[Informations connexes](#)

[Introduction](#)

Ce document fournit un exemple de configuration pour chiffrer le trafic du réseau derrière le routeur 1 vers le réseau derrière le routeur 2 (les 0 de bouclage sont utilisés comme réseaux dans cet exemple). Si la liaison principale (Ethernet) entre le routeur 1 et le routeur 2 tombe en panne, le trafic de sécurité IP (IPSec) continue de transiter par la liaison secondaire (RNIS). Il existe plusieurs moyens d'atteindre cet objectif ; vous pouvez utiliser dialer watch, l'interface de sauvegarde, le circuit de demande et l'interface statique flottante. Cet exemple de configuration illustre le mécanisme de surveillance du numéroteur. Pour plus d'informations sur d'autres fonctionnalités, référez-vous à [Évaluation des interfaces de sauvegarde, des routes statiques flottantes et à Surveillance du numéroteur pour la sauvegarde DDR](#).

[Conditions préalables](#)

[Conditions requises](#)

Aucune spécification déterminée n'est requise pour ce document.

[Components Used](#)

Les informations contenues dans ce document sont basées sur les versions de matériel et de logiciel suivantes :

- Routeurs Cisco 2621 et 3640
- Logiciel Cisco IOS® Version 12.3(3)

Les informations présentées dans ce document ont été créées à partir de périphériques dans un environnement de laboratoire spécifique. All of the devices used in this document started with a cleared (default) configuration. Si votre réseau est actif, assurez-vous de bien comprendre l'incidence potentielle de chaque commande avant de l'utiliser.

Conventions

For more information on document conventions, refer to the [Cisco Technical Tips Conventions](#).

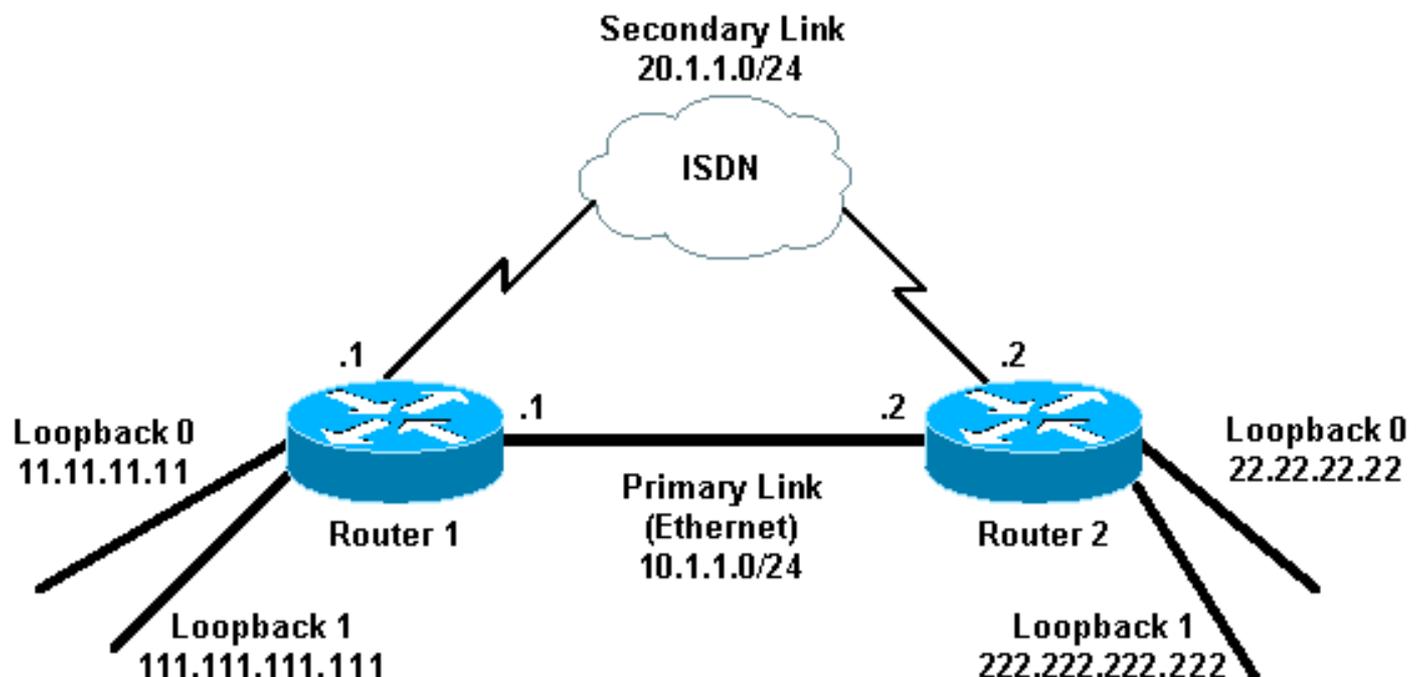

Configuration

Cette section vous fournit des informations pour configurer les fonctionnalités décrites dans ce document.

Remarque : Pour en savoir plus sur les commandes utilisées dans le présent document, utilisez [l'outil de recherche de commandes](#) (clients [inscrits](#) seulement).

Diagramme du réseau

Ce document utilise la configuration réseau présentée dans le schéma ci-dessous :

Configurations

Ce document utilise les configurations indiquées ici:

- [Routeur 1 \(2621\)](#)
- [Routeur 2 \(3640\)](#)

Routeur 1 (2621)

```

Le numéroteur de débogage et plusieurs sorties de la commande **show** affichées ici montrent que la liaison principale a échoué, et Dialer watch reconnaît la route perdue. Le routeur initie ensuite la liaison de sauvegarde et OSPF converge via la liaison secondaire. Chaque fois que le délai d'inactivité expire, le routeur vérifie si la liaison principale est arrêtée. Si la liaison principale est activée, dialer watch déconnecte la liaison de secours après l'expiration et la fin de l'appel du compteur de désactivation, et OSPF converge par la liaison principale comme d'habitude.

Il s'agit des sorties **debug** et **show** de la commande du routeur un (2621), lorsque la liaison principale tombe en panne et est réactivée.

Dépannage

Cette section fournit des informations que vous pouvez utiliser pour dépanner votre configuration. Pour plus d'informations sur le dépannage de problèmes généraux avec les couches RNIS 1, 2 et 3, référez-vous à [Utilisation de la commande show isdn status pour le dépannage BRI](#).

Dépannage des commandes

Certaines commandes **show** sont prises en charge par l'[Output Interpreter Tool](#) (clients enregistrés uniquement), qui vous permet de voir une analyse de la sortie de la commande show.

Remarque : Avant d'émettre des commandes **debug**, reportez-vous à [Informations importantes sur les commandes de débogage](#).

Ces commandes **debug** peuvent être exécutées sur les deux homologues IPsec.

- **debug crypto isakmp** - Affiche les erreurs au cours de la phase 1.
- **debug crypto ipsec** - Affiche les erreurs pendant la phase 2.
- **debug crypto engine** — Affiche des informations du moteur de chiffrement.

Ces commandes **show** peuvent être exécutées sur les deux homologues IPsec.

- **show crypto isakmp sa** - Affiche toutes les associations de sécurité (SA) IKE (Internet Key Exchange) actuelles sur un homologue.
- **show crypto ipsec sa** - Affiche les paramètres utilisés par les SA [IPsec] actuelles.
- **show crypto engine connections active** - Affiche les connexions actuelles et les informations concernant les paquets chiffrés et déchiffrés.

Ces commandes **clear** peuvent être utilisées pour effacer les SA.

- **clear crypto isakmp** : efface les associations de sécurité de phase 1.
- **clear crypto sa** : efface les associations de sécurité de la phase deux.
