Introducción

Este documento describe cómo validar la programación de hardware de Capa 2 y el reenvío en switches Catalyst serie 9400.

Prerequisites

Requirements

No hay requisitos específicos para este documento.

Componentes Utilizados

La información de este documento se basa en el switch Catalyst serie 9400 (UADP 2.0).

Nota: La versión de software utilizada en este documento es 16.6.1, pero esto debería seguir siendo aplicable para versiones posteriores de Cisco IOS-XE.

Nota: Puede utilizar este documento para otros tipos de switches Catalyst 9000, pero ignorar cualquier comando que haga referencia a una tarjeta de línea.

The information in this document was created from the devices in a specific lab environment. All of the devices used in this document started with a cleared (default) configuration. Si tiene una red en vivo, asegúrese de entender el posible impacto de cualquier comando.

Antecedentes

- El Catalyst 9400 Supervisor1 (C9400-SUP-1) tiene 3 ASIC de reenvío UADP 2.0 (0, 1, 2).
- Cada ASIC de reenvío UADP 2.0 tiene: Núcleo dual (0, 1): esto no existía en las generaciones anteriores de ASICS UADP 2.0.SIF (interfaces de pila): se utiliza para conectarse a los otros 2 ASIC UADP 2.0 mediante un anillo de pila interno.NIFs (Interfaces de red): se utiliza para conectarse a 1 o más tarjetas de línea a través de la placa de interconexiones.
- Todas las decisiones de reenvío de paquetes para las tarjetas de línea y las interfaces de link ascendente del supervisor son tomadas por los 3 ASIC de reenvío UADP 2.0 en el Supervisor activo.
- Las tarjetas de línea utilizadas en este ejemplo tienen 1 ASIC de stub de núcleo único de tarjeta de línea que no participa en las decisiones de reenvío de paquetes.
- El ASIC stub de tarjeta de línea en la tarjeta de línea se conecta a 1 o más de los 3 ASIC de reenvío UADP 2.0 en el Supervisor a través de la placa de interconexiones.
- Los 3 ASIC de reenvío UADP 2.0 en el Supervisor toman todas las decisiones de reenvío de paquetes.

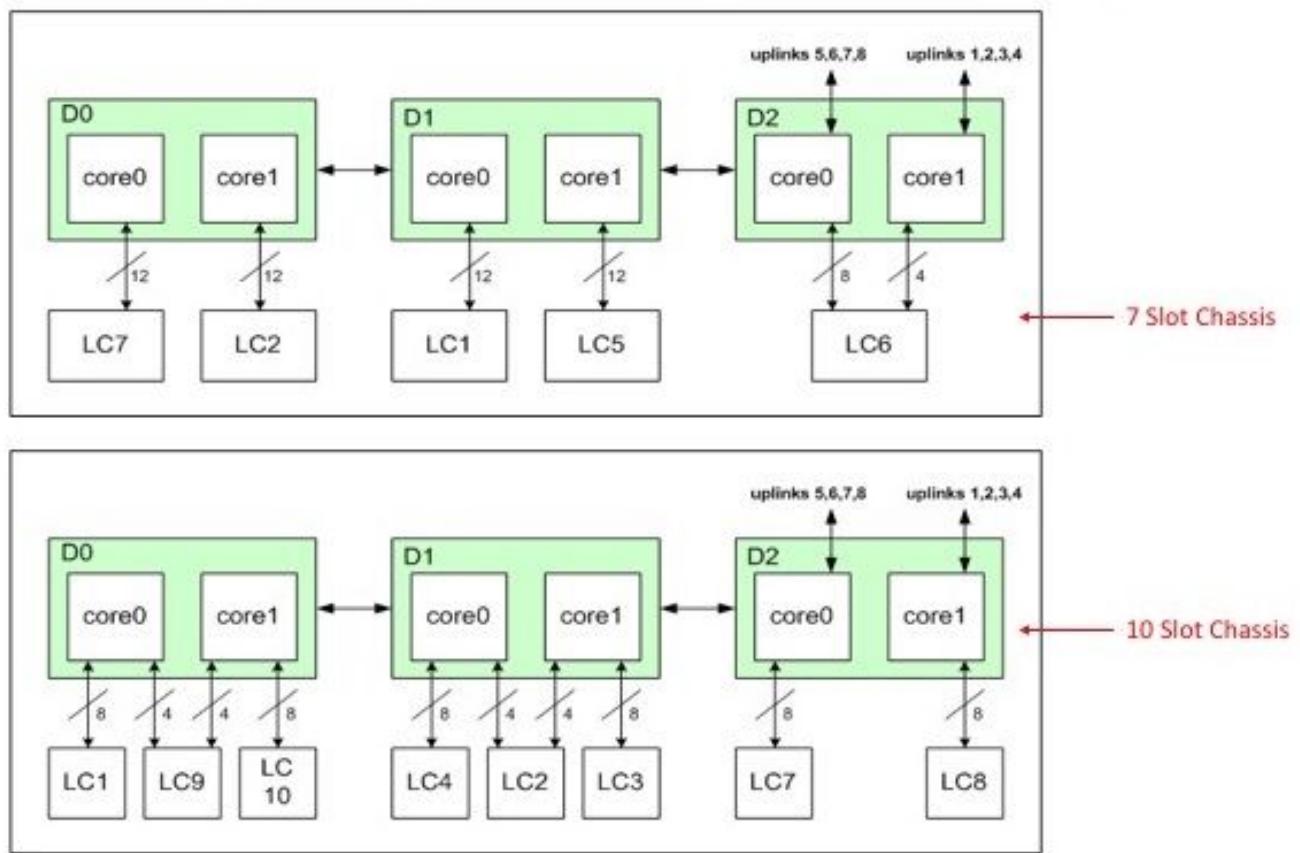

Terminology

| Acrónimo | Definición |
|--------------------------|--|
| RP | Procesador de ruteo |
| FP | Procesador de reenvío |
| FED | Controlador del motor de reenvío. El proceso de software que programa el ASIC de reenvío supervisor. |
| Administrador de objetos | Entradas MAC de software FP que se almacenan como objetos asíncronos en la base de datos de objetos. |

| | |
|----------|--|
| LSMPI | Interfaz de punto de memoria compartida de Linux. El transporte entre el plano de datos (hardware-UADP 2.0) y el plano de control (software-CPU). |
| IFM | Proceso de software de Interface Manager. |
| IF_ID | Interface IDentifier es un valor único que representa una interfaz específica. Se utiliza durante la programación interna en el switch. |
| Inst | Instancia. Indica que la interfaz Asic/Core UADP 2.0 está conectada a: 0=Asic0/Core0, 1=Asic0/Core1, 2=Asic1/Core0, 3=Asic1/Core1, 4=Asic2/Core0, 5=Asic2/Core1. |
| ASIC | Especifica con qué UADP 2.0 se asocia una interfaz: 0=UADP 2.0 #0, 1=UADP 2.0 #1, 2=UADP 2.0 #2. |
| Núcleo | Especifica con qué núcleo de la interfaz UADP 2.0 se asocia: 0=core0, 1=core1. |
| Puerto | Número de instancia ordinal de un puerto dentro de una ranura. Dentro de la misma ranura todos los números de puerto son únicos. |
| SubPort | Identifica un puerto dentro de un grupo de puertos (Cntx) para los puertos del panel frontal. Los SubPort están sub-portados (Cntx y SubPort juntos identifican un puerto único que está sub-portado). |
| Mac | Identificador de interfaz que se utiliza cuando una interfaz ejecuta MACsec (autenticación y seguridad y cifrado). |
| Cntx | Contexto. Número de grupo al que pertenece un puerto cuando se subporta una interfaz dentro del panel frontal (Cntx y SubPort juntos identifican un puerto único que se subporta). |
| LPN | Número de puerto lógico asociado a una interfaz. |
| GPN | Número de puerto global asociado a una interfaz. |
| Tipo NIF | Interfaz de Red; NRU = enlace ascendente redundante de red |
| IF_IS | Identificador de interfaz. Este es un valor único que representa una interfaz específica. Se utiliza durante la programación interna en el switch. |
| Port_LE | Entidad lógica de puerto. Ésta es la configuración de la interfaz. |
| AOM | Administrador de objetos asíncronos. El FP programa la información en la base de datos los objetos como un objeto. |
| VP | Puerto virtual |
| MATM | Administrador de tabla de direcciones MAC |
| RP | Procesador de ruteo |
| OM_PTR | Puntero del gestor de objetos |
| Tbl_ID | Identificador de tabla = vlan |
| CMAN | Administrador de chasis |
| FP | Procesador de reenvío |
| fp_port | Los puertos del panel frontal. |
| Sif | Interfaz de pila (hacia los otros 2 ASIC de reenvío UADP 2.0 en el Supervisor). |
| Nif | Interfaz de red (hacia la interfaz del panel frontal) |
| IGR/EGR | Entrada/Salida |
| IQS | Planificador de cola de ingreso |
| SQS | Planificador de cola de pila |
| PBC | Complejo de búfer de paquetes |
| AQM | Administración de cola activa. Esto hace comprobaciones de administración de congestión. |
| AQMRed | Administración de cola activa Detección temprana aleatoria. |
| EQC | Controlador de cola de salida |
| ESM | Administración del programador de egreso |

| | |
|-----------------------------|--|
| RWE | Motor de reescritura. Agrega o elimina la información del encabezado del paquete. |
| IOMD | Controlador del módulo de salida de entrada |
| fp_port | El puerto del panel frontal. |
| Nif | Interfaz de red (hacia la interfaz del panel frontal) |
| SLI | Interfaz de enlace del sistema (hacia el supervisor) |
| IGR/EGR = | Entrada/Salida |
| AQMRed | Administración de cola activa Detección temprana aleatoria. |
| OCI | Interfaz de control fuera de banda = canal de comunicación interno entre la tarjeta de línea supervisor activo |
| MATM | Administrador de tabla de direcciones MAC |
| Recuento de movimientos MAC | Este es el recuento para cuando una dirección MAC se mueve (se aprende) en una nueva interfaz. El conteo de trasladados puede ocurrir cuando un host final se mueve físicamente de una interfaz a otra, un host inalámbrico pasa de un punto de acceso (AP) a otro AP conectado a una interfaz diferente, o el trayecto del árbol de expansión cambia o se lancan. |

Line Card (LC) to UADP 2.0 Mapping

Nota: Los comandos show platform pueden requerir que el comando service internal global configuration se incluya en la sentencia.

Programación de interfaz

Interfaz para asignación de instancias UADP 2.0

El comando de programación de la interfaz muestra la asignación de la interfaz del panel frontal para todas las tarjetas de línea a uno de los 3 UADP 2.0 que reenvían ASIC en el Supervisor activo.

Ejemplo de Salida

Este ejemplo muestra que:

- La interfaz Gig1/0/3 está conectada a: UADP 2.0 instancia 2 (UADP 2.0 Asic 1, Núcleo 0) en el Supervisor.
- La interfaz Gig5/0/21 está conectada a: UADP 2.0 instancia 3 (UADP 2.0 Asic 1, Núcleo 1) en el Supervisor.

```

```

Programación Etherchannel

En estos resultados de ejemplo de programación de Etherchannel, el RP programa el FP, el FP programa la FED y luego la FED programa el hardware ASIC de reenvío del Supervisor. Las entradas de software RP se almacenan como objetos en la base de datos de objetos y las entradas de software FP se almacenan como objetos asincrónicos en la base de datos de objetos.

```

Programación de hardware - Método 2

Acrónimo/término Definición

| | |
|------------------------|---|
| vlan:10 | MVID 10. La VLAN 100 utiliza la ID de VLAN asignada (MVID) 10 internamente dentro del switch. |
| gpn:1104 | Número de puerto global del canal de puerto 1. |
| mac:0x20bbc05e5 351 | MAC address 20bb.c05e.5351 |

Ejemplo de resultado del método de programación de hardware 2:

```

C9400#show platform hardware fed active matm macTable vlan 100
--snip--

Programación de hardware correcta

Todas las funciones (ya sean una dirección mac, una interfaz, una vlan, etc.) se almacenan en la base de datos de objetos y se programan en el hardware como objetos.

El RP programa el FP, el FP programa la FED y la FED finalmente programa el hardware ASIC de reenvío de Supervisor. Las entradas de software RP se almacenan como objetos en la base de datos de objetos y las entradas de software FP se almacenan como objetos asíncronos en la base de datos de objetos.

Cuando el FP programa la FED (que a su vez programa el ASIC de reenvío del supervisor), la FED envía un reconocimiento de vuelta al FP. El FP luego lo reenvía al RP para indicar que la programación de hardware se completó correctamente. Si falta la programación de hardware FED o es incorrecta, puede utilizar este siguiente comando para comprobar si hay problemas o confirmaciones.

```
C9400#show platform software object-manager fp active statistics
Forwarding Manager Asynchronous Object Manager Statistics

Object update: Pending-issue: 0, Pending-acknowledgement: 0
Batch begin: Pending-issue: 0, Pending-acknowledgement: 0
Batch end: Pending-issue: 0, Pending-acknowledgement: 0
Command: Pending-acknowledgement: 0
Total-objects: 3269
Stale-objects: 0
Resolve-objects: 0
Error-objects: 0
Paused-types: 0
```

Si el comando anterior muestra objetos que no son cero en estado de problema pendiente, utilice

este comando para encontrar el número de objeto involucrado:

```
C9400#show platform software object-manager fp active pending-issue-update
```

A continuación, utilice este comando para determinar el proceso atascado asociado con el número de objeto:

```
C9400#show platform software object-manager fp active object {object#}
```

En el lado RP, utilice este comando para comprobar si hay eliminación pendiente (Del Pend) para un objeto que el FP no reconoció.

```
C9400#show platform software object-manager rp active object-type-info
Object type Name Count Del Pend Layer -----
----- CC cc 5 0 2 SPA spa 0 0 4 PORT_DPIDB port_dpidb 164 0 10 CHANNEL_DPIDB
channel_dpidb 0 0 12 VIRTUAL_DPIDB virtual_dpidb 503 0 13 SW_DPIDB sw_dpidb 0 0 17 VLAN vlan 0 0
19
--snip--
```

Comprobación de estado

Tráfico y política del plano de control

Verifique las caídas de CoPP (Control Plane Policy) en el hardware-UADP 2.0 para el tráfico dirigido a la CPU de software. Esto puede afectar al aprendizaje de MAC y a la estabilidad del árbol de expansión.

```
C9400#show policy-map control-plane
Control Plane

Service-policy input: system-cpp-policy

--snip--

Class-map: system-cpp-police-sw-forward (match-any)
  0 packets, 0 bytes
  5 minute offered rate 0000 bps, drop rate 0000 bps
  Match: none
  police:
    rate 1000 pps, burst 244 packets
    conformed 1298 bytes; actions:
      transmit
    exceeded 0 bytes; actions:
      drop

--snip--

Class-map: system-cpp-police-12-control (match-any)
  0 packets, 0 bytes
  5 minute offered rate 0000 bps, drop rate 0000 bps
  Match: none
  police:
    rate 500 pps, burst 122 packets
    conformed 239197001 bytes; actions:
      transmit
    exceeded 0 bytes; actions:
      drop
```

--snip--

```
Class-map: system-cpp-default (match-any)
  0 packets, 0 bytes
  5 minute offered rate 0000 bps, drop rate 0000 bps
  Match: none
  police:
    rate 1000 pps, burst 244 packets
    conformed 0 bytes; actions:
      transmit
    exceeded 0 bytes; actions:
      drop

Class-map: class-default (match-any)
  0 packets, 0 bytes
  5 minute offered rate 0000 bps, drop rate 0000 bps
  Match: any
```

Aquí se muestra el mismo resultado de CoPP que el ejemplo anterior en un formato más granular y más sencillo de leer (comprimido).

Estadísticas de Supervisor - Ruta de datos de Supervisor a Tarjeta de Línea

Verifique las estadísticas ASIC de reenvío del Supervisor UADP 2.0 activas asociadas a una interfaz específica del panel frontal. En este ejemplo, se utiliza la interfaz Gig1/0/13.

Ejemplo de salida:

- Verifique qué interfaces de la tarjeta de línea forman parte del mismo grupo de puertos.
- Cada grupo de puertos compartió 8 Gbps de ancho de banda desde el ASIC stub de tarjeta de línea hacia el ASIC de reenvío del supervisor.
- Cada grupo de puertos se asocia con una de las SLI (interfaz de enlace del sistema) en el ASIC stub de tarjeta de línea hacia el ASIC de reenvío del supervisor.

Estadísticas de tarjeta de línea - Ruta de datos de supervisor a tarjeta de línea

Verifique las estadísticas ASIC stub de tarjeta de línea asociadas a una interfaz específica del panel frontal. En este ejemplo, la interfaz Gig1/0/13 es el foco.

Ejemplo de salida:

- Los paquetes recibidos de Gig 1/0/13, ingresan al puerto de recepción de la interfaz de red y avanzan a través de IQS a la interfaz de pila.
- A partir de ahí, un paquete sale de la interfaz de pila a otro Supervisor ASIC , o regresa a través de SQS, AQM, EQC, ESM, RWE, y luego sale de la transmisión de la interfaz de red de Gig 1/0/13.
- Los paquetes enviados desde otras interfaces de Supervisor ASIC que salen de Gig 1/0/13 ingresan Sif y luego pasan a través de SQS, AQM, EQC, ESM, RWE y luego salen del NifTx de Gig 1/0/13.
- Para AQM hay 8 colas Tx. Si ve caídas de estas colas, puede utilizar este comando para determinar cuál de las colas está experimentando caídas: show platform hardware fed active go queue stats interface Gig 1/0/13

Verifique el estado del control de flujo desde una perspectiva de tarjeta de línea para la interfaz del panel frontal. Esto ayuda a identificar cualquier congestión en la interfaz.

- Los valores son "-" cuando no hay ningún control de flujo, de lo contrario se indica el número de cola que experimenta control de flujo (congestión).
- El control de flujo recibido por la interfaz se pasa de la tarjeta de línea ASIC en la tarjeta de línea al Supervisor ASIC en el Supervisor donde las caídas de AQM se suelen ver en el Supervisor ASIC. El OCI (interfaz de control fuera de banda) es el canal de comunicación interno entre la tarjeta de línea y el supervisor activo que se utiliza para indicar el control de flujo de la tarjeta de línea al supervisor.
