[Introduction](#)

Este documento fornece uma configuração de exemplo para o balanceamento de carga do Content Switching Module (CSM) do tráfego SSL (Secure Socket Layer) para um farm de SCAs (Secure Content Accelerators, aceleradores de conteúdo seguro). A configuração é para SCAs no modo proxy não transparente com conexão no modo de uma porta.

No modo não transparente, o SCA usa o endereço IP do SCA como origem para conexões de texto simples com os servidores Web.

Observação: use duas sub-redes VLAN/IP diferentes para SCAs e servidores Web; uma sub-rede é para todos os SCAs, e uma sub-rede separada é para todos os servidores Web. Se você colocar ambos os farms no mesmo domínio de Camada 2 (L2), a Conversão de Endereço de Rede (NAT - Network Address Translation) de origem será necessária. O NAT de origem garante que os pacotes retornem ao CSM e que o hardware do Catalyst não comuta simplesmente os pacotes de L2.

[Prerequisites](#)

[Requirements](#)

Não existem requisitos específicos para este documento.

[Componentes Utilizados](#)

As informações neste documento são baseadas nestas VLANs/sub-redes:

- Lado do cliente: IPs virtuais (VIPs) e roteador upstream (Multilayer Switch Feature Card [MSFC])
- Catalyst 6500/6000 com CSM no slot 5
- Lado 1 do servidor: servidores Web
- Servidor lado 2: SCAs

The information in this document was created from the devices in a specific lab environment. All of the devices used in this document started with a cleared (default) configuration. If your network is live, make sure that you understand the potential impact of any command.

Conventions

For more information on document conventions, refer to the [Cisco Technical Tips Conventions](#).

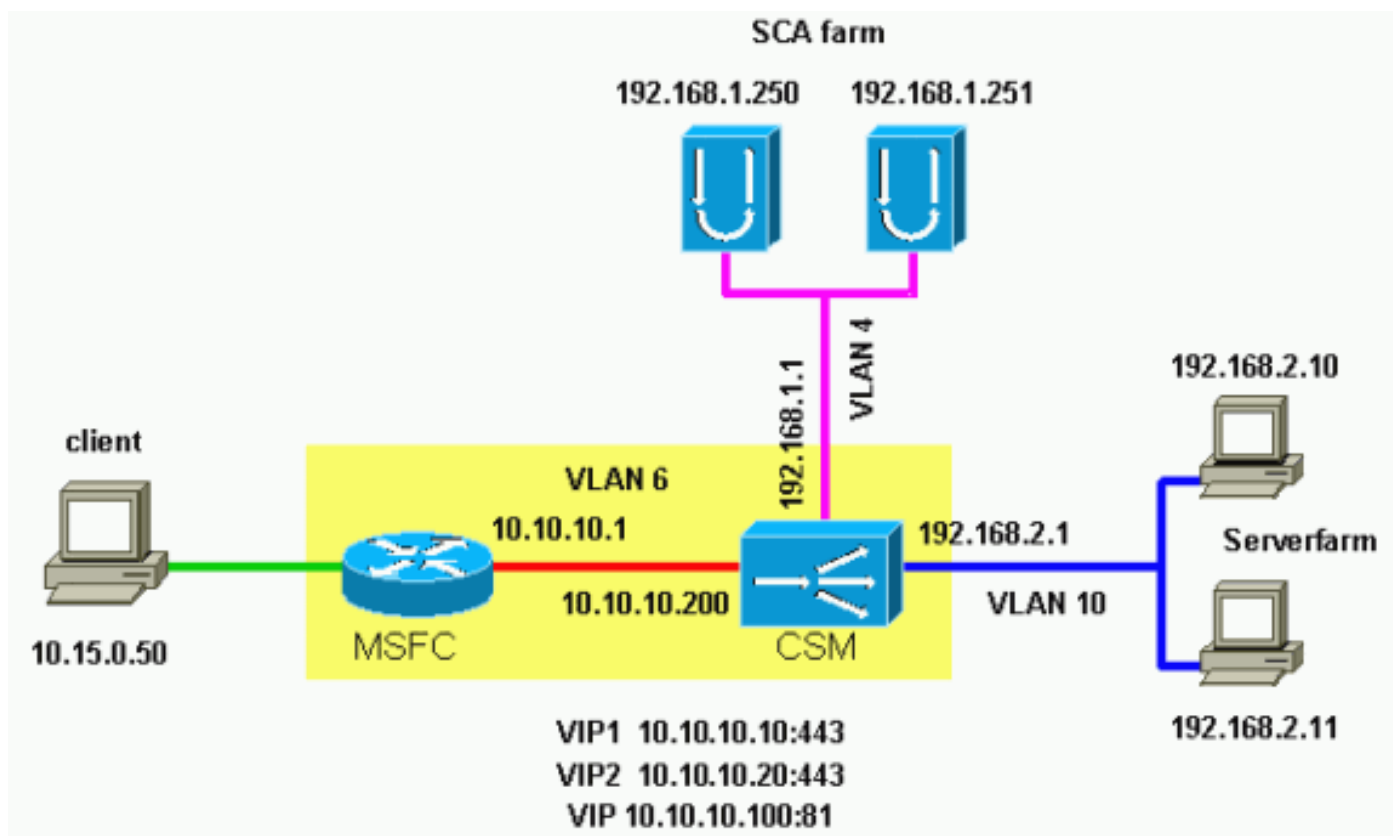

Configurar

Nesta seção, você encontrará informações para configurar os recursos descritos neste documento.

Observação: para encontrar informações adicionais sobre os comandos usados neste documento, use a [Command Lookup Tool](#) (somente clientes registrados).

Diagrama de Rede

Este documento utiliza a seguinte configuração de rede:

Configurações

Este documento utiliza as seguintes configurações:

- Slot 5 do Catalyst 6000/CSM
- SCA 1
- SCA 2

Slot 5 do Catalyst 6000/CSM

```
!--- This is the configuration of nontransparent SSL
load balance. Cat6k# show running-config | begin Module
5
module ContentSwitchingModule 5
  vlan 6 client
    ip address 10.10.10.200 255.255.255.0
    gateway 10.10.10.1
!--- This is the CSM IP address on the client side and
!--- CSM upstream gateway (the MSFC). ! vlan 4 server ip
address 192.168.1.1 255.255.255.0 !--- This is the CSM
IP address on the SCA server farm VLAN. !--- SCAs use
this IP address as the default gateway. ! vlan 10 server
ip address 192.168.2.1 255.255.255.0 !--- This is the
CSM IP address on the web server farm VLAN. !--- The web
servers use this IP address as the default gateway. !
static drop real 192.168.2.0 255.255.255.0 !--- This
drops every new connection that the web servers
originate, !--- unless the connection matches a VIP. !
serverfarm SCA443 nat server !--- When connections are
directed to this server farm, !--- the IP address of the
SCA selection replaces !--- the destination IP address.
no nat client real 192.168.1.250 443 inservice real
192.168.1.251 443 inservice !--- The configurations of
both SCAs are such that, !--- with the send of a
connection to this server farm, the destination port !--
- translates to 443. In this example, there is no
translation, as !--- the VIP listens to port 443. !---
This is different in the following server farm, SCA444.
! serverfarm SCA444 nat server no nat client real
192.168.1.250 444 inservice real 192.168.1.251 444
inservice !--- With the selection of this server farm,
there is a !--- modification of connections that go to
either SCA. !--- The destination IP changes to match the
IP of one of the SCAs !--- (NAT server), and the
destination port becomes 444. ! serverfarm WEBFARM nat
server no nat client real 192.168.2.10 80 inservice real
192.168.2.11 80 !--- Specify port 80 to translate from
port 81 inservice. !--- (The SCA communicates on port
81, according to the SCA setup.) !--- This is a standard
web server farm. ! sticky 10 ssl timeout 60 sticky 20
ssl timeout 60 !--- This creates two distinct sticky
groups with SSL ID as a basis. !--- The timeout is 60
seconds. ! vserver TESTSITE1 virtual 10.10.10.10 tcp
https serverfarm SCA443 sticky 60 group 10 persistent
rebalance inservice !--- The vserver for the first site
(www.testsite1.com) listens !--- to 10.10.10.10 on port
443. !--- Connections go to the SCAs without a change in
the !--- destination port. (See the configuration of
server farm SCA443.) ! vserver TESTSITE2 virtual
10.10.10.20 tcp https serverfarm SCA444 sticky 60 group
```

```
20 persistent rebalance inservice !--- The vserver for
the second site (www.testsite2.com) listens !--- to
10.10.10.10 on port 443. !--- Connections go to the SCAs
and change the !--- destination port to 444. (See the
configuration of server farm SCA444.) ! vserver WEB-
DECRYPT virtual 10.10.10.100 tcp 81 serverfarm WEBFARM
persistent rebalance inservice ! !--- This is the
vserver for the plain-text connections. !--- This
vserver receives connections on port 81 from the SCAs.
!--- As the configuration of this vserver does not
specify a VLAN, !--- the vserver can also receive
connections directly !--- from the client side. !--- To
prevent direct client access of this VIP, !--- you can
use the VLAN 4 option. !--- You can also place this VIP
in the SCA subnetwork. In that case, !--- clients do not
even have a route to that subnetwork. (Clients only !---
have a route if you configure the upstream router !---
with a static route.)
```
