Introduction

Este documento fornece uma configuração de exemplo para a conexão básica do Fibre Channel Over TCP/IP (FCIP) Multilayer Director Switch (MDS) ao MDS.

Essa configuração de exemplo é relevante para as versões 1.2 e 1.3 do SAN-OS. Alguns parâmetros mudam na versão 2.0 do SAN-OS. Consulte o guia de configuração do SAN-OS 2.0 e as notas de versão.

O FCIP descreve os mecanismos que permitem a interconexão de ilhas de SANs (Storage Area Networks, redes de armazenamento) Fibre Channel (FC) em redes baseadas em IP para formar uma SAN unificada em uma única malha FC. O FCIP depende de serviços de rede baseados em IP para fornecer a conectividade entre as ilhas de SAN através de redes locais, redes de área metropolitana ou redes de longa distância.

SANs Fibre Channel conectadas por FCIP

O FCIP usa o Transmission Control Protocol (TCP) na porta 3225 como um transporte da camada de rede.

Prerequisites

Requirements

O backbone IP deve estar operacional e oferecer a largura de banda necessária para suportar os aplicativos executados nos enlaces FCIP - pode ser uma topologia de Camada 2 (L2) ou Camada 3 (L3). Se L3, os roteadores intermediários ou switches multicamada devem ser configurados e configurados para encaminhar o tráfego IP entre os endereços IP origem e destino dos túneis FCIP de forma adequada. Se a Qualidade de Serviço (QoS - Quality of Service) ou a modelagem de tráfego for aplicada em qualquer dispositivo de rede no caminho entre os correspondentes FCIP, o gerente de rede que administra a infraestrutura IP deve ser consultado para obter os detalhes necessários antes de configurar quaisquer parâmetros e recursos relacionados ao TCP no(s) perfil(s) MDS FCIP .

Componentes Utilizados

As informações deste documento são baseadas nas seguintes versões de software e de hardware:

- MDS 9509 com módulo de serviço IPS (IP Storage, armazenamento IP) (DS-X9308-SMIP) executando a versão 1.2.(2a)
- MDS 9216 com módulo de serviço IPS (DS-X9308-SMIP) executando a versão 1.2.(2a)
- Win2003 Server (HPQ Pro-Liant-P4) com Emulex LP9K HBA
- IBM Storage Array (ESS-2105-F20)

The information in this document was created from the devices in a specific lab environment. All of the devices used in this document started with a cleared (default) configuration. If your network is live, make sure that you understand the potential impact of any command.

Conventions

For more information on document conventions, refer to the [Cisco Technical Tips Conventions](#).

Informações de Apoio

O FCIP consiste nas seguintes especificações:

ANSI T11

1. FC-SW-2 descreve a operação e a interação de switches FC, incluindo E_Port e operação de estrutura.
2. FC-BB-2 é um mapeamento que diz respeito à extensão de redes comutadas FC através de um backbone de rede TCP e define modelos de referência que suportam E_Port e B_Port.

Grupo de Trabalho IPS IETF

1. FC sobre TCP cobre os requisitos de TCP/IP para transportar quadros FC através de uma rede IP.

2. O encapsulamento de quadro FC define o formato comum de encapsulamento de fibra.

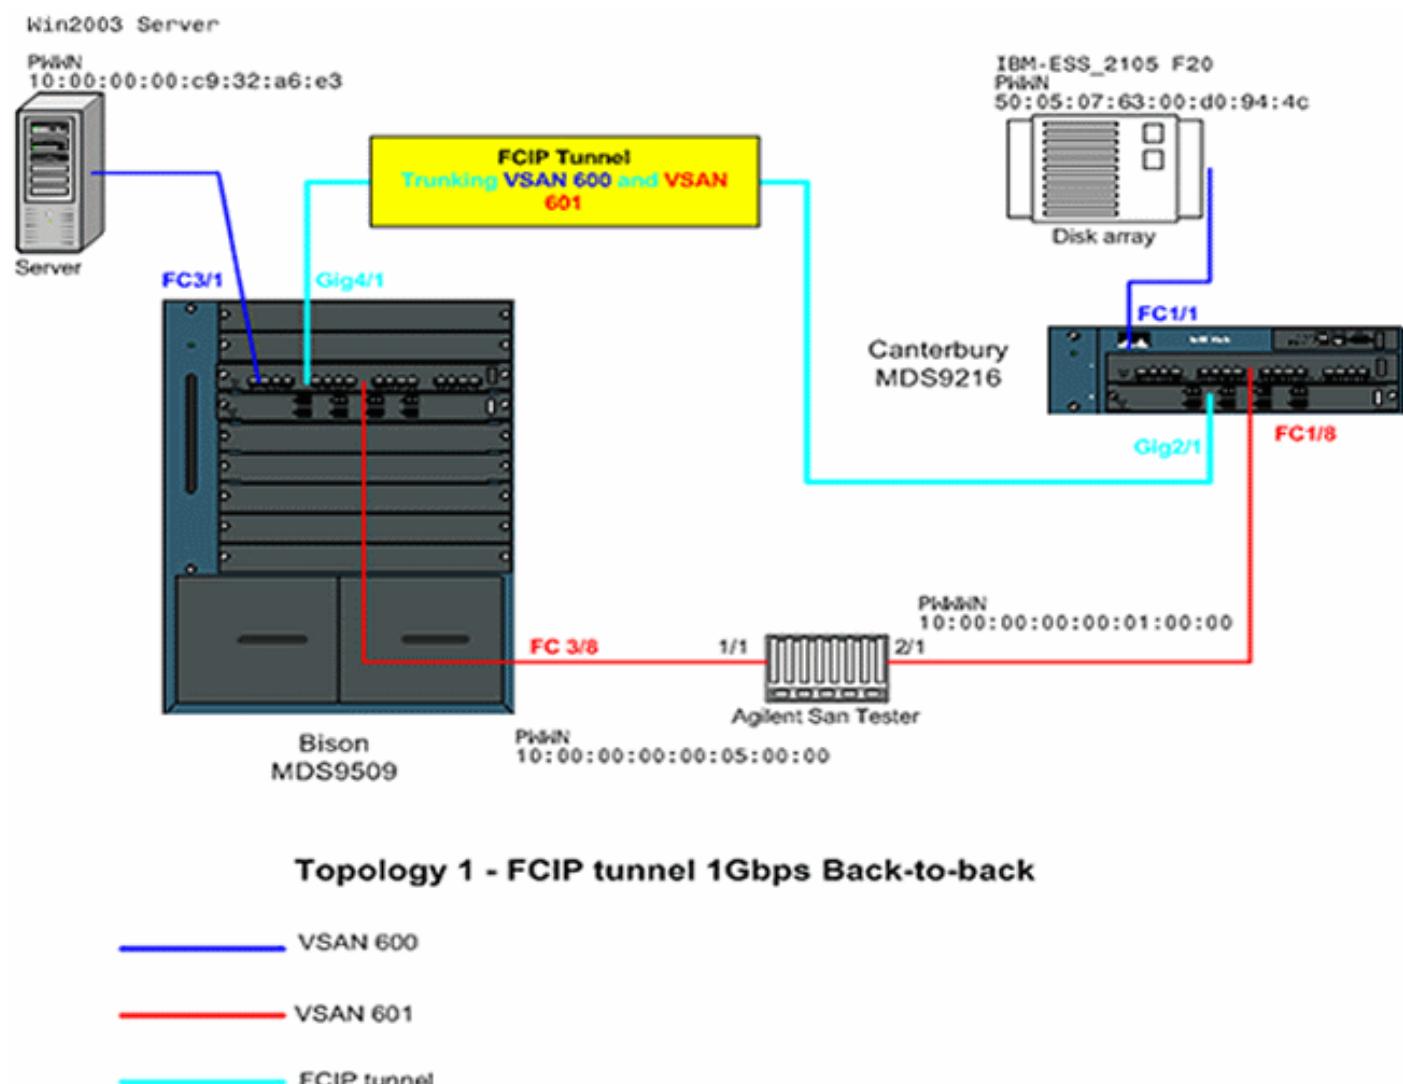

Uma interconexão entre dois switches SAN ou malhas em FCIP é chamada de link FCIP e pode conter uma ou mais conexões TCP. Cada extremidade de um link FCIP é associada a uma porta E virtual (VE_port) ou a uma porta B_port, dependendo da implementação. FC-BB e FC-BB-2 estão descrevendo as diferenças entre as duas abordagens. O módulo de Serviços IP (DS-X9308-SMIP) suporta ambos os modos, mas assume como padrão o VE_Port, que também é o modo recomendado para ser executado se todos os correspondentes relevantes forem módulos DS-X9308-SMIP. A funcionalidade VE_Port em plataformas MDS também suporta a funcionalidade de porta TE, o que a torna capaz de truncar o tráfego de várias VSANs em uma instância FCIP.

Configurar

No MDS, você precisa se familiarizar com os guias de configuração do IPS para ambas as plataformas. A versão mais recente do manual é [Configuração do armazenamento IP](#).

Diagrama de Rede

Este documento utiliza a instalação de rede mostrada no diagrama abaixo.

Este diagrama mostra uma configuração típica de laboratório em que nenhum equipamento de rede adicional está conectado entre as interfaces Gigabit Ethernet (GE) de ambos os switches

MDS. Essa é a forma mais simples de uma instalação de FCIP MDS e é normalmente usada em laboratórios de clientes para verificar a funcionalidade básica. No VSAN 600, o HBA Emulex LightPulse 9000 conecta o servidor Windows 2003 ao MDS9509 chamado Bison e um storage Array IBM conectado ao MDS9216 chamado Canterbury, onde os LUNs para o servidor Windows 2003 são configurados.

O dispositivo de teste de SAN da Agilent é usado como um emulador para preencher o VSAN 601 com dois dispositivos, bem como para gerar tráfego substancial de segundo plano FC-2 não-FCP. Esse equipamento periférico é adicionado para tornar a configuração mais realista e para ter entradas substanciais no servidor de nomes distribuídos de ambos os switches participantes. O foco deste documento não é a conectividade fim-a-fim e nenhuma captura de tela do servidor ou da matriz de armazenamento está incluída. O equipamento periférico não tem conhecimento sobre o FCIP e se comporta como se o link EISL entre os dois MDSs estivesse sendo executado em um link FC normal.

Configurações

Este documento utiliza as configurações mostradas abaixo.

Verificar

Esta seção fornece informações que você pode usar para confirmar se sua configuração está funcionando adequadamente.

- **show interface gig x/y**—Exibe o status da interface Gigabit relevante vinculada ao perfil FCIP.
- **show ips stats tcp int gig x/y**—Exibe as estatísticas do TCP e as conexões ativas para a interface Gigabit relevante.
- **show ips arp int gig x/y**—Exibe todas as entradas do Address Resolution Protocol (ARP) para a interface Gigabit relevante; o próximo salto ou peer deve estar presente nesta lista.
- **show ips ip route int gig x/y**—Exibe as rotas específicas que passam pela interface Gigabit relevante.
- **show interface fcip x**— Exibe o status da interface FCIP e todos os detalhes relacionados a este túnel FCIP.
- **show profile fcip x**— Exibe o endereço IP ao qual o perfil está vinculado e todos os parâmetros TCP configurados.
- **show int fcip x counters**—Usado para verificar se há algum quadro passando pelo túnel FCIP.
- **show fcdomain vsan x**— Lista todos os detalhes relacionados ao domínio; usado para verificar se a estrutura é formada através dos túneis FCIP.
- **show fcns da vsan x**— Exibe todos os tipos de pwwn, FC4 e FCIDs da VSAN relevante; usado para verificar se todas as entradas esperadas são distribuídas pelo(s) túnel(s) FCIP.

Troubleshoot

Emita os comandos **show** acima várias vezes para criar um histórico de contadores. Os contadores que não estão relacionados a um ponto no tempo e são coletados apenas uma vez são, em sua maioria, inúteis.

Utilize as configurações mostradas abaixo para mais Troubleshooting.
