a network file system designed to store data securely on untrusted servers. SUNDR lets clients detect any attempts at unauthorized file modification by malicious server operators or users. SUNDRs protocol achieves a property called fork consistency, which guarantees that clients can detect any integrity or consistency failures as long as they see each others file modifications. An implementation is described that performs comparably with NFS (sometimes better and sometimes worse), while offering significantly stronger security.

TCF

Name/CLI Keyword	tcf
Full Name	TCF
Description	Target Communication Framework (TCF) is a vendor-neutral, lightweight, extensible network protocol used mainly for communicating with embedded systems (targets). Its most distinguishing feature is that TCF is designed to transparently plug in value-adding servers between the tool and the target. Without value-add, the protocol can unify many currently independent communication links, thus saving resources and making setup and configuration much easier than in current embedded development scenarios.

ULP

Name/CLI Keyword	ulp
Full Name	User Location Protocol
Description	The User Location Protocol (ULP) is the interface between a user location client and a user location server. User Location Servers are server programs that maintain dynamic information about users and the applications they are running. The server is similar to a DNS server in that the set of resource information associated with a particular user is composed of separate resource records. User Location Clients are programs that connect to user location servers. Clients can create, delete, modify, and query resource records on the server.

VPP

Name/CLI Keyword	vpp
Full Name	Virtual Presence Protocol
Description	The Virtual Presence Protocol (VPP) is used to enable the exchange of document based virtual presence information. Virtual presence information is the foundation for virtual neighborhood services which provide users with information about virtual neighbors, i.e. other users who are close within the virtual document space. VPP enables the creation of dynamic vicinities based on hypertext references. It is not meant to replace or supersede presence notification protocols, but it augments online presence with location information. The purpose of presence notification protocols is to tell whether another individual is online or arrives online, etc.

WAP-PUSH

Name/CLI Keyword	wap-push
Full Name	WAP PUSH
Description	A WAP Push is a specially encoded message which includes a link to a Wirless Application Protocol (WAP) address. WAP Push was specified on top of WAP Datagram Protocol (WDP). As such, it can be delivered over any WDP-supported bearer, such as GPRS or SMS. WAP Push is an ideal technology for reaching users of legacy devices that have limited message content, formatting and viewing capabilities. This technology can deliver WAP Push messages to the user which in turn may be viewed by them in their device browser.

WAP-WSP

Name/CLI Keyword	wap-wsp
Full Name	WAP connectionless session service
Description	Wireless Session Protocol (WSP) is an open standard for maintaining high level session. Wireless session is a normal Web browsing session that starts when the user connects to one URL and ends when the user leaves that URL. By establishing the session, the session wide properties need only to be defined once at the beginning of the session. This has the benefit of saving bandwidth due to the nature of the wireless communication. The session establishing process does not have lengthy hand shaking mechanisms.

XTP

Name/CLI Keyword	xtp
Full Name	Xpress Transport Protocol
Description	Xpress Transport Protocol (XTP) is a transport layer protocol developed by the XTP Forum for high-speed networks, to replace TCP. XTP provides protocol options for error control, flow control, and rate control. Instead of separate protocols for each type of communication, XTP controls packet exchange patterns to produce different models, e.g. reliable datagrams, transactions, unreliable streams, and reliable multicast connections.
