

Cisco Catalyst 6000 6500 7600 MPLS

Low
Cisco Catalyst 6000 6500 7600 MPLS
CVE-2007-1258
2007-02-28 00:00
Final
CVSS 3.3
No Workarounds available
Cisco ID : CSCef90002

[CVE-2007-1258](#)

Multi Protocol Label Switching (MPLS) feature on Cisco Catalyst 6000, 6500, and 7600 series switches is vulnerable to a Denial of Service (DoS) attack.

Impact

The vulnerability affects the Multi Protocol Label Switching (MPLS) feature on Cisco Catalyst 6000, 6500, and 7600 series switches. The attack is triggered by sending a specially crafted packet to the switch, which causes the switch to crash and become unavailable. This attack can be performed remotely and does not require any authentication. The vulnerability is caused by a buffer overflow in the MPLS control plane. The severity of this vulnerability is Low (CVSS 3.3). There are no workarounds available for this vulnerability.

MPLS feature on Cisco Catalyst 6000, 6500, and 7600 series switches is vulnerable to a Denial of Service (DoS) attack.

For more information, please visit the Cisco Security Advisory page.
