Introduction

On 8/13/2021, Cisco received a report from a customer that they had discovered a vulnerability in Cisco Packet Tracer for Windows 8.0.1. The vulnerability is a Denial of Service (DoS) attack that can be triggered by sending a specially crafted packet to the application.

Vulnerability Details

The vulnerability is located in the `PacketTracer.dll` file. It is a buffer overflow vulnerability that can be triggered by sending a specially crafted packet to the application. The vulnerability is caused by a buffer overflow in the `PacketTracer.dll` file.

Impact

The impact of this vulnerability is a Denial of Service (DoS) attack. An attacker can send a specially crafted packet to the application, which will cause the application to crash. This can be used to disrupt the service provided by the application.

Conclusion

This vulnerability is a Denial of Service (DoS) attack that can be triggered by sending a specially crafted packet to the application. The vulnerability is caused by a buffer overflow in the `PacketTracer.dll` file. The impact of this vulnerability is a Denial of Service (DoS) attack. An attacker can send a specially crafted packet to the application, which will cause the application to crash. This can be used to disrupt the service provided by the application.
