l2 vfi manual

To create a Layer 2 virtual forwarding instance (VFI) and enter Layer 2 VFI manual configuration mode, use the **l2vfimanual** command in global configuration mode. To remove the Layer 2 VFI, use the **no** form of this command.

12 vfi name manualno 12 vfi name manual

Command Default The Layer 2 VFI is not configured.

Command Modes Global configuration (config)

Command History	Release	Modification
	12.2(18)SXF	This command was introduced on the Supervisor Engine 720.
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
	15.0(1)M	This command was integrated into a release earlier than Cisco IOS Release 15.0(1)M.
	Cisco IOS XE Release 3.7S	This command was integrated into Cisco IOS XE Release 3.7S.

Usage Guidelines

A VFI is a collection of data structures used by the data plane, software-based or hardware-based, to forward packets to one or more virtual circuits (VC). It is populated and updated by both the control plane and the data plane and also serves as the data structure interface between the control plane and the data plane.

Within the Layer 2 VFI manual configuration mode, you can configure the following parameters:

- VPN ID of a Virtual private LAN service (VPLS) domain
- Addresses of other PE routers in this domain
- Type of tunnel signaling and encapsulation mechanism for each peer

Within the Layer 2 VFI manual configuration mode, the following commands are available:

- vpn id vpn-id
- [no] neighbor *remote-router-id* {encapsulation {l2tpv3 | mpls} | pw-class pw-name | no-split-horizon}

Examples

This example shows how to create a Layer 2 VFI, enter Layer 2 VFI manual configuration mode, and configure a VPN ID:

Router(config)# 12 vfi vfitest1 manual Router(config-vfi)# vpn id 303

Related Comm	nands
---------------------	-------

5	Command	Description
	l2 vfi point-to-point	Establishes a point-to-point Layer 2 VFI between two separate networks.
	vpn id	Configures a VPN ID in RFC 2685 format. You can change the value of the VPN ID only after its configuration, and you cannot remove it.
	neighbor	Specifies the type of tunnel signaling and encapsulation mechanism for each peer.

l2protocol-tunnel

To enable the protocol tunneling on an interface and specify the type of protocol to be tunneled, use the **l2protocol-tunnel** command in global or interface configuration mode. To disable protocol tunneling, use the **no** form of this command.

Global Configuration 12protocol-tunnel [cos cos-value | global | mac-address] no 12protocol-tunnel

Interface Configuration l2protocol-tunnel [cdp | lldp | stp | vtp] no l2protocol-tunnel

Syntax Description		(Optional) Specifies a class of service (CoS) value globally on all ingress Layer 2 protocol tunneling ports.
	global	(Optional) Displays global settings.
	mac-address	(Optional) Displays L2PT MAC address.
	cdp	(Optional) Enables Cisco Discovery Protocol (CDP) tunneling.
	lldp	(Optional) Enables Link Layer Discovery Protocol (LLDP) tunneling.
	stp	(Optional) Enables Spanning Tree Protocol (STP) tunneling.
	vtp	(Optional) Enables VLAN Trunking Protocol (VTP) tunneling.
Command Default	Disabled	
	21000100	
Command Modes	Global configur	ration (config)
	Interface config	guration (config-if)
Command History	Release	Modification
	12.2(14)SX	Support for this command was introduced on the Supervisor Engine 720.
	12.2(17d)SXB	Support for this command on the Supervisor Engine 2 was extended to Release 12.2(17d)SXB.
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
	15.2(2)T	This command was modified. The lldp , cos, global, and mac-address keywords were added.
Usage Guidelines		ce provider edge switches, you must enable PortFast BPDU filtering on the 802.1Q tunnel og these commands:
	=	r-if)# spanning-tree bpdufilter enable r-if)# spanning-tree portfast

	Note PortFast BPDU filtering is enabled automatically on tunnel ports.
	If you do not specify a protocol, all protocols are tunneled.
	You can configure protocol tunneling on VLAN and trunk interfaces.
	You must enter the switchport command once without any keywords to configure the LAN port as a Layer 2 interface before you can enter additional switchport commands with keywords. This action is required only if you have not entered the switchport command for the interface.
Examples	This example shows how to enable a tunneling protocol on an interface:
	Router> enable Router# configure terminal Router#(config) interface FastEthernet 0/0 Router(config-if)# 12protocol-tunnel cdp
	This example shows how to disable a tunneling protocol on an interface:
	Router> enable Router# configure terminal Router# (config) interface fastEthernet 4/0

Displays the protocols that are tunneled on an interface or on all interfaces.

Modifies the switching characteristics of the Layer 2-switched interface.

lacp active-port distribution automatic

To have an effective auto interleaved port priority distribution of active and bundled ports across different slots that are part of the same port channel distributed EtherChannel (DEC) and multichassis EtherChannel (MEC), use the **lacp active-port distribution automatic** command in port channel configuration mode.

lacp active-port distribution automatic no lacp active-port distribution automatic

Syntax Description This command has no keywords or arguments.

Command Default Auto interleaved port priority is disabled.

Command Modes Interface configuration (config-if)

Command History Release Modification 12.2(33)SXI4 This command was introduced.

Usage Guidelines The auto interleaved port-priority feature automatically distributes active and bundled ports based on the position of a port link when it comes up and is effective only if you configure it on the system that has the higher LACP system priority.

The port priority per port that you configured continues to take precedence over a dynamic port number. You need to perform a shutdown and no shutdown on the interface port channel to enable the auto interleaved port priority feature on all ports.

Examples This example shows how to configure interleaved port priority:

```
Router(config)# interface port23
Router(config-if)# lacp active-port distribution automatic
Please shut/no shut the port-channel for configuration to take effect immediately.
Router(config-if)# shutdown
Router(config-if)# no shutdown
Router(config-if)# end
```

This example shows how to verify that interleaved port priority is configured:

```
Router# show running interface port23
Building configuration...
Current configuration : 81 bytes
!
interface Port-channel23
no switchport
no ip address
lacp max-bundle 4
lacp active-port distribution automatic
end
Router# show etherchannel 23 summary
Flags: D - down P - bundled in port-channel
I - stand-alone s - suspended
H - Hot-standby (LACP only)
R - Layer3 S - Layer2
```

```
U - in use N - not in use, no aggregation
{\rm f} - failed to allocate aggregator
\ensuremath{\text{M}} - not in use, no aggregation due to minimum links not met
m - not in use, port not aggregated due to minimum links not met
u - unsuitable for bundling
d - default port
w - waiting to be aggregated
Number of channel-groups in use: 9
Number of aggregators: 9
Group Port-channel Protocol
                               Ports
23

Command	Description
show etherchannel	Displays EtherChannel information for a port channel.

lacp fast-switchover

To enable Link Aggregation Control Protocol (LACP) 1:1 link redundancy, use the **lacp fast-switchover** command in interface configuration mode. To dis able LACP 1:1 link redundancy, use the **no** form of this command.

lacp fast-switchover no lacp fast-switchover

Syntax Description This command has no arguments or keywords.

Command Default LACP 1:1 link redundancy is disabled by default.

Command Modes Interface configuration (config-if)

Command History	Release	Modification
	12.2(33)SXH	This command was introduced.
	12.2(33)SRC	This command was integrated into Cisco IOS Release 12.2(33)SRC.
	12.2(33)SB	Support for this command was implemented on the Cisco 10000 series router and integrated into Cisco IOS Release 12.2(33)SB. The time allowed for a link switchover was modified from the default of 2 seconds to 250 milliseconds.
	Cisco IOS XE Release 2.5	This command was integrated into Cisco IOS XE Release 2.5

Usage Guidelines

lines Prior to entering the **lacp fast-switchover** command, you must ensure the following:

- The port channel protocol type is LACP.
- The **lacp max-bundle 1**command has been entered on the port channel. The **lacp fast-switchover** command will not affect the **lacp max-bundle** command.

When you enable LACP 1:1 link redundancy, based on the system priority and port priority, the port with the higher system priority chooses the link as the active link and the other link as the standby link. When the active link fails, the standby link is selected as the new active link without taking down the port channel. When the original active link recovers, it reverts to its active link status. During this change-over, the port channel is also up.

Note

We recommend that you configure two ports only (one active and one hot-standby) in the bundle for optimum performance.

You can enter this command on any port channels with different EtherChannel protocol types of LACP, Port Aggregation Protocol (PAgP), or Fast EtherChannel (FEC).

Examples This example shows how to enable LACP 1:1 link redundancy:

Router(config-if) # lacp fast-switchover

This example shows how to disable LACP 1:1 link redundancy:

Router(config-if) # no lacp fast-switchover

lacp port-priority priority

no lacp port-priority

Syntax Description	 <i>riority</i> Integer from 1 to 65535 that indicates the priority for the physical interface. The default is 32768. On the Cisco ASR 1000 series router, the range is 0 to 65535. 	
Command Default	The default port priority is set.	
Command Modes	terface configuration (config-if)	

Release Modification 12.1(13)EW This command was introduced on the Cisco Catalyst 4500 series switches. 12.2(14)SX Support for this command on the Supervisor Engine 720 was integrated into Cisco IOS Release12.2(14)SX. 12.2(17d)SXB Support for this command on the Supervisor Engine 2 was integrated into Cisco IOS Release12.2(17d) SXB. 12.2(33)SRA This command was integrated into Cisco IOS Release 12.2(33)SRA. 12.2(31)SB2 This command was integrated into Cisco IOS Release 12.2(31)SB2. 12.2(33)SRB Support for this command on the Cisco 7600 router was integrated into Cisco IOS Release 12.2(33)SRB. Cisco IOS XE Release 2.4 This command was integrated into Cisco IOS XE Release 2.4. 15.1(2)SNG This command was implemented on the Cisco ASR 901 Series Aggregation Services Router.

Usage Guidelines

Command History

You may assign a port priority to each port on a device running Link Aggregation Control Protocol (LACP). You can specify the port priority by using the **lacp port-priority** command at the command-line interface (CLI) or use the default port priority (32768) that is carried as part of the LACP protocol data unit (PDU) exchanged with the partner. Port priority is used to decide which ports should be put in standby mode when a hardware limitation or the **lacp max-bundle** command configuration prevents all compatible ports from aggregating. Priority is supported only on port channels with LACP-enabled physical interfaces.

Note A high priority number means a low priority.

Port priority together with port number form a port identifier. To verify the configured port priority, issue the **show lacp** command.

Examples

This example shows how to set a priority of 23700 for an interface:

```
Device> enable
Device# configure terminal
Device(config)# interface ethernet0/0
Device(config-if)# lacp port-priority 23700
Device(config-if)#
```

Related Commands

Command	Description	
channel-group	Assigns and configures an EtherChannel interface to an EtherChannel group.	
debug lacp	Enables debugging of LACP activities.	
lacp max-bundleDefines the maximum number of active bundled LACP ports allowed in a port channel.		
lacp system-priority Sets the priority of the system.		
show lacp	Displays information about LACP activity on the device.	

lacp rate

To set the rate at which Link Aggregation Control Protocol (LACP) control packets are ingressed to an LACP-supported interface, use the **lacp rate** command in interface configuration mode. To return to the default settings, use the **no** form of this command.

lacp rate {normal | fast}
no lacp rate

Syntax Description		Specifies that I link is bundled.	-	ckets are ingressed at the normal rate, every 30 seconds after the	
	fast	Specifies that I	ACP control pa	ckets are ingressed at the fast rate, once every 1 second.	
Command Default	The default ingressed rate for control packets is 30 seconds after the link is bundled.				
Command Modes	Interface configuration (config-if)				
Command History	Release		Modification		
	12.2(18)S	XF2	This comman	d was introduced on the Catalyst 6500 series switch.	
	12.2(33)SRC		This command was integrated into Cisco IOS Release 12.2(33)SRC.		
	Cisco IOS XE Release 3.6S			d was implemented on Cisco ASR 1000 Series Aggregation ers in Cisco IOS XE Release 3.6S.	
Usage Guidelines	Use this command to modify the duration of a LACP timeout. The LACP timeout value is set on Cisco switch to a value of 90 seconds. Using the lacp rate command, you can select the LACP timeout value for a swit to be either 30 seconds or 1 second.				
	This command is supported only on LACP-enabled interfaces.				
Examples	This example shows how to specify the fast (1-second) ingress rate on interface Ethernet 0/1:				
	Router(config)# interface ethernet 0/1 Router(config-if)# lacp rate fast			0/1	
Related Commands	Command	Description			
	show lacp	Displays LA	CP information.		

lacp system-priority

To set the priority for a system, use the **lacp system-priority** command in global configuration mode. To return to the default setting, use the **no** form of this command.

lacp system-priority priority

no lacp system-priority

Syntax Description	priority	Integer from 1 to 65535 that indicates the priority for the system. The default is 32768.
		• On the Cisco ASR 1000 series router, the range is 0 to 65535.

Command Default The default system priority is set.

Command Modes Global configuration (config)

Release	Modification		
12.1(13)EW	This command was introduced on the Cisco Catalyst 4500 series switches.		
12.2(14)SX	Support for this command on the Supervisor Engine 720 was integrated into Cisco IOS Release12.2(14)SX.		
12.2(17d)SXB	Support for this command on the Supervisor Engine 2 was integrated into Cisco IOS Release12.2(17d) SXB.		
12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.		
12.2(31)SB2	This command was integrated into Cisco IOS Release 12.2(31)SB2.

Cisco IOS XE Release 2.4	This command was integrated into Cisco IOS XE Release 2.4.		
15.1(2)SNG	This command was implemented on the Cisco ASR 901 Series Aggregation Services Router.		

Usage Guidelines

Command History

You can assign a system priority to each device running Link Aggregation Control Protocol (LACP). You can specify the system priority by using the **lacp system-priority** command at the command-line interface (CLI) or use the default system priority (32768) that is carried as part of the LACP protocol data unit (PDU) exchanged with the partner. System priority is used with the MAC address of the device to form the system ID and also is used during negotiation with other systems. Priority is supported only on port channels with LACP-enabled physical interfaces.

Note A high priority number means a low priority.

To verify the configured system priority, issue the **show lacp** command.

Examples

The following example shows how to set a system priority of 25500 for a device:

```
Router> enable
Router# configure terminal
Router(config)# lacp system-priority 25500
```

Related Commands

6	Command	Description
	channel-group	Assigns and configures an EtherChannel interface to an EtherChannel group.
	debug lacp	Enables debugging of LACP activities.
	lacp port-priority	Sets the priority of a port.
	show lacp	Displays information about LACP activity on the device.

lbo

lbo

To set a cable length longer than 655 feet for a DS-1 link, use the**lbo**command in interface configuration mode on the interface for a T1 link. To delete the **lbo**value, use the **no** form of this command.

Syntax Description	long	Specifies the long-haul mode where the gain and line build out must be configured.
	gain26	Specifies the decibel pulse gain at 26 decibels. This is the default pulse gain.
	gain36	Specifies the decibel pulse gain at 36 decibels.
	-15db	Specifies the decibel pulse rate at -15 decibels.
	-22.5db	Specifies the decibel pulse rate at -22.5 decibels.
	-7.5db	Specifies the decibel pulse rate at -7.5 decibels.
	0db	Specifies the decibel pulse rate at 0 decibels. This is the default.
	short	Specifies the short-haul mode where the cable length, in feet, must be configured.
	133	Specifies a cable length from 0 to 133 feet.
	266	Specifies a cable length from 134 to 266 feet.
	399	Specifies a cable length from 267 to 399 feet.
	533	Specifies a cable length from 400 to 533 feet.
	655	Specifies a cable length from 534 to 655 feet.

Command Default

gain26 and0db

Command Modes Interface configuration

Command History

Release	Modification
11.3MA	This command was introduced as a Cisco MC3810 controller configuration command.
12.0(5)XE	The command was introduced as an ATM interface command.
12.0(7)XE1	This command was implemented on Cisco 7100 series routers.
12.1(5)T	This command was integrated into Cisco IOS Release 12.1(5)T.
12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
12.28X	This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.

Usage Guidelines	his command is supported on T1 links only.					
	Each T1 port can operate in long-haul or short-haul mode. In long haul mode, the user must specify the gain and the line build out. In short-haul mode, the user must specify the cable length in feet.					
	The transmit attenuation value is best obtained by experimentation. If the signal received by the far-end equipment is too strong, reduce the transmit level by entering additional attenuation.					
Examples	On Cisco 7100 or Cisco 7200 series routers, the following example specifies a pulse gain of 36 decibels and a decibel pulse rate of -7.5 decibels:					
	Router(config)# interface atm 1/2 Router(config-if)# lbo long gain36 -7.5db					

lex burned-in-address

To set the burned-in MAC address for a LAN Extender interface, use the **lexburned-in-address** command in interface configuration mode. To clear the burned-in MAC address, use the **no** form of this command.

lex burned-in-address *ieee-address* no lex burned-in-addresslex burned-in-address command

Syntax Description	ieee-addr	48-bit IEEE MAC address written as a dotted triplet of 4-digit hexadecimal numbers.					
Command Default	No burned	No burned-in MAC address is set.					
Command Modes	Interface c	Interface configuration					
Command History	tory Release Modification						
	10.3	This command was introduced.					
	12.2(15)T	This command is no longer supported in Cisco_IOS Mainline or Technology-based (T) releases. It may continue to appear in Cisco_IOS 12.2S-family releases.					
Usage Guidelines	Use this command only on a LAN Extender interface that is not currently active (not bound to a serial interface).						
Examples	The follow	ving example sets the burned-in MAC address on LAN Extender interface 0:					
	Router(co Router(co Router(co	<pre>onfig)# interface serial 4 onfig-if)# encapsulation ppp onfig)# interface lex 0 onfig-if)# lex burned-in-address 0000.0c00.0001 onfig-if) ip address 10.108.172.21 255.255.255.0</pre>					

lex input-address-list

To assign an access list that filters on MAC addresses, use the **lexinput-address-list** command in interface configuration mode. To remove an access list from the interface, use the **no** form of this command.

lex input-address-list access-list-number no lex input-address-listlex input-address-list command

Syntax Description	access-list-number		Number of the access list assigned with the access-list global configuration command. It can be a number from 700 to 799.			
Command Default	No access	No access lists are preassigned to a LAN Extender interface.				
Command Modes	Interface c	onfiguratio	on la			
Command History	Release Modification		tion			
	10.0	This com	mand was introduced.			
	12.2(15)T		is command is no longer supported in Cisco_IOS Mainline or Technology-based (T) releases nay continue to appear in Cisco_IOS 12.2S-family releases.			
Usage Guidelines	Use the lexinput-address-list command to filter the packets that are allowed to pass from the LAN Extend to the core router. The access list filters packets on the basis of the source MAC address. The LAN Extender interface does not process MAC-address masks. Therefore, you should omit the mask from the access-list commands.					
	For LAN Extender interfaces, an implicit permit everything entry is automatically defined at the end of an access list. Note that this default differs from other access lists, which have an implicit deny everything entry at the end of each access list.					
Examples	The following example applies access list 710 to LAN Extender interface 0. This access list denies all packets from MAC address 0800.0214.2776 and permits all other packets.					
	Router(config-if)# access-list 710 deny 0800.0214.2776 Router(config)# interface lex 0 Router(config-if)# lex input-address-list 710					
Related Commands	Command	Descri	ption			
	access-list Configures the access list mechanism for filtering frames by protocol type or vendor code.					

lex input-type-list

To assign an access list that filters Ethernet packets by type code, use the **lexinput-type-list** command in interface configuration mode. To remove an access list from an interface, use the **no** form of this command.

lex input-type-list access-list-number no lex input-type-list lex input-type-list command

Syntax Description	access-list-number		Number of the access list that you assigned with the access-list command. It can be a number in the range 200 to 299.		
Command Default	No access	lists are pr	reassigned to a LAN Extender interface.		
Command Modes	Interface configuration				
Command History	Release Modification				
	10.3	This com	mand was introduced.		
	12.2(15)T	This command is no longer supported in Cisco_IOS Mainline or Technology-based (T) releas It may continue to appear in Cisco_IOS 12.2S-family releases.			
Usage Guidelines	Filtering is done on the LAN Extender chassis.				
	The LAN Extender interface does not process masks. Therefore, you should omit the mask from commands.				
For LAN Extender interfaces, an implicit permit everything entry is automatically defined at access list. Note that this default differs from other access lists, which have an implicit deny e at the end of each access list.			this default differs from other access lists, which have an implicit deny everything entry		
Examples	The following example applies access list 220 to LAN Extender interface 0. This access list denies all AppleTalk packets (packets with a type field of 0x809B) and permits all other packets.				
	Router(config-if)# access-list 220 deny 0x809B 0x0000 Router(config)# interface lex 0 Router(config-if)# lex input-type-list 220				
Related Commands	Command	Descri	ption		

Configures the access list mechanism for filtering frames by protocol type or vendor code.

access-list

lex priority-group

To activate priority output queueing on the LAN Extender, use the **lexpriority-group** command in interface configuration mode. To disable priority output queueing, use the **no** form of this command.

lex priority-group group
no lex priority-group

	no lex priority-group						
Syntax Description	group N	group Number of the priority group. It can be a number in the range 1 to 10.					
Command Default	Disabled						
Command Modes	Interface c	configuration					
Command History	Release	Modification					
	10.3	This command was introduced.					
	12.2(15)T	This command is no longer supported in Cisco_IOS Mainline or Technology-based (T) releases. It may continue to appear in Cisco_IOS 12.2S-family releases.					
Usage Guidelines	To define queueing priorities, use the priority-listprotocol global configuration command. Note that you can use only the following forms of this command:						
	priority-list						
	list protocol						
	protocol						
	{ high						
	medium						
	normal						
	low						
	priority-list						
	list						
	protocol bridge						
	{						
	high						
	medium						
	normal						
	 1 orr						
	low }						

list

list-number

If you specify a protocol that does not have an assigned Ethernet type code, such as **x25**, **stun**, or **pad**, it is ignored and will not participate in priority output queueing.

Examples

The following example activates priority output queueing on LAN Extender interface 0:

Router(config-if)# priority-list 5 protocol bridge medium list 701
Router(config-if)# lex interface 0
Router(config-if)# lex priority-group 5

Related Commands	Command	Description
	priority-list protocol	Establishes queueing priorities based on the protocol type.

lex retry-count

To define the number of times to resend commands to the LAN Extender chassis, use the **lexretry-count** command in interface configuration mode. To return to the default value, use the **no** form of this command.

lex retry-count number no lex retry-count number lex retry-count command

Syntax Description	number	Number of times to return conding common do to the LAN Entender. It can be a number in the renge
Syntax Description		Number of times to retry sending commands to the LAN Extender. It can be a number in the range 0 to 100. The default is 10.
Command Default	10 retries	
Command Modes	Interface c	onfiguration
Command History	Release	Modification
	10.3	This command was introduced.
	12.2(15)T	This command is no longer supported in Cisco_IOS Mainline or Technology-based (T) releases. It may continue to appear in Cisco_IOS 12.2S-family releases.
Usage Guidelines		outer has sent a command the specified number of times without receiving an acknowledgment AN Extender, it stops sending the command altogether.
Examples	The follow	ing example resends commands 20 times to the LAN Extender:
		nfig-if)# lex interface 0 nfig-if)# lex retry-count 20
Related Commands	Command	Description
	lex timeo	ut Defines the amount of time to wait for a response from the LAN Extender.

lex timeout

To define the amount of time to wait for a response from the LAN Extender, use the **lextimeout** command in interface configuration mode. To return to the default time, use the **no** form of this command.

lex timeout milliseconds
no lex timeout [milliseconds] lex timeout command

Syntax Description	millisecon	Time, in milliseconds, to wait for a response from the LAN Extender before resending the command. It can be a number in the range 500 to 60,000. The default is 2000 ms.				
Command Default	2000 ms (2	e seconds)				
Command Modes	Interface c	onfiguration				
Command History	Release	se Modification				
	10.3	This command was introduced.				
	12.2(15)T	This command is no longer supported in Cisco_IOS Mainline or Technology-based (T) releases It may continue to appear in Cisco_IOS 12.2S-family releases.				
Usage Guidelines		reout command defines the amount of time that the router waits to receive an acknowledgment g sent a command to the LAN Extender.				
Examples	The following example causes unacknowledged packets to be resent at 4-second intervals					
		nfig-if)# lex interface 0 nfig-if)# lex timeout 4000				
Related Commands	Command	Description				
	_					

lex retry-count Defines the number of times to resend commands to the LAN Extender chassis.

license feature gnss

To configure the license for the global navigation satellite system (GNSS) module on the Cisco ASR 920 routers, use the **license feature gnss** command in the global configuration mode. To remove the license, use the **no** form of this command.

license feature gnss no license feature gnss

Command Default No default behavior or values.

Command Modes Global configuration (config)

Command History	Release	Modification
	IOS-XE 3.17	This command was introduced on the Cisco ASR 920 routers.

Usage Guidelines Only when the GNSS license is in use, the shutdown and no shutdown operations for the GNSS module can be performed.

Examples The following example shows how to configure the GNSS license:

Router# configure terminal Router(config)# license feature gnss

Related Commands	Command	Description
	gnss	Configures the GNSS on the router.

linecard-group y-cable

To create a line card group for one-to-one line card redundancy, use the linecard-group y-cable command in redundancy mode. To remove the line card redundancy group, use the no form of this command.

linecard-group linecard-groupId y-cable
no linecard-group linecard-groupId y-cable

Syntax Description	linecard-gr		An unsigned integer in the range 0 to the (maximum number of chassis line card subslots/2) -1.The link protection type for the line card group.			
	y-cable	The				
Command Default	No default	behavior o	r values .			
Command Modes	Redundancy	/

linecode

To select the line-code type for T1 or E1 lines, use the linecode command in controller configuration mode.

linecode {ami | b8zs | hdb3}

Syntax Description	ami	amiSpecifies alternate mark inversion (AMI) as the line-code type. Valid for T1 or E1 controllers. This is the default for T1 lines.b8zsSpecifies B8ZS as the line-code type. Valid for T1 controller only.hdb3Specifies high-density bipolar 3 (hdb3) as the line-code type. Valid for E1 controller only. This is the default for E1 lines.				
	b8zs					
	hdb3					
Command Default	AMI is	the defaul	It for T1 lines. High-density bipolar 3 is the default for E1 lines.			
Command Modes	Control	ler config	uration			
Command History	Releas	e	Modification			
	10.3		This command was introduced.			
	12.2(33)SRA		This command was integrated into Cisco IOS Release 12.2(33)SRA.			
	12.2SX		This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.			
	XE 3.18SP		This command was integrated into Cisco NCS 4200 Series.			
	XE Everest 16.5.1		This command was integrated into Cisco NCS 4200 Series and Cisco ASR 900 Series Routers.			
Usage Guidelines	data lines. The		d in configurations in which the router or access server must communicate with T1 fractional I service provider determines which line-code type, either ami or b8zs , is required for your ise, the E1 service provider determines which line-code type, either ami or hdb3 , is required it.			
	This command does not have a no form.					
Examples	The following example specifies B8ZS as the line-code type:					
	Router(config-controller)# linecode b8zs					

line-mode

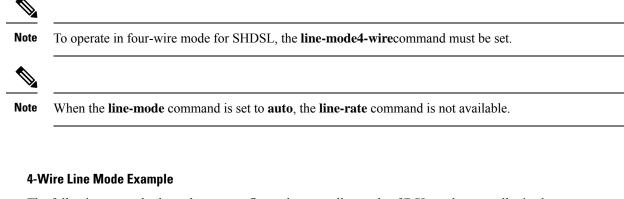

To configure the mode of the controller for the Symmetrical High-Speed Digital Subscriber Line (SHDSL) port, use the **line-mode** command in controller configuration mode. To return to the default two-wire mode, use the **no** form of this command.

line-mode [2-wire | 4-wire [enhanced | standard] | auto] no line-mode

Syntax Description	2-wire	(Optional) Configures the controller to operate in two-wire mode.			
	4-wire	(Optional) Configures the controller to operate in four-wire mode.			
	enhanced	(Optional) Configures 4-wire mode to exchange handshake status on both wire pairs. This is the default if the handshake mode is not specified.			
	standard	(Optional) Configures 4-wire mode to exchange handshake status on the master wire pair only.			
	auto	(Optional) Configures the controller to automatically operate in the mode to match the other line termination. This mode is compatible with a remote host that is in one of the following modes:			
		• line-mode 2-wire line 0			
		• line-mode 2-wire line 1			
		line-mode 4-wire enhanced			
Command Default	The defaul	t is two-wire mode if this command is omitted or if the 4-wire keyword is omitted.			
Command Default Command Modes	_	t is two-wire mode if this command is omitted or if the 4-wire keyword is omitted.

This command was implemented on Cisco 1800 series routers.			

Usage Guidelines

This command is used to configure the controller for two-wire or four-wire mode.

The following example shows how to configure the controller mode of DSL on the controller in slot 4 and port 0 to operate in four-wire mode:

```
Router(config)# controller dsl 4/0
Router(config-controller)# line-mode
4-wire
```

CPE Line Mode Example

The following example configures the controller in slot 1 and port 0. The router is set to terminate as CPE with the line mode automatically selecting between two-wire mode and four-wire mode.

```
Router(config)# controller dsl 1/0
Router(config-controller)# line-mode auto
Router(config-controller)# line-term cpe
```

Related Commands

Examples

Command Description		Description
liı	ne-rate	Specifies a line rate for the DSL controller.
liı	ne-term	Specifies a termination for a line.

line-mode bonding

To enable bonding mode on a CPE, use the **line-mode bonding** command in controller configuration mode. To disable the bonding mode, use the **no** form of this command.

line-mode bonding no line-mode bonding

Syntax Description This command has no keywords or arguments.

Command Default Bonding is not the default mode.

Command Modes Controller configuration (config-controller)#

Command History	Release	Modification		
	15.4(4)T	This command was introduced.		

Usage Guidelines Use this command when a CPE is expected to operate in bonding mode.

Examples The following example shows how to enable bonding mode:

Router(config-controller) # line-mode bonding

The following example shows how to disable bonding mode:

Router(config-controller) # no line-mode bonding

Related Commands	Command	Description		
	line-mode single-wire line	Enables single-wire (nonbonding) mode on a selected line.		

line-mode single-wire line

line-mode bonding

To enable single-wire (nonbonding) mode on a selected line, use the **line-mode single-wire line** command in controller configuration mode. To disable the mode, use the **no** form of this command.

line-mode single-wire line line-number or line-mode single-wire line line-number [profile 30a] no line-mode single-wire line line-number

Syntax Description	<i>line-number</i> Line number. Valid values are either 1 or 0.					
	profile 30a Enables 30a profile on line 1. If profile 30a is not specified, profiles 8a to 17a are enabled of that line.					
Command Default	By default, sir	ngle-wire n	node is enat	oled on line 0 with profiles f	rom 8a to17a enabled.	
Command Modes	Controller configuration (config-controller)#					
Command History	Release 15.4(4)T			Modification		
				This command was introduced.		
Usage Guidelines	Use this comm	nand to con	nfigure eithe	er line 0 or line 1 in single-w	vire (non-bonding) mode.	
Examples	The following example shows how to enable 30a profile on line 1: Router(config-controller)# line-mode single-wire line 1 profile 30a					
Related Commands	Command	[Description			

Changes the mode of a CPE to bonding.

line-rate

To specify a line rate for the DSL controller, use the line-rate command in controller configuration mode.

line-rate {autorate}

Syntax Description	auto	Allows the controller to select the rate. This option is available only in two-wire mode.
	rate	DSL line rate, in kbps. The line will train at the selected rate plus 8 kbps of DSL framing overhead. The supported line rates are as follows:
		• For two-wire mode:
		• 192, 256, 320, 384, 448, 512, 576, 640, 704, 768, 832, 896, 960, 1024, 1088, 1152, 1216, 1280, 1344, 1408, 1472, 1536, 1600, 1664, 1728, 1792, 1856, 1920, 1984, 2048, 2112, 2176, 2240, and 2304
		• For four-wire mode:
		• 384, 512, 640, 768, 896, 1024, 1152, 1280, 1408, 1536, 1664, 1792, 1920, 2048, 2176, 2304, 2432, 2560, 2688, 2816, 2944, 3072, 3200, 3328, 3456, 3584, 3712, 3840, 3968, 4096, 4224, 4352, 4480, and 4608

Command Default No default behavior or values.

Command Modes Controller configuration

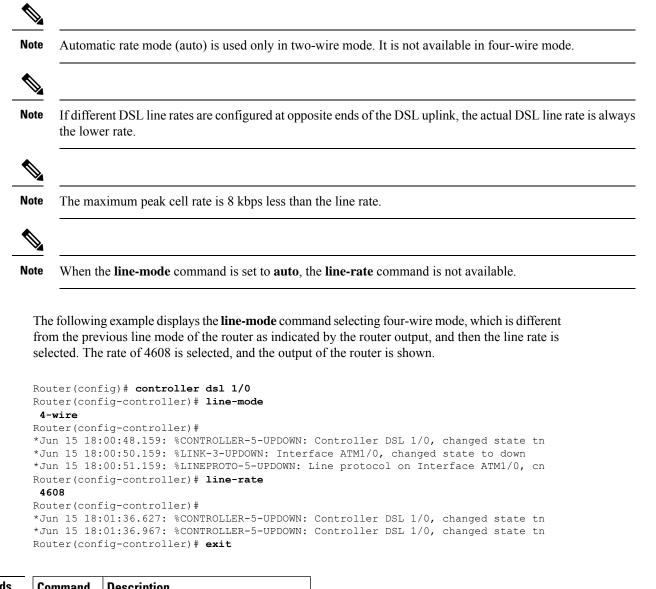

Command History Release Modification This command was introduced on Cisco 2600 series and Cisco 3700 series routers. 12.3(4)XD 12.3(4)XG This command was implemented on Cisco 1700 series routers. 12.3(7)T This command was integrated into Cisco IOS Release 12.3(7)T on Cisco 2600 series and Cisco 3700 series routers. 12.(11)T This command was implemented on Cisco 2800 and Cisco 3800 series routers. 12.3(14)T This command was implemented on Cisco 1800 series routers. 12.4(5)A Modified **line-rate** command to be disallowed when **line-mode**command is set to **auto**. 12.4(4)TModified **line-rate** command to be disallowed when **line-mode** command is set to **auto**.

Usage Guidelines

This command does not have a **no** form.

This command specifies the DSL line rate for the Symmetrical High-Speed Digital Subscriber Line (SHDSL) port. Use this command to configure the line rate in two-wire or four-wire mode. The SHDSL rate is in kbps, but the line trains at the selected rate plus two times the 8 kbps of DSL framing overhead.

Examples

Related Commands	Command	Description
	line-mode	Configures the mode of the controller.
	line-term	Specifies a termination for a line.

line-term

To specify a termination for a line, use the line-term command in controller configuration mode.

line-term {co | cpe}

Syntax Description	со	Central office.
	cpe	Customer premises equipment. This is the default.

Command Default The default value is **cpe**.

Command Modes Controller configuration

Command History	Release	Modification
	This command was introduced on Cisco 2600 series and Cisco 3700 series routers.	
	12.3(7)T	This command was integrated into Cisco IOS Release 12.3(7)T on Cisco 2600 series and Cisco 3700 series routers.
	12.3(11)T	This command was implemented on Cisco 2800 and Cisco 3800 series routers.
	12.3(14)T	This command was implemented on Cisco 1800 series routers.

Usage Guidelines This command does not have a no form.

This command is used to configure the line termination for use as either the central office (CO) or the customer premises equipment (CPE).

Examples The following example shows how to configure the controller in slot 1 and port 0. The router is set to terminate as CPE with the line mode automatically selecting between two-wire mode and four-wire mode.

```
Router(config)# controller dsl 1/0
Router(config-controller)# line-term
    cpe
Router(config-controller)# line-mode
auto
```

No change in line mode

Commands Command Description line-mode Configures the mode of the controller. line-rate Specifies a line rate for the DSL controller.

line-termination

To set the line termination on an E1 controller, use the **line-termination** command in controller configuration mode. To return to the default line termination, use the **no** form of this command.

line-termination {75-ohm | 120-ohm} no line-termination

Syntax Description	75-ohm S	Specifies 7	5-ohm unbalanced termination.			
	120-ohm	Specifies 1	20-ohm balanced termination. This is the default.			
Command Default	120-ohms	120-ohms				
Command Modes	Controller co	nfiguration	n			
Command History	Release	Modific	ation			
	11.3(2)AA	This cor	nmand was introduced.			
	12.2(33)SRA	This cor	nmand was integrated into Cisco IOS Release 12.2(33)SRA.			
	12.28X		nmand is supported in the Cisco IOS Release 12.2SX train. Support in a specific release of this train depends on your feature set, platform, and platform hardware.			
Usage Guidelines	This command applies only to E1 controllers. To determine the line termination setting for the controller, use the showcontrollerse1 command.					
Examples	In the following example, the line termination is set to 75 ohms for the E1 port located in shelf 6, slot 0, port 0:					
		ig)# cont ig-contro	croller e1 6/0/0 Dller)# line-termination 75-ohm			
Related Commands	Command		Description			
	show contro	llers e1	Displays information about the E1 links supported by the NPM (Cisco 4000) or MIP			

(Cisco 7500 series).

link debounce

To enable the debounce timer on an interface, use the **linkdebounce** command in interface configuration mode. To disable the timer, use the **no** form of this command.

link debounce [time time]
no link debounce

Syntax Description	time	time	(Optional) Specifies the extended debounce timer; va lid values are from 100 to 5000
			milliseconds.

Command Default

The table below lists the debounce timer defaults.

Table 1: Port Debounce Timer Delay Time

Port Type	Debounce Timer Disabled	Debounce Timer Enabled
10BASE-FL ports	300 milliseconds	3100 milliseconds
10/100BASE-TX ports	300 milliseconds	3100 milliseconds
100BASE-FX ports	300 milliseconds	3100 milliseconds
10/100/1000BASE-TX ports	300 milliseconds	3100 milliseconds
1000BASE-TX ports	300 milliseconds	3100 milliseconds
Fiber Gigabit ports	10 milliseconds	100 milliseconds
10-Gigabit ports except WS-X6501-10GEX4 and WS-X6502-10GE	10 milliseconds	100 milliseconds
WS-X6501-10GEX4 and WS-X6502-10GE 10-Gigabit ports	1000 milliseconds	3100 milliseconds

Command Modes Interface configuration

Command History

Release	Modification
12.2(14)SX	Support for this command was introduced on the Supervisor Engine 720.
12.2(17a)SX	This command was changed to remove support for the following modules: • WS-X6501-10GEX4 • WS-X6502-10GE
12.2(17d)SXB	Support for this command on the Supervisor Engine 2 was extended to Release 12.2(17d)SXB.
12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.

Usage Guidelines The **time** keyword and argument are supported on Gigabit Ethernet and 10-Gigabit Ethernet interfaces only.

The **linkdebounce** command is not supported on the following modules in releases prior to Release 2.2(17a)SX:

- WS-X6501-10GEX4
- WS-X6502-10GE

The debounce timer sets the amount of time that the firmware waits before it notifies the software that the link is down. The debounce timer does not apply to linkup because the linkup is immediately notified by the firmware.

The default debounce time applies when you enter the **linkdebounce** command with no arguments. For example, when you enter the **linkdebouncetime100** command, it is equivalent to entering the **linkdebounce** command with no arguments and you will see the following link debounce entry in the configuration:

```
interface GigabitEthernet1/1
no ip address
link debounce
```

Enter the **showinterfacesdebounce** command to display the debounce configuration of an interface.

Examples This example shows how to configure the debounce timer on a Gigabit Ethernet fiber interface:

Router(config-if) # link debounce time 100
Router(config-if) #

Related Commands	Command	Description
	show interfaces debounce	Displays the status and configuration for the debounce timer.

link state group

To configure the link state group, use the linkstategroup command in interface configuration mode.

link state group [number] {upstream | downstream}

Syntax Description	number	Specifies a link-state group. The acceptable range of group number is between 1 to 10 and the default value is 1.			
	upstream	Configures the interface as an upstream interface in the group.			
	downstream	n Configures the interface as a downstream interface in the group.			
Command Default	The default li	inkstategroupnumber is 1.			
Command Modes	Interface configuration (config-if)				
Command History	Release Mo	odification			
	15.1(1)8 Thi	is command was introduced.			
Usage Guidelines	interfaces. Wi adding the do	tracking (LST), also known as trunk failover, is a feature that binds the link state of multiple /hen you configure LST for the first time, add upstream interfaces to the link state group befor ownstream interface, otherwise the downstream interfaces would move into error-disable mode m number of link state groups configurable is 10. These are the limitations:			
	• An interface can only be an upstream or downstream interface.				
	• An inter	rface cannot be part of more than one link state tracking group.			
Examples	The following	g example shows how to configure the link state group number.			
	Router# configure terminal Router(config)# link state track 1 Router(config)# interface gigabitethernet3/1 Router(config-if)# link state group 1 upstream Router(config-if)# interface gigabitethernet3/3 Router(config-if)# link state group 1 upstream Router(config-if)# interface gigabitethernet3/5 Router(config-if)# link state group 1 downstream Router(config-if)# interface gigabitethernet3/7 Router(config-if)# link state group 1 downstream				
Related Commands	Command	Description			
	link state tra	rack Configures the link-state track number.			

Displays the link-state group information.

show link state group

link state track

To configure a link state tracking number, use the **linkstatetrack** command in global configuration mode. To restore the default **linkstatetrack**number, use the no form of this command.

link state track number no link state track number

Syntax Description	number	Specifies the l value is 1.	link state tracking number. The acceptable range is between 1 and 10 and the default
Command Default	The defa	ult link state trac	ck number is 1.
Command Modes	Global co	onfiguration (con	nfig)
Command History	Release	Modification	
	15.1(1)S	This command	was introduced.
Usage Guidelines	interfaces	s. When you cor	T), also known as trunk failover, is a feature that binds the link state of multiple nfigure LST for the first time, add upstream interfaces to the link state group before nterface, otherwise the downstream interfaces would move into error-disable mode.
Examples	The follo	wing example s	shows how to configure the link state tracking number.
		configure ter config)# link	rminal state track 1
Related Commands	Comman	ıd	Description
	link stat	te group	Configures the link state group and the interface as either an upstream or downstream interface in the group.
	show lin	nk state group	Displays the link state group information.

li-slot rp rate

To apply the user specified Packets Per Second (PPS) value when an Lawful Intercept (LI) is provisioned in RP mode, use the **li-slot rp rate** command in global configuration mode. To disable the user specified value, use the no form of this command .

li-slot rp rate pps

Syntax Description		kets per second (pps). The range is from 10 to 8500 for SUP720, 10 to 6000 for SUP32, and 000 for RSP720.	1 10 to
Command Default	No default	t behavior or values.	
Command Modes	Global configuration (config)		
Command History	Release Modification		
·····,	15.0(1)85	This command was introduced on the Cisco 7600 series routers.	

router# configure terminal
router(config)# li-slot rp rate 5000

Related Commands	Command	Description			
	show mls rate-limit	Displays information about the configured rate limiters.			

link-test

To reenable the link-test function on a port on an Ethernet hub of a Cisco 2505 or Cisco 2507 router, use the link-test command in hub configuration mode. To disable this function, use the no form of this command.

link-test commandlink-test no link-test

This command has no arguments or keywords. Syntax Description

Enabled **Command Default**

Hub configuration **Command Modes**

Command History Release **Modification** 10.3 This command was introduced. 12.2(33)SRA This command was integrated into Cisco IOS Release 12.2(33)SRA. 12.2SX This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.

Usage Guidelines

This command applies to a port on an Ethernet hub only. Disable this feature if a 10Base-T twisted-pair device at the other end of the hub does not implement the link test function.

Examples

The following example disables the link test function on hub 0, ports 1 through 3:

Router(config)# hub ethernet 0 1 3 Router(config-hub)# no link-test

Related Commands

Command Description hub Enables and configures a port on an Ethernet hub of a Cisco 2505 or Cisco 2507 router.

load-balancing

r

To apply a load-balancing method to a Gigabit EtherChannel (GEC) interface, use the **load-balancing** command in interface configuration mode. To reset to the default, use the **no** form of this command.

load-balancing {flow | vlan} no load-balancing

Syntax Description	flow Flow-based load balancing is used.				
	vlan	VLAN-manual loa	d balancing is used.		
Command Default	The port channel uses the global load-balancing configuration.				
Command Modes	Interface configuration (config-if)				
Command History	Release Modification				
	Cisco	IOS XE Release 2.5	This command was	introduced.	
Usage Guidelines	delines The load-balancing command sets the load-balancing method on a specific port channel. The load-bala method configured with this command takes precedence over the global configuration defined with the port-channelload-balancingvlan-manual command.			· · ·	
	•	do not explicitly cor d on the port channe	-		bally or on the port channel, the load-balancing
	differe	nt traffic flows are n	happed to the bucket	s and each b	ows to the member links of the port channel. The ucket has one active member link associated with hk associated with that bucket.
	There are two methods of load balancing on a GEC interface:			ee:	
	• VLAN-manualAll packets forwarded over the same VLAN subinterface are considered part of the same flow and are mapped to the member link specified in the configuration.				
	• F	low-basedTraffic f	lows are mapped to	different me	mber links based on the packet header.
Examples	This ex	xample shows how t	o set the load-baland	cing method	to VLAN-manual:
		r(config)# interf a r(config-if)# loa d	=	1	
Related Commands	Comm	nand		Description	1
	interf	âce port-channel		Creates a p	ort-channel virtual interface.
	port-	channel load-balan	cing vlan-manual	Applies the	VLAN-manual load-balancing method globally

to all GEC interfaces.

Command	Description
show interfaces port-channel etherchannel	Displays the load-balancing bucket distribution currently in use for a GEC interface.
show etherchannel load-balancing	Displays the load-balancing method applied to GEC interfaces.

load-interval

To change the length of time for which data is used to compute load statistics, use the **load-interval** command in interface configuration, Frame Relay DLCI configuration, or template configuration modes. To revert to the default setting, use the **no**form of this command.

load-interval seconds no load-interval seconds

Syntax Description	seconds	•	or which data is used to compute load statistics. Value is a multiple of 30, from , 90, 120, and so on). The default is 300 seconds.
Command Default	Enabled		
Command Modes	Interface c	onfiguration	
	Frame Rel	ay DLCI configur	ation
	Template of	configuration (con	fig-template)
Command History	Release		Modification
	10.3		This command was introduced.
	12.2(4)T		This command was made available in Frame Relay DLCI configuration mode
	12.2(18)SXF		Support for this command was introduced on the Supervisor Engine 720.
	12.2(28)SB		This command was integrated into Cisco IOS Release 12.2(28)SB.
	12.2(33)SRA		This command was integrated into Cisco IOS Release 12.2(33)SRA.
	15.1(2)SNG		This command was implemented on the Cisco ASR 901 Series Aggregation Services Routers.
	15.2(2)E		This command was integrated into Cisco IOS Release 15.2(2)E. This command is supported in template configuration mode.
	Cisco IOS	XE Release 3.6E	This command was integrated into Cisco IOS XE Release 3.6E. This command is supported in template configuration mode.

Usage Guidelines

To make computations more reactive to short bursts of traffic, you can shorten the length of time over which load averages are computed.

If the load interval is set to 30 seconds, new data is used for load calculations over a 30-second period. This data is used to compute load statistics, including the input rate in bits and packets per second, the output rate in bits and packets per second, the load, and reliability.

Load data is gathered every five seconds. This data is used for a weighted-average calculation in which recent load data has more weight in the computation than older load data. If the load interval is set to 30 seconds, the average is computed for the last 30 seconds of load data.

If you change the calculation interval from the default of five minutes to a shorter period of time, the input and output statistics that are displayed by the **show interface** command or the **show frame-relay pvc** command will be more current and will be based on more nearly instantaneous data, rather than reflecting the average load over a longer period of time.

This command is often used for dial backup purposes to increase or decrease the likelihood of implementation of a backup interface, but it can be used on any interface.

Examples

Interface Example

In the following example, the default average of five minutes is changed to a 30-second average. A burst in traffic that would not trigger a dial backup for an interface configured with the default five-minute interval might trigger a dial backup for this interface, which is set for the shorter 30-second interval.

```
Router(config) # interface serial 0
Router(config-if) # load-interval 30
```

Frame Relay PVC Example

In the following example, the load interval is set to 60 seconds for a Frame Relay PVC with the DLCI 100:

```
Router(config)# interface serial 1/1
Router(config-if)# frame-relay interface-dlci 100
Router(config-fr-dlci)# load-interval 60
```

Interface Template Example

In the following example, the load interval is set to 60 seconds in an interface template:

```
Device# configure terminal
Device(config)# template user-template1
Device(config-template)# load-interval 60
Device(config-template)# end
```

Related Commands

Command	Description
show interfaces	Displays statistics for all interfaces configured on the router or access server.

local ip address

To define an IP address to identify a local circuit emulation (CEM) channel, use the **localipaddress** command in CEM xconnect configuration mode.

local ip address ip-address

	_			
Syntax Description	<i>ip-address</i> IP add	dress of a regular or loopback interface in the local router. Default is 0.0.0.0		
Command Default	The default local IP address is 0.0.0.0 for a CEM channel.			
Command Modes	CEM xconnect cont	figuration		
Command History	Release Modificat	tion		
	12.3(7)T This com	mand was introduced.		
Usage Guidelines	or enter the noxcon The local IP address	s not have a no form. To remove a local IP address, either configure a new local IP address nect command to disable the connection and all its parameters. s used to identify the local end of a CEM connection must be the same as the IP address <i>inte-ip-address</i> argument used in the xconnect command to identify the CEM channel at CEM connection.		
		Itiple CEM connections that originate from the same router, they may share the same local IP ed that each local IP address defines a unique UDP port number using the localudpport command.		
Examples	The following exam CEM over IP (CEol	uple demonstrates how to configure the IP address of the local endpoint of the IP) connection.		
	Router(config-cer	m-xconnect)# local ip address 10.0.5.1		

Related Commands	Command	Description
clear cem		Clears CEM statistics.
local udp port		Defines the UDP port at the local end of a CEM connection.
	show cem	Displays CEM statistics.
	xconnect (CEM)	Builds one end of a CEM connection and enters CEM xconnect configuration mode.

local-priority

To set the PTP clock's local priority.

		1			
	Note This comr	nand is used only f	for the G.8275.1 telecom profile.		
	local-priority	local-priority			
Syntax Description	local-priority	Local priority val	lue of the clock. The valid values are from 1 to 255.		
Command Default	The default loc	al priority is 1.			
Command Modes	PTP Clock Cor	nfiguration			
Command History	Release	Modification			
	IOS-XE 3.18	This command wa	s introduced.		
Usage Guidelines	The configured	l local priority is ig	mored on ports without the G.8275.1 or G.8275.2 profile.		
Examples	The following example demonstrates how to configure the local priority of the master-only ordinary clock.				
	Router(config	gure terminal g)# ptp clock or g-ptp-clk)# loca	dinary domain 24 1-priority 1		
Related Commands	Command		Description		
	ptp clock		Creates a Precision Time Protocol clock and specifies the clock mode .		
	priority1		Sets priority1.		
	priority2		Sets priority2.		
	show ptp cloc	k dataset default	Verifies the local priority of the PTP clock.		

local udp port

To define the User Datagram Protocol (UDP) port of the local endpoint of a circuit emulation (CEM) connection, use the **localudpport** command in CEM xconnect configuration mode.

Builds one end of a CEM connection and enters CEM xconnect configuration mode.

local udp port port

xconnect (CEM)

Syntax Description	port Number of the CEM local UDP port. Possible values are 0, 2141, and 15872 through 16383. The default is 0. The default local UDP port number is 0 for the local endpoint of a CEM connection. CEM xconnect configuration				
Command Default					
Command Modes					
Command History	Release Mo	dification			
	12.3(7)T Thi	s command was introduced.			
Usage Guidelines	This command does not have a no form. To remove a local UPD port number, either configure a new UPD port number or enter the noxconnect command to disable the connection and all its parameters.				
Examples	The following example demonstrates how to configure the UDP port of the local endpoint of the CEM over IP (CEoIP) connection.				
	Router(conf:	ig-cem-xconnect)# local udp port 2141			
Related Commands	Command	Description			
	remote udp	port Defines the UDP port of the remote endpoint of a CEM connection.			
	show cem	Displays CEM channel statistics.			

local-Inm

To enable Lanoptics Hub Networking Management of a PCbus Token Ring interface, use the **local-lnm** command in interface configuration mode. To disable Lanoptics Hub Networking Management, use the **no** form of this command.

local-lnm commandlocal-lnm no local-lnm

Syntax Description This command has no arguments or keywords.

Command Default Management is not enabled.

Command Modes Interface configuration

Command History	Release	Modification
	10.3	This command was introduced.
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
	12.28X	This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.

Usage Guidelines The Token Ring interface on the AccessPro PC card can be managed by a remote LAN manager over the PCbus interface. At present, the Lanoptics Hub Networking Management software running on an IBM compatible PC is supported.

Examples The following example enables Lanoptics Hub Networking Management:

Router(config-if) # local-lnm

logging event

To enable notification of interface, subinterface, and Frame Relay data link connection identifier (DLCI) data link status changes, use the **loggingevent** command in interface configuration mode. To disable notification, use the **no** form of this command.

logging event {dlci-status-change | link-status | subif-link-status [ignore-bulk]} no logging event {dlci-status-change | link-status | subif-link-status [ignore-bulk]}

Syntax Description	dlci-status-ch	Enables notification of Frame Relay DLCI status changes.			
		Note This option is supported only when the encapsulation on the interface is Frame Relay.			
	link-status	Enables notification of interface data link status changes.			
	subif-link-sta	tus Enables notification of subinterface data link status changes.			
	ignore-bulk	Suppresses link status messages for subinterfaces when they are caused by a state change of the main interface.			
Command Default	For system ima enabled by def	ages, notification of interface, subinterface, and Frame Relay DLCI data link status changes is fault.			
		es, notification of Frame Relay subinterface and DLCI data link status changes is disabled by eation of interface data link status changes is enabled by default.			
Command Modes	Interface confi	guration			
Command History	Release	Modification			
	12.0	This command was introduced.			
	12.2(32)S	The ignore-bulk keyword was integrated into the Cisco IOS Release 12.2(32)S.			
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.			
	12.3(7)T	The ignore-bulk keyword was integrated into Cisco IOS Release 12.3(7)T.			
	12.28X	This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.			
Examples	The following	example shows how to enable notification of subinterface link status changes:			
	Router(confi	g-if)# logging event subif-link-status			
	The following are examples of Frame Relay DLCI and subinterface status change notification messages filtered by the loggingevent command:				

00:16:22: %FR-5-DLCICHANGE: Inteface Serial3/0/0:1 - DLCI 105 state changed to INACTIVE

00:16:22: IINEPROTO-5-UPDOWN: Line protocol on Interface Serial3/0/0:1.5, changed state to down

logging source-interface

To specify the source IPv4 or IPv6 address of system logging packets, use the **loggingsource-interface** command in global configuration mode. To remove the source designation, use the **no** form of this command.

logging source-interface type number no logging source-interface

Syntax Description	type number	Interface type and number.
--------------------	-------------	----------------------------

Command Default The wildcard interface address is used.

Command Modes Global configuration (config)

Command History	Release	Modification
	11.2	This command was introduced.
	12.4(4)T	This command was modified. IPv6 support was added.
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
	12.28X	This command is supported in the Cisco IOS Release 12.2SX. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.

Usage Guidelines This command can be configured on the Virtual Routing and Forwarding (VRF) and non-VRF interfaces. Normally, a syslog message contains the IPv4 or IPv6 address of the interface used to leave the router. The loggingsource-interface command configures the syslog packets contain the IP or IPv6 address of a particular interface, regardless of which interface the packet uses to exit the router.

When no specific interface is configured, a wildcard interface address of 0.0.0.0 (for IPv4) or :: (for IPv6) is used, and the IP socket selects the best outbound interface.

Examples

In the following example, the user specifies that the IP address of Ethernet interface 0 is the source IP address for all syslog messages:

Router(config) # logging source-interface ethernet 0

The following example specifies that the IP address for Ethernet interface 2/1 is the source IP address for all syslog messages:

Router(config) # logging source-interface ethernet 2/1

The following sample output displays that the **loggingsource-interface** command is configured on a VRF source interface:

Router# show running interface loopback49 Building configuration... Current configuration : 84 bytes

```
!
            interface Loopback49
             ip vrf forwarding black
             ip address 49.0.0.1 255.0.0.0
            end
Router# show running | includes logging
     logging source-interface Loopback49 vrf black
     logging host 130.0.0.1 vrf black
```

nds	Command	Description	
	logging	Logs messages to a syslog server host.	

logging event link-status (global configuration)

To change the default or set the link-status event messaging during system initialization, use the **logging event link-status** command in global configuration mode. To disable the link-status event messaging, use the **no** form of this command.

logging event link-status {default | boot} no logging event link-status {default | boot}

Syntax Description	default	Enable	es system logging of interface state-change events on all interfaces in the system.		
	boot	Enables system logging of interface state-change events on all interfaces in the system during system initialization.			
Command Default	Interfac	e state-c	change messages are not sent.		
Command Modes	Global	configur	ation		
Command History	Release	e	Modification		
	12.2(14	4)SX	Support for this command was introduced on the Supervisor Engine 720.		
	12.2(17	d)SXB	Support for this command on the Supervisor Engine 2 was extended to Release 12.2(17d)SXB.		
	12.2(33	B)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.		
Usage Guidelines	You do not have to enter the logging event link-status boot command to enable link-status messaging during system initialization. The logging event link-status default command logs system messages even during system initialization.				
	If you enter both the logging event link-status default and the no logging event link-status boot commands, the interface state-change events are logged after all modules in the Cisco 7600 series router come online after system initialization. The logging event link-status default and the no logging event link-status boot commands are saved and retained in the running configuration of the system.				
	present i	in the ru	logging event link-status default and the no logging event link-status boot commands are nning configuration and you want to display the interface state-change messages during system nter the logging event link-status boot command.		
Examples	This example shows how to enable the system logging of the interface state-change events on all interfaces in the system:				
	Router(config)# logging event link-status default Router(config)#				
			nows how to enable the system logging of interface state-change events on all interfaces nitialization:		
	Router	config) # logging event link-status boot		

Router(config)# logging event link-status boot
Router(config)#

This example shows how to disable the system logging of interface state-change events on all interfaces:

Router(config)# no logging event link-status default
Router(config)#

This example shows how to disable the system logging of interface state-change events during system initialization:

Router(config) # no logging event link-status boot
Router(config) #

Related Commands	Command	Description

adapter.

logging-events (T1-E1 controller)

To show the controller state change and alarms on a controller, use the **logging-events**command in controller configuration mode. To turn off controller state change reporting, use the **no** form of the command.

logging-events *detail* no logging-events

Syntax Description	<i>detail</i> Alarm along with the controller state change.			
Cyntax Desonption	<i>uetuu</i> Atalin along with the controller state change.			
Command Default	Logging-events is the default.			
Command Modes	Controller configuration			
Command History	Release M	Release Modification		
		This command was introduced to support SPAs on the Cisco 7600 series router and Catalyst 6500 series switch.		
	12.2(33)SRA Th	2.2(33)SRA This command was integrated into Cisco IOS Release 12.2(33)SRA.		
Usage Guidelines	Use the logging-events command to show the state change and alarms on a controller on an 8-Port Channelized T1/E1 Serial SPA.			
Examples	The following shows enabling the logging-events command.			
	Router(config)#contr el 2/1/0 Router(config-controller)# logging-events			
Related Commands	Command Description			
	controller	Configures a T1, E1, or T3 controller and enters controller configuration mode.		
	show controller	Displays controller configuration.		

loopback (CEM)

To set the loopback method for testing a T1, E1, serial CEM interface, and VCoP Smart SFP, use the **loopback** command in controller configuration or CEM configuration mode. To remove any existing loopback, use the **no** form of this command.

Cisco NM-CEM-4SER loopback {local | network} no loopback

Cisco NM-CEM-4TE1 loopback {local {payload | line} | network} no loopback

Cisco IOS XE Release 3.18SP loopback {diag | local | {payload | line}} no loopback

Cisco IOS XE Release 3.18.1SP loopback {local | network {payload | line}} no loopback

Syntax Description	diag	Loops the outgoing transmit signal back to the receive signal. This is done using the diagnostic loopback feature in the interface module's framer.			
	local	Places the interface into local loopback mode and creates a loopback wherein information received from the locally-attached customer premises equipment (CPE) is transmitted back to the locally-attached CPE.			
		• payload (Used only if a local loopback is specified for a T1/E1 channel) Creates a loopback of only the data in individual time slots. In this mode, framing bits are terminated and then regenerated instead of being looped back. This mode is not available if the port is configured for framingunframed .			
		• line(Used only if a local loopback is specified for a T1/E1 channel) Creates a full physical layer loopback of all bits, including data and framing bits.			
	network	Creates a loopback wherein data received over the network from the remote CPE is transmitted back to the remote CPE.			
	No loopback is configured for a CEM interface.				
Command Modes	CEM configuration				
	Controller configuration

Enters controller configuration mode.

l2 vfi manual through loopback PA-MC-8TE1 + port adapter

loopback (DSL controller)

To test the controller and configure the core loopback, use the **loopback**(**DSLController**)command in controller configuration mode. To remove the loopback interface, use the **no** form of this command.

loopback {analog | digital} no loopback

Syntax Description	analog	Loops the circuit at the analog hybrid to verify the analog loopback hardware to the analog hybrid.
	digital	Loops the circuit at the framer to verify the hardware to the framer.

Command Default No default behavior or values.

Command Modes Controller configuration

Command History

Release	Modification
12.3(4)XD	This command was introduced on Cisco 2600 series and Cisco 3700 series routers.
12.3(4)XG	This command was integrated into Cisco IOS Release 12.3(4)XG on the Cisco 1700 series routers.
12.3(7)T	This command was integrated in Cisco IOS Release 12.3(7)T on Cisco 2600 series, Cisco 3631, and Cisco 3700 series routers.
12.3(11)T	This command was integrated into Cisco IOS Release 12.3(11)T on Cisco 2800 series and Cisco 3800 series routers.
12.3(14)T	This command was integrated into Cisco IOS Release 12.3(14)T on Cisco 1800 series routers.

loopback hardware to the analog hybrid. The controller must be shut down before loopback can be configured.

Usage Guidelines Analog and digital loopbacks are local loopbacks. Digital loopbacks loop the circuit at the framer to verify the hardware to the framer, and analog loopbacks loop the circuit at the analog hybrid to verify the analog

Examples

If the controller is still up, the router will prompt you to turn the controller off as shown in this example:

```
Router(config-controller)# loopback
analog
Please shut down the xDSL controller
```

```
Router(config-controller)# loopback
digital
```

Please shut down the xDSL controller

The following example shows the configuration of a loopback digital interface:

```
Router(config-controller)# loopback digital
Please shut down the xDSL controller
Router(config-controller)# shutdown
```

```
Router(config-controller)#

loopback (E3 controller)

show controllers e3

To loop an entire E3 line toward the line and back toward the router, use the **loopback**command in controller configuration mode. To remove the loop, use the no form of this command.

 $\label{eq:loopback} \begin{array}{l} \mbox{loopback} & \{\mbox{local} \mid \mbox{network} \quad \{\mbox{line} \mid \mbox{payload}\}\} \\ \mbox{no loopback} \end{array}$

	no noppack					
Syntax Description	local		Loops the data back toward the router and sends an AIS signal out toward the network. This is the default.			
	network l	line payload	Sets the loopback toward the network either before going through the framer (line) or after going through the framer (payload).			
Command Default	local					
Command Modes	Controller configuration					
Command History	Release Modification					
	11.3	This comman	d was introduced.			
	12.2(11)YT This command was integrated into Cisco IOS Release 12.2(11)YT and implemented on the following platforms for E3: Cisco 2650XM, Cisco 2651XM, Cisco 2691, Cisco 3660 series, Cisco 3725, and Cisco 3745 routers.					
	12.2(15)T	This command was integrated into Cisco IOS Release 12.2(15)T.				
Usage Guidelines	Use this command for troubleshooting purposes. To verify that a loopback is configured on the interface, us the showcontrollerse3 EXEC command. Note that line loopback is available only in C-bit parity mode.					
Examples	The following example shows how to configure the controller located in slot 1, port 0 for a lo loopback:					
		fig)# control fig-controlle	ller e3 1/0 er)# loopback local			
Related Commands	Command	Des	scription			
	-					

Displays information about the E3 controllers.

loopback (interface)

To diagnose equipment malfunctions between the interface and device, use the **loopback**command in interface configuration mode. To disable the test, use the **no** form of this command.

loopback no loopback

Syntax Description This command has no arguments or keywords.

Command Default Disabled

Command Modes Interface configuration

Command History

Release	Modification
10.0	This command was introduced.
12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
12.2SX	This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.

Usage Guidelines Loopback on HSSI Cards

On High-Speed Serial Interface (HSSI) cards, the loopback function configures a two-way internal and external loop on the HSA applique of the specific interface.

Loopback on MCI and SCI Serial Interface Cards

On MCI and SCI serial interface cards, the loopback functions when a CSU/DSU or equivalent device is attached to the router or access server. The**loopback** command loops the packets through the CSU/DSU to configure a CSU loop, when the device supports this feature.

Loopback on MCI and MEC Ethernet Cards

On the MCI and MEC Ethernet cards, the interface receives back every packet it sends when the **loopback** command is enabled. Loopback operation has the additional effect of disconnecting network server functionality from the network.

Loopback on CSC-FCI FDDI Cards

On the CSC-FCI FDDI card, the interface receives back every packet it sends when the **loopback** command is enabled. Loopback operation has the additional effect of disconnecting network server functionality from the network.

Loopback on Token Ring Interface Cards

On all Token Ring interface cards (except the 4-megabit CSC-R card), the interface receives back every packet it sends when the **loopback** command is enabled. Loopback operation has the additional effect of disconnecting network server functionality from the network.

Active Loopback Interfaces

To show interfaces currently in loopback operation, use the showinterfacesloopback EXEC command.

Note Loopback does not work on an X.21 DTE because the X.21 interface definition does not include a loopback definition.

Examples

The following example configures the loopback test on Ethernet interface 4:

Router(config)# interface ethernet 4
Router(config-if)# loopback

Related Commands	Command	Description
	down-when-looped	Configures an interface to inform the system it is down when loopback is detected.
	show interfaces loopback	Displays information about the loopback interface.

loopback (J1 controller)

To set the loopback method for testing the J1 interface, use the **loopback** command in controller configuration mode. To turn off loopback, use the **no** form of this command. This command should be used for testing purposes only.

loopback {local | line | isolation} no loopback {local | line | isolation}

Syntax Description	local	Places the interface into local loopback mode.
	line	Places the interface into external loopback mode at the line level.
	isolation	Places the interface into both local and line loopback mode.

Command Default No loopback is configured.

Command Modes Controller configuration

Command History	Release	Modification
	11.3 MA	This command was implemented on the Cisco MC3810.
	12.0(5)T and 12.0(7)XR	The command was implemented on the Cisco 2600 and Cisco 3600 series.
	12.0(5)XE	The command was implemented on the Cisco 7200 and Cisco 7500 series.
	12.1(1)T	The command was implemented on the Cisco 2600 series.
	12.2(8)T	The command was implemented on the Cisco 2600 and Cisco 3600 series.

Examples

The following example establishes a loopback of the incoming J1 signal on controller J1 3/0:

Router(config)# controller j1 3/0
Router(config-controller)# loopback line

loopback (PA-MC-8TE1+ port adapter)

To enable loopback testing of data for the PA-MC-8TE1+ port adapter, use the **loopback** command in interface configuration mode. To disable loopback testing, use the **no** form of this command.

loopback [internal | line] no loopback [internal | line]

Syntax Description	internal	(Optional) Loops any data received at the PA-MC-8TE1+ port adapter's network interface back into the PA-MC-8TE1+ port adapter.		
	line	(Optional) Loops any data received at the PA-MC-8TE1+ port adapter's network interface bac into the network.		
Command Default	Loopback	mode is not enabled.		
Command Modes	Interface c	onfiguration		
Command History	Release	Modification		
	12.2(13)T	This command was introduced.		
Examples	In the follo	owing example, a loopback is set f	or the PA-MC-8TE1+ port adapter in slot 2:	

Router(config)# interface 2/0
Router(config-if)# loopback line
