STM1 SOH、HO-POH、および LO-POH バイト

次の一連の図は、STM1 SOH、High Order Path Overhead（HO-POH）、Low Order Path Overhead（LO-POH）のすべてのバイトの説明を示しています。

RSOH Regenerator Section Overhead

A1, A2: Indicates the beginning of the STM-1 frame (A1:11110110, A2:00101000). The frame alignment word of an STM-N frame is composed of 3*N A1 bytes followed by 3*N A2 bytes.

J0: Regenerator section trace. Used to transmit a section access point identifier so that a section receiver can verify its continued connection to the intended transmitter.

Z0: Spare. Reserved for future international standardization.

B1: Regenerator section error monitoring. The BIP-8 is computed over all bits of the previous STM-N frame after scrambling and is placed in the B1 byte of the current frame before scrambling.

E1: Provides orderwire channels for voice communication between regenerators.

F1: Reserved for user purposes (e.g. temporary data/voice channel connections for special maintenance purposes).

D1 - D3: Data communication channels (DCC). A 192 kbit/s channel used from a central location for alarms, control, monitoring and administration functions.

AU Pointers

H1, H2: Pointer bytes. The pointer contained in these bytes designates the location of the VC-n frame. The last ten bits (b7 - b16) carry the pointer value (binary number with a rage of 0 to 782).

H3: Pointer action byte. It is used for frequency justification. Depending on the pointer value, this byte is used to adjust the fill input buffers. It only carries valid information in the event of negative justification, otherwise it's not defined.

MSOH Multiplex Section Overhead

B2: Multiplex section error monitoring. The BIP-N *24 is used to determine if a transmission error has occurred over a multiplex section. It is computed over all bits of the previous STM-N frame except for the first three rows and is placed in the B2 byte of the current frame.

K1, K2: Allocated for APS (Automatic Protection Switching) signaling for the protection of the multiplex section.
