[Gerelateerde informatie](#)

[Inleiding](#)

Dit document bevat informatie over het configureren van DDR (dial-on-demand routing) back-up voor een seriële, WAN- of huurlijn-link met behulp van de functie dialer watch. De back-uplink gebruikt modems op de AUX-poorten van beide routers. Wanneer de primaire link naar beneden gaat, start dialer watch de back-updialoog met de modem op de AUX-poort.

[Voorwaarden](#)

[Vereisten](#)

Dit document gaat ervan uit dat u een goed begrip hebt van de verschillende problemen die gepaard gaan met modems in de AUX-poorten. Als u meer informatie over deze problemen nodig hebt, raadpleegt u de documenten [met de verbindingsgids](#) van de [modem](#) en [de uitbel configureren met een modem in de AUX-poort](#) voordat u doorgaat met dit document.

[Gebruikte componenten](#)

De informatie in dit document is gebaseerd op de volgende software- en hardware-versies:

- Twee Cisco-apparaten van de 2600 met Amerikaanse robotica-modems aangesloten op de

AUX-poorten. Beide routers maken gebruik van Cisco IOS®-software release 12.1(2). Aanbevolen wordt om Cisco IOS versie 12.1(7) of hoger te gebruiken, die fixes voor IOS-knoppen bevat die het horloge van het dialer beïnvloeden.

De informatie in dit document is gebaseerd op apparaten in een specifieke laboratoriumomgeving. Alle apparaten die in dit document worden beschreven, hadden een opgeschoonde (standaard)configuratie. Als u in een levend netwerk werkt, zorg er dan voor dat u de potentiële impact van om het even welke opdracht begrijpt alvorens het te gebruiken.

Conventies

Raadpleeg [Cisco Technical Tips Conventions](#) (Conventies voor technische tips van Cisco) voor meer informatie over documentconventies.

Achtergrondinformatie

Dit scenario omvat het configureren van dialin en dialout met behulp van modems op de AUX-poorten, en het configureren van DDR-back-up met dialerbewaking. Voor meer informatie over de functie dialer watch, raadpleegt u [Reserve-interfaces, zwevende statische routen en Dialer Watch voor DDR-back-up evalueren](#).

Raadpleeg [DDR-back-up configureren met BRI's en Dialer Watch](#) voor informatie over de configuratie en probleemoplossing van het dialoogvenster dat u wilt controleren. De concepten die bij het kijken van de dialer betrokken zijn, zijn onafhankelijk van de gebruikte media, zodat het document bruikbaar is voor kwesties die het bekijken van de dialer betreffen.

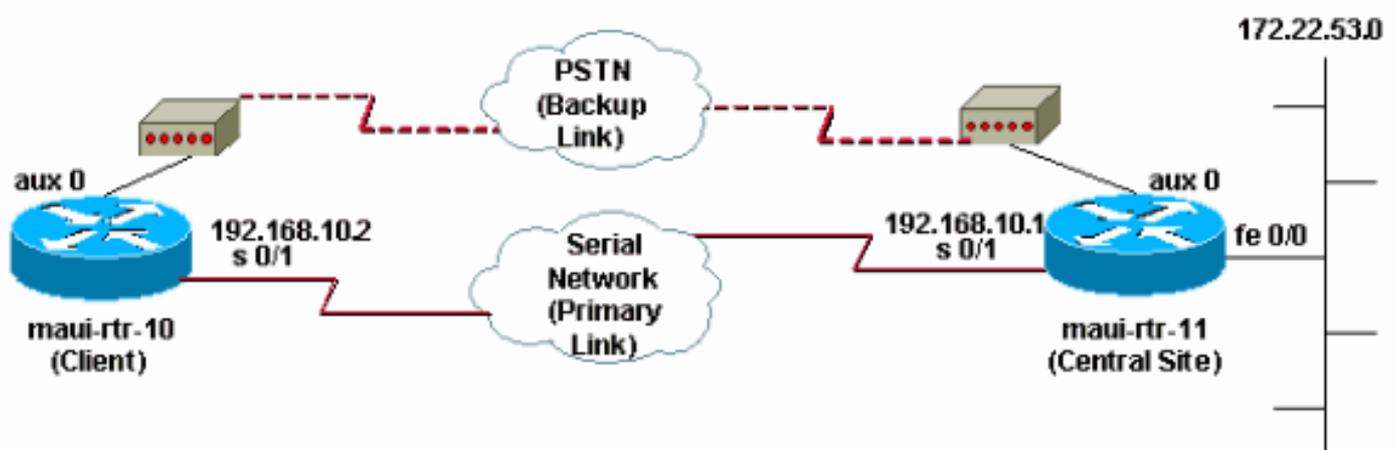

Configureren

Deze sectie bevat informatie over het configureren van de functies die in dit document worden beschreven.

N.B.: Als u aanvullende informatie wilt vinden over de opdrachten in dit document, gebruikt u het [Opdrachtplanningprogramma](#) (alleen [geregistreerd](#) klanten).

Netwerkdigram

Dit document gebruikt de netwerkinstellingen die in dit diagram worden weergegeven:

Configuraties

Bij deze configuratie wordt maui-rtr-10 (client) aangesloten door een seriële link naar maui-rtr-11 (Central Site). Beide routers hebben ook externe Amerikaanse robotica-modems die op de AUX-poorten zijn aangesloten en als back-up worden gebruikt. Wanneer de primaire verbinding daalt, leidt dialer watch de back-uplink in en maui-rtr-10 voert de centrale router van de site aan, verbindt, onderhandelt PPP, en uitwisselt Open Shortest Path First (OSPF) routing informatie. Al het verkeer tussen de routers gebruikt nu de back-upverbinding. Wanneer de primaire verbinding opnieuw wordt gevestigd, wordt de routingtabel bijgewerkt en al verkeer opnieuw gebruikt de primaire verbinding. Aangezien er geen verkeersstromen via de back-uplink zijn, verloopt de ingebruikname van de software-out verloopt en kijkt de dialer naar de back-uplink.

0 4 ! no scheduler allocate end

```

Verifiëren

Deze sectie verschaft informatie die u kunt gebruiken om te bevestigen dat uw configuratie correct werkt.

Bepaalde **show** opdrachten worden ondersteund door het gereedschap [Uitvoertolk](#) ([alleen geregistreerde](#) klanten), waarmee u een analyse van **show**-opdrachtoutput kunt bekijken.

Uitvoer voorbeeld

De routingtabel van de client (maui-rtr-10) met de primaire link die functioneert, wordt hier weergegeven:

```

maui-rtr-10#show ip route
Codes: C - connected, S - static, I - IGRP, R - RIP, M - mobile, B - BGP
       D - EIGRP, EX - EIGRP external, O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2, E - EGP
       i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS inter area
       * - candidate default, U - per-user static route, o - ODR
       P - periodic downloaded static route

Gateway of last resort is not set

    192.168.10.0/24 is variably subnetted, 2 subnets, 2 masks
C       192.168.10.0/30 is directly connected, Serial0/1
C       192.168.10.1/32 is directly connected, Serial0/1
    172.17.0.0/24 is subnetted, 1 subnets
C       172.17.1.0 is directly connected, Loopback0
    172.16.0.0/24 is subnetted, 1 subnets
C       172.16.1.0 is directly connected, Ethernet0/0
    172.22.0.0/16 is variably subnetted, 2 subnets, 2 masks
O       172.22.53.0/24 [110/65] via 192.168.10.1, 00:00:57, Serial0/1

```

```
O      172.22.1.1/32 [110/65] via 192.168.10.1, 00:00:59, Serial0/1
```

De hierboven getoonde **ip** route uitvoer van **route** toont de OSPF routes die van de peers geleerd zijn die de primaire verbinding (serie 0/1) gebruiken. Merk op dat de route die wordt bekeken (172.22.53.0 met masker 255.255.255.0) in de routingtabel bestaat. Dit moet worden geverifieerd om te controleren of de dialer correct functioneert.

Nu wordt de primaire verbinding naar beneden gebracht en het dialer horloge activeert de back-uplink.

Nadat de back-uplink is geactiveerd, wordt de OSPF-tabel uitgewisseld en wordt de nieuwe route via de back-uplink geïnstalleerd. Het verkeer gaat nu over de back-uplink. Hier is een voorbeeld van:

```
maui-rtr-10#show ip route
```

```
Codes: C - connected, S - static, I - IGRP, R - RIP, M - mobile, B - BGP
       D - EIGRP, EX - EIGRP external, O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2, E - EGP
       i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS inter area
       * - candidate default, U - per-user static route, o - ODR
       P - periodic downloaded static route
```

```
Gateway of last resort is not set
```

```
      172.17.0.0/24 is subnetted, 1 subnets
C      172.17.1.0 is directly connected, Loopback0
      172.16.0.0/24 is subnetted, 1 subnets
C      172.16.1.0 is directly connected, Ethernet0/0
      172.22.0.0/16 is variably subnetted, 2 subnets, 2 masks
O      172.22.53.0/24 [110/870] via 172.22.1.1, 00:00:11, Async65
C      172.22.1.1/32 is directly connected, Async65
```

De bovenstaande uitvoer toont dat de routingtabel is bijgewerkt en dat al het verkeer voor het bekeken netwerk nu de back-uplink gebruikt (Async 65).

[Problemen oplossen](#)

Deze sectie bevat informatie waarmee u problemen met de configuratie kunt oplossen.

[Opdrachten voor troubleshooting](#)

Bepaalde **show** opdrachten worden ondersteund door het gereedschap [Uitvoertolk](#) (alleen [geregistreerde](#) klanten), waarmee u een analyse van **show**-opdrachtoutput kunt bekijken.

Opmerking: Voordat u **debug**-opdrachten afgeeft, raadpleegt u [Belangrijke informatie over debug-opdrachten](#).

- **bug dialer-om** zuiverende informatie over de pakketten die op een dialerinterface worden ontvangen te tonen. Wanneer DDR op de interface is ingeschakeld, wordt ook informatie over de oorzaak van een vraag (de genaamd Dialing Cause) weergegeven. Zie **Dialoginformatie** in de documentatie [Debug Commands voor meer informatie](#).
- **bug van modem:** om de activiteit van de modemijs, modemcontrole en procesactiveringsberichten op de router weer te geven.
- **debug chat**-om de uitvoering van het chat script te controleren wanneer async/POTS het

draaien wordt gestart. Raadpleeg [Dialup-technologie: Technieken voor probleemoplossing](#) voor meer informatie.

- **debug van PPP onderhandeling**-informatie over PPP-verkeer en -uitwisselingen tijdens het onderhandelen van de PPP-componenten zoals Link Control Protocol (LCP), Verificatie en Network Control Protocol (NCP). Een succesvolle PPP-onderhandeling opent eerst de LCP-staat, dan Verifieert en tenslotte onderhandelt NCP.
- **debug van PPP-verificatie**—Hier worden de PPP-verificatieprotocolberichten weergegeven, inclusief Challenge Verification Protocol (CHAP)-pakketuitwisselingen en PAP-uitwisselingen (Password Authentication Protocol)

Voorbeeld van output van foutopsporing

De debug uitvoer hieronder toont de primaire verbinding die faalt en dialer die de verloren route herkent. De router start vervolgens de back-upkoppeling. Nadat de inactiviteitstimer van dialer verloopt, controleert de router of de primaire link is neergezet. Wanneer de primaire verbinding wordt hersteld, sluit dialer watch de back-uplink af nadat de timer voor uitschakelen is verlopen. Wanneer het kijken naar de debugs, let dan op de tijdstempel in elk bericht aangezien ze informatie kunnen geven over de verschillende timers en ongebruikte tijden die actief zijn.
