Introducción

Esta configuración muestra una configuración de LAN a LAN entre dos routers en un entorno de hub-spoke. Cisco VPN Clients también conectan con el hub y utilizan Autenticación ampliada (Xauth).

El router spoke en este escenario obtiene su dirección IP dinámicamente a través de DHCP. El uso del protocolo de configuración dinámica de host (DHCP) es habitual en situaciones en las que el spoke se conecta a Internet a través de un módem DSL o por cable. Esto se debe a que el ISP a menudo aprovisiona las direcciones IP de forma dinámica mediante DHCP en estas conexiones de bajo coste.

Sin configuración adicional, el uso de una clave precompartida comodín en el router hub no es posible en esta situación. Esto se debe a que Xauth para las conexiones VPN Client rompe la conexión de LAN a LAN. Sin embargo, cuando inhabilita Xauth, reduce la capacidad de autenticar clientes VPN.

La introducción de perfiles ISAKMP en Cisco IOS® Software Release 12.2(15)T hace posible esta configuración ya que puede coincidir en otras propiedades de la conexión (grupo de clientes VPN, dirección IP de peer, nombre de dominio completamente calificado [FQDN], etc.) en lugar de sólo en la dirección IP de peer. Los perfiles ISAKMP son el tema de esta configuración.

Nota: También puede utilizar la palabra clave no-xauth con el comando `crypto isakmp key` para saltar Xauth para los pares LAN a LAN. Consulte [Capacidad para Inhabilitar Xauth para Peers](#)

[IPSec Estáticos](#) y [Configuración de IPSec entre Dos Routers y un Cisco VPN Client 4.x](#) para obtener más información.

La [configuración del router spoke](#) en este documento se puede replicar en todos los otros routers spoke que se conectan al mismo hub. La única diferencia entre radios es la lista de acceso que hace referencia al tráfico que se va a cifrar.

Consulte [Ejemplo de Configuración de Cliente y Servidor EzVPN en el Mismo Router](#) para obtener más información sobre el escenario donde puede configurar un router como un Cliente EzVPN y un servidor en la misma interfaz.

Consulte [Túneles de LAN a LAN en un Concentrador VPN 3000 con un Firewall PIX Configurado para DHCP](#) para configurar la Serie de Concentradores Cisco VPN 3000 para crear túneles IPsec dinámicamente con los Firewalls Cisco PIX remotos que utilizan DHCP para obtener direcciones IP en sus interfaces públicas.

Consulte [Ejemplo de Configuración de Túnel IPsec LAN-to-LAN en un Concentrador VPN 3000 con un Router Cisco IOS Configurado para DHCP](#) para configurar la Serie de Concentradores VPN 3000 para crear túneles IPsec dinámicamente con dispositivos VPN remotos que reciben direcciones IP dinámicas en sus interfaces públicas.

Consulte [Ejemplo de Configuración de IPSec entre un Router IOS Estático y un PIX/ASA 7.x Dinámico con NAT](#) para habilitar el Dispositivo de Seguridad PIX/ASA para aceptar las conexiones IPsec dinámicas del router IOS®.

Prerequisites

Requirements

No hay requisitos específicos para este documento.

Componentes Utilizados

Los perfiles IPsec se introdujeron en Cisco IOS Software Release 12.2(15)T. Debido al ID de bug de Cisco [CSCea7140](#) (sólo clientes [registrados](#)), necesita ejecutar la versión 12.3(3) o posterior del software del IOS de Cisco, o la versión 12.3(2)T o posterior del software del IOS de Cisco para que esta configuración funcione correctamente. Estas configuraciones se probaron con estas versiones de software:

- Software Cisco IOS versión 12.3(6a) en el router hub
- Software Cisco IOS versión 12.2(23a) en el router spoke (puede ser cualquier versión crypto)
- Cisco VPN Client versión 4.0(4) en Windows 2000

La información que contiene este documento se creó a partir de los dispositivos en un ambiente de laboratorio específico. Todos los dispositivos que se utilizan en este documento se pusieron en

funcionamiento con una configuración verificada (predeterminada). If your network is live, make sure that you understand the potential impact of any command.

Convenciones

Consulte [Convenciones de Consejos Técnicos Cisco para obtener más información sobre las convenciones del documento.](#)

Configurar

En esta sección encontrará la información para configurar las funciones descritas en este documento.

Nota: Utilice la [herramienta de búsqueda de comandos](#) (solo para clientes [registrados](#)) para obtener más información sobre los comandos utilizados en este documento.

Diagrama de la red

Este documento utiliza la configuración de red que se muestra en el siguiente diagrama.

Configuraciones

En este documento, se utiliza esta configuración de red:

- [Configuración del hub](#)
- [Configuración de radio](#)

Cliente VPN

Cree una nueva entrada de conexión que haga referencia a la dirección IP del router hub. El nombre del grupo en este ejemplo es "testgroup" y la contraseña es "cisco321". Esto puede verse en la [configuración](#) del [router hub](#).

Verificación

Use esta sección para confirmar que su configuración funciona correctamente.

Los comandos de depuración que se ejecutan en el router hub pueden confirmar que los parámetros correctos coinciden para las conexiones spoke y VPN Client.

[La herramienta Output Interpreter Tool \(clientes registrados solamente\) \(OIT\) soporta ciertos comandos show.](#) Utilice la OIT para ver un análisis del resultado del comando show.

Nota: Consulte [Información Importante sobre Comandos Debug](#) antes de utilizar los comandos debug.

- show ip interface: muestra la asignación de la dirección IP al router spoke.
- show crypto isakmp sa detail—Muestra las IKE SAs, que se han configurado entre los iniciadores IPsec. Por ejemplo, el router spoke y el cliente VPN, y el router hub.
- show crypto ipsec sa—Muestra las SAs IPsec, que se han configurado entre los iniciadores IPsec. Por ejemplo, el router spoke y el cliente VPN, y el router hub.
- debug crypto isakmp — Muestra mensajes acerca de eventos de intercambio de claves por Internet (IKE).
- debug crypto ipsec — Muestra eventos de IPsec.
- debug crypto engine: muestra los eventos del motor criptográfico.

Este es el resultado del comando show ip interface f0/0.

```
<#root>
spoke#
show ip interface f0/0
FastEthernet0/1 is up, line protocol is up
Internet address is 10.100.2.102/24
Broadcast address is 255.255.255.255
Address determined by DHCP
```

Ésta es la salida del comando show crypto isakmp sa detail.

```
<#root>
hub#
show crypto isakmp sa detail
```

Codes: C - IKE configuration mode, D - Dead Peer Detection

K - Keepalives, N - NAT-traversal

X - IKE Extended Authentication

psk - Preshared key, rsig - RSA signature

renc - RSA encryption

C-id	Local	Remote	I-VRF	Encr	Hash	Auth	DH	Lifetime	Cap.

Verificar números de secuencia de mapa criptográfico

Si los peers estáticos y dinámicos están configurados en el mismo mapa crypto, el orden de las entradas de mapa crypto es muy importante. El número de secuencia de la entrada de mapa crypto dinámica debe ser mayor que todas las otras entradas de mapa crypto estáticas. Si las entradas estáticas están numeradas más arriba que la entrada dinámica, las conexiones con esos pares fallan.

A continuación, se proporciona un ejemplo de un mapa crypto numerado correctamente que contiene una entrada estática y una entrada dinámica. Observe que la entrada dinámica tiene el número de secuencia más alto y que se ha dejado espacio para agregar entradas estáticas adicionales:

```

<#root>

crypto dynamic-map dynmap 20
set transform-set myset
crypto map mymap 10 ipsec-isakmp
match address 100
set peer 172.16.77.10
set transform-set myset

crypto map mymap 60000 ipsec-isakmp dynamic dynmap

```

Troubleshoot

Actualmente, no hay información específica de troubleshooting disponible para esta configuración.
