Configurar túneis de site a site IPsec IKEv1 com o ASDM ou a CLI no ASA

Contents

Introduction

Este documento descreve como configurar um túnel site a site IPsec (IKEv1) versão 1 do Internet Key Exchange entre um Cisco 5515-X Series Adaptive Security Appliance (ASA) que executa a versão de software 9.2.x e um Cisco 5510 Series ASA que executa a versão de software 8.2.x.

Prerequisites

Requirements

A Cisco recomenda que você tenha conhecimento destes tópicos:

- A conectividade IP de ponta a ponta deve ser estabelecida
- Estes protocolos devem ser permitidos:
  User Datagram Protocol (UDP) 500 e 4500 para o plano de controle IPsecEncapsulating Security Payload (ESP) IP Protocol 50 para o plano de dados IPsec

Componentes Utilizados

As informações neste documento são baseadas nestas versões de software e hardware:

- Cisco 5510 Series ASA que executa a versão de software 8.2
- Cisco 5515-X ASA que executa a versão de software 9.2

The information in this document was created from the devices in a specific lab environment. All of the devices used in this document started with a cleared (default) configuration. Se a rede estiver ativa, certifique-se de que você entenda o impacto potencial de qualquer comando.

Configurar

Esta seção descreve como configurar o túnel VPN site a site por meio do assistente de VPN do ASDM (Adaptive Security Device Manager) ou por meio da CLI.
Diagrama de Rede

Esta topologia é usada para os exemplos deste documento:

Configurar por meio do assistente de VPN do ASDM

Siga estas etapas para configurar o túnel VPN site a site por meio do assistente do ASDM:

1. Abra o ASDM e navegue até Wizards > VPN Wizards > Site-to-site VPN Wizard.

2. Clique em Next quando chegar à página inicial do assistente.

Observação: as versões mais recentes do ASDM fornecem um link para um vídeo que explica essa configuração.

3. Configure o endereço IP do par. Neste exemplo, o endereço IP do par é definido como 192.168.1.1 no site B. Se você configurar o endereço IP do par no site A, ele deve ser alterado para 172.16.1.1. A interface através da qual a extremidade remota pode ser alcançada também é especificada. Clique em Next após a conclusão.
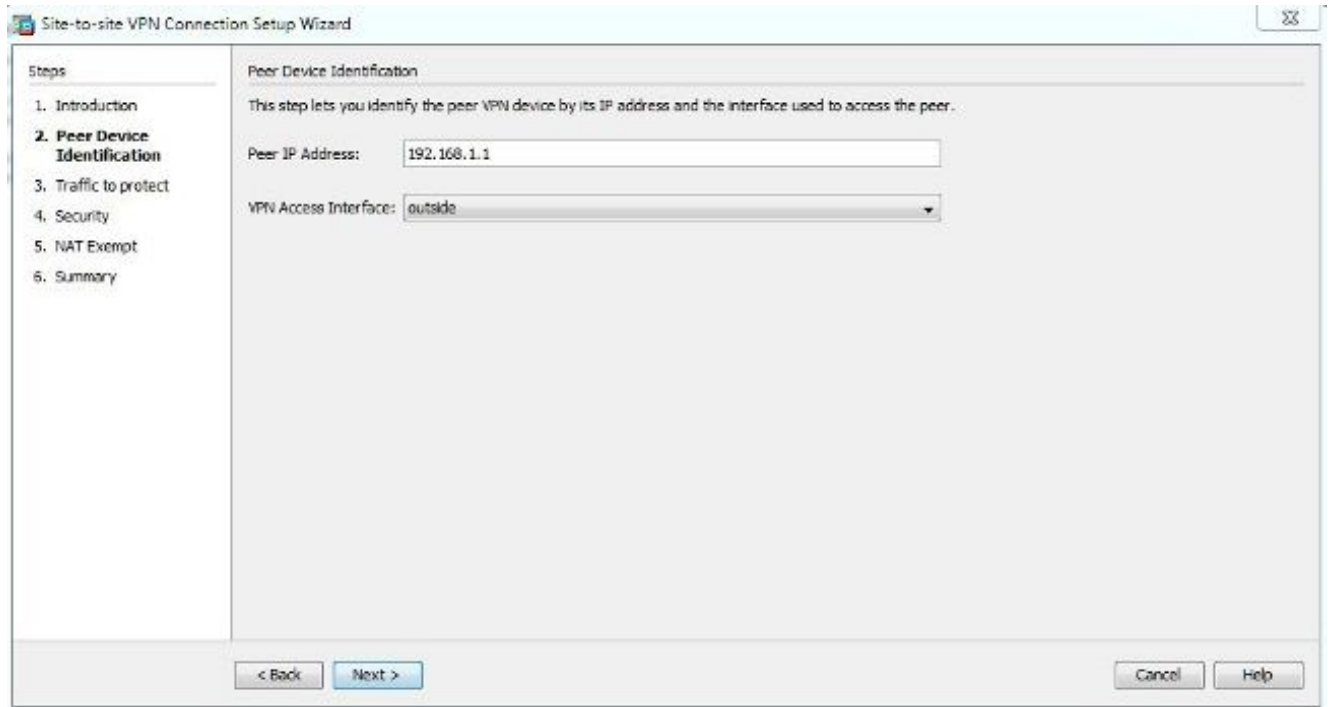

4. Configure as redes locais e remotas (origem e destino do tráfego). Esta imagem mostra a configuração para o Site B (o inverso se aplica ao Site A).
5. Na página Segurança, configure a chave pré-compartilhada (ela deve corresponder em ambas as extremidades). Clique em Next após a conclusão.
6. Configure a interface de origem para o tráfego no ASA. O ASDM cria automaticamente a regra de Network Address Translation (NAT) com base na versão do ASA e a envia com o restante da configuração na etapa final. **Observação**: no exemplo usado neste documento, 'inside' é a origem do tráfego.
7. O assistente agora fornece um resumo da configuração que é enviada para o ASA. Revise e verifique as definições de configuração e clique em Finish.
Configurar por meio da CLI

Esta seção descreve como configurar o túnel site a site IPsec IKEv1 por meio da CLI.

Configurar o site B para ASA versão 8.4 e posteriores

No ASA versão 8.4 e posteriores, introduziu-se o suporte para IKEv1 e Internet Key Exchange versão 2 (IKEv2).

> **Dica**: para obter mais informações sobre as diferenças entre as duas versões, consulte a seção [Por que migrar para IKEv2?](#) da Migração rápida de IKEv1 para a Configuração de túnel L2L IKEv2 no Código ASA 8.4 do documento Cisco.

> **Dica**: para obter um exemplo de configuração IKEv2 com o ASA, consulte o documento [IKEv2 Tunnel entre sites do ASA e Exemplos de Configuração de Roteador da](#) Cisco.

Fase 1 (IKEv1)

Siga estas etapas para a configuração da Fase 1:

1. Digite este comando na CLI para ativar o IKEv1 na interface externa:

   ```
   crypto ikev1 enable outside
   ```
2. Crie uma política de IKEv1 que defina os algoritmos/métodos a serem usados para hash, autenticação, grupo Diffie-Hellman, vida útil e criptografia:

   ```
   crypto ikev1 policy 1
   !The 1 in the above command refers to the Policy suite priority
   (1 highest, 65535 lowest)
   ```

```
authentication pre-share
encryption aes
hash sha
group 2
lifetime 86400
```

3. Crie um grupo de túneis nos atributos de IPsec e configure o endereço IP do par e a chave pré-compartilhada do túnel:

```
tunnel-group 192.168.1.1 type ipsec-l2l
tunnel-group 192.168.1.1 ipsec-attributes
ikev1 pre-shared-key cisco
! Note the IKEv1 keyword at the beginning of the pre-shared-key command.
```

Fase 2 (IPsec)

Siga estas etapas para a configuração da Fase 2:

1. Crie uma lista de acesso que defina o tráfego a ser criptografado e encapsulado. Neste exemplo, o tráfego de interesse é o tráfego do túnel originado da sub-rede 10.2.2.0 para 10.1.1.0. Ele pode conter várias entradas, se houver várias sub-redes envolvidas entre os sites.

   Na versão 8.4 e posteriores, podem ser criados objetos ou grupos de objetos que servem de contêineres para redes, sub-redes, endereços IP de host ou vários objetos. Crie dois objetos que tenham as sub-redes locais e remotas e os use para as instruções da lista de controle de acesso (ACL) e NAT.

   ```
   object network 10.2.2.0_24
   subnet 10.2.2.0 255.255.255.0
   object network 10.1.1.0_24
   subnet 10.1.1.0 255.255.255.0

   access-list 100 extended permit ip object 10.2.2.0_24 object 10.1.1.0_24
   ```

2. Configure o Transform Set (TS), que deve envolver a palavra-chave IKEv1. Um TS idêntico também deve ser criado na extremidade remota.

   ```
   crypto ipsec ikev1 transform-set myset esp-aes esp-sha-hmac
   ```

3. Configure um mapa de criptografia que contenha estes componentes:
   O endereço IP do parA lista de acesso definida que contenha o tráfego de interesseO TSUma configuração opcional de PFS (Perfect Forward Secrecy), que cria um novo par de chaves Diffie-Hellman usadas para proteger os dados (ambos os lados devem ser habilitados para PFS, antes que a Fase 2 seja iniciada)

4. Aplique o mapa de criptografia na interface externa:

   ```
   crypto map outside_map 20 match address 100
   crypto map outside_map 20 set peer 192.168.1.1
   crypto map outside_map 20 set ikev1 transform-set myset
   crypto map outside_map 20 set pfs
   crypto map outside_map interface outside
   ```

Isenção de NAT

Verifique se o tráfego de VPN não está sujeito a outras regras de NAT. Esta é a regra de NAT usada:

```
nat (inside,outside) 1 source static 10.2.2.0_24 10.2.2.0_24 destination static
10.1.1.0_24 10.1.1.0_24 no-proxy-arp route-lookup
```

> **Observação**: quando várias sub-redes são usadas, você deve criar grupos de objetos com todas as sub-redes de origem e de destino e usá-las na regra NAT.

```
object-group  network 10.x.x.x_SOURCE
network-object 10.4.4.0 255.255.255.0
network-object 10.2.2.0 255.255.255.0

object network 10.x.x.x_DESTINATION
network-object 10.3.3.0 255.255.255.0
network-object 10.1.1.0 255.255.255.0

nat (inside,outside) 1 source static 10.x.x.x_SOURCE 10.x.x.x_SOURCE destination
static 10.x.x.x_DESTINATION 10.x.x.x_DESTINATION no-proxy-arp route-lookup
```

Exemplo de configuração completa

Esta é a configuração completa do site B:

```
crypto ikev1 enable outside

crypto ikev1 policy 10
authentication pre-share
encryption aes
hash sha
group 2
lifetime 86400

tunnel-group 192.168.1.1 type ipsec-l2l
tunnel-group 192.168.1.1 ipsec-attributes
ikev1 pre-shared-key cisco
!Note the IKEv1 keyword at the beginning of the pre-shared-key command.

object network 10.2.2.0_24
subnet 10.2.2.0 255.255.255.0
object network 10.1.1.0_24
subnet 10.1.1.0 255.255.255.0

access-list 100 extended permit ip object 10.2.2.0_24 object 10.1.1.0_24

crypto ipsec ikev1 transform-set myset esp-aes esp-sha-hmac

crypto map outside_map 20 match address 100
crypto map outside_map 20 set peer 192.168.1.1
```

```
crypto map outside_map 20 set ikev1 transform-set myset
crypto map outside_map 20 set pfs
crypto map outside_map interface outside

nat (inside,outside) 1 source static 10.2.2.0_24 10.2.2.0_24 destination static
10.1.1.0_24 10.1.1.0_24 no-proxy-arp route-lookup
```

Configurar o site A para ASA versão 8.2 e anteriores

Esta seção descreve como configurar o site A para o ASA versão 8.2 e anteriores.

Fase 1 (ISAKMP)

Siga estas etapas para a configuração da Fase 1:

1. Digite este comando na CLI para ativar o Internet Security Association and Key Management Protocol (ISAKMP) na interface externa:

   crypto isakmp enable outside
   Observação: como várias versões de IKE (IKEv1 e IKEv2) não são mais suportadas, o ISAKMP é usado para se referir à Fase 1.

2. Crie uma política de ISAKMP que defina os algoritmos/métodos a serem usados para criar a Fase 1.

   Observação: neste exemplo de configuração, a palavra-chave IKEv1 da versão 9.x é substituído por ISAKMP.
   ```
   crypto isakmp policy 1
   authentication pre-share
   encryption aes
   hash sha
   group 2
   lifetime 86400
   ```

3. Crie um grupo de túneis para o endereço IP do par (endereço IP externo de 5515) com a chave pré-compartilhada:

   ```
    tunnel-group 172.16.1.1 type ipsec-l2l
   tunnel-group 172.16.1.1 ipsec-attributes
   pre-shared-key cisco
   ```

Fase 2 (IPsec)

Siga estas etapas para a configuração da Fase 2:

1. Semelhante à configuração na versão 9.x, você deve criar uma lista de acesso estendida para definir o tráfego de interesse.

   ```
   access-list 100 extended permit ip 10.1.1.0 255.255.255.0
   10.2.2.0 255.255.255.0
   ```

2. Defina um TS que contenha todos os algoritmos de criptografia e hash disponíveis (os problemas oferecidos têm um ponto de interrogação). Verifique se é idêntico ao que foi

configurado do outro lado.

```
crypto ipsec transform-set myset esp-aes esp-sha-hmac
```

3. Configure um mapa de criptografia que contenha estes componentes:
O endereço IP do parA lista de acesso definida que contenha o tráfego de interesseO TSUma configuração opcional de PFS, que cria um novo par de chaves Diffie-Hellman usadas para proteger os dados (ambos os lados devem ser habilitados para PFS, para que a Fase 2 seja iniciada)
4. Aplique o mapa de criptografia na interface externa:

```
crypto map outside_map 20 set peer 172.16.1.1
crypto map outside_map 20 match address 100
crypto map outside_map 20 set transform-set myset
crypto map outside_map 20 set pfs
crypto map outside_map interface outside
```

Isenção de NAT

Crie uma lista de acesso que defina o tráfego a ser isento das verificações de NAT. Nesta versão, ela parece semelhante à lista de acesso definida para o tráfego de interesse:

```
access-list nonat line 1 extended permit ip 10.1.1.0 255.255.255.0
10.2.2.0  255.255.255.0
```

Quando várias sub-redes forem usadas, adicione outra linha à mesma lista de acesso:

```
access-list nonat line 1 extended permit ip 10.3.3.0 255.255.255.0
10.4.4.0 255.255.255.0
```

A lista de acesso é usada com o NAT, como mostrado aqui:

```
nat (inside) 0 access-list nonat
```

Observação: aqui, 'inside' se refere ao nome da interface interna na qual o ASA recebe o tráfego que corresponde à lista de acesso.

Exemplo de configuração completa

Esta é a configuração completa do site A:

```
crypto isakmp enable outside
crypto isakmp policy 10
authentication pre-share
encryption aes
hash sha group 2
lifetime 86400
```

```
tunnel-group 172.16.1.1 type ipsec-l2l
tunnel-group 172.16.1.1 ipsec-attributes
pre-shared-key cisco

access-list 100 extended permit ip 10.1.1.0 255.255.255.0
10.2.2.0 255.255.255.0
crypto ipsec transform-set myset esp-aes esp-sha-hmac

crypto map outside_map 20 set peer
crypto map outside_map 20 match address 100
crypto map outside_map 20 set transform-set myset
crypto map outside_map 20 set pfs
crypto map outside_map interface outside

access-list nonat line 1 extended permit ip 10.1.1.0 255.255.255.0
10.2.2.0 255.255.255.0

nat (inside) 0 access-list nonat
```

Política de grupo

As políticas de grupo são usadas para definir configurações específicas aplicáveis ao túnel. Essas políticas são usadas juntamente com o grupo de túneis.

A política de grupo pode ser definida como interna, o que significa que os atributos são extraídos do que é definido no ASA, ou pode ser definida como externa, na qual os atributos são consultados em um servidor externo. Este é o comando usado para definir a política de grupo:

group-policy SITE_A internal

> **Observação**: Você pode definir vários atributos na política de grupo. Para obter uma lista de todos os atributos possíveis, consulte a seção Configuração de políticas de grupo dos Procedimentos selecionados da configuração de VPN do ASDM para o Cisco ASA 5500 Series, versão 5.2.

Atributos opcionais da política de grupo

O vpn-tunnel-protocol determina o tipo de túnel ao qual essas configurações devem ser aplicadas. Neste exemplo, o IPsec é usado:

```
vpn-tunnel-protocol ?
group-policy mode commands/options:
IPSec IP Security Protocol l2tp-ipsec L2TP using IPSec for security
svc SSL VPN Client
webvpn WebVPN

vpn-tunnel-protocol ipsec - Versions 8.2 and prior
vpn-tunnel-protocol ikev1 - Version 8.4 and later
```

Você tem a opção de configurar o túnel para que ele permaneça ocioso (sem tráfego) e não seja desativado. Para configurar essa opção, o comando vpn-idle-timeout o valor do atributo deve usar

minutos ou você pode definir o valor para none, o que significa que o túnel nunca cai.

Aqui está um exemplo:

```
group-policy SITE_A attributes
vpn-idle-timeout ?
group-policy mode commands/options:
<1-35791394> Number of minutes
none IPsec VPN: Disable timeout and allow an unlimited idle period;
```

O default-group-policy sob os atributos gerais do grupo de túneis define a política de grupo que é usada para enviar determinadas configurações de política para o túnel que é estabelecido. As configurações padrão das opções definidas na política de grupo são derivadas de uma política de grupo geral padrão:

```
tunnel-group 172.16.1.1 general-attributes
default-group-policy SITE_A
```

Verificar

Use as informações fornecidas nesta seção para verificar se a configuração funciona corretamente.

ASDM

Para visualizar o status do túnel a partir do ASDM, navegue até Monitoring > VPN. Estas informações são fornecidas:

- O endereço IP do par
- O protocolo usado para criar o túnel
- O algoritmo de criptografia usado
- A hora em que o túnel foi criado e o tempo de atividade
- O número de pacotes recebidos e transferidos

  Dica: clique em Refresh para exibir os valores mais recentes, pois os dados não são atualizados em tempo real.

CLI
Esta seção descreve como verificar a configuração por meio da CLI.

Fase 1

Digite este comando na CLI para verificar a configuração da Fase 1 no lado do site B (5515):

```
show crypto ikev1 sa
```

```
Active SA: 1
Rekey SA: 0 (A tunnel will report 1 Active and 1 Rekey SA during rekey)
Total IKE SA: 1

1 IKE Peer: 192.168.1.1
Type : L2L Role : initiator
Rekey : no State : MM_ACTIVE
```

Digite este comando na CLI para verificar a configuração da Fase 1 no lado do site A (5510):

```
show crypto isakmp sa

Active SA: 1
Rekey SA: 0 (A tunnel will report 1 Active and 1 Rekey SA during rekey)
Total IKE SA: 1

1 IKE Peer: 172.16.1.1
Type : L2L Role : initiator
Rekey : no State : MM_ACTIVE
```

Fase 2

O show crypto ipsec sa mostra as SAs IPsec que são criadas entre os correspondentes. O túnel criptografado é criado entre os endereços IP 192.168.1.1 e 172.16.1.1 para o tráfego que flui entre as redes 10.1.1.0 e 10.2.2.0. Você pode ver as duas SAs de ESP criadas para o tráfego de entrada e de saída. O cabeçalho de autenticação (AH) não é usado porque não há SAs de AH.

Digite este comando na CLI para verificar a configuração da Fase 2 no lado do site B (5515):

```
interface: FastEthernet0
Crypto map tag: outside_map, local addr. 172.16.1.1
 local ident (addr/mask/prot/port): (10.2.2.0/255.255.255.0/0/0)
remote ident (addr/mask/prot/port): (10.1.1.0/255.255.255.0/0/0)
 current_peer: 192.168.1.1
PERMIT, flags={origin_is_acl,}
#pkts encaps: 20, #pkts encrypt: 20, #pkts digest 20
#pkts decaps: 20, #pkts decrypt: 20, #pkts verify 20
#pkts compressed: 0, #pkts decompressed: 0

       sa timing: remaining key lifetime (k/sec): (4608000/52)
IV size: 8 bytes
replay detection support: Y
outbound ah sas:
outbound pcp sas
```

Troubleshoot

Use as informações fornecidas nesta seção para solucionar problemas de configuração.

ASA versão 8.4 e posteriores

Digite estes comandos debug para determinar o local da falha de túnel:

- debug crypto ikev1 127 (Fase 1)
- debug crypto ipsec 127 (Fase 2)

Aqui está um exemplo completo de saída de depuração:

```
IPSEC(crypto_map_check)-3: Looking for crypto map matching 5-tuple: Prot=1,
saddr=10.2.2.1, sport=19038, daddr=10.1.1.1, dport=19038
