Configurando o IPSec entre um Cisco IOS Router e um Cisco VPN Client 4.x para Windows usando RADIUS

Contents

Introdução

Este documento demonstra como configurar uma conexão entre um Cisco IOS Router e o Cisco VPN Client 4.x usando o RADIUS para autorização de grupo e autenticação de usuário. O Cisco IOS® Software Release 12.2(8)T ou posterior suporta conexões do Cisco VPN Client 3.x. Os VPN Clients 3.x e 4.x usam as políticas de Diffie Hellman (DH) group 2. O comando isakmp policy # group 2 permite que os VPN Clients se conectem.

Observação: o relatório de VPN IPSec está disponível agora. Consulte IPSec VPN Accounting para obter mais informações e configurações de exemplo.

Pré-requisitos

Requisitos

Certifique-se de atender a estes requisitos antes de tentar esta configuração:

- Um conjunto de endereços a ser atribuído ao IPSec
- Um grupo chamado "3000clients" com uma chave pré-compartilhada de "cisco123"
- Autorização de grupo e autenticação de usuário em um servidor RADIUS

Observação: a Contabilidade RADIUS não é suportada no momento.

Componentes Utilizados

As informações neste documento são baseadas nestas versões de software e hardware:

- Um roteador 2611 que executa o Cisco IOS Software Release 12.2(8)T.
- Cisco Secure ACS para Windows (qualquer servidor RADIUS deve funcionar).
- Cisco VPN Client para Windows versão 4.8 (qualquer VPN Client 4.x deve funcionar).

As informações neste documento foram criadas a partir de dispositivos em um ambiente de laboratório específico. Todos os dispositivos utilizados neste documento foram iniciados com uma configuração (padrão) inicial. Se a sua rede estiver ativa, certifique-se de que entende o impacto potencial de qualquer comando.

Esta é a saída do comando show version no roteador:

<#root>

```
vpn2611#

show version

Configuration register is 0x2102
```

Material de Suporte

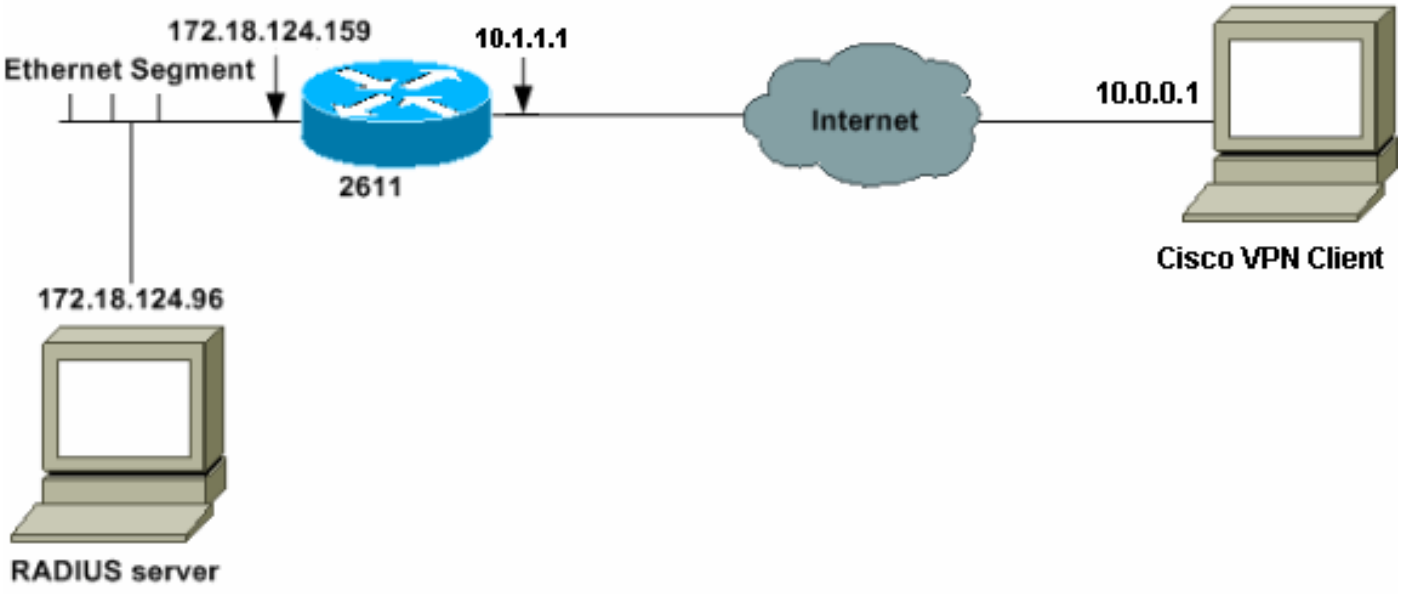
Este documento mostra a autenticação e a autorização, como a atribuição do Windows Internet Naming Service (WINS) e do Domain Naming Service (DNS), pelo servidor RADIUS. Se estiver interessado em executar a autenticação pelo servidor RADIUS e a autorização localmente pelo roteador, consulte Configuração de IPSec entre um Roteador Cisco IOS e um Cisco VPN Client 4.x para Windows usando RADIUS para Autenticação de Usuário.

Configurar

Nesta seção, você encontrará informações para configurar os recursos descritos neste documento.

Diagrama de Rede

Este documento utiliza a seguinte configuração de rede:



Observação: os endereços IP nesta rede de exemplo não são roteáveis na Internet global porque são endereços IP privados em uma rede de laboratório.

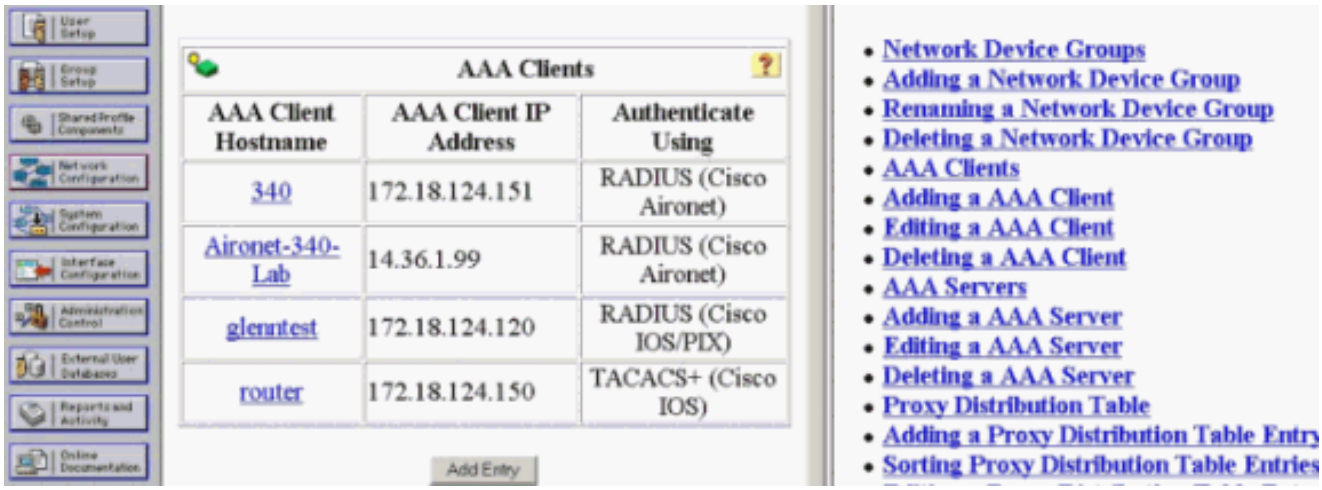
Configuração de servidor RADIUS

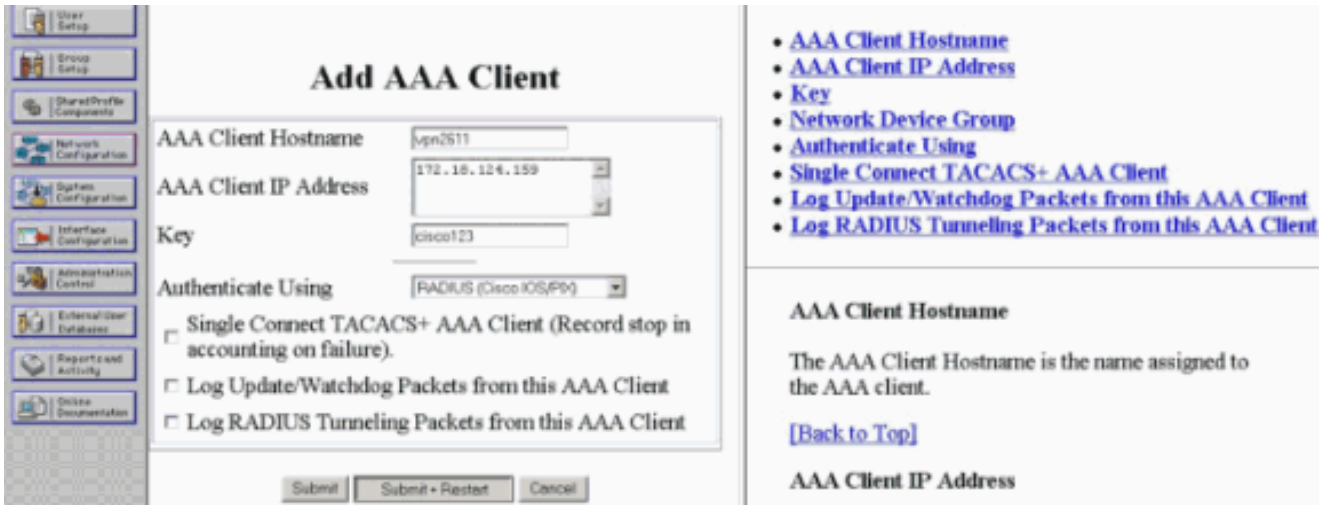
Configurar o servidor RADIUS para clientes AAA (roteador)

Conclua estes passos:

1. Clique em Add Entry para adicionar o roteador ao banco de dados do servidor RADIUS.



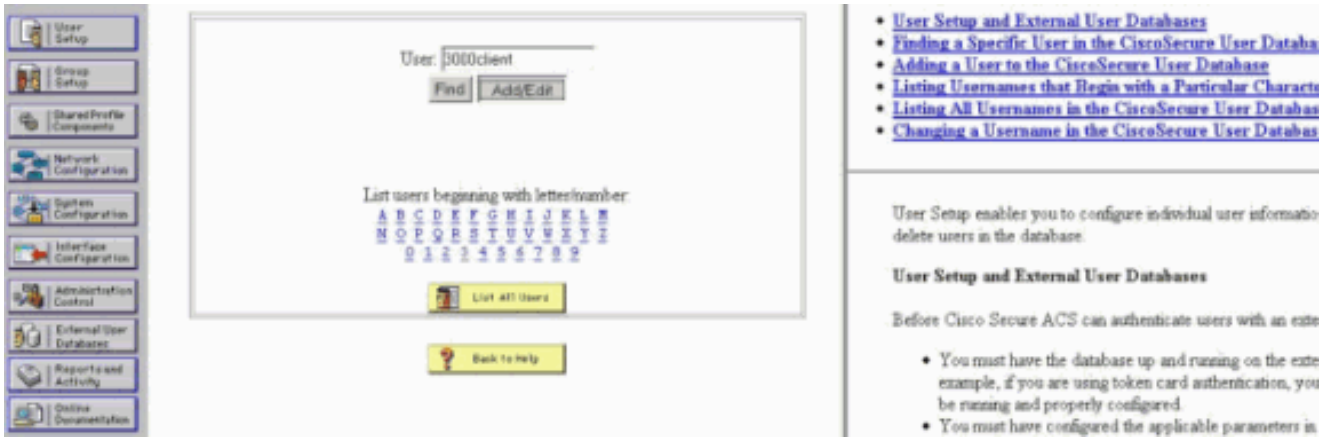
2. Especifique o endereço IP do roteador "172.18.124.159" juntamente com a chave secreta compartilhada "cisco123" e escolha RADIUS na caixa suspensa Autenticar usando.



Configurar o Servidor RADIUS para Autenticação e Autorização de Grupo

Conclua estes passos:

1. Clique em Add/Edit para adicionar um usuário chamado 3000client ao servidor RADIUS.

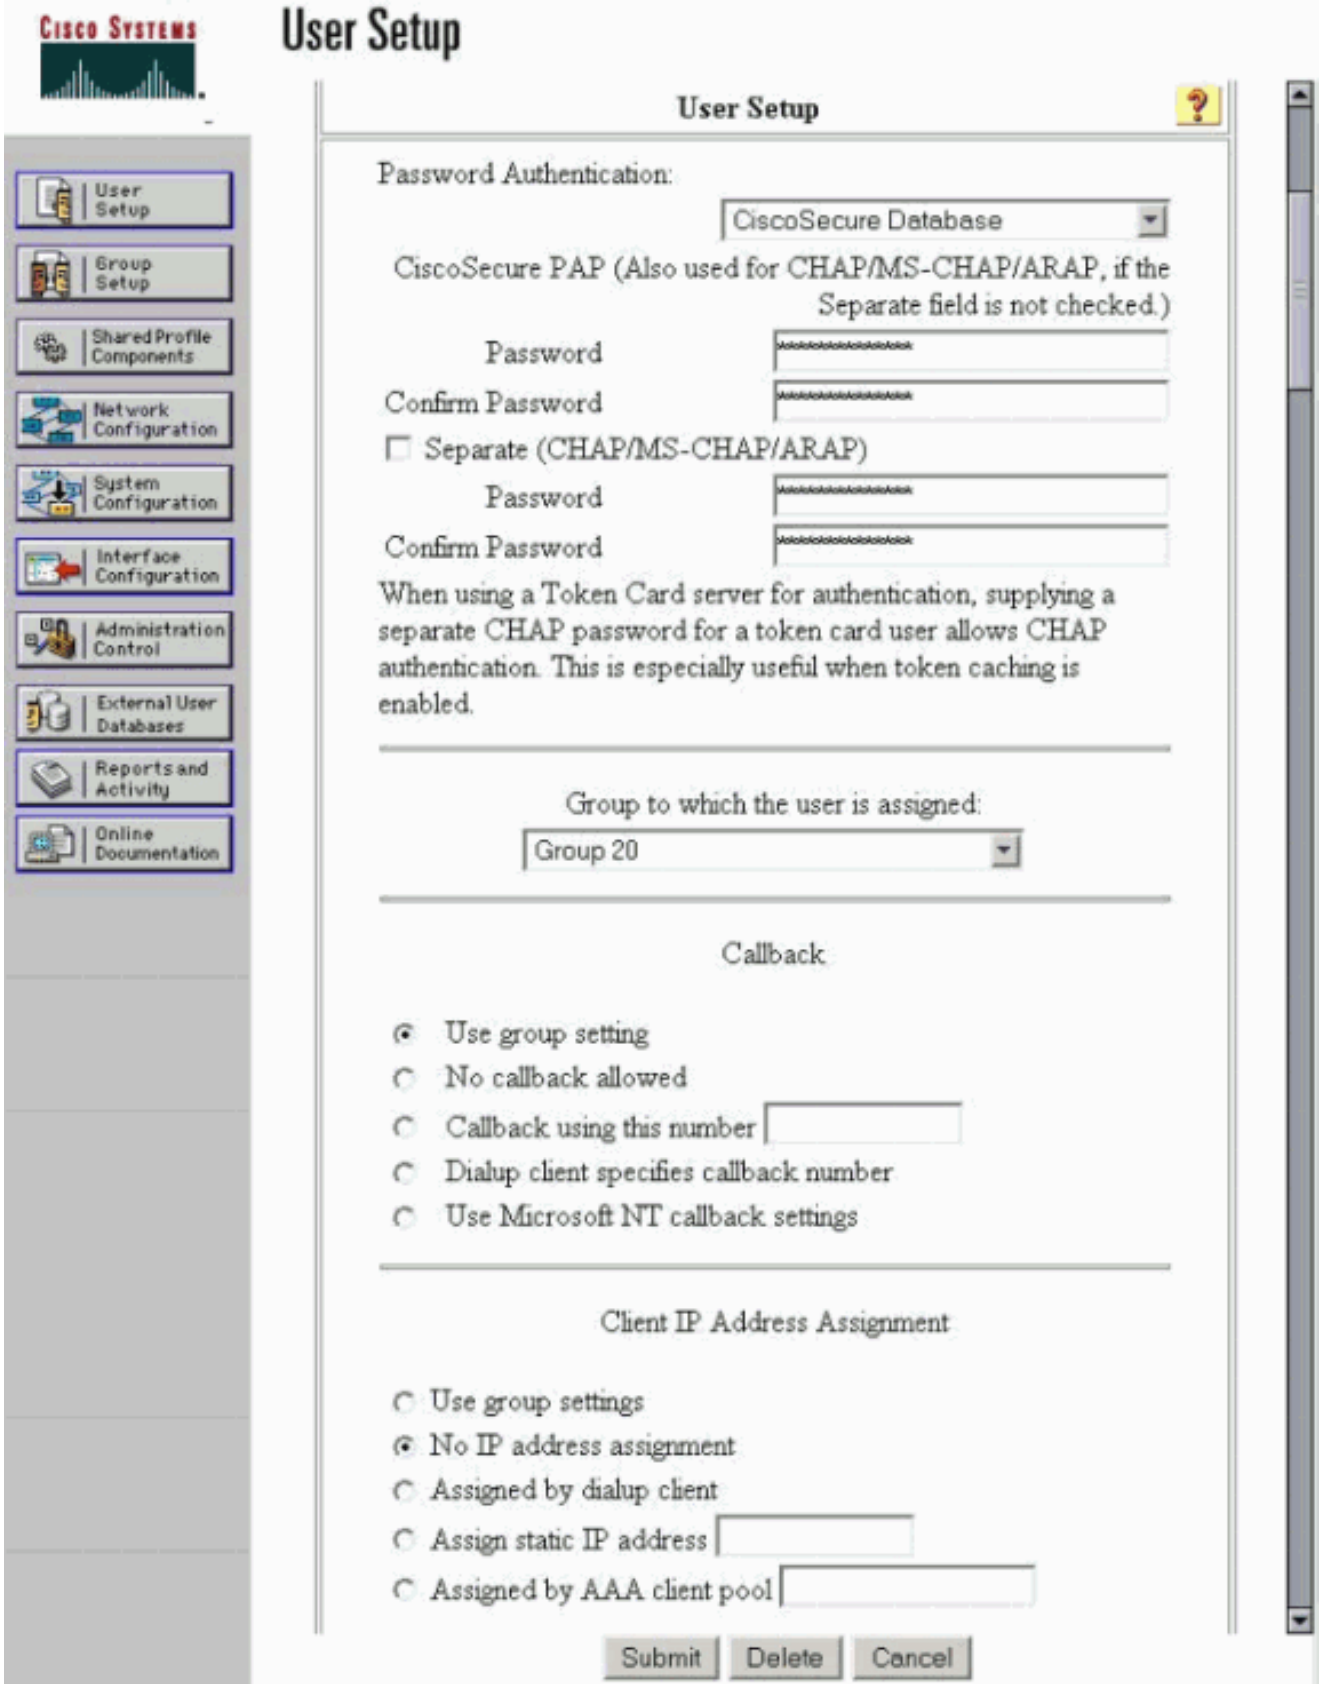


2. Antes do Cisco IOS Software Release 15.8.3 e do Cisco IOS XE Software Release 16.9.1, essa senha era uma palavra-chave especial para o Cisco IOS, que indica que um perfil de

grupo deve ser referenciado. Você pode mapear o usuário para um grupo do Cisco Secure, se preferir. Certifique-se de que nenhuma atribuição de endereço IP seja escolhida.

Após o Cisco IOS Software Release 15.8.3 e o Cisco IOS XE Software Release 16.9.1, a autorização AAA precisa de uma senha e é obrigatória. Recomenda-se definir a senha usada através do comando isakmp authorization list aaa_list1 password <secret>.

O administrador deve configurar a senha correspondente <secret> no servidor RADIUS.



3. Especifique os parâmetros de autorização de grupo que serão passados por esta conta de usuário de volta para o VPN Client.

   Certifique-se de que o cisco-av-pair esteja habilitado com estes atributos:

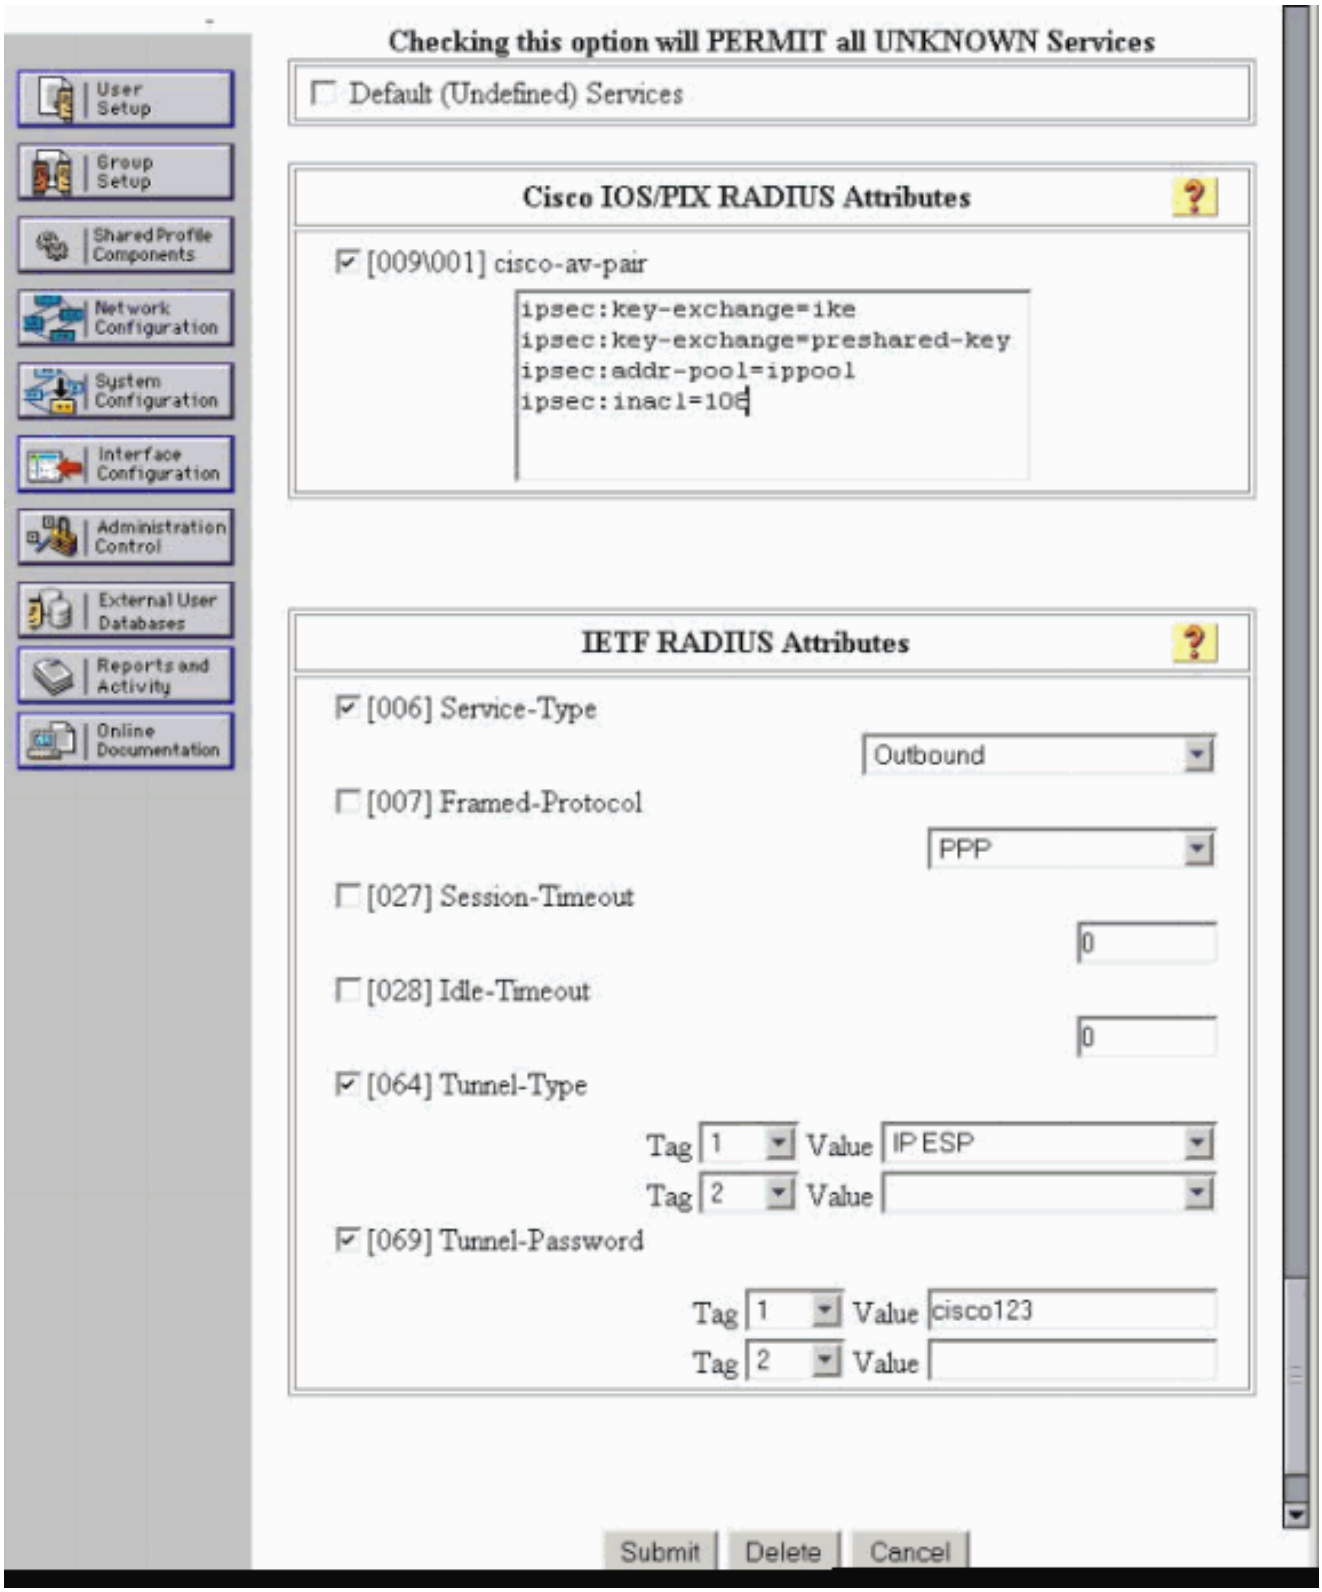
   - ipsec:key-exchange=ike

- ipsec:key-exchange=preshared-key
- ipsec:addr-pool=ippool
- ipsec:inacl=108 (necessário apenas se você usar tunelamento dividido no roteador)

Além disso, certifique-se de que esses atributos IETF RADIUS estejam ativados:

- Atributo 6: Service-Type=Outbound
- Atributo 64: Tunnel-Type=IP ESP
- Atributo 69: Tunnel-Password=cisco123 (esta é a sua senha de grupo no VPN Client)

Quando terminar, clique em Enviar.



Em Atributos específicos do fornecedor, você também pode ativar estes atributos opcionais:

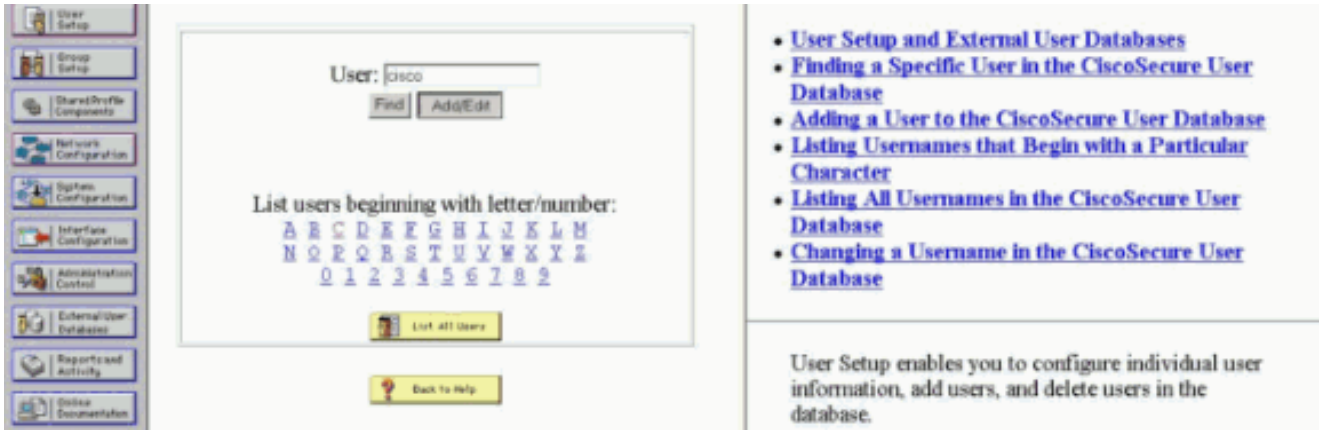
- ipsec:default-domain=
- ipsec:timeout=
- ipsec:idletime=
- ipsec:dns-servers=
- ipsec:wins-servers=

Configurar o servidor RADIUS para autenticação de usuário

Conclua estes passos:

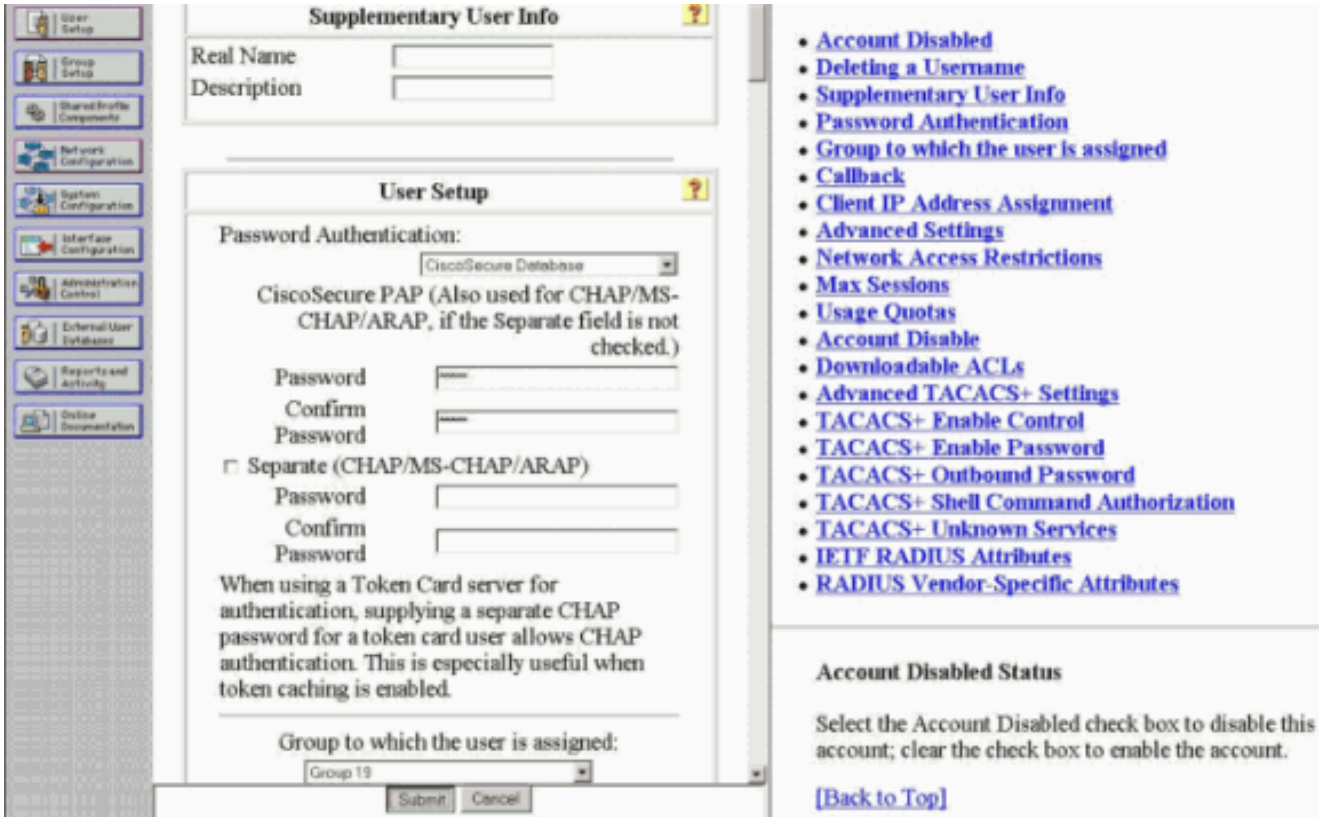
1. Clique em Add/Edit para adicionar o usuário da VPN ao banco de dados do Cisco Secure.

   Neste exemplo, o nome de usuário é cisco.



2. Na próxima janela, especifique a senha para o usuário cisco. A senha também é cisco.

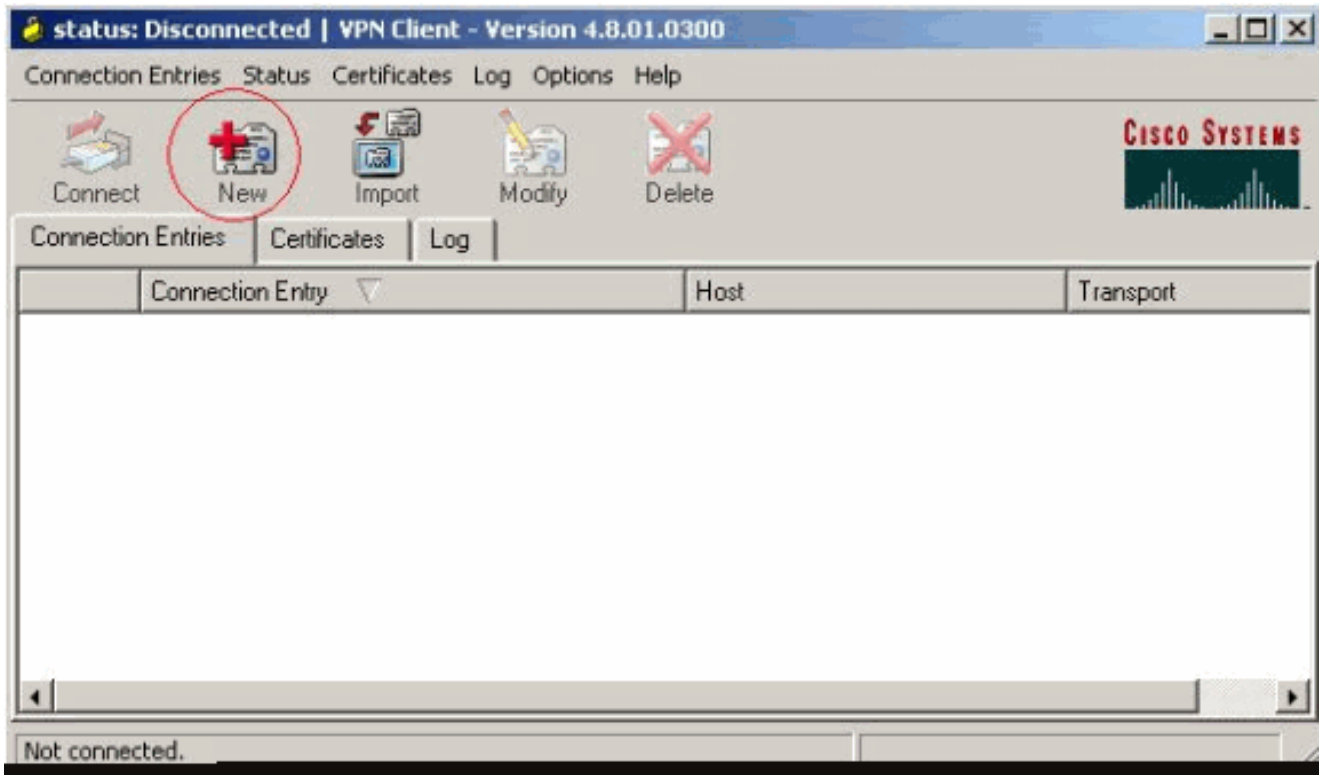
   Você pode mapear a conta de usuário para um grupo. Quando terminar, clique em Enviar.



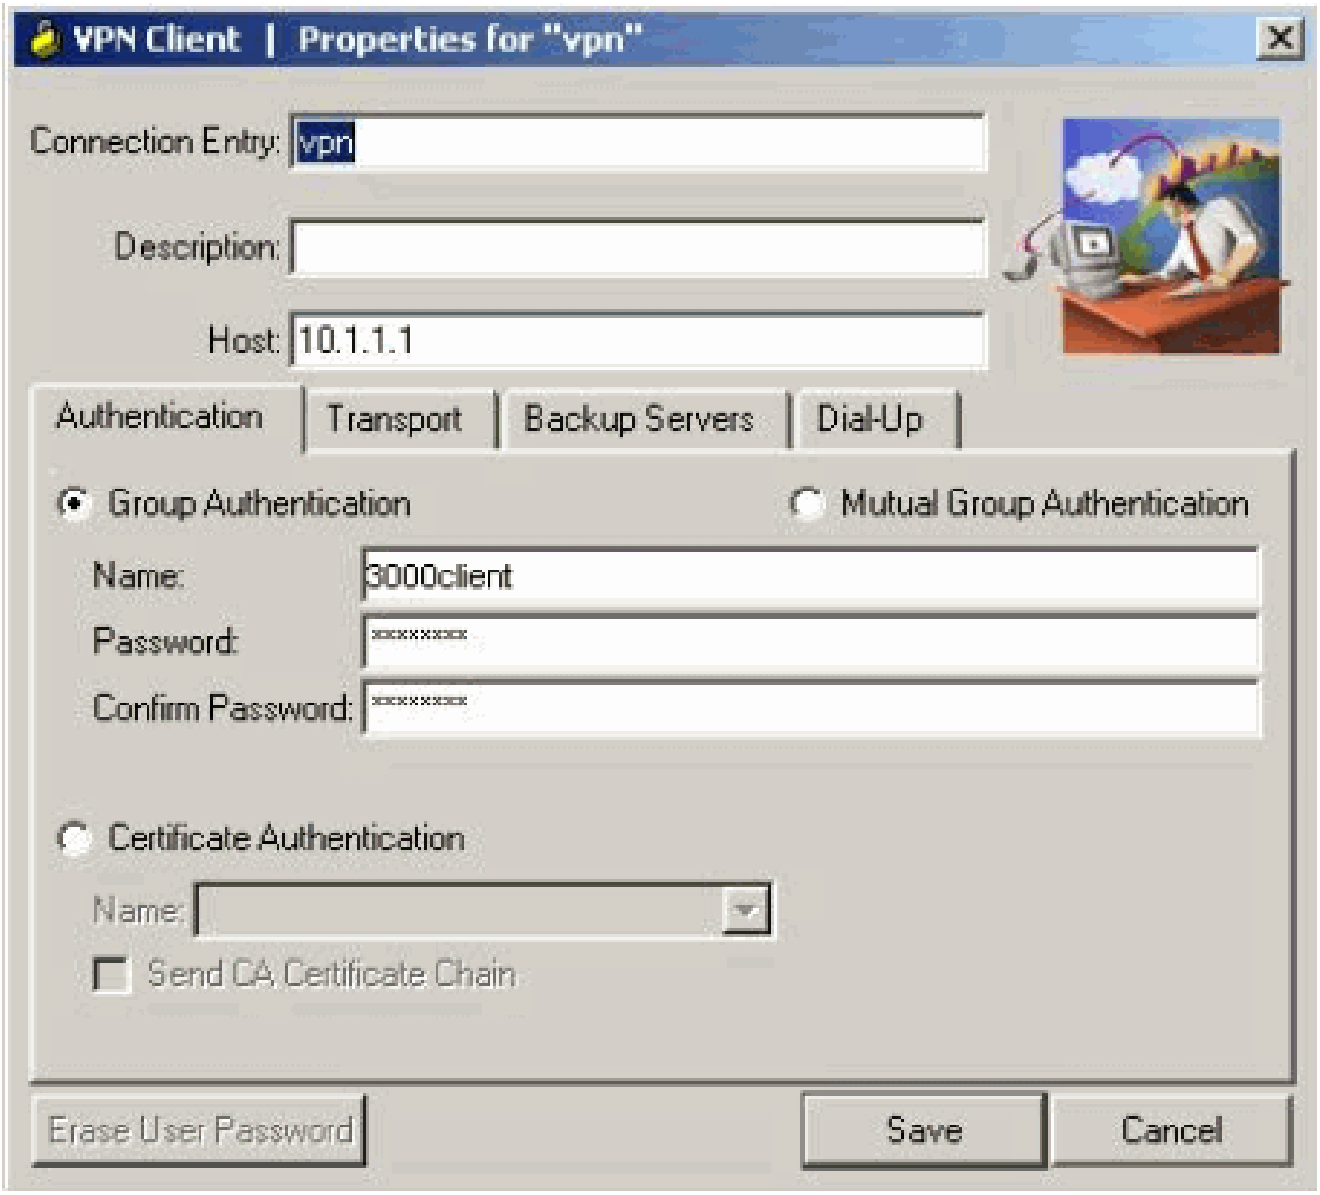
Configuração de VPN Client 4.8

Conclua estes passos para configurar o VPN Client 4.8:

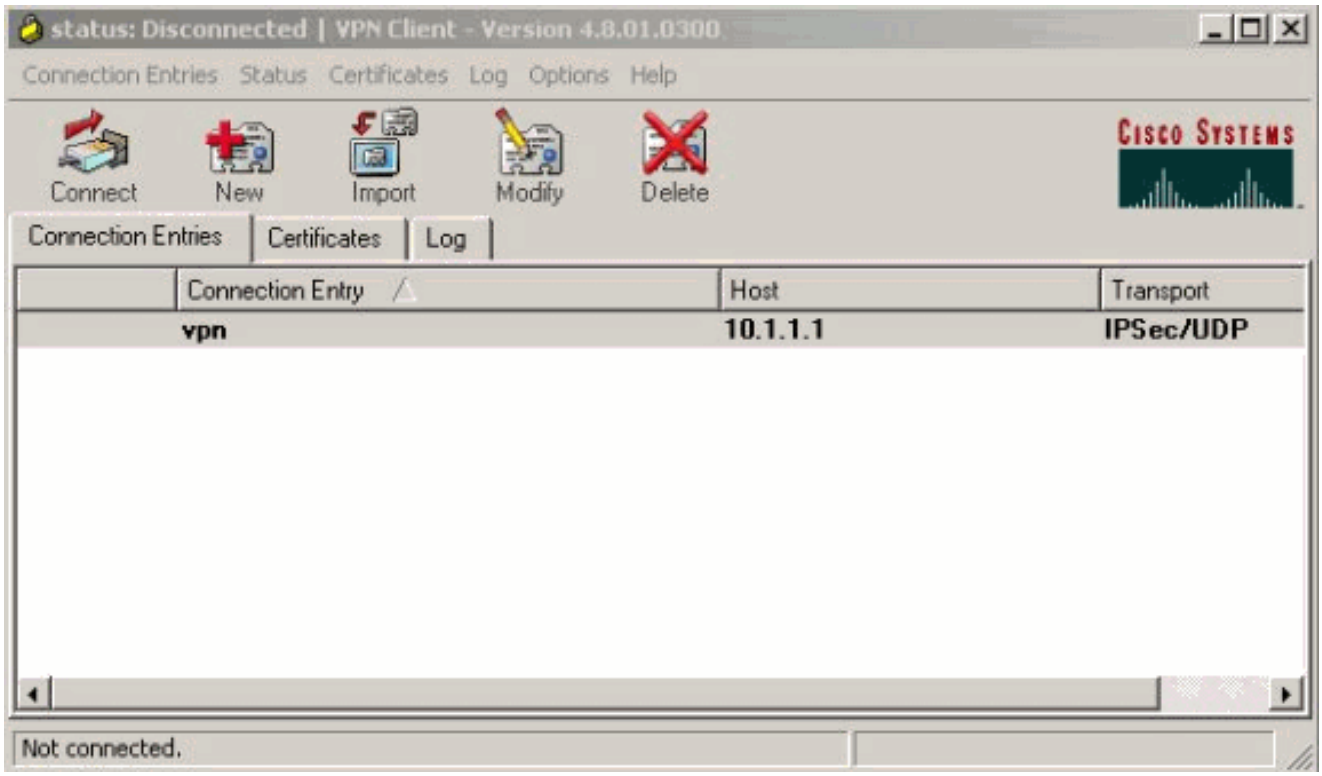
1. Escolha Start > Programs > Cisco Systems VPN Client > VPN Client.
2. Clique em New para abrir a janela Create New VPN Connection Entry.



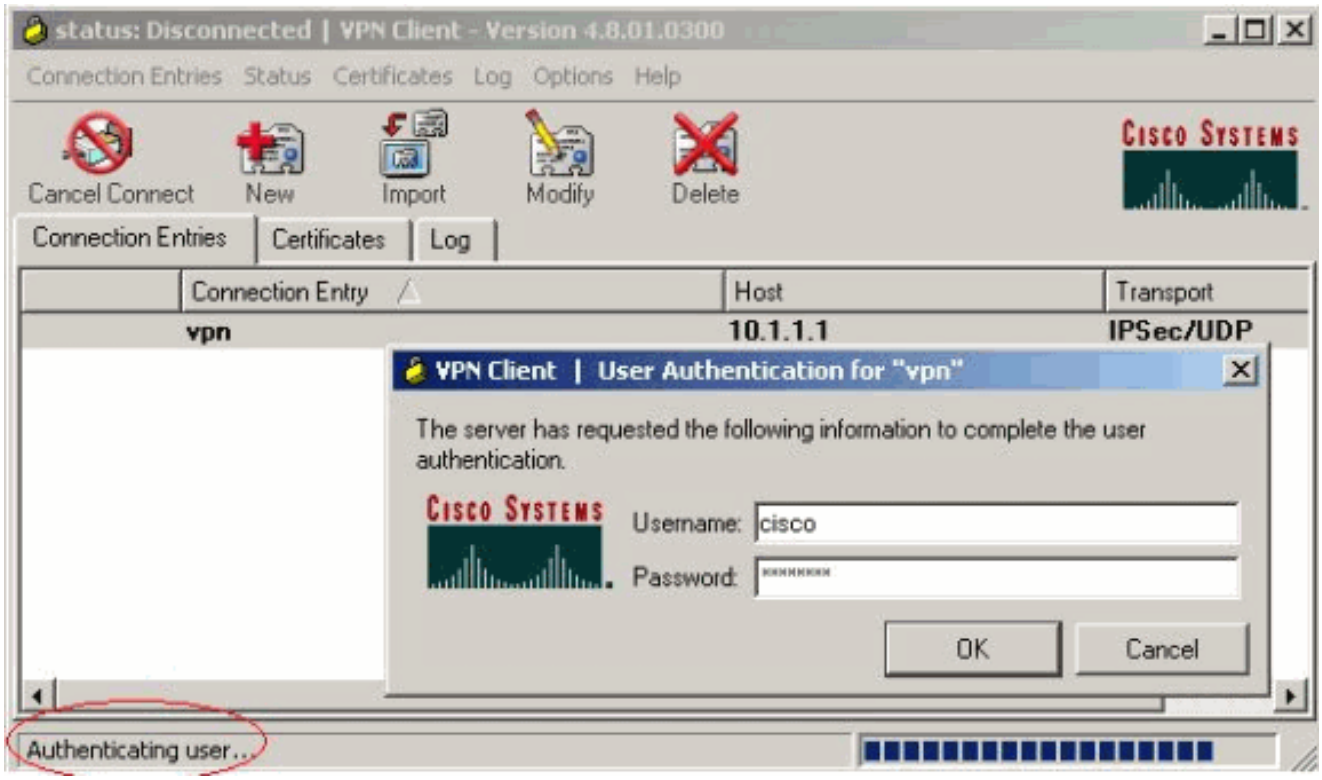
3. Digite o nome da Entrada de Conexão juntamente com uma descrição. Insira o endereço IP externo do roteador na caixa Host. Em seguida, insira o nome e a senha do Grupo VPN e clique em Save.



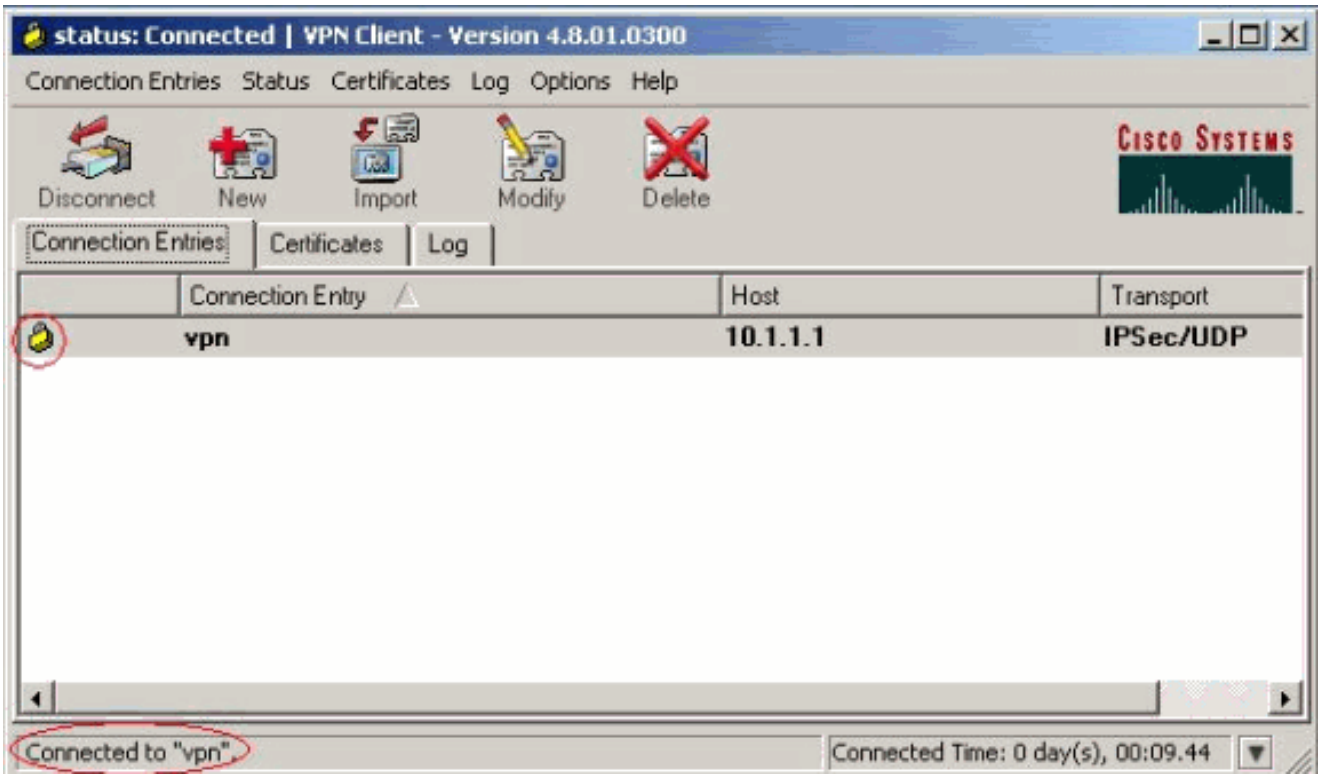
4. Clique na conexão que deseja usar e clique em Connect na janela principal do VPN Client.



5. Quando solicitado, introduza o nome de usuário e senha para Xauth e clique em OK para conectar-se à rede remota.



O cliente VPN é conectado ao roteador no local central.



Verificar

Use esta seção para confirmar se a sua configuração funciona corretamente.

Troubleshooting

Use esta seção para resolver problemas de configuração.

Comandos para Troubleshooting

Consulte Informações Importantes sobre Comandos de Depuração antes de usar comandos debug.

- debug crypto ipsec — Exibe informações de depuração sobre conexões de IPSec.
- debug crypto isakmp — Exibe informações de depuração sobre conexões de IPSec e mostra o primeiro conjunto de atributos negados devido a incompatibilidades em ambas as extremidades.
- debug crypto engine — Exibe informações a partir do cripto mecanismo.
- debug aaa authentication — Exibe informações sobre autenticação AAA/TACACS+.
- debug aaa authorization rate — Exibe informações sobre autorização AAA/TACACS+.
- debug radius — Exibe informações sobre a comunicação de troubleshooting entre o servidor RADIUS e o roteador.

Saída de depurações

Esta seção fornece informações de depuração do roteador, que podem ser usadas para resolver

problemas na configuração.
