## Introduction

Este documento descreve a configuração de VXLAN usando o plano de controle MP-BGP EVPN. Ele mostra um exemplo de cenário de rede e sua configuração com saídas relevantes para verificação e melhor entendimento.

## Prerequisites

### Requirements

A Cisco recomenda que você tenha conhecimento destes tópicos:

- VPNs MPLS de camada 3
- MP-BGP certamente ajudaria.

## Componentes Utilizados

Este documento não se restringe a versões de software e hardware específicas.

Este documento não se restringe a versões de software e hardware específicas. The information in this document was created from the devices in a specific lab environment. All of the devices used in this document started with a cleared (default) configuration. If your network is live, make sure that you understand the potential impact of any command.

## Informações de Apoio

A VXLAN foi projetada para fornecer virtualização de rede. É MAC no encapsulamento UDP. A infraestrutura da camada 2 é estendida sobre a rede de base da camada 3 para fornecer um serviço simplificado que não depende da localização física e geográfica dos servidores nos data centers.

Este documento descreve VXLAN com Plano de Controle de MP-BGP EVPN. Isso significa que o protocolo BGP é usado na infraestrutura de sobreposição para enviar e receber atualizações.

Em implantações de rede tradicionais, o STP foi usado, o que resultou em alguns uplinks em um estado de bloqueio permanente. No projeto de VXLAN, todos os uplinks estão operacionais e o ECMP é aproveitado como a infraestrutura subjacente é a rede IP.

A discussão de todos os detalhes está fora do escopo deste documento, no entanto algumas terminologias importantes são mostradas abaixo.

VXLAN - Virtual Extensible LAN.

MP-BGP - BGP multiprotocolo.

EVPN - Ethernet VPN.

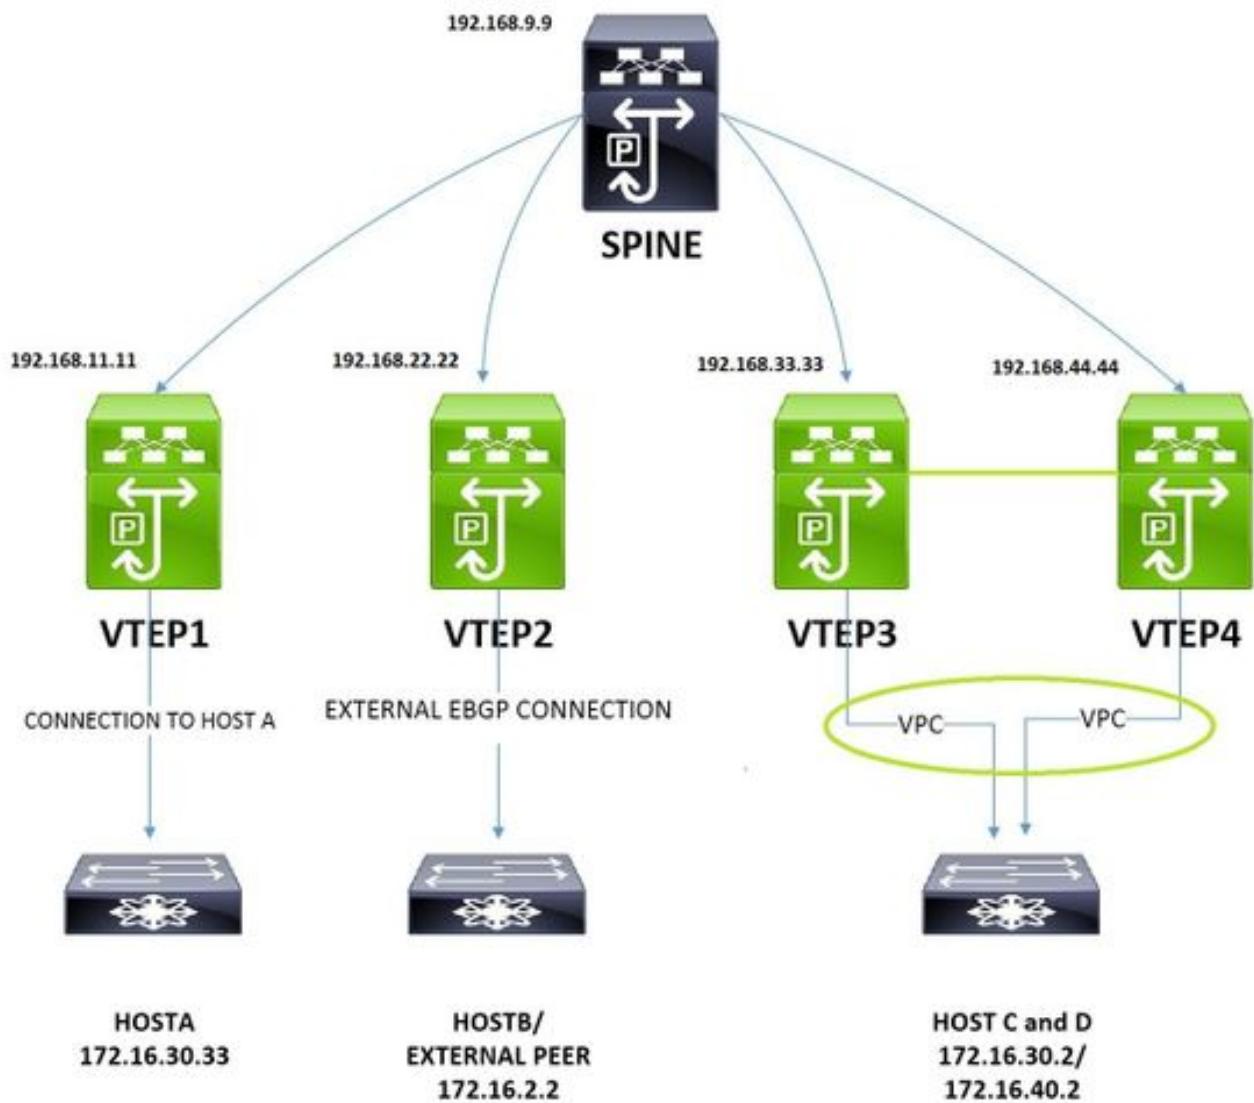

VTEP - Ponto Final do Túnel Virtual. Também conhecido como folha. Este é o local onde os pacotes são encapsulados e desencapsulados.

Spine - Isso é muito semelhante ao Route-Reflector em VPNs MPLS L3. Esse dispositivo pega as atualizações de um VTEP e as passa para outro VTEP.

VNI - Identificador de rede VXLAN. Isso é usado principalmente para fornecer isolamento para limites da camada 2. Esse campo tem 24 bits de comprimento, portanto, supera a limitação de intervalo das vlans tradicionais. Um VNI em um VTEP é 'mapeado' para uma vlan tradicional. Isso será discutido posteriormente.

## Configurar

### Diagrama de Rede

A imagem mostrada é usada para aspectos de configuração e verificação. Isso abrange configurações de conectividade não-vpc, vpc, intra-vni, inter-vni e externa da perspectiva da infraestrutura de VXLAN.

## Troubleshoot

- Se nenhuma interface for verificada, os incrementos de contadores para encapsulamento e desencapsulamento devem ser vistos.

```

VTEP1# show interface nve 1

```

- Se um firewall transparente estiver sendo usado para filtragem, verifique se a porta associada é permitida.

```

VTEP1# show nve vxlan-params
