IPSec entre deux concentrateurs Cisco VPN 3000 avec chevauchement des réseaux privés

Contenu

Introduction

Ce document décrit comment configurer le concentrateur VPN Cisco 3000 dans un VPN IPSec site à site avec des adresses réseau qui se chevauchent derrière les passerelles VPN. La fonction NAT (Network Address Translation) améliorée introduite dans VPN 3000 Concentrator version 3.6 a été utilisée dans cet exemple pour traduire les réseaux qui se chevauchent de chaque côté du tunnel VPN IPSec afin de modifier les adresses de la plage qui ne se chevauchent pas.

Conditions préalables

Conditions requises

Avant d'essayer cette configuration, assurez-vous de respecter les conditions suivantes :

- Connaissance du concentrateur Cisco VPN 3000
- Connaissance du VPN IPSec

Components Used

Les informations contenues dans ce document sont basées sur les versions de matériel et de

logiciel suivantes :

- Concentrateur VPN Cisco 3000 version 3.6 ou ultérieure

The information in this document was created from the devices in a specific lab environment. All of the devices used in this document started with a cleared (default) configuration. If your network is live, make sure that you understand the potential impact of any command.

Diagramme du réseau

Ce document utilise la configuration réseau suivante :

Le réseau local privé 1 et le réseau local privé 2 ont un sous-réseau IP de 14.38.100.0/24. Cela simule l'espace d'adressage qui se chevauche derrière chaque côté du tunnel IPSec.

Dans cet exemple, le concentrateur VPN 3000 effectue une traduction NAT bidirectionnelle afin que les deux réseaux locaux privés puissent communiquer via le tunnel IPSec. La traduction signifie que le LAN privé 1 « voit » le LAN privé 2 comme 14.38.200.0/24 via le tunnel IPSec, et que le LAN privé 2 « voit » le LAN privé 1 comme 14.38.80.0/24 via le tunnel IPSec.
