Inleiding

In dit document wordt beschreven hoe u fusierouters configureert in een Cisco SDA-oplossing (Cisco Software-Defined Access of SD-Access).

Voorwaarden

Vereisten

Er zijn geen specifieke vereisten van toepassing op dit document.

Opmerking: installatie is vereist volgens Ondersteunde apparaten die u kunt vinden onder [Link to Releaseopmerkingen](#)

Gebruikte componenten

De informatie in dit document is gebaseerd op de volgende hardware-versies:

- DNAC, versie 1.2.1
- Rand en border - Cat3k Cisco-switch
- Fusie - Cisco-router met ondersteuning voor doorgifte tussen VRF's

De informatie in dit document is gebaseerd op de apparaten in een specifieke laboratoriumomgeving. Alle apparaten die in dit document worden beschreven, hadden een opgeschoonde (standaard)configuratie. Als uw netwerk live is, moet u zorgen dat u de potentiële impact van elke opdracht begrijpt.

Achtergrondinformatie

In de Cisco SD-Access-oplossing worden apparaten beheerd en geconfigureerd door Cisco DNA Center. Over het algemeen kunnen alle onderdelen van de SD-Access-fabric worden geconfigureerd en beheerd door Cisco DNA Center. Het fusieapparaat bevindt zich echter buiten de fabric en wordt dus handmatig geconfigureerd. Border Automation, hierna besproken, is een functie binnen Cisco DNA Center die de Border configuratie voor de overdracht van VRF's naar de Fusion-apparaten kan automatiseren.

Om redenen die gewoonlijk verband houden met de compatibiliteit met de huidige configuratie, is grensautomatisering soms niet geschikt, en dus kan de overdracht van de grens naar het fusieapparaat ook met de hand worden geconfigureerd. Inzicht in de gebruikte configuratie helpt belangrijke details te illustreren over de optimale configuratie en werking van het hele systeem.

Functionaliteit van een fusieapparaat in DNA SD-Access-oplossing

Met een fusieapparaat wordt doorgifte via VRF (Virtual Routing and Forwarding) in SD-Access-fabricdomeinen en hostconnectiviteit met gedeelde services, zoals DHCP, DNS, NTP, ISE, Cisco DNA Center en wireless LAN-controllers (WLC), mogelijk gemaakt. Hoewel deze rol door andere apparaten dan routers kan worden vervuld, wordt in dit document alleen gekeken naar routers als fusieapparaten.

Zoals eerder vermeld, moeten de gedeelde diensten ter beschikking worden gesteld van alle virtuele netwerken (VN) op de Campus. Dit wordt bereikt door de aanmaak van BGP-peerings (Border Gateway Protocol) van de grensrouters naar de Fusion Routers. Op de fusierouter worden de subnetten van de fabric-VRF die toegang moeten hebben tot deze services doorgegeven aan de GRT, of een VRF voor gedeelde services, en andersom. Routekaarten kunnen worden gebruikt om specifieke routingtabellen voor SD-Access-fabrics in op te nemen.

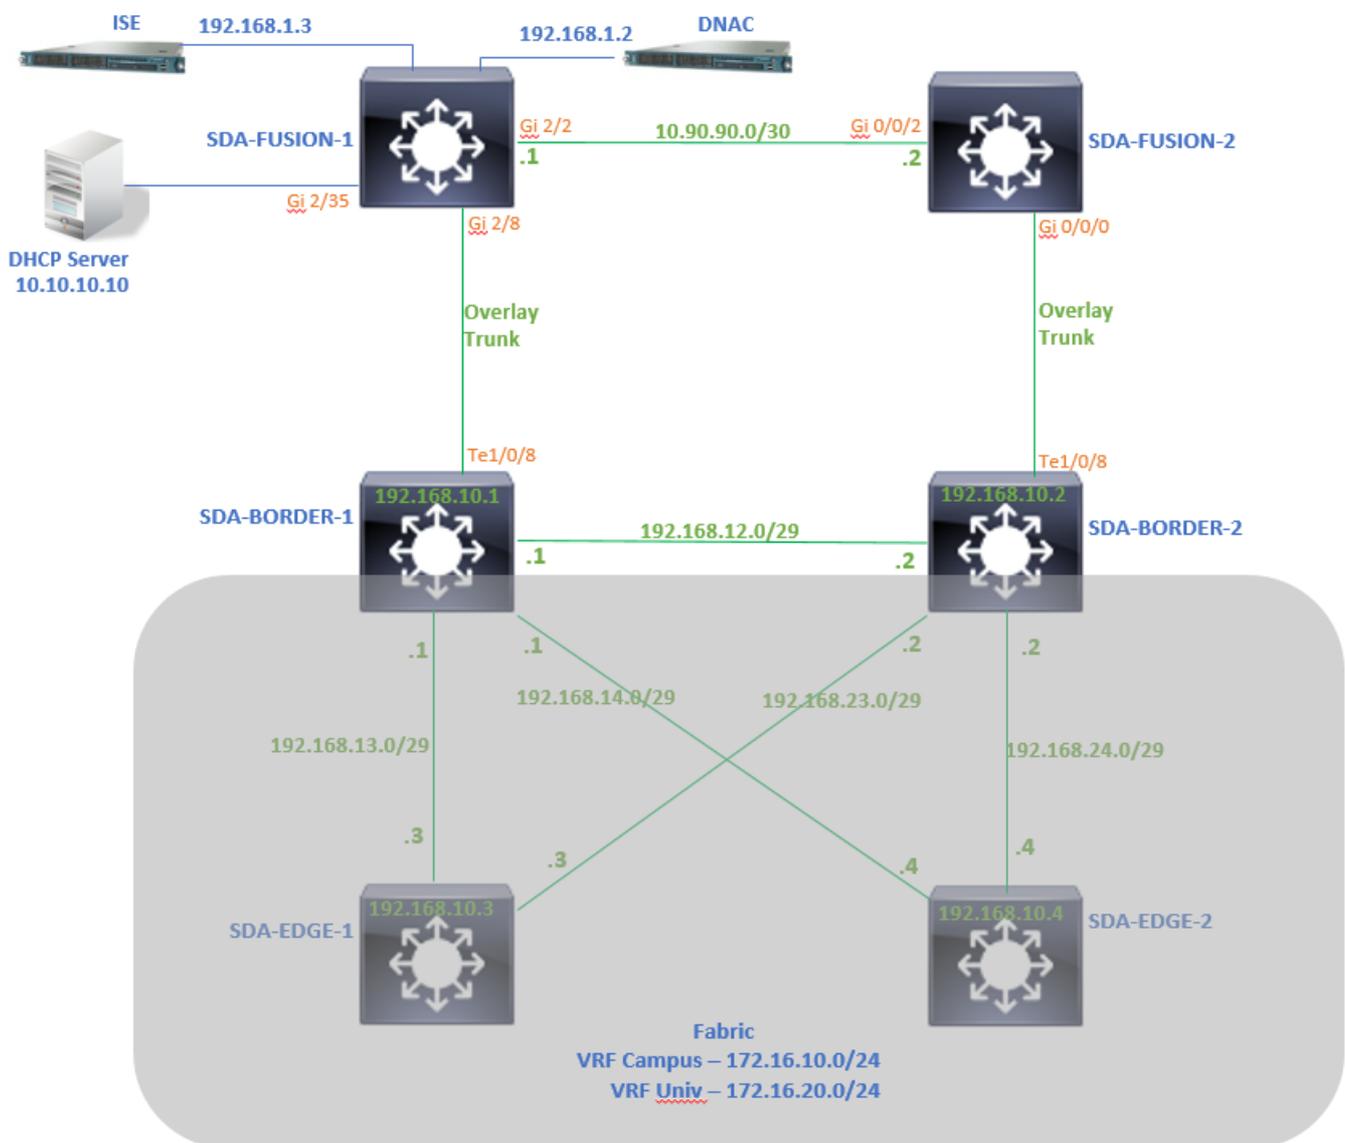

Opmerking: SD-Access border-knooppunten ondersteunen geen overzichtsroutes die overlappen met SD-Access IP-pools. Overzichtsroutes die overlappen met IP-pools moeten worden gefilterd in het routeren van advertenties van Fusion-apparaten naar border-knooppunten.

Configureren

De hier gegeven configuratiedetails zijn met betrekking tot de hieronder getoonde netwerktopologie. Deze netwerktopologie is geen aanbevolen topologie voor implementaties. Deze topologie wordt hier alleen gebruikt om de presentatie van de gegeven configuratievoorbeelden te vergemakkelijken. Raadpleeg [Design Zone for Cisco Digital Network Architecture](#) (Designzone voor digitale netwerkarchitectuur van Cisco) voor de aanbevolen implementatieontwerpen.

Netwerkdigram

De topologie die wordt gebruikt voor dit artikel bestaat uit twee border-routers die beide zijn geconfigureerd als externe borders en twee fusierouters die elk zijn verbonden met een border-router.

Configuraties

Stap 1. De koppeling Hand-off vanuit DNAC configureren

Binnen de stap van het toewijzen van apparaten een rol van Border Router terwijl het wordt toegevoegd aan de Fabric, kan een hand-off link worden gecreëerd. Bij Layer 2 is het een trunklink die is aangesloten op de Fusion Router. De volgende stappen zijn noodzakelijk:

1. Configureer een lokaal AS-nummer voor BGP. Dit AS-nummer (autonoom systeem) wordt gebruikt om het BGP-proces op de borderrouters te configureren.
2. Voeg een interface toe onder Transit. Deze interface is de directe verbinding tussen border- en fusierouter. (Te 1/0/8 op border in dit voorbeeld).

3. Configureer het nummer van het externe AS. Dit AS-nummer wordt gebruikt op border-routers voor buurverklaringen naar Fusion Router om externe BGP-peers (eBGP) te configureren.
4. Selecteer alle virtuele netwerken (VRF's) waarvoor VRF-doorgifte vereist is op de fusierouter.
5. Implementeer de configuratie van DNAC naar apparaten.

Gebruik dezelfde stappen voor het SDA-Border-2 apparaat.

Stap 2. Controleer de configuraties die door DNAC op border-routers worden uitgevoerd

In deze sectie wordt de verificatie van de configuratie op border-routers met betrekking tot het BGP-protocol behandeld.

SDA-Border-1

```
SDA-Border1#show run interface loopback 0

weight 65535 exit-address-family
```

Stap 3. Inloggen op border-routers configureren

Door de VRF-doorgifte op de fusierouter leert address-family ipv4 vrf Campus de route afkomstig uit vrf Univ (172.16.20.0/24). De bronrouter en de lerende router hebben echter hetzelfde BGP AS-nummer (65005). Om mechanismen voor het voorkomen van BGP-lussen te overwinnen en de routes op border-routers te accepteren en te installeren, moet **allowas-in** worden geconfigureerd voor de peerings met de fusierouter:

SDA-Border1

```
SDA-Border1(config)#router bgp 65005
SDA-Border1(config-router)#address-family ipv4 vrf Campus
SDA-Border1(config-router-af)#neighbor 10.50.50.26 allowas-in
SDA-Border1(config-router-af)#exit-address-family
SDA-Border1(config-router)#
SDA-Border1(config-router)#address-family ipv4 vrf Univ
SDA-Border1(config-router-af)#neighbor 10.50.50.22 allowas-in
SDA-Border1(config-router-af)#exit-address-family
SDA-Border1(config-router)#
```

SDA-Border2

```
SDA-Border2(config)#router bgp 65005
SDA-Border2(config-router)#address-family ipv4 vrf Campus
SDA-Border2(config-router-af)#neighbor 10.50.50.2 allowas-in
SDA-Border2(config-router-af)#exit-address-family
SDA-Border2(config-router)#
SDA-Border2(config-router)#address-family ipv4 vrf Univ
SDA-Border2(config-router-af)#neighbor 10.50.50.10 allowas-in
SDA-Border2(config-router-af)#exit-address-family
SDA-Border2(config-router)#
```

Opmerking: Opdracht **allowas-in** moet worden gebruikt met voorzorg omdat het kan leiden tot loops. Als u slechts één Fusion-apparaat gebruikt waar beide Borders mee werken, is filtering nodig om ervoor te zorgen dat lokaal voortgekomen routes niet worden geaccepteerd in het AS van de Fusion-peer - binnen dezelfde VN. Als dat gebeurt, krijgt het eBGP-pad vanwege het maximale gewicht voor eBGP-paden de voorkeur boven het lokaal gegenereerde pad.

Stap 4. Fusion-routers configureren

In deze sectie wordt de handmatige configuratie voor de fusierouters beschreven.

SDA-Fusion-1

Configureer de link naar de border-router als een trunk om deze af te stemmen met de VLAN-configuratie van Border-1:

```
interface GigabitEthernet2/8
  switchport
  switchport trunk encapsulation dot1q
  switchport trunk allowed vlan 3006, 3007
  switchport mode trunk
end
```

Configureer de vereiste VRF's:

```
vrf definition Campus
  rd 1:4099
  !
  address-family ipv4
    route-target export 1:4099
    route-target import 1:4099
  exit-address-family
!
```

```
vrf definition Univ
  rd 1:4100
  !
  address-family ipv4
    route-target export 1:4100
    route-target import 1:4100
  exit-address-family
```

Configureer SVI-interfaces:

```
interface Vlan3007
  vrf forwarding Campus
  ip address 10.50.50.26 255.255.255.252
end
```

```
interface Vlan3006
  vrf forwarding Univ
  ip address 10.50.50.22 255.255.255.252
end
```

Configureer eBGP-peering (externe BGP) met SDA-Border-1:

```
router bgp 65004                                     <<< Remote AS from DNAC
  bgp log-neighbor-changes
  !
  address-family ipv4
  exit-address-family
  !
  address-family ipv4 vrf Campus
    neighbor 10.50.50.25 remote-as 65005
    neighbor 10.50.50.25 update-source Vlan3007
    neighbor 10.50.50.25 activate
  exit-address-family
!
```

```
address-family ipv4 vrf Univ
  neighbor 10.50.50.21 remote-as 65005
  neighbor 10.50.50.21 update-source Vlan3006
  neighbor 10.50.50.21 activate
exit-address-family
```

Configureer iBGP-peering (interne BGP) met SDA-Fusion-2:

```
interface GigabitEthernet2/2
  description SDA-Fusion1--->SDA-Fusion2
  ip address 10.90.90.1 255.255.255.252
end
```

```
router bgp 65004
  neighbor 10.90.90.2 remote-as 65004
  !
  address-family ipv4
    neighbor 10.90.90.2 activate
  exit-address-family
  !
```

Geef het DHCP-serversubnet door onder de globale adresfamilie waar het IP-adres van de DHCP-server 10.10.10.10 is:

```
interface GigabitEthernet2/35
  description connection to DHCP server
  ip address 10.10.10.9 255.255.255.252
end
```

```
router bgp 65004
  !
  address-family ipv4
    network 10.10.10.8 mask 255.255.255.252
  exit-address-family
  !
```

SDA-Fusion-2

Configureer de link naar de border-router. Als een fusie-interface L3 is in plaats van trunk, configureert u subinterfaces:

```
interface GigabitEthernet0/0/0.3001
  encapsulation dot1Q 3001
  vrf forwarding Campus
  ip address 10.50.50.2 255.255.255.252
end
```

```
interface GigabitEthernet0/0/0.3003
  encapsulation dot1Q 3003
  vrf forwarding Univ
  ip address 10.50.50.10 255.255.255.252
end
```

Configureer de bijbehorende VRF's:

```

vrf definition Campus
 rd 1:4099
 !
 address-family ipv4
  route-target export 1:4099
  route-target import 1:4099
 exit-address-family
!
!
vrf definition Univ
 rd 1:4100
 !
 address-family ipv4
  route-target export 1:4100
  route-target import 1:4100
 exit-address-family
!

```

Configureer eBGP-peering met SDA-Border-2:

```

router bgp 65004
 bgp log-neighbor-changes
 !
 address-family ipv4
 exit-address-family
 !
 address-family ipv4 vrf Campus
  neighbor 10.50.50.1 remote-as 65005
  neighbor 10.50.50.1 update-source GigabitEthernet0/0/0.3001
  neighbor 10.50.50.1 activate
 exit-address-family
 !
 address-family ipv4 vrf Univ
  neighbor 10.50.50.9 remote-as 65005
  neighbor 10.50.50.9 update-source GigabitEthernet0/0/0.3003
  neighbor 10.50.50.9 activate
 exit-address-family

```

Configureer iBGP-peering met SDA-Fusion-1:

```

interface GigabitEthernet0/0/2
 ip address 10.90.90.2 255.255.255.252
 negotiation auto
 end

```

```

router bgp 65004 neighbor 10.90.90.1 remote-as 65004 ! address-family ipv4 neighbor 10.90.90.1
 activate exit-address-family

```

Stap 5. VRF-lekkage op fusierouterie configureren

De configuratie voor VRF-doorgifte is identiek voor de fusierouters SDA-Fusion-1 en SDA-Fusion-2.

Configureer eerst de VRF-lekkage tussen de twee VRF's (Campus en Univ) en gebruik **route-target import**:

```

vrf definition Campus
!
 address-family ipv4
route-target export 1:4099 route-target import 1:4099
route-target import 1:4100 <<< Import VRF Univ prefixes in VRF Campus
exit-address-family
!
vrf definition Univ
!
address-family ipv4
route-target export 1:4100 route-target import 1:4100
route-target import 1:4099 <<< Import VRF Campus prefixes in VRF Univ
exit-address-family
!

```

Configureer vervolgens de route die lekt tussen de Global Routing Table (GRT) naar de VRF's en van de VRF's naar de GRT, gebruik **import ... map** en **export ... map**:

```

ip prefix-list Campus_Prefix seq 5 permit 172.16.10.0/24 <<< Include Prefixes belonging to
VRF Campus
ip prefix-list Global_Prefix seq 5 permit 10.10.10.8/30 <<< Include Prefixes belonging to
Global (eq DHCP Server Subnet)
ip prefix-list Univ_Prefix seq 5 permit 172.16.20.0/24 <<< Include Prefixes belonging to
VRF Univ

route-map Univ_Map permit 10
 match ip address prefix-list Univ_Prefix
route-map Global_Map permit 10
 match ip address prefix-list Global_Prefix
route-map Campus_Map permit 10
 match ip address prefix-list Campus_Prefix

```

```

vrf definition Campus
!
 address-family ipv4
 import ipv4 unicast map Global_Map <<< Injecting Global into VRF Campus matching route-map
Global_Map
 export ipv4 unicast map Campus_Map <<< Injecting VRF Campus into Global matching route-map
Campus_Map
 exit-address-family
!
vrf definition Univ
!
address-family ipv4
import ipv4 unicast map Global_Map <<< Injecting Global into VRF Univ matching route-map
Global_Map
export ipv4 unicast map Univ_Map <<< Injecting VRF Univ into Global matching route-map Univ_Map
exit-address-family
!

```

Verifiëren

Deze sectie bevat controlestappen om er zeker van te zijn dat de vorige configuratie correct is uitgevoerd.

Stap 1. Controleer de eBGP-peer tussen fusie- en grensrouters

SDA-Border-1 -----Peering-----SDA-Fusion-1

SDA-Border1#show ip bgp vpnv4 vrf Campus summary

Neighbor	V	AS	MsgRcvd	MsgSent	TblVer	InQ	OutQ	Up/Down	State/PfxRcd

Handmatige configuratie voor border-redundantie

Voor redundantie tussen de PETR's wanneer een externe link aan de grens mislukt, moet u voor de externe en externe+interne grenzen iBGP-sessies tussen de twee randen voor elk van de VPN's handmatig bouwen. Bovendien zijn in het geval van de Externe+Interne grens waar BGP wordt ingevoerd in LISP en LISP terug in BGP wordt herverdeeld, markeringen nodig om iBGP te verhinderen aan LISP routeinvoer en zo potentiële loops te vermijden.

Vereenvoudig fusieconfiguratie met het gebruik van sjablonen

Deze sectie bevat configuratievoorbeelden voor fusiesjablonen om de configuratie te vereenvoudigen.

Vervolgens zijn de Variabelen die moeten worden gedefinieerd op basis van uw implementatieontwerp. In dit voorbeeld zijn de configuraties en VPN's gebaseerd op de vorige topologie die twee VPN's heeft, Campus en Univ.

Definitie van variabelen

```

interface_Fusion1: GigabitEthernet2/8
interface_Fusion2: GigabitEthernet0/0/0

```

```

Global_prefixes = 10.10.10.8/30

```

```

FUSION_BGP_AS = 65004
BORDER_BGP_AS = 65005

```

Voor VN1:

```

VN1 = Campus
Fusion1_VN1_VLAN = 3007
Fusion2_VN1_VLAN = 3001
VN1_prefixes = 172.16.10.0/24

Fusion1_VN1_IP = 10.50.50.26

Fusion1_VN1_MASK = 255.255.255.252

```

Fusion2_VN1_IP = 10.50.50.2

Fusion2_VN1_MASK = 255.255.255.252

VN1_RD = 4099

VN1_border1_neighbor_IP = 10.50.50.25

VN1_border2_neighbor_IP = 10.50.50.1

Voor VN2:

VN2 = Univ

Fusion1_VN2_VLAN = 3006

Fusion2_VN2_VLAN = 3003

VN2_prefixes = 172.16.20.0/24

Fusion1_VN2_IP = 10.50.50.22

Fusion1_VN2_MASK = 255.255.255.252

Fusion2_VN2_IP2 = 10.50.50.10

Fusion2_VN2_MASK = 255.255.255.252

VN2_RD = 4100

VN2_border1_neighbor_IP = 10.50.50.21

VN2_border2_neighbor_IP = 10.50.50.9
