Cisco Spaces: IoT Explorer App

Overview

The Cisco Spaces: IoT Explorer app enables you to monitor and optimize the performance of your assets, sensors, alerting system, and work flows.

Features

The Cisco Spaces: IoT Explorer app is a comprehensive single resource for managing, monitoring, and optimizing your assets, Internet of Things (IoT) sensors, alerting system, and operational workflows.

The Cisco Spaces: IoT Explorer app is the third generation enhanced version of Operational Insights and Cisco Asset Locator applications. The **IoT Explorer** application is designed to bring in quick value to users exploring device-driven IoT use cases in Cisco Spaces and to add value to IoT services at the ACT licensing level.

This application accomplishes the three use cases listed below:

- Temperature Monitoring: Monitor spaces and receive notifications of changes in temperature

- Asset Tracking: Locate, monitor, and set up alerts to gain insight into your asset's locations

- Presence Detection: Get real time insights into how your physical spaces are occupied

Within each of these use cases, you can create rules/alerts, view data logs, view the real time location and status of the device or sensor. The **IoT Explorer** application UI is designed to set up the use case in a simplified way.
