Configurazione di un router IPsec come peer LAN-to-LAN dinamico e client VPN

Sommario

Introduzione

Questa configurazione mostra una configurazione da LAN a LAN tra due router in un ambiente hub-spoke. Anche i client VPN Cisco si connettono all'hub e utilizzano l'autenticazione estesa (Xauth).

In questo scenario, il router spoke ottiene il proprio indirizzo IP in modo dinamico tramite DHCP. L'utilizzo del protocollo DHCP (Dynamic Host Configuration Protocol) è comune nelle situazioni in cui lo spoke è connesso a Internet tramite un modem DSL o via cavo. Infatti, spesso l'ISP effettua il provisioning degli indirizzi IP in modo dinamico utilizzando DHCP su queste connessioni a basso costo.

Senza un'ulteriore configurazione, in questa situazione non è possibile utilizzare una chiave già condivisa con caratteri jolly sul router hub. Infatti, Xauth per le connessioni client VPN interrompe la connessione LAN a LAN. Tuttavia, quando si disabilita Xauth, si riduce la possibilità di autenticare i client VPN.

L'introduzione dei profili ISAKMP nel software Cisco IOS® versione 12.2(15)T rende possibile questa configurazione in quanto è possibile stabilire una corrispondenza con altre proprietà della connessione (gruppo client VPN, indirizzo IP peer, nome di dominio completo [FQDN] e così via) anziché semplicemente con l'indirizzo IP del peer. I profili ISAKMP sono l'oggetto di questa configurazione.

Nota: è possibile usare la parola chiave no-xauth anche con il comando crypto isakmp key per

ignorare Xauth nei peer da LAN a LAN. Per ulteriori informazioni, fare riferimento a Possibilità di disabilitare Xauth per i peer IPsec statici e Configurazione di IPsec tra due router e un client VPN Cisco 4.x.

La configurazione del router spoke in questo documento può essere replicata su tutti gli altri router spoke che si connettono allo stesso hub. L'unica differenza tra i spoke è l'elenco degli accessi che fa riferimento al traffico da crittografare.

Per ulteriori informazioni sullo scenario in cui è possibile configurare un router come client e server EzVPN sulla stessa interfaccia, fare riferimento agli esempi di configurazione di EzVPN su uno stesso router.

Fare riferimento ai tunnel da LAN a LAN su un concentratore VPN 3000 con un firewall PIX configurato per DHCP per configurare la serie di concentratori Cisco VPN 3000 in modo da creare dinamicamente tunnel IPsec con firewall Cisco PIX remoti che usano DHCP per ottenere gli indirizzi IP sulle loro interfacce pubbliche.

Fare riferimento al tunnel IPsec da LAN a LAN su un concentratore VPN 3000 con un router Cisco IOS configurato per la configurazione DHCP. Esempio di configurazione della VPN 3000 per creare dinamicamente tunnel IPsec con dispositivi VPN remoti che ricevono indirizzi IP dinamici sulle loro interfacce pubbliche.

Per abilitare le appliance di sicurezza PIX/ASA ad accettare le connessioni IPsec dinamiche dal router IOS®, fare riferimento alla sezione IPsec tra un router IOS statico e un'appliance PIX/ASA 7.x dinamica con configurazione NAT.

Prerequisiti

Requisiti

Nessun requisito specifico previsto per questo documento.

Componenti usati

I profili IPsec sono stati introdotti nel software Cisco IOS versione 12.2(15)T. A causa dell'ID bug Cisco CSCea77140 (solo utenti registrati), per il corretto funzionamento della configurazione è necessario eseguire il software Cisco IOS versione 12.3(3) o successive o la versione 12.3(2)T o successive. Queste configurazioni sono state testate utilizzando le seguenti versioni software:

- Software Cisco IOS release 12.3(6a) sul router hub
- Software Cisco IOS versione 12.2(23a) sul router spoke (può essere una versione crittografica)
- Cisco VPN Client versione 4.0(4) su Windows 2000

Le informazioni discusse in questo documento fanno riferimento a dispositivi usati in uno specifico ambiente di emulazione. Su tutti i dispositivi menzionati nel documento la configurazione è stata

ripristinata ai valori predefiniti. Se la rete è operativa, valutare attentamente eventuali conseguenze derivanti dall'uso dei comandi.

Convenzioni

Per ulteriori informazioni sulle convenzioni usate, consultare il documento Cisco sulle convenzioni nei suggerimenti tecnici.

Configurazione

In questa sezione vengono presentate le informazioni necessarie per configurare le funzionalità descritte più avanti nel documento.

Nota: per ulteriori informazioni sui comandi menzionati in questo documento, usare lo strumento di ricerca dei comandi (solo utenti registrati).

Esempio di rete

Per la stesura di questo documento è stata utilizzata la configurazione di rete illustrata in questo diagramma.

Configurazioni

Il documento usa la seguente configurazione di rete:

- Configurazione hub
- Configurazione Spoke

Client VPN

Creare una nuova voce di connessione che faccia riferimento all'indirizzo IP del router hub. Il nome del gruppo nell'esempio è "testgroup" e la password è "cisco321". Questa condizione può essere rilevata nella configurazione del router dell'hub.

Verifica

Per verificare che la configurazione funzioni correttamente, consultare questa sezione.

I comandi di debug eseguiti sul router hub possono confermare che i parametri corretti per le connessioni spoke e VPN Client siano stati soddisfatti.

Lo strumento Output Interpreter (solo utenti registrati) (OIT) supporta alcuni comandi show. Usare OIT per visualizzare un'analisi dell'output del comando show.

Nota: consultare le informazioni importanti sui comandi di debug prima di usare i comandi di debug.

- show ip interface: visualizza l'assegnazione dell'indirizzo IP al router spoke.
- show crypto isakmp sa detail: visualizza le associazioni di protezione IKE impostate tra gli iniziatori IPsec. Ad esempio, il router spoke, il client VPN e il router hub.
- show crypto ipsec sa: visualizza le SA IPsec, impostate tra gli iniziatori IPsec. Ad esempio, il router spoke, il client VPN e il router hub.
- debug crypto isakmp: visualizza i messaggi sugli eventi IKE (Internet Key Exchange).
- debug crypto ipsec: visualizza gli eventi IPsec.
- debug crypto engine: visualizza gli eventi del motore di crittografia.

Di seguito viene riportato l'output del comando show ip interface f0/0.

<#root>

```
spoke#

show ip interface f0/0

FastEthernet0/1 is up, line protocol is up
Internet address is 10.100.2.102/24
Broadcast address is 255.255.255.255

Address determined by DHCP
```

Di seguito viene riportato l'output del comando show crypto isakmp sa detail.

<#root>

```
hub#

show crypto isakmp sa detail
```

```
Codes: C - IKE configuration mode, D - Dead Peer Detection

Verifica dei numeri di sequenza delle mappe crittografiche

Se i peer statici e dinamici sono configurati sulla stessa mappa crittografica, l'ordine delle voci della mappa crittografica è molto importante. Il numero di sequenza della voce della mappa crittografica dinamica deve essere maggiore di tutte le altre voci della mappa crittografica statica. Se le voci statiche sono numerate più in alto rispetto alla voce dinamica, le connessioni con questi peer non riescono.

Di seguito è riportato un esempio di mappa crittografica correttamente numerata contenente una voce statica e una voce dinamica. Si noti che la voce dinamica ha il numero di sequenza più alto e che è stata lasciata spazio sufficiente per aggiungere altre voci statiche:

<#root>

```
crypto dynamic-map dynmap 20
set transform-set myset
crypto map mymap 10 ipsec-isakmp
match address 100
set peer 172.16.77.10
set transform-set myset
```

crypto map mymap 60000 ipsec-isakmp dynamic dynmap

Risoluzione dei problemi

Al momento non sono disponibili informazioni specifiche per la risoluzione dei problemi di questa

configurazione.
